Τὸ δυνατόν γὰρ ἡ φιλία ἐπιζητεῖ, οὐ τὸ κατ' ἀξίαν· οὐδὲ
γὰρ ἔστιν ἐν πᾶσι, καθάπερ ἐν ταῖς πρὸς τοὺς θεοὺς τιμαῖς
καὶ τοὺς γονεῖς· οὐδεὶς γὰρ τὴν ἀξίαν ποτ' ἂν ἀποδοίη.

Aristotle, *Eth. Nic.* 1163^b 15.

PREFACE

THE inclusion of the *Problemata* in the Aristotelian Corpus is no doubt due to the fact that Aristotle is known to have written a work of this kind, to which reference is made in his genuine works and by other writers. An examination of these references shows that some of them can be connected with passages in the *Problemata*, while others cannot; from which it may be concluded that, while the *Problemata* is not the genuine Aristotelian work, it nevertheless contains an element derived from such a work. It is also obviously indebted to other Aristotelian treatises, especially those on Natural History, to the Hippocratean writings, and to Theophrastus. The repetitions and contradictions which occur in the work seem to show that it was a gradual compilation by several hands; and, if one may judge from the late forms of words which occur in several passages, it did not reach its final form until some time after the beginning of the Christian Era. Some critics would date its completion as late as the fifth or sixth century A.D. The doctrine throughout is Peripatetic, and the variety of subjects treated shows the wide interests of that school.

The text used for this translation is that of Ruelle-Knoellinger-Klek (Leipzig, Teubner, 1922). The preface to that edition contains a complete account of the MSS. and a valuable bibliography.¹ Wherever any other reading is adopted the fact is stated in the foot-notes.

¹ An important contribution to the text (not mentioned in this bibliography) is that of the late Mr. H. P. Richards in his *Aristotelica* (London, Grant Richards, 1915). This only came into my hands after I had completed the first draft of my translation; it confirmed in several passages conclusions at which I had arrived independently.

Professor W. D. Ross has been good enough to read the translation both in MS. and in proof; a small part of the debt which I owe him is indicated in the foot-notes, but there are innumerable other passages in which his vast knowledge of Aristotelian usage has enabled me to introduce material improvements. I have also to thank Sir Henry Hadow, D.Mus., Vice-Chancellor of the University of Sheffield, and my colleague Mr. G. E. Linfoot, Mus.Bac., B.Sc., for generous assistance in elucidating the Musical Problems.

- XXXVII. 965^b The Whole Body.
- XXXVIII. 966^b The Coloration of the Flesh.

PROBLEMATATA

BOOK I

PROBLEMS CONNECTED WITH MEDICINE

- 1 WHY is it that great excesses cause disease? Is it because 859^a
they engender excess or defect, and it is in these after all
that disease consists?
- 2 But why is it that diseases can often be cured if the
patient indulges in excess of some kind? And this is the 5
treatment used by some doctors; for they cure by the
excessive use of wine or water or salt, or by over-feeding
or starving the patient. Is it because the causes of the
disease are opposites of one another, so that each reduces
the other to the mean?
- 3 Why is it that the changes of the seasons and the winds
intensify or stop diseases and bring them to a crisis and 10
engender them? Is it because the seasons are hot and cold
and moist and dry, while diseases are due to excess of these
qualities and health to their equality? In that case, if the
disease is due to moisture or cold, a season which has the
opposite characteristics stops it; but if a season of the
opposite kind¹ follows, the same admixture of qualities
being caused as before intensifies the disease and kills the
patient. For this reason the seasons even cause disease in 15
healthy persons, because by their changes they destroy the
proper admixture of qualities; for it is at the same time
improved by suitable seasons, times of life, and localities.
The health therefore requires careful management at
times of change. And what has been said generally as to
the effect of the seasons applies also in detail; for changes
of winds and of age and of locality are to some extent 20
changes of season. These also therefore intensify and stop
diseases and bring them to a crisis and engender them, as

¹ i. e. wet or cold.

do the seasons and the risings of certain constellations, such as Orion and Arcturus and the Pleiads and the Dogstar,¹ since they cause² wind and rain and fine weather and storms and sunshine.

25 Why ought emetics to be avoided at the changes of the 4 seasons? Is it in order that there may be no disturbance when the excretions³ are being altered by such changes?

859^b Why is it that the feet swell both of those who are 5 bilious and of those who are suffering from starvation? Is it in both cases the effect of wasting? For those who are starving waste because they do not receive any nourishment at all, while the bilious waste because they do not derive any benefit from the nourishment which they take.

5 Why it is that, though the diseases due to bile occur⁴ in 6 the summer (the season when fevers are at their height), acute diseases due to bile occur rather in the winter? Is it because, being accompanied by fever, they are acute because they are violent, and violence is unnatural? For fervent inflammation is set up when certain parts of the body 10 are moist, and inflammation, being due to an excess of heat, engenders fevers. In the summer, therefore, diseases are dry and hot, but in the winter they are moist and consequently acute (for they soon kill the patient), for concoction will not take place because of the abundance of the excretion.

15 Why is it that the plague alone among diseases infects 7 particularly persons who come into contact with those who are under treatment for it? Is it because it is the only disease to which all men alike are liable, and so the plague affects any one who is already in a low state of health? For

¹ Cp. Hippocr. *de aere*, &c., § 11 (Gundermann, p. 26, 24 ff.).

² The triple repetition of ὡσπερ points to some corruption in the text, and the clause ὡσπερ πνευμάτων . . . ἀλέας cannot be translated. It is probable that ὡσπερ has displaced some such words as αἰτίαι οὐσαι; Theodore Gaza's version (quoted hereafter as T. G.) renders *qui flatus imbresque excitant, qui serenitates frigora teporesve solent afferre*.

³ For the various excretions see D'A. W. Thompson's note on *H. A.* 487^a 5.

⁴ Reading νοσημάτων (ὄντων) ἐν τῷ θέρει from T. G.

they quickly become infected by the inflammatory matter caused by the disease which is communicated by the patient. 20

- 8 Why is it that, when north winds have been prevalent in the winter, if the spring is rainy and characterized by south winds the summer is unhealthy with fever and ophthalmia?¹ Is it because the summer finds the body full of alien humours, and the earth, and any place in which 25 men dwell, becomes moist and resembles localities which are regarded as permanently unhealthy? The result is that, first, ophthalmia occurs when the excretion in the region of the head liquefies, and, secondly, fever ensues. For it is noticeable that anything which admits of extreme 860^a cold also admits of extreme heat,—water, for example, and a stone, of which the former boils quicker than other things, the latter burns more.² As, therefore, in the air a stifling heat occurs when it grows warm owing to its density, so likewise in the body stifling and heat are engendered, and heat in the body is fever and in the eyes ophthalmia. Generally speaking the change which occurs when a warm, 5 dry summer follows immediately on a wet spring, being violent has a deleterious effect upon the body. The effect is still worse if the summer is rainy; for then the sun finds material, which it will cause to boil in the body as in the earth and air; the result is fever and ophthalmia. 10

- 9 Why is it that, if the winter is characterized by south winds and rainy and if the spring is dry with the wind in the north, both the spring and the summer are unhealthy?³ Is it because in the winter owing to the heat and moisture 15 the body assimilates its condition to that of the season, since it must necessarily be moist and relaxed? When the body is in this state, the spring being cool congeals and hardens it owing to its dryness. The result is that women who are pregnant run a risk of abortion in the spring because of

¹ This problem is clearly derived from Hippocr. *de aere*, &c., § 10 ad fin. (Gundermann, p. 26, 14 ff.).

² The sense requires τὸ μὲν ζεῖ, ὁ δὲ κáει for ὁ μὲν ζεῖ, τὸ δὲ κáει. This is clearly the reading which T. G. renders, *feruet etenim illa, urit hic vehementius*.

³ The source of this problem is Hippocr. *de aere*, &c., § 10 (Gundermann, p. 22, 25 ff.).

20 the inflammation and mortification caused by the dry cold, since the necessary moisture is not secreted, and the foetus in the womb becomes weakly and defective owing to the excess of cold ; for children who are born at this season in fine weather become strong and receive nourishment in the womb. In the case of other persons—because in the
 25 spring the phlegm is not purged away owing to its excess (as happens when the weather is warm), but congeals owing to the cold—when the summer and warmth succeeds, setting up violent liquefaction, humours form in those who are bilious and dry because their bodies lack moisture and are naturally parched ; but these humours are slight and so
 30 such people suffer from dry ophthalmia. Those on the other hand who are phlegmatic are afflicted with sore throats and catarrh of the lungs. Women suffer from dysentery owing to their natural moisture and cold ; while elderly persons are afflicted with apoplexy, when moisture being all set free at once overcomes them and solidifies owing to the weakness of their natural heat.

35 Why is it that, when the summer is dry and northerly 10 winds prevail and the autumn on the contrary is wet and characterized by south winds, headaches and sore throats and coughs occur in the ensuing winter and then terminate
 860^b in phthisis?¹ Is it because the winter finds a considerable amount of matter in the body and so it is a difficult task for it to solidify the moisture and form phlegm?² Consequently, when moisture is engendered in the head, it causes
 5 a feeling of heaviness, and if it is plenteous and cold, it causes mortification ; but if, owing to its abundance, it does not solidify, it flows into the nearest region of the body,³ and thus coughs are caused and sore throats and wasting.

But why is it that if the summer and autumn are dry and 11 northerly winds prevail, this weather suits those who are
 10 phlegmatic, and women?⁴ Is it because in both cases

¹ This problem is derived from Hippocr. *de aere*, &c., § 10 (Gundermann, p. 24, 29 ff.).

² For phlegm see *G. A.* 725^a 15 ff., and A. Platt's note.

³ i. e. the throat and chest.

⁴ This problem is derived from Hippocr. *de aere*, etc., § 10 (Gundermann, p. 26, 3 ff.).

nature tends to an excess in one direction, and so the season exerting its influence in the opposite direction establishes an equable temperament, and they are healthy at the time,¹ unless they themselves do anything which harms them, and, when the winter comes on, they are not in a moist condition, having heat in them with which to resist the cold?

12 Why is it that a dry summer and autumn in which 15 northerly winds prevail is unhealthy for those who are bilious?² Is it because their bodily condition and the season have the same tendency and it is like adding fire to fire?³ For the body becoming dry (the freshest⁴ element in it becoming evaporated) and being overheated, dry 20 ophthalmia must necessarily ensue owing to solidification;⁵ but because the remaining humours are full of bile⁶ and these become overheated, acute fevers must ensue caused by the bile, which is undiluted, and in some cases madness, where black bile is naturally present; for the black bile comes to the surface as the contrary humours are dried up. 25

13 Why do they say that a change of drinking-water is unhealthy, but not a change of air? Is it because water becomes nutriment, with the result that it gets into one's system and has an effect upon one, which is not the case with air? Further there are many kinds of water differing⁷ intrinsically from one another, but not of air; this then 30 may also be a reason. For even when we change our place of dwelling we continue to breathe practically the same⁸ air, but we drink different waters. It is, therefore,

¹ i. e. in the summer and autumn.

² This problem is derived from Hippocr. *de aere*, &c., § 10 (Gundermann, p. 26, 5 ff.).

³ A very common phrase in Aristotle; see Bonitz, *s.v.*, and cp. below, 861^a 31, 880^a 21, &c.

⁴ γλυκός here means 'sweet' or 'fresh' in the sense in which water is 'fresh'.

⁵ Reading συμπίξεις for συντήξεις, the point being that the effect of a dry summer and autumn is to reduce the liquid matter in the body. T. G. evidently read συμπίξεις, since he renders *dum humor consumitur*.

⁶ Reading χολώδεις for χολῶδες. T. G. renders *residuo quod bilosum remanserit*.

⁷ Reading διάφορα with Ap, T. G., and Bekker.

⁸ Reading αὐτῷ for the misprint αὐτῶ.

probably a right opinion that change of drinking-water is unhealthy.

Why is it that a change of drinking-water is more 14
35 unhealthy than a change of food? Is it because we consume more water than anything else? For water is found in farinaceous and other foods and whatever we drink consists mainly of water.

861^a But why is a change of water unhealthy?¹ Is it because 15
every change also of season and of age is liable to disturbance? For extremities, such as beginnings and ends, are particularly liable to disturbance. So too foods, when they
5 are different, corrupt one another;² for some have only just entered the system, while others have not yet done so. Further, just as a varied diet is unhealthy (for the concoction³ is then disturbed and not uniform), so those who change their drinking-water are using a varied diet in what they drink; and liquid nourishment has more effect than dry food because it is greater in bulk and because the moisture from the foods themselves forms nourishment.

10 Why does a change of drinking-water cause an increase 16
of lice in those who suffer from louse-disease?⁴ Is it because, owing to the disturbance set up by the different water in those who frequently change their drinking-water, the unconcocted state of the liquid causes a moist condition, especially in that part where the conditions are suitable?
15 Now the brain is moist, and therefore the head is always the moistest part of the body (as is shown by the fact that hair grows there more than elsewhere),⁵ and it is the moisture of this part which generates lice.⁶ This is clear

¹ T. G. here renders, *Sed cur cibi et aquae mutatio gravis est?* We should perhaps read Διὰ τί ἡ (τῶν σιτίων καὶ τοῦ ὕδατος) μεταβολὴ νοσώδης;

² The argument, which is somewhat condensed, appears to be as follows: It is a mechanical truth that the extremities of anything material (e. g. a plank of wood, cp. *Mech.* 857^a 27, &c.) are most liable to movement; similarly changes of seasons and of a man's age, and alterations in diet imply a beginning and an end and are therefore more liable to disturbance. ³ Reading οὐ μίαν (ἢ) πέψιν (Platt).

⁴ For the *morbus pedicularis* see *H. A.* 556^b 27 ff., and D'A. W. Thompson's note, and Pliny, *N. H.* xi. 39.

⁵ Cp. *H. A.* 658^b 2.

⁶ Cp. *H. A.* 557^b 2.

in the case of children; for their heads are moist and they frequently have either running at the nose or discharge of blood, and persons of this age suffer particularly from lice.¹

17 Why is it that from the rising of the Pleiads until the 20 west wind blows those who suffer from chronic diseases are most likely to die, and the old rather than the young? Is it because two things are fatal to life, excess² and cold? For life is heat, whereas this season has both the above characteristics, for it is cold, and winter is then at its height, the subsequent season being spring. Or is it because those 25 who suffer from chronic diseases are in a similar condition to the old?³ For the occurrence of a long illness is like premature old age, since in both the body is dry and cold,—in the one case owing to the time of life, in the other from disease.⁴ Now winter and frosts constitute an excess of coldness and dryness; therefore to those who 30 are in a condition where a very little will turn the scale, winter is like 'fire added to fire' and so causes death.

18 Why is it that in marshy districts sores on the head are quickly cured, but those on the legs only with difficulty?⁵ Is it because the moisture, owing to the fact that it contains 35 an earthy element, is heavy, and heavy things are carried⁶ downwards? Thus the upper parts of the body are cleared out⁷ because the impurities are carried to the lower parts, and these become full of excretions which easily putrefy.

19 Why is it that, when a very dry summer follows after 861^b northerly winds have prevailed in the winter and the spring has been damp and rainy, the autumn is universally fatal, especially to children, while in other people dysentery and prolonged quartan fevers occur then?⁸ Is it because, 5

¹ Cp. *H. A.* 557^b 7.

² Cp. above, 859^a 2, 3.

³ Cp. *G. A.* 784^b 32.

⁴ *ib.* 25-7.

⁵ This problem occurs again in xiv. 6.

⁶ Reading *ὑποχωρεῖ* . . . *ὑποκεχωρηκένας* (cp. 909^a 38, 39 and Bonitz, *Arist. Stud.* iv, p. 401).

⁷ It is doubtful whether *ἔκκριτα* can mean this. The parallel passage 909^a 38 reads *εὐπεπτα*, 'easily concocted', which should probably be restored here.

⁸ Cp. Hippocr. *de aere*, &c., § 10 (Gundermann, p. 22, 18 ff.).

when there is a moderate amount of rain in the summer, the moisture boiling within us, which collected in the damp spring, is cooled and becomes quiescent? If on the other hand this does not happen,¹ children, because they are moist and hot, are in a state of excessive boiling, because they are not cooled; and anything which does not as it
 10 were² boil out in the summer, does so in the autumn. If the excretions do not cause death immediately, but settle round the lungs and windpipe—for they collect first in the upper part of the body, because we are warmed by the air, for it is owing to this that ophthalmia occurs before fever in an unhealthy summer—if then, as I have said, the
 15 excretions in the upper parts of the body do not immediately kill the patient, they descend³ in an unconcocted condition into the stomach; and thus dysentery is caused, because the moisture owing to its abundance is not discharged. If the dysentery ceases, quartan fevers arise in those patients who survive; for the sediment of the unconcocted moisture remains very persistently in the body
 20 and becomes active, just like black bile.

Why is it that, if the summer and the autumn have
 20 been rainy and damp, the ensuing winter is unhealthy?⁴ Is it because the winter finds the body in a very moist state, and also the change from great heat is violent and not
 25 gradual,⁵ because the autumn as well as the summer has been hot, and so acute diseases are caused in some persons, if they have no rarity in their bodies (for in such persons the moist excretions tend to collect in the upper part of the body, because these parts provide room for them, whereas the lower parts differ in this respect)? Those then whose
 30 flesh is solid do not allow of much excretion. When therefore the excretion in the upper parts of the body cools (as happens in drunken persons when they grow cold), the above-mentioned diseases are engendered. On the other

¹ i. e. if there is no rain in the summer. ² Reading οἶον for ὄσον.

³ The change from the singular ἀνέλη to the plural καταβαίνουσι can hardly stand and we should read καταβαίνει.

⁴ This problem is derived from Hippocr. *de aere*, &c., § 10 (Gundermann, p. 24, 25 ff.).

⁵ οὐκ ἐκ προσαγωγῆς is a very common Hippocratic term.

hand when fevers are set up in persons in whose bodies there is more rarity, the fevers caused by a large quantity of unconcocted moisture become burning fevers,¹ because in such people the humours are distributed more through the 35 whole body than in solid-fleshed people, and, when the flesh is contracted by the winter-cold, the humours being heated cause fever. For excessive heat in the whole body is fever, and, when it is intensified by the abundance of 862^a moisture already present there, it turns into a burning fever.

- 21 Why is it that when a large amount of vapour is drawn out of the earth by the sun, the year is pestilential? Is it 5 because it is necessarily a sign that the year is damp and rainy and the ground is necessarily damp? The conditions of life will then resemble those under which people live in a marshy district, and these are unhealthy. The body must then have in it an abundance of excretion and so contain unhealthy matter in the summer.
- 22 Why is it that those years are unhealthy in which small 10 toad-like frogs are produced in abundance? Is it because everything flourishes in its natural environment, and these frogs are naturally moist and so signify that the year is moist and damp? Now such years are unhealthy; for then 15 the body being moist contains abundant excretion, which is a cause of diseases.
- 23 Why is it that south winds which are dry and do not bring rain cause fever?² Is it because they cause alien moisture and heat³ (for they are naturally moist and hot), and this is what causes fever, for it is due to the combined 20 excess of moisture and heat? When therefore south winds blow without bringing rain, they engender this condition⁴ in us, whereas, when they bring rain with them, the rain

¹ *Kαῦσος* is the remittent bilious fever which is epidemic in the Levant; cp. Hippocr. *de aere*, &c. *l. c.*, *Vet. med.* 15, *Aphor.* 1248.

² This problem is partly identical with that of Bk. xxvi. 50. The source is Theoph. *de Ventis*, § 5.

³ i. e. in the body. The parallel passage 946^a 5 reads ἐμποιοῦσι τοῖς σώμασιν.

⁴ i. e. heat and moisture.

cools us. Now south winds from the sea are also beneficial to plants, for they are cooled by the sea before they reach 25 them; whereas blight is due to alien moisture and heat.

Why is it that men feel heavier and weaker when the 24 wind is in the south? ¹ Is it because moisture becomes abundant instead of scanty, being melted by the heat, and moisture, which is heavy, takes the place of breath, which 30 is light? Further, our strength is in our joints, and they are relaxed by south winds (as is shown by the fact that things which have been glued together creak); for the viscous matter in the joints, if it hardens, prevents us from moving, whereas, if it is too moist, it prevents us from exerting ourselves.

Why are people more liable to fall ill in the summer, 25 35 while those who are ill are more liable to die in the winter? ² Is it because in the winter, owing to the fact that the hot matter from its density becomes collected within the body and we suffer more through the excretions which solidify in us, if we cannot concoct them, ³ the commencement of the disease must necessarily be violent, and being of this 862^b character it is likely to prove fatal? In the summer on the other hand, because the whole body is in a state of rarity and cool and too much relaxed for great exertion, there must necessarily be many commencements of disease owing to fatigue and to the fact that we do not concoct all that we 5 swallow (for summer is the season of fresh fruit); but such diseases are not so violent, and therefore yield easily to treatment.

Why is it that deaths are particularly likely to occur 26 during the hundred days following each solstice? Is it because in each case the excess of heat or cold extends 10 over this period, and excess causes disease ⁴ and death in the weakly?

¹ This problem occurs again in Bk. xxiv. 42 (945^a 10 ff.), where it is more briefly treated. The source is Theoph., *op. cit.*, § 56.

² Cp. below, chapter 28.

³ Taking *πονοῦντες* as a *nominativus pendens* and reading <διὰ> τῶν ἐν ἡμῖν κτλ.

⁴ Cp. 859^a 1.

27 Why is it that the spring and the autumn are unhealthy? Is it because changes are unhealthy?¹ The autumn is more unhealthy than the spring, because we are more apt to contract disease when heat turns to cold than when cold turns to heat, and it is in spring that cold turns to heat and 15 in autumn that heat turns to cold.

28 Why is it that illnesses are rarer in the winter than in the summer, but more often fatal?² Is it because illnesses arise from slight causes in the summer but not in the winter? For in winter we are in a better condition for concoction and at the very height of our health,³ so that naturally illnesses which arise from more serious causes are them- 20 selves more serious and more likely to prove fatal. We see the same thing in athletes and generally amongst those who are in a healthy condition; for they either are not afflicted with disease, or, if they are, they rapidly succumb, for they only become ill from some serious cause.

29 Why is it that in the autumn and winter burning fevers 25 are more likely to occur when the weather is cold, while in the summer chills are most troublesome when it is hot? Is it due to the fact that of the humours in man the bile is hot and the phlegm cold? As a result, in summer the cold matter is set free, and being diffused in the body gives rise to chill and shivering; in the winter, on the other hand, the 30 hot matter is overpowered by the weather and cooled. Burning fevers are more troublesome in the winter and autumn, because, owing to the cold, the hot matter collects within, and the fever is within and not on the surface; it is natural therefore that burning fevers should occur during this part of the year. This can be well illustrated by con- 35 trasting those who bathe in cold water and those who use warm water in the winter; those who wash in cold water, though they feel chilled for a short time whilst they are

¹ Cp. 859^a 9.

² The problem of chapter 25 is here rather differently stated and answered.

³ There is no reason with the Teubner editors to doubt the correctness of the reading here.

actually washing, suffer no ill effects from the cold during
 863^a the rest of the day, while those who use hot water continue
 to be less able to resist the cold. For the flesh of those who
 wash in cold water becomes solid, and the hot matter collects
 within; but the flesh of those who use warm water becomes
 5 rare, and the hot matter is diverted to the outside of the
 body.¹

In what does the virtue of a poultice consist? Would it, 30
 owing to its dissolvent action, set up perspiration and
 evaporation?

How can the presence of an abscess be diagnosed? Is it 31
 true that, if, when hot water is poured over it, a change
 takes place, there is an abscess, but none if there is no
 change?

10 In what cases ought cauterization to be employed, and in 32
 what cases the surgeon's knife?² Is it true that wounds
 which have large openings and do not close up quickly
 ought to be cauterized, so that a scab may form? If this is
 done, there will be no festering.

In what does the virtue of a remedy for stanching blood 33
 consist? Is it because it has a drying effect and stops the
 discharge of excretions without³ making a scab or causing
 15 decay of the flesh? If so, the wound must be free from
 inflammation and likely to heal up. For if there is no dis-
 charge, it will be free from inflammation, and being dry it
 will close up; whereas it will not close up as long as it
 is discharging moisture. Most remedies, therefore, for
 stanching blood are pungent, so as to cause contraction.

When ought drugs to be employed and not the knife or 34
 20 cauterization?⁴ Ought drugs to be used for the armpits
 and groin? For sores in these parts are sometimes painful
 and sometimes dangerous after they are cut open. Flat
 growths and those which project considerably and are

¹ Some manuscripts here add a sub-title *ὅσα βοηθήματα (or βοηθημα-
 τικά, or βοηθηματικά προβλήματα) πρὸς ἰασιν.*

² See below, chapter 34.

³ The Teubner text omits *ἀνευ* before *ἐσχαρώσεως*.

⁴ Cp. chapter 32 above.

situated in parts which are venous and not fleshy, should be cauterized; but those which collect at an acute point and are not situated in solid parts of the body should be treated with the knife.

- 35 Why is it that, if one is cut with a copper instrument, ²⁵ the wound heals more quickly than if the cut is made with iron? Is it because copper is smoother and so tears the flesh and bruises the body less? Or must we reject this explanation, since, if iron takes a better edge, the cleavage is easier and less painful? Yet even so copper has a medicinal power of its own,¹ and 'in all things it is the beginning that is important',² and so the copper, by its immediate action³ as soon as the cut is made, causes the ³⁰ wound to close up.
- 36 Why is it that burns inflicted by copper heal more quickly than others? Is it because copper contains more rarity and is less substantial, and the more solid a thing is the more heat it contains?
- 37 Is barley-gruel lighter and better for use in sickness than that made from wheat? For the latter commends itself to ³⁵ some people who argue from the fact that amongst bakers ^{863^b} those who handle wheaten flour have a much better colour than those who employ barley meal,⁴ and furthermore that barley is moister and that which is moister requires⁵ more concoction. But is there any reason why barley should not have some qualities which make it more difficult of concoction and others which make it more serviceable because of its lightness? For barley is not only moister than wheat, ⁵

¹ Cp. 890^a 27 and *Mir. Ausc.* 834^b 30, where flower of copper is said to be prescribed for the eyes. For the preference of bronze or copper over iron in antiquity, see Dr. R. Caton in *J. H. S.* xxxiv. (1914), p. 114, who quotes the scholiast on Theocr. ii. 36.

² Here the proverbial μέγιστον ἀρχὴ παντός (cp. *Soph. El.* 183^b 22, *E. N.* 1098^b 7, &c.) is used to emphasize the importance of the immediate application of the remedy, which is here supplied by the copper of the surgical instrument.

³ Reading as suggested by Bekker τῷ οὖν εὐθύς.

⁴ Cp. Bk. xxi. 24, and xxxviii. 10.

⁵ Ruelle's πλέονος (οὔσης) does not give the required sense. T. G. renders *concoctionem desiderat pleniorum*, and Sylburg's πλέονος (δείται) or something similar must be read.

but it is also colder, and porridge and any other food which is served to one who is in a fever ought to be such that it will provide him with a little nourishment and also cool him. Now barley-gruel has these qualities; for, because it is moist rather than substantial, it gives nourishment which
 10 is small in bulk and at the same time has a cooling effect.

Why do purslane and salt stop inflammation of the gums?¹ Is it because purslane contains some moisture? This is seen if one chews it or if it is crushed together² for some time; for the moisture is then drawn out of it. This glutinous matter sinks into the gum and drives out the acidity. For that there is an affinity between the disease
 15 and the remedy is shown by the acidity; for the juice of purslane has a certain acidity. Salt on the other hand dissolves and draws out the acidity. Why then do lye and soda not have this effect? Is it because they have an astringent instead of a dissolvent action?

Why is it that fatigue must be cured in summer by baths,
 20 in winter by anointing?³ Is anointing employed in the latter case because of the cold and the changes which it causes in the body? For the fatigue must be got rid of by heat which will warm the body, and olive-oil contains heat. In summer, on the other hand, the body requires moisture, because the season is then dry and chills are not to be feared, because the natural inclination is towards heat. A sparing diet of solid food and a liberal indulgence in
 25 liquid nourishment are appropriate to the summer, the latter being peculiar to summer, while the former is commoner than at other seasons; for indulgence in drinking is peculiar to the summer because of the dryness of the season, but a sparing diet is found at all seasons but is more

¹ This problem is repeated in Bk. vi. 9 (887^b 1 ff.). *αίμοδία* is generally applied to a scorbutic affection of the gums, swelling of the gums being one of the symptoms of scurvy; this can hardly be the meaning here, since salt would be the last thing to prescribe for scurvy.

² The parallel passage (887^b 3) reads *συντεθῆ* for *συνθλασθῆ*. The latter gives better sense and should be read in both passages.

³ The same problem is treated in almost identical words in Bk. v. 38; cp. Theophr. *de Lassit.*, § 17.

general in the summer ; for then, owing to the weather, heat is engendered by food.

40 Why do some drugs relax the stomach and not the bladder, others the bladder and not the stomach? Is it 30 true that anything which is naturally moist and full of water, if it has medicinal properties, relaxes the bladder? For it is there that the unconcocted moisture settles ; for the bladder is a receptacle for any moisture which is not concocted in the stomach ; and such moisture does not remain there, but passes away without undergoing or causing any change. But anything which partakes of the 35 nature of earth, if it has medicinal properties, relaxes the 864^a stomach ; for it is to the stomach that anything of an earthy nature is carried, so that, if it has any motive power, it causes a disturbance in the stomach.

41 Why is it that some things affect the upper part of the stomach, hellebore for example, others the lower part, for instance scammony,¹ while others like elaterium² and the 5 juice of thapsia³ affect both parts? Is it because some of the drugs which affect the stomach are hot and others cold, so that some of them, owing to their heat, as soon as they reach the upper part of the stomach are carried thence to the upper region of the body,⁴ melting in particular⁵ anything there⁶ which is most alien to them and least substantial ; and if the drug be powerful or has been administered 10 in a dose stronger than nature can withstand, it carries these liquefactions⁷ and any excretions that there may be down into the upper part of the stomach, and by its heat stirring up the breath, which it engenders in great quantity, checks

¹ A species of convolvulus found in Asia yielding a resinous gum.

² A drug deriving its name from its medicinal qualities (Hippocr. *Acut.* 383); according to Pliny (*N. H.* xx. 1. 3) it was prepared from the wild cucumber. Cp. also Celsus, 5, 12 ; 6, 5.

³ The *Thapsia Asclepium* of Linnaeus ; in large doses it was a violent poison and was so used by Nero (Pliny, *N. H.* xiii. 22. 43) ; cp. also Theoph. *H. P.* ix. 9. 1.

⁴ Cp. *H. A.* 494^a 27.

⁵ If the text is sound, *μάλιστα μὲν* is here used without any corresponding *δέ*.

⁶ Reading *τὰκείθεν* (W. D. R.) for *κακείθεν*.

⁷ *ταῦτα*, i. e. *τὰ ἀλλοτριώτατα καὶ ἥκιστα συμπεφυκότα*.

their progress and causes vomiting? Drugs of a cold nature,
 15 on the other hand, owing to their weight are carried down-
 wards before undergoing or causing any change and, borne
 thence, have the same action as those which affect the upper
 part of the body; for passing thence¹ upwards through the
 ducts and setting in motion any excretions or liquefactions
 over which they prevail, they carry them with them in the
 same direction.² Drugs which partake of both these kinds
 20 and are a mixture of hot and cold, possessing both qualities,
 have both these effects, and are the composite drugs which
 doctors now make up.

Why is it that drugs have a purgative effect, while other 42
 things, though they surpass them in bitterness and astrin-
 gency and other such qualities, do not have this effect? Is it
 25 because the purgative effect is not due to these qualities but
 to the fact that they are unconcocted? For anything which,
 though small in bulk, owing to its excessive heat or cold is
 unconcocted and of such a nature as to overcome, and not
 be overcome by, animal heat, if it is easily dissolved in
 30 the two stomachs, is a drug. For when such drugs enter
 the stomach and become dissolved, they are carried into the
 vein by the ducts through which the food passes, and, not
 being concocted but themselves prevailing, they make their
 way out, carrying with them anything which gets in their
 way; and this is called purging. Copper and silver and
 35 the like, although they are not concocted by animal heat,
 are not easily dissolved in the stomach.³ Oil and honey
 864^b and milk and other such foods have a purgative effect; but
 this depends, not on any quality which they possess, but on
 quantity; for, if they act as a purge, they only do so when
 they are unconcocted owing to their quantity. For things
 can be unconcocted for two reasons, either because of their
 quality or because of their quantity. So none of the above-
 5 mentioned foods are drugs, because they do not purge owing
 to their quality. Astringency and bitterness and unpleasant
 odour are characteristic of drugs, because a drug is the

¹ i. e. from the lower part of the stomach.

² i. e. cause vomiting, like the drugs which are of a hot nature.

³ And therefore do not act as drugs.

opposite of a food ; for that which is concocted by a natural process amalgamates with the body and is called a food ; but that whose nature it is to refuse to be overcome¹ and which enters into the veins and causes disturbance there¹⁰ owing to its excess of heat or cold, this is of the nature of a drug.

43 Why is it that pepper if taken in large quantities relaxes the bladder, but if taken in small quantities affects the stomach, whereas scammony² if taken in large quantities relaxes the stomach, but if taken in small quantities and when it is old affects the bladder ? Is it because each has more effect on one part of the body ? For pepper promotes¹⁵ urine, while scammony is purgative. Pepper therefore if taken in large quantities is carried into the bladder and does not dissolve in the stomach, but if taken in small quantities it is overcome and relaxes the stomach and acts upon it as a drug. Scammony, on the other hand, if it is taken in large quantities, is overcome to such an extent that²⁰ it is dissolved, and being dissolved it becomes a drug for the reason mentioned above ;³ but, if it is taken in small quantities, it is swallowed with what is drunk and passes into the ducts and is quickly carried into the bladder before it can cause any disturbance, and there by its own force it carries off all the excretions and liquefactions which are on the surface. When it is taken in large quantities, as has²⁵ already been remarked, owing to its strength it remains a long time in the stomach and effects an extensive purgation of the earthy element.⁴

44 Why do some cure by cooling the same inflammations which others bring to a head by heating them ? Surely it is because the latter collect the inflammation by applying³⁰ external heat, the former by cooling the heat already present in the body.

45 Why is it necessary to change poultices ? Is it in order that⁵ they may be more felt ? For as, in things which we

¹ i. e. which is not subject to the process of concoction.

² See note on 864^a 4.

³ Cp. *ib.* 29, 30.

⁴ Cp. 863^b 35-864^a 2.

⁵ Reading *ὄπως*, with Richards, for *ὄτι ὤς*.

eat, that to which we have grown accustomed no longer
 35 acts as a drug but becomes a food, so poultices lose their
 effect.

Why does it promote health to reduce one's diet and 46
 865^a increase one's exercise? Is it because an excess of excretion
 causes disease, and this occurs when we take too much
 nourishment or too little exercise?

Why is it that drugs, and bitter and evil-smelling sub- 47
 stances generally, have a purgative effect?¹ Is it because
 5 anything which is evil-smelling and bitter does not admit of
 concoction? Drugs therefore are bitter and evil-smelling;
 for they are drugs because, in addition to being bitter, they
 do not admit of concoction and can cause motion; and
 if they are administered in too large doses, they are destruc-
 tive of life. But substances which are destructive of life
 even if given in small quantities are not drugs but deadly
 10 poisons. Nor again do we give the name of drugs to those
 substances which are not purgative through their natural
 qualities; for indeed many foods have the effect of drugs,
 if taken in sufficient quantity—milk, for example, and
 olive oil² and unfermented wine; all these things, because
 they are not easily concocted, have a purgative effect on
 those by whom they are not easily concocted.³ For
 different things are easy or difficult of concoction to
 different people; and so the same things do not act upon
 15 every one as drugs, but particular things act upon certain
 people. For, generally speaking, a drug ought not only to
 be difficult of concoction, but also ought to have the power
 to produce movement; just as also exercises, whether
 external or internal, expel alien matter.

Why is it that sweet-smelling seeds or plants promote 48
 the flow of urine?⁴ Is it because they contain heat and are

¹ This chapter is largely a repetition of chapter 42 in a slightly different form.

² Cp. above, 864^a 36.

³ *καθαίρει καὶ τοῦτους* and *καθαίρει καὶ τοῦτους* are obviously variants both of which have come into the text. The next sentence shows that we should read *διὰ τὸ μὴ εἶναι εὐπεπτα, οἷς μὴ εὐπεπτα καθαίρει καὶ τοῦτους*.

⁴ This problem with several additional lines is repeated in xii. 12 and xx. 16; the shorter version here given does not complete the

easily concocted, and such things have this effect? For the heat in them causes quick digestion,¹ and their odour has no corporeal existence; for even strong-smelling² plants, such as garlic, promote the flow of urine owing to their heat, though their wasting effect is a still more marked characteristic; but sweet-smelling seeds contain heat.

49 Why is it that unclean and foul sores require to be treated with dry, pungent, and astringent drugs, while clean, healthy sores require moist, porous³ remedies? Is it because something must be drawn out from unclean sores, and it is foreign moisture which must be extracted? Now biting, pungent, and astringent substances have this effect, and the dry rather than the moist. Clean sores, on the other hand, only require to skin over.

50 Why is it that sexual excess is beneficial to diseases caused by phlegm?⁴ Is it because the semen is the secretion of an excrement and in its nature resembles phlegm, and so sexual intercourse is beneficial because it draws off a quantity of phlegm-like matter?

Is it better to give the patient nourishment at first or later?⁵ Ought nourishment to be given at the beginning, so that the inflammation, when it sets in, may not find the patient already weak? Or ought the patient to be reduced at once? Or ought the following to be the treatment, namely, that the patient should first take nourishment in the form of draughts, since food of this kind is milder and more readily swallowed and dissolved, and it is easier for a sick person to receive nourishment from this sort of food? For where⁶ the food has first to be acted upon in

sense, and the additional matter (907^b 9-12, 924^b 23-6) should probably be restored here.

¹ *λεπτύνει* is here apparently used in its technical medical sense of 'digest', cp. Hippocr. *Vet. Med.* 16.

² The parallel passages 907^b 7 and 924^b 21 read here τὰ μὴ εὐώδη for τὰ ὀσμώδη.

³ Reading *μανοῖς* (Monro) for *μόνοισ*.

⁴ Cp. iv. 16. τὰ should be read for the misprint τὸ of the Teubner text.

⁵ Apparently a new problem begins with this question.

⁶ Reading *οὐ* (Bussemaker) for *οὐ*.

the stomach,—namely, both dissolved and heated—these
5 processes cause pain to the body.

Why is it that, in order to examine urine to see if it is 51
concocted, one must stop the flow of urine rather than
continue to pass it? Is it because it is a sign of concoction
if it is reddish in colour, and this is better detected if
the flow is stopped? Or is it because anything that is
10 liquid forms as it were a better mirror of its colour in
a small than in a large quantity? For form is better
discerned in a large quantity, but colour in a small quantity,
in dew, for example, and drops of rain and tears on the
eyelids. If urine, therefore, is allowed to flow it becomes
15 greater in quantity, but, if it is checked, it takes on colour¹
more readily; and so if it has already taken on this character²
by concoction, this can be better observed if the flow of
urine is stopped and light thus refracted and a mirror
formed.

Why should the flesh be made rare rather than dense in 52
order to promote health? ³ For just as a city or locality is
healthy which is open to the breezes (and this is why the
20 sea too is healthy), so a body is healthier in which the air can
circulate. For either there ought to be no excrement present
in the body or else the body ought to get rid of it as soon
as possible and ought always to be in such a condition that
it can reject the excrement as soon as it receives it, and be
in a state of motion and never at rest. For that which
25 remains stationary putrefies (standing water, for example),
and that which putrefies causes disease; but that which is
rejected passes away before it becomes corrupt. This then
does not occur if the flesh is dense, the ducts being as it
were blocked up, but it does happen if the flesh is rare.
One ought not therefore to walk naked in the sun; for the
flesh thereby solidifies and acquires an absolutely fleshy
30 consistency, and the body becomes moister; for the internal
moisture remains, but the surface moisture is expelled,

¹ *sc.* τὰ χρώματα as the object of *δέχεται*.

² Reading with Bekker *αὐτὸ τοιοῦτον*.

³ This problem is repeated in v. 34 and is identical with the second part of xxxvii. 3. *ὅτι* must be emended to *διὰ τί*. Cp. 884^a 26.

a process which also takes place in meat when it is roasted rather than boiled. Nor ought one to walk about with the chest bare; for then the sun draws the moisture out of the best constructed parts of the body, which least of all require to be deprived of it. It is rather the inner parts of the body which should be submitted to this process; because ³⁵ they are remote, it is impossible to produce perspiration from them except by violent effort, but it is easy to produce it from the chest because it is near the surface.

53 Why is it that both cold and hot water are beneficial to chilblains? Is it because chilblains are caused by an excess ^{866^a} of moisture? If so, the cold water thickens and hardens the moisture, while the hot water causes it to evaporate and enables the vapour to escape by rarefying the flesh.

54 Why is it that cold both causes and stops chilblains, and ⁵ heat both causes and stops burns? Is the cause the same in both cases, namely, that they cause them by setting up liquefaction and stop them by drying them up?

55 In fevers liquid nourishment ought to be administered often and in small quantities.¹ For a large quantity flows away and is wasted, but a small quantity taken frequently ¹⁰ sinks in and penetrates into the flesh. For as the rain, if it comes down upon the earth in torrents, runs to waste, but, if it comes down in small quantities, merely moistens the ground; ² so the same thing occurs in fever patients. In irrigation, if the water is allowed to flow gradually, the channel sucks it up; whereas, if the same amount of water is allowed to flow all at once, it makes its way wherever it ¹⁵ is directed.

Next the patient ought to lie as still as possible, because fire also obviously dies down if one does not stir it. And he ought not to lie in a draught, because the wind stirs up the fire, and, being fanned, it becomes great instead of small. For this reason the patient ought to be well

¹ This and the following chapter are not, strictly speaking, problems, but descriptions of treatment. They were apparently extracted from some medical treatise with a view to being put into the form of problems, and this purpose was for some reason never carried out.

² Placing a comma after *μόνον*.

wrapped up,¹ because fire is extinguished if it is not
 20 allowed to draw in air; and the garments ought not to be
 removed until damp heat is present, for the fire if exposed
 to the air dries up the moisture—just as happens also in
 nature.²

In the case of intermittent fevers one must make prepara-
 tions beforehand by washing³ the patient and applying
 25 fomentations to his feet, and he must rest well wrapped up,
 in order that there may be as much heat as possible in him
 before the attack begins. For a flame will not be able to
 burn where there is a great fire; for the great fire will
 absorb the little fire. Consequently a great fire must be
 prepared beforehand in the body; for fever has but little
 30 fire in it, and so the great fire will absorb the little fire.

In quartan fevers⁴ the patient must not be allowed to get 56
 thin, and heat must be introduced and engendered in his
 body. Exercises must also be employed. On the day on
 which the attack is expected he must bathe himself and
 avoid sleep. A heating diet is beneficial, because a quartan
 35 fever is weak; for if it were not so, it would not occur only
 every fourth day. For, mark you, where there is a great
 fire, a flame cannot burn; for the great fire attracts and
 866^b absorbs the little fire. For this reason it is necessary to
 engender great heat in the body, because fever has but
 little fire in it. The daily treatment consists in introducing⁵
 at one time heat and at another time moisture into the
 body. Some diseases are caused by heat, others by mois-
 ture; those which are caused by heat are cured by moisture,
 5 and those which are due to moisture are cured by heat, for
 heat dries up moisture.

¹ Reading with Bonitz *περιστελλέσθω* for *περιστέλλεσθαι*, cp. *κατα-
 κείσθω* l. 15, *ἀπογυμνούσθω* l. 21.

² i. e. it is always the nature of fire to dry up moisture.

³ Reading *ἐκλούοντα* with the majority of MSS., cp. below, l. 33.
 There should be no comma after *ἐκλούοντα*.

⁴ This chapter is clearly another version of the last part of the
 previous chapter (ll. 23–30 above).

⁵ It appears necessary to read *εἰσάγειν* for *εἰσάγοντα*.

BOOK II

PROBLEMS CONNECTED WITH PERSPIRATION

- I WHY is it that perspiration is caused neither when the breath is expanded nor when it is held in, but rather when 10 it is relaxed? ¹ Is it because, when it is held in, the breath fills out the veins and so does not allow the perspiration to escape, just as the water in a water clock cannot escape if you turn it off when the clock is full? ² But when the perspiration does come out, it does so in great abundance, because it has gradually collected during the actual period ³ that it has been checked.
- 2 Why is it that the parts of the body that are immersed in 15 hot water do not perspire, even though they are themselves hot? ⁴ Is it because the water prevents liquefaction, while perspiration is formed when matter which is not properly attached to the flesh ⁵ is expelled by heat?
- 3 Why is perspiration salty? ⁶ Is it because it is caused by movement and heat which rejects any foreign matter in 20 the process by which nourishment passes into blood and flesh? For such matter quickly separates, because it has no affinity with the body, and evaporates externally. It is salty because the sweetest and lightest part of the food is taken up by the body, while the unsuitable and unconcocted part is discharged. This when it is excreted below is 25 called urine, in the flesh it is sweat; both of these are salty for the same reason.

¹ This problem is derived from Theoph. *de Sud.* 25, 26.

² This comparison with the water clock was originally made by Empedocles; cp. *de Respir.* 473^b 1-474^a 5.

³ Reading αὐτῇ (τῇ) ἐπιληψία (Bussemaker).

⁴ Cp. Theoph., *op. cit.* 30. This problem is cited by Athenaeus (i. 44) as from the *Physical Problems* of Aristotle.

⁵ Omitting with C^a Υ^a ὁ κωλύει τήκεσθαι; this omission is supported by Theoph., *l. c.*, ὁ δὲ ἰδρῶς τῆξίς τις ἐστὶ τῶν οἶον κακῶς προσφοκοδομημένων ταῖς σαρκῖν ὅταν ἐκκρίνηται διὰ τὸ θερμόν.

⁶ From Theoph., *op. cit.* 2, 3.

Why is it that the upper parts of the body perspire 4
more freely than the lower?¹ Is it because heat rises
upwards and remains there, and this carries the moisture
30 upwards? Or is it because breath causes sweat, and the
breath is in the upper parts of the body? Or is it because
sweat is unconcocted moisture, and such moisture resides in
the upper parts because the process of its composition takes
place there?

Why is it that sweat is produced most copiously if we 5
exercise the arms while we keep the other parts of the
body in the same position?² Is it because we have most
35 strength in this region of the body? For it is in this
region, which is nearest to the strongest part of us, that we
hold our breath; and we gain strength by violent exertion,
and, having gained strength, we can hold the breath more
867^a easily. Furthermore, we feel the effect of friction more
in the arm³ than when any other part of the body is
rubbed; for it is by holding the breath that we get exer-
cise, both when we are rubbed and when we rub.

Why is it that sweat given off from the head either has 6
no odour or less than that from the body?⁴ Is it because
5 air circulates freely in the region of the head? That the head
possesses rarity is shown by the fact that it produces hair.
And it is those regions of the body and the substances of
which they are composed through which the air does not
circulate that are malodorous.⁵

Why is it that those who take athletic exercise, if they 7
wrestle after a period of rest, perspire more freely than if
10 they wrestle continuously?⁶ Is it because the sweat collects
while they are resting, and then the wrestling afterwards
brings out this sweat? Continuous exercise, on the other
hand, dries up the sweat, just as does the heat of the sun.

¹ From Theoph., *op. cit.* 24, somewhat amplified.

² This chapter is Theoph., *op. cit.* 34, cast in problem form.

³ *sc.* *χεῖρ*, which is inserted by Theoph., *l. c.*

⁴ This chapter is an almost verbal transcription of Theoph., *op. cit.* 9, in problem form.

⁵ Cp. 908^b 20 ff.

⁶ This problem is derived from Theoph., *op. cit.* 31.

- 8 Why is it that one sweats more freely if one has not for a long time employed means to induce perspiration?¹ Is it because sweat is not caused by moisture alone, but is also due to the fact that the pores are opened wider and the body becomes porous? In those, therefore, who take no¹⁵ measures to induce perspiration the pores become closed up, whereas if they do take such measures the pores are kept open.
- 9 Why is it that, although the sun warms those who are naked more than those who are clothed, the latter perspire more freely?² Is it because the sun by burning causes the²⁰ pores to close up? Or is it because it dries up the moisture? These processes are less likely to happen in those who are clothed.
- 10 Why is it that the face gives off the most perspiration?³ Is it because the sweat can find a way out through⁴ parts which are particularly porous and moist? Now the head²⁵ seems to be the source of moisture, and it is owing to the presence of copious moisture that the hair grows; and the region of the head is rare and porous, and so the sweat naturally finds a way out.
- 11 Why is it that one perspires most freely, not when the heat is applied all at once or when it is gradually diminished, but when it is gradually increased?⁵ For those who are in vapour baths perspire under these conditions more freely than if all the heat be applied at once. Is it because it is³⁰ the presence of anything in proper proportions which produces each required effect, and so, if it produces this effect, its presence in greater quantity will not produce a greater effect, or will rather produce the contrary effect, for it is because a thing is proportionate⁶ that it produces a certain effect? For this reason then increased perspiration

¹ The source of this problem is Theoph., *op. cit.* 22.

² Cp. Hippocr. *de aere*, &c. 8 (Gundermann, pp. 15, 30 ff.).

³ From Theoph., *op. cit.* 33; cp. below, chapter 17.

⁴ Omitting δὲ after διὰ (W.D.R.).

⁵ Compare below, chapter 32; the source of both these problems is Theoph., *op. cit.* 28, somewhat amplified.

⁶ Omitting τὸ after τῷ with most MSS.

is not induced as the result of greater heat ; but because to each increment of heat there answers a different proportion, 35 and that which has already produced its effect produces no greater effect, increased perspiration is rather the result of successive additions of heat. For it is not the same cause which prepares the way and creates a favourable condition for a series of effects and then begins to produce the effect, but a different cause. So a small quantity of heat prepares the way and predisposes the body to perspire 867^b better than a large quantity ; but another and a greater proportion is required actually to produce the perspiration, but this does not continue to produce the effect which it originally produced, but must be followed by another application of heat different again in its proportions.¹

Why does the sweat flow more freely if a scraper be 12 used than if it be allowed to remain on the body ? Is it 5 because the presence of external sweat induces cooling ? Or is it because the external sweat forms as it were a lid over the pores and so prevents the movement of the internal sweat ?

Why is it that rue and certain unguents give the per- 13 spiration an evil odour ?² Is it because things which 10 have a heavy scent, mixing with the excretory fluids, make the odour of these still more unpleasant ?

Why do we perspire more on the back than on the front 14 of the body ?³ Is it because in the front of the body there is an interior region into which the moisture is drained, but this is not the case with the back, but there the excretion of 15 moisture must be external ? (It is for the same reason that we perspire less on the stomach than on the chest.) A further reason is the fact that the back and hinder parts hold the perspiration more than the front, because the latter become more cooled than the former. (This is the reason too why 20 the armpits perspire most readily and freely ; for they are least subject to cooling.) Further, the regions about the back are fleshier than those in front and therefore moister ;

¹ Reading τῆ συμμετρία for τῆς συμμετρίας.

² Cp. Theoph., *op. cit.*, § 10. This problem occurs again in xx. 33.

³ Cp. Theoph., *op. cit.*, § 32.

and there is more moisture in the hinder parts, because the marrow in the spine causes considerable humidity.

- 15 Why is it that we do not perspire in those parts of the ²⁵ body on which we are lying? Is it because the area with which we come into contact with anything is hot and therefore prevents the perspiration from passing forth, for it dries it up? Furthermore it is compressed, and pressure causes the blood to disperse, and, when this happens, the part tends to become cool. This can be illustrated from numbness, which is a condition due to cooling and is caused ³⁰ by pressure or by a blow.
- 16 Why do those who are asleep perspire more freely? ¹ Is it due to the heat being driven inwards? ² For the heat collects ³ inside and expels the moisture.
- 17 Why is it that one perspires most freely on the face, though it is far from being fleshy? ⁴ Is it because parts ³⁵ which are rather moist and rare perspire freely, and the head has these characteristics? For it possesses an abundance of natural moisture; this is shown by the veins which extend from it and the discharges which it produces and the brain-fluid and the numerous pores. That there are numerous pores extending outwards is shown by the presence of the hair. The perspiration then comes not from ^{868^a} the lower parts of the body but from the head; and so one perspires most readily and freely on the forehead, for it is the first thing below the top of the head, and moisture flows down and not up.
- 18 Why is it that those who are perspiring are apt to vomit ⁵ if they are cooled either by water or by air? ⁵ Is it because

¹ This problem is more fully dealt with in chapter 28; the source in both cases is Theoph., *op. cit.* 40.

² The doctrine of ἀντιπερίστασις of heat and cold is very common in the *Problems*; cp. 875^a 11, 888^a 35, 906^a 15, &c. It is a favourite doctrine of Theophrastus; cp. *caus. pl.* i. 12, 3; ii. 9, 8; vi. 7, 8; *de Igne*, 74, &c. For ἀντιπερίστασις in sleep cp. *de Somno* 457^b 2 and Professor Beare's note.

³ i. e. collects internally because it is driven inward by the external cooling which takes place in sleep.

⁴ This problem is repeated verbally in xxvi. 2; cp. also above, chapter 10 and note.

⁵ The source of this problem is Theoph., *op. cit.*, § 38.

the moisture when cooled ceases to move and collects together, whereas before it was not at rest because it was in a state of flux? Or is it because the breath which turns into perspiration by being cooled as it passes out, being cooled internally before passing out turns into moisture and attacking the body¹ causes vomiting?

10 Why is it that sweat is given off from the head and feet 19
of those who are heated more freely than from any other part of the body? Is it because the part which is heated attracts the moisture to itself, and the moisture has nowhere where it can expend itself in these regions of the body, because they are bony, and therefore it finds its way out?

15 Why do those who exert themselves perspire when they 20
cease to exert themselves?² For since the exertion is the cause, they ought to perspire while they are exerting themselves. Is it because during their exertion the veins, being inflated with breath, cause the pores to close up, whereas, when they stop, the veins contract, and so the pores become
25 wider and the moisture finds an easier outlet? Or is it because during the exertion the motion expels air from the solidified moisture and, owing to the heat caused by the motion, the moisture becomes breath on the surface of the body; while on the other hand, when the exertion ceases, the heat also stops at the same time, and then the moisture, which we call perspiration, is generated from the condensa-
25 tion of the breath?

Is it more necessary to induce perspiration in the summer 21
or in the winter?³ Is it not more necessary to do so at a time when, unless care be taken, the body would become too moist and in a dangerous condition? If so, it would be more necessary to perspire in the summer,⁴ when a violent

¹ We should perhaps read from Theoph., *l. c.*, προσπεσὸν (τῷ ἀναπνευστικῷ τόπῳ) ποιεῖ.

² Reading with Bekker ὅταν παύσωνται. The same subject is treated in chapter 23; the source of both chapters is Theoph., *op. cit.*, §§ 25, 26.

³ The same subject is treated in chapter 33; see next note.

⁴ Chapter 33 shows that perspiration is less necessary in the winter, because concoction then goes on naturally in the body, and this is also stated in 1.31 of the present problem. It therefore appears necessary to read θέρους here for χειμῶνος.

change takes place in the body and the excretions are not thoroughly concocted. Again in the winter, since the body 30 is cool, it is also unnatural to perspire. It is clearly, therefore, more necessary to induce perspiration in the summer; for moisture of all kinds is then more apt to putrefy and should therefore be drawn off. This was the opinion of all the ancients and for the above reason.

22 Why is it that, although the body is in a state of continual 35 flux, and effluvia are given off from the excrements, the body is only lightened if it perspires? ¹ Is it because the excretion in the form of effluvia is too little? For when liquid is transformed into air, much air is formed out of little liquid; for what is excreted in liquid form is more abundant. 868^b The process of excretion, therefore, takes longer to begin, both for the above reason ² and because the excretion takes place through smaller pores. Further, the viscous and adhesive matter is expelled with the moisture, because it mingles with it, but it cannot be expelled with the breath; 5 and it is this thick matter in particular that causes pain. Therefore also vomiting lightens the body more than sweating, because that which is vomited, being thicker and more substantial, carries away this viscous matter with it. Or is there a further reason, namely, that ³ the region in which the viscous and the adhesive matter is, is situated at a distance in relation to the flesh (and so it is difficult to make it change its position), but near the stomach? For it is engendered either in or close to it; and therefore it is difficult to get rid 10 of it in any other way. ⁴

23 Why is it that one perspires less during actual exertion than when one ceases? ⁵ Is it because while one is exerting oneself one is engendering perspiration, but the process of engendering it is only complete when the exertion is ended? This then is naturally the time when it is expelled from the body in greater quantities; for during exertion it is coming into being, but, when the exertion is finished, it actually

¹ This problem is almost verbally repeated in xxxvii. 1 and 2.

² i. e. because the moisture is more abundant.

³ Reading ἡ καὶ ὄτι, cp. 965^b 31.

⁴ i. e. except through the bowels.

⁵ Cp. above, chapter 20.

15 exists. Or is it because during exertion the pores of the flesh are closed, because the breath is held, but when the pressure of the breath is relaxed the pores open again? Consequently one perspires less when one is holding the breath.

Why is it that perspiration is more copious not when one 24 is running and the body is in motion, but when one stops? ¹
 20 Is it because the same thing happens as when flowing water is checked by the hand or by some other means and collects from every direction, and, when it is released, flows in greater volume than before; so perspiration can be stopped by the breath—like water in a water clock—and also in the bladder, which keeps the moisture within. So too, while
 25 there is considerable movement, the breath is cut off inside the body, and so the veins are distended, the moisture being unable to find its way out. The moisture then, being cut off, collects, and when the breath is relaxed comes all out at once.

Why is it that, when one is drinking, one perspires less 25 if one eats something as well? Is it because the food sucks
 30 up the moisture, as though a sponge were applied, and, just as a stream can be stopped by blocking up its channels, so by stopping ² the pores through administering food it is possible to a large extent to prevent the flowing of moisture?

Why is that the feet of those who are nervous perspire 26
 35 and not the face? ³ For it would be more natural that the feet should perspire only when the whole body perspires; for the feet are the coldest region of the body and therefore least liable to perspire. Also in sickness physicians order the feet in particular to be wrapped up, because they are especially susceptible to cold and so readily give rise to
 869^a cold in the rest of the body also. Is it because nervousness does not cause a displacement of heat—such as takes place from the upper to the lower parts of the body under the

¹ This problem is derived from Theoph., *op. cit.*, § 29.

² Putting a comma after *ρέύμασι* and reading *τῶ ἐπιλαβεῖν*.

³ The source of this problem and chapter 31 is Theoph., *op. cit.*, § 35.

influence of fear¹ (hence the relaxation of the bowels in those who are alarmed).—but an increase of heat² such as is caused by anger? For anger causes the heat round the heart to boil up; and one who is nervous is affected not by fear or cold, but by an increase of heat.³

27 How is it that one can become red in the face without perspiring?⁴ Is it due to excessive warmth which results in the heat on the surface drying up the moisture in the face, whilst it liquefies the moisture in the feet because, though less than the heat on the surface, it is more powerful than the natural heat already existent in the feet?

28 Why is it that we perspire more when asleep than when awake?⁵ Is it because perspiration originates internally, and the interior parts of the body are hotter, and so the internal heat melts and expels the internal moisture? Or is it because in all probability there is always something given off from the body, but it is not apparent because there is nothing with which it can come into contact and by which its escape can be arrested? That this is so is shown by the fact that the hollow parts of the body perspire continually.

29 Why is it that persons in vapour baths perspire more freely when it is cold?⁷ Is it because the heat does not find a way out, because it is surrounded by the cold, which prevents its exit, but collects internally, and, remaining there, dissolves the moisture in our body and engenders perspiration from it?

¹ The distinction between φόβος and ἀγωνία is not always kept up in the *Problems*. They are distinguished here, but in ^b7, 8 and 903^b 12 ἀγωνία is φόβος τις. In 903^a 2 and 905^a 8 ἀγωνία is said to be the result of αἰσχύνη.

² ἀγωνία is here described as being due to increase of heat; in 903^a 1 it is ascribed to heat rising upwards, while in 903^b 11 it is said to cause coldness.

³ Reading from Theoph., *l. c.*, διὰ τὸ μᾶλλον ἐκθερμαίνεσθαι for διὰ τὸ μέλλον.

⁴ The source of this problem is Theoph., *op. cit.*, § 37.

⁵ Cp. above, chapter 16 and note.

⁶ Reading with Bonitz, *op. cit.*, p. 408, ⟨ἦ⟩ ὄτι.

⁷ Cp. above, chapter 11.

Why is it that perspiration, even though it be less 30
 25 profuse, is more beneficial if it be induced by running naked
 rather than clothed? ¹ Is it because exertion in general is
 better than non-exertion, and perspiration which is induced
 by exertion is better than that which is produced without
 exertion, and that which is due in a greater degree to
 exertion is better than that which is due in a less degree?
 Now perspiration involves more exertion if induced by
 30 running about naked: for a naked man cannot perspire at
 all unless he runs with considerable energy; whereas, if he
 be clothed, owing to the heat produced by his garments,
 he soon perspires although he runs only moderately fast.
 Those too who run naked in the summer have a healthier
 colour than those who wear garments; for just as those
 35 who live in regions open to the air have a better colour than
 those who live in a stifling atmosphere,² so too a man, when
 he is as it were in a well-aired condition, acquires a better
 colour than when he is stifled and surrounded by consider-
 able heat, as he is more likely to be when he runs clothed.
 869^b For this reason too those who sleep much have a less healthy
 colour than those who sleep a moderate amount; for a man
 who is asleep is in a stifled condition.

Why is it that our feet perspire, but not our faces, when 31
 5 we are in a state of nervousness, whereas under ordinary
 conditions our faces perspire most and our feet least? ³ Is
 it because nervousness is a kind of fear connected with the
 beginning of an action, and fear causes a cooling in the
 upper part of the body; this is also why those who are
 nervous are pale-faced.⁴ On the other hand they move and
 10 dance their feet about, thus resembling those who are taking
 exercise; therefore they naturally perspire in those parts
 which they are exercising. Also they rub their hands together
 and bend and stretch themselves and keep jumping up and
 can never remain still; for they are eager for action, because
 the heat within them is collected in the region of the chest,
 15 which is one of the more substantial parts of the body, and

¹ Cp. Theoph., *op. cit.*, §§ 39, 40.

³ Cp. above, chapter 26.

² Cp. 865^a 19-21.

⁴ Contrast 903^a 3.

this heat and the blood rushing thence through their whole body results in frequent and varied movement. But they perspire most in the feet, because these are being continually exerted, whereas the other parts of the body obtain rest in the changes of position and movement.

32 Why is it that in a vapour bath one perspires most freely ²⁰ not when the heat is applied all at once nor when it is gradually diminished, but when it is gradually increased? ¹ For if the heat is gradually introduced into the vapour bath, ² one perspires more freely than if the full amount were admitted at first. Is it because heat which is great from the beginning, finding the flesh on the surface dry, burns the ²⁵ skin and bakes it hard, and the flesh when it is in this condition holds the perspiration within? ³ Less heat on the other hand tends to relax and rarefy the flesh and as it were stimulates the internal moisture to separate itself and come forth. This condition being established, when more heat is gradually introduced and penetrates deep into the flesh owing to its rarity, it vaporizes the already softened humours ³⁰ and separating those which are light expels them with the breath.

33 Is it more necessary to induce perspiration in the summer or in the winter? ⁴ In winter does not the heat collecting within the body concoct and vaporize our internal humours, and so, because all or most of them are expended, there is ³⁵ no need to supply an appropriate method of expelling them? In the summer, on the other hand, because the flesh is in a state of rarity, the heat escapes and our internal humours become less concocted and therefore need to be drawn off. For if they are allowed to remain, they putrefy owing to the season and cause disease; for anything that ^{870^a} putrefies does so owing to heat that is not its own, whereas its own natural heat causes concoction. Consequently in

¹ Cp. above, chapter 11 and note.

² Reading *ἐπεισφερομένου γὰρ* (<eis> τὰ πυριτήρια [so also Richards]. The corruption, however, is probably more serious and *ἐπεισφερομένου* perhaps belongs to the previous sentence, cp. 867^a 29.

³ The sense demands *στέγει* for *τέγγει*.

⁴ Cp. above, chapter 21 and note.

the summer the external heat prevails, and so everything within the body tends to putrefy; but in the winter the 5 natural heat predominates, and so the winter does not cause putrefaction.

Why is it that, whereas perspiration is due to internal 34 heat or else to heat attacking the body from without, yet we sometimes shiver while we perspire? Is it because, when owing to the internal heat the perspiration is expelled from a large area into a small space,¹ it collects² on the 10 surface of the body and entirely blocks up the channels through which the heat circulates, and so shivering ensues? Another reason is that the flesh becomes saturated and the heat escapes. On the other hand the external heat attacking the flesh at first rarefies it, and then the internal natural heat as it is given off³ causes the shivering.

15 Why are hot sweats considered to be better than cold?⁴ 35 Is it because all perspiration is the rejection of some excretion, and it is natural that a small excretion should become heated, whereas a more abundant excretion is less likely to do so, and so a cold sweat would be an indication of a copious excretion; consequently the disease, the presence of which 20 it indicates, is likely to last longer?

Why is it that, although perspiration is caused by heat, 36 we perspire less in front of a large fire?⁵ Is it because, when the body is subjected to considerable heat, the⁶ humours are dissolved into vapour; or else we do not feel the moisture, because it makes its way out and quickly 25 dies on the surface?

Why is it that, though the sun heats us more if we wear 37 no clothing, yet we perspire⁷ more freely when we are

¹ i. e. from the whole interior of the body to the surface.

² Reading *συστελλόμενοι* (agreeing with *ιδρώτες* supplied) for *συστελλόμενοις*.

³ Reading *ἀποκρινόμενον* (W. D. R.); the middle *ἀποκρινόμενον* in this sense cannot be paralleled.

⁴ Cp. 959^b 25 ff., and Hippocr. *de Morb.* i. 25.

⁵ Cp. Theoph., *op. cit.*, § 28.

⁶ Reading *πνεύματα* <τὰ> ὑγρά.

⁷ The problem here is the same as that of chapter 9; to give point to the question it is therefore necessary to read *ιδρώτες* <μᾶλλον> *γίνονται*, the omission being due to the occurrence of the same word in the line above.

clothed? To this we shall give the same answer as to the last problem.¹

38 Why is it that, though brisk movements are generally regarded as more heating than slow movements, walking³⁰ up a steep hill, which is a slower movement, induces more perspiration and obstructs the breathing, as though it were more heating than walking down hill?² Is it because it is natural for weights to be carried downwards and unnatural for them to be carried upwards? Consequently the nature of the heat³ which carries us along does not undergo any³⁵ strain when we are going down hill, but has to bear a continual burden when we are walking up hill; and so it grows exceedingly hot by movement of this kind and causes more profuse perspiration and obstructs the breath. The bending, too, of the body involved in walking up hill contributes to^{870^b} prevent the free passage of the breath by obstructing it.

39 Why is it that, although more perspiration is induced by additional clothing, it is not those who wear most clothing that perspire most? To this question we shall give the same answer as we gave above.⁴ 5

40 Why is it that, although our bodies are drier in the summer than in the winter, we are more disposed to perspire in the summer? Is it because, our bodies being in a condition of rarity in the summer, not much natural heat is contained in them? This, therefore, dissolves the humours into vapour. In the winter on the contrary, our¹⁰ bodies being externally in a dense condition, the considerable amount of natural heat enclosed within does not dissolve the humours into vapour. Moreover, in the summer we swallow liquid in large quantities, but in small quantities in the winter.

41 Why is it that in healthy persons spontaneous perspiration is not considered to be as good as that produced by¹⁵

¹ i. e. the case of a person exposed naked to the sun is parallel to that of a person in front of a large fire.

² Walking down hill being a brisker movement and therefore *ex hypothesi* more heating.

³ ἡ τοῦ θερμοῦ φύσις seems merely a periphrasis for τὸ θερμόν.

⁴ Cp. above, chapters 36 and 37.

exertion? Is it because exertion continually drains off the superfluous moisture and makes the flesh drier, so that the hollows of the pores are healthy and there is no obstruction to the straining off of the heat? On the other hand the
 20 so-called spontaneous perspiration (which really occurs of necessity when the natural pores are disturbed by excessive moisture, and the heat¹ is not completely retained, but can still resist and expel the moisture) is rightly regarded as a sign of disease. For then, owing to the presence of
 . 25 a more than proportionate amount of moisture, a natural process of cooling takes place, and the flesh becoming saturated assumes a most unhealthy condition.

Why is it that in the winter perspiration is given off less 42
 freely and we do not feel the same desire to induce it, although our bodies are moister in the winter? Do we
 30 perspire less, because in winter our humours are congealed and solidified to a considerable extent, and are consequently less easily dissolved? The reason why we do not think it necessary to induce perspiration in the winter is because the condition in which we are is a healthy one, and any one who induces perspiration dissolves and upsets that condition; moreover, by creating in the body a condition of
 35 greater rarity than it ought to have, he expels and reduces the natural heat, so that it cannot so effectively resist the surrounding cold; also external moisture will more easily burst its way into the body when the pores are rarefied by process of perspiration.

¹ Reading τὸ θερμὸν (Sylburg).

BOOK III

PROBLEMS CONNECTED WITH THE DRINKING OF WINE AND DRUNKENNESS

- 1 WHY is it that, though wine is hot, the drunken are 871^a
unable to endure cold and are very readily attacked by
pleurisy and similar diseases?¹ Is it because a large
quantity of moisture, if it be cooled, forms a mass of cold
and so overpowers the natural heat? For this is similar to 5
what happens when, if a garment is soaked in cold water,
the flesh beneath it also becomes cold.
- 2 Why is it that it is not those who are very drunk that are
most troublesome in their cups, but those who are only
slightly intoxicated?² Is it because they have neither
drunk so little that they still resemble the sober nor so 10
much that they are in the incapacitated state of those who
have drunk deep? Further, those who are sober have
more power of judgement, while those who are very drunk
make no attempt to exercise their judgement; but those
who are only slightly intoxicated can still exercise their
judgement because they are not very drunk, but they
exercise it badly because they are not sober, and they are
ready to despise some of their neighbours and imagine that 15
they are being slighted by others.
- 3 Why is it that those who drink slightly diluted wine
suffer more from the after effects than those who drink
wine absolutely unmixed?³ Is it because owing to its
lightness diluted wine penetrates better into more numerous
and narrower parts of the body than unmixed wine, and so
is less easy to get rid of? Or is it because those who drink
unmixed wine drink a less quantity, because it is impossible 20
to drink more, and vomit more readily? Furthermore un-

¹ This problem is more fully treated in chapter 6.

² Cp. below, chapter 27. This problem is referred to by Plutarch
(*Quaest. Conviv.* iii. 8. 1) as Aristotelian.

³ Cp. chapters 14 and 22.

mixed wine, being hotter, causes concoction in other things and in itself; whereas watery wine has the opposite effect.

Why is the semen of drunkards generally infertile? Is it 4 because the composition of their body has become full of 25 moisture, and the semen is fertile not when it is liquid but when it has body and consistency? ¹

Why do drunkards tremble, and more so the more they 5 drink unmixed wine? ² Now wine is heating; but trembling is chiefly due to cold, and so those who are chilled tremble 30 very much. Yet many people before now, who have taken unmixed wine as their only form of nourishment, have been seized with such violent trembling as to throw off those who were trying to hold them down; and when they wash in hot water, they have no perception of it. Is it because trembling is due to cooling, and cooling takes place either 35 in winter, or when the natural heat is extinguished either by its opposite or by lapse of time, as in old age, or by the excess of extraneous heat which is caused in that which is exposed to the sun or to a blazing fire? This occurs also 871^b in those who take unmixed wine. The wine, being hot, when on mingling with the proper heat of the body it exceeds it in power, ³ quenches the bodily heat; and the heat being thus extinguished and the body cooled, trembling ensues. But there is also another process of cooling differing 5 from all those described above; ⁴ namely, ⁵ when the matter whereby the heat in anything is fed, is removed, and, as a result, the heat dies down. This can be illustrated in the inanimate world from the lamp; for when the oil is expended, the light goes out; and in living beings old age 10 and long, wasting diseases have a similar effect. For when that which feeds the heat is removed or diminished, the result is that the heat fails; ⁶ for heat is fed by moisture,

¹ Cp. *G. A.* 765^b 5. This problem is referred to as Aristotelian by Athenaeus (x. 692^b). ² Cp. below, chapter 26.

³ Reading, with Bonitz and Richards, *ὑπερτείνῃ τῆ δυνάμει*.

⁴ i. e. in 871^a 33-8.

⁵ Reading *δὴ* (W. D. R.) for *δέ*, and placing a colon after *καταψύξεως*.

⁶ Reading *ἐκλείπειν* for *ἐκλύειν* with Bonitz, *op. cit.*, p. 408; cp. l. 16 below.

not, however, by any kind of moisture but by that which is smooth and fat.¹ In those, therefore, who are suffering from the diseases mentioned above and in those who are growing old, when moisture of this kind becomes corrupted and changed (becoming harsh and dry instead of smooth and 15 oily), as a result the heat fails. A proof of the above is afforded by the treatment applied to those who are wasting to death; for, whenever they have any nourishing liquid administered to them, the result is that their vitality² is revived, which implies that their bodily dissolution is due 20 to the lack of such a substance. The same cause seems to operate in those who drink unmixed wine. For the wine, being warm, co-operating with the heat already naturally present in the body, tends to use up the supply already present in the body for the natural heat; consequently some drunkards become dropsical, others rheumatic, whilst in 25 others the stomach is affected. For the other humours in them are harsh, and what they imbibe, being soft, does not acquire consistency owing to the weakness of the natural heat. Their heat is weak because the matter in which it is still contained is itself weak; like a fire fed by reeds, which, 30 because its material is weak, is weaker than a wood-fire.

6 Why is it that, though wine is hot, the drunken are unable to endure cold and are very readily attacked by pleurisy and similar diseases?³ Is it because a large quantity of moisture, if it be cooled, forms a mass of cold, and so overpowers the natural heat? Now the moister 35 anything is the hotter it is by nature, as is shown by the fact that external agencies cause heat but do not cause liquefaction; but where there is less heat, it is clear that either the heat or the moisture is failing too quickly, and so, cold humours only being left, it is natural that the 872^a drunken should be colder and show the usual symptoms of chill.

¹ Reading *πίονι*, suggested by Bekker, for *πλείονι*.

² Reading, with Richards, *τὸ ζωτικὸν* for *τὸ δὲ ὀπτικὸν*, and omitting the stop after *συμβαίνει*.

³ A fuller treatment of the topic of chapter 1; cp. also Hippocr. *de Morb.*, § 26.

Why is it that children, who have a hot temperament, 7
 are not fond of wine, although the Scythians and all who
 are courageous are fond of wine because they have a hot
 5 temperament? Is it because the latter, though they are
 hot, are also dry (for this is the natural condition of a
 man), whereas children are hot and moist? Now fondness
 for drink is due to a desire for moisture; and so their moist
 condition prevents children from being thirsty, for desire
 implies a lack of something.

Why is it that men are more sensitive to salty and bad 8
 10 water when they are drunk than when they are sober? ¹
 Is it because that which is like and similarly constituted is
 unaffected by its like, but opposites are very sensitive to
 opposites? A drunken man then has sweet liquids in him
 (for such seems to be the nature of wine), and so is more
 15 sensitive to bad liquids; but the sober man has harsh and
 salty liquids in him, and so, when his food becomes con-
 cocted, the excretory humours come to the surface and
 these are unaffected by their like ² and cause the man in
 whose body they are to be similarly unaffected.

Why is it that to those who are very drunk everything 9
 seems to revolve in a circle, and as soon as the wine takes
 hold of them they cannot see objects at a distance, and so
 20 this is used by some as a test of drunkenness? Is it because
 the vision is continually disturbed by the heat of the wine?
 It makes no difference then whether it is the vision that is
 disturbed or the object seen; for the result is the same in
 producing the above-mentioned effect. And since the vision
 of drunken persons is often mistaken about objects near at
 25 hand, it is only natural that it should be even more so in
 looking at distant objects. So the latter are not visible to
 them at all, while objects near at hand are not seen in their
 proper places, but appear to revolve in a circle and not to
 be near or far, because, firstly, the circular motion makes it
 less possible for the sight to be directed towards distant
 objects; for it is difficult to do two contrary things at the

¹ Cp. below, chapter 19.

² i. e. salty and bad water.

same time.¹ Now the movement of the sight in a straight line² towards the distance is strong, but the circular movement of the vision is restricted to the area implied by its name. For the above-mentioned reasons then the vision does not travel to a distance. Secondly, if it could travel to both near and distant objects,³ it would not see them, for the next moment the near or distant object at which it was looking in the same direction would fail, and, if it did so,⁴ 35 the eye could not see it. The circular movement is due to the natural constitution of the sight; for it is a cone,⁵ the base of which is a circle, and, moving in this circle, the sight always sees the same thing,⁶ because it never fails, but it is 872^b deceived as to its position, because it never directs the same glance upon it; for just the same thing would happen whether the object moved in relation to the eye or the eye in relation to the object.

10 Why is it that to those who are drunk one thing at which they are looking sometimes appears to be many?⁷ Is it because, as has already been remarked,⁸ the vision is dis- 5 turbed, with the result that the same glance does not rest on the same object for any length of time? Now that which is seen differently at the same time appears to exist later in time; for that which is seen is seen by contact with the vision, and it is impossible for several objects to be in contact with the same thing at the same time. But because the intervening time, during which the vision comes into 10 contact with and passes away from the object seen, is imperceptible, the moment during which it has been in contact and passed away seems to be one and the same; and so when several glances come into contact with the same object at the same time, the objects seen appear to be

¹ i. e. the sight cannot travel simultaneously straight forward and in a circle.

⁸ i. e. in ^a 21.

several, because it is impossible for the glances to be in contact with the same¹ thing at the same time.²

15 Why is it that those who are drunk are incapable of II
having sexual intercourse?³ Is it because to do so a certain
part of the body must be in a state of greater heat than
the rest, and this is impossible in the drunken owing to
the large quantity of heat present in the whole body, for
the heat set up by the movement is extinguished by the
greater surrounding heat, because they have in them a con-
20 siderable quantity of unconcocted moisture? Furthermore
the semen is derived from food and all food is concocted,
and those who are satiated with food are more inclined for
sexual intercourse. This is why some people say that with
a view to the sexual act one ought to take a plenteous
midday meal but a light supper, so that there may be less
25 unconcocted than concocted matter in the body.

Why is it that sweet wine and unmixed wine and mead⁴ 12
if drunk from time to time during a drinking bout make
men more sober? And why do those who drink from
large vessels become less drunk?⁵ Is the reason in all
cases the same, namely the repression⁶ of heat on the
30 surface of the body? For drunkenness takes place when
the heat is in the region of the head.

Why is it that, though that which is sweet tends to rise 13
to the surface, if any one who is already drunk takes a sweet
draught the wine which he has drunk before is concocted
and causes less discomfort? Is it because that which is
sweet is both soothing and adhesive (which is the reason
35 why it blocks up the pores), while that which is bitter has
a roughening effect? The latter makes it easy for the heat

¹ Reading *ταύτου* for *ταῦτα*.

² *sc.* and yet produce different sensations. Reading with K^a *χρόνον*
for *τρόπον*. ³ Cp. below, chapter 33.

⁴ There is no exact equivalent for *κυκεών*, which was a mixture of
wine, barley, cheese, and honey.

⁵ This second question and the suggested solution are repeated in
chapter 25, and the two passages can be emended from one another.

⁶ Reading *κατάκρουσις* from 874^b 12, which gives much better sense,
because, as is shown in the next clause, sobriety depends on the heat
of the wine being kept out of the head.

to rise, but the sweet draught keeps it in by blocking up the pores; and it has already been remarked¹ that drunkenness is due to the upper parts of the body becoming heated. Furthermore sweet wine is odourless, but bitter wine is not, and any odour oppresses the head.

14 Why is it that wine which is mixed but tends towards the unmixed causes a worse headache the next morning than 5 entirely unmixed wine?² Is it because unmixed wine is composed of heavy particles and so does not find its way into the pores of the head, which are narrow, but only its power, namely its odour and heat, reaches the head? Diluted wine on the other hand, being mixed with water, which is light, itself penetrates to the head and having body, as well as much of the power of unmixed wine, is much less easily 10 concocted; for moist things are most difficult of all to concoct, and actual substances are more difficult of concoction than mere effects.

15 Why is it that those who do not take physical exercise are better able to drink themselves into a condition of drunkenness, and throw it off more easily, than those who take such exercise? Is it because those who have excretions and moisture in their bodies are more inclined to pass 15 urine? This enables them to drink and afterwards to be relieved of the effects, because much vinous moisture does not remain in them. Those who take no exercise are moist and full of excretions; but those who do take exercise are dry, and so the vinous moisture penetrates into their 20 body, and its impetus immediately checks the flow of urine, and the moisture remaining afterwards behind forms a weight in the body.

16 Why has wine the effect both of stupefying and of driving to frenzy those who drink it? For these are contrary states, the frenzied being in a state of excessive movement and the stupid in a condition of too little movement. Is it true, as Chaeremon says, that 25

Wine mingles with the temper of the drinker?³

¹ i. e. in l. 30.

² Cp. chapters 3 and 22.

³ Fr. 16 (Nauck², p. 787).

It therefore has the opposite effect not on the same but upon the unlike, just as fire dries up some things but liquefies others, but does not have both these effects on the same things—for instance it melts ice, but hardens
 30 salt. So wine, being in its nature moist, excites the slow and makes them quicker, while it enervates the quick. Therefore some of those who are naturally of a melancholic temperament become entirely enervated as the result of a drunken debauch. For just as a bath makes supple those who have a well-knit and hard frame, while it relaxes those
 35 who are supple and moist, so wine has this effect, acting as an internal bath.

Why is it that cabbage stops the ill effects of drinking? 17
 873^b Is it because its juice is sweet and has a cleansing effect (and so doctors use it to purge the bowels), while in itself it is cold? This is shown by the fact that doctors use it in cases of acute diarrhoea, boiling it thoroughly and draining off the juice¹ and letting it cool. In those who are suffer-
 5 ing from the after effects of drinking the effect of the juice of cabbage is to draw off the internal humours, which are vinous and unconcocted, into the stomach, whilst the cabbage itself remains in the upper part of the stomach and cools the body. As the body cools, the light humours are carried into the bladder. Thus since the humours through-
 10 out the body are expelled by these two methods and it becomes cool, the ill effects of drinking naturally vanish; for wine is moist and hot. A further result of the humours being drawn downwards and expelled is that breath is thereby carried down into the body, and it is only from there that breath can be carried from the wine into the
 15 head and cause stupor and headache. But if the breath is carried downwards and the body cooled in the manner mentioned above, the pain of the headache is relieved. For the headache is due to a seething and to inflammation as it dies down; but it is more painful than drunkenness, because the latter drives men out of their senses, but the headache
 20 causes them pain when they are in full possession of

¹ Reading ἀποχυλίζοντες.

their wits. Just as those who are in a fever are delirious rather than in pain, but feel pain when they are relieved of the fever and recover their senses; for just the same thing happens with headache and drunkenness.

18 Why is it that watery wine is more apt to cause vomiting than water and than unmixed wine? Is it because anything²⁵ that tends to rise to the surface and is unpleasant to the taste is most likely to cause vomiting? Now wine has the effect of repression;¹ while water is light and not unpleasant, and, therefore, being light² it quickly penetrates downwards, but, not being unpleasant, it does not cause heartburn. Now excessively diluted wine is not light enough to percolate through quickly, and because it has³⁰ a little wine in it, it is unpleasant; for it disturbs the sense of taste by setting up two kinds of movement, one produced by the wine and the other by the water, both of which make themselves felt. But the proper mixing of wine does away with the taste of water and gives the wine a soft taste, which makes it pleasant to drink. But watery³⁵ wine, being unpleasant to the taste, has a tendency to rise, and anything which does this is apt to cause vomiting.

19 Why is it that men are more sensitive to salty and bad water when they are drunk than when they are sober?³ 874^a
Is it because anything which has an unpleasant taste is more perceptible to those who feel no desire, but is not noticed by those who feel desire? A man therefore who is in a state of lacking something⁴ resembles one who feels a desire, and the sober man is in this condition; whereas the drunken man is satiated.

20 Why is it that to those who are very drunk everything⁵ seems to revolve in a circle, and as soon as the wine takes hold of them they cannot count objects at a distance, and so

¹ Cp. 872^b 29 and note, and 874^b 12.

² Omitting *καὶ οὐκ ἀηδέες*, which has clearly come in from the previous line.

³ The same problem is discussed in chapter 8.

⁴ Reading *ἐνδέως* for *ἰδέως* with Bonitz (*op. cit.*, p. 409); cp. 950^a 14, *E. N.* 1118^b 10, 1153^a 1.

this is used by some as a test of drunkenness?¹ Is it because the vision is continually disturbed by the heat of the wine? The same thing then happens to those who are drunk as when an object appears double if one puts it²
 10 close to the eye. For it makes no difference if you move the eye instead of³ putting the object close to it, and whether the movement is within the eye or outside it; for the effect on the vision is the same in both cases. The result will be that the object seen appears not to be at rest, and more so if it is at a distance (for it has less hold upon the vision when the latter is extended to a distance); and this near
 15 movement⁴ causes a still greater variation at the farthest point to which the eye reaches; and if the vision is moved violently and unevenly⁵ up and down, it has still less hold upon the distant object. Now anything which is extended to a distance moves in a circle, masts,⁶ for example, and objects suspended; and so the same thing happens to the vision owing to its weakness, as though it were actually
 20 is the vision which moves or the object seen; for the effect on the appearance of the object is the same.

Why is it that, when a quantity of wine is drunk at once, 21 the stomach becomes drier, whereas it ought to be rendered moister by the additional liquid? Is it because the stomach has no action upon a large amount of liquid swallowed at
 25 once, but it goes unaltered to its proper place (and the proper place for unconcocted liquid is the bladder), whereas the stomach acts upon a small quantity and concocts it, so that it remains in the stomach and makes it moist?

Why is it that those who drink wine properly diluted 22 suffer more from the after effects than those who drink unmixed wine?⁷ Is it because diluted wine, being light, finds its way into more parts of the body (just as it pene-

¹ The same problem is the subject of chapter 9 and the treatment of it is partly identical.

trates into clothing), and is more difficult to expel (water 30 by itself being of a thinner consistency but easier to expel)?¹ Or is it because the amount of unmixed wine which is drunk is less because of the impossibility of drinking a large quantity, and there is more liability to vomiting? Moreover unmixed wine concocts everything else as well as itself.²

23 Why is it that death ensues from the drinking of un- 35 mixed wine in large quantities by one who is already in a lean condition? On the other hand, those who are addicted to drinking, if they are not in a lean condition, often become dry from drinking a large quantity at a time; for both wine and life³ seem to be of the nature of hot things, whereas death is a process of cooling. Is it because 874^b death by drinking resembles death by hemlock, the natural heat being gradually extinguished? But the process is different in the two cases; for hemlock by its coldness congeals the moisture and heat, whereas wine by its own heat parches up the natural heat. So just as a small fire is 5 extinguished by a large blaze and by the heat of the sun, so too the heat in the body is extinguished by that in the wine, if the latter surpasses it in strength.

24 Why are the drunken more easily moved to tears? Is it because they become hot and moist, and so they have no command over themselves and are affected by trifling 10 causes?

25^a <Why is it that sweet wine and unmixed wine and mead if drunk from time to time during a drinking bout make men more sober? And>⁴ why do those who drink from

¹ This doctrine is quoted as Aristotelian by Plutarch, *Quaest. Conviv.* vi. 9. 3.

² Omitting *ταὐτὸ δ' ἐστὶ πρόβλημα*, which is not translated by T. G. and probably introduced a further explanation; cp. 885^b 3 and Prantl, *op. cit.*, p. 354.

³ *τὸν ζῆν* in the Teubner text is a misprint for *τὸ ζῆν*.

⁴ It is obvious from *πάντων* (l. 12) that several alternatives are offered in the statement of the problem. The problem is clearly a repetition of chapter 12 and we must restore *διὰ τί ὁ γλυκὺς καὶ ὁ ἄκρατος καὶ ὁ κυκεὼν μεταξὺ διαπινόμενοι ἐν τοῖς πότοις νήφειν ποιῶσιν; καὶ διὰ τί ἤττον μεθύσκονται κτλ.*

large vessels become less drunk? Is the reason in all cases¹ the same, namely the repression of heat; ² that is to say, on the surface of the body? For drunkenness takes place in the region of the head.

(Why is it that those who drink much unmixed wine fall ²⁵^b asleep easily?)³ Is it because to induce sleep warm moisture ¹⁵ must be present, for it is easily concocted? But if no moisture is present, or⁴ only a little, or moisture which is difficult of concoction, sleep does not come on. Therefore men become sleepest when they are fatigued and after meat and drink, owing to the heat. But sleeplessness afflicts the melancholic and those who are in a high fever,⁵ the former because the moisture in them is cooled, the latter because ²⁰ there is little or no moisture in them; these facts must clearly be looked to as the causes of sleeplessness in these two ⁶ cases.

Why do drunkards tremble, and the more so the more ²⁶ they drink unmixed wine?⁷ Now wine is heating, and trembling is chiefly due to cold; and so it is principally those who are chilled that tremble. Yet many ²⁵ people before now who have taken unmixed wine as their only form of nourishment, have been seized with such violent trembling as to throw off those who were trying to hold them down, and when they wash with hot water they have no perception of it. Others who live in this way,⁸

¹ Reading ἡ πάντων for πάντων γὰρ; cp. 872^b 28.

² Reading ἡ κατάκρουσις (τοῦ θερμοῦ), τουτέστιν; cp. 872^b 29.

³ It is clear that ἡ ὅτι δεῖ πρὸς τοὺς ὕπνου κτλ. begins the solution of a new problem the title of which has fallen out. T. G. begins this new problem with the words, *Cur vinolentis somnus oriri nequeat?* But the fact that drunkenness often induces sleep rather than prevents it and the arguments contained in the solution point to some other question. That inserted above seems to be the most applicable, since, as has been already shown, unmixed wine is hot and easily concocted.

⁴ Reading (ἡ) ἀλίγη (Bonitz).

⁵ τοῖς μεγάλας πυρίας is untranslatable and a participle appears to have fallen out; the sense must be either that given above or else 'those who indulge in strong vapour baths', which seems to be the meaning of πυρία in *de Part. Anim.* 651^a 1. T. G. renders *vehementer aestuantes*.

⁶ Reading ἐκίτερον (Richards) for ἕτερον.

⁷ The same problem is treated, and partly in identical words, in chapter 5.

⁸ i. e. who drink much unmixed wine.

but also undergo massage and take meat as part of their diet, have been stricken with apoplectic seizures; these are less subject to trembling, because they are unable to move, 30 but they suffer from violent pain and an inability to rest. Trembling is due to cooling; for, as has been remarked, it is those who are chilled who suffer from it and the very old, the cause being in the former their cold condition, in the latter their age. Wine, on the other hand, is very 35 heating; so that it ought to have the opposite effect. Is there any reason why the same effect should not be produced by contraries working in a different manner? For example, burning¹ is caused both by frost and by heat, when the frost collects the heat in one place. Thus there is a sense in which the same condition is produced² both by 875^a contrary causes and by the same cause. Now trembling is due to lack of heat,—not, however, of any kind of heat, but of natural heat. Heat perishes either by dying down or by being extinguished; it is extinguished by its contraries, cold and moisture, and it dies down either through 5 lack of material, as lamps do when they have no more fuel or oil, or under the influence of external heat, as the fire goes out in the sunlight and lamps when they are exposed to the fire. Those then who are chilled tremble because the heat in them is extinguished by the cold. This is why the pouring of hot water over a person makes his hair 10 bristle; for the cold being enclosed within and being compressed³ causes the hair to stand on end. The coldness of one who is beginning to suffer from fever is due to a like cause. In old age the heat dies down because the material which feeds it fails; for moisture is the food of heat, and old age is dry.⁴ Now it is because their own 15 heat dies down that drunkards tremble and any others in whom this effect is produced by wine; but they do not do so in the same way as those who tremble from old age, but there is, as we saw, a third way in which the heat is

¹ ἀποκαίειν is regularly used both of 'burning off' and of 'frost-bite'.

² Reading συμβάλει (Y^a).

³ For the doctrine of ἀντιπερίστασις cp. 867^b 32 and note.

⁴ Reading with Bonitz (*op. cit.*, p. 409) ξηρόν for ψυχρόν; cp. *de long. et brev. vit.* 466^a 22, ^b 14. T. G. renders *senectus autem sicca est.*

destroyed. For when too much wine is taken, the heat
 20 being considerable in the body¹ extinguishes or weakens
 our own heat, in which our strength consists; for trembling
 arises when the motive power loses control over that which
 it moves, just as the extremity of a long and large piece of
 wood trembles if one has not a good hold² upon it, and
 this happens because either that which is being held is too
 large or that which is moving it is too weak. So, when the
 25 heat is extinguished (for heat appears to be the cause of
 motion in animals), the natural control of the body is lost.
 That this condition is induced in drunkards and the aged
 by a process of cooling is proved by the fact that the
 trembling is unaccompanied by chill.

Why is it that one who is slightly intoxicated is more
 27 troublesome in his cups than one who is more drunk and
 30 than the sober man?³ Is it because the sober man
 exercises his judgement properly, whereas one who is quite
 drunk, because his senses are blocked up, being unable to
 resist the heaviness which oppresses him, cannot exercise
 his judgement at all, and, this being so, he is not trouble-
 some in his cups? But he who is slightly intoxicated uses
 his judgement, but, owing to the wine which he has drunk,
 he uses it amiss, and so is troublesome in his cups. He is
 35 like Satyrus of Clazomenae, who was given to abuse, and
 so when he was defendant in a lawsuit, in order that he
 might speak to the point and not abuse his adversary, they
 stopped up his ears, so that he might not hear anything
 and become abusive; but as his adversary was finishing his
 speech, they uncovered his ears, and he, hearing a few
 words at the end of the speech, could not restrain himself
 and began to revile him, because he could use his senses
 40 but could not use his judgement aright.

875^b Why is it that men do not become drunkards by being
 28 addicted to sweet wine, which is pleasanter to the taste?
 Is it because sweet wine possesses a flavour other than

¹ Putting the comma before, instead of after, ἐν τῷ σώματι.

² Reading ἐγκρατῶς (Richards).

³ This problem has already been discussed in chapter 2.

that of wine?¹ He then who is addicted to sweet wine will be a lover of what is sweet rather than of wine.

29 Why is it that drunkards take a particular delight in 5 the warmth of the sun?² Is it because they need concoction? Another reason is the fact that they are cooled by the wine; which is also a reason why apoplectic seizures and torpidity very readily occur after drinking.

30 Why is it that drunkards when looking at a single object sometimes see several objects?³ Is it because the sources 10 of vision (like the whole head) are disturbed internally by the wine, and, this being so, the vision of the two eyes cannot meet at the same point, but as it were moves to different parts of the object seen; consequently the object appears to be two? The same thing happens if one presses one eye from below;⁴ for this disturbs the source of its 15 vision, so that it no longer falls upon the same point as the other eye. This then is an external disturbance, while that caused by wine is internal; but there is no real difference, the effect being the same whatever the cause of the disturbance.

31 Why is it that the tongue of those who are drunk stumbles?⁵ Is it because, just as the whole body staggers 20 in drunkenness, so also the tongue staggers and stumbles and cannot articulate clearly? Or is it because the flesh of the tongue is spongy? It therefore becomes saturated and swells up, and when this happens it is more difficult to move, owing to the thickness caused by its increased bulk, and it cannot articulate distinctly. Or is it because, just as we cannot speak under water through lack of air, 25 so we cannot speak when we take liquid into the mouth? So in a state of drunkenness we cannot articulate because the tongue is surrounded by a large quantity of moisture; for a stumbling speech is due to inability to articulate. Or is it because in drunkenness the mind is affected and stumbles? If the mind is in this condition, it is only

¹ i. e. its sweetness predominates over its vinous quality.

² Cp. chapter 32.

³ Cp. chapter 10.

⁴ Cp. 959^a 11.

⁵ Cp. 888^b 7.

30 natural that the tongue should suffer likewise; for the mind is the source of speech. This is why, apart from drunkenness, if the mind is affected, the tongue is affected also, as for example in those who are frightened.

Why is it that drunkards and those who have to do 32
35 with the sea delight in the sun?¹ Is it because drunkards require concoction and at the same time certain parts of their bodies have become cooled? This is why apoplectic seizures and torpor follow after drinking. Those who have to do with the sea like the sun because they live always amid moisture.

Why is it that those who are drunk are incapable of 33
40 having sexual intercourse?² Is it because to do so a certain part of the body ought to be in a state of greater heat 876^a than the rest, and this is impossible in the drunken owing to the large quantity of heat in them; the heat therefore caused by the movement is extinguished, being heated by the surrounding heat?³ Or is it because for sexual intercourse the lower parts of the body must be heated, whereas wine naturally rises upwards and so creates heat in the 5 upper parts and withdraws it from the lower parts? Also people are least inclined for sexual intercourse after food and are recommended to take a heavy midday meal and a light supper with a view to it, for the heat and moisture move upwards when the food is unconcocted and downwards when it is concocted; and the semen is formed from concocted food. Those who are fatigued emit semen during 10 sleep,⁴ because fatigue is a moist and hot condition; if therefore the excretion takes place in this part of the body, the result is that semen is emitted during sleep. This also occurs for the same reason in certain forms of illness,⁵ and likewise in those who are frightened and in the dying.⁶

15 Why is it that the young wet their beds more, when 34 they are drunk, than the old? Is it because they are hot and moist, and so the excretion which collects is abundant,

¹ Cp. above, chapter 29.

² Cp. above, chapter 11.

³ An instance of the doctrine of $\pi\upsilon\rho\ \epsilon\pi\iota\ \pi\upsilon\rho$.

⁴ Cp. v. 3.

⁵ Namely in phthisis; cp. 884^a 6.

⁶ Cp. 877^a 26 ff.

because the body does not expend the moisture, and so it overflows; but as they become older, the body owing to its dryness absorbs the excess of moisture? Or is it because the young are more inclined to sleep than the old? Consequently, without their being aware of it, the flow of urine finds its way out while they are asleep, before they can wake up, whereas the old are aware of it, just as they are more alive to any external movement than the young. This is confirmed by the fact that the young themselves wet their beds most when they are most sound 25 asleep.

- 35 Why is it that oil is beneficial against drunkenness and sipping it enables one to continue drinking? Is it because it promotes the flow of urine and so prepares a way for the liquor?

BOOK IV

PROBLEMS CONNECTED WITH SEXUAL
INTERCOURSE

WHY is it that one who is having sexual intercourse, **1**
and also a dying person, casts his eyes upwards, while
a sleeper casts them downwards? Is it because the heat
going out in an upward direction makes the eyes turn
in the direction in which it is itself travelling, whereas
during sleep the heat collects in the lower part of the body
35 and so inclines the eyes downwards? The eyes close
because there is no moisture left in them.

Why do the eyes and flanks of those who indulge too fre- **2**
quently in sexual intercourse sink very noticeably,¹ though
the latter are near and the former far from the sexual organs?
Is it because these parts co-operate very noticeably in the
effort made in the act of coition, contracting at the time
876^b of the emission of the semen? It is from these parts then
in particular that any easily liquefied nourishment which
is present there is squeezed out by the pressure. Or is
it because these parts become overheated and waste away
most, and sexual intercourse operates through heat, and
those parts are most heated which are moved in the act
5 of coition? Now the eyes and the parts about the buttocks
noticeably co-operate in the sexual act; for it is impossible to
emit the semen without drawing the buttocks together and
closing² the eyes, for the buttocks by their contraction press
out the semen (just as the liquid can be expelled from the
bladder by the pressure of the hand), while the bringing to-
10 gether of the eyelids presses out the moisture in the brain.

¹ Cp. *de Gen. Anim.* 747^a 16.

² Unless τῶν ὀφθαλμῶν καταβληθέντων here means merely 'closing the eyes' as is implied by συναγωγή (l. 10), there will be a direct contradiction with 876^a 32, 33. The alternative is to emend καταβληθέντων to ἀναβληθέντων. Platt omits μή as having come from the previous line.

That the eyes and the region near them have considerable influence in procreation is shown by the fact that childless and fruitful¹ women alike try the experiment of anointing them, thinking that strength must pass by this way into the semen. These two parts, the fundament and the eyes, are always in all persons full of fatness; and, because they¹⁵ co-operate in the act of coition, they share in the heat which it engenders and are made lean thereby, and much of their substance is excreted into the semen. For unless a part of the body is fat, the heat will not melt it properly, nor will it do so if the part is fat but does not co-operate in the sexual act, as is the case with the stomach. (The kidneys, however, have more sensation in sexual intercourse²⁰ than other parts of the body because of their nearness to the organs employed.) Moreover, the mere passage of the semen through these parts, which is quite perceptible by these parts, is sufficient to make them lean; for its proximity takes away something without adding anything to them.

3 Why is it that both those who indulge in sexual excess and eunuchs, who never do so, alike² lose their sharpness²⁵ of vision? Is it because in the former owing to their desire, and in the latter owing to their mutilation, the upper parts of the body become drier than they ought to be, and this is most noticeable in those organs which have delicate work to do, such as the eye? So when the moisture is drawn away downwards, the upper parts become dry. It is quite obvious that sexual intercourse³⁰ has this effect. In eunuchs the legs swell and the bowels are easily relaxed, which shows that the moisture has moved downwards.

4 Why is it that man alone grows hair on the face and body when he begins to be capable of sexual intercourse, whereas this does not happen in the other animals which have hair? Is it because on coming to maturity the characteristics of animals change to their opposites? For³⁵

¹ ἀγόνων should perhaps be read for γονίμων.

² Reading ὁμοίως with some MSS.

the voice becomes deep instead of shrill, and they become hairy instead of bare; it is clear therefore that animals which are hirsute from birth ought to become bare and not continue to be hirsute when they begin to secrete semen. But this is not so, because animals which emit
 877^a semen become drier and rarer, conditions which are favourable to the growth of hair. This is shown by the fact that hair does not grow on scars, for scars are of a close texture and not rare; nor does hair grow upon women and children, both of whom are moist and not dry.

5 Why is it that having the feet bare is prejudicial to sexual intercourse? Is it because the body, when it is about to have sexual intercourse, ought to be warm and moist internally? This condition is attained during sleep rather than when one is awake; and so emission of semen takes place readily and without effort during sleep, but requires exertion in those who are awake. When the
 10 body is moist and warm, the feet are even more so; as is shown by the fact that the feet of those who are asleep are warm, being in this condition simultaneously with the interior of the body. But bareness of the feet has the opposite effect of causing dryness and cold. So since it is either difficult or impossible to have sexual intercourse when the feet are not warm, bareness of the feet must
 15 necessarily be prejudicial to the performance of the sexual act.

Why is it that man is more languid after sexual inter- 6 course than any other animal? Is it because in proportion to his bulk he emits more semen than any other animal? But why does he do so? Is it because man digests his food with less effort and is naturally moister and hotter
 20 than all the other animals? His moistness then creates an abundance of semen, while his heat creates a natural condition favourable to it; for the semen must be moist and hot as long as it is kept in the body.

Why is it that, whereas sexual intercourse takes place 7 by means of heat, and fear and death have a cooling effect, 25 yet semen is sometimes emitted by those who are frightened

and by the dying?¹ Is it because, though some parts are cooled, others become somewhat warmed, since they already have their own heat and receive additional heat from the parts which are cooling? So that, though such persons are growing cold, the emission of semen is due not to cooling but to the simultaneous heating. Observation proves this to be so in those who are frightened; for the blood leaves ³⁰ the upper parts of the body, and the lower parts become moist, and the bowels and bladder are relaxed. Thus under the influence of fright the heat makes its way downwards, and at death it travels upwards from below, and, because it creates a state of moisture by its warmth, it causes the emission of semen.

8 Why is it that one ought not to have sexual intercourse ³⁵ or vomit or sneeze or emit a deep breath, unless one is in a turgid state? Is it because if we are not in a turgid state, we are in the condition of plants torn up from the earth with which something which does not belong to them is torn up also, or of which some part is torn off and left in the ground? Now anything which ought to be removed, but of which a part is detached and remains ^{877^b} behind, will cause trouble for a long while. And if one disturbs something external to oneself, this will cause trouble, because it is not in its proper place; and this is what will happen if we do any of the above-mentioned things when we are not in a turgid state.

9 Why is it that one can have sexual intercourse ⁵ more readily when fasting? Is it because the ducts of the body are emptier in those who are fasting and full in those who are full? In the latter case they prevent the moisture from passing through into the semen. This is seen to be the case with the bladder; for when it is full it is impossible to have sexual intercourse readily.²

10 Why is it that the young, when they first begin to have ¹⁰ sexual intercourse, feel loathing after the act for those with whom they have had intercourse? Is it due to the fact

¹ Cp. 876^a 13.

² Cp. 878^b 33-5.

that the change caused in them is great? For they are only conscious of the ensuing feeling of discomfort, and so avoid those with whom they have had intercourse as being the cause of this feeling.

15 Why is it that those who are continually on horseback **II** are more inclined for sexual intercourse? Is it because owing to the heat and movement they are in the same condition as during sexual intercourse? So as growth takes place with increasing age in the region of the genital organs, these parts become enlarged. Since then they are always in this state of movement, their bodies become open-pored and in a condition which disposes them for
20 sexual intercourse.

Why is it that when sexual powers begin to be present **12** the flesh has an unpleasant odour which is not present in men or women before puberty?¹ Is it because unconcocted matter always has a worse taste—being more acid or salty or bitter—and a more unpleasant odour, while
25 concocted matter has a pleasant, or less unpleasant, taste and a more agreeable, or less disagreeable, odour? This is clear from an observation of the whole vegetable and animal world. If the properly concocted matter is removed, that which is left is unconcocted,—for instance in ashes, the sweet portion having been consumed, the dust which remains is bitter, and similarly perspiration is salty.
30 Now the natural heat concocts the semen, which though small in amount is very strong, being a large quantity in a concentrated form.² When, therefore, it leaves the body, the latter usually becomes languid and cold; and so the juices in it are subject to less concoction, since the pores are opened owing to the excretion of the semen. Conse-
35 quently the perspiration of adults is saltier and has a more unpleasant odour than that of children, because it is unconcocted; and if their natural condition is such that the residue³ of their perspiration has an unpleasant odour,

¹ Cp. below, chapter 24, and Theoph. *de Odoribus*, § 7.

² i. e. the semen, though small in quantity, is concocted from a large amount of nourishment, cp. 879^a 9, 10.

³ i. e. what is left when the moisture in the perspiration has evaporated.

it is still more evident in such persons, and particularly¹ in those parts, such as the armpit,² in which it is especially evident in other people also.

13 Why is it that we regard the creature which is born³ 878^a from our own semen as our offspring, while that which is produced from any other part of us or from any other excretion is not looked upon as our own? For many things are produced by putrefaction, even from semen. Why then is that which resembles us claimed as our own, while that which is alien to us is not so considered? For 5 either all or none ought to belong to us. Is the reason that, in the first place, what is produced from the semen is born from what is our own, but that which is produced otherwise originates from something which is not ours, namely, from what is purged or excreted from us? In a word, nothing in a creature procreates another creature except the semen; and that which is harmful and evil, and also that which is alien, is not claimed by anything as its 10 own; for it is not the same thing to be part of a thing and to be alien to it and other than it and evil. Now our excretions and putrefactions are not our own but are other than us and alien to our nature. For all things that grow in the body must not be considered as belonging to the body, for even boils grow on it and these are removed and cast forth. In a word, all things that are contrary to nature 15 are alien to the body, and many of the things that grow there are contrary to nature. If therefore the semen is the only thing in us from which a creature can be born, we should be right in regarding as our own offspring that only which is produced from the semen. Moreover anything else which is produced from the semen, as for instance, when it putrefies, a worm, or the so-called monstrosities, 20 when there is corruption in the womb, are not to be reckoned as offspring. In a word, anything which is produced from corruption is no longer produced from that which is our own but from that which is alien to us, like

¹ The Teubner text wrongly prints *μάλιστα* for *μάλιστα*.

² Cp. 867^b 19.

³ The Teubner text wrongly prints *γένηται* for *γένηται*.

that which is generated from excretions such as ordure. That all such things are produced from corruption is
 25 proved by the fact that what is generated from uncorrupted semen is of such a nature as to resemble that from which the semen came, a horse being born from a horse and a man from a man. And¹ we do not value the semen in itself or everything that is being completed in the process of coming into being (for it is sometimes moisture and a mere mass
 30 and flesh which is coming into being),² because it has not yet its true nature but only so much of its nature as is implied in the fact that it is so disposed as to produce something resembling ourselves; and nothing even of this kind can be produced from corrupted semen. For these reasons we do not regard as our offspring that which is produced either from anything else in us except the semen, or from the semen when it is corrupted or fails to achieve perfection.

35 Why are people less able to have sexual intercourse in the water? Is it because in water none of those things liquefy which liquefy with heat—lead, for example, or wax? Now the semen obviously liquefies with heat, for it does not liquefy until it is warmed by the friction. Fishes, however, have sexual intercourse without friction.

878^b Why is it that sexual intercourse is the most pleasant of 15 all things to animals, and is it so of necessity or with some purpose in view? Is it pleasant because the semen comes either from the whole body, as some declare,³ or not from
 5 the whole body but only from the area over which all the ducts of the veins extend? The pleasure then of the friction⁴ being similar in both cases, the sensation extends as it were over the whole body. Now the friction is pleasant, since it involves the emission of vaporous moisture enclosed unnaturally in the body; but the act of generation

¹ Reading *καὶ αὐτὸ δέ* (Richards).

² Reading in ll. 28-30 *περαινόμενον* (*καὶ γὰρ ὑγρὸν καὶ ὄγκος τις καὶ σὰρξ γίγνεται ποτε*), *διὰ κτλ.*

³ This is the Hippocratean doctrine denied by Aristotle in *G. A.* 721^b 13 ff.

⁴ For this meaning of *κνησμός*, see *G. A.* 723^b 34 and A. Platt's translation.

is an emission of similar matter for its natural purpose. It is pleasant both of necessity and because it has a purpose¹⁰ in view,—of necessity, because the way to a natural result is pleasant, if it is realized by the senses; and because of its purpose, namely, the procreation of animal life. For it is the pleasure more than anything else which incites animals to sexual intercourse.

16 Why is it that sexual excess is beneficial in some diseases caused by phlegm?¹ Is it because it involves the emission¹⁵ of an excretion, and so a considerable amount of excreted matter is rejected with it, and phlegm is an excretion?

17 Why does sexual intercourse cool and dry the stomach? Does it cool it because the heat is expelled in coition? Coition causes dryness, because, as the heat goes out, the moisture² is vaporized and finds its way out as the body cools, while at the same time the heat caused by the act of²⁰ copulation has a drying effect.

18 Why are those whose eyelashes fall off accounted lustful? Is it for the same reason as that for which the bald also are so accounted?³ For the eyelashes and the hair of the head really belong together. The reason is that all the congenital hair which does not increase as a man gets older,²⁵ falls off owing to lustfulness. For the hair of the head and the eyebrows and eyelashes are congenital hair; and of these the eyebrows alone sometimes grow thicker with advancing years (the reason for this has been stated elsewhere),⁴ while the hair of the head and the eyelashes both fail from the same cause, viz., that lustfulness cools the upper³⁰ parts of the body which are deficient in blood, and so this portion of the body does not concoct any of the nourishment, and the hair not receiving any nourishment drops off.

19 Why is it that those who wish to pass urine cannot have sexual intercourse?⁵ Is it because the ducts become full?

¹ This problem has been already treated in i. 50.

² It seems necessary to supply τὸ ὑγρὸν here as the subject of ἐξαρμίζεσθαι.

³ Cp. *G. A.* 783^b 27 ff.

⁴ This appears to be a direct reference to *P. A.* 658^b 19, 20.

⁵ Cp. 877^b 6–8.

35 Now that which is full of moisture cannot admit any more moisture.

Why is it that varicocele prevents both man and any 20 other animals which suffer from it from procreating their species? Is it because varicocele is due to a displacement of breath, and this is why it is beneficial to melancholic diseases? Now sexual intercourse also is accompanied by 879^a an emission of breath.¹ If therefore a rush of breath makes its way along when sexual intercourse is taking place, it fails to impart movement to the semen² and the latter becomes cold; consequently it enfeebles the erection of the penis.

Why do those who have sexual intercourse usually 21 5 become languid and weaker?³ Is it because the semen is an excretion from the whole body,⁴ and so the composition of the body, like the harmony of a building, is disturbed by the loss of any portion of it—if, for example, all the blood⁵ or any other component part of it is removed? So important is that which the body loses in sexual intercourse, being indeed formed from a large amount of nourish- 10 ment though itself small in quantity,⁶ just as a cake is made from wheaten flour.

Why is it that the penis is greatly distended in those who 22 have sexual intercourse at a time when they desire to pass urine? Is it because, owing to the ducts being full of moisture, the semen, passing out through a narrower space, swells the bulk of the penis and lifts it up, for it is situated close to the ducts.

15 What is the cause of the erection and swelling of the 23 penis? Are there two reasons, first, that it is raised by a weight applied behind the testicles, the latter acting as the fulcrum, and, secondly, that the pores become full of

¹ For the semen is *ὑγρὸν πνευματώδες* (cp. 878^b 8).

² i. e. the breath passes into the vein instead of helping in the emission of the semen.

³ This problem is almost identical with that of chapter 6, but there man is compared with other animals.

⁴ Cp. 878^b 3 and note.

⁵ Omitting *ἦ* before *πᾶν* with T. G.

⁶ Cp. 877^b 31.

breath? Or does its bulk become greater from the increase of the moisture and its change of position, or from the formation of moisture? Now very large objects are less ²⁰ easily moved, because the weight is farther away from the fulcrum.¹

24 Why is it that those who have sexual intercourse or are capable of it have an evil odour and what is called a hircine smell, whereas children do not?² Is it because, as has already been said,³ in children the breath concocts the moisture and perspiration, whereas the perspiration of ²⁵ grown men remains unconcocted?

25 Why is it that in summer men are less capable of sexual intercourse and women more so?⁴ As the poet says,

Men, when the artichoke blooms, are weaker and women more wanton.⁵

Is it because the testicles hang down lower than in the winter, and they must be drawn up if sexual intercourse ³⁰ is to take place? Or is it because hot natures collapse in summer when the heat is excessive, but cold natures are invigorated⁶ by it? Now a man is dry and hot, but a woman is cold and moist; consequently a man's strength is impaired, but a woman's force is invigorated, its deficiency ³⁵ being compensated by its opposite.⁷

26 Why is it that some persons find pleasure in submitting to sexual intercourse, and some take pleasure in performing the active part, and others do not? Is it because each form of excretion has a region in which it is naturally secreted and, when an effort is made, the breath in finding its way ^{879^b} out causes the excretion to swell and expels it; for example, urine collects in the bladder, food from which the moisture has been extracted in the bowels, tears in the eyes, mucous matter in the nostrils, and blood in the veins? Similarly ⁵ the semen collects in the testicles and penis. In those whose ducts are not in a natural condition, owing either

¹ And in this case the object is not large and is therefore easily moved.

² Cp. above, chapter 12.

³ Cp. 877^b 22 ff.

⁴ Cp. below, chapter 28.

⁵ Hesiod, *Op.* 582, 586.

⁶ Reading *θάλλουσιν* (Richards).

⁷ i. e. heat.

to the blocking up of the ducts leading to the sexual organs (as in the case of eunuchs or other victims of sexual disablement) or to some other cause, all such moisture collects in the region of the fundament; for it is by this way that it
 10 passes out of the body. That this is so is proved by the contraction of that part in sexual intercourse and the wasting of that region of the body.¹ If therefore through wantonness a man has a superfluity of semen, it all collects there; and so, when desire comes upon him, the part in which it is collected desires friction. This desire may be
 15 due to diet or to the imagination. When desire is stirred from any cause, the breath collects and secretion of this kind flows to its natural place. If the secretion be thin and full of air, when the breath finds its way out the desire ceases (just as the erection in boys and older persons sometimes ceases without the discharge of any moisture);² and the same thing happens, if the moisture dries up. But if
 20 neither of these things occurs, the desire continues till the one or the other of them takes place. But those who are effeminate by nature are so constituted that little or no semen is secreted where it is secreted by those who are in a natural state,³ but it collects in this part of the body.⁴ The reason of this is that they are unnaturally constituted; for, though male, they are in a condition in which this part
 25 of them is necessarily incapacitated. Now incapacity may involve either complete destruction or else perversion; the former, however, is impossible, for it would involve a man becoming a woman. They must therefore become perverted and aim at something other than the discharge of semen. The result is that they suffer from unsatisfied desires, like women; for the moisture is scanty and has not enough
 30 force to find its way out and quickly cools. When it finds its way to the fundament only, there is a desire to submit to sexual intercourse; but if it settles both there and in the sexual organs, there is a desire both for performing and

¹ Cp. chapter 2.

² Enclosing *ὡσπερ . . . ἐκκριθέντος* in a parenthesis and reading *παύονται, ὅταν τε κατασβεσθῇ κτλ.*

³ i. e. *εἰς ὄρχεις καὶ αἰδοῖα*, cp. above, ll. 5, 6.

⁴ i. e. *ἐν τοῖς περὶ τὴν ἔδραν.*

submitting to the sexual act, and the desire for one or other is greater as more semen is present in either part. This condition is sometimes the result of habit; for men take a pleasure in whatever they are accustomed to do and emit the semen accordingly. They therefore desire to do the 35 acts by which pleasure and the emission of semen are produced, and habit becomes more and more a second nature. For this reason those who have been accustomed to submit to sexual intercourse about the age of puberty and not before, because recollection of the past presents itself to 880^a them during the act of copulation and with the recollection the idea of pleasure, desire to take a passive part owing¹ to habit, as though it were natural to them to do so; frequent repetition, however, and habit become a second nature. All this is more likely to occur in the case of one who is 5 both lustful and effeminate.

27 Why is it that those who desire to submit to sexual intercourse feel a great shame about confessing it, which they do not feel in confessing a desire for meat or drink or anything of that kind? Is it because the desire for most things is necessary and its non-satisfaction is sometimes fatal to life, but sexual desires proceed from something 10 beyond mere necessity?

28 Why is it that men are more inclined for sexual intercourse in the winter and women in the summer?² Is it because men are hotter and drier in their nature, and women moister and cooler? In men therefore during the winter the moisture and heat³ are sufficient to cause the 15 impulse (and it is moisture and heat which give rise to the production of the semen), whereas in women the heat is less and the moisture is congealed owing to the lack of fire. But in summer in women⁴ the heat is well proportioned, whereas in men it is more than sufficient; for the excess dissolves much of their strength. For this reason

¹ Omitting δὲ after διὰ; the sentence otherwise has no principal verb.

² Cp. above, chapter 25.

³ i. e. the natural heat and the moisture of the season.

⁴ Reading τοῦ δὲ θερμοῦ ταῖς μὲν ἐστί: X^a reads ἐστί for οὖν.

20 also children are thinner during the summer ; for it is a case of ' fire added to fire '.¹

Why is it that those who are hot by nature, when they 29
are strong and well nourished, if they do not have sexual
intercourse are often oppressed² by bile, which makes its
way down in a very bitter condition, and a salty phlegm is
25 engendered, and their complexion changes? Is it because
some excretion always comes away with the semen?
(Wherefore also the semen of some men who emit a large
quantity of excretion³ is said to smell of the water in which
fish have been washed.⁴) So when they have sexual inter-
course, this excretion comes away with the semen and so
causes no inconvenience ; but if they abstain from copula-
tion, the excretion becomes bitter or salty.

30 Why are the melancholic particularly inclined for sexual 30
intercourse?⁵ Is it because they are full of breath, and the
semen is a discharge of breath? If so, those whose semen
is full of breath must necessarily often desire to purge
themselves of it ; for thus they are relieved of it.

35 Why are birds, and men with thick hair, lustful?⁶ Is it 31
because they have a large amount of moisture? Or is this
not true (for the female sex is moist and not hairy), but is the
real reason that the natures both of birds and of thick-
haired men are able owing to their heat to concoct a large
quantity of moisture? This is indicated by the presence of
hair and feathers. Or is it because the moisture is plentiful
and is overpowered by the heat? For if the moisture were
880^b not plentiful or were not overpowered, hair would not grow
on human beings nor feathers on birds. Now the semen is
formed most plentifully under conditions of locality and
at seasons that have these characteristics,⁷ in spring for
example, which is naturally moist and hot. Birds and

¹ Cp. 861^a 31 and note. ² Reading *προσίσταται* (Bussemaker).

³ Reading *περιττωματικῶν* for *πνευματικῶν*; the Latin version renders *excrementis abundantium*.

⁴ *ἰχθύων πλύντρον* must be taken together (cp. *πλύμα ἰχθύων*, *H. A.* 534^a 27), and *ἰχθύων* does not agree with *περιττωματικῶν* as implied by Bonitz (Index, p. 352, *s. v.* *ἰχθύς*).

⁵ Cp. 953^b 32 ff.

⁶ Cp. below, x. 24.

⁷ i. e. when moisture is plentiful and is overpowered by heat.

lame men are lustful for the same reason, namely, that in 5
both, owing to the deficiencies of their legs, the nourishment
is carried downwards in small quantities only, while the rest
travels into the upper region of the body and is converted
into semen.

32 Why is it that when a man has sexual intercourse his
eyes grow very weak? Is it not clear that this happens
because the moisture leaves them? This is proved by the 10
fact that the semen is cold; for it does not become moist
unless the heat warms it thoroughly. Nor does it require
melting, for it is dispersed about the body like blood.

BOOK V

PROBLEMS CONNECTED WITH FATIGUE

15 WHY is it that long walks are more fatiguing and short I
walks less fatiguing over level ground than over uneven
country ?¹ Is it because much movement and violent move-
ment causes fatigue, and spasmodic movement is violent, and
continuous and monotonous movement is much movement ?
In walking therefore on hilly ground, if the distance be long,
20 the change provides a rest, and the same movement is not
continued for long, even in the case of horses, owing to the
change. On even ground, on the other hand, the similarity of
position continues uninterruptedly and gives the limbs no
rest, but helps to make the movement continuous. Now if
the distance is short, no fatigue is caused on flat ground by
25 long-continued motion ; whereas over hilly ground the
violent change to an opposite kind of movement, sometimes
uphill and sometimes down, gives rise to fatigue. Such, in
our opinion, is movement over hill country, and that over
level ground is the contrary.

Why is it that those who faint and those who collapse 2
30 after physical exertion are generally held to become smaller
in bulk and their voices shriller ? Is it because their voices,
appearing to be less, seem shriller (this can be illustrated
by the fact that those who imitate distant voices make shrill
sounds),² while their bulk appears less (because the blood
removes from the upper to the lower parts of the body) ?³

Why is it that only the stomach becomes thinner in those 3
35 who take violent physical exercise ? Is it because the greatest
quantity of fat is found round the stomach ?

¹ This problem is derived practically word for word from Theophr.
de lassit., § 15.

² Cp. 899^a 22 ff.

³ The MSS. read *καὶ οἱ ὄγκοι ἐλάττωσι* without adding any reason,
which is necessary to the sense and to the balance of the sentence.
The words enclosed in brackets are taken from T. G., who evidently
translates a longer text and reads *quod sanguis a summis corporis*
partibus sevocat ad imas.

- 4 Why is it that the fat is consumed in those who exert themselves? Is it because fat melts when heated, and the movement causes heat, whereas flesh does not melt?
- 5 Why is it that the parts round the belly are fattest? Is it because they are near to the nourishment? While then ^{881^a} the other parts of the body receive something from the belly, the belly itself often receives something. Or is it because the belly is exerted less than the other parts, because it has no joints?
- 6 Why is it that fatigue ceases more readily if one mixes water with the oil with which one rubs oneself?¹ Is it ⁵ because the oil sinks in farther when mixed with water, whereas by itself it does not penetrate so well, because it has a tendency to remain on the surface? If, therefore, it sinks in, the body is more softened; for oil is naturally hot, and hot things have a drying and hardening effect, and dryness and hardness are inexpedient in fatigue; but when ¹⁰ applied with water the oil has a less drying effect.
- 7 Why is it that vomiting is prescribed for those who are suffering from fatigue, although vomiting is itself fatiguing? Is it because fatigue is caused by the crushing and pressure and weariness of the bones, and this can be caused either by some external or by some internal agency, and in the latter ¹⁵ case from one of two causes, either because the flesh overreaches its own strength, or because one bodily constituent mingles in a large quantity with the rest of the body and does not keep to its proper place, as happens with the excretions? For any burdens which are put upon us externally cause more fatigue than our own members, even ²⁰ though they are lighter than these in weight. This can be illustrated by the fact that those who have eaten or drunk somewhat freely, though they have exerted themselves less than when they were fasting, yet feel more fatigue, because the food, being unconcocted, is not in its proper place. And since fatigue causes liquefaction, and liquefaction is an excretion, it is the latter which produces fatigue in us, ²⁵

¹ Cp. Hippocrates, *de Diact.* ii. 65.

wandering about at random and attacking the bones and sinews and the interior parts of the flesh, which are rare and open. Consequently vomiting, by dislodging the excretion which is the cause of fatigue, naturally makes us less fatigued; for it leaves the body in the state in which it was when the exertion began. Vomiting is fatiguing, not
 30 because of the excess of movement caused while it is taking place, but when it does not happen to be thoroughly carried out; for fatigue caused by vomiting occurs when a considerable amount of food is left behind and this contains excretions, which, as we have already said,¹ happens in those who have eaten largely. If, therefore, in the latter it
 35 is not exertion which causes fatigue, but they feel fatigue because of the condition in which they are, so vomiting could not be the cause of fatigue in those who do not get rid of all the food which is in them;² for in that case every one who vomited would feel fatigue, whereas many through vomiting become less fatigued.

Why is it more fatiguing to the arm if one casts with the
 881^b hand empty than with a stone in it?³ Is it because the movement is more spasmodic if the hand be empty, for the hand has nothing to rest upon,⁴ such as the thrower finds in the missile which he holds in his hand? Similarly the competitor in the fivefold contest⁵ finds resistance in the weights⁶ which he holds, and the runner in his arms which

¹ Cp. ll. 21-3 above.

² i. e. the cause of fatigue is not the act of vomiting but the fact that food is sometimes left behind which engenders excrements, and these cause fatigue.

³ This problem is clearly derived from Theophr., *op. cit.*, § 13; cp. also *de Incess. Anim.* 705^a 17 ff.

⁴ ἀπερείδειν is practically the same as ἀντερείδειν of *Mech.* 851^b 35, where τὸ ἀντερείδειν expresses *vis inertiae*, the tendency of a body at rest to remain at rest. In this case the tendency of the missile to remain at rest causes resistance and therefore makes the action of the arm less spasmodic. Cp. also *Mech.* 858^a 9 ἀντιτείνει γὰρ τὸ ἡρεμοῦν.

⁵ The *pentathlon* was a combined contest in running, jumping, disk-throwing, javelin-throwing, and wrestling.

⁶ ἀλτήρες were weights held in the hand and thrown backwards by the jumper whilst in the air to give him impetus. Several such weights still exist in the British Museum and elsewhere, cp. Norman Gardiner, *Greek Athletic Sports and Festivals*, p. 298 ff., and A. S. L. Farquharson on *de Incess. Anim.* 705^a 17.

he swings;¹ so the former jumps farther if he holds weights⁵ than if he does not, and the latter runs more quickly if he swings his arms than if he does not do so.

9 Why is it that quick running causes a tendency to disease in the head both in man and in the other animals? Yet generally speaking running appears to draw the excretions¹⁰ downwards, as does walking; for which reason also those who walk much grow fat in the legs, because both the nourishment and the excretions settle down from the upper into the lower parts. Is it true that while motion has this² effect, yet quick motion, owing to the strain and the holding of the breath which it involves, causes heat in the head and inflates the veins in it and renders them liable to be affected¹⁵ by external influences, such as cold and heat, and by the contents of the trunk;³ and that if these can enter the head, disease is necessarily engendered in that region?

10 Why is it more fatiguing to walk on level than on uneven ground, whereas one can walk more quickly on an even than on an uneven road?⁴ Is it because it is less fatiguing²⁰ if one does not move continually in the same position, and this is the case rather in traversing uneven ground? On the other hand one progresses more quickly the less one's movement is contrary to nature. On even ground, therefore, the raising and planting of the foot is a slight but frequent movement, while the opposite occurs on uneven ground. Now to raise the foot is unnatural (for raising anything²⁵ requires an effort); and the slight movement of raising the foot at each step becomes considerable when repeated many times.

11 Why is it more fatiguing to lie down on a flat than on a concave surface?⁵ Is it for the same reason that it is more fatiguing to lie on a convex than on a flat surface?

¹ On the importance attached by the Greeks to arm action, especially in short races, see N. Gardiner, *op. cit.*, p. 282.

² Reading *τοῦτο* for *ταῦτό*.

³ The *θώραξ* is defined by Aristotle (*H. A.* 491^a 27) as *τὸ ἀπ' ἀρχένης μέχρι αἰδοίων κύτος*.

⁴ This problem is again treated in chapter 23; the source in both cases is Theophr., *op. cit.*, § 14.

⁵ The source of this problem is Theophr., *op. cit.*, § 9.

30 For the weight being concentrated in one place in the sitting or reclining position causes pain owing to the pressure. This is more the case on a convex than on a straight surface, and more on a straight than on a concave; for our body assumes curved rather than straight lines, and in such circumstances concave surfaces give more points of contact than flat
35 surfaces. For this reason also couches and seats which yield to pressure are less fatiguing than those which do not do so.

Why are short walks fatiguing?¹ Is it because they 12 involve abrupt change, for they necessitate coming often to a standstill? Now frequent change from one extreme to
882^a another is fatiguing, for it does not allow one to become accustomed to either extreme, and this is tiring; and one cannot become accustomed to both things at once.

Why is it that those who ride on horseback water more 13 freely at the eyes the quicker the horse goes?² Is it
5 because the stream of air which meets them is colder according as it is for a shorter time in contact with the body (as happens in the case of naked runners), and it is the cold which makes the eyes water?³ Or is the reason the contrary of this, namely, that heat makes the eyes water (the sun, for instance), and movement engenders heat?
10 Or is it due to the impact of the air? For as blasts of wind coming from an opposite direction trouble the eyes, so the air all the more deals a gentle blow the quicker the horse is driven.

Why is it that the other parts of the body become more 14 fleshy when subjected to friction, but the stomach becomes leaner? Or is it true that the stomach does not become
15 gradually leaner⁴ but solider? The flesh, however, is not similarly affected, and this is the point of the problem; for, speaking generally, the stomach does become leaner as the result of exercise and exertion. The reason is that the fat

¹ Cp. below, chapter 35: the source of both problems is Theophr., *op. cit.*, § 14.

² Cp. below, chapter 37.

³ Reading *δακρύειν* (Richards).

⁴ *sc.* λεπτότερα γίνεται; but T. G. appears to translate a different text.

parts, and those which naturally admit of more expansion, liquefy when heated. Now the skin naturally admits of expansion; but, because it very quickly fattens, it always 20 contains some fat, unless any disease is present. The reason of this is that it is near the nourishment.¹ Since, therefore, generally speaking, fat is not natural but adventitious, and is not one of the necessary constituents of the body, as is the flesh, the movements set up by exercise and friction warm and melt it and distribute the superfluous nourishment 25 in the other portions of the body. It is for this reason that sitting still makes the stomach fat and the rest of the body thin; whereas movement and friction make the stomach thin and fill out the rest of the body.

15 Why is it that after long and violent walking or running, if one stands on tiptoe, the heels quiver and are hastily 30 drawn² down again? Is it because, owing to the continuity and violence of the movement, the quivering of the muscles in the man does not cease? For the mind often controls the body as a whole, but does not control certain parts of it, when they have been set in motion in a certain way, the heart, for example, and the sexual organ. The reason is 35 that a considerable quantity of breath is consumed by heat round the muscles, which does not cool off immediately a man comes to a standstill. This breath, therefore, is drawn down, making him quiver, as it were dragging at him beneath by its movement, and leaves him little control over the most distant part of his body—in this case over his heels. A similar phenomenon occurs in the trembling of the lower lip in those who are angry.

16 Why is it that those who are not running very hard 882^b respire rhythmically? Is it because every rhythm is measured by a definite movement, and the movement at regular intervals which occurs in running is of this nature? As soon, therefore, as they begin to run they respire; and so the respiration taking place at equal intervals, because it 5 is measured out by a uniform movement, creates a rhythm. Or is it because all respiration without exception takes

¹ Cp. 880^b 39 ff.

² Reading *σπῶνται* for *σπάται*.

place at equal intervals in those who respire naturally and do not hold their breath? The rhythm then is not obvious in those who are sitting or walking, because the movement
 10 of the body is slight; and in those who are running vigorously we cannot comprehend the rhythm of the respiration, because our senses cannot follow the movement. But in those who arerunning moderately fast the movement allows the measure observed by the breathing to be perceptible, and so shows the rhythm.

Why is it that, when we are running, the air seems to
 15 turn into breath? Is it because, while we are moving in the act of running, we set in motion a stream of air continuous with our bodies, and this is breath? Wherefore the air not only seems to turn into breath, but actually does so. Or is it because in running we come into collision with the air, and, when this happens, we have a more acute
 20 perception of the air owing to the movement? It is only natural, therefore, that it should seem to us to turn into breath; for the phenomenon occurs through the rush of our movement.

Why is it that one is more liable to fall when running
 18 than when walking?¹ Is it because in the former case one raises oneself higher before moving? For this is the difference between running and walking.

Why is it that in ascending a slope our knees feel the
 25 strain, and in descending our thighs?² Is it because when we ascend we throw the body upwards and the jerk of the body³ from the knees is considerable, and so we feel the strain in the knees? But in going downhill, because the
 30 weight is carried by the legs, we are supported by our thighs, and so they feel the strain. Furthermore, whatever is unnatural causes strain and pain. Now it is natural for the knees to bend forward and the thighs to bend backwards. In going uphill then the knees are bent backwards owing

¹ Cp. below, chapter 29.

² Cp. below, chapter 24; the source in both cases is Theophr., *op. cit.*, §§ 11, 12.

³ Omitting *καὶ* before *ἤ* ἀπὸ τῶν γονάτων with Bonitz.

to one's desire to support oneself, but in going downhill 35
the thighs are bent forwards because the body has a tendency
to fall forwards.

20 Why is it that on journeys the middle of the thigh is the
part which feels the strain most? Is it because in anything
that is prolonged and continuous and fixed¹ the strain falls
most upon the centre, and so it is most likely to break at
that point? Now the thigh is of this nature, and so it is in 883^a
the middle of it that we feel the strain most.

21 Why is it that persons of a moist temperament easily
choke as a result of exertion and through heat? Is it
because their moisture when heated becomes air and the
excess of it burns more fiercely? When, therefore, it cannot 5
find its way out owing to its abundance, the process of
cooling does not take place; and so it quickly catches fire
owing to the natural and adventitious heat. It is for this
reason that perspiration induced by taking physical exercise,
and by exerting oneself generally, and the emission of breath
are beneficial; for breath is formed by the separation and 10
rarefaction of moisture.

22 Why is it that bodies of an equable temperament often
feel weariness but throw it off more easily? Is the cause
the same in both cases? For that which is equable is
uniform, and that which is uniform is the more subject to
similar influences; so if any part suffers, the whole straight-
way suffers in sympathy. But that which is not equable,
being more disunited, is not sympathetically affected by its 15
parts. A body of equable temperament therefore often
feels weariness, but throws it off more easily, because the
whole body shares it; for the suffering, being distributed
over a larger area, is weaker and therefore more easily got
rid of. But a body which is not of an equable temperament,
inasmuch as it has no communion with its members, is less
often afflicted with weariness, but has greater difficulty in
shaking it off; for its suffering is acute. 20

¹ Inserting a comma after ἐστημιγμένον δέ.

Why is it more fatiguing to walk on level than on uneven **23**
ground, whereas one can walk more quickly on an even
than on an uneven road? ¹ Is it because it is least fatiguing
if one does not move continually in the same position, and
25 this is the case rather in traversing uneven ground? ² But
one travels more quickly when the foot has to be lifted less
in any equal period of time. On level ground the raising
of the foot is a slight but frequent movement, on uneven
ground the reverse; but the slight ³ movement of raising
the foot at each step becomes considerable when repeated
many times.

Why is it that in descending a slope we feel the strain **24**
30 most in the thighs, and in ascending in the legs? ⁴ Is it
because in ascending the strain is due to the raising of the
body? For the whole body becomes a burden; and so
the part upon which it all rests and with which we raise it
(that is, the legs) feels the strain most. For the leg is an
extremity, having length but not having width, as the foot
has; consequently it is shaken. So we may cite in
35 illustration the fact that we move weights with the shoulder
and rest them upon it, and therefore feel the strain most in
the shoulder. But when we are descending, the strain is
caused by the body falling downwards and thrusting us
forward unnaturally, so that we feel the strain most in the
part on which it falls most and which it shakes. Now the
40 leg remains unaffected, and the trunk forms the weight; but
it is the thigh which receives the weight and is shaken,
883^b because it has extension and is forced from above into a bent
position where the trunk presses on it.

Why is it that a journey seems longer when we traverse **25**
it without knowing its length than when we do know it,
all other conditions being equal? ⁵ Is it because to know

¹ A repetition, partly verbal, of the problem of chapter 10.

² The text as it stands gives no sense and we must clearly restore from 881^b 20, 21 ἢ ὅτι ἀκοπώτατον μὲν τὸ μὴ αἰεὶ ἐν (τῷ αὐτῷ σχήματι ποιεῖσθαι τὴν κίνησιν, ὃ συμβαίνει ἐν) τῇ ἀνωμάλῳ κτλ., the omission being due to *homoeoteleuton*.

³ Reading γινόμενον (μικρὸν) πολὺ, cp. 881^b 26.

⁴ Cp. above, chapter 19.

⁵ This problem occurs again in xxx. 4.

its length is to be able to connect a number with it, and 5
 the indeterminate is always more than the determinate?
 Just as, therefore, if one knows that a journey is a certain
 length, it must necessarily be finite, so, if one does not know,
 as though the proposition was convertible,¹ the mind
 draws a false conclusion, and the distance appears infinite.
 Furthermore, a quantity is determinate, and that which is
 determinate is a quantity; therefore when a thing appears 10
 not to be determinate, it appears to be as it were infinite,
 because that which is of a nature to be determined, if it is
 not so, is infinite; so that what appears not to be determined
 necessarily appears in a sense unlimited.

26 Why is it that the thighs feel fatigue more than the legs? ²
 Is it because they are nearer to the part of the body which
 contains the excrement, so that, when that part overflows 15
 with heat owing to the movement, the thighs contract more
 readily and to a greater extent? Or is it because the thighs
 are more closely connected by growth with one another,³
 for they suffer considerably owing to the separation of what
 is really continuous?⁴ For indeed, If one feels fatigue
 when there is no excrement in the body, yet it is the thighs 20
 and loins which suffer more than the other parts. Or is it
 because, just as swellings in the groin are caused, if one
 receives a blow,⁵ owing to the close connexion of the veins
 and sinews, so the thigh is similarly affected? For the
 thigh is nearer than the leg to the source of the veins.⁶ Or
 is it because the thigh remains more in the same position
 than the legs, and this is more fatiguing?⁷ Or is it because

¹ ἀντιστρέφοντος is here used in its logical sense of transposing the terms of a proposition (cp. *Pr. Anal.* 25^a 6 ff.); the proposition 'any journey of which I know the length must be finite' is converted into 'any journey that is finite must be one of which I know the length'.

² The source of this problem is Theophr., *op. cit.*, § 10.

³ Reading συμφυείς for συμφυές.

⁴ Cp. *Top.* 145^b 2 ἡ ἀλγηδὼν διάστασις τῶν συμφύτων μερῶν μετὰ βίας.

⁵ Reading πληγέντος (cp. Bonitz, *Index*, p. 140). The sense is clearer in the original source (Theophr., *l. c.*), ὅτι δὲ ἡ ἀνάρτησις ποιεῖ συμπίθειαν τῶν νεύρων καὶ φλεβῶν καὶ ἐκ τῶν βουβῶνων δῆλον' πληγέντων γὰρ τῶν κάτωθεν ἐνταῦθα βουβῶνες.

⁶ i. e. the heart, cp. *P. A.* 665^b 15, *de iuv. et sen.* 468^b 31.

⁷ Cp. 881^b 20-22.

25 the thigh is fleshy, and therefore the natural heat¹ there is considerable?

Why is it that in some people² sores are formed as the 27 result of exertion?³ Is it because, when the body contains impurities, movement heats it and causes other excretions to exude with the perspiration? These excretions, being 30 thick and containing harmful humours of an acid, bitter, and salty nature, cannot be expelled owing to their thickness, but swell up through the flesh and cause sores owing to the bitterness of the humour which they contain.

Why is it that food is not given immediately after exercise 28 and after medicine has been administered? Is it because 35 the body is still being purged and has not yet rested from its toil, and the excretions have not yet been expelled?

Why is it more difficult to run than to walk?⁴ Is it 29 because the runner has a heavier burden, since, when he is raised in the air, he has his whole weight to support? But a man who is walking continues to put his weight on the 40 part of him which is at rest, like a man leaning against a wall.

884^a Why is it that one does not feel hungry immediately after 30 exercise? Is it because liquefaction still remains until the concoction of anything is complete?⁵ Or is it owing to the breath which the exertion engenders from the moisture? Or is it owing to the thirst which is due to the heat caused 5 by the exertion? All these possible causes are present.

Why is it that those who are fatigued and those who are 31 suffering from phthisis are apt to emit semen during sleep?⁶ Is it because generally speaking those who are warm and moist are inclined to do so, since the semen naturally has these characteristics?⁷ Now such a thing is most likely to

¹ Reading, with Richards, τὸ κατὰ φύσιν <θερμὸν> ἔχειν.

² Reading, with Richards, ἐνιοί.

³ The source of this problem is Theophr. *de Sudore*, § 13; cp. Hippocr. *Epid.* vi. 5. 15.

⁴ Cp. chapter 18.

⁵ Reading ἕως ἄν τι πεφθῆ (Bussemaker).

⁶ Galen, *Epid.* vi. 3 quotes this problem as Aristotelian; cp. also Theophr. *de Lassit.*, § 16.

⁷ Cp. 876^a 9-12.

happen in persons in these conditions, when the heat engendered by sleep is added; for the body requires a slight 10 impulse only, which must be internal and not external. This condition is fulfilled in those who are suffering from phthisis and in those who are fatigued; the latter being full of hot liquid owing to their fatigue and movement, and the former owing to their state of flux and the heat engendered by their inflamed condition. 15

2 Why is it more difficult to apply prolonged friction oneself to the left leg than to the right? Is it because, though our right is the side which is capable of exertion, yet the rubbing of the left leg, since it involves¹ a distorted attitude, is unnatural, and anything which is unnatural is difficult?² The difficulty of rubbing the right side with 20 the left hand is not obvious, because the left hand has no strength whichever side it is applied to.³

3 Why is it healthy to reduce the amount of nourishment and to increase the amount of exercise? Is it because abundance of excretion is the cause of disease? Now this is due either to excess of nourishment or to lack of 25 exercise.

4 Why should the flesh be made rare rather than dense in order to promote health?⁴ For just as a city or locality is healthy which is open to the breezes (and that is why the sea too is healthy), so a body is healthier in which the air can circulate. For either there ought to be no excrement present in the body, or else the body ought to get rid of it 30 as soon as possible and ought to be in such a condition that it can reject the excrement as soon as it receives it and be always in a state of motion and never at rest. For that which remains stationary putrefies (standing water, for example), and that which putrefies and does not move causes disease; but that which is rejected passes away before it becomes corrupt. This then does not occur if the 35

¹ Reading ἐξεστραμμένως (γὰρ) γίνεται with Bussemaker.

² Cp. 882^b 31.

³ The text here seems corrupt, but the sense is clear.

⁴ This problem occurs also in i. 52, and is identical with the second part of xxxvii. 3.

flesh is dense, the ducts being as it were blocked up, but it does happen if the flesh is rare. One ought not, therefore, to walk naked in the sun; for the flesh thereby solidifies and acquires an absolutely fleshy consistency, and the body becomes moister, for the internal moisture remains,¹ but the surface moisture is expelled, a process which also takes
 884^b place in meat when it is roasted rather than boiled.² Nor ought one to walk about with the chest bare; for then the sun draws the moisture out of the best constructed parts of the body, which³ least of all require to be deprived of it. It is rather the inner parts of the body which should be
 5 submitted to this process; for, because they are remote, it is impossible to produce perspiration from them except by violent effort, but it is easy to produce it from the chest because it is near the surface.

Why is it that short walks are fatiguing?⁴ Is it because
 one often comes to a standstill and there is no uniform
 10 movement in the joints, and this is fatiguing?

Why do those who stand still in the sun become warmer
 than those who move, and this although movement is productive of heat? Is it true that every kind of movement does not produce heat, but some kinds have a cooling effect, as happens, for example, when one blows upon or
 15 keeps in motion kitchen-pots which have boiled up? If then the heat remains when one stands still and, doing so, heats us more than if it were in motion (for our own body always gives off a warm steam, which heats the neighbouring air, as though there were a burning brand there), then, if we remain motionless, the air surrounding us becomes warm
 20 for the reasons already stated; whereas, if we move, a wind is set up which cools us, for wind always has a cooling effect.

Why is it that those who ride on horseback water more
 freely at the eyes the quicker the horse goes, and those on
 foot the quicker they run?⁵ Is it due to the fact that the

¹ Reading *διαμένει* for *δη μένει*, cp. 865^b 31.

² Reading *τὰ ὀπρὰ τῶν ἐφθῶν*, cp. 865^b 32, 966^a 28.

³ Reading *ἀ* for *ὀ*, as in 865^b 34.

⁴ Cp. above, chapter 12.

⁵ Cp. above, chapter 13.

air which meets them is cold? For cold causes the eyes to 25
 water; for by contracting and solidifying the flesh it purges
 out the moisture. Or is the reason the contrary of this,
 namely, that the heat causes perspiration, and watering at
 the eyes is a form of perspiration? Therefore both perspira-
 tion and watering at the eyes are due to heat*and are alike
 salty; and it is movement which causes heat. Or is it due 30
 to the impact of the air? For as blasts of wind coming
 from an opposite direction trouble the eyes, so too the
 quicker a man drives or runs the more does the air deal
 a gentle blow, and this causes the eyes to water, because
 the ducts of the eye are rarefied by the blow; for every
 blow has the effect either of cleaving or crushing. 35

38 Why is it that fatigue must be cured in the summer by
 baths, in the winter by anointing?¹ Is it because the latter,
 owing to the cold and the changes which it causes in the
 body, must be got rid of by heat, which will cause warmth,
 and olive-oil contains heat? In summer, on the other hand,
 the body requires moisture; for the season is dry and chills 885^a
 are not engendered, because it is warm. A sparing diet of
 solid food and a liberal indulgence in liquid nourishment
 are characteristic of the summer, the latter being peculiar
 to the summer, while the former is commoner than at^oother
 seasons; for indulgence in drinking is peculiar to the
 summer because of the dryness of the season, but a sparing
 diet is found at all seasons, but is more general in the
 summer; for then owing to the season more heat is 5
 engendered by food.

39 Why is it that those who are running vigorously experi-
 ence the greatest shock, if any one impedes them in their
 course? Is it because a thing is being drawn apart most
 vigorously when it is being dragged or moved violently in
 a contrary direction? If therefore any one impedes one
 who is running and whose limbs are being vigorously 10
 thrust forward, the result is that he wrenches him back at
 the same time as his limbs are still moving forward, and so

¹ A repetition almost word for word of Bk. i. 39.

the more vigorously he is running the more violent is the shock which he receives.

Why is it that walking along roads¹ over uneven ground 40
 15 is less fatiguing than along a flat, straight surface? Is it
 because an upright carriage is natural to everybody, but
 walking over even surfaces is more fatiguing than over
 uneven ground, since walking over even ground causes a
 continuous strain on the same members, whereas walking
 over uneven ground distributes the strain over the whole
 body? Now walking in warm weather tends more to make
 20 the body thin than in cold weather; for it causes more strain
 upon the outer parts, and so causes thinness by engendering
 perspiration. Walking in cold weather makes the flesh
 more solid and causes a great desire for food; for it
 engenders an increase of heat in the inner parts and, since
 25 they become less liable to be affected by the cold, it cleanses
 the inner region by increasing the heat there, while it makes
 the flesh firm, since it cannot prevail over the whole of it.
 In like manner walking uphill is a greater exertion and
 tends more to cause thinness than walking downhill. For
 walking uphill causes most strain to the loins (whereas
 30 walking downhill is most trying to the thighs, for the
 whole weight falls upon them and so usually causes fatigue
 in them); for as they are forcibly carried² upwards in an un-
 natural manner, heat is engendered. Walking uphill there-
 fore induces perspiration and causes thinness by heightening
 the respiration and engenders pain in the loins; for the legs,
 35 being lifted with difficulty, cause the loins to bend and draw
 them up, which naturally causes a very great strain. Walking
 on hard, resisting ground causes fatigue to the muscles and
 tendons of the legs; for it causes tension in the sinews and
 885^b muscles, because the pressure upon them is violent. Walking
 on soft ground is fatiguing to the joints; for it causes
 frequent bending of the joints, because the surface trodden
 gives way.³

¹ Reading τῶν κατὰ τὰς ὁδοῦς (Richards).

² Omitting ἰπὸ τοῦ θερμοῦ, which spoils the sense, and reading φερομένους.

³ Omitting τὸ δ' αὐτὸ ἐστὶ πρόβλημα, cp. 874^a 34 and note.

41 Why do we walk with difficulty up a steep slope? Is it 5
because all progression is made up of raising the feet and
putting them down again? Now raising the foot is un-
natural and putting it down is natural, while putting the
foot forward¹ is a mean between the two. Now in walking
up a steep slope the unnatural motion preponderates.

42 [Why are riders on horseback less likely to fall? Is it 10
because owing to their fear they are more careful?]²

¹ Reading *προθεῖναι* for *προσθεῖναι*; the Latin version renders *pro-*
ponere; so too Bussemaker.

² This problem is omitted by C^a and neither makes any sense nor
is relevant to a discussion of fatigue.

BOOK VI

PROBLEMS CONNECTED WITH THE POSITIONS
ASSUMED IN LYING DOWN AND IN OTHER
POSTURES.

15 WHY is it that sitting down makes some persons fat and 1
others lean? Is it because bodily conditions differ, some
men being hot, others cold? Those therefore who are hot
grow fat (for the body owing to its heat prevails over¹ the
nourishment); but those who are cold, owing to the fact
20 derives it chiefly from movement, cannot concoct their food
while they are at rest. Or is it because the hot are full of
superfluities and require movement to expend them, while
the cold are not so?

Why is it necessary that the parts of the body should be 2
distended, as happens when a man takes athletic exercise?
25 Is it because the ducts must be purged by their own
breath?

Why is it better to lie in a curved position and why do 3
many physicians prescribe this? Is it because the stomach
concocts food more quickly when it is kept warm, and it
keeps warmer in this position? Furthermore it is necessary
to give the vapours a place where they can settle; for then
30 there is less likely to be pain from flatulence. (It is on this
account that swollen veins and abscesses of all kinds help
to restore a healthy condition, because they form hollows
in which they receive the vapours.) When the body then
is extended no hollow is formed (for the internal organs
occupy all the space); but a hollow is formed when the
body is curved.

35 Why is dizziness more likely to occur in those who are 4
standing than in those who are sitting?² Is it because,
when one is still, the moisture all inclines to one part of the
body? This is why raw eggs cannot be spun round and
round but fall over.³ The same thing occurs when the

¹ i. e. concocts (*πέρρει*) or digests.

² Cp. Theophr. *de Vert.* 12.

³ *Ib.* 2.

moisture in the body is put in motion. So one stands up after having been at rest, when one is in this condition;¹ 886^a but one sits down after having been in motion, when the moisture is evenly and uniformly distributed

5 Why is it that sleep comes more readily if one lies on the right side? Is it because the conditions when we are awake and when we are asleep are the contrary of one another? Since, therefore, when we are awake we recline 5 on the left side, the contrary will occur when another principle, namely, the contrary, is at work. Or is it because sleep is the absence of movement? The parts then of the body which are most active must be at rest; and the parts of the body on the right are most active. So, if one is lying on this side, a waking principle is as it were enchained.

6 Why does one feel numbness? And why more in the 10 hands and feet than elsewhere?² Is it because numbness is a process of cooling, being due to deprivation of blood and its transference elsewhere? Now these parts, especially the feet, are least fleshy and most muscular, and so they are naturally disposed to cool quickly.

7 Why do we find it comfortable to recline on the left side, 15 but sleep better on the right side?³ Is it because by turning away we avoid looking towards the light, since in the dark sleep comes on more readily? Or is it because we keep awake when reclining on the left side, and in this position we can easily employ ourselves in any particular function; and so for the contrary purpose⁴ the contrary position⁵ is advantageous; for each position invites to a particular 20 function.⁶

¹ i. e. when the moisture is collected in one place.

² Cp. Theophr., fr. 11 (Wimmer), *de Membrorum Solutione*.

³ Cp. above, chapter 5.

⁴ i. e. for rest.

⁵ Reading from T. G. πρὸς τὸ ἐναντίον (τὸ ἐναντίον) σχῆμα (so too Bussemaker).

⁶ Many MSS. here repeat a shorter and slightly different form of chapter 1: 'Why is it that sitting down makes some persons fat and others lean? Is it because of their bodily condition? For those who are hotter grow fat, for the body prevails over the nourishment owing to its heat, which is not lost (reading ἀφαιρουμένην); but those who are cool, because they require heat introduced from without, cannot concoct their nourishment while they are at rest.'

BOOK VII

PROBLEMS CONNECTED WITH SYMPATHETIC
ACTION

WHY do men generally themselves yawn when they see
 25 others yawn?¹ Is it because, if they are reminded of it
 when they feel a desire to perform any function, they then
 put it into execution, particularly where the desire is easily
 stirred, for example, that of passing urine? Now a yawn
 is a breath and a movement of moisture; it is therefore
 easy of performance, if only one sees some one else yawn-
 ing; for the yawn is always ready to come.

Why is it that, although we do not imitate the action
 30 if we see a man stretching out his hand or foot or doing
 anything else of the kind, yet we ourselves yawn if we
 see some one else doing so?² Or does this not always
 occur, but only when the body happens to feel a desire
 and is in such a condition that its moisture becomes heated?
 For then it is recollection which gives the impulse, as also
 in sexual desire and hunger; for it is that which causes
 35 recollection to exist³ that provides the stimulus towards
 the condition observed in another person.

Why is it that if we stand by a fire we desire to pass
 urine, and if men stand near water (for example, near
 886^b a river) they actually pass urine? Is it because water in
 general reminds us of the water in our own bodies, and
 the neighbourhood of water incites our internal moisture
 to come out? Fire of itself dissolves anything which is
 solidified in the body, just as the sun melts the snow.⁴

¹ Cp. problems 2 and 6.

² Cp. problems 1 and 6.

³ *ἐστὶ καὶ* should perhaps be read for *εἶναι*, 'for that which causes the recollection also provides the stimulus', &c.

⁴ This problem is definitely referred to as Aristotelian by Aulus Gellius (xix. 4): 'Aristotelis libri sunt, qui problemata physica inscribuntur, lepidissimi et elegantiarum omne genus referti. In his quaerit . . . cur accidat, ut eum qui propter ignem diutius stetit, libido urinae lacessat . . . De urina crebra ex igne proximo facta, verba haec posuit: τὸ δὲ πῦρ διαχαλᾷ τὸ πεπηγός, ὥσπερ ὁ ἥλιος τὴν χιόνα.'

- 4 Why is it that those who come into contact with certain diseases become affected by them, but no one ever becomes healthy through contact with health?¹ Is it because 5 disease is a state of movement, while health is a state of rest? If so, disease can set up movement, but health cannot. Or is it because disease comes to us against our will, while health comes by our own wish? Things then which occur against our will are different from those which occur by our wish and deliberate choice.
- 5 Why is it that not only do some unpleasant sounds make us shudder²—for example, when a saw is being 10 sharpened, or pumice-stone cut, or a stone ground³—but the signs of effects produced in others conveyed by the sight cause those very effects in ourselves? For our teeth are set on edge when we see others eating anything bitter, and some people faint when they see any one being strangled. Is it because every sound or noise is a breath,⁴ and this penetrating into us naturally causes disturbance? 15 Now it will cause greater disturbance if it comes either in great quantity or with an unusually violent impact, setting up a new condition or causing some alteration within us. Wherefore breaths⁵ which, though large in bulk, are yet soft, stir the actual seat of sensation, and such have a pleasant effect; but those which are rough, causing a violent impact, shake the seat of sensation and affect a wide area 20 owing to the force of their impact. Now things which are cold also affect a wide area, for coldness is a kind of force; therefore, as has been already said, it causes shuddering. But things which are rough, because they cause a series of frequent impacts, striking on the base of the hair thrust it in the opposite direction;⁶ for when the hair is thrust out, its ends must necessarily assume a contrary position, 25 with the result that it stands upright; for hair always naturally lies flat. The direction taken by the breath

¹ Cp. 951^a 4 ff.

² *φρίττειν* covers the meanings both of trembling or shuddering and of the hair standing on end.

³ Cp. 964^b 35 ff.

⁴ i. e. sound-vibration.

⁵ Cp. 871^a 33, 889^a 28.

⁶ i. e. outwards from the head.

which is conveyed to the body by the hearing is downwards from above. The sounds, therefore, which we have mentioned¹ being harsh, the hair bristles for the reasons stated. The bristling occurs more on the rest of the body than on
 30 the head, because the hair there is weaker and the effect produced is weaker. The sensation produced by hearing being blunter than that produced by sight, the effects produced by it are confined to the surface of the body; the bristling of the hair is an effect of this kind, so it occurs
 35 from many dissimilar causes. The sensation produced by sight being very distinct, its results too are correspondingly more distinct; therefore the effects actually² occurring in others are reproduced in those who observe them, but
 887^a more mildly than in the original.³ But as a result of hearing our hair stands on end for fear, not of the actual sounds, but of the anticipation which they arouse; for it is an anticipation of grievous ill.

Why is yawning caused by the sight of others yawning,⁴ 6
 5 and so also the passing of urine, particularly in beasts of burden? Is it due to recollection? For when recollection occurs the part of the body concerned is stimulated. In men then, because their sensations are finer, when they see something stimulation and recollection occur simultaneously. But in the beasts the sight is not sufficient by itself, but they require another sense to be called into
 10 activity; so the sense of smell must also be employed, this being a more easily stimulated sense in unreasoning animals. So the other animals always pass urine in the same spot as the first one; for the stimulus is most acute when the sense of smell is employed; and the sense of smell is called in play when they are near the spot.

15 Why is it that when we see any one cut or burned or 7
 tortured or undergoing any other painful suffering, we share mentally in his pain? Is it because nature is common

¹ Cp. ll. 10, 11 above.

² Reading with Bonitz *αὐτὰ* for *ταῦτα*, cp. above, l. 12.

³ As in the example given in 886^b 12-14, viz. fainting as the result of seeing a person strangled.

⁴ Cp. chapters 1 and 2.

to us all, and it is this which shares in the sufferer's pain, when we see any of these things happening to him, through kinship with him? Or is it because, just as the nose and hearing according to their particular faculties receive certain emanations, so also the sight does the same as the result of things pleasant and painful?

8 Why is it that those who come into contact with phthisis or ophthalmia or scurvy become affected by them, but there is no contagion from dropsy or fevers or apoplexy and the rest? In ophthalmia is contagion due to the fact that the eye is very easily affected and more than the other senses assimilates itself to that which it sees—for example, it moves when it sees something else moved—and so it very readily becomes disordered when it sees another eye in that condition? In phthisis is the contagion due to the fact that phthisis makes the breath weak and laboured, and those diseases are most quickly contracted which are due to the corruption of the breath, as is seen in plagues? He therefore who comes into contact with the sufferer inhales this corrupted breath, and so himself becomes ill, because the breath is unhealthy; and he catches the disease from one person only, because that person exhales this particular breath, which is different from that which others exhale; and he catches the same disease, because, in inhaling the breath¹ by which he becomes infected, he is inhaling just such breath as he would if he were already suffering from the disease. Scurvy alone is catching among similar diseases,² such as leprosy and the like, because it affects the surface of the body and causes a glutinous discharge (for this is the nature of itching diseases), and so this disease,³ being on the surface of the body and glutinous, can be conveyed by contact. Other similar diseases are not so conveyed, because either they are not on the

¹ Reading *τοῦτο* for *τούτω*, but the corruption of the text has probably gone farther than this and some such reading as *τὴν αὐτὴν δὲ νόσον τοῦτω ὡς ἂν ἀσθενήσῃ, ὅτι ἀναπνέει κτλ.* is perhaps nearer to the original: 'he catches the same disease as the sick man, because he is inhaling', &c.

² Reading *μόνον* with the best MSS.

³ Reading *αὐτῆ* (Richards).

surface, or else, being on the surface, they do not remain there, because they are dry.

887^b Why do purslane and salt stop inflammation of the 9 gums?¹ Is it because purslane contains some moisture? This is seen to be so if one chews it or if it be crushed together² for some time; for the moisture is then drawn out of it. The glutinous matter sinks into the gum and draws out the acidity. For that there is an affinity between 5 the disease and the remedy is shown by the acidity; for the juice of the purslane has a certain acidity. Salt, on the other hand, dissolves and draws out the acidity. Why then do lye and soda not have this effect? Is it because they have an astringent instead of a dissolvent effect?

¹ This problem occurs also in i. 38, where see notes.

² Reading *συνθλασθῆ* for *συντεθῆ*, see note on 863^b 13.

BOOK VIII

PROBLEMS CONNECTED WITH CHILL AND SHIVERING.

- 1 WHY is it that those who are chilled become livid? 10
Is it because the blood is congealed by the cold and, as it congeals, becomes black through the absence of heat? (A white colour, on the other hand, is to be attributed to fire.) For this reason also the flesh of the aged is particularly livid, because it contains very little heat.
- 2 Why is it that those who are chilled cannot sleep? ¹ Is 15
it because any one who is chilled tends to hold his breath, but a sleeper exhales rather than inhales, so that it is difficult for one who is cold to sleep, since it is impossible to do contrary things simultaneously?
- 3 Why is it that those who are ill or in pain or angry become more active under the influence of cold? Is it 20
because a cold condition makes a man stronger?
- 4 Why is it that athletes in good training do not bear the cold well? ² Is it because their condition is clean and airy and free from fat? Such a condition is easily accessible to the air, since it is permeable and does not contain any heat; fat, on the other hand, is hot, unless it is saturated 25
with moisture.
- 5 Why are the extremities most affected by cold? Is it due to their narrow shape? Also the ducts in them, being narrow, hold little blood, and therefore little heat; for the blood is hot.
- 6 Why are the feet more liable to become chilled when they are suspended in mid air? Is it because the wind blows more underneath then? Or is it because the blood 30
is contracted into a narrower space below, and so the rest

¹ Cp. chapter 22.² Cp. chapter 10.

of the foot is more easily chilled, because the heat leaves it?

Why is it that stout persons are especially liable to chill, 7 although fat is warm? Is it because, owing to the greatness of their bulk, their extreme parts are far from the internal heat, while their near parts are far from the external cold?

35 Why do people shiver after sneezing and after passing 8 urine?¹ Is it because in both processes the veins are emptied, and when they are empty the cold air enters, and this causes shivering?

Why is it that ravenous hunger is felt in cold weather 9 and in winter rather than in summer? Is it because 888^a ravenous hunger is brought on through lack of dry nourishment, and in the cold and winter the internal heat contracts into a narrower space and its internal nourishment soon fails, and when this happens ravenous hunger is more likely to occur? The faintness and weakness due to 5 ravenous hunger occur when liquefaction takes place in the body owing to the collection of heat in one place. This liquefied matter flows into the region usually occupied by the nourishment and itself becomes nourishment for the body; if it attacks the seat of respiration, loss of voice and weakness ensue, the loss of voice being due to the obstruction of the passage of the breath, while the weakness is 10 caused by the lack of nourishment in the body and internal liquefaction. Treatment in such cases can be quickly and simply applied, because the cause of the trouble is external; for it is the external² cold making our heat contract which causes the ravenous hunger. So just as one trembles and turns pale from fear, but, when freed³ from the danger, 15 one recovers immediately; so too those who are suffering from ravenous hunger, after taking a little bread, quickly recover,⁴ having undergone a violent and unnatural dis-

¹ This problem is almost identical with xxxiii. 16.

² Reading ἐκτός (W. D. R.) for ἐντός.

³ Reading ἀφεθέντες for ἀφέντες (so also Richards).

⁴ καὶ οἱ βουλιμίωντες . . . ταχεῖα ἢ ἀποκατάστασις γίνεται is an anacoluthon for οἱ β. ταχέως ἀποκαθίστανται.

turbance, but not having been permanently injured thereby ; for the same thing which resists the tendency¹ of nature also restores us to our natural course. Once relax the force which is straining against nature, and the body slips back into its natural state as suddenly as children who are ²⁰ playing at 'tug-of-war' with a rope, if the rope is let go, fall on their backs.

10 Why is it that those who have undergone athletic training do not bear the cold so well as those who have not done so?² Is it because the fat is got rid of by their exercises, and it is the fat which gives warmth, since that which is oily is hot? Or is it because the body is in a ²⁵ more airy and rare condition, because the fat and the excretions have been got rid of, so that there is nothing to keep out the cold? Or is it because through the opening³ of the pores by perspiration a number of doors are as it were removed?⁴ It is clear that the same condition does not conduce both to health and to strength; for obviously a condition of health is one of fatness, while a condition ³⁰ of strength is a state of rarity.

11 Why do we shiver both when hot and when cold water is poured over us? For it is strange that contraries should produce the same result. Is it because, when cold water is poured over us,⁵ the extinguishing of the internal heat causes shivering, whereas, as the effect of warm water, the superficial cold is enclosed⁶ in one place and massed to- ³⁵ gether by its inward rush?⁷ So both effects are due to the same cause, but in one case it operates from within and in the other from without.

12 Why do the hairs bristle upon the skin?⁸ Is it because they naturally stand erect when the skin is contracted, and

¹ Reading $\tau\eta \dots \acute{\alpha}\gamma\omega\gamma\eta$.

² Cp. chapter 4.

³ It is doubtful whether *ἀποστόμωσιν*, a word apparently only occurring here, can mean 'opening', since the verb *ἀποστομοῦν* means 'to stop up'; *ἀναστόμωσιν* should therefore probably be read.

⁴ And so let in the cold.

⁵ Reading *προσχερόμενοις* for *προσχερόμενοι*.

⁶ See note on 867^b 32.

⁷ Cp. *de Somno*, 457^b 14-17.

⁸ This problem is repeated in xxxv. 5; the same subject is treated in chapters 15 and 21 below.

40 this contraction occurs owing to cold and certain other conditions?

888^b Why is it that one shivers at the last emission of urine? 13

Is it because, whilst the warm liquid is still within, the bladder and the passages round it are full, but when it has passed out they fill up¹ again with cold air, for nothing can be empty, but must be full either of something corporeal 5 or of air? Inasmuch then as cold air enters, shivering is a natural result.

Why is it that the tongue of those who are chilled, like 14 that of the drunken, stumbles? Is it because, as it stiffens and hardens with the cold, it becomes difficult to move, and, when this happens, it cannot speak plainly? Or is it 10 because, the outer parts of the body being solidified by the cold, the moisture flows together within and saturates the tongue, and so it cannot perform its function, as has been already described in the case of the drunken?² Or is it because owing to the trembling produced by chill, the movement of the tongue is irregular and it cannot 15 articulate the words which it utters, and consequently it stumbles?

Why do the hairs stand erect on the bodies of those 15 who are chilled?³ Is it because as a result of cooling the heat collects in the inner region of the body, and the flesh, as the heat leaves it, contracts more and more, and, as it is drawn together, the hairs become more upright? 20 [Or is it because . . .]⁴

Why in the winter are we more likely to become chilled 16 through running than through standing still? Is it because the air surrounding the body, when we stand still, no longer causes discomfort when once the body is thoroughly warm, but on the other hand, when we are running, we are continually encountering more and more cold air, and so 25 are more liable to become chilled? Moreover also air is

¹ Reading ἐνέπλησθεν.

² Cp. 875^b 27 ff.

³ Cp. chapters 12 and 21.

⁴ A further reason has been accidentally omitted.

cold when it is in motion, and it is for the most part such air that meets us in running.

- 17 Why is it that it is colder at dawn, although¹ the sun is nearer to us? Is it because the period of the sun's absence is then at its longest, so that the earth has become more cooled? Or is it because towards daybreak the dew falls, as does the hoar-frost, and both of these are cold?³⁰ Or do they too fall because the heat which rises from the earth is overpowered, the reason that it is overpowered being the absence of the sun? So that they do not fall when the sun is farther away, but when it is nearer they fall and become congealed,² because the longer the sun is absent the cooler the ground becomes.³ Or is it because the nocturnal breezes tend to cause cold⁴ towards day-³⁵ break? Or do we only imagine that it is colder because then the food within us is concocted and, the stomach being emptier, we are more liable to feel the cold? This can be illustrated by the fact that we feel very cold after vomiting.
- 18 Why is it that those who are chilled feel pain if they are taken straight to the fire, whereas they do not do so if they are warmed gradually? Is it because one contrary⁴⁰ immediately succeeding another contrary always sets up 889^a a violent change? We may compare the fact that if one bends a tree by degrees, it does not suffer, but if one bends it with greater violence and not gradually, it breaks off. If therefore like is unaffected by like, and the heat of a man who is chilled collects and concentrates within him,⁵ and the moisture and cold are left behind, and a contrary is destructive of its contrary, it follows that, if one is warmed by degrees, the heat comes out gradually and less

¹ Omitting ἢ, or else reading ἢ <νυκτὸς> from 938^a 32, where the same problem is treated more briefly; cp. below, l. 33, which clearly states that the dew and the hoar-frost, which fall at dawn, fall when the sun is near the earth. T. G. renders *cur tempore matutino frigus acrius est, cum tamen sol propius adsit?*

² Putting a comma after πύγνυται instead of a semicolon.

³ i.e. it so happens that the time when the dew and hoar-frost fall is the time when the sun is nearest to the earth, but the cause is not the position of the sun but the fact that the ground is coldest at dawn.

⁴ Reading, with Richards, πνεύματα <αἴτια> τῆς ψύξεως.

pain is caused, but, if the warming is not gradual, the heat is rather drawn out.¹

- 10 Why is it that when we are chilled the same heat causes 19
more burning and pain?² Is it because owing to its
density the flesh holds the heat which comes into contact
with it? This is the reason why lead becomes hotter than
wool. Or is the passage of the heat violent because the
pores are congealed by the cold?
- 15 Why is it that those who are angry do not become 20
cold? Is it because anger and wrath are the opposite
of cowardice? Now anger is the result of fiery heat, for
by retaining a large quantity of fiery heat within us we
become warm. This is particularly noticeable in children.
For grown-up men when angry become distracted,³ but
children first of all take in breath in large quantities and
20 then blush; for the amount of heat in them being very
great and causing liquefaction makes them blush, since,
if one were to pour a quantity of cold water on them, they
would cease⁴ from their wrath, for their heat would be
quenched. The opposite occurs in cowards and those
who are afraid;⁵ for they are chilled and become cold
25 and pale; for the heat leaves the superficial region of
their bodies.

Why is it that when we shiver, the hairs stand erect?⁶ 21
Do they lie down⁷ because they grow in moisture? For
the weight⁸ of the hair prevails over the moisture. Now
shivering is caused by the cold, for the cold naturally
30 congeals the moisture. When therefore the moisture, out

¹ The text of the whole of this passage is unsatisfactory though the general meaning is plain.

² i. e. more than it would if we were not chilled. This problem is repeated in xxxvii. 4.

³ It is improbable that *βλάπτονται* can mean this by itself without the addition of *ταῖς φρέσι* or something similar; it is almost certainly corrupt. Some verb meaning 'suppress their feelings' or 'escape notice' would be expected. T. G. does not render *οἱ μὲν γὰρ ἄνδρες βλάπτονται*.

⁴ Reading *παύσαντ' ἄν* (Richards).

⁵ The Teubner text prints *φοβούμενο* for *φοβούμενοι*.

⁶ Cp. chapters 12 and 15.

⁷ Reading *κατακέκλιται* (W. D. R.) for *κατακεκείσθαι*, cp. below, l. 35.

⁸ Reading, with Bonitz, *βάρος* for *βάθος*, cp. below, l. 34.

of which the hair grows, undergoes a change and congeals, it is natural that the hair should undergo a change also. If therefore it changes into a contrary condition, it either remains permanently in that condition, or else the hair will again prevail over the moisture. It is not, however, likely that the hair can by its weight overpower the moisture when it is congealed and condensed; and if it is impossible for the hair to lie down anywhere because the 35 moisture is congealed, the only thing left for it to do is to stand erect. Or is it because, as a result of cooling, the heat collects in the interior region of the body, and the flesh, as the heat leaves it, contracts more and more, and, as it draws together, the hair grows more upright,¹ just as when one fixes a twig or some other object into 889^b the ground and fills the space round it and collects the soil on every side, it is more likely to remain erect than if one leaves the soil loose round it?

- 22 Why is it that those who are chilled find it particularly difficult to go to sleep?² Is it because one who is chilled holds his breath rather than exhales, and a sleeper exhales 5 rather than inhales? Chill therefore induces a condition which is directly opposed to sleep.

¹ Down to this point the sentence is a repetition of 888^b 17-21.

² Cp. chapter 2

BOOK IX

PROBLEMS CONNECTED WITH BRUISES,
SCARS, AND WEALS¹

10 WHY is it that weals can be prevented by the application I
of newly flayed hides, particularly those of rams, and by
breaking eggs over the part affected? Is it because both
these things prevent the collection of moisture and the
consequent swelling? For the wounded place attracts the
moisture and swells owing to the inflammation.² Now
eggs owing to their glutinous consistency cause adhesion
15 and prevent swelling (their effect resembling that of
cautery³), acting as a kind of glue. The hide owing to its
glutinous condition adheres and at the same time by its
heat sets up concoction and stops the inflammation, for they
do not remove it for several days. Rubbing with salt and
vinegar is also employed with the object of drawing out the
inflammation.

20 Why is it that scars are black on the rest of the body but 2
white on the eye?⁴ Is it because a scar, like everything
else which is diseased, takes on the contrary of its original
colour, and it is in the black part of the eye that wounds
are inflicted? However, scars on the body do not become
25 black immediately, but are white at first; nor are scars in the
eye always white,⁵ but it is only after a while that they
become absolutely or comparatively so.

Why does a fennel-stalk⁶ make the parts round the place 3
which is struck red and the centre of it white? Is it

¹ Some MSS. read *τραύματα*, wounds, for *μώλωπας*.

² Bekker's reading *ἔλκει ἐπαίρεται* makes no sense. T. G. renders *pars enim collisa humorem trahit intumescitque*. We clearly should read *ἔλκει (τὸ ὑγρὸν καὶ) ἐπαίρεται*, the omission being due to *homoeoteleuton*. The sentence then explains *τὴν ἄθροισιν τοῦ ὑγροῦ καὶ τὴν ἔπαρσιν* of the previous sentence.

³ Cp. 862^a 10, 11.

⁴ This subject is also treated in chapter 7.

⁵ Reading *λευκαί* for *μέλαιναι* (Bonitz).

⁶ Fennel-stalks were used as canes by ancient schoolmasters, cp. Xen. *Cyrop.* ii. 3, 20.

because it presses the blood away from the middle, at the point where, being round, it strikes deepest? Or would one not expect the blood for this reason to return there again, the redness being due to the rush of blood and such 30 a rush taking place towards the part which is struck?

4 Why is it that, when a violent blow is struck with a fennel-stalk, the middle of the flesh which is struck turns white and the surrounding parts red, whereas, if an ordinary stick is used, the middle is the reddest part? ¹ Is it because the fennel-stalk owing to its lightness, if it strikes a hard blow, disperses the blood on the surface, and so the part 35 from which the blood has retired has a white appearance, but the parts to which it flows in greater quantities become redder? When the part struck swells up, the dispersed blood does not readily return to its place, because it is scanty and the course which it must follow is upwards; ² for it needs the force imparted by mass to make it follow an 890^a unnatural course. But blows dealt with hard objects owing to their weight and strength cause compression and crushing. The compression, therefore, produces a hollow, while the crushing causes rarity; for crushing is a mild form of cutting and cleaving. The middle of the part struck becoming 5 hollow and rare, the blood flows into it from the surrounding surface; for it naturally flows downwards and into the rare parts, because they give way before it. The blood collecting there naturally makes this part red, whilst the surrounding regions, from which the blood retires, turn white.

5 Why do those who are splenetic have black scars? Is it 10 because their blood is corrupted by the admixture of vitiated and watery blood from the spleen? Now the scar occupies only a small depth of the skin on the surface, but the blood, which is black because it is watery and hot, shows through the skin and gives the scar also a black appearance. Moreover, very often the scar meanwhile becomes blacker 15 and blacker; this is due to the same cause, for owing to

¹ A fuller and more satisfactory treatment of the problem of the previous chapter.

² i. e. the blood must flow uphill in order to reach the centre of the swelling.

the weakness of the skin the blood cools, and as the heat evaporates, turns blacker. Similarly in the aged the flesh becomes blacker,¹ and their congenital scars are blacker
 20 than those of the young; for their whole body assumes as it were the condition of a bruise owing not to the thinness of their skin but to the fact that their heat fails.

Do things which cause the same effect possess the same 6 power for the production of that effect, or not? For
 25 example, seeing that copper and radishes and mashed beans and 'sea-lungs'² and clay and various other things take away bruises, do they do so in virtue of the same power? Or does copper produce this effect because of its rust, which has a medicinal value,³ and beans and 'sea-lungs' and clay because they have an attractive force owing to their rarity,
 30 and other things for various other reasons? Or is the ultimate effect the same in all these cases (for many of them possess contrary qualities, for example heat and cold⁴), while the earlier effects may nevertheless be different?

Why do all other scars turn black, while those in the eye 7 are white?⁵ Is it because they cause a change in respect
 35 of colour in the parts in which they occur, and so scars which occur in the eye, which is black, must necessarily be white?

Why is the blow of a fennel-stalk more painful than that 8 of some much harder instruments, if in dealing the blow one considers their comparative effects? For it would be much more natural to suppose that the stroke of a harder instrument would be more painful, for it deals a heavier
 890^b blow. Is it because the flesh is pained not only by receiving a blow but also by dealing one? When it is struck by

¹ Cp. 967^b 13 ff.

² Apparently the marine animal of *de Part. Anim.* 681^a 18 and *Hist. Anim.* 548^a 11.

³ For the supposed medicinal value of copper cp. 863^a 28 and note.

⁴ This is explained by 890^b 7-10, where particular examples are given in illustration of the same problem. There the instances of contraries are *χαλκός*, which is cold, and *θαψία*, which is hot. Of the examples given in this chapter *ῥαφανίς* corresponds most nearly to *θαψία*.

⁵ Cp. above, chapter 2.

hard substances, it only receives a blow (for it yields to them because they are hard); but when it is struck by a fennel-stalk, two effects are produced—it receives a blow and it also deals one, because it does not yield owing to the 5 lightness of the weight imposed upon it; and so the blow is of a double nature.

- 9 Why are thapsia¹ and metal ladles used to stop bruises, (the former being applied immediately, the latter at a later stage), containing as they do opposite qualities?² For a ladle is cold, as the poet says,

Between his teeth the chilly bronze he bit;³

whilst thapsia is hot and burning. Does the ladle have the 10 same effect that water has upon the fainting? For its coldness encounters the heat and prevents it from escaping out of the blood, which collects on the surface owing to the blow and congeals when the heat passes out. For just as would happen if it congealed outside, so the blood congeals near the outer surface while it is still under the skin; but⁴ 15 if the heat is prevented from escaping by the coldness of the bronze, the blood does not congeal, but disperses again and returns to the area from which it was collected. Thapsia being hot has the same effect; for by its heat it prevents congelation.

- 10 Why are bruises dispersed by the application of copper 20 objects such as ladles and the like?⁵ Is it because copper is cold? It therefore prevents the escape of the heat from the blood which collects as the result of the blow, and it is the loss of heat from the surface which causes the bruise. The ladle must therefore be applied quickly⁶ before congelation takes place. Thapsia, too, mixed with honey is 25 a good remedy for the same reason; for being hot it prevents the blood from becoming cold.

¹ Cp. 864^a 5 and note.

² Cp. above, chapter 6.

³ Homer, *Iliad*, v. 75.

⁴ Reading δὲ ἐξίέναι (W. D. R.) for διεξίέναι and putting a colon before κωλυθέντος, and deleting the comma after θερμῶν.

⁵ Cp. above, chapter 9.

⁶ This hardly agrees with 890^b 8.

Why is it that if a wound occurs several times in the **11** same place, the scar turns black? Is it because, whenever a wound is dealt, the part affected is always weak and
 30 becomes weaker the more often it is wounded? Now that which is weak is chilled and full of moisture; therefore it has a black appearance. Again¹ large and inveterate wounds form black scars, and to receive frequent wounds is equivalent to having one wound for a long time.

Why do we apply metal ladles to bruises?² Is it because, **12**
 35 when we are struck, the part affected is cooled and the heat leaves it? So the application of the ladle, the material of which, being copper, is cold, prevents the heat from escaping.

Why is it that hairs do not grow on scars? Is it because **13** the pores, from which the hairs grow, become blocked up and displaced?

891^a Why do blows cause swelling and discoloration? Is it **14** because the moisture in the part affected is dispersed and, after breaking its way into the adjoining regions, recoils again and collects owing to the conglutination of the moisture? Also if any small veins are burst, a collection of
 5 bloodshot matter is formed.

¹ Putting a full stop after *φαίεται* and reading *εἶτα* <τὰ> for *εἰ τὰ* (C^a according to Bekker reads *εἶτα*).

² Cp. above, chapters 9 and 10.

BOOK X

A SUMMARY OF PHYSICAL PROBLEMS

- 1 WHY is it that some animals cough, while others do not, for example a man coughs, but an ox does not? Is it because in most animals the excretion is directed to some 10 other part, but in man to this part? Or is it because in man the matter in the brain is very copious and liquid, and coughing occurs when phlegm flows down?
- 2 Why is it that in man alone of the animals blood flows from the nostrils? Is it because the matter in his brain is very copious and liquid, whence the veins, becoming full of excretion, send forth a stream through the ducts? For 15 unhealthy blood (that is, blood which is mixed with excretions from the brain) is thinner than pure blood and resembles lymph.¹
- 3 Why is it that some animals are fat under the flesh, others in the flesh, and others in both these places? Is it 20 because in those whose flesh is dense the moisture collects between the skin and the flesh, because the skin there is naturally loose,² and this moisture being concocted turns into fat? Those, on the other hand, who have rare flesh and a tightly fitting³ skin, become fat in the flesh; while those who have both these characteristics are fat both in and 25 under the flesh.
- 4 Why are boys and women less liable to white leprosy than men, and middled-aged women more than young? Is it because white leprosy is due to the escape of breath, and the bodies of boys are dense and do not allow the passage of breath, and those of women do so less than those of men, 30 for the breath is diverted into the *catamenia*? The density

¹ Cp. *P. A.* 651^a 17.

² Reading *διὰ τὸ ταύτη εἶναι τὸ δέριμα ἀφροστὸς φύσει* (Bekker).

³ Reading with Bussemaker *προσεστός* for *προεστός*.

of their flesh is shown by its smoothness. But the bodies of middle-aged and old women allow the passage of breath; for they alone, like old buildings, have a loose structure of their component parts.

35 Why is it that man alone has white leprosy?¹ Is it 5
because he is the thinnest-skinned and at the same time the fullest of breath² amongst the animals? An indication of this is the fact that leprosy appears most abundantly and soonest on the parts of the body where the skin is thinnest. Or, while this is true, is there a further reason, namely, that
891^b in man alone of the animals the hair turns grey? For in leprosy the hair becomes grey,³ and so it is impossible for leprosy to occur in those in whom the hair does not turn grey.

Why is it that goats and sheep yield the most milk, 6
5 although their bodies are not the largest, whereas women and cows produce proportionately less? Is it because in the latter two cases the available material is used up to form bulk, whilst in the other animals it goes into excretions, and in sheep and goats the residue of the excretion all becomes milk? Or is it because sheep and goats are more prolific than the large animals, and so draw off more
10 excretion, because they have more offspring to nourish? Or is it because owing to the weakness of their bodies more excretion is formed during the period of gestation, and the milk comes from the excretion?

Why is it that in some animals (goats, for example) 7
a change of water causes a change in their colour, which assimilates to that of other animals in the new locality,
15 whereas with other animals (man, for example) this is not so? Or, to put the question generally, why do some animals change and others not (the crow, for example)? Do those animals not change in whom the element of moisture does not predominate, birds, for example, which consequently have no bladder?⁴ Why is it that while such creatures do

¹ Cp. below, chapter 33.

² Reading *πνευματωδέστατον* (Richards).

³ Cp. *G. A.* 784^a 26.

⁴ Cp. *P. A.* 671^a 15 and W. Ogle's note.

not themselves change, yet their offspring do so? Is it ²⁰ because the offspring is weaker than its parents?

8 Why are males usually larger than females? Is it because they are hotter,¹ and heat is productive of growth? Or is it because the male is complete in all its parts, whereas the female is defective? Or is it because the male takes a long time to attain perfection, the female a short time?

9 Why is it that some animals bear their young quickly, ²⁵ but in others the period of gestation is a long one? Is it because the longer-lived animals come to perfection more slowly? It is the longer-lived animals that take a long time to bear their young. This is not, however, true of the longest lived of all animals; for example, the horse is slower in bearing its young but shorter-lived than man. The reason of this is the hardness of the uterus; for the ³⁰ uterus of a mare may be compared to a dry soil which does not readily bring the crops to maturity.

10 Why is it that the young of all other animals resemble their parents in nature more closely than do those of man? Is it because man's mental condition is more varied at the moment of sexual intercourse, and so the offspring varies according to the condition of the male ² and female parents? ³⁵ The other animals, or most of them, are wholly absorbed in the sexual act; ³ further, owing to this avidity, impregnation does not usually take place.

11 Why is it that fair men and white horses usually have ^{892^a} grey eyes? Is it because there are three colours in eyes, black, greenish,⁴ and grey, and the colour of the eyes follows that of the body, resulting in this case in greyness? ⁵

12 For what reason are there dwarfs? Or to put the question more generally, why are some creatures quite large, others small? Let us examine the latter question. The causes of smallness are two, either space or nourishment—space, if it

¹ A much-disputed point, cp. *P. A.* 648^a 30 ff.

² The Teubner text prints ὄρε for ὄρε.

³ Reading πρὸς αὐτῷ τοῦτο (Richards).

⁴ Lit. 'as in goats' eyes'; for the meaning of αἰγώπος see D'A. W. Thompson's note on *H. A.* 492^a 3.

be narrow, and nourishment, if it be scanty; as happens
 10 when attempts are made to make animals small after their
 birth, for example by keeping puppies in quail-cages.
 Those who suffer from lack of space become pygmies; for
 they have width and depth corresponding to the dimensions
 of their parents, but they are quite small in stature. The
 reason of this is that owing to the narrowness of the space
 15 in which they are confined the straight lines become crushed
 and bent. So pygmies are like figures painted on shops
 which are short in stature but are seen to be of ordinary
 width and depth. Those who fail to come to perfection
 from lack of nourishment clearly have the limbs of children,
 20 and one sometimes sees persons who are very small and yet
 perfectly proportioned, like Melitæan terriers.¹ The reason
 is that the process of growth has a different effect from that
 of space.

Why is it that some animals come into being from the 13
 sexual intercourse of animals with one another, others
 from the compounding of certain elements—a process
 resembling the original production of their species?² Just
 25 as the writers on natural phenomena explain the first
 origin of animals as being due to powerful changes
 and movements in the world and universe;³ so now, if
 it is to happen again, some similar movements must
 take place.⁴ For the beginning of anything is the most
 30 important part, being indeed half of the whole;⁵ and in
 this case the seed is the beginning. The reason then why⁶

¹ Also mentioned in *H. A.* 612^b 10, where D'A. W. Thompson renders 'Maltese dogs'; but according to Pliny (*N. H.* iii. 26. 30) they came originally from an island off Dalmatia (now called Meleda). They were a common form of lap-dog; cp. Theophr. *Char.* 21, *Anth. Pal.* vii. 211. They frequently appear on vases, e.g. one figured in *Ann. dell' Inst.* 1852, which has the inscription *Μελιταίαιε*, and shows a long-haired dog with a bushy tail and a sharp nose, rather of the type of a 'Spitz' or 'Pomeranian': such dogs also figure on coins and gems, see Imhoof-Blumer and Keller, *Tier- und Pflanzenbilder des klass. Altertums*, Plates I. 45; II. 29; XV. 33, 34.

² Cp. below, chapter 65.

³ Omitting the comma after *γενέσθαι* and reading *παντός <τὰς> μεγά-*
λας, οὕτω καὶ νῦν.

⁴ Putting a full stop after *κινήσεις*.

⁵ Hesiod, *Works and Days*, 40.

⁶ Reading *αἴτιον <τοῦ> τοιαῦτα* (Richards).

small animals which are not produced by sexual intercourse resemble the species as it originally came into being, is the smallness of the seed; for the smaller a thing is, the smaller is its first beginning. So the changes even of this are sufficient to produce a seed for it.¹ And this is what actually happens; for it is under conditions of ³⁵ change² that such creatures usually come into being. In the larger animals a greater change is necessary for their production.

14 Why is it that some animals are prolific, such as the pig, the dog, and the hare, whilst others are not so, for ^{892^b} instance man and the lion?³ Is it because the former class has a number of wombs which they desire to fill and moulds into which⁴ the semen is distributed, while with the latter the opposite is the case?

15 Why has man a smaller distance between his eyes in proportion to his size than any other animal? Is it because ⁵ man follows the law of nature most closely⁵ and perception is naturally of that which is in front,⁶ since it is necessary to see beforehand that to which the movement is directed? Now the greater the distance between the eyes, the more will the sight incline sideways. So if the sight is to accord with the law of nature, the distance between the eyes ¹⁰ ought to be as small as possible, for then it will travel most directly forward. Further, the other animals must necessarily turn their gaze sideways, since they do not possess hands; their eyes therefore are farther apart, especially those of sheep, because they generally advance bending their heads downwards.

16 Why is it that the other animals seldom or never emit ¹⁵ semen during sleep? Is it because no animal except man sleeps on its back and no emission of semen takes place except in that position?⁷ Or is it because the other

¹ The text here appears to be corrupt and gives no very satisfactory sense.

² i. e. by decay, cp. *G. A.* 715^a 25.

³ Cp. *G. A.* 771^a 14 ff.

⁴ Reading *εἰς ἄς* (W. D. R.) ⁵ Cp. *de Incess. Anim.* 706^b 10.

⁶ Reading *τοῦ ἐμπροσθεν* (so also Richards).

⁷ Cp. Theophr. *de Lassit.*, § 16.

animals dream less than man, and the emission of semen only takes place when the imagination is stirred?

Why is it that some animals move their heads and others 17
20 not? Is it because some have no necks¹ and so cannot move their heads?

Why does man sneeze more than the other animals?² 18
Is it because in him the ducts are wide through which the breath and scent pass in? For it is with these, when they fill with breath, that he sneezes. That these ducts
25 are wide is shown by the fact that man has a weaker sense of smell than any other animal; and the narrower the ducts, the keener is the sense of smell. Since, therefore, the moisture, the evaporation of which causes sneezing, enters in larger quantities and more often into wide ducts, and man more than any other animal has such ducts, he might naturally be expected to sneeze³ most often. Or
30 is it because his nostrils are particularly short and so the heated moisture can quickly turn into breath, whereas in the other animals, owing to the length of their nostrils, it cools before it can evaporate?

Why is it that in no animal is the tongue of a fatty 19
consistency? Is it because that which is fat is dense, whereas the tongue is naturally rare in order that it may
35 recognize different flavours?

Why is it that females pass urine with an effort, but 20
males without an effort? Is it because in the female the bladder is farther away both in depth of position and in distance, since the womb is situated between the fundament
893^a and the bladder? It therefore requires a greater effort to drive the urine owing to the distance of the womb; and the requisite force is exercised by an effort of the breath.

Why is it that all such animals as do not fly shed their 21
winter coats, except the pig? The dog, for example,
5 does so, and the ox. Is it because the pig is very hot and

¹ e. g. fishes and serpents, cp. *P. A.* 664^a 20, 686^a 1, 691^b 30.

² This problem is more fully treated in chapter 54; it is repeated in xxxiii. 10.

³ Reading *παρνύοντο* for *πάρνυοντο*.

its hairs grow out of a hot substance (for that which is fat is hot)? In the other animals the hair is shed because either the moisture cools or else the natural heat cannot concoct the¹ nourishment. But the pig² does not shed its hair, either because the moisture in it undergoes no¹⁰ change or because its nourishment is properly concocted; for whenever any cause is present to make it shed its hair, the fat is sufficient to prevent it. Sheep and men are unaffected owing to the quantity and density of their hair; for the cold cannot penetrate deep enough to congeal the¹⁵ moisture or to prevent the heat from concocting it.

22 Why is it that in sheep the hair grows again softer when it is plucked out, but in man it is harder? Is it because the hair of sheep grows out of the surface, and so can be plucked out without causing pain, the source²⁰ of its nourishment, which is in the flesh, remaining unimpaired? So the pores³ being opened, the excretions evaporate more readily, and the wool receives the natural nourishment of the flesh, the latter being fed by soft, sweet nourishment. The hair of man, on the other hand, since it grows from a great depth, can only be plucked out by²⁵ force and painfully. This is shown by the fact that it draws blood with it. The place therefore from which it is plucked is wounded and scarred. So at last the hair ceases to grow on those who pluck it out, and as long as it does grow again, it grows hard, because all the nourishing food in the flesh fails, and it is from the excre-³⁰tions of this food that the hair grows. This can be illustrated by the fact that in all those who inhabit a southerly clime the hair is hard, because the exterior heat penetrates deeply and vaporizes the well-concocted nourishment; but the hair of those who dwell in northern climes is soft, because in them the blood and sweet humours are nearer the surface, for which reason also they have a³⁵ healthy complexion.

¹ Reading *πέττειν* <τῆν> τροφήν (Bussemaker).

² Reading <ἡ δὲ ἔσ> ἢ διὰ . . . <ἡ> διὰ κτλ. These changes are demanded by the sense and supported by the Latin version of T. G.

³ *ἀνοιχθέντων* seems to require a substantive such as *τῶν πόρων* in agreement with it. The Latin version renders *meatibus patefactis*.

Why is it that in sheep the longer the hair grows the **23**
 harder it is, whereas in man it is softer? Is it because
 the hair of sheep, obtaining the nourishment described
 above,¹ receives less food because it is far removed from
 40 the source of it, and the nourishment already present in
893^b it easily evaporates out of it owing to the heat as a result
 of incomplete concoction?² And as the hair dries it
 becomes harder;³ for it is the moisture which makes it
 soft. Human hair, on the other hand, receives less nourish-
 ment but is situated nearer to the source of it;⁴ and the
 nourishment is more thoroughly concocted because it is
 less abundant, and, being concocted, it makes the hair
 5 softer, because anything that is concocted is softer than
 that which is unconcocted; for human hair is derived
 more⁵ from excretion than that of sheep. That concocted
 matter is softer than unconcocted⁶ is shown by the fact
 that the wool of young sheep is softer than that of old.

10 Why is it that thick-haired men and birds with thick **24**
 feathers are lustful?⁷ Is it because they are naturally hot
 and moist? Now both these characteristics are necessary
 for sexual intercourse; for the heat causes excretion, and
 the moisture is the form which the excretion takes. Lame
 men are lustful for the same reason as birds;⁸ for, owing
 to the deficiencies of their legs, the nourishment is carried
 15 downwards in small quantities only, but travels into the

¹ i. e. in ll. 22-4 above.

² Reading ἀπεψίαν with Bussemaker.

³ Reading σκληρότεροι (T. G. has *duriores*).

⁴ The sentence αἱ δὲ τῶν ἀνθρώπων ἐλάττω μὲν, μᾶλλον δὲ τῆς ἀρχῆς is obviously incomplete as it stands and the required sense must be supplied from the Latin version of T. G. and the implied contrast with the hair of sheep given in ^a 38 ff., and something like αἱ δὲ τῶν ἀνθρώπων ἐλάττω μὲν (ἔχουσι τὴν τροφήν), μᾶλλον δὲ τῆς ἀρχῆς (ἐγγίζονται) must be restored.

⁵ Reading πλείον for πλείστου.

⁶ This σημείον cannot refer to the sentence immediately preceding it, with which it has no connexion; it must therefore refer to πάντα γὰρ τὰ πεπεμμένα κτλ; the Latin version of T. G. inverts the order of the last two sentences.

⁷ This problem is partly identical with iv. 31; cp. also *Physiogn.* 806^b 18.

⁸ Reading διὰ τὸ αὐτὸ δὲ καὶ οἱ (ἄρρυθες λάγνοι καὶ οἱ) χολοὶ ἄνδρες; cp. 880^b 4.

upper region of the body in large quantities, and is there converted into semen.

- 25 Why has man no mane? Is it because he has a beard, and so the nourishment consisting of the necessary excretion, which in animals goes into the mane, in man goes into the beard?
- 26 Why is it that all animals have an even number of 20 feet?¹ Is it because it is impossible to move (except by jumping), unless some part is at rest? Since, then, progression involves two things,² namely, movement and rest, we immediately get here a pair³ and an even number. Quadrupeds have two more legs;⁴ for they move two, while the other two are at rest.⁵ Six-footed animals have 25 an additional pair,⁶ of which one moves while the other is at rest.
- 27 Why is it that in horses and asses hair grows out of scars, but not in man?⁷ Is it because in the other animals the skin is part of the flesh, but in man it is only as it were a condition of the flesh? For in man the surface 30 of the flesh seems to become harder through cooling and resembles what we call the crust of boiled meal;⁸ just, then, as this crust is really only boiled meal, so what is called man's skin would really be only flesh. Now when a man receives a wound or is chafed, the result is that his flesh becomes denser; and so, the surface of the flesh 35 having undergone a change, the wounded parts do not assume the same nature as the original skin; and, as the flesh has undergone a change, it is not to be wondered at that what grew from it no longer does so—a phenomenon also occurring in what is called baldness, which

¹ Cp. below, chapter 30; also *H. A.* 489^b 22, and *de Incessu Anim.* 708^a 21 ff., which is clearly the source of this problem.

² Reading *ἐκ δυοῖν τινοῖν ἀνάγκη τὴν πορείαν εἶναι*.

³ δὲ must be omitted as a dittograph of δύο.

⁴ Reading *καὶ τετράποδα δύο ἔτι* (for *διότι*) *πλείους*, cp. l. 25.

⁵ Placing a full-stop after *ἐστήκασι*.

⁶ οἱ ἔξ is clearly corrupt, since οἱ can only agree with πόδες understood, which gives no sense. οἱ is perhaps a corruption due to the influence of οἱ δὲ δύο. What the sense requires is *καὶ ἐξάποδα καὶ ἄλλους δύο ἔτι*, and this has been translated above.

⁷ Cp. below, chapter 29.

⁸ Cp. *G. A.* 743^b 7.

is also due to a corruption and change in the surface of
 40 the flesh. When, however, beasts of burden have been
 894^a chafed and recover again, the parts of the body affected
 fill out again with the same substance, but it is weaker
 than it was before; and since their skin too is a part
 of them, the hair (which grows out of the skin) must
 come forth and grow, but it is white, because the skin
 5 which was formed is weaker than the original skin, and
 white hair is the weakest kind of hair.

Why is it that among the other animals twins though 28
 differing in sex are just as likely to survive, but this is
 not so with the young of man?¹ Is it because human
 twins are particularly weak, for man naturally produces
 10 only one offspring at a time? Now in twins it is unnatural
 to find a diversity of sex; and so what is most contrary
 to nature is also weakest.

Why is it that in horses and asses hair grows out of 29
 scars, but not in man?² Is it because the scar impedes
 the growth of the hair, either owing to the condensation
 of the flesh or because its nutrition is impaired? In man,
 15 therefore, it absolutely prevents the growth owing to the
 weakness of the hair; but in horses it does not prevent,
 but merely impairs, the growth.

Why have animals an even number of feet?³ Is it 30
 because in anything that moves something must necessarily
 be at rest, and this could not happen if there were an odd
 20 number of feet (for⁴ it was the arrangement of the feet in
 pairs which originally made movement possible)?

Why is it that animals are asleep for a shorter time than 31
 they are awake, and their sleep is not continuous? Is it
 because all the excretion is not concocted at the same
 time, but, when some is concocted, the animal is relieved
 and wakes up? Again, they more often wake up when
 the region in which the excretion is concocted becomes
 25 cold; for it quickly and frequently ceases to do its work,

¹ Cp. *H. A.* 584^b 36 ff.

³ Cp. above, chapter 26.

² Cp. above, chapter 27.

⁴ Reading *εἴπερ* for *ὄπερ* (Richards).

and this cessation causes awakening. Sleep not unnaturally¹ seems to be pleasant, because it gives us rest; but the rest which we take in sleep does not last longer than the time taken by our natural activities, nor do we eat for a longer period than that during which we abstain from food, in spite of the fact that eating is pleasanter than fasting.

32 Why is it that some animals imitate their parents immediately after birth, whilst others, like man, do so late, or hardly at all, or never? Is it because some quickly attain a state of physical perfection,² whilst others are late in doing so, and some are without a perception of what is for their good, whilst others possess such a perception? Those therefore which possess both these qualities, namely, perception of what is for their good and physical perfection,³⁵ imitate their parents, but those who have not both these qualities do not do so; for physical and perceptive powers are both requisite.

33 Why is it that white leprosy does not occur in animals other than man?³ Is it because, while it is a disease which afflicts other animals, only in man does the hair and skin turn partially white? (But, if so, one might raise the question 894^b why diversity of colour in animals occurs at birth and not afterwards.) Or is it because the skin of other animals is hard, whereas man has naturally very thin skin? Now white leprosy is an excretion of breath,⁴ which in the other animals is prevented from escaping by the thickness of their skin. 5

34 Why is it that in white leprosy the hair turns grey, but it does not necessarily follow that leprosy is always present where there is grey hair?⁵ Is it because the hair grows from the skin, and greyness is as it were a corruption of the hair? When therefore the skin is in a morbid condition, the hair that grows from it is necessarily affected; but when 10 the hair is unhealthy the skin is not necessarily so.

¹ Reading *ὡς εἰκός* for *οὐδὲ εἰκός*: the Latin version renders *non immerito*.

² τὸ γνωρίζειν is certainly corrupt and has probably come into the text as a gloss upon αἰσθησιν. τῆν ἐπιτέλεισιν τοῦ σώματος or its equivalent must be restored from l. 35. (Richards suggests τὸ βαδίζειν.)

³ Cp. above, chapter 5.

⁴ Cp. 891^a 28.

⁵ The source of this problem appears to be *G. A.* 784^a 25.

Why is it that some animals are ill-tempered after bearing 35
 young, dogs, for example, and pigs, but others are not
 noticeably so, for instance women and sheep? Is it because
 those animals which are full of excretions¹ are mild-
 tempered, for that which causes them pain passes out at the
 15 time of birth? Those,² on the other hand, who in bearing
 young lose healthy material, are made irritable by the
 reduced condition in which they are; just as hens are bad-
 tempered, not just when they have laid, but when they are
 sitting, from want of food.

Why is it that eunuchs, when they are emasculated, in 35
 20 other respects change into the likeness of the female,—for
 they have the voice, the shapelessness,³ and the looseness of
 joints which characterize women, and so undergo a violent
 change, as do other animals when castrated (in bulls and
 rams, however, we find the horns assuming contrary forms,
 the reason being that their females have contrary kinds of
 25 horns, and so bulls when they are castrated grow larger
 horns and rams smaller horns)—in respect of size, however,
 alone eunuchs change into the likeness of the male, for they
 become larger? Now size is characteristic of the male, for
 the female is smaller than the male. Or is it not after all
 a change into the likeness of the female rather than the
 male? For it is not a change in every dimension, but only
 in height, whereas the male is characterized by width and
 30 depth as well; for this is what his full growth involves.
 Furthermore, as is the female to the male, so within the
 female sex is the maiden to the woman; for the latter has
 reached the full nobility of form, while the former has not
 yet done so. It is into the likeness of *their* nature⁴ then
 that the eunuch changes; for their growth is in height.
 So Homer well says,

Stature chaste Artemis gave them,⁵

¹ Such as women and sheep, cp. *H. A.* 584^a 6.

² Omitting ὥστε or reading τούτοις in its place.

³ X^a clearly preserves the right reading here, ἀμορφίαν. ὀξύτητα has come into the text as a gloss upon φωνὴν θηλυκὴν.

⁴ Reading εἰς τὴν τούτων οὖν (φύσιν) μεταβάλλει (Richards).

⁵ Homer, *Od.* xx. 71.

as being able to give what, being a maiden, she herself 35 possessed. When, therefore, a eunuch changes in size, he does not change into the likeness of the male; for the change is not in the direction of physical perfection, but eunuchs increase in size only in respect of height.

- 37 Why is it that eunuchs either never suffer from varicocele, or do so less than others? Is it because, by their being 895^a castrated, their nature changes into that of persons lacking generative power? Now boys and women lack this power, and neither has varicose veins except women very occasionally.
- 38 Why is man better able to utter many voices, while other 5 animals of one and the same species utter only one voice? Has man too¹ really only one voice, but many forms of speech?²
- 39 And why has man different forms of speech in different 10 places,³ while the other animals have not? Is it because men in their speech make use of a number of letters, but the other animals employ either none or only two or three consonants? (Now it is consonants combined with vowels that form 10 speech.) Now speaking is signifying something not merely by the voice but by certain conditions of the voice, and not merely to signify pain or pleasure; and it is the letters which regulate these conditions. But children express what they want to say just in the same way as wild beasts; for young children cannot yet make use of the letters in speech.
- 40 Why is it that of all animals man alone is apt to hesitate 15 in his speech?⁴ Is it because he is also liable to be dumb, and hesitancy of speech is a form of dumbness, or at any rate the organ of speech is not perfect? Or is it because man partakes more of rational speech, while the other animals only possess voice, and hesitancy of speech, as its

¹ Reading <ῆ> καὶ κτλ. (So also Richards.) T.G. has *an hominum etiam vox una est?*

² On δὶάλεκτος and φωνή see 898^b 30, and cp. *H. A.* 536^b 1.

³ Reading αὐτῆ <ἄλλῃ> ἄλλῃ (W. D. R.).

⁴ Cp. below, Book xi. 55.

name implies,¹ is simply² being unable to explain one's meaning continuously?

20 Why is it that man more than the other animals is apt to 41
be lame from birth? Is it because the legs of animals are strong (for quadrupeds and birds have bony and sinewy legs), but human legs are fleshy, and so owing to their softness they more easily become damaged through movement?³ Or is it because in man alone of animals the period
25 of gestation varies? For he may be born after the seventh or the eighth or the tenth month.⁴ For the other animals there is one fixed time for coming to perfection without any further delay;⁵ but in man the period of delay⁶ is long, and so, when the foetus moves, its extremities being soft
30 are more⁷ liable to become broken in the longer period.

Why have eunuchs sore and ulcerated legs? Is it because 42
this is also characteristic of women, and eunuchs are effeminate? Or, while this is true, is the cause in women as well this, that the heat has a downward tendency? (Menstruation shows that this is so.) So neither eunuchs
35 nor women grow thick hair, owing to the presence of copious moisture in them.

Why is it that no animal except man suffers from gall- 43
stones?⁸ Is it because in beasts of burden and cloven-hoofed animals the ducts of the bladder are wide? Those animals which produce their young alive not immediately but after
895^b an interval, like certain of the fishes,⁹ never have bladders, but the sediment which might form gall-stones is forced into the bowels (as happens also in birds), and so easily passes out with the excrement. But man has a bladder and a stalk¹⁰ to the bladder, which is narrow in proportion to his

¹ i.e. *ισχνόφωνος* from *ἴσχειν* and *φωνή*, cp. 903^a 38 f. *οἱ ἰσχνόφωνοι ἴσχονται τοῦ φωνεῖν.*

² Reading *κατὰ τὸ ὄνομα οὐδὲν ἢ οὐ* for *οὐ κατὰ τὸ ὄνομα ἐν ἢ οὐδὲ*.

³ i.e. in the uterus before birth.

⁴ Cp. *G. A.* 772^b 7 ff.

⁵ Reading *οὐ διατρίψασι* (Richards).

⁶ *ἐν πλήθει*, if retained, must be used here of time, but some such reading as *ἐν τῇ μήτρᾳ*, 'in the uterus', seems to be demanded by the context. (Richards makes the same suggestion.)

⁷ Reading *πλείον* for *πλείω*.

⁸ Cp. *G. A.* 519^b 20.

⁹ Cp. *P. A.* 670^b 10, 671^a 15, 676^a 30.

¹⁰ Cp. *H. A.* 497^a 20, 24.

size; so, because he has this part, the earthy matter is ⁵ forced into the bladder (and so chamber-pots become discoloured by it) and, owing to the heat in that region, it becomes concocted and thickens still more and remains there and increases owing to the narrowness of the urethra; for the earthy sediment, being unable to make its way out ¹⁰ easily, coheres together and forms a gall-stone.

44 Why is it that beasts of burden and cattle and horned animals and birds do not eruct? ¹ Is it owing to the dryness of their stomachs? For the moisture is quickly used up and percolates through; whereas eructation results when the moisture remains and evaporates. In animals with long ¹⁵ manes and tails, ² owing to the length of their necks, the breath tends to travel downwards, and therefore they generally break wind backwards. Birds and horned animals neither eruct nor break wind; and ruminating animals do not eruct, because they have several stomachs and the so-called 'reticulum'; ³ and so the breath finds a passage up and down through many channels, and the ²⁰ moisture is taken up before it can become vaporized and cause either eructation or breaking of wind.

45 Why is it that tame animals are invariably found also in a wild state, but wild animals are not always found also in a tame condition? ⁴ For even men certainly exist in a wild state in some places, ⁵ and wild dogs are found in ²⁵ India and horses elsewhere; but lions and leopards and vipers and many other animals are never found in a tame state. Is it because the inferior condition is more easily acquired at first and it is easier to degenerate into it, since it is not the original but the ultimate nature which is difficult to attain to at once? ⁶ For this reason all tame animals are

¹ This problem is quoted by Apollonius, *Hist. Mirab.*, as from the *φυσικὰ προβλήματα* of Aristotle.

² This class is enumerated in *H. A.* 491^a 1 ff.

³ Or 'second stomach', see *H. A.* 507^b 4-8. ⁴ Cp. *H. A.* 488^a 30.

⁵ Cp. *P. A.* 643^b 5 (but in *H. A.* 488^a 27 man is said never to be 'wild'). Darwin (*Descent of Man*, pp. 41, 42) insists on the fact that it is erroneous to regard man as more domesticated than the other animals.

⁶ This statement seems to contain a glimmering of the Doctrine of Evolution.

30 at first wild rather than tame (for example the child is greedier and more quick-tempered than the man), but physically weaker. So we find the same state of affairs in the products of nature as in those of the arts. For among the latter there are always badly made objects, and the bad are more numerous than the good, beds for instance and
 35 garments and the like; and, where a good object is produced, it is always possible to find also a bad one, but, where a bad object is produced, it is not also possible always to find a good one. This can be seen from an examination of the works of the primitive painters and sculptors; for in their day there was not yet any good painting or sculpture anywhere, but only inferior work. So likewise nature always
 896^a produces inferior specimens and in a greater number,¹ and superior specimens in a smaller number and in some cases not at all. Now the tame is superior and the wild inferior. It is, I suppose, easier for nature—not the primitive nature but that towards which animals develop—to make the good kinds also tame;² but the opposite kinds never, or scarcely ever, become tame, and it is only under certain conditions of
 5 locality and time that sooner³ or later owing to a general admixture of circumstances all animals can become tame. The same thing happens in plants of all kinds;⁴ those which are garden plants are also found in a wild state, but it is impossible for all to be cultivated, but some are so peculiarly conditioned in many respects in their natural soil
 10 that, though neglected and left wild, they grow better and more like cultivated plants than those which are carefully tilled in other soil.

Why is it that men have large navels, whereas in the 46 other animals they are inconspicuous? Is it because in the latter, owing to the long period of gestation,⁵ they wither

¹ Omitting καὶ πλείους.

² Reading φύσει δὲ οὐ τῆ ἐξ ἀρχῆς ἀλλ' ἐφ' ἧν, οἶμαι, ῥᾶον ποιεῖν (τὰ) σπουδαία καὶ ἡμέρα.

³ Reading ἄρτι for ἀρτίον, and placing the comma after ποτὲ instead of after ἀρτίον.

⁴ With the whole of this passage cp. *de Plantis*, 819^b 29 ff., and Theophr. *H. P.* iii. 2. 2.

⁵ i. e. the period of gestation is longer in proportion to the time from conception to the full maturity of the young.

off and project outwards and swell all up into sores, and so ¹⁵ the navel sometimes even becomes mis-shapen? ¹ Now man comes forth from the womb in an imperfect condition, and so his navel comes away still full of moisture and blood. That some animals are perfect and others imperfect at birth is shown by the fact that some animals can fend for themselves, but children require looking after.

47 Why is it that some animals copulate only once, others ²⁰ frequently, and some only at certain seasons of the year and others at no fixed time? ² For example, man does so at all times but wild animals only occasionally, and the wild boar only does so once but the domesticated pig frequently. Is it the effect of nourishment and warmth and exercise, since 'Cypris depends on fullness'? ³ Again, the same species bears young once in some localities but several times in ²⁵ others; for instance, the sheep in Magnesia and Libya have young twice a year. ⁴ The reason is the prolonged period of gestation; for animals, when their desire is satisfied, feel desire no longer, just as, when they have fed, they no longer desire food. Also animals when pregnant feel less desire for sexual intercourse, because the menstrual purgation does not take place.

48 Why is it that men who have porous teeth are generally ³⁰ short-lived? ⁵ Is it a sign that the skull is thick? For the brain is weak if it is not well ventilated, and so, being moist, it quickly decays, just as all other things decay if they are not in motion and cannot evaporate. For this reason too man has very thick hair upon the head, and the male is longer-lived than the female because of the sutures in his skull. ⁶ ³⁵

¹ The sense is unsatisfactory, since the latter part of the sentence seems to contain arguments which imply a prominence of the navel.

² Cp. Plutarch, *Quaest. Nat.* 21.

³ A quotation from a lost play of Euripides; cp. Nauck², p. 647, no. 895.

⁴ Cp. *H. A.* 573^b 30.

⁵ Cp. xxxiv. 1.

⁶ Which permit more evaporation; cp. *P. A.* 653^b 1 ff. and W. Ogle's note.

But we must next consider length of life in relation to other conditions.¹

Why then are men long-lived who have a cut right across 49
their hands?² Is it because animals whose limbs are badly
articulated are shortest-lived, aquatic animals for example?

896^b And if those which are badly articulated are short-lived,
clearly those that are well articulated must be the opposite.
Now the latter are those in which even those parts are best
articulated which are by nature badly articulated; and the
inside of the hand is the least well articulated part of the body.

5 Why is it that man alone squints, or at any rate does so 50
more than any other animal?³ Is it because he alone, or
more than other animals, is liable to epilepsy⁴ in infancy,
when distortion of the vision also always begins?

Why is man more affected by smoke than other animals? 51
Is it because he is most prone to shed tears, and shedding
tears is one of the effects of smoke?

10 Why does horse take pleasure in and desire horse, and 52
man take pleasure in man, and generally why do animals
delight in animals which are akin to and like them? For
every⁵ animal is not equally beautiful, and desire is of the
beautiful. The beautiful then ought to be pleasanter; but
in actual fact it is truer that not every kind of beauty is
pleasant,⁶ nor are pleasure and the beautiful equally⁷
15 pleasing to all men; for example, one creature takes greater
pleasure in eating or drinking and another in sexual inter-
course. The question why each creature prefers and takes

¹ The Latin version of T. G. is no doubt right in rendering here, *an in ceteris quoque idem est cogitandum*; the reference being to the following problem, which is coupled to the present chapter by the connecting particle δέ, and probably also chapter 64.

² i. e. the so-called 'line of life', cp. also xxxiv. 10.

³ Cp. xxxi. 26, 27.

⁴ ἐπιληπτον should probably be read here for ληπτόν, cp. 96^a 10 and note.

⁵ Reading ὅτιοῦν (Platt) for ὅτι πᾶν.

⁶ Omitting τὸ καλὸν καὶ τὸ ἡδύ, which in its original form, τὸ καλὸν καὶ ἡδύ, was doubtless a marginal variant of κάλλος ἡδύ.

⁷ Reading πᾶσιν (ὁμοίως) ἢ ἡδονῇ to complete the sense.

greatest pleasure in sexual intercourse with a creature that is akin to it is dealt with elsewhere ;¹ but to add that what is akin is also most beautiful is not true.² But we regard as beautiful that which is pleasing with a view to sexual intercourse, because, when we feel desire, we delight in ²⁰ looking upon the object of our desire. And indeed the same thing happens in other forms of desire ; for example, when we are thirsty we take greater pleasure in the sight of something to drink. So that which is beautiful in view of a certain use of it seems to be most pleasant because we particularly desire it. (But this is not true of that which is beautiful in itself, as is proved by the fact that even grown men appear to us beautiful, when we look at them without ²⁵ any idea of sexual intercourse. Do they then appear beautiful in such a way as to give our eyes more pleasure than those who are of an age for sexual intercourse? There is no reason why they should not, provided we do not happen to feel a desire for sexual intercourse.) Thus something to drink appears to us as particularly good ; for, if we happen to be thirsty, we shall see it with considerable pleasure.

53 Why is it that in man the front of the body is more thickly covered with hair than the posterior portion, but in ³⁰ quadrupeds the posterior part is hairiest? ⁴ Is it because all two-footed animals have the front part of the body more thickly covered? For the birds resemble man in this respect. Or is nature always wont to protect the weaker parts and is every creature weak in some respect? ⁵ Now in all quadrupeds the posterior portions are weaker than ³⁵ the front parts owing to their position ; for they are more liable to suffer from cold and heat ; but in man the front portions of the body are weaker and suffer likewise under these conditions.

¹ Viz. in iv. 15 and 26.

² Restoring the MS. reading οὐκέτι, which is more idiomatic than οὐκ ἔστι.

³ To make sense of this passage we must read <οὐ> πρὸς τὴν συνουσίαν βλέψασι, the negative here being implied by εἰ μὴ ἐπιθυμοῦντες τύχομεν in l. 27. (So too Sylburg and Bussemaker.)

⁴ The source of this problem is clearly *P. A.* 658^a 16 ff.

⁵ τόπον should perhaps be read for τρόπον.

897^a Why is it that man sneezes more than any other animal?¹ 54

Is it because he also suffers most from running at the nose? The reason of this is that, the heat being situated in the region of the heart and being naturally disposed to rise upwards, in the other animals its natural direction is towards the shoulders and thence, splitting up owing to refraction, it travels partly into the neck and head and partly into the backbone and flanks, because these parts are all in the same straight line and parallel to the ground on which the animal stands. Now the heat,² as it travels along, distributes the moisture uniformly to these parts alike; for the moisture follows the heat. Four-footed animals therefore do not suffer either much from running at the nose or sneeze; for sneezing is due to the rush either of a mass of breath, when moisture evaporates more quickly than the body, or of unconcocted moisture (hence it precedes a cold in the head);³ and these forms of moisture are not found in the other animals, because the rush of heat is equally distributed between the fore and hind parts of an animal. Man being naturally, like the plants, at a right angle to the ground on which he stands, the result is that a very copious and violent rush of heat takes place in the direction of the head, and the heat in its course thither rarefies and heats the ducts in the region of the head. Now these ducts being in this condition are better able to receive the moisture than those leading downwards from the heart. When, therefore, a man happens to have become in too moist a condition and to have been cooled off externally,⁴ the result is that the heat obtaining nourishment and collecting within increases, and as it does so it is carried to the head and the ducts there. Into these the moisture, which is thin and unconcocted, follows the heat and fills them up and causes cold in the head and likewise sneezing. For at the beginning of a cold the heat, being carried along in advance of the

¹ Cp. above, chapter 18, and xxxiii. 10.

² Omitting τὸ σῶμα, which has probably come in as a gloss.

³ Punctuating ἀπέπτων (διὸ πρὸ τῶν καταρρων γίνεται), ἃ κτλ., and taking ἰγρῶν as the antecedent of ἃ.

⁴ Putting the comma after instead of before ἕξωθεν.

moisture and inflating the ducts, causes sneezing by the expulsion of the breath and by the drawing off¹ of those humours which are light and pungent. Hence it happens³⁰ that after sneezing from a cold in the head one wipes away watery matter. These all² having been set in motion, the continuous and solid³ humours follow closely upon them and block up the ducts in the region of the head and nostrils. If they become swollen and distended, they³⁵ cause pain in the region of the head. That the ducts are blocked is shown by the fact that no breath can pass out through them;⁴ so those who suffer from running at the nose neither sneeze nor can they use their sense of smell. Sneezing unaccompanied by running at the nose is due to the same causes, but has some slight and insignificant origin; and so the humours, being collected by^{897^b} the heat and vaporized by it owing to their small mass, are precipitated down the nostrils. The noise made by the breath is due quite as much to the violence of its rush as to its quantity. For the heat, being carried along in a direct line to the brain and rushing into it, is refracted⁵ into the nostrils, because the ducts there lead out from the brain. The rush made by the breath in breaking out into the nostrils, being unnatural, is consequently violent, and therefore makes loud noises. Amongst the other animals birds are most liable to running at the nose, because they¹⁰ most resemble man in form; but they are less liable to it than man, because they usually hold their heads down, since they derive their food from the ground.

55 Why are marine animals larger and better nourished than land animals? Is it because the sun consumes the¹⁵ outer surface of the earth and takes the nourishment out

¹ Omitting *πρό*. T. G., who has *ductuque humoris tenuis acrisque*, does not render it, and its insertion destroys the sense of the passage, since the light humours are expelled in sneezing while the solid humours remain.

² i. e. the breath and the light humours.

³ Reading *πάχος ἔχοντα* (cp. 871^a 26 and G. A. 739^a 12) for *πάθος ἔχοντα*. The Latin version renders *crassi*.

⁴ Reading *τὸ μηδὲν ἔκτος δι' αὐτῶν. τὸ μήτ' ἔκτος ἢ δι' αὐτῶν* neither is Greek nor does it make sense. The required meaning, however, is clear. *ἀφίεσθαι* should probably be read for *ἀφείσθαι*.

of it? (For this reason too those animals which are enclosed in the earth are better nourished.) Marine animals then are free from all these disadvantages.

Why is it that the other animals provide themselves 56
20 more often with dry than with moist food, but man takes more moist than dry nourishment?¹ Is it because man is naturally very hot and therefore requires most cooling?

Why is it that eunuchs do not become bald?² Is it 57
because they have a large amount of brain-matter? Now this is the result of their not having sexual intercourse
25 with women;³ for the semen passes from the brain through the spine. For this reason too bulls which have been castrated appear to have large horns after castration. For the same reason also, apparently, women and children are not bald.

30 Why is it that some animals are able to feed themselves 58
directly after birth, while others cannot? Are those who can do so the shorter-lived among those animals which are capable of memory? It is for this reason that they always die sooner.

Why does man produce more moist than dry excrement, 59
35 but horses and asses more dry than moist? Is it because the latter animals take more dry food, whereas man takes more moist than dry nourishment?⁴ For all excrement comes from food, and a greater amount of food produces a greater quantity of excrement.⁵ Some animals then take more moist food, others more dry food, because some are
898^a naturally dry and others moist. Animals then which are naturally dry feel more desire for moist food, since they require it more; but those which are naturally moist desire dry food, for they stand more in need of it.

Why is it that birds and men and the courageous animals 60
5 have hard frames? Is it because high spirit is accompanied

¹ Cp. below, ll. 35, 36.

² Cp. *H. A.* 632^b 4, *G. A.* 784^a 6, and Hippocr. *Aph.* 6.

³ *G. A.* 783^b 27.

⁴ Cp. above, ll. 19-22.

⁵ Reading *πλείων* (Richards) for *πλείω*.

by bodily heat, since fear is a process of cooling? Those then whose blood is hot are also courageous and high-spirited; for the blood gives them sustenance. Plants too which are watered with warm water become harder.

61 Why is it that quadrupeds of a small size most often give birth to monstrosities, whereas man and the larger 10 quadrupeds, such as horses and asses, do so less often?¹ Is it because the small quadrupeds, such as dogs, pigs, goats, and sheep, have much more abundant progeny than the larger animals, which either always or usually produce only one offspring at a time? Monstrosities come into being when the semen becomes confused² and disturbed 15 either in the emission of the seminal fluid or in the mingling which takes place in the uterus of the female. So birds too produce monstrosities; for they lay twin³ eggs, and their monstrosities are born from such eggs in which the yolk is not separated by the membrane.⁴

62 Why is the head in man more hairy than the rest of the 20 body⁵—in fact quite disproportionately so—while in the other animals the opposite is the case? Is it because some of the other animals send an excessive amount of their nutritive material into teeth, others into horns, others into hair? Those who expend their nourishment on horns have less thick hair on the head; for the available material is used up in the horns. Those whose nourishment goes 25 into teeth have thicker hair on the head than horned animals (for they have crests or manes),⁶ but less thick than such creatures as⁷ birds. For birds have the same sort of covering as man;⁸ but,⁹ whereas in birds the

¹ Cp. *G. A.* 770^a 10 ff.

² For *ἐπιλλάττειν* cp. *G. A.* 769^b 34, 36. ³ i. e. double-yolked.

⁴ Cp. *H. A.* 562^a 24 ff., *G. A.* 770^b 16, and A. Platt's notes.

⁵ Cp. *H. A.* 498^b 17 ff., *P. A.* 658^b 1.

⁶ *λοφιά* includes both crest and mane.

⁷ Reading, with Richards, *οἶων ὀρνέων*.

⁸ The sense here is clear and is that of T. G.'s version (*his enim illud etiam, quod homini, genus integendi natura tribuit*), but the reading is doubtful. *τὴν τῶν ἀνθρώπων* seems to require a noun, and Richards suggests *ἔκδοσιν*; but (1) is *ἔχουσι τὴν τῶν ἀνθρώπων ἔκδοσιν* good Greek for 'have the same distribution of hair as men', and (2) is not this contradicted by what follows? *ἔχουσι γὰρ τὴν αὐτὴν χαίτην τῶ ἀνθρώπων* is perhaps preferable.

⁹ Reading *ὁ <δ> ἐκείνους* (so also Richards).

covering is distributed all over the body owing to its abundance, in man¹ it breaks out only on the head; for man is neither² on the one hand devoid of hair, nor on
30 the other hand has he sufficient to cover the whole body.

Why is it that in man alone of the animals the hair 63 turns white?³ Is it because most of the animals shed their coats every year, for instance the horse and the ox, while others, though they do not do so, are short-lived, such as sheep and others (in which case the hair does not
35 turn white, because it does not as it were grow old)? But man does not change his hair and is long-lived, and so he grows white owing to age.

Why is it that those in whom the distance from the 64 navel downwards is longer than that from the navel to 898^b the chest are short-lived and weak? Is it because their stomach is cold owing to its small size, and therefore it tends to cause excretion rather than concoction? Now such persons are unhealthy.

Why is it that some animals come into being not only 65 from the sexual intercourse of animals with one another 5 but also spontaneously, while others, such as man and the horse, can only be born as the result of sexual intercourse?⁴ Is it due, if to no other cause, at any rate to the fact that the former have a short period of coming to birth, so that the moment of birth is not protracted and can take place at the change of the seasons;⁵ but of the latter class the coming to birth is much protracted,
10 since they are born after a year or ten months, so that they must necessarily be born from the intercourse of animals with each other or not at all?⁶

¹ Reading *τούτω* (Richards); Y^a has *ρούτω*.

² Reading *οὔτε . . . οὔτε* (Richards).

³ Cp. 891^b I, *G. A.* 778^a 25, 780^b 4, 782^a 11.

⁴ Cp. chapter 13.

⁵ Which sets up the process of decay necessary for spontaneous generation, cp. 892^a 35, 36 and *G. A.* 715^a 25.

⁶ The text as it stands makes no sense. Since, however, the Latin version of T. G. renders *quapropter vel nullo pacto vel ex coitu procreantur illa necesse est*, we should certainly read with Bussemaker $\langle \hat{\eta} \mu\eta \rangle$ γίνεσθαι ἢ κτλ.

66 Why is it that the teeth of Ethiopians are white—indeed whiter than those of other nations, but their nails are not correspondingly white? Are their nails dark because their skin also is black and blacker than that of others, and the nails grow out of the skin? But why ¹⁵ are their teeth white? Is it because those things turn white out of which the sun extracts the moisture without adding any colour to them, as happens in the case of wax? Now the sun colours ¹ the skin, but it does not colour the teeth, but the moisture is evaporated out of them by the heat.

67 Why is it that, when the head is removed, some animals ²⁰ die immediately or very soon, while others do not? Does death occur less quickly in the bloodless animals, which require little nourishment, since they do not need food immediately and the heat in them is not diffused in moisture, whereas full-blooded animals cannot live without food and heat? The former can live after their heads are cut off, for they can live longer without breathing. The reason for this has been stated elsewhere. ²⁵

¹ i. e. tans.

² This appears to be a direct reference to *de Respir.* 475^a 20 ff.

BOOK XI

PROBLEMS CONNECTED WITH THE VOICE

WHY is it that of all the senses the hearing is most liable ¹ to be defective from birth? Is it because the sense of hearing and the voice may be held to arise from the same ³⁰ source? ¹ Now language, which is a kind of voice, ² seems to be very easily destroyed and to be very difficult to perfect; this is indicated by the fact that we are dumb for a long time after our birth, for at first we simply do not talk at all and then at length begin only to lisp. And ³⁵ because language is easily destroyed, and language (being a kind of voice) and hearing both have the same source, hearing is, as it were, *per accidens*, though not *per se*, the most easily destroyed of the senses. ³ Further evidence ^{899^a} of the fact that the source of language is eminently easy to destroy may be taken from the other animals; for no animal other than man talks, and even he begins to do so late, as has already been remarked.

Why is it that the deaf always speak through their ² nostrils? ⁴ Is it because they are near to being dumb? ⁵ Now the dumb make sounds through their nostrils; for the breath escapes by that way because their mouth is closed, and it is closed because they make no use of their tongue for vocal purposes.

¹⁰ Why have all hot-natured men big voices? Is it because ³ they necessarily have a large amount of cold air ⁶ in them?

¹ Cp. *de Anim.* 426^a 27.

² Cp. above, 895^a 5.

³ Reading *ἐκ* for *εἰ* before *συμβεβηκότος* and punctuating as follows: *διὰ τε τὸ τὴν διάλεκτον εὐφθαρτον εἶναι, τὴν αὐτὴν δὲ ἀρχὴν ἀμφοτέρων εἶναι, καὶ τῆς διαλέκτου (φωνὴ γὰρ τις) καὶ τῆς ἀκοῆς, ὥσπερ καὶ ἐκ συμβεβηκότος ῥᾶστα τῶν αἰσθήσεων φθείρεται καὶ οὐ καθ' αὐτὴν ἡ ἀκοή.*

⁴ Cp. chapter 4 and xxxiii. 14.

⁵ Cp. *H. A.* 536^b 3 ff.

⁶ T. G. evidently translates from a text which read *θερμὸν* for *ψυχρὸν*, for he renders *perfervidum*. If *ψυχρὸν* is retained the meaning is that the heat inside the body attracts a quantity of cold air from without; there is therefore more air to expel and consequently the voice is big

For their breath, which is hot, attracts the air to itself, and the more of it there is the more it attracts. Now a big voice arises from setting in motion a large quantity of air, and when the motion is swift, the voice is shrill, and when it is slow, it is deep.

- 4 Why do the deaf always speak through their nostrils?¹ 15
Is it because the deaf breathe more violently? For they are near to being dumb; the passage therefore of the nostrils is distended by the breath, and those who are in this condition speak through the nostrils.
- 5 Why are sounds more audible at night?² Is it because there is more quiet then owing to the absence of great 20
heat? For this reason too there is usually less disturbance; for it is the sun which is the source of movement.
- 6 Why do voices sound shriller at a distance?³ For example, those who try to imitate persons shouting from a very great distance utter shrill noises, like those of an echo; and the sound of an echo is distinctly shriller,⁴ and it is a distant sound, being the result of refraction. Since 25
then in sound the swift is shrill and the slow is deep, one would have expected voices to seem deeper from a distance, for all moving bodies move more slowly the farther they progress from their starting-point, and at last fall. May not the explanation be that these mimics use a feeble and thin voice⁵ when they imitate a distant 30
sound? Now a thin voice is not deep, and it is impossible to emit a small and feeble sound that is deep, but such a sound is necessarily shrill. Or is it true that not only do the mimics imitate for this reason, but also the sounds themselves become shriller? The reason is that the air which travels makes the sound; and just as that which first sets the air in motion causes the sound, so the air 35

in volume. The reading *ψυχρόν* is borne out by Hippocr. *Epid.* vi. 4. 19
ἐν οἷς πλείστον τὸ θερμὸν, μεγαλοφωνότατοι· καὶ γὰρ ψυχρὸς ἄηρ πλείστος.

¹ A repetition of chapter 2 in a slightly different form; cp. also xxxiii. 14.

² For a more elaborate treatment of this problem see chapter 33.

³ Cp. chapters 20 and 47, and xix. 11.

⁴ i. e. shriller than the sound which it echoes.

⁵ Reading *μιμῶνται καὶ λεπτή*.

in its turn must do likewise and be partly a motive power and partly itself set in motion.¹ That is why sound is continuous, motive power continually succeeding to
 899^b motive power, until the force is spent, which results in falling in the case of bodies, when the air can no longer impel the missile, while in the case of sound the air can no longer impel other air. Continuous sound is produced when air is impelled by air, while the missile continues its progress as long as there is air to keep a body in
 5 motion. In the latter it is always the same body that is carried along until it drops, in the former it is always different air. Smaller objects travel more quickly at first, but do not go far. Therefore voices are shriller and thinner at a distance; for that which moves more quickly is shrill—a question which we have already raised.² It is for the
 10 same reason that children and invalids have shrill voices, whereas grown men and healthy persons have deep voices.³ That⁴ from near at hand one cannot clearly distinguish degrees of deepness and shrillness and that altogether the conditions are not the same as those of heavy bodies thrown, is due to the fact that the body thrown is one and preserves its identity throughout; whereas sound is
 15 air impelled by air. Consequently a body falls in one particular spot, while the voice scatters in every direction, just as though a body thrown were, in the course of its flight, to be broken into infinitesimally small pieces, some particles even returning on their track.

Why are newly plastered houses more resonant? Is it 7
 because their smoothness gives greater facility for refraction? They are smoother because they are free from cracks
 20 and their surface is continuous. One must, however, take a house which is already dry and not one which is still quite wet; for damp clay gives no refraction of sound. It is for this reason that stucco⁵ has a higher degree of

¹ Cp. *de Aud.* 800^a I-II.

² i. e. in 899^a 13 and 26.

³ Cp. chapter 16.

⁴ Reading *τοῦ δέ* (Richards).

⁵ Apparently a smoother and more expensive material than ordinary plaster: it was used for coating the inside of reservoirs, cp. *de Col.* 794^b 31, 32.

resonance. Perhaps the absence of disturbance in the air also contributes something; for when the air is¹ massed together it beats back the air that strikes against it.

8 Why is it that if a large jar or empty earthenware²⁵ vessels are buried in the ground² and lids placed on them, the buildings in which they are have more resonance, and the same is true if there is a well or cistern in the house? Is it because, since an echo is due to refraction, the air when enclosed is necessarily massed together, and so the sound has something dense and smooth upon which it can strike³ and from which it can be refracted, these being the most favourable conditions for an echo? A well,³⁰ then, or a cistern causes the contraction and massing together of air, and jars and earthenware vessels also have dense surrounding walls, and so the phenomenon in question results in both cases. For anything which is hollow is particularly resonant; for which reason bronze vessels are particularly so. That resonance still continues when the vessels are buried need not surprise us; for the voice is carried downwards as much as in any other direction—indeed one conceives of it as being carried in a circle in³⁵ every direction.

9 But why is it that there is more resonance where vessels are buried than where they are not? Is it because covered^{900^a} vessels receive the air and retain it better? The result is that the impact of sound upon them is more violent.

10 Why does cold water poured out of a jug make a shriller sound than hot water poured from the same vessel? Is it because the cold water falls at a greater speed, being heavier,⁵ and the greater speed causes the sound to be shriller?

¹ It is quite clear from a comparison with the next problem (ll. 27–34 below) that ὄν must be read for ἰόν. The meaning is that a mass of undisturbed air collected in an enclosed space (in this case in a room, in the next problem in an earthenware vessel, well, or cistern) is a good medium for the refraction of sound, and therefore gives an echo. For another instance of the confusion of ὄν and ἰόν see 904^b 16 and note.

² The custom of burying storage vessels in the floors of houses is amply borne out by excavations on ancient sites from the earliest periods onwards.

³ Omitting the comma after ἀνακλασθήσεται, and reading προσπίπτων.

Heat, on the other hand, makes water lighter by rarefying it and causing it to rise.¹ We may compare the phenomenon that torches deal softer blows when they are alight.

10 Why is it that the voice is rougher when one has passed 11
a sleepless night? Is it because the body, owing to absence
of concoction, is moister than usual, especially in its upper
part (which is also the cause of heaviness in the head), and
moisture in the region of the windpipe necessarily makes
the voice rougher? For roughness is due to unevenness,
15 whilst depth is due to congestion; for the passage of sound
is then slower.

Why does the voice become broken very readily after 12
meals?² Is it because the region in which it is produced
is thoroughly heated by constant impacts, and, becoming
heated, attracts the moisture? The moisture too is itself
more copious and readier to hand when food is being taken.

20 Why is the sound of weeping shrill, whereas that of 13
laughing is deep?³ Is it because those who weep⁴ either set
only a little breath in motion, because they are weak, or else
exhale violently, which makes their breath travel quickly?
Now speed makes for shrillness; for that which is hurled
from a body which is tense travels quickly. (On the other
hand, a man who is laughing is in a relaxed condition.⁵)
Those who are weak make shrill sounds, for they set only
25 a little air in motion, in some cases merely on the surface.⁶
Further, the air emitted by those who are laughing is warm,
while the breath of those who are weeping is colder, just as

¹ i. e. by evaporation.

² Cp. chapter 22. On 'broken' voices cp. *de Aud.* 804^b 11 ff.

³ Cp. chapters 15 and 50.

⁴ *οἱ μὲν ὀλίγον κινουῦσι πνεῦμα δι' ἀσθένειαν* must refer to the weepers, not to the laughers, for (1) those who weep are weaker (cp. 904^a 25, 26), and (2) laughers emit large quantities of air (cp. ll. 25-9 below). *οἱ δὲ σφοδρῶς, ὁ ποιεῖ ταχὺ φέρεσθαι τὸ πνεῦμα* must also refer to weeping, for breath which is quickly and violently expelled makes a shrill sound. The whole sentence therefore refers to two different cases of *οἱ κλαίοντες*. Any other way of taking the passage involves hopeless confusion in this problem and contradicts chapters 15 and 50. Greater clearness would be obtained by reading *ἢ ὅτι <οἱ κλαίοντες> οἱ μὲν κτλ.* Richards (*op. cit.*, p. 18) suggests *σφοδρῶς δὲ* for *οἱ δὲ σφοδρῶς*.

⁵ Reading *διαλελυμένος* for *διαλελυμένως*.

⁶ Richards (*loc. cit.*) suggests that *οἱ δ' ἀσθενεῖς . . . ἐπιπολῆς* is a gloss.

pain is a chilling of the region round the breast. Now heat sets a great mass of air in motion, so that its progress is slow,¹ whereas cold imparts movement to a little air only. 30 The same thing happens with flutes; when the player's breath is hot,² the sound produced is much deeper.

- 14 Why do children³ and the young of other animals have shriller voices than the full-grown of their species, and that though shrillness involves a quality of violence? Is it because⁴ the voice is a movement of the air, and the swifter the movement the shriller is the sound? Now a little air 35 can be moved more easily and quickly than a large quantity, and it is set in motion owing either to its concretion or to its dissolution by heat. Now since we draw in cold air when we inhale, the air within us can become concreted by the act of inhalation; but exhalation, when heat sets air in motion, can become voice, for it is when we are exhaling that we speak, not when we are inhaling. And since the young are hotter 900^b than their elders, and their interior passages are narrower, they may well have less air in them. So, as there is less in them of that which is moved⁵ and more motive power, namely heat, for both reasons the movement of the air may 5 be quicker; and, for the reasons already stated,⁶ the quicker the movement the shriller the voice.

- 15 Why is the sound of weeping shrill and of laughter deep?⁷ Is it because those who weep, in uttering their cries, strain and contract the mouth? Owing to the tension the air that is in them is impelled into swift motion, and the 10 contraction of the mouth, through which it passes, makes its speed still greater. For both these reasons the voice becomes shrill. On the other hand, those who laugh relax the tension in doing so and open the mouth. Since then for this reason they emit the air from the mouth through a wide aperture and slowly, their voice is naturally deep.

¹ And therefore deep.

² Reading *θερμῶ* (Platt); all MSS. have *θερμοί*.

³ Cp. chapters 16, 34, 62.

⁴ Reading *ἢ <ᾠτι> ἢ φωνῆ*, suggested by Ruelle.

⁵ i. e. air.

⁶ 899^a 13, ^b 8, &c.

⁷ Cf. chapters 13 and 50.

15 Why is it that persons without generative power, such 16
 as boys, women, men grown old, and eunuchs, have shrill
 voices, while adult men have deep voices? ¹ Is it because ²
 the thin voice has only one dimension, just as the line and
 other thin things have one dimension, while thick things
 have more than one? Now it is easier to create and set in
 20 motion one thing than several things. Now the breathing
 of the persons mentioned above is feeble and sets little air in
 motion; and the air which has only one dimension is very
 small in quantity, for it will be thin for the reasons already
 stated. And the voice produced from it will be of the same
 quality, and a thin voice is shrill. This then is the reason
 why persons without generative power have shrill voices;
 25 whereas men who are vigorous set a large quantity of air in
 motion with their breath, and the air, being large in quantity,
 is likely to move slowly and causes the voice to be deep.
 For shrillness of voice is, as we have seen, produced by
 a movement at once swift and thin, neither of which
 conditions is fulfilled in an adult man.

Why are our voices deeper in the winter? ³ Is it because 17
 30 then the air both inside and outside us is thicker, and, being
 such, its movement is slower and the voice therefore deeper?
 Further, we are drowsier in the winter than in the summer
 and sleep longer, and we are heavier after sleeping. In the
 period then during which we sleep for a longer time than
 we are awake (namely, the winter), we may expect to have
 35 deeper voices than in the season when the contrary happens.
 For during the short interval of wakefulness the condition
 set up during sleep persists and causes a tendency to
 drowsiness.

Why is the voice deeper as a result of drinking and 18
 901^a vomiting and cold weather? Is it due to the congestion
 of the larynx ⁴ caused by phlegm, which makes fluid matter
 collect in it? In some people vomiting and drinking, in
 others the season and the constriction resulting therefrom,

¹ Cf. chapters 14, 34, and 62, and *de Aud.* 803^b 18 ff.

² Reading ἢ <ὅτι> καθάπερ.

³ Cp. chapter 61.

⁴ Greek φάρυγγς, cp. *P. A.* 664^a 16 and Ogle's note.

make the larynx narrower, so that the passage of breath is 5 slower ; and its slow passage makes the voice deep.

19 Why is it that a deeper voice is more audible close at hand, but less so at a distance ? Is it because a deeper voice sets a greater amount of air in motion, but not at a distance ? So we hear it less well at a distance, because it travels less far, but better from near at hand, because a greater mass 10 of air strikes upon our sensory organ. A shrill sound is audible at a distance, because it is thinner ; and that which is thin has greater longitudinal extension. It might also be said that the motion which causes it is quicker ; this would be so, if the breath which sets the air in motion were at the same time dense and narrow. For, in the first place, 15 air which is small in bulk moves more readily (for the air which is set in motion by that which is narrow is small in bulk) ; and, secondly, that which is dense deals more impacts, and it is these which cause the sound. This can be illustrated from musical instruments ; for, all other conditions being the same, it is the thinner strings that give shriller sounds.¹

20 Why does the voice seem shriller to those standing at 20 a distance, whereas shrillness depends on the rapidity at which the voice travels, and that which travels moves more slowly the farther it goes ?² Is it because the shrillness of the voice depends not only on the rapidity with which it travels but also on the attenuation of sound ?³ The farther one is away the more attenuated is the voice when it reaches 25 one, because very little air is set in motion. For the motion gradually diminishes ; and just as number in diminishing terminates in the unit, so a body terminates in a single dimension, and this in a body is tenuity. So it is also with the voice.

21 Why is it that both those who have taken violent exercise 30 and those who are ill speak shrilly ?⁴ Is it because those who are ill set only a little air in motion, and a little air

¹ Cp. *de Aud.* 803^b 23 ff.

² Cp. chapters 6 and 47.

³ Reading *λεπτόν τὸν* (Richards) for *λεπτότατον*.

⁴ Cp. chapter 40.

travels more quickly than a larger quantity? Those who have taken violent exercise, on the other hand, set the air in vigorous motion, and air which is in vigorous motion travels more quickly, and in the voice quickness of motion causes shrillness.

35 Why do those who shout after meals spoil their voices? ¹ 22

901^b Indeed, we can see how those who are training their voices, such as actors and chorus-men and all such persons, practice early in the morning and on an empty stomach. Is it because the spoiling of the voice is simply the spoiling of
5 the region through which the voice passes out? So too those who have sore throats have their voices spoiled, not because the breath which causes the voice is any worse, but because the windpipe is roughened. This region by its nature is especially liable to be roughened by violent heat;² and so neither can those who are in a fever sing, nor can
10 those who have been suffering from a violent fever sing immediately after it leaves them; for their larynx is roughened by the heat. The consumption of food naturally increases and heats the breath, and it is reasonable to suppose that the breath being in this state makes the windpipe sore and rough as it passes through; and when this
15 happens the voice is naturally spoiled.

Why is it that the voice, which is air that has taken ²³ a certain form and is carried along, often loses its form by dissolution, but an echo, which is caused by such air striking on something hard, does not become dissolved, but we hear it distinctly?³ Is it because in an echo refraction takes
20 place and not dispersion? This being so, the whole continues to exist and there are two parts of it of similar form;⁴ for refraction takes place at the same angle. So the voice of the echo is similar to the original voice.

¹ This problem clearly continues the topic raised in chapter 12.

² In 900^a 12-14 moisture is said to be the cause of roughness, not heat as here.

³ This problem is repeated, in part verbally, in chapter 51.

⁴ The two 'parts' into which τὸ ἦλον is divided are (1) the voice on its way to the hard object from which it is refracted, and (2) the voice after refraction, i. e. the echo.

- 24 Why is it that, although the young of all other animals and infants have shriller voices than the full-grown of their species,¹ calves have deeper voices than full-grown oxen?² Is it because in each species the young resembles the female of the same kind? Now among cattle cows have deeper voices³ than bulls, and the calves resemble the former rather than the latter; but in all other species the males have deeper voices.
- 25 Why is it that when the orchestra of a theatre is spread with straw, the chorus makes less sound? Is it because, owing to the unevenness of the surface, the voice does not find the ground smooth when it strikes upon it and is therefore less uniform, and so is less in bulk, because it is not continuous? Similarly light too shines more on smooth surfaces, because it is not cut off by anything which intercepts it.
- 26 Why does salt make a noise when it is thrown on fire?⁴ 902^a Is it because salt has a little moisture in it which is evaporated by the heat and violently bursting forth rends the salt? Now anything which is rent makes a noise.
- 27 Why is it that some children, before they reach the age at which it is time for them to express themselves clearly, find voice and say something distinctly, and then go on as before⁵ until the usual age for speaking arrives? Some regard such incidents as portents; and before now cases have been reported of children who spoke immediately after birth. Is it because generally the majority of children at birth⁶ follow the usual course of nature (and so the phenomenon in question occurs only in a few), and their faculties keep pace with one another; and so they hear [and find voice]⁷ and understand what they hear and speak and express themselves clearly all at the same time? Sometimes,

¹ As has already been stated in 900^a 32 ff.

² Cp. *G. A.* 786^b 15, *H. A.* 545^a 19.

³ Cp. *G. A.* 786^b 22, *H. A.* 538^b 14.

⁴ Cp. chapters 42 and 43.

⁵ i. e. do not speak again.

⁶ Retaining the MS. reading *γινομένων*.

⁷ *καὶ φωνεῖ* is hardly necessary here, its meaning being more appropriately expressed by *καὶ λέγει* following.

however, these things¹ do not go together, but some
 15 children understand before the faculty by which they
 converse is set free for use, while in others the opposite
 happens. The latter, then, would not converse intelligently
 (for they merely repeat what they hear); but when the time
 comes at which they can both speak and understand, they
 make a natural use of both functions. But in those in whose
 20 souls perception through hearing has been perfected before
 the organ² by which the voice is first set in motion and
 speech is formed, the full power and freeing of the organ of
 speech sometimes comes to pass when they already
 understand a great deal. This is especially likely to happen
 after sleep—the reason being that sleep makes the body
 and the faculties more sluggish by giving them a rest—or,
 if not after sleep, after some other similar change has taken
 25 place. We can do many things of this sort which require
 some short-lived opportunity—after which the conditions
 are no longer suitable—when the organ of speech is in this
 state of freedom; and³ when there has been obviously
 present to their sensation something by which thought was
 stirred, in virtue of having heard it the child returns to it
 and utters it. Now tunes and phrases often occur to us
 30 without our deliberate intention, but if we originally utter
 them deliberately, we afterwards speak or sing them without
 deliberate intention and cannot get rid of them from our
 lips. So too when this happens in children, they speak,⁴
 and then the faculty involved relapses again into its natural
 condition, until the time comes for it to become strong and
 35 to be separately constituted.

Why do some objects, chests for example, suddenly make 28
 a noise and move, when nothing perceptible sets them in
 motion? Yet that which causes motion is stronger than
 that which is moved. The same question arises in connexion

¹ Reading ταῦτα (Richards).

² Reading with Bussemaker <ῆ> ᾤ.

³ Reading with Richards ὅταν <δ'> . . . ᾤ.

⁴ Reading οὕτω καὶ τοῖς παιδίοις ὅταν συμβῆ τοῦτο, εἶπον, εἶτα πάλιν κατέστη κτλ. (cp. above, ll. 7, 8); this is supported by the Latin version of T. G., *ita fieri potest ut pueri aliquid dicant, rursusque membrum . . . redeat ad suam naturam.*

with corruption and old age; for everything which is said to be 'destroyed by time' is destroyed by something imperceptible. Is it similar to dripping water and stones 902^b lifted by the growth of plants, namely, that it is not the final effort but its continuity which raises or moves the object? This continuity of effort is imperceptible, but it results in a movement which is perceptible. So too that which is contained within perceptible spaces of time 5 moves and can be divided into imperceptible portions, but these cause motion and corruption by their sum and their continuity.¹ Now continuity is not in the present time but in the period of time terminated by the present.

29 Why does one hear less well when one is yawning?² Is it because a quantity of breath emitted in the yawn finds its 10 way also into the ears, so that the motion which it sets up in the neighbourhood of the ears makes a distinct impression on the perception, especially after sleep? Now sound is air or a certain condition of it. The sound then from outside enters the ear, and that from within comes into collision with it, and the movement thus caused checks the progress 15 of the sound from without.

30 Why do children hesitate more in their speech than grown men? Is it because, just as, when we are children, we always have less control over our hands and feet and at a still earlier age cannot walk at all, so the young cannot control their tongue? Now when they are quite small, they 20 cannot speak at all but can only make sounds like the animals, because they lack control. This is the cause not only of hesitancy in speech but also of lisping and stammering. Lisping is due to the inability to master a letter—not any letter but some particular one; stammering is due to

¹ i. e. it takes a considerable period for the growth of a tree to move a stone, and if it is examined at any particular moment the movement is imperceptible; but there is a perceptible difference between the position of the stone at the beginning and at the end of the period, and this is the effect of the sum of the continuous but imperceptible movement.

² Cp. chapter 44 and *G. A.* 781^a 30.

the dropping out of some particular letter or syllable;¹
 25 hesitancy is due to the inability to join one syllable to
 another sufficiently quickly. All three are due to want of
 power; for the tongue is not an efficient servant of the
 intelligence. The same thing occurs in those who are
 drunken and in the old; but always to a less extent than in
 children.

30 Why is it that the voice trembles in those who are nervous² 31
 or afraid?³ Is it because the heart is shaken by the passing
 out of the heat? For this happens in both conditions,
 being an effect both of nervousness and of fear.⁴ When the
 heart is shaken, the impact⁵ is not one but many, like that
 35 from strings which are not properly stretched.⁶

Why is it that those who are nervous have deep voices, 32
 but those who are afraid speak shrilly?⁷ Is it because in
 those who are afraid the region about the heart is chilled,⁸
 because the heat passes downwards, and so they set only
 a little air in motion? For the force which sets the air in
 motion is derived from heat. In those who are nervous the
 903^a heat travels upwards,⁹ as happens in those who are ashamed;
 for it is through shame¹⁰ that nervousness is felt. In those
 who are ashamed the heat travels upwards to the face, as is
 shown by the fact that they tend to blush.¹¹ The heat
 therefore dissolves and thickens the air with which they
 5 speak, and such air can only be propelled slowly; and in
 the voice that which is slow is deep.

¹ Cp. *de Aud.* 804^b 26-33.

² For a definition of *ἀγωνία* see 869^b 6; see also note on *ib.* ^a 2 for the difference between *ἀγωνία* and *φόβος*.

³ Cp. xxvii. 1, 6, and 7.

⁴ *καὶ γὰρ . . . φοβουμένοις* has perhaps come into the text as a gloss upon *ἀμφοτεράκις δὲ πάσχωσι τοῦτο*. The doctrine here agrees with that of ii. 31 as far as the effect of fear is concerned (*ὁ δὲ φόβος κατάψυξις τῶν ἄνω*, 869^b 7), but the effect of nervousness is there said to be *τὸ τὸ θερμὸν αὐτῶν ἠθροῖσθαι εἰς τὸν περὶ τὸ στήθος τόπον* (*ib.* 13).

⁵ i. e. of the voice upon the air.

⁶ Cp. *de Aud.* 804^a 38 ff.

⁷ Cp. chapter 53.

⁸ Cp. 869^b 7 (quoted in note on l. 32 above).

⁹ In 869^a 4 *ἀγωνία* is called *ἀξίσησις θερμοῦ*.

¹⁰ Cp. 905^a 8.

¹¹ Contrast 869^a 8, where those who are nervous are said to turn pale.

33 Why are sounds more audible in the night than in the day? ¹ Is it for the reason that Anaxagoras ² gives, namely, that in the day-time the air, heated by the sun, hisses and roars, but at night it is still because the heat has ceased, ¹⁰ and that when there is no noise hearing is easier? Or is it because one hears more easily through a comparative void than through a *plenum*? Now in the day the air is dense, being full of light and of the sun's rays; but at night it is rarer, for then the fire and the rays, which are bodies, have gone ¹⁵ out of it. Or is it because in the day-time the various bodies around us ³ distract our intelligence, and so it is less able to distinguish ⁴ what it hears? Also because we do all that we have to do preferably in the day rather than at night, our intelligence ⁵ too is busy then; and the perception apart from intelligence does, if one may say so, ⁶ only an imperceptible amount of work—as the saying is, 'It is the mind ²⁰ which sees, the mind which hears'.⁷ But at night when our sight has no work to do and our intelligence is more at liberty, the channel of hearing, being wider open, is just as receptive of sounds ⁸ and better able to report them to the intelligence, because the latter is neither busy nor distracted ²⁵ by the sight, as it is in the day-time.

34 Why is it that persons without generative power, such as boys, women, men grown old, and eunuchs, have shrill voices, while adult men have deeper voices? ⁹ Is it because of the weakness of the organ which sets the air in motion? For that which is weak sets only a little in motion; and ³⁰ a little air travels quickly, and that which travels quickly is shrill. Or is it because the first passage through which the air passes is narrow in those who are without generative power, so that that which expels the air from it has little force,

¹ A more elaborate statement of the problem already briefly treated in chapter 5.

³ i. e. visible objects.

⁴ Reading *ἐὐκρινής* (Richards).

⁵ Reading *αὐτῇ* (*sc. ἡ διάνοια*) for *αὐτὰ*; so also Richards.

⁶ *καθάπερ* is inserted to apologize for the play upon the words *αἴσθησις* and *ἀναισθητόν*.

⁷ Epicharmus, fr. 2.

⁸ Omitting *καθάπερ τῆς ἡμέρας* (Platt) as having come from l. 26.

⁹ Cp. chapters 14, 16, and 62.

and the air, being small in volume, travels quickly through the larynx above, which is wide? But in the adult and
 35 fully developed men this passage is wide (just as also is that¹ leading to the testicles), and so the quantity of the air expelled is also greater; and so passing through more slowly it makes a deeper sound.

Why is it that those who hesitate in their speech cannot
 903^b speak in a low voice? Is it because they are hindered from using their voice by some impediment? Since, then, there is² not equal force exerted and similar movement set up when there is some impediment to the movement and when there is none, a violent effort is required. Now the voice is a movement, and those who use more force
 5 speak louder; and so, since they have to force the hindrance out of the way, those who hesitate in their speech must necessarily speak louder.

Why do those who hesitate in their speech become worse
 36 when they are nervous, but better under the influence of drunkenness? Is it because their condition is a state resembling apoplexy³ of some interior part of the body
 10 which they cannot move and which by its coldness hinders their speech?⁴ Wine then, being naturally hot, tends to get rid of the coldness, but nervousness creates coldness; for it is a form of fear, and fear is a chilling condition.⁵

Why is it easier to hear sounds from outside in a house
 37 than those from inside a house outside it? Is it because the sound from inside becomes dispersed because it travels
 15 over an immense space, so that each component part of the sound is not sufficiently strong to make itself heard, or at any rate is less audible? On the other hand, a voice from without entering within into a smaller space and into stagnant air arrives in a close mass, and so being greater in bulk is more audible.

¹ Reading ὡσπερ καὶ <ὁ> ἐπὶ (Platt).

² Reading κινήσεως <οὔσης> (Richards).

³ Reading ἀποπληξία (Bekker).

⁴ Apoplexy is accompanied by loss of heat, cp. 860^a 34

⁵ See note on 869^a 2.

38 Why are those who hesitate in their speech melancholic? Is it because melancholy is due to their responding too 20 quickly to the imagination? Now this is characteristic of those who hesitate in their speech; for the impulse to speak outstrips their power to do so, the mind responding too quickly to that which is presented to it. The same thing occurs in those who lisp;¹ for in them the organs employed in speech are too slow.² This is shown by the fact that men under the influence of wine become lispers, 25 since then they respond most to the objects presented to their vision and not so much to the mind.

39 Why do leeks contribute to loudness of the voice (for we find that this is so even with partridges)? Is it because, whereas boiled garlic makes the throat smooth, leeks contain a certain amount of adhesive matter, and this cleanses the larynx?

40 Why is it that in all other creatures the sounds made 30 are shriller when more violence is used, but man speaks more shrilly when he is weak?³ Is it because then he sets less air in motion, and this passes along quickly, and its speed makes the sound shrill?

41 Why can one hear better when one holds one's breath than when one exhales?⁴ This is why people when 35 hunting tell one another not to breathe. Is it because the power of perception rises into the upper parts of the body when the veins are distended? For it sinks when one is asleep; and so those who are sleeping exhale rather than inhale, and lose the sense of hearing. Or does the blood rise upwards when one exhales, so that the lower 904^a parts of the body become void, and one can hear better in a void? Or is it because breathing is a noise, and when it takes place in the act of exhaling it impedes the hearing?

¹ Cp. Hippocr. *Epid.* ii. 5. ἡ νοσήματα δὲ ἔχουσι τραυλὸς . . . ἢ ἰσχνόφωνος . . . μελαγχολικά.

² Reading βραδύτερα.

³ Cp. chapter 21.

⁴ Cp. chapter 48.

Why do small quantities of salt make a noise and ex- 42
 5 plode more quickly, but large quantities more violently?¹
 Is it because in the former case the particles burst quickly
 because they are small (for the fire does not have far to
 penetrate), but in the latter case slowly, since a large mass
 is more difficult to burst than a small? A small quantity
 makes a small noise because the impact is small, whereas
 10 a large quantity makes a loud noise because the impact
 is greater; and sound is an impact. The stronger an
 object is, the greater is the explosion if it is struck;² for
 it is less yielding.

Why is it that if the same quantity of salt is thrown 43
 on to a large fire, it makes less noise than if thrown on
 a small fire, or else makes no noise at all? Is it because
 it is burnt up before it can burst? For it burns because
 15 the moisture is used up,³ and it makes a noise because
 it bursts.

Why does one hear less well when one is yawning?⁴ 44
 Is it because the action of yawning cuts off the breath
 internally and the breath so cut off accumulates in the
 region of the ears? This is shown by the fact that there
 is a noise in the ears when one yawns. Now the breath
 20 thus cut off hinders the hearing. Further one also makes
 a noise when one yawns, and this tends to impede the
 hearing. Also the organs of hearing must necessarily
 become compressed by the distension of the mouth in
 yawning.

Why is it that though the voice, since it is a kind of 45
 stream, is naturally inclined to travel upwards, yet it is
 more audible below from above than above from below?
 25 Is it because the voice is a kind of air mingled with
 moisture, and this air being weighed down by the moisture
 is carried downwards instead of upwards, since it is the
 natural characteristic of moisture to be carried downwards?
 For this reason one hears better when one is below. Or

¹ *Sc.* when thrown upon the fire, as in chapters 26 and 43.

² Reading *πληγῆ*.

³ Cp. 902^a 2, 3.

⁴ This is the same problem as that of chapter 29, somewhat differently treated.

is such a result characteristic only of the voice of a living creature (for it contains moisture), while the phenomenon which we are discussing is found also in other sounds? Just as the sight then, if it be allowed to fall from a higher ³⁰ to a lower object, makes an upward reflexion and vice versa,¹ so the voice, which has a natural tendency to rise, coming into collision with the air which bars its progress, cannot overpower the air, which is greater in mass and heavier, but the air which is set in motion by the voice, ³⁵ being refracted, is carried in a contrary direction and downwards, and so, being scattered in a downward direction, it is more audible below. Somewhat similar is that which happens in an echo, which is due to the refraction of the voice in a contrary direction.

46 Why are the voices of drunken persons more broken ^{904^b} than those of the sober? Is it because their voice breaks easily owing to their state of repletion? This can be illustrated by the fact that chorus-men and actors practise not after a meal but on an empty stomach.² Now since a person in a state of drunkenness is in a condition of ⁵ greater repletion, his voice is naturally more broken.

47 Why can one hear shriller voices at a greater distance? Is it because shrillness in the voice is rapidity, and what is carried forcibly along moves more rapidly, and what is carried violently along is carried farther?³ 10

48 Why can we hear better if we hold the breath?⁴ Is it because breathing makes a noise? It is only natural therefore that we should hear better when the noise is less; for the noise is less when we hold the breath.

¹ The reference here seems to be to the fact that if one gazes at an object and then lowers or raises the eyes, a momentary image is retained of the object first looked at. It is difficult to see the exact force of this comparison between the voice and the sight; there is perhaps some confusion due to the use of the word *ἀνάκλασις* in two senses, viz. refraction of sound and reflection of light.

² Cp. 901^a 35-b 3.

³ This is a condensed form of the answer given to the same problem in chapter 6; cp. also chapter 20.

⁴ This problem has been more fully treated in chapter 41.

15 Why is it that light cannot penetrate through dense 49
objects, whereas sound can do so, although light is rarer
and travels¹ farther and quicker than sound?² Is it
because light travels in a straight line, and so, if anything
blocks its direct course, it is completely cut off, but sound,
because it is a breath, can also travel in a line that is not
20 direct? So we can hear those who make sounds from
any direction and not only those who are in a straight line
with our ears.

Why is the sound of laughing deep, whereas that of 50
weeping is shrill?³ Is it because a voice which comes
from those who are in a state of tension is shrill, and that
which is shrill is weak? Now both these characteristics
25 are found rather in those who are weeping; for they are
in a state of greater tension and they are weaker.

Why is it that the voice, being air which has assumed 51
a certain form and is carried along,⁴ often loses its form
by dissolution, but an echo, which is formed by such air
striking on something hard, does not become dissolved,
30 but we hear it distinctly?⁵ Is it because in an echo refraction
takes place, not dispersion? It starts then as a complete
whole and continues to be so.⁶ Also, the effect produced
upon it is due to a similar agency;⁷ for it is refracted from
the air in the hollow, not from the hollow itself.

Why is it that when one person makes a sound and 52
a number of persons make the same sound simultaneously,
35 the sound produced is not equal nor does it reach corre-
spondingly farther?⁸ Is it because each of them thrusts
forward his own portion of air and they do not all impel
the same air, except to a very small extent? The result

¹ Reading with Bonitz (*op. cit.*, p. 412) *λόν* for *δν*; see also note on 899^b 24.

² This problem is more fully treated in chapter 58.

³ The same question is treated in chapters 13 and 15.

⁴ Reading *ἐστὶ καὶ φερόμενος, διαλύεται* (W. D. R.); cp. 901^b 17.

⁵ Cp. chapter 23.

⁶ Cp. 901^b 20.

⁷ i. e. the air in the hollow upon which the sound strikes and from which it is refracted, resembles the air in the hollow of the mouth from which the sound first proceeded.

⁸ Cp. xix. 2. Reading *γεγώνασιν* (cp. 901^b 31).

is much the same as when a number of persons throw stones but each throws a different stone, or at any rate most of them do so. Neither in the latter case will any missile travel far (or at any rate not correspondingly farther),¹ nor in the former case will the voice reach farther. For this great voice is that of many, not of one; so at a short distance it appears correspondingly greater (just as a number of missiles reaches the same spot), but at a great distance this is no longer so.

53 Why do those who are nervous have deep voices, but those who are afraid speak shrilly,² though a feeling of shame is a kind of fear?³ Or are the two conditions really very different? For those who feel shame blush (and nervousness is a kind of shame),⁴ whereas those who are afraid turn pale. It is clear then that in those who are afraid the heat fails in the upper part of the body, so that the breath, being weak, sets only a little air in motion; and that which is small in bulk travels quickly, and in the voice quickness is shrillness. But in those who feel shame the heat in the region of the breast travels upwards, as is shown by the fact that they blush. Now a strong force⁵ sets a great mass of air in motion, and a great mass travels slowly, and in the voice slowness is deepness.

54 What is the cause of hesitation of speech?⁶ Is it due to the chilling of the region in which the sound is produced, and to a condition resembling apoplexy in that part of the body?⁷ This is why those who hesitate, if warmed with wine and deriving thence a continuity of speech, are better able to connect their words together.

¹ i. e. in the rare event of two persons helping to hurl the same stone.

² The same problem is treated in chapter 32.

³ And *ἀγωνία* is a kind of shame, see below. For the difference between *φόβος* and *ἀγωνία* see 869^a 1 ff., ^b 7 ff., and note on *ib.* ^a 2.

⁴ It is impossible in English to find separate words to express *αἰδώς* and *αἰσχύνη*. *αἰσχύνη* is 'shame', but *αἰδώς* is a more complicated feeling which includes 'shame', 'awe', 'honour', and a 'sense of wounded honour'; here it seems to denote a combination of 'shame' and 'awe' or 'dread'.

⁵ Such as that exerted by heat.

⁶ The same problem is treated somewhat differently in chapter 60.

⁷ Cp. 903^b 8-10 and note.

20 Why is it that of all animals man alone is apt to become 55
hesitating in speech?¹ Is it because he alone possesses
the power of uttering words, while the other animals only
have voices? Now those who hesitate in their speech use
their voice, but they cannot connect their words together.

Why is the voice shriller in winter and in those who 56
25 are sober, and deeper in summer and in those who are
drunken? Is it because the quicker a voice is the shriller
it is, and it is quicker when it proceeds from one who is
in a state of tension? The bodies of those who are sober
are in a more solid condition than those of the drunken,
and bodies are in a more solid condition in winter than in
summer; for heat and warmth have a dissolvent effect upon
the body.

30 Why does the voice come to perfection later in man 57
than in any other creature capable of sound?² Is it
because there are many variations and kinds of sounds in the
human voice? For the other animals can express few or
no letters;³ and that which is most elaborate and contains
a large number of variations takes a long time to perfect.

35 Why is it that the sight cannot pass through hard 58
objects, but the voice can do so?⁴ Is it because the course
of the sight can only take one direction, namely, a straight
line (as is shown by the rays of the sun and the fact that
we can only see what is directly opposite us), whereas the
voice can take many directions, since we can hear from
everywhere? When therefore the sight is prevented from
making its way through in a straight line, because there
40 is no continuous passage between the eye and the object,
it is impossible to see through the impeding matter. But
905^b the air and the voice, since they travel everywhere, find
their way everywhere and make themselves audible. On
the other hand, the sight can penetrate through liquids,
but voices cannot be heard through them or hardly at all,
although the liquid is rarer than the earth, because the

¹ Cp. x. 40.

² Cp. 898^b 32.

³ Cp. 899^a 1; *H. A.* 488^a 32, 536^b 1.

⁴ Cp. chapter 49, and xxv. 9.

passages are small and close together and continuous, and so the sight is not prevented from travelling in a straight line. For the same reason it is possible to see through glass, although it is dense, but not through a fennel-stalk, although it contains rarities, because in the former the pores are continuous, in the latter they are irregular, and their size is no advantage if they are not straight.¹ The voice is not audible through water, because the empty air-spaces² in it are too small and so cannot admit the voice or let it pass through, or only with difficulty; for the voice is a kind of air. For that which is rarer is not necessarily more penetrable, unless at the same time the passages are adapted to that which is passing through. So also that which is rarer is not necessarily more compressible, unless its passages are of such a kind as to admit the passage of other bodies. But, it may be urged, that which is rare is soft and compressible. True, but in some things compression is impossible owing to the smallness of the passages—in glass, for example; for its passages cannot be contracted, although it may be rarer than a fennel-stalk, for the reason already mentioned. So too with water and the like. This then is clear, that, although the rare and the soft are either identical or else of a very similar nature, yet it does not follow that the rarer a thing is the more it admits of contraction. The reason in all these cases is the same.

59 Why is it that the sound produced becomes less if some of those who produce it are withdrawn,³ but its character is unchanged? Is it because their voice had formed part of a general mingling of sound, and that which is mingled is not mingled in one part and not in another, but is mingled throughout?⁴ So when some of those who make

¹ Reading with Bonitz (*op. cit.*, p. 412) διοράται, ὅτι τῆς μὲν οἱ πόροι κατάλληλοι, τοῦ δὲ παραλλάττοντες, οὐθὲν δ' ὄφελος εἶναι κτλ.

² τὰ δυίκενα are the same as the πόροι of the rest of the passage.

³ This must be the meaning of ἐξαιρουμένων, though it is very inadequately expressed in the text. The source of this problem, like that of chapter 52, is evidently a series of questions connected with chorus singing; and in its original setting the context doubtless made its meaning clearer.

⁴ Cp. *MIXG.* 977^a 10 ἅπαν ἅπαντι μέρος μέμκται ὁμοίως καὶ τὸ ὄλον.

the sound are withdrawn, the volume of sound comes forth in the same way as before from the various voices, and must therefore, though smaller, necessarily retain the same characteristics.

What is the cause of hesitancy in speech?¹ Are those 60
 who hesitate in too great a hurry because of the heat that
 30 is in them, and so they stumble and stop? If so, they
 resemble those who are angry, for they too become full
 of panting, with the result that a large quantity of breath
 comes together. Or do they pant owing to the boiling
 of the heat, because it is abundant and cannot come forth
 before the proper moment² of exhalation? Or is the
 right explanation the exact contrary, namely, that it is
 the chilling rather than the heating of the region in which
 35 the sound is produced—a state resembling apoplexy in
 that part of the body? That is why those who hesitate,
 when warmed with wine and deriving thence a continuity
 of speech, are better able to connect their words together.³

Why are voices deeper in the winter?⁴ Is it because 61
 then the air is thicker and as a consequence its movement
 is slower, and therefore the voice is deeper? Or is it
 40 because the air passes more slowly through narrow pas-
 906^a sages, and the region round the larynx is closed by the cold
 and by the phlegm which flows into it?

Why is it that boys, women, eunuchs, and old men have 62
 shrill voices?⁵ Is it because the movement of air which
 creates a shriller sound is quicker? Now it is more
 5 difficult to move a greater amount of the same thing,⁶
 and so those who are in the prime of life draw in
 the air in greater quantities, and therefore this air, since
 it travels more slowly, makes the voice deeper. In boys
 and eunuchs the contrary occurs, because they contain less

¹ This problem is the same as that of chapter 54, but some alternative solutions are suggested here.

² It appears necessary to read τὸν . . . καιρόν.

³ This last explanation is a verbal repetition of 905^a 16-19.

⁴ Cp. chapter 17.

⁵ Cp. chapters 4, 16, and 34.

⁶ Reading πλεῖον ὄν (W. D. R.) for πλείονος.

air. Old men's voices tremble¹ because they cannot control them, just as, when invalids and children take hold of 10 a long stick by one end, the other end shakes, because they have no control over it; this too is the cause of trembling in old men, namely lack of control. We must suppose also that trembling of the voice in those who are nervous or afraid or chilled is due to the same cause. For in one whose voice is in this state, since most of the heat collects 15 within as a result of the above conditions,² the rest,³ which is small in quantity, cannot control the voice; consequently it shakes and trembles. This is the reason why artists who belong to the class of those who are conscious of nervousness speak in a low voice at first, until they settle down to their work; for by keeping the voice low they 20 can control it.

¹ There is an anacoluthon in this sentence, the infinitive *τρέμειν* being picked up by *διὰ τοῦτο καὶ οἱ πρεσβῖται τρέμουν*.

² The text is disturbed. In the above *τοιούτων*, *(τοῦ θερμοῦ διὰ) τῶν τοιούτων* has been translated. The Latin version of T. G. has: *cum enim, qui vocem ita emittit, eius calor pulsus ab affectibus illis intro se colligat maxima a parte*, &c. The insertion of *calor* here is quite in accordance with the doctrine that it is heat which sets the voice in motion (cp. 902^b 37-9); also the theory of *περίστασις* or *ἀντιπερίστασις τοῦ θερμοῦ* is exceedingly common in the *Problems*, see note on 876^b 32.

³ Reading *<τὸ> λοιπὸν* (W. D. R.).

BOOK XII

PROBLEMS CONNECTED WITH THINGS OF PLEASANT ODOUR

WHY is it that perfumes produced by burning affect the I senses less at a short distance? ¹ Is it because the effluvium is pleasanter when mingled with the air in a weak form, 25 as happens in medicinal myrrh? Or can the contrary of this be the explanation, namely, that the fire destroys the odour in the immediate neighbourhood of the flames? For the odour is produced when the perfume evaporates; wherefore near the embers the effluvium has no odour, but it appears purer and thinner the farther away it is.

30 Why is it that the odours of burning perfumes and of flowers are less sweet-scented at a close distance? ² Is it because particles of earth ³ are given off with the odour, and these, owing to their weight, fall more quickly to the ground, and therefore the odour is pure at a greater distance? Or is the effluvium not at its strongest either quite near to its source or very far from it? For close 35 at hand it has not yet gained strength, while at a distance it has become dissipated. It is said that trees become 3 sweet-scented upon which the rainbow has fallen. Is this true or false? ⁴ And if it is true, what can be the cause of 906^b the phenomenon? ⁵ That it does not happen always and as

¹ The same problem or kindred questions are treated in chapters 2, 4, and 9. The source of these problems is clearly Theophrastus, *de Caus. Plant.* vi. 17. 1; fr. 3 (*de Odoribus*), 12, 13.

² Cp. chapters 1, 4, and 9.

³ For the 'earthy element' in plants, cp. *de Plant.* 822^a 12, ^b 2, &c.

⁴ λέγεται γάρ, as Prantl (*op. cit.*, p. 350) has shown, does not begin a new problem. Chapter 3 is a digression which raises a side issue, as in the source from which this problem is taken (Theophrastus, *de Caus. Plant.* vi. 17. 7). In several MSS. λέγεται γάρ . . . κατασκήψη follows τὸ συμβαῖνον (l. 38), which shows that a difficulty was felt in beginning a new problem with a statement such as λέγεται γάρ, instead of a question; this alteration, however, would give a form of problem which cannot be paralleled elsewhere.

⁵ Reading αἰρίαν (<άν> εἴη (so also Richards).

a universal rule is obvious ; for rainbows often occur without any visible effect on the trees. When it does happen (for it does occur sometimes and this has given rise to the saying), the effect is not produced on every kind of wood. The cause can only be attributed to the rainbow *per accidens*, especially if the rainbow does not really occur in nature but is an effect produced on the eye by refraction.¹ Now the phenomenon, as we said, does not occur whatever the condition of the wood ; for shepherds say that sweet odour is noticeable after the rains which accompany the rainbow not in green or in dry trees but in burnt wood, and in particular where briars and brambles grow and trees which have sweet-scented flowers. The reason of the sweet scent is the same as in the soil ; for where the soil is hot and burnt through and through, anything which grows from it is at first sweet-scented. For things which contain but little moisture, if they are burnt at all, become sweet-scented ; for the heat concocts this moisture. (So, all the world over, those parts towards the sun have a sweeter odour than those towards the north ; and of the former those towards the east have a sweeter odour than those towards the south, for the districts of Syria and Arabia have more soil, but Libya is sandy and free from moisture.) For there must not be a large amount of moisture—for much moisture is difficult of concoction—nor must there be a complete absence of it, or else there will be no evaporation. These conditions are fulfilled in newly burnt wood and wood which naturally has a sweet odour in itself. This is proved to be true by the flowers, for it is through them that the wood emits its scent. The theory that sweet odour is engendered in any trees upon which the rainbow rests is due to the fact that this cannot happen without the presence of water ; for it is when the wood has been wetted and has then concocted the moisture by the heat which is in it, that it gives out the vapour which is being engendered in it. But² there must not be a large amount of water ; for too much water drenches the

¹ Cp. *Meteor.* 372^a 18, 32 ; *de Mundo*, 395^a 29 ff.

² Reading *οὐδέ* for *οὐτε*, as suggested by Bekker.

tree and extinguishes the heat previously caused by the
 30 burning. Now the rains which follow the rainbow, so far
 from being heavy, may almost be called slight. Also if
 there is a number of rainbows, the rain is not heavy, but
 it falls little and often. It is therefore natural under these
 circumstances that men notice nothing unusual except
 the rainbow and attribute to it the cause of the sweet
 odour.

35 Why is it that flowers and burnt perfumes smell sweeter 4
 at a distance,¹ whereas close at hand they have rather the
 smell either of vegetation or of smoke? Is it because
 scent is a form of heat and sweet-scented things are hot?
 907^a Now heat is light, and so, the further the perfumes pene-
 trate, the more does their scent become purified from other
 concomitant odours produced by their leaves and by smoke,
 which is a watery steam; at a short distance, on the other
 hand, the mingled odours² are simultaneously perceptible
 in the plants in which they are present.

5 Why do things always emit a stronger odour when they 5
 are in motion?³ Is it because they fill a larger space of
 air than when they are at rest? The result is that the
 odour is thus transmitted more quickly to our perception.

Why is it that we perceive odours less in the winter, 6
 especially in frosty weather? Is it because the air is more
 10 free from motion when it is cold? The motion therefore
 set up by the body which produces the odour cannot have
 such a far-reaching effect owing to the difficulty of im-
 parting motion to the effluvium and to the air in which
 it is present.

Why do perfumes have a more pungent odour when 7
 they are burnt on ashes than on the fire?⁴ And why is
 their odour stronger and more persistent when they are
 15 burnt on ashes? Is it because their odour is less tho-
 roughly concocted on ashes, and therefore greater in bulk?

¹ Cp. chapters 1, 2, and 9.

² i. e. the odour of the leaves and of the 'smoke' as well as the
 scent.

³ Cp. xiii. 12.

⁴ Cp. below, chapter 11.

Now fire by quickly concocting their natural force alters their odour; for concoction involves alteration in that which is concocted.

- 8 Why do those roses in which the centres are rough ²⁰ smell sweeter than those in which they are smooth? Is it because those roses smell sweetest which partake most of the natural characteristics of the rose? Now the rose is naturally 'spiky', and so it smells sweeter when its characteristics are more a centuated.
- 9 Why are the odours both of burnt perfumes and of flowers less pleasant at a short distance?¹ Is it because ²⁵ at a short distance the earthy element is transmitted with the scent, and so mixing with it lessens its strength, whereas the odour travels to a distance? It is for this reason too that flowers when rubbed lose their scent.²
- 10 Are scents smoke [or air]³ or vapour? For it makes a difference, in that the former is produced by fire, the ³⁰ latter without it. And is something transmitted from the sense to the objects producing the scent or vice versa, causing a continuous motion in the adjoining air? Also, if any effluvium is given off by these objects, one would expect them to become less; yet we see that those things which have the strongest scent last the longest.
- 11 Why have perfumes a more pungent odour when they ³⁵ are burnt on ashes than on fire?⁴ Is it because their odour is less thoroughly concocted on ashes and is therefore greater in bulk? Consequently a large quantity of the earthy element is vaporized in the process and becomes smoke; but the fire burns up the earthy element before it can escape, and so the odour is purer and reaches the senses untainted by the smoke. This is also the reason ^{907^b} why flowers when rubbed smell less sweet; for the rubbing

¹ Cp. chapters 1, 2, and 4.

² Because rubbing brings out the earthy element, which prevails over the scent, cp. 907^b 1-3, 33-4.

³ ἢ ἀήρ, which has probably crept into the text owing to the mention of ἀήρ in l. 33, should be omitted, since only two alternatives are offered in the next sentence.

⁴ Cp. chapter 7.

imparts motion to the earthy element and the slow heat¹ does not destroy it.

Why is it that sweet-smelling seeds and plants promote¹² the flow of urine?² Is it because they contain heat and
 5 are easily concocted,³ and such things have this effect? For the heat which is in them causes quick digestion⁴ and their odour has no corporeal existence; for evil-smelling plants, such as garlic, by reason of their heat promote the flow of urine, but their wasting effect is a still more marked characteristic. But sweet-smelling seeds contain
 10 while evil-smelling things are unconcocted. Now anything which is to promote the flow of urine must be not only hot but also easily concocted, in order that it may accompany the liquids in their downward course and effect their digestion.

Why is it that wines mixed with water have a less strong¹³ odour⁵ than when they are unmixed? Is it because wine
 15 mixed with water is weaker than unmixed wine? Now the weaker is more easily changed by any force acting upon it than the stronger.⁶ So wine mixed in the water is more easily affected than unmixed wine. Now it is characteristic of that which is easily affected⁷ to yield⁸ to something else or to receive something which does not belong to it; unmixed wine, therefore, has a strong odour, but wine mixed with water is odourless.

¹ i. e. that produced by friction.

² This problem is partly identical with i. 48 and is repeated in xx. 16.

³ Reading *εὔπεπτα*, cp. 865^a 20, 924^b 19: the reading *λεπτά* is probably due to *λεπτύνει* in the next line.

⁸ Reading *ὑπέξει* (W. D. R.).

BOOK XIII

PROBLEMS CONNECTED WITH THINGS OF
UNPLEASANT ODOUR

- 1 WHY is it that urine acquires a more unpleasant odour the longer it remains in the body, whereas ordure becomes less unpleasant to the smell? Is it because the latter becomes drier the longer it remains in the body (and what is dry is less liable to putrefaction), but urine thickens, and ²⁵ the fresher it is the more like it is to the original liquid drunk?
- 2 Why is it that things of unpleasant odour do not seem to have an odour to those who have eaten them? Is it because, owing to the fact that the scent penetrates to the mouth through the palate, the sense of smell soon becomes satiated and so it no longer perceives the odour inside the ³⁰ mouth to the same extent—for at first every one perceives the odour, but, when they are in actual contact with it, they no longer do so, as though it had become part of themselves—and the similar odour from without is overpowered by the odour within?
- 3 Why have flowers an unpleasant odour when they are rubbed? Is it because the earthy element, which is in the flower, mingles with the odour? ¹
- 4 Why is it that no living creature is pleasant to the smell ³⁵ except the panther ²—which is pleasing even to the animals, for they are said to find pleasure in its odour—and when they decay they are unpleasant to the smell, but many plants when they decay and wither become still more pleasant to the smell? Is it because the cause of evil odour is an unconcocted condition of excretion? For this reason ^{908^a} the perspiration of some people is sometimes unpleasant,

¹ Cp. 907^a 27, ^b 1 ff.

² Cp. Theophrastus, *de Caus. Plant.* vi. 5. 2.

particularly in those whose perspiration is not usually unpleasant, as the result of disease.¹ Also the exhalations and eructations of those who are in an unconcocted state are unpleasant. The same cause must be ascribed for evil odour in the flesh and in that which is analogous to it (by
 5 which I mean that which in other animals corresponds to flesh); for here too there is sometimes unconcocted excretion. This then when it putrefies is a cause of evil odour in living creatures and in decaying bodies. For this reason too the fat and the bony parts and the hair have no evil odour, because the fat and bones are already concocted,
 10 while the hair contains no moisture. Now plants contain no excretion.² Or is there excretion in them also, but, because plants are naturally dry and hot, is the moisture in them more easily concocted and not of a thick consistency? This can be illustrated from the soil, which is pleasant to the smell in hot regions, such as Syria and Arabia, and from the fact that the plants which come from
 15 there are sweet-smelling, because they are dry and hot; and such plants are not liable to decay. But animals are not dry and hot,³ and so their excretions are unconcocted and malodorous, and likewise their⁴ exhalations, and when they decay the moisture putrefies. This does not happen in plants, because they contain no excretions.

20 Why are things of unpleasant odour more unpleasant 5 when they are hot than when they are cool? Is it because odour is a vapour and an effluvium? A vapour, then, and an effluvium is caused by heat; for a movement takes place, and heat is the source of the movement. Cold, on the contrary, is a source of stagnation and contraction and
 25 downward movement;⁵ but heat and all odours have an upward tendency, because they are in the air, and the organ which perceives them is above and not below; for odour penetrates to the brain and so causes perception.

¹ The Teubner text misprints *τοιούτοι ἐκ τῶν* for *τοιούτοι ἐκ τῶν*.

² This is the Aristotelian view, cp. *P. A.* 650^a 22, *de Plantis*, 817^b 19.

³ *τοιαιῦτά ἐστι καὶ θερμά* appears to be a mixture of two readings, (1) *ξηρὰ ἐστι καὶ θερμά*, (2) *τοιαιῦτά (= ξηρὰ καὶ θερμά) ἐστι*.

⁴ Reading with Richards *καὶ <αἱ> διαφύσεις*.

⁵ Reading *φοροῦν*, neuter of the participle of *φορέω*.

6 Why, if one eats garlic, does the urine smell of it, whereas this does not happen when other things are eaten which have a strong odour? Is it because, as some of the followers of Heraclitus say,¹ vaporization takes place³⁰ in the body just as in the universe, and then, when the process of cooling succeeds, moisture is formed in the universe and urine in the body, so the vaporization from the food, when it is formed by intermixture, causes the odour (for it is odour after it has undergone change)?² If so, ought not all the foods too which have a strong odour³⁵ to produce this effect, which we know they do not? Furthermore, concretions from vapour do not resume their original form—which would result in wine, for example, being produced from the vapour of wine instead of water, as actually happens—and so this part of their theory is also untrue. The truth is that garlic, alone of foods which^{908^b} have an odour which is strong and also promotes the flow of urine, has the quality of inflating the lower part of the belly; all other such foods (radishes, for example) engender³ breath higher up or else do not promote the flow of urine. But garlic⁴ has these three qualities: it promotes the flow of urine, it engenders breath, and it does so in the lower⁵ part of the body. The region round the privy parts and the bladder feels the effect of such foods owing to its nearness⁵ and because it is liable to admit breath; that this is so is shown by the distension of the privy parts. It is clear therefore that the excretion of garlic is more liable than that of any other such food to reach the bladder with the breath, and this excretion mingling with the urine¹⁰ imparts its odour to it.

7 Why is it that the mouths of those who have eaten nothing, but are fasting, have a stronger odour, 'the smell of fasting', as it is called, but when they eat the odour

¹ For other applications of the Heraclitean doctrine of ἀναθυμίασις cp. below 934^b 33 ff., *de Anima*, 405^a 25, 26.

² Reading μεταβάλη. ³ Omitting καὶ before τὰ πνεύματα.

⁴ κάρω cannot stand here; it is in its proper place in the next line. The Latin version of T. G. has *allium vero tria nimirum haec facit*, and we must read τούτω (= σκορόδω) which the context demands.

⁵ i. e. to the lower part of the stomach.

ceases, when one would expect it to increase? Is it because, as the stomach becomes empty, the air becomes hotter from the absence of motion and causes the breath and the excre-
 15 tions of phlegm to putrefy? That the air becomes hotter is proved by the fact that fasting also induces an increase of thirst. When food is taken, the odour ceases because it is less than that of the food; for the heat in the food overcomes the internal heat, so that it cannot undergo any process of change.¹

20 Why has the armpit a more unpleasant odour than any other part of the body? Is it because it is least exposed to the air?² Such parts have a particularly unpleasant odour because putrefaction takes place in them owing to the stagnation of fat. Or is it because the armpit is not moved and exercised?

Why is it that those who have a rank odour are still
 25 more unpleasant when they anoint themselves with unguents? Is it because this kind of thing happens in many instances; for example, if something acid and something sweet are mixed, the resulting whole is sweeter? Now any one who perspires has an unpleasant odour, and unguents are productive of heat and therefore induce perspiration.

Why is it that the odour of the breath of those who
 30 are bent and deformed is more unpleasant and oppressive?³ Is it because the region round the lungs is contracted and bent out of an upright position, so that it does not give a free passage to the air, but the moisture and the breath, which tends to be enclosed within, putrefies?

Why is it that most unguents are unpleasant when they
 35 mingle with perspiration, but others have a sweeter or at any rate not a more unpleasant odour? Do those which change as a result of movement or friction deteriorate in odour, whereas those which do not are improved? There

¹ i. e. produce putrefaction which engenders the 'smell of fasting'.

² Cp. 867^a 4-7.

³ This is quoted by Apollonius, *de Mirab.* 37, as from the *Physical Problems* of Aristotle.

are some such perfumes, just as there are some flowers from which scents are made, which deteriorate when rubbed 909^a or heated or dried, white violets, for example; but others remain the same, for instance roses. The unguents too made from flowers of the former class change, while those made from the latter do not; and so rose-perfume is least liable to change. Also unguents have a more unpleasant odour on those whose perspiration is malodorous, through 5 mingling with their opposite, just as honey when mixed with salt becomes not sweeter but less sweet.

- 12 Why do objects always produce a stronger odour when they are in motion?¹ Is it because they fill up the air? The result is that the odour is thus transmitted more 10 quickly to our perception.

¹ This chapter is an almost verbal repetition of xii. 5.

BOOK XIV

PROBLEMS CONNECTED WITH THE EFFECT
OF LOCALITY ON TEMPERAMENT

WHY are those who live under conditions of excessive **1**
cold or heat brutish in character and aspect? Is the cause
15 the same in both cases? For the best mixture of conditions
benefits the mind as well as the body, but excesses of all
kinds cause disturbance, and, as they distort the body, so
do they pervert the mental temperament.

Why is it that in Pontus corn, if exposed to the cold, **2**
keeps intact for many years?¹ Is it because the extraneous
20 moisture is evaporated together with the heat, as happens
in grapes? For some things are evaporated by the cold
and others with the heat.

Why do burning fevers occur more frequently in the **3**
coldest season? Is it because the cold imprisons the heat²
within? In the summer the contrary occurs, the interior of
25 the body being cooler than the exterior. Burning fever
is the inflammation in which,³ the exterior of the body
being cold, the interior is in a condition of excessive heat.

Why are the Ethiopians and the Egyptians bandy- **4**
legged? Is it because the bodies of living creatures
become distorted by heat, like logs of wood when they
become dry? The condition of their hair too supports this
30 theory; for it is curlier than that of other nations, and
curliness is as it were crookedness of the hair.

¹ Cp. Theophr. *de Caus. Plant.* iv. 16. 2.

² For ἀντιπερίστας τοῦ θερμοῦ see 867^b 32 and note.

³ The text, as it stands, does not give any good sense, but the meaning is quite clear from a comparison with 862^b 31 ff., which expressly states that burning fever comes from within and is due to the collection of heat inside the body. The simplest emendation is to read with Sylburg πυρετὸς (ἐν φῶ) τῶν κτλ.

- 5 Why is it that in damp regions copulation is more likely to lead to the birth of female offspring?¹ Is it because a large amount of moisture thickens more slowly, and in damp regions the semen is moister owing to the presence of more moisture in the temperament?
- 6 Why is it that in marshy districts sores on the head are 35 quickly cured, but those on the legs only with difficulty?² Is it because the moisture, since it contains an earthy element, is heavy, and heavy things are carried downwards? Thus the upper parts of the body are easily concocted, because the impurities are carried downwards; but the lower parts become full of abundant excretion which easily putrefies. 40
- 7 Why is it that those who live in airy regions grow old 909^b slowly, but those who inhabit hollow and marshy districts age quickly? Is it because old age is a process of putrefaction, and that which is at rest putrefies, but that which is in motion is either quite free from, or at any rate less liable to, putrefaction, as we see in water? In lofty regions, therefore, owing to the free access of the breezes, 5 the air is in motion, but in hollow districts it stagnates. Furthermore, in the former, owing to its movement, the air is always pure and constantly renewed, but in marshy districts it is stagnant.
- 8 Why are the inhabitants of warm regions cowardly, and those who dwell in cold districts courageous?³ Is it because there is a natural tendency which counteracts the effects of 10 locality and season, since if both had the same effect mankind would inevitably be soon destroyed by heat or cold?⁴ Now those who are hot by nature are courageous, and those who are cold are cowardly. But the effect of hot regions upon those who dwell in them is that they are cooled, while cold regions engender a natural state of heat in their inhabitants. Both races are large of stature—those 15

¹ Cp. *G. A.* 766^b 34, where the same view is stated.

² The same problem occurs in i. 18.

³ Cp. chapter 16.

⁴ For this use of *καίειν* for the effects of both extreme heat and extreme cold cp. *Meteor.* 382^b 8 *καίειν λέγεται . . . τὸ ψυχρὸν.*

who live in cold regions because of the innate heat in them, and those who inhabit hot districts owing to the heat in which they live; for increase of stature occurs both in those who are hot and as a result of heat, whereas cold has a contracting effect. Since then those who live in cold districts
 20 have a powerful principle of growth in themselves, and those who live in hot regions encounter no external cold which prevents their growth, both naturally admit of considerable increase in stature. But this is less true of those who live in our latitudes, because the principle of growth in them is less strong, and those who live in cold regions feel the contracting effect of cold.

25 Why are those who live in hot regions longer-lived? Is 9
 it because their natural condition is drier, and that which is drier is less liable to putrefaction and more lasting, and death is as it were a kind of putrefaction? Or is it because death is due to the chilling of the interior heat,¹ and every-
 30 thing is chilled by a surrounding medium which is colder than itself? Now in warm regions the surrounding air is hot, but in cold regions it is cold and so more quickly and effectively destroys the interior heat of the body.

Why are those who live in hot regions longer-lived? 10
 35 Is it because they preserve their heat and moisture better? For death is the corruption of these.²

Why is it that we become drowsier in marshy districts? 11
 Is it because there we are more cooled, and cooling, being
 40 a kind of rest,³ induces sleep, and sleep occurs during rest?

910^a Why is it that those who live on board ship, though 12
 they spend their time on the water, have a healthier colour than those who live in marshes? Is the weather and the free access of the breezes the cause? Now water makes men pale when it putrefies, a process which is due to the absence of movement; that is why those who live in marshy regions are rather pale.

¹ Cp. *de Iuv. et Sen.* 469^b 18; *de Vit. et Mort.* 478^b 32.

² A condensed form of the previous chapter.

³ i. e. cold is ἡσυχία, just as heat is κίνησις.

- 13 Why is suffocating heat very frequently experienced in 5
wintry regions, much more so than in warm districts? ¹ Is
it because of the moisture in the air? For as a result of
the same heat applied to it water becomes hotter than air,
and therefore damper air ² becomes hotter than dry air.³
Or perhaps the air is not really hotter ⁴ in these regions,
but only seems so by contrast with the general coolness, as ¹⁰
the sun emerging from a cloud seems hotter in contrast with
its effect when it is behind a cloud.
- 14 Why do those who live in southerly climes tend to have
black eyes? Is blueness of the eyes due to excess of
internal heat, whereas blackness is due to its absence, as
Empedocles affirms? Just, therefore, as those who dwell ¹⁵
in the north have blue eyes, because the internal heat is
prevented from escaping owing to the external cold; so in
those who dwell in southerly climes the moisture cannot
escape owing to the surrounding heat, but the heat escapes
because there is nothing to bar its exit, and the moisture ²⁰
left behind causes blackness; for when light departs that
which is left behind is dark. Or does the pigmentation of
the eye assimilate itself to the colour of the rest of the
body? If so, the eyes of those who live towards the north
are blue, because they are themselves white (for blue is
akin to white); and those who dwell in the south being ²⁵
black, their eyes also are black.
- 15 Why are those who live in warm regions wiser than
those who dwell in cold districts? ⁵ Is it for the same
reason as that for which the old are wiser than the young?
For those who live in cold regions are much hotter, because
their nature recoils owing to the coldness of the region in
which they live, so that they are very like the drunken and
are not of an inquisitive turn of mind, but are courageous ⁶ ³⁰
and sanguine; but those who live in hot regions are sober
because they are cool. Now everywhere those who feel

¹ Cp. 938^a 37 ff.

² Reading *ὁ ἀῖρ* <ὁ> *ὑγρότερος* (W. D. R.).

³ Reading *ξηροῦ* for *θερμοῦ* (W. D. R.).

⁴ Reading *θερμότερος* for *ξηρότερος* (W. D. R.); T. G. renders *calidior*.

⁵ Cp. *Pol.* 1327^b 23 ff. ⁶ Cp. 909^b 10 ff.; 910^a 37 ff.

fear make more attempt to inquire into things than do the self-confident, and therefore they discover more. Or is it because the race of those who live in warm regions is more ancient, the inhabitants of the cold regions having perished
 35 in the Flood,¹ so that the latter stand in the same relation to the former as do the young to the old?

Why are the inhabitants of warm regions cowardly, and 16 those who dwell in cold regions courageous?² Is it because human beings have a natural tendency which counteracts
 910^b the effect of locality and season (for, if both had the same tendency, they would soon be destroyed)? Now those who are hot by nature are courageous and those who are cold are cowardly. The effect of hot regions upon their inhabitants is to cool them (for, their bodies having rarities,
 5 the heat escapes out of them), but those who live in a cold climate become heated in their nature, because their flesh is densified by the external cold, and when it is in this condition the heat collects internally.

¹ For references to the Flood in Aristotle see *Pol.* 1269^a 4 ff., *Meteor.* 352^b 16 ff. Synesius is perhaps referring to this passage when he says (*Encom. Calvit.* 22) *περὶ ὧν παροιμιῶν Ἀριστοτέλης φησὶν ὅτι παλαιῆς φιλοσοφίας (v.l. ἱστορίας) ἐν ταῖς μεγίσταις φθοραῖς ἀπολομένης ἐγκαταλείμματα περισωθέντα διὰ συντομίαν καὶ δεξιότητα.* The doctrine of the Flood is also found in Theophrastus, cp. J. Bernays, *Theophrastos' Schrift über Frömmigkeit*, p. 50. Plato refers to the Flood in *Tim.* 22 A, C, 23 A, B, *Crit.* 109 D, 111 E; for other classical references see J. B. Mayor's note on Juvenal i. 83.

² This problem is partly identical with chapter 8.

BOOK XV

PROBLEMS CONNECTED WITH
MATHEMATICAL THEORY

- 1** WHY is it that of all the lines which divide a rectilinear figure into two parts that drawn from angle to angle alone bears the name of diameter? ¹ Is it because the diameter, as its name implies, divides the figure of which it is the diameter into two parts without destroying it? The line therefore which divides it at its joints ² (by which I mean ¹⁵ the angles) will be the diameter; for it does not destroy the figure but divides it, like those who divide up implements of war for distribution. But a division which cuts through a composite figure in the lines which form it destroys the figure; for a rectilinear figure is constructed on angles.
- 2** Why is the diameter so called? ³ Is it because it is the only line which divides a rectilinear figure into two parts, as though one should call it the 'dichiameter'? ⁴ And why ⁵ ²⁰ is it the only one that bears this name of all the lines which divide a rectilinear figure into two parts? Is it because it is the only line which divides the figure at the points where its limbs bend, ⁶ whereas all other lines divide it in its sides?
- 3** Why do all men, barbarians and Greeks alike, count up to 10 and not up to any other number, saying for example, 2, 3, 4, 5 and then repeating them, 'one-five', 'two-five', ²⁵

¹ *διάμετρος* has the meanings both of diameter and diagonal.

² The rectilinear figure is conceived as something organic, its sides being members which are jointed together at the angles; this is more clearly brought out in ll. 21, 22 below.

³ A repetition in a shorter form of chapter 1.

⁴ i. e. 'that which measures into two parts'. All the MSS. here read *διάμετρος*, but the emendation to *διχάμετρος* is certainly correct.

⁵ Reading with Bekker *διὰ τί* for *διότι*.

⁶ Cp. above, ll. 14, 15 and note.

just as they say eleven, twelve? ¹ Or why do they not stop at some point beyond ten and repeat from there? For every number is made up of one, two, &c., combined with a preceding number,² and thus a different number is formed; but the counting always proceeds in fixed sets of ten. For it is clearly not the result of chance that all men ³ invariably
 30 count in tens; and that which is invariable and universal is not the result of chance, but is in the nature of things. Is it because ten is a perfect number? For it combines every kind of number, odd and even, square⁴ and cube, length and surface, prime and composite. Or is it because ten is the original number, since one, two, three, and four
 35 together make ten?⁵ Or is it because the bodies which move in the heavens are nine in number?⁶ Or is it because in ten proportions four cubic numbers result,⁷ from which numbers the Pythagoreans⁸ declare that the whole universe is constituted? Or is it because all men have ten
 911^a fingers, and so, as though possessing counters that indicate the numbers proper to man, they count all other things by this quantity? One race among the Thracians alone of all men count in fours, because their memory, like that of children, cannot extend farther and they do not use a large number of anything.

(Why is it that the shapes of the heavenly bodies always 4
 5 appear to us the same? Is it)⁹ because the earth is a centre? For the shapes which appear to us are always

¹ The Greek *ένδεκα*, *δώδεκα*, 'one-ten', 'two-ten', bring out the point better than the English 'eleven', 'twelve'.

² e. g. thirty-one, thirty-two, &c.

³ Reading with Bekker *ποιοῦντες* (<*πάντες*>) *φαίνονται*.

⁴ Omitting the commas after *ἄρτιον* and *τετράγωνον*.

⁵ i. e. ten, not one, is the unit, which for convenience has been divided into four fractions 1, 2, 3, and 4, which added together make 10.

⁶ i. e. there are nine planets (including the sun and moon), which with the addition of the earth make 10.

⁷ e. g. in ten proportions obtained by continuous multiplication of 1 by 2 four cubes occur: 1 (1³), 2, 4, 8 (2³), 16, 32, 64 (4³), 128, 256, 512 (8³).

⁸ Diels, *Vorsokr.* I³, 350. 1.

⁹ This problem is not translated in T. G.'s Latin version and the text is clearly unsatisfactory. The statement of the problem is derived by Bussemaker from another ancient version.

similar. This does not seem¹ to be so unless one views them from the centre, but they would sometimes appear triangular, sometimes irregular foursided figures, and sometimes take other forms.² Now the earth would appear to us to be the centre of the universe, if we could view it from the heavenly bodies. For the earth being spherical, the centre of the universe and of the earth will be the same. But we dwell on the 10 surface of the earth, so that it is not from the centre but at the distance of half the diameter that the heavenly bodies appear to have the shapes that they do appear to have. What reason then is there why the appearance of their shapes should not remain the same when the distance is increased?

5 Why is it that, although the sun moves with uniform motion, yet the increase and decrease of the shadows is not the same in any equal period of time?³ Is it because the 15 angles to the objects seen, that is the angles made by the rays⁴ of the sun and subtending equal arcs, are equal? Now if these are equal, so also are the angles which the rays when produced⁵ make in the triangle formed by the first ray⁶ and the object seen and the shadow. If the angles are equal, the line which is farther from the 20 object seen must be greater than that which is less far; for we know that this is so. Let the circumference, therefore, be divided into any number of equal parts, and let the object seen be Θ . When therefore the sun at A falling on Θ ⁷ makes the shadow $\Theta\Delta$,⁸ the ray must fall on A .⁹ But when the sun comes to B , the ray from B will 25

¹ Reading with Bussemaker <οὐ> δοκεῖ.

² No sense is to be made of the text as it stands; in particular there is nothing for τοῦτον (l. 9) to refer to. It seems probable that something has fallen out owing to *homoeoteleuton*, e. g. ἐδόκει <ἄν. τοῦ δὲ κόσμου ἂν ἐδόκει> ἡ γῆ.

³ Putting the comma before, and not after, ἐν τῷ ἕσθῳ χιρόνῳ.

⁴ Retaining the MS. reading ὑπὸ τῶν ἀκτίνων.

⁵ Reading εἰ δ' αἴται, καὶ <ἄς> ἐκβαλλόμεναι ποιούσιν <αἱ> ἀκτίνες. T. G. renders *quodsi illi aequales sunt, eductos quoque inde aequales esse necesse est*.

⁶ i. e. the ray from the sun when it is at A to Δ , the top of the object Θ .

⁷ Reading προσβαλὼν τῷ Θ (W. D. R.), cp. 911^b 37.

⁸ Reading with Bussemaker $\Theta\Delta$ for ΘA .

⁹ Reading with Bussemaker Λ for A .

fall within ΘA ,¹ and similarly again when the sun comes to Γ ; otherwise one straight line will touch another straight line at two points. Since therefore AB is equal to $B\Gamma$, the angles which subtend them² at Δ will also be equal, for they are situated about the centre. But if the angles on this side³ of Δ are equal, so also are the corresponding³⁰ angles in the triangle; for they are at the apices of the first pair of angles.⁴ So while the angle is divided into two equal parts,⁵ the line AE will be greater than the line EZ within $\Delta\Theta$.⁶ So too with the other angles formed by the rays from the circumference. At the same time it is clear

that the shadow must be shortest at midday and that then
 35 its increases are least. For the sun is most over our head
 at midday, and stifling heat occurs both for the reason just
 mentioned⁷ and because there is no wind; for wind is
 caused when the sun dissipates the air near the earth. If
 911^b therefore it does so simultaneously in both hemispheres,
 midnight and midday would naturally be windless.

¹ Reading with Bussemaker ΘA for $\Theta \Lambda$.

² Reading $\acute{\upsilon}\pi\delta\ \tau\acute{\alpha}\upsilon\tau\alpha\iota\varsigma$.

³ Reading with Bussemaker $\tau\eta\delta\epsilon$ for $\tau\eta$.

⁴ i. e. the angle $\Lambda\Delta E$ equals the angle $E\Delta Z$, these angles being at the apices of the triangles $\Lambda\Delta B$ and $B\Delta\Gamma$.

⁵ i. e. the angle $\Lambda\Delta Z$ is divided into two equal parts $\Lambda\Delta E$ and $E\Delta Z$.

⁶ Reading with Bussemaker $\acute{\eta}\ \Lambda E\ \tau\eta\varsigma\ E Z\ \acute{\epsilon}\nu\ \tau\eta\ \Lambda\Theta$. The fact that ΛE is greater than $E Z$ proves the main point of the problem, viz. that the decrease of the shadows is not uniform in an equal period of time.

⁷ i. e. because the sun is directly overhead.

6 Why does the sun penetrating through quadrilaterals form not rectilinear shapes but circles, as for instance when it passes through wicker-work? Is it because the projec- 5 tion of the vision is in the form of a cone,¹ and the base of a cone is a circle, so that the rays of the sun always appear circular on whatever object they fall? For the figure also formed by the sun must be contained by straight lines, if the rays are straight; for when they fall in a straight line on to a straight line, they form a figure contained by straight 10 lines. And this is what happens with the rays; for they fall on the straight line of the wicker-work, at the point where they shine through, and are themselves² straight, so that their projection is a straight line. But because the parts³ of the vision which are cut off towards the extremities of the straight lines are weak, the parts of the figure 15 about the angles are not seen; but what there is of straight line in the cone describes a straight line, while the rest does not, but the sight falls on part of the figure without perceiving it. For there are many things to which the sight penetrates without our seeing them, objects, for instance, which are in darkness. A similar phenomenon is the fact that a quadrilateral figure appears polygonal, and at a greater distance circular. Now since the projection of sight is in the form of 20 a cone, when the figure is removed to a distance the parts of the vision which are cut off towards the angles, because they are weak and few, do not see anything when the distance is increased; but the parts of the vision which fall upon the centre of the figure, being numerous and strong, are more persistent. When, therefore, the figure is near at hand, they 25 can⁴ see the parts in the angles; but, when the distance is greater,⁵ they cannot do so. For this reason too a curved line removed to a distance appears straight, and the moon on the eighth day seems to be contained by straight lines, if the vision falls upon the line which encloses it and not on its breadth. For when the circumference is near, the sight 30

¹ Cp. above, 872^a 37.

² Reading *αὐταὶ* with Bekker.

³ Omitting *ἀπὸ* after *ἀποσχιζομένας*, cp. below, l. 22.

⁴ Reading *δύναται* (Sylb.).

⁵ Reading *πλείονος δ' αὐτοῦ* (W. D. R.).

can discern how much nearer one part of the circumference is than another ; but when it is distant, the sight does not perceive it clearly, and it seems to be equally distant ; and so it appears to be straight.

35 Why, though the moon is spherical, do we see it straight 7
when it is half-full? Is it because our vision and the
circumference of the circles which the sun makes when it
falls upon the moon are in the same plane? Whenever
912^a this happens, the sun appears as a straight line ; for, since
that which casts its vision on a sphere must see a circle,
and the moon is spherical, and the sun looks down upon it,
there must be a circle which is caused by the sun. When
therefore this is opposite to us, the whole is visible and the
5 moon appears to be full ; but when it changes owing to the
altered position of the sun, its circumference becomes on a
plane with our sight and so it appears straight, and the rest
appears circular, because a hemisphere is opposite our
vision, and this has the appearance of a semicircle ; for the
10 moon is always facing our vision, but when the sun sheds
its rays we do not see it. And after the eighth day it
begins to fill out from the middle, because the sun as it
passes on makes the circle incline more towards us ; and the
circle being thus presented to view resembles the section of
a cone. It assumes a crescent-like appearance when the
sun changes its position ; for when the circle of the sun
15 reaches the extreme points, which make the moon seem
half-full, the circumference of the circle appears ; for it is
no longer in a straight line with the vision, but passes
beyond it. When this happens and the circle passes
through the same points, it must necessarily appear to have
a crescent shape ; for a part of the circle is directly on a
20 plane with the eye (a part of the circle, that is, which was
formerly opposite to us),¹ so that part of the brightness is
cut off.² Then the extremities too remain in the same
position, so that the moon must have a crescent shape to
a greater or less extent according to the sun's movement ;

¹ Putting a comma after ὄντος.

² Reading ἀποτέμνεται <τι>.

for when the sun changes its position, the circle upon which it looks also turns, remaining on the same points; for it might assume an infinite number of inclinations, since ²⁵ an infinite number of the largest circles can be described through the same points.

8 Why is it that the sun and moon, which are round, have the appearance of being flat? Is it because all things¹ of which the distance is uncertain seem to be equidistant, when they are more or less distant? And so in a single body ³⁰ composed of parts, provided that it is uniform in colour, the parts must necessarily appear equidistant, and the equidistant must appear to be uniform and flat.

9 Why does the sun make long shadows as it rises and sets, and shorter when it is high in the heavens, and shortest ³⁵ of all at midday? Is it because, as it rises, it will at first make a shadow parallel to the earth and cast it to an infinite distance,² and then make a long shadow, which

grows ever less because the straight line from the higher point falls within that from the lower point. Let AB be the gnomon,³ and Γ and Δ two positions of the sun. The ⁴⁰ ray from Γ , the line ΓZ , will fall outside the line ΔE ; ⁴ and **912^b** the shadow BE is formed when the sun is higher in the heavens, and BZ when it is lower,⁵ and it will be shortest when ⁶ the sun is at its highest and over our head.

¹ Reading πάντα.

² Reading ὑπερτερεῖ, and omitting ἀνισον as the corruption of a gloss ἀνίσχων.

³ i. e. the pole or pillar used for casting a shadow, or the index of a sun-dial.

⁴ Reading ΔE for ΓE.

⁵ Reading κατωτέρω (W. D. R.) for κατωτάτω.

⁶ Reading ὅταν ἀνωτάτω ἦ (Ruelle).

Why are the shadows thrown by the moon longer than **10**
 5 those thrown by the sun, though both are thrown by the
 same perpendicular object? Is it because the sun is higher
 than the moon, and so the ray from the higher point must
 fall within that from the lower point? Let AA be the

gnomon, B the moon, and Γ the sun. The ray from the
 moon is BZ , so that the shadow will be ΔZ ; but the ray
 from the sun is ΓE , and its shadow therefore will necessarily
 10 be less, viz. ΔE .

Why is it that during eclipses of the sun, if one views **11**
 them through a sieve or a leaf—for example, that of a
 plane-tree or any other broad-leaved tree—or through the
 two hands with the fingers interlaced, the rays are crescent-
 shaped in the direction of the earth?¹ Is it because, just
 as, when the light shines through an aperture with regular
 15 angles, the result is a round figure, namely a cone² (the
 reason being that two cones are formed, one between the
 sun and the aperture and the other between the aperture
 and the ground, and their apices meet), so, when under
 these conditions part is cut off from the orb in the sky,³
 there will be a crescent on the other side of the aperture
 from the illuminant, that is, in the direction of the earth
 20 (for the rays proceed from that part of the circumference
 which is a crescent)?⁴ Now as it were small⁵ apertures are

¹ i. e. on the lower side of the medium through which they shine.

² Cp. 911^b 5.

³ The Latin version of T. G. renders *ergo cum pars orbi superiori detrahitur*, and something like the following is probably the right reading, ὅταν οὖν ἐχόντων οὕτως <τοῦ> ἄνωθεν κύκλου ἀποτέμνηται <τι>, ἔσται μηνίσκος κτλ.

⁴ Placing a full stop after ἀκτίνες.
⁵ αἱ δὲ is certainly corrupt, and we should probably read μικραὶ δὲ, which is indicated by the Latin version of T. G., *pro foraminum exiguitate*, and which is implied by the contrast of ἢ διὰ μεγάλων ὀπῶν.

formed between the fingers and in a sieve, and so the phenomenon can be more clearly demonstrated than when the rays pass through wide apertures. Such crescents are not formed by the moon, whether in eclipse or waxing or waning, because the rays from its extremities are not clear-cut, but it sheds its light from the middle, and the middle 25 portion of the crescent is but small.

- 12 Why does the parhelion not occur either when the sun is in mid-heaven or above the sun or below it, but only at the side of it? Is it because the parhelion is produced when our visual ray to the sun is refracted, and this stationary condition of the air, on the occasion of which the vision is refracted, cannot occur either near the sun or far away from it? For, if it is near, the sun will dissolve it, whereas, if it is far away, the sight will not be refracted; for, if it is strained to a distance, it is weak when refracted from a small refractor.¹ (So too a halo does not form.) If then a refractor forms opposite the sun and near to it, the sun 35 will dissolve it, whereas if it be far away, the incidence of the sight upon it will be too weak. If, however, it forms at the side of the sun, it is possible for the refractor to be at such a distance that neither does the sun dissolve it nor does the sight ascend weakened² by passing under the earth. It does not form below the sun because, being near the earth, 40 it would be dissolved by the sun; whereas, if it were above the sun when the sun is in mid-heaven, the sight would be 913^a distracted. And it cannot form at all even at the side of the sun when it is in mid-heaven, because, if the sight is directed too far under the earth, very little of it will reach the refractor, so that, when it is refracted, it will be very³ weak.

- 13 Why does the extremity of the shadow caused by the 5 sun seem to tremble? For it is not due to the fact that the

¹ i. e. the stationary air. Sight and light are identified here as elsewhere frequently in the *Problems*, the sight being said to travel up to the object seen and back again to the eye.

² Reading ἀσθενῆ for ἀθρόαν, which gives exactly the opposite of the sense required, cp. below, 913^a 2-4.

³ Reading πᾶνν with Ruelle.

sun is travelling along ; for it is impossible for it to move in contrary directions, and it is of such motion that trembling consists. (Moreover it is uncertain why a shadow changes its position, as also why the sun itself moves.) Is it due to the movement of the so-called motes in the air ?
10 These can be seen in the rays which enter through a window ; for they move even when there is no wind. These then being constantly carried from the shadow into the light and from the light into the shadow, the common boundary between the light and the shadow is seen to move similarly. For changing¹ from side to side of it, these motes cause as it were shadow in one place and light in another ; so that
15 the shadow appears to move, though it is not really it but the motes which move in this way.²

² Reading *ἐκεῖνα* for *ἐκεῖναι* with Bussemaker.

BOOK XVI

PROBLEMS CONNECTED WITH INANIMATE THINGS

- 1 WHY is it that the bases of bubbles in water are white, and if they are placed in the sun they do not make any shadow, but, while the rest of the bubble casts a shadow, the base does not do so but is surrounded on all sides by sunlight? And, what is still more wonderful, even if a piece of wood is placed on the water in the sunlight, (there is no continuous shadow but)¹ it is cut off by the water at that point.² Is no shadow really formed? Is the shadow dissolved by the sun? If then a shadow is to be defined as anything which is not visible to the sun, the whole mass of the object all round must be visible to the sun; but the impossibility of this has been demonstrated in the treatises on optics,³ for even the largest optical system cannot see the whole circumference of the smallest visible object.
- 2 Why are bubbles hemispherical? Is it because the radii between the centre and the outer air extend in every direction upwards to the same distance and thus necessarily produce a hemispherical form? The corresponding hemisphere below is cut off by the watery surface in which the central point is situated.
- 3 Why is it that in magnitudes of uneven weight,⁴ if you set the lighter part of them in motion, the object thrown

¹ The text here makes no sense, and it is clear from T. G., who renders *nec si lignum per aquam in sole apposueris, umbra ligni continua exsultabit sed*, &c., that something has fallen out.

² ταῦτα gives no possible sense, and ταύτη (= 'on the surface of the water') has been translated.

³ There is no evidence that Aristotle wrote a work on Optics (cp. Bonitz, *Index*, 104^a 61 ff.); so we must suppose a general reference here to works on Optics, cp. 959^b 2 οἱ περὶ τὰ ὀπτικά.

⁴ The example of the loaded dice indicates that we should read βάρος for βᾶθος.

35 revolves in a circle, as happens, for example, with loaded
 dice if you throw them with the unweighted side turned
 towards you ?¹ Is it because the heavier part cannot travel
 at the same speed as the lighter when hurled with the same
 force ? Now the object must travel as a single whole, but
 913^b cannot move alike in all its parts ; therefore if the parts were
 moved with equal speed they would move in the same line,
 while since one part² travels more quickly than the other, the
 object necessarily revolves as it moves ; for it is only in
 this manner that the parts³ which are always opposite one
 5 another can follow unequal paths in the same time.

Why is it that objects which fall to the earth and rebound 4
 describe similar angles to the earth's surface on either side
 of the point at which they touch the surface ?⁴ Is it because
 all things naturally tend to travel at right angles to the
 earth ? Objects, therefore, which fall upon the ground at
 10 right angles, striking the surface perpendicularly and dia-
 metrically, when they rebound, form angles of that size,⁵
 because the diameter divides the angle at the surface into
 equal parts. But objects which fall obliquely, since they do
 not strike the ground perpendicularly but at a point above
 the perpendicular, when they are thrust back by that against
 15 which they strike, travel in the opposite direction. This in
 the case of round objects is due to the fact that,⁶ striking
 against it⁷ in their course, they revolve in an opposite
 direction to that in which they are thrust back, whether
 their central point is at rest or changes its position. In the
 case of rectilinear objects it is due to the fact that their
 perpendicular is thrown backwards after being brought
 forward ;⁸ just as happens to those whose legs are sheared

¹ This problem is partly identical with chapter 12 below.

² i. e. the lighter.

³ Reading τὰ (W. D. R.) for ταῦτα.

⁴ Cp. chapter 13.

⁵ i. e. right angles.

⁶ ὅτε of the Teubner text is a misprint for ὅτι.

⁷ ἐν αὐτῷ is perhaps corrupt.

⁸ Reading διὰ τὸ τὴν κάθετον αὐτῶν εἰς τοῦμπροσθεν προσερχθεῖσαν ἐκκρούεσθαι. T. G. renders *rectis vero compacta lineis, quod perpendicularum eorum in partem priorem adductum retorquetur*. The corruption of προσερχθεῖσαν may have been due to a desire to provide a principal verb, which is unnecessary, since συμβαίνει φέρεσθαι is to be supplied from ll. 14-15.

away from under them or whose scrotum is pulled down- 20
wards, for such persons always fall in a contrary direction
and backwards, because their perpendicular is raised above
the ground¹ and then thrust forward. For clearly the
opposite of perpendicularity will be to fall backwards and
downwards, and objects carried downwards would be
heavier. That, therefore, which in these persons involves 25
a fall, becomes movement in rebounding objects. Neither
round nor rectilinear objects therefore rebound at right
angles, because the perpendicular divides the objects in
motion into two parts depthways, and there cannot be
several perpendiculars to the same plane surface cutting
one another,² which will happen if a perpendicular is formed 30
at the moment of their impact at the point where the object
in motion strikes the plane surface,³ so that the original
perpendicular along⁴ which it travelled must necessarily be
cut by the new perpendicular. Now since the object will
be borne back, but will not be borne back at a right angle,
it remains that the angle on either side of the point of
impact with the plane surface must be an acute angle; for 35
the right angle forms the division between the opposite
angles.

- 5 Why is it that a cylinder, when it is set in motion, travels
straight and describes straight lines with the circles in
which it terminates, whereas a cone revolves in a circle, its
apex remaining still, and describes a circle with the circle in 914^a
which it terminates? Both move with a circular motion,
but the cylinder describes straight lines on the plane surface,
while the cone describes circles because the circles which
compose the cone are unequal and the greater circle
always moves more quickly than the less about the same 5

¹ Omitting *ισάξειν αὐτὰ* and reading *ἐκπίπτουσι διὰ τὸ τὴν κάθετον μετέωρόν τε κτλ.* (W. D. R.).

² Reading *αὐτὰς* for *αὐτῶν* (so too Bussemaker).

³ The text as it stands will not translate, since the repetition of *συμβήσεται* gives two principal verbs. C^a omits *ἐπ' αὐτῆς . . . τέμνεσθαι*; but better sense is gained by omitting *διχοτομείσθαι . . . συμβήσεται*, its insertion being probably due to a gloss on the words immediately following.

⁴ Reading *ἐφ' ἧς* (Bussemaker).

centre. Now since all the circles composing the cone move at different rates, it results that the outermost circles travel over most space and describe the longest line in the same time (hence they must move in a circle); for all the circles are described by the same straight line,¹ and when
 10 the straight line revolves the various points on it do not describe an equal line in the same time, but can travel along an equal line only if they proceed in a straight direction. But in the cylinders, since all the circles are equal and about the same centre, the result is ² that, since they touch the plane surface at all the points on them at the same time, as they roll they travel at a uniform speed (because
 15 cylinders ³ are uniform throughout), and reach the plane surface again simultaneously when each has completed its own circuit; thus the straight lines described on the plane surface are also equal, for the circles describe them by contact, since they both are equal and travel at the same speed. Now the lines described by the same line travel-
 20 ing in a straight direction⁴ are straight, and so the cylinder would travel ⁵ straight along them; for it makes no difference whether you drag the cylinder over the plane surface at the line where it first ⁶ touched the plane surface, or whether you roll it over it;⁷ for the result will always be that an equal and similar line made up of points on the cylinder will touch the plane surface, both when the cylinder is dragged and when it is rolled along.

25 Why is it that the section of a rolled book, which is flat,⁸ 6 if you cut it parallel to the base becomes straight when

¹ i.e. the line from the apex of the cone to the point of contact of the plane surface and the base of the cone.

² The sense here is clear and is that of the Latin version of T. G., *Euenit ut et simul suis omnibus punctis planum contingendo parili celeritate voluantur*. Hence συμβαίνει ἅμα τοῦ ἐπιπέδου τὰ ἐν αὐτοῖς πάνθ' ἀπομένους σημεῖα φέρεσθαι is read.

³ Bonitz, *op. cit.*, p. 412, reads κύκλους for κυλίνδρους; but τοὺς κύκλους is already the subject of the sentence and would not be repeated, and τοὺς κυλίνδρους clearly refers to cylinders in general.

⁴ i. e. when drawn along instead of being rolled.

⁵ Reading ἄν φέροιτο for ἀναφέροιτο.

⁶ Reading ἢ πρώτη for ἢ ἢ πρώτη (so too Bussemaker).

⁷ Reading ἀντῶ (Bonitz) for ἀντό.

⁸ Omitting καὶ εὐθεία with C^a.

unrolled, but if it is cut obliquely becomes crooked?¹ Is it due to the fact that, since the circles in the first section are in the same plane, the result is that the oblique section is not parallel but is partly² more and partly less distant from the first section, so that, when the roll is unfolded, the circles, which are in the same plane and have their origin³⁰ in the same plane,³ assume, when unrolled, the line which they themselves form? For the resulting line is formed from the circles which are in the same plane, so that the line, being on a plane, is also straight. But the line⁴ of the oblique section when it is unrolled, not being parallel to³⁵ the first section, but partly more and partly less distant from it (this being the position of the section relative to it), will not be on a plane and therefore not straight either; for part of a straight line cannot be in one plane and part in another.

7 Why is it that magnitudes always appear less when 914^b divided up than when taken as a whole? Is it because, though things which are divided always possess number, in size they are smaller than that which is single and undivided? For that which is great is said to be great owing to its continuity and because it is of a certain size, but the number of its parts⁵ is always greater than the number of any undivided magnitude. So it is only natural⁵ that the whole should appear greater than the parts into which it is divided; for, though the whole and its parts are identical, the whole, being continuous, possesses more of the quality of magnitude, while the parts have more of the quality of number.

8 Of the phenomena which occur in the water-clock the cause seems to be in general that ascribed by Anaxagoras;⁶ 10

¹ The problem might be stated in other words thus: 'Why does a roll which is made up of sections of parchment unroll absolutely straight if all sections are cut square, while it will not do so if any section is cut obliquely?'

² Reading ἀλλὰ τῇ μὲν (W. D. R.).

³ Reading a comma instead of a full stop after ἐπιπέδῳ.

⁴ Reading ἡ δὲ for ἡ τε.

⁵ Reading ὁ δὲ ἀριθμὸς (τῶν μερῶν) πᾶς κτλ., to complete the sense; T. G. renders *numerus vero partium omnis*.

⁶ Diels, *Vorsokr.*³ i, p. 390, 28 ff.; cp. *Phys.* 213^a 27. The present

for the air which is cut off within it is the cause of the water not entering when the tube has been closed. The air, however, by itself is not the cause; for if one plunges the water-clock obliquely into the water, having first blocked up the tube, the water will enter. So Anaxagoras does not adequately
 15 explain how the air is the cause; though, as has been said, it certainly is the cause. Now air, whether impelled along or travelling of itself without any compelling force, naturally travels in a straight line like the other¹ elements. When therefore the water-clock is plunged obliquely into the water, the air preserving its straight course is driven out
 20 by the water through the holes opposite to those which are in the water, and, as it goes out, the water flows in. But if the water-clock is plunged upright into the water, the air not being able to pass straight up, because the upper parts are closed, remains round the first holes; for it cannot contract² into itself.³ The fact that the air can keep out
 25 the water by its immobility can be illustrated by an experiment with the water-clock itself. For if you fill the bulb itself of the water-clock with water, having stopped up the tube, and invert it with the tube downwards, the water does not flow along the tube to the outlet. And when the outlet is opened, it does not immediately flow out along the tube
 30 but only after a moment's interval, since it is not already at the outlet of the tube but passes along it afterwards, when it is opened. But when the water-clock is full and in an upright position, the water passes through the strainer⁴ as soon as ever the tube is opened, because it is in contact with the strainer, whereas it is not in contact with the
 35 extremities of the tube. The water does not, therefore, flow into the water-clock, for the reason already mentioned, but

passage is the *locus classicus* on the construction of the *clepsydra*, or water-clock, in its simplest form as used in the law courts to regulate the length of speeches. It appears to have been a hollow globe terminating above in a narrow neck or tube (*αὐλός*) with a stopper and with several holes at the bottom, through which the water escaped when the vessel was filled and the stopper removed.

¹ Reading τᾶλλα.

² Reading σάττεσθαι (Bonitz).

³ Reading αὐτὸν (so also Diels); T. G. renders *in sese contrahi non possit*.

⁴ i. e. the holes at the bottom of the bulb of the water-clock.

flows out when the tube is opened because the air in it being set in motion up and down causes considerable movement¹ in the water inside the water-clock. The water then, being thrust downwards and having itself also a tendency in that direction, naturally flows out, forcing its way through the air outside the water-clock, which is set in motion and is equal in 915^a force to the air which impels it but weaker than it in its power of resistance, because the interior air, since it passes through the tube, which is narrow, flows more quickly and violently and forces the water on. The reason why the water does not flow when the tube is closed is that the water on 5 entering into the water-clock drives the air forcibly out of it. (That this is so is shown by the breath and noise engendered in it as the water enters.²) And driving the air forcibly along it rushes into the tube itself, and³ like wedges⁴ of wood or bronze driven in by cleavage, remains in position without anything else to hold it together, until 10 it is expelled from the opposite direction, as pegs⁵ which are broken in wood are knocked out. This occurs when the tube is opened for the reasons already mentioned. If⁶ this is the reason, it is only natural that it⁷ should not flow out or make its way forth, since the air forcibly prevents it⁸ and becomes inflated. (The noise which is made shows that 15 the water is drawn up by the air, and this is a common phenomenon.) All the water then, being drawn up and being in itself⁹ continuous, remains in the same position under the pressure of the air, until it is thrust away again by it; and, since the first part of the water remains in the same position, the rest of the water is dependent from it in

⁶ Reading *εἰ* with all the best MSS., and placing a comma after *ταῦτα.*

⁷ Reading *αὐτὸ* (Bussemaker).

⁸ Reading *ἢ ἐξί<ἐναι κωλύ>οντος* (with Diels) *βία τοῦ ἀέρος.*

⁹ Diels reads *αὐτῶ* (*sc. τῷ ἀέρι*).

one continuous mass. It is only natural that this should be
 20 so; for it is the property of the same thing to move some-
 thing from its own place and to hold it when it has moved
 it,¹ and to do so for a longer time, if that which holds and
 that which is held are of equal force, or if that which holds²
 is stronger, as occurs in the present case; for air has greater
 force than water.

25 Why is it that the parts of plants and of animals which 9
 have no functional importance are all round—in plants, for
 instance, the stem and the shoots, and in animals the legs,
 thighs, arms, and chest—and no whole or part is triangular
 or multi-angular? Is it due, as Archytas³ used to say, to
 30 the fact that in natural movement the proportion of equality
 is always present (for he holds that all things move in a
 proportion), and that this is the only proportion which can
 return to itself, and so it forms circles and rotundities
 wherever it occurs?

Why do extremities always take rounded forms? Is it 10
 because nature makes everything as excellent and as
 35 beautiful as the available material permits, and a rounded
 form is the most beautiful, being as uniform as possible?

Why does a circular object⁴ when it is thrown at first 11
 describe a straight line, but, as it ceases to move, describe
 a spiral, until it falls? Does it describe a straight line at
 first, because the air on either side of it alike keeps it
 915^b upright? The inclination then to either side being equal,
 the line also which it describes must be of such a nature
 that it divides the space on either side of it equally,
 and such a line is a straight line. But when it inclines
 to one side, because the air on either side of it is not
 even, it no longer describes an equal line with its inner
 5 and with its outer edge, but is forced to describe a circular
 line.

¹ Reading *ὡς ἐκίνησεν* (Bussemaker) for *ὡς ἐκείνης*.

² Reading *τὸ ἴσχυον* (so too Bussemaker).

³ The Pythagorean philosopher.

⁴ The writer has no doubt a flat-edged discus in mind as the circular object.

12 Why is it that in magnitudes of uneven weight,¹ if you set the² lighter part of them in motion, the object thrown revolves in a circle, as happens for example with loaded dice if you throw them with the unweighted side towards you?³ Is it because the heavier part cannot travel at the 10 same speed as the lighter when hurled with the same force? Now since it must necessarily move, but cannot do so in the same manner, that is in a straight line, it must take an inward direction and revolve; just as, if part of the object had as a whole remained motionless owing to a weight in the centre, the part next to the person setting the object in motion would have moved so as to occupy the position of the part away from him, while the farther side would 15 have moved towards him. But when the whole object moves and, as it travels, has a weight in the middle, it must necessarily behave in the same manner.⁴

13 Why is it that objects which are travelling along, when they come into collision with anything, rebound in a direction opposite to that in which they are naturally travelling, and at similar angles?⁵ Is it because they move not only 20 with the impetus which accords with their own nature but also with that which is due to the agent which throws them? Their own impetus then ceases when they reach their own proper position (for everything comes to rest when it reaches the position to which it is naturally carried), but, owing to the extraneous impetus, it is forced to continue to move, not, however, in a forward direction, because it is prevented 25 from doing so, but either sideways or in a direct line backwards.⁶ Now every object rebounds at similar angles, because it is travelling to the point to which it is carried by the impetus which was imparted by the person who threw it; and at that point it must be travelling at an acute angle or at a right angle. Since then the repelling object stops the movement in a straight line, it stops alike the moving

¹ Reading *βάρος* for *βάθος*; see note on 913^a 34.

³ This problem is partly identical with chapter 3 above.

⁴ i. e. revolve.

⁵ Cp. chapter 4.

⁶ We should probably read *ἄπισθεν* (W. D. R.) for *ὀρθόν*.

30 object and its impetus. As then in a mirror the image appears at the end of the line along which the sight travels, so the opposite occurs in moving objects, for they are repelled at an angle of the same magnitude as the angle at the apex¹ (for it must be observed that both the angle and the impetus are changed), and in these circumstances it is
 35 clear that moving objects must rebound at similar angles.

¹ Let A be the point from which the object is thrown, and BC a wall against which it strikes at the point D . The angle which it forms, ADC , will be ἡ κατὰ κορυφήν γωνία. The object will rebound to E forming the angle BDE which will equal the angle ADC . Thus the object rebounds 'at a similar angle'. The above is a case where the object strikes the wall at an acute angle; if it strikes it at right angles the similar angles will be right angles.

BOOK XVII

PROBLEMS CONNECTED WITH ANIMATE THINGS

1 WHY do those who are unsymmetrical appear larger when set side by side with other men¹ than by themselves? Is it because that which is symmetrical is one, and symmetry more than anything else gives unity to a thing, and that which is one tends to be indivisible, and the indivisible is smaller, whereas asymmetry by causing diversity creates a multiplicity? When things therefore are seen by themselves, their dimensions are less likely to be noticed; but this is not so when they are seen side by side with one another. That then which is indivisible appears to be one, 5 and the impression which it makes on the beholder is one because of its symmetry. But that which is unsymmetrical makes a greater impression, as though it were many, and appears greater because, though in reality only one, it seems to be many; for it partakes of the nature of magnitude, because it is continuous, and of number, because of the inequality of its parts; and so being increased in both 10 these respects, it naturally appears great by the side of that which is simple and one.

2 Why do animals and plants grow more in length than otherwise? Is it because length increases three times over, width twice, and depth once? For length is the first and original dimension, and so it increases both of itself, and 15 secondly in combination with width, and thirdly in combina-

¹ ἀλλήλους, if retained here, must be used not in its fullest reciprocal sense, but more generally of 'other men', i. e. members of the same species but not ἀσύμμετροι. If this involves too much straining of the meaning of ἀλλήλους, the simplest change is to ἄλλους. It is quite clear from 916^a 11 that the unsymmetrical are contrasted not with one another but with the symmetrical (there called τὸ ἀπλοῦν καὶ ἓν). The Latin version implies the reading *συμμέτρος*, which is perhaps right, the reading ἀλλήλους having arisen either from *παρ' ἀλληλα* of 916^a 5, or from a gloss on *ἀσυμμέτρος* copied by mistake for *συμμέτρος*.

tion with depth. But width implies an increase in two dimensions only, in itself and at the same time in depth.¹

In what sense must we understand the terms 'prior' and 3
'posterior'? As those who lived in the time of Troy are
'prior' to us, so are those who lived before them 'prior' to
20 them and so on *ad infinitum*? Or since there is a beginning
and a middle and an end of the universe, and when a man,
as he becomes old, reaches the limit and turns again towards
the beginning,² that³ which is nearer to the beginning is
earlier, what prevents our being nearer to the beginning
than to the end, in which case we should be 'prior'? Just
25 as the course⁴ of the firmament and of each of the stars is
a circle, why should not also the coming into being and the
decay of perishable things be of such a kind that the same
things⁵ again come into being and decay? This agrees
with the saying that 'human life is a circle'.⁶ To demand
that those who are coming into being should always be
numerically identical is foolish, but one would more readily
30 accept the theory of the identity of the species. And so we
should ourselves be 'prior', and one might suppose the
arrangement of the series to be such that it returns back in
a circle to the point from which it began and thus secures
continuity and identity of composition. For Alcmaeon⁷
declares that men perish because they cannot link together
35 the beginning to the end⁸—a clever saying, if one supposes
that he uses it metaphorically and the literal meaning is not
insisted upon. If then human life is a circle, and a circle
has neither beginning nor end, we should not be 'prior' to
those who lived in the time of Troy nor they 'prior' to us
by being nearer to the beginning.

⁸ i. e. when a man reaches the end of life, personal identity is lost and the new life starts with a new personality.

BOOK XVIII

PROBLEMS CONNECTED WITH LITERARY STUDY

I WHY is it that some people, if they begin to read, are 916^b
overcome by sleep even against their will, whereas others
wishing to be overcome by sleep are kept awake by taking
up a book?¹ Is it because in those in whom movements
of breath take place owing to the coldness of their nature 5
or of melancholic humours, which by their coldness engender
an unconcocted excretion of breath—in such people, the
intelligence, when it is set in motion and does not think of
anything with concentrated attention, is checked by the
second movement,² which has a cooling effect, and this
causes a tendency to sleep? But when they fix the intelli-
gence firmly upon something, as happens in reading, they 10
are impelled by the heating movement, which is unchecked
by anything, and so they cannot go to sleep. In those who are
in a natural condition, however, when the intelligence, which
is very powerful, stands at a single point and does not keep
changing from one subject to another, every function in that
region ³ (whose inactivity involves sleep) is at a standstill; 15⁴
and when the intelligence stands still and is as it were weary,
being situated in the head, it weighs it down and produces
sleep. But as long as the mind moves naturally, it does
not go to sleep; for it is then that it is most alive, and
wakefulness rather ⁵ than sleeping is the cause of life.

¹ A comparison with the parallel passage in chapter 7, which clearly deals with the same problem and is partly identical with the present chapter, shows that *τοὺς δὲ βουλομένους ποιεῖ ἐγρηγορέναι* must be read here; cp. 917^a 19 and note (so too Bussemaker).

² i. e. the unconcocted excretion of breath.

³ i. e. the head.

⁴ Reading *ἴσται* as in 917^a 30.

⁵ Reading with Bonitz, *op. cit.*, 413, *(μᾶλλον) αἰτιὸν ἐστίν*; but *αἰτιὸν* is possibly itself corrupt and some such word as *ἰδιαίτερον*, 'more characteristic of', seems to be required.

Why are contentious disputations useful as a mental **2**
 exercise? Is it because they involve frequent victories and
 20 defeats? They therefore quickly instil a spirit of rivalry;
 for, when men are victorious, they are induced by their joy
 to contend yet more, and, when they are defeated, they
 continue the struggle in hopes of turning defeat into victory.
 Those engaged in struggles of other kinds act in the same
 way, and so when fighting and getting the worst of it often
 refuse to come to terms.

25 Why is it that in rhetorical displays men prefer examples **1** **3**
 and fables ² rather than enthymemes? ³ Is it because they
 like to learn and to learn quickly, and this end is achieved
 more easily by examples and fables, since these are familiar
 to them and are of the nature of particulars, ⁴ whereas
 enthymemes are proofs based on generalities, with which
 30 we are less familiar than with the particular? Further, we
 attach more credence to any evidence which is supported
 by several witnesses, and examples and fables resemble
 evidence, and proofs supported by witnesses are easily
 obtained. Further, men like to hear of similarities, and
 examples and fables display similarities. ⁵

35 Why do we talk of an orator, or a general, or a business **4**
 man as being shrewd, but not use the term of a musician
 or of an actor? Is it because the powers of the two last
 are exercised apart from any desire of gaining an advantage
 (for their aim is pleasure), whereas the three first aim at
 some advantage? For a good orator or general or business
 917^a man is one who can gain some advantage, and shrewdness
 consists mainly in getting the better of some one else.

Why is the philosopher generally regarded as superior **5**
 to the orator? ⁶ Is it because the philosopher treats of the
 nature of injustice, while the orator says that such and such
 a person is unjust, and the orator states that such and such

¹ Cp. *Rhet.* 1357^b 25-30, *Rhet. ad Alex.* 1429^a 21 ff.

² λόγιοι here equivalent to μῦθοι, cp. below, l. 35.

³ Cp. *Rhet.* 1357^a 32 ff., *Rhet. ad Alex.* 1430^a 23 ff.

⁴ Cp. *Rhet.* 1357^a 27, 28.

⁵ Cp. *Rhet. ad Alex.* 1429^a 25-7.

⁶ This problem is repeated in a longer form in xxx. 9.

a person is a tyrant, while the philosopher discusses the nature¹ of tyranny? 5

6 Why is it that some men spend their time in pursuits which they have chosen, though these are sometimes mean, rather than in more honourable professions? Why, for example, should a man who chooses to be a conjurer or an actor or a piper prefer these callings to that of an astronomer or an orator? Is it because some men would prefer to undertake the more honourable professions but do not do so because 10 they do not feel confident that they would succeed in them? Or is it because each man chooses the calling in which he thinks he can excel and devotes himself to that which he chooses, giving up the greater part of each day to it, in order that he may improve his own proficiency² in it? Now when men have chosen a calling from the first and 15 have become accustomed to it, they lose the power of discriminating between the higher and the lower; for their mind is warped by their bad choice.

7 Why is it that some persons, if they begin to read, are overcome by sleep even against their will, whereas those who wish to go to sleep are made unable to do so if they take up a book?³ Is it because in those in whom 20 movements of breath take place owing to the coldness of their nature or of melancholic humours, which by their coldness engender an unconcocted excretion of breath—in these when the intelligence is set in motion and does not think of anything with concentrated attention, the intelligence is checked by the second movement,⁴ and so they undergo a great mental change and go to sleep (for the 25 movement of breath is overcome)? But when they fix their intelligence on something, as happens in reading, they are impelled by the movement of breath⁵ unchecked by any-

¹ Reading, with Richards, *ποιόν*.

² Reading *κρατιστεύων* (cp. above, l. 12) for *κράτιστος ὤν*.

³ The problem of this chapter is obviously the same as that of chapter I and we must read *τοὺς δὲ βουλομένους οὐ ποιεῖ δύνασθαι* (W. D. R.).

⁴ Reading *τῆ ἑτέρα κινήσει*, cp. above, 916^b 8 and note.

⁵ The parallel passage (916^b 10) has *θερμαντικῆς*, but *πνευματικῆς* can stand here since *ἡ πνευματικῆ* and *ἡ θερμαντικῆ κίνησις* both refer to

thing, and so cannot sleep. But in those who are in a natural condition, when the intelligence is fixed on one thing and does not keep changing from one subject to another, every function in that region (the inactivity of which involves sleep) is at a standstill. (Similarly during a rout,¹ if the leader halts, all the forces under his command halt also.) For naturally that which is light rises, while the heavy sinks.² As long, therefore, as the mind moves naturally, it does not go to sleep; for it is then that it is most alive.³ When the mind stands still and is as it were weary, the intellect undergoes a change, and the corporeal elements rise to the head and produce sleep. Reading might be expected to prevent sleep; but wakefulness is not due to the fact that we are thinking (for then our mind is most concentrated) but to the constant change; for the intellectual activities which cause wakefulness are those in which the mind searches and finds difficulties rather than those in which it pursues continual contemplation; for the former cause lack of concentration, while the latter do not.

Why is it that in contentious disputes no trifling can ever occur? Is it because such reasoning is apparent syllogism, and syllogism involves only a brief discussion; and, if it be prolonged, after a time the false reasoning is detected and the disputant can withdraw the premisses which he has granted?

Why do we feel more pleasure in listening to narratives in which the attention is concentrated on a single point than in hearing those which are concerned with many subjects? Is it because we pay more attention to and feel more pleasure in listening to things which are more easily comprehended, and that which is definite is more easily comprehended

the same thing, viz. the movement of breath when it is unaffected by natural cold or melancholic humours.

Cp. *Post. An.* 100^a 12.

² This sentence seems out of place here and would make better sense if it were inserted after *ποιεί τὸν ὕπνον*, l. 36.

³ *οὕτω γὰρ ἔχει* gives no sense and is obviously corrupt. As the parallel passage 916^b 17 has *ξῆ γὰρ τότε μάλιστα*, we should here read *οὕτω γὰρ ξῆ μάλιστα* or something similar.

than that which is indefinite? Now a single thing is definite, but a plurality partakes of the nature of the infinite.

- 10 Why do we like to hear of events which are neither very old nor quite new? Is it because we discredit events which occurred long before our time and take no pleasure in 15 events which we discredit, while we can still as it were perceive very recent events and so take no pleasure in hearing about them?

BOOK XIX

PROBLEMS CONNECTED WITH MUSIC

WHY do those who are grieving¹ and those who are I
 enjoying themselves alike have the flute played to them?
 20 Is it in order that the distress of the former may be lessened
 and the pleasure of the latter increased?

Why is it that, when the same person uses the same vocal 2
 power, the sound travels farther when he is singing or
 shouting with others than when he does so by himself?²
 Is it because the doing of anything with a number of other
 people—compressing, for instance, or pushing something—
 does not produce an effect in simple proportion to the
 25 number of persons; but, just as a line two feet long
 describes a circle³ which is not double but quadruple that
 described by a line a foot long, so collective actions have
 greater force in proportion to their number than when they
 are carried out separately?⁴ When, therefore, a number of
 persons sing together, the force of their voice unites, and
 impels the air simultaneously, so that it travels many times
 as far; for the voice produced by all is the multiple of each
 single voice.

30 Why does the voice waver most when singing *parhypate*⁵ 3
 and to no less a degree than when singing *nete* and the
 higher notes, although the interval is greater? Is it because

¹ The reference is to the use of the flute at funerals.

² Cp. xi. 52.

³ Vollgraff is no doubt right in thus interpreting *γράφειν* in its usual sense in geometry.

⁴ i. e. multiplication takes place and not mere addition.

⁵ The following is the usual scheme employed by Peripatetic writers (see Jan, *Musici Scriptores*, p. 81):

hypate	parhypate	lichanos	mese	paramese	trite	paranete	nete
<i>e</i>	<i>f</i>	<i>g</i>	<i>a</i>	<i>b</i>	<i>c'</i>	<i>d'</i>	<i>e'</i>

There seems no reason why, in a diatonic scale, *parhypate* should be specially difficult to sing. Bojesen and Stumpf therefore suppose that the reference is to an enharmonic scale, in which the interval from *hypate* to *parhypate* is a quarter-tone, which would actually be hard to take.

the interval¹ is more difficult to sing and is a primary element?² Now the difficulty is due to the straining and pressure of the voice; and these require an effort, and things which require an effort are more likely to fail.

4 But why is *parhypate* difficult to sing, but *hypate* easy,³⁵ although there is only a quarter-tone between them?³ Is it because *hypate* is accompanied by relaxation of the voice and also because after tension it is easy to slacken?⁴ It is probably for the same reason that what a man says with violence,⁵ he says with this note or *paranete*.⁶ [For one must . . . with a consciousness of the character which one is representing and under conditions most akin to it according to one's purpose.]⁷ [But what is the first condition of 918^a concordant music?]⁸

5 Why do men take greater pleasure in listening to those who are singing such music as they already know than music which they do not know?⁹ Is it because, when they recognize what is being sung, it is more obvious that the 5 singer is as it were achieving¹⁰ his aims, and this is pleasant to contemplate? Or is it because it is less¹¹ pleasant to learn? And the reason of this is that in the one case there is acquisition of knowledge, in the other the use and recognition of it. Further, that which is familiar is always pleasanter than the unfamiliar.

6 Why does recitation with a musical accompaniment have 10 a tragic effect when introduced into singing? Is it owing

¹ Stumpf has been followed here in taking *ταύτην* and *αὐτήν* to refer to the quarter-tone.

² i. e. the quarter-tone is the smallest interval in the musical scale.

³ The meaning seems to be: 'Why is it easier to sing the same interval downwards than upwards?'

⁴ Reading with Jan *ἀναχαιλᾶν* for *ἀνω βιάλλειν*.

⁵ Reading with Bussemaker and Stumpf *βίαν* for *μίαν*. The interpretation here adopted is that of Stumpf.

⁶ We should, with Stumpf, expect *paramese* rather than *paranete* here.

⁷ This sentence (which is incomplete, since there is no infinitive after *δεῖ*) appears to be out of place here.

⁸ This sentence appears to be the statement of another problem, the solution of which is lacking.

⁹ Cp. below, chapter 40.

¹⁰ Omitting *ό*; cp. ^a 24.

¹¹ Reading with Richards *ἡ ὄτι* (<*ἡτρον*>) *ἡδύ*.

to the resulting contrast? For the contrast gives an expression of feeling and implies extremity of calamity or grief, whereas uniformity is less mournful.

Why did the ancients, when they gave the scale seven 7 notes, leave in *hypate* and not *nete*?¹ Is this a false statement, since they left in both and omitted *trite*, or is the truer answer that the lower note contains the sound of the higher note,² so that *hypate* gives the impression of the octave above better than (*nete* for the high note needs³ more force, while the low note is easier to utter)?

Why does the low note⁴ contain⁵ the sound of the high 8 note?⁶ Is it because the low note is greater and resembles an obtuse angle, while the high note resembles an acute angle?⁷

Why do we listen with greater pleasure to a solo when a man sings it to the accompaniment of a flute or lyre?⁸ Yet the same tune is sung note for note⁹ with or without

¹ Cp. below, chapter 47. For the scheme of eight notes used by the Peripatetic writers, see note on 917^b 30. Two stages can be traced in the earlier evolution of the seven-stringed lyre (see Jan, *op. cit.*, p. 81).

(a) The earliest form was:

hypate	parhypate	lichanos	mese	paramese or trite	paranete	nete
<i>e</i>	<i>f</i>	<i>g</i>	<i>a</i>	<i>b</i>	<i>c'</i>	<i>d'</i>

(b) After the time of Terpander *trite* (= *b*) was omitted (cp. below, 920^a 15-17), and *nete* was made equivalent to *e'*:

hypate	parhypate	lichanos	mese	paramese or trite	paranete	nete
<i>e</i>	<i>f</i>	<i>g</i>	<i>a</i>	<i>c'</i>	<i>d'</i>	<i>e'</i>

The Peripatetic, being familiar with the eight-note scale which was evolved from the seven-note scale, inverts the order in which the two systems came into being. The question arises why *nete* (= *e'*) was omitted as in system (a) above. The answer, having system (b) in mind, asks whether it is not a truer statement of the case to say that *nete* (= *d'*) was retained and *trite* (= *b*) rejected.

² The phrase *ισχύει τὸν τῆς ὀξυτέρας φθόγγου* gives no meaning since *ισχύει* is a neuter verb and cannot govern an accusative. If it is retained, we must read something like *ισχύει (πλέον) τοῦ τῆς ὀξυτέρας φθόγγου*. A better alternative is to read *ἰσχει*, with Eichtal and Reinach (*Rev. Ét. Grec.* v. (1892) p. 33), who compare 918^a 40 ἢ ὅτι τὸ βαρὺ μέγα ἐστίν, ὥστε κρατερόν; καὶ ἔνεστιν ἐν τῷ μεγάλῳ τὸ μικρόν.

³ Some verb must be supplied to complete the sense: *ἐπεὶ (δείται) τὸ ὀξὺ δυνάμεως* (Wagner) is more probable than the insertion of *σημείων* by the Teubner editors. *ἐπεὶ . . . φθέγγασθαι* seems, however, quite irrelevant here.

⁴ i. e. *hypate*.

⁵ Reading *ἰσχει*, as above, for *ισχύει*.

⁶ i. e. *nete*.

⁷ Cp. *de. An.* 420^b 1 ff.

⁸ Cp. below, chapter 43.

⁹ Reading *πρόσχορδα* (Jan); cp. Plato, *Laws*, xii. 812 D.

accompaniment. This creates a problem, for if it gave more delight to hear more of the same thing,¹ we ought to sing to the accompaniment of a large number of flute-players and this ²⁵ ought to be even more pleasant. Is it because the singer is more obviously achieving his aim when he is accompanied by a flute or lyre? And the accompaniment of a number of flute-players or lyres does not add to the pleasure, because it drowns the singing.

10 Why, if the human voice is more pleasant than an instrument,² is the voice of a man singing without words—as, for ³⁰ example, when making meaningless warblings³—not so pleasant as a flute or lyre? Or is it true that even in the case of an instrument we get less pleasure if it is not expressive of meaning? The instrument, however, has an advantage even in its actual effect; for while the human voice is pleasanter, instruments strike the note better than the human mouth, wherefore they are pleasanter to hear than meaningless warblings.

11 Why is the voice higher when it echoes back?⁴ Is it ³⁵ because it is smaller,⁵ having become weaker?⁶

12 Why does the lower of two strings sounded together always give the tune? For if one omits *paranele*, when one should sound it with *mese*, the tune is given none the less; but if one omits *mese*, when one should sound both, the tune is lost.⁷ Is it because the low note is large and ⁴⁰ therefore strong, and the less is contained in the greater?⁸ So too if *hypate* is stopped down in the centre,⁹ two *netes* are produced. 918^b

¹ Reading εἰ γὰρ ἔτερπε (Jan) μᾶλλον τὸ αὐτὸ πλέον (ὄν), ἔδει κτλ.

² Putting a comma after φωνή instead of after ἄδοντας.

³ For the meaning of τερετίζειν see *An. Post.* 83^a 33.

⁴ For ἀπηχέειν cp. 899^a 24. ⁵ Reading with Vollgraff ἐλάττων.

⁶ Cp. above xi. 6 and 20. Lord Rayleigh (*Theory of Sound*, ii. p. 152) notes that echoes returned from such reflecting bodies as a group of trees are sometimes raised an octave.

⁷ Reading ἂν γὰρ εἴσῃ τὴν παρανήτην, δέον συμφῆλαι τῇ μέσῃ, γίνεται τὸ μέλος οὐθέν ἦττον· εἰ δὲ τὴν μέσῃν, δέον ἀμφω ψῆλαι οὐ γίνεται. This is the reading of Monro, except that he reads παραμέσῃν, for which Fétiis and Gevaert read παρανήτην. The Teubner editors wrongly report Monro as reading ψιλῶ.

⁸ Cp. 918^a 20.

⁹ i. e. by striking the string on either side of the central point. The

Why is it that the low note in the octave gives the effect **13** of unison with the high, but not vice versa? ¹ Is it because, **5** if possible, the sound of both notes is in both notes, but, failing that, in the low note, since it is greater?

Why does the accord in the octave escape notice, and **14** why does there appear to be a simple unison, as for example in the Phoenician lyre and in the human voice? ² For the upper and lower notes ³ do not give the same sound but are analogous ⁴ to one another at the octave. Is it because their **10** sound appears to be practically the same owing to the analogy, and analogy is equality in sounds, and equality is of the one? ⁵ The same deception occurs also in the pipes.

Why were 'nomes' not composed in antistrophes like **15** all other songs, that is, choric songs? Is it because the 'nomes' were assigned to virtuosi, and as these were **15** already able to imitate different characters and sustain their parts, the songs composed for them became long and elaborate? Like the words, therefore, the music conformed to the imitation, becoming constantly different; for it was more essential for the music to be imitative than the words. ⁶ (For this reason too dithyramb, since they have become imitative, no longer have antistrophes, as they had formerly.) The **20** reason is that in the old days free citizens themselves formed the choruses; it was difficult, therefore, for a large number

fact that *hypate* can be made to produce two *netes* is a proof that the less is contained in the greater.

¹ i. e. a note contains as a harmonic or upper partial the note an octave higher than itself, whereas it does not contain the note an octave lower than itself. Our author seems to have had some knowledge of 'undertones', i. e. harmonics which work downwards instead of upwards, so far as the octave is concerned.

² e. g. a man and a boy, when they think they are singing the same tune, are really singing an octave apart.

³ Reading with Eichtal and Reinach *ἐν τοῖς ὀξέ(εῖσιν καὶ τοῖς βαρ)έσιν ὄντα.* ⁴ Reading *ἀνά λόγον.*

⁵ Reading *διὰ τὸ ἀνάλογον, (τὸ δὲ ἀνάλογον) ἰσότης ἐπὶ φθόγγων, τὸ δὲ ἴσον τοῦ ἐνός.* This is clearly the text rendered by T. G., who translates 'an modus proportionis facit ut sonus quasi idem esse appareat? proportio enim in sonis aequalitas est, aequale autem omne ad unitatem referendum est'.

⁶ This is certainly true of the only 'nome' of which the words have come down to us, the *Persae* of Timotheus, which resembles the meaningless libretto of an inferior opera and must have depended for its effect on the music and the mimetic powers of the performer.

to sing together like virtuosi, so they sang in one mode.¹ For it is easier for a single person to make many changes than for a large chorus, and for a professional than for those who are preserving the character of the music. And so they made the music more simple for them. Now the antistrophic song is simple; for there is one rhythm² and ²⁵ one unit of metre. For the same reason songs executed from the stage are not antistrophic, but those sung by the chorus are so; for the actor is a virtuoso and an imitator, but the chorus is less imitative.

16 Why is 'antiphonal'³ accompaniment⁴ more pleasing ³⁰ than 'symphonic' accompaniment?⁵ Is it because in the former the consonance is more obvious than when the accompaniment of the singing is 'symphonic'? For of the two notes played by the instrument one must be in unison with the note sung, and so two notes contending against one drown the other note.⁶

17 Why is it that singing in fifths⁷ does not give the effect of 'antiphony'?⁸ Is it because one 'symphonic' note is

¹ *ἐναρμόνια* Y^a, *ἐν ἀρμονίᾳ* C^a X^a AP. Chabanon's conjecture *ἐν μιᾷ ἀρμονίᾳ* has been adopted; the corruption can be explained by supposing that *μιᾷ* was written *ᾳ*.

² Reading with Jan *εἰς ῥυθμός*. The MS. reading *ἀριθμός* can be explained as a misunderstanding of *ᾳ* (= *εἰς*) *ῥυθμός*.

³ *ἀντιφωνος* can be applied in general to any reproduction of a tune in a different part of the scale; but it is frequently used in these problems in the technical sense of the accord in the octave, the only interval in the view of the Greeks which could be used consecutively in singing. *σύμφωνος* is used either (1) of any consonance (cp. the use of *συμφωνεῖν* in l. 31, and *ἡ διὰ πιασῶν συμφωνία* (l. 40), and chapter 39, where *τὸ σύμφωνον* includes all consonances), (2) in the technical sense as applied to musical accompaniment when two notes are played by an instrument, one of which is the same as that of the voice (*ὁμόφωνος*), the other consonant with the voice, i.e. a fourth or a fifth higher. *ὁμοφωνία* (= unison) occurs when two identical notes are used simultaneously.

⁴ That harmonized musical accompaniment is here intended is shown by the words of ll. 31-2 *ὅταν πρὸς συμφωνίαν ἄδη* (cp. D. B. Monro, *J. of P.* I, pt. ii, pp. 87-8).

⁵ Cp. chapters 35 and 39.

⁶ i.e. one of the notes played on the instrument is identical with that uttered by the singer; these two notes drown the third note, i.e. the second note played on the instrument.

⁷ T. G. appears to render *διὰ πέντε* (<*καὶ διὰ τεσσάρων*>).

⁸ 'Antiphonal' is here used in its wider sense of reproducing the same tune in a different part of the scale.

35 not the same as the other 'symphonic' note,¹ as are the notes which are an octave apart? For in the accord² in the octave the deep note in the lower part of the scale is analogous to the high note in the upper part; it is, therefore, as it were at once the same and different. But this does not occur in fifths and fourths, so that the sound of the 'antiphonal' note does not appear, for it is not identical.

40 Why is it that the accord in the octave alone is used in 18
919^a singing?³ For in 'magadizing'⁴ this and no other accord is used. Is it because it alone is made up of 'antiphonal' notes, and with 'antiphonal' notes, if but one be sung, the same effect is produced as if both were sung? For the one note in a way contains the sounds of both, so that, when one 5 is sung, the concordant note⁵ at this interval is also sung; and when they sing both,⁶ or when one note is sung and the other played on the flute, they both as it were sing one note. Therefore the accord in the octave alone is sung, because the 'antiphonal' notes have the sound of one note.

But why does the power of producing the effect of a single 19
10 note belong only to 'antiphonal' notes? Is it because they alone are equidistant from *mese*?⁷ The presence then of this mean creates a certain similarity in their sounds, and the ear seems to tell us that it is the same note and that they are both extremes.

Why is it that, if, after tuning the other strings, one alters 20
mese and uses the instrument, the ear is offended and an 15 unmusical effect is produced not only when *mese* is used,

¹ Reading with Jan ἡ σύμφωνος τῆ συμφώνω.

² Reading ἐκεῖ with Vollgraff for ἐκείνη. The meaning clearly is that there is the same succession of corresponding notes in the scale as sung by a man's voice and by a boy's.

³ Cp. below, chapter 39^b.

⁴ The *μίγαδις* was a large stringed instrument containing at least two octaves (Athenaeus, xiv. 36; Anacreon, fr. 18; Xen. *Anab.* vii. 3. 32); hence *μαγαδίζειν* comes to mean the singing of a succession of notes by different voices in octaves.

⁵ Reading with Jan ἡ σύμφωνος for ἡ συμφωνία.

⁶ Punctuating καὶ ἄμφω ἄδοντες, ἢ τῆς μὲν ἄδομένης, τῆς δὲ αἰλουμένης, ὡσπερ κτλ.

⁷ This is untrue, and the whole problem is singularly inept and clearly inserted by a writer who knew nothing of music.

but in the rest of the piece as well, whereas, if *lichanos* or any other string is altered, it only seems to make a difference when that particular string is used? ¹ Surely this is only natural; for in all good music *mese* occurs frequently, and all good composers have frequent recourse to *mese*, and, if ²⁰ they leave it, they soon return to it, as they do to no other note. Similarly in language, if certain connecting particles are removed, such as *τε* and *καί*, the language is no longer Greek; whereas the omission of some particles does not offend the ear, because certain particles must be frequently ²⁵ used, if there is to be language, but others not. So *mese* is as it were a conjunction among sounds, and more so than the other ² notes, because its sound occurs more often.

- 21 Why is it that of singers those who are singing low notes are more conspicuous if they sing out of tune than those ³⁰ who are singing high? So too those who make mistakes in time in the lower notes ³ are more conspicuous. Is it because the period of time occupied by the low note is longer, and this longer period is more perceptible (for, ⁴ lasting for a greater time, it creates a deeper sense-impression), whereas a quick, ⁵ high note escapes notice ³⁵ owing to its swiftness?
- 22 Why does a large choir keep better time than a small one? ⁶ Is it because they look more to one man, their leader, and dance ⁷ more slowly and so more easily achieve unity? For mistakes occur more frequently in quick singing.
- 23 Why is *hypate* double *nete*? ⁸ Is it because in the first ^{919^b} place, when half the string is struck and when the whole

¹ Cp. below, chapter 36.

² Reading with Ruelle and Stumpf ἄλλων for καλῶν. μάλιστα τῶν καλῶν (μελῶν) is, however, possible: 'particularly in good music', cp. above, l. 19.

³ Reading with the MSS. βαρυντέρῳ. The generally accepted emendation βραδυτέρῳ spoils the sense; the question of duration being introduced in the *solution*.

⁴ Omitting ἦ before ὄτι with Reinach and Eichthal, and punctuating αἰσθητός, ὄτι.

⁵ Reading ταχὺ with the MSS.

⁶ Cp. below, chapter 45.

⁷ Reading ἀρχοῦνται with Graf.

⁸ Reading with Wagener and Jan τῆς νήτης ἢ ὑπάτη. The solution

string is struck an accord in the octave is produced? So too with wind instruments,¹ the sound produced through the middle hole and that produced through the whole flute
 5 give an accord in the octave. Again, in the reed-pipe an accord in the octave is obtained by doubling the length, and this is how flute-makers produce it. Similarly they obtain a fifth by means of a length in the ratio of 3 to 2.² Again, those who construct Pan-pipes stuff wax into the extreme end of the *hypate*-reed, but fill up the *nete*-reed
 10 to the middle. Similarly they obtain a fifth by means of a length in the ratio of 3 to 2, and a fourth by means of a length in the ratio of 4 to 3. Further, *hypate* and *nete*³ on triangular stringed instruments, when they are equally stretched, give an accord in the octave when one is double the other in length.

15 Why, if one strikes *nete*⁴ and then stops it down, does *hypate* alone seem to resound?⁵ Is it because the vibration produced from *hypate* is very much of the same nature as the sound of *nete*, because it is in accord with it? When it is increased by the addition of its like, it alone is audible, the other sounds being imperceptible owing to their smallness.

20 Why is *mese* ('the middle note') so called in the scale, *25* though there is no middle of eight notes?⁶ Is it because in the old days scales had seven notes,⁷ and seven has a middle?

shows that *hypate* is double *nete* in length of string. In 920^a 29, where *nete* is said to be double *hypate*, the reference is to frequency of pitch.

¹ τῶν σφίγγων is here used generally of wind instruments, of which particular examples are given, (1) the single flute (σφίγγξ), (2) the reed-pipe (αἰλός), and (3) the Pan-pipes (σφίγγες).

² Deleting the square brackets inserted in the Teubner text and putting a full-stop after ἡμιολίω. There is no reason why the method of producing a fifth should not be mentioned here as well as in l. 10, since it is a question of a different instrument.

³ Reading with Bojesen αἰ for οἰ or εἰ of the MSS.

⁴ Deleting the second νήτην.

⁵ Cp. below, chapter 42. As a matter of fact the striking of *hypate* would set up a sympathetic vibration in *nete* to a much greater extent than vice versa.

⁶ A longer version of this problem occurs at chapter 44. For the usual scheme of eight notes used by the Peripatetic writers see note on 917^b 30.

⁷ See note on 918^a 14.

- 26 Why do most men sing high when they sing out of tune?¹ Is it because it is easier to sing high than low? Or is it because singing high is worse than singing low,² and a mistake is doing what is worse? 25
- 27 Why is it that of all things which are perceived by the senses that which is heard alone possesses moral character?³ For music, even if it is unaccompanied by words, yet has character; whereas a colour and an odour and a savour have not. Is it because that which is heard alone has movement, not, however,⁴ the movement in us to which the sound gives rise (for such movement exists also in the other 30 things which affect our senses, for colour also moves our sight), but we perceive the movement which follows such and such a sound? This movement resembles moral character both in the rhythms and in the melodic disposition of the high and low notes, but not in their commingling; for 'symphony' does possess moral character. This does not occur in the other objects of sense-perception. 35 Now these movements are connected with action, and actions are indicative of moral character.
- 28 Why are the 'nomes' (*νόμοι*) which are sung so called? Is it because before men knew the art of writing they used to sing their laws (*νόμοι*) in order not to forget them, as they are still accustomed to do among the Agathyrsi?⁵ 920^a They, therefore, called the earliest of their subsequent songs by the same name as their earliest songs.
- 29 Why do rhythms and tunes, which after all are only voice, resemble moral characters, whereas savours do not, nor yet colours and odours?⁶ Is it because they are movements, 5 as actions also are? Now efficient action is already moral and determines character, but savours and colours have no similar effect.

Why is neither the Hypodorian nor the Hypophrygian 30
mode suitable for use by the chorus in tragedy? ¹ Is it
because they do not admit of antistrophic melody? ² They
10 are used, however, from the stage, because they are imita-
tive. ³

Why were Phrynichus and his contemporaries primarily 31
musicians? Is it because in those days the lyrical portions
of tragedies were many times longer than the purely
metrical? ⁴

Why is the 'diapason' (accord in the octave) so called 32
and not named after the number of notes a 'diocto', like
15 the 'diatessaron' (fourth) and the 'diapente' (fifth)? Is it
because the notes were originally seven in number, ⁵ and
then Terpander took away *trite* and added *nete*, and in his
time it was called 'diapason' and not 'diocto', since it was
really 'diepta'?

Why is it more satisfactory for a singer to pass from 33
a high to a low note than from a low to a high note? Is it
20 because the former amounts to beginning at the beginning,
for the *mese*, or leader, ⁶ is the highest note in the tetra-
chord? But in passing from a low to a high note one
begins not at the beginning but at the end. Or is it because
a low note is nobler and more euphonious after a high
note?

Why are a double fifth ⁷ and a double fourth not con- 34
25 cordant, whereas a double octave is? ⁸ Is it because

¹ The same problem is treated at greater length in chapter 48.

² Gevaert explains as follows: 'Elles se prêtaient mal à la mélodie absolue, exprimant un état d'âme permanent. Elles s'appliquaient uniquement aux chants scéniques ou semi-scéniques coupés en sections libres; elles affectionnaient en conséquence la mélodie déclamée, visant à une expression précise.'

³ Reading with Wagener *μμητικά*. For the meaning of the term cp. 922^b 17-27.

⁴ i. e. the choruses were still the principal element (as in Aeschylus' earliest play, the *Suppliques*), and the actor who spoke and did not sing his lines took only a minor part.

⁵ See note on 918^a 14.

⁶ Omitting the *καὶ* inserted by Ruelle after *ἡγεμῶν*.

⁷ *δι' ὀξείων* is the Pythagorean name for a fifth (cp. Nicomachus, ch. 9 in Jan's *Mus. Script.*, p. 252).

⁸ This problem is more fully and clearly treated in chapter 41.

neither a double fifth nor a double fourth is in a super-particular ratio,¹ though a fourth and a fifth are so?²

35^a Why is the accord in the octave the most beautiful of all? Is it because its ratios are contained within integral terms,³ while those of the others are not so contained? For since *nete* is double *hypate*,⁴ as *nete* is two, so *hypate* is one; and as *hypate* is two, *nete* is four; and so on. But *nete* is to *mese* in the ratio of $\frac{3}{2}$ to 1 (for a fifth is in this ratio), and that which is in the ratio of $\frac{3}{2}$ to 1⁵ is not contained within integral terms; for as the lesser number is one, so⁶ the greater number is one with the addition of a half, so that it is no longer a comparison of whole numbers, but fractions are left over. The like happens also with the fourth; for the 'epitrite'⁷ of a term is as great as that term⁸ and one third as great again. Or is it because the accord which is made up of both the other two⁹ is the most perfect, and because it is the measure¹⁰ of the melody?¹¹

35^b Why (is the sound shrillest in the middle of the note? Is it because)¹² in any body which is displaced the move-

¹ This sentence is obviously incomplete in the MSS. and for the above translation Jan's suggestion $\delta\iota\varsigma\ \delta\iota\alpha\ \tau\epsilon\tau\tau\acute{\alpha}\rho\omega\upsilon\upsilon\langle\ \acute{\epsilon}\pi\iota\mu\acute{\omicron}\rho\iota\omicron\nu\rangle\ \acute{\epsilon}\sigma\tau\omega$ has been read; cp. 921^b 5. The meaning of $\acute{\epsilon}\pi\iota\mu\acute{\omicron}\rho\iota\omicron\nu$ (cp. *Met.* Δ. 1021^a 2) is 'that which is $\frac{n+1}{n}$ of something else'; but the author seems to confine his attention to values of n not greater than 3, since only octaves, fourths, and fifths are considered.

² A fifth being in the ratio of 3 to 2 and a fourth in the ratio of 4 to 3, a double fifth is $\frac{9}{4}$ ($=\frac{4+5}{4}$) to 1, and a double fourth $\frac{16}{9}$ ($=\frac{9+7}{9}$) to 1.

³ Unity is always taken as the second term of the ratio; the author's idea is that for a consonance the first term must either be an integer, as in the octave, or of the form $\frac{n+1}{n}$ ($\acute{\epsilon}\pi\iota\mu\acute{\omicron}\rho\iota\omicron\nu$), as in the fourth and fifth.

⁴ See note on 919^a 1.

⁵ Reading $\tau\acute{\omicron}\ \gamma\acute{\alpha}\rho\ \delta\iota\alpha\ \pi\acute{\epsilon}\nu\tau\epsilon\ \langle\ \acute{\eta}\mu\acute{\omicron}\lambda\iota\omicron\nu,\ \tau\acute{\omicron}\ \delta'\ \rangle\ \acute{\eta}\mu\acute{\omicron}\lambda\iota\omicron\nu$.

⁶ Reading with Bekker and Bojesen $\tau\omicron\sigma\omicron\upsilon\tau\acute{\omicron}\nu\ \tau\epsilon\ \kappa\acute{\alpha}\iota$.

⁷ i. e. that which is in the ratio of $\frac{4}{3}$ to 1.

⁸ Reading with Bussemaker and Bekker $\acute{\omicron}\sigma\omicron\nu\ \tau'\ \acute{\epsilon}\kappa\acute{\epsilon}\iota\kappa\omicron\nu\ \kappa\acute{\alpha}\iota$.

⁹ i. e. the accord in the octave.

¹⁰ i. e. the melody keeps within the compass of the octave.

¹¹ Putting a question mark after $\mu\epsilon\lambda\omega\delta\acute{\iota}\alpha\varsigma$, where the problem evidently ends, as it does in Gaza's version.

¹² It has been generally recognized that the latter portion of this

ment is most violent in the middle and quieter at the
 920^b beginning and end, and when the movement is most violent
 the sound of that which is displaced is shriller? For this
 reason also strings which are tightly stretched give a shriller
 note, for their movement is quicker.¹ Now if a sound is the
 displacement of air or of something else,² a sound which is
 5 in the middle of its course must be shrillest. If this were
 not so, there would be no displacement of anything.

Why is it that if *mese* is altered, the sound of the other 36
 strings also is spoilt,³ but if on the other hand *mese* is left
 alone and one of the other strings altered, the note which
 10 is altered⁴ alone is spoilt?⁵ Is it because for all strings
 'being in tune' means standing in a certain relation to
mese,⁶ and the tension⁷ of each is already determined by
mese? If, therefore, that which is the cause of their being
 in tune and which holds them together is taken away, their
 proper relationship appears to be no longer maintained.
 But if one string is out of tune but *mese* is not altered,
 15 naturally the defect lies in that string only;⁸ for all the
 others are in tune.

Why is it that, though height in a voice is in accordance 37
 with smallness and lowness in accordance with largeness
 (for a low note is slow owing to its largeness, and a high
 note quick owing to its smallness), yet more effort is required
 to sing a high than a low note, and few can sing the top
 20 notes, and the 'Orthian songs'⁹ and high music are hard to
 sing owing to the strain which they involve? Yet it requires
 less effort to set in motion that which is small than that which
 is large, and this ought to be true also of the air. Is it

chapter belongs to another problem. Reinach and Eichtal's sug-
 gested statement of the problem has been adopted in the translation:
 διὰ <τί ἢ φωνῆ ἀνὰ μέσον ὀξυτάτη; ἢ ὅτι> παντὸς κτλ.

¹ Cp. 899^a 13.

² Placing a comma after *φορά*.

³ Reading with Stark *φθειρόμεναι*.

⁴ Reading with Sylburg <ἢ> *κινηθείσα*.

⁵ Reading with Stark *φθείρεται*. The problem is the same as that
 of chapter 20.

⁶ Omitting the comma after the first *ἀπάσαις* and *δὲ* after *τὸ*, and
 deleting the second *ἀπάσαις*.

⁷ Reading *τάσις* for *τάξις* (so also Ruelle).

⁸ Reading *ἐκλείπει μόνον* with Bojesen.

⁹ Reading *οἱ νόμοι <οἱ> ὄρθιοι*. Orthian songs were of a stirring,
 martial kind.

because the possession¹ of a naturally high voice and the singing of high notes are not the same thing, but naturally high voices are always due to weakness because of the inability to set more than a little air in motion, and the little air thus set in motion is carried quickly along? But height²⁵ of note in singing is a sign of strength; for that which is carried violently along is carried swiftly.² Hence persons in robust health³ can sing high. And it requires an effort to sing the high notes, but the low notes are easier.⁴

38 Why do all men delight in rhythm and melody and concords in general? Is it because we naturally rejoice in natural movements?⁵ This is shown by the fact that 30 children rejoice in them as soon as they are born. Now we delight in the various types of melody for their moral character,⁶ but we delight in rhythm because it contains a familiar and ordered number and moves in a regular manner; for ordered movement is naturally more akin to us than disordered, and is therefore more in accordance 35 with nature. This is shown by the fact that by working and eating and drinking in an ordered manner we preserve and improve our nature and strength, whereas if we do these things irregularly we destroy and derange our nature; for diseases are disturbances of the natural order⁷ of the 921^a body. Thirdly, we delight in concord because it is the mingling of contraries which stand in proportion to one another. Proportion, then, is order, which, as we have said,⁸ is naturally pleasant. Now that which is mingled is always more pleasant than that which is unmingled, especially if, being perceived by the senses, it contains equally the force of both extremes; and in a concord the 5 proportion has this characteristic.⁹

¹ Reading <τὸ> ὀξύφωνον.

² Omitting διὸ τὸ ὀξὺ δυνάμεως σημεῖον as a repetition from the preceding line.

³ Reading εὐεκτικοί (W. D. R.).

⁴ κάτω is clearly due to a gloss on τὰ βαρέα and has displaced another word. For the above translation ῥᾶον (Jan) has been read.

⁵ Cp. *Pol.* viii. 1340^a 3, 4.

⁶ Reading ἡθός with most editors.

⁷ Omitting οὐ with most editors.

⁸ 920^b 33, 34.

⁹ Reading δύναμιν <ἐχῆ· ταῦτο δ'> ἔχει (W. D. R.).

Why is 'antiphony'¹ more pleasant than 'homophony'? 39
 Is it because² 'antiphony' is concord in the octave? For
 'antiphony' is produced by young boys³ and men whose
 10 voices are separated in pitch as *nete* is from *hypate*. Now
 any concord is more pleasing than a simple note for the
 reasons already stated,⁴ and of concords that in the octave
 is the most pleasing; whereas 'homophony' produces only
 a simple sound. 'Magadizing'⁵ is in the concord of the
 octave, because, just as in verses the syllables stand to one
 15 another in the proportion of equal to equal, or two to one,
 or some other proportion, so too the sounds in a concord
 stand in a proportion of movement to one another. In the
 other concords the termination of one of the two notes is
 incomplete since it coincides with the end of only a half of
 the other;⁶ and so they are not equal in force,⁷ and being
 unequal they make a different impression⁸ on the sense-
 20 perception, as happens in a chorus⁹ when at the conclusion
 some are singing louder than others.¹⁰ Furthermore, *hypate*
 happens to have the same conclusions to the periods in its
 sounds as *nete*,¹¹ for the second stroke which *nete* makes
 upon the air is *hypate*. As, then, these notes, though
 25 they do not do the same thing, terminate together, the
 result is that they carry out one common task, like those
 who are playing a stringed accompaniment to a song; for

¹ Reading *ἀντίφωνον* with Bojesen and most editors, following T. G.'s version. For the meaning of the terms 'Antiphony' and 'Homophony' see note on 918^b 30.

² Reading ἢ <ὄτι> with most editors.

³ Omitting καὶ inserted in the Teubner text before νέων.

⁴ i. e. in chapter 38.

⁵ See note on 919^a 1. Some editors, following T. G., hold that a new problem begins at this point and read <διὰ τί> μαγαδίζουσιν ἐν τῇ διὰ πασῶν συμφωνίᾳ; ἢ <ὄτι> κτλ. The rest of the chapter, however, seems to follow naturally on the remarks about the superiority of the concord in the octave.

⁶ i. e. in the fifth, the length of the two notes being as 3 : 2, the slower terminates when one and a half beats of the faster have taken place; in the fourth, the length of the two notes being as 4 : 3, the second beat of the faster terminates when one and a half beats of the slower have taken place.

⁷ Placing a comma instead of a full-stop after εἰσίν.

⁸ Reading διάφοροι with Reinach and Eichtal.

⁹ Deleting the comma after χοροῖς.

¹⁰ Reading ἄλλων <ἄλλων> φθεγγομένων or ἄλλοις <ἄλλων> φθεγγομένους (W. D. R.).

¹¹ Reading συμβαίνει <τῇ νεάτῃ> τὴν αὐτὴν from T. G.'s version.

these, though they do not play the same other notes as the singer, yet, if they finish on the same note, give more pleasure by their conclusion than they give pain by the differences which occur earlier in the piece, because after diversity the unity due to the accord in the octave is very pleasing.¹ Now 'magadizing' is made up of contrary notes,² and for this reason it is carried out in the accord in the ³⁰ octave.

40 Why do men take greater pleasure in listening to those who are singing tunes which they already know than if they do not know them?³ Is it because it is more obvious that the singer is as it were achieving his aim when they recognize what is being sung, and when they recognize it ³⁵ the contemplation of it is pleasant? Or is it because the listener is in sympathy with one who sings what he himself knows? For he sings with him; and every one enjoys singing when he is under no compulsion to sing.

41 Why are a double fifth⁴ and a double fourth not concordant, whereas a double octave is?⁵ Is it because a fifth is in the ratio of 3 to 2, and a fourth in that of 4 to 3? Now in a series of three numbers⁶ in a ratio of 3 to 2⁷ or 4 to 3, the two extreme numbers will have no ratio to one another; ⁵ for neither will they be in a superparticular ratio⁸ nor will one be a multiple of the other. But, since the octave is in a ratio of 2 to 1,⁹ if it be doubled the extreme numbers would be in a fourfold ratio. So, since a concord is a compound of sounds which are in a proper ratio¹⁰ to one another, and sounds which are at an interval of two octaves ¹⁰ from one another are in a ratio to one another (while double fourths and double fifths are not), the sounds con-

² i. e. high and low.

³ Cp. above, chapter 5.

⁴ For δι' ὀξειῶν see note on 920^a 24.

⁵ This chapter is a longer version of chapter 34.

⁶ Reading with the MSS. τριῶν.

⁷ This phrase clearly means a series consisting of n , $n \times \frac{3}{2}$, $n \times (\frac{3}{2})^2$.

⁸ For the meaning of ἐπιμόριος see note on 920^a 26.

⁹ Putting a comma instead of a full-stop after λόγῳ.

¹⁰ Reading ἐνλόγως with Stumpf; cp. *de Sensu*, 439^b 31 ff.

stituting the double octave would give a concord (while the others would not) for the reasons given above.

Why is it that, if one strikes *nete* and then stops it 42
 15 down, *hypate* seems to respond? ¹ Is it because *nete*, as it
 ceases and dies down, becomes *hypate*? (This can be
 illustrated by the fact that it is possible to sing *nete* from
hypate; for the similarity can be taken from *hypate* as being
 a response to *nete*.²) And since an echo is a response to
 a note ³, and when *nete* ceases a sound ⁴ is set in motion
 20 which is the same as the note of *hypate*, it is only natural
 owing to the similarity that *nete* should seem to set *hypate*
 in motion. For we know that *nete* is not ⁵ in motion,
 because it is stopped down, and seeing that *hypate* itself is
 not stopped down and hearing its note we think that it
 is *hypate* which is giving forth a sound. (This kind of
 25 illusion is quite common, where we cannot perceive the
 exact truth either by reasoning or by the senses.) Again,
 it would be nothing extraordinary if, after *nete* is struck
 when it is very tightly stretched, the bridge were set in
 motion; and it would not be strange if, when the bridge
 moved, all the strings were set in motion with it and made
 30 a sound. Now the sound of *nete* is alien to the other notes
 both in its end and in its beginning, but is the same as
hypate in its end.⁶ This having been added to the move-
 ment of *hypate* itself, it would not be strange that the
 sound should seem to be entirely that of *hypate*; and it
 will be louder than the combined sound of the other notes,
 because the latter, being as it were impelled by *nete*,
 35 give only a soft sound, whereas *nete*, being the most violent
 of notes, sounds with its full force; and so naturally its
 second sound would be louder than that of the others,
 especially if only a slight movement has taken place in them.⁷

¹ Cp. chapter 24.

² Reading *ὡς γὰρ οὔσης ἀντιφθῆς (τῆς) νεάτης* (W. D. R.).

⁷ Reading with Sylburg *ἄλλως τε καὶ βραχείας κινήσεως αὐταῖς γεγεννη- μένης*. T. G. clearly renders *ἄλλως τε καί*.

43 Why do we listen¹ with greater pleasure to a solo sung 922^a
to a flute than to one sung to a lyre?² Is it because
anything becomes still more pleasant when mingled with
what is more pleasant?³ Now the flute is more pleasant
than the lyre, so that singing would be more pleasant when
it mingles with the flute than with the lyre. Further,⁴ that
which is mingled is more pleasant than that which is un-
mingled, if there is a simultaneous perception of both the 5
elements. For wine is pleasanter than 'oxymel',⁵ because
natural mixtures are more thoroughly mingled than those
which we make ourselves. For there is also wine which is
mingled of bitter and sweet savours, as is shown by the
so called vinous pomegranates. Singing, then, and the
flute mingle with one another owing to their similarity,¹⁰
for they are both produced by breath. But the sound of
the lyre, since it is not produced by breath (which is what
makes the sound of the flute less noticeable),⁶ mingles less
well with the voice and, causing a contrast in the percep-
tion, has a less sweetening effect, as has been said of savours.
Furthermore, the flute by its own sound and by its likeness
to the voice covers up many of the mistakes of the singer; 15
but the sounds of the lyre, which are isolated and mingle
less well with the voice, since they are themselves observed,
and exist, on their own account,⁷ show up the mistakes of
the singing as well, providing as it were a standard for
criticizing it. And when there are many mistakes in the
singing, the combined effect of the singing and the accom- 20
paniment must necessarily be worse.

44 Why is *mese*⁸ ('the middle note') so called, though
there is no middle of eight notes?⁹ Is it because in the

¹ Reading with X^a *μονοδίας ἀκούομεν εἰάν κτλ.*

² The sense of the solution requires ἢ (ἐὰν πρὸς) *λύραν*. This is not the same problem as that of chapter 9, although in the MSS. the questions are identical.

⁴ Putting a full-stop after *εἴη* and reading with Bojesen *ζτι* for *ἐπεί*.

⁵ An artificial drink made of honey and vinegar.

⁶ So that it mingles better with the voice. Reading ἦ (Egger for ἡ)
ἦττον αἰσθητὸν ὁ τῶν αὐλῶν.

⁷ Reading *αὐτοὶ* (W. D. R.) for *αὐτοῖς*.

⁸ Omitting *τῶν μὲν ὀκτώ*: the MSS. have *τῶν μὲν ἐπτά*, which gives just the wrong sense and is due to a false gloss.

⁹ This problem is a longer version of chapter 25.

old days the scales had seven notes,¹ and seven has a middle? Again, since of the points which fall between two extremes the middle alone forms a kind of starting-
 25 point,² that which lies between the points which verge towards either end in an extended space, being also a starting-point³—*that* will be the true middle. And since *nete* and *hypate* are the extremes of the scale⁴ and the other sounds lie between them, of which the one which is called *mese* alone is the beginning of the second tetra-
 chord,⁵ the name *mese* ('middle note') is amply justified; for of the points lying between certain extremities, as has been shown, the middle alone forms a beginning.

30 Why does a large chorus keep the rhythm better than a 45 small one?⁶ Is it because they look more to one man, their leader, and dance⁷ more slowly, and so more easily achieve unity? For mistakes occur more frequently in
 35 quick singing. Now a large chorus attends to its leader, and no one by differing from the rest would render himself conspicuous by making himself heard above the rest: in a small chorus, on the other hand, individuals can make themselves more conspicuous; they, therefore, vie with one another instead of looking to their leader.

Why do most men sing high when they sing out of 46
 922^b tune?⁸ Is it because it is easier to sing a high note than a low note? They have at all events a tendency to sing high and so make mistakes in what they sing.

Why did the ancients, when they made the scales consist 47
 of seven strings, leave in *hypate* but not *nete*?⁹ Or should
 5 we say that they omitted not *nete* but what is now called *paramese* and the interval of a tone?¹⁰ They treated

⁷ Reading *ὀρχοῦνται* as suggested by E. Graf in 919^a 38.

⁸ Cp. above, chapter 26.

⁹ Cp. above, chapter 7 and the note on 918^a 14.

¹⁰ i. e. the disjunctive.

mese,¹ then, as the lower note of the upper 'pycnon';² whence came the name *mese*, because³ it was the end of the upper tetrachord and the beginning of the lower, and was in pitch in an intermediate relation between the extreme notes.

48 Why do the choruses in tragedy not sing either in the 10 Hypodorian or in the Hypophrygian mode? Is it because these modes have very little of the kind of tune⁴ which is specially necessary to a chorus? Now the Hypophrygian mode has a character of action (hence in the *Geryone*⁵ the march-forth and arming are composed in this mode); and the Hypodorian is magnificent and steadfast, and so is the 15 most suitable of all the modes to accompaniment by the lyre. Now both these are unsuited to the chorus and more proper for the characters on the stage; for the latter imitate heroes, and among the ancients the leaders alone were heroes, and the people, of whom the chorus consists, were mere men. So a woeful and quiet character and type 20 of music are suited to the chorus, for they are more human. These characteristics belong to the other modes, but least to the Phrygian⁶ among them—for it is exciting and orgiastic—and most to the Mixolydian.⁷ In accordance with this mode, then, we adopt a passive attitude, and the weak are more passive than the strong; and so this mode is appropriate to choruses. When we use the Hypodorian and Hypophrygian modes, on the other hand, we are active, 25 and action is not fitting for choruses; for the chorus is in

¹ Reading with Jan μέση τῆ ἐσχάτη.

² 'Pycnon' is a term used for the range covered by the three lower notes of the tetrachord when that range is less than that which is included between the two upper notes; cp. Aristoxenus, i. 24.

³ Reading with Bojesen προσσηγόμευσαν [ῆ], ὅτι and putting a full-stop at the end of the sentence.

⁴ Reading ὅτι (τὸ) μέλος.

⁵ A tragedy attributed to Nicomachus (Nauck², p. 762).

⁶ The MSS. here read ὑποφρυγιστί, which cannot stand here, since the Hypophrygian mode has already been shown to have the character of action (πρακτικός), which Aristotle in the *Politics* (1341^b 34) contrasts with ἐνθουσιαστικός. The Phrygian mode is characterized in the *Politics* (1342^b 3) as ὀργιαστικός and is therefore appropriate here.

⁷ Inserting with Bojesen μάλιστα δὲ ἡ μίξολυδιστί from T.G. The Mixolydian mode was mournful (*Pol.* 1340^a 42 ff.) and is therefore appropriate here.

attendance and takes no active part, for it simply shows goodwill towards those with whom it is present.

Why is it that of the sounds which form a consonance 49
the lower is more suited to melody? ¹ Is it because
30 melody is in its own nature soft and tranquil, but becomes
harsh and full of movement by the admixture of rhythm?
Now since the low note is soft and tranquil, and the high
note full of movement, of the notes which maintain the
same melody the lower would rather be more melodious ² in
the same melody; for melody in itself, ³ as has been shown,
is soft.

35 Why is it that the sounds produced from two jars of the 50
same size and quality, one empty and the other half-full,
give an accord in the octave? Is it because the sound ⁴
produced from the half-full jar is double ⁵ that produced
from the empty jar? This surely is just what happens in
the pipes. For the quicker the movement, the higher
923^a seems the note, and in larger spaces the air collects more
slowly, and in double the space in double the time, and
proportionately in the other spaces. A wine-skin too
which is double the size of another, gives an accord in the
octave with one which is half its size.

¹ Reading with Bojesen *μελικώτερον*; cp. 918^a 37. The meaning seems to be that where there is an independent accompaniment, it should be above, not below, the singing voice. This appears to have been the Greek practice.

² Reading *μελικώτερος*; see last note.

³ Reading *αὐτὸ* with C^a.

⁴ Omitting *καὶ* after *γίνεται* with Bojesen.

⁵ *διπλασία* here means 'twice as rapid'.

BOOK XX

PROBLEMS CONCERNING SHRUBS AND 5
VEGETABLES

- 1 WHY is it that celery can endure salt water, but the leek cannot? Is it because the roots of the latter are weak, but those of the former are strong, and that which is stronger is less liable to be affected?
- 2 What is the reason of the saying :
Mint should neither be eaten nor planted in season of warfare? ¹
Is it because mint has a cooling effect upon the body, as is 10 shown by the corruption which it causes in the semen? This is opposed to courage and spirit, being the same in kind.
- 3 Why is it that some plants, though they have blossom, have no fruit, such as the cucumber and the pumpkin and the pomegranate? Or have they fruit, the blossom being the fruit? For example the part which blossoms is a fruit- 15 case, and the cucumber is a fruit-case.
- 4 Why is it that some plants are edible only after they have been boiled, while others can be eaten raw? Do the juices of such plants as are not at first edible become sweeter when the plants have been warmed by heat, whilst in others the juices are originally sweet, and these can be 20 eaten raw?
- 5 Why is it that some plants are boiled, others roasted? Is it because the moister plants do not require so much moistening,² while the drier plants must not be further dried? Now anything which is boiled becomes moister

¹ See Leutsch, *Paroemiogr.* ii. 530.

² Reading οὐ τοσοῦτον <υγρυνθῆναι>. The Latin version of T. G. renders 'an quod humidiora non eatenus humectari . . . oportet'.

and softer, and that which is less moist becomes dry if exposed to the fire.

25 Why are some plants edible and others inedible? Is it 6
owing to their juices? For plants which in their raw state
have uncooked juices and, when heated, do not undergo
change, are inedible. Now those of which the juice is
edible but somewhat strong are used as condiments; for
plants which have a strong savour in a small compass serve
to flavour those of which the savour is distributed over a
large bulk.

30 Why is it that some plants live only until they have 7
produced seeds and having borne seeds dry up—grass, for
instance, and the so-called herbs—while others do not, but
bear seeds time after time? And of those which live only
until they have produced seed why are the majority annuals,
while horse-parsley produces its fruit in the second year and
35 having done so dries up? Is it because all things flourish
until their seed¹ reaches its prime (for man too continues
to grow until the age of thirty, sometimes in height² and
sometimes in bulk), but when they can no longer produce
seed, as in the case of man, they begin to dry up and grow
923^b old—in some cases slowly and in proportion?³ The reason
why some forms of life are long-lived and others short-
lived is to be the subject of another treatise.⁴ But since
the perfection of the seed is the limit in all cases, it neces-
5 sarily follows that the short-lived bear fruit only once or
only a few times, and the long-lived many times; so that
the weakest bear⁵ only once and so necessarily dry up;
and those of them which can bear seed in a year are
annuals, whilst others, like horse-parsley, do so in the second
year, both plants and trees alike.⁶

¹ Reading καὶ for κατὰ (Platt). Some MSS. read καὶ κατὰ.

² Reading μήκει (Bonitz) for πλήθει.

³ i. e. in proportion to their length of life.

⁴ Apparently a direct reference to *de Longit. et Brev. Vitae* 464^b 19 ff.

⁵ Reading ἐνεγκέιν (Bonitz) for ἐνέγκοι.

⁶ The Latin version here translates a longer text: 'alia postero ut equapium. Quae vero praevalida surgunt, haec annis plusculis post fructificare incipiunt, diuque vitam agere possunt, fructificareque saepius, ut arbores'. This gives a much fuller sense and the Greek

8 Why is it that if one digs down to the roots of celery 10 and surrounds them with barley-husks, and puts earth over these and then waters the plants, the roots become very large?¹ Is it because the barley-husks, being hot and spongy, hold the nourishment in a mass so that it does not rise upwards, but, being hot, causes concoction, and so considerable growth takes place? 15

9 Why is it that if one buries gourds or pumpkins in the ground when they are still small, they become large?² Is it because the wind and the sun dry everything up and prevent growth, and make everything smaller in bulk but closer in texture? (As can be seen in the difference between trees growing in windy and sunny³ localities and 20 those in hollow and moist places, the latter being large and spongy in texture, the former small and dense.) Now the burying of things in the earth is the contrary of this and produces a contrary result. (A similar difference occurs in fruits placed in vessels; if pumpkins are placed in hollow fennel-stalks or boxes, and pomegranates or apples 25 in earthenware jars, the apples become large and spongy,⁴ but the pumpkins become small and hard because they grow against a resisting surface.) The reason then is that the nutriment is increased, because it is not dispersed by the wind or dried up; for the covering of earth prevents it from being thus affected.

10 Why are the seeds of pungent plants more pungent than 30 the roots and the leaves? Is it because everything is derived

text as we have it probably has a lacuna between τῶ ὑστέρω ἔτει and ὥσπερ τὰ δένδρα.

¹ The source of this problem is Theophrastus, *de Caus. Plant.* v. 6, 3.

² Cp. Theophrastus, *op. cit.* v. 6, 4.

³ Reading εἰλώδεσι for ἐλώδεσι; Theophrastus has ἐνείλοις.

⁴ The text here is unsatisfactory and perhaps beyond emendation. For the above translation the following text has been read: τὰ μὲν μεγάλα σομφὰ δέ, οἱ δὲ μικροὶ στερροὶ δέ, ἀξανάμενοι εἰς ἀντίτυπον. The omission of μὴ before εἰς ἀντίτυπον may be justified since (1) the negative should be οὐ not μὴ, and (2) μὴ gives no sense. The phrase εἰς ἀντίτυπον seems to imply a reference to the well-known practice in ancient and modern times of enclosing growing gourds in some narrow receptacle in order to shape them for use as receptacles for liquid (cp. Theophrastus, *Hist. Plant.* vii. 3, 5). The contrast then is between gourds placed in a fennel-stalk or some other narrow receptacle and apples stored in a large earthenware vessel.

from the seed and distributed to the other parts from it, as it were pre-existing in it, as some contend, including the juices and odours, since the odours always become distinctive as soon as the seeds are formed? If, therefore, the
 35 pungency in the rest of the plant is derived from the seed, it is only natural that it should be present in the greatest degree in the seed.¹

Why are thin radishes more pungent? Is it because the II larger radishes are more concocted owing to the lapse of time?

924^a Why is it that the caper-plant will not grow easily in II tilled ground²—for the experiment has often been made of transplanting the roots or sowing the seed (for in some places it is more profitable than roses)—but grows best
 5 among the tombs because the ground is most untrodden? As regards this and similar questions the principle must be accepted that all things do not come into being and grow from the same matter, but some things originally come into being and grow from the corruption of other things
 10 nutriment is corrupted and when the body is itself³ in a state of deterioration. As therefore in the body certain products are engendered from the excrement of nutriment (which means that concoction is incomplete), and since, when nature cannot prevail over the excrement, the commonest excretions are absorbed into the bladder and bowels, while from others living organisms
 15 are engendered⁴ (and so these attain the greatest growth in old age and disease⁵), so in the earth some products are engendered and grow from the concoction of nutriment, others from excretions and matter that is in a condition which is the opposite of concoction. Now tillage concocts

¹ Reading *ἀντῶ* (= *τῶ σπέρματι*) for *αὐτό*.

² Cp. Theophrastus, *op. cit.* i. 3, 6; iii. 2, 1.

³ Reading *αὐτοῦ* for *ἀεί τό*. Richards reads *τοῦ* for *τό*.

⁴ This passage is directly referred to in *Meteor.* iii. 381^b 9–13, where the question of the formation of living organisms in the body is said to be treated *ἐν τοῖς ἐτέροις*, which Alexander Aphrodisiensis interprets as *ἐν τοῖς προβλήμασι*.

⁵ Because then nature has the least power of resistance.

the nutriment and makes it productive, and from this the cultivated fruits are formed. The products, therefore, of this cultivation are called cultivated because they are benefited by art, undergoing as it were a kind of training. Plants, on the other hand, which cannot be so benefited²⁰ or are formed from an opposite condition, are 'wild' and will not grow in a highly tilled soil. For tillage spoils them by trying to train them; for they are engendered from corruption. It is to this class that the caper-plant belongs.

- 13 Why is it that, when radishes are in their prime in the winter, if one cuts off the leaves and heaps earth round²⁵ them and treads it in so as to keep out the water, they grow to an extraordinary size in the summer?¹ Is it because the heaping up of the earth round them secures them from becoming corrupted by preventing the water from rotting them, and the nutriment, which the plant used to send into the shoot, enters into the radish, so³⁰ that it must either itself increase in size or send out lateral shoots and grow other roots, as do onions? For onions, if they are not pulled up each year but are left in the ground during the winter, become multiplied. Now onions are among the plants which send out shoots laterally; but the radish does not do so, and must therefore increase in bulk, because it absorbs all the nutriment. 35
- 14 Why is it that if one plants pumpkins or gourds near a well and, when they are ripe, lets them down into the well and covers them over, they remain green for a whole year?² Is it because the vapour from the water cools them and prevents them from drying up and keeps them in good condition, and the covering of them up fosters the breath which has formed in them? Their conservation is due to the fact that 924^b they still receive nutriment, because their roots are left undisturbed; for even if one removes the shoots, when they have borne fruit, and after cutting them away heaps earth round the roots and treads it down, the plant will produce early 5

¹ The source of this problem is Theophrastus, *de Caus. Plant.* v. 6, 2-3.

² The source of this problem is Theophrastus, *op. cit.* v. 6, 5-6.

pumpkins, because the roots can survive; for the pumpkin-plant¹ is not a biennial. Plants treated in this way² will bear fruit more quickly than seedlings, because the root, the most important part of their organism, is already present in their growth, whereas in seedlings the roots must grow first. Furthermore,³ the heaping of earth round
 10 the root engenders warmth, so that it is preserved and sends up a shoot more quickly. So too if one sows gourd-seeds during the winter in small wicker baskets and waters them with hot water and carries them out into the sun and places them by the fire, very early gourds will be produced if one plants them out in the ground, as they are, in the baskets, when the proper season arrives.

15 Why are plants watered at dawn or at night or in the evening? Is it in order that the sun may not consume the water? Or is it because, when the water is warm, it corrupts the plants which are watered with it? 16

Why is it that sweet-smelling seeds and plants promote the flow of urine?⁴ Is it because they contain heat and are easily concocted, and such things have this effect? For
 20 the heat which is in them causes quick digestion,⁵ and their odour has no corporeal existence; for evil-smelling plants, such as garlic, owing to their heat, promote the flow of urine, but their wasting effect is a more marked characteristic. But sweet-smelling seeds contain heat, because odour is entirely engendered by the presence of some heat; but
 25 evil-smelling things are unconcocted. Now anything which is to promote the flow of urine must be not only hot but also easily concocted, so that it may accompany the liquids in their downward course and effect their digestion.

Why is it that vegetables which are produced from older seeds (for example, two or three years old) produce more 17

¹ Reading *ἔστι* with C^a.

² Reading *οὔτοι* for *αὐτοί*.

³ *ἐν ἧ* is clearly corrupt, as it has no antecedent. It is clear, however, that the right reading is *ἔτι δὲ ἡ περίσσεια ἀλέαν ποιεῖ, ὥστε σώζεσθαι καὶ θᾶπτον ἀνίεναι βλαστόν*, cp. Theophrastus, *l. c.*, *ἔτι δὲ ἡ περίσσεια ἀλέαν παρέχουσα θᾶπτον ἀνίεναι ποιεῖ βλαστόν*.

⁴ This problem occurs also at xii. 12, and is partly identical with i. 48.

⁵ Cp. 865^a 21 and note.

stalk than those grown from fresh seeds?¹ Is it because, just as in animals that which is at its prime produces³⁰ semen most readily, so too very old seeds lose their vigour by evaporation, and those which are produced from fresh seeds are too weak because they still contain excrement which is alien to them, but those which are of moderate age are strongest, because the moisture has left them, and so they produce seed more readily? And the production of seed is the same process as the production of stalk, since the seed comes from the stalk.

- 18 Why does rue grow best and most abundantly if it is³⁵ grafted on to a fig-tree?² Now it is grafted inside the bark and plastered with clay. Is it because the roots of the rue require heat and warmth (and this is why they are benefited by being surrounded with ashes), and the fig-tree contains heat? That this is so is shown by the fact that its sap is^{925^a} the most pungent of all and by the amount of smoke which it produces when burnt.³ It therefore possesses the same kind of heat and moisture as ashes, so that if ashes benefit rue, it must necessarily flourish greatly when grafted on the fig-tree, since, whereas ashes give off no fluid, the flow of liquid from the fig-tree is continuous, its moisture being never exhausted. 5
- 19 Why do some plants always produce empty stalks? Are they among those plants which have to produce something other than stalk?⁴
- 20 Why is it that in Attica, while all other fruits are very sweet, thyme is very bitter, yet thyme is a kind of fruit? Is it because the soil there is thin and dry,⁵ so that the¹⁰ plants which grow there do not contain much moisture?

¹ Cp. Theophrastus, *op. cit.* iv. 3, 5-6.

² Cp. Theophrastus, *op. cit.* v. 6, 10.

³ Cp. Theophrastus, *Hist. Plant.* v. 9, 5.

⁴ The Latin version of T. G. apparently translates a different text here, since it renders: 'an illis quarum natura imbecillior est, has rarum inanemque emittere caulem necesse est?'

⁵ There is clearly a lacuna here. The margin of X^a notes ἴσως λείπει ἢ ὅτι ἀγρὸς ἐκείνος λεπτός τε καὶ ξηρός ἐστι. The Latin version of T. G. also translates this reading, and it has been adopted in the above translation.

In plants, then, which are naturally sweet, owing to the moderate quantity of moisture which they contain, when the sun has absorbed the greater part of it the remainder is easily concocted; for it is difficult for a large amount, but easy for a moderate amount, to be ripened. Fruits, therefore, which are naturally sweet become more so; but in those which are naturally dry and not sweet, the natural moisture fails, because it is scanty, and is very far from being sweet. For the sun absorbs the sweetest and lightest part of it; and these fruits have no superfluous moisture, as have other fruits.

Why do pennyroyal and narcissi and onions bloom if hung up at the time of the summer solstice? Is it because there is unconcocted nutriment in them, which¹ in winter does not become concocted owing to the cold, but at the summer solstice owing to the season becomes concocted, and so the growth takes place? This growth, however, because there is no influx of moisture, quickly dies down; for if they have not some source of nutriment or influx of moisture, they dry up. A similar phenomenon occurs in Scythia, where, owing to the presence of abundant snow, the corn remains a long time in the earth and then suddenly shoots up.

Why does the onion alone make the eyes smart to such an excessive degree (hence it is said to derive its name because it makes one cover up the pupil),² whereas marjoram and other pungent plants do not have this effect? For the nasturtium, though it is more stinging, does not cause tears to the same extent if placed near the eyes, whereas the onion has this effect both when so placed and when eaten. Is it because many differences attach to each of the pungent plants, which give each its peculiar property? The nasturtium then, because it is hotter, is so dry that it prevails over the liquefaction which it causes; for it causes tears when it is eaten, but it does not cause tears when

¹ Reading ἦ for ἧ in l. 21.

² i. e. κρόμμυον is popularly derived from κόρη, the pupil, and μύειν, to close.

placed near the eyes, because it does not give off any thin vapour, being too dry and hot to do so. But marjoram and such warm plants are dry, though only slightly so; and 925^b that which is to cause tears must be stinging and moist and viscous. This is why olive oil causes tears, though its sting is weak; for it penetrates owing to its viscosity and tenuity and causes pain, and the pain causes melting. Now the 5 onion has such properties that its moisture and the vapour which it gives off are hot and tenuous and viscous; and so, when it is placed near the eye, it causes tears, because the vapour which it gives off is of such a character and carries with it a thin moisture; and, when it is eaten, the exhalation penetrates and produces the same effect.¹ Garlic, on the 10 other hand, is hot and pungent and contains moisture, but is not viscous; and so does not cause tears.

23 Why is it that myrtle-berries which have been compressed in the hand seem to us sweeter than those which have not been so compressed? Is it for the same reason as makes 15 dried grapes sweeter than fresh clusters and undried grapes? For dried grapes are, it appears, flavoured by the juice, which is naturally sweet (for they are even externally saturated by it), but the grapes which are still in the cluster are not so flavoured. So too myrtle-berries, which are naturally sweet and have their sweetness within, like grapes 20 when they are compressed, become saturated by the sweetness which is within them and are clearly sweeter externally.

24 Why is it that, the smaller myrtle-berries are, the more they tend to have no stones, and the same is true also of dates and clusters of grapes, in which² the small grapes have no stones at all or only smaller stones? Is it because, 25 being less perfect, they have less distinctly formed stones? For the purpose of the stone is to contain the seed. Now the berries are smaller, because they are mere offshoots and imperfect, and they are less sweet than those which have

¹ There is clearly a lacuna here. Sylb. supplies *ταὐτὸ ποιεῖν δύναται* from T. G.

² Omitting *δ'*.

proper stones ; for they are less concocted, and concoction is a process which produces perfection.

30 Why is it that in some fruits the parts which are near the 25
root are more bitter (for example in the cucumber), but in
others the parts towards the upper extremity (for example in
acorns)? Is it because in the former the nutriment in that
part is unconcocted, because there is a continual influx
along the root ; while the latter are naturally dry, and so,
when the sweetness is drawn off from the extremity and
35 has become concocted, they are henceforward dry and the
bitterness is left behind like salt ? Now as anything becomes
dry, it becomes more bitter, just as olives and acorns
become bitter as they grow old.

926^a Why do some plants sprout when they are not in the 26
earth, but either cut off or placed in store, lily-stalks, for
example, and garlic and onions? ¹ Is it because they all
have nutriment within themselves and not in any definite
place outside the plant? ² [It is therefore their superabun-
5 dance of nutriment which makes them sprout, as is clear
from the fact that squills and purse-tassels do the same.]
Now each of them grows not merely because it contains
nutriment, but only when that nutriment is concocted and
distributed ; it therefore contains nutriment before, but it
only grows when the season comes at which this process
takes place owing to the concoction caused by the season,³
as happens also to crocodiles' eggs. The growth, however,
10 is not continuous, because there is no influx of more
nutriment.

Why is it that garlic and onions grow better according 27
as they are drier when planted, whilst other plants grow
worse under such conditions? Is it because all plants of
this kind are exceedingly full of moisture? If, then, they
are planted in this condition, they enjoy equable conditions.

¹ See below, chapter 28.

² οὐθέν φυτόν is obviously corrupt. For the above translation ἐξωθεν τοῦ φυτοῦ has been read. The two following sentences ἡ περιουσία . . . ποιούσιν, which occur again in chapter 28, are omitted by the best MSS.

³ Reading πεττούσης (τῆς) ὄρας.

A further reason is that they are less likely to rot if they are dried before being planted.

15

28 Why is it that garlic and onions alone among plants sprout when they are stored away?¹ Is it because they are full of moisture and nutriment? It is abundance of nutriment, then, which makes them sprout, as is clear from the fact that squills and purse-tassels do the same. But they grow only when the proper season for each of 20 them comes.

29 Why is it that plants which are watered with cold water are sweeter than those watered with warm water? Is it because the warm water when it becomes enclosed in the plant is saltier (just as that which is saltier is hotter, and that which is sweet is the opposite, that is, in a sense, cold)? Now the nutriment of vegetables is liquid, and it is this 25 which gives them their juices.

30 Why is it that garlic has a stronger odour when it has run to stalk than when it is young? Is it because, when it is young, there is still a large quantity of alien moisture in it which deprives it of its strength? When, however, the plant has ripened, the alien moisture having been already excreted, it then has its own proper odour; and this is 30 naturally pungent.² Similarly, all other fruits when they are young are more watery. This is the reason why young onions are less pungent.

31 Why is it that, if myrtle-branches are not embalmed,³ the berries rather than the leaves drop off, whereas, if they are embalmed with seaweed, the leaves drop off but the berries 35 do not? Is it what naturally happens if the branches are not embalmed, for the berries naturally drop off when they become ripe? This does not occur when the branches are stored away, but the moisture in the seaweed only prevents the moisture in the berries from undergoing change. The leaves, on the other hand, drop off as the branches become 926^b dry, and the seaweed, which is salty, has a drying effect

¹ Cp. above, chapter 26.

² *δριμεία* is omitted by a misprint after *φύσει* in Bekker's text.

³ Apparently for use as chaplets.

upon them. The leaves thus undergo different processes when they remain on the tree and when they are stored away.

Why do melons¹ grow best in marshy plains which are 32
 5 humid, for example, round Orchomenus and in Egypt, which appears to be a well-watered country? Now marshy districts are full of water and melons themselves are somewhat moist; and this is why those grown in gardens are poor. Is it because they have to be planted deep
 10 owing to the hardness of the ground? For clayey, flat ground becomes very hard, and plants grow best which are deeply planted. Or is it because the ground must be dry, because the plant itself is naturally moist? For thus being pulled in opposite directions it will attain the mean. Now ground which is somewhat marshy but deep contains nutriment owing to the depth of the soil and the locality,
 15 but not in an excessive quantity, because the ground dries up again.

Why is it that rue and certain unguents give the per- 33
 spiration an evil odour?² Is it because things which have a heavy and pungent odour, mixing with the excretory fluids, make the odour of these still more unpleasant?

Why is rue said to be a remedy against the evil eye?³ 34
 20 Is it because men think they are victims of the evil eye when they eat greedily or when they expect some enmity and are suspicious of the food set before them? For instance, when they take anything for themselves from the same course, they offer some one else a portion, adding the
 25 words, 'so that you may not cast the evil eye upon me'. All therefore will take with alarm of what is offered them, whether liquid or solid, of those foods, the constriction or vomiting forth of which causes the solids to be carried upwards and ejected or the flatulence from the liquid to give

¹ Reading *οἱ σίκνοι* (*οἱ*) *πέπωνες* (Richards).

² Repeated from ii. 13, where see note on 867^b 9.

³ The belief in the evil eye was evidently as widespread in the Mediterranean lands in ancient times as it is to-day; see Otto Jahn, *Berichte d. Sächsischen Gesellschaft*, 1855, pp. 28 ff., and A. Michaelis, *J. H. S.*, 1885, p. 312.

rise to pain and writhing. Rue, therefore, being eaten beforehand, since it is naturally warming, rarefies the organ which receives the food and the whole body, with the result ³⁰ that it drives out ¹ the flatulence ² enclosed within it.

35 Why is it that marjoram, being thrown into the must, makes the wine sweet, and two cupfuls are thrown into a jar of wine? Is it because it takes away the elements which cause harshness by absorbing into itself by its dryness ³⁵ the watery and sedimentary parts? That it is these which cause harshness is shown by the fact that wines are less soft if water is added or if they have been allowed to stand a long time on the lees. Also when they make raisin wine,³ they expose the grapes for a long time to the sun, which draws out the watery element and concocts the remainder. ^{927^a} Now marjoram produces the same result, for it is dry and hot, and so naturally has a lasting effect.

36 Why do black myrtle-trees have thicker foliage than white? Is it because they are a wilder species? That they are so is proved by the fact that they grow in the untilled ⁵ ground ⁴ and undergo very little modification as a result of cultivation. Now wild plants invariably have denser foliage; for, because their fruit is less concocted, the nutriment is diverted into the foliage.

¹ Reading ἐξωθεῖν: all MSS. read ἐξωθεν.

² The Teubner text misprints πνεῦμα as πείμα.

³ Reading γλυκύν (sc. οἶνον) for γλυκύ, see Bonitz, *Index*, 157^a 17.

⁴ Reading ἀργαῖς (Bussemaker) for ἀγροῖς.

BOOK XXI

PROBLEMS CONCERNING BARLEY-MEAL,
BARLEY-CAKE, AND THE LIKE

WHY is it that barley-gruel and wheaten-flour become **1** whiter if oil is poured on to them, though oil is reddish in colour? Is it because oil naturally foams when it is mixed with liquid, and foaming causes whiteness? Now mixing is carried out by pounding and motion, and is most complete
15 in the case of corporeal substances. This process occurs in foods which are boiled, and so makes them whiter.

Why is it that foods made from wheat suit our bodies **2** best and are more nourishing than those made from barley? ¹ Is it because wheat contains a moderate amount of stickiness, and food ought to have this quality, since it ought to cling
20 and adhere to the body, and its stickiness causes it to do so? But barley ² is less cohesive, and so cakes in which the barley is well kneaded are more nourishing than those in which it is not kneaded.

Why is it that of wheaten-flour that which is ground first **3** is whiter, but of barley-meal that which is ground last? ³ Is it because barley, being dry, breaks into pieces, whereas
25 wheat is soft and crushes? Now in both it is the inner part which is whitest.

Why do loaves appear whiter when they are cold than **4** when they are hot? Is it somehow for the same reason that stale oil is whiter than fresh? For the cause of the
30 blackness is the water which in both cases is present in

¹ Cp. Hippocr., *de Diaeta*, ii. § 40.

² Reading ἀλλὰ {ἡ κριθή} ψαθυρότερον. γλισχρός and ψαθυρός are regularly contrasted (cp. ll. ^b 7 ff.), hence it is impossible for ψαθυρότερον to refer to ἡ ἐκ τοῦ πυροῦ τροφή, which has already been stated to be γλισχρόν. The Latin version of T.G. renders *hordeum vero rigidius est*, and evidently read ἡ κριθή, though ψαθυρότερον is incorrectly translated.

³ A longer version of this problem occurs in chapter 7.

larger quantities when they are fresh; but after a time, owing to evaporation, the water remaining near the surface becomes less. Now it is either the passage of time or the heat of the sun which causes evaporation from the oil; and from loaves the heat goes forth as they cool and has entirely departed when they are cold, whereas it is still present when they are warm.

5 Why do loaves which contain no salt weigh heavier than 35 those which are salted, the other ingredients being exactly the same? The contrary would be expected, since salt is added, and salt is heavier than water. Is it because the salt causes drying to take place? This is why things which are preserved with salt remain uncorrupted; for the moisture in them is taken up and dried up by the salt, and 927^b it is the moisture in things that is corrupted by heat. So too in bread the moisture is taken up by the salt and evaporates outside. Stale bread therefore is lighter than hot bread, since it is colder. Now in loaves which do not contain salt this moisture is present in greater quantities 5 and makes them heavier.

6 Why is it that loaves which have become cold, if they are moistened and placed in contact with one another, do not cohere, whereas hot loaves do so? Is it because the cold loaves give off with the vapour the sticky moisture which is in them, and, because this has gone forth, do not cohere (for the water with which they were wetted is too un- 10 cohesive); but the hot loaves contain a certain amount of stickiness, and so, when they are moistened and the vapour comes forth, the heat, owing to its rarity, is given off, but the sticky matter, which comes out with it and mingles with the moisture, causes the loaves to adhere together?¹

7 Why is it that of wheaten-flour that which is ground first 2 15 is whiter, but of barley-meal that which is ground last? Is it because barley, being dry, breaks into pieces, and this happens most when it is ground for a very long time, but

¹ Reading *προσέχουσαι ἑαυτοῖς* (so too Bussemaker).

² Reading *τὰ πρῶτα* for *τὰ ἄλφιστα*, cp. chapter 3 (^a 23) which is a shorter version of the same problem.

the flour which is inside the wheat is soft and fine and is
 20 crushed out at first? Now in both cases it is the inner part
 which is whitest.

Why is it that barley-cake becomes more indigestible the 8
 more it is kneaded, whereas wheaten-bread becomes easier
 to digest? Is it because dough becomes less by being much
 kneaded (and this is the nature of that which is sticky), but
 the moisture has been expelled from every part of the loaf
 25 by the fire, so that, when the moisture has been entirely
 expelled, the loaf becomes more uncohesive the more it is
 kneaded, because in the kneading it is divided up into
 smaller particles? Now that which is uncohesive is more
 easily concocted. Barley-cake, on the other hand, the more
 it is kneaded becomes more sticky, as the liquid mingles in
 it; and that which is sticky is not easily divided up, and
 30 such foods are not easily concocted; for that which is to be
 concocted must be split up into small parts.

Why does barley-cake become less when it is kneaded, 9
 whereas dough becomes more? Is it because barley-meal
 when moistened and kneaded unites owing to the binding
 quality of the moisture, because it is of even texture and
 35 granulated, but wheaten-flour rises, because it is very
 dense? For that which is dense grows hot when kneaded
 and, when it is hot and inflated, it rises, as does the flesh.

But why does dough increase more when it is heated than 10
 928^a barley-cake does?¹ Is it because dough contains moisture
 which is not separated in such a way that it can escape
 when warmed, owing to the kneading? When therefore
 it is warmed, breath is engendered, and more breath is
 necessarily engendered from a greater amount of moisture.

5 Why is it that although honey is more adhesive than 11
 water, wheaten-flour is more uncohesive, when it is boiled
 or baked, if it is mixed with honey-water than with water?
 Is it because water becomes stiff and solid under the influence
 of the heat, whereas the honey becomes solid but also has

¹ Cp. chapter 23.

a drying effect, and so makes the food more uncohesive (for this quality is produced by dryness)?

10

- 12 Why do twice-baked loaves, when they are cool, not become hard? Is it because wheat has in it a certain sweet and sticky juice, which is as it were its 'soul'? This can be illustrated by the fact that when it is dried it becomes quite empty, but, when it is wetted, it expands.¹ This juice, 15 therefore, being present also in wheaten-flour, especially in that of the purest quality, when the flour is made into dough and the dough is kneaded the same thing² happens, as is proved by the fact that when it is boiled it becomes more digestible.³ When, therefore, the bread is baked for the first time, the thin and light part of the moisture⁴ is evaporated from the bread, and the part of the flour which 20 most resembles chaff is burnt out. But when the dough is taken out and kneaded again, the smoothest part of the flour and the⁵ stickiest part of the moisture being left mingle more with one another, owing to the fact that they have become smoother and stickier, and owing to the effect of the heat; for their mixing resembles the process of 25 dyeing, so that the dough, when subsequently kneaded, is like boiled flour. For when this⁶ dough is kneaded and the lightest flour and the stickiest moisture are left, the bread, when it has been exposed to the fire, becomes glutinous and does not dry up; for that which is sticky cannot be separated, and that which is dense does not of 30 itself give up any moisture.⁷ Twice-baked bread then undergoes this same process for the reasons mentioned above, and, always containing moisture, does not become hard.

- 13 Why is it that we can go on partaking of some kinds both of solid and of liquid food for a long period—for

¹ Reading *ἐκφυσᾶται*, since *ἐκφύεται* does not offer any contrast to *κενοῦται*.

² Reading *ταὐτό* for *αὐτό*.

³ The point here is not clear, unless boiling, like kneading (cp. chapter 8), gets rid of τὸ γλισχρόν and causes ψαθυρότης.

⁴ Omitting *δέ*.

⁵ Reading *καὶ (τὸ) τοῦ ὑγροῦ*.

⁶ Reading *ἐκείνου*.

⁷ Reading *πρoίεται ὑγρόν. ταὐτὸ οὖν τοῦτο καὶ δίπυρος κτλ.*

35 instance, food made from barley-meal and wheaten-flour, and dry wines, and water—whereas we cannot partake continually of others, though they are pleasanter to the taste? Is it because some of the foods which we take tend to float on the stomach and are highly nutritious,¹ so that when one has discharged them,² though their first nutri-
 928^b ment has been consumed, a considerable force still remains in the body, concocted for the first bodily process but unconcocted for its final purpose and for the succeeding process? Now most of the pleasing foods belong to this class; for the fatty and sweet and rich foods seem pleasantest
 5 to our taste, and these, however they differ from one another, are all foods which are nutritious, and not difficult of concoction, and apt to float on the stomach; their force is therefore lasting, if one takes one's fill of them, and the perception of them does not quickly pass away;³ for the feeling of satiety does not only continue while they are in the stomach but also when their nutriment has been dis-
 10 tributed to other parts of the body. Or is this not the only reason, and is there a further reason, namely, that some foods are naturally suited and akin to us? For our bodies accept all such foods more readily because they are natural, while they accept less readily those which are unnatural. And different foods suit different tempera-
 15 ments; for example, honey is the natural food of bees, so that they take no other, though they are physically weak; so that what they consume must be small in amount, but must be to their strength as what men eat is to theirs. And so any pleasing foods which are of this kind seem pleasing because they are present in small quantities in our nature,
 20 but they only appear so for a short time, and then soon cause a feeling of satiety. But we always need the natural foods, so that we feel less satiety from foods continually taken other than those which are most pleasing in themselves.⁴

¹ Cp. *de Sensu*, 442^a 10–12.

² *κενωθῶσι* is apparently an 'impersonal' third person plural, which in this problem alternates with the first person plural.

³ Reading *ἐκλιπεῖν* (Bussemaker) for *ἐκλιπῆ*, and placing a comma after *πληρωθῆ*.

⁴ *δι' αὐτὰ οὐ τῶν ἡδίστων* is apparently equivalent to *οὐ τῶν δι' αὐτὰ ἡδίστων*.

14 Why is it that the same things seem pleasant when we are becoming accustomed to them and not pleasant if we partake of them too continuously, though being accustomed 25 to anything is doing it often and continuously? Is it because custom engenders a receptive habit but does not bring satiety, whereas taking anything continuously fills up the desire, just as a vessel¹ is filled; for desire is a kind of void?² Now habits, when exercised, increase and grow, but vessels when they are filled full do not become any bigger. Hence custom, being an exercise, increases the 30 receptive habit; but that which is continuously taken fills up and satisfies the desire, and, when this is satisfied, we no longer receive any more, and nothing can increase the desire for the reasons already stated regarding the filling of vessels. Furthermore, custom is not pleasant through constantly 35 giving pleasure (for such things too cause pain through continual practice), but because we enter upon the beginning of the process with pleasure and can continue doing the same thing longer than if we were unaccustomed to it. In the same way then as custom, which is pleasant, causes pain, so too do all other pleasant things; for things which happen and foods which are taken continuously, both alike cause pain. The reason is that the powers of acceptance 929^a and action which we possess in ourselves³ are not unlimited but limited, and when they have reached their full capacity (and this is continually visible to an increasing extent) the receptive powers are satisfied, and the powers for action can no longer function. 5

15 Why does dough become white when it is kneaded, while barley-cake becomes blacker? Is it because the surface of the barley-meal becomes drier, and it is the⁴ heat in the moisture which causes the whiteness? Or is it because, through exposure to the heat, the surface of barley-meal attracts the moisture, since it consists of larger particles? 10

¹ Reading ἀγγεῖον for αἴτιον (Bonitz).

² Reading κενὸν for καὶ (Bonitz).

³ Reading αὐτοῖς (Bonitz).

⁴ Reading τὸ δὲ ἐν ὑγρῷ θερμὸν ποιεῖ (Y^a omits ὁ before ποιεῖ). The Latin version of T. G. renders 'calor autem humori permistus candorem gignit'.

Why does barley-meal adhere better together when 16
mixed with water than with oil, though oil is more viscous?
Yet that which is viscous is more binding, and oil is more
viscous than water. Is it because water is thinner and so
penetrates into everything and makes the barley-meal
15 soft, and the grains adhere together better and are com-
pressed into one another, even though pressed together
without any kneading?

Why does bread which is either not kneaded or very 17
much kneaded break up? Does the unkneaded bread do
so because it is not sufficiently bound together? Now it is
the kneading that binds the bread; so that unkneaded
bread is already on the way to breaking up. Further, it
20 contains much moisture not properly mixed in.¹ Bread
which is very much kneaded is dry, because it has very
little moisture; for when it is heated, the moisture all
escapes. So that in both cases the bread breaks up because
much moisture goes forth; for much moisture is actually
present in the unkneaded bread, and in the over-kneaded
bread much <escapes>² compared to what remains behind.

25 Why is the admixture of barley-meal and liquid lighter 18
than the two things together when unmixed? Is it because,
when they are mixed, air is enclosed in them? Or is it
because part of the water is evaporated by the heat in the
barley-meal, and so the mixture becomes smaller in bulk?
The air, however, if it were also mixed in, would not make
30 the mixture any lighter; for air enclosed in air possesses
weight.

Why do milk and sweet wine appear sweeter if drunk 19
with barley-meal? Do they appear sweeter in contrast
with anything which is not sweet (for barley-meal is not
sweet)? Or is it because the barley-meal continues to hold
35 sweetness, and so the perception of it is prolonged?

Why does the same potion seem less strong if it is drunk 20
with barley-meal? Is it because the barley unites what has

¹ Which therefore escapes when the baking takes place.

² The text as it stands contradicts *διὰ τὸ ὀλίγον ἔχειν ὑγρόν* (l. 21),
and some such word as *ἔξῃσι* appears to have dropped out.

one quality with what has another, or because the barley-meal interferes with the potion and destroys it, absorbing it into itself?

- 21 Why does gruel take up more water than the wheat from which such gruel is made? Is it because the gruel is a kind of flour, and flour takes up more water (for its bulk is greater than that of the wheat, for even the particles of the wheat are packed closely together)? Now that which is more holds more both for this reason¹ and also because both flour and gruel contain heat, and heat both attracts the moisture more and expends it by evaporation.
- 22 Why does wheaten-flour increase much more in proportion than barley-meal when it is kneaded?² Is it because flour admits a large quantity of water, but barley-meal only a little? (But why does it admit more, for barley-meal would naturally be expected to do so, because it has been exposed to heat, whereas the flour has not, and that which has been exposed to heat is drier?) Or is it because flour admits of more kneading, the reason being that it is composed of smaller particles? As therefore it is potentially as it were more manifold by reason of the smallness of its parts, so much the more water does it take up. For it uses the water as a glue—a metaphor employed by Empedocles in the *Physics*,³ when he says ‘gluing barley with water’—and it consumes much water for this reason.
- 23 Why does dough increase more when it has been heated than barley-cake does?⁴ Is it because it contains moisture which is not separated in such a way that it can escape when it is warmed, and this⁵ moisture, becoming breath and not being able to escape (as it can in the barley-cake) owing to the density of the dough (for that which is made up of smaller particles is dense), makes the dough, therefore,

⁴ A longer version of chapter 10.

⁵ Reading with Bonitz ὁ πνεῦμα γενόμενον καὶ οὐ δυνάμενον κτλ.

rise and causes the mass to be greater? Furthermore, the moisture which it contains is more considerable, and it is from this, when it is heated, that the breath is engendered; and from the greater amount of moisture more breath must
 25 necessarily be engendered.

Why is it that, of persons engaged in the preparation of 24 cereals, those who handle barley become pale and are subject to catarrh, while those who handle wheat are healthy? ¹ Is it because wheat is more easily concocted than barley, and therefore its emanations are also more easily concocted?

30 Why is it that bread, if one toasts it, becomes harder, 25 whereas, if one warms it, it becomes moister up to a certain point? Is it because, when it is toasted, the moisture goes out of it, and so it becomes harder, whereas, when it is warmed, the moisture having acquired consistency is liquefied again by the fire, and so the bread becomes moister?

35 Why does flour, as it cools, become less closely packed, 26 but barley-meal more so? Is it because things which are made up of small particles contain no vacant spaces, and heavy things, by the pressure which they exert, take up the same space whether they are more or less ² numerically? Barley-meal then is soft; when it cools, therefore, it becomes less, so that the less is more compressed.³ But wheaten-
 930^a flour already consists of small particles, and so it does not cool in this way,⁴ but in such a way as to become lighter and not so as to become more closely packed by compression; for wheaten-flour is naturally heavier than barley-meal.

¹ This problem occurs again at xxxviii. 10; cp. also 863^a 35 ff. It is quoted as occurring in the *Φυσικὰ Προβλήματα* of Aristotle by Apollonius, *Hist. Mirab.* 7.

BOOK XXII

PROBLEMS CONNECTED WITH FRUIT

5

- 1 WHY is it that the volume of food necessary for repletion is not proportionate¹ in the same persons if they eat fruit at the beginning and at the end of a meal? Is it because fruit is much heavier than solid food? This can be illustrated by the fact that figs, though eaten last, are vomited 10 out last. If, therefore, they are eaten first, owing to their weight they sink downwards and leave ample space above, so that one can easily contain the volume of solid food. If, however, the converse takes place, the solid food when it enters in, because it does not sink downwards, quickly occupies the vacant upper space.
- 2 Why is it that, although sweet foods are more akin to us than pungent, we are more quickly sated by the former?² 15 For the contrary might have been expected, since we might naturally be supposed to be less sated by foods which are akin to us. Is it because the organ whereby we receive nourishment³ and the body, which is nourished, are not sated equally quickly, but sometimes the stomach is full, in those, for instance, who are thirsty, but the thirst is not less? For we do not cease being thirsty because the stomach is 20 full, but when each part of the body has drawn thence its own particular moisture; and we cease being thirsty only when they have received this in sufficiency. The same thing also occurs when we are hungry.
- 3 Why are we more quickly sated by sweet than by pungent foods?⁴ Is it because we cease desiring sweet things sooner? 25 Or, while it is not generally admitted⁵ that we become

¹ Reading *ἀνάλογος* with C^a, A^p, and according to Bekker Y^a.

² Cp. chapter 3.

³ Reading *τρεφόμεθα* with Bonitz for *πληρούμεθα*.

⁴ Cp. chapter 2.

⁵ Putting a comma after *γλυκέων* in l. 27; it is obvious that the sentences introduced by *μέν* and *δέ* are parallel and that the general sense is the same as that of ll. 16–22 above.

satiated as the stomach is filled by sweet foods, yet might it not be said that our desire is more quickly sated by them? Or is it because desire is simply a want, which occurs when
 30 we no longer have any nutriment in us or very little? Pungent foods then are not nourishing, but contain little nutriment and a considerable amount of excrement. We therefore naturally seek to eat them in large quantities, and yet do not satiate our desire with them,¹ because we still lack nutriment and they do not contain it. But all sweet foods
 35 are nutriment, and the body derives a large amount of nutriment from a small quantity of them. When, therefore, it derives a large amount of nutriment, it can no longer eat, because it cannot tolerate more. We are therefore naturally more quickly satisfied by sweet foods.

930^b Why is it that fruits and meat and the like remain 4 uncorrupted if placed in skins, when these are tightly inflated, as also do substances placed in closely covered vessels?² Is it because all things become corrupt through being in motion, and things which are full are without motion (for it is impossible for anything to be moved without there being a void), and these vessels are full?

5 Why does wine seem bitter when drunk after the eating 5 of rotten fruits? Is it because such rottenness contains bitterness? That, then, which remains on the tongue, mingling with the draught and becoming diffused in it, makes the draught bitter. The fruit by itself, when eaten,
 10 seems less bitter, because juice of this kind takes effect at many different points and is divided up into small particles.

Why should dried fruits be eaten? Is it in order that we 6 may drink sufficiently? For we ought not only to drink to satisfy the thirst which is engendered by solid food, but also when the solid food is finished.

15 Why do roasted nuts deteriorate when they become cool, 7 and also bread and acorns and many such things, but improve when they are heated again? Is it because, when

¹ Reading *αἴτρων*.

² A shorter version of this problem occurs in xxv. 17.

they become cold, the juice becomes hard, but, when they are warmed up, it becomes liquid again, and it is the juice which is pleasing?

8 Why is it that, for the proper enjoyment of fruits such as 20
figs and the like, one ought to drink with them either
unmixed wine or water, which are the opposites of one
another? Is it because fruit is both hot and moist owing
to the manner of its growth? For it contains much both
of fire and of moisture; and so, owing to the fire, the juice
causes as it were a boiling within, such as must makes on 25
the surface (though the others, the hard-shelled fruit, also
have this force, but in a less degree), while the large
quantity of moisture causes an unconcocted condition.
Water then, owing to its coldness, extinguishes the boiling,
as wine also usually does by its heat; for it takes away its
power, just as one fire extinguishes another if the latter be 30
less. And wine by its heat is better able to concoct the
moisture, and by its weight it prevails over the scum formed
on the surface by the boiling.

9 Why is it that those dried figs are sweetest which are slit
twice, and not those which are slit either many times or not
at all? Is it because, if they are slit many times, most of
the sweetness escapes and evaporates with the moisture, 35
whereas in those which are entirely closed the watery
element is considerable, because it has not been turned into
vapour? Those, however, which have been slit, but not
many times, do not suffer from either of these dis-
advantages.

10 Why is it that figs when they are dried¹ in an oven are
harder if they are left to cool in the oven than if they are 931^a
taken out to cool? Is it because in the oven all the moisture
is evaporated by the heat, whereas outside the surrounding
air cools the moisture and prevents it from escaping and
the moisture retains its consistency rather than evaporates?² 5
Now what is dry is hard, and what is moist is soft.

¹ Reading with Sylburg *ξηραϊόμενοι* for *ψυχόμενα*.

² Reading *καὶ συνίσταται μᾶλλον ἢ ἐξατμίζει*. *μᾶλλον γὰρ ἐξατμίζει* does not give the required sense.

Why is it that wine and water seem sweeter when taken **II** with something sour, if, for instance, one munches acorns or myrtle-berries or something of the kind? Is not this natural and does it not happen in other things too? For everything seems to assert its identity more forcibly when
 10 compared with its opposite, and here the tastes of the two opposites are in a way set against one another. Or is it because, as in objects which are being dyed, the tongue has already been permeated by the sour matter and opens its pores, and so the sweetness can penetrate better? For objects which are being dyed are first of all moistened in sour liquid, because that which is thus permeated¹ takes
 15 the dye better.

Why do sweet things seem to be less sweet when they **12** are hot than when they are cold? Is it because two sensations of the two qualities are present together, and so that of heat dispels the other? Or is it because that which is sweet² is also hot, and it is therefore a case of 'fire upon fire', and thus the heat prevents the perception of the
 20 sweetness? Or is it because fire takes away the power of everything, since it causes motion? Things, then, which are hot are nearer to change, but when they cool they become stable again.

Why is it that chaff concocts hard fruits and does not **13** corrupt those which are already concocted? Is it because
 25 chaff is both hot and absorbent? It, therefore, by its heat causes concoction, while owing to its absorbent property it attracts the corrupted impurity, which therefore does not cause corruption.

Why do figs, which are soft and sweet, destroy the teeth? **14** Do they, owing to their stickiness, penetrate into the gums, and, because they are soft, insinuate themselves into the
 30 spaces between the teeth, and, being hot, quickly cause decay? Perhaps also, owing to the hardness of the seeds, the teeth are quickly caused to ache in the process of chewing them up.

¹ Reading τῶ <τὸ> διεργασθέν.

² Reading γλυκὺ for γλευκός, which is invariably used to mean 'must'.

BOOK XXIII

PROBLEMS CONNECTED WITH SALT WATER
AND THE SEA

- 1 WHY is it that the waves do not ripple in the deep open 35 sea, but only where it is confined and shallow?¹ Is it because a small amount of liquid, as it is carried along, is more divided up by the wind than a large amount?
- 2 Why do the waves sometimes begin to move before the winds reach them?² Is it because the portion of the sea near the source of the wind being impelled along first has 931^b continually the same effect upon the adjoining part, and so, since the sea is continuous, the same effect is caused in every part of it, as though from one continuous impetus? Now this occurs simultaneously, with the result that the first and the last parts of the sea are set in motion at the same time. This effect is not produced in the air, because it is not a single body (since many hindrances affect 5 it from all sides, which often cut short the first and most vigorous movement); the sea, however, suffers from no such impediments, because it is heavier and less easily disturbed than the air.
- 3 Why do ships seem to be more heavily loaded in harbour than out at sea, and why do they travel more quickly from 10 the open sea towards the land than from the land towards the open sea? Is it because the greater quantity of water offers more resistance than³ the less, and the vessel sinks deeper into the latter, because it prevails more over it, for it pushes up the water from below? Now in a harbour the sea is shallow, but deep out at sea; so that a vessel will 15 seem to carry a heavier load in harbour and will move with greater difficulty, because it is sunk deeper into the water,

¹ Cp. below, chapter 24.² Cp. below, chapters 12 and 28.³ Omitting *ἐκ*.

which offers less resistance. But in the open sea the contrary happens.

Why is it that if anything (for example an anchor) is 4
 20 thrown into the sea when it is rough, a calm ensues? Is it
 because the sea is stopped by the descending object, with
 which a certain amount of air is carried down, and this air,
 carried in a direct course downwards and drawn thither,
 draws with it also the lateral force which is disturbing the
 sea? Now a wave does not move downwards from above
 but along the surface, and, when it ceases, a calm ensues.
 25 Furthermore, the sea, as it closes in upon the space opened
 by the descending object, makes an eddy, and eddies move
 in a circle. Now since it is a case of a straight line touching
 a circle at a point (and waves travel obliquely in a straight
 line), the result would be that the waves touch the circum-
 ference of the eddy only at a point, both for the reasons
 30 stated and because the eddy pushes the wave off as soon as
 it comes into contact with it. The place, then, where the
 eddy is, being without waves, the result is that there is
 a calm where the surface is broken, because the air, which
 descended with the object thrown in, subsequently ascending
 and thrusting the sea upwards, causes it as it were to bubble;
 35 for a bubble consists of moisture thrust up by air from below.
 Now every bubble is smooth and still. A proof that the
 above process takes place is given by the fact that the sea
 at the point where the object is thrown in rises a moment
 later to a higher level than the surrounding sea.

Why is it that sometimes vessels which are journeying 5
 over the sea in fine weather are swallowed up and disappear
 932^a so completely that no wreckage even is washed up? Is it
 because, when a cavernous space breaks open in the earth
 beneath the sea, the ship at the same time follows the
 rush of air¹ into the sea and into the cavern? And in like
 manner the sea, being carried everywhere² round in a
 5 circle, is borne downwards; and this constitutes a whirl-

¹ It appears unnecessary to read here *ῥεύματος* for *πνεύματος* as suggested by Bonitz.

² *πάντα φερόμενα* should perhaps be read.

pool. And ships in the Straits of Messina suffer the same fate owing to the flow of water, which causes eddies, and are swallowed up into the abyss, for the reasons stated above and also because the sea is deep and the land cavernous to a great distance. The eddies, therefore, overpower the ships and carry them thither, and so no wreckage ¹⁰ is washed up. The flow occurs when, the former wind having stopped, a contrary wind blows over the sea when it is running under the impulse of the former wind, and especially when the contrary wind is the south wind. For the currents flowing against¹ one another try to thrust one another aside, as happens in rivers, and eddies are formed. And the original movement, which is strong, is borne ¹⁵ whirling round and round from above. Since then the currents cannot travel laterally (for they are mutually repelled), they must be thrust down into the depths, and so whatever is caught by the eddy must necessarily be carried down too. Hence they build ships with slanting ends; for cases have been recorded before now in which a ship with straight ends has been swallowed up. ²⁰

6 Why is the water whiter in the Black Sea than in the Aegean? Is it owing to the refraction of the vision from the sea into the air? For in the region of the Black Sea the air is thick and white, so that the surface of the sea appears to be similar, whereas in the Aegean it is blue, ²⁵ because it is clear to a great distance, and so the sea too reflecting the air appears to be similar. Or is it because all lakes are more whitish than the sea, and the Black Sea has the character of a lake because many rivers flow into it? Now lakes are whiter than the sea, and than rivers; for ³⁰ example, painters picture rivers as pale yellow and the sea as blue. Or is it because the sight cannot penetrate quickly through fresh water and is refracted into the air,² but is not

¹ Reading *ἀντιρρέοντα* for *ἀντιπνέοντα*. This change gives better sense than Bonitz's change of *πνεύματα* for *ρέυματα*.

² The text as it stands gives no satisfactory sense, and we must read: *ἢ ὅτι διὰ μὲν τοῦ ποτίμου (οὐ) διέρχεται ταχὺ ἢ ὕψις, καὶ ἀνακλᾶται πρὸς τὸν ἀέρα, ἀπὸ δὲ τῆς θαλάσσης οὐτ' ἄνω ἀνακλᾶται διὰ τὸ μὴ λεῖον εἶναι τὸ ὕδωρ, κάτω τε κτλ.* This gives agreement with the doctrine of ll. 35-37 and ^b8, and, except for the insertion of the first negative (which

perishes before it becomes perceptible ; and so the wave is not really prior to the wind, but the former is noticeable, while the latter is not. Or do the winds not blow everywhere at the same time, but at first only in the quarter from which they arise? Now as soon as they begin to blow, 5 they set in motion the sea which is near them, and this sets in motion the adjoining sea ; and thus it would be possible for the wave to break forth before the wind reaches it. For the movement is due to the sea and not to wind, being a movement of the sea which travels more quickly than that of the air.¹

Why is it easier to swim in the sea than in a river? Is it 13
10 because the swimmer always leans on the water as he swims, and we receive more support from that which is of a more corporeal nature,² and sea water is more corporeal than river water, for it is thicker and able to offer more resistance to pressure?

Why can one remain longer in the sea than in a river? 14
15 Is it because river water is rare and therefore penetrates more into the body and chokes one?

Why is sea water combustible, while fresh water is not?³ 15
Or does fresh water also burn, while the reason why sea water has less power to extinguish fire is because it is of a more fatty composition?⁴ (And that it is so is proved by 20 the fact that an oil is given off from sea water.⁵) Or are the interstices in sea water⁶ less able to adapt themselves to fire because they are too wide, and all the more so owing to the presence also of salt? As, therefore, that which is dry has less power to quench than that which is moist, so that which is drier is proportionately more capable of being 25 burnt, one thing being more so than another, since the drier

¹ Reading with Bonitz ἡ κίνησις, ἡ θάπτων τοῦ ἀέρος, ἡ τῆς θαλάττης, which is equivalent to ἡ κίνησις ἡ τῆς θαλάττης, ἡ θάπτων οὐσα ἢ ἡ τοῦ ἀέρος κίνησις.

² Cp. Plut. *Quaest. Conviv.* i. 9, which appears to be a direct reference to this passage.

³ Cp. chapter 32.

⁵ *Ib.* b 18 ff.

⁴ Cp. above, 932^b 4.

⁶ *Ib.* b 10 ff.

a thing is the more closely allied is it to heat;¹ and sea water possesses both these qualities of dryness and heat to a greater extent than fresh water.

16 Why is it that the wind blows cold in early morning from rivers, but not from the sea?² Is it because the sea extends over open spaces, but rivers are in narrow places? The breeze, therefore, from the sea is dispersed over a wide area 30 and is consequently weak; whereas the breeze from a river is carried along in a mass and is stronger and therefore naturally seems colder. Or is the reason other than this, namely, that the rivers are cold, but the sea is neither hot nor cold? Now a breeze or an exhalation is due to the 35 heating or cooling of liquids; for whichever of these two processes they undergo, evaporation takes place, and, when water evaporates, the resultant air is set in motion, and this is a breeze. That which is produced from cold liquids naturally blows cold, while that which blows from very hot 40 liquids cools and becomes cold. One would, therefore, find 933^b that all the rivers are cold, but that the sea is neither very hot nor very cold. That which blows from it, therefore, is not cold, because it is not itself cold, nor does it cool quickly, because it is not very hot.

17 Why do waves calm down more slowly in the wider open 5 sea than in shallow waters? Is it because everything calms down more slowly after much motion than after little? Now in the wide open sea the ebb and flow is greater than in shallow waters; there is, therefore, nothing strange if that which is greater is more slow in calming down. 10

18 Why is it that salt water when it is cold is not drinkable, but becomes more drinkable when it is heated, and when it is heated and then cooled? Is it because a thing naturally changes from one opposite into the other? Now drinkable 15 water is the opposite of salt water; and, when salt water is heated, the salt is boiled out, and, when it cools, is precipitated.

¹ Reading with Bonitz τῷ ἐγγυτέρῳ τοῦ θερμοῦ εἶναι τὸ ξηρότερον. τῇ δὲ θαλάττῃ ἄμφω ταῦτα μᾶλλον ὑπάρχει.

² This problem occurs again in Book xxvi. chapter 30.

Why is it that waters near the sea are usually fresh and 19
not salty? Is it because water which is allowed to percolate
becomes more drinkable, and the nearer water is to the sea
20 the more it percolates?

Why does salt water not flow readily? Is it because that 20
which is heavy is stationary, and salt water is heavy? Hence
only warm salt waters flow readily, for they have lightness
in them which prevails over the heaviness which is in their
25 saltness; for that which is hot is lighter. Furthermore,
water which flows readily can percolate through the earth;
and if water can percolate, the thickest and heaviest part of
it is always carried to the bottom, while the light and clean
element becomes separated. For salt water is heavy and
30 fresh water is light. And so flowing water is fresh. It is
for the same reason that salt water, when it is set in motion
and undergoes change, becomes fresher; for it becomes
lighter and weaker owing to the motion.

Why is it that in Libya, if one digs a hole near the sea, 21
the water that first comes is drinkable, but afterwards
35 quickly becomes salty, but this happens less elsewhere?¹
Is it because the water which comes first is the water which
was already there and has been concocted by the earth, but
after a time the sea also percolates through² and, because it
has had no time to undergo any change, makes the water
more salty? [Elsewhere, however, there is³ either no water
40 or abundant water, because the ground is not dried up.]

934^a Why does salt water melt salt more quickly than drinking 22
water? Is it because the process of melting anything is its
dissolution by moisture or heat penetrating into it so that it
becomes liquid? Now those things do not cause melting
which either cannot penetrate at all or penetrate in such
a way as not to touch the substance. Those things which
5 pass through easily scarcely cause any melting, but those

¹ Cp. chapter 37.

² Reading *προσδιηθουμένη*.

³ The Latin version of T. G. renders 'aqua vel nulla est vel plurima', but *ἔχει* can hardly be used thus intransitively by itself, and we must either read *οὐκ ἔστι* or else *ὁ τόπος* for *τὸν τόπον*. The sentence, however, is quite out of place here and appears to have come in from some other problem.

which enter in with violence dissolve substances very quickly. Now those liquids which are composed of very large particles do not penetrate, for they are too large for the pores; while those which are composed of small particles pass through without touching. Now drinking water is rare, while salt water is thicker; and so the former, passing through easily owing to its rarity, scarcely causes any melting, whereas the latter penetrates, but percolates through¹ to a less extent, because it is composed of larger particles, and forces its way in more quickly.

23 Why does water appear less white when it is in motion, for instance when there is a ripple? Whence Homer says that, when the wind begins to blow,

the sea grows blacker beneath it.²

15

Are there two reasons? Firstly, because, when the sight is near to it, it can penetrate farther through the water when it is still, but when it is in motion the sight cannot pass directly through it. (And that which is transparent appears white, for that through which the sight cannot pass is what Homer calls black; therefore the air appears black from a distance but white near at hand, and the part of the sea which is near is white, while that which is distant is blue or black.) And, secondly, because,³ when the sight is at a distance and is subject in any way to disturbance, it is refracted back in a mass towards the light, if the water is still,⁴ but cannot be refracted when it is in motion.

4 Why is it that the waves do not ripple in the deep, open sea, but only on small expanses?⁵ Is it because a small amount of water, as it is carried along, is more divided by the air than a large amount? Hence it beats more and is broken up. Now in deep water the quantity which is set in motion is great, but in shallow water it is small.

¹ Reading *διαρρεῖ* for *διαρρεῖ*, which contradicts the doctrine of ll. 5, 6.

² *Iliad* vii. 64.

³ Reading *διὰ τὸ* for *καὶ τῶ* (C^a, Y^a, and AP read *τὸ*) to correspond to the *διὰ τὸ* *δύεσθαι* in l. 16.

⁴ Placing a comma after *ἡρεμῆ*.

⁵ A longer version of chapter I.

30 Why are the waters saltier in regions facing the south 25
wind? Do they become mixed because the sea is driven
under the earth by the south wind?

Why does the salty element in water come to the 26
surface more in sweet than in dry wine? Is it because
35 sweet wine, like raisin wine, has more earth in it? Or is it
because sweet wine is heavier and stickier and so mixes
less, and, as the wine does not mix¹ with the water, the salty
element comes to the surface?

Why does the salty element, being earthy, float on the 27
surface at all (for its natural tendency is to sink)? Is it ²
934^b owing to its heat, as happens with salt (for it resembles
an efflorescence)? Or is there some other reason? For if
it is for no other reason,³ it is not unreasonable that it
should be for this reason that it floats specially on the
surface of sweet wine; for that is the hottest of wines.

Why do the waves sometimes begin to move before the 28
5 winds reach them?⁴ Is it because they also cease to move
later? For the first breath of wind as it were dies down
before the wave which has been impelled by it into motion;
and it is not the wave which is first set in motion that
arrives, but there is a⁵ successive impetus given to the
adjoining water.

Why is it that the ground where the waves break more 29
violently becomes solid, often to such an extent as to appear
10 to have been artificially levelled, and why is the ground
where the waves break solid, whereas further from the sea
it is loose? Is it because the fine sand is not cast up from
a long way off by the waves, but rather the coarser sand,
just as it is not possible to throw a very small object far
with the hand? Then, many objects being mingled in
15 confusion, the smallest particles fall out⁶ and form into
a mass, and the motion of the wave, as it recedes, levels

¹ Reading *μιγνυμένον* (W. D. R.).

² Omitting *ὅτι μάλλον ἔχει γῆν ὁ γλυκὺς*; ἦ with the best MSS. These words obviously came in from the previous chapter.

³ Placing a comma after *οὐ* and omitting that after *μάλλον*.

⁴ Cp. chapters 2 and 12 above.

⁵ Omitting *ἡ* before *ὄσως*.

⁶ Reading *ἐκπίπτοντα*; the Latin version renders *interlapsa*.

them and no longer disturbs them. Since, then, the smallest particles cannot leap far, a mass is formed of very small objects; and since it is in frequent motion, it becomes continuous, the sand falling in amongst it until it unites it together; it is then levelled by the last waves, and the slight moisture causes it to adhere together. But the ground farther from the sea, being dry, becomes disintegrated, and is formed of larger pebbles and is unlevelled.

30 Why is it that the upper parts of the sea are saltier and hotter than the depths? So, too, in wells of drinking water 25 the upper water is saltier than that at the bottom; yet salty water, being heavier, ought to stand at a lower level. Is it because the sun and the air always attract the lightest part of liquid? Now water which is suitable for drinking is always lighter, and the sun can more easily attract it from the part of the water nearest to it. And so that which is left on the surface both of the sea and of drinking water is 30 saltier (since the fresh element has been extracted) than that from which little or nothing has been withdrawn. For this reason the upper part is also hotter; for salt water is hotter than drinking water. Therefore some of the followers of Heraclitus declare that stones and earth are formed from the drying and solidifying of fresh water¹ and that 35 the sun draws up vapours from the sea.²

31 Why are the waters of the sea fresher which are nearer the land? Is it because they are more continuously in motion? Now salt water becomes fresher through motion. Or is it because the water is saltier in its depths,³ and the part of the sea near the land is less deep? Wherefore also 935^a water which shelves deeply near the shore is less fresh. The reason of this is that the salty element being heavy is carried down more into deep water.

2 Why is sea water the only kind of water that is combustible,⁴ whereas drinking water and river water are not? Is it because it has much earth in it, as is proved by the

¹ Diels, *Vorsokr.* i.³ p. 434, 5.

² Cp. xxiv. 11.

³ This directly contradicts the doctrine of chapter 30.

⁴ Cp. above, chapter 15.

presence of the salt in it? Or is it because it is of a fatty composition, as is proved by the oil which forms on the surface¹ of salt water?

Why does sand not form in lakes, or at any rate less 33
 10 than in the sea and in rivers? Is it because rocks form in
 the sea and the earth has been to a great extent burnt out
 of them? Now sand is rock which has been broken up into
 small and minute particles, and it is broken up by the impetus
 of the waves. But in lakes rocks free of earth are not
 formed to the same extent, nor are they broken to the
 15 same extent, because there are not waves to the same extent.
 But sand is formed more in rivers, because they carry down
 the earth and break up the rocks with their impetus.

Why is it that, when a lake either falls or dries up, the 34
 corn in the adjoining plain is more likely to be cut off
 by frost? Is it because the moisture in the lake evaporates
 20 and warms the air with its vapour, and so makes the frosts
 slighter and weaker than in hollow and marshy districts?
 Or is it from the earth, as men say, that the cold begins
 and penetrates unnoticed? If then the lake becomes dry,
 owing to the larger space of earth greater cold attacks the
 25 crops and freezes them and cuts them off to a greater
 extent; and on such ground the cold comes from below,
 as is the popular belief. And yet the earth is warm in
 winter; but the surface heat which is in the earth, owing to
 the fact that it is moist, becomes cooled, for the moisture is
 neither so far in as not to be affected by cold, owing to the
 30 heat which is present in liquids, nor so slight as to have no
 force, since the earth is permeated with water. For instance,
 owing to its becoming cold, one walks and lives upon ice.

35 Why is the sea salty and bitter? Is it because the juices 35
 in the sea are numerous? For saltness and bitterness
 appear at the same time.

Why do shells and stones which are in the sea become 36
 round? Is it because the breaking off of their extremities

¹ Reading *ἐφιστάμενον* with Y^a and Ap.

equally on every side causes them to assume a round form? For this is the only shape in which the outer surface is the same on all sides, and the sea by moving objects in every direction breaks off their extremities equally.

37 Why is it that sometimes, if one digs a hole near the sea, the first water which enters is drinkable but afterwards it becomes salty?¹ Is it because the water comes from the sea itself which percolates under the earth? The water which first comes is, therefore, naturally fresh; for fresh water is lighter than salt water, and the sea has some freshness in it, which mingling with the earth tends to come to the surface. But the salt water, owing to its weight and to the fact that it has power to penetrate, is carried downwards. Whether this is so or whether the fresh water flows from the mainland into the sea through the earth's veins, it would naturally float on the surface of the sea which mingles with it;² but, the passages being opened, the salt water, owing to its greater volume, subsequently prevails and makes the whole sea salty. For if the passages are blocked the result is that the inflowing salt water finds another way higher up;³ but when they are opened, it is all carried there, just as happens in the veins in the body.

8 Why is it that the sea, which is heavier than fresh water, is more transparent?⁴ Is it because of its fattier composition? Now oil poured on the surface of water makes it more transparent, and the sea, having fat in it, is naturally more transparent. Or is that which is lighter not always more transparent also? For oil itself is lighter than water but not more transparent. Or is the sea not really more transparent, but only apparently so? For fresh water comes from the earth or from streams, and its source sends forth earth also with the water, so that the streams, not being pure, bring down with them the earth and sediment. This then is the reason why fresh water is less transparent.

¹ Cp. above, chapter 21.

² Reading $\alpha\upsilon\tau\omega$ (W. D. R.) for $\alpha\upsilon\tau\eta$.

³ Reading with the MS. A^v $\tau\hat{\omega}\nu$ $\pi\acute{o}\rho\omega\nu$ $\acute{\alpha}\nu\omega$.

⁴ Cp. above, chapter 8.

Why do the bowels of those who swim in the sea open 35
readily? For if it is because they take violent exercise,
those who run also take very violent exercise, yet their
30 bowels do not open. Or does not every form of exertion
cause the bowels to open, but only such exercise as does
not cause wasting? Now staying in the sea seems to make
men, generally speaking, hungrier and opens the bowels;
for the vapour given off by it is both hot and dry.

Why does the Lake of Paesus,¹ of which the water is 4
35 drinkable, wash and also remove the stains from garments?
For water which is fresh washes, but that which is bitter
removes stains, and water cannot have both these qualities
at the same time. Are stains removed not because the
water is bitter, but by the quality of stickiness which has
this power? Hence animals' hoofs have this effect, and any-
thing which contains gelatinous matter; and so also any
936^a bitter substances which partake of this character do the
same. Now in this lake it so happens that the bitter
element of the quality of soda has been burnt out, but the
fatty and sticky element remains. It is by virtue of this
that it removes stains, and it washes because it is fresh.

5 Why does the part of the sea which is calm appear white,
while that which is agitated appears black? Is it because
that which is less visible appears blacker, and water which
is in motion is less seen than that which is still? Or is it
because that which is transparent is white, while that
which is not so is black, and that which is in motion is less
10 transparent?

¹ T. G. renders *πάσα λίμνη* (which is omitted by Bonitz from his *Index*) by *Lacus Paesa*, and we should probably read *Παῖσα λίμνη* here with Sylburg. The reference then will be to a lake at Paesus on the left bank of the Hellespont near Lampsacus. See Strabo, p. 589.

BOOK XXIV

PROBLEMS CONCERNING HOT WATER

- 1 WHY is it that, if one is anointed with oil, hot water poured over one seems less hot, in spite of the fact that oil contains heat? Is it because owing to the smoothness caused by the oil the water glides off and sinks in less? 15
- 2 Why is it that in the summer the water in wells becomes warm after midday? Is it because by that hour the heat has mastered the air, whereas before midday the heat is dissolving and putting an end to the cold; but the one does not prevail as soon as the other has ceased, but only after 20 time has elapsed?
- 3 Why is it that water, which sometimes becomes hotter than a flame, does not burn wood, whereas the flame does so?¹ Is it because the flame, and the breath which comes from it, consist of small particles, whereas water is made up of large particles and so does not penetrate? Now flame and the heat from coals owing to their rarity can 25 penetrate and destroy.
- 4 Why is it that boiling water has not the power to melt, while the stomach possesses this power?² Is it because the heat which is in the stomach penetrates owing to its rarity, whereas water cannot penetrate because of its density? Or is it because liquid prevents other things also from melting (for nothing melts in liquid)? In the stomach, however, the 30 liquid flows down into the bladder and so does not prevent the process of melting.³
- 5 Why is it that the bottom of a vessel containing boiling water does not burn, but one can carry it holding it by the bottom, whereas if the water be removed it burns? Is it

¹ Cp. Theophrastus, *de Igne*, § 40.² *Ib.*, § 45.³ Reading *οὐ κωλύει* for *οὐτω λύει*.

because the heat as it is engendered in the bottom of the
 35 vessel is extinguished by the water? Wherefore also sub-
 stances which can be melted do not melt if any liquid is
 added to them.¹

Why is it that water does not boil over so much in 6
 winter as in summer, although heated not only up to the
 same temperature but even higher, and although equally
 936^b hot or even hotter?² Is it because boiling over is due to
 the rising of bubbles? The water then itself becomes just
 as hot in winter as in summer,³ but the bubbles cannot rise
 to the same extent, because the surrounding air is cold, but
 5 they rise smaller in size, being compressed by the cold, and
 soon burst, being broken by the air. They are, therefore,
 smaller in bulk and fewer in number in the winter, and the
 contrary in summer. Now boiling over is due to the
 number and size of the bubbles forming the froth.

10 Why does hot water cause wrinkles, but fire, though it is 7
 hot, not do so? Is it because fire produces breath and so
 causes swelling (for it distends the skin), whereas it is the
 curving of the skin which makes wrinkles?

Why is it that the bottoms of vessels in which water is 8
 being heated are hotter while the water is still cold?⁴ Is
 15 it because, while the water is still cool, the heat is enclosed
 and driven inwards,⁵ being prevented from making its way
 out, but, when the water in the vessel becomes thoroughly
 heated, since the fire no longer holds the heat but expends
 itself and becomes less, the bottom of the vessel becomes
 cooler, just as a bath does? For a bath is hotter in winter
 20 than in summer, because the heat is more enclosed in
 winter than in summer by the surrounding air which is
 cold.

¹ The words $\mu\eta\ \psi\acute{o}\phi\omicron\varsigma$ appear hopelessly corrupt, but the right sense is given by T. G., who renders *si quid humoris admittatur*.

² Punctuating, with Bonitz, $\text{o}\acute{\upsilon}\ \mu\acute{o}\nu\omicron\nu\ \acute{o}\mu\acute{o}\iota\omicron\varsigma\ \theta\epsilon\rho\mu\alpha\iota\nu\acute{o}\mu\epsilon\omicron\nu\ \acute{\alpha}\lambda\lambda\acute{\alpha}\ \kappa\alpha\iota\ \mu\acute{\alpha}\lambda\lambda\omicron\nu$, $\kappa\alpha\iota\ \acute{o}\mu\acute{o}\iota\omicron\varsigma\ \theta\epsilon\rho\mu\acute{o}\nu\ \delta\upsilon\nu\ \kappa\alpha\iota\ \xi\tau\iota\ \mu\acute{\alpha}\lambda\lambda\omicron\nu$. The source of this problem is Theophrastus, *de Igne*, § 16.

³ Reading with Bonitz $\theta\acute{\epsilon}\rho\omicron\nu\varsigma$ for $\psi\acute{\upsilon}\chi\omicron\nu\varsigma$.

⁴ Cp. above, chapter 5.

⁵ For the doctrine of *ἀντιπερίστασις* of heat and cold see note on 867^b 32.

9 Why is it that water when it boils does not form a scum, as do pea-soup and lentil-soup? And yet water is lighter than these, and light substances ought to be able to project themselves more easily to a distance. The same 25 thing¹ happens in the case of silver when it is being purified; for those who clean out the mint make gains by appropriating the remnants, sweeping up the silver which is scattered about. Is it because the heat causes the scum by vaporizing and subjecting to force anything which opposes its own natural impetus? Water, therefore, owing 30 to its lightness and rarity is not subjected to force, and so no great heat is collected in it, but the heat which continually passes into it cuts its way through before it can become massed together. But substances which have body in them, like thick soups and silver, since, owing to their weight, they contain much corporeal matter and offer resis- 35 tance,² because they are subjected to violent force as the heat tries to make its way out, form bubbles wherever the heat prevails; for, owing to their density, the heat cannot pass through them, but the density prevails until it is thrown off by the heat which flows into it. The result is a sudden impact, and not a continuous pressure, owing to the heat passing up quickly from below.

ο Why, if substances are moistened in hot water for a 937^a short time, do they swell, but, if for a long time, collapse and become wrinkled? Is it because the heat makes a thing liquid instead of solid and produces breath from liquid and rarefies what is dense? At first, therefore, it heats things which are solid and makes them moister, 5 and producing breath from the moisture distends and swells them; but when it heats them still more, it rarefies their outer part,³ so that the vapour is given off, and the drying up of moisture causes their bulk to collapse. Now, as anything collapses, its outer skin shrivels up, and where 10 it shrivels up unevenly, wrinkles are formed.

ι Why are stones formed by hot water rather than by

¹ Deleting the comma after ταῦτό.

² Placing a comma after ἀνταπωθοῦντα instead of after βία.

³ Putting the comma after θερμαίνῃ instead of after τὸ πέριξ.

cold? Is it because a stone is produced from the failure of moisture, and moisture fails more through the operation of heat than of cold, in other words petrification is the result
 15 of heat, as Empedocles says both rocks and stones come into being through the action of¹ hot waters?² Or, while it is true that heat petrifies, can petrification also take place through cold, because an extremely hard frost consumes the moisture and causes hardening? That cold, pure and simple,³ produces this effect is clear from the fact that its excess does so.

20 Why is it that if one has one's foot in hot water, if the I foot is kept still the water appears to be less hot, but hotter if it is moved? Does the same thing happen as in the body, viz. that, when one runs in the wind, the opposing air becomes increasingly colder, and the farther one continues to go⁴ the more one notices it?

25 Why do hot things cool off more in the sun than in the I shade? Is it because the lesser heat is destroyed by the greater?⁵ Or is it because in the shade the surrounding cold represses the interior heat and does not allow it to make its way out, producing the same effect as the pouring of cold water produces upon those who are fainting⁶ (for it
 30 encloses the heat and prevents it from escaping); and speaking generally the interior parts of anything are warmer in the winter? But in the sun, since there is nothing which intercepts it, the heat is free to move and vanishes more quickly.

Why is it that water heated by the sun is not more
 35 wholesome for washing purposes?⁷ Is it because, owing to the fact that it is cooling, it causes shivering while it is still

¹ Reading *διὰ* for *καί*.

² Diels, *Vorsokr.* i,³ p. 211, 31.

³ For this use of *τὸ ἀπλῶς* cp. *Τοφ.* v. 135^a 2, where it is opposed to *τὸ μάλιστα*.

⁴ Reading with Bonitz *ἀεὶ ἰὼν* for *εἰσιῶν*.

⁵ This is the doctrine of *πῦρ ἐπὶ πῦρ* which occurs so often in the *Problems*.

⁶ Cp. Theophrastus, *de Ignis*, § 15, where the word *λιποψυχήσασσι* shows that we must read *ἐκθνήσκουσι*, with Bussemaker, here for *ἐνθήσκουσι*.

⁷ Cp. below, chapter 15.

upon the body?¹ Or, while it has this effect, is it unhealthy if used often for washing? For hot water, generally speaking, produces concoction and has a drying effect, whereas cold water has an astringent effect, and so both do good. Therefore cold water and water heated over a fire are both 937^b beneficial to those who wash in them; but water heated by the sun owing to the weakness of its heat produces the effect of neither of these, but merely has the effect of moistening—like the light of the moon.²

15 Why is water which has been heated in the sun not 5 wholesome?³ Is it because that which is cooling causes shivering?

16 Why are the hot waters at Magnesia⁴ and at Atarneus⁵ drinkable? Is it because more water pours into the hot water as it flows out, and so its saltness disappears, but its heat remains? 10

17 Why is it that in Magnesia the hot waters ceased to be hot but the water remained salty?⁶ Is it because more cold water from elsewhere was poured at the same time into the springs and extinguished the heat? Now the earth was salty,⁷ but not hot owing to the abundance of 15 water flowing into it. (A similar process occurs in water which is strained through hot ashes; for the water being strained through the hot ashes cools the ashes and itself becomes cold, but⁸ is salty and bitter owing to the ashes.) But when the water which was added had become transformed, the heat in the earth for a different reason prevailed over 20 the coldness of the water owing to its small volume, and hot waters flowed again.

¹ Reading *διὰ τὸ ψύχεσθαι καὶ ἔτι ἐπὶ τῷ σώματι ὄν*. The Latin version of T. G. renders *corpore adhuc insidens*.

² The light of the moon does not heat us because it is not hot enough.

³ Cp. above, chapter 14.

⁴ i. e. Magnesia on the Maeander; cp. Strabo, p. 579.

⁵ On the west coast of Asia Minor opposite Lesbos. The fact that Aristotle resided for a time at or near Atarneus makes it possible that this problem is Aristotelian (cp. Frag. 625, 1583^b 20, 30).

⁶ The sense given by this problem as it stands is not clear and is opposed to that of the preceding chapter.

⁷ Cp. Strabo, *l. c.*

⁸ Reading *δέ* with C^a (according to Bekker).

Why are waters from hot springs all salty? Is it because **18**
they usually percolate through earth which contains alum ¹
(as is shown by the smell of the water) and has been burnt?
Now the ashes of anything are salty and smell of sulphur.
25 The earth therefore burns the water like a thunderbolt.
Many hot springs therefore are due to strokes of thunder-
bolts.

Why are hot bathing-places sacred? Is it because they **19**
are due to two very sacred things, sulphur and the thunder-
bolt?

¹ Or, perhaps, 'vitriol'.

BOOK XXV

PROBLEMS CONNECTED WITH THE AIR 30

- 1 WHY is it that pain is caused if the limbs are enclosed in inflated skins? Is it due to the pressure of the air? For just as the air does not yield to pressure applied to the skin from outside but repels it, so the air also presses upon the limbs enclosed within. Or is it because the air is held 35 within by force and is compressed, and so, having naturally an outward impetus in every direction, it presses against the body enclosed within?
- 2 Why is it that in marshes near rivers the so-called 'bellowings' take place, which according to the fable are uttered¹ by the sacred bulls of the god? That which is 938^a produced is certainly a noise which resembles the roaring of a bull, so much so that it has the same effect on cows when they hear it as the bellowing of a bull. Is it due to the fact that this phenomenon always occurs wherever rivers stagnate into marshes,² or are driven back by the sea, or 5 give forth wind in unusually large quantities? The reason is that hollows in the earth form, and the water making its way in (for there is always a flow of water in marshy ground of this kind) thrusts the air also through a narrow entrance into a wider hollow, just as a noise like roaring is produced if one makes a sound through the aperture into an empty 10 jar; for it is by a similarly shaped organ that a bull's roaring is produced. Now, if the hollows have irregular forms, a variety of strange noises is produced; for if one takes off the base³ of a vessel and rubs it against the

¹ Reading *ίέναι* (W. D. R.) for *είναι*. With the whole passage compare *Μeteor.* 368^a 23 ff.

² Omitting *ἢ ὅσα ἐλη λιμνάζονται*, in which the plural verb with a neuter plural subject and the change to the middle voice are suspicious, and which is probably due to dittography of the preceding clause.

³ *πύνδαξ*, which by derivation is connected with *πυθμήν*, *πύματος* and the Latin *fundus* can hardly mean 'lid' (L. and S.), and must mean 'base'.

15 bottom, drawing it in and out,¹ it makes enough noise to frighten away wild animals when orchard-watchers employ this device.

Why does the air not become moist when it comes into 3 contact with water?² For all other things become moist when they touch water. Is it because the extremities of the air and water meet, but the surface of each remains 20 distinct?³ All other things then are heavier, but the air does not sink below the outer extremity of the water. It therefore touches it, because there is nothing between them; but it does not become wet, because it always remains above the water.

Why does calm weather occur most often at midnight 4 and at midday? Is it because calm is immobility of the air, and the air is most at rest when it either has the mastery or 25 is overmastered, and it is in movement when it is struggling? Now it has the mastery most at midnight and is overmastered at midday; for at the former time the sun is farthest away and at the latter nearest at hand. Again, the winds begin to blow either about dawn or about sunset; and the wind which blows at dawn dies down when it is overpowered, and that which blows at sunset dies down 30 when it ceases to have the mastery. Consequently the former dies down at midday, the latter at midnight.

Why is it colder when dawn is breaking and it is already 5 early morning than at night, although the sun is nearer to us?⁴ Is it because towards daybreak dew and hoar-frost 35 fall, and both of these are cold? The whole ground then being as it were sprinkled with cold moisture, a process of cooling takes place.

Why is it that in Pontus both intense cold and stifling 6 heat occur? Is it because of the thickness of the air?⁵

¹ εἰ τρίψει διὰ τοῦ καταδήματος has been omitted as a gloss. The word *κατάδημα* is otherwise unknown and is probably a corruption of *κατάγματος* (the break).

² Cp. below, chapter 10.

³ Omitting *οὐχ* with Richards, *op. cit.*, p. 143, where see note.

⁴ This problem is treated at greater length in Book viii, chapter 17.

⁵ Cp. above, Book xiv, chapter 13.

For in the winter it cannot be thoroughly warmed, and in the summer, when it is heated, it burns because it is thick. It is for the same reason also that marshy regions are cold 938^b in winter and hot in summer. Or is it because of the course of the sun? For in the winter it is far away, and in the summer near at hand.

- 7 Why is the sky finer at night than by day? Is the sun 5 the cause of wind and disturbance? For these occur when some movement takes place; the cause therefore is the heat. So, when the heat is not present, everything is at rest, and there is more rest when the sun is rising than when it is sinking. And the saying,

Have no fear of a cloud from the land,¹ 10

means that, where there is most movement, there must be least permanence and consistency, that which is trying to hold together being inequable and unable to gain the mastery. And this is what happens on the sea in winter and on land in summer.

- 8 Why is it that when liquid which fills a jar is poured into skins the jar not only holds the liquid and the skins as well 15 but also has room for more liquid? Is it because there is air present in the liquid? This then, when it is in the jar, cannot be given off owing to the size of the jar; for the larger anything is the more difficult it is to press any moisture or air out of it, as can be seen in sponges. But when it is divided up into small portions, it is pressed out 20 of the skin together with the air already there,² so that the space occupied by the air becomes empty; and so the jar can hold the skins and additional liquid as well. This is more especially the case with wine, because there is more air in wine than in water. Similarly the same vessel can 25 hold the same quantities of ashes and water together as it can hold of each poured in separately. For there are apparently many empty spaces in ashes, and so the water,

¹ The whole proverb is given at 947^a 7-9.

² i. e. as the air in the skin is displaced by the liquid which is being poured in, it makes its way out, taking with it any air that there may be in the liquid.

being thinner,¹ sinks in more and saturates the ashes, so that they become dense,² because the saturation takes place in one part after another (for a thing always becomes more thoroughly saturated if the process takes place little by little than all at once), and, as this takes place, the ashes gradually sink, at the same time absorbing the liquid because they contain hollows. (But ashes thrown into water while still hot cleave the water and cause it to evaporate.) And the same thing happens if the water is poured in first and the ashes put in afterwards, so that the water also would seem to contain hollows and empty spaces. Or do the ashes take up the water, and not the water the ashes? For it is only natural that that which is composed of smaller particles should be that which finds its way into something else. (Further, this can be illustrated by an experiment; for when ashes are sprinkled water³ is attracted to any spot where they are sprinkled; whereas the contrary would have taken place if it were the water which takes up the ashes.) Or does this process not occur if the water be poured in first and fill the vessel to the brim, but, if anything then be added, does it overflow?⁴ But if the water once overflows and the ashes settle down,⁵ then it does occur; for it was the ashes which took up the water. There is a parallel to this in the fact that trenches do not hold all the earth which has been dug out of them; for apparently some air occupies the space excavated, and for this reason it does not hold all the earth.

10 Why is it that, though air is denser than light, it can pass through solids?⁶ Is it because light travels in a straight

¹ Reading *λεπτότερον* <ὄν>.

² Omitting *καὶ* after *πυκνοῦσθαι*.

³ Omitting *ἄλλο* with AP.

⁴ The argument here is not very clear, but the meaning is apparently something like the following: the fact that when ashes are dropped in an absolutely full vessel the water overflows is no argument against the theory that a vessel can hold the same quantity of water and ashes together as it holds of each separately; for the ashes when first put in naturally cause an overflow, but, when they become saturated and settle down, there is room left for the amount of water which has overflowed, just as if earth is dug out of a trench and then replaced it takes some time to settle down to its original level.

⁵ Reading *ὑποπέση* for *ἐπιπέση*. The Latin version renders *descenderit*.

⁶ Cp. above, Bk. xi. 49 and 58.

line only, and so the sight cannot see through porous substances like pumice-stone, in which the pores are irregular, whereas they are not so in glass? The air, on the other hand, is not obstructed, because it does not travel directly ¹⁵ through anything through which it passes.

10 Why is it that the air becomes cold by touching water but not moist, even though one blows so hard upon water as to cause waves?¹ That it becomes cold is clear from the change which it undergoes; for the air from water² causes cold. Is it because it is the nature of air to be cold or hot, and it changes by touching anything with which it ²⁰ comes into contact; but it does not also become moist, because it is too light and so never penetrates below the level of the water, but always remains in contact only with the surface, even though it be forced downwards, and the water then recedes still lower, so that the air can never penetrate into its depth?

11 Why is the air from bubbles and the air which comes up ²⁵ from beneath the water never wet? Is it because the moisture is not retained, but the water drops off? The water on the surface of a bubble is also too little to moisten anything.

12 Why is it that air cannot saturate anything, but water can? For water even when it is transformed into air is moist. Is it for the same reason as that for which stone ³⁰ cannot do so? For everything has not this faculty of saturating other things, but only that which is viscous or liquid.

13 (Why is it that an inflated skin floats?)³ Is it because the air in it is carried upwards? For when the skin is empty it sinks; but when it is inflated, it remains on the surface, because the air supports it. But if the air makes ³⁵ it lighter and prevents it from sinking, why does a skin become heavier when it is inflated? And how is it that

¹ Cp. above, chapter 3.

² Reading <ó> ἀπὸ τῶν ὑδάτων (Bonitz).

³ The statement of the problem has fallen out and must be supplied from the Latin version of T. G. which reads: *Cur utres inflati valeant fluitare?*

when it is heavier it floats, and when it is lighter¹ it sinks?

Why is it that the air does not rise upwards?² For if 14
939^b the winds are the result of air being moved by heat and it is the nature of fire to rise upwards, the wind ought to travel upwards, since that which sets it in motion rushes upwards and that which is set in motion has a natural tendency to travel in the same direction. As a matter of fact, however, the air obviously travels in an oblique direction.³

5 Why is the hour of dawn colder than the evening?⁴ 15
Is it because the former is nearer to midnight and the latter to midday? Now midday is the hottest time, because it is nearest to the sun, and midnight the coldest⁵ for the opposite reason.

Why is it that in hot weather the nights are more stifling 16
10 than the days? Is it owing to the absence of wind? For the periodical winds and the 'forerunners'⁶ blow less at night.

Why is it that substances enclosed in inflated skins and 17
closely covered vessels remain uncorrupted?⁷ Is it because things which are in motion become corrupt, and all things that are full are without motion, and such skins and vessels are full?

15 Why is it that it is colder when the sky is clear than 18
when it is overcast, though the stars and the heaven are warm?⁸ Is it because in clear weather there is nothing to hold the vapour, but it is diffused everywhere, whereas in cloudy weather it is contained?⁹ For the same reason it is colder when the wind is in the North than when it is in the South; for the South wind attracts cloud, whereas the North

¹ i. e. empty.

² It is unnecessary to suppose with Klek that there is a lacuna in the statement of this problem.

³ The explanation of this is given in Book xxvi, chapter 48, *ad fin.*

⁴ Cp. above, chapter 5 and Book viii, 17. ⁵ Reading $\psi\upsilon\chi\rho\acute{o}\tau\alpha\tau\alpha$.

⁶ Cp. 946^a 15.

⁷ A shorter version of the problem already dealt with in xxii. 4.

⁸ Cp. below, chapter 21.

⁹ i. e. in the clouds.

wind dispels it, and more evaporation appears to take place ²⁰ when the wind is in the North than when it is in the South, and in winter than in summer. Or is it because of dissimilarity? Or because vapour is formed when that which is hot cools?

19 Why is it that a smaller amount of air is warmer than a larger quantity (for confined spaces are always warmer)? Is it because a larger quantity is subjected to more motion, ²⁵ and motion makes a thing cold? This can be seen from the fact that hot things become cold if set in motion.

20 Why is it that water and earth become corrupt, but air and fire do not? Is it because anything which is corrupted must become hotter,¹ but there is nothing hotter than fire?² Or is it because a thing must be chilled before it can be corrupted, but fire is always hot and the air is full of fire?³⁰ So nothing becomes corrupted when it is hot, but only when it is chilled. Now earth and water³ can become hot and cold.

21 Why is cloudy weather hotter than clear weather?⁴ Is it because, as the men of old said, the stars are cold? Or is this too absurd a doctrine,⁵ and is the real reason that in clear weather vaporization takes place? That this is so ³⁵ can be inferred from the fact that, when there is no wind, dew and hoar-frost are formed. When, therefore, the weather is clear, the hot substance, by which the moisture is taken up, is blown about, and so the air becomes cold; for which reason also the moisture which the hot substance lets fall forms dew. But when the weather is cloudy the moisture is contained; and therefore there is no dew or hoar-frost in cloudy weather. The heat, therefore, remaining in the ^{940^a} neighbourhood of the earth makes the weather warm.

22 Why is it that in lofty rooms the air constantly ebbs and flows, especially in calm weather? Is it because the air

¹ Reading *θερμότερον* for *θερμώτατον* with Bonitz.

² And since fire cannot become hotter, therefore it cannot become corrupt.

³ Omitting *καὶ ἀήρ* with AP.

⁴ Cp. above, chapter 18.

⁵ The contrary doctrine, that the stars are hot, is assumed in l. 16 above.

5 contains much void in its composition? When, therefore,
 it begins to flow in, the air inside the room gives way and
 contracts; and when in course of time this air becomes
 massed together, the air outside becomes more full of voids
 and contains much vacant space. Into this space then the
 air from the room rushes, since it is near at hand, and
 10 passes into it, because it is in suspense and the nature of the
 void cannot resist. So when this happens in many parts of
 it, the adjoining air follows it owing to the forward impetus;¹
 and then, since a large quantity of air rushes out,² the space
 within becomes full of voids, while the air outside is denser
 and so rushes in again from outside. Thus these two
 15 currents continually interchange.

BOOK XXVI

PROBLEMS CONNECTED WITH THE WINDS

I WHY does the North-East wind (Caecias)¹ alone of the winds attract the clouds to itself?² Is it because it blows from higher regions? For the parts towards the East are higher than those towards the West,³ as is shown by the 20

¹ Caecias does not strictly speaking correspond with our NE. wind, since the quadrants of the Greek compass were divided into three and

Chart of the winds to illustrate *Problems*, Bk. xxvi.

[The names in square brackets are supplied from other treatises.]

not four sections as in a modern compass; Caecias is, therefore, 30° and not 45° north of the East wind. The chart of the Greek winds has been dealt with by Professor D'Arcy Thompson in *C. R.*, xxxii, p. 49 (1918), who has independently come to the same conclusion as I had previously formed in translating the *de Mundo*: he proves conclusively that Kaibel and Capelle's 'wind-rose', which I had adopted when translating the *de Ventorum Sitibus*, is wrong, but he was apparently unaware that I had changed my view when translating the *de Mundo*.

² Cp. chapter 29. The source of both problems is Theophrastus, *de Ventis*, §§ 37, 39; cp. also *Meteor.* 364^b 12.

³ i. e. the earth is conceived of as sloping gradually from E. to W.

extent and depth of the sea towards the West. Now the North-East wind (Caecias), blowing from above to a contrary direction, describes in its course a line which follows an upward curve in relation to the earth;¹ and falling, as has been said,² upon the western regions of the earth and massing the clouds together as a result of the form of line
 25 which it follows, on its return back it thrusts the clouds before it towards itself.³ It is the only one of all the winds which does this, because for some the opposing regions are higher,⁴ towards which their course, either starting from⁵ a lower level or proceeding in a straight line, as a result travels in a downward curve⁶ towards the earth,⁷ so that
 30 there can be no return of the wind to its source because it ends its course round the earth, where, besides, there are no clouds.⁸ The East wind and the other winds which follow a less curving course do not form clouds because they have no moisture. Since, then, it forms no clouds, the effect produced by the East wind is less obvious than that produced by the North-East wind.

35 Why do the North winds occur at a fixed period of the 2 year, whereas the South winds do not?⁹ Or do South winds occur annually but are they not continuous, because the source of the South wind is far away from us, and we live

¹ Reading *κυρτά* (T. G. has *convexum*) for *κοῖλα* in order to give the required sense and to agree with the doctrine of 943^b 1. *Κοῖλα* and *κυρτά* appear to have changed places here and in l. 28. The meaning here is that the N.E. wind, descending from above, sweeps in a circular course up into the sky and thence returns to the point from which it started.

² Nothing has yet been said on this point.

³ i. e. to the point from which it started. *ἐφ' αὐτόν* must be read for *ἐπὶ αὐτόν*.

⁴ Reading *τοῖς μὲν ὑψηλοτέροις τοὺς ἐναντίους εἶναι τόπους* (W. D. R.).

⁵ Inserting *ἐκ*, omitted by error in the Teubner text, before *τοῦ κάτωθεν*.

⁶ Reading *κοῖλα* (T. G. has *devenxus*) for *κυρτά*; see note on l. 22.

⁷ Reading *ἔχουσιν* for *ἐχούσης* and deleting the comma after *συμβαίνει*. T. G. renders *quae versus, ut aut de imo aut e directo flatus feratur devenxus, terram versus necessum sit*.

⁸ Reading *τῷ περὶ τὴν γῆν* (cp. 943^a 37) *ἔχειν τὴν τελευταίαν τῆς φορᾶς, ἐν ᾧ οὐδὲ νέφη ἐστί* (W. D. R.). The fact that the wind blows below the cloud level gives an additional reason why it cannot form clouds. *περὶ τὴν γῆν* appears to have been displaced from l. 30 by an emblemata from l. 29 and to have found its way into l. 31.

⁹ The source of this problem is Theophrastus, *op. cit.*, § 11.

close to the North wind? Further, the annual North winds blow when the air is still (for they blow in summer); 940^b whereas the South winds occur in the spring, when the region of the air is less stable. Again, the South wind is moist, and the upper region of the atmosphere is unfavourable to moisture; so any moisture which is formed in it¹ is quickly dissolved. Also moisture is erratic; and so the South wind, because it does not remain in the same place, 5 helps to set up changes in the movement of the air. And since the air does not remain in the same place when it moves, other winds are consequently set up; for a wind is a movement of air.

3 Why does the South wind blow after a hoar-frost?² Is it because hoar-frost occurs when concoction takes place, and after concoction and cleansing a change to the opposite 10 condition takes place? Now the South wind is the opposite of the North wind. For the same reason also the South wind blows after snow. In a word, both snow and hail and rain and all such processes of cleansing are a sign of concoction; therefore after rain and similar storms the 15 winds fall.

4 Why do the alternating winds blow?³ Is it for the same reason as causes the change of current in straits? For both sea and air are carried along until they flow; then, when the land-winds encounter opposition and can no longer advance, because the source of their motion and 20 impetus is not strong, they retire in a contrary direction.

5 Why do the alternating winds come from the sea? Is it because the sea is close at hand? Or is it because the alternating wind is the opposite of the land-wind and as it were the reverse of it? Now the land-wind is the breeze which blows from the land towards the sea, and the alternating wind is the reflux of the land-wind, so that it 25 must necessarily come from the sea. Or is it because⁴ the

¹ Reading with Bekker $\alpha\upsilon\tau\hat{\omega}$ for $\alpha\upsilon\tau\hat{\omega}$.

² The source of this problem is Theophrastus, *op. cit.*, § 50.

³ This and the following problem are derived from Theophrastus, *op. cit.*, § 26.

⁴ Reading $\eta\ \delta\iota\alpha\ \kappa\tau\lambda.$, omitting $\eta\ \theta\acute{\alpha}\lambda\alpha\tau\tau\acute{\alpha}\ \acute{\epsilon}\sigma\tau\iota.$

air which has been set in motion collects out at sea? The reason of its not collecting on land and of its being thrown back¹ is the fact that the sea is in a hollow, and air, like water, flows always into the deepest hollow it can find.

30 Why do cloud-winds² stop sooner when rain falls? Is it 6 because, when it rains, the hollows of the cloud, in which the source of the wind is formed, collapse?

Why are not the same winds everywhere rainy?³ Is it 7 because the same winds do not everywhere blow against 35 mountains, but different winds are opposed to different mountains? For example, when the winds blow laboriously against steep mountains, the clouds are more likely to form there, since the wind cannot push them farther forward; and when the clouds form and are compressed, they burst.

941^a Why are sunsets, if they are clear, a sign of fine weather; 8 if they are disturbed, a sign of stormy weather? Is it because a storm occurs when the air is dense and thick? When, therefore, the sun prevails, it breaks up and clears the air; but, if it is itself overpowered, an overcast sky 5 results. If, therefore, the density is excessive, a storm occurs as soon as the day dawns; whereas if it is weaker but not completely overpowered, the denseness which forms is driven towards the setting sun and remains there, because the air round the earth is thicker⁴ than the storm. And the rest of the air quickly densifies, because 10 a beginning of the process has already been made and there is a rallying point to receive and collect anything which comes to it,⁵ the same thing occurring in the air as happens in a rout, where, if one man makes a stand, the rest also remain firm. Hence the sky sometimes becomes quickly and suddenly overcast. When,

¹ Omitting ἀπὸν as a dittography of αἴτιον.

² Cp. *de Mundo* 394^b 17.

³ Cp. Theophrastus, *op. cit.*, § 5. This problem is more fully treated in chapter 56.

⁴ Reading παχύτερον for παχύτατον, the comparative and superlative being frequently confused in the MSS.

⁵ Omitting the meaningless καθάπερ ὄρθρος.

therefore, there is a disturbed sunset, it is a strong indication that the sun has not got the mastery over the density, ¹⁵ though it has struggled long against it, so that probably ¹ further condensation has taken place. This is a less alarming symptom when it occurs after a storm than in calm weather; for in the former circumstances it is probably the remnant of a storm, but in the latter the beginning of condensation.

9 What is the origin of the saying,

20

Boreas blows not at night when once the third sun
hath arisen? ²

Is it because the breezes which come from the north are weak when they blow at night? A proof that the amount of air which is set in motion is not great is the fact that they blow at a time when there was a small amount of heat; and a small amount of heat was moving a small amount of air. Now all things terminate in multiples of three, ³ and things which are very small terminate at the ²⁵ end of the first triad; and that is what this wind does.

10 Why does the North wind blow more frequently than the South wind? ⁴ Is it because the North wind, being near the inhabited portion of the world, attracts our notice in spite of its short duration (for it is with us as soon as it begins to blow), whereas the South wind does not reach us, because it ³⁰ blows from a distance?

11 Why does the South wind blow as much ⁵ on winter nights as on winter days? Is it because during the night the sun is near the southern region, and the nights there are warmer than are the days in the north? Much air, therefore, is set in motion and not less than by day; but the ³⁵

¹ Reading *εἰκὸς* for *εἰκότως*.

² Cp. below, chapter 14. The source of both chapters is Theophrastus, *op. cit.*, § 49.

³ Cp. *de Caelo* 268^a 10 *καθάπερ γὰρ φασὶ καὶ οἱ Πυθαγόρειοι, τὸ πᾶν καὶ τὰ πάντα τοῖς τριῶν ὄρισται.*

⁴ Cp. below, chapter 15, and Theophrastus, *op. cit.*, § 9.

⁵ Reading *<οὐχ>* ἥττον, which is demanded by the logic of the problem. Whereas North winds blow less at night than by day (chapter 9), South winds blow at least as much by night as by day.

warmer days prevent the wind from blowing more strongly by drying up the moisture.¹

Why does the South wind blow at the time of the Dog-
star, and why does this happen regularly like any other
natural phenomenon?² Is it because the southern regions
are warm, since the sun is not far³ away, and so the evapora-
tion is considerable? The South winds would⁴ blow fre-
941^bquently if it were not for the annual winds; as it is, these
prevent their blowing.⁵ Or is it because a sign occurs⁶ at
the setting and rising of any star, and especially of the
Dog-star? It is clear that winds blow most at the time of
and after its rising, and since it causes stifling heat, it is
5 only natural that the hottest winds should be set in motion
when it rises; and the South wind is hot. And since things
are most accustomed to pass from contraries into contraries,
and the 'forerunners',⁷ which are northern winds, blow
before the rising of the Dog-star, the South wind naturally
blows after the Dog-star appears, since a sign then occurs,
10 and the occurrence of a sign⁸ at the time when stars rise
means a change in the air. Now all winds change either
into their contraries or into those on their right; but since
the North wind cannot⁹ change into the winds on its right,
the only thing left for it to do would be to change into
a South wind. Now on the fifteenth day after the winter
15 solstice the wind is in the south, because the solstice marks
as it were a fresh start and the sun sets in motion air which

¹ Cp. Theophrastus, *op. cit.*, § 49, *ad fin.*

² The source of the first explanation offered is Theophrastus, *op. cit.*, 48. The problem is repeated in chapter 32.

³ Reading τοῦ ἡλίου (οὐ) πόρρω ὄντος, cp. Theophrastus, *l. c.*, αἴτιον δ' ὅτι θερμὰ τὰ κάτω, τοῦ ἡλίου πάροντος, ὥστε γίνεται πολλὴ ἀτμίς.

⁴ Reading πολλοὶ ἂν ἔπνεον.

⁵ There should be a full stop in place of a comma after κωλύουσι. The rest of this chapter occurs in the MSS. under chapter 32, whence the editors have transferred it to this chapter as dealing with the same problem.

⁶ σημαίνει and ἐπισημαίνει (l. 9) are used impersonally as equivalent to σημείον ἐστί. The Latin *significat* has the same force, cp. Columella, ix. 2 *Siderum occasus tempestates facit, interdum tantum significat.*

⁷ So called because they precede the Etesian winds (946^a 15).

⁸ Reading ἐπειδὴ ἐπισημαίνει μὲν, ἐπιτέλλουσι δὲ τοῖς ἄστροις τὸ ἐπισημαίνειν ἐστί κτλ.

⁹ Reading ἐπιδεξίους (οὐ) μεταβάλλει (Bonitz); the Latin version of T. G. inserts the negative.

is nearest to it¹ and at this solstice it is near the south. Just as, therefore, when it sets the region of the east in motion it stirs up the East winds, so when it sets in motion the southern region it stirs up the South winds. It does not do this immediately after the solstice, because the ²⁰ changes which it sets up extend at first over a very small area, but only on the fifteenth day, because this date corresponds to the first sensible impression made by the change; for the said date is simply the most significant part of a whole.

13 Why are the days most changeable during the period of Orion, and why is there then such variability in the ²⁵ wind?² Is it because during a period of change all things are always most indeterminate, and Orion rises at the beginning of autumn and sets in the winter, so that, since there is not yet one settled season, but one is coming on and the other coming to an end, the winds must therefore necessarily be unsettled, because those of each season are ³⁰ passing into one another? And Orion is said to be dangerous both in his setting and in his rising owing to the uncertainty of the season; for it must needs be full of confusion and inconsistency.

14 Why does the North wind which blows at night cease on the third day?³ Is it because it comes from a small and ³⁵ weak source and the third day marks the crisis? or is it because it expends itself all at once like the 'cloud-winds',⁴ and therefore quickly dies down again?

15 Why do the North winds blow more than the other winds?⁵ Is it owing to the fact that the inhabited portion of the earth is near the region of the north, which is high ^{942^a} and outside the tropics and full of snow, which never leaves some of the mountains? As, therefore, frozen matter is usually melting there, a wind often arises, and this wind is the North wind which comes from the region of the pole.

¹ Reading καθ' αὐτὸν for κατ' αὐτήν (cp. 944^a 22).

² The source of this problem is Theophrastus, *op. cit.*, § 55.

³ Cp. above, chapter 9.

⁴ See above, 940^b 30, and *de Mundo*, 394^b 17.

⁵ Cp. above, chapter 10.

5 Why do the South winds blow during winter and at the 16
beginning of spring and the end of the autumn,¹ and why
are they boisterous and whirling in their course, and why
are they cold to the inhabitants of Libya in like manner as
the North winds are to us?² Is it because, the sun being
near, the winds must necessarily be set in motion? Now
10 during the winter the sun travels towards the south, and at
the beginning of the spring and at the end of autumn it is
giving forth heat; whereas during the summer the sun
travels towards the north and leaves those other regions.
The South wind is hot, because it mingles its breath with
the air in the region of Libya, which is hot; and so it is
15 boisterous³ and makes the summer rainy, sweeping down
on the sea.

Why does the South wind cause evil odours? Is it 17
because it makes bodies moist and hot, and they are then
most liable to corruption? South winds, however, which
come from the sea are good for plants—for the South wind
reaches the Thriasian Plain in Attica from the sea⁴—and
20 the reason is that it is cooled before it arrives. Now
mildew is caused by moisture which is hot and comes from
without.

Why does wind usually occur before eclipses, at nightfall 18
before midnight eclipses and at midnight before those
which occur at dawn? Is it because the heat which comes
25 from the moon becomes faint, because its course is already
getting near the earth, and when it is quite near the eclipse
will take place? Now when the heat, by which the air is
held back and kept still, is set free, the air begins to move
again and a wind springs up later in time according as the
eclipse is later.⁵

¹ Cp. Theophrastus, *op. cit.*, § 10.

² This is dealt with in chapter 49.

³ Reading μεγαλοκύμων (<ὄν> (Platt).

⁴ Reading ἐκ θαλάττης γὰρ ὁ νότος (for αὐτοῖς) προσπίπτει καὶ τῆς Ἀττικῆς τῷ Θριασίῳ πεδίῳ· αἴτιον δ' ὅτι (for διότι) κτλ. Unless ὁ νότος is read for αὐτοῖς there is no subject for προσπίπτει; cp. the Latin version, *nam et Thrasio campo terrae Atticae auster de mari occurrit.*

⁵ The sense (cp. above, ll. 23, 24 ἀκρόνυχον . . . τῶν ἑώων) demands some such reading as ὀψιαίτερον, τῆς ἐκλείψεως ὀψιαίτερον (<ούσης>).

19 Why is the South wind rainy not when it is beginning but when it is ending?¹ Is it because it collects the air³⁰ from a distance? For the rain comes when the South wind masses the air together, and it masses the air together only after it begins to blow. Or is it because, when the South wind begins to blow, the air is still hot, because it comes from a hot region, but in course of time it becomes cool, and then tends to become massed into rain?

20 Why is it that the South wind, when it is less strong, brings clear weather, but, when it is strong, brings clouds³⁵ and lasts longer?² Is it, as some say, owing to the source from which it comes? For if it comes from a weaker source it brings clear weather, but if it starts from a stronger source it brings clouds. Or is it because it is weaker when it begins, so that it does not propel much air, but in the end it usually becomes strong? Hence^{942^b} comes the proverb,

When the South wind begins and when Boreas ceases his blowing.³

21 Why is it that in the winter the winds come forth from the east, but in the summer also from the west?⁴ Is it because, when the sun no longer prevails, the air flows freely?⁵ When, therefore, the sun sinks, it leaves clouds behind it, which cause the West winds, and anything which it carries with it to the inhabitants of the southern hemisphere becomes an East wind. And, contrariwise, when it sinks in the southern region of the earth, it will cause West winds for the inhabitants of that region and East winds in our part of the world from the air which accompanies it. For¹⁰ this reason too, if it finds another wind blowing, that wind becomes stronger when the sun rises, because it adds something to it.

¹ Cp. Theophrastus, *op. cit.*, § 7.

² Cp. below, chapter 38, and Theophrastus, *op. cit.*, §§ 6, 7.

³ The complete proverb is εὖ πλείν ἀρχομένου, &c.; cp. below, 945^a 29.

⁴ The source of this problem is Theophrastus, *op. cit.*, § 47. The subject is treated more fully in chapter 54 below.

Why are hounds least able to find the scent when a West 22
wind is blowing? Is it because it disperses the scent most
owing to the fact that of all the winds it blows most
15 continuously and down on to the earth?

Why, when there are shooting stars, is it a sign of 23
wind?¹ Is it because they are carried along by the wind,
and the wind occurs where they are, before it reaches us?
For this reason also the wind rises in that quarter from
which the stars are set in motion.

20 Why is it that of all the winds the West wind drives the 24
largest clouds?² Is it because it blows from the open sea
and over the deep, so that it collects clouds from a large
area?

Why are the winds strongest which are at their ending?³ 25
Is it because when they expend themselves all at once, what
remains is very little?⁴

25 Why is it that, if the South-West wind (Lips)⁵ blows 26
about the time of the equinox, rain results? Is it because
the sun sets the winds in motion from any part of the
universe in which it is? Hence the succession of the winds
corresponds to the course of the sun. Now since the
equinox is the boundary between winter and summer,
30 when it happens that the sun, according to the equinox as
it appears to us, has passed the exact boundary or falls
short of it and is rather in the wintry region, the result is
that the winds from that region blow, of which the first is
the South-West wind (Lips), which is naturally moist. Now
when the sun is rather in the wintry region of the universe
35 and stirs up the winds there, the result is that the functions of
winter come into operation; one of which is wet weather.
Again, since the equinox is as it were winter and summer

¹ Cp. Theophrastus, *op. cit.*, § 36.

² The source of this problem is Theophrastus, *op. cit.*, § 42.

³ The source of this problem is Theophrastus, *op. cit.*, § 36.

⁴ And therefore they come to an end. *λοιπόν* should be read for the meaningless *θερμόν* from Theophrastus, *l. c.*, *ὅταν γὰρ ἀθρόοι ἐμπνεύσωσι, μικρὸν γίγνεται τὸ λοιπόν.*

⁵ Lips does not correspond exactly to our SW. wind, being 30° and not 45° south of the West wind. See note on 940^a 18.

equally balanced, if anything is added to either one of them it causes a distinct inclination in one direction, just as happens in the case of equally balanced scales. But, since the South-West wind (Lips) is of the wintry order and naturally moist, its addition at the equinox causes an inclination towards winter and rainy weather; for rain is the wintry weather most akin to the wind that has begun to blow.

- 27 Why are the South wind and the South-East wind (Eurus),¹ which are warmer than their respective contraries, the North wind and the West wind, more rainy, although water is engendered from the air by cold? For it is not true that the clouds form because the North wind thrusts them away from our part of the world; for the West and South-East winds both alike—for they are similarly at the sides of the world²—drive away clouds from the quarter from which they blow, as also do all the other winds. Is it because the more the heat exists outside, the more the cold is driven within? Or is it due in some degree to the quarter from which they blow that certain winds bring clear weather? For the South-East wind rises from the dawn (and the region is warm), while the West wind is situated towards the evening.³ But is there not a further reason, namely, that air, like water,⁴ cools most quickly and thoroughly when it is previously heated? The air then brought by the South-East wind arrives warm from the rising sun, as does that brought by the South wind from the midday sun; when, therefore, they reach the colder region, they quickly condense and become massed into rain. And the South-East wind has a greater tendency to

¹ Eurus does not correspond exactly with our SE. wind, being only 30° south of the East wind (see note on 940^a 18).

² πλάγιοι is contrasted with ἄνωθεν and κάτωθεν (north and south). Cp. *Meteor.* 377^b 29.

³ Reading ἀπ' ἡοῦς ἐστίν· ἥδε δὲ ἡ χώρα (θερμῆ)· πρὸς (δὲ) ἐσπέραν κείται ζέφυρος. ἥδε ἡ χώρα can only refer to ἀπ' ἡοῦς; it is therefore impossible to take it with πρὸς ἐσπέραν, which must belong to ζέφυρος. We must therefore suppose that something has fallen out after ἥδε δε ἡ χώρα, apparently θερμῆ, cp. below, l. 17. Something may similarly have fallen out between καὶ and ζέφυρος. The Latin version of T. G. simply renders, *eurus namque ex ortu, favonius ex occasu adventat.*

⁴ Cp. *Meteor.* 348^b 30 ff.

20 form rain, because it brings the air more directly from the sun and equally hot; but the South wind is rainy as it ceases to blow, because the first air that is brought comes cold from the sea, whereas the last air, which is very warm, is brought¹ from the land. Or is there not a further reason, namely, that the South wind is stronger as it ceases
25 to blow (hence the proverb applied to it, 'When the South wind begins . . .'²), and stronger winds are colder, and so the South wind masses the clouds together at the end of its duration?³ Is not this why it is more rainy then than when it first begins to blow?

Why do the winds, though they are cold, cause dryness? 28
Is it because the colder winds cause evaporation? But why should they do so more than the sun? Is it because
30 they carry off the vapour, whereas the sun leaves it where it is and consequently causes more moisture and less dryness?

Why does the North-East wind (Caecias)⁴ alone of all the 29
winds attract the clouds towards itself,⁵ as the proverb has it, 'Drawing it to himself, as Caecias draws clouds'⁶? For the other winds simply drive forward the clouds from the quarter from which they blow. Is this phenomenon to
35 be attributed to the fact that the contrary wind blows at the same time? But would not this have been obvious, and is it not more likely that the North-East wind naturally follows a circular course? The other winds therefore
943^b blow round the earth, but the North-East wind (Caecias)⁷ has the concave side of its course towards the heavens and not towards the earth, and so, blowing towards its source, it attracts the clouds to itself.

Why is it that the wind blows cold in the early morn- 30
5 ing from rivers but not from the sea?⁸ Is it because the

⁴ See note on 940^a 18.

⁵ Cp. above, chapter 1.

⁶ Reading *ὥστε* for the sake of the metre instead of *ὥσπερ*, cp. *Meteor.*
364^b 13 (Nauck, *Frag. Trag. Adesp.* 50).

⁷ Reading *τούτῳ* (W. D. R.) for *τούτο*.

⁸ This problem also occurs in Book xxiii, chapter 16.

sea extends over open spaces, but rivers are in narrow places? The breeze, therefore, from the sea is dispersed over a wide area and is consequently weak; whereas the breeze from a river is carried along in a mass and is stronger and therefore naturally appears colder. Or is the reason other than this, namely, that the rivers are cold, 10 but the sea is neither hot nor cold? Now a breeze or exhalation is due to the heating or cooling of liquids;¹ for whichever of these two processes they undergo, evaporation takes place, and, when water evaporates, the resultant air is set in motion, and this is a breeze. That which is produced from cold liquids naturally blows cold, 15 while that which blows from very hot liquids cools and becomes cold.² One would therefore find that all the rivers are cold, but the sea is neither very hot nor very cold. That which blows from it therefore is not cold, because the sea is not itself very cold, nor does it cool quickly because 20 the sea is not very hot.

31 Why is the West wind always considered to bring fair weather and to be the pleasantest of the winds?³ So, for instance, Homer says that in the Elysian Plains

Ever the breezes blow of the Zephyr.⁴

Is it because in the first place it has an equable temperature? For it is neither hot like the winds from the south and east, nor cold like that from the north, but is⁵ on the 25 boundary between the cold and the hot winds; and, being near to them both, it partakes of their qualities, and is consequently temperate and breathes most of spring. Furthermore, the winds change either into their contraries or into those on their right;⁶ blowing therefore after the North wind (for the west is on the right of the north⁷), it 30 enjoys a good reputation, as being mild as compared with

¹ Reading *ψυχομένων* (*τῶν ὑγρῶν*), cp. 933^a 36.

² Cp. 943^a 15 and note.

³ The same problem is dealt with in chapter 55 below.

⁴ Hom. *Od.* iv. 567, where, however, the *textus receptus* reads

Ἵκκεανὸς ἀνίησιν.

⁵ Reading *ἐστὶ* for *ἐπὶ*, cp. 946^b 22.

⁶ Cp. 941^b 10.

⁷ This contradicts the doctrine of 941^b 12 as emended by Bonitz

an inclement wind. Also as soon as wintry weather ceases, fine weather usually follows; and the North wind is a wintry wind. [The East wind,¹ though it lies between the warm and the cold winds, partakes less of them; for, when
 35 it blows, it sets in motion the winds towards the south (for when it changes it does so in that direction), but though it sets them in motion it does not mingle with them. The West wind is set in motion by the South winds, and when it
 944^a blows it sets the North winds in motion; for there the succession of the winds ceases. Hence the West wind, constituting as it does the end of some winds and the starting-point of others, justly is and is considered to be a pleasant wind.]

Why does the South wind blow at the time of the Dog-³²
 5 star?² Is it because a sign occurs³ at the setting or rising of any star, and especially of the Dog-star? It is clear then that the wind blows most at the time of and after its rising. And since it causes stifling heat, it is only natural that the hottest winds should be set in motion when it rises; and the South wind is hot. And since, &c. (as 941^b 6-23).

10 Why does the West wind blow towards evening and not³³
 in the early morning?⁴ Is the sun at its rising and setting usually the cause of breezes? For when it concocts and dissolves the air, which is moist, by thoroughly heating it, it dissolves it into breath; and if the air is full of breath, it becomes still more evaporated by the sun. When, there-
 15 fore, the sun is in the east, it is far away from the West wind, for the latter blows from the setting sun; but when the sun is already near its setting, the breath is then thoroughly dissolved, and from midday onwards and towards evening the sun is most suitably situated for heating and dissolving the air. It is for this reason also
 20 that the East wind begins to blow in the early morning; for since the air above the earth becomes charged with

¹ The remainder of the chapter does not occur in the best MSS. It certainly contradicts the doctrine just stated that winds change into those on their right, and in general it does not give satisfactory sense. The passage occurs again in chapter 55, where it is more relevant.

² Cp. above, chapter 12 and note.

³ See note on 941^b 2.

⁴ The same problem is treated in the first part of chapter 35 below.

moisture during the night and owing to its weight approaches the earth, the sun from dawn onwards dissolves it and sets in motion first the air which is nearest to itself. Now the East wind get its name Apeliotes because it is the wind which blows from the rising sun.¹

34 Why is it that when the sun rises the winds both rise ²⁵ and fall? Is it because a wind is the movement either of the air or of moisture carried up? Now this movement, when it is only slight, is quickly absorbed by the sun, so that no wind occurs; but when it is greater, the movement is increased when the sun rises, for the sun is a source of movement. 30

35 Why does the West wind blow in the evening?² Is it because all the winds blow when the sun disperses the moisture? For the moisture being already in a mass, the power of heat, when it approaches it, concocts it.³ Now the West wind blows from the setting sun; it is only natural then that it should rise in the evening, for then the sun ³⁵ reaches the quarter proper to that wind.

The North and the South winds are the most frequent of winds,⁴ because, when one contrary is overcome by its direct contrary, it is least able to continue,⁵ whereas it is better able to resist a wind blowing against it from an angle.⁶ Now the South and the North winds blow from ^{944^b} regions on either side of the sun's course, while the other winds blow rather in a straight line with it.

36 Does the wind come from a source, as water does, and is it unable to rise to a higher level than that source, or is this ⁵

¹ i. e. the name Apeliotes is derived from ἀπὸ ἡλίου.

² Cp. above, chapter 33.

³ Reading ἐκπέττει (cp. above, 11, 12, 13) for the meaningless ἐξάπτει.

⁴ The latter part of the chapter deals with quite a different subject from the former portion. It is, indeed, quite possible that the Latin version of T. G., which renders, *Cur aquilo et auster saepissime spirant? An quia, &c.*, translates a better reading, and that a new problem should begin here: 'Why are the North and the South winds the most frequent of all the winds? Is it because, &c.'

⁵ And passes into its contrary, e. g. the North wind becomes the South wind and *vice versa* (cp. above, 941^b 10 ff.).

⁶ Cp. Theophrastus, *op. cit.*, § 2.

not so? And does it come from a single point or from a wider area? There are indeed in the wind certain similarities to that which seems to occur in water; for water flows faster when it travels downhill, whereas it stagnates on flat and level¹ ground, and the winds act
 10 similarly, for on promontories and high ground the air is always in motion, whereas in hollows it is often at rest and there is a calm. Moreover on exceedingly high mountains there is no wind at all—on Mount Athos, for example, amongst others, as is proved by the fact that offerings
 15 which persons sacrificing leave there one year are, so it is said, found there still in the following year. It is clear then that the course of the wind starts as it were from a source of some kind.² It cannot, therefore, rise any higher. Hence the above phenomenon occurs on high mountains, to which what happens to water would be a close parallel; for apparently neither a strong flow of water nor a violent
 20 wind is found in high mountains.

Why is it that when the South wind blows the sea
 37 becomes blue, but when the North wind blows it becomes dark?³ Is it because the North wind disturbs the sea less, and that which is less disturbed appears to be all black?

25 Why do the South winds when they blow gently cause
 38 no overclouding, but when they become strong overcloud the sky?⁴ Is it because, when they blow gently, they cannot thrust many clouds along?⁵ They therefore cover only a small area with cloud; but, when they blow strongly, they thrust along many clouds, and therefore seem to cause more overclouding.

30 Why is the North wind strong when it begins to blow,
 39 but weak as it ceases, whereas the South wind is weak when it begins, but strong as it ceases?⁶ Is it because the North wind is near to us and the South wind distant? The former then, when it begins, blows immediately in one part of the

³ This problem is translated word for word by Aulus Gellius, ii. 30, as from Aristotle's *Books of Problems*.

⁴ Cp. above, chapter 20.

⁵ Reading $\acute{\alpha}\pi\omega\theta\epsilon\acute{\iota}\nu$ (W. D. R.) for $\pi\omicron\iota\epsilon\acute{\iota}\nu$; cp. l. 29.

⁶ Cp. below, chapters 41 and 45, and Theophrastus, *op. cit.*, § 5.

world, whereas the beginning of the latter becomes dispersed owing to the long time it takes to travel, and little of its 35 first breath reaches us; and we feel the end of the North wind, but that of the South wind not at all. It is, therefore, only natural that the North wind should be weak as it ceases (for the end of all things is weak), while the South wind is not weak at its close, since we do not feel its ending at all.

40 Why do alternating winds blow where there are bays, 945^a but not where there is a wide expanse of open sea? Is it because the wind, when it pours into the bays, is less broken up and travels practically in a collected mass, whereas over open expanses of sea the land-winds tend to be broken up 5 as they begin to flow, and when they move the same thing happens to them, because they are free to travel in many directions? For an alternating wind is the reflux of a land-wind.¹

41 What is the origin of the saying,
When the South wind begins and when Boreas ceases
his blowing?²

Is it because the North wind, owing to the fact that we live near it and our habitation is towards the pole, immediately 10 blows strongly, for it is with us as soon as it begins? Hence, as it ceases, it blows pleasantly; for it then blows weakly. The South wind, on the other hand, because it is far away, reaches us later in greater strength.

42 Why is it that men feel heavier and weaker when the wind is in the south?³ Is it because moisture becomes abundant instead of scanty, being melted by the heat, and 15 moisture, which is heavy, takes the place of breath, which is light, and under these conditions men's strength becomes languid?

43 Why are men hungrier when the wind is in the north than when it is in the south? Is it because the North winds are colder?

¹ Reading *ἀπογέας* (W. D. R.).

² Cp. chapters 39 and 45. The complete proverb is *εὖ πλέον ἀρχομένου*, &c. (cp. l. 29).

³ A longer version of this problem occurs in Book i. 24.

Why does the South wind not blow in Egypt itself in 44
 20 the regions towards the sea nor for the distance of a day
 and a night's journey inland,¹ while in the regions beyond
 Memphis and for the distance of a day and a night's journey
 it blows freshly; and does not blow to the west for the
 distance of two days' and two nights' journey, while to the
 east the South-West wind (Lips)² blows? Is it because
 Egypt in its lower regions is hollow, so the South wind
 25 passes over above it, but to the south and farther away the
 regions are loftier?

Why is it that the South wind is weak when it begins 45
 to blow, but becomes stronger as it ceases, while with the
 North wind the contrary is the case, hence the proverb,

Sail when the South wind begins and when Boreas
 ceases his blowing?³

30 Is it because we dwell rather towards the pole than towards
 the midday sun, and the North wind blows from the pole,
 while the South wind blows from the midday sun? It is
 only natural, therefore, that the North wind, when it
 begins, immediately attacks with violence the regions
 nearer to it, and afterwards transfers its violence to the
 dwellers farther south. The South wind, on the contrary,
 35 when it begins, presses upon those who dwell towards the
 midday sun, and, when it has passed them by, blows freshly
 upon those who dwell towards the pole.

What is the origin of the saying,

Straightway the winter comes, if the South wind call
 to the North wind?⁴

Is it because it is the nature of the South wind to collect⁵
 clouds and much rain? When therefore the North wind
 945^b blows under these conditions, since there is abundant

¹ The source of this problem is Theophrastus, *op. cit.*, § 8.

² Lips is strictly speaking slightly to the north of the SW. wind, being only 30° south of the West wind, see note on 940^a 18.

³ Cf. above, chapters 39 and 41. There should be a question mark after βορέας in place of a comma.

⁴ Cp. Theophrastus, *op. cit.*, § 46.

⁵ Reading συναρπείν; T. G. renders *colligat*.

material, the North wind freezes it and brings on the winter. Hence the saying,

When Boreas findeth the mire, soon cometh the season
of winter.

Now mud and rain in general are usually, if not invariably, due to the South wind.

- 47 Why does the North wind follow quickly upon the South 5
wind, but not the South wind upon the North wind? ¹ Is it
because the North wind arrives from near at hand, but the
South wind from a distance, since our habitation is towards
the pole?
- 48 Why is it that the winds are cold, although they are due
to movement caused by heat? ² Is movement caused by
heat not invariably hot, but only when it occurs in a certain 10
manner? If it comes forth ³ in a mass, it burns with its heat
the very thing which emits it; but if it passes out gradually
through a narrow space, it is itself hot, but the air which is
set in motion by this process completes the movement in
accordance with whatever was its original nature.⁴ This
can be seen in the mouth; ⁵ for there is a saying that from 15
the same organ we breathe both hot and cold,⁶ but this is
untrue, since all that proceeds from the mouth is hot, as is
shown by the fact that it appears hot if the hand is placed
close to the mouth. It is the manner in which it comes
forth which makes the difference. For if in yawning we
emit breath from a wide opening, it appears hot because
we can feel it; but if it be emitted through a narrow
opening, being more violent, it impels the air in its imme- 20
diate neighbourhood, which in its turn impels the adjoining
air. If the air is cold, its movement is also cold. May not
the same thing happen also in the winds, and their first
movement be through a narrow channel and then set in

¹ The source of this problem is Theophrastus, *op. cit.*, § 9.

² The source of this problem is Theophrastus, *op. cit.*, §§ 19-20.

⁴ i. e. temperature.

⁵ Reading στόματος for σώματος (cp. Theoph. § 20).

⁶ Cp. Aesop, *Fab.* 64 (ed. Halm).

motion¹ the adjoining air, and then other air begin to rush
 onwards? So in the summer the winds are hot, in winter
 25 they are cold, because in each case this is the temperature
 of the air which is already there; for that the air does not
 follow this course because it is either set in motion by itself
 or overpowered by the heat, is clear not only from the fact
 that it heats the winds when there is more heat in it, but
 also because it was originally being carried upwards. For
 30 fire is of this nature; whereas cold naturally travels down-
 wards. The winds move horizontally and for good reason;
 for since the heat presses upwards and the cold downwards
 and neither prevails, and the air cannot remain still, it is
 only natural² that its motion should be sideways.

35 Why are the South winds cold in Libya as the North winds 49
 are with us?³ Is it primarily because the sources of these
 winds are respectively nearer to us and to them? For if,
 as we have already said,⁴ the winds pass through a narrow
 channel, they will be colder to those who are nearer to
 them owing to the violence of their movement; for when
 946^a their movement proceeds farther, they become dispersed.
 Hence the North winds are cold in our part of the world,
 because we are nearer to them and dwell quite near the
 pole.

Why is it that those South winds which are dry and do 50
 5 not bring rain cause fever?⁵ Is it because they engender
 unnatural moist heat in the body? For they are by nature
 moist and hot, and this causes fever, which is due to a
 combined excess of these two things. When, therefore, the
 South winds blow under the influence of the sun without
 bringing rain, they engender this condition in us;⁶ whereas,
 when they bring rain with them, the rain cools us.

¹ For this meaning of *διαφέρω* cp. Soph. *Trach.* 323.

⁵ This chapter (the source of which is Theophrastus, *op. cit.*, § 7) is partly identical with i. 23.

⁶ Reading *ταύτην τὴν διάθεσιν ποιῶσιν* (from 862^a 21) for the corrupt *ταύτην τὴν τάξιν*.

51 Why do the periodical winds always blow at the season¹⁰ at which they do blow¹ and with the force with which they blow?² And why do they cease at close of day and not blow during the night? Is this due to the fact that the melting of snow by the sun ceases towards evening and at night? Now these winds blow in general when the sun begins to prevail and melt the northern ice. When the ice¹⁵ begins to melt, the 'forerunners' blow; when it is already melting, the periodic winds blow.

52 Why is the West wind at once the gentlest of winds and also cold, and why does it blow mainly at two seasons, namely, spring and autumn, and towards evening, and usually in the direction of the land?³ Is it cold because it²⁰ blows from the sea and from extended areas? It is less cold indeed than the North wind, because it blows from evaporated water and not from snow; but it *is* cold, because it blows either after the winter, when the sun is only just beginning to prevail, or in the autumn, when the sun no longer has power. For it does not have to wait for its proper matter,⁴ as it would if it were a land-wind, but²⁵ wanders freely, because it has travelled over water.⁵ For the same reason it blows evenly; for it does not blow from mountains or from forcibly melted matter, but flowing gently as through a channel. For the regions towards the north and south are mountainous; but towards the west there is neither mountain nor land but the Atlantic Sea, so that it travels in the direction of the land. Further, it³⁰ blows towards evening owing to the quarter from which it comes; for the sun then approaches that quarter. It ceases at night because the movement set up by the sun dies down.

¹ The form *ταύτην*, which Ruelle reads, does not exist; the MSS. read *ταίτην*.

² The source of this problem is Theophrastus, *op. cit.*, § 11.

³ The source of this problem is Theophrastus, *op. cit.*, §§ 38, 40, 41.

⁴ Reading *ὑλην*, cp. 947^a 2, 3. The lacuna in Theophrastus, *op. cit.*, § 40 *ad fin.* (ed. Winmer), can be filled from this passage, viz. *οὐ γὰρ ὥσπερ ἐν γῆ (ὑπομένει τὴν ὑλην) ἀλλὰ κτλ.*

⁵ i. e. where there is evaporation everywhere going on, and therefore matter for wind.

Why do all things appear larger when the South-East 53
wind (Eurus)¹ blows?² Is it because it makes the air
gloomier?³

35 Why is it that during the winter the winds blow early 54
and from the east, but in summer in the evening and from
the setting sun?⁴ Is it because what happens in our part
of the world during the summer occurs during the winter
among those who inhabit the opposite hemisphere of the
earth, and with us in the winter the winds blow early and
from the east, because the air, which during the night is
946^b full of moisture,⁵ is dissolved and set in motion by the sun
in the early morning, the air nearest the sun being the first
to be affected? The sun begins to produce this effect even
before it rises; therefore the breezes blow just as much
before sunrise. Since then the sun attracts the moisture to
5 itself and in the winter before its rising sets in motion in
our part of the earth the air which is moist, it is clear that
it would also attract the moisture when it is in the southern
hemisphere, and it would be evening there when it is early
morning with us. The result would be that the air, which
the sun attracts to itself before its rising in our part of the
world, would become a West wind to the dwellers in the
10 south and would blow in the evening. Now what happens
during our winter at dawn happens to them in the evening,
and what happens in the summer to them at dawn happens
to us in the evening;⁶ for when it is summer here, it is
winter there, and our evening is their early morning, at
which time they have breezes from the east,⁷ while we have
15 West winds for the same reasons as are mentioned above.
In the summer breezes do not blow from the east, because
the sun, when it rises, finds the air in our part of the earth
still too dry, owing to the short period of its absence; and

¹ See note on 943^a 5.

⁵ Reading κάθυγρον (ὄντα) (Richards).

⁶ The sentence as it stands in the text is clearly incomplete, and something like the following must be read: ὁ δὲ ἐν τῷ παρ' ἡμῶν χειμῶνι τῆς ἕω, ἐκείνοις <τῆς δείλης> συμβαίνει· ὁ δὲ ἐν τῷ θέρει <τῆς ἕω ἐκείνοις>, τῆς δείλης ἡμῶν.

⁷ Reading ἕω for ἰώας.

² Reading πνέη for πνεῖ.

⁴ Cp. above, chapter 21.

West winds do not blow in the evening during the winter, because East winds do not blow in the southern hemisphere either at that time for the aforesaid reasons, in virtue of which the sun attracts the moisture to itself and ²⁰ produces¹ the West wind in our part of the earth.

55 Why is the West wind always considered to bring fair weather and to be the pleasantest of the winds?² Is it because it is on the boundary between the hot and the cold winds, and being near to them both it partakes of their qualities, and is therefore temperate? The East wind, though it also lies between the hot and the cold winds, ²⁵ partakes less of them; for when it blows it sets in motion the winds towards the south (for, when it changes, it does so in that direction), but, though it sets them in motion, it does not mingle with them. The West wind is set in motion by the South winds and, when it blows, it sets the North winds in motion; for there the succession of the winds ceases. Hence the West wind, constituting as it does the ³⁰ end of some winds and the starting-point of others, justly is and is considered to be a pleasant wind.

56 Why are different winds rainy in different places;³ for example, Hellespontias⁴ (the East wind) in Attica and the islands, the North wind on the Hellespont and in Cyrene, and the South wind round Lesbos? Is it because rain occurs wherever there is a collection of clouds, since density ³⁵ collects wherever it can settle? It is for this reason that there is more rain among the mountains than where the mass of clouds can find a free passage, for that which is confined becomes dense as a necessary consequence; also it rains more in calm weather. In the Hellespont the North wind, blowing from its upper end, masses together many ^{947^a} clouds, which Hellespontias (the East wind) drives towards Attica and the islands, being thus provided with ample material; for most clouds come round from the north.

¹ ποιῆ should perhaps be read here for ποιεί, 'for the sun to attract the moisture to itself and cause', &c.

² This chapter is a shorter version of chapter 31 above.

³ A longer version of chapter 7.

⁴ Another name for Apeliotes, cp. *Vent. Sit.* 973^a 22.

Round Lesbos the South-East (Eurus)¹ and South winds
5 bring much cloud from the open sea and drive² it against
the land. Similar instances might be quoted for the other
winds.

What is the origin of the saying,

57

Have no fear of a cloud from the land in the season of
winter,

But if it come from over the deep have a care; and in
summer

Ever distrust the cloud that sweeps from the gloom of
the mainland?³

Is it because in the winter the sea is warmer, so that, if any
10 cloud has formed, it must have done so from some powerful
cause, otherwise it would have been dissolved, because the
region in which it forms is warm? Now in the summer
the sea is cold, as also are the sea breezes, but the land is
hot, so that if any cloud comes from the land, it must have
been formed from some considerable cause; for it would
have been dissolved if it had been weak.

15 Why is it that in Arcadia, which is high, the winds are 58
no colder than elsewhere, but when there is no wind and it
is cloudy, it is cold, just as it is in flat, marshy districts?
Is it because Arcadia resembles a marshy district, since it
has no outlet for its waters to the sea, for which reason also
20 there are many chasms there? When, therefore, there is
a wind, it winnows away the exhalations from the earth,
which are cold, but the winds themselves are not cold,
because they arrive from the sea; but when there is no
wind the vapour which rises from the stagnant water
causes the cold.

25 Why is it that the wind lasts a long time when it begins 59
to blow at dawn? Is it because, when the sun rises, the
impetus given to the wind is very violent and can therefore
maintain its character? That this is so is shown by the
fact that it forms a strong mass.

¹ See note on 946^a 33.

² Reading with Sylburg *προσβάλλουσι*.

³ The source of this problem is Theophrastus, *op. cit.*, § 60, where
ὡς ἀπὸ πόντου should be emended *ἀλλ' ἀπὸ πόντου*. Cp. 938^b 10.

60 Why is it that the North wind is keen during the day but falls at night? Is it because it is generated from frozen rain when this is evaporated by the sun? It falls at night, 30 because the process does not go on as before, but is reversed; for at night the North wind expends itself,¹ but it is less apt to do so during the day.

61 Why is it that when many spiders' webs² are borne through the air, they are a sign of wind? Is it because the spider works in fine weather, but the webs are set in 35 motion because the air, as it cools, collects on the ground, and this cooling process is the beginning of winter, so that the movement of the webs is a sign? Or is it because after rain and storms the spiders³ are borne through the air in large numbers, since they work in fine weather (for they do not appear at all in the winter, the spider being an animal⁴ which cannot support the cold), and as they are 947^b borne along by the wind they unwind a quantity of web? Now after rain winds usually blow.

62 Why is it that the strong North winds⁵ in winter cause clouds in the cold regions, but outside them bring a clear 5 sky?⁶ Is it because they are at the same time cold and strong, and in the regions near the north they are colder and so congeal the clouds before they can drive them along, and the clouds, when they are congealed, remain where they are owing to their weight? Elsewhere, however, it is their strength rather than their coldness which takes effect.

¹ For this meaning of ἐκπνέω cp. 942^b 24, and the similar use of ἔκχυσις 941^b 36.

² i. e. gossamers.

³ Reading ἀραχνῶν for ἀραχνίων. Though ἀράχνιον is frequently used in the sense of a 'small spider', in this passage it seems always to mean 'spider's web', and ἀραχνῶν must be read to agree with ἐργαζομένων and to provide a masculine plural to which φερόμενοι may refer.

⁴ Reading τὸ θηρίον for τόδε (Bonitz).

⁵ Reading οἱ βορέαι {οἱ} μεγάλοι.

⁶ The source of this problem is Theophrastus, *op. cit.*, §§ 6, 7.

BOOK XXVII

PROBLEMS CONNECTED WITH FEAR
AND COURAGE

WHY do those who are afraid tremble?¹ Is it due to the process of chilling? For the heat fails and contracts; that is also why the bowels usually are loosened.²

15 Why do men become thirsty under certain conditions, those, for example, who are about to be punished?³ For this ought not to be so, since they are chilled. Is it because the chilling and heating do not occur in the same region, but the former takes place on the surface of the body, from which the heat departs, but the heating takes place in the interior, so that it warms it, as is proved by the fact that the bowels become loosened? For thirst occurs when
20 the sovereign region⁴ of the body becomes dry. The same thing seems to happen as occurs in those suffering from ague,⁵ who are thirsty and cold at the same time; for in their case too the same part of the body is not hot and cold.

Why is it that under the influence of anger men become heated and bold (the heat collecting in the interior of the body), whereas in a state of fear they are in a contrary
25 condition? Is it because they are not affected in the same region, but in those who are angry the heat collects in the region of the heart—hence they become courageous and red in the face and full of breath—the course of the heat being upwards, whereas in those who are afraid the blood and heat both retreat in a downward direction—hence the bowels become loosened. For the beating of the heart is

¹ This problem is dealt with more fully in chapters 6 and 7.

² See below, chapter 10.

³ Cp. below, chapter 8.

⁴ The region in which the most important organs are situated; cp. *κύρια μόρια*, *Gen. An.* 744^b 31.

⁵ The exact nature of this disease is doubtful; see W. H. S. Jones, *Malaria, a Neglected Factor in the History of Greece and Rome*, pp. 25, 36, 37.

different, since in those who are frightened it is frequent and 30 strongly punctuated, as would naturally occur from the failure of heat, while in those who are angry it has the character which one would expect when a greater quantity of heat collects. Hence the expressions about anger 'boiling up' and 'rising' and 'being stirred up' and the like are apt and fitting. Is the thirst also due to this cause, since dry-spitting and the parching of the tongue and the 35 like are due to the simultaneous upward rush of breath and heat? Thirst, moreover, is clearly due to the body becoming heated. How then can the same region, namely, that in which we feel thirst, become dried up both in one who is afraid and in one who is angry? That fear tends to produce thirst is clearly shown in the case of routed 948^a soldiers; for under no other condition is such thirst experienced. The same is true of those suffering from great anxiety; therefore they wash out their mouths and swallow liquid, as did Parmenon the actor. Or is it in such cases not thirst but dryness due to the flight of blood (whence also they become pale)? This is indicated by the fact that 5 they do not drink much but simply take a gulp; routed soldiers on the other hand are undergoing violent exertion.¹ So those who are about to be punished feel thirst, and in this there is nothing strange. In war some brave men even, when they are drawn up in battle array, actually tremble when they are not distraught but confident; and they often beat their bodies with a flat cane or, failing 10 that, with the hand, in order that they may be warmed.² It seems probable that owing to the violence and impetus of the heat a disturbing inequality of the temperature is set up in the body.

- 4 Why are brave men generally fond of wine? Is it because the brave are full of heat, and the heat is in the region of the chest? (For it is there also that fear shows 15 itself, acting as a process of cooling; with the result that³

¹ Which gives a reason for their excessive thirst in addition to the effect of fear.

² Reading with Richards *χερσίν* ('iv') *ἀναθερμανθῆναι*.

³ Omitting *τοῖς μὲν*, inserted by Ruelle without MS. authority.

less¹ heat remains in the region of the heart, and in some men the heart beats violently as it is cooled.) Those then who have an abundance of blood in their lungs have hot lungs, as though they were drunk, and so the presentiment of danger does not chill them. Such men are fond of drinking; for the desire for drink is due to the heat of this
 20 region, as has been stated elsewhere,² and the desire is for that which has power to stop the heat. Now wine is naturally hot and satisfies the thirst better than water, particularly in those whom we are now considering;³ the reason for this has been stated elsewhere.⁴ Hence those who are suffering from inflammation of the lungs and those
 25 who are mad both desire wine, though the lungs of the former are hot owing to the fever, and those of the latter owing to their state of disturbance. Since, then, the same people are usually of a thirsty and of a brave kind, and those who are thirsty desire wine and are therefore fond of drinking, it necessarily follows that the two characteristics of bravery and fondness for wine usually go together.
 30 Hence those who are drunk are braver than those who are not.

Why do states honour courage more than anything else, 5 though it is not the highest of the virtues? Is it because they are continually either making war or having war made against them, and courage is most useful in both these circumstances? They, therefore, honour not that which is ideally best, but that which is best for themselves.

35 Why do those who are afraid tremble most in the voice, 6 the hands, and the lower lip?⁵ Is it because this affection is due to the departure of heat from the upper parts of the body? If so, their pallor is due to the same cause. The voice, then, trembles owing to the departure of heat from the chest, the region in which the voice is set in motion

¹ Reading ἥττων (Bussemaker) and omitting μὲν, which is due to dittography.

² Cp. 872^a 4 ff.

³ Reading τῶν τοιούτων (sc. τῶν ἀνδρείων) for τῶν αὐτῶν which gives no sense: T. G. renders *maximeque id genus hominum*.

⁴ The reference cannot be identified.

⁵ Cp. chapters 1 and 7, and xi. 31.

thus becoming cooled. So too with the hands; for they are attached to the chest. The lower lip trembles, and not the upper, because the upper lip hangs downwards¹ in the direction of its natural tendency; but the upward direction of the lower lip is contrary to nature and it is held steady in that position by the heat. When, therefore, the heat is withdrawn as the process of cooling takes place, it trembles. For the same reason the lip hangs down when a man is angry, as can be seen clearly in children; for the heat 5 rushes together into the heart.

7 Why do those who are afraid tremble, especially in the voice, the hands, and the lower lip?² Is it because the heat fails in the region of the body in which the voice is situated, while the trembling of the lip and hands is due to the fact that they are very easily set in motion and contain very little blood? Those who are afraid also emit bile and their 10 sexual organs contract, the emission of bile being due to the heat which descends and causes liquefaction, while the contraction of the sexual organs is due to the fact that fear comes from outside, and therefore the rush of heat is in the contrary direction.³

8 Why do those who are afraid feel both thirst and cold, these being contrary affections?⁴ Do they feel cold because they are chilled, and thirst because they are heated, since 15 under the influence of fear the heat and the moisture leave the upper parts of the body? That this happens is shown by the change of colour and by the effect on the bowels; for the face becomes pale and the bowels are sometimes loosened. The cold, therefore, is caused by the departure of the heat, and the thirst by the departure of the moisture,⁵ from the upper parts of the body.

9 Why is it that, although both fear and pain are a kind of 20 grief, those who are in pain cry out, but those who are

¹ Reading τὸ δὲ κάτω χεῖλος ἀλλ' οὐ τὸ ἄνωθεν (τρέμει, διότι τὸ ἄνωθεν κάτω κρέμαται κτλ.

² Another version of the problem of chapter 6.

³ Cp. 949^b 15 ἅτε τοῦ θερμοῦ ἐκκεκριμένου.

⁴ This question has already been touched upon in chapter 3.

⁵ Reading διὰ τὸ <τὸ> ὑγρὸν (sc. ἐκλείπειν) with Bonitz and Richards.

afraid keep silence? Is it because those who are in pain hold their breath (and so it is emitted all at once and comes forth with a loud cry), whereas the body of those who are afraid is chilled and the heat is carried downwards and
 25 creates breath? It creates breath in the particular region to which it is carried; hence those who are frightened break wind. Now the voice is a rush of breath upwards in a particular manner and through certain channels; and the reason why those who are in pain hold the breath is that when we suffer anything (just as the other animals use their horns or teeth or claws in self-defence) we invariably
 30 make use straightway and without thought of the resources which we have in ourselves by nature, and against all or most forms of pain heat is helpful. This is what occurs when a man holds his breath; for he applies heat and concoction to the pain by collecting heat within him by means of the breath.

35 Why is it that in those who are afraid the bowels are loosened and they desire to pass urine? ¹ Is it because the heat in us is as it were alive? It therefore flees whenever it is afraid of anything. Since, then, the fears due to nervousness and the like come from without and pass from the upper to the lower parts of the body and from the surface to the
 949^a interior, the regions round the bowels and bladder becoming heated are loosened² and make these organs ready to function. For anise and wormwood and all substances which promote the flow of urine have heating properties. Similarly the drugs which affect the bowels are those

¹ This problem is quoted as Aristotelian by Aulus Gellius (xix. 4): *Aristotelis libri sunt qui problemata physica inscribuntur, lepidissimi et elegantiarum omne genus referti. In his quaerit quam ob causam eveniat, ut quibus invasit repentinus rei magnae timor plerumque alvo statim cita fiant . . . ac de alvo quidem inter timendum prona atque praecipiti causam esse dicit quod timor omnibus sit algificus, quem ille appellat ψυχροποιητικόν, quae vis frigoris sanguinem calidoremque omnem de summa corporis cute cogat penitus et depellat, faciatque simul uti qui timent, sanguine ex ore decedente, pallescant. Is autem, inquit, sanguis et calor in ultima coactus movet plerumque alvum et incitat.* While Aulus Gellius gives in the main the substance of this problem, it is noticeable that the word ψυχροποιητικόν does not occur in the text as we have it, nor indeed elsewhere in the Aristotelian Corpus.

² Reading δῖ for δέ, as suggested by Richards.

which cause heat in the lower parts of the body,¹ and some of those which are applied merely² have a loosening effect, while others set up a further process of liquefaction, like 5 garlic, which passes into the urine.³ Now heat coming from the surfaces of the body and meeting in these regions has the same effect as such drugs.

II Why do the sexual organs contract in those who are afraid? For one would expect the contrary to happen, namely, that they should become relaxed, since the heat 10 collects in this region in those who are afraid. Is it because those who are afraid are almost always as it were chilled? Their sexual organs therefore contract, because the heat has left the surface of the body; hence also those who are greatly frightened have internal rumblings. The surface of the body and the skin of those who are cold seems to contract, because the heat is driven out; and it is for this 15 reason too that they shiver. Now the scrotum too contracts upwards and the testicles also are lifted up with it as it is drawn in.⁴ This is more readily seen in the effect on the sexual organs; for fear causes excretion, and an emission of semen often occurs⁵ in those who are nervous or 20 greatly alarmed.

¹ Reading τῶν κάτω.

² Reading μόνον with X^a, Y^a, A^p.

³ Cp. above, 908^a 28 ff.

⁴ Reading αὐτῇ συστέλλομένη for αὐτοῖς συστέλλομένων (cp. the Latin version of T. G. *atque eo* (sc. *scroto*) *contracto una testiculi contractuntur*). There is nothing for αὐτοῖς to refer to, and the view of Bonitz (*Index, sub voce συστέλλω*) that συστέλλομένοι is equivalent to φοβούμενοι can hardly be right. *συνεσταλμένοι* might conceivably mean 'downcast' (cp. Eurip. *H. F.* 1417 *συνέσταλμαι κακοῖς*), but this is scarcely the sense required here, and the present participle could not possibly bear this meaning.

⁵ Reading συμβαίνει (Platt) for συγκινεῖ ἤ.

BOOK XXVIII

PROBLEMS CONNECTED WITH TEMPERANCE
AND INTEMPERANCE, CONTINENCE AND
INCONTINENCE

WHY is it that some men become ill when, after having
 been accustomed to live intemperately, they adopt a tem-
 25 perate mode of life? For example, Dionysius the tyrant,
 when during the siege¹ he ceased drinking for a short
 time, immediately became consumptive, until he changed
 his manner of life and began to drink again. Is it because
 in every one habit is a matter of importance, since it soon
 becomes a second nature? Just, then,² as a fish would
 fare ill if it continued long in the air or a man if he con-
 30 tinued long in the water, so those who alter their manner
 of life suffer from the change, and a resumption of their
 accustomed mode of life is just as much their salvation as if
 they were returning to a natural condition. Furthermore,
 men waste away if they have been accustomed to large quan-
 tities of a particular diet; for if they do not receive their
 usual food, they are reduced to the condition in which they
 35 would be if they had no nourishment at all. Moreover,
 the excretions, when mixed with a large quantity of food,
 disappear, but by themselves they rise to the surface and are
 carried to the eyes or lungs; whereas, if one takes nourish-
 ment, they mix with it and become diluted and harmless.
 949^b But in those who live an intemperate life the excretions
 become superabundant up to a certain point, when they
 cease from their accustomed mode of life, owing to the fact
 that much undigested matter is still present in them from
 their former manner of living; and, when this is melted,
 like a mass of snow, by the natural heat, the result is that
 5 violent fluxes take place.

¹ i. e. the siege of Syracuse by the Carthaginians in 397 B. C.

² Reading *οὐν* for *ἀν* (Richards).

2 Why is it that we speak of men as incontinent in connexion with two only of the senses, namely, touch and taste?¹ Is it because of the pleasures that result from these in us and in the other animals? Being then shared by the animals, they are held in least honour and so are regarded as the only pleasures deserving of reproach, or at any rate more so than any others. So we blame a man who is a slave to them and call him incontinent and intemperate, 10 because he is a slave to the worst pleasures.

3 Why are men called incontinent in respect only of their desires, although incontinence is possible also in anger? Is it because an incontinent man is one who acts in some way contrary to reason, and incontinence is a mode of life 15 which is contrary to reason, and the desires are, generally speaking, contrary to reason? Feelings of anger, on the other hand, are in consonance with reason, not in the sense that reason prompts them, but in the sense that reason informs us of the insult or of the charge made against us.

4 Why is it that we approve most of continence and 20 temperance in the young and wealthy, and of justice in the poor? Is it because we feel most admiration if a man abstains from what he most desires, rather than from the contrary? Now a poor man desires easy circumstances, while a rich young man wants enjoyment. 25

5 Why can men tolerate thirst less easily than hunger?² Is it because thirst is more painful? A proof that it is so is the fact that there is more pleasure in drinking when one is thirsty than in eating when one is hungry. Now the contrary of what is more pleasant³ is more painful. Or is it because the heat whereby we live⁴ requires moisture more?⁵ Or is it because thirst is a desire of two things, 30 namely, drink and food, but hunger is a desire of only one, namely, food?

¹ Cp. below, chapter 7. The doctrine is that of *E. N.* 1148^a 8-10.

² Cp. chapter 6.

³ Reading τῶ ἡδίονι, since the comparative is demanded by the sense.

⁴ Heat being ἡ ψυχικὴ ἀρχή (*G. A.* 751^b 6).

⁵ Reading δέεται τοῦ ὑγροῦ τὸ θερμὸν ᾧ ζῶμεν (*W. D. R.*). ἡ τὸ ξηρὸν appears to be a gloss which has replaced τὸ θερμὸν, and τὸ θερμὸν has been afterwards inserted in the wrong place.

Why can we endure thirst less than hunger?¹ Is it 6
because the former causes us more pain? A proof of the
pain it causes is the fact that the pleasure it gives is more
intense.² Further, he who is thirsty needs two things,
35 nourishment and cooling, and drink provides both of these;
but he who is hungry needs one of them only.

Why are men called incontinent if they indulge to excess 7
in the pleasures connected with touch and taste?³ (For
950^a those who are intemperate in sexual intercourse and the
enjoyments of eating and drinking are called incontinent;
and in the joys of eating and drinking the pleasure is partly
in the tongue and partly in the throat; hence Philoxenus⁴
longed for the throat of a crane.) And why is the term incontinent
never extended to the pleasures of sight and hearing?
5 Is it because the pleasures of touch and taste are common
to us and the other animals? Being, then, shared by the
animals they are held in least honour and so are regarded as
the only pleasures deserving of reproach, or at any rate more
so than any others. So we blame a man who is a slave to
them and call him incontinent and intemperate, because he
is a slave to the worst pleasures. Now the senses being
10 five in number, the other animals find pleasure only in the
two already mentioned; in the others they find no pleasure,
or, if they do, it is only incidentally. For the lion⁵ rejoices
when he sees or scents his prey, because he is going to
enjoy it;⁶ and when he has satisfied his hunger, such
things do not please him, just as the smell of dried fish
15 gives us no pleasure when we have eaten our fill of it,
though, when we wanted to partake of it, it was pleasant.⁷

¹ Cp. chapter 5.

² Reading ἡ ἡδονὴ (<ἡ> σφοδροτέρα.

³ Cp. above, chapter 2. This problem is quoted in Greek by Aulus Gellius (xix. 2) as Aristotelian.

⁴ Cp. *E. E.* 1231^a 17.

⁵ The repetition of ὀρώων . . . ὀρώων here is unsatisfactory, and in any case we should expect a neuter to agree with ζῴων understood. In *E. N.* 1118^a 18 ff., where the same subject is discussed, the example taken of an animal is the lion. We ought certainly, therefore, to read here ὀρώων μὲν γὰρ ὁ λέων. [Richards (*op. cit.*, p. 144) makes the same suggestion.]

⁶ Reading ἀπολαύσει (Bonitz).

⁷ Reading ἡδέια (Sylburg) for ἡδέα.

The scent of the rose, on the other hand, is always pleasant.

- 8 Why are men less able to restrain their laughter in the presence of friends? Is it because, when anything is especially elated, it is easily set in motion? Now benevolence causes elation,¹ so that laughter more readily moves us.

¹ εἰπεῖν is clearly corrupt. The point of the solution of the problem appears to depend on the metaphorical use of ἐξείρειν; and something like the following seems to be required: ἡ δ' εὐνοία ἐξείρει, ὥστε κινεῖ μᾶλλον τὸ γελοῖον.

BOOK XXIX

PROBLEMS CONNECTED WITH JUSTICE
AND INJUSTICE

WHY is it that, although injustice is greater according as **1**
the good which is injured is greater, and honour is a greater
good, yet injustice in the matter of money seems to be
more serious and those who are unjust as regards money
25 are considered more unjust? Is it because men prefer
money to honour, and money is common to all, whereas
honour comes only to a few and its enjoyment is a rare
occurrence?

Why is it a more terrible thing to rob a man of a deposit **2**
than of a loan?¹ Is it because it is disgraceful to wrong
a friend? Now he who robs another of a deposit does
30 wrong to a friend; for no one places a deposit with another
unless he trusts him. A creditor, on the other hand, is not
a friend; for, if a man is a friend, he gives and does not
lend. Or is it because the injustice is greater, since, in
addition to the loss inflicted, he also violates his plighted
word, for the sake of which, if for no other reason, he
ought to abstain from doing the wrong? Further, it is
35 base not to requite like with like; for the one party in
making the deposit regarded the other as his friend, but
the latter in robbing him treated him as an enemy; but
a lender does not lend in the spirit of friendship. Again,
a deposit is handed over to be guarded and returned,
whereas the lender lends for his own advantage as well.
Now we are less angry at losing if we are in pursuit of
950^b gain, like fishermen when they lose their bait; for the
risk is obvious. Again, those who make deposits are
generally the victims of plots or misfortune, but it is the
rich who lend money; and it is more terrible to wrong the
unfortunate than the fortunate.

¹ Cp. below, chapter 6.

- 3 Why is it that in some law courts the jury give their 5
verdict¹ in accordance with the birth of the litigants rather
than the provisions of the will? Is it because about birth it is
impossible to lie, but the truth must be declared, whereas
before now many wills have been proved to be forged?
- 4 Why is it that poverty is more commonly found amongst
the good than amongst the bad?² Is it because, being 10
universally hated and despised, she takes refuge with the
good, thinking that with them she is most likely to find
safety and a place of habitation; whereas she thinks that if
she goes to the wicked, they would never remain content
with the same condition but would steal or plunder, in
which case she could no longer remain with them? Or 15
is it because she thinks that the good will treat her better
than any one else and that she is least likely to be in-
sulted by them? So, just as we place deposits³ of money
with good men, so she of her own accord⁴ ranges herself
with them. Or is it because, being of the female sex, she
is more helpless, so that she needs the assistance of the 20
good? Or is it because, being herself an evil, she will not
betake herself to that which is evil, since if she were to
choose the evil, her position would be quite irremediable?
- 5 Why is it that wrongs in other matters are not so liable
to be committed on a large scale⁵ as those in respect of
money?⁶ For example, a man who has spoken a light
word would not therefore necessarily divulge a secret, nor⁷
would one who has betrayed an individual also betray 25
a city, as a man who has stolen an obol would steal a talent

¹ Reading *ψηφίζονται* for *ψηφιοῦνται*, as suggested by Bekker.

² Cp. below, chapter 8.

³ In the Teubner Text *τιθέμενα* is a misprint for *τιθέμεθα*.

⁴ Reading *αὐτῆς* for *αὐτῆς*.

⁵ Reading *αἱ ἀδικίαι* <*αἱ*> *μείζους* (Richards).

⁶ Reading *χρήματα*. Most MSS. read *ρήματα*, but Y^a (which not infrequently preserves the correct reading) reads *χρήματα*, and the Latin version renders *iniuriae in pecuniis*. The origin of the change to *ρήματα* may be found in the fact that *εἰπῶν . . . εἶποι* occur below. If *ρήματα* is read, no sense can be found for the concluding sentence of the chapter; whereas, if *χρήματα* is read, the argument is clear and resembles that of chapter I.

⁷ Reading *οὐδὲ* for *ἀλλὰ*; the Latin version renders *neque qui unum prodiderit*, &c.

also. Is it because, though there are forms of unjust disposition which are worse,¹ the acts resulting from them are less serious owing to lack of power?

Why is it more disgraceful² to rob a man of a small 6 deposit than of a large loan?³ Is it because he who robs 30 another of a deposit is deceiving a man who thought him to be honest? Or is it because he who commits the one crime would commit the other also?

Why is it that man, who of all animals has the advantage 7 of most education, is yet the most unjust of all? Is it because he possesses the power of reasoning to the greatest degree, and has therefore most carefully estimated the 35 pleasures and happiness, and these are impossible of attainment without injustice?

Why is it that wealth is more often found in the hands 8 of the wicked than in those of the good? Is it because, being blind,⁴ it cannot read men's hearts and choose the best?

951^a Why is it considered more just to defend the dead than 9 the living? Is it because those who are alive can look after themselves, but a dead man can no longer do so?

Why is it that a man who associates with one who is 10 healthy does not himself become any healthier,⁵ nor does intercourse with the strong or beautiful improve a man's 5 condition, whereas association with the just and temperate and good does have this effect? Is it because some qualities can, and others cannot, be imitated by the soul, goodness being a quality of the soul and health of the body? A man can, therefore, accustom himself to feel pleasure and pain under the proper circumstances; but his association with the healthy does not produce this result, for health does not consist in taking pleasure or not in certain 10 things, since none of these things can produce health.

¹ Sc. than that involved in stealing a talent.

² Reading *αισχλιον* for *αισχροδον* with Bonitz (*Aristot. Stud.*, p. 418).

³ Cp. above, chapter 2.

⁴ Cp. above, chapter 4, where poverty is personified.

⁵ Cp. 886^b 5.

- 11 Why is it more terrible to kill a woman than a man, although the male is naturally superior to the female? Is it because she is weaker and so he commits a greater¹ injustice? Or is it because it is not a manly act to use one's strength against that which is greatly inferior?
- 12 Why is the defendant given the position on the right¹⁵ hand in a law court? Is it from a desire to equalize matters? Since, then, the plaintiff possesses other advantages, the defendant is given the advantage of position. Further, as a rule defendants are under guard; and, if the defendant has the right-hand position, the guard is on his right.²
- 13 Why is it that, when the votes for the plaintiff and for²⁰ the defendant are shown to be equal, the defendant wins the case? Is it because the defendant has heard only in court, during the course of the trial itself,³ the charges against which he has to make his defence and produce the witnesses to refute the accusations,⁴ if any advantage is to be obtained from them?⁵ Now it is not easy for a man to foresee of²⁵ what he ought to provide witnesses or some other kind of evidence to prove his innocence. The plaintiff, on the other hand, can act as he pleases, and can begin to take action before having the summons issued; and even after he has summoned his opponent he can invent and bring against him any plausible accusation he likes. The lawgiver then, recognizing that the defendant has the disadvantage in all these³⁰ respects, has given him any advantage which may accrue from the disagreement of the jury. And, indeed, that defendants are at a disadvantage is shown by the fact that when men are in a state of alarm they omit much of what they ought to have said or done, and defendants are, generally speaking, always in greater danger; and so, if

¹ Reading *μείζω* (W. D. R.) for *ἐλάττω*, cp. 952^a 1.

² The meaning perhaps is that the accused is placed on the right hand of the judge and has on his own right hand the guard which has charge of him; he is, therefore, protected on both sides.

³ Reading with Richards, *ἀτφ* for *αὐτοῦ*.

⁴ Omitting *<τὸ>* and *ἔχουσθαι*, which is probably due to the preceding *παρασχέσθαι*.

⁵ Reading with Y^a *ὠφεληθῆσθαι* and taking *μέλλουσι* as a careless plural for singular.

35 they omit necessary parts of their defence, when they are put on a level with their opponents in respect of their claims, they would clearly have been victorious if they had not omitted anything.

Further, any one of us would prefer to pass a sentence
 951^b acquitting a wrong-doer rather than condemn as guilty one who is innocent, in the case, for example, of a man being accused of enslavement or murder. For we should prefer to acquit either of such persons, though the charges brought against them by their accuser were true,¹ rather than con-
 5 demn them if they were untrue; for, when any doubt is entertained, the less grave error ought to be preferred; it is a serious matter to decide that a slave is free, yet it is much more serious to convict a freeman of being a slave.

Further, if one man brings a charge and another disputes his claim to any piece of property, we do not consider that
 10 we ought to award the disputed property immediately to the plaintiff, but that the man in possession ought to enjoy it until the matter is decided. Similarly, when a number of persons are involved in a case and the numbers of those who declare that a wrong has been committed and of those who deny it are equal—just as in the case cited above when one man brought an accusation, while another denied the truth of it—we consider that the lawgiver is right in
 15 not handing over the disputed property² to the accuser but allowing the defendant to remain in possession until the plaintiff³ has established some superiority. Similarly, when the votes of the jury are equal and so neither side has the superiority,⁴ the lawgiver has allowed matters to be left as they are.

Again, in serious crimes the punishments are also heavy,
 20 so that, if the jury pass an unjust sentence and then change their mind,⁵ it is impossible to take the opportunity of

¹ Punctuating τούτων γὰρ ἑκάστου, ὄντων ἂ κατηγορεῖ αὐτῶν, μᾶλλον κτλ.

² We should perhaps read προστίθεσθαι (cp. 951^a 31) for προστιθέναι. The Latin version of T. G. renders *favere*.

³ Reading διώκων for ἀδικῶν with Bonitz, *Aristot. Stud.*, p. 418.

⁴ Reading οὐδεμία ὑπεροχή with Bonitz, *loc. cit.*

⁵ Reading μετανοῶσιν (Richards).

remedying the mistake ; if, on the other hand, they acquit the accused when they ought not to do so, if he lives¹ so circumspectly as never to commit any crime again, how can the jury have made a serious mistake in failing to condemn such a man to death? If, however, he subsequently commits a crime, the law² would consider³ that he ought to be 25 punished for both crimes.

Or is it because it is an act of greater injustice to bring an unjust accusation than to commit an offence which may easily be made the subject of an unjust accusation?⁴ For wrong-doing may be due to anger or fear or desire and to many other causes, and not only to design, but an unjust accusation is generally due to design. So when the votes 30 have proved equal, indicating both⁵ that the accuser has brought an unjust charge and that the defendant is in the wrong, the unjust accuser being judged the greater offender,⁶ the lawgiver has awarded the legal victory to the defendant.

Again, we ourselves adopt the attitude towards our servants that, when we suspect that they have committed 35 a crime and have no certain knowledge, but nevertheless think that they have done the deed, we do not immediately proceed to punish them ; and when we cannot pursue our inquiries any further, we acquit them of blame.

952^a

Further, he who designedly commits a crime does a greater wrong than he who does not act designedly. Now the man who brings a vexatious charge against another always does wrong designedly, whereas he who commits any other crime may happen to do so either under compulsion or through ignorance or by some other chance. But 5 when the votes are equal, the prosecutor has been judged by half the jury to be committing a wrong wilfully, while

¹ Reading *εἰ μὲν οὕτως ἐύλαβῶς* <ζῆν> or some similar verb.

² The subject is *ὁ νομοθέτης* supplied.

³ Reading *ἀξιολογῆ* (W. D. R.).

⁴ The text as it stands gives no sense either in itself or in view of the rest of the argument, which seems to require something like the following : *ἢ ὅτι ἀδικωτέρου μὲν ἐστὶν ἀνδρὸς* <*ἀδικῶς ἐγκαλεῖν ἢ*> *ταῦτα ἀδικεῖν ἢ [ἦπτον] εἰκὸς ἐστὶν ἀδικῶς ἐγκαλεῖσθαι.*

⁵ Reading *τό τ'* for *τὸ δέ* [so also Bussemaker].

⁶ Reading *φραυλοτέρου* for *φάυλου* (Richards).

the defendant is considered by the remainder to be in the wrong, but not wilfully; and so, since the prosecutor is judged guilty of a more serious wrong than the defendant, the lawgiver has rightly decided that he who has committed
 10 the less serious wrong wins the case.

Further, a man is always more unjust who does not expect to escape the observation of the man whom he wrongs and nevertheless commits the wrong, than he who expects to remain undiscovered. Now¹ he who brings a vexatious charge against another does not expect to escape the observation of the man whom he falsely accuses, whereas those who commit any other crime usually try to commit an injustice with the expectation of doing so with-
 15 out the knowledge of their victims, so that plaintiffs ought to be regarded as more unjust than defendants.

Why is it that, if a man steals from the baths or the 14 wrestling-school or the market or any similar place, he is punished with death, whereas, if he steals from a house, he merely pays back double² the value of what he has stolen?
 20 Is it because in houses it is possible in some way or other to safeguard one's property? For the wall is strong and there is a key, and it is the business of all the slaves in the house to see that the contents of the house are kept safe. At the baths, however, and in places which are similarly public, it is easy for any one who wishes to commit a crime;
 25 for those who place their property there have no sure means of guarding it except their own eyes, so that, if one takes one's eye off it for a moment, it is immediately placed at the mercy of the thief. Hence the lawgiver, considering that bathers are not able to guard their property, has set the law to guard against thieves by threatening that they
 30 shall lose their lives if they appropriate the possessions of others.

Further, the owner of a house is responsible for admitting into it whom he wishes and for introducing³ into it any one whom he does not trust; but the man who deposits any

¹ Reading with Richards *οὐν* for *γάρ*.

² The Teubner Text misprints *διπλοῦς* for *διπλοῦν*.

³ Reading *εἰσφέρεισθαι* (Richards).

property in a bath cannot prevent any one from coming in, nor can he prevent him, when he has entered, from placing his garments next to his own¹ when he has stripped himself;² but, contrary to his wishes, the clothing of the thief and of the man who is about to be robbed lie together 35 in a confused heap. Therefore the lawgiver has prescribed not very heavy penalties to help the man who of his own free will and by his own mistake has admitted the thief to 952^b his house, but has clearly fixed heavy penalties for theft to aid those who are obliged to share with others the right of entrance and the promiscuity of the baths.

Further, it is obvious that all those who commit theft in places the entrance to which is open to any one who wishes 5 to come are bad men,³ and so, if they are allowed to live, do not desire to have the semblance of honest men even for the future advantage which they can gain from it, regarding it as useless to pretend to be honest in the eyes of those who know their real character; they therefore continue henceforward to be openly wicked. Those, on the other hand, 10 whose wickedness is known to one person only, try to persuade that person by bribery not to make known their real character to the rest of the world; they are not likely therefore to be completely wicked for ever, and so the penalty which the lawgiver has fixed for them is less severe.

Further, of all crimes those which are committed in the most crowded meetings and assemblies bring most disgrace 5 upon the city, just as public orderliness brings the greatest 15 credit; for it is at public gatherings that the citizens are most conspicuous to each other and the rest of the world. The result, therefore, of such thefts is that not only is the man who loses his property personally injured, but also abuse is heaped upon the city. This is why the lawgiver has fixed heavier penalties for such thieves than for those 20 who abstract property from a private house.

¹ Reading τὸ αὐτοῦ <τὸ> ἱμάτιον κτλ., and omitting κλέπτῃν as a gloss.

² Omitting ἄν.

³ Reading πονηροί for φανεροί.

Again, the man who loses anything from a private house is in a place where¹ it is easy for him to bear his misfortune, since he is in his own home and neither suffers anything nor is jeered at by others. But the man who is robbed at the baths finds it difficult to leave without his
 25 clothing, and, in addition, is usually jeered at by others; and this is harder to bear than the actual loss. Therefore the lawgiver has prescribed heavier penalties to assist such persons.

Again, many legislative parallels can be found for these penalties. For example, if any one speaks evil of a magistrate the punishment is severe, but there is no penalty for speaking evil of an ordinary individual; and rightly so, for
 30 the legislator considers that the slanderer not only commits an offence against the magistrate but also insults the city. Similarly, a man who commits a theft at the harbour is considered not only to harm the individual whom he robs, but also to bring disgrace upon the city. And the same is
 35 true of any crime committed in a place of public meeting.

Why is it that in law courts, if equal votes are given for 15 the two adversaries, the defendant wins the case?² Is it 953^a because the defendant has remained unaffected by the action of the plaintiff, and in a position of equality with him he would probably have won?

Why is it that for theft the punishment is death, whereas 16 for assault, which is a more serious crime, the penalty or fine is assessable in court? Is it because to commit an
 5 assault is an act of human weakness, of which all more or less partake, whereas there is no force which compels us to theft? A further reason is the fact that a man who tries to commit theft would think nothing of committing assault also.

¹ ὁθεῖν can hardly be right and ὁθι should probably be read.

² This chapter gives an additional suggestion for the solution of the problem of chapter 13.

BOOK XXX

PROBLEMS CONNECTED WITH PRUDENCE,
INTELLIGENCE, AND WISDOM

I WHY is it that all those who have become eminent in 10 philosophy or politics or poetry or the arts are clearly of an atrabilious temperament, and some of them to such an extent as to be affected by diseases caused by black bile, as is said to have happened to Heracles among the heroes? ¹ For he appears to have been of this nature, wherefore 15 epileptic afflictions were called by the ancients 'the sacred disease' after him. ² That his temperament was atrabilious is shown by the fury which he displayed towards his children ³ and the eruption of sores which took place before his disappearance on Mount Oeta; for this often occurs as the result of black bile. Lysander the Lacedaemonian also suffered from similar sores before his death. ⁴ There are 20 also the stories of Ajax and Bellerophon, of whom the former became insane, while the latter sought out habitations in desert places; wherefore Homer writes,

And since of all the gods he was hated,
Verily o'er ⁵ the Aleïan plain ⁶ alone he would wander,
Eating his own heart out, avoiding the pathway of 25
mortals. ⁷

¹ This problem is cited as Aristotelian by Cicero, *Tusc. Disp.* i. 33 *Aristoteles quidem ait omnes ingeniosos melancholicos esse; ut ego me tardiozem esse non moleste feram. Enumerat multos, idque quasi constet, rationem, cur ita fiat, adfert.* It is also quoted by Plutarch; see below, note 4.

² Called by Hippocrates and Galen νόσος Ἡρακλείη.

⁴ This passage is quoted as Aristotelian by Plutarch, *Vit. Lysandri* 2 Ἀριστοτέλης δὲ τὰς μεγάλας φύσεις ἀποφαίνων μελαγχολικὰς, ὡς τὴν Σωκράτους καὶ Πλάτωνος καὶ Ἡρακλέους, ἱστορεῖ καὶ Δύσανδρον οὐκ εὐθὺς ἀλλὰ πρῶτον ὄντα τῇ μελαγχολίᾳ περιπεσεῖν.

⁵ Reading κάπ πεδίον for καππεδίον.

⁶ Cp. Herodot. vi. 95; Arrian, *Anab.* ii. 5; Strabo xiv, p. 963. It was situated near the city of Mallus in Cilicia, between the rivers Pyramus and Sinarus.

⁷ *Iliad* vi. 200-2.

And many others of the heroes seem to have been similarly afflicted, and among men of recent times Empedocles, Plato, and Socrates, and numerous other well-known men, and also most of the poets. For many such persons have bodily
 30 afflictions as the result of this kind of temperament, while some of them obviously possess a natural inclination to affections of this kind; in a word, they all, as has been said, are naturally atrabilious. The cause of this may be understood if we first take an example from the effect of wine, which if taken in large quantities appears to produce
 35 such qualities as we attribute to the atrabilious, inducing, as it is drunk, many different characteristics, making men for instance irritable, benevolent, compassionate, or reckless; whereas no such results are produced by honey or milk or water or anything similar. One can easily see that wine has a variety of effects by observing how it gradually
 953^b changes those who drink it; for, finding them chilled and taciturn as the result of abstinence, a small quantity makes them more talkative, while a larger quantity makes them eloquent and bold, and, when they proceed to action, reckless, and a still larger quantity makes them insolent and afterwards frenzied, while outrageous excess enfeebles
 5 them and makes them stupid like those who have been epileptic from childhood,¹ and very similar to those who are exceedingly atrabilious. As, therefore, an individual as he drinks and takes wine in different quantities changes his character, so there are men who embody each character. For the temporary condition of one man when he is drunk is the permanent character of another, and one man is
 10 loquacious, another emotional, another easily moved to tears; for wine has this effect also on some people² and therefore Homer writes,

He says that I swim in tears, like a man that is heavy
 with drinking.³

Others become compassionate or savage or taciturn; for

¹ Placing a comma after *ἐπιλίπτους*.

² Cp. above, 874^b 8-10.

³ *Od.* xix. 122, where the received text has *φῆ δὲ δακρυπλώειν βεβαρηότα με φρένας ὄνφ*.

some maintain a complete silence, especially those atrabilious subjects who are out of their minds. Wine also makes men amorous; as is shown by the fact that a man who is drinking ¹⁵ is induced to kiss those whom, owing to their appearance or age, no sober person would kiss. Wine then gives a man extraordinary characteristics, but for a short time only, while nature gives them permanently for the period of a lifetime; for some men are bold, others taciturn, others compassionate, ²⁰ and others cowardly by nature. It is therefore clear that each ¹ characteristic is produced by wine and by nature by the same means; ² for the whole body functions under the control of heat. Now both the juice ³ and the atrabilious temperament are full of wind; wherefore the physicians say that flatulence and disorders of the stomach are due to black ²⁵ bile. Now wine has the quality of containing air; so wine and the atrabilious temperament are similar in nature. The froth which forms on wine shows that it contains air; for oil does not produce froth, although it is hot, but wine produces it in large quantities and dark wine more than white because it contains more heat and substance. It is ³⁰ for this reason that wine excites sexual desire, and Dionysus and Aphrodite are rightly coupled together, and atrabilious persons are generally lustful.⁴ For sexual desire is due to the presence of breath, as is shown by the fact that the virile organ quickly increases from a small to a large size by ³⁵ inflation; also ⁵ boys before they are capable of emitting semen find a certain pleasure in rubbing their sexual organs through lust when they are approaching the age of puberty, and the swelling of the organ becomes manifest because breath passes through the passages through which the semen subsequently passes; also the effusion ^{954^a} and impetus of the semen in sexual intercourse is clearly due to propulsion by the breath.⁶ So those foods and liquids which fill the region of the sexual organs with breath are rightly regarded as aphrodisiac. Thus dark wine

¹ Reading *ἐκαστον* (Richards) as in l. 8.

² Reading *διὰ τοῦ αὐτοῦ* (Richards).

³ i. e. wine.

⁴ Cp. 880^a 30-33.

⁵ Omitting *ἔτι* with Burnet.

⁶ Cp. *H. A.* vii. 7. 586^a 16. It seems necessary to read with Richards *φανερὸν ὅτι γίνεται*.

5 more than anything else produces the condition found in
 atrabilious persons.¹ This condition is obvious in some
 individuals; for most atrabilious persons are thin² and
 their veins stand out, the reason being the abundance not
 of blood but of breath. The reason why all atrabilious
 10 persons are not thin³ or dark,⁴ but only those who contain
 particularly unhealthy humours, is stated elsewhere.⁵

But to return to our previous subject of discussion, this
 humour, namely, the atrabilious, is originally mingled in
 the bodily nature, for it is a mixture of heat and cold, of
 which two things the bodily nature consists. Black bile,
 15 therefore, becomes both very hot and very cold, for the
 same thing naturally admits both heat and cold, like water,
 which, though cold, yet when it is sufficiently heated (for
 example, when it boils) is hotter than the actual flame which
 heats it, and similarly a stone or a piece of iron when
 thoroughly heated becomes hotter than charcoal, though
 20 they are naturally cold. (This subject has been dealt with
 more clearly in dealing with Fire.⁶) Now black bile, which
 is naturally cold and not on the surface,⁷ being in the con-
 dition mentioned above, if it abounds in the body, produces
 apoplexy or torpor or despondency or fear; but when it is
 overheated, it produces cheerfulness accompanied by song,
 25 and frenzy, and the breaking forth of sores, and the like.
 In most people then black bile engendered from their daily
 nutriment does not change their character, but merely
 produces an atrabilious disease. But those who naturally
 possess an atrabilious temperament immediately develop
 30 diverse characters in accordance with their various tempera-
 ments; for example, those who are originally full of cold
 black bile become dull and stupid, whereas those who

³ Reading *σκληφροί* with AP.

⁴ Omitting *οί* before *μέλανες* with Bekker.

⁵ This reference cannot be identified in the Aristotelian Corpus.

⁶ Camotius at the end of Book 24 states that according to some authorities books on Fire and Light formerly found a place at that point, but are now lost. The reference here is possibly to a lost book on Fire.

⁷ Reading *ἐπιπόλαιος* for *ἐπιπολαίως* with Sylburg and Platt.

possess a large quantity of hot black bile become frenzied or clever or erotic or easily moved to anger and desire, while some become more loquacious. Many too, if this heat approaches the region of the intellect, are affected by 35 diseases of frenzy and possession; and this is the origin of Sibyls and soothsayers and all inspired persons, when they are affected not by disease but by natural temperament. Maracus, the Syracusan, was actually a better poet when he was out of his mind. Those in whom the excessive heat dies down¹ to a mean temperature are atrabilious, but 954^b they are cleverer and less eccentric and in many respects superior to others either in mental accomplishments or in the arts or in public life. In respect too of facing dangers an atrabilious state causes great variation, in that² many of 5 those who are in this condition are inconsistent under the influence of³ fears; for they vary from time to time according to the state in which their bodies happen to be in respect to the atrabilious temperament. Now this temperament is itself also inconsistent, just as it produces inconsistency in those suffering from the diseases which it causes; for, like 10 water, it is sometimes cold and sometimes hot. And so the announcement of something alarming, if it occurs at a time when the temperament is rather cold, makes a man cowardly; for it has already prepared a way for the entrance of fear, and fear has a chilling effect (as is shown by the fact that those who are greatly alarmed tremble). If, however, the temperament is inclined to be hot, fear reduces it to a moderate temperature and causes a man to be in his senses and 15 unexcited. So too with the despondency which occurs in everyday life (for we are often in the condition of feeling grief without being able to ascribe any cause for it, while at other times we feel cheerful without knowing why), such feelings and those usually called superficial⁴ feelings occur to a slight degree in every one, for something of the force

¹ Reading ἐπανεθῆ ἢ ἄγαν θερμότης with Bywater. The Latin version of T. G. has *ab quibus minus* (a misprint for *nimius*) *ille calor remissus ad mediocritatem sit.*

² Reading τῷ for τοῦ.

³ Reading ἐν for μέν. [So, too, Richards and Klek.]

⁴ Reading ἐπιπόλαια (which is suggested by the contrast with ὄσους δ' εἰς βάθος) instead of the meaningless παλαιά; T. G. renders *superius*.

20 which produces them is mingled in every one; but those
 who are thoroughly penetrated by them acquire them as
 a permanent part of their nature. For as men differ in
 appearance not because they possess faces but because they
 possess certain kinds of faces, some handsome, others ugly,
 others with nothing remarkable about them (those, that is,
 who are naturally ordinary); so those who possess an atra-
 25 bilious temperament in a slight degree are ordinary, but
 those who have much of it are quite unlike the majority of
 people. For, if their condition is quite complete, they are
 very atrabilious; but, if they possess a mixed temperament,
 they are men of genius. If they neglect their health, they
 have a tendency towards the atrabilious diseases, the part
 of the body affected varying in different people; in some
 30 persons epileptic symptoms declare themselves, in others
 apoplectic, in others violent despondency or terrors, in
 others over-confidence, as happened to Archelaus, King of
 Macedonia. The force which gives rise to such a condition
 is the temperament according as it contains heat or cold.
 If it be cold beyond due measure, it produces groundless
 35 despondency; hence suicide by hanging occurs most
 frequently among the young, but sometimes also among
 older men. Many men too put an end to themselves after
 drunkenness, and some atrabilious persons continue in a
 state of despondency after drinking; for the heat of the
 955^a wine quenches their natural heat. Heat in the region in
 which we think and form hopes makes us cheerful; and for
 this reason all men are eager to drink until they become
 intoxicated, for abundance of wine makes all men hopeful,
 just as their youth makes children sanguine; for old age is
 5 despairing but youth is full of hope. There are a few who
 are seized with despondency while they are drinking, for
 the same reason as makes others despondent after drinking.
 Those then who become despondent as the heat in them
 dies down tend to hang themselves. Hence the young and ¹
 the old are more likely to hang themselves; for old age
 10 makes the heat die down, and so, in the young, does their

¹ Omitting ῆ with Richards.

condition, which is itself natural.¹ When the heat is extinguished² suddenly, most men make away with themselves to the general astonishment of all, since they have given no previous sign of any such intention. When the temperament caused by the admixture of black bile is colder, it gives rise, as has been already remarked, to despondency¹⁵ of various kinds, but when it is hotter to cheerfulness. Hence the young are more cheerful, the old more despondent, the former being hot and the latter cold; for old age is a process of cooling. Extinction takes place suddenly from external causes, just as objects which have been heated in the fire are cooled by unnatural processes, as for example when water is poured over hot coals. Hence men some-²⁰ times commit suicide after drunkenness; for the heat of the wine is introduced from outside, and when it is extinguished the condition which leads to suicide is set up. Also after sexual intercourse most people tend to be despondent; those, however, who emit a considerable amount of excrement with the semen become more cheerful, for they are relieved of an excess of excrement and breath and heat.²⁵ But those who indulge in sexual intercourse³ are often more despondent, for by so doing they become cooled, because they lose something which is valuable, as is shown by the fact that the amount of semen which is emitted is not great.⁴

To sum the matter up, owing to the fact that the effect of black bile is variable, atrabillious persons also show varia-³⁰ tion; for the black bile becomes very hot and very cold. And because it has an effect upon the character (for heat and cold have such an effect to a greater extent than anything else in us), like wine mingling in a stronger or weaker form in the body, it gives us our own special characters. Now both wine and black bile are full of breath. And³⁵

¹ Omitting τὸ μαραινόμενον θερμόν as a gloss on τὸ πάθος.

² ὅτοις δὲ σβενιυμένον can hardly stand here, and the required sense is given by the Latin version, which renders *quibus autem calor extinctus subito est*. We should probably read ὅσοις δὲ σβέννυται ἐξαίφνης, οἱ πλείστοι κτλ.; cp. below, l. 18.

³ ἐκείνοι will be equivalent to οἱ ἀφροδισιάσαντες. Possibly ἕτεροι should be read; the Latin version has *ceteri*.

⁴ i. e. it has quality rather than quantity.

since it is possible for an abnormal state to be well
 attempered and in a sense a favourable condition, and since
 it is possible for the condition to be hotter and then again
 cold, when it should be so, or to change to the contrary
 owing to excess, the result is that all atrabilious persons
 40 have remarkable gifts, not owing to disease but from
 natural causes.

955^b Why do we say that we acquire a habit as the result 2
 of pursuing some sciences but not others? Are we said to
 acquire a habit only by such sciences as enable us to make
 discoveries, since discovery is the result of a habit?

Why is it that of all the animals man has most practical 3
 5 wisdom? Is it because he has the smallest head in pro-
 portion to his body? Or is it because he is abnormally
 small in certain parts? For that is why his head is small,
 and among men those who have smaller heads are wiser
 than those who have larger heads.

Why is it that a journey seems longer when we traverse 4
 10 it without knowing its length than when we know it, all
 other conditions being equal?¹ Is it because to know its
 length is to be able to connect a number with it? For that
 which cannot be numbered is the same as the infinite, and
 the infinite is always more than the determinate. Just as,
 therefore, if one knows that a journey is a certain length
 it must necessarily be finite, so if one does not know its
 15 length one as it were converts the proposition² and the
 mind draws a false conclusion, and this journey appears
 infinite. Furthermore,³ a quantity is determinate, and that
 which is determinate is a quantity; therefore when a
 thing does not appear determinate it will appear to be
 as it were infinite, because that which is of a nature to be
 20 determined, if it is not so, is infinite, and that which
 appears not to be determined necessarily appears in a sense
 unlimited.

¹ This problem has already been dealt with in V. 25.

² See note on 883^b 8.

³ Reading *ἐτι* for *ἐπεὶ* and placing a full stop before it, cp. 883^b 9.

5 Why is it that, whereas we become wiser as we grow older, yet the younger we are the more easily we can learn? Is it because God has given us two instruments within ourselves, which enable us to use external instruments, providing the body with the hand and the soul ²⁵ with intelligence? For intelligence is among the things implanted in us by nature, being as it were an instrument; and, whereas the sciences and arts are among the things created by us, intelligence is one of the gifts of nature. So just as we cannot use the hand to the best advantage immediately after birth, but only when nature has perfected it (for the hand can perform its particular function best as ³⁰ age progresses), in like manner of our natural endowments reason is of most assistance to us not in early life but as we get old, and is then at its highest perfection, unless it becomes incapacitated by anything, as may happen also to the other natural endowments. Intelligence comes to us later than the faculty of using the hands, because the instruments ³⁵ used by the intelligence are posterior to those used by the hands. For science is an instrument of the intelligence (for it is useful to the intelligence just as flutes are useful to the flute-player), and many things in nature are instruments of the hands, but nature itself and its creations are prior to science. Now it is natural that where the instruments are prior, the faculties should also come into being ⁴⁰ in us first (for it is by using the instruments that we acquire a habit); and the instrument of each faculty is related ^{956^a} similarly to that faculty,¹ and conversely, as the instruments are to one another, so are the faculties of which² they are the instruments to one another.³ Intelligence then for this reason comes to us when we are older; but we learn more ⁵ quickly when we are young because we do not yet know anything, and when we know more we are no longer so well able to acquire knowledge,⁴ just as we remember best

¹ i. e. as the instrument of any other faculty is related to that faculty.

² Reading with Richards *οὕτως* (<ὄν> τὰ ὄργανα.

³ Reading *αὐτὰ* (Richards). The reasoning resembles that of *E. N.* 1131^b 5-7: *A'* is to *A* as *B'* is to *B*; and, therefore, as *A'* is to *B'* so is *A* to *B*.

⁴ Reading with Richards *οὐκέτι ὁμοίως δυνάμεθα δέχεσθαι κτλ.*

what we come upon early in the day, and then, as the day
 10 goes on, are less able to remember what happens, because
 we have come into contact with a number of incidents.

Why should man be obeyed more than any other animal? 6
 Is it because, as Plato answered to Neocles, he alone of all
 the animals can count? Or is it because he is the only
 animal that believes in gods? Or is it because he is the
 most imitative (for it is for this reason that he can learn)?

15 Why is it that we feel no pleasure in the contemplation 7
 or anticipation of the fact that the interior angles of a
 triangle are equal to two right angles, and similar geo-
 metrical truths—except in so far as we enjoy the specula-
 tion, and the pleasure of this is always the same and would
 be equally great if these angles were equal to three or more
 right angles—but we rejoice at the recollection of an Olympic
 20 victory or the sea-battle at Salamis, and at the anticipation
 of such events, but not in their opposites? Is it because¹
 we rejoice in such events as having taken place or taking
 place, but as regards what happens in the course of nature
 the contemplation of the real state of affairs alone causes us
 pleasure, whereas actions² give rise to the pleasure caused
 25 by their results? Since, then, actions are various, their
 results too are sometimes painful and sometimes pleasant;
 and we avoid and pursue anything in accordance with
 pleasure and pain.

Why do doctors continue their treatment only until 8
 health is restored?³ For the doctor reduces⁴ the patient,
 and next dries his body, then creates a healthy condition
 30 and at that point stops. Is it because⁵ it is impossible for
 any other condition to be produced from health? Or, if it
 is possible, is it the task of another science, and will what
 is produced from health be something different? Now,

¹ Reading *ποιούτοις*; ἢ ὅτι.

² Reading *φύσιν* <ἢ> ὡς κατ' ἀλήθειαν ἔχει θεωρία ἡδονὴν μόνη ἡμῖν ποιεῖ,
 αἱ δὲ πράξεις κτλ. (W. D. R.).

³ The text of this chapter is unsatisfactory, but the general sense is
 clear.

⁴ The Teubner text misprints *ισχναίνα* for *ισχναίνει*.

⁵ Reading *πότερον* <ὅτι> οὐκ (Richards.)

if health is produced from conditions which are its opposite or are intermediate between health and sickness, it is obvious that the patient is sick because he is too moist or too dry or something else.¹ The doctor, then, from a state of cold creates a less extreme condition and, finally,² a condition of a certain heat or dryness or moisture by change from the 35 opposite or intermediate condition,³ until he achieves a state which is such as to constitute a condition of health; and from this no condition can be produced except one which is intermediate between health and sickness. The possessor of the art can, then, create some new condition; for, when he has reached a certain point, he can retrace his steps and undo his work; but the doctor's *art* has nothing to do with such a course, for its aim is always to create a better 40 condition.⁴ So neither the doctor's art⁵ nor any other art will create anything else out of health; for either nothing 956^b would be being produced,⁶ or else the opposite of health, if the same science were being employed (so too out of a house nothing could make its contrary): nor is there any other art⁷ which can make anything out of health, except as making a whole out of a part, as, for example, when the cobbler's art makes a shoe out of the front part of a shoe;⁸ for these two things can be produced out of one another by two processes, one of composition and the other of 5 destruction.

9 Why is it generally considered that the philosopher is superior to the orator?⁹ Is it because the philosopher spends his time in studying the actual forms of things, while the orator deals with the embodiments of these forms—the former considering what injustice and tyranny are, the latter urging that a certain individual is unjust or dealing with the character of a tyrant?

10

¹ Reading *τοιούτων* <ὄν>.

² Reading *τέλος* for *τέλειον*: T. G. renders *postremo*.

³ Deleting the comma after *ἐναντίων*.

⁴ Reading *βελτίονος* (Richards).

⁵ Reading *ὥστε οὔτε ἄλλη οὔτε αὐτή*.

⁶ Reading *ἐγένετο* <ἄν> (Richards).

⁷ Reading *οὐδ' ἔστιν ἄλλη τέχνη* (from T. G.).

⁸ Cp. *Rhet.* 1392^a 31 ff.

⁹ A shorter form of this problem occurs in xviii. 5.

Why are theatrical artists generally persons of bad **10** character?¹ Is it because they partake but little of reason and wisdom,² because most of their life is spent in the pursuit of the arts which provide their daily needs, and because the greater part of their life is passed in incontinence **15** and often in want, and both these things prepare the way to villainy?

Why did the men of old institute prizes for physical **11** contests but none for wisdom? Is it because in all fairness the judges should in the intellectual sphere be either the superiors or at any rate not the inferiors of the competitors? Now if those who were pre-eminent in wisdom had to **20** compete and a prize had been offered, they would have no one to act as judges.³ In athletic contests, however, anyone can judge by merely using his eyes. Further, the original institutor of the games did not wish to propose to the Greeks such a contest⁴ as would be likely to produce **25** violent disputes and enmity; for when one is rejected or accepted in a contest of bodily strength, men do not altogether harbour any grievance nor feel sentiments of enmity towards the judges, but they feel great wrath and indignation against those who decide their relative wisdom or worthlessness; and this is a quarrelsome and bad state of affairs. **30** Furthermore, the prize ought to be better than the contest; for in athletic games the prize is more desirable than, and superior to, the contest. But what prize could be found superior to wisdom?

Why is it that man in particular thinks one thing and **12** does another? Is it because the same science deals with contraries? Or is it because the reason has many objects, **35** desire one? Now man usually lives by the intelligence, the animals by appetite, passion, and desire.

¹ This problem is quoted by Aulus Gellius (xx. 4) with slight textual variations as from the *προβλήματα ἐγκύκλια* of Aristotle.

² Reading λόγου <καὶ> σοφίας, which is supported by Aulus Gellius, who reads λόγον καὶ φιλοσοφίας.

³ Reading αὐτοῖς.

⁴ Reading ἐξ ἧς for ἐξ ὧν.

- 13 Why is it that some prudent men spend their time acquiring rather than using? Is it because they are following the habit of doing so? Or is it due to the pleasure of anticipation?
- 14 (Why do those who sleep deeply and most pleasantly see no visions? Is it)¹ because sensation and thought function because the mind is at rest—hence the word knowledge (*ἐπιστήμη*) seems to be derived from the fact that knowledge ⁴⁰ checks the mind (*ἴσθησι*)—² since when it is in motion and being carried along it can neither have sensation nor ^{957^a} think? Hence it is that children and those who are drunk and the insane are senseless; for, owing to the abundance of heat present in them, they are in a state of considerable and very violent movement, but when this ceases they ⁵ become more sensible; for, when the thought is undisturbed, they can control it better. Those who have visions during their sleep dream because thought is checked, and in proportion as it is at rest. For the mind is greatly moved during sleep, since, when heat collects in the interior from the rest of the body, there is a very considerable and ¹⁰ violent movement; and it is not true, as most people suppose, that it is most at rest and by itself, and especially so when no vision is seen. The contrary is really true; for because it is in considerable movement and never rests for a moment, it cannot think. And it is naturally in most movement when ¹⁵ it sleeps most pleasantly, because it is then in particular that the greatest amount of heat collects in the interior of the body. That, when it is in motion, the mind cannot think, not only in its waking hours but also in sleep, is proved by the fact that one is least likely to see visions during the ²⁰ sleep which follows the taking of food; now this is the time when the mind is most disturbed owing to the nourishment which has been introduced into the body. A vision occurs when sleep comes over us while we are thinking or letting

¹ Reading, with the margin of X^a A^p, *Διὰ τί οἱ βαθέως καὶ ἡδιστα καθεύδοντες οὐδὲν ἐνύπνιον ὁρώσιν; ἦ.* This reading is also translated in the Latin version.

² The word *ἐπιστήμη*, which is really derived from *ἐπίσταμαι*, is here derived from *ἴσθημι* or rather *ἐφίσθημι* (cp. below, 957^a 6).

things pass before our eyes. Hence we usually see things which we are doing or intend or wish to do; for it is on
25 these things that our thoughts and fancies most often dwell. And the better men are, the better are their dreams, because they think of better things in their waking hours, while those who are less well disposed in mind or body have worse dreams. For there is a close correspondence between the disposition of the body and the images of our dreams;
30 for, when a man is ill, the ideas proposed by his thoughts are bad, and furthermore, owing to the disturbance which reigns in his body, his mind cannot rest. It is for this reason that atrabilious persons start in their sleep, because, owing to the excess of heat, the mind is in a state of too much movement, and, when the movement is too violent,
35 they cannot sleep.

BOOK XXXI

PROBLEMS CONNECTED WITH THE EYES

- 1 WHY does rubbing the eye stop sneezing?¹ Is it because by this means evaporation is given to the moisture? For the eye sheds tears after friction, and sneezing is due to an abundance of moisture. Or is it because the lesser heat is destroyed by the greater? Now the eye when it is rubbed acquires more heat than is contained in the nose; and for this reason even if we rub the nose itself the sneezing stops. 957^b
- 2 Why can one see more accurately with one eye than with both eyes? Is it because more movements are set up by the two eyes,² as certainly happens in those who squint? The movement of the two eyes, therefore, is not one, but that of a single eye is one; therefore one sees less accurately with both eyes.
- 3 Why do the eyes tend to become very red in those who are angry, and the ears in those who are ashamed? Is it because the eyes are chilled in those who are ashamed (for 'shame dwells in the eyes'), so that³ they cannot look straight in front of them? (Cowardice also involves a cooling in the same region.) Now the heat⁴ travels in a direction away from the forepart of the head, and the ears are situated in the opposite part of the head, and therefore they redden most under the emotion of shame.⁵ But under

¹ This problem is verbally repeated in xxxiii. 8; cp. also xxxiii. 2.

² Reading *πλείους αἰ* (Platt).

³ Reading (*ἐν ὀφθαλμοῖς γὰρ αἰδώς*) <ὥστ'> ἀντιβλέπειω κτλ., ὥστ' having probably fallen out by haplography owing to the *αἰδώς* preceding. The quotation is from the *Cresphontes* of Euripides, Nauck² fr. 457.

⁴ Reading τὸ θερμὸν (cp. 961^a 11) for τὸ ὀπισθεν. The Latin version of T. G. has *calor autem in partem transit adversam*, &c. The meaning will be that under the influence of shame the eyes become cold, and therefore the heat is driven backwards and so reddens the ears.

⁵ Cp. xxxii. 1, 8, and 12, where additional reasons are given.

the influence of provocation assistance is sent ¹ to the more sensitive and easily affected part,² as though it were suffering violence; for in those who are frightened it fails altogether there.

Why is it that, if one eye is held down, the other has a 4 more intent gaze? Is it because the origins of sight in the two eyes are connected at one source? So when one eye
20 moves, the common source of sight is also set in motion; and when this moves, the other eye moves also. When one eye therefore is held down, all the movement will be concentrated on the other eye, which consequently will be able to gaze more intently.

Why is it that those who are blind from birth do not 5 become bald? Is it because the eye is injured by the presence of a large quantity of moisture in the region of
25 the head? This is why they cauterize the veins round the temples of those who suffer from running at the eyes (thus closing the ducts through which the humours flow), and scrape the head, cutting into the skin upon it. Since, therefore, it is the excretion gathering in the head which injures the eyes, this same excretion by collecting in too
30 great quantities in the head might prevent the eyes³ from originally coming into being at all. And since the hair grows from excretions, and the excretion in the head of those who are blind from birth is abundant, it is only natural that they are not bald.

Why are those whose eyes protrude affected more than 6 others by smoke? Is it because smoke reaches the projecting parts most quickly?

35 Why is it that we can turn the gaze of both eyes simultaneously towards the right and the left and in the direction of the nose, and that of one eye to the left or to the right, but cannot direct them simultaneously one to the right and the other to the left?⁴ Similarly, we can direct them downwards and upwards; for we can turn them simultaneously in the

¹ i. e. there is a rush of heat.

² i. e. the eyes.

³ The Teubner text misprint *αἰρούς* for *αἰρούς*.

⁴ i. e. outwards away from the nose.

same direction, but not separately. Is it because the eyes, 40 though two, are connected at one point,¹ and under such conditions, when one extremity moves, the other must follow 958^a in the same direction, for one extremity becomes the source of movement to the other extremity? Since, therefore, it is impossible for one thing to move simultaneously in contrary directions, it is impossible also for the eyes to do so; for the extremities would move in opposite directions if one moved up and the other down, and the source of the 5 movement of both of them would have to make corresponding movements, which is impossible.² The distortion of the eyes is due to the fact that the eyeballs possess a moving principle and turn, to a certain extent,³ upwards and downwards and sideways. When, therefore, being so placed that they are in a similar position to one another and midway between an upward and a downward and an 10 oblique movement,⁴ the two eyeballs catch the visual ray on corresponding points of themselves, they are not distorted and their gaze is quite mobile⁵ (though when⁶ they catch the visual rays on corresponding points of themselves, although the vision is not distorted it does not follow that the position of the eyes is the same.)⁷ Yet, if you turn up the whites of the eyes, part of the pupil is 15 obscured, as for example in those who are about to sneeze; others have oblique vision, madmen for example; in others the gaze is turned towards the nose, as in tragic masks and in those who are nervous, for their glance denotes concentrated thought. But those who keep their gaze fixed on one point without⁸ having their eyeballs similarly situated, or who have them similarly situated but do not keep them

¹ Cp. above, 957^b 19 ff.

² The movement of each eye corresponds with a movement of their common point of connexion; if, therefore, the two eyes move simultaneously in contrary directions, the point of connexion must make two contrary movements at the same time, which is impossible.

³ Reading μέχρι του.

⁴ Placing the comma after πλάγιον instead of κινείσθαι.

⁵ Reading κινητοί: T. G. renders *mobiles*.

⁶ Reading ὅσαι δ' (ἴν), as suggested by the Teubner editors.

⁷ The point of this sentence seems to be that the previous proposition is not convertible.

⁸ Reading μὴ for μίθ'. The Teubner text misprints ὁμοίως for ὁμοίως.

20 fixed on the same point, both these have distorted vision ;
 they therefore scowl and screw up the eyes, for they try
 to fix one eyeball in the same position as the other ; so
 they leave one eye alone and try to bring the other into
 position. If the vision of both eyes does not rest on the
 same point,¹ they must be distorted ; for the same thing
 25 happens as in those to whom, when they press under the
 eye,² a single object appears double, for in these too the
 source of vision is disturbed. If, therefore, the eye is moved
 upwards, the terminus of the vision is lowered ; if down-
 wards, it is raised. And if the position of one eye is
 changed, the object of the vision therefore seems to move
 30 up or down, because the vision also does so, but it does not
 appear double unless the vision of both eyes is in use.
 A similar distortion³ occurs also in one whose eyes do not
 correspond,⁴ causing him to see double ; but this is due
 to the position of the vision, because it is not in the middle
 of the eye.

35 Why do those who are short-sighted write in small 8
 characters?⁵ For it is strange that those who have not
 acute vision should do what requires such vision. Is it
 because small things appear large when they are near at
 hand, and the short-sighted hold what they are writing
 close to their eyes? Or is it because they screw up their
 eyes when they write? For owing to the feebleness of
 their sight, if they write with their eyes wide open, the
 958^b vision, being dispersed, can only see dimly ; but when the
 eyes are screwed up, it all falls on one point, and, since it
 forms a small angle, it necessarily causes the writing of
 small characters.

¹ Reading *κατὰ τὰντὸ* with Bussemaker.

² The full phrase would be *ὑποβάλλουσι τὸν δάκτυλον ὑπὸ τὸν ὀφθαλμόν* ;
 cp. *de Insomniis* 441^b 31, and *Met.* 1063^a 8. The reference is to the
 experiment of slightly displacing the eyeball by pressing the finger
 under it.

³ Putting a full stop after *δοσι* and reading *καὶ διαστροφῇ τοιαύτη*.

⁴ *ἑτερόφθαλμος* in Classical Greek means 'having only one eye' ; in
 later Greek it can mean 'having different eyes' ; see L. and S. *s. v.*
 and cp. *ἑτερόγλαυκος*, *ἑτερόπους*, &c.

⁵ Cp. below, chapter 15.

- 9 Why can some people see more clearly after suffering from ophthalmia? Is it because their eyes are thus purged? 5 For often the external thickening blocks the vision, but is dissolved when the eye discharges. Hence also it is beneficial that the eyes should be made to smart, with onion for example;¹ but a substance of the opposite kind, such as marjoram, has an adverse effect.²
- 10 Why are those who see with only one eye less liable to disturbance of the vision? Is it because their mind is less 10 affected, and so the disturbance of the vision is less felt?
- 11 Why do objects appear double to those whose eyes are distorted?³ Is it because the movement⁴ does not reach the same point on each of the eyes? So the mind thinks that it sees two objects when it really sees one twice. A similar phenomenon occurs if one crosses the fingers; for a single object appears to be two to a single person 15 touching it twice.⁵
- 12 Why is it that the senses on the right side of the body are not superior to those on the left side, but in all other respects the right side of the body is superior?⁶ Is it a question of habit, namely, that we accustom ourselves immediately to perceive equally well with the senses on both sides of the body? And it seems that the superiority of the right-hand parts of the body is due to habit, for we can accustom ourselves to be ambidextrous. Or is it 20 because to feel sensation is to be passive, and the right parts of the body are superior in that they are more active and less passive than the left?
- 13 Why is it that in all other respects the right side of the body is superior, but in sensation the two sides are alike?⁷

¹ Cp. 959^b 11, 12. It seems necessary to read *κρομμύφ* for *κρόμμνον*.

² The reading here is uncertain, but the sense is clear.

³ Reading *διεστραμμένοις* (cp. ^a20) for *δισταμένοις*, which can hardly bear the meaning given by Bonitz (*Index* 196^a 22) of *distractis oculis*.

⁴ i. e. of the visual ray from the object seen.

⁵ This phenomenon is referred to again in 959^a 15; cp. also *Met.* 1011^a 33, and *de Somniis* 460^b 20 ff. It appears necessary to read *ἀππομένωφ*.

⁶ Cp. below, chapters 13, 18, and 29.

⁷ Cp. chapters 12, 18, and 29.

25 Is it because we habitually practise the equal use of sensation on both sides? Moreover, to feel sensation is to be passive, and the superiority of the right side of the body is shown in activity, not in passivity.

Why is physical exercise detrimental to acuteness of 14 vision? Is it because it makes the eye dry, as it does the 30 rest of the body? Now dryness hardens every kind of skin; so it has that effect also on the skin covering the pupil. This is also the reason why the aged have not acute vision; for their eyes have a hard and wrinkled surface, and so the vision is obscured.

Why do the short-sighted, though they have not acute 15 vision, write in small characters?¹ Yet it is characteristic of acute vision to see what is small. Is it because, having weak sight, they screw up their eyes? For when the sight proceeds forth in a concentrated glance it sees better, but when the eye is wide open its vision is dispersed. So owing to the feebleness of their sight they bring their eyelids close together, and, because their vision proceeds from a small area, they see magnitude on a small scale, and 959^a the characters which they write are on the same scale as their vision.

Why do the short-sighted bring their eyelids close 16 together when they look at anything? Is it due to the weakness of their sight, so that, just as a man in looking at 5 a distant object puts his hand up to his eyes, they close the eyelids to look at objects near at hand? They do so in order that the vision may proceed forth in a more concentrated form, since it passes through a narrower opening, and that it may not be immediately dispersed by passing out through a wide aperture. A wider vision, however, covers a larger field.

Why is it that if the eye be moved sideways a single 17 10 object does not appear double? Is it because the source of sight is still in the same line? It can only appear double when the line is altered upwards or downwards; and it

¹ Cp. above, chapter 8.

makes no difference if it is altered sideways, unless it is also at the same time altered upwards or downwards.¹ Why, then, is it possible in sight for a single object to appear double if the eyes are in a certain position in relation to one another, but impossible in the other senses? Is it not possible also in touch that one thing becomes² 15 two if the fingers are crossed?³ But with the other senses this does not happen, because they do not perceive objects which extend to a distance away from them, nor⁴ are they duplicated like the eyes. It takes place for the same reason⁵ as it does with the fingers; for then the touch is imitating the sight.⁶

18 Why is it that, though in the rest of the body the left 20 side is weaker than the right, this is not true of the eyes, but the sight of both eyes is equally acute?⁷ Is it because the parts of the body on the right side are superior in activity but not in passivity, and the sight is passive?

19 Why is it that when we keep our gaze fixed on objects of other colours our vision deteriorates, whereas it improves if we gaze intently on yellow and green objects, such as 25 herbs and the like? Is it because we are least able to gaze intently on white and black (for they both mar the vision), and the above-mentioned colours come midway between these,⁸ so that, the conditions of vision being of the nature of a mean, our sight is not weakened thereby but improved? Perhaps, just as we take harm from over-violent physical 30 exertion but moderate exercise is beneficial, so too is it with the sight; for we over-exert the sight if we gaze intently on solid objects, but we do not strain it in looking at objects which contain moisture, since there is nothing in them to resist the vision. Now green things are only moderately solid and contain a considerable amount of moisture; they 35

¹ Reading *ἐὰν μὴ ἄμα καὶ ἄνω* (<ἢ κάτω).

² We should perhaps read *φαίνεται* for *γίνεται*.

³ Cp. above, 95^b 14, 15, and note.

⁴ Reading *οὔτε* for *οὐδέ*.

⁵ Reading, with Richards, *διὰ ταῦτό*.

⁶ i. e. the two crossed fingers resemble the two eyes.

⁷ Cp. chapters 12, 13, 29.

⁸ Black and white being contraries (cp. *de Sensu* 445^b 25, &c.).

therefore do not harm the sight at all, but compel it to rest upon them, because the admixture of their colouring is well attempered to the vision.

Why is it that we see other things better with both eyes, 20
but we can judge of the straightness¹ of lines of writing
40 better with one eye, putting it close to the letters? Do
959^b both eyes falling on the same point cause confusion, as the
writers on optics say, whereas, when we look with one eye,
straightness is more apparent to the straight vision, just as
it is when a measuring rod is used?

5 Why does smoke make the eyes smart more than any
other part of the body? Is it because they alone are very
weak, since the inner parts of the body are always the
weakest? (This is shown by the fact that vinegar and
anything pungent causes not the outer but the inner flesh
to smart, because² the latter is the rarest flesh in the body
and contains most pores.) For the vision finds its exit
10 through certain pores, and so what causes most stinging
within is drawn away³ from the outer flesh. The onion
too has a similar effect and anything else which causes the
eye to smart, and of liquids olive-oil more than any other,
because it is composed of very small particles and so sinks
in through the pores. Vinegar is used as a medicament for
the rest of the flesh.

15 Why is it that the eye, although it is very weak, is the only 22
part of the body which does not feel the cold? Is it because
the eye is of a fatty consistency and does not partake of the
nature of flesh, and such substances are unaffected by the
cold? For if the eye is really a fire,⁴ this is not the reason

¹ Reading τὸ δὲ εὐθὺν with X^a.

² The Latin version implies a new solution beginning at this point, which would necessitate a full stop after ἐντός and the reading ἢ ὅτι ἀραιώτατον (ἀραιώτατον being read by several MSS., including Y^a). This second question is, however, hardly likely, since, where alternatives are offered, the first is almost invariably introduced by πότερον, whereas here in l. 5 we have ἢ ὅτι.

³ ἀποπίπτει is certainly corrupt: the Latin version of T. G. has *itaque quod his mordacissimum est, ceteris corporis partibus obvium subire densiora non potest sed perreptat et decidit*, which implies a longer text.

⁴ Cp. below, 960^a 32, and *de Sensu* 437^a 22 ff., where this view, at

why it does not feel cold, for its fire is not at any rate of such a character as to engender heat.

- 23 Why are tears warm when we let them fall in weeping, ²⁰ but cold when we shed them owing to an affection of the eyes? Is it because that which is unconcocted is cold, while that which is concocted is hot? Now every malady certainly proceeds from lack of concoction, and the tears of those whose eyes are affected are unconcocted and therefore cold. It is for this reason that physicians regard cold ²⁵ sweating as a sign of serious illness, while on the contrary they consider that hot sweating tends to get rid of disease.¹ For if the excretion is abundant, the internal heat cannot concoct it,² so that it must necessarily be cold; but when it is scanty, the internal heat prevails over it. Now all diseases ³⁰ are caused by excretions.³
- 24 Why is it that, though the parts of the body on the right side are more easily moved, the left eye can be closed more easily than the right? Is it because the parts of the body on the left always contain more moisture,⁴ and things that ³⁵ are moist naturally close up more easily?⁵
- 25 Why is it that though both a short-sighted and an old man are affected by weakness of the eyes, the former places an object, if he wishes to see it, near the eye, while the latter holds it at a distance? Is it because they are afflicted with different forms of weakness? For the old man cannot see ⁴⁰ the object; he therefore removes the object at which he is ^{960^a} looking to the point at which the vision of his two eyes meets, expecting them to be able to see it best in this position;⁶ and this point is at a distance. The short-sighted man, on the other hand, can see the object but cannot proceed to distinguish which parts of the thing which Empedocles appears at times to hint, is criticized at great length.
- ¹ Cp. 870^a 15 ff., and note.
² *δύναται* in the Teubner text is a misprint for *δύναται*.
³ Cp. 856^a 1. ⁴ Cp. 961^a 2.
⁵ The following sentence *εἶτα . . . καθ' αὐτό* appears to be hopelessly corrupt. The Latin version of T. G. apparently translates a different text.
⁶ Reading *ἄτ' ἐκεῖ* (Richards).

at which he is looking are concave and which convex,
 5 but he is deceived on these points. Now concavity and
 convexity are distinguished by means of the light which
 they reflect; so at a distance the short-sighted man cannot
 discern how the light¹ falls on the object seen; but near at
 hand the incidence of light can be more easily perceived.

Why is man alone, or at any rate more than the other 26
 animals, liable to distortion of vision?² Is it because he
 10 alone, or more than the other animals, suffers from epilepsy
 in his youth,³ at which time distortion of the vision always
 begins?

Why are men alone among the animals liable to distort- 27
 tion of the vision?⁴ Is it because they have the smallest
 distance between their eyes and their eyes are in a straight
 15 line, so that any perversion is very obvious? Or is it because
 the eyes of the other animals tend to be of one colour only,
 and if the eyes were of uniform colour there could be no
 distortion? Or is it because man alone in the animal
 world is liable to epilepsy, and epilepsy, whenever it
 occurs, causes distortion in the eyes as in the other parts
 of the body? Distortion, however, sometimes occurs quite
 20 late in life, namely, in those to whom the illness comes
 late.

Why is it that we can see better against the light of 28
 a lamp or the sun, if we place the hand in front of the
 light? Is it because the light of the sun or of the lamp fall-
 ing on our vision makes it weaker by its excess of brightness,
 since by this excess it destroys those very things⁵ which
 25 are akin to it?⁶ But if the light is shaded by the hand, it
 does not hurt the sight, and the object seen is equally in
 the light; so the sight sees⁷ better and the object seen is
 just as visible.

³ Cp. above, 959^b 17 and note.

BOOK XXXII

PROBLEMS CONNECTED WITH THE EARS

WHY is it that, though the ears are the most bloodless part **1** of the face, they are most affected by blushing in those who feel shame? ¹ Is it because extraneous moisture naturally makes its way most easily into a void, and so, when the moisture is dissolved by the heat engendered in those who
 40 feel shame, it collects in the ears? Or is it because the ears
 960^b are near the temples, where the moisture most collects? Now under the emotion of shame the moisture flows into the face and causes blushing. But the ears have less depth than any other part of the face and are naturally very warm and fresh coloured, unless they have been long numbed
 5 by the cold; they are then the most fresh coloured of all the parts of the face, and so the heat, when it is dispersed, being nearest the surface in the ears, makes them red.

Why is it that the ear-drums of divers burst in the sea? **2** Is it because the ear, as it fills with water, is subject to violent pressure, because it retains the breath? Surely, if this
 10 is the reason, the same thing ought to happen in the air. Or is it because a thing breaks more easily if it does not yield, and more readily under pressure from what is hard than from what is soft? Now that which is inflated is less yielding, and the ears, as has been said, are inflated because the breath is retained in them; and so the water, which is harder than the air, when it presses upon them bursts them.

15 Why do divers tie sponges round their ears? ² Is it in **3** order that the sea may not rush violently in and burst the ear-drums? For thus the ears do not become full, as they do when the sponges are removed.

¹ Cp. above, xxxi. 3, and below, chapters 8 and 12.

² Cp. above, chapter 2.

- 4 Why is the dirt in the ears bitter? ¹ Is it because sweat is corrupt? It is, therefore, a salty, corrupt substance; and that which is corrupt and salty is bitter. 20
- 5 Why do sponge-divers slit their ears and nostrils? Is it in order that the breath may pass more freely? For it is by this way that the breath seems to pass out; ² for it is said that they suffer more from difficulty of breathing by being unable to expel the breath, and they are relieved ²⁵ when they can as it were vomit the breath forth. It is strange, then, that they cannot achieve respiration for the sake of its cooling effect; this appears to be a greater necessity. Is it not quite natural that the strain should be greater when the breath is held, since then they are swollen and distended? But there appears to be a spontaneous passage of the breath outwards; and we must next consider ³⁰ whether breathing inwards is so also. Apparently it is; for they enable the divers to respire equally well by letting down a cauldron; ³ for this does not fill with water, but retains the air, for it is forced down straight into the water; since, if it inclines at all from an upright position, the water flows in.⁴
- 6 Why do some people cough when they scrape their ears? ³⁵ Is it because the hearing is connected with the same duct as the lungs and the wind-pipe? This is shown by the fact that, if these parts are filled up, a man becomes deaf.⁵ When, therefore, heat is set up by the friction, moisture is caused by melting and flows downwards from the duct ⁶ into the wind-pipe and causes coughing.
- 7 Why is it that, if a hole is pierced in the left ear, it generally ⁴⁰ closes up more quickly than in the right ear? It is for this **961^a**

¹ Apollonius, *Mirab.* 28, seems to be referring to this problem, which he cites as occurring *ἐν τοῖς φυσικοῖς προβλήμασι*.

² Omitting *ἀνατέμνονσι δὲ . . . εὐπνοῖαν*, which is not rendered by T. G., and is almost certainly a gloss on *ὅπως εὐπνοῦστεροι ᾖσι*. Also *πονεῖν γὰρ κτλ.* clearly explains *ἐξιέναι δοκεῖ τὸ πνεῦμα* and should follow immediately after it.

⁶ Reading *πόρου* with A^D.

reason that women call the right ear the 'male' and the left the 'female'. Is it because the left parts of the body are moister¹ and hotter, and such things close up very quickly? This is why green plants grow together again; and why
 5 wounds close up more readily in the young than in the old. That the parts on the left side of the body are moister is shown by the fact that they are softer and, generally speaking, partake rather of feminine characteristics.²

Why is it that in those who feel shame the extremities of 8 the ears turn red, but in those who are angry it is the eyes that do so?³ Is it because shame is a cooling in the eyes
 10 accompanied by fear, so that the heat naturally leaves the eyes? So, when it withdraws thence, it travels to the region best adapted to receive it, and this is the extremity of the ears; for the region of the face is otherwise bony. In those who are angry the heat travels in the other direction and
 15 makes itself most manifest in the eyes owing to their white colour.

Why is it that buzzing in the ears ceases if one makes a 9 sound? Is it because the greater sound drives out the less?

Why is it that, if water has flowed into the ear, one pours 10 olive oil in, though the moisture in the ear cannot pass out
 20 through another liquid? Is it because the oil floats on the surface of the water and, owing to the adhesive nature of the oil, the water clings to it when it comes out, the object being to make the water come out with the oil? Or is it in order that the ear may be lubricated and the water therefore come out? For oil being smooth acts as a lubricant.

Why is it that the ⁴ ear-drums of divers are less liable to 11
 25 burst if they pour olive-oil beforehand into them?⁵ Does

¹ Cp. above, 959^b 33.

² The text makes no sense, since it merely repeats as a σημείον what has already been assumed in l. 2 above. The right sense is certainly that of the Latin version of T. G., *argumentum partes sinistras esse humidiores quod molliores sunt atque effeminatiores*, and we must read σημείον δὲ ὅτι ὑγρὰ μᾶλλον (ὅτι μαλακώτερα) καὶ ὄλως θηλυκώτερα τὰ ἀρστέρα.

³ Cp. chapters 1 and 12 and xxxi. 3.

⁴ Reading (τὰ) ὦτα as in 960^b 8.

⁵ Cp. above, chapters 2 and 3.

the reason for their bursting already mentioned¹ still hold good, but the oil poured into the ears cause the sea-water, which subsequently enters the ear, to glide smoothly over its surface, just as happens on the exterior parts of the bodies of those who anoint themselves? The sea-water gliding smoothly along does not make a violent impact upon the inside of the ear, and so does not break the drum. 30

12 Why is it that, although the ears are the most bloodless part of the face, they turn red in those who feel shame? ² Is everything carried to that part which is most devoid of it? Now in a man who feels shame the blood seems to be carried upwards in a heated condition; it therefore passes ³ into the part which is most devoid of it and causes it to become red. The same thing happens also in the cheeks. A further reason is that the skin of the ears, which is tightly ³⁵ stretched, is very thin and therefore very transparent.⁴

13 Why is it that no one scrapes out the ear while yawning? Is it because, when one yawns, the drum of the ear, by means of which he hears, is inflated? That this is so is shown by the fact that one hears least well while yawning; ⁵ for the breath, as happens also in the mouth, ⁶ finds its way ⁴⁰ into the interior of the ears and thrusts the membrane outwards and prevents the sound from entering. If, therefore, ^{961^b} one touches the seat of hearing when in this condition in such a way as to scrape it, one might cause considerable damage to it; for the impact would be against a resisting and unyielding surface inflated by the breath,⁷ and it is obvious that the skin ⁸ and the membrane are far from being ⁵ solid; and so great pain is caused and a wound might result.

BOOK XXXIII

PROBLEMS CONCERNING THE NOSE

WHY is it that sneezing stops hiccuping but does not
 10 stop eructation? ¹ Is it because they are not affections of
 the same region, but eructation is a cooling and lack of
 concoction in the stomach, ² while hiccuping is a similar
 affection of breath and moisture in the region of the lungs?
 Now the regions about the head (the ears, ³ for example)
 are closely connected with the lungs. This is proved by
 the facts that deafness and dumbness are found together,
 15 and that the diseases of the ears become diverted into
 affections of the lungs; also in some persons coughing
 results when the ears are scratched. ⁴ That there is a
 connexion between the region of the nose, in which the
 sneeze takes place, and the lungs is shown by the fact that
 both share in respiration; and so, while the nose sneezes
 when that region becomes hot, the lower region, ⁵ where
 hiccuping takes place, also sneezes in sympathy. Now
 20 heat causes concoction; hence vinegar stops hiccups, as
 also does holding the breath if the hiccup is only slight,
 for it heats the breath which is constricted. ⁶ So too in
 sneezing the counter-constriction of the breath has this
 effect and expiration takes place properly and from the
 upper region; for it is impossible to sneeze without expiring.
 25 The impetus then dispels the enclosed breath which is the
 cause of the hiccup.

Why is it that if, when one is about to sneeze, one rubs ²
 the eye, one sneezes less? ⁷ Is it because what causes the
 sneeze is a kind of heat, and friction produces heat, which,
 30 owing to the close proximity to the eyes of the region in

¹ Cp. below, chapters 5, 13, and 17.

² Which is too far away to be affected.

⁴ Cp. 960^b 35.

⁶ Reading <τὸ> κατεχόμενον.

which the sneeze occurs, destroys the other heat, just as the lesser fire fades away before the greater ?

- 3 Why is it that one generally sneezes twice, and not once or many times ? Is it because there are two nostrils ? The channel, therefore, through which the breath passes is 35 divided between the two.¹
- 4 Why is it that one sneezes more after one has looked at the sun ? Is it because the sun engenders heat and so causes movement, just as does tickling the nose with a feather ? For both have the same effect ; by setting up movement they cause heat and create breath more quickly from the moisture ; and it is the escape of this breath which 40 causes sneezing.
- 5 Why do sneezing and holding the breath and vinegar 962^a stop hiccups ?² Does sneezing, since it is a displacement of the lower breath, act in the same sort of way as medicines which, though applied to the upper part of the body,³ affect the lower part of the stomach ? Holding the breath stops weak hiccups, because the slight impetus of the 5 breath which comes forth represses and stifles and completely dispels the hiccup, just as happens in coughing, which⁴ ceases if you hold it back. Vinegar stops hiccuping because by its heat it vaporizes the surrounding moisture, which prevents eructation ; for eructation takes place when the moisture in the upper part of the stomach is vaporized 10 and concocted, whereas hiccuping occurs when by the action of moisture breath is retained in an excessive quantity in the region of the lungs ; for this, gaining impetus and being unable to break through, causes a spasm, and this spasm is called a hiccup. Hence hiccuping seizes those who are cold, because the cold causes the moisture to acquire consistency⁵ from the breath, and the rest of the 15 breath, being still⁶ enclosed, gives a leap, and its movement is hiccuping.

¹ Reading καθ' ἑκάτερον ; the MSS. read καθ' ἑτέρα.

² Cp. chapters 1, 13, and 17. ³ i. e. through the mouth.

⁴ Reading περὶ τὴν βῆχρα (ῆ), εἰάν κτλ.

⁵ Reading συνεστάναι (Y^a reads συνιστάν), since ποιεῖ requires an infinitive.

⁶ Punctuating πνέματος' ἔτι περιλαμβανόμενον κτλ.

Why do we sometimes pour cold water over a person's 6
face when his nose is bleeding? Is it because the heat is
20 thus driven inwards? If, therefore, the blood is near the
surface, it tends to liquefy it.

Why do we regard sneezing as divine,¹ but not coughing 7
or running at the nose? ² Is it because it comes from the
most divine part of us, namely, the head, which is the seat
of reasoning? Or is it because the other affections are the
results of disease, but sneezing is not?

25 Why does rubbing the eye stop sneezing? ³ Is it because 8
by this means evaporation is given to the moisture? For
the eye sheds tears after friction, and sneezing is due to an
abundance of moisture. Or is it because the lesser heat is
destroyed by the greater? Now the eye when rubbed
30 acquires more heat than is contained in the nose; and for
this reason, even if we rub the nose itself, the sneezing stops.

Why is it that the emission of other kinds of breath, of 9
wind, for example, and of eructation are not regarded as
sacred, but that of a sneeze is so regarded? ⁴ Is it because
of the three regions of the body—the head, the thorax, and
35 the lower stomach—the head is the most divine? Now
wind is breath from the lower stomach and eructation is
from the upper stomach, but sneezing is from the head;
because, therefore, this region is most sacred, the breath also
from it is revered as sacred. Or is it because all discharges
of breath show that the above-mentioned parts are in a
40 better state generally (for without any discharge of excre-
962^b ment ⁵ the breath in its passage out lightens the body), and
so too sneezing shows that the region of the head is in a
healthy condition and capable of concoction? For when
the heat in the head overcomes the moisture, the breath
turns into a sneeze. This is why men test the dying by

¹ Reading *θείον* (Richards).

² This problem is dealt with at greater length in chapter 9.

³ This chapter is verbally identical with xxxi. 1; cp. also chapter 2.

⁴ Cp. chapter 7.

⁵ Cp. the impersonal use of *διαχωρεῖν* in Xen. *Anab.* iv. 8. 20 *κάρω*
διεχώρει αὐτοῖς ('they were suffering from diarrhoea'), and Plato,
Phaedrus 268 B.

applying something which will cause sneezing, with the idea that, if this does not affect them, their case is indeed 5 desperate. Thus sneezing is revered as sacred as being a sign of health in the best and most sacred region of the body, and is regarded as a good omen.

IO Why does man sneeze most of all animals?¹ Is it because in him the ducts are wide through which the breath and scent² pass in? For it is with these when they are full 10 of breath that he sneezes. That these ducts are wide is shown by the fact that man has a weaker sense of smell than any other animal, and those who have narrow ducts³ have a keener sense of smell. If, therefore, the moisture, the evaporation of which causes sneezing, enters in larger quantities and more often into wide ducts, and man more than any other animal has such ducts, he might naturally be expected to sneeze⁴ more often. Or is it because⁵ his 15 nostrils are particularly short, and so the heated moisture can quickly become breath and be expelled, whereas in other animals owing to the length of their nostrils it cools before it can evaporate?

II Why is sneezing between midnight and midday regarded as a bad thing, but between midday and midnight as a good 20 thing? Is it because sneezing seems rather to check those who are commencing anything and are at the beginning? And so, if it occurs when we are intending or beginning something, we are deterred from action.⁶ Now early morning and the period after midnight are as it were a new beginning; therefore we carefully avoid sneezing so as not to hinder the action which has been begun.⁷ But towards 25 evening⁸ and up to midnight there is as it were an ending

¹ This problem is almost verbally identical with x. 18. The subject is more fully treated in x. 54.

² Reading *ὄσμη* for *ῥύμη* (Bussemaker), cp. 892^b 23.

⁵ Reading *ἢ ὅτι* for *ὅσοις*, cp. 892^b 30.

⁶ *ὅταν μέλλωσιν ἀρχομένοις συμβῆναι* of the MSS. gives no sense, and *ὅταν μέλλουσιν ἢ ἀρχομένοις συμβῆναι* or something similar must be read. The Latin version of T. G. renders: *itaque cum rem agere pergitimus atque inter initia sternuisse acciderit.*

⁷ Reading *ἄνω* *ἄρρημένον*.

⁸ Reading *δειλην* (Richards).

and the contrary of the earlier period, so that the same thing that was undesirable becomes, under contrary conditions, desirable.

Why do the old sneeze with difficulty? Is it because the 12 ducts through which the breath passes have become partially closed? Or is it because they are no longer able to 30 raise the breath¹ up with ease, and, when they have done so, they expel it downwards with a violent effort?

Why is it that, if one holds the breath, hiccuping ceases? ² 13 Is it because hiccuping is the result of cooling (hence those who are frightened and those who are chilled hiccup), whereas the breath when it is held back warms the interior region?

35 Why do the deaf usually talk through their noses? ³ Is it 14 because they suffer from lung trouble, since deafness is simply a congestion in the region of the lungs? The voice therefore does not easily find a passage; but, just as the breath of those who are panting or gasping accumulates owing to their inability to exhale it, so it is with the voice of the 40 deaf. It therefore forces its way even through the nostrils, 963^a and, as it does so, owing to the friction, causes the echoing sound. For talking through the nose takes place when the upper part of the nose, where the openings to the roof of the mouth are situated, becomes hollow in form; it then resounds like a bell, its lower part being narrow.

5 Why is sneezing the only phenomenon which does not 15 occur when we are asleep, but takes place practically always while we are awake? Is it because sneezing is the result ⁴ of heat of some kind causing motion in the region from which the sneeze proceeds (and this is why we look up at the sun when we want to sneeze ⁵), whereas ⁶ when we are asleep the heat is driven inwards? ⁷ This is why the lower 10 parts become warm in those who are asleep, and the large

¹ Reading *ἀντὸ* for *τὰ* (Richards).

² Cp. chapters 1, 5, and 17.

³ The same problem is differently treated in xi. 2 and 4.

⁴ Omitting *καὶ* after *γίνεται*.

⁵ Cp. 961^b 36 ff.

⁶ Reading *καθευδόντων δὲ* for *<ἦ> ὅτι καθευδόντων*, the *δὲ* being implied by the preceding *μέν*. [Bussemaker confirms this reading from *Prob. Ined.* (in his edition) ii. 40.]

⁷ Cp. 867^b 32.

quantity of breath which collects there is the cause of the emission of semen during sleep.¹ It is only natural, therefore, that we do not sneeze; for when the heat (which naturally sets in motion the moisture in the head, the evaporation² of which causes the sneeze) is withdrawn from the head, it is only natural that the phenomenon which it causes does not take place. Men break wind and eruct 15 rather than sneeze when they are asleep,³ because, as the region about the stomach becomes hot during sleep, the moisture there becomes vaporized and, as it does so, is carried into the nearest parts; for it is thrust together there by the breath engendered during sleep. For a man who is 20 asleep is better able to hold than to expel the breath; therefore he collects the heat within him. Now when a man holds his breath he forces it downwards; for a downward course is unnatural to the breath, and that is why it is difficult to hold the breath. The same thing is the cause of 25 sleep also; for since waking is movement and this movement occurs to a great extent in the organs of sensation while we are awake, it is plain that we should go to sleep when our organs of sense are at rest.⁴ And since it is fire which creates movement in our parts, and this during sleep 30 is driven inwards and leaves the region of the head, where the seat of sensation is situated, our organs of sense would then be most at rest, and this must be the cause of sleep.

16 Why do people shiver after sneezing and passing urine? ⁵ Is it because by both actions the veins are emptied of the warm air which was previously in them, and, when they are 35 empty, other air enters from without colder than that which was previously in the veins; and such air entering in causes shivering?

17 Why does sneezing stop hiccuping? ⁶ Is it because hiccuping (unlike eructation, which comes from the stomach

¹ Cp 867^b 9. ² Reading with Sylburg and Bekker *ἐξαερωμένον*.

³ Omitting *ἢ ἐγρηγορότερος* as a mistaken gloss on *μᾶλλον*. The position of *καὶ ἐρέγονται* after *πτάρννται* is very awkward and perhaps *ἢ πτάρννται* is also a gloss—this time a correct one—on *μᾶλλον*.

⁴ Omitting *ἡμῶν* as a gloss.

⁵ A slightly longer version of viii. 8.

⁶ Cp. chapters I, 5, and 13.

4^o when it receives food) comes from the lungs¹ and gene-
 963^b rally results from cooling as an effect of chill or pain or
 medicine entering from above? For the region of the lungs,
 being naturally hot, when it is cooled does not emit all the
 breath but forms as it were bubbles. This is why hiccup-
 5 ing stops if the breath is held (for the region then becomes
 warm); and the application of vinegar, which is heating,
 has the same effect. Heat then collecting from the heat of
 the brain also (for the upper regions are connected by
 passages with the lungs) and the lungs being warm, the hold-
 ing of the breath which precedes the sneeze, and the down-
 ward impetus from above, dissolve the hiccuping.

10 Why is it that those who have crisp hair and whose hair 18
 curls are usually rather snub-nosed? Is it because crisp-
 ness resides in fatness, and fatness is accompanied by hard-
 ness, and the blood being hard is hot, and heat does not
 produce excrement, and boniness is formed from excrement,
 and the cartilage of the nose is bony—therefore a scantiness
 15 of this part is a natural result? This theory is supported
 by the fact that young children are always snub-nosed.

¹ Reading *πνεύμονος* for *πνεύματος* [so too Bussemaker], cp. 961^b 11
ὁ δὲ λιγμὸς τοῦ περὶ πνεύμονα κατάψυξις; also the mention of some part
 of the body is required to which *ὁ τόπος* (963^b 2) may refer.

BOOK XXXIV

PROBLEMS CONCERNING THE MOUTH AND
THE PARTS THEREIN

- 1 WHY is it that those who have spongy teeth are not long-lived?¹ Is it because the long-lived have more teeth, for instance males have more than females, men than 20 women, and rams than ewes? Those then who have spongy teeth apparently resemble those who have fewer teeth.
- 2 Why is it that, though the teeth are stronger than the flesh, yet they are more sensitive to cold? Is it because they are closely connected with the pores, in which the heat, because it is small, is quickly overcome by the cold 25 and causes pain?
- 3 Why are the teeth more sensitive to cold than to heat, while the contrary is true of the flesh? Is it because the flesh partakes of the mean and is of moderate temperature, but the teeth are cold and therefore more sensitive to cold?² Or is it because the teeth consist of narrow pores in which the heat is scanty, so that they are quickly affected 30 by the opposite of heat? Now the flesh is warm, so that it is unaffected by the cold, but is quickly sensitive to heat; for it is a case of 'fire added to fire'.
- 4 Why is it that the tongue is indicative of many things? For in acute diseases it indicates fever by the presence³ of

¹ This is the same problem as that of x. 48, differently answered. The solution of the problem presented here is taken direct from *Hist. Anim.* 501^b 20 ff.

² Reading ψυχροῦ for ἐναντίου. The reading of the MSS., οἱ δὲ ὀδόντες ψυχροί, ὥστε τοῦ ἐναντίου (i. e. τοῦ θερμοῦ) μᾶλλον αἰσθητικοί, is quite impossible, since (1) the problem is discussing why the teeth are more susceptible to *cold*, (2) the flesh, being hot, is stated (in ll. 30, 31) to be more susceptible to heat, therefore the teeth, being cold, ought to be more susceptible to *cold*. The Latin version, which renders *rem frigidam sentire plenius possunt*, evidently translates ψυχροῦ.

³ Omitting καὶ before εἶν.

blisters upon it ; also the tongues of sheep are particoloured
 35 if the sheep are so. Is it because the tongue is capable of
 taking up moisture and is situated near the lungs, which
 are the seat of fevers? Now all things which are parti-
 coloured are so because their humours are particoloured,
 and that part first takes on colour through which the humour
 first passes ; and this is what happens to the tongue. Now
 blisters collect on the tongue because it is spongy ; for a
 40 blister is as it were an eruption which has not been con-
 cocted within.¹

964^a Why is it that the tongue becomes bitter and salty and 5
 acid, but never sweet? Is it because these qualities are
 corruptions and so the tongue cannot perceive its own real
 nature?

Why is it that the coloration of the tongue corresponds 6
 5 with that of the skin?² Is it because it is really an external
 part of the body, though it is enclosed in the mouth, and is it
 because the skin on it is thin that even a slight variegation
 of colour makes itself visible? Or is it because it is liquid
 that causes change of colour, and the tongue is most affected
 by what is drunk?

10 Why is it that one can emit both hot and cold breath 7
 from the mouth? For one can puff out cold breath and
 breathe out warm breath.³ That the breath is warm can
 be demonstrated by placing the hand near the mouth.⁴ Or
 is the air which is set in motion warm⁵ in both cases, but
 does he who puffs out breath not set the air in motion all
 at once but blow through a partly closed mouth, so that,
 15 though he emits but little breath, he sets up motion over
 a large area of the outer air, in which the warmth from his
 mouth is not apparent owing to its scantiness? But one
 who breathes out breath emits it all at once, and therefore
 it is warm. For it is characteristic of puffing out breath

¹ Cp. 965^b 16.

² This subject has been already dealt with as part of the problem of
 chapter 4 above.

³ Cp. 945^b 15 and note.

⁴ Putting a full stop after *χεῖρα*.

⁵ Reading *θερμός* (Ruelle) for *ψυχρός*.

to¹ pack the air into a particularly small space; whereas breathing out air is emitting it all at once.

8 Why is it that, if one expires violently and with all the breath at once, it is impossible to expire again? So too with violent inspiration, which cannot be repeated again immediately. Is it because expiration is a local dilatation, and inspiration a local contraction, both of which can be carried out within certain limits? Clearly, therefore, the two processes must be carried out one after another, but neither can be performed twice consecutively.

9 Why is it that, though there is one passage through which meat and drink pass and another through which we breathe, if we swallow too large a morsel we choke? In this there is nothing strange; for not only do we choke if something penetrates into this passage, but we choke still more if it be blocked. Now the passages through which we take food and through which we breathe are parallel to one another; when, therefore, too large a morsel is swallowed, the respiration is also blocked, so that there is no way out for the breath.

10 Why is it that men are very long-lived who have a cut right across the hand?² Is it because those animals which are badly articulated are short-lived and weak? As an instance of weakness we may take young animals, and of shortness of life the aquatic creatures. Clearly then those who are well articulated must be the opposite,³ namely, those in whom even those parts are best articulated which are by nature badly articulated. Now the inside of the hand is the least well articulated part of the body.

11 Why is it that, in deep breathing, when we draw in the breath the stomach contracts, but when we expire it fills out? Now the contrary of this might be expected to occur. Is it because in breathing the stomach is compressed downwards by the flanks and then appears to expand again, like bellows?

¹ Reading τὸ for τῶ, but the corruption is perhaps deeper, though the sense is clear.

² The so-called 'line of life'. The same problem is treated in a slightly different form in x. 49.

³ i. e. long-lived.

5 Why do we respire? Does the breath dissolve into fire, **12**
 just as the moisture dissolves into breath? The heat, then,
 of nature, when the greater part of the breath produces
 fire, causes pain and pressure upon the ducts; and that is
 why we emit the fire with the breath.¹ Now when the
 breath and fire go forth, the ducts contract and are
 10 cooled, and pain results; we therefore draw the breath in
 again. Then when we have opened the breath-ducts² and
 given them relief, fire is again engendered and we again
 feel discomfort, and therefore expel it and continue to do
 so indefinitely; just as we continually blink as the part
 15 round the eye cools and becomes dry. Also we walk
 without³ giving attention to the manner of our walking,
 the intellect by itself⁴ guiding us. In like manner, there-
 fore, we carry out the process of breathing; for we do so
 by contriving to draw in air, and then continue to draw
 it in.

¹ The Teubner text omits a whole line here by haplography and should read τὸ πῦρ <μετὰ τοῦ πνεύματος. ὅταν δὲ ἐξέλθῃ τὸ πνεῦμα καὶ τὸ πῦρ>, συμπιπτόνων κτλ.

³ Reading οὐ for οὐν with Bussemaker.

⁴ Reading αὐτῆς for αὐτοῖς, unless we suppose a lacuna after τῆς διανοίας αὐτοῖς.

BOOK XXXV

PROBLEMS CONNECTED WITH THE EFFECTS
OF TOUCH

- 1 WHY do we shudder more when some one else touches us than when we touch ourselves? Is it because the touch of a part of some one else has more power to produce sensation than that of a part of oneself, since that which is connected by growth with the sense-organ is imperceptible? Also anything which occurs unawares and suddenly is more ²⁵ frightening, and fright is a process of cooling; and both these qualities are possessed by the touch of another as contrasted with one's own touch. And, speaking generally, passive sensation is produced either solely by some one else or at any rate in a greater degree¹ than by oneself; as happens for example in tickling.
- 2 Why do we feel tickling in the armpits and on the soles ³⁰ of the feet? Is it owing to the thinness of the skin? And do we feel it most where we are unaccustomed to being touched, as in these parts and the ears?
- 3 Why is it that every one does not shudder at the same things?² Is it because, just as we do not all feel pleasure or pain at the same things, so we do not shudder at the same things? For the same sort of cooling process takes ³⁵ place.³ So some people shudder when a garment is torn, others when a saw is being sharpened or drawn through wood, others when pumice-stone is being cut, others when the millstone is grinding on stone.⁴
- 4 Why is it that, though the summer is warm and the winter cold, bodies are colder to the touch in summer than ^{965^a}

¹ Transposing ἡ μάλλον and ἡ μόνον (Richards). ² Cp. vii. 5.

³ i. e. when we shudder and when we feel pain.

⁴ i. e. when there is no grist in the mill. ὄνος is always used of the upper millstone.

in winter? Is it because perspiration and the act of perspiring cool the body, and this takes place in summer but not in winter? Or is it because cold and heat are
 5 driven inwards¹ inversely to the seasons,² and in the summer the cold takes refuge within and therefore causes perspiration to be given off, whereas in winter the cold keeps the perspiration in and the body vaporizes it, as does the earth?

Why do the hairs bristle upon the skin?³ Is it because
 5 they naturally stand erect when the skin is contracted,⁴
 10 and this contraction occurs owing to cold and certain other conditions?

Why is it that no one can tickle himself? Is it because
 6 one also feels tickling by another person less if one knows beforehand that it is going to take place, and more if one does not foresee it? A man will therefore feel tickling least when he is causing it and knows that he is doing so. Now laughter is a kind of derangement and deception (and
 15 so men laugh when they are struck in the midriff; for it is no ordinary part of the body with which one laughs⁵). Now that which comes unawares tends to deceive, and it is this also which causes the laughter, whereas one does not make oneself laugh.

Why is it that we feel tickling in particular on the lips?⁷
 Is it because the part which feels tickling must be situated
 20 not far from the seat of sensation? Now the lips are essentially in this position, and so of all parts of the head the most sensitive to tickling are the lips, which are fleshy, and therefore very easily set in motion.

Why is it that a man bursts out laughing if one scratches
 8 the region of his armpits, though he does not do so when

¹ For the doctrine of ἀντιπερίστασις see note on 867^a 32.

² i. e. cold drives heat inwards and vice versa; cp. 888^a 34 ff., where hot water is said to drive cold inwards.

³ The same problem occurs in viii. 12.

⁴ Reading σσπιάσωσι for σπιάσωσι, cp. 888^a 39.

⁵ Laughter being a contraction of the muscles of the midriff or diaphragm, which according to the Greeks enclosed the seat of intelligence.

any other part is tickled? And why does a man sneeze if he tickles his nostrils with a feather? Is it because these 25 parts are regions where the small veins are situated, and when these are cooled or undergo the opposite process¹ they become moist or dissolve² into breath as the result of the moisture? (Similarly, if one compresses the veins in the neck of one who is asleep, an extraordinarily pleasant sensation is caused.)³ And when the breath is engendered in greater abundance, we emit it in a single mass.⁴ Similarly also in sneezing, when we warm the moisture in the 30 nostrils and scratch them with a feather, we dissolve it into breath; and when the breath becomes superabundant we expel it.

9 Why is it that we often shudder after taking solid food? Is it because when food which is cold enters the body it prevails at first over the natural heat rather than vice 35 versa?

10 Why is it that an object which is held between two crossed fingers⁵ appears to be two? Is it because we touch it at two sentient points? For when we hold the hand in its natural position we cannot touch⁶ an object with the outer⁷ sides of the two fingers.

¹ i. e. become hot.

⁷ Reading *ἐκτός*, from T. G., for *ἐντός*.

BOOK XXXVI

PROBLEMS CONNECTED WITH THE FACE

965^b WHY is the face chosen for representation in portraits? **1**
Is it because the face shows best what the character of a
person is? Or is it because it is most easily recognized?

Why is it that one perspires most freely on the face, **2**
though it is far from being fleshy? ¹ Is it because parts
5 which are rather moist and rare perspire freely, and the
head has these characteristics? For it contains an abun-
dance of natural moisture; this is shown by the veins
which extend from it and the discharges which it produces,
and the fluidity of the brain and the numerous pores.
That there are numerous pores extending outwards is
10 shown by the presence of the hair. The perspiration
then comes not from the lower parts of the body but
from the head; and so one perspires most readily and
freely ² on the forehead, for it is highest in position and
moisture flows down and not up.

Why do eruptions occur more frequently on the face **3**
than elsewhere? Is it because this part contains rarities
15 and moisture? That this is so is shown by the growth of
hair on it and by its power of sensation; and an eruption
is as it were an efflorescence of unconcocted moisture.

¹ This problem occurs also in Bk. ii. 17.

² Reading *πρῶτον* *(καὶ)* *μάλιστα*, cp. 868^a 2.

BOOK XXXVII

PROBLEMS CONNECTED WITH THE WHOLE
BODY

- 1** WHY is it that, though the body is in a state of continual ²⁰ flux, and effluvia are given off from the excrements, the body is only lightened if it perspires?¹ Is it because the excretion in the form of effluvia is too little (for when liquid is transformed into air, much air is formed out of little liquid)? For what is excreted ² is more, which ²⁵ accounts for the excretion taking longer to begin.
- 2** And what is the reason of this? Is it because its exit takes place through smaller pores? For the viscous and the adhesive matter is expelled with the moisture because it mingles with it, but it cannot be expelled with the breath; and it is this thick matter in particular which causes pain. Therefore also vomiting lightens the body more than sweating, because that which is vomited, being thicker and ³⁰ more substantial, carries away this viscous matter with it. Or is there a further reason, namely, that the region in which the viscous and the adhesive matter is, is situated at a distance in relation to the flesh (and so it is difficult to make it change its position), but near to the stomach? For it is engendered either in or close to it; and therefore ³⁵ it is difficult to get rid of ³ it in any other way.
- 3** Why is it that friction produces flesh? Is it because heat has great power to increase what is in the body? For the bulk of what already exists in it becomes greater if the

¹ This and the following chapter are almost verbally identical with ii. 22, but the problem is here divided into two.

² i. e. in sweat.

³ Reading *δυσεξάγωγον* from 868^b 11.

body is in continual motion and if our internal humours are carried upwards and vaporized, and this occurs as
 966^a a result of friction; whereas in the absence of this, the body wastes away and decreases. Or is it because the flesh increases in bulk by nutriment¹ as the result of heat (for anything which is hot has the power to attract moisture, and the nutriment distributed in the flesh is moist and the flesh takes up moisture better by being rare, for the rarer a thing is the more it can absorb, like a sponge), whereas friction makes the flesh well ventilated and rare and prevents congestion in the body? Now if there is no congestion, there can be no wasting either; for atrophy and
 10 wasting are the result of conglomeration. But the better ventilated and the rarer and the more homogeneous the parts of the body are the more likely they are to acquire bulk, for they are better able to take up nutriment and to get rid of excrements, since the flesh must be rarefied and not densified in order to promote health.² For just as a city or
 15 locality is healthy which is open to the breezes (and that is why the sea too is healthy), so the body is healthier if the air can circulate in it than when it is in the contrary condition. For either there ought to be no excrement³ in the body, or else the body ought to be able to get rid of it as soon as possible and be in such a condition that it can reject the excrement as soon as it receives it and be always
 20 in a state of motion and never at rest. For that which remains stationary putrefies (standing water, for example), and that which putrefies creates disease; but that which is rejected passes away before it becomes corrupt. This then does not occur if the flesh is dense (the ducts being as it were
 25 blocked up), but it does happen if the flesh is rare. One ought not therefore to walk naked in the sun; for the flesh thereby solidifies and acquires an absolutely fleshy consistency; for the internal moisture remains, but the surface moisture is expelled in the form of vapour, just as in roast meat the inner portions are moister than in boiled meat.

¹ Reading τῆ τροφῆ (W. D. R.).

² 966^a 13-34 is almost verbally identical with 865^b 18-37 and 884^a 24-b7.

³ Reading μηδὲν <περίττωμα>, ἢ τούτου, cp. 865^b 21, 884^a 29.

Nor ought one to walk in the sun with the chest bare, for then the sun draws out the moisture from the best ³⁰ constructed parts of the body, which ¹ least require to be deprived of it; but it is rather the inner parts which need to be dried,² for, because they are remote, it is impossible to produce perspiration except by a violent effort; but it is easy to exhaust the moisture in the chest, because it is near the surface.

4 Why is it that, when we are chilled, the same heat causes ³⁵ more burning and pain?³ Is it because owing to its density the flesh holds the heat which comes into contact with it? This is the reason why lead becomes hotter than wool. Or is the passage of the heat violent because the body is congealed by cold?

5 Why does dry friction render the flesh solid? Is it ^{966^b} because heat is engendered by the friction and the moisture is used up? Furthermore, the flesh when rubbed becomes dense,⁴ and everything becomes denser and solider the ⁵ more it is rubbed. This can be seen in many examples; dough, for instance, and clay and similar substances, if you pour water into them and spread them out, remain moist and fluid, but, if you apply more friction, they quickly densify and solidify and become viscous.

6 Why does friction produce more flesh than running? Is ¹⁰ it because running cools the flesh and makes it less absorbent of nutriment, but part of the nutriment is shaken downwards, while the part on the surface,⁵ owing to the

¹ Reading *ἀ*, as in the parallel passage 865^b 34.

² Punctuating (as in the parallel passage 865^b 32-5) *οὐδὲ τὰ στήθη γυμνὰ ἔχοντα βαδίσειν ἐν ἡλίῳ· ἀπὸ γὰρ . . . ἀφαιρέσεως, ἀλλὰ μᾶλλον τὰ ἐντὸς ξηραντέον.*

³ i. e. than it would if we were not chilled. This chapter is almost verbally identical with viii. 19.

⁴ This is a direct contradiction of the doctrine of chapters 3 and 6 (^a 7, ^b 15), where it is stated that friction rarefies the flesh.

⁵ Reading *ἐπιπολῆς* [so too Bussemaker] for the meaningless *ἐπὶ πολλοῦ*, which probably arose from the dittography of the *λ* and the subsequent assimilation of the gender to that of *θερμοῦ*; cp. ^a 27 τὸ δὲ ἐπιπολῆς ἀπαλλάττεται ἑξατμιζόμενον.

exhaustion of the natural heat, becomes quite thin and is expelled in the form of breath? But the hand by friction
¹⁵ makes the flesh rare and able to take up nutriment. Moreover, the external contact, opposing by its pressure the natural impetus of the flesh, makes it compact and drives it back upon itself.

BOOK XXXVIII

PROBLEMS CONCERNING THE COLORATION 20
OF THE FLESH

- 1 WHY is it that the sun bleaches wax and olive oil, but darkens the flesh?¹ Is it because it bleaches the former by extracting the water from them (for that which is moist is naturally black owing to the admixture of the earthy element), whereas it scorches the flesh?
- 2 Why have fishermen reddish hair, and purple-fishers and 25 in short all who work on the sea? Is it because the sea is hot and full of dryness because it is salty? Now that which is of this nature, like lye and orpiment, makes the hair reddish. Or is it because they are warmer in their outer parts, but their inner parts are chilled, because, owing 30 to their getting wet, the surrounding parts are always being dried by the sun? And as they undergo this process, the hair being dried becomes fine and reddish. Furthermore all those who live towards the north have fine, reddish hair.
- 3 Why is it that running in clothing and anointing the body under the clothing with oil makes men pale skinned,² 35 whereas running naked makes them ruddy? Is it because ventilation produces a ruddy colour, while suffocation has the opposite effect and causes³ pallor, because the moisture on the surface is heated up and does not cool? Now perspiring in clothes and anointing the body under the clothing both have the same effect, namely, that the heat is enclosed. But running naked makes the flesh ruddy for 967^a the opposite reason, because the air cools the excrements

¹ Cp. below, chapter II.

² The same subject is dealt with in Hippocr. *de Diæt.* ii. 63 and Theophrastus *de Sudore*, § 39.

³ Reading *τοὐναντίον*, διὰ δέ.

which form¹ and ventilates the body. Further, the oil, which is moist and thin, being smeared over the body under the clothing and blocking up the pores, does not
5 allow either the moisture and breath from the body to escape or the external air to penetrate inwards. Therefore the moist excrements being choked in the body decay and produce pallor.

Why is it that the ventilation of the flesh makes it 4 ruddy? Is it because pallor is as it were a corruption of the flesh? When, therefore, the surface is moist and hot,
10 it becomes yellow unless it is cooled and gives off the heat in the form of breath.

Why is it that those who perspire are ruddy as a result 5 of their exercises, whereas athletes are pale? Is it because as the result of moderate exertion the heat is burnt up and comes to the surface, whereas by constant exertion it is
15 drained off with the perspiration and breath, the body being rarefied by exertion? When, therefore, the heat comes to the surface, a man becomes ruddy, just as he does when he is hot or ashamed; but when the heat fails, he is pallid. Now ordinary persons indulge in moderate exercise, whereas athletes are constantly training.

20 Why are men more sunburnt who sit still in the sun than 6 those who take exercise?² Is it because those who are in motion are as it were fanned by the breath owing to the movement of the air which they set up, whereas those who are sitting still do not undergo this process?

Why does the sun scorch, while fire does not? Is it 7
25 because the heat of the sun is finer and can penetrate farther into the flesh?³ Fire, on the other hand, if it does scorch, only raises the surface of the flesh by creating what we call blisters, and does not penetrate within.

967^b Why is it that fire does not make men black, whereas 8 the sun does so, and why does fire blacken earthenware,

¹ And so causes them to evaporate.

² Cp. Theophrastus, *de Igne*, § 36.

³ Cp. Theophrastus, *op. cit.*, § 38.

while the sun does not? Or do they produce their effects by dissimilar means, the sun blackening the flesh by scorching it and the fire permeating the earthenware with the soot which it sends up? (Now soot consists of fine ember-dust, 5 formed by the simultaneous breaking-up and burning of the charcoal.) The sun, then, makes men black, while the fire does not do so, because the heat of the sun is gentle and owing to the smallness of its parts it can scorch the flesh itself; and so, because it does not set the flesh on fire, it does not cause pain, but it blackens it because it scorches it. 10 Fire, on the other hand, either does not kindle at all or else penetrates within; for what is burnt by fire also becomes black, but it does not burn merely that part of the body in which the colour is situated.

9 Why do men become darker complexioned as they become older?¹ Is it because anything which decays becomes blacker, except mildew? And old age and decay are the same thing.² Further, since the blood when it 15 dries up becomes blacker, it is only likely that the older men are the darker they are; for it is the blood which naturally gives colour to our bodies.

10 Why is it that, of persons engaged in the preparation of cereals, those who handle barley become pale and are 20 subject to catarrh, while those who handle wheat are healthy?³ Is it because wheat is more easily concocted than barley, and therefore its emanations are also more easily concocted?

11 Why is it that the sun bleaches olive oil but darkens the flesh?⁴ Is it because it extracts the earthy element from the olive oil, and this, like the earthy element in wine, is 25 the black part of it? Now it darkens the flesh because it burns it; for that which is earthy always becomes black when burnt.

¹ Cp. 890^a 16 ff.

² Reading *ταὐτὸ* for *τοῦτο*.

³ This problem is identical with xxi. 24, where see note on 929^b 28; cp. also 863^b 1 ff.

⁴ The problem here dealt with is the same as that of chapter 1 above, but somewhat differently answered.

- Briers, 906^b 11.
- Bronze, 890^b 9; b. vessels resonant, 899^b 33.
- Bruises, Scars, and Weals, Problems connected with,* 889^b 10-891^a 5.
- Bruises, cures for, 890^a 25, ^b 7, 20.
- Bubbles, bases of, are white and throw no shadows, 913^a 19 ff.; why hemispherical, ^a 29 ff.; in boiling water, 936^b 2; in soup, ^b 36; air in b.s. not wet, 939^a 25.
- Bulls, effect of castration upon, 894^b 23, 897^b 26; sacred b.s., 938^a 1.
- Cabbage, prevents the ill effects of drinking, 873^a 37 ff.; useful as a purge, ^b 2.
- Caecias, see *North-East wind*.
- Calm, usually occurs at midday or midnight, 938^a 23; on high mountains, 944^b 12 ff.
- Caper-plant, does not grow on tilled ground, 924^a 1.
- Castration, effects of, 894^b 19 ff.; 897^b 26 ff.
- Catarrh, 929^b 27.
- Cauterization, χ surgery, 863^a 10; χ drugs, 863^a 19; as a cure for running at the eyes, 957^b 25.
- Celery, benefited by salt water, 923^a 6; method of cultivation, ^b 10.
- Chaeremon, tragic poet, quoted, 873^a 25.

INDEX

- Chaff, used for preserving fruit, 931^a 23.
- Chilblains, care of, 865^b 38 ff., 866^a 5 ff.
- Children, dislike wine, 872^a 2; have hot and moist temperaments, ^a 7; methods of communication, 895^a 13; phenomenon of speech in, 902^a 5 ff.; have shrill voices, ^a 32; hesitate in speech, ^b 16.
- Chill and Shivering, Problems connected with*, 887^b 10-889^b 7.
- Chill, makes the flesh livid, 887^b 10; prevents sleep, ^b 15, 889^b 4; affects stout persons most, 887^b 32; effect on the tongue, 888^b 7; effect on the hair, 888^a 39, ^b 16 ff.; prevented by anger, 889^a 15; caused by fear, ^a 24, 948^b 13; see also *Cold*.
- Choking, cause of, 964^a 25 ff.
- Chorus, c.-singers practise before taking food, 901^b 2, 904^b 3; consisting of free citizens, 913^b 20; songs of, antistrophic, 918^b 27; less imitative than actors, 918^b 29; large c. keeps better time, 919^a 36 ff., 922^a 30 ff.; modes suitable and unsuitable for tragic c., 920^a 8 ff., 922^b 10 ff.; function of, ^b 26.
- Circle, 'human life is a c.', 916^a 28.
- Cistern, 899^b 27.
- Clay, a cure for bruises, 890^a 26.
- Clazomenae, 875^a 35.
- Clock, water-c., 866^b 12, 868^b 23; phenomena connected with the, 914^b 9 ff.
- Cloud-winds, 940^b 30, 941^b 37.
- Cloudy weather hotter than clear, 937^b 33.
- Coat, shedding of, by animals, 893^a 4 ff., 898^a 33.
- Cold, effect of, on those who are ill, or in pain, or angry, 887^b 19 ff.; affects the extremities most, ^b 26; effect on the feet, ^b 29; athletes unable to bear c., 888^a 23; reason of c. at dawn, ^b 27, 938^a 32, 939^b 5; excessive cold causes brutishness, 909^a 13; c. climate makes men courageous, ^b 9, 910^a 39; see also *Chill*.
- Coloration of the Flesh, Problems connected with the*, 966^b 20-967^b 27.
- Coloration of the eyes, 892^a 1, 910^a 13.
- Cone, the vision has the form of a c., 872^a 37, 911^b 5, 16, 20; formed by the light of the sun through a rectangular hole, 912^b 15 ff.; movement of a c., 913^b 39 ff.
- Conjurer, 917^a 8.
- Consonants, 895^a 9.
- Contagiousness of diseases, cause of, 886^b 4 ff., 887^a 22 ff.
- Continence and Incontinence, Problems connected with*, 949^a 21-950^a 19.
- Continence, most praised in the young and wealthy, 949^b 20.
- Contraries, sometimes produce the same result, 874^b 36, 888^a 32; destroy one another, 889^a 6; mingling of, in music, 921^a 2; change into one another, 941^b 6.
- Cooking, effect of, on vegetables, 923^a 17, 21.
- Copper, 864^a 34; surgical instruments made of, 863^a 25 ff.; burns inflicted by, ^a 31; curative effects of, 890^a 27, ^b 20, 37.
- Corn, cut off by frost, 935^a 18; see also *Wheat, Barley*.
- Coughing, 891^a 8, 962^a 22; caused by scraping the ears, 960^b 35.
- Counting, by tens, 910^b 23 ff.; on the fingers, ^b 39; by fours, 911^a 2.
- Courage, Problems connected with Fear and*, 947^b 10-949^a 20.
- Courage, why so highly honoured, 948^a 31 ff.
- Courageousness of those who live in cold regions, 909^b 9.
- Cowardice of those who live in hot regions, 909^b 9, 910^a 38.
- Crocodiles' eggs, 926^a 9.
- Crow, does not change its colour, 891^b 16.
- Cucumber, 923^a 13, 925^b 31.
- Cultivated χ wild plants, 896^a 6, 924^a 18, 927^a 4.
- Cylinder, path described by, in motion, 913^b 37.
- Cypris, 896^a 24.
- Cyrene, 946^b 33.
- Dawn, reason of coldness at, 888^b 27, 938^a 32, 939^b 5.
- Deaf, the, speak through their nostrils, 899^a 4, 15, 962^b 35 ff.
- Deafness, 898^b 28, 960^b 37; often found with dumbness, 961^b 14.
- Death, a process of cooling, 874^b 1; as a penalty for theft, 953^a 3.

INDEX

- Defect, a cause of disease, 859^a 3.
- Defendant, position of, on the right hand in court, 951^a 15 ff.; wins if the votes are equal, 951^a 20 ff., 952^b 36.
- Deposit, robbery of a, more serious than of a loan, 950^a 28 ff., ^b 28 ff.
- Dew, 938^a 34, 939^b 36.
- Diameter, 910^b 11 ff., 19 ff.
- Dice, loaded, 913^a 35, 915^b 8.
- Diet, in disease, 863^a 34 ff., 865^a 35 ff., 866^a 8 ff.; in summer, 863^b 24, 885^a 2; reduction of, healthy, 864^b 36, 884^a 22; human d. moist rather than dry, 897^a 19, 36; effect of monotonous d., 928^a 33, ^b 23.
- Dionysius, the tyrant, 949^a 25.
- Dionysus, 953^b 31.
- Disease, due to excess or defect, 859^a 2; cured by excess, ^a 5, or by starvation, ^a 7; effect of the seasons on, 859^b 9 ff., 861^b 1 ff., 21 ff.; effect of the weather on, 859^b 21 ff.; contagiousness of, 886^b 4 ff., 887^a 22 ff.
- Disputations, as a mental exercise, 916^b 18 ff.
- Dithyrambs, 918^b 19.
- Divers, their ear-drums burst in the sea, 960^b 8 ff.; protect their ears with sponges, ^b 15 ff.; slit their ears and nostrils, ^b 20 ff.; use cauldrons as diving-bells, ^b 32.
- Dizziness, occurs in those standing rather than in those sitting, 885^b 35.
- Doctors, aim of treatment by, 956^a 28 ff.
- Dogs, prolific, 892^b 1, 898^a 13; change their coats, 893^a 4; bad-tempered after bearing young, 894^b 12; produce monstrosities, 898^a 12; Melitaean d.s, 892^a 21; wild in India, 895^b 25.
- Dog-star, 859^a 23, 941^a 37, ^b 3, 8, 944^a 4.
- Dough, 927^b 33, 38, 928^a 27, 929^a 6, ^b 18.
- Dreams, 956^b 39; cause of, 957^a 7, 23.
- Dropsy, 887^a 24; drunkards liable to, 871^b 25.
- Drugs, effect of, 863^b 40 ff., 864^a 3 ff., 23 ff., 865^a 3 ff.; χ surgery and cauterization, 863^a 19 ff.
- Drunkards, Drunken, the, cannot endure cold, 871^a 1 ff., ^b 33 ff.; the slightly d. more troublesome than the very d., 871^a 7 ff., 875^a 29 ff.; infertile, 871^a 23; why the d. tremble, ^a 27 ff., 874^b 22 ff.; often dropsical or rheumatic, 871^b 25; more sensitive to salty and bad water, 872^a 9 ff., 873^b 37 ff.; incapable of sexual intercourse, 872^b 15 ff., 875^b 39 ff.; easily moved to tears, 874^b 8 ff.; those who like sweet wine do not become d., 875^b 1 ff.; fond of the sun, ^b 5 ff., 34 ff.; voices of, broken, 904^b 1; deep voice of, 905^a 25.
- Drunkenness, Problems connected with the drinking of wine and,* 871^a 1-876^a 28.
- Drunkenness, 871^a 1, 876^a 28; effect on the vision, 872^a 18 ff., ^b 3 ff., 874^a 5 ff., ^b 9 ff.; more seriously affects those who take physical exercise, 873^a 13; ill effects prevented by taking cabbage, ^a 37 ff.; effect on the speech, 875^b 19 ff.; oil beneficial against, 876^a 26.
- Dumb, the, speak through their nostrils, 899^a 6, 17.
- Dumbness, 895^a 16, 898^b 32; often found with deafness, 961^b 14.
- Dwarfs, 892^a 6.
- Dysentery, 860^a 32, 861^b 4.
- Ear-drums, inflated by yawning, 960^a 38; of divers, burst in the sea, ^b 8 ff.; protected by sponges, ^b 15 ff.; oil poured into, 961^a 24.
- Ears, Problems connected with the,* 960^b 36-961^b 6.
- Ears, turn red from shame, 957^b 10, 960^a 36 ff., 961^a 8, ^b 31; slitting of, by divers, 960^b 21 ff.; scraping the e.s causes coughing, ^b 35; holes close up more quickly in left e., ^b 40 ff.; 'male' and 'female' e.s, 961^a 2; buzzing in, ^a 16; oil placed in e.s, to drive out water, ^a 18 ff.; closely connected with the lungs, ^b 13 ff.; see also *Hearing*.
- East wind (Apeliotes), 940^a 32, 943^b 33; begins in early morning, 944^a 20; origin of its name, 944^a 24; (Hellespontias), 946^b 33, 947^a 2.

INDEX

Echo, 899^a 24, ^b 30, 901^b 17, 904^a 38, ^b 28; higher than original sound, 918^a 35.

Eclipse of the sun, 912^b 11, 942^a 22.

Edible plants, 923^a 25 ff.

Eggs, as a cure for weals, 889^b 11; raw, will not spin round, 885^b 37; double-yolked, 898^a 17; of crocodiles, 926^a 9.

Egypt, cultivation of melons in, 926^b 5; S. wind does not blow in the maritime regions of, 945^a 21 ff.

Egyptians, bandy-legged, 909^a 27.

Elaterium, 864^a 5.

Elements, when pure show no variation, 960^a 31.

Elysian Plains, 943^b 22.

Emetics, 859^a 25.

Empedocles, on the pigmentation of the eye, 910^a 15; quoted, 929^b 16; on petrification, 937^a 15; afflicted by melancholy, 953^a 27.

Enslavement, accusation of, 951^b 2.

Enthymemes, 916^b 26, 29.

Epilepsy, 896^b 6, 953^a 16, 954^b 30; occurs only in man, 960^a 18.

'Epitrite', 920^a 36.

Equinox, 942^b 25, 30, 36, 943^a 2.

Ethiopians, have white teeth, but dark nails, 898^b 12; bandy-legged, 909^a 27.

Eunuchs, 879^b 8; vision of, 876^b 25; swollen legs of, ^b 31; physical peculiarities of, 894^b 19, 36, 895^a 35; do not suffer from varicocele, 894^b 39; have sore legs, 895^a 31; do not become bald, 897^b 23; have shrill voices, 900^b 15, 903^a 27, 906^a 3.

Euripides, quoted (lost play), 895^a 14, (*Cresphontes*) 957^b 11.

Eurus, see *South-East wind*.

Evil eye, 926^b 20 ff.

'Examples', 916^b 25.

Excess, a cause of disease, 859^a 2, 862^b 10.

Exercise, physical, effect on health, 865^a 1; increase of, healthy, 884^a 22; distends the body, 885^b 23; the voice shrill after violent e., 901^a 30; detrimental to the vision, 958^b 28.

Eyebrows, grow thicker with advancing years, 878^b 28.

Eyelashes, falling off of, 878^b 22.

Eyes, Problems connected with the, 957^a 36-960^a 33.

Eyes, the, position of during sexual intercourse, at death, and in sleep, 876^a 31 ff.; effect of sexual intercourse upon, ^a 36 ff., 880^b 8 ff.; anointed by childless women, 876^b 12; watering of e.s of riders on horseback, 882^a 3, 884^b 22; scars on e.s are white, 889^b 21; coloration of, 892^a 1 ff.; human, why near together, 892^b 4 ff.; effect of climate on colour of, 910^a 13 ff.; effect of various plants upon, 925^a 27 ff.; two e.s better than one, 957^b 5; become red from anger, 957^b 9, 961^a 9; do not feel cold, 959^b 15; sneezing stopped by rubbing, 957^a 38, 961^b 14, 962^a 25 ff.; the two e.s connected at their source, 957^b 19, 40; sometimes benefited by ophthalmia, 858^a 4; sight of two e.s equally acute, 959^a 20; various movements of, 957^b 35 ff.; causes of distortion of, 958^a 6 ff., 960^a 9, 13; effects of distortion of, 958^b 12; the e. is a fire, 959^b 18, 960^a 33; left e. more easily closed than right, 959^b 31; see also *Vision*.

Face, Problems connected with the, 965^b 1-17.

Face, the, perspires most freely, 867^a 23 ff., ^b 34 ff., 965^b 4 ff.; why chosen for representation in portraits, ^b 2 f.; eruptions on, ^b 14.

Fasting, makes sexual intercourse easier, 877^b 4 ff.; odour resulting from, 908^b 11.

Fat, consumed by exertion, 880^b 34, 37; not natural, 882^a 22; distribution of, on the body, 891^a 19.

Fatigue, Problems connected with, 880^b 15-885^b 11.

Fatigue, cures for, 863^b 19 ff., 881^a 4, 12; more f. caused to the arm from casting if the hand is empty, ^a 39 ff.; more f. caused by lying on a flat than on a concave surface, ^b 28 ff.; caused by short walks, ^b 37 ff., 884^b 8 ff.; persons of equable temperament liable to f., but easily throw it off, 883^b 11 ff.; felt less by the legs than by the thighs, ^b 14 ff.; cured by baths in summer, by anointing in winter, 884^b 36 ff.

INDEX

- Fatness, a condition of health, 888^a 30.
- Fear and Courage, Problems connected with*, 947^b 10-949^a 20.
- Fear, causes chill, 889^a 24, 903^b 12, 948^b 13; a process of cooling, 898^a 6; causes trembling, 947^b 12, 948^a 35, ^b 6; effect on the bowels, 869^a 3, 948^b 14, 19, 29, 35 ff.; effect on the heart, 947^b 29; causes thirst, ^b 20, 948^a 1, 7, ^b 13 ff.; makes men silent, ^b 20 ff.; causes urine to pass, ^b 36 ff.

- Females, smaller than males, 891^b 21; shorter-lived, 896^a 35; f. infants more likely to be born in damp districts, 909^a 32; naturally inferior to males, 951^a 12; have fewer teeth, 963^b 20; 'male' and 'f.' ear, 961^a 2.
- Fennel-stalks, 905^b 7, 19, 923^b 25; effect of blows from, 889^b 27, 32, 890^a 37.
- Fever, 859^b 6, 7, 10, 23, 861^b 33 ff., 862^a 18 ff., ^b 25, 32, 873^b 17, 874^b 18, 875^a 13, 887^a 24, 948^a 25; treatment of, 866^a 8 ff.; caused by dry S. winds, 946^a 4; the tongue as an indication of, 963^b 34; burning f.s more common in cold weather, 862^b 32 ff.; quartan f., 861^b 5, 866^a 31.
- Fifth (musical), 920^a 15; how obtained in wind instruments, 919^b 7 ff.; singing in f.s, 918^b 34 ff.; double f. not concordant, 920^a 24, 921^b 1; ratio of, 920^a 32, 921^b 3.
- Fig-tree, grafting on, 924^b 36 ff.
- Figs, 930^b 20, 32 ff., 39 ff.
- Fire, a greater f. overpowers a less, 860^b 18, 861^a 32, 874^b 5, 876^a 2, 880^a 21, 930^b 30, 931^a 19, 937^a 26, 961^b 31, 962^a 28; stimulates the passing of urine, 886^a 36; does not become corrupt, 939^b 27; the eye consists of f., 959^b 18, 960^a 33.
- Fishermen, have red hair, 966^b 25.
- Fishes, sexual intercourse of, 878^a 39; some f. have no bladder, 895^b 1.
- Flesh, Problems concerning the coloration of the*, 966^b 20-967^b 27.
- Flesh, the, should be rare rather than dense, 865^b 10 ff., 884^a 26 ff., 966^a 13 ff.; effect of friction on, 882^a 13, 965^b 36 ff., 966^b 1 ff., 10 ff.; nature of human f., 893^b 29 ff.; more sensitive to heat than to cold, 963^b 26; effect of running on, 966^b 10 ff.; darkened by the sun, ^b 21 ff., 967^b 23 ff.; cause of pallor in, 966^b 34 ff., 967^a 9, 13; cause of ruddiness in, 966^b 36 ff., 967^a 8 ff., 12 ff.; becomes blacker in old age, 967^b 13 ff.
- Flood, the, 910^a 35.
- Flour, wheaten, 927^a 23, ^b 15, 35, 928^a 6, 16, 35, 929^b 8, 35, 930^a 3; whitened by oil, 927^a 11 ff.
- Flowers, odour of, 906^a 31, ^b 23, 35, 907^a 20, 29, ^b 1, 908^b 37, 909^b 3, 950^a 16.
- Flute, 900^a 31, 918^a 23, 31, 919^b 4; used both by those who grieve and those who rejoice, 917^b 19; a more pleasant accompaniment to song than the lyre, 922^a 1; covers up the mistakes of the singer, ^a 15.
- Fomentations, 866^a 25.
- Food, not taken immediately after exercise, 883^b 33; effect of sweet f., 930^a 14, 24; see also *Diet*.
- Forerunners, the (winds), 939^b 11, 941^b 7, 946^a 16.
- Fourth (musical), 920^a 15; how obtained in wind instruments, 919^b 11 ff.; double f. not concordant, 920^a 24, 921^b 1; ratio of, 920^a 35.
- Friction, effect on the flesh, 882^a 13, 965^b 36 ff., 966^b 1 ff., ^b 10 ff.; more difficult to apply to the left than to the right leg, 884^a 16.
- Frogs, 862^a 11.
- Fruit, Problems connected with*, 930^a 5-931^a 32.
- Fruit, as an article of diet, 930^a 7; methods of preserving, ^b 1, 931^a 23; dried, 930^b 12; how to enjoy, ^b 20.
- Furniture, spontaneous noise made by, 902^a 36 ff.

INDEX

- Gall-stones, man alone suffers from, 895^a 37 ff.
- Garlic, 865^a 22, 903^b 29, 907^b 7, 908^a 28, ^b 4, 925^b 10, 926^a 3, 11, 16, 26, 949^a 6.
- Geometrical truths, contemplation of, gives no pleasure, 956^a 15 ff.
- Geryone* (play by Nicomachus), 922^b 13.
- Gestation, period of, 891^b 11, 25, 896^a 14, 898^b 10; varies in man, 895^a 24.
- Glass, 905^b 7, 18, 939^a 14.
- Gnomon, 912^a 40, ^b 7.
- Goats, milk of, 891^a 4; change of colour in, 891^b 13; prolific, 898^a 12.
- Gourds, grow well if buried, 923^b 16 ff.; keep fresh in wells, 924^a 36 ff.; methods of producing early, 924^b 10 ff.
- Grafting, 924^b 36 ff.
- Grapes, 909^a 21; dried sweeter than fresh, 925^b 15; stones of, ^b 24.
- Grass, 923^a 31.
- Green objects, beneficial to the sight, 959^a 24 ff.
- Growth, in different dimensions, 916^a 12 ff.
- Gruel, 929^b 1; see also *Barley-gruel*.
- Gums, inflammation of the, 863^b 11, 887^b 1.
- Hail, 940^a 13.
- Hair, growth of, at puberty, 876^b 33 ff.; men with thick h. are lustful, 880^a 34 ff., 893^b 10 ff.; cause of bristling of, 886^b 24, 888^a 39, ^b 16 ff., 889^a 26 ff., 965^a 8 ff.; does not grow on human scars, 890^b 38, 893^b 28, 894^a 13 ff.; turns grey through leprosy, 891^b 1, 894^b 6; grows harder if plucked out, 893^a 18; soft in northern, hard in southern people, ^a 31; softer when long, ^a 36; grows on scars upon animals, ^b 27, 894^a 12 ff.; distribution of, in man and animals, 896^b 29 ff., 898^a 20 ff.; turns white in man only, ^a 31 ff.; curliness of, 909^a 30, 963^b 11 ff.; reddish, of those who work on the sea, 966^b 25 ff., of those who live in the north, ^b 33.
- Halo, solar, 912^b 34.
- Hare, prolific, 892^b 1.
- Head, the, sores on, 861^a 33, 909^a 35; effect of running on, 881^b 7; movement of, by animals, 892^b 19; some animals live after their h.s have been cut off, 898^b 21; the most divine part of man, 962^a 23, 35.
- Health, a state of rest, 886^b 6; fatness a condition of h., 888^a 30; not communicable to others, 951^a 4 ff.
- Hearing, often defective from birth, 898^b 28; has the same source as the voice, ^b 29; better in those who hold their breath, 903^b 34, 904^b 11; prevented by yawning, 902^b 9 ff., 904^a 16 ff.; see also *Ears*.
- Heart, the, not controlled by the mind, 882^a 35; effect of fear upon, 947^b 29.
- Heat, lack of, causes old age, 875^a 13; feeds on moisture, ^a 14; the cause of motion in animals, ^a 25; excessive h. causes brutishness, 909^a 13.
- Heavenly bodies, nine in number, 910^b 35; appear always to retain the same shapes, 911^a 5 ff.
- Hellebore, 864^a 4.
- Hellespont, 946^b 34, 38.
- Hellespontias (East Wind), 946^b 33, 947^a 2.
- Hemlock, effects of, 874^b 2.
- Heracles, affected by melancholy, 953^a 14.
- Heraclitus, 908^a 30, 934^b 34.
- Herbs, 923^a 32.
- Hesiod, quoted (*Works and Days*, 582, 586), 879^a 28, (*ib.* 40) 892^a 29.
- Hesitation in speech; see *Speech*.
- Hiccups, cause of, 963^a 39; stopped by sneezing, 961^b 9 ff., 963^a 38 ff.; stopped by vinegar, 961^b 20, 962^a 1, 963^b 6; other preventives, 962^a 1 ff., ^b 31 ff.
- Hoar-frost, 888^b 30, 938^a 34, 939^b 36, 940^b 8.
- Homer, quoted (*Il.* v. 75), 890^b 9; (*Od.* xx. 71) 894^b 34; (*Il.* vii. 64) 934^a 14; (*Od.* iv. 567) 943^b 23; (*Il.* vi. 200-2) 953^a 23; (*Od.* xix. 122) ^b 12.
- ‘Homophony’, less pleasant than ‘antiphony’, 921^a 7 ff.; produces only a simple sound, ^a 12.

INDEX

- Honey, 890^b 25; mixed with flour, 928^a 5.
- Hoofs of animals, gelatinous matter in, 935^b 38.
- Horned animals, less hairy, 898^a 24.
- Horse-back, riders on, water at the eyes, 882^a 3, 884^b 22.
- Horse-parsley, 923^a 34, ^b 8.
- Horses, 893^b 27, 894^a 12, 896^b 10, 897^b 35, 898^a 11, 33, ^b 6; period of gestation in, 891^b 28; colour of eyes of, 892^a 1; wild, 895^b 25.
- Hunger, not felt immediately after exercise, 884^a 1; stimulated by recollection, 886^a 33; ravenous, in cold weather, 887^b 38 ff.; more tolerable than thirst, 949^b 26, 32.
- Hypate*, 918^a 14, 17, 919^b 9, 12, 921^a 10, 21, 24, 922^b 4; easy to sing, 917^b 35; stopped down produces *nete*, 918^b 1; is double *nete* (in length of string), 919^b 1; is half *nete* (in frequency of pitch), 920^a 30; effect of *h.* produced by stopping down *nete*, 919^b 15, 921^b 14; one of the extremities of the scale, 922^a 27.
- Hypodorian mode, unsuited for tragic chorus, 920^a 8, 922^b 10 ff.; characteristics of, ^b 15 ff.
- Hypophrygian mode, unsuited for tragic chorus, 920^a 8, 922^b 10 ff.; has a character of action, ^b 13.
- Imitation, in music, 918^b 17; by actors, ^b 28; of parents by young, 894^a 30.

- Infertility, of drunkards, 871^a 23 ff.; caused by varicocele, 878^b 36 ff.
- Inflammation, cured by salt and vinegar, 889^b 19.
- Injustice, varying degrees of, 952^a 22 ff.; in respect of money, ^a 20, ^b 23.
- Instruments, wind, 919^b 3; importance of *mese* in tuning, 919^a 14 ff., 920^b 7 ff.; see also *Flute*, *Lyre*.
- Intelligence and Wisdom, Problems connected with Prudence*, 953^a 8–957^a 35.
- Intelligence, use of the, 955^b 26 ff.
- Interval, musical, 917^b 32, 36; see also *Fifth*, *Fourth*, *Octave*.
- Jars, buried, cause resonance, 899^b 25 ff.; two, one full and the other half full, give an accord in the octave, 922^b 35 ff.; capacity of, 938^b 14 ff.
- Journeys, unfamiliar, seem longer, 883^b 3 ff., 955^b 9 ff.
- Jumpers, weights held by, 881^b 4.
- Justice and Injustice, Problems connected with*, 950^a 21–953^a 7.
- Justice, association with, makes men just, 951^a 5 ff.
- Kidneys, 876^b 20.
- Knees, strain on, in ascending, 882^b 25 ff.
- Lacedaemonian, 953^a 19.
- Lame, the, are lustful, 880^b 5.
- Lameness, more common in man than in the animals, 895^a 20 ff.
- Language, 898^b 30, 35.
- Larynx, 901^a 2, ^b 11, 903^a 34, ^b 29, 906^a 1.
- Laughter, a deep sound, 900^a 21, ^b 7; more difficult to restrain among friends, 950^a 17 ff.; nature of, 965^a 14 ff.; caused by tickling, 965^a 23 ff.
- Laws, originally sung, 919^b 38.
- Lead, 889^a 13.
- Leeks, make the voice loud, 903^b 27; cannot endure salt water, 923^a 7.
- Left side of the body, more comfortable to lie upon, 886^a 15 ff.; moister and hotter than the right, 961^a 3 ff.; inferior to right except in the senses, 958^b 16, 23, 959^a 20, 960^a 29.
- Legs, sores on, 861^a 34, 895^a 31, 909^a 36; of eunuchs, swollen, 876^b 31; feel fatigue less than the thighs, 883^b 13 ff.
- Lentil-soup, 936^b 24.
- Leopards, never tame, 895^b 26.
- Leprosy, 887^a 34; white l., 891^a 26; found only in man, 894^a 37; turns hair grey, 891^b 1, 894^b 6.
- Lesbos, 946^b 34, 947^a 4.
- Letters, use of, in speech, 895^a 8, 905^a 32.

INDEX

- Libya, 906^b 19, 933^b 33; sheep in, 896^a 26; winds in, 942^a 8, 14, 945^b 35.
- Lice, 861^a 10 ff., 924^a 9.
- Lichanos*, 919^a 17.
- Life, 'human l. is a circle', 916^a 28 ff.
- Light, cannot penetrate through dense objects, 904^b 15 ff., 939^a 10 ff.; travels farther and quicker than sound, 904^b 16 ff.
- Lily, 926^a 2.
- 'Line of life', 896^a 37 ff., 964^a 33 ff.
- Lion, 950^a 12; not prolific, 892^b 2; never tame, 895^b 26.
- Lip, trembling of lower, 948^a 36, ^b 1, 7; sensitive to tickling, 965^a 18 ff.
- Lips, see *South-West wind*.
- Lispings, 902^b 23 ff., 903^b 23 ff.
- Literary Study, Problems connected with*, 916^b 2-917^b 16.

- Loaves, whiter when cold, 927^a 27 ff.; heavier without salt, ^a 35 ff.; do not cohere when cold, ^b 7 ff.; twice-baked, do not become hard, 928^a 11 ff.; see also *Bread*.
- Locality, Problems connected with the effect of, on Temperament*, 909^a 13-910^b 9.
- Longevity, causes of, 909^b 1, 25, 34; indicated by the 'line of life', 896^a 37 ff., 964^a 33 ff.
- Lye, 863^b 17, 887^b 7, 966^b 28.
- Lying, in a curved position, recommended by physicians, 885^b 27 ff.; on right side induces sleep, 886^a 3 ff.
- Lymph, 891^a 18.
- Lyre, 918^a 23, 31, 922^b 16; less pleasing than flute as accompaniment to solo, 922^a 1 ff.; Phoenician, 918^b 8.
- Lyrical character of early tragedies, 920^a 12.
- Lysander, a victim of melancholy, 953^a 19.
- Macedonia, 954^b 32.
- Madness, due to black bile, 860^b 23.
- 'Magadizing', 919^a 1, 921^a 13, 29.
- Magnesia, sheep in, 896^a 26; hot waters in, 937^b 7, 11.
- Males, larger than females, 891^b 21; longer-lived, 896^a 35; deeper-voiced, 901^b 28; naturally superior, 951^a 12; have more teeth, 963^b 20; 'm.' and 'female' ears, 961^a 2.
- Man, sneezes more than other animals, 897^a 1 ff., 962^b 8 ff.; the most unjust of the animals, 950^b 32; has most wisdom of the animals, 955^b 4; reasons for his superiority, 956^a 11; inconsistency of his thought and action, 956^b 33; alone liable to gall-stones, 895^a 57 ff., to distortion of vision, 960^a 9, 10, to epilepsy, ^a 18.
- Maracus, the Syracusan, 954^a 38.
- Marine animals, well nourished, 897^b 14.
- Marjoram, 924^a 37, 958^b 8; put in wine, 926^b 32.
- Market-place, theft from the, 952^a 18.
- Marshes, effect of living among, 909^a 35, ^b 2, 37, 910^a 2; subterranean roarings in, 937^b 38 ff.
- Masks, tragic, 958^a 17.
- Mathematical Theory, Problems connected with*, 910^b 11-913^a 16.
- Mead, 872^b 26, 974^b 11.
- Meat, ways of preserving, 930^b 1.
- Medicine, Problems connected with*, 859^a 1-866^b 6.
- Medicine, not administered just after exercise, 883^b 33; see also *Drugs*.
- Melancholic (atrabilious), effect of wine upon the, 873^a 32; the m. suffer from sleeplessness, 874^b 18; m. diseases, 878^b 38; the m. particularly inclined to sexual intercourse, 880^a 30; those who hesitate in their speech are m., 903^b 19; m. humours, 916^b 6, 917^a 22; the m. temperament, possessed by many eminent men, 953^a 10 ff., characteristics of, ^b 23 ff.; the m. start in their sleep, 957^a 33.
- Melitaean dogs, 892^a 21.
- Melons, cultivation of, 926^b 4 ff.
- Memphis, 945^a 22.
- Menstruation, 891^a 31, 35, 895^a 34, 896^a 29.

INDEX

- Mese*, 918^a 38, 39, 919^a 11, 922^b 6; importance of *m.* in tuning instruments, 919^a 14 ff., 920^b 7 ff.; occurs most frequently of all notes, 919^a 19, 26; why so called, ^b 20, 922^a 21; the highest note in the tetrachord, 920^a 21; ratio of *nete* to *m.*, ^a 31.
- Messina, Straits of, 932^a 5.
- Milk, 891^b 4, 929^a 31.
- Millstone, 964^b 37.
- Mint, cooling effect of, 923^a 10.
- Mirror, 915^b 30.
- Mixolydian mode, 922^b 22.
- Modes of music, 918^b 22; Hypodorian, 920^a 8, 922^b 10 ff.; Hypophrygian, 920^a 8, 922^b 10 ff.; Mixolydian, 922^b 22; Phrygian, ^b 21.
- Moisture, naturally carried downwards, 904^b 27.
- Money, injustice in respect of, 950^a 24 ff., ^b 23 ff.
- Monstrosities, 878^a 20, 898^a 9; their cause, ^a 14 ff.
- Moon, appearance of, at eighth day, 911^b 28 ff.; appearance when half full, ^b 35 ff.; reason of flat appearance of, 912^a 28 ff.; casts longer shadows than the sun, 912^b 4 ff.
- Moral character, in music, and its nature, 919^b 26 ff., 920^a 2 ff., ^b 32 ff.
- Motion, movement, in animals, caused by heat, 875^a 25; usually produces heat but sometimes has a cooling effect, 884^b 12; disease a state of *m.*, 886^b 5; of head in animals, 892^b 19; the sun a cause of *m.*, 899^b 21.
- Mouth and the parts therein, Problems concerning the*, 963^b 16-964^b 19.
- Murder, of woman worse than of man, 951^a 11 ff.; accusation of, ^b 2.
- Music, Problems connected with*, 917^b 19-923^a 3.
- Music, familiar *m.* more pleasing, 918^a 3 ff., 920^a 32; moral character of, 919^b 26 ff., 920^a 2 ff., ^b 32 ff.; reason of pleasure caused by, ^b 29.
- Musicians, 916^b 35; their aim is to give pleasure, ^b 37.
- Myrrh, 906^a 25.
- Myrtle, berries, 925^b 13, 23, 931^b 7; branches, methods of preserving, 926^a 33; trees, 927^a 3.
- Narcissus, 925^a 19.
- Narratives, concentrated *n.s* give more pleasure than diffuse, 917^b 8 ff.
- Nasturtium, 925^a 30.
- Navel, size of, in man and the animals, 896^a 12 ff.
- Necks, some animals are without, 892^b 20.
- Neocles, 956^a 12.
- Nervous, the, their feet but not their faces perspire, 868^b 34 ff., 869^b 4 ff.; their voice trembles, 902^b 30, 906^a 13; their voice is deep, 902^b 36, 905^a 5; their heat travels upwards, 903^a 1.
- Nervousness, increases hesitancy of speech, 903^b 7; makes the voice shrill, ^b 11; a kind of shame, 905^a 8; in singers, 906^a 17.
- Nete*, 917^b 31, 918^a 14, ^b 1, 919^b 9, 13, 920^a 17, 921^a 10, 23, 922^b 4; is half *hypate* (in length of string), 919^b 1; is double *hypate* (in frequency of pitch), 920^a 30; when *n.* is stopped down, *hypate* seems to sound, 919^b 15, 921^b 14; ratio of *n.* to *mese*, 920^a 31; the most violent note, 921^b 35; one of the extremities of the scale, 922^a 27.
- 'Nomes', 918^b 13; why so called, 919^b 38.
- North, dwellers in the, have fine, red hair, 966^b 33.
- North-East wind (Caecias), attracts the clouds to itself, 940^a 18 ff., 943^a 32 ff.
- North wind, brings cold, 939^b 18, 945^b 2; dispels cloud, 939^b 20; occurs at fixed times, 940^a 35, 941^b 38; ceases to blow at night on the third day, 941^a 21, ^b 34; frequency of, 941^a 27, 944^a 36; cannot change to the wind on its right, 941^b 12; is strong when it begins, weak as it ceases, 944^b 30, 945^a 8, 27; causes hunger, 945^a 18; follows quickly upon south wind, ^b 5; keen during the day, but falls at night, 947^a 28; effects of, in winter, ^b 4 ff.

INDEX

- Nose, Problems connected with the*, 961^b 9-963^b 16.
- Nose, the, bleeding at, 891^a 13, 962^a 17; the deaf speak through, 899^a 4, 15, 962^b 35 ff.; closely connected with the lungs, 961^b 17; cartilage of, 963^b 14.
- Note, scale of seven n.s., 918^a 13, 919^b 22, 920^a 16, 922^a 22; scale of eight n.s., 919^b 21, 922^a 21; n.s. compared with angles, 918^a 20; low n.s. more conspicuous if out of tune, 919^a 29; easier to pass from a high to a low than from a low to a high n., 920^a 19 ff.; a low n. nobler than a high, ^a 23; sound shrillest in the middle of a n., ^a 38; a high n. requires more effort, ^b 16; lower of two n.s. in a chord more suited to melody, 922^b 28.
- Numbness, cause of, 886^a 10.
- Nuts, 930^b 15.
- Octave, 918^a 17, ^b 3, 919^b 3, 13, 921^a 12, 14, 29, 31; accord in the o. gives the effect of unison, 918^b 7; alone used in singing, 918^b 40; the most beautiful of all accords, 920^a 27; in 'antiphony', 921^a 8; produced by two jars, one full and the other half full, 922^b 35 ff.; or by two wine-skins, one double the size of the other, 923^a 2 ff.; double o., how obtained in wind instruments, 919^b 5; is concordant, 920^a 25; the ratio of the o., 921^b 7.
- Odour, Problems connected with things of pleasant*, 906^a 23-907^b 19; *Problems connected with things of unpleasant*, 907^b 20-909^a 10.
- Odour, of persons after puberty, 877^b 21 ff., 879^a 22; of flowers, 906^a 31, ^b 23, 35, 907^a 20, 29, ^b 1, 33, 908^b 37, 909^b 3, 950^a 16; of trees, affected by the rainbow, 906^a 36 ff.; of things in motion is stronger, 907^a 5, 908^b 8; of urine, 907^b 21, 908^a 28; of animals, unpleasant, except the panther, 907^b 35; of perspiration, 908^a 2, ^b 27, 909^a 5, 926^b 17; of the breath of the deformed, 908^b 29; o.s. are less perceptible in winter, 907^a 8; are smoke or vapour, 907^a 29; unpleasant o.s. not perceived in eating, ^b 27; rendered more unpleasant by heat, 908^a 20; see also *Perfumes*.
- Oeta, Mt., 953^a 18.
- Offspring, resemblance of, to parents, 891^b 32.
- Oil, olive oil, 863^b 22, 865^a 11, 925^b 3, 927^a 12, 28, 929^a 12, 932^b 23, 936^a 12, 959^b 12, 966^b 35, 967^a 3; beneficial against drunkenness, 876^a 26; mixed with water stops fatigue, 881^a 4; contains heat, 884^b 39; used to expel water from the ears, 961^a 18 ff.; poured into the ears of divers, ^a 24 ff.; bleached by the sun, 966^b 21 ff., 967^b 23 ff.
- Old age, due to lack of heat, 875^a 13; long sight in, 959^b 39; flesh becomes blacker in, 967^b 13 ff.
- Olympic victory, 956^a 19.
- Onions, 924^a 31, 925^a 19, 27, 926^a 11, 16, 32, 958^b 7.
- Ophthalmia, 859^b 23 ff., 860^a 21; dry o., 860^a 30; why contagious, 887^a 22 ff.; sometimes beneficial to the eyes, 958^b 4.
- Optics, treatises on, 913^a 27, 959^b 2.
- Orator, 916^b 35, 917^a 10; aim of the, 917^a 1; inferior to the philosopher, 917^a 3, 956^b 6; deals with the particular, 917^a 4, 956^b 8.
- Orchard-watcher, 938^a 16.
- Orchestra of a theatre, 901^b 30.
- Orchomenus, 926^b 5.
- Organisms engendered in the body by corruption, 924^a 8.
- Orion, 859^a 23; causes changeable weather, 941^b 24.
- Orpiment, 966^b 28.
- 'Orthian Songs', 920^b 20.
- Oxen, do not cough, 891^a 9; do not change their coats, 898^a 33.
- Oxymel, 922^a 6.
- Paesus, Lake of, peculiar properties of its waters, 935^b 34.
- Pain, caused by a fire to the chilled, 888^b 39.
- Painters, primitive, 895^b 37; represent rivers pale yellow, the sea blue, 932^a 31.
- Pan-pipes, 919^b 8.
- Panther, pleasant odour of, 907^b 35.
- Paramese*, 922^b 6.
- Paranete*, 917^b 39, 918^a 38.

INDEX

Parhelion, 912^b 27.
Parhybate, the voice breaks most on, 917^b 30; difficult to sing, ^b 35.
 Parmenon, the actor, 948^a 3.
 Particles, connecting, 919^a 22.
 Partridges, 903^b 28.
 Pea-soup, 936^b 24.
 Penalties, for theft, 932^a 17, 953^a 3; for assault, 953^a 4.
 Pennyroyal, 925^a 19.
 Pentathlon, 881^b 4.
 Pepper, as a drug, 864^b 12, 17.
Per accidens χ *per se*, 898^b 37, 906^b 5.
 Perfumes, burnt, less perceptible near at hand, 906^a 23, 30, ^b 35, 907^a 24; burnt on ashes, more pungent, 907^a 13, 35; made from flowers, 909^a 3.
Perspiration, Problems connected with, 866^b 9-870^b 38.
 Perspiration, when caused, 866^b 7 ff.; why not caused under water, ^b 15 ff.; why salty, ^b 19 ff.; why freer on the upper part of the body, ^b 28 ff.; why produced freely by exercising the arms only, ^b 33 ff.; why less odorous from head than from body, 867^a 4 ff.; why more copious after a rest, ^a 8 ff., 868^a 15 ff.; why freer on the clothed than the naked, 867^a 18 ff.; why freest on the face, ^a 23 ff., ^b 34 ff., 965^b 3 ff.; why most copious if heat is applied gently, 867^a 28 ff.; why more copious if a scraper is used, ^b 4 ff.; effect of rue upon odour of, ^b 8 ff.; why freer on back than front, ^b 12 ff.; why freer during sleep, ^b 31 ff., 869^a 13 ff.; what is the cause of vomiting after p., 868^a 5 ff.; why freest on head and feet, ^a 10 ff.; why freer after than during exertion, 868^a 15 ff., ^b 12 ff.; why more necessary in summer than in winter, ^a 26 ff., 869^b 32; why does p. lighten the body, 868^a 35 ff., 965^b 20 ff.; why less free if one eats as well as drinks, 868^b 29 ff.; why do the nervous perspire on the feet and not on the face, ^b 34 ff., 869^b 4 ff.; how can the face be red without perspiring, 869^a 8 ff.; in vapour baths, ^a 19, ^b 20; why healthier

to perspire naked than clothed, ^a 24 ff.; hot p. healthier than cold, 870^a 15 ff., 959^b 25; less free in front of a large fire, 870^a 21 ff.; freer in the clothed, ^a 26 ff.; freer in those walking up hill, ^a 32 ff.; freer in summer, ^b 6 ff.; spontaneous inferior to artificial, ^b 14 ff.; less free in winter, ^b 27 ff.; odour of, 908^a 2, ^b 27, 909^a 5, 926^b 17.
 Philosopher, superior to orator, 917^a 3, 956^b 6; deals with the general rather than the particular, 917^a 4, 5, 956^b 7.
 Philoxenus, 950^a 3.
 Phlegm, 860^a 25, 30, ^b 3, 10, 880^a 24, 891^a 12, 901^a 2, 906^a 2, 908^b 15; diseases due to, 878^b 14.
 Phoenician lyre, 918^b 8.
 Phrygian mode, 922^b 21.
 Phrynichus, 920^a 11.
 Phthisis, 860^b 1; emission of semen during sleep by sufferers from, 884^a 6; why contagious, 887^a 22.
Physical Problems, Summary of, 891^a 6-898^b 25.
Physics, the, of Empedocles, 929^a 16.
 Pigs, prolific, 892^b 1, 898^a 12; does not shed its coat, 893^a 4; bad-tempered after bearing young, 894^b 13; compared with wild boar, 896^a 23.
 Plague, why contagious, 859^b 15 ff.
 Plaintiff, advantages of, in a suit, 951^a 27.
 Plane-tree, 912^b 12.
 Plants, wild χ cultivated, 896^a 6 ff., 924^a 18; stones dislodged by, 902^b 2; contain no excretion, 908^a 10; roundness of stems in, 915^a 29 ff.; growth of, 916^a 12 ff.; cooking of, 923^a 17, 21; edible and inedible, ^a 25 ff.; annual and biennial, ^a 33; time to water p.s., 924^b 15 ff.; effect of watering, 926^a 21 ff.
 Plaster, fresh p. gives resonance, 899^b 18.
 Plato, a victim of melancholy, 953^a 27; his answer to Neocles, 956^a 12.
 Pleiads, 859^a 23, 861^a 20.
 Pleurisy, drunkards liable to, 871^a 3, ^b 33.
 Poet, 954^a 39.

INDEX

- Poetry, 953^a 11.
- Pomegranate, 923^a 14, ^b 25.
- Pontus, corn in, 909^a 19; extreme variations of temperature in, 938^a 37.
- Porridge, 863^b 6.
- Portents, 902^a 8.
- Positions assumed in lying down and in other postures*, 885^b 12-886^a 21.
- 'Posterior', meaning of, 916^a 18 ff.
- Poultices, 863^a 6, 864^b 32.
- Poverty, more common among the good than among the bad, 950^b 9 ff.
- 'Prior', meaning of, 916^a 18 ff.
- Professions, honourable χ mean, 917^a 6 ff.
- Property, law-suits regarding, 951^b 9.
- Proportions of the human body and their relation to longevity, 898^a 37 ff.
- Proverbs quoted, 938^b 10, 941^a 21, 942^b 2, 943^a 25, 33, 945^a 8, 28, 36, ^b 3, 947^a 7.
- Prudence, Intelligence, and Wisdom, Problems connected with*, 953^a 8-957^a 35.
- Prudent, the, acquire rather than spend, 956^b 37.
- Pumice-stone, noise of cutting p. causes shuddering, 886^b 11, 939^a 38; porosity of, 964^b 38.
- Pumpkins, 923^a 14; grow well if buried, ^b 16 ff.; keep fresh in wells, 924^a 36 ff.
- Purse-tassels, 926^a 6, 19.
- Purslane, 863^b 11, 887^b 1.
- 'Pycnon', 922^b 7.
- Pygmies, 892^a 12.
- Pythagoreans, 910^b 37.
- Quadrupeds, hair of, 896^b 30; do not sneeze, 897^a 10; small q.s produce monstrosities, 898^a 9.
- Quartan fever, 861^b 5, 866^a 31.
- Radishes, 890^a 25, 908^b 3, 923^b 37; cultivation of, 924^a 24 ff.
- Rainbow, its effect on trees, 906^a 37; due to refraction, 906^b 7.
- Raisin-wine, 926^b 38.
- Rams, 963^b 21; their hides, 889^b 11; effect of castration upon, 894^b 23.
- Reading, keeps some awake and sends others to sleep, 916^b 2 ff. 917^a 18 ff.
- Recitation with musical accompaniment, 918^a 10.
- Recollection, a cause of sympathetic action, 886^a 33, 887^a 6; gives an impulse to sexual desire and hunger, 886^a 34.
- Rectilinear figure, 910^b 11, 19.
- Refraction, of light, 906^b 7, 912^b 30; of sound, 899^a 25, ^b 22, 901^b 19, 22, 904^a 38, ^b 30.
- Respiration, rhythmical, of runners, 882^b 1 ff.; see also *Breathing*.
- 'Reticulum', the, 895^b 20.
- Revolutions of unevenly weighted objects, 913^a 33 ff., 915^b 6 ff.
- Rhetorical displays, 916^b 25.
- Rheumatism, drunkards liable to 871^b 25.
- Right side of body, easier to sleep on, 886^a 3, 16; the more active, ^a 7; superior to the left except in the senses, 958^b 16, 23, 959^a 20, 960^a 29; more easily set in motion, except the eye, 959^b 31; less moist and hot than the left, 961^a 3 ff.
- Roll (of a book), 914^a 25 ff.
- Roses, scent of, 907^a 20, 909^b 3, 950^a 16; perfume made from, 908^b 3.
- Roundness, of parts of animals and plants, 915^a 25 ff.; of extremities, 915^b 33 ff.
- Rue, 867^b 8, 926^b 16; grows best if grafted on a fig-tree, 924^b 35 ff.; a remedy against the evil eye, 926^b 20 ff.
- Runners, use of arms by, 881^b 4 ff.; rhythmical respiration of, 882^b 1 ff.; shock to r.s when stopped suddenly, 885^a 6 ff.
- Running, effect on the head, 881^b 7; effect of violent r., 882^a 29; more liability to fall while r. than walking, ^b 22; why more difficult than walking, 883^b 37; colder than standing in the winter, 888^b 21; produces less flesh than friction, 966^b 10 ff.
- Salamis, the battle of, 956^a 20.
- Salt, effect of, on the gums, 863^b 11, 887^b 1; a cure for inflammation, 889^b 19; crackling of, in the

INDEX

- fire, 902^a 1 ff., 904^a 4, 13; makes bread lighter, 927^a 35 ff.; melts more freely in salt water than in fresh, 934^a 1 ff.
- Salt Water and the Sea, Problems connected with*, 931^a 35-936^a 10.
- Salt water, drunkards sensitive to, 872^a 9 ff., 873^b 37 ff.; suits celery, 923^a 6; warmer than fresh, ^a 39 ff.; dries quicker than fresh, ^b 25 ff.; combustible, 933^a 17 ff., 935^a 5 ff.; drinkable when heated, 933^b 12 ff.; does not flow readily, 933^b 22 ff.; see also *Sea*.
- Sand, 934^b 12; does not form in lakes, 935^a 10 ff.
- Satyros of Clazomenae, 875^a 35.
- Saw, sharpening of a, causes shuddering, 886^b 10.
- Scale, of seven notes, 918^a 13, 919^b 22, 920^a 16, 922^a 22; of eight notes, 919^b 21, 922^a 21.
- Scammony, as a drug, 864^a 5, ^b 13, 19.
- Scars and Weals, Problems connected with Bruises*, 889^b 10-891^a 5.
- Scars, 877^a 2; black on body, white on eye, 889^b 20 ff., 890^a 32 ff., ^b 27; black on splenetic persons, 890^a 10 ff.; congenital, ^a 19; hair does not grow upon human s.s., ^b 38 ff., 893^b 28, 894^a 13 ff.; but grows on animal s.s., 893^b 27, 40 ff., 894^a 12 ff.
- Scent; see *Odour, Smell*.
- Science, created by man, 953^b 27; an instrument of the intelligence, ^b 37.
- Scraper, athlete's, 867^a 4.
- Sculpture, primitive, 895^b 37.
- Scurvy, why contagious, 887^a 22, 33.
- Scythia, quick growth of crops in, 925^a 26.
- Scythians, fond of wine, 872^a 3.
- Sea, Problems connected with Salt Water and the*, 931^a 35-936^a 10.
- Sea, calmed by throwing in objects, 931^b 19 ff.; whiter in the Black S. than in the Aegean, 932^a 21; more transparent than fresh water, 932^b 8 ff., 935^b 17; more transparent when the wind is N. than S., 932^b 16 ff.; contains an oily substance, ^b 5, 19; easier to swim in than fresh water, 933^a 9 ff.; saltier on the surface, 934^b 23 ff.; fresher near land, ^b 37 ff.; why salt, 935^a 34; why shells and stones are round in the s., 935^a 37 ff.; white when calm, black when rough, 936^a 5 ff.; made black by N., and blue by S. wind, 944^b 21 ff.
- 'Sea-lungs', 890^a 26.
- Seasons, effect of, on the body, 859^a 9 ff., 861^a 20 ff., ^b 1 ff., 21 ff., 862^a 34, ^b 7 ff., 11 ff., 25 ff.
- Sea-weed, 926^a 35, ^b 2.
- Seeds, sweet-smelling, promote the flow of urine, 907^b 3; plants live to produce seeds, 923^a 30, 35, ^b 4; more pungent than roots, ^b 30; older s.s. produce more stalk, 924^b 27 ff.
- Semen, alone produces offspring, 878^a 1 ff.; an excretion from the whole body, ^b 3, 879^a 5; passed from the brain through the spine, 897^b 25; emission of, during sleep, 876^a 11, 892^b 15, 963^a 12, in illness, 876^a 12, by the dying, ^a 13, 877^a 26, owing to fright, 876^a 13, 877^a 25, 949^a 20, by those who are fatigued and by the phthisical, 884^a 6.
- Sexual Intercourse, Problems connected with*, 876^a 30-880^b 12.
- Sexual intercourse, beneficial in diseases caused by phlegm, 865^a 32 ff., 878^b 14 ff.; the drunken are incapable of, 872^b 15 ff.; position of eyes during, 876^a 31 ff.; effect on eyes and flanks, ^a 36 ff., 880^b 8; effect on vision, 876^b 24 ff.; bareness of feet prejudicial to, 877^a 5 ff.; man languid after, ^a 16 ff., ^b 32, 879^a 4 ff.; a turgid state necessary for, 877^a 35 ff.; easier when fasting, ^b 44 ff.; the young feel loathing after, ^b 10 ff.; riding predisposes to, 14 ff.; difficult in the water, 878^a 35; of fishes, ^a 39; why pleasant, 878^b 1 ff.; cools and dries the stomach, ^b 17 ff.; those who wish to pass urine cannot have, ^b 33 ff.; men less capable of, in summer than in winter, 879^a 26 ff., 880^a 11 ff.; why some prefer an active, others a passive part in, 879^a 36 ff.; why a cause of shame, 880^a 6 ff.; effect of

INDEX

- abstinence from, 880^a 22 ff.; the melancholic particularly addicted to, 880^a 30 ff.; desire for, stimulated by recollection, 886^a 33; the beautiful as a stimulus to, 896^b 12 ff.; effect upon offspring of condition of parent at time of, 891^b 34 ff.; production of life without, 892^a 23 ff.; more frequent among tame than wild animals, 896^a 20; the intemperate in s. i. called incontinent, 950^a 1; makes men despondent, 955^a 26.
- Sexual organs, effect of fear upon the, 948^b 10, 949^a 8.
- Shadows, cast by sun, their increase and decrease not uniform, 911^a 14 ff.; shortest at midday, ^a 34 ff.; longest at sunrise and sunset, 912^a 34 ff.; moon casts longer s.s. than sun, ^b 4 ff.; extremity of s. trembles, 913^a 5 ff.; no s. thrown by the base of a bubble, ^a 19 ff.; of floating wood, ^a 23.
- Shame, causes blushing, 903^a 3, 905^a 7; makes the ears red, 957^b 10, 960^a 36 ff., 961^a 8, 31; 's. dwells in the eyes', 957^b 11.
- Sheep, milk of, 891^b 4; eyes of, far apart, 892^b 13; wool of, 893^a 13, 17, 36; Magnesian and Libyan, 896^a 26; prolific, 898^a 12.
- Ships, seem more heavily laden in harbour than out at sea, 931^b 9 ff.; travel more quickly towards than from land, ^b 10 ff.; sudden disappearance of, at sea, ^b 39 ff.; shape of, 932^a 18.
- Shivering, Problems connected with Chill and*, 887^a 10-889^b 7.
- Shivering, simultaneous with perspiring, 878^a 6 ff.; after sneezing, 887^b 35 ff., 963^a 33 ff.; after passing urine, 887^b 35, 888^b 1, 963^a 33; caused both by hot and by cold water, 888^a 32 ff.; see also *Shuddering*.
- Short-sighted, the, write small, 958^a 35, ^b 34; screw up the eyes, 959^a 3; hold objects near to the eyes, ^b 39.
- Shrewdness, meaning of the term, 917^a 1; to whom applied, 916^b 35.
- Shrill, weeping a s. sound, 900^a 20 ff., ^b 7 ff.; voices shriller, at a distance, 899^a 22 ff., 901^a 20 ff., in winter, 905^a 24 ff.; s. voices audible farther, 904^b 7 ff.; see also *Voice, shrillness of*.
- Shrubs and Vegetables, Problems concerning*, 923^a 5-927^a 9.
- Shuddering, causes of, 886^b 9 ff., 964^b 32 ff.; at the touch of others, 964^b 21 ff.; after taking solid food, 965^a 33 ff.; see also *Shivering*.
- Sibyls, 954^a 37.
- Sight, long, in old age, 959^b 39; see also *Eyes, Short-sighted, Vision*.
- Silver, 864^a 34; purification of, 936^b 25 ff.
- Sitting, makes some fat, others lean, 885^b 15 ff.
- Skin, effect of hot water on the, 936^b 12 ff., 937^a 10 ff.; s.s. for holding liquid, 938^b 15, see also *Wine-skins*; inflated s.s. preservation of food in, 931^a 39 ff., 939^b 12 ff., pain caused to limbs enclosed in, 937^b 31 ff., cause of their floating, 939^a 33 ff.
- Skull, 896^a 31; sutures in, ^a 35.
- Sky, clearer at night than by day, 938^b 5 ff.
- Slander of public official more serious than of private persons, 952^b 28.
- Sleep, perspiration more copious during, 867^b 31 ff., 869^a 13 ff.; position of eyes during, 876^a 32 ff.; easier if one lies on the right side, 886^a 3; is absence of movement, ^a 7; prevented by cold, 887^b 15, 889^b 3; shortness of, in animals, 894^a 21; induced or prevented by reading, 916^b 2 ff., 917^a 18 ff.; men in deep s. see no visions, 956^b 39 ff.; sneezing never occurs during, 963^a 5 ff.
- Smell, as a stimulus to sympathetic action, 887^a 10 ff.; see also *Odour*.
- Smoke, effect of, on the eyes, 896^b 8, 957^b 33, 959^b 5; odours are s. or vapour, 907^a 29.
- Sneezing, a turgid state necessary for, 877^a 35; followed by shivering, 887^b 35 ff., 963^a 33 ff.; commonest in man, 892^b 22 ff., 897^a 1 ff., 962^b 8 ff.; cause of, 897^a 12, 963^a 7; stopped by rubbing the eye, 957^a 38, 961^b 27 ff., 962^a 25 ff.; cause of s. twice, 961^b 33 ff.; after looking at the sun, 961^b 36 ff.; cures hiccups, 962^a

INDEX

- 1 ff., 963^a 38 ff.; regarded as divine, 962^a 21 ff., 32 ff.; a good sign between midday and midnight, 962^b 19 ff.; difficult for the old, ^b 28 ff.; never occurs during sleep, 963^a 5 ff.
- Snub-nose, cause of, 963^b 11 ff.
- Socrates, a victim of melancholy, 953^a 27.
- Soda, 863^b 17, 887^b 7, 936^a 2.
- Solstice, 862^b 8, 941^b 15, 20.
- Soothsayers, 954^a 37.
- Sores, treatment of, 865^a 25; on head, 861^a 33, 909^a 35; on legs, 861^a 34, 909^a 36, (of eunuchs) 895^a 31; caused by exertion, 883^b 26; by black bile, 953^a 18, 954^a 26.
- Sound, every s. is a breath, 886^b 15; is air set in motion, 899^a 34, 902^b 13, 920^b 4; refraction of, 899^a 25, ^b 22, 901^b 19, 22, 904^a 38, ^b 30; more audible at night, 899^a 19 ff., 903^a 7 ff.; audibility of, in buildings, ^b 13 ff.; can penetrate through dense objects, 904^b 19 ff., 905^a 36 ff.; travels less far and more slowly than light, 904^b 16 ff.; not audible through water, 905^b 10 ff.; effect of a number of persons making the same s. simultaneously, 904^b 33 ff., 917^b 21 ff.
- South wind, attracts clouds, 939^b 19 ff., 945^a 38 ff.; does not occur at fixed times, 940^a 35 ff.; blows after hoar-frost, ^b 8 ff.; less frequent than N. wind, 941^a 27 ff.; in winter blows as much by night as by day, ^a 31 ff.; blows regularly in the season of the dog-star, ^a 37 ff., 944^a 4 ff.; periods of the, 942^a 5 ff.; causes evil odours, ^a 16 ff.; rainy when it begins and ends, ^a 29 ff.; when weak, brings clear weather, ^a 34 ff.; why rainy, 943^a 5 ff.; one of the most frequent winds, 944^a 36 ff.; makes the sea blue, ^b 21 ff.; its effect on the clouds, ^b 25 ff.; weak when it begins, strong when it ceases, ^b 31 ff., 945^a 8 ff., 27 ff.; makes men heavy and weak, ^a 14 ff.; does not blow in the maritime parts of Egypt, ^a 20; if dry, causes fever, 946^a 4 ff.
- South-East wind (Eurus), why rainy, 943^a 5 ff.; rises at dawn, ^a 13; makes objects look larger, 946^a 33 f.
- South-West wind (Lips), brings rain at the Equinox, 942^b 25 ff.; naturally moist, ^b 33, 943^a 2; in Egypt, 945^a 24.
- Speech, effect of drunkenness upon, 875^b 19 ff.; the mind is the source of, ^b 31; many forms of human, 895^a 6; defined, ^a 10; hesitation in, 895^a 15, 902^a 38, ^b 17, 903^b 7, 19, 905^a 16, 20, ^b 29; peculiar to man, 899^a 2.
- Spiders' webs (gossamers), a sign of wind, 947^a 33 ff.
- Spine, 897^b 26.
- Splenetic persons, have black scars, 890^a 10.
- Sponge, 938^b 20; used to protect the ears of divers, 960^b 15 ff.
- Sponge-divers; see *Divers*.
- Spontaneous generation, 898^b 5.
- Squills, 926^a 6, 19.
- Squinting, 896^b 5.
- Stammering, 902^b 24 ff.
- Standing, less cold than running in the winter, 888^b 21.
- Stars, are warm, 939^b 16; are cold, according to the ancients, ^b 34; shooting, a sign of wind, 942^b 16 ff.
- Starvation, as a cure for disease, 859^a 7; swelling of the feet due to, ^b 2 ff.
- Stature, effect of climate upon, 909^b 15 ff.
- Stomach, dissolvent power of the, 936^a 27.
- Stones, dislodged by plants, 902^b 2; form more in hot than in cold water, 937^a 11 ff.
- Straw, effect on sound of spreading s., 901^b 30.
- Strength, not communicable to others, 951^a 5.
- Strings, thinner give shriller note, 901^a 18; the lower s. gives the note, 918^a 37 ff.; tuning of, 919^a 14 ff., 920^b 7 ff.; tight, give a shrill note, 920^b 3.
- Stucco, 899^b 22.
- Suicide, after drinking, 955^a 8, 22.
- Sulphur, 937^b 24, 28.
- Sun, the, drunkards like the warmth of, 875^b 5 ff., 34 ff.; warmer to stand than to sit in, 884^b 11 ff.;

INDEX

- a source of movement, 899^a 21 ; disturbs the air in the daytime, 903^a 8 ; shadows cast by, do not increase and decrease uniformly, 911^a 14 ff. ; shapes formed by, passing through quadrilaterals, ^b 3 ff. ; reason of flat appearance of, 912^a 28 ff. ; casts longest shadows at sunrise and sunset, and shortest at midday, ^a 34 ff. ; casts shorter shadows than the moon, ^b 4 ff. ; eclipse of, ^b 11 ; a parhelion forms only at the side of, ^b 27 ff. ; rising of, effect upon the winds, 944^a 35 ff., 946^b 3 ff., 947^a 26 ff. ; looking at, causes sneezing, 961^b 36 ff. ; bleaches wax and oil, but darkens the flesh, 966^b 21 ff., 967^b 23 ff. ; its effects upon the flesh, 966^b 21 ff., 967^a 20 ff., ^b 24 ff.
- Sunset, signs of coming weather at, 941^a 1 ff.
- Superparticular ratio, 920^a 26, 921^b 6.
- Surgery, χ cauterization, 863^a 10 ff. ; χ drugs, ^a 19 ff. ; use of copper instruments in, ^a 25 ff.
- Sweat ; see *Perspiration*.
- Swimming, easier in the sea, 933^a 9 ff. ; effect upon the bowels, 935^b 28 ff.
- Syllogism, 917^b 5.
- Sympathetic Action, Problems connected with*, 886^a 24-887^b 8.
- Sympathy with suffering, cause of, 887^a 15 ff.
- Symphonic, accompaniment, 918^b 30 ; notes, ^b 35.
- Syracusan, 954^a 38.
- Syria, 906^b 18, 908^a 14.
- Tame, χ wild, animals, 895^b 23 ff.
- Taste, pleasures of, 949^b 6, 37.
- Tears, hot and cold, 959^b 20 ff.
- Teeth, 898^a 22, 26 ; set on edge, 886^b 12 ff. ; men with porous, spongy teeth are short-lived, 896^a 30 ff., 963^b 18 ff. ; of Ethiopians, 898^b 12 ; effect of figs upon, 931^a 27 ff. ; sensitive to cold, 963^b 22 ff., 26 ff. ; more numerous in males than in females, ^b 20.
- Temperament, Problems connected with the effect of Locality on*, 909^a 11-910^b 9.
- Temperament, persons of moist, more affected by exertion, 883^a 3 ff. ; persons of equable, feel fatigue but throw it off, ^b 11 ff.
- Temperance and Intemperance, Continece and Incontinence, Problems connected with*, 949^a 21-950^a 19.
- Temperance, ill effects of a sudden change to, 949^a 23 ff.
- Temperate, association with the, makes men t., 951^a 5.
- Tens, counting in, 910^b 23 ff.
- Terpander, 920^a 17.
- Thapsia, 864^a 5, 890^b 7, 18, 25.
- Theatrical artists, bad character of, 956^b 11 ff.
- Theft, penalties for, 952^a 17 ff., 953^a 3 ff.
- Thighs, strain upon the, in descending, 882^b 25 ff., 883^a 9 ; on long journeys, 882^b 37 ff. ; feel more fatigue than the legs, 883^b 13 ff., 885^a 30 ff.
- Thirst, caused by fear, 947^b 16, 948^a 1, 7, ^b 13 ; less tolerable than hunger, 949^b 26, 32.
- Thracians, 911^a 2.
- Thriasian Plain, 942^a 19.
- Thunderbolt, 937^b 26, 28.
- Thyme, 925^a 8.
- Tickling, felt most in the armpits and the soles of the feet, 964^b 30 ff. ; a man cannot tickle himself, 965^a 11 ff. ; stimulates laughter, ^a 16 ; the lips sensitive to, ^a 18 ff.
- Tongue, the, effect of drunkenness upon, 875^b 19 ff. ; effect of cold upon, 888^b 7 ff. ; of animals, 892^b 33 ff. ; effect of sour matter upon, 931^a 12 ; as an indication of disease, 963^b 33 ff. ; of sheep, ^b 35 ; coloration of, ^b 38, 964^a 4 ff. ; becomes bitter but never sweet, ^a 1 ff.
- Touch, Problems connected with the effect of*, 964^b 20-965^a 39.
- Touch, the pleasures of, 949^b 6, 37.
- Tragedies, early, writers of, primarily musicians, 920^a 11 ; mainly lyrical, ^a 13.
- Tragic chorus ; see *Chorus*.
- Trembling, of drunkards, 871^a 27 ff., 874^b 22 ff. ; of shadows, 913^a 5 ff. ; from fear, 947^b 12 ff., 948^a 35 ff., ^b 6 ff. ; see also *Voice, trembling of*.

INDEX

Trite, 918^a 15, 920^a 17.
 Troy, 916^a 19.
 Tug-of-war, 888^a 21.
 Tunes 'running in the head', 902^a 30 ff.
 Twins, difference of sex in, 894^a 7 ff.

Unguents, 926^a 17; see also *Perfumes*.
 Unison, 918^b 8.
 Unsymmetrical, appearance of the, 915^b 37 ff.
