To have nothing near by on which a swarm could alight except dummy bushes set up in holes in the ground—why, that might almost be called the poetry of taking swarms. But that is a poetry which most of us who are on old homesteads can not indulge in. The work of renovating the dummies as often as they get dry would be tedious. Say, Mr. Hobbs, set your dummies in tubs of rich earth, and make some morning-glory vines green them up for you. With a year or two to grow in, I judge that a young maple or willow a dozen feet high, but cut back to six feet, and transferred to a tub, would make a nice, portable, prairie swarm-catcher. Page 419.

York's Honey Calendar for 1900 is a 16-page pamphlet especially gotten up to create a demand for honey among should-be consumers. The forepart was written by Dr. C. C. Miller, and is devoted to general information concerning honey. The latter part consists of recipes for use in cooking and as a medicine. It will be found to be a very effective helper in working up a home market for honey. We furnish them, postpaid, at these prices: A sample free; 25 copies for 30 cents; 50 for 50 cents; 100 for 90 cents; 250 for \$2.00; 500 for \$3.50. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

Belgian Hare Breeding is the title of a pamphlet just published, containing 10 chapters on "Breeding the Belgian Hare." Price, 25 cents, postpaid. It covers the subjects of Breeding, Feeding, Houses and Hutches, Diseases, Methods of Serving for the Table, etc. It is a practical and helpful treatise for the amateur breeder. (See Prof. Cook's article on page 292.) For sale at the office of the American Bee Journal. For \$1.10 we will send the Bee Journal for a year and the 32-page pamphlet on "Belgian Hare Breeding."

"The Hum of the Bees in the Apple-Tree Bloom" is the name of the finest bee-keeper's song—words by Hon. Eugene Secor and music by Dr. C. C. Miller. This is thought by some to be the best bee-song yet written by Mr. Secor and Dr. Miller. It is, indeed, a "hummer." We can furnish a single copy of it postpaid, for 10 cents, or 3 copies for 25 cents. Or, we will mail a half-dozen copies of it for sending us *one new* yearly subscription to the American Bee Journal at \$1.00.

Queenle Jeanette is the title of a pretty song in sheet music size, written by J. C. Wallenmeyer, a musical bee-keeper. The regular price is 40 cents, but to close out the copies we have left, we will mail them at 20 cents each, as long as they last. Better order at once, if you want a copy of this song.

PUBLISHED WEEKLY BY

GEORGE W. YORK & COMPANY,
118 Michigan Street, Chicago, Ill.

[Entered at the Post-Office at Chicago as Second-Class Mail-Matter.]

DEPARTMENT EDITORS:

DR. C. C. MILLER, "Questions and Answers." * * E. E. HASTY, "The Afterthought."

LEADING CONTRIBUTORS:

G. M. DOOLITTLE, F. A. SNELL, C. P. DADANT, R. C. AIKIN, PROF. A. J. COOK, "OLD GRIMES,"

IMPORTANT NOTICES:

The Subscription Price of this journal is \$1.00 a year, in the United States, Canada, and Mexico; all other countries in the Postal Union, 50 cents a year extra for postage. Sample copy free.

The Wrapper-Label Date of this paper indicates the end of the month to which your subscription is paid. For instance, "Dec00" on your label shows that it is paid to the end of December, 1900.

Subscription Receipts—We do not send a receipt for money sent us to pay subscription, but change the date on your wrapper-label, which shows you that the money has been received and duly credited.

Advertising Rates will be given upon application.

VOL. 40. AUGUST 23, 1900. NO. 34.

NOTE—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound. Also some other changes are used.

Honey Season of 1900.—There seems to be quite a difference of opinion concerning the honey crop of this year. However, Editor Root sums up the situation pretty well in the following sentence, found in *Gleanings in Bee-Culture* for Aug. 1st:

"Taking it all in all, the season is no better than last year, which was considered poor, altho there have been special favored localities where quite large crops of honey have been secured."

If such is really the case, prices of honey of all grades should certainly be no lower this year than last, and possibly in some localities somewhat higher.

Minimizing Swarming, next to the prevention of swarming, is a topic the very mention of which makes the average bee-keeper prick up his ears. One of the things that has prevented greater advance in this direction has been a stolid indifference on the part of many, arising from the belief that nothing could be done, and that bees would swarm just about so much anyhow. To those who are a little faint-hearted in the matter, and yet are trying to keep up their hope, the following extract from a paper by H. L. Jones in the *Australasian Bee-Keeper* is reassuring:

"With a strong desire on my part for rapid increase, my apiary grew from four colonies in 1883 to over 100 in 1886, aided much by favorable seasons and artificial swarming, but a complete change in my management soon became imperative, as at the rate things were going the prevention of swarming promised to become a serious problem.

For a few years it was almost impossible to keep the bees within reasonable bounds once they got the swarming-fever, and as many as half a dozen swarms in the air at once was of frequent occurrence. In time, however, the percentage of swarms gradually grew less, so that to-day it does not average above 5 percent.

"This satisfactory state of things is due to several improvements in our fixtures and methods of management. Hives more perfectly ventilated with deep entrances and cool double-gable covers have superseded those modeled on foreign patterns and more adapted to cooler climates, while careful selection of breeding-stock from the most non-swarming strains has also had considerable influence in minimizing the desire to swarm. It speaks well for our present fixtures, too, that such unpleasant and expensive occurrences as combs melting down in the hives thru excessive heat are now unknown, but many a sad spectacle of broken-down combs and drowned bees reveals itself to my mind's eyes as I look back to those days of the old single-board flat cover and narrow entrance."

The three things specifically mentioned by Mr. Jones as being strong factors in diminishing the amount of swarming are: Deep-entrances, cool double-gable covers, and selection of breeding-stock from non-swarming strains. If attention to these points has so greatly reduced swarming in Australia, why not in this country?

The Chicago Convention of the National Bee-Keepers' Association, as doubtless all know, will be held next week, beginning with Tuesday evening, Aug. 28th.

Referring to the Chicago convention, Editor Root, of *Gleanings in Bee-Culture*, had this to say in regard to some of the attractions:

If there is any one feature that our bee-conventions have lacked in the last few years, it has been stereopticon work. It was introduced for the first time, if I am correct, in the history of the National, at Philadelphia, by W. E. Flower, and was a marked success. It was also a distinct and prominent feature at the New York State convention, held at Geneva last winter.

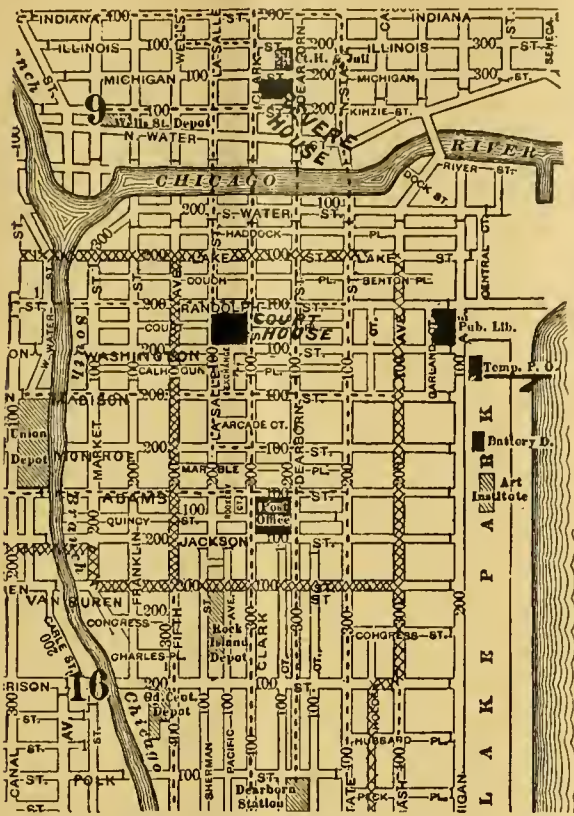

For a long time I have been wishing for a first-class stereopticon, and have now finally purchased one using a powerful electric light of 3,000 candle power—one that the manufacturers tell me will give the very finest and best results. This will be in evidence at the Chicago convention on Wednesday and Thursday evenings. On the first evening there will be thrown on the screen some pictures of some of the prominent bee-keepers of the day; Dr. Miller will pay tribute to Langstroth, and Dr. Mason will come in for the jokes. The views will also embrace snap-shots from many apiaries of the United States, and even from old mother England. In connection there will be shown briefly the anatomy of the bee, special reference being given to the tongue, about which so much interest is now being manifested. The methods of measuring tongues will be illustrated, together with a view of the variations already discovered. Thursday evening, the last session, some of the beautiful photographs secured by Mr. Hutchinson, on his recent trip thru Minnesota and Wisconsin, will be thrown on the screen. These will be some of the finest pictures that were ever projected, and no one who can come should miss this treat. Of course, Mr. Hutchinson will tell us about them.

Revere House—Convention Headquarters.

On both evenings will be shown views of the various hive-manufacturing plants of the United States. Every establishment, so far as I know, will be represented, or at least an effort will be made to secure photographs of each.

A glance at the program will show that such men as Thomas Wm. Cowan, editor of the *British Bee Journal*, and perhaps the most distinguished bee-keeper in all Europe, will

HOW TO REACH HOTEL.

- Take State St. Car going North to Michigan St.
- Take Dearborn St. Car going North to Kinzie & Clark Sts.
- Take N. Clark St. Cable going North to Illinois & Clark.
- Elevated Railroad Station, Clark & Lake Sts.
- Street Car Lines designated-----
- Elevated RailroadsXXXXXXXXXXXX

have a paper. There will be another paper from Dr. W. R. Howard, the scientist who has done more in the study of the diseases of bees than, perhaps, any other man in this country. R. C. Aikin, president of the Colorado State Bee-Keepers' Association, and one of the most practical bee-keepers of the world, will be present and discuss a live issue.

There are other equally good papers, but these are only samples of the good things that will be spread before the bee-keepers who will be fortunate enough to attend the convention in Chicago. The railroad rates will undoubtedly be very low, so it will be possible for many to make a very pleasant and enjoyable trip. After the convention there will be ample opportunity for any one who may desire to take in Lincoln Park, the old World's Fair grounds, and a hundred and one interesting things in the most hustling city of the United States—Chicago. Lincoln Park alone is worth the trip.

I nearly forgot to say that we will endeavor to have pictures taken of the members of the convention, probably during the first session. If our plans work well, this picture will be thrown on the screen Wednesday or Thursday evening; so if you wish to see "yersilf" as ithers see you, come and see "yersilt" projected on the screen.

The seven sessions of the convention will be held in Wellington Hall, located on the third floor at 70 North Clark street. This hall is just about two blocks north of the river, and about five blocks north of the Court House and City Hall. It will be very easily found.

The bee-keepers' headquarters and hotel will be at the Revere House, at the southeast corner of North Clark and Michigan streets—only a short half block south of Wellington Hall. Surely, the hall and hotel are near enough together to suit the most critical person that will be present.

The editor of the American Bee Journal expects to devote himself wholly to seeing that all are well taken care

of, and that everything possible is done to make it the best bee-keepers' convention ever held on this continent. He will be assisted by members of the Chicago Bee-Keepers' Association, particularly Secretary Herman F. Moore and Vice-President Mrs. N. L. Stow, who are also on the Executive Committee of the Chicago Association.

The Weekly Budget

DR. A. B. MASON, Secretary of the National Bee-Keepers' Association, writing us Aug. 15th, says:

"The railroad rate for G. A. R. week is one cent a mile each way on all railroads in Canada and the United States."

As the Chicago Convention is held the same week, bee-keepers will please take notice—and can also take advantage of the low railroad rate.

MR. S. B. STRADER, of Vermilion Co., Ill., writing us Aug. 6th, says that his shop and grist-mill was burned to the ground July 12th with everything in the building, including books, etc. The loss was about \$1,500. We hope that Mr. Strader had everything insured, as it does not pay any business man to be without insurance on his buildings, stock, etc.

DR. A. B. MASON was visited in July by a reporter from the Toledo Daily Blade, who afterward gave the Doctor and his bees nearly a two-column article. He must have been a reporter above the average, as he got everything pretty correct. The heading given the article was, "Honey-Bees and their Wonderful Talents." It was illustrated with a picture of the Doctor and the three kinds of bees found in a hive.

MR. O. O. POPPLETON, of Dade Co., Fla., writing us Aug. 4th, had this to say:

"FRIEND YORK!—It looks now like a pretty sure thing that I will be able to go to Chicago for the convention. . . . My crop this year is about 16,500 pounds of extracted honey from 115 colonies. As a rule, the season has been a poor one, but I happen to be among the fairly lucky ones."

We are twice glad—first, that Mr. Poppleton will quite certainly be at the convention; and, second, that he has been so fortunate as to secure a good crop of honey. If he comes to the convention we may be sure of at least one happy man among the number.

THE CHICAGO CONVENTION ATTENDANCE promises to be very representative in character. Among those whom we expect to be present may be mentioned these: R. C. Aikin and wife, of Colorado; W. Z. Hutchinson and wife, and Hon. Geo. E. Hilton and wife, of Michigan; O. O. Poppleton, of Florida; N. E. France and son, with Mr. and Mrs. W. J. Pickard and daughter, Miss Ada, all of Wisconsin; Rev. E. T. Abbott, of Missouri; L. A. Hammond, of Maryland; E. Kretchmer, of Iowa; and doubtless many others could be named if we could only recall them. Quite a number from a distance have written us that they are coming, if all is well. It will be a "big meetin'." Better pack up and "get there," if possible.

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.)

The "Premium Queens" Are Clipt.

A correspondent writes that he received his premium queen all right, but is puzzled to know whether the one in the hive now is the same queen, as this is a clipt queen, and the one he received as a premium had whole wings. Another says his queen is clipt, and wants to know if I did it.

At the request of the publishers, I have clipt the queens sent out. It would be a little less trouble to send them out with whole wings, but most nowadays prefer to have queens clipt, and it sometimes helps to decide the question whether the right queen is present. When a queen has her wings closely folded together, it is not so easy to tell she is clipt, but it is easily told when she spreads her wings, and that probably accounts for the correspondent thinking his queen was unclipt when received, and clipt when found later in the hive.

To another question, I reply that I have not previously sent out queens to exceed perhaps half a dozen, rearing them merely for my own use, and that I now send out only as ordered thru the publishers of the American Bee Journal.

C. C. MILLER.

Combs and Fixtures from a Paralytic Colony— Bees's Length of Life.

1. Would it be safe to use combs and fixtures taken from a colony that has bee-paralysis?

2. Do you think the life of the worker-bee is prolonged during a period of enforced idleness in summer, when there is no honey or very little coming in? MINNESOTA.

ANSWERS.—1. It is probably entirely safe.

2. Yes, a bee grows old not altogether according to the number of days since it was born, but rather according to the amount of work it has done.

Building Queen-Cells Over Drone-Eggs.

To-day I send a queen, some drone-brood in worker-cells, and a sample of queen-cells, cut from the same comb. I desire you to make a post-mortem examination of the same, and report at an early date in the "Old Reliable." I will give a history of the queen, viz.: In the first place I will say that I have the stands, or places where my colonies rest, numbered as we do land sections, and keep a regular diary of each colony. In this way I can give a correct history of the colony and queen therein. May 16th No. 7 was very good; clipt queen's wing, and gave two frames for new colony at No. 11. May 30th queen-cells started, nearly ready for capping. Made new colony at No. 15 by giving seven frames with cells for new colony, and filling up No. 7 with empty combs. I find this an easier way to live swarms than to climb trees, or be bothered watching for swarms, and if the queen is not clipt the swarm may be lost.

June 9, No. 15, saw fine queen, colony good. June 21st, saw queen laying all right; put on upper story—8 frames in the upper story, and 10 in the brood-chamber. I use the standard Langstroth 10-frame hive, and upper story the same size. These I can make into an 8-frame or any other size, by the use of division-boards. June 27th, working in

upper story. July 26, need attention, as I found one frame in the upper story that contained a lot of drone-brood in worker-comb, and queen-cells started. July 27th, removed upper story, found a fine, large queen, but seemed to have quit laying, as I found no brood in any stage from the egg up to capping in the brood-chamber. Queen seems to have been injured. Her last laying seems to have produced drones, as stated above. July 30th, gave upper story to No. 13; took away queen, so as to be ready for one that will lay.

Now, the query is, will bees start queen-cells over eggs that produce drones? I have fears of this, and send you a sample of them. I did not find any worker-cells at all in this comb that contains the drones. The queen, as you will see, is only a few weeks old. Most of my other colonies are doing well, especially in brood-rearing, and we hope to have a good honey harvest yet from heartsease and other fall flowers. Almost too much rain during basswood, white clover, etc., so our early honey crop is not large.

There is an immense growth of all kinds of vegetation and weeds, especially the latter, hence the reason why, if the weather proves favorable during August and early September, we may get a good crop of honey. All bee-keepers I have met report about the same.

I run my apiary mostly for extracted honey, as I find as a rule it pays best. The American Bee Journal is always a welcome visitor. J. S., Marshall Co., Iowa, July 31.

ANSWER.—It is a rather common thing for queens that are failing with old age to lay an increasing number of drone-eggs, until all the brood is drone-brood, but is an unusual thing for the queen no older than the one in question to fail in that way. Still, it does sometimes happen. I once had a queen which laid eggs that never hatched at all. Another laid worker-eggs all right for three or four days, then stopt laying altogether.

When bees have nothing but drone-brood, you may count on their starting queen-cells, but nothing ever hatches out of such cells, the poor drone pampered with royal food dying in his cell.

Weak Colony.

I have a colony of bees which have been very poor the whole season. First they lost the old queen, then the other died, and the combs have had brood which has changed to maggots, as the queen died, and the colony is in very bad shape. I lookt it over every day and cut out the tracks left by the worms, and I could not get them out, so I have bought a new queen and have put a new colony on the old stand with some comb-starters in the frames, and left the old hive stand near by. Have I done the right thing with the bees, by changing the hive? What can I do in regard to the comb of the old hive? BROOKLYN.

ANSWER.—Furnishing a queen was a wise move—doubtful about changing combs. Fumigate the old combs with sulfur to kill the worms, and then if the bees are strong enough return the combs. The great danger is that the colony has become so weakened as to be worthless. When a colony has been a long time without a queen and has dwindled away, it is hardly worth fussing with.

Variations in Brood-Frames.

I wish that some of the manufacturers of bee-keepers' supplies would be on the program in the bee-keepers' convention, and discuss the sameness of the inside of bee-hives. I have been buying 1,000 brood-frames here, of different makes; some go in the hives while others do not, or vary up to about ½ inch. Such goods are no better to me than a common box, or even that. CALIFORNIA.

ANSWER.—The trouble you mention is a grievous one. In the main, manufacturers are not the chief sinners in this regard. They try to make what bee-keepers demand. A good way to do is to stipulate when ordering goods that they shall be of certain dimensions. It does seem, however, that a frame varying ½ inch from the standard size, 17½ x 9½, if that is what you have, must have been made by a mistake of the manufacturer, and should be rectified by him.

ROOT COMPANY'S PAGE.

SHIPPING-CASES.

Our No-Drip Cases are still in the lead. We keep constantly on hand a large assortment from 12-pound size up. We also make special sizes to order.

That Root's Cases are in demand is shown by the fact that one dealer alone has ordered 16,000 this season.

WINTER-CASES.

Our Winter-Cases are made of thin lumber dovetailed at the corners, with a telescope cover.

The cost is only 75 cents each singly, yet for convenience they are unsurpassed, and only excelled by the chaff hive in the protection afforded. Don't let your bees winter-kill or spring-dwindle when you can avoid it by using our Winter-Cases.

RUBBER GLOVES.

This is the time of the year when you need gloves, for robbers are about the bees and they are harder to handle than earlier. Take comfort with a pair of our gloves.

Ladies' sizes, Nos. 6, 7, 8 and 9, \$1.35; postage, 5c
Gents' sizes, Nos. 10, 11 and 12, \$1.45; " 5c
Extra long driving, Nos. 13, 14, \$1.70; " 10c

Mark size of hand on sheet of paper when ordering. If you order by number, remember that in rubber you need two sizes larger than you wear in kid; i. e., if you wear No. 6 in kid you will need No. 8 rubber.

BICYCLES

In trade for honey at market prices.

□ Having sold a carload of bicycle crates, we took in trade a quantity of machines which, so long as they last, we will sell **AT COST**.

□ A \$30.00 bicycle—"Pathfinder"—made by the National American Cycle Company, Akron, O., for \$17.00 cash or \$20.00 in trade for honey of good quality at market prices. Catalog and further particulars will be sent on application. Send a sample of your honey and we will give you price we will allow.

COMB FOUNDATION.

□ Not too late yet to order Comb Foundation for the fall flow. If you order Root's Weed Process you may be sure you will be pleased with the result. We keep in stock the four grades in boxes of 1, 2, 3, 5, 10 or 25 pounds.

□ A small order has the same attention as an order for a ton.

SPECIAL GOODS.

This is the time when you should order odd size or special goods. Our busy season is over and we can do almost any work in wood you want, either for bee-keepers or others.

We make a specialty of packing-boxes, from the size of a section-box up. Let us figure with you.

FEEDERS.

How about your winter stores? Are you sure your bees have enough? Should it be necessary to feed you can't do it easier than with our Division-Board Feeder. This is made to hang like a frame in a Langstroth hive. Price, 20 cents each, complete. Less in quantities.

Honey-Labels.

Do you use labels for your honey? Are they really ATTRACTIVE labels? If you do not you may be losing many sales because your honey lacks attractiveness. You can't expect to market your honey at the best price unless you use every care in putting it up. Send for our label catalog and see our 1, 2, and 3 color labels.

Tin Packages for Honey.

If you are one of the people who market extracted honey in small lots you will find our pails just what you want. A dozen sizes and kinds to select from. We also furnish square cans—1-quart, 2-quart; 1-gallon and 5-gallons. A single can or carload, as you wish. Write for prices.

Gleanings in Bee-Culture.

When our advertisers write us that their advertisements have paid them well, we know GLEANINGS IN BEE-CULTURE must be read by the best bee-keepers. We know, too, that GLEANINGS is appreciated, for our circulation is increasing all the time. Send 25c for a six months' trial and get A. I. R's Notes of Travel and hundreds of other interesting things.

Comb-Foundation Mills.

Perhaps you are so far from us and rates are so high that you want to make your own foundation.

Our mills are being improved constantly. If you want to purchase a foundation mill, send for package of samples showing different styles we can furnish. Send 2c stamp for these.

Bushel Boxes.

□ Bee-keepers are always looking for labor-saving ideas. Have you ever read our 16-page pamphlet, "Handling Farm Produce?" It is full of information and gives prices of bushel boxes and other things. Free for the asking.

HONEY-EXTRACTORS.

"Operator No. 6 puts the honey-combs in the extractors, which is a Cowan 4-frame reversible, with ball-bearings and lever-brake—in short, the best extractor on the market."

Extract from article of N. E. France, of Wisconsin, in June Review. No one is better qualified to judge the worth of an extractor than Mr. France. He says the ROOT COWAN IS THE BEST.

Thousands of others say so.

Glass Honey-Packages.

We have all sizes of Mason Jars with aluminum or porcelain-lined caps. Also Jelly Tumblers, two sizes; Glass Pails, four sizes; and Self-Sealing Jam Jars. Besides these we still have the four sizes square jars, which have long been on the market. Don't forget us when you need glass packages for honey.

RUBBER STAMPS.

Have you ever thought how handy it would be to use a rubber stamp to mark your honey-cases, showing the grade? Then, too, if you sell in the home market you ought to have your name on the case so it would be returned. We make stamps of all kinds for all sorts of purposes. Let us send you our rubber stamp circular.

QUEENS.

We don't say much about our queens, do we? I suppose some of our friends wonder why. Let us tell you: We began selling queens many years ago. We know all about the business from A to Z. We have the best breeding queens to be found in this country or Italy, and the best apiarist to be had. The result is our 400 colonies do not begin to furnish enough queens for our orders. Our queens are unsurpassed.

You will find it so if you buy them.

HONEY.

We buy a number of carloads of comb and extracted honey each year. If you have secured a good crop send us your offer. You don't have to worry about the returns if you sell to us.

If you have extracted honey send sample. If you have failed to secure enough for your home market, let us supply you. We have honey engaged all over the country, and can ship direct from the producer, many times.

AGENCIES.

A list of our principal agencies will be mailed you on request. We can ship from stock such items as our regular Hives, Sections, Foundation, Extractors, etc., from these agencies.

Send your order direct to us, if you prefer, and request that we ship from nearest point, and we will do so, saving you freight charges and giving you quick delivery.

The Bee-Keeper's Guide

Or, Manual of the Apiary,

—BY—
PROF. A. J. COOK.

460 Pages—16th (1899) Edition—18th Thousand—\$1.25 postpaid.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published to-day. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without THE BEE-KEEPERS' GUIDE.

This 16th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to GIVE AWAY to our present subscribers, for the work of getting NEW subscribers for the American Bee Journal.

Given for TWO New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the two NEW subscribers—simply the Bee Journal for one year:

Send us TWO NEW SUBSCRIBERS to the Bee Journal (with \$2.00), and we will mail you a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both for only \$1.75. But surely anybody can get only TWO NEW SUBSCRIBERS to the Bee Journal for a year, and thus get the book as a premium. Let every body try for it. Will YOU have one?

GEORGE W. YORK & CO.,
118 Michigan Street, CHICAGO, ILL.

BY RETURN MAIL.

Golden Beauty Italian Queens,
Reared from imported mothers.

Untested, 50 cts.; 12 Untested, \$5.50; Tested, \$1.
J. S. TERRAL & CO., Lampasas, Texas.
18Atf Please mention the Bee Journal.

GENERAL ITEMS

Good Prospects for a Fall Crop.

Our bees are not doing anything to speak of at present, but I think the prospects are good for a fall honey crop.

ARTHUR STANLEY.
Lee Co., Ill., Aug. 4.

Bees Doing Fairly Well.

My bees are doing fairly well—better than some of the others around here. I have one colony that has filled four supers, which was started July 5th.

W. BISHOP.
Otero Co., Colo., Aug. 1.

A Financial Report.

I have sold \$180 worth of extracted honey from 40 colonies.

W. E. YOUNG.
Ontario, Canada, Aug. 10.

Bees Did More Than Poor.

Bees have done more than poor this year. My 40 colonies, spring count, have produced only 300 or 400 pounds of white honey.

S. A. MATSON.
Nodaway Co., Mo., Aug. 10.

Honey a Light Crop.

Honey is a light crop, but very nice. The flow is over for the present, tho there may be a fall flow. One neighbor one-fourth of a mile from me, informs me he has taken one 13-ounce section of honey from 50 colonies this season. He is keeping bees according

ARE YOU FULL OF GINGER? If you want health and vigor, good appetite and sound sleep, take LAXATIVE NERVO-

A VITAL TABLETS, the quick and safe cure for Constipation, Nervous Dyspepsia, Insomnia, Nervous Affections, the "Blues" and all attendant evils. It aids digestion, purifies the blood, strengthens the nerves, improves the appetite, induces sweet sleep, tones up the whole system and makes you a new creature. It not only makes you feel well, it makes you really well. It gives you that vim and

vigor which makes life worth living.

LAXATIVE

NERVO-VITAL

TABLETS

It contains no narcotics nor bromides nor other injurious drugs. We give the formula with every box. You know exactly what you are taking. Originally put up for physicians' use. Ask your druggist for a **FREE SAMPLE.** If he hasn't it, don't take a substitute, but send us a stamp for our

book on "Health" and we will send you a free sample, sufficient for you to try it and test its merits to your own satisfaction. Isn't it worth trying free? It positively cures. Price 10c and 25c per box. Don't delay sending.

The Modern Remedy Co., Kewanee, Ill.

to "teachings of dad" 40 years ago, tho he has good dovetailed hives and supers. He does not take the American Bee Journal nor any other paper, as he knows how now without the aid of any city editor's chin music, and he doesn't want a bee-paper! I have taken 600 pounds of fine honey from 28 colonies (in the same range); not a large yield, but it proves a bee-journal will beat 40-year-old methods. C. E. MORRIS. Carroll Co., Iowa, Aug. 13.

Very Poor Season.

This has been a very poor season with me. The bees made only a living thru July, and almost ceased rearing brood. The buckwheat is in bloom now, but if we don't get some rain soon we will not get any honey. Vegetation is drying up. At this time last year I had 2,000 pounds of honey; this year so far I have taken 200 pounds.

G. W. BELL.

Clearfield Co., Pa., Aug. 13.

A Queer Be(e)-Combed Lizard.

I am sending by mail under separate cover, a new "material" to which bees in a tree attach their combs. As you will see it is a scorpion, or species of lizard. It was found by a farmer in the small hollow of a bee-tree. How it came there is accounted for in this way:

In the winter things of this kind go into hollow limbs and lie dormant till spring. During this long stay it doubtless died, and when the bees went into the tree they could not move it, and it being as dry as wood they just attach the comb to its back. See?

R. V. Goss.

Walker Co., Ala., Aug. 3.

[We received the specimen sent by Mr. Goss, for which he has our thanks. The lizard is about 7 inches long, being about a half inch in diameter, and nearly half its length tail. The comb is fastened on its back.—EDITOR.]

Two "Salty" Honey-Plants.

Sweet clover and heartsease are the "salt" that saves the bees and bee-interests in this vicinity. The outlook for a fall honey-flow is not very encouraging, unless we have rain soon.

D. L. DURHAM.

Kankakee Co., Ill., Aug. 10.

Light Honey Crop.

We are having a nice, gentle rain this morning, and we needed it very badly. Our honey-crop is light—no basswood honey this year.

LEWIS LAMKIN.

Woodbury Co., Iowa, Aug. 11.

Shade and Salt for Bees.

My bee-hives all face the southeast, and are in rows 16 feet apart, and five feet apart in the row. I set one sweet clover plant to the right of each hive, and one behind the hive. I use, no other shade. I have had them under trees, but I prefer the sunlight to too much shade.

Some one has askt if too much salt can be given to bees. My experience is that the more salt used the less

SPECIAL NOTICE!

Last winter's cut of basswood is the whitest it has been for many seasons. We are now making sections out of this new stock and therefore are in a position to furnish you with the very finest quality in the market.

Four Celluloid Queen-Buttons Free AS A PREMIUM.

For sending us ONE NEW SUBSCRIBER to the Bee Journal for the balance of this year, with 40 cents, we will mail you FOUR of these pretty buttons for wearing on the coat-lapel. (You can wear one and give the others to the children.) The queen has a golden tinge. This offer is made only to our present regular subscribers.

NOTE.—One reader writes: "I have every reason to believe that it would be a very good idea for every bee-keeper to wear one (of the buttons) as it will cause people to ask questions about the busy bee, and many a conversation thus started would wind up with the sale of more or less honey; at any rate, it would give the bee-keeper a superior opportunity to enlighten many a person in regard to honey and bees."

Prices of Buttons alone, postpaid: One button, 8 cts.; 2 buttons, 6 cts. each; 5 or more, 5 cts. each. (Stamps taken.) Address,

GEORGE W. YORK & CO., 118 Michigan St., CHICAGO.

Rocky Mountain Bee-Plant Seed!

(*Cleome integrifolia.*)

...FREE AS A PREMIUM...

The A B C of Bee-Culture says of it: "This is a beautiful plant for the flower-garden, to say nothing of the honey it produces. It grows from two to three feet in height and bears large, clusters of bright pink flowers. It grows naturally on the Rocky Mountains, and in Colorado, where it is said to furnish large quantities of honey."

We have a few pounds of this Cleome seed, and offer to mail a ¼-pound package as a premium for sending us ONE NEW subscriber to the American Bee Journal, with \$1.00; or ¼ pound by mail for 40 cents.

GEORGE W. YORK & CO.

118 Michigan St. CHICAGO ILL.

young brood will be in the hives in the fall, and so there will be a scarcity of young bees in winter. I would not feed salt to bees very late in the season.

Wm. H. EAGERTY.

Republic Co., Kan.

No Honey—Too Dry.

I see that some of the bee-keepers have honey, but we have none in this section. If we do not get some rain soon our buckwheat crop of honey will be short, and we may have to feed our bees. I never knew but one season as poor as this up to this time.

D. H. COGGSHALL.

Tompkins Co., N. Y., Aug. 6.

No Surplus Honey.

I have 22 colonies of bees in movable frame hives. We have been flooded with rains all year. I have not gotten any surplus honey this season. Last year I extracted 500 pounds of fine basswood honey.

W. H. MOORE.

Trinity Co., Tex., Aug. 9.

Not Doing Well.

Bees are not doing well here this summer—too much rain. D. BAKER.

Citrus Co., Fla., Aug. 8.

Fair Surplus Crop.

I have 66 colonies of bees in good condition. The surplus crop is fair.

G. W. MCGUIRE.

Watauga Co., N. C., Aug. 8.

Bees Stored Some Honey.

Bees have stored some honey. They wintered well, but have workt very little in the past two weeks; it has been so dry that the honey-plants haven't done very well. But we have had two big rains lately, so I think there will be some honey stored during August. There will be some buckwheat honey late this fall. The white clover is rather thin, but doing very well. My land runs to within 40 rods of the Green River.

C. W. ANDERSON.

Bureau Co., Ky., July 28.

Introducing Queens—Bee-Disease.

I have a Dr. Miller queen safely introduced, and of course I am proud of her. This is the way I did: Anticipating a new queen I placed a hive-body on top of a certain colony, dividing the brood and empty frames about equally in each. When the new queen came I left the old queen in the bottom brood-chamber, and took the top chamber with most of the sealed brood and adhering bees, and made another colony, changing the location of both somewhat. In about seven hours I placed the cage with the new queen on top of the frames. In two days she was out, but the bees that were with her died, or were killed. The fourth day I opened the hive, and found the new queen all right, and showing them how they keep house in Illinois.

My foul brood is all gone now, and one colony that had it has since stored about 60 pounds of fine surplus honey. They must have had either foul or black brood. One of my neighbor's bees have the same disease. There is no bad smell, but it has every other

NO EXCESS FARES ON THE NICKEL PLATE ROAD.

Our trains are composed of the best equipment, consisting of three vestibuled sleeping-car trains in both directions between Chicago, Buffalo, New York and Boston, with unexcelled dining-car service, to which are added assurances of safety, speed and comfort, forming a peerless trio of advantages.

Train No. 2, leaving Chicago at 10:35 a.m., with thru cars for Boston, New York and intermediate points.

Train No. 4, leaving Chicago at 2:30 p.m., with thru cars for Buffalo, New York and intermediate points on the Lackawanna Road; also on the West Shore Road, making direct connections at Buffalo with the New York Central and Lehigh Valley Roads; also making direct connections at Brocton for Chautauqua Lake points.

Train No. 6, leaving Chicago at 10:30 p.m., with thru cars for Buffalo, New York and intermediate points; also at Brocton for Chautauqua Lake points.

Individual club meals ranging in price from 35 cents to one dollar, served on all our dining-cars. Rates always lowest. Write, wire, phone or call on nearest ticket agent, or Mr. J. Y. Calahan, General Agent, 111 Adams St., Chicago, Ill. (No. 20)

symptom of foul brood. This is what I did:

I first placed in each hive four moth-balls to keep out the moths, as I thought they were too weak to defend themselves. Then I sprayed with a nozzle injector (cost 75 cents) all the combs and bees every seven days, with the preparation given in Prof. Cook's book. And now I don't see any signs of disease. There were three causes for its cure—either the naphthaline balls, the Cook preparation, or a heavy flow of catnip honey.

My bees are storing lots of honey. Thanks to the information from the American Bee Journal and text-book, I am beating all the old fogies who are too stingy to subscribe for a journal, or who think they know more than the whole aggregation of bee-keepers summed up in a first-class journal.

A. L. McFARLANE.

Wallawalla Co., Wash., Aug. 4.

No White Clover Honey.

We have had no white clover honey this year in this locality, but had a heavy honey-dew. We must depend upon aster for our honey. It has never failed yet, but it comes late.

T. M. BARTON.

Pendleton Co., Ky., Aug. 4.

HONEY AND BEESWAX
MARKET QUOTATIONS.

CHICAGO, Aug. 7.—Fancy white comb honey is selling at 15c per pound, with No. 1 grades bringing 14@15c. There is not much demand at present, and will not be until this hot spell shall pass. Very few amber grades on the market and yet what there is does not sell. Extracted white, 7@7½c; amber, 6½@6¾c; dark, 6@6½c Beeswax, 28c. R. A. BURNETT & CO.

CINCINNATI, Aug. 8.—The demand for extracted honey is slow, while the shipments are many. I quote as follows: White clover, 8@8½c; Southern and amber, 6½@7c. Comb honey sells as fast as it arrives at the following prices: Fancy, 16@16½c; No. 1, 15c. Beeswax, good demand, 25c. C. H. W. WEBER.

BOSTON, Aug. 8.—Fancy 1-pound cartons, 17c; A 1, 15@16c; No. 1, 15c; No. 2, 12@13c. Extracted honey from 7½@8½c, as to quality.

It is too early in the season and too warm for any inquiry on honey, so prices named are only nominal. The prospects in this vicinity seem to be for a light crop. BLAKE, SCOTT & LEE.

BUFFALO, Aug. 18.—For strictly fancy white one-pound comb honey we are getting 16@17c. Any grade sells high—10@15c, as to grade. BATTERSON & CO.

KANSAS CITY, Aug. 20.—Very little comb or extracted honey in the market yet. We quote: No. 1 white comb, 14@15c; No. 2, 13@14c; No. 1 amber, 13½@14c; dark, 11@12c. Extracted, white, 6½@7c; amber, 6@6½c; dark, 5@5½c. Beeswax, 25c.

W. R. CROMWELL PRODUCE CO., Successors to C. C. Clemons & Co.

DETROIT, Aug. 10.—Fancy white comb, 14@15c; No. 1, 13@14c; no amber or dark to quote. White extracted, 6½@7c. M. H. HUNT & SON.

NEW YORK, July 26.—There is a fair demand for white comb honey, and enough arriving from the South to supply the demand. Fancy white sells at 15c; No. 1 white, 13@14c; No. 2 white, 11@12c. Extracted remains rather quiet, and the market is sufficiently stocked to meet the demand. Beeswax very firm at 28@29c. HILDRETH & SEGELKEN.

SAN FRANCISCO, Aug. 8.—White comb, 12@12½c; amber, 9@11; dark, 6½@7½c. Extracted, white, 7½@7¾c; light amber, 6½@7¾c; amber, 5½@6c. Beeswax, 26@28c.

There is not much honey coming forward at present from any quarter, neither is there very brisk demand locally or for shipment at full current rates. Water-white honey is the scarcest sort, and market for this description shows the most firmness.

WANTED—HONEY AND BEESWAX.

We have a tremendous and growing trade in this line, and would like to hear from all who have such goods to sell in any part of the country, with quality, description, and lowest cash price. THOS. C. STANLEY & SON, Fairfield, Ill.

Hamilton, Hancock Co., Ill.

DR. MILLER'S

Honey Queens

One Untested Queen Free as a Premium for sending ONE New Subscriber to the American Bee Journal for one year.

We have been fortunate in making an arrangement with DR. C. C. MILLER—the well-known honey-specialist—to rear queens EXCLUSIVELY FOR US DURING THE

SEASON OF 1900. These Queens will be mailed in rotation, so "first come first served."

The Queens Dr. Miller will send out on our orders will be precisely the same as those he rears for his own use, so of course they will be from his best stock. His best colony in 1899 had a queen reared in 1898; May 5, 1899, it had brood in 4 frames, and he gave it at that time a frame of brood without bees. It had no other help, but May 25 a frame of brood with adhering bees was taken from it, and the same thing was repeated June 3, leaving it at that time 5 frames of brood. It stored 178 sections of honey, weighing 159 pounds (and that after July 20, in a poor season), being 2½ times the average yield of all his colonies. A point of importance is the fact this colony did not swarm, and an inspection every week or 10 days showed that at no time during the entire season was there even so much as an egg in a queen-cell. Dr. Miller rears queens from this one.

The demand nowadays is for BEES THAT GET THE HONEY when there is any to get, and Dr. Miller has such bees. You will want to have a queen from his best, we are sure, even if she is not pure Italian.

Do not send any orders to Dr. Miller, as all orders MUST come thru us, according to our agreement.

Remember, send us \$1.00 for ONE NEW SUBSCRIBER to the American Bee Journal for one year, and YOU will get ONE OF DR. MILLER'S UNTESTED HONEY-QUEENS FREE AS A PREMIUM. This offer is made only to our present regular subscribers. Orders for queens are to be filled in rotation.

AMERICAN BEE JOURNAL

GEORGE W. YORK,
Editor.

CHICAGO, ILL., AUGUST 30, 1900.

FORTIETH YEAR.
No. 35.

WEEKLY

HON. EUGENE SECOR,
*Gen'l Manager and Treasurer of the Nat'l Bee-Keepers' Association,
Forest City, Iowa.*

THE AMERICAN BEE JOURNAL

PUBLISHED WEEKLY BY

GEORGE W. YORK & Co.

118 Michigan St., Chicago, Ill.

[Entered at the Post-Office at Chicago as Second-Class Mail-Matter.]

IMPORTANT NOTICES:

The Subscription Price of this journal is \$1.00 a year, in the United States, Canada, and Mexico; all other countries in the Postal Union, 50c a year extra for postage. Sample copy free.

The Wrapper-Label Date of this paper indicates the end of the month to which your subscription is paid. For instance, "Dec00" on your label shows that it is paid to the end of December, 1900.

Subscription Receipts—We do not send a receipt for money sent us to pay subscription, but change the date on your wrapper-label, which shows you that the money has been received and duly credited.

Advertising Rates will be given upon application.

Reformed Spelling.—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound. Also some other changes are used.

The Weekly Budget

HON. EUGENE SECOR, whose portrait graces our first page this week, needs no formal introduction to American bee-keepers. We may say, however, for the benefit of the newer readers, that he was born in New York State, May 13, 1841, being one of 11 children—a good old-fashioned family. At the age of 21 he went to Iowa, and in 1864 entered Cornell College. In 1866 he married Millie M. Spencer—a native of Ohio, of course! They have four children living—six having "gone on before."

Mr. Secor has held many prominent and responsible positions, to enumerate which would take too long and occupy too much space, tho it may be briefly noted that he is a Methodist, a banker, farmer, horticulturist, apiarist, stock-breeder, president and ex-president of nearly everything, and the "poet laureate" of apiculture—a sample of the latter being found on another page of this issue.

MR. J. H. SIPLE, of Bolivar Co., Miss., is spending a few weeks in Chicago. He is attending the National convention, after which he expects to return to look after his over 250 colonies of bees "way down in Mississippi."

MR. JOHN R. SCHMIDT, of Hamilton Co., Ohio, writing us Aug. 20th, said:

"The season has been quite poor. One apiary of 35 colonies yielded about 200 pounds of surplus honey. Others

have done worse, and some a little better. I have doubled my number of colonies, and averaged 48 pounds of A No. 1 comb honey per colony, which is about half the amount I have been working for *ever since last fall*. Only those who gave their bees the necessary care can boast of a crop. The others say there was no honey this year. Certainly, not for them."

STENOG gives this stanza as his first "pickup," in last Gleanings in Bee-Culture:

"From brazen skies the sun pours down
A flood of torrid heat;
All Nature pants beneath the scourge,
The bees get little sweet."

A Dutchman friend thinks this expresses it also:

Dot sun bin awful warm, I dinks,
He makes dot hot coom oud;
Und all dose flow'rs dry oop, py chiuks—
Pees not could vork deir mouid.

MR. FRANK B. WHITE, of the agricultural advertising firm of Frank B. White Co., of Chicago, is one of the whitest men we know. Tho not a bee-keeper, he is greatly interested in the success of bee-keepers, and, in fact, in the success of all agricultural people.

Without any invitation, or suggestion, he volunteered financial assistance, and was among the most generous contributors to the expenses of the National convention of bee-keepers now being held in Chicago. We believe his tribe is increasing, as it very properly deserves to do.

BEE-KEEPING IN HUNGARY.—The British Bee Journal says that in 1897 there were 641,127 colonies of bees in Hungary, of which 197,382 occupied hives with movable frames, and 443,745 were in straw hives. The honey was estimated at 6,800,000 pounds, and wax 3,000,000 pounds.

DR. E. GALLUP, of Orange Co., Calif., wrote us Aug. 6, as follows:

"As I went up town last week I past a century plant in full bloom, about 20 feet high, and literally alive with bees and humming-birds. Why don't bee-keepers advocate its planting for honey, as it is sure to bloom once in a hundred years? (!)

"This county has produced about 48 or 50 tons of honey this year, and San Diego county 400 tons; and it is about all marketed at from 5 to 6¼ cents—nearly all for the German market."

DR. MILLER'S HONEY QUEENS!

One Untested Queen Free as a Premium for sending ONE New Subscriber to the American Bee Journal for one year.

Or, send us \$1.50 and we will mail you a Queen and also credit your own subscription for One Year.

We have been fortunate in making an arrangement with DR. C. C. MILLER—the well-known honey-specialist—to rear queens EXCLUSIVELY FOR US DURING THE

SEASON OF 1900. These Queens will be mailed in rotation, so "first come first served."

The Queens Dr. Miller will send out on our orders will be precisely the same as those he rears for his own use, so of course they will be from his best stock. His best colony in 1899 had a queen reared in 1898; May 5, 1899, it had brood in 4 frames, and he gave it at that time a frame of brood without bees. It had no other help, but May 25 a frame of brood with adhering bees was taken from it, and the same thing was repeated June 3, leaving it at that time 5 frames of brood. It stored 178 sections of honey, weighing 159 pounds (and that after July 20, in a poor season), being 2½ times the average yield of all his colonies. A point of importance is the fact this colony did not swarm, and an inspection every week or 10 days showed that at no time during the entire season was there even so much as an egg in a queen-cell. Dr. Miller rears queens from this one.

The demand nowadays is for BEES THAT GET THE HONEY when there is any to get, and Dr. Miller has such bees. You will want to have a queen from his best, we are sure, even if she is not pure Italian.

Do not send any orders to Dr. Miller, as all orders MUST come thru us, according to our agreement.

Remember, send us \$1.00 for ONE NEW SUBSCRIBER to the American Bee Journal for one year, and YOU will get ONE OF DR. MILLER'S UNTESTED HONEY-QUEENS FREE AS A PREMIUM. This offer is made *only* to our present regular subscribers. Orders for queens are to be filled in rotation.

AMERICAN

THE OLDEST BEE-PAPER
IN AMERICA

BEE JOURNAL

40th YEAR.

CHICAGO, ILL., AUGUST 30, 1900.

No. 35.

* Editorial Comments. *

It's Just the Same "old reliable" American Bee Journal—only it has a brand new bonnet, and very properly "a bee in it."

The Chicago Convention of the National Bee-Keepers' Association will have closed by the time the majority of our readers receive this number of the American Bee Journal. We hope that, as anticipated, it was the largest and best bee-keepers' convention ever held on this continent. Surely, the program promised a rich treat for all who could attend. We expect very soon to begin the publication of the convention proceedings in these columns.

A Mission of Bee-Editors.—One of the editors of the British Bee Journal has this to say on the mission of the bee-editors:

"There can be no reasonable objection to individual bee-keepers making hives for their own use to whatever style, size, or shape they may prefer; but it forms part of our mission as editors to guide readers into the methods of management proved by experience to be best. . . . While allowing perfect freedom for all so far as regards personal preferences, we strongly deprecate any general interference with the size or measurement of the standard frame."

Nothing wrong with that view, as we can see.

To Find a Queen, one of the plans is to put the combs in pairs, having the pairs a little distance apart, using an additional hive for the needed room. After a time the bees without the queen will show signs of uneasiness, and the operator may look for the queen in the brace of combs where the bees are quiet. W. W. Case gave the plan in *Gleanings in Bee-Culture*, and Editor Root did not find it a success. The probability is that he did not wait long enough for the bees to have time to discover their queenlessness; and still greater is the probability that he did not heed one little item in Mr. Case's instructions, which was to open the hive rather roughly. If a queen is removed from a hive very quietly, a colony may not discover its loss for some hours, while the loss may be discovered in a less number of minutes if the bees be forcibly thrown from the combs, or be otherwise roughly handled.

New Kinks from the Inexperienced and Others.—It should not be supposed that only those with large experience and with large numbers of colonies of bees can write acceptable matter for a bee-paper. Sometimes an item is given by a novice that is of value to many others, possibly new to some of the veterans, and yet no one of the veterans familiar with it would think of giving it in print, because of the supposition that all were already familiar with it.

Often some little kink in bee-keeping may not be common property, and the experienced bee-keeper is always appreciative of such things, for it is the little things that often count the most.

Several illustrations of what has just been said have appeared lately. Editor Root told how he got the better of some cross bees by taking a piece of lath, or something of that kind, and whirling it rapidly in front of his face, so that every time one of the invaders approached him there was a dead bee. Dr. Miller said he had used the same plan for many years, but did not know enough to tell about it. No doubt many others had thought of and practiced a thing so simple, but like Dr. Miller had not known enough to tell of it. In the July Bee-Keepers' Review the following item occurs:

"BRACE-COMBS IN SUPERS are sometimes attached to the separators, and when the sections are taken out a piece of comb is pulled out. To avoid this trouble, set the super up on end. Look thru the spaces, and if any brace-combs are seen, cut thru them with a sharp, thin knife, giving the knife a sawing motion."

To this Editor Hutchinson adds the comment:

"This is another of those things that I supposed everybody knew, but Mr. J. T. Hairston writes as tho it was quite a discovery to him, and, if so, it may be to some others."

So do not hesitate to give freely little items of experience you have gained. They may be of as much value to others as to you. If not generally known, such items will always be welcomed in these columns. If so well known that you do not find what you have sent appearing in print, do not be discouraged; the next item you send may be just the thing that is wanted.

Should Extracted Honey be Left Open in tanks or cans for the sake of improving its body by evaporation? was a question discussed in the Canadian convention, as reported in the Canadian Bee Journal. Mr. McKnight, with whom the others seemed to agree, expressed himself somewhat strongly against it, on the ground that such exposure would allow the aroma to escape. He said:

"It altogether depends upon the character of the vessel in which it is put, and the conditions of the atmosphere, whether it improves or deteriorates. There is one thing certain, that if you put honey into an open vessel and keep it there for a certain length of time, it will lose its aroma whether it improves in body or fails. The essential oil which gives the honey the aroma is a volatile oil, and will pass off if it gets a chance, and it will get a chance in an open vessel; therefore, it will deteriorate so far as losing its aroma is concerned. As to its body, that depends much upon the temperature, the condition of the atmosphere, and the season of the year."

Dampening Sections for Folding.—When one-piece sections have been allowed to become dry they can not be folded without much breaking, and must be moistened in some way at the joints, where the wood is to bend. In *Gleanings in Bee-Culture* mention was made of taking 30' or more at a time, and Dr. Miller said it was too slow work.

to take so small a number. The editor replied that he thought nothing would be gained by putting 100 or 200 in a row. To this Dr. Miller replied:

"Bless your heart, I don't put any in a row at all. I just take a package as it comes from the factory, and, without taking out a section, wet the whole business at one fell swoop. I've told how, but I'll tell again. Take off one side of the package so as to expose the grooves, and see that the ends of the sections are chucked down solid together so that a drop of water let fall on a groove can run right down thru the whole. Understand, as the package lies before you, the edges, not the sides, of the sections are uppermost. Put a plug in a funnel that closes the opening entirely, except a groove at one side to let thru a very small stream. Let the plug project downward, and be whittled down to a point. Take a tea-kettle of water *boiling hot*, pour it into the funnel and direct the stream along the line of grooves, moving just fast enough so that the hot water will run clear thru."

Editor Root very properly suggests that this will work only with square sections, unless care be taken to place all the sections the same way in a box, so that each set of grooves will register with those below.

The Somerford Nucleus Plan Modified. In Gleanings in Bee-Culture W. A. H. Gilstrap speaks very highly of the plan of forming nuclei given by W. W. Somerford, which consists of making queenless several colonies, then in about nine days dividing the colonies into nuclei, each nucleus being supplied with queen-cells, and the nucleus being fastened in by means of leaves stuffed into the entrance, which leaves the bees will themselves remove. Mr. Gilstrap says:

"This splendid plan of increase is all right if you have a sufficient number of *best* queens. I am never so fortunate. It has been desirable for me to modify the plan in order to make rapid increase and properly improve stock. But it takes more time than to follow Mr. Somerford's method entirely.

"The modification which suits me best is, first, to get queen-cells by the Alley, Doolittle, Hyde, or other good plans from your *best* queen. Destroy as many of your *worst* queens as is necessary. When the brood is sealed, destroy all queen-cells of this inferior stock, and the following day form nuclei, using the cells from your choice stock, confining as Mr. Somerford directs. My best success has been where I stopt the hive-entrance with strips of old grain-sacks, but it is always convenient for me to liberate the bees if they fail to do so."

Bee-Keeping for Boys has not had the same attention as bee-keeping for women. Women nowadays are getting more and more able to hoe their own row, why not give the boys a chance? Here are some wise words spoken by J. J. Gunn, of Manitoba, in the Northwest Farmer:

"I would also suggest that when casting about for answers to the perplexing questions how to keep the boy on the farm, it might be a good idea to try what giving him a start as a bee-keeper in a small way would do. Very few boys, it seems to me, would fail to make a gratifying response to such a move. The management of an apiary for a number of years would not only be a business training, but would, I believe, foster and develop in most boys an appreciative love of nature and power of observation that would help them to a just discrimination between the perennial attractiveness of 'Nature, the dear old nurse,' and the tawdry varnish of city artificialities, which, unfortunately, possess such a fascination for young minds to which no healthful impetus and direction have been given."

To Avoid Propolis Between Sections and Sheet, a writer in the British Bee Journal says he succeeds by putting on the sheet wet. This allows it to be prest down snug on the sections, and it will remain close to the wood when dry, so that the bees will not be tempted to fill up the space with propolis. This may be worth trying for those who use sheets over their sections.

The Marriage of the Flowers.

BY HON. EUGENE SECOR.

In the meadow grasses tall
Bloomed a maiden Buttercup,
Golden as the yellow ball
With a Jersey cow yields up.

Sweet and beautiful she grew,
Fair enough for any king,
But no flower-lover knew
How this maid was blossoming:

For the meadow grass was high,
And she'd never learned to roam—
Was content if sun and sky
Kist her in her meadow home.

But the time had come to wed,
And new longings filled her heart;
Quiet happiness had fled,
Only *love* could heal the smart.

She had drunk the thought of God—
Longed for immortality;
Shrank from sinking 'neath the sod,
Barren, like a fruitless tree.

"Who will bring my Love to me?
Who will make my passion known?
Who will come and set me free
Ere I die, unblest, alone?"

"Over yonder hedge one hears
Mirth and music 'mong the flowers;
No one heeds the sighs and tears
Which my love has caused for hours.

"Who will make my passion known?
Who will take me to my Love?
When shall I embrace my own,
Witness by the blue above?"

Thus she cried and mourned her fate,
Just as any maid might do
When her days are growing late,
And she has no lover true.

Sweetness, tho, is never lost!
Never blossomed flower in vain!
All the wisdom which these cost
Argues lasting good and gain.

In the universe of God
Nought is wasted which is made;
Monarchs rule and daisies nod,
Working out the plan he laid.

Bird, and beast, and grass, and tree,
Each contributes unto each;
Scented rose and social bee
Both the art of service teach.

So the lonely maiden wept
Nect'rous drops of amber dew,
Wondering why her lover slept
Since the wind her passion knew.

Priestess Bee her secret guest—
Stopt to kiss her tears away—
Promptly volunteered the quest
For a mate that very day.

Swift of wing, and tireless, too,
Quickly she from flowers to flower
Told the story as she flew,
And returned within an hour

Bearing golden pledges back
From the tallest flower of all;
Sealed the union with a smack—
But remarkt, "*The fee was small.*"

Contributed Articles.

A Review of Bee-Books—"Langstroth Revised."

BY PROF. A. J. COOK.

IT is my purpose in a series of articles for the American Bee Journal to comment upon some of our bee-books, three of which I have carefully read during the past few months. I write in the spirit of most friendly criticism. I am proud of all the works. I well may be proud of them, for each one is not only a credit to the author and the art of bee-keeping, but also to the great world of book-making. Each is genuine and honest; and each shows the results of hard, persistent effort to benefit the people for whom the work was written. When any man writes a book with true, unselfish, disinterested purpose, aiming to benefit, refine and exalt those for whom he writes, well may we call such a man a philanthropist. He is adding another sheaf to the great garner of true, honest work, and, therefore, blesses the world.

The above thoughts were called forth by each of the three books which it has been my pleasure and my great profit to read in these last weeks, and which I now propose to review for the readers of our excellent American Bee Journal. The three books in the order in which they were read, and in which I shall review them are, "Dadant's Langstroth," Root's "A B C of Bee-Culture," and Cowan's "The Honey-Bee."

"LANGSTROTH ON THE HONEY-BEE."

It is with peculiar pleasure that I studied this masterpiece of bee-literature. It brought so vividly to mind the delights which came to me over a third of a century ago when I read that classic, not only in the presentation of the art side, but also in the revelation of the processes of scientific discovery—"Langstroth on the Honey-Bee."

Langstroth combined in himself that happiest trio of possessions—genius, rich culture, and, best of all, a pure,

Rev. L. L. Langstroth.

refined heart. Combine with these a masterful gift of language, and surely we have a rare specimen of manhood. All that was our dear friend Langstroth. Mr. Dadant has wisely left untouched those parts of the original work where new discoveries in art and science did not require a new cast. It has always been a wonder to me, as I have gone

over the eloquent paragraphs of Langstroth's great classic, how it was possible for any man to divine so many of the hidden facts of both science and practice, as did our genial, kindly old friend whose memory is so dear, to every American bee-keeper. This shows that he was a genius. A graduate of Yale College, he possessed the rare culture which is every genius' helpmeet. As a man, absolutely honest, and one who thought no evil, he was so guileless that others of very different mold were quick to take advantage of his very loveliness. The conduct of some others toward Mr. Langstroth furnishes the darkest page in all the great volume of American apiculture. I believe such treatment today would be impossible. God be praised that the world is moving so rapidly towards higher ideals and better lives.

Mr. Dadant, as one of the ablest bee-keepers of the United States, and one conversant with the bee-literature of the world, was, without doubt, just the person to undertake this important work. I doubt if he has a rival in his ability in the direction of extracted honey and the production and use of comb foundation. Thus, as we should expect, wherever he has touched the pages to bring the work into line with the best modern practice and knowledge, we are not pained by any serious contrast, as we might well expect to be.

It is to be regretted that he gives Cheshire credit for illustrations which the latter took without credit from such authors as Schiemenz, Wolff, etc. But, of course, he can not be blamed for this. He also gives Cheshire credit for ideas which the latter also plagiarized. A copyist is always likely to run into error, especially a copyist who gives no credit. It is always dangerous to follow such an one. Mr. Dadant could not know regarding this, and so is not blamable for the blemishes. It seems questionable to criticize so excellent a book, but the mistakes as I have seen them are so few that I am bold to do so.

In a note on page 14, taken from the great Claude Bernard, I think there is plainly an error. "If you deprive a bird, a pigeon, for instance, of its cerebral lobe it will be deprived of its instinct, yet it will live if you stuff it with food. Furthermore, its brain will eventually be renewed, thus bringing back all the uses of its senses." As I understand, instinctive actions are such as take place independent of the cerebrum. Walking after one is started is almost wholly instinctive. We do it without thought. The cerebrum plays no part. The piano-player acquires ability so that after commencing to play a piece the fingers run on and the person may talk or sing something else. I have heard instinct called "frozen habit." We cut a frog's head off, throw the body into the water, and it swims almost as well as before the decapitation. These are purely reflex acts, and I think are akin to what we call instinct. The cerebrum, of course, takes no part. I supposed that the nerve-cells that were the center of instinctive actions were largely, if not wholly, outside of the cerebrum; the latter is the great center of intelligent action. Again, I did not suppose that brain tissue once lost was restored. I had thought that a fatty substance replaced it. We know that the function comes back, and so are led to believe that a part of the brain, upon occasion, may do the work previously done by quite another part. I am surprised that Bernard wrote the above paragraph. I do not believe he would have done so in the latter part of his life.

On page 15 the glands that appear like a string of onions are referred to as the upper head-glands. I remember them as lower than the other glands, and would call them the lower head-glands.

On page 16 Cheshire and others are quoted as showing that the secretions of these glands is the food of the larvæ, queen, etc. We now know positively that this is not true. The food of the larvæ, etc., is digested and regurgitated by the nurse-bees, and the secretion is a digestive fluid. Even Schiemenz (from whom so much of Cheshire is taken) made this mistake. By mixing finely ground charcoal with honey I have found that it appears in the brood-cells. This demonstrates that the nurse-bees digest the larval food.

On page 17 we read that the food eaten by the queen is digested and assimilated by the bees for her use. Of course, this is a wrong use of the word assimilated. To assimilate is to convert into tissue. It may be defined in some of the dictionaries as a synonym with digestion; but it is not so used in our physiologies. It is rather synonymous with constructive metabolism or anabolism.

On the same page (17), in speaking of the racemose glands, the other glands of the head and those of the thorax, it is stated that the saliva produced from them helps the digestion, changes chemical conditions of nectar, helps to knead the scales of wax, and perhaps the propolis. The

author adds that it is also used to dilute the honey and moisten the pollen-grains. I believe too much is claimed for this secretion. It certainly aids in digestion, for it without doubt digests the nectar. I would hardly claim more for it, at least with any great positiveness.

Los Angeles, Calif.

(Concluded next week.)

The France Quadruple Hive System.

REFERRING to page 466, how does Mr. France fix the entrance thru the chaff packing?

2. Why does he have upper and lower entrances?
3. Why use auger-holes instead of ordinary entrances?
4. How are the hive-bodies set on the bottoms? Facing which way?
5. Does he use the ordinary hive-bottom—Danzy?
6. Are the two or three auger-holes sufficient to admit a rush of bees in the honey harvest?
7. Does he remove the middle band for winter?

Cook Co., Ill.

HERMAN F. MOORE.

[Mr. France kindly replies to the above as follows:—
EDITOR.]

1. A 2-inch space packed with chaff on all sides of the hive. The entrance is thru 2x4 inch blocks, with entrance cut thru the block. Lower entrance, $\frac{3}{4}$ -inch notch in the block on the bottom-board.

2. If only lower entrance, it may get clogged in winter; also is not entrance enough during the harvest season, hence the upper entrance—2-inch auger-hole, with button nearly to close the same in winter.

3. Auger-holes are easily made, and are mouse-proof in winter.

4. The hive-bottom is nailed on the hive when the hive is made. One entrance on each side—north, south, east and west. A 20-year record of each colony finds no preference in direction of entrance. I have seen similar hive-entrances to the east and west with good results.

5. Standard Langstroth frame.

6. Yes; during the honey-flow the upper entrance is open, but nearly closed at other times.

7. The hive-band is removed only when the hives are three stories high, during the honey harvest.

Grant Co., Wis.

N. E. FRANCE.

Comb Honey—Harvesting, Storing and Crating.

BY F. A. SNELL.

IN harvesting or taking comb honey from our bees it is important that we do it at the right time, especially if intended for market, which is the case with the more extensive bee-keeper. In securing comb honey I practice the tiering-up system, and have done so for over 30 years. I can get more honey by this system than any other I have ever tried, and they have been many. One super of boxes is first given each strong colony run for comb honey, and as more room is required the first cases are raised up and a new one placed beneath, and at times during good seasons the third case is added and placed next to the brood-chamber.

I go thru my apiary twice each week during a good flow, and note the progress being made in the supers, as I can quickly do, as every super has an observation glass thru which I can at a glance see what is being done. All completed supers are removed from the hives at each time, freed of bees, and taken to the honey-room adjoining the bee-yard. At this time, if more room is needed it is given each colony requiring it.

To have the honey in the best shape to sell, it should be removed from the hives as soon as all is capt over. The beautiful cappings are then white and very inviting. If allowed to remain long after being capt in the hives the cappings become darkened by the bees, and the appearance is injured.

As the summer harvest, which here is secured from white and alsike clover, and basswood, nears its close, less surplus room should be given, for by the contraction of space in the supers more combs will be completed than in the larger space, and I desire to get all the finished comb honey possible. At the close of surplus gathering from the above sources, all the supers should be removed from the hives, cleared of bees, and stored in the honey-house.

For the correct storing of surplus honey a warm, dry, and airy room is essential. There should be windows at least on two sides of the room to admit light and a good circulation. The windows should be opposite, and I think preferably at the east and west sides of the room. The building should not be shaded, and should be painted a dark red or some dark color, so as to draw heat. The hot, dry air of summer will in motion do much to still better ripen the honey. Screens of fine wire should be tacked on the outside of the window-casing at the bottom and sides, and a $\frac{3}{8}$ -inch space left at the top by full width of the window, and extend about one foot above the window. This will allow any bees that may be carried in with the honey to escape at the top, and will also exclude all bees, flies, and millers.

The building should be one foot or more above ground, so no dampness may be caused from beneath. The windows should be left open on all pleasant days in summer. Of course, the honey-room should be mouse-proof. A strong rack should be made on which to place the honey, and preferably at one side or end of the room, as it will so least interfere with working room. The rack should be one foot above the floor, so the air may freely pass under it. A row of cases should first be put on, and on top of these at the front and back strips one inch square should be placed; and this should be continued in the same way until the space is filled to the ceiling of the room, if necessary.

All of the finest honey should be stored in a body, and that not so fine by itself. At the time the honey is taken in I place it to one side, and the next morning clean off the propolis from the supers and boxes, so far as we can, and tier it up on the rack in the proper place.

By storing the honey as above stated, the hot air circulates freely all thru between the cases and boxes, just as it should do to ripen the honey more fully. The honey is thus left until time for crating to market, which is of necessity after the close of the summer harvest. Some is crated to supply my home demand, but the larger part is left until September.

The supers taken off at the close of the summer harvest not completed are tiered separately.

To handle and crate comb honey properly requires much care. The delicate combs are very easily cut or bruised, and a little carelessness will result in broken combs and dripping honey. In crating comb honey I have a case at my right hand on a bench; at my left I place a honey-case. A section-box is raised from the super, taken in the left hand, and with the right hand I use the hive-opener with which I scrape off the propolis from the box and place it at one corner of the case, next the glass. The second section is removed from the super, and placed next to the first one in the case, and so I proceed until the case is filled. The other supers of the same grade are thus emptied. If any combs are cut, or in any way broken, such should not be put in the case. A very few broken combs, if cased, will make a dauby mess, as the honey will cover much of the case bottom and drip thru, thus disgusting all who may in any way later handle the honey.

I usually case my nicest honey first, which I grade as No. 1. That not so white in comb, or a little colored by the bees, and combs not so complete, is styled No. 2. The honey in the cases of each grade should be uniform in quality. The honey next the glass in each case should be no nicer than that in the central part. The honey should in other ways be cased so that to see the combs next the glass, as it stands in the store or commission house, may be an evidence of the quality of the whole case without further inspection. When honey is so put up, the purchaser, whether grocer or consumer, can take it, and handle it comb by comb with satisfaction in selling or using. Every bee-keeper has his own reputation to build up and hold; if he expects good sales in the future, his goods should be as represented by the honey in full view.

The partially filled supers taken off at the close of the summer harvest should be looked over, and all complete boxes cased for sale, and those not so filled returned to the hives at the opening of the fall honey-flow, if such comes.

For the second grade I use very few uncapt combs, or those combs not nearly all capt. I sell some of the partially capt combs to neighbors, or to those who call and may see and prefer it at a lower price. Those not sold at the close of the honey season are emptied and used the next season. My honey-cases have two glass sides, which show off the honey to good advantage, and aid sales. The covers are tight fitting, and come over to the outside of the cases thus keeping out all dust, etc.

Carroll Co., Ill.

New Apiarian Inventions—Are They Needed?

BY JOHN H. MARTIN.

(Read at the last meeting of the California State Convention.)

EVERY bee-keeper recognizes that in order to get the most profit out of the bees, the business must be conducted upon a large scale. We have examples in many portions of the country where the owner of many apiaries, and at least a thousand colonies of bees, are the ones that are deriving the greatest profit from them, and the profit is increased according as they adopt short cuts in the labor, and where hired help is dispensed with as far as possible.

While working our bees for extracted honey, our present method of removing each frame separately and brushing the bees therefrom, and stirring them up to a high state of anger, may be classed as a primitive and roundabout way of management.

I will outline some work that is being done along this line with some degrees of success. In the first place, a shallow super is required. If the cover is quietly removed from such a super, and a cloth saturated with a solution of carbolic acid is spread over it, the bees, having a dislike to the odor, will soon leave the super, and it can be removed. Or a shallow super that is fitted with close-end frames that can be held firmly in place can be rid of the bees by a peculiar method of shaking.

The Porter bee-escape has been recommended by some bee-keepers, but it is too slow in its operation, and on that account should be discarded for this particular purpose.

Then, when the exigencies of the time demand, we will have a machine for uncapping the honey. I have gone so far with some experiments in this line that I am quite sure that a machine can be constructed that will uncap six or eight combs in just a few seconds; or, in other words, you touch the button and the machine will do the rest.

When a bee-keeper can uncup a number of combs as quickly as he can one side of one comb, there is a distinct gain in time, and a consequent reduction in the cost of production.

An ordinary two-frame honey-extractor will, when the combs are well filled with honey, enable us to extract ten pounds at one operation; and to double this amount the four-frame extractor has been introduced; but now we need in a large apiary, and to follow the lightning uncapping machine, an extractor that will enable us to extract 100 pounds at one operation, and nearly as rapidly as one man can extract ten pounds with a small machine. The labor then would in a great measure be with the care of the honey, getting it into cans and to market.

I also certainly expect that the automobile will play an important part in honey production. There is no bee-keeper who feels safe to drive a span of horses near a bee-ranch, except in the night, and we learn of the death of horses every year from the stings of angry bees. The automobile will enable the bee-keeper to approach, or pass directly thru, the apiary with his load of appliances and honey at any seasonable hour; and the automobile can be used for a variety of purposes in the apiary, running a saw, running the extractor, or anything where light power is needed.

Franklin's printing press was a crude affair, but it answered the purpose when Franklin was a printer, and the circulation of papers was limited, but Franklin's press would make a sorry show beside the modern lightning press; but the bee-keeper's interests are not so extensive, like the making of newspapers, and inventors will not give their time to the invention of appliances that will have but limited sale; but we may be quite sure that if the business had warranted it, such rapid manipulation as I have outlined would have been in use long ago.

When we further consider the subject of new inventions for the apiary and its management, we find that there is room for improvement in every line of our work. The smoker with which we subdue our bees is too large and cumbersome to operate with dispatch. In fact, with any of our bellows smokers quite a percentage of our time is spent in working the bellows. My ideal smoker would be not overlarge, and with it I would have a proper, prepared fuel, and it should be self-operating; and so arranged that both hands of the bee-keeper can be used in the manipulation of the hive while the smoker is doing its part automatically.

We need new and fancy packages for small amounts of honey, something that can be sold on the street and on the lines of transportation.

☐ Such a package was sent to me some time ago, and it worked like a charm. The honey could be eaten from it as it was held in the hand, but there was a strong objection to

the material it was made from. It was made from the same material that forms the covering for sausages. Such material is all right when applied to sausages, but there is an evident unfitness of things when applied as a receptacle for honey.

The foregoing improvements I think will occupy the attention of bee-keepers in the near future, and greater than these will certainly be developed if the exigencies of our industry demand.

"The Importance of Water for Bees."

BY G. M. DOOLITTLE.

ON page 482 is a most remarkable article, considering that it comes from the pen of that careful observer, Prof. A. J. Cook. Not that I think that we know "all that is to be known regarding the use of water in the apiary," but *facts* go to prove that his analogy regarding the bees and higher animals is faulty, and his logic mainly theory rather than logic coming from close observation.

Did Prof. Cook ever see a bee perspire? If so, he has seen something I never saw, and I have looked particularly on this point. He has doubtless seen perspiration stand on nearly all of the higher order of animals. He quotes bees dying of suffocation as proof of perspiration. But had he touched his tongue to one of those bees just dead from the "water of respiration," and "of perspiration," he would have found that instead of a "mass of dead bees and water," he had a mass of dead bees and stickiness, thus showing that in their dying efforts the bees had disgorged the honey they had taken thru their disturbance caused by being shut up. And had he allowed these "stuck up" bees their liberty just before death overtook them, in a place where they could "wallow" in the dust and dirt, as I once happened to do, he would have found that the dust and dirt was fastened to them after dry, very much as paint is fastened to a building, rather than becoming a dust that would rub off easily, as dust always will where only water is mingled with it.

Again, facts prove that bees visit watering-places to any great extent only when *brood* is being reared, instead of at times of greatest heat and activity, as Prof. Cook's theory would lead him and us to believe.

Let me give some facts which I have observed almost times without number. In March, April and May I have seen bees by the thousands repairing to the watering-places with the mercury at from 45 to 50 degrees—so cold that, should a cloud pass over the sun, hundreds and thousands would remain chilled, and die from the cold and frosts of the night following. Were they in a state of perspiration then? No. Well, what were they out at the watering-places for? Thousands and millions of little larval mouths "watering" at home, for water to mix with honey and pollen so that these little larval mouths might have chyle to eat that they might grow into imago bees. Can it be that Prof. Cook never observed bees at watering-places at such times as this?

Now let us change the time of year. Several years of my bee-keeping life have given very hot weather during September and October, after brood-rearing had nearly or quite ceased, and during these months with this extreme heat often came a great gathering of "honey-dew," so that the bees were as active and the weather just as hot as it ever is during basswood harvest, the mercury standing up in the 90's, and the bees rushing pell-mell in and out at the entrance every day for a few days, while the heat and dew lasted, but thus far neither lasted long enough (or else it was out of season) to start brood-rearing to any extent. Did I find any bees at the watering-places "slaking their thirst," or getting water to take the place of that thrown off by perspiration? No, not a bee there, or very few at most. Why? Because there were no larval mouths in the hive calling for water in the chyle not being prepared.

Once more, and I will leave other facts to rest till Prof. Cook meets these given. When we handle combs of brood, the larvæ in which are nearly ready to seal, or have just been sealed, are they heavy or light? I have weighed combs of brood, the central portion of which was just sealed, and the remainder nearly ready to seal, which weighed 4½ pounds, while the same frame when full of sealed honey weighed six pounds, and when empty ¾ of a pound. Where and from what source did this weight mainly come? Was it the honey the larvæ contained? Was it the pollen they had eaten? Prof. Cook knows, and the readers in general know, that said weight was *water*, to

nearly or quite as great an extent as Prof. Cook tells us in his article on page 482, enters into the composition of fruits and vegetables. Where did this water come from? Some from the honey in their food, some from the pollen which entered into the chyle formed, but mostly from the "rill" or watering-place which the bees visited to secure the necessary water for the chyle out of which the larval bee grew from the tiniest speck scarcely discernible to the naked eye, until each comb full weighed nearly or quite four pounds, 90 percent of which was water.

With six combs of brood to the hive we have an approximate weight equal to about 20 pounds, or 2½ gallons of water; and yet Prof. Cook would have us believe, "I doubt then if it is correct to say that bees need water to aid in brood-rearing." Oh, Professor!

Onondaga, Co., N. Y.

Questions and Answers.

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

[The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.]

Colonies Building Drone-Comb.

I have two colonies with queens hatcht last spring. For awhile they built nice worker-comb and I supposed they would do so all summer, but since they became populous they have been determined to build drone-comb. Will it do to cut out the drone-comb, and after pinching out the larvæ, put the new drone-comb into sections for the bees to fill with honey?

BEGINNER.

ANSWER.—Yes, but it will be a tedious job to pick out the larvæ one by one. Sprinkle fine salt on them, and the bees will clean them out, but you must be sure to miss none. If left out of the hive a few days, the bees will clean them out when given to them. But it will do little good to cut drone-comb out of the brood-combs, unless you fill in the places with patches of worker-comb or foundation, for if left to themselves the bees will promptly fill up again with drone-comb.

Clovers for Tennessee.

1. I want to sow some kind of clover this fall that will bloom next summer for my bees, and for hay. Will either one of the sweet variety bloom next summer, if sown this fall or next spring?

2. Will alsike or alfalfa clover do as the above?

I mean for Tennessee, as I want to buy the right kind.

3. Will any of the above-named clovers be a torment to the farm, as it has been said of the sweet variety?

TENNESSEE.

ANSWERS.—1. Neither white nor yellow sweet clover will bloom next summer if the seed is sown next spring, but either will bloom next summer if sown so as to start growth this fall.

2. Alfalfa will not bloom the first year, but alsike will.

3. Neither one of them is troublesome on cultivated ground, but sweet clover is persistent on the roadside. It is a mistake to think that sweet clover is hard to kill out on cultivated ground. It grows one year and blooms the next, and then dies out root and branch the second winter. It can be plowed under so as to prevent going to seed, and that's the end of it.

Holy Land Bees Filling the Brood-Nest, and Avoiding the Super.

1. All things equal in the spring, and allowing each colony to swarm once, which will get the more surplus comb honey, a colony of 3-banded Italians, or Holy Land bees? Are Holy Land bees very savage?

2. Would a cross between 3-banded and golden Italians be an improvement? I have heard that crosses usually are better.

3. A colony declines to go into the super, but fills the

brood-nest with honey; I have furnisht a young queen, and she has scarcely any room to lay; I have no extractor, and I don't know what to do.

MINNESOTA.

ANSWER.—1. Taking both kinds as the average, it might be safest to risk the Italians. Root's A B C of Bee-Culture says: "The Holy Lands seem quiet enough, and the queens are enormously prolific; but for some reason or other, at the present writing quite a number of the friends are getting rid of them, and going back to the Italians again, as more gentle."

2. A first cross is likely to show increast vigor; but without care in selection the successors of that first cross are likely to deteriorate.

3. About the easiest thing to do is to get an extractor, and you may find this a profitable investment if you have several colonies. However, it may be better to get the bees to empty the combs than to empty them yourself. Uncap the honey in the parts of the combs that you think ought to be occupied with brood. Instead of uncapping with a sharp knife, it may be still better to scratch the surface with a three-tined fork. The tines of an ordinary table-fork are too far apart for best work. Tie them together with fine wire so that the points shall be about 3-16 of an inch apart. Of course the wire must not be too close to the ends of the points, say half an inch, or more, distant. Still another way is to take a common wire hair-brush and strike repeatedly upon the cappings hard enough to pierce them. The bees will clean the honey out, giving the queen room to lay, and this also tends to have the emptied honey stored in the sections. You can aid the matter by giving a bait-section in the super, a section that is partly or wholly drawn out; a good way being to take a half-filled section from a colony storing well in the super, taking bees and all.

Tulip or Whitewood—Uniting Weak Colonies.

1. Will the tulip or whitewood tree live and thrive in northwestern Iowa?

2. I had a colony of bees in a home-made hive which in the spring showed signs of having had the bee diarrhea, and I of course had to feed them, as they did not have any honey left in the combs. They did fairly well for awhile, but were attackt by the bee-moth and became so bad that I united it with a weak after-swarm. Both swarms had queens. The swarms united quite peaceably. Is there danger of both queens getting killed? or do you think that I ought to have killed one queen?

IOWA.

ANSWERS.—1. Somewhat doubtful. I made a little attempt at it without success, but possibly you might do better.

2. There is not much danger that both queens were killed. Indeed, it is a common practice to unite two colonies without paying any attention to the queens, unless there is a choice of queens, when the poorer is killed.

Please don't blame the bee-moth unjustly. The colony did not fail because the moth attackt them, but the moth attackt the colony because the bees had reacht the point of failure. If you want to bid defiance to the moth, keep all colonies strong. Even a rather weak colony will keep the moth at bay if the bees are Italian or partly Italian.

Colonies Seemingly Queenless.

I am a beginner in bee-culture, and in looking thru my 14 colonies of bees I found two colonies seemingly queenless. There were no eggs or brood in any stage. I gave them each a frame from a strong colony containing eggs and brood in all stages, and two days later I found no queen-cells. What shall I do?

OREGON.

ANSWER.—The great probability is that a virgin queen was present, and most likely before this answer appears she will be laying all right. You did exactly the right thing. Of course there is a possibility that the virgin queen may have been lost later, and a week after giving the first frame of brood it may be well to give another, if you do not find the queen yet laying.

There is a possibility that the bees were hopelessly queenless, and slow about starting queen-cells, and that altho no queen-cells were started within two days, they might be started later. If the bees have not been queenless so long as to be old and reduced in strength, a continued giving of brood, especially young brood, will result successfully.

* The Afterthought. *

The "Old Reliable" seen thru New and Unreliable Glasses.
By E. E. HASTY, Richards, Ohio.

A NOSEY BRIDGE.

Notwithstanding the woe pronounced upon those "who do their trades forsake," I'm going to go into a new trade, to-wit, bridge-building. Think I can profitably construct a bridge out of the *noses* of those who wrote in Nos. 28 and 29. These sage lucubrations are too far after date; and the above seems to be the most practical way to catch up a little.

CRIMSON CLOVER AS A HONEY-PLANT.

That crimson clover that opens No. 30 looks familiar—and it's sad to part with so good a friend. The last two winters at this point have been bad about killing things, crimson clover included; and I sadly fear our farmers have been frightened out of sowing it—quite a calamity. Twenty bees to the square foot is almost amazing. Mr. Greiner is reliable, I believe; and no such crowd of bees would come unless there was considerable honey. Say, some of the boys where the crimson is plenty try a little rivalry with Notre Dame, and do some May extracting.

QUADRUPLE HIVES—OUT-APIARIES.

The picture on page 467 tells a plain story about the France quadruple hive. It seems rather a wonder that this hive, described long ago, has been adopted by so few. Some of its points look quite attractive.

Have your out-apiary on a slope so one man can pull in the empty wagon from above, and the crew can run out the loaded wagon below, without bringing any horses in dangerous proximity to bees. (Better than ku-klux robes on the horses.) Temporary extracting-house of cheese-cloth, made up with strips of leather in: at the proper places. Permanent posts and margin strips. To put up house, just drive (half way) a few wire nails thru the leathers; and pull the nails out when you fold up *a la* Arabs.

UNFINISHT SECTIONS.

Deacon reminds us once more that apiculture is a business of details. Yes, that's so, details with a spice of sharp tails sprinkled on now and then—and a few dull tales taken betimes medically. Two thousand unfinished sections in one season! And their owner almost thinking of suicide! A familiar experience to many of the boys; but some remedy ought to have arrived before this. My system requires 200 to start out with next season (can do with 100), and I almost always wish I had more. Like the oculist who takes your eye out, and fixes it, and puts it back again, Mr. D. (having postponed suicide till another year) cuts the comb out, renovates both comb and section, and then marries the twain again with a hot case-knife. I suspect that his style of setting empty combs in a section is worth remembering and trying. Hold the comb gently against the wood, and fiddle between with a hot knife, and suddenly, all at once, the comb is fast. Page 467.

AGAINST EXTRA-CLOSE FRAME-SPACING.

Doolittle sits hard (but none too hard, I think) on extra-close spacing for frames. More fuss for yourself, less heat for the early brood, bother in exchanging frames, more danger in out-door wintering—and advantage, nobody knows what. And Mr. D. thinks that the delay necessitated by the Heddon method of transferring puts it entirely out as an early spring method. When there is no more hope of a crop from that hive, Heddon method O. K. then. Page 468.

KEEPING UNCOOKT FRUIT IN HONEY.

Mrs. Axtell years ago won her recognition as a reliable writer, and if she finds all her efforts to keep uncooked fruit in honey to be failures (others finding the same), probably we would better set that down as only practical under exceptional conditions. Page 477.

VARIOUS KINDS OF DISEASED BROOD,

Page 471 gets at distinctions which are urgently needed in pretty nearly the right way differentiation. Without this a description of diseases and things is pretty sure to

mix us up in our minds. Foul brood, smell of glue; black brood, sour smell; pickled brood, no very pronounced smell (I take it). Foul brood, curiously elastic consistence; black brood, jelly-like consistence; pickled brood, neither rope nor jelly, but a watery willingness to squeeze out. But pickled brood often turns black by reason of a black fungus that attacks it. And is black brood black looking at all stages? I've forgotten, if any one ever told.

CATNIP VS. SWEET CLOVER.

Four times as much honey in catnip as in sweet clover, is the way J. L. Gandy puts it. Yum, yum! Page 474.

"AGIN" THE COTTON-WASTE SMOKER-FUEL.

How about the new smoker-fuel, page 473? Well, I think we already have propolis on our hands (both figuratively and literally), and some other dirtinesses unavoidable, and I decidedly object to importing wheel-grease from the railroads. No need of it.

IS IT A "FREE MASON" APIARY.

Wonder if I see the White apiary correctly. Do I faintly see the front of the hives markt with Free Mason signs—diamond, cross, clover leaf, double column, straddle-bug, etc.?" If it's on the "square," and within the "compass" of sweet reasonableness, he might tell us about it. Page 481.

BEESWAX—CORRECTING THE CORRECTERS.

The Chicago Record's article on beeswax was pretty full of errors; but I fear the correcters corrected too much. Locality does come in to a limited extent on beeswax. African wax is not like American, if I am right; and wax imported from Jamaica has a fine red tint, and a peculiar fragrance never found in northern samples. Dr. Miller may be right that fresh wax-scales direct from the bee are always the same tint; but my *idea* of the matter has been that some are nearly white, and some quite a bit more yellow, the exact tint depending upon how recently that individual bee has been digesting pollen to feed larvæ. How is that, ye experimenters? It is quite desirable that when experts correct the great journals they should correct correctly. Page 483.

"HOW TO GET THE MOST OUT OF YOURSELF."

This is so important a topic that I should like to see every able writer in beedom essay it—not all at once perhaps, but anon and anon. How *not to do it* is a science sadly in vogue. Old Grimes does well on it, page 484—one of the best articles he has given us. Get clear in soul. Translate "Quit your meanness" into the terms of bodily health. (But there's lots of room for others in the details of the clarification and translation.) Then feed your mind liberally, and go ahead. Especially good is the counsel to teach little children never to get into debt—then one mortgage upon the mind and leaden weight upon the soul will never hinder *them*.

MANAGING LATE SWARMS.

Not over 18 hours afterward, Doolittle says (and I guess that's an important item), give to the colony that has swarmed and been moved to a new location a virgin queen or ripe cell. The poverty of soul that accepts anything you give them will not last but a little while, and it is essential to use it before it gives place to a bumptious *esprit du corps*. Wonder if 18 hours is not a slip for 28 hours. Otherwise it would run out, and not cover the "any time during the forenoon of the next day," of which we read. Page 485.

SWARMING "A-FOOT."

The swarm of bees traveling on foot, reported on page 486, is of decided interest. I never had exactly that; but I once had a swarm that *might* have proceeded similarly had the ground been smooth and hard, and had I let them alone. A swarm in an apple-tree, with grass underneath, left for the woods. After some 20 minutes, perhaps more, they came back and alighted on the ground. It seems the queen, unknown to me, had fallen there.

RAINBOW OR CALICO-COLORED CUBAN SOIL.

No previous writer on Cuba has told us about its calico-colored soil, as I remember. To see on one acre of hillside soil white, black, brown, yellow, blue and red is quite unique. But as the Cuban bogey-man is not going to spoil our markets with floods of untariffed honey, we can afford to let them have all the rainbow they want in their soil. T. B. Drury, page 491.

ROOT COMPANY'S PAGE.

SHIPPING-CASES.

Our No-Drip Cases are still in the lead. We keep constantly on hand a large assortment from 12-pound size up. We also make special sizes to order.

That Root's Cases are in demand is shown by the fact that one dealer alone has ordered 16,000 this season.

WINTER-CASES.

Our Winter-Cases are made of thin lumber dovetailed at the corners, with a telescope cover.

The cost is only 75 cents each singly, yet for convenience they are unsurpassed, and only excelled by the chaff hive in the protection afforded. Don't let your bees winter-kill or spring-dwindle when you can avoid it by using our Winter-Cases.

RUBBER GLOVES.

This is the time of the year when you need gloves, for robbers are about the bees and they are harder to handle than earlier. Take comfort with a pair of our gloves.

Ladies' sizes, Nos. 6, 7, 8 and 9, \$1.35; postage, 5c
Gents' sizes, Nos. 10, 11 and 12, \$1.45; " 5c
Extra long driving, Nos 13, 14, \$1.70; " 10c

Mark size of hand on sheet of paper when ordering. If you order by number, remember that in rubber you need two sizes larger than you wear in kid; i. e., if you wear No. 6 in kid you will need No. 8 rubber.

BICYCLES

In trade for honey at market prices.

Having sold a carload of bicycle crates, we took in trade a quantity of machines which, so long as they last, we will sell **AT COST**.

A \$30.00 bicycle—"Pathfinder"—made by the National American Cycle Company, Akron, O., for \$17.00 cash or \$20.00 in trade for honey of good quality at market prices. Catalog and further particulars will be sent on application. Send a sample of your honey and we will give you price we will allow.

COMB FOUNDATION.

Not too late yet to order Comb Foundation for the fall flow. If you order Root's Weed Process you may be sure you will be pleased with the result. We keep in stock the four grades in boxes of 1, 2, 3, 5, 10 or 25 pounds.

A small order has the same attention as an order for a ton.

SPECIAL GOODS.

This is the time when you should order odd size or special goods. Our busy season is over and we can do almost any work in wood you want, either for bee-keepers or others.

We make a specialty of packing-boxes, from the size of a section-box up. Let us figure with you.

FEEDERS.

How about your winter stores? Are you sure your bees have enough? Should it be necessary to feed you can't do it easier than with our Division-Board Feeder. This is made to hang like a frame in a Langstroth hive. Price, 20 cents each, complete. Less in quantities.

Honey-Labels.

Do you use labels for your honey? Are they really ATTRACTIVE labels? If you do not you may be losing many sales because your honey lacks attractiveness. You can't expect to market your honey at the best price unless you use every care in putting it up. Send for our label catalog and see our 1, 2, and 3 color labels.

Tin Packages for Honey.

If you are one of the people who market extracted honey in small lots you will find our pails just what you want. A dozen sizes and kinds to select from. We also furnish square cans—1-quart, 2-quart; 1-gallon and 5-gallons. A single can or carload, as you wish. Write for prices.

Gleanings in Bee-Culture.

When our advertisers write us that their advertisements have paid them well, we know GLEANINGS IN BEE-CULTURE must be read by the best bee-keepers. We know, too, that GLEANINGS is appreciated, for our circulation is increasing all the time. Send 25c for a six months' trial and get A. I. R's Notes of Travel and hundreds of other interesting things.

Comb-Foundation Mills.

Perhaps you are so far from us and rates are so high that you want to make your own foundation.

Our mills are being improved constantly. If you want to purchase a foundation mill, send for package of samples showing different styles we can furnish. Send 2c stamp for these.

Bushel Boxes.

Bee-keepers are always looking for labor-saving ideas. Have you ever read our 16-page pamphlet, "Handling Farm Produce?" It is full of information and gives prices of bushel boxes and other things. Free for the asking.

HONEY-EXTRACTORS.

"Operator No. 6 puts the honey-combs in the extractors, which is a Cowan 4-frame reversible, with ball-bearings and lever-brake—in short, the best extractor on the market."

Extract from article of N. E. France, of Wisconsin, in June Review. No one is better qualified to judge the worth of an extractor than Mr. France. He says the ROOT COWAN IS THE BEST.

Thousands of others say so.

Glass Honey-Packages.

We have all sizes of Mason Jars with aluminum or porcelain-lined caps. Also Jelly Tumblers, two sizes; Glass Pails, four sizes; and Self-Sealing Jam Jars. Besides these we still have the four sizes square jars, which have long been on the market. Don't forget us when you need glass packages for honey.

RUBBER STAMPS.

Have you ever thought how handy it would be to use a rubber stamp to mark your honey-cases, showing the grade? Then, too, if you sell in the home market you ought to have your name on the case so it would be returned. We make stamps of all kinds for all sorts of purposes. Let us send you our rubber stamp circular.

QUEENS.

We don't say much about our queens, do we? I suppose some of our friends wonder why. Let us tell you: We began selling queens many years ago. We know all about the business from A to Z. We have the best breeding queens to be found in this country or Italy, and the best apiarist to be had. The result is our 400 colonies do not begin to furnish enough queens for our orders. Our queens are **unsurpassed**.

You will find it so if you buy them.

HONEY.

We buy a number of carloads of comb and extracted honey each year. If you have secured a good crop send us your offer. You don't have to worry about the returns if you sell to us.

If you have extracted honey send sample. If you have failed to secure enough for your home market, let us supply you. We have honey engaged all over the country, and can ship direct from the producer, many times.

AGENCIES.

A list of our principal agencies will be mailed you on request. We can ship from stock such items as our regular Hives, Sections, Foundation, Extractors, etc., from these agencies.

Send your order direct to us, if you prefer, and request that we ship from nearest point, and we will do so, saving you freight charges and giving you quick delivery.

SWEET CLOVER

And Several Other Clover Seeds.

We have made arrangements so that we can furnish Seed of several of the Clovers by freight or express, at the following prices, cash with the order:

	5lb	10lb	25lb	50lb
Sweet Clover (white)	60c	\$1.00	\$2.25	\$4.00
Crimson Clover	70c	1.20	2.75	5.00
Alsike Clover	80c	1.50	3.50	6.50
White Clover	90c	1.70	3.75	6.50
Alfalfa Clover	80c	1.40	3.25	6.00

Prices subject to market changes. Add 25 cents to your order, for cartage, if wanted by freight.

Rocky Mountain Bee-Plant Seed!

(*Cleome integrifolia*.)

...FREE AS A PREMIUM...

The ABC of Bee-Culture says of it: "This is a beautiful plant for the flower-garden, to say nothing of the honey it produces. It grows

from two to three feet in height and bears large, clusters of bright pink flowers. It grows naturally on the Rocky Mountains, and in Colorado, where it is said to furnish large quantities of honey."

We have a few pounds of this Cleome seed, and offer to mail a ¼-pound package as a premium for sending us ONE NEW subscriber to the American Bee Journal, with \$1.00; or ¼ pound by mail for 40 cents.

Bees Doing Well.

I have 150 colonies of bees, and they are doing well. I have taken off 2,000 pounds of honey already.

ALPHA CRANK.

Oscoda Co., Mich., Aug. 19.

Poorest Season in Ten.

I have kept bees for 10 years, and this is the poorest season I have seen. Everything has failed, even buck-wheat. I will have to feed my bees.

C. G. ASCHA.

Berkshire Co., Mass., Aug. 21.

Transplanting Sweet Clover.

Having a piece of land sown to sweet clover, and wishing to double the sweet clover pasturage for my bees by the addition of more land which should be sown to sweet clover, but not wishing to wait so long for bloom from seed, I transplanted sweet clover plants last November, and any of the plants that winter-killed I replaced last March; at the same time sowing sweet clover seed between the rows of plants which were 5 feet apart each way. I thus secured early bloom, not having to wait a year for the bloom.

I am well pleased with my venture of setting out plants, and shall plant more every year. **WM. H. EAGERTY.**

Republic Co., Kan.

Lost Swarms.

I've just read the contribution of Mr. Harry Lathrop, on page 486, on "How a Swarm was Lost," etc. Now, here is another, and stranger still:

In the spring I helped a neighbor clip his queens, and said to him that there would be little or no danger of losing a swarm hereafter. Some time after, while at dinner, a swarm came out of a hive of a clipt queen, and left without clustering. The owner arrived on the scene just in time to hear them say "Good-bye." He thought it very queer with a clipt queen. Curiosity incited him to examine the inside of the hive, where he found the clipt queen in peaceable possession, but the majority of the bees gone. I have a theory to account for this anomalous condition, but would like to hear if any others have known like occurrences.

Death of Mr. R. L. Hastin.

My dear husband, R. L. Hastin, departed this life July 27, 1900. He had been a sufferer from consumption for over 10 years. At last he had a hemorrhage of the lungs and lived only about five minutes. He was snatcht away so quickly that he didn't have time to talk to us, but gave me a hope of his being saved, by clapping his hands. I also have the witness of the spirit that all is well with him.

He read the American Bee Journal with so much interest every week. He

The Bee-Keeper's Guide

Or, Manual of the Apiary,

—BY—
PROF. A. J. COOK.

460 Pages—16th (1899) Edition—18th Thousand—\$1.25 postpaid.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published to-day. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without THE BEE-KEEPERS' GUIDE.

This 16th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to GIVE AWAY to our present subscribers, for the work of getting NEW subscribers for the American Bee Journal.

Given for TWO New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the two NEW subscribers—simply the Bee Journal for one year:

Send us TWO NEW SUBSCRIBERS to the Bee Journal with \$2.00, and we will mail you a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both for only \$1.75. But surely anybody can get only TWO NEW SUBSCRIBERS to the Bee Journal for a year, and thus get the book as a premium. Let every body try for it. Will YOU have one?

laid on his bed and read it the day before he died. Oftentimes he would read a piece to me, especially the poetry—it always sounded so nice about the little honey-bee, and seemed to have the spirit of God in it, directing one's thoughts above. He did want to live so badly, and keep bees to make a living for his family. He had only 9 colonies, and they are not storing much honey on account of not having anything to work on. They are also needing new hives.

On account of Mr. Hastin's long-continued sickness I am left with no home and almost nothing to go on, with three little children to bring up. I am going to do my best to get along and keep the bees. I don't understand working with them much, as he did almost all the work, with my help.

MRS. ADA HASTIN.
Dade Co., Mo., Aug. 7.

[We wish to express our own sympathy, as well as that of all bee-keepers, Mrs. Hastin, in your great loss and sorrow. We trust you will be able to care for those little children, and that the bees may do better so as to be a help to you in your struggle to get along.—EDITOR.]

On the Increase—1 to 5.

This is how it all happened: Last spring I felt in need of some soul-stirring excitement, and I got it. It was in the shape of a 4-frame nucleus with a healthy queen of "scrapping" propensities. I lodged them comfortably under my cherry-trees and awaited results.

It wasn't long before I wanted to call on them, as it were, to show them my neighborly consideration; and say, they "saw the call!" They came at me with pat hands. They thought it a bluff, and it wouldn't work. I just had

The Modern Remedy Co., Kewanee, Ill.

to lie right down and pass. The way those bees boiled out of that 8-frame hive was great!

Well, thinks I to my lonely, there isn't room enough in that hive for so many, so I divided it in two. Got a queen for No. 2, and awaited results. Why, it didn't seem but a short time when both the colonies manifested strong predilections to swarming. So I divided them some more, then I had 3 colonies. Well, along in July, colony No. 1 got on the rampage, and I took out four full frames and made colony No. 4.

And what do you think? Along the forepart of August I got honey-hungry, and lookt into the only super I had on, but not a section filled! Then I concluded I would see what was the matter. I found out at once—about a million bees, or less, found a rent in my armor—the netting had failed to connect at the back of my head. It was their picnic, not mine.

After awhile I mustered up courage and a big smoke, and I showed the pesky things my feelings had been trifled with. I just put half of that family into an empty hive—and now have 5 good colonies, but not over 20 pounds of honey.

I don't feel real certain that I like honey, anyway!" EMM DEE.
Cook Co., Ill.

Severe Drouth.

The drouth has burned us here for this year. I have not taken over 200 pounds of honey to date, and have 30 colonies. JOHN DOTY.

Getting Some Honey.

I am getting some honey. So far as I have heard I am the only bee-keeper in this locality who will get any. E. W. HAAG.
Stark Co., Ohio, Aug. 16.

Poor Season for Queen-Rearing.

This season (up to the present time) has been very disagreeable for queen-rearing; however, in consequence thereof, I have learnt some very valuable lessons. I have come to the conclusion that it is as necessary to feed nuclei during a drouth as it is the cell-building colonies, for without feeding nuclei poor queens will be the result, the same as if poor cells were used. All my nuclei now have permanent feeders attacht, so that in the future I shall be prepared. H. G. QUIRIN.
Erie Co., Ohio, Aug. 17.

Somewhat Remarkable Season.

The season here thus far has been somewhat remarkable. It opened very flatteringly for a good crop of honey. White clover began to bloom the latter part of May, and by June 10 the pasture land and the roadsides were a mat of bloom, but scarcely a bee did I see on the bloom. The weather had changed from being quite warm to quite cool and dry, but shortly a change came. We began to have showers and warmer weather, which seemed to cause the white clover to secrete nectar. I ought to have said, the bees did a good business by way of gathering honey from the dandelion—the

The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

[THIS CUT IS THE FULL SIZE OF THE KNIFE.]

Your Name on the Knife—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a last-time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.10, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00.) We will club the Novelty Knife and the Bee Journal for one year, both for \$1.00.

GEORGE W. YORK & CO., 118 Mich. St., Chicago, Ill.

Please allow about two weeks for your knife order to be filled.

first time for years that there was a surplus stored in the sections—usually it is fed to the young brood.

About July 1 the basswood came into bloom, and such a rush—honey came in by the wholesale. I added the third set of supers to some of the swarms that issued in May. This rush only lasted about a week, and very suddenly and abruptly closed. I think there was too much rainfall.

There was a lull for two or three weeks, then things began to liven up again. Buckwheat came into bloom, and many of the honey-producing wild flowers, and now, at this date, the bees are putting in their best licks. Golden-rod, asters and heartsease are in bloom. The weather is very warm, and we have frequent showers. To me the outlook is good for a good yield of honey from now until frost comes.

Yesterday I had a swarm issue—one of, if not the, largest for the season. There must have been at least 10 quarts of them. I gave them two sets of brood-frames, of 8 each—16 frames—and am quite certain that by the way they have gone to work, in two weeks they will have the whole batch filled with honey.

L. ALLEN.

Clark Co., Wis., Aug. 9.

Honey a Failure.

The honey crop is a total failure here. I don't know of a pound of honey that has been taken. I have 17 colonies of bees, and there are 30 or 40 colonies in this vicinity. No honey has been taken by any one here.

JAMES AKINS.

Putnam Co., Ind., Aug. 17.

No White Honey.

Bees are just commencing to whiten the edges of the top-bars for the first time this year. Not an ounce of white honey, so far. Unless buckwheat and fall flowers yield honey, bees must be fed for winter.

CHAS. B. ALLEN.

Oswego Co., N. Y., Aug. 18.

Making Bees Do Hot-Bed Work.—Uncle Lisha gives the following in Gleanings in Bee-Culture:

"I don't know that it is quite orthodox, but I am fond of early vegetables, and, like the son of the Emerald Isle, I find 'it is niver aisy to work hard,' and I find it a good deal of work to make a hot-bed every spring with manure and earth frozen hard, so I have just made me some boxes with old sheet-iron bottoms, and fill them with earth in the fall; and then in the spring when it is time I just take off the cushion from the top of the brood-chamber of some of my strongest hives and replace with these boxes of earth, and pack round the edges, and cover with glass. You can use, as you see, a box some 12 to 14 inches wide by 20 long. A good colony of bees will give just about the right amount of bottom heat, and the earth is about as good as a cushion to keep the bees warm, and there is no danger of too much bottom

Yellow Sweet Clover Seed

WE HAVE IT AT LAST!

We have finally succeeded in getting a SMALL quantity of the seed of the YELLOW variety of sweet clover. This kind blooms from two to four weeks earlier than the common or white variety of sweet clover. It also grows much shorter, only about two feet in height. It is as much visited by the bees as the white, and usually comes into bloom ahead of white clover and basswood. We offer the seed as a premium

A QUARTER POUND FOR SENDING ONE NEW SUBSCRIPTION.

So long as it lasts, we will mail a quarter pound of the seed to a regular paid-up subscriber who sends us ONE NEW subscriber for the American Bee Journal one year, with \$1.00; or ¼ pound by mail for 30 cents.

We have been trying for years to secure this seed, and finally succeeded in getting it. It is new seed, gathered last season by an old personal friend of ours, so we know it is all right. But we have only a small supply. When nearly out we will mention it.

heat, as there is with a hot-bed. You can fix as many hives as necessary to supply your family with all the early plants you want, and it is but little more work to care for half a dozen such miniature hotbeds than one. And, besides, you can use old tin fruit-cans for tomato and other plants. Just put them in the fire and melt the solder and then tie them together with a string and they will hold just the right amount of earth for plants to grow in, and then you can transplant without disturbing the roots, and save time and money both."

Honey Dishonored in Europe.—The United States consul-general, James T. DuBois, at St. Gall, Switzerland, sends to the Department of State, at Washington, a lengthy communication on "Food Adulteration in Europe." Regarding honey, he says:

This delicious and, in its natural state, very wholesome breakfast dish is coming into general use on the continent of Europe; and the bees, be they never so busy, can not supply one-third of the honey that is consumed, so some one must naturally make enough to supply the deficit. Thru a series of manipulations of almost everything containing saccharine, this is now being successfully and very profitably accomplished; and, of course, this industry flourishes best in those years when the bees have but little success in manufacturing the real article, which very often occurs.

The "dishonoring of honey," as it is called, is a growing art, and several successful establishments are now in operation, producing large quantities of this artificial honey for the market, and the product is in popular demand. The people seem to like it. It is cheap, and the sales are large. All sorts of ingredients enter into its manufacture, among which may be mentioned syrups, malt extracts of the lowest grades, meal of different kinds, and cornstarch.

From a pound of bee-honey 5 to 10 pounds of "dishonest honey" are made so successfully that it sometimes requires an expert to discover the deception.

Sweet Clover for Horses and Sheep.

—Dr. Miller had just cut two tons of sweet clover hay. I should say by the looks of it it was allowed to get rather too rank and tall to make the best hay; but as an object-lesson he opened the stable door and whistled for his three horses. They evidently supposed it was feeding-time, or for some special reason they were to be fed. All three marched into the barn, and turned their heads toward the mangers; but as nobody seemed to hinder them they marched over to the hay-mow and pitched into the sweet-clover hay. They first pick off the leaves and small twigs; but after they have trimmed off the stalks and can't get any more they eat up this dry brush, as it were. The doctor suggested something I never heard before—that, altho the horses would eat the green-growing clover with avidity, they preferred the cured hay; so he led one of them out in the yard and gave him a taste of some rank but tender shoots. Of course, he grabbed for this, but soon showed his

preference for the cured hay in the barn.

Just now it occurs to me that M. M. Baldrige said *sheep* were exceedingly fond of sweet clover; and, by the way, we are just making a test of using sheep according to Vernon Burt's plan, to keep the apiary slickt up from grass and weeds, making sheep take the place of a lawn-mower. We have fenced off a part of our apiary with wire-netting, and a ewe and her lamb occupy the inclosure. About the first thing the lamb did was to pick out all the sweet clover in the inclosure. Then it reacht over the low fence for all that could be secured outside; and when the leaves and small brush were gone it began to devour the larger branches. I have seen so many cases of this kind I should like to see some cattle, horses or sheep that can not be taught to eat sweet clover.—A. I. Root in Gleanings in Bee-Culture.

Pat and the Bees.—In Charles Lover's "O'Donoghue," there occurs a remarkably rich passage illustrating the relations subsisting between an improving landlord and an untutored tenant. The agent presents the tenants to the worthy innovator, who inquires into the conditions of the grumbling and dissatisfied recipients of his favors. At length, on a tenant presenting himself whom the agent fails to recognize, the baronet turns to the figure before him, which, with face and head swollen out of all proportions, awaits his address in sullen silence.

"Who are you, my good man? What has happened to you?"

"Faix, and it's well you may ask! My own mother wouldn't know me this blessed mornin'. 'Tis all your own doin' entirely."

"My doing?" replied the astonisht baronet. "What can I have to do with the state you are in, my good man?"

"Yes, it is your doin'," answered the proprietor of the swollen head.

"'Tis all your doin', and may ye well be proud of it. 'Twas them blessed bees you gev me. We brought the devils into the house last night, and where did we put them but in the pig's corner. Well, afther Katty an' the childer an' myself was a while in bed, the pig goes rootin' about the house, and he wasn't aisy till he hookt his nose in the hive and spilt the bees out about the flure; and then, when I got out of bid to let out the pig that was a-roarin' thru the house, the bees sitted down on me, an' began stingin' me, an' I jumpt into bid again with the whole of them afther me, to Katty an' the childer; and thin, what wid the bees a-buzzin' an' a-stingin' us under the clothes, out we all jumpt agin, and the devil such a night was ever spint

in Ireland as we spint last night. What wid Katty an' the childer! an' the pig tarin' up an' down like mad, an' Katty wid the besom, an' myself wid the fryin'-pan flattenin' the bees again the wall till mornin', an' thin the sight we wor in the mornin—begor, it's ashamed of yourself ye ought to be."—Selected.

Nebraska.—The annual meeting of the Nebraska Bee-Keepers' Association will be held in the Honey Hall on the State Fair Grounds at Luicolen, Tuesday evening, Sept. 4th. We hope to see bee-keepers from other States present at that time, as well as our own apiarists.

THE BOXERS OF CHINA

are attempting to solve a gigantic problem, but they are going about it in the wrong way, and will never succeed. Some people, in this country, seem to think that they have as great a puzzle on their hands in selecting a location for a home. They will certainly go about it in the wrong way unless they inspect the beautiful farming country on the line of the Chicago, Milwaukee & St. Paul Railway, in Marinette County, Wisconsin, where the crops are of the best, work plenty, fine markets, excellent climate, pure, soft water; land sold cheap and on long time. Why rent a farm when you can buy one for less than you pay for rent? Address C. E. Rollins, Land Agent, 161 La Salle St., Chicago, Ill.

HONEY AND BEESWAX

MARKET QUOTATIONS.

CHICAGO, Aug. 24.—Fancy white comb honey is selling at 15c per pound, with No. 1 grades bringing 14@15c. There is not much demand at present, and will not be until this hot spell shall pass. Very few amber grades on the market and yet what there is does not sell. Extracted white, 7@7½c; amber, 6½@6¾c; dark, 6@6½c. Beeswax, 25c. R. A. BURNETT & Co.

CINCINNATI, Aug. 8.—The demand for extracted honey is slow, while the shipments are many. I quote as follows: White clover, 8@8½c; Southern and amber, 6½@7c. Comb honey sells as fast as it arrives at the following prices: Fancy, 10@10½c; No. 1, 15c. Beeswax, good demand, 25c. C. H. W. WEBER.

BOSTON, Aug. 8.—Fancy 1-pound cartons, 17c; A 1, 15@16c; No. 1, 15c; No. 2, 12@13c. Extracted honey from 7½@8½c, as to quality.

It is too early in the season and too warm for any inquiry on honey, so prices named are only nominal. The prospects in this vicinity seem to be for a light crop. BLAKE, SCOTT & LEE.

KANSAS CITY, Aug. 20.—Very little comb or extracted honey in the market yet. We quote: No. 1 white comb, 14@15c; No. 2, 13@14c; No. 1 amber, 13½@14c; dark, 11@12c. Extracted, white, 6½@7c; amber, 6@6½c; dark, 5@5½c. Beeswax, 25c.

W. R. CROMWELL PRODUCE CO.,
Successors to C. C. Clemons & Co.

DETROIT, Aug. 10.—Fancy white comb, 14@15c; No. 1, 13@14c; no amber or dark to quote. White extracted, 6½@7c. M. H. HUNT & SON.

BUFFALO, Aug. 25.—Fancy new 1-pound comb, 16@17c; choice, 14@15c; No. 2, 12@13c; No. 3, 10@11c; old, 10@14c. Fancy Beeswax, 28@33c. Demand improving some. BATTERSON & CO.

NEW YORK, Aug. 25.—Comb honey in very good demand, and fancy white sells readily at 15 cents, and exceptional fine at 16 cents. Nos. 1 and 2 white, 13@14c; amber, 11@12c. No change in extracted. Beeswax firm at 28@28½c. HILDRETH & SEGELKEN.

SAN FRANCISCO, Aug. 8.—White comb, 12@12½c; amber, 9@11; dark, 6½@7½c. Extracted, white, 7½@7¾c; light amber 6¾@7¼c; amber, 5½@6c. Beeswax, 26@28c.

There is not much honey coming forward at present from any quarter, neither is there very brisk demand locally or for shipment at full current rates. Water-white honey is the scarcest sort, and market for this description shows the most firmness.

WANTED—HONEY AND BEESWAX.

We have a tremendous and growing trade in this line, and would like to hear from all who have such goods to sell in any part of the country, with quality, description, and lowest cash price. THOS. C. STANLEY & SON, Fairfield, Ill.

WANTED COMB HONEY AND EXTRACTED HONEY. Will buy your honey, no matter what quantity. Mail sample with your price expected delivered in Cincinnati. I pay cash on delivery. C. H. W. WEBER, 2146 Central Ave., CINCINNATI, OHIO.

Extracted Honey Wanted

We have a demand for AMBER extracted honey. Please let us know how much you have, how put up, and cash price wanted f.o.b. your railroad station. Also mail us small sample for inspection. Address,

Four Celluloid Queen=Buttons Free

AS A PREMIUM
For sending us **ONE NEW SUBSCRIBER** to the Bee Journal for the balance of this year, with **40 cents**, we will mail you **FOUR** of these pretty buttons for wearing on the coat-lapel. (You can wear one and give the others to the children.) The queen has a golden tinge.

This offer is made only to our present regular subscribers.

NOTE.—One reader writes: "I have every reason to believe that it would be a very good idea for every bee-keeper to wear one [of the buttons] as it will cause people to ask questions about the busy bee, and many a conversation thus started would wind up with the sale of more or less honey; at any rate, it would give the bee-keeper a superior opportunity to enlighten many a person in regard to honey and bees."

Prices of Buttons alone, postpaid: One button, 8 cts.; 2 buttons, 6 cts. each; 5 or more, 5 cts. each. (Stamps taken.) Address,

GEORGE W. YORK & CO., 118 Michigan St., CHICAGO.

AMERICAN BEE JOURNAL

ERNEST R. ROOT,
President of the National Bee-Keepers' Association.

THE AMERICAN BEE JOURNAL

PUBLISHED WEEKLY BY

GEORGE W. YORK & Co.

118 Michigan St., Chicago, Ill.

[Entered at the Post-Office at Chicago as Second-Class Mail-Matter.]

IMPORTANT NOTICES:

The Subscription Price of this journal is \$1.00 a year, in the United States, Canada, and Mexico; all other countries in the Postal Union, 50c a year extra for postage. Sample copy free.

The Wrapper-Label Date of this paper indicates the end of the month to which your subscription is paid. For instance, "Dec00" on your label shows that it is paid to the end of December, 1900.

Subscription Receipts—We do not send a receipt for money sent us to pay subscription, but change the date on your wrapper-label, which shows you that the money has been received and duly credited.

Advertising Rates will be given upon application.

Reformed Spelling.—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound. Also some other changes are used.

The Weekly Budget

MRS. M. L. WILLIAMS, of Wadena Co., Minn., writing us Aug. 23, said:

"My bees are doing a rushing business."

MR. D. PATERSON, of Hardin Co., Iowa, wrote us Aug. 25, as follows:

"Bees in this part of Hardin County have done very well."

MR. O. P. HENDRIX, of Yazoo Co., Miss., writing us Aug. 25, said:

"This has been the poorest season for honey that I have ever seen."

MR. R. C. AIKIN, wife and little daughter, of Colorado, were the first bee-keepers from the West to arrive for the convention last week. They will visit Mrs. Aikin's relatives in Kentucky, and then return home the last week in this month. They were all looking well, and seemed to enjoy life as they should.

"ONE HUNDRED YEARS in the White House," opening the September Ladies' Home Journal, gives some highly interesting glimpses of the social life of the century, and of the home life of our Presidents since the time the Adamses moved into the Executive Mansion as its first occupants, in November, 1800. The "Romances of Some Southern Homes," in the same issue, pictures the most notable historic mansions of the South, and recalls the incidents which made them famous—their brave men and beauti-

ful women. Some new anecdotes attract further interest to the beloved Phillips Brooks, as a man and a preacher. They are characteristic, and exceedingly well told. Anticipating the rather radical change that fashion has decreed in woman's attire, ten special articles are devoted to the fall and winter modes. The pictorial features of the September Journal include a page drawing of "Loiterers at the Railroad Station," as A. B. Frost sees them; "The Wonders of California Gardens," and the beauties of Yellowstone Park. There are numerous practical articles, and much else that is helpful in the departments. By the Curtis Publishing Company, Philadelphia. One dollar a year; ten cents a copy.

REFORMED SPELLING is supposed to have had its quietus in Gleanings in Bee-Culture, but "Uncle Lisha" gets in the following skit in the last number:

"Johnnie, what is the matter now?" said Tim Fasset to his boy who was going by on his way home from school, sobbing as tho his heart would break.

"Oh!" said the little fellow, "I didn't have any luck at spelling today. The teacher put out *slow* to John

Gilpin, and he spelled it s-l-o-w. And then she put out *now* to Dick Carey, and he spelled it m-o-w. And then she put out *dough* to me, and I spelled it d-o-w, and the teacher said it wasn't right—said it was spelled d-o-u-g-h. I don't see why."

"Come here," said Deacon Strong; and he took the boy up in his arms and told him he spelled right—the trouble was, the English was wrong.

"I can't have you talking such nonsense as that to my children," said Miss Barton, the teacher, rather crisply.

"Why not?" said the deacon.

"Why," said Miss Barton, "because that is the way it is spelled, and that is the way our fathers and grandfathers spelled it. Words have a history, and we should lose their history if we didn't spell as our fathers did."

"Suppose," said Tim Fasset, "we were to keep bees just as our fathers did, without making any change."

"I guess the price of honey would be higher than it is now," said Charley Atkins.

"I tell you," said Deacon Strong, "if I could have my way I would have a few more letters invented to represent every sound in the English language, and I would then spell it straight, and leave the history for the dictionaries."

DR. MILLER'S HONEY QUEENS!

One Untested Queen Free as a Premium for sending ONE New Subscriber to the American Bee Journal for one year.

Or, send us \$1.50 and we will mail you a Queen and also credit your own subscription for One Year.

We have been fortunate in making an arrangement with DR. C. C. MILLER—the well-known honey-specialist—to rear queens EXCLUSIVELY FOR US DURING THE

SEASON OF 1900. These Queens will be mailed in rotation, so "first come first served."

The Queens Dr. Miller will send out on our orders will be precisely the same as those he rears for his own use, so of course they will be from his best stock. His best colony in 1899 had a queen reared in 1898; May 5, 1899, it had brood in 4 frames, and he gave it at that time a frame of brood without bees. It had no other help, but May 25 a frame of brood with adhering bees was taken from it, and the same thing was repeated June 3, leaving it at that time 5 frames of brood. It stored 178 sections of honey, weighing 159 pounds (and that after July 20, in a poor season), being 2 2/3 times the average yield of all his colonies. A point of importance is the fact this colony did not swarm, and an inspection every week or 10 days showed that at no time during the entire season was there even so much as an egg in a queen-cell. Dr. Miller rears queens from this one.

The demand nowadays is for BEES THAT GET THE HONEY when there is any to get, and Dr. Miller has such bees. You will want to have a queen from his best, we are sure, even if she is not pure Italian.

Do not send any orders to Dr. Miller, as all orders MUST come thru us, according to our agreement.

Remember, send us \$1.00 for ONE NEW SUBSCRIBER to the American Bee Journal for one year, and YOU will get ONE OF DR. MILLER'S UNTESTED HONEY-QUEENS FREE AS A PREMIUM. This offer is made *only* to our present regular subscribers. Orders for queens are to be filled in rotation.

Address all orders to **GEORGE W. YORK & Co.,**
118 Michigan Street, CHICAGO, ILL.

ESTABLISHED IN 1861

AMERICAN

THE OLDEST BEE-PAPER IN AMERICA

BEE JOURNAL

40th YEAR.

CHICAGO, ILL., SEPTEMBER 6, 1900.

No. 36.

* Editorial Comments. *

The Great Chicago Convention is over. It exceeded any former meeting in attendance, there being at one evening session fully 350. The following were elected as officers and executive committee:

President—Ernest R. Root, of Ohio.
Vice-President—R. C. Aikin, of Colorado.
Secretary—Dr. A. B. Mason, of Ohio.

All being well, we fully expect to begin publishing the report next week. It will likely be the fullest and best ever published of a national convention of bee-keepers.

Extracted vs. Comb Honey.—In browsing around for good things in the bee-keeping press to dish up for the readers of the Progressive Bee-Keeper, Somnambulist presents this item from the pen of C. A. Hatch, in the Bee-Keepers' Review:

"Of course, we might produce extracted honey, but were everybody to do so there is no telling where the price would go. I know by experience in selling honey that a great many people won't use extracted honey at all. There is an attraction about nice comb honey that appeals to the eye; and what looks pleasing, tastes good."

Then with a mischievous twinkle in his eye, Sommy places over against this statement that of another Wisconsin bee-keeper, N. E. France, in the same periodical:

"Our home-market consumes about 10,000 to 12,000 pounds of extracted honey, and 500 pounds of comb honey per year."

The Somerfield Plan of Forming Nuclei, that is, shutting the bees in by stuffing green leaves in the entrance and leaving them to gnaw their own way out, is very highly spoken of by some. One of its advocates, however, Dr. Miller, while giving it words of praise in *Gleanings in Bee-Culture*, allows one to read between the lines that it has not been an unqualified success in his hands. He says:

"I've tried Somerfield's plan of penning in nuclei with leaves to make them stay. More dead bees than desirable sometimes; still I like the plan. It seems to work very well to free them in 24 hours; but a good feature of the plan is that, if you forget to free them, they will free themselves."

"More dead bees than desirable sometimes" suggests a very variable quantity, and in some cases *may* mean the practical annihilation of the nucleus. Suppose two or three frames of brood with adhering bees are put in a full-sized hive, the entrance left closed by leaves plugged in, and the weather remains moderate until the bees gnaw out—the mortality would probably be little, if any, greater than if the bees were not confined. Suppose, however, that the nucleus be partitioned off into the smallest space it can occupy, and the weather is very hot, practical suffocation will

take place, and the nucleus will be worthless if the entrance is so closely plugged that the bees do not force an exit for two or three days. A good deal may depend upon the manner of closing the entrance. The green leaves will shrink so as to close the entrance less tightly each day, and yet it is possible that some entrances might be so closed as to make the closing almost permanent.

All this is said with no thought of denying the value of the plan, but merely as a word of caution, and with the belief that, rightly used, the plan is a valuable contribution to practical bee-keeping.

Tenement Hives have never come into very general use, but as a rule those who use them are quite partial to them. R. F. Whiteside, of Ontario, Canada, sends a description of his, which does not differ greatly from some others, and is especially pleased with the shade for the operator that is afforded by the large cover when it is propped up.

Bee-Poison and Honey.—Dr. F. W. Rich, of Cook Co., Ill., sends us the following item from the *Medical Era*, which we are pleased to reproduce here:

THE POSSIBLE ANTI-TOXIC RELATION BETWEEN BEE-POISON AND HONEY.

A remarkable result following the sting of a honey-bee is related by Dr. Stover, of Denver (*Johns Hopkins' Hospital Bulletin*). The case is of a young woman who was stung by a bee. The right cheek, which was the point of attack, and the whole right side of the face, were immensely swollen, and the patient felt some constitutional symptoms.

After treatment for five days the woman recovered, and on her final visit made the interesting statement that, while in the past she had never been able to eat honey, indeed, was even nauseated by the smell of it, since being stung she had developed a craving for honey, and found that she could eat it with complete satisfaction, and with no ill results. Dr. Stover asks, "Will some of the immunization experimenters throw light on this occurrence?"

We would add the query, whether this is not, also, a demonstration of the dynamic action of *apis mellifica*?

Why wouldn't it be a good idea for honey salesmen to carry a few bees along with them for immediate application when they meet persons who say they are not able to eat honey? It would be a cheap "remedy," and help to increase possible honey customers. Who'll be the first to inaugurate this new scheme for creating a larger demand for honey? Of course, the salesman ought to be able to guarantee a "cure" before applying the "remedy."

Getting Bees to Clean Extracting-Combs and Sections.

—This matter is discussed by R. C. Aikin and G. M. Doolittle in the *Progressive Bee-Keeper*, and the two men are far from coinciding in their views. Mr. Aikin advises putting out a large number of combs at once and allowing the bees the freest access to them, in order to avoid having the combs torn by the bees. Mr. Doolittle says he tried the plan last fall by putting in his bee-cellar the accumulation of partly filled sections from both apiaries. The bees were admitted to them on a warm day, and as a result "fully one-fourth

of the sections which the bees cleaned up that day were so despoiled, as to comb, that they were nearly or quite worthless as 'bait' sections." He prefers to put over colonies any sections or comb to be cleaned up. To prevent the bees from putting back into the same combs the honey cleaned up, he puts a sheet of enameled cloth over the frames, turning back one corner of the same so the bees can get up.

The plan advised by Mr. Aikin was first given by the late B. Taylor, and others have practiced it successfully, but according to Mr. Doolittle's experience it may not succeed under all circumstances, and beginners may do well to be a little cautious. Let the bees have access to the combs to be cleaned up somewhat late in the day, then if the combs are found to be torn it will not be likely to be so bad as if they had had the whole day for it. If the combs are found uninjured, then access may be given again to the combs.

Mr. Doolittle, however, is of the belief that it is not necessary to have sections cleaned up by the bees in the fall, differing in this from the experience of many others. He says:

"I find that where either extracting-supers or sections having comb in them (the honey being extracted from them in the fall), are placed in position for storing at the time when they should be so placed, at the *earliest beginning of the honey harvest*, the bees will clean out all of the honey in the cells to these combs, whether candied or not, before they will store any honey from the fields in them."

Carniolan Bees must differ greatly, if one is to believe the conflicting reports concerning them. As swarmers they have been reported by a large number to excel. Yet all do not agree. The same difference of opinion seems to prevail outside of the United States. The British Bee Journal has made repeated mention of their excessive swarming, Mr. Webster reporting eight swarms from one hive in a single day! Mr. Brice says: "Gentleness is the only good quality they possess. Swarming is their bane. Out they come; prime swarm, first, second, third, and fourth casts, which means good-by to any chance of surplus." Yet C. N. White says: "They are the bees for beginners, and none should start with any other kind."

Turning to Canada, the following extract from the report of the convention in the Canadian Bee Journal shows the same conflict of opinion there, as well as the high esteem in which some hold the Carniolan:

Mr. Craig—What about the swarming propensities of the Carniolan bees?

Mr. Hall—Just as good as others, and no worse.

Mr. Shaver—Mr. Hall clips the queens; I know of two different apiaries where they have them, and they complain terribly of their swarming.

Mr. Post—My experience has been almost identical with Mr. Hall's, with the exception that I have never had any poor ones. They are the best race of bees I ever handled. This was one of the poorest years we ever had—we secured between three and four tons of buckwheat honey. The whole amount was secured by the Carniolan bees placed promiscuously in the yard along with Italian-hybrids. Many of the Italians required feeding, and they were fed with combs taken from the Carniolans. They will beat any bee I ever had in wintering and in building up in the spring, and they are no more likely to swarm than any other bee, in my experience, but you will make a mistake if you put them in a small hive. Give them plenty of room. I believe in a large hive. My hive is equal to 11 Langstroth frames. Thru the forepart of the season until about June 14th, I allow the queen one top story and the bottom story—that makes 16 plus 8, equals a capacity of over 19 Langstroth frames. As soon as the queen begins to lay a little above, I raise the top story and place another one under, and place the queen-excluder below.

The Premiums offered this week are well worth working for. Look at them.

Contributed Articles.

Carniolan Bees, Freak Queens, and Plain Sections.

BY JOHN R. SCHMIDT.

CARNIOLAN bees, strange to say, do not seem to be very popular among honey-producers, but there are a few who like them, and I am one of the few. Having kept this bee for a number of years, and also the Italians, I believe I am informed well enough to say a few words about their good qualities, especially for the production of comb honey.

Carniolan bees have always been noted as of a *steel-gray* color, and for their superior swarming qualities. Now, both of these statements have always fallen thru with every Carniolan colony I ever saw or owned, and some of my queens were absolutely pure. As to the steel gray color, I could never discover anything that resembled steel-gray within the past four or five years, either on my own bees or those that I bought. Possibly the piece of steel they were compared with was out in the rain a few days. This color question is wrong, and should be a *rusty* gray instead.

As to their swarming propensities, I do not find them more inclined to swarm than the Italians, and I keep them in Danzenbaker hives, which are not Draper barns, by a good deal.

For comb honey this bee can not be surpast. The queens begin to lay very early, and by the first of May ten Danzenbaker frames can easily be filled solid with brood if the honey in the comb was previously uncapt about once a week and placed in the center of the brood-nest where it will be consumed. I was surprised when I read a certain article in *Gleanings in Bee-Culture*, an extract from which reads as follows:

"About the first of May I go over the whole yard and examine each hive to see how much brood there is, and all colonies which do not have an equivalent to 2½ Gallup frames full are shut up on the frames of brood they do have," etc.

Why, if I had a colony of bees on the above date that had no more brood than in 2½ frames, I should consider such bad enough to brimstone, and our honey-flow is from sweet clover, too. When I read that article, some of my Carniolan queens had already filled 10 frames, and were filling others for weaker colonies. No wonder some beekeepers favor contraction of the brood-nest to produce comb honey!

One very favorable trait in Carniolan queens is that they do not allow themselves to be crowded in the brood-chamber like most Italians do. They simply keep everything packed with brood during the flow, and thereby everything goes into the supers, just where we want it.

As comb-builders they can not be surpast. No greasy or watery-looking sections with them. I never heard of such a thing. The wintering qualities are excellent. Last winter I doubt if 100 bees died in each colony during the whole winter; while with the Italians I had to clear the entrance three times, and scraped them out by the handful.

A first or second cross between a Carniolan queen and Italian drone produces the ideal bee for comb honey. They possess the push and energy which can not be found in any other cross. Some of these crosses are actually wonderful, and I possess one queen now—a Carniolan reared from a pure mother. This queen (the daughter) was cross with an Italian drone, and here is what she has done for me: she was reared last fall, and everything is from a record I have kept from the time she hatcht, so there is no guess-work about it:

April 28, brood in 7 frames nearly all solid: May 15, removed 3 frames of brood and adhering bees, and substituted three frames of foundation; May 25, did the same thing, and with the 6 frames removed I formed a new colony. June 12 I exchanged stands with the new colony. This old colony, after being removed from the old to the new stand, continued to work in the *supers*, and on July 15 I removed 32 pounds of comb honey in 4x5 sections. July 22 it had just finisht its second super, and the third nicely started.

Now, this is undoubtedly something extra, but I am not

going to fly off the handle and advertise *superior stock* for sale. This queen is a *hybrid*, and we all know that it is exceedingly uncertain to produce like from something that is not pure. I have reared a few queens from her for my use, but do not expect to duplicate her in the least.

We now frequently hear of such queens making their appearance almost from nowhere, and from stock which is not pure, and never did anything extraordinary in the past. Bee-keepers, as a rule, understand that such *freak* queens are unfit to breed from, but during these days of the superior-stock craze—where in the last year or two nearly all the most beautiful golden bees have suddenly changed to that of superior stock—some of our brethren have lost sight of all these facts, and are breeding from such a queen as I have described, under the disguise that it will raise the standard of honey-producing qualities. They know that many queens sent out will not be what they should be. This is a very wrong thing to do, and should not be tolerated. It will do more to lower the standard than it can ever hope to raise it, and is almost as bad as adulterating honey and labeling it as such to escape the law, hoping also thereby to raise the standard and sale of pure extracted honey.

We should not breed from anything except that which has a good, solid foundation of many years standing back of it, and then we know we will get what we are after. There are several queen-breeders who have such stock, and I hope they will be the ones who will profit by the present sensible craze for something better.

EXPERIENCE WITH PLAIN SECTIONS.

Some little time ago some one asked in the American Bee Journal whether it would be advisable to change to plain sections. In reply I beg to give my little experience of one season.

I have changed to the tall Danzenbaker sections and fence separators, using full sheets of foundation in connection with the same, and I am pleased to say I shall never regret the day I made the change. The first super taken this season had 28 sections filled solid to the wood all around, and ranked as fancy. I never before had anything to equal this, and in many cases I only received about one dozen *fancy* bee-way sections from the first super, the others being more or less unsealed. The bees were not crowded in the least, as they were working in an empty super below it when completing this one, thus showing that it is *not* necessary to crowd to get *fancy* comb honey in tall sections.

If any one is in doubt about this question, better try a super or two of tall sections with full sheets of foundation before buying anything else. My tall section honey is selling for 20 cents per section—5 cents more than I got for the 4¼ bee-way. With me I can heartily endorse all the good things that have been said about tall narrow sections.

Hamilton Co., Ohio.

The Influence of Locality in Bee-Keeping.

BY W. Z. HUTCHINSON.

THIS matter of locality and the part that it plays in bee-keeping is really becoming a chestnut; but it needs cracking just the same. Anything in the nature of a paradox, or that appears mysterious, is at once charged up to locality. In many instances the inference is correct. To illustrate:

Holy Land bees are not liked here at the North. They are great breeders. So long as there is honey in the hive they will keep on rearing brood. We don't wish any such characteristics here in the North. When the harvest is over we wish breeding to stop. We don't care to rear a horde of useless consumers. In the South, in Cuba, for instance, the harvest comes in the winter, or what corresponds to our winter, and it is very desirable that the colonies shall be populous at that season of the year. To accomplish this, Holy Land bees exactly fill the bill. Thus you see, in one locality one strain of bees is desirable, but another is not. In some other locality the conditions are reversed.

Again, here at the North, where our main harvest comes early and is of short duration, small brood-chambers are desirable. In the South, or where the harvest is prolonged thru the whole summer, large brood-nests find favor. Then there is the wintering problem that is ever with us here at the North. In the South, chaff hives, and bee-cellars, and the like, are of no interest whatever. California and Colorado have conditions and sources of honey-flow that are entirely different from those of Michigan and Canada. The fundamental principles of bee-keeping are ever the same,

but localities differ; they differ so much that a bee-keeper going from Michigan to Cuba, or to Texas, and attempting to carry on bee-keeping as he has done at his old home, would be sadly "left."

In reading our bee-journals, and attempting to profit by the advice they contain, we should ever have in mind this matter of locality. The experience, and views and advice of Mr. Doolittle may be all right for New York, and Ontario and Michigan, and some of it may be all right for Florida or California, but not all of it.

Then there is another point: the more thoroughly a man understands his own locality, the greater his chances for success. He must know at exactly what time in the season to look for the different honey-flows. It may seem incredible, but I have had bee-keepers come to me to buy sections, come in great haste, and a heart filled with enthusiasm, the bees were "just piling in the honey, and the owners had only discovered it, and the *basswood honey harvest was coming to a close*. These men did not even know *where* the honey was coming from. Of course, this is an extreme case, but not so very extreme as some may think.

A man ought to know what strain of bees to keep; what size and kind of hive and fixtures to use; when to take his bees from the cellar (if he winters them in the cellar); whether to protect them on the summer stands when he takes them out, and, if so, in what manner; whether to feed in the spring; whether to unite before the harvest; whether to shade his hives and how; when to put on the sections; and so on thru the whole season he should know, as nearly as it is possible for him to learn, exactly what is best adapted to his particular locality. In reading articles in the bee-journals he should always ask himself: "Does this apply to my locality?"—Bee-Keepers' Review.

Genesee Co., Mich.

Are Queens Confined in Cages Short-Lived?—Queenless Colonies.

BY HENRY ALLEY.

SEVERAL things have been said in the bee-papers the past few months that have attracted my attention. One statement, made by some one, that young queens confined in cages are short-lived; that for every day so confined the life of the queen is shortened three months. Now, it would be interesting to know just how this conclusion was reached. It seems to me it would require much time and careful experiment to test this thing. I do not believe any one has reached these conclusions except by guessing at it.

I have had queens live to great age. One queen lived four years and two months. One of my customers wrote me that he had one of my queens that lived six years. How long would these queens have lived had they not been confined in cages?

The cause of short-lived queens is not owing to confinement in cages, but is caused by the methods used in rearing the queens. Except at swarming-time, I find that queens reared in a hive above the brood-chamber proper, are short-lived. Superior queens can be reared by almost any method at swarming-time, say from May 20 to July 10.

Owing to the fact as above stated, I long ago gave up the "top story" method of rearing queens. I found that queens so reared were very inferior, and not more than 25 percent of such queens were of any value.

For several years I have employed a method for producing queen-cells that give me the finest, most prolific and long-lived queens. This process has not been given in any of the bee-papers. Later on I shall attempt to describe it so that all will understand it. Talk about getting cell-cups by the bushel! Well, by my method I can get them by the thousands, and they are all made by the bees—no artificial work about them. I never have found it necessary to make artificial cell-cups, nor to transfer larvae to cell-cups. I furnish the bees with eggs, and they do the rest, and all is done in a natural way, and the result is queens that give perfect satisfaction. They are large, well-developed, and many of the queens are superior to those reared under the swarming impulse.

I made this statement in the bee-papers several years ago. Editor Hutchinson thought I could rear just as good queens artificially as are reared under the swarming-fever, but not better. I am ready to back up this statement by sending one dozen queens to any prominent bee-keeper, and put them against the same number of those reared at swarming-time. If mine do not prove to be the better queens, I will so acknowledge it.

There are certain principles that must be followed in

rearing queens. A few, half-starved bees will not rear good queens. Large colonies of bees should be used in cell-building, and the bees should be put in condition for such work several days before they are set to cell-building, by feeding, unless there is a natural flow of nectar.

One more point I wish to touch upon: A man ordered a queen from me, but before I could fill the order, in fact, the next mail, brought a countermand. The man said that he wanted the queen for a colony that had swarmed. But after he ordered the queen some one had said in the American Bee Journal that "he did not approve of requeening at such a time!" Is it better to have colonies queenless than to have them all supplied with queens? The good bee-keeper will never permit a colony to go queenless any longer than is actually necessary. No queenless colonies are allowed in my yard over three days at any one time. I have always made it a point in cases of swarming to remove the queen-cells and introduce a queen three days after the swarm issued. 'Tis the only proper way to manage an apiary.

Queenless colonies are like lame horses standing in a stable—you have the horses, but what are they worth for any practical use? Keep all colonies supplied with good queens, then your apiary is always in condition for business.

A Review of Bee-Books—"Langstroth Revised."

BY PROF. A. J. COOK.

(Continued from page 550.)

I WAS pleased to read on page 18, as follows: "A glance at these figures is enough to convince any intelligent horticulturist of the truth of Aristotle's remark, made more than two thousand years ago, that bees hurt no kind of sound fruit, but wasps and hornets are very destructive to them." Strange that a truth promulgated so long ago should have failed to win credence even in our day.

On page 27, in discussing the digestion, in the second and third paragraphs, it is evident that the recent views of digestion are not well understood. It is doubtful if it is wise to use the words chyme and chyle at all in discussing this subject. Again, on the next page, the Malpighian tubes are referred to as glands. True, in the past they have been thought to act as hepatic organs, but now we are pretty certain that they are renal in their function.

In speaking of the heart, on page 30, Cheshire is quoted as stating that the blood soaks thru the body. Surely, this is a very strange and misleading expression.

On pages 61 and 62, Mr. Root is quoted favorably as expressing the view that smaller cells promote the fecundation in the egg-laying of the queen. Mr. Dadant further adds that he believes the queen finds it pleasanter to lay the impregnated egg, and so generally deposits worker-eggs. I doubt both these propositions. I have often seen worker-eggs in cells too shallow to compass the abdomen, and I believe the queen works intelligently, and lays the eggs to suit the needs of the colony. I believe this is much more in harmony with the animal economy generally.

On page 63 the well-proved fact is given that chilling the queen will often result in producing a drone-layer. This is further proof that drones come from unimpregnated eggs.

In speaking of aphid honey-dew, the author states that the bees prefer the "true honey-dew or exudation of the leaves, and adds that he has seen them gathering both from the same trees at the same time. This is on page 117. I am sure that bees prefer nothing to some aphid honey-dew, and wisely, too, as the nectar is often very excellent. I am very skeptical regarding this honey-dew from the leaves—Mr. Dadant's "true honey-dew." I am seeking hard, but vainly, in its pursuit.

It is strange that Mr. Dadant objects to clipping the wings of the queen. Tho I believe Mr. Heddon was, or is, likeminded. Mr. Dadant, as a producer of extracted honey, and as one who uses very large hives, may have so little swarming that this may color his opinions and practice.

On page 284, it is stated that when the Italians are irritated they are very cross. I have not noticed that this was more true of them than of others. I prefer the Italians to any bees that I ever handled, on the score of amiability, every time.

On page 384, viper's bugloss, *Echium vulgare*, is clast with Canada thistle as a plant hard to get rid of. I do not think that this is true. I have not so observed.

Mr. Dadant, on page 406, gives 50 pounds of honey as the average per colony per year. This is founded on an ex-

perience of 20 years. Surely, this is very valuable experience.

On page 413, the practice of "reversing" is discouraged. The danger of leaking of honey and of taking too much out is emphasized. It is stated that the practice is abandoned in France, where it was formerly in vogue.

Mr. Dadant is a strong advocate of the production of extracted honey, and gives his reasons in his usual vigorous style, on page 431. Every bee-keeper should read the pages and study the reasons. He also prefers half-frames for extracting. It is to be remembered that he uses very large brood-frames.

I think that Mr. Dadant would hardly say now, as he does on page 443, that the automatic reversing extractor "has not been sufficiently tried to be proclaimed decidedly superior."

The bee-moth is referred to on page 458 as *Tinea mellonella*. It has long been known to science as *Galleria mellonella*. The clothes moths, of which there are several species, belong to the genus *Tinea*. These belong to a different family, even from that of the bee-moth.

The idea given on page 475, that bees are swallowed so quickly by toad and bird that they do not thrust out their stings, is certainly not true of the toad, as I have found the stings of the bees swallowed as many as five at once in the throat of the toad that did the swallowing. I doubt if it is true of the kingbird. Who will be the first one to find out the exact truth in this last case?

Mr. Dadant expresses the opinion, on page 481, that it is cold air that causes extracted honey to granulate. We know of a certainty that cold favors granulation. The fact that sealed liquid honey and comb honey is so slow to granulate would lend favor to the statement. We know that honey is made up of two kinds of sugar—dextrose and levulose. The first is quick to crystallize, while the latter is very slow to do so. I presume that the varying amounts of these two kinds of sugars will often explain the differences that we may observe in the granulation of honey.

The author, on page 482, discusses coarse and fine granulation. He thinks that the kind of granulation or size of crystals is due to the kind of honey. Is it not true here, as it is in all crystallization, that slowly formed crystals are large, while those that form quickly are small? Would it not be true, then, that cold weather, or a preponderance of dextrose in the honey, would favor fine granulation? Mr. Dadant adds that in France the fine granulated honey is held in higher esteem, and he thinks with reason, as he says that it keeps better.

In closing this review of this admirable work, I wish again to apologize for the criticisms. The points criticized are mostly of small importance, and the errors, if such they be, are of no great import, and many of them are such as would easily creep into any such work. I feel assured that the bee-keeper can not read too widely of the matters obtaining to his business. I can heartily recommend that among the books which he should prize for his study, may well be found "Dadant's Langstroth." Certainly, all those who are to engage in the production of extracted honey, in the manufacture of comb foundation, or in the cleansing of beeswax, will find this work invaluable.

I feel persuaded that for the average bee-keeper in the United States no hive will serve better, all points considered, than the Langstroth, yet it is quite possible that for those who are to engage exclusively or largely in producing extracted honey, a larger hive and frame may have merits worthy of consideration. I believe every bee-keeper would profit by a thoro reading of the arguments which Mr. Dadant gives in favor of such hives.

Los Angeles Co., Calif.

Shall We Work for Long-Tongued Bees or Short-Tubed Red Clover?

BY DR. C. C. MILLER.

THERE is no good reason why work should not be pushed with vigor in both directions. Suppose it should take ten years to secure the necessary increase in the length of tongue to work on ordinary red clover. It is probable that half that increase of length could be secured in much less than half the time necessary to secure the full length, for it is the extreme that costs effort. Probably in the first year could be gained as much as in the succeeding nine years, or, in other words, if the desired length could be obtained in ten years, half that length could be obtained in one year. Suppose, also, that ten years should be necessary to secure red-clover tubes sufficiently shortened

for ordinary bees to work on, we might expect to secure half that shortening in one year. Now, instead of spending ten years upon one to the neglect of the other, put in the one year on both, and bring together your bees with tongues half lengthened, and your clover with tubes half shortened, and—*there you are.*

Of course, nothing is certain in any of these estimates. It might take twice ten years, or it might take only half of ten years to reach the desired result by working in only one direction. It might take more than one-tenth the time to reach the half-way point in either direction, or it might take less. The only point I am urging is that, if we modify both tongues and tubes, we *must* reach the point of getting red-clover honey in half the time we could get it by working alone at either tongues or tubes; and I suspect that one-tenth of the time comes nearer the truth than one-half. So, Mr. Editor, don't let up in your enthusiasm for long tongues, and get switcht off on the track of short tubes, but run the two parallel.

Another point I want to urge with equal emphasis—yes, with even *greater* emphasis. It is that this is to be the work of *all* rather than of a few. I do not undervalue the work of our scientists and our experiment stations. Blessings on them for what they have done and are doing. But this is a work in which the multitude can join. You have struck the right chord, Mr. Editor, in saying, "In the meantime I hope our bee-keepers will be on the watch for red-clover heads with short tubes."

As to both tongues and tubes, it is a matter rather more of finding than of making. The father of a lost child may die of old age before finding it if the search is left to him alone; but if all the world joins in the search he will soon have the child in his arms. In the matter of establishing a strain of short-tubed clover, the very first move is to find a plant with tubes at least a little shorter than those of its neighbors. Manifestly, two men on the watch will be more likely to succeed in finding this than one alone. A thousand giving a little attention to the matter will be better than one man spending the whole time in the search. Remember that variations in plants are things of freak. Florists secure new varieties of flowers by looking out for these freaks. A rose-plant, for example, will throw out a branch having roses different from the rest of the bush in some way, and this is called a sport. Or, the flowers may be the same, with a difference in growth of stock. Catherine Mermet is a popular pink tea-rose. One day a branch on a bush of that kind was noticed to bear roses that were pure white. Slips were taken from it and propagated, and now we find in all the catalogs "The Bride," the beautiful sport from Catherine Mermet. Agrippina is a Bengal rose bearing crimson roses in great abundance, the plant growing of usual height. In 1858, Rev. James Sprunt found a branch of Agrippina shooting away above its fellows. Slips from this branch were taken, and now we have the climbing rose, James Sprunt.

So it is just among the possibilities—nay, even among the probabilities—that somewhere is growing to-day a sport among red-clover plants that is just what we want, and some one may find it where least expected. The point is that this thing must not be left to the scientists, but all of us common bee-keepers must have our eyes open, and no telling who will be the lucky finder. Probably, however, it will be by cultivation and selection that the goal will be reached; yet the first step must be the finding of something at least a little out of the common. You and I can find it just as well as the experiment station—yes, more readily—for there are more eyes belonging to us, and we can plant and pick out the best. I do not mean that our experiment-station men are not better adapted to the work than are we common bee-keepers. Perhaps one of them may do more than any hundred of us. They are trained for the work. But there are thousands of us; and as this is largely a matter of finding, numbers count.

What applies to clover applies also to bees. Differences in length of tongue exist now, and it will be easier to find the longest tongue if many engage in the search. If I understand the matter correctly, glossometers are constructed that are not expensive, and it requires no special skill to operate them. One can be inclosed over a colony so that no other bees can reach it, and the depth to the liquid in the glossometer be noted. In this way all the colonies in an apiary can be noted, and those with longest tongues used as breeders. If the longest tongues are chosen each year, please tell me why constant progress will not be made by *any one*. Please bear in mind that differences in length now exist, and that variations are of constant occurrence. All we are to do is to take advantage

of the differences and the variations. When some one has made a successful find, let him divide up with the rest, getting a substantial return for his dividend. Mr. Editor, please announce the price of glossometers, and let us all go at the work. At the same time let us all be on the lookout for short-tubed clover.

For our encouragement we have the fact that there have been red-clover queens and red-clover bees. In general, a little is done by bees everywhere on red clover. A little effort ought to bring a little increase in the amount of red-clover honey secured, and united effort ought to bring entire success. It would be a shame to American enterprise if, within a short time, bee-keepers of this country do not succeed in bringing together tongues and tubes so that tons of honey now wasted may be taken. Shall we all help?—Gleanings in Bee-Culture. McHenry Co., Ill.

Marketing Honey Thru Commission Men.

BY W. F. MARKS.

(Address before the New York State Association of Bee-Keepers' Societies.)

I HAVE seen it stated, and I believe with good reason, that the securing of a crop was only one-half the labor or cost. This is true in all industries. I have wondered why the time at our farmers' institutes was not divided equally between "How to Produce" and "How to Sell." I tell you we must adopt different methods of disposing of our products. It will take years to bring this about, and the agitation of the question can not begin too soon. No farmer or bee-keeper under our obsolete method of trade is receiving full value for his products.

Just let us stop and think for a minute. What other class of products is there, the bulk of which must pass thru the hands of commission men before reaching the consumer? Where are there any successful manufacturers disposing of their goods thru the commission house? Our product, thru the prevailing method of sale, is at the mercy of the most unscrupulous commission man. It is the commission man who sells the lowest who does the business, and who establishes the price of our products. The honest commission man, the one who would get full value, is not in it. He, too, is at the mercy of the most unscrupulous member of the craft; and we are no better than their slaves. I want you to understand me, and I will repeat—it is the commission man who sells the lowest who establishes the price. Stop selling thru the commission man, and then see what the dealers who will buy for cash will pay. If they can not get our goods on commission they must pay cash. Having money invested in it, then and not till then, will they try and sustain prices.

Last fall a friend, a person who buys thousands of dollars' worth of goods thru commission houses every year, told me—and he had just returned from New York City—that he was offered fine, choice apples by the commission houses at \$1.00 per barrel; and that very day cold-storage dealers were paying \$2.25 cash per barrel, and taking all they could get at our station to my certain knowledge. Some one will say, did they not have to compete with the commission houses? Of course they would if they sold at that time; and it is plainly to be seen that they could not have paid very much. But they hold their apples until the commission houses can get no more, then they enter the market. Had the commission houses been unable to get apples on commission at any time, would they have been selling at \$1.00? It seems plain enough, and yet the same holds true in every other product.

I have asked many city dealers of whom they purchase their farm produce, and they invariably said thru commission houses, and gave for their reason that they could in that way buy cheaper than of the farmer; and I remember one instance in particular, where the dealer with a knowing wink and laughing, said he would rather let the commission men settle with the farmer, and then his conscience would be clear. Ontario Co., N. Y.

[Mr. G. M. Doolittle comments on the foregoing as follows in the American Bee-Keeper:—EDITOR.]

I have shipped my honey on commission ever since 1877, and his assertion that "our product, thru the prevailing method of sale, is at the mercy of the most unscrupulous commission man," is not the truth, by any means, according to my experience. To be sure, I have run across unscrupulous commission men, and I now know of some who will drop off honey, or any other products, at a lower price by 25 percent than the goods are really worth, or quoted at.

But I can not allow that these unscrupulous ones "who sell the lowest establish the price," for all of my experience, covering a period of 23 years, tells me that there are many commission men in the cities of Boston, New York and Philadelphia who do not even so much as "wink" at the prices made by these unscrupulous ones. Therefore, Bro. Marks' assertion that "the honest commission man—the one who would give full value, is not in it," is very far from the truth.

I could name parties handling honey in each of the cities above mentioned, who have sold my honey each year for the past 12 years at from one to three cents per pound above the prices quoted in the "Producers' Price Current," and from the same price to one and two cents above the prices quoted in our bee-papers for those same cities. Bro. Marks must have had in mind the poorest specimen of a commission man, and compared him with the best dealer when he penned those words, very much as the world takes the poorest specimen of a Christian and holds him up beside the best worldlying, when Christianity is to be scoffed at. Don't do it Bro. Marks; it isn't nice.

Questions and Answers.

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

[The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.]

Bees Overheated in Handling.

What is the best thing to do with bees that have brood that has been overcome by heat in moving?

I moved my bees 80 miles in June, hauling them on a spring wagon. I started with 19 colonies, and 3 smothered on the way, and the brood of the others died, and also two queens. Now the bees either have the old brood, or the later brood, in the cells, and do not carry it out as I supposed they would; and I also saw a few small, white worms in the combs about a half inch long. NEBRASKA.

ANSWER.—The trouble was lack of ventilation, and perhaps lack of water. The colonies were weakened that were not killed outright, and the reason they do not carry out the dead brood as promptly as you desire is because they have too big a contract on hand for their numbers. In course of time they may get all straightened up, but you may help matters by taking from a weak colony one of its outside combs that is left uncovered and giving it to a stronger colony.

If in the whole there are more bad combs than can be covered by the bees, it may be best to remove enough so that all will be well covered, selecting the worst combs for removal, and melting them up. If the bees are gathering nothing, feeding will be a help to them in cleaning house.

A Queen Experience.

The queen sent me as a premium was a failure as a queen. She has laid a little here and there, not enough to fill a comb. She filled a small piece of drone-comb, some cells having two and three eggs to the cell; and now the bees are preparing to supersede her. They have built and have eggs in two queen-cells. I have kept bees for 20 years, and never knew them to stop superseding when matters had gone thus far. I believe if Dr. Miller knew the facts he would like to send me another one; which I will pay for if matters right themselves here. If not, I think he would not want me to. If you send me another queen send me a good one, as I would rather pay for a good one than have a poor one otherwise. INDIANA.

ANSWER.—Your letter is a fair illustration of the misunderstandings and misconceptions often entertained. You ask that if another queen be sent you she shall be a good one. No one can really tell how good a queen is until she is old enough for her force of bees to have past thru at least one honey harvest, thus generally making her a year old. The premium queens sent out lay no claim to being tested

queens, but are all untested. All that is promised is that they are the daughters of choice queens, that they are all right as far as can be told from appearance, and that they are laying all right before being taken from the hive for mailing. Such a queen may have mated with a very poor drone, and in spite of her ancestry may be a poor queen. The purchaser receiving her as an untested queen takes his chances.

The queen is sometimes blamed when she is not at all at fault. From your description it is morally certain that the trouble in your colony is not with the queen. You do not say whether you have seen the queen since introducing her, but according to the testimony she never laid in the hive at all. The small piece of drone-comb filled with eggs, some cells two and three eggs to a cell, points clearly to the presence of laying workers, and you will find that all the bees produced will be drones, and no queen will ever come from either of the queen-cells. The queen was a good one so far as any one could judge from appearance, was laying well before being mailed, and even if injured in passing thru the mails so that her progeny would afterward be only drones (a thing which might possibly occur) her eggs would still be laid by preference in worker-cells and not in drone-cells. According to the testimony, however, she was killed in introducing, and laying workers are responsible for what is going on in the hive, and not the dead queen.

Colony Rearing Drones in August.

The honey crop is very poor around here this year. There is barely enough for the bees for wintering. What causes bees to rear drones at this time of the year, when there is no honey coming in? WISCONSIN.

ANSWER.—It is not always easy to give a reason for all the things that bees do. As a rule, when the honey-flow stops, drone-rearing stops. A queenless colony will continue the drones it has. If a colony has a drone-layer or laying workers, it will rear only drones. Every queen is superseded in the ordinary course of nature, the superseding generally taking place well on in the season, and a superseding colony needs drones. Sometimes, however, a normal colony rears queens when according to all rules it ought not to do so.

Wire-Fence for Bee-Yard.

Can you give any information as to the best kind of portable fence for inclosing a bee-yard—something that will turn chickens, rabbits (if necessary,) and that a hog can not get under, thru or over, and that will also turn cattle, if possible? NEW JERSEY.

ANSWER.—It's asking a good deal to ask for a fence that will do all that and still be portable, and I'm not sure whether the want can be supplied. You might try the Page woven wire fence recently advertised in these columns.

A Bunch of Beginners' Questions.

1. Are separators or fences necessary and generally used in supers when working for extracted honey?
2. Will bees build thin comb straight with only a comb or wooden guide where no starters are used?
3. Do bee-keepers ever use a full frame of foundation in either top or bottom chamber, or do they use only starters, say one or two inches wide clear across the entire length of the frame?
4. Is it best to wire the brood and extracting frames?
5. Does it pay to buy one's entire foundation for an apiary of the size of mine (40 colonies), where they have no mill of their own, and would also have to buy wax to make it, where either starters or full sheets are used?
6. Do you recommend the double brood-case used in the Heddon hive?
7. What is the difference between the Simplicity and the Langstroth hives?
8. Do you prefer the dovetail pattern?
9. Would it pay me next spring to use the combs now in my home-made box-hives, when I transfer the bees into some other movable-frame hives?
10. I have a style of hive of my own make, somewhat on the Langstroth pattern. I can move the frames in the supers but can't move those in the brood-chamber. My hives are 12 inches square in the clear, 10-inch deep brood-

chamber, and 5-inch super, and all of them now full of nice honey. Do you know of an extractor that would take so small a frame as mine? MISSISSIPPI.

ANSWERS.—1. In working for extracted honey, fences and other separators are entirely unnecessary, and probably not used by any one.

2. You cannot rely upon it.

3. A large number use full sheets. You can hardly afford to use starters such as you mention, just because such a large part of your frames would be filled with drone-comb.

4. If your extracting-frames are shallow, they may do without wiring. Even with shallow frames it may be best to use wire or foundation splints.

5. Whether you use starters or full sheets (and I couldn't easily be hired to use anything less than full sheets,) it will pay to buy your entire foundation, whether you have 10 or 100 colonies.

6. No; and yet some good bee-keepers use them.

7. The Simplicity is one form of the Langstroth hive, and the dovetailed is another. The Simplicity is of the same size and has the same frame, but is not so simple in construction, the corners being mitred together and the joints being beveled.

8. Yes; altho there is very little difference between a plain Langstroth and a dovetailed hive.

9. Yes, if straight worker-comb; and by all means if filled with brood at the time of transferring. But if you transfer 3 weeks after swarming, there will be no brood in the case.

10. Probably any extractor manufactured would take so small a frame. Each extractor has its limit as to the largeness of the frame it will take, but not as to its smallness. A frame 4 inches square can be extracted in any extractor made, but not one 4 feet square.

Virgin Queens—Putting a Nucleus in the Place of a Strong Colony.

1. Is a virgin queen an unimpregnated queen?

2. If a nucleus with queen is placed where a strong colony of bees were, will there not be danger of the strange bees not accepting the queen, since they are in a majority? WASHINGTON.

ANSWER.—1. Yes.

2. Yes, unless the strong colony was queenless. The greater the difference in numbers between the colony and the nucleus, the greater the danger. But when a colony swarms, I have many times put a weak nucleus in its place to catch the returning swarm, with no danger to the queen. I understand Mr. Doolittle to say that such queen would be killed with him, and I don't understand what should make the difference.

Thinks It a Funny Sight.

What is it that makes some of my bees act so funny, and also those of some of my neighbors? The alighting-board—especially the front part of it—and the lower part of the front board of the hive, are always covered with bees; and while they seem to stand still, they keep their bodies moving backward and forward all the time, keeping their heads close to the wood, as if rubbing the lower part of their heads. It is rather a funny sight to see those bees keeping up this peculiar motion day after day, just whole rows of them. Those colonies are in good, healthy condition, some very strong, and are storing honey. IND.

ANSWER.—This performance has been likened to raking hay, and also to rubbing on a washboard, and may be seen in any apiary, but no one seems to know why bees do it. They do it every summer, and that's all we know about it.

Overheated Bees.

The following is a case I would like solved: A nucleus was formed by taking new frames of brood from a new hive and placing in another new hive. The combs containing the brood were drawn this summer from new foundation. The brood was from a colony having a queen reared last year—an Italian from choice stock. The hive containing a frame of brood and a queen-cell was placed where it would be in the sun most of the time, the nucleus being formed about July 28th or 30th.

In a few days, when examined, many young bees were

found dead in the comb, with their heads slightly protruding; a few others had succeeded in getting out of the cells, some to die and others crawling about. Still others in the cells were struggling to get out, but unable to do so, the comb appearing to have become slightly stiffened by heat and then cooling. If assisted by pressing back the sides of the cells, the young bees would crawl out, their bodies having a dull, blackish tint. Is this state due entirely to heat, the hive-entrance being closed tight, as the nucleus was small? or is there some disease? If so, what?

I never have known any disease to exist in the apiary except in one colony, which had an unusually large entrance all winter and spring, and, before I realized what was transpiring, had been robbed and killed by robbers until no honey remained in their combs. They then appeared to have paralysis, the queen disappeared, and the few remaining bees were allowed to shift for themselves, considerable larva and eggs remaining in all stages in the cells. NEBRASKA.

ANSWER.—There is no likelihood of any disease in the case. The bees were closed tight in the hive, and the excitement of the imprisonment added to the heat of the sun from the outside cooked bees and all. When forming nuclei, it is a good plan to pen the bees in the hive for a time, but great care must be taken to avoid having them overheated, especially if they stand out in the sun.

The Space Above Frames—Combs Overheated.

1. Is it preferable in dovetailed hives to use an oilcloth cover on top of the extracting-frames, thereby preventing the bees from getting above those frames? or is it better to use no cover, thus allowing the bees the ¼-inch space between the top of the frames and the hive-cover?

2. In chaff hives, or other double-walled hives, when the outer box is retained on the summer stand, should a cover be used on top of the frames, or should no cover be used, but the bees be allowed to roam at will between the outer and inner boxes?

3. What is best to do when, thru overheating, the comb breaks down in a hive? UTAH.

ANSWERS.—1. Put nothing between the top-bars and the cover when there is only ¼-inch space between.

2. Use a cover and confine the bees to their proper place.

3. The first thing to be done is to give the bees an abundant supply of fresh air, throwing cold water on the hive to cool it down. That's on the supposition that you are on hand when the trouble occurs. Generally, however, you will know about it only some time after, and then you must straighten up the combs. Some of them will be so badly broken down that they must be removed entirely, and if they are full of good brood they may be fastened in the frame the same as when transferring. Some of them will be only partially out of the frame, and by a little coaxing can be pushed back in and tied in place till the bees fasten them.

Queenie Jeanette is the title of a pretty song in sheet music size, written by J. C. Wallenmeyer, a musical bee-keeper. The regular price is 40 cents, but to close out the copies we have left, we will mail them at 20 cents each, as long as they last. Better order at once, if you want a copy of this song.

Please send us Names of Bee-Keepers who do not now get the American Bee Journal, and we will send them sample copies. Then you can very likely afterward get their subscriptions, for which work we offer valuable premiums in nearly every number of this journal. You can aid much by sending in the names and addresses when writing us on other matters.

York's Honey Calendar for 1900 is a 16-page pamphlet especially gotten up to create a demand for honey among should-be consumers. The forepart was written by Dr. C. C. Miller, and is devoted to general information concerning honey. The latter part consists of recipes for use in cooking and as a medicine. It will be found to be a very effective helper in working up a home market for honey. We furnish them, postpaid, at these prices: A sample free; 25 copies for 30 cents; 50 for 50 cents; 100 for 90 cents; 250 for \$2.00; 500 for \$3.50. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

ROOT COMPANY'S PAGE.

SHIPPING-CASES.

Our No-Drip Cases are still in the lead. We keep constantly on hand a large assortment from 12-pound size up. We also make special sizes to order.

That Root's Cases are in demand is shown by the fact that one dealer alone has ordered 16,000 this season.

WINTER-CASES.

Our Winter-Cases are made of thin lumber dovetailed at the corners, with a telescope cover.

The cost is only 75 cents each singly, yet for convenience they are unsurpassed, and only excelled by the chaff hive in the protection afforded. Don't let your bees winter-kill or spring-dwindle when you can avoid it by using our Winter-Cases.

RUBBER GLOVES.

This is the time of the year when you need gloves, for robbers are about the bees and they are harder to handle than earlier. Take comfort with a pair of our gloves.

Ladies' sizes, Nos. 6, 7, 8 and 9, \$1.35; postage, 5c
Gents' sizes, Nos. 10, 11 and 12, \$1.45; " 5c
Extra long driving, Nos. 13, 14, \$1.70; " 10c

Mark size of hand on sheet of paper when ordering. If you order by number, remember that in rubber you need two sizes larger than you wear in kid; i. e., if you wear No. 6 in kid you will need No. 8 rubber.

BICYCLES

In trade for honey at market prices.

Having sold a carload of bicycle crates, we took in trade a quantity of machines which, so long as they last, we will sell **AT COST**.

A \$30.00 bicycle—"Pathfinder"—made by the National American Cycle Company, Akron, O., for \$17.00 cash or \$20.00 in trade for honey of good quality at market prices. Catalog and further particulars will be sent on application. Send a sample of your honey and we will give you price we will allow.

COMB FOUNDATION.

Not too late yet to order Comb Foundation for the fall flow. If you order Root's Weed Process you may be sure you will be pleased with the result. We keep in stock the four grades in boxes of 1, 2, 3, 5, 10 or 25 pounds.

A small order has the same attention as an order for a ton.

SPECIAL GOODS.

This is the time when you should order odd size or special goods. Our busy season is over and we can do almost any work in wood you want, either for bee-keepers or others.

We make a specialty of packing-boxes, from the size of a section-box up. Let us figure with you.

FEEDERS.

How about your winter stores? Are you sure your bees have enough? Should it be necessary to feed you can't do it easier than with our Division-Board Feeder. This is made to hang like a frame in a Langstroth hive. Price, 20 cents each, complete. Less in quantities.

Honey-Labels.

Do you use labels for your honey? Are they really ATTRACTIVE labels? If you do not you may be losing many sales because your honey lacks attractiveness. You can't expect to market your honey at the best price unless you use every care in putting it up. Send for our label catalog and see our 1, 2, and 3 color labels.

Tin Packages for Honey.

If you are one of the people who market extracted honey in small lots you will find our pails just what you want. A dozen sizes and kinds to select from. We also furnish square cans—1-quart, 2-quart; 1-gallon and 5-gallons. A single can or carload, as you wish. Write for prices.

Gleanings in Bee-Culture.

When our advertisers write us that their advertisements have paid them well, we know GLEANINGS IN BEE-CULTURE must be read by the best bee-keepers. We know, too, that GLEANINGS is appreciated, for our circulation is increasing all the time. Send 25c for a six months' trial and get A. I. R.'s Notes of Travel and hundreds of other interesting things.

Comb-Foundation Mills.

Perhaps you are so far from us and rates are so high that you want to make your own foundation.

Our mills are being improved constantly. If you want to purchase a foundation mill, send for package of samples showing different styles we can furnish. Send 2c stamp for these.

Bushel Boxes.

Bee-keepers are always looking for labor-saving ideas. Have you ever read our 16-page pamphlet, "Handling Farm Produce?" It is full of information and gives prices of bushel boxes and other things. Free for the asking.

HONEY-EXTRACTORS.

"Operator No. 6 puts the honey-combs in the extractors, which is a Cowan 4-frame reversible, with ball-bearings and lever-brake—in short, the best extractor on the market."

Extract from article of N. E. France, of Wisconsin, in June Review. No one is better qualified to judge the worth of an extractor than Mr. France. He says the ROOT COWAN IS THE BEST.

Thousands of others say so.

Glass Honey-Packages.

We have all sizes of Mason Jars with aluminum or porcelain-lined caps. Also Jelly Tumblers, two sizes; Glass Pails, four sizes; and Self-Sealing Jam Jars. Besides these we still have the four sizes square jars, which have long been on the market. Don't forget us when you need glass packages for honey.

RUBBER STAMPS.

Have you ever thought how handy it would be to use a rubber stamp to mark your honey-cases, showing the grade? Then, too, if you sell in the home market you ought to have your name on the case so it would be returned. We make stamps of all kinds for all sorts of purposes. Let us send you our rubber stamp circular.

QUEENS.

We don't say much about our queens, do we? I suppose some of our friends wonder why. Let us tell you: We began selling queens many years ago. We know all about the business from A to Z. We have the best breeding queens to be found in this country or Italy, and the best apiarist to be had. The result is our 400 colonies do not begin to furnish enough queens for our orders. Our queens are unsurpassed.

You will find it so if you buy them.

HONEY.

We buy a number of carloads of comb and extracted honey each year. If you have secured a good crop send us your offer. You don't have to worry about the returns if you sell to us.

If you have extracted honey send sample. If you have failed to secure enough for your home market, let us supply you. We have honey engaged all over the country, and can ship direct from the producer, many times.

AGENCIES.

A list of our principal agencies will be mailed you on request. We can ship from stock such items as our regular Hives, Sections, Foundation, Extractors, etc., from these agencies.

Send your order direct to us, if you prefer, and request that we ship from nearest point, and we will do so, saving you freight charges and giving you quick delivery.

SWEET CLOVER

And Several Other Clover Seeds.

We have made arrangements so that we can furnish Seed of several of the Clovers by freight or express, at the following prices, cash with the order:

	5lb	10lb	25lb	50lb
Sweet Clover (white)60c	\$1.00	\$2.25	\$4.00
Crimson Clover70c	1.20	2.75	5.00
Alsike Clover80c	1.50	3.50	6.50
White Clover90c	1.70	3.75	6.50
Alfalfa Clover80c	1.40	3.25	6.00

Prices subject to market changes. Add 25 cents to your order, for cartage, if wanted by freight.

Langstroth on... The Honey-Bee

Revised by Dadant—1899 Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroly explained, so that by following the instructions of this book one cannot fail to be wonderfully helped on the way to success with bees.

The book we mail for \$1.25, or club it with the American Bee Journal for one year—both for \$1.75; or, we will mail it as a premium for sending us **THREE NEW** subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

GEORGE W. YORK & CO.

Honey a Short Crop.

The honey crop in our immediate vicinity is quite small. The season has been against us, but with a dry May and wet June there was little else to expect. There was also very little swarming, so you see we will not nearly reach Mr. Doolittle's mark of 556 pounds for one colony; if we get that from 20 we will do well. However, prospects are good for a fall crop from asters. Extracted honey sells at 10 cents a pound, and is scarce at that.

J. WILEY MOUNTJOY.

Anderson Co., Ky., Aug. 19.

Dry Season—Keeping Combs from the Moth.

The season during the honey-flow here was excessively dry, besides everything was pastured so closely. We have no marshes here that we can even expect a fall flow from, as in many localities. I began feeding my colonies to-day. They are in excellent condition, having a very fine strain.

I am not discouraged but am putting forth much energy in forming plans to keep my colonies strong and active thru the winter season. I shall procure winter-cases to put them in.

I notice in the Bee Journal some one inquiring how to keep comb from moths. I let the bees clean them out late in the fall, then put the hives away in some outhouse or left accessible to the coldest weather, and away from mice. I stack the hives with the combs spaced in them with two thicknesses of burlap between each hive, starting the burlap on the floor. I stack them as high as convenient, and cover the last hive with the burlap and lid. Should there by chance be eggs deposited in the comb by the moth, the stinging cold weather will destroy them. Doing as directed will save the young bee-keeper much perplexity. I have a lot of most beautiful brood-combs put up in this way last fall, and upon examination a few days since, I was surprised to find them in as good condition as on the day they were put in—not a sign of a web to be seen, and perfectly clean.

M. N. SIMON.

Wood Co., Ohio, Aug. 23.

Keeping Empty Combs—Introducing Queens.

During the winter of 1898 I lost 39 colonies wintered in the same cellar, and same method, as the previous winter when I lost none. After cleaning up the combs and hives as best I could in the spring, the question before the house was, How to preserve these frames of comb, pollen and honey for future use, until I could get queens, and by dividing fill up and use these combs.

I saw Frank Benton's plan in the American Bee Journal, and followed it, putting down a bottom-board upside down to make all tight, stacked up the hives (with combs in place) in 3 stacks (fitting all joints) in the corner of the

The Bee-Keeper's Guide

Or, Manual of the Apiary,

—BY—
PROF. A. J. COOK.

460 Pages—16th 1899 Edition—18th Thousand—\$1.25 postpaid.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published to-day. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without **THE BEE-KEEPERS' GUIDE.**

This 16th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to GIVE AWAY to our present subscribers, for the work of getting NEW subscribers for the American Bee Journal.

Given for TWO New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the two NEW subscribers—simply the Bee Journal for one year:

Send us TWO NEW SUBSCRIBERS to the Bee Journal (with \$2.00), and we will mail you a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both for only \$1.75. But surely anybody can get only TWO NEW SUBSCRIBERS to the Bee Journal for a year, and thus get the book as a premium. Let every body try for it. Will YOU have one?

GEORGE W. YORK & CO.,

PACIFIC RURAL PRESS,

330 Market Street, SAN FRANCISCO, CAL.

apiary, leaving the covers and bottoms all off, and set an empty hive, with frames removed, on top of each stack. I divided 25 cents worth of bisulphide of carbon into three parts, and put into an empty peach-can which I set on top of the frames, in the empty hive. I put on the cover good and snug, and in 12 hours the thing was done (less time would do.) It's all right, and much less trouble than sulphur (but keep bisulphide away from artificial light, and don't inhale the gas that forms by its evaporation.)

The caging of queens on combs of brood and honey in a cage made 3x5 inches of screen-wire, by turning down and ravelling out the edges, as recommended by W. Z. Hutchinson last year, failed with me. The bees gnawed under the cage, hugged the queen to death, and I got \$1.00 worth of experience. The best way I have tried is to make the cage large enough to hold a frame of hatching brood; hang in the center of the brood-nest, and put the queen on that one frame. Let her stay till the brood hatches, then take away the cage, and all's well.

The honey crop will be light, but fine, so far. **CYRENE E. MORRIS.**

Carroll Co., Iowa, Aug. 17.

Honey Crop Almost a Failure.

Honey seems to be a thing of the past with bee-keepers here, but heavy rains make prospects for a fall flow.

In my yard of 40 colonies, only 123 finish sections of honey have been taken off, and there were probably 700 or more, ranging from 1/4 to 3/4 filled at the time the rain began, since which they have barely held their own, and before the rain they were not doing much. I have had a hive on a platform Fairbank's scales, but the record is so poor and broken that I hesitate to give it, but will do so anyhow; perhaps some will see a point that is obscure

hook on "Health" and we will send you a free sample, sufficient for you to try it and test its merits to your own satisfaction. Isn't it worth trying free? It positively cures. Price 10c and 25c per box. Don't delay sending.

The Modern Remedy Co., Kewanee, Ill.

to me. The hive is a Langstroth 8-frame, and at the time the swarm was put in (July 1) it contained one frame of brood and seven frames of dry combs of the previous year's building, built out from full sheets of foundation, and a super on top. July 7 the super was apparently $\frac{3}{4}$ full, and was raised up and an empty one put under it, with about $\frac{3}{4}$ sheets of foundation put in the sections, as was also the first super. At the same time the scales were set under the hive, and adjusted. I neglected to weigh the swarm, but it was an enormous one. The record of weights of hive and bees are as follows:

July 7th, 12:00 m	76 $\frac{1}{2}$	ounces
" 8th, 7:30 a.m.	77 $\frac{1}{2}$	"
" 8th, 12:00 m	76 $\frac{1}{2}$	"
" 8th, 8:00 p.m.	79	"
" 9th, 7:30 a.m.	78 $\frac{1}{4}$	"
" 9th, 12:00 m	77 $\frac{1}{2}$	"
" 9th, 8:00 p.m.	79	"
" 10th, 7:00 a.m.	78 $\frac{1}{2}$	"
" 10th, 12:00 m	77 $\frac{1}{4}$	"
" 10th, 7:30 p.m.	79 $\frac{1}{2}$	"
" 11th, 7:30 a.m.	79 $\frac{1}{4}$	"
" 11th, 12:00 m	77 $\frac{1}{2}$	"
" 11th, 8:00 p.m.	80 $\frac{1}{4}$	"
" 12th, 7:30 a.m.	79 $\frac{3}{4}$	"
" 12th, 12:00 m	79	"
" 12th, 8:30 p.m.	80 $\frac{3}{4}$	"
" 13th, 7:30 a.m.	80 $\frac{1}{4}$	"
" 13th, 12:00 m	79 $\frac{1}{4}$	"
" 13th, 8:00 p.m.	80 $\frac{3}{4}$	"
" 14th, 7:30 a.m.	80	"
" 14th, 12:00 m	80	"
" 21st, 7:30 a.m.	70 $\frac{1}{4}$	"
" 22nd, 7:30 a.m.	70 $\frac{1}{4}$	"
" 22nd, 12:00 m	69 $\frac{1}{2}$	"
" 22nd, 8:00 p.m.	70	"
Aug. 8th, 2:00 p.m.	67 $\frac{1}{4}$	"

July 21 it was found the bees had abandoned both supers, and the upper one was taken off and weighed 10 pounds. Apparently considerable of the honey had been moved below, but no work was done on the foundation of the lower super. To-day the sections are full of bees, and the foundation is slightly drawn. I think the last week's clear warm weather gave a honey-flow, and it is hoped they may build up enough for winter and store some to spare.

F. W. HALL.

Sioux Co., Iowa, Aug. 8.

Long Drouth Broken.

Our long drouth has at last been broken. We have had rain every day for five days. Everything is looking fine again.

HENRY ALLEY.

Essex Co., Mass., Aug. 17.

Plain Sections and Fences.

In regard to plain sections and fences, I will say that I have used the 4 $\frac{1}{4}$ x 4 $\frac{1}{4}$ x 1 $\frac{1}{2}$ plain sections and fences three seasons, and I would not exchange them for any other kind. I think the bees will fill about 3 supers of them with honey while they are filling 2 $\frac{1}{2}$ supers of the old slotted sections with separators. I mean strong colonies and a good flow of honey. I have used both kinds every season, but remember that is only my experience in my locality; somebody else is likely to think differently. I can clean three plain sections to two slotted ones.

We had a good flow of honey in June, lasting two or three weeks. There has not been any to amount to anything

SPECIAL NOTICE!

Last winter's cut of basswood is the whitest it has been for many seasons. We are now making sections out of this new stock and therefore are in a position to furnish you with the very finest quality in the market.

LEWIS WHITE-POLISHT SECTIONS

Are perfect in workmanship and color.

The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

[THIS CUT IS THE FULL SIZE OF THE KNIFE.]

Your Name on the Knife—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a lifetime, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.00, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00.) We will club the Novelty Knife and the Bee Journal for one year, both for \$1.90.

GEORGE W. YORK & CO., 118 Mich. St., Chicago, Ill.

Please allow about two weeks for your knife order to be filled.

since. There will not be any fall honey for the fire has burnt up all the beepasture for miles around, and it looks pretty dark for next season. I got about 2,500 pounds of section honey.

EDWARD WILSON.

Iosco Co., Mich., Aug. 13.

A Cheap but Durable Paint.

Painted hives look better. The paint keeps the nails from drawing out, and the lumber from warping. The less the lumber warps, the better the covers, supers, escape-boards, etc., fit. Some months ago Mr. F. D. Lacy sent me a description of a cheap but durable paint. It is made of three parts superfine, calcined, land-plaster, and one part of yellow ochre, or any other fine earth-paint costing from two to three cents a pound. For oil, he uses 3 quarts of kerosene, $\frac{3}{4}$ pint of linseed oil, $\frac{1}{4}$ of a pint of spirits of turpentine, and $\frac{1}{4}$ of a pound of melted beeswax. Before adding the turpentine and beeswax, the other ingredients are mixed and brought almost to the boiling point. The paint should be applied warm. The wax makes up for the lack of fish oil. This paint is better than any mineral paint mix with clear linseed oil. It is not very brilliant at first, but grows brighter by wear, while the ordinary paint fades by age.

Mr. Lacey recommends the addition of some coloring-matter to this kind of paint. He would use chrome green, or yellow, or Prussian blue, or something of the kind, painting some of the hives one color, and some another. I prefer to have all of the hives and supers the same color. It greatly simplifies some of the operations of the apiary. We often wish to change one hive for another, and, if it is of a different color from the first hive, the bees are confused, and try to find some other hive having a color like that of their old home.—Bee-Keepers' Review.

Drone-Comb vs. Thin Foundation.

The general belief has been, I think, that bees preferred to build drone-comb as store-comb because it took less wax to store a given amount of honey. That belief must be given up, according to Prof. Gillette's observations, which showed that it took just a fourth more wax for drone than worker-comb when each was .9 of an inch thick.—[Prof. Gillette's observation proves another thing; namely, that it does not follow that comb built entirely by the bees will have less of "gob" than comb built off from thin or extra-thin foundation. The former will necessarily be worker; the latter, probably drone; and, if so, there will be as large a chunk of wax (gob) to the pound of comb honey eaten in the one case as in the other. If it is an advantage, therefore, to use foundation at all, in that it induces the bees to build comb faster—that is, to do more work in the sections—it would seem that it would be false economy to give the bees a narrow starter, on the mistaken assumption

H. G. Quirin, the Queen-Breeder,

Is as usual again on hand with his improved strain of

GOLDEN ITALIAN QUEENS.

The A. I. Root Co. tell us that our queens are EXTRA FINE. We obtained thru special correspondence a breeder from Doolittle, who says, "If there is a queen in the U.S. worth \$1.00, this queen is." Queens bred from her, soon as they begin to lay, \$1.00 each.

Queens promptly by RETURN MAIL. We guarantee safe delivery.

Yellow Sweet Clover Seed

WE HAVE IT AT LAST!

We have finally succeeded in getting a SMALL quantity of the seed of the YELLOW variety of sweet clover. This kind blooms from two to four weeks earlier than the common or white variety of sweet clover. It also grows much shorter, only about two feet in height. It is as much visited by the bees as the white, and usually comes into bloom ahead of white clover and basswood. We offer the seed as a premium

A QUARTER POUND FOR SENDING ONE NEW SUBSCRIPTION.

So long as it lasts, we will mail a quarter pound of the seed to a regular paid-up subscriber who sends us ONE NEW subscriber for the American Bee Journal one year, with \$1.00; or $\frac{1}{2}$ pound by mail for 30 cents.

We have been trying for years to secure this seed, and finally succeeded in getting it. It is new seed, gathered last season by an old personal friend of ours, so we know it is all right. But we have only a small supply. When nearly out we will mention it.

GEORGE W. YORK & CO.,
118 Michigan St., - CHICAGO, ILL.

tion that the resultant comb would have the less of wax to chew in the eating. This observation of Prof. Gillette was confirmed in our own experience in our own apiary.—ED.]—Gleanings in Bee-Culture.

Introducing Queens

by confining them against the side of a comb where young bees are hatching out is a good plan in theory. It is also good in practice when the one doing the practicing is an experienced, thoughtful man; but in the hands of a novice there are failures.

The plan of taking away the queen and all of the brood, thus making the colony hopelessly queenless, and then allowing the bees to release the queen by eating out the candy from the end of the cage, worked well this season until the time of the year came when robbers gave trouble. A colony robbed of its brood and queen, altho it has a caged queen, does not put up the fight that a colony will that has brood to defend. The disturbance caused by taking away the brood and giving it to other colonies, sometimes incites robbers to begin their depredations. I know that the plan of releasing a queen upon combs of just-hatching brood from which the bees have been brushed, and then keeping the hive closed a few days, is an infallible method, but it is considerable trouble, causes a loss of some brood, and may cause robbing in a time of scarcity. I would like to find some easier and better method than these for the novice, and one that is, practically, infallible. I am looking forward with considerable hopefulness to the use of tobacco-smoke.—Bee-Keepers' Review.

Feeding Bees With Squirt-Guns.

In reading Mr. Victor's article on stimulative feeding, it seems to me that to depend on the force of gravity to get the feed into the hive would be rather slow work. Why not apply muscular force, getting the same result in a fraction of the time? If he will get a common bicycle-pump, about 12 inches long by one inch in diameter, unscrew the lower end, and in its place attach a curved flat nozzle, say $2\frac{1}{2}$ inches long by one inch wide, he will have a rapid-fire honey-gun that will do great execution. Dip the end of the gun into the bucket of thin syrup or honey, and then draw on the handle until the proper quantity is sucked into the gun, then fire it into the hive. If one wish to feed exactly the same amount to each colony, marks might be made on the piston-rod showing the number of fluid ounces the gun would hold if the rod was drawn out up to that mark, etc. In practice, however, I think one would soon get used to drawing the handle out the proper distance, and would pay no attention to the marks.

Three years ago I had occasion to do a little stimulative feeding, and with an implement of this sort I could feed 100 colonies in a little less than 12 minutes. Ordinarily one might take 15 to 18 minutes to feed 100 colonies, but even then it would be rapid feeding.

Another thing, it won't be necessary to spend any time pounding on the hives to let the bees know that supper is ready. Just insert the nozzle into

the entrance, give a quick push on the handle, and the ration will be left on the bottom-board, or else it will strike the back end of the hive and fly in all directions, or it will be sent kiting up among the bees, depending on the "elevation" you give the gun and the force applied to the handle. It is far ahead of any other method for *stimulative* feeding that I ever heard of.—G. F. HYDE.

[Mr. Hyde, I believe you have struck on something that is valuable and practicable. I just *know* it would work. Nearly every one has a bicycle, and can very quickly put the plan to a test. But if he has not a wheel he can buy one of these pumps at a repair-shop for about 25 cents. I am inclined to think something made specially for the purpose will be better still. I would construct a bicycle-pump with a longer barrel, without hose, and on the end have a stationary curved nozzle. If the pumps are about 18 inches long one could reach down to the pan of syrup, shove the nozzle into the entrance of the hive, and squirt the food between all the combs and all thru the hive. If this were done at night there would be no danger from robbers, and I will guarantee there is no method for stimulative feeding that would equal this for rapidity of work. I will have a pump

made on purpose, and have the thing tested at once.—EDITOR.—Gleanings in Bee-Culture.

Carniolan Bees; Their Appearance.

Doolittle says (page 617) that Carniolans do not differ in looks from black bees. I said that once, and a man mailed me a cage of bees he called Carniolans that were distinctly different from blacks—no yellow on them, but narrow white bands.—[The real pure Carniolans that I have seen look slightly different from the typical black bee. At one time it was claimed that the abdomens of the former were of a steel blue, but this was a mistake. Carniolans look about like blacks, except that the fuzz-rings between the segments, or scales, are of a whiter color. The bees themselves are a trifle larger, or appear to be so. Some so-called Carniolans look very much like black bees—act like them in tumbling off the combs in general confusion as they are pickt out of the hive. But we have had colonies of them in our apiary that behaved as quietly as Italians, and were just as gentle. As both races of bees came from Germany, it may be assumed that there are many crosses between the two. It is very difficult, therefore, to get pure Carniolans.—EDITOR.]—Gleanings in Bee-Culture.

HONEY AND BEESWAX
MARKET QUOTATIONS.

CHICAGO, Aug. 24.—Fancy white comb honey is selling at 15c per pound, with No. 1 grades bringing 14@15c. There is not much demand at present, and will not be until this hot spell shall pass. Very few amber grades on the market and yet what there is does not sell. Extracted white, 7@7½c; amber, 6½@6¾c; dark, 6@6½c Beeswax, 28c. R. A. BURNETT & Co.

CINCINNATI, Aug. 8.—The demand for extracted honey is slow, while the shipments are many. I quote as follows: White clover, 8@8½c; Southern and amber, 6½@7c. Comb honey sells as fast as it arrives at the following prices: Fancy, 16@16½c; No. 1, 15c. Beeswax, good demand, 25c. C. H. W. WEBER. □

BOSTON, Aug. 8.—Fancy 1-pound cartons, 17c; A 1, 15@16c; No. 1, 15c; No. 2, 12@13c. Extracted honey from 7½@8½c, as to quality. It is too early in the season and too warm for any inquiry on honey, so prices named are only nominal. The prospects in this vicinity seem to be for a light crop. BLAKE, SCOTT & LBB.

KANSAS CITY, Aug. 30.—Fancy white comb honey firm, 12-section case, 15 cents per pound; 24-section case, 14c; No. 1 amber, 24-section case, 13@13½c. Demand good. Extracted firm at 6@8 cents, as to quality. Beeswax scarce at 35c. W. R. CROMWELL PRODUCE CO., Successors to C. C. Clemons & Co.

DETROIT, Aug. 25.—Fancy white comb, 15c; No. 1, 14@15c; a little buckwheat is being offered at 10@11c. Extracted, white, 7c; amber and dark, 5½@6c. Beeswax, 25@26c. M. H. HUNT & SON.

BUFFALO, Aug. 25.—Fancy new 1-pound comb, 16@17c; choice, 14@15c; No. 2, 12@13c; No. 3, 10@11c; old, 10@14c. Fancy beeswax, 28@33c. Demand improving some. BATTERSON & Co.

NEW YORK, Aug. 25.—Comb honey in very good demand, and fancy white sells readily at 15 cents, and exceptional fine at 16 cents. Nos. 1 and 2 white, 13@14c; amber, 11@12c. No change in extracted. Beeswax firm at 28@28½c. HILDRETH & SEGELKEN.

SAN FRANCISCO, Aug. 8.—White comb, 12@12½c; amber, 9@11; dark, 6½@7½c. Extracted, white, 7½@7¾c; light amber, 6¾@7¼c; amber, 5½@6c. Beeswax, 26@28c.

There is not much honey coming forward at present from any quarter, neither is there very brisk demand locally or for shipment at full current rates. Water-white honey is the scarcest sort, and market for this description shows the most firmness.

WANTED—HONEY AND BEESWAX.
We have a tremendous and growing trade in this line, and would like to hear from all who have such goods to sell in any part of the country, with quality, description, and lowest cash price. THOS. C. STANLEY & SON, Fairfield, Ill.

Four Celluloid Queen-Buttons Free

AS A PREMIUM

For sending us **ONE NEW SUBSCRIBER** to the Bee Journal for the balance of this year, with **40 cents**, we will mail you **FOUR** of these pretty buttons for wearing on the coat-lapel. (You can wear one and give the others to the children.) The queen has a golden tinge.

This offer is made only to our present regular subscribers.

NOTE.—One reader writes: "I have every reason to believe that it would be a very good idea for every bee-keeper to wear one [of the buttons] as it will cause people to ask questions about the busy bee, and many a conversation thus started would wind up with the sale of more or less honey; at any rate, it would give the bee-keeper a superior opportunity to enlighten many a person in regard to honey and bees."

Prices of Buttons alone, postpaid: One button, 8 cts.; 2 buttons, 6 cts. each; 5 or more, 5 cts. each. (Stamps taken.) Address,

GEORGE W. YORK & CO., 118 Michigan St., CHICAGO.

[Entered at the Post-Office at Chicago as Second-Class Mail-Matter.]

IMPORTANT NOTICES:

The Subscription Price of this journal is \$1.00 a year, in the United States, Canada, and Mexico; all other countries in the Postal Union, 50c a year extra for postage. Sample copy free.

The Wrapper-Label Date of this paper indicates the end of the month to which your subscription is paid. For instance, "Dec 00" on your label shows that it is paid to the end of December, 1900.

Subscription Receipts—We do not send a receipt for money sent us to pay subscription, but change the date on your wrapper-label, which shows you that the money has been received and duly credited.

Advertising Rates will be given upon application.

Reformed Spelling.—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound. Also some other changes are used.

The Weekly Budget

MR. E. E. HASTY, of Lucas Co., Ohio, writing us Sept. 5, said:

"Some honey came at last, and may be more will yet."

HON. EUGENE SECOR attended the Farmers' National Congress at Colorado Springs, Colo., Aug. 18 to 28, and so could not also get to the Chicago convention. He reports as follows, Sept. 3:

"We had a very interesting meeting, and some delightful outings in the mountains. Last week I spent two days at the Iowa State Fair, judging honey, etc. This week I have promised to perform the same act for Minnesota. Bees are doing nothing in these parts. Poorest season for years."

MR. J. T. CALVERT, of the A. I. Root Co., is still in Europe. In the last number of Gleanings in Bee-Culture he gave a very entertaining account of his trip so far, closing with these paragraphs referring to some people in England:

"I am particularly struck with the markt civility and gentlemanly bearing of the people. You may accost any one on the street, and always receive a courteous and civil answer. They appear not to begrudge the time taken to be civil. Indeed, they will often volunteer just the information needed at the opportune time. In the common exchanges of everyday life the deferen-

tial 'Thank you, sir,' is heard on every hand, even between servants and porters. I have not yet heard a word of profanity nor anything approaching it.

"The feeling system is quite universal, and servants expect a fee for every service rendered. No doubt this has its influence in molding their manners, and yet they are none the less courteous if they do not receive the expected fee. They are often quite ready to remind you of the fee in an adroit way."

MR. THOS. B. BLOW, of England, called on us just after the Chicago convention. Mr. Blow, some years ago, was perhaps the most extensive bee-supply dealer in Europe. He sold out his business a few years ago, and since then he has put in most of his time in trotting around the world. He is now on his way to Japan via the Pacific Ocean. Mr. Blow is such an exceedingly pleasant gentleman to meet, that it was unfortunate that he could not have arrived in Chicago in time to attend the convention, and let the American bee-keepers see more of him.

MR. GEO. P. PRANKARD, of Bergen Co., N. J., sends us a clipping from the St. Louis Republic, which tells of a

young farmer, Henry Fitch, who, while plowing with an ox team and whistling, had a swarm of bees to settle on him and the oxen. He continued to plow and whistle until he arrived near his home, the field extending up to the house. Upon arriving, his mother helped him to hive the bees. The report said that both Mr. Fitch and the oxen lookt as if they were covered with a soft brown fur when the bees were on them. It seems he held the tails of the oxen so they should not anger the bees by switching.

So there are bee-stories as well as fish-stories.

OUR POSTAL SERVICE IN WAX is the heading of an interesting column article in the Kansas City Star, sent us by Mr. A. C. Thomas. It tells all about an interesting United States Government display at the Paris Exposition, covering half the floor space of a building 80 feet square. From the beginning of our wonderful postal system up to the present time—every development is illustrated in wax. No doubt Mr. C. P. Dadant will see it, and have something to say about it in these columns, as he has promised to write of other things of interest to bee-keepers.

Extracted Honey For Sale

ALL IN 60-POUND TIN CANS.

ALFALFA HONEY *****

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

BASSWOOD HONEY *****

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms in Wisconsin. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

Prices of Either Alfalfa or Basswood Honey:

A sample of either, by mail, 8 cents; samples of both, 15 cents—to pay for package and postage. By freight—one 60-pound can, 9½ cents per pound; two cans, 9 cents per pound; four or more cans, 8½ cents per pound. Cash must accompany each order. If ordering two or more cans you can have half of each kind of honey, if you so desire. This is all

ABSOLUTELY PURE BEES' HONEY,
The finest of their kinds produced in this country.

Read Dr. Miller's Testimony on Alfalfa Honey:

I've just sampled the honey you sent, and it's prime. Thank you. I feel that I'm something of a heretic, to sell several thousand pounds of honey of my own production and then buy honey of you for my own use. But however loyal one ought to be to the honey of his own region, there's no denying the fact that for use in any kind of hot drink, where one prefers the more wholesome honey to sugar, the very excellent quality of alfalfa honey I have received from you is better suited than the honeys of more market flavor, according to my taste.
C. C. MILLER.
McHenry Co., Ill.

Order the Above Honey and then Sell It.

We would suggest that those bee-keepers who did not produce enough honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

* **Editorial Comments.** *

Can a Man Support a Family on Bee-Keeping Alone? is a question discussed in the German *Bienen-Vater* by Jul. Steigel. In lower Austria, he says, no one makes bee-keeping an exclusive business, but he thinks it possible. He figures that it is a conservative estimate to say that an annual income of \$200 might be had from bees, and says many at other callings work the year round for half that sum. That would seem a very small sum to one in this country, but expense of living is much higher here. As a matter of fact, very few in this country depend entirely upon the income from their bees; perhaps not so much on account of small returns, as on account of the exceeding uncertainty of the business. It is probably true, however, that the number is by no means small of those who get their chief support from bees, holding on to some other means of support to tide them over years of failure.

Buying Queens of Queen-Breeders.—Referring to the statement by Frank Coverdale, that nearly every one of 50 purchased queens fell short of common stock on the honey-gathering point, E. E. Hasty propounded the question: "Shall we 'edicate' our breeders, or stop buying queens, or what?" Replying to this in the *Ruralist*, J. O. Grimsley says:

"It may be that Mr. Coverdale has been buying of unreliable queen-breeders or dealers, but I kind o' think he does not realize the fact that queens hardly ever show up as well after having gone thru the mails. The journey is evidently a drawback so far as future service is concerned. But there are queen-breeders, and there are queen-breeders."

This partly answers Mr. Hasty's question, but the importance of the question warrants fuller consideration. Besides the possibility suggested by Mr. Grimsley—buying of unreliable dealers—there is also the possibility that what Mr. Coverdale calls "common stock" may not be so very "common." Mr. Coverdale is an intelligent bee-keeper, by no means a novice, and it is not likely that the 50 queens were all obtained at one time, but at different times with the view of improving his stock. The supposition is, that most of the queens he bought did not show as good results in honey-gathering as the queens he already had, leaving the inference that one or several of the queens he got did show better results than those already on hand. For the sake of illustration, let us suppose that three of his purchases showed an advance. It is not hard to understand that the greater the improvement resulting from any of these purchases, the more difficult it was for any subsequent purchase to show still further improvement. If at any one time a purchase showed a great advance, a number of succeeding purchases might show no advance, altho the queens received should all be good. So if Mr. Coverdale's

stock should all the time be called "common stock," the fact that only one or several of the purchased queens made any improvement is by no means clear proof that any one of the queens purchased was not above the average of queens throughout the country.

Suppose, however, that most of the queens were really bad, much poorer than the average throughout the country, the possibility is still left that the improvement from the few good ones might more than pay for the whole cost of the 50; in which case Mr. Hasty's question, "Shall we stop buying queens?" must be answered in the negative.

Referring to Mr. Grimsley's statement that "queens hardly ever show up as well after having gone thru the mails," the question might arise, "If the queen received by mail, after being fully settled, shows no better results in honey-gathering than the average colony already on hand, is there any advantage in purchasing such queen?" It would be unwise hastily to decide that such a question should always be answered in the negative. It is well understood that while some queens may pass thru the mails unharmed, the injury to others is of all degrees. A queen may be so injured that she ever after does poor work at laying. But the direct result in honey-gathering by the worker progeny of that queen is a very small part of the object the purchaser has in view. What he wants is improvement in queen progeny, and that may be as great as if the queen had never been thru the mail.

The testimony of hundreds upon hundreds is that great improvement has been made thru queens purchased and sent by mail. If such were not the case it could hardly be possible that the trade in queens should have attained its present proportions. And the probability is that more queens to-day are sent by mail than ever before.

All this does not in the least militate against the fact that the intelligent honey-producer, whether he makes further purchases or not, should aim at constant improvement by careful weeding out of poor stock and breeding from the best.

Keep a Record of Your Colonies.—Every bee-keeper has noticed the difference in the performance of different colonies, and sometimes the question has been asked as a poser: "Why is it that two colonies side by side, equal in all respects, show such different results in storing?" As a matter of fact, they are not equal "in all respects;" one is more industrious than the other. It is important that a written record be kept, showing just how many pounds of honey have been secured from each colony. Other things bearing on the reputation of a colony should also be recorded, for example, when for any purpose brood is taken from or given to a colony. Other things being equal, a colony that has had brood or bees drawn from it ought of course to have some credit for that.

If these things are not put down in writing somewhere near the time of their occurrence, they are likely to be forgotten; at most, the bee-keeper has a rather indistinct remembrance of them.

Such a record may be of very great value if proper use is made of it. Having positive knowledge as to the relative working power of different colonies, the bee-keeper will know from which colonies to breed so as to improve the character of his stock. Not only is it important to know the best stock, but also to know the poorest. In the ordinary apiary are found colonies that produce much less than the average, which are allowed to go on year after year reproducing their own kind. True, there may be, and probably will be, an improvement of stock when the poorest colony in an apiary is entrusted with the matter of superseding its own queen, but with that improvement the stock will still be poor. The wise bee-keeper will at this time of year take account of stock, and remorselessly kill every queen whose progeny has shown itself inferior in working qualities, replacing her with one of best stock.

Some bee-keepers make a practice of replacing every queen which has past a certain age. Much better is it if instead of selecting for destruction those which have past a certain time limit, those be doomed which have failed to come up to the average in storing, whether the queen be young or old.

This must not be understood as meaning that the queen now in the hive shall always be held responsible for the work done. Here is a certain colony which had at the beginning of the season a very old queen, but one which did fine execution the previous year. Owing to her great age, the colony was not brought up to full strength in time for the honey harvest, but before the close of the harvest she was superseded by the workers. The colony has done poor work at storing, but it would be unwise to kill the present queen. She is of good stock, and next year her colony may surpass all others. But when the same queen has been in the hive all the season, she may be held accountable for the good conduct of the colony under penalty of dethronement.

Bee-Paralysis has had many a cure reported, but when tried these cures do not seem to stand the test. Editor Root gives in *Gleanings in Bee-Culture* a treatment which, altho its difficulty of application may prevent its use in many cases, it may still be well to know. Mr. Root says:

"As to bee-paralysis, there has been proof advanced to show that the disease is constitutional, and resides in the queen. There has also been proof to show that even when the queen is removed the disease would go on just the same. The only rational way of treating bee-paralysis is to take all the colonies so affected and remove them to a new location a mile and a half from any other bees, and then remove the queen and give them another. But before doing so, shake all the bees in front of the entrance, in the grass. The sick ones will remain outside, while the healthy ones will crawl in. After the queen is introduced, go over the combs ever so often, and hand-pick the sleek, shiny bees off the combs. Once in awhile give the colony a frame of hatching brood from a healthy colony.

"We have found this, that removing the queen and also removing the sick bees as fast as they show symptoms of the disease, at the same time giving hatching brood, will very often cure the worst cases.

"One writer recommends putting a healthy colony on the stand of the weak one, and the weak one on the stand of the healthy one. The result is that the healthy bees carry out the dead ones and the sick ones, and, according to the statement of the one who recommends this treatment, it effects a cure."

"**The Hum of the Bees** in the Apple-Tree Bloom" is the name of the finest bee-keeper's song—words by Hon. Eugene Secor and music by Dr. C. C. Miller. This is thought by some to be the best bee-song yet written by Mr. Secor and Dr. Miller. It is, indeed, a "hummer." We can furnish a single copy of it postpaid, for 10 cents, or 3 copies for 25 cents. Or, we will mail a half-dozen copies of it for sending us one new yearly subscription to the American Bee Journal at \$1.00.

Convention Proceedings.

Report of the Proceedings of the 31st Annual Convention of the National Bee-Keepers' Association, held at Chicago, Ill., Aug. 28, 29 and 30, 1900.

BY DR. A. B. MASON, SEC.

The 31st annual meeting of the National Bee-Keepers' Association was called to order at 7:15 o'clock, Tuesday evening, Aug. 28th, by the President, E. R. Root, of Ohio.

The convention, led by Mr. George W. York, of Illinois, with Mrs. York at the piano, sang the "Bee-Keepers' Reunion Song," after which prayer was offered by Mr. R. C. Aikin, of Colorado.

President Root—The next thing on our program is "How to Sell Honey," but we have with us Mr. Frank A. Converse, of New York, Superintendent of the Live Stock and Agricultural and Dairy Products, of the Pan American Exposition. Those with whom I have talkt, think best to call upon him to speak to us now.

Mr. Converse—Mr. President, Ladies and Gentlemen: I did not come here to advertise the Pan American Exposition. You represent one of the greatest industries in the United States, and since my connection with the work in our own and other States, I have come to believe that the bee-industry is one that should receive special attention at the hands of the Exposition. I am not a bee-man and know nothing of the business whatever. I told your president I would like very much to come and meet with you here, and find out what you wanted with reference to an exhibit at the Exposition. I may say to you that every State in the Union will be represented at Buffalo next year. Many of them have made large appropriations, and some of them who have not made appropriations we expect will do so later on. Every Central and South American country, save three, have already signified their intention of making an exhibit. Then in connection with the Live Stock Exhibit, I come here to find out what you as bee-keepers want, and if you want to make an exhibit by States, and in just so far as I am able, and I know that is the wish of the management of the Exposition, we will meet your suggestions and your demands, and I would simply ask that during this convention you have a committee, or formulate some action which will guide us in making one of the best apiarian exhibits that ever has been brought together on this continent. It seems to me that this is a question that interests you as well as it does us, and I simply come here for that purpose. I have been visiting at Colorado Springs, attending the Farmers' Congress, and have just stopt over here a little while to meet you for this purpose. Now not being a bee-man, I can not make to you any suggestions, but I will promise you that we will do everything that it is possible for us to do to carry out any suggestion or any plan that you may formulate. Our present plan, I may say, is to have those exhibits in the main Agricultural Building, and we do that for the reason that I am told by some of your number that at some other expositions the bee-men have made their exhibits in a special building, and that but few, aside from those who were specially interested in that exhibit, visited that building. My idea is to give it a prominent place in the main building, and make people see it whether they want to or not.

Now, then, about the character of the exhibit, you bee-keepers know a great deal better about that than I do, and our plans, so far as that is concerned, have not taken any definite shape, and I should be more than pleased to have this meeting take some action and make some suggestions. I promise you, so far as we are able, we will carry out your plans.

Mr. President, I am not here to take your valuable time, because I know you come here to listen to some talks and look at the pictures, and I simply express in an offhand way my pleasure at meeting you, and I trust that your convention will be successful, and I know it will be, because you men and women have come together, I believe, in the right spirit, and wherever men come together in that way, whatever the association may be, my experience is that great good can come from it. I thank you very kindly, sir, for

this opportunity of bringing this matter up. I can't say more than bid you God-speed along the line of your work. Whatever you want us to do, we will try to do the best we can. I thank you very much for this opportunity.

Rev. E. T. Abbott—Perhaps I owe the gentleman who just left the platform, and the convention, an apology. I am not feeling very well, did not sleep any last night, and I went to the hotel to take a nap and just waked up. I am not in the habit of going to sleep on duty, but I promise the gentleman to meet him before the Association had their meeting, and for that reason I did not do it. I just discovered a little while ago it was time to commence. There was appointed at Philadelphia just such a committee as we need now, consisting of our chairman, Mr. Root, Mr. Marks, of New York, and Mr. York, of Chicago, Mr. Selser, of Pennsylvania, and Mr. Hershiser, of Buffalo, who is right on the ground. I do not know as it is necessary for us to make a motion, or for me to make a motion that that committee go on and do their duty and make such arrangement as they deem necessary, but I think they will without discussing the matter further. I know Mr. Root will look after the matter. It had been overlooked by him and a number of us that that committee was appointed, but Mr. York remembered it, however, and on investigating the files, we find such a committee was appointed, and I do not think we could better it. So far as I am concerned, I think we would better leave it just there.

Dr. Mason—A few weeks ago, as Secretary of this Association, I received a letter from Mr. Converse in regard to this matter, and we have been corresponding in regard to it since. He is here by my invitation to-night, being in the city. I think we ought to put our influence with Mr. Converse to make such an exhibit as will be creditable to our fraternity, to us as bee-keepers.

Pres. Root—What instructions, if any, do you wish to give to this committee at this time?

Dr. Mason—Not any.

Hon. R. L. Taylor—I move that that be made a subject for consideration at the first hour, Thursday morning. (Seconded and carried.)

Mr. Converse—I would like to say just one word and that is regarding our present plan, so far as it is mapped out, that is, to have this bee-exhibit a representative exhibit from States, and each exhibitor won't lose his identity. That is, if one man comes from Colorado, we shall expect his exhibit to be a part of the Colorado exhibit in the apiarian display, and whatever awards go to that exhibit, of course will go to the individual who makes the exhibit; and if any of you people don't know who your State commission are, if you will correspond with me, I will put you in touch with the man who has charge of this particular part of the State exhibit, if the commission has designated such a man; I will be glad to render you any assistance I can. You can get my name from the Secretary. I shall be glad to receive letters from you and receive suggestions along the line of State Exhibits.

Then followed a paper on "How to Sell Honey," written by Mr. S. A. Niver, of New York, but read by Mr. York, as Mr. Niver was not present. The paper is as follows:

HOW TO SELL HONEY.

When our genial secretary propounded to me the conundrum, "How to Sell Honey," for a solution to be given to the National Bee-Keepers' Association, I said to Editor York, "That's too easy; just offer your customer a *better bargain* than your neighbor does, either in quality or price, and, as a matter of course, you will sell your honey, and your neighbor can—well, perhaps *eat* his."

Thinking the subject over in the light of giving directions "How to Sell Honey," to a convention of bee-keepers, it would appear to be necessary to give that neighbor a hint how to proceed after Dr. Mason had filled his market full "forinst" him; and here the subject began to look complicated, so, as is customary, I put it off until a more convenient season.

A short time ago W. L. Coggshall askt me if I was going to attend the Chicago convention of the National Bee-Keepers' Association, I replied, "No; but I have a conundrum for you. Can you tell 'How to Sell Honey?'"

"I can't; haven't any to sell," was his reply. That was like the old recipe for cooking hare—"First catch your hare."

Then I lookt up the authorities, the writings of the veterans, and found all harping on the same string—sell in your home market after getting the crop in the most attractive condition possible. The results of this line of advice is familiar to all. Polish and sand-papered sections,

nice shipping-cases, fancy labels and cartons, bleached combs, and extra-filled sections ("stuff prophets," Morton used to call them) obtained by crowding bees for room in the surplus department, at the expense of shortened crops, much extra time and labor, extra annoyance from swarming, and crowding out the queen in the brood-chamber.

After all this, when we come to market with our honey we find our neighbor has been busy at precisely the same thing, and has beaten us by a day, or has sold some inferior honey at a low price, which is about as bad.

This line of advice, carefully followed by all, will result in a greater consumption of honey, without doubt, for nice looking, clean looking goods sell much more rapidly, but it makes a comb-honey producer work on Dr. Miller's 8-hour system—8 hours in the forenoon and 8 hours in the afternoon—and every year get less for the crop than he did the year before, other things being equal.

David Harum's golden rule, "Do to the other feller just what he's tryin' to do to you, but *du it fust*," pithily sums up the anti-moral, anti-Christian, anti-common-sense methods now in vogue, but which will endure until displaced by something better.

Shipping honey to the city commission merchant is another method which has so many drawbacks that the veterans give about the same advice in regard to it that "Puck" gave to those about to be married—"Don't." And in a stage whisper let me say that the commission man has troubles of his own, which Mr. Burnett may tell us more about before this meeting is over.

Six years ago, a number of honey-producers of Groton, N. Y., believing it better to combine than to compete, pooled their interests, and sent the writer of this article, "armed and equipt as the law-directs," with sample case and power of attorney, to the grocers in cities reacht by our one line of railroad, to sell and collect for all, and divide the expenses in proportion to amount sold for each member. This arrangement workt so satisfactorily that it has been followed each year since, with growing acquaintance, and mutual dependence between our customers and ourselves. True, there are some drawbacks to this method, such as bad debts, much book-keeping, owing to large number of small sales, and length of time it takes to get collections in and distributed, but the net results in price and security have, on the whole, been very satisfactory.

Fellow honey-producers, isn't the key to Dr. Mason's conundrum to be found in that experiment of ours, with its basic principle of combination as opposed to competition? An adoption of some such general method would put the honey-producer abreast of the times, in harmony with the spirit of the age.

The trusts have taught us that success must be lookt for chiefly by eliminating unnecessary expenses and losses. Our old cut-throat system can only change for the worse. There can be no patching or doctoring that will effectually improve it.

At the outset we are confronted with the utter impossibility of combining the interests of such a vast number of individuals, scattered over such vast areas, and the great variety in quality, color, flavor, and demand for just the particular kind the customer has been educated to prefer; but isn't it within the range of the possible, for the buckwheat honey-producers of New York State, for instance, to organize, and give the method a trial? In numbers, area of production, and area of effective markets, there are presented no difficulties which rightfully should discourage as energetic and intelligent a body of men as the New York State buckwheaters are known to be, in a matter so vitally interesting. With a thoro knowledge of the amount to sell, and a common agreement as to a minimum price to be accepted of anybody except the representative of the combination, who will take all unsold honey at a fixt date, and dispose of it to the best advantage possible, the York State buckwheaters would have a chance to be less conspicuous by his absence at the next meeting of the National Bee-Keepers' Association.

Mr. Chairman, it is said that "a word to the wise is sufficient," and I hope this crude outline of a plan may prove to be the right "word," which will reach the ears of the "wise," and result in a better condition of affairs. If the secretary had only worded his conundrum, "How *not* to sell honey," I could have described the prevailing methods in detail, and felt that my answer had been nearly correct.

In conclusion, I hope that the convention will turn the search-light on this subject, and evolve a practical plan, which shall benefit the apiarist in this all-important branch of his beloved pursuit.

S. A. NIVER.

(Continued next week.)

Contributed Articles.

Letter from Mr. C. P. Dadant, Now in France.

LE CHALET, NYON, FRANCE, Aug. 22, 1900.

DEAR MR. YORK:—You must think that I am very neglectful of the promise I made you to write you from Europe, about bee-culture abroad. I must say, in explanation, that two things have detained me from writing, the main one being that I have seen but little of bee-culture so far. The other reason is, that I have traveled so much, and have so well occupied my time, that I have found no occasion to put my thoughts and observations on paper.

I came to Europe ostensibly to represent American bee-keeping at the Paris Congress, but more particularly to visit the land of my birth, and the home of my young days. It is now 37 years since we landed in America, and we are more attaché to our adopted country than to the land of our birth; but a visit to the scenes of one's childhood has an invincible attraction. I went to the city where I was born—Langres—on top of a high cliff, a walled fortress, such as does not exist in America; and when I reached it I found myself much in the position of Rip Van Winkle, after his 20 years' sleep, with the difference that the time was 37 years instead of 20, and that I had been wide awake a good portion of that time. But one generation has past, and I find the sons where their fathers used to be. Friends of 25 years of age are now 62. It is old age instead of youth.

So far, as I already said, I have seen but few bee-keepers, at Rouen, at Pierre, in the valley of the Saone, at Macon. I find that, in France, practical bee-keeping is only practiced by educated men—school-teachers, doctors, lawyers, priests and cures, and a few retired merchants. In the country, the villages, the peasants still cling to the old ways, and it is difficult to pull them out of the rut. Education, tho' gratuitous, is still not so generally diffused as among our American countries, and people are either better educated, more scientifically, more thoroly, in a more classical manner, than in America, or they are more ignorant, slower, more rusty, than our roughest classes. Hence their slow progress. But in return we can see highly educated men of most ancient houses who are as progressive as any of our Americans, and who are impatiently trying to draw the peasants out of the rut in all industries, as well as in bee-keeping.

I believe it will interest you in this connection to hear of an establishment which I visited in the city of my birth. I stopt with a friend, a manufacturer of cutlery, Mr. Beligne; staid a week at his home, and had occasion to visit his office and his warerooms. In a massive stone building, 500 or 600 years old, the office is a spacious room with desks and closets. This room is warmed in winter by a stove of *queensware* (faience), elegantly ornamented with brass mouldings, and of snowy whiteness. In each angle of the room is a niche with the bust of some noted man of ancient days. On the walls, carefully framed, are old circulars, advertisements, on coarse paper, dating back as far as 1780, 1690, 1610, the latter being the oldest, showing that the great, great, etc., grandfather of the present owner, bearing the same name, was already a manufacturer of cutlery 290 years ago. But let me quote verbatim:

“Didier Beligne, master cutler, at Langres, at the sign of the Royal Scepter, manufactures and sells razors, lancets, knives, and all surgical and tonsorial instruments. Langres, 1610.”

Is not this wonderful? A business kept up, from father to son, for 290 years, and perhaps longer, for this is only the length of time traced back by actual prints! We have no idea of the steadiness of an industry which has been handed from father to son for three centuries. This alone is an advertisement, for it attracts the attention, and one can not help thinking that a business which has been kept up for so many years, and has been on the increase, must have been carefully conducted, and on safe but progressive principles, and must have an intrinsic value.

Mr. Beligne produces some 3,200 different patterns of cutlery, manufactured either under his supervision or for his trade, which extends all over Europe. They seek but little trade in America, owing to the heavy tariffs, but they do extensive business with Russia, Germany, Italy, Switzer-

land and Spain. Not only are the manufacturers steadily engaged from father to son, in the same line for centuries, but they often keep the same employees from father to son. Our friend introduced me to a man in his employ whose grandfathers were employed by his own grandfather.

In these ancient places, one would think that the latest discoveries of civilization would be slow to come, but they are very readily taking advantage of the latest invention—the telephone, the typewriter, the electric tramway, and electric appliances, etc. Why, then, is bee-culture so far behind? Because bee-culture belongs to the rural pursuits, and the peasants, as I said before, are still uneducated. Routine is absolute queen of the French village. The houses are old, the manners are quaint. The entire household is under one roof, and from the kitchen you can pass into the barn, thence to the wagon-sheds, and thence to the stables, without stepping out-of-doors. So the apiary is still represented by straw skeps or willow baskets, carefully daubed with mud in all their joints. If there is a progress, it is found in the apiary of the schoolmaster, or of the cure, of the village doctor, or of some wide-awake horticulturist, who has brought home from the city college, or from the county fair, some new ideas, and a few good books.

But as the people are evidently conservative, as all changes are hooted at and condemned, they hesitate very much to change from the old ways to the new, and I have met men who extolled the movable-frame hives owing to the understanding they had of the manipulations they permit, but who were absolutely determined to use them only to hive new swarms, without any thought of transferring the bees out of their old skeps into new styles, unless the hives were entirely rotten.

Honey sells at a good price, and no wonder, for sugar retails at double the price we pay in the United States, and we all know that honey closely follows the price of sugar. But why does the Frenchman pay so high for his sugar? Because there is a high revenue tariff on sugar, and at the same time a premium to the exporter. Thus, French sugar sells in Switzerland at 5 cents per pound, while the Frenchman has to pay 10 cents for the same article. He is, therefore, giving a premium to a few sugar factories in order that he may pay more for the article for his own consumption. That is a finely constructed method of helping progress, is it not? *Protection a outrance.*

Among things of no value to us, I have seen, at Pierre, a lot of honey of the very best quality, put up in glass tumblers, the smallest of which, I was told, holds 40 grammes of honey, or about one-tenth of a pound. These glasses sold for 3 cents, and as the tumbler itself costs only a cent, the honey is thus retailed at 20 cents per pound.

Labor is exceedingly cheap, and they do things that we would not think of doing. For instance, an apiary will be surrounded with fine flower beds and gravel walks, altho the hives themselves, if they were in our hands, would either be considered as unfit for use, or would be looked upon as very inferior specimens of workmanship.

Scientific investigations, among the educated, are followed very closely. I met an old doctor who had analyzed honey taken just after it had been harvested by the bee, and at the same time some nectar from the blossoms on which the bees had been working. He had also tested the density of the honey comparatively when taken from the bloom in the early morning and at noon. Yet he was not a chemist, but had simply wished to satisfy himself, and by close personal examination, of the quality and condition of the honey his bees produced.

I am at present enjoying the hospitality of our good friend, Mr. Bertrand, in his fine *chalet* on the shores of the lake of Geneva. Mr. Bertrand is the worthy editor of the *Revue Internationale d'Apiculture*. We are to have a meeting of Swiss bee-keepers here, and in some future letter I will speak of this, as also of my visit to the apiaries of Mr. Maigre, at Macon, France.

We are to remain here another week, then go to Paris, and two weeks later we go back to dear America.

Your friend,

C. P. DADANT.

Wanted—Better Prices for Honey.

BY H. D. BURRELL.

A VERY small crop of honey is reported from nearly all sections this season. Because of this fact, it seems to me the present quotations for honey in the city markets are too low. There has been a sharp advance in prices

in most lines of goods in the past 18 months—why should not honey prices advance also?

A little experience of mine has a bearing on the matter. Some 12 or 15 years ago I was fortunate in securing a good crop of fireweed honey. We lived then near a large tract of land over which a fire ran the year before. In this country fireweed grows, usually profusely, for one season after such a fire. Then there is little of it seen until after another fire, which may not come for several years. In this particular year, bee-keeping neighbors, who lived out of beehive range of this fire-swept tract, got a poor crop, and I had little except fireweed honey. This honey is light in color, and of good flavor, and will pass for clover honey, except with experts.

When the comb honey was ready for market, I packed about 500 pounds and went with it to Chicago. The year before there had been a large crop, and prices had ruled low for those times, and there was still some old honey in the commission houses there. I talked with many commission men. They thought about 15 cents was the right price for honey—possibly 16 for a fancy article. I knew from various sources the honey crop was light, and decided my honey must sell for more than that. I selected a good house, and told the manager he could have my honey if he would hold it for 20 cents. "Well," he said, "we have room to store it, and can hold it, if you wish, until you order it sold for what it will bring. But there is no use trying; we can't sell it for that price." "All right," I replied, "when I want it sold for less I will write you."

Three days later a card came saying the honey was sold, and they could use more at the same price; that "buyers thought it an extreme price, but the quality was so fine, and the packing so attractive, it sold readily."

In a short time my comb honey was all sold at 20 cents.

Now, can't a moral, or several morals, be drawn from this little story? First, it pays to understand our business, whatever it is, and attend to it ourselves, in an intelligent manner. I was richer by a considerable sum than would have been the case had I left all to the discretion of the commission man. Take the papers, and keep posted. All progressive honey-producers know there is not much honey to come forward this season. There is a class, and not a very small one either, who will have good honey at almost any price.

I have sold honey, a great many tons of it, as well as other produce, thru commission men for over 25 years. I have frequently interviewed them, and I think I understand them pretty well. I am glad to be able to say they are most of them very fine men, and my dealings with them have almost always been very satisfactory. But they are between two fires—shippers and buyers. They have friends, often heavy buyers, whom they are anxious to please and hold, and it is not strange that they will often do so at the expense of shippers. Put it out of their power to do this with *your* honey this year by limiting the price. If not in too much of a hurry to sell, you can get a good price for all there is to sell. Of course, this plan will not work so well in flush years.

I now produce only extracted honey, and have a good home market for most of it. If I had comb honey this year, and wanted to sell it thru commission houses in Chicago, or any other city, I would induce honey-producing friends to pool their interests with mine, put up the honey in attractive shape, go to the market and explain the situation to a half dozen or more good houses in the selling district, and fix the selling price at a fair figure, considering the probable supply and demand. Selling honey in many places at the same price, buyers would soon learn that they must pay a good price for honey if they got it, and would pay it just as readily as a low one.

Shade for Hives—Preventing Drone-Comb.

BY G. M. DOOLITTLE.

WILL you please tell us in the American Bee Journal what is the best method of shading hives from the sun?

ANSWER.—Various methods have been advanced, such as grape-vines, sunflowers, trees, shade-boards, etc., each having its good points. Trees have one advantage over everything else, in that they shade the *apiarist* as well as the hives; and what bee-keeper is there who has not wish for a shield from the sun for himself when working for hours on a July or August day when the mercury was play-

ing among the 90's in the shade? While this is so, yet trees, as a rule, are apt to give too dense a shade; and I am satisfied, from years of close observation, that, so far as the bees are concerned, they do much the best right out in the rays of the sun the whole year around, when the question comes to dense shade or no shade at all. For this reason I prefer to have a shade where I can go once in a while when becoming greatly heated, and either paint the hives white or use a shade-board for each hive, letting them stand in the sun.

Lately, in making some new hives, I have taken no pains in making the cover water-tight, but have made a shade-board to project from two to six inches around the top of the hive, the six inches being on the south, while the north side has a four-inch cleat nailed to it, thus giving it a pitch to the south, this causing the rain to run off easily, while at the same time it gives a good circulation of air over the top of the hive, so that the heat never drives the bees out of the sections, or causes the combs to melt down, with the hives standing in the full blaze of the sun in the hottest of weather.

Where I formerly covered the tops of my hives with tin, or made tin-roof hives, I now cover this shade-board with tin, and in this way no water ever touches the top of the hive. After a use of them for six or eight years I am much pleased with them, and prefer this arrangement for shade to anything else I have ever tried. The wood material used for the shade-board is $\frac{1}{4}$ -inch stuff, thus making it very light to handle; and as an insurance against the wind blowing it off, I put a common brick on each; and during the time I have used them, not more than one or two have been blown off, even in the most severe gales.

HOW TO PREVENT DRONE-COMB BEING BUILT.

QUESTION.—In the production of comb honey where a first (or prime) swarm is hived on comb-foundation starters, say two or three inches deep, and with sections on top filled with full sheets of foundation, what is the best method of preventing the building of drone-comb?

ANSWER.—Under such circumstances as the question describes, prime swarms are not very apt to build much drone-comb, as drone-comb is very largely built the first season for store-comb. In other words, bees build very little drone-comb the first season after being hived, only as they get in advance of the queen in comb-building. If they build comb faster than the queen can occupy it with eggs, then they keep on building comb, the same as they would if she kept eggs in the cells as fast as built; but instead of building worker-comb they change the size of the cells to those which are more economical for storing honey, which are of the drone size. These cells are filled with honey, so do very little harm the first year; but the next year, as the honey is consumed from them, the queen deposits eggs there, and from this comes a horde of useless drones, or such bees as produce no honey, but constantly consume it.

The above is applicable to a swarm of bees in a hollow tree or some box-hive, where they can do just as nature prompts. But it will be seen that the questioner has placed his swarm in a different condition than would be one in a hollow tree, in that he has put on sections filled with foundation, which foundation will be drawn out into comb as fast as the bees want room to store honey, as well as to remove a large part of the bees from the brood-chamber, and for this reason the bees will very rarely build comb in the brood-chamber faster than the queen will fill it with eggs, if the queen is a good prolific layer, as she should be in all cases where comb is being built; and the result is, sections filled with honey with very little, if any, drone-comb in the brood-chamber below.

And, I believe, as does W. Z. Hutchinson and some others, that the brood-chamber is filled with comb more cheaply under such circumstances, and more honey secured in the sections than where the brood-chamber is filled with frames full of foundation.

Now, if in addition to the above, the brood-nest or brood-chamber is contracted to two-thirds its usual size when the swarm is hived, we are almost certain not to have any drone-comb built, for this gives an additional security against the bees getting the start of the queen. But suppose a frame or two of drone-comb should be built, this can be removed from the hive the next spring, and frames of worker-comb substituted for it, when the drone-comb can be melted into wax, or kept for the production of extracted honey, using it in an upper story over a queen-excluding honey-board. I have practiced this method for years, and think it pays me better than to buy foundation.

I am well aware that there are many of our best bee-

keepers who do not agree with me here, but would say: "Fill the frames full of foundation every time;" but when I answer any question I, of necessity, must answer it from my own standpoint; and if any reader thinks otherwise than I do, he or she is at perfect liberty to follow any plans given; test them to know that these different ways are better, or let them alone altogether. I have never seen where there was any occasion to feel hard toward a brother or sister bee-keeper who honestly differs from me in opinion, for there is room enough for all. Onondaga Co., N. Y.

Moving Bees to Fall Pasturage—When and How.

BY GEO. DEMUTH.

MY locality furnishes surplus honey from clover and basswood only. No honey is gathered after the basswood harvest closes, the bees thus becoming consumers in July. Twenty-five miles away, in a region of small lakes, are numerous "dead lakes," or swamps and prairies. In August and September the goldenrod and Spanish-needle transform these prairies again into

have been by no means dazzling, yet the cash realized on the time actually spent makes a *per diem* wage, which, if continuous, would tempt most of us.

One year very little surplus was secured, yet if there had been none, the increase amount of brood reared, and the filling of the hives for winter, would have been ample pay for the time spent in moving.

Many have asked why I do not locate permanently in this prairie region. If I were located there I would need to move *here* for the *early* honey-flow. When the honey-flow ceases here, the sections are removed, and, as far as they will go, extracting-supers are adjusted. If I had enough extracting-supers I would ordinarily extract all the amber honey; yet, as I have no trouble in selling this amber comb honey at more than double the price of the same extracted, I have not seen fit to provide extracting-supers for all colonies to be used only in autumn.

Any colonies that are very heavy have the heaviest combs extracted to prevent cramping the brood-room. New swarms that have their brood-nest contracted are given empty combs to com-

Loading the Hives on the Wagon for Moving to Better Pastures—(From Bee-Keepers' Review.)

lakes, surpassing even their former glory, with their brilliant yellow surface stretching from shore to shore. Those that are dry enough to pasture present a silvery appearance from the abundance of boneset. In the adjacent corn-fields, heartsease is plentiful during wet seasons; and on the sandy upland, goldenrod monopolizes the waste land.

My management at home has been such that the bees are brought thru the white honey harvest short of stores, the honey having gone into the supers. This necessitates feeding for winter; the expense of which, after a poor season, when most of the cash receipts must be invested in sugar, has sometimes almost made me wish I had never seen a bee. In 1896 I moved a load of bees to this location of autumn flowers, and secured an average of about 40 pounds of comb honey per colony. In addition to this, each hive contained enough honey to last until the next spring.

Since then a part of each year's program has been this "mid-summer outing;" and I have not fed any for winter since I began moving.

While the net returns from surplus honey secured by moving

plete the set. The bottoms are now fastened to the hive-bodies by two nails driven thru the bottom into the sides of the hive-body. To drive these nails the hives are stood on the back end. The bottoms are left on from year to year, unless there are reasons for taking them off, when they are easily removed. Rims $2\frac{1}{4}$ inches deep, having the same outside dimensions as the hive, and covered with wire-cloth, take the place of the cover. These rims are fastened to the hive-body by two long, slender wire-nails, driven down thru the rim into the edges of the sides of the hive. The cover and bottom are thus fastened with four nails. Hives having on extracting-supers have the stories fastened together by tacking on lath or frame-stuff. Sometimes neither the bottom nor rim are nailed to the hive-body, but a lath is nailed on each corner to the bottom, bodies and rim.

As there are generally at least two weeks after the close of the harvest here before there would be any great advantage in having the bees in their new location, I sometimes wait for a cool night. Moonlight nights are preferable for moving, but not necessary—we are sometimes glad to have even the light of the stars.

On the Road to a Sweeter Land—(From the Review.)

The time for the journey having been selected, the top screens are put on and all the hive-fastening done by daylight except putting on the entrance screens. These screens are fastened to a lath with two small nails. These nails are partly driven into the lath, and the entrance screens are distributed before evening, that they may be put on quickly when the bees quit flying. When the top screens are put on, the cover is laid over them, and the shade-board put in place to prevent, if possible, the bees clustering out. It is quite a task to smoke in the bees of 50 colonies, and put on entrance screens during a hot July evening. If the bees are in the hives, as they should be, one person, with an assistant to load, can easily close the entrances and take to the wagon 50 colonies after the bees quit flying, and before dark. If a hive should leak, the hole is plugged, and no attention paid to the bees that are outside, unless they are in the driver's way. Bits of comb, not too old, make excellent plugs for leaky hives. It is well to prepare one or two extra colonies, to be substituted for any that might leak badly. I have moved on springs and on straw. Springs are preferable, being handier and lighter. When straw is used, it is well to use a false rack on top of the straw. This is made of light pieces the length of the hay-rack, spaced at such distances that the cleats of the bottom-boards will just catch over their edges. This false rack is simply laid upon the straw, and wired to the end sticks of the hay-rack. It holds the hives in place, and requires much less straw, as no individual hive can settle down into the straw.

When bolster springs are used, the hay-rack is easily transformed into a bee-rack by nailing on extra boards lengthwise, spaced so as to hold the hives in place by the cleats on the bottom-boards. The covers are packed in the lower part of the rack before the bees are loaded.

Unless the roads are rough, or the night is very warm, I drive as fast as the horses will walk.

Most of my frames are the Hoffman; but the loose, hanging frames go all right without any fastening or attention whatever. Perhaps if they rested on tin rabbets they might need fastening. I have never seen a frame moved out of place by handling.

After the frost has killed the flowers the bees are moved home at once. The return trips are made during the day. No screens are now used, as the weather is cool. I brought them home last year without fastening the covers, as the propolis held them firmly. Neither do I find it necessary to fasten the covers when hauling to an out-yard in the spring; but care must be taken in loading, that the covers of the different hives do not bind, or they may be broken loose.

Owing to insufficient ventilation and an extremely hot night the first load that I hauled to fall pasturage got "hot" when about 12 miles away from home. They were set off in a school yard, the entrances opened, and the journey was not resumed until the next evening. When the bees wedge themselves in the entrance

and begin to squeal, it is time to unload and open the hives. Since using the deep screens on top no trouble has been experienced. The risk item has grown less with each trip until it has become practically nothing.

In the larger picture the fellow in the foreground is myself. The little tent is where the extracting is done. It is also my kitchen, parlor and bedroom while I "batch" it when caring for the bees. The picture shows only a portion of the bee-yard. I had 80 colonies in that yard when the picture was taken. Near by is a small lake, where I go fishing and boating when time permits.

This season has been the flattest failure that we have had since I have kept bees. I have read of total failures, but this is the first I have ever experienced, and I have kept bees over 15 years. I look with more than usual anxiety to the autumn flowers.

The hive fastenings described in the forepart of my article are somewhat objectionable, in that nails must be driven into the hives. This year I expect to make frames to hold several hives clamped together, without fastening the individual hives. A bottom frame, so constructed that it will hold the bottom-boards in place, and of proper length to fit

crosswise in a railroad car, will have holes mortised in just below the corners of each hive. T-shaped posts, formed by nailing a one-half by three-inch piece (top of the T) to a one and one-half by $\frac{3}{4}$ piece (stem of T), length of post to be a little greater than height of hive, upper story and rim for screen, will be dropped down into these holes in such manner that the stem of the T (the $\frac{3}{4} \times \frac{1}{2}$ piece) will be between the sides of the adjacent hives, and the top of the T will catch over the ends of the hives, *i. e.*, the corners of two adjacent hives will fit snugly into the corners of the T-shaped post. A light frame, having holes to correspond with the tops of these posts, will be placed on top of the group of hives and drawn down tight against the top of the screens by means of wire loops with sticks. These groups, or clamps, of hives will be placed on the wagon-rack crosswise, which will make the combs run lengthwise of the wagon. This will permit a greater number of hives on the rack one tier high. I would not expect any damage to the combs by being placed lengthwise on the wagon. When placed in a car they will be all right.—Bee-Keepers' Review.

Miami Co., Ind., July 6.

Questions and Answers.

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

[The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.]

Moving Bees a Long Distance.

I am going to locate in western Missouri, and having an apiary of 15 colonies which I want to take along with me, how would you advise shipping them, and at what time of the year, to have them reach their destination with as little loss as possible? I have been in the business five years, and have had great success, so I now dislike giving them up, if I can take them along without too much expense.

ILLINOIS.

ANSWER.—The best time is in spring, when the combs are light, and when the weather is not yet hot. Fall is good, if the combs are not too heavily laden. The exact manner of preparing for shipment depends somewhat upon the kind of hive. In any case there must be provision for ample ventilation, the hotter the weather the more it is needed. Make a frame to cover the entire top of the hive, and cover it with wire-cloth. If the hive is not provided with first-distance frames, fasten the frames against mov-

ing, either by driving a nail into each end of each frame, or by shoving little sticks down between the end-bars. A sponge full of water in each hive is a good thing. On a wagon, let the frames run across the wagon-box; on the cars, parallel with the rails.

Feeding Foul-Broody Honey.

Can honey taken from foul-broody colonies be boiled and fed back? If so, how much water should be added, and how long should it be boiled? MASSACHUSETTS.

ANSWER.—Opinions vary greatly as to the length of time required to make such honey safe by boiling, and on the whole there is so much danger that it is better not to use it for bee-food. It will not hurt you to eat it, but it might be death to the bees.

Clipping Queens—Basswood, Etc.

You will likely receive my order from the publishers of the American Bee Journal, for one of your queen-bees. I am not in a rush to have her, only before you cage her be kind enough to clip her just the way you clip a queen, for I keep every fertile queen-bee clipped, and I would not like to meddle with her.

My way of introducing a queen is this: I remove the queen in the hive (if any), then I hunt out a frame of just-hatching brood. I then fit wire-cloth bee-tight over both

sides of this frame of brood and some honey, and here is where I let the caged queen and the several bees with her run on them. I put them in the hive for three days; after the third day I take the wire-cloth off. It has always worked nicely for me.

I inclose a wild honey-yielder that grows on the ore banks. When I go there and stand still, I see bees on it by the thousand. Just as far as my eyes can see the ground is like velvet, and bees on all day. In the morning the nectar on this velvet shines like silver.

Also basswood was in full bloom this summer, but I could not see a bee on the blossom, but it was full of bugs and wasps. Why was this? PENNSYLVANIA.

ANSWER.—Unless there was an accidental omission, every premium queen sent out has had the two wings on the left side clipped, not because that is better than having the other two clipped, but because it is more convenient.

The plan of introduction that succeeds is all that can be asked. As yours succeeds, it is all right. Indeed, one might expect success with such a plan without trying it.

Why didn't you give us the name of the plant that makes the ground look like velvet? The sample sent is beautifully delicate, and it is easy to imagine that a wide expanse of it must be an attractive sight. Perhaps the editor can have it named for us. [Later it will be named. —EDITOR.]

Basswood seemed to act with you as goldenrod generally does here—flies, bugs and things on it, but no bees. I don't know why, unless because there isn't enough nectar to pay a self-respecting bee for the time needed to gather it.

The Adel Queen

you sent me in 1899 is the best queen I ever saw. Her colony stored 42 pounds whitest honey in 19 days, commencing Aug. 11th, now working on third super. Send two more queens.

Albino Queens

by return mail. Untested, 75 cts.; warranted, \$1.00; tested, \$1.25. 12A 26t J. D. GIVENS, LISBON, TEX.

Please mention Bee Journal when writing.

The Sure Hatch Incubator Company, of Clay Center, Neb., write us that they will make an exceptionally fine exhibit at the Illinois State Fair. This will be in charge of Nellie Hawks, the well known poultry writer. She will bring incubators from Nebraska full of eggs one week before the fair, timing them to hatch during the fair. This is the Sure Hatch Company's favorite method of demonstrating the efficiency and simplicity of their machine, and, as Mrs. Hawks will be personally in charge of the exhibit, the interest of the visitors and practical value of the exhibit to them is bound to be increased. Many people regard Mrs. Hawks as the Fair's Field of to-day in the poultry business. Probably no one has done more than Mrs. Hawks to dignify the poultry business, and at the same time simplify the proper raising of poultry on the part of common people. Nothing else indicates the growth of the poultry business better than the sale of incubators which, but a few years ago, was regarded with suspicion by the masses, but now take their place as a farm necessity along with the plow and cultivator; the only essential difference being that these latter are used by the men, and the incubators by the women-folks, both contributing to the farm profits. We trust that all of our readers who see the Illinois Fair will visit the exhibit of the Sure Hatch Company. You are sure of a hearty welcome.

Please mention Bee Journal when writing Advertisers

Dr. Miller's Honey-Queens!

One Untested Queen Free as a Premium for sending ONE New Subscriber to the American Bee Journal for one year.

Or, send us \$1.50 and we will mail you a Queen and also credit your own subscription for One Year.

Or, for \$1.00 queen alone by return mail.

We have been fortunate in making an arrangement with DR. C. C. MILLER—the well-known honey-specialist—to rear queens EXCLUSIVELY FOR US DURING THE

SEASON OF 1900. These Queens will be mailed in rotation, so

"first come first served."

The Queens Dr. Miller will send out on our orders will be precisely the same as those he rears for his own use, so of course they will be from his best stock. His best colony in 1899 had a queen reared in 1898; May 5, 1899, it had brood in 4 frames, and he gave it at that time a frame of brood without bees. It had no other help, but May 25 a frame of brood with adhering bees was taken from it, and the same thing was repeated June 3, leaving it at that time 5 frames of brood. It stored 178 sections of honey, weighing 159 pounds (and that after July 20, in a poor season), being 2 2/3 times the average yield of all his colonies. A point of importance is the fact this colony did not swarm, and an inspection every week or 10 days showed that at no time during the entire season was there even so much as an egg in a queen-cell. Dr. Miller rears queens from this one.

The demand nowadays is for BEES THAT GET THE HONEY when there is any to get, and Dr. Miller has such bees. You will want to have a queen from his best, we are sure, even if she is not pure Italian.

Do not send any orders to Dr. Miller, as all orders MUST come thru us, according to our agreement.

Remember, send us \$1.00 for ONE NEW SUBSCRIBER to the American Bee Journal for one year, and YOU will get ONE OF DR. MILLER'S UNTESTED HONEY-QUEENS FREE AS A PREMIUM. This offer is made only to our present regular subscribers. Orders for queens are to be filled in rotation.

Address all orders to **GEORGE W. YORK & CO.,**

ROOT COMPANY'S PAGE.

A \$200 Red-Clover Queen at Last!

We finally have her, and she seems to be fully equal to our red-clover queen of years ago. The colony of this queen has given one of the most remarkable showings on red clover of any bees we have ever had, notwithstanding the stock has been robbed repeatedly of young larvæ for queen-rearing. The queen in question is an imported one, and, therefore, of the genuine pure leather-colored Italian stock. We have been sending out daughters from her all the season, but we had not discovered her value until the clover season, second growth, came on, and then her colony so far out-distanced all the other 450 that she attracted attention at once.

We can not sell her daughters untested any more for 75 cts.; but when taken with Gleanings we will sell them for \$1.00; that is to say, we will send Gleanings one year, and an untested red-clover queen from this \$200 mother for \$2.00; a tested queen of this same stock, and Gleanings one year, for \$4; or a select tested and Gleanings for one year, \$6.00. These queens will be sold only in connection with Gleanings.

Atho these queens have been offered only a week there is a great demand for them, and therefore we can only guarantee that the orders will be filled in rotation and sent as fast as they are ready to send out. Those who send orders immediately will stand the best show of getting stock at once. We can not guarantee to supply, this season, select tested stock, as we may not have it, as such queens will necessarily be limited, but we *think* we can furnish all that will be called for.

It must, however, be understood that these queens are not golden yellow, neither are their bees of the five-banded stock. They are simply leather-colored Italians whose mother came direct from Italy. Those who desire queens of this stock had better get them this season, as the queen may die this winter. At the present time we are setting aside some of her choice tested queens for next season, to test for our own use.

SHIPPING-CASES.

Our No-Drip Cases are still in the lead. We keep constantly on hand a large assortment from 12-pound size up. We also make special sizes to order.

That Root's Cases are in demand is shown by the fact that one dealer alone has ordered 16,000 this season.

SPECIAL GOODS.

This is the time when you should order odd size or special goods. Our busy season is over and we can do almost any work in wood you want, either for bee-keepers or others.

We make a specialty of packing-boxes, from the size of a section-box up. Let us figure with you.

FEEDERS.

How about your winter stores? Are you sure your bees have enough? Should it be necessary to feed you can't do it easier than with our Division-Board Feeder. This is made to hang like a frame in a Langstroth hive. Price, 20 cents each, complete. Less in quantities.

Honey-Labels.

Do you use labels for your honey? Are they really ATTRACTIVE labels? If you do not you may be losing many sales because your honey lacks attractiveness. You can't expect to market your honey at the best price unless you use every care in putting it up. Send for our label catalog and see our 1, 2, and 3 color labels.

Tin Packages for Honey.

If you are one of the people who market extracted honey in small lots you will find our pails just what you want. A dozen sizes and kinds to select from. We also furnish square cans—1-quart, 2-quart; 1-gallon and 5-gallons. A single can or carload, as you wish. Write for prices.

Gleanings in Bee-Culture.

When our advertisers write us that their advertisements have paid them well, we know GLEANINGS IN BEE-CULTURE must be read by the best bee-keepers. We know, too, that GLEANINGS is appreciated, for our circulation is increasing all the time. Send 25c for a six months' trial and get A. I. R.'s Notes of Travel and hundreds of other interesting things.

Comb-Foundation Mills.

Perhaps you are so far from us and rates are so high that you want to make your own foundation.

Our mills are being improved constantly. If you want to purchase a foundation mill, send for package of samples showing different styles we can furnish. Send 2c stamp for these.

Bushel Boxes.

Bee-keepers are always looking for labor-saving ideas. Have you ever read our 16-page pamphlet, "Handling Farm Produce?" It is full of information and gives prices of bushel boxes and other things. Free for the asking.

HONEY-EXTRACTORS.

"Operator No. 6 puts the honey-combs in the extractors, which is a Cowan 4-frame reversible, with ball-bearings and lever-brake—in short, the best extractor on the market."

Extract from article of N. E. France, of Wisconsin, in June Review. No one is better qualified to judge the worth of an extractor than Mr. France. He says the ROOT COWAN IS THE BEST.

Thousands of others say so.

Glass Honey-Packages.

We have all sizes of Mason Jars with aluminum or porcelain-lined caps. Also Jelly Tumblers, two sizes; Glass Pails, four sizes; and Self-Sealing Jam Jars. Besides these we still have the four sizes square jars, which have long been on the market. Don't forget us when you need glass packages for honey.

RUBBER STAMPS.

Have you ever thought how handy it would be to use a rubber stamp to mark your honey-cases, showing the grade? Then, too, if you sell in the home market you ought to have your name on the case so it would be returned. We make stamps of all kinds for all sorts of purposes. Let us send you our rubber stamp circular.

WINTER-CASES.

Our Winter-Cases are made of thin lumber dovetailed at the corners, with a telescope cover.

The cost is only 75 cents each singly, yet for convenience they are unsurpassed, and only excelled by the chaff hive in the protection afforded. Don't let your bees winter-kill or spring-dwindle when you can avoid it by using our Winter-Cases.

HONEY.

We buy a number of carloads of comb and extracted honey each year. If you have secured a good crop send us your offer. You don't have to worry about the returns if you sell to us.

If you have extracted honey send sample. If you have failed to secure enough for your home market, let us supply you. We have honey engaged all over the country, and can ship direct from the producer, many times.

AGENCIES.

A list of our principal agencies will be mailed you on request. We can ship from stock such items as our regular Hives, Sections, Foundation, Extractors, etc., from these agencies.

Send your order direct to us, if you prefer, and request that we ship from nearest point, and we will do so, saving you freight charges and giving you quick delivery.

The Bee-Keeper's Guide

Or, Manual of the Apiary,

—BY—

PROF. A. J. COOK.

460 Pages—16th (1899) Edition—18th Thousand—\$1.25 postpaid.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published to-day. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without THE BEE-KEEPERS' GUIDE.

This 16th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to GIVE AWAY to our present subscribers, for the work of getting NEW subscribers for the American Bee Journal.

Given for TWO New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the two NEW subscribers—simply the Bee Journal for one year:

Send us TWO NEW SUBSCRIBERS to the Bee Journal (with \$2.00), and we will mail you a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both for only \$1.75. But surely anybody can get only TWO NEW SUBSCRIBERS to the Bee Journal for a year, and thus get the book as a premium. Let every body try for it. Will YOU have one?

Some Honey in San Diego Co., Calif.

Up to May 4th we had the best prospect for another season of feeding the bees that we ever had; but the heavy rains of the 4th and 5th wrought wonders for the bee-men, and, in place of starving bees, most apiaries have produced a considerable surplus, and those most favorably located a fair crop. The orange groves in this section came out in full bloom in June—about 3 months later than the usual time—and bees located near them secured a fair crop of that very fine flavored honey. The atmospheric conditions for the secretion of nectar have been favorable, and bees are still storing some surplus. My own bees have heavier stores, and are in better condition for winter, than for the past 3 years; and, besides, I have saved one solid frame of honey for each colony next spring, in the time "between hay and grass."

F. C. WIGGINS,
San Diego Co., Calif., Aug. 28.

Fears Colonies Short of Stores.

Bee-keepers in this district lost heavily last winter. My loss was none. Some of them are beginning to realize that success does not depend upon luck. They have kept me quite busy rearing queens and Italianizing their bees for them. The fall flow from goldenrod and asters failed last fall, bees quit breeding very early, and where feeding was neglected, the bees went into winter quarters short of stores, and with nothing but a lot of old bees that were ready to die when the first cold snap

came. I fear that the conditions are going to be about the same this year, unless we get some warm weather before long. **JESSE McDONALDSON.**
Worcester Co., Mass., Aug. 27.

A Prolific Queen.

In the summer of 1868 I sold a neighbor a queen for \$5.00, which was the common price at that time for a warranted queen. She was reared on the old plan of making a colony queenless. She was given to a colony of black bees in a box-hive, and in the spring built the colony up very strong and led out a swarm early in the season, which was also hived in a box-hive. In due time the old colony sent out a second and third swarm, which were also hived in box-hives. Then on the 20th day from the first swarm, the colony of original queen swarmed again, making four hives well stocked with bees from the old queen, as no bees from the young queens had hatch at this time.

J. L. STRONG.

Page Co., Iowa, Aug. 27.

Bee-Papers Hustle the Bees.

Bees swarmed little, and this means lots of honey, altho a few bee-keepers here did not get a pound of honey to take off. I tell them that bee-papers make my bees hustle.

E. B. KAUFFMAN.

Lebanon Co., Pa., Aug. 20.

Bees in Fine Condition.

There has been much that was both instructive and interesting in the American Bee Journal the past year, all of which I have enjoyed very much. The latest is Mr. J. G. Norton's beehive incubator. His description of it is fine. I had been waiting for it.

My bees have been in fine condition all summer, but the early drouth spoiled the white clover, and the extreme heat will shorten the fall crop. All together, I will probably have between 1,200 and 1,500 pounds from 18 colonies, spring count. The quality of the honey is fine. I had only five swarms.

MRS. PAUL BARRETTE.

Crawford Co., Wis., Aug. 28.

When to Sow Sweet Clover.

I have been gathering some sweet clover seed that I intend to scatter along the highway thru this country. When is a good time to sow it?

L. J. BERGH.

Dane Co., Wis., Aug. 31.

[A good time to sow sweet clover ought to be when it seeds itself, which is just now, around Chicago.—Ed.]

Two Kinds of Yellow Sweet Clover.

I feel like congratulating you on publishing so able an article as that from S. A. Deacon, in two recent issues. It is the most pointed (and right to the point, too) article I have read in a long while. He is too sharp for Mr. Dadant.

If I remember correctly, you said something awhile ago about yellow sweet clover being earlier than the white. Well, that is so, and still not so. I have been into the sweet clover "field" 15 years or more, and I find

Bees For Sale

100 colonies of black and yellow bees in eight-frame dovetailed hives, two supers to the hive, just as good as new, and all on full worker combs. \$200 buys the lot.

37A1t **F. GENT, Rockford, Minn.**

there are two varieties of the yellow. The early is very early, blossoming in May, and nearly all ripe by the time the white commences to bloom; and the late yellow is two or three weeks later than the white. The early yellow is small, not more than half as large as the white, but the late is fully as large as the white. I have gathered the seed of the white, and had it all thrasht, but have not cut any late yellow as yet. I gathered the early yellow the forepart of July.

AARON SNYDER.

Not Much Honey.

I did not get much honey this season, but bees are in fine condition.

MRS. T. P. EVANS.

Allamakee Co., Iowa, Aug. 25.

Bees in South Africa.

An apiary near Spion Kop, consisting of seven bar-frame hives, is cleared out, but in this case some broken frames scattered about gave the impression that they had been "taken up" on the Boer system by thrusting some lighted grass into the entrance; the owner also losing a good supply of bee-appliances, as well as all his household goods and farm implements.

The tragic fate of another colony in a fine, full-size glass observatory hive, standing in a garden inside the town, was not involved in the mystery attaching to the others, for it was blown to atoms by a shell that burst close to it, and a splinter from it knockt a cup of tea out of the owner's hand, who himself escaped uninjured.

A little lot of bees up near the top of the mountains managed to escape the general ruin, and beyond one or two isolated hives that I have not yet heard about, I think it is almost all that is left in the district. But the owners do not intend to give up bee-keeping, as one was down here last week and took back two colonies to make a fresh start, and I have just heard from my old friend that he has captured a stray swarm, evidently a starvation one, and is bringing it up with the syrup-bottle.—British Bee Journal.

Carbolic Acid for Robbing.

With all the virtues attributed to the bee, she, nevertheless, falls from grace in at least one respect, and that is in the utter disregard she displays for the good old maxim, "Honesty is the best policy." Her motto is to get honey honestly if she can, but to get it, and this disposition of hers to get it when none is to be obtained by honest quest is frequently the cause of much perplexity and vexation of spirit to the inexperienced. My troubles in this line have been as deep as any, and first obruded themselves upon me when I found it necessary to extract during times of scarcity of nectar, and was guileless enough to replace the combs in the hives at once after extracting. I know better now how to manage these things, and I find that I can ex-

Langstroth on... The Honey-Bee

Revised by Dadant—1899 Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroly explained, so that by following the instructions of this book one cannot fail to be wonderfully helpt on the way to success with bees.

The book we mail for \$1.25, or club it with the American Bee Journal for one year—both for \$1.75; or, we will mail it as a premium for sending us **THREE NEW** subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

GEORGE W. YORK & CO.

tract with impunity at any time, providing that I have a bee-proof honey-house, and return the extracted combs at dusk, so that the bees can have them cleaned up and everything in apple order before morning.

Carelessness in feeding, or in exposing sweets of any kind, is also often the source of an outbreak of robbing. But very few experiences, in an apiary of any size, with the robbing propensities thoroly aroused, are required to induce the greatest care in the performance of any future operations that are necessary during a dearth of honey.

Of the many remedies that I have tried in bad cases of robbing, carbolic acid has been the most successful. This acid emits an odor so obnoxious to the olfactory organs of the bee that only the legitimate occupants of the hive, with their strong attachment to home, will pass it, while the most persistent marauders are content to sniff it from afar. A weak mixture of the acid and water sprinkled at the entrance is often sufficient; but in very bad cases I find it a big advantage to throw a quantity of grass loosely at the entrance, and sprinkle this occasionally with the mixture.

Apart from the loss sustained thru the plunder and murder of their own species another disagreeable result of the robbing mania is the persistency with which the demoralized bees attack every living object in the vicinity of the apiary, and the unfortunate attendant speedily finds himself a special target for the operations of their stinging apparatus.—H. L. JONES.

Confirming the above the editor says :

I, too, can testify to the efficacy of carbolic acid in cases of robbing; and I think that, if once tried, no apiary will be without a bottle of it. . . . To use the acid solution conveniently I procure a tight-fitting cork and cut two slots in it lengthwise. This makes a good sprinkler of the bottle; for, by suddenly inverting it, several drops of acid are thrown out, and by a simple swing of the inverted bottle the acid can be directed to any spot. When bees get to making a target of the bee-keeper he should wear a black hat, as they will strike it every time.—Australasian Bee-Keeper.

Bisulphide of Carbon.

In order to make its use effective it is necessary that the combs to be treated should be put in a barrel, box, or something of the kind that can be closed up perfectly tight; and instead of sprinkling a small amount of the bisulphide on the inside of whatever is used, quite a quantity of it must be placed inside in an open dish. I use a small glass tumbler. The amount to use does not matter so there is enough; for any that does not evaporate can be poured back in the can for future use, as, no matter how long a quantity of it may have been exposed to the air any of it which has not evaporated is just as strong as it was before being exposed. It is like chloroform in this respect. The latter I have also used, and found to be effective in destroying worms in brood-combs. But it has no effect on the eggs, and it utterly ruins the flavor of comb honey, giving it a strong rank taste. It is much more expensive for this purpose than the bi-

sulphide, and the combs have to be subjected to its fumes for a much longer time.

When using bisulphide, the length of time necessary to expose the combs to its fumes depends upon how tight the box or whatever is used to treat them in can be closed, and its size—no matter, tho, how long brood-combs are exposed to these fumes, it does not injure them in the least; but as a matter of economy, merely, one would not desire to treat them for a longer time than is necessary, and this is an easy matter to tell; for if, upon lifting out one of the combs, and one dead worm is found, they are all dead, for this stuff shows no favor, but kills all, big or little alike, and at the same or very nearly the same time. It is entirely different in this respect from the fumes of sulphur, for with sulphur, as those who have used it have probably noticed, the small worms are killed in much less time than the large ones; and if, as my experiments last summer lead me to believe, there is one grade or kind of bisulphide that will not injure section honey, it will be a great boon to bee-keepers in localities where moth-worms are as troublesome as they are here, for, except when they are quite small, it is impossible to kill them in comb honey with the fumes of sulphur unless the combs are treated long enough to become discolored, which, in the case of section honey, may injure or prevent its sale altogether; and after worms reach a certain size, say one inch in length, it is impossible to kill them at all with sulphur unless the combs they are in are treated so long that they become fairly green in color. But for some reason moth-worms develop much more rapidly in brood-combs than they do in section honey. On this account it is not so difficult a matter to keep the latter free of them by the use of sulphur, provided they are treated in time, and often enough so the worms do not reach much size; for when the worms are very small they can be killed by the fumes of sulphur without discoloring the combs in the least; but sulphur has no effect on the moth-eggs, and the great advantage of bisulphide to treat brood-combs is that it kills the eggs also, so only one treatment is necessary if the combs are afterward put where the moth-miller does not have access to them.—C. DAVENPORT, in Gleanings in Bee-Culture.

"The American Boy" for September.—The September "American Boy" contains 84 illustrations and the usual collection of interesting and profitable matter for its boy readers. It contains an illustrated description of the boys' gardens conducted by The National Cash Register Company, and two pages full of pictures and sketches of boys who are distinguishing themselves in school, in sport, and in business. The Agassiz Association occupies its usual page with interesting matter in the realm of natural science. The "Boys as Money Makers and Money Savers" department contains many hints to boys of how to make and save money, while the departments devoted to "The Boy in the Home, Church and School," and "The Boy in the Office, Store, Factory and on the Farm" are replete with good, practical advice to boys, young and old. \$1.00 per year. SPRAGUE PUBLISHING COMPANY, Detroit, Mich. Send for free sample copy, and mention seeing this notice in the American Bee Journal.

BEE = BOOKS

SENT POSTPAID BY

George W. York & Co. 118 Mich. St. Chicago.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman. It is nicely illustrated, contains 160 pages, beautifully printed in the highest style of the art, and bound in cloth, gold-lettered. Price, in cloth, 75 cents; in paper, 50 cents.

Langstroth on the Honey-Bee, revised by Dadant.—This classic in bee-culture has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apiarian library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 520 pages, bound in cloth. Price, \$1.25.

Bee-Keepers' Guide, or Manual of the Apiary, by Prof. A. J. Cook, of the Michigan Agricultural College.—This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 460 pages, bound in cloth and fully illustrated. Price, \$1.25.

Scientific Queen-Rearing, as Practically Applied, by G. M. Doolittle.—A method by which the very best of queen-bees are reared in perfect accord with Nature's way. Bound in cloth and illustrated. Price, \$1.00.

A B C of Bee-Culture, by A. I. Root.—A cyclo-pædia of 400 pages, describing everything pertaining to the care of the honey-bees. Contains 300 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.20.

Advanced Bee-Culture, Its Methods and Management, by W. Z. Hutchinson.—The author of this work is a practical and entertaining writer. You should read his book; 90 pages, bound in paper, and illustrated. Price, 50 cents.

Rational Bee-Keeping, by Dr. John Dzierzon.—This is a translation of his latest German book on bee-culture. It has 350 pages, bound in paper covers, \$1.00.

Bienen-Kultur, by Thos. G. Newman.—This is a German translation of the principal portion of the book called "Bees and Honey." 100-page pamphlet. Price, 25 cents.

Bienenzucht und Honiggewinnung, nach der neuesten methode (German) by J. F. Eggers.—This book gives the latest and most approved methods of bee-keeping in an easy, comprehensive style, with illustrations to suit the subject. 50 pages, board cover. Price, 50 cents.

Bee-Keeping for Beginners, by Dr. J. P. H. Brown, of Georgia. A practical and condensed treatise on the honey-bee, giving the best modes of management in order to secure the most profit. 110 pages, bound in paper. Price, 50 cts.

Bee-Keeping for Profit, by Dr. G. L. Tinker.—Revised and enlarged. It details the author's "new system, or how to get the largest yields of comb or extracted honey." 80 pages, illustrated. Price, 25 cents.

Apiary Register, by Thomas G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25.

Dr. Howard's Book on Foul Brood.—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cents.

Winter Problem in Bee-Keeping, by G. R. Pierce.—Result of 25 years' experience. 30 cts.

Foul Brood Treatment, by Prof. F. R. Cheshire.—Its Cause and Prevention. Price, 10 cts.

Foul Brood, by A. R. Kohnke.—Origin, Development and Cure. Price, 10 cents.

Capons and Caponizing, by Dr. Sawyer, Fanny Field, and others.—(Illustrated.) All about caponizing fowls, and thus how to make the most money in poultry-raising. 64 pages. Price, 20c.

Our Poultry Doctor, or Health in the Poultry Yard and How to Cure Sick Fowls, by Fanny Field.—Everything about Poultry Diseases and their Cure. 64 pages. Price, 20 cents.

Poultry for Market and Poultry for Profit, by Fanny Field.—Tells everything about Poultry Business. 64 pages. Price, 20 cents.

HONEY AND BEESWAX

MARKET QUOTATIONS.

CHICAGO, Sept. 4.—The market is in good shape and choice lots of white comb honey bring 15c; good but not strictly No. 1 sells at 13@14c; amber, best grades, 12@12½c; dark, 9@10c. Extracted, best grade of white, 7½@8c; ambers, 6½@7c; dark, 6@6½c. Beeswax, 28 cents, all in good demand.

R. A. BURNETT & Co.

CINCINNATI, Aug. 8.—The demand for extracted honey is slow, while the shipments are many. I quote as follows: White clover, 8@8½c; Southern and amber, 6½@7c. Comb honey sells as fast as it arrives at the following prices: Fancy, 16@16½c; No. 1, 15c. Beeswax, good demand, 25c.

C. H. W. WEBER.

BOSTON, Aug. 8.—Fancy 1-pound cartons, 17c; A 1, 15@16c; No. 1, 15c; No. 2, 12@13c. Extracted honey from 7½@8½c, as to quality.

It is too early in the season and too warm for any inquiry on honey, so prices named are only nominal. The prospects in this vicinity seem to be for a light crop. BLAKE, SCOTT & LEE.

KANSAS CITY, Aug. 30.—Fancy white comb honey firm, 12-section case, 15 cents per pound; 24-section case, 14c; No. 1 amber, 24-section case, 13@13½c. Demand good. Extracted firm at 6@8 cents, as to quality. Beeswax scarce at 35c.

W. R. CROMWELL PRODUCE Co.,
Successors to C. C. Clemons & Co.

BUFFALO, Sept. 5.—Fancy new 1-pound comb, 16@17c; No. 1, 14@15c; No. 2, 12@13c; No. 3, 10@11c; old, 8@14c. Demand quite good for season. Extracted, 5@6c. Beeswax, 28@33c.

BATTERSON & Co.

DETROIT, Sept. 7.—Fancy white comb, 15@16c; No. 1, 13@14c; amber and dark, 10@12c. Extracted, white, 7@8c; dark, 5@6c. Beeswax, 25@26c.

M. H. HUNT & SON.

NEW YORK, Sept. 8.—Comb honey in good demand, all grades. Supply light, and arrivals sell readily at 15@16c for fancy white; 13@14c No. 1 white; 12c for amber and 10@11c for buck-wheat. Extracted in fair demand at 7@7½c for white, 6½@7c for light amber; 6c amber, and 5½c dark. Beeswax firm at 28c.

HILDRETH & SEGELKEN.

SAN FRANCISCO, Aug. 22.—White comb, 12@12½c; amber, 9@11; dark, 6½@7½c. Extracted, white, 7½@8c; light amber, 6¾@7¼c; amber, 5½@6c. Beeswax, 26@28c.

Stocks continue light, and market inclines in favor of sellers. Indications are that the yield in this State is one of the smallest on record. Most of the business is of a light jobbing character, necessarily so on account of the limited offerings. Water white honey remains in slim supply, and dark honey is also scarce, spot supplies being principally amber.

WANTED—HONEY AND BEESWAX.

We have a tremendous and growing trade in this line, and would like to hear from all who have such goods to sell in any part of the country, with quality, description, and lowest cash price. THOS. C. STANLEY & SON, Fairfield, Ill.

WANTED COMB HONEY AND EXTRACTED HONEY. Will buy your honey, no matter what quantity. Mail sample with your price expected delivered in Cincinnati. I pay cash on delivery. C. H. W. WEBER, 2146 Central Ave., CINCINNATI, OHIO.

5-Banded Queens

—FROM THE—

Best Strains in this Country.

I make a specialty of queen-rearing. My queens speak for themselves. I have sold all I could rear this year without advertising them much, but I want to break up or double up my nuclei and offer these FINE QUEENS now for 45 cents each; \$2.60 for 6; or \$5.00 per dozen. Remit by post-office money order. This advertisement will not appear again.

We keep in stock a full line of popular Apirian Supplies. Catalog free.

Apiaries—Glen Cove, L. I. I. J. STRINGHAM, 105 Park Place, New York, N. Y.

Please mention Bee Journal when writing.

Four Celluloid Queen-Buttons Free

AS A PREMIUM

For sending us ONE NEW SUBSCRIBER to the Bee Journal for the balance of this year, with 30 cents, we will mail you FOUR of these pretty buttons for wearing on the coat-lapel. (You can wear one and give the others to the children.) The queen has a golden tinge.

This offer is made only to our present regular subscribers.

NOTE.—One reader writes: "I have every reason to believe that it would be a very good idea for every bee-keeper to wear one [of the buttons] as it will cause people to ask questions about the busy bee, and many a conversation thus started would wind up with the sale of more or less honey; at any rate, it would give the bee-keeper a superior opportunity to enlighten many a person in regard to honey and bees."

Prices of Buttons alone, postpaid: One button, 8 cts.; 2 buttons, 6 cts. each; 5 or more, 5 cts. each. (Stamps taken.) Address,

GEORGE W. YORK & CO., 118 Michigan St., CHICAGO.

AMERICAN

BEE JOURNAL

GEORGE W. YORK,
Editor.

CHICAGO, ILL., SEPTEMBER 20, 1900.

FORTIETH YEAR.
No. 38.

WEEKLY

DR. A. B. MASON,
Secretary of the National Bee-Keepers' Association.

THE AMERICAN BEE JOURNAL

PUBLISHED WEEKLY BY

GEORGE W. YORK & CO.

118 Michigan St., Chicago, Ill.

[Entered at the Post-Office at Chicago as Second-Class Mail-Matter.]

IMPORTANT NOTICES:

The Subscription Price of this journal is \$1.00 a year, in the United States, Canada, and Mexico; all other countries in the Postal Union, 50c a year extra for postage. Sample copy free.

The Wrapper-Label Date of this paper indicates the end of the month to which your subscription is paid. For instance, "Dec 00" on your label shows that it is paid to the end of December, 1900.

Subscription Receipts—We do not send a receipt for money sent us to pay subscription, but change the date on your wrapper-label, which shows you that the money has been received and duly credited.

Advertising Rates will be given upon application.

Reformed Spelling.—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound. Also some other changes are used.

The Weekly Budget

THE CHICAGO CONVENTION PICTURE is now ready for delivery, and is a fine one. It is nearly 8x10 inches in size, mounted on heavy cardboard 10x12 inches. It is, we believe, the largest group of bee-keepers ever taken in one picture. It is sent, postpaid, for 75 cents; or we can send the American Bee Journal one year and the picture—both for \$1.60. It would be a nice picture to frame. We have not counted them, but think there are nearly 200 bee-keepers shown.

MR. FRANK McNAY called on us last week, when leaving for the West. For many years he has been one of the most prominent extracted-honey producers in Wisconsin, but now has removed permanently to Los Angeles Co., Calif. Mr. Harry Lathrop recently visited Mr. McNay in Wisconsin, and had this to say of him in the Wisconsin Agriculturist:

"Frank McNay, as many know, is one of the most extensive, as well as most successful, bee-keepers in the State. For many years he has kept from 300 to 500 colonies in apiaries situated sometimes as far as 100 miles apart. He has, in addition to producing honey in large quantities, bought and sold a good deal in recent years. His whole life since boyhood has been spent in the work of bee-keeping. But he informed me that he was about to sell out all his interests here and make his permanent home in southern California, where his family are already settled. He makes this change not in

order to find a better bee-country, but on his family's account. But as he has worked hard for many years he finds himself in need of rest and a change and as a result of his good business management and faithful effort, he is financially able to retire from active life. With his removal, Wisconsin loses one of her most practical bee-keepers. He has written little but is ready in conversation and willing to impart useful information to any fellow worker. I was very glad of my good fortune in meeting this veteran bee-keeper before his departure. Mr. McNay informed me that he had kept bees on a certain field for 20 years, during which time there had not been a single failure of the honey crop. By actual record his annual yields averaged more for a long term of years than large apiaries in the famous honey-district of southern California. I am glad to know that our State, as a whole, is second to none, both in the quantity of its honey and the possible amount of productions."

MR. L. KRETZINGER, of this (Cook) County, had his "annual honey harvest" last Saturday, Sept. 15, to which were invited a number of city guests to watch the taking off of honey, and

to become acquainted with an apiary and its management. Of course, very few practical bee-keepers would follow this plan, and for excellent reasons.

"GOOD HONEY AND GAB did it." That is what Mr. J. T. Hairston, of Indian Territory, writes me in regard to his selling 3,300 pounds of honey in his home market inside of three weeks. Good honey and gab make a winning combination.—Bee-Keepers' Review.

"A. I. ROOT has discovered afresh that, the more one lives outdoors, the healthier one will be. He's making progress. Time was when he would smoke bees into the hive when they insisted on hanging on the outside," so says Dr. Miller, in Gleanings in Bee-Culture.

MR. C. M. SCOTT, of Marion Co., Ind., wrote us Aug. 6th: "Hurrah for the American Bee Journal. It looks fine in its new dress."

HERR THEODOR WEIPPL, editor for 10 years of the German bee-paper Bienen-Vater, has resigned. Herr Josef Schmuck is now filling the position.

BEST

Extracted Honey For Sale

ALL IN 60-POUND TIN CANS.

ALFALFA HONEY*****

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

BASSWOOD HONEY*****

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms in Wisconsin. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

Prices of Either Alfalfa or Basswood Honey:

A sample of either, by mail, 8 cents; samples of both, 15 cents—to pay for package and postage. By freight—one 60-pound can, 9½ cents per pound; two cans, 9 cents per pound; four or more cans, 8½ cents per pound. Cash must accompany each order. If ordering two or more cans you can have half of each kind of honey, if you so desire. This is all

ABSOLUTELY PURE BEES' HONEY,
The finest of their kinds produced in this country.

Read Dr. Miller's Testimony on Alfalfa Honey:

I've just sampled the honey you sent, and it's prime. Thank you. I feel that I'm something of a heretic, to sell several thousand pounds of honey of my own production and then buy honey of you for my own use. But however loyal one ought to be to the honey of his own region, there's no denying the fact that for use in any kind of hot drink, where one prefers the more wholesome honey to sugar, the very excellent quality of alfalfa honey I have received from you is better suited than the honeys of more market flavor, according to my taste.
C. C. MILLER.
McHenry Co., Ill.

Order the Above Honey and then Sell It.

We would suggest that those bee-keepers who did not produce enough honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

Address,
GEORGE W. YORK & CO., 118 Michigan St., Chicago, Ill.

No. 38.

* Editorial Comments. *

Location for Bee-Keeping.—It is not an uncommon thing for a bee-keeper to feel somewhat discontented with his location when he reads or hears of the advantages of some other location. But perhaps if all the disadvantages were as clearly set forth as the advantages, he would not be willing to exchange places. The talk upon the subject, on page 600 of this number, by "Uncle Lisha," may help to make some bee-keepers more contented with their lot.

Do Bee-keepers' Conventions Pay? is a question discussed by G. M. Doolittle in *Gleanings in Bee-Culture*. As sometimes conducted in former times, with not the best spirit pervading them, he thinks they do not pay. As conducted generally at present, they are paying institutions in three respects:

First of all, according to Mr. Doolittle, is the recreation, the social part, when flinging all care to the winds the bee-keeper goes in for a good time, meeting at one time and at small expense a number of his fellows whom otherwise he could not afford to visit.

Second, to learn from others many things brought out at a convention that would never appear in a book or bee-journal otherwise. Especially valuable are the little private talks between sessions.

The third advantage is that of seeing some of the latest improvements in bee-keeping implements.

Pasteboard Method of Introducing Queens has already been mentioned in these columns. Heretofore the Benton shipping-cage has had a cork in one end and the receiver pulled out the cork so as to allow the bees to eat out the candy and release the queen. Mr. Wardell, the queen-breeder of the A. I. Root Co., hit upon the plan of using pasteboard to cover the hole, dispensing with the cork. The candy comes out clear to the pasteboard, and a line of perforations allows the bees to reach the candy with their tongues, and then they gnaw away the pasteboard, making the queen's imprisonment lengthened by exactly the time it takes the bees to gnaw away the pasteboard. Editor Root says:

This method of introducing is no experiment. We have used it in our own apiary for a year back. Mr. Wardell, our apiarist, came to the conclusion that bees were eating out the candy too quickly, and sometimes releasing the queen before they had had a chance to become acquainted with her. He conceived the idea of nailing a piece of pasteboard over the candy, as a restrainer, which, from his knowledge of bees, he thought they would gnaw away. The scheme worked perfectly. He thought so little of the invention that he did not tell me anything about it, and I presume he had been using the method for some 6 months before I happened to blunder on to it—that is, I learned that he had made an

improvement in the ordinary method of introducing by the candy plan. He continued using it with the greatest success; but, as he used it, it was in connection with the Miller cage, which used just the same principle as the Benton.)

Early this summer we applied the plan to all the Benton cages we sent out, and the results secured have been uniformly good. By the old plan, after the receiver of the queen had removed the cork, the candy had been so much eaten by the bees, in some cases, after a long journey, that the bees would sometimes release the queen in from 10 to 15 hours, which is altogether too short a time; but now these same bees spend from 12 to 18 hours in eating away the pasteboard before they get at the candy, and at the very least calculation it takes very nearly 24 hours before they can release their new queen-mother, and nine times out of ten it will be much longer.

I ask Mr. Wardell what percent of queens he could introduce safely by this method.

"Why," said he, "I do not lose any at all."

"Would it be safe," I asked, "to say in print, that at least 99 percent of the queens introduced by that method would be received and accepted by the bees?"

"Why," he replied, "if I were using the Miller cage I think I could guarantee a good deal better than 99 percent."

We have heard of many methods of introducing queens, but I do not think there has been anything yet devised that is so simple for the beginner and the average person to apply as the candy-pasteboard method. If the Miller cage is used (a flat oblong cage), and the colony has not been queenless for over four or five days, you can almost guarantee absolute introduction.

Hiving Swarms in Shallow Brood-Chambers is practiced by Harry Lathrop. In *Gleanings in Bee-Culture* he says he uses these shallow hives temporarily, returning the bees to the dovetailed 8-frame hives after the harvest is over. The season with him is so short that a swarm hived in a full-sized hive takes too long a time to get the hive filled before working in supers. The shallow brood-chamber he uses is of the same dimensions as the 8-frame hive, except as to its depth, which is 7 inches, the depth of the frame being $\frac{1}{4}$ -inch less. He also has a cheaper arrangement which he likes. He says:

"It is a shallow brood-chamber made of common fencing, and having common lath nailed in the top—no frames. The lath are planed smooth, placed only a bee-space apart, and a close bee-space ($\frac{1}{4}$ -inch) below the top edge of the brood-chamber. The supers of finished honey come off from these as clean as they were when they went on, even when used without queen-excluders."

Inexcusable Carelessness is often illustrated in the mail that we receive. For instance, last week, a subscriber who desired his copy of the *Bee Journal* sent to another post-office wrote us as follows:

"Please send my paper here.—Howe, Ind. Ter."

There was no name signed, and the former post-office was not given. We simply have to wait until he writes again.

A short time ago we received an order for a sample of honey, with the money enclosed, but no State was given. The post-mark on the outside of the envelop was too indistinct to read. Result—we had to wait until the correspondent wrote again, asking why he didn't get the honey sample.

Those who want to do any business with anybody else should never forget always to sign their full name and address to every communication they write. Or, get a rubber stamp with it all on and use that.

New Bee-Papers and Their Treatment.—In a recent Bee-Keepers' Review Mr. Hutchinson has a splendid editorial on this subject, nearly every word of which we can heartily endorse. It reads as follows:

The death of a bee-journal a few months ago has been followed by a variety of comments in some of the other journals. Some of these criticisms have been written in a spirit that seemeth to say: "It's good enough for you. You ought to have known better than to have started a bee-journal." Other journals have condemned this style of comment. My own opinion is that the death of a bee-journal furnishes a fitting opportunity for pointing out the folly of embarking in such an enterprise, but it should be done in a kindly manner.

There certainly is no need of any more bee-journals. The field is well covered; perhaps overstocked. If I should sell the Review to-day the last thing that I would think of doing would be that of starting another bee-journal; and I certainly would be in a better position to make a success of it than would some man who had had no experience in that line. If Bro. York should sell the American Bee Journal I doubt if he would ever think of such a thing as starting another bee-journal. I doubt if there is a publisher of a bee-journal in this country who would not find it well nigh impossible, even with his present capital and experience, to start in and build up a new journal. If this be true, what can a novice expect?

The birth, growth and prosperity of existing journals have resulted from a peculiarly appropriate combination of men, time and circumstances. A successful bee-keeping editor must possess several characteristics. To understand bee-keeping alone will not suffice. Even a college education may not make of a man a good school-teacher. In the making of an editor there must be editorial instinct. To this ought to be joined a knowledge of printing and some taste in typography. This last is not so important, as good printers can be hired. I have, however known of a bee-journal being started because the owners of some job-office thought they could *print it so cheaply!* It is much easier to learn the printer's trade than it is to learn bee-keeping.

I think that in justice to ourselves, and to those who may be thinking of starting a bee-journal, it should be made known that at present there is really no demand for another bee-journal; that to establish one would require an outlay of time, energy, skill and capital that, if invested in some other business, would bring far greater returns.

Having said all this, it must be admitted that this is a free country. If a man believes that he can make a success of bee-journalism, he has a perfect right to put his time, talents and money into that business. We ought not to encourage him to start; but, if he *will* do it, there is a certain amount of courtesy due him as a brother publisher. I know of an ex-editor of a bee-journal who would not allow even the name of a new rival to appear in his journal.

We need not exchange advertising space with a new journal unless we believe it to be to our advantage to do so; there is no call for us to pat the new editor on the back and urge him on to spend his last dollar in what we believe to be a losing venture, but the courtesies extended to a journal ought not to be proportioned according to its age or prosperity. No one ever *lost* anything by being polite, or even kind, to the new journal; and sometimes the new journal succeeds in spite of predictions to the contrary, and then the past favors become as bread cast upon the waters. The old, established journals can afford to be magnanimous in this matter. It creates a much better impression even among their own readers than does a course that savors of jealousy and selfishness. Don't encourage them to start; but, if they do enter the ranks, their position entitles them to our editorial courtesy.

To Prevent Swarms Settling in Undesirable Places is a desideratum. A swarm may settle in a place very high or otherwise difficult of access, and after the bee-keeper with immense pains has secured it, he is anything but pleased to see another swarm settle in the same place. For it is a very common thing for a swarm to settle on the same spot where another has settled on the same day, or the day before. Indeed, a number of swarms, one after another, are likely to choose the same spot for clustering. To prevent a second clustering in an objectionable place, it is recommended in Maehrische Biene to paint the place with carbolic acid.

Convention Proceedings.

Report of the Proceedings of the 31st Annual Convention of the National Bee-Keepers' Association, held at Chicago, Ill., Aug. 28, 29 and 30, 1900.

BY DR. A. B. MASON, SEC.

(Continued from page 581.)

Pres. Root—You have heard Mr. Niver's paper, what do you wish to say on this subject?

C. A. Hatch—Don't we have a paper later, on co-operation in selling honey?

Pres. Root—Yes, we have such a subject. It comes the last thing on the program.

Mr. Hatch—This seems to be in the line of that. I move the discussion of this paper be taken up at the same time that the subject is brought up on the program. (Motion prevailed.)

Pres. Root—We will pass to the next subject, by L. Kreutzinger, of Illinois,

BEE-KEEPING IN A CITY.

The following paper on city bee-keeping will mainly relate to that part of apiculture where bee-keeping is conducted on a large scale with three or more apiaries in a large city. The principal object in view is to enumerate its advantages and drawbacks in comparison with country bee-keeping.

Nearly every city bee-keeper runs his apiary for comb-honey production. The reason for this is the handy transportation facilities—the short distance to the market and stores, the very little risk, if any, of getting the combs broken or soiled while in transit—which enable him to deliver and sell his honey in the most perfect condition and in the neatest appearing packages or cases.

The country bee-keeper, especially one whose apiary is located a great distance from markets, and perhaps way off from any railroad transportation—who has his honey crop first to transport by wagon to the station, then have it unloaded in order to get the cases into the freight-car to be shipped to the point of its destination, whereby the unavoidable jarring may cause considerable damage thus marring the neatness of the cases, will risk no chances, and, in order to avoid such losses, will choose the more safe method of extracted-honey production.

While the city bee-keeper often encounters difficulty in finding a proper locality for an out-apiary, which, in order to answer all purposes must be somewhat detached, yet not too much isolated, the country bee-keeper may locate his bees on almost any place on a farm without going to the expense of building sheds and fences.

The city bee-keeper has generally little trouble, if any, in selling all of his crop; people will call on him and buy his honey freely, being satisfied of its purity; they know it is pure, because they see him remove the honey from the hives, and therefore there can be no doubt or distrust as to its purity.

I wish to mention a method of creating a large demand for honey thru the medium of splendid advertising without cost. About a week previous to your intended honey crop harvest, send out notices to your friends and acquaintances inviting them to be present at the event, naming place, date and hour your friends will be welcomed; then, too, send one to each editor of the newspapers of your city. In turn you will find in their papers not only an announcement of the event, but they will also send their reporters, who will describe it more particularly, thus giving you lots of advertising—for nothing!

One thing is not to be overlooked—don't be prepared to start with the harvesting of your crop at that time, but have all things prepared when the occurrence is to take place—have the honey mostly taken off and packed and ready for sale; in other words, have your harvesting work nearly all done when you expect the crowd. As your friends will see you remove the honey from the hives, they will want some like they are offered to taste; you will therefore be kept busy with packing, and entertaining them by illustrating

the workings of the honey-bee, and other matters of interest in the line of apiculture.

The country bee-keeper, unless he has a reliable agent or commission-house to handle his product, is more or less compelled to dispose of his honey by peddling it.

From personal experience and observation, I am of the opinion that the country bee-keeper is at an advantage over the city bee-keeper as to the quantity of the honey crop harvested. The continual dust, vapor and smoke in a large city settle more or less for miles around down upon all honey-secreting plants, and thus check the development of the nectar. The heavy and close atmosphere mingled with dense smoke is greatly detrimental to the development of plants and consequently their secretion of honey. Thus the city bee-keeper, under above-mentioned atmospheric conditions, but with otherwise exactly the same quantity and nature of honey-producing flora, is, in comparison with the country bee-keeper, at a disadvantage of about 20 per cent in the quantity of honey gathered.

In conclusion let me add, that in order to round up the experiences in the pursuit of keeping bees in a city, another feature sprung up which to relate may be of interest to the

L. Kreutzinger.

bee-keepers. On Aug. 3d the writer hereof was served with a warrant for "unlawfully keeping and owning a great number of bees in such willful, wrongful manner that the aforesaid bees became, were, and are, a nuisance in violation of Section 1028 of an ordinance of the City of Chicago." The warrant was sworn out by a neighbor of one of the writer's out-apiaries. The first hearing took place before a justice of the peace in a suburb of Chicago the following day. Upon motion of the writer's attorney, the case was continued for several days. At the second the witnesses present testified to the vicious character of the bees, being a regular nuisance, having stung passers-by, a couple of horses, a dog, went into neighboring yards for water and grass to feed on, and did some other mischievous work! Upon hearing the testimony, the presiding judge, finding no fine provided for in the above cited section, dismissed the case.

However, soon after another warrant was sworn to by the same complainant, this time for "keeping on the 8th day of August, 1900, and still continues to use certain premises known as No. 1791 Ainslie Ave., in said County of Cook, for the exercise of the honey-trade and maintaining 80 hives of bees which are offensive and dangerous to the health and public."

Thru the efforts of the writer's able attorneys, the judge pointed out the unusual and extraordinary character of the case, and asked, before rendering his decision, a week's time

in order to look up matters and authorities, as the case required careful consideration. On the day set for the decision (Aug. 23d) the judge, first enumerating several decisions pro and con, rendered in similar cases, concluded his sentence with the following words: "The defendant is therefore discharged." L. KREUTZINGER.

Mr. York was asked to read the final decision of the justice in Mr. Kreutzinger's case, which is as follows:

STATEMENT FROM THE JUSTICE OF THE PEACE.

The counsel for defendant contends that the defendant should be discharged for three reasons, viz:

1st. That it is not a public but a private nuisance, and therefore a civil matter.

2d. That the complaint is insufficient.

3d. That the section under which the complaint is drawn: does not apply to this case.

In regard to the first question raised by the counsel, there are a number of decisions upon the question, as to how many people a particular nuisance must affect before it becomes a public nuisance. In *Hackney vs. the State*, 8th Indiana, page 494, Judge Stuart laid down the law that is followed by all the text-books. He said, Every nuisance that is annoying to only a few of the citizens of the particular place, is a public nuisance, they being the public of that locality. It is a public nuisance if it annoys such part of the public as necessarily comes in contact with it.

In Illinois, Judge Shope said: It can make no difference that the number actually injured by the nuisance is comparatively small.

In regard to the second contention, I will say that the complaint as drawn follows the statute closely, and that is all that is required by the statutes.

The third contention, however, is a more difficult one. After careful study I do not feel justified in coming to the conclusion that the keeping of bees is covered by Paragraph 8, Section 221, under "Trades;" and the authorities make no mention of any agricultural pursuit, and the keeping of bees, in my opinion, ought to be so classed. Then, again, the heading of the paragraph in Starr and Curtis, and in Original Statutes, is "*Offensive Factories*;" and in "construing statutes," I take it that the heading governs where the meaning of the words are doubtful. And again, Paragraph 9 of the same section gives the municipal authorities full control of all nuisances not specified by statute. The intention of the legislature was to leave such matters to the municipalities.

The defendant is therefore discharged.

THOMAS EDGAR, J. P.

Pres. Root—The question is now open for discussion. Does any one wish to take it up?

N. E. France—We have a paper similar to that, "Bee-Keepers' Rights and their Protection by Law," on Wednesday afternoon. Might it not be deferred to that time and take it all up then?

Pres. Root—Do you wish to discuss any other phase of the question of bee-keeping in the city? Is there any one here who has knowledge whether flowers of any kind in the city are affected by smoke? This question was brought up six months ago in a convention which I attended, and much interesting discussion was brought out.

Dr. Mason—Don't in Toledo; we burn up our smoke.

G. E. Purple—I have more to do with the city smoke and dirt than any other one, I think; and as far as I can see, it does not affect the honey or the flowers, but it is a fact that after you have a drouth from a week to two weeks, the flowers get covered with dirt enough so that it stains any honey that may be left in the hive, enough so the entrance and the frames below will get quite black; but as far as the honey goes, that is as clear as any honey I ever saw from the country.

Mr. Acklin—Those two bottles of white clover honey on the table were gathered from flowers in the city.

Mr. Purple—I have kept bees in the country as well as city, and my present source of honey is sweet clover; after the sweet clover goes out of bloom, and after burdock commences to bloom, the latter seems to give the honey a sort of dark green look. That is where our discussion should come in the convention, whether white sweet clover gives a green or white honey. I noticed that particularly this year, that after burdock comes, then my honey begins to get green, and quite green, and then after that it is as white as any honey I ever saw.

Mr. Aikin—I would like to ask Mr. Purple a little more about that. Do I understand him to say that the honey gathered from sweet clover is a greenish color?

Mr. Purple—The honey that was as near as I could say collected from the straight sweet clover, beginning from the first of July, was white, but beginning from about Aug. 10th, when burdock began to bloom, it was quite green. I am sorry I did not bring some samples, but the sweet clover honey was about as white as any white clover honey I ever produced. Take it in a can a foot deep, I can see the bottom very plainly, a good deal like water.

Mr. Aikin—The reason I askt the question is this: In Colorado we have a Rocky Mountain plant called cleome, and one bee-keeper in particular comes up every year and talks about the green honey that he gets from cleome. Some of the rest of us don't get that colored honey from the same plant. It occurred to me here, where there is none of it, perhaps we don't know what causes the color in the honey, for they do have in that country some honey that is quite green. It is almost as green as is some of the honey I have seen down here in one of your stores that was said to be buckwheat honey. I don't know what is the trouble with the honey, but I do know it comes green in some cases, not only the honey, but the comb as well is green. That is all I can tell about it; I don't know why.

Mr. Krentzinger—I wish to say that yellow sweet clover produces light white honey, while the white variety produces a greenish color.

Mr. Purple—May I ask Mr. Aikin if he has any burdock out there?

Mr. Aikin—I do not remember ever having seen a stalk of it.

Mr. Purple—I have lots of it in places, and it is a great honey-producer. I was anxious about it when I began noticing it; the bees will work very fast on it.

[Continued next week.]

Further Particulars of Queen-Rearing.

BY W. H. PRIDGEN.

TO take up the subject where Dr. Miller left off in his reply to "Apis Mellifica," on page 470, allow me to say that as soon as the cells or cups are worked on a few hours, or from evening until morning, they are given to colonies to be completed, and the queenless bees placed back over the excluder to be ready for the same operation the next day. If one prefers it, he can tack wire-cloth to the bottom of a hive or hive-body (which?), block it up as the Doctor suggested, and transfer the combs, bees and all, from the upper story to it, and after the cups are accepted and disposed of, return the bees and combs to the story above the excluder; but the plan recommended above enables one to handle hives instead of frames.

The object in waiting 10 or 12 days after the cell-starters are prepared over the excluder, is for all the brood to be sealed, and to have a good force of young bees, as the Doctor says, as we want no unsealed brood with queenless bees that are expected to accept cups.

A few days ago, 54 cups were given at one time to the same bees, shaken from the combs, and confined 3 hours before, and 52 were accepted. Late in the evening of the same day, the batches of accepted cups were given to different colonies to be completed, and the bees were placed back over the excluder, whence they came.

To have the cups invariably accepted and given a send-off and shaping-up that they will get under no other treatment or conditions, give them to bees taken from a colony that has a laying queen and unsealed brood, tho it is not important that there should be unsealed brood in the combs from which the bees are taken, for just as good if not better results are obtained by shaking the bees from a few combs of a colony in a single-story hive, in a normal condition, into a ventilated hive, prepared with a comb filled with water, and several containing pollen and honey, than is the case when the upper story, as described, is transferred from over the excluder to a frame covered with wire-cloth, or an ordinary bottom-board with the most of the board cut away and the hole covered with wire-cloth. If bees are confined for this purpose, the ventilation should be at the bottom,

and not far below the brood-frames or combs, as we want them to cluster on the combs.

The only disadvantage in getting the bees where there is a queen, is that the queen must be found, which often takes more time than it does to place the combs over an excluder, and then shake the bees from them.

Just so, the bees to be used as cell-starters are taken from a colony in a normal condition, and placed on combs minus unsealed brood, they will accept cups in from two to five hours. Such bees must be confined to prevent their deserting the hive, even if the queen and brood be taken away and the bees left on the old stand in the daytime, if other colonies are near, and they must be ventilated to prevent suffocation. With these facts to consider, every one can arrange matters to his own liking.

☐ If one has trouble in fixing the cups so that they are readily accepted and has to resort to first giving them to queenless bees, when built over an excluder, the upper story of the cell-builders can be placed over the ventilator until the cups are accepted, and then place it back over the excluder, and the desired end is accomplished, provided there be no unsealed brood in the upper story at the time; but it should not be forgotten that the shaking of the bees from the combs, even if it be into their own hive on the same combs, materially hastens the conditions for accepting the cups.

The only advantage in having the bees to be used as cell-starters above an excluder, is that they are ready for use at any time without having to look up the queen, and by the judicious use of excluders one can accomplish nearly everything pertaining to queen-rearing without having to find old queens.

I would have no idea of calling in the hired help and spending an hour looking for a skittish black, or any other kind of queen, when I could shake and brush the bees from all the combs in a few minutes, place them in another hive, and the hive containing the brood over the old hive, above an excluder, until the bees crawl up, and then take the bottom hive away and leave the top one on the old stand.

One comb of brood should be left below with the queen which will go towards forming a nucleus with the old queen, in case the object is to introduce a queen to the bees made queenless, and thus keep the old queen until the acceptance of the new one is assured. Warren Co., N. C., Aug. 1.

The Swarming of Bees—Experience.

BY F. GREINER.

NOT all Prof. Cook says on page 530 on the above subject is in perfect accord with my experience. For instance, he says: "Nearly all the bees that are mature enough to fly, including drones and queen, push out in the act of swarming." It seems to me that this is putting it stronger than the case warrants. On opening a hive after a swarm has issued from it, there will be found plenty of drones and quite enough worker-bees to carry on housekeeping quite decently. One may often see laden workers enter the hive during the act of swarming.

The Professor further says: "The queen rarely goes out until the last of the bees' swarming out," and, in substance: "The queen does not lead the swarm." The latter I think is just as the Professor says: The workers are the leading and deciding element in all the enterprises, undertakings and ventures of a colony, and it appears to me that the queen is chased or driven out of the hive when it is decided to swarm. According to my observation the queen is generally among the first half of the lot as they sally forth.

Prof. Cook places the time of bees swarming between the hours of eleven and two. In regard to this matter I wish to say: A great deal depends upon the weather and the atmospheric conditions generally. On a hot, sultry morning one may look for swarms much earlier than on a cool morning with a heavy dew. I have had swarms with old queens come forth as early as 6 o'clock in the morning, and then again as late as 6 in the evening. I want to be in my yard from 9 till 3, and then I sometimes miss it.

Swarms having virgin queens may come out at any time during the day, rain or shine, but of course the most swarming occurs during the midday period.

I have not been able to observe that the height of the place a swarm selects for clustering depended on the queen, whether a virgin or a laying queen, a swarm with a virgin being more apt to cluster high. All I have observed, is,

that a swarm with a feeble queen will always cluster low, sometimes on a weed or in the grass.

I agree with the Professor that it is very rare for a swarm to come out and not cluster at all. In 25 years I have had but a single case of the kind. The swarm came forth about 8 o'clock in the morning, and went straight for the hollow of a tall elm tree about one-fourth mile distant. My observation, like Prof. Cook's, points that way, that bees sometimes select a home before swarming, and, that after swarming they send out scouts to find a home.

On the next point I am at variance with the Professor. He says: "As many bee-keepers have observed, rarely several queens go forth with a new swarm." According to my experience it is not uncommon for several virgin queens to go out with a swarm. With me it has occurred frequently, and it occurs probably oftener than we are aware of, altho when it does happen the swarm frequently clusters in several different places near each other.

Toward the close of his article Prof. Cook says: "The

Exhibiting Bees and Honey at the Fairs.

BY F. L. GRANT.

THE first, and by no means the least, as regards the work, is in getting ready. Perhaps one has to lie awake nights to think of something new so as to get ahead of the other fellows. This is not easy work; it is rather trying to the nerves and sometimes discouraging; especially when we call to mind that it is likely that the other fellow is doing the same thing.

After we have decided what is to be the leading feature of our exhibit, then comes the "grind," the working out of the details and getting them into shape so as to please the eye of the judges and visitors. This is very important, for our success in winning premiums, and the disposing of our crop of honey at good prices is largely dependent upon this.

Whatever there is in the exhibit that is in the line of novelty should be so constructed that it can be put together

Apiarian Exhibit of Mr. F. L. Grant, at the Lewiston (Maine) Fair—(From Bee-Keepers' Review).

bees guard the queen-cells, so that the first hatcht queen can not destroy the others." I am aware that other authorities claim also, that the first hatcht queen destroys or tries to destroy her rivals in their cells, but I have observed at different times that the young queen was in another part of the hive 3 or 5 combs away from where the cells were when the work of destroying cells was going on right along, and the virgin queen, which had her liberty, did not take any part in the murder of the innocent whatever. I suppose that queens will act the same whether in colonies that have swarmed or in colonies rearing or having reared a batch of artificial cells. Ontario Co., N. Y.

Please send us Names of Bee-Keepers who do not now get the American Bee Journal, and we will send them sample copies. Then you can very likely afterward get their subscriptions, for which work we offer valuable premiums in nearly every number of this journal. You can aid much by sending in the names and addresses when writing us on other matters.

in sections, to save time, which is very limited in the rush of setting up and taking down, especially the latter.

All wax-work should be as nearly in place as it is possible to box it. The roof of the honey-house in the accompanying cut of my exhibit at the Maine State Fair, of 1898, consists of beeswax shingles which were cut from sheets of brood-foundation. They were glued to a very thin boarding on the roof, which, in this case, came apart in six sections. The boards were also covered with paper so as to make the wax adhere to them more firmly. The wax-work of the roof and other parts were shipt with soft packing between them.

The windows were made whole, and were shipt in a separate box packt with great care. The walls of honey were supported by a frame-work made from 1 3/4 x 1 3/4 joist fastened together with bolt and screws. The name, "Sweet Home," at the top, consists of beeswax letters suspended by silk thread. The distance from the table to the top of the flags was about seven feet, and the length of house about six feet.

As the picture shows many of the details of construc-

tion I will not say any more on that point, except that every part which does not show honey or glass, consists of wax-work. The table on which my exhibit was placed is 22 feet long. The pyramid at the further end is about eight feet high, and seven feet wide. This pyramid is nailed permanently in place so that it will be there ready for use every season; thereby saving much time in getting the honey in place.

That space in front of the pyramid, of which only a part can be seen, was taken up by a display of bees and implements. A part of the counter, from which the honey was sold, is shown just in front of the wax arrangements by the portico of the house.

After having the leading feature of the exhibit packed and ready for shipment, the next move is the packing of the honey so that it will arrive at the grounds in good condition. This is of great importance. I know of one man who shipped quite a quantity of it, and it was nearly all broken. I think the most successful method of shipping honey, unless in very large quantities, is to tie the comb honey in bundles, two cases with glass in a bundle; the ropes which cross the top case in the center serving as a convenient place for the hand in lifting.

With extracted honey, the cans or bottles should have folded paper packing between them, running each way. They should also have a heavier packing around the sides; and at the top and bottom there should be very heavy mats of the same material. In fact, the secret of successful packing is in having the jars fit perfectly tight. I have had a box containing 24-pint Mason jars filled with honey fall into the street from the top of my load without cracking a single can. I find that a box which will contain about 40 pounds of honey in jars is the best package for shipping.

In shipping my honey I do not send it directly to the fair grounds; for the goods are so roughly handled at that point, and the railroad company will not be responsible for damages. I have it shipped to the city, about two miles further on, where it is more carefully handled. It is then conveyed by means of truck teams back to the grounds.

I manage, if possible, to arrive at the grounds two or three days before the fair commences, so as to have plenty of time in setting up the exhibit.

I always carry a cot bed with me so that I can camp down right beside my table. This makes it far less expensive for us than if we paid \$1.00 per night for lodging. During the day we keep our bedding under the tables; and, by the way, I think it is a very good plan to have as many boxes as possible of a size that will slide under the table easily, for then we are sure of having them when we get ready to repack the exhibits.

If an exhibitor is going to sell honey during the fair he should be particular to arrange the exhibit so that the leading feature shall be as near as possible to the counter from which sales are to be made; for there is where the visitors become interested, and interested visitors make good customers.

In conclusion, I will say that any one who is intending to enter this department of the bee-business should be prepared to meet the many disappointments which will arise, and to take them as a matter of course.—Bee-Keepers' Review, Somerset Co., Maine.

Selecting Locations for Bee-Keeping.

BY "UNCLE LISHA."

SO we all began to discuss locations, as bee-keepers will. Of course, Charley Atkins thought Cuba the bee-keeper's paradise. But I told him of the long continued heat and the worse dampness; the insects, the lack of good society, etc.

"Well," said Charley, "I think I can stand the heat, and I guess there aren't any insects much worse than the bees themselves; and as for society, my wife is as good society as I want."

"Good!" said Deacon Strong. "I like to see a man stand by and appreciate his wife; but did you ever think your wife may not be able to remain there long? I have known a good many families to go no further south than Florida, and it would not be many years before their wives or daughters, or both or all, would be coming North to visit; and they would visit all their brothers and sisters, and uncles and aunts, staying at each place a good long while. They seemed to have learned the art of sitting to perfection, and lookt so contented like when sitting, as tho they had kind o' grown to the chair. And pretty soon the head of the family would come, too. His skin was several shades darker than when

he went South. He usually goes into ecstasy over our invigorating climate, and thinks he would better stay. And as for insects, I met a bee-keeper from Florida a few years ago, a regular cracker, as Northern folks call them, and I askt him what kind of place it was in Florida for bee-keeping. 'Well,' said he, 'it is a perty good place over on the Indian River, where there are plenty of orange-groves and mangrove. The mangrove gives lots of honey, and of pretty good quality, when the frost doesn't kill it;' but then he thought of some of the vexations even in that favored locality, and added, 'But there is one trouble in keeping bees in Florida, when you handle your bees you have to wear a bee-veil to keep off the mosquitoes.' So you see there are troubles, even in that land of flowers."

"There is another thing; we must not forget about locations," said I. "If there is a big yield in any section of country, we hear of it and are apt to think that the best place in the world. One year Mr. Manum, of Vermont, had an enormous yield of honey; yet now, owing to cutting down the basswood, and other causes, the yield of honey is scarcely large enough to make bee-keeping pay, and he is turning his attention to fruit and garden truck. A place may be very good one year and very poor the next. They seem to get pretty good crops in the buckwheat sections of New York, but sometimes the buckwheat fails to yield honey, and it almost always sells for less than white honey. I have always thought the central parts of Vermont were very poor for honey; yet Mr. M. F. Cram, secretary of the Vermont Bee-Keepers' Association, had, last year, I believe, the largest crop of honey of any person in Vermont, and perhaps in New England, and he had a fine crop the year before. He lives in a queer place to think of making bees pay. I made him a visit last summer, and found to my surprise he lived near the top of a great hill. After walking up what is known as Cram Hill until I perspired profusely, and was not a little weary, I found his place. I am afraid I wasn't very polite; for, almost as soon as I found him, I accused him of being pretty well stuck up. He said he didn't think he was, as he was only 2,000 feet above sea-level, which he considered very moderate. Here he makes it pay in producing choice honey that he sells for prices that might please any bee-keeper at the present time.

"Then there is California; but they have drouths, or dry years, and many of the bee-keepers have to leave their families and back it, as Rambler does; and while some years they get large crops, it doesn't sell as high as our honey right near the markets—at least, doesn't net them so much. In Colorado they are already overstocked with bees, and so it goes."

"I guess," said Deacon Strong, "finding a good place to begin bee-keeping is a good deal like finding a good place to begin to be a Christian. Some folks seem to think it would not be difficult if they were only living among strangers, or were out West, or following some other occupation; but I believe there is no better place than right where you are. Most of our successful bee-keepers began right where they were, and have made the business pay."—Gleanings in Bee Culture.

York's Honey Calendar for 1900 is a 16-page pamphlet especially gotten up to create a demand for honey among should-be consumers. The forepart was written by Dr. C. C. Miller, and is devoted to general information concerning honey. The latter part consists of recipes for use in cooking and as a medicine. It will be found to be a very effective helper in working up a home market for honey. We furnish them, postpaid, at these prices: A sample free; 25 copies for 30 cents; 50 for 50 cents; 100 for 90 cents; 250 for \$2.00; 500 for \$3.50. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

Belgian Hare Breeding is the title of a pamphlet just published, containing 10 chapters on "Breeding the Belgian Hare." Price, 25 cents, postpaid. It covers the subjects of Breeding, Feeding, Houses and Hutches, Diseases, Methods of Serving for the Table, etc. It is a practical and helpful treatise for the amateur breeder. (See Prof. Cook's article on page 292.) For sale at the office of the American Bee Journal. For \$1.10 we will send the Bee Journal for a year and the 32-page pamphlet on "Belgian Hare Breeding."

The Premiums offered this week are well worth working for. Look at them.

Questions and Answers.

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

[The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.]

Granulated Honey in Extracting-Combs.

Some of my extracting-combs are filled with granulated honey, and the extractor will not throw it out. What can I do with them? SOUTH CAROLINA.

ANSWER.—If you do not want to melt the combs you can feed to the bees. If you give them to the bees just as they are, they will throw out and waste some of the granules. Spray them well with water, and the bees will use all. It may be necessary to repeat the spraying after the bees have used part. You might try Mr. Aikin's plan of wetting: Take a tub or other vessel large enough, and dash the comb down into it violently several times.

Queenless Colony—Late Swarming.

1. I am just a beginner, and I have had fine success so far. I have a colony which I discovered to be queenless about two weeks ago, and as I have been very busy I did not do anything for them. On Aug. 21st a swarm of black bees came and clustered on a tree right over my bee-yard. As it was a very small swarm (about a quart), I got the queen, and, caging her up with about 20 of her followers, I placed her on the frames in the queenless colony, and dumped the rest in front of the hive, and as they went in I gave them all a good smudge of smoke. On Aug. 24th I liberated the queen, and they seemed to accept her all right. Did I do right?

2. Will this colony send out a black swarm next spring? The others were Italians.

3. Isn't it odd for bees to swarm at this time of the year? or is it a frequent occurrence? ILLINOIS.

ANSWERS.—1. Your procedure was all right. Very likely it would have been all right without caging the queen, but caging made it safer.

2. Yes, when a swarm issues it will be black, just the same as if no Italians had ever been in the hive.

3. While not common, it is not a very rare thing for bees to swarm even later. Sept. 3, I found hanging on a tree a fair-sized swarm this year.

That Queen Experience—Laying Workers.

I did not say that the queen was dead, but that the bees were preparing to supersede her. In 3 or 4 days after I introduced her (the bees would not gnaw at the card), she began to lay an egg here and there, and in a few drone-cells she would put 2 or 3 eggs. In a few days the bees built queen-cells and put eggs in them, or she laid in them. She did not lay any more until I took the queen-cells and eggs from them, then she laid a few more, and they began again to build queen-cells. I let them seal one of them. She did not lay any more until I took the eggs and cells away. I took away part of the bees, altho there was not more than half enough for a strong colony, at first. She did not lay, up to 3 days ago, enough to fill $\frac{1}{4}$ of a frame, nor did she enlarge in size visibly. She has now commenced to lay consecutively, and I think looks better. She has laid a patch on both sides of comb half as large as a hand. The bees seem to be working better, I think, by promptly removing their queen-cells and what few eggs, thwarted their purposes of supersession. I know it has so far, and will continue to do so if they build any more cells. Is it not possible that bees, after they accept a queen, change their minds? No, Doctor, there were no laying workers in the matter. I have had experience enough with them to know something of their ways! INDIANA.

ANSWER.—This is the case referred to on page 568, and from the letter there given I supposed the queen was dead. In that I was mistaken, but I still think laying workers

were present. One of the first signs of laying workers is to find an egg in a queen-cell, and if more than one egg is in a queen-cell, that settles it. I have never known a queen, I think, to lay more than one egg in a queen-cell, altho she may in a worker-cell. It is by no means an uncommon thing for a queen to be held in contempt for some time, and then make good work afterward. I have known cases in which she was not allowed to lay until a week after being put in the hive. If laying workers are present, her chances are rather poor.

Chapman Honey-Plant Seed.

Where can I get some seed of the Chapman honey-plant (*Echinops sphaerocephalus*)? WISCONSIN.

ANSWER.—When the boom of this plant was at its height, there was no difficulty in finding the seed, but at the present time I don't know where you can get any. I had quite a plat of it, but at present not a plant, and have some doubt whether any one who has tried it in this country thinks it worth cultivating.

Queen Killed in the Cage.

The queen came and was introduced according to directions in an out-apiary. The fourth day afterward I opened the hive and found the queen dead in the cage. If killed by the bees, it is the first instance under my observation where the queen was killed in the cage. The queen seemed in fair condition when received and introduced. I am at a loss to account for it. NORTH CAROLINA.

ANSWER.—It is unusual for bees to kill a queen in a cage, but there is no reason why they might not. Possibly, however, the thing is more common than generally supposed, for the queen might be killed in the cage, and then dragged out by the bees before the hive was opened.

Shade for Bees—Bee-Moths, Etc.

While I have been taking the American Bee Journal (about two years), I have not noticed much in it about location, shade, etc. Now, I wish to ask a question or two:

I have a lot 50x150 feet, which I wish to put about 35 colonies of bees on next spring. The street is on the west, buildings on the north, a grove on the east, a 6-foot board fence on the south, and a few trees on the west side. I would put the bees on the east one-half—50x75 feet.

1. Is it shaded too much?

2. Will the bees, while having to rise directly over buildings, grove, and high board fence, store as much honey as if their start was on a level?

3. The bee-moths make me lots of trouble. Can you give me any advice about them? You will likely say, "Keep your colonies strong." They are. My bees are black or brown. You may say, "Get Italians;" but I don't want them. I think what I have store more honey, especially in supers, than the Italians. I have had both. MINNESOTA.

ANSWERS.—1. Unless the shade is so dense as to make the place cold and damp, it is probably all right.

2. They will do just as well.

3. Aside from keeping bees strong and having Italians, it will be well to take care not to encourage the breeding of moths by allowing old combs to lie around, and some help may be given by digging out the worms in the combs by the aid of a wire nail. If you will pardon my saying so, I venture to say that if your bees have not enough "git up and git" to keep the worms cleared out, they are not as good bees as you might have, either for keeping moths at bay or for gathering honey. All blacks are not alike, and all Italians are not alike, nor for that matter all hybrids, and it may be that the Italians and hybrids you had were not up to the mark.

"The Hum of the Bees in the Apple-Tree Bloom" is the name of the finest bee-keeper's song—words by Hon. Eugene Secor and music by Dr. C. C. Miller. This is thought by some to be the best bee-song yet written by Mr. Secor and Dr. Miller. It is, indeed, a "hummer." We can furnish a single copy of it postpaid, for 10 cents, or 3 copies for 25 cents. Or, we will mail a half-dozen copies of it for sending us *one new* yearly subscription to the American Bee Journal at \$1.00.

* The Afterthought. *

The "Old Reliable" seen thru New and Unreliable Glasses.
By E. E. HASTY, Richards, Ohio.

FUMIGATING WITH BISULPHIDE OF CARBON.

That is a large-sized hope which is held out in the editorial on page 505. Of course, nobody desires to protest against it—only let nobody mistake a not yet settled matter for a settled one. To give an unpleasant taste or a green-yellow tinge to a great heap of choice sections would hardly be fun; so be sure (in a small way) that the bisulphide your druggist furnishes *you* does no harm before you run large risks. Desirably convenient to kill the small worms in sections it doubtless is. I have a suspicion that *bees*, and not chemicals of any kind, are really the proper agents to destroy said little worm villains.

MR. ANDERSON'S DANISH-AMERICAN APIARY.

Mr. Anderson proves, on page 497, that a Danish-American apiary looks very much like a nice straight-out American apiary. The objection to regular unbroken rows, which seems at first sight to lie against it, is really removed for the most part by those little trees. They practically divide the thing up into sections of about three hives each.

CREATING A DEMAND FOR HONEY.

How nobly up-to-date and scientific is C. Davenport's question on page 497! "Why isn't the demand and consumption greater"—of my honey? Blind scratching and kicking around are not likely to remedy things like intelligent effort along the lines of the answer to that question. First find causes, then remove them, rather than wrestle with the inevitable effects. Some of the strong reasons, however, are not easily removable; for instance, the multiplicity, excellence, cheapness and handiness of other dainties on sale, especially sweets. Instead of trying to remove a cause like this sometimes one can remove self and honey—to a country road, where the cause does not operate so strongly. Glad he succeeds so well with local advertising as a means of removing the two greatest reasons, suspicion, and "out of sight out of mind."

BOKHARA THE SAME AS SWEET CLOVER.

Some of the readers of page 499 probably puzzled their heads with the question, What is Bokhara clover? The writer (using both terms in his article) omitted to state that Bokhara clover and sweet clover are the same.

If cattle (or we) ate all that the chemist finds plenty of nutriment in, our respective diets would be rather queer. On that point chemical analysis is good as far as it goes; but it must not be expected to go very far, certainly not so far as to dictate to the animal stomach.

THE CELL-CUP BUSINESS.

Say, Mr. Pridgen, if you don't look out some of the outsiders will be stamped with the idea that your neat and wholesale arrangements are really to dip *honeycomb*, to put fabricated honey in. They will hardly be able to see how so many queen-cells should be needed. Your soakt board on which to shape and cool goblet bases is further evidence of ingenuity—if any were needed. Page 499.

"LARGE HIVES" AND A BISCUIT HONEY-MOP.

Mr. Davenport's hive "eight feet square" sounds as if squinting toward the importation of another enormous species of bee. And that stingy Texan, who used biscuit to mop up the last stray drop of honey, when he (in verisimilitude) "robbed his bees"—well, a room just about the size of that bee-hive, with a cross-bar window in it, seems to be what he is steering for. Page 501.

SWARMS OF B'S.

Many years ago some one got up a large and cunning swarm of B's—and it was a good one. Unlike other bees, they seemed to do the most good by emigration, and being found ever and anon on a new bush. Well, when I saw the "Swarm of B's" at the head of "General Items," page 506, I supposed it was the same eternal, wandering swarm, and came near not reading it. Lo, a new swarm, good as the old one. Thanks to the nameless somebody who made all these B's, notwithstanding his "Miss B Haviour."

A HINT TO BEE-SUPPLY FOLKS.

That was an extra-good talk that Mr. DeBusk gave the bee-supply folks on page 506. His strong sentence, "The beginning of every transaction is in part wrong," ought to settle into their minds and souls. We can not see what we are getting. Because we are at their mercy they ought to be merciful—supposing, of course, they really want to do the fair thing, which most of them do. Considerable improvement would result, I imagine, should each dealer soberly ask himself, Would my customer buy this if he could see it before he bought?

CHUNK HONEY IN THE SOUTH.

Did you ever? So prominent a man as E. J. Atchley producing and advocating chunk honey! Still, if the Southern market calls for it, and will have it, perhaps Mr. A. is all right. That it can be shipt in cans with no such smashage and leakage as sections often incur, is a strong point in its favor. It seems it does not mash itself up so badly if extracted honey enough to fill up all the crevices is put in—and thus 20 percent or so of extracted is workt off at the same price. Wonder how they open and close their cans. Page 516.

KEEPING VIRGIN QUEENS.

So Mr Doolittle finds that virgin queens can be kept nearly four weeks unmated, and yet become fertile eventually; but such have always been very poor queens. Probably he is right as to the reason. A queen put alone will worry herself to death in a few hours; and it is very reasonable to suppose that worrying about captivity when she greatly desires to go out, altho it does not kill her, damages her constitutionally and vitally. Page 514.

TWO COMB-FOUNDATION ITEMS.

From the editorial review of Prof. Gillette on comb foundation, I cull two items to hold up one more time: Natural midrib at some times is almost twice as heavy as at other times. No foundation midribs are thinned down quite as thin as natural ones. Page 520.

BEES AND THE KORAN.

Were it not for the general reliability of the British Bee Journal, I should almost be tempted to think it had been taken in by an interpolated copy of the Koran. Even if the quotations on page 521 do come from a standard copy, I still don't get quite rid of the idea that some writer later than Mohammed (and less shrewd) has been interjecting his own notions as he copied. Take these words as a test: "European bee-keepers call them drones." Just think once what Europe was early in the seventh century. How should an Arab know what European bee-keepers thought—or care to mention opinions from such a sunken barbarian hole, in case he accidentally knew? (I'm clearing the road, don't you see, to believe the book in case I want to believe?) Granting authenticity both ancient and modern, we have here a strong example of an able man going out of his field, the religious field, quite needlessly, and getting into the mire—like all who do their trades forsake. What fatal spell is it about bees which has made all men take leave of their senses when writing of them? Why do even wise men claim, practically, that they know all about them when they know almost nothing? It does look a little imposter-ish and shrewd to tell that bees all come home at night on the eve before the Mohammedan Sabbath, but not on other eves. Every once in awhile some one would watch to see if a lot of bees came in before any went out on Friday morn, and not seeing them (naturally he would not, as it is rather rare) he would be much strengthened in the true faith—and most likely would not test the other mornings of the week. Even should he see lots of early bees Friday morn it would be easily said, Satan moved somebody to capture a lot of your bees, and let them loose at an hour to mislead you.

PREVENTING THE TEARING OF CAPPINGS.

On page 527 I wonder if Mr. Hairston is right, that bees in famine-time leave a super of honey with less waste of time if a little honey is poured on the escape-board introduced. If so, why? I'll guess that the honey gives them the impression and feeling of business and prosperity, and thus causes them to act more as they would in prosperous times. In robbing times naturally the normal feeling is "hold the fort" and fight. That the fluid honey below would save some tearing of cappings, one almost knows without trying.

ROOT COMPANY'S PAGE.

A \$200 Red-Clover Queen at Last!

We finally have her, and she seems to be fully equal to our red-clover queen of years ago. The colony of this queen has given one of the most remarkable showings on red clover of any bees we have ever had, notwithstanding the stock has been robbed repeatedly of young larvæ for queen-rearing. The queen in question is an imported one, and, therefore, of the genuine pure leather-colored Italian stock. We have been sending out daughters from her all the season, but we had not discovered her value until the clover season, second growth, came on, and then her colony so far out-distanced all the other 450 that she attracted attention at once.

We can not sell her daughters untested any more for 75 cts.; but when taken with Gleanings we will sell them for \$1.00; that is to say, we will send Gleanings one year, and an untested red-clover queen from this \$200 mother for \$2.00; a tested queen of this same stock, and Gleanings one year, for \$4; or a select tested and Gleanings for one year, \$6.00. These queens will be sold only in connection with Gleanings.

Atho these queens have been offered only a week there is a great demand for them, and therefore we can only guarantee that the orders will be filled in rotation and sent as fast as they are ready to send out. Those who send orders immediately will stand the best show of getting stock at once. We can not guarantee to supply, this season, select tested stock, as we may not have it, as such queens will necessarily be limited, but we *think* we can furnish all that will be called for.

It must, however, be understood that these 'queens are not golden yellow, neither are their bees of the five-banded stock. They are simply leather-colored Italians whose mother came direct from Italy. Those who desire queens of this stock had better get them this season, as the queen may die this winter. At the present time we are setting aside some of her choice tested queens for next season, to test for our own use.

SHIPPING-CASES.

Our No-Drip Cases are still in the lead. We keep constantly on hand a large assortment from 12-pound size up. We also make special sizes to order.

That Root's Cases are in demand is shown by the fact that one dealer alone has ordered 16,000 this season.

SPECIAL GOODS.

□ This is the time when you should order odd size or special goods. Our busy season is over and we can do almost any work in wood you want, either for bee-keepers or others.

□ We make a specialty of packing-boxes, from the size of a section-box up. □ Let us figure with you.

FEEDERS.

How about your winter stores? Are you sure your bees have enough? Should it be necessary to feed you can't do it easier than with our Division-Board Feeder. This is made to hang like a frame in a Langstroth hive. Price, 20 cents each, complete. Less in quantities.

Honey-Labels.

Do you use labels for your honey? Are they really ATTRACTIVE labels? If you do not you may be losing many sales because your honey lacks attractiveness. You can't expect to market your honey at the best price unless you use every care in putting it up. Send for our label catalog and see our 1, 2, and 3 color labels.

Tin Packages for Honey.

If you are one of the people who market extracted honey in small lots you will find our pails just what you want. A dozen sizes and kinds to select from. We also furnish square cans—1-quart, 2-quart; 1-gallon and 5-gallons. A single can or carload, as you wish. Write for prices.

Gleanings in Bee-Culture.

When our advertisers write us that their advertisements have paid them well, we know GLEANINGS IN BEE-CULTURE must be read by the best bee-keepers. We know, too, that GLEANINGS is appreciated, for our circulation is increasing all the time. Send 25c for a six months' trial and get A. I. R.'s Notes of Travel and hundreds of other interesting things.

Comb-Foundation Mills.

Perhaps you are so far from us and rates are so high that you want to make your own foundation.

Our mills are being improved constantly. If you want to purchase a foundation mill, send for package of samples showing different styles we can furnish. Send 2c stamp for these.

Bushel Boxes.

Bee-keepers are always looking for labor-saving ideas. Have you ever read our 16-page pamphlet, "Handling Farm Produce?" It is full of information and gives prices of bushel boxes and other things. Free for the asking.

HONEY-EXTRACTORS.

"Operator No. 6 puts the honey-combs in the extractors, which is a Cowan 4-frame reversible, with ball-bearings and lever-brake—in short, the best extractor on the market."

Extract from article of N. E. France, of Wisconsin, in June Review. No one is better qualified to judge the worth of an extractor than Mr. France. He says the ROOT COWAN IS THE BEST.

Thousands of others say so.

Glass Honey-Packages.

We have all sizes of Mason Jars with aluminum or porcelain-lined caps. Also Jelly Tumblers, two sizes; Glass Pails, four sizes; and Self-Sealing Jam Jars. Besides these we still have the four sizes square jars, which have long been on the market. Don't forget us when you need glass packages for honey.

RUBBER STAMPS.

Have you ever thought how handy it would be to use a rubber stamp to mark your honey-cases, showing the grade? Then, too, if you sell in the home market you ought to have your name on the case so it would be returned. We make stamps of all kinds for all sorts of purposes. Let us send you our rubber stamp circular.

WINTER-CASES.

Our Winter-Cases are made of thin lumber dovetailed at the corners, with a telescope cover.

The cost is only 75 cents each singly, yet for convenience they are unsurpassed, and only excelled by the chaff hive in the protection afforded. Don't let your bees winter-kill or spring-dwindle when you can avoid it by using our Winter-Cases.

HONEY.

We buy a number of carloads of comb and extracted honey each year. If you have secured a good crop send us your offer. You don't have to worry about the return if you sell to us.

If you have extracted honey send sample. If you have failed to secure enough for your home market, let us supply you. We have honey engaged all over the country, and can ship direct from the producer, many times.

AGENCIES.

A list of our principal agencies will be mailed you on request. We can ship from stock such items as our regular Hives, Sections, Foundation, Extractors, etc., from these agencies.

Send your order direct to us, if you prefer, and request that we ship from nearest point, and we will do so, saving you freight charges and giving you quick delivery.

The Bee-Keeper's Guide

Or, Manual of the Apiary,

—BY—
PROF. A. J. COOK.

460 Pages—16th (1899) Edition—18th Thousand—\$1.25 postpaid.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published to-day. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipt, or his library complete, without THE BEE-KEEPERS' GUIDE.

This 16th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to GIVE AWAY to our present subscribers, for the work of getting NEW subscribers for the American Bee Journal.

Given for TWO New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the two NEW subscribers—simply the Bee Journal for one year.

Send us TWO NEW SUBSCRIBERS to the Bee Journal (with \$2.00), and we will mail you a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both for only \$1.75. But surely anybody can get only TWO NEW SUBSCRIBERS to the Bee Journal for a year, and thus get the book as a premium. Let every body try for it. Will YOU have one?

California! If you care to know of its Fruits, Flowers, Climate or Resources, send for a sample copy of California's Favorite Paper—

The Pacific Rural Press,

The leading Horticultural and Agricultural paper of the Pacific Coast. Published weekly, handsomely illustrated, \$2.00 per annum. Sample copy free.

PACIFIC RURAL PRESS,
330 Market Street, SAN FRANCISCO, CAL.

GENERAL ITEMS

Fall Honey Coming Lively.

The fall honey crop is now coming at a lively rate. A hive on the scales showed a gain of 10½ pounds one day last week, and 29 pounds for 5 consecutive days. If it holds warm we seem likely to get a record-breaker from goldenrod. H. D. BURRELL.
Van Buren Co., Mich., Sept. 10.

Another Poor Honey Season.

Our bees have done poorly. We have taken only about 200 pounds from 29 colonies, spring count, and will get but little more at the end of the season. They made a good start in the early spring and built up finely, and have gathered just enough honey to keep in good condition to take advantage of a harvest should it come. And why it has not come cannot be stated by this deponent. We have had no severe drouth nor excess of rain; all kinds of vegetation have grown luxuriantly. L. JONES.

Floyd Co., Iowa, Sept. 4.

Bees Scraping—Best Season.

I see on page 569 a question and answer in regard to bees scraping the alighting-board of the hive, near the entrance. I have noticed this same thing many times, and think that when they do this they are perfectly contented with their home; that is, they have no notion of swarming. Did any one ever know of a colony casting a swarm while this was in progress? If so, I would like to hear of it.

This has been the best season for honey with us since I have been in the

DR. PEIRO,

34 Central Music Hall, CHICAGO.

Golden Italian Queens.

By return mail, 75 cents each; \$7.50 per dozen. They pleased every customer this year; well, why not? They are the prettiest, gentlest and best hustlers you ever saw.

—Muth's—

Square Glass Honey-Jars.

Just the package for home trade. Full line of ROOT'S GOODS at their prices.

HONEY.

Have you any FANCY WHITE comb or extracted honey for sale? Also beeswax wanted.

C. H. W. WEBER,

2146 Central Ave., Cincinnati, Ohio.

FOR HOMESEKERS.

The Chicago, Milwaukee & St. Paul R'y will sell regular Homeseekers' Excursion tickets to all points in South Dakota, at one fare plus \$2.00 for the round trip, on Sept. 18 and Oct. 2, 1900. This will enable parties to visit the Corn Belt Exposition to be held in Mitchell, S. D., Sept. 26 to Oct. 4, 1900, inclusive. This exposition is held to demonstrate the great agricultural resources, wealth and possibilities of this thriving State. The exposition is held in a gorgeously decorated corn-palace, which for beauty can hardly be excelled anywhere by a building of a temporary nature. There are thousands of acres of cheap lands left in South Dakota that will, under the present conditions in that State rapidly increase in price, and the holding of this corn-palace with its many attractions, that both amuse and instruct, should be an opportunity that all land and investment seekers should embrace.

For further information apply to any ticket agent of the Chicago, Milwaukee & St. Paul R'y, or address Geo. H. Heafford, General Passenger Agent, Chicago. 39A3t

We Can't Give Away Anything

You pay for what you get in this world. You understand that. But as a business proposition we want you to try our great medicine for Indigestion, Constipation, Biliousness, Sick Headache, Insomnia, "the Blues," and like complaints—

Laxative **NERVO-VITAL** Tablets

We know you won't buy it, until you know something about it. The best way to get you to know how good it is, is to let you try it. That's what we do. Send Stamp for "Health" booklet, and we will send you a free sample package, that you may try it yourself. We know you will always keep it in the house, if you once try it. What fairer offer could we make? At all Druggists—10 and 25 cents.

Handsome **FREE!**
Stick Pin

If, instead of sending for a sample, you send us 25c we will send you "Health" booklet, a 25c box and a handsome gold stick-pin, set with emerald, ruby or pearl, warranted to be worth double the money. Order by number. This is an extra introductory offer. Only one pin to one person. If unsatisfactory, money returned. Send now while the offer is good.

MODERN REMEDY COMPANY, KEWANEE, ILLINOIS.

[This company will do exactly as it promises.—Editors.]

bee-business. I had eight colonies, spring count, two of them almost worthless. I increased to 24 artificially, and they soon commenced to swarm, and it seemed as tho they were going to swarm themselves to death. They run my number of colonies up to 34, produced over 1,000 pounds of surplus honey, and all are in good condition. How is this for bee-keeping in North Carolina? I have imported Italians, golden Cyprians, and Holy Land bees, and find them all good races. Cyprians are the best of all for comb-building and honey-gathering, but a little too hard to control when excited.

H. E. COFFEY.

Rutherford Co., N. C., Sept. 11.

A Very Dry Season.

We are having a very dry season, no white honey at all. Nuclei have swarmed out by the dozens. A neighbor has had several colonies starve, or nearly so. There is very little brood or honey in the hives. It is the driest season I ever saw. If we have rains we may get buckwheat honey. Hay was 1/2 of a crop. W. L. COGSHALL.
Tompkins Co., N. Y., July 25.

No Surplus Honey.

We have had no surplus honey this year, and bees have barely lived thru the season. We expect them to get some winter stores from goldenrod this week. I have been breeding for non-swarming bees for years. If some call the Dadant hive a barn I would be pleased to know what you would call some of mine—perhaps a ranch. They are 30 inches long and 18 inches wide, with air space. They have 22 frames 10 1/2 x 12 inches. P. W. CORYA, M.D.
Jefferson Co., Ind., Aug. 30.

Swarming.

On page 310 I read about Mr. Smith's second swarm in 21 days. Three years ago I bought a colony of bees of a man who found them in a tree which he cut down, giving him 20 cents for it. I elipt the queen's wing and put them into a frame hive, where they staid until May 22d, when they swarmed. I caught the same queen and put her in a 10-frame Langstroth hive. The swarm was the largest I ever saw. May 26th they swarmed again, leaving a very good colony in the hive, also a queen-cell with an egg in it. The queen was an Italian. How is that?

M. H. SOSSOMAN.

Franklin Co., Ark., Sept. 4.

Wetting Sections Before Folding.

There are a good many of us who cannot afford to wet a whole bunch of sections when we only want a few. When all are wet those not used mildew or mold, which makes them look dark. Here is a way to wet sections before folding them:

Take what you can grasp in one hand, having the grooves all one way. Bunt the ends against something to make them even, then hold in both hands and press down edgewise to even them the other way; while in this shape incline them over sidewise about 15 degrees, which will make all the

Sharples Cream Separators: Profitable Dairying

SPECIAL NOTICE!

Last winter's cut of basswood is the whitest it has been for many seasons. We are now making sections out of this new stock and therefore are in a position to furnish you with the very finest quality in the market.

LEWIS WHITE-POLISHT SECTIONS

Are perfect in workmanship and color.

Orders shipt immediately upon receipt. A complete line of everything needed in the apiary. Five different styles of Bee-Hives.

Lewis Foundation Fastener simplest and best machine for the purpose. Price, ONE DOLLAR, without Lamp.

Dr. Miller's Honey-Queens!

One Untested Queen Free as a Premium for sending ONE New Subscriber to the American Bee Journal for one year.

Or, send us \$1.50 and we will mail you a Queen and also credit your own subscription for One Year.

Or, for \$1.00 queen alone by return mail.

We have been fortunate in making an arrangement with DR. C. C. MILLER—the well-known honey-specialist—to rear queens **EXCLUSIVELY FOR US DURING THE**

SEASON OF 1900. These Queens will be mailed in rotation, so "first come first served."

The Queens Dr. Miller will send out on our orders will be precisely the same as those he rears for his own use, so of course they will be from his best stock. His best colony in 1899 had a queen reared in 1898; May 5, 1899, it had brood in 4 frames, and he gave it at that time a frame of brood without bees. It had no other help, but May 25 a frame of brood with adhering bees was taken from it, and the same thing was repeated June 3, leaving it at that time 5 frames of brood. It stored 178 sections of honey, weighing 159 pounds (and that after July 20, in a poor season), being 2 2/3 times the average yield of all his colonies. A point of importance is the fact this colony did not swarm, and an inspection every week or 10 days showed that at no time during the entire season was there even so much as an egg in a queen-cell. Dr. Miller rears queens from this one.

The demand nowadays is for **BEEES THAT GET THE HONEY** when there is any to get, and Dr. Miller has such bees. You will want to have a queen from his best, we are sure, even if she is not pure Italian.

Do not send any orders to Dr. Miller, as all orders **MUST** come thru us, according to our agreement.

Remember, send us \$1.00 for **ONE NEW SUBSCRIBER** to the American Bee Journal for one year, and **YOU** will get **ONE OF DR. MILLER'S UNTESTED HONEY-QUEENS FREE AS A PREMIUM.** This offer is made *only* to our present regular subscribers. Orders for queens are to be filled in rotation.

Address all orders to **GEORGE W. YORK & CO.,**
118 Michigan Street, CHICAGO, ILL.

IT PAYS TO DEHORN. Hornless cows give more milk. Hornless steers make better beef.
Keystone Dehorning Knife

The best dehorner, the most humane and easiest to use in the world. Cuts on four sides at once, without crushing or bruising. Endorsed by leading colleges. Highest award at world's fair. Send for circulars.
M. T. PHILLIPS, Pomeroy, Pa., (Successor to A. C. BROSIUS).

openings show. Now grasp them in the left hand, and pour cold water from a common teakettle in the grooves. Hold them tight together to keep the water from going between them, and lay them down in a pile with grooves up. To foid them, turn the bunch over, and all is well. C. CRANK.

Oscoda Co., Mich.

Crop Failure—A Yellow Weed.

The honey crop in this immediate vicinity has been a failure this year. I got only about 150 pounds (in the spring) from 20 colonies. Usually the bees are working busily at this time on the yellow weed I mentioned once before, but altho the ground in every direction is covered with its yellow bloom, the bees are doing no good. Fig. 133, page 387, of Dadant's Langstroth, is an exact cut of this yellow weed, which is there called "Helenium tenuifolium," the honey of which Dr. J. P. H. Brown is quoted as classing poisonous; but if it is, it must either be very slightly so, or vary with locality. During the past winter we ate over 100 pounds of it without the slightest ill effect, but the flavor is rather disagreeable, in addition to its bitterness, which also seems to vary in amount. ALBERT E. ISAAC.

Morgan Co., Ala., Sept. 5.

Fairly Good honey Crop.

The honey crop has been fairly good here, strong colonies getting 50 pounds each of extracted honey. I expect to get that much more when the fall flowers bloom.

My premium Dr. Miller queen received some weeks ago, is doing nicely. Her workers are two and three banded. I liberated her immediately upon arrival, in a queenless colony, with no trouble. They are getting strong now for the fall. S. CHEATHAM.

Edgefield Co., S. C., Aug. 30.

Paper Bag Feeders—Printers' Ink.

There was very little honey produced in this part of the country this season. My bees didn't average 10 pounds of surplus honey to the colony, but they are filling up nicely with fall honey for winter, and they are rearing a nice lot of young brood for next spring. I had the queens caged in about 100 hives during the buckwheat flow. I don't like August bees for wintering, so I thought I would try September and October bees, and new hives and combs, for a change; so I caged the queens for 9 or 10 days. To try such an experiment on so many hives was rather a risky thing—I should have tried it on four or five hives first, but I suppose I will know more about it when the cherry-trees are in bloom next spring.

I had no idea that printers' ink was so poisonous to bees, but a case that came under my observation lately proved it to be true beyond a doubt. I have been in the lazy habit of using for feeders small paper bags—the kind that storekeepers use for tying up groceries. Whenever I found a colony that needed feeding, I poured four or five pounds of honey or thick syrup into a paper sack, and placed it on top of the frames, with an empty super and tight cover on top of the hive.

H. G. Quirin, the Queen-Breeder,

Is as usual again on hand with his improved strain of

GOLDEN ITALIAN QUEENS.

The A. I. Root Co. tell us that our queens are EXTRA FINE. We obtained thru special correspondence a breeder from Doolittle, who says, "If there is a queen in the U.S. worth \$1.00, this queen is." Queens bred from her, soon as they begin to lay, \$1.00 each.

Queens promptly by RETURN MAIL. We guarantee safe delivery.

Price of Queens after July 1.	1	6	12

ALL THE ADVANTAGES

of a low down wagon, such as ease of loading, saving of heavy lifting, saving the land from cutting up and rutting, are derived from using a set of

Electric Steel Wheels

They convert your old wagon into a low down handy wagon at the lowest possible cost. They are made of steel with either direct or slaggered oval steel spokes. They are made in sizes to fit any wagon. A set of these wheels means

that you have practically two wagons—A low one for the farm and a high one for the roads. Any height you want, and all wide, non-rutting, easy draft tires. Write at once for catalogue, prices, etc.

Electric Wheel Co., Box 16, Quincy, Ill.

Please mention Bee Journal when writing.

The Emerson Binder

This Emerson stiff-board Binder with cloth back for the American Bee Journal we mail for but 60 cents; or we will send it with the Bee Journal for one year—both for only \$1.40. It is a fine thing to preserve the copies of the Journal as fast as they are received. If you have this "Emerson" no further binding is necessary.

BEEES QUEENS

Smokers Sections, Comb Foundation And all Apiarian Supplies cheap. Send for

FREE Catalogue. E. T. FLANNAGAN, Editor

Please mention Bee Journal when writing.

When removing the empty bags I almost always found more or less dead bees around on top of the frames. I thought at first that the bees got to fighting among themselves about the pin-holes that I made in the bags for the syrup to run thru. There was surely no chance for robbers, as I always feed in the evening. I have come to the conclusion that it was "J. D. Reeser & Co., Dry Goods, Groceries, Millinery, Etc." that was printed on the paper bags that was the cause of the trouble. I don't know what I'll do, but I think I will have to get some feeders made to order, without any printing on them. WM. KERNAN.

Sullivan Co., Pa., Sept. 5.

Bees Did Fairly Well.

My bees have done fairly well so far this season, but we had too much rain until recently. We look for a heavy fall crop of honey. I have 90 colonies in two-story Simplicity hives, but I ran out or hives toward the last and put one hive in a drum coal-stove, and they are as happy as if they were in a \$5 hive. D. F. MARRS.

McLennan Co., Tex., Aug. 25.

Did Fairly Well on White Clover.

Bees did tolerably well on white clover for a time here, then it turned off dry, and the flow ceased. Now they are doing fairly well on Spanish-needle, smartweed, goldenrod, etc. I have sold some honey at 12½ cents per section, and more at 13 cents a pound. Bees will secure enough and to spare to winter on. I have 41 colonies, and want to increase as fast as practicable to 100. DANIEL JONES.

Marshall Co., Ill., Sept. 7.

Honey Crop a Total Failure.

The honey crop is a total failure here this season. I will have to feed to get the bees thru the winter.

J. C. BERGEN.

Humboldt Co., Iowa, Sept. 6.

Blooming of Alfalfa.

In a recent issue of the American Bee Journal a mistake is made in teaching that alfalfa does not bloom the first season. If it is planted by the 4th of July it will get ripe before frost, and frost comes early at this altitude. JAMES H. WING.

Prowers Co., Colo., Sept. 1.

A Beginner's Experience.

I am a beginner with bees, having bought three colonies in the spring, which have increased to nine. I have been greatly helped by taking the American Bee Journal, and expect to take it as long as I keep bees.

I bought a black colony of bees last spring which was six years old, and had never cast a swarm. It was ordinarily strong and had lots of honey. I wanted to work for increase, so I divided the colony, taking three frames of brood and bees and placing them in another hive, gave it one of Dr. Miller's queens, and it is doing fine. The old colony soon filled up the brood-chamber and started to fill the super, but all at once it failed to work. I left them for a few days and they became

very cross. I finally divided them again, and the new colony went to work splendidly the same day. The old one did not do any better, so I left it five days longer, then killed the old queen, and they went to work at once. When I killed the old queen I cut out all the queen-cells and left the colony queenless for five days. Before introducing the new queen I lookt thru the hive carefully, and found a strip of new comb built on one of the brood-frames about two inches long with three queen-cells on it. Each cell was capt over and had a queen in it. I wish some one would tell me how those queen-eggs got there. I have had six queens and lost only one, and it was my fault they did not accept her.

A swarm issued July 10 which I gave foundation starters and a queen, and it has filled its hive and 24 sections; and on Aug. 5 it cast another swarm, the largest I ever saw.

JAMES H. KNOTTS.

Preston Co., W. Va., Sept. 4.

Bees Surprised Him.

I arrived home from the Chicago convention at noon, Sept. 3, none the worse from my ten days' visit in the Windy City. Matters at home seemed to have gone on about as well as if I had not been absent. Strange, isn't it? The bees, too, thought to surprise me would be about the right thing to do, by getting a "move on," which they seem to have done, and have kept it up ever since. I have abandoned the thought of having to feed for wintering the bees, and am nursing the prospect for at least a little surplus to help make buckwheat cakes a little more relishsome for my own family. In my communication under "General Items," page 572, the type make me say "ounces" instead of "pounds." The scales colony is now 12 3/4 pounds heavier than it was Aug. 24—not a big gain, but better than a loss. What is true of this colony is apparently true of my 40 others.

F. W. HALL.

Sioux Co., Iowa, Sept. 10.

The Adel Queen

you sent me in 1899 is the best queen I ever saw. Her colony stored 42 pounds whist honey in 19 days, commencing Aug. 11th, now working on third super. Send two more queens.

QUEENS

Untested Queens, Italian, 60 cents. Tested, \$1. From honey-gathering stock. We keep in stock a full line of popular Apiarian Supplies. Catalog free.

Apiaries—Glen Cove, L.I. **I. J. STRINGHAM, 105 Park Place, New York, N. Y.**

Please mention Bee Journal when writing.

Four Celluloid Queen-Buttons Free

AS A PREMIUM

For sending us ONE NEW SUBSCRIBER to the Bee Journal for the balance of this year, with 30 cents, we will mail you FOUR of these pretty buttons for wearing on the coat-lapel. (You can wear one and give the others to the children.) The queen has a golden tinge.

This offer is made only to our present regular subscribers.

NOTE.—One reader writes: "I have every reason to believe that it would be a very good idea for every bee-keeper to wear one [of the buttons] as it will cause people to ask questions about the busy bee, and many a conversation thus started would wind up with the sale of more or less honey; at any rate, it would give the bee-keeper a superior opportunity to enlighten many a person in regard to honey and bees."

Prices of Buttons alone, postpaid: One button, 8 cts.; 2 buttons; 6 cts. each; 5 or more, 5 cts. each. (Stamps taken.) Address,

GEORGE W. YORK & CO., 118 Michigan St., CHICAGO.

THOMAS G. NEWMAN,
Director of the National Bee-Keepers' Association.

PUBLISHED WEEKLY BY

GEORGE W. YORK & CO.

118 Michigan St., Chicago, Ill.

[Entered at the Post-Office at Chicago as Second-Class Mail-Matter.]

IMPORTANT NOTICES:

The Subscription Price of this journal is \$1.00 a year, in the United States, Canada, and Mexico; all other countries in the Postal Union, 50c a year extra for postage. Sample copy free.

The Wrapper-Label Date of this paper indicates the end of the month to which your subscription is paid. For instance, "Dec00" on your label shows that it is paid to the end of December, 1900.

Subscription Receipts—We do not send a receipt for money sent us to pay subscription, but change the date on your wrapper-label, which shows you that the money has been received and duly credited.

Advertising Rates will be given upon application.

Reformed Spelling.—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound. Also some other changes are used.

MR. AND MRS. R. C. AIKIN, with their little daughter Eva, called at our office Sept. 18, when on their way back to Colorado. They had a pleasant stay among relatives in Kentucky and southern Indiana after the Chicago convention. The Aikin family are some of the real salt of the earth.

AMONG THE CALLERS at our office last week were, John Wagner, of Stephenson Co., Ill., having 80 colonies of bees; L. J. Bergh, of Dane Co., Wis., with 20 colonies; Robt. Halley and Chas. Clarke, of Cook Co., Ill., with 19 and 35 colonies, respectively. We are always glad to see our readers, and shake their honest and loyal hands, even if we do sometimes fail to mention their calling thus publicly.

MR. L. KREUTZINGER'S HONEY HARVEST, for 1900, mentioned last week, was held Saturday, Sept. 15, and was quite a success. Some 200 people from all parts of the city came to look into the inner life of the honey-bee, and their desire for a glance into its mysteries was manifested in every way.

Among the visitors present were Mr. Toshiro Fujita, consul of the Japanese Empire, with his chancellor, Mr. T. Funatsu; Mr. Baron A. A. von Schlippenbach, Imperial Russian consul; Dr. Walther Weber, consul of the Imperial German Government; and about 12 teachers from the public schools.

Mr. Herman F. Moore, secretary of

the Chicago Bee-Keepers' Association, rendered valuable assistance in explaining the wonders of apiculture to the interested onlookers. About 100 cases of honey were carried home by the visitors. Mr. Reinhold Jahn is Mr. Kreutzinger's managing apiarist, and has been a very busy man the past season with four apiaries to look after.

BEES AT THE PAN-AMERICAN.—The Pan-American will open at Buffalo, N. Y., May 1, 1901, and continue until Nov. 1. The following has been sent us by the superintendent of the press department of the bureau of publicity, Mr. Mark Bennett:

"The important industry of beekeeping will have adequate representation. Very useful knowledge has been developed in recent years in regard to this branch of farm work, and by reason of this better knowledge larger profits are being realized by those who make use of it. The exhibits in this class will show the localities and conditions in which and under which honey-bees thrive best. The uses of bees for other purposes than honey—such as the fertilization of flowers by reason of carrying the pollen from one flower to another—will be shown.

There will be displays of a variety of hives, the commercial forms of honey, the different varieties of bees, and the methods of management in apiaries."

A SWEET-TOOTH POLICEMAN was thus mentioned lately in the Chicago Times-Herald:

"Officer Smith, of Rogers Park, was sent out yesterday morning to investigate the damage done by Tuesday's storm. The police officials waited a long time for his report, and they booked him as a mysterious disappearance, and two other officers were detailed to find him. They wandered thru the streets and across the farms for hours and finally came across the missing man behind a clump of bushes. He was seated near a fallen tree lading something from the stump and putting it into his mouth.

"Smith had found a honey-bee's store-house in the middle of an old tree that had been blown down by the wind. The charms of the honey proved so great that he forgot all about his report."

ALL IN 60-POUND TIN CANS.

ALFALFA HONEY*****

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

BASSWOOD HONEY*****

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms in Wisconsin. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

Prices of Either Alfalfa or Basswood Honey:

A sample of either, by mail, 8 cents; samples of both, 15 cents—to pay for package and postage. By freight—one 60-pound can, 9½ cents per pound; two cans, 9 cents per pound; four or more cans, 8½ cents per pound. Cash must accompany each order. If ordering two or more cans you can have half of each kind of honey, if you so desire. This is all

ABSOLUTELY PURE BEES' HONEY,
The finest of their kinds produced in this country.

Read Dr. Miller's Testimony on Alfalfa Honey:

I've just sampled the honey you sent, and it's prime. Thank you. I feel that I'm something of a heretic, to sell several thousand pounds of honey of my own production and then buy honey of you for my own use. But however loyal one ought to be to the honey of his own region, there's no denying the fact that for use in any kind of hot drink, where one prefers the more wholesome honey to sugar, the very excellent quality of alfalfa honey I have received from you is better suited than the honeys of more market flavor, according to my taste. C. C. MILLER.
McHenry Co., Ill.

Order the Above Honey and then Sell it.

We would suggest that those bee-keepers who did not produce enough honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

Address,
GEORGE W. YORK & CO., 118 Michigan St., Chicago, Ill.

* Editorial Comments. *

Uniting Weak Colonies should not be delayed too long.

While they may be united almost any time, it is better that the uniting be done so the united colony can be settled down comfortably in its winter quarters long before freezing weather, with plenty of time to have its winter stores arranged to its entire satisfaction.

One of the troubles in uniting colonies is that the bees of the colony removed to the new location are likely to return to the old location on their first flight. To avoid this, some practice putting a broad board in front of the new entrance, so that when a bee bumps its nose against the board in coming out it turns about to see what is the trouble, and is thus induced to mark its new location and return to it. It is also well to remove the stand from the old location, and to make it look as unlike home as possible.

Queenless bees take up with a new location better than those having a queen. So it is a good plan to remove the queen from the colony to be removed, so that it may be queenless two or three days before uniting.

Bees are somewhat like people, more inclined to be good-natured after a full meal. So to encourage their uniting peaceably, induce them to fill up on honey by pounding on the hive of one colony a minute or more, then on the other hive the same way, and then allowing two or three minutes more for the bees to fill their honey-sacs. The pounding should be heavy, so as to jar the hive rather than to make a noise. The fist makes a good hammer for the purpose. Then take the colony made queenless to the place of the other colony, and put into the hive standing there the best filled combs from each hive, alternating the frames so the bees will be all mixt up, not knowing where to begin fighting.

It takes a good deal of resolution for a beginner who is anxious to increase the size of his apiary to decide to unite two weak colonies and go into winter quarters with only four colonies, when by keeping them separate he could make his winter debut with five. But as he increases in experience he learns that it is of less importance to go into winter quarters with a given number than it is to come out of winter with that number. Having three fairly strong colonies and two weak ones, if he unites the two weaklings he stands a good chance of coming out in the spring with four good colonies, whereas if he tries to winter the whole five the chances are that the weaklings will succumb, leaving him with only three. In other words, the fall uniting is likely to increase his spring number by one.

Even if the two weak colonies are sure to winter over, it is policy to unite them. A very weak colony makes very slow work increasing in strength in spring. A colony having brood in four combs well covered with bees will increase

right along, while one with bees on one or two combs will stand still or decrease in numbers till quite warm weather. So if the two weaklings are united in the fall, the united colony will build up in spring, and a new colony can be formed from it early in the season, so that the owner will have two better colonies than if he had tried to keep the original weaklings separate.

The sooner you unite weak colonies after reading this the better.

Bees and Peaches.—We have received the following from General Manager Secor, of the National Bee-Keepers' Association, which will be of interest to our readers:

FOREST CITY, IOWA, Sept. 17, 1900.

Wide notoriety has been given thru the daily and weekly press to a lawsuit between two brothers by the name of Utter, near Amity, N. Y., one a bee-keeper and the other a peach-grower.

The fruit-grower alleged that the bees belonging to his brother, the bee-keeper, destroyed or lessened his crop of peaches.

The case seems to have been one growing out of former family feuds and was therefore fought bitterly, but not thoroly.

While the public has no interest in family or neighborhood quarrels, the bee-keeping fraternity does have an interest in truth and justice.

The case was tried before a justice of the peace, and from reports of the evidence presented by the defendant the bees were fairly exonerated, but the court decided against the bee-keeper and rendered judgment for \$25 and costs.

Notice of this suit came to me, as General Manager, but too late to get in the proper evidence to rebut the allegations of the plaintiff. Therefore I have authorized an appeal to the county court, and have pledged \$100 toward fighting it.

The defendant is a poor man, which may have had something to do with the failure in the lower court, as he could not afford to employ the best legal counsel, or procure the attendance of expert witnesses from any distance.

I am assisting the attorneys in obtaining evidence, and hope to get a reversal of the lower court.

I merely want to let the bee-keepers know that the National Bee-Keepers' Association is not dead or asleep.

The Association can not afford to let such a decision stand, and will fight it to the bitter end, if I have any authority in the matter.

EUGENE SECOR, *General Manager.*

Moving Bees a Short Distance.—Where only one or two colonies are to be moved, Editor Hill, of the American Bee-Keeper, gives the following plan, which certainly has a "good look" to it:

"Set all frames containing unsealed brood, queen and nearly all the bees into another hive-body and place it upon the stand where it is desired to have it remain, leaving but a few frames of comb with honey and sealed brood upon the old stand. In the evening of the second day carefully transfer the old hive also to the new location, and, having its bottom-board removed, set it upon the hive first removed. If a board or other object is set against the front of the hive, causing the bees to note their new location upon first starting out in the morning, but few bees will be lost."

Stark.—From *Wagener Pollen* Above, from *Stark Pollen* Below. *Markt Benefit* from *Cross-Pollination*.

Pollination of Orchards is the title of an exceedingly interesting paper by S. W. Fletcher, of Cornell University, in the *American Fruit and Vegetable Journal* for July. It appears that some varieties of fruits, say of apples, are self-sterile; that is, they will produce little or no fruit unless planted near other varieties, so as to have the benefit of foreign pollen. Much of the unsatisfactory fruiting of orchards all over the country is due to self-sterility, which, however, is not a constant character with any variety. The same variety may be self-sterile in one place, and self-fertile in another. Some varieties seem to show no benefit from cross-pollination, but it will not do to depend on this, for in another place cross-pollination may be important. A difference in results may come from using different varieties as fertilizers, as for example, Seckel pears from Kieffer pollen are larger than from Lawrence pollen. As to the pollen-carriers, Mr. Fletcher says:

“The pollen of one variety is carried to the pistils of another in two ways—by the wind and by insects. There are many kinds of insects which aid more or less in the cross-pollination of orchard fruits, principally bees, wasps and flies. Of these, the wild bees of several species are probably the most important. In a wild thicket of plums or other fruits, they are usually numerous enough to insure a good setting of fruit. But few, if any, wild bees can live in a large orchard, especially if it is well tilled. As the extent and thoroughness of cultivation increases, the number of these natural insect aids to cross-pollination decreases; hence it may become necessary to keep domestic honey-bees for this purpose.”

In other words, as cultivation progresses, it will be more and more important to have hive-bees on hand, to secure better crops of fruit.

Six beautiful illustrations accompany the article, two of which are here reproduced. Regarding these, Mr. Fletcher says:

“The difference between the cross and self-pollinated *Starks* and *Longfields* is so striking that one would almost be tempted to think the self-pollinated fruits were wormy, but they were not.”

Measuring the diameters of the two lots of *Stark* apples, and remembering that their weights are in direct ratio as the cubes of their diameters, it is easy to figure out that with an equal number of specimens of each kind averaging the same as those in the illustration, the weight of the cross-pollinated fruit would be 5 and $\frac{3}{8}$ times

as much as that of the self-pollinated. At this rate, a man with an orchard of *Stark* apples could afford to pay a round price for the presence of bees to insure cross-pollination.

This testimony is all the more valuable, because coming from one of our most important experiment stations, and written, evidently, not by a bee-man, but by a fruit-man.

Something About Robber-Bees.—

G. M. Doolittle discourses about them in the *American Bee-Keeper*, and says one good thing is for beginners to know that robbers are very troublesome only in the spring before either honey or pollen is to be had from flowers. Another good thing to know is that in the spring the entrance of a hive should be closed (before the bees take their first flight) on the side of

the hive where the honey is, and open only in front of the cluster. Mr. Doolittle continues:

Another good thing, and to my mind the *best* of all, is to fix all weak colonies and all nuclei in any hives as follows (for only weak colonies and nuclei are subject to robbing at any time of the year): Just at night, on some cloudy, cool day (not so cool but that bees can fly), or under a tent, take the combs all out of the hive, then place a frame of honey next one side of the hive. Next to this put the frames of brood they have—one, two or three, and next the last frame a division-board, filler or dummy, as they are differently called by different persons when speaking of the same thing. To digress a little:

Take a piece of inch or $\frac{7}{8}$ board and make it so it will fit your hive below the rabbeting on which the frames hang loosely, and to the top of this nail the top-bar of a frame. Hang it in the hive the same as a frame and you have just as good a division-board, filler or dummy as can be made. To return: Having your two, three or four frames and your dummy in, say the west part of your hive, make the en-

Longfield.—From *Greening Pollen* Below, from *Longfield Pollen* Above. *Markt Benefit* from *Cross-Pollination*.

trance at the bottom at the extreme east side; and for the two-frame colony give an entrance $\frac{3}{8} \times \frac{3}{8}$ of an inch; for the three-frame colony make the entrance $\frac{3}{8}$ high by $\frac{3}{8}$ long; for the four-frame colony make the entrance $\frac{3}{8}$ high by one inch long, and you will never have any trouble from robbing at any time of the year, providing said colonies have a queen, some little brood, and bees enough to protect in any way or cover those combs. If a robber-bee should enter the entrance after so fixt, it must travel over all the vacant space to the dummy, ready to be met by a guard at any time, then go under the dummy where the guards are doing duty the same as at the entrance, and if it succeeds in passing there and reaching a comb, it is a comb having brood in it, not honey, the honey only being reached after passing thru all of the hive and all of the bees, clear to the further side, and no robber-bee will make such a venture.

Convention Proceedings.

Report of the Proceedings of the 31st Annual Convention of the National Bee-Keepers' Association, held at Chicago, Ill., Aug. 28, 29 and 30, 1900.

BY DR. A. B. MASON, SEC.

(Continued from page 598.)

Dr. Mason—I suggest that we take a recess, and that those who wish to become members of this Association give me their dollars. They are enquiring for badges and we can not give them out until I get your dollar.

Mr. France—May I rise for information as to the status of the Wisconsin State Bee-Keepers' Association. Last winter its members joined the National Association in a body, as provided by the constitution of this Association. Is our dollar due for the next year now, or a year from the time we paid that dollar in?

Pres. Root—I will turn that question over to Dr. Mason to answer.

Dr. Mason—The dollar isn't due until the dollar you paid is used up, and every member of the Wisconsin Bee-Keepers' Association that is present is entitled to a badge, but you can't get it until I get your name and address so that I may know from Manager Secor, by-and-by, that you are members.

Mr. Abbott—I think, as chairman of the Board of Directors who have the expending of the money, it would be a good idea for me to make an old-fashioned explanation just now. I want to say to the bee-keepers that the Board of Directors are doing all they possibly can to advance the interests of bee-keeping in the United States with the funds that they have on hand; they are limited in their work a great deal because they lack funds, and the only means they have of getting funds is from the membership fees. And now let me give you an incident that occurred a short time ago, which will show you it is vastly important that you become a member of this Association: A lady who lives some 17 miles from St. Joseph, Mo., came into my office about fruit-blooming time, and appealed to me to know what could be done because 22 colonies of her bees had been poisoned by spraying the apple-orchards when in bloom. The first question I askt her was, "Are you a member of the National Bee-Keepers' Association?" and she immediately said, "No." "Well," I said, "So far as helping you financially is concerned, I can't do anything, but I will help you all I can individually;" but the individual help didn't amount to a great deal, and the lady is yet mourning the loss of 22 colonies of bees. If she had been a member of this Association, we would have immediately taken the matter up, and she would not only have been benefited, but the bee-keeping fraternity also. It was too late by joining the Association after the bees were dead. She said she had thought she probably would never get any good of the dollar, and she would not spend it—she would simply save the dollar. Sometimes when you think you won't have your life insured is when you die. You want to get ready for those things as they come along; they come to all people when they least expect them. I remember that I kept my property insured for a long while, until the New Era Expo-

sition came to St. Joseph, and I neglected to insure it for two days, and it had no better sense than to burn during those two days. Since that I have been paying my insurance money. I have everything insured but my life. I pay the money that I pay for insurance as cheerfully as any money that I pay, and I look upon this dollar that you give this Association as an insurance, and you ought to give it if you never expect to get any benefit out of it. If each bee-keeper would send in his dollar, instead of having 400 or 500 members, we would have 5,000 members, and we would be so strong that we could say to anybody in the United States—"If you interfere with the rights of a single bee-keeper, you will run afoul of 5,000 men and women who are in earnest, and mean that their rights shall be defended." What have we in China? Why have the troops of the United States gone to China? Simply because the lives of a few men and women were in peril. Uncle Sam called out his navy and his soldiers, and is spending hundreds of thousands of dollars. Why? To protect the lives of a few individuals. That is all. As soon as their lives are protected and our citizens are fully protected, they will all come back and we will go about our business as usual. If Uncle Sam had not had the army and prestige, and demonstrated by actual experience it would not do to fool with him, the little troop we sent over to China would not have amounted to a drop in the Ocean; but the world knows and understands if she stirs up the American people that every man, woman and child, if it need be, will take arms in defense of the citizens of this country. If people had the right kind of feeling in regard to bee-keepers, there would be no petty judges to call us to account because perchance a few people got stung; they will get their rheumatism cured. They won't say to us, "You can't keep bees in the city." Our council past a resolution, and the marshal came to me and said, "Abbott, move your bees out of town." I said, "I don't move them out to-morrow, or the next day; wait until I get ready; we will settle this matter; we will go into the court; I will just law you a while before I will move my bees out of town." He consulted the city attorney, and he said to him, "You would better let Abbott's bees alone; you will get your fingers burned if you go to monkeying with him." That was the last of it. The lawyer had read the decision in Arkansas where the judge said bee-keeping was not *per se* a nuisance. That is what it means to give your dollar. You ought at least to have added \$100 while I have been talking.

Dr. Mason—I wish you could get \$100 apiece for every one of such talks.

"BEE-KEEPING IN THE CITY"—(Continued).

Pres. Root—When we began our recess, we were discussing the subject of bee-keeping in the city. Opportunity will now be given to discuss the matter further.

A Member—I think we have something different at home than most cities. We have sulphuric acid works; of about 325 colonies in our neighborhood not more than about 15 swarmed this season. I have an out-yard where they have swarmed very much. About 18 or 20 days after I moved them they commenced swarming; so we thought probably the acid works was what affected the bees, there being so much arsenic in the works. I don't know whether that would do it or not.

Pres. Root—Mr. Aikin perhaps can tell us something about the effect of the smelting works on the bees in Denver.

Mr. Aikin—It is true we have the smelters in Denver, and a large producing territory immediately surrounding. About 4 years ago there was a large loss of bees—they died—nobody knew why nor how, nor much about it; some said they "evaporated;" they applied that term because they disappeared so quickly. At our Colorado State convention one said it was the smelter smoke; another said it was the high winds; another said it was insects that preyed upon them; they all told their different views in regard to it; once in a while several had the same idea, yet no one could say positively what killed the bees. I said it was not the smelter smoke, because I knew a similar circumstance to that—the parties who were in that particular territory said it was the wind, others said it was the high winds; I said it was not the high winds because we had lots of high wind at my place, and no smelter smoke; the same trouble has appeared since then in less intensity, and in a territory where the smelter smoke did not go. After thinking the matter over for several years, and discussing it over and over again in our State conventions, I have come to the conclusion that we don't know yet what is the trouble. The only experience I have had is this: In 1889, in an out-yard 7 miles from headquarters, the colonies were very strong.

When I next visited that apiary, I think about 10 days afterward, I was surprised to find that those strong colonies did not show many bees. Where those bees had gone to I could not tell. They said it was the winds that did it; but when the same thing occurred a few years later in the vicinity of Denver, covering a territory of from 10 to 20 miles in diameter, the bees disappeared in the same general way. We don't know what happened to them. The same trouble was experienced a little bit last year, and a little bit the year before.

Pres. Root—I desire to break right in here. Do you wish to continue the discussion, or have a stereopticon of about 10 minutes before closing? I have a few slides showing bee-keeping in England as it is practiced to-day.

Dr. Mason—We are to have a question-box during our sessions, and somebody should have charge of that box; I move that the chairman appoint a committee of three to take charge of it. (Motion carried.)

Pres. Root—I will name on that committee O. O. Poppleton, of Florida; R. L. Taylor, of Michigan; and R. C. Aikin, of Colorado. We want the members of this Association to hand in questions; don't be afraid to ask questions on any subject whatever, and they will receive some sort of an answer.

Stereopticon views were then thrown on the screen showing the anatomy of the bee, etc., and were described by Prof. C. P. Gillette.

The convention then adjourned until 9:30 a.m. the next day.

(Continued next week.)

Contributed Articles.

Finding Queens—Various Methods Described.

BY ADRIAN GETAZ.

VERY often, beginners in bee-keeping, and others that are not beginners, have trouble in finding queens.

During a honey-flow, with a colony not excessively populous, gentle bees clinging to the combs, the simplest way is to take the combs out and examine them. Put them in a comb-basket, and if the queen has not been found, look over them again, putting them in another comb-basket. Look in the hive also. It is necessary to use as little smoke as possible so as to avoid starting the queen to run and hide. I always begin at one side, first blowing a little smoke between the comb and the wall of the hive, so as to drive the queen between the combs if she happens to be against the wall. I then take out only one comb on that side and begin on the other side, continuing thruout. The object is to prevent the queen from being left on the walls of the hive.

A correspondent wrote some time ago that he frequently lost his queens, and finally got in the habit of looking under the cover of the hive before working with the colony, and often finds the queen there, that is, under the cover. That correspondent is smoking his bees entirely too much. Only enough smoke should be given at the entrance to keep the guards from starting an assault against the operator. Then raise the cover just enough to send some smoke under, and as soon as the bees begin buzzing, take off the cover. If there is a super, take it off in the same manner as you did the cover.

However, when the circumstances are not as stated above, another method must be pursued. Put an entrance-guard or a queen-trap in front of the hive. Shake every comb, as you take it out, in front of the hive, and put it in the comb-basket. When all the combs are out, look before the entrance-guard and you will find the queen there 19 out of 20 times. Sometimes, if the queen has been frightened, she may have left the combs. She may be found inside of the hive, but not often.

A frightened queen will run from the light and hide in the first crack or dark place she can find, and the most probable place she has taken is inside the entrance-guard or at the entrance of the hive right under the wall. If there is a crack in the bottom of the hive, she is almost certainly under the bottom and will turn up after awhile, after you have hunted her perhaps for hours and could swear that she is nowhere.

In some cases, I am almost certain that the queen went simply out by the "front door," and hid somewhere, proba-

bly under the hive-bottom. That was before using entrance-guards or rather queen-traps.

It takes but little shaking to drop a laying queen and most of the bees, but a virgin queen hangs to the combs much better, and very often does not fall. So if she is not found in front of the queen-trap, it is necessary to look over the combs, transferring them to another comb-basket. Do not put the combs back into the hive until the queen is found.

In hunting a virgin, I always look over the combs before putting them into the basket. If the queen is neither on the combs nor in front of the trap, I smoke the bees in the trap from *inside the hive*, and thus drive most of the bees out of the trap, and the queen in the upper story of the trap. But it is very seldom that such operation has to be resorted to.

In favorable circumstances, such as are described in the beginning of this article, and if the operator has been careful and not scared the queen, she will be found on the combs, and often she has not even interrupted her work, and can be seen laying eggs. Generally she has retreated from the light and taken refuge between the bottom of the comb and the bottom-bar, if there is a space there, as there generally is. Then when the operator looks over the comb, there begins a game of hide-and-seek.

When the operator looks for the queen he always turns the comb and himself so that the sun will be at his back and strike on the comb. As soon as the comb is in that position, the queen skips on the opposite side, remaining near the bottom and among the bees that are there; for the bees, as well as the queen, have retreated to the lower part of the combs, except those that are filling themselves with honey. Then when the operator turns the comb over, the queen skips again on the other side; not that she cares for the operator, but away from the sun and light.

After the combs have been in the comb-basket 5 or 10 minutes, the queen, if there, has generally left the bottom of the comb, and can much more easily be found on the surface of the combs.

If there are on some combs some queen-cells that are to be saved, it is better not to shake the bees, as the embryo queens might be injured. Such combs are to be put in a basket by themselves, and after 5 or 10 minutes, when the bees are quieted, examine carefully, that is, if the queen has not been found elsewhere. If the bees are piled up together, smoke them very slightly, just enough to disperse them. Those that are filling themselves with honey need not be disturbed, as the queen is not there.

Knox Co., Tenn.

Paper Drip-Catchers for Shipping-Cases.

BY G. M. DOOLITTLE.

QUESTION:—I am told that you use drip-catchers, or paper pans inside of your shipping-cases, when sending honey to market, to catch the drip from any section that may chance to get marred or the capping to the cells broken in any way so that the honey leaks, thus preventing this leak or drip from soiling the floor, counter, or cases of honey below it, as it otherwise would, were no such thing used. What I should like to know is, how you make these paper pans. I have a way of folding them over a sheet of tin, cut to fit the inside of the case, but it is rather slow where hundreds of them have to be prepared in a single season. If some one could invent a machine for doing this work, that would not be too expensive, it would be a great boon to bee-keepers. The going over each corner separately is the part which takes the most time. I think you can do the bee-keeping fraternity no greater favor at this time than by describing in the American Bee Journal your method of making these drip-catchers.

ANSWER:—As those who have section honey will be preparing the same for market at this time, this question comes in very opportunely; and I know of no one thing which helps as much to bring favor to our goods as do these drip-catchers in the bottom of each shipping-case. Some years ago, while in New York city, I saw cases of honey piled 8 to 12 high, and the drip from the upper cases ran all the way down to the floor, daubing the snow-white cases, which had been gotten out and put up with great pains, not only spoiling all their beauty, but making them a sticky, nasty mess to handle. Up to that time I had not used drip-catchers, but then resolved that I would try to fix some way so that my honey should not appear in market in that condition. That winter, while attending a bee-keepers' con-

vention, I fell in with one of New York's most successful bee-keepers, and an arrangement was made for the holding of a convention at 10 o'clock at night, after the main session was over, the later convention to consist of two, namely, Samuel Snow and G. M. Doolittle.

At this meeting I told Mr. Snow of what I had seen in New York city, and of my resolves, but how, as yet, I had not come to any plans in the matter. He then told me how he had used drip-catchers made of paper for the prevention of leakage thru shipping-cases, telling minutely how he made them, kind of paper used, etc. The next season found me buying what is called manilla papers, of a quality costing about 7 cents a pound, in quantities sufficient for all of the cases I expected to use. I now took a $\frac{7}{8}$ -inch board and from it cut a piece that would fit the inside of my shipping-cases, a little loosely, say 1-16 of an inch play each way.

The paper was cut $1\frac{3}{4}$ inches larger each way than this board, so that when folded up evenly all around it, the sides of the paper pans or drip-catchers was just $\frac{7}{8}$ -inch deep. The pan was now slipt inside the case and little strips of wood, just as long as the case was wide, and $\frac{1}{2}$ -inch wide by 3-16 thick, were placed at such distances along the inside of the paper tray as was necessary, so that the ends of the sections rested on these, thus keeping the sections up 3-16 of an inch from the paper, this allowing the drip to fall below the sections so that the outside of the cases were never soiled, while the bottoms of the sections were kept clean also, if anything should occur to start the honey in them to leaking. This, of course, requires the cases to be made 3-16 of an inch deeper than they would be were it not for these little pieces of wood. But, according to my thinking, the keeping of the sections clean is of fully as much importance as the preventing of the drip thru the cases. I have kept leaking honey standing all winter in such cases with paper trays, and this manilla paper seemed sufficient to stand a wetting of honey that length of time, as none of it soakt thru so as to be sticky on the under side.

I am well aware that it takes considerable time to fold the paper for each case separately, and would prefer to buy them already folded by machinery or otherwise, provided I could buy them that way as cheap, or cheaper than I could buy the paper and fold them myself. While I have put considerable thought on the matter and done some experimenting, yet I have found no better way to fold them than doing it one by one as given above, where anything like a decent tray was to be made.

Several have told us to lay the paper on the top of the case and then place the board on top of the paper, pushing the whole to the bottom of the case, but with me the corners are sure to tear more or less, especially where slats are used at the sides so the honey is shown thru the glass. With the board plan as here given, I can fold from 80 to 100 an hour, and as each case holds 20 sections, it is not so serious a job as it looks to be at first thought, unless one produces honey up into the tons. However, if there is a quicker way that will give as neat a job every time, or one where several drip-catchers can be folded at once, I, as well as other readers of the American Bee Journal, would like to know of it.

I have taken up considerable space with this matter, but I thought that, if I said anything on the subject, it should be made so plain that any one who wisht could make and use these drip-catchers. Any and all of these little things which have a bearing on putting our honey in market in the best shape, should be lookt after, if we wish good prices for our product. And if we do not do these things, we are not only injuring ourselves, but every one else who has honey to sell.

Brace and Bur-Combs—Drone-Comb.

BY S. C. PETTIT.

RECENTLY in some of our bee-papers a very good thing was suggested, when the writer, in speaking of removing sections from supers, said: Set the super on edge, and with a sharp, thin knife, cut any bur-combs or brace-combs that may fasten the sections of honey to any other object. In my experience I have found that, especially if the weather is a little cool, the capping is quite liable to break and cause a leak, but if the knife be hot it will do the work safely and with satisfaction.

On page 583, Mr. Doolittle, in answering the question, "In the production of comb honey where a first or prime swarm is hived on comb-foundation starters, say two or three inches deep, and with sections on top filled with sheets

of foundation, what is the best method of preventing the building of drone-comb?" says:

"But suppose a frame or two of drone-comb should be built, this can be removed from the hive the next spring, and frames of worker-comb substituted for it."

I beg to say that I remove such in the fall, after all the brood is hatcht. Years ago I found that whatever portion of such combs were of worker-comb, were very likely at clipping-time to contain brood; and I never for a moment think of going thru my hives before that time.

If there are any good reasons for leaving such combs in until spring, I should be pleased to have Mr. Doolittle tell us what they are.

Ontario, Canada.

Disposing of the Honey Crop—Some Good Advice.

BY W. Z. HUTCHINSON.

SO many bee-keepers, after having workt all summer, and produced a good crop of honey, almost "fool it away" when it comes to the marketing of the crop. Some lose it entirely by sending it to some irresponsible party. If all of the losses of this kind were known, I think some of us would be surprised. In my travels among bee-keepers, I am often surprised to learn how men of apparently good judgment have lost hundreds of dollars by sending a crop of honey to some swindler. Where is the bee-keeper who ships his honey to distant markets and has *never* been swindled? My losses in this direction have been very small—25 pounds of comb honey. This happened several years ago, when I lived at Rogersville. Some firm in Detroit wrote and wisht to buy my crop of honey, but before making an offer they wisht to see a sample. If my honey was nice, white honey they would pay 15 cents a pound for it. They askt me to send them, by express, a couple of cases; upon its arrival they would send the pay for it, and make an offer for the whole lot. They referred me to Bradstreet or Dun, or, if I preferred, I could send the honey C. O. D. Mr. West, who then lived here, sent seven cases of honey. Another man living here sent them 20 barrels of cider, having new barrels made expressly to ship the cider in. This firm of swindlers got a large amount of produce from all over the State in just this way. They sold it for cash as soon as it arrived, or else re-shipt it to another State. If one of the dupes went to Detroit he could not find his goods, nor anything else, for that matter, as nothing was stored. It was either sold or shipt at once. Of course, this firm soon found it necessary to seek a cooler climate than Detroit, but they had plenty of money with which to buy winter clothing.

Above all other considerations towers this one of knowing, *positively*, within the range of human possibilities, that the firm to which you send your produce is absolutely honest and reliable. Better sell your comb honey at 10 cents to a firm that you know will pay you 10 cents, than to a firm that offers you 15 cents, but about the honesty of which there is the slightest doubt. This is so self-evident that it seems almost like folly to repeat it, but the transactions of every year show that such advice is abundantly needed. The strong point of these swindlers is that they offer just a *little* more than the market price. Not enough more to arouse suspicion, but just enough to lead the unsuspecting victim to believe that, all things considered, this market is the best. There is usually some plausible story goes with this offer—some apparently reasonable reason why this slight advance in price can be made.

Before sending honey to a firm, see how they are quoted in the commercial agencies. Consult their references if they give any. If they don't, then ask for references. This *alone* will not answer. Swindlers have a way sometimes of getting a fair rating in commercial agencies' books, or of getting good references from some bank by depositing money that may be withdrawn later. A good rating and good reference count; but, as I have said, they are not everything. In addition to this, I would advise a shipper who is in doubt, to write to the bee-journals. A great mass of correspondence goes thru the hands of an editor. If a firm is shaky, or is not dealing fairly with its customers, the editor is sure to get a hint of it right away. If a firm does not pay, or is unfair in any way, the first thing the victim does is to write to his editor and ask him what to do. A great many things come to an editor in this way that he may not feel at liberty to publish. If he did, he might lay himself open to libel; but he can give to a subscriber, privately and confidentially, what it would never do to publish.

I think that there have been very few, if any, losses where the shipper has consulted the editors of the bee-journals, and they have

advised shipment. There are a few dealers in honey in this country for whom I would unhesitatingly vouch. I would mention them here, only that it would be a reflection upon the honesty of others who may be just as honest, only I am not so sure of it.

After the question of honesty and reliability is settled, comes that of ability and experience. To handle honey to the best advantage and get the best prices a man must know something of the business. I frequently hear of some man sending honey to some commission firm, perhaps because he has been sending it other produce, that knows almost nothing about the honey-business. In such cases honey is almost sure to be sacrificed.

Then there is occasionally a dealer or commission man who, while he may be an out and out swindler, that is, he may make some kind of returns for the goods consigned him, yet there is always something wrong. Either the honey is badly broken, or the packages are leaking, or the bottom has dropt out of the market since the shipment was made. I don't mean to say that none of these things ever happen, but there is occasionally a firm that makes such reports, when it thinks it safe to do so, even when they have not happened. Then there are some firms that are very slow pay. As I have said before, write to your bee-keeper editors. All of these things come to their knowledge.

The question of whether a man shall sell his crop out and out, or ship on commission, is one that has been much discusst. Both plans have their advantages and disadvantages. If sold out and out for a certain price that has been agreed upon, there is no uncertainty and no chance for a dispute or dissatisfaction. The shipper knows exactly how much he is to get for it, and when he will get it; provided, of course, that he is dealing with a reliable firm. On the other hand, a dealer can afford to pay as much cash down, using his own money, as he might be able to get for the goods if he had them on commission. There must be a greater margin for profit if he buys them and puts his own money into them, than when he is doing business on the capital of the shipper, and the latter is taking the risk of a change in the market. If the dealer buys the goods he must buy them at such a price that he can afford to put his own money into them, and then take his chances of making the profit. There has been a lot of talk about the commission man doing business on the other fellow's capital. It is true that he *does*, and that is the very reason why he can afford to do it on a less margin.

Some shippers limit their commission man. They say, "Get 15 cents for that honey, or don't sell it." I have done this, and made money by doing it; and I have also lost by the same operation. I knew one bee-keeper who made a large shipment of comb honey, and limited his commission man, and the result was that most of the honey was held until in February, when it began to candy, and was then sold at a greatly reduced price. As a rule, I think it better not to limit the dealer. He is right on the ground. He knows the markets, the supply and the demand, the prospects etc., better than does any one else. I would not send my honey to a dealer unless I had confidence in him, and believed that he would do the best he could, and, having put my honey in his hands to sell, I would not turn around and tie those hands.

Much has been written and said in favor of developing a home market, and of every man selling his own honey, and all that. If a man has a good home market, or can develop one, or if he is a good salesman, such a course is all right, but the best locality for producing honey is often a very poor one for selling, and the best bee-keeper is sometimes the poorest kind of a salesman. In such cases it is wisdom to seek distant markets, and to employ somebody to do the selling.

Lastly, comes the question of when to sell, and it is the most puzzling of any. When there is a large crop the tendency of prices is downward. The man who sells early, before the fall in prices, is fortunate. Knowing this, there is a tendency to rush the honey into market when it becomes known that there is a bountiful crop. This puts the prices down still farther; and the bee-journals have been blamed for reporting large crops because such reports tend to lower prices. If there is a short crop it seems to be all right to report it, as it tends to raise prices.

This matter of when to sell is one of those questions that each man must decide for himself. If there is a short crop generally, and prices are advancing gradually, it certainly seems safe to hold honey a reasonable length of time. As a rule, however, I would not hold honey until winter. Bro. York recently advised his readers to sell at once if they could get a fair price; and mentioned 14

cents as what he would consider a fair price for comb honey. I think that he is not far out of the way. If I had honey to sell I should hold it at 15 cents. If I could get that I should let it go. If not, then I should hold it and watch the market. It may possibly go a cent or two above that, but I doubt it.

Yes, there is one more little point, and that is *where* to sell. It often happens that the dealers in the large centers, like Chicago and New York, do not pay so much for honey as can be obtained in some of the smaller cities. A man with a produce of any kind to sell should be alert and watchful. I once sold my entire crop of comb honey in Detroit at 17 cents a pound, when the market in all of the other cities was only 15 cents at the top notch. I saw the quotations in a Detroit daily; took a sample case and skipt at once for Detroit; sold my honey; came home and skipt it the next day; and, within a week, the Detroit market was glutted, and prices away down. Last year, at the Springfield, Ill., fair, I was offered 12 cents. I stopt at Chicago while on my way home, and was offered 13 cents. I came on home, and did some correspondence, finally selling it to a Columbus, Ohio, firm for 15 cents on board the cars here at Flint.

In closing, I can only repeat what I said at the beginning: Having workt hard and produced a crop, don't fool it away. Don't send it to a swindler, nor an irresponsible or inexperienced commission man, but thoroly investigate the whole matter, and market your honey in a safe, intelligent, and profitable manner, instead of simply sending it off haphazard, and then "kicking" yourself afterwards for some loss that might have been prevented.—Bee-Keepers' Review.

Questions and Answers.

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

[The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.]

Bee-Keepers' Right to Bee-Pasturage.

DR. MILLER:—I have been much interested in your department, and I believe there is only one article that I have read from your pen with which I disagree. In that you speak so positively, I think perhaps you have lookt at it only from one point of view. Of course we are all subject to prejudice and especially to that developt by a habit of thought caused by following a generally accepted idea. I am simply going to call your attention to the other side of the question. I refer to the matter of legislation to keep apiarists from encroaching upon each other's territory.

Assuming that it could be determined with any degree of accuracy, how much territory a given apiary needs, the fact still remains that the right to use that territory as a bee-pasture belongs to the public, and I fail to see how an individual gains possession of that right by occupying and using it for 5, 10, 50, or 100 years. If it pays a man to encroach upon another's territory he has a right to do it; otherwise the other man would be enjoying a monopoly of that which belongs to the public. CALIFORNIA.

ANSWER.—I am afraid you misunderstand just a little the position in which I stand. So far as I hold any view at all at variance with the views of my fellow bee-keepers, it does not lie in the direction you indicate. That a man who has for 25 years kept in a given locality an apiary sufficiently large fully to stock the territory, has a better right to that territory than any new comer, is not my view but the view of the entire fraternity, yourself excepted, so far as can be judged from any expression of opinion heretofore given.

Let me try to give in a very few words the view that I have advocated, in which my brethren do not all coincide: They say, "The man first on the ground has a moral right to the location, and the man that encroaches upon his territory is doing wrong, but you must have no legislation that would make it a legal wrong. It must be left altogether to a man's sense of honor." To this I reply: "I do not see why you should make such distinction. If a man's cow trespasses upon my cornfield, it is not left to his sense of

honor to keep her out and pay me for damages, but the law compels him to do what his sense of honor might or might not enforce. Should he not likewise be compelled by law in the matter of the much greater damage done me as a bee-keeper?"

With your view of the case you would probably say that one man has as good right to the location as another, and I should reply that we will not quarrel about that, but start upon a platform upon which we both stand. One of the drawbacks to bee-keeping is its uncertainty as a business, and it is made doubly uncertain by the fact that I have no sure tenure of a location. If a man had no stronger hold upon his farm, he would hesitate a little about putting in a crop. Farm lands were all public property, but it was for the public good that a man should have a certain right to a certain portion of land, and laws were framed accordingly. What I believe would be for the general good would be to have by purchase or some other way the same right to a crop of honey as to a crop of corn. That's the whole thing in a nutshell.

Hives and Sections—Sulphuring Honey.

I think before asking some questions about hives and sections I ought to say that I have only three or four hives, and wish to run for comb honey.

1. Which would you advise me to get, the Danzenbaker hive or the 8-frame dovetailed, for comb honey?

2. Which sections would you advise me to use, the plain section and fence, the Danzenbaker tall sections, or the old-style $4\frac{1}{4} \times 4\frac{1}{4}$?

3. I took a comb of $\frac{3}{4}$ sealed honey from a hive, and finding moths in it I sulphured it. I let the vapor settle, and it has a slightly greenish tinge. Will that honey be bad for the bees to winter on? I did not kill the moths, and, as I do not wish to put it back in the hive until the middle of October, and as by that time the moths will have ruined the comb, do you think I would better set it by the hive and let the bees clean it? This hive is a long way distant from the others, so I do not fear robber-bees.

MINNESOTA.

ANSWERS.—1. My preference is for the dovetailed, but you might think differently.

2. That's a very hard question to answer. Something depends upon your own tastes and something upon your markets. Either one well managed will bring good results, and perhaps your safe plan would be to use that which is already on your market, trying anything else on a small scale.

3. The sulphur on the comb will not hurt the bees. Unless the hive is half a mile or more distant from other colonies, there would be danger of robbing if you set a comb of honey outside the hive. What's the harm of putting the comb in the hive now? You might kill the worms with bisulphide of carbon, or even with a heavier dose of sulphur. You can take a wire nail and pick out the large worms, for it is only large worms that would fail to be killed by sulphuring heavy enough to make the combs green.

Introducing Queens—Laying Workers—A Reverent Apology.

1. Whenever one has bees working above a queen-excluder has he not the means for introducing a queen speedily and with absolute safety by placing the hive on a bottom-board prepared to shut the bees in, and at the same time give ventilation? It seems to me that this is better than the Doolittle caged-bees plan, as one can have bees ready to receive a queen at any and all times with very little trouble.

2. Here I wish to say that I have written some things about laying workers that I should not write with my present knowledge and experience. My practice now is to unite the laying-worker colony with a colony having a laying queen. The frames when cleared of brood can be used where they will be of most advantage. The plan I once recommended, of making a nucleus with laying queen and then build up the nucleus with frames from the hive having the laying-workers, is liable at times to start robbing, and so I abandoned it.

3. And now I wish to apologize to you, Dr. Miller, and to others, for the rough and seemingly irreverent way in which I have sometimes alluded to them, and to some of the things they have written. I am not irreverent or unkind, and as I am nearing the 70th milestone in my journey of

life, and have not long to live at most, I wish to leave the world feeling that there are none in it who entertain any but kindly sentiments towards me. EDWIN BEVINS.

ANSWERS.—1. Many things look all right in theory, but the miserable bees don't always understand just what is expected of them, and deliberately upset one's best plans. At least that's the way my bees have treated me. I'm afraid that actual trial of your plan would result in a dead queen oftener than the caging plan. But it might be worth trying.

2. You have come to the same place at which every one will land who has had sufficient experience with laying workers, that the best thing is to break up the colony in the great majority of cases. If you have plenty of brood and bees that you can use just as well as not, it may sometimes pay to give to such a colony several frames of brood with adhering bees, and then treat it as a queenless colony, but generally that is not as well as to break up the whole business. If you have a young queen that has just emerged from her cell, she may be accepted in a colony of laying workers, and she may not. It's hard for one to give up the idea of trying first one plan and then another for continuing a colony with laying workers, and one will fight hard against breaking up all such colonies, but he'll get to that practice if he lives long enough.

3. Bless your heart, Mr. Bevins, I don't believe any of us feel sour toward you at all. There's always a streak of good nature underlying all you say, and for one I'm always glad to see anything from your pen.

Apicultural Jurisprudence—Straining Honey—Feeding—Eastern Oklahoma.

1. In Mr. Newman's report in the American Bee Journal for Jan. 25th, he tells about the case of Mr. Buchheim. Do you know anything about the case? Were city ordinances, prohibiting the keeping of bees within city limits, declared unconstitutional? If so, was the decision based on principles of the common law which would apply in any State, or on principles peculiar to the laws and constitution of this State?

2. Where can I get literature on apicultural jurisprudence in general?

3. What do you think about the necessity of straining honey thru cheese-cloth? Do you know of any convenient method or device for doing it without expending too much time and patience?

4. Can you tell us, approximately, how much honey it would take to duplicate a colony by feeding when other colonies are just gathering enough to hold their own—taking a colony of given strength and amount of comb, of course?

5. How is eastern Oklahoma for bees? Is alfalfa raised there? If so, does it yield much nectar in that locality?

SUBSCRIBER.

ANSWERS.—1. I only know what has been in print on the subject. I don't know upon what the decision was based, but I think the same decision would obtain in any State. But I may be mistaken, and am ready for correction.

2. Can any one tell?

3. It is decidedly important that there should be nothing but the honey itself present, and some means should be used to remove all other matters. For small quantities perhaps nothing is better than to strain thru cheese-cloth, making sure that the strainer be not too small. For large quantities it is better to have the honey go from the extractor into a tank, with an arrangement for drawing off the honey from the bottom after the impurities have had time to rise to the top.

4. I'm not sure whether I understand the question. If it means how much honey must be fed a colony in order to make two colonies out of it at a time when other colonies gather only enough for their daily needs, I should guess 50 or 60 pounds. But the guess may be wild.

5. Will some one tell us?

"The Hum of the Bees in the Apple-Tree Bloom" is the name of the finest bee-keeper's song—words by Hon. Eugene Secor and music by Dr. C. C. Miller. This is thought by some to be the best bee-song yet written by Mr. Secor and Dr. Miller. It is, indeed, a "hummer." We can furnish a single copy of it postpaid, for 10 cents, or 3 copies for 25 cents. Or, we will mail a half-dozen copies of it for sending us one new yearly subscription to the American Bee Journal at \$1.00.

A Close and Exciting Election!

Which will be Elected?
How many Votes will he Get?

Send 25 cents for a three months' subscription to the

***** Farm, Field and Fireside *****

CHICAGO,

and a chance in the

Prize guessing contest
for \$5,000 in cash,

which will be awarded to those coming the nearest to the official figures of the popular vote cast for the successful presidential candidate.

The Publishers' Guarantee Association has deposited \$5,000 in the Metropolitan National Bank, Chicago, Ill., for the purpose of paying these prizes, under strict conditions preventing its use for any other purpose.

First Grand Prize, \$2,000,

to the nearest guesser, and 197 more cash prizes to be awarded as follows:

To the nearest correct guess.....	\$2,000.00
To the second	500.00
To the third	250.00
To the next 5, \$50.00 each.....	250.00
To the next 40, \$25.00 each.....	1,000.00
To the next 50, \$10.00 each.....	500.00
To the next 100, \$5.00 each.....	500.00
198 cash prizes'.....	\$5,000.00

TO AID GUESSERS:

McKinley's popular vote in 18967,107,304

Bryan's popular vote in 1896.....6,533,088

Our Offer: We have made arrangements with the Publishers' Guarantee Association, of Chicago, to enable our subscribers and friends to participate in these great cash prizes. Every one is invited to participate, and for each three months' subscription to the Farm, Field and Fireside sent us, accompanied by 25 cents, a guess will be allowed. Those remitting 50 cents for six months' subscription will be allowed two guesses, and those remitting \$1.00 for one year's subscription will be allowed four guesses. This applies both to new subscribers and to renewals. Present subscribers can send in their guesses, accompanied by the money, and their subscription will be extended.

How to Guess: When you send in your subscription you make your guess. Be sure you write your name and address and guess as plainly as possible. As soon as we receive your subscription we will fill out and send you a certificate corresponding to guess made by you, which will entitle you to any prize that you may draw. Be sure and keep your certificate. We will file the duplicate with the Publishers' Guarantee Association. Every subscriber will receive as many certificates and have as many guesses as he sends subscriptions to Farm, Field and Fireside.

In case of a tie, or that two or more estimators are equally correct, prizes will be divided equally between them.

Root's Column

THE ABC of Bee-Culture

The only Encyclopædia on Bees.
1900 Edition. 500 Pages.

The last edition, 5,000 copies, issued in October, 1899, was exhausted in the short space of one year. Even before the edition was out of the press, 1,500 copies had been sold; and before 30 days had past 1,000 more copies were taken. We immediately set to work to print a new edition. While the edition of 1899 was more thoroly revised than any previous one, that for 1900 has received even larger additions of new matter, so that the book from beginning to end is almost entirely new. It now contains 500 double-column pages. It has been most carefully gone over by Dr. C. C. Miller, who has prepared a new set of comments, and by Prof. A. J. Cook, of Pomona College, Calif. As before, old subjects have been rewritten. Descriptions of obsolete methods have in all cases been stricken out, and the very latest put in their place.

The 1900 Edition marks the 75th Thousand.

It is in many respects superior to any previous one in regard to typographical appearance, quantity of new subject-matter, and general revision of old subjects, for we are now building on the knowledge and experience of these latter days, when such wonderful strides are being made.

For the Veteran as well as for the Beginner.

While the book is, in the true sense, an A B C of bee-culture, in that it is adapted to the requirements of beginners, it is also a comprehensive X Y Z of the subject; for no veteran, no matter how extensive his experience, can afford to be without a work of this kind, containing as it does a carefully prepared dissertation on every late method or practice known to the business. All the bee-literature of past ages, all the current literature of this and every other country, has been carefully scanned; and whatever there is that is new and valuable has been incorporated in this work.

High-Class Engravings.

The most expensive half-tone engravings, taken direct to the majority of cases from fine, clear photos, adorn its pages. Besides 59 full-page illustrations there are something like 500 smaller ones, fully setting forth the exact MODUS OPERANDI of every method.

We are confident that this work will save any one who keeps even a few bees, 10 times its cost in a single year.

While the book has been enlarged, and hundreds of pages have been rewritten and revised, the price will be the same as before: \$1.20 post-paid, or \$1.00 by express or freight with other goods; or when sent with our journal, GLEANINGS IN BEE-CULTURE, which is a constant appendix to the A B C book, a journal beautifully printed and illustrated, 42 pages, for the very low price of \$1.75 for the two. For quantity of up-to-date bee-literature there is nothing else offered at this low price.

The new edition will be ready for delivery about Nov. 15. Send your orders at once to get a copy of the first lot from the bindery. Orders filled in rotation. Orders may be sent to the undersigned, or to any dealer in bee-keepers' supplies, or to booksellers generally.

THE A. I. ROOT CO.,
MEDINA, OHIO.

Bees Did Fairly Well.

Bees have done fairly well in this section, which is a poor locality, and I am somewhat anxious about their getting winter stores. J. H. CLUTE.
Essex Co., N. J., Sept. 17.

A Beginner's Experience.

This is my second season in bee-keeping. Last season I was so lucky as to have a swarm of Italian bees settle in my yard, which I hived in a shoe-box, having nothing better on hand. They filled the box, which I shall call No. 1. This year, about the last of April, it sent out a very fine, large swarm, which I saved and will call No. 2. About 10 days later No. 1 cast another swarm about the same size—No. 3, which went off in my absence. About two months from that time No. 2 cast a swarm—No. 4, and on Sept. 10 No. 4 swarmed—No. 5. Now what ought I to have done with No. 5? I had no comb to put them on, and did not know enough to find the queen so as to return it to No. 4. Shall I try to feed them thru? They seem to be working nicely. No. 1 is filling the super and has it nearly full. No. 2 is about ready to work in the super.

FRED R. HAWKINS.

Edgar Co., Ill., Sept. 15.

[We should unite No. 5 with the weakest of the other four, first killing the poorer queen of the two. Then next spring, if the combination winters well, and is strong, divide it about the middle of May.—EDITOR.]

Fall Crop a Failure.

The white clover here did not yield an ounce of honey, and owing to excessive drouth in this immediate vicinity, our fall crop is a failure.

E. T. FLANAGAN.

St. Clair Co., Ill., Sept. 12.

My First Year's Experience.

Since a boy I always have had a great fancy for bees, tho not until last December did I gratify this fancy, when I bought four colonies, and in February I purchast 11 more colonies. Out of 15 colonies two, which proved

Labor Saving Conveniences.

Success on the farm today is largely proportioned to the saving of time and labor—which means economy of production—and not higher prices for farm products. Probably no single machine or appliance saves in the aggregate so much time and hard labor as the modern low down handy wagon. Take for

ELECTRIC

instance the loading and hauling of manure, ensilage corn, grain in the straw, corn fodder, hay, &c., all hard to load, the use and advantages of a low down wagon are almost inestimable. The Electric Low Down Handy Wagon excels for these purposes. Has the famous Electric steel wheels, is light, strong and durable. Write Electric Wheel Co., Box 56 Quincy, Ill., for catalog.

Rocky Mountain Bee-Plant Seed!

(*Cleome integrifolia*.)

...FREE AS A PREMIUM...

The A B C of Bee-Culture says of it: "This is a beautiful plant for the flower-garden, to say nothing of the honey it produces. It grows from two to three feet in height and bears large, clusters of bright pink flowers. It grows natur-

ally on the Rocky Mountains, and in Colorado, where it is said to furnish large quantities of honey."

We have a few pounds of this Cleome seed, and offer to mail a 1/2-pound package as a premium for sending us ONE NEW subscriber to the American Bee Journal, with \$1.00; or 1/4 pound by mail for 40 cents.

The Bee-Keeper's Guide

Or, Manual of the Apiary,

—BY—
PROF. A. J. COOK.

460 Pages—16th 1899 Edition—18th Thousand—\$1.25 postpaid.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published to-day. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without THE BEE-KEEPERS' GUIDE.

This 16th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to GIVE AWAY to our present subscribers, for the work of getting NEW subscribers for the American Bee Journal.

Given for TWO New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the two NEW subscribers—simply the Bee Journal for one year:

Send us TWO NEW SUBSCRIBERS to the Bee Journal (with \$2.00), and we will mail you a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both for only \$1.75. But surely anybody can get only TWO NEW SUBSCRIBERS to the Bee Journal for a year, and thus get the book as a premium. Let every body try for it. Will YOU have one?

weak ones, died, and one short of stores left for parts unknown. So much for inexperience with bees.

At this point I purchased a copy of "A B C of Bee-Culture," which proved an indispensable help to me. I then subscribed for the American Bee Journal and Gleanings in Bee-Culture, both of which have given me a great deal of very valuable information. I practiced the clip-wing plan, and put the swarm on the old stand; two colonies never swarmed. So starting with 12 colonies, I increased to 25, and one second swarm took leave of me.

I harvested 700 pounds of comb honey this season from 12 colonies, spring count. There will be no fall flow on account of drouth. My colonies are well provided with stores for the winter. I have already made sale of the greater part of my crop thru the home market at a satisfactory price.

So with my first year's experience, I feel very much encouraged.

LESLIE H. McCUE.
Albemarle Co., Va., Sept. 11.

Drouth and Grasshoppers.

While in some portions of this State this season the honey-flow was all right, with big crops, in many places there has not been over half a crop, and in some places, owing to drouth and grasshoppers, the season was nearly a total failure for many of our bee-keepers. As an illustration of the uncertainty of bee-keeping, I would say that while last year in the north and central parts of the State we had a cold spring, we had a good honey-flow later, but many colonies of bees failed to build up, so were in no condition to gather it; but this year we had a beautiful spring, with the hives full of bees, then came a dry, red-hot June,

IT PAYS TO DEHORN.

The best dehorner, the most humane and easiest to use is the

Keystone Dehorning Knife

Cuts on four sides at once, without crushing or bruising. Endorsed by leading colliers.

M. T. PHILLIPS, Pomeroy, Pa., (Successor to A. C. CROSIUS)

Please mention Bee Journal when writing.

The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

[THIS CUT IS THE FULL SIZE OF THE KNIFE.]

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a last-time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelties" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1 10, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00.) We will club the Novelty Knife and the Bee Journal for one year, both for \$1.90.

GEORGE W. YORK & CO., 118 Mich. St., Chicago, Ill.

Please allow about two weeks for your knife order to be filled.

the hottest ever known in this State, and it scorcht much of the bloom and dried up the irrigation water; and, as it is said misfortunes seldom come single-handed, so then came the grasshoppers. Why, for about three weeks around one of my apiaries it was but a dry aching void of everything green. As far as looks were concerned, you couldnt tell an alfalfa field from a barnyard, or an apple tree from a plum tree; and some days, just before sundown, the grasshoppers would gather up to roost on the bee-hives so thick that you could scarcely tell a white hive from a black one; and while they bit and killed a few bees, they did leave the hives; but I felt mean enough to wish them all in the lake or some other good place.

There is another old adage, that things are never so bad but they might be worse, so one morning I went out to the bees, and I don't know which feeling predominated, discouragement or disgust, and what should I find but those blessed gulls from off the islands in the Salt Lake, devouring the "hoppers" by the wholesale, and while I got about the biggest dose they are mostly gone now, but thy left no bloom except some Rocky Mountain honey-plant which they would not eat, and the bees have gathered some honey from fields farther away, so they will average a surplus of about 35 to 40 pounds, which is my first flat failure in 15 years.

The above is not exaggerated at all, as it was really a sickening sight to see those "hoppers" gather up to roost in the evening on the bee-hives, the sweet clover stems, the fences and trees. A near neighbor, who has 15 acres of orchard, had many of his trees

left with the fruit hanging glistening in the sun without a leaf on them; but the "hoppers" were so bad only in certain localities. In some alfalfa fields they would scarcely leave a green stem, while in other fields a mile or so away it was still in full bloom.

E. S. LOVESY.

Salt Lake Co., Utah, Sept. 7.

Queen-Rearing.—Editor Root gives some interesting information as to the practical work of queen-rearing at Medina, in Gleanings. After mentioning the different methods, he says:

Mr. Wardell has tried faithfully and carefully all these methods, and at the present time he is using all of them side by side. The result is, he has drifted somewhat from his first love—the Doolittle plan—and now prefers drone-comb, grafting with royal jelly and larvæ every fourth cell. That is to say, he grafts one drone-cell, skips two, which he destroys, then grafts the next one, and so on. He will take an ordinary queen-cell of the right age, when it has the largest amount of royal food, and with the quantity in that cell he will supply 20 ordinary drone-cups with sufficient food to give the cells which he grafts a good start. But before the drone-cells are grafted he enlarges the opening of the cell by means of a blunt stick. The grafted cells of drone-comb are then fastened on a stick and inserted in a frame. It is next given to a queenless colony that has previously been fed up for three or four days, and then deprived of all unsealed brood.

COLONIES FOR CELL-BUILDING.

He now prefers queenless colonies, or colonies that are about to supersede their queens, to upper stories having a reigning queen below. He says the upper-story plan is all right during the swarming-time, but it is impracticable (alho he can use them) after the honey-flow.

Mr. Wardell has recently been using worker-cells in place of drone-comb, which sometimes he does not have, and with them he secures uniformly good results. Yet, all things considered, he prefers the drone-comb when he can get it.

He wishes it to be distinctly understood that he does not condemn the Pridgen method, which he says is all right, but that he can graft a certain number of drone-cells, or Doolittle

The Emerson Binder

This Emerson stiff-board Binder with cloth back for the American Bee Journal we mail for but 60 cents; or we will send it with the Bee

Journal for one year—both for only \$1.40. It is a fine thing to preserve the copies of the Journal as fast as they are received. If you have this "Emerson" no further binding is necessary.

FOR HOMESEEEKERS.

The Chicago, Milwaukee & St. Paul R'y will sell regular Homeseekers' Excursion tickets to all points in South Dakota, at one fare plus \$2.00 for the round trip, on Sept. 18 and Oct. 2, 1900. This will enable parties to visit the Corn Belt Exposition to be held in Mitchell, S. D., Sept. 26 to Oct. 4, 1900, inclusive. This exposition is held to demonstrate the great agricultural resources, wealth and possibilities of this thriving State. The exposition is held in a gorgeously decorated corn-palace, which for beauty can hardly be excelled anywhere by a building of a temporary nature. There are thousands of acres of cheap lands left in South Dakota that will, under the present conditions in that State rapidly increase in price, and the holding of this corn-palace with its many attractions, that both amuse and instruct, should be an opportunity that all land and investment seekers should embrace.

For further information apply to any ticket agent of the Chicago, Milwaukee & St. Paul R'y, or address Geo. H. Heafford, General Passenger Agent, Chicago. 39A3t

Langstroth on... The Honey-Bee

Revised by Dadant—1899 Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroly explained, so that by following the instructions of this book one cannot fail to be wonderfully helpt on the way to success with bees.

The book we mail for \$1.25, or club it with the American Bee Journal for one year—both for \$1.75; or, we will mail it as a premium for sending us THREE NEW subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

GEORGE W. YORK & CO.

118 Michigan Street, CHICAGO, ILL.

Utah.—There will be a meeting of the Utah Bee-Keepers' Association in the City and County Building, Salt Lake City, Oct. 6, 1900, at 10 o'clock a.m., to which all are cordially invited. A full program in the interest of the industry will be presented. Correspondence is solicited. Send in questions and send us the addresses of other bee-keepers. Among the subjects it is desired to consider are the purchase of supplies and the disposing of bee-products.
E. S. LOVESY, Pres. J. B. FAGG, Sec'y.

BEE-BOOKS

SENT POSTPAID BY

George W. York & Co. 118 Mich. St. Chicago.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—It is nicely illustrated, contains 160 pages, beautifully printed in the highest style of the art, and bound in cloth, gold-lettered. Price, in cloth, 75 cents; in paper, 50 cents.

Langstrath on the Honey-Bee, revised by Dadant.—This classic in bee-culture has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apiarian library is complete without this standard work by Rev. L. L. Langstrath—the Father of American Bee-Culture. It has 520 pages, bound in cloth. Price, \$1.25.

Bee-Keepers' Guide, or Manual of the Apisery, by Prof. A. J. Cook, of the Michigan Agricultural College.—This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 400 pages, bound in cloth and fully illustrated. Price, \$1.25.

Scientific Queen-Rearing, as Practically Applied, by G. M. Doolittle.—A method by which the very best of queen-bees are reared in perfect accord with Nature's way. Bound in cloth and illustrated. Price, \$1.00.

ABC of Bee-Culture, by A. I. Root.—A cyclopedia of 400 pages, describing everything pertaining to the care of the honey-bees. Contains 300 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.20.

Advanced Bee-Culture, Its Methods and Management, by W. Z. Hutchinson.—The author of this work is a practical and entertaining writer. You should read his book; 90 pages, bound in paper, and illustrated. Price, 50 cents.

Rational Bee-Keeping, by Dr. John Dzierzon.—This is a translation of his latest German book on bee-culture. It has 350 pages, bound in paper covers, \$1.00.

Bienen-Kultur, by Thos. G. Newman.—This is a German translation of the principal portion of the book called "Bees and Honey." 100-page pamphlet. Price, 25 cents.

Bienenzucht und Honiggewinnung, nach der neuesten methode (German) by J. F. Eggers.—This book gives the latest and most approved methods of bee-keeping in an easy, comprehensive style, with illustrations to suit the subject. 50 pages, board cover. Price, 50 cents.

Bee-Keeping for Beginners, by Dr. J. P. H. Brown, of Georgia.—A practical and condensed treatise on the honey-bee, giving the best modes of management in order to secure the most profit. 110 pages, bound in paper. Price, 50 cts.

Bee-Keeping for Profit, by Dr. G. L. Tinker.—Revised and enlarged. It details the author's "new system, or how to get the largest yields of comb or extracted honey." 80 pages, illustrated. Price, 25 cents.

Apiary Register, by Thomas G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25.

Dr. Howard's Book on Foul Brood.—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cents.

Winter Problem in Bee-Keeping, by G. R. Pierce.—Result of 25 years' experience. 30 cts.

Foul Brood Treatment, by Prof. F. R. Cheshire.—Its Cause and Prevention. Price, 10 cts.

Foul Brood, by A. R. Kohnke.—Origin, Development and Cure. Price, 10 cents.

Capons and Caponizing, by Dr. Sawyer, Fanny Field, and others.—Illustrated. All about caponizing fowls, and thus how to make the most money in poultry-raising. 64 pages. Price, 20c.

Our Poultry Doctor, or Health in the Poultry Yard and How to Cure Sick Fowls, by Fanny Field.—Everything about Poultry Diseases and their Cure. 64 pages. Price, 20 cents.

Poultry for Market and Poultry for Profit, by Fanny Field.—Tells everything about Poultry Business. 64 pages. Price, 20 cents.

STUDY EMPLOYMENT at home or traveling \$3.00 to \$5.00 per day guaranteed. Send for particulars at once.

HONEY AND BEESWAX

MARKET QUOTATIONS.

CHICAGO, Sept. 20.—Choice to fancy comb is selling at 15@16c per pound; good to No. 1, 14@15c; No. 2, white, 12@13c; amber, 11@12c; off grades, including buckwheat, from 9@10c. Extracted white, 7½@8c; ambers, 7@7½c; dark and off grades, 6½@7c. Beeswax, 28c.
The market is strong, and sales are prompt of nearly all arrivals. R. A. BURNETT & Co.

KANSAS CITY, Sept. 13.—Fancy white comb honey, 14@15c; No. 1 white, 13½@14c; No. 1 amber, 12c; dark, 11@11½c. Market firm, demand good, receipts light. Beeswax, 25@30c.
W. R. CROMWELL PRODUCK CO.,
Successors to C. C. Clemons & Co.

NEW YORK, Sept. 8.—Comb honey in good demand, all grades. Supply light, and arrivals sell readily at 15@16c for fancy white; 13@14c No. 1 white; 12c for amber and 10@11c for buckwheat. Extracted in fair demand at 7@7½c for white, 6½@7c for light amber; 6c amber, and 5½c dark. Beeswax firm at 28c.
HILDRETH & SEGELKEN.

BOSTON, Sept. 21.—Our honey market is very strong at the following prices, with supplies very light: Fancy one-pound cartons, 17c; No. 1, 15@16c; No. 1, 15c; No. 2, 12@13c. Extracted from 7½@8½c, according to quality. Can see no reason why these prices should not be well maintained right thru the season.
BLAKE, SCOTT & LEE,

CINCINNATI, Sept. 21.—The demand for fancy comb honey is good and finds ready sale at 16@16½c; No. 1, 15c. The demand for extracted honey at present is slow and offer same by the barrel as follows: White clover, 8½@9c; Southern, 6½@7c; Florida, 7@8 cents, according to quality. Beeswax, 27c.
The above are MY SELLING PRICES. I do not handle any honey on commission, but pay spot cash on delivery. C. H. W. WEBER.

ALBANY, N. Y., Sept. 22.—Demand good, now at firm prices: White comb, 15@16c; mixt white, 13@15c; amber, 12@13c; buckwheat, 11@12c. Extracted, white, 8@9c; mixt white, 8@8½c; amber, 7@7½c; buckwheat, 6@6½c. H. R. WRIGHT.

BUFFALO, Sept. 21.—Fancy white one-pound comb very active, mostly 16c; few small sales extra fancy, 17c, with 18c askt. Lower grades accordingly, 15@8c, as inspect. Demand improving. Extracted honey, 5@7c. Fancy beeswax selling to-day 30@33c; other grades 27@25c.
BATTERSON & CO.

DETROIT, Sept. 21.—Fancy white comb 15@16c; No. 1, 13@14c; amber and dark, 10@12c. Extracted, white, 7@8c; dark, 5@6c. Beeswax, 25@26c.
M. H. HUNT & SON.

SAN FRANCISCO, Sept. 12.—White comb, 12½@13½ cents; amber, 11½@12½c; dark, 7@9c. Extracted, white, 7½@8c; light amber 6½@7½c; amber, 5½@6½c. Beeswax, 26@28c.
There is a very healthy tone to the market, which bids fair to continue thruout the season. Spot supplies are light of all descriptions, and buyers are not lacking at full current rates.

cup, with larva and royal food, in less time than he can prepare a given number of cells *a la* Pridgen by transferring cocoons; and he also believes that those cells that contain royal food will be more likely to be accepted. While the royal jelly is not absolutely necessary, yet from many experiments he is convinced that it furnishes a larger percent of accepted cells. He has now charge of our 500 colonies and nuclei, and almost alone he keeps the whole number at work. His experience with us for the last two years must, therefore, be somewhat extended.

HOW TO GET DRONES OUT OF SEASON.

Some little time ago he complained that he was not able to get sufficient drones for fertilizing our queens; that he might give a queenless colony crames of drone-comb, and feed them ever so carefully, yet the queens would not lay in drone-comb; but he partially solved the problem in this way: He gives a colony a frame containing two-thirds worker-comb and about one-third drone near the bottom edges. The queen will start laying in worker-cells, and as her circle enlarges she will gradually work over into the drone-cells. In this way he thinks he "steals a march" on the queens and bees, for he has been able to secure drones from choice stock, and at a season of the year when it is very difficult to get a good supply of choice drones.

Soon after the Philadelphia convention last year I askt Mr. Doolittle how he managed this difficult problem. "I don't manage it very successfully," said he. "At a certain period in the summer there is a time when bees will almost refuse to rear drones." If so good an authority as Doolittle has been floored, perhaps this kink will be worth much to many of our queen-breeders.

263 CELLS FROM ONE COLONY.

A moment ago I spoke of the fact that Mr. Wardell uses, when he can, colonies that are about to supersede their queens. He always keeps such colonies, as he considers them a real acquisition. One such colony has reared him 263 cells. The bees have been trying to supersede their queen all this time; but before they can possibly get a young mother he takes away their cells and makes them go all over their work again. This colony has actually reared batches of cells, batch after batch, and yet they go on faithfully, building cells without a murmur, in the hope that, in the sweet by-and-by they will be able to rear a young queen that will relieve the reigning mother. They have continued this till they have reacht the total number of 263 cells, and how much longer they will keep this up remains to be seen. He has other super-secedure colonies that he is working in the same way, but none of them have approacht anywhere near the record of this one. Possibly the bees have learned that, so long as they rear cells, they are liberally fed. If so, they are worthy of their hire.

Illinois.—The annual meeting of the Northern Illinois Bee-Keepers' Association, will be held in the Court House in Freeport, Ill., on Tuesday and Wednesday, Oct. 16 and 17, 1900. All are cordially invited to attend.

Four Celluloid Queen-Buttons Free

AS A PREMIUM

For sending us ONE NEW SUBSCRIBER to the Bee Journal for the balance of this year, with 30 cents, we will mail you FOUR of these pretty buttons for wearing on the coat-lapel. (You can wear one and give the others to the children.) The queen has a golden tinge.

This offer is made only to our present regular subscribers.

NOTE.—One reader writes: "I have every reason to believe that it would be a very good idea for every bee-keeper to wear one of the buttons as it will cause people to ask questions about the busy bee, and many a conversation thus started would wind up with the sale of more or less honey; at any rate, it would give the bee-keeper a superior opportunity to enlighten many a person in regard to honey and bees."

Prices of Buttons alone, postpaid: One button, 8 cts.; 2 buttons, 6 cts. each; 5 or more, 5 cts. each. (Stamps taken.) Address,

GEORGE W. YORK & CO., 118 Michigan St., CHICAGO.

GEORGE W. YORK,
Editor.

CHICAGO, ILL., OCTOBER 4, 1900.

FORTIETH YEAR.
No. 40.

WEEKLY

Part of Harry Lathrop's Out-Apiary, in Green Co., Wis.

PUBLISHED WEEKLY BY

GEORGE W. YORK & CO.

118 Michigan St., Chicago, Ill.

[Entered at the Post-Office at Chicago as Second-Class Mail-Matter.]

IMPORTANT NOTICES:

The Subscription Price of this journal is \$1.00 a year, in the United States, Canada, and Mexico; all other countries in the Postal Union, 50c a year extra for postage. Sample copy free.

The Wrapper-Label Date of this paper indicates the end of the month to which your subscription is paid. For instance, "Dec 00" on your label shows that it is paid to the end of December, 1900.

Subscription Receipts—We do not send a receipt for money sent us to pay subscription, but change the date on your wrapper-label, which shows you that the money has been received and duly credited.

Advertising Rates will be given upon application.

Reformed Spelling.—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound. Also some other changes are used.

Mr. J. T. CALVERT, of the A. I. Root Co., called on us last week when in Chicago on business. He had just returned from his European trip, and look as if he was enjoying the best of health.

Mr. J. B. JUDD, of Cass Co., N. D., made us a very pleasant call last week when on his way, with Mrs. Judd, to visit Boston and other places in the East. After that they will go to California and spend the winter on the Pacific Coast. Mr. Judd is only 78 years old, and as lively as a boy. He was a bee-keeper off and on for years beginning about 1860, and has kept bees continuously the past few years.

Mr. CHAS. ALBERTS, of Dane Co., Wis., wrote as follows, Sept. 15:

"I consider the American Bee Journal one of the right things in the right place. There are some 25 bee-keepers in this vicinity, and one of them has kept bees for 25 years, and sometimes over 100 colonies, and never subscribed for a bee-paper. I think none of the others have, either, for I talk with nearly all of them, and find that with my five-years' experience and the Bee Journal I have done much better than the average. One man who has kept bees for 16 years complimented me at the last Farmers' Institute by saying that my exhibit of honey there was the best he ever saw."

MISS ELLA WOODCOCK, of Cook Co., Ill., sends us the following item which first appeared in the London (England) Chronicle:

BATTLE OF BEES AND WASPS.

A resident in the Colney Hatch-lane possess a hive of bees. One day they were besieged by a large swarm of wasps. A battle raged between the rival armies for a couple of days, with the result that the wasps are now in possession of the hive. The dead bodies of hundreds of bees killed during the encounter now lie around the hive.

EDITOR HUTCHINSON, of the Bee-Keepers' Review, said in his September issue that he was about to move into his new house, which is on a small lot with streets on three sides of it, so that he would be compelled to give up the keeping of bees.

We are glad to know that Mr. Hutchinson and his family are to have a new home, as it shows a degree of prosperity that is well deserved. Some day, in the by-and-by, we hope to make a similar "move." It is likely a far-away day, tho.

AS OTHERS SEE US.—Some of our esteemed contemporaries have our thanks for kind notices referring to the American Bee Journal. Here are a few:

"A great change in the appearance of the American Bee Journal has been made by Mr. York. A new heading, very tastily designed, graces the first page; and instead of reading-matter a half-tone of Mr. Eugene Secor fills the rest of the space. It seems there will be no more reading on the first page, but a picture of some prominent bee-keeper. Some might think the change would effect a saving; but the expense of the cut is fully equal to that of the reading-matter. The idea is an excellent one. The issue for this week gives a half-tone of E. R. Root."—Gleanings in Bee-Culture.

"The 'old reliable' American Bee Journal comes to us with a new face, the cover being artistically designed and printed on a highly calendered paper."—Canadian Bee Journal.

* Editorial Comments. *

Cash vs. Commission Honey Sales.—Messrs. Aikin and Doolittle are not of one mind on this topic, as shown in the Progressive Bee-Keeper. Mr. Aikin is quite positive that the commission business is neither necessary nor right. He says, "How many have turned over to somebody else all their honey crop to sell when that crop represented their living, and in the end got nothing for it?" Mr. Doolittle replies that in 23 years' experience he has been trying to sell for cash, but has sold only 100 pounds to distant parties, because he could get cash only on the arrival of the honey. He was not willing to sell in that way, because formerly he did just that thing, and could not get a cent of pay for what had "arrived at the store in the distant city in good order." He says:

"And when it comes to shipping my honey to commission men, or shipping for 'pay on arrival,' I will take the commission man every time, for it is a criminal affair for him to 'run off with my honey,' while it is no such thing if he runs off with the cash for which he bought my honey, or rather agreed to pay me."

The moral of all this is, that neither cash buyers nor commission men have a monopoly of honesty, and probably neither of them are composed mainly of scoundrels, and the policy of the producer of honey who sends honey to a distant market is to inform himself thoroly, and whether he sells for cash or on commission to deal only with honest men.

A Story from Bee County, Tex., is going the rounds of the press, several of our subscribers having sent it to us. It says that some of the bees down there will work only on a certain kind of flower, "each hive, or cluster of hives, always drawing its sweets from some particular flower, and religiously shunning the others." Now, aren't those wonderful bees?

Then it goes on to say that they have "bee-trackers" there; that these are native Mexicans "who mount a broncho, ride over to a row of hives, wait until a big, healthy-looking bee emerges, and, when it flies away on its daily quest, gallop along in its wake, to see from just what kind of flowers it gathers, so as to help the bee-keeper decide how much honey of a certain flavor he is going to have!"

This whole fool story is credited to the New Orleans Times-Democrat.

Getting Unfinisht Sections Cleaned Out is one of the things that comes up about this time of the year. Some think it well to leave them without cleaning out, unless it be to extract the honey from them, while a large number insist that they should be licked out dry by the bees, lest the remaining honey should granulate or sour so as to affect

the honey put in them the following season. Whether to expose fully a large lot in the open air, or to take the slower, and what is in some cases the safer, plan, and allow access to only one bee at a time, is a question upon which there may be difference of opinion. The following Stray Straw from Gleanings in Bee-Culture may throw some light on the subject:

G. M. Doolittle says, in the Progressive Bee-Keeper, that he had tried the plan of giving bees free access to a large number of unfinisht sections to clean up last fall, and the bees tore the combs so much that one-fourth of them were spoilt for baits. He calls it "the Dr. Miller plan," but it's the B. Taylor plan. The Miller plan is just the opposite: Allow an entrance to the sections only large enough for one bee at a time to enter, which is very much the better plan when there are only a few sections. When one has a large number of sections to be cleaned, the Taylor plan is away ahead, and I don't understand how it should work so disastrously with Bro. Doolittle.

[A good deal hinges on what Mr. Doolittle means when he speaks of having given access "to a large number of unfinisht sections." I once exposed 10 or 20 poor uneven combs containing honey to the bees just after the honey season, at one of our out-yards, when there were 80 colonies all producing comb honey. I think I never saw a madder lot of bees in all my life. The combs in question were literally covered with a lot of bees scrambling and tumbling over each other in mad, hot haste to get a sip at the honey. Thousands of bees were also in the air that couldn't even get a smell, much less a taste, stinging right and left. It was impossible to do any work in the apiary, and it seemed as if our clothes were literally filled with stings. We hastily closed up our work for the day, and went off with our hands in our pockets, with a resolve that we would never try it again. When any one talkt with me about letting bees help themselves to unfinisht sections in a wholesale way, I thought he was next thing to a fool; but I have recently learned that the bees must have unfinisht sections in such numbers so that there will be no scrambling and tumbling over each other to get a taste of sweet. If 500 to 1,000 of them were exposed in the apiary in a shady place, I venture to say that Doolittle would have very little trouble, and I would suggest that he try it at some future time, and report. If, in the case I have just mentioned above, I had given 50 or 100 combs, I do not think we should have had the rampage we did. But this is a kind of business that beginners should let entirely alone, and the question may be raised whether it might not be a somewhat dangerous experiment even for some experts. In any case the first trial of it should be at an out-yard remote from a public highway.—EDITOR.]

Trying to Winter Weak Colonies is a weakness from which few novices in bee-keeping are free. No matter that he is told the chances are largely in favor of the loss of each weak colony in winter after it has lived long enough to consume most of its stores; no matter that he is told that two weaklings united will consume very little more stores than each one separately, the beginner gives assent to all that is said in that direction, but holds still in reserve the thought that as some weak colonies do pull thru, his will be pretty sure to be of that fortunate number. Time and experience make him change his views, but the experience of others counts for little with him.

There is one argument, however, that may prove effective

tive when others fail. He is likely to hesitate about trying to winter over several weaklings if you tell him in a convincing way that by uniting two weak colonies now he will have more colonies next July than if he keeps them separate, and both live thru the winter and spring. More colonies, mind you, for he has not yet reached that point where he counts more upon the number of bees he has than upon the number of hives that contain bees.

In the cool weather of spring and early summer it takes about all the bees of a weak colony to keep up heat enough for life, without sparing any bees for outside or inside work. The bees cluster somewhat in spherical form, the outside bees forming a blanket to keep the others warm. It is easy to see that if a large cluster needs a blanket of a certain thickness, a small cluster can not be kept warm with a thinner blanket, and so it happens that at a time when a small proportion of the large cluster do the blanketing business the small cluster may be all blanket. This explains why it is that a colony in the spring, able to have only a small surface of brood in one or two combs, is at a standstill till hot weather, while one with bees enough to cover four frames will be increasing right along.

Now suppose in the same apiary four colonies equally weak No. 2 is united with No. 1, and Nos. 3 and 4 are left separate. Now suppose that the loss of bees in No. 1 during winter is just equal to that of both the other two—not a very supposable case, but we suppose it. In the spring, when brood-rearing has fairly started, there will be more brood in No. 1 than in both the others; but suppose the amount is equal, four frames of brood in No. 1, and two frames each in Nos. 3 and 4. The experience of every observing bee-keeper will tell him that for a time No. 1 will be on the increase while the other two will be at a standstill, if indeed they hold their own. So before there is any increase in either of the weaker ones, No. 1 will have six frames of brood. The bee-keeper can now divide No. 1 and have two colonies with three frames of brood each, against the two frames of brood in each of Nos. 3 and 4.

He who is wise will lose no time now in uniting colonies that have only enough bees to cover three or four combs.

Clarifying Beeswax.—An editorial in the American Bee-Keeper reads:

"An exchange says the secret of getting beeswax of a bright yellow color is to 'allow it to cool slowly.' Our contemporary would increase its prestige with the bee-keeping fraternity by running in a lot of slugs and quads instead of such information (?)."

Now will Editor Hill please tell us why? Is it that the information is of so little value that it is a waste of space, or because there is no bee-keeper who does not already know it?

Errors in Bee-Journals will occur, no matter how much one may try to be careful. In "Pickings" in Gleanings in Bee-Culture—a department conducted by Stenog, the man to whom the A. I. Root Co. are indebted for the large number of errors in language and printing that are not allowed to appear in their journal and published books—occurs the following:

A correspondent says: "I set one sweet clover plant to the right of each hive." I supposed all clover plants were equally sweet. What kind of clover was it?

The greater number of the readers of Gleanings will hardly make out what Stenog is driving at, and the few who understand that he is calling attention to the omission of a hyphen may feel just a little puzzled to explain why it is that when one is speaking of a plant of sweet clover he should not call it a "sweet clover plant" just as well as to call it a "sweet-clover plant." Especially will he feel puz-

zled when he finds the omission of the hyphen endorsed by so able an authority as Stenog himself. If Stenog will carefully run his finger over the columns of the same number of Gleanings from which the above item is quoted, he will find, 13 pages farther on, at the northeast corner of page 693, mention made of "a \$200 red clover queen." Now if any evil-minded person should send in an inquiry asking, "Are other clover queens yellow, and is this the only clover queen that is red?" he may as well understand at once that no such offensive personalities will be admitted into these columns.

Base is the sin of ingratitude, and when Stenog so unselfishly points out what should be corrected in this journal, the least that can be done is to return the favor by pointing out what might be bettered in the very excellent journal over which he keeps watch and ward.

On page 551 of the American Bee Journal J. H. Martin speaks of a new package for a small amount of honey, and Stenog says (Gleanings, page 719):

In speaking of suitable packages for small amounts of honey, Mr. Martin says he saw one lately that worked like a charm. The containing medium was made of sausage-stuffing, but he thinks this was evidently unfit.

It would not be appropriate to say that one would think it "evidently unfit" to have honey contained in something made of chopt meat, for that is not what Stenog means. Instead of "sausage-stuffing," he means *the thing that holds the stuffing*, or, as Mr. Martin express it, "the material that forms the covering for sausages."

When it comes to writing pure and undefiled English, it must be confessed, "We are all poor critters."

Bee-Keeping at the Pan-American.—In a private letter from Mr. F. A. Converse, superintendent of live stock, dairy and agricultural exhibits, at the Pan-American Exposition, to be held in Buffalo, N.Y., next year, he has this to say regarding the apiarian exhibit:

"I may say regarding the bee-exhibit at the Pan American Exposition, things are beginning to assume a tangible shape, and already several exhibits from the various States are being taken up, and the outlook is that the bee-exhibit will be one of the prominent features of the Exposition. Separate space has been set aside in the main Agricultural Building for this display, and it will be fitted with every accommodation possible to have this industry represented in a way that shall be commensurate with its importance."

Bee-keepers had the pleasure of meeting Mr. Converse at the recent Chicago convention, and everybody can feel assured that he will do all in his power to make the bee-keeping part of the Pan-American one of the most interesting and helpful exhibits in the whole aggregation.

"The Hum of the Bees in the Apple-Tree Bloom" is the name of the finest bee-keeper's song—words by Hon. Eugene Secor and music by Dr. C. C. Miller. This is thought by some to be the best bee-song yet written by Mr. Secor and Dr. Miller. It is, indeed, a "hummer." We can furnish a single copy of it postpaid, for 10 cents, or 3 copies for 25 cents. Or, we will mail a half-dozen copies of it for sending us one new yearly subscription to the American Bee Journal at \$1.00.

The Chicago Convention Picture is a fine one. It is nearly 8x10 inches in size, mounted on heavy cardboard 10x12 inches. It is, we believe, the largest group of bee-keepers ever taken in one picture. It is sent, postpaid, for 75 cents; or we can send the American Bee Journal one year and the picture—both for \$1.60. It would be a nice picture to frame. We have not counted them, but think there are nearly 200 bee-keepers shown.

The Premiums offered this week are well worth working for. Look at them.

Contributed Articles.

A Wisconsin Bee-Keeper and His Apiaries.

SEND herewith a view of a part of my Monroe apiary, and also one of the larger yard at Browntown, the next station on the railroad 8 miles west. In reference to my bee-keeping, I will say I became interested in bees while working for the railroad company as agent at Prairie du Sac, Wis., about 18 years ago. It was from the veteran bee-keeper, J. J. Ochsner, that I purchast my first colony of bees. Like the Ochsners, my business has been principally the production of comb honey, but always producing more or less extracted along with it.

Soon after making my beginning in bee-keeping, we removed to Browntown, Green Co. There were only a few colonies of bees on the field, all of which I purchast, as the owners took but little interest in them. But after several years had clapt, and I had succeeded in building up a good paying apiary, then a number of people on the field discovered that bee-keeping was just the business they wanted, and, as a result, I have had to contend with an overstockt locality; but I have this much to claim, I never started an apiary on another's field, and don't think I ever will. It is unnecessary. If I can't buy out the occupant, there are unoccupied fields.

After pursuing the business at Browntown for 12 years, I purchast a block of land in the residence portion of the county seat of Green county, on which I built a family residence. I bought out the only apiary then in the city, one that had been establisht for 25 years, thus making this my headquarters. We have at this time something over 200 colonies, the greater part of which are at Browntown. We use the 8-frame dovetailed and the 8-frame Grimm-Langstroth hives, and practice tiering up for extracted honey, and the Heddon method of hiving swarms. All queens are clipt at the beginning of each season. Our percentage of colonies workt for comb honey that cast swarms are low; this year, with a fair crop from white clover, only 25 to 30 percent. Colonies workt for extracted honey rarely cast swarms; there was not a single one in the Browntown yard this season, and only one here.

I wish to say a word or two about our county here in Southern Wisconsin. We hear lots of bragging about California and other places said to be much more desirable, but I have known a number of people to leave this locality for California, and, after a few months, come back disgusted with the dry, dusty counties they had gone to. Our country is fair for bees; there may be other places better, but certainly there are many worse. But in all that goes to make up a truly fruitful country, this excels. By this, I mean, a country that produces in great abundance corn, rye, oats, potatoes, vegetables, fruit, honey, and especially milk, butter and cheese. Truly it is a land flowing with milk and honey, and it is not subject to failures. We always have some paying crops if others are short. I love my native State of Wisconsin; I love her hills and valleys, her streams and lakes of clear water, and I love her people. They are a healthy, industrious class of people, for our climate tends to produce such a type.

In regard to the honey sources of my immediate field I will say: This is a natural white clover country, and this, supplemented by more or less alsike, we consider our main source. Basswood, which is not nearly so plentiful as formerly, occasionally gives us a crop, but it is an uncertain yielder. This season, with a good prospect in view, we had only 3 or 4 days of a flow from it. Heavy storms followed by hot, sultry days cut it short. Outside of these we sometimes get nice crops of light amber fall honey along the creek bottoms, from heartsease and various yel-

low flowers. Willows, dandelions and fruit-bloom in spring make it almost unnecessary ever to feed.

Wisconsin bee-keepers are just foolish enough to believe that our white clover and basswood honey is not excelled in quality by honey that is produced beyond the Mississippi, or in any other country. The proof of the pudding is in the eating. I just got an order for a shipment of comb honey to go to Nebraska, the purchaser saying he could buy honey out there at 1½ to 4 cents per pound cheaper; but it didn't have the Wisconsin flavor.

But after all I have said, I want all other people to think just as much of their part of the country and its advantages as I do of mine.

It is unnecessary for me to inform the Bee Journal man that the "old reliable" American Bee Journal "stands in" with Wisconsin bee-keepers; his subscription list shows that, as I discovered on my travels among the people. Long may it continue to be the practical, helpful paper it is; and long may its editor have life and strength to work for the best interests of bee-keepers as few men have workt.

Green Co., Wis.

HARRY LATHROP.

Letter No. 2 From Mr. C. P. Dadant, Now in France.

NYON, FRANCE, Aug. 27, 1900.

DEAR MR. YORK:—After having visited the home of my childhood, I left for the south with the intention of stopping on my way in the village that my grandfather inhabited years ago. He was a country doctor, and his children and grandchildren used to gather at his home during vacation every summer. This was 40 years ago. But he has since died, and the old uncle, his brother-in-law, who was mayor of the village, has also died; the old mansion has been sold to a villager, who transformed the fine fruit and flower garden, and the terraces, into vegetable gardens and potato patches, so that all the romance has disappeared, especially as the house has not been kept up, and is in a greatly dilapidated condition. But I roamed about the village, made my name known, and we were soon at home among a dozen families who claimed intimate acquaintance, and in some cases remote relationship, with our family.

We remained but two days, but I had occasion to ascertain that here also the only progressive bee-culture to be found is in the hands of the school-teacher, who devotes his spare hours to a small apiary of movable-frame hives.

A short trip to the forest on top of the neighboring mountain, convinced me that the flora of the country is much richer than that of Illinois, during the months of July and August, for there are hundreds of different wild blossoms visited by the bees during those months. The climate is neither so hot nor so dry as ours, and everything keeps green usually during the warmest weather. In many regards things remind me of northern Wisconsin, but they have an early spring and a milder winter.

We then proceeded to Macon by way of Dijon, along the

A Corner in Mr. Lathrop's Home Bee-Yard, in Green Co., Wis.

shores of the Saone River, among some of the finest scenery I ever saw, for the shores of the Saone look like an endless village, dotted with villas and castles of ancient date, among an uninterrupted line of vineyards.

At Macon, Mr. Maigre awaited us at the station. I had never met this gentleman, but had had a great deal of correspondence with him, and we both soon felt at home in his family. He is an extensive bee-keeper, and manufactures bee-supplies on a small scale. He has four out-apiaries in Beaujolais, across the river Saone: and the trip was taken in his *automobile*—the first one on which I ever rode. Automobiles are becoming very plentiful in France, and no wonder, they have such fine roads.

It is difficult for an American, who has never visited Europe, to picture to himself the roads of Europe. A few words will suffice to express the difference between their roads and ours. The poorest of their roads are better than the best of our macadamized streets. The average European road is an avenue with a solid smooth bed, high in the middle, with a row of trees on either side, and a drain just outside of the row of trees. In the wettest weather, you can walk, or ride a bicycle, without finding more than a little thin mud that will hardly dampen the tire of the wheel.

Beaujolais is a fine honey-producing district, having alfalfa, sainfoin, basswood in the early summer, and any amount of buckwheat during the later months. Maigre's apiaries are scattered among vineyards, plum and pear orchards, and around and about houses in close proximity to the road. I should be afraid of the bees stinging people and horses, but it is very evident that they become accustomed to the bustle of busy thoroughfares, for I have nowhere seen quieter bees.

The practical bee-keepers in France all use the extractor, for it appears that extracted honey brings as high a price as comb honey. This is the result of the ancient custom of pressing the honey out of the comb before eating it. As a matter of course, they find the honey that has been extracted far superior to the old strained honey. In Mr. Maigre's apiaries I saw two small improvements that I think are very good. The one is a wire-netting shield around the fire-box of the smoker, which effectually prevents one's burning his fingers, as this shield permits a free passage of air, and is always cool. They use a copy of the Bingham smoker nearly exclusively with this improvement. The other implement is a long brush for brushing bees off the combs. These brushes are thin and strong, with very long bristles, and are superior to anything we have.

A thing which strikes us Americans as very odd, is the numerous different articles employed to make bee-hives, owing to the high price of lumber. I saw hives made of straw, of wood and straw, of earth, of willow wood covered with mortar, of cement, and, in a few cases, of reeds and rushes. Straw roofs are plentiful, but they use also tiles and wooden roofs. But in no case is the workmanship equal to what is made in the United States. They make section-boxes that no one in the United States would buy—they are too rough and dark. I am told that the white basswood is very scarce in France, and they have to fall back on much darker lumber. The best of their pine comes from Sweden and Norway.

I have been kept so busy visiting that this letter, begun at Nyon, is finished at Paris. I will write you again soon, and describe my trip in Switzerland. C. P. DADANT.

Natural-Built Combs vs. Foundation.

BY B. A. HODSELL.

IN reply to Mr. S. A. Deacon's articles in the numbers of the American Bee Journal for Aug. 16 and 23, I would say that, if he were talking to C. P. Dadant or other practical bee-keepers only, I would not say a word, but believing that his long article will mislead and greatly damage hundreds of beginners, I feel it my duty as one of the largest bee-keepers of the Southwest to reply.

I have about 700 pounds of wax made into foundation on the halves, annually, using every pound of my half in full sheets, mostly in the brood-chamber the first year, therefore securing all worker-comb in the brood-chamber.

To illustrate the advantage of foundation over natural-built combs, last spring in one of my out-apiaries which I had run in that way for years, and had weeded out the natural-built drone-comb in my first extracting, I found only a

handful of drone-brood in the super, and 12 cases of 120 pounds each of extracted honey.

In another out-apiary of equal number, and equally well filled, about one-half foundation combs were in the super, much of the rest being natural-built drone-comb. After extracting the honey I uncapped and jarred out the drone-brood, securing about a bushel of drone bees, and only eight cases of honey—a direct loss of four cases, or \$30, in the one extracting, because I allowed the bees to use natural-built combs instead of foundation.

I allowed the young swarms to be hived on the halves this year, using full sheets of foundation for my 20, and obtained about 26 pounds of surplus honey to each hive, worth \$30. The renter used no foundation, got plenty of crooked combs, and no surplus.

I never saw any irregularity or breaking down of foundation, as Mr. Deacon would have us believe, or changed into drone-comb, but always as nicely completed as stamp.

We do know by experience that if allowed to build the combs themselves, a large proportion of worthless drone-comb will be found in the brood-chamber and supers, which must be melted up and run into foundation, or the result will be as I have just stated. I have no bees, queens, bees-wax, or foundation, to sell, but use all the full sheets of foundation I can get, and expect to continue until I work out all the natural-built drone-combs except a few patches in my best breeding colonies.

Mr. Deacon says the old bee-keepers don't use as much foundation as formerly. Perhaps not since they have their natural-built drone-combs melted up and replaced in the form of foundation. If I ever get that far along I will also sell my wax, but when I get thru my 11 apiaries I will continue to patronize the foundation-mill.

Maricopa Co., Ariz.

Convention Proceedings.

Report of the Proceedings of the 31st Annual Convention of the National Bee-Keepers' Association, held at Chicago, Ill., Aug. 28, 29 and 30, 1900.

BY DR. A. B. MASON, SEC.

(Continued from page 614.)

SECOND DAY—FORENOON SESSION.

The forenoon session of the second day, Aug. 29, was called to order by Pres. Root, when little Miss Ethel Acklin played and sang the bee-keeper's song, "The Hum of the Bees in the Apple-Tree Bloom," after which the Rev. E. T. Abbott offered prayer.

Pres. E. R. Root, of Ohio, then delivered the following

PRESIDENT'S ANNUAL ADDRESS.

I should prefer to omit this part of the program altogether; but as the president's address has been a conspicuous and important feature in the conventions of this Association in the past, it is, perhaps, proper that a precedent should not be started now. It is hardly proper, tho, that I should take up much time in view of the part I take in the stereopticon work later on, and I will, therefore, be very brief.

INCREASE IN BROOD DISEASES.

This convention should consider the increase of both foul and black brood thruout the country. That both diseases are certainly making advancement in certain sections of the country can scarcely be denied. A few years ago, if I received at our office more than one sample of diseased brood a month it was considered as something somewhat remarkable; but now specimens of brood are sent in almost daily. Black brood, which I regard as more insidious, and the more to be dreaded of the two diseases, is thought to travel thru the air; that is to say, many of the bee-keepers who are in the vicinity of its ravages believe that the germs of this dread disease float from one locality to another. I am inclined to doubt it; but, in the face of the facts, we are compelled to admit that it travels much more rapidly than foul brood. This convention should pass suitable resolu-

tions, calling attention to the seriousness of the situation, and ask State and National governments, where they have not already done so, to pass such legislation as will afford the necessary relief.

Indorsement should be made of the splendid work done by the inspectors of Wisconsin and New York; and in the last-named, especially the Commissioner of Agriculture, should receive the thanks of this Association for the interest he has taken in the matter of the suppression of black brood thru the Empire State. This commissioner has not only helped in every way possible, but has placed on the pay of the State some four inspectors, bee-keepers, each of whom has a series of counties in which it is his duty to make frequent and careful inspections of all apiaries within his jurisdiction. The prompt and energetic measures undertaken by the State of New York should be recognized by bee-keepers in every State in the Union; for without such prompt action bee-keeping might be almost entirely wiped out of some important sections of other States, as it is already in some localities in New York.

A vote of thanks should also be tendered to Dr. W. R. Howard, Bacteriologist at the University of Fort Worth, Texas, who has performed a service for bee-keepers in his investigations of black brood and pickled brood, with very little show of remuneration. Such services, if paid for either by any individual State, or by the general government, would cost hundreds of dollars.

HONEY ADULTERATION IN THE CITIES.

I am glad to believe that adulteration, one of the greatest evils with which we have to contend, is not on the increase; indeed, it has been most decidedly checked (thanks to this organization) in some of our large centers of population; but there is a broad field for work, and this convention should not only hold up the hands of the general manager in the work he has already begun, but should consider plans by which the evil may be further curtailed.

BEES FOR BUSINESS.

This Association should go on record as indorsing the efforts made by queen-breeders to develop a strain of bees that can work on red clover. Too much attention has been given to the breeding of handsome bees—bees for color. The matter of breeding for longer tongues, and the securing of shorter corolla-tubes in red clover, will come up later in the sessions of this convention.

SPRAYING DURING FRUIT-BLOOM.

From all sections of the country we hear complaints of bees and brood being poisoned during spraying time. Ignorant and vicious fruit-growers in many localities, sometimes in spite of legislation, persist in administering the poisonous mixtures during the time that the trees are in full bloom. It has been shown repeatedly by experiment stations and by private individuals that spraying during blooming time is both a waste of material and a great damage to a very important industry—bee-keeping. This convention should pass certain resolutions praying State legislatures to enact such legislation, where there are no anti-spraying laws, as will bring the needed relief to bee-keepers. The general manager of this Association has already done some good work, especially in the preparation of certain pamphlets on this question of spraying, designed for free distribution by the members of this organization.

RETAILING EXTRACTED HONEY.

Some recommendation should go forth from this Association to the bee-keepers of the country, urging the importance of the development of the home markets for extracted honey. Too much of the liquid article is being rushed to the cities, where it is adulterated, and palmed off on the unsuspecting public. A number of prominent producers are now bottling their own product, and putting it out on the markets of their own vicinities, under their own name and guarantee. The fact has been demonstrated over and over again, that the general public will pay a good round price providing it can be assured that the honey it is buying is pure bees' honey, and that the bee-keeper or person putting it out is reliable and honest.

BEES A NUISANCE.

In various sections of the country bees have been declared a nuisance. They are being voted out by town councils, and suits are being begun; but in the great majority of cases where the bee-keepers have got into trouble they are not members of this Association. Within the last few days two parties have written for advice as to how to

proceed. But neither of them was a member of the National Bee-Keepers' Association. I wrote to both, telling them that they could not expect the Association to defend them, but that I had no doubt if they gave the facts in each case to General Manager Secor, inclosing a membership fee of one dollar, he would advise them how to proceed; but that it must be distinctly understood that, as they were not members before the trouble began, they could not expect financial aid by joining the Association now. Bee-keepers who are already members should use every effort to induce their neighbors and friends who are also in the same business to send in their dollar, and thus be ready for any emergency that may arise, and at the same time help the Association carry on its grand work.

RESOLUTIONS.

Thus far I have outlined work for the committee on resolutions. I do not mean to dictate; but having been before our Ohio State legislature in the interest of certain bills up for passage, I have learned the value of an indorsement by a State or National association. When I tried to interest the members of our Ohio legislature in a foul-brood bill and in an anti-spraying bill, about the first question I was asked was, "Does your State organization ask for them?" When they learned that we had no such organization they manifested very little interest in the measures that I was advocating. The reason of this is not difficult to find. Our legislators are constantly beset by people who have all kinds of hobbies to ride and axes to grind; and as it is impossible to listen to all their claims, our law-makers are compelled to confine their attention to matters that emanate from representative *bodies* of men rather than to the men individually.

Resolutions, suitably drawn, would go a long way in influencing legislators, and even our general government, in matters directly touching our interests; and in this connection it goes without saying, that this organization should lend its indorsement to the Brosius Pure-Food Bill, or some equally good measure that may be brought before our next Congress.

There are many other important matters to which I might refer; but as these will be brought up in one way or another during the sessions of this convention, I forbear.

E. R. ROOT.

On motion of Dr. Mason it was voted that the president's address be referred to a committee consisting of Rev. E. T. Abbott, Hon. Eugene Secor, and Mr. O. L. Hershiser, to consider the suggestions offered, and make such recommendations as they might see proper.

A Member—Are they to be the committee on resolutions?

Dr. Mason—I think it a very good plan to make that a separate committee—they will have enough to do.

Pres. Root—That matter will come up a little later on when we appoint committees.

A Member—Was there a committee appointed last evening?

Pres. Root—Yes, but not on resolutions.

The next thing on the program for this morning is a paper on "Queen-Rearing by the Doolittle Method," by Mrs. H. G. Acklin, of Minnesota, who has had considerable experience in the rearing of queens.

By Mrs. Acklin's request Mr. George W. York, president of the Chicago Bee-Keepers' Association, read her paper, which is as follows:

QUEEN-REARING BY THE DOOLITTLE METHOD.

I do not follow the Doolittle plan exclusively, notwithstanding it has pleased our worthy secretary to assign me this subject. I presume there are as many methods used in rearing queens as there are queen-breeders. Individuality is sure to crop out, in the minor points at least, in every undertaking in life. Nevertheless, I think Mr. Doolittle is a real benefactor to bee-keepers, and especially so to the queen-rearing element, and that he should receive our lifelong homage. I believe he has been perfectly unselfish in giving his experience to the world, and just imagine what a vast amount of planning and tinkering he has saved the lesser lights.

I speak for myself now, as we are so crushed with work during the queen-rearing period that it would be practically impossible for me to evolve for myself, without any pointers or suggestions, a plan which would be altogether satisfactory. If I mistake not, Mr. Doolittle is the pioneer in the cell-cup method.

No one can rear good queens unless great care and untiring vigilance is practiced in the selection of queens to

breed from. There are so many qualities to be considered—gentleness, prolificness, good honey-gathering, color, and so on to the end of the chapter. One hardly knows what a queen is until it is time to supersede her; unless, indeed, you get hold of a queen like one we bought last summer for breeding purposes, and had to ship her to an out-apiary so we could step out of the back door, and the poor kittens could have a chance to live in the back yard. Do you wonder that I put gentleness first in the list of good qualities?

But, "honor bright," as we used to say at school. I believe that gentleness can be combined with all other good qualities without detracting one iota from any of them.

Living, as we do, on the corner of a busy street in a large city, and having our bees just a step from the back door, we would naturally breed for gentleness for our own convenience. But I know that we do not eliminate other good qualities, as our queens fill every available place in the brood-nest with eggs, and the last honey-year we had we took off something over 100 pounds to the colony, spring count. We have very few swarms if plenty of room is given the bees at the proper time.

But to return: Most of our queen-rearing nuclei are at home, and that fact affords us the opportunity of selecting the best queens from the out-yards for the home yard, and also of taking away any undesirable ones. We frequently make changes of this kind.

The matter of drones, as you all know, is another very important factor in the rearing of good queens. A neighbor bee-keeper has a queen which produces most beautiful drones, and we have secured several combs of them from him this season. We like to get good drones from another apiary, as it makes a direct cross.

In looking over the bee-papers one reads a multiplicity of ways of starting queen-cells, all of which may be good. We use the cell-cup plan—the details of which you are all familiar with—and start the cups at intervals of two days. That gives time to get one lot put away before the next lot is ready. I use very young larvæ, and expect the queens to hatch the 12th or 13th day after the larvæ are transferred. I also use royal jelly, as that seems the surest way. I plan to look over the nuclei, to see if the queens are out the 14th day; as, if I go over them the 13th, I am just about sure to find one or two which are not out. I take the cells from the colony in which they are built the 10th or 11th day.

We use the 10-frame hive with a movable bee-proof partition-board in the center, which gives room for a 4-frame nucleus and division-board on each side. This plan has the double advantage of saving room and hives, and also of being able to throw the two nuclei together when one queen or nucleus is sold in the early spring. A cover is necessary directly over the frames, which may be of either canvas or enameled cloth. For the winter covering we have a different arrangement.

It may sound strange to many of you when I speak of saving room; but as we are not fortunate enough to live on a large farm, such as our worthy general manager so feelingly describes in his song, it behooves us to economize space whenever practicable.

Believing, with one of our talented editors, that the mission of a paper is to start discussion on a subject, not exhaust it, I will close. MRS. H. G. ACKLIN.

Pres. Root—You have heard this paper; it is now open for discussion.

R. L. Taylor—The writer says she has very little swarming; I would like to inquire whether she produces comb honey or extracted?

Mrs. Acklin—Mostly extracted honey.

Pres. Root—This is a very interesting paper, and as most of you are probably honey-producers, you ought to be interested in this subject of queen-rearing. I believe every one should try to rear the bulk of his own queens. I can't help feeling that many queens shipped thru the mail suffer somewhat from the jolting and jarring they get.

C. A. Hatch—I think the point of selecting drones one that is well taken. In my own management of apiaries I find that I can materially change the character of a whole apiary by giving attention to the drones alone. It is a well known fact by all breeders of stock that the progeny rests more with the male than with the female, and I think queen-breeders heretofore have been inclined to lay too

Little Miss Ethel Acklin with Queen-Cell Frame.

much stress on the influence of the queen, and ignore the male side of the progeny.

Mr. Abbott—Excuse me, I want to offer some objections to the president's statement about shipping queens. The best "queen" that I have was reared for me in New York. Her mother took care of her until she was about 21; I think she did a better job than I could! I don't believe in everybody rearing his own queens; I can get better queens reared than I can rear myself. If you know how, it is best to do it yourself; if you don't, it is best to let the other fellow do it.

Dr. Mason—It seems to be exceedingly and uncomfortably warm here for some of us boys; as the ladies are allowed to wear shirt-waists, I suggest that those of us who would like to do the same thing, just do it [taking off his coat]. I want to say another thing: Every member of this Association that has paid his dollar, whether to Mr. Secor or to myself, is entitled to one of these badges free, and I am going to suggest that no one be allowed to say a word until he has a badge on.

Pres. Root—That would be hard on a good many of us here; how are you going to know when they take off their coats, that they haven't any badge?

Mr. York—I would suggest that we have an intermission so that people can come forward and get badges; perhaps it is not their fault that they haven't them.

Pres. Root—We will have such an intermission now for about five or ten minutes, when we will take up this discussion again. [Continued next week.]

York's Honey Calendar for 1900 is a 16-page pamphlet especially gotten up to create a demand for honey among should-be consumers. The forepart was written by Dr. C. C. Miller, and is devoted to general information concerning honey. The latter part consists of recipes for use in cooking and as a medicine. It will be found to be a very effective helper in working up a home market for honey. We furnish them, postpaid, at these prices: A sample free; 25 copies for 30 cents; 50 for 50 cents; 100 for 90 cents; 250 for \$2.00; 500 for \$3.50. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

Questions and Answers.

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

[The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.]

Feed for Winter Stores.

If a colony requires 10 pounds more feed than it has to winter on, and we feed granulated sugar, equal parts by weight, should we take 5 or 10 pounds of sugar to make up the necessary 10 pounds weight? or will 10 pounds of sugar go as far as 10 pounds of honey, when mixt as above, sugar mixt with water? NEW YORK.

ANSWER.—Ten pounds of sugar goes farther than 10 pounds of honey. About 5 pounds of sugar to 2 pounds of water is considered a feed equal in strength to honey, so if your bees need 10 pounds of feed that is to be half-and-half, they should have about 7 pounds of sugar and the same of water. But it will not do to feed so much water late in the season. The bees will not have time to evaporate it, and a thicker feed will be better.

A Beginner's Questions.

I suppose you must grow tired of beginner's questions, as the things they ask about are so old and stale to you. I never ask what I can gain from the bee-books; but the trouble is they describe things in such a way that we can't grasp the idea. Besides, there are some things we can't learn from the books, and here I come again to ask you:

1. From the best information you have, what would be the best honey-plant (flowers, shrubs) I could plant for the benefit of my bees next year in my two-acre orchard lot fenced to itself, and set out in all the different kinds of orchard fruits, supposing such plants to be planted among the fruit-trees?

2. Why do bees fill up when smoked or disturbed? I know they do it, but *why* do they do it? and do they retain it permanently?

3. What could cause some of my bees (just a few, say a pint) to swarm out and cluster on a nearby bush? I have had two different occasions of this kind lately. If the entire swarm had come out I would better understand it, but these few came out, clustered, and never pretended to leave, only to change their bush from one to another, and never returned to the mother colony. Last fall I had this same thing to occur Nov. 1, but they left for the woods.

4. If I were to transfer my bees, would it be safe to do so next spring before they begin to gather and store honey? and if I did, would it not be absolutely necessary to feed them until they did begin to store?

5. When would be the best time to move my entire apiary to a distance of 100 or 200 yards, after, or before, I transfer them?

6. Would my orchard be a good locality for them, placing the hives along on the fruit-tree rows? or would their alighting on the fruit-trees in swarming-time cause damage to the trees in having to saw off so many limbs to live them?

7. Can the Manum swarm-catcher be used successfully enough to prevent sawing off these limbs?

8. Is an orchard generally considered a good locality for an apiary, all these things considered?

9. In using old comb, does it require that the comb should be placed so as to stand as it did in the hive where it was made by the bees? I've heard one could not invert the comb for the reason the bees could not refill it unless it had the same angle (incline) it had at first, that it would not hold the honey. MISSISSIPPI.

ANSWERS.—1. No, I do not weary of beginners' questions, but am always interested in them, unless the question be one that is fully answered in every text-book on bee-culture, and then it is only a waste of space to answer it here. You must not be too hard on the books. It is utterly impracticable for them to answer all questions that may arise. If it were possible for them to do so, there would be no excuse for this department. If they give general prin-

ciples in such way as not to be misleading, they do well. But they are indispensable, and the man who depends upon a bee-journal without having a text-book is unwise. After carefully studying his text-book, however, he will still have plenty of questions to ask, and the intelligent questions of the beginner are always of interest. It may, however, be no easy matter to answer some of them, as for example your first question. The book that should attempt to give point-blank instructions on such a matter would need to occupy much room, and the instruction that would be all right for one locality might illy fit another. But I will make some attempt to answer.

1. If the prosperity of the orchard is the main thing to be considered, a good plow might be better than any kind of honey-plant. And yet there might be something planted among the trees whose product, together with the nectar gathered therefrom, would more than repay the damage done to the trees of the orchard. Your wise plan would be to consult an experienced orchardist as to the things that might be judiciously planted in an orchard, and then select among them such as would be best for the bees. And his experience should be in Mississippi, not in Massachusetts. Sweet clover or alsike clover would be fine for the bees, but not so good for the trees. One of the best things might be the raspberry. It succeeds well in partial shade, and yields a large amount of nectar, and its presence will do the trees no harm if kept properly cultivated. The different vines, such as cucumbers, squashes and pumpkins are also honey-plants, and would not be very bad for the orchard.

2. I don't know. The supposition is that bees reason something like this, allowing that they reason: "It looks a good bit as tho we were to be turned out of house and home, and if we're to migrate to some other place it's high time we were loading up our knapsacks with provisions to take with us." When the excitement subsides, and they conclude they're not going to move after all, they unload most of the honey they have taken, but no doubt every such disturbance costs at least a little in the way of stores.

3. It might be bees accompanying a superseding queen on her wedding-flight, or a small after-swarm, more likely the latter, which is very freaky with its virgin queen.

4. It might not be unsafe to transfer so early, but the disarrangement of the brood-nest would be more easily overcome at a time the bees were storing. It would not be absolutely necessary to feed unless there was danger of starving, and either to transfer or feed when too cold for bees to fly would be unadvisable. Better transfer in fruit-bloom, or, perhaps still better, wait till they swarm.

5. The transferring need not be considered, but it will be well to move them early; if convenient, just before their cleansing flight in spring.

6. An orchard is one of the very best places to put hives. The trees would trouble little more about swarms alighting on them than if they were near by outside the orchard.

7. Yes, generally.

8. Yes.

9. Practically it makes little difference. The bees are able to straighten up matters.

No Swarming and a Remarkable Yield.

I would like to inquire the probable reason of bees not swarming. I have 5 colonies but did not get a swarm this season. The colonies were very strong in the spring. I put on supers early, and have taken off 650 pounds of comb honey. Is it more than the usual yield? ILLINOIS.

ANSWER.—It is hard to say with any degree of positive-ness just why your bees did not swarm. You say you put on supers early, and the bees thus feeling that there was plenty of room at home were less inclined to look for quarters elsewhere. You say nothing about the size of your hives, and it may be that large hives had something to do with it. It may be, too, that the strain of bees had more to do with it than anything else, for some bees are much less inclined to swarm than others. If you have bees not inclined to swarm, you are much to be congratulated. Your average of 130 pounds per colony is a remarkable one for northern Illinois this year. If your bees had swarmed, the chances are that your crop would have been less.

The American Fruit and Vegetable Journal is just what its name indicates. Tells all about growing fruits and vegetables. It is a fine monthly, at 50 cents a year. We can mail you a free sample copy of it, if you ask for it. We club it with the American Bee Journal—both for \$1.10.

* The Afterthought. *

The "Old Reliable" seen thru New and Unreliable Glasses.
By E. E. HASTY, Richards, Ohio.

THAT BEE-HIVE INCUBATOR—OR HENLESS HATCHER.

"The proof of the pudding is in the eating," no doubt; but even if it eats well we want more than a teaspoonful, else we lose interest in the whole thing. Many of us knew that a few eggs carefully adjusted over a very strong colony of bees could be hatcht, as an experiment; but I imagine that the commercial, business-like, right-straight-along incubating of eggs by bee-heat will come to some of us as a new revelation. Here we have it right before our eyes, and 16 top-story chicks out foraging their way in this queer world, minus hen. And the dark man behind the hive backs it with the assertion that he has been at it all the spring, finds it satisfactory, not unreasonable in its demands for care, and safe enough to trust \$5.00 sittings to. And now that old chestnut of a debating-society question about who is the chicken's mother will need readjusting. Which indeed? the queen? or the workers? or the drones? or the cushion? or the Norton? or the combination? Perchance when we try to do the trick we shall smother the prospective chicks for lack of air, else chill them by too much of it. Better find out first what those cushions are stuff with, as therein may lie the whole thing—pure air, without draft and its chills. Page 529.

CAUSES OF SWARMING.

Prof. Cook rather requests criticism, page 530, and he may get all the "no, no!" chorus he wants on his fundamental proposition, "Bees are incited to swarm because of something disturbing their peace." I shall not cry no, however. I rather like the dictum—if you will only take it in a sense sufficiently broad. Say the young man goes West because of feelings disturbing his peace; and say the male of the herd jumps over the fence, according to his well-known style, because of feelings disturbing his peace, and then you may proceed to float the proposition in question also. Yes, the disturbance can usually be more readily pointed out in the bees' case than in the others. Blessed be disturbance. It moved Budha until he renounced a throne. It moved Paul to preach the gospel. It moved the Christ until he volunteered the cross. But when it comes to the swarming of bees we are a little inclined toward, Blessed be lack of disturbance. If we only could give them "Something to do, something to love, and something to hope for"—that earthly heaven in a nutshell, without any disturbance thrown in, we should be very glad.

□ I'll consent to kick right lively against the Professor's notion that bees swarm for lack of honey. Here, alighting upon a certain effect he thinks it a cause. After a colony has swarmed itself nearly to death there is usually very little honey in the hive. Of course there are "famine swarms;" but it does not elucidate matters to jumble them up with normal swarms, which are very different. I'll object also to those words "if ever," more than half way down the last column. If they mean anything they mean to suggest a doubt whether bees ever swarm without long and careful preparation; and I think a leading bee-man should, at this late day, be ashamed to encourage such a doubt as that. It is of decided interest that Prof. Cook's experience is that a swarm when the queen is left behind usually clusters. A prevalent impression, at least among non-clippers, is that such a thing is quite rare.

EVAPORATING OR RIPENING HONEY ARTIFICIALLY. □

□ How to evaporate the superfluous water in honey without having the aroma (which is much more volatile than water) also evaporate, well, that, I sadly fear, is an insoluble question. The bees themselves make a partial failure of it; and they will work it much nearer to success than any one else can. Exposing in a shallow pan will certainly let some aroma get away; but what are you going to do? Artificial heat will do worse. And I doubt if the vacuum pan would be any improvement in that respect. Earnest determination not to have thin honey will suppress the most of it. And when one does have it I guess that long exposure in a deep storage, letting the water rise and pass off,

while part of the aroma remains because down where it can't evaporate, is about the best one can do. But look a little out. Changes in the direction of spoiling may come faster than ripening. The shallow pan in a hot, well ventilated chamber may be the best sometimes, notwithstanding loss of aroma. *Who will notice aroma anyhow* in a honey which has begun to be slightly tart, and also begun to have a mean taste, indescribable, but entirely undeniable?

OVERSTOCKING—AN ANTI-SWARM REMEDY.

Deep entrances and selection in breeding will no doubt help to some extent about undesirable swarming; and so in torrid climes (or torrid days in nominally temperate climes) will double covers; yet the suspicion forces itself upon my mind that the real relief of H. L. Jones in Australia is the same as mine here—*overstocking of the location*, that king of anti-swarm remedies. It is quite desirable not to be fooled in such a matter as this. Number of bees may remain stationary if the pasturage is half plowed up. Also the honey supply need not be past if the pollen supply is over-reach. Page 536.

AN EXTRA-EARLY FALL FASHION.

And it's a new dress Miss Journie has, is it, and all to make her look young? Faith, and does she think she can hide the fact that she's comin' forty by a new dress? And wasn't the old dress as becomin' as any in town, sure? Why need she be worritin' the other girls and their sponsors by her extra-early fall fashions?

Don't you know I'm really queer on the subject of such changes in the papers I read. (I don't know whether any one else is affected that way or not.) It almost always takes me awhile to get reconciled to the change so as to like it even as well as the old style. Eventually I wonder at myself, and wouldn't go back for anything.

BEES AND BOYS.

Bee-keeping for boys, to keep them on the farm, page 548. Well, it may work sometimes; but usually when a boy is old enough to keep bees his heart has already gone to the city, or somewhere off the farm, and the remedy would come too late. 'Spects it would work better if begun a good deal earlier. At the place I call home are two boys that call me "Uncle Em." One is five and the other seven. Without any initiative of mine they long ago prest me to the promise that I would give them some bees when they got old enough. Two colonies to each it was to be. They sagely consider that two colonies would be very much nicer than one. This anticipation looks very big on their horizon; and they talk of it a great deal. *They don't throw dirt and clubs at the entrances of my hives now*, at least not exactly as they used to do. But they often run needless risks of being stung on purpose to get themselves injured to stings; and a sting seldom swells much on them now. They catch bees in hollyhocks, and hive them in fruit-cans—or did till no more fruit-cans for breakage could be obtained of mamma. It strikes me that we have here a pointer as to how to make a bee-keeper if desirable to make one.

IMPRISONMENT OF NUCLEI.

Anent the Somerford plan of nuclei I guess the damage from imprisonment of the bees is less than it would be from the desertions which elsewhere occur; also that making exit difficult is better than making it impossible. But don't forget to see that they have plenty of water poured into empty comb. Page 548.

A MIGHTY BUMP OF FAITH.

My, how Rambler's bump of faith is developing! He sees a coming uncapping-machine that will uncapp eight combs a minute (whole apiary in an hour), and a self-puffing smoker that will let the bee-man use both hands for something else! Page 551.

"LOST SWARMS."

On Wm. M. Whitney's problem, page 555, I'll guess the swarm went without clustering because they had been out several times before, and came back unseen—last time only the day before. A little later in point of time a wandering swarm of small size entered the same hive—because it was exhaling odor, and too much in a disturbance to fight. Having now a queen that could fly (and plenty of practice), the rest was easy as rolling off a log. In the common case of swarm intrusion which lasts only over night, both queens usually survive, I believe.

A Close and Exciting Election!

Which will be Elected?
How many Votes will he Get?

Send 25 cents for a three months' subscription to the

***** Farm, Field and Fireside *****

CHICAGO,

and a chance in the

Prize guessing contest
for \$5,000 in cash,

McKinley

Bryan

which will be awarded to those coming the nearest to the official figures of the popular vote cast for the successful presidential candidate.

The Publishers' Guarantee Association has deposited \$5,000 in the Metropolitan National Bank, Chicago, Ill., for the purpose of paying these prizes, under strict conditions preventing its use for any other purpose.

First Grand Prize, \$2,000,

to the nearest guesser, and 197 more cash prizes to be awarded as follows:

To the nearest correct guess.....	\$2,000.00
To the second	500.00
To the third	250.00
To the next 5, \$50.00 each.....	250.00
To the next 40, \$25.00 each.....	1,000.00
To the next 50, \$10.00 each.....	500.00
To the next 100, \$5.00 each.....	500.00
198 cash prizes	\$5,000.00

TO AID GUESSERS:

McKinley's popular vote in 1896	7,107,304
Bryan's popular vote in 1896.....	6,533,088

Our Offer: We have made arrangements with the Publishers' Guarantee Association, of Chicago, to enable our subscribers and friends to participate in these great cash prizes. Every one is invited to participate, and for each three months' subscription to the Farm, Field and Fireside sent us, accompanied by 25 cents, a guess will be allowed. Those remitting 50 cents for six months' subscription will be allowed two guesses, and those remitting \$1.00 for one year's subscription will be allowed four guesses. This applies both to new subscribers and to renewals. Present subscribers can send in their guesses, accompanied by the money, and their subscription will be extended.

How to Guess: When you send in your subscription you make your guess. Be sure you write your name and address and guess as plainly as possible. As soon as we receive your subscription we will fill out and send you a certificate corresponding to guess made by you, which will entitle you to any prize that you may draw. Be sure and keep your certificate. We will file the duplicate with the Publishers' Guarantee Association. Every subscriber will receive as many certificates and have as many guesses as he sends subscriptions to Farm, Field and Fireside.
In case of a tie, or that two or more estimators are equally correct, prizes will be divided equally between them.

What They Say of

THE

ABC of Bee-Culture

We have just received the latest edition of this manual of apiculture, published by the celebrated house of The A. I. Root Co., and, after having gone over it attentively, we do not fear to affirm that it is the most learned treatise that has ever been published on bees and their culture.

This work was written for American novices, but it will be none the less profitable to skillful practitioners who will find mentioned therein all the discoveries and progress in modern apiculture. Its title, "A B C of Bee-Culture," is too modest; it deserves, rather, to be called an encyclopedia of bee-culture. This work is, in fact, a veritable magazine where all questions relative to apicultural science are explained with the greatest thoroughness. The subjects in it are arranged in alphabetical order, with numerous engravings, finely executed, which aid to a proper understanding of the text.

Since the first edition, published in 1877, 67,000 copies have been sold. This unprecedented success indicates sufficiently the value of the work, which, in every respect, is a perfect one. The typography, the illustrations, the paper, the binding, leave nothing to be desired. Let no one believe here that we make an idle boast. The humble praise we have accorded this work is based on its real merit, to which the masters of apicultural science have already rendered the most flattering testimonies.

The well-known editor of *Gleanings in Bee-Culture*, one of the bee-journals the most widely known, is better situated than anybody else to follow the progress of modern apiculture. Not only is Mr. E. R. Root in correspondence with the leading lights in modern apiculture, but he is at the head of the most extensive apicultural establishment that exists. Not only has he gathered together the experiences of the most celebrated bee-keepers during the past 22 years, but, before accepting them and putting them in his book, he has carefully tested them all, and has experimented with all in his own apiary; hence one should look in this book for the most recent conclusions in movable-frame apiculture. It is there, also, that one will find the best systems. Nowhere, it is well known, has the development of apiculture been so great as in North America. The Americans, eminently industrious and practical, have made bee-keeping a special source of revenue. It is, consequently, of great interest to study their methods, the best of which are explained in the *ABC of Bee-Culture*, and which will, we believe, extend the horizon of all beginners who have entered the apicultural field with the object of making it a means of livelihood. We do not know how to urge those of our readers any more strongly, if they understand English, to get this book. We hope to see it published in French. We are satisfied that it would have in France, as well as in America, a considerable success.

L. P. PRIEUR.
Revue Eclectique, Sainte Soline, par Lezay,
Deux Sevres, France, February, 1900.

While the book has been enlarged, and hundreds of pages have been rewritten and revised, the price will be the same as before: \$1.20 post-paid, or \$1.00 by express or freight with other goods; or when sent with our journal, *GLEANINGS IN BEE-CULTURE*, which is a constant appendix to the *A B C* book, a journal beautifully printed and illustrated, 42 pages, for the very low price of \$1.75 for the two. For quantity of up-to-date bee-literature there is nothing else offered at this low price.

The new edition will be ready for delivery about Nov. 15. Send your orders at once to get a copy of the first lot from the bindery. Orders filled in rotation. Orders may be sent to the undersigned, or to any dealer in bee-keepers' supplies, or to booksellers generally.

THE A. I. ROOT CO.,
MEDINA, OHIO.

GENERAL ITEMS

Season's Report—Dog Stung by Bees

The honey crop in this section is short about one-half. I have 4 apiaries, two located near large fields of sweet clover, and I secured 5,000 pounds from those two with 150 colonies of bees. The other two consisted of about 125 colonies, and depended principally on basswood for a surplus. I secured from these latter two only 2,500 pounds.

While extracting about the first of June, a mad dog came into the apiary; the bees were pretty cross, so I had a little fun. I have heard it said that a mad dog will not halloo or complain from any sort of punishment, but that one did. I did not think about the dog being mad at the time. I thought it strange that he should lie down and snap at the bees as he did. I have seen several dogs stung, but they would run off as soon as the first bees stung them. I could have killed this one easily, but supposed it belonged to some negroes near the apiary. A few hours afterward, some negroes killed him, and came to the apiary and told me about his being mad. I concluded then that anything a lot of angry bees could not run, did not have much life in it.

The Bee-Keeper's Guide

Or, Manual of the Apiary,

—BY—
PROF. A. J. COOK.

460 Pages—16th (1899) Edition—18th Thousand—\$1.25 postpaid.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published to-day. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without THE BEE-KEEPERS' GUIDE.

This 16th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to GIVE AWAY to our present subscribers, for the work of getting NEW subscribers for the American Bee Journal.

Given for TWO New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the two NEW subscribers—simply the Bee Journal for one year:

Send us TWO NEW SUBSCRIBERS to the Bee Journal (with \$2.00), and we will mail you a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both for only \$1.75. But surely anybody can get only TWO NEW SUBSCRIBERS to the Bee Journal for a year, and thus get the book as a premium. Let every body try for it. Will YOU have one?

GEORGE W. YORK & CO.,
 118 Michigan Street, CHICAGO, ILL.

California! If you care to know of its Fruits, Flowers, Climate or Resources, send for a sample copy of California's Favorite Paper—

The Pacific Rural Press,
 The leading Horticultural and Agricultural paper of the Pacific Coast. Published weekly, handsomely illustrated, \$2.00 per annum. Sample copy free.

PACIFIC RURAL PRESS,
 330 Market Street, SAN FRANCISCO, CAL.

Norton is right, and glad of it, as I have been working on the same thing at odd times since 1898, on the till or drawer system. I learned that the colony would swarm with very light flows. This has been a poor season for surplus honey—a continuation of short flows all summer. It has been fine for increase. My apiary has increased from 30, spring count, to 82, with clipped queens, and only 1200 pounds of extracted honey. There is a full flow of white chapperrall now on, and the broomweed and other fall producers are looking fine. J. M. McCURDY.
 Frio Co., Tex., Sept. 14.

[Mr. Norton replies as follows to the above.—EDITOR.]

In reply to the letter from J. M. McCurdy, I would say that I consider the chaff packing in my hives just as necessary in Texas as Illinois, as it equalizes the temperature, thus avoiding changes that would destroy the eggs. It is very essential that the bees fill the body of the hive, and cluster on all side-walls to attain success. Five or six frames should be well filled with brood, and hen's eggs may be placed over the cluster as early in the spring

The Best Dishorner.
 The easiest on both operator and cow, because it makes the smoothest, quickest cut. Is the **CONVEX DISHORNER.**
 My Bucker Stock Holder and calf dishorners are equally good. All dishorning appliances. Geo. Webster, Box 123, Christiana, Pa. Western trade supplied from Chicago. Illustrated Book Free.

The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

[THIS CUT IS THE FULL SIZE OF THE KNIFE.]

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a last-time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.10, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00.) We will club the Novelty Knife and the Bee Journal for one year, both for \$1.90.

GEORGE W. YORK & CO., 118 Mich. St., Chicago, Ill.

Please allow about two weeks for your knife order to be filled.

Please mention the Bee Journal when writing Advertisers.

as bees are in this condition. If your bees show signs of swarming during the time you are hatching chickens in the hives, use the extractor freely—it will stop swarming, and not lower the temperature.

I consider any material similar to oats chaff just as good, tho I have used oats chaff mostly. J. G. NORTON.

It is Willow-Herb.

Is the enclosed plant willow-herb? I have been told that it is. I saw hundreds of acres of it in full bloom a month ago, about 75 miles from here, and if it is the willow-herb I shall make arrangements to have my bees there next year. JOHN ATKINSON. Crow Wing Co., Minn., Aug. 29.

Pleurisy-Root or Milkweed.

I enclose a plant I would like to have named. It yields a good deal of pollen. Does it yield any honey? Cook Co., Ill. JOHN ROORDA.

Prof. Walton replies as follows:

The plant is the butterfly-weed, or pleurisy-root, *Asclepias tuberosa*, and belongs to the milkweed family. Nearly all milkweeds have an abundance of pollen in waxy masses suspended from the stigma. They furnish considerable nectar, and the bees going in quest of it carry the pollen from flower to flower, and thus aid in cross-fertilization. In the "Bee-Keepers' Guide" milkweed is mentioned as a good honey-plant.—C. L. WALTON.

Almost a Total Failure.

The honey crop is an almost total failure in this part of Minnesota. In one or two places a little surplus was secured, but with most bee-keepers it was not.

Bees have plenty for winter, mostly from sweet clover and wild buckwheat, which took a second growth after the heavy rains in August. How it will do for wintering is a question.

J. M. DOUDNA. Douglas Co., Minn., Sept. 20.

Pinweed.

Prof. Walton, reporting on a plant specimen sent to us and mentioned a few weeks ago, by E. B. Kauffman, of Lebanon Co., Pa., says this:

"The specimen sent for identification is pinweed, *lechea minor*. It is quite common in dry, sandy soil, and blossoms from June to September. It is an indifferent honey-producing plant."

Bees Away Up North.

The precious colony I wrote about last fall is my precious colony still, tho it is divided into three thriving little communities now. It came out strong in the spring, and found its way to the sugar-bush, where we had some maple trees cut down. The stumps were running over with sap, which delighted the bees till they got the pussy-willows and dandelions. But when fruit-bloom came they fairly took possession of the garden. The noise they made was wonderful, and they looked so strong we were afraid

Sharples Cream Separators: Profitable Dairying

they would swarm out and leave us, so we divided them, putting the queen on the new stand, and left the bees to do the rest. But after all this they sent off a swarm, tho we had no trouble in hiving them, and at the end of July we had a nice lot of honey—the best I ever tasted, I think.

This is a nice place for honey-bees after all. I would like to get one of Dr. Miller's queens for the poorest colony, I think, as I am not quite sure about their queen. I see some white babies being carried out—not full size, so I fear laying workers.

We have had a very severe drouth the last six weeks, but are having a good rain now.

TOM HENRY.

Muskoka, Canada, Sept. 19.

Pleased With Tall Sections and Fences.

I have five 8-frame hives with Ideal supers and section fence-separators. I am well pleased with the fence-separators. I got 148 sections of nice water-white honey from one colony in the spring, and I now have about 25 sections of dark honey on the same hive, which I shall not take off. My other four colonies did well. I will not get any fall honey on account of drouth, as we have had no rain for two months. Holly is our main white honey producer here, beginning to bloom about May 1st and continuing about five weeks.

I take four bee-papers and read them thoroly. I also have some good textbooks. I hope every reader appreciates the American Bee Journal as I do, and that it may long continue to send out its weekly budget of interesting information.

JOHN P. McCASLIN.

Grenada Co., Miss., Sept. 18.

Illinois.—The annual meeting of the Northern Illinois Bee-Keepers' Association, will be held in the Court House in Freeport, Ill., on Tuesday and Wednesday, Oct. 16 and 17, 1900. All are cordially invited to attend.

B. KENNEDY, Sec.

R. F. D. No. 5, Rockford, Ill.

Convex Dishorner.—We notice with pleasure the advertisement of George Webster, of Christiansburg, Pa., elsewhere in this issue. Mr. Webster will be remembered as the manufacturer of the celebrated Convex Dishorner, the firm having been formerly Webster & Dicklason. Some months ago Mr. Webster purchased his partner's entire interest and now is sole owner of the business. A very convenient feature of his sales department is the branch in Chicago from which western orders are filled. All orders, however, go to Christiansburg as heretofore. Mr. Webster is advertising several new special appliances—one a calf dishorner, and another his Bucker stock-holder—a most effective aid to proper dishorning. It is to the interest of every breeder of cattle to correspond with Mr. Webster and get his catalog, not forgetting to mention the American Bee Journal.

The Mississippi Valley Democrat

—AND—

Journal of Agriculture,

ST. LOUIS MO.

A wide-awake, practical Western paper for wide-awake, practical Western farmers, stock-raisers, poultry people and fruit-growers, to learn the science of breeding, feeding and management. Special departments for horses, cattle, hogs, sheep, poultry and dairy. No farmer can afford to do without it.

It stands for American farmers and producers. It is the leading exponent of agriculture as a business, and at the same time the champion of the Agricultural States and the producer in politics. **Subscription, One Dollar a Year.**

The Emerson Binder

This Emerson stiff-board Binder with cloth back for the American Bee Journal we mail for but 60 cents; or we will send it with the Bee Journal for one year—both for only \$1.40. It is a fine thing to preserve the copies of the Journal as fast as they are received. If you have this "Emerson" no further binding is necessary.

GEORGE W YORK & CO.

118 Michigan Street, CHICAGO, ILL.

FOR HOMESEEEKERS.

The Chicago, Milwaukee & St. Paul R'y will sell regular Homeseekers' Excursion tickets to all points in South Dakota, at one fare plus \$2.00 for the round trip, on Sept. 18 and Oct. 2, 1900. This will enable parties to visit the Corn Belt Exposition to be held in Mitchell, S. D., Sept. 26 to Oct. 4, 1900, inclusive. This exposition is held to demonstrate the great agricultural resources, wealth and possibilities of this thriving State. The exposition is held in a gorgeously decorated corn-palace, which for beauty can hardly be excelled anywhere by a building of a temporary nature. There are thousands of acres of cheap lands left in South Dakota that will, under the present conditions in that State rapidly increase in price, and the holding of this corn-palace with its many attractions, that both amuse and instruct, should be an opportunity that all land and investment seekers should embrace.

For further information apply to any ticket agent of the Chicago, Milwaukee & St. Paul R'y, or address Geo. H. Heafford, General Passenger Agent, Chicago. 39A3t

The Humphrey Bone-Cutter advertisement appears in this issue, and we very gladly call the attention of our readers to it. The Humphrey machine is not an experiment; Mr. Humphrey, the maker, is both a skilled machinist and a practical poultryman. They are issuing a very handsome catalog of which their Egg Record is a new feature. Write to Humphrey & Sons, Joliet, Ill., and mention this paper.

HONEY AND BEESWAX
 MARKET QUOTATIONS.

CHICAGO, Sept. 27.—Choice to fancy comb is selling at 15@16c per pound; good to No. 1, 14@15c; No. 2, white, 12@13c; amber, 11@12c; off grades, including buckwheat, from 9@10c. Extracted white, 7½@8c; ambers, 7@7½c; dark and off grades, 6½@7c. Beeswax, 28c.

The market is strong, and sales are prompt of nearly all arrivals. R. A. BURNETT & Co.

KANSAS CITY, Sept. 13.—Fancy white comb honey, 14@15c; No. 1 white, 13½@14c; No. 1 amber, 12c; dark, 11@11½c. Market firm. Demand good, receipts light. Beeswax, 25@30c. W. R. CROMWELL PRODUCE CO.,
 Successors to C. C. Clemons & Co.

BUFFALO, Sept. 28.—Fancy one-pound comb very light receipt and much wanted at 16 cents mostly, occasionally 17c; very light supply; poor also selling 14@15c as grades. Extracted, no stock here, and not in great demand at any time in Buffalo. Fancy beeswax, 30@33c; dark, etc., 24@28c. BATTERSON & Co.

NEW YORK, Sept. 28.—Comb honey in good demand for all grades at 15@16c for fancy white; 13@14c for No. 1 white; 12c for amber and 10@11c buckwheat. Extracted in fair demand at 7@7½c for white, 6½@7c for light amber; 6c amber, and 5½c dark. Beeswax quiet and declining; selling at from 27@28c. HILDRETH & SEGELKEN.

BOSTON, Sept. 21.—Our honey market is very strong at the following prices, with supplies very light: Fancy one-pound cartons, 17c; A No. 1, 15@16c; No. 1, 15c; No. 2, 12@13c. Extracted from 7½@8½ cents, according to quality.

Can see no reason why these prices should not be well maintained right thru the season.

BLAKE, SCOTT & LEE,

CINCINNATI, Sept. 21.—The demand for fancy comb honey is good and finds ready sale at 16@16½c; No. 1, 15c. The demand for extracted honey at present is slow and offer same by the barrel as follows: White clover, 8½@9c; Southern, 6½@7½c; Florida, 7@8 cents, according to quality. Beeswax, 27c.

The above are MY SELLING PRICES. I do not handle any honey on commission, but pay spot cash on delivery. C. H. W. WEBER.

ALBANY, N. Y., Sept. 22.—Demand good, now at firm prices; White comb, 15@16c; mixt white, 13@15c; amber, 12@13c; buckwheat, 11@12c. Extracted, white, 8@9c; mixt white, 8@8½c; amber, 7@7½c; buckwheat, 6@6½c. H. R. WRIGHT.

DETROIT, Sept. 21.—Fancy white comb 15@16c; No. 1, 13@14c; amber and dark, 10@12c. Extracted, white, 7@8c; dark, 5@6c. Beeswax, 25@26c. M. H. HUNT & SON.

SAN FRANCISCO, Sept. 12.—White comb, 12½@13½ cents; amber, 11½@12½c; dark, 7½@9c. Extracted, white, 7½@8c; light amber 6½@7½c; amber, 5½@6½c. Beeswax, 26@28c.

There is a very healthy tone to the market, which bids fair to continue thruout the season. Spot supplies are light of all descriptions, and buyers are not lacking at full current rates.

WANTED—HONEY AND BEESWAX.

We have a tremendous and growing trade in this line, and would like to hear from all who have such goods to sell in any part of the country, with quality, description, and lowest cash price. THOS. C. STANLEY & SON, Fairfield, Ill.

MADE TO ORDER.

Bingham Brass Smokers,

Made of sheet-brass which does not rust or burn. It should last a life-time. You need one, but they cost 25 cents more than tin of the same size. The little pen cut shows our brass hinge put on the three larger sizes.

No wonder Bingham's 4-inch Smoke Engine goes without puffing and does not

DROP INKY DROPS.

The perforated steel fire-grate has 381 holes to air the fuel and support the fire. Prices: Heavy Tin Smoke Engine, four-inch Stove, per mail, \$1.50; 3½-inch, \$1.10; three-inch, \$1.00; 2½-inch, 90 cents; two-inch, 65 cents.

BINGHAM SMOKERS

are the original, and have all the improvements, and have been the STANDARD OF EXCELLENCE for 22 years. Address, T. F. BINGHAM, FARWELL, MICH. Please mention Bee Journal when writing.

QUEENS

Untested Queens, Italian, 60 cents. Tested, \$1. From honey-gathering stock. We keep in stock a full line of popular Apiarian Supplies. Catalog free.

Apiaries—Glen Cove, L.I. I. J. STRINGHAM, 105 Park Place, New York, N. Y.

Please mention Bee Journal when writing.

Four Celluloid Queen=Buttons Free

AS A PREMIUM For sending us ONE NEW SUBSCRIBER to the Bee Journal for the balance of this year, with 30 cents, we will mail you FOUR of these pretty buttons for wearing on the coat-lapel. (You can wear one and give the others to the children.) The queen has a golden tinge.

This offer is made only to our present regular subscribers.

NOTE.—One reader writes: "I have every reason to believe that it would be a very good idea for every bee-keeper to wear one [of the buttons] as it will cause people to ask questions about the busy bee, and many a conversation thus started would wind up with the sale of more or less honey; at any rate, it would give the bee-keeper a superior opportunity to enlighten many a person in regard to honey and bees."

Prices of Buttons alone, postpaid: One button, 8 cts.; 2 buttons, 6 cts. each; 5 or more, 5 cts. each. (Stamps taken.) Address,

GEORGE W. YORK & CO., 118 Michigan St., CHICAGO.

FORTIETH YEAR.
No. 41.

WEEKLY

MR. W. F. MARKS, of New York,
Director of the National Bee-Keepers' Association.

(Kindness of Gleanings in Bee-Culture.)

THE AMERICAN BEE JOURNAL.

PUBLISHED WEEKLY BY

GEORGE W. YORK & CO.

118 Michigan St., Chicago, Ill.

[Entered at the Post-Office at Chicago as Second-Class Mail-Matter.]

IMPORTANT NOTICES:

The Subscription Price of this journal is \$1.00 a year, in the United States, Canada, and Mexico; all other countries in the Postal Union, 50c a year extra for postage. Sample copy free.

The Wrapper-Label Date of this paper indicates the end of the month to which your subscription is paid. For instance, "Dec 00" on your label shows that it is paid to the end of December, 1900.

Subscription Receipts—We do not send a receipt for money sent us to pay subscription, but change the date on your wrapper-label, which shows you that the money has been received and duly credited.

Advertising Rates will be given upon application.

Reformed Spelling.—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affixes a preceding sound. Also some other changes are used.

The Weekly Budget

MR. E. E. HASTY, of Lucas Co., Ohio, writing us Oct. 3d, said:

"This is the last day of the 21st year of my ownership of this apiary—and about the 49th since I helped to found it, by going with my father to get its two initial hives."

RAYMOND J. CLARK, the 23-year-old son of L. J. Clark, of Winona Co., Minn., mysteriously disappeared from Winona, Minn., Aug. 18, 1900, and has not been heard from since. Any information as to his whereabouts would be thankfully received.

MR. MICHAEL JOYCE, of Clay Co., Nebr., called on us Oct. 5th. He reported the seasons for two years as failures, most bees dying from lack of food. He now has 10 colonies, and averaged 50 pounds this year. The prospects for next year appear good, as they have had plenty of rain this fall.

SENATOR G. W. SWINK is the great muskmelon and honey producer of Otero Co., Colo. Early in September a Chicago commission firm received and sold 100 cases of Mr. Swink's fine comb honey at 17 cents a pound, which was one or two cents above the market. It was said to be as fine honey as ever came to Chicago. The firm handling the honey say they intend feeding Chicago people on the luscious Colo-

rado muskmelons in summer and on the rich honey in winter from the same locality.

MR. C. P. DADANT called on us last Wednesday, when on his way home from his European trip. He reports a splendid time, and will write a number more letters about his long trip. He was looking well, but was very glad to get home once more. He had a delightful reception at the Paris Bee-keepers' Congress. The name of Dadant seems to be as widely known in France as in America—and that is no small thing.

ALFALFA HONEY IN UTAH.—Uinta County seems to be one of the best localities in the State of Utah for fine alfalfa honey. A local newspaper publishes a long article on the subject, closing with these paragraphs:

"The crop of honey produced in this county this season has been a phenomenal one when the facts are taken into consideration, because of drouth the second crop was a partial failure, and the entire cultivated area of the county does not exceed 30,000 acres.

"The people from all parts of the

country unhesitatingly pronounce our honey the best that they ever tasted, and our people often boast that honey produced here is the best in the world.

"By making a great effort we have secured a report of the amount of honey produced this year by a majority of our bee-keepers, tho there are several yet to hear from. Following are the figures:

"James Hacking, 24,000 pounds; Geo. Freestone, 14,000; Green & Crandal, 20,000; Jacob Collier, 10,000; Weeks Bros., 8,000; Richens & Christensen, 35,000; Geo. Glines, 8,000; C. C. Bartlett, 45,000; J. H. Holgate, 25,000; G. W. VanGundy, 26,000; Bartlett Bros. & Merkle, 53,000; Lewis Lind, 7,500; Orin Perry, 8,000; Thomas Bingham, 4,500; George Langston, 7,200; Abner Richens, 10,500; Alfred Powell, 8,100; Philly Stringham, 4,200. Total, 318,400 pounds."

We have just received a carload of alfalfa honey from the county mentioned in the above, and it is a fine article. Our prices are given below. There ought to be no trouble to develop a large local demand almost anywhere with such beautiful honey to offer to the public.

== BEST ==

Extracted Honey For Sale

ALL IN 60-POUND TIN CANS.

ALFALFA HONEY *****

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

BASSWOOD HONEY *****

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms in Wisconsin. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

Prices of Either Alfalfa or Basswood Honey:

A sample of either, by mail, 8 cents; samples of both, 15 cents—to pay for package and postage. By freight—one 60-pound can, 9½ cents per pound; two cans, 9 cents per pound; four or more cans, 8½ cents per pound. Cash must accompany each order. If ordering two or more cans you can have half of each kind of honey, if you so desire. This is all

ABSOLUTELY PURE BEES' HONEY,
The finest of their kinds produced in this country.

Read Dr. Miller's Testimony on Alfalfa Honey:

I've just sampled the honey you sent, and it's prime. Thank you. I feel that I'm something of a heretic, to sell several thousand pounds of honey of my own production and then buy honey of you for my own use. But I have loyal one ought to be to the honey of his own region, there's no denying the fact that for use in any kind of hot drink, where one prefers the more wholesome honey to sugar, the very excellent quality of alfalfa honey I have received from you is better suited than the honeys of more market flavor, according to my taste.
C. C. MILLER.
McHenry Co., Ill.

Order the Above Honey and then Sell It.

We would suggest that those bee-keepers who did not produce enough honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

* Editorial Comments. *

Mailing Clipt Queens.—In the department of "Questions and Answers," a correspondent inquires why the wings of the Dr. Miller premium queens were clipt before being sent out, and he is entitled to a fuller answer than he there receives.

It should be frankly stated in the outset that it is to be regretted that it was not distinctly mentioned in advance that the premium queens would be clipt. Then there would have been no chance for misunderstanding. But one does not always think of everything in advance.

It would have been easier, of course, to have sent out the queens without clipping, but after careful consideration it was concluded that the best interests of those receiving the queens would be served by having the queens clipt before mailing. It was believed that the large majority would prefer to have their queens clipt in advance—a belief that seems warranted by the fact that only *one* of the whole number receiving the queens has entered any protest.

This brings up the general subject of clipping all queens previous to mailing, a practice that is beginning to prevail to a small extent, and it may be well to give some reasons why it should more generally prevail. The number of those who prefer to have queens clipt has been constantly on the increase, and among those who receive queens by mail are no doubt many who have had little or no experience in clipping queens, but still prefer them without whole wings. Our correspondent says: "It seems to me that if the purchaser wishes the wings clipt, he can do it." It would be at much inconvenience that a purchaser could clip a queen on arrival, for she is in an introducing-cage, and if taken out for the purpose of clipping, there are chances that she might decide to make use of her wings before the clipping was done. Instead of being to the trouble of taking the queen out of the cage and then putting her back into the cage after being clipt, the purchaser would naturally prefer that the operation should be performed by the one who cages her for mailing, for it is comparatively little trouble to clip her while she is in his fingers for caging.

Aside from the generally familiar reasons why a queen should be clipt so that she may not decamp with a swarm, there is a very important reason why a queen received by mail should be clipt, even if the purchaser should prefer that all the rest of his queens should be unclipt. It is that clipping is necessary for the purpose of identification. A queen is received thru the mail, and after the purchaser has had sufficient time to note results, he finds no improvement in his stock. It is important that he should know for certain that the queen in the hive is the identical queen he received by mail. It is difficult in most cases, if not impos-

sible, to be entirely certain whether the queen in a hive is the one introduced or some other. The cases are by no means rare in which two queens are in a hive, a mother and a superseding daughter. The bee-keeper kills one, but the other remains to kill the new queen after she is put in the hive. Sometimes an unsuspected queen-cell is present, and a queen from that takes possession. It sometimes happens that a virgin, or even a laying queen, enters from some other hive, after the bee-keeper has made sure, as he thinks, of the impossibility of the presence of anything in the shape of a queen. In all these cases it is highly important that the new queen be clipt, so that she may be positively identified.

A Stray Straw in last Gleanings in Bee-Culture is right to the point, and is as follows:

August 18th I took a queen from a nucleus and gave it a caged queen-cell due to hatch Aug. 22d. Aug. 31st I gave it a frame of young brood. Sept. 18th I found eggs and brood, and on the same comb, not two inches apart, two queens, one a virgin by her looks. The case looks a little like this: When the frame of brood was given Aug. 31st, the bees started a queen-cell as a precautionary measure, because their queen was not yet laying, and then allowed both to continue. But did you ever know of such an exception before? Now, suppose these had been black queens, and I had sent to a queen-breeder for an Italian, which I introduced after killing one of the blacks without seeing the other. The Italian would be killed, and three weeks later I would find only blacks hatching, and would feel sure a black queen had been sent me.

[This can and probably does explain how, in one way, a good tested queen turns out to be no better than a common black. Lately we have been clipping our best queens, and only this week we had a case where a customer reported that an imported we had sent him was nothing but a hybrid. We wrote back, and asked if the queen now in the hive had a clipt wing. We have not yet heard from him, but are morally certain that one of two things is true—either that he does not know how to distinguish hybrids from pure Italians, or that the queen has got supplanted in the manner you speak of. It has very often happened, when we have ferreted the matter clear down, that there has been an exchange of queens. The customer was entirely honest, and supposed that we had, of course, made some mistake.—EDITOR.]

The question arises: If the A. I. Root Co., think it advisable that the "best queens" be clipt before mailing, is it not equally desirable for queens of less value?

Extracting-Combs and Unfinished Sections.—Getting such cleaned up by the bees in the fall is considered by some to be an unnecessary labor. Before acting too largely on that belief, it may be well for the novice to remember that such cleaning up by the bees is at least safe, and that it will *not* result in having anything sour in the combs, nor in having granules to help granulation in the honey the following season.

If a large number of sections or extracting-combs are to be cleaned, the most rapid way to have it done is to use the B. Taylor plan, and expose all at once as fully as possible in the open air for the bees to rob out. While this is

the most rapid way, it is not the safest way in all cases, for if the amount to be cleaned up is not sufficiently large for the number of bees, the sections and the extracting-combs that are not tough thru age will be badly torn. For the beginner at least, the safer way is to use the Dr. Miller plan, and allow access to the combs by means of an entrance large enough to admit only one bee at a time.

It will be still better if you can induce the bees to clean out the combs by placing them over strong colonies and allowing only a small passage between the lower and upper stories. But in some cases the bees will not do this.

The Illinois State Fair was held Sept. 24th to 29th, inclusive. The exhibits of bees and honey were excellent, but confined to a very few exhibitors. Mr. F. Grabbe, of Lake Co., Ill., was judge of the apianian exhibits. The following is a list of the awards and winners of them, kindly furnished by Mr. Jas. A. Stone, secretary of the Illinois Bee-Keepers' Association:

Display of comb honey—1st premium, Jas. A. Stone & Son, \$20; 2d, Chas. Becker, \$15; 3d, J. Q. Smith, \$10.
 Collection of labeled cases of white honey—1st, J. Q. Smith, \$8; 2d, Chas. Becker, \$5; 3d, Jas. A. Stone & Son, \$3.
 Collection of labeled cases of amber or dark honey—1st, J. Q. Smith, \$8; 2d, Chas. Becker, \$5.
 Case of white clover comb honey—1st, J. Q. Smith, \$4; 2d, Jas. A. Stone & Son, \$3; 3d, Chas. Becker, \$2.
 Case of sweet clover honey—1st, J. Q. Smith, \$4; 2d, Chas. Becker, \$3; 3d, Jas. A. Stone & Son, \$2.
 Case of basswood comb honey—1st, Chas. Becker, \$4; 2d, Jas. A. Stone & Son, \$3; 3d, J. Q. Smith, \$2.
 Case of amber comb honey—1st, Chas. Becker, \$4; 2d, J. Q. Smith, \$3; 3d, Jas. A. Stone & Son, \$2.
 Display of extracted honey—1st, Chas. Becker, \$20; 2d, J. Q. Smith, \$15; 3d, Jas. A. Stone & Son, \$10.
 Display of honey extracted on the grounds 1st, Chas. Becker, \$5; 2d, J. Q. Smith, \$3.
 Frame of comb honey for extracting—J. Q. Smith received all three premiums—1st, \$5; 2d, \$3; 3d, \$2.
 Display of candied honey—1st, J. Q. Smith, \$20; 2d, Chas. Becker, \$15; 3d, Jas. A. Stone & Son, \$10.

Non-Swarmers Good Harvesters.—A Stray Straw in Gleanings in Bee-Culture says:

Formerly I thought that a colony that did not swarm stored more than others simply because of not swarming. I am gradually settling into the belief that, when you find a colony not given to swarming, you find unusually good harvesters, and *vice versa*.

Expresses His Thanks Untested Queens.—The following letter from Dr. Miller needs no explanation from us:

MR. EDITOR:—I wish you would express my hearty thanks to the many that have sent words of appreciation of the premium queens sent out. But that my time is so fully occupied, it would have been a pleasure for me to have written a personal word to each.

It has been a matter of surprise that a few have had erroneous views as to what constitutes an untested queen. They seem to have thought that it was one which would without fail be properly received by the colony to which it was introduced, and would do good work at laying *after* being thus introduced. Instead of that, all that is to be demanded of one who sends out an untested queen is that she shall be the daughter of certain stock, and that she shall lay before being sent out. The responsibility of the sender ends with that, unless he specially agrees to replace

any queen that arrives dead. Every one of the premium queens sent out was the progeny of stock that had an extra record for honey-production, and every one of them did good work at laying *before* being sent out. There will be some losses in introduction, and occasional cases in which queens do poor laying after being thru the mail, but the receiver takes the risk of that.

One subscriber mailed me a queen, with the desire that I replace it, saying it did not lay. Even if it had been the right thing to replace any that did not lay, I could hardly be asked to replace that queen, for the queen he sent to me was not the one I sent to him, having entire wings, whereas the one I sent him was clipped. I have no doubt he was honest in supposing he had returned the queen I sent him, as he says he killed the queen in the hive before the introduction, but it is by no means a rare thing for a virgin queen to turn up in a hive where she is not suspected.

As I said some time ago, there will no doubt be among the premium queens some that are not up to the mark, but the great majority of them will, I think, give a good account of themselves. C. C. MILLER.

Foreign Apianian Views.—The views and practices of bee-keepers in other countries differ so much from those of this country that one is at a loss to account for it. In England, as well as in some other countries, the black bee is by a great many preferred to the Italian, whereas in this country the Italian is almost universally preferred.

In this country the number of bee-keepers who make their own comb foundation is very small, and nearly all the foundation is made on cylinder machines, while in Germany thousands of foundation presses are owned and operated by bee-keepers.

In this country a brood-comb ten years old is considered better than one freshly drawn out, while across the water a ten-year-old comb is considered objectionable. H. Stassart, a writer in the French journal, *l'Abeille et sa Culture*, advises that each year at least two of the old combs in a brood-nest be replaced by frames of foundation. It would be hard to get many bee-keepers in this country to do that if the frames of foundation were furnished free.

The same writer says it is essential that every colony that has not swarmed shall have its queen renewed at least once in three years. In this country it is generally preferred to leave the matter to the bees, and it is probably rare that the bees will continue a queen longer than the three-year limit.

York's Honey Calendar for 1900 is a 16-page pamphlet especially gotten up to create a demand for honey among should-be consumers. The fore part was written by Dr. C. C. Miller, and is devoted to general information concerning honey. The latter part consists of recipes for use in cooking and as a medicine. It will be found to be a very effective helper in working up a home market for honey. We furnish them, postpaid, at these prices: A sample free; 25 copies for 30 cents; 50 for 50 cents; 100 for 90 cents; 250 for \$2.00; 500 for \$3.50. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

“**The Hum of the Bees** in the Apple-Tree Bloom” is the name of the finest bee-keeper's song—words by Hon. Eugene Secor and music by Dr. C. C. Miller. This is thought by some to be the best bee-song yet written by Mr. Secor and Dr. Miller. It is, indeed, a “hummer.” We can furnish a single copy of it postpaid, for 10 cents, or 3 copies for 25 cents. Or, we will mail a half-dozen copies of it for sending us *one new* yearly subscription to the American Bee Journal at \$1.00.

Our Wood Binder (or Holder) is made to take all the copies of the American Bee Journal for a year. It is sent by mail for 20 cents. Full directions accompany. The Bee Journals can be inserted as soon as they are received, and thus preserved for future reference. Upon receipt of \$1.00 for your Bee Journal subscription *a full year in advance*, we will mail you a Wood Binder free—if you will mention it.

Convention Proceedings.

Report of the Proceedings of the 31st Annual Convention of the National Bee-Keepers' Association, held at Chicago, Ill., Aug. 28, 29 and 30, 1900.

BY DR. A. B. MASON, SEC.

(Continued from page 632.)

After a short intermission, the convention was again called to order by Pres. Root, and Miss Ethel Acklin delighted the delegates with a song.

Mr. N. E. France moved as follows: As there is a great difference in score cards in judging bees, honey, and supplies at the fairs of our land, I move that this National Bee-Keepers' Association appoint a committee of three to consider the matter and report on the same before we adjourn. The motion was seconded and carried.

THE MAILING AND REARING OF QUEEN-BEES.

Pres. Root—Is there anything further before we renew the discussion on Mrs. Acklin's paper, the rearing of queens? Where we left off was whether queens are injured in transmission thru the mails, and whether we should rear our own queens or buy them. You may not care to go on with that, but I simply tell you where we left off.

Dr. Mason—Queens are injured in the mail, or else those who have sent me queens have defrauded me, and that I don't believe, because I have gotten them from Root, Dadant, Hutchinson and Doolittle, and I don't believe I have been defrauded by any one of them; I believe the queens are injured in the mails.

H. F. Moore—I can think of one instance where they may be injured. At my station the mail train goes by at 40 miles an hour, and the mail-bags are thrown off at that speed against a shanty. I am satisfied a queen would not be worth very much after passing thru that ordeal.

E. Kretchmer—I know of one instance where every bee in the cage was killed by being thrown from a rapidly passing train.

Pres. Root—Are you sure it was from the concussion they received, or was it from some other cause?

Mr. Kretchmer—They had not been in the mail-bag more than 10 to 15 minutes.

Mr. Poppleton—I have quit ordering bees thru the mail entirely.

Mr. Hutchinson—There is something else besides rough treatment; some of the very best queens I have had have been sent a long distance by mail; while the queens may not apparently be injured, people report they are almost worthless, and superseded in a very short time. There is something about putting them in a little cage and sending them away in the height of the season that seems to weaken their laying powers.

Mr. France—I have noticed over the State of Wisconsin this year more than usual that specially tested laying queens were the ones that complaint was brought about, and I think the sending of a laying queen by mail is a detriment to her.

Frank Coverdale—I received 50 queens in one batch from Texas, about two years ago, and all were introduced safely without the loss of one, but two smothered to death, which might have happened in Mr. Kretchmer's case; they might have been smothered instead of being killed in the mail. All those queens came thru as perfectly as if I had reared them myself. That is a pretty big batch.

Dr. Mason—How do you know they were smothered?

Mr. Coverdale—I watcht them smother.

A Member—What did you let them smother for?

Dr. Mason—Did they smother after they got to your place?

Mr. Coverdale—The weather was very hot; I had to get them down cellar in a hurry.

Mr. Abbott—It strikes me we are getting too much on one side of the question. We are giving the impression that it isn't safe to send queens thru the mail at all; that isn't doing justice to our queen-breeders. I have been getting queens thru the mails for 13 or 14 years, and I have never had an instance of a queen being injured in the mails,

excepting on one occasion where all the bees and the queen were dead; how that came about I am not able to tell; of course, they may have been killed in the mails. A great many times they are killed, I know, by bad handling before they reach the mails as many times as they are in the mails. A few years ago I was getting queens from the Old Country; while Mr. Benton was in the East he sent me a number of queens from the Island of Cyprus, and if I am not mistaken some came from Jerusalem, and only two or three of all the queens that were sent over were dead, and they died on the way. Those queens were, so far as I could see, just as good as tho I had reared them in my own yard. I think we are doing the queen-breeders a little injustice when we emphasize the fact too much that they are injured in the mail. You may break your leg walking down a slippery street; you don't always do it. If you see your neighbor walking down and he does it, you don't stop on that account. There were four men in our city killed with electric wires in four weeks, yet the men go right up the places where the others went, and go on with the work as tho nobody had fallen and was killed; it doesn't necessarily follow that because one man took hold of the wrong wire and got more electricity than he could stand, that the next man will do it. It doesn't necessarily follow that because a few bees are injured in the mails the rest will be injured. I believe I get as good queens to send out to my customers as tho they had been reared in their own apiaries; and on very many occasions I believe they are a great deal better, because the people from whom I get them know better how to rear them than I do, or the people to whom they are sent. There are a whole lot of things to know. I don't know anything about rearing good queens. A man askt me about foul brood; I don't know anything about it. If you will ask me about Belgian hares, I can tell you, but I don't know anything about the diseases of bees. I believe in giving the fellow that does know how every possible chance, and don't let us kill his business by creating the impression that you can't transmit bees in the mail.

Dr. Mason—I don't see that we are doing the queen-breeders any more injury when we say we have failed to get good queens thru the mails than we are giving all the people of St. Joseph unjust consideration because four of them got killed by lightning; there is just as much justice in blaming those fellows for getting killed as there is in blaming queen-breeders for the injury to queens in the mails. I don't blame Mr. Root for sending me a queen that proved to be a poor one. I feel sure he sent me a good one; something went wrong before she reached me, and I believe the mail was to blame for it. Like those men Mr. Abbott speaks of in St. Joseph getting killed, the rest will go on handling wires and we will go on ordering queens just the same, I suppose.

Pres. Root—There are other phases of the question very interesting; we ought to have our question-box very soon.

H. W. Funk—I wish to ask Mrs. Acklin about what percent of those cell-cups will be accepted when bees are not gathering honey freely?

Mrs. Acklin—I hardly know what to say. I know this year we have had a great deal of trouble in having the cells accepted—more this year than ever before; it was so very dry in our part of the country the first of the season. I should think anyway about 75 percent for a poor season.

Mr. Funk—I have tried the system, and the bees accept about 1 in 3, when there is no honey coming in. When honey is coming in freely it works all right; when honey seems to be a failure the plan is pretty much a failure to put in the cell cups direct.

Mrs. Acklin—If you feed the colonies before you put the cells in, you will succeed better.

Mr. Funk—I have tried that to some extent with very little difference, if any.

Mrs. Acklin—It seems to make a difference with us.

Pres. Root—It makes all the difference with us; we can't do anything with getting cell-cups accepted unless we feed a little every day; feed them four or five days previous to the time of giving the cell-cups.

Dr. Mason—I want to ask Mr. France if he thought the queens were as liable to be injured in the mail provided they were caged and left a day or two before being shipped?

Mr. France—I think not.

Dr. Mason—When I have ordered queens I have generally suggested to those I ordered from to cage them and leave them a day or two before shipping.

O. L. Hershiser—It strikes me that we can not tell whether they have been injured in the mails or not; take the class of untested queens that are shipped a very short

time after they begin to lay; it is impossible to tell whether they would be good layers or not; you can't tell whether they were injured in the mail or not. It seems to me that only with queens that have been kept a long time can we tell whether they have been injured or not in this way. I received about 65 queens in the mails last summer; there was no injury that I could tell. Mr. Root has handled a good many queens that have come from the Old Country. I think he could tell us a good deal.

Frank Benton—It seems to me we should distinguish as to the packing; that may cause these injuries. There is no doubt that a queen occasionally is injured by the jarring in the mails by the violent throwing of the sacks, but that is very seldom. I have sent out some hundreds of queens in the last few years, and not one arrived dead until this year, and the report was that that queen having gone from Washington, D. C., to Philadelphia, had arrived, and look as tho the bees had been smasht, or something of that kind. I can't understand how it could have occurred except from throwing the sack, but I believe more queens are injured by faulty packing than by any other process whatever. I began sending queen-bees by mail 28 years ago. Some shipments at first went across the Gulf of Mexico, across into Texas, and arrived in excellent condition. The percentage of successful shipments was very much behind the present day, but I have been experimenting with that all these years; I shipt some from the Island of Cyprus; I think I sent the first queen that went on a long sea voyage, sent one lot of 80, and they arrived in good condition in London, England; that shipment was followed by others in 1872; the first shipment was sent across the Atlantic to Australia and New Zealand in 1875; many arrived in as perfect condition as they were sent; many times there were losses attributed to the packing and accumulation of the mails, and things of that kind. I have here in my hand a queen that traveled by letter post from the Island of Cyprus to this country, 18 days on the way, and when I took her from the hive day before yesterday, I could not see that she had suffered on her journey at all. That would not establish a rule, but I have received large numbers of queens from Austria. It is very rare indeed to get a queen that is injured. Occasionally some of them, I think, are replaced sooner, but it is very rare indeed to get one that is dead. When the bees begin to suffer I feel the queen may be injured; she will be if the bees suffer very severely. The food is a very important element, and should be neither too soft nor too hard. It should be so prepared that it is impervious to moisture. The central department of the cage should be shut off as far as possible from the other compartments, and still be free of access in case of change of temperature. It is better to put too few than too many workers in; too many cause the bees to sweat or smother, but too few will stand a greater degree of cold if they have this compartment shut off so they can draw back. The cage should not be too large. When the bees are jolted about, they should have room to be protected. I would not take altogether very young bees or very old bees—perhaps about seven days old. I think if we give heed to the manner of packing, and be sure that our queens themselves are vigorous, there will be a very much less percentage of loss or injury thru the mails.

Mr. Acklin—I would like to ask Mr. Benton how many workers he puts into a cage with one compartment?

Mr. Benton—I never made a cage with one compartment—always three compartments.

Mr. Acklin—The cage we use has one compartment for the candy and one for the bees.

Mr. Benton—It is not the cage that has received my name then. For transmission anywhere east of the Rocky Mountains, I would put, during the summer season, about eight to ten workers, not more than ten. In the cage should be two compartments for the bees, and one for the food; in this instance each compartment about one inch across and $\frac{3}{4}$ inch deep. For transmission across the Atlantic I put in about 12 to 14 workers, have the holes a little deeper, nearly one inch deep and one inch across; two good compartments for the bees, one for the food. That is the size I would use in the shipments to Australia and New Zealand.

Mr. Acklin—We have formerly been using a cage with one large compartment, one side of which we have tin. We found we had a large percentage of loss. We changed to the Benton cage, and our losses were largely reduced. Small compartments about $\frac{3}{4}$ inch hole and 1 inch deep are better than large openings.

A. D. D. Wood—Twice the past season I have had a queen from the same place; a gentleman who has handled bees for a good while, altho he is a foreigner, not conver-

sant with our language, and did not read much in our books; he furnisht queens at two different times, and both times they died without being successfully introduced, and were only carried a matter of three miles. I think in this instance the deaths were due to the fact that he put no paste-board or air-tight covering over the wire in the face of the cage. He used the ventilated cage; did not protect them in any way; they were not in the mails at all.

Mr. Acklin—That is a very important matter that Mr. Benton mentions, of having three holes, one a dark compartment, and another that is lighted and better ventilated. In cold weather we make a little difference in the packing of our cage. We put oil paper over the top, up to the outside hole. I never before noticed there was a difference between our cage and the real Benton.

(Continued next week.)

Importance of Preparation of Bees for Winter.

BY H. D. BURRELL.

IF we hope for a good honey crop in 1901, and of course every live apiarist does, it is very necessary that bees go into winter quarters in good condition. Unite the weak colonies, feed the light ones, and, if bees are to be wintered out-of-doors, tuck all in snug and warm before Nov. 1. In my experience for a long term of years, bees winter better if all work with them is finisht before settled cold weather begins. Bees should have several good flights after they are disturbed last, if possible.

Bees often winter well when badly disturbed in winter, but they winter in spite of it, not because of it. I once heard—from a reliable source, too—of a bee-keeper who made a practice of frequently stirring up his bees in winter, pounding on the hives, etc. He "wanted them to wake up and eat, and not get cold and stiff, and starve." And his bees wintered well, too; but no wise bee-keeper will follow that plan.

Once I had three live-covers blow off during a wet snow-storm in November, and when it was discovered some hours later, there were several inches of snow on the bare combs. While one-third of all the colonies I had died before May came, those three wintered well; but I never thought it was because they got wet. When the stores are all right, and the bees of normal strength, and kept dry, they will winter well anyway, but we seldom know surely that the stores are all right. Therefore, it is always safest to supply the good conditions every year that are always under our control. It is better to be safe than sorry.

My methods of preparing bees for winter are as follows: I have seen in August that all colonies I intend to winter are of good strength, and have good queens. I always have a fall crop of honey, large or small, which lasts until frost comes, usually about the middle to the last of September. Very soon after this time, the caps are removed from the hives and each hive weighed. Light platform scales are easily moved from hive to hive, and two operators lift the hives to the scales and weigh them. This work is soon done, and there is no guess-work about weights. We know the weight of a hive and set of combs, and, before the colonies are put away for winter, know that each one has at least 30 pounds of stores, and if some have 40 pounds, all the better. All these stores will not be used before new honey comes in the spring, but sometimes little honey is carried from early bloom, because of unfavorable weather, and I prefer that every colony shall have sufficient stores in the fall to last until June. It saves time and tinkering.

Sometimes combs of honey are taken from extra-heavy hives for lighter ones; sometimes the light ones are given frames of honey reserved for this purpose when extracting, and sometimes I have to feed sugar.

If I lived in a locality where there was no fall honey crop, and it was necessary to feed, I would feed in August a thin syrup made of about equal quantities by weight of water and sugar, mixt cold, and fed slowly. For feeding late I want a syrup nearly of the consistency of ripe honey, and this should be fed as quickly as possible, so as not to

induce brood-rearing. Too young bees are apt to winter poorly.

For each 14 pounds of feed wanted, weigh out 4½ pounds of water, the ¼ pound to allow for evaporation. Heat the water to the boiling point, then stir in slowly 10 pounds of the best granulated sugar for each 4 pounds of water, and let all commence boiling again; then remove from the fire. While waiting for the syrup to boil, dissolve in a cup of warm water one-half teaspoonful of pure tartaric acid for each 10 pounds of sugar, and stir it into the syrup. This is important. Unless some preventive measure is taken, the syrup will harden in the combs, and the bees starve. I once lost 50 colonies of bees in that way. One-fourth or one-third pound of good extracted honey to each pound of syrup, well mixt while the syrup is warm, will also prevent granulation.

While the feed is yet quite warm, feed it to the bees, giving at one time all a colony needs, if possible.

I have used many different kinds of feeders, but like best one invented by James Heddon. This is a wooden box which holds about 25 pounds of honey or syrup, and covers the entire top of a hive. It is so arranged that bees won't drown in it, and can be filled without coming in contact with the bees. With 30 of these feeders I once made the syrup and fed five barrels of sugar in five days, to over 100 colonies of bees, for winter stores. If the weather is not too cool, an average colony will carry 25 pounds of syrup in one night.

A tin pan makes a fair feeder, if placed in the hive cap filled with warm syrup, and covered with cheese-cloth, thru which the bees will draw the feed and not get drowned.

I have wintered bees successfully in a cellar, but in this country, where we usually have cold, backward springs, bees need protection about as much in the spring as in winter, often until late in May, and we prefer protecting them on the summer stands.

My hives set in groups of four, two facing east and two west. In summer the hives in each group are about one foot apart, and the groups eight feet. With this arrangement bees or queens seldom get into the wrong hive. For wintering, the hives in each group are placed close together, and a bottomless box is used large enough to allow five inches of packing around the hive, and six inches on top. This box is made in four sections of shiplap stuff, and can be easily taken apart and packed away in small compass in summer. One side of the box is 8 inches higher than the other, which gives a slope to the roof. The roof is made of 6-inch re-sawed sound lumber. Two layers of these thin strips, loosely laid on, and breaking joints over the cracks, keep all dry. They are held in place by a loose crosspiece at the top and bottom, weighted with stones. If nailed together they swell and shrink and crack. For packing material I prefer dry sawdust, but planer-shavings, dry leaves, or chaff, does very well.

The hive-covers are removed, and the slat honey-boards turned over. This gives an open space of about ⅝ of an inch over the frames, and permits the bees to pass freely in a body over them. A piece of burlap or other cloth is placed over the honey-board, and the packing placed on it. An opening is arranged thru the box, and packing to the entrance of the hive, which permits the bees to pass out and in, in fair weather. The packing material is placed directly on the ground, and never absorbs enough moisture from it to wet it for more than an inch. Of course, the hives set where water never stands.

The hives have loose, reversible bottoms, and as placed for winter allow two inches of space under the frames, which I find a great advantage in wintering. It permits the dead bees to drop below the combs, and insures good ventilation. A strip of wood, with a notch on one edge ¼ by 3 inches, fills the front end of this open space. In winter this strip is placed notch-side up, and gives an entrance-way for the bees, which never gets clogged with dead bees, and is too small to permit mice to enter. In the spring the strip is easily removed, and the dead bees raked out, and then the strip is replaced notch-side down, for the better convenience of the bees in their spring work. In winter, a slanting board is leaned against the packing-case before the hive entrances, which keeps out wind, snow, and sunshine. The sun shining into the entrance of a hive will often coax bees out when it is so cold they will not get back.

My bees are left in winter quarters until all danger of cold weather is past, often until June. I much prefer the method of out-of-door wintering to using double-walled hives. They are expensive and cumbersome.

□ I have been almost uniformly successful with this

method of wintering bees, and have never met with very serious winter losses since I adopted it, even in hard winters when neighbor bee-keepers lost all, or nearly all, their bees.

Van Buren Co., Mich.

Questions Answered—Sections Carrying Foul Brood

BY G. M. DOOLITTLE.

QUESTION.—Would there be danger of communicating foul brood to a healthy colony of bees by using over it sections and section-holders which had been used the previous season on foul-broody colonies (the combs in them containing no honey), provided the sections and holders were scraped and sandpapered?

ANSWER.—This is something I do not remember ever hearing about being tried, nor did I try it when my bees had foul brood in the early 70's. From the experience I had with the disease at that time, and knowing what foul brood in the apiary means, I would say that I should not want to try such an experiment, for the risk would be too great. However, if I had many such sections and holders I think I would do this: I would locate two or three colonies of bees four or five miles from all other bees, and use these sections on them, keeping the remainder where no bees could gather propolis from them, and, after one or two years' test, if no harm resulted to these colonies, I should consider it safe to use the rest anywhere.

FOUL BROOD SPREADING.

QUESTION.—If a colony is attackt with foul brood, how long a time will it require for the combs to become one-half or more affected?

ANSWER.—That depends very much upon the time of the year, and upon how much foul-broody honey was taken into the hive when the disease was started. If one of my colonies was to rob out a diseased colony, bringing from 10 to 15 pounds of honey from it during the month of April, I should expect that said colony would have cells of diseased and dead larvæ thruout all of the brood by the middle of July to the amount of one-half or more of the cells containing brood; but of course the dead and live brood would be all mixt together to a greater or less extent. If only a few bee-loads of honey were taken, and this during the month of September, I should not expect the brood to present the above appearance before the next August, and possibly not till the spring of the second year. But, as I have had no foul brood to deal with since the year 1873, I feel that my ideas in the matter may be like the backslidden professor's prayers. "a little rusty."

SUPERSEDING QUEENS.

QUESTION.—In your "Scientific Queen-Rearing" you speak of finding a colony about to supersede their queen, and then keeping them building queen-cells and rearing queens for you as long as the queen, about to be superseded, lived. Now, what I wish to know is this: How do you know, or how can you tell, when a colony is about to supersede its queen?

ANSWER.—From an experience covering a period of more than 30 years, I think that I can safely say that bees never build queen-cells to a state of perfection great enough to be supplied with eggs or larvæ unless they expect to swarm or supersede their queen. To be sure, they will start embryo queen-cells or "acorn-cups," as some call them, all along during the season of the year when they can fly from the hive, but none of these are carried or built out further toward perfect queen-cells by way of lengthening out and drawing the mouth of them down to the size in which we find eggs and larvæ in them, unless the bees are either intending to swarm or supersede their queen. So, when you find lengthened-out queen-cells, you can rest assured you will find either eggs or larvæ in them. And when you find queen-cells having eggs or larvæ in them at any other time save the swarming season; you may know that the bees are about to supersede their queen.

Now, when finding such lengthened-out cells containing eggs or larvæ, you may always know that such a colony will save and rear all of the larvæ (unless injured in transferring) into fine queens you may give them in prepared cells, as I give in my book, and all queens so reared will prove to be the very best queens that you can possibly rear under any condition, or by any of the known plans, no matter whether the colony intends to swarm or supersede its queen. There is this difference, however: If the colony

swarms that puts a stop to its rearing queens for you, unless you return the swarm; but if it intends to supersede its queen it will build queen-cells right along for you as long as the old queen lives. But you must not let this colony so perfect a young queen that it emerges from the cell, but keep the queen-cells taken out before any hatch, all the while; for if a young queen is allowed to emerge from her cell, the bees may let her kill the old one, or whether she does this or not they will build no more cells, and most likely they will destroy all the other queen-cells that may be in the hive at this time.

REARING QUEENS AFTER THE HONEY-FLOW.

QUESTION.—I wish to rear some queens to supersede a part of my old ones after the honey-flow is past. Can I rear them as late as September or October, and be sure of drones for their fertilization without any special provision for drones?

ANSWER.—In this locality drones are usually driven out of the hives very soon after the honey-flow ceases; and unless there should happen to be some queenless colony in the neighborhood which would keep their drones, the queens reared as our questioner proposes might prove to be drone-layers; still, as a rule, some colony within mating distance of our queens is liable to hold or keep their drones so that little risk is run in having queens prove drone-layers if reared the first half of September. But I should prefer to run no risks, nor would I wish my queens to take their chances of mating inferior drones, coming from a promiscuous source; and for this reason I set frames of drone-comb in two or three of my best colonies for drones about the middle of the summer honey-flow, and as soon as that flow is over this drone-brood is mated in a very strong tiered-up colony, which is now made queenless, when it will keep the drones from this selected brood as long as it has no laying queen. This colony is now fed abundantly, so that the drones are inclined to go out in great numbers on every pleasant day, and thus we secure the mating of our queens to our satisfaction.

This massing of drone-brood from selected mothers for fall rearing of queens pays as well, according to my way of thinking, as anything any queen-breeder can do. I am fully persuaded that as much depends upon the selection of good drones as upon the selection of the queen we breed from; yet how few pay any attention to this matter of the selection of drones. And I have been so much interested in this matter that for several years I have, on cool days when not troubled with robber-bees, "hand-picked" the drones coming from these selected mothers, picking out and killing all of the inferior drones, as to size and markings, contained in this drone-keeping colony, believing that the improvement in my bees has more than paid me for so doing.

Of one thing I am certain, and that is, that we can not pay too much attention to the improvement of our bees.

Onondaga Co., N. Y.

Apiary of Mr. Chas. Roebling, Hamilton Co., Ohio.

BY JOHN R. SCHMIDT.

AUGUST 4th I had the pleasure of visiting one of the best regulated and nearest to the so called "model apiary" that I have ever seen. Taking a street car I was soon "whizzing" thru the busy streets toward one of the most beautiful and picturesque suburbs to be found anywhere in the United States. A ride of 30 minutes on one of our fast and up-to-date electric cars, brought me to within a seven minutes' walk of the home and apiary of Mr. Chas. Roebling, a most enthusiastic and intelligent bee-keeper.

Apiary of Mr. Chas. Roebling, Hamilton Co., Ohio.

Mr. Roebling has an ideal country home of 88 acres, just far enough from the city to be convenient, where one may live in true country style and still have all the advantages of the city and country combined. The apiary—a picture of which I secured—is situated on one of the highest points in this section of the country, and at present consists of about 36 colonies, which are run for both comb and extracted honey. The owner of the apiary is pictured in the act of lifting a cover from a hive. The other individual—well, he did not "press the button" this time. ♣

In the rear of the apiary, forming the background of the picture, the house stands among the trees; and near by, located at a convenient distance from the well, where one may quench his thirst with cold, sparkling water so desirable on a hot, dry, July or August day, a hammock swings in the cool shade of the trees. This is Mr. Roebling's favorite resting-place, where he reads his bee-literature, of which he has a good supply. Indeed, this is the favorite place with all, for on the hottest day it is one of the very few cool places to be found. There is always a refreshing breeze, and Mr. Roebling informs me that this breeze does away with the necessity of shade for his bees, and he has never experienced the least trouble from the heat which seems to prevail in the apiary.

The beauty of the view from among these trees is something that can not be described or pictured. Looking down directly toward the apiary the hill slopes toward a small wooded ravine, then gradually rises into green meadows and cultivated fields to nearly the same height as the observing point. Turning slightly to the left there is a break in this beautiful panorama, and thru the blue, hazy distance one can see the Kentucky hills 20 miles away. This is a fine bee-location, but, like all others, failure is not an unknown term, this year being something little short of being a failure.

While talking bees and resting under these trees, Mr. Roebling related how he built up his present apiary from one colony—a swarm caught while at work in the fields one day. The first attempt at bee-keeping proved a failure; the bees being hived in a dry-goods box lived and prospered for a short time in one corner of the box, but the cold winter soon put an end to their existence. The following spring another swarm was captured, and this time a 10-frame Langstroth hive was purchased, and the happy owner thinking 10 frames too many in the hive, only inserted two; but, to his surprise, on examining them some time afterwards, he found these two frames completely filled, and the remaining space filled with combs running in every

direction. This colony was the nucleus of his present apiary, and it threw off large swarms every year until recently, when it was transferred to a new hive, and the usable combs properly fitted into frames.

Mr. Roebing has a good grocery and private trade for his honey, and delights in having the best bees and apian implements procurable. His section and extracted honey are placed upon the market in the most up-to-date manner. He reads the best methods by the best writers, and does not fail to apply them. In fact, he is a bee-keeper who does *not* think he knows more than any other bee-keeper; has not a lot of silly notions, and does not already know more than the journals can ever teach him, and therefore feels he ought to read them. He combines the Belgian hare business with bee-keeping successfully, of which I will have something to say in another article later on.

Questions and Answers.

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

[The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.]

Clipping the Wings of the Premium Queens.

DR. MILLER:—The premium queen mailed to me arrived in good health, and is safely introduced.

Please tell me the reason you clip the wings of queens you send out. I never clip the wings of my queens, and do not like them clipped. Had the season not been advanced I should have sent the queen back and requested another.

It seems to me that if the purchaser wishes the wings clipped he can do it; but who can put the wings back if he does not want them clipped?

I do not want to be crabbed or fault-finding, but really, Doctor, do you not think it doubtful policy to send out mutilated queens, unless the purchaser requests such?

MASSACHUSETTS.

ANSWER.—There is just one reason why I have gone to the extra trouble of clipping the premium queens that were sent out, and that is that the contract with the publishers of the American Bee Journal demanded it. As to its being doubtful policy, the editor can speak for himself, altho I believe on the whole it was a wise thing to do.

[See "Editorial Comments" for further reply.—ED.]

Making Bees Swarm Naturally.

Can bees be made to swarm naturally by feeding so they will rear queen-cells before they swarm at this time of the year?

MISSISSIPPI.

ANSWER.—If the weather is warm enough for bees to fly freely, and they are gathering nothing from the flowers, you may hasten the swarming of a colony by feeding. But feeding will make no difference if the bees are gathering freely abroad. You may do something toward hastening swarming by giving a colony frames of sealed brood from other colonies, thus increasing its strength.

Full Sheets or Starters—Best Comb-Honey Hive—Transferring.

1. I filled a hive with full sheets of foundation, and the bees tore it and pulled it out. Would you advise me to put in full sheets, or just starters?

2. I want to use the most convenient hives for comb honey next year. My frames fit the Langstroth hive. Would you advise me to use the Langstroth hive? or what would be better?

3. Would you advise me to lift out the frames and bees and put them in new hives, as I want them all in hives alike? and when would be the best time to do it—this fall or in the spring?

WEST VIRGINIA.

ANSWERS.—1. Full sheets are better, because they make sure of all worker-comb. But when a swarm is first hived,

if you confine them upon four or five frames till they are built full, there will be very little drone-comb with starters.

2. With Langstroth frames of the regular size, $17\frac{3}{8} \times 9\frac{3}{8}$, a change is hardly advisable.

3. If your hives now in use are good, it would hardly pay to throw them away and use new, unless there be some difference in size of the hives, which would hardly be if all frames are of the same size. The dovetailed hive is a very desirable kind, but not enough better than hives with plain joints to make it advisable to throw away a good hive of the latter kind. If frames are merely to be lifted out of one hive and put in another, it matters not whether it is done in fall or spring, only it ought not to be done after bees stop daily flights.

Troubles of a City Bee-keeper.

1. I am trying to keep a few bees away up in the northern part of New York city, but make a poor showing, owing no doubt largely to my unskillful handling of them. I am in trouble with them, and want advice and help. I shall secure a fair crop of honey this fall if I can get the supers off of my hives. At present they are stuck so tight with bee-glue that it is hard to move them, and when I get them partly loose and raised, say an inch, I find the lower frames glued to them; that is, the top of the brood-frames glued to the bottom of the super. Now tell me what is to be done.

2. Yesterday I took off 40 pounds from one hive by taking out the sections one by one. It was the best I could do without tearing things all to pieces. Next season I am going to try rubbing castile soap over all parts liable to be glued; as the soap is of a greasy, oily nature, I have an idea it may help. Do you think it will work? N. Y.

ANSWERS.—1. You can hardly be said to "make a poor showing" if you "secure a fair crop of honey." A crop of honey is the desideratum.

Raise the super as you did before, say half an inch or an inch, blowing in a little smoke and putting a block under the super to hold it up. Now, take your screw-driver, or whatever you use as a hive-tool, and putting it between the top-bar of one of the frames and the super, gently pry down the top-bar. Do the same with all the top-bars that are glued to the super, and then you can remove the super.

2. It is at least worth trying. Vaseline has been recommended for the same purpose. With a $\frac{1}{4}$ -inch space between top-bar and super there ought not to be need for much precaution.

Comb Foundation Sample Appears to be All Right.

I enclose a sample of comb foundation of the last I bought. I had no chance to find out thru the bees, owing to their not gathering any surplus since the first week in August (I got a half crop of comb honey.) Please tell me if it is made of adulterated wax, or what is wrong with it. It neither looks nor smells like any I have had before.

WISCONSIN.

ANSWER.—It looks and smells there appears nothing other than should be found in a very excellent sample of surplus foundation, and it would be a matter of great surprise if bees should make any objection to such foundation. I don't know who made it, but it is a matter of comfort to know that in this country all the reputable makers of foundation may be safely trusted to send out nothing but a pure article. Altho other countries are accustomed to point to America as the seat of all adulterations, yet in the matter of comb foundation the shoe is certainly on the other foot. Adulteration is so common in Germany that it is one of the reasons why something like 20,000 bee-keepers have foundation-presses of their own.

The Chicago Convention Picture is a fine one. It is nearly 8x10 inches in size, mounted on heavy cardboard 10x12 inches. It is, we believe, the largest group of bee-keepers ever taken in one picture. It is sent, postpaid, for 75 cents; or we can send the American Bee Journal one year and the picture—both for \$1.60. It would be a nice picture to frame. We have not counted them, but think there are nearly 200 bee-keepers shown.

The Premiums offered this week are well worth working for. Look at them.

* The Afterthought. *

The "Old Reliable" seen thru New and Unreliable Glasses.
By E. E. HASTY, Richards, Ohio.

VARIATIONS IN WEIGHT OF A COLONY.

That greatly longed for and despaired of thing—a cure for bad seasons—arrived at last! And will the inventor patent it? And how high will he put the price? F. W. Hall, page 573, takes a 10-pound super of sections from a hive that only weighs 70¼ ounces all told! Or are we driven to suspect (Bathos!) that where we read 70¼ ounces we must understand 70¼ pounds?

To assist Mr. H. in a puzzle which seems to trouble him, I will remark that a hive gets lighter in the forenoon from at least four causes. First, drying out of dew or rain in the wood of the hive—often much more than one would suspect, but perhaps insignificant in this case. Second, exhalations from the bodies of the bees and brood. I think there is a variation as to how much of this remains inside the hive at night, and gets outside during the forenoon, and how much passes out immediately at night. This loss may be expected to be large when much brood is present, and small when there is little brood. Third, evaporation of nectar—mostly fanned outside at night, except when the gathering is very large; but some of the vapor may remain inside as a dampening of inner surfaces. The fourth cause, of course, is the weight of the bees that go out to the fields—a very variable element. Also, sometimes, nectar comes in in the forenoon, and not in the afternoon, and sometimes *vice versa*. I think these causes properly adjusted will account for most of the eccentricities of weight in such tables.

WHIMSICAL ABOUT EATING HONEY.

That lady on page 563, I guess her inability to eat honey was simply a whim—supported perhaps by a little nerve action, as when we can't "go" something because we once took it with pills. Her five days of swollen face kept her thinking about bees and honey, and tasting of the latter, until the rather immaterial barrier disappeared, and the real facts came to the surface—and hitherto unknown kinks of chemistry need not be called in.

COLOR OF CARNIOLAN BEES.

And it's a rusty gray instead of a steel gray that the Carniolan bees are. Strange, how long it took this fact to get to the surface. Doctors disagree of course, but the way our bee-doctors disagree on the color of the Carniolans seems to be a rather extreme case. Chance for our skeptics to say, Is there any such thing as the Carniolan, except as A B and C pop the name onto something they want to float? Page 564.

REARING QUEENS UPSTAIRS.

The scheme of rearing queens upstairs, while a queen presides as usual below, is still mooted, I believe; and those who still adhere to it might do well to meditate on what the veteran breeder Alley says on page 565—most of such queens are short-lived and worthless, except in the swarming season, when good queens can be reared almost any way. The thing is rather important. To win a little convenience at the cost of a general damaging of queens would be a sorry bargain. To be sure, Mr. Alley is not above being mistaken; but the probabilities of the thing rather seem to lie his way. Should we expect bees that already have a good queen, and no assignable reason for wanting another, to do their *best* in that line? But I should say, look a little out—yes, look a big out—for bees that will build queen-cells by the thousand. There is such a thing in nature as degeneration.

LONG-TONGUED BEES AND SHORT-TUBED CLOVER.

I will not try for a complete review of the stirring paper of Dr. Miller on long-tongued bees and short-tubed clovers, which begins on page 566, but merely murmur a little at two of the dominant ideas. One is that we *must* succeed if the effort is pushed years enough. Suppose now that there was a proposition to increase the size of the elephant. Would it be true that with thousands of years enough (or millions) man must succeed in breeding an elephant a hundred feet high? No. Long before that size was reached the

point would be reached where flesh and blood and bone could not endure the pressures that would occur. I think it not a rare thing, but a common one, for nature's developments to be already quite near in some vital element (very likely an unseen and unsuspected point), but quite near to the point beyond which development can not be pushed for physical reasons. I think this so frequent that the phrase, "We must succeed," ought not to be used. The other thing is a sort of air that "one man is as good as another, sure," in work of this kind. How is it in looking for a queen? One pair of eyes will see her very quickly. A dozen other pairs will only see a curious, moving mass of bees, all looking just alike. Should you "commandeer" a hundred men at random, and order them at tongue-clover work, three or four out of the hundred would *accomplish* more than all the rest.

FINE-GRAIN AND COARSE-GRAIN GRANULATION.

One of the valuable remarks in the valuable paper of Prof. Cook, page 566, is the surmise that fine grain and coarse grain in granulated honey mainly depends (as in other crystallization) on the rapidity of the process; the more quickly the thing is over with the finer the grain. I would add that the coarsest crystals of all seem to be at the bottom and sides of thin honey, and in unsealed cells where only part granulates. In both these situations the process can go on for weeks. Still, rapidity alone may not determine all.

HONEY ON COMMISSION OR OTHERWISE.

It seemed to me that Mr. Doolittle hit almost too hard at the article of W. F. Marks, page 567; but the plan of Mr. Marks, to try stopping entirely the sale of honey by commission, can not be tried, not even if the trial seemed desirable to the most of us. Obviously it would require something like unanimity, and that *couldn't* be secured.

SQUIRT-GUN FEEDING OF BEES.

To have the bottom tight, and everything just right, and then with a squirt-gun feed the whole apiary in a few minutes just at dusk—well, it does seem to be just the poetry of stimulative feeding. The trouble 'pears to be that the practice of stimulative feeding is losing currency. Get a bigger crop if you use a pop-gun instead. (Patent applied for on stimulative pop-gun.) Page 574.

A MUCH-RETAILED STORY.

So they held the tails of the oxen that mugged home to whistle music, carrying a swarm of bees as an outer coat of fur—but our editor, he wouldn't hold the *tales* of the plowman and the St. Louis Republic. Page 578.

MINIATURE TUMBLERS FOR HONEY SAMPLES.

Possibly C. P. Dadant may have been too fast in saying that we have no use for the miniature tumbler of honey holding a little over an ounce, and selling for three cents—the tumbler itself costing only a cent. All our packages are to eat at *home*, while this seems to be an eat-on-the-spot sort of device, a novel rival for candy. May it not act as a missionary to increase the customers for honey? May it not (properly pushed) in some great crowds, carry off a big lot of honey without lessening ordinary sales in the least, but the contrary? And American glass men are capable of devising a tiny tumbler that would be valued as a toy when empty. Page 582.

SHADE-BOARDS OF TIN AND SHINGLES.

Shade-board covered with tin, and let the roof leak *if it can*.—Doolittle. Shade-board made of second-hand shingles and a slat—to cost almost nothing—and a reliable roof.—Hutchinson. You pay your money (\$1.00 per year) and you take your choice. Page 583.

FLIES AND BUGS ON BASSWOOD.

Quite a problem when flies and bugs visit basswood and bees do not. Possibly the insects seen could get some provender by *gnawing* at the nectar-glands, while bees do not come till there is nectar sufficient for pumping. Page 586.

LATE YELLOW SWEET CLOVER.

That's quite a bit of news that Aaron Snyder contributes, page 589—two yellow kinds of sweet clover, one of them late, and just as big as the white kind. But as it's not beauty nor variety that we're after, the late yellow hardly shows any reason why we should desire it, as I see—that is, provided we have the white kind already.

A Close and Exciting Election!

Which will be Elected?
How many Votes will he Get?

Send 25 cents for a three months' subscription to the

***** Farm, Field and Fireside *****

CHICAGO,

and a chance in the

Prize guessing contest
for \$5,000 in cash,

which will be awarded to those coming the nearest to the official figures of the popular vote cast for the successful presidential candidate.

The Publishers' Guarantee Association has deposited \$5,000 in the Metropolitan National Bank, Chicago, Ill., for the purpose of paying these prizes, under strict conditions preventing its use for any other purpose.

First Grand Prize, \$2,000,

to the nearest guesser, and 197 more cash prizes to be awarded as follows:

To the nearest correct guess.....	\$2,000.00
To the second	500.00
To the third	250.00
To the next 5, \$50.00 each.....	250.00
To the next 40, \$25.00 each.....	1,000.00
To the next 50, \$10.00 each.....	500.00
To the next 100, \$5.00 each.....	500.00
198 cash prizes	\$5,000.00

TO AID GUESSERS:

McKinley's popular vote in 18967,107,304

Bryan's popular vote in 1896.....6,533,088

Our Offer: We have made arrangements with the Publishers' Guarantee Association, of Chicago, to enable our subscribers and friends to participate in these great cash prizes. Every one is invited to participate, and for each three months' subscription to the Farm, Field and Fireside sent us, accompanied by 25 cents, a guess will be allowed. Those remitting 50 cents for six months' subscription will be allowed two guesses, and those remitting \$1.00 for one year's subscription will be allowed four guesses. This applies both to new subscribers and to renewals. Present subscribers can send in their guesses, accompanied by the money, and their subscription will be extended.

How to Guess: When you send in your subscription you make your guess. Be sure you write your name and address and guess as plainly as possible. As soon as we receive your subscription we will fill out and send you a certificate corresponding to guess made by you, which will entitle you to any prize that you may draw. Be sure and keep your certificate. We will file the duplicate with the Publishers' Guarantee Association. Every subscriber will receive as many certificates and have as many guesses as he sends subscriptions to Farm, Field and Fireside.

In case of a tie, or that two or more estimators are equally correct, prizes will be divided equally between them.

CUT THIS OUT AND SEND WITH YOUR SUBSCRIPTION.

Langstroth on... The Honey-Bee

Revised by Dadant—1899 Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroly explained, so that by following the instructions of this book one cannot fail to be wonderfully helped on the way to success with bees.

The book we mail for \$1.25, or club it with the American Bee Journal for one year—both for \$1.75; or, we will mail it as a premium for sending us **THREE NEW** subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

GEORGE W. YORK & CO.

118 Michigan Street, CHICAGO, ILL.

If You Want Bees

That will just "roll" in the honey, try **Moore's Strain of Italians**, the result of 21 years of careful breeding. They have become noted for honey-gathering, whiteness of cappings, etc., throuth the United States and Canada.

Warranted Queens, 75c each; 6 for \$4.00; 12 for \$7.00. Select warranted, \$1.00 each; 6 for \$5.00; 12 for \$9.00. Strong 3-frame Nucleus with warranted Queen, \$2.50. Safe arrival and satisfaction guaranteed. Circular free.

Rocky Mountain Bee-Plant Seed!

(*Cleome integrifolia*.)

...FREE AS A PREMIUM...

The ABC of Bee-Culture says of it: "This is a beautiful plant for the flower-garden, to say nothing of the honey it produces. It grows from two to three feet in height and bears large, clusters of bright pink flowers. It grows naturally on the Rocky Mountains, and in Colorado, where it is said to furnish large quantities of honey."

We have a few pounds of this *Cleome* seed, and offer to mail a ¼-pound package as a premium for sending us **ONE NEW** subscriber to the American Bee Journal, with \$1.00; or ¼ pound by mail for 40 cents.

GEORGE W. YORK & CO.

118 Michigan St. CHICAGO ILL.

Red Clover Queens—A Caution.

I wish to say something about red-clover queens. I have kept bees some 40 years, and in that time I have known the bees to work on red clover 3 times—this fall, and twice before, about 10 years apart; but they gathered no surplus. I think they only do it when all other flowers fail to produce nectar. I never saw bees work any stronger than they did on the clover. I have seen as high as 20 to a rod square, doing their best to gather nectar, and no doubt but they reach some, but not to gather any surplus. In my opinion it is not right to hold out an idea that such a queen has been found, when next summer will disprove it. D. C. WILSON.

Linn Co., Iowa, Sept. 9.

Wintering Bees—Refrigerator System.

Having had inquiry regarding my method of wintering bees on the summer stands, and requesting a full description of same, I can only say as I have already written:

Arrange your hives for wintering like a refrigerator—that is, with a dry-air circulation. This will carry up all moisture from the brood-nest, and when any particles of matter or smells reach the cold-air chamber above the bees, this moisture is condens, all vapor and odor is removed, and only the pure dry air is returned to the brood-chamber.

Trusting that most bee-keepers have used refrigerators during this last summer, and in order that all may be prepared fully to understand this method. I enclose cut of the inside of a refrig-

Refrigerator—Showing Air-Currents.

erator, showing the air circulation—the cold air descends, and the hot air ascends. Open the door of the provision chamber, place your hand quickly under the ice-box, and you will feel the downward current, but it soon ceases, because the door is open. The same would occur in a bee-hive if there was a large opening at the bottom, as many have recommended. By having the hive nearly closed the circulation will continue strong enough to carry the

DITTMER'S FOUNDATION

Wholesale and Retail

This foundation is made by an absolutely non-dipping process, thereby producing a perfectly clear and pliable foundation that retains the odor and color of beeswax, and is free from dirt.

Working wax into foundation for cash, a specialty. Write for samples and prices.

The Bee-Keeper's Guide

Or, Manual of the Apiary,

—BY—
PROF. A. J. COOK.

460 Pages—16th (1899) Edition—18th Thousand—\$1.25 postpaid.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published to-day. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipt, or his library complete, without THE BEE-KEEPERS' GUIDE.

This 16th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to GIVE AWAY to our present subscribers, for the work of getting NEW subscribers for the American Bee Journal.

Given for TWO New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the two NEW subscribers—simply the Bee Journal for one year:

Send us TWO NEW SUBSCRIBERS to the Bee Journal (with \$2.00), and we will mail you a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both for only \$1.75. But surely anybody can get only TWO NEW SUBSCRIBERS to the Bee Journal for a year, and thus get the book as a premium. Let every body try for it. Will YOU have one?

moisture above. This is no invention of mine—only its adaptation to beehives. This system of dry-air circulation is old, is scientifically correct, simple, effective and purifying. The air currents will take their natural courses unless obstructed by having a large opening at the bottom of the hive.

With this arrangement the empty section-holder filled with a basket or pillow of absorbents—chaff, shavings or leaves (leaves preferred)—represents the ice-box of a refrigerator. This is the cold-air chamber and is not protected from the outside cold weather. The hive proper is fully protected and made warm; this contains the bees and the brood-nest, represents the provision-chamber of a refrigerator, and is arranged so that there will be a slight circulation—not enough perceptibly to cool this apartment—but sufficient to carry off all moisture.

Bees Didn't Do Well.

Bees did not do very well this season. While I was away from home I lost two swarms. Honey is scarce.

CHARLES LEHNUS.
 Kankakee Co., Ill., Oct. 1.

A Report—Dry and Hot.

Three years ago I had a nice lot of honey, but have had none since. I got only 35 one-pound boxes from two colonies this season, and that they gathered from buckwheat the last week in August and first of September. I took it off last week. The old colony produced 25 pounds and the spring colony 10 pounds. I did not let the old colony swarm, but killed the young queen, and, having a lot of brood-frames, placed them in another hive, and put one on top of the other. I lookt at

Yellow Sweet Clover Seed

WE HAVE IT AT LAST!

We have finally succeeded in getting a small quantity of the seed of the YELLOW variety of sweet clover. This kind blooms from two to four weeks earlier than the common or white variety of sweet clover. It also grows much shorter, only about two feet in height. It is as much visited by the bees as the white, and usually comes into bloom ahead of white clover and basswood. We offer the seed as a premium

A QUARTER POUND FOR SENDING ONE NEW SUBSCRIPTION.

So long as it lasts, we will mail a quarter pound of the seed to a regular paid-up subscriber who sends us ONE NEW subscriber for the American Bee Journal one year, with \$1.00; or ¼ pound by mail for 30 cents.

We have been trying for years to secure this seed, and finally succeeded in getting it. It is new seed, gathered last season by an old personal friend of ours, so we know it is all right. But we have only a small supply. When nearly out we will mention it.

them before putting on the super and found that they had filled both brood-chambers with brood and honey.

For a section of 10 miles square we have had the driest and hottest weather ever known. I had a fine lot of sweet clover but it all dried up, and being along the pasture-field the cattle got at it and stripped it. There are a few blossoms coming out now, but being dry there is nothing for the bees to gather.

We have had but two good showers in 10 weeks, and the springs are all getting very low. We will have no potatoes, cabbage, or garden stuff; there will be a few tomatoes, but the crop will be very small. HENRY C. MOYLE,
Hunterdon Co., N. J., Sept. 27.

Fall Crop a Failure.

The fall crop of honey here is a failure, and I have disposed of my spring crop in the home market at 15 cents per pound for comb honey. We secured only about half a crop, which was 35 pounds to the colony.

W. L. MCGHEE.

Jackson Co., Ohio, Sept. 29.

Bees' Tongues and Red Clover.

I have felt a good deal of regret that so much pains have been taken to breed for color with so few far more valuable points or traits of character. I have sometimes thought that the National Bee-keepers' Association could not do anything more helpful to American bee-keepers than to pass a resolution something like this:

RESOLVED, That we look with regret upon the efforts to breed high-colored bees, and deem three full bands of yellow on Italian-worker bees as much color as necessary or desirable.

Such a resolution would at least let the younger bee-keepers know what they thought of color, and establish a standard the same as the rules for grading honey, and at the same time give queen-breeders an opportunity to turn their attention to something of more value than color. The Ethiopian may not be able to change his skin, nor the leopard his spots; but we can all see how the American queen-breeder can change the color of a breed of bees. A few careful, thoughtful men have largely increased the production of honey by selecting and breeding from the strongest and most industrious colonies, and we have at least one well-authenticated instance where swarming has been reduced a half. Now, if swarming can be reduced a half by careful breeding in a few years, it can be reduced three-fourths and nine-tenths with the same care, and probably even more than that.

If the color of bees can be changed, their industry increased, and their swarming instincts reduced a half, with a few years of careful attention to breeding, is there any reason to doubt that bees can be produced with tongues sufficiently long to reach the honey of red clover? All that is needed

Sharples Cream Separators: Profitable Dairying

Please mention the Bee Journal when writing Advertisers.

is to breed with this object in view. The Michigan Experiment Station has reported some very interesting facts in this connection, showing that they have now a strain of Italian bees whose tongues are more than one and a third times the length of those of black bees, and one and a fifth times the length of the average Italian bees.

But we must not be content with simply increasing the length of the tongues of our bees. We must also decrease the length of the corolla of the red-clover blossom. And here is a nice job for some bright boy, and there will be money in it, too. Go to the fields and watch until you find plants of red clover that the bees work on freely, then mark and secure the seed, and sow and cross-fertilize by hand, and in a few years a variety of clover will be produced with blossoms not half the average length of those varieties now in general use. As soon as such a variety is produced, seed can be grown for market when the bee-keepers will fairly tumble over each other to get hold of it. But as it will be many years before such a variety will come into general use, let the good work go on in lengthening the tongue of our bees.

All bee-keepers may do more or less by keeping a close watch for colonies that work on red clover, and breed from the queens of such for a series of years. There is little doubt in my mind that much might be done in this line. I shall be surprised if we do not find that those colonies that work best on white clover and basswood are not the same that take most kindly to red clover.—J. E. CRANE, in Gleanings in Bee-Culture.

The Emerson Binder

This Emerson stiff-board Binder with cloth back for the American Bee Journal we mail for but 60 cents; or we will send it with the Bee

Journal for one year—both for only \$1.40. It is a fine thing to preserve the copies of the Journal as fast as they are received. If you have this "Emerson" no further binding is necessary.

HONEY AND BEESWAX

MARKET QUOTATIONS.

CHICAGO, Sept. 27.—Choice to fancy comb is selling at 15@16c per pound; good to No. 1, 14@15c; No. 2, white, 12@13c; amber, 11@12c; off grades, including buckwheat, from 9@10c. Extracted white, 7½@8c; ambers, 7@7½c; dark and off grades, 6½@7c. Beeswax, 28c.

The market is strong, and sales are prompt of nearly all arrivals. R. A. BURNETT & Co.

KANSAS CITY, Sept. 13.—Fancy white comb honey, 14@15c; No. 1 white, 13½@14c; No. 1 amber, 12c; dark, 11@11½c. Market firm, demand good, receipts light. Beeswax, 25@30c.

W. R. CROMWELL PRODUCE CO.,
Successors to C. C. Clemons & Co.

BUFFALO, Sept. 28.—Fancy one-pound comb very light receipt and much wanted at 16 cents mostly, occasionally 17c; very light supply; poor also selling 14@8c as grades. Extracted, no stock here, and not in great demand at any time in Buffalo. Fancy beeswax, 30@33c; dark, etc., 24@28c. BATTERSON & Co.

NEW YORK, Sept. 28.—Comb honey in good demand for all grades at 15@16c for fancy white; 13@14c for No. 1 white; 12c for amber and 10@11c buckwheat. Extracted in fair demand at 7@7½c for white, 6½@7c for light amber; 6c amber, and 5½c dark. Beeswax quiet and declining; selling at from 27@28c.

HILDRETH & SEGELKEN.

BOSTON, Sept. 21.—Our honey market is very strong at the following prices, with supplies very light: Fancy one-pound cartons, 17c; A No. 1, 15@16c; No. 1, 15c; No. 2, 12@13c. Extracted from 7½@8½ cents, according to quality.

Can see no reason why these prices should not be well maintained right thru the season.

BLAKE, SCOTT & LEE,

CINCINNATI, Sept. 21.—The demand for fancy comb honey is good and finds ready sale at 16@16½c; No. 1, 15c. The demand for extracted honey at present is slow and offer same to the barrel as follows: White clover, 8½@9c; Southern, 6½@7c; Florida, 7@8 cents, according to quality. Beeswax, 27c.

The above are MY SELLING PRICES. I do not handle any honey on commission, but pay spot cash on delivery. C. H. W. WEBER.

ALBANY, N. Y., Sept. 22.—Demand good, now at firm prices; White comb, 15@16c; mixt white, 13@15c; amber, 12@13c; buckwheat, 11@12c. Extracted, white, 8@9c; mixt white, 8@8½c; amber, 7@7½c; buckwheat, 6@6½c. H. R. WRIGHT.

DETROIT, Oct. 6.—Fancy white comb, 15@16c; darker grades, 11@12c. Extracted, white, 8@9c; amber, 5@6c. Beeswax, 26@27c.

No demand at present for extracted.

M. H. HUNT & SON.

SAN FRANCISCO, Sept. 26.—White comb, 13@14c; amber, 11½@12½c; dark, 8@9c. Extracted, white, 7½@8c; light amber 6½@7½c; amber, 5½@6½c. Beeswax, 26@28c.

Market presents a healthy tone, being lightly stocked with all descriptions, with inquiry not lacking, even for most common qualities, altho choice to select naturally commands the most attention.

WANTED—HONEY AND BEESWAX.

We have a tremendous and growing trade in this line, and would like to hear from all who have such goods to sell in any part of the country, with quality, description, and lowest cash price. THOS. C. STANLEY & SON, Fairfield, Ill.

WANTED COMB HONEY AND EXTRACTED HONEY. Will buy your honey, no matter what quantity. Mail sample with your price expected delivered in Cincinnati. I pay cash on delivery. C. H. W. WEBER, 2146 Central Ave., CINCINNATI, OHIO.

The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

[THIS CUT IS THE FULL SIZE OF THE KNIFE.]

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a last-time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1 10, or give it as a Premium to the one sending us 12 FREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00.) We will club the Novelty Knife and the Bee Journal for one year, both for \$1.90.

GEORGE W. YORK & CO., 118 Mich. St., Chicago, Ill.

QUEENS

Untested Queens, Italian, 60 cents. Tested, \$1. From honey-gathering stock. We keep in stock a full line of popular Apiarian Supplies. Catalog free.

Apiaries—Glen Cove, L.I. I. J. STRINGHAM, 105 Park Place, New York, N. Y.

Please mention Bee Journal when writing.

Four Celluloid Queen-Buttons Free

AS A PREMIUM

For sending us ONE NEW SUBSCRIBER to the Bee Journal for the balance of this year, with 30 cents, we will mail you FOUR of these pretty buttons for wearing on the coat-lapel. (You can wear one and give the others to the children.) The queen has a golden tinge.

This offer is made only to our present regular subscribers.

NOTE.—One reader writes: "I have every reason to believe that it would be a very good idea for every bee-keeper to wear one (of the buttons) as it will cause people to ask questions about the busy bee, and many a conversation thus started would wind up with the sale of more or less honey; at any rate, it would give the bee-keeper a superior opportunity to enlighten many a person in regard to honey and bees."

Prices of Buttons alone, postpaid: One button, 8 cts.; 2 buttons, 6 cts. each; 5 or more, 5 cts. each. (Stamps taken.) Address,

GEORGE W. YORK & CO., 118 Michigan St., CHICAGO.

AMERICAN BEE JOURNAL

MASSACHUSETTS
AGRICULTURAL
COLLEGE

GEORGE W. YORK,
Editor.

CHICAGO, ILL., OCTOBER 18, 1900.

FORTIETH YEAR.
No. 42.

WEEKLY

REV. E. T. ABBOTT, of Missouri,
Director of the National Bee-Keepers' Association.

PUBLISHED WEEKLY BY

GEORGE W. YORK & CO.

118 Michigan St., Chicago, Ill.

(Entered at the Post-Office at Chicago as Second-Class Mail-Matter.)

IMPORTANT NOTICES:

The Subscription Price of this journal is \$1.00 a year, in the United States, Canada, and Mexico; all other countries in the Postal Union, 50c a year extra for postage. Sample copy free.

The Wrapper-Label Date of this paper indicates the end of the month to which your subscription is paid. For instance, "Dec00" on your label shows that it is paid to the end of December, 1900.

Subscription Receipts—We do not send a receipt for money sent us to pay subscription, but change the date on your wrapper-label, which shows you that the money has been received and duly credited.

Advertising Rates will be given upon application.

Reformed Spelling.—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound. Also some other changes are used.

The Weekly Budget

MR. H. M. CARR, of Thomas Co., Ga., writes us Oct. 8th, as follows:

"This is my first year with the excellent American Bee Journal, and I am well pleased with it. As one of the common readers I wish to say I like your short spelling. The 'new dress' pleases me, too."

MR. W. P. ROOT, otherwise "Stenog.," to whom we referred on page 628, offers the following defense:

MR. YORK:—In your issue for this week is a criticism on me which I feel ought to be answered in your columns. You refer to the expression "red clover queen" as being inconsistent with my claim that it should be "red-clover queen." The fact is, the hyphen was there in the first place, but, like Zacheus of old, it was short of stature, and hence made no impression. When an adjective stands before a noun, and the two words become an adjective in turn, they should be united; as left-hand figure, long-eared rabbit. This rule is never questioned, and is universally observed by proof-readers. Any system of punctuation that makes no distinction between twenty-eight frame hives and twenty eight-frame hives is not worthy of the name. I call for a criticism of rules, and not a mere oversight on my part in their proper application. Sweet clover stems means that the stems are sweet, and nothing else. Of course, the intelli-

gent reader may not be misled; but suppose you really mean to speak of clover stems that are sweet; then that reader would be misled, supposing you meant sweet-clover stems. Disregard of this principle is indefensible in toto. I leave it to Mr. Hasty. W. P. Root. Medina Co., Ohio, Oct. 6.

If Mr. Root hadn't left it to Mr. Hasty, we would say that not a single one of our readers would be misled by the omission of a hyphen between the two words "sweet clover," no matter how or when they are used. No one would ever think of the stems being red, when he reads about "red clover stems;" nor would any one be misled about thinking of an "eared rabbit", being "long" in body when he reads of a "long eared rabbit." If any one desired to say that the stems of a certain kind of red clover are red he would likely say it in that way.

Of course, we are willing to admit that the hyphen may properly be used in the illustrations mentioned; but we are equally free to admit that the editors and proof-readers are the ones who should see to it that all contributions appear in print in correct English—as to words and punctuation—and that such matters ought not to be referred to in public print except in

general newspapers, or in school journals or books on the subject. We believe much harm has been done already from what has been said in bee-papers on this subject. We only hope that none of our readers or contributors will ever feel that they can't write the English language correctly enough to suit us. We are willing to be responsible for the correct appearance in print of anything sent to us for the American Bee Journal, so no one need fear writing to us in the best manner he knows, and let it go at that.

The EASIEST TO RUN because they have the best system of regulating temperature and moisture. MARILLA Incubators & Brooders Hot Air or Hot Water. Money back if you want it. Absolutely safe. Durable built. Catalog for 2c. MARILLA INCUBATOR CO., Box 31 Rose Hill, N.Y.

Best on Earth

What? Our New Champion Winter-Cases. And to introduce them thruout the United States and Canada we will sell them at a liberal discount until Oct 15, 1900. Send for quotations. We are also headquarters for the NO-D RIP SHIPPING-CASES. R. H. SCHMIDT & CO Sheboygan, Wisconsin.

Please mention Bee Journal when writing.

BEST Extracted Honey For Sale

ALL IN 60-POUND TIN CANS.

ALFALFA HONEY*****

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

BASSWOOD HONEY*****

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms in Wisconsin. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

Prices of Either Alfalfa or Basswood Honey:

A sample of either, by mail, 8 cents; samples of both, 15 cents—to pay for package and postage. By freight—one 60-pound can, 9½ cents per pound; two cans, 9 cents per pound; four or more cans, 8½ cents per pound. Cash must accompany each order. If ordering two or more cans you can have half of each kind of honey, if you so desire. This is all

ABSOLUTELY PURE BEES' HONEY,

The finest of their kinds produced in this country.

Read Dr. Miller's Testimony on Alfalfa Honey:

I've just sampled the honey you sent, and it's prime. Thank you. I feel that I'm something of a heretic, to sell several thousand pounds of honey of my own production and then buy honey of you for my own use. But however loyal one ought to be to the honey of his own region, there's no denying the fact that for use in any kind of hot drink, where one prefers the more wholesome honey to sugar, the very excellent quality of alfalfa honey I have received from you is better suited than the honeys of more market flavor, according to my taste. C. C. MILLER. McHenry Co., Ill.

Order the Above Honey and then Sell It.

We would suggest that those bee-keepers who did not produce enough honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

No. 42.

* Editorial Comments. *

Comparison of Races of Bees, or at least three of them, is given in the American Bee-Keeper by F. Greiner, and he ranges them as follows:

In the order of general preference among bee-keepers, Italians stand at the head, Carniolans second, blacks last.

In the order of beauty: Italians, Carniolans, blacks.

As to gentleness: Carniolans, Italians, blacks.

As to prolificness: Carniolans, Italians, blacks.

By properly manipulating the brood-nest one can get an Italian queen to lay as many eggs as a Carniolan; but left to themselves the Italians crowd the brood-nest with honey, preventing the queen from doing her best at laying.

Carniolans are most given to swarming, Italians least.

As to whiteness in capping honey, the order is: Carniolans, blacks, Italians. Italians are worse than the others in gathering propolis and in storing pollen. In conclusion Mr. Greiner says:

The special features which make the Italian bee a favorite with the bee-keepers generally are: 1, their beauty; 2, their manner of clinging to the combs while being hauled, making it easy to find queens; 3, their gentleness; 4, their greater vim and determination to keep their combs free from wax-moths, and protecting their hives better generally. Along all these lines they do excel the other races by a long way.

How Many Acres Will Support 100 Colonies? is a question sure to be asked sooner or later by every bee-keeper who desires to engage in bee-keeping to any considerable extent. Just as surely as he asks the question is he likely to be disappointed in getting an answer. Those of longest experience hardly dare to venture more than the broadest kind of a guess. When a positive answer is given, it is likely to be found nothing more than a guess, and sometimes a very wild one. In the Canadian Bee Journal the unqualified statement is made that "100 acres will maintain 150 colonies." Not many would name so high a number of colonies for that amount of territory.

Speaking of the distance bees go in quest of stores, G. M. Doolittle says: "I claim they go from 3 to 6 miles from choice." Taking the average of that as $4\frac{1}{2}$ miles, we would understand that any apiary on any given spot, if it contained enough bees, would gather all the nectar within $4\frac{1}{2}$ miles. A circle having $4\frac{1}{2}$ miles as its radius contains 40,715 acres. If 100 acres will maintain 150 colonies, then 40,715 acres will maintain 61,072. It would be a pretty large apiary that would contain 61,072 colonies!

For the sake of making some little approximation toward an answer, it may not be amiss to do some figuring. While not all might agree with Mr. Doolittle as to bees foraging as far as 3 to 6 miles from choice, probably not many would say that $1\frac{1}{2}$ miles was the limit of profitable

foraging. But for the moment suppose we set it at that. Neither would many say that the average locality would support more than 100 colonies in the most profitable manner. If we put 100 colonies in an apiary, and they work no farther than $1\frac{1}{2}$ miles from home, it will take a little more than 45 acres to support each colony.

If we put 100 colonies in one spot, and allow 100 acres to each colony, that will make not quite $2\frac{1}{4}$ miles as the distance they will travel in quest of stores. While some might want the distance put less than $2\frac{1}{4}$ miles, there would be just as many who would say that 100 was too large a number for one apiary, so it is quite likely that if an attempt was made to average opinions, the result would not be far from saying that in the average location it takes about 100 acres to support each colony of bees.

Seasonable Reading.—There is a good deal in what S. P. Culley says in the Progressive Bee-Keeper, when he says:

"Speaking of seasonable articles, the most seasonable time to *write* is just too late to be seasonable to *read*. One can write best while all details are fresh in mind. Keep your Progressives, file them away, and refer to them for seasonable information. Seasonable writing is as important as seasonable reading."

Only that last sentence is probably a slip, and should read, "Seasonable reading is as important as seasonable writing."

Bisulphide of Carbon is much spoken of nowadays in place of sulphur for destroying wax-worms, with the special advantage that it kills eggs as well as worms. It appears there are two kinds, the pure and the crude, the crude being perhaps the better of the two for bee-keepers. It also appears that the fumes being heavier than air, the bisulphide should be placed above rather than below the combs to be fumigated. The following extract from Farm Student's Review, copied in Gleanings in Bee-Culture, is of interest:

This compound, when pure, forms a colorless mobile liquid having a peculiar odor, and, when taken internally, is a violent poison. As usually obtained it contains impurities in the form of other compounds of sulphur, which give it a strong and extremely offensive odor, and when inhaled soon causes death. For the purpose of destroying gophers the crude bisulphide is better and much cheaper than the pure article. Care should be taken in using it as it is both inflammable and explosive. Its efficacy depends on the fact that its vapor is heavier than air, and, when introduced into burrows, it flows like water into all the recesses. This fact should be borne in mind in using it in sloping ground, as, unless the poison is introduced at the highest opening of the burrow, a certain part of the hole will remain free from it where the animal may take refuge.

Does Climate Affect the Color of Honey?—It has been said that honey from any one honey-plant is darker in the South than in the North. C. A. Hatch, in the Progressive Bee-Keeper, says this is a mistake. In proof of the view that the hot climate makes the honey dark is the fact that alfalfa honey of Arizona is darker than that of Col-

orado; also the honey from the second crop of alfalfa is darker than the first crop gathered when it is cooler. But Mr. Hatch argues that if the difference in color were due to temperature, then a very hot spell should darken the honey, whereas in the same field the color is the same regardless of temperature. He asks the pertinent question whether white clover honey is darker in Kentucky than in Minnesota, or whether horsemint honey is darker in Texas than in Wisconsin. The darker color he attributes to mixture. The bees work at the same time on flowers that yield darker honey, so the second crop of alfalfa has in it enough honey from darker sources to color it.

A Boy for Bees to Cluster On is the story told in the Austrian-Hungarian Bee Journal. A bare-headed 10-year-old boy stood near by as a swarm issued. After circling about for a short time, the swarm began to settle on the head of the boy. The father took in the situation at a glance, and called to the boy, who had often watched the operation of hiving a swarm: "Don't stir, Hans; shut your mouth and eyes, and I'll hive the swarm in a jiffy." The boy obeyed; the father drenched with water the bees that enveloped the boy's head, which he bent forward while he gently brushed the bees into a straw skep held beneath. Not a sting did the boy receive.

Developing Short-Tubed Red Clover.—Editor Root has been advocating the production of a strain of red clover with corolla-tubes so short that ordinary bees can get the nectar out of them. E. E. Hasty, a few years ago, made some effort in that direction, and tells something about the work in *Gleanings in Bee-Culture*. What he says is not extremely encouraging, but valuable in directing any one who may desire to take up the work. On the whole it may be easier to fit the bees to common red clover than to fit the clover to the bees. Mr. Hasty says in part:

And what can I tell the new volunteers which will be to their profit? Perhaps not very much. I'll advise them to keep distinct in their minds the three kinds of work to be done. Call them, if you please, A work and B work and C work. The A of it is to go into the fields and select short-tubed clovers. Better take plenty of time and do lots of this, as this is likely to be the most encouraging part of it (perhaps all the encouragement you'll get). Field clovers vary greatly—vary in the line of being lots of long-tubed ones and lots of short-tubed ones, and also vary in the line of their being few and rare specimens, which can be found by long hunting, much more hopeful than the easy-found ones.

Work B is the slow and tedious work of raising seedlings year after year, and *keeping them from backsliding*, as they will probably disgust you by doing, and slowly, with careful selection, getting a little shorter and shorter as the years go by. It was this work that tired me out. It is going to take a great many years. Five years, or ten, will be only a "circumstance" in it.

Work C is a sort of diamond-hunting work. Most plants, besides their capacity for gradual change, show from time to time sudden and great changes in a particular seedling or a particular bud. These almost startling manifestations are called "sports." If the desired bee-clover arrives during the present generation it will be by finding and rendering permanent one of these sports. During the years I was in the work I found two sports, or plants, which I called such. One of them I lost my grip of so completely that I have nothing to show for it—couldn't be sure that it would ever have filed the bill anyway. The other one seemed to be pretty much all one could ask, gained at one leap—but with one lamentable shortcoming. It was about as near to being *seedless* as a plant could be without being absolutely so. I never had a dozen seeds at one time.

There is also a sport which *frequently* appears in red clover, having white seeds and pure-white blossoms. I made easy progress in breeding this down to a fixt variety; but had I kept on to completion it would have been of the same use as stripes around our bees' tails, no use at all—tubes no shorter than ordinary reds.

But in fussing with the white sports I think I made a

discovery which perhaps ought to be understood and considered by all those who work in such work as this. It is, that progress tends not to go on regularly with each generation, but by regular *alternation* of generations. A little hard to describe this so a reader will catch on readily. Say you are trying to get a white variety from a white sport. First generation you raise 100 seedlings, and say 3 of them are white and 97 backslidden and red. (Think you have got a tough job before you.) Second generation, 100 seedlings pan out 50 white and only 50 backslidders. (Think you are getting on swimmingly.) Third generation you find 15 white to 85 backslidders. (Half inclined to give the thing up as impossible.) Fourth generation, however, pans out 55 white to 45 reds. And so it goes on, with regular oscillation back and forth with each generation, but on the whole manifestly getting ahead. I have come to feel that something like this affects nearly all work of the kind with seedlings.

Convention Proceedings.

Report of the Proceedings of the 31st Annual Convention of the National Bee-Keepers' Association, held at Chicago, Ill., Aug. 28, 29 and 30, 1900.

BY DR. A. B. MASON, SEC.

(Continued from page 646.)

We have the question-box, of which Mr. R. L. Taylor has charge, and will introduce it now.

Mr. Taylor—Any one who desires to disagree or to make any remark will have the privilege.

QUES.—Are the best imported Italian bees superior to home-bred Italians for honey-gathering? Are the best American-Italian bees superior to imported stock for honey-gathering?

Mr. Taylor—No. Don't be afraid of offending me, if you have anything to say.

QUES.—What does the cocoon of a larva look like?

Mr. Taylor—It is a very fine, gauzy substance, shape of the cell. If you can get hold of it properly you can pull it out and it will retain its shape; it is a very fine, semi-transparent substance.

QUES.—Can not larvae be transferred to cups with a quill tooth-pick successfully?

Mr. Taylor—I don't know how they transfer them. I never tried to transfer them; perhaps some one here has done it, but I should not think a tooth-pick would be apt to get the cocoons out in good shape.

W. J. Lawrence—I have transferred a good many larvae with a quill, not a tooth-pick. The quill is formed something like a tooth-pick, a little bit duller, and narrow at the end, perhaps 1-16 or 1-32 of an inch; bend that over so it comes down about ¼ inch; you can see the larva readily, and put this right under and take it out.

Mr. Taylor—That is the answer to the question. I think I read this wrong—at least I understood it wrongly. I took it that it was the transferring of the cocoon. The larva can be transferred very readily with a tooth-pick.

QUES.—Should the average honey-producer try to rear the bulk of his queens, or would it be better and cheaper for him to buy them when the price is lowest, in dozen lots, of good breeders?

Mr. Taylor—Rear your own queens; it doesn't pay to buy them, except perhaps now and then one for breeding purposes when you know you can get a good one. You can rear just as good queens as you can buy—no question about it. I have bought \$6 queens, and queens that my bees have reared under the swarming-impulse were just as good.

QUES.—Should a large honey-producer engage in raising Belgian hares, poultry or fruit, or some other side line? If not, why not?

Mr. Taylor—He should if he wants to.

QUES.—Why do bees make honey when dark bees of the same stock make dark honey?

Mr. Taylor—Why, they don't.

Dr. Mason—I don't believe the one who asked the question asked it as he wished to have it asked. I presume it is the same one who asked me this morning, Why is it that one

colony of bees owned by one person gathers white honey while another colony of bees owned by another person a block away gathers dark honey?

Mr. Taylor—They get the honey from different sources, that is all there is about it; bees don't make honey, they gather it.

QUES.—Can a bee-keeper afford to take time to sit down while working over a hive?

Mr. Taylor—He can't afford to stand up; he can't, unless he has a cast-iron hinge in his back. If he has the hinge raised up it would be all right to stand up; but I have found it dangerous to stand up if you have to stoop.

QUES.—Can gloves be worn to advantage by a practical bee-keeper in the handling of his bees?

Mr. Taylor—No; you can take the sting out quicker than you can put on your gloves.

Dr. Mason—I would like to say sometimes, especially in early spring and in the fall, they can be worn with practical benefit. The gloves are easily put on, and then there are no stings to take out.

Mr. Taylor—I am giving my opinion now.

Dr. Mason—I am giving what I know.

QUES.—In gathering pollen do bees use their tongues in connection with their legs?

Mr. Taylor—I don't think they do for gathering pollen. They may moisten the pollen to some extent by the use of the tongue, but if you watch a bee as it is getting pollen, say from the blossom of the willow, it gets right into it and scrapes it, and gets it on and pokes it back and works it together with its legs. Of course, bees sometimes gather a little pollen with the tongue, but that generally gets into the honey, and I think that sometimes is the means of our bad wintering. I prophesy in a good many sections we will lose a good many bees the coming winter, for the reason that a good many fall flowers are yielding nectar, and bees are gathering a good deal of pollen from them, and a good deal of pollen will go into the honey, and the honey will not be very well evaporated.

HOW OFTEN TO EXAMINE COLONIES.

QUES.—How often should one examine the hives and bees?

Mr. Taylor—I understand the answer to that is, as often as they need it; but I suppose the questioner means how often do they need it. Well, I don't think they need it very often, if one has some experience in the handling of bees. A person who has kept bees and uses his powers of observation can tell by going thru the yard pretty nearly correct whether a hive needs any looking into. Some years I don't take out a frame from my hives to exceed one out of 20 hives; that is, at that rate, it would take me 20 years to have opened all my colonies and taken out the frames; but my hive has this advantage—it is in sections, and I can open the sections; can lift one end of one section and see what is in the center of the brood-nest without disturbing the frames. Sometimes, if your bees are not in good condition in the spring, it may be necessary to go over them two or three times, and examine those that are in bad condition, and see that they are helped all that it is possible to help them.

Mrs. Gear—Does it do any harm to open a hive and look at the bees when they are gathering honey? Does it disturb them?

Mr. Taylor—No, I don't think it does any harm at all if the weather is sufficiently warm, if one handles them carefully. I think of the two, in the spring it is a slight advantage because it excites the bees, and they will deposit a little more honey while they are being excited than they would otherwise.

Pres. Root—I was going to say there is an opportunity presented to ask questions. Mr. Taylor is right here to answer them.

TOO MUCH SMOKE AFFECTS THE HONEY.

A. F. Morley—Does it do any harm to use much smoke? Does it injure the bees in any way, or the honey?

Mr. Taylor—If there is very much smoke used it may flavor the honey for the time, but I don't think there is any material danger in it.

— Mr. Poppleton—The first year I went to Cuba I shipped a large quantity of honey—some 40,000 pounds—to Mr. Muth, of Cincinnati, for sale. It was extracted by Mr. Osburn. His method of extracting honey was to have the smoke pump against the frame all the time, not to shake the bees, to brush them, and use an enormous quantity of smoke. Mr. Muth afterwards told me that all the honey tasted of smoke.

TOBACCO-SMOKE FOR INTRODUCING QUEENS.

QUES. Has any one introduced queens by the use of tobacco-smoke? If so, with what success?

Mr. Taylor—I never tried it. Does any one here know anything about it? Has any one used tobacco-smoke for the purpose of introducing queens?

Dr. Mason—No one here who uses tobacco?

Mr. Taylor—Tobacco-smoke we are talking about.

Dr. Mason—It takes tobacco and a man to make tobacco-smoke.

UNITING COLONIES.

QUES.—I want to keep not more than 30 colonies. Could I cull out the poorest in excess of that by sulphuring this fall, and then keep the combs with the honey, and hive swarms on them next season?

Mr. Taylor—You could do so, but I would not.

Dr. Mason—What should be done?

Mr. Taylor—I would prefer to unite weak colonies, but would not make too strong colonies. I don't think it is best to have too strong a colony. In the fall I would manage to get rid of the old bees. Take the hive away when they are flying, or when they are gathering honey, and leave them out in the cold and then unite the younger bees, and in that way you probably will have better colonies for standing the winter. Mr. Poppleton will have something to say on that. I see he shakes his head. I would not keep honey in combs for the purpose of giving them to swarms. Your honey will more or less deteriorate, will generally become more or less candied, and, more than that, it will be carried more or less into the sections or into the honey that is being gathered in the honey season the next year, which will probably have a bad effect upon it. Save what combs you need with honey to have your bees well supplied with honey in the spring while they are breeding, before the honey season comes on, and extract the rest in the fall as soon as you can after you take it off the hive.

Mr. Poppleton—I used to practice in Iowa exactly as that question suggests. In destroying the bees I followed a little different plan from Mr. Taylor's. Instead of uniting the bees, I simply took out the brood-combs of the colonies I wanted to destroy and changed them over. This uniting was never done during the honey season. We suggested doing it while they were after honey. This uniting doesn't want to be done until after the honey is all gone.

Mr. Taylor—What I meant by their being out after honey, was not that this uniting was to be done during any gathering of surplus, but after that was closed bees still go out and gather a little.

Mr. Kretchmer—We usually set the hive in a new location; take the combs, shake all the bees off, the young bees will enter the hive and not leave it, and the old bees will return to the old location. You will be surprised at the number of young bees, or the bees you have in the spring that will unite. Young bees never fight; they will unite peaceably and remain there; then you may select the old that you desire to save. By this means of saving the young only, gives good, strong colonies for spring use, separating the old bees from the young.

Mr. Taylor—The plan Mr. Kretchmer suggests is substantially the one that I mentioned.

FUMIGATING COMBS.

QUES.—What is the best method of sulphuring?

Mr. Taylor—If you must sulphur, I think the best way would be to put an empty hive on top of the open hive, and set in the empty hive an iron vessel with a little sulphur in it; then put in a piece of red-hot iron with the sulphur, and close your hive, and the sulphur will do the rest.

Dr. Mason—I had occasion to do a little sulphuring recently. I disposed of some of my bees, and had a large number of super-combs for use, and I noticed the other day, just before I came to this convention, that the worms were getting into them. I piled the hives with combs on top of each other, and put an empty hive on top. In that I put a basin with some dirt in it. I had made some sulphur matches by melting sulphur, and while it was melted I drew strips of old cotton cloth, about two inches wide, thru it, and wound the sulphured rags around short pieces of narrow shingles. You will need about two in a pile of a dozen hives. I stuck the stick up in the dirt; set the sulphured rags on fire at the top end, and put on the cover. It will do all there is to be done. It will kill the worms every time.

Mr. Kretchmer—Why not use bi-sulphide of carbon?

Dr. Mason—Sometimes it blows up, and might blow the bee-keeper up; sulphur won't do that.

Mrs. Acklin—I think sulphuring bees is a cruel thing to do. I don't think people ought to rear any more bees than they want.

Pres. Root—I think the question refers more to sulphuring of combs and killing worms.

Dr. Mason—I would not sulphur bees; they are worth too much.

Mr. Taylor—There is another question with reference to combs: What would be the best method of keeping combs until swarming-time next season?

Mr. Taylor—In this climate, wherever it freezes hard, you can keep the combs safely during the winter in a place where the temperature is low. Moths don't stand the low temperature. In the spring the combs will be entirely free of them. If you still keep them closed tightly they will be perfectly safe; or if you can't do that, if you keep them in a cold cellar they will keep all right, so far as moths are concerned; if they are hung an inch apart in the light where the air circulates they will be comparatively safe for a year or two; but insects soon infest them in that way.

Mr. Benton—It seems to me that we want something to protect combs that will operate all the while. Objection was made to bisulphide of carbon; that can be used with a little care if you have a big room or shed where the hives may be packed up there on top of each other. Have a shallow tin on top with a little of that, and it will operate for weeks and save a great deal of trouble. You simply have to lift off the top cover and put in a little more bisulphide when evaporated. It is only dangerous if you bring fire near it. If set away in that fashion combs ought to be kept all summer.

Mr. Kretschmer—Why not pile the hives in the apiary, five or six high; then there is no more danger about it than to have matches in the house, not one particle of danger, using proper care. I admit the fumes are readily ignited if confined in a place; so is gasoline, but bisulphide of carbon can be used safely if used with proper care.

Mr. Abbott—I will give you the benefit of a little experience I got in the patent-medicine business. You can stack your hives up out in the yard and put the empty hives at the bottom, instead of on top, just as Mr. Kretschmer said. You need not use bisulphide of carbon; you can use the preparation I will give you. You can't set your hive a-fire with it. Here is the recipe: Take two parts of sulphur; nitrate of soda one part; black oxide of manganese one part, and mix them together, and have your preparation ready when you want to fumigate. I don't care if there are 20 hives, put about a big spoonful of that into a wooden dish if you want to, and you can't set the dish a-fire. The fumes generated by burning will put it out. That will burn readily by putting a match to it. It will burn quick. The nitrate of soda is very inflammable, and the black oxide of manganese generates oxygen sufficient to feed the fire; the sulphur fumes consume the oxygen. A spoonful of that put into an empty hive below 20 hives will not only make fumes that will kill the worms, but will stay two or three weeks if the hives are air-tight, and you don't have to do it two or three times in the season. While I am on my feet I want to say, if you people who keep poultry will put a pound of that in your poultry-house during the summer, and get your poultry-house thoroly sprinkled before you do it so the water will permeate the cracks and crevices, which will enable the water to absorb the fumes readily, you will kill every louse without any trouble.

Dr. Mason—I would like to ask, What is the object of putting the empty hives at the bottom?

Mr. Abbott—Because the fumes go up better than they go down.

QUES.—Do you make the colonies queenless 48 hours before introducing the new queen?

Mr. Taylor—Well, that depends; if honey is coming in during the honey season, you can introduce the queen almost any time, almost immediately. I have introduced a good many this year—just threw them in. When honey comes in rapidly the bees will take any queen; there is no trouble about it. I remember one time when I handled the bees a good deal more than I do now during the honey season, I was taking off some combs to extract, and I had the bees out on the ground in front of the hive, and they were scattered around; when I got thru and the bees got back, I saw they were greatly agitated. I surmised the queen was gone, and I lookt around and found I had stepped on her. I happened to have an extra one, and I put her down among the bees, and they crowded around her and were just as pleased to see her as tho she was their own; it didn't make a bit of difference. In the spring you can do the same thing. When they are anxious to build up, they are anxious for a

queen, and they will frequently take a queen at once. But a person needs some experience to do that. A person who has tried to introduce queens can tell at once whether the bees will accept a queen. Without that experience you sometimes make a mistake.

Mr. Hershiser—I would like to refer to the first question—Are best American Italians superior to imported Italians? What was the answer to that?

Mr. Taylor—I don't think it reads so. The question is, "Are the best American-Italian bees superior to imported stock?" I think I said no, but I didn't comprehend the question fully. I don't think there is any difference.

Mr. Hershiser—I didn't think you comprehended it. What is the difference between imported Italians and American Italians?

Mr. Taylor—I don't know as there is any difference, except we select them to get color, and perhaps they are a little lighter.

Mr. Hershiser—If the imported ones were better I think that would be the best way of improving stock. I think American breeders are doing more towards improving stock than foreigners are.

Mr. Rankin—I would like to say a word with reference to this bisulphide of carbon; it is a deadly poison. It will kill woodchucks and men, and it is well to handle it with a great deal of care.

Mr. Taylor—It won't kill a woodchuck unless it is shut up with him pretty tight—same way with men.

QUES.—I would like to know what is the matter with the frame of brood on the platform?

Mr. Taylor—I think it is pickled brood, but I may be wrong. It seems to be that according to the opinion of many in the room. If any of you want to know what pickled brood is, look at this comb.

The convention then adjourned to 1:30 p.m.

(Continued next week.)

Contributed Articles.

Water for Bees and Brood-Rearing—A Reply.

BY PROF. A. J. COOK.

IT is always pleasant to have Mr. G. M. Doolittle as a critic. He is always candid, and never flippant. He has had a wide observation, and does a good deal of thinking. Therefore, any opinion that he may have is never to be dismissed without full consideration.

I have carefully reread my article, page 482, and should wish to change very little were I to rewrite it. In one or two places I should be a little more explicit were I to write the article again.

Mr. Doolittle claims, and with much show of reason, that the main use served by water in the economy of the hive is to form a part of the food fed to the brood. His two reasons for this opinion are as follows: First, water is gathered very rapidly when the bees are rapidly building up, and this irrespective of activity in the field; secondly, the weight of the brood can only be accounted for in that water is given abundantly to the brood. I am not at all certain that Mr. Doolittle's first proposition is true, tho I am sure it would generally be so. I feel very certain that the latter is not true. Mr. Doolittle and all bee-keepers know that bees frequently continue breeding for days without gathering any water at all. Certainly, then, water can not be directly requisite for the production of brood.

As I stated in my previous article on this subject, water serves the animal in three ways, as follows: First, it helps form the tissues themselves; second, it aids the processes, as, for instance, the keeping of substances in solution so that they can be used in the body; thirdly, it serves in cooling off the animal body. This last is mechanical, as the cooling comes from the act of evaporation. We see, then, that bees take water as they do all other food, to help build up their tissues, and also to aid the processes. Secretions, then, could not be formed except as water is taken as part of the food. I believe that it may be shown, some day, that the so-called chyle is largely digested pollen to which, very likely, honey may be added. The precise origin and nature of the food fed to the drones, queens, and larvæ by the nurse-bees is not yet fully determined. That some honey may

pass into the true stomach and there mix with the digested pollen is not improbable. I feel very certain that no water does pass directly into the stomach as a component part of this larval food. I believe that it is all absorbed, passing into the blood and, of course, indirectly aids in digestion, and so is important in all the work of the bee. In all animals, water is very quickly absorbed when it is taken into the alimentary canal, and I believe with bees, as with higher animals, that it speedily passes to the blood and so promotes secretion and excretion.

I do not suppose that perspiration on the outside among bees is at all active. The chitinous cover of bees would serve to greatly lessen perspiration from the outside surface of the body. Thus, it is probable that what we might call skin perspiration is very slight. Possibly it does not exist at all. But we must remember that the skin of bees is reflex, and lines all the great network of breathing-tubes. These breathing-tubes come in close apposition with the blood. That water from the blood is constantly and rapidly passing to the air in the breathing-tubes or trachea, is certainly true. This is purely analagous to perspiration, as the water is constantly passing from the blood and cools the body. Of course, this water passes out with the air, always bearing its load of heat with it. It goes without saying that neither Mr. Doolittle nor I ever saw this "sweating." It is entirely out of sight. There is no question but that the bee must cool off. It is as active as the higher animals, and all animal activity genders heat. This heat would soon destroy life were it not carried away. I still believe, despite Mr. Doolittle's kindly criticism, that a very important function of the water taken by bees is to secure this cooling-off process.

Mr. Doolittle remarks upon the sticky moisture that we always find when bees are suffocated in the hive. Of course, any honey that is incorporated in this moisture is regurgitated by the bees. I do not state that there may not be a good deal of this honey. I believe as strongly that very much is water which passes from the bees in their attempt to cool off their bodies. Does Mr. Doolittle know that this is not the case?

Mr. Doolittle's weight of brood I think is no argument in this case. The brood is not made up of water, but of tissue like all larval insects. I do not think the brood contains any more water than do other larvæ, yet many larvæ surely get no water at all in their food except in combination. This is true of all the borers.

To recapitulate: Bees need water as food to build up their bodies, to aid in performing their functions, hence, in producing the food of their young and in counteracting the heat produced by vital action. It is probable that this water all goes to the blood, and not directly into the food given to the larvæ. I do not believe that in the general economy of the body the processes are greatly different with bees from those of higher animals. If not, then surely the cooling-off process which comes thru evaporation of water—we might call it respiratory sweating—is of exceeding importance.

I am very glad Mr. Doolittle wrote his critique, and I hope others will do so if they feel that they have good and substantial reason for doubting these propositions. The processes in the animal economy are so complicated that none of us can afford to be dogmatic. We only want to get at the truth, and there is no such good way as by friendly criticism.

Los Angeles Co., Calif.

Finding Queens—Experiences in Introducing, Etc.

BY EDWIN BEVINS.

KILLING old and other undesirable queens, and introducing young ones in their places, has been my chief occupation for several days. Much has been written lately on the subject of finding queens, and judging from the remarks of some, they seem to consider it a formidable task. I have not found it so. My method is as follows:

I first get an empty hive and fasten a swarm-guard at the entrance. Then I smoke the bees to be operated on, and set the hive to one side. Then I place the empty hive where the one removed stood. Then I adjust a wide board so that its upper side shall be on a level with the upper side of the alighting-board. Then I place two short pieces of 2x4 on the wide board, so that one end of each piece shall connect with one side of the hive. These pieces of 2x4 direct the bees to the entrance, and prevent the queen from crawling off to one side, as she sometimes will if there are no obstructions. Then I smoke the bees a little

more at the top, and proceed to take the frames out one by one, and shake the bees all off in front of the empty hive.

If time presses, I do not look on the combs for the queen at all. If not, I give them a few hasty glances. The combs as fast as shaken are put into the hive, and the bees soon cover them. The bees that have clung to the sides and bottom of the old hive are brushed down in front of the new hive, so there is practically no chance to miss the queen. I never miss finding her outside, and sometimes while there are a good many bees outside with her. The time consumed is less than the time spent in telling how it is done.

The queen I got from Dr. Miller was introduced safely, but it took a long time to do it. She was received on Tuesday, and put in a hive with bees taken from above a queen-excluder, and confined to the hive by means of wire-screen. This confinement was continued for only about 48 hours. By Dr. Miller's advice I left the pasteboard over the candy. On the Friday following the Tuesday when the queen was received, the bees had not attacked the pasteboard at all, and I had it removed. Then the bees were left unmolested till the following Tuesday or Wednesday, when I had an examination made, and found the queen still in the cage. I told the person making the examination to take a small stick and punch a hole thru the candy. He did so, and a day or two after being able to get around myself, I looked and found the queen on one of the combs.

I was not so fortunate with another queen I received from Alabama a day or two after Dr. Miller's came. The candy had been eaten into to a considerable depth, and fearing the bees might release the queen too soon, I tacked a piece of pasteboard so as partly to cover the hole that admits to the candy. After two days the pasteboard had not been touched, and it was removed. Examining again at the end of five days after the cage was placed on the frames, I found the queen and her escort dead in the cage. The bees had not tried to release her. Whether the pasteboard had any part in the loss of this queen I will not venture to say. I am inclined to believe, however, that my bees do not like pasteboard.

The season here has been almost a failure so far as surplus honey is concerned. Most of my colonies have enough for winter. A few will have to be fed. I made some nuclei and reared some queens for them in August, and I shall do a good deal of doubling up, partly to save stores and partly to get rid of some undesirable queens. A nucleus with a young queen will be united with an old colony having considerable honey, but whose queen was past her usefulness.

Decatur Co., Iowa, Sept. 28.

A Visit to Some Kane Co., Ill., Bee-Keepers.

BY THE EDITOR.

SEPTEMBER 19th we accompanied the Prohibition Special Train (which carried candidates Woolley and Metcalf, with others) as far as Aurora, Ill., expecting to spend the day among bee-keepers in and near that city.

Mr. W. H. Norris, one of the bee-keepers, met us at the depot, he having come to see the special train arrive, and hear the speakers. He took us "under his wing," and

Mr. F. L. Taylor and Apiary.

Mr. John Diveky and Apiary.

after a sumptuous dinner at his elegant home, hitch up his speed-away horse, and took us to visit a few of the bee-keepers in that locality. The honey crop the past season had been only about a quarter the usual amount, the principal source being sweet clover, we believe.

We first called on Mr. John Mareth, who has a very nice yard of some 80 colonies. He runs principally for comb honey. Mr. Mareth is a pleasant young man, working in the shops as a foundry-man, so he has but little time to devote to his bees. Still, he is making a success with them, as he well deserves to do.

Mr. John Divekey was the next "victim" we saw, a picture of whose apiary is here presented, and is the oldest bee-keeper in the place. He is contentedly sitting on one of the hives.

He was born in Germany, and there commenced handling bees when 10 years of age, using at that time the old straw hive. He came to his present place in 1857, and in 1858 built the comfortable home that he now lives in. At the rear is a large lot that extends to the river, on which he has kept bees for 42 years. Tho he has held the position of foreman of the coach department of the C. B. & Q. railroad shop all these years, his spare time has always been spent with the bees, and none in that locality has had a longer or more practical apianian experience than he. At times he has had as many as 225 colonies.

Mr. Divekey was the first bee-keeper there to import and introduce the Italian bees, in the days when the introducing of queens in box-hives was an entirely different process from the operation in the dovetailed hive of to-day. Tho many years have past over his head, he still has the same interest in his bees, and works with them with even more pleasure than he did 40 years ago. With his quiet, homelike disposition, Mr. Divekey is always ready to tell of his experiences, and to impart his information to those less informed.

Last spring he had 40 colonies, and now has 90, all in first-class condition. He expects to kill about one-half the number this fall, and extract the honey from them, keeping the empty hives with full combs for the new swarms next season, considering them of great benefit to the new swarms each year. Aside from his extracting he works entirely for comb honey, and reports about an average crop. He is using the new 8-frame dovetailed hives with fence supers, believing them the best he has ever used. Bee-keeping has been to him, these many years, a "side line" of pleasure and profit—a pleasure because of the success he has made, and a profit because of the assistance it has been to him in gaining his very comfortable financial circumstances.

Mr. F. L. Taylor is another bee-keeper who lives quite near to Mr. Norris. By the way, Mr. Norris has a very small apiary at present which he expects to increase another year. He now spends most of his time in looking after his extensive property interests.

Mr. Taylor has kept bees in his present locality about

eight years. He works much on the same plan as Mr. Divekey, tho he prefers and uses 10-frame hives, using the T super. He thinks the 8-frame hive is all right if it is lookt after often, and the colonies fed when necessary, tho he can see nothing gained, and is very certain the bees in 10-frame hives will get along with less attention, and are pretty sure to have enough to eat, and make a larger and stronger colony.

Mr. Taylor is in the jewelry business, but his greatest pleasure is the bees. He introduced six 3-banded Italian queens in July, 1899, and three golden Italian queens. All are doing well, as all were successfully introduced. He thinks the 3-banded Italian queens better layers than the golden, tho the golden colonies are very strong.

Mr. Taylor has 22 colonies now, and does not expect to keep over 30, as he is on the river bank in the center of a city of 22,000, and not over three blocks (in a direct line) from the post-office, city hall, etc. We take pleasure in showing a picture of Mr. Taylor's neat apiary, which is just at the rear of his jewelry shop. The gentleman in the picture, apparently drest like a Chinaman, is the jovial owner.

We also met Mr. Sylvester, who has 25 or 30 colonies. He is a contractor and builder, and has little time to devote to his bees.

We returned to Chicago after spending a few very pleasant hours among the bee-keepers mentioned.

Eighteen Years' Experience with Bees.

BY A. MOTTAZ.

I FIRST started with a stray swarm that I caught. Then I got "Langstroth on the Honey-Bee," "A B C of Bee-Culture," and some minor books, and subscribed for *Gleanings in Bee-Culture* and the *American Bee Journal*. I increase my bees slowly, aiming for extracted honey rather than increase. Tho my winter losses have been light (except winter before last, when I lost 50 percent in one apiary), my increase has been from bought bees. Timely and careful spring and early summer management does prevent swarming for me. I now have 140 colonies in five different apiaries, spread 10 miles apart, or between extremes, mostly in 10-frame Simplicity hives, tho some are in 2-story chaff hives, and some in new 8-frame dovetailed chaff hives, with two half stories, one for extracting and one for comb honey. I have not had them long enough to express any opinion on them. I have serious doubt if there is any hive better for extracting than the regular 10-frame Simplicity, tiering as necessary, having at least enough of them and combs, or foundation, to tier three high.

I handle my combs in the hives. I have a high wheelbarrow, with corn cultivator wheel, and legs high enough so that it will just clear the grass or rubbish when I stand. The barrow consists of only the frame, being as light as possible consistent with the strength necessary to carry all I can wheel.

I have adopted the castor-wheel platform for two hives, which I lay loose on the barrow frame, projecting two or three inches to one side, so as to rest that side on the table in the honey-house as I wheel in, then it is the easiest thing for me and my assistant to take hold of each of the other corners and roll the platform on the table, which is made just high enough so that it is on a level with the barrow, just wide enough to hold the platform lengthwise, and long enough to hold the two platforms, the one empty and the full one.

I have an extracting-house 15x8x6 feet, on iron truck wheels 28 and 32 inches high. It has a door behind; two single sash windows at opposite sides, and one in front, all provided with removable sash and wire screen with bees-escapes; round roof, railroad-car fashion; floor of fencing drest and matcht on foundation like a hay-rack, only more crosspieces; side and roof frame 2x2 inches, and 1/2 inch boards 6 or 8 inches wide. It is lined all around inside with sheeting, to close all cracks. The roof is double, with building-paper between. The whole thing ready to work with driver in, weighs 3,300 pounds. I haul it as near to the apiary as possible. I have for the horses a pair of covers extending all over the head and nose, and also a rope 100 feet long with hooks at both ends to pull away a distance, if bees are very bad. We have done one extracting, and are much pleased with it.

I use duck sheets on the hives, and they work nicely to flap in smoke to drive down the bees. I leave one end sticking to the hive, raise one end, blow a puff of smoke to

the other end, then flap in the smoke. If there are two supers, the top one full, it works very well.

Tho I have all the necessary implements to make it, I prefer to buy all my comb foundation from extensive manufacturers; so also as to queens. I believe it pays me to buy of experienced and reliable breeders, except perhaps it is well to rear a few from one's best stock, to have on hand for emergencies.

I have made a very satisfactory wax-rendering tank, as per directions given by some one in the bee-papers. It is 3x4 feet, 16 inches deep, made of 2-inch plank, with galvanized sheet-iron bottom, set on bricks on edge, and of a convenient height for a roomy fire-place underneath. A wire sieve is made to slip in from the top, and is wedged down so I can dip the melted wax from the top. I believe it is an unexcelled way.

I had a long siege of foul brood 10 years ago. I failed with spraying salicylic acid, but cured by transferring bees on foundation and clean hives. I boiled hives, melted combs for wax, extracted, boiled and fed infected honey, all successfully. Some years later I bought the disease again with bees, but got rid of it promptly the same way as before.

Except winter before last, I have wintered bees successfully both in the cellar and outside in chaff hives, and some in Simplicity hives, protected by straw in movable sheds.

I have gradually created a good market for extracted honey in pint jars to grocers, and 1, 2 and 4 quart pails to families. It has been an up-hill and persistent work. I now supply from 80 to 100 grocers in some 10 different towns or cities, and dispose of 5,000 or 6,000 pounds yearly. I found it necessary until now to sell either for cash down or on commission, in order to introduce both myself and the honey, and overcome the prejudice against it. Now I am doing away with the time plan.

I hereby wish to thank the many contributors to our papers whose kinks I have appropriated, and that have been such helps. That is my main object in reading the bee-papers. I think best to adopt and apply the experiences of others, as I see their practicability, rather than try to originate very much myself. La Salle Co., Ill.

with about an inch or two of honey at the top. There was no space at the end of the frames, and I had to knock the hive to pieces to get them out. The brood-combs had separated about an inch from the top. The last 20 I got I am to return the hives when they are empty, so I transferred two into my hives.

1. What I wish to know is, can I leave them until spring, and if they swarm put the swarm into a new hive and then destroy the old brood-combs and return the old hives? Or, could I put an 8-frame super on and let them fill up, then after awhile divide and put the queen in? Or, kill the old queen and send and get a young one? Thinking you might know of a better way to get them out without going to the trouble of fastening all those old brood-combs to Hoffman frames, is why I ask. If I don't transfer them now, will they swarm in the spring?

2. I will have to feed those that I transferred. How often should they be fed? Which is the best feeder? How much water to sugar should I use? CALIFORNIA.

ANSWERS.—1. Yes, it is an excellent plan to leave the bees in the old hive till they swarm next year, then 21 days after swarming there will be no worker-brood in the hive, when you can drum out the remaining bees and dispose of the comb as you see fit. If the hives are not unusually large, the colonies in them stand as good a chance of swarming as any bees. If the season is fair, and if no surplus room is given, they will be pretty sure to swarm.

2. Once feeding is enough, if plenty is given. Root's "A B C of Bee-Culture" gives the preference to the Miller feeder for fall feeding.

Uniting Bees—Causes of Swarming.

I read all the bee-books, and still I don't understand some things, and therefore know of no way to find out but to consult the best authority.

Why is it that I invariably fail in my attempts to unite two colonies, as they go to fighting, after following all the directions laid down by yourself and others? To illustrate more fully: A few days ago (Sept. 28) I discovered a swarm of bees flying around my apiary. I don't know where they came from. After they clustered I took a second super from a hive I had on for feeding up a colony. I hived them in this super, carried them to the hive the super came from, and after placing a piece of wire-cloth over the first super left on the hive, I placed these wandering bees on this hive over the wire-cloth about dark. The next morning I found many dead bees in front. These I think were those that took wing from the ones I had lately hived.

Then I concluded to try a new plan. After removing the wire-cloth, I left a passage or entrance for the new bees by raising the top a little so they could come in and out without going thru the lower hive of bees.

I neglected to say at the proper place that I smoked the hive of bees before putting on the new bees, but could not smoke the bees I had just hived because they, being in a shallow super, would almost all take wing.

After leaving this entrance and removing the wire-cloth, I don't think they have fought any more up to date, (Sept. 30th.)

1. Now I wish to ask, What do you think of my plan of uniting? I will leave open the passage at the top for a few days longer until everything seems peaceable, when I expect to add the third super in which to feed, and then close the top. If you approve of my plan, how long before you would close the top or extra entrance? Remember, I was feeding the bees originally in this hive for winter, and as they were my weakest colony I chose to unite the strong bees with them. I neglected to say, also, that when I was hiving these bees I very carefully looked for the queen, but saw none, altho they were a good-size colony.

2. Is there any other cause for bees swarming at this season of the year, besides starvation? Several swarms have past along lately, like they do in the spring.

I will say in conclusion that I read of apiarists uniting bees as a very frequent and simple thing, but it doesn't work that way for me. For instance, they speak of uniting nuclei in the fall, as a plain, easy-going thing. They speak of taking frames of brood with the bees clinging to them, from different hives, and forming a new colony, and never speak of the bees fighting. It must be I have fighting bees that won't unite. MISSISSIPPI.

ANSWERS.—1. I am a little in the condition you are after you have read the text-books. After reading your question there are points not clear. As I understand it,

Questions and Answers.

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

[The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.]

Uniting Weak Colonies.

I have three weak colonies; please tell me plainly how to unite them for winter. NEW YORK.

ANSWER.—Follow any of the plans laid down in your text-book, and you will be pretty sure of success. But bees do not always act alike, and sometimes there will be fighting with the best of plans. In such case a good smoking helps to make them behave. Here is one good plan: Kill the queen of one of the colonies two or three days before the time of uniting. Call this colony No. 1, and the other in which the queen is left No. 2. Two or three days after killing the queen of No. 1, bring it near No. 2. Set No. 2 off the stand and put an empty hive in its place. Now take alternately from the two hives frames of brood or honey with adhering bees—first from one, then from the other—and set in the new hive. The excess combs must of course be removed after the bees are brushed from them.

Transferring and Feeding Bees.

About two weeks ago I bought 20 box-hives of bees and transferred them to 10-frame hives, and had 6 frames extra, mixt with brood and honey, but I was afraid they would not winter on 6 frames. I bought 20 colonies in 8-frame hives, thinking that I would take one frame each from the last 20 and put into the first 20; but I find that the last 20 are not any better off than those I got from the box-hives. It seems that those in 8-frame hives are about 4 years old, and perhaps older; the brood-chamber is solid with old brood-comb

when you first put on the super of strange bees, there was no passage from the super directly into the open air, but it is not stated whether there was any passage from the super thru the wire-cloth to the space below. If there was none, and the bees were completely imprisoned, there certainly could be no fighting. If part of the bees of the swarm were not secured in the super, and entered the hive thru the regular entrance, they would pretty surely be killed. That could hardly be considered failure on your part, for it would simply be some stray bees entering a wrong hive. Then (if I understand correctly) you took away the wire-cloth and allowed the bees in the super a passage into the open air. The fact that there was no fighting is proof that the scheme as a whole was a success. But if I have made the right suppositions you are not to take it for granted that your second attempt was a success independent of the first. The bees had some time to get acquainted before the wire-cloth was taken away. It would have been as well, possibly better, if the outside entrance had been allowed from the start.

The time for closing the upper outside entrance is merely a matter of your own convenience. It can be done any time after 3 or 4 days, or later.

It is not a bad thing that you have learned that there may be difficulty in uniting. Many a one has puzzled over a failure after a number of successes. Next June, you may take a frame of brood and bees from any colony and give it to any other colony with scarcely a chance of any fighting, and you may keep it up all summer, but in the fall, after all gathering has ceased, it's another story. Then you may count on fighting unless you take special precaution. One good way is this: Set an empty hive on the stand where you want the united colony to remain, and this will be usually on the stand of the stronger colony, the weaker having been unqueened 2 or 3 days before. Now take a frame from one of the hives, shake down the bees in front of the empty hive, and put the frame in the empty hive. Then do the same thing with a frame from the other hive, and thus proceed alternately until all have been used. Of course the surplus frames must be taken away after shaking or brushing the bees from them. After the first frame has its bees shaken down close to the hive, the remaining bees should be shaken down a foot or so farther from the hive.

2. Yes, bees sometimes swarm regularly quite out of season, when it is by no means a case of starvation. It is not easy to account for all the freaks of bees.

Wintering Bees in a Damp Cellar.

Last winter, in New York, I wintered 12 colonies in a dark cellar, in which the temperature would often go down to 35 degrees. The bees were in 8-frame dovetailed hives with covers sealed down, and on deep bottom-boards. Many of the hives became very damp and moldy, and water ran out of the entrance of every hive. They wintered poorly, but all came thru alive. I expect to winter them there again this winter. Would it not be better to leave the bottom-boards off, and put some absorbent like burlap under the cover?

SUBSCRIBER.

ANSWER.—It is doubtful that any gain would be made by removing bottom-boards that are deep enough to allow an entrance of 1½ to 2 inches. Possibly there might be a gain by having some absorbent under the cover; but anything of that kind to allow a freer passage of air would make the hives cooler, and they are too cool already. If the temperature often goes down to 35 degrees, the thing to strive for is to have the cellar warmer. Can you not bank the cellar with some kind of banking that will raise the temperature several degrees? A fire in a stove in the cellar would make all right, but it might not pay with only 12 colonies. There would be some gain upstairs, however, in having a warmer floor—an important thing—especially if there are small children in the family. In a cold spell you could carry down hot bricks or stones, or, better still, jugs of hot water. But the water must be cork tight, so no vapor can escape in the cellar.

"Chunk Honey"—Honey-Plant Illustrations.

1. I am thinking of trying to build up a trade (in a certain section) on chunk or bulk comb honey, as it is called in Texas. I want to produce this honey in the regular Langstroth brood-frame, in an upper story. Do you think the thin-super foundation would be heavy enough to put in full

sheets in this size frame without wires? If not, kindly advise me what weight foundation I would better use?

2. Does Prof. Cook's "Bee-Keepers' Guide" give any more illustrations of honey-producing plants than the "A B C of Bee-Culture"?

VIRGINIA.

ANSWERS.—1. In all probability it would sag badly. If you do not care to use shallow frames, it would not be a great trouble to nail a middle bar in the Langstroth frame, which would make it all right to use thin foundation. Or, you could use the full frame without the middle bar, and use a narrow starter of thin foundation. It would hardly be advisable to use foundation heavy enough to fill a full frame, for you could hardly build up a trade with such honey. Texans prefer the term "bulk honey" to "chunk honey," altho until lately they have always called it "chunk honey."

2. A hasty count shows more in Prof. Cook's book.

The Nonsensical Sting-Trowel Theory Again.

The following paragraph was taken from the New York Tribune:

BEES.—C. M. (Winchester, N.H.)—The bee's sting, supposed to serve merely as a fighting weapon, is more frequently utilized by this insect to preserve the stored-up food. Before closing its cell the bee adds to the honey a drop of the venom of its sting, this venom containing the formic acid which prevents the honey from fermenting or getting spoiled. Thus the bee, long before Lister and Pasteur, knew the use of antiseptics.

I have never seen such a statement in any bee-book or bee-paper, and would like to know if it is the truth.

SUBSCRIBER.

ANSWER.—Yes, if you go back far enough, you will find both in book and paper the nonsensical statement made that the sting of the bee is used as a trowel to manipulate wax, and that just before the closing of each cell of honey a tiny morsel of formic acid is dropt into the cell from the sting of the bee. The Rev. Wm. F. Clarke was the originator of the idea, the only book in which it appeared being a small volume of verse written by him. He never gave any proof for the assertion, but persisted in giving the vagary of his imagination as an established fact. It seems too bad that so influential a paper as the New York Tribune should start anew such arrant nonsense.

York's Honey Calendar for 1900 is a 16-page pamphlet especially gotten up to create a demand for honey among should-be consumers. The fore part was written by Dr. C. C. Miller, and is devoted to general information concerning honey. The latter part consists of recipes for use in cooking and as a medicine. It will be found to be a very effective helper in working up a home market for honey. We furnish them, postpaid, at these prices: A sample free; 25 copies for 30 cents; 50 for 50 cents; 100 for 90 cents; 250 for \$2.00; 500 for \$3.50. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

The Chicago Convention Picture is a fine one. It is nearly 8x10 inches in size, mounted on heavy cardboard 10x12 inches. It is, we believe, the largest group of bee-keepers ever taken in one picture. It is sent, postpaid, for 75 cents; or we can send the American Bee Journal one year and the picture—both for \$1.60. It would be a nice picture to frame. We have not counted them, but think there are nearly 200 bee-keepers shown.

"The Hum of the Bees in the Apple-Tree Bloom" is the name of the finest bee-keeper's song—words by Hon. Eugene Secor and music by Dr. C. C. Miller. This is thought by some to be the best bee-song yet written by Mr. Secor and Dr. Miller. It is, indeed, a "hummer." We can furnish a single copy of it postpaid, for 10 cents, or 3 copies for 25 cents. Or, we will mail a half-dozen copies of it for sending us one new yearly subscription to the American Bee Journal at \$1.00.

Our Wood Binder (or Holder) is made to take all the copies of the American Bee Journal for a year. It is sent by mail for 20 cents. Full directions accompany. The Bee Journals can be inserted as soon as they are received, and thus preserved for future reference. Upon receipt of \$1.00 for your Bee Journal subscription a full year in advance, we will mail you a Wood Binder free—if you will mention it.

A Close and Exciting Election!

Which will be Elected?
How many Votes will he Get?

Send 25 cents for a three months' subscription to the

***** Farm, Field and Fireside *****

CHICAGO,

and a chance in the

Prize guessing contest
for \$5,000 in cash,

McKinley

Bryan

which will be awarded to those coming the nearest to the official figures of the popular vote cast for the successful presidential candidate.

The Publishers' Guarantee Association has deposited \$5,000 in the Metropolitan National Bank, Chicago, Ill., for the purpose of paying these prizes, under strict conditions preventing its use for any other purpose.

First Grand Prize, \$2,000,

to the nearest guesser, and 197 more cash prizes to be awarded as follows:

To the nearest correct guess.....	\$2,000.00
To the second	500.00
To the third	250.00
To the next 5, \$50.00 each.....	250.00
To the next 40, \$25.00 each.....	1,000.00
To the next 50, \$10.00 each.....	500.00
To the next 100, \$5.00 each.....	500.00
198 cash prizes	\$5,000.00

TO AID GUESSERS:

McKinley's popular vote in 1896	7,107,304
Bryan's popular vote in 1896.....	6,533,088

Our Offer: We have made arrangements with the Publishers' Guarantee Association, of Chicago, to enable our subscribers and friends to participate in these great cash prizes. Every one is invited to participate, and for each three months' subscription to the Farm, Field and Fireside sent us, accompanied by 25 cents, a guess will be allowed. Those remitting 50 cents for six months' subscription will be allowed two guesses, and those remitting \$1.00 for one year's subscription will be allowed four guesses. This applies both to new subscribers and to renewals. Present subscribers can send in their guesses, accompanied by the money, and their subscription will be extended.

How to Guess: When you send in your subscription you make your guess. Be sure you write your name and address and guess as plainly as possible. As soon as we receive your subscription we will fill out and send you a certificate corresponding to guess made by you, which will entitle you to any prize that you may draw. Be sure and keep your certificate. We will file the duplicate with the Publishers' Guarantee Association. Every subscriber will receive as many certificates and have as many guesses as he sends subscriptions to Farm, Field and Fireside.

In case of a tie, or that two or more estimators are equally correct, prizes will be divided equally between them.

CUT THIS OUT AND SEND WITH YOUR SUBSCRIPTION.

Langstroth on... The Honey-Bee

Revised by Dadant—1899 Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroly explained, so that by following the instructions of this book one cannot fail to be wonderfully helpt on the way to success with bees.

The book we mail for \$1.25, or club it with the American Bee Journal for one year—both for \$1.75; or, we will mail it as a premium for sending us **THREE NEW** subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

Rocky Mountain Bee-Plant Seed!

(*Cleome integrifolia.*)

...FREE AS A PREMIUM...

The A. B. C. of Bee-Culture says of it: "This is a beautiful plant for the flower-garden, to say nothing of the honey it produces. It grows from two to three feet in height and bears large, clusters of bright pink flowers. It grows naturally on the Rocky Mountains, and in Colorado, where it is said to furnish large quantities of honey."

We have a few pounds of this *Cleome* seed, and offer to mail a ¼-pound package as a premium for sending us **ONE NEW** subscriber to the American Bee Journal, with \$1.00; or ¼ pound by mail for 40 cents.

Bleaching Comb Honey.

Build a bleaching-house by placing posts 2x4 or 4x4 in the ground, 5 feet apart on all sides, making it 10 feet square and 7 feet high. Put on plates and roof. Build up around the bottom with lumber 2 feet high from the ground, making it bee-tight. Put in your shelves between the posts, making them 4 inches wide, and placing them 6 inches apart, one above the other. Place these shelves entirely around your bleaching-house, then cover the outside, from the lumber at the bottom to the plate, with the lightest house-lining. Seal overhead with cloth or lumber. Leave the space between the sealing and roof open so

as to keep your house as cool as possible.

Place a screen-door in one corner, as seen in the sketch. Locate a work-table, 3x6, in the center of your bleaching-house, for cleaning and packing on.

The best way to build a sulphuring-box is to take a stovepipe 8 feet long, with an elbow at one end. Place the

pipe under ground about 8 inches deep, letting the elbow come up above ground in one corner of your bleaching-house. For the outside end of the pipe take an old coal-oil can and cut a hole in the side sufficiently large to admit the stovepipe. Cut about half of the top of the can out square to allow you to put in your sulphur and for draft; then make a box just the size of a super, but four times deeper. Place the box over the elbow on the ground, in the corner of your bleaching-house, as seen in the sketch.

We are now ready for business. When you take off full supers of honey from the hives, carry them into your bleaching-house and place on the sulphuring-box; build up ten or twelve high. Put a heaping tablespoonful of sulphur in an old tin plate or pan, and place it in the oil-can and start it to burning. In this way you get the full benefit of your sulphur, as it enters the super in every row of sections and passes from super to super. Some may ask why I have the sulphur so far from the honey. Why not put it directly over it? The reason is, I have tried that, and the consequence was I had a lot of comb honey that became hot enough to begin to settle in the sections, and also turned them dark at the bottom of the sections. To get the best results, keep your honey

as cool as possible when sulphuring. After the sulphur that you have put in your box has burned out, turn your supers upside down on your table; take out the honey and clean; and as you clean place on the shelves side by side, the honey facing the outside. Let it remain about 24 hours in daylight, then reverse, putting the other side of the section out to the light. When my

The Bee-Keeper's Guide

Or, Manual of the Apiary,

—BY—

PROF. A. J. COOK.

460 Pages—16th (1899) Edition—18th Thousand—\$1.25 postpaid.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published to-day. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without THE BEE-KEEPERS' GUIDE.

This 16th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to GIVE AWAY to our present subscribers, for the work of getting NEW subscribers for the American Bee Journal.

Given for TWO New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the TWO NEW subscribers—simply the Bee Journal for one year:

Send us TWO NEW SUBSCRIBERS to the Bee Journal (with \$2.00), and we will mail you a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both for only \$1.75. But surely anybody can get only TWO NEW SUBSCRIBERS to the Bee Journal for a year, and thus get the book as a premium. Let every body try for it. Will YOU have one?

GEORGE W. YORK & CO.,

California! If you care to know of its Fruits, Flowers, Climate or Resources, send for a sample copy of California's Favorite Paper—

The Pacific Rural Press,

The leading Horticultural and Agricultural paper of the Pacific Coast. Published weekly, handsomely illustrated, \$2.00 per annum. Sample copy free.

PACIFIC RURAL PRESS,

330 Market Street, SAN FRANCISCO, CAL.

shelves are pretty well filled I go over it every morning before the sun is up, reverse, and pick out what is sufficiently white. When the sun is shining it all looks white when it is not.

Pack as you take from the shelves. Care should be taken that the sun does not shine too hot on your bleaching-house during a hot day, or you will have a lot of honey settling down in the sections and dropping out. When the weather is cool the sun does no harm. In hot weather I use an awning on the sides that the sun shines on, about four feet wide, sufficient to break the heat of the sun from the shelves. It is not the heat of the sun that you want. It is the sulphuring and the light that do the work. After comb honey has remained on the shelves three days, and is not sufficiently white, place in supers and sulphur, and place on the shelves again. You will find that you can bleach the darkest comb. Any foreign matter that is on the comb will not bleach. I commenced the bleaching of comb honey several years ago, and there are but five others in the State, up to the present time, who have adopted it.—L. J. CROMBIE, of San Diego Co., Calif., in Gleanings in Bee-Culture.

GENERAL ITEMS

Fine Season—Eastern Oklahoma.

Bees have done fine here this season, mine averaging 66 pounds of comb honey per colony, spring count. I have sold the increase in colonies to people who are tired of paying me 20 cents per pound for honey.

People said I was foolish to invest money in bees, hives, and bee-papers,

DR. PEIRO,

34 Central Music Hall, CHICAGO.

We Can't Give Away Anything

You pay for what you get in this world. You understand that. But as a business proposition we want you to try our great medicine for Indigestion, Constipation, Biliousness, Sick Headache, Insomnia, "the Blues," and like complaints—

Laxative NERVO-VITAL Tablets

We know you won't buy it, until you know something about it. The best way to get you to know how good it is, is to let you try it. That's what we do. Send Stamp for "Health" booklet, and we will send you a free sample package, that you may try it yourself. We know you will always keep it in the house, if you once try it. What fairer offer could we make? At all Druggists—10 and 25 cents.

Handsome Stick Pin **FREE!**

If, instead of sending for a sample, you send us 25c we will send you "Health" booklet, a 25c box and a handsome gold stick-pin, set with emerald, ruby or pearl, warranted to be worth double the money. Order by number. This is an extra introductory offer. Only one pin to one person. If unsatisfactory, money returned. Send now while the offer is good.

MODERN REMEDY COMPANY, KEWANEE, ILLINOIS.

[This company will do exactly as it promises.—Editors.]

for this place was not a good one for bees. Now some say I "make" my section honey, but the most of them want bees. I have disposed of my entire crop around home, and have also bought some to sell.

On page 617, it is askt if Eastern Oklahoma is a good location for bees. It is not as good as some places, but I believe with careful attention bees will average 50 pounds of comb honey per colony here. Our honey is from sumac, both black and white, and cottor, which makes a "No. 1 white honey. The sumac honey has a nice flavor, but is light amber in color. Alfalfa clover is grown to some extent here, and yields honey at times. Sweet clover does fine, blossoming from seven to eight weeks, or from June 10 to Aug. 10, and has bees on it all of the time.

F. W. VAN DEMARK.

Payne Co., Okla., Oct. 8.

Bees Did Well.

My bees have done well. They are all in good movable-frame hives with plenty of stores for winter.

I have taken off 250 pounds of fine honey this year, and increase from 2 colonies to 8. Honey is in good demand at 15 cents a pound.

H. C. SPRINGER.

Story Co., Iowa, Oct. 4.

Crop Almost a Failure.

My honey crop this year is almost a failure. I think I never experienced a poorer season.

C. W. MCKOWN.

Knox Co., Ill., Oct. 9.

Bees Did Fairly Well.

My bees did fairly well the past season. I shipt 125 cases of honey. It has been very dry here, and we did not get any fall honey-flow.

MRS. FLORA WING.

Montrose Co., Colo., Sept. 29.

Selling Honey—Cleaning Combs.

I notice in "Editorial Comments," on page 627, it is said that Doolittle complains that in 23 years he had sold only 100 pounds of honey for cash to distant parties. My experience has been very different. Up to 1896 I cultivated my home market, but that year my crop was so large that I could not possibly handle it in that way, so I shipt it to commission men and to parties who paid cash on arrival, but the greater part of my crop I sold to those who sent cash with their orders. I received the smallest price from the commission men, the next smallest from those who bought for cash on arrival, and the best price from those who sent cash with the order, as they were mostly consumers.

The result is that since then, with the exception of one customer to whom I sell, I sell all my honey direct to consumers who send cash with the order. Tho my own crop of honey is large, I now buy all the No. 1 extracted honey produced in my own neighborhood, and ship in large quantities besides, from Wisconsin, Illinois, and Ohio.

You also speak of the effect of exposing combs to have the bees clean them of honey. I keep about 400 colo-

nies of bees, but tho I run them exclusively for extracted honey, they swarm. In the fall I unite heavily. I aim to do all the uniting for a single apiary in a single day, throwing the combs on the ground some distance from the hive, as I unite them. At first they act wild, later they become quiet, and by-and-by gentle, and can be brushd off the combs on which they are at work with the hand without any danger of attack. Towards evening the combs are all ready to be stored away. But it might not work as well with one not used to it.

M. V. FACEY.

Fillmore Co., Minn., Oct. 6.

Bees Did Well this Year.

My bees have done very well this summer, and are in fine condition for wintering. I shall winter about 200 colonies this year.

I get the Bee Journal every week right on time, and always save it for Sunday evening. It is bright and newsy, and full of little items of interest, and I enjoy it very much.

My speciality is the rearing of bees for the use of farmers. I always advise those to whom I sell bees—where they ask for advice as to the care of them—to take a year's subscription of the American Bee Journal, read it carefully, follow directions, and I will guarantee they will be all right in their care of the bees.

CHARLES A. HOLMES.

Suffolk Co., Mass., Oct. 8.

One of the Common Asters.

I send you a sample of some flowers that are in full bloom here. If they had not bloomed the bees would all have starved to death.

JOHN CRAIG.

Macoupin Co., Ill., Oct. 1.

(We referred the above to Prof. Walton, who replies as follows:—EDITOR.)

Of the autumn nectar-bearing flowers, the asters are dearer to the apiarist's heart than almost all others, and happy is the bee-keeper who is fortunate enough to live in a district that is unfortunate enough to be overrun with these weeds. The asters are hardy plants, and will thrive anywhere if left to themselves, especially in waste pasture-land or open wood-lots. While the average farmer regards them with an evil eye, and wishes them well out of his way, they possess one redeeming quality precious in the sight of bees. Altho the honey obtained from the asters is not of the very best, it is nevertheless abundant and good for wintering purposes.

The specimen you sent is the Aster ericoides, and is found very abundant in the middle and western States.—C. L. WALTON.

The Pasteboard Queen-Cage.

Seeing that the Root Company has been so successful with the queen-cage with cardboard over the food instead of a cork, I want to give my experience in that line.

My premium queen from Dr. Miller came in such a cage, without a dead bee in the cage, and I congratulated myself on having received one queen in fine shape. Out I went to my queen-

less colony to introduce her to her new home and family. I opened the hive, took a frame from the side, spread the others to make room for the cage to hang between them, and lookt for the cork to remove, when, lo! there stared me in the face a piece of cardboard full of small holes, and on it were printed very plainly the words, "Do not remove; see directions." So the directions were carefully read, and the same words greeted me there, "Do not remove the card; the bees will gnaw thru and liberate the queen in two or three days." Thinks I, "That's a new wrinkle; but it must be right for it came from Dr. Miller, so here goes."

Well, being busy, and supposing the queen was out, I did not open the hive again for ten days, and what was my surprise to find the cardboard untouched, the bees in the cage all dead, and the queen badly daubed and feeble. I at once liberated her, the bees started to clean her up, and I closed the hive. Now my queen is gone. In order to make sure that I did not overlook her, I ran the bees all thru a queen-guard, but no queen was found, so I have doubled that colony in with another.

The next time I get a queen in a cage with cardboard on there will be a separation between them before the queen goes into the hive. I will go on record as the one percent that made a failure with the cardboard on the cage.

Another American Triumph.—The following letter has been received at West Chester, Pa., by Mr. P. M. Sharples, manufacturer of the Sharples Cream Separators, and will give great pleasure to thousands of Mr. Sharples' friends and users of his machines. Of course this recognition of merit was quite confidently expected, but the assured fact is a great satisfaction. We congratulate Mr. Sharples and his associates, including the humblest workman on his pay roll, whose combined efforts have deserved this noteworthy award:

U. S. DEPT. OF AGRICULTURE,
BUREAU OF ANIMAL INDUSTRY, DAIRY DIVISION
WASHINGTON, D. C., Aug. 27, 1900.

MR. P. M. SHARPLES, West Chester, Pa.
DEAR SIR:—It gives me pleasure to inform you that we have just received from Major Henry E. Alvord, Chief of this Division, and now in charge of the U. S. Animal Industry Exhibit at the Paris Exposition, a partial report of awards on dairy machinery and products in the U. S. Collective Exhibit, which states that the Cream Separators sent by you HAVE BEEN AWARDED THE GOLD MEDAL.

Very respectfully, R. A. PEARSON,
Acting Chief of this Division.

Please mention Bee Journal when writing advertisers.

HONEY AND BEESWAX
MARKET QUOTATIONS.

CHICAGO, Oct. 8.—The receipts of all kinds of honey are lighter than usual at this season of the year. The market is steady with no advance probable, as prices are now at a point that is curtailing consumption. Fancy white brings 16c; No. 1, 15c, and good white but travel-stained or irregular in shape, 13@14c; amber, 10@12c; dark, 8@10c. Extracted, white clover and basswood, 7½@8c; amber, 7@7½c; buckwheat and other dark grades, 6½@6¾c. Beeswax, 28c. R. A. BURNETT & Co.

KANSAS CITY, Oct. 10.—Market steady; 24-pound section-cases, \$3.25 to \$3.40; 12-pound cases, \$1.60 to \$1.80 for fancy white; No. 1 amber, 13@14c per pound. Extracted honey, light color, 7½@8½c; amber, 6@7c. Beeswax, 25@30c. W. R. CROMWELL PRODUCE Co., Successors to C. C. Clemons & Co.

BUFFALO, Oct. 11.—Market decidedly strong and active, as demand exceeds supply of fancy 1-pound comb, which is selling at 17@18c to-day; receipts small. Dark, 10@14c, as to grade. Beeswax, 25@33c, as to grade. BATTERSON & Co.

NEW YORK, Oct. 11.—Comb honey in good demand for all grades at 15@16c for fancy white; 13@14c for No. 1 white; 12c for amber and 10@11c buckwheat. Hardly enough supply to meet demand. Extracted firm at 7@7½c for white, 6½@7c for light amber, 6c amber, and 5½c dark; good demand for Southern, basswood and clover. Beeswax quiet at 27c.

HILDRETH & SEGELKEN.

BOSTON, Sept. 21.—Our honey market is very strong at the following prices, with supplies very light: Fancy one-pound cartons, 17c; A No. 1, 15@16c; No. 2, 15c; No. 2, 12@13c. Extracted from 7½@8½ cents, according to quality. Can see no reason why these prices should not be well maintained right thru the season.

BLAKE, SCOTT & LEE,

CINCINNATI, Sept. 21.—The demand for fancy comb honey is good and finds ready sale at 16@16½c; No. 1, 15c. The demand for extracted honey at present is slow and offer same by the barrel as follows: White clover, 8½@9c; Southern, 6½@7½c; Florida, 7@8 cents, according to quality. Beeswax, 27c.

The above are MY SELLING PRICES. I do not handle any honey on commission, but pay spot cash on delivery. C. H. W. WEBER.

ALBANY, N. Y., Sept. 22.—Demand good, now at firm prices; White comb, 15@16c; mixt white, 13@15c; amber, 12@13c; buckwheat, 11@12c. Extracted, white, 8@9c; mixt white, 8@8½c; amber, 7@7½c; buckwheat, 6@6½c. H. R. WRIGHT.

DETROIT, Oct. 6.—Fancy white comb, 15@16c; darker grades, 11@12c. Extracted, white, 8@9c; amber, 5@6c. Beeswax, 26@27c. No demand at present for extracted.

M. H. HUNT & SON.

SAN FRANCISCO, Sept. 26.—White comb, 13@14 cents; amber, 11½@12½c; dark, 8@9c. Extracted, white, 7½@8c; light amber 6½@7½c; amber, 5½@6½c. Beeswax, 26@28c.

Market presents a healthy tone, being lightly stocked with all descriptions, with inquiry not lacking, even for most common qualities, altho choice to select naturally commands the most attention.

WANTED—HONEY AND BEESWAX.

We have a tremendous and growing trade in this line, and would like to hear from all who have such goods to sell in any part of the country, with quality, description, and lowest cash price. THOS. C. STANLEY & SON, Fairfield, Ill.

Chicago.—The regular semi-annual meeting of the Chicago Bee-Keepers' Association, will be held in Wellington Hall, 70 N. Clark Street, Saturday, Nov. 3, 1900, from 2 to 5 in the afternoon, and 7 to 9 o'clock in the evening. Dr. C. C. Miller will probably be present. The regular annual election of officers will occur. The general subject for discussion will be reports on the season's work. All bee-keepers are requested to send questions by mail to the President. Mr. George W. York, who will assign them to others to be answered. Ladies are especially invited to be present.

GEORGE W. YORK, Executive
MRS. N. L. STOW, Committee.
HERMAN F. MOORE,

We have a Large Stock on hand and can ship promptly.

SEND US YOUR ORDERS FOR
Hives, Extractors

OR ANYTHING YOU WANT IN THE BEE-KEEPING LINE.

WE MAKE ONLY THE BEST.

Our Falcon Sections and New Process Foundation are ahead of everything, and cost no more than other makes. New Catalog and copy of THE AMERICAN BEE-KEEPER free. Address,

THE W. T. FALCONER MFG. CO.,
JAMESTOWN, N. Y.

W. M. GERRISH, East Nottingham, N. H., carries a full line of our goods at catalog prices. Order of him and save freight.

Please mention Bee Journal when writing.

SWEET CLOVER

And Several Other Clover Seeds.

We have made arrangements so that we can furnish Seed of several of the Clovers by freight or express, at the following prices, cash with the order:

	5lb	10lb	25lb	50lb
Sweet Clover (white)	60c	\$1.00	\$2.25	\$4.10
Crimson Clover	70c	1.20	2.75	5.00
Alsike Clover	80c	1.50	3.50	6.50
White Clover	90c	1.70	3.75	6.50
Alfalfa Clover	80c	1.40	3.25	6.00

Prices subject to market changes. Add 25 cents to your order, for cartage, if wanted by freight.

One-Pound Square Honey-Jars,

—\$5.00 a gross; 5 gross, \$4.80 per gross.—

WINTER-CASES, 10 for \$7.00. CARTONS—the best made. Catalog of Apiarian Supplies and Queens free.

Apiaries—Glen Cove, L.I. **I. J. STRINGHAM, 105 Park Place, New York, N. Y.**

Please mention Bee Journal when writing.

Four Celluloid Queen=Buttons Free

AS A PREMIUM

For sending us **ONE NEW SUBSCRIBER** to the Bee Journal for the balance of this year, with **30 cents**, we will mail you **FOUR** of these pretty buttons for wearing on the coat-lapel. (You can wear one and give the others to the children.) The queen has a golden tinge.

This offer is made only to our present regular subscribers.

NOTE.—One reader writes: "I have every reason to believe that it would be a very good idea for every bee-keeper to wear one [of the buttons] as it will cause people to ask questions about the busy bee, and many a conversation thus started would wind up with the sale of more or less honey; at any rate, it would give the bee-keeper a superior opportunity to enlighten many a person in regard to honey and bees."

Prices of Buttons alone, postpaid: One button, 8 cts.; 2 buttons, 6 cts. each; 5 or more, 5 cts. each. (Stamps taken.) Address,

GEORGE W. YORK & CO., 118 Michigan St., CHICAGO.

AMERICAN BEE JOURNAL

GEORGE W. YORK,
Editor.

CHICAGO, ILL., OCTOBER 25, 1900.

FORTIETH YEAR
No. 43.

WEEKLY

Langstroth Monument at Dayton, Ohio, Erected by Bee-Keepers.

THE AMERICAN BEE JOURNAL.

PUBLISHED WEEKLY BY

GEORGE W. YORK & Co.

118 Michigan St., Chicago, Ill.

[Entered at the Post-Office at Chicago as Second-Class Mail-Matter.]

IMPORTANT NOTICES:

The Subscription Price of this journal is \$1.00 a year, in the United States, Canada, and Mexico; all other countries in the Postal Union, 50c a year extra for postage. Sample copy free.

The Wrapper-Label Date of this paper indicates the end of the month to which your subscription is paid. For instance, "Dec00" on your label shows that it is paid to the end of December, 1900.

Subscription Receipts—We do not send a receipt for money sent us to pay subscription, but change the date on your wrapper-label, which shows you that the money has been received and duly credited.

Advertising Rates will be given upon application.

Reformed Spelling—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound. Also some other changes are used.

The Bee-Keeper's Guide

Or, Manual of the Apiary,

—BY—
PROF. A. J. COOK.

460 Pages—16th (1899) Edition—18th Thousand—\$1.25 postpaid.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published to-day. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without THE BEE-KEEPERS' GUIDE.

This 16th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to GIVE AWAY to our present subscribers, for the work of getting NEW subscribers for the American Bee Journal.

Given for TWO New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the two NEW subscribers—simply the Bee Journal for one year:

Send us TWO NEW SUBSCRIBERS to the Bee Journal (with \$2.00), and we will mail you a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both for only \$1.75. But surely anybody can get only TWO NEW SUBSCRIBERS to the Bee Journal for a year, and thus get the book as a premium. Let every body try for it. Will YOU have one?

GEORGE W. YORK & CO.,
118 Michigan Street, CHICAGO, ILL.

Doolittle's Queen-Rearing Book

FREE—For Sending Us TWO New Subscribers for One Year at \$1.00 Each.

Index to the Chapters of the Book.

Scientific Queen-Rearing,

as practically applied, describes and illustrates a method by which the best Queen-Bees are reared in perfect accord with Nature's ways. It is written for the amateur and veteran in bee-keeping, by Mr. G. M. Doolittle, the leading queen-breeder of the world.

Importance of Good Queens; Nature's Way of Rearing Queens; Another of Nature's Way; Old Methods of Rearing Queens; Later Methods of Rearing Queens; New Way of Rearing Queens; Getting the Bees off the Cells; What to do with the Queen-Cells; Queen-Cell Protectors; Nuclei—How to Form; Nuclei—How to Multiply; Bee-Feeders and Bee-Feeding; Securing Good Drones; Introduction of Queens; Introducing Virgins Queens; Keeping a Record of Cells, Queens, Etc.; Queen-Register; Clipping the Queen's Wings; Shipping, Shipping-Cages, Bee-Candy, Etc.; Queens Injured in Shipping; Quality of Bees and Color of Queens; Rearing a Few Queens; Later Experiments in Queen-Rearing; Latest Feats in Queen-Rearing.

Bound in cloth, price \$1.00, postpaid; or we will mail it FREE as a premium for sending us TWO NEW subscribers to the American Bee Journal for one year, at \$1.00 each; or for \$1.60 we will mail the book to any one and credit a year's subscription on the American Bee Journal. Address,

GEORGE W. YORK & CO. 118 MICHIGAN ST., CHICAGO, ILL.

BEST Extracted Honey For Sale

ALL IN 60-POUND TIN CANS.

ALFALFA HONEY *****

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

BASSWOOD HONEY *****

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms in Wisconsin. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

Prices of Either Alfalfa or Basswood Honey:

A sample of either, by mail, 8 cents; samples of both, 15 cents—to pay for package and postage. By freight—one 60-pound can, 9½ cents per pound; two cans, 9 cents per pound; four or more cans, 8½ cents per pound. Cash must accompany each order. If ordering two or more cans you can have half of each kind of honey, if you so desire. This is all

ABSOLUTELY PURE BEES' HONEY.

The finest of their kinds produced in this country.

Read Dr. Miller's Testimony on Alfalfa Honey:

I've just sampled the honey you sent, and it's prime. Thank you. I feel that I'm something of a heretic, to sell several thousand pounds of honey of my own production and then buy honey of you for my own use. But however loyal one ought to be to the honey of his own region, there's no denying the fact that for use in any kind of hot drink, where one prefers the more wholesome honey to sugar, the very excellent quality of alfalfa honey I have received from you is better suited than the honeys of more market flavor, according to my taste.

McHenry Co., Ill.

C. C. MILLER.

Order the Above Honey and then Sell It.

We would suggest that those bee-keepers who did not produce enough honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

Address,

GEORGE W. YORK & CO., 118 Michigan St., Chicago, Ill.

ESTABLISHED IN 1861

AMERICAN BEE JOURNAL

THE OLDEST BEE-PAPER IN AMERICA

40th YEAR.

CHICAGO, ILL., OCTOBER 25, 1900.

No. 43.

* Editorial. *

The Honey Crop of 1900, it seems, will be quite well cleaned up before next spring. The honey of the past two seasons has found a very ready market. This has been a very good thing for those who have been so fortunate as to have secured a crop. There is no good reason why the fair prices at which honey sells now should not be maintained right along, no matter if the future crops should be larger again. Honey should always be worth the price it is now bringing in the markets, and will be if it is properly handled.

One of the chief reasons why honey is bringing a better price almost universally, is because it is being handled more and more by a better class of dealers—or by dealers who pay cash and get cash for it. Some of the honey-commission men of the past have been a great damage to the producers of honey. They not only defrauded many bee-keepers, but kept the price of honey down for all by needlessly sacrificing what was sent to them to handle.

We believe that the end of the old commission frauds is very near. Bee-keepers and farmers are fast learning—tho by dearly bought experience—that there are still a few dealers left in our large cities who are honest, and who will do the right thing by their shippers. Our own experience in dealing in honey on a cash basis has been eminently satisfactory—that is, in all cases where the bee-keeper or shipper has wanted only what was fair and right. Of course, there are a few people even among bee-keepers, who need to be less economical of the truth, and square their consciences by the Golden Rule. The commission men have not always and invariably been in the wrong. Not by a 60-pound can full of honey! We have witness instances where the bee-keeper was really trying his best to “work a game” on the commission man. But the “game” never worked in that way. We would never think of trying to get ahead of even the ordinary kind of commission men. They are too keen ever to be caught by any scheme.

The only way to do business is to do it honestly. No other way will last very long, or be at all satisfactory. The sooner men come to learn that there are some things in this life of greater value than the dollar, the sooner will the time be here when it will be a genuine pleasure to do business. Now it is too often the case that one man is trying to get ahead

of the other—trying to get up in the world by using his neighbors as so many steps to tread upon. That is not the way to rise permanently. One may rise in that way for a while, and to a dizzy height, but it would be too dangerously dizzy, and too great would be the disastrous “come down” that must soon follow.

Let us all deal honestly, giving value for value; then, if we prosper, well and good. If not, we can fail honorably, and still merit the esteem of all whose esteem is worth having.

Haul Bees Home Early.—If this is your first year's experience with an out-apiary, and you are of those who must haul home bees to winter in the cellar, you may make the mistake of delaying unwisely the home-bringing. So long as bees are gathering, even if only a little every day, it is better to have them as widely distributed as possible. But when all gathering ceases, the sooner the hauling is done the better. The bees should have time to get off the effects of the excitement caused by their ride, and should have at least one good flight before going into the cellar.

The Langstroth Monument.—Through the courtesy of Gleanings in Bee-Culture we show on our first page this week an excellent picture of the granite monument erected by appreciative bee-keepers to the memory of the Rev. L. L. Langstroth—the father of improved American bee-keeping. It is located in Dayton, Ohio, and cost \$300.

The inscription, which is somewhat indistinct in the picture, reads as follows, having been written by Hon. Eugene Secor, who did much to secure the necessary funds for the erection of the substantial memorial stone:

INSCRIBED TO THE MEMORY OF
REV. L. L. LANGSTROTH,
“FATHER OF AMERICAN BEE-KEEPING.”

by his affectionate beneficiaries in the Art; who, in remembrance of the services rendered by his persistent and painstaking observation and experiments with the Honey-Bee, his improvements in the Hive, and the charming literary ability shown in the first scientific and popular book on the subject of Bee-Keeping in the United States, gratefully erect this monument.

Rest thou in peace. Thy work is done.
Thou hast wrought well. Thy fame is sure.
The crown of love, which thou hast won
For useful deeds, shall long endure.

We are glad that the Langstroth monument is in place. It looks for some time as if bee-keepers were a little apathetic in regard to it, but it has been only about five years since Father Langstroth passed over to his eternal home. Many a prominent public man who left this world waited much longer for the

erection of a permanent and appropriate shaft to mark the resting-place of all that was mortal about him.

Bee-keepers have done well; tho perhaps there was no absolute need of the stone to aid his living in the memory of a grateful people, as his consecrated life and abundant labors must ever be a greater and more lasting monument than one of crumbling granite that now stands in yonder cemetery.

We trust that some day there will arise an inspired writer who will undertake the loving task of writing a volume on Father Langstroth's devoted life—a volume that will find a place in the home of every bee-keeper.

Winter Stores in Belgium are rated a good deal more heavily than in this country. L. Pirson, in *Le Rucher Belge*, says it has been proven repeatedly that for native bees the minimum allowance is 44 pounds, while Italians, because of their greater activity in brood-rearing, must have at least 55 pounds. In this country many are satisfied with half that amount; and no distinction is made between the amounts given to blacks and Italians. Possibly it would be the part of wisdom to make such distinction. Mr. Pirson claims that the extra amount needed for Italians is well paid for in the extra amount of brood reared in early spring.

Unsalable Sections may be profitably used to piece out winter stores. One way in which they may be used is to fit them into the brood-frames. If the frame is too small to take eight sections easily, take off the side or bottom of some of the sections to bring them within the required compass. Trim off the edges of the sections, so the wood will not project beyond the comb, unless you have plain sections, when no such trimming will be necessary.

Candied vs. Liquid Honey.—Chalon Fowls has ably championed the practice of selling extracted honey in the liquid form, melting it for the grocers as fast as it became candied, and has used the forceful argument that by so doing he has obtained a high price for his honey. In a foot-note to an article by him in *Gleanings in Bee-Culture*, the editor sums up the subject in the following dispassionate manner:

This whole question, when simmered down, stands about this way: The general public are suspicious of candied honey. Now, honey will candy. Considering this fact, Dr. Miller, R. C. Aikin, *et al.*, argue that the public may be and can be educated to the wholesomeness and purity of honey in the solid form; then, if perchance the liquid article while in the market, or in the home, shall turn cloudy or solid, no suspicions will be aroused as to its

purity or wholesomeness. In Mr. Aikin's locality consumers will take the candied honey as quickly as they will that in a liquid form, and pay as much money for it. Why? Because he has educated them on that point. You, Mr. Fowls, have educated your trade to nothing but the very best of liquid extracted. Your practice and belief have almost been forced on you by the fact that your customers will have nothing but ripe, thick extracted honey; but, methinks, you might personally show to some of the consumers that here, for example, is a honey candied solid that is of the same lot as that in the jar, beautifully transparent, and so tempting to the eye. If you went one step further, and said some people like the candied article better, you might be able to get them to buy some of both. If I mistake not, Mr. Aikin started out on this very plan until now a large part of his retail trade not only receives, but expects, candied honey, for they know they can easily reduce it to a liquid condition by following the directions on the pail.

Now about the man who sells at double prices. At the time of making the statement I tried to place emphasis upon the fact that one can, if he has gumption enough, get double price, providing he takes pains to sell ripe, thick honey of first quality, and no other. When the consumers learn that Fowls always sells a fine article, and that Jones sells the cheap, disagreeable, twangy stuff at half of Fowls' price, they will patronize Fowls every time, even tho he does ask "double prices." Of course, the phrase sounds bad; but the man who is alive and awake to the opportunity presented, and who puts out a first quality of thick honey, has a right to charge for his honey twice as much, for it is really cheaper than the honey of the other fellow, who puts out a cheap, inferior, watery article. Yes, sir; I have great respect for the "double-price" man when he gives me double-price value.

Ontario Bee-Keepers' Association will meet at Niagara Falls, Dec. 4, 5 and 6. This will make it convenient for many from this side of the line to be in attendance. The Ontario has moved to the front in the matter of conventions, the time being largely taken up with discussions of the most profitable kind. Success to our Canadian brethren.

Treatment of Foul Brood.—Askt whether it is necessary that the supers should come off the hives after the starters are put in, Wm. McEvoy thus replies in the Canadian Bee Journal:

"All supers must be kept off the hives until you have the bees most thoroly cleansed of all the diseased honey which they took out of the old combs when you removed them. To cleanse the bees, remove all the combs in the evening in the honey season, and give them nothing but comb-foundation starters, which you will leave with the bees for four days. During these four days the bees will use up the most of the diseased honey in comb-building, and will store the balance of it in the little pieces of new combs. Then in the evening of the fourth day take out these new combs (which the bees made out of the starters), and give them full sheets of comb foundation, and when the foundation is made into combs you will find complete cures in all cases that have been cleansed this way.

"After the honey-flows are over, or at any time that the bees are not gathering honey, this same cleansing process can be carried out, and perfect cures made, by feeding sugar syrup in the evenings. I have had hundreds of colonies cured in this way, and fed up for winter on sugar syrup, and the most of these cured colonies gave good yields of honey the following season. Never put supers of extracting-combs on right after you put the starters in the brood-chamber, because if you do the bees will rush up and store all the diseased honey in them, and then you will still have diseased honey on hand to cause you trouble later on."

The Weekly Budget

MR. A. L. BOYDEN, secretary of The A. I. Root Co., made us a short call Oct. 12th. He had been spending a week's vacation among relatives in Michigan, and was on his way home.

MISS ADA L. PICKARD, of Richland Co., Wis., wrote us as follows Oct. 13:

"MR. YORK:—You will remember that while at the National convention last August I told you that I had sent direct to Italy for a lot of queens. Well, they have come, have been introduced, and are in fine condition. They are much better than the imported queens that _____ send out. It seems as if those I sent for could not have been as long coming over from Italy as the one _____ sold me, as they were much younger. The bees have superseded the imported queen I got from _____, or else she died from old age. I feel as if she was quite an expensive article. I think next season I will be in a position to send out some good stock."

EDITOR W. J. CRAIG is making a very neat-appearing and interesting monthly of the Canadian Bee Journal. Every Canadian bee-keeper should subscribe for it in addition to the weekly American Bee Journal. It would be difficult for any one really interested in the keeping of bees to have too much literature on the topic. There is not a bee-paper published to-day that is not well worth its subscription price. Of course, it would be natural for us to recommend first of all the taking of the American Bee Journal. But after that, take just as many more as you feel that you can afford. Then study carefully whichever ones you take, in connection with one or more good-books on the subject.

IDEAL WOMAN.—In one of her addresses at Chicago, Lady Aberdeen said she thought the ideal woman had been sketched by Lowell in one of his beautiful poems:

For with a gentle courage she doth strive,
In thought, in word, in feeling so to live
As to make earth next Heaven; and her heart
Herein doth show its most exceeding worth,
That, bearing in her frailty her just part,
She hath not shrunk from evils of this life,
But hath gone calmly forth into the strife,
And all its sins and sorrows hath withstood
With lofty strength of patient womanhood.

SPELLING REFORM finds a strong champion in the person of Hon. Frank E. Fitts, a member of the Massachusetts legislature. Mr. Brooks D. Cook, of that State, has sent us a clipping from a local newspaper, which says that Mr. Fitts introduced a bill looking to the change of spelling certain words whenever they appear in State documents. It aims simply at dropping useless letters. Mr. Fitts wisely says:

"The legislature can not make people use the improved method of spelling, but it can put the words before them, so that they will get used to their appearance and see the gain, and will soon come to use them.

"The statement is made that the irregular spelling of the English language causes a loss of two years of the school time of each child, and is mainly the cause of the alarming illiteracy of our people; that it involves an expense of hundreds of millions of dollars annually for teachers, and for writing and printing superfluous letters, and that it is an

obstacle in many ways to the progress of those speaking the English language, and to the spread of the language among other nations." We form societies, hold meetings, and work day and night, to reduce the hours of labor for the working people. Why should we not be a little interested in reducing the labor of our own children? Should the legislature see fit to adopt the resolution, I have no doubt the improved spelling would be taken up by more papers and individuals, and finally by all."

We are glad to welcome Mr. Fitts as a co-laborer with the American Bee Journal in endeavoring to simplify the spelling of the English language. This needed reformation will come only by degrees until all the necessary changes in spelling are made.

We notice that the Nickel Plate railroad time tables now use "thru" for through—the same as we do. We are glad to see the general public take hold of this reform. Many of our own correspondents are doing nicely, as is shown by the letters we receive daily. Spelling reform is going to be a winner. Better join the procession, or you'll "get left."

MR. H. D. BURRELL, of Van Buren County, Mich., seems to be having some trouble with a neighbor, about his bees trying to save certain peach-juice going to waste. The following "special" item appeared in the Chicago Record of Oct. 18th:

"One of the most peculiar suits at law ever brought before any court is soon to be tried in Van Buren Co., between two neighbors and old friends. One of the men, H. D. Burrell, keeps about 60 colonies of bees. The other is a peach-grower. A few weeks ago the latter complained of the former's bees destroying his early Crawford peaches, claiming that the bees came into his orchard in large numbers, bit holes in the fruit and rendered it unmarketable, for which he demanded \$200. Prof. J. M. Rankin, of the Agricultural College, and the entomologist of the Agricultural Department at Washington, will be called as expert witnesses by the defense in a suit for damages."

We hope Mr. Burrell will send us a report of the matter after the decision is rendered.

BEEES IN WARFARE.—An exchange says history records two instances, according to Mr. Whittely Stokes, in which bees have been used in warfare as weapons against besieging forces. The first is related by Appian of the siege of Themiscyra, in Pontus, by Lucullus in his war against Mithridates. Turrets were brought up, mounds were built, and huge mines were made by the Romans. The people of Themiscyra dug open these mines above, and thru the holes cast down upon the workmen, bears, and other wild animals, and hives or swarms of bees.

The second instance is recorded in an Irish manuscript in the Bibliotheque Royale at Brussels, and tells how the Danes and Norwegians attackt Chester, which was defended by the Saxons and some Gallic auxiliaries. The Danes were worsted by a stratagem; but the Norwegians, sheltered by hurdles, tried to pierce the walls of the town—when, "what the Saxons and the Gaedhil, who were among them, did was to throw down large rocks, by which they broke down the hurdles over their heads. What the others did to check this was to place large posts under the hurdles." What the Saxons did next was to put all the beer and water of the town into the caldrons of the town, to boil them and spill them down upon those who were under the hurdles, so that their skins were peeled off. The remedy which the Locheans applied to this was to place hides outside on the hurdles. What the Saxons did next was to throw down all the bee-hives in the town upon the besiegers, which prevented them from moving their hands or legs from the number of bees which stung them. They afterward desisted and left the city.

Convention Proceedings.

Report of the Proceedings of the 31st Annual Convention of the National Bee-Keepers' Association, held at Chicago, Ill., Aug. 28, 29 and 30, 1900.

BY DR. A. B. MASON, SEC.

(Continued from page 662.)

SECOND DAY—AFTERNOON SESSION.

The afternoon session was called to order by Pres. Root, after which Miss Ethel Acklin sang a song, entitled, "My First Music Lesson."

Pres. Root—The next thing we have on the program is a paper by Mr. Herman F. Moore, on

BEE-KEEPERS' RIGHTS AND THEIR PROTECTION BY LAW.

As an axiom it may be stated that apiarists have as many rights as ordinary citizens, and as many more as they can discover in the constitution of the United States and the common law.

In the statutes of the United States, and of the different States, very few laws are found favoring bee-keeping in particular over any other occupation. Lawmakers try to make the laws cover all possible cases of a particular kind, hence are most general in their terms of command or prohibition.

Bee-keepers have, in common with others, a right to "life, liberty, and the pursuit of happiness," or business in their own peculiar way, subject always to the equal rights of others. This "rights of others" has been the stumbling-block in the way of many of our fraternity. The legal construction of "rights of others" has made all the litigation, from the beginning, on all matters.

There is in the minds of many people who don't keep bees, and know nothing of their habits, an insane fear of a bee-sting, for themselves or their children. A bee-keeper

Herman F. Moore.

settles in their vicinity, and perhaps makes no effort to be agreeable, or to show his pets, and their harmless little ways. A child, a cow, or a horse, is stung, and the neighbor instantly puts on his war-paint, and vows the banishment of all bees and bee-keepers from his neighborhood. Even during this month one of our members has been brought into court, charged with maintaining a nuisance. On this the Illinois law says:

"It is a public nuisance to throw a dead body in a public place or water, to corrupt a river or lake, etc.; to obstruct navigable waters; to obstruct highways, etc.; to make explosives within 20 rods of a building; to advertise on fences, etc.; to carry on any trade, employment or manufacture, which, by offensive smells or otherwise, is offen-

sive or dangerous to the health of individuals or of the public."

As bees are ordinarily kept, I am of the opinion that no action would lie under any of these different heads against a bee-keeper.

But suppose a bee-keeper was so ignorant, or careless or malicious as to drop honey about the apiary in a time of scarcity, or handle his bees in such a way as to cause robbing and continual stinging of people and animals passing by, it seems very probable that such a case could be abated under this last clause of the public-nuisance law.

☐ The next phase of the matter is private nuisances. This is where only a private individual is annoyed or injured, and not the general public. This is an entirely separate head under our laws.

☐ The attempt, as usually prosecuted, has been to show that bee-keeping, *ipso facto*, was a nuisance, and to be abated as a matter of course. In such cases the bee-keepers have been almost uniformly victorious, for the general rule is, a private nuisance is a matter of fact for the jury to decide.

Bee-keeping of itself is not necessarily a nuisance, but may become such by an objectionable method of managing bees. So may keeping hogs, dogs, horses, cows, etc., be or become a nuisance by an objectionable or offensive manner of caring for them, or nearness to those who may be annoyed or injured by them.

The principal case upon which bee-keepers rely is entitled, "City of Arkadelphia, Arkansas, against Z. A. Clark," in the supreme court of Arkansas, June 22, 1889. The city of Arkadelphia past an ordinance forbidding bee-keeping within the city limits, and arrested Mr. Clark for keeping bees, declared a nuisance by the ordinance. The supreme court said, among other things, "Bees may become a nuisance in a city, but whether they are so or not is a question to be judicially determined in each case."

In some of the States laws have been past prohibiting the spraying of fruit-trees in bloom. The poison solution kills the bees working on the bloom, and experiments seem to prove that the enemy is not destroyed by spraying at that time. The interests of bee-keepers and fruit-growers are almost identical, and the time will come when their community of interest will be recognized by the laws of all our States.

It must be borne in mind that all our States are independent of each other in making laws. If bee-keepers are to be protected just laws must be made in all the States. The only bearing the Arkansas case has in Illinois is that courts generally respect the decisions of sister States about any matter not adjudicated there. But they have no binding force.

As to foul-brood laws, the same may be said—the good law they have in Wisconsin does not help us in Illinois. Bee-keepers must look after their own interests as jealously as other occupations guard theirs. If the thousands of bee-keepers in Illinois had been united on the question of our need of a foul-brood law, the much-needed law would now be on the statute-books.

One of the most important rights that bee-keepers insist on, is to be paid for honey shipped to dealers and commission merchants in our large cities. Bee-keepers in common with other farmers have tempted the city sharks by being such an easy prey. You must be methodical; have your bargain in writing; save the envelop covering your correspondence; look up the standing of a purchaser in Dun or Bradstreet; write a personal letter to a banker enclosing a stamped envelop for reply, asking about the party.

If you sell on commission, it is larceny not to account. If you sell to the dealer direct, he can say collections are bad, or go into bankruptcy. If by the correspondence and other evidence you can make out a fraud, one of the best ways to prosecute is for using the mails to defraud, and Uncle Sam is very prompt and severe in such cases; but that doesn't get your honey back, or the money for it.

It seems as if the one precaution of asking a banker for the name of a reliable dealer would almost entirely prevent losses.

Bear well in mind that the laws protect best those who don't go to law. To illustrate: Big corporations pay big fees to lawyers to keep them out of trouble, out of court. Don't dash in recklessly, and then hire an expensive lawyer to get you out of trouble. Rather pay in advance for some good advice on any given doubtful point.

Don't imagine that there is any such thing as law made easy for the people in one, small volume. You might just as well expect bee-keeping made easy in six short lessons of one hour each.

One of the burning questions of the day is how to prevent the fraudulent sale of adulterated honey and imitations of honey. A pure-food commissioner and a corps of assistants to help enforce the law seems to work well in Ohio. Constant inspections of sales of honey and other foods, and analyses followed by prosecutions, are necessary to prevent fraud, and control in any degree the operations of the mixers.

A pure-food law has just gone into effect in Illinois. A pure-food commissioner, an assistant, a chemist and a number of inspectors, have been appointed under the law, and efforts are being made to enforce the law. As far as I am informed no prosecutions for frauds in honey have been begun, but it has been only about two months since the law went into effect.

Bee-keepers should work as one man for good pure-food statutes in all the States. They are on the winning side, for all the people are for pure food by instinct.

Every bee-keeper, as well as every citizen, can aid this good work by reporting to the proper authorities, with a sample purchase, every case of violation of the law.

A well-known bee-keeper says that when a man deeds land he does not convey the honey in the flowers. Why? One reason may be that he can not deliver it. It would seem to be elementary that you can not sell anything you can not deliver. This question opens up a big field in more ways than one. What are the rights of the first bee-keeper in any given locality? Has he any rights that the later arrival is bound to respect?

This matter of overstocking any given locality is sure to be more and more interesting as people increase in numbers per square miles. Even now, in certain localities, specially favored with extraordinary honey-flows, there is danger of overstocking. As far as I know no law has been made touching this question. How would it do for counties to give a license to the first comer, for a certain number of colonies in a certain territory, rights assignable?

HERMAN F. MOORE.

SWEET CLOVER AS A WEED AND VALUABLE PLANT.

R. H. Longworth—What may we do to anticipate action by our legislature unfavorable to the growth of sweet clover? They have made the laws different in Iowa in the last year or two in regard to cutting the weeds in the highways; they call sweet clover a weed, and they fight it like we would rattlesnakes. They are now cutting it twice a year, and the law is made so now in regard to weeds, not only in the highways, but in other places, that no one need to be bothered, they say, with a weed growing on their neighbors' farms. All they have to do is to complain to the trustees of the township, and they will see that the weeds are eradicated from the man's farm. I look ahead and see the time coming that after the sweet clover is killed out of the highways and waste-places, if we want to have a ten-acre patch of sweet clover, I fear there will be a law against our growing it. What may be done to anticipate that kind of action by the legislature?

Pres. Root—You want to know how we can anticipate unfavorable legislation destroying the sweet clover that is so valuable to bee-keepers?

Mr. Longworth—On our farms.

Pres. Root—On the edges of them and the highways. Those who have been in our legislatures elsewhere perhaps know how to anticipate them.

N. E. France—In reply to that last question I would say that Wisconsin had sweet clover on the list of noxious weeds for a term of years. The bee-keepers thru their associations, askt the legislature to take it off that list, and thru the reasons shown to the members of the legislature that it was not a noxious weed, it was removed. The next season, as I was out on my State work, among the first things I was called on in Milwaukee by a weed-warden. He ordered a field of sweet clover to be plowed as a noxious weed, the owner of the ground claiming that it was his land, and he had sown the crop for his bees; that the weed-warden had no jurisdiction in there, and he called on me as counsel. I askt the weed-warden to show me a copy of the law which he was serving; he showed it to me, and I said, "My dear, sir, why don't you execute the law of to-day? That law is four years old. The law to-day says sweet clover is not on the noxious weed list, and you have no jurisdiction." He submitted the question, acknowledged that he was executing a law that was old and dead, and we now have no such thing as sweet clover on the list of noxious weeds in Wisconsin. The only way we can accomplish anything is by joining together in societies.

Frank Coverdale—There is the point. In Iowa sweet

clover is not yet counted a noxious weed in the law; it is not included. The law does not specify any noxious weed. It provides for the cutting of weeds, specifying nothing, but I fear that the law will in a few years specify sweet clover because there is such an enmity towards it now.

Rev. E. T. Abbott—Sweet clover is my pet, and I am in favor of having my pets preserved, and I don't think there is any danger or any occasion to be alarmed about sweet clover being declared a nuisance. I live right close to Iowa. We Missourians are given credit for asking to be shown everything and not knowing much. I have unbounded faith and confidence in the intelligence of the people who till the soil in Iowa. I don't think there is cussedness enough in Iowa in the 19th Century, verging on the 20th, to call sweet clover a nuisance, or to declare it a weed. If I wanted to guard against it, the way I would do it would be to call on the editors of some of the papers and ask them to say something about it, and thereby teach the people what sweet clover is, and some of its merits. The coming industry of the world—Belgian hares—will eat it right along without being taught. By the way, let me tell you how to cure sweet clover for hay, altho this is not a farmer's meeting. There isn't over one farmer in three hundred that knows how to cure sweet clover for hay. He thinks the sun ought to cure, but it burns it, it doesn't cure it. Let it cure itself. The leaves have pores, and the stems have not. There is no chance for moisture to evaporate out of the stems, but the leaves act like pumps, and they can pump the moisture out of the stems. If you want to cure sweet clover, and do it well so that it will be of some value as hay, don't cut it down and let the hot sun dry it; the hot sun immediately destroys the action of the pumps. Don't do that, but put it up in the shade so the winds can blow thru it. The leaves will keep green, and those leaves will go to work and pump the moisture out of the stems; and as soon as they get their work done the stems will be dry, and you will have hay that anything will eat, and that is the only way to make hay of any kind. Nine-tenths of the hay that comes into the markets in large cities is not fit for anything to eat. Any man ought to be ashamed to bring lots of it to market, yet the farmers are making that kind of hay all the time. You can't cure sweet clover any other way than by letting the leaves pump the moisture out of the stems; they are so large that it won't evaporate. The only thing necessary with sweet clover is to talk about it. I am writing about it all the time in the Modern Farmer—writing about it as tho I thought nobody on earth knew anything about it. The truth of the matter is, there are only a few people who do know about it. Kansans just found out the other day from the Kansas Farmer, that sweet clover hay is of some use; and the funny thing was, that men who are connected with the Kansas Farmer, who are interested in fine horses, got to discussing the matter with each other, and one of them said (and, by the way, I had been talking this very same way about sweet clover for six years, but it didn't do any good—didn't make any impression on them). Well, he said, "I cut some of that sweet clover the other day and gave it to my horse, and he ate it up. He is a kind of a fool horse, doesn't seem to have much sense, and he ate it right up." The other fellow replied, "My horse won't eat it." The first man then said, "When you go home, cut some of the sweet clover and cure it thoroly and give it to your horse, and see if he won't eat it." He did so, and what was the result. The next time he called on me he said, "I tried my horse on that. He is a horse that will eat almost everything, and, strange to say, he ate that entirely up and whinnied for more." They have just discovered over in Kansas that sweet clover is fit for something besides bees. It is the best thing for dairy cows outside of alfalfa; there is nothing grown to-day that will make so much milk for the amount of energy exerted as sweet clover; the man who lets a cow starve while there is a pasture of sweet clover makes a mistake. I know plenty of people who let their cows eat ragweed where they eat two inches into the dirt, and haven't brains enough to cut sweet clover for them. I think we will get them taught after awhile that sweet clover has some little value. It is a very nice thing to tell us *what* we ought to do; it is a great deal nicer to tell us *how* to do it. We have acres and acres in my locality, and we have the shade to cure it.

Dr. Mason—I wish Mr. Abbott would tell us how to make shade.

Mr. Abbott—If Dr. Mason doesn't know that the Almighty makes the shade more than half the year he would better find it out.

Dr. Mason—He hasn't done it in our locality this summer. We have had more sweet clover this year than ever

before; we do cure sweet clover in our locality without shade. We have cured it right in the sun this summer; it makes first-class hay. One of our large farmers, who never knew it was good for anything until this summer, found it out because he couldn't help himself; he had ten acres of grass growing for the first season in many years in a field just over the fence from my apiary; he raised oats there last season, and the sweet clover came up, but I didn't sow it, and it was great big, nice, bunchy stuff, and his hired help said to him, "What are you going to do with this stuff?" He replied, "Rake it all up together." From the first load he took home he fed some to the horses, and they cleaned up the sweet clover before they ate the hay. He has a pasture of about 30 acres by the side of this meadow, with lots of sweet clover, but the horses and cattle keep it eaten close to the ground. A lady had the effrontery last week to tell me there would nothing on earth eat sweet clover. I took her over to the pasture fence, and I said, "Show me any sweet clover unless it is some where the cattle and horses can't get at it.

Mr. Abbott—Post the farm papers about this, and there is no danger of passing a law against it.

Dr. Mason—Dr. Besse, a bee-keeper in Delaware Co., Ohio, had several acres, and the township trustees cut it down, and he had a lawsuit with them, and was beaten. This Association helpt the Doctor run the suit.

Mr. Kretchmer—How does the bee-pasture come in when the cows eat it down?

Dr. Mason—Bee-pasture isn't worth as much as cow-pasture, but the sweet clover lasts only one year as pasture for stock.

A Member—I would like to ask Mr. Abbott at what stage he cuts sweet clover for hay?

Mr. Abbott—As it is coming into bloom. Without any joking about shade, you know the ordinary way is to spread hay out. The way to put it up is to put it in cocks immediately; as it is cockt, lay it up so the winds will blow thru it. They say down our way I am a city farmer; but there is a difference between cocking hay and spreading it out thin.

Mr. Kretchmer—In the city a pasture for the cows is more valuable than anything else. I sowed some sweet clover, alfalfa, and red clover, expecting the red clover would be eaten by the cows. The cows kept the sweet clover down to the ground, the alfalfa was next to the sweet clover, and the red clover was the only one that went to bloom. The sweet clover was eaten so much it never got over two inches high.

Dr. Mason—There isn't a better way to cure sweet clover for hay than Mr. Abbott has given us—pile it up.

Mr. Taylor—You never farmed it, did you Mason?

Dr. Mason—What do you know about it? *Yes, sir*; I was born and lived on a farm till I was 25 years old, and I have farmed it a good deal since then.

Mr. Taylor—I know from the way you say to cure hay. What struck me is how you are going to put it up light when it is green—you can't do it; I have cured a good deal of clover hay. I suppose you want to cure sweet clover hay the same as you would red clover. The right way to do it is to let it wilt; don't let the sun burn it up and let some of the moisture out; cock it up and get it as dry as you can without the leaves breaking at all or getting bitter; let it sweat. If it gets moist you have to turn it over to make real good hay.

Dr. Mason—Not in our locality. It wilts almost as soon as cut, and by the time a field is cut, what was first cut is ready to cock up.

M. M. Baldrige—I wish to say in regard to curing sweet clover for hay, that there is another plan they practice in Mississippi extensively. Sweet clover there is a farm crop, the same as oats or wheat, and is grown by people who do not keep any bees at all, from 50 to 100 acres on a farm. I have seen 75 acres on a single farm, and the way they cure sweet clover hay is this: They cut it, say today, and let it wilt until to-morrow, then put it into an airtight barn and let it cure itself; let no air to it whatever; it will cure itself, and in the winter they have the finest hay for cows and milk that can be produced. The idea that it is clast as a noxious weed in the North is considered nonsensical by those farmers of the South.

(Continued next week.)

No. 3.—Interesting Notes on European Travel.

BY C. P. DADANT.

ON THE ATLANTIC, Sept. 24, 1900.

FROM Macon my intention was to have gone direct to Switzerland by way of Geneva, visit the most noted resorts of Switzerland, thence come back to Nyon, which, by the way, is not in France, as I see the dating of my letters induced you to believe, for I did not mark the name of the country from which I wrote. But Nyon is so close to France that it matters but little. It is on the shores of the Lake of Geneva, and about four miles from the French frontier, and there, as in Geneva, the inhabitants all speak the French language.

Having received an invitation to visit some of our American friends who live at Lyon, some of whom had crost the Atlantic with us, we concluded to go there from Macon for a couple of days, as Lyon is only about two hours' ride from the latter place.

The line follows the valley of the Saone which joins the Rhone at Lyon. These two streams have long been celebrated for the great contrast between them, and they have often been represented and pictured by poets, painters and sculptors as two human beings—man and woman. This comparison is very forcible, for the smaller stream—the Saone—is clear, quiet and pretty, running smoothly and noiselessly among vineyards in a beautiful valley, while the other—the Rhone—roars boisterously, swift and muddy between steep hills, among rocks and cliffs, tumbling along in apparent recklessness, and the union of the two, just at the lower end of the city, is a very pretty symbol of a human wedding.

At Lyon we admired the numerous monuments, conspicuous among which is the monumental fountain representing a woman driving four horses who throw a spray, or rather a mist, thru their nostrils. This gives them a wonderful appearance of life. We saw the new Catholic church, located on a hight 600 feet above the city, costing already some 50,000,000 francs, altho it is far from being completed. It will make a fine monument. We also visited the silk museum, which contains specimens of the best silk fabrics of all ages. Lyon is the city of silk, par excellence, and we were induced to make a visit among the looms, and admired the patience with which the finest patterns are woven.

Another of the curiosities of Lyon is the "Gros Caillou" (The Big Pebble). It is only a large piece of granite weighing perhaps 15 or 20 tons, but which had been brought on top of the highest hill, it is said, by the waters and floating ice of the glacial period. A public park has been made around it, and an inscription put on the stone, and the Lyonnese are exceedingly proud of their "pebble."

After two days at Lyon we reach Geneva by the valley of Rhone, following the banks of the stream which foams between two hills, and at times appears as if it might be a full half mile beneath our feet. We now arrive in Switzerland, and as we pass thru the custom-house we notice that it becomes necessary again to change our watches, which we have already set forward a little over six hours in the trip between Illinois and France. The change between France and Switzerland, or, as they call it, between Western and Central European time, is 55 minutes. So we are now seven hours ahead of home time; that is, while we are eating dinner they are just waking up at home, for altho it is noon in Switzerland it is only 5 o'clock in Illinois.

Geneva is a beautiful place, half hotels, and the other half—boarding-houses. Perhaps I am overstating it, but it lookt to me as if not only in Geneva, but in many of the Swiss cities, the main business was taking care of the visitors. Geneva is renowned for its watch-making and jewelry industry, but it is specially known for its beautiful location, its fine lake, pleasant climate, and its view of Mont Blanc, which looks the more attractive because it is so far away, some 60 miles, I believe.

We remained in Geneva but a short time, and started out on our tour with the intention of running about for a week, so we left our trunk at the hotel and carried with us only a small satchel each. The smoking-car is most conspicuous in Switzerland, or rather the smoking compart-

Queen-Rearing is a very interesting part of bee-keeping. Mr. Doolittle's book tells practically all about the subject. See the offer we make on the second page of this number.

ment, which occupies about two-thirds of every railroad coach. In every direction you read the words "raucher" and "nicht raucher," (smoking and non-smoking). It would seem as if the non-smoking people were rather the exception. But there is no chewing.

This does not look much like an account of a bee-keeping trip, but the reader must remember that we can not find bee-keepers everywhere. We shall come across some of them by and by.

I can not leave the railroad question without making a comparison between our American railways and those of Europe. Our railroad coaches are far superior, in my mind, to anything that exists in Europe, for in many instances their "wagons," as they call them, are partitioned off into compartments without any passages, so that when you are shut up in one of them—ten persons in a compartment—you can not get out, and have neither drinking water nor water-closets, nor wash-stands, at your disposal. The better class of coaches, and especially the international coaches, are now made with a passage along one side of the car, and are provided with these necessities of travel, and the Swiss cars are in this far ahead of the French, tho still inferior to our United States cars.

The excuse the Europeans give for their slowness in taking hold of the latest improvements, is the shortness of their trips, as compared with ours, and it is true that in four or five hours you can almost cross any of the European States. But if their coaches are inferior to ours, they make up some of the unpleasantness by the exquisite politeness and affability of most of their railroad employees, the excellence of their railroad beds, tracks, bridges, crossings, and railway stations. The politeness of their officials would perhaps be construed here as a useless waste of time and words. In America, when the conductor calls the passengers, he rings out a dry, "All aboard." The European conductor says, "Ladies and gentlemen passengers, come aboard, if you please." He hustles about to seat his passengers conveniently, and save them trouble. He takes your ticket with a bow and "Thank you," as tho you were doing him a favor.

Our American travelers seem to be everywhere. We did not get into a single Swiss coach without hearing English spoken, and American English at that, tho the true "Hinglishman" is also very conspicuous. The hotels, the public roads, the mountains of Switzerland were swarming with English-speaking people, and the little flower-girls always address us in our own language.

There are three classes on all railroad trains, except international fast trains, which are usually composed only of first and second class coaches. Second-class is good enough for anybody, and third-class is used almost altogether by the laboring people, or those who wish to travel very cheaply. The difference between the classes is in the upholstering of the coaches and the softness of the springs, but especially in the price, which varies from a little less than two cents per mile to over three cents, first-class being just about double third-class prices.

But the classes are not confined to railroad trains, you find them in the waiting-rooms, and in the tramway-coaches, and even in the railroad dining-rooms. The same piece of butter sells for a higher price in the first-class dining-room than in the third-class.

We had been told that traveling in Switzerland was very expensive. We did not find it so. The hotel fares compare very favorably with the fares of America; and as to railway travel, we bought what they call an "abonnement"—a subscription, or, in other words, a pass in second-class—over all the railroads of Switzerland, for two weeks, at a cost of \$8.40. This does not include the inclined-plane railways that ascend the mountains, but it covers the Brunig Pass incline, and the lakes of Thun and Brienz for boat travel.

Exterior View of a Belgian-Hare Shed.

Belgian Hares and Bees as a Combination.

BY JOHN R. SCHMIDT.

BELGIAN hares in California, Belgian hares at home, on the farm, in the city, everywhere, and we now read of them in the newspapers! Never has a fad spread with such great rapidity, or found such universal favor among so large a number of people. The craze has invaded Chicago, so says the Cincinnati Commercial Tribune, and the exorbitant prices now paid for blooded stock has tempted many into the business, and rabbits are being bred everywhere. Already a prominent society girl of Chicago is raising them on an extensive scale, has realized a big profit in the business, and proved in the early start that the fair sex can not be left behind in this new adventure.

The keeping of Belgian hares in connection with bees now seems to be attracting universal attention among the apiarists of this country, and already there is some talk of establishing departments on this subject in the apicultural journals. [But not in the American Bee Journal.—EDTOR.]

It is not a bad idea for bee-keepers to have something else besides the bees, which will afford an additional income, but not all things will hitch with bee-keeping, and "more bees," as has been suggested, does not always prove to be the worst way to solve this ever-increasing question of importance. Bees may be added until one finds his time fully occupied during the busy season, then any additional increase after this, in the hope of financial returns, would be a very uncertain and unwise move for the hope of betterment. What the bee-keeper is really looking for is something that will occupy his time during the winter months, or when bees need no attention—not that which will increase his work when he is most busy with his bees. This, whatever it may be, will be discovered sooner or later, and we can look forward to the time when our apicultural journals will be devoting space equally among two distinct pursuits, but perfectly adapted to the bee-keeper. At present we are only guessing, and trying to discover what pursuit will be best adapted to the wants of the modern apiarists. Belgian hares have been suggested, and they now hold the lead, with more points in their favor than anything else heretofore tried, and stand a good chance of winning.

Only a few bee-keepers at present keep Belgian hares in connection with their bees, but it has been proven that it will be profitable with at least many who will undertake it. This number is rapidly increasing, not only among bee-keepers, but in almost every rank of life, and in the many different professions. To start right in anything is half the battle, and to start right in the Belgian-hare business is what we are just now seeking. Experience is always the best teacher, and years of experience by a bee-keeper in the Belgian hare and bee-keeping lines combined, ought to be of some value to those bee-keepers who are about to launch forth.

Mr. Chas. Roebing, a bee-keeper, and also manager of the Ohio Belgian Hare Farm, has kept about 35 colonies of

The American Fruit and Vegetable Journal is just what its name indicates. Tells all about growing fruits and vegetables. It is a fine monthly, at 50 cents a year. We can mail you a free sample copy of it, if you ask for it. e club it with the American Bee Journal—both for \$1.10.

bees for a number of years, and was one of the first among those who combined the two pursuits profitably. He has an ideal country home, and a bee-location that many would envy. But the hare part of the business is what we want now, so I will endeavor to make things plain from his valuable talk and experience.

The first and most important thing is to construct a shed which will be rain-proof, rat-proof, wind-proof, and easily cleaned. One like the picture shown herewith combines many things of importance, and is cheapest in the long run. Good, *dry*, clean quarters are very important if not essential to success. Having accomplished this, very little trouble will be encountered. Belgian hares can not stand a draft, but must have plenty of ventilation. This is accomplished by having the south side of the shed, which, according to inside construction (see view of interior) is one end of each hutch; this is left open and covered with poultry-netting, and in turn is covered, or may be at will, with a one-half cover which covers up the lower half of the netting, thus keeping everything cool and well ventilated without any draft on the rabbits. There is also a rising hinged cover which may be let down, and this makes a solid wall, when all is closed, almost air-tight, and leaves no place where rats may enter at night.

The size of the shed must be governed by the number of hares one intends to keep. A shed 15x30 feet, arranged like this one, will accommodate from 50 to 100 hares; but old hares must be kept separate, and this requires some additional room. A leaky roof can not be tolerated—it should be absolutely rain-proof, or it will be impossible to keep things nice and dry inside. A roof covered with felt or tarred paper is probably best, and, if painted occasionally, will last a lifetime.

Now let us examine the interior, which we see is partitioned off into numerous hutches, about 2½ feet wide and 6 feet long. Boards on edge form the base, and extend up about 16 inches, then it is continued up with the netting to within 5 or 6 feet, but this is not absolutely necessary. A 4-foot height would probably answer all purposes, and allow more elbow-room. A suitable door forming an entrance to each hutch, a box large enough to admit a full-grown doe comfortably, and a small amount of clean straw, completes the arrangement of each abode; and now we are ready for the rabbits.

One corner of the shed may be left without these hutches, and serves a good place to keep feed, etc. It can also be used in an emergency for confining young hares, and just such a case introduced the hares shown in the photograph, which, by the way, are only 2½ months old, but as large as a good-sized cat.

Under no circumstances should two old bucks be allowed in this enclosure at one time. They are worse than game roosters, and always looking for trouble among themselves. This should be watched closely, and a good idea is to alternate them in the confinements, first a buck and then a doe, but never two of a kind side by side. Even thru one-inch poultry-netting they will bite and claw at each other, and this generally proves serious if not discovered in time.

Procuring *good* stock in the beginning, and the prevention of in-breeding by introducing new blood from time to time, will overcome many of the little troubles which would be encountered.

The Belgian hare is a very clean animal in its habits, and the more we can do to allow it to carry out its instincts by keeping its abode sweet and clean, and, above all, perfectly dry, the better success we are assured.

A good start can be procured by buying a trio of known good stock from a responsible breeder. Of course, the price will be governed by the purse, but something good can be purchased at \$35 to \$50 a trio, and as each mother has a nestful of young creatures every month, the profit realized from the sale of this blooded stock at the present high prices may be well left to the imagination.

I do not wish any one to overestimate the profits which may be derived from this business, for surely there will be a surplus soon, with so many going into the business; but at present nothing is thought of paying \$25 for a good buck, and many are being sent from California every day even at a higher price.

The advice of many is to get good stock at a moderate price, and this the bee-keeper will do well to follow, and leave the extra-fancy stock, with its accompanying high price, strictly alone, for it is the bread-and-butter side to be looked upon in this case, and breeding for market and table use will be the thing to be considered, and not the show-room with its uncertain results.

Before closing this article I would like to say that the information (?) I have endeavored to give to the readers was received from a talk with Mr. Roebling, and, outside of what I have written, I am totally uninformed, and know about as much of Belgian hares as the average newspaper reporter does about bees. I have tried to avoid anything which would mislead, and only give a few facts resulting from the practical application of the business by some one else, and I think these may be safely followed with good results.

Honey-Vinegar—How to Make a First-Class Article.

BY MRS. A. J. BARBER.

USE about one pint of honey to the gallon of water (you will soon be able to tell by the taste when it is sweet enough). Put it into a keg or barrel with a good, tight head, and leave a hole not larger than one inch for ventilation. Keep it in a warm place, and put in some good vinegar or yeast to start it. After it gets to working, draw off a pailful now and then and pour it back; or if you have more than one keg, pour from one to another. It helps new vinegar to put old vinegar into it; but it spoils the keeping qualities of the old vinegar to put fresh vinegar into it.

We save all the washings from the extractor, tank, strainers, and cappings for vinegar. We wash the cappings by pouring warm water thru them again and again, until about all the honey is out of them. They are then rinsed by pouring a pail or two of cold water thru, when they are in fine shape for the wax-extractor. The water is all put into the vinegar-barrels. It took us two years to get really good vinegar from the start in new barrels. Now that we have our old sour barrels and good vinegar to start with, we can get good vinegar this season from last year's washings. For the last four years we have made from four to twelve barrels each year. We have twelve for market this year, and now at the last of July four new ones coming on for next year. We expect to make several more before the season closes. Each barrel should be cleaned every other year. Unless this is done the "mother" will begin to decay and break up, making the vinegar flat in taste, and muddy in color. The barrels that we started vinegar in

Interior View of a Belgian-Hare Shed.

this spring had the sweet water put in with the remnant of last year's salable vinegar. Next spring the vinegar in them will be drawn off and put into clean barrels to keep until sold. When we get an order for a barrel of vinegar, we draw off again and put into a clean barrel. By this time there is but little "mother" forming, as the vinegar is ripe and will keep indefinitely.

We have a house specially for our vinegar. It is a double-wall frame, with a 10-inch space between walls, packed with sawdust. The ceiling is covered with several inches of sawdust, and the vinegar keeps nicely all winter. We put the barrels into the house in November, and take them out in April. They stand in the sun all summer.

When we take them out we find which barrel has the best vinegar. The vinegar is drawn off and put into a clean barrel. The head is then taken out of the one just emptied, and it is well scrubbed with water and a stiff broom. When clean it is reheaded, and the contents of the next best barrel drawn off and put into it. Thus the barrels are cleaned and the vinegar put in shape for market. We have a long low bench or platform for the barrels, where they stand in two rows. The first barrel drawn off is placed at the east end of the south row. That is No. 1, as it is the first to be ready to sell from. The next barrel drawn off being next best, is placed next to No. 1 on the row, and is No. 2. So we go on till we get to No. 12. When we sell a few gallons from No. 1 we draw from No. 2 and replenish it; draw from No. 3 and fill up No. 2; from No. 4 and fill No. 3, until we have gone thru and left the empty place in No. 12. When No. 12 is empty, or nearly so, we fill it with sweetened water again, and it makes No. 1 for next year. Nothing helps so much to make vinegar clear and sparkling and sharp as the working from one barrel to another. It seems to act like kneading on dough. It sounds, to tell of it, like a lot of work; but, really, when one has good faucets in all the barrels it doesn't take long to run a few pailfuls from one to another of the whole lot. I try to get at mine once a month, and oftener when we sell a large quantity.

Our neighbors come to get honey-vinegar in preference to the cider-vinegar at the stores. We have kept some in the stores, but have never had enough to supply them yet. We use all kinds of refuse or waste honey, such as broken combs and dark, unfinished sections, and this year we had about 300 pounds of dark, strong honey that came from weeds before alfalfa bloom. That will go into the vinegar next year if I don't need it to feed my bees in the spring.

I believe the secret of success in the bee-business lies in looking after every part of the business, and saving everything produced; and what can not be marketed as first-class honey should be turned into first-class vinegar.

I have been asked if honey-vinegar will keep pickles. I have put up quantities of them in the last three years, and have never lost any, but have sold a great many, both of whole and mixt pickles. We are using mixt pickles now that were put up last August, and they are as firm and brittle as they ever were. If the vinegar is old enough, and has been properly handled, it is of the very best quality for pickling, or anything else that vinegar is used for.—Gleanings in Bee-Culture.

Montezuma Co., Colo., August, 1900.

Printed Paper Sacks Not Poisonous. The editor of Gleanings in Bee-Culture commends the plan of feeding given in this journal by Mr. Kernan (by means of paper sacks), but thinks him mistaken in supposing that the printing on the sacks killed bees, as printing-ink is not poisonous to human beings. He says:

Mr. Kernan thinks that some of his bees were poisoned by the printing-ink on the side of the sack. I can not think that that had anything to do with it—that the dead bees, if any, were robbers that had stolen their way thru the entrance, and, on being discovered, were killed by the inmates of the hive. During robbing time robbers are quite apt to work themselves thru the entrances of fed colonies, and be found in and about any kind of feeder, dead, whether there is printing-ink about it or not; but the idea of using paper sacks is quite ingenious, and I see no reason why it would not work very nicely.

Destroying Queen-Cells to prevent swarming is by no means reliable; still it may be depended upon to some ex-

tent according to a Stray Straw in Gleanings in Bee-Culture, which reads:

I've more faith than formerly in killing queen-cells to prevent swarming. A number of colonies did not swarm this summer after having queen-cells killed once, twice, or three times. Some had swarming delayed two to four weeks by the killing of queen-cells. But generally only eggs were in the cells where destroying them made any difference. If an egg was destroyed in a cell, and a week later a queen-cell was found with a grub in it, it was not much use to make any effort to thwart them.

York's Honey Calendar for 1900 is a 16-page pamphlet especially gotten up to create a demand for honey among should-be consumers. The fore part was written by Dr. C. C. Miller, and is devoted to general information concerning honey. The latter part consists of recipes for use in cooking and as a medicine. It will be found to be a very effective helper in working up a home market for honey. We furnish them, postpaid, at these prices: A sample free; 25 copies for 30 cents; 50 for 50 cents; 100 for 90 cents; 250 for \$2.00; 500 for \$3.50. For 25 cents extra we will print your name and address on the front page, when ordering 100 or more copies at these prices.

Belgian Hare Breeding is the title of a pamphlet just published, containing 10 chapters on "Breeding the Belgian Hare." Price, 25 cents, postpaid. It covers the subjects of Breeding, Feeding, Houses and Hutches, Diseases, Methods of Serving for the Table, etc. It is a practical and helpful treatise for the amateur breeder. (See Mr. Schmidt's article on page 680.) For sale at the office of the American Bee Journal. For \$1.10 we will send the Bee Journal for a year and the 32-page pamphlet on "Belgian Hare Breeding."

"**The Hum of the Bees in the Apple-Tree Bloom**" is the name of the finest bee-keeper's song—words by Hon. Eugene Secor and music by Dr. C. C. Miller. This is thought by some to be the best bee-song yet written by Mr. Secor and Dr. Miller. It is, indeed, a "bummer." We can furnish a single copy of it postpaid, for 10 cents, or 3 copies for 25 cents. Or, we will mail a half-dozen copies of it for sending us *one new* yearly subscription to the American Bee Journal at \$1.00.

The Chicago Convention Picture is a fine one. It is nearly 8x10 inches in size, mounted on heavy cardboard 10x12 inches. It is, we believe, the largest group of bee-keepers ever taken in one picture. It is sent, postpaid, for 75 cents; or we can send the American Bee Journal one year and the picture—both for \$1.60. It would be a nice picture to frame. We have not counted them, but think there are nearly 200 bee-keepers shown.

Our Wood Binder (or Holder) is made to take all the copies of the American Bee Journal for a year. It is sent by mail for 20 cents. Full directions accompany. The Bee Journals can be inserted as soon as they are received, and thus preserved for future reference. Upon receipt of \$1.00 for your Bee Journal subscription *a full year in advance*, we will mail you a Wood Binder free—if you will mention it.

Please send us Names of Bee-Keepers who do not now get the American Bee Journal, and we will send them sample copies. Then you can very likely afterward get their subscriptions, for which work we offer valuable premiums in nearly every number of this journal. You can aid much by sending in the names and addresses when writing us on other matters.

Queenie Jeanette is the title of a pretty song in sheet music size, written by J. C. Wallenmeyer, a musical bee-keeper. The regular price is 40 cents, but to close out the copies we have left, we will mail them at 20 cents each, as long as they last. Better order at once, if you want a copy of this song.

The Premiums offered this week are well worth working for. Look at them.

A Close and Exciting Election!

Which will be Elected?
How many Votes will he Get?

Send 25 cents for a three months' subscription to the

Farm, Field and Fireside

CHICAGO,

and a chance in the

Prize guessing contest
for \$5,000 in cash,

McKinley

Bryan

which will be awarded to those coming the nearest to the official figures of the popular vote cast for the successful presidential candidate.

The Publishers' Guarantee Association has deposited \$5,000 in the Metropolitan National Bank, Chicago, Ill., for the purpose of paying these prizes, under strict conditions preventing its use for any other purpose.

First Grand Prize, \$2,000,

to the nearest guesser, and 197 more cash prizes to be awarded as follows:

To the nearest correct guess.....	\$2,000.00
To the second	500.00
To the third	250.00
To the next 5, \$50.00 each.....	250.00
To the next 40, \$25.00 each.....	1,000.00
To the next 50, \$10.00 each.....	500.00
To the next 100, \$5.00 each.....	500.00
198 cash prizes	\$5,000.00

TO AID GUESSERS:

McKinley's popular vote in 18967,107,304
Bryan's popular vote in 1896.....6,533,088

Our Offer: We have made arrangements with the Publishers' Guarantee Association, of Chicago, to enable our subscribers and friends to participate in these great cash prizes. Every one is invited to participate, and for each three months' subscription to the Farm, Field and Fireside sent us, accompanied by 25 cents, a guess will be allowed. Those remitting 50 cents for six months' subscription will be allowed two guesses, and those remitting \$1.00 for one year's subscription will be allowed four guesses. This applies both to new subscribers and to renewals. Present subscribers can send in their guesses, accompanied by the money, and their subscription will be extended.

How to Guess: When you send in your subscription you make your guess. Be sure you write your name and address and guess as plainly as possible. As soon as we receive your subscription we will fill out and send you a certificate corresponding to guess made by you, which will entitle you to any prize that you may draw. Be sure and keep your certificate. We will file the duplicate with the Publishers' Guarantee Association. Every subscriber will receive as many certificates and have as many guesses as he sends subscriptions to Farm, Field and Fireside.

In case of a tie, or that two or more estimators are equally correct, prizes will be divided equally between them.

Langstroth on... The Honey-Bee

Revised by Dadant—1899 Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroly explained, so that by following the instructions of this book one cannot fail to be wonderfully helpt on the way to success with bees.

The book we mail for \$1.25, or club it with the American Bee Journal for one year—both for \$1.75; or, we will mail it as a premium for sending us **THREE NEW** subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

Rocky Mountain Bee-Plant Seed!

(*Cleome integrifolia.*)

...FREE AS A PREMIUM...

The A B C of Bee-Culture says of it: "This is a beautiful plant for the flower-garden, to say nothing of the honey it produces. It grows from two to three feet in height and bears large, clusters of bright pink flowers. It grows naturally on the Rocky Mountains, and in Colorado, where it is said to furnish large quantities of honey."

We have a few pounds of this *Cleome* seed, and offer to mail a ¼-pound package as a premium for sending us **ONE NEW** subscriber to the American Bee Journal, with \$1.00; or ½ pound by mail for 40 cents.

GEORGE W. YORK & CO.

118 Michigan St. CHICAGO ILL.

Getting Bees Ready for Winter.

The following discussion at the Ontario convention last winter, which is published in the last Canadian Bee Journal, is seasonable at the present time:

QUES.—Bees intended to be wintered in the cellar which are on their summer stands at present (Dec. 6th) with a rim of 3 inches filled with sawdust on top, would it be better to put them into the cellar right away, or leave them until they get another flight?

Mr. Hall—My answer to that is to put them in to-morrow if it is not freezing, and if it is freezing let them alone until they are thawed out; or get some hot water from the tea-kettle and pour it around the stands, so that the moving may be done without cracking. Never mind a flight; they have eaten nothing in the last few weeks to require it. If they are frozen down loosen them somehow and with as little jarring as possible. I like to put bees in when they are flying; the clusters are all loose; you will get a few stings. It is true, but very few. We do not break a cluster by putting them in; the cluster is already broken. They form a cluster when they go into the cellar.

Mr. Dickinson—I believe in putting them in early. Mine have been in about a month now, and, just as Mr. Hall says, there were lots to fly out, as they had not settled down to clustering.

Mr. Post—If bees have a rim of sawdust, as represented in the question, even zero weather will not do them any harm. I have about 200 colonies myself now in the same condition; I do not feel at all uneasy about them, altho as soon as the weather changes a little warmer I will take them in. The way my stands are built they will never stick.

Mr. Darling—My bees are not in the cellar yet, they are not packed with sawdust, but I can take them up quietly by putting them on a pair of sloops or bobs, and draw them when there is a little snow or on the bare ground, and when I get them to the house they scarcely know that they have been moved; sometimes they are all quiet when we get them into the cellar, and sometimes they stir about. Mr. Hall advocates loose bottom-boards. I raise up those that are loose, and loosen those that are not loose, propping the front of the hive off the bottom-board about an inch; I am not bothered with moisture. My bees last year were not put in until somewhere about Christmas. My reason for being so late was on account of sickness. However, I found my bees last spring came out drier and better on the average than they have for some years.

Mr. McEvoy—Let us hear from men who winter bees on the summer-stands, as to when they pack their bees.

Mr. Sibbald—I have not had very much experience in wintering outside. I have wintered some in that way for two or three seasons, and this season I

Yellow Sweet Clover Seed

WE HAVE IT AT LAST!

We have finally succeeded in getting a **SMALL** quantity of the seed of the **YELLOW** variety of sweet clover. This kind blooms from two to four weeks earlier than the common or white variety of sweet clover. It also grows much shorter, only about two feet in height. It is as much visited by the bees as the white, and usually comes into bloom ahead of white clover and basswood. We offer the seed as a premium

A QUARTER POUND FOR SENDING ONE NEW SUBSCRIPTION.

So long as it lasts, we will mail a quarter pound of the seed to a regular paid-up subscriber who sends us **ONE NEW** subscriber for the American Bee Journal one year, with \$1.00; or ½ pound by mail for 30 cents.

We have been trying for years to secure this seed, and finally succeeded in getting it. It is new seed, gathered last season by an old personal friend of ours, so we know it is all right. But we have only a small supply. When nearly out we will mention it.

The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

[THIS CUT IS THE FULL SIZE OF THE KNIFE.]

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a last-time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.10, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00.) We will club the Novelty Knife and the Bee Journal for one year, both for \$1.90.

GEORGE W. YORK & CO., 118 Mich. St., Chicago, Ill.

Please allow about two weeks for your knife order to be filled.

packt them only a couple of weeks ago. I believe they would be better packt earlier, but I had not time to do it.

Mr. Saunders—As far as wintering outside, my hives are packt all summer; the only trouble I have in the fall is putting on the cushions, which I do about the last of September or the first of October. I askt this question. I winter the bees in my home yard in the cellar. After I had left for the West about the 1st of September last, they got some honey-dew for about a week or so, and I have been too busy to put them in since I came home, and I wanted to know whether it would be advisable to give them a flight on account of the honey-dew, or to put them in right away.

Mr. McEvoy—This is a serious thing. If he puts them into the cellar he will have to bring them out pretty early. Leave them out a little longer, and bring them in earlier, too.

Mr. Evans—I winter bees both in the cellar and outside. I packt some outside a couple of weeks ago in sawdust, clamping 8 or 9 of them in a 12-foot clamp. I usually take the sawdust in the spring and put it in the honey-house, so that it is perfectly dry. I can winter in the cellar without any loss whatever, unless from starvation, but I do not think the bees come on as well in the spring after they are taken out. I do not usually put them into the cellar until the middle of January; and I think it is wise to keep them out as long as possible and take them out as early as possible. My cellar is particularly dry; the room is just opposite the furnace so I can open the door and heat it, or close the door and cool it off. Instead of propping up the hives I simply slide the hives back so that they are a couple of inches behind the bottom-board. I don't put any cushions on top—just leave the ordinary quilt without loosening it. I set them around in rows, and they seem to

"The Prohibition Hand-Book and Voter's Manual," Size, 5x7 Inches; 50 Pages.

The Emerson Binder

This Emerson staff-board Binder with cloth back for the American Bee Journal we mail (for but 60 cents) or we will send it with the Bee

Journal for one year—both for only \$1.40. It is a fine thing to preserve the copies of the Journal as fast as they are received. If you have this "Emerson" no further binding is necessary.

GEORGE W. YORK & CO.

18 Michigan Street, CHICAGO, ILL.

WANTED.

Light Amber Comb Honey. Please mention quantity you have, how put up, from what flowers gathered, and what price you ask f.o.b. Chicago.

GEORGE W. YORK & CO.
118 Michigan St., - CHICAGO, ILL.

The Marilla Incubator Co.—We call attention to the advertisement of the Marilla Incubator Co., which appears elsewhere in this issue. Many of our readers know and have used this machine which has had a most successful record extending over more than 12 seasons. During the last year the company has removed to Rose Hill, N. Y., has built a large and completely equipped factory, and is out for business in earnest. Mr. H. H. Blackman, the inventor, is associated with the present company, of which Mr. W. E. Willis is secretary. Write the Marilla Incubator Co., at Rose Hill, N. Y., for catalog before buying an incubator. Please mention the Bee Journal when writing.

Chicago.—The regular semi-annual meeting of the Chicago Bee-Keepers' Association, will be held in Wellington Hall, 70 N. Clark Street, Saturday, Nov. 3, 1900, from 2 to 5 in the afternoon, and 7 to 9 o'clock in the evening. Dr. C. C. Miller will probably be present. The regular annual election of officers will occur. The general subject for discussion will be reports on the season's work. All bee-keepers are requested to send questions by mail to the President, Mr. George W. York, who will assign them to others to be answered. Ladies are especially invited to be present.

GEORGE W. YORK, Executive
MRS. N. L. SNOW, Committee
HERMAN F. MOORE, Committee

Illinois.—The 10th annual convention of the Illinois State Bee-Keepers' Association will be held at the State House at Springfield, on Tuesday and Wednesday, Nov. 20 and 21, 1900. Railroad rates will be an open fare and a third without certificates. Notice will be given later if a better rate is secured. A good program is expected. Those who wish the full benefit of the meeting will have to be in attendance.

JAS. A. STONE, Sec.
R. R. No. 4, Springfield, Ill.

winter all right. The only objection I have to that system is that they don't come along in the spring as well as those that winter out-doors. At the same time this is not a fair comparison, because I always put the light colonies in the cellar.

Mr. Hall—What time do you put them out in the spring?

Mr. Evans—Last spring I did not put them out until about April 1st, the year before about the middle of March.

Mr. Hall—If you have time, put them out on the 1st of March.

Mr. Newton—I am an out-door winterer, and I fixt mine up about one month ago. Bees that are wintered out-doors should be fixt up just as early as those that go into the cellar, and I think the sooner we get done with them and leave them to settle down quietly for the winter the better. If we keep disturbing them in the fall I think we will not have such a successful winter. Then, too, I winter them in separate cases. I used to winter four in a case, and I think it is a very good way and cheaper than single. I like either in angles or in four, but I do not care for clamps.

Mr. Armstrong—How much packing does Mr. Newton use?

Mr. Newton—Four inches on the side, and about 10 on top.

Mr. Armstrong—Is it necessary for 10 inches on top?

Mr. Newton—I won't say it is necessary to have 10 inches on top, but I like it.

Mr. McEvoy—What is that on top composed of?

Mr. Newton—Composed of forest leaves; I do not think there is anything to equal forest leaves unless it is cork sawdust.

Mr. Post—Do you pack them solid?

Mr. Newton—I don't make any solid work of it; I just throw them in. I do not think the solid packing is as good as loose packing; the frost goes thru solid packing sooner.

Mr. McEvoy—What is your packing composed of, Mr. Shaver?

Mr. Shaver—Wheat-straw, usually, but sometimes I use a little oat.

Mr. McEvoy—Have you seen any other packing than forest leaves used, Mr. Newton?

Mr. Newton—Yes; I've seen planer-shavings, sawdust, flax-leaves and cut straw, and I saw one place where they used rough papers torn up and thrown in.

Chocolate, Rolls, and Honey.

I have just returned from a European trip of 3 months. While it no doubt is not news to you, it was to me that the staple and universal breakfast meal thruout the Continent, with no exception, from Holland to Belgium, France, Switzerland, Italy, Austria, Germany, and even in the hotels of London, consisted of the regular breakfast of chocolate, coffee, rolls, and honey. Sometimes a marmalade would be substituted for honey. No meat is ever served for breakfast unless specially ordered.

With this breakfast our party, consisting of 44 people, thrived exceedingly, doing steady hard work traveling for 3 months, no one missing a meal, which seemed to me remarkable, as it convinced me that there must be more nourishment in honey than is commonly supposed. It was all ex-

tracted honey, and most of it would not compare favorably with our Northern State production in flavor, etc. The consumption of extracted honey must be very great there. I saw no comb honey.—H. R. WRIGHT, in Gleanings in Bee-Culture.

To Clean a Smoker-Nozzle.

When the nozzle of your smoker becomes clogged and sticky with soot, squirt in with an oil-can a few drops of kerosene, and light with a match. In a few minutes the soot will be burned to a blister, when it can readily be scraped off with a knife, and your smoker will be as good as new.—Canadian Bee Journal.

Doolittle on Carniolan Bees.

They are natives of Carniola, and, if I am correct, they were imported into this country thru Mr. Frank Benton when he was in the Old World looking up *Apis dorsata*. Soon after their importation there seemed to be a great difference of opinion regarding them. Some extolled them very highly as comb-builders and honey-gatherers, while many more could give no words in their favor.

During the season of 1885 I procured a queen, said to be as good a Carniolan queen as there was in this country. But from a careful inspection of them for months I could not think otherwise than that they were a very peaceable strain of the black bee. They were said to be of a steel-blue color; but a close observation, with the two side by side, failed to reveal such color further than the black bee shows it. All the mark of distinction I could see was in their being great swarmer, while the blacks swarm only moderately.

I gave my experience with them, and and some thought I did not have Carniolans in their purity, so offered to send me a queen on trial. I accepted, and had queens from 3 other parties; but the latter revealed nothing different, except that two of them were mixt with the yellow races. They proved so inferior as honey-gatherers that I finally superseded their queens with Italians. The main trouble seemed to be that, as soon as the honey-harvest came on, they would go to breeding with "double diligence," and reared so much brood that the surplus gathered was consumed by the multitudinous brood. That others found them not so good as the Italians is proven by their having comparatively gone from notice, very few breeders of the present day offering them for sale.—G. M. DOOLITTLE, in Gleanings in Bee-Culture.

FOR SALE!

Best Extracted Alfalfa Honey.

Guaranteed absolutely Pure Bees' Honey. Pack in 5-gallon tin cans, of about 60 pounds each, two cans to the case, 7½ cents per pound, cash with order. Buy direct from the home of Alfalfa. BEE-BOOKS

SENT POSTPAID BY

George W. York & Co. 118 Mich. St. Chicago.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—It is nicely illustrated, contains 160 pages, beautifully printed in the highest style of the art, and bound in cloth, gold-lettered. Price, in cloth, 75 cents; in paper, 50 cents.

Langstroth on the Honey-Bee, revised by Dadant.—This classic in bee-culture has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apian library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 520 pages, bound in cloth. Price, \$1.25.

Bee-Keepers' Guide, or Manual of the Apiary, by Prof. A. J. Cook, of the Michigan Agricultural College.—This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 460 pages, bound in cloth and fully illustrated. Price, \$1.25.

Scientific Queen-Rearing, as Practically Applied, by G. M. Doolittle.—A method by which the very best of queen-bees are reared in perfect accord with Nature's way. Bound in cloth and illustrated. Price, \$1.00.

A B C of Bee-Culture, by A. I. Root.—A cyclopaedia of 400 pages, describing everything pertaining to the care of the honey-bees. Contains 300 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.20.

Advanced Bee-Culture, Its Methods and Management, by W. Z. Hutchinson.—The author of this work is a practical and entertaining writer. You should read his book; 90 pages, bound in paper, and illustrated. Price, 50 cents.

Rational Bee-Keeping, by Dr. John Dzierzon.—This is a translation of his latest German book on bee-culture. It has 350 pages, bound in paper covers, \$1.00.

Bienen-Kultur, by Thos. G. Newman.—This is a German translation of the principal portion of the book called "Bees and Honey," 100-page pamphlet. Price, 25 cents.

Bienenzucht und Honiggewinnung, nach der neuesten methode (German); by J. F. Eggers.—This book gives the latest and most approved methods of bee-keeping in an easy, comprehensive style, with illustrations to suit the subject. 50 pages, board cover. Price, 50 cents.

Bee-Keeping for Beginners, by Dr. J. P. H. Brown, of Georgia.—A practical and condense treatise on the honey-bee, giving the best modes of management in order to secure the most profit. 110 pages, bound in paper. Price, 50 cts.

Bee-Keeping for Profit, by Dr. G. L. Tinker.—Revised and enlarged. It details the author's "new system, or how to get the largest yields of comb or extracted honey." 80 pages, illustrated. Price, 25 cents.

Apiary Register, by Thomas G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25.

Dr. Howard's Book on Foul Brood.—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cents.

Winter Problem in Bee-Keeping, by G. R. Pierce.—Result of 25 years' experience. 30 cts.

Foul Brood Treatment, by Prof. F. R. Cheshire.—Its Cause and Prevention. Price, 10 cts.

Foul Brood, by A. R. Kohnke.—Origin, Development and Cure. Price, 10 cents.

Capons and Caponizing, by Dr. Sawyer, Fanny Field, and others.—Illustrated. All about caponizing fowls, and thus how to make the most money in poultry-raising. 64 pages. Price, 20c.

Our Poultry Doctor, or Health in the Poultry Yard and How to Cure Sick Fowls, by Fanny Field.—Everything about Poultry Diseases and their Cure. 64 pages. Price, 20 cents.

Poultry for Market and Poultry for Profit, by Fanny Field.—Tells everything about Poultry Business. 64 pages. Price, 20 cents.

HONEY AND BEESWAX

MARKET QUOTATIONS.

CHICAGO, Oct. 13.—The receipts of all kinds of honey are lighter than usual at this season of the year. The market is steady with no advance; probable, as prices are now at a point that is curtailing consumption. Fancy white brings 16c; No. 1, 15c, and good white but travel-stained or irregular in shape, 13½@14c; amber, 10½@12c; dark, 8½@9c. Extracted, white clover and basswood, 7½@8c; amber, 7½@7¾c; buckwheat and other dark grades, 6½@6¾c. Beeswax, 29c. R. A. BURNETT & Co.

KANSAS CITY, Oct. 10.—Market steady; 24-pound section-cases, \$3.25 to \$3.40; 12-pound cases, \$1.60 to \$1.70 for fancy white; No. 1 amber, 13½@14c per pound. Extracted honey, light color, 7½@8½c; amber, 6½@7c. Beeswax, 25½@30c. W. R. CROMWELL PRODUCE CO., Successors to C. C. Clemons & Co.

BUFFALO, Oct. 14.—Honey is scarcer than for many years; in fact, just about none here, and would probably bring 19@20c. Arrivals are 9-10 dark, and low grade, but sell at 10½@12 cents readily. No extracted here. Beeswax, 25½@30c. BATTERSON & Co.

BOSTON, Oct. 17.—Demand is good and market strong at the following prices, with supplies very light: Fancy one-pound cartons, 17c; A No. 1, 15½@16c; No. 1, 15c; No. 2, 12½@13c. Extracted from 7½@8½ cents, according to quality. Can see no reason why these prices should not be well maintained right thru the season. BLAKE, SCOTT & LEE.

CINCINNATI, Sept. 21.—The demand for fancy comb honey is good and finds ready sale at 16½@17c; No. 1, 15c. The demand for extracted honey at present is slow and offer make in the barrel as follows: White clover, 3½@4c; Southern, 6½@7½c; Florida, 7@8c cents, according to quality. Beeswax, 27c.

The above are MY SELLING PRICES. I do not handle any honey on commission, but pay spot cash on delivery. C. H. W. WEBER.

NEW YORK, Oct. 14.—During the past two weeks, receipts of comb honey have been quite extensive, several carloads of California and Nevada honey having arrived, and some large shipments of buckwheat, and for the present there is plenty of supply to meet the demand. We quote: Fancy white comb, 15@16c; No. 1, white, 14@14½c; fancy amber, 12½@13c; amber, 11½@12c; buckwheat, 10½@11c.

There are no new features in regard to extracted honey. The demand is fair at unchanged quotations. Beeswax dull at 27c. HILDEBETH & SEBELZEN.

ALBANY, N. Y., Oct. 17.—White comb, 16½@17c; No. 1, 15c; mixt, 13½@14c; buckwheat, 12½@13c. Extracted, white, 8½@9c; amber, 7½@7¾c; buckwheat, 6½@6¾c.

The market here is quite bare of comb honey, owing to the destruction of bees by foul brood. Honey is selling higher than for many years. H. R. WRIGHT.

DETROIT, Oct. 15.—Fancy white comb, 15½@16c; No. 1, 13½@14c; amber and dark, 10½@12c. Extracted, white, 7½@8½c; dark and amber, 5½@7c. Beeswax, 24½@27c. M. H. HUNT & SON.

SAN FRANCISCO, Oct. 10.—White comb, 15½@14c; amber, 11½@12½c; dark, 9½@9c. Extracted, white, 7½@8c; light amber 6½@7½c; amber, 5½@6½c. Beeswax, 26½@27c.

Several lots were forwarded toward the past week, aggregating over 300 cases, partly re-packed, and including 100 cases in original packages, bound per sailing vessel for Liverpool. Local demand is fair. Values are being well sustained.

WANTED—HONEY AND BEESWAX.

We have a tremendous and growing trade in this line, and would like to hear from all who have such goods to sell in any part of the country, with quality, description, and lowest cash price. THOS. C. STANLEY & SON, Fairfield, Ill.

Four Celluloid Queen-Buttons Free

AS A PREMIUM

For sending us ONE NEW SUBSCRIBER to the Bee Journal for the balance of this year, with 30 cents, we will mail you FOUR of these pretty buttons for wearing on the coat-lapel. (You can wear one and give the others to the children.) The queen has a golden tinge.

This offer is made only to our present regular subscribers.

NOTE.—One reader writes: "I have every reason to believe that it would be a very good idea for every bee-keeper to wear one [of the buttons] as it will cause people to ask questions about the busy bee, and many a conversation thus started would wind up with the sale of more or less honey; at any rate, it would give the bee-keeper a superior opportunity to enlighten many a person in regard to honey and bees."

Prices of Buttons alone, postpaid: One button, 8 cts.; 2 buttons, 6 cts. each; 5 or more, 5 cts. each. (Stamps taken.) Address,

GEORGE W. YORK & CO., 118 Michigan St., CHICAGO.

AMERICAN BEE JOURNAL

GEORGE W. YORK,
Editor.

CHICAGO, ILL., NOVEMBER 1, 1900.

FORTIETH YEAR.
No 44.

WEEKLY

*J. M. HAMBAUGII, of California,
Director of the National Bee-Keepers' Association.*

PUBLISHED WEEKLY BY

GEORGE W. YORK & CO.

118 Michigan St., Chicago, Ill.

[Entered at the Post-Office at Chicago as Second-Class Mail-Matter.]

IMPORTANT NOTICES:

The Subscription Price of this journal is \$1.00 a year, in the United States, Canada, and Mexico; all other countries in the Postal Union, 50c a year extra for postage. Sample copy free.

The Wrapper-Label Date of this paper indicates the end of the month to which your subscription is paid. For instance, "Dec 00" on your label shows that it is paid to the end of December, 1900.

Subscription Receipts—We do not send a receipt for money sent us to pay subscription, but change the date on your wrapper-label, which shows you that the money has been received and duly credited.

Advertising Rates will be given upon application.

Reformed Spelling.—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound. Also some other changes are used.

The Bee-Keeper's Guide

Or, Manual of the Apiary,

—BY—
PROF. A. J. COOK.

460 Pages—16th (1899) Edition—18th Thousand—\$1.25 postpaid.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published to-day. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipt, or his library complete, without THE BEE-KEEPERS' GUIDE.

This 16th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to GIVE AWAY to our present subscribers, for the work of getting NEW subscribers for the American Bee Journal.

Given for TWO New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the two new subscribers—simply the Bee Journal for one year:

Send us TWO NEW SUBSCRIBERS to the Bee Journal (with \$2.00), and we will mail you a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both for only \$1.75. But surely anybody can get only TWO NEW SUBSCRIBERS to the Bee Journal for a year, and thus get the book as a premium. Let every body try for it. Will YOU have one?

GEORGE W. YORK & CO.,

— BEST —

Extracted Honey For Sale

ALL IN 60-POUND TIN CANS.

ALFALFA HONEY *****

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

BASSWOOD HONEY *****

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms in Wisconsin. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

Prices of Either Alfalfa or Basswood Honey:

A sample of either, by mail, 8 cents; samples of both, 15 cents—to pay for package and postage. By freight—one 60-pound can, 9½ cents per pound; two cans, 9 cents per pound; four or more cans, 8½ cents per pound. Cash must accompany each order. If ordering two or more cans you can have half of each kind of honey, if you so desire. This is all

ABSOLUTELY PURE BEES' HONEY,
The finest of their kinds produced in this country.

Read Dr. Miller's Testimony on Alfalfa Honey:

I've just sampled the honey you sent, and it's prime. Thank you, I feel that I'm something of a heretic, to sell several thousand pounds of honey of my own production and then buy honey of you for my own use. But however loyal one ought to be to the honey of his own region, there's no denying the fact that for use in any kind of hot drink, where one prefers the more wholesome honey to sugar, the very excellent quality of alfalfa honey I have received from you is better suited than the honeys of more market flavor, according to my taste.
C. C. MILLER
McHenry Co., Ill.

Order the Above Honey and then Sell It.

We would suggest that those bee-keepers who did not produce enough honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

Address,
GEORGE W. YORK & CO., 118 Michigan St., Chicago, Ill.

Doolittle's Queen=Rearing Book

FREE—For Sending Us TWO New Subscribers for One Year at \$1.00 Each.

Scientific * Queen-Rearing,

as practically applied, describes and illustrates a method by which the best Queen-Bees are reared in perfect accord with Nature's ways. It is written for the amateur and veteran in bee-keeping, by Mr. G. M. Doolittle, the leading queen-breeder of the world.

Index to the Chapters of the Book.

—o—

Importance of Good Queens; Nature's Way of Rearing Queens; Another of Nature's Way; Old Methods of Rearing Queens; Later Methods of Rearing Queens; New Way of Rearing Queens; Getting the Bees off the Cells; What to do with the Queen-Cells; Queen-Cell Protectors; Nuclei—How to Form; Nuclei—How to Multiply; Bee-Feeders and Bee-Feeding; Securing Good Drones; Introduction of Queens; Introducing Virgin Queens; Keeping a Record of Cells, Queens, Etc.; Queen-Register; Clipping the Queen's Wings; Shipping, Shipping-Cages, Bee-Candy, Etc.; Queens Injured in Shipping; Quality of Bees and Color of Queens; Rearing a Few Queens; Later Experiments in Queen-Rearing; Latest Feats in Queen-Rearing.

Bound in cloth, price \$1.00, postpaid; or we will mail it FREE as a premium for sending us TWO NEW subscribers to the American Bee Journal for one year, at \$1.00 each; or for \$1.60 we will mail the book to any one and credit a year's subscription on the American Bee Journal.

GEORGE W. YORK & CO. 118 MICHIGAN ST., CHICAGO, ILL.

ESTABLISHED IN 1861

AMERICAN BEE JOURNAL

THE OLDEST BEE-PAPER IN AMERICA

40th YEAR.

CHICAGO, ILL., NOVEMBER 1, 1900.

No. 44.

Editorial.

A Dishonest Honey-Shipper.—This may seem a strange and severe heading for an editorial, but it is a true one. We met him only about two weeks ago, one beautiful afternoon. He came to Chicago with his honey, just across Lake Michigan—from Ludington. He first went among the commission honey-dealers, and then called on us. He told us what he had at the freight depot, and wanted us to see it before buying.

We went with Mr. H. S. (Honey-Shipper), inspected his amber and white comb honey, and we both agreed perfectly on the price. He was to call at our office the next morning to accompany the man and wagon to get the honey. We had even agreed, upon his request, to send him the American Bee Journal for one year as a "to boot" for the honey.

We have not seen Mr. Honey-Shipper since leaving him that afternoon. He failed to report at our office the next day. What became of him and his honey?

Well, we learned later that he went to the freight depot the next day, paid the freight on the honey, and evidently had it delivered to some other honey-dealer, who, perhaps, offered him a quarter cent more per pound than the price at which he agreed to sell the honey to us, so we were to pay him about a half cent more than another firm upon whom he said he had called before seeing us.

Bee-keepers are inclined to denounce the honey commission men, and seem often to try to show that all the blame is on their side. But here is a shining example of fraud and dishonesty on the part of a bee-keeper. We have heard of such cases before now. It was not so much that we were disappointed in not getting the honey that we had bought fairly and squarely, but to have such clear evidence that the young bee-keeper in question was dishonest, and evidently intended to be so.

We think it about time to "show up" the other side of the question of fraudulent dealing in honey, hence we have given the foregoing actual experience. We have purposely omitted the name of the shipper, as we don't wish to be too hard on him, tho he deserves to be given some free personal advertising.

We believe that business can be carried on successfully and yet honestly. No other way of doing business can possibly continue very long. And, then, aside from its sinfulness, what satisfaction is there in scheming to defraud one's fellow man? What a pity it is that it seems almost necessary in some cases

to watch like a hawk lest you are deceived and beaten out of your very boots by those whom you have a right to expect will be the very soul of honor and uprightness! But the heart of man is desperately wicked, and highly deceitful, 'tis said, and very true it often is. Yet we believe there is a constant improvement going on generally. Those who have been existing by genteel theft and deception are finding it more difficult every day to work their schemes successfully. They are being detected and exposed as never before.

What is needed is a fearless and incorruptible public press that dares to warn the people against those who would get their living and fill their coffers by stealing from their fellows. But unless the good people will in return generously support such a public press, they will find very few who will feel like standing at the forefront to battle thus for them.

Canadian Honey in Paris.—Mr. W. A. MacKinnon, of Ontario, in charge of the food products of Canada at the Paris Exposition, wrote the following in a letter which has been copied into the Canadian Bee Journal:

On a six-sided stand, three stories high, is the display of honey, both liquid and granulated, in bottles of various sizes and shapes, arranged about the center of a mirror glass. The upper half of the lower story is fitted with glass panels, behind which comb honey is seen in squares just as it is sold. The upper two stories are separated only by a sheet of plate glass, which supports the apex of the pyramid, while resting on the tops of the bottles beneath. The effect is that of a solid cone of glass and honey, four feet high, offering almost no obstruction to the passage of light, which is transformed into the prettiest shades of amber and pearl. This exhibit is one of the most attractive and most admired. It is the climate of Canada in liquid and crystal, flowers, fragrance and sunshine, compressed into sweetness.

Clipping Queens.—Editor Hill holds in contempt the manner in which queens are usually clipped, saying:

The 20th century bee-keeper will smile at the thought of using scissors and such contrivances as the "Monette" device, and taking queens from the comb to clip them, as is yet advocated—and well he may.

Perhaps. And yet, Mr. Hill, don't sour on the world if you find the scissors still in use to a large extent in the 20th century. Some good bee-keepers after having tried both knife and scissors still prefer the scissors. Thanks, however, for very explicit instructions for those who want to try the knife in the coming century. The instructions are:

An ordinary pocket-knife is the only tool necessary. It should have a razor edge. If the knife is not *very* sharp some pressure will be necessary in order to sever the wing; but with a very keen edge its own weight is suffi-

cient to accomplish the work instantly, without danger of cutting the finger.

Stand the frame upon which the queen is found against the side of the hive, or have it otherwise firmly supported in a convenient position. Do not attempt to catch the wing until the queen, of her own accord, assumes an upright position; that is, wait until she stands or walks with head upward, which she will soon do ordinarily. Now, with the knife in the right hand, and the thumb and index finger of the left lightly prest together, gently raise the tip of the left wing with point of finger, and with a rolling motion, caused by a slight contraction of the thumb and finger, engage the tip of the wing, and at the same instant cut off about three-sixteenths of an inch of the upper wing thus held. This is accomplished by simply giving a slight stroke of the knife across the wing against the fingertip without pressure.

Feeding Medicated Syrup to Bees.

In the foreign bee-journals appear frequent reports of the cure of foul brood by means of this or that drug, but in this country the belief in such drug-cures has rather been discouraged. Now, however, Editor Root, of *Gleanings in Bee-Culture*, encourages, in regions where diseases of brood prevail, the use of some antiseptic of recognized value to medicate all syrups used. This is not as a cure, but a preventive. Possibly even a cure in the early stage of the disease. The editorial on this subject is so important that it is here given almost entire:

Let it be understood that germicides, when introduced into the food in a quantity sufficiently diluted to be harmless to the bees and to the brood, will not kill the spores of either black or foul brood; but they will kill the bacilli, or living germs, that have developed from the spores, or, as we might say, from the eggs of the microbes. The only thing we can hope to accomplish by introducing the medicated feed to the bees direct is to kill the bacilli as fast as they develop from the spore state. The active principle of the disease in the spore is protected by a cyst, or thick coating, which, I have shown, will successfully resist the action of boiling water for an hour, or an hour and a half, at a time. This same coating will also resist the action of drugs when given to the bees at the proper dilution.

There are hundreds of bee-keepers located in vicinities where black and foul brood have been raging; and I would by all means urge all such to medicate all the syrup they feed, either with carbolic acid or beta naphthol, a new drug that is decidedly less objectionable to the bees than the other, and quite as destructive to the active bacilli themselves.

This same drug is recommended by bee-keepers in England, and especially by Thos. Wm. Cowan, editor of the *British Bee Journal*. It comes in a kind of powder, in one-ounce boxes. Into an eight-ounce (or half-pint) bottle empty one of these ounce packages. Then pour in just enough wood alcohol to dissolve the powder; then fill the bottle full, or very nearly so. This quantity of chemical in solution is just right for 140 pounds of sugar undissolved. Measure off 140 pounds of sugar, and then 140 pounds of water, and mix. Pour the contents of this

eight-ounce bottle into the syrup, and stir well. We make all our syrup by mixing sugar and cold water, equal proportion, in the extractor; that is to say, after the two are placed in the machine we turn the reel vigorously for a few minutes. The next move is to pour in the requisite quantity of the drug in solution, and turn the reel again till the ingredients are thoroughly mixed. If one wishes to feed a less quantity he can figure out for himself just what the proportions will be.

Mr. Cowan, just referred to above, says that beta naphthol has been thoroughly tested in England, and its efficacy proved, and that it is now the common practice of the most advanced bee-keepers in that country to medicate all their syrup before giving it to the bees. We are medicating all the syrup fed to our bees this fall, with the naphthol solution. We are doing it as a matter of safety; for no one knows in these days when one of the dread diseases may visit his apiary.

Beta naphthol can be obtained at most drug-stores.

Carbolic acid crystals can be furnished at the drug-stores in pound bottles for about 75 cents; but on account of a very decided repugnance for it on the part of the bees, the beta naphthol should be used.

We have been trying the carbolic-syrup mixture in the proportion recommended by Cheshire, but our bees positively refuse to take it. They will go to the feeder and smell of it, and then turn away in disgust. We have even reduced the quantity of the acid, but that seems to make but little difference; and I conclude, therefore, that bee-keepers had better not waste their time with it. I remember when we used to spray with a solution of carbolic acid and water, when we had foul brood, the odor would sometimes drive the bees clear out of the hive.

But it must be distinctly understood that neither carbolic-acid nor beta-naphthol syrups will cure a case of foul brood after it is well started. I would waste no time in spraying-solutions of either in water on foul-broody combs. They are valuable only as preventives—that is, to catch the disease at the start. A pail of water at the beginning may put out what would otherwise be a million-dollar fire, when it would be worthless after it had got well going.

Beta naphthol can be ordered from the office of the American Bee Journal at 30 cents per ounce, postpaid.

Commercial Value of Propolis.—

Reports in foreign journals say that propolis has proved of great value in surgical cases in the British army in South Africa. The name suggests that this is some preparation of propolis. It is said that serious results had been attending wounds, which results became very much modified on the application of propolis, when prompt healing took place. When the supply of propolis became exhausted, the wounds again assumed their virulent character. Interesting it would be if it should turn out that those who have been grieved to think they were living in a region where propolis abounded should find they had an article of much value on hand.

Maiden Ladies as Bee-Keepers.—

We have always favored women taking up bee-keeping at least for a partial livelihood, believing that it would be to their physical, spiritual, and financial betterment should they get out into the country and "keep bees." Well, it seems from the following, taken from the American Bee-Keeper, that a couple dozen ladies have gone West for the very purpose of taking up bee-keeping:

The Western Bee-Keeper is informed that 24 maiden ladies arrived at Denver, Colo., on one train recently to engage in the culture of bees in that State. Our contemporary is of the opinion that Colorado offers to women in

quest of profitable investments for their savings a very desirable field as apiarists. California, we believe, would offer even greater inducements to such a trainload of aspirants for fame in the realm of apiculture. There would be abundant opportunities for them to become equal partners in well-established apiaries without the expenditure of capital.

Editor Hill, who wrote the above paragraph, makes a very catchy suggestion in his last sentence. Provided the other "equal partner," which the prospective lady bee-keeper got in the deal, should be exactly to her liking, we don't see why it wouldn't be an easy and inexpensive way for her to get "into bee-keeping" "with both slippers," and "right on the ground floor."

But we know several better chances than that. It is where the young lady herself is a bee-keeper, and has a fine apiary. But it would take a mighty good fellow to be an "equal partner" there. She'd always be the "better half."

Attachments of Section-Combs to the separators are usually cut thru with a knife. F. Greiner says in the American Bee-Keeper that he uses a thin-bladed compass-saw. "The saw would cut away without denting the capping; the knife would only crowd thru and not infrequently injure the capping, especially when the honey is cold."

Weekly Budget

LEAVES AND HONORS.

Now in clouds the leaves are falling
Silently and slow—
Fitting types of human frailty
And of honor here below.

—STENOG, in Gleanings.

Mr. W. A. BROWN, of Ontario, Canada, writing us Oct. 19th, said:

"I receive the American Bee Journal regularly, and would not like to be without it. The honey crop here has been poor for the past two seasons, an average for 1900 of 16 pounds per colony, spring count; in 1899, 20 pounds; and in 1898, 55 pounds."

THE VOTER'S DUTY.—We do not regard it as within the province of the American Bee Journal to discuss political or religious issues, but it is a duty, in all places and at all times, to stand for political righteousness and truth, no matter whom it may injure or overthrow, be he king or president of a nation, or the humblest official, who has betrayed the sacred trust reposed in him, and thus endangered the very existence of a free people.

Without going further into the subject here, we want to ask our voting readers to remember the following truthful statements when they exercise their sovereign prerogative next Tuesday, Nov. 6, at the ballot-box:

It is the duty of the voter to vote his convictions, not to carry the election. It is not his duty to win, but to record his honest convictions. Any other theory of politics is that of partisanship, not of free voters. To say that the voter must choose between two candidates or parties is both false and mischievous. It is built upon the assumption that the political parties are the bosses of the voters. My party is my servant, not my master. It is my duty to vote my will at the polls, even if I do not choose either of the dominant parties. I pro-

test against any party telling me what I shall vote upon. To consent to this is to wear a party chain and to come when I am whistled for. It is repugnant to any man who does his own thinking or says his prayers. The true worth of the independent voter to his country can never be over-estimated. It is the only hope of civil salvation.—REV. CHARLES A. CRANE, of Boston.

And when the victory shall be complete—when there shall be neither a slave nor drunkard on the earth—how proud the title of that land which may truly claim to be the birthplace and the cradle of both those revolutions that shall have ended in that victory! How nobly distinguish that people who shall have planted and nurtured to maturity both the political and moral freedom of their species.—ABRAHAM LINCOLN.

"No vote for principle is ever lost."

MR. WILL WARD MITCHELL will hereafter take Mr. R. B. Leahy's place as editor of the Progressive Bee-Keeper. Mr. L. says that in making this change he feels that greater success awaits him in another direction, so he deems it for the best to have Mr. Mitchell assume the editorial pen. Well, Mr. M. is a poet, and as apiculture has been called the poetry of agriculture, we don't see why he shouldn't fit his new position to a dot. We wish him all kinds of success, even tho we know that editing a bee-paper isn't the greatest snap in the world.

DR. C. C. MILLER has recently been in ill-health again. We don't know what bee-keepers will recommend as a proper treatment for him, if he doesn't stop trying to do so much. When a man gets to be nearly 70 years old, it's about time he began to "let up" a little on hard physical labor, and enjoy himself by doing as little as possible of work that others can do. Every reading bee-keeper in the land wants the Doctor to keep on for a long time, yet telling his experience and answering questions about bees and bee-keeping. We can't be spared yet, either by his loving family or by the bee-keepers. And, personally, we want him to stay here below many years more. Of course, we can't hope to keep him always on earth, but we don't want him to do anything that will shorten his stay here.

Doctor, take things easy. But, like the Irishman said, "If you can't do that, take things as easy as you can."

MR. H. W. BARTLETT, of Plymouth Co., Mass., wrote us Oct. 24th, that he wish to purchase some bees near his home. He said he noticed Mr. Chas. A. Holmes, of Suffolk Co., Mass., reported in the Bee Journal recently that he rears bees for sale. We wish to suggest that Mr. Holmes could hardly do a better thing than to advertise in this journal when he gets ready to offer bees again. There are many others who doubtless could increase their business by doing some advertising in these columns.

The American Bee Journal is ready to help all who do an honorable business, and trusts that such will patronize it in an advertising way. As a matter of mere justice and right, we must require that any who wish to do business with our subscribers shall do it thru the advertising columns, and pay for the space used, just as do our other advertisers. We can not conscientiously charge one man for publishing his advertisement, and then let another man work in a free notice with regular reading-matter.

Convention Proceedings.

Report of the Proceedings of the 31st Annual Convention of the National Bee-Keepers' Association, held at Chicago, Ill., Aug. 28, 29 and 30, 1900.

BY DR. A. B. MASON, SEC.

(Continued from page 679.)

J. A. Green—I would not be greatly afraid of having sweet clover clast as a noxious weed, because it has been so clast in this State for several years, and in some townships down our way the commissioners try to eradicate it.

Dr. Mason—Where is that?

Mr. Green—In La Salle Co., Ill. But usually their efforts only result in making a pasture for the bees; they change the time of blooming, and until they have gone thru a long course of education in better methods of eradicating sweet clover, I am not at all afraid of their getting it out of the way—they only help it.

O. L. Hershiser—I don't think there is any danger of sweet clover becoming a noxious weed if all the information given here is made public thru the country. The definition of a weed is a plant whose virtues have not been discovered. The virtues of sweet clover seem to have been pretty thoroly discovered.

J. Q. Smith—As I am one of the largest apiarists in Central Illinois, I have had considerable experience with the road commissioners in regard to sweet clover. They used to cut it twice a year, but they found out my bees were getting some benefit by that act. They have cut it three times this year, and I had a conversation with one of them, and was trying to explain to him it was not a noxious weed. He said, "You can't tell me that. If I am driving anywhere in my buggy, or with my team, and see a stalk of sweet clover, if I haven't anything to cut it with, I get out and pull it up." I replied, "I am going to keep you pulling sweet clover; it has come to stay, and it must stay."

Mr. France—I think that was a wise suggestion from this side of the house, that we distribute at large this information; but there are other points in Mr. Moore's valuable paper that are well worthy our consideration. Have bee-keepers' rights besides those pertaining to sweet clover?

Mr. Smith—I believe it would be well to get a copy of an article on sweet clover, and each bee-keeper have his local paper publish it. I am willing to pay for the space in my local paper to have it published. That is, in the weekly papers that go out thru the country, and have the farmers read it. I believe it would be one of the best facilities we could have.

Pres. Root—That is a good suggestion.

R. Rodenberger—I wish to inquire if there is any use that can be made of the seed? If so, if the farmers would learn that, they would raise it for the value of the seed. I think there would be a chance for some one to make some money out of it. If this matter was brought up by those who are farmers, in our farmers' institutes, I think they could educate the farmers in regard to sweet clover so they would not class it as a noxious weed when they learn the use of it.

C. H. Coon—I know how valuable sweet clover seed is. Some years ago, in the city of Cleveland, I bought a peck and paid \$3.00 for it. I took it home and sowed it in different places. I can't get a stem of it to grow. I have gathered it since then in Kankakee Co., Ill., by the side of the road, and sown it in my section [Ohio], and I can't get a bit of it to grow. My wife put a little of it in a flower-pot in the house and babied it, and she got it to grow a little spindling plant, but it didn't survive the winter. Thruout Ashtabula county we are not bothered by road commissioners destroying it. I tried my best to get it to grow, but I can't do it. If Dr. Mason, or anybody else, can give me a little instruction how to raise sweet clover, I would like to have him give it.

A Member—When did you plant it?

Mr. Coon—The time I gathered the seed. Nature seemed to indicate that that was the time to sow it. I have sown it in the spring of the year; I have sown it all thru the year—in June when the supervisors were working the

road, and the soil was fresh. I have sown it a good many times; I have taken the seed along and scattered it where the soil was fresh; I have sown it with my grass-seed in the fall of the year; I have sown it in the spring of the year also when I sowed my clover seed. I have given to my neighbors out of that peck, and they have put it in with grass-seed, but never could get it to grow. I have seen it growing in Pennsylvania right in the sand where it apparently would not grow. I have seen it growing there four feet high, and I have seen it growing in Kankakee Co., Ill., in black soil.

Pres. Root—You don't see it growing in your county at all?

Mr. Coon—Except occasionally, right in a flower-bed.

H. Lathrop—I have just been visiting two weeks in Anglaize Co., Ohio; I saw some nice sweet clover growing right along the roadside.

August J. Hintz—There is one thing I wish to say about sweet clover that has not been touched upon; that is, it fertilizes the ground. Six years ago I had a piece of land near Denver, Colo. There was a piece of sweet clover there that had been growing two years, and I had that plowed about six or seven inches deep, and raised strawberries, and for years after that they were on that patch. Then as many as four years afterward sweet clover would come up. I was on the place last year, four years after the seed was plowed up, and it still came up; it fertilized the ground even where there was manure. Put on sand it would produce a better crop of strawberries than where they used horse-manure. I am surprised that Mr. Coon could not get it to grow. By sowing the seed in the fall the frost will crack the seed. If I sow it in the spring I can't get it to grow. In the fall I can get it to grow almost anywhere, where alfalfa or anything else will grow.

J. L. Anderson—In a patch that I have, in northern Illinois, scattered on top of the ground in October two years ago, it stands as high as your head now.

Pres. Root—We will next listen to the subject to be handled by Mr. R. A. Burnett, the honey-dealer, on

TRIALS OF THE COMMISSION MAN.

I am here because you have a smart president. It is quite a while since I have been before a bee-keepers' convention, and I have managed to get out of it pretty well until this time, and it is only fair that I should state, to begin with, that the subject upon which I am expected to address you is not one of my own choosing. Your president managed to get out his program, get it on the press, and then send me a copy, and said that if I couldn't, or wouldn't, or something to that effect, that I would have to telegraph my declination. I felt it would be rather unkind of me to do that, so I am going to try to make the best of this.

I suppose one of the trials of the commission man is that all the producers of honey don't send him their goods. Another one might be, that instead of the commission man before you to tell of the trials of that business, you could tell him a whole lot of the trials you have with him. I think it was a little bit wise, perhaps, that our friend who has explained the law should precede me, so that in case you get into trouble with what I have to say, you know your remedy. The trials of a commission man are the trials of you all; and many trials that we have arise largely thru ignorance, and we, who may be the consignors, do not understand how to get merchandise in such shape that it will please the buyers. That, we might say, was the beginning of our difficulties on that side; if the commission man undertakes to educate his patron, he must do it with lots of circumspection. The chief idea with the ordinary consignor is that if he gets his honey into the hands of a commission merchant the latter must do the rest; that is, he must get the top price for the kind of honey he sends. The shipper may see that honey is quoted at 15 cents a pound, and he knows of some others that have obtained that; and if he doesn't get it, why, of course, there is something wrong, and there is no doubt that, as a rule, that is true—there is something wrong.

I will cite a case or two that came up within the last few days, so that the moss has not grown over them yet. A small consignment of beeswax—and I think the shipper may be in the audience, as he wrote me he expected to come on the proceeds of it—sent it in after ascertaining how the market was, and when we came to examine it, we found it had a greasy condition about it; it lookt to us very much as if there was tallow in it—at least tallow had been used in the pans to get it out. We found a white spot in one of the

cakes, that, without examining it chemically, we pronounced tallow. The matter having got to the party who was expected to tell all these things, he wrote the consignor telling what they had found, and also advising him his beeswax would be held until he came in, etc. He wrote back and said there was no tallow in that beeswax; that it was made in the sun extractor, and that the white spot we saw in the cake was hog-lard; that he had run it from the extractor into a jar that had had lard in it. Well, it did look as tho it might be lard, and I am quite satisfied that he was honest about it. We broke a cake or two of it and found there was a great deal of honey left in the wax, and this some buyers object to; they claim it won't answer the purposes of beeswax; there didn't seem to be any grease mixt thru it. So, now, there was a small case of ignorance. He had no idea that that little piece of lard was going to affect the price of his beeswax, or any one find any objection to it, and not noticing or caring very much what kind of a vessel he put that in, it met with those results.

Then we get lots of other things. Mr. Baldrige could tell you a whole lot more about the trials, probably, than he has had with me than I could about the trials I have with you. Most of the commission men are anxious to please and to hold their patrons; they do about the best they know. It may be at times they don't sell the honey to the man that would pay the highest price, but he is often very hard to find. Mr. Baldrige will come in and he will say, "Mr. Burnett, what are you charging for honey to-day?" Why, so and so. "Yes. Well, I think it ought to bring that." But I notice Mr. Baldrige doesn't ask me to sell him any. "Well," I would say, "what is the matter, Mr. Baldrige? Why don't you buy this honey if you think it ought to bring that?" He says, "I can do better; I can get it cheaper somewhere else." If I sell him honey I must meet his views on that question, if I thought he could get that honey anywhere else; tho I would be stubborn enough if I believed he could not get it at his price, but being fairly well posted in this line of business, I know there are times when he can get that honey for less.

If I have some honey that a party wants to get his money out of rather soon, I will do perhaps what we call "shading the price," and I make the sales accordingly, and explain to the shipper, perhaps, if he finds any fault, that that was the best price that I could get at that time—it was all the buyer would pay.

Now, this idea that a commission merchant isn't about like the average producer of honey, I think you will agree with me is a mistake. He is just doing the very best he can in his sphere. I might say, if the president will permit me, that I consider that we are all in a great school, and that the common enemy is ignorance, and the task set before us is to overcome ignorance. As we go along in life, if we have been careful—if we have been industrious, if we have tried to learn—perhaps there are some who have grown faster in knowledge than others. I believe we must all overcome ignorance in every form; the disturbing of the equilibrium always brings trials; if something comes up that seems to disturb us very much we call it a trial; if we allow it to get hold of us in such shape that it destroys our ability to think and plan, and to know or plan, what would remedy the difficulty, we are in rather a bad way, and we must wait until we get the mind in shape again, until we can apply the mind and find the way out of this difficulty.

Personally, I have no trials. I don't get angry at a fellow if he doesn't ship me his honey, and I am very anxious indeed that every man who ships me his honey shall know the conditions that he is likely to meet before he sends it, and the stereotyped reply almost, I might say, of our office is, "If you can not market your honey yourself in any way that is satisfactory to you, you may expect that our market will bring you so and so, providing that your honey arrives in such condition, and will not be objectionable to the man who goes around with his money and buys where he can buy the cheapest, and at the same time get the best value for the money he invests."

If I recollect, it so happens that the second man in this part of the world that shipped me honey over 20 years ago, is in the audience. I was asking him how long ago it was he made me that shipment. I think he said it was in 1876. I simply mention this as a corroboration of the fact that because a man shipped his honey to a commission merchant he must not necessarily die or "go broke."

R. A. BURNETT.

Pres. Root—This subject is open for discussion for just a few minutes; perhaps there are bee-keepers here who have trials as well as commission men.

Mr. Hershiser—I have not had many trials with commission men; I have not heard of many that have been tried; there is once in a while one; I think that the offenses that some commission men usually commit are of such a character as to make it rather a discouraging outlook for any one to bring legal proceedings against them; they cheat on small shipments. We had a commission merchant in Buffalo a few years ago that had robbed people thru the country of perhaps a good many thousands of dollars on many small shipments. He sent out very attractive notices, and received shipments mostly of poultry from all over the western part of the State of New York, and in Ohio and Michigan, and other places, and he gauged the amount of his stealings from these people according to the distance they lived from Buffalo. If they lived 100 miles, or something like that, so that the expense of coming down to Buffalo would be likely to be more than he would get out of it if he got there, he would cheat that party out of that much money. He finally ran across one man away out in Ohio who was willing to make a trip to prosecute the man, and he had to pay \$500 fine for his cheating. He was prosecuted thru the United States court for using the United States mails for schemes to defraud. That is the only case of the trial of a commission man that I know of.

A Member—What is his name?

Mr. Hershiser—He is not in business any more; his name was Unger.

(Continued next week.)

Contributed Articles.

Old or New Hives for Wintering—Other Questions.

BY G. M. DOOLITTLE.

WILL bees stand the winter as well, and be as healthy in old hives, or those having been used several years, as in new ones? Tell me in the American Bee Journal.

ANSWER.—When I first read this question it seemed to me that the proper answer to give would be this: Old hives in a good state of preservation, with no decayed spots and no open cracks, should be as good as new ones for wintering bees, and the new ones as good as the old. But after thinking a little I am not so sure about that answer. Years ago I found out that a single-walled hive painted on the outside would not winter nor spring bees nearly so well as an unpainted hive, on account of the moisture, evaporating from the bees and their food, not being able to pass thru the pores of the wood, as was the case with the unpainted hive, this causing a dampness about the bees and on the combs which was not in accord with the best welfare of the inmates of the hive. All old hives, after long use, become so varnished with propolis on the inside that this places them in a condition similar to hives painted on the outside; and in cases where the slow passing of moisture out of the hives was not provided for by way of chaff or sawdust cushions, etc., I should expect that the bees would winter best in new hives.

But there is an item generally favorable toward the old hives, which is, that they are more likely to contain old combs; and it is generally conceded by all practical bee-keepers, and was given to the public away back in the '50's, by Quinby and others, that, other conditions being equal, bees will winter better on old combs than on new ones. This I have found to be universally true. This being the case, if there is any preference, it would lie along the line of old combs in new hives.

BEES AFFECTED BY MOISTURE.

QUESTION.—Does moisture affect bees wintering on sugar-syrup stores in the same way as it does those wintering on honey?

ANSWER.—That depends altogether where the moisture is—whether a damp outside air, damp cellar, or moisture in the hives. From past experience I think that bees winter best in a moist atmosphere, and I do not think that a foggy, misty winter has any deleterious effect on colonies wintered on the summer stands. The moisture often accumulates in my bee-cellar so it stands in drops and runs down the stone flagging overhead, to an extent sufficient to form little pools

in the depressions on top of the side-walls of the bee-cellar, and yet the bees appear to winter perfectly. It is often so damp inside that mold will begin to form in different places, and by the time the bees are put out in the spring some of these patches of mold will be as large as, and stand out like, the crown of a hat; still the bees have generally wintered well in this cellar, very much better, as a rule, than those left on the summer stands. Inside the hives, the combs, bees, and all, seem to be as dry as when put into the cellar; but were dampness to collect on the combs and the walls of the hives about the bees, or run down on them, I should have fears of injury.

As to stores, I believe that sugar syrup does not attract moisture as much as honey, therefore the sugar syrup is the better of the two for wintering bees. Honey seems very susceptible of moisture, in fact, more so than any other liquid with which I am acquainted.

SQUARE FRAMES—DEPTH OF FRAMES, ETC.

QUESTION.—Would I not better adopt a square frame in keeping bees? What do you think of the square frame? I am assured by men of experience that the Langstroth frame is not deep enough for the cold climate of Canada.

ANSWER.—Replying to this I wish to say that bee-keeping does not depend upon the size of the frame used, or upon its form. There are few frames now in use but that a man or woman of energy, and love for bee-keeping, can take and make a success with them. I believe in always having the best appliances as far as may be; but I wish to put emphasis on the fact that it is the man or woman who puts the success into the thing, primarily, and the best appliances come in as a secondary matter.

Altho I have been an advocate of the Gallup or square form of frame all my life, still, as I have said before in print, if I had 25 colonies in any style of frame now advocated by our practical apiarists, I would not consider it a paying job to transfer them to another style of frame, whether in Canada or York State, provided the hive containing these frames would accommodate the style of surplus arrangement which it was necessary to use in order to place my honey on the market in the most attractive and marketable shape. No, no! it is not *all* in the frames or the hives as some assert, but it is in the man or woman with energy, push, and real worth enough to surmount every obstacle which stands in the way, and make a success of a thing in spite of a few minor hindrances.

Look at the great potato-grower and lecturer at farmers' institutes, Mr. Terry, of Ohio. Had he gone on a rich farm instead of a poor one, he probably would have arrived at the same wealth sooner, but his success would not have been greater than now—perhaps not as great—and, in all probability, the world would not have been benefited nearly so much as it has been; for the overcoming of that obstacle, in the shape of a poor farm, gave a certain vim to the success that led him to tell others how it was done, and in this telling has come the greatest light to the world.

Reader, if you find a difficulty in your way, and succeed in overcoming that difficulty, don't keep the matter hid, but tell us about it, and thus help the world. Don't be foolish enough to say, "No one will pay me for telling," for that is a selfish spirit, and selfishness *never* pays; for in the doing of some kind act, or in trying to lift the burden from some tired shoulder, comes a wealth that money can not buy.

Now a word about a square frame for the cold climate of Canada. In most of the localities in Canada, where bees are kept, the mercury does not go lower than it does here in Central New York. As the older readers of the American Bee Journal know, I have gone over the ground of a shallow frame like the Langstroth not being suitable for our cold climate, many times. And I still think there are some few things in favor of the square frame where bees are to be wintered on the summer stands; yet, as I have said before, if I had 25 colonies on the Langstroth frame I should consider it a losing job to transfer them to a square frame, hoping for better wintering when they were on the latter. Where bees can be wintered in the cellar the Langstroth frame is not required to "take off its cap" or "make a bow" to any of the others, even in cold climates; and in a climate where bees have a chance of flying every two or three weeks during winter, no one has any occasion for looking for a better frame.

Onondaga Co., N. Y.

Queen-Rearing is a very interesting part of bee-keeping. Mr. Doolittle's book tells practically all about the subject. See the offer we make on the second page of this number.

An Interesting Experience With Queen-Bees.

BY J. L. GANDY.

FOR the last 15 years I have purchased and introduced on an average 60 queens annually, except last season, when I introduced only 20, tho 50 more old queens should have been changed. The press of other business caused me to neglect this important matter, and by the time I got them requeened and built up the season was so far advanced that I got no surplus from them; while from 50 other colonies in the same yard I have five tons of surplus honey. From one colony that I requeened late last fall I secured 502 pounds of surplus honey, one-half being comb honey. I paid but 50 cents for the queen of this colony; I have been offered a fabulous price for her, but she is not for sale. I have purchased quite a number from the same breeder this year, and all seem equally good. The bees from this and several other colonies worked the whole season on red clover and catnip.

I have found in buying queens that all breeders are honest, as a rule. I have purchased and introduced 75 untested queens this season from a dozen different breeders, and all have turned out to be pure Italians, and good layers, but there is no doubt that some breeders have a better strain of bees than others.

Some think that it injures queens to send them thru the mails. According to my experience such is not the case with young untested queens; but I believe after a queen has become an establish layer in a full colony, she is injured by being taken away from the colony. I have purchased three five-dollar queens at different times, and none of them proved to be more than half as good as untested queens purchased from the same breeders. I once bought a dozen tested queens, leather-colored, six months old, and six of them died during the winter, and the others would have starved if I had not fed them. At another time I bought six tested queens one year old, and all died during the winter. I have also had poor luck with untested queens. I once drove to a breeder 15 miles distant to buy queens. He had none fertilized, so I told him I must have one queen anyway, and he sold me an untested one six weeks old from one of his colonies that then had six frames of brood. I introduced her the same day. I kept her for two years, but she never had at any one time two full frames of brood, and would have starved had I not constantly fed sugar.

I would suggest to breeders that queens to be sent by mail be reared in small nuclei, so that the laying would be very little; and never, under any circumstances, to send out a queen after she has become an establish layer in a colony.

I rear my own queens, to a certain extent, and will give my experience in breeding 30 the past season, which is about the same experience as I have each year. Eight of the queens were lost in mating, three had defective wings and had to be killed, two laid drone-eggs, one never laid at all, only six were purely mated, and the balance were very poor hybrids. One of my reasons for purchasing queens is that I think it just as important to change the strain of bees often, as is done with the breed of hogs and cattle, and unless this is done, and if bees are allowed to inbreed, in a few years they will degenerate and be worthless as honey-gatherers.

I think, as a rule, queens should be changed at the end of the third season, tho I find some good at four years of age, and others poor when two years old. I once had a queen fairly good until she died in her eighth year. Queens should be changed when they begin to fail, regardless of age. By long and careful observation I have come to the conclusion that under no circumstances should bees be allowed to change their old queen. A bee-keeper would better requeen as I have mentioned, and he will make money in so doing, even if he has to pay \$2.00 each for good queens (that is about the average cost of a queen if a bee-keeper breeds her himself). I haven't the least doubt if I had expended \$25 for 50 additional queens last fall, I would have had a thousand dollars worth more of honey this season.

Richards Co., Nebr., Oct. 2.

The Influence of Location in Bee-Keeping.

BY ADRIAN GETAZ.

THREE times since I began keeping bees the discussion of large versus small hives has been commenced in the bee papers, kept up a year or two, and then dropt, only to begin again two or three years later. Each time the

same arguments have been presented by substantially the same writers. Each time the conclusion has been reached that it was a matter of "locality;" but why some localities require a certain method of management, and why some others require a different method, has not been explained. Why does Dadant's locality require large hives and correspondingly large colonies? Why does Doolittle's locality need small ones? What influence has the more or less successful wintering due to the climate, upon the condition of the colonies in the spring and the subsequent management? What management is required for a short, heavy, flow of honey, and what for a long, light flow? What for localities having a fall flow, etc.?

All of these points should be thoroly investigated and understood. We should be able to say: A given locality of such and such climate, honey-flow, etc., requires such and such management; and we ought to be able to explain *why*.

I can only describe the characteristics of East Tennessee, from an apiculturist's standpoint, and explain how those conditions brought me to my present ideas on the subject. I may add that I am writing from the standpoint of a comb-honey producer.

Beginning in the spring of the year, we may say that our honey-flow, or, rather, our honey season, begins about April 1st, and ends about the middle of July. But it is by no means a continuous flow. In April, fruit blossoms; in May, after an interruption, tulipwood. Then another interruption until the persimmon flow comes in June; then basswood and sourwood during the latter part of June and July. Basswood is found only away in the mountains; there is none here. Some white clover bridges more or less the interval between fruit-blossoms and poplar, but not enough to be depended upon for surplus. Occasionally there is a heavy flow of honey-dew during May and June; generally of a tolerably fair quality, but sometimes abominable in taste and color.

What increases the difficulty is the irregularity of these different flows. Often the fruit-blossoms and poplar flows are interfered with by bad weather. Sometimes there is honey-dew; sometimes there is none. Sometimes the sourwood yields, and sometimes not. The persimmon has never failed yet with me, but there are only a few trees here and there, and the period of blossoming is very short.

There is absolutely no way to tell in advance which of these sources will yield, and which will not; so the only chance to secure surplus is to keep the colonies strong during the whole season (three months and a half), so as to catch whatever flow may happen to come. I am speaking for Tennessee generally. In my immediate neighborhood there are very few tulip trees, and no lindens.

Needless to say that a management similar to the one advocated by Mr. Doolittle and others would be a failure; for the flow for which they would build up might be the very one that would fail. In fact, I tried once to build up my colonies very, *very* strong for the sourwood flow, when, lo, and behold, that flow failed completely.

To keep colonies of bees in full strength during three months and a half, it is necessary to control swarming, otherwise both the mother colonies and the swarms would be too weak during the remainder of the season.

This is one of the reasons which prompted me to adopt large hives. I had some correspondence with the Dadants on the subject, stating that there was no demand for extracted honey here, and they advised me to build up a home market as they have done. Unfortunately the bulk of our honey is dark, rather inferior in quality, and varies greatly both in taste and color. To build up a special home market at advanced prices, it is necessary to have first-class honey.

Prevention of swarming can be accomplished only by caging or removing the queens at the proper time. This, however, entails quite a loss of brood, as the bees must be at least four days without unsealed brood.

Those four days or more without brood are the key to success. After the bees have begun to build queen-cells they will continue as long as there is unsealed brood, and the conditions of honey-flow, temperature, strength of colony, etc., are favorable. After having been without unsealed brood a few days they will not resume cell-building, at least not for quite a while, and generally the remainder of the season. But, as stated above, this entails a loss of brood. With me the swarming takes place in May. The brood lost at that time is precisely what would furnish the field-bees for the sourwood flow in July. So it becomes necessary to reduce the loss to a minimum.

By using large hives, putting on supers early, and protecting them against the cold nights so that the work goes on in the super day and night with no interruption, using bait-sections, shading the hives in hot days, etc., I have, for the last six years, succeeded in reducing the swarming from 5 to 15 percent of the number of colonies.

Under such circumstances, rather than to requeen thru-out, I let the colonies swarm; catching the queens in the traps and returning the queens, or giving the colonies others after they have been a few days without unsealed brood; or I let them have queens out of the cells they have built. If, occasionally, in examining the colonies, I find cells started, I treat them the same way without waiting for actual swarming.

Between the honey season and the winter there is a little nectar gathered every day except in the very dry seasons. That quantity increases materially when the golden-rod and asters bloom, but there is never enough to furnish any surplus, and very often not enough to winter the colonies.

During that period there are plenty of weeds and flowers of all sorts along the fences and in the fields after wheat and oats are harvested, in the pastures and other places; but they yield very little honey; and, as a rule, only in the early morning. This must be due to the fact that the ground is too dry to admit the formation of the nectar, for, occasionally, if an abundant rain comes there is something like a flow of honey for a few days after.

The result is that the more bees there are in a colony the more flowers will be visited, and the more honey brought in; in fact, while the strong colonies will gain some in population and stores during that period, the medium ones will only sustain themselves and the weak ones will lose, if they don't get robbed by the others, which happens occasionally. The result is, that by the time winter sets in the difference between the large and the small colonies will be greater than it was at the close of the honey harvest.

During the winter the difference becomes still greater. The strong colonies will eat proportionately less, lose a less percentage of bees, rear some brood, and when spring comes they will be very much stronger in proportion, begin brood-rearing in earnest much sooner, and be ready to enter the surplus apartments in full force long before the weaker colonies can even recover their lost strength. Do you wonder that I am such a strong advocate of the large hives and larger colonies?

If this state of affairs were a purely local one, I should not have written this contribution; but it applies in its main characteristics to the whole country south of the Mason and Dixon line except Florida; there are differences, of course, between one locality and another. The further south we go the shorter is the winter. Then, below this section there is the cotton, while, on the other hand, the sourwood does not exist in the low plains. But, nevertheless, the general features of the Southern-States' honey-production remain the same. A few months of honey season during which nectar can be gathered from different sources, but in a very irregular manner, some sources yielding this year, and some other yielding the next year, necessitates the keeping up of the colonies to their full strength during several months; then the late summer and fall season, with very scant yielding of nectar, during which the strongest colonies have a decided advantage over the others.

Other sections of the country are under different conditions. In the northern States there is a definite honey season of a few weeks from white clover or basswood, or both, the swarming take place at the beginning of it. Some of these have, besides that, a honey-flow from buckwheat later in the season; and, in a few localities, there is also a fall flow of considerable importance.

In Colorado and other northwestern States, they have two distinct flows. Thru some correspondence with a prominent Colorado apiculturist, I have learned that one difficulty with them was that during the honey-flow the bees were filling the brood-nest with honey and curtailing the brood, with the result that at the time of the second flow the number of field-bees was considerably reduced.

Some portions of California seem, on the other hand, to have a long, continuous flow, with the swarming taking place before the flow opens.

I have done my part. Now, if others in different localities will do the same, we will eventually have the matter fully understood.—"Prize Article" in the Bee-Keepers' Review.

Introducing Queens With Tobacco-Smoke.

BY HENRY ALLEY.

I HAVE read the thousand-and-one methods given in the bee-papers for introducing queens, and none of them, it seems to me, are at all practical. They all require too much work and trouble, and, so far as I know, none of them are reliable.

I never have practiced but one method for introducing either fertile or unfertile queens, and it is always attended with the best of success.

To be successful in introducing a queen, a colony must be put in shape to realize thoroly their queenless condition, and this can best be done by letting the bees remain queenless 72 hours. This applies to colonies to which either fertile or unfertile queens are to be introduced. At the end of three days cells will be started, but not capt, and then is just the right time to introduce a queen and make it a success.

When a queen is received, do not put the cage near the colony to which the queen is to be introduced. This is a bad practice and a mistake a good many bee-keepers make. When a colony has been queenless three days, place the cage over the frames in such a way that the bees in the hive can have access to the food in the cage, and in the course of a few hours the food will be removed, and everything being so quiet the queen walks out and takes command of the colony, and all goes on well.

Now, to make the introduction doubly sure, just blow a quantity of tobacco-smoke in at the entrance of the hive—enough smoke so that all the bees will feel it. The best time to do this, and to introduce a queen, is just before dark.

Now, I can not use tobacco as a good many people can; that is, I can not smoke a cigar nor pipe, and so I was obliged to perfect some arrangement whereby I can fumigate the bees with tobacco, so I made a tin pipe in this way:

The body of the pipe is made of tin $\frac{3}{4}$ inch in diameter, and about 5 inches long; then a wood stopper at each end. A hole is made thru each stopper, and the one placed in the mouth is shaped to fit the mouth. The stopper at the other end has a small tin tube run thru it so that the smoke can be directed to any particular point. The pipe is held between the teeth, and the hands are then at liberty. Fill the pipe with fine, cheap tobacco—tobacco such as cheap cigars are made from is strong enough for bees, while the common tobacco used for chewing and smoking in clay pipes is too strong.

If too much smoke is given, and the bees commence to tumble out at the entrance, throw some grass on the alighting-board, but not enough to stop ventilation.

All my queens are reared in full colonies, and are hatched in nursery-cages, and then the queens are introduced to nuclei in hives having four combs and frames 4x5 inches. These little colonies build up strong—so strong, in fact, that on hot days I will have nearly 200 of them with the bees clustered on the outside, and it is a handsome sight to look upon.

Each of these hives has a hole in the top, or cover, thru which the feed is given the bees. When I have 30 or 50 virgin queens to introduce, I place as many cages with queens in them in a box, and then get a plantain leaf for each hive. I then stop the entrance with the leaf, and blow a quantity of tobacco-smoke into the hive thru the hole in the top, and quickly shake the queen from the cage into the top of the hive. It does not require over 30 minutes to introduce 50 queens, and, what is the best part of it, I never lose a queen.

Fertile queens can be introduced in the same way; that is, they can be shaken out of the cage just as soon as the colony has been smoked. I gave the first method, as it will better suit most people.

Now, if any reader of this knows of a better and more expeditious way of introducing queen-bees safely, by all means tell us of it.

Essex Co., Mass.

Belgian Hare Breeding is the title of a pamphlet just published, containing 10 chapters on "Breeding the Belgian Hare." Price, 25 cents, postpaid. It covers the subjects of Breeding, Feeding, Houses and Hutches, Diseases, Methods of Serving for the Table, etc. It is a practical and helpful treatise for the amateur breeder. (See Mr. Schmidt's article on page 680.) For sale at the office of the American Bee Journal. For \$1.10 we will send the Bee Journal for a year and the 32-page pamphlet on "Belgian Hare Breeding."

* The Afterthought. *

The "Old Reliable" seen thru New and Unreliable Glasses.
By E. E. HASTY, Richards, Ohio.

FINE SALT TO KILL DRONE-BROOD.

Fine salt to kill unsealed drone-brood. Ah, that's a kink I had failed hitherto to get. Dr. Miller, page 522—and see also editorial, page 547.

KINKS ON MOVING BEES.

When you move the bees with straw for a spring set the hives on a false rack of slats put on top of the straw. Quite an improvement, evidently. If during the journey the bees of a colony, or a few colonies, jam the entrances and begin to *squeal*, that's the time to save their lives by setting them off beside the road, and giving them liberty. A mixt bushel of melted wax, honey and bees would be more valuable in a tub than in a bee-hive—and not very valuable even in a tub. Let the bees live, and come for them another eve. Page 585.

THAT HYPHEN SQUABBLE—WHEN DOCTOR'S DISAGREE, ETC.

It is taking me in a weak spot to ask me to adjust the hyphen quarrel (or should that be hyphen-quarrel?), so in what I may say please do not consider me as a judge deciding a case, but only as the Afterthinker, making his comments as usual. I say, let the doctors disagree peaceably. If you don't, they'll disagree anyhow, and non-peaceably. It should not be forgotten that the rules of the grammarians have been often at war with the invincible usage (the really correct usage) of the rank and file of good writers; so to show that a thing is rulable does not always settle matters. Now, in regard to the phrase immediately in hand, as the Bible says sweet cinnamon and not sweet-cinnamon, sweet calamus and not sweet-calamus, sweet cane and not sweet-cane, the usage sweet clover, when clover is a noun, seems to be well supported, certainly. Exodus 30:23, Jeremiah 6:20. (It should be remarkt that the Bible runs very light on hyphens, and mostly uses consolidations in the place of them, freewill in the place of free-will; but these plant names in which "sweet" figures are not consolidated.) The original criticism of Mr. Root, if allowed at all, would lie against all these cases, it seems to me. Furthermore, to say in the same article "I saw some sweet clover" (without hyphen), and "I saw some sweet-clover plants" (with the hyphen), impresses me as too fine a distinction. Don't believe the English language will, as a *finality*, settle things so. Still, from a strictly grammarian point of view, it may be all right to let an adjective and noun, with slight peculiar relations, run loose, and tie them together when they shift character into a feebly-compounded compound adjective. So, if I was to decide at all, I should decide that Mr. York should have been allowed to keep on his own way, and Mr. Wallace Root should have kept on his, without making any attack. Pages 658 and 628.

Earth enters the new century with pretty much every doctrine it holds in a state of flux. I'm glad it is so. It is too soon, I think, to browbeat either the man who uses many hyphens, or the man who uses few hyphens. Same of the other points. The Bible (magnificently punctuated, somebody has said) is heavy with colons, and with commas put in pretty much every place where one could imaginably be stuck. Yet very many present-day writers punctuate much lighter, seldom using the colon at all, and using scarce half the commas the scholars of 1611 would have used. It's too soon to try to put down either the heavy system or the light system. "Let every man be fully persuaded in his own mind"—if he can. My feeling is that excess of hyphens gives one's page a look of fussiness that had best be avoided—somebody and somebody both of them better taste than somebody. But for a century or so yet I'll consent to tolerate either bee hive or bee-hive or beehive. Still you must let me keep my own thought, to-wit, that the popping in of a hyphen wherever an acute mind can discern some sort of *special* relations between two words—I don't believe those who are moving that way realize how far the principle is going to take them.

While a combination is somewhat unfamiliar the hyphen should be retained, of course; but, if I am right, there is a steady current of language on which *familiar*

hyphenated words float out in both directions, into consolidated words on one hand, and into independent words on the other. Bee-culture did not become beeculture, but has already mostly become bee culture—in diverse look from its synonym apiculture. But we write jack-plane because that is not universally familiar, while jack-knife long ago became jackknife. And this state of things pleases me. My personal rule (if I have any) is to omit most of the hyphens, unless I feel that the omission would cause the reader to lose my exact shade of meaning.

As a finality I would vote for the very system that makes the critics the maddest, a phonetic punctuation, intended to represent, in the main, the exact way the writer would like to have his words read. As the historic spelling is doomed (Stenog would put in a big ? there, perhaps), so let the punctuation founded solely on grammar be doomed—not worth the trouble it makes—and no uniformity ever reached yet, or ever likely to be. *Really*, there is a plain difference in sound between bee hive and beehive, while bee-hive is intermediate in length, with a trifle of special emphasis put in somewhere. With the hyphen (and the other points also), why not write things as we speak them ?

PASTEBOARD METHOD OF INTRODUCING QUEENS.

As to pasteboard with pin holes in it for the bees to tear away in being requened, quite possibly less than one percent of queens so introduced would be killed by the bees; still I demur at calling it an absolutely sure way. See "Indiana," page 601, for refusal to tear the pasteboard. That tricksey—something or other—that loves to make our sure plans go wrong will, in general practice, knock out more than one percent, I fear—queen dying of neglect, and pasteboard not torn at all. Page 595.

SWARMING—COOK VS. GREINER.

Case of Cook vs. Greiner, page 598. Do bees nearly all go with the swarm, or are there lots of them left? I should say sometimes, and sometimes. I have often thought it depended largely upon the amount of up-stairs and behind-dummy space the hive afforded. While bees are pouring from the entrance other bees are marching everywhere inside, and forcing themselves into every cranny. With small entrance and great amount of matching-space many may satisfy their appetite for excitement without going out at all. If it was desirable I suspect I could fix a set of upper stories so as to retain in the hive say one-third of the swarm—sometimes. Furthermore, bees much belated in getting out may lose the location of a distant cluster, and return to the hive after a short flight near by. Of course, whatever bees happen to be at work in the fields return to the old stand—sometimes very few, and, sometimes, I think, very many. I may be mistaken, but I think that bees of a new swarm often feel disgruntled with their new quarters, and return *individually* to the old stand during the first 48 hours, sometimes in considerable numbers.

QUEEN PLAYING SQUIRREL.

I can't quite accept that, Mr. Getaz, that the queen is not thinking of the operator, but only of the light, when she plays squirrel behind a limb with me. She's too quick and keen of purpose for that theory, I ween. Page 614.

A MODEL OUT-APIARY.

That's the way to have your out-apiary (home apiary, too,) the way Harry Lathrop has his on the first page of No. 40. Have a good, high, tight board fence around it. Then have some trees, not too big nor too many. Not absolutely necessary to copy the honey-vinegar barrel reposing under a tree—but it's all right if you do.

CLIMATE AND SECTIONS IN BEE-KEEPING FRANCE.

That the climate of bee-keeping France should be called (and by a Frenchman, too,) northern Wisconsin, with an earlier spring and a milder winter, is hardly what we should expect. Probably northern Wisconsin is nicer than a stay-at-home Ohio man would picture it. Also, Mr. Dadant was candid in telling us that sections in France are such as no American would use at all—so rough and dark. Page 629.

THAT SCHEME OF BEE-PASTURE-OWNERSHIP.

The trouble with your scheme of pasturage-ownership, Dr. Miller, is with the *details* of it. It would be handy, as well as just, to have some way quietly and legally to hold off the predatory bee-man, who wants to flounce into an occupied location with a big apiary, and crowd the occupant out. But how to frame the legal bars so as to keep the bad cow out and let the good cow in, that is a tough problem for

he law-carpenters. We feel and confess the right of ordinary farmers to have a few colonies of bees for their own use if they want to. Any law taking this right away would probably be unconstitutional, and therefore worthless. But the farmers bee-corner, not worth calling an apiary, *might* take a notion to grow—like Topsy—and change ownership. A law adjusting number of colonies to acres would fearfully overrate the whole region, else unconstitutionally wrong the man who owned a rich bit of pasturage—and the up-shot would be that we should all eventually have to pay for rights which we now get gratis. The prevalent apathy on the subject, Doctor, is largely a disinclination to bring dead snakes to life. We can get along *somehow* with the occasional snake already in life; but we don't want the brood which agitation of this subject would hatch out. Page 616.

Questions and Answers.

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

[The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.]

Chaff-Packing for Winter-Cases.

I have winter-cases 3 inches wider than the hive, and high enough to take a super. What do you think is best to do—put on a super with a Hill's device, and fill with chaff, or leave the cover sealed to the hive and put chaff all over it? I have winter-canvas to fit the cases. I would rather have the supers in the house, but want to know what you think is best. NEW YORK.

ANSWER.—Your idea of putting on the super filled with chaff agrees with that of experienced bee-keepers in general. Of course, burlap or something of the sort will be over the frames so the chaff can not sift down among the bees.

Preparing and Feeding for Winter.

1. How would you prepare 5 colonies of bees or more for winter in a dry-goods box, large enough for them out-of-doors ?

2. How shall I feed my bees for winter ?

3. How can I make a bee-feeder ?

4. How can I make a smoker ?

IOWA.

ANSWERS.—1. The most troublesome thing in the case is to preserve a passage from the hive-entrance to the outside of the box. Make a sort of box open at both ends that shall allow a constant passage with no possibility of being closed up. Fill up around and over the hive with dead leaves, planer-shavings, chaff, or something of the sort, and then see that it is covered so that no drop of rain can work thru. Of course, you don't mean five or more colonies in one box, but a box for each.

2. Give them combs filled with sealed honey. If you haven't these, it may not be too late to feed syrup made of granulated sugar, or you can make candy, for either of which you will find instruction in your bee-book.

3. You can buy a good feeder cheaper than you can make one, except the crock and-plate feeder, which answers the purpose very well. Take a one-gallon stone crock or other vessel, fill it as full as you desire with syrup, lay over the crock a covering of thick woolen cloth or 5 thicknesses of cheese-cloth, over this put a common dinner-plate upside down. Now with one hand under the crock and the other over the plate, quickly turn the whole thing upside down. Set this on the brood-frames of the colony to be fed, with an empty hive-body around it well covered so that no bee can get to it from the outside.

4. You might learn to make a smoker, and so you might learn to make a coat, but it is cheaper to buy.

The American Fruit and Vegetable Journal is just what its name indicates. Tells all about growing fruits and vegetables. It is a fine monthly, at 50 cents a year. We can mail you a free sample copy of it, if you ask for it. We club it with the American Bee Journal—both for \$1.10.

A Close and Exciting Election!

Which will be Elected?
How many Votes will he Get?

Send 25 cents for a three months' subscription to the

***** Farm, Field and Fireside *****

CHICAGO,

and a chance in the

Prize guessing contest
for \$5,000 in cash,

McKinley

Bryan

which will be awarded to those coming the nearest to the official figures of the popular vote cast for the successful presidential candidate.

The Publishers' Guarantee Association has deposited \$5,000 in the Metropolitan National Bank, Chicago, Ill., for the purpose of paying these prizes, under strict conditions preventing its use for any other purpose.

First Grand Prize, \$2,000,

to the nearest guesser, and 197 more cash prizes to be awarded as follows:

To the nearest correct guess.....	\$2,000.00
To the second	500.00
To the third	250.00
To the next 5, \$50.00 each.....	250.00
To the next 40, \$25.00 each.....	1,000.00
To the next 50, \$10.00 each.....	500.00
To the next 100, \$5.00 each.....	500.00
198 cash prizes	\$5,000.00

TO AID GUESSERS:

McKinley's popular vote in 1896	7,107,304
Bryan's popular vote in 1896.....	6,533,088

Our Offer: We have made arrangements with the Publishers' Guarantee Association, of Chicago, to enable our subscribers and friends to participate in these great cash prizes. Every one is invited to participate, and for each three months' subscription to the Farm, Field and Fireside sent us, accompanied by 25 cents, a guess will be allowed. Those remitting 50 cents for six months' subscription will be allowed two guesses, and those remitting \$1.00 for one year's subscription will be allowed four guesses. This applies both to new subscribers and to renewals. Present subscribers can send in their guesses, accompanied by the money, and their subscription will be extended.

How to Guess: When you send in your subscription you make your guess. Be sure you write your name and address and guess as plainly as possible. As soon as we receive your subscription we will fill out and send you a certificate corresponding to guess made by you, which will entitle you to any prize that you may draw. Be sure and keep your certificate. We will file the duplicate with the Publishers' Guarantee Association. Every subscriber will receive as many certificates and have as many guesses as he sends subscriptions to Farm, Field and Fireside.

In case of a tie, or that two or more estimators are equally correct, prizes will be divided equally between them.

CUT THIS OUT AND SEND WITH YOUR SUBSCRIPTION.

Langstroth on... The Honey-Bee

Revised by Dadant—1899 Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroughly explained, so that by following the instructions of this book one cannot fail to be wonderfully helped on the way to success with bees.

The book we mail for \$1.25, or club it with the American Bee Journal for one year—both for \$1.75; or, we will mail it as a premium for sending us **THREE NEW** subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

Rocky Mountain Bee-Plant Seed!

(*Cleome integrifolia*.)

...FREE AS A PREMIUM...

The A B C of Bee-Culture says of it: "This is a beautiful plant for the flower-garden, to say nothing of the honey it produces. It grows from two to three feet in height and bears large clusters of bright pink flowers. It grows naturally on the Rocky Mountains, and in Colorado, where it is said to furnish large quantities of honey."

We have a few pounds of this *Cleome* seed, and offer to mail a ¼-pound package as a premium for sending us **ONE NEW** subscriber to the American Bee Journal, with \$1.00; or ½ pound by mail for 40 cents.

GEORGE W. YORK & CO.

118 Michigan St. CHICAGO, ILL.

GENERAL ITEMS

Bees Did Fairly Well.

Bees have done fairly well this year. But few bee-keepers have done as well or better than I did. The drouth in June—our best month for clover honey—lessened the crop. H. G. WALKER. Stearns Co., Minn., Oct. 20.

Spirea or Verbena for Honey.

I would like to know about the quality of honey gathered from *Coryopteris mastacanus*, commonly called blue spirea and shrubby verbenas. The plant grows luxuriantly here cultivated and bees fairly tumble over each other in their eagerness to work it. It has been in bloom full two and a half months to this date.

Our bees are working with a will now on asters and ironweed.

WM. CRENSHAW.

Fulton Co., Ga., Oct. 15.

Early Honey Crop.

We had a good crop of honey early in the season, gathered from the following sources: Maple, cherry, apple, raspberry, blueberry, blackberry, and one other bush, the name of which I can not give, but it blossomed just after blackberry, and this was the last honey we got until fall. There was no clover or basswood flow. Bees worked on goldenrod and asters a little but did not gather enough for winter stores, and many colonies will have to be fed, or starve before spring.

Our best flow in this locality was from apple-bloom, and many to whom I sold this honey said it was the best they ever ate. It was very thick, white, and had a nice flavor. It sold readily at 25 cents per pound, or section, in the home market.

ALBERT E. WILLCUTT.

Hampshire Co., Mass., Sept. 30.

Bees Did Poorly.

Bees did very poorly in this locality. I secured about 2,000 pounds of comb honey from 85 colonies the past season. The prices are very good—15 cents for comb honey—which helps us out. We hope for a better crop another year.

WM. M. DICK.

Ford Co., Ill., Oct. 17.

A Report for the Season, Etc.

The Dr. Miller queen, which reached me some three months ago, has proven more than I anticipated. This was the first queen I had ever introduced to a colony. Already the hive is half full of her offspring, which are doing finely. Should they prove better honey-gatherers than my several colonies of black bees, I shall be glad to requeen these with the Dr. Miller stock.

It may be of interest for me to say that the State University town is here, some 10 miles northeast of San Francisco. We directly face the Golden Gate, the Bay of San Francisco inter-

GINSENG

—Book all about it 4c. Tells how to grow this great money maker. Write to-day, AMERICAN GINSENG GARDENS, Rose Hill, N. Y. 38Est Mention the American Bee Journal.

The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

[THIS CUT IS THE FULL SIZE OF THE KNIFE.]

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a last-time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.10, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00.) We will club the Novelty Knife and the Bee Journal for one year, both for \$1.90.

GEORGE W. YORK & CO., 118 Mich. St., Chicago, Ill.

Please allow about two weeks for your knife order to be filled.

"The Prohibition Hand-Book and Voter's Manual," Size, 5x7 Inches; 50 Pages.

It contains Platform, Sketches, Pictures and Letters of Acceptance of Candidates and much valuable Statistical matter. Full of Facts. An Argument Settler. Pass them around. Price, 10c per copy, postpaid; \$1.00 per dozen, postpaid. Send your order at once to

ALONZO E. WILSON, Room 823—153 La Salle St., Chicago, Ill.

vening. Our climate is mild, but not especially adapted to bee-culture; however, I take great pleasure in my half-dozen colonies, which produced about 50 pounds each of comb honey the past season.

I desire to express my appreciation of the weekly visits of the valuable American Bee Journal, without which I would not like to be.

F. H. KRAUSS,
Alameda Co., Calif., Oct. 15.

Gather From Asters—Moving Bees.

Bees are gathering nectar from asters as we have not had any frost yet. I move my bees in the middle of the day when the thermometer is 94 degrees in the shade, with the help of a wet carpet doubled and laid over the hives.

ROBERT J. CARY,
Fairfield Co., Conn., Oct. 10.

Honey Crop Not Large.

I am a farmer and bee-keeper, and have only black bees. They used to store some surplus, but this year the honey crop was not large in this county. It is the first time it has been a failure here for many years.

PETER SONNENSON,
Pine Co. Minn., Oct. 14.

Whistled to Prevent Stinging.

On page 578 is an account of bees settling on oxen, and the comment was, "so there are bee-stories as well as fish-stories."

I would like to tell one similar, and if there is any truth in man, it is absolutely true.

An old bee-keeper of our town, Mr. Ezra Somers, in his 80th year, told me how he got his first colony of bees. In 1835 he was drawing logs from the woods, and a swarm of bees settled on the neck-yoke of the oxen and on him.

We Can't Give Away Anything

You pay for what you get in this world. You understand that. But as a business proposition we want you to try our great medicine for Indigestion, Constipation, Biliousness, Sick Headache, Insomnia, "the Blues," and like complaints—

Laxative NERVO-VITAL Tablets

We know you won't buy it, until you know something about it. The best way to get you to know how good it is, is to let you try it. That's what we do. Send Stamp for "Health" booklet, and we will send you a free sample package, that you may try it yourself. We know you will always keep it in the house, if you once try it. What fairer offer could we make? At all Druggists—10 and 25 cents.

Handsome Stick Pin **FREE!**

If, instead of sending for a sample, you send us 25c we will send you "Health" booklet, a 25c box and a handsome gold stick-pin, set with emerald, ruby or pearl, warranted to be worth double the money. Order by number. This is an extra introductory offer. Only one pin to one person. If unsatisfactory, money returned. Send now while the offer is good.

MODERN REMEDY COMPANY, KEWANEE, ILLINOIS.

SEND FOR CATALOG.

He knew nothing about bees, but had heard if he whistled they would not sting him, so he commenced to whistle and drove his oxen slowly home, took off the neck-yoke and laid it down before a box, and the bees went in. At the present time he has 15 or 20 colonies in box-hives, but gets no honey, except late in the fall he brimstones one of his colonies.

(MRS.) F. W. SAGENDORF.

Fairfield Co., Conn., Oct. 13.

Poor Year for Bees.

This has been a poor year for bees in this part of the country. I increase from one colony to three with no surplus, and have had to feed for winter stores. Bee-keeping seems to be uphill business with me, having had two hard years to start with. T. BISER.

Buffalo Co., Nebr., Oct. 20.

Very Little Honey This Year.

My bees have done very poorly this year—almost as poor as in 1892 when I got no honey at all. This year I had a very little honey, and did not need to feed them. JOSEPH HENTRICH.

Grant Co., Wis., Oct. 17.

Poorest Season of All.

This has been the poorest season for honey that we ever experienced. In the spring—the latter part of May and the first of June—we had a very good honey-flow which lasted about 10 days. We had no more to speak of until about July 20, when we had a light flow from alfalfa and sweet clover.

This county averaged about 15 or 18 pounds surplus to the colony. I have 240 colonies, from which I secured 5,700 pounds.

We have foul brood in the southern part of the county.

A. F. STEVENSON.

Davis Co., Utah, Oct. 16.

Some Very Important Questions.

There is an old adage which says that "He who works without tools is twice tired," and there is also a well-understood condition among business men which makes the doer an undesirable credit risk, known as "doing too much business for his capital." I believe these sayings aptly fit a large number of the bee-keepers of this country. Take an inventory of your own plant, study the files of the apicultural press and see how often it is

INCUBATORS FOR THE FARM

must be simple in operation, sure in results. That's the SURE HATCH INCUBATOR.

anybody can run it, because it runs itself. Send for our free catalog and see for yourself how very successful it has been on the farm. It also describes our Common Sense Folding Brooder. We Pay the Freight. SURE HATCH INCUBATOR CO., Clay Center, Nebraska. Please mention Bee Journal when writing.

Hornless cows give more milk. Hornless steers make better beef.

Keystone Dehorning Knife

M. T. PHILLIPS, Pomeroy, Pa., (Successor to A. C. BROSIUS)

Please mention Bee Journal when writing

matter of getting along without sundry tools, etc., or of making some poor substitute do. We do not have hives enough, excluder-boards or surplus stock of combs. How many have even a room exclusively for apicultural work, not to mention a building properly fitted for it?

Winter will soon be here with its stormy days and long evenings, affording ample opportunity for a careful inspection of your outfit. Is your apiary in the most convenient location? If you have no honey-house and work-house, can you build one? Have you a modern extractor, good uncapping-knives, a good smoker in good order, a good foundation-fastener? Have you suitable feeders ready for instant use when needed? If you rear even a few queens for your own use, are you properly equipt for it? Are your conveniences for preparing your crop for market all that could be desired?

Is your business stationery correct? Let it be of good paper and the printing artistic and well done. This is an item that will pay for careful attention.

Look all these things over and see where you can save steps, for these save time and that means money, even more than you may realize. See where you can increase your outfit to advantage. It is capital with which to conduct business.

Are you equipt to conduct your business most economically? Is your capital sufficient for the volume of business that you are trying to do?

These are questions which it will pay you to ponder well.

HONEY AND BEESWAX
MARKET QUOTATIONS.

CHICAGO, Oct. 25.—Fancy white, 16c; No. 1, 14@15c; No. 2, 12@13c; amber, 10@12c; dark, including buckwheat, 9@10c. Extracted, best white, 7½@8c; light ambers, 7@7½c; dark ambers and buckwheat, 6½@6¾c. Beeswax, 28c. A steady market prevails with all the best grades of honey in good demand.

R. A. BURNETT & Co

KANSAS CITY, Oct. 25.—Fancy white comb, 14@15c; receipts light; amber, 13@14c; dark amber, 9@11c; slow sale Beeswax, 24@25c; fair demand; light receipts.

W. R. CROMWELL PRODUCE Co.,
Successors to C. C. Clemous & Co.

BUFFALO, Oct. 26.—Fancy honey is just about unobtainable, and not a cake noticed in market. Such would sell at probably 20c. Few lots fair to good are selling at 16@18c, and very poor 14@16c. Shortest crop we ever heard of. Wax—none coming. For extracted, Buffalo is a poor market.

BATTERSON & Co.

ALBANY, N. Y., Oct. 29.—We quote fancy white, 17@18c; No. 1, 16c; mixt, 15c; buckwheat, 13@14c; amber, 13@14c. Extracted, white, 9@10c; mixt, 8@8½c; dark, 6, 6½@7c.

H. R. WRIGHT.

BOSTON, Oct. 26.—Our market on honey continues strong, with light receipts. Fancy one-pound cartons, 17c; A No. 1, 15@16c; No. 1, 15c; No. 2, 12@13c. Extracted from 7½@8½ cents, according to quality. Beeswax steady at 25@27c.

BLAKE, SCOTT & LEE,

CINCINNATI, Sept. 21.—The demand for fancy comb honey is good and finds ready sale at 16@16½c; No. 1, 15c. The demand for extracted honey at present is slow and offer same by the barrel as follows: White clover, 8½@9c; Southern, 6½@7½c; Florida, 7@8 cents, according to quality. Beeswax, 27c.

The above are MY SELLING PRICES. I do not handle any honey on commission, but pay spot cash on delivery.

C. H. W. WEBER.

NEW YORK, Oct. 19.—During the past two weeks, receipts of comb honey have been quite extensive, several carloads of California and Nevada honey having arrived, and some large shipments of buckwheat, and for the present there is plenty of supply to meet the demand. We quote: Fancy white comb, 15@16c; No. 1, white, 14@14½c; fancy amber, 12½@13c; amber, 11@12c; buckwheat, 10@11c.

There are no new features in regard to extracted honey. The demand is fair at unchanged quotations. Beeswax dull at 27c.

HILDRETH & SEGELEN.

DETROIT, Oct. 22.—Fancy white comb, 15@16c; No. 1, 13@14c; amber and dark, 10@12c. Extracted, white, 7@8c; dark and amber, 5@6c. Beeswax, 26@27c.

M. H. HUNT & SON.

SAN FRANCISCO, Oct. 17.—White comb, 13@14 cents; amber, 11½@12½c; dark, 8@9c. Extracted, white, 7½@8c; light amber 6½@7½c; amber, 5½@6½c. Beeswax, 26@28c.

Stocks of all descriptions are light, and especially is water white scarce, the latter being hardly quotable. Stocks of amber comb are of fair volume for an off year. Former quotations remain in force, with market decidedly firm for all desirable stock.

WANTED—HONEY AND BEESWAX.

We have a tremendous and growing trade in this line, and would like to hear from all who have such goods to sell in any part of the country, with quality, description, and lowest cash price. **THOS. C. STANLEY & SON, Fairfield, Ill.**

Four Celluloid Queen=Buttons Free

AS A PREMIUM

For sending us ONE NEW SUBSCRIBER to the American Bee Journal for three months with 30 cents, we will mail you FOUR of these pretty buttons for wearing on the coat-lapel. (You can wear one and give the others to the children.) The queen has a golden tinge.

This offer is made only to our present regular subscribers.

NOTE.—One reader writes: "I have every reason to believe that it would be a very good idea for every bee-keeper to wear one [of the buttons] as it will cause people to ask questions about the busy bee, and many a conversation thus started would wind up with the sale of more or less honey; at any rate, it would give the bee-keeper a superior opportunity to enlighten many a person in regard to honey and bees."

Prices of Buttons alone, postpaid: One button, 8 cts.; 2 buttons, 6 cts. each; 5 or more, 5 cts. each. (Stamps taken.) Address,

GEORGE W. YORK & CO., 118 Michigan St., CHICAGO.

AMERICAN BEE JOURNAL

GEORGE W. YORK,
Editor.

CHICAGO, ILL., NOVEMBER 8, 1900.

FORTIETH YEAR.
No. 45.

WEEKLY

*G. M. DOOLITTLE, of New York,
Director of the National Bee-Keepers' Association.*

THE AMERICAN BEE JOURNAL

PUBLISHED WEEKLY BY

GEORGE W. YORK & Co.

118 Michigan St., Chicago, Ill.

Entered at the Post-Office at Chicago as Second-Class Mail-Matter.

IMPORTANT NOTICES:

The Subscription Price of this journal is \$1.00 a year, in the United States, Canada, and Mexico; all other countries in the Postal Union, 50c a year extra for postage. Sample copy free.

The Wrapper-Label Date of this paper indicates the end of the month to which your subscription is paid. For instance, "Dec 00" on your label shows that it is paid to the end of December, 1900.

Subscription Receipts—We do not send a receipt for money sent us to pay subscription, but change the date on your wrapper-label, which shows you that the money has been received and duly credited.

Advertising Rates will be given upon application.

Reformed Spelling.—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound. Also some other changes are used.

The Bee-Keeper's Guide

Or, Manual of the Apiary,

—BY—
PROF. A. J. COOK.

460 Pages—16th (1899) Edition—18th Thousand—\$1.25 postpaid.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published to-day. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without **THE BEE-KEEPERS' GUIDE**.

This 16th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to **GIVE AWAY** to our present subscribers, for the work of getting **NEW** subscribers for the American Bee Journal.

Given for TWO New Subscribers.

The following offer is made to **PRESENT** subscribers only, and no premium is also given to the two **NEW** subscribers—simply the Bee Journal for one year:

Send us **TWO NEW SUBSCRIBERS** to the Bee Journal (with \$2.00), and we will mail you a copy of Prof. Cook's book **FREE** as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both for only \$1.75. But surely anybody can get only **TWO NEW SUBSCRIBERS** to the Bee Journal for a year, and thus get the book as a premium. Let every body try for it. Will **YOU** have one?

GEORGE W. YORK & CO.,
118 Michigan Street, CHICAGO, ILL.

BEST Extracted Honey For Sale

ALL IN 60-POUND TIN CANS.

ALFALFA HONEY*****

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

BASSWOOD HONEY*****

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms in Wisconsin. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

Prices of Either Alfalfa or Basswood Honey:

A sample of either, by mail, 8 cents; samples of both, 15 cents—to pay for package and postage. By freight—one 60-pound can, 9½ cents per pound; two cans, 9 cents per pound; four or more cans, 8½ cents per pound. Cash must accompany each order. If ordering two or more cans you can have half of each kind of honey, if you so desire. This is all

ABSOLUTELY PURE BEES' HONEY,

The finest of their kinds produced in this country.

Read Dr. Miller's Testimony on Alfalfa Honey:

I've just sampled the honey you sent, and it's prime. Thank you. I feel that I'm something of a heretic, to sell several thousand pounds of honey of my own production and then buy honey of you for my own use. But however loyal one ought to be to the honey of his own region, there's no denying the fact that for use in any kind of hot drink, where one prefers the more wholesome honey to sugar, the very excellent quality of alfalfa honey I have received from you is better suited than the honeys of more market flavor, according to my taste.
C. C. MILLER.
McHenry Co., Ill.

Order the Above Honey and then Sell It.

We would suggest that those bee-keepers who did not produce enough honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

Address,
GEORGE W. YORK & CO., 118 Michigan St., Chicago, Ill.

Doolittle's Queen-Rearing Book

FREE—For Sending Us **TWO** New Subscribers for
One Year at \$1.00 Each.

Scientific * Queen-Rearing,

as practically applied, describes and illustrates a method by which the best Queen-Bees are reared in perfect accord with Nature's ways. It is written for the amateur and veteran in bee-keeping, by Mr. G. M. Doolittle, the leading queen-breeder of the world.

Index to the Chapters of the Book.

—o—
Importance of Good Queens; Nature's Way of Rearing Queens; Another of Nature's Way; Old Methods of Rearing Queens; Later Methods of Rearing Queens; New Way of Rearing Queens; Getting the Bees off the Cells; What to do with the Queen-Cells; Queen-Cell Protectors; Nuclei—How to Form; Nuclei—How to Multiply; Bee-Feeders and Bee-Feeding; Securing Good Drones; Introduction of Queens; Introducing Virgin Queens; Keeping a Record of Cells, Queens, Etc.; Queen-Register; Clipping the Queen's Wings; Shipping, Shipping-Cages, Bee-Candy, Etc.; Queens Injured in Shipping; Quality of Bees and Color of Queens; Rearing a Few Queens; Later Experiments in Queen-Rearing; Latest Feats in Queen-Rearing.

Bound in cloth, price \$1.00, postpaid; or we will mail it **FREE** as a premium for sending us **TWO NEW** subscribers to the American Bee Journal for one year, at \$1.00 each; or for \$1.60 we will mail the book to any one and credit a year's subscription on the American Bee Journal. Address,

* Editorial. *

Confidential to Our Subscribers.—

Now that the flurry and worry of another quadrennial political campaign are over, we can all get down to business again. We would like to suggest that the first business at this office is to continue to furnish just as good a bee-paper every week as we possibly can, considering the support or patronage extended by bee-keepers generally. And sometimes we are led to believe that our efforts to supply a good bee-paper are almost successful—yes, quite so, if we may accept at their full face value the appreciative words so often express by some of the best bee-keepers in our land.

Well, there's nothing so very "confidential" in all we have said so far, is there? Right you are; but here's what we want to say very effectively, if possible:

We want *you* to help during this month and next—November and December—to increase by at least 50 percent the regular subscription list of the old American Bee Journal. Will you do it?

How can it be done?

Firstly, the time for renewing for another year your own subscription is near at hand. Don't fail to renew, for by so doing the present large list of readers will remain, and an advance will thus be more easily be possible.

Secondly, get at least one new subscriber to send with your own renewal. Now, some will be able to secure more than one, and thus make up for those who can not possibly get a single neighbor bee-keeper to subscribe. There are many who think they are just as well off without a bee-paper, but every one who has read any of the papers for even a short time knows better than to believe such a statement, for they can now judge from their own experience.

Now, we are not asking any one to spend his time for nothing when trying to get new subscribers, for we are continually offering valuable premiums for such work. Of course, we can not afford to offer as large, or perhaps as valuable, premiums as can some of the

other bee-paper publishers, for we believe we furnish, every year, for the one dollar subscription, as much, if not more, bee-literature than any other two bee-periodicals published in this country. We are sending 52 copies for \$1.00—less than *two cents each!* Where is there to-day anything like such value for so little money?

But we need not tell our readers what they already know, tho we think perhaps there is no harm in reminding them of some facts that are likely to be overlooked or forgotten.

Now, the question is, Will *you* try your best to help increase the number of regular subscribers of the American Bee Journal, and thus enlarge its sphere of influence, and make possible still greater improvement in its contents? We believe you will. You have done it before, and so we know you can do it again. There is no good reason why the American Bee Journal shouldn't have the largest list of regular subscribers of any bee-paper in America. It has over half as many now, so that it ought not to require such a great effort to put it in the lead.

We shall be pleased to mail all the sample copies of the American Bee Journal that you can use among those whom you would like to get as subscribers, if you will let us know how many you can use; or if you will send us the names and addresses, we will mail them direct. But, please say, when sending the names, whether or not *you* expect to try to get them as subscribers.

Let us all push for a great subscription campaign during the last two months of this closing 19th Century. The 20th Century is dawning. Shall not the old American Bee Journal welcome it with the largest number of the best bee-keepers ever enrolled in one list of regular readers of current bee-literature? What is *your* answer? We are ready to do *our* part.

Cans or Barrels for Honey.—Editor Root is a square man in general, and a square-man in particular. He says:

"Every now and then we are receiving barrels of honey almost empty. Our readers already know of our experience, of the honey running out, and on to the bottom of the cans, and how the robber-bees made things lively for all the railroad men. Our honey-buyer says square cans should always be used for

white honey. If we get it in barrels we have to go to the expense of putting it into cans, because our trade calls for it in that way. Low grades of honey are generally put up in barrels because the bulk of it is used for manufacturing purposes. But the best grades should be put into cans, if for no other reason than that the honey can be sold in large or small lots. Many customers will take one or two cans when they would not take a whole barrel."

The square five-gallon pound can is *the* package for holding extracted honey. But you want to be sure that you have a well-made can, for cans sometimes come apart at the seams or joints, and then they will leak worse than a barrel. Tin cans have a big advantage in not soaking up any of the honey as do barrels. There is a big loss due to soakage, and both the producer and the consumer of the honey seem to expect the dealer or middleman should stand that loss. To this we object. If the bee-keeper persists in using the barrels he is the one that should bear the loss from soakage.

A Pocket to Save Wax.—Here is a bright hint from G. H. Harrison, in the Australian Bee-Keeper:

One thing we all want to watch, that is when we *have* the wax, to see that we keep it. I was always a miser in that regard, and carried a wax-pocket, into which every little scrap, bnr-comb, or ball of wax, after eating a titbit of comb, was hoarded. Without this, these bits get left on the tops of hives, get melted down, blown away or wasted in some way. In many apiaries the leakage in this way is very great, and in these days we can't afford it.

Agricultural Managers Wanted.—We note the following paragraph on this subject in the October bulletin of the Missouri State University, at Columbia:

MANAGERS WANTED.—Each year the College has numerous requests for young men who are properly trained to take charge of stock farms, dairies, creameries, and orchard plantings. Thus far the supply of men with the proper training has not been equal to the demand.

The same shortage might be noted in regard to managers of apiaries. There is always a good demand for the right kind of young men—those who are properly trained and equipt for the work of managing things agricultural. There never has been such a need as now for educated and pushing young farmers—the kind that know how to do things, and are not afraid of soiling their hands or clothes in doing them.

The greatest weakness in all the trades or professions is the incompetency of the individual. And the worst of it is, many of these same individuals don't care. This is what causes so much vacant "room at the top," and such a crowded condition at the bottom,

of the ladder. The young man or woman who would get up in the world nowadays, as heretofore, must work—must climb. And after doing all that is possible to merit success, competition in many lines of the world's work is so keen, that often it is well-nigh impossible to "Arise and shine." But the discouraged worker never gets very far ahead.

We believe that along agricultural lines is one of the best openings for the young man or young woman who would make the most of life, and also win the greatest success and enjoy life to the fullest extent.

Water for Bees, says Dzierzon, in the Lpzg. Bztg., is of very great importance in the spring. He thinks the best way is to furnish it in combs in the hive. Use a comb that has never contained brood, and the comb will not be injured thereby, no matter how long the water stays in it. According to Dr. Dzierzon, if you want to see how much the bees use, give it to them in a comb, and then see how soon the comb is cleaned out dry.

Age of Brood-Combs.—In one thing the bee-keepers of this country seem to differ from the rest of the world in considering that age is a benefit rather than a detriment to a brood-comb. M. Brabant, in *Le Progrès Apicole*, laughs at the idea of brood-combs 10 years old. He says if the bee-keeper neglects to renew them, the bees do not. Give, says he, a set of old combs to a swarm, and watch. After a few days the bees have torn down the cells to the midrib, perhaps even gnawing away the base, and building all new.

American bee-keepers, in their turn, will laugh at M. Brabant, well knowing that comb 10 or 20 years old, if in good condition, will be carefully cherished by the bees, swarm or no swarm. If bees are in the constant habit of renewing comb before it is 10 years old (he says such comb is a myth), they cover up their tracks so carefully that they are never caught in the act. At least not in this country.

Perhaps Mr. Brabant would insist that "locality" has something to do with this matter!

Red Clover and Bees.—S. P. Culley, in *Gleanings in Bee-Culture*, discusses the chance of getting bees with tongues long enough, so that the crop of red clover honey may be harvested. He seems to favor working at the clover end of the problem, and thinks it is a work for the specialist, and if seedsmen can see enough money in it they may reach the desired result. Editor Root says his company are ready to offer a substantial reward for seed of red clover upon which hive-bees can work, providing such clover will reproduce its kind with constancy; but referring to subsequent difficulties he says:

Even if we did get one variety of short-tubed clover, our bees would go right in and mingle the pollen of the red and short-tubed varieties, with the result that the next crop of seed would grow a long-tubed clover. If we grow the one variety our neighbors would be almost sure to grow the other. Here is a little mountain in the way. If one were to attempt to grow short-tubed clovers he would have to get all his neighbors to raise the same varieties, and here again we might encounter the difficulty that we have already experienced in regard to alsike.

I am not sure, after all, but the problem would be easier solved by stretching the tongues of your bees.

Weekly Budget

MR. F. GREINER, of Ontario Co., N. Y., wrote us thus appreciatively, Oct. 27th:

"The report of the proceedings of the Chicago convention of the National Bee-Keepers' Association is interesting indeed. It seems to me it is the best report we ever had."

MR. G. M. DOOLITTLE is pictured on the first page of this number. He needs no introduction to our readers. The engraving shown is a new one which we had made last week from his latest photograph, taken within a month. So all can now see just how their and our good friend looks on paper. We think it is a most excellent picture of Mr. Doolittle.

MR. WALTER S. POWDER, a large city honey-dealer, in an article in *Gleanings in Bee-Culture*, says: "I hope the day of putting honey in barrels is past." Blessed hope. Then when bee-keepers will use only the best-made tin cans, and not poorly-made ones, everybody will be happy. The 60-pound tin can is a winner for holding and shipping extracted honey.

MR. E. S. LOVESY, of Salt Lake Co., Utah, writing us Oct. 24th, said:

"The honey crop here this year, if we consider the entire State, I think was only about half of the usual amount, and possibly not over an average of 50 pounds per colony. While some run into the hundreds, many did not get over 25 pounds to the colony. I appreciate very much the dress, general appearance, and contents, of the 'old reliable' American Bee Journal."

MR. JAS. A. STONE, of Sangamon Co., Ill., wrote us as follows, Oct. 30th:

"I am glad to see the picture of Father Langstroth's monument in the Bee Journal, and I think the words of the inscription could not be better. We bee-keepers surely have one poet in our ranks.

"Bees have worked a little all fall, and are at it yet, as we have had no killing frosts so far. Our bees were light, we thought, at Fair time—the last week in September—but now they are very heavy, so we will not have to feed them."

OWN LAND OF YOUR OWN.—Mr. T. B. Terry is known almost everywhere in this great country of ours as one of its leading farmers. We have met him, and have heard him speak to an audience. He knows several things, and can tell all about them. Here is a sample of the kind of advice he writes for the *Practical Farmer*—every boy should read it and profit by it:

Hold on to your land, friends, if you have some. If you haven't any, it will be a good thing to work for. It is inspiring actually to own even a small piece of land. Mr. G. tells how he traded an old watch, not worth a dollar really, for a little piece of poor land when he was a boy. And then his father said he paid too much for it. But he said he went out on that land, poor as it was, after it was deeded to him, and it thrilled him thru and thru to think he owned the ground he stood on, away down to the center of the earth, away up to the stars. Birds were sitting on the branches of the trees, and singing—his trees and his branches, and their songs never sounded so sweetly to him before. It is a

valuable ambition for every young man, every boy, to own a piece of land, if no more than an acre. Save your money, boys, toward buying some land where you can make a little Garden of Eden, your home when you get older. Perhaps it would be well to put your money in a good savings bank, and let it accumulate until the right time comes for investing it. If you loved the country, with its pure air and sunshine, and quiet and independence, as much as the writer does, you would never pay one cent for tobacco or liquor, but would save everything possible to be used in getting a country home for your best girl and yourself. I hardly ever talk with a business man in town without finding out that he means to get a farm to live on in his old age. Many men working on a salary have said that, as soon as they could pay for a good farm they intended to change their business. Most men love the country, in summer at least; and in many sections now it is easy to live on the farm and get into a large place by electric car readily. Thus, one can live in the best place and have many of the advantages of town within his reach.

THE REFORMED SPELLING used in the American Bee Journal seems to be gaining a foothold among its readers. Here is what Dr. Miller wrote us last week:

I wish to remark that I am surprised at the effect the reformed spelling is having. I am surprised to see so many who send questions using it.
C. C. MILLER.

We have often noticed that those who write to us are rapidly falling into line, and are naturally beginning to write their words as they read and see them printed in the American Bee Journal. It is strong evidence that the spelling of the whole English language could be reformed in a very few years if all publications would unite for its success. But we are willing to be among the leaders, and let the rest follow when they get ready to do so.

LITTLE MISS ETHEL ACKLIN was quite a favorite at the late convention, with her songs accompanied on the piano by herself. Her picture graces a page in *Gleanings in Bee-Culture*. She is as winsome as can be, even fascinating Dr. Mason, and tempting him to race around in the hall during intermission. Did he hear some one say that it doesn't take very much in the feminine line to fascinate the Doctor? Well, that may be true; but the jovial Doctor and Miss Ethel were all right, and helped much to make the great convention a completer success than it otherwise would have been.

WHILE STENOG, of *Gleanings in Bee-Culture*, may sometimes seem a little exacting in his criticisms, he is nevertheless a good critic in the true sense of the word, and likes to mention the good as well as the bad. Here is his estimate of the report of the Chicago convention now running in these columns:

The prominent feature of the "Old Reliable" just now is the report of the late Chicago convention. This is doubtless the best report of the best convention the bee-keepers of this country ever had. The report alone is worth all the paper costs for a year.

MR. C. A. HATCH, of Richland Co., Wis., writing us Oct. 29th, said:

"There has been more than the usual amount of feeding necessary this fall to prepare bees for the winter. I had plenty of honey in the combs for mine, but one bee-keeper reports feeding 3,000 pounds of sugar for winter stores."

Convention Proceedings.

Report of the Proceedings of the 31st Annual Convention of the National Bee-Keepers' Association, held at Chicago, Ill., Aug. 28, 29 and 30, 1900.

BY DR. A. B. MASON, SEC.

(Continued from page 694.)

A. V. Bishop—I came here this afternoon to attend your exercises and to hear the discussion from my friend and colleague, Mr. Burnett, on the trials of commission merchants. I am also in that class of business myself, and I was thinking as he spoke about ignorance, that there is another sister who always goes along with Ignorance, and that is Superstition; in this case it may be Suspicion. We stand in a place where we are suspicioned by our shippers, and they expect we are going to be like the firm down in Buffalo some years ago, which consisted of I. Catchem and U. Cheatem. But allow me to say in this presence that commission merchants are, as a rule, good men, very much like yourselves, that we do have a conscience, and that we do purpose to do about the fair thing, or else we would not do anything a great while. Mr. Burnett referred to a shipper of 1876. I have had shippers who started over 30 years ago, and they are alive now, and they are not afraid to ship some more. The trials of the commission merchant lie along the way of the fact that the shippers do not understand what the commission merchant has to do. We want to take a case of honey, for instance, and present to our patrons. He says, "Is that honey all right?" I say, "Yes, sir, the man that shipt that honey puts as good sections in the front of the case as he does in the back of the case, and just as good in the back of the case as he does in the front of the case." He says, "I will take that if you know that is true." But we open the case of honey and we find in the center some poor sections; then we find in the back, where they don't expect you will ever go, some very poor. That is one of the trials which we have in selling honey; and it is very desirable that the shipper of honey should treat the commission merchant fairly, that he may stand up and defend his patron, and that he will also supply his customer so he will be satisfied. We stand, as it were, between two fires. We don't want to get burned on your side or on the side of our customer, because we simply serve the interests of both. We desire to do that, and to be treated fairly. If we ship honey to a man, that man expects to get a fair return, and will get a fair return considering the quality. We are supposed to know what the market demands and the difference between white and black, and the difference between No. 1, 2 and 3, and we get as near to the value as circumstances will permit. We desire to have your confidence; we desire to build on that basis, because a man stands then as a reciprocal law, and it is the only way to prosper, and we will prosper if we do that. Men ship honey to market and expect the next day to get a return and get full value; that can not always happen. Honey is a luxury, and a very desirable thing. I like to have it on my table every day in the year. I love to smell it because it is very sweet. We want a good quality, and then we can obtain a good price. If it is poor quality you can not expect to get as good return as if it is first quality. The trouble always comes from a man who sends an inferior article. If there is a shipper on earth who knows what No. 1 honey is, and puts it up in No. 1 style, he knows very close what he is going to get. A man who ships an inferior article and expects to get a good price is the man who finds fault—he is the one who says he is treated unfairly. That is one of the trials we have to meet. I thank you for listening, and I appreciate this presence, and I hope all here will remember that a commission merchant has his trials, and you must help him to obtain the good prices by sending a good article.

Mr. Hatch—I would like to ask Mr. Bishop what kind of a case he prefers to have honey in, what size and what style, 12-pound, 24-pound, or 48-pound.

Mr. Bishop—In answer to that I would say a one-story case is preferable to two-stories; a 12 or 24 section-case is desirable in our markets. I believe the one-story case is

shipt with less breakage than the two-story case, and when honey is commanding the price it is now, it is better to have a good proportion in small cases. Many times a dealer will buy a small case when he will not buy a large one. I find the small cases hold a lot, and there is less breakage, it is very easily inspected, and, if found to be all right, it sells very readily.

Mr. Hatch—Does Mr. Burnett agree with that?

Mr. Burnett—Yes.

Dr. Mason—Mr. Burnett says the trials of commission men are the result of ignorance—ignorance of whom—commission men? I have found the trials of the commission men have been largely the result of the ignorance of the commission men of the men they are having to deal with. I have made collections in several instances in the name of the Association, from commission men that were not acquainted with this Association. As soon as they became acquainted with it they were ready to "pony up" the cash. I am going to report one case. He buys and sells honey, and has been for two years trying *not* to settle a bill with a member of this Association, and this year we are going to expose him; it will come out in my report to the Association. He will not get any more honey from any member of this Association, or anybody we can influence. His name is H. P. Robie, editor, and, I believe, proprietor, of the Successful Farmer, Sioux Falls, S. D.

R. L. Taylor—I would like to ask Mr. Burnett and Mr. Bishop what advantage there is in non-drip cases.

Mr. Burnett—A non-drip case, I think, is quite an advantage, if the inquiry is confined to that case. It is a great injury to a nice shipment of honey to have one case injured and smear a half dozen or more of the others. There is some ignorance about managing those non-drip cases. If the party putting the honey in the non-drip case does not fasten the strips in the bottom of the case so as to keep them in their proper place, they are really a detriment to the honey. The sections get out of place and get damaged in that way. When the strips are properly put in their place, and the paper properly arranged, I certainly recommend the non-drip case.

Mr. Bishop—I agree heartily with what has been said, and the cause of the advantage is when these pieces are fastened they hold the drip from the sections and prevent it running out and smearing other cases, unless there is so much breakage as to run over the strips. If there is only a little drip, the lower portions of the sections do not get smeared with the honey, and when they come out they are clean. It is an advantage, decidedly so.

ELECTION OF THE EXECUTIVE COMMITTEE.

Pres. Root—If there is nothing further, we have come to the special order of business, the election of officers of the annual meeting, or executive committee. The other officers are elected in the beginning of the year thru the work of Mr. Secor. We will now listen to nominations for president.

Mr. Kretchmer—I nominate Mr. E. R. Root for president.

Mr. Abbott—I second the nomination. We have had a most excellent meeting, and a most excellent chairman, and I do not think that we have any disposition to make any change or put anybody else in nomination. The fact that he has been able to get such men as Mr. Burnett on the program by such a shrewd scheme as he has practiced, is an indication to me that he is the very man for the occasion; and this meeting having proven so very successful under his direction, I think it is no more than fair to the Association that we work him a little longer. He won't want to, but he will. He will kick about it and think somebody else ought to have the honor—don't pay any attention to him; it will all come right in time, and I second the nomination most heartily.

Secretary Mason—For fear Mr. Root may be a little slow in appointing tellers to count on his side, I am going to take the liberty of appointing tellers. We have no vice-president here, so I suppose I will have to do this work.

Pres. Root—We have not heard any other nominations yet.

Dr. Mason—We are not going to have any other. I will appoint Mr. Moore, Mr. York, and Mr. Green as tellers. If there are any other nominations to be made we will listen to them after we have voted.

Mr. Smith—I move the rules be suspended, and that the secretary be instructed to cast the vote of the Association for Mr. Root for president.

The motion was seconded and carried, and Dr. Mason cast the vote for Mr. Root for president for 1901.

Pres. Root—I was not expecting anything of this kind. I had in mind two or three other gentlemen who would be most worthy of your honor. I had an intention of doing something of this kind, and thought I would be able to do it, but when I get such men as Messrs. Abbott and Mason against me, it is pretty hard work.

Dr. Mason—We want you to understand you are not running this Association entirely.

Pres. Root—I want to thank you all for this exhibition of confidence. I am no speech-maker. If I wanted to make a really good, all-around speech I would call on Dr. Mason and Mr. Abbott, and a few of these other friends. We will now listen to nominations for vice-president.

Dr. Mason—I would like to nominate Mr. R. C. Aikin, of Colorado.

The nomination was seconded, and on motion the rules were suspended and the secretary instructed to cast the vote of the Association in favor of Mr. Aikin for vice-president. □ Dr. Mason—I don't want anybody to get the impression that I am trying to run this convention, but I do want to nominate Mr. Moore for secretary.

Mr. Moore—I withdraw absolutely. I could not take it under any circumstances. I move that the rules be suspended, and that Pres. Root be instructed to cast the ballot for Dr. Mason for secretary.

The motion of Mr. Moore prevailed, and Pres. Root cast the ballot for Dr. Mason as secretary.

Dr. Mason—I want to say in regard to the work that has been done this year, you are largely indebted to Pres. Root for the success of this meeting. I never had so much trouble with a president before in getting up a program as I have had with him; it was trouble, trouble, all the time. I could do hardly anything with him; he was bound to have his own way. He has had it, but I have agreed with him every time; but he has worked faithfully; he has spent time and money; he has not spared himself work and trouble. And I want to say another thing, we owe the Chicago Bee-Keepers' Association a great, big debt of gratitude for the way they have treated us. That will come out in the way of resolutions. These nice badges they presented to us free of expense. You know they are somewhat expensive. We have appreciated this, I am sure. Another thing, we have here sample copies of the American Bee Journal, the Bee-Keepers' Review, the American Bee-Keeper, and Gleanings in Bee-Culture—they are here for you to take with you; take them home and read them, because each and every one of them has some good things in it.

Pres. Root—Do you wish to make a motion or offer a resolution?

Dr. Mason—No, that will come in later.

TRIALS OF THE COMMISSION MERCHANT (CONTINUED).

Pres. Root—I was going to say we had to chop off the discussion we had a little while ago right in the midst of the time it was most interesting, and Mr. Hatch suggested he would like to ask the commission men some more questions. If it is the pleasure of the convention I will turn it over to Mr. Hatch and tell him to "fire away." Silence gives consent. Mr. Hatch will put more questions.

Mr. Hatch—it is not often that you can get two commission men like Mr. Burnett and Mr. Bishop where we can question them. We have one bone of contention, and that is, What is the best package for shipping extracted honey? Now that we have these two commission men here—and they probably handle the biggest part of the crop of this audience—if we can have their opinion on this question as to which is the better, cans or kegs for extracted honey, it will be dollars and cents in our pocket. I would like to have them give their opinion.

Mr. Moore—This matter will come up on Thursday afternoon in Mr. York's paper, and it seems to me we might pass it over to be discussed under that paper.

Mr. Hatch—These men won't be here then, in all probability; we want their opinion now. Mr. York's opinion is all right.

Dr. Mason—Mr. York may want to re-write his paper after he hears what they have to say!

Mr. Burnett—I am very much indebted to my fellow merchant for the kind manner in which he has come to my support this afternoon, and as I have pride in all these things—and especially as this is my home—I desire to tender the opening address to Mr. Bishop, and I ask the president to ask him to make the opening address on this very important matter.

(Continued next week.)

Contributed Articles.

One of the Borers—A Bee-Killer—Swarming.

BY PROF. A. J. COOK.

UNDER a separate cover, in a little box, I send you a singular insect which I captured in the act of working its ovipositor in the seams of a water-cask between the staves. The cask is kept standing near my well. If you will kindly tell the American Bee Journal about it you will greatly oblige me.—A. R. SEAMAN, Pennsylvania.

ANSWER.—The insect came safely, tho' it was a wonder that it did so, as the slight pasteboard box was crushed as flat as a griddle-cake. I know the insect well, as I have seen and taken many in Michigan, and some of the same genus here. This one—Tremex columba—is very common in Michigan, and is a borer. It is a Hymenopteron, and so belongs to the same order as do our pets of the hive. The bees, however, are the highest of the order, while these "horntails," as they are called, are the very lowest. They are very large, often more than one and one-half inches long, are a smoky-brown in hue, with an abdomen whose black is lined with yellow after the fashion of many wasps. Very likely this color arose, thru natural selection, to mimic bee and wasp so these would be past by a ravenous bird in quest of savory insect. The bird has learned to respect wasp and bee because of previous experience, and has now a wholesome dread of any insect in stripes. Thus our horntail may thank his ringed dress for escape from many a bird banquet.

At the tip of the body is the large ovipositor, referred to by Mr. Seaman. This is triple in its make up, like that of the bee. It, however, can not sting. It uses this to bore into wood, as this is one of the great family of borers, and the larvæ do very much harm by thus boring into trees. They often bore into the hardest, like the maple, to find a safe place to lay their eggs. As they do this in the bright sunlight, and are often a long time doing it, we see that they would be greatly exposed were they not guarded by their stripes.

I say that maple is a common tree for them to bore. I have given a fine picture of this pigeon Tremex, as it is often called in my "Maple Sugar and the Sugar-Bush." It often gets its large auger in so far and tight that it can not get out. I have caught them in this dilemma, and one now is in the museum of the Michigan Agricultural College that I captured thus fastened, and he, or she, I should say, now is pinned with a chip of the wood where it was impaled, if that is a proper way to state it. Very likely it gets so weary boring in the hard wood that it is too weary to extricate its auger.

The Tremex is not very common, or else it would work great harm in the timber of our forests. They work on not only maple, but beech as well. While, as I have shown, they are safe largely from the birds, they are not so from a large, fine Ichneumon fly. This great fly, longer even than the horntail, and with an ovipositor three inches long, finds the place of the boring larval horntail, and bores in and lays the fatal egg—fatal to the latter. These also get caught, as I have frequently seen them and taken them apparently fixt to the wood where they were boring for the Tremex. Isn't it curious that they can tell just where the borer is, tho' the latter is deep in hardest wood? They doubtless have sense-organs that we could not begin to equal.

THE PHYMATA OR BEE-KILLER.

The other day some goldenrod came to me in a box, while I was busy with my large laboratory class. I opened it enough to see what it was, and to read a word in a note that an insect was in the flower of the plant, and thus hid could kill bees which it was quick to capture and kill. I did not see where the letter, which was lost, or box came from, nor who sent it, but I am of the opinion that it came from the American Bee Journal office.

The insect was one of the bee-killers, Phymata erosa. It has strong, jaw-like front legs. By use of these it can grasp and hold even the strong, stout bee until it sucks its blood and life from it. It is strange that the Phymata is colored like the flowers, so it is hid in its own color, and, like the horntail, it is saved or helped by its strange mim-

icry. This law of mimicry is a great savior in the lower realm of life. In the horn-tail it keeps the bird away; in the Phymata it hides the foe so that the bee runs into the very jaws of death. The student of insects, indeed of all life, sees countless examples of this mimicry in his quests, and soon comes to regard it as a great factor in the economy of life.

The Phymata is curious in the wonderful development of its leg-jaws, which I have figured in detail in my "Bee-Keepers' Guide." On pages 419-21 will be found full drawings and description of the structure of the insect and its work.

SWARMING CRITICISMS.

Mr. Editor, why can we not all be as kindly and sweet in our criticisms as is Mr. Hasty? I will tell you why it is—we have not all the same measure of the Christ spirit as he has. Wouldn't it be blessed if we had? Hasty illustrates most perfectly the passage, "Out of the abundance of the heart the mouth speaketh." I wish all hearts had the abundance of kindly feeling and sympathy that is ever shown by our friend. I would like to visit his place; and there is one thing that moves me thus, and that is the man there that every bee-keeper has learned to love.

I, of course, meant famine swarms in speaking of swarming because of no food. Swarms that occur early in the spring—disturbance is surely what sends them off. I still believe it is in other normal cases. We know that bees often prepare the home in advance. This being true, we may believe that they always do, till our good friend, or some other, shows to the contrary.

I have always wondered that the opinion so generally prevails that bees will not cluster without the queen, as that is almost always the case, as I have observed for years. Los Angeles Co., Calif.

Successful Cellar-Wintering of Bees.

BY DANIEL WHITMER.

MY hives are the 8-frame Langstroth, with honey-boards on all, some with wood and others with perforated-zinc boards, and having a super of my own construction for surplus comb honey, altho I use some of the Heddon reversible supers with good success.

I place bricks having two holes in each on all hives, and use small, flat blocks, fitting them in the holes for summer use as sign-blocks. One side of the block is painted, and the other is left the color of the wood, but planed, upon which I make any record necessary in the manipulation of my bees. By the position of the bricks, sign-blocks, and entrance-blocks on the hives, I can see at a glance, no matter what part of the yard I may be in, any colony that has swarmed, any that may be queenless, any that may be weak, and almost anything that needs to be done without opening the hive for investigation.

I pass thru the yard every day in swarming-time to see by the sign-blocks any colony needing internal work of any kind, such as pruning queen-cells, introducing queens to queenless colonies, grafting cells, liberating queens, etc. Of course, I use numbers on the hives, and keep a record on a double slate for each season.

I have catalpa trees in my apiary, which are very profuse bloomers, and do not make as dense a shade as some other trees, but enough so I do not need shade-boards.

My apiary contains 160 colonies, nearly all being pure Italian bees, and are docile and amiable to handle. I have not purchased a queen for 10 years or more, but rely on my own rearing of queens for purity.

The front row of hives to the right in the yard is 1½ rods from my dwelling and bee-cellar, and just north of them the rows of hives run east and west and due north and south. The rows of trees are located the same way, presenting a very attractive appearance to visitors in the summer time.

Under my dwelling, or a part of it, is located my winter repository for the bees. The main part of the house stands with the gable end north, and on the east of this, or to the left, is an addition 14x24 feet, under which I place the bees, on the floor; and on a level with the floor of the main house is our dining-room. In the east end of this addition is a honey-room, made by a partition thru it 10 feet from the east wall, and a door from the dining-room opens into it. In this room I keep comb and extracted honey, as well as doing the extracting, putting sections together, putting foundation in brood-combs and sections, etc. In the partition and in the dining-room there is a chimney, and in the

back of the flue in the honey-room there is a 4-inch hole just opposite the hole in the flue in the dining-room; and in the floor of the honey-room there is also a 4-inch hole with a thimble in it to receive a 4-inch pipe running from 10 inches of the cellar-floor upward, intersecting the hole in the flue in the honey-room, making a ventilator of 12 feet in length from the bottom of the ventilator. I have a funnel-shaped apparatus to assist in drawing out the impurities of the cellar, if any have collected, and it is quite a success, as there is quite a draft when the hand is placed in the mouth of the ventilator.

When the temperature of the cellar gets too low I close the mouth of the ventilator with a stop with springs riveted to it, pressing it against the inside of the pipe. I keep the temperature as near 45 degrees, Fahr., as I can, and, strange to say, it is not a difficult task to do this.

Besides this ventilator, I have two windows in this cellar—one on the south side of the cellar wall, and midway from each corner. This window is under the veranda, the latter being on three brick pillars, hence all open underneath, giving plenty of air to the windows.

Midway in the wall on the east end of the cellar I have another window the same size as the first mentioned, namely, 12x24 inches. These windows lie the long way horizontally with the wall on the outside of the window-frame. I have wire-screen tacks on, such as is used for screen doors and windows. This is for the purpose of keeping bees, flies and varmints out of the cellar, as well as to protect the straw in the ventilating-frame, which I am now going to describe.

This ventilator is composed of a frame made of ½-inch lumber, made to fit exactly the inside of the window-frame, and as large as the window-frame is wide inside, less the jam or rabbet in which the glass window-sash fits. On one side of these ventilating frames I nail strips of wood ½ inch by ¾, then fill and pack snugly with straw or marsh hay. Then on the other side nail the same kind and size strips. These strips of wood keep the straw from falling out of the frames. When I place my bees in the cellar I shove these ventilating frames in the window-frames of the cellar. These frames are a necessity for the very good reason that they keep the cellar dark so the bees will not leave the hives in wintering, and at the same time give sufficient pure air, which is quite satisfactory.

On the inside of the window-frame I have a window-sash containing six lights, three on each side of the sash, giving a dead-air space when the sash is placed in the jam and closed. These windows are used in cold weather to prevent the cellar from getting too cold. The sash is hung on hinges on the upper side, and to the upper jam of the cellar window-frame, so that when I wish to raise the window-sash for ventilation, or for any other cause, all I have to do is to take hold of the lower side of the sash and raise it up, fastening it to the ceiling of the cellar. This gives me perfect control of the interior of the cellar, so far as humidity and temperature are concerned.

My bee-cellar is 24x14 feet, outside measure, 6½ feet deep, is walled with stone from the bottom up, and is 18 inches thick. I would not have any other kind in this locality. The bottom of the cellar is composed of sand and gravel, and is perfectly dry. By the way, I am considering the propriety of cementing the bottom of my cellar, for the only reason that it would be more convenient and satisfactory to sweep the dead bees off the cellar floor, yet I do not know whether it would be for the best. Will some one having experience come to my rescue by informing me about it? I wish to let good enough alone.

I have another building north of the one just described, 11x24 feet, and a cellar under this one also. This cellar runs northward toward the apiary, and is the same depth as the bee-cellar. There is a door opening into it, thru which I carry the bees into the repository. In cold weather I keep this door closed, which is also used as a means of ventilation. Pretty big tube, isn't it (this cellar) thru which to breathe oxygen? But, you see, I like much of it for my pets, and it makes me rest at night.

In the north end of this cellar I have another door with a window in it, also a window on each side, so that I can ventilate as I please, and darken them if I choose.

I have but three steps to get on a level with the bottom of the bee-cellar, as my house is on a hill, and the bottom of the last cellar mentioned opens out in the side-hill. This makes it easy to get into the cellar with the bees, which I carry by means of a rope doubled just long enough so I can place it over my neck and around the opposite side of the hive from me, and under the cleat on the hive ½ inch below the top of

the hive. These cleats are intended for covers or rims to telescope $\frac{1}{2}$ inch over the hive, as well as for hand-holds.

I tier up my bees in the cellar three and four high, if necessary. I place them 8 inches above the cellar bottom, on scantling which are resting on brick, and I do not allow the scantling or hives to touch the walls of the cellar. I have had as high as 247 colonies of bees in this cellar at one time with success, losing none but queenless colonies, which I would just as soon lose as not. For several years I have lost but one or two colonies each year in wintering. Give me good, strong colonies with 20 pounds of honey each, and I can go to sleep at night knowing that my bees are coming thru, tho we may have zero weather for months at a time.

The bottoms of my hives are nailed fast to the body. The hive-entrance is left open $\frac{1}{2}$ x 12 inches. The honey-boards are left on the hives with a quilt or muslin cover well propolized on the boards. They have no upward ventilation, but I am of the opinion that it would be better if there was more room between the frames and bottom of the hive.

I place my bees in the cellar about Nov. 20, and leave them until the forepart of April, or until they can gather from black alder, black willow, and the soft maples.

St. Joseph Co., Ind.

No. 4. Interesting Notes on European Travel.

BY C. P. DADANT.

BEFORE I leave Geneva I must mention the pleasant surprise we had there. We staid but a day, and, in the morning, as I walkt away from the breakfast table, in the Hotel Suisse, I found myself face to face with Mr. J. T. Calvert, the business manager of the A. I. Root Co. I was so much astonisht to find him there that I had to hear his voice before I recognized him. I knew he was in Europe, but thought him far away. He was with the Christian Endeavor people, and they had just completed a tour of Switzerland, while we were beginning ours. As you will readily imagine, we had a good, long talk about Europe, and about the possibility of our meeting again, which we did at Paris, later on.

So we started on our trip thru Switzerland, and the first night was spent at Fribourg, where we were lucky enough to happen on the evening of a concert by the world-renowned organs of their cathedral. I had heard church organs many times before, but none such as these. They are said to be the finest in the world. The church is lighted only sufficiently to allow the visitors to find their way to the seats with a very few dim lights, and in the darkness of that imposing edifice one listens with wonder to music which runs from the frightful sounds of a terrific thunder and wind storm to the sweetest strains of the Alpine horn from the distant mountains. We only spent an hour there, but we were both, my daughter and myself, so entranced with the music that we thought we had been there but half of that time.

The following day saw us at Berne, the capital of the Republic, and we visited the new Federal Palace, saw the parks, paid our compliments to the Bernese bears, and crost a few of the suspension bridges over the Aar River, which winds about the city at the bottom of a deep gorge in the manner which seems to be customary with the Swiss streams. It makes the landscape very picturesque.

From Berne we went to Thun and crost the Lake of Thun on a steamer to Interlaken, with mountains on both sides, and the Jungfrau and its snowy summit in the distance ahead. The town of Interlaken, with the two lakes of Thun and Brienz on either side, with half a dozen inclined-plane railroads ascending high peaks within half an hour's ride in almost any direction, with its fine hotels, and rugged surroundings, seemed to us to be the very center of the tourists' excursions. And there is no lack of tourists anywhere, especially English and Americans.

Well, we took in the trip to the Jungfrau, or rather to the spot that was nearest to the Jungfrau by rail, inclined-plane railroads, and went up beyond the line of the pines where nothing but a little short and velvety grass grows. For a few days bees were entirely forgotten, yet I must say that I found profuse blooms and bees at work upon them, almost as far as the station called Kleine Scheidegg, which is but a mile or two beneath the eternal snows of the peaks, and about 8,000 feet above sea level.

Switzerland is certainly well fitted for bee-keeping, for all of its uplands are pastures, and many of the slopes in the valleys are in meadows composed of different plants which bloom profusely. The mode of agriculture of the

Bernese Alps is very peculiar, and puzzles the traveler who looks for a large number of cattle in a country where everything is meadows. But no cattle are to be seen about the farms at this time. During the winter the cows are kept in the valleys, well stabled in the village barns, and fed on the hay gathered in summer. As soon as spring opens they are put into the hands of a shepherd, who takes them up the hills, and drives them farther and farther up as the snow disappears, so that when summer comes they are all on the cliffs away up above the pines, each cow with a bell, herded, milkt and sheltered among the precipices on the heights just below the snows of the peaks.

In the meantime, the farmers in the valley below harvest two crops of grass from their fields and store it in little sheds—broad-roof "chalets"—built here and there and everywhere, all along the slopes. This hay is fed to the cattle as they come down away from the snows at the approach of winter. It is in this manner that they have solved the problem of removing their crop from often inaccessible fields. So there is an almost perpetual travel with the cattle from the valley to the mountain in the spring, and from the mountain back to the valley in the fall. The short, but thick and tender grass, growing on steep hill-sides, among rocks and bushes, in ditches, and, in fact, in places where a man can hardly hold himself upright without a support, is all cut, cured, and put away, and is said to pay well for the labor involved, altho I am sure that our average American farmer would not think it worth the trouble of harvesting.

Apiaries are numerous, and as the Swiss farmer is very fairly educated, movable-frame hives are much used. Nearly all the honey is extracted, as in France, for the reason that it sells best in that shape.

In most of the Swiss hotels where we stopt during our trip, we were served extracted honey at the breakfast table, the early breakfast usually consisting of milk and coffee with bread, toast and butter. I have since been told that a great deal of adulterated honey is sold under the name of "mellose," but I must say that what I ate at different times seemed to me to be excellent honey, for it had the flavor, the consistency, and the sweetness, of the true article. Their best honey is harvested from esparcet, but they have also a great deal of alfalfa, rape, mustard, and an abundance of fruit-bloom, besides the wild flowers of the meadows that I have mentioned previously.

Our ascent on the inclined-plane railroad to the Jungfrau's new electric road was the pleasantest of our trip. The road follows the windings of the Linth—a precipitous stream formed from the water of the melting snows—to Lauterbrunnen, thence it ascends the edge of a cliff on the left, and from hill to hill reaches Wengern, Scheidegg, where the electric road branches off and goes down again on the opposite side in an irregular circle to Grindelwald and back to Interlaken. When we reach Lauterbrunnen, where we had a 40-minutes stop, I spied a small village thousands of feet over our heads on the right, with a cable road leading to it by an almost straight route. I askt some one the name of that village. "It is Murren," was the reply. I felt rather sorry that we had not decided to go that way, it seemed so high up. But soon after that the train started up the opposite hill, and I was so busy admiring the frightful way in which we were leaving the tall pines like green spots under our feet—as each of the little engines, with its single car of human freight, pusht us up farther and farther—that I forgot all about Murren. When we arrived at Wengern, I saw a few clustered houses away down below us on the opposite hill, and askt again what village that was. "It is Murren." Our ascent had been so rapid that I did not realize till then the dreadful height we had traveled.

Those far-up mountain-peaks, which seem to be lost in the clouds, and entirely remote from civilization, are nevertheless daily visited by thousands of people. The train on which we made the ascent was divided into five sections, each of one car and one locomotive, each section about 200 feet from the next, so that in the windings of the ascent we could easily see one section above us and one below. I calculated that about 200 people were with us at that hour, and as there are three or four trains each day, and hundreds of pedestrians besides, who take great pride in walking every inch of the way, I am satisfied that over a thousand people made this trip the same day that we did. But when the snows are reacht few are the lovers of danger who go farther.

But go up ever so high you will be sure to find the inevitable dealer in picture postal-cards, alpenstocks, and St. Bernard dogs. Everybody gets the postal-card craze, for

every one is desirous of making his friends acquainted with a view of the fine scenery he sees, and altho those photographic views are cold when compared with the reality, they convey some idea of the wonder of those scenes.

Mr. Perry McDowell and His Apiary.

MY beginning in the bee-business was in 1888, when I found and captured a swarm in a tree in the woods, and from this start has grown my apiary, as shown by the accompanying picture.

Besides the hives there will be seen the small trees which furnish shade for the hives, and the two persons are myself and little boy—my only help in the business.

In the 12 years my apiary has grown from the one swarm to 60 nice, healthy colonies, with a yearly output of over 2,500 pounds of honey.

I have also improved my stock by buying queens from the best breeders in the United States, until I now have them to the highest degree of excellence; and from the old oak-tree to the latest improved hives, run especially for comb honey, and as yet I have never been able to supply my home demand for honey at fair prices.

My success with bees has aroused great interest thruout the community, and so visitors at my place are many, all of whom express surprise at my supply of stock, and the honey I handle.

Besides the honey-production, I have been fairly successful the last two years in rearing queens on the "Do little" plan, for myself and neighbors.

During my 12 years' work with bees, I have not lost a single colony by moth, and have won all the premiums offered on honey that I competed for at county fairs.

As shown in the picture, my apiary faces east, and the small trees are fruit-trees.

Mason Co., Ky.

Questions and Answers.

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

[The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.]

Molasses Not Good for Winter Stores.

I have 3 colonies of bees that I have to feed. What is the best feed? How is molasses? Is it as good as sugar? Bees did not do much here the past summer from 15 colo-

Apiary of Mr. Perry McDowell, of Mason Co., Ky.

nies I got only 100 pounds. Sugar is a little too high to buy at 7 cents a pound. I want to feed before it gets cold.

NEW YORK.

ANSWER.—You can feed molasses in the spring late enough so the bees are flying every day, but don't think of feeding it for winter unless you think that's a cheaper way to kill the bees than to brimstone them. It seems a good deal to pay 7 cents a pound for granulated sugar, but it's about the cheapest way to get along, and better than to let the bees die to save a dollar or so per colony. Don't dream of using anything but the best honey or granulated sugar.

Propolis in Water-Tight Cracks.

How do the bees crowd propolis thru between the edges of the sections when they fit together *water-tight*? Don't say you "don't know," for we think you *do* know. Don't forget the trowel theory, or that the propolis may be "partly digested."

PENNSYLVANIA.

ANSWER.—Bees crowd propolis into cracks perhaps not entirely water-tight but certainly very small. I wouldn't like to be too positive about it, but I think they do it with their tongues, when the propolis is warm and thin. By the "trowel theory" I suppose you mean the theory that a bee uses its sting as a trowel for spreading wax. If it can spread wax with its sting, it ought to be able to work propolis in the same way. The trouble is that there is not the slightest proof that the sting is ever used for spreading wax, the whole "trowel theory" being one of the wildest vagaries ever conceived in the brain of man. I think there is no proof that propolis is ever "partly digested," nor is there any need of such belief. On a hot summer day propolis becomes so thin that it is easy to believe a bee's tongue is sufficiently strong to crowd it into a small crack.

Tendency to Balling of Queens.

1. I appeal to you in my trouble, and altho you appear to be nearly omniscient in relation to bee-matters, I fear you will reply, "I don't know." My trouble is, the tendency my bees have to balling their queens.

First, a virgin queen, if in a moderately strong colony, is apt to be balled before she becomes fertile. My fertile queens often disappear, and as I frequently find one in a ball, I infer that that is the way the others went. Sometimes, during the honey-flow, I cage the queens, and liberate them near its close, and encourage breeding to secure a good supply of young bees for winter. On releasing the queens they nearly all disappeared, and by watching I found that they were balled.

I next tried caging the queens with bee-zinc, thinking that as the bees would all the time have free access to the queen they would certainly receive her kindly when released. But, no! I have tried the different plans advised for the introduction of queens—tobacco-smoke, leaving the bees queenless for some time in a box, *a la* Doolittle, etc., but generally to no purpose. I can not unite two weak colonies or allow a number of strange bees to enter a hive, without endangering the queens, no matter how much I smoke them. Some time ago a swarm left the hive, into which I had put them, and went into another hive, and both queens disappeared; they were both fertile.

I have had very good success with bees with this exception, and if you can give me a remedy you will do me a great service.

Never, to my knowledge, have I had but one case of the queen being balled, until 6 years ago, and I never heard of but one person complaining of such experience, and his only related to virgins; and so he put them in very small nuclei—just a handful

of bees with each queen—till they commenced laying. I can save my young queens in that way, but then I can not safely give them strength except by giving them hatching brood, and I do not often have a frame of that without larvæ, which these few bees are unable to nurse.

Heretofore my bees had been blacks and Italians till 6 years ago, and since then I have had a mixture of golden. And the man who had trouble with his virgins also had some golden blood with his. Is it possible that that cross has had anything to do with it?

Unless you have heard of other such cases I fear you will consider me untruthful, and perhaps insane; but I don't know that I can furnish you any "more reliable testimony"—except for you to come and see for yourself.

2. Is it considered that bees that have been reared in a foul-broody colony have less vigor and energy than others?

When I read of using bees for incubators, my daughter suggested that "fowl"-broody bees would be best for that purpose.

WYOMING.

ANSWERS.—1. If a man should tell me that his bees came into his house, took some ropes, and harnessing part of their number moved their hive into a more sheltered location, I would have some doubt as to his veracity or sanity; short of that I could swallow whole almost anything told about bees, so I have no trouble in believing your story.

I wonder if you have told the whole of the story. You don't say what you do when you find a queen balled. Do you just leave the queen to her fate, or do you try to rescue her? I often find a queen balled, and if I try to free her from her tormentors, there is danger she may be treated the worse for it. But when I find a queen balled, I close the hive as quickly as possible, and the next time I get around to the hive the probability is that the queen is all right. This is true whether the queen be a laying one or a virgin. It is probably a very common thing for virgin queens to be balled on returning from a wedding-trip, for the commonness of torn wings points that way, but if the bee-keeper does not interfere they are likely to come out all right.

When a queen is caged, the bees seem to think she is not all right, for if she's all right why doesn't she keep on laying? And so it is not strange that they may have some thought of superseding her?

When giving strange bees to a queen, the chance for peace will be greater if the strange bees are from a queenless colony.

One would hardly think that a certain strain of blood would make a difference about balling queens, but still it is possible.

2. Yes, the likelihood is that bees in a foul-broody colony are weaker for the presence of the disease.

Carpenter-Bees—Presence of Drones.

1. I enclose you two Marechal Niel rose leaves that bees have cut pieces out of and carried off, for what purpose I would like to know.

2. Do the presence of drones in hives at this time denote queenlessness?

ALABAMA.

ANSWERS.—These leaves were not cut by hive-bees, but by carpenter-bees. With powerful and sharp jaws like a pair of scissors, they cut with great rapidity. Then they carry away the pieces and use them to construct a very ingenious nest.

2. The presence of drones is not conclusive proof of queenlessness. Here and there a few drones may be found quite late, and in rare cases they are suffered to remain over winter, notwithstanding the presence of a good queen.

Transferring Bees—Queen-Excluders—Extracting-Frames.

1. When and how would you transfer colonies in hives with odd-size frames into dovetailed hives with Hoffman frames filled with full sheets of foundation? I do not want to increase my number of colonies nor diminish my honey crop.

2. I am thinking of producing extracted honey. I do not like queen-excluders. Would you advise me to tier up and extract from the hive-bodies?

3. Are the shallow extracting-frames better than the full-depth ones?

NORTHERN ILLINOIS.

ANSWERS.—1. If white clover is your main crop, at the beginning of the white clover harvest take away all combs from a colony and give frames of foundation in place. That

will leave the colony in the condition of a swarm, with no thought of swarming, and giving full attention to the honey-crop. Just possibly, however, you might transfer the combs from one frame to another in fruit-bloom, saving the expense of the foundation. If you intend to work for extracted honey, proceed in this way: At the beginning of the harvest, put on the stand a hive filled with frames of foundation, over this a queen-excluder, and over the excluder the hive of brood, bees, etc., making sure that the queen is in the lower story.

2. Better overcome your dislike to queen-excluders. If that's too tough a job, tier up, and extract from those combs that have the most honey and the least brood.

3. Yes, the objection being that they can not be used interchangeably as brood-combs.

Late Dividing—Catnip Seed—Bee Journal Index.

I have 4 colonies of bees that gathered enough for winter, but no surplus. There was no surplus honey in this locality this year.

1. I have one colony of bees with two full brood-chambers—one the regular brood-chamber; I put the other on for honey, and the queen took possession, and now there is brood in both. Can I make two colonies of this? There are too many bees to drive into the one body. I believe there is but one queen. I have the 5-banded Italians.

2. Where can I obtain catnip seed? and at what price?

3. Is there an index to the Bee Journal? KANSAS.

ANSWERS.—1. At this time of year it would be unwise to divide the colony. The colony is in all probability none too strong for good wintering, and when a cold day comes you may be surprised to find into what a small space the bees can pack themselves.

2. For 5 cents you can get a packet of catnip seed from any leading seed-dealer. Watch the advertising columns of the Bee Journal about next February or March for seed offers.

3. A full and very valuable index appears at the close of each volume of this journal.

Value of Having Queens Cleft.

I wrote you some time ago your premium queen was killed, but she is not. I placed the caged queen between the combs for the bees to eat out the candy, and I did not open the hive till 10 days later, at which time the queen was out of the cage and there was no eggs laid but a number of sealed queen-cells, and I at once told you the queen was lost.

But a few weeks ago I sent to Ohio for an Italian queen; on receiving her I wanted to introduce her to this same colony. I opened the hive and found the colony strong in bees, and plenty of brood, and your queen with the cleft wing.

I always thought the new queen destroyed the cells as soon as she got out of the cage.

The queen is a good layer, for she has a strong family, and I will say the cleft wing saved your queen. I am thankful for having it so arranged as to have them cleft. The bees from your queen are one, two, and three banded, and I am well pleased with them. I will try them in 1901 as honey-gatherers. I hope you will excuse my mistake.

IOWA.

ANSWER.—This is another instance of the advantage of having a queen cleft. But for the cleft wing this queen would have been destroyed as an interloper. It also shows that one must not be too hasty in voting a queen absent. Many a time it happens that a new queen does not lay for several days after leaving a cage; in some cases not for a week. Neither is the presence of queen-cells in such cases proof of queenlessness.

"The Hum of the Bees in the Apple-Tree Bloom" is the name of the finest bee-keeper's song—words by Hon. Eugene Secor and music by Dr. C. C. Miller. This is thought by some to be the best bee-song yet written by Mr. Secor and Dr. Miller. It is, indeed, a "hummer." We can furnish a single copy of it postpaid, for 10 cents, or 3 copies for 25 cents. Or, we will mail a half-dozen copies of it for sending us *one new* yearly subscription to the American Bee Journal at \$1.00.

The Premiums offered this week are well worth working for. Look at them.

Langstroth on... The Honey-Bee

Revised by Dadant—1899 Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son.

Each subject is clearly and thoroly explained, so that by following the instructions of this book one cannot fail to be wonderfully helpt on the way to success with bees.

The book we mail for \$1.25, or club it with the American Bee Journal for one year—both for \$1.75; or, we will mail it as a premium for sending us THREE NEW subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

GEORGE W. YORK & CO.

118 Michigan Street, CHICAGO, ILL.

DITTMER'S FOUNDATION

Wholesale and Retail

This foundation is made by an absolutely non-dipping process, thereby producing a perfectly clear and pliable foundation that retains the odor and color of beeswax, and is free from dirt.

Working wax into foundation for cash, a specialty. Write for samples and prices.

A full line of Supplies at the very lowest prices, and in any quantity. Best quality and prompt shipment. Send for large, illustrated catalog.

Wooden Cell-Cups.

As a result of Mr. Doolittle's ingenuity it is quite likely that the bee-keeping world will be provided with a cell-cup, at an early date, which is practically indestructible. By its adoption, the use of cell-protectors will become entirely uncalled for in the queen-rearing apiary. Having queens hatch from holes in a block of wood has something of the sound of a fairy tale; yet this is exactly what Mr. Doolittle has been doing, and we are indebted to him for an account of his experiments in this line, as well as for specimens of the cells from which queens had hatcht.—American Bee-Keeper.

Putting Up Fruit with Honey.

I often read of putting up fruit with honey, but seldom see any reference to what constituted a decided objection to using honey instead of sugar for that purpose, if not done rightly; namely, a strong twang about the product, which, to my taste, is not nearly so agreeable as the taste of fruit put up with sugar. This seems to be owing either to the change of taste which honey undergoes when heated too high, or to strong-tasting honey, or both. But once at Mr. R. D. Willis' house I tasted some peaches put up with honey, which I would not have known had not been put up with sugar, if I had not been told. At one of the Montrose meetings Mrs. Willis told her method. She uses none but the whitest, first-crop alfalfa honey, which has the least twang about it of any honey gathered here; puts a small quantity of it in a shallow pan on the stove, together with a small quantity of peaches, and stirs constantly, removing before the honey is heated enough to alter its flavor, and never using the same honey twice. The idea is to keep from heating the honey all you can, and use only the whitest honey.—F. L. THOMPSON, in Progressive Bee-Keeper.

Honey Your Porridge.

If you have the exceedingly unaristocratic habit of sugaring your porridge, try a little honey on it instead of the sugar some morning. You will find it a great improvement on sugar.—MARTHA'S MANAGEMENT, in Chicago Record.

Outdoor and Indoor Wintering.

The beginner may be at a loss to know which method of wintering may be the right one for him, and it will be a good thing for him if he can fall back upon the experience of others in his region. If he cannot do that, the wise thing is to try both plans and compare results. Even with this he may not be able to come to any definite conclusion until after a term of years, for seasons vary so much that what is

AMERICAN BEE JOURNAL, 118 Mich. St., Chicago, Ill.

best for one winter may not be best for another. If he is without any precedent, a careful study of conditions may help to a decision whether to risk the greater part of his bees out or in. Upon this point here are some wise words from the editor of Gleanings in Bee-Culture :

The beginner will often ask the question whether he shall winter bees indoors or out. The answer to this will depend upon the weather conditions. If one has in his locality cold weather that lasts nearly all winter, with only now and then a day of temperature above the freezing-point, I would recommend by all means indoor wintering; or if the weather conditions are such that there is a month of cold weather ranging from 10° above to 10° below zero, then a warmer spell a little above the thaw-point, followed by 3 or 4 days of weather at that temperature, followed again by freezing weather, such weather continuing clear up till actual springtime, then I would still advise the indoor method. But if, on the other hand, the winters are somewhat open, there being perhaps a month of zero weather, followed by a month of warm open weather, continuing thus thru the winter, the bees should be wintered outdoors in double-walled hives. We may have in our locality a month of real cold weather, but two weeks is about as long as it lasts at a time, when we will have a general breaking-up, a thaw, and perhaps rains. This will last for 3 or 4 weeks, when we will have another cold spell, lasting possibly a month. This kind of weather will continue in alternation till along in April. In such a climate the average beginner will do far better with the outdoor method.

GENERAL ITEMS

Hoping for Better Things.

The bee-business is at rather a low ebb here; last year was the worst one ever known in this locality for bee-keeping, and this year is but little better. But we are not going to give up just yet.

White clover is looking fine, so we hope for better things another year.

J. I. CLARK.

Addison Co., Vt., Oct. 30.

Short Honey Crop.

My bees did fairly well, but most of the bee-keepers in this locality complain of a short honey crop.

I like the American Bee Journal so well that each week I anxiously await its coming. I would not be without it for twice its price. WM. HARTWIG.

St. Croix Co., Wis., Oct. 29.

Japanese Knotweed.

I send a sample of a plant. The flower is on each little spur, and grows out on either side about 3/8 of an inch. It is pure white, and bees work on it more than on any other plant I ever

The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

[THIS CUT IS THE FULL SIZE OF THE KNIFE.]

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a last-time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.10, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00.) We will club the Novelty Knife and the Bee Journal for one year, both for \$1.90.

GEORGE W. YORK & CO., 118 Mich. St., Chicago, Ill.

Please allow about two weeks for your knife order to be filled.

saw. As the plant grows the blossoms continue to come out to the topmost branch. It is not a common plant in this section, and I have the only one I ever saw. It grows with a stout, woody stock, and dies in winter, springing up from the root in early spring. What is it? and how came it to grow in my yard without planting?

F. R. WEBSTER.

Cheshire Co., N. H., Oct. 26.

Prof. C. L. Walton, of the Lake View, Chicago, High School, says:

The specimen is Japanese knotweed, *Polygonum zuccarini*, and belongs to the buckwheat family. It is a native of Japan, and is cultivated in this country as an ornamental plant. In common with many other cultivated flowers it escaped, and is found growing wild in restricted sections on the Atlantic coast. Belonging as it does to the buckwheat family, it furnishes considerable honey, as this seems to be a characteristic of the entire family.

Just how the plant got started in Mr. Webster's garden I can not tell, but being a perennial it might have been planted by a former owner, or the wind or a bird might have carried the seed from a distance and dropt it there.

C. L. WALTON.

Some Experience with Bees.

I started with two colonies in movable-frame hives, and afterward bought two and caught one, and increased to 11 in two years. I bought 3 Italian queens of different breeders, and they are doing fine. My way of introducing them is to make the colony queenless for 3 days, go thru and destroy all cells, remove some brood for empty comb—if necessary, or early in the season—then remove the covering from the queen-cage, and the cork or cardboard over the candy, lay it just over and between two frames, replace the

We Can't Give Away Anything

You pay for what you get in this world. You understand that. But as a business proposition we want you to try our great medicine for Indigestion, Constipation, Biliousness, Sick Headache, Insomnia, "the Blues," and like complaints—

Laxative NERVO-VITAL Tablets

We know you won't buy it, until you know something about it. The best way to get you to know how good it is, is to let you try it. That's what we do. Send Stamp for "Health" booklet, and we will send you a free sample package, that you may try it yourself. We know you will always keep it in the house, if you once try it. What fairer offer could we make? At all Druggists—10 and 25 cents.

Handsome Stick Pin **FREE!**

If, instead of sending for a sample, you send us 25c we will send you "Health" booklet, a 25c box and a handsome gold stick-pin, set with emerald, ruby or pearl, warranted to be worth double the money. Order by number. This is an extra introductory offer. Only one pin to one person. If unsatisfactory, money returned. Send now while the offer is good.

A HANDY TOOL-HOLDER!

Sent by Express, for \$1.50; or with the Bee Journal one year—both for \$2.00.

Every Manufacturer, Miller, Carpenter, Cabinet Maker, Machinist, Wheelwright and Quarryman, Farmer, or any one using a grindstone, should have one of these Tool-Holders. One boy can do the work of two persons, and grind much faster, easier and with perfect accuracy. Will hold any kind of tool, from the smallest chisel to a draw shave or ax. Extra attachment for sharpening scythe blades included in the above price. The work is done without wetting the hands or soiling the clothes, as the water flows from the operator. It can be attached to any size stone for hand or steam power, is always ready for use, nothing to get out of order, and is absolutely worth 100 times its cost.

No farm is well-equipped unless it has a Tool-Holder. Pays for itself in a short time.

How to Use the Holder.

DIRECTIONS.—The Tool is fastened securely in the Holder by a set-screw and can be ground to any desired level by inserting the arm of the Holder into a higher or lower notch of the standard. While turning the crank with the right hand, the left rests on an steady the Holder; the Tool is moved to the right or left across the stone, or examined while grinding, as readily and in the same way as if held in the hands.

For grinding **Round-Edge Tools**, the holes in the standard are used instead of the notches.

The Fannie Field Poultry Pamphlets Cheap.

We will mail you your choice of any of the following 64-page poultry pamphlets at 10 cents each, or all 3 for only 25 cents—while they last:

POULTRY FOR MARKET.—It is written for those who wish to make poultry-raising profitable.

CAPONS AND CAPONIZING.—It shows in clear language and by illustrations all the particulars about caponizing fowls, and thus how to make the most money out of them. Every up-to-date poultry-keeper should have it.

OUR POULTRY DOCTOR, or, Health in the Poultry Yard, and How to Cure Sick Fowls. All about poultry diseases and their cure.

Remember, we mail the above at 10 cents each, or all three for 25 cents; or for \$1.10 we will mail the three pamphlets and credit your subscription to the American Bee Journal for one year. Address,

GEORGE W. YORK & CO.,
118 Michigan Street, CHICAGO, ILL.

quilt, let alone for 6 days, and all is well.

I made a great mistake in taking some bees on shares, and probably if I had taken some bee-paper in time my apiary would have been saved. I noticed after taking them that these bees did not work as briskly as mine, or increase as fast, and when I examined them I found diseased brood. I hardly think it is foul brood, but, if it is, my loss will be somewhere near \$50 or \$60, and that would pay for two or more bee-papers for several years! I take two bee-papers, and if my apiary is wiped out I will continue to take them and start again in the business, as I have a great demand for honey.

We hear reports on the honey crop from Kentucky, Michigan, Illinois and Ohio, but nothing from Indiana—the garden spot of the United States. I think there is honey in Indiana, and I won't give it up just yet. With the poor season I secured about 30 pounds per colony from those that were in a condition to store honey.

RIX L. HASKITT.

Tipton Co., Ind., Oct. 20.

Bees Didn't Do Well.

Bees have not done well in this part of Ohio this season. I had 40 colonies, but 5 of them starved to death, and I had to feed the balance 800 pounds of sugar.

We have had several big rains during the last 5 or 6 weeks, and white clover has come up thick.

NOAH THOMAS.

Darke Co., Ohio, Oct. 26.

Cotton-Bloom Honey.

I am a beginner in the bee-business, and am very anxious to learn all I can of it. I have a number of colonies, and all have done exceedingly well this year, averaging about 50 pounds to the colony. The cotton-plant is our mainstay here for honey, and it is a good one. Our entire section is planted with it, and our bees lay in great stores of honey from the time it begins to bloom until November and December, sometimes. The honey from cotton-bloom is light-colored, very clear, and mild in flavor. It is as clear as glycerine, and the combs are almost as white as snow.

R. P. DAVIES, M.D.

Lamar Co., Texas, Oct. 29.

No Lost Swarms—An Explanation.

For the benefit of all bee-keepers in general, and Mr. Whitney in particular (see page 555), I will tell of a "like occurrence," except that no swarm was lost.

June 27, I clipped a young black queen. Wishing to Italianize this fall, on Aug. 28th I found the queen in the top of a 2-story 8-frame dovetailed hive. Her wings were entirely gone, tho I had only clipped a part on one side. She was very active, and of common black stock. I took her away, and looked thru the combs twice for the other queen which I felt sure they had, because they were much stronger than I expected, had more brood, and were both black and hybrid bees. Sept. 1st I found so many eggs that I hunted till I found a fine, active young queen.

Now I'll explain: Last summer when I realized that my Dr. Miller queen

would be too late for use this season, I got one elsewhere, which arrived June 11th. I also got some experience when I tried to introduce her—the queen was balled, etc. However, success rewarded my perseverance, and soon she was treating us to a "praise service." I had let her loose on a comb, and she stopt several times to pipe. Looking closely we could not see a motion of wings or body while she was piping, but she seemed to be flat on the comb with her head in a cell, and her throat on the edge of it. In a few days a queenless colony was starting cells (part of which were finisht in the young black queen's hive), in the second story, and no excluder on to keep the queen below.

The blacks had built cells of their own which I cut out. June 27th the black queen went up into the top to lay, and my choice cells were destroyed. Then I put capt cells into West cages, till I could prepare nuclei and have ripe cells for them. Some hatcht in less than 16 days, and I lost them, or supposed I had, till I found this young queen. This shows that the young queen was reared in the hive while there was a black laying queen in it all the time.

I now have 40 colonies, mostly with Italian queens mismated, there being few of the pure stock near me, but lots of blacks and hybrids. I workt for increase, so secured no honey this year. The honey crop has been light in this valley for two years.

In closing, let me thank you, Mr. Editor, for the Dr. Miller queen, which came Aug. 6th. Not a bee died in the mails. Some queens have hatcht from this stock. CLARK S. FUGE.

Clackamas Co., Oreg., Oct. 13.

Clumsy and Capricious Spelling.

[Our system of spelling is so irrational that one wonders how it happens that educated men, apparently kind-hearted in other respects, should insist that tender childhood shall continue to be tortured by it. The number, however, of those who are outspoken against the continuation of the atrocity is on the increase, and some day the number will be so great that they will not fail to be heard. Here is a man who speaks in no uncertain tones in that most influential of all dailies, the Chicago Record:—EDITOR.]

EDITOR THE RECORD:—I can offer no adequate explanation of the discreditable fact that college freshmen misspell one out of every eight fairly selected words. It certainly seems to suggest that spelling is neglected or improperly taught in the high schools, as intelligent and systematic drill will certainly enable any one of fair ability to write correctly all words in common use. I have often said, however, and take this occasion to repeat, that the authorized spelling of English words is so clumsy and capricious as to be a national scandal and disgrace, and that the educators and legislators who tolerate such a chaos are far more to blame than the young people who are confused by it. To adopt the rules of spelling recommended by the English and American Philological Associa-

tions would save years of time to scholars, and millions of money to printers and the public. A rational, uniform spelling, a straight road to good speech and writing would be more valuable than a transcontinental railway or a Nicaragua canal or decimal coinage. Why can not we have it?

C. W. PEARSON,
Professor of English, Northwestern University.

Illinois.—The 10th annual convention of the Illinois State Bee-Keepers' Association will be held at the State House at Springfield, on Tuesday and Wednesday, Nov. 20 and 21, 1900. The I.O.O.F. will have their State meeting the same week, and we get the benefit of their rates, going Monday and Tuesday and returning as late as Saturday. Round trip tickets must be obtained at starting point in order to get the benefit of the rates. A good program is expected. Those who wish the full benefit of the meeting will have to be in attendance.

JAS. A. STONE, Sec.
R. R. No. 4, Springfield, Ill.

Colorado.—The Colorado State Bee-Keepers' Convention will be held Nov. 21, 22, and 23, 1900, in Denver. The horticulturists meet at the same time and place. F. RAUCHFUSS, Sec.
Box 378, Denver, Colo.

Dishorning Cattle.—Dairymen and breeders who are competent to speak on the subject are unanimous in their approval of the practice of dishorning, both from the humane and the practical money-making point of view. A great deal depends, however, upon the manner in which the operation is performed. The accom-

panying illustration shows the Webster Convex Dishorner as used in conjunction with the Bisher Stock-Holder. The Convex is one of the simplest, and at the same time most powerful, dishorners made, having a double action, and making a smooth, clean, quick cut, with the least possible pain to the animal. One special advantage is the fact that it is open on one side, so that it hooks onto the horn, being easily put in place and easily removed, if the animal for any reason becomes unmanageable before the cut is made. Mr. Webster, the inventor of this and other instruments used in dishorning, has had unusual success in placing it in the hands of farmers and breeders. The large sale it has had is ample testimony to its value. All western orders are filled from the Chicago store, thus effecting a saving of time and freight, but all correspondence should go to the home office. Send for the illustrated pamphlet on dishorning. Address, George Webster, Christiana, Pa., and please mention the American Bee Journal when writing.

GEORGE W. YORK & CO.,
118 Michigan Street, CHICAGO, ILL.

HONEY AND BEESWAX

MARKET QUOTATIONS.

CHICAGO, Oct. 25.—Fancy white, 16c; No. 1, 14@15c; No. 2, 12@13c; amber, 10@12c; dark, including buckwheat, 9@10c. Extracted, best white, 7½@8c; light ambers, 7@7½c; dark ambers and buckwheat, 6½@6¾c. Beeswax, 24c.

A steady market prevails with all the best grades of honey in good demand.

R. A. BURNETT & Co

KANSAS CITY, Oct. 25.—Fancy white comb, 14@15c; receipts light; amber, 13@14c; dark amber, 9@11c; slow sale. Beeswax, 24@25c; fair demand; light receipts.

W. R. CROMWELL PRODUCE CO.,
Successors to C. C. Clemons & Co.

BUFFALO, Oct. 26.—Fancy honey is just about unobtainable, and not a case noticed in market. Such would sell at probably 20c. Few lots fair to good are selling at 16@18c, and very poor 14@16c. Shortest crop ever heard of. Wax—none coming. For extracted, Buffalo is a poor market.

BATTERSON & Co.

ALBANY, N. Y., Oct. 27.—We quote fancy white, 17@18c; No. 1, 16c; mixt, 15c; buckwheat, 13@14c; amber, 13@14c. Extracted, white, 9@10c; mixt, 8@8½c; dark, 6, 6½@7c.

H. R. WRIGHT.

BOSTON, Oct. 26.—Our market on honey continues strong, with light receipts. Fancy one-pound cartons, 17c; A No. 1, 15@16c; No. 1, 15c; No. 2, 12@13c. Extracted from 7½@8½ cents, according to quality. Beeswax steady at 25@27c.

BLAKE, SCOTT & LEE,

CINCINNATI, Sept. 21.—The demand for fancy comb honey is good and finds ready sale at 16@16½c; No. 1, 15c. The demand for extracted honey at present is slow and offer same by the barrel as follows: White clover, 8½@9c; Southern, 6½@7½c; Florida, 7@8 cents, according to quality. Beeswax, 27c.

The above are MY SELLING PRICES. I do not handle any honey on commission, but pay spot cash on delivery.

C. H. W. WEBER.

NEW YORK, Oct. 19.—During the past two weeks, receipts of comb honey have been quite extensive, several carloads of California and Nevada honey having arrived, and some large shipments of buckwheat, and for the present there is plenty of supply to meet the demand. We quote: Fancy white comb, 15@16c; No. 1, white, 14@14½c; fancy amber, 12½@13c; amber, 11@12c; buckwheat, 10@11c.

There are no new features in regard to extracted honey. The demand is fair at unchanged quotations. Beeswax dull at 27c.

HILDRETH & SEGELKEN.

DETROIT, Oct. 29.—Fancy white comb, 15@16c; No. 1, 13@14c; darker grades, 10½@11c. Extracted, white, 7½@8½c; amber and dark, 5½@6½c. Beeswax, 26@28c.

Market firm for comb honey, but not much call for extracted.

M. H. HUNT & SON.

SAN FRANCISCO, Oct. 17.—White comb, 13@14 cents; amber, 11½@12½c; dark, 8@9c. Extracted, white, 7½@8c; light amber 6¾@7¾c; amber, 5½@6½c. Beeswax, 26@28c.

Stocks of all descriptions are light, and especially is water white scarce, the latter being hardly quotable. Stocks of amber comb are of fair volume for an off year. Former quotations remain in force, with market decidedly firm for all desirable stock.

WANTED—HONEY AND BEESWAX.

We have a tremendous and growing trade in this line, and would like to hear from all who have such goods to sell in any part of the country, with quality, description, and lowest cash price. THOS. C. STANLEY & SON, Fairfield, Ill.

Four Celluloid Queen=Buttons Free

AS A PREMIUM

For sending us ONE NEW SUBSCRIBER to the American Bee Journal for three months with 30 cents, we will mail you FOUR of these pretty buttons for wearing on the coat-lapel. (You can wear one and give the others to the children.) The queen has a golden tinge.

This offer is made only to our present regular subscribers.

NOTE.—One reader writes: "I have every reason to believe that it would be a very good idea for every bee-keeper to wear one (of the buttons) as it will cause people to ask questions about the busy bee, and many a conversation thus started would wind up with the sale of more or less honey; at any rate, it would give the bee-keeper a superior opportunity to enlighten many a person in regard to honey and bees."

Prices of Buttons alone, postpaid: One button, 8 cts.; 2 buttons, 6 cts. each; 5 or more, 5 cts. each. (Stamps taken.) Address,

GEORGE W. YORK & CO., 118 Michigan St., CHICAGO.

AMERICAN

BEE JOURNAL

GEORGE W. YORK,
Editor.

CHICAGO, ILL., NOVEMBER 15, 1900.

FORTIETH YEAR.
No. 46.

WEEKLY

Mr. W. S. Feedback and Apiary, of Nicholas Co., Ky.
[See page 724.]

PUBLISHED WEEKLY BY

GEORGE W. YORK & CO.

118 Michigan St., Chicago, Ill.

Entered at the Post-Office at Chicago as Second-Class Mail-Matter.

IMPORTANT NOTICES:

The Subscription Price of this journal is \$1.00 a year, in the United States, Canada, and Mexico; all other countries in the Postal Union, 50c a year extra for postage. Sample copy free.

The Wrapper-Label Date of this paper indicates the end of the month to which your subscription is paid. For instance, "Dec00" on your label shows that it is paid to the end of December, 1900.

Subscription Receipts—We do not send a receipt for money sent us to pay subscription, but change the date on your wrapper-label, which shows you that the money has been received and duly credited.

Advertising Rates will be given upon application.

Reformed Spelling.—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound. Also some other changes are used.

The Bee-Keeper's Guide

Or, Manual of the Apiary,

—BY—
PROF. A. J. COOK.

460 Pages—16th (1899) Edition—18th Thousand—\$1.25 postpaid.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published to-day. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without THE BEE-KEEPER'S GUIDE.

This 16th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to GIVE AWAY to our present subscribers, for the work of getting NEW subscribers for the American Bee Journal.

Given for TWO New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the two NEW subscribers—simply the Bee Journal for one year:

Send us TWO NEW SUBSCRIBERS to the Bee Journal (with \$2.00), and we will mail you a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both for only \$1.75. But surely anybody can get only TWO NEW SUBSCRIBERS to the Bee Journal for a year, and thus get the book as a premium. Let every body try for it. Will YOU have one?

GEORGE W. YORK & CO.,

— BEST —

Extracted Honey For Sale

ALL IN 60-POUND TIN CANS.

ALFALFA HONEY*****

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

BASSWOOD HONEY*****

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms in Wisconsin. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

Prices of Either Alfalfa or Basswood Honey:

A sample of either, by mail, 8 cents; samples of both, 15 cents—to pay for package and postage. By freight—one 60-pound can, 9½ cents per pound; two cans, 9 cents per pound; four or more cans, 8½ cents per pound. Cash must accompany each order. If ordering two or more cans you can have half of each kind of honey, if you so desire. The cans are boxt. This is all

ABSOLUTELY PURE BEES' HONEY,
The finest of their kinds produced in this country.

Read Dr. Miller's Testimony on Alfalfa Honey:

I've just sampled the honey you sent, and it's prime. Thank you. I feel that I'm something of a heretic, to sell several thousand pounds of honey of my own production and then buy honey of you for my own use. But however loyal one ought to be to the honey of his own region, there's no denying the fact that for use in any kind of hot drink, where one prefers the more wholesome honey to sugar, the very excellent quality of alfalfa honey I have received from you is better suited than the honeys of more market flavor, according to my taste.
C. C. MILLER.
McHenry Co., Ill.

Order the Above Honey and then Sell It.

We would suggest that those bee-keepers who did not produce enough honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.
Address,
GEORGE W. YORK & CO., 118 Michigan St., Chicago, Ill.

Doolittle's Queen-Rearing Book

FREE—For Sending Us TWO New Subscribers for One Year at \$1.00 Each.

Scientific Queen-Rearing,

as practically applied, describes and illustrates a method by which the best Queen-Bees are reared in perfect accord with Nature's ways. It is written for the amateur and veteran in bee-keeping, by Mr. G. M. Doolittle, the leading queen-breeder of the world.

Index to the Chapters of the Book.

Importance of Good Queens; Nature's Way of Rearing Queens; Another of Nature's Way; Old Methods of Rearing Queens; Later Methods of Rearing Queens; New Way of Rearing Queens; Getting the Bees off the Cells; What to do with the Queen-Cells; Queen-Cell Protectors; Nuclei—How to Form; Nuclei—How to Multiply; Bee-Feeders and Bee-Feeding; Securing Good Drones; Introduction of Queens; Introducing Virgin Queens; Keeping a Record of Cells, Queens, Etc.; Queen-Register; Clipping the Queen's Wings; Shipping, Shipping-Cages, Bee-Candy, Etc.; Queens Injured in Shipping; Quality of Bees and Color of Queens; Rearing a Few Queens; Later Experiments in Queen-Rearing; Latest Feats in Queen-Rearing.

Bound in cloth, price \$1.00, postpaid; or we will mail it FREE as a premium for sending us TWO NEW subscribers to the American Bee Journal for one year, at \$1.00 each; or for \$1.60 we will mail the book to any one and credit a year's subscription on the American Bee Journal.

Address,
GEORGE W. YORK & CO. 118 MICHIGAN ST., CHICAGO, ILL.

ESTABLISHED IN 1861

AMERICAN BEE JOURNAL

THE OLDEST BEE-PAPER IN AMERICA

40th YEAR.

CHICAGO, ILL., NOVEMBER 15, 1900.

No. 46.

* Editorial. *

Where the Honey was Produced.—

Editor Root says in *Gleanings in Bee-Culture* that "the great bulk of the honey this year was produced in Colorado and Michigan. A considerable amount was produced in Texas and in some parts of Florida." So far as we are able to learn it seems that the crop is already pretty well cleaned up throuth the country. It is a good thing to have a bare market for the new crop, as prices can then be maintained more easily.

The Pan-American Honey-Exhibit.

—As probably most of our readers know, there is to be held a Pan-American Exposition next year, at Buffalo, N. Y. Judging from the way its managers, and those interested, are taking hold, it will compare very favorably with the World's Fair held in Chicago in 1893.

Mr. O. L. Hershiser has been appointed superintendent of the apiarian exhibit to be made by the State of New York at the Pan-American. It will be to the interest of all bee-keepers living in that State, who have been so fortunate as to secure any honey the past season suitable for exhibit at the Pan-American, to correspond with Mr. Hershiser in order to get the full particulars, so that those who furnish honey will obtain the award their products merit, without expense or loss of any kind to them. Mr. Hershiser's Buffalo address is 1106 D. S. Morgan Bldg.

Mr. Hershiser intends the New York exhibit to be just as fine as he and the bee-keepers of that State can make it. This will not be alone for New York's glory, but for the benefit of apiculture generally.

It is hoped that other States will also make fine apiarian exhibits at the Pan-American, as such displays promote the interests of bee-keepers by increasing the uses and consumption of honey generally, and especially its use as a table food.

We hope that other States will take up the matter so that the industry of bee-keeping will be represented to the extent which its importance merits.

It is just possible that the next meeting of the National Bee-Keepers' Association will be held in Buffalo during the time of the Exposition. This will be practically certain provided the Grand Army does not hold its meeting next year; this latter, we believe, being contingent upon the railroad companies making satisfactory rates to Denver. We have

heard it hinted that if such rates were not allowed there would be no meeting next year of the G. A. R. Personally, we prefer Denver for holding the National convention, as it never has been held so far west as that point, and it is no more than fair that the Pacific Coast bee-keepers, at least once in a lifetime, should have the convention held as near as 1,000 miles. It has often been held in the East, and only recently at Buffalo; but, of course, if our National convention can not accompany the G. A. R., the next best thing is to meet where there is a great exposition, which has as a part of it a large apiarian exhibit.

In all probability it will not be possible to secure as low a rate to Buffalo as the Grand Army usually succeeds in getting for its annual encampments. It is likely, however, that if the G. A. R. does not meet next year, a fairly favorable rate will be secured for the National convention some time during August or September for Buffalo. In the meantime, bee-keepers can only wait until something definite is known as to what the Grand Army will do about its meeting next year.

The Case of Utter vs. Utter, in New York State, is thus referred to in *Gleanings in Bee-Culture* for Nov. 1st:

General Manager Secor is still at work on the case of Utter vs. Utter. The attorneys in the case are Messrs. Baker & Merritt, of Goshen, N. Y., who have been retained to defend the bee-keeper Utter.

In this connection I am pleased to state that the *Rural New-Yorker*, one of the very best, cleanest, and most reliable agricultural papers published in the world, is greatly interested in this case. I have seen a personal letter from the editor of that journal, expressing the hope that bee-keepers would leave no stone unturned in reversing the absurd decision of the justice of the peace before whom the case was originally tried.

I have also been informed that some evidence, very valuable to the bee-keepers, was suppressed by the aforesaid justice. He made much of the testimony of a certain *bee-keeper* who averred that bees could bore holes thru boards, and would therefore puncture fruit! The fruit-grower, Mr. Utter, testified, as I understand, that the bees *stung his trees* and killed them; that they ate up his fruit, etc. Such rank nonsense should be corrected, and I believe it will be by the higher court, where we shall get full justice.

Our readers will remember that this is the case of a peach-grower against a bee-keeper, which we mentioned nearly two months ago. Mr. Secor had written us also that he was taking care of the case in the interest of the members of the National Bee-Keepers' Association. All will be interested in the outcome, which can hardly be otherwise than in favor of the bee-keeper.

Getting Bees to Make Wax.—While on this side of the globe we are urging the

use of foundation so as to save bees the labor and expense of manufacturing wax, in Australia there is considerable talk about the best means to get bees to make as much wax as possible. The constant demand for beeswax there, and the low price of honey (sometimes only 3 cents a pound) are strong factors in the case. While the same conditions do not prevail here, still it may not be out of place to be informed in the matter. The September number of the *Australasian Bee-Keeper* is mainly taken up with the subject. Loyalstone's plan for securing a large quantity of wax is as follows:

Instead of using wire in frames I use a small $\frac{1}{4}$ inch square stick, nailed diagonally, across the middle of the frame. To the top-bar I attach a $\frac{1}{2}$ -inch starter of foundation, nothing to the middle bar, and find the bees build well in these frames, thoroly covering the middle bar, which makes the frame very staunch. At extracting-time, after extracting from these frames, I have a large tub alongside me. I cut the lower half of the comb away lengthwise from the top-bar and the middle bar; and at the end of a big day's extracting I have a fair tub full of comb to melt down. I have taken 11 pounds of wax from one colony in a good season by this system, tho the average runs from 5 to 8 pounds per season. The main thing is to give the bees plenty of clustering-room, and my style of hive suits this. You will always find your best honey-gatherers produce the most wax. You also want a prolific breeder, as the more young bees you have the more wax.

At the swarming period is the time to give the bees plenty of comb to build. Take the honey from them ripe or unripe (unripe honey you can ripen in your honey-tanks), always remove the sealed brood from the brood-chamber, giving empty frames, or frames newly extracted, with half the comb cut away, in their place. During the swarming-period you should overhaul the hives every five days, and take away all fresh comb, giving empty in its place, as this is the time you will get the most wax; and if you do not attend to them properly during this period, it is useless for you to try to run your apiary for wax-production.

Editor Pender says on this same subject:

Alternate a few frames with starters only in every super replaced on the hives during a honey-flow, and cut out these combs after extracting, except about one-quarter of an inch along the top-bar, which is to be left to form a starter, when the frame is replaced in the super. By so doing beautiful wax will be secured from new combs.

Another way, and the one I have adopted, tho it could be combined with the former to greater advantage, and that is, use thick combs in the supers, and shave down the combs to a reasonable depth when uncapping. This method puts rather more honey thru the uncapping-can than is desirable, but with large cans for the cappings no disadvantage is felt. All my extracting-supers have fixed-distance closed-end standing frames, and these are spaced $1\frac{1}{2}$ from center to center, the top and bottom bars are each an inch wide and $\frac{5}{16}$ thick. When uncapping, the comb is sliced down to the edge of the frame, thus giving me a slice off the side-walls of $\frac{3}{4}$ inch from each frame (allowing $\frac{1}{4}$ -inch space be-

tween built combs). Mr. Munday complains that his bees refuse to extend the cells when shaved back. I think the reason is his extracting and brood combs are identical. If he were to use separate extracting-combs, and work his super-combs for deep cells, but little brood will get into his extracting-combs to make the combs "old," and he would always have soft wax-cells, not tough cocoons, for the bees to extend.

Carbolic Acid for Spraying.—It is unwise to spray fruit-trees when in bloom, if for no other reason than that it is a waste, as at that time it does no good, and it is believed that the poison is a damage to the blossoms. Even if there be no spraying until after the blossoms have fallen, it is thought by some that damage may be done to the bees that may lick up the moisture that is on the foliage. As bees refuse to touch sugar syrup that is very slightly flavored with carbolic acid, J. S. Callbreath recommends in *Gleanings in Bee-Culture* that when spraying fruit-trees it will be well to mix carbolic acid with the liquid used.

Tongues and Tubes are acquiring a good deal of prominence nowadays—that is, the tongues of bees and the tubes of red clover blossoms. The editor of *Gleanings in Bee-Culture* is becoming quite enthusiastic over the matter, especially over the prospect of obtaining bees with tongues long enough to work on red clover as it now exists. He gives the following figures:

The approximate length of the tongues of average bees—that is, the reach—is 16-100. The greatest length so far measured is 23-100. Red-clover corolla-tubes vary in length all the way from $\frac{1}{2}$ to $\frac{3}{4}$; and an average of them is about $\frac{1}{4}$ of an inch, or 25-100, deep. The bees of red-clover queens have tongues anywhere from 18-100 to 23-100 long; and we are now striving to get a strain that will have 25-100 length.

The Illinois and Colorado State bee-keepers' conventions will be held next week—the Illinois at Springfield, Tuesday and Wednesday, Nov. 20 and 21; and the Colorado, Wednesday, Thursday, and Friday, at Denver. We expect to be present at the Illinois meeting, and hope to see many of the old as well as new friends there. We trust that both conventions may be well attended, and be profitable and pleasant to all who can be present.

Carniolan Queens having been placed at the head of the list as to prolificness by Mr. Greiner, Mr. Doolittle says in the *American Bee-Keeper*:

They may be the most prolific queens of the races named; but all of my experience with them goes to prove that their prolificness is so used that it counts for less in section honey than any other race of bees with which I am acquainted, unless it be the Syrians. The trouble lies in the fact that the queen does not reach nearly to her height of egg-laying powers till the honey-harvest commences, after which she will spread herself in a most magnificent style. This brings an excessive swarming during the middle or near the close of the honey-harvest, causing nearly all the honey gathered by the few bees on hand at the beginning of the harvest to be used in the rearing of brood, the bees from which are of little value, as the most of them help with the excessive swarming, or become consumers after the honey-harvest is past.

All bee-keepers should understand that prolificness in any queen counts for little or nothing unless this prolificness is used at the right time to produce hosts of bees just in the

right time for the harvest. And it is because the prolificness of Italian queens can be so used to a better advantage than can the prolificness of any other race or variety that I am wedded to the Italians, and not for their white capping of honey, as the reader of Mr. Greiner's article would be led to think. If I have ever said that my "strain of Italian bees will cap their honey as white as the blacks," I must have been dreaming, for the whiteness is in favor of the blacks. But my Italians do cap their honey white enough so that it never has to take second place as to price in the markets of Boston, New York or Philadelphia.

Cessation of Brood-Rearing in the fall, according to an item in *Gleanings in Bee-Culture*, is not always, possibly not often, caused by a cessation of the queen's laying. It is common to find in a hive in the fall eggs and sealed brood, but no unsealed brood. In such case the queen keeps on laying, but the bees cease ministering to the eggs or young larvae. More and more it is coming to be considered that a queen is not a queen, but that the workers hold the reins of government.

Weekly Budget

MR. W. S. FEEBACK AND APIARY are shown on the first page. Mr. F. sent us the following with the picture:

I had about 100 colonies when the picture was taken—very nearly all golden Italians, but a few three-banded Italians. I prefer the golden Italians to any other kind I have ever tried.

This was an off year for honey. There was very little surplus honey here, and what there was is of very poor quality. White clover (which is our main source for surplus) yielded but little.

MESSERS. KITSELMAN BROS., manufacturers of wire fencing, have changed their location from Ridgeville to Muncie, Ind. The reasons for this change are that they desire to get into the gas belt, near the manufacturers of the iron, steel, bolts, etc., used in the construction of their goods, and at the same time improve their shipping facilities. Those of our readers who are customers of Kitzelman Bros. will please note the change in address. This firm is usually found among our advertisers when the fencing season is at hand.

MR. S. P. CULLEY, a well-known bee-keeper and writer on bees, of Higginsville, Mo., was killed Nov. 1st, while on his way to Havana, Cuba, with a car-load of bees. Mr. E. T. Flanagan, of St. Clair Co., Ill., and others, have kindly sent us newspaper clippings about the terrible accident. From the notices we learn the following particulars:

Mr. Culley was ground to pieces beneath the wheels of a freight train at Venice, Mo. When just outside of Venice he was awakened by the conductor, who informed him that the train would soon reach St. Louis. The conductor then went on top of the car for the purpose of switching the train thru the yards. He had scarcely reached the top of the caboose before he felt the car wheels grind thru somebody. He signaled to stop the train, which was done as quickly as possible. Walking back a few feet he found the body of a man, and he recognized the remains of Mr. Culley. It is believed by the trainmen that when the conductor awakened Mr. Culley he, in a half-dozing condition, walked to the front door of

the caboose and fell off between the cars. The conductor thinks the accident could have happened in no other way.

In the pockets of Mr. Culley's vest was found a letter which he had written to his wife since his departure from his home. It informed her of forebodings which he had had during the preceding night, and hoped that she would be doubly guarded about the family during his absence. He said he had a feeling that some misfortune would befall him or his family. The letter contained many endearing terms ascribed to the wife and family, and wound up by hoping again that she would be very careful for her own safety.

Mr. Culley was a recognized authority on bees in the section in which he lived, and his reputation had spread to different parts of the world. Recently he entered into a contract with a firm in the East to take a car-load of bees to Havana, Cuba, and there attempt to cultivate the industry. He was offered a liberal sum to accompany the consignment, and started on his long journey. He leaves a widow and three children.

This is all very sad indeed. How strange are some of the occurrences in life, and how uncertain is life itself.

Mr. Flanagan was engaged by the railroad company to take the car-load of bees on to New Orleans. As Mr. F. is an experienced shipper of bees, doubtless they were delivered all right.

EDITOR HUTCHINSON, of the *Bee-Keepers' Review*, seems to be so unfortunate as to have an annual attack of "rheumatics." This year, with other afflictions, it has interfered with getting out the October issue of his paper, which was just about a month late. Here is his explanation:

Soon after my return from the Chicago convention I was taken down with my annual, autumnal attack of rheumatic fever. Most of the time I was able to sit up, but there were a great many days when I was not able to even answer the mail. Before I was really able to do much work, came the moving from the old house into the new. This was quite a task, as there were the household goods, the office, and the bee-hives, sections, and other bee-keeping supplies to move. We were right in the midst of this work, when there came a telegram announcing the death of my father, who lived in Tuscola County. Altho scarcely able to take the journey, I went to the funeral and returned with apparently no bad effects. At present I am writing with a great variety of things piled up around me. Eventually, however, things will get into their proper places, and the long, hard task of building a house and getting settled in it will be over, and we can all put our shoulders once more to the wheel that runs the *Review*, and get it out on time.

A RECORDER ABOVE.—Politics has no place in this journal, but an item by Stenog, in a rival bee-paper, may be excused for finding a place here on account of the kindly spirit in which it is written, and on account of its closing sentence. Stenog says:

The editor of the *American Bee Journal*, Mr. G. W. York, has been nominated on the Prohibition ticket as Recorder of Deeds of Cook County. In view of the fact that in the neighboring city of Cleveland nearly all, if not all, of the city council are in criminal court for bribery, it seems a pity that such men as Mr. York—men of ability and uncompromising honesty—can not have control of public affairs instead of such men as the slum vote gives us—men who care nothing for office except as a means of plunder. But there's a "Recorder of Deeds" overhead who will make this all right some day.

MR. THOS. CHANTRY, of Clay Co., So. Dak., writing us Nov. 7, said: "We got very little honey this year, and had to feed many colonies for winter."

Convention Proceedings.

Report of the Proceedings of the 31st Annual
Convention of the National Bee-Keepers'
Association, held at Chicago, Ill.,
Aug. 28, 29 and 30, 1900.

BY DR. A. B. MASON, SEC.

(Continued from page 694.)

PACKAGES FOR EXTRACTED HONEY.

Mr. Bishop—I did not come here to make any speech, but I will endeavor to give you my experience—it will take only a short time. The first requisite in selling extracted honey is to have the customer understand that we are presenting to him a pure article; that has more to do with it than any package. The first requisite in the disposition of extracted honey is to establish the fact to our customer that we are showing him, and seek to sell him, a *pure article*. That, I trust, you will all appreciate. The next thing regards the package in which it is contained. My experience has been that a wooden package is the best, largely. It came from the fact that in 60-pound cans, early in the history of extracted honey, there was adulterated honey sold for California honey, or some other far-famed product; hence, there is a prejudice, and prejudice, you know, is a very bad thing to remove from the minds of men. It is a hard matter to disarm prejudice, and they don't forget the fault readily; hence, there is a prejudice in my experience against tin packages holding 60 pounds. However, we have had some of the finest honey in those cans of any honey that was ever brought into market; yet I believe a five-gallon, and ten-gallon, and even 100-pound, or 150 to 200, or 300-pound, package of wood, properly made so it will not leak, is a very desirable package. It is easily handled—you can roll it along the floor, trundle it on your truck, and there is no danger of injuring the package; you can open it if you desire by pulling the bung, and exhibit what it contains. The case which holds cans usually has two; it is heavy, and it is a bigger package. It is not so easily handled; you can't roll it; you have to truck it; if it falls over there is danger of bursting the tin; after a while the tin becomes rusty if the can is kept long enough, or perhaps will spring a leak, and sometimes they break of themselves and the honey runs away. I believe there is more loss in the can than in the wood package. I would recommend wood packages, either kegs or quarter barrels, half barrels and casks, for honey. In handling amber honey, which is sold largely to manufacturers, barrels are very good, and the quantity does not cut so much of a figure with them as it does with the retail trade; if we sell to the retail grocer, or those who want small quantities of honey, they usually like to buy 50, 100, 150, or 200 pounds at a time. I think I can't throw any great light on this matter. This is my experience from handling honey in this manner.

Mr. Burnett—There is a fellow over there who said, "About all that Burnett cares for is to get the honey, provided it is in a package that does not give him any trouble," and I guess that is about so. The question is one that we have thrashed over considerably, and I have noticed in a few years, according to my friend, Dr. Mason, that I have been abandoned, and getting behind the light-house; that it has been a live question in quite a number of gatherings of bee-keepers, and it is certainly an important thing that you get your goods in packages that will take them to the market safely, and where they will not meet with objections that will discount the price. I think that localities have something to do with the kind of package to use. I think that for lower California, the mountainous regions where the honey does not granulate so, some of it not perhaps in years, and the nature of the country, where a package that a man can lift, is desirable, and where the hoops won't get loose because of a long, long dry time, then the 5-gallon or 60-pound tin can, two in a case, is perhaps the most practical one for that purpose that I know of. There are other sections of the country where the honey will granulate in anywhere from 10 to 90 days after its extraction. In some sections of the country they can manufacture their own packages, and manufacture a most excellent package out of wood. I have known of losses after the goods came into

my hands, because the honey was not properly ripened, or in a condition to send to market when the producer sent it. During hot weather it fermented, and the end would blow out of a barrel, for something has to give way; but that holds equally true with the tin can. If the honey isn't ripe when you put it in the tin can, the tin can won't hold it. It will burst the can and burst the case around the can. It will get out under the right conditions. Now, I am of the opinion that hard and fast lines in any cause are not desirable. I do not think that every man, even if he is a member of the same organization or fraternity, ought to wear exactly the same shaped hat or coat, but that there is a necessity for a variety of packages. Furthermore, a barrel, or a wooden package, has been for many years used to market honey in, and people are accustomed to getting it in that shape. I know a great many who argue wholly for the tin can, and say it is a more convenient package. You can take a tin can and put it on a steam heater, or anything of that kind, after it has become candied, and so bring the honey to a liquified state, and it gives you very little bother; and that it is a more convenient package for retail purposes, and that sort of thing. I quite agree with them, and for that purpose, and for that trade, a tin can is necessary; but you may not all know it, and I don't know that I know it myself, but one-half, certainly, in my opinion, of the honey that is produced in the United States is bought by parties who buy large quantities at a time, and are in a position to handle it in large packages. They have the facilities for getting the honey all out of a barrel just as clean as they will out of a tin can, in Wisconsin in particular; and I think that the bias that Mr. Bishop has for the wooden package is that based on his experience largely with the honey produced in Wisconsin. I don't know that anywhere in the country there is a package made that is equal to a package that a member of this convention uses—Mr. Pickard. He tells me it is made of basswood for staves, and oak for heads, and oak hoops; they are preferable to iron hoops; that is my experience. I think that he has told me that he has never yet lost any honey—not a pound—in that kind of package. Now, Mr. Pickard might have lost it in this way: Those who got his honey weighed the barrel after the honey had been in it for a while. I think the package will "drink" anywhere from three to five pounds of honey, and it will keep that weight, so that the gross weight won't have lost anything. If it is kept in a damp place, the gross weight will have gained, there will have been a certain amount of moisture that goes from the outside into these barrels, but I haven't had any trouble with them of any kind, aside from that which I have already stated, of finding it, or rather having had them filled with unripe honey; but we have had cans burst that were new cans in new cases, because the honey expanded in the cans. I think it is well to use the package that you are accustomed to using, providing you find by your experience you do not have to sell it at a discount. Cans in Wisconsin, I think, would cost in the neighborhood of about a cent a pound for the honey they contain; how much does your package cost you a pound, Mr. Pickard?

Mr. Pickard—One holding 350 pounds costs 90 cents.

Mr. Hatch—It cost us $\frac{3}{4}$ cent per pound.

Mr. Burnett—Wouldn't it at that rate cost you over $\frac{1}{3}$ of a cent? If you save $\frac{2}{3}$ of a cent a pound on a package that will sell equally well as another, it is certainly to your interest to use that kind of package; but I do deplore the idea of advising people promiscuously to use a 50-pound can, or a 75-pound can, or 100, or any dimension whatsoever under 1,000, if they haven't the conditions that surround those people in Wisconsin. For instance, in the South they use cypress barrels, and we have a good deal of trouble with those, and I have found generally that it has been because the honey was not thoroughly ripened before being put into packages; but they are a wonderfully good package for what they use them, and most people of that country are familiar with them. The honey will bring as much in that 50-gallon cypress package as it will in tin cans. Of course, in talking in this way I can't meet everybody's special experience with their packages, but if they will ask questions I am sure Mr. Bishop will be able to answer them intelligently, and if he can't, why, I don't know that I can.

Pres. Root—I think there is another commission man present who buys honey outright—Mr. Weber. If he will come forward we will be glad to have his opinion on the question of barrels, kegs, and tin cans.

C. H. W. Weber—I have found, if you want white clover honey sold for table use, it is best to put it into tin cans, while for manufacturing purposes a barrel is cheaper, and

every bit as good, and sells as well. Barrels don't come as high as tin cans, and in some manner are preferable.

Dr. Mason—Why do you prefer tin cans?

Mr. Weber—I buy it any way it comes.

Dr. Mason—Which do you prefer?

Mr. Weber—It wouldn't make any difference to me at all, if it comes in cans or barrels; I take it any way at all. We are prepared to take it out of barrels and sell it in that way, and put it up in glass jars.

Pres. Root—Do you pay any more for it in tin cans?

Mr. Weber—We try to buy in barrels on that account; we want to buy it as cheap as possible.

Mr. Hatch—You like to put it in cans yourself?

Mr. Weber—We don't put it in cans, but in small glass jars, so as to bring a little bit more, if we have to pack it over.

Dr. Mason—Do you sell on commission?

Mr. Weber—No, I buy outright.

A Member—I would like to ask the gentleman if he handles any honey from New York State put in 210-pound white poplar kegs; all kinds of honey.

Mr. Weber—We do not get any light-colored honey from New York. We used to get some buckwheat honey from there, and can use that in barrels just as well as not.

A Member—We almost all use 210-pound kegs.

Mr. Weber—Small packages are more easily handled than big ones.

A Member—Our barrels are made of white poplar, and come from Maine. We have very little trouble with their leaking.

Mr. Weber—Last year we had a shipment from Mississippi—a lot of barrels that were old molasses barrels; the head was out of one, and not a drop of honey left in. We were lucky enough to secure pay for the honey from the railroad company. I would not advise molasses barrels, in general they are very poor; cedar barrels are better.

Mr. Aikin—We did not hear all these gentlemen were talking about, do the best we could. We couldn't get the gist of their talk, and I fear we are stealing some of Mr. York's thunder. We will have to be a little bit careful what we do and say just now until his paper comes; but I would like to ask some questions still further, and get the opinion of these commission men. I would like to ask this question and get an answer from each of them: What portion of the extracted honey passing thru your hands goes to the manufacturer, and what portion for table use? It has a direct bearing on this question of packages—what we are to put our honey in. I don't wish just now to discuss that matter thoroly. I am loaded down heavy on that subject, but I am not going to steal Mr. York's thunder, but try to lay the foundation for something that is to come hereafter. May we have the answer to that question?

Mr. Burnett—As I am likely to be here at some of the other meetings, and my colleague may not be, I would like to have Mr. Bishop answer.

Mr. Bishop—I was trying to think what kind of an answer I would give to that question, and I believe that during the past two or three years the largest proportion of my sales have been to consumers, from the fact that there has been a sort of an organized effort on the part of manufacturers to secure their supplies direct from certain buyers in the country who have bought and re-sold it to them.

Mr. Weber—My last year's experience was that about $\frac{3}{4}$ of the honey which I handled was used by manufacturers, and the balance went into the retail trade. It is awfully hard, these days, to make people believe that honey is pure; they have an idea all the time that it is adulterated; we have to overcome that. For my own part I am going to have signs made, and warrant the honey with a certain sum of money to show them that it is all right. I don't see how we can do it any other way, because they have doubts all the time.

Mr. Aikin—Lest a wrong impression get out, I want to say that my question was intended in no way to reflect upon these gentlemen as dealers in honey, but to get at the real truth of the matter, where our extracted honey goes to, what use it is put to, because, as I said, that has a direct bearing upon the question of how we shall pack it, and without entering into a full discussion of that, I want, as I said, to lay the foundation to get the people to thinking; when Mr. York gets thru we can enlarge still further upon the subject. I hope before the close of the convention to touch these matters indirectly myself, and of course we don't want you to steal all our thunder before we come on the floor with our papers.

Pres. Root—I would explain here that Mr. Weber is located in Cincinnati. A great deal of his honey is South-

ern honey, and dark—that has to go for manufacturers' purposes, that means for bakers' use, principally. The National Biscuit Co. use a great deal of dark Southern honey, and that accounts for his percentage being so different from the percentage of Mr. Bishop, who has white honey.

D. H. Coggs—I would like to make a statement. I was in one of the National Biscuit Company's plants a year or so ago. I went up overhead where they were melting honey, and askt them with regard to putting it into cans or barrels. They took the cans and heated the honey to get it out, but they took a knife to cut around the ends of the can, and took out the bottom of the can, so the can was thrown away; and in a barrel where the honey was candied they knockt the hoops off, cut the honey in chunks and melted it. Where a man uses a keg or barrel, the storage costs only about $\frac{1}{4}$ cent a pound; where we use cans it costs $\frac{3}{4}$ of a cent a pound; we sell just as readily with barrels, or 210-pound kegs, and it is a great labor-saving way. A barrel you can throw down, or roll, or pick up and carry it.

Mr. Aikin—There are three States west of the Mississippi and Missouri rivers that cover a great deal of territory. I would like to ask some of the Eastern people what they are going to do with us when we have to buy their barrels to ship our honey, and ship it back to them and pay \$2.25 a hundred for first-class freight from Denver to Chicago, and 90 cents for fourth-class, which is the class honey goes in. Are we to go to New York or Wisconsin to buy our barrels to put our honey in? There are two or three sides to this question.

Dr. Mason—Go there, if you want to.

Pres. Root—In going thru the country I noticed that the kegs and barrels, especially when I visited Coggs' brothers, are used almost exclusively. In the Western States I see the tin cans are used almost exclusively. In the first place, they can't get the barrels; in the second place, kegs and barrels would not do in that dry climate. I remember looking in Mr. Aikin's apiary, near Denver, and seeing how the barrels had warped and twisted. Anything in the nature of wood held together by hoops could not be used there. Mr. C. A. Hatch has had the same experience.

F. P. White—They get some honey that isn't ripe. What do they do with unripe honey? Do they sell it to put on the table to eat, or to manufacturers for manufacturing purposes?

Mr. Bishop—I am going to tell you a story about extracted honey; it is a living joke on me in our part of the country. I bought 5,000 pounds of honey, and as it came in I listened to it, and there was a good deal of humming about it—no bees in it, but there was a music, and I rapt out one of the bungs to see what might be in there, and up it came, and you know I just caught it in my beard, and I was a sweet looking individual for a few minutes, I assure you. That was the first time. The next year the same party came to me and wanted me to buy his honey, and I heard the same sound. I knew what was there. I was working to get him around to look at the keg, hoping he might get the same thing I got the year before, and I got it again. Well, he told the story all about, and he said, "The strange part of it is, Bishop didn't swear." You know that wouldn't be very nice for a bishop to do [laughter], and I don't think it is either gentlemanly, polite or wise for any man. So much for the moral side. When we get honey of that kind it is a very hard thing to manage, I tell you. You realize that from what I have told you. We put such honey in a cool place, and keep it until cold weather, and sell it the best we can, but we can not always sell it at the highest point, because it has not the quality in it. Sometimes it is almost as good, but it gets into a store, and, before we know, they come back and say, "That honey you gave us isn't right; there is something the matter with it." So I advise you as apiarists to be sure your honey is ripened before you send it to market.

A Member—Mr. Weber, what do you do with thin honey?

Mr. Weber—I do not have any thin honey—don't get any; but if there should be some shipt in such a condition I would not buy it. I expect only good honey, and will buy only good honey.

Mr. White—I produce extracted honey, and my object in finding out what these commission men do with that unripe honey is simply this: If they will sell that to their customers for use on the table as food, it is certainly helping the comb-honey trade, because if people get hold of that kind of honey, they want comb honey, and I don't blame them. I would like to see people put good extracted honey

on the market. If it is white honey it is just as good as comb honey, only it is out of the comb. Let us help the extracted-honey trade as well as the comb-honey trade, and we can do this by putting a good article, and nothing but a good article, on the market.

Mr. Bishop—People will eat extracted honey if they know enough to know when they do get a good article. There is an objection to eating comb because some people feel that wax is not a digestible article, that it is an injurious, indigestible article; but extracted honey is used by many people in the place of butter. It is spread on bread, is good for many uses, and taken among the German people they think as much of good extracted honey as they do of the very best food they have; they believe it is useful for children; they think it cures the croup, and they think it is good for all the family from the least to the greatest.

Mr. Moore—There is no question but what this extracted-honey question is a burning question. From an experience of upwards of 15 years in family trade, I would say I have no doubt but what 95 percent of the honey consumed in this country is extracted honey, and the question of putting it on the market ripened, is this: If they ever get any unripe honey they will never buy any more of you if you sold it to them, or never buy any more of me if I sold it to them. Is it practical to "doctor" up thin honey? We read in the journals of the practice in California of exposing honey in large tanks to the air. Another way is by putting it in a water bath and bringing it up to about 150 degrees, and throwing out the germs of fermentation. I would like to hear from any one who has had experience in artificial ripening of thin honey.

Mr. Hatch—The honey in California, as a rule, does not need any ripening. It is very sweet and nice when it is extracted, that is, if proper precautions are taken by letting at least one-third of the comb become sealed before it is taken out. It is then put in immense tanks that will hold from four to as high as eight tons. The apiaries I work in had two tanks holding eight tons each. They made a cone-shaped strip up from each side of the man-hole about 18 inches across; after the tank is full, it is covered with a cap something like a tight paper cover. It stands at a proper angle to get all the heat of the sun—it gets very hot; if there be any thin honey the thin part of the honey will rise to the top, where it gets the most heat. You must remember that when one of these tanks is full—five feet deep of honey—it takes a great deal of heat to get to the bottom. This layer of thin honey, if there be one, is right at the top, and exposed to the hottest rays, and all evaporates and becomes thick and nice; you don't often see any thin honey come from California or Arizona. In Arizona they have a different method—they tie cheese-cloth over the top of the tank. They also store it in the tanks holding about 1,000 to 1,500 pounds; they tie a large cheese-cloth over the top, which catches all the insects, and let it stand for at least a week, as a rule, and then skim, and put it into cans.

Mr. Kretschmer—I find California isn't the only State using evaporating-tanks for honey. We have made scores of tanks for people this side of the Rocky Mountains two feet deep and eight feet across; the top is covered with cheese-cloth, and it is exposed to the sun to evaporate the moisture out of the honey.

Mr. Burnett—As to honey being ripened before it is put on the market is the most serious question in the whole extracted-honey business; you don't know, to save two pounds of honey, how much you injure the consumption of honey by putting on the market unripe honey; there isn't anything that has limited my sales to the extent of unripe extracted honey.

Mr. France—I would like to ask Mr. Hatch if he has observed, in their artificial ripening, any effect on the flavor of the honey. Is it retained as it is where the bees have ripened it? I have noticed that honey ripened artificially in Wisconsin does not have the same flavor as that ripened in the hive.

Mr. Hatch—You will have to take this second-hand, for I was a stranger in that country, only one year in each place—one in Arizona and one in California—and I made inquiry of the bee-keepers there as to the flavor of the sun-
evaporated honey. They found if the honey was left in the hive until one-third of the comb was sealed over, and then put into these tanks, and let it remain a week, the flavor was still perfect and all right; but I would like to emphasize what Mr. Burnett has said, that the greatest enemy to extracted honey is poor, thin stuff; let it get ripe, and then you have something that the adulterators can not imitate.

Mr. Moore—Here is one point that I want to bring out.

I am satisfied that this ripening in tanks will only work in the West where they have red-hot air; here in the East, where any metals will be covered with rust, I don't believe there is any way of ripening our honey, but to leave it in the hive long enough.

H. W. Funk—I was just going to say what Mr. Moore has said. Our air here is not dry enough. I had a couple hundred pounds of unripe honey last winter. I placed it on top of the furnace in the basement. After being exposed two weeks it did very nicely. I think honey, if exposed to the air longer, will deteriorate in flavor. I think it advisable for us to try some method by which we could thicken our honey by artificial heat; when frost comes it will get thinner instead of thicker, no matter how long you leave it in the hives.

Dr. Mason—We hear considerable about this matter in bee-papers, saying it is advisable to keep honey closed up tight, so it will keep its aroma. Last week I wanted to prepare some things to bring here to exhibit. I went to work opening honey I had bottled up nine years ago; there was nice flavor and nice aroma when I bottled it, but it did not retain its aroma, altho it was kept sealed as tight as bees-wax and corks could seal it. I have other honey that has stood in open cans for the past three years, and it is nice yet. There is a difference in localities, we know that.

Mr. Green—Some have feared that evaporation by hot air would injure the flavor of honey. I keep my honey in a very warm room, heat it up to 100 degrees, or thereabouts; I save the honey which drips from the bottom comb, and when it is exposed to this hot, dry air, 100 degrees or more, sometimes it is improved in flavor. When it gets so thick that you can not pour it or make it drop from a knife, it is the finest honey I ever tasted.

At this point the convention adjourned to have pictures taken, and to meet again at 7:30 p.m.

(Continued next week.)

Contributed Articles.

Wintering Bees, Upward Ventilation, Etc.

BY F. GREINER.

IT would be difficult to bring out anything new in an article on wintering bees. I don't attempt it. However, I have learned that cast-iron rules can not be laid down any more for wintering than for the production of honey. The climate, the location, and many other factors, play an important part, and will have to be taken into consideration. In this latitude and elevation a good cellar insures fair results, but outdoor wintering gives, on the whole, less trouble in several ways, and stronger colonies early.

In a very dry climate perhaps upward ventilation is not essential, but here, with the amount of snow, rain and fog, etc., I consider it very desirable—yes, most important. In a damp cellar upward ventilation will prove a benefit to the bees and combs.

A colony wintering well will show but very few dead bees on the bottom-board at any time, whether wintered indoors or on the summer stands. If the vitality of a colony is at a low state, and the mortality is greater than it should be, dead bees will accumulate under the frames, and, when damp, become moldy, and sometimes a by no means odorless, but a rather disagreeable, mess. A deep, empty space below the frames, and upward ventilation thru a warm quilt or some packing, will be beneficial. For cellar wintering this space below the frames should never be omitted. To provide such I prefer to slip a low rim between the body of the hive and the floor-board. My method is this:

About a week or two before it is time to take the bees to the cellar I go to hive No. 1 with a clean bottom-board, with rim attach, and exchange it for the bottom on that hive. I clean the latter from all little lumps, etc., and fasten a rim to it. I then go to hive No. 2, and proceed in a like manner till all hives are thus gone over.

In the spring, after all colonies are returned to their places in the yard, I follow a similar system in removing the rims. This gives us clean bottom-boards in the fall and also in the spring. Reversible bottom-boards accomplish the same object, but we don't all have them.

Very few bee-keepers make it a practice to reduce the

number of combs in their colonies to so small a number that all combs are protected or covered during the colder part of the year. This being the case, we find the conditions of our colonies on the summer stands at times like this:

"Bees clustered near one side of the hive and occupying about five spaces.

"Stragglers—anywhere from 25 to 100 bees—left in spaces not occupied, and dead.

"Later on these dead bees become moldy; also the comb near and around them." This happens even in colonies of average strength; and the more moisture there is in the hive the worse for the combs and bees. Sometimes parts of the combs become so badly affected as to make them worthless.

The best remedy would be, to reduce the combs of all colonies to that number which they are able to cover during cold winter weather. But to do this involves a great deal of labor—an article which we all wish to economize in as much as possible. Many, therefore, choose the shorter cut, and give upward ventilation thru chaff packing on top, which is a reasonably safe preventive measure against mold.

Some of the best bee-keepers in Germany provide their bees during the winter with a bottle of water. Several different patterns of water-bottles are advertised in the German bee-papers, which are said to work well. I, myself, am down on this bottle business in general. I like to see my town a "dry" town, and I want to keep my bees as "dry" as possible. It is true bees consume some water when rearing brood, and it may be beneficial to give them water inside of the hive during April and May; at other times I can see no need of it whatever. I have thought a number of times before that I would experiment along this line, but when I saw my well-protected colonies doing well, without the bottle, I let well enough alone.

Speaking about well-protected colonies, I want to say that for outdoor wintering packing is very, very necessary to insure good results in this part of the country. The winter-cases offered at the present day, and used without packing, I regard as a very poor excuse. I want three inches of packing all around, and a little more on top. It has also been my experience that the best results in wintering are obtained with a hive made of very thin stuff, and of the most porous wood; this in reference to the inner walls of said hive. Our regular single-walled hives, made of $\frac{7}{8}$ -inch lumber, are not as well adapted for packing as such made of $\frac{1}{4}$ -inch lumber. Basswood lumber for the inner walls has answered the purpose the best for me.

As to the best winter food for bees—well, in practice it is not quite possible to regulate the quality of it. Not until this can be easily accomplished may we expect perfect and uniform results. Generally we are even unable to ascertain whether the food is of a healthy character or not. We can tell honey-dew from buckwheat and other honeys, and we might remove the former, but we can not foretell with any degree of certainty whether the basswood or buckwheat honey of this year will be as safe as that of last year, etc.; and so we are at sea. Extracting all stores and feeding syrup instead would be all right, of course, but such a course is entirely out of the question with large apiaries.

It is therefore my opinion that wintering, on this account, will continue to be a sort of lottery business for some time to come. I would, and should, say, however, that poor winter stores are rather the exception than the rule, and the chances in allowing the gathered stores to remain in the hives do not involve very much risk.

Ontario Co., N. Y.

A Criticism of Queen-Breeders and Queen-Rearing.

BY DR. C. C. MILLER.

MR. EDITOR:—I have received a letter that was sent as a private letter; but as matters of general interest are involved, the writer will perhaps raise no objections to its being answered in this public manner. The letter is as follows:

DR. C. C. MILLER,

Dear Sir:—I have reared three daughters from the first queen sent. They are all partakers of her nature—lay two or more eggs in a cell—and very poor layers, but an improvement on their mother in some respects, tho none of them are fit for any use. I reared them to demonstrate the transmitting potency of the stock. If she could transmit good qualities like she does bad ones, it would be desirable, but you know that the laws of transmission are such that

the good must be very strong and well-fixed if it can lead. The other queen will have to do better another year if she will do to keep; she is not yet as good as the one I killed to make room for her.

I am afraid you queen-breeders have made a very bad mistake in adopting this untested queen-rearing process. About as well go to raising babies with a manikin! Some years ago the Jersey cattle-breeders raised a boom on stock, and bred and sold everything that would register, and have filled the country with a worthless stock. Not one cow in ten is fit to keep for milk, and the nine are not worth much for anything the farmer wants. The queen-breeder is following the same trend—anything that will lay is whirled thru the mail, and if she doesn't turn out right the receiver is to blame! Never the breeder! Yet, I am pleased to note that a few breeders guarantee satisfaction, and are willing to bear their share of responsibility in the matter. But I am sorry to know that many to whom we look—not only for instruction in apiculture, but in morals as well—are willing to allow themselves to get so far behind those who do not set themselves as moral guides. Every bee-keeper should give his influence for improving the general stock of bees. I don't think that any one who sends out queens without a guarantee to suit is doing much to improve the general stock, or cares to.

I don't say that she should be purely mated, but that she should be a well-formed queen, and a good layer. Most bee-keepers would prefer a good hybrid to a poor Italian. Any one who will study thoroly the laws of nature—physiology, biology, etc.—will readily come to the conclusion that many more poor queens than good ones are produced by the queen-stick-cell-royal-jell-egg-in-a-quill process that has been so largely adopted.

Now, Doctor, don't think that I mean you more than others; but you must allow me kindly to say that I am somewhat surprised to find that, instead of crying out against it, you are probably following it. But I believe you are too level-headed and pure-hearted a man to allow infatuation to prevent you from properly considering the matter in due time. Good men will not allow their good to be evil spoken of, any more than their charity to think evil.

Truly yours,

P. M. CORVA, M. D.

Jefferson Co., Ind., Oct. 18.

Within the last two or three years I have done some battling for natural processes in queen-rearing, and have been assailed with some warmth for holding that when a queen is removed from a colony the bees will not be in such haste to rear a successor that they will select a larva too old for a good queen. I believe that in such case, the farmer who knows nothing about scientific queen-rearing, if he leaves the bees entirely to themselves, will have as good a queen as if he had used the latest kinks of the scientific breeder. But if he goes to cutting out all the cells and rearing queens from them, he will be far outstript by the scientific breeder.

Now, however, it seems I must take up the cudgel for the scientific breeder. Please do not understand that I am classing myself as a scientific queen-breeder. I am a practical honey-producer, and during the past summer have sent out a number of queens such as I would rear for myself. I tried to have it distinctly understood that not all of these would prove upon trial to be satisfactory; not all queens can be expected to turn out equally good; and there is the additional chance that a queen may not do well after having been thru the mail. My correspondent receiving a queen that is not satisfactory, assumes that the manner of rearing is at fault, calling it in one place the "queen-stick-cell-royal-jell-egg-in-a-quill process." He says, "I am afraid you queen-breeders have made a very bad mistake in adopting this untested queen-rearing process." The assumption that the process is an "untested" one is hardly warranted. Doolittle's book on queen-rearing appeared in 1889, and a method that has been before the public for 11 years—a method by which thousands upon thousands of good queens have been reared—can hardly be termed an "untested queen-rearing process."

"Any one who will study thoroly the laws of nature, etc., will readily come to the conclusion that many more poor than good queens are produced" by the method mentioned. He might reach such a conclusion, but it would be a wrong conclusion, for the facts are against him. I have tried the plans offered by such men as Doolittle, Alley, Pridgen, etc., and I have found good queens the rule, with poor ones the exception. Hundreds of others can no doubt testify to the same thing.

The statement that one who sends out queens without

a guarantee to suit does not care to do much to improve the general stock, sounds rather strange. And when a hint is given that there is something immoral in the transaction, it sounds still more strange. A queen may be sent out as a tested queen, but the breeder can afford to send her for less money if he sends her out before the testing. And so it happens that an untested queen is sold for less usually than a tested one. A queen may be sent out as warranted, but the breeder can afford to send for a less price without warranting. On the whole, very much the larger part of queens sent out by breeders are untested, and the probability is that in consequence of the larger number and lower price untested queens have done more than tested queens for the improvement of stock in general. But the man who gets a queen with the distinct understanding that she is untested ought not to expect the advantages of a tested or even a warranted queen without paying for them, and if he does, the immorality lies on his side.

McHenry Co., Ill.

Questions and Answers.

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.)

Foul-Broody Hives and Frames.

When foul brood gets to its worse stage can hives and frames be saved successfully by boiling? UTAH.

ANSWER.—Wm. McEvoy says, save the hives, and he's good authority. But he does not advise saving the frames.

Feeding During the Winter Months.

What do you think is the best and cheapest food to feed bees during the winter months? Or will it pay to feed small colonies that swarmed the past summer, that have very little honey now (Oct. 28)? My bees are in good hives and have expensive (?) queens—that is, the old colonies have. Bees in this section stored very little honey, so we will have to feed, and I have been asked to write for advice.

KANSAS.

ANSWER.—As combs of sealed honey seem to be out of the question in your case, the next best thing is some preparation of granulated sugar. Don't think of using any cheaper kind. It is not so good for the bees, and as the granulated is more concentrated, it is considered as cheap as coarser sugar. The very best is none too good for winter stores, altho after bees are flying in the spring they may safely be fed almost anything that is sweet. Unless there should be a very warm spell of weather, it is now rather late to feed syrup, and your safe plan will be to feed the sugar in the form of candy as directed in your text-book.

Bees Affected with Paralysis.

I have a colony of bees that seems to be badly afflicted with paralysis. The queen is one I reared myself last summer. When I lookt last there were a number of dead bees on the bottomboard, and some in the combs as well as numbers outside. With regard to feed and other circumstances, that colony is the same as the others, so I should think the cause is owing to some weakness in the queen. She was not bred from the queen whose colony was troubled with that disease in the spring, but may have been fertilized by a drone from it.

1. Would it be safe to use the combs, etc., for other colonies if, as seems likely, it dies out during the winter? Or if it does not, would it be advisable to unite it with another?

2. In directions for uniting and finding queens, I see it advised to shake off the bees on the entrance-board. Would it not injure a queen if she were to be shaken off onto a board?

3. This has been a poor season for honey, and there was little coming in after July, in consequence of which I

suppose some of my colonies have not been breeding much since then. Towards the end of August I noticed several without brood of any kind, and in some I have not seen any since; in others only a small patch, and only in some that were requeened in August was their brood on 3 or 4 frames. The queens are there all right. Will those colonies be very weak in the spring? Some had honey enough and some I had to feed. If I had fed them slowly would it have been better?

4. I fed syrup two parts by measure of water to three of sugar. Will that candy, or should I have mixt tartaric acid with it? BRITISH COLUMBIA.

ANSWERS.—1. It will probably be safe to use the combs. If the bees seem very badly affected, it might be well to destroy the colony. If only weak, it may be united with another.

2. Such a tumble can certainly do her no good, but it is not at all certain that it does her any serious harm, for thousands of queens have probably been thus treated with no report of harm from it.

3. Bees seem to grow old in proportion to the amount of work they do. A bee hatcht in August which works hard till late in the season can not be expected to stand a severe winter, but if there has been no chance for work since it came into existence, it is practically a young bee and all right for winter. Continued slow feeding after the harvest stopt would have secured later bees.

4. Probably there will be no candying, altho if the feeding was done very rapidly there is a possibility of it. Tartaric acid would be a preventive, but it would be better to omit the acid and feed early equal parts of sugar and water.

Queen Slow in Laying—Oil-Cloth Covering.

1. August 4th I divided a colony, and the queenless division built 10 nice queen-cells, but as they were quite weak I gave them a frame of eggs and brood Aug. 11th; then they destroyed all the queen-cells and built some new ones, but as I never found any queen I gave them another frame of eggs Sept. 7th, and about Sept. 20th I opened the hive and found one cell was hatcht and the others were destroyed. There were plenty of drones in the hive, but the queen never started to lay. Oct. 10th I killed the queen and united the bees with another weak colony. What was the matter?

2. Are bokhara clover and sweet clover the same?

3. What kind of a cushion over the bees would you advise for outdoor wintering? Bee-keepers around here use oil-cloth. Is that preferable? MINNESOTA.

ANSWERS.—1. It is nothing strange that a queen hatcht late in September should be slow about laying, especially in a weak nucleus. Sometimes such a queen will not lay till the following spring. But a queen started in a nucleus late in the season is not likely to be of great value.

2. Yes.

3. The trouble with oil-cloth is that the moisture will condense on it and fall in drops on the bees. The more packing over the oil-cloth the less the danger. But it is better to have burlap or some other material that will allow the moisture to pass thru.

Glucose to Prevent Granulation, Etc.

1. Would it be all right to mix glucose with sugar syrup to prevent the sugar from crystallizing in the combs?

2. Are the Adel bees gentle?

3. Would the tulip tree do well in this part of Kansas? L. H.

ANSWERS.—1. A few years ago glucose was given a pretty thoro trial, and it was decided that no glucose should be brought any where near bees.

2. I think they are.

3. It might, but you can only tell by actual trial.

Belgian Hare Breeding is the title of a pamphlet just published, containing 10 chapters on "Breeding the Belgian Hare." Price, 25 cents, postpaid. It covers the subjects of Breeding, Feeding, Houses and Hutches, Diseases, Methods of Serving for the Table, etc. It is a practical and helpful treatise for the amateur breeder. (See Mr. Schmidt's article on page 680.) For sale at the office of the American Bee Journal. For \$1.10 we will send the Bee Journal for a year and the 32-page pamphlet on "Belgian Hare Breeding."

6 Reasons for Subscribing for Gleanings in Bee-Culture at Once

(1)
Rest of the Year Free.

All new subscriptions received from this date until Jan. 1st, whether on a clubbing offer or for Gleanings only, will receive our Nov. 15th, Dec. 1st and 15th issues free.

(2)
Our Market Reports

are made up with the utmost care. We not only show the prices at which honey is selling in the large cities, but our reports are always up-to-date, and we give you the full addresses of the best buyers.

(3)
Our Contributors

are the best-known writers in Apicultural field. We pay them well to give our readers the results of their long experience and experiments made with new ideas and inventions.

(4)
Our Editors

are visiting frequently the leading apiaries of this country, and present from time to time in Notes of Travel and Editorial Columns sketches of same, with illustrations, bringing our readers, as it were, face to face with the bee-keepers all over the land, as well as their methods and conditions under which they work.

(5)
Important Topics.

As an illustration of determination to serve bee-keepers we cite the matter that has appeared in the last year in our Columns on the new bee-disease—Black Brood—which threatened to wipe out the industry in some sections of the country, and later has been found in all parts of the United States.

(6)
Because

we are preparing a series of articles on Bottling Extracted Honey, and these alone would be worth the subscription price for a year. These will probably appear before Jan. 1st, so send your order at once.

THE "POST" FOUNTAIN PEN.

The very best in the market; regular price \$3, and not obtainable under this price anywhere.

The 6 Cardinal points peculiar to the "Post:"

Self-filling, Self-cleaning,
Simplicity, Durability,
Reliability, No
Leaking.

**GIVEN
ABSOLUTELY
FREE**

For two new subscriptions to Gleanings and your own renewal with \$3;
Or for one new subscription and your own renewal, with \$2.50;
Or your own subscription will be advanced 2 years, and the pen furnished for \$2.50.

In each case all arrears, if any, must be paid in addition, the above offers being for subscriptions fully in advance only. We believe we can say truthfully, without fear of contradiction, that no fountain pen ever put upon the market ever received in so short a time so many unsolicited testimonials from such distinguished men as the POST. The above drawing shows its construction. To fill the POST, all you have to do is to dip the nib into the ink-bottle, draw out the plunger, and the pen is ready for use. Compare this with unscrewing the ordinary style, and refilling with a glass filler that you can not always find when wanted. The self-cleaning feature of the POST, as illustrated, will also commend itself. With most pens, specially prepared ink must be used or they are soon of no use, because they become so gummed up, and it is well nigh impossible to clean them. With the POST you simply dip the nib in water, draw the plunger back and forth like a syringe or squirt-gun, and in less than five seconds it is clean and free for a perfect flow of any ink that may be handy. We will send on request a few of the many testimonials from noted men in various callings who have written merited words of praise for this most valuable invention. We can not offer the pen for sale for less than \$3.00; but by special arrangement we are able to offer it free as a premium with GLEANINGS in any of the following combinations: All arrears, if any, must first be paid at \$1.00 a year. Then for \$3.00 we will send GLEANINGS for one year, or till Jan. 1, 1902, to two new names; for one year to yourself, and send you the pen free. For \$2.50 we will send you the pen and GLEANINGS for 1 year, and to one new subscriber a year; for \$2.50 we will send the pen and GLEANINGS for 2 years. If you have ever been disappointed with a fountain pen we assure you that you will not be with this one.

THE A. I. ROOT COMPANY,

Langstroth on... The Honey-Bee

Revised by Dadant—1899 Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son.

Each subject is clearly and thoroly explained, so that by following the instructions of this book one cannot fail to be wonderfully helpt on the way to success with bees.

The book we mail for \$1.25, or club it with the American Bee Journal for one year—both for \$1.75; or, we will mail it as a premium for sending us **THREE NEW** subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

GEORGE W. YORK & CO.

118 Michigan Street, CHICAGO, ILL.

DITTMER'S FOUNDATION

GENERAL ITEMS

Next Year the Honey-Year.

Nov. 4th my bees were working some on red clover, and also carrying in pollen from a few other plants. This has been another poor season for us, yet my honey-bees put up from 75 to nearly 100 pounds of comb per colony. Everywhere in this locality white clover is well started, and if it holds its own it should make a big crop of honey next year. We get a good crop here about every 4 years. Next year will be our honey-year, according to time.

D. J. BLOCHER.

Stephenson Co., Ill., Nov. 5.

Not Much Honey, but Well Sold.

We did not get very much honey this year. I have sold all of my No. 1 white honey for 14 cents cash, in the home market, while some of the bee-keepers here sold as low as 10 cents, so I can afford to pay up for the Bee Journal and still have some profit left. My bees are in fine shape for winter, and I am looking for a better honey-flow next year. Success to the American Bee Journal.

D. A. HOLEMAN.

Warren Co., Pa., Oct. 30.

A Letter from Mrs. L. Harrison.

We commenced keeping bees by purchasing two colonies of Adam Grimm, of Wisconsin, in 1872. The first year we increased to four, but secured no surplus honey—the colonies had an abundant supply for winter stores—and were strong the following spring.

Since the second season, we have not been one day without honey. Almost every year during the first score of years that we engaged in bee-keeping, honey was so abundant that it was difficult to find a market for it; but during the last 10, there has been but a small amount of surplus stored in this locality. We've never had to feed our bees for winter, and always had a few pounds of surplus. I'm puzzled to know why this lack of nectar. The past season there was abundant bloom from white clover and melilotus, both the white and yellow varieties. The white sweet clover is covered with bloom now (Nov. 5). There has not been sufficient frost to kill tomato-vines. I've never known an autumn when bees did

AMERICAN BEE JOURNAL, 118 Mich. St., Chicago, Ill.

not fill the lower stories of hives, with honey.

Some writers tell of the sweetness of the ground this year—how sweet the corn and beets are. We thought differently, and often spoke of it.

Any one who wants to keep the bees from swarming, can do so by moving them to this locality.

Our bees have not swarmed enough to occupy the hives from winter losses for a decade. When we were kept busy hiving swarms we had plenty of honey—and such honey! The comb was so tender and delicate as to be scarcely discernible.

MRS. L. HARRISON.
Peoria Co., Ill.

"Lost Swarms."

Afterthought, in his guess on page 634, respecting the problem he refers to on page 555, is as wide of the mark as one could well be. This particular colony had been carefully watched, as it was expected to swarm at any time, and an examination was given it just before the owner went in to dinner. The weather had been unpropitious for a day or two, and no swarm had emerged.

Now, my theory is, that the young queen had emerged from the cell some time during this unfavorable weather, but had not, for some reason, met the old queen, and that when the swarm came out, she, as well as the old queen, came out also. The old crippled queen crawled back into the hive, and the young queen went off with the swarm, which "was as easy as rolling off a log."

WM. M. WHITNEY.
Kankakee Co., Ill., Nov. 1.

An Old New Subscriber.

I have been a subscriber to the American Bee Journal before, and only left off because my bees failed to pay expenses. I have now 29 colonies of as nice Italians as you read about. They produced this past season 300 pounds of comb and extracted honey, and I sold \$24 worth at 10 and 12 1/2 cents. Some years we get nothing and often next to nothing. The past sea-

The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

[THIS CUT IS THE FULL SIZE OF THE KNIFE.]

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The holsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a last-time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.10, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00.) We will club the Novelty Knife and the Bee Journal for one year, both for \$1.90.

GEORGE W. YORK & CO., 118 Mich. St., Chicago, Ill.

Please allow about two weeks for your knife order to be filled.

son I began to think of the old American Bee Journal, and concluded to write a postal and see if you were still in the land of the living, and prosperous in "the home of the brave."

I have been keeping bees since 1876, and obtained my first swarm on Whit-sunday of that year, as I was taking a walk. Passing along under a large cherry-tree I heard a large humming overhead, and upon looking up I discovered a large cluster of blacks. To secure the prize was the problem. In half an hour everybody will be going to church, and to be caught running to a very religious neighbor aroused some mental reservations; besides, people would exclaim, "Young was caught violating the sanctity of the Sabbath." But the fugitives must be captured, so I decided. I went to the house and said to my "better half," "Let's knock the inside out of that humming churn that I was swindled in." "Agreed;" and soon the contemptible churn was a fair-looking receptacle for the strangers.

Out to the tree was the next move.

The Best Dishorner.
The easiest on both operator and cow, because it makes the smoothest, quickest cut is the **CONVEX DISHORNER.**

We Can't Give Away Anything

You pay for what you get in this world. You understand that. But as a business proposition we want you to try our great medicine for Indigestion, Constipation, Biliousness, Sick Headache, Insomnia, "the Blues," and like complaints—

Laxative NERVO-VITAL Tablets

We know you won't buy it, until you know something about it. The best way to get you to know how good it is, is to let you try it. That's what we do. Send Stamp for "Health" booklet, and we will send you a free sample package, that you may try it yourself. We know you will always keep it in the house, if you once try it. What fairer offer could we make? At all Druggists—10 and 25 cents.

Handsome Stick Pin **FREE!**

If, instead of sending for a sample, you send us 25c we will send you "Health" booklet, a 25c box and a handsome gold stick-pin, set with emerald, ruby or pearl, warranted to be worth double the money. Order by number. This is an extra introductory offer. Only one pin to one person. If unsatisfactory, money returned. Send now while the offer is good.

MODERN REMEDY COMPANY, KEWANEE, ILLINOIS.

[This company will do exactly as it promises.—Editors.]

A HANDY TOOL-HOLDER!

Sent by Express, for \$1.50; or with the Bee Journal one year—both for \$2.00.

Every Manufacturer, Miller, Carpenter, Cabinet Maker, Machinist, Wheelwright and Quarryman, Farmer, or any one using a grindstone, should have one of these Tool-Holders. One boy can do the work of two persons, and grind much faster, easier and with perfect accuracy. Will hold any kind of tool, from the smallest chisel to a draw shave or ax. Extra attachment for sharpening scythe blades included in the above price. The work is done without wetting the hands or soiling the clothes, as the water flows from the operator. It can be attached to any size stone for hand or steam power, is always ready for use, nothing to get out of order, and is absolutely worth 100 times its cost.

No farm is well-equipped unless it has a Tool-Holder. Pays for itself in a short time.

How to Use the Holder.

DIRECTIONS.—The Tool is fastened securely in the holder by a set-screw and can be ground to any desired level by inserting the arm of the Holder into a higher or lower notch of the standard. While turning the crank with the right hand, the left rests on an steadies the Holder; the Tool is moved to the right or left across the stone, or examined while grinding, as readily and in the same way as if held in the hands.

For grinding Round-Edge Tools, the holes in the standard are used instead of the notches.

and with the aid of a ladder I was soon up and presented my credentials. The limb was soon severed and gently taken to the home which they were to occupy if accepted. With a rush and a hum of delight they soon were established in "headquarters."

The next winter I wanted to be good to them, you know, and took them to the cellar to spend the winter. The next spring I bought 5 colonies of blacks in old gums, transferred them and Italianized the whole lot.

W. R. YOUNG.

Frederick Co., Md., Nov. 2.

How's This for a Crop?

My honey crop this year was 19,258 finisht sections from 142 colonies, and increased to 265 colonies. From my best colony I took off 346 completed sections.

ERWIN WILLIAMS.

Otero Co., Colo., Oct. 23.

Not Much Honey This Year.

Bees in Tulare County did not store very much honey this year. One of my neighbors and myself run 150 colonies for extracted honey, and secured a little over 5 tons. A few miles south of us the bee-men had to feed their bees to tide them over winter.

DAN CLUBB.

Tulare Co., Calif., Nov. 1.

Comb-Honey Management—Clipping Queens.

In running for comb honey in this county we put the supers on early, then, if the bees swarm, hive them on the old stand, turn the old hive around, throw all the flying bees we can in with the new swarm, and lift out the brood-frames and shake nearly all of the bees in front of the new hive. Then, from some other hives we take frames with sealed brood or combs of honey and exchange all the unsealed larva there is in the hive, even if we have to give some to a nucleus, as we don't want anything that needs feeding. Then we take a piece of wire-screen such as is used on doors, and cover over the top of the supers on the new hive. Next we brush all the bees that are on the frames of the old hive in front of the new one, and set the old hive on top of the supers. By not having the entrance very large the bees will generate heat enough to hatch out all the brood. As the bees hatch out we slip some of the old brood-frames down below. Every few days shake all the young bees that have hatcht out down in front. It is well to leave some young bees in the top hive to kill the little ants and protect the honey from the moths.

This method is to let them swarm without increase in colonies, but lots of bees.

The Monette queen-clipping device is not made exactly as it should be, or, in other words, there is too much of it. I used something similar to it many years before it was advertised in the bee-papers. Take off that slide or door on the bottom, and when you want to clip a queen hold the device in your left hand and put it down over her as she runs on the comb, then press down, and this pressure will close the wire at the bottom and make it dark, when the

BEE BOOKS

SENT POSTPAID BY

George W. York & Co. 118 Mich. St. Chicago.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—It is nicely illustrated, contains 160 pages, beautifully printed in the highest style of the art, and bound in cloth, gold-lettered. Price, in cloth, 75 cents; in paper, 50 cents.

Langstroth on the Honey-Bee, revised by Dadant.—This classic in bee-culture has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apiarian library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 520 pages, bound in cloth. Price, \$1.25.

Bee-Keepers' Guide, or Manual of the Apizry, by Prof. A. J. Cook, of the Michigan Agricultural College.—This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 400 pages, bound in cloth and fully illustrated. Price, \$1.25.

Scientific Queen-Rearing, as Practically Applied, by G. M. Doolittle.—A method by which the very best of queen-bees are reared in perfect accord with Nature's way. Bound in cloth and illustrated. Price, \$1.00.

A B C of Bee-Culture, by A. I. Root.—A cyclopedia of 400 pages, describing everything pertaining to the care of the honey-bees. Contains 300 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.20.

Advanced Bee-Culture, Its Methods and Management, by W. Z. Hutchinson.—The author of this work is a practical and entertaining writer. You should read his book; 90 pages, bound in paper, and illustrated. Price, 50 cents.

Rational Bee-Keeping, by Dr. John Dzierzon.—This is a translation of his latest German book on bee-culture. It has 350 pages, bound in paper covers, \$1.00.

Bienen-Kultur, by Thos. G. Newman.—This is a German translation of the principal portion of the book called "Bees and Honey." 100-page pamphlet. Price, 25 cents.

Bienezucht und Honiggewinnung, nach der neuesten methode (German) by J. F. Eggers.—This book gives the latest and most approved methods of bee-keeping in an easy, comprehensive style, with illustrations to suit the subject. 50 pages, board cover. Price, 50 cents.

Bee-Keeping for Beginners, by Dr. J. P. H. Brown, of Georgia.—A practical and condensed treatise on the honey-bee, giving the best modes of management in order to secure the most profit. 110 pages, bound in paper. Price, 50 cts.

Bee-Keeping for Profit, by Dr. G. L. Tinker.—Revised and enlarged. It details the author's "new system, or how to get the largest yields of comb or extracted honey." 80 pages, illustrated. Price, 25 cents.

Apiary Register, by Thomas G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25.

Dr. Howard's Book on Foul Brood.—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cents.

Winter Problem in Bee-Keeping, by G. R. Pierce.—Result of 25 years' experience. 30 cts.

Foul Brood Treatment, by Prof. F. R. Cheeshire.—Its Cause and Prevention. Price, 10 cts.

Foul Brood, by A. R. Kohnke.—Origin, Development and Cure. Price, 10 cents.

Capons and Caponizing, by Dr. Sawyer, Fanny Field, and others.—Illustrated. All about caponizing fowls, and thus how to make the most money in poultry-raising. 64 pages. Price, 20c.

Our Poultry Doctor, or Health in the Poultry Yard and How to Cure Sick Fowls, by Fanny Field.—Everything about Poultry Diseases and their Cure. 64 pages. Price, 20 cents.

Poultry for Market and Poultry for Profit, by Fanny Field.—Tells everything about Poultry Business. 64 pages. Price, 20 cents.

MISTAKES COST MONEY.
You need make no mistake in buying an incubator if you send for our **NEW PREMIER Incubator.** Give it a thorough trial, when satisfied pay us for it. None better made. Took first premium at World's Fair. Also sole makers of Simplicity Incubators. Send 5c. postage for illustrated catalog and "Poultry Helps."
COLUMBIA INCUBATOR CO., 5 Water St., Delaware City, Del.

HONEY AND BEESWAX

MARKET QUOTATIONS.

CHICAGO, Nov. 8.—There is a demand for fancy white comb honey at 16c that takes all of this grade upon arrival; other grades are less active, with No. 1 white at 15c; amber and travel-stained white ranges from 13c-14c, with dark amber and buckwheat comb 10c-12c. Extracted, white, 7½@8c; amber, 7@7½c; dark grades, including buckwheat, 6½@6¼c. Beeswax, 28c.
R. A. BURNETT & Co.

KANSAS CITY, Oct. 25.—Fancy white comb, 14@15c; receipts light; amber, 13@14c; dark amber, 9@11c; slow sale. Beeswax, 24@25c; fair demand; light receipts.

W. R. CROMWELL PRODUCE CO.,
Successors to C. C. Clemons & Co.

BUFFALO, Nov. 8.—The high prices attract increase receipts, but fancy white comb is sustained and active at 17@18c; fair to good, 14@15; buckwheat, etc., 11@12c. Supplies here are moderate. All small lots. Extracted is selling some better. Fancy, 8@9c; common would sell at less. Beeswax, 25@30c. BATTERSON & Co.

ALBANY, N. Y., Nov. 10.—Best white comb, 16@17c; good, 15@16c; mixt, 14@15c; best buckwheat, 13@14c; good, 12@13c. Best white extracted, 9@9½c; mixt, 7½@8½c; buckwheat, 6@6½c.

The honey market holds firm here; receipts light and but little stock on hand.
H. R. WRIGHT.

BOSTON, Nov. 9.—Our market on honey continues strong, with light receipts. Fancy one-pound cartons, 17c; A No. 1, 15@16c; No. 1, 15c; No. 2, 12@13c. Extracted from 7½@8½c, according to quality. Beeswax steady at 25@27c.
BLAKE, SCOTT & LEE.

CINCINNATI, Sept. 21.—The demand for fancy comb honey is good and finds ready sale at 16@16½c; No. 1, 15c. The demand for extracted honey at present is slow and offer same by the barrel as follows: White clover, 8½@9c; Southern, 6½@7c; Florida, 7@8 cents, according to quality. Beeswax, 27c.

The above are MY SELLING PRICES. I do not handle any honey on commission, but pay spot cash on delivery.
C. H. W. WEBER.

NEW YORK, Oct. 19.—During the past two weeks, receipts of comb honey have been quite extensive, several carloads of California and Nevada honey having arrived, and some large shipments of buckwheat, and for the present there is plenty of supply to meet the demand. We quote: Fancy white comb, 15@16c; No. 1, white, 14@14½c; fancy amber, 12½@13c; amber, 11@12c; buckwheat, 10@11c.

There are no new features in regard to extracted honey. The demand is fair at unchanged quotations. Beeswax dull at 27c.
HILDRETH & SEGELKEN.

DETROIT, Oct. 29.—Fancy white comb, 15@16c; No. 1, 13@14c; darker grades, 10½@11c. Extracted, white, 7½@8½c; amber and dark, 5½@6½c. Beeswax, 26@28c.

Market firm for comb honey, but not much call for extracted.
M. H. HUNT & SON.

SAN FRANCISCO, Oct. 31.—White comb, 13@14 cents; amber, 11½@12½c; dark, 8@9c. Extracted, white, 7½@8c; light amber, 6½@7½c; amber, 5½@6½c. Beeswax, 26@28c.

There would be considerable activity in this article if stocks were obtainable in greater quantity at or near the values now ruling. Supplies are too small, however, to admit of much movement. Present offerings are mostly of amber grades and a rather large proportion is comb.

A HONEY MARKET.—Don't think that your crop is too large or too small to interest us. We have bought and sold five carloads already this season, and want more. We pay spot cash. Address, giving quality, quantity and price,
THOS. C. STANLEY & SON, Fairfield, Ill.

Four Celluloid Queen-Buttons Free

AS A PREMIUM

For sending us ONE NEW SUBSCRIBER to the American Bee Journal for three months with 30 cents, we will mail you FOUR of these pretty buttons for wearing on the coat-lapel. (You can wear one and give the others to the children.) The queen has a golden tinge.

This offer is made only to our present regular subscribers.

NOTE.—One reader writes: "I have every reason to believe that it would be a very good idea for every bee-keeper to wear one [of the buttons] as it will cause people to ask questions about the busy bee, and many a conversation thus started would wind up with the sale of more or less honey; at any rate, it would give the bee-keeper a superior opportunity to enlighten many a person in regard to honey and bees."

Prices of Buttons alone, postpaid: One button, 8 cts.; 2 buttons, 6 cts. each; 5 or more, 5 cts. each. (Stamps taken.) Address,

GEORGE W. YORK & CO., 118 Michigan St., CHICAGO.

IMPORTANT NOTICES:

The Subscription Price of this journal is \$1.00 a year, in the United States, Canada, and Mexico; all other countries in the Postal Union, 50c a year extra for postage. Sample copy free.

The Wrapper-Label Date of this paper indicates the end of the month to which your subscription is paid. For instance, "Dec 00" on your label shows that it is paid to the end of December, 1900.

Subscription Receipts—We do not send a receipt for money sent us to pay subscription, but change the date on your wrapper-label, which shows you that the money has been received and duly credited.

Advertising Rates will be given upon application.

Reformed Spelling.—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound. Also some other changes are used.

BEST

Extracted Honey For Sale

ALL IN 60-POUND TIN CANS.

ALFALFA HONEY *****

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough of the Alfalfa extracted.

BASSWOOD HONEY *****

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms in Wisconsin. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

Prices of Either Alfalfa or Basswood Honey:

A sample of either, by mail, 8 cents; samples of both, 15 cents—to pay for package and postage. By freight—one 60-pound can, 9½ cents per pound; two cans, 9 cents per pound; four or more cans, 8½ cents per pound. Cash must accompany each order. If ordering two or more cans you can have half of each kind of honey, if you so desire. The cans are boxt. This is all

ABSOLUTELY PURE BEES' HONEY,

The finest of their kinds produced in this country.

Read Dr. Miller's Testimony on Alfalfa Honey:

I've just sampled the honey you sent, and it's prime. Thank you. I feel that I'm something of a heretic, to sell several thousand pounds of honey of my own production and then buy honey of you for my own use. But however loyal one ought to be to the honey of his own region, there's no denying the fact that for use in any kind of hot drink, where one prefers the more wholesome honey to sugar, the very excellent quality of alfalfa honey I have received from you is better suited than the honeys of more market flavor, according to my taste. C. C. MILLER.

McHenry Co., Ill.

Order the Above Honey and then Sell It.

We would suggest that those bee-keepers who did not produce enough honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

Address,

GEORGE W. YORK & CO., 118 Michigan St., Chicago, Ill.

The Bee-Keeper's Guide

Or, Manual of the Apiary,

—BY—

PROF. A. J. COOK.

460 Pages—16th (1899) Edition—18th Thousand—\$1.25 postpaid.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published to-day. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without THE BEE-KEEPERS' GUIDE.

This 16th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to GIVE AWAY to our present subscribers, for the work of getting NEW subscribers for the American Bee Journal.

Given for TWO New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the two NEW subscribers—simply the Bee Journal for one year:

Send us TWO NEW SUBSCRIBERS to the Bee Journal (with \$2.00), and we will mail you a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both for only \$1.75. But surely anybody can get only TWO NEW SUBSCRIBERS to the Bee Journal for a year, and thus get the book as a premium. Let every body try for it. Will YOU have one?

No. 47.

* Editorial Comments. *

Moving Bees 1,100 Miles in November is reported by John D. Bixby in the Bee-Keepers' Review. The loading on cars began Nov. 18, the weather was mild, freezing only at night, and the bees were settled in their new place after 11 days, altho only $4\frac{1}{2}$ days on the railroad. The loss in stores and bees was heavy, most colonies having a pint to a quart of dead bees on the bottom-board. But, he thinks these were mostly old bees, as the loss in winter was light.

Spacing Extracting-Frames.—C. Guillemin says in Revue Eclectique that for years he has spaced his extracting-frames $1\frac{1}{2}$ to $1\frac{3}{4}$ inches from center to center, and is well pleased with it. The thick combs projecting beyond the wood of the frame make the work of uncapping easier, and there is also less surface to uncap for a given weight of honey. The queen is less likely to invade the surplus apartment when the combs are so thick. There is a saving in the number of frames and the amount of foundation employed. Some, however, would argue that thinner combs would facilitate more rapid evaporation.

Local Bee-Keepers' Associations can do much more than they might at first think, toward aiding the National Association, and for the interest of the pursuit of bee-keeping at large.

Hon. Eugene Secor, the general manager of the National Bee-Keepers' Association, was asked by the Chicago Bee-Keepers' Association as to what he thought local associations could do to assist the National, and here is his reply:

WHAT CAN LOCAL BEE-KEEPERS' ASSOCIATIONS DO TO HELP THE NATIONAL?

First.—They can join the National in a body, and thus add to its influence by increasing its numbers. A membership of one thousand is more than proportionately stronger than of one hundred.

While a full treasury can accomplish some things, of more importance is a united and interested constituency behind it. If the South African republic had had *men* enough she would have successfully resisted the power of Great Britain. If our association comprised all the bee-keepers in the land, as the Boer army comprised all the fighting population of the Transvaal, we might, with equal generalship and equal enthusiasm, overpower the enemy of adulteration. We could make ourselves felt in the Congress of the United States; we could influence State legislation; we could stiffen the backbone of officers whose duty it is to enforce the laws. The very fact of a large membership would have its effect on every contemplated aggression against the rights of bee-keepers.

Second.—They can discuss the objects of the Association, and thus become familiar with its purposes. Many bee-keepers do not appear to understand what we are trying to accomplish, or the importance of standing together to bring about results. Every individual in the country has

some influence in the community where he lives. If that influence is properly exercised it will do much to discourage adulteration and help to enlighten the people on the value of honey and the importance of the honey-bee.

Third.—They might with profit discuss methods of warfare against the adulteration of honey, and agree on an organized plan of collecting evidence for the use of the National Association.

The National is willing to furnish the funds to pay expenses, but the work of massing evidence must be done by friends in the community where suits are brought. It is impossible for the general manager to leave his home for the purpose of working up cases of violation of law. It would be very expensive, even if he had the time. But local associations might assist very materially and effectually. These matters could be discussed with great profit, especially if the society happens to be in a State or city where open violations of the pure-food laws are practiced.

EUGENE SECOR.

But in many places there are no local bee-keepers' organizations to unite with the National in a body. In that case we wish to say that we will be pleased to receive the membership dues of \$1.00 each when such of our readers are renewing their subscriptions for another year. We will forward the amount to Mr. Secor, when he will mail receipts to the members thus paying.

This is an exceedingly important matter, and we hope our readers will not neglect it. The membership roll of the National should number thousands, so that its treasury would be ample to push the cases which it undertakes in the interest of bee-keeping.

It may be that nearly all who pay their dues may personally never need the help of the National, but they will be just as much interested in the successful prosecution of a case in which a brother member of the bee-keeping fraternity is directly affected, and also in all prosecutions of honey-adulterators.

Better get into line at once for the defense of apiculture, if not already a member of the National. You can't tell at what time *you* may need the aid it can furnish better than any other organization.

Wintering Bees in Clamps.—Of late little has been said about burying bees in clamps for winter, but Editor Hutchinson, of the Bee-Keepers' Review, says where outdoor wintering is unsafe, and one has no cellar, clamps may well be used. He speaks from personal experience, an experience that cost him nearly the whole of 96 colonies in one winter, because they had no ventilation, and perhaps because the number was so large. There was no dysentery; the combs were clean, dry, and full of honey, but the bees had deserted the bives and crawled all thru the straw. On a dry, sandy hillside (not in clay) he would have no hesitation in putting any number up to 25 or 30 into a clamp.

Queenlessness in the mother colony sometimes occurs, according to Schweiz. Bztg., in this way: After-swarms leave the colony so weak that the cluster of bees shrinks away from the lower edges of the frames where alone are any queen-cells left, and these are chilled so that the colony is left hopelessly queenless.

* The Weekly Budget. *

THE CHICAGO CONVENTION, as has been said before, was the largest and best national convention ever held in this country. A big feature was the stereopticon views which were thrown on the canvas during each of the three evening sessions. The success of this part of the program was due to Pres. E. R. Root, Mr. W. Z. Hutchinson, and Mr. Huber Root, a younger brother of E. R. Root.

Referring to this matter in *Gleanings in Bee-Culture*, Editor Root wrote as follows:

When I left for Chicago with my stereopticon outfit and slides I had just a little misgiving whether this feature of the meeting would be a success; but it succeeded beyond my own sanguine expectation—not from anything I said, but because of the enlivening speeches descriptive of the subjects thrown on the screen from Messrs. Abbott, Mason, York, Baldrige, France, Weber, Benton, and Hutchinson. While the pictures were for the most part good, yet had one speaker held the floor for the evening I fancy the entertainment would have been tiresome. As it was, we had the most delightful variety from all the gentlemen named; and after some of the speeches there was a general cheering and encore.

Mr. Abbott introduced the poet laureate and general manager of the National Bee-Keepers' Association, Hon. Eugene Secor, whose picture was thrown on the screen. He spoke of the delightful poems which had emanated from Mr. Secor's pen; of the good work he had been able to perform in the interests of the Association; and as Mr. Abbott closed his happy speech there was a burst of applause. He likewise introduced, in the same delightful vein, Dr. Mason, Editor York, and E. Whitcomb—as their pictures were successively thrown on the screen.

Mr. York introduced Prof. A. J. Cook and Dr. C. C. Miller. Mr. C. H. W. Weber, who had bought out the business of the late C. F. Muth, spoke feelingly of his acquaintance with Mr. Muth. He told how Mr. Muth had been known to have in his warehouse and on his platforms \$75,000 worth of honey at a time, which he had bought of bee-keepers, paying cash for it.

Dr. Mason, in his usual genial manner, said some very pleasant things of W. Z. Hutchinson and of E. T. Abbott, and then when some comic pictures were thrown on the screen illustrative of certain familiar scenes in the apiary, he told how he had been there too.

R. C. Aikin, of Colorado, president of the Colorado State Bee-Keepers' Association, introduced W. L. Porter, of Denver; also Frank Raufuss and J. E. Lyon, prominent bee-keepers of Colorado.

N. E. France told something about his methods when pictures of his apiaries were thrown on the screen.

M. M. Baldrige, one who has been, perhaps, connected with bee-keeping longer than most living bee-keepers, told of his early acquaintance with Langstroth when the father of American bee-keeping had just launched out into the new industry and put out his book, which, for real practical value and literary excellence, has never been excelled. In connection with the full-portrait view of Langstroth there was shown a picture of him as he was walking thru a park in Dayton a year or so before he died; and finally there was shown in colors the Langstroth monument, where it now stands, and which has been purchased wholly by small sums from grateful bee-keepers of this and other lands.

Mr. Frank Benton, who is intimately acquainted with Capt. J. E. Hetherington, referred to his having been styled the "prince of American bee-keepers," and very properly so, and the most extensive bee-keeper, probably, in all the world. He dwelt upon his army record, of which any bee-keeper or soldier might well be proud; explained how his sword had been struck and bent by a bullet that would have pierced the Captain's heart while he was in the thick of the fight directing his men, and a fine target for sharpshooters, and how he fought for the flag that thrills the heart of every American. At this remark, Old Glory was thrown on the screen in all its beautiful colors. General applause followed; for besides the loyal bee-keepers there were many old soldiers who had come to attend the great G. A. R. gathering.

On the last evening, Thursday night, Mr. Hutchinson, by the aid of the stereopticon, took us on a delightful trip among bee-keepers thru Wisconsin and Michigan. He not only showed the pictures of persons he had met and of the apiaries he had visited, but all the hive-manufacturing establishments where he had visited, including some he had not seen.

The Chicago Bee-Keepers' Association, which entertained us so royally, first arranged for a small hall, but finally at the last minute they found it was necessary to secure a hall that would seat comfortably 500 people; and the wisdom of this change was made apparent the first evening. The Chicago Bee-Keepers' Association not only entertained us handsomely, but paid all bills, and even furnished a big brass band which came into the convention hall and served us with some delightful music during recess times.

The great national convention of bee-keepers—the largest conclave that ever met in the Western Hemisphere—will long be remembered. It is doubtful whether there will be another meeting as large until we meet again in that great hot-bed of bee-keepers—Chicago. The Association ought to consider this its home, and should go home at least once in 5 years.

Surely the members of the Chicago Bee-Keepers' Association are under obligation to Editor Root for all the kind things he has said about them.

The brass band mentioned was the Dupage County Band, of Wheaton, Ill., about 25 miles west of Chicago. Mr. John P. Weibler, a well-known employe at the American Bee Journal office, and two of his brothers-in-law, were members of the band. Thus it was possible to secure them at practically their expenses, else it would have been too great a luxury for the convention entertainment fund to bear.

MR. H. D. BURRELL was not threatened by a lawsuit on account of his bees visiting a neighbor's peach-orchard, as stated on page 676, we are glad to be able to report. It seems that feature of the supposed case was, as usual, the result of the imagination of a newspaper reporter. Here is what Mr. Burrell himself writes us about it:

In regard to the Chicago Record "special" about bees and peaches mentioned in the American Bee Journal, please give me space to say:

A neighbor did complain that our bees were working on his peaches, and he thought they were doing considerable injury, but no damages were demanded, and no lawsuit was mentioned. We are good friends, and always have been. It was during hot, moist weather, and peaches in all orchards in this great peach-growing country were decaying badly on the trees, in many cases before they commenced to ripen. There were few blossoms at the time to keep bees busy.

I suppose some enterprising but dishonest newspaper correspondent invented for a sensation the "special." He certainly accomplished his object, for the article has been copied far and wide, and I have been kept busy answering questions from many different States. I wish here to thank the many bee-keeping friends for kind words and suggestions.

Perhaps some of our readers may not know that a series of experiments were conducted by the United States Department of Agriculture, to ascertain if bees could puncture or bite open fruits. Prof. Riley was chief entomologist of the Department at the time, and the experiments were under his direction. Ripe peaches, pears, plums, and 23 varieties of grapes, were placed where bees were confined and subjected to fasting. All damaged fruits were quickly appropriated by the bees, but they were unable to get at the juices of sound fruit. If the skin of a sound fruit was punctured by a needle, the bees soon sucked out the contents, but without this assistance, altho they crawled over the fruit every day for some time, seeking points of attack, the bees finally starved. The account of these experiments may be found in the report of the United States Department of Agriculture for 1885, pages 336-339.

Van Buren Co., Mich., Nov. 5. H. D. BURRELL.

We are indeed pleased to know that the report referred to is proven a false one. Perhaps we should have written Mr. Burrell before copying it from *The Record*, but as there have been similar reports that were true, we did not question this one.

Convention Proceedings.

Report of the Proceedings of the 31st Annual Convention of the National Bee-Keepers' Association, held at Chicago, Ill., Aug. 28, 29 and 30, 1900.

BY DR. A. B. MASON, SEC.

(Continued from page 727.)

THIRD DAY—MORNING SESSION.

The Thursday morning session of the convention was called to order by Pres. Root, and was opened with prayer by Rev. L. Allen, after which there was a song by Miss Ethel Acklin.

Pres. Root—The first thing on the program this morning is the paper by Dr. William R. Howard, of Ft. Worth, Tex. I received it this morning, and have handed it to Mr. York and requested him to read it.

VARIOUS FORMS OF DISEASES AMONG BEES—CAUSE AND CURE.

In 1881 and 1882 I undertook the investigation of bee paralysis and dysentery. As laboratories for original research were then crude compared with those of the present day, my success was not pronounced. Since I have been better equipped with laboratory appliances, and become better acquainted with the technic necessary for such investigations, I have, again, partially investigated these diseases.

In dysentery, I have succeeded in finding several forms of fungi and water bacteria, none of which were isolated or determined; neither were the experiments made with cultures capable of reproducing the disease in prosperous colonies. I have quite a number of times repeated these experiments without arriving at any satisfactory conclusions. I have found as many as a dozen forms of fungi, besides numbers of algids, water bacteria, etc., growing in cultures made from bees of a single colony; this, at first, was somewhat strange, but further investigation showed that the pollen (bee-bread) found in these combs furnished many of the same forms which, on suitable media, grew luxuriantly. Cultures made from the excreta and body contents gave similar results.

Here allow me to mention a point worthy of attention, since it has been taught and is very generally believed, that old bees do not consume pollen when in a normal state; that they may be successfully wintered without it; that they do not require it except for brood-rearing; etc. I have always found more or less pollen in the stomach of all bees, both old and young, whether suffering from disease or in a healthy condition. I have always found pollen more abundant in the bees during confinement, especially in the spring months, but I have examined them during all the months with the same results. Climate may have something to do with it, as bees here are usually not confined over a week at a time during the winter months. In all bees suffering from dysentery, that have fallen under my observations, they have had an abundance of pollen, heavily charged with various forms of fungi in their excreta.

These outbreaks of dysentery usually follow a period of activity closed with a few days of confinement, on account of showers or cold weather sufficient to prevent daily flying. Frequently pollen has been gathered from flowers upon which the rain has fallen; this may have had fungi from the branches of the plant or tree conveyed to it by the rains.

The warm, wet weather of spring starts to life thousands of forms of microscopical animal and vegetable organisms. Trees, plants, ponds, pools, etc., become literally alive with groves and swarms. Thru the water many of these forms find their way to the hives, bringing about unsanitary conditions, which, to a greater or less extent, influence the general health of the colony, giving rise to spring dwindling, and possibly dysentery, paralysis, etc.

I have seen yards badly affected with paralysis and dysentery cured in a few days by feeding artificial pollen and pure water in the hive, when the weather was too bad for bees to fly; or fed in the open air when the weather was fair. Good water, plenty of honey in the field, fresh pollen and hygienic environments, will generally put an end to paralysis, dysentery, and pickled brood.

Apiaries should be so arranged and located that plenty of sunlight and pure, fresh, dry air could circulate thru them; the bottom-board should always be dry, even on the underside; many harmless molds and mildews spring up in the presence of heat and moisture, some grow in the dark better than in the light, many spores are carried into the hive and find a suitable medium in which to grow. High weeds and grass should not be allowed to grow about hives, neither should the shade be so dense that a few hours' sunshine could not dry the ground.

Cheshire found the cause of some of these diseases to be a bacillus which he isolated. I have not been so fortunate as to isolate a single species that would infect a prosperous colony with paralysis or dysentery. In fact, during a good honey-flow, with a prosperous colony and proper sanitation, it will be found a difficult task to infect such a colony with any disease and obtain immediate disastrous results. The most infectious, and one that is always present and more or less visible, is foul brood. Black brood, pickled brood, dysentery and paralysis all disappear during a good honey-flow and hygienic surroundings; to this common-sense principle the "McEvoy method" owes its success.

Much has been said in conventions and written for journals on paralysis, yet little is known as to its cause. I have not had the time at my disposal to make a thorough analysis of this disease, but will give some of the results obtained. It appears, at first, as an indigestion; dissection shows obstruction in the way of casts of pollen and fungi in the true stomach and intestinal tract; there seems to be an enlargement, as if engorged, of the tubules corresponding to the urinary apparatus of higher animals—a general displacement of the internal organs is common. The mycelia, or threads, of various fungi are found in the uriniferous tubules and air-passages of those dead from the disease. All of these bring me to conclude that when an individual bee has a bad case of paralysis nothing would cure it, and that it might be worthless if cured. What is usually meant by curing all diseases among bees, is stopping the infection from spreading to new individuals, and not individual cures.

In dysentery dissection shows a dropsical condition, an extra amount of fluids in the circulatory system, fungus and pollen casts in the excretory organs, and in some cases a great amount of liquid in the alimentary tract.

In pickled brood the adult bee is rarely affected; in the larva and pupa much the same conditions are found as in the adult bee in dysentery, and I have known pickled brood to follow dysentery and finish the destruction of the already decimated colony. In this, which is strictly a fungus disease, the attack seldom occurs before the feeding of pollen, yet I have sometimes found it earlier in larval life, where the disease had raged previously. Combs which have had any disease, whether of a fungus or bacterial nature, are never entirely free from the infection; while many cells may be free and safe, yet, as a rule, there always lurks spores capable of reinfection. Nearly all bee-bread contains fungi of various forms which are gathered with it, but which are unimportant, as they do not grow except upon the leaves of plants, grasses, etc., and are incapable of producing disease.

In the two colonies which were used for experimental purposes last spring, in which black brood was well developed and thoroughly established, the disease entirely disappeared during the spring honey-flow from horsemint; they became strong, and one swarmed, giving off a good swarm, which was placed in one of the hives, on the infected combs left after the death of the colonies used last winter in experimenting with this same black brood.

In order to make a more severe test on a new swarm during a good honey-flow, I used a sufficient number of all the combs sent from New York last fall to fill a frame, transferred these to the center of the brood-nest and watch the results. The combs were all thoroughly united and cleaned, and no disease occurred in this hive. A cessation of the honey-flow in the latter part of July came, and the disease reappeared, so that on the first of August quite a number of both larvæ and pupæ were found diseased. The fall honey-flow came in about this time, so that on Aug. 20th no sign of the disease was present. The disease recurred in one of the colonies used last spring—not the one which swarmed, nor in the new swarm.

In this disease the first germ-growth appears in the ventriculus, which, in the larva, is a blind sack, which, on account of the sedentary life and liquid food provided, is not a fully developed alimentary canal till late in pupal life. There is no evidence of solid excreta until after the bee is

hatch and begins to take food. In the larvæ the stomach (ventriculus) appears distended with pollen-grains, partially digested pollen atoms, chyle, a few fungi, bacteria, etc. The urinary apparatus, which develops early in larval life, appears engorged, sometimes colonies of bacteria are found within them. Much distortion and faulty development results from arrest of nutrition to the internal organs; there is a general abnormality of the glandular structures from faulty development. These developmental errors are due to the influence of the poisons elaborated by the bacteria in the digestive organs. In many examinations I have never been able to find growths or scattering bacteria in the dorsal vessel—which is the heart of the bee—or in any other parts of the vascular system.

In foul brood, if the egg has been deposited in a foul cell, when the food comes in contact with the infectious material, a suitable media is formed for the growth of the germ, and bacterial changes in the food destroy its nutritive qualities, and the young larva dies of starvation or from the effects of the poisons. Where the egg is deposited in clean combs, and the infection reaches the brood thru the food, growth of brood continues until the infectious growth changes the nutriment, produces poisons, and death results. The brood may continue to the pupa state, and death may take place after casting of the pupa skin, just before the bee is ready to emerge as a perfect insect. The fact that the alimentary tract is not a fully developed passage until the perfect state is reached, may influence to some extent the virulence of the infection, and be held to explain why diseases which belong to the larval and pupal states do not infect the perfect state.

I have been unable to find any valid evidence for holding queens responsible for, or that they have any influence upon, the perpetuation of any disease with which I am acquainted. Cheshire's statement of finding the *bacillus alvei* in the undeveloped egg, in the blood of the queen, in spermatozoa of the drone, etc., has not been verified in this or in any other instance, so far as I am aware. He cites as a parallel case the silkworm disease, which was once so destructive in France. Bechamp, who was first to investigate the case, gave quite a lengthy detail of his investigations. Here is what he says, that led Cheshire to quote him:

"The microzyma multiplies in the interior of the moth, developing with its growth so that the infected moth is unable to lay its egg without depositing the spores at the same time, and thus exposes the young grub to attack as soon as it is born."

Bechamp nowhere states that the miniature ovum, or undeveloped egg, is attacked. Again, this is not a parallel case, inasmuch as the silkworm larva partakes of much solid food, voids solid excreta, is active, chooses its food, etc.; while the female moth lives but a few days, deposits thousands of eggs regardless of surroundings, and partakes of little or no food during her life.

Let us follow the undeveloped egg from its beginning to its deposition, and we shall see where the infection comes in contact with it.

The egg at first is a microscopical atom in the ovary answering to the ovum of higher animals, and subject to the same developmental changes; its growth begins under certain stimuli, and we now see it as a shapeless mass of apparently homogeneous matter, containing certain microscopical and chemical elements, in the minute channels of the ovary; as it continues to grow we find it in the larger channels, and finally the surrounding conditions to which it is subjected induce condensation of the peripheral zone, whereby the definite form is greatly favored; this progressive condensation is productive of a distinct limiting membrane; here, by high amplification, we discover the micropyle (little gates), or open pores, thru which spermatozoa enter the interior of the egg for the purpose of fertilization. Now passing the gate whose opening leads to the seminal receptacle, or spermatheca, it receives the seminal element, which later results in fecundation; passing now into the still broader channel—the oviduct—it comes in contact with a liquid secretion called "chitin," which appears at first of a gelatinous nature, but which soon hardens, forming the shell of the egg. In this chitinous fluid we may meet the infectious germ, but this is the only place we may reasonably expect to meet it. This gelatinous fluid serves to fasten the egg to the base of the honey-comb cell. If the infection were to depend upon the transmission by the seminal elements, what must be the condition of the seminal receptacle or spermatheca during the long life of the queen?

It may be a puzzle to some how such definite conclusions are arrived at, such as locating germ growths in the

uriniferous tubules, malformations of glands, relative position of organs, etc. No better way can be found to explain this than to send with this sections of a larva and of a pupa. These sections are about 1-500 of an inch thick—much too thick for bacteriological study, so I send two or three sections about 1-1000 to 1-1500 of an inch in thickness. Serial or ribbon sections show the position very accurately of the organs, thickness and all. I have sections of bees of all ages and conditions. WM. R. HOWARD.

Accompanying the paper by Dr. Howard was the following, which he termed an

APOLOGY:

I had written my paper for illustrations, and not having time myself to make the pictures, I employed a competent draftsman, and furnished him with such sections as I wanted pictured, and told him they were to be used as pictures from which to obtain lantern-slides. Our color-grounds etc., were all agreed upon, and when the work was to be delivered he informed me he could not finish it. I then began to rewrite and alter my manuscript, and am not satisfied with it now.

Since I began to rewrite this manuscript there has not been over one hour's consecutive work, usually 15 to 30 minutes, with hours and sometimes days of intermission, working at any time, daylight, midnight, and all hours.

I send some slides made recently for anatomical purposes, from which to make illustrations. A low-power microscope or a common hand-glass will show the relation.

I hope that you will excuse inaccuracies, etc., inelegant expressions, etc.

All remarks regarding cures, etc., had to be cut out in order to get this ready for to-day's mail.

Keeping Queens Outside of Colonies of Bees.

BY G. M. DOOLITTLE.

A CORRESPONDENT wants me to tell, thru the columns of the American Bee Journal, how to keep queens outside of colonies of bees, he wishing to make preparation for so doing during the winter, if any special preparation is needed.

There are only two reasons that I know of why a laying queen should be kept outside of a colony of bees, except in the case of shipping them where sold to a customer, or transporting them from one apiary to another. This exception has been covered quite thoroly during the past in our bee-papers, no year having gone by but some one has had something to say in regard to sending queens in the mails, telling of the best cage, the best candy to use, the right number of bees to put with the queen, and so on. With me, I use a cage as made by the Root Company, of Ohio, and styled the small Benton cage, during the months of June, July, August, and September, where the queens do not have to go more than 1,000 to 2,000 miles away. And I often use these to send to any part of the United States and Canada, when I think the weather will prove warm enough until they reach their journey's end.

In all cages I use for food what is known as the "Good candy," no matter where sent.

For early spring and late fall, and when I fear the weather may be cold, I use a cage of the same pattern, but about three times as deep. With the first or smaller cage I use from 10 to 12 bees, and with the larger cage from 16 to 20. These workers are bees from six to ten days old, as nearly as can be told, or young bees which have had their first cleansing flight, as bees which have not flown to empty themselves of the accumulations collecting thru their larval period are not in condition to endure confinement to the best advantage.

Worker-bees are best caught and selected when they have their heads in the cells taking honey, and bees of the age spoken of above are far more likely to take honey when the hive is being disturbed than are those older or younger,

so if the operator takes the bees that have their heads in the cells, loading with honey, upon the removal of the frames from the hive, he is not liable to be far out of the way in his selection of bees to ship as companions with a queen. Besides, such bees as are filling their sacs with honey seem to stand the journey much better than bees taken with empty sacs, as I have proven several times during the past. My way of accounting for this is, that the honey taken with them helps them to moisten the sugar in the candy, so the candy is more readily used than where they have no honey to moisten it with; for it is a well-known fact with those who have fed candy to bees for winter purposes, that, so long as honey remained in the hive, the candy would be moistened and used; but when the supply of honey gave out the bees would often starve with plenty of candy within easy reach. Since I learned this fact—that bees partly filled with honey when put into the shipping-cage were more likely to go thru in better shape than were a promiscuous selection—I have lost very few queens, and the past season has been one of unusual success, as only one queen out of every 387 sent out has been lost, so far as reports have come in.

For shipping to foreign countries, which are not more than 3,000 to 5,000 miles away, I use a four-hole cage, the same being twice the depth of the larger one spoken of above; while for countries from 5,000 to 11,000 miles away, like Australia and South Africa, I use a cage double the latter size, and having eight holes in it—three for the food, one for the bees to collect together in should they go over cold mountains or thru a cold wave, and four which are ventilated in every direction, for them to spread out in whenever or wherever it is warm or hot. In the first large cage I use 25 bees, and in the latter 40.

With part of the cages sent to foreign countries I have used a small piece of empty comb, so that the bees could store the honey taken in their sacs in it to use as they needed, thus making the cage appear more home-like; but I am not sure that any better results have been obtained with those as a whole.

Where the journey requires more than from 20 to 25 days, the results are always very doubtful. Perhaps I have dwelt too long on the exception part of this matter, but I do not see where to stop, and yet have it plain to a beginner.

One of the other reasons for desiring to keep queens outside of the hive is, where we wish to take the reigning queen from the hive in order to introduce another, or take one from a nucleus to make room for cells which must be taken care of before they hatch. It is always well to preserve the old queen when we are trying to introduce another in her stead; for, should it happen that the queen which we are desirous should supplant the old one is lost in introducing, then we will not be obliged to leave the colony queenless, as we have the old one on hand to give back to the bees; or we can give one of those taken from a nucleus, if preferred, to take the place of the lost one, if all of these have not been sent off to customers.

To keep such queens as last spoken of I use two methods. One is, to put them in cages with accompanying bees, the same as for shipment, placing the cages where a temperature of from 60 to 65 degrees can be maintained as nearly as possible, for such temperature seems to be most conducive to the longest life of bees when in confinement in a cage outside of the hive. The second is to place the queen in a provisioned cage without any worker-bees with her, placing the cage over the frames of a nursing colony. The nursing colonies are made of five or six frames of hatching brood, and are kept well stocked with young bees, which are not permitted to have a laying queen while used as a nursing colony.

My advice would be not to keep any queen away from the bees and combs, so but what she can lay, for more than three weeks, and, better still, not more than a few days, for I believe such confinement tends toward the injury of the queen thus kept.

The last reason for desiring to keep queens outside of the hive is, the prevention of increase while securing a crop of comb honey. A large increase of bees and a large crop of comb honey do not go together, and for this reason many of our best bee-keepers practice removing the queen from the hive when the swarming season arrives, and in nine or ten days destroying all queen-cells, return the queen, when the bees are expected to go at once into the sections, and no further trouble results. While this plan does not always work as expected, yet I have had good success with it in some years. Where queens are kept for this purpose a small, round, wire-cloth cage is as good as anything, the

same containing the queen being split between the bottom of the comb and the bottom-bar to the frame, where the bees have left some open space. There is no need of provisioning this cage, for the bees will supply all the wants of their mother, by feeding her thru the meshes to the cage. When the cells are cut the queen is allowed her liberty again.

Ouondaga Co., N. Y.

Black Brood in New York—Its Ravages.

BY P. W. STAHLMAN.

BLACK brood has practically knocked the props from under the bee-business in this locality, and the worst of it is, it is not over with yet. This disease is hard to fight, and seems to be almost incurable when once established in the apiary. No apiarist can work contentedly with his bees when he knows that this disease is present. I have fought it hard for two years, and my experience, as well as that of others, is that to get rid of it clean and clear is to quit the business until it has done its work of destroying all of the bees in the woods, and those of the slipshod bee-keepers of this State. My present views are that, until this comes to pass, black brood will spread (regardless of treatment), and will hold the fort. In all likelihood there will be some bees that will survive, but they will be in the hands of practical men in the business. Last season I kept care for and handle over 400 colonies, and the result was that over one-half of them were destroyed, and a set of "blue" bee-keepers were left (I was one of them).

This season I had charge of over 100 colonies, and but few came thru free from disease. Some colonies were treated the second time in one season, and still the disease comes again in spite of all the starvation they may be made to endure, or all the medicated syrup that is fed. I say without hesitation, that the majority of colonies treated under any or all treatments given in the book of instructions on this disease will be found to have more or less of it within one year, as long as the disease reigns in a yard to any extent. Just how it spreads is yet to be learned. I can not understand its origin, but I fully understand its qualities in destroying bees and giving their operator "the blues." To tell all about it would require more time and paper than I can spare. "The half has never yet been told."

However, there is one strange thing about it, and it is this: Once in a while a certain colony can be surrounded by the disease and still not show any signs of it. I often see enquiries in the bee-papers from those wanting to know if their bees have the New York bee-disease, because they see a few dead bees about their hives, or lose a few colonies during the winter. To such I wish to say, Don't try to make yourself believe that your bees have black brood. When you find your bees going down, down, down, as if by magic, and upon opening a hive you are met with a nasty smell which you never smelled before, then begin to make examinations, and if you find dead brood in all stages, almost all colors from yellow to black (all thru the comb), of a jelly-like, or rather, mattery, appearance, with a sour smell; and if upon seeing all these conditions you feel your backbone and nerves begin to weaken, and your hopes blasted, then you may know there is something wrong; and in finding this you have my heartfelt sympathy, as you no doubt have black brood among your bees.

Beware of those unsealed, pointed larvae; also some that have been sealed and turned brown, but not mattery. This is evidently a forerunner. At least I have so found it.

This season I cared for over 100 colonies of bees, fully three-fourths of which had to be treated for black brood—all hives to be disinfected, etc. In connection with this I raised artificially 700 ducklings, four or five hundred chicks, 41 goslings, and cared for 200 old fowls, all of which had to have their water supplied by muscle.

Our bees are now reduced to six colonies, which we propose to keep for honey for home use, and poultry must be the main thing the coming season, for my employer and myself.

From 36 colonies I secured 4,150 pounds of extracted honey. The season was too dry for bees. The spring opened fairly well, but the continuous drouth ruined clover, hence our only honey-flow was from buckwheat, which was a short crop. The outlook for next season is not flattering, as the clovers are practically killed by the drouth, and the forest-worms are ruining the basswood.

I expect to form "a union" of only two members early in November, and expect to be on a farm the coming year. I have kept two swarms of bees for seed and company, and

for experiments on black brood. I regret that I can not follow bee-keeping extensively, but at present I don't feel thus inclined. I trust the disease will disappear soon, so we can safely keep bees again.

Albany Co., N. Y., Oct. 15.

The Golden System of Comb-Honey Production in 1900, and the Results.

BY J. S. HARTZELL.

A GAIN we are at the close of a honey harvest. Just what the successes and disappointments have been each must determine for himself. Reports upon the whole speak of a generally poor season. Some localities, however, were highly favored, and an abundant reward received for labor bestowed. Circumstances have been such that while I had determined that 1899 would be an ending of my apicultural experience, I was compelled to fight the battles of 1900, and with what success I will again report.

Before entering upon a summary of my crop report, I will say that perhaps too much is written concerning systems in practice for the production of honey, yet we have apostles in apiculture that, whatever is written or said by them concerning the management of bees, is accepted as a fact whether or not in real practice it is practical. When, however, a new apostle arose in a village in Morgan Co., Ohio, and portrayed thru the American Bee Journal in 1896 and since, a new construction of hive and management of the colony therein for the production of comb honey, the meager reports coming thru the various bee-papers, of success or failure achieved in the practice of that system, have led me to conclude that as it was in Christ's time thus it is to-day, and the inquiry goes forth, What good thing can come out of Nazareth? Yes, verily. But had some of the conceded bright lights in apiculture advanced the theory, long ere this many would have given it a trial and reported as to the success or failure achieved by its use.

However, every system in vogue has its adherents and advocates, whether religious or political, and in the agricultural field we find an abundant harvest of systems, hives, etc., to select from, each having its admirers and advocates, and I am one (possibly of only a few) who is glad to have it said he accepted and has since been practicing to considerable extent the theory promulgated by Mr. J. A. Golden. Four seasons' trial, and each season in increasing numbers, on any plan, should prove whether or not it is entitled to merit.

I have, as a specialist in the production of section honey, practiced to some extent double tiering of 8-frame hive-bodies, supers on top; also at the time of swarming caging the queen and placing her in a super over the brood-nest, and cutting out queen-cells the sixth day and liberating the queen, but evidently there is much depending upon the construction of the hive, and I feel confident that Mr. Golden has given to the world the best hive extant for summer as well as winter management. I feel confident it will ultimately triumph over all opposition, and become as universal and popular as the Langstroth size of frame.

At present my apiary consists of 53 colonies in Golden hives, and 23 colonies in 8 and 10 frame dovetailed hives on the general plan. The results for the season of 1900 stand as follows:

The 53 colonies on the Golden plan yielded 1,266 sections of completed honey—an average of practically 23 4-5 sections per colony: 23 colonies on the general plan yielded 285 sections of completed honey—an average of practically 12 1/3 sections per colony. This, my fellow bee-keepers, shows almost double in favor of the Golden plan.

I will just say, while making a report, that of sections not completed I made a selection of those nearest completion, filling seven supers, and extracted from others, and by feeding back succeeded in having six supers entirely completed, and the seventh mostly completed. The nights turning cool prevented feeding to complete the seventh super; and while succeeding in completing six supers, it was evidently at extra cost, as weight and measure were kept account of. These, however, are not accounted for on either plan, being only an effort on my part to test whether advisable to feed back to complete sections, and my verdict is no.

How many of the vast number of bee-keepers who may read this article will give the Golden plan a fair and impartial trial in 1901? And of those who have given it a trial during the season of 1900, will they please hand in their reports? I will be glad to hear, whether favorable or

unfavorable, as it may have a great bearing on the possibility of inducing the incredulous to test a plan which, in my opinion, will count in dollars and cents to the man who adopts it.

Now, in order to verify my appreciation of the Golden system, I will make a proposition which will determine (if accepted) my earnest desire to better if possible the condition of the vast number of bee-keepers in our country. I would like, if possible, to induce Dr. C. C. Miller, A. I. Root, Eugene Secor, Dr. A. B. Mason, and Chas. Dadant—five all told, and who I believe are honorable men and unbiast—or any other five of equal merit provided these gentlemen decline, and whoever the editor of the American Bee Journal may deem competent (as there are so many worthy ones) to accept the following terms: Secure from Mr. Golden next spring a complete hive with full instructions as to the management of a colony when placed therein, and give equal opportunities with other colonies. Place a good colony in the hive, and at the close of the season, if it proves unsatisfactory (after having followed instructions closely), ship the empty hive complete to me, by freight, and I will refund the cost of the hive and pay the freight. Is this fair? And will the proposition be accepted? Thus you can determine my unbounded confidence in the Golden system for the production of comb honey, after an experience with it for four successive seasons.

Mr. C. S. Younkin, of this county, who I consider one of the best informed and practical men in apiculture in western Pennsylvania, has determined, after the results achieved during the season just closed, that he will fully test Golden's system during 1901, and I am rejoiced that he will, as he is fully competent to decide the merits of any system when tested by him.

In conclusion, it just comes to mind that the worthy late critic of the Bee-Keepers' Review, Mr. R. L. Taylor, doubted my report as given in the American Bee Journal in 1898 (and possibly may doubt the one given herewith for the season of 1900). But I want to assure him they are facts, and cordially extend to Mr. Taylor an opportunity to test the Golden method, according to the same terms named to the other gentlemen, and I hope the proposition will be accepted.

No. 5.—Interesting Notes on European Travel.

BY C. P. DADANT.

WHILE traveling the short distance between Interlaken and the famous Rigi, I saw a number of apiaries, and this called my attention to the notable difference in the hives used in the various countries of Europe since the introduction of the movable frames has become general.

The adoption of hives of modern styles was evidently made in each country according to the information brought to the public by the different specialists or inventors. The Germans, who were the first to set aside the old straw skeps in practical bee-keeping, are also, in my opinion, at the present time the farthest behind as to the practicability of their hives. Berlepsch and Dzierzon were their leaders, and their hives are still in use. The Berlepsch hive, invented and popularized over 50 years ago, is very inconvenient, for it has no movable top, but opens from the rear like a closet, and the frames have to be drawn out backward. But as it was so very much ahead of the old straw skep, it was easily introduced, and its use is still continued in many apiaries of Germany. The Dzierzon hive is very elementary, having only movable top-bars instead of frames, so that when you wish to remove the combs you must cut them away from the ends.

The French apiarists have taken to half a dozen different styles, among which the DeLayens is probably the most conspicuous. This hive has frames very similar to the King-American frames, from 20 to 24 in number, and no supers. They extract the honey from the side combs of the hive. As a matter of course it is possible to fit supers upon this hive, but it is then found to be too large in the lower story.

They also use the Sagot hive—a hive very similar to the Langstroth, and which was invented by L'Abbe Sagot, years ago, almost simultaneously with the Langstroth invention, but was not put before the public until later. One drawback of this hive is the shape of its supers, which are triangular, and give but little room for surplus. The pound section could not be fitted upon it unless an additional half-story was added.

They have also the Voirnot hive, and the hive introduced by my father, which is, as the reader knows, a modification

of the Langstroth hive, with large Quinby frames, and is known over there as the Dadant hive. In Switzerland this hive is almost exclusively used, so I found our name very familiar to every bee-keeper whom I met, and in two or three instances I found myself literally hugged with the greatest enthusiasm at the simple mention of my name, by people who had never seen me before.

One of these apiaries I found on the shores of the Lake of Sarnen, a small body of water just beyond the Bruinig pass, and which deserves more than a passing notice, owing to the crystalline appearance of its surface. Its waters are very clear, and as it lies between two very steep hills, there is but little breeze to mar its smoothness, and every hill, every tree, every house, was mirrored to perfection when we saw it. It ought to be called "Mirror Lake."

This lake, we were told, was lowered 100 feet by artificial means, to increase the area of tillable land. It appears that it was originally formed by the tumbling of a portion of a hill—probably thru an avalanche—across the valley. The wall thus formed, not being of very great width, it was found possible to bore thru and lower the depth of the lake, the land so reclaimed being of great utility as pasture and meadows. In these thickly settled countries they do not waste land surface as we do here. The railroad embankments are kept in grass, no matter how steep they be, and this is carefully mowed and stowed away twice in the season, and in many places we saw vegetable gardening, cabbages, potatoes, etc., clear up to the edge of the railroad ballast, along the track. I imagine that if those people saw our prairie public roads, four rods wide, with the little beaten track in the middle, and a strip of weeds on both sides, they would wonder at our wastefulness.

That same day we ascended the far-famed Rigi, the fashionable mountain from which you command a view of 300 miles in circumference, providing it is not cloudy; but as clouds always form around those mountains, a clear sky is an exception. Here I had the pleasure of seeing a cloud form under our feet, from an almost invisible little smoky spot, to a mist that covered everything below us. I do not know whether many are like myself, but I had never thought of enquiring as to the formation of clouds. While the passing of clouds over my head was a matter of daily notice, it had always seemed to me that they must come from somewhere else, for I could not imagine how they should form. But here was the thing in practice, in plain view; a clear sky, a half dozen beautiful lakes below, with villages, orchards, roads, all so straight below us that it seemed as if we could throw a pebble on the roofs of the houses, then in a few seconds two currents of air coming in contact from different directions, one cold, the other hot and moist, a sudden whirl and the condensation of invisible to visible moisture is instantaneous; the beautiful view is hidden under an opaque cloud. But in another minute the cloud blows away, the sun again shines, to be hidden again in the same manner a little later.

I enjoyed the ascent of the Rigi, but after an afternoon and a night there I was still gladder to leave it. It would not suit me to live above the clouds. We staid over night to see the sun rise, and were awakened at break of day by the Alpine horn. We hurried from the big, cold, moldy-smelling hotel to the top of the peak with the hundreds of tourists, in the raw morning air; we admired the numerous snow-capt peaks that glistened in the south like the waves of the sea, but were glad to get back to the warmth of an August forenoon by the first train we could take for Lucerne, and it was with pleasure that we saw our car slowly descend from those dizzy heights to the level of the cities below. Better live 600 than 6,000 feet above sea-level.

Back to Geneva we returned the following day. Up hills down ravines and thru tunnels, these Swiss railroads never seem to be on a level; but the sights are always interesting, and not the least is the view when just out of the last tunnel coming back to the beautiful lake of Geneva. The sudden change from the steep meadows, abrupt hills and pine forests to the splendid vine-clad slopes and the busy shores of that wonderful lake, is striking.

That same evening we landed at Nyon, where the pleasant face of Mr. Bertrand, the editor of the *Revue Internationale*, was readily recognized by us at the station. He had a carriage in waiting, and inside of a half hour we were literally "at home," enjoying a chat with him and his devoted wife.

Mr. Bertrand's health has been quite poor for a number of years, and it was a happy surprise to find him quite a younger looking man than his last picture had led us to believe, and as active as any man of his years, for, if I remember rightly, he is 65 or 66 years old.

Questions and Answers.

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.)

Out-Apiaries—Draper Barns—Plain Sections.

1. How do you run your out-apiary for comb honey? Do you hire experienced help?
2. What salary should a young man be paid who has some knowledge of bee-keeping?
3. How did bees in your Draper barns do the past summer?
4. What about the plain sections? I don't like them because they are so light in weight, and on account of the bur-combs on the fences. Hurrah for the old-style sections! Long may they stay on the market. ILLINOIS.

ANSWERS.—1. Just the same as the home apiary. Two of us go to the out-apiaries as regularly as we can, and do the same work we do in the home apiary. We can hardly be said to have an establishment plan, and are all the time on the lookout for something better. If you strike on something good, by all means let us have it.

2. So many things must be taken into account, and circumstances vary so much that it would be impossible to give an answer to fit all cases. "Some knowledge of bee-keeping" might be so little that a young man might not earn his board with an experienced bee-keeper; and it might be so much that he could earn \$50 or more per month taking care of an apiary whose owner had no knowledge of bees.

3. They didn't average any better than others.

4. It seems hard to get the plain sections settled down to any uniform basis. As at the first, some like them very much, while others will have none of them.

How to Transfer Bees.

This fall I got one colony of bees in a lime-barrel. I would like to know the best way to transfer them to a frame hive. IOWA.

ANSWER.—Transferring from a lime-barrel does not differ materially from transferring from a box-hive, and so you will be all right to follow the instructions in your text-book for transferring from box-hives. Very likely, however, you may prefer a plan which is growing in favor, and that is to wait till the colony swarms before any transferring is done. If the colony is in a whole barrel, it is not likely that the whole barrel is filled with comb, and you will do well in the spring to saw off the lower end of the barrel which is empty. If you should saw off so much that it would take off some of the lower edges of the combs it will do no harm. If you leave the whole of the barrel, the bees might swarm quite late, if at all. When the colony swarms, hive the swarm in a frame hive, and set the new hive on the old stand, setting the barrel close beside it. A week later remove the barrel to an entirely new place. Two weeks later still—that is, three weeks after the time of swarming—drive out what bees remain in the barrel, uniting them with the swarm, and then you can melt up the old combs, which will be bare of worker brood, unless you prefer to fasten some of the straight worker-brood in frames. If, however, you prefer increase to honey, you may proceed in a different way. When the colony swarms, leave the barrel on the old stand, and put in a new place the hive with the swarm. If an after-swarm issues from the barrel, you can hive that, if you care to have weak colonies, but the better way is to return the after-swarm as often as it issues. Then three weeks after the time of the first swarm, transfer the contents of the barrel into a frame hive.

The American Fruit and Vegetable Journal is just what its name indicates. Tells all about growing fruits and vegetables. It is a fine monthly, at 50 cents a year. We can mail you a free sample copy of it, if you ask for it. We club it with the American Bee Journal—both for \$1.10.

* The Afterthought. *

The "Old Reliable" seen thru New and Unreliable Glasses.
By E. E. HASTY, Richards, Ohio.

OATS CHAFF FOR BEE-HIVE CHICKENS.

Stick a good-sized pin right here. Oats chaff is used to fill the cushions with which J. G. Norton hatches bee-hive chickens. Oats chaff and wheat chaff are practically very different substances. Where ventilation thru the cushion is desired wheat chaff is much the better; but so long as perfectly dry (a condition rather hard to maintain) oats chaff is much the warmer. Page 637.

WAKING UP BEES IN WINTER.

H. D. Burrell, page 646, does not think much of pounding on hives in winter to wake the bees up. No more do the most of us. Still, there seems to be need for them to arouse once in a while and readjust things; and if we knew all about their needs, and also knew in advance what the weather was going to be, we *might* time these periods of winter activity so that the expenditure of vitality would be less than it is. It is quite possible that the warming up of the hive is costly, even when bees do it at their own option.

MASSING DRONES IN A QUEENLESS COLONY.

Anent the subject of massing drones in a queenless colony for fall queen-rearing, I would like to put in a special remark. Right here may lie a very important advantage of rearing queens in the fall. In the swarming season I should feel pretty sure that drones from such a drone boarding-house would mate very few of the queens—more normally placed drones getting the start of them in nearly every instance; but (with some untoward exceptions, owing to conditions one can't get at) the selected drones would in the fall *actually mate the queens*, I presume. To go thru a lot of wise fuss and fixing, and to plume ourselves with the idea that we have accomplished something, is an uncommendable sort of bliss unless we *have* accomplished something. Page 648.

BREEZY HILLS NOT ALWAYS BREEZY.

And so Mr. Roebing thinks that on the top of a breezy hill hives have less need of shade. Probably that's so, to some extent. But even breezy hills do not always have breeze. The most injurious of "tan-toasters" come with a dead calm, do they not? Page 648.

THE ANTI-QUEEN-CLIPPING SENTIMENT.

The editor and Dr. Miller are sensible about the clipt premiums—and yet they don't *feel* for the agonies of one class of their helpless patrons quite as much as they might. I, being an anti-clipper myself, can take them right to my bosom. Sentiment is quite a word to conjure with; and, seriously, do we want man to be without sentiment? A new dolly with one leg torn off; a painting for the best light in the parlor with a hole punched thru the canvas; a bicycle (style of 1901) with but half a handle on one side; the present of a riding pony, and he blind in one eye; what human can feel, or ought to feel, fully enthusiastic over these serviceable but provoking treasures? If we delight in the enthusiasm of beginners, and we do, why step on and crush even the littlest of their sentimental little toes. If a subscriber is willing to say, "Send my queen without clipping, and I'll never, never, never even say peep, no matter what ensues," why, then, it looks as tho he might, without very much expense, be granted the boon he craves. Page 649.

HONEY-FLORA AREA FOR A COLONY.

On page 659 the editorial off-hand that 100 acres are required for each colony of bees is not bad; yet some blundering bee-boys will go straight and forget the *reason* why it takes so much. In the average location a great percentage of its acres furnishes nothing for bees; and another great slice only a trifling amount for a few weeks. The 100 acres for 150 colonies would not be wild if all the ground was fully set with the proper assortment of plants. Mr. Doolittle's claim that bees work $4\frac{1}{2}$ miles away from choice would probably be met by a lot of practical men claiming that from *choice* bees keep inside of a half mile. Without much assurance, I rather think that the truth lies between

these two extremes, and that the reason that bees seem sometimes to prefer near-by locations is that they have not *found* the more remote ones yet. The reason why a long flight is sometimes more profitable than a short one is, that it gives opportunity for both evaporation and ejection of water from the nectar. And several kinds of forage (when yielding at best) give the bees no compulsion to fly while loading up, each flower or cluster holding more than a load. Whitewood and yucca are notable instances of this; and probably basswood sometimes comes near it.

A BOY'S HEAD A DANGEROUS SWARM-CATCHER.

That Austrian swarm-story, on page 660, is both shocking and pestilent. It would be wicked foolishness to encourage a boy to let a swarm cluster on his head, and murderous nonsense to begin operations by drenching the bees with water. A swarm, so long as it is warm and dry, can be deftly coax to crawl away; but a mass of soaked bees will not crawl a step. I think those kind-hearted folks who always rescue drowning bees at water-tubs can testify that wet bees *sometimes* sting if you rescue them with your finger. Still, if the boy's hair was cut so short that no bee could possibly crawl into it, the incident *might* have been a real one. "Bees do nothing invariably."

NO POLLEN IN ORDINARY FINISHT HONEY.

I think Mr. Taylor, page 661, to be totally wrong in intimating that bees get pollen into honey outside the combs. If he will mix pollen and honey half and half, and give it to bees in an open-air feeder—well, I never tried it, but I *think* pretty strongly—I think he wouldn't be able to find with a microscope one single grain of pollen in the resultant, after it had been carried home and placed *in a new and perfectly clean cell*. I once bought a costly microscope on purpose to be able to tell for *sure* the source of my different kinds of honey—and the thing was an utter failure, just because ordinary finisht honey has no pollen-grains in it.

KILLING OLD BEES AND WINTERING YOUNG ONES.

The gruesome plan of killing the old bees in the fall and wintering only the young ones ought to be proved profitable by a good many different experimenters before it is recommended for general practice. Page 661.

MR. ABBOTT'S FUMIGATING COMPOUND.

Sulphur one-half, and nitrate of soda and black oxide of manganese each one-quarter—Mr. Abbott's worm-killing compound. Burns all up with a rush, and then puts out any fire that may be left with its own fumes. This is handy apparently, and presumably valuable. Scarce a corner of our craft can be named which has been so scandalously in need of a little invention as the burning of sulphur. Page 662.

EXTRACTING-HOUSE ON WHEELS.

The extracting-house of Mr. Mottaz, page 664, seems to be one of those "other ways" to do things which we do not often hear of. Have a nice extracting-house built on wheels, and haul it to out-yards like a photographer's gallery. Not a bad way. But it seems to me that some of the boys will do it, and have the outfit weigh less than 3,300 pounds.

FAILURES WITH CARDBOARD INTRODUCING.

The failures of bees to tear cardboard from a cage seem to be coming in freely; and my apprehensions in that regard seem likely to be justified (longer phrase for "told you so").

BLEACHING COMB HONEY BY SUNSHINE.

The bleaching of comb honey, tho at first not considered practical by theorists, threatens a little to become a generally adopted manipulation. L. J. Crombie's bleaching-house, illustrated on page 668, seems very well adapted to the purpose. Pleasant to be told by one who has tried it, "You will find you can bleach the darkest comb." Perhaps the cloth awnings and open gables would not be imperative where the sun is less fierce than in California; but it is better to be on the safe side than to have a big lot of honey melted. Well to remember the deceptive character of sunlight which he speaks of—making one think his sections are done when they are not. I would query whether it is sunlight or *heat* that does that—warm wax looks lighter than cold. Mercy on one's own lungs and health would suggest one improvement. Have a sectional big box close by the door, but outside the house, to do the sulphuring in. It doesn't pay to save steps by knocking days off the end of one's life.

* These prices are not the publishers' prices for these papers, but they are our special reduced prices when taken in connection with GLEANINGS. In many cases they are just one-half the regular rate.

HOW TO GET THE PRICE FOR ANY OR ALL OF THE PAPERS NAMED ABOVE.

1. Gleanings in Bee-Culture, one year, \$1.00.
2. If you want only one additional paper, add the price found in the top of the column in which that paper appears. For instance: Gleanings, and Success (2d col.) will cost you \$1.50.
3. If you want several papers in addition to Gleanings, each one may be had at the price named at the top of the column. For instance: Gleanings, Success (2d col.) and Rural New-Yorker (3rd col.) will cost you \$2.25.
4. You may select as many papers from each column as you wish.
5. Every order sent us must include Gleanings.

CONDITIONS.—Offers subject to withdrawal Dec. 31, 1900. Subscriptions to the Review of Reviews, Youth's Companion, and Country Gentleman must be strictly new. New subscriptions sent for Success, Youth's Companion, or Gleanings will receive the balance of this year free. Neither the Review of Reviews nor Post Fountain Pen will be sent in any combination amounting to less than \$2.50.

CHRISTMAS PRESENTS.—We will send all papers or pen to one or separate addresses, as desired. In this way you can easily make desirable Christmas Presents.

THE A. I. ROOT CO., Medina, Ohio.

Succeeding with Bees.

I started in the bee-business 2 years ago with 5 colonies. I increased to 11 last year, and this year to 22. I secured about 2,000 pounds of extracted honey and 200 pounds of comb, and made money. I sold out in September, but still want the American Bee Journal, which affords me great pleasure, as well as instruction. I am very fond of honey.

JOEL A. MOSS.
Missoula Co., Mont., Oct. 29.

Honey for the Pan-American.

I have 100 colonies of bees, and secured this season 300 gallons of extracted honey and 400 pounds of comb. I took some of it to the State Fair and was awarded every premium that was offered on honey. I think I will take some to the Pan-American Exposition at Buffalo, N. Y., next year.

I don't think that I could do without the American Bee Journal.

J. M. HAGOOD.
Delta Co., Texas, Oct. 29.

Rendering Old Combs into Beeswax.

What is the best method of rendering old brood-combs into wax (combs 15 years old), so as to get the most wax with the least work? Or, would it pay better to burn them? Perhaps G. M. Doolittle will give a good answer.

MACON CO., ILL. FRANK BAKER.

[Upon request, Mr. Doolittle kindly responds to the above as follows:—
EDITOR.]

Some zero morning, or nearly as cold, put those old combs into a bag or cloth sack, two or three at a time, and then tread on the sack with the feet, or whip the sack around the corner of some building till the comb is all broken into fragments. Then treat more the same way till all are broken. Now put the broken comb into a sack made of burlap, or some other openly

YOU KNOW YOU ARE RIGHT when you buy one of our celebrated **NEW PREMIER Incubators** because you can try it before you pay for it. It was good enough to take First Prize at World's Fair. Both papers for the price of one. Send your renewal subscription to this office while this offer is open. Both papers, \$1.00.

AMERICAN BEE JOURNAL, 118 Mich. St., Chicago, Ill.

woven cloth, putting sack and all into a kettle having boiling water in it. As the water boils, work the sack with an old hoe, and see how the wax will rise. Work till you are satisfied the wax is all out; or if you have a press of any kind, you can press the sack of refuse at the finish, but with me the hoe will work out 95 percent. If you have more than the sack will hold at first, you can untie and fill in more as it works down in the boiling water.

Never burn up any comb of any kind, unless your labor is worth more than \$5.00 a day. And if it is hire some \$1.50 a day laborer to get out the wax, and save the \$3.50 as your profit. Of course, wax and old combs will make a good fire, but such a fire would be rather expensive. I have heard of persons rolling up \$5.00 bills and lighting cigars with the flame from them while burning, but I think a match would be preferable. And I also prefer good wood and coal for fuel for my stoves, to that of using old bee-combs.—**G. M. DOOLITTLE.**

Bees Did Poorly.

My bees did poorly this season, and I expect to have to feed them. I think the weather has been too wet. Basswood was in full bloom when a heavy rain came and washed the honey all out of the flowers. The same thing hap-

The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

[THIS CUT IS THE FULL SIZE OF THE KNIFE.]

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a last-time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.25, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00.) We will club the Novelty Knife and the Bee Journal for one year, both for \$1.90.

GEORGE W. YORK & CO., 118 Mich. St., Chicago, Ill.

Please allow about two weeks for your knife order to be filled.

PATENT WIRED COMB FOUNDATION

Has no Sag in Brood-Frames.

Thin Flat-Bottom Foundation

Has no Fishbone in the Surplus Honey.

For Sale

15 colonies of bees in good chaff hives; also a good farm.

40A31 ALBERT BAXTER, Muskegon, Mich.

pened to buckwheat and all the rest of the honey-plants. All the honey the bees secured was from white and red clover, in July.

I have found 3 bee-trees, but there wasn't a good mess of honey in them. There were ants in one nearly as big as bees, and I suppose they ate the honey as fast as the bees stored it. I took some of the bees home, and they have stored about 10 pounds of honey since Aug. 15.

I expect to winter 4 colonies, and hope to have better luck next year.

B. F. SCHMIDT.

Clayton Co., Iowa, Oct. 29.

Working Bees on Shares.

I came across a lot of bees the other day—about 30 colonies—in a blue-thistle and basswood section along the Potomac River. They were in box-hives, and had never had any attention. The people who own them want me to work for the half of them, pay me for new hives, and bear half of the expense after paying for the hives. I expect to go to look after them in a day or two. They say that there is a great deal of honey in the hives, but they are afraid of the bees, so have not taken any off this season, and if I take it off I am to have half of it.

L. A. HAMMOND.

Washington Co., Md., Nov. 6.

Two Girl Bee-Keepers.

I am a little girl only 13 years old, and live on a farm away out here in Washington. My younger sister and I have one strong colony of bees which we found in an old hollow log a year ago. We put them into an old box and brought them home. We got a neighbor to make us a hive, which is 13x20 inches, 2 story, with 7 frames below and 6 above, put in crosswise.

I want to tell what those bees did the past summer. They started in last

We Can't Give Away Anything

You pay for what you get in this world. You understand that. But as a business proposition we want you to try our great medicine for Indigestion, Constipation, Biliousness, Sick Headache, Insomnia, "the Blues," and like complaints—

Laxative NERVO-VITAL Tablets

We know you won't buy it, until you know something about it. The best way to get you to know how good it is, is to let you try it. That's what we do. Send Stamp for "Health" booklet, and we will send you a free sample package, that you may try it yourself. We know you will always keep it in the house, if you once try it. What fairer offer could we make? At all Druggists—10 and 25 cents.

Handsome Stick Pin **FREE!**

If, instead of sending for a sample, you send us 25c we will send you "Health" booklet, a 25c box and a handsome gold stick-pin, set with emerald, ruby or pearl, warranted to be worth double the money. Order by number. This is an extra introductory offer. Only one pin to one person. If unsatisfactory, money returned. Send now while the offer is good.

MODERN REMEDY COMPANY, KEWANEE, ILLINOIS.

[This company will do exactly as it promises.—Editors.]

A HANDY TOOL-HOLDER!

Sent by Express, for \$1.50; or with the Bee Journal one year—both for \$2.00.

Every Manufacturer, Miller, Carpenter, Cabinet Maker, Machinist, Wheelwright and Quarryman, Farmer, or any one using a grindstone, should have one of these Tool-Holders. One boy can do the work of two persons, and grind much faster, easier and with perfect accuracy. Will hold any kind of tool, from the smallest chisel to a draw shave or ax. Extra attachment for sharpening scythe blades included in the above price. The work is done without wetting the hands or soiling the clothes, as the water flows from the operator. It can be attached to any size stone for hand or steam power, is always ready for use, nothing to get out of order, and is absolutely worth 100 times its cost.

No farm is well-equipped unless it has a Tool-Holder. Pays for itself in a short time.

How to Use the Holder.

DIRECTIONS.—The Tool is fastened securely in the Holder by a set-screw and can be ground to any desired level by inserting the arm of the Holder into a higher or lower notch of the standard. While turning the crank with the right hand, the left rests on a steady the Holder; the Tool is moved to the right or left across the stone, or examined while grinding, as readily and in the same way as if held in the hands.

For grinding **Round - Edge Tools**, the holes in the standard are used instead of the notches.

The Fannie Field Poultry Pamphlets Cheap.

We will mail you your choice of any of the following 64-page poultry pamphlets at 10 cents each, or all 3 for only 25 cents—while they last:

POULTRY FOR MARKET.—It is written for those who wish to make poultry-raising profitable.

CAPONS AND CAPONIZING.—It shows in clear language and by illustrations all the particulars about caponizing fowls, and thus how to make the most money out of them. Every up-to-date poultry-keeper should have it.

OUR POULTRY DOCTOR, or, Health in the Poultry Yard, and How to Cure Sick Fowls. All about poultry diseases and their cure.

Remember, we mail the above at 10 cents each, or all three for 25 cents; or for \$1.10 we will mail the three pamphlets and credit your subscription to the American Bee Journal for one year. Address,

GEORGE W. YORK & CO.,
118 Michigan Street, CHICAGO, ILL.

spring without any starters or anything. They just filled that hive plump full of honey. By the first of August we took out two frames of honey, and one of them was 3 inches thick and weighed 8 pounds. Of course, our frames were too far apart, but we have just sent for 3 new hives, 2-story, complete for comb honey. So you see we will be all right for next summer, if we don't lose the bees this winter.

We now have the hive in a large box. First we took a box about 3 feet square—nailed a couple of 2x6 for it to rest on, then we set the hive in it, fixed the entrance, and packed the sides with chaff, then banked up around with earth. We are going to put cushions on top of the upper story, and finish packing the box when it gets colder.

There was a bee-man here this summer who said my bees were hybrids, so I want to get a good Italian queen in the spring, and divide them, and then replace the old queen with another in July. How should I proceed in dividing next spring? If I put a new queen in the old hive will they swarm or not in the spring?

ADNAH AND ALICE YOUNT.
Spokane, Wash., Nov. 7.

[You will find full directions in the bee-book which we have just mailed you, both for introducing queens and dividing. If after reading the book carefully, you don't understand fully, then send on your questions and they will be answered in the Bee Journal.—EDITOR.]

Introducing Queens.

We hear some complaints with the new pasteboard feature. I believe there must have been something wrong with the cages that failed to work. Were the perforations in the pasteboard cut out clear? And did the candy come clear out to the pasteboard, thru the hole intended for the cork? This, I think, is very important. If the bees once get a taste of the candy thru the pasteboard, they are then determined to get it all, and will tear away the paper.

I think by lengthening the cage and making the cork-hole twice as long, and filling it (the hole) with candy, would work nicely if we remove the pasteboard entirely. It would certainly take the bees several hours longer to release the queen than by the cork method.
A. E. WILLCUTT.
Hampshire Co., Mass.

Two Years of Failure.

I have had two years of failure with bees, and this year I got only 23 pounds of honey from 28 colonies.
Fulton Co., Ind. SAMUEL RICKEL.

YELLOW OR WHITE

Sweet Clover Seed

—FREE AS A PREMIUM—

For Sending us One New Subscriber for a Year.

There has been so much written about both the white and the yellow variety of sweet clover, that we will simply say here that if one of our pres-

ent regular subscribers will send us \$1 with a new name for next year (1901), we will send the new subscriber the balance of this year's (1900) numbers free, and mail, postpaid, to the one sending the new name and the dollar, either one pound of yellow sweet clover seed, or two pounds of the white sweet clover. This is a good chance to get a start of both kinds of these honey clovers. Better send two new subscribers (with \$2.00) and get the three pounds of seed. Address,

Langstroth on... The Honey-Bee

Revised by Dadant—1899 Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroly explained, so that by following the instructions of this book one cannot fail to be wonderfully helped on the way to success with bees.

The book we mail for \$1.25, or club it with the American Bee Journal for one year—both for \$1.75; or, we will mail it as a premium for sending us THREE NEW subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

HONEY AND BEESWAX

MARKET QUOTATIONS.

CHICAGO, Nov. 8.—There is a demand for fancy white comb honey at 10c that takes all of this grade upon arrival; other grades are less active, with No. 1 white at 15c; amber and travel-stained white ranges from 13@14c, with dark amber and buckwheat comb 10@12c. Extracted, white, 7½@8c; amber, 7@7½c; dark grades, including buckwheat, 6½@6¾c. Beeswax, 28c. R. A. BURNETT & Co.

KANSAS CITY, Oct. 25.—Fancy white comb, 14@15c; receipts light; amber, 13@14c; dark amber, 9@11c; slow sale. Beeswax, 24@25c; fair demand; light receipts.

W. R. CROMWELL PRODUCE Co.,
Successors to C. C. Clemons & Co.

BUFFALO, Nov. 8.—The high prices attract increase receipts, but fancy white comb is sustained and active at 17@18c; fair to good, 14@15; buckwheat, etc., 11@12c. Supplies here are moderate. All small lots. Extracted is selling some better. Fancy, 8@9c; common would sell at less. Beeswax, 25@30c. BATTERSON & Co.

ALBANY, N. Y., Nov. 10.—Best white comb, 16 @17c; good, 15@16c; mixt, 14@15c; best buckwheat, 13@14c; good, 12@13c. Best white extracted, 9@9½c; mixt, 7½@8½c; buckwheat, 6@6½c.

The honey market holds firm here; receipts light and but little stock on hand.

H. R. WRIGHT.

BOSTON, Nov. 9.—Our market on honey continues strong, with light receipts. Fancy one-pound cartons, 17c; A No. 1, 15@16c; No. 1, 15c; No. 2, 12@13c. Extracted from 7½@8½ cents, according to quality. Beeswax steady at 25@27c. BLAIRE, SCOTT & LEE.

CINCINNATI, Sept. 21.—The demand for fancy comb honey is good and finds ready sale at 16@16½c; No. 1, 15c. The demand for extracted honey at present is slow and offer same by the barrel as follows: White clover, 8½@9c; Southern, 6½@7½c; Florida, 7@8 cents, according to quality. Beeswax, 27c.

The above are MY SELLING PRICES. I do not handle any honey on commission, but pay spot cash on delivery. C. H. W. WEBER.

NEW YORK, Oct. 19.—During the past two weeks, receipts of comb honey have been quite extensive, several carloads of California and Nevada honey having arrived, and some large shipments of buckwheat, and for the present there is plenty of supply to meet the demand. We quote: Fancy white comb, 15@16c; No. 1, white, 14@14½c; fancy amber, 12½@13c; amber, 11@12c; buckwheat, 10@11c.

There are no new features in regard to extracted honey. The demand is fair at unchanged quotations. Beeswax dull at 27c. HILDRETH & SEGELKEN.

DETROIT, Nov. 12.—Fancy white comb, 15@16c; No. 1, 13@14c; darker grades, 10½@11c. Extracted, white clover, 8½c; light amber, 7½c; darker grades, 6@6½c. Beeswax, 26@28c. M. H. HUNT & SON.

SAN FRANCISCO, Nov. 7.—White comb, 13@14 cents; amber, 11½@12½c; dark, 8@9c. Extracted, white, 7½@8c; light amber 6½@7½c; amber, 5½@6½c. Beeswax, 26@28c.

Owing to slim stocks, business in honey of all descriptions is of necessity restricted to very small compass. High-grade water white, either comb or extracted, is especially scarce. Previous quotations remain in force, with market firm at these figures.

A HONEY MARKET.—Don't think that your crop is too large or too small to interest us. We have bought and sold five carloads already this season, and want more. We pay spot cash. Address, giving quality, quantity and price, THOS. C. STANLEY & SON, Fairfield, Ill.

Four Celluloid Queen-Buttons Free

AS A PREMIUM

For sending us ONE NEW SUBSCRIBER to the American Bee Journal for three months with 30 cents, we will mail you FOUR of these pretty buttons for wearing on the coat-lapel. (You can wear one and give the others to the children.) The queen has a golden tinge.

This offer is made only to our present regular subscribers.

NOTE.—One reader writes: "I have every reason to believe that it would be a very good idea for every bee-keeper to wear one (of the buttons) as it will cause people to ask questions about the busy bee, and many a conversation thus started would wind up with the sale of more or less honey; at any rate, it would give the bee-keeper a superior opportunity to enlighten many a person in regard to honey and bees."

Prices of Buttons alone, postpaid: One button, 8 cts.; 2 buttons, 6 cts. each; 5 or more, 5 cts. each. (Stamps taken.) Address,

GEORGE W. YORK & CO., 118 Michigan St., CHICAGO.

AMERICAN BEE JOURNAL

GEORGE W. YORK,
Editor.

CHICAGO, ILL., NOVEMBER 29, 1900.

FORTIETH YEAR.
No. 48.

WEEKLY

MR. ED. BERTRAND,
• Editor of the "Revue Internationale d'Apiculture,"
Nyon, Switzerland.

PUBLISHED WEEKLY BY

GEORGE W. YORK & CO.

118 Michigan St., Chicago, Ill.

Entered at the Post-Office at Chicago as Second-Class Mail-Matter.

IMPORTANT NOTICES:

The Subscription Price of this journal is \$1.00 a year, in the United States, Canada, and Mexico; all other countries in the Postal Union, 50c a year extra for postage. Sample copy free.

The Wrapper-Label Date of this paper indicates the end of the month to which your subscription is paid. For instance, "Dec00" on your label shows that it is paid to the end of December, 1900.

Subscription Receipts—We do not send a receipt for money sent us to pay subscription, but change the date on your wrapper-label, which shows you that the money has been received and duly credited.

Advertising Rates will be given upon application.

Reformed Spelling.—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound. Also some other changes are used.

The Bee-Keeper's Guide

Or, Manual of the Apiary,

—BY—
PROF. A. J. COOK.

460 Pages—16th (1899) Edition—18th Thousand—\$1.25 postpaid.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published to-day. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipt, or his library complete, without THE BEE-KEEPERS' GUIDE.

This 16th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to GIVE AWAY to our present subscribers, for the work of getting NEW subscribers for the American Bee Journal.

Given for TWO New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the two NEW subscribers—simply the Bee Journal for one year:

Send us TWO NEW SUBSCRIBERS to the Bee Journal (with \$2.00), and we will mail you a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both for only \$1.75. But surely anybody can get only TWO NEW SUBSCRIBERS to the Bee Journal for a year, and thus get the book as a premium. Let every body try for it. Will YOU have one?

GEORGE W. YORK & CO.,
118 Michigan Street, CHICAGO, ILL.

BEST Extracted Honey For Sale

ALL IN 60-POUND TIN CANS.

ALFALFA HONEY*****

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough the Alfalfa extracted.

BASSWOOD HONEY*****

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms in Wisconsin. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

Prices of Either Alfalfa or Basswood Honey:

A sample of either, by mail, 8 cents; samples of both, 15 cents—to pay for package and postage. By freight—one 60-pound can, 9½ cents per pound; two cans, 9 cents per pound; four or more cans, 8½ cents per pound. Cash must accompany each order. If ordering two or more cans you can have half of each kind of honey, if you so desire. The cans are boxt. This is all

ABSOLUTELY PURE BEES' HONEY.

The finest of their kinds produced in this country.

Read Dr. Miller's Testimony on Alfalfa Honey:

I've just sampled the honey you sent, and it's prime. Thank you. I feel that I'm something of a heretic, to sell several thousand pounds of honey of my own production and then buy honey of you for my own use. But however loyal one ought to be to the honey of his own region, there's no denying the fact that for use in any kind of hot drink, where one prefers the more wholesome honey to sugar, the very excellent quality of alfalfa honey I have received from you is better suited than the honeys of more markt flavor, according to my taste.
C. C. MILLER.
McHenry Co., Ill.

Order the Above Honey and then Sell It.

We would suggest that those bee-keepers who did not produce enough honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

Address,

GEORGE W. YORK & CO., 118 Michigan St., Chicago, Ill.

Doolittle's Queen-Rearing Book

FREE—For Sending Us TWO New Subscribers for One Year at \$1.00 Each.

Scientific Queen-Rearing,

as practically applied, describes and illustrates a method by which the best Queen-Bees are reared in the perfect accord with Nature's ways. It is written for the amateur and veteran in bee-keeping, by Mr. G. M. Doolittle, the leading queen-breeder of the world.

Index to the Chapters of the Book.

—o—
Importance of Good Queens; Nature's Way of Rearing Queens; Another of Nature's Way; Old Methods of Rearing Queens; Later Methods of Rearing Queens; New Way of Rearing Queens; Getting the Bees off the Cells; What to do with the Queen-Cells; Queen-Cell Protectors; Nuclei—How to Form; Nuclei—How to Multiply; Bee-Feeders and Bee-Feeding; Securing Good Drones; Introduction of Queens; Introducing Virgin Queens; Keeping a Record of Cells, Queens, Etc.; Queen-Register; Clipping the Queen's Wings; Shipping, Shipping-Cages, Bee-Candy, Etc.; Queens Injured in Shipping; Quality of Bees and Color of Queens; Rearing a Few Queens; Later Experiments in Queen-Rearing; Latest Feats in Queen-Rearing.

Bound in cloth, price \$1.00, postpaid; or we will mail it FREE as a premium for sending us TWO NEW subscribers to the American Bee Journal for one year, at \$1.00 each; or for \$1.60 we will mail the book to any one and credit a year's subscription on the American Bee Journal. Address,

AMERICAN

THE OLDEST BEE-PAPER
IN AMERICA

BEE JOURNAL

40th YEAR.

CHICAGO, ILL., NOVEMBER 29, 1900.

No. 48.

* Editorial Comments. *

The Illinois State Convention was held last week at Springfield, and it was our pleasure to be present on Wednesday, the second day. While it was not largely attended, it was an interesting meeting. Mr. C. P. Dadant was present, besides Secretary Jas. A. Stone, Pres. J. Q. Smith, Treasurer Chas. Becker, and others.

The Illinois Association ought to have a larger membership. It offers a year's subscription to the American Bee Journal with a year's membership—all for only \$1.00. Now, there ought to be fully 500 bee-keepers in Illinois who would accept this generous offer.

In order to save trouble to those who wish to take advantage of the foregoing offer, we will say that if you wish to send to us your dollar, instead of Secretary Stone, we will see that you get a receipt for your membership in the Association for 1901—that is, provided you send us all back subscription due (if any), and also \$1.00 for 1901. By accepting this offer, you would not be entitled to any premium or be allowed to take advantage of any other offer we have made.

It seems to us that every bee-keeper in Illinois ought to have enough State pride to become a member of the State organization; and particularly when such easy terms are offered.

Remember, if you accept, be sure to mention that you want the membership also, so that we will know what to do.

Will Cooling Slowly Make Bright Yellow Beeswax?

—An editorial in a bee-paper having said that the secret of getting bright yellow wax was to allow it to cool slowly, Editor Hill thought the space thus occupied would better have remained blank. Whereupon the question was asked in these columns:

"Now, will Editor Hill please tell us why? Is it that the information is of so little value that it is a waste of space, or because there is no bee-keeper who does not already know it?"

The answer given to this question illustrates anew what is so frequently illustrated, that difference of view comes often from a difference in view-points. Editor Hill introduces his reply by saying:

"Yes, we will try to tell why; tho' at a loss to understand why such a request should be made by 'the oldest bee-paper in America.'"

It is only fair to say that the request was made in all sincerity, with an honest doubt as to whether the information was thought to be erroneous or already too well known. Possibly just because of being "the oldest bee-paper" the question was asked, for if Mr. Hill were old enough, or if he were to dig back far enough into the history of the past, he

would find, and without going back more than the matter of a quarter of a century, that at one time it was held as a "secret" that slow cooling would produce bright yellow wax.

Mr. Hill turns his attention almost entirely to the color of the wax, as white or yellow, and says truthfully that nothing in the way of cooling will change the color from white to yellow, or *vice versa*. If a beginner should send to him the question, "What is the secret of obtaining bright yellow wax?" he might be supposed to reply, "There is no way of changing white wax to yellow. The color is a part of the wax."

If Mr. Charles Dadant were asked the same question, he would probably pay little attention to the word "yellow," and mentally put the emphasis on the word "bright," understanding his questioner to say something like this:

"I see cakes of bright yellow wax that are made by others, but mine have not the same brightness of appearance, and have a dull or dirty look. How can my wax be made into bright yellow wax?"

And taking the question from that point of view, the veteran foundation manufacturer would probably reply:

"The secret of bright yellow wax is slow cooling. Melt your wax and let it be a long time cooling, so the impurities will have time to settle, and it will be as bright as the wax of others that you admire."

As a matter of fact, the slow cooling is a *sine qua non* in ninety-nine cases out of a hundred, and perhaps necessary in the one-hundredth case. As Mr. Hill mentions, some wax from old combs needs the addition of acid to bring out the bright color, but that does not take away the necessity of slow cooling, and there is practically no bright yellow wax without slow cooling. Indeed, it is a bit amusing to note that Mr. Hill emphasizes this point by mentioning it in three different places. He truthfully says:

"After a body of wax has been melted and permitted to remain at a high temperature for a sufficient length of time to allow the coarser particles of foreign matter to settle to the bottom, its color can not be perceptibly affected by the length of time occupied in the process of cooling."

That is, you must let it cool slowly enough so that it will be a bright yellow, and after that the cooling will make no difference in the color. Of course it must not be understood that slow cooling changes the color of wax, only as it gives time for impurities to settle.

It would not be right for that editor, who first called out this little discussion, to cultivate a spirit of retaliation, but if he should weakly give way to a spirit of that kind, it would be nothing strange to hear him ask Editor Hill:

"If to get bright yellow wax it is of so little consequence to have the wax cool slowly, would it not be better, instead of occupying nearly a third of a column saying that it must cool slowly, that you should run in a lot of slugs and quads?"

Colorado and Moths.—In the Progressive Bee-Keeper, page 327, F. L. Thompson, referring to what was said in the American Bee Journal about moths in Colorado, objects

to the words, "the moth that infests comb honey there," and says, "An injustice has been, and is, done to Colorado bee-keepers by allowing those words to stand without retraction." Mr. Thompson calls attention to the fact that it was the editor who used the words, but he seems not to have noticed the equally prominent fact that in the same item it was no less an authority than Prof. Gillette, a Colorado man, occupying a chair in the State Agricultural College of Colorado, who said, "there is a small moth.... which I have repeatedly seen infesting honey-comb.... and I have seen them in crated sections of comb honey." The American Bee Journal has neither motive nor desire to do injustice to Colorado bee-keepers, and it is not likely that many Colorado bee-keepers feel that any injustice has been done. Will Mr. Thompson please answer just one question: When Prof. Gillette said, "I have seen them in crated sections of comb honey," was he not speaking of the larvæ of the moth that infests comb honey there?"

* The Weekly Budget. *

MR. W. L. PORTER, of Arapahoe Co., Colo., made us a very pleasant call Nov. 13th, when on his way to visit in Michigan and elsewhere. Mr. Porter's honey crop the past season was something like 30,000 pounds, about one-third being comb honey. He has four apiaries, being one of the big bee-keepers of that great honey State.

MR. GEORGE E. DUDLEY, of Arapahoe Co., Colo., writing us Nov. 12th, said:

"The bee-keepers have not been very prosperous in the West for the past two years, tho honey has been quite high. Owing to the lack of rain and the grasshoppers the crop has been very light. In Colorado the honey crop was fair, and the last carloads of comb honey sold in Denver for \$3 00 per 24-section case."

FATHER JOSHUA TERRY, of Salt Lake Co., Utah, called on us last week when he was attending the national irrigation congress which met here. Father Terry is 76 years old, a pioneer of three States—Utah, Wyoming, and Idaho—and is the oldest living mountaineer in the West. He certainly is a patriarch, and can give some wonderful accounts of life among the Indians and in that wild country a half century ago. He has been a bee-keeper for some 30 years, but lately his apiary has been run down from 90 to 13 colonies, on account of the smelter smoke, it is thought.

We hope Father Terry may survive yet many years, and continue to be one of our oldest esteemed readers of the American Bee Journal.

MR. THOS. WM. COWAN, whose splendid convention paper appears on page 758, sent the following explanatory letter with it to Secretary Mason:

PACIFIC GROVE, CALIF., Aug. 17, 1900.

DEAR DR. MASON:—I have much pleasure in sending you a paper on the Chemistry of Honey. I have endeavored to write it in such a way that every one should clearly understand what I mean, and I hope it may be of some use in clearing up some of the confusion that exists in a few minds about honey, glucose, and sugar. I have tried to make it as short and concise as possible, and I hope it will not be considered too lengthy. You will see that the chemical make-up of glucose is not the same as honey, if we understand by glucose the common sense of the term, namely, commercial glucose.

I am sorry I shall not be able to be with you at Chicago, so you must convey my greetings to the bee-keepers assembled, and say I hope they will have a successful meeting. I

should certainly have greatly enjoyed being with you, and meeting those I have seen before, and the larger number of those of whom I have only read. I hope you will enjoy the convention.

Yours very truly,
THOS. WM. COWAN.

The National Association, and bee-keepers in general, can count themselves very fortunate in being permitted to have among their number a man of such great ability as Mr. Cowan—and one who is so willing to impart his large fund of information for the benefit of all beedom. We esteem it no little honor to number Mr. Cowan among our personal friends, and are glad that now he is practically one of the United States bee-keepers, seeing he makes his home with his son in California, tho still editor of the British Bee Journal, published in London.

THE DEATH OF EDITOR HUTCHINSON'S FATHER, at the age of 82, was chronicled on page 724. Those who know Mr. Hutchinson's kind heart will not be surprised at the following reminiscence of his father:

I can remember, soon after we came from York State, our one cow wandered so far into the woods in search of better pastures that she did not reach home until the next day. Did father get a fish-pole and proceed to dress her down? No, sir! He went into the house and spread a big slice of bread and butter, sprinkled on a thick layer of sugar, and then fed it to the truant. I can remember yet how she bobbed her head up and down while she was eating it, and how she followed father around afterwards, and kept smelling and sniffing to see if she could find another sweet morsel.

The notice ends by the editor saying of his father what is much to say of any man, viz.: "Father was a Christian, a kind husband and father, and an honest and upright man."

SECRETARY A. B. MASON, of Toledo, Ohio, writing us Nov. 17, had this to say about his bees, etc.:

FRIEND YORK:—Cold weather came on the 14th, and our bees went into the cellar yesterday in good condition. I had but little surplus honey this year—perhaps 25 pounds of extracted per colony.

Well, it's so late I believe I'll not send you an invitation to my 67th birthday (or is it the 68th?) anniversary, that comes to-morrow, but we'll not celebrate till the next day.

Very truly yours,
A. B. MASON.

Too bad we had to miss that anniversary occasion—both on account of receiving no invitation, and because Dr. Mason doesn't know any better than to live so far away from Chicago! Well, just the same we wish him a large number of returns of the day, before he shall be called to join the great majority of good bee-keepers and others who have "gone on before."

MR. W. H. NEBLICK, of Indian Territory, we must thank for a nice box of open cotton-bolls, sent Nov. 5. He reported the cotton-fields as being white at that time, with no frost yet, and that bees had done well this year. We have never seen cotton growing, but think it would be a beautiful sight. We divided some of the cotton-bolls among the employees of this office, reserving several for our own home. They are ornamental in this locality, and will be prized by all.

THE NOVELTY POCKET-KNIFE offered on page 765, will hereafter be \$1.25, or the knife and the American Bee Journal one year both for \$1.90. In either case the knife is sent by registered mail. If wanted in time for using as a Christmas present, the order should be sent to us as early as possible. There is always a great rush for these knives a week or two before Christmas, and then they are more likely to arrive after Christmas than before, spoiling the effect of the present somewhat.

Convention Proceedings.

Report of the Proceedings of the 31st Annual Convention of the National Bee-Keepers' Association, held at Chicago, Ill., Aug. 28, 29 and 30, 1900.

BY DR. A. B. MASON, SEC.

(Continued from page 742.)

DISCUSSION OF DISEASES OF BEES AND THEIR CURES.

Prof. C. P. Gillette—I have with me two small microscopes and lenses. I will be glad to place them on the table and let any of you examine these larvæ. Dr. Howard says they can be examined with small lenses. I will put them on the table during the intermission, and you may examine them.

Pres. Root—This question is open for discussion. I would like to hear from Prof. Gillette in regard to pickled brood in Colorado.

Prof. Gillette—I have made no special study of the pickled brood in Colorado. We have in the northern part of the State, I think at least quite generally over the State, what is considered there as pickled brood. The larvæ will lie in the cells, and usually surrounded by a considerable amount of food. The larva itself is in a wet, soggy condition, usually somewhat discolored, of a brownish color, and can be removed with a toothpick or a pin, and you can still detect the shape of the larva and the pupa, and in some cases I have noticed the adult bee, or the bee apparently ready to emerge from the cell, but still dead in the cell, and apparently from the same cause—wet, soggy, and dead—evidently not foul brood.

Mr. Green—To what extent is pickled brood contagious?

Prof. Gillette—I don't think any one knows; in fact, I am not sure it is known that it is positively contagious, tho it probably is. I believe the cause of pickled brood is not known at present any farther than what Dr. Howard has told us. It is probably due to bacteria of some sort.

Mr. Green—Have you known it to damage colonies to any great extent as honey-producers?

Prof. Gillette—I think so in some cases, but not in very many; I have heard of two reports of the disease where it was large enough to decrease the number of colonies quite badly, so that the colonies would not amount to much. At Ft. Collins I have noticed the disease for four or five years, but only a small number of colonies were affected; I never had a case bad enough to injure the colonies perceptibly. Usually only a few cells in a colony were affected—I could find ten or a dozen, perhaps 15 or 20 of these dead larvæ when the disease was the worst, but this occurred within a short period of time. Mr. Aikin is present, and could give some information in regard to that.

Mr. Aikin—I can't give any information further than has already been given. There is some disease existing among our bees, and has been for a number of years—I think six or eight years; what it is I never knew, and, as to the extent of it, I never had it to appear sufficiently in any one colony to make any perceptible difference in the strength of the colony, or affect it any way, further than that there was scattering dead brood. It comes and goes; as to the cause of it any further, in a scientific way, I can't give you any information whatever.

Mr. Hatch—Perhaps I can offer something in a practical way. I don't know anything about it scientifically, but I found this pickled brood in California, and so bad in some instances that the colonies were entirely worthless the whole season.

Dr. Mason—When was that?

Mr. Hatch—That was three years ago. Then I came to Colorado and bought out two apiaries. I found it there, and I found the colonies were completely worthless the whole season. When I came to Wisconsin I bought out four apiaries. In three of those I found the same pickled brood, and I have had this season colonies that were completely worthless—good for nothing on account of it. I think it is almost worthless where you find bees with pickled brood. I never found any kind of disease in Arizona bees, and I think for lack of observation is one reason,

when they think they haven't got it. I think there are very few apiaries in Wisconsin but what have it more or less.

S. W. Snyder—I would like to ask if a prevailing notion does not exist among bee-keepers that this pickled brood will finally develop, thru a series of developments, into foul brood?

Pres. Root—If you are asking the chairman that question, I would say that it is somewhat of a prevailing notion that pickled brood continuing to develop would develop into foul brood. The most I can say is that it would only be a favorable medium for foul brood; pickled brood would not very well turn into foul brood. Am I correct, Prof. Gillette? This gentleman here wants to know whether one disease would turn into another. The question was asked whether pickled brood, after a series of developments, would finally develop into foul brood. Prof. Gillette does not know what I have said, so I will see what he says without any prejudice.

Prof. Gillette—We might have to know a little more about pickled brood before we could positively answer that, but it is practically certain that the pickled brood can not be any stage of foul brood. Any disease that is caused by disease-germs produces a peculiar disease; you can't get from that disease-germ some other disease any more than you can plant one kind of seed and get another kind of crop. Certain diseases work in a certain way upon plants and animals, and produce certain results, always the same. The cause of pickled brood not being certainly known, might be noticed in a certain locality, might take a certain form which we call "pickled brood;" in that case we would occasionally find foul brood developing from it; it is practically certain that one isn't related in any way to the other.

Mr. France—I agree with the professor in my experiments in that respect; my observation now is for four years in our State, that pickled brood need not develop into foul brood. It may form the proper medium, but so far as my observation goes pickled brood would be a way to develop foul brood. I think they are independent.

Pres. Root—Dr. Mason has asked me how I am to tell if they agreed with me; all right enough.

Dr. Mason—That doesn't agree with what you said awhile ago.

Pres. Root—I said it might be a favorable medium for it; but it would not develop into foul brood, as I understand it.

Mr. Snyder—I would like to ask another question. In case a colony has been slightly affected this year with pickled brood is it likely to follow up next year in a more serious form, having disappeared this year?

Pres. Root—I would like to pass that on to some one who has had more experience—Mr. France or Mr. Lathrop.

H. Lathrop—Several years ago I had several colonies in northern Wisconsin that were so badly affected with pickled brood when I first saw it that I was scared, because I was afraid of foul brood. I marked those colonies, and went so far as to burn up one frame of brood and honey; but the disease disappeared towards fall, and did not appear the next year in those colonies that I had marked on account of being the worst affected with pickled brood; but I can always find, every year, a few cells somewhere in the apiary of what I understand now to be pickled brood.

Dr. Mason—What is the cause of pickled brood?

Pres. Root—Lack of pollen is one thing, I think Dr. Howard says. I don't know what the other causes are; perhaps Prof. Gillette will tell us.

Prof. Gillette—I don't know the cause. I think Dr. Howard has been working on a certain cause of pickled brood, and I believe he stated in the paper he did not yet know certainly the cause. It seems to work like a bacterial disease, and still he has not been able to isolate the particular germ that will cause the disease; so as yet we are in the dark, as I understand it, as to what the real cause is. It has been thought to be caused by chilling of the brood, but I think that has been disproved, from the fact that it will disappear when there has been no opportunity for chilling of the brood. It seems like a disease caused by a disease-germ, and that that germ has not been found.

David Coggs—I don't know anything about it. I have never seen a case.

Dr. Mason—Of pickled brood?

David Coggs—Not that I ever thought was such a thing, in my apiaries.

Mr. Aikin—You were speaking of the lack of pollen being probably the cause, or having something to do with the disease. I will make this statement in regard to the matter, that I have been reading in the papers in regard to the famine districts in the East, that the famine itself was not

the worst result; that the consequences that followed the famine were of far greater concern than was the famine itself, and one of the particular reasons is this, that the famine produces such a weakened or enervated condition of the system that diseases are likely to follow and attack the individual. Now, coming more directly to our subject, Mr. W. L. Hawley, of Ft. Collins, with whom Prof. Gillette is well acquainted, I suppose—they are both in the same town—Mr. Hawley claims to have discovered the cause of pickled brood. He has a dead brood that has afflicted his bees the worst of any I have known in the State, and I suppose it is this same disease that we are talking about. I say I suppose, for I don't know. Mr. Hawley said that he came to the conclusion that it was a lack of pollen, and when he was examining his colonies he took special pains to notice whether the colonies being diseased had pollen in the hives, and he found those that were the worst diseased had the least amount, some having none to be found whatever. Well, now, it is a fact that in our locality there is a dearth of pollen, usually at all seasons of the year in my locality, which is 14 miles from the Agricultural College where Prof. Gillette is, and 15 miles from Mr. Hawley's apiary. In my locality the bees will search for pollen at all times of the year, except during a fine honey-flow, and when the honey is being gathered during a flow there is no pollen whatever gathered, except occasionally a bee will get a little, which the bees seem to need, absolutely need, in their building operations. I might incidentally mention that of course that condition favors us, that we never have pollen in the sections or surplus honey under all normal conditions. Now, Mr. Hawley undertook a method of curing this disease in his bees, and he said it was so bad that almost the entire brood of some colonies was dead, and the procedure was this: He took combs—brood-combs, right from the brood-nest, but not having brood in them—and took common flour and filled the cells of from one to two combs, placing those combs one on either side of the brood-nest, and he assures me that just as quickly after putting that in as the bees could mature what brood they had, or clear out what brood was dead, that thereafter there was no more of the disease, and he was so confident that he was on the right track that he has practiced now for two seasons feeding flour at that time of year. It usually gives most trouble about June and July, and he says he has no more trouble with it. Now, here in this room yesterday I examined the comb that was badly affected, I would say badly, with some disease, some dead brood, I don't know what it was, but it looks just like what we have in Colorado, and I mention this matter of the lack of pollen; and on examination of this comb I find there is pollen in it; but the question will arise, Was that pollen there when the disease entered and killed that brood, or has it been stored in that comb since? It is evident to every one of you that the presence of pollen in that comb does not in any sense prove that the brood died for lack of pollen, or otherwise, because, as I say, the pollen may have been placed in that comb after the disease entered the brood, so we don't know. This is one of the points—one of the places—in which we are so liable to make a slip in our observations, and it is very hard for us to say that a certain thing is so, that a disease is caused by certain conditions, unless we have put it thru a very severe and accurate test, such as they are capable of doing at our agricultural colleges and experiment stations. You all know how that comes about, that people will tell you that they have found out for certain what will accomplish this and that in our apicultural affairs, and they come out in the papers with an article and tell what they have discovered; and the next year, or, may be, before the next year commences, they find they have made a mistake, and hear no more from them. Now, I don't want you to go out and say that this disease is caused by lack of pollen, from what I have told you of Mr. W. L. Hawley's observations. It is possible, after all, he is mistaken; that the disease exists all over the country more or less, east, west, north and south, and in localities where they evidently have pollen at all times in the hive or available in the fields, seems to me to be proof that Mr. Hawley may be mistaken. The thought is worth considering, and we should look into it, but we should not yet jump to the conclusion that we have the cure, or the cause, of pickled brood in the absence of pollen. Now, from a scientific point, and from a practical point, this is all I know about the matter. I have intended to follow Mr. Hawley's methods, and make some closer observations. I intended to do so during the past season, but a man who is as busy as I am, and has to make his living from his business, can not accomplish these things in definite form so that we really know, and

can say absolutely that we do, or do not, know the cause; and it is a matter for experiment stations to take up and go into the details in a thoro and scientific manner. It should be the duty of every one of us who is in touch with these experiment stations to aid in every way we can in getting at the right in these matters.

Pres. Root—I would say that in my private correspondence I run across quite a number of letters wherein the suggestion is made of the lack of pollen as the cause of this disease. I did not know that Mr. Hawley had ever thought that the lack of pollen had ever been instrumental in starting pickled brood, and I know that quite a number have said something to that effect, and there may be something in it.

Mr. Hatch—I am not anxious to prolong this discussion, but I am loth to have the convention go on record as assigning the lack of pollen as the cause of pickled brood, because I am quite positive there are cases in Wisconsin that are not due to lack of pollen, as there is no lack of pollen from the time willows bloom until the honey season closes. I am sure that all the cases that have come under my observation in Wisconsin are not from lack of pollen. I think the case stated by Mr. Aikin doesn't necessarily prove the lack of pollen. It would seem to indicate to my mind that it came from the pollen, and not from the lack of pollen.

Pres. Root—Of course that is a matter to be determined by the experiment stations. I hope the one at Ft. Collins may be able in time to take hold of that, as it is in that immediate vicinity. We must not spend too much time on it. I thought some of the convention would like to know some of the symptoms from the bee-keepers' standpoint, of pickled brood, foul brood and black brood. I haven't a microscope; you will have to depend upon what I can see with my naked eye. Foul brood has for its principal symptom the ropiness of the dead matter; it has a sort of coffee color, or yellow color, and it also has a foul odor, something like an ordinary glue-pot, such as we see at the cabinet-maker's shop with poor glue in it. Pickled brood sometimes has a sour smell. Black brood will not have that sour smell. Pickled brood and black brood look very much alike, and I think in many cases, and perhaps a majority of them, it would take a microscope to determine the difference; but pickled brood, after it has advanced to a certain stage, if taken away from the bees and left for a week or ten days, will be apt to show a kind of white mold, something as the cotton-batting had been drawn over the surface of it. Black brood never has that. Pickled brood sometimes will have a sour pickle smell to it. Black brood always has it so far as I know, very strongly. The color of pickled brood and black brood I describe together, because they are alike; the color of the dead larvæ is generally white at the first stage of the disease, and sometimes the pupa itself is white. In the more advanced stages we find it turning to a coffee color like foul brood, and then we will find, if it is black brood, a cell—perhaps a very few of them—that will "rope" very slightly, perhaps $\frac{1}{8}$ to $\frac{1}{4}$ inch, but you will find, I should think, only three or four of such cells in a good comb. In the case of foul brood, if you find one cell that is ropy, you will be likely to find other cells ropy; but that isn't true of black brood. In pickled brood I think we never find a ropy cell. From a layman's standpoint—for any one who is not a scientific bee-keeper, and does not have at his command a microscope—I think these are the only symptoms which we can give by which we can diagnose these various diseases.

Pres. Root—We will now listen to the paper by Mr. Thomas Wm. Cowan, editor of the British Bee Journal. Mr. Cowan is now living in California. Dr. Mason will read the paper.

CHEMISTRY OF HONEY, AND HOW TO DETECT ITS ADULTERATION.

It is not at all unusual to hear people speak about bees gathering honey from flowers, or mentioning various plants as "honey-producing plants." Even in botanical text-books we read about "nectaries" or "honey-glands" in flowers. These terms are certainly not correct, because honey is essentially a product of the bee, and not of the flower which the insect visits. The sweet secretion which the bee gathers from the flower is called *nectar*, and consists almost entirely of cane-sugar. But after it has been collected by the bee, and before it is stored in the cells of the comb, it undergoes a change, and the cane-sugar is transformed into two other sugars called respectively grape-sugar and fruit-sugar. This transformation is brought about thru the action of a secretion produced by glands

situated in the head of the bee, and is similar in operation to saliva in the human being.

In order to have a right understanding of the subject, we will briefly glance at the way in which the sugar composing nectar is produced in the plant.

There is an important group of compounds which form the largest part of the body of all plants. These contain carbon, hydrogen and oxygen, and the elements of hydrogen and oxygen being present in the same proportion as they exist in water, the name of *Carbohydrates* has been given to them.

When light shines on a green leaf and stimulates it into activity, the leaf absorbs, principally thru its stomata or pores, carbon dioxide (also called carbonic-acid gas) from the air. After entering into the cells of the leaf, the carbon dioxide, together with a certain proportion of water, undergoes chemical changes, the carbon of the carbon dioxide becoming fixed, and a rapid accumulation of carbohydrates takes place in the tissues of the plants, the oxygen escaping into the air.

The most important of these carbohydrates is starch, which, thus formed, at first deposits in the leaf-cell in which it took its origin. From it a number of other vegetable products take their rise, which constitutes the greater proportion of all plant structures. In order that this may be done, the starch once formed must be carried about by the sap of the plant into every cell, whether of the root or flower. As each cell is a delicate membranous bag closed in itself, a solid matter—such as starch would be, owing to its insolubility in cold water—can not be removed from the tissues in which it is stored to the centers of growth where it is needed, but must be digested or transformed into a soluble easily diffusible substance. The solution is effected by the chemical activity of an enzyme, or unorganized ferment, which is secreted by the protoplasm in the plant. This ferment is called *Diastase*, and it is owing to its presence in active plant-juices, that the starch is dissolved. The solution thus obtained is devoid of starch, has become sticky and sweet, and contains a substance called Dextrine, and a variety of sugar named Maltose.

From the solution every minute cell abstracts a portion of the sugar and deposits it in the form of *cellulose*. This is the framework or woody fibre of every plant. It has chemically exactly the same composition as starch. Another portion of the dissolved starch is changed by the plant into *cane-sugar*. All plants form more or less cane-sugar, and secrete it by an apparatus called a nectary, which is generally connected with every flower, altho in many plants nectaries exist in other parts, perhaps quite distant from the blossom, and these are called extra-floral nectaries. This secretion, properly called *nectar*, is what bees gather, and it consists almost entirely of cane-sugar, to which the sweetness of most flowers is chiefly due. The bee appropriates this cane-sugar, and by means of the glands already mentioned, transforms it into two other sugars called respectively *dextrose* and *levulose*.

According to their composition sugars fall into three groups. These are:

1. The *glucose group*. The principal members of this group are dextrose or grape-sugar, levulose or fruit-sugar, and galactose.
2. The *cane-sugar group*. The principal members are cane-sugar, sugar of milk, and maltose.
3. The *cellulose group*. The principal members are cellulose, starch, gum, and dextrine.

As much confusion exists in the lay mind respecting the various terms used by the chemist in describing sugars, and as each of the above groups contains different sugars, altho of the same chemical composition, it is well to explain the meaning of those terms with which we have to deal, so that the uninitiated may understand just what the chemist means by the words he uses.

Dextro-glucose, glucose, and grape-sugar, are synonymous, and are frequently used to designate dextrose.

Levo-glucose, fruit-sugar and fructose, are other names for levulose.

In like manner saccharose, sucrose, and cane-sugar, signify the same thing.

When the chemist speaks of sugar he may allude to any of the sugars in groups 1 or 2, and when he uses the term glucose he may mean any glucose of group 1. With those who are not chemists it is different; they understand by glucose, commercial glucose which is dextrose only, and by sugar ordinary cane-sugar such as they use daily in their households. Now, altho, from a chemist's point of view honey is glucose, to call it so puzzles an ordinary person, because he at once, and quite naturally, associates it with

commercial glucose or dextrose, from which honey materially differs in that it consists of both dextrose and levulose.

Honey consists of water and sugars belonging to the first group. The quantity of water varies from 12 to 23 percent, the normal proportion being 18 to 21 percent. When the percentage falls below 18 the honey is generally hard and solid; when it is higher than 21 it is often almost or quite clear, but the clearness does not always depend upon the amount of water alone.

Normal honey almost invariably divides into two portions, a crystalline, solid one, and a syrupy one devoid of the power of crystallizing, and rather sweeter than the solid portion. Chemically these two dissimilar substances are identical in composition, and both belong to the glucose group of sugars, but physically they possess very widely different properties. If a polariscope be used it would be found that the crystalline portion twists a ray of polarized light to the right, and is therefore called *dextrose*; the non-crystalline portion however turns the polarized ray to the left, and for this reason it is called *levulose*.

The great bulk of honey is composed of these two sugars in about equal proportions. It is kept in solution or liquid by about one-fifth of its weight of water, which, however, is not quite sufficient to keep one of the sugars—dextrose—permanently in solution, and gradually this separates in the crystalline form, holding the liquid levulose in suspension, and we have what is known as candied or granulated honey. The proportion of water in the honey is not a merely accidental one. Were more than one-fifth part of water present, it would be so fluid as to cause the honey to run out of the comb. Were it smaller than that stated, it would in damp weather attract moisture from the air. It remains transparent in the comb for a considerable length of time, because it neither loses nor appreciably attracts moisture.

Genuine honey almost invariably becomes opaque, or granulates, altho there are rare exceptions. When it happens that before the honey is extracted some of the crystals of dextrose remain attached to the cells, levulose predominates, and the honey remains clear for a long time, notwithstanding that the proportion of water may be very low.

All the saccharine substances in the different groups mentioned act upon polarized light, turning it more or less to the right, except levulose, which, as I have already stated, turns the ray to the left.

When treated with acids they undergo a remarkable change—they are all transformed more or less completely into dextrose, with the exception of cane-sugar, which yields both dextrose and levulose.

The rotation of the polarized ray, to the left of levulose is greater than the rotation of the same quantity of dextrose is to the right. Therefore, when mixed together, as they are in honey, the polarized ray is twisted to the left side. All other sugars turning to the right, it is clear that whatever saccharine admixture is made to the honey, the mixture must polarize to the right, thus possessing perfectly distinct optical properties, distinguishing it from genuine honey.

But the bee carries with it from the flowers other constituents of considerable importance, and incorporates them in the honey. A great number of pollen-grains find their way into the cells, and from these minute quantities of coloring-matter are dissolved, which give honeys from different flowers the innumerable shades of yellow and brown with which we are so familiar. Thus, honey produced from white clover is devoid of color, that from sainfoin is yellow, from beans brown, and from heaths quite dark. Honey always contains more or less pollen, and with the microscope an expert can frequently tell from the shape of the various pollen-grains, the sources from which the honey was derived.

Still greater is the variety of flavors and odors, and every conceivable aroma due to the essential oils, is met with, so that a practiced observer can, without much difficulty, decide from what kind of blossom the nectar was obtained from which the honey was produced.

Having briefly stated the characteristics of genuine honey, I will endeavor to show how when adulterated the adulteration can be detected.

There are three classes of manufactured honey: First, that made from ordinary sugar, consisting of cane-sugar syrup; second, that obtained by the action of an acid or ferment upon cane-sugar, and consisting as genuine honey does, of water, dextrose and levulose; and, third, the product of the action of acid on starch, called corn syrup or commercial glucose.

A solution of pure honey in water when boiled with an alkaline solution of sulphate of copper deposits a precipitate of red cuprous oxide. Neither by the addition of alcohol nor of lead acetate, nor of barium chloride, should a solution of honey be rendered perceptibly turbid. Subjected to fermentation by the addition of yeast, practically the whole of the saccharine material should be decomposed and transformed into alcohol and carbon dioxide. And lastly examined by the polariscope the polarized ray should turn to the left. Some honeys, such as those produced from nectar gathered from extra-floral nectaries, polarize to the right, but if further subjected to dialysis for a certain length of time, the ray turns from right to left back to zero.

Cane-sugar syrup, altho it agrees in its chemical behavior with real honey, when treated with alcohol, lead acetate or barium, not yielding any precipitates with them, differs essentially from it inasmuch as it does not reduce an alkaline solution of copper sulphate, consequently no deposit of red cuprous oxide takes place. A solution of cane-sugar turns the polarized ray of light to the right.

Cane-sugar which has been made into dextrose and levulose by treatment with an acid, is chemically identical with honey, and exhibits the same characters, but its origin is betrayed by the traces of acid which always remain mixed with it, and which cause precipitates with lead or barium solutions.

Starch or corn syrup, known commercially as glucose, differs in almost every respect from honey. It throws down abundant precipitates with lead and barium solutions, and often with alcohol. It does not ferment completely, but leaves about one-fifth of its weight as unfermentable gummy residue, and, examined by the polariscope, it turns the ray of light powerfully to the right.

Glucose is prepared on a large scale from corn-starch. The transformation is usually effected by boiling with dilute sulphuric acid. The excess of acid is removed by treating the solutions with chalk and filtering. The filtered solutions are evaporated to a syrupy consistency, and sent into the market under the names of glucose, corn syrup; or to dryness, the solid product being known in commerce as "grape-sugar." Much of the granulated sugar of commerce is adulterated with glucose.

If in the treatment of starch with sulphuric acid the transformation is not complete, and this is usually the case, the product is a mixture of dextrose, maltose, and dextrin. It is quite easy generally to recognize the acid which has been used to convert starch into glucose. In the laboratory it is quite possible to make pure glucose and remove every trace of acid, but commercially it is practically impossible by subsequent precipitation of the product to get rid of this acid, and as a consequence it appears in the honey which is adulterated with it, and by adding to a clear solution of honey containing such glucose a solution of barium chloride, a white turbidity at once makes its appearance varying in density with the quality of corn syrup present and the state of its purity.

The exact percentage of glucose added to honey can be determined by the polariscope. I use a Soleil-Duboscq instrument with a tube 200 millimetres long, and Dr. Haenle's formula, which is the following:

$$x = \frac{(P+p) \times 3}{10}$$

for flower honey, x = percentage of adulteration, P = polarization of honey that is being examined, p = normal polarization of pure honey. The normal polarization of honey being 30 degrees, it follows that if we find a honey that shows say 44 degrees of polarization to the right, according to this formula, we have

$$\frac{(44+30) \times 3}{10} = 22.2 \text{ percent}$$

of corn syrup added. In this way it is quite easy to determine whether a sample is adulterated with glucose, and the amount of the adulteration.

Cellulose has chemically exactly the same composition both qualitatively and quantitatively as starch, and, like it, can be transformed into glucose by the action of sulphuric acid. It will, therefore, be seen that substances containing cellulose, such as old cotton and linen rags, paper or wood, could be used for the preparation of dextrose or glucose, did not the low price of starch render the employment of cellulose for the preparation of this kind of sugar unprofitable.

When bees have been fed with cane-sugar syrup, only part of this is transformed into dextrose and levulose, so

that it is easy to detect the presence of cane-sugar in the way I have pointed out before, when this method of fraud had been adopted.

Chemistry has made enormous strides during recent years, but so far only chemical compounds of comparative simplicity have been the result, and not in any case has any complex product, such as is used for man's food, been obtained. The value of food substances, and above all their price, generally stands in no relation to their composition. Composition, as ascertained by chemical analysis, goes for very little; *quality*, which is dependent upon circumstances beyond the present knowledge of the chemist, goes for a great deal. For instance, a pound of tea has chemically no more value than a pound of plum or willow leaves, but who would pay the price for these that tea is really worth? Wine consists of dilute alcohol, slightly acid, and more or less colored, but chemistry has failed to produce from these ingredients anything resembling the high-class wines which command such enormous prices. Sawdust is chemically the same, both qualitatively and quantitatively, as corn flour, but one would not care to have the former substituted for the latter at the same price. We would resent our butcher giving us leather instead of meat, altho the composition of these is chemically almost identical. I might extend this comparison indefinitely, for it is the same with almost every article of food or luxury. The difference between good and bad tea, or wine, or meat, is so small that the most careful analysis fails to detect it. The value, therefore, is not a question of the composition of the article, but is regulated by the presence or absence of minute quantities of flavoring-matters about which we know very little or nothing at all.

We prize honey not because it consists, as the chemist would say, of sugar and water, but because it possesses a delicate aroma and flavor which is always absent from, and can not by any known means at present be imparted to, any artificially made syrup. Glucose, and even cane-sugar that has been given to bees to store in the combs, are totally devoid of the aroma of honey, so that when these are substituted for honey the fraud can be easily detected.

The taste of the public has not yet been sufficiently educated, and any syrup is eaten as honey provided it looks transparent, and is contained in a neat jar and has a gaudy label. When the taste is as well educated for honey as it is for tea, meat or other articles of every-day consumption, no one would venture to palm off artificial syrup for real honey.

It is difficult to decide whether the food-value of the substitute is as good as that of the original article. Sugar in any form produces the same proportion of heat. Oleo-margarine, when burnt or digested, produces the same amount of heat as butter. Yet butter holds its own against its substitutes on account of its delicacy of flavor and more ready digestibility. And we have reason for believing that a similar difference exists between honey and glucose. We know that bees refuse, as long as they are able, to feed upon glucose, and when driven by starvation to take it they soon die. The probable reason for its deleterious effect is that levulose, one of the constituents of honey, is absent, and that the glucose of commerce contains impurities. At any rate any chemist caring for his reputation would pause before giving a definite opinion as to the relative food-values of the two products.

Moreover, we know that dextrose is the sugar found in the urine in cases of diabetes, often to the extent of 8 to 10 percent, and also that levulose is a purgative, which probably counteracts any evil influence dextrose may have if taken alone. Thus we have very good grounds for considering glucose deleterious, while the combination of dextrose and levulose in the form of honey as a healthy food. Experience has shown that honey can frequently be eaten by those who can not take sugar. The reason is, that when cane-sugar is taken, before it can be assimilated it has to be transformed into the two sugars that compose honey. Should the digestion be faulty, and the transformation not be complete, some of the cane-sugar enters the circulation and acts as a poison in the blood. Honey is already cane-sugar perfectly transformed, and is therefore ready to be assimilated without any previous digestion. For this reason pure honey is to be recommended for children and persons of weak digestion.

I will not enter into the question of whether the substitutes for honey should be allowed to be sold. If they are *per se*, not considered harmful, they should at any rate, in fairness to the purchaser, be labelled, and their constituents stated on the labels, so that the buyer may know exactly what he is paying for, and I have no doubt that when

the public taste is educated, as it has been in respect to other foods, there will be a demand for good, delicately flavored honey, and glucose sold as a substitute for it will be a thing of the past. THOS. WM. COWAN.

Pres. Root—This is a most valuable paper, but it is a little too technical for most of us, I imagine. As our time is spent this morning, I think we would better hurry on with the program. If there is no objection I will do so. Before taking up the balance of the program, I wish to name the committees I was to name yesterday.

THE COMMITTEE ON RESOLUTIONS.—R. L. Taylor, Rev. E. T. Abbott, and O. L. Hershiser.

COMMITTEE ON SCORE CARDS.—N. E. France, W. Z. Hutchinson, F. Wilcox, R. C. Aikin, and O. L. Hershiser.

These committees will be prepared to report the first thing this evening.

(Continued next week.)

Contributed Articles.

No. 6.—Interesting Notes on European Travel.

BY C. P. DADANT.

BEFORE I describe my visit at Nyon, it may be well for me to tell the readers how we originally became acquainted with the editor of the *Revue Internationale*. This is a bit of retrospective history on European bee-culture.

When we came to America in 1863, my father, who was then 46 years of age, had for many years kept bees in Europe for pleasure, but had never made a business of bee-keeping. Within two or three years, with the help of the works of Langstroth and Quinby, he ascertained what a great step forward was being made in this country, and he endeavored to give his native land the benefit of what he had learned by sending articles on the movable-frame hives to *L'Apiculteur*, published at Paris, and which was the second oldest periodical publication in the world, the oldest being the *Bienenzeitung*. But the editor of *L'Apiculteur*, Mr. H. Hamet, happened to be a man who was satisfied, in his own mind, that no progress could be made in the particular lines that he controlled, and he systematically fought everything new in bee-culture. He called the movable-frame hive a "puppet-show box," and the honey-extractor "a useless toy." He resolutely closed the pages of his magazine against any attempt at introducing progress.

But my father was not to be put off, and began to write articles for the various French agricultural papers. After some seven or eight years of controversy, public opinion began to form, in spite of Hamet, in favor of the American movable-frame hives, and several imitators came to the rescue. It was then that Mr. Bertrand established the magazine now known as the "*International Review*," and wrote to my father, asking for his collaboration. His request had hardly been mailed when he received a proffer of help from him. The fight for progress was then well established on Swiss soil, and it was not long till American views on bee-culture were generally accepted by French speaking bee-keepers. Even the old *Apiculteur*, after the death of Hamet, was reluctantly compelled to accept the progress accomplished.

Since that time Mr. Bertrand has published one of the most popular books on bee-culture, the "*Conduite du Rucher*"—the *Conduct of the Apiary*—which was translated into several languages. He has also been the editor of the French edition of Langstroth. Thus for 22 years past we have been in constant communication with him, and I may truly say that when we found ourselves in his house we felt absolutely "at home."

The Swiss "chalet," which is seen everywhere in Switzerland, from the top of the highest pastures to the foot of the hills, on the lake shores, makes a very pretty picture. Up in the mountains, the coarse shingles that form those long-eaved roofs, are not only nailed down to the rafters, but they are also covered with large

stones to prevent the high winds, that whirl around the peaks, from tearing them off.

The mountain chalet is used not only as a dwelling for the herdsmen, but as a milk-house, and in many cases as a shelter for the cattle during the storms. The chalets on the lake shores are, on the contrary, very ornamental villas, with all the comforts of civilization. The view given here is of the one inhabited by Mr. Bertrand, and, tho very attractive, is not to be compared with the view obtained from the windows of that same house. Imagine yourself looking out on a pretty park adorned with flower-beds, running streams of clear water, two small ponds with water-lilies of different colors, small groves of trees on either side; beyond the blue waters of the lake, three miles wide, a number of villages scattered on the far-away hills, an amphitheater of mountains in the rear, and, still further back, 60 miles away, but seemingly close at hand, the snowy summit of Mont Blanc, white in the morning, pink at sunset, and of a bluish shade at dusk. Walking thru this little park you discover, in a remote corner on the right, a couple dozen hives of bees, hidden among the trees, and a small bee-house with the usual implements of the experimenting apiarist. On the left is a small river emptying into the lake, with a nice little row-boat harbored in its mouth.

In that little park Mr. Bertrand has gathered together a wonderful collection of foreign plants and trees, especially, of course, honey-producers. Here I saw an old acquaintance, the Chapman honey-plant (*Echinops sphaerocephalus*), which made such a stir among our bee-men at one time. Mr. B. narrated to me his experience with that plant. He had noted its attractiveness for the bees long before we did on this side of the Atlantic, and had cultivated it extensively enough to ascertain that its value to the bee-keeper was only apparent. When the demand began for it in America, Mr. D. A. Jones, of Canada, offered \$5.00 per ounce for the seed. Upon this, Mr. B. harvested some four pounds of it and sent it to Mr. Jones with his compliments. Mr. Bertrand says that a number of plants have, like this, a great attraction for the bee that are not honey-yielders.

He showed me another, the *Eryngium giganteum*, on which the bees are forever working while it blooms, but without results. This was tested by marking some of the bees with flour. The same bee was seen to work about the same bunch of these flowers for five consecutive hours without any apparent result. He nicknamed the plant, "The-bar-room of the honey-bee," because the more they sip the dryer they are. Luckily it does not make them tipsy, but wears them out, which is nearly as bad. There are probably a number of plants which ought to be placed in the same category, plants whose fragrance evidently attracts them without furnishing any returns for their pains, except, perhaps, the pleasure of sipping an infinitesimal drop of nectar, which serves only to keep them at work trying for more. Perhaps there are times or locations when the honey-yield of these plants is greater. One thing is very evident, the same blossoms do not furnish honey in like quantity in different countries, tho it may be ever so common. For instance, the white clover, which is one of our best crops, is of no value in Switzerland, if I believe the authority of the most practical apiarists there, including Mr. Bertrand himself, who has had several hundred colonies in different apiaries and at different altitudes. He

The Chalet or Home of Mr. Bertrand.

now keeps only about 80 in two apiaries, owing to his ill-health, and devotes most of his time to his journal, with the help of his kind wife, who has bent her energies to the task out of devotion to her husband.

The curiosities of this little park are not confined to bee-plants, for I saw there many sorts of exotic plants, or trees, from the cedar of Lebanon to the bamboo of our southern countries, which seems to thrive in the climate of Lake Geneva. As one instance of Mr. Bertrand's love of observation, I will say that he showed me a record of his remarks on the growth of the latter, which we all know is very rapid, and if I remember rightly, the fastest growth in warm weather was as much as an inch in the space of an hour. On the other hand, I saw an American tree—a blue ash, I believe—that seemed like a homesick exile, stunted and suffering as if in want of nutrition.

Two days after our arrival we took an excursion on the lake, to visit the home and the apiary, of a bee-keeper who had formerly been in the employ of our host as landscape gardener, but who had saved enough to be independent, and was keeping bees and growing grapes on a very pretty little farm on the lake shore. We were received, as in every other place that we visited, with the utmost cordiality, but with a little of the excess of hospitality so common among the working classes and the peasants of Europe. You must eat, you must drink, and it serves nothing to say that you have just had your dinner, that you are neither hungry nor thirsty, for you will be given no peace—in fact, you will almost offend those naive people if you do not accept what they consider themselves in duty bound to offer you. It is hospitality carried to extremes.

Questions and Answers.

CONDUCTED BY

DR. C. C. MILLER, Marengo, Ill.

[The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.]

Cellars for Wintering Bees.

In answer to Daniel Whitmer's question, on page 711, I may say that one summer I was at Adam Grimm's place, and he showed me a cellar that he had just built, specially intended for bees, having a cement floor. The next time I was there he told me it was not a success, and he thought the cement floor was objectionable. The cellar under my own house was divided into 3 rooms, one of them intended for bees, having a cement floor. It did not seem to work satisfactorily, and for years the bees have been cellared in the rooms with clay floor. Mr. Whitmer wants the cement floor for convenience in sweeping up dead bees. He might take Mr. Doolittle's plan and put half an inch of sawdust on the cellar bottom, which would make it easier to sweep up the bees.

Caging the Queen to Keep Down Increase.

To keep down increase I would like to try the plan of caging the queen. I use the 10-frame Simplicity-Root hive.

1. What style and most convenient cage should be used?
2. In what part of hive (or brood-chamber) and in what manner, should the caged queen be placed?
3. I presume the swarm is returned, and queen-cells cut out then; and also cut out again 5 days afterward; and finally, in 5 more days, again destroyed and the queen re-least?

4. In case swarming has been delayed, and a young queen should have emerged, when the swarm issued, should said young queen be destroyed, or taken away?

OREGON.

ANSWERS. 1. When I followed the plan of management I learned from Mr. Doolittle, I used a very simple little cage of my own devising, which cost less than a cent for material and was easily made. Take a pine block 5x1x½ inch, and wrap around it a piece of wire-cloth 4 inches square. The wire-cloth is allowed to project at one end of the block a half inch. The four sides of this projecting end are bent down upon the end of the stick and hammered down tight

in place. A piece of fine wire about 10 inches long is wrapt around the wire-cloth, about an inch from the open end, which will be about the middle of the stick, and the ends of the wire twisted together. Then pull out the block, trim off the corners of the end a little so that it will easily enter the cage, slide the stick in and out of the cage a number of times so that it will work easily, and the thing is complete. When not in use the block is pushed clear in, so as to preserve the shape of the cage. Such cages can be carried in the pocket without danger of being injured.

2. The best place is between two combs in the brood-nest. It is more convenient, however, for the first 5 days, to put the caged queen in at the entrance, far enough in so there will be no danger of the bees deserting her if a cool night should come.

3. No, no attention was paid to queen-cells till 5 days ensued, then they were cut out, and 5 days later, (10 days after the issuing of the swarm) the cells were again cut out and the queen liberated.

4. I never had a case of the kind. Unless the old queen were especially valued it might be better to leave the young queen.

Feeding Bees in Winter.

When I come to put my bees into the cellar I find, by weighing them, some are too light to winter. I have 80 colonies, and about 20 will need feeding. How can I best feed them in the cellar? The light ones are all on top, so I can get at them easily. I have a few frames of honey, also some frames of hard candy that I have prepared. Can I give them these, or would I better give sugar syrup? How would I better feed them, and when? Now, or wait till toward spring? I would prefer doing it now if it is just as well.

WISCONSIN.

ANSWER.—Don't feed syrup in winter. Use the combs of honey and the candy. It is just as well if not better to feed right away. Very quietly remove the outside comb or combs at one side, so that you can put the frame of honey or candy right next to the bees. The bees will do the rest. Of course you will not use any smoke. If your work is carefully done you will have no trouble.

When to Put Bees Into the Cellar.

Is this a good time to put bees into the cellar? They had a good flight Nov. 5.

NORTHERN ILLINOIS.

ANSWER.—I don't know, and I'd give a good deal to find the man that does know. My bees had a flight the same time as yours, and the right thing was to put them into the cellar Nov. 6, if Nov. 5 is to be the last day they can fly. If, however, they have a chance to fly again within the next 6 weeks, they're better off to stay out till then. The trouble is that no one can be certain about it. I think mine will stay out till late in November if they do not have a chance to fly before then, and if they are put in then without a chance to fly, I shall wish very much that they had been put in early in the month. But it is a very unusual thing that bees do not have a chance to fly later than Nov. 5, only happening once, I think, in a great many years.

Getting Extra-Large Colonies by Artificial Heat.

Is it practicable or desirable in forming extra-large colonies, to use artificial heat on the outside of the bottom and back of the brood-chamber (those parts of the brood-chamber being a single board, the rest being double and filled)? If so, within what limits, it being understood that the heat is to be uniform?

CALIFORNIA.

ANSWER.—I doubt the advisability of anything of the kind. At one time Mr. A. I. Root was quite enthusiastic about advancing a colony in spring by means of artificial heat, and he made a sort of hotbed about it. If I remember correctly, the colony petered out—at any rate, the proceeding was a damage to the colony.

Please send us Names of Bee-Keepers who do not now get the American Bee Journal, and we will send them sample copies. Then you can very likely afterward get their subscriptions, for which work we offer valuable premiums in nearly every number of this journal. You can aid much by sending in the names and addresses when writing us on other matters.

Langstroth on... The Honey-Bee

Revised by Dadant—1899 Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the Ameri-

can Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroughly explained, so that by following the instructions of this book one cannot fail to be wonderfully helped on the way to success with bees.

The book we mail for \$1.25, or club it with the American Bee Journal for one year—both for \$1.75; or, we will mail it as a premium for sending us THREE NEW subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

GEORGE W. YORK & CO.

118 Michigan Street, CHICAGO, ILL.

DITTMER'S FOUNDATION

Wholesale and Retail

This foundation is made by an absolutely non-dipping process, thereby producing a perfectly clear and pliable foundation that retains the odor and color of beeswax, and is free from dirt.

Working wax into foundation for cash, a specialty. Write for samples and prices.

A full line of Supplies at the very lowest prices, and in any quantity. Best quality and prompt shipment. Send for large, illustrated catalog.

GUS. DITTMER, Augusta, Wis.
Beeswax Wanted.

Please mention Bee Journal when writing.

GENERAL ITEMS

Cellaring the Bees.

We are having a blizzard and excessive cold weather. We must put our bees into the cellar at once, for if we do not take good care of them we will not have any honey to ship next season. We have 400 colonies in good condition for winter quarters, and if they winter well (as they always do,) and with the usual amount of bloom and proper atmospheric conditions, we hope to have a greater amount of honey to sell next year.

ADA L. PICKARD.
Richland Co., Wis., Nov. 17.

A Short Report.

Over a year ago I started with one colony which increased to four, but I got no honey. I put the four into winter quarters, but lost two before spring, so I had only two left, which increased to three the past season, and I secured two cases of section honey.

I like the Bee Journal very much.
H. H. FISHEL.
Richland Co., Wis., Nov. 12.

Honey-Can Experience.

I have been a good deal interested in the discussion which has occurred at different times in the American Bee Journal in regard to the best package in which to ship extracted honey. Some favored barrels, and quite a goodly number advocated the use of the 60-pound tin cans, cased in wooden boxes, two cans in a box.

I have shipped a good many tons of ex-

tracted honey during the last 10 years, and have always used barrels, and never had any complaint of leakage. You can judge of my surprise, perhaps, when I opened the box containing two cans of honey which I bought recently, and which I have just received, to find one of the cans had leakt. The cans must have been ruptured soon after being shipt, as there was a layer of honey on the bottom and some on two sides of the can that was candied quite thick, and what remained in the box was in the same condition. The top of the can is torn from the side where it was soldered, and the side of the can is somewhat kinked at that edge.

When the cans were weighed, the full one weighed 63 pounds, and the other 42 pounds, showing a loss of 21 pounds. I opened both of the cans to see the condition of the honey, and both were candied quite hard.

DAVID HALL.

Wyoming Co., N. Y., Nov. 13.

[We have known several instances this year, of tin cans breaking, and thereby causing a loss of honey. They were poorly made cans, and should not have been used in the first place. Of course, a poor tin can is almost as bad as a leaky barrel, only with a can there can't more than 60 pounds of honey get away, while with a barrel—well, it depends upon its size.—EDITOR.]

Dividing - Cheap Bee-Feeder.

Last fall I bought 12 colonies of bees but was robbed out. I tried dividing but made a bad job of it. Some colonies didn't have queens, some queens didn't lay, and some swarmed and made the parent colonies too weak, so

Sharples Cream Separators: Profitable Dairying

Strong, Healthy Chicks

are hatched by our incubators and more of them than hens can hatch. Why? Because our separator never fails to keep the heat just right. and the Clipping Device. Address, GEORGE W. YORK & COMPANY, 118 Michigan St., Chicago, Ill.

The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

[THIS CUT IS THE FULL SIZE OF THE KNIFE.]

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a last-time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.25, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00.) We will club the Novelty Knife and the Bee Journal for one year, both for \$1.90.

GEORGE W. YORK & CO., 118 Mich. St., Chicago, Ill.

Please allow about two weeks for your knife order to be filled.

this fall I doubled them up until now I have 15 colonies. I secured only 150 pounds of honey. I think I will let them swarm after this.

It is very warm here now, and bees are flying every day.

On page 698 Iowa asks how to make a bee-feeder. This is the way I made one: I took a 2x4 16-inch board, sawed notches in it, and nailed 1/4-inch strips on the sides, then poured hot wax into the cracks. I put a cover on it, and bored a hole 1/4 inch from the top of the feeder, in which I put a tin spout. Then I set it in the top of a super, and filled up the super with chaff. Next spring I can feed by just taking the cover off.

D. H. KELLER.
Jefferson Co., Colo., Nov. 12.

A Poor Year for Bees.

My bees came thru last winter alive, but few in a hive. The cold weather the last of April and all thru May was a stunner, but most of my 85 colonies survived and filled their hives with apple-bloom honey and brood, so they were in fair condition for white clover

and basswood. When at the close of the latter the dry, hot weather struck this locality, our honey season was over, altho buckwheat was yet to come, but we were so badly scorcht that when the buckwheat flow was over, all my bees and myself as well, were amazed to find that all we had to depend upon for the next 8 months was nearly 500 pounds of white honey, and less than 200 pounds of buckwheat; but, fortunately for all concerned, my bees stored the nicest clover and linden honey this year I ever saw, most of which I sold in my home market for 20 cents a pound. D. F. BLIGHTON.
Fulton Co., N. Y., Nov. 15.

Preparing the Bees for Winter.

I started last spring with 8 colonies, have increased to 17, and have sold \$15 worth of honey, besides having plenty for home use in a family of four. I just finisht putting them away for the winter yesterday. I winter them outdoors, and this is the way I did:

I built a shed 8 feet wide and 32 feet long, out of rough lumber, and covered it with grooved roofing. It is 5 feet on the lower side, and 7 on the upper side. I used four 2x8 joists, and nailed 2x4's on the edges so they were the width of the hive, and 20 inches apart. I set the hives on them after filling with straw as tight as I could pack it, then I packt straw between the hives and over back of them, also put on a "Hill's device," made out of barrel staves, then put a piece of muslin over the device, and a super on, and then filled it with clover chaff. When the weather gets colder I will put on more straw, but I will keep the fronts of the hives exposed to the weather so the bees can fly out whenever the weather is warm enough to fly. What do you think of that way? Will they get too warm?

FRED TYLER.

Mason Co., Ill., Nov. 17.

WE MAKE INCUBATORS

that hatch strong, healthy chicks and lots of them. Our faith in these facts is such that we send you our **NEW PREMIER Incubator ON TRIAL**. You put the eggs in it and make a hatch for yourself. When you have tried it thoroughly and are satisfied, you pay us for it. Isn't that the sensible way to buy and sell incubators? Send 5c stamp for Catalog & "Poultry Help."

No. 4 "Barler Ideal" Oil-Heater.

The "Barler Ideal" OIL-HEATER....

**Saves Its Cost Every Year!
NO ODOR! NO SMOKE! NO ASHES!**

Costs only a cent an hour to run it.

The editor of the American Bee Journal is using the "Barler Ideal" Oil Heater, and it is all right in every way. We liked it so well that we wanted our readers to have it too, so we have recently arranged with its manufacturers to fill our orders. The picture shown herewith is the one we recommend for general use. It is a perfect gem of a stove for heating dining-rooms, bed-rooms, and bath-rooms. It hinges back in a substantial way, and is thoroly well made thruout. The urn removes for heating water. The brass fount, or well, has a bail, and holds nearly one gallon of kerosene oil. It is just as safe as an ordinary lamp. You wouldn't be without it for twice its cost, after once having one of these stoves. Most oil-stoves emit an offensive odor, but this one doesn't. Its height is 2½ feet, and weighs 20 pounds, or 30 pounds crated ready for shipment, either by freight or express.

Price, f.o.b. Chicago, \$6.00; or, combined with a year's subscription to the American Bee Journal—both for only \$6.50. FULL DIRECTIONS GO WITH EACH STOVE.

If you want something that is really serviceable, reliable, and thoroly comfortable, you should get this "Barler Ideal" Oil Stove, as it can easily be carried by any woman from one room to another, and thus have all the heat you want right where you want it.

Address.

GEORGE W. YORK & CO.,
118 Michigan St., Chicago, Ill.

MERIT ALWAYS WINS.

The hard times of the past three or four years have been very destructive to all industrial affairs, and the railroads have had unusual amount of difficulty in making both ends meet. Roads that have, during this trying period, earned dividends while at the same time affording high-class transportation facilities to their patrons, have, indeed, been fortunate. And such an event speaks well for the management of the roads.

The record of the Nickel Plate Road during the recent period of industrial depression, has indeed been remarkable, and it speaks most eloquently of the conservative judgment of the managers. For this road has made great and steady progress in the material improvement of its roadway and appliances, and in perfecting its equipment. The interests of the public have been in no wise neglected; in fact, the success of this road has inured to the benefit of the public, as much, if not more, than to the stockholders. The condition of the road to-day shows this. Great and valuable improvements of a permanent character have been made—in the shape of strengthening the roadway, bridges and other accessories, and procuring new and improved safety appliances; new coaches have been added, elegant Pullman sleeping-cars put on, new and powerful engines have been placed in service, and everything has been done to raise the standard of the road, to perfect its service, and to give it a leading place among the best roads in the country. The result has been obvious. The people have observed the

progressive spirit of this road, have given it a liberal patronage, have enjoyed its excellent facilities, and that tells the whole story of a highly successful enterprise.

Among the most noteworthy improvements effected by the Nickel Plate Road is the introduction of a first-class dining-car service, which has won the approval of the best class of patrons. Then the coaches have been illuminated by the brilliant Pintsch gas, heated by steam, and placed in care of a colored porter, so the passengers have had the best that money can afford, at the lowest rates. The thru train service of the Nickel Plate, running in connection with the West Shore and Fitchburg Railroads over the great Hoosac Tunnel Route, between New York, Boston and Chicago—ranks with the best in the country, and has become deservedly popular. Elegant new coaches, and palatial Pullman buffet sleeping-cars run thru without change; the service is unexcelled, the time fast, scenery most fascinating.

Located along the south shore of Lake Erie are many substantial and attractive summer resorts that are yearly growing in popularity, and this class of travel promises a continual increasing source of revenue to the Nickel Plate Road. 48A4t

ELECTRIC HANDY WAGONS

HONEY AND BEESWAX

MARKET QUOTATIONS.

CHICAGO, Nov. 24.—There is a demand for fancy white comb honey at 16c that takes all of this grade upon arrival; other grades are less active, with No. 1 white at 15c; amber and travel-stained white ranges from 13@14c, with dark amber and buckwheat comb 10@12c. Extracted, white, 7½@8c; amber, 7@7½c; dark grades, including buckwheat, 6½@6¾c. Beeswax, 28c. R. A. BURNETT & Co.

KANSAS CITY, Nov. 16.—Fancy white comb, 15@16c; No. 1 white, 14@15c; amber, 12@13c; dark, 8@9c. Extracted, in 5-gallon cans, white, 7½@9c; amber, 7@8c. Receipts light. W. R. CROMWELL PRODUCE Co., Successors to C. C. Clemons & Co.

BUFFALO, Nov. 16.—Fancy white comb remains at 17@18c mostly, with rather larger receipts. Common selling at 12@16c. Possibly some lots poor enough to go less. We believe the high prices will curtail consumption. Extracted never sells well in Buffalo, but a little might sell at 8@9c in fancy shape. BATTERSON & Co.

ALBANY, N. Y., Nov. 17.—Fancy white, 17@18; No. 1, 15@16c; mixt, 13@14c; fancy buckwheat, 13@14c; No. 1, 12@13c; mixt, 12c. White extracted, 8½@9½c; mixt, 8@9c; buckwheat, 6½c. Honey market still firm with good demand; light receipts at high prices, especially for comb honey of all grades. H. R. WRIGHT.

BOSTON, Nov. 19.—Our market on honey continues strong, with light receipts. Fancy one-pound cartons, 17c; A No. 1, 15@16c; No. 1, 15c; No. 2, 12@13c. Extracted from 7½@8½ cents, according to quality. Beeswax steady at 25@27c. BLAKE, SCOTT & LEE.

CINCINNATI, Sept. 21.—The demand for fancy comb honey is good and finds ready sale at 16@16½c; No. 1, 15c. The demand for extracted honey at present is slow and offer same by the barrel as follows: White clover, 8½@9c; Southern, 6½@7½c; Florida, 7@8 cents, according to quality. Beeswax, 27c.

The above are MY SELLING PRICES. I do not handle any honey on commission, but pay spot cash on delivery. C. H. W. WEBER.

NEW YORK, Nov. 20.—Good demand continues for all grades of comb honey. We quote: Fancy white, 15@16c; No. 1 white, 14c; No. 2 white 12@13c; amber, 12c; buckwheat, 10@11c. Extracted in fairly good demand at 7½@8c for white, and 7c for amber; off grades and Southern in barrels at from 65@75c per gallon, according to quality. Not much demand for extracted buckwheat as yet. Some little selling at 5½@6c. Beeswax firm at 28 cents. HILDRETH & SEGELKEN.

DETROIT, Nov. 22.—Fancy white comb, 15@16c; No. 1, 13@14c; dark and amber, 10@12c. Extracted, white, 8@8½c; light amber, 7@7½c; dark, 6@6½c. Beeswax, 26@28c. M. H. HUNT & SON.

SAN FRANCISCO, Nov. 7.—White comb, 13@14 cents; amber, 11½@12½c; dark, 8@9c. Extracted, white, 7½@8c; light amber 6¾@7¾c; amber, 5½@6½c. Beeswax, 26@28c.

Owing to slim stocks, business in honey of all descriptions is of necessity restricted to very small compass. High-grade water white, either comb or extracted, is especially scarce. Previous quotations remain in force, with market firm at these figures.

A HONEY MARKET.—Don't think that your crop is too large or too small to interest us. We have bought and sold five carloads already this season, and want more. We pay spot cash. Address, giving quality, quantity and price. THOS. C. STANLEY & SON, Fairfield, Ill.

Four Celluloid Queen-Buttons Free

AS A PREMIUM

For sending us ONE NEW SUBSCRIBER to the American Bee Journal for three months with 30 cents, we will mail you FOUR of these pretty buttons for wearing on the coat-lapel. (You can wear one and give the others to the children.) The queen has a golden tinge.

This offer is made only to our present regular subscribers.

NOTE.—One reader writes: "I have every reason to believe that it would be a very good idea for every bee-keeper to wear one [of the buttons] as it will cause people to ask questions about the busy bee, and many a conversation thus started would wind up with the sale of more or less honey; at any rate, it would give the bee-keeper a superior opportunity to enlighten many a person in regard to honey and bees."

Prices of Buttons alone, postpaid: One button, 8 cts.; 2 buttons, 6 cts. each; 5 or more, 5 cts. each. (Stamps taken.) Address,

GEORGE W. YORK & CO., 118 Michigan St., CHICAGO.

AMERICAN BEE JOURNAL

GEORGE W. YORK,
Editor.

CHICAGO, ILL., DECEMBER 6, 1900.

FORTIETH YEAR.
No. 49.

WEEKLY

*MR. A. I. ROOT, of Ohio,
Director of the National Bee-Keepers' Association.*

THE AMERICAN BEE JOURNAL.

PUBLISHED WEEKLY BY

GEORGE W. YORK & CO.

118 Michigan St., Chicago, Ill.

Entered at the Post-Office at Chicago as Second-Class Mail-Matter.

IMPORTANT NOTICES:

The Subscription Price of this journal is \$1.00 a year, in the United States, Canada, and Mexico; all other countries in the Postal Union, 50c a year extra for postage. Sample copy free.

The Wrapper-Label Date of this paper indicates the end of the month to which your subscription is paid. For instance, "Dec 00" on your label shows that it is paid to the end of December, 1900.

Subscription Receipts—We do not send a receipt for money sent us to pay subscription, but change the date on your wrapper-label, which shows you that the money has been received and duly credited.

Advertising Rates will be given upon application.

Reformed Spelling.—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound. Also some other changes are used.

The Bee-Keeper's Guide

Or, Manual of the Apiary,

—BY—

PROF. A. J. COOK.

460 Pages—16th (1899) Edition—18th Thousand—\$1.25 postpaid.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published to-day. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without THE BEE-KEEPERS' GUIDE.

This 16th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to GIVE AWAY to our present subscribers, for the work of getting NEW subscribers for the American Bee Journal.

Given for TWO New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the two NEW subscribers—simply the Bee Journal for one year:

Send us TWO NEW SUBSCRIBERS to the Bee Journal (with \$2.00), and we will mail you a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both for only \$1.75. But surely anybody can get only TWO NEW SUBSCRIBERS to the Bee Journal for a year, and thus get the book as a premium. Let every body try for it. Will YOU have one?

GEORGE W. YORK & CO.,

118 Michigan Street, CHICAGO, ILL.

BEST Extracted Honey For Sale

ALL IN 60-POUND TIN CANS.

ALFALFA HONEY*****

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough the Alfalfa extracted.

BASSWOOD HONEY*****

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms in Wisconsin. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

Prices of Either Alfalfa or Basswood Honey:

A sample of either, by mail, 8 cents; samples of both, 15 cents—to pay for package and postage. By freight—one 60-pound can, 9½ cents per pound; two cans, 9 cents per pound; four or more cans, 8½ cents per pound. Cash must accompany each order. If ordering two or more cans you can have half of each kind of honey, if you so desire. The cans are boxt. This is all

ABSOLUTELY PURE BEES' HONEY.

The finest of their kinds produced in this country.

Read Dr. Miller's Testimony on Alfalfa Honey:

I've just sampled the honey you sent, and it's prime. Thank you. I feel that I'm something of a heretic, to sell several thousand pounds of honey of my own production and then buy honey of you for my own use. But however loyal one ought to be to the honey of his own region, there's no denying the fact that for use in any kind of hot drink, where one prefers the more wholesome honey to sugar, the very excellent quality of alfalfa honey I have received from you is better suited than the honeys of more market flavor, according to my taste.

McHenry Co., Ill.

C. C. MILLER.

Order the Above Honey and then Sell It.

We would suggest that those bee-keepers who did not produce enough honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.

Address,

GEORGE W. YORK & CO., 118 Michigan St., Chicago, Ill.

Doolittle's Queen-Rearing Book

FREE—For Sending Us TWO New Subscribers for
One Year at \$1.00 Each.

Scientific Queen-Rearing,

as practically applied, describes and illustrates a method by which the best Queen-Bees are reared in perfect accord with Nature's ways. It is written for the amateur and veteran in bee-keeping, by Mr. G. M. Doolittle, the leading queen-breeder of the world.

Index to the Chapters of the Book.

Importance of Good Queens; Nature's Way of Rearing Queens; Another of Nature's Way; Old Methods of Rearing Queens; Later Methods of Rearing Queens; New Way of Rearing Queens; Getting the Bees off the Cells; What to do with the Queen-Cells; Queen-Cell Protectors; Nuclei—How to Form; Nuclei—How to Multiply; Bee-Feeders and Bee-Feeding; Securing Good Drones; Introduction of Queens; Introducing Virgin Queens; Keeping a Record of Cells, Queens, Etc.; Queen-Register; Clipping the Queen's Wings; Shipping, Shipping-Cages, Bee-Candy, Etc.; Queens Injured in Shipping; Quality of Bees and Color of Queens; Rearing a Few Queens; Later Experiments in Queen-Rearing; Latest Feats in Queen-Rearing.

Bound in cloth, price \$1.00, postpaid; or we will mail it FREE as a premium for sending us TWO NEW subscribers to the American Bee Journal for one year, at \$1.00 each; or for \$1.60 we will mail the book to any one and credit a year's subscription on the American Bee Journal.

BEE JOURNAL

40th YEAR.

CHICAGO, ILL., DECEMBER 6, 1900.

No. 49.

* Editorial Comments. *

A Helping Hand has been extended by British bee-keepers to a brother in trouble. Mr. Longley's bees stung men and team in an adjoining field, and Mr. Longley was sued and made to pay damages. Damages, costs, and lawyer's fee made him out of pocket altogether \$45. Contributions were sent by bee-keepers to the British Bee Journal, and a check for \$45 was sent Mr. Longley.

British bee-keepers are wiser in their generation than American. Some of the sums contributed were only 25 cents each, thus dividing the amount among so many that the burden was lightened. In this country there is sometimes a false pride that says, "If you can not give a large enough amount to look well in print, don't give anything."

Shall Extracting-Combs be Cleaned by the Bees? is a question undergoing consideration in *Revue Internationale*. So far as replies have been received, opinions are equally divided. In favor of putting away combs in the fall without having them licked clean by the bees it is urged that moths are more troublesome if the combs are dry; that in putting away the combs in a moist state there is a saving of time, stings, and the danger of exciting robbing; and that when the combs are given the following year the bees are more prompt to occupy those with a residue of honey. On the other hand, it is urged that there is danger of molding and souring of the honey that remains; that it attracts mice and insects; and that dry combs may be given at leisure to the bees the next season without danger of exciting robbing.

Feeding Bees has had some discussion lately in *Gleanings in Bee-Culture*. J. E. Crane gives his way. If he were beginning all over again, he might prefer Miller feeders, but has on hand tin cans holding 6 pounds and 9 pounds each, and he uses these much after the old pepper-box plan. He melts the sugar on a stove, using 2 pounds of sugar to one of water. To prevent granulation, he adds liquid honey, or if he has not the liquid honey to spare, he adds one tablespoonful of vinegar to each 10 pounds of sugar, or to each 20 pounds of sugar if the vinegar is sharp.

Editor Root strongly prefers to use one pound of water to one of sugar. It makes a thinner syrup to start with, but the bees ripen or "invert" it more thoroughly, and they will not invert one-to-two syrup. When they formerly used the one-to-two proportion, there was more or less granulation in the comb, but with one-to-one there is no granulation, and no need to use honey or acid. No need of cooking, just pour the proper quantities of sugar and water into the extractor can, and turn the reel till it is thoroughly mixed. This can be done at the out-yards, saving the carrying of water.

Then Dr. Miller appears, and says he has a simpler plan. He pours the sugar in the feeder and then pours water on it, saving the trouble of putting in and taking out of the extractor. Editor Root objects that this leaves the feeder matted up with a residue of sugar or of crystals, and the only way to have it left licked up clean by the bees is to have it thoroughly mixed in the extractor. Dr. Miller says this is more easily, and perhaps better, accomplished by pouring in a little more water at the last. Then Mr. Root suggests that the bees may not ripen or invert this as readily as if the whole had been thoroughly mixed before being put in the feeder.

There is still room for something more to be said. What is the objection to having a few crystals remaining in the feeder? and does Mr. Root find it possible to have an entirely clean feeder when the syrup is slowly lowered, as in the Miller feeder which he uses, or in any feeder which does not allow the bees access to the inside of the feeder? Does he not find also that when water is poured upon the dry sugar in the feeder that more water will be taken by the bees, thus giving a better chance for inverting? In other words, if he finds that the bees invert better the one-to-one than the one-to-two syrup, will they not invert still better if the syrup is still thinner?

But Dr. Miller fails to notice, or at least to mention, that with this plan the greater amount of evaporation makes it necessary to do the feeding earlier than with the thoroughly mixed one-to-one syrup. The beginner should be told that if he is late about his feeding, Mr. Root's is the safer plan, and that if he is very late Mr. Crane's is still safer. He should, however, be told that it is much better to feed as early as August or September, in which case Mr. Root's course is better than Mr. Crane's, and perhaps Dr. Miller's is still better.

The Sale of Comb-Foundation Machines in this country does not seem to be large. Probably fewer machines are sold now than some years ago. Most bee-keepers find it more satisfactory, and perhaps cheaper, to buy foundation than to make it. This is in market contrast with the state of affairs in Europe. Of the Rietsche press alone, 17,000 have been sold since the first press was put on the market 17 years ago. One reason for the difference in the two countries is that in Europe some of the foundation put on the market is adulterated, while in this country such a thing is practically unknown.

A Big Honey-Yield is reported in the *Progressive Bee-Keeper*, John Krantz being the successful man, the year not being given. The colony had the range of a large apple-orchard, some apple-honey being stored in sections, until the colony swarmed the first of May. Both colonies then worked on apple bloom, and the first week in June both swarmed. From the colony and its increase Mr. Krantz obtained 1,600 pounds of comb honey, besides allowing his family with ten children all the honey they could eat.

* The Weekly Budget. *

THE NEW EDITOR of the Progressive Bee-Keeper, Will Ward Mitchell, starts in well, and it is not likely that the paper will suffer under his guidance. He is the man who has written so much excellent verse for the Progressive, his poems forming quite a feature of that journal. Success to him.

THE CANADIAN BEE JOURNAL.—The literary shortcomings of contemporaries are not considered the best things with which to fill up the columns of a bee-journal, but it may not be greatly out of order to say that since W. J. Craig has taken the editorial chair of the Canadian Bee Journal, there has been a very gratifying improvement in the proof-reading of that journal.

BEE-KEEPERS' INSTITUTES are to be held at several places in the State of New York this month, as will be noticed by referring to the notices of conventions on another page of this issue. These ought to be very valuable gatherings for those bee-keepers who can arrange to attend them. We hope as many of our readers as possible will be present, and do what they can to make the institutes as helpful and interesting as may be.

HON. EUGENE SECOR was a delegate to represent the Iowa State Horticultural Society at the Southern Minnesota Horticultural Society's meeting held at Austin, Minn., Nov. 21, 22, and 23, 1900. He was also to speak at the meeting of the Northeastern Iowa Horticultural meeting at Iowa Falls, Nov. 27, 28, and 29, his subject being "Desirable Flowering Shrubs and Plants." Mr. Secor is interested in establishing extensive greenhouses at his home—Forest City, Iowa—toward which he has been laboring for a year, now having arrangements made for beginning the work as soon as the weather permits next spring. About 6,000 feet of glass will be used, and hardy shrubs and perennials grown outside. Mr. Secor is a busy man, and is ingenious as well as a "Eugene-ius."

MR. A. I. ROOT AND THE BEE JOURNAL.—Those who were familiar with the earlier volumes of the American Bee Journal will easily recall how its pages were enlivened by the spicy contributions of one who signed himself "Novice." The opportunity of thus appearing 12 times in a year seeming too narrow for "Novice," by the aid of a windmill he issued a little quarterly of his own, which grew, and grew, until it became the Gleanings in Bee-Culture of to-day with its 24 superbly illustrated issues every year—a journal that has made the name of A. I. Root a household word in the homes of bee-keepers all over the world. Having achieved a name and fame, it seems he might be content therewith. But he is not. He has not forgotten his old friends, and the wish in him is strong for increase success to others. Here is the way he talks in the number of Gleanings for Nov. 15th:

THE AMERICAN BEE JOURNAL.

Forty years ago next January, Vol. I., No. 1 of the American Bee Journal made its appearance under the management of our good friend Samuel Wagner. It continued one year; but there did not seem to be bee-keepers enough in our land to keep even one bee-journal running. If I am correct, the breaking-out of the war had something to do with letting it drop for a time.

When I "went crazy," however, on the honey-bee, be-

cause of the loss of that truant swarm I became so much interested in, I began rubbing my eyes and hunting up the bee-literature of the world. As soon as I found a bee-journal had been published I had every back number, and read them over and over day and night almost. How familiar those pages in regard to the Dzierzon theory look even now! and those strange stories of the wonderful natural history of the honey-bee awaken a thousand pleasant recollections even now as I glance over it. I enjoy even yet exploring new fields of science; but I am afraid the world does not contain any new field that I shall enjoy as much as my explorations in that observatory hive that stood in the window of my home.

Well, when I became acquainted with Langstroth and Wagner, there was no peace till they promised to get the American Bee Journal going again, for Mr. Langstroth seconded my exhortations. Well, it is *still* going; and when I glanced over the issue for Nov. 8, I really felt happy to see such a bright, wideawake, live publication, filled not only with valuable hints, but bright, hopeful, sharp witticisms.

The thing that troubles me most just now is the fear that our good friend York does not get pay enough for sending such a beautiful journal 52 times for the small sum of \$1.00—not quite two cents for each issue. (At one time the American Bee Journal was \$2.00 for only 12 issues.) Why, Dadant's account of his trip thru Switzerland, alone is worth almost the subscription price for an entire year, to say nothing of the report of the Chicago convention. And it is not altogether bees. Friend York, as well as myself, got hold of that little item about having some land of your own. And the American Bee Journal is an excellent *family* paper. It is up to the times in standing out strong and fearlessly for good morals, temperance, and purity and honesty.

Now, if anybody sees this who has not subscribed for the "Old Reliable," let him make haste to give friend York a little encouragement in the shape of a subscription. This is from your old friend—
A. I. R.

We hardly know what to say in response to the exceedingly kind words Mr. Root has written above, for it isn't possible for us to deserve them. At any rate, we take off our hat and make our best bow, with a sincere "Thank you," for all he has said.

No one knows any better than does Mr. A. I. Root what it means to get out a paper like the American Bee Journal every week in the year, and year after year. It is now about 16 years since we have been helping to get up and send out this journal, and we can testify that it means hustle all the time. But that is what we are here for, and if bee-keepers will continue to give us their hearty support, we will agree to do our best for them, so long as health and strength permit.

Our Wood Binder (or Holder) is made to take all the copies of the American Bee Journal for a year. It is sent by mail for 20 cents. Full directions accompany. The Bee Journals can be inserted as soon as they are received, and thus preserved for future reference. Upon receipt of \$1.00 for your Bee Journal subscription *a full year in advance*, we will mail you a Wood Binder free—if you will mention it.

Please send us Names of Bee-keepers who do not now get the American Bee Journal, and we will send them sample copies. Then you can very likely afterward get their subscriptions, for which work we offer valuable premiums in nearly every number of this journal. You can aid much by sending in the names and addresses when writing us on other matters.

Queenie Jeanette is the title of a pretty song in sheet music size, written by J. C. Wallenmeyer, a musical bee-keeper. The regular price is 40 cents, but to close out the copies we have left, we will mail them at 20 cents each, as long as they last. Better order at once, if you want a copy of this song.

The American Fruit and Vegetable Journal is just what its name indicates. Tells all about growing fruits and vegetables. It is a fine monthly, at 50 cents a year. We can mail you a free sample copy of it, if you ask for it. We club it with the American Bee Journal—both for \$1.10.

Convention Proceedings.

Report of the Proceedings of the 31st Annual Convention of the National Bee-Keepers' Association, held at Chicago, Ill., Aug. 28, 29 and 30, 1900.

BY DR. A. B. MASON, SEC.

(Continued from page 761.)

Next on the program was the following address by Rev. Emerson T. Abbott, on

PURE FOOD LEGISLATION.

I want to say I will not afflict you with any paper. I may afflict you with something worse. Those who talk at random sometimes do worse than those who read papers to you. I hadn't time to prepare any paper on food legislation, and, in fact, I did not deem it necessary. I desire, however, to make a report of what work has been done by our representatives at the National Pure Food Congress, and offer a few suggestions with regard to food legislation.

In the first place, I may say that three years ago some gentlemen in Washington, who were purely unselfish and had no personal interests to serve, issued a circular and called together what was known as the National Pure Food Congress, or rather, what afterwards became the National Pure Food Congress. They agreed upon a basis of representation, issued the circulars at their own expense, and invited the people to come there and discuss the food question. Something like 300 people, representing the various productive industries of the United States, responded to that call, and your general manager and myself were sent as delegates from this society to represent the bee-keepers of the United States.

We met an exceedingly intelligent and interesting body of gentlemen, and the result was that the bee-keepers at once received prominent recognition in that food congress. The congress was organized, the proper officers were elected, and we mapped out a course of work. We took what was known then as the Brosius Bill, which had been drafted by Mr. Brosius, of Philadelphia, and a committee was appointed consisting of 25, of which I had the pleasure of being a member, to go over that bill. We went over it, item by item, and eliminated everything that we thought was objectionable, and agreed as a whole, and reported the bill back to the congress. The congress discuss the bill, and after having made just two verbal changes in it, agreed to it as a whole; they then turned it over to one of the best lawyers in the city of Washington, and he examined it carefully; then they turned it over to the Secretary of Agriculture, and he examined it carefully and fully. It was placed in the hands of the committee to be presented to the House of Representatives and also to the Senate. The Pure Food Congress adjourned, and in a year from that time they met again. That was a year ago last January. Our bill was still being discuss, and the subject was still being agitated, but never had yet reached the point of action. In fact, the committees which had the matter in charge in the House and Senate had never reached an agreement, and no report had been made.

Last January we met again. I might say, however, that I was sent as a delegate a year ago in January, and last January I was sent again, this society having only one representative on the floor of the congress; last January we met again. Previous to last January everything had been harmonious. We had moved along smoothly; we had been a unit in representing the interests of the pure-food bill, known as the Brosius Bill. But there came up to Washington last year some very wise and intelligent gentlemen; they were dairymen, they said. One of them lives in Chicago; his name is Knight. He is a dairyman; he milks his cows by proxy, and he is in the employ of the National Dairy Association, and no doubt gets a fat salary, for he wore good clothes, and had the best around the hotel. There came along with him a Mr. Hoard, from Wisconsin, who, I believe, has been governor, and he is a dairyman; he milks the dairy people of the United States, and he had something to say. There was also a gentleman by the name of Adams, who is another milker; he milks the tax-

payers of the State of Wisconsin, and secures a large salary. There came another gentleman from the State of New York; he was a milker—by the name of Flanders; he also milks the tax-payers of the State of New York, and he is a dairyman. There also came the honorable food commissioner of Ohio, who is another dairyman, for he milks the tax-payers of the State of Ohio, and he had the honor of being the president of the Pure Food Congress, and as their wisdom was superior to the combined wisdom of all those men who had come up the previous year and gone over the ground and discuss the matter carefully, they wanted a new bill, and so up in Wisconsin, in a little room, Mr. Adams wrote a new bill, absolutely ignoring the Brosius Bill, and embodying some things that were absolutely obnoxious to all members except this little company.

With this bill in their pocket, and Mr. Babcock, of Wisconsin, to defend it, they came on the floor of the Food Congress determined to run it. You know some few sometimes think they run the world. We battled there for three days, *pro* and *con*, and made the fight with the chairman against us, and finally we routed the enemy. We had discovered a new difficulty in food legislation that we had never dreamed of before—never occurred to us that we should find enemies in our own camp, or that men would come there with the object of destroying all we had done during these years; but after the smoke cleared away, and the matter was all over, and we had gathered up the maimed, and the halt and the wounded, and the dead, that had come out of the conflict, we discovered that there was legion of us and exceedingly few of them, and we carried our point, and the bill known as the Babcock Bill is buried now in oblivion. But what was the result? These gentlemen said, No. If we can't have our way; if we can't displace the Secretary of Agriculture in the execution of this bill, and have a commissioner appointed as we want it—for we know that nobody but a commissioner can do it—why, we will not have anything; we will fight the Brosius Bill, and they did. One of their number went over before the Inter-State Commerce Committee (your speaker was one of the number appointed to address that committee in behalf of the bee-keepers), and they had the cheek and gall to stand up there and defend their bill, when they were appointed to urge the interests of the Brosius Bill; but the Inter-State Commerce Committee saw how things were, and they simply ignored their protest, and the result was the Brosius Bill was immediately favorably reported by the House Committee, and is now ready to be taken up for action; the Senate Committee is ready to report favorably upon it, I am informed. As soon as it can be gotten before the two Houses, we have no doubt but what it will pass, but we will have to meet all along the opposition of these gentlemen.

Now, then, I will tell you why I have given you this history. You have influence with your congressmen; the average congressman is a very busy man; the average congressman hasn't more than average intelligence; he doesn't claim to have, and he can't comprehend everything at once; he can't read up about everything. You haven't any idea, if you have never been to Washington and seen the congressmen besieged, how many people there are who have schemes and things that they want to push thru congress, and want their congressmen to do it for them, and they have not time to investigate all of these subjects.

Now, the reason I am presenting this matter to you is, that I want you to present the facts. When you get home I want you to go to your congressman, and state to him clearly, what I have stated, and say, "Now, it is the Brosius Bill, and no other bill, that we want you to push. The National Bee-Keepers' Association as a unit stands behind the Brosius Bill, and that is the bill the National Pure Food Congress wants pushed, and it covers the ground entirely, and you pay no attention to these little side-issues that will be crowded upon you, for they are simply put in that the bill may be beaten."

I will tell you the difference between the Brosius Bill and the other pure-food bills. The Brosius Bill recognizes the fact that every man, woman and child has rights; it also recognizes the fact that any industry that sails under its own colors has a right to exist, provided it can not be proven beyond the possibility of controversy that that industry is injuring the welfare of the human family. It doesn't propose to make any warfare on anybody; it doesn't propose to say that you shall put a placard up in your restaurant and say that glucose and honey mixt is served here, butterine is served to the people, or something else is served at clean tables which are not clean tables, and biscuits that have been poorly baked are served along with it. It is sup-

posed the intelligent eater will know when he gets poor biscuit, and will know whether the class of the restaurant he patronizes is the class he wants to patronize in order to satisfy the cravings of his stomach, and it is not necessary to have a great number of labels stuck up all over the State, in various places where people eat, in order to execute the law. The Brosius Bill simply makes it a criminal offense to sell a man a thing for what it is not, just as the United States makes it a criminal offense to counterfeit a dollar. I have a silver dollar here in my hand. Now, the United States does not throw any restraint around my counterfeiting that silver dollar, doesn't even go so far as to explain what a counterfeit of that silver dollar is, but simply says in so many words, robbed of its technicality—we will let some of the lawyers put the technicalities in, and I will state the facts in so many words—"If you counterfeit that dollar, and we catch you at it, we will put you behind the prison bars." That is all; it doesn't lay any restraints, or say this thing, or that thing, or the other.

What is the use of enacting laws all over the country, in all the various States of the Union, that you shall not color a thing green, or that you shall not color it black, or it shall not be this color or that color; shall not be made to look like this thing or that thing. What is the use of that? What advantage is there in it? It is of advantage to a man who wants to sell something that is of the color that this other thing might be, of course; but that isn't what the Legislature is for; that isn't what laws are for; laws are to look after the common interest of all the people, not a few of the people, or half of the people, but all of the people. The only law we need in the shape of pure-food legislation is to make it a criminal offense to sell anything for what it is not.

If I come into your store and ask you for a pound of honey, and you give me a half pound of glucose and a half pound of honey, and you know it when you give it to me, and charge me for a pound of honey, you are a thief and a criminal, and you ought to be in the penitentiary. [Applause.] That is clear; you all understand that; there isn't any scientific phraseology about that, but what you can get thru your heads; that is clear and plain. A man who sells a thing for what it is not is a thief, a robber, and a criminal, and ought to be so treated; it doesn't make any difference whether he sells a carload of glucose or 15 cents worth of ice-cream, he is as much a criminal in one case as in the other; it is the intention and the theory which it embraces; that is all there is to it, and that is why we want you to support the Brosius Bill.

We thrasht the ground all over, fought the battle time and again, and simply settled down to this one proposition, that every man who pays his money for an article is entitled to get the thing that he expects to get when he gives his money. You trade a horse for a cow. Suppose the man should give you a donkey, and the donkey should be worth more than the cow that you were to get; but perchance you wanted the cow that you might milk her, and he would run in a \$40 donkey instead of a \$20 cow, and you or your wife would go out to get some milk at night—there would be trouble; not because you had been defrauded of your money. There might be reasons why the cow would be worth \$40 to you, while she wouldn't bring more than \$20 in the market.

Now, then, you ask me what you can do to help bring this about. I have already hinted what you can do; you can do a great deal; you can do more than you think you can. When I was a boy about 16 years old, I used to think that I would just give my eyes to look at the president. I thought if I could see a congressman it would be a wonder; I felt a certain kind of awe and a certain kind of reverence for them, and sometimes would step a little higher over the ground when I was talking about governors and presidents, and congressmen, than I did when I was talking about ordinary citizens and clodhoppers like I was myself, plowing corn. But after awhile I began to come in contact with these men; after awhile I had seen a governor or two, and they didn't look quite so magnificent as I thought they would—they had ordinary common mustaches, and sometimes their hats were good and sometimes they were not; sometimes they had on boots, and sometimes they did not; and sometimes they were kind of sleepy looking, and sometimes pretty sleek. I sized them up, and I said: "You are kind of human anyway, a little animal like myself; may be you have a little more possibly than I have, but you are an animal just the same as I am, anyway, and have all the animal propensities that other clodhoppers have."

After awhile I saw a president or two, and I began to have that same kind of feeling; after I had seen a good

many congressmen I felt more and more that way; but I went up to Washington a few times, and I went into the legislative halls and I saw those men. I heard them talk, I met them face to face; I came in contact with them, and I discovered that they were men just like other men; they didn't know a great deal more than the average bee-keeper; they were susceptible to influences just like the average bee-keeper, and if they were good congressmen they made it a point to do the thing that their constituents wanted done, and they devoted as much time as they could to the interests of their constituents, and that they had to learn to be congressmen.

If this were a political meeting I would make a suggestion, and I will make it anyway if it is not. That is, don't forget the fact that it takes a man a little while to learn to be a congressman; it doesn't matter much about his politics. If you want him to be heard in Washington, see that he stays there a little while; don't send a new man every time there is an election; that isn't politics; but it is common sense. I have been up there; I know men who have gone there and staid 20 years. A man died while I was in Washington the last time; he had been in the House 20 years, and every man lifted his hat reverentially when he spoke his name. Twenty years of faithful service in the House! A congressman said to me, "When that man arose to talk they listened whether he had anything to say or not. He always had something to say because he had been there so long, because he knew what to say and when to say it."

But to go back to my subject: All you have to do if you want your congressman to do anything is to talk common sense to him. If you want a hired hand of yours to plow your field a certain way, and cut the furrow so wide, and make it so deep, and turn the grass over just so, why, you simply tell him, "I want this field plowed so and so," and he plows it that way. Go to your congressman when you get home—it won't hurt if you call him John, treat him just as you would your hired hand, that is all he is; we just pay him for doing the business. I often say to my wife about the man who does my little banking—I don't have much, and he is a millionaire several times over—I say, "I have got him hired to take care of the few dollars I have up there, and he is looking after it." Look at your congressman that way, with that kind of feeling, and make him understand that you mean something when you talk to him, and that you mean if he doesn't look after your interests, and do the things he ought to do, you will see that he doesn't go back there any more, without regard to politics; don't believe because he is a congressman, is a republican and you are a democrat, that he won't listen to you. If you are a republican and your congressman is a democrat, he will listen quicker; he wants to convince you, and *vice versa*. I tell you that they want to hear from their constituents, and they are just like a thermometer—they will bob up and down with the change in the weather when they hear from the people, just like the mercury bobs up and down when a cold norther comes sweeping in, and the temperature changes suddenly; they are just like thermometers, and they are very responsive, too. I presume I am not revealing any secrets; I am not telling a good many of you people anything new.

As Dr. Mason says, "If you don't believe what I am saying, just try it."

But now I think I have talked long enough. It was not my intention to give you information or anything, but simply to make you think about the importance of this pure-food legislation. I would like to stand here and talk to you for a solid hour about the terrible curse of food adulteration. I will say just this much, that we have gone mad and crazy on the Almighty Dollar. The world has lost sight of grand moral principles and has given itself over to one grand scramble for money and gain [Applause]. And unfortunately we have all been so influenced that, the moment anything is broached, we all stand up and say, "What is there in it for me?" Now, friends, we must get beyond that, and rise higher than that, and feel that life means something more than that. I believe in money; I get all the money I can, and I don't blame any man for doing it; in fact, I condemn the man who does not lay up something for his old age. I think it is wrong for many men to be poor. Many people squander their money, and they are criminal in the sight of God Almighty when they do it, for they leave their families to suffer on account of their squandering money when they ought to keep it and provide for those that God has entrusted to their care. Let us not live for that alone; let us not give our whole lives to the accumulation of a few paltry dollars, but let us feel

that life means something; let us feel that it is worth something to feel we are honest and treating our fellow men right, and telling them the truth.

If I have a deal with a man, and give him what he expects to get, and get a good sound profit out of it, I don't feel any compunctions of conscience; but if I misrepresent, if I don't tell him all the facts, if I don't make the matter clear and plain so that he is thoroly satisfied, I can't sleep at night; I can't get over it; in some way those dollars burn in my pocket, and I feel as tho I had done a wrong thing; but when I can accumulate anything and do it honestly, and get a legitimate profit, that is all right and proper.

It seems to me that a man who sits down here in Chicago and mixes glucose with honey and labels it "pure clover honey," and sends it out into the States of Missouri, Kansas, and Iowa, and all over the United States, and has it sold for pure honey, and who knows it will be sold for pure honey, ought to have the nightmare so he could not sleep; the demons ought to chase him night and day. Just think of sitting down deliberately to defraud the people in a thing that they are to eat, and that is absolutely necessary in order to live! Why, I would just as soon think of cheating a man with regard to his grave-clothes, sell him a robe that was only cotton and claim it was silk; I would as soon think of doing it as I would to cheat a man in what he has to eat. But that is going on every day. Mr. York knows it; the whole city is full of it; our city is full of it. Here is an illustration:

I went into a store one day, pickt up a bottle—Mr. Root knows something about it, as I had it down in Philadelphia last year, and had it analyzed, and it was 75 percent glucose, labeled pure clover honey, purporting to be put up at Medina, Ohio. I went into the store and I said to the man—oh, he was a Christian man, takes a high stand with regard to morals, profest to be an example—I said: "I want to get just this much testimony. I want to know if these people down in Kansas City will say in black and white whether this honey does or does not come from Medina; would you have any objections to having your buyer ask that question that they might answer in black and white."

What do you think he said? Well, it was this: "I don't want to get mixt up with other people's business. I don't want to meddle with anything that doesn't concern me."

But, I said, "Sir, this does concern you; I bought this bottle of honey off your shelves, and the salesman who sold it to your buyer here, who doesn't know anything about honey, told him it was pure. Now, sir, what have you to say?"

He said, "Well, I will study about it;" and he is studying yet about it, hasn't anything to say; he hasn't the manhood; he hasn't the moral courage to come up and furnish the testimony that would send that man to jail, for proof of food adulteration would do it in Missouri. The people all over this country are winking at those things, and the time has come for us to stand for the truth and the right, whether it injures us or our neighbors. [Applause.]

EMERSON T. ABBOTT.

(Continued next week.)

"The Hum of the Bees in the Apple-Tree Bloom" is the name of the finest bee-keeper's song—words by Hon. Eugene Secor and music by Dr. C. C. Miller. This is thought by some to be the best bee-song yet written by Mr. Secor and Dr. Miller. It is, indeed, a "hummer." We can furnish a single copy of it postpaid, for 10 cents, or 3 copies for 25 cents. Or, we will mail a half-dozen copies of it for sending us *one new* yearly subscription to the American Bee Journal at \$1.00.

The Chicago Convention Picture is a fine one. It is nearly 8x10 inches in size, mounted on heavy cardboard 10x12 inches. It is, we believe, the largest group of bee-keepers ever taken in one picture. It is sent, postpaid, for 75 cents; or we can send the American Bee Journal one year and the picture—both for \$1.60. It would be a nice picture to frame. We have not counted them, but think there are nearly 200 bee-keepers shown.

Queen-Rearing is a very interesting part of bee-keeping. Mr. Doolittle's book tells practically all about the subject. See the offer we make on the second page of this number.

Contributed Articles.

No. 7.—Interesting Notes on European Travel.

BY C. P. DADANT.

LEARNING that I was fond of visiting ancient establishments, which are rather a curiosity to a man coming from a new country like America, Mr. Bertrand proposed to show me the most interesting remains of olden times along the shores of Lake Geneva, at the same time giving me an opportunity of becoming acquainted with some of the most practical bee-keepers in the country.

"We will arrange for a visit to De Blonay to-morrow," he said one day. "Who is De Blonay?" "Mr. H. De Blonay is one of our oldest practical bee-keepers. He belonged to the first progressive bee-keepers' association in the country years ago; he is a retired civil engineer, living during the winter in Lausanne, and in the summer in the castle built by his ancestors in the eleventh century, four miles above the city of Vevey, some 30 miles from here. We will go by steamboat, take breakfast with the Blonay family, and come home late in the afternoon by rail."

This was done. A call on the telephone by Mrs. Bertrand gave due notice of our coming, and we were informed that they would expect us without fail a little before noon the next day. Telephones are not so numerous in country places in Europe as they are here, but they are all long-distance instruments.

So on Saturday morning we left Nyon together—Mr. Bertrand, my daughter, and myself—on one of the swift steamers that ply back and forth on this deep, clear lake, so clear that you can see fishes 20 feet below the surface when the water is still. The waters of Lake Geneva reminded me of Sturgeon Bay, in Wisconsin, where one can see the fish bite at the hook eight or ten feet below the surface. But the view of Lake Geneva is beyond description. The boat stops a minute or two at each landing—pretty villages or large towns stretch in the sun on the slope of the hills, with endless vineyards running back from the suburbs up to the pine forests above. In two or three hours we were at Vevey, a city of some six or eight thousand inhabitants, and a carriage was soon found to go to the castle.

I will note here that the city of Vevey was once inhabited by the great apiarist Huber, at least according to Bevan, who, however, spells the name "Vivai," but he evidently referred to this town, for Huber was born at Geneva, and lived at different spots along the north shore of the lake. It is remarkable that Switzerland has been the birth-place of several noted apiarists, among whom I can name Gelieu, and the famous Francois Burnens, the servant of Huber, who so faithfully and so earnestly helped in his experiments. Without him Huber could have done but little, since he was blind, and his discoveries in the natural history of the bee might have remained ignored much longer.

The castle of Blonay, built as a fortress, and overlooking the neighboring village to which it gave its name, is on a steep eminence from which one sees the city of Vevey, the lake, and the mountains of Savoy. It is a romantic spot. High walls, towers, a 60-foot dungeon (useless to-day), an inner court, with walls covered with ivy, massive abutments here and there to keep the walls from falling outward, a dozen or more terraces to support these abutments; big apartments, a small chapel, a stone archt ogival stairway leading to the upper floors—everything here looks odd, antique, I would almost say fantastic. It is clear that when this was built the main thought was safety, not convenience. But civilization has shown its footprints, the more so as we are now in the most democratic country in the world, and with some of the most progressive people in that republic. The drawbridges have disappeared, the court opens to all comers. The old stone ogival stairway which must have once resounded with the armors of steel that we saw hanging in the chapel, is now modernized with a telephone at the top of the steps. In the big reception hall, hung with family paintings of hundreds of years, we see a phonograph.

But what an immense dwelling for three persons—our host, his wife, and daughter, besides three or four servants. No wonder they do not stay here in the winter. Altho this is certainly a pleasant summer home, it would be a chilly

Chateau (or Castle) De Blonay.

place in winter. The young lady tells my daughter that it is just a hundred steps from her bedroom to the kitchen.

We were welcomed with the usual hospitality. We visited the apiary, some 15 hives with movable frames, on one of the numerous terraces, the vegetable garden, the flower garden; and on every terrace we saw the walls covered with trellis trees, especially pear trees laden with fruit. Mr. De Blonay is also a lover of exotic trees and shrubs, and I saw an American black walnut side by side with a fig-tree, and tasted American blackberries as large as my thumb, and as sweet as those they raise in the United States, which put to shame the little dwarf, sour, worthless European blackberry.

After the meal we had the treat of a small martial display. A squad of Swiss soldiers was passing on the public road below the castle on their way to an annual parade at Bern, and as they stopt for their meal, our host had a big flag brought down from the attic, and unfurled at the window. This called for cheers and a salute, and it lookt for all the world as if we might yet be in the middle ages, but the steel armors, instead of being on the breasts of those men, were asleep and rusting in the little chapel, where we had the pleasure of seeing them a little later, together with ancient arms and a big closet full of parchments in drawers carefully labeled, and dating back 800 years. And yet this gentleman takes no false pride in his ancestry, but modestly signs his name "H. de Blonay, Engineer." Why can't our American heireses look at those empty titles of nobility in the same democratic style?

How about the "oubliettes?" Of course, we must see the oubliettes. A big key was produced, a torch procured besides a lantern, and we started down thru the basements and the cellars.

"And deeper still the deep down oubliette,
Down thirty feet below the smiling day"—(TENNYSON.)

was revealed to us by the removal of a few bunches of fagots. Then I understood the need of the torch, which I could not perceive since we had a lantern. The torch was lighted and thrown down the hole, so we could see the inside of the oubliette, which is made just like a cistern, the only opening being at the top. To think that, perhaps, people had been buried in that place alive! What a story those old castles could tell, if stones could speak!

It was with a sigh of relief that we came up to the light again, and past thru the laundry, where they do the washing once every six months. Yes, once in six months! What a pile of linen those Europeans must have! For it was not only here, but nearly everywhere, the same way. And they have a way of ironing by passing the linen thru what they call a "calender," consisting of two big rollers some four or five feet long, similar to an enormous clothes wringer. It seems quite practical.

After sitting down to tea with our kind hosts we took our leave, and walkt back to Vevey by short paths, following the little stream of water which tumbles down the hill a short distance from the castle. In another hour the train landed us again at Nyon.

The Premiums offered this week are well worth working for. Look at them.

Light Honey Crop—Basswood Failure, Etc.

BY C. DAVENPORT.

ANOTHER honey season is a matter of history. The crop in this State was, on the whole, a light one. It was, however, very irregular. In some localities a fair crop was secured, in other places but a few miles distant it was nearly a failure. We had a great drouth during the summer, and locality formed an important part, with what little rain there was, for when we needed rain the most good showers would fall in some places, and in others but a few miles away it would not rain for weeks.

In my own locality white and alsike clover yielded well while they lasted, but it was so dry they did not remain in bloom long. Basswood was a total failure; there were no blossoms, and it would be of great interest to me to know why. There were no frosts late enough in the spring to have injured the buds if they had started, and the dry weather had nothing to do with it, for there was plenty of moisture in the ground early in the season, at the time the buds should have formed. There were no insects that workt on the foliage, as has been the case some seasons before. The yield from basswood here seems to be coming more and more uncertain of late—a matter to be regretted, for while the honey from this source is not equal in quality to that from clovers, there is nothing here in the North, at least, that bees can in the same length of time secure the quantity from that they can from basswood when it yields well.

GATHERING HONEY AND POLLEN AT THE SAME TIME.

I noticed a statement in one of our journals some time ago—I forget now which one, and also who made it, but it was a Prof. Somebody—which was to the effect that bees do not carry or gather honey and pollen at the same time. I expected that many would refute this statement, but I believe no one has done so. I wonder if locality can play any part in this; it would seem so, for here bees often gather both pollen and honey at the same time, not merely a few, but a large part of the field-force does when working upon certain flowers.

I have caught in the fields, and at the entrances of the hives, hundreds of bees that were loaded with both pollen and honey. As a rule, they will not when carrying both have nearly as large a load of pollen as when gathering pollen alone, but will apparently have a full load of nectar; that is, they will eject, when prest, a large drop that looks to be as much as can be obtained from one loaded with nectar alone. But sometimes the conditions will be reverst, and those carrying both will have a good load of pollen and but a small one of nectar.

Here there are different sources from which bees gather both pollen and nectar on the same trip, but it is most noticeable from clover, especially alsike, and during the forenoon, tho I have noticed them carrying both as late as 4 o'clock in the afternoon on cloudy days.

GETTING EXTRACTING-SUPERS CLEANED UP.

The past season I run 40 colonies for extracted honey. Two full-depth upper stories were used. This gave 80 extracting-bodies, and after the last extracting this fall, instead of putting them back on the hives in order to get the combs cleaned up, I piled up the hives containing the combs crosswise of each other in the extracting-house, opened the windows, and the bees did the rest. The house sets right in the yard, and there were 156 colonies, many of which had become pretty well stirred up over the removal of the upper stories. Not a drop of honey was to be obtained in the fields, and the way they piled into the house and those hives was a sight and sound worth going many miles to see. It was the greatest uproar among bees that I have ever seen, and I was afraid that the extracting-combs would be badly torn, but they were not injured, and this is the method I shall practice in the future in order to get the combs, as well as the house itself, cleaned up after the last extracting.

The air in and around the yard was black with flying bees for two or three days, and two queenless colonies were cleaned out. I presume every colony in the yard was attackt by robbers, but all except the two queenless ones were amply able to protect themselves. I expected that I would have to contract the entrance to some of the hives, for a few were 1½ inches deep, and the full width of the hive, but it was not necessary in a single instance.

Aside from the two mentioned, which I did not try to save, the rest were all strong colonies. Of course there were thousands of bees killed in the rush and general uproar, but I believe this to be a good thing, for the most, if

not all of them, were bees of such an age that they would have died this fall or the forepart of the winter, any way.

FEEDING LIGHT COLONIES FOR WINTER.

Of late I have practiced a different method of feeding colonies light in stores for winter, which may be of interest to some who neglect or overlook some light colonies until it is too late to feed syrup. The last few years, since honey has dropped so low in price, I have not fed a pound of sugar either in the spring or fall. As I produce comb honey principally, I always have, each fall, more or less unfinished sections. While many of these contain enough honey to be salable at a reduced price, a great many contain but a small amount, and these are what I principally use for fall feeding.

When carrying a colony into the cellar, if it is light enough to cause a suspicion that it may run short of stores before spring, the cover is removed and a super containing as many of these unfinished sections as seems necessary is set on. A super fitted with T tins is best, as it gives easier access to the sections; but I have often used those containing section-holders, and the bees never failed to go up and remove the honey if they ran short below. This, perhaps it is needless for me to say, is in a cellar kept at the proper temperature. Of 17 colonies thus fed last fall, one died, and this one had been given sections of honey with some pollen in them, which had previously, on account of moth-worms, been subjected to the fumes of bisulphide of carbon. Whether trace enough of these deadly fumes remained in the honey to affect the bees, I am not able to say. Southern Minnesota.

Do Bees Select Their Future Home Before Swarming?

BY "RIP VAN WINKLE."

HAVING read the article by Prof. Cook, on page 529, on the "Swarming of bees," I desire to say a word on the subject, not to criticize, particularly, as most apiarists will agree that Prof. Cook is an able and scientific entomologist, and what he says in beedom "goes." But we haven't yet learned all about either end of the bee, and on the point of whether bees in swarming have or have not selected their future home before clustering, I think that while in many cases the evidence tends to show that they have exercised sufficient forethought and "reuted" their domicile beforehand, and the case mentioned by Prof. Cook indicates it, or tends to do so, still even that case is not strictly conclusive, as a smart lawyer in the "cross-examination" would ask, "Have you any evidence to show that the colony that came next day and took possession of the cornice, as mentioned, was not already hanging on a tree when the scouts were seen examining the locality the day before?"

Prof. Cook is too able a scientist not to know that a long series of undoubted facts alone can determine any positive law in natural history. He says on page 530: "I have little doubt but that this is always true, and that the bees simply cluster to rest the queen." Bees certainly seem to act sometimes with an intelligence approaching reason, but at many other times act, as my grandmother used to characterize it, with "hen-wit," as her broody hens would as soon sit on a white door-knob as on an egg.

And now for one or two facts tending to show the other side of the question, that is, that they do not always select their future home before clustering: Some years ago a swarm came out from one of my hives about half-past eight in the morning, after I had gone to the city (I lived in a South Side suburb, and kept a few colonies for fun). They clustered on a tree (not very leafy), and remained there all day with a hot June sun (the latter part of June) pouring down on them, and they obligingly remained until my return home at about 7 p.m., when I hived them. If they had already selected a home, why did they remain all day in the hot sun?

Again, Aug. 16th, last, on Thursday, a big swarm came out from one of my hives and clustered on an oak tree about 30 feet from the ground, and it was impracticable for me to get them, and I was schooling myself to say a fond farewell, glancing at them occasionally while at work among the rest, expecting to see them "git." But no; there they provokingly hung, and they were still there when I went home. Friday morning they were still there. Then Jupiter Pluvius "got in his work." Clouds came up, rain came down—no "mist that resembles the

rain," as Longfellow says, but "cats and dogs," and "pitch-forks," with blustering wind-gusts. I lookt to see them dissolve, but no! there they stuck. The afternoon was pleasant and clear; Saturday the same, and, to make a long story short, they remained until Sunday afternoon, when they finally took their leave.

Now, Professor, that swarm had not, in my humble opinion, selected its future home at the time of swarming, or that queen must have been very tired. And she was a young queen, too—I have strong reason to suppose a virgin about seven days old. An old queen might get "tired" in flying the distance of say 50 feet—the tree was scarcely 50 feet from the hive; but I can't think a young one would.

I do not give bees credit for a possibility of knowing that their queen is tired. I see little evidence of their remarkable intelligence. Their instincts *are* remarkable; their comb-building has been the wonder and admiration of man from Virgil down; but as to that intelligence some folks wonders at, I do not think it can compare with that of certain species of the ant; and I think there is as much architectural skill shown by the paper nest of the wasp.

"There is a great deal of human nature in a man," and when the bee tickles his palate with its honey, and lights his altars with its wax, he, the said man, is apt to become fulsome in his flattery. Cook Co., Ill.

A Small California Apiary.

BY HARRY L. HEWITT.

I SEND herewith a picture of our apiary. We have all seen thru the American Bee Journal pictures of Eastern apiaries, and read how they get along from day to day and year to year. Now, I am going to tell how we get along from day to day here in California, the land of sunshine and flowers.

There is hardly a day but what our bees get some chance to fly. They winter on the summer stands, and all we need to see to is that when it rains the shade-boards are on, as is seen in the colony away back in the corner. These boards are made so that the rain drops off in front of the alighting-board to the ground, and keeps the entrance dry. It extends back about six inches from the hive, and is not closed at that end. We also use these boards in spring to keep the hives shaded during swarming-time.

On the left is my brother, who is in partnership with me. I am at the right in the picture. In the corner on the fence are my other two brothers, who help about swarming-time, hunting for swarms, etc.

We do not keep bees for profit, but for the pleasure, and also what honey they bring. We sell some, but don't make a business of it. We keep them near the stable, where it is warm, which, with the fence, acts as a wind-break.

Our bees are all in Langstroth movable 8-frame hives, and are painted white. The hives were weighed and lookt over last week for winter.

Along the fence are some empty combs that I exchanged

The Little Apiary of the Hewitt Brothers.

from other hives for full frames of honey, so that now the hives average about 25 pounds of honey each, enough to carry them over into June.

The two hives at the right are full of honey, and I will take the supers off in a day or two.

This year our honey is scarce, on account of the alfalfa bloom producing no honey at all this year, and many an old bee-man has lost half his colonies. This is the first time in years that such a thing has happened. Next year we look for something choice.

I hope to see more views of California apiaries in the American Bee Journal in the future.

San Joaquin Co., Calif., Oct. 25.

* The Afterthought. *

The "Old Reliable" seen thru New and Unreliable Glasses.
By E. E. HASTY, Richards, Ohio.

BEES AS A WEAPON IN WARFARE.

In ancient warfare a colony of bees was a most excellent weapon against enemies undermining your wall. The situation was a very common one, and roofing the assailants in, so well that stones and hot water from above were no good, was the usual recourse—and the wall itself would protect them against these after a big hole was once made. The modern counter-move would of course be explosive. The ancients, not having explosives, could find a tolerable substitute by throwing down hives of bees. In fact, infuriated bees have a hold-the-fort quality which powder notably lacks. Modern war works at such long range that bees have little opportunity. Still, I think an opportunity *might* occur. A retreating army might desire to keep the enemy from occupying with artillery a certain hilltop about to be abandoned; and a few dozen hives of bees wisely placed and dissected would establish an unwholesome climate there decidedly warmer than Gedrosia. Page 676.

CURING SWEET CLOVER HAY.

Perhaps most farmers know in a general way how to cure sweet clover hay; but just how to manage all the details is no doubt a fine art. Mr. Abbott is "shouting" when he says for us not to get the leaves killed early in the process, but to utilize them as pumps to draw the water from the thick, succulent stems. Avoid blazing hot days. If you can't do that, cut in the afternoon. Know just when to make the windrows—and see to it that they are windrows in reality. Also know just when to cock it up (slender and high), and when, and how many times, to spread it out again. These fine points pay well with ordinary grass, but with some out-of-ordinary hay-plants they are quite indispensable. Page 678.

MAKING HONEY-VINEGAR.

So it saves a year of time in making honey-vinegar to have the wood of the barrel thoroly vinegar-soaked? Quite an item. And many of us, wouldn't know that vinegar mother will decay and break up in time, spoiling the looks of the vinegar, and damaging its quality. Looks reasonable, when the mind is turned to it once, and "better we looks a little out." But what shall we say of that endless drawing out and pouring in—robbing Peter and paying Paul? Well, if a *lady* finds it a moderate task to shift several pails of fluid all down the line, one step at a time, thru a row of twelve barrels ('twas a lady that watered Abraham's camels, wasn't it?) well, then, an epizoot on the lout of a man who thinks it too much work and fuss! Do we produce good queens (or good honey, either, for that matter) without fuss? Interesting to find customers preferring honey-vinegar to cider-vinegar. But it was *store* cider-vinegar. Possibly some store vinegar, like some store honey, is "all right, of course"—and the rest of the words unspoken. Page 681.

THE FOLKS THAT WAR AGAINST SWEET CLOVER.

J. A. Green struck a bright idea when he suggested that the folks that war against sweet clover be let alone. Likely to help the honey harvest about as much as they damage it, until they know a heap more than they know now. The plant is apparently with us to stay. As another

reason for letting alone, I would suggest the reading of Luke 14:31. Page 693.

RUBBING IN AN IMPORTANT QUEEN-MATTER.

J. L. Gandy, on page 695, is rubbing in once more an important matter which may probably be regarded as about settled. Young queens just beginning to lay, suffering much less from a journey thru the mails than those which have come to the full of their powers. A wise previous treatment to check laying can do something toward putting a valuable old queen in traveling condition; and we might politely hear more on that point.

THE "WHY" OF BIG VS. LITTLE HIVE A "PERSONAL EQUATION."

So long as we can not tell *why* a given locality requires big hives, or little ones, there is room to suspect that the why is what the astronomers would call the "personal equation" of some man—and said man having a lot of implicit followers. Page 696.

INTRODUCING QUEENS WITH TOBACCO-SMOKE.

Henry Alley's introducing with tobacco-smoke 50 virgin queens in half an hour is a high grade of work, surely; but still we must not forget that it is introducing to *nuclei*, not to old, strong colonies of hybrid bees in big hives. How shall we get the latter ilk of bees *all* tobacco-civilized without pretty nearly killing half of them? And how keep their new saintliness from backsliding a few hours later? That both the smoking and chewing "fine-cuts" of the shops are too strong for bee-smoking, is a point not kept before us heretofore, I think. Smoke of knock-'em-down strength would be much more difficult to manage just right, I judge. Page 697.

EACH TO PAY FOR HIS OWN SOAKT HEAD.

And so our editor thinks that if a man *will* soak his (barrel) head he should pay for the soakage. Unanswerable proposition. Page 707.

WINTERING BEES IN CELLARS.

Between the intense anxiety to have his bees in the best of ventilated quarters, shown by Daniel Whitmer, page 711, and the indifference to the whole matter, or the counter desire to have no ventilation at all, shown by other beemen of good standing, there is quite a gulf. The situation must be very puzzling to an active-minded beginner. We old chaps long ago had to get accustomed to just such point-blank disagreements. And I can't do the whole of the big job of cleaning the discrepancy up for the benefit of said beginner. But for one thing, in winter, nature *will* ventilate most quarters (even many cellars) in spite of us. For another thing, 247 colonies would try the oxygen of the unventilated cellar more than it usually gets tried—quite a different thing from taking thru a quarter hundred or half hundred of colonies. For another thing, any number of colonies roaring and excited require immensely more oxygen than if quiet—no quiet lot of bees being likely to suffer in that regard. And for another thing, the quality of the food bees have to winter on is so much more important than everything else put together, that one can indulge mistaken notions and never find it out, if only the food is good. As a compromise, I would suggest this: Have the cellar so you *can* ventilate—but don't do anything of the kind till the need of it appears—until the bees begin to get unquiet, or at least until the air inside impresses you as bad when you breathe it.

IF IT WERE "FOWL-BROOD" ONLY.

Yes, it does sound a bit as if the bees that hatch chickens must be "fowl-brooders." If that were the only kind of fowl-brood abroad we should be happy. Page 714.

THE BEE-MAN AND THE BALLED QUEEN.

Interesting to see that so able a bee-man as Dr. Miller thinks it best to let entirely alone, and "make yourself scarce," whenever bees are found to be balling their own queen. It requires some nerve to keep this precept, but may be it is for the best. Page 714.

WOODEN QUEEN-CELLS—NEXT!

Wooden queen-cells—nicely venerated with wax, I presume—but Connecticut wooden-ware all the same! If they are not enough to make testy advocates of nature undefiled retire to their graves, or turn over in the same if they have already retired, what would suffice, pray tell? Page 715.

Langstroth on... The Honey-Bee

Revised by Dadant—1899 Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the Ameri-

can Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroughly explained, so that by following the instructions of this book one cannot fail to be wonderfully helped on the way to success with bees.

The book we mail for \$1.25, or club it with the American Bee Journal for one year—both for \$1.75; or, we will mail it as a premium for sending us THREE NEW subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

GEORGE W. YORK & CO.

Unsuccessful Wintering on Honeydew

In August, 1884, the leaves on the basswoods, elms and hickories in my locality were covered with honey-dew, and the bees filled the brood-chambers just as full as they possibly could of the off-colored stuff. I did not like to risk the wintering of all my bees on honey-dew, when I had plenty of sealed clover honey in the top stories, which I had saved to winter them on, but I thought I could safely do some experimenting along this line and go thru the winter without any loss. I had 85 colonies, and in the fall I took all the combs out of 65 brood-chambers, and placed from 5 to 6 combs of sealed clover honey in each hive, and put a division-board on each side of these combs. I then packed the colonies with forest leaves. I then fitted up 10 colonies with 5 combs of sealed honey-dew each, (which I had taken from other colonies), and after placing division-boards on each side of the combs I packed these colonies with leaves also. I then fix up the other 10 colonies with 3 sealed combs of clover in the center and a comb of honey-dew at each side and the division-boards, packing these colonies in leaves the same as I did the others.

The 65 that were given the sealed combs of clover honey wintered fine, and were very strong with bees in the spring, and gave a large yield of honey in 1885. The 10 that had mixt stores dwindled down very much in spring, and gave me but very little honey that season. The 10 colonies that I tried to winter on nothing but honey-dew soiled their hives very badly, the most of them died before spring, and the balance "petered out" and were gone before the middle of April.

When the clover season is nearing the end I leave 5 sealed combs in each top story for winter stores, and extract from the other super-combs until the

Rocky Mountain Bee-Plant Seed

(*Cleome integrifolia.*)

...FREE AS A PREMIUM...

The ABC of Bee-Culture says of it: "This is a beautiful plant for the flower-garden, to say nothing of the honey it produces. It grows from two to three feet in height and bears large, clusters of bright pink flowers. It grows naturally on the Rocky Mountains, and in Colorado, where it is said to furnish large quantities of honey."

We have a few pounds of this *Cleome* seed, and offer to mail a ¼-pound package as a premium for sending us ONE NEW subscriber to the American Bee Journal, with \$1.00; or ½ pound by mail for 40 cents.

AMERICAN BEE JOURNAL, 118 Mich. St., Chicago, Ill.

season ends, and when the time comes to prepare my bees for winter, I have 5 combs of choice stores to put into each brood-chamber for the bees to winter on. If I had left all the colonies to winter on honey-dew in 1884, when the brood-chambers were filled up full with it, I would have lost nearly all of my bees. It doesn't pay to try to winter bees on poor stores.—Wm. McEvoy, in Canadian Bee Journal.

Churning Slumgum Under Boiling Water.

The following is from W. L. Porter, in the Progressive Bee-Keeper:

"For rendering old combs I use a tank 15 inches deep and 19 inches square on top. I have it these dimensions so it is suitable for holding four square 5-gallon cans of honey for liquefying. This I place on a brick furnace with pipe sufficient to give a good draft, and fill 3/4 full of water. When boiling I put in old comb until the tank is full. I then have a screen made out of 1/2-inch lumber, 5 inches wide, and the size just to fit the inside of the can; the lumber is put together in the form of a box. On this I fasten firmly screen wire (window-screen) with a brace thru the middle. When the wax is boiling vigorously I place in this frame, with the screen up. The 5-inch frame prevents the slumgum from coming up, and the wax will come thru the screen.

"When the frame is prest down I dip off this, and by agitating the frame it churns the refuse, the wax is liberated and comes on top. I then take out the frame and screen and stir vigorously, then put in the screen and repeat the dipping off. I then weigh down the screen with heavy weights, and leave over night. The heat of the brick and the coals under the furnace will keep the tank at the boiling-point for a good many hours, and in the morning wax can be taken off in a cake. This leaves the slumgum quite free of wax."

The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

[THIS CUT IS THE FULL SIZE OF THE KNIFE.]

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a last-time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.25, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00.) We will club the Novelty Knife and the Bee Journal for one year, both for \$1.90.

GEORGE W. YORK & CO., 118 Mich. St., Chicago, Ill.

Please allow about two weeks for your knife order to be filled.

ago I got permission of the railway company to use it by way of experiment. Of course, nothing would grow on it—that is, nothing but sweet clover—which is already along the railroad. We let it grow up and scatter seed until last spring, when I saw there was a dense growth of thick succulent stalks about two feet high. When we were plowing under the clover in the field adjoining, I directed our folks to turn under the sweet clover, and said we would try it with Carman potatoes. The potatoes came up rank and strong to my great surprise, and we have just been digging them, and I was surprised again to find some of the handsomest, cleanest potatoes on that hard, unproductive clay bank that I ever raised anywhere. There was not a particle of scab, no work of wire worms or grubs; and the crop that we got was at the rate of at least 100 bushels per acre. From this experiment I infer that sweet clover is not only worth as much to turn under as any of the common clovers, but I should say even more.—A. I. Root, in Gleanings in Bee-Culture.

Report for the Season of 1900.

My bees are on the summer stands with the supers full of dry leaves, and from 4 to 6 inches of dry leaves around the hives, with tar-paper outside of all, and I believe they are in good shape to stand any kind of a winter we may have.

When I came to Iowa, two years ago, I sold all my bees, and as they were scarce and high, I did not buy any till last spring, when I got two colonies in box-hives. They gave me two new

MERIT ALWAYS WINS.

The hard times of the past three or four years have been very destructive to all industrial affairs, and the railroads have had unusual amount of difficulty in making both ends meet. Roads that have, during this trying period, earned dividends while at the same time affording high-class transportation facilities to their patrons, have, indeed, been fortunate. And such an event speaks well for the management of the roads.

The record of the Nickel Plate Road during the recent period of industrial depression, has indeed been remarkable, and it speaks most eloquently of the conservative judgment of the managers. For this road has made great and steady progress in the material improvement of its roadway and appliances, and in perfecting its equipment. The interests of the public have been in no wise neglected; in fact, the success of this road has inured to the benefit of the public, as much, if not more, than to the stockholders. The condition of the road to-day shows this. Great and valuable improvements of a permanent character have been made—in the shape of strengthening the roadway, bridges and other accessories, and procuring new and improved safety appliances; new coaches have been added, elegant Pullman sleeping-cars put on, new and powerful engines have been placed in service, and everything has been done to raise the standard of the road, to

perfect its service, and to give it a leading place among the best roads in the country. The result has been obvious. The people have observed the progressive spirit of this road, have given it a liberal patronage, have enjoyed its excellent facilities, and that tells the whole story of a highly successful enterprise.

Among the most noteworthy improvements effected by the Nickel Plate Road is the introduction of a first-class dining-car service, which has won the approval of the best class of patrons. Then the coaches have been illuminated by the brilliant Pintsch gas, heated by steam, and placed in care of a colored porter, so the passengers have had the best that money can afford, at the lowest rates. The thru train service of the Nickel Plate, running in connection with the West Shore and Fitchburg Railroads over the great Hoosac Tunnel Route, between New York, Boston and Chicago—ranks with the best in the country, and has become deservedly popular. Elegant new coaches, and palatial Pullman buffet sleeping-cars run thru without change; the service is unexcelled, the time fast, scenery most fascinating.

Located along the south shore of Lake Erie are many substantial and attractive summer resorts that are yearly growing in popularity, and this class of travel promises a continual increasing source of revenue to the Nickel Plate Road. 48A4t

swarms, June 6 and 16, and 21 days after I drove them out into new hives; and I took off 125 nicely filled sections of honey from the two new colonies; I got none from the old. They are all four good, strong 10-frame colonies.

I received my "premium queen" Aug. 29th, and removed the old queen (put her in an old hive with a few bees). Aug. 31st I placed the cage with the queen between the combs after cutting out all queen-cells, and on Sept. 2nd, at noon, they had her releast. I did not even remove the pasteboard, that some have seemed to have had trouble with. Sept. 5th I found her balled, and about 25 more queen-cells started, and some of them capt. I caged her, cut out all queen-cells again, and placed her on a frame of honey, eggs, larvæ, and hatching brood, covered with wire cloth, and the next day at noon found they had gnawed under the wire and let her out. I found her running around on the bottom of the hive, with a string of bees chasing her, but they did not ball her again, and two days later she was laying and now has a strong colony of her own bees, and I look for good results from her another year. I bought 6 colonies this fall, so I have 10 now.

We have had a very warm, open fall here. Nov. 4th my bees were bringing in pollen, and, I believe, some honey. We had our first freeze after that. What will be the result of bees gathering pollen so late?

I hated to kill my queen in the old hive, as she was a good, this year's queen, so I made an observatory hive with glass sides, and put her with one frame of bees in it, and have them in my office with an outside entrance, and they are breeding right along, and are watcht with interest by a great many grown people and children who would not dare go near a bee-hive.

Will I be able to keep them thru the winter? or will the unnatural warmth and activity cause them to die off fast before spring?

I haven't set any of my bees on hen's eggs yet; but if this is worth a place in the Bee Journal, perhaps I will tell next time how I am planning to have my bees call me up over the 'phone when they are swarming next summer.

A. B. GINNER.

Hardin Co., Iowa, Nov. 16.

What Honey-Plants for Mississippi?

This is not a good locality for bees. Mine did not store any honey after June this year, and I fear I shall lose some of my colonies from starvation. What has become of the white clover that once grew wild and could be found along every lane and on every uncultivated spot in the country, from the time I could first remember until recently? It never occurred to me, however, till I began keeping bees the second time, two years ago.

Of course, every bee-keeper is constantly on the lookout for bee-plants. The goldenrod down here didn't bloom this year. The bloom seemed to dry up. Is this to be accounted for? Or is it natural down here to do that? I never noticed it before. In fact, I don't see what our bees live on, let alone store from, in this vicinity, after June.

I am thinking of buying some of the best honey-plants to help the bees out next year, and would like some one who knows, to tell thru the American Bee Journal what plants are best adapted to this climate and soil. I am 8 miles from the great Mississippi River. I know of some apiaries on or near the river that pay well, and have a surplus every year. Who can tell

whether or not the yellow or white sweet clover, spoken of so often, would do for this locality? and when would be the time to plant them? also, would such require any special cultivation, or could such plants be sown promiscuously anywhere along the fence-rows or on uncultivated places to get it started? We know red clover as a forage plant doesn't pay down here. Lespedeza didn't seem to attract bees, either. I do not know about alfalfa. I would be obliged if some one would recommend honey-plants that I could plant in my orchard, as I haven't planted anything in it but cow-peas so far, as I have mostly young trees in it. But I have a two-acre lot fitted out with all the different kinds of fruit-trees, and I would like to grow some kind of honey-plants in there.

Unless bees can be made to do much better than mine have the past two years, they won't pay. What a ridiculous idea I see advanced by those who assert that bees puncture and damage peaches and other fruit. If they said birds were damaging to fruit, I would endorse it, but not bees.

JOHN KENNEDY.

Adams Co., Miss., Nov. 17.

CONVENTION NOTICES.

New York.—Bee-Keepers' Institutes will be held as follows: Batavia, Dec. 12th; Canandaigua, Dec. 13th and 14th; Romulus, Dec. 15th; Auburn, Dec. 17th; and Johnstown, Dec. 18th. Bee-Keepers living in the vicinity of these Institutes are urged to attend and take an active part in the proceedings.

New York.—The Ontario County Bee-Keepers' Convention will be held in Canandaigua, N.Y., Dec. 13 and 14. There will be a bee-keepers' institute in connection with the same, and Editor W. Z. Hutchinson has been engaged to attend. Naples, N.Y. FRIEDEMANN GREINER, Sec.

HONEY AND BEESWAX
MARKET QUOTATIONS.

CHICAGO, Nov. 24.—There is a demand for fancy white comb honey at 16c that takes all of this grade upon arrival; other grades are less active, with No. 1 white at 15c; amber and travel-stained white ranges from 13@14c, with dark amber and buckwheat comb 10@12c. Extracted, white, 7½@8c; amber, 7@7½c; dark grades, including buckwheat, 6½@6¾c. Beeswax, 28c. R. A. BURNETT & Co.

KANSAS CITY, Nov. 16.—Fancy white comb, 15@16c; No. 1 white, 14@15c; amber, 12@13c; dark, 8@9c. Extracted, in 5-gallon cans, white, 7½@9c; amber, 7@8c. Receipts light. W. R. CROMWELL PRODUCE Co., Successors to C. C. Clemons & Co.

BUFFALO, Nov. 16.—Fancy white comb remains at 17@18c mostly, with rather larger receipts. Common selling at 12@16c. Possibly some lots poor enough to go less. We believe the high prices will curtail consumption. Extracted never sells well in Buffalo, but a little might sell at 9@9c in fancy shape. BATTERSON & Co.

ALBANY, N.Y., Nov. 17.—Fancy white, 17@18; No. 1, 15@16c; mixt, 13@14c; fancy buckwheat, 13@14c; No. 1, 12@13c; mixt, 12c. White extracted, 8½@9½c; mixt, 8@9c; buckwheat, 6½c.

Honey market still firm with good demand; light receipts at high prices, especially for comb honey of all grades. H. R. WRIGHT.

BOSTON, Nov. 19.—Our market on honey continues strong, with light receipts. Fancy one-pound cartons, 17c; A No. 1, 15@16c; No. 1, 15c; No. 2, 12@13c. Extracted from 7½@8½c, according to quality. Beeswax steady at 25@27c. BLAKE, SCOTT & LEE.

CINCINNATI, Sept. 21.—The demand for fancy comb honey is good and finds ready sale at 16@16½c; No. 1, 15c. The demand for extracted honey at present is slow and offer same by the barrel as follows: White clover, 8½@9c; Southern, 6½@7c; Florida, 7@8 cents, according to quality. Beeswax, 27c.

The above are MY SELLING PRICES. I do not haude any honey on commission, but pay spot cash on delivery. C. H. W. WEBBER.

NEW YORK, Nov. 20.—Good demand continues for all grades of comb honey. We quote: Fancy white, 15@16c; No. 1 white, 14c; No. 2 white 12@13c; amber, 12c; buckwheat, 10@11c. Extracted in fairly good demand at 7½@8c for white, and 7c for amber; off grades and Southern in barrels at from 65@75c per gallon, according to quality. Not much demand for extracted buckwheat as yet. Some little selling at 5½@6c. Beeswax firm at 28 cents. HILDRETH & SEGELKEN.

DETROIT, Nov. 22.—Fancy white comb, 15@16c; No. 1, 13@14c; dark and amber, 10@12c. Extracted, white, 8@8½c; light amber, 7@7½c; dark, 6@6½c. Beeswax, 26@28c. M. H. HUNT & SON.

SAN FRANCISCO, Nov. 21.—White comb, 13@14 cents; amber, 11½@12½c; dark, 8@9c. Extracted, white, 7½@8c; light amber, 6½@7½c; amber, 5½@6½c. Beeswax, 26@28c.

Market is seldom more lightly stocked than at present, and is firm at current rates. Offerings are principally amber grades, choice to select water white honey being a rarity at present, as it has been, in fact, most of the current season. A shipment of 90 cases of honey went forward per steamer to British Columbia.

A HONEY MARKET.—Don't think that your crop is too large or too small to interest us. We have bought and sold five carloads already this season, and want more. We pay spot cash. Address, giving quality, quantity and price, THOS. C. STANLEY & SON, Fairfield, Ill.

A HANDY TOOL-HOLDER!

Sent by Express, for \$1.50; or with the Bee Journal one year—both for \$2.00.

Every Manufacturer, Millier, Carpenter, Cabinet Maker, Machinist, Wheelwright and Quarryman, Farmer, or any one using a grindstone, should have one of these Tool-Holders. One boy can do the work of two persons, and grind much faster, easier and with perfect accuracy. Will hold any kind of tool, from the smallest chisel to a draw shave or ax. Extra attachment for sharpening scythe blades included in the above price. The work is done without wetting the hands or soiling the clothes, as the water flows from the operator. It can be attached to any size stone for hand or steam power, is always ready for use, nothing to get out of order, and is absolutely worth 100 times its cost.

No farm is well-equipped unless it has a Tool-Holder. Pays for itself in a short time.

How to Use the Holder.

DIRECTIONS.—The Tool is fastened securely in the Holder by a set-screw and can be ground to any desired level by inserting the arm of the Holder into a higher or lower notch of the standard. While turning the crank with the right hand, the left rests on an steady the Holder; the Tool is moved to the right or left across the stone, or examined while grinding, as readily and in the same way as if held in the hands.

For grinding Round-Edge Tools, the holes in the standard are used instead of the notches.

Four Celluloid Queen-Buttons Free

AS A PREMIUM For sending us ONE NEW SUBSCRIBER to the American Bee Journal for three months with 30 cents, we will mail you FOUR of these pretty buttons for wearing on the coat-lapel. (You can wear one and give the others to the children.) The queen has a golden tinge.

This offer is made only to our present regular subscribers.

NOTE.—One reader writes: "I have every reason to believe that it would be a very good idea for every bee-keeper to wear one [of the buttons] as it will cause people to ask questions about the busy bee, and many a conversation thus started would wind up with the sale of more or less honey; at any rate, it would give the bee-keeper a superior opportunity to enlighten many a person in regard to honey and bees."

Prices of Buttons alone, postpaid: One button, 8 cts.; 2 buttons, 6 cts. each; 5 or more, 5 cts. each. (Stamps taken.) Address,

GEORGE W. YORK & CO., 118 Michigan St., CHICAGO.

AMERICAN

BEE JOURNAL

GEORGE W. YORK,
Editor.

CHICAGO, ILL., DECEMBER 13, 1900.

FORTIETH YEAR.
No. 50.

WEEKLY

W. Z. HUTCHINSON, of Michigan,
Director of the National Bee-Keepers' Association.

PUBLISHED WEEKLY BY

GEORGE W. YORK & CO.

118 Michigan St., Chicago, Ill.

Entered at the Post-Office at Chicago as Second-Class Mail-Matter.

IMPORTANT NOTICES:

The Subscription Price of this journal is \$1.00 a year, in the United States, Canada, and Mexico; all other countries in the Postal Union, 50c a year extra for postage. Sample copy free.

The Wrapper-Label Date of this paper indicates the end of the month to which your subscription is paid. For instance, "Dec00" on your label shows that it is paid to the end of December, 1900.

Subscription Receipts—We do not send a receipt for money sent us to pay subscription, but change the date on your wrapper-label, which shows you that the money has been received and duly credited.

Advertising Rates will be given upon application.

Reformed Spelling.—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound. Also some other changes are used.

The Bee-Keeper's Guide

Or, Manual of the Apiary,

—BY—
PROF. A. J. COOK.

460 Pages—16th (1899) Edition—18th Thousand—\$1.25 postpaid.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published to-day. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipped, or his library complete, without THE BEE-KEEPERS' GUIDE.

This 16th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to GIVE AWAY to our present subscribers, for the work of getting NEW subscribers for the American Bee Journal.

Given for TWO New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the two NEW subscribers—simply the Bee Journal for one year:

Send us TWO NEW SUBSCRIBERS to the Bee Journal (with \$2.00), and we will mail you a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both for only \$1.75. But surely anybody can get only TWO NEW SUBSCRIBERS to the Bee Journal for a year, and thus get the book as a premium. Let every body try for it. Will YOU have one?

GEORGE W. YORK & CO.,

118 Michigan Street, CHICAGO, ILL.

No. 1 "Barler Ideal" Oil-Heater.

The "Barler Ideal" OIL-HEATER...

Saves Its Cost Every Year!
NO ODOR! NO SMOKE! NO ASHES!
Costs only a cent an hour to run it.

The editor of the American Bee Journal is using the "Barler Ideal" Oil Heater, and it is all right in every way. We liked it so well that we wanted our readers to have it too, so we have recently arranged with its manufacturers to fill our orders. The picture shown herewith is the one we recommend for general use. It is a perfect gem of a stove for heating dining-rooms, bed-rooms, and bath-rooms. It hinges back in a substantial way, and is thoroughly well made throughout. The urn removes for heating water. The brass fount, or well, has a bail, and holds nearly one gallon of kerosene oil. It is just as safe as an ordinary lamp. You wouldn't be without it for twice its cost, after once having one of these stoves. Most oil-stoves emit an offensive odor, but this one doesn't. Its height is 2½ feet, and weighs 20 pounds, or 30 pounds, crated ready for shipment, either by freight or express.

Price, f.o.b. Chicago, \$6.00; or, combined with a year's subscription to the American Bee Journal—both for only \$6.50. FULL DIRECTIONS GO WITH EACH STOVE.

If you want something that is really serviceable, reliable, and thoroughly comfortable, you should get this "Barler Ideal" Oil Stove, as it can easily be carried by any woman from one room to another, and thus have all the heat you want right where you want it.

Address,

GEORGE W. YORK & CO.,
118 Michigan St., Chicago, Ill.

BASSWOOD HONEY in 60-pound CANS

This is the well-known Basswood Honey, and is very fine. Sample, by mail, 8 cents; two or more 60-pound cans, two cans in a box, at 9 cents a pound, f.o.b. Chicago.

Dark Amber Honey in Barrels.

We have a few barrels of this honey holding 300 pounds each, net. Many people prefer the rich amber honey, and in some retail markets it brings as much as the light-colored honeys. Sample, by mail, 8 cents; per 300-pound barrel, 7½ cents a pound. Cash with order in each case.

Address,

GEORGE W. YORK & CO.,

118 Michigan Street, CHICAGO, ILL.

YELLOW OR WHITE

Sweet Clover Seed

Free as a Premium

For Sending us One New Subscriber for a Year.

There has been so much written about both the white and the yellow variety of sweet clover, that we will simply say here that if one of our present regular subscribers will send us \$1 with a new name for next year (1901), we will send the new subscriber the balance of this year's (1900) numbers free, and mail, postpaid, to the one sending the new name and the dollar, either one pound of yellow sweet clover seed, or two pounds of the white sweet clover. This is a good chance to get a start of both kinds of these honey clovers. Better send two new subscribers (with \$2.00) and get the three pounds of seed. Address,

GEORGE W. YORK & CO.

ESTABLISHED IN 1861

AMERICAN BEE JOURNAL

THE OLDEST BEE-PAPER IN AMERICA

40th YEAR.

CHICAGO, ILL., DECEMBER 13, 1900.

No. 50.

* Editorial. *

The Brosius Pure Food Bill is given in full in this number of the Bee Journal, as requested at the Chicago convention. Secretary Wilson, of the Department of Agriculture at Washington, in his annual report just issued, has the following strong endorsement of the Brosius bill:

"The Division has during the year been engaged in active co-operation with other organized bodies, notably the Pure Food Congress of the United States, to promote the effort to secure State and National legislation on the subject of food adulteration. In quite a number of the States the laws which have been passed have been modeled upon the Brosius Pure Food Bill, which is now pending before Congress, and which, by its passage, would secure a perfect control of interstate traffic in adulterated foods. It is only by such National legislation that the excellent work which the States are doing in controlling State legislation can be properly supplemented and made efficient. Every consideration of honesty and justice to the producer and consumer demands that Congress should take early and favorable action upon the pure-food bill which is now pending."

Every honest man will say "Amen" to Mr. Wilson's last sentence above, and earnestly hope that Congress will act thus speedily in the interest of all the people.

Honey-Prices in City Markets.—G. M. Doolittle, in Gleanings in Bee-Culture, advises that the price of honey in the home market shall be fixed by adding to the city market the freight and commission. In a straw in a subsequent number, Dr. Miller approves this, but thinks the matter should be reversed when there is a shortage in the home market; for in that case the home grocer buying in the city would pay freight on his purchase.

While both may be correct, and there is probably no disagreement between them, there are some factors in the case that make it generally advisable to shade the figures just a little in favor of the home market. There is no risk of railroad breakage in the case of the home market. Some may be so experienced in the matter that this is of little account, but many a beginner has suffered considerable loss from breakage occurring either while on the cars or else in putting on or taking off the cars.

Another thing worth considering is the matter of shipping-cases. In the home market these may be used several times, thus saving most of the expense for cases, whereas, cases sent to the city market are never seen

again. In the home market the grocer may want to pay in trade, and the bee-keeper may say he would rather have the money to buy where he pleases. There is no good reason why the grocer in the country should not pay cash as well as the city grocer. It is probably a fact, however, that most bee-keepers buy their groceries generally at one place, even if they do pay all cash, and if the grocer makes the same charge for the goods he sells to the bee-keeper in payment for honey as when he sells for cash—and any honest grocer ought to do that—where is the difference whether the bee-keeper gets trade or cash?

Corking a Honey-Funnel.—When filling cans one sometimes uses a funnel, and the funnel must be carried from one can to another. If this is done when much honey is in the funnel there may be trouble. H. P. Miner tells in the Bee-Keepers' Review how he avoids it. Have a cork that fits the lower end of the funnel with a heavy wire reaching up thru the honey to the top of the funnel. When one can is full, cork up the funnel and carry it to another.

Cuba as Seen by a Woman.—Mrs. G. E. Moe talks about Cuba in the Bee-Keepers' Review, and ends by saying:

If one can surmount the obstacles of living without schools, churches, or society, or the ordinary conveniences of life: if one can live in a tent or a palm cabin, and pay exorbitant prices for dry-goods, groceries, freight, etc.; if one can keep bees free from death and disease thru the summer, one will be rewarded by an abundant flow of beautiful white honey of a fine quality during the winter.

Tobacco-Smoke for Introducing queens seems to be quite in favor in the Bee-Keepers' Review. The introducing should be in the evening, and every bee should be reached with the smoke.

The Utter vs. Utter Case remains without new developments, but Gleanings in Bee-Culture gives some information as to the testimony given at the trial. It was charged that the bees stung the plaintiff's peach-trees, but it was shown that they were badly affected with the yellows, and the plaintiff told two of the witnesses that he was going to pull up 49 of the trees because they were so badly affected. The plaintiff's sons testified that they had seen bees attack peaches; that the bees would stand on their hind legs and probe or puncture a peach, and then fly away; which operation they had seen thru a magnifying-glass. Also:

Another witness for the prosecution testified on direct examination that he saw a bee alight

on a peach, and, calling his hired man, they watch the bee, and the result was that the bee punctured the peach, obtained some juice, and flew away; that the peach showed a small puncture. On a cross-examination the lawyer asked, "Did you examine that peach before the bee alighted on it?" He replied that he did not; that there might have been a hole in it before he saw a bee on it.

Editor Root makes the following comments, which it is to be hoped will be heeded by many:

It does not seem possible that the decision of the lower court will be sustained, but still we can not afford to take any chance; and the bee-keepers of the land, thru the National Bee-Keepers' Association, should contribute liberally toward the defense of this case by sending in their dollars as membership fee to General Manager Eugene Secor, Forest City, Iowa. If you are interested in this case, and desire to see justice done, and your own interests preserved, send in a dollar at once. You can not do it any too soon. Remember that an adverse decision in New York will affect every bee-keeper in every other State in the Union; and we must not let prejudice and ignorance blast or blight out the rights of the honest bee-keeper.

Legislation as to Locality is a subject that was at one time discussed with some degree of warmth, but for some time it has been sleeping. Now it seems to be trying to get its eyes open again, from the following stray straw by Dr. Miller, in Gleanings in Bee-Culture:

The Australasian Bee-Keeper approaches the subject of a bee-keeper's right to territory in a somewhat gingerly manner, questioning the moral right to encroach on territory already occupied so long as other territory can be found, inviting discussion "with a view of establishing an etiquette or understanding between bee-keepers and their acknowledged rights to localities." Friend Pender, unless etiquette is stronger in Australia than here it will not keep a newcomer from encroaching, and I once got a whole lot of hot shot for saying law ought to back up etiquette.—[While etiquette in the matter of priority of rights is sometimes grossly violated, yet in my travels over the country I find that it has a larger sway and influence than you would imagine. There has been so much talk on the subject that all bee-keepers of the better class, I believe, are disinclined to encroach on the territory of their neighbor bee-keepers.—ED.]

It is evident that there has been some change in the sentiment of bee-keepers in the passing years. At first the general sentiment seemed to be that there ought to be no sort of restriction in any way; that a bee-keeper had the right moral as well as legal to plant an apiary when and where he liked, and that there was something approaching to littleness and meanness in any man who would advocate the idea that there was any sort of wrongdoing on the part of a man who should plant an apiary on ground already fully occupied by others. Editor Root seems to be of the impression that this change of sentiment has

been brought about by discussion, or because "there has been so much talk on the subject." If the discussion has resulted in confirming this view among "all bee-keepers of the better class," then it has been to that extent a good thing.

Perhaps it may not be far out of the way to say that the present general sentiment is something like this: "No man has the moral right to encroach upon bee-territory already fully occupied, and this fact is so generally recognized that there is no need of legislation on the subject." It can hardly be a misinterpretation to quote Mr. Root as saying:

"While priority of rights is sometimes grossly violated, the feeling is so strong among all bee-keepers of the better class that such rights should be respected, that it is needless to talk about any means for greater security to those already occupying a given territory."

That sounds well, but Mr. Root might learn that his words have in them very little salve for the sore feelings of those whom he mentions as having had their rights "grossly violated." How would it do to apply the same reasoning to the matter of stealing, and paraphrase Mr. Root's words after this fashion?

"While etiquette in the matter of property rights is sometimes grossly violated, yet in my travels over the country I find that it has a larger sway and influence than you would imagine. There has been so much talk on the subject that all citizens of the better class are disinclined to appropriate their neighbors' property."

In other words, 49 out of every 50 would not steal if there were no law against stealing, therefore, no law against stealing is needed. But the law is not meant for the 49, but for that one out of 50. So Dr. Miller might reply to Mr. Root that legislation was not needed for "bee-keepers of the better class," but for those who "sometimes grossly violated" their neighbors' priority rights.

Admit that a man who is already occupying a certain territory has a moral right to its possession, and it seems reasonable to say: "The man who encroaches on territory that belongs to another is stealing, just as much as the man who steals a pound of honey, and if the law protects a man from having his honey stolen, it should also protect him from having his territory stolen."

The weak part of the whole matter, however, will be found to be farther on than has yet been considered. If all bee-keepers should agree that it was the proper thing that a bee-keeper's moral rights should be made his legal rights, the real difficulty would come up in trying to decide how such laws should be framed, and how they should be carried out. Before Dr. Miller wastes any more breath trying to make it appear that legislation is necessary, let him give us a sample of a law that would commend itself as being at all practicable. It is easy to define property in honey or money, but to define property in the nectar of flowers in a certain territory is quite another thing.

Grading of Honey by Color.—In this country there has been some discussion as to having colored cards or something of the kind as a standard for the color of extracted honey. The British Bee-Keepers' Association, according to the British Bee Journal, seems to be

sending out tinted glass for the purpose, with the following instructions:

One piece of the glass, supplied herewith, when held up to ordinary daylight (not in sunlight), shows the lightest shade allowable, and the two pieces in juxtaposition denote the darkest shade permitted in classes for medium-colored extracted honey.

The test of color must be made with honey in glass jars similar to those in which it is to be exhibited, and in no other way.

The following more explicit instruction is given in the British Bee Journal:

Place *one* piece of the glass alongside a jar of honey (similar to those in which the latter is to be staged), with a sheet of white paper as a background, and compare the respective colors of honey and glass when look at in a good light (not sunlight). If *not lighter* in color than the glass it is eligible. Then place the two pieces of glass together, and if the color, as seen thru *both* pieces, is *not darker* than the honey, it is also eligible in the medium class. Thus the glasses used singly and both together represent respectively the extreme shades of color (light and dark) beyond which it must not go.

Driven Bees, or "naked colonies," as the Germans call them, seem to be almost a staple article in some parts of the Old World. Such things are hardly known in this country, for the custom of "taking up" bees in the fall to get the honey has almost entirely died out. Editor J. B. Kellen says in the Luxemburgischen Bienenzeitung that such colonies, the bare bees with neither combs nor stores, weighing four or five pounds, can be had for 12 to 25 cents per pound, and if obtained in September or sooner, they may be used to advantage by those who have on hand the proper combs and stores to receive them.

The Silver Linden is reported in Revue Internationale as being disastrously destructive to bees, thousands of their dead bodies being found on the ground under such trees, while no dead bees were found under the common linden. The silver linden is a superb tree, growing rapidly, but colonies in its neighborhood are so depopulated that it is advisable to move them to another locality as soon as the common linden is thru blooming, the silver blooming a little later than the common.

Settling Swarms.—According to an item in Leipz. Bztg., a swarm that begins to settle in an unfavorable place, or does not settle at all, can be induced to settle where desired by the smell of burning wax. Throw some crumbs of old comb upon burning coals, and hold in such position that the ascending smoke will strike the bees, and they will as a rule turn toward the odor and promptly settle. It may be questioned whether bees in this country are so docile.

To Improve Stock Thru Drones, J. S. Callbreath recommends in Gleanings in Bee-Culture the following:

Each year select a number of colonies with pure queens, purely mated, that have stored a lot of honey and capt it white, and that have not swarmed. The next year rear an immense lot of drones from these colonies, and limit or entirely prevent drone-production in all others. In a very few years there will be a noticeable decrease in swarming—at least that is my experience.

Weekly Budget

MR. O. O. POPPLETON, of Dade Co., Fla., writing us Dec. 3d, said:

"My bees are very strong for the time of year, with plenty of stores, and for the first time in years not a trace of bee-paralysis among them. Pennyroyal is just commencing to open its bloom."

MR. A. E. WILLCUTT, of Hampshire Co., Mass., offers the following chapter of proverbs:

1. "Keep all colonies strong."
2. He that keepeth his bees protected during winter is wise.
3. He that readeth the bee-papers shall obtain knowledge.
4. He that uniteth all weak colonies in the fall is also considered wise.
5. Leave no sweets exposed about the apiary, and by so doing prevent much robbing.
6. Watch, lest thy swarms go to the woods.
7. He that is slow about putting on supers may lose his reward.
8. Bees with long tongues make their owner to rejoice.
9. Be not too wise in thine own conceit.
10. He that loveth his bees ought surely to succeed.

WHEN RENEWING YOUR SUBSCRIPTION why not send along the name of a new subscriber for the American Bee Journal? We offer a number of premiums for doing this, and also clubbing offers. This is the best time of year for new readers to begin, as by reading all winter they will be more ready to do something with bees next spring. There must be quite a large number of bee-keepers within easy distance of nearly all the present readers of the Bee Journal, who do not now get it, but who would subscribe if they were asked by one who knows just what the Bee Journal contains from week to week.

We would like to send sample copies to any bee-keepers you think would be inclined to subscribe, if you will kindly send us their names and addresses.

PRICES ON BEE-SUPPLIES FOR 1901.—We find the following paragraph in Gleanings in Bee-Culture for Dec. 1st, which will be of interest to intending purchasers of bee-keepers' supplies, as it indicates about what the prices will be for next year, at least so far as The A. I. Root Co. is concerned, and all who handle their goods:

"We have decided to continue the prices in effect last season on hives and sections for the coming season, or until conditions warrant a further change. While the cost of lumber would warrant the advance proposed two months ago, we have concluded not to make it, but to be content with a narrower margin of profit. Bee-keepers have had two quite unfavorable years, which we have also felt in a reduced demand for supplies. We trust that, with the high prices prevailing for honey, and the favorable outlook for a clover crop the coming year, the demand will increase, and we shall be rewarded by increased business at the old price. The beeswax market is such that we shall have to advance comb foundation 2 cents a pound above last season's price. We are able to make lower prices on some other items."

We presume then the prices of bee-keepers' supplies next season may safely be relied upon as being practically the same as during the past season. There was an apparent tendency to raise prices again, but we are glad that it has been found unnecessary to do so, except in the case of comb foundation.

Convention Proceedings.

Report of the Proceedings of the 31st Annual Convention of the National Bee-Keepers' Association, held at Chicago, Ill., Aug. 28, 29 and 30, 1900.

BY DR. A. B. MASON, SEC.

(Continued from page 775.)

DISCUSSION ON PURE FOOD LEGISLATION.

Mr. Moore—I would like to have Mr. Abbott go on and state specifically what we as individuals and organizations should do to have the Brosius Pure Food Bill past.

Pres. Root—I thought he did state that pretty clearly, didn't he?

Mr. Moore—Shall we each write a personal letter? or shall we as organizations pass resolutions and have those forwarded?

Mr. Abbott—Do both; you can't send too much. Let it hail, rain, and snow influence in Washington, and let them know that you mean business.

Mr. Hershiser—I would like to inquire what the length of this bill is; how much matter there is in it.

Mr. Abbott—Four pages in the original coarse type that bills are usually printed by the Senate; it is very coarse print.

Mr. Hershiser—It seems to me it would be quite interesting to bee-keepers to read this bill; it doesn't seem to me it would be out of place to have it published in the bee-papers; I would like to read it.

Mr. York—I would suggest it be published in connection with the report of this meeting.

Pres. Root—If there is no objection, and Mr. York is perfectly willing to do it, I think we would be glad to have him do so.

Mr. Benton—I couldn't possibly sit still and let one statement made by Mr. Abbott pass. He said the bee-keepers were represented in the second pure-food congress by one bee-keeper only; the first congress by Mr. Secor and himself. The National Bee-Keepers' Union appointed a delegate to both congresses; he was present and took part and formed a part of several different committees, particularly the committee on legislation—an important one—and was able to influence the wording of the bill in some respects; that member was also a member of the committee on resolutions, which past one or two important resolutions affecting the work of the congress, and one of those resolutions was proposed by the member as the chief resolution at one of the meetings of the congress. Utah also appointed the same delegate to represent the Utah State Bee-Keepers' Association at both congresses. It is due to the bee-keepers to mention that. I think it was an oversight on the part of Mr. Abbott. That delegate supported the Brosius Bill, feeling that it was the bill which gave the execution of this law into the hands of the Secretary of Agriculture; gave him the power to appoint those who should see to the execution of the law, which required everything to be labeled as to its contents. The Babcock Bill was designed, as far as I could ascertain myself, to put in office a few people who should have control of a large bureau, and give five or six political offices to people, and that seemed to be the sole reason of the existence of the Babcock Bill, and I think the delegates saw thru that and supported the Brosius Bill, which was widely supported.

Mr. Abbott—I think I misspoke myself a little. Mr. Benton is correct. If I said the bee-keepers, I meant this Association, and it had not occurred to me about the combination of the two associations, but the gentleman referred to was Mr. Benton himself, who was in all of these congresses, but at the last congress I had the impression that he represented the Government as a delegate. I hadn't any intention of making this society include the bee-keepers of the United States; I simply meant to say that this society sent only one delegate. Mr. Benton heartily supported the Brosius Bill, and I think he was a member of some of the important committees in every meeting that we have had. I didn't know whether he was a delegate from some State representing some bee-keepers' association, or whether he was a delegate from the Government; it doesn't cut any

figure, anyway; he was there and gave his influence, and I am glad he called my attention to it. I had no disposition to misrepresent in any way. The reason I made the remark was that this Association was called upon to pay some expenses both times, and I knew that you hadn't paid anybody's expenses but mine for the two times, but Mr. Benton was the representative of the other society. I forgot we were then two societies; this is really the two societies now, as we united only last year.

Dr. Mason—I think it is only justice to say that this Association did not pay all of Mr. Abbott's expenses. I think he paid his own railway fare. At any rate, it didn't cost much; he gave his own time and looked out for his own railroad fare, if I am correct.

Mr. Abbott—I happened to be able to "work" the railroads with my paper.

Dr. Mason—I didn't say how. I think it cost this Association only \$20 the last time Mr. Abbott went.

Pres. Root—Anything further?

Mr. York—A number of bee-keepers have been asking whether or not Dr. Miller is going to be here. I received a letter yesterday morning, saying he expected to be here this morning, and now I have received this letter:

FRIEND YORK:—I have strongly fought against giving up the intention to be at the convention, but it is no use. I regret it exceedingly, but I am not able to be up all the time, and there is no use fighting against it longer. I know the bee-keepers are all having a good time, and I am almost baby enough to cry that I can't shake hands with all of them when it is only two hours away. Give my best wishes to all of them.
C. C. MILLER.

Pres. Root—We have about ten minutes more; and there are some very important and valuable questions to be discussed. We might have one or two now.

Mr. Aikin will read the questions.

LUBRICATING COMB-FOUNDATION MACHINES.

Mr. Aikin—I will read a question and refer it for answer, viz.: "Would Pres. Root explain how to clean and lubricate a foundation machine. Which is the best make of soap to use for lubricating?"

Pres. Root—The plan we use ordinarily is a jet of steam. But as steam is something every bee-keeper doesn't have, and can't have, hot water can be used. A jet of steam is just turned onto the rolls, and the rolls being revolved while the jet of steam is turned on, will cause the rolls to become clean, and the wax will be blown off. If you haven't hot water use gasoline. I don't know any particular brand of soap, but you want a good washing-soap.

A Member—Ivory soap?

Pres. Root—I would prefer a soap a little stronger, something like Dobbins'.

Mr. Wood—The cheapest yellow soap you can get is best.

Pres. Root—You have to get a good deal of lye in it in order to make it work.

HIVING SWARMS IN A SHALLOW BROOD-CHAMBER.

Mr. Aikin—Here is a question for Mr. Hutchinson: "In hiving a swarm in one division of the Heddon hive, causing the queen to fill every cell with brood, and forcing the bees to carry all the honey up into the sections, how does Mr. Hutchinson keep the bees from storing pollen in the sections?"

Mr. Hutchinson—I don't have that trouble; but I can tell why it is. Where the sections are set over from the old colony, those sections are partly filled, and all the cells will contain some honey, so the bees don't put pollen into the cells, as they have honey in them; the cells below will have some honey and some pollen; bees don't store much pollen at the time they are filling cells with brood.

WINTERING BEES IN A COLD TEMPERATURE.

Mr. Aikin—"How is it best to winter bees where the temperature goes 10 degrees below zero?" For my part, I don't know; locality has something to do with that. In Colorado it will go 30 or 40 degrees below zero, and we winter bees right on the summer stands in single-wall hives. Where the temperature goes so low, and continues for a long time, and the bees have no opportunity to get warm, I suspect you would better winter them in the cellar; but in Colorado the thermometer may indicate 20 degrees below zero, or may be as many degrees above freezing; you see the conditions are altogether different. Here you may not see snow for a week or two at a time, and the thermometer lies in the zero neighborhood.

Mr. Moore—I would like to hear from Mr. France; he has commonly zero temperature up there.

Mr. France—I fully agree with what Mr. Aikin has said; much depends upon the location, and much depends upon climatic conditions. In the central part of our State (Wis.) last winter snow fell the forepart of November; that snow was still on the ground March 6. But in that northern country bees will winter successfully. Two years ago, when the thermometer was from 20 to 30 degrees below zero without a let up for a week, my bees were in chaff-packet hives, but wintered all right outdoors; a little more feed is required. The subject of wintering must be considered according to a man's surroundings.

BEST SMOKER-FUEL.

"What material is best for use for smoker-fuel?"

Mr. Aikin—I use rotten railroad ties. Nearly all the railroad ties in our country are pine, and I want the material so that it will burn freely, make a dense smoke without too much heat, and too much of the—I am not scientific enough to describe it—that pungent, sharp smoke. I often use burlap, but I like the rotten wood the best of all.

W. L. Coggshall—The best thing of all—everybody has the best thing—is phosphate sacks, or burlap; that is the best thing we ever had. Leave them out in the weather and let them rot partially, and then get them thoroly dry; set a couple of nails in your work bench, about four perhaps. It takes two to roll the burlap, a boy and a man; take a rod out of the back end of the wagon-box and roll this burlap over and over until you have a roll of burlap of the right size for your smoker; have strings cut just about long enough to go around that burlap, and tie it every four inches; pull out the rod when the roll is large enough. Then take a common axe, cut up the rolls into pieces as long as you want them for the smoker, say four inches. Be careful not to roll too tight, for if you do you might have to untie the string so the smoke would go thru. Put some salt-peter in a pan, and add water enough to have it about half an inch deep; put in some blueing to color the water nicely, dip the end of the pieces in this salt-peter water, and put them out to dry. Light with a match, and it will go like gunpowder. A bushel of this will last an apiary all summer. It is one of the nicest things I ever used, I will not except anything. Rotten wood and hard wood are too heavy and hot. I have laid a smoker down in a wagon and driven ten miles and had a good smoke then.

Mr. Moore—I think shavings is one of the best.

F. W. Hall—I would like to ask Mr. Coggshall if his fuel will drip the inky substance from the smoker. We have any amount of cottonwood in our country; it gets so rotten we can break it up with our fingers. Before it gets so rotten I take a buck-saw and saw it into blocks, probably two inches long, and split it up with a hatchet; that makes a good fuel that hasn't the inky substance in it. I have had no trouble with it whatever.

Mr. Coggshall—Wood has too much heat in it. This doesn't have so much. One of the bunches of burlap will last four or five hours of ordinary work.

David Coggshall—That is the beauty of this sacking; if it is thoroly dried and laid outdoors, as my brother says, you can work with it all day and not have any of the inky substance on the sections. It doesn't create a sediment (creosote) that drops out. It will burn all day long. There isn't anything equal to it, in my estimation.

W. L. Coggshall—There is no danger of fire; no sparks fly, but just remember to put the salt-peter on; you don't have to blow to get it started; it will go off quick.

Dr. Mason—Do you light it before you put it in the smoker?

Mr. Coggshall—Sure; and turn the lighted end next to the draft.

Mr. Benton—Mr. Bingham has had lots of experience in making bee-smokers; of course he wants those smokers to have the best reception among bee-keepers, and he has studied the question of fuel. In sending out directions he advises sound hickory or hard maple, cut in lengths to suit the smoker, and split fine. He says nothing about the manner of lighting the smoker; there would be a little difficulty, perhaps, with sound wood. I have used a great variety of fuel, and have never found anything better than solid hard wood split in small pieces the size of the finger, the proper length.

CLARIFYING HONEY-VINEGAR.

"What is the best way to make honey-vinegar clear?"

Mr. Aikin—I suppose the intent of the questioner is not to make the vinegar water-white, but to get the impurities

out of it so it is a free liquid, may have color, but free of floating substance. I take this to be the intent of the questioner.

Dr. Mason—I askt that question, so I can give the information. My experience in making honey-vinegar is that it frequently will not settle and become clear. There is a species of cloudiness all thru it. I have had it in that condition two years, and I want to know how to make it settle or become clear. I have filtered it, have put it thru sand, and I don't know what not to get it clear, but it won't clear. I don't mean water-white; it may be very dark-colored vinegar and still be clear.

Mr. Funk—Take the white of eggs and beat until they froth; then take out some of the vinegar and mix it with it, and pour it into the bung-hole. Take a dozen eggs for your barrel, and take something like a gallon, or half gallon, and beat it up the way women beat eggs. Turn it into the bung-hole and stir it up, and you will have it clear. If that won't do it, I think a solution of isinglass would; they use that for clarifying wine.

J. M. Rankin—I don't think there is any precipitate that will not be taken out of a liquid by the use of chemist's filter-paper.

Pres. Root—Please explain what that chemist's filter-paper is.

Mr. Rankin—It is a paper that is prepared for this purpose, and the chemists use it in laboratories for taking a precipitate out of a liquid and making analyses. I don't know the cost of it, but it doesn't cost very much.

Dr. Mason—Where can we get it?

Mr. Rankin—Of druggists.

[Dec. 1.—I have tried the filtering paper referred to by Mr. Rankin, during this present week, and it does the work satisfactorily. It will enable me to prepare several barrels of vinegar for sale.—SECRETARY.]

PROPOLIS AS A MARKETABLE ARTICLE.

"Can bee-keepers collect propolis in sufficient quantity to be profitable at 50 cents per pound?"

Mr. Aikin—I don't know.

Mr. Benton—I would say I think so. I have scraped hives sometimes and then found at the expiration of another week that fair-sized hives would produce it weighing surely a quarter of a pound, or enough to make about a dollar a month. I have collected 30 or 40 pounds this way with a view of seeing what I could make for a varnish for beehives; it can be dissolved in wood alcohol and utilized in that fashion. It seems to me there are a very great variety of uses to which it can be put. In some of the old countries poor people go about and collect propolis and make varnish for furniture; they give a small sum for the privilege of taking old hives, that have been knocked apart and are to be put together again and used, to get the privilege of cleaning the inner surface. Those shavings are then treated with wood alcohol, and the shavings thrown away. Of course, labor is very cheap there. I would not suppose a man could produce propolis as a business. I think 50 cents a pound would pay us to collect it as we go along.

Pres. Root—I would state there is a limited market for propolis here, and any one who has a quantity may dispose of it if he desires.

Mr. York—I would like to say further on this subject that a gentleman from New York, who is interested in the manufacture of oils and polishes, has stopt off here, and has been talking to some of us about gathering propolis. He can use perhaps a ton of it a year, and has made an offer of 50 cents a pound. Mr. Benton is now showing the bottom of his hand-satchel on which the gentleman put a coating of this polish, and it is quite nice. It is good also for polishing floors and harness; it is water-proof. He uses in it, I think, two pounds of the propolis to a gallon of the polish, and he could afford to pay 50 cents a pound for the propolis. He wanted the question brought up to see whether bee-keepers could supply it—see whether it was worth while for them to save it. It is a very nice polish. He put it on the shoes of a gentleman in the hall, as well as on the bottom of Mr. Benton's satchel; he says it will retain its luster for three months. Of course, it won't on your shoes when you wear them, but it will last about a week on them. It might pay the bee-keepers to look into this and see what they could do along the line of saving propolis. It is a subject I think we should think about.

At the suggestion of Pres. Root the convention adjourned to 1 o'clock p.m.

Continued next week.)

THE BROSIUS PURE FOOD BILL.

Mr. Brosius introduced the following bill in the House of Representatives, March 16, 1900, which was referred to the Committee on Interstate and Foreign Commerce, and ordered to be printed:

A BILL,

For preventing the adulteration, misbranding, and imitation of foods, beverages, candies, drugs, and condiments in the District of Columbia and the Territories, and for regulating interstate traffic therein, and for other purposes.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,

That for the purpose of protecting the commerce in food products and drugs between the several States and in the District of Columbia and the territories of the United States and foreign countries, the Secretary of Agriculture shall organize the Chemical Division of the Department of Agriculture into a bureau of chemistry, which shall have the direction of the chemical work of the present Division of Chemistry, and of the chemical work of the other Executive Departments, whose respective heads may apply to the Secretary of Agriculture for such collaboration, and which shall also be charged with the inspection of food and drug products, as hereinafter provided in this Act. The Secretary of Agriculture shall make necessary rules and regulations for carrying out the provisions of this Act, under which the Director of the Bureau of Chemistry shall procure from time to time, or cause to be procured, and analyze, or cause to be analyzed or examined, chemically, microscopically, or otherwise, samples of foods and drugs offered for sale in original unbroken packages in the District of Columbia, in any Territory, or in any State other than that in which they shall have been respectively manufactured or produced, or from a foreign country, or intended for export to a foreign country. The Secretary of Agriculture is hereby authorized to employ such chemists, inspectors, laborers, and other employees as may be necessary to carry out the provisions of this Act, and to make such publication of the results of examinations and analyses as he may deem proper.

SEC. 2.—That the introduction into any State or Territory or the District of Columbia from any other State or Territory or the District of Columbia, or from any foreign country, or shipment to any foreign country of any article of food or drugs which is adulterated or misbranded within the meaning of this Act is hereby prohibited, and any person who shall ship or deliver for shipment from any State or Territory or the District of Columbia to any other State or Territory or the District of Columbia, or to a foreign country, or who shall receive in any State or Territory or the District of Columbia from any other State or Territory or the District of Columbia or foreign country, or who, having received, shall deliver, in original unbroken packages, for pay or otherwise, or offer to deliver to any other person, any such article so adulterated or misbranded within the meaning of this Act, or any person who shall sell or offer for sale in the District of Columbia or in any Territory of the United States such adulterated, mixt, misbranded, or imitated foods or drugs, or export or offer to export the same to any foreign country, shall be guilty of a misdemeanor, and for such offense be fined not exceeding two hundred dollars for the first offense, and for each subsequent offense not exceeding three hundred dollars, or be imprisoned not exceeding one year, or both, in the discretion of the court.

SEC. 3.—That the Director of the Bureau of Chemistry shall make, or cause to be made, under rules and regulations to be prescribed by the Secretary of Agriculture, examinations of specimens of food and drugs offered for sale in original unbroken packages in the District of Columbia, in any Territory, or in any State other than that in which they shall have been respectively manufactured or produced, or from any foreign country, or intended for shipment to any foreign country, which may be collected from time to time in various parts of the country. If it shall appear from such examination that any of the provisions of this Act have been violated the Secretary of Agriculture shall at once certify the facts to the proper United States district attorney, with a copy of the results of the analyses, duly authenticated by the analyst under oath.

SEC. 4.—That it shall be the duty of every district attorney to whom the Secretary of Agriculture shall report any violation of this Act to cause proceedings to be com-

menced and prosecuted without delay for the fines and penalties in such case provided.

DEFINITIONS.

SEC. 5.—That the term "drug," as used in this Act, shall include all medicines and preparations recognized in the United States Pharmacopœia for internal or external use. The term "food," as used herein, shall include all articles used for food, drink, confectionery, or condiment, by man or domestic animals, whether simple, mixt, or compound. The term "misbranded," as used herein, shall apply to all drugs, or articles of food, or articles which enter into the composition of food, the package or label of which shall bear any statement regarding the ingredients or substances contained in such article, which statement shall be false or misleading in any particular, and to any food or drug product which is falsely branded as to the State, Territory, or country in which it is manufactured or produced.

ADULTERATIONS.

SEC. 6.—That for the purposes of this Act an article shall be deemed to be adulterated—

In case of drugs:

First.—If, when a drug is sold under or by a name recognized in the United States Pharmacopœia, it differs from the standard of strength, quality, or purity, as determined by the tests laid down in the United States Pharmacopœia, official at the time of the investigation.

Second.—If its strength or purity fall below the profest standard under which it is sold.

Third.—If it be an imitation of or offered for sale under the name of another article.

In the case of confectionery:

If it contain terra alba, barytes, talc, chrome yellow, or other mineral substances, or poisonous colors or flavors, or other ingredients deleterious or detrimental to health.

In the case of food:

First.—If any substance or substances has or have been mixt and packt with it so as to reduce or lower or injuriously affect its quality or strength, so that such product, when offered for sale, shall deceive or tend to deceive the purchaser.

Second.—If any substance or substances has or have been substituted wholly or in part for the article, so that the product, when sold, shall deceive or tend to deceive the purchaser.

Third.—If any valuable constituent of the article has been wholly or in part abstracted, so that the product, when sold, shall deceive or tend to deceive the purchaser.

Fourth.—If it be an imitation of or offered for sale under the specific name of another article.

Fifth.—If it be mixt, colored, powdered, or stained in a manner whereby damage or inferiority is concealed, so that such product, when sold, shall deceive or tend to deceive the purchaser.

Sixth.—If it contain any added poisonous ingredient or any ingredient which may render such article injurious to the health of the person consuming it.

Seventh.—If it be labeled or branded so as to deceive or mislead the purchaser, or purport to be a foreign product when not so, or is an imitation, either in package or label, of another substance of a previously established name, or which has been trade-mark or patented.

Eighth.—If it consists of the whole or any part of a diseased, filthy, decomposed, or putrid animal or vegetable substance, or any portion of an animal unfit for food, whether manufactured or not, or if it is the product of a diseased animal, or one that has died otherwise than by slaughter:

Provided, That an article of food which does not contain any added poisonous or deleterious ingredient shall not be deemed to be adulterated in the following cases:

First.—In the case of mixtures or compounds which may be now, or from time to time hereafter known as articles of food, under their own distinctive names, and not included in definition fourth of this section. Second. In the cases of articles labeled, branded or tagged so as plainly to indicate that they are mixtures, compounds, combinations, imitations, or blends: *Provided*, That the same shall be labeled, branded, or tagged, as prescribed by the Secretary of Agriculture, so as to show the exact character thereof. *And provided further*, That nothing in this Act shall be construed as requiring or compelling proprietors or manufacturers of proprietary foods which contain no unwholesome added ingredient to disclose their trade formulas, ex-

cept in so far as the provisions of this Act may require to secure freedom from adulteration or imitation: *Provided further*, That no dealer shall be convicted under the provisions of this Act when he is able to prove a written guaranty of purity, in a form approved by the Secretary of Agriculture, as published in his rules and regulations, signed by the manufacturer, or the party or parties from whom he purchased said articles: *Provided also*, That said guarantor or guarantors reside in the United States. Said guaranty shall contain the full name and address of the party or parties making the sale to the dealer, and said party or parties shall be amenable to the prosecutions, fines and other penalties which would attach in due course to the dealer under the provisions of this Act.

SEC. 7.—That it shall be the duty of the Secretary of Agriculture to fix standards of food products when advisable, and to determine the wholesomeness or unwholesomeness of preservatives and other substances which are or may be added to foods, and to aid him in reaching just decisions in such matters he is authorized to call upon the Director of the Bureau of Chemistry and the chairman of the committee on food standards of the Association of Official Agricultural Chemists and such physicians, not less than five, as the President of the United States shall select, three of whom shall be from the Medical Department of the Army, the Navy, and the Marine Hospital Service, and not less than five experts, to be selected by the Secretary of Agriculture by reason of their attainments in physiological chemistry, hygiene, commerce and manufacture, to consider jointly the standards of all food products (within the meaning of this Act), and to study the effect of preservatives and other substances added to food products on the health of the consumer; and when so determined and approved by the Secretary of Agriculture such standards shall guide the chemists of the Department of Agriculture in the performance of the duties imposed upon them by this Act, and shall remain the standard before all United States courts. It shall be the duty of the Secretary of Agriculture, either directly or thru the Director of the Bureau of Chemistry and the chairman of the committee on food standards of the Association of Official Agricultural Chemists and the medical officers and experts before mentioned, to confer with and consult, when so requested, the duly accredited representatives of all industries producing articles for which standards shall be established under the provisions of this Act.

SEC. 8.—That every person who manufactures or produces for shipment and delivers for transportation within the District of Columbia or any Territory, or who manufactures or produces for shipment or delivers for transportation from any State, Territory, or the District of Columbia to any other State, Territory, or the District of Columbia, or to any foreign country, any drug or article of food, and every person who exposes for sale or delivers to a purchaser in the District of Columbia or in any Territory, any drug or any article of food manufactured or produced within said District of Columbia or said Territory, or who exposes for sale or delivers for shipment any drug or article of food received from a State, Territory, or the District of Columbia other than the State, Territory, or the District of Columbia in which he exposes for sale or delivers such drug or article of food, or from any foreign country, shall furnish within business hours, and upon tender and full payment of the selling price, a sample of such drugs or articles of food to any person duly authorized by the Secretary of Agriculture to receive the same, and who shall apply to such manufacturer, producer, or vendor, or person delivering to a purchaser such drug or article of food for such sample for such use, in sufficient quantity for the analysis of any such article or articles in his possession. And in the presence of such dealer and an agent of the Department of Agriculture, if so desired by either party, said sample shall be divided into three parts, and each part shall be sealed by the seal of the Department of Agriculture. One part shall be left with the dealer, one delivered to the Director of the Bureau of Chemistry of the Department of Agriculture, and one deposited with the United States district attorney for the district in which the sample is taken. Said manufacturer, producer, or dealer, may have the sample left with him analyzed at his own expense, and if the results of said analysis differ from those of the Department of Agriculture, the sample in the hands of the district attorney may be analyzed by a third chemist, who shall be appointed by the president of the Association of Official Agricultural Chemists of the United States, and the analysis shall be conducted, if so desired, in the presence of a chemist of the Department of Agriculture and a chemist

representing the dealer, and the whole data obtained shall be laid before the court.

SEC. 9.—That any manufacturer, producer, or dealer who refuses to comply, upon demand, with the requirements of Sec. 8 of this Act shall be guilty of a misdemeanor; and upon conviction shall be fined not exceeding one hundred dollars, or imprisoned not exceeding one hundred days, or both. And any person found guilty of manufacturing, or offering for sale, or selling an adulterated, impure, or misbranded article of food or drug in violation of the provisions of this Act shall be adjudged to pay, in addition to the penalties hereinbefore provided for, all the necessary costs and expenses incurred in inspecting and analyzing such adulterated articles which said person may have been found guilty of manufacturing, selling, or offering for sale.

SEC. 10.—That this Act shall not be construed to interfere with commerce wholly internal in any State, nor with the exercise of their police powers by the several States.

SEC. 11.—That any article of food or drug that is adulterated or misbranded, within the meaning of this Act, and is transported or being transported from one State to another for sale, or if it be sold or offered for sale in the District of Columbia and the Territories of the United States, or if it be imported from a foreign country for sale, or if intended for export to a foreign country, shall be liable to be proceeded against in any district court of the United States, within the district where the same is found and seized for confiscation, by a process of libel for condemnation. And if such article is condemned as being adulterated the same shall be disposed of as the said court may direct, and the proceeds thereof, if sold, less the legal costs and charges, shall be paid into the Treasury of the United States; but such goods shall not be sold in any State contrary to the laws of that State. The proceedings in such libel cases shall conform, as near as may be, to proceedings in admiralty, except that either party may demand trial by jury of any issue of fact joined in such case; and all such proceedings shall be at the suit of and in the name of the United States.

How to Know How to Look for the Queen-Bee.

BY W. W. McNEAL.

HERE is a little kink, dear reader, which I think may be worth your while to consider. It is in regard to finding a queen-bee easily and quickly when the hive is densely crowded with bees.

When these conditions prevail, the queen's whereabouts may, to a very great extent, be determined by noting the position the ventilating bees occupy at the entrance to the hive. I have not yet found it otherwise that when these bees were stationed at one side of the hive-entrance, the queen was not to be found upon the combs at the other. No doubt you have many times noticed that the bees upon the alighting-board, that are engaged in ventilating the hive, frequently change their position from that of one side of the entrance to that of the other side. Of course, when the entrance is small, not being the full width of the front of the hive, this becomes no longer a means of judging of "internal conditions by external signs."

If the hive contains nine frames, or ten frames, or possibly more, and these frames are self-spacing, it is a wonderful saving of time to be enabled to confine your search to half that number, with a reasonable degree of certainty of finding the queen upon one of the number you have selected.

HOW TO CATCH A QUEEN, WHEN FOUND, WITHOUT INJURING HER.

If the work of finding the queen has been pursued properly, not carelessly provoking the bees to anger, they seldom resent an attempt, on the part of the apiarist, to take the queen when she is found upon the comb. Having a small cage in readiness, and a piece of wire about the size of an ordinary slate-pencil, one end of which has been bent to form a circle an inch and a half in diameter, it is an easy matter to lift the queen from the comb and secure her in the cage. It being the habit of the queen to run away from

under the eye of the operator, she will, when corralled with this piece of wire, quickly attempt to climb out of the enclosure, especially so when the frame is slightly jarred or the breath is gently blown upon her. In doing the latter, it is well to remember that unless the bees have been properly subdued, they are apt to show a very decided resentment. Now, when the queen is crossing the wire, and before she can catch hold of the comb again with her front feet, lift her off the comb. A fertile queen takes wing very reluctantly, and there is little danger of losing her, for the left hand is to be placed over her at once, while the cage is held in the right, allowing the queen to run up out of the closed fist of the left hand into the well-lighted cage above. All this can be done very quickly, with no danger, practically, of hurting the queen.

HO! THE ASTER FLOWER!

I want to speak of the wild aster—the “little daisies,”—which bloom here beginning about Sept. 20, and continue thruout the greater part of October. At no time during the season of bee-work do I find my enthusiasm running so high as when these flowers are in full bloom. When the atmospheric conditions are most favorable for nectar secretion, the little blossoms seem fairly to drip with the crystal juices. The aroma is exceedingly pronounced, and it can easily be detected by one when several hundred yards from the apiary, upon a still evening after a good day's work by the bees.

When first gathered the honey is so thin that it will run out of the combs, if great care is not used in handling them. As to color, it ranks well with white clover, and owing to its most peculiar flavor, and the intimate acquaintance I have formed with it, I am very fond of aster honey. However, it has a habit of granulating very quickly, even excelling in this the celebrated alfalfa honey. I believe it is a rule that whenever bees are enabled to gather a load of nectar quickly, and likewise enabled to dispose of it by having the hive provided with an abundance of storage-room—ready-drawn combs—the honey has an increase tendency to granulate.

The Italian bees, as all know who have tested their merits as honey-gatherers, are largely inclined, during a good honey-flow, to devote themselves more to the storing of honey than to the rearing of brood. Now this trait of the Italian bee is not altogether an advantage here, for I have known large colonies of these bees rendered practically worthless at the closing of the season of the aster bloom by their indisposition to remain at home to act in the capacity of a nurse when honey in abundance awaits them in the fields. The early honey harvest having closed ere the latter days of July, the greater part of the colony is represented in field-workers, well advanced in life, just as they enter upon the period when is to be made the wildest rush for honey during the entire season. The brood-combs are quickly filled with honey from top to bottom, and the space occupied by brood growing smaller all the while, till it becomes practically nothing. The queen may approve of this, or it may be that she does not, tho the giving of extracting-combs does not divert, to any appreciable extent, their purpose to store in the combs below.

With hybrid bees the case is somewhat different; and with the pure black bees I find it is largely so. They will nearly always be found, at the close of the season, in better condition as regards bees to withstand the climate, but less fitted in stores.

The aster plants, when once introduced along the roadside and in the waste places, quickly overrun the meadows, therefore the farmers regard it as a hateful weed, and are always on the alert to prevent its getting a start. But with all their vigilance the aster somehow seems to flourish, and it is no uncommon thing for a good bloom to appear before the arrival of cool weather, upon the same land from which a crop of hay has been harvested.

A field of asters in full bloom is pretty to look upon, at least when considered wholly in the light of a honey-plant. The snowy whiteness is approacht unto, not equaled, by the old-time buckwheat; for the aster excels both in beauty and in nectar secretion. Coming at a time of the year when all other plants, from whose flowery fountains the bees gather honey, have long since dried up, its importance to the bee-keeping industry becomes second to no flower that blossoms in the Ohio valley. Scioto Co., Ohio, Nov. 2.

The Premiums offered this week are well worth working for. Look at them.

Queen-Rearing Apiary of D. J. Blocher.

A Queen-Rearing Apiary in Northern Illinois.

BY D. J. BLOCHER.

MY queen-rearing apiary is located in a village of about 700 inhabitants. There are houses all around me. To the left of the apiary is a dense growth of raspberries, and behind the raspberries the Warfield strawberry. At the bottom of the picture is shown a dense growth of vegetables. Back of the apiary about 40 feet is a street, and to the right (but not seen) about 60 feet is another street. I am in the corner of a block. To the right of the picture, near the center, is part of a circle—this is a walk running between the apiary and my house. This walk is used all the time, and is only about 15 feet from the first bee-hives.

The girl in the picture is my oldest daughter, Ruth. She is standing very close to the hives.

I am in the early garden-plant business, and some small fruit, too. The two streets that bound our lots on two sides are the finest in town.

We keep the apiary mowed with a lawn-mower, as well as the streets. All together it makes a nice scene in summer time, and with all the visitors and customers my bees have given no trouble to any one. They do not even molest the family, that are all the time about.

My yard is now put on improved plans for rearing improved queens. Inferior bees will not be allowed in this yard. It has some very fine queens, and bees that are not behind in the production of honey. The past three years have been very poor, and yet my honey colonies averaged from 75 to about 100 pounds of honey. (These honey-bees produce the drones for mating purposes.) Visitors to my yard are captivated by the industrious, gentle bees.

In order to get a front view of the apiary we had to take a bird's-eye view of the yard. The hives are not all seen. Stephenson Co., Ill.

Cementing the Floor of a Bee-Cellar.

BY F. WILCOX.

ON page 711 Mr. Whitmer asks opinions about cementing the floor of his bee-cellar. His cellar is a good one. I have a cellar under my house very nearly like his. I used it three or four years, then cemented it well, and have used it about 20 years since.

All things considered, I would advise cementing the cellar-bottom, if it is under the house he lives in. Soft sand makes a poor floor. The first two winters after cementing mine, I thought the bees did not winter quite so well as before cementing it, but I cemented the side-walls as well as the bottom, which is not necessary.

If well cemented, the dead bees can be swept up and carried out as often as desired. After carrying the bees out in the spring, the floor can be scrubbed and kept as clean as any floor. If dead bees are tramped down in carrying out, it may need whitewashing. It can be cleaned.

A ground floor is good enough for an outside cellar, where a portion of the dead bees can be tramped down and left without further ceremonies.

For scraping propolis from sections I like a light cellar with a ground floor, where the propolis can be tramped in the dirt. I think bees need very little ventilation in cellars.

and a draft of cool air is hurtful. Good food is quite as important as good air. But if the cellar is not right, they may have good food when put in and very poor food when taken out. The honey may absorb moisture and sour in the hive. I leave the bottom-boards in the yard all winter, and have better success than when I leave them on the hives. If bottom-boards were nailed on, I would pry them off, or perhaps bore a hole in the front end of the hive for better ventilation.

I put 99 colonies in the cellar to-day, and 175 colonies last week. They are a little lighter in stores than usual, but I think they will winter.

Juneau Co., Wis., Nov. 22.

Questions and Answers.

CONDUCTED BY

DR. C. O. MILLER, Marengo, Ill.

(The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.)

Combs that Seem to Have the "Blues."

What is the matter with my bees? All seem to be doing well, but some have combs that have a bluish-white color, and have a strange smell. I don't think it is foul brood, as they did this same thing last year, in the fall, but came out all right in the spring. OHIO.

ANSWER.—I have seen what I suppose is the same thing many a time, and don't know why it is. It looks a little like a kind of mold, but no harm seems to come from it.

Laying More than One Egg in a Cell.

There is one clause in Dr. Corya's letter that you seem to have overlooked—"lay two or more eggs in a cell"—which I think shows very plainly that the fault is in himself instead of the queens. I have never known a queen to lay more than one egg in a cell unless she was crowded. Those queens are, I have no doubt, prolific, producing the eggs, and must lay them somewhere, and all the cells being occupied she puts in another egg instead of dropping it, as queens often do. I think you have sometimes express the same thing.

I have never reared a queen for sale, but have bought quite a number, mostly untested, but have never felt like censuring the breeder. WYOMING.

ANSWER.—You are right that a queen will lay only one egg in a cell so long as she has room, but bees are so much inclined to make exceptions to all rules that I would not like to crowd too hard upon that point.

Bees Dying in a Colony—Plain Sections to Hold a Pound.

1. My bees are packed on the summer stands, and when I examine them I find many more dead bees in front of the hive containing my "premium queen" than any other, and by looking in at the entrance I see that the bottom is covered. I fed this colony quite late with sugar syrup made as follows:

I tied a clean white cloth over the end of a common tin funnel and put it in a glass fruit-jar, then filled the funnel full of the best granulated sugar, and poured on cold water till it stood half an inch deep over the sugar. I let it percolate thru, and fed it as it came thru. It seemed very nice and thick. Could this have anything to do with their dying off so?

2. What width of plain sections do I want to use with fence-separators, to insure their holding a full pound ($4\frac{1}{4} \times 4\frac{1}{4}$ sections)?

3. If I fold the sections and put in the foundation during the winter, and pack them away in boxes, will the bees work it as freely and easily next summer as they would if put in just before placing on the hive? IOWA.

ANSWERS.—1. Late feeding of syrup might be enough

to account for the trouble. August and September are the best months to make sure bees have enough for winter, if sugar and water is to be the feed.

2. You may as well give up first as last the idea that you can settle on any size of section that will always give just a pound in weight. If you should find a size that would make the average weight of your sections exactly a pound this year, there might be a difference of an ounce or two next year. The season has a good deal to do with it as well as the management. I have just figured up the weight of the ordinary $4\frac{1}{4}$ section, taken in two different years at random. In one year the average weight was 14.45 oz., in the other 15.29 oz. It may be that some years would show a weight lighter than either, and some years heavier than either.

But some approximation can be made. If the uprights of the fences be 5-32 of an inch thick, then a plain section should be about 5-16 of an inch narrower than a plain section of the same length and height to be of the same weight. According to that, a season and management that would make a bee-way section $1\frac{1}{4}$ wide weigh 15 ounces, would need a plain section about 1 19-32 wide to weigh a pound.

3. Some think there is a decided difference, but I have always believed the difference so little that the foundation is always put in in the winter, and then the supers are filled ready to put on the hive. Sometimes they stand 2 or 3 years before the bees get them, and it seems to work all right.

Bees Balling Queens.

In your answer to my question about bees balling their queens, you seem to think the trouble has been on account of my disturbing the ball, or that they were superseding, that there is nothing unusual with the bees. If you will carefully read my statement of the cause you will see that your supposition is incorrect. Whenever I find a ball I cage the queen, and liberate her after a few days. You did not notice that I said that when two swarms settle together, or I unite two colonies, they kill both queens, or I afterwards find them queenless. If I changed places with two hives, or put a few strange bees into a hive, the queens are very sure to disappear. WYOMING.

ANSWER.—This is only another illustration of the many cases in which I imagine I know something, when I really don't know. There is certainly something exceptional about such fatality with queens, and I'd give a cookie to be with you a few days to see if we could ferret out the mystery. Possibly, however, I couldn't tell a thing about it if I were there.

What Ailed the Bees?

I had 32 colonies wintered on the summer stands come thru last winter all right, and were in splendid shape for business. When fruit-bloom opened a number of colonies apparently were getting ready to swarm, when all at once there appeared to be not half so many bees as there were a few days before. I learned since that a neighbor less than a half mile from my bees sprayed his 7-acre orchard when in full bloom. I have lost 11 colonies the past season. They did not die right away, but lingered along thruout the season, two giving up as late as October. Almost all have queens, but little brood in the comb, just here and there one; the queen is stupid, doesn't care to get out of the way. I examined carefully one colony that was affected. The second time I opened the hive I found brood, but it was scattering. In about 3 weeks I examined the same comb again, and found the brood on both sides about 6 inches, in all stages of growth. If poisoned, has the colony gotten over it? Would the poison gathered at fruit-bloom affect the queens all summer?

I thought at first there might be foul brood among my bees, or some other disease, but there is nothing to indicate foul brood from the descriptions I have read.

ILLINOIS.

ANSWER.—I confess I don't know enough to answer, and will be glad if any one will help us out. Without having any positive knowledge of the matter, I have always supposed that bees poisoned in fruit-bloom would soon get over its effects; but I may be all wrong in that, and it may be that the queen may be permanently injured. The colony that showed increase amount of brood at the last examination has at least the appearance of recovery.

THE NEW CENTURY

ABC of BEE-CULTURE

The Only Encyclopedia
ON BEES.

Fully revised during the summer and fall of 1900, and brought down to date, detailing the newest and best methods of work, and all the important information in bee-culture. Even now (Nov. 29th) Mr. E. R. Root is busy on the latest forms of the book, so that it will be really a New Century Encyclopedia of Bee-Culture.

SAMPLE PAGES Now, we haven't space here to show all of the good things in this book, neither will a few sample pages do it justice; but some may prefer to see how the printing is done, the information contained, size, etc., so we will send sample pages to any one who thinks of purchasing. No expense to you, but you must mention where you saw this ad. Do not put off your request, but let us send the sample pages at once.

PROF. A. J. COOK—California }
DR. C. C. MILLER—Illinois } *Reviewers and Critics.*
G. M. DOOLITTLE—New York }

That the ABC of Bee-Culture may be found reliable, and the readers have the views of others in different parts of the country, we have engaged the above-named parties to go over the book. In the case of errors the same have been corrected. In the comments of Miller and Doolittle which are published in the book, our readers will find a veritable mine of information. See what the Ohio Farmer says:

"It is a veritable encyclopedia of bee-culture and contains about all one would want to know to engage in practical bee-keeping. The work is practical and up-to-date. It is concise, and able, clear and comprehensive. Bee-keepers should have it."

Now see what the Farm Journal says:

"The last edition is a gem. It contains all that a bee-keeper needs to know about treating, hiving and manipulating the busy bees. No one having or expecting to own a few colonies of bees need hesitate to invest \$1.20 in this volume."

Here is what a Frenchman says:

"Why have I not had your ABC of Bee-Culture? Really, if I had had it in place of —, I should not have lost my queen. I have just devoured with my eyes your ABC book which a friend lent me; and I assure you I should have preferred it to a thousand —. In fact your valuable ABC book would not only have saved me the cost of —, but would have reconciled me to the loss of 4 queens by the success I should have had with the one. In any case, that was not my fault. When I wanted the ABC of Bee-Culture, there was none to be had as the edition was exhausted."
A. POUGET.

Now see what a Spaniard says:

"Put my name down on your list for new issue of the ABC of Bee-Culture. The one I have is very old: I received it as a present from a bee-teacher some years ago. I wish I knew enough to translate it for it is worth its weight in gold and would do lots to advance bee-culture in this country."
ROBT. LUACES.

NOW, send for the book and see for yourself, or, if you prefer, send for the sample pages. Do it at once. It is kept for sale by all dealers in bee-keepers' supplies, and booksellers generally. Price, \$1.20 postpaid, to any country.

Orders are already entered for about a thousand copies of the new book, so send your order early so you may not be delayed in getting one.

If you want Gleanings one year and ABC of Bee-Culture, you may have both, postpaid, for only \$1.75. If Gleanings is mailed to a foreign country, add 48 cents extra for postage.

THE A. I. ROOT COMPANY,
Medina, Ohio.

GENERAL ITEMS

Report for the Past Season.

About half a crop of extracted honey and only about $\frac{1}{4}$ of a crop of comb seems to have been the general result among southern Indiana bee-keepers the past season. A severe drouth in July played sad havoc with the bees: I lost 20 colonies by starvation. My best colony gave me nearly 200 pounds of extracted honey. Their queen is a Cyprian-Italian hybrid, and her workers show an enormous tongue-reach.

The retail price of comb honey has advanced from 15 to 20 cents, and extracted is in fair demand at $12\frac{1}{2}$ cents in a small way. Our best honey was from the dry-weather honey-vine which has not entirely failed to yield some surplus in the past 8 years.

J. C. WALLENMEYER.

Vanderburgh Co., Ind., Nov. 22.

Dry Season—Prospects Good.

This is a poor locality for bee-keeping, and I have had but little success. This has been the driest season we have had in Dakota since I came here; we secured very little surplus honey, and had to feed some of the colonies for winter. I think we will have a better season the coming year, as there has been a good deal of fall rain here.

F. GRASSER.

Barnes Co., N. Dak., Nov. 26.

Fine Looking Buckwheat Honey.

I began keeping bees 4 years ago, and now have 13 colonies, and take most of the care of them myself. For two seasons I have not secured any honey during the summer, but this year my fall crop was 300 sections of fine buckwheat honey. I use separators, and thus have fine looking honey. I sell it at home for 14 and 15 cents a section.

The Bee Journal helps me often, and I think it pays to take it as long as I get some honey, even if my crop is small. Good luck to it.

MRS. WM. HAAS.

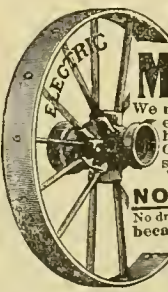

Venango Co., Pa., Nov. 28.

No Fall Honey—Figwort.

I commenced the spring of 1900 with 24 colonies of bees, and increased to 30 (but had only two natural swarms), and secured 760 pounds of extracted honey. The weather was fair, and we had plenty of blossoms, but the flowers had no nectar in them.

The fall flowers yielded but little, but the bees got enough to fill up for winter, and the

THE WHEEL OF TIME
for all time is the

Metal Wheel.
We make them in all sizes and varieties, TO FIT ANY AXLE. Any height, any width of tire desired. Our wheels are either direct or stagger spoke. Can FIT YOUR WAGON perfectly without change.

NO BREAKING DOWN.
No drying out. No resetting tires. Cheap because they endure. Send for catalogue and prices. Free upon request.

Electric Wheel Co.
Box 16 Quincy, Ills.

Please mention Bee Journal when writing.

SPECIAL NOTICE!

Last winter's cut of basswood is the whitest it has been for many seasons. We are now making sections out of this new stock and therefore are in a position to furnish you with the very finest quality in the market.

LEWIS WHITE-POLISHT SECTIONS

Are perfect in workmanship and color.

Orders shipped immediately upon receipt. A complete line of everything needed in the apiary. Five different styles of Bee-Hives.

Lewis Foundation Fastener simplest and best machine for the purpose. Price, ONE DOLLAR, without Lamp.

American Fruit and Vegetable Journal

Publish at 713 Masonic Temple.... CHICAGO, ILL.

Sample copy free. Mention this paper.

I have before me a copy of the American Fruit and Vegetable Journal, which I like pretty well. It fills the bill better than any paper I have seen lately. IRA C. TRACY, Foreman in the Home Nurseries.

I was much pleased to receive your publication. It is a very neatly printed and well edited journal, and merits success. D. W. BARKLEY, Editor of the "Rocky Ford Enterprise."

All departments of the Fruit and Vegetable business discuss by practical and experienced persons.

FREE!

We will send the above Journal absolutely FREE for one year as a premium to all old subscribers sending us \$1.00 to pay their subscription one year STRICTLY IN ADVANCE.

Both papers for the price of one. Send your renewal subscription to this office while this offer is open. Both papers, \$1.00.

AMERICAN BEE JOURNAL, 118 Mich. St., Chicago, Ill.

prospect for next year is fine, as we had plenty of rain during the latter part of the season, and white clover got a good start.

While feeding my pigs early one morning in a timber lot, I noticed several fine plants of figwort. A bee hovered over one of the plants, and after awhile it settled on a blossom and remained there a long time, then selected another, and another, and at the third blossom it got a full load and started off for home. I broke off a twig, and opened some of the flowers and found what looked like a drop of rain-water in it. It was only the flowers that had opened during the night that showed so much nectar.

An acre of figwort with all the blossoms filled like that, would keep several colonies of bees busy. FRED BECHLY. Poweshiek Co., Iowa, Nov. 24.

Well Supplied with Stores.

Bees did fairly well here this season. They are well supplied with winter stores, and are flying a little every day. W. H. HOUGH. Santa Fe Co., New Mex., Nov. 23.

Bees Didn't Do Much.

My bees did not do much this year. I secured only about 400 pounds of surplus honey from 35 colonies.

I was in Chicago during the encampment of the Grand Army, but was taken sick while there and was unable to attend the National convention of bee-keepers.

I like the Bee Journal very much. SPENCER S. BUXTON. Erie Co., N. Y., Dec. 2.

Prospect for Honey Next Year.

With other blessings we have rain to be thankful for, which means a prospect for honey the coming season. I have 112 colonies of bees in good condition.

FRANCES P. SARGENT. San Bernardino Co., Calif., Nov. 29.

Poor Season—No Increase.

Bees did poorly here this season. I had 256 colonies last spring, and did not increase any. I secured only about 1500 pounds of comb honey and 2500 pounds of extracted. Bees are in fine condition for winter.

E. C. FEATHERS. Waupaca Co., Wis., Nov. 24.

Results of the Season of 1900.

We have taken about 900 pounds from over 15 colonies this season, and sold it all at 25 cents—both comb and extracted—right here in town, and there were others selling theirs for less, too. The extracted sold more readily than comb, as soon as people began to find out that it was real, true honey. We tasted each comb before extracting, and saved all

The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

[THIS CUT IS THE FULL SIZE OF THE KNIFE.]

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a last-time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.25, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00.) We will club the Novelty Knife and the Bee Journal for one year, both for \$1.90.

GEORGE W. YORK & CO., 118 Mich. St., Chicago, Ill.

Please allow about two weeks for your knife order to be filled.

bitter honey to feed back after the season was over.

Our bees are in a little pine grove near the house. For wintering we drive stakes, and wind with common wrapping-twine, then fill in with pine-needles and leaves to the top of the hive (except the front, which is left uncovered.) We put an empty super on top of the hive, then fill cheese-cloth bags with dry maple leaves, the bags being just a fit for the super. We put slats across the super to keep the bags from falling down on the frames, thus giving the bees space to crawl over the top of the frames, and like this better than the chaff hives.

We put covers of match 1 1/2-inch boards, 3 1/2 feet square, and close the entrance by putting a little strip under, leaving a space 3 or 4 inches long, and high enough for bees to crawl out. Bees winter-killed all about here last winter, but ours wintered finely.

L. E. AMMIDOWN.

Worcester Co., Mass., Nov. 25.

Bees Did Very Nicely.

My bees did very nicely this year, having taken over 200 pounds of honey from 5 colonies. Three other colonies did not store any surplus. One colony produced 80 pounds of comb honey, which is pretty good for this part of the country.

F. D. KEYES.

Hampshire Co., Mass., Nov. 30.

Cotton as a Honey-Plant.

On page 718, R. P. Davies, of Lamar Co., Tex., says, "The cotton-plant is our mainstay here for honey, and it is a good one." Considering the time it continues to bloom one would think it a great boon to Southern bee-keepers, but I don't think it anything extra, tho the bees do work on it.

We have a great variety of prairie blossoms here in the spring, which are our main source

We Can't Give Away Anything

You pay for what you get in this world. You understand that. But as a business proposition we want you to try our great medicine for Indigestion, Constipation, Biliousness, Sick Headache, Insomnia, "the Blues," and like complaints—

Laxative NERVO-VITAL Tablets

We know you won't buy it, until you know something about it. The best way to get you to know how good it is, is to let you try it. That's what we do. STUDENTS RETURNING HOME

For holiday vacations can, upon presentation of proper credentials, obtain tickets via Nickel Plate Road, to all points in Central Passenger Association territory, at a fare and a third for the round trip. Tickets will be sold on day of closing school and on day immediately preceding closing date; good returning until date school reconvenes, but not later than January 8, 1901.

For information as to train service to Ft. Wayne, Cleveland, Fostoria, Erie and other points, call on or address John Y. Calahan, General Agent, 111 Adams St. Chicago Passenger Station, Van Buren St. and Pacific Ave., on the Elevated Loop. (43)

CONVENTION NOTICES.

New York.—Bee-Keepers' Institutes will be held as follows: Batavia, Dec. 12th; Canandaigua, Dec. 13th and 14th; Romulus, Dec. 15th; Auburn, Dec. 17th; and Johnstown, Dec. 18th. Bee-Keepers living in the vicinity of these Institutes are urged to attend and take an active part in the proceedings.

New York.—The 36th semi-annual meeting of the Seneca County Bee-Keepers' Association will be held at the Bevier House, Romulus, N. Y., Saturday, Dec. 15, 1900. W. Z. Hutchinson, editor of the Bee-Keepers' Review, will be present and address the meeting, and also conduct the question-box. Meals will be served at the Bevier House, special rates having been secured.

C. B. HOWARD, Sec.
Romulus, N. Y.

Michigan.—The next annual meeting of the Michigan State Bee-Keepers' Association will be held in the Grange Hall, Traverse City, Dec. 26 and 27, 1900, commencing at 2 p.m. This will without doubt be the largest attended meeting in the State for many years. We are to be honored with the presence of Mr. A. I. Root, whose name has become almost a household word, not only thruout the United States, but the world, wherever bees are kept. The program will be in the form of an open parliament, and those topics will be discuss that are nearest to bee-keepers' interests. A beautiful and novel badge has been adopted by the officers of the association, and will be sold at cost, 25 cents, and the annual dues will be 25 cents more. This will constitute expenses, except railroad and hotel bills. Reduced rates on all railroads, and the following hotels have made reduced rates to bee keepers: Park Place Hotel, \$1.50; Hotel Whiting, \$1.00 to \$1.50; Hotel Plankhorn, \$1.00; Hotel Shiels, \$1.00; and Columbia Hotel, \$1.00 to \$1.25. Certainly all should be suited with the above rates to choose from.

for surplus honey. I think the most important of these flowers as a honey-yielder is the horse-corn. Next to the prairie flowers in importance we have sumac, which blooms in July and August.

I have no desire to dispute Mr. Davies' statement, tho I should not wonder if he has given cotton a better name as a honey-plant than it deserves; but locality may make the difference.

H. M. CARR.
Bosque Co., Tex., Dec. 3.

Poor Season—Rainy and Cold.

We have had another poor season; too much rain and cool weather, with just enough honey stored to keep up the swarming-fever. I have extracted about 2000 pounds of Spanish-needle honey, and took off during the summer a few hundred pounds of comb honey, much travel-stained and of mixt quality. I increased from 104 to 144 colonies in two yards.

Many thanks for the fine pictures we are getting on the front page of the Bee Journal, and particularly for the one of G. M. Doolittle, on page 705. I have seen several pictures of our beloved leader in apiculture, but I have seen none with so much "life" in it.

T. H. WAALE.
Clarke Co., Wash., Nov. 19.

Cellar Wintering—Poor Season.

I promist to tell how those 56 colonies of bees wintered which I placed in the cellar Oct. 7, 1899, and removed April 10, 1900. That was a pretty long time for them to be in the cellar, and some will not believe it, but they all came out strong in bees and began to gather pollen the first day.

This has been another poor honey season on account of the dry weather. I took off 500 pounds of comb honey, which is 200 pounds more than a neighbor got who left his bees outdoors until late. Neither of us secured any increase as we were both working for honey.

I leave the supers on all winter, and fill them with dry oats chaff. My bee-cellar is under the kitchen, and has only walls of clay, and after I put them in I do not disturb them until I take them out. I put them in this year Nov. 4th.

JOSEPH BETHKE.
Sauk Co., Wis., Nov. 30.

Not an Encouraging Report.

The sugar to feed up the bees in the spring and fall cost more than the honey crop was worth this year.

O. E. CLARK.
Calumet Co., Wis., Nov. 26.

Feeding and Wintering Bees.

Bees were gathering nectar and pollen at a great rate Nov. 20th and 21st, altho I do not know from what they were gathering it unless it was from chrysanthemums. All of my bees have plenty of stores to carry them thru the winter, but should they get short I should supply them in the following way:

Take the best sugar I could obtain—3 pounds of sugar to 3 pints of water per colony, per month. Mix this well and add 2 pounds of honey, letting it simmer down to 7 pounds. Put the frame of comb in a tub or something of that sort, then take the mixture when the chill is not more than approaching and hold it up about 2 feet above the comb, and pour it

on until the cells are all full, especially near the top. This is done with two frames, and one is put on each side of the brood-nest, after two of the empty ones have been taken away.

Now, should they get short of pollen or become bad in any way, so they could not carry on brood-rearing, I should take a little sweetened water and sprinkle it in the cells and then turn the frame over and shake it out well. Then take some pulverized corn-meal and wheat flour—about two of meal to one of flour—sift it with the hand over the cells I have dampened, till they are not quite full; this done, hit the under side of the frame 3 or 4 times to settle it in the cells to the proper height. Now put the frame on the outside of one of the frames with feed in that has just been given—the warmest side is better. With this method I never have been unable to start brood-rearing in from 5 to 12 days. Of course if one does not want to start brood-rearing leave the hives unprotected and I think that will be all that is necessary; but if that does not do better leave out the pollen entirely and feed the syrup when necessary.

I winter my bees by putting the hives 3 or 4 inches apart, facing the South, and build a stone wall on both sides and at the back, leaving about 3 feet at the back for leaves and 18 inches at the ends. Stuff well with leaves, and pack it down hard between the hives. Put on supers containing chaff cushions. Then lay strips of boards 2 feet by 6 inches over the space between the hives, put brush or boards over the leaves, and then put stones on top of it all. I am well satisfied with the results.

ROBERT J. CARY.

Fairfield Co., Conn., Nov. 26.

Having a Nice Honey-Flow.

We are having a nice honey-flow from broom-weed, sage, etc. Bees are in fine condition. Several of my neighbors extracted 15 to 20 pounds per colony. I shall leave mine, as I want an early start in the spring.

MERIT ALWAYS WINS.

The hard times of the past three or four years have been very destructive to all industrial affairs, and the railroads have had unusual amount of difficulty in making both ends meet. Roads that have, during this trying period, earned dividends while at the same time affording high-class transportation facilities to their patrons, have, indeed, been fortunate. And such an event speaks well for the management of the roads.

The record of the Nickel Plate Road during the recent period of industrial depression, has indeed been remarkable, and it speaks most eloquently of the conservative judgment of the managers. For this road has made great and steady progress in the material improvement of its roadway and appliances, and in perfecting its equipment. The interests of the public have been in no wise neglected; in fact, the success of this road has inured to the benefit of the public, as much, if not more, than to the stockholders. The condition of the road to-day shows this. Great and valuable improvements of a permanent character have been made—in the shape of strengthening the roadway, bridges and other accessories, and procuring new and improved safety appliances; new coaches have been added, elegant Pullman sleeping-cars put on, new and powerful engines have been placed in service, and everything has been done to raise the standard of the road, to perfect its service, and to give it a leading place among the best roads in the country. The result has been obvious. The people have observed the progressive spirit of this road, have given it a liberal patronage, have enjoyed its excellent facilities, and that tells the whole story of a highly successful enterprise.

Among the most noteworthy improvements effected by the Nickel Plate Road is the introduction of a first-class dining-car service, which has won the approval of the best class of patrons. Then the coaches have been illuminated by the brilliant Pintsch gas, heated by steam, and placed in care of a colored porter, so the passengers have had the best that money can afford, at the lowest rates. The thru train service of the Nickel Plate, running in connection with the West Shore and Fitchburg Railroads over the great Hoosac Tunnel Route, between New York, Boston and Chicago—ranks with the best in the country, and has become deservedly popular. Elegant new coaches, and palatial Pullman buffet sleeping-cars run thru without change; the service is unexcelled, the time fast, scenery most fascinating.

Located along the south shore of Lake Erie are many substantial and attractive summer resorts that are yearly growing in popularity, and this class of travel promises a continual increasing source of revenue to the Nickel Plate Road.

HONEY AND BEESWAX
MARKET QUOTATIONS.

CHICAGO, Dec. 7. The demand has fallen off very much of late, but prices have not declined to any great degree from those prevailing for the past 60 days, but any pressure to sell would cause a decline. Fancy white comb, 16c; No 1, 15c; amber and travel-stained white, 13@14c; dark and buckwheat, 10@11c. Extracted, white, 7 1/2@8c; amber, 7@7 1/4c; buckwheat and other dark grades, 6@6 1/2c. Beeswax, 28c.

R. A. BURNETT & Co.

KANSAS CITY, Dec. 6.—Fancy white comb, 16@16 1/2c; choice, 15c; light amber, 13 1/2@14c; dark, 10c. Extracted, 7 1/2@8c. Beeswax, 22@23c. Receipts very light; demand good.

W. R. CROMWELL PRODUCE Co.,
Successors to C. C. Clemons & Co.

BUFFALO, Dec. 7.—Honey is so high that it curtails the demand very materially. Sales are moderate, and some lots will have to be cut to sell. Fancy comb, 17@18c; choice, 16c; other grades, 10@15c. No extracted, and none wanted. Beeswax quiet at 25@30. BATTERSON & Co.

ALBANY, N. Y., Dec. 6.—Fancy white, 17@18c; No. 1, 16@17c; No. 2, 14@15c; mixt, 13@14c; buckwheat, 12 1/2@13 1/2c. Extracted, white, 8@8 1/2c; mixt, 7@7 1/2c.

The honey market is steady with light receipts and good, stiff prices. Extracted, market quiet and but little movement. Will be more demand later on. H. R. WRIGHT.

BOSTON, Dec. 7.—Our market on honey continues strong, with light receipts. Fancy one-pound cartons, 17c; A No. 1, 15@16c; No. 1, 15c; No. 2, 12@13c. Extracted from 7 1/2@8 1/2 cents, according to quality. Beeswax steady at 25@27c. BLAKE, SCOTT & LEE.

CINCINNATI, Sept. 21.—The demand for fancy comb honey is good and finds ready sale at 16@16 1/2c; No. 1, 15c. The demand for extracted honey at present is slow and offer same by the barrel as follows: White clover, 8 1/2@9c; Southern, 6 1/2@7 1/2c; Florida, 7@8 cents, according to quality. Beeswax, 27c.

The above are MY SELLING PRICES. I do not handle any honey on commission, but pay spot cash on delivery. C. H. W. WEBER.

NEW YORK, Nov. 20.—Good demand continues for all grades of comb honey. We quote: Fancy white, 15@16c; No. 1 white, 14c; No. 2 white 12@13c; amber, 12c; buckwheat, 10@11c. Extracted in fairly good demand at 7 1/2@8c for white, and 7c for amber; off grades and Southern in barrels at from 65@75c per gallon, according to quality. Not much demand for extracted buckwheat as yet. Some little selling at 5 1/2@6c. Beeswax firm at 28 cents.

HILDRETH & SEGELKEN.

DETROIT, Nov. 22.—Fancy white comb, 15@16c; No. 1, 13@14c; dark and amber, 10@12c. Extracted, white, 8@8 1/2c; light amber, 7@7 1/2c; dark, 6@6 1/2c. Beeswax, 26@28c.

M. H. HUNT & SON.

SAN FRANCISCO, Nov. 21.—White comb, 13@14 cents; amber, 11 1/2@12 1/2c; dark, 8@9c. Extracted, white, 7 1/2@8c; light amber, 6 1/2@7 1/2c; amber, 5 1/2@6 1/2c. Beeswax, 26@28c.

Market is seldom more lightly stocked than at present, and is firm at current rates. Offerings are principally amber grades, choice to select water white honey being a rarity at present, as it has been, in fact, most of the current season. A shipment of 90 cases of honey went forward per steamer to British Columbia.

A HONEY MARKET.—Don't think that your crop is too large or too small to interest us. We have bought and sold five carloads already this season, and want more. We pay spot cash. Address, giving quality, quantity and price, THOS. C. STANLEY & SON, Fairfield, Ill.

Four Celluloid Queen-Buttons Free

AS A PREMIUM

For sending us ONE NEW SUBSCRIBER to the American Bee Journal for three months with 30 cents, we will mail you FOUR of these pretty buttons for wearing on the coat-lapel. (You can wear one and give the others to the children.) The queen has a golden tinge.

This offer is made only to our present regular subscribers.

NOTE.—One reader writes: "I have every reason to believe that it would be a very good idea for every bee-keeper to wear one [of the buttons] as it will cause people to ask questions about the busy bee, and many a conversation thus started would wind up with the sale of more or less honey; at any rate, it would give the bee-keeper a superior opportunity to enlighten many a person in regard to honey and bees."

Prices of Buttons alone, postpaid: One button, 8 cts.; 2 buttons, 6 cts. each; 5 or more, 5 cts. each. (Stamps taken.) Address,

GEORGE W. YORK & CO., 118 Michigan St., CHICAGO.

AMERICAN

BEE JOURNAL

Editor.

CHICAGO, ILL., DECEMBER 20, 1900.

FORTIETH YEAR.
No. 51.

WEEKLY

W.M. McEVOY,
Foul Brood Inspector of Ontario, Canada.

THE AMERICAN BEE JOURNAL.

PUBLISHED WEEKLY BY

GEORGE W. YORK & CO.

118 Michigan St., Chicago, Ill.

Entered at the Post-Office at Chicago as Second-Class Mail-Matter.

IMPORTANT NOTICES:

The Subscription Price of this journal is \$1.00 a year, in the United States, Canada, and Mexico; all other countries in the Postal Union, 50c a year extra for postage. Sample copy free.

The Wrapper-Label Date of this paper indicates the end of the month to which your subscription is paid. For instance, "Dec00" on your label shows that it is paid to the end of December, 1900.

Subscription Receipts—We do not send a receipt for money sent us to pay subscription, but change the date on your wrapper-label, which shows you that the money has been received and duly credited.

Advertising Rates will be given upon application.

Reformed Spelling.—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound. Also some other changes are used.

The Bee-Keeper's Guide

Or, Manual of the Apiary,

—BY—
PROF. A. J. COOK.

460 Pages—16th (1899) Edition—18th Thousand—\$1.25 postpaid.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published to-day. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipt, or his library complete, without THE BEE-KEEPERS' GUIDE.

This 16th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to GIVE AWAY to our present subscribers, for the work of getting NEW subscribers for the American Bee Journal.

Given for TWO New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the two NEW subscribers—simply the Bee Journal for one year:

Send us TWO NEW SUBSCRIBERS to the Bee Journal (with \$2.00), and we will mail you a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both for only \$1.75. But surely anybody can get only TWO NEW SUBSCRIBERS to the Bee Journal for a year, and thus get the book as a premium. Let every body try for it. Will YOU have one?

GEORGE W. YORK & CO.,
118 Michigan Street, CHICAGO, ILL.

YELLOW OR WHITE

Sweet Clover Seed

Free as a Premium

For Sending us One New Subscriber for a Year.

There has been so much written about both the white and the yellow variety of sweet clover, that we will simply say here that if one of our present regular subscribers will send us \$1 with a new name for next year (1901), we will send the new subscriber the balance of this year's (1900) numbers free, and mail, postpaid, to the one sending the new name and the dollar, either one pound of yellow sweet clover seed, or two pounds of the white sweet clover. This is a good chance to get a start of both kinds of these honey clovers. Better send two new subscribers (with \$2.00) and get the three pounds of seed. Address,

GEORGE W. YORK & CO.

118 Michigan Street, CHICAGO, ILL.

BASSWOOD HONEY in 60-pound CANS

This is the well-known Basswood Honey, and is very fine. Sample, by mail, 8 cents; two or more 60-pound cans, two cans in a box, at 9 cents a pound, f.o.b. Chicago.

Dark Amber Honey in Barrels.

We have a few barrels of this honey holding 300 pounds each, net. Many people prefer the rich amber honey, and in some retail markets it brings as much as the light-colored honeys. Sample, by mail, 8 cents; per 300-pound barrel, 7½ cents a pound. Cash with order in each case. Address,

GEORGE W. YORK & CO.,
118 Michigan Street, CHICAGO, ILL.

The "Barler Ideal" OIL-HEATER....

Saves Its Cost Every Year!
NO ODOR! NO SMOKE! NO ASHES!

Costs only a cent an hour to run it.

The editor of the American Bee Journal is using the "Barler Ideal" Oil Heater, and it is all right in every way. We liked it so well that we wanted our readers to have it too, so we have recently arranged with its manufacturers to fill our orders. The picture shown herewith is the one we recommend for general use. It is a perfect gem of a stove for heating dining-rooms, bed-rooms, and bath-rooms. It hinges back in a substantial way, and is thoroly well made thruout. The urn removes for heating water. The brass fount, or well, has a bail, and holds nearly one gallon of kerosene oil. It is just as safe as an ordinary lamp. You wouldn't be without it for twice its cost, after once having one of these stoves. Most oil-stoves emit an offensive odor, but this one doesn't. Its height is 2¼ feet, and weighs 20 pounds, or 30 pounds crated ready for shipment, either by freight or express.

Price, f.o.b. Chicago, \$6.00; or, combined with a year's subscription to the American Bee Journal—both for only \$6.50. FULL DIRECTIONS GO WITH EACH STOVE.

If you want something that is really serviceable, reliable, and thoroly comfortable, you should get this "Barler Ideal" Oil Stove, as it can easily be carried by any woman from one room to another, and thus have all the heat you want right where you want it.

Address,

GEORGE W. YORK & CO.,
118 Michigan St., Chicago, Ill.

No. 4 "Barler Ideal" Oil-Heater.

No. 51.

✽ Editorial. ✽

The Chicago Convention Report has been unavoidably delayed somewhere, so that we are unable to continue it this week. We trust that such a break will not happen again; but perhaps in view of the excellent matter in its place this week no one will complain on account of its omission for one issue. We hope it will not occur again, as we desire to complete it as soon as possible, as we have other interesting and helpful matter waiting its turn.

Shipping Comb Honey.—There is no one who knows better than the dealer in honey how it should be prepared for shipment. He is the man that is at the other end of the line from the producer or shipper, and is the only one who can report as to the condition of the honey after having traveled on the cars from starting-point to destination. He ought to be able to give some good advice about shipping honey, especially as he receives many shipments from almost as many different shippers, thus becoming familiar with the various methods of preparing it before starting it off to market.

Well, we have been doing something in the line of handling honey for several years, and during that time we have been able to collect some very valuable experience. But the trouble we find is, to get some bee-keepers to learn to take advice that is wholly for their own good. For instance, how often we have gone into the details, in these columns about preparing comb honey for shipment, and yet scarcely a season passes but what we have a repetition of an experience with broken-down comb honey that is anything but agreeable to us, and far from profitable to the producer.

Quite recently we received a shipment of about 50 cases of amber comb honey from an old bee-keeper, some 500 miles from Chicago. It arrived here in such a smash-up condition that our honey-man had to spend two full days in going thru the lot, cleaning it up, and putting all the broken-down sections of honey into cases by themselves. When he finished the miserable, sticky job, there were just 13 cases of 20 sections each of the wholly broken down comb honey.

And there needn't have been any broken-down comb if the shipper had prepared it properly before loading it on the cars.

Let us tell how it was packed: The 20-section cases were put into heavy boxes holding six cases each, but there was practically no

extra space to pack in straw. In some of the boxes the cases fitted so tight that it was difficult to get them out without first taking the box to pieces. Of course this was all wrong. There should have been a space of three or four inches all around the six cases (except on top) in which to put straw to act as a cushion. We also think it well, if using a large box instead of a crate (tho the crate is preferable), to leave one side rather open, using slats there instead of making it solid. Then the freight-handlers can see that it is comb honey, and will be more careful.

Of course, on top of each box or crate should be plainly marked—"COMB HONEY—HANDLE WITH CARE."

Another thing: The sections in the above lot of honey were crowded so tight into the shipping-cases that we actually had to pry the rear side of each case off before being able to take out a section. This is all wrong. The cases should have at least three-fourths inch space at the back, for a one-fourth inch thick board to stand on edge next to the sections of honey, and then newspaper wadded up and crowded in between the thin board and the back of the case. This serves as a sort of cushion, and will prevent many a comb from being broken down.

The boxes in this particular shipment had handles on them for the freight men to carry them by. That part was all right, but nearly everything else was wrong.

We have never received a shipment of comb honey in bad condition when it was properly packed before shipping. It is absolutely useless to expect to be able to ship comb honey safely when not prepared as it should be. To do otherwise is simply to be almost certain of loss. And the miserable, leaky, dauby mess that the receiver has to clean up is anything but pleasant, especially when he knows that it would have been wholly unnecessary had the honey been put up right before putting it on the cars.

We hope this story will serve as a warning to all who read it, to pack their comb honey as it should be when shipping to a distant market.

Bees and Fruit Again.—A certain judge in Adams Co., Ill., sent the following letter to Mr. J. Q. Smith, president of the Illinois State Bee-Keepers' Association, who, upon receiving it, referred it to us for reply and publishing, if we so desired to use it in these columns:

J. Q. SMITH—

Dear Sir:—A client of mine seeks damages because his neighbor's bees, from about 400 hives, clustered about his ripe grapes and peaches, and spoiled the crops of his vineyard and peach orchard. The bloom and flowers

were not as thick in woods and bottoms as usual this year.

Do bees usually do such damages to ripe grapes and peaches, seeking sweets, whether bloom is plentiful or not? The habits and customs of bees would answer this, and you may be able to suggest an answer.

Would bees do such damage usually, so the owner would ordinarily be supposed to have notice of such propensity?

To put the question fairly as to the habits and customs of bees, would solve the question in part. What books or papers treat of that point?

Upon receiving the above, we immediately requested General Manager Secor, of the National Bee-Keepers' Association, to mail the judge all the literature he had bearing on the subject. We have no doubt nothing further will be heard from the threatened prosecution. A conscientious attorney, after informing himself on the matter, would do all he could to prevent litigation of the kind indicated, for the intending plaintiff could well afford to pay a fat fee for being kept out of court, rather than certainly to end with a lost suit, and then to have all the costs to settle, besides his attorney's fee.

It would be well for our readers to bear in mind that all members of the National Bee-Keepers' Association have free access to any aid that it is able to give. If you are not a member, you can't do a better thing than to send your annual dues (\$1.00) to General Manager Eugene Secor, Forest City, Iowa, and thus put yourself in line with such help as you might require some day; and if not for yourself, you will be aiding your fellow bee-keepers in maintaining their rights against any unjust aggressions.

If more convenient for you, send the dollar to us, and we will see that Mr. Secor gets it. Then he will mail you a membership receipt.

Growing Clover.—Three prize articles on this subject appear in Gleanings in Bee-Culture, alsike getting the lion's share of attention, red clover seeming to come in only incidentally. The writers are from different States—Wm. Robinson from Wisconsin, Wm. W. Case from New Jersey, and Harry L. Smith from Maine. The first article is of such importance that it is given elsewhere entire. What is true for Wisconsin is probably true for a large area of territory visited by this journal.

According to Mr. Case, it is easier to get a catch of alsike than of red, and it does not kill out so easily in winter. An objection is that alsike gives no second crop unless cut before thru blossoming, which spoils the honey crop. Mr. Case says:

"At the usual time of sowing clover in the spring on wheat and rye, mix red and alsike clover seed in the proportion of two pounds of red to one of alsike, and apply with tim-

othy, two pounds, at rate of not less than six quarts to the acre, and as much more as experience with your own peculiar soils shows will make a heavy stand. Should the first trial prove a failure, if necessary, furnish the farmers seed at half cost for second trial, and eventually you will get an alsike convert who would not do without it even if the seed cost \$30 per bushel. In the following hay crop, without interfering with the red crop in the least, it will, on the average, add 40 percent to the yield of hay, while the second crop of red will follow as tho no alsike had been grown. I have frequently seen it grow to a height of 20 to 24 inches the first season after removal of the wheat or rye.

"Fully three-fourths of the clover sown throught this section of country contains its proper share of alsike; and as practically all the red clover froze to death last winter, and scarcely none of the alsike, next spring will see a far higher percent of alsike sown than in the past."

"The common practice in this section," says Mr. Smith, "has been to use about one-third red clover in seeding to grass; but experiments upon our farm have proved to us that we get more hay, and a much greater feeding value, by using more clover; about one-third red and one-third alsike clovers, the rest timothy and red top.

"The first year we get two crops of clover in which but little else will show; but during the following winter, fully half of the clover plants die, and the timothy and red-top take possession and feed upon the decaying roots, giving us a good crop of hay for two or three years. On our heavy clay soils we sow enough alsike to take the place of the red clover, as the latter will rarely make a stand. On moist fertile soil we can produce alsike three feet tall, and it will stool out so thick that it will form a perfect tangle; and how the bees revel in it! It seems as tho all the bees in the neighborhood were there. If it is cut when it first begins to bloom we may expect a second crop, but not otherwise, for alsike is a biennial; and if it is not cut before it comes into full bloom the most of the plants will die. If the summer is moist, red clover will produce a second crop, even if the first is not cut until the heads begin to turn brown. By seeding with both alsike and red clovers, and not cutting the first crop until it is in the height of bloom, we get a larger first crop; then the red clover will take possession and give us as large a second crop as tho it had been used alone in seeding. Clover likes a mellow soil, so we plan to have it follow some crop which leaves the ground light and friable."

A. I. Root adds in a foot-note: "Clover grown as we grow it, solely for improving the soil, is all right for honey, for we seldom plow it under until it is in full bloom, and some of the heads begin to turn brown. The largest crop of buckwheat we ever grew was where we turned under mammoth clover so late it was already full of seed. A neighbor told us the clover seed on the land was worth more than we could get for our buckwheat; but he was mistaken; and from this experiment I am inclined to think that clover is worth more to plow under when it contains some seed nearly or quite mature than at any other period."

Honey as a Daily Food. Dr. C. C. Miller, in the National Stockman and Farmer of recent date, had this to say about the daily use of honey in the families of farmers:

Some farmers are in the habit of selling off all the best of anything raised, letting the family worry along with the leavings. It is pleasant to believe that in many cases honey forms an exception: that the farmer with two or three colonies of bees does not think of selling any of the honey, but leaves it all in the hands of the good wife, to do with when and how she will. Very wise indeed is such a farmer. Indeed, if he is wise enough, he will have honey on the table daily, even tho he should be obliged to buy it.

It is for the health to use honey. Many a poor mortal is to-day living a life of lingering torture or cruel self-denial, to whom the doctors have forbidden the use of all sugar and all foods abounding in starch. And the trouble came about from over-indulgence in

sugar. This nation has a wonderfully sweet tooth. Do you know that the average man, woman and child of the American nation consumes more than a pound of sugar every week of life? Some more than that, some less; more than a pound a week is the average. Before the sugar can be worked into flesh and blood, it must be changed from cane-sugar to grape-sugar. When too much of this work is thrown upon the stomach, there comes trouble—sour stomach, headache, and all the varied ills that come from bad digestion. The stomach turns over the job to the kidneys, and when the kidneys have more than they can do, having no one else to turn to for help, they break down with disease.

The use of honey satisfies this craving for sweet without the dangers that attend the use of sugar. The sugar in honey is already grape-sugar, all ready for assimilation. Give a child the choice between sugar and honey, and see which it will take. For too many children bread and honey is a treat, a luxury, instead of being an article of daily food. The old man or woman of 80, as well the child, finds the daily use of honey both pleasant and healthful.

The average family of five persons would be considered as using a good deal of honey to use 50 pounds in a year. Many do not use 10. But the average of sugar for such a family is about 300 pounds a year. If half of that, or even 100 pounds, were replaced by honey, it would be for the betterment of the health of the family.

The foregoing advice will apply to bee-keepers as well. Why shouldn't they use more of their own honey and buy less sugar? We have honey on our table three times a day, and the meal would seem hardly complete without it.

A good way to use extracted honey is to put a good-sized tablespoonful in a little saucerdish for each one at the table. This will usually all be eaten. It is a much better way than to pass a dishful of it and let each one take what he wants and put it on his plate, to run all over it and daub the other things on the plate with its sticky sweetness. Try the side-dish plan, putting only enough into the dish so that it will be used at that particular meal.

Bee-keepers should set a good example to the world in the line of eating honey—take their own medicine," or advice, as it were.

Weekly Budget

EDITOR W. Z. HUTCHINSON, in the last issue of his Bee-Keepers' Review, has these two very complimentary paragraphs:

The American Bee Journal receives a very kind but well-deserved notice from Gleanings. Among other things, Mr. Root fears that Bro. York does not get money enough for his journal when he sells 52 numbers for only \$1.00. This is what I have often thought; and only a first-class business-man, like Bro. York, would ever have kept the American Bee Journal afloat at that price, and made it what it is.

The Chicago convention report of the National Association meeting held last August in that city, as now being published in the American Bee Journal, is the best, most accurate, and fullest report ever published of any convention held by this body. It shows that it pays to have an efficient stenographer.

We can not conceive of anything that we have done to merit such kind words as have recently appeared in some of the bee-papers, notably Gleanings and the Review. We certainly appreciate them very much, and only hope that there never may anything occur

that will cause our good friends to regret having written the commendatory words.

We have been devoutly thankful for the kindly feelings that have existed for so many years between the editors of the various leading bee-papers. It was not always so. In other days, long ago, there was more or less of strife among the bee-brethren, not only touching those who were guiding and guarding the helms of the bee-papers, but among the rank and file of bee-keepers themselves.

Let us all rejoice in this better day that has dawned, and trust that the present era of good-will and good-nature may be as lasting as it is desirable and pleasant.

MR. WM. McEVoy is perhaps the best known bee-keeper in Canada to-day. His excellent report for 1900 as foul-brood inspector for the Province of Ontario appears on another page. Mr. McEvoy has made a success of handling that dread disease, and seems to have done so in a manner that all can approve. This is saying a good deal, when we remember that he has all kinds of people to deal with. We have met Mr. McEvoy, and also his good wife, and it would be rather difficult to say which is the better "man" of the two. However, we might say of them as did the Irishman when he wished to compare a couple of men, and do it gallantly. He said: "One is as good as the other, if not a little better!"

MR. WM. F. WARE, of Cumberland Co., N. J., gives his estimate of the American Bee Journal as follows:

"If you can tell me how any one keeping only a few bees, and can get along without taking the American Bee Journal, or some other paper just as good, and will make me believe it, I will send you at once another dollar for another year's subscription. You can't do it, you know.

"I hope to have a good season next year with my 20 colonies of bees."

EDITORS ROOT AND HUTCHINSON have been enjoying the attendance upon several bee-keepers' conventions in the East, particularly the recent Ontario convention, of which Mr. Wm. McEvoy, the bustling and efficient foul brood inspector for that Province, writes us as follows:

"We had the best convention ever held in the Province of Ontario. Mr. Holmes read the best paper on queens ever written, and of immense value. Prof. Fletcher, of Ottawa, prepared himself, and with charts and a lecture he astonished every one. Mr. J. B. Hall moved to have it published in pamphlet form for the benefit of both bee-keepers and fruit-growers. It was promptly carried. Our conventions are getting better every year. Woodstock is the next place of meeting."

It is too bad that we are not able at this season of the year to get away to meet the bee-keepers in conventions, but from Dec. 1st to Feb. 1st, we are usually kept very busy in the office, and feel that we simply must be here, not allowing anything but severe sickness or death to keep us away for even a day.

But we are glad that our brother editors can attend and enjoy the conventions. Besides, any one of them is more helpful to a meeting than we possibly could be. So it is all right in that way; but we feel we are missing a good deal of profit and pleasure by being prevented from attending. Still, we will try to be satisfied to remain at home, and look after the weekly Bee Journal, which requires more constant attention than any other bee-paper published in America. Only by attending strictly to business, and letting nothing interfere, are we able to keep it "afloat at the price," as Mr. Hutchinson has well said.

Contributed Articles.

Review of Thos. W. Cowan's Book—The Honey-Bee.

BY PROF. A. J. COOK.

IT seems almost unnecessary to criticize so accurate and admirable a work as "The Honey-Bee," by Thos. W. Cowan. However, a small horse is quickly carried.

On page 1 it is stated that the honey-bee belongs to the sub-kingdom Annulosa. There has never been very good authority for Annulosa as a Phylum. At present all our best authorities place insects in the Branch or Phylum, Arthropoda.

On page 2 I should prefer Ichneumon Flies to Ichneumons, both for euphony and symmetry. On the same page I notice Mr. Cowan still uses the old word, "mellifica" for the honey-bee. I think I prefer this to "mellifera," altho the latter would take precedence if we follow the latest rules of priority. In a popular work, it is always better, I think, to use names that have generally been used in our literature.

It is the usage at present, not to capitalize specific names, even tho they may be derived from proper nouns. Thus, *Bombus virginica* or *Xylocopa californica* should be written as here shown.

On page 4, we have "workers *who* represent." Of course this was a case of faulty proof-reading.

Is it true, as stated on page 5, that the worker-bees are unloaded of their burden at the entrance to the hive? From the middle of page 7, we learn that the same bee that gathers pollen, not only pushes it into the cell, but packs it with her head, and then goes to other cells to empty her honey-stomach. Does the same bee that gathers the pollen pack it? And do bees generally gather pollen and honey at the same time? They certainly do sometimes, but I think not usually.

On page 10, it is stated that the egg contains a vital germ. The seed contains a germ, but never the egg. The egg is simply a cell and usually receives another cell which is incorporated into its substance before development commences. While it would be perfectly proper to say that a seed contains a germ, I do not think it would be correct to speak in like way of an egg.

On page 12, pupa, chrysalis and nymph are all given as synonyms. It were better to confine chrysalis to the pupa of butterflies, while entomologists now use nymphs for both the larva and pupa of such insects as pass thru incomplete metamorphoses like the locust.

On page 13, 15 days is given as the term of a queen's development from the time the egg is laid till the queen emerges. I believe the usual 16 days is a more correct average. Fifteen and even seventeen days may occasionally mark this time.

On page 18 we read "clypeus or nose." Neither form, position, nor function would warrant the use of nose in this place.

On page 20, we read that the compound eyes of the imago are developot from the simple eyes of the larva. This is certainly not always the case. Is it ever true?

On page 22, pharynx, gullet and mouth mean the same. I supposed, as with us, that pharynx refers to the enlargement just back of the mouth, and that gullet was synonymous with *oesophagus*.

On page 30 we read, "Bees are also able to distend the infolded membrane on the under side of the tongue, and expose the rod, probably for the purpose of cleaning it." I have demonstrated by using colored sweets that this unfolding is sometimes for the purpose of lapping thick honey. I am inclined to think this is its true function.

The naming of the wing, on page 39, is misleading. The front long vein is called the costal, and the one towards the tip from this, the marginal. The large cell back of the costal is called the median, while all those that touch the marginal are called sub-marginal, sub-costal or cubital.

On page 40 it is stated that the hooklets of the posterior wing are on the outer margin. I should say they are on the inner two-thirds of the front margin, as shown in the beautiful figure on page 39.

At the bottom of page 62, we find, "the others are termed ganglions." All the masses of gray cells are termed

ganglia. I prefer the Latin plural which is certainly the more euphonious.

On page 64, certain nerve fibres are spoken of as reflex. The word reflex better refers to a sensation. It is probable that every nerve is more or less the track of reflex nervous actions.

Mr. Cowan's statistics on page 70, regarding the size of the brain of different insects, are very interesting. It is stated that the pediculated bodies of the brain form one-fifth part of the volume of the brain, and 1-940 of the whole body, while in the ant, they are nearly half the volume of the brain and 1-286 part of the whole body. Yet in the next paragraph it is stated that the whole brain of the worker-bee is 1-174 of the body, while in the ant it is 1-286 of the body. Of course there is some mistake here. When we read that the brain of the water-beetle is only 1-4200 part of the body, our respect for the bee's position in the insect world is augmented. The first figures would seem to put the ant at the head of the insect world. It has seemed to me that it rightly belongs there, tho we must say that the bee is a close second.

I think the wrong impression is given on page 79, as I think the removal of the sting always proves fatal, tho death may not occur for some days. This opinion was the result of numerous careful experiments.

The fact as given on page 82 that the poison of the queen is very different from the poisonous contents of the sac of the worker, is very interesting.

That Mr. Cowan is up with the latest is shown by his explanation of vision as shown on page 104.

Mr. Cowan says on page 105, last line, that white-eyed drones are blind. Are we sure of this? Albino people, it is true, have defective vision, but can see. I believe the same is true of white-eyed bees.

Digestion is not to separate the nutrient food from the other ingesta, as we read on page 106. Absorption or osmosis performs the separation. Nor is digestion necessarily to make the food liquid, tho this is generally the case. Some liquids, like blood albumen, are yet non-osmotic, and so must be digested. I think the best definition for digestion is the process by which the food is rendered osmotic.

On page 107, we are told that the food is digested by the action of the gastric juices secreted by cells in the chyle stomach. I believe that the pollen is mostly digested by the secretion from the lower head-glands, while the nectar is digested by secretion from the upper head and thoracic glands. The stomach-cells may furnish some digestive ferment tho I doubt if they do more than to keep the stomach moist and absorb the digested food. Near the bottom of the page, the action of the stomach mouth is referred to as voluntary. I believe all the muscles of the alimentary canal are involuntary.

I do not like the use of the word "chyme." Its use is almost discontinued in human physiology, and better be everywhere. I suppose we shall continue to use the word chyle for the digested food of the true stomach, tho I do not like it. It is now used in human physiology to designate the digested fat, and to give it so different a meaning in discussing bees is confusing.

I was glad to note, as stated on page 112, that Mr. Cowan has actually seen the queen void her faeces. I had supposed that she utilized all her aliment, and that there were no excretæ. Mr. Cowan saw the workers sucking this up.

On page 117, it is stated that the upper head-glands and thoracic glands—Mr. Cowan uses singular number—are larger in the queen and absent in the drone. It is strange that in the modification of the queen, these glands have not diminished in size or disappeared. If their secretion, as I believe, is to digest the nectar, they would seem hardly more necessary for the queen than the drone. Possibly the food must be more thoroly digested in winter, and so as the queen lives thru the winter, she requires these glands. It is an interesting fact, as given on page 124, that the drones die in three days if not fed by the workers, and the fact that this food is withheld by the workers accounts for the quiet taking off of the drone at the last.

On page 135, the ovaries are called glands. If this be correct, then the eggs are a secretion. I would call neither the ovaries nor testes, glands.

It is stated on page 136 that eggs are not found in the ovaries. As the queen emerges from the pupa stage, I think this is an error. As with all higher animals, all the eggs are present at birth, but are not fully developot until just previous to deposition.

On page 141, Berlepsch is quoted as never having

known a queen to be impregnated earlier than the third day. Dzierzon once knew a queen to be impregnated at 47 days. Is Mr. Cowan correct on the same page in the following? "Generally the wedding flight takes place between twelve and four o'clock, seldom later and *yet more seldom earlier.*" Mr. Cowan says the time the queen is out varies from *one minute* to 45 minutes.

On page 147, Mr. Cowan argues in favor of telegony. I do not believe that the drone from a pure mother will ever show taint, however mated. I believe if there is a show of taint, the queen was not pure. My very extensive experiments in this matter seem conclusive.

Mr. Cowan states on page 157, that while both drones and workers are fed different food during the close of the feeding period of their larval state, the queen-larva has the same food thruout. After this partial weaning, digested pollen and honey are given the workers, and undigested pollen the drones. I wonder if this has been demonstrated.

The quotation on page 171, from H. Holz, that "the fat cells are connected with the membrane by tubes thru which the liquid wax flows to the membrane, and passes thru when the temperature is at 95 to 98 degrees Fahr."—have others seen the fat cells or the tubes? It is stated on the same page that wax-secretion is voluntary. I do not believe this at all. As shown in my "Bee-Keepers' Guide," it probably results from much eating and great quiet.

It is probably correct, as stated on page 173, that the presence of both pollen and honey in the food will increase the amount of wax-secretion. We, our cows, all animals, work better when they have normal food.

Mr. Cowan's explanation of the varying form and size of cells—pages 179-187—is intensely interesting, and is the result of most valuable research. His descriptions, as well as his photographs, show that cells may be of almost any form and of very varying size. The old idea of exactness and perfection goes for naught. Dr. Planta is quoted on page 189 as authority for the statement that the coloring of the wax when it is pale yellow is owing to the pollen in the food. This is interesting, if true.

I feel as tho an apology is due for any criticism of so excellent a work. I do it in no spirit of dogmatism, but only to call attention to points which I think will warrant investigation. The book is rightly regarded as authoritative in Europe, and is certainly one of our very best works. Los Angeles Co., Calif.

Report for 1900 of the Ontario Apiary Inspector.

BY WM. M'EVROY.

DURING 1900 I visited bee-yards in the counties of Lincoln, Wentworth, Brant, Huron, Perth, Waterloo, Wellington, Halton, York, Ontario, Simcoe, Lanark and Russell.

I inspected 100 apiaries and found foul brood in 33 of them, and dead brood of other kinds in many others which had been mistaken for foul brood. The first thing I did when I entered a locality was to pick out the best bee-keeper in it, and get him to take me from place to place so that he could see how I managed the business, and, if required, would make a valuable witness. I have done this for the last ten years, and kept up a correspondence with the most of them, and by this means I always knew pretty well how all were getting on at the curing.

At this work I burned a good deal of midnight oil, and sometimes I wrote all night and part of the next morning. Sometimes death and sickness delayed the curing, and in all places where I found this to be the case, I went and did the curing myself.

The following is a list of part of the men that went the rounds with me during the last ten years: Messrs. F. A. Gemmill, J. B. Hall, C. W. Post, Wm. Wells, Charles Mitchell, Martin Emigh, D. W. Heise, Abner Pickett, R. L. Patterson, James Armstrong, W. A. Chrysler, J. McPherson, E. Donnelly, Samuel Wood, J. K. Darling, Peter Byer, Jas. Nolan, John Fixter, of the Ottawa Experimental Farm, John Calvert, Alexander Taylor, A. E. Hoshal, Moses Vernon, Wm. Holden, A. Boomer, J. Ward, and Henry Couse.

I have here furnished a list of part of the men that I pick out "to pad the road with me," and taking them as a whole, for good bee-keepers, they will rank among the best, if not *the* best, in the world, and I will leave it to them to say if I did not manage the whole business justly, very fairly, and successfully, all along the line.

Since I was first appointed inspector, I have had thousands of diseased colonies cured of foul brood, and very

many apiaries that were once in a bad state with foul brood, have not only been cured, but have given some of the largest average yields of honey of any ever taken in the Province of Ontario. One of the treated apiaries gave an average of 200 pounds of clover and basswood honey per colony, and 50 percent increase in bees, and had plenty of clover and basswood honey left in the hives for wintering the bees. This yield was taken in a locality where no buckwheat was grown.

Every bee-keeper I visited during the past season treated me in the most courteous and generous way, and to them and the kind friends I met everywhere, who took me from place to place, I return my most heartfelt thanks.

I also thank the editors of all the bee-journals for the valuable help they gave me.

Woodburn, Ont., Dec. 3, 1900.

No. 8.—Interesting Notes on European Travel.

BY C. P. DADANT.

THE crowning pleasure of our stay at Nyon was a bee-keepers' banquet, given in our honor by our kind host, Mr. Bertrand, the day previous to our departure. He had invited a number of leading bee-keepers, members of their association, and the invitation was not only for the banquet, but for a full day at his chalet. Two or three days before, he told me, with a smile, that every one of the invitations had been accepted "with the greatest enthusiasm." I believe he meant to credit this enthusiasm to my presence at Nyon, but it was quite evident that if any of these friends had ever had the opportunity of visiting at the home of Mr. Bertrand, there was no need of any other incentive than an invitation from him to create enthusiasm.

They began coming in about nine o'clock, and by eleven quite a nice little party had assembled on the veranda, and the usual bee-talk was going on. You all know how this goes, and European bee-keepers are just like us. They like to talk of their crops, of what they do, and above all, they love to talk of far-off America's bee-keeping. So I had my hands full. But we had no crop to report this year, while our Swiss bee-keepers had a very good honey season, and one or two of them had magnificent returns.

In practical bee-culture, I found one difference of opinion with us, and that is on the usefulness of the Italian bee. Swiss bee-keepers do not seem to consider this bee as superior to the common bee. Our American bee-keepers are almost unanimous in recognizing that the Italian bees are more active, go out earlier, work later in the day, and are more economical than the blacks. Personally, I have often noticed that, in bad seasons, when strong colonies of common bees have not enough to winter, the even moderately strong Italian colonies have a sufficient amount for their needs, tho there are exceptional seasons when none have enough. But it would seem that they put their honey in more compact shape, and crowd their breeding apartment more, and some people even say they do this too much in good seasons. At any rate, we find them decidedly superior. But our Swiss friends, honey-producers or queen-breeders, and all practical men, were in unison in the assertion that they found very little difference in results between the common bee and the Italian. The same thing was said to me later by two or three French apiarists. They all agree on their greater gentleness, their steadiness on the combs when these are lifted out of the hive, and it was the universal verdict that, as far as handling was concerned they were decidedly more desirable. In this we are all of the same opinion.

Much was said about adulteration, not only of honey, but of beeswax. The adulteration of this last-named substance is so common in Europe, that most Swiss bee-keepers prefer to make their own beeswax into foundation themselves, on what is called the Rietsche press, than run the risk of buying goods that break down in the hive at very ordinary temperatures. Yet the foundation made on the Rietsche press is very inferior in workmanship, and would not be accepted on this side of the ocean. But they produce mainly extracted honey, and the thickness of the central rib in the combs does not cause them any worry. The Rietsche press is made of a pair of copper plates hinged together, and bearing the imprint of the honey-cells, into which the hot beeswax is poured and prest. It is a German invention, and its manufacturer claims a sale of over 16,000 presses since its introduction. The price is low, from \$6 to \$8 each.

I was highly pleased to see that, in spite of all that has

been said in Europe, concerning America, and its adulterated goods, we are certainly not any worse off, in this respect, than the countries of Europe, with all their laws and strict police. There was no end of complaints about adulterated honey being sold on the markets in competition with the pure article, but what seemed most strange to me, was the assertion that in many instances adulterated honey is sold under its true name, and seems to please the consumer better than the pure article.

At one o'clock we sat down to a meal that would bring a smile of content to the face of the most fastidious epicure. Swiss cooks are as good as French cooks, and like them they deserve to be ranked among the masters of the art. Not only was the palate pleased, the eye was feasted also by the sight of an enormous pike, roasted whole, a profusion of flowers, a bouquet in front of each plate, and in the center of the table an almond cake in the shape of a movable-frame hive. In addition to this specimen of our pursuit, the honey crop was represented by fine samples brought from Bulgaria, two days before, by one of Mr. Bertrand's pupils, Mr. Pantcheff. These samples, both comb and extracted honey, were probably gathered from alfalfa or esparcet.

But all good things come to an end, and after many a toast, our bee-friends left us one after another, and wished us a safe and pleasant journey in our long return voyage toward the setting sun. Hearty invitations were extended to us to visit them, by several of the guests, in case we came again at a later day. I hope I may have occasion to accept.

The following afternoon we, in our turn, took leave of our host and boarded the thru train for Paris. Thus ended one of the pleasantest visits of our voyage.

On this train, we had another illustration of the politeness and attention of Swiss railroad men. Our Swiss railroad passes which were about to expire, took us as far as the frontier, and from there we expected to take a ticket for Paris. When the conductor came to us, I enquired about this matter, at the same time handing our passes to him. "Oh," said he "this coach goes on to Paris, and when we get to Vallorbe, I will get your tickets for you, so you will not need to get down." And so he did; but we did have to get down, just the same, a little farther, because of our trunk, which had to be examined at the custom house, in passing the frontier. Whatever may be said in favor of tariffs, custom houses are a curse to the traveler, and just as much so in our own land as between the countries of Europe.

Growing Alsike Clover—First Prize Article.

BY WILLIAM ROBINSON.

I HAVE been familiar with this plant several years, and will give you my experience with it, both as a farmer and a bee-keeper. It is the hardiest of all the clovers, thrives on almost any soil, but gives better results in soils containing some clay than in sandy soil. It makes a luxuriant growth in land too wet to grow red clover at all. The roots do not heave out of the ground in spring, as other clovers often do; therefore it has never been known to winter-kill in our locality, while last year fully 90 percent of the red clover here was killed. Some fields near me were sown two years ago with red and alsike mixt, half of each; but now very few plants of the red clover are to be found in those fields, while the alsike still flourishes as tho it were a native of the soil.

For sowing with timothy it can not be equalled by any other variety. This combination makes as heavy a hay crop as any; but the advantage of the alsike is, it is as easily cured as the timothy, and retains its beautiful bright green color in the hay, which is sometimes difficult to get in the red varieties. It remains green and succulent a long time after seed has fully matured, so it does not require harvesting "just at the right time," as is the case with other varieties.

As to its feeding value, I think it superior to any other kind, and my neighbors all agree with me on this point. The stalks, not being coarse and woody, are eaten absolutely clean by all kinds of stock—no waste.

Some farmers claim it does not make as good an after-growth as the red during dry seasons; but I can see no great difference in this respect. The dairy farmers in some parts of this State prefer to mix the seed in equal portions, claiming the best results in this way.

The seed may be sown on spring grain. This gives best results in our part of the state with all varieties of clover. Good catches are also usually had by sowing on

Alsike Clover.

winter rye or wheat in early spring before the frost is all out. We also sometimes sow on old timothy meadows with good results in early spring.

Mixt with timothy, four pounds per acre of the alsike is sufficient; alsike alone, 6 to 8 pounds per acre, or about half the amount usually sown of other kinds. I have four acres, sown two years ago, 6 pounds to the acre, and the clover now stands a little thicker on the ground than I like it.

Those who will sow red clover should always mix some alsike with it. The alsike, being more hardy, occupies the spaces where the red fails to grow. When we sow with timothy we sow 2 quarts of alsike and 6 quarts of timothy per acre.

This season, up to June 27, we had the worst drouth ever known in this part of the State. Under these unfavorable conditions the alsike made the best and largest hay crop of all our grains. This, it seems to me, would indicate that it would do well in warmer climates than ours.

Alsike clover is the best honey-plant we have in Northern Wisconsin. I have never known it to fail to yield nectar abundantly since it was first grown here, about ten years ago. During our severe drouth here last June, it was the only plant our bees worked on, white clover being an entire failure with us. My 42 colonies stored 30 pounds each from the first crop. Since July 1, we have had abundant rains and warm weather, and the bees have been working on the after crop the past ten days, and are still storing honey from the alsike. My plan has been to encourage my neighbors to sow alsike by making a present to each member of the family a nice section of alsike honey, telling them that it was a small portion of the honey my bees gathered from their clover. All bee-keepers should so encourage their neighbors by giving them a taste of honey or by donating at least seed to give it a trial.—Gleanings in Bee-Culture. Barron Co., Wis.

Wintering Bees Where Snow Drifts Deep, Etc.

BY G. M. DOOLITTLE.

QUESTION.—We have 25 colonies of bees in chaff hives which stand where the snow drifts deep. Would it do to put them in a room during winter, or could we fix a shelter over them where they are, moving them together under this shelter, or could we set up a shelter in front of each hive and let the snow drift over hive, shelter and all?

ANSWER.—If the room spoken of in the first question is an underground room or cellar, then I should say move the bees into this cellar at the beginning of winter, providing a temperature of from 41 to 48 degrees can be maintained; for I have the best of success in wintering bees in my beecellar, and in this the temperature stands at from 43 to 46 degrees. A part of my bees are in chaff hives and a part in single-walled hives, and I find that the bees in the chaff hives winter fully as well in the cellar as do the others. The only disadvantage chaff hives have for cellar-wintering lies in their extra weight and the room they take up in the cellar (according to my opinion), but these disadvantages are more than overcome by the advantage they possess during cool and cold weather coming in the fall before they are put into the cellar, and in the spring after they are put on their stands.

A spring wheelbarrow overcomes the difficulty of carrying chaff hives, while the packing of one hive on top of the other to the ceiling of the cellar overcomes the lack of room, in a measure. If the room spoken of is to be a room above ground, with no special provision made for controlling the temperature, then I should say, try almost any other way of wintering them, than in a room with an un-governable temperature; for where the temperature in any room goes below the freezing-point, and remains thus for days or weeks, and during a warm spell rises to 50 degrees

or more, bees are almost sure to perish before spring arrives. Moving the bees together under a shelter might answer, providing they can have a chance to fly during warm days in winter; still there is much work to this process, and, worse still, many bees are liable to be lost or become badly mixed up when the hives are placed back where they are wanted during the summer, after having been thus wintered.

The plan of having a shelter over the entrance of each hive, and letting shelter and hive drift over, I have tried several times, but with me it is not a success. Several of our best apiarists claim that this plan is a success with them, and advise the wintering of bees in this way, but I have yet to see the colony of bees in this locality over which the snow has been drifted from two to three months, that has not become uneasy, gone to breeding, contracted the bee-diarrhea, and exhausted its vitality to an extent sufficient to cause a bad case of spring dwindling, or loss of the colony altogether. After a process of time the bees seem to become too warm, break the cluster, commence brood-rearing to replace the bees dying of exhausted vitality, run to the entrance and fan there as in summer, the commotion thawing the snow all about the hive, until a cat or small dog could run all around the lower part of the hive, this causing them to consume their stores of pollen and honey very rapidly, which consumption brings on diarrhea and death, unless the bees have a chance to fly at about the time brood-rearing commences, and even then the colony is so weakened that it is of little use the following season.

Where the snow stays about the hive only for a few days or a week at a time, it will do no particular harm. But otherwise I would advise carrying the bees to some higher ground, where the snow does not drift, or else fix an underground cellar to winter in.

HALF-DEPTH FRAMES FOR EXTRACTING.

QUESTION.—I worked five colonies the past season for extracted honey, using the full-depth Langstroth frame in the upper stories. These frames were filled half full of light-colored honey and half with dark, the light being in the upper part of each frame and the dark in the lower part. What I wish to know is, if I were to use half-depth frames could I secure the light honey in the upper set and the dark in the lower ones? If so, it would save mixing the honey when extracting, as was the case the past season, for I could not extract the light honey without having the dark all mixed with it.

ANSWER.—I very much doubt your ever having an experience again similar to the one outlined above, as seasons vary so much. Indeed, I hardly see how you could have had such a result this year, for in all of my experience I never saw a whole set of frames that were evenly half filled with light and dark honey. It is no rare occurrence to have one or two frames so filled that, practically speaking, they would be half filled with white honey and half with dark; but to have the whole upper story thus filled is something that does not happen more than once in a lifetime.

Half-depth frames are recommended by some of our most practical bee-keepers for upper stories for extracting; but I never heard any claim as coming from them that the light and dark honey could be kept separate by using such frames. Some years we have a large yield of white honey with little if any dark honey; other years just the reverse of this is the case; hence it will be seen that the supposition hinted at by the questioner could not possibly come to pass in such years; for when white honey was abundant the bees would use nearly all the room furnished, in storing white honey, finishing out the very bottom parts of the combs with dark. When there was a light yield of white honey with a good yield of dark, just the reverse would be the case; namely, there would be a small quantity of white honey in the upper part of the upper half-depth frames, while the rest of the said frames would be filled with dark honey, and all of the lower ones.

The only way that I know of to avoid mixed honey is to either extract all of the white honey as soon as the white honey harvest is over, putting back the combs for the bees to use during the dark honey-flow; or take away the frames of white honey at the end of the white honey-flow, and substitute other frames in their places. Where one has the time that can be spared for extracting in the summer, the former is the preferable plan, as it requires a less investment in frames of comb; but where time is of great value during the summer months, and of little value at other times, it may pay to adopt the latter plan. In either case the white honey should be left on the hive as long as possi-

ble, taking it off just as the dark honey is beginning to appear, so that it may be as thoroughly ripened as possible without being mixed with the dark.

Onondaga Co., N. Y.

Better Outlook for Southern California Bee-Keeping.

BY GEO. W. BRODBECK.

DURING the 14 years of residence in this State, I have endeavored to be reasonably conservative in all of my statements regarding the bee-keeping interests of Southern California; consequently, I have no fear of being considered an extremist in anything I may say.

The past three seasons (with an emphasis on the first two), have been the most disastrous successive seasons this section has ever known, and the present estimate is that fully 75 percent of the bees that were living in these southern counties four years ago, have perished; the remaining 25 percent that survive are in the hands of our most enterprising bee-keepers. This is an instance fully demonstrating the "survival of the fittest."

While I sympathize fully with those who have met with such a serious financial loss, I am constrained to believe it will result in the building up of the bee-keeping industry of this section on a better and firmer basis.

California bee-keeping in the past has been conducted in a slipshod manner; and while we have many who are the peer of any bee-keeper in the United States, nevertheless it has been a lamentable fact that a great percentage cared but little how or in what manner they secured their product, with the consequent result of selling honey for any price they could get.

The few who survive the ordeal of the last three years, look forward to a brighter and better future of this industry in this great State, and at this writing, as we listen to the patter of the rain which has been falling almost continuously for five days, and in such quantity and at such an opportune season, that it incites a hope that the coming year may prove one of the phenomenal ones often referred to in the history of California bee-keeping.

Los Angeles, Calif., Nov. 21.

P. S., Nov. 22.—We have had a fraction over six inches of rain up to the present, and every one I meet is happy.

B.

Questions and Answers.

CONDUCTED BY

DR. C. O. MILLER, Marengo, Ill.

[The Questions may be mailed to the Bee Journal office, or to Dr. Miller direct, when he will answer them here. Please do not ask the Doctor to send answers by mail.—EDITOR.]

Working an Out-Apiary for Comb Honey.

1. I understand you run your out-yard for comb honey. How do you manage it at swarming-time? Is some one there all the time thru the day watching swarms, to manipulate the colonies, exchanging supers, etc.? If not, how often do you go there in harvest time?

2. Why do you work your out-apiary for comb honey? Does it give better results in dollars and cents? Would you recommend working an out-yard for comb honey? Will it not do as well to run for extracted honey, counting the labor?

INDIANA.

ANSWERS.—1. It is not easy to say what the management is, for it is by no means always the same. Formerly a watcher was on hand all the time whose sole business was to watch for swarms and cage the clipped queens when a swarm issued. The caged queen was put in at the entrance of the hive far enough so the bees would be sure to take care of her. About 5 days after the issuing of the swarm, I cut out all queen-cells, and also 5 days later, when the queen was released. No colony so treated ever swarmed again. Lately I have had no watcher, and we try to visit the out-apiary every 5 to 7 days. Something is done toward prevention of swarming by destroying all eggs found in

queen-cells. Beyond that all sorts of plans have been tried and are being tried, without fully solving the problem. One way is to give the bees the same treatment already mentioned when they swarmed. That is, when grubs are found in cells, to cage the queen and treat the colony just as if they had swarmed.

2. I work out-apiaries for comb honey for much the same reason that one man works at blacksmithing and another at tailoring; I've got into the way of producing comb honey, and it's easier to run on in the same rut. If one can do as well with extracted honey in the home apiary, then by all means it is the best for the out-apiary, for the swarming matter could be managed more easily with bees run for extracted than for comb honey.

Hive for Extracted Honey.

What style of hive should I adopt for extracted honey? I have always used the Gallup hive, and have been thinking of changing and getting some standard make of hive.

WISCONSIN.

ANSWER.—If you have all the frames you need, it is doubtful if a change to any other form or size would bring gain enough to pay for the change. There are advantages, however, in having fixtures as nearly standard as possible, one great reason being that it is easier to get such goods at low rates; so if your hives are not in sufficient number, or if you have at present only a small number, so that the cost of change will not be great, you may do well to change to the dovetailed hive with its frame $17\frac{3}{8} \times 9\frac{1}{8}$.

Amount for Winter Stores.

I have a colony of medium strength, which I am wintering on five frames, in the cellar, the frames being the Langstroth size. I fed rather late in the season, so that when I put them into the cellar, not more than half the honey-cells were capt in those frames. The rest all, or mostly all, had honey in them, but it was not capt over. Will this be enough to winter them on? If not, would one section filled with hard candy, placed on the frames, be enough?

I see you smile at my asking you to answer me, when I have given such a vague description, but please "make a guess."

MINNESOTA.

ANSWER.—Five combs ought to be enough, capt or un-capt. It will not be a bad plan, however, to give some hard candy, as being better for them than so much of the unsealed syrup, which may be rather thin.

Was Sugar in the Urine Caused by Honey?

I applied for a life insurance policy, but was rejected because there was sugar in my urine. The examining doctor told me that I ate too much honey. This would tend to show that honey has some bad effect. Was that doctor correct as to the cause of that sugar, or would you place the blame elsewhere than on the honey?

IOWA.

ANSWER.—If analysis showed the presence of sugar in the urine, and if nothing in that line had been consumed but honey, then it would be reasonable to conclude that the honey was at fault. If however, sugar and honey had been consumed, the case would be quite different. Sometimes a physician does not have clearly in mind the distinction between cane-sugar and honey, and if both have been consumed, he may charge to the account of the honey what should justly be charged to the sugar.

Wintering Bees—Rearing Queens.

1. I have 10 colonies, nine of which I bought. All are in 8-frame Langstroth hives, and are from last year. They filled from one to two supers, but the supers are taken off. Will they have enough in the eight frames, or must I feed them next spring?

2. I also would like to know what you think of my plan of wintering. I have them on the summer stands, which are in a shed built purposely for them. I have an empty super filled with fine hay on top of them, a canvas over the hive first to keep the hay from getting into the hive. I have them six inches apart, five in a row; two rows, one on top

of the other. I have them stuf between, and about two feet thick at the back and on top, with hay. The front is unprotected, with the entrance about one-fourth open. Is that air enough? The hay I put in there to take up the moisture from the bees.

3. The one I caught last summer I put into a 9-frame hive with old combs. Can I rear queens from them if they winter? They are four or five banded Italians.

ILLINOIS.

ANSWERS.—1. A colony in an 8-frame hive, that has workt in supers is likely to have enough honey for winter, but not always. Sometimes there will be so much brood in the eight frames when the supers are on that the honey will be all crowded in the supers, then if they gather nothing after the supers are off they may be short.

2. Your plan of packing your bees ought to work well, but if the entrances are as small as some entrances, it would be better to leave the whole entrance open; that is, supposing the entrance to be only $\frac{3}{8}$ inch or so deep.

3. There is no apparent reason why you should not be able to rear queens from them.

A Beginner's Questions.

1. Can I get better filled sections by having a bee-space over them?

2. Do bees start to work sooner with a mat or cover over the sections?

3. When producing extracted honey, does the queen-excluder interfere with swarming when placed over a 10-frame brood-chamber? I want to prevent swarming as much as possible.

4. Where do bumble-bees winter?

5. How does Mr. Cogshall manage swarming with all his out-apiaries?

6. How long can a queen be confined in an Alley queen and drone trap without injuring her?

7. How many pounds of honey will a Langstroth frame hold when spaced the proper distance?

8. Can you give me the address of some reliable queen-breeder in Italy?

9. How long does a drone-bee live?

10. What is the length of a bumble-bee's tongue?

QUERIST.

ANSWERS.—1. Doubtful. The advantage of a bee-space over sections is in other directions.

2. Generally not. They might do so at a time when the coolness of the weather would make a difference in temperature with and without covering.

3. If the excluder makes any difference, it ought to increase the likelihood of swarming, by confining the queen to a smaller space, and perhaps by the slight inconvenience to the bees caused by the presence of the excluder.

4. I don't know. Probably in their nests.

5. I don't know.

6. Under favorable circumstances she probably might do good work after several weeks' confinement. Generally her chances for much usefulness would lessen rapidly after a week's confinement.

7. Perhaps six.

8. I can not.

9. Probably in most cases until the workers decide it is too expensive a business to support a lot of idlers. This is likely to happen whenever pasturage becomes scarce. A queenless colony, however, will continue the lives of the drones. When the workers decide it is best to dispense with the continued presence of drones, they may be seen busily engaged in harrying the drones, the death of the latter being principally caused by the withholding of food by the workers.

10. Not sure I've ever seen it given.

"The Hum of the Bees in the Apple-Tree Bloom" is the name of the finest bee-keeper's song—words by Hon. Eugene Secor and music by Dr. C. C. Miller. This is thought by some to be the best bee-song yet written by Mr. Secor and Dr. Miller. It is, indeed, a "hummer." We can furnish a single copy of it postpaid, for 10 cents, or 3 copies for 25 cents. Or, we will mail a half-dozen copies of it for sending us one new yearly subscription to the American Bee Journal at \$1.00.

The Premiums offered this week are well worth working for. Look at them.

* The Afterthought. *

The "Old Reliable" seen thru New and Unreliable Glasses.
By E. E. HASTY, Richards, Ohio.

"GETTING BEES TO MAKE WAX."

Quite a good few of us do not take any stock in the old tradition about wax being (to the bees) an expensive article, which causes them a mysterious loss when they secrete it. A rotten tradition hardly worth the very small amount of powder required to blow it to pieces. To change honey to wax costs the bees a little valuable time; but beyond that it apparently costs them neither less nor more than what the relative water, carbon, oxygen and hydrogen of honey and wax naturally call for. (O king, the full pail *does* run over when you put a live turbot in it!) One by one sham mysteries have to "clear the coop." Well, this being thus, the Australian experiences in intentionally harvesting as much wax as possible during their great runs of honey is practical, dollar-and-cent apiculture, which we may well look into. I rather guess that Loyalstone's method of cutting off the lower half of each comb every time it is extracted is the winning way. The other way of cutting the whole of each alternate comb would make them build *some* when by the other method they would not build any; but it divides the comb-builders up into small sections, to no particular good, I reckon. As for the third method of slicing off half the face of the comb in uncapping instead of the thinnest possible sheet, I should think that to be the poorest of the ways mentioned. And indeed it straightly appears that in Australia bees are not always prompt to lengthen out again such shaved combs. I would remark that my bees very often seem reluctant to lengthen the cells of super combs. When I was experimenting in this line I cut from the *brood-chamber*, and took all the comb every three days, to keep the eggs from hatching—rather too severe a method for very extended use; but it utilizes one of the strongest of bee qualities—obstinacy. The Australian record of 11 pounds wax from one colony in a season—well, we would have to "scratch gravel" to come up to it. But 11x25x100=3275, from an apiary—worth scratching for. It is of interest to hear that the best honey-gatherers produce the most wax. Page 723.

COTTON HONEY A CHOICE ARTICLE.

That is quite high praise for cotton honey—combs of snow and contents of glycerine. If the flavor even tolerably corresponds, the South has at least one choice kind of honey. Let me see, this is Texas. A yield from cotton not by any means universally expected, I believe. Page 718.

A MOSES (NOT A CALEB OR JOSHUA) ON SPELLING REFORM.

And this last number I am reviewing closes with another shot for improved spelling. On that subject I am like Moses—delighted to view the good land, but not going in myself—absorbed in a more important reform that I am unwilling to lay an extra ounce of weight on—and too old. Would have to use both spellings for awhile, and I fear I should be all mixt up in the process till my page would be but a delirious species of "pi." When sentiment gets strong enough to sustain the move, two simple laws can help the reform amazingly without exactly taking away any one's liberty to spell, if he chooses, as crooked as the horns of Noah Webster's ram. Let one little law say that all public advertising shall be given to newspapers using the improved spelling; and let another little law say that books printed in the improved spelling may travel at a somewhat cheaper rate by mail.

CAUSES OF DISEASES OF BEES.

Pollen-shells heavily charged with fungi in *all* winter dysentery excreta in Texas. I suppose some of our wise-heads would incline to the darkey's explanation ament the chicken, "whoever put the pollen in there was no friend of ours." Dr. Howard is nobly considerate in admitting that it may be different in the North, where bees are quiet and shut in for months. That he has not been able to find a definite microbe in paralysis to which the disease can be charged, is of some interest to us. And much more so is his experience in trying to infect healthy colonies—can not as yet make them take paralysis *when conditions are sanitary, and neclar coming in lively*. Dr. Howard evidently

does not *think* the queen communicates any disease to the eggs she lays. Good thing if we could be fully assured of that—and practical certainty may come by and by. But, on the whole, I'm glad there is no professor in my region to be starting every plague for experimental purposes. I should be thinking how the bubonic plague got loose in Vienna. Mr. Stahlman's article (page 743), helps my feelings on in this same direction.

BARRELS FOR LARGE USERS OF HONEY.

How strong the honey-dealers are in favor of barrels, as a general thing! Don't believe they "catch on" to the main objection. The main objection is the *impossibility* of making oak barrels so the staves will not shrink in contact with honey. The dealers persist in thinking that all the trouble is owing to careless cooperage. But we really seem to have some light in the direction of getting the barrels made of just the right kind of wood. Barrels are certainly *desirable* in supplying great bakeries that take honey by the ton. Pages 725-7.

WATER FOR BEES.

So Mr. Greiner wants both his bee-town and his man-town to be "dry" towns. He is right. Nonsense, and worse than nonsense, to give bees water in the winter. But his hint is also sensible that during cold spring weather, when a good many bees are perishing in the work of bringing water, perhaps something useful might be done in that line. I believe the trouble has hitherto been that the "contrary little critters" will go for water all the same, and neglect that which you give them. Water-carriers don't know what else to go at, perhaps. Had you been betimes with your watering, possibly they would never have *become* water-carriers.

BEES WINTERED IN A CLAMP.

Mr. Hutchinson's heavy loss of bees in a clamp is so illustrative that it should not be forgotten. Too many colonies for the space and air they were in. Air got a little bad, but they could have borne it, if they had all kept passive. Instead of that, they all got supremely active in the very natural effort to improve their air by fanning. This speedily used the oxygen up until the air got unendurably bad. Then every bee crawled in the direction from which oxygen was coming by percolation. Some may have suffocated, but probably most died of starvation, not knowing enough to get back to the food. Page 739.

EXPERIMENTING WITH THE GOLDEN SYSTEM.

The proposition of J. S. Hartzell, page 744, to prove the superiority of the Golden system by trying *one hive* is hardly what one would expect of a practical bee-man. Neither the success nor the failure of one hive can count for very much, unknown elements of the problem will creep in so. Even with dozens of test-hives in each of two methods it requires much thought and care on the part of the experimenter really to hold the scales level—and otherwise our favorite "hoss" is pretty apt to win the race.

GRANULATED SUGAR AND GLUCOSE.

The apparent error on page 760 is not an error in reality, I judge. I mean where Mr. Cowan says much of the granulated sugar of commerce is adulterated with glucose. Here the trouble seems to be that (being a scientist and also a foreigner) he doesn't sling our "United States" exactly as we do. Where he says glucose he does not mean the *fluid* article we mostly have in mind. And we apply the term "granulated" only to very dry white sugar, while he apparently means *brown* sugar in a granulated but moist state.

NO POLLEN IN NORMAL FINISHT HONEY.

Well, there is also my blunt declaration on page 746, that there is no pollen in normal finisht honey, and Mr. Cowan's, on page 759, exactly to the contrary. Not a case of what shall be done when doctors disagree, but what shall be done when one of the doctors in the temple of science disagrees with one of the door-keepers thereof. Mr. Cowan is an expert microscopist of large experience, while I am a very green and shockingly inexperienced one. Good chance for me to say I must have been mistaken; and yet somehow I decline to say it. I just point out the contradiction and the situation, and let things stand that way for a bit. Pretty cheeky, am I not? I have a sneaking idea that scientific men, as well as others, sometimes bandy sayings back and forth till they come to believe them, when no one ever actually proved them at all.

BEE-BOOKS

SENT POSTPAID BY

George W. York & Co. 118 Mich. St. Chicago.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—It is nicely illustrated, contains 160 pages, beautifully printed in the highest style of the art, and bound in cloth, gold-lettered. Price, in cloth, 75 cents; in paper, 50 cents.

Langstroth on the Honey-Bee, revised by Dadant.—This classic in bee-culture has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apiarian library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 520 pages, bound in cloth. Price, \$1.25.

Bee-Keepers' Guide, or Manual of the Apiary, by Prof. A. J. Cook, of the Michigan Agricultural College.—This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 460 pages, bound in cloth and fully illustrated. Price, \$1.25.

Scientific Queen-Rearing, as Practically Applied, by G. M. Doolittle.—A method by which the very best of queen-bees are reared in perfect accord with Nature's way. Bound in cloth and illustrated. Price, \$1.00.

A B C of Bee-Culture, by A. I. Root.—A cyclopaedia of 400 pages, describing everything pertaining to the care of the honey-bees. Contains 300 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.20.

Advanced Bee-Culture, Its Methods and Management, by W. Z. Hutchinson.—The author of this work is a practical and entertaining writer. You should read his book; 90 pages, bound in paper, and illustrated. Price, 50 cents.

Rational Bee-Keeping, by Dr. John Dzierzon.—This is a translation of his latest German book on bee-culture. It has 350 pages, bound in paper covers, \$1.00.

Bienen-Kultur, by Thos. G. Newman.—This is a German translation of the principal portion of the book called "Bees and Honey." 100-page pamphlet. Price, 25 cents.

Bienenzucht und Honiggewinnung, nach der neuesten methode (German) by J. F. Eggers.—This book gives the latest and most approved methods of bee-keeping in an easy, comprehensive style, with illustrations to suit the subject. 50 pages, board cover. Price, 50 cents.

Bee-Keeping for Beginners, by Dr. J. P. H. Brown, of Georgia.—A practical and condensed treatise on the honey-bee, giving the best modes of management in order to secure the most profit. 110 pages, bound in paper.

Bee-Keeping for Profit, by Dr. G. L. Tinker.—Revised and enlarged. It details the author's "new system, or how to get the largest yields of comb or extracted honey." 80 pages, illustrated. Price, 25 cents.

Apiary Register, by Thomas G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25.

Dr. Howard's Book on Foul Brood.—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cents.

Winter Problem in Bee-Keeping, by G. R. Pierce.—Result of 25 years' experience. 30 cts.

Foul Brood Treatment, by Prof. F. R. Cheshire.—Its Cause and Prevention. Price, 10 cts.

Foul Brood, by A. R. Kohnke.—Origin, Development and Cure. Price, 10 cents.

Capons and Caponizing, by Dr. Sawyer, Fanny Field, and others.—Illustrated. All about caponizing fowls, and thus how to make the most money in poultry-raising. 64 pages. Price, 20c.

Our Poultry Doctor, or Health in the Poultry Yard and How to Cure Sick Fowls, by Fanny Field.—Everything about Poultry Diseases and their Cure. 64 pages. Price, 20 cents.

Poultry for Market and Poultry for Profit, by Fanny Field.—Tells everything about Poultry Business. 64 pages. Price, 20 cents.

GENERAL ITEMS

Bees Did Fairly Well.

My bees did fairly well this season. I had four colonies last year, and by chance incrcast to 28 this spring, a friend of mine offering me his whole apiary at a bargain. With my little experience, the "A B C of Bee-Culture," the American Bee Journal, and my good wife, I managed it very well. I devote all my time outside of the shop to my bees and a good-sized garden. We had only five swarms, and scenred 1200 pounds of sweet clover comb honey, but had a lot of partly-filled sections left.

On account of no rain the clover crop was cut short, and the buckwheat crop was a complete failure.

I sold five colonies, and put 28 into winter quarters with plenty of stores.

Rock Co., Wis., Dec. 6. CHAS. LUEBKE.

An Old Bee-Keeper.

I have taken the Bee Journal ever since it was first publisht, and should feel lost without it. I have owned bees and kept them ever since I was 14 years old, and I earned the money that I bought them with by dropping eorn.

I will be 78 years old if I live until the 12th of next May. If there are any readers of the American Bee Journal that have been continuously in the bee-business longer than I have, I should like to have them say so thru the Journal.

I was sorry that I was not able to attend the National convention, but I have very much enjoyed reading the proceedings.

Delaware Co., O., Dec. 4. H. BESSE, M.D.

Unsatisfactory Season—Kind Words

The past season was rather unsatisfactory, tho it started in with the promise of a fair yield of honey. But first too dry, then too wet weather cut the yield short about one-half, tho I managed to secure a little over 800 pounds of section honey from 25 colonies, spring count, and an increase of 11 colonies. One peculiar thing about the swarms that I never experienced before, was that they produced very little surplus, only two supers from the 11 swarms. They were large swarms too, and came out early, before June 20th. One old colony that did not east a swarm produced 82 well-filled sections.

As my health is too poor to do much else I seem to become more and more attacht to bee-keeping and the American Bee Journal, and intend to keep right on with both as long as possible.

I have been very much interested in the report of the National convention held in Chi-

Sharples Cream Separators: Profitable Dairying

YOU KNOW YOU ARE RIGHT when you buy one of our celebrated **NEW PREMIER Incubators** because you can try it before you pay for it. It was good enough to take First Prize at World's Fair. Simple, sure, efficient. Send 5c. postage for Catalogue and "Poultry Helps." Also sole makers of Simplicity Incubator. **COLUMBIA INCUBATOR CO., 5 Water St., Delaware City, Del.** Please mention Bee Journal when writing

Langstroth on... The Honey-Bee

Revised by Dadant—1899 Edition.

This is one of the standard books on bee-culture, and ought to be in the library of every bee-keeper. It is bound substantially in cloth, and contains over 500 pages, being revised by those large, practical bee-keepers, so well-known to all the readers of the American Bee Journal—Chas. Dadant & Son. Each subject is clearly and thoroly explained, so that by following the instructions of this book one cannot fail to be wonderfully helpt on the way to success with bees.

The book we mail for \$1.25, or club it with the American Bee Journal for one year—both for \$1.75; or, we will mail it as a premium for sending us **THREE NEW** subscribers to the Bee Journal for one year, with \$3.00.

This is a splendid chance to get a grand bee-book for a very little money or work.

The Past Season's Results.

This is the first year I ever kept more than four or five colonies. They increased to 12 and averaged 35 pounds to the colony.

GEORGE MITCHELL.

Cook Co., Ill., Dec. 13.

Bees Dying Off.

My bees are dying very fast. Since cold weather set in about half of them have died, and now I think they will not winter. I lost 3 colonies just the same way last winter. The trouble seemed to come from a colony to which I introduced a premium queen. I was away in the fall, and one day my wife saw a lot of dead bees in front of the hive, and she soon discovered that the bees from another colony were robbing this one, so she had it carried away 2½ miles. The bees all died in a short time. As cold weather came on the bees from the other colonies commenced to die and by Feb. 19th they were all dead.

A swarm was given to me in June of this year, and about two weeks after I got them I found that they were queenless. I sent for a queen and introduced her July 4th. But they did not build up as fast as I thought they ought to. The first of October they seemed to be quite full of bees, but now I should think there are about 2½ quarts. Of course they are clustered for winter and that may make some difference.

None of the bees seem to be old, as the wings are not worn any; they are not swollen nor shiny, and they have plenty of honey. I do not know of any one that does any spraying, and no one else is losing their bees as I am.

Last winter I put the bees into the cellar, but as it was damp I thought perhaps that made some difference, so this year I have them on the summer stands in an outside case, and some burlap on top of the frames.

AUSTIN STOVER.

Hancock Co., Maine, Dec. 6.

Measuring Bees' Tongues.

A short time ago two cages of bees were sent to me from J. H. Gerbracht, McHenry Co., Ill., for measurement. Cage No. 1 was a sample from a colony that stored 240 pounds of surplus honey, and were a strain of his own breeding. Cage No. 2 was from a five-banded strain that stored 135 pounds of surplus honey during the past season. The measurements of the bees from each cage are as follows:

Cage No. 1—Length of tongues were as follows: 6, 5.9, 6, 5.8, 6, 6, 5.9, 6, 5.8, 5.7. Average length, 5.9 millimeters.

Cage No. 2—Length of tongues were as follows:

The Novelty Pocket=Knife.

Your Name and Address on one side—Three Bees on the other side.

[THIS CUT IS THE FULL SIZE OF THE KNIFE.]

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a last-time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.25, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00.) We will club the Novelty Knife and the Bee Journal for one year, both for \$1.90.

GEORGE W. YORK & CO., 118 Mich. St., Chicago, Ill.

Please allow about two weeks for your knife order to be filled.

Sheboygan, Wisconsin.

lows: 4.5, 5, 4.8, 4.7, 4.8, 5, 6, 5.5, 4.5, 4.3. Average length, 4.9 millimeters.

It will be seen that the measurements are very irregular, probably owing to the fact that the bees were of all ages, as Mr. Gerbracht says he ran them into the cage just as they came. These colonies were on a double stand, with the entrances only a few inches apart. This will easily account for the one long-tongued bee in the cage with the five-banded ones, as they doubtless worked from one hive to another to a certain extent. One experiment, of course, does not absolutely prove anything, but after many cases of this kind I am sure that the difference of length of tongue goes with the corresponding difference in honey-production, other things being equal.

The more work I do along this line the more certain I am that there is nothing in bee-culture to-day that furnishes the opportunity for improvement that is offered along this line of improving the strains of our bees. I am confident that there are tons of honey going to waste every year simply because the bees have not the ability to gather it. As I have said before, it probably will not be practical for every bee-keeper to run an experiment station of his own, but he can well afford to pay more attention to this phase of improvement, and select his breeding-stock from his best workers, even if they are not the highest colored bees in his yard.

J. M. RANKIN,

Apiarian Dept., Mich. Agricultural College.

Two Almost Entire Failures.

We have had two seasons in succession of almost entire failures of the honey crop, and at least 50 percent, if not more, of the bees have perished from starvation, and the effects of foul brood, which has gained a firm foothold here.

There are no bees kept here except as a side-issue, altho some keep from half a dozen to 50

We Can't Give Away Anything

You pay for what you get in this world. You understand that. But as a business proposition we want you to try our great medicine for Indigestion, Constipation, Biliousness, Sick Headache, Insomnia, "the Blues," and like complaints—

Laxative **NERVO-VITAL** Tablets

We know you won't buy it, until you know something about it. The best way to get you to know how good it is, is to let you try it. That's what we do. Send Stamp for "Health" booklet, and we will send you a free sample package, that you may try it yourself. We know you will always keep it in the house, if you once try it. What fairer offer could we make? At all Druggists—10 and 25 cents.

Handsome **FREE!** Stick Pin

If, instead of sending for a sample, you send us 25c we will send you "Health" booklet, a 25c box and a handsome gold stick-pin, set with emerald, ruby or pearl, warranted to be worth double the money. Order by number. This is an extra introductory offer. Only one pin to one person. If unsatisfactory, money returned. Send now while the offer is good.

MODERN REMEDY COMPANY, KEWANEE, ILLINOIS.

[This company will do exactly as it promises.—Editors.]

colonies or more, but they are kept in a slipshod manner, as the bee-keepers have the impression that they know all about keeping bees, and have no use for any bee-papers. I think it is safe to say that 90 percent of them never heard of foul brood, and many will not believe that it amounts to anything, altho they have lost nearly all their bees from the effects of it.

I am trying to save some of mine and have been very successful by putting them in clean hives filled with foundation, but it is time and money almost thrown away, so long as my neighbors will not take any precautions to prevent spreading it. If I can succeed in saving some of them until the overwise bee-keepers are bee-keepers no more, and their bees are a thing of the past, perhaps I can then rid them of disease, and do something with them, but this is a very poor locality for bees, at best.

The present outlook for bee-keeping in this vicinity is very discouraging, but I enjoy reading the Bee Journal, and will take it one year more at least, bees or no bees.

□Tioga Co., Pa., Dec. 5. A. D. WATSON.

Results of the Season of 1900.

Bees did next to nothing this year. I secured about 800 pounds from 24 colonies. They never started out better than they did last spring, but the weather was first cold and then dry to extremes.

I received the premium Dr. Miller queen all right, was much pleased with her, and had no trouble in introducing.

I have 40 colonies in the cellar, but several of them are light. We hope for better results next year.

C. A. FAIRBANKS.

Jones Co., Iowa, Dec. 12.

Poor Season for Bees.

We have been doing some *bee-keeping* in this neck of the woods the past season, but *honey-getting* has been almost a total failure.

The early spring was very promising. Bees built up splendidly, and when white clover should have bloomed they were ready to gather in the harvest. But, alas! a dronth such as the writer has never seen so early, set in, and never did vegetation stand as still as it did then. The result was, of course, not a bit

DITTMER'S FOUNDATION

Wholesale
and Retail

This foundation is made by an absolutely non-dipping process, thereby producing a perfectly clear and pliable foundation that retains the odor and color of beeswax, and is free from dirt.

STUDENTS RETURNING HOME

For holiday vacations can, upon presentation of proper credentials, obtain tickets via Nickel Plate Road, to all points in Central Passenger Association territory, at a fare and a third for the round trip. Tickets will be sold on day of closing school and on day immediately preceding closing date; good returning until date school reconvenes, but not later than January 8, 1901.

For information as to train service to Ft. Wayne, Cleveland, Fostoria, Erie and other points, call on or address John Y. Calahan, General Agent, 111 Adams St. Chicago Passenger Station, Van Buren St. and Pacific Ave., on the Elevated Loop. (43)

of surplus white clover or basswood honey in most localities in this county. There were a very few localities where the bees gathered a little surplus white honey. I have been obliged to disappoint my customers as never before.

There was some fall honey gathered, and merchants are very glad to get it at 12 and 13 cents per pound. White honey from Michigan is bringing 20 cents.

Tho the bees did not store any surplus worth mentioning, they are generally in good condition for winter with abundance of stores.

GEORGE SPITLER.

Crawford Co., Pa., Dec. 7.

A Foolish Claim.

The retail price of honey in this market is 20 cents per pound. It is claimed that full sheets of foundation were given to the bees, and that they were fed glucose, as the very white honey in the market has no sweet taste!

I leave for my winter home in Florida, Dec. 12th.

MRS. L. HARRISON.

Peoria Co., Ill., Dec. 10.

Results of the Season, Etc.

I commenced the season with about 77 colonies, which increased to 125. I secured about 500 pounds of comb honey and 2000 pounds of extracted, and get 15 cents per pound for the comb, and retail the extracted at 11 and 12½ cents—9 pounds for \$1, or 12½ cents a pound for a less quantity.

In preparing the bees for winter I fed, I should think, about 600 or 700 pounds of early comb honey saved for the purpose, in extracting-combs. I have not fed any sugar syrup for a long time as people are so afraid they will get some of it in the honey.

I, for one, would be a pleased man to see the Brosius bill past. It would add very much to the use and sale of extracted honey, and would, in some ways perhaps, help the sale of comb honey.

We are having some thawing and freezing

LOW RATES TO THE SOUTH.

Excursion tickets at reduced rates are now being sold by the Chicago, Milwaukee & St. Paul Railway to the prominent resorts in the South, including Jacksonville, Fla., Mobile, Ala., New Orleans, La., Savannah, Ga., El Paso, Tex., which are good for return passage at any time prior to June 1, 1901. Information regarding rates, routes, time, etc., can be obtained on application to any coupon ticket agent of the Chicago, Milwaukee and St. Paul Railway.

The Ohio Farmer

—AND THE—

American Bee Journal,

Both One Year for only \$1.40.

THE OHIO FARMER is clearly one of the leaders of the agricultural papers of this country. It is a 20-page weekly, often 24 pages, handsomely printed on good paper, and CLEAN in both reading and advertising columns. It has the largest actual staff of editors and correspondents (all farmers) of any farm paper published, and is practically progressive in defending the farmer's interests.

IT WILL HELP YOU MAKE "THE FARM PAY." Send to OHIO FARMER, Cleveland, Ohio, for a free sample copy.

REMEMBER, we send both the Ohio Farmer and the American Bee Journal, both one year for only \$1.40. Address,

GEORGE W. YORK & CO., 118 MICHIGAN STREET, CHICAGO, ILL.

weather, which I fear will be a little hard on the clover.

I put my bees in the cellar about the middle of November, and they seem to be very quiet.

It is hard to see how you can furnish so good a paper for so little money. May the American Bee Journal live long to stand for the rights of bee-keepers and be a foe to adulteration and swindlers.

Hardin Co., Iowa, Dec. 11. W. C. NUTT.

CONVENTION NOTICES.

New York.—The annual meeting of the New York State Association of Bee-Keepers' Societies will be held in the Kirkwood, at Geneva, N. Y., Wednesday, Jan. 9, 1901, at 10 a. m., and continue thru the afternoon and evening. An interesting program has been arranged, and a good time is expected. C. B. HOWARD, Sec.
Romulus, N. Y.

Michigan.—The next annual meeting of the Michigan State Bee-Keepers' Association will be held in the Grange Hall, Traverse City, Dec. 26 and 27, 1900, commencing at 2 p. m. This will without doubt be the largest attended meeting in the State for many years. We are to be honored with the presence of Mr. A. J. Root, whose name has become almost a household word, not only thruout the United States, but the world, wherever bees are kept. The program will be in the form of an open parliament, and those topics will be discussed that are nearest to bee-keepers' interests. A beautiful and novel badge has been adopted by the officers of the association, and will be sold at cost, 25 cents, and the annual dues will be 25 cents more. This will constitute expenses, except railroad and hotel bills. Reduced rates on all railroads, and the following hotels have made reduced rates to bee-keepers: Park Place Hotel, \$1.50; Hotel Whiting, \$1.00 to \$1.50; Hotel Plankborn, \$1.00; Hotel Shilms, \$1.00; and Columbia Hotel, \$1.00 to \$1.25. Certainly all should be suited with the above rates to choose from.

Fremont, Mich. GEO. E. HILTON, Pres.

MERIT ALWAYS WINS.

The hard times of the past three or four years have been very destructive to all industrial affairs, and the railroads have had unusual amount of difficulty in making both ends meet. Roads that have, during this trying period, earned dividends while at the same time affording high-class transportation facilities to their patrons, have, indeed, been fortunate. And such an event speaks well for the management of the roads.

The record of the Nickel Plate Road during the recent period of industrial depression, has indeed been remarkable, and it speaks most eloquently of the conservative judgment of the managers. For this road has made great and steady progress in the material improvement of its roadway and appliances, and in perfecting its equipment. The interests of the public have been in no wise neglected; in fact, the success of this road has inured to the benefit of the public, as much, if not more, than to the stockholders. The condition of the road to-day shows this. Great and valuable improvements of a permanent character have been made—in the shape of strengthening the roadway, bridges and other accessories, and procuring new and improved safety appliances; new coaches have been added, elegant Pullman sleeping-cars put on, new and powerful engines have been placed in service, and everything has been done to raise the standard of the road, to perfect its service, and to give it a leading place among the best roads in the country. The result has been obvious. The people have observed the progressive spirit of this road, have given it a liberal patronage, have enjoyed its excellent facilities, and that tells the whole story of a highly successful enterprise.

Among the most noteworthy improvements effected by the Nickel Plate Road is the introduction of a first-class dining-car service, which has won the approval of the best class of patrons. Then the coaches have been illuminated by the brilliant Pintsch gas, heated by steam, and placed in care of a colored porter, so the passengers have had the best that money can afford, at the lowest rates. The thru train service of the Nickel Plate, running in connection with the West Shore and Fitchburg Railroads over the great Hoosac Tunnel Route, between New York, Boston and Chicago—ranks with the best in the country, and has become deservedly popular. Elegant new coaches, and palatial Pullman buffet sleeping-cars run thru without change; the service is unexcelled, the time fast, scenery most fascinating.

Located along the south shore of Lake Erie are many substantial and attractive summer resorts that are yearly growing in popularity, and this class of travel promises a continual increasing source of revenue to the Nickel Plate Road. 48A4t

HONEY AND BEESWAX

MARKET QUOTATIONS.

CHICAGO, Dec. 7.—The demand has fallen off very much of late, but prices have not declined to any great degree from those prevailing for the past 60 days, but any pressure to sell would cause a decline. Fancy white comb, 16c; No. 1, 15c; amber and travel-stained white, 13@14c; dark and buckwheat, 10@11c. Extracted, white, 7½@8c; amber, 7@7½c; buckwheat and other dark grades, 6@6½c. Beeswax, 28c.

R. A. BURNETT & Co.

KANSAS CITY, Dec. 6.—Fancy white comb, 16@16½c; choice, 15c; light amber, 13½@14c; dark, 10c. Extracted, 7½@8c. Beeswax, 22@23c. Receipts very light demand good.

W. R. CROMWELL PRODUCE Co.,
Successors to C. C. Clemons & Co.

BUFFALO, Dec. 7.—Honey is so high that it curtails the demand very materially. Sales are moderate, and some lots will have to be cut to sell. Fancy comb, 17@18c; choice, 16c; other grades, 10@15c. No extracted, and none wanted. Beeswax quiet at 25@30. BATTERSON & Co.

ALBANY, N. Y., Dec. 6.—Fancy white, 17@18c; No. 1, 16@17c; No. 2, 14@15c; mixt, 13@14c; buckwheat, 12½@13½c. Extracted, white, 8@8½c; mixt, 7@7½c.

The honey market is steady with light receipts and good, stiff prices. Extracted, market quiet and but little movement. Will be more demand later on.

H. R. WRIGHT.

BOSTON, Dec. 7.—Our market on honey continues strong, with light receipts. Fancy one-pound cartons, 17c; A No. 1, 15@16c; No. 1, 15c; No. 2, 12@13c. Extracted from 7½@8½ cents, according to quality. Beeswax steady at 25@27c.

BLAKE, SCOTT & LEE.

CINCINNATI, Sept. 21.—The demand for fancy comb honey is good and finds ready sale at 16@16½c; No. 1, 15c. The demand for extracted honey at present is slow and offer same by the barrel as follows: White clover, 8½@9c; Southern, 6½@7½c; Florida, 7@8 cents, according to quality. Beeswax, 27c.

The above are MY SELLING PRICES. I do not handle any honey on commission, but pay spot cash on delivery.

C. H. W. WEBER.

NEW YORK, Nov. 20.—Good demand continues for all grades of comb honey. We quote: Fancy white, 15@16c; No. 1 white, 14c; No. 2 white 12@13c; amber, 12c; buckwheat, 10@11c. Extracted in fairly good demand at 7½@8c for white, and 7c for amber; off grades and Southern in barrels at from 65@75c per gallon, according to quality. Not much demand for extracted buckwheat as yet. Some little selling at 5½@6c. Beeswax firm at 28 cents.

HILDRETH & SEGELKEN.

DETROIT, Dec. 10.—Fancy white comb, 15@16c; No. 1, 13@14c; dark and amber, 10@12c. Extracted, white, 8@8½c; amber and dark, 6@7c. Beeswax, 26@28c.

M. H. HUNT & SON.

SAN FRANCISCO, Dec. 5.—White comb, 13@14 cents; amber, 11½@12½c; dark, 8@9c. Extracted, white, 7½@8c; light amber, 6½@7½c; amber, 5½@6½c. Beeswax, 26@28c.

There is no opportunity for much activity in this article, spot stocks being of such slim proportions as to admit of little other than a light jobbing trade. Market has a firm tone, with prospect of values being maintained at current range thruout the season.

A HONEY MARKET.—Don't think that your crop is too large or too small to interest us. We have bought and sold five carloads already this season, and want more. We pay spot cash. Address, giving quality, quantity and price.

Please mention Bee Journal when writing.

Four Celluloid Queen-Buttons Free

AS A PREMIUM

For sending us ONE NEW SUBSCRIBER to the American Bee Journal for three months with 30 cents, we will mail you FOUR of these pretty buttons for wearing on the coat-lapel. (You can wear one and give the others to the children.) The queen has a golden tinge.

This offer is made only to our present regular subscribers.

NOTE.—One reader writes: "I have every reason to believe that it would be a very good idea for every bee-keeper to wear one (of the buttons) as it will cause people to ask questions about the busy bee, and many a conversation thus started would wind up with the sale of more or less honey; at any rate, it would give the bee-keeper a superior opportunity to enlighten many a person in regard to honey and bees."

Prices of Buttons alone, postpaid: One button, 8 cts.; 2 buttons, 6 cts. each; 5 or more, 5 cts. each. (Stamps taken.) Address,

GEORGE W. YORK & CO., 118 Michigan St., CHICAGO.

AMERICAN

BEE JOURNAL

GEORGE W. YORK,
Editor.

CHICAGO, ILL., DECEMBER 27, 1900.

FORTIETH YEAR.
No. 52.

WEEKLY

*E. WHITCOMB, of Nebraska,
Director of the National Bee-Keepers' Association.*

F.B. WHITE CO. ILL.

PUBLISHED WEEKLY BY

GEORGE W. YORK & Co.

118 Michigan St., Chicago, Ill.

Entered at the Post-Office at Chicago as Second-Class Mail-Matter.

IMPORTANT NOTICES:

The Subscription Price of this journal is \$1.00 a year, in the United States, Canada, and Mexico; all other countries in the Postal Union, 50c a year extra for postage. Sample copy free.

The Wrapper-Label Date of this paper indicates the end of the month to which your subscription is paid. For instance, "Dec00" on your label shows that it is paid to the end of December, 1900.

Subscription Receipts—We do not send a receipt for money sent us to pay subscription, but change the date on your wrapper-label, which shows you that the money has been received and duly credited.

Advertising Rates will be given upon application.

Reformed Spelling.—The American Bee Journal adopts the Orthography of the following Rule, recommended by the joint action of the American Philological Association and the Philological Society of England:—Change "d" or "ed" final to "t" when so pronounced, except when the "e" affects a preceding sound. Also some other changes are used.

The Bee-Keeper's Guide

Or, Manual of the Apiary,

—BY—
PROF. A. J. COOK.

460 Pages—16th (1899) Edition—18th Thousand—\$1.25 postpaid.

A description of the book here is quite unnecessary—it is simply the most complete scientific and practical bee-book published to-day. Fully illustrated, and all written in the most fascinating style. The author is also too well-known to the whole bee-world to require any introduction. No bee-keeper is fully equipt, or his library complete, without THE BEE-KEEPERS' GUIDE.

This 16th and latest edition of Prof. Cook's magnificent book of 460 pages, in neat and substantial cloth binding, we propose to GIVE AWAY to our present subscribers, for the work of getting NEW subscribers for the American Bee Journal.

Given for TWO New Subscribers.

The following offer is made to PRESENT subscribers only, and no premium is also given to the two NEW subscribers—simply the Bee Journal for one year:

Send us TWO NEW SUBSCRIBERS to the Bee Journal (with \$2.00), and we will mail you a copy of Prof. Cook's book FREE as a premium. Prof. Cook's book alone sent for \$1.25, or we club it with the Bee Journal for a year—both for only \$1.75. But surely anybody can get only TWO NEW SUBSCRIBERS to the Bee Journal for a year, and thus get the book as a premium. Let every body try for it. Will YOU have one?

For Sending us One New Subscriber for a Year.

There has been so much written about both the white and the yellow variety of sweet clover, that we will simply say here that if one of our present regular subscribers will send us \$1 with a new name for next year (1901), we will send the new subscriber the balance of this year's (1900) numbers free, and mail, postpaid, to the one sending the new name and the dollar, either **one pound** of yellow sweet clover seed, or **two pounds** of the white sweet clover. This is a good chance to get a start of both kinds of these honey clovers. Better send two new subscribers (with \$2.00) and get the three pounds of seed. Address,

GEORGE W. YORK & CO., 118 Michigan St., CHICAGO, ILL.

Extracted Honey For Sale

ALL IN 60-POUND TIN CANS.

ALFALFA HONEY *****

This is the famous White Extracted Honey gathered in the great Alfalfa regions of the Central West. It is a splendid honey, and nearly everybody who cares to eat honey at all can't get enough the Alfalfa extracted.

BASSWOOD HONEY *****

This is the well-known light-colored honey gathered from the rich, nectar-laden basswood blossoms in Wisconsin. It has a stronger flavor than Alfalfa, and is preferred by those who like a distinct flavor in their honey.

Prices of Either Alfalfa or Basswood Honey:

A sample of either, by mail, 8 cents; samples of both, 15 cents—to pay for package and postage. By freight—one 60-pound can, 9½ cents per pound; two cans, 9 cents per pound; four or more cans, 8½ cents per pound. Cash must accompany each order. If ordering two or more cans you can have half of each kind of honey, if you so desire. The cans are boxt. This is all

ABSOLUTELY PURE BEES' HONEY,
The finest of their kinds produced in this country.

Read Dr. Miller's Testimony on Alfalfa Honey:

I've just sampled the honey you sent, and it's prime. Thank you, I feel that I'm something of a heretic, to sell several thousand pounds of honey of my own production and then buy honey of you for my own use. But however loyal one ought to be to the honey of his own region, there's no denying the fact that for use in any kind of hot drink, where one prefers the more wholesome honey to sugar, the very excellent quality of alfalfa honey I have received from you is better suited than the honeys of more market flavor, according to my taste. C. C. MILLER.
McHenry Co., Ill.

Order the Above Honey and then Sell it.

We would suggest that those bee-keepers who did not produce enough honey for their home demand this year, just order some of the above, and sell it. And others, who want to earn some money, can get this honey and work up a demand for it almost anywhere.
Address,
GEORGE W. YORK & CO., 118 Michigan St., Chicago, Ill.

ESTABLISHED IN 1861

AMERICAN BEE JOURNAL

THE OLDEST BEE-PAPER IN AMERICA

40th YEAR.

CHICAGO, ILL., DECEMBER 27, 1900.

No. 52.

Editorial.

A Happy New Year we wish to every one who reads the American Bee Journal. Yes, and a happy New Century, too—tho, in all probability, very few now living will see the whole of the 20th century, which begins with 1901.

Volume 40 of the American Bee Journal closes with this number. It is getting old, and, like ripe fruit, should be mellow and sweet. We only hope that in its future years it may be as great a help and blessing to its hosts of readers as it has been in all its past years. If we shall be permitted to live, and labor upon it, it will likely become better with its increasing years. At least that will be our aim.

The Annual Index will be found in this number. It will prove of immense value to all who have been wise enough to preserve the weekly copies as they were received during the year. While its preparation involved no small amount of labor, it is also of no small importance, as by referring to it every subject that one wishes to look up can easily be found and reread. Those who have not all the copies will be surprised, by reading over the index, to find how great has been the variety of topics treated during this year in the American Bee Journal.

Getting Outside Sections Filled.—It is well known that a super of sections will not all be promptly finished at the same time, some of the outside sections being still unsealed when the rest are fully completed. The Pettit plan is devised to overcome this difficulty, and some practice returning the unfinished sections to the bees to have them completed. F. L. Thompson suggests a plan which, altho he has not tried it, promises so well that it may be well worth considering. He says in the Progressive Bee-Keeper:

Being very short of time this summer, and sometimes of material, I used a number of last year's sections, with more or less honey in them, for the outside rows in a number of supers in one yard, and noticed that in those supers the bees, as a rule, commenced work on the new sections in the rows next the outside ones. They did not finish them sooner than the center ones, but as soon, so that I was almost always enabled to handle supers instead of sections in that yard, in such cases.

Of course, such a means of arriving at the result would hardly pay in ordinary circumstances—it makes more supers of new sections to handle, for one thing. But it suggests an idea that may be worth while, that if two

thin permanent combs, one on each side, were allowed to remain in each super thruout the season, the bees in ordinarily strong colonies would likely finish the outside rows soon enough to enable one to handle supers instead of sections, just as well as if the combs were thick, and the expense of the honey thus permanently invested, as it were, would be slight.

I have thought of laying a sheet of foundation on an ordinary separator, warming it sufficiently to attach it to the wood, then cleating it with five half-inch cleats, and placing it outside of each outside row in T-supers made slightly wider than usual. This would give two permanent one-sixth inch combs (after once being built out) next the outside of each super, and have the same effect as if the two outside rows were honey-combs. I have never tried it.

Reducing the Swarming Habit.—Harry Lathrop, having mentioned in Gleanings in Bee-Culture that there was a notable decrease in the amount of swarming by his bees, he was urged to say just why he thought there had been such decrease. He prefaces his reply by saying that he has had in years no swarm from colonies worked exclusively for extracted honey, and seems to suppose that bee-keepers in general have no swarms from such colonies. As to those worked for comb honey, about one-third of them swarm in good honey-years, but swarming is much more troublesome in years when bees get just enough to keep brood-rearing going with little or no storing. His practice is to keep his comb-honey colonies as busy in the sections as possible, watch them closely, and give storage-room as needed, removing the finished supers promptly. This being followed up year after year results in the small numbers mentioned, but he would expect the same results only after several years with colonies which had been in the habit of sending out two or three swarms every season.

He quotes Frank McNay as agreeing with him in the opinion that by proper management bees can be made to lose their desire and tendency to swarm. The following very emphatic testimony is quoted as coming from Mr. McNay:

He related how at one time he purchased a good-sized apiary from a farmer, and worked them the same as he did his other yards, but was surprised to find these bees casting swarms right along, while there was none in the other apiaries. In apiaries of bees that he has owned and operated for a number of years he has so little swarming that it is not necessary to keep any one in on the watch.

All of which is very encouraging to those who are making effort by way of selection to obtain bees with little tendency to swarm. It can hardly be repeated too often or too emphatically, that it lies within the power of every bee-keeper to work for results in this line. No great amount of skill or knowledge is required to discourage those conditions that

are known to favor swarming, and then to breed from stock the freest from the habit of swarming. The man who does this need wait no long series of years for his reward. Immediate results will be obtained in the increase of the honey crop, for it seems now to be pretty well agreed that non-swarming and good gathering keep very close company. The fact can not be disputed that there is now a great difference in bees as to the tendency to swarm. Can it be reasonably questioned that if care be taken each year to breed from those least given to swarming, the habit will each year grow less and less?

The Bee-Keeper of Limited Means has his case diagnosed in the Progressive Bee-Keeper by R. C. Aikin. He says:

There is almost a necessity that a poor man—one with little or no capital to push a business in a special and wholesale way—should engage in several lines. Competition is sharp, and the man who has hundreds of colonies of bees, and an equipment in proportion with all the faculties to handle them, can produce cheaper than the man with a few colonies. A man with ten colonies of bees, a few dozen hens, two or three pigs, a cow, a horse, fruit and a vegetable garden, and above all *owning these things*, can live and be comfortable in a modest way, but can not well lay up money. The man with his hundreds of colonies, and selling at a given price, will make more money per colony from his apiaries than will the man with the few. Then with the garden, fruit and other things in a small way, he has advantage of the man with limited means.

But what will the poor man do if he can not compete with his well-to-do neighbor? Select some one thing that he will push as a specialty, keep that thing growing as he is able, and all the while hold fast to the other side issues and helps that go far toward supporting the family. Do the specialty well, push to the front, and let no one excel you in it, and keep the other things going in good shape, too, even tho limited.

Mr. Aikin is a careful writer and a fair man, but some of his views in the foregoing may bear scrutiny. Because a poor man is not able to compete with the man who has his hundreds of colonies, he is advised to divide his forces and "engage in several lines." If the man with many colonies can do better because of his many colonies, will it not be true that the more the poor man has the better he can do? So why divide his forces, unless it be that by so doing he may have something more reliable? And therein lies the gist of the matter. Bee-keeping is an uncertain business—the fact may as well be faced—and the man of limited means dare not safely trust his all to it. But to many it is a very desirable business. Taking together its desirability and its uncertainty, Mr. Aikin's advice is good; at least with a little modification: Do not trust your all to such an uncertain business as bee-keeping, but if you have along with it the

business of chopping cord-wood, hold on to the less congenial but more reliable business, at least until you can see your way clear in the other.

"The man with his hundreds of colonies, and selling at a given price, will make more money per colony from his apiaries than will the man with the few." is no doubt true if

viewed as Mr. Aikin intended it. But the inexperienced may make a wrong deduction from it. He may say: "I see that an increase of colonies leads to increase profit per colony; so when I have 100 colonies I shall have more than the \$5.00 profit per colony that I now have with 10 colonies." He needs to be told what it was not necessary to say to

most of Mr. Aikin's readers: "Other things being equal, on a given field, the profit from each of 100 colonies will be much less than the profit per colony from a small number on the same field, notwithstanding the advantages accompanying the larger number. The yield per colony with 10 may be cut in two when the 10 become 100."

Convention Proceedings.

Report of the Proceedings of the 31st Annual Convention of the National Bee-Keepers' Association, held at Chicago, Ill., Aug. 28, 29 and 30, 1900.

BY DR. A. B. MASON, SEC.

(Continued from page 790.)

THIRD DAY—AFTERNOON SESSION.

The convention was called to order by Pres. Root. The question-box was continued by Mr. Aikin.

UPWARD VENTILATION IN WINTER.

Is upward ventilation in winter a benefit or a detriment to a colony of bees?

Mr. Aikin—I would say it is a benefit.

Dr. Mason—That depends upon the meaning of ventilation, and where that ventilation is to be given, whether in the cellar or outdoors; it is sometimes a benefit and sometimes a damage, so you can't say yes or no.

Mr. Aikin—Some of us were having a little contention over at the back of the room, and were in the midst of that discussion when I was brought up here. Mr. Green says he wants the cover sealed down tight. I told him I could take him into the State of Colorado in the winter time and show him chaff hives in which the colony would be wet and moldy, and single wall hives with the cracks open all around the top and bottom, have the colony dry and healthy, and seemingly as prosperous and good as we can have. It is a fact our bees will winter in open hives in Colorado right outdoors better than they will in a close hive or chaff-packet hive. We have just one difficulty, and that is the great amount of exercise—they climb around and consume stores, which naturally comes with a free and open hive in a warm, sunny climate. I say "warm" because, as stated before, it will be zero at night and freezing at midday. It is nothing uncommon for the temperature to change 40 degrees there in a very few hours, but all the time everything is snow and you work there in your shirt sleeves with comfort, or at a temperature that you would be freezing to death with your overcoat on here in Chicago.

Dr. Mason—I winter bees in the cellar with the cover sealed tight, and I don't lose any.

Pres. Root—We do both ways. Some years we get better results with the cover sealed down, and sometimes better with an absorbing cushion for upper ventilation. One winter we concluded the absorbing cushion was just the thing, and the next winter lost very heavily. We can't tell why.

A Member—What ventilation do you give at the bottom?

Pres. Root—Wide open ends, and have ordinarily $\frac{3}{8}$ inch.

Dr. Mason—The bottom-board is removed from all our hives when the bees are put in the cellar in November, and the hives are piled on top of each other with a $\frac{3}{8}$ inch strip between.

Mr. Rankin—We had an interesting little experiment at the Michigan Station last winter; 15 colonies were used, and they were wintered outdoors inside of chaff wintering cases. Five had the covers sealed on, five with cushions on top of the frames with a cover over it, and five with burlap over the frames and the whole wintering-case packed with chaff, which gave them an absorbing cushion of about four square feet, and the result of the experiment was, those that had the whole top of the wintering-case to breathe in, came thru the winter in a great deal the best condition.

A Member—That was just one test, was it?

Mr. Rankin—Yes.

Mr. Aikin—The gist of the whole matter is this: Keep the colony absolutely dry; ventilating carries off the moisture; keep them dry, and with proper food they will winter in almost any temperature, and in almost any place.

Mr. Green—I don't think that I should want the cover sealed tight unless there was protection. My hives have an outside case with four inches of packing at the sides and eight inches on top, and, with that packing, I don't think bees get damp inside—the hives get damp. I want them covered.

TALL SECTIONS AND THE HONEY MARKET.

What effect will 4x5 sections have on the honey market?

Mr. Aikin—For my part, I don't know that it would have any effect.

Dr. Mason—They have a good effect on some markets.

A Member—But as compared with other sections?

Mr. York—I don't think they have any effect on the Chicago market. Honey in tall sections is worth no more here than in square sections. The honey is no sweeter in one than in the other.

Dr. Mason—I was in a grocery in Toledo the other day, where they had some sections 4x4 and some 4x5, and some parties who wanted some for their own consumption, a section or two, or three, took the 4x5 until they were gone.

Mr. York—Why?

Dr. Mason—They liked the shape, and said there was more honey in them.

A Member—I would like to ask if the 4x5 stood up and down, or flatwise, in the market?

Dr. Mason—Up and down.

A Member—Was it sold by the box?

Dr. Mason—By the single section.

ADOPTING THE SPELLING REFORM.

Is it desirable for our periodicals to adopt reform spelling?

Mr. York—Yes, I think it is.

Dr. Mason—Yes.

Mr. Abbott—That depends upon whether they want it or not.

Dr. Mason—It depends upon locality. You take Toledo, O., for instance; I saw there the other day a sign stuck up, "5 cts a pc"—that meant "five cents apiece." A lot of our street-cars have got "Union Dpo," instead of "Union Depot," and it saves lots of printing. I can remember the time when we pronounced it "de-pot," then it got to be "de-po," and then "da-po," and now we have in Toledo "dpo" for "depot," and we know just where we are going; and I say reformed spelling is a *good thing*, and when an editor has to consult all his subscribers to find out whether he should adopt it or not, I think he is wasting his time and money. If he hasn't got mind enough to know what his subscribers want, it is all right to consult them, but he ought to adopt the reform while consulting them.

Mr. Abbott—I ate dinner with one of our members, and as we came to the foot of the stairs coming back, he bought a paper; he looked at it and said: "Well, we buy a paper, we look thru it and don't find anything; we have to waste thru so much." Let us have the reform spelling, it saves us time in this world.

Dr. Mason—I saw some time ago in one of our religious papers a statement to the effect that it was impossible to reform the English spelling, and in the same issue was a quotation of a few verses from an old edition of the Bible, where *f* was used where we now use *s*, and such a way of spelling many words as many of us were familiar with, as would make it quite difficult to understand without paying close attention to the connection. Some of our periodicals are adopting this reform spelling. I say if there is any way by which we can reform our outlandish spelling, and shorten it up in such a common-sense way as is being done

by the American Bee Journal, let's adopt it. You know when President Root—

Pres. Root—Don't rub it in, Doctor.

Dr. Mason—I am not rubbing it in; these are the facts in the case. When you took the first vote among the subscribers to *Gleanings in Bee Culture*, as to whether the reform spelling should be adopted, you got a hundred or more votes which said "yes, adopt it," before one came in against it, then they began to come the other way, and you just went with those that came in last. Some of them did not want it done because it was changing so much, and some threatened to stop taking the paper if it was adopted. This is a changeable world, and we must change if we keep up with the times—have to move or get left. If we can write and leave out many useless and worse than useless letters, and know what it means just as well, why not adopt that method?

Mr. York—I suggest we take a vote on it; how many are in favor of reform spelling and how many are not, just for the fun of the thing.

Pres. Root—All who are in favor of adopting the spelling reform to the extent that the American Bee Journal has done, raise the hand.

All raised their hands in favor, except one lady, who voted against it.

Dr. Mason—May I ask the lady why? If there is a good reason, you may change every one of us, you know.

The Lady—It is probably because I am not as bright as Dr. Mason. I can't see thru it so quickly.

Dr. Mason—Practice is all that is needed.

FEEDING FOR WINTER STORES.

What is the best way to feed bees for winter stores, and when?"

Mr. Aikin—The best way to feed them is during the honey-flow, if you can. If there is no honey-flow, I don't know. I don't want to answer that question.

Jacob Hoffman—Feed them in time so they get it sealed over before cold weather.

Mr. Aikin—Here is another question that goes along with it: "How much food is required for average colonies?" In my locality, we would want 40 pounds for an average colony; in some other places, 20 pounds would do.

W. L. Coggshall—How many pounds of honey do you think necessary for the bees over winter?"

Mr. Aikin—Thirty pounds will do, 35 would be better, and 40 would be better yet. Bees "cut a garment according to their cloth." If they have plenty of honey, they breed up nicely; if they haven't they won't.

Dr. Mason—How many pounds is required for an average colony?"

Mr. Aikin—That depends upon where you winter them, whether in the cellar or some other place, or outdoors.

Dr. Mason—I winter mine in the cellar. I like to have them have a good lot; they will average about 10 pounds while in the cellar.

R. L. Taylor—It makes quite a difference in the quality. They will use twice as much poor honey as good.

Mr. Fixter—It takes so much less to winter in the cellar, why not winter in the cellar altogether?"

A Member—I askt that question. We have about 40 colonies at home that will all have to be fed. They are very strong colonies, and I would like to know the best way and how to feed them, and how much sugar is required to winter in the cellar?"

Mr. Aikin—Does your question intend to cover the time from now practically until new honey, next spring?"

A Member—Certainly, from fall until spring.

Mr. Taylor—Do you put your bees in the cellar and feed them granulated sugar?"

A Member—Yes, sir. I want to know how much from now until they will gather honey in the spring.

Mr. Taylor—If he puts his bees in the cellar, he can be very sure that if he feeds ten pounds of granulated sugar per colony, they will all be alive so far as stores are concerned when he takes them out in the spring. Of course, if they don't get much honey until the middle of June, they will want more than that.

Mr. Fixter—It makes a difference what kind of a cellar you winter the bees in. Some cellars require a great deal more honey for bees than others.

Mr. Taylor—If the temperature is about the same, I don't see why it should make much difference. If your cellar is very damp, the temperature ought to be a little higher than when it is very dry.

Mr. Aikin—I realize that there is a great deal of misunderstanding in regard to this matter, and we can not

take the time of the convention to go fully into details; but get this one fact into your mind, that it is wise always to have an abundance of stores for your colonies—better that there be 10, 20 or 30 pounds more than they use than half a pound less than they need; and simply to give the colony enough now to last them until the first day of next March, might not be at all a wise policy. I would want my colonies to have enough in the fall to be sure that they got clear thru in the spring when they can go out and forage if there is anything to feed upon; because a colony that is wintered with barely enough stores to carry it thru until spring when you think you can feed them safely, is almost sure to come thru in a poor condition, and you will never be able to calculate what you have lost by them coming thru in that semi-starved condition. I am well satisfied that with 10 or 15 pounds more stores they might make you all the difference between a very handsome profit and a very serious loss in that colony for its season's work.

A Member—Would it be best to feed at the entrance or in the hive?"

Mr. Aikin—That part of the matter I have never experimented with.

D. H. Coggshall—I know how some feed. I never had occasion to feed much. Take a colander and put the combs on the under side of it and turn the honey and let it drop from a short distance; that drops the honey into the combs; hang them up, let the honey drip off, then put those in hives; put these combs below, and the bees will put it above.

Mr. Aikin—It is best to have the colony store it as solidly as possible in the combs, and not scatter it thru a whole lot of combs. Four combs solidly packed with stores is far better for the colony to winter on than eight combs with the same stores scattered thru eight combs.

Continued next week.)

Contributed Articles.

No. 9.—Interesting Notes on European Travel.

BY C. P. DADANT.

HERE we are, at Paris, the city of arts, the city of fashion, the leader in a thousand things, the capital of the world. But if I should try to detail my stay in Paris, and the sights we saw, I should make the editor and the readers weary of my prose.

We arrived at midnight, and it looked as if it might have been noon, for the boulevards were as busy, the crowds were as thick, on the sidewalks, in the cafes, in the restaurants, as at midday. They had just emerged from the theatres, and before these people were ready to go to bed, the market gardeners and hucksters would in their turn come forth to prepare for another busy day. That city never sleeps.

Two or three readers of the American Bee Journal have asked me to give my impressions of the Paris Exposition as compared with the World's Fair at Chicago. I think I can repeat what I have heard other Americans say: The French exposition is more artistic, the details are better finished, the buildings more elegantly decorated, than at Chicago, but our World's Fair was on a much greater scale. Not only were the buildings larger, but there were more of them. We had some 40 States of our own from which to draw, outside of the foreign element. The buildings were situated far enough apart to give a fine view from all sides. The lagoons, the avenues, the Court of Honor, and that beautiful lake could not be replaced by any of the beauties of Paris. The view of the "White City" from the steamboat on Lake Michigan was a sight which will be hard to match anywhere.

On the other hand, we must acknowledge that we have the fault of making things too "rough and ready," and not taking pains enough in the finish. In that Court of Honor, I remember seeing holes in the columns, where scaffolding had been taken off, and the woodwork was showing under the plaster, thus effacing the "marble finish" impression, and taking away the admiration which the artistic work should have left. No such defects were to be seen at Paris, and each and every detail was finished up as if all that architecture was to remain for centuries. But the lack of space had compelled the building of these works of art in too

small a compass. The finest views were to be had from the Seine, or from the Eiffel Tower.

The apiarian exhibits were scattered over a great deal of ground. This is because each country had a special exhibit, in which all its products were gathered, while there was also a general exhibit for each special industry. If I am not mistaken, the different exhibits of America were scattered in some 35 different spots. But the American exhibit of apiculture was confined to three manufacturers as far as I could find—The A. I. Root Co., The W. T. Falconer Mfg. Co., and our own firm. It consisted solely of apiarian implements, sections, foundation, a few smokers, an extractor or two, and some hives—no honey, no beeswax! No individual or collective exhibit of the products of the bee!

It is true that these exhibits had been considered worthy, for they were each rewarded with a medal, and the few goods that were there were certainly superior to what they have in Europe, so much so that I wondered whether the people who saw them would realize that they were only fair samples of what is made in America, for the mechanical finish of what they use in bee-culture is very inferior. But, nevertheless, I felt that we were outdone by Canada, for they exhibited, in their own building, a stack of the finest honey that it is possible to see. This was evidently under the auspices of the Ontario Bee-Keepers' Association, and intended to show to the world what Canada could do. But the names and addresses of the producers were attached to all the samples. They may be less practical than we are, individually, but they take more pains, collectively, to bring their products forward.

Yet the United States is rich enough and successful enough to make the finest exhibit that can be made in the bee line. Just think of California, Arizona, Colorado, Utah, uniting with New York, Ohio, Michigan, Illinois, Wisconsin, and other States, to make a honey exhibit! What a grand display we could have! And are we not in honor bound to do something of this kind for the next International Fair, wherever it may be held, but especially if outside of our land? This should not be left to individual enterprise, but each State and local association should take pride in sending samples of the products of its members labeled with the producer's name, under the supervision of the National Association. Thus we may hold our rank with any other country in an international exhibit. If there was a single pound of United States honey on exhibition at Paris, I neither saw it nor heard of its being there.

The main apiarian exhibit consisted of a number of hives of all styles and shapes, under the control of the French Association, in an open-air annex, close to the main building of the Champ De Mars. The best of this exhibit was from Mr. Gariel, of Paris, who showed a very nice assortment of practical apiarian supplies. One exhibitor of a newly invented hive, guaranteed returns of 50 percent annually, on the money invested, to purchasers of his invention. The quacks are not all in America.

One thing astonishes me. It is the number of honey-presses exhibited side by side with honey-extractors. This comes from the persistent use of the straw skep which is well represented here, in all sorts of shapes. Owners of bees in straw hives have no use for an extractor. Stopping a few minutes to hear the remarks of passing visitors, I find that the bee-keepers there do not know anything about the extractor, while the press seems familiar to them. A little farther on, I notice a coarse wooden dish hinged on a lid which seems to be made to fit inside of it and is attached to a long lever. It is labeled "Honey-press of the eleventh century." It looks old enough, indeed.

But the French honey exhibit was a very fine display. This exhibit located in Class 42, contains show-cases from eight or ten local associations, besides personal displays from a number of honey-producers. Here we see American section-boxes, filled with French honey. The exhibits are tastefully arranged, and two or three gold medals show that the jury was appreciative. A number of the largest exhibitors show the pains taken with the bees, by exhibits of comb honey in the shape of words, diagrams, circles, etc. In the main exhibit, Mr. Duviquet has represented the words, "SOCIÉTÉ CENTRALE D'APICULTURE," in letters 16 to 18 inches in length, made of comb honey. E. Moret takes a gold medal with the finest honey display, some of which is evidently from previous years, and we are told that this honey has already taken the medal at other exhibitions. Here also Mr. Gariel has a fine exhibit and a gold medal.

The products made with honey, or partly from honey, are numerous, especially honey-cakes, gingerbread, metheglin, both sweet and dry, and especially honey chocolate. It would appear that chocolate sweetened with honey is

making its way freely in France, altho the manufacturer of his article is a recent I tasted of it and found it excellent.

Another bee-exhibit, I was told, was to be found at the Vincennes annex, where they said American machinery took a very prominent position, in all sorts of industries, but I had no opportunity to go to Vincennes, which is quite distant from the Exposition grounds. Was there not enough to see right there? We went many times, but could not hope to see it all. And, besides, there was enough to see in Paris outside of the Exposition, even in the Louvre alone, to occupy the two short weeks we had to stay.

Here, as in every other place we visited, business acquaintances or friends of my young days whom I happened to meet proved most hospitable. We thought ourselves total strangers in Paris, but found one cousin, one former schoolmate of mine, and last, but not least, our business correspondent in Paris, Mr. Gariel, whom I have mentioned as having so fine an exhibit, and whom we found to be one of the pleasantest and most hospitable of men. He directed us to a good lodging, invited us several times to dine and spend the evening with his pleasant family, showed us thru the exposition grounds, and accompanied us to Versailles on the Sunday following our arrival. There he proved to us that a Parisian of small stature could outwalk a resident of Illinois, for he kept me a-going from noon until about six o'clock, with scarcely a minute's rest, thru the immense park of the old kings of France. We tried to see, in that short time, what could not be seen in detail by a two weeks' stay, and I have in my memory a medley of beautiful groves, grand avenues, gardeus, marble statues, fountains, palaces without end, thru throngs of visitors who came as we did, in the two-story excursion trains, to "do" Versailles in a half day.

Early Drones—How to Get Them.

BY JESSE M. DONALDSON.

BREEDING queens for quality is fast superseding the old craze of breeding for color. Almost all bee-keepers will agree that it is a move in the right direction. Several breeders are offering for sale queens of superior strains. No doubt many of these queens possess all the good qualities claimed for them, but even with one of those good queens for a breeder, our progress will be very slow if we allow her queen progeny to mate with common or inferior drones.

If we could secure the mating of queens in confinement, all would be easy sailing, but, as all bee-keepers know, repeated trials have proved that to be one of the impossibilities of bee-keeping.

But we can lessen the chances of our queens mating with poor drones, by not allowing them to be reared in our yards, and encouraging drone-rearing only in colonies that show good qualities. These drones should be in the fields early in the season.

I have experimented on these lines till I have worked out a plan by which I get good drones much earlier than I would if I allowed the bees to take their own time about it. Of course, it means some extra work, or, as some would call it, "fussing," but in the long run I find that it pays.

Before giving my plan, I will say that I use the eight-frame dovetail hive, and a winter-case high enough to admit an Ideal super, which I fill with planer-shavings.

When preparing the bees for winter, all drone-comb is removed from the colonies that I do not want drones from. I then select the ones that I intend using for drone-rearing; for this purpose I prefer colonies with queens at least one year old. In the center of these colonies I place two or three frames that have previously been prepared by removing the drone-comb from the corners, and replacing it with worker-comb, and grafting a small piece of drone-comb in the center. We now have our drone-cells in the center of the hive, just where the queen begins laying. I now make sure that these prepared colonies have plenty of stores for winter, which ends my work with them till spring.

When spring comes, I crowd the bees on just the number of frames that they can cover, and place the extra frames outside of the division-boards. The enameled-cloth is now placed on the frames, and over it the super filled with planer-shavings. An extra rim is now placed on the winter-case, which gives it a slope from north to south. Instead of the regular winter cover, I now use one made of glass.

As soon as these colonies can take care of it more brood

is added; of course this brood is drawn from some colony that can spare it. When the hives are filled with brood, a little warm syrup should be fed every night. The drone-comb that was placed in the center of the hives will soon be filled with brood, which should be given to other colonies just before it hatches, and the space filled with other frames containing drone-comb.

By not allowing any drones to hatch in these colonies, we keep up their desire for drones.

When the brood hatches in the frames that were placed in other colonies, they should be returned to the drone-rearing colonies, or placed in an upper story over a queen-excluder. If they should remain any length of time after the brood hatch, we would only be encouraging the bees to rear the very kind of drones that we are trying to suppress.

Altho this plan may seem somewhat fussy, I am confident that the results will pay for the little extra work, especially where one is trying to improve his stock.

Worcester Co., Mass.

Report for the Season of 1900—Bee-Forage.

BY WM. STOLLEY.

THE year of 1899 was (as previously reported) a very poor year for bees in central Nebraska. From September 15th to October 1st, I had to feed over 1,000 pounds of honey and sugar syrup mixt, to provide ample winter stores for my 30 colonies of bees, in double-walled hives, on the summer stands in my open bee-shed. All wintered well, as usual.

During the winter of 1899 and 1900, bees flew freely—three days in December, 14 in January, two in February, and 16 in March. Of zero days we had—three in January, six in February, and one in March. The lowest point of temperature reached was 14 degrees, Fahr., below zero, January 30, 1900. I lost three old queens in wintering, sold one fine colony for \$10, and also a few choice queens for \$1.50 each, in early spring; and by uniting all queenless colonies thus made, with the weaker ones, I had 20 colonies left, all very strong, by the middle of June, when sweet clover began to bloom—this season being about two weeks early.

March 11th, soft maple began to bloom, and bees workt on them on and off, up to March 22d.

Next followed the buffalo-berries, which are, if plentiful, a veritable boon to bees in early spring. The buffalo-berry bloom lasts for 10 to 15 days, and is closely followed by elm, box-elder, willows, cedar, cottonwood, and matrimony-vine, in the order named, when, at the end of June, fruit-bloom follows. By the middle of May raspberries, black walnuts, spider-lilies, black locust, honey-locust and wild grapes are in season, up to about June 1st.

The month of June, and until sweet clover began blooming, always used to be a time of want for my bees, and they invariably drifted backwards, unless fed promptly, until of late years, when I was successful in getting motherwort and white clover to grow in such quantities, that this annoying scarcity of bee-forage was bridged over. I now have sufficient motherwort growing in the immediate vicinity of my apiary to employ my bees fully, and thus keep brood-rearing going on without interruption. This plant (motherwort) blooms about four weeks and is, as far as my experience goes, always to be depended upon. Bee-keepers, whose localities, like my own, are not well supplied with bee-forage in the month of June, should not neglect sowing the seed of this valuable honey-yielder, together with catnip, on all vacant and suitable places, in sufficient quantities to meet the requirements. (I have no seed for sale.) They will, if they follow my advice, be well rewarded for so doing.

Alfalfa would answer the same purpose, and is even better if it were not generally cut down just about the time when it begins to yield nectar. Some 15 years ago I first started an alfalfa-field of about eight acres here, but it took more than 10 years before other farmers in the neighborhood followed suit; but now this section of the country is dotted all over with large tracts sown to alfalfa, of which some fields every year are likely to remain uncut long enough to become of great utility to my bees.

As soon as sweet clover begins to bloom, my bees are all right all around. I have the satisfaction of reporting that within 1½ miles of my apiary, a young, progressive farmer, who used to be very much opposed to sweet clover, gathered the seed of it along the roadsides, and put ten acres solid into sweet clover, for pasturing his sheep, after

he learned to appreciate the true value of this plant, by herding his flock of sheep on the country roads.

Sweet clover so herded off by sheep, throws out numerous small branches close to the ground, which are white with bloom late in the season.

Of course, some of the old fellows whose minds are set in opposition to sweet clover, persist in condemning it. They are the old Israelites, who are destined to die in the wilderness—surrounded, however, by lots of sweet clover, notwithstanding their foolish opposition to it.

Now, as to the result of this summer's work in my little apiary: I obtained 1123 pounds of the very best of extracted white honey from 20 colonies of bees (spring count); hence, about 56 pounds per colony on an average, besides plenty and to spare for winter-stores, without resorting to feeding for winter.

This result is quite satisfactory to me, inasmuch as the season, take it all around, was anything but normal. Excessive drouth in midsummer, together with damaging hail, curtailed my honeycrop greatly.

Besides my crop of surplus honey, I have increased the number of my colonies from 20 to 30, by the nucleus plan. While I bought five queens, for the purpose of infusing new blood, I have reared 14 choice queens myself from my very best stock.

I had but two swarms from the 20 colonies, and they were hived back on the old stands.

For the last two years I have had no fall honey from wild bloom, owing, I suppose, to the drouth we have had; while in former years from August 15th to the end of the season I got nothing but dark and rather rank honey, equal in quantity to the crop of white honey obtained in the forepart of the summer. But this year, clear up to September 29th, when I extracted the last, the honey remained the same excellent quality.

October 12th, all my bees in the open shed were packed for winter. Yesterday (November 19th), we had the first light snow.

I would like to say something about the introduction of queens, and some other matters pertaining to the successful management and working of bees, but I think that the foregoing is rather too lengthy already, so I suppose I would better stop.

Hall Co., Neb.

[Why not send us several articles on the subjects you mention in your last paragraph, Mr. Stolley? We are very certain they would be eagerly read, and also prove profitable.—EDITOR.]

“The Hum of the Bees in the Apple-Tree Bloom” is the name of the finest bee-keeper's song—words by Hon. Eugene Secor and music by Dr. C. C. Miller. This is thought by some to be the best bee-song yet written by Mr. Secor and Dr. Miller. It is, indeed, a “hummer.” We can furnish a single copy of it postpaid, for 10 cents, or 3 copies for 25 cents. Or, we will mail a half-dozen copies of it for sending us *one new* yearly subscription to the American Bee Journal at \$1.00.

The Chicago Convention Picture is a fine one. It is nearly 8x10 inches in size, mounted on heavy cardboard 10x12 inches. It is, we believe, the largest group of bee-keepers ever taken in one picture. It is sent, postpaid, for 75 cents; or we can send the American Bee Journal one year and the picture—both for \$1.60. It would be a nice picture to frame. We have not counted them, but think there are nearly 200 bee-keepers shown.

Our Wood Binder (or Holder) is made to take all the copies of the American Bee Journal for a year. It is sent by mail for 20 cents. Full directions accompany. The Bee Journals can be inserted as soon as they are received, and thus preserved for future reference. Upon receipt of \$1.00 for your Bee Journal subscription *a full year in advance*, we will mail you a Wood Binder free—if you will mention it.

Please send us Names of Bee-Keepers who do not now get the American Bee Journal, and we will send them sample copies. Then you can very likely afterward get their subscriptions, for which work we offer valuable premiums in nearly every number of this journal. You can aid much by sending in the names and addresses when writing us on other matters.

BEE-BOOKS

SENT POSTPAID BY
George W. York & Co. 118 Mich. St. Chicago.

Bees and Honey, or Management of an Apiary for Pleasure and Profit, by Thomas G. Newman.—It is nicely illustrated, contains 160 pages, beautifully printed in the highest style of the art, and bound in cloth, gold-lettered. Price, in cloth, 75 cents; in paper, 50 cents.

Langstrth on the Honey-Bee, revised by Dadant.—This classic in bee-culture has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apiarian library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 520 pages, bound in cloth. Price, \$1.25.

Bee-Keepers' Guide, or Manual of the Apizry, by Prof. A. J. Cook, of the Michigan Agricultural College.—This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 460 pages, bound in cloth and fully illustrated. Price, \$1.25.

Scientific Queen-Rearing, as Practically Applied, by G. M. Doolittle.—A method by which the very best of queen-bees are reared in perfect accord with Nature's way. Bound in cloth and illustrated. Price, \$1.00.

A B C of Bee-Culture, by A. I. Root.—A cyclopaedia of 400 pages, describing everything pertaining to the care of the honey-bees. Contains 300 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.20.

Advanced Bee-Culture, Its Methods and Management, by W. Z. Hutchinson.—The author of this work is a practical and entertaining writer. You should read his book; 90 pages, bound in paper, and illustrated. Price, 50 cents.

Rational Bee-Keeping, by Dr. John Dzierzon.—This is a translation of his latest German book on bee-culture. It has 350 pages, bound in paper covers, \$1.00.

Biene-Kultur, by Thos. G. Newman.—This is a German translation of the principal portion of the book called "Bees and Honey." 100-page pamphlet. Price, 25 cents.

Bienezucht und Honiggewinnung, nach der neuesten methode (German) by J. F. Eggers.—This book gives the latest and most approved methods of bee-keeping in an easy, comprehensive style, with illustrations to suit the subject. 50 pages, board cover. Price, 50 cents.

Bee-Keeping for Beginners, by Dr. J. P. H. Brown, of Georgia.—A practical and condensed treatise on the honey-bee, giving the best modes of management in order to secure the most profit. 110 pages, bound in paper.

Bee-Keeping for Profit, by Dr. G. L. Tinker.—Revised and enlarged. It details the author's "new system, or how to get the largest yields of comb or extracted honey." 80 pages, illustrated. Price, 25 cents.

Apiary Register, by Thomas G. Newman.—Devotes two pages to a colony. Leather binding. Price, for 50 colonies, \$1.00; for 100 colonies, \$1.25.

Dr. Howard's Book on Foul Brood.—Gives the McEvoy Treatment and reviews the experiments of others. Price, 25 cents.

Winter Problem in Bee-Keeping, by G. R. Pierce.—Result of 25 years' experience. 30 cts.

Foul Brood Treatment, by Prof. F. R. Chestnut.—Its Cause and Prevention. Price, 10 cts.

Foul Brood, by A. R. Kohnke.—Origin, Development and Cure. Price, 10 cents.

Capons and Caponing, by Dr. Sawyer, Fanny Field, and others.—Illustrated. All about caponing fowls, and thus how to make the most money in poultry-raising. 64 pages. Price, 20c.

Our Poultry Doctor, or Health in the Poultry Yard and How to Cure Sick Fowls, by Fanny Field.—Everything about Poultry Diseases and their Cure. 64 pages. Price, 20 cents.

Poultry for Market and Poultry for Profit, by Fanny Field.—Tells everything about Poultry Business. 64 pages. Price, 20 cents.

CONVENTION NOTICES.

New York.—The annual meeting of the New York State Association of Bee-Keepers' Societies will be held in the Kirkwood, at Geneva, N. Y., Wednesday, Jan. 9, 1901, at 10 a.m., and continue thru the afternoon and evening. An interesting program has been arranged, and a good time is expected. C. B. HOWARD, Sec., Romulus, N. Y.

LOW RATES TO THE SOUTH.

Excursion tickets at reduced rates are now being sold by the Chicago, Milwaukee & St. Paul Railway to the prominent resorts in the South, including Jacksonville, Fla., Mobile, Ala., New Orleans, La., Savannah, Ga., El Paso, Tex., which are good for return passage at any time prior to June 1, 1901. Information regarding rates, routes, time, etc., can be obtained on application to any coupon ticket agent of the Chicago, Milwaukee and St. Paul Railway.

The Novelty Pocket-Knife.

Your Name and Address on one side—Three Bees on the other side.

[THIS CUT IS THE FULL SIZE OF THE KNIFE.]

Your Name on the Knife.—When ordering, be sure to say just what name and address you wish put on the Knife.

The Novelty Knife is indeed a novelty. The novelty lies in the handle. It is made beautifully of indestructible celluloid, which is as transparent as glass. Underneath the celluloid, on one side of the handle is placed the name and residence of the subscriber, and on the other side pictures of a Queen, Drone, and Worker, as shown here.

The Material entering into this celebrated knife is of the very best quality; the blades are hand-forged out of the very finest English razor-steel, and we warrant every blade. The bolsters are made of German silver, and will never rust or corrode. The rivets are hardened German silver wire; the linings are plate brass; the back springs of Sheffield spring-steel, and the finish of the handle as described above. It will last a last-time, with proper usage.

Why Own the Novelty Knife? In case a good knife is lost, the chances are the owner will never recover it; but if the "Novelty" is lost, having name and address of owner, the finder will return it; otherwise to try to destroy the name and address, would destroy the knife. If traveling, and you meet with a serious accident, and are so fortunate as to have one of the "Novelties," your POCKET-KNIFE will serve as an identifier; and in case of death, your relatives will at once be notified of the accident.

How appropriate this knife is for a present! What more lasting memento could a mother give to a son, a wife to a husband, a sister to a brother, or a lady to a gentleman, the knife having the name of the recipient on one side?

The accompanying cut gives a faint idea, but cannot fully convey an exact representation of this beautiful knife, as the "Novelty" must be seen to be appreciated.

How to Get this Valuable Knife.—We send it postpaid for \$1.25, or give it as a Premium to the one sending us THREE NEW SUBSCRIBERS to the Bee Journal (with \$3.00.) We will club the Novelty Knife and the Bee Journal for one year, both for \$1.90.

GEORGE W. YORK & CO., 118 Mich. St., Chicago, Ill.

Please allow about two weeks for your knife order to be filled.

26 cents Cash paid for Beeswax.

This is a good time to send in your Beeswax. We are paying 26 cents a pound—CASH—for best yellow, upon its receipt, or 28 cents in trade. Impure wax not taken at any price.

Address as follows, very plainly,

GEORGE W. YORK & CO., 118 Michigan St., CHICAGO.

Have You Either an Orchard or Garden ?

Publish
713 Masonic
Temple....
CHICAGO, ILL.

Sample copy free. Mention this paper.

I have before me a copy of the American Fruit and Vegetable Journal, which I like pretty well. It fills the bill better than any paper I have seen lately. IRA C. TRACY, Foreman in the Home Nurseries.

I was much pleased to receive your publication. It is a very neatly printed and well edited journal, and merits success. D. W. BARKLEY, Editor of the "Rocky Ford Enterprise."

All departments of the Fruit and Vegetable business discuss by practical and experienced persons.

FREE! We will send the above Journal absolutely FREE for one year as a premium to all old subscribers sending us \$1.00 to pay their subscription one year STRICTLY IN ADVANCE. Both papers for the price of one. Send your renewal subscription to this office while this offer is open. Both papers, \$1.00. AMERICAN BEE JOURNAL, 118 Mich. St., Chicago, Ill.

"Poultry Raising on the Farm"

"Poultry and Incubators on the Farm," "Feeding Specially for Eggs," "Raising Broilers for Market," "Successful Egg Farming," "Captions for Profit," "The Pekin Duck Industry," &c., are a few of the many good things contained in our **20TH CENTURY POULTRY BOOK.**

It is undeniably the best work of its character ever published. Among other things it treats of the latest improvements in the world famous reliable Incubators and Brooders which are used all over the United States and in 51 foreign countries. Sent anywhere on receipt of 10c for postage. **Reliable Incb. & Brooder Co. Box B-2, Quincy, Ill.** Please mention Bee Journal when writing

GENERAL ITEMS

Shipping Bees to Cuba.

Bees were short of honey, so I shipped 200 colonies to Cuba. They were started Oct. 16th, put on a boat the 20th, and reached Havana the 24th. The bees were then carried 60 miles, one mule taking 40 colonies on a cart without springs. The bees were let out the 27th. There were 50 combs broken, and two colonies dead, being only one percent, and that loss occurred on the last 60 miles. They are doing nicely now, having 1,000 pounds of honey on the hives.

W. L. COGGSHALL.

Tompkins Co., N. Y., Nov. 29.

Bee-Keeping in Indian Territory

I have 50 colonies of bees, but got no honey this year. For some reason the Italians not only stored no honey, but I had to take some from the black bees to give to them to winter on.

We winter our bees here in single-walled 8-frame hives, out-of-doors, in this way:

Place one row of 12 hives close together on 2x4x16 scantling. Then place 12 more in the same manner, facing the opposite way. Make a roof slanting each way. I use 3-foot boards to make the cover, and give it a good pitch extending far enough over the front of the hive to throw all water over the entrance, and have never lost a colony by freezing.

My bees have been flying every day this fall, and they are out now working just as they do in the summer-time.

During the summer I thought my bee-business was profitable. Sharple's Cream Separators: Profitable Dairying

BEE-SUPPLIES!

Root's Goods at Root's Prices! POWDER'S HONEY-JARS and everything used by bee-keepers. Prompt Service—low freight rate. Catalog free. **WALTER S. POWDER,** 512 Mass. Ave., INDIANAPOLIS, IND.

50 VARIETIES.

I breed fine poultry on one of the best equipped poultry farms in the world. Send 8c in stamps for new 1901 Book, telling all about 50 varieties, with special prices on fowls and eggs. **B. H. CREIDER, Florin, Pa.**

STUDENTS RETURNING HOME

For holiday vacations can, upon presentation of proper credentials, obtain tickets via Nickel Plate Road, to all points in Central Passenger Association territory, at a fare and a third for the round trip. Tickets will be sold on day of closing school and on day immediately preceding closing date; good returning until date school reconvenes, but not later than January 8, 1901.

For information as to train service to Ft. Wayne, Cleveland, Fostoria, Erie and other points, call on or address John Y. Calahan, General Agent, 111 Adams St. Chicago Passenger Station, Van Buren St. and Pacific Ave., on the Elevated Loop. (43)

ALL ADVANTAGES THE ADVANTAGES

of a low down wagon, such as ease of loading, saving of heavy lifting, saving the land from cutting up and rutting, are derived from using a set of **Electric Steel Wheels.** They convert your old wagon into a low down handy wagon at the lowest possible cost. They are made of steel with either direct or staggered oval steel spokes. They are made in sizes to fit any wagon. A set of these wheels means farm and a high one for the roads. Any height you want, and all wide, non-rutting, easy draft tires. Write at once for catalogue, prices, etc. **Electric Wheel Co., Box 16, Quincy, Ill.**

We Can't Give Away Anything

You pay for what you get in this world. You understand that. But as a business proposition we want you to try our great medicine for Indigestion, Constipation, Bilioussness, Sick Headache, Insomnia, "the Blues," and like complaints—

Laxative NERVO-VITAL Tablets

We know you won't buy it, until you know something about it. The best way to get you to know how good it is, is to let you try it. That's what we do. Send Stamp for "Health" booklet, and we will send you a free sample package, that you may try it yourself. We know you will always keep it in the house, if you once try it. What fairer offer could we make? At all Druggists—10 and 25 cents.

Handsome Stick Pin **FREE!**

If, instead of sending for a sample, you send us 25c we will send you "Health" booklet, a 25c box and a handsome gold stick-pin, set with emerald, ruby or pearl, warranted to be worth double the money. Order by number. This is an extra introductory offer. Only one pin to one person. If unsatisfactory, money returned. Send now while the offer is good.

47A17t Please mention the Bee Journal.

ness was ruined. I kept smelling an awful stench around certain hives, but thought it was a dead rat. It became so bad that finally investigated, and upon taking off the snper and cover I found one colony almost rotten. I at once destroyed everything, and sent a sample of the comb to a very prominent bee-keeper and publisher, asking his advice, and what it was. His reply was very unsatisfactory. He said it was not foul brood, he didn't think it was black brood, but it was probably pickled brood, and I would better send a sample to Dr. Howard. I can't help thinking he knew what it was, as it certainly was a decided case of some disease, and how could I send to Dr. Howard when I had burned everything?

R. N. CROFTON.

Cherokee Nation, Ind. Ter., Dec. 2.

Bees Did Well—Prospects Good.

My bees have done well this year; I have taken off 1,200 pounds of surplus honey, and the prospect for their wintering well is good.
Navajo Co., Ariz., Dec. 3. J. A. LEWIS.

Light in Winter Stores.

I got 500 pounds of comb honey the past season from 16 colonies, spring count, and increased to 20. They are in the cellar in good condition. Bee-men in this county complain that their bees are going into winter quarters very light.
JOHN CLINE.

Lafayette Co., Wis.

A Poor Year for Honey.

This was a poor year for honey, altho my bees did better than my neighbors'. I secured 2,000 pounds of honey, 400 of which was extracted. I have 93 colonies in winter quarters, in good condition.

I am much pleased with the Danzenbaker hive, as I have had less unfinished sections with it than with the others, and only one swarm. I think it the best hive for comb honey.
G. W. BELL.

Clearfield Co., Pa., Dec. 7.

Report for the Past Season.

I started last spring with 20 colonies, increased to 34, and secured 800 pounds of comb honey, which I sold at 12 cents per pound.

The Bee Journal is all right.
ANDY SCRINGER.

Floyd Co., Iowa, Dec. 8.

Not Half a Honey Crop.

Bees did very poorly in this part of Ontario last season, not half a crop being secured. There was no basswood flow, which is very often our mainstay.

I think so much of the "Old Reliable" that it is a pleasure for me to introduce it; I could not get along without its weekly visits.
Ontario, Canada, Dec. 11. WM. AIKEN.

A Change in the Atmosphere.

I have 26 colonies packed well on the summer stands. The dry weather last May killed the white clover, and that was our main source for honey. The fall crop of heartease in the bottomlands was good for winter stores. The bees in the uplands are mostly in a starving condition.

It seems that there is a decided change in

the atmosphere in this part of the country in comparison with what it used to be. At times the bloom is, to all appearance, perfect, and there is plenty of it, but the bees pass it by. I have come to the conclusion that however large the crop of bloom, there will be no nectar if the atmosphere is not just right to produce it. Consequently tile-draining, clearing the land, and other like improvements have brought this peculiar condition about, and we will have to look to something besides bees in this locality for a livelihood. But we will trust that next season will be a good one, and will keep on reading the "Old Reliable" and do the best we can, and let the bees do the rest.

P. W. GREGOR.

Wayne Co., Ohio, Dec. 10.

Rocky Mountain Bee-Plant Seed!

(*Cleome integrifolia.*)

...FREE AS A PREMIUM...

The A B C of Bee-Culture says of it: "This is a beautiful plant for the flower-garden, to say nothing of the honey it produces. It grows from two to three feet in height and bears large, clusters of bright pink flowers. It grows naturally on the Rocky Mountains, and in Colorado, where it is said to furnish large quantities of honey."

We have a few pounds of this Cleome seed, and offer to mail a 1/4-pound package as a premium for sending us ONE NEW subscriber to the American Bee Journal, with \$1.00; or 1/4 pound by mail for 40 cents.

GEORGE W. YORK & CO.

118 Michigan St. CHICAGO, ILL.

HONEY AND BEESWAX
MARKET QUOTATIONS.

CHICAGO, Dec. 21.—The demand has fallen off very much of late, but prices have not declined to any great degree from those prevailing for the past 60 days, but any pressure to sell would cause a decline. Fancy white comb, 16c; No. 1, 15c; amber and travel-stained white, 13c@14c; dark and buckwheat, 10c@11c. Extracted, white, 7 1/2c@8c; amber, 7c@7 1/4c; buckwheat and other dark grades, 6c@6 1/2c. Beeswax, 29c.

R. A. BURNETT & Co.

KANSAS CITY, Dec. 6.—Fancy white comb, 16c@16 1/2c; choice, 15c; light amber, 13 1/2c@14c; dark, 10c. Extracted, 7 1/2c@8c. Beeswax, 22c@23c. Receipts very light; demand good.

W. R. CROMWELL PRODUCE Co.,
Successors to C. C. Clemons & Co.

BUFFALO, Dec. 20.—Honey continues to drag at quotations. Holiday business kills every thing, almost, but presents. Fancy 1-pound comb, 15c@16c; common, 10c@14c, as to grade. No extracted wanted.

BATTERSON & Co.

ALBANY, N.Y., Dec. 6.—Fancy white, 17c@18c; No. 1, 16c@17c; No. 2, 14c@15c; mixt, 13c@14c; buckwheat, 12 1/2c@13 1/2c. Extracted, white, 8c@8 1/2c; mixt, 7c@7 1/2c.

The honey market is steady with receipts and good, stiff prices. Extracted, market quiet and but little movement. Will be more demand later on.

H. R. WRIGHT.

BOSTON, Dec. 7.—Our market on honey continues strong, with light receipts. Fancy one-pound cartons, 17c; A No. 1, 15c@16c; No. 1, 15c; No. 2, 12c@13c. Extracted from 7 1/2c@8 1/2c cents, according to quality. Beeswax steady at 25c@27c.

BLAKE, SCOTT & LEE.

CINCINNATI, Sept. 21.—The demand for fancy comb honey is good and finds ready sale at 16c@16 1/2c; No. 1, 15c. The demand for extracted honey at present is slow and offer same by the barrel as follows: White clover, 3 1/2c@9c; Southern, 6 1/2c@7 1/2c; Florida, 7c@8 cents, according to quality. Beeswax, 27c.

The above are MY SELLING PRICES. I do not handle any honey on commission, but pay spot cash on delivery.

C. H. W. WEBER.

NEW YORK, Nov. 20.—Good demand continues for all grades of comb honey. We quote: Fancy white, 15c@16c; No. 1 white, 14c; No. 2 white 12c@13c; amber, 12c; buckwheat, 10c@11c. Extracted in fairly good demand at 7 1/2c@8c for white, and 7c for amber; off grades and Southern in barrels at from 6c@7 1/2c per gallon, according to quality. Not much demand for extracted buckwheat as yet. Some little selling at 5 1/2c@6c. Beeswax firm at 28 cents.

HILDRETH & SEGELKEN.

DETROIT, Dec. 10.—Fancy white comb, 15c@16c; No. 1, 13c@14c; dark and amber, 10c@12c. Extracted, white, 8c@8 1/2c; amber and dark, 6c@7c. Beeswax, 26c@28c.

M. H. HUNT & SON.

SAN FRANCISCO, Dec. 5.—White comb, 13c@14 cents; amber, 11 1/2c@12 1/2c; dark, 8c@9c. Extracted, white, 7 1/2c@8c; light amber, 6 1/2c@7 1/2c; amber, 5 1/2c@6 1/2c. Beeswax, 26c@28c.

There is no opportunity for much activity in this article, spot stocks being of such slim proportions as to admit of little other than a light jobbing trade. Market has a firm tone, with prospect of values being maintained at current range throughout the season.

A HONEY MARKET.—Don't think that your crop is too large or too small to interest us. We have bought and sold five carloads already this season, and want more. We pay spot cash. Address, giving quality, quantity and price.

No. 4 "Barler Ideal" Oil-Heater.

The "Barler Ideal"
OIL-HEATER....

Saves Its Cost Every Year!
NO ODOR! NO SMOKE! NO ASHES!

Costs only a cent an hour to run it.

The editor of the American Bee Journal is using the "Barler Ideal" Oil Heater, and it is all right in every way. We liked it so well that we wanted our readers to have it too, so we have recently arranged with its manufacturers to fill our orders. The picture shown herewith is the one we recommend for general use. It is a perfect gem of a stove for heating dining-rooms, bed-rooms, and bath-rooms. It hinges back in a substantial way, and is thoroly well made thruout. The urn removes for heating water. The brass fount, or well, has a bail, and holds nearly one gallon of kerosene oil. It is just as safe as an ordinary lamp. You wouldn't be without it for twice its cost, after once having one of these stoves. Most oil-stoves emit an offensive odor, but this one doesn't. Its height is 2 1/4 feet, and weighs 20 pounds, or 30 pounds crated ready for shipment, either by freight or express.

Price, f.o.b. Chicago, \$6.00; or, combined with a year's subscription to the American Bee Journal—both for only \$6.50. FULL DIRECTIONS GO WITH EACH STOVE.

If you want something that is really serviceable, reliable, and thoroly comfortable, you should get this "Barler Ideal" Oil Stove, as it can easily be carried by any woman from one room to another, and thus have all the heat you want right where you want it.

The Ohio Farmer
—AND THE—
American Bee Journal,

Both One Year for only \$1.40.

THE OHIO FARMER is clearly one of the leaders of the agricultural papers of this country. It is a 20-page weekly, often 24 pages, handsomely printed on good paper, and CLEAN in both reading and advertising columns. It has the largest actual staff of editors and correspondents (all farmers) of any farm paper published, and is practically progressive in defending the farmer's interests.

IT WILL HELP YOU MAKE "THE FARM PAY." Send to OHIO FARMER, Cleveland, Ohio, for a free sample copy.

REMEMBER, we send both the Ohio Farmer and the American Bee Journal, both one year for only \$1.40. Address,

GEORGE W. YORK & CO., 118 MICHIGAN STREET, CHICAGO, ILL.

Four Celluloid Queen-Buttons Free

AS A PREMIUM

For sending us ONE NEW SUBSCRIBER to the American Bee Journal for three months with 30 cents, we will mail you FOUR of these pretty buttons for wearing on the coat-lapel. (You can wear one and give the others to the children.) The queen has a golden tinge.

This offer is made only to our present regular subscribers.

NOTE.—One reader writes: "I have every reason to believe that it would be a very good idea for every bee-keeper to wear one (of the buttons) as it will cause people to ask questions about the busy bee, and many a conversation thus started would wind up with the sale of more or less honey; at any rate, it would give the bee-keeper a superior opportunity to enlighten many a person in regard to honey and bees."

Prices of Buttons alone, postpaid: One button, 8 cts.; 2 buttons, 6 cts. each; 5 or more, 5 cts. each. (Stamps taken.) Address,

GEORGE W. YORK & CO., 118 Michigan St., CHICAGO.
