FOREMENT INTELLIGENCE. The Lower of Napoleon I. — M. A. Léo has pub-lished an elaborate series of papers on that hage palace, from which we derive the following sketch of the Lowre, as it *was* projected under Napoleou I.— "The Emperor fully appreciated the plan of Bernini, and wished to execute it. Bat there are plans of amhition (even in the arts), which a wise economy disguades to follow. Because and Provision the letter and wished to excente it. But there are plans of amhition (even in the arts), which a wise economy disandes to follow. Percier and Pontaine, the latter lowing plan:—There was to be a gallery contiguous to the library, and parallel to the façale of the Tuilories, which reached ou one side the build-ings of the Rue de Rivoli, and towards which the south and north wings of the Loure were to be prolouged. The north part of the palace had to re-ceive, on the side of the Palais-Royal, a chapel, the durante to which was a pouldar to that of the Muscle, and a little further the great Opera building was to rise. Hetween the new building on the south side of the court, and the gallery on the bank of the Srine, a Court de Serrice was intended. This plan approached much that of Perroult." Messrs. Percier and Footaine excention, however, that spleadid monu-mental stircesse, which icd formerly to the gallery of paintings, and which did nuck contribute towards the fame of these two archites. Inanguration of the Lourne, Paris.—The Moni-

the tame of these two architects. Inauguration of the Lowre, Paris.—The Moni-teur announced that, on the 14th instant, at two, p.m. the emperor in person would inaugurate the uew buildings of the Palace of the Louvre, begun in 1852 and finished in 1857. Paris Exhibition. Charles V. at St. Just.—This picture of M. Palace there were the second second second picture of M. Palace there were the second second second second the second seco

Paris Exhibition. Charles V. at St. Just.—This picture of M. Robert Fleury may be considered as one of the best amongsta deal of mere handlieraft of art. It represents a richly decorated sallon of the Convent-Palace of St. Just, when the aged monarch, Convent-Fance of St. Sats, which the agent moments, borne down by illness and *ennai*, received the mes-senger of Philipp II. to engage bim to re-occupy bis former position, to which he gave a declining answer.

Paris.--Menilmontant. - Menilmontant, that charming suburb of Paris, where J. J. Rousseau dreamed, is to be cleared away, although for a useful purpose. As the people's *alimentation* is one of the great topics of Paris journalism, M. Victor Bonie has put forth a plan of a "Matché central de la Boucherie Parisienne." of rars journalism, M. Oracla Doub may part for the plan of a "Marcbé central de la Boncherie Parisienne." M. Bonie places in the middle of his plan a large covered *rotonda*, this being the central **bul**, of more than three hectares of ground surface, where men and heast would be, at all times, under shelter. As the whole of Paris is necessary under shelter. As the whole of Paris is necessary is circular railway, there will be a branch line starting from its necessary. part to the a black the starting from the heated without transslipment from the farm direct to the slaughterhouse. The site of Meinimontant has been chosen on account that out of the I,300,000 inhabitants of Paris, 349,000 only live on the left bank of the Seine.

Paris : Improvements in the Cité .- These im-Paris: Improvements in the Cité.—These im-provements, hegmn in 1836 and 1839, are to be com-pleted on a great scale. According to the plan, the Rue Constantine is to he continued from the Rue d'Arcole to the banks of the Scine, amogst a heap of old and rainous houses. At the top of the Rue Con-stantine thus prolonged, the archiepiscopal palace would rise on the eastern point of the Isle de la Cité. This new piercing would make a new passage from the Quai Napoleon to the northern portal of Notre Dame, which would then he seen from the great soloon of the Hôtel de Ville. This street would ent the Rue Constantine at right angles, and the four finest huild-Constantine at right angles, and the four finest huildings of Paris would be visible at one sight. The expense of these improvements would not be very great, considering that the houses to be pulled down great, considering that the noises to be print about are of little value, and those erected in such cleared localities being worth the double of the former old masures. However, of ancient Paris there will be soon no vestige left.

The modelling of the arrangements connected with the indication of the arrangements connected with the indication of the arrangements connected with the ands attention. The prime of the sense of the definition of the arrangements of the sense of the s

of this quality will for any length of time engage attention. They apply this axion to the pictures of Rodelph Hapsburg, by Schwind, and the Ascent to Heaven of Christ, by Schwind, We cannot follow the writers of the Ally. Zeitung in comparing the former figure to that of a master tailor (Schwider-meister), &c. The Genre-bilder of Bischof, J. Zim-mennon Creat is a can activity of the meister), &c. The Genre-bilder of Bischof, J. Zim-merman, Gugel, &c. one representing a scene of Vermerman, Gugel, &c. one representing a scene of Ver-soilles of the olden time, are more favourably spoken of. While historical pictures are now made after sickly models or dolls (!), the landscape is the only thing possessing a foundation of real apperception. Tous Isar scenery hy A. Zimmerman is much preised, which has procerred for this young artist a call as professor to the art academy of Milan.

Berlin : New Gates, Sansouci .- The new gates to that former residence of Frederic the Great arc now completed, and form a worthy entrance to that his-torical palace. Four large iron columns, each of the Weight of 30 ewt, topped hy heads in the form of Hernes, support the four parts of the main railing. Each of these weighs 18 ewt, and is ornamented with weighter a start of the main railing. with arabespres, chiff es, laurel wreaths, &c. Most of these oronneous are richly gilded. The Freidens-kirche, ornamented last year with two Roman columns, Most and other palaces and public buildings, add to the find sights of this part of Potsdam.

Bararia : a National Work.—By order of the king the first volume of the work entitled "Bavaria," will appear at the close of the year. The whole work, destined for universal circulation amongst the work, destined for universal circulation amongs the nation, will comprise four vols. of about forty sheets of impression each. It will contain a succinct his-tory of the country in its external relations, a general statistical description of the lood and its inhabitants, and an outline of the constitution and administration of the realm will conclude the introductory volume The remainder will cootain a detailed description of the different *Kreise* (connties); their chains of moun-tains, net of rivers and water-courses, character of the landscape, the climate, the geological geographic cha-racter, and distribution of the animal and vegetable Kingdoms. The ethnographical portion will comprise the bodily and sanitary condition of the people, moral physiognomies (1), sketches of popular and enlure his-tory, and the social condition. It will also dilate further on the habitations, towns and villages, cloth-ing and nonrishurent, the different dilatects spoken by the Bavarian people, and their peculiar habits and customs. The agricultural and horitoultural condi-tion, the condition of the forests, iodustry, trades and commerce, will also be traded. The history and de-scription of each Kreis will, in fine, cubrace a descripthe different Kreise (counties) ; their chains of mouncommerce, will also be treated. The history and de-scription of each Kreis will, in fine, embrace a description of monuments and remarkable buildings, and the various art curiosities contained in public and private collections. [Such a work deserves to be imitated throughout Europe.]

GAS.

It is well known, says a French paper, that the illuminative power of gas may be beightened hy mixing it with the vapour of liquid hydro-carburet. But when this mixture is effected at the gasworks, the gas, in its progress along the pipes, loses a consid able portion of the hydro-earburet, on account of gas, in its progress along the pipes, loses a consider-able portion of the hydro-earburct, on account of the partial condensation of the latter; so that the effect obtained is much inferior to what might be expected. M. Lacarrière, a manufacturer, has just invented a small apparatus, which the cells a "Saturator," by which the mixture of the gas with the vapour of the before accurations. hydro-carburet may be effected on the consumer's premises, thus obviating the inconvenience and loss alluded to. The substance he uses for this purpose is a compound of several hydro-carbriets, known in trade under the name of Benziue-Collas. About forty grammes of benziue to every cable metre of gas will grammes of behavior to every endoe mettre of gas will increase the intensity of light by seventy per cent. There is, however, a serions objection to the general introduction of this method in the high price of benavice, which at present costs 2f. 70c. per kilo-gramme; whereas, to apply it usefully in an economical point of view, the highest price that could be admitted output not a grand new former. point of view, the induces price that could be attimited ought not to exceed one franc.—Alex. Ross, Jas. Vallentine, A. Murray, and Alex. Don, Fettereairn, Kineardineshire, bave invented a new process for purifying coal gas, by the use of all kinds of pine-tree and hard wood, either in a state of sawlast or in The half hard wood, either in a state of sawdust or in a chorped and bruised condition, in lieu of the ingre-dients hitherto employed for purifying coal gas; the same ordinary purifying apparatus, without alteration, isorving for the purpose of purifying gas accord-niog to this invention, thus:--The gas coming into contact with the sawdust, or wood in any other state, chornical action accure and affect the purification of chemical action ensues, and effects the purification of the gas, and the purifying matter (wood) is converted

THE BUILDER.

gas, and the residuum in the retorts will be pure chareoal.——The *Yorkshire Gazette* states that a firm in York have received instructions to fit up the *Great Eastern* steam-ship with gas-works, and all necessary gas-fittings, on a most elaborate seale.— A recent reduction of 100, per thousand feet has heen the work and the catraction of the theorem to the control of the present day. hrm in 10rk have received instructions to it up the Great Eastern steam-ship with gas-works, and all necessary gas-fittings, on a most elaborate scale.— A recent reduction of 10d, per thousand feet has heen made in the price of gas at Otley; namely, from 7s. 6d. to 6s. 8d.—The Worcester Gas Company have declared a dividend at the rate of seven per cent. ----In boring for water in Crystal-street, Hull natural jet of gas has been found, which yielded Hull, a once a flame two yards in height, sufficient to light all Hnll

ALDERSHOT HOSPITAL. VENTILATION.

SIR,—In reference to a notice in the Builder, of July 11th, together with the aditorial note attached to the same, touching Nelley and Aldershot hos-pitals, may I beg a spare corner in your paper for the iug.

Although many of the advantages cootained in my designs for the military hospital at Aldershot are remarked upon by "Juste Judicato," there are others, of still more importance, which require a brief notice : among these are warming and ventilation.

From the large amount of space given to each patient (about 1,500 enbie feet), it may be considered by some that very special efforts connected with venby some that very special efforts connected with ven-tilation are unnecessary. I am, how ver, far from such an opinion : I believe that in apartments of all sizes, and to whatever purpose appropriated, too much care cannot be bestowed upon this most essential pro-vision for the promotion of both health and comfort.

The manner in which rooms are now constructed in my opinion, really criminal; one would suppose in my opinion, really criminal; one would suppose at every pains and care were taken to render them thoroughly uncomfortable and nobealthy as posthat every sible they are positively as much like air-tight baces as they can be. They have no properly construct d inlets for fresh air, which is left to get in as it can, through the childs and erevices of ill-fitting doors or windows. It is a mercy, for the sake of f their nmates, that the joiner does not more perfectly cominnates, that the joiner does not more perfectly com-plete his work: were he so to do, the chances are that they would not "live out half their days," where the foul or respired ni is guardedly retained, as though tenacions of losing one breath. It is scarcely necessary to say that when air bas passed from the lungs it has acquired that levity with which Nature, in her woadrons adaptations, has invested it, and by which it rises to the ceiling,—if not allowed and by which it rises to the ceiling, --- if not allowed to escape, spreads itself out into a thin layer over the to escape, spreads itself out into a thin layer over the cold surface of our plaster ceilings,—condenses into a leavier gas than the pure sir, and from thence descends upon the nuforfunate invates of the opart-ment, to be by them re-inventided. It is true that a portion escapes up the chinney (provided there be a fire hurning), but it must be borns in mind, that as the chinney-place is mustally lower than the months of persons sitting in the rooms, so in its passage to the fire-place it must pass below the level of their monthis, and consequently be inhaled, with all its siekly and pestilential qualities.

months, and consequently be infinited, with all its sickly and pestilential qualities. Considering, therefore, that uature would effect all the purposes of ventilation if we did not prevent her, I decided to construct the wards of the hospital in question so as to offer as few impediments to her un-uided action as possible. Thus, firstly, as to the admission of cool fresh air. I propose introducing it through the flooring, down the centre of the ward, so that passing between the foot of one bed and the foot of the opposite one (for the heds are opposite to each other, down both sides of the room), it will keep the ward thoronghly pure, while it will offer no dranght to the patients, whether in or out of bed. The mode of its introduction is most simple—as follows:—The ceilings to he arched brick work', running longitudinally, "rendered" to a fine face, to offer as little impediment to the upward drainage of the respired air as possible; these supplied with per-forated glazed earthenware key-stones, divided horionce as intic impediated to the upward orlange of the respired air as possible; these supplied with per-forated glazed extleaware key-stones, divided hori-zontally into two compartments, the under half receiving the vitiated air from the lower ward, while the upper half supplies the ward over with pure ecol-air, throng its perforated surface in the floor advec, the former to be connected with a fire-place at the extremity of the building, which is to be constantly burning, and thereby extracting the respired atmo-sphere night and day; or the arches night be placed transversely across the ward, which would allow the foul air to escape on eiber side of the building, according to the manner in which the wind was blowing. The upper half of the earthenware key-stone communicates with the external air by small fues at short intervals, to introduce the cool fresh air into the ward. I firmly believe this would be sufficient for all healtiful purposes, and contrivances table gas, and the purpying matter (wood) is converted mote at short intervals, to intervals, to intervals, to intervals, the mathematical structure of the mote and the introduction of the most approved machinery that extraction shafts, fans, pumps, and contrivances must have its baneficial effect upon the whole huilding process of manufacturing coal gas, when it will be of this sort are needed, when the building is designed at trade in general. The huilding in question is 160 of the sort are needed, when the building is designed at trade in general. The huilding is designed at forder of the sort are needed, when the building is designed at the feet long by 55 wide, containing twenty-eight sawing-

suggested that the external air passes into fire-store chambers behind the stoves, and from thence to the wards in positions most convenient for its thorough diffusio

itusion. The latrines, sculleries, bath-rooms, and washing rooms, are all in an ortagon tower at the end of each ward; and as these towers will always he at a higher ward; and as these towers will always he at a higher temperature than the ward; it will be quite impos-sible that disagreeable effluria should pass towards the patients in the wards, even supposing the double doors which are provided were both left open. Independently of the large wards for twenty-five men each, there are smaller rooms for a less number

of patients, besides an operating room to each block, with doctors' rooms, and the usual offices and apart-

with doctors' rooms, and the usual offices and apart-moctor requisite for a military hospital. In conclusion, I beg to say. I am extremely pleased that the designs proposed hy me, under the orders of the Royal Engineer Department, for the hospital at Aldersbot, should be found to be in ac-cordance with the "suggestions," that you state have appeared in the *Builder*, as that bas strengthened mo-in-monitor that the nuiverbase accords a theorem. appeared in the *Builder*, as that bas strengthened me in my opinion that the principles are correct, although at the same time I cau assure you that I have not benefited by them, never having seen the "article" you have referred to, the general plan having been completed more than six months since. I may also state that I have explained the drawings to Miss widthing the have in a summunicity much me Nightingale, who, in a communication with me, was pleased to say :- "I consider the ground plan as the most perfect example of the block system I have seen: the Prench and the Russians, ever before us in euryping out that which we ourselves have originated, are adopting this plan—corps de bátimens—(for a great number of sick) uoiversally. Yours is superior to the Laribosière at Paris, in the greater distance hetween the blocks, and the better construction of the lattines.

As my professional connection with the Govern m nt ut terminates very shortly, I feel particularly atified at baving received the commendation of that gratified at having received the continentation of the lady, as well as others to whom I have had the plea-sure of explaining my design, although it is only fair to state that there are points connected with ventila-tion upon which Miss Nightingale and myself par-tially differ. F. WARDURTON STENT. and myself par-

THE CARRARA MARBLE WORKS.

CARRARA, a place familiar to all soulptors and architects, with its inexhanstible supply of marble for the whole world, bas hitherto been, as it were, an-conscious of the improvements of the ace, and modern machinery of any kind has been a thing unknown there, notwithstanding its great commerce with the whole civilized world. The sawing-mills are little hetter elvinzed world. The sawing-multis are little hetter than a few buls, wherein the same appliances used 300 years ago in the shape of machinery are still in existence; for in Carrara, more than, perhaps, in any other part of Italy, the people are greatly averse to chunge or improvement of any kind. In all the marble-mills here, the same old wooden rule machi-chinery exists which must the same minimale didition where the same principle, did its work 300 years ago: the original wooden spiked eog-wheels, scoop water-wheels, and the rest, are still in motion,-hence the uneven, bad sawing that exists Content to jog on as their fore athers did-jealons of innovations of any kind-the Carrara marble n the age, resisting to the utnost the application of the age, resisting to the utnost the application of those high mechanical attainments to which we have the age those might mechanical attainments to where we have at the present day arrived. Time, however, must tell them that the introduction of the modern arts in machinery is for their own advantage. The com-mencement of the user are has, however, begun; and amongst all the old jinerack and rule modes of apply-ing the great water nowr of this construct surponent. ing the great water power of this country, surmount-ing all difficulties (and they far from few), the energy of one mind has at length, amidst all the jcalousies of parties and state duties upon machinery, made a revo-lution in the marble trade in Carrara. The extensive mills just creeted by Mr. Wm. Walton in that eity are the first step to the passing away of all things old Wm. Walton in that eity

frames, each frame capable of holding 100 saws, making seventy direct cuts per minute. In one part stand the polishing-machines, lathes for turning columns, planing-machines, &c. Large travellingeraues travel the entire length of the building, bringing up the blocks and depositing them ander the frames, and in like manner removing the cut slabs for erportation, which are adhesively put together so as to transport them in one block, thereby avoiding the great risk in breakage.

the great risk in hreakage. The whole of the machinery is of wrought and cast iroo, the frames being supported by four eastiron pillars each, over which are placed the saud and water boxes, which supply and regulate themselves when the machinery is in motion. The blocks, when onder the operation of swinz, rest upon six-wheeled waggons, securely screwed down, thereby securing steady and even cuting, a thiog so much desired by the marble trade. The whole of this large mass of machinery is pot in motion from a Turbine waterwheel, only 5 feet 6 inches in diameter, haviog a diract fall of water of 18 feet. This wheel is placed under the factory, so that no motive power is visible save the shafts runoing through the building. The water is obtained from the river Carrione, and conveyed hy an aqueduct, about a quarter of a mile long. The last arch of the aqueduct is enread, at a radios of eleven yards. This is the first andectaking of Moleon, and may be coosidered as a new epoch in this dormant conctry. Tew people can imagine the amout the introduction of new machinery: there has heen no invention that jealousy and noimosity could hrid og ott that bas oo theen put in motion to retard and obstruct the works, and which nothiog but a resolute and be first works, and which used so for 7,0007. The same gentleman has, we believe, offered a preminum of 2007. for improvements, in the best mode of outling and polishing marble.

THE NAMES OF SLATES.

We sometimes find, in our various and many-sided contemporary, Notes and Queries, items of curious knowledge belonging to our specially. Here, for example, is a communication on slates:-

"The whimsical names new io use, 'Princesses, Duchesses, Countesses, and Ladies,' are said to have been given by General Warharton, the proprietor of some of the great quarries io North Wales about a contry ago. Perhaps it is out generally known that hefore that time names still more whimsical were used. The following list is taken from that very extraordinary collection of curious information, a 'portable library,' as some former owner of my copy and Blazon.' As Holme was a Cheshire man, we may he prety sure that he gives us the names then need in the slate districts:—'Mames of slates according to their soveral lengths:—Short Haghattee, Long Haghattee, Farwells, Chitts, Warnetta, Shorts, Shorts save one, or Short so won, Short Backs, Long Backs, Jeony why Jettest thou, Rogue why Winkest thou. The shortest slate is ahout 4 inches, all the rest exceed an inch, one in length from the other; sometimes less or more, according as the workman pleaseth.'— 'Academy of Armory,'&c. h. iii. e.v. p. 265. According to this explanation the 'Long Twelves,' were shout 16 inches in length, or 12 jonkes longer

According to this explanation the 'Long Twelves' were about 16 inches in length, or 12 ioches longer than 'Short Haghattees;' hence, probably, the name of 'Long Twelves.' The largest sistes, 'Rognes,' must have been about 18 ioches loog. There is nothing said about the hreadth. The largest slates now used, 'Princesses,' I believe are about 24 inches long. J. W. PHILLIPS.'

Miscellanca.

OLD "TROLLOP" AGAIN.—Out good and gracefal contemporary, the *Builder*, meditatiog among the tomhs, throws the following stone at our poor parish:—Amongst the ludierons and ecceotrie cpitaphs, perhaps one of the vorst is that at Gateshead, on Robert Trollop, architect of the Exchange and Town Court of Newcessite:—

of Newcastics. Here lies Robert Trollop, Who made you stones roll up: When death took his soul up, His body filled this hole up.

How often must we say that there is no such epitaph "at Gateshead"—and never was? Trollop was buried in our churchyard, but with no such epitaph. The Builder's quotation from Mr. Pettigrew helongs not to "posthuroous literature," but was written as a joke while Trollop was in the flesh.—Gateshead Observer.

ACCIDENTS. — At the Thames-hank saw-mills a poor fellow, last week, had hoth of his arms cut off, and was carried to St. George's Hospital, to which a horther of his had just hefore heen taken, after falliog from a cab acd receiving injuries of which he died, as also did the sawyor himself, shortly sfterwards. Nerrousness on account of the accident to his brother led to his own sad fate. — The holt of a fly-wheel having got loose aod dropped into the main gear wheel of the machinery of a floundry and machineinto onnerous pieces, the boilter smashed, and the whole of the machinery reduced to a mass of ruins. Various persons were injored.

REPORT ON DRAINAGE, &C. AT KENSINGTON.— A report by Mr. James Broadhridge, the surveyor of St. Mary Abbotts, Keosingtoo, has been printed by authority of the vestry. From this document it appears that during the four or five years that the Kensiogton Improvement Act was in operation, from 1831 owards, a great many improvements were effected, and that the total sum expended on paving aloue was 9,0244, old. The report coters ioto details as to the particular drainage and other works dooe since the passing of the Act. The total lengths of sewers in the parish and under the direction of the vestry are,—hrick sewers, 27² milles; jue sewers, 7³ milles; and open sewers, 1⁴ mile. Mr. Broadbridge, as we koow, is very active to his vocation. ROYAL CONWALL POLYTECHNIC SOUTER.—This

ROYAL CORNWALL POLYTECHNIC SOCIETY.--This society will hold their exhibition on the 29th and following days, and are soliciting the loan of objects of interest. They aonoaoce a number of prizes, amoogst them in the fice arts, competition in this department being restricted to amatenzs. Fremiums of one pound each are offered to persoos under eighteco years of age for the following subjects:--1. For the best-filled sketch-book from nature. 2. For the hest series of six followers from nature, io chalk or pencil. 3. For the hest series of six sketches, io water colours, of different rocks, showing their jointed structure and characteristics. 4. For the best watercolour drawing of a mossy stone, the flower of the hydrangea, a primose-plant natural size, or other suitable natural object. 5. For the hest isometrical drawing of a huilding in the county. 6. For the hest engraviog on wood, or lithograph.

GIFT OF PUBLIC FOUNTAINS TO THE TOWN OF BLACKNURN.—MIR. PIlkington, mayor of Blackburo, has aonoucced to the general purposes committee there that he will make the town a present of three public funntains. The large one will be placed to the right of the principal entrooce to the park, another in the small reservoir at the foot of the artificial waterfall, and the third io the small sheet of water to the left of the large one. The park is fast approaching completion, and is visited by thousands, particularly on Sundays. The conduct of the working classes hitherto in the park is said to be admirable.

park is said to be admirable. ALUMINIUM.—This new metal is still making hopeful progress. The *Blining Journal* states that Mr. F. Wm. Gerhard, of Trafalgar-square, has patented a simple and ecoomic process for obtaining the metal, whereby it is produced at a considerably less expense than by the means heretofore practised. In this process hydrogen gas combines in an oven with the flooride of aluminium, and forms hydro-fluorie acid, which acid is taken up by iron, and is thereby converted into flooride of iron, whilst the resulting aluminium thus obtained remains in the metallic state in the bottom of trays containing the flooride.

FIES, RE METROPOLITAN ÉUNOUS BUILDINGS —Permit me to call your atteotion to the miserable scale of fees contemplated to repay services in regard to minous structures, by the Metropolitan Board. To form a correct judgmeet of the object, it is well first to consider for whom these services are to be performed, or rather, perhaps I should say, ly whose mellect they are rendered necessary, in order to protect the lives of the occupants, that is to say, of these who pay the rent. They omit to do the necessary reprires to uphold the premises, possibly their own property, possibly held merely upon lease. Well, in commiscration for these very parties, the court are about to repay the competent and experienced professional men whom they employ in tuces arduous and responsible duties fees varying from fice shillings to *lwenty*. The professional men would, in the ordiuary course of such duties, receive many times these amounts. But to save those heartless landlords who reaging the its, in fact, a premium upon their neglect. And when once the fee is so hardly armed and due, how is it to he levied? There will he as much trouble in getting the fee as earning it. Fray yo through the list, item y item, and expose the injustice of *renearing* the responsible duties of firstrate professional men, *their own officers*, by such hermuoeration as mere bacelle's fices.—ARCHTRECT.

[Aug. 15, 1857.

APPARATUS FOR ENTERING FOUL AIR WITH.--Mr. Kay, manager of the Gas Works in Dundee, has recently submitted to the Royal Scottish Society of Arts an invention which is thought likely to be useful in all eases where it is necessary for persons to enter places filled with gas, or choke-damp in any form, smoke, &c. It is a covering for the head, resembling a diver's hood, eaabling the wearer to breather fresh air supplied hy a pipe from a distance, and its utility has been tested by Mr. Kay himself having gone with it into a gasholder filled with gas, and remained there half an hour quite minjured. The Society of Arts in Edioburgh remitted to their Committee on Inventions to examice Mr. Kay's apparates; and the committee report that the apparatus is capable of being used with great advantage, not only in gas works, but in wells, mincs, cesspools, and hrewers' and distillers' vats, heing evidently as well adapted for a security against carbonie soid, or any other deleterious gas, as against earbunetet ad hydrogen.

THE LONDON MASTER BAKERS' PENSION SO-CIETT ASYLUM.—The foundation-stone of the almshouses to be creeted for the reception of master bakers who had become in ucedy circumstances, was laid on the 5th instaot. The site selected is contiguous to the Lee-bridge-road, about a mile from the station, and a short distance from Snaresbrook. A piece of freehold land there has heen purchased at a cost of 1,350,0 npon which there is space to erect fifty-four almshouses, and a plan for that object, in the rustie Halian style of architecture, has been furnished by Mr. Knightley, architect, which, when carried out, will form three sides of a quadrangle, with towers in the rear of the two angles. At present, however, the funds ooly admit of a portion of the plan being carried out to the extext of ten almshouses, which have been cootracted for by Mr. E. Clarke, of Tottenham, huilder, at 2,270.

More STNEING OF HOUSES IN LANCASHIEE.— At Barosley a short time since there was a coosiderable alarm in the neighbourhood of Worldey-street, from the foundations of a number of buildings having given way in consequence of the coal underneath having heee got. Since then the buildings in that vicioity have further given way; and at C.leodar works there ao accident has occurred to the machinery, hy pressure from the giving way of the foundations. Occurrences of this nature have previously takeo place in Barnsley, but coue of such magoilude as the pressot. The giving way of the holidings has heen atteeded with such noises that the tenants have deserted their dwellings. Many huildings in Wilson's place have given way, but not oearly to the extent of those alluded to.

CAST HOON RAILWAY SLEEPERS.—A pamphlet has been published by the Permacent Way Compasy, Westmioster, on east-iron sleepers, pointing out their superiority over those of timher, especially under certain new forms, in which the metal is coosidered to be arranged to the best advactage, to prevent breakage, &c. It is calculated that the saving of the cast iron read, as compared with an ordinary timber read with a similar hearing surface, is 337. 4s, per mile per anuum; requal to 531,2004. on the whole mileage of the kiogdom. Many of the early trials of east iron sleepers, however, were by no mens successful; hut this, it is alleged, was from want of a proper disposal of the metal, and from the high and fluctuating prices of iron. Of late years the price of irou has heen more moderate and steady, and if our home consumption of iron could be (profitably or uschuly) made to supersede the present coosumption of foreign timher for such a purpose as this, a national benefit would be realized. The idea of substituting iron of a proper form for sleepers, in the place of wood, which is so subject to decay, does seem to be a good one. The advantage, we should think, would be particularly olvicos in tropical countries, as in Iodia, where insects prey so rapidly on timher. Kew GANDENS.—The even museum is now opeo.

Kew GARDENS.—The eew muscum is now opeo. The gardens are in all their summer beauty and splendour: they are open free every week-day at one, Sundays, at two. The plun-house, museum, and fifteen other conservatornes close at six; the hotonic gardens at seven; the pleasure-grounds at eight. The Victoria regia is now blossoming in the tropical aquarium erected specially for it at a cost of 3,000 guineas.

The BURNLEY SURVEYORSHIP.—Mr. J. Briedey having resigned the office of surveyor to the Burnley commissioocres, in coosequence of his appointment as surveyor to the Blackhern corporation, the streets and buildings committee reported that there were forty-three applicants for the office. Out of these the committee selected the following, and iovited them to attend the general meeting;—Mr. William Cohran, Rughy; Mr. Goorge Laing, Birmingham; Mr. Richard Charlesworth, Halifax; and Mr. William Yoang Hardie, Blackharo. Mr. William Cohran, was specially recommended to the general meeting, and was elected to the office hy a large majority. Aug. 22, 1857.

Vol. XV.-No. 758.

HALDEA is a land of mystery.* The interest with which the recent excavations at Ninevch, and the remains of its ancient temples and palaces, have been regarded, has been not a little enhanced by the still more recent. restarches and discoveries at Bírs Nimrúd, or Babylon, Múgeyer or the Ur of the Chaldecs, Warka, or the Ercch of Nimrod, and other sites of ancient cities in Chaldea and Babylonia. From the frequent allusions to the three associated regions of Assyria, Bahylonia, and Chaldea in the Bible, and from all that history, profane as well as sacred, discloses as to their ancient inhabitants,

these researches and discoveries have conspired to render this district one of the most distinguished and most important, not only to eccle siologists, but to archaeologists in general, throughout the whole of the civilised world. To every helicver in our sacred records, iudced, this is even hallowed ground. Here, as we think could easily he shown, was (perhaps mys-tically) located that "Paradise of God," which, tearly located that "Paralise of God, which, according to the Revelations, *still exists* (though no longer *here*), with its "tree of life in the midst" thereof; *i* just as, in subsequent agos, that heavenly "Canaan," which was hut ano-ther name for the Paralise of God, was figuratively located only a little farther to the westward, in Palestine, the land of the Philistines, and to inherit which "the father of the faithful was "led, hy the Spirit of the Lord," out of the euough, is now helieved to have heen a city, if not a land, of the dead.

That the Garden of Eden, according to the Bible, occupied (figuratively or literally), in antediluvian times, that very site which, after the Flood, was known as Chaldea, we think can easily he shown from a little consideration of the four rivers which united at this "Garden of the Lord,"—this "God's Acre;" two of these heing "the great rivers" Euphrates and Hid-dekel (or Tigris), which do there unite; hut our sole object in even hinting at such a conelusion here, is merely to indicate one of the chief of those sources of the peculiar interest with which we all regard the ancient Chaldea, Bahylonia, and Assyria; as to the long-huried and forgotten architectural remains of which we

simply intend to present to our readers a few particulars, gleaned from the very interesting volume lately written hy Mr. Loftus, who has explored and excavated some of the more im-portant of their vast and sand covered "heaps." One of the most extraordinary circumstances connected with the recent excavations in Chaldea is the discovery that the whole of this desolate region is thickly studded with cities of the dead, sepulchral temples, and mounds containing myriads of terra-cotta, slipper-shaped coffins, -- a circumstance all the more remarkable that, in the associated land of Assyria not a single tomh has ever been found. The obvious conclusion deduced by the enterprising excavators to whom we are indebted for a knowledge of these circumstances is, that, in alt probahility, Chaldea was the ancient burial-ground of Assyria itself, whence the dead were floated down the Tigris, like another Nile, to this land of the departed and the shades of Assyrian life. There are citics of the dead in this very "land of spirits," and to this very day, to which "the faithful" of the Persian people are sent, after death, from all parts of the Persian empire, and even from India, there to be buried with their fathers, on ground consecrated to that end from time immemorial, in the "marshes of God," as much of the land of Chaldea is specially called. Such citics of the dead are Nedjef or Meshid Ali, and Kerhella, on the western or Chaldean border of the Euphrates. The remains of aucient cities of a similar order which have heen recently uncovered, lic farther to the south. Múgeyer and Warka are the modern names of the most im portant of these; hut indeed the whole region of Lower or Southern Chaldca abounds in sepulchral cities and temples, of immense extent. The enormous accumulation of human remains at Warka proves that it was a peculiarly sacred spot, and that it was so esteemed for many centuries.

centuries. "It is difficult," says Mr. Loflus, "to convey any-thing like a correct notion of the piles upon piles of human relies which there utterly assound the beholder. Evrepting only the tringular space between the three principal rouns, the whole remainder of the platform, the whole space between the walls, and an unknown extent of desert beyond them, are everywhere filled with the bones and sepulchres of the dead. There is probably no other site in the world which can compare with Warka in this respect: even the tombs of ancient Thebes do not contain such an aggregate amount of mortality. From its foundation by Urakh until finally abandoned by the Parthians—a period of pro-bably 2,500 years—Warka appears to have heen a sacred burial-place!"

The relationship of Chaldea to Assyria in ancient times must therefore have been a very eculiar one. Can we not shed some little light npon that relationship hy help of the sacred Scriptures? Though there is no passage that we can trace which elearly indicates that the Assyrians held Chaldea in the light of a sacred hurial-ground, there is one that we have not seen quoted which does bespeak a peculiar relationship hetwceu Chaldea aud Assyria, even apart from the fact that the Chaldeans seem to have heen a priestly order of men in Assyria and Babylonia as well as Chaldes, whose duties were peculiarly spiritual and magical.*

b climate, in the entry, the shift in y cliptined, and other spectral distribution of the spectral distribution distribution of the spectral distribution distrestribution distribution distribution distribution distribution

"Behold the land of the Chaldeans 1 This people was not till *the Assyrian founded it* for them that dwell in the wildeness; thry set up *the towers thereof:* they raised *the palaces thereof:* and he [the Assyrian] brought it to *ruin.*"*

The Assyrians theu did found or establish Chaldea as a nation or a people, -- a peculiar people indeed, from amongst whom came forth the Chaldcan father of that peculiar people the Jews, - a spiritual people, who, ascetic-like, dwelt in the wilderness, yet, mason-like, set up the towers thereof, and raised the palaces thereof, and whence, indeed, went Asshur forth, and huilded Nincych itself and many other citics .--- a sacred, pricstly, yet masonic hrotherhood, mysteriously associated with the dead in their coffins, as also with temples and towers, in the midst of which this priestly race presided over the funeral rites performed around these sacred shrines of the Assyrian people. Strange it seems to he that this very people should have brought these, their own sacred temples and towers as it were, as well as this their own venerated priesthood or magi, to ruin : yet doubtless it must have been to the Assyrian, as the Bible tells us, that the wreck we now hehold is to be ascribed, And perhaps after all this is not to he wondered at when we consider that the Chaldeans at length became "a bitter and hasty nation," who marched through the hreadth of the land to possess the dwelling-places that were not theirs, --that they became "terrible and dreadful."demons indeed, - who "came all for violence;"+ and thus most justly came this violent trihe of military pricsts themselves to a violent end.

The ruins of Waska were at one time identified by Sir H. Rawlinson as the ancient Ur of the Chaldecs, wheuce Abram the Chaldean migrated into Syria and Canaan, a valuable manuscript in his library determinately connecting the one with the other. During the excavations at Múgeyer, however, which was almost a neighbouring eity to Warka, eylinders were found, upon which the name of "Hur" was inscribed; and since that event Sir Henry has regarded Múgeyer as the true Ur of the Chaldees, and Warka as the Ercch of Nimrod. Mr. Loftns seems still to he inclined, notwithstanding the title of his book, to favour Sir II. Rawlinson's *first* idea, that Warka is Ur; or rather he is disposed to attribute the name Ur "to a district of the Chaldees, which included hoth the ruined sites of Warka and Múgeyci. And there is a reason for this, and perhaps for still more than this, of which neither Mr. 1 oftus nor Sir Henry Rawlinson appears to have taken eognizance. The word "Hur" is the root of the well-known word " hurra !" and of other forms of it, such as hri ! hurri ! hurraj ! all of which, etymologists tell us, were exelamations originally denoting a vehement desire to go,-"to Paradise ! to Paradise !" and were often shouted out in hattle to imply contempt of DEATH and a vision of bliss heyond its awful precinets. "Hur" then meant "Paradise," and this very district of the dead was its

and this very district of the dead was its means and of whom by no means disregatef 'Imention-by the way, is mado in the Bills, -a itset of ''the wisdom and this is mado in the Bills, -a itset of ''the wisdom here now line by Moses, as were those of Balylon by particle the by Moses, as were those of Balylon by particle the by Moses, as were those of Balylon by particle the by Moses, as were those of Balylon by particle the by Moses, as were those of Balylon by particle the by Moses, as were those of Balylon by particle the bills of the bills of the bills of the bills in the instructions of Bulkin to this disripter who desire to the translated out of '' Pravitil,'' or the concretive or "bills of the bills of the bills of the bills of the bills most is dispersed, annihilated, are extinguished, like a deed, or the bills of allowed, or the life that here is a dispersed, annihilated, are extinguished, like a deed, or called by why the bills of allowed, and the bills the bills of the bills of allowed, its dispersed, and baly and the prophet, speaking of those who, in minitation of the heathen, were list of here balls and the darge in the monumeerst.'' accredited site! Well therefore might the name of "Hnr" he found there. More than that, the word "Honri," which Mr. Loftus, hy the way, inadvertently, and without the slightest the word "Honn," which Mr. Lordus, by The way, inadvertently, and without the slightest idea of any allusion to Hur, to Paradise, or to Chaldea, hut still most properly, spells "Huri," denotes an angel of Paradise; so that Hur and its Huris denoted Paradise and its angels or spirits.* The "Hari" of the Hindoos doubt-hand denotes much the second dia availation of the less denotes much the same angelie or spiritual nature as the "Huri" of other eastern nations.† Even the "Haran" in which Ahram's father, Even the "Haran" in which Anran's hander, Terah, dwelt, would seem to have had something to do with the same interpretation as that of Hnr. As for "Ur," we are told hy Cruden and other commentators that words beginning or other commentators that words beginning or ending with this root denoted Light. Thus Uriel and Uriah meant "the Light of the Lord," and perhaps "Urukh" (the name of the huilder hoth of Warka and of Múgeyer) meant much the same : thus too the "Urim and thummim," hy which "the oracles of God" were consulted, meant light and perfection : and according to all meant light and perfection ; and according to all mystics, Christian or heathen, to he in Paradise, the divine ahyss, divine spirit, or heatific vision, in death-like is to he resting or reposing, in death-like entrancement, "in the light," which too was a entrancement, "In the high, which below this a phrase well known in the ancient Eleuisinian mysteries, as it even is in the modern free-masonry, associated also as it there is with the 'high noon' of midnight—the time of rest and refreshment—in hilss—" filled with the spirit" or "the midnight snn," as the divinity of the Eleuisinian mysteries was ealled, and who is no other than the sun of righteousness, the holy of rest in glory, and the Lord himself of spirit spirit or rest in glory, and the Lod hinsert of Paradise or the heavenly Jerusalem — Zion — and temple whose sanctam sanctorum "needs no candle neither light of the sun," since it is ever "in the light" of the holy Spirit of entrancing rest, or paradisical and death-like measure in bise or player. repose in bliss or glory.

Whether Warka or Múgeyer were the true Ur of the Chaldees, however, matters little to our present purpose. Warka appears to have heen the eity of the dead distinguished and patronised as such heyond all others as yet dis patromsed as such heyond all others as yet dis-covered. It is now, with its vienity, one of the most consummate picturies of desolation, Mr. Loftus says, that can well be conceived. The very Arabs of the desert, with the excep-tion of one wild and strange tribe, shun it as the abode of evil spirits, and noue will dare to pass a single night upon the doleful spot.

The principal edifice or ruin, to some extent uncovered by Mr. Loftus, is called the Buwáríyya, and thence is visible an astouishing accumulation of mounds and ancient relies, snr-rounded hy the traces of an earthen rampart. The principal or ceutral ruin is that of a tower 200 feet square. A more interesting structure, however, is that called Wuswas, and contained in a spacious walled quadrangle, the eastern corner \$40 feet from the central tower. This, like all the other huildings at Warka and Migrey, points with our control to the true north, an arrangement which seems to have prevailed generally in Chaldean architecture. It was at the Wuswas rulu that Mr. Loftus chiefly excavated. The facade to which his attention was given, afforded what he regards as the first glimpse of Bahylonian architecture, although Sir Henry Rawlinson cousiders it of post Bahylonian date. It exhibited, says Mr.

* Angels "are all ministering spirits, sent forth to inister for them who shall be heirs of sulvation."-Heb. i. 14

minister for them who shall be heirs of salvation." = thelb. 1.3. + "Heri," in Sancerli, means Saviour, and "Harita," with the Brahmiss, denotes "the visible tree of the universe, like abode of perfection,"-which, in fact, is the formation of visition, and the same structure of the same structure of the savient of the same structure of the same all bonds, and perfect in abstraction." Has not this some-thing to do with "the tree of life which is in the Paralles of God,"- the tree "hole of perfection," and with the sacred tree of the Asyrian or Minetife sculptures, to be different of the same structure of the build bit cones, it was used as an outward object of, or aid to, contemplet then or contemplative abstraction, "Hole build bit cones, it was used as an outward object of, or aid to, contemplet, the ordering up of the cone, it, like the Build bit cones, it was used as an outward object of, or aid to, contemplet, the ordering and "planger into the divine abys," or, in fact, translated, by entrancement, into Paralles, "the which they those any present, into Paralles, "the satisfies of those the same are sadder to the same as an division" of the same sadder of the satisfies of the same and the same as an division as a Hierophate, Hieropolis, and even Hierosolyma or Jerusslem, seem all bore alluston to Lydw and e San, as it appears U isolf did.

Loftus, peculiarities so remarkahle and original, Lottus, peculiarities so remarkahle and original, as to pronounce at once its undouhted anti-quity, and furnish a new page to the annals of architectural art. It measures 174 feet in length, aud in some places 23 feet of the height remains. It has long heen a question whether the column was employed by the Babylonians as au architectural embellishment. The Wus-was facade, our anther thinks settles this exist. was façade, our anthor thinks, settles this point heyond dispute. Upon the lower portiou of the edifice are groups of seven half columns, repeated seven times, rude in structure, hut built of moulded semi-circular hricks, securely built of molitical semi-forciant infects, second honded to the wall. There is neither cornice, capital, nor hase. The groups of columns are separated by dentated recesses, or chasings, 7 inches deep. This chasing, he remarks, occurs in many other Chaldcan mins, and is regarded as a chief characteristic of Bahylonian architectural ornamentation.

The walls of Wuswas are so thick, that it was for some time mistaken for a solid mass. At length, however, the interior was reached. Every chamher was filled with ruhhish, and two Every channer was hied with turning into two of them were excavated, hut they contained no sculpture. Neither, indeed, has anything of special interest heen as yet found in this in-terior, except a valuable ring, got hy a negro named Wnswas, from whom the runn was named; hut this ring Mr. Loftus did not see.

The preconceived idea on which Mr. Loftns founds his conclusion as to the original nature of the Wuswas ruin, namely, that a rude and simple arrangement, without much ornamentasimple arrangement, without inneh ornamenta-tion, mist necessarily, or at least prohably, he a very early one, is by no meaus a safe idea; and in the present instance we feel much more inclined to agree with Sir H. Lawrence than with Mr. Loftus.

Near the central enclosure, a very interesting and curions example of decorative architecture was found in the fragmentary remains of an edifiee like the Wuswas. This was part of a an wall, 30 feet long, and faced with, or rather entirely composed of, terra-cotta cones imhedded in cement, of mud mixed with chopped straw. These cones were fixed horizontally, with their circular hases facing outwards. Some had heen dipped in red and hlack colour, and were arranged in varions ornamental patterns, such as diamonds, triangles, zigzags, and stripes, which are said to have had a remarkably pleasing effect. The wall which these cones ornamented as diamoud ; consisted of a plane surface 14 feet IO inches long, hroken away for a short space in the centre, and projecting 1 foot 9 inches heyond a series of half-columns, arranged precisely as in the Wuswas façade side by side. In aneient Egyptian tombs, similar hut much larger cones are found, with hieroglyphs stamped upon their bases, several specimeus of which are in the British Mnsenm.

"They are supposed," says Mr. Loftus, "to bave a sepulchral character, and to have been let into the wall at the eotrance of the tomb, although they have wan at the cortainer of the tohic, antoget usy late never here observed in that position. The hieroglyphs are probably the names of the deceased. No marks or inscriptioos occur on these Warka cones, but there is every reason to suppose that they were in a similar manner connected with the hurinl of the dead. The ascertained fact, hefore noticed, that the site was a vast cemctery, is strong presumptive evidence in favour of this conclusion.

Cones of the same kind are of frequent occurreoce upon the ruins of the great platform, sometimes reoce upon the ruins of the great platform, sometimes fruly fixed together in strong white plaster or cement, but no other building was observed with them in *situ*. There is, bowever, little doubt that several might be discovered by largely excessing in the mounds. Similar cones are found io many other ruins of undoubted Bahylonian age, which, nulke Warka, have escaped heing built upon by succeeding races. Mr. Taylor discovered them plentifully, both at Migeper and Abú Shebreyn, at which latter place they occurred 10 inches in length. Composed of limethey occurred 10 inches in length, composed of lime stone and marble, and sometimes with a rim round the edge filled with copper. They were, undoubtedly, much used as an architectural decoration in Lower Chaldera, and always in connexion with sepulchraf remains

These cones remind one much not only of the cones in the hands of Egyptian and Assyrian priests, hnt of those used by the Buddhists of the present day, apparently as objects on which to fix the eye in that "contemplation" which

forms so distinguished a religious duty in Thihet, China, and India. The "sanctifying instru-ment" ealled the dorje or tortché, and also used hy the Buddhists, has conical extremities, and a very similar instrument appears in each hand of a human figure moulded in terra-cotta, as if in a coffiu, or a vesica piscis, and engraved in Mr. Loftns's hook: he calls these instruments maees

Warka, says onr author, is a complete mine for extraordinary aud nnheard-of modes of decoration in architecture. Within a stone's throw of the south-west façade of Wuswas, he found a eurions huilding somewhat resembling the cone-brick structure, but formed of conical vases, months ontwards, which produce a strange effect

But the locality at Warka which furnished the most valuable and interesting fruits of research, was a small detached mouud 40 feet high, situated about half a mile south-east of the central ruin. Here a chamber was discovered measuring 40 feet long and 28 feet wide, the mud walls of which stood only 4 feet high, and had been eovered with coloured plaster.

" It was a perfect museum of architectural scraps, of a highly instructive and curious character. The unhaked hrick floor was literally piled with broken columns, capitals, cornices, and innumerable relies of rich internal decoration, which exhibited undoubted symptoms of Greek and Roman influence on Oriental tester. The smaller objects were wholly inhere : hut taste. The smaller objects were woolly plaster; hut the larger consisted of moulded bricks, thinly coated with white plaster : many of them were fantastically coloured.

coloured. Three of the capitals are Ionic; but the propor-tions of the volutes and other members are peculiar. A fourth description of small capital has peculiarities of its own, suggestive of the later Byzautine style. A large and elegant leaf rises from the necking, and hardwork are become of the later. bends under each corner of the abacus. Springing from behind a smaller curled leaf in the centre is the bust of a human figure, wearing the same preposterous head-dress which is characteristic of the slipper coffins and Parthian coins.

No columns were discovered to correspond with No columns were discovered to correspond with the larger capitals; but the walls were liberally adorned with small Ionic half-columns, with half-smooth, balf-flated shafts, which were highly columed. The lower and smooth surfaces were diagonally striped with red, green, yellow, and black; the flates being painted black; red, and yellow alteroately, while the level ridges between them are left white. In some cases the flates were quartered with the same colours. Among the débrie of smaller articles were hases of columns,—friezes, with bunches of grapes alternating with leaves,—gradines, resembling those on the castles of the Ninevel has-reliefs, hut gramemted at the

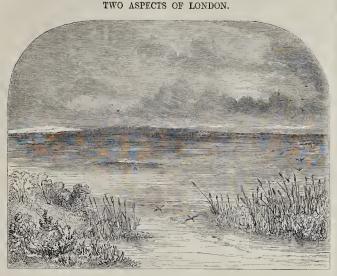

of the Nineveh bas-reliefs, but ornamented at the of the Nineveh bas-retiegs, but orhamented at the hase with a conspicuous six-rayed shar in a circle,— fragments of open screen-work, with complicated geometric designs of different patterns on the opposite sides (these are very peculiar, and differ materially from the arahesque),—and fakes of painted plaster from the walls, with fragments of small statuettes,

from the walls, with regiments of shall shall be colored, and sometimes gilded. * It has long been a disputed question whence originated the germs of Saracenic architectore; hut the prevalent opinion is that the Moslems, baving no style of their own, adopted those which they found practised in the countries whither they carried their processes in the countries worther to be a string their conquests, more especially the Byzantine. It is, nevertheless, remarkable that the same uniformity in richly-wrought tracery and geometric ornamentation prevails from India to Spain in Saracenic structures, which could only bave arisen from a central point.

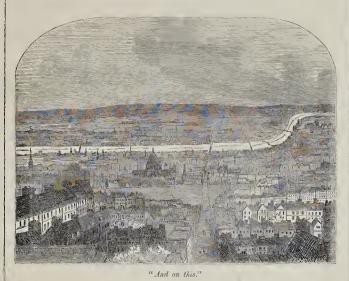

May we not suppose that the peculiarities of Sara any we not suppose that the pecularities of Sara-cenic architecture are due to a much earlier period, and that they originated with the Parthians, who succeeded the Greeks in the possession of Mesopo-tamia? Of this race we have, unfortunately, scarcely any memorials left."

Amongst various other interesting remains und at Warka and Sinkara, were monlded found at hricks in spiral columns and coronet-like capi tals. Scrpeutine and elay tahlets were also found, and numerous small terra-cotta figures. jars, aud jngs, from the coffin mounds, as also trinkets, clay seals, lamps, and lachrymatories.

The researches of Mr. Loftus and Sir F. W Williams of Kars at Susan, the Palaee, where columns and other valuables were found, are also highly interesting, hut our space is now fully exhausted, and all we can do is to recom-Mr. Loftus's volume, which they will find to he well worthy of perusal, though not very skilfully put together.

" Look on this Picture"

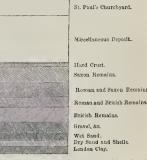

TWO ASPECTS OF LONDON.

NOTWITHSTANDING the examples of the mighty Babylon, Nineveh, "Eternal Rome," and other famed eities of antiquity, we look forward with firm hope to biojon, indext, herdak took, and with firm lope to the spleadid future of London. This metropolis is, in our sight growing in wealth, strength, and popula-tion. The dwellings of the poor are giving way to better buildings and, ere a score of years are passed. It is probable that the sad condition of things which has heen illustrated in these pages will have ceased to exist. Year after year the London houses are as-suming a more important appearance,—a circum-stance which may be readily proved by an examina-tion of a few of the streets of various classes, built thirty or forty years ago. The warehouses in the City, the backs and other offices, are in many in-stances towering above their former height, and, instead of diagy flat brickwork, now present fronts of massive stonework and elaborated design. Our public structures are in blice manner increasing in substance and extent : wise and kindly-intended in-stitutions are springing into use: these and other tances towering above their former height, and, as a means of soling line from their terms. This is all work, but in our days the sine process of massive stonework and elaborated design. Our may be seen going forward in the ship-building yards near the docks and elsewhere. We would, however, there and other as the sine and kindly-intended in-stitutions are springing into use: these and other he and the solution of the ship building yards that hold over mentioned—to a time when all gold a *quarter of an inch* wile. This, I think, will indications of healthy progress assure us that London

is but approaching its prime strength, and that it will, as it has done for the last thousand years, con-tinue to progress for long to rome. If the present coulditon of London is wonderful, its future hopful, its rise and progress in ancient filmes have also an interest, which is rendered the more inteuse in consequence of the indistinct and dreamy records of the past. We have hefore, on more than one occasion, re-ferred briefly to the rise of London and to the sur-prising extent of ground which has, in the surround-ing neighbourhood, been saved from mores hand water. In parts along Thannes-street, which, in the days of Romanoccupation, was the boundary of the Chames, we have noted the tumber, pilee, &c. which were used as a monast of saving land from the river. as a means of saving land from the river.

works, and occupied with living multitudes—was a watery waste as desolate as the neighbourhood of Babylon at the present day. Standing on a high part of Clerkenwell or Islington, it is easy to imagine the picture; — a foreground of sedges, reeds, and wil-lows, and a sloping bank towards the Fleet river; then a stream of considerable magnitude. On the south, east, and west a space of water extends to the base of the higher lands, presenting the appearance of a large lake in which the channel of the Thames is not even defined. In the midst of the waters there may, however, be traced three portions of land which have risen by gradual degrees above the water : that incarect at hand is the site of the present eity, the highest part of which is near St. Paul's. The little island to the right, B, has now grown into Westmin-ster, and that to the left, C, is now occupied hy Kent-stred in the Borough—a spot on which many Roman and other remains have been discovered. It is most interesting to wander in the various

and other remains have been discovered. It is most interesting to wander in the various districts of London, and trace the evidence of the de-crease of the water and the rise of the land. Sir Christopher Wren, at the time of executing for the foundation of the present St. Paul's, made careful examination of the various layers of soil from the sur-face of his day to the bed of the London clay, and enables us to give a sketch of the various deposits.

Covering the London clay, the famous architect found shells, fine sand, and other indications which show the rise of the site multi presented somewhat the same appearance as the large shoels do which are still some appearance as the large storals do which are solu-in course of formation in the Thames. Then come various other matters, and eventually evidences of the occupation and raised surface hy man. Then appear the remains of different people, and marks of fire and buildings, which form a suggestive model of London's bitton. story. By watching the numerous excavations which are

By 'watching the numerous excavations which are being made from time to time, by a careful examina-tion of different localities, and irom the accounts of different writers, we gather distinct evidence of the truthfulness of our old picture. It accms evident that London, or by whatever name the eity was then a known, had assumed considerable consequence before the erection of the river embank-ment—that great and mysterious work,—for it is not reasonable to suppose that what may be called the formation of the river would be undertaken writhout a-very express purpose; and when we think of the

formation of the river would be undertaken without a-very express purpose; and when we think of the extent of that work, and cousider that so little is known of its origin, we cannot but centrast it with some of the trifling improvements of recent times. After the embankment of the Thames, a consider-able portion of what was once the lake must have been readered comparatively dry. The city spread, but still extensive districts were flooded by every tide; eveu less than a century ago a part of Lambeth was daily under water; and castward there were great marshes which were considered not worth editivation. These undrained spaces had evidently an injurious marshes which were considered not worth caltivation. These undrained spaces had evidently an injurious effect on the health of London, and sgue and some of the levers peculiar to the Fens were common in the metropolis; hut these have now disappeared, except in a few cases where they have been introduced from damp districts. In order to give a more clear idea of the contrast of the past with the present, we anær a slight sketch of the same scene from one of the tall houses now while on the backs of the Elect, near Barniver-wells

built on the banks of the Fleet, near Bagnigge-wells. The view of St. Paul's from here is very fine, and it will be a matter for future regret that the opportunity afforded by the late improvements in this valley has not been taken advantage of to open a direct line to the Cathedral.

STATEMENT BY MR. COCKERELL, R.A. ON THE WELLINGTON MONUMENT COMPE-TITION.

MR. EDITOR,-I have to acknowledge and to thank you for the interpretation you have heen pleased to put upon my retirement from the adjudication of the prizes in the fine art competiadjudication of the prizes in the hite art compet-tion for the Wellington monument, which, as you justly suggest, was grounded, first, on my doubts as to my own competency, though a well-knowu amatent of sculpture, to give judgment on an art not professionally my owu; and, secondly, on my doubts as to the efficiency of a tribunal, on a toolingtal and professional subject. on a technical and professional subject, without the aid of technical and professional subject, without as to give satisfaction to the artists concerned and to the public generally, --for my isolated appointment ou that commission cannot fairly urged as supplying the professional element

At the same time, as you have inferred, I deemed it my duty to the occasion, to my office as surveyor to St. Paul's Cathedral during more than thirty-two years, and as the original suggestor of the site adopted for the erection of national monumeut, to offer every service and advice in my power to the commissioners in that character, with reference to the harmouics of the cathedral architecture and of the special of the cathedral arcmitecture and of the special locality, though I give no judgment ou the relative merits of the designs. These semples were submitted to my distinguished colleagnes with all the zeal and logalty I owe to the cause of art, and were listened to with the utmost candour; but circumstances preventing their acting upon them, I deemed it my duty to retire.

Of the imitative arts, the plastic is surely the most exalted in its conception, style, and composition : it ranks as the epic of those imagina-tive arts. Abstract, and grave, and rare in its genius, it exercises no less those rare qualities in the critic, far different from those he may bring to hear on the more popular art of paint-ing. Enduring, like the architecture to which it is attached, it should be Catholic and of all times, harmonizing with its proportions, aiding its scale, and incorporated with its features.

The appropriateness of the symbols and the images amongst the many which present them-selves in the illustration of the character and history of the great personage to be commemorated; the paneity of space, after all, to give expression and emphasis to the most important of these; the doing justice to those who have best contributed to these conclusions, hy their thoughts and designs, and who so have led us to a juster estimate of the object to which we to a juster estimate of the object to which we hope to arrive ultimately, is a delicate matter, on which we cannot be too scrupulous and deliberate. To aid in these, we want the counsels of the historical painter, the architect, the master of scenery, the learned sculptor,—no less than of the poet, the man of letters, the tasteful patron, and the accomplished man of the sored J. these hart the compusion abounded. world. In these last the commission abounded : it was in the first that I could not hut esteem that we were deficient; and it is certain that light can come only from the free discussion and interchauge of thoughts amongst such persons as these

The success of the system of competition depends primarily ou the constitution of the tribunal appointed for the adjudication. This competeucy of the award, not only as doing exact justice to the public as represent it object of the competition, but to the relative claims of those who have contributed their genins, experience, and expense towards that object. Without these secure foundations, the whole fabric falls to the ground, and our labours are fruitless and utterly abortive; adventurers alone will enter the chance medley; the osteu-tations elap-trap takes the place of the soundness of design; fashiou prevals over the permanent principles of art; true taste is put to flight; and and experience, ever modest and real, shrinks from a tribunal in which it will be scarcely heard, much less valued, iu the face of garish attractive pretensions. The veteran declines to expose himself to the mortification and the injustice of a lowstandard of criticism: the public thus lose the advantage of long labour and devout studies; ucw names alone appear on the list of candidates, and the celebrities disappear from

these most generous and interesting occasions : disgnst and dissatisfaction generally follow. Our illustrious neighbours in France largely

practise the system of competition in the matters of fine art. Their tribunals are hy a mixed of fine art. Their tribunals are by a linked commission. As with us, the leaders are selected from amongst the most distinguished and reiron amongst the most distinguished and re-sponsible public characters, understood to be *dilettanti* and amateurs; hut they do uot stop there, as we have done: they call in a large pro-portion of professional and technical members, reputed in their several academies ;-lastly, men of literature and science, whose studies bear more or less on the subject of fine art. All these vote and discuss in perfect equality, as members of the tribunal.

The deference to scientific and artistic opinion, in a country where these qualifications are supreme, is carried to great lengths, and presents supreme, is carried to great tengths, and paselins a remarkable contrast to our own, and the English members of the juries in Paris, 1855, were scandulized by the regulation which ad-mitted into the juries the most distinguished competitors, who thus became judges in their own emuss; and this was avowed by those who employed them as presented to use a subappointed them as necessary to guide the ju ment of the leaders and less cultivated members of the jmy. In Rome this principle is carried even further : with them the adage holds still, "Cuique in sua arte credeudum est." The sculptor does not admit the painter to the award, nor vice versa, much less the dilettanti,

nd the amateur. But what shall we say of the practice of this country, in which gentlemen, patrons, dilettanti, and scholars alone are the judges? gentlemen, indeed, of whom we are justly proud, and to whom we defer as guarantees of the perfect perfect honour and impartiality of the awards, but who from their loftier avocations must uccessarily he deficient in the professional and technical considerations which are of searcely secondary

considerations which are of searchy secondary importance in the adjudication. Sir, it must be felt hy every one as degrading to our arts, to he subjected to the judgments alone of the *dilettanti*, and it is equally derogatory to the professor gifted hy nature, and cul-tivated by the devotion of a life, to be dispensed with on these occasions of competition, and to have his judgment set aside as of no advantage and sometimes suspected. It is incomprehensible that in enlightened Englaud, the determination of those professional merits, ou great national occasions, by a committee of taste alone, should

still hold amongst us. None of us will deny the great respect and weight due to those high public characters, and our perfect satisfaction in the soundness of their leadership in competitions of all kinds; but their eminence in their special vocations cannot constitute them the all-sufficient judges of matters technical and professional; nor do they allow themselves this pretension in any other than questions of taste.

The profession of asthetics is not to be treated as so light a matter when the glory and good repute of a country is in question, and when we are preparing to hand down to pos-terity a specimen of the understanding of this day in these matters. The very large sum pro-posed to be expended is not enough to pur-chase the wit and the taste required, much less is it necessary where these qualities can be found by a cheaper and more liberal method, a grave and enlightened discussion and criticism, ith leisure and with learning, assisted hy men of art and of thoughts in these higher departments.

All these considerations, as I have already said, I urged very respectfully on my distin-guished colleagnes, and I trust that the words of their report will sufficiently exhibit the can-dons with which there are a sufficiently exhibit the candour with which they were received, as neither control or no founded. Let us look to a future more enlightened practice in this parti-cular, and I urge you, Mr. Editor, and the friends of true liberality, to enforce views which can alone lead to a right judgment in these

no instances of equal splendour can be cited in history, in respect of occasion and subject, im-partiality, public exhibition, and the splendour of the rewards held out to genius, both in honour and in pecuniary compensation. It would he lameutable indeed, that such generous and enlightened efforts should fail to attain their great results, which results we are all of us bound, at whatever cost of private feeling, to promote by every fair argument. I grive that a principle which I hold as loyal to my profes-sion should have prevented my co-operation with the distinguished commission amongst whom I had the honour to be associated in this last particular of adjudication, and to have appeared to offer any objection to the generous course of Government in favour of those fine arts which are so calculated to promote the honour and advantage of the country, and in which we all so heartily rejoice.—I have the honour to be, Mr. Editor, your most obcdieut humble servant, C. R. COCKERELL.

THE WILTSHIRE ARCHÆOLOGICAL SOCIETY AT BRADFORD.

SOCIETY AT BRADFORD. BRADFORD, in Wiltshire, where the anoual meeting of the Wiltshire, where the anoual meeting Society was held on the 11tb, 12tb, and 13th inst. is a picturesque and interesting town, and bas a suf-ficient number of antiquities in and around it to fit it for such a meeting. The church, the free-school, the ancient haro, the hridge with what some antiquaries coll a chapel on it, the "Duke's House," and many remnuts of early domestic architecture discertible in the streets well deserve examination. Some of the views of the town, with bonses and factories built on the bill-slide and surrounded by trees, are very charm-ing. The narish church ujves the evideoce of shallow the bill-side and surrounded by trees, are very charm-ing. The parish church gives the evideoce of shallow flat buttesses egainst part of the chancel, and an apparent semicircular-bealed opening in the same part of the church, long since filled up and white-washel over; -- that it was founded in the time of the Norman, if not earlier; but the present structure is for the most part of the Perpendicular period. There is a recess on the south side of the chancel belonging to quite the end of the 14th century, ormamented with junacles and crockets, which have been restored, and containing the remains of a cross-legged effigy. There is a corresponding recess on the opposite side, but of containing the reliants of actions to see the second secon once elaborately painted. A straight headed pauelled and ornamented recess in the north wall of the nave and ornamenter recess in the north wall of the nave aisle, which once contained a crucifix and was deco-rated with colours, is peculiar. It is probably simply a tabernarde, but the pews which now shrond the lower part of it should be cleared away, so that it might be examined. One of the Perpendicular win-dows on the south side of the nave with a traceried temporaries particularly cond-

transom is puticularly good. Within the free-school near the east end of the chu ch will be found portions of a building displaying some of the characteristics attributed to work executed some of the characteristics attributed to work excended before the Conquest,—Sax ni a short. The sami-circular bead of the doorway springs from an impost : the opening is wider at the floor than at the springing, while in another part of the building the plaster-like arrangement of stones known in pre-Norman work is detentible.

The town was all alive, and had set itself to work the town was an arrest and has see itsen to work to show it appreciated the visit of the society. Wreaths of everyreens spanued the streets, banners futtered here and there, and one enthusisatic small tradesmon, hight Howell, had decorated the front of tradesman, hight Howel, had ecorated the front of his house with an inscription formed in roses and dahlias, which read "Prosp rity to the Archeeolo-gical Society." The opening meeting was beld at the Town-ball, a new huilding crected at some cest from the designs of Mr. Fuller, an architect, lately of Bath. It is of a mixed style, scarcely El z hethan, and the lower part, where Gothie forms more strikingly prevail, is marb b ther than the upper. The Rev. J. H. Bradney, who filled the presidential that while a "paper" must be strictly confined for the subject of which it treats, an address may be loose and rambling; and he certainly fully availed bimself of the privilege,-flitting from Ciero to bte Commissariat, and from the Oid Tesament to Tom Paine's bours. However, it was done with good friends of true liberality, to enforce views which can alone lead to a right judgment in these glorious line arts, and which have the sanction of all classical history, and especially of our illustrious neighbours on the Continent. I cannot refrain from rejoicing with yon at this moment in the unexampled liberality of those authorities who have originated these memorable competitious, to which I believe object in view-he wants to see the tomb of Archi-

[Aug. 22, 1857.

medes, for in the course of his studies he had read that that great geometrician was buried there, and that on his tomb a sphere and cylinder (emblematic of his pursuits) were engraven, and also some verses inacribed, and he was determined to verify the fact by actual inspection. He quistims the great men of Syracense, the magistrates, npon it, and to his sur-prise they can give him no information about it. They conduct him, however, to the gate of the city, where stood the greatest number of their old sepal-ehres, and there he observed, in a spot overgrown with shrubs and buriars, a small column – a columella he calls it – whose head just peeped above the bushes ; and just faucy his delight : he sees the figures of the sphere and the cylinder upon it 1 And then he goes to work with a zeal and energy which could not be surpassed even by a member of the Witshire Archeological Society ; and at length he has the satisfaction of finding the verses inscribed on its base, and after wards of indelight is a little of that boast medes, for in the course of his studies he had read and afterwards of indulging in a little of that boast-ing which was one of bis weaknesses.

In the committee's report, which was read by the Rev. W. C. Lukis, one of the honorary scoretaries, feeling reference was made to the death of Mr. Brit-ton, a member of the society.

" Mr. Britton was personally known to yon," con-tinued the report, " and it is scarcely necessary for your committee to remind you of, for you will your-selves recolled; the very active part which, natwith-standing his great age, he has taken at each of these our annual meetings; not only attending himself, and always with a paper in his porket, to be read if occa-sion required, but using all his powers to stir up others to a like activity in the cance. It is energy and animation on thmse cecasions will long remain impressed on our memories. There was a kind of youtbful classicity and phyfulness about him, even at our general nuccling at Wareninster hast year, only a few months before his decease, which gave us a hope that he would have been spared for some yvars longer. Moreover, it is not too much to state that, but fur his indelatigable exertions in the eause of archeology in " Mr. Britton was personally known to yon," Moreover, it is not not mere to state that, out in this indefatigable exertions in the cause of archeology in his native county, this society would not have existed. In addition to the admirable sketch of his life, which appeared in the last number of our Magazine, and a very excellent portrait of him, which will appear in the forthcoming unmher, our speicty is collecting subscriptions from its members and others towards Subscriptions from its members and others towards erecting a memorial in the church of his native parish, Kington St. Micharl, and also for providing a small annuity for his widow, to either or both of which your committee would recommend your sub-scriptions. We may add that the Institute of British Armitistic also cautoachies also as meanwanted Architects also contemplate placing a monumental memorial (we believed an invised trass) in S-li-bury

Cathedral." The Rev. W. H. Jones, Viear of Bradford, then road an interesting paper on the "History of Brad-ford," stating, amongst other things-first, -That the Romans hegan to visit this locality about seventy or Romans hegas to visit this locality about seventy or eighty years after the final subjugation of Britain hy Claudius, A.D. 62; that the period when they were most numerons here was from shout A.D. 250 to within some ihirry years of their leaving Britain alto-gether; and that, at that period (say about the *end* of the fourth century) they began to leave the imme-diate neighbourhood. Second,—That as most of the coins have beeh found in the upper part of the toman is what is now called Budbury, there was the Roman settlement. This spot, situated at the top of a bill, almost inaccessible at that time on the south or west, was just such a one as we should, from the customs of the Romans, have expected them to select, and it was the nearest point to Bath, in from the customs of the Komans, have expected them to select, and it was the nearest point to Bath, in which place we know they clustered in great num-bers. In clearing ont a well, a few years ago, he understood that large numbers of short swords, a ring, and other things were discovered; but he had never seen any of them, nor heard so exact a description of seen any of them, nor near so exact a desemption to them as to enable a correct judgment to be formed as to their age. In the same field there is still the appearance of earthworks, which, a few years ago, were distinctly traceble on some of the adjuining were distinctly traceable on some of the adjoining pieces of ground, before they were partitioned off as gardeus and fields, and then levelled. The common mame that is given to the field is the "Bed and Bol-ster," which, if the hyp thesis be true, may be a bomely, hut certainly not alloge ther an inexpressive description of the *vallum* and its corresponding *agger* in a Borner generation.

possibly been built in comparatively molera times), does not look unlike a memorial of what the Old Anglo-Saxon Monastery may have been. An exami-nation of the interior of the building, a short time ago, reveled the fragment of an ant- h a large portion of which had been cut away, and which may have been the entrance to some large hall, or, perhaps, chapel. The two anique figures of angels which are now fixed above the present entrance to the school-house may fairly be deemed ceclesization de containon. They were found imbedded in the wall at the upper part of this arch that I lave just alluded to, one on either side, the whole of the central part of the arch having been cut away for the purpose of introducing a large stack of chinnory. There may have heen oripossibly been built in comparatively modern tim a large stock of chimory. There may have here ori-ginally a central subject, which, together with the figures of angels, formed the ornament of the tym-panum of the duouway leading to some building, the purpose of which can only now be a subject of con-jecture.

jecture. Of the "chapel" on the bridge, Mr. Jones ssid,— "L-land, who visited our town in 1540, speaks of the bridge, which, he syss, had nine arches of stone, but does not allude to tho chapel. There have heen some who have thought that it was marely a toll-house for the collection of Pontagium—a contribu-tion for maint injuring and readition a bridge. Although tion for meintaining and re-edifying a bridge. Aubrey, however (who wrote 200 yrars ago), systempress, 'Here is a strong and handsome bridge in the midst 'Here is a strong and handsome hridge in the midist of which is a little chargel, no at Bath, for masse.' So that no doubt its object was to contain the image of the patron snint, and to receive at once the devotions and alms up for sears-by, the latter being probably given to the support of the hospit-l at the bridge-foot. Murray, in its hand-book, calls it St. Lawrence's Chapel, upon what authority I know met. I have endeavoured, as yet in vain, to a certain the tush in this matter. The Bridge Chapel at Bath was dedicated to St. Catharine. As Murray grees on, in his account of Bradford, to tell us that by the I have endowoured, as yet in van, to a certain the tuch in this matter. The Bridge Chapel at Bath was dedicated to St. Catharine. As Murray goes on, in his account of Bradford, to tell us that by the Reform Bill we acquired the right of sending two members to Parliament, and yet aids immediately that Bradford has slender rlains to historic notice, I for that we are a sume that chadre insting from such That Broulder a resistencer releases to instore notice, 1 fear that we can expect but slender justice from such a chronichr, and 1, for one, am not much inclined to pin my faith to bim in his assertion concerning the deciention of our Bridge Chapel." The growth of the town through the wool trade—for, as Leland writes. "The town of Bradford standesh by cloch making,"—was of course traced and illustrated, hut We have not space to pursue it. Suffice it that the Viear's paper give great pleasure to the meeting.

To this followed a paper by Mr. Matchan, on the bearing of the antiquities of Malta on the history of Stonehenge. Views of structures brought to light in bearing of the antiquities of Maita on the history or Stonehenge. Views of structures brought to light in Malta, were exhibited to s'ow their liken is to Stone-henge, and other similar monanents. There could be no reasonable doubt, he thought, as to the nation which erroted these structures, for, independently of the tradition of the Maltree, Diodorus S cultus writes, "Melita (Malta) is a colony of the Phanicians, who, after they had extended their mercantile alventures are to the vegtern peers had a whose of spicts in even to the western occan, hid a place of safety in this island on account of the commoniousness of i's ports and its harbour in a deep sea." Indeed, inight conclude that the name itself, though said Inderd, we inight conclude that the name itself, though said by classic writers to be derived from the nymph Melita, or from the greek µ2h or hong (which is not a pro-duct of the island), is no other than the Phaenician word Melita, a place of refuge or sanctary. The Carthaginians, their successors, "Tyrii cohere coloni," passessed Malta 402 years hefore our ers. From the superior antiquity and carlier civilization of these nations, we might, therefore, stely conclude that the Haglar Chem and the Maneilra were temples exect d in honour of the national religion of Presulting for the celebration of these rites which it presenbed jalthough (as in similar cases) herces and swerrigns sometimes received sequenture within their walls. Monuments of this description still their walls. by and soverages sometimes received sepultare within their walks. Momuneuts of this description still remain on the Phœuleian coast, and have been notired by a late taveller in that county. Mr. Matcham continued,—The five loty trillions which form the ellipse of that edifice, and which he ad elsewhere culcavoured to show were dedicated to the five intercalary days and their presiding deities, were doubtless to be ascribed to the same found rs.

intricate conformation, "a mighty maze, and not

its intriente conformation, "a mighty maze, and not without a plan." At the dinner which followed the meeting, and whereat Mr. Sothrono Exteorri, M.P. presided, and did his "spiriting" very pleasantly and ably, this paper led to a passage of arms. The chairman, in the coarse of the evening, said Mr. Matcham had reversed what he had always considered the current of history: "He has put so much doubt into my mind," went on the chairman, "that whereas I always thought that the farthest point of my poligree was bidden amongst the Saxons, I am half indicad now to think I have got Phennian blood in my veits. Of conree I am not presumplumes enough to suppose there is any relationship between myself and the great Hannibal. I am content simply with being told, that whereas you, Mr. Esteoriet, have always supposed that your ancestor was either a Norman or a Saxon,—be it known, if yon have fancied anything of this kind, you are uticily wrong; Stonchenge is a priof that You have Plaonteian blond in your veins; you come originally from Carthage, and most likely it was some relation of yones that originally stant de from Tyre and Sidon with Queen Dito." And so he drank Mr. Matcham's health. And then that gentlemen, in a tone which made people believe that he did uot exactly like the banter, admitted the possibility of Mr. Esteorar's descent from Hannihal; and, as the batter gentleman is a cipt in in the Witshire

exactly like the banter, admitted the possibility of Mr. Estcourt's descent from Hamilhal; and, as the batter gentleman is a ciptin in the Witshire Yeomany Cavalry, congratulated the regiment on having such noble military blood in its ranks. At a conversatione, held after the dinner, a paper on Avelury, by Mr. William Long of Bath, was real, and one on Mediaval Houses in Wills, by Mr. Park r; a fare, which, the Rev. J. Wilkinson sketched out the next day's excursion. When the morning came, Mr. Wilkinson hedded the party, and performed prodigies of horsenauship in the meritorions codes-voir to keep them to their time and enable them to get through the work. Of what was seen, however, we must speak in another number. Right loorious were the woods that day, and many recollected that

" The groves were God's first temples,"

THE WELLINGTON MONUMENT IN ST. PAUL'S.

I HAVE read with much pleasure the excellent re-marks on this subject in your last week's number. The interest you take in the subject may induce you to insert the following. All that was mortal of our two great naval and addition because whether the new or the great naval.

All that was mortal of our two great naval and military heroes, who, is the commencement of this century, lurade back the tide of war from these shores, —Nelson and Wellington,—now rest side by side in the crypt beneath the dome of St. Paul's. Memory will ever connect them together, especially in St. Paul's. Does not good judgment point to their historie parity being emphasised in marhle as well as in the page of history? Monuments are the emblems of history, and surptrue unites with the chiefs a literature with the pro. The monument of Nelson, from the hand of Floxman, exists on one side of the entrance to the choir in St. Paul's. Does not to the indicate that of Well agton to compy the opposite place? That of Corrawills now fills the space, both the whan it records is not buried beneath it, and why might it not he re-moved to a corresponding site on the west side of the dome? dome P

At any late, and uniter all aspects, this would be the popular sput for the monument to Wellington ; but it is the more evidently judicions now, inasmuch as the sculptural resources of this country and Europe have been called on to produce a design for the me m risl suitable to the place that was proposed in the In this suitable to the place that was proposed in the conditions of the competition, rancingly, the open arch between the nave and aisle to the north-west of the dome. Eighty-three models were suit in and not one is recommended to be carried out. Is this the fault of the sculptors? Not so. There were many her mitill things there, hat the rhoise of the site was incorrect, and no tre tment of it can be sticked by.

and no tre fment of it can be setisfactory. The truth was, the am out of the sum suggested has, from the first, embarrassed the whole affair; 20,000/, were felt to be too much to expend in any situation atim to in sea level, send so a new kind of site was indicated, which was decaud to afford scope for the expenditure, and thus a place was chosen in the eathedral, which Sir Christopher Wren would, in my belief, never have assectioned for the purpose. That great architert left spaces on the solids of the cathedral to be duty couldelhaled, hut not the spaces of his noble arches, &c. to be tampered with and filled up, so as to intercept the vistas of his magnificent structure. There were three marked ways, as evister," which, if the hyp thesis be trac, may be a bomely, but certainly not altogether an inexpressive description of the willow and its corresponding eggers. In a Roman encampment. Althelic built a monastery at Brainford. Mr. Jones said, —The site was most probably near to the north-east end of the present church, a spot ground there still bearing the name of the Abby Yard. Perhaps a portion of what now is the Charity or Free School [16] which we have spoken formed part of the Old Monastery, for you can sees a a glance, that what is now the entrance to the school That small areade of semirircular archieve which you may observe in the south wall (though it may have beceath the springings was to be treated; and, *Hirdly*, making the monument *pervices*. Of these three the last is the best for the architecture, but the worse for the monument, for there is a great window at the back (in the wall of the sisle), and even if the glass of this were painted (which certaiuly might do some good), still everything in the way of statues would look black against it, and be seen most indisticely. The same defect would rest with a low moument, and a bigh one would block up the space too much. A monument should be a solid substantial work, but any solid substantial work would he in the way in the space; and a *pervicens* one, or a low one, would have but a mean effect, and would be wretchedly lighted. Thus, therefore, in this ease; either the architecture or sculpture must be sacrificed, and that to the tune of 20,0007. 1 The multie must take care that they are not visited

Sachieed, and that to the theol 20,000." The public must take care that they are not visited again by another great hotch like the Nelson column, which was also regulated by noble lords, and not by those specially fitted to arbitrate in such matters. The authorities, in putting forth the conditions for the Wellington monument, do not appear to have known whether the arch were a fitting place or no, at least if we are to take the conditions and the report of awards together. The cighty-three models pretty well illustrate that the arch is not a fitting place. Surely it is not too late to choose another? If the monument to Wellington be eventually made to pair with that of Nelson, something mader 10,0000, will be sufficient for the work (few of the memorinas already rected in St. Paul's have exceeded 5,000k) and the embarrassing 20,0000. might be split into two manageable amounts, and what is not required for the St. Paul's monument might be applied to some opeo air one, worthy of the duke, say near the Horse Guards.

THE AWARD ON THE WELLINGTON MONUMENT DESIGNS.

Now that the committee appointed to adjudicate upon the Wellington models have returned their verifict, it cannot fail to strike the public as a singular act of injustice, not to say mala fides, towards the unsuccessful exhibitors, to find, from the express avowal of the committee themselves, that their selections have been made wholly irrespective of the suitability of the models chosen to the locars and position which the Wellington monument is intended to occupy. Surely the committee must have been aware of the terms upon which public competition was originally invited. These terms were annonace theforehand, and had especial reference to the site of the monument and the character of the edifice in which it was to be created. Now the circumstance that these could tions were not only lost sight of, but virtually and ostensibly ignored, was calculated in the highest degree to prejudice the success of those candidates who had executed their designs with special regard to the particular locality indicated to them by the Tirst Commissioner of Public Works. Hence the injustice. Again, if the models selected will not subserve the contemplated purpose, what are they good for? May, the fitness of the judges in such a case may well be questioned, if they are unable (as they say they are) to decide whether the models are suited to the locality or not.

There is then, I concive, goal cause for a protest (if indeed such a protest could avail much) on the part of the profession against the principle on which the committee made their selection, in leaving out of view some important cooldinous of the problem conditions, too, which had an evident and predominating influence over many of the works of art voich are now exhibited at Westmituster Hall. But what should he dane in such a case? It would seem that those who are at the head of the profession should speak out—if not for themselves, at least for others. Of cornes such men as Gibson can afford to treat such matters with indifference. But why does not Mr. Bell (Nos. 57 and 60) declare his mind? Surely ke has some reason to be dissatisfied. Again there is Mr. Thotoss (No. 65), whose model attracted marked atteution: does he not feel aggrievel? And lastly, has Mr. Biroie Philip, whose model (No. 18) was so claburate and congritous, no cause of complaint? But the fact is, the members of the profession generally are uowilling to take any "grumblers," and so they are forced to arquiesce in the verdict that has been prononneed. AMATEUR.

Sir CHARLES EASTLAKE has drawn up a report on certain minor galleries of pictures which exist in London, for the benefit of the purliamentary commissioners. The report, besides serving its special purpose, contains much curious information ou old portraits and pictures, and on City compunits.

THOUGHTS ON THE DESIGNS FOR THE WELLINGTON MONUMENTS.

THERE are three modes of treating monumental subjects, — the allegorical, the historical, and the religious. The allegorical is generally supposed to be the most elegant and poetic; the bistorical the be the most degant and poetre; the distortion the most practically instructive; the religious the most impressive. In the allegoric, the effigy or statue of the illustrious decased is often hut a secondary ob-ject in the group. His virtues, represented in stons or marble, attract the regards of the spectator more then the furge of the heave in which they are summased than the figure of the hero in which they are supposed to have dwelt, and this necessary result of fine statuary conceptions of valour, fortitude, prudencies, &c. oduces often a depreciatory comparison of the man mself whom the nation delighteth to honour. It produce himself has also the inherent defect of requiriog explanation or valour may be confounded with fortitude, prudence with some kindred virtue. The expression of valour or of fortitude, in peculiar and fine human faces may be known to artists, and a few great observers o be known to artist, and a tew great outstriction the influence of these virtues on the exterior man; but the general public will require to be told "this is intecded for Fortitude," "this for Valour," &c. All such explanations weaken the force of the combination, and introdoce criticism as o poetical propriety, when the mind waots full moral poctear propriety, when the mind waots full moral impression. Heave allegory, with modern Christians, is almost always weak. Almongst the Greeks they had their unquestionable Minerwas and Mercurys, the well-know defield types of Wisdom and Eloquence, and when these sacred embodiments of goddesses and gods were made parts of a public monument to the unemory of an illustrious warries or citizen these variable. memory of an illustrious warrior or citizen, they carr with them all the expression requisite to convey vey bis peculiar claims to remembrance to every helio But with us who believe in one God, the grea great be stower of all mental powers, as well as all phys blessings, there are no such means of communication, an instantaneous *poetic* impression that the distin eating guished dead was remarkable for eloquence or valour, except the plain, straightforward one of an epitaph. The allegarical mode, therefore, seems not applicable to our times and the general conceptions of the national mind. We find that in the Middle Ages, when warriors fought especially under the hanner the Cross, their monuments contained this fact asserted the Cross, their nonuncents contained this fact asserted in very simple language. It was the one which constituted all their praise, or in which all other dis-tinctions were loss—aud they lice on their biers, with hands uplifted, assorting no claim whatever to be sur-rounded by *attributure* figures of Valour, Justiev, or Mercy. This is the simply *religious* and *impressive* mode of monumental erections. I believe few persons heave believe for person montest without forling the their have looked on such monuments without feeling their have looked of such motifications without tering their simplicity to be more affecting that all the poetic episodes which could be written in artistic language, in the elaborate hieroglyphies of the virtues crowded round our modern coulds! Such groups, at all events, are not calculated for churches,--therein the praise of God, not the praise of man, is to be pro-claimed, more especially the praise of deeds, which, however they may have consolidated the power of a particular country, may have empended in power of a particular country, may be regarded by many as totally at variance with the spirit of the Christian religion preached in that very edifice. If these actions be regarded as nationally worthy of praise, on account of the merit of valour or prudence which they display, building should be specially creeted for the recep tion of such statuary as would demonstrate the national respect for the bravery, the eloquence, or the t be called in plain, but, elecant English, "I Temple of the illustrious." But leaving this su gestion for the present L would patriotism w "The

paction for the present, I would past to the individual subject of this discussion. Many of the designs, if compared with the views here (but with all due defenence enunciated), will appear totally unfit for creediou in the temples of Most High. Figures of Fame hlowing the trumple over the heads of the spectators to the parise of the departed, with a retinue of enhodied attributes surrounding the base of the manament, or otherwise distributed, will not be regarded as a satisfactory exposition of national good sense and religious reverse in relation to the subject. The Star-Monument seems peculiarly unfit for the House of God, and almost reminds us of the expression, the "Star-Of your God Reuphan," associated with avother Doity of revolting character in Sarred Writ. All such conceptions of the forms in which homage should be offered to patriotism or valour should not be permitted to enter the sanctary of the Lord Jelowah. But if it still be desirable to introduce into the eathedral where the hero is buried a mountent expressive of this fact, let it be historical but alsorelizious. Let him repose upon his hier under a canopy not too elaborate, and let some of his chief and trusted compations stand round unusing of the end of all great.

and historical fact, and religious sentiment would be blandcasly combined, and the labours of the sculptor would convey, iostead of fanciful shapes of non-existent beings, the veritable features of those who shared the great warrior's deeds, and rejoiced in the long years of prosperity with which they were crowned. I trust these few remarks may not be considered for the states of some of the states of the

of prosperity with which toey were crowned. I trust these few remarks may not be considered presumptuous: they are, iodeed, offered with much deforence, and in the hope that other and greater minds may be disposed to bring the light of their own reflections to bear on a matter which has much to do with the character of our national taste, and the hereafter of sculpture as an educational aid to the intellect of future greatfulna.

after of setupfutes and characteristic and the other the setupof future generations. All of the setup of th

FOREIGN INTELLIGENCE.

The Dome of Cologne. — The report of the Central Building Commission mentions that the receipts for the half-year ending, amounted to the large sum of 83,000 thalers. It is characteristic of the times, that some of the Jewish firms of Cologne hegin to contribute considerably towards the restoration of the huge enthedral.

Paris.—A huge Hippodrome.—The French Government bas decided on huilding a huge Hippodrome, to afford room to 25,000 people: 15,000 soliders will he admitted *free*, as a sort of antidote against the immorality and intemperance prevalent in that class : 10,000 persons are to he admitted at a soall entrance *e.e.* just to cover the expenses of the establishment. There are to he horse races and other equestrian exercises, as well as athletic (zymnastic) games.

Paris.—Palais des Archives.—This French Recordoffice occupies the place of the Hôtel of the Duke de Soubise, originally crected in 1697. His successor, Duke Rohan Subise, had it ornamentei by the first architects of the age, as well as by soulpture of Coaston, and paintings of Natoise, Carle Vanloo, &c., which made it one of the first places of the French equilat. The revolution made it public property, and heing appropriated in 1805 to the collection of States' records, various improvements were effected in the course of time. In 1838, Messis, Dubois and Dulory were named architects of the Palais des Arehives, and one million of finces was expended in ameliorations and restorations. M. Greterin also archives present a similar character of solidity and firmoess, the wills being constructed of hewn stones. The floors are of iron and pottery i he roof is also of the Toureg, which terminate in *ten fountains*, being an angle protection in cases of fire. All these works have mide another grant of one and a half millions of tranes necessary. The works now in progress comprise the restoration of the huidlings, forming the iront towards the Rue du Chaunea, and the repairing the fountain called du Paradis.

 ON TRACING CURVED TUNNELS.

7

To be the industry of the curve, as well as the length of the curve, and the right angle Y G X. From these two angles the third angle, ϕ_{1} is found : $\phi = 180^{\circ} - (Y G X + G X Y)$, or, $\phi = 90^{\circ} - \theta 90^{\circ} \cdot 0 : 0$. In the diagram the curve is subdivided into four In the diagram the curve is subdivided into four equal parts; coasequently, each of the small angles, a, b, c, d, one-fourth of the angle b, and generally the small angles, are equal to ϕ divided by the number of divisions into which it is found practically convenient to operate with the tangents of these angles. In the first small sector, Y E G, we know the small angle, a, the right angle, Y G E, and the radius, Y G, to find the sub-tangent, G E, and the hypothemuse, Y E, from which to find the short line, F E. If now we take the line Y G as the radius to the angle a, G F is the tangent of the angle a, and Y E the secant of the same angle in terms of the radius of curvature of the tannet.

curvature of the tunnel. Hence we ha

ve—E	G	=	Y	G	х	tan. a,
Y	\mathbf{E}	=	Y	G	×	sen. a.
						YF.
		_	Y	E	_	roding .

= 1 E - radus; or, baving found the line G E in terms of the radius we have $Y E^2 = Y G^2 + E G^2$, which may be nsed as a eheck to verify the other computations. Knowing the radius of curvature and numerical length of tangent G X, the biscetrice X Y is known from the same formula for $X^2 = Y G^2 + G X^2$ and A X = Y X - radius. By the principle of geometry it is shown that $K X^2 = Y X \times X X$

$$= (2 \text{ rad.} + A X) \times A X.$$

= $(2 \operatorname{rad} + A X) \times A X$. The next operation is to find the angle GEF, which is easily done, as we know the small angle a, and the right angle Y GE, to find the third angle $= 90^{\circ} - a$, the double of which gives the angle D E G contained by the two sub-tangents D E and E G. We are now in possession of all we require, for we know the lengths of the lines E G and E F, and the semi-angle FE G, and its double D E G; for hy the con-struction of the diagram, the four angles a, b, c, d, are equal to each other, the lines GE, ED, D B, B A are each equal, B C and E F are equal, and the angles GE D, D B A are equal: so that all these lines and angles are repetitions of each other, which may thus he continued through the whole length of the curve, and the points G, F, D, C, A hy means of them traced on the centre line of the tunnel, or axis of the eurve.

By means of these simple formula the required lines are easily determined, and their arithmetical values found in terms of the radius, whatever that may he. These lines and angles once determined, it is not These lines and aggles once determined, it is not a difficult operation to fix the reacting, whatever that may position of the various points on the axis of the tunned as the work progresses; great care and frequent verification, however, heim necessary to guard against any deviation, either from derangement of the standard points or negligence of the overlookers. From the preceding observations, the following rules may be deduced:— To find the length E G on the main tangent to the curve: moltiply the radius of the curve hy the tangent of the sub-all angle a_i and the result is the length of the sub-tangent in terms of the radius, which line forms one of the equal sides of the polygon circum-scribing the eave.

scribing the corve. In the project circuits To find the length of the line E F, which fixes the point F on the axis of the tunnel : multiply the radius of one curve by the secant of the angle a, and from the result subtract the radius, the difference is the length required of the bisectrice of the angle G E D. These two operations give the arithmetical results required, but to avoid tedious multiplications loga-rithms are most convenient for use. The following from the Combe Essure cutting on the Brziers Ruilway, France, which was commenced as a tunnel, but subsequently changed to an open cutting, to get stuff for a heavy benk 60 fect deep, containing upwards of 100,000 yards, may be taken as an example.

<text><text><text><text>

The object sought is the means of fixing accurately a series of points, G, Y, D, C, A, on the axis of the curve; in the diagram these points are only marked on one side, as the same lines and points apply equally for the other, as in the subsequent operations the lines and augles are mere repetitions of one another. To effect this parpose we must find the length of the line G E, the sub-tangent; the length of the line F E; the angle G E F; and its double, G E D: these lines being once determined, all the other lines and angles are precisely the same.

The series of sub-tangents of the sub-tangents of the sub-tangent of the sub-tangent of the sub-tangent of the sub-tangent, and the diagram, that the length of the two required lines, G E and E F, are in practice limited by the formation, width, or excession of the tunnel; because if the sub-tangent, G E, is taken too long, the line E F will be longer than the half width of the tunnel, and, consequently, nucleas for all practical purposes. As the series of sub-tangents form a polygon either sub-tangent for the tunnel, it is evident that if these lines are taken too long, it will not be possible to set out the lines F and B C underground as the exeavation progresses, because if they are equal to

the exeavation progresses, because if they are equal to the half width of the tunnel, there will not be suffi-

the half width of the tunnel, three will not be suffi-cient room for the engineer to operate between the instrument and the flank walls of the excavation; they must, therefore, be so chosen, as to be less than the semi-transverse formation width of the tunnel. It will save time and trouble if, in the first in-stauce, this line is determined approximately, either by a few rough calculations, or by drawing the curve to a sufficiently large scale, and marking thereone the first sub-tangent G E, and the line E F, from which its approximate length is readily obtained. From this approximation it will he easy to determine into how many parts the semi-augic ϕ_i or the curve A G, had best he divided into, so as to give the line E F of convenient length for using within the narrow limits of the tunnel.

In the data in the semi-development of the axis of the curve is divided into four parts only, for the sake of distinctness; in practice, however, the num-ber will depend on the circumstances of the case, the radius, and width of the excavation

radius, and which of the excertation. In general, the greater the number of fixed points in the eurve the hetter; hut there is a limit to this, for if too numerous, the respective lines and angles will be so small that considerable difficulty will be experienced in operating on the ground, or rather, underground, in setting out the lines. All that is re-quired is to get these lines of lengths suitable for easy operation in the works, so that they may he readily traced, and the angles easily set out by the theodolite. From the detailed plans, and form the networks From the detailed plans, and from the nature of the question we have given,-

 θ = the semi-angle hetween the tangents.

G X = the length of the tangent.

sub-tragents or lines, G.E., E.D., D.B., B. V. and four equal lines, corresponding with E.F., B.C. in the diagram, which 'or reasons already explained is only divided into four equal parts; so that in this example we are enabled to fix mine points in the axis of the entree corresponding with G. F. D. C. A. in a length of entree of 300,894 meltree. As the ayele at the centre, in this example, was

As the angle at the centre, in this example, was divided into eight parts, we have,--

Angle at centre = 43° 6'; $\frac{1}{2}$ angle at reatre, $-a = 5^{\circ}$ 23' 15" Then G E = radius × tangent a. Log. tangent, $5^{\circ} 23' 15'' = 8.97262444$ Log. radius, 400 = 2.6020600Log. tangent G E = 1574679337.556 Tangent G E = 37Also Y E = Y E × sec $mt \pi$; or, $Y E = \sqrt{Y G^2 + E G^2} =$ $= \sqrt{161410} = 4017587;$ then F E = Y E - Y F = Y E - radius, = 4017587 - 400 = 17587.

For the bisertrice we have $Y X = \sqrt{rad^2 + tangent^2}$ or, $Y X = (2rd + A X \times \Lambda X)$ 828 ;

$$= 547828$$

and $X = YX - XA = 147828$.

Then, for the angle G E F, we have $G E F = 90^{\circ} - 5^{\circ} 23' 15'$

$$=$$
 84° 36' 45'
G E D, the double, $=$ 169° 13' 30"

This angle enables us to fix the p-int F, and de-termines the direction of the second line, D E, which is a tangent, to the curve at D: we are now in possession of all the clements, which m-y be collected and arranged as foll ws:---

	100
Radius of the curve	400
Bisectrice X Y	517 828
Line A X	I47 ⁻⁸²⁸
Tangent G X	374.316
Length of curve	601 788
Angle b tween tangents	93° 48'
$\frac{1}{2}$ angle = θ	46°51'
Angle of at centre	43° 6'
Angle YEG	84° 36' 45"
The double DEG	$169^{\circ} 13' 30''$
Angles a, b, c. &c	$5^{\circ} 23^{\circ} 15^{\prime\prime}$
Sub-tangent E G	
Scean or line Y E	
Line E F	1 73877

The method of using these lines and angles is The method of using close bines and angles is sufficiently simple. The line PX hoing the axis of the straicht part of the railway, and G the commence-ment of the curve, in which the tunn I is placed, the point G must be accurately and pen usually fixed, with two or three of the back points, in the direction P on the axis of the railway, so as to be a le to refer to them when necessary to verify the life G E in the works

works. To trace the curve, we proceed as follows:--Con-tioue the line P G in the exact direction P E, and mea-sure off the length G E, as found from previous cele-lations, and fix a p-runneet mark at E. Place the theodolite at E, and set off very exactly the angle because and the approximate matrix at E_{c} relate the theodelite at E_{c} and set off very exactly the angle $G \to D$, which first the direction of the second line E D, which will be ultimately prolonged double its length to the point B. Divide the angle $D \to G$ in two equal parts, and from the central fixed mark E, set off the length E F, and F will be the second point on on the engine F, and F will be the second point of the envery-and when the wirk his progressel to B, repeat the operation and so on, for all the other points. Con-iderable erre and account verification of the various lines are angles are required to prevent of the various and angles are required to prevent errors creeping into the work. The permanent bench marks are generally square dressed stones, if suitable size, firmly fixed in the ground, two intersecing diagonals bring legibly marked on the face, the point of intersection of these lines being the centre of the fixed neity termination.

points at any given equal distance apart from each ith r, we may raily find the off-sets from those points on the sub-tangent to the curve, measured at right angles to the sub-tangent; for if we make $\pi = qaa$ to the first given off-set, call the radius R, and dis-tance measured on the sub-tangent δ , we know that approximately $\pi = \frac{\delta}{2 R} = \text{length of first off-set, and}$

 $\frac{\tilde{c}^2}{R}$ = to the second, third, &c. off-sets : hence

these minute quantities may be readily found, and two these minute quantities may be readily found, and two or three intermediate points marked on the curre, to check the exearcian as it progresses, and thus verify the work step by stp, when the principal lines are once well determined and securely fixed. The length of the line, or chord, uniting the points D and G (not shown in the diagram) may be readily found, for we know the angle D E G and its two inducting sides to find the remaining side, as the two other angles are already known lines, which may be

other angles are already known lines, which may be useful in testing the work.

useful in testing the work. By way of illustration, the following taunels, partly straight and partly curved, are given, as excented noder C. Hutton Gregory, esq. Engineer-iu-chief, Mr. T. J. Hay, resident, on the Graiss.sac Railway, in the south of France.

In conclusion, it may be observed that this system of sub-targents applies equally well for the trace of ordinary entries on a rollway, as the off-sets are never far removed from the cuve, and may be closen of convenient lengths for operation in the field; and since each process is a repetition of the first in every respect, it will be easy and expeditious in practice with a group instrument. with a good instrument.

JOSEPH LOCKWOOD.

ANCIENT ARMS AND ARMOUR.

ANCIENT arius and armour offord to the inquiring ANCIENT artus and armoir aufor to data requiring and artistic mind many poiots of great interest, aud may be studied with much advantage. There is a singularly fine cellection, as we have already soid, autongs the Art-treasures at Manchester, narty from Goodrich Court, and parily from the Tower. A well-known authority on the subject is contributing A well-known atthony on the subject is controlling some papers on this collection, with community, to the Manchester Guardian, and we have made some gleanings from these, confining ourselves to ance-dotes and observations of general application. On the subject of ancient arms and armour, says the writer, nothing but the most confused and erroneous solutions of the present the subject of ancient arms and armoor, says the writer, nothing but the most confused and erroneous ideas existed at the commencement of the present century. Francis Gross had published (1786-1801) his military antiquities, fall of valuable documents and false deductions. Juseph Strut, the most laborious and unassuming of arrelexologists, had seat tered here and there throughout his voluminous works, important facts without system tic arrang ment or scientific investigation. It remained for Sir Samuel (then Doelor) Meyrick to collert, to examine, to sift, to classify, and chronologically marshal all three and numbeless other evidences, and to produce, as the "critical Inquiry into Ameient Arms and Armonr," which, despite the imperfections almost novaidable to the first publication of an estensive work upon a forgoiten art and an abstruse subject, increased by the pecolisely disadvantageous circumstances under which it passed through the applies the industances of enchanged by devine and the fact in this branch of archaeology. The practical knowledge Sir Samuel vectually drived from the accumulation and expenditions and or goiter art and the accumulation and expenditions and the terms of the English student in this branch of archaeology. The practical knowledge Sir Samuel be the grammar of the English student in this branch of archicology. The practical knowledge Sir Samuel eventually derived from the accumulation and exami-uation of existing specimens of the weapons and personal defences of our acce-tor, was communicated some twenty wars afterwards to the autiquarian world in two quorito volumes, envitted "Engraved Illustrations of Ancient Arms and Armonr" (London, 1830)

[Aug. 22, 1857.

collected an immense mass of material, he sat patiently down to examine and compare the dated and un-dualisted evidences with those supposed to belong to the same eras. By this text he was enabled to correct an erroneous date, and to receify misconception. Every thing that did not tally with the general features of the age to which it had been assigned was speedily found its project place in another. Shrewd, enaritous, indefaigable, warped by no theory, misled by no assertion, he toiled on in parsait of truth, his veneration for which, in all things, was the finess putt in his character. Due as this networkedgment is to his memory, particularly from the writer of this article, it would not have been obtruded upon the reader, did it not furnish one of the strongest guaran-tees for the integrity and instructiveness of the colleccollected an immeuse mass of material, he sat patiently tees for the integrity and instructiveness of the colleetion about to be described. A few corroded sword-blades, bosses of shields, and

" His saddle was of whale's bone,

"His saddle was of whale's bone," such heing in the middle ages the ordinary name for ivory, which had become familiar to the Normans-origically by the use made of the tasks of the walres or sca-horse, and whose descendants continued to apply to dephantine ivory the ancient term for all similar material. At the outrance is sloo to be seen the morning star, a formidable weapon, used from the carliest times to the reign of Heary VIII. and still carried by the watchmen in Norway; and apeciments of the two-handed sword, which seems to have been first used in England about the commencement of the fifteenth century, and remained in fashion to the fifteenth century, and remained in fashion to the middle of the sixteenth.

Different century, and remained to taking the middle of the sixteenth. Although the era of complete plate is assigned with good reason to the reign of Henry V, and the armour of that time possessed characteristics which could not easily be mistaken, it is a singular fact, that in no public or private collection in England, France, or Germany, that is known to the writer, nor in the works that have been published illustrating the im-perial and royal armouries of Russia, Spain, and Sardinia, is there to be found a suit which could be confidently ascribed to an eriter date than 1428. The tilting helmet, saddle, and shield of Henry V, monlder in tust and dost on oaken rafters, almost out of sight, over his tomb in Westminster Abbey; and helmets and spurs of that period are to be met with occust, and one of similar form to them will be seen The hands and spurs of that period are to be met with hearts and spurs of that period are to be met with coessionally. Two baseinets remain at Goodrich Court, and one of similar form to them will be seen in the armony on the north side of the nave, but not a fragment of the long steel costs that bore the brand at Haufleur or Agincourt have been as yet identified. In the Tower of London, in the Musée d'Artillerie at Paris, the Rast-Kammer at Dresden, and the Ambras Collection at Vienus, the carliest suis present the same features as those to be observed in the montual knight from G odrich Court, re-ferred to. The headpicce is the salade (so called from the Italian celate), introduced to Eugland appurently in the reign of Henry VI, though the basinet con-tinued to be woru with and without the vizor. The peculiarity of the salade consists in its covering the tinued to be woru with and without the vizor. The peopliarity of the sal-de consists in its covering the upper half of the face, a h rizontal aperture being made for the sight, as io the earlier tilling belmets, and projecting considerably bebind, where it termi-nates in a peak like the kuight's chapean, which was usually worn over it. The lower portion of the visage is guarded by a piece called the hanse-col, rising above the chin, and almost meeting her im of the selade. The breast and back-blates are of exquisize, firmly fixed in the ground, two intersecting diagonals bring legbly marked on the face, the point of intersection of thess lines being the creater of the fixed point required. From the nature of the question, the line 6 first point requires and the first point requires in the ranket of the tarse (as the plates is always smill in comparison with the radius of antermediate check to the work, if n cessary, we may find other points between F and G on the axis. Suppose we measure off on the sub-tangent G E arm is a face shield, also German : the notch on the side was called the bouche, and was made for the pas-sage of the lauce. It does not appear before the reign of Henry IV. in England. The left thigh is pro-tected by what English antiqueries call a socket (a fashion peculiarly German), the orasmentation of which induces us to attribute it to the same period as the suit the suit

the suit. Looking at the lobster-tailed easques, backs, breasts, and tassets, worn by the cavaliers and Roundheads in the civil wars, and, while contemplating the single and triple-barred helmets of this period, a circum-stance is recalled to our memory which may not he without its lesson. Sir David Wilkie did the writer of these lines the heaven of a survival his memory. of these lines the honour of consulting him respecting his elaborate picture of Juhn Knox Preaching the Ins etain state picture of John Andy Freaching the Reformation. He was desirous, he sold, of being very correct in the enstance he had introduced, and requested a candid opinion upon it, the picture being then finished, and ready for removal to the Royal Academy for the purpose of exhibition. On its being pointed out to hum that he had introduced in the gallery of the church mditary personages wearing the barred helmets of the time of Charles I in the reign barred helmets of the time of Charles I in the reign of Mary Shuart, he replied that his reason for so doing was, that these persons were to be supposed as having visited the church with a desire to be unknown; and yet he had eatually selected—more in the spirit of an Irisbman than of a Scotchmau—the open head piece of the seventeenth century, through the bars of which the face was distinctly wible, in preference to the beimet of the sitteenth, the clused vizor of which would have defeed scratiny! The glaring absardity of this anachronism was, notwithstanding, allowed by the great painter to remain, and to be disseminued by the borin of the engraver, although it might have been remedied in half an hour, with as much advan-tage to be effect of the picture as to its historical accuracy.

tage to the effect of the picture as to its historical ,accuracy. This anecdote "reminds us," as an inveterate story-teller would say, of one more creditable to the taste and intelligence of another Royal Academician. Mr. A. Cooper's "Bittle of Bosworth" graces, by permission of the Earl of Durhem, the walls of the Gallery of Modeun Artists in this Exhibition (No. 195). While at work upon it the painter consulted Sir Sannel Meyrick as to how King Richard III.'s horse should be caparisoued. "In slk housings embroidered with the royal arms," was the naswer, "covering the steel from his cans to his hoofs." "Onl" exclosing the mortified artist, "that will never do for me: up principal object is to paint White "Oai" exclaimed the morthied artist, "that will never do for me: my principal object is to paint White Surrey, and if 1 cover bim from head to loot, as you describe, I may as well not paint him at al." "Bat," rejoined the antiquary, "you tell me the moment you have chosen is that in which Riebard mate his last descente durant of the Siz Liebe Chosen Bast rejoined the act quary, "you tell me the moment you have chosen is that in which Richard ma'e his last desperate charge and slew Sir John Cheney, Rich-mond's standard-barer. Now, as this was at the close of the battle, the caparisons of the borse would probably by that time have been cut and torm to shreds, and the col ar and anatomy of the horse in that ease might be readered sufficiently visible for your purpes." The true arits it maped at the sug-gestion. Look, rader, at the result: the silken busings rent to ribbons streaming in the wind ad action to the horse, tell a terrible tale of the finy of the fight, and completely satisf the archeologist, while they display the peculiar genus of the painter, and give additional effect to the picture. Amongst be most interesting specimens of fire-rums will be found the dragon, so called from the head represented at the mazzle, and from the use of which the troops now know a sed regions derived their man-, a hand undrar of the time of El zabeth, for throwing greandes, a sangbannee, a blunderbuss, wheel-look pistols by Lazzanino C muminazzo. The batton of the removanel Duke of Alva, presented at battle bottle the construct a data presented at the man barries and a fire pair of pistols by Lazzanino C muminazzo.

The balon of the renowned Duke of Alva, presented to him by Philip II, of Sprin, is of steel, hollow, to contain the muse e-roll of an army, and covered out-side with Arabie numerals in gold, with divisions of suce with Arabic numerals in gold, with divisions of silver on a russet ground. These are the results of calculations, according to the system of warfare to the sixteenth coultary, by which the general is apprised what number of men would occupy any given space. Some phrases in the French language are supposed to allude to this description of numerical transhous, such as "Ere bien assured de son balon; obtain son objet par le four du baton," and "Etre reduit au balon blanc," i.e. to his last shirt by the exhaustion or obliteration of the calculations.

or oblication of the calculations. [The writer hinself, we will reature to say, is not of this opinion, for these phrases have evidently no special reference to this description of transheem.]

In commenting on the North Armoury, from the

which, it is much to be regretted, is not amongst the historical portraits exhibited from that palace. It is profusely decorated with the royal badges at England, France, and Scotland, the rose, the fleur-de lys, and thistle, as well as the letters II. P. conjoined under a thistle, as well as the letters II. P. conjoined under a corouet, the charfront for the horse's head having the prince's arrss in full, gilt and enamelled. An extra gamblet for the right hand, belonging to this suit, is in the Meyrick collection (glass case), and an extra helmet is placed at its feet, while it is surrounded by a complete set of filting-pieces (*pibces de renfort*) and an extra vam-plate for the lance. On the left-hand of the figure is the long-bridled gauntlet. This chivalrie young prince, who is said to have heen "in mour frequently five and six times a day," applied, at the early age of ten, to Colonel Elmonds, to send him a suit from Holland, and in 1607 the Dauphio, son of Henry IV. of France, sent him a suit well gilt and enamelied, ungeher with pistols and a sword of the same kind, and an flows. Three years and enamelied, together with pistols and a sword of the same kind, and armour for a horse. Three years later, 1610, on being created Prince of Wales, he caused a challenge to be given to all the knights in fread Britain, under the name of Meliades, Lord of the Isles; and on the day appointed, assisted mily by the Duke of Lennor, the Earls of Arcudel and South-ampton, Lord Hay, Sir Thomas Somerset, and Sir Richard Preston, his instructor in arms, sustained the combat against fifty-six earls, harons, knights, and esquires; Prince Henry himself receiving thirty-two pushes of the pike, and about 360 strakes of the swnd; being then not quite sixteen years of age. Sir Samed preserve to the pick, and about about stokes of the sword ; being then pick sitter a verse of ange. Sir Samuel Meyrick, who was anxious to identify the relie which he had acquired, remarks, that from the above eircruu-stances of most of Prince Henry's armour being sent from abroad, the impression would he that this suit was of foreign manufacture; but there is in the State-ers of Oreign manufacture; but there is in the Statepaper Office an original warrant, ordering the pay-ment of the sam of 2007, the balance of 3402, for a rich suit of armour made for Heny Prince of Wales, dated July 11, 1614; he having did don the 6th of November, 1612. This document is directed by King Jumes I. to the commissioners for the exer-cise of the office of High Treasurer of England, and states that "whereas there was made in the office of our survaum of Generation he William Dirich cise of the office of Irigh Treasurer of England, and states that "whereas three was made in the office of our armoury at Greenwich, by William Pickeringe, our master workman there, one rich annour, with all peaces complete, fayrly guilt and graven, by the com-mand near of our late deere some Prince Henry, which armour was work (as we are informed) the somme of three hundred and forty poundes only, sos as there remay at the dae unto him the samme of two hundred poundes; " therefore they are ordered to dis-charge the same forthwith. Now, as the suits sent from Holland and France, in 1004 and 1007, were made for Prince Henry at the ages of 10 and 13, the size of the one before as readers it exceedingly probable that we have here actually the ""rich annour, with all pickeringe, at Greenwich, when the prince was in his eightreenth year, and which was ordered by him most likely with a view to some grand chivalric entertain-ument in honour of the visit of the Elector Palatine, the afilanced husband of bis sister Elizabeth, whose unptials, however, he did not five to celebrate. In 16600 we have, appmently, another notice of this sumeth with whole weare to home an ensered the haptisis, however, he did not hve to celebrate. In 1660 we have, apprenulty, another notice of this superbuilt, which secure to have been amongst hose originally keyl in the gallery at Greenwich, but a'tr-wards removed to the Tower; for in an investmy taken in that year by order of a commission issued by Charles II. we find "upon a horse statue of wood, me compleat til ing armour cap-a-pe, richly gilt, part graven, part damasked, made for Prince Henry, part graven, part damaskei, made for Prince Henry, with two gaudelts and one gilt grand ganzd, the horse furnitue being one shaffroone of the same sort." The mention of two gaudelts is interesting, because it evid-ntly implies two extra gaunkts, as they are coupled with the grand guard, the armonr being previously described as complete copa-pied, which it would not be without guantlets. We know where the extra right-hand gaunth is. The other, it is probable, was an extra bridle gauntlet.

At the conclusion of his paper-, the writer points the two armouries in the Exhibition of Art Treato the two armouries in the Exhibition of Art Trea-sures at Mauchester, as the first attempt to make such collections instructive, by famillarising the eye to the gradual progression of form and ornement. The fust-Kammer at Dresden, the Music d'Artillerie at Paris, and other similar muscums, are merely large storchouses, the valuable culents of which are more or less picturesquely displayed. In the Tower of London, Sir Sa nuel Meyrick, some years ago, suc-ceeded in obtaining permission to abilish the most glaring absorblier, and to place the mounted suits in the horse armoury in their true order, had on the sin-sular condition that manes of bistorical personances In commuting on the North Armoury, from the gular con littor thrue order, hat on the sun-tower and elsewhere, the writer speaks at some length of a suit (against the staticrass screen) made for Heary Prince of Wales, the eldest son of James I, whose early death was so universally lament d. It is the islattical one in which he is painted in the well-known full-length prirait, by VanSomers, at Hampton Court,

chester, by shawing what can be accomplished despite all the obstacles arising from restrictive pledges, con-flicting interests, limited space, and disadvantageons position, may happily have some influence an public opinion, both at home and abvoad, and induce those who have the power, to exert it in improving the character of those national collections which, instead of mouch redden in the moistic world he include of mercly gratifying idle enriosity, should be made to afford must valuable information, artistic, historical, and biographical.

ELECTRO-TELEGRAPHIC PROGRESS.

ELECTRO-TELEGRAPHIC PROGRESS. The European end of the great Atlautie telegraph cable was laid with due ceremony by the Lord Lieu-tenant of Ireland, at Valentia, on the west coast of the island, as our readers all doubtless very well know, as also that between 400 and 500 m les of the cable were payed out, latterly, into a depth of two miles and upwards, bencath the surface of the neean, when unfortun-tdy the cable snapped in consequence of additional check being put on the paying-out ma-chinery to prevent it from running out too fast. Mactuer this partion of the line will be regained may be doubtial, bat the experiment, and there is ittle doubt now fell, we beheve, of the per-fect practicability of laying down the cable. The only quastion is whether this should be done in October, after the equinortial gales of the present fect practicability of laying down the conce. The only quisition is whether this should be done in October, after the equinoctial gales of the present autumn have passed over, or whether it may not be better to put oif further procedure till next year. Imperfections in the paying-ont ma-binery require to be rectified, and we must record the fact that great miggivings existed previous to the departure of the expedition as to the efficiency of this machinery. A naval officer, too, Liceutanot F. Higgiuson, confi-dently predicted what has occurred; in cons quence, as he maintained, of the circum-tance that the appa-rates and its management were arr.uged by laud-men ralus and its management were arranged by laudsinen who bad not adequate experience of the straius to which the cable might be subject on shipboard.

which the cable might be subject on shiphord. In describing, some time since, the remarkable state of a piece of felegraph line which had heen worked out in the British Chonnel, if m y be remem-hered, we suggested that it might be instructive with reference to the Athantic cable and its working. The wire was, as it were, consolid 4cd into little pellets, completely disintegrated, and which looked as if each bad heen shortened by harmoring on the ends. completely disintegrated, and which looked as if each had been shortened by hanmering on the ends. This, we remarked at the time, was quite explicable on an idea previou-ly braached more than once by us in the Badlder, that the influence of the positive electric force was concentrative, or attractive, rather than the contrary, or more analogous to cold, for example, than to heat, the *negative*, of course, being the contrary, or more of the nature of repulsive force than of attractive. The necessity or advantue of no term the toking of the negative, of course, being the contrary, or more of the nature of replicive force than of attractive. The necessity or advantage of so working telegraph lines as to obviate this tendency of the positive to consolidate and disintegrate the wircs, was then suggested, with special reference to the Allaotic Telegraph. Since then, a very simple, and we do anticipate, a most effectual method of doing so has been adopted by Mr. Whitehouse, whether ind-verteally or with this special perposes in view we know not. The working apparatus, it appears, is so con-structed that, simply by raising and depressing the handle of a key, the operator tansmits alternately negative and positive electricity through the wire, and never sends two eurrents of the same kind succes-sively from the same pole of the battery. One con-sequence of this arrangement, whether designed or not (and, indeed, one can hardly see any other design of the positive clochicity through the wire, di-nie as perpetually counteracted by the nega-tive, and the wire be sustained in *stats quo*, or at least in a workable condition, so far as the special infilnence of either the positive or the negative on it is succroad. We think we may syfely prognosticate that a great economy in the sustained of degraph wires would follow from the general ad-ption of some such method as this of counteracting the influence of the positive by means of the negative. The form of instrument at present used for deve-loping signals by the Atlastic Telegraph Company is it scenus a mod fication of the well-known marking in-trument invected by Professor Morse. The British and Irush Magnetic Telegraph Com-pany are progressing very rapelly with the creation of an overground line of telegraph along the highway

he ornsh and trist suggestic telegraph Com-pany are progressing very rapidly with the cretelion of an overground line of telegraph along the highway between Killarney and Valentia, for the purpose of connecting the existing tel-graphic system with the Atlantic cable at the later plac, by means of which, under an arrangement entered line between the mag-ue is and electric connecting of the lines

The entire through communication to station. Valentia is at this moment in all probability completed.

Mr. Edward Highton, C.E. bas just completed his patent for, firstly, sending telegraphic messages both ways through one and the same wire, at the same instaot, without the messages interfering in any way with each other; secondly, for preventing in any way with each other; secondly, for preventing the destruc-tion of a wire in the sea or underground; and, tbirdly, for mending a decayed telegraphic wire in the ocean without leaving the land. It is obvious that this last invention, its alls meridles result has far average. without leaving the land. It is ouvious that this last invention, if really practicable, would be of enormous value to the Atlantic cable; but we scarcely compreheod its true purport.

A new system of constructing ctions), has his submarine telegraph cables (in sections), has his submarine telegraph cables (in sections), has his submitted to the notice of the Paris Academy of constructing and laying down has heen submitted to the notice of the Paris Academy of Sciences hy M. A. Balestrini. The memoir was merely a preliminary one, to be followed up with details

Before quitting the subject of the great submarine Atlantic cable, we would suggest that had one or two ropes, of sufficient length, with floats appended, been temporarily affixed to the cable as it was payed out, so as to iodicate its whereabouts, and enable those engaged in laying it down to hand it up agaio when hroken, the present ioterruption, and probable loss of eable, as well as of time, might have been obviated. Each successive live of rope so attached to the cable, as it accessive for or type so attende to the canle, as it proceeded, might have been separated from its float when succeeded by another, and sunk by means of weights, or hy its own gravity if it were a wire rope. It might thus, too, have been made to act as a sort of such as the university is even to be a set of the set of anchor to the main cable, repeated at every score of half-hundred mile

A new telegraph has been erected to coonect the establishmeots of Messrs. Waterlow aod Sons, in Birchin-lane aod London-wall, London. This is the Directin-tane and London-wall, London. This is the first instance, it is helieved, of a telegraph being car-ried over houses in any large town in England. The distance hetween the two establishments is about one-third of a mile, and the whole space is traversed by a single wire suscended from rule to rule of the travel third of a mile, and the whole space is traversed by a single wire, suspended from pole to pole, at a great elevation above the immediate houses; indeed, so much so as to be scarcely perceptible to the eye. Mr. S. H. Watcrlow suhmitted such a scheme some time since to the police authorities, for uniting the police eourts, police stations, and fire-brigade statons throughout the metropolis. This arrangement is already acted on in the United States.

INAUGURATION OF THE LOUVRE, PARIS.

ON Friday, the 14th instant, as we announced last be the case, the emperor inaugurated the ouvre. Of the works here we have beweek would completed Louvre. Of the works here we have be-fore now often spoken, and views and plans will be found in previous numbers of our journal. The Times the 17th instant gives a full and excellent account of the ceremony, and menions as a curious coinci-dence, that the inscriptioos intended to commemorate the date of the foundation of the Palaee of the Louvre the date of the foundation of the Palace of the Lewre were only discovered the day previously. To them is added the date of its completion. Both are oow efficient to the front of the Paulion Sully, which is right opposite the ceotral pavillon—the Pavillon de l'Horloge—of the Palace of the Tuileries. They are engraved in golden letters on slabs of black marble, and are to this effect:—"1541, Francis I. com-mences the Louvre; 1564, Catherine de Medicis commences the Tuileries; 1852-1857, Napoleco III. connect the Tuileries with the Louvre."

commences and toniertes; 1002-1007, Napolcoo III. connects the Tolleries with the Louve." On the arrival of the emperor, M. Fould, Minister of State, read an address, in which a sketch was given of the proceedings. Referring to the workmen, he said .-

said :--"A four Majesty no longer sees at their head the eminer artist whom you had selected to complete the Lourze. A premature death striking him four years ago, at the com-mencement of this great uncrtaking, deprived him of the dy your Majesty as his successor, has the glory of having inithed it, and his names will remain attached with that of Viscouti to the monument which we now inaugurate. The death of Viscouti is not the only circumatance of which this seremony reminds ms. This year even we have lost Lomart, an artist at once boil and correct, and whose hat compo-sitions are the caryatides of the Pavillon de l'Horloge and he handsome pediment of the Pavillon de l'Horloge and the handsome pediment of the Pavillon de l'Horloge and the handsome pediment of the Pavillon de l'Horloge and of all those who have taken part in them. I have heen pore particularly distinguished themselves, and to whom your Majesty has deigned to accord recompenses." The fits was then read of the persons engaged in the particular distinguished themselves and the zeal of all those was then read of the persons engaged in the persons engaged in the Minister recommended as

whom the Minister recommended these works, whom the Minister recommended as worthy of marks of the Emperor's approval. The names were numerous, and comprised every class, from the priocipal architect, sculptor, and painter, to the working mechanic—all, in fact, who excelled in their respective hranches. These persons advanced as their names were called, and each received from the bands of the Emperor the Cross of Commander, Officer, or Knight of the Legion of Honour. works,

The Emperor, in his reply, showed that the history of moouments has its philosophy as well as the history of events.

THE BUILDER.

of events. A dinner by the Minister of State was given in the evening. The majority of the guests were of the working classes, those who have here engaged in completing the Louvre: the rest consisted of men of letters, representatives of the press, and artists. M. Fould, Minister of State, presided. On his right was M. Maret, one of the contractors for the works ; and on his left a young workman named Riffaut, a stonemason by trade. After the bealth of the Emperor had been drunk, M. Lefuel, the architect, pronosed the health of

"Geotlemen, in the name of the assistants and operatives of whom I am the interpreter, I come to express the gratitude with which we are penetrated for the rewards which have been decreed to ns, and to propose 'The health of the Emperor,' whose geoerons propose 'The beath of the Empror,' whose geoerons ben't has given so many marks of sympathy for the working classes; 'His Excellency the Minister of State, a worthy interpreter of his ideas; 'M. Lefnel, the architect of the works, a worthy completer of the undertaking commenced by M. Visconti,' and, finally, 'The Contractors, our patrons,' whose intelligent activity never ceased to guide us, and of whose kind-ness we shall ever preserve an acreeable recollection. ners we shall ever preserve an agreeable recollection. Vive VEmpereur 1"

PREMIATED DESIGNS FOR THE GOVERN-MENT OFFICES.

WE this week publish an illustration of the design We this were puttien an instruction of the view) and the for the War Office (on the left of the view) and the Foreign Office, by Messes. Prichard and Seddon, of Llandaff, for the first of which was adjudged a pre-Datical, for bars of which we competition." The view is taken from the north-west. The draw-ings explanatory of the complete design, as they appeared in the former exhibition at Westminster appeared in the former exhibition at Westminster-Halt, included a block plan, showing the general arrangement of Offices as proposed by the authors, hesides the detailed representations of the portion of the design appropriated to the Foreigo Office and Foreigo Minister's residence. The drawings were numbered 140 in the exhibition, and were marked "Cymrn," with the Prices of Wales's feathers. The two chief Offices and residence were designed as three distinct buildiogs, though grouping to eacher and ac-cording with one another in style and character. The premium, however, was warded, as io other cases, for premium, however, was awarded, as io other cases, for only one of the Offices, apparently without regard to a question whether the merit which might be per-ceived in one, could be separated from what might exist in the other. The peculiarity of the award is even more remarkable in the case of Mr. Dwyer's desigo, where the two Offices are designed as one building, with a central feature which would have to be cut in two, to effe separation. Considering that all competition designs should be viewed as made for actual execution, it cansuch a considered that the indges in their desire to distribute the premiums with fairness to all, have attained their object. They have rather adapted a course which involved essentially some degree of in-They were, however, placed in a position of instice. difficulty by the instructions, and by the form in which the premiums were offered. That there should have been successive competitions instead of three undertaken at the same time; or else, that the premiums should have been announced for one com-prehensive class of designs, such as those which the priorial competitors folt compelled to undertake, is we suppose, now admitted on all sides. We pointed out the mistake in the first instance, and after the drawings were sent in, and feel compelled to recer to it often. We hope architects will at length be bronght to hesitate ere they attempt to work upon "instruc-tions" worked without word to be the s," worded without regard to the first elements logic and those laws of thought which are be departed from least of all in architects' tions. designs, or such instructions as do not leave them and their judges free to the realization of the hest work for the object. Architects should also hesistate ere they compete without security that there will be some retarn to them, if not employed to super-intend the huilding—such return as they might get from a well-managed public exhibition. We are not disposed, however, to pursue this disagree-hie subject. It is ecough to say, that the enormous waste of labour which there has been in this recent ease, is a source of constant lamentation to us

The opposition, however, which the Government have met with in parliament, is in every respect ill-advised and discreditable. The primary object surely need not he dehated about; and the pursuit of the have met object, with the sole exception of the management of

* Our drawing was prepared from a photograph made in the Hall by Mr. Herbert Watkins,

AUG. 22, 1857.

the competition, need not be found fault with. We do not even think that a first step was to impose a limit of expenditure. Clearly, in national works, the pre-liminary measure is to see what is wanted for comvenience and use. The means can be found-with economy and return of interest-hoth for that, and for any amount of decoration which an architect would deem accordant with the purpose of the structure. We are more than ever puzzled to understand the language of honourable members to treating of questions of architecture and public works. Mr. Henley nons or architecture and public works. Mr. Henley is quite right in saying, that competitors would think themelves hardly treated io being put to the expense of plans which the Government had no intention of carrying out. He might well thick that such course would not be an honest one towards those gentlemen. carrying out. The inflat net wards those gentlemen. But why need he refer to the state of the Foreign and Colonial Offices, as having existed for twenty years, since there can be no iofercoce therefrom, years, since there can be no horecore thereinding, whils the necessity for the speedy erection of a new building is so apparent? Or why should another honourable gentleman, uncontradicted, treat the de-signs for the Foreign Office and War Office by differeot authors, as one; and mix up the design for the conversion of the bcd of the river into a flowergarden, with the others-to reason from these pre-misses that "architects who indulged in such poetical misses that "architects who undiget in such polycos-designs, could not complain of their plans being rejected?" Verily, the qualifications for the parlia-mentary sphere, which we are told are previhar and special, must be of a singular kind, since they involve no knowledge of what a man speaks about. Has Mr. Briacoe ever been into Westminster Hall, aud seeo the drawings ?

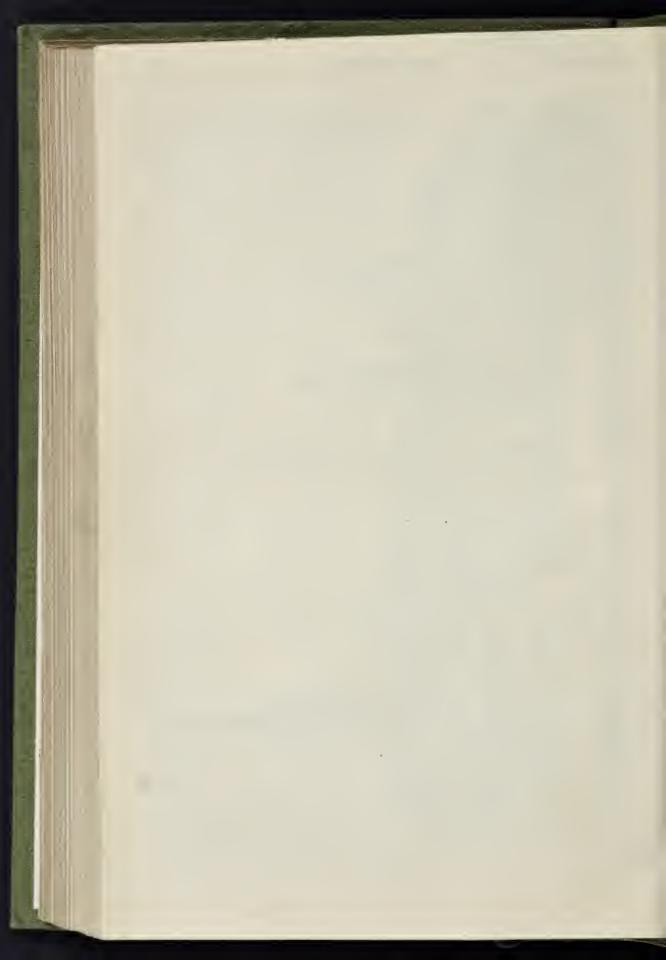

We confiss to being a little led away from the immediate matter before us, namely, the notice of the one particular design by Messrs. Prichard and Seddoo. Its authors have this advantage the one particular design by Messrs. Prichard and Seddoo. Its authors have this advantage over some who have received high premiums, that nearly the whole of their project is displayed on the walls of the Hall in the collection of draw-ings now exhibited,—the several portions of their design—the War Office, the Foreign Office, and the Residence being on the same sheets. Their design was not without reason regarded as in many respects superior as compared with others io the same style. Its disticctive characteristic may be said to be the regularity of distribution of its-window computers, and a general attention to groupwindow openings; and a general attention to group-ing and uniformity which is admirably adapted to the

ing and uniformity which is admirably scapice to he character and purpose of the offices. The buildings, in plan, are arranged about an oblong cont, opening from Charles-street,-entering which by a gateway, the residence is seen opposite, at the oorth end. The gateway occupies the centre of a screen, or covered way between the two buildings. Each building has a lofty tower with a landtron or covered user screen parts and the way to be the War sereen, or covered way between the two buildings. Each building has a lofty tower with a lantern or pyramidal roof, and a spire capping. In both the War Office and the Foreign Office, the principal feature of the plan is a large central hall on each floor, with a staircase in the middle of its ar.a. The hall is lighted partly by windows from the ends of courts, and partly from the lantern of the staircase. The other chief feature of the plan which descress notice, consists in the provision of numerous loggins of arches to the cutraoces, and square projections in other parts, so as curraces, and square projections in other parts, so as to conform to the superficial area required by the in-structions—which was different in the chief floors— and yet economically to secure an addition to the external effect, and to convenience as regards the en-

Another feature of Messrs. Prichard and Seddon's plan, is the introduction of a stable as a low detached huildiog, at the north-west angle, or most prominent position. They seem to have sacrificed a considerable position. They seem to have sacrificed a considerable portion of ground, and to have injured their plan by this addition to the objects required in the instruc-tions; and in the effect, this is the least satisfactory part of the design. The character of the design, as we have remarked, results from the general more down moments. regard for symmetry. The grouped window-openings are separated by broad piers with niches. The loggias —sometimes in two stories—and the towers form -sometimes in two stories-and the towers form central features in a front; and the projecting masses are placed symmetrically. Pointed and cusped arches, over a square lintel and sculptured tympanam, are used generally; and the details both of sculpture and ornament, display much taste. Good art is also exhibited in the staircases and the internal decora-tion. The design is well shown by drawings, includiog well-executed perspective views.

BRONZE POWDER .- Experiments have heen instituted by Herr König in order to ascertain the method of preparing bronz powder, hitherto a series. From the results it appears that the several varieties of bronze powdered leaf are each composed of nearly the same proportions of copper, zine, and tin, and that the variation of colour is owing to different degrees of oxidation, which have been produced by heating the alloy at different temperatures.

CHURCH-BUILDING NEWS.

CHURCH-BUILDING NEWS. Wantage,---We omitted to mention last week that the restoration of the parish cburch here bas been carried out from the designs of Mr. G. E. Street, including the glass, the pavements, and the scelpture. Leicester.--The foundation-stone of a new Inde-pendent Chapel was haid upon a vacant piece of ground nearly opposite De Montfort-street, London-road, by Mr. J. D. Harris, M.P. on the 11th instant. The design of the building is described by the local Advertiser as "Modern Italian, being an adaptation of the Italian style to the requirements of the present day, both as regards material, construction, and in-ternal arrangements." The facale to the London-road will present a projecting centre, crowned by a road will present a projecting centre, crowned hy a pediment, and supported on each side by wings, forming the termination of the side aisles and galforming the termination of the side aisles and gal-leries. In the centre part are three entrances, deco-rated with an enriched order of columns, cornices, &c. and quoins. The interior consists of a ground-floor and galleries, affording accommodation for upwards of 800 persons, and also a large school-room, even-tually to be added to the chapel, which will these sent more than 1,200 addits. The arrangements for warming are in the hands of Mesars. Haden and Sons, of Trowhridge. The contractors for the building are as follows:--Mesars. Lindley and Firm, masons; Messrs. Cox and Son, bricklayers, &c.; Mr. Fozzard, plamber and glazier; Mr. Barsby, ironfounder; Mr. Haynes, painter; Mr. Morrell, plasterer; Mr. Webb, slater.

Alter. *Abingdon.*—Since the last vestry meeting as to the restoration of St. Helen's Church, Mr. W. Wilkinson, of Oxford, and Mr. Socit, of London, the architects selected for the purpose, have examined the tower and spire of the church, and each having furnished a report to the committee, a vestry meeting was called for the 13th instant, to consider these reports, to direct measures for the re-building or repair of the tower and steeple, and to provide the necessary funds for the same. Mr. Wilkinson, in his report, ex-pressed his belief that it is possible to repair the tower and spire, and in doing so, proposes to shore un the same. pressed his behef that it is possible to repair the tower and spire, and in doing so, proposes to shore np the east wall, the inner arelway and weak por-tions of the south wall, and other parts where neces-sary; to build two new buttresses on the east side of the tower; to shore up the south wall above the inner archway, and to construct a new entrance of smaller size than the present one; to build on the south aisle of the church two other buttresses; to construct of oak timber a trussed framework, and to construct of oak timber a trussed inductors, and co fast it at the weakest part of the tower; to insert iron theroads on the east and west sides; put iron pins through the wall and holt them; and do certain works (not of any great magnitude) to the spire. Mr. Wilkinson advises the committee to obtain tenders Wilkinson advises the committee to obtain tenders for the supply of various articles, such as timber for shoring and seaffolding, oak timber for the framiug, stone, Portland eencet, iron rods and nuts, and for the supply of masons, carpenters, and labourers at per diem, and that an efficient practical elerk of works, who has earried out works of a similar kind, should be appointed. Mr. Scott, in his report, alludes to the principal defects to be remedied, as "the overhanging towards the east and south, the erushing, cracking, and this erushing of the areb opening into the church." He explains the following courses which would be adopted to save the tower:—The into the church." He explains the following courses which would be adopted to save the tower:—The erection of a thorough system of shoring on east and wast sides, a considerable addition to the existing buttresses on the east side, the reparation of the shat-tered walling, the replaying of the cracked portions in other parts of the tower, the renewal of the shat-tered stonework of the southern arch, the reconstruc-tion is an end coursed scenario of the shattered stonework of the soluthern area, the reconstruc-tion in a great measure of the satiraces, and the sub-stitution of better iron ties for the existing ones. With certain requisites named, Mr. Secti is of opioion that the restoration of the tower is practicable, and recommends it. After the reports had been read, the chairman stated that the committee had assortained

ing, stated that the plans for the cemetery had been approved by the bishop and the secretary of state, and that after twice advertising for tenders, four had been received, the lowest of which was so much above the that after twice advertising for tenders, four had been received, the lowest of which was so much above the estimate of Mr. Clarke, the architect, that the com-mittee bad consulted with that gendlemon as to a modification of his plans, so as to reduce the expendi-ture. Mr. Clarke, however, thought that no change could be made which would occasion any consider able saving, while at the same time it would damage the general effect of the buildings. He therefore strongly recommended that the plan should he car-ried out in its entirety, and expressed his belief that the total cost of all the works of the cemetry would not exceed 7,000. The committee consequently sup-ported Mr. Clarke's view, and urged the eouncil to have the entire plan carried out according to the lowest tender — namely, that of Messrs. Chambers and Hylton for 4,8302.14s, 6d. After some discussion, the adoption of the report and of Messrs. Cham-bers and Hylton's tender was agreed to unani-monsly.—The extensive works for the partial restoration of Worcester Cathedral, are in rapid pro-gress. The southern portion of the castern transept was fearfully cracked and warped by the lapse of ages, and the windows defaced by the introduction of had tracery belonging to a later period. The southern wall and buitresses of this tracsept have recently been taken down and the vial commolous tracery. The main wall and buttresses of this transpit have recently been taken down and rebuilt, and the ancient windows re-stored free from the anomalous tracery. The main feature of the renovations in progress lies at the east end of the cathedral. The huttresses properly be-longing to the edifice bave now been rendered perpen-dicular and nearly rebuilt, and an Early English window will fill up the end of the cathedral in place of the Decorated one which bad supplanted the ancient work. The flying buttresses at the angles were removed as soon as the augle huttresses properly forming part of the diffice were trengtheods suffi-ciently to ensure proper resistance to the threas of the groining one of these flying buttresses, according to the growing of the root and the other steads. If removing one of these fixing buttresses, according to the *Chronicle*, from which we quote, a piece of chioa was found imhedded in the macoury. This is regarded as itself a proof that their erection took place at a was found imhedded in the macony. This is regarded as itself a proof that their erection took place at a comparatively modern date. The new esst window will contain ten lights disposed in two tiers of five, each divided by a gallery. The lights in both tiers decrease in width, and those of the upper tier in height also, from the centre outwards, and by this arrangement a variety is obtained in the various members of the window. The lights are divided by piers, ornamented by slender shafts, which, rising from the bottom of the window, eross the gallery and terminate in moulded capitals, surmouted by the mouldings of the arches. The hollows of some of the mouldings are filled in with the tooth ornament. There are said to be proofs that the ancient window was of five lights, and Mr. Perkins has constructed the window in accordance, as to details, with the re-mains of Early English east of the tower. In the interior thes window, considered and the surface marble, and these support combinations of deeply eut mouldings forming the heads of the lights. The lights, it is hoped, will ultinately be filled with stand glass. The long Inacet windows on each side the chancel of the Lady Chaple are also to be takeu lights, it is topical, will automately to make with stained glass. The long lancet windows on each side the chancel of the Lady Chaple are also to be takeu out and restored. The Dean and Chapter, in re-storing the interior walls of the choir and Lady Chapel, have caused the whitewash to be removed, and the polished face so the marche columns to be exposed. The workmen have also restored the decayed exposed. portions of the walls, columns, and masonry generally, of the choir and Lady Chapel. Extensive renovations of the choir and Lady Chapel. Extensive renovations at the west front were completed some months ago. These consisted chiefly of the erection of new but-tresses to restrain the tendency of the nave to fall westwards, the rebuilding of the gable, in which an areb has been introduced for the purpose of allowing the removal of the window when the funds of the Dean and Chapter permit, the millions and portions of the tracery being in a very dilapidated condition, though this is not readily perceptible. Among the receast improvements may be noticed the masoury of the Adelaide and the Wheeler memorial windows, and the introduction of three triplet langet windows.

The style is Geometrical. The edifice will consist of nave, north and south aisles, chancel, and scaristy, and a bell turret at the south-west angle of the nave. The principal entrance will be in the centre of the west front: three will also be another entrance on the south side. The length of the nave will be 80 feet hy 25 feet width, and the beight 45 feet to the ridge of the roof; the aisles will be nearly the same length as the nave by 13 feet wide. The roof will he of open timher framing, celled between the rafters, which, together with the seats and other wood-work, will be stained and varnished. The style is Geometrical. The edifiec will consist and other wood work, will be stained and varmshed. The nave will be separated from the aisles on each side by arcades of five arches. The pillars and arches both to nave and chancel will be worked in Bath stone. The passages and chancel will be paved with tiles. The west window and the chancel cash window will hoth be of five lights filled with tracery : the aisle windows will he of two lights each, with the asise windows will be of two nguis cath, will simple trefoiling in the heads. Externally the walls will be of white brick, with Bath stone dressings. The church will accommodute 650 adults and 150 children, and one-half of the kneelings will be free.

MALVERN.

It may perhaps enable some of the younger readers of the *Builder*, who chance to visit Malvern, to view with greater interest and profit the abbey or priory church of that place, if I attempt shortly to indicate the points which struck me as most worthy of atten-tion in a recent examination of that structure.

tion in a recent examination of that structure. In the interior are brought together, without any of the intermediate links which connect them, the ex-tremes of that Mediaval architecture whose rise, development, and decline spread over some centuries. The supports of the pier-arches which divide the area from the west to the crossing into three aisles, are those huge cylicatrical masses of masonry, supposed by some to date from the pre-Norman era. The abneus, a square stone, with the lower edge plain chamfered, follows the plan of the pier : the moulding below it is a quarter round, with small circolar tore beneath. The basses, if they crist, are concealed by the elevation is a quarter round, with small circelar tore beneath. The bases, if they exist, are concealed by the elevation of the floor; the arches round, of three orders of square-edged members. The space of wall between the pier-arches and the bottom of the elevestory windows-enough for a triforium stage, had this feature entered into the builder's design-is left blank, with somewhat unpleasing effect. Of the windows, of rigidly late Perpendicular eharacter, I will say a word bereafter. The covering of the central aisle is a flat ceiling.

The covering of the central aisle is a flat ceiling, The covering of the central aide is a flat celling, divided into small squares by wooden moulded ribs, allogether poor and ineffective. The alternate trans-vorse ribs are returned downwards upon the wall, until stopped by sculptured brackets placed upon the point of each window, and between the pairs. The spandril spaces, obtained by the addition of a curved brace, are pierced into Perpendicular lined panelling. The four arches of the crossing, pointed, lofty, and rising until they intersee the vauling, are composed of circular fillets and hollows, not retiring within and behind each other in the nusual way, but upon the The total affine to the control of the control of the same plane, —an arrangement quite destructive of the same plane, and depth of the compound area. The hollows are filled in with panelling, and all the members of the arch are brought down the sides in the tunkroken continuity as elaracteristic, perhaps, of Perpendicalar as of French Flamboyant. Below these main arches me constructed, to the north and south, subsidiary ones, the space of wall between them, which is considerable, being relieved hypanelling. The last-anneed arches, by a gallery of pews, completely shutting out of view the arms of the transpit. The pier-arches of the choir, there in number, have, like those described, which endirele the mouldings on the line of impost. As in the part of the eburch west of the erossing, so in the choir, the space of wall between the line of impost. As in the part of the burch west of the erossing, so in the choir, the space of will between the pier-arches and the clerestory windows is considerable, but bere it is relieved by its decroative panelling. The absence of a string course of any sort throughont the building struck me as a very obvious defect. The ercetion of a massive semi-circular wall, 10 or 12 feet high, for an inconceivable purpose, serves at once to curial the choir of its proportions, and utterly to destroy the effect of the large window, which, if exposed fully to view, would form a very moble termination to the castard. The north side, too, is closed up by a wooden screen, of the Perpendicular period, which, though heautiful in design, and recommends it. After the reports had been read, the charman stated that the committee had ascertained the probable cost of repairing and restoring, and also the probable cost of repairing and restoring, and also the probable cost of repuilting, and the following was the result: —To repair and the function of the vertailty perceptible. Among the space of a sting course of any sort throughout the space of a sting course of any sort throughout the space of a sting course of any sort throughout the south side of the choir. The space of a sting course of any sort throughout the space of the space of a sting course of any sort throughout the space of the course of the space of the space of a sting course of any sort through the space of the space of a sting course of any sort through the space of the space of a sting course of any sort through the sting and restoration, and to engage him as the architect, and the courted restory of the space of the sproprious, and turk will he

been too snccessfully employed in marring the heanties of this really fine edifice. The stone vaulting of the crossing is groined and

The stone vanifung of the crossing is groited and ribbed, in raber n complex manuer; that of the central aisle of the choir, a flat ceiling like the one defore described, though the presence of vanilings shafts formed by the prolongation of the external mouldings of the elerestory window arch to the ground, would seem to indicate that a regular groined roof once existed, or was contemplated: the roof of the choir-aisles consists of cight-celled compartments, produced by the transverse, diagonals, and longitudinal ridge rihs, and a rib from point of pier-arch to point of aisle window.

There is some good Perpendienlar panelling in various parts of the church. Besides that already mentioned, this mural decoration is employed on each side of the elerstory windows of the choir, in the space hetween the summit of these windows and the foot of the windows of the choir aisle, and of the great eastern window. The last named appears to me the most perfect example ;--the bead of each compartment formed into an ogee arch trefoliated, then the foliated, an instance of which has here termed *louble foliation*, or *double feathering*: two small ogee arches, also trefoliated, under a transom, correspond to each of the upper one.

to each of the upper ones. A large part of the floor of the north transcpt, and of the upper end of the eboir is formed of encaustic 1 itles, and there are others scattered in smaller quantities about the church. On the south side of the choir is an elaborate markle tomh, raised to one Lane, of "Knight, servant of Henry VII." and his lady. These personages are represented in efficy, in a retember posture, and at the head of the tomb is a i henceling figure with upfitted bands, in the attitude of prayer. I suppose this monument not to be earlier than the reign of Elizabeth. The execution is very **T** good, and the preservation complete. In the north transcpt are two ancient stone tombs, one of them yuite defaced; the other surmounted by the effigy of a warrior in chain armour, I presume, of the close of the twelfth, or commencement of the succeeding

The windows of the nave are of three lights, those of the choir aixles of four, of the transcets of six; the west window of seven, and the enst of eight, all formed on the same principle, which, I think, may easily be rendered intelligible by a description of the last named. The central multion splits near the top, and divides the window archws into two secondary arebes; each of these, in turn, subdivided into four lights, with oge-arched heads, on a level with the springing of the window arch; from the points of the oges vertical lines are carried upwards to the forum lights are in like maaner prolonged. All the perpendicult lines are the interstilial spaces thus obtained are trefoliated. A transom divides the secondary arches at about half their height, and helow this is monther line of diminutive trefoliated divides the window into two stories, the secondary attention to the about Au their height, and helow this is monther line of diminutive trefoliated divides the window into two stories, the series of oge-headed lights is repeated. I wish to direct attention to the abundant use which is made in this church, hoth in windows and panelling, of *cing-foliation*, in contemporaneous stained glass in the eastern window, and in those of the choir aixles. The modern glass in the western portion of the chards offers a deplorable contrast both in colour and in design, the batter consisting, strangely enough, of armorial beavings and heraldie derices, surely somewhat misplaced in an ecclesiastical defice.

The windows, outside, have plain dripstones, continued as n string over the sides and faces of the hattresses. The hroad, shallow, strazgling hollow of the declining period of Pointed architecture forms the main feature of their mouldings. There appears no attempt to ornament the buttresses: their set-offs are nuited by plain slopes, and they run up into square shafts set diagonally with finialled and erocketed pinacles. The parapets are various, but all of the hattlemented form; some solid, some pierced into vertical lined panels, and another portion formed of two stages of similar panelling, the upper being placed at equal intervals, to form the merlins of the hattlement. The central tower is well proportioned, of two stories ahove the roof; the helfry stage, consisting of a two-light window in cach face, erowned with concidal-shaped canopies, with concave sides, finialled and crocketed. The parapet is pierced, and there open angular treets.

There is no entrance now into the church hut by the projecting square porch at the north-west end, n

good example of the Perpendicular period, of as pronounced a character as the rest of the building. The stone vanling of the interior is claborately groined and ribhed, the front overlaid with panelling, and from the middle of the upper story projects a canopy, and corbel pedestal for a statue. The old Priory Gate-house, ndjacent to the church, is worthy to be noticed. One side of it is in very vander by the state of the state averated with

The old Priory Gate-house, ndjacent to the church, is worthy to be noticed. One side of it is in very excellent preservation, the whole surface evered with pacelling, with quartefoliated eireles enclosing shields, and lighted by a very graceful little oriel window in the upper story.

the upper story. These, I believe, are the only antiquities of which Malvern can boast. VLYTOE.

HALIFAX.

THE inauguration of the people's park, the costly cift of Mr. F. Crossley, M. P. took place on the 14th inst. On that day, the formal presentation of the new park to the corporation was made. It is situated on the western side of the borough. It has four entrances, two in Park-road, one in Hopwood-lane, and one in King's Cross-street, and the whole is surrounded by palisides. The promenate is reached by means of flights of stone steps. In the centre of the terrace is a semicircle of steps, nice in number, and 27 feet in width. At the top of these steps a stone building is erceted, 30 feet bigh, with arches in front, borne ou pillars of stone. On each side of the huilding will be small fountains, and Greeian vases on pedestals. In different parts of the terrace are productions of marble statuary, of life size, eight in number, the work of Italian artists, representing Hercules, Venus at the Bath, Aristides, Ke. Below the terrace is a stone basin, 4 feet in depth, and 216 feet in circumference, with a fountain in the centre. Lower down is a little huke, with a serpentine walk about it, and bridges over it,—one formed out of rocks. These sheeds of water will hereafter be tonanted by constit heids of water will hereafter be tonanted

by equatic birds of various kinds. At the south or sonth-cast side of the grounds, baths are to he created hy the corporation. The external part of the building is to be elaborately decorated, at an estimated cost of 1,500. Voy public subscription, the rest to be built by corporation rates. The park grounds, which are laid out with trees, shrubs, plants, and flowers, comprise in all 7 aeres and 25 perches of grass; I aere, 3 roods, mil 20 perches of walks; 2 roods and 0 perches of water; and 2 aeres 2 roods laid, and 1 pereb of plantations, in all ahout 12g aeres, suitably studded with numerons seats for the use of visitors.

The opening of the new Congregational Church at Square, Halitax, took place on the 15th ult. It is regarded as "a muniature cathedral," and has en upwards of two years in process of crection. It adjoins and is in lieu of Square Chapel. Hitberto West Riding of Yorkshire has been a Unitarian chapel, at Leeds. The new edifice at Halifax comprises a have transpir, tower, spire, and cloisters. The architect, Mr. Joseph James, of London, has adopted a treatment of the inter or to suit the object for which the building is designed. The period of architecture selected is that of the fourteenth century The form of the edite is that of the following with clos-ters on each side, north and south transepts, with a tower and spire in the junction of the latter with the cover and spire in the junction of the latter with the maye, and a small spirelet on the opposite side: there is a projection for the organ in place of the usual choir. The maye or body of the elifice does not occupy the western end, and the small substitute for a chancel the eastern end, the site being such as to compel the usual position to be reversed. The enstern end of the nave abuts upon Square-road, the gable rising to the height of 72 feet, surmounted by metil closs with cars of wheat. Near the apex of the gable is a four-light window, with lowve-boards for ventilation. Below it is the great east window, 36 feet in height, of seven lights, the mullions terminating at the top in c'riles, with Flamb yant tracery Underneath this window is the cutrance to the scals on the ground floor of the nave, by a recessed doorway, hiving a double niche on cach side of the entrance, and surmounted by a small gable. The gable is flanked on each side with a broad huttress (in which are inserted the entrance doors and steps to an eastern all matrix the contract dors not all parts at the second s -rather low covered passages into the transcuts, entered by doors in the first bay, and lighted by broad, flat-arched windows in the other bays. The The windows in the nave between each buttress of three lights, of almost eithedral size, the head of each being filled in with varied geometric and Flam-

hoyant tracery. The ends of the transepts have on the ground stage three single-light windows, and in the gables wheel-windows about 16 feet in diameter, filled in with tracery, the latter lighting the galleries and the formor the seals below the galleries, in the transpts. The western projection, containing the organ, bas also windows in the ground-stage, intended to light the vestry, the organ heing i rst designed to stand in a gallery above. But as the organ has now been placed on the ground, the windows are filled with slate; but au upper window in the western gable is seen over the organ. There is an entrance both to the floor of ibe nave and south transept, and by a staircase to the gallery of the latter, in the first stage of the tower, with which also the south cloister communicates. The tower and spire which were huilt by private subscription (understood to he from were the ssrs. Crossley), mount up to about 235 feet, Lae Atesers. Crossey), mount up to anoit 230 reck, including the vace. A pierced battlement surmounts the tower; and the springing of the cetagonal spire from this base has been bidden hy crocketed pin-nacles at each angle. The spire itself is a bowed one, though at a distance this pecularity esunds he observed. It is crocketed at the angles, and on the cardinal faces is broken into stages by lacerne-lights. Within, the arebited has been obliged to make the pulpit the main object. The nave is 95 feet long by 45 feet broad, and 45 feet higb, with transept on each side of the eastern end of the nave 28 feet wide. Two aisles, each 6 feet 6 inches wide, and flagged with stone, run up the uave, nud afford ingress and geress to low-backed oak pews on either hand. The scats in the transpots stand at right angles to those in the nave; and the space between the transcepts is occupied by the pulpit upon a reised dais, surrounded light oaken railing. The polpit is of Caen . Immediately behind it stands the organ, the hv stone. recess in which it stands being separated from the nave by a large arch, equivalent to the chancel arch of an ordinary church. In order to secure the re quired acoustical properties of the building the arch quired acoustical properties of the building the archi-tect has adopted a five-sided pauelled ceiling; the whole of which has been coloured and emblazoned, under the architest's designs, by Mr. Haley, deco-rator, & Bradford. All the windows are filled with quarried glass, with a sparing use of deep colours in the traceried heads (the glass being supplied by Mr. N. W. Livers, of Lundon). It uthe evenings the ha'dding will be lighted by three sun-lights in the roof, the pulpit, organ, and seats under the transept galleries having separate gaslights. Accommodation is provided for I,040 admits and 200 children. The building has been erected by Mesre, J. and W. building has been erected by Messrs. J. and W. Beanland, of Bradford, nuder Mr. J. Dilworth, clerk of the works, and its cost will be about 15,000%.

PROVINCIAL NEWS

Chelmsford.—The opcoing of the new school at Southchurch, according to the *Chelmsford Chronicle*, took place on the 4^{ch} inst. The new buildings are situated on the south side of the high road to Southand, a little castward of the parish church of Southendy, a little castward of the parish church of Southendy, a little castward of the parish church of Southschurch. They are from the designs, and have been executed under the superintendeuce, of Mr. Williaru Slater, of Lond n. There is a teacher's residence of six rooms, and a school-room, 33 feet by 17 feet, with an open cradled roof, ceiled to the ridge. The style of the whole is "Niddle Pointed." The walls are built of grey stone, and are rooted with darkroloured tiles. The appearance of the buildings, both as to form and colour, is plain, but relieved by galled windows of a lighter-coloured stane on the north side of the school-room, and by a triplet at the cast end. Together with the restoration in the parish church of a harge south porch of carved woodwork, designed hy Messrs. Carter, of Rochford, Mr. Garrard, also of Rochford, undertaking the carpenters' work.

a large south porch of carred woodwork, designed hy the sume arehitect, the works were contracted for hy Messrs. Carter, of Rochford; Mr. Garrard, also of Rochford, undertaking the carpenters' work. Banbury,.—The whole of the contracts for the waterworks are now taken ;—for the reservoir and engine house, by Messrs. Davis and Sons, Ranhury ; steam-engine and pumps, Mr. C. Lampitt, Neithrop ; filter-beds and pignelaying, Mr. J. Aird, London ; shuee-cocks and hydrants, Messrs. Gnest and Chrimes, Rotherham ; supply of mains, the Butterley Company, Alfreton, D.chyshire. Some of the tenders are necessarily upon sebedules of prices, on unascertained quantities.

Maidstone.—The following tenders were received for the new buildings to be erected at the Red Lioncorner. High-street and Week-street. Maidstone :—

mer, migh-screet and week-street, manus	scone	
Lourence and Son, London £3,940	0	0
Patrick, Loudon 3,895	0	0
Fisher, Reignte	0	0
Sutton and Walter, Maid-tone 3,392	- 0	0
Sutton and Vaugban, Maidstone 3,387	0	0
Tompson, Maidstone (accepted) 3,353	10	0

Preston.-The boys' schools of St. Ignatius (R.C.) have been completed by Mr. John Walker and Mr. Henry Butcher, the contractors. The buildings are

They consist of a boys' school-room, 61 feet plain. by 36 feet, and 21 feet high; a class-room, 25 feet by 21 feet, and 15 feet high; and an infants' school, 42 feet by 21 feet, and 15 feet high; lighted by about 300 feet of skylight.

STAINED GLASS.

Dover .- On the recommendation of the committee of the local council, formed for the restoration of the Mason Dien-hall, it has been resolved that the council subscribe 1001. towards the alterations consequent

subscribe 100% towards the alterations consequent upon the restoration of the western window. This window is to be restored by Mr. J. Bell, in memory of the late William Kingsford, of the Mason Dieu House: it is to be composed of coloured glass, from a design already prepared. *Weilington (Somersed)*.—Mr. John Toms, who put up a stained-glass window in the parish church here about six months since, has just completed and fixed two others in the same church. No. 1—window, con-tains four principal lights, with tracery in the head. Two lights are filled with the figures of SS. James and Andrew, under compies, with backgrounds of dispered ruby: undernosth each figure is placed the saint's emblem. The other two side-lights are of a grissill ground, enriched with doured foliage and flowers: it is a memorial window creeted by Mrs. Ireland, of this places to be choused to the state.

a grisalle ground, enriched with coloured longe and flowers; it is a memorial window crected hy Mrs. Ireland, of this place, to her deceased parcuts. No. 2, is a window of three principal compart-ments, with tracery lights. The general ground-work is a grisalle of thy pattern, -the centre light bearing the figure of the Virgin and Infant Saviour, or a rich diapered hackground of gold colour: the liby is also introduced as the emhlem. This window has been presented to the church by the parishioners. Both are placed in the north aisle.

NEW ZEALAND.

THE following extract, from a journal kept during my voyage recently made from New Zealand to Eogland, may probably interest some of your readers.

England, may probably interest some of your reders, (1857.) I was struck, whilst in New Zeahand, with the extraordinary width and height of some trees, willows especially, which had been planted only a very few years; and this rapid growth, with strength of vegetation peculiar to its soil, must he attributed to its temperate and agreeable climate. The Maories, are faulted inductions of the aligned will mine tree to its temperate and agreeaus climate. The Maorics, as a further illustration of the climate, will raise two crops of potatoes in a year, without manure; a crop sometimes coming to maturity in foorteen weeks. Almost all our English fruits and vegetables are suited to the antipades, and grow to perfection. Forn land, which is pleutiful, when sown with Eoglish grasses produces excellent pastore. There are forests of lofty trees, which are in flower and in leaf nearly the whole of the year. The light and pensite folinge of the blue and red gum-trees is particularly admired. Flax grows wild, and in large quantities: it has a beautiful silky appearance, and is of superior quality. It would repuy cultivation, and in this light it has recently been considered by the Go-verament, which has offered prizes to the producers of the best specimens. Mats and baskets are made of this flax, closely woren : it is a good substitute for cord, and is used in a variety of ways. Some of the native trees, though, perhaps, not so gigantic as those of Yan Diremor's Land are year beautiful ad valu. as a further illustration of the climate, will raise two cord, and is used in a variety of ways. Some of the native trees, though, perinaps, not so gigantic as those of Van Diemen's Land, are very beantiful and valu-able for building, and for spars: the pime (kaurr), for instance, is unequalled for that purpose, and the Admiralty has imported large eargoes of it. It is an intermediar eight the accumpart of rulling down from Admiraty has imported large eargues of it. At is an interesting sight the ceremony of rolling down from their native heights to the beach, whence they are shipped, these valuable timhers. The striking of axes, the song aud dance, the chief's signal for a number of labourers to roll the buge spar down the steep, amid the shoutings of many voices, form a scene neare the forcertien

Induce of haddners to four the buge spin down die steep, and the shouldings of many voices, form a scene never to he forgotten. Nature has indeed favoured this country. The flowers of an island where so many Englishmen have fixed their homes are abundant, charming the eye with all their varieties: many which here would re-quire the protection of glass, grow there in the open air. The noble aloc flourishes, and might be planted, as it is in Italy, for a fence; still it is to be much admired as a central ornament in a circular flower-bed. The golden gorze cheers the eye wherever we travel: the sweet-hriar, roses of several sorts, honey-suckle, hawthorn, and acacias of many colours, in-termingle in the hedges, and decorate and diffuse their delicious perfumes over the fields, the gardens, and road-sides. Perhaps there is no country in the world that will equal New Zealand for its seenery, elimate, and productiveness. How lovely and sweet a fue day is *there*, when it is cheerfully souny and not too hot, coanot well be imagined by those who have never resided at the antipoles. I find the opinions of every traveller, deduced after long obserhave never resided at the antipodes. I find the opinions of every traveller, deduced after long observation, confirming the remark. Mr. Sweinson, the naturalist, Mr. Hursthouse, and others, all speak the same of its advantages in these respects.

Botanists, I helieve, bave pretty well explored the flora of New Zealand : they have introduced plants into this country, and acquainted us with many which, unknown in Europe, are found only in New Zealand. Quantities of iron-sand, carried down by the tomortic marked is uncleable that there is line Zealand, Quantities of Foulsaind, Carled usona of the torrents, make it probable that there is iron-ore in the interior part of the country : manganese I my-self picked up in digging, and gold has been dis-covered. We coursed along some of the finest barcovered. We coursed along some of the finest bar-hours of the world. Water is scarce in some places: one sees at the

present day the poor fetching it from a stream in some gally, often a long distance from their homes. In other places where there are wells, the water is ahundant. As a proof of the mildness of the winter, ahundant. As a proof of the mildness of the winter, in June, which corresponds to our December, the mercury has not follen below 48 degrees.

The roads in this colory—where anything approach-ing to roads exists—are constructed with soil aud small stones, with bundles of a small shrub as an under-stratum: the surface is covered with scorie, or and where, with a surface is covered with scorie, or the law of the volcanic mountains. This is a road that would not be approved of by a McAdam or a Patteson. But everything bears strongly the cha-raderistics of a new country. There are some pleasing villas in the outskirts of Auckland, well built, and situated in romantic positions, commanding a view of the country around and the harbour of the city. The city itself has at present nothing that can gratify the eye of the architect. Even the new Government House is so poor, and so out of the pale of fua erachitecture, notwithstanding its claring white compo front, that it is little ealculated to elevate the public taste. Certaioly, something more ought and could have been done by the provisional government to have sceured better artists and a better building. to have scentred better attrists and a better attrists and a better However, we must remember that this is a new country, and not expect to find in its architecture and public works evidence of any very high degree of F. L. civilization.

THE NEW-ROAD.

THE NEW-ROAD. In Mr. Pinks's article bearing the above heading, which appeared in your paper, he says, p. 453, there is "a classe in the original Act for making the road prohibiting the exection of any huilding within 50 feet of it. * The lapse of a century, however, seems to have materially modified this penal enactment, for numerons are the instances in which the 50-feet plot is built upon." The the optime the instances in which the 50-feet plot is built upon." The same course might he adopted with respect to the City-road, which would give us a con-tinnons railway from Old-street, or penhaps Flusbury-square, to the Edgeware-road. The back of Bedford's day to oppose the form thin of the roak of Bedford's day to oppose the form thin of the toak of Bedford's day to appose the form thin of the toak of Bedford's day to appose the form thin of the toak of Bedford's day to appose the form thin of the toak is blick of the transchet question of the advisability or the practicability of my sugges-tion. A railroad, or even a trannond, would he a greader hoos to us in 1856 than the Newsroud was to our grandsites in 1756. E. P.

our grandsites in 1756.

PRACTICAL REMARKS ON DOMES.

PRACTUAL REMARKS ON DOMES. The articles in your journal of late treating of domes, and lastly of the necessity of large rooms, with what has been said of the new readug-room at the British Museum and the dome of St. Paul's at various times, seem to imply a difficulty of construction, whereas it is not, hut practicable to creet a building covered with a dome *larger* than any hitherto built in the known world. This may be done with brick and cement, stone, or terra-cotta, to have a lantern-light or a eupoda on it—not as at St. Paul's, where and eemeut, stone, or terra-cotta, to have a lantern-light or a enpola on it—not as at St. Paul's, where there is a conical stone erection to support the capola built within a *timber* dome. Theatres, concert or town halls, museums, lecture-rooms, churches, chapels, S.c. may be so built freproof that timher need only he used to a limited extent for futings and doors, and upon such a plan that there may be numerous stair-esses, refreshment-rooms, with cloak-rooms for ladies and geutlemen (distinct), offlices, &c. as may he required. required.

The ground plan may he a square, octagon, circular, or formed by cight right angles, the latter making the most nniform abutment, if the dome is so large as to require it.

In my humble opinion as a practical man, there is scope for the development of this nohle feature, and its adaptation to firsproof building of stores, factories, &c. need not be more expensive than ordinary coostruction, as a vast space may be covered with a dome springing a few leet from the ground, for utility and struction, as a vast space may be evered with a collec-springing a few leet from the ground, for utility and economy, with strength and great durchility. A building of octagon plan, about 220 feet diameter outside the walls, including usually necessary offices,

rooms, &c. will scat 10,000 persons so as to see on the stage, platform, or pulait, and not be liable to real or fulse alarms of danger incident to all the present places of amusement or worship, as of late at Covent Garden Thestre and Surrey Gardens. The strength of a dome would be tried in its building, as no fixed centre should be used, but a revolving one, to give the form only. JAS. PULHAM.

EXHIBITION OF THE ART-UNION OF LONDON PRIZES.

THE pictures selected by the prizeholders of the past year are exhibited in the Suffolk-street Galleries The pictures selected by the prizeholders of the past year are exhibited in the Suffok-Street Galleries is the subscribers and their friends, by tickets, which, moreover, may readily he obtained by any who will apply at the office, 444, Strand. After the 31st, the Exhibition will be open to the public without tickets for a week, an usual. The Exhibition consists of 152 pictures and water-colour drawings, together with a roomful of the hronzes, medals, statuettes, drawings, and other works of art which have been produced by the Society, and which, admittedly, have given great impulse to the production of similar works out of doors, to supersede the pucrilities which filled the shop-windows a dozen years ago. We have already men-tioned the principal pictures purchased by the prize-holders, so that it is nuncessary now to go into detal], but we may point oot as amongst the best in the col-lection, No. 2, "Leith-hill," by G. Cole; 12, "Harvest Repat," by F. Underhill, 16, "Shades of Frening," by H. J. Boddington; 59, "A Family Group," by H. B. Wills; 85, "The Druids Circle," hy H. W. B. Drvis; "Eststaff proposing to marry Dame Quickly," by I. Huezell, &c. Some of the water-colour drawings are admirable specimens. The pizzholdiers next year should bear in mind that the eperations of the Art Union of London have had the effect, in conjunction with obber more recent agendes, in creating so more picture-hyers, that it is desirahle effect, in conjunction with other more recent agencies, in creating so many picture-huyers, that it is desirable to make their selections the moment they obtain the right to do so.

SANITARY GOVERNMENT.

On an application being made by the Government authorities to the vestry of Lambeth, to put a stop to the pestilential effluxia which not only trouble our members of Parliament, hut also some thousands of members of Parliament, hut also some thousands of other persons, the Board, in answer, declined to under-take the expense and trouble of prosecution; and, in consequence, the unfortnante dwellers in the neigh-bouchood are under the necessity of bearing their un-pleasent condition until Sir Benjamin Hall can get a fresh Act of Parliament passed for the purpose of compelling the parish authorities to do their duty. These unpleasant circumstances give rise to several invectors to considerations: the first is surprise and

Liese unpleasant circumstances give rise to several important considerations: the first is surprise and vexation that it should be found necessary at the present day to use force to compel a body of gentle-inen, in whose earc the health and well-being of a large district is intrusted, to do an evident duty. If the often beaut to use a matter of this is not to the bas often been to us a matter of pain to note the "penny-wise-and-pound-foolish" policy of several of the m tropolica parish boards in sanitary matters. This course of practice is not only injurious to large masses of the people, but must if persisted in lead to a change in the parochial management of this great

a change in the partnah management of this great population. In the City, and some other districts where sani-tary inspection has been made a matter of police, it is surprising to notice the progress which has heen made, and how well with their at present limited anthority the officers who have some under our notice

have fulfilled their somewhat difficult duties. It would be unjust to make these remarks without It would be unjust to make these remarks without at the same time mentioning that in the poorer dis-tricts the parish antibrities are awkwardly circum-stanced. A large naoher of those who are called upon to pay the heavy poor and other rates are them-selves struggling for an existence. Consider the tracks of property which in the present state of things it is necessary to occupy as dwellings are so displicated and saddled with ground-rent, that the present holders enable of the small profits of the fourth-rate cottage kind of household property to carry out the proper drainage and other improvements which may he required. We have heard the authorities of London parishes

We have heard the authorities of London parishes we have not a both the hose smiltry measures, we shall not only be driving many who coutribute towards the rates to another place, but also will so much raise them, that we shall make paupers of several who are Such an barely able to pay the present amount." Such an argument as this is well worthy of careful thought, and when we look round the wide extent of the metro-polis, and find that in some parishes, where there are few needy housekeepers and tradesmen, the parish rates are not more than 4d. or 5d. in the pound, we see others in which the greatest amount of poverty exist, and where the most vigorous sanitary exertions are required, pay 2s. in the pound and upwards.

Experience shows that this uneven local taxation

Experience shows that this interest local taking of our great city is pregnant with numerous critics, which are at present so palpable and increasing, that a remedy must be specify applied. Granding all this, it will be found that proper care for the health of parishes will, in the long run, be found a aaving in money, without taking into account matters of a bisher presencement. and it should found a saving in money, without taking into account matters of a higher consequence; and it should be earefully horne in mind now, when London and its suburbs are so much shove the average as to bealth, that in those places which at the last eholera attack were found so ill provided, but which since then have been greatly improved, we find the greatest comparative decrease in the usual number of deaths, and this should encourage all to increased exertions.

It is unfortunately the case that in times of com parative safety some are apt to lapse in their exer-tiona, and view with but little consideration the exertions of those who, mindful of what is likely to come will not put off using proper exertions until evil is upon ns and all is terror and confusion.

THE GENIUS OF TURNER

COMPARATIVELY the art of landscape painting is of very recent introduction. The Egyptians, Grecks, and Romans, notwithstanding their skill in architec-tare, sculpture, and painted representations of the human figure, and of inferior animals, seem to have overlooked the other fair forms of nature, and not considered them wortby of imitation

considered them worthy of initiation. In the foreign schools Claude Lorraine, Poussin, Salvator Rose, Rembrandt, Ruhens, and a few others, may be said to bave been the first who, with skill and a proper amount of truth, represented landscape secury. At home, amongst the most eminent dead paintors, are Richard Wilson, Gainsteinient dead paintors, are Richard Wilson, Gainstein, Con-stable, and Turner; all of whom, possessed of high artistic ability, are very varied in style. In considering the merits of the artists above named, it may be worth while to clause shiftly at the obs. may be worth while to glance slightly at the cha-raeteristics of some of them.

In Salvator Rosa's pictures we find a wild com-hination of human and other figures with landscape, but we seldom in this artist's works see much variety but we heldom is this actist's works see much variety of feeling: wild, grand, and gloomy are the land-scapes which have come from this pencil. Ruhens's landscapes are very much like coloured photography; see, for instance, the view of his chiteau, pre-served in the National Gallery. How different is the treatment of that view from the hold and magical arrangement of his historical pieces. If an unknown arrangement of his historical pieces. If an unknown artist of the present day were to send such a land-scape as that by Remfrandt of "foldit and the Fish " to the Royal Academy exhibition, it is doubtful if it are, however, some other landscapes by this artist; for instance, the light and dark views of the "Windmill," which are wonders in their way. Claude Lorraine is all sweetness and calm ; in look.

ing at his pietures you finely that you can hear the soft sound of minstrelsy, the feet fall of the damers, the garging of the water, and even the touch of the falling leaves. The famous Clande has not, however, essayed to paint the hlasts before the thunder.storm-the storm itself-the flitting glimpses of sunshine and rain-or the fierce contentions of the

of substite and rann-or the heree contentions of the seas and rocks. In the landscape pictures by Poussin, fine in broad and transparent depths of shadow, and most heauti-fully and boldly manipulated in all parts,-descend-ing angels and other allegorical representations mar and destroy the illusion of the scenes according to our present ideas

our school, in looking at the works of Richard Wilson, it is impossible not to recognise the poe conception and the grandeur of many of them. They

are, however, not transcripts of nature. Some of Gainsborough's are sweet and faithful; but he has not attempted very lofty flights. Con-stable's pictures are boldly-chosen points of English scenery -- cornfields, locks, di-tant views or config-bills, -- over which are often rainhows and showers. -cornhields, locks, di-tant views of towns and hills .

In Turner's pictures we have a combination of the best qualities of many pointers. In some he conveys best qualities of many pointers. In some he conveys to us the soft and still feeling of Claude; in others, the wild and poetic famices of SIv.tor Rosa. More-over, in many of the works of Turner there is a sentiment shown in the introduction of the figures which conveys the mind to circumstances connected with the spot, but which do not, like the allegorical introthe spot, but which do not, like the allegorisal intro-ductions of Poussin, destroy the harmony of the scenes. For instance, in his drawing of the spot on medium of your pages, that London should not be which Harold the Saxon is supposed to have died at further extended either west, north, or east, but that the hattle of Hastings, the has introduced a couple of Government should direct all extension and improve-greyhounds in pursuit of a hare, and so fagged is poor puss, that we feel certain the dogs will as now on the north to Highgate and Hampstead,-

THE BUILDER.

and how mysteriously the distant sea mixes with the clouds ! Compare this with the quiet, luxurious the quiet, luxurious view at Ivybridge. In lookin fancy that the painter must have In looking at the first, we must have been reared amidst wilds and storms, and at the last it's difficult to think that the mind which conceived, and the hand which executed this sweet picture, could have skill in any-thing unconnected with green leaves and singing

How different, however, are these from the magnifi-How different, however, are unsee non-ne magne-cent pictures of "The Rise and Fall of Carthage," "The Vale of Tempe," and other subjects of the highest class. In thinking of this great painter, picture after picture crowds npon the unich : the hattered war-ship towed to its last beith by the little steamer, the whole lighted by the setting sun; the view of Plrmouth with many groups in the foreground; the fike pic-tures of Oxford; the still and truly English scene at Bolton Abbey; the view from near Bristol: in this a schoolhoy has fastened his kite in the branches of a a schoolhay has fastened his kite in the branches of a tree,—might the painter have thought of Chatterton's flight and tangled end when he introduced this? It however, take many pages to enumerate Turner's varied works. The purpose of the writer is, however, merely to direct attention to the numerous works of this great painter, in order that they may contrast his productions with the landscape-painters who have gone before, and note how great he is.

AN ARTIST.

THE SURREY SIDE OF THE METROPOLIS.

PROMPTED by reading your remarks on "The nsanitary State of the Houses of Parliament," in Insanitary State of the Houses of Parinaucon, in respect of the nauscons and peruicious trades carried on in Lambeth, I am induced to offer a few remarks and suggestions in furtherance, and for the general and suggestions in intructance, and for the getting improvement of the metropolis. As there are two sides to a question, so are there to our river Thames, but this fact seems hitherto not to have been known, or duly considered. London, in its metrop-litan sense and locality, lies, in fact, on both sides of the river, but improvement has been confined to one. West, north, and east, the metropolis has been of late years vastly improved, but the south has been wholly eglected : why should this he? The increased and creasing value of land and houses on the north side of the river is in strange contrast with that of the sonth : and again I say, why should that he ?

The deteriorated properties in the Waterloo road, amford-street, and surrounding localities, prove the atrange contrast, yet might be made far more valuable and creditable to the metropolis hy the Government turning some slight share of its attention in that direction. For instance, there stands the magnificent direction. For instance, there stands the magnificent structure Waterloo-bridge: at the north foot is the claborate and ornamental Somerset House, recently so much improved, and rendering the approach to the bridge so perfect; hat on the Surrey side what is there to balance the claimbility? Abaducty mothing, and direct on. bridge so perfect ; hut on the Si to balance the eligibility? A to balance the eligibility? Absolutely nothing; or worse than nothing! Yet there is an ample space to let of ground helouging in freehold to the Duchy of worse that let of ground helouging in freehom, to Cornwall. Public offices are wanted—Somerset House is gorged with them,—why not build some auxilinry offices on the Surrey side, of a style of architecture corresponding with Somerset House, and completing corresponding with Somerset House, and completing the state of the bridge? "Lancester place" the magnificence of the bridge? "Lancaster place" in sufficiently met on the Surrey side by "Tillotson-place," and it is on the eastern foot of the hridge that defect exist. If the more once took place as sug-gested, and the improved opening from Stamford. street to the Borough was perfected, the north side of London would be s on greatly relieved of overcrowd-ing by some of the unicess houses and professionals availing themselves of the cheaper and more central locality thus offered to them in improved availability. locality thus offered to them in improved availability; for the South-Western and South-Eastern lines of railway would equally be convenient. We are stretch-ing across the Atlautic: France and Ireland are as nothing to us in the way of distance; and yet Lam-both, and the Surrey side,—"Transportine," as it is sarcustically called,—is tahooed as an outlandish

into a radius, and rendered more convenient of interest communication. The Prince of Wales has a great personal interest in this suggestion, which would render his "Duchy of Cornwall" more integrally, respectably, and profit-ably a portion of the great metropolis of the world, known throughout the earth by the high name of V_{1} and V_{2} we have the provided of the second second transfer in V_{2} and V_{2} and WYKES. London.' W_'T

THE MEDLEVAL SOCIETY.

THE object of the society which is being organized and object of the softety when is being orphalzed under this title is the collection of copies of works of art of all kinds executed during the Middle Ages, hut especially of those executed before the end of the thirteenth century; " and this not as counteracting the independent influence of our own time upon its own art, but with the view of promoting the study of the Medieval period as the highest and purest of former times." The collection would consist of—

Casts of sculpture, especially of the French and Italian schools.

Copies of tracings of frescoes and other wall paint.

Copies and easts of works in metal.

Rubbings of hrasses and copies or tracings of stained glass.

Notes of schemes of decoration in sculpture, paint-ing, and glass, carried out in the Middle Ages, with a with a to leading to the more careful treatment of its

story in modern sculpture, &c. Books bearing upon the various branches of art and upon costume, &c.

Photographs, and especially of any sculpture threatened with restoration.

A wardrobe of costumes, or anthenticated reproduc-tions of said costumes, for the use of painters, and Specimens of Eistern textile fabries, and of ceramic art

Amongst the regulations it is set forth that the committee are " to exercise great care in the selection of objects to he admitted into their Muscum; taking of objects to be admitted into their Museum ; taking pains to exclude all works of inferior art, and to obtain, purchase, or receive such only as in their opinion are of really geod character." Further, the committee are "to be prohibited from receiving any ancient objects of art taken from their proper and original position, with a view to forming a collection original position, with a view to forming a collection of antiquities. The collection of illuminated MSS, pictures; ivories, coina, or scala, vestments, furnihne, or movables, would not be open to this objection, but portions of ancient sculpture, painting on walls, or the like, to be scruppilously rejected, as the object of the society is in no sense antiquarian, and one of its lead-tion reinspines will always he the preservation of ing principles will always he the preservation of ancient art with the most jealous care in its original locality

Jocaity." Without the slightest desire to impede or dis-courage the gentlemen who have associated themeelves to form this society, the accomplishment of their views would seem to lie so completely within the province of the established "Architectural Mussenm," that we would much rather see them using their views in a start of the set of the second s energies and influence to enlarge the scope and in-crease the usefulness of the existing society than forming a new one. We hold the same opinion with respect to the Archaeological Societies. The dissipation of forces and the multiplication of expenses are to be regretted.

SCHMIDT'S ORGANS : ST. PAUL'S CATHEDRAL.

CATHEDRAL I was glad to see lately in the *Builder*, the mild castigation of one who had termed St. Paul's organ an "outrageous" instrument; with the very sus-picious addition, that some other large organ would he soon purchaseable. The assertion, that "Father he soon purchaseable. The assertion, that Schmidt" was not a known or eminer Schmidt? was not a known or eminent organ-huilder, was somewhat overmuch. I believe he was invited over to England after the "Great Fire;" and common sense will dictate that a maker of " ut was and common series will deate that a maker of no mark" or *presige* could hardly have jumped into such extensive employment. Perhaps it was hardly known to the first of your correspondents, that hesides his metropolitan labours he was engaged in desides his metropolitan labours de was calgede in distant places. There was, about thity years ago, a small, hut very sweet-toned organ, by him, in the remote cathedral of *St. David's*. The only cathedral in Wales where there is daily choral service. The organs of St. Mary's, Oxford, and St. Panl's, Bedford, were by Schmidt: the latter, in lieu of

repairs, was sub-tituted about fifteen years ago by a modern medioere one. But one of his best works

modern medioere one. But one of his best Works ont of London may have been at *limity College*, *Cambridge*—the swell heing afterwards added by *Green*, and the pedal-pipes by *Avery*. Is it correct, as reported to me by a tourist, that the organ in *St. Patrick's*, Dublin, was taken from the Spanish Armada? The same thing is reported, positively, of a clock, with outside "jacks"—like

Old " St. Dunstan's," and Carfax, Oxford ; also, of an Our St. Dunstan's," and Carfax, Oxford; also, of an inlaid communion-table at Rye, Sussex. The organ at Trinity College, Cambridge, has its hellows worked by a *volcel*—isolated from the organ: the two at St. Paul's are in a low apartment nader the organ-loft, leaving the lower part of the ease free---mainly, I thick, for " pedal" pipes.

thick, for "pedal" pipes. I never saw an allusion to a notice, either in the Spectator or Guardian, that "Mr. Renatus Harris," Schmidt's rival, who built St. Andrew's, Holhorn, organ, " had an amhition to erect an organ over the west door of St. Paul's Cathedral, to exceed anything

orgon, had an infinite Cathedral, to exceed any thing of the kind yet known." Having began with "St. Paul's," allow me to express a "national" regret, knowing that foreigners. as well as natives, visitit, that "more is not mide" of it in the way of handsomeness and decoration. The half-consecrated inscription to Sir Christopher Wren—"Si montmentane requiris," &c.—has heen banished, somewhere, in pieces; and a thing which, if endurable, should be temporary—covered with rusty red cloth—coerpies its place. Will no one advo-cate the restoration of Sir C. Wren's "mounnent," in his principal work? The east end has heen a little improved; and the communion-cloth has some old gold fringe. The "well-worn" one of the pulpit never had: enricates and other things hwe heen "dipped" till they are "no colour," handsome re-placement to thaving heen preferred. The musical services have, for a considerable time past, duue much credit to all concerned; renderable

any other deficiencies regrettable. CRITO.

RUINOUS BUILDINGS, METROPOLIS.

Ar Mariborough street, on the 15th, a great deal of time was devoted by Mr. Beadon to the hearing of summonses served on the owners or occupiers of dila-pidated or highly ruinous baildings in the district of this court.

This court. It was contended by a professional geutleman (na-derstood to be surveyor to the Marquis of Salishary) who appeared for the owner of the property, No. 5, Cranbouru-passage, that the authorities had exercised a very achitrary power in coming on the premises and giving peremptory directions respecting them, which had put his client to considerable expense, and that noncessarily. It was stated that the intention had been to take down the dangerous put, but they had now been called upon to shore up a portion, and thus increase the expense, and that there was no occasion for this. He was of option that the magistrate's time was very unnecessarily occupied by sum-monoses for such enses as the one in question. Mr. Bendou said he was quite of another opinion. 'A very salutary Act of Perliament had been propely put into operation, and was being carried and twith

put into operation, and was being carried out with judicious effect in the matter of old and dilapidated premises dangerous to the public. Time occupied in the investigation of these cases could not be unnecessarily hestowed. The owner or occupier was person-ally liable, and where neither could be readily found it was required by the Act simply to affix a notice on the do r of the daugerous premises complained of.

Ordered to he put in proper repair, or taken down w within fourteen days.

NOTES UPON IRON.

(From our Correspondent at Wolverhampton.) THE past week bas witnessed an improved demand for iron. The orders have come chiefly from the United States and our South American account. With I United St des and our South American account. With the United States there is now more nativity, because of the nearness of the period at which the "fall" it make must cease. The orders have been kept back so blong th there does not remain sufficient time before it they must be excended for the making of all the iron nmeeded in the American mwrket. The home demnad is tolerably good, but inquiries mare for comparatively small quantities; and no very blarge demand is expected from America after the "fall" trade has hern supplied. But very few cal-ceulations to be relied on can be made in relation to

meulations to be relied on can be made in relation to ththe future of the American market.

The Indian disturbaness are not checking very much the trade with India in respect of the railways isin progress there, as tenders have been asked for within the past day or two for hest South Staffordshire nirou for such uses

taron for such uses. The prices that were determined shuld rule the "f'trade" throughout the quarter do not appear to be hydr any means adhered to by all the members of that exombination. We have heard that prices ranging foram 5. to 30s. helow that scale have here accepted by such houses. There is now too much competition why such noises. There is now no much competition in the manufacture of iron to permit of the reverse of Wibis heiog the rule. If the "fall" trade of America Ashould not he followed by an equally good general Keemand from the States; it is more than likely that Sihis variation in prices will be so marked at the time

of the next preliminary meeting, that a determination to lower prices in council will be come to. At the same time there are some few houses in the trade who

same time toere are some tev nouses in the viale way have nequired so fair a name as to secure a constant demand at the "trade" rates. At Wolverhampton, on Wednesday, and at Birm-ingham gesterday (Thursday), pigs were offered largely, without, however, any very marked anxiety to press other sales.

EXPENDITURE BY MIDDLESEX MAGISTRATES

Mn. EDITOR,—At a recent special meeting of the Middlesex megistrates, the following resolution,— "That the plans which were laid hefore the court on the 16th July instant, for altering and enlarging the the 16th July instant, for altering and enlarging the County Locatic Asylum at Cohey Hatch, he approved, and that the same he carried into execution, at an ex-pense not exceeding 70,000." was carried by a large majority. These gentlemen deal with thousands with the greatest coolness; but is it always with equal wisdom ? May we not inquire what is now going to he done, and under whose direction the 70,0000. are to he spent ? If I remember rightly, this was about the sum specified for the total expenditure when de-signs for the huilding were first songht hy public the huilding were first sought hy public m. A STRUGGLING RATE PAYER. signs for competition.

TASTE.

THE man whose mind has been prepared by study The man whose mind has been prepared by Sidoy and cultivation for receiving the impressions of works of genius, *ought* to possess taste in proportion to his knowledge of and habit of contemplating heautiful objects. The mind neurally takes its tone and com-plexion from objects which it hultitually contemplates. We should never forget the accient advice : *Diligently other and the mediate theory*. The mind heaven

plexion from objects which it hiltually contemplates. We should never forget the axient advice: Diligently contemplate excellent things. The mind hecomes like them. On this principle the Greeks, whum we mention from their precedence to other nations in these matters, made a practice of clausting the eye of the public by presenting it with the most refined productions of their favorite artists: where they collected in largest numbers, there the choicest specimens of art stood ranged he'roe them. A public monument is an useful in promoting the taste when it is beautiful, as it is certain to corrupt it, when it is not so, *-Emeric David*. A public monument is an useful in promoting the taste when it is beautiful, as it is certain to corrupt it, when it is not so, *-Emeric David*. A public monument is a weeful is received in a time when there existed skilled artists, is an injury done to the nation and to the age which witnessed its creation is promoting to by, as some have, that taste is a fields of the joid greatest. It is wrong to sy, as some have, that taste is a fit they of mind distinct from the imagination and be judgment; that it is playly the result of the joid sense (It as, then, be the effect of the inagin time (upon which good sense depends), taken together, it will he asked haw far the judgment ought to interpose in regulating the power of imagination, or of correcting its exchemences, in order to produce good take.--Dalezel-" L-clause."

Dataset — Detunes. It is taste which, according to the different degrees of perfection in which it is possessed, distinguishes nations that are improved from those that are har-barous, and which in the same country reuders one an superior to another. We may form a sufficient notion of the taste of any

nation, in any country, and at any period, by the state of its architecture.

inside period, which the unknown of the magnation are built of disciplined by study, and which therefore, to its hest results, hetrays only the ill-regulated aspirations after the benutiful that belong to a semi-vivilised people. The Pernvian architecture, hearing also the general

The Peruvian architecture, hearing also the general characteristics of an imperfect state of refluenced, had still its peculiar character, and so uniform was that character, that the edifices throughout the country seem to have here all east in the same model. The architecture of the luces is characterized hy

The architecture of the incas is characterized by simplicity, symmetry, and solidity. It may seem un-philosophical to condemu the peculiar asthion of a nation as indicating want of taste, herease its standard of taste differs from our own; yet there is an incon-grairy in the composition of the Peruvian hulldings. grairy in the composition of the Feruvian hulidings, which argues a very imperfect acquaintance with the first principles of architecture. While they put to-gether their bulky masses of porphyry and gravite with the necest art, they were incapable of mortising their timbers, and in their ignorance of iron, knew no button mee of bulking the timber to make the there way of holding the timbers together than theter way of holding the timbers together than tying them with thongs. In the some incom-atmospheric air, ander influences to which they must grows spirit, the hulding that was that held with he more or less liable, from natural causes, in clam-straw and unilluminated by a window, was glowing with tagestries of gold and stonel These are the inconsistencies of a rude people, among whom the

arts are but partially developed. It might not be difficult to find examples of like inconsistency in the architecture and domestic arrangements of our Anglo-Saxon, and, at a still later period, of our Norman an-

Yet the huildings of the Incas were accommodated to the character of the climate, and were well fitted to resist those terrible convulsions which belong to the land of the volcanoes." But of course the displeasure that arises from such

incongruities is attributable to circumstances, to want of resources, and may not he the fault of those engaged in them.

I have witnessed in Australia and New Zealand I have witnessed in Abstrait and New Zeanau similar absurdities and deficiencies to those mentioned by Prescott, in Peru. In the colonies it is a very common thing for every man to be his own architect: his materials consisting only of shingles. Nothing great can be expected of him; hut had be genius, he would dignify even them. One of the class I speak of for he width be a refurmed convict essence/ wound angaing even them. One of the constrained would be a returned coavict,--scarcedy ever beheld beauty, has no perception of it, and is alto-gether destitute of taste: he is wealthy now, and the owner of a hause, and he has hedanbed gaady colours upon it--red balls of stone on blue pier-gates; and the passer-by smiles at the vain attempt of the uncultivated man to excite admiration.

THE AIR-SYPHON VENTILATOR.

A mistakco supposition appears to have been here A mislickcu supposition appears to lave been here-tofore hasily taken up, that the effects obtained by the use of a beot tube or air-syphon, in the processes of ventilation, were attributed to the bend itself; hut according to the specification, as well, indeed, as to other descriptions given by the patentee, the inven-tion is stated to consist "of applying a principle which he has found to prevail in the atmosphere; or, in other words, of the practical appropriation or em-ployment of "oper-tions constantly taking place in the atmosphere."

It appears to be only in accordance with a rational It appears to no only in accorance with a rational view of the subject that as certain chauges and move-ments do take place in the extremely sensitive and mobile atmosphere, even under the alightest thermo-metrical or hygrometrical changes of its condition, different from those that take place nuder similar variations in less sensitive and less mobile fluids, as

different from those that take place noder similar variations in less sensitive and less mobile fluids, as water, it would be neither philosophical uor logical to deay that in two such tabes, one being immersed in water, the other in atmospheric air, and all other things being equal, the contents of the latter might be liable to movements dependent upon its elastic and mobile qualities; while the less active contents of the former may remain, practically speaking, still. The different methods of artificial vent latton known as the plenum and the vacuum system, whether pro-duced by the agency of heat, or of mechanical power, are devised and applied as if atmospheric air existed under exactly the same relations to these forces as water; in other words, as if the former were as in-sensitive and inactive a body as the latter, -notwith-standing that the one is an inelastic body, retaining practically the same volume at all temperatures, he-tween the freezing and the holing points, and the other au extremely elastic body, etanging its volume and its place with every variation of heat or of humidity; and althongh, moreover, the one holy is homogeneous, the other heterogen ous; consisting of air and vapour, the latter of which being lighter than air, is constantly rising through the atmosphere to its highter regions. It is certain that atmosphere air hesides obeying.

It is contained integrates and the second se

have not influence of the simulation of the influence of the account in practical ventilation. Those points which appear to deserve more of the attention of architects, enbrace, indeed, considerations relating to the susceptibilities and the actions of atmospheric air, nuder influences to which they must he more or less liable, from natural causes, in cham-

laws only, be bronght to a state which renders them capable of re-acting on the atmosphere in such a way as to bring its inherent elasticity and activity into ope

Is the atmosphere of a house, for example (and I will assume that it is a house with the duors and windows closed, to exclude the impulse of winds, and winnows closed, to exclude the impulse of winds, and wbat is called the plouum agency, and without any source of artificial heat, in order to exclude also the vacuum agency), in exactly the same quiescent coa-dition as the water in a ship, or (fif there possible), in such a house at the bottom of a lake, or of a calm sca? sea ?

Supposing a sbip or a house, thus filled and surrounded by water, to be liable to the same natured accessions of terrestrial heat as a similar ship or house filled and surrounded by atmospheric sir on the surface of the earth would be, can we nudertake to deny, considering the different relations existing bedeny, considering the under an data statistical wave tween heat and water, and heat and atmospheric air, that there are at least prima facie reasons for suspead-ing our opinion before we pronounce that the air would not under such accessions of heat be brought into the exercise of certain movements consequent npon expansion and diminished specific gravity, which water at similar temperatures does not exercise. We scarcely meed ask whether the atmosphere within a house, being subject to influences which that ont of doors is not subject to, is liable to acquire a higher temperature from natural causes than the external air.

temperature from natural causes than the exteroid air. If we take, as an example, a piece of ground not built upon—an open common—and a similar piece, say adjoining, but with a house or other building upon it, the terrestrial beat given out by the nucevred space of ground would be at once ralisted into space and bat while that given out by the nucevred space of ground would be at once railated into space and lost, while but given ont by the ground covered by a building would be communicated by radiation, conduction, &c. to all parts of the house itself, and would be accumulated, in fact, to be again given out to the contained air; thus becoming, quite inde-pendently of artificial causes, an agent capable of dis-turbing the equilibrium between the internat and the external atmosphere, and causing: inevitable moveexternal atmosphere, and causing inevitable move-ments to take place.

If we still further suppose the building to be divided If we still farther suppose the building to be divided into partments, then some would be so situated as to receive more, others less, of the heat: the warmer combiners or rooms would act upon the atmospheres of the less warm, and the larger would act upon the atmospheres of the smaller.

From these spontaneous influences, and we may say actions, the flues cannot be free; indeed a banse even when totally free from artificial h at, is still a pneumatic instrument, in which a regular series of movements take place in this or that direction, accordingly as the atmosphere in the different parts may vary in temperature and in humidity, and by consequence in specific gravity. Without further pursuing this interesting

at this moment, all ow me to add that we should rather at this moment, allow me to add that we should rather foster than express the association of science with our architetural designs, in regard to ventilation, as well as in regard to be other great and useful objects which are dependent for their fulfiment mom the architet's skill; and especially encourage the study of phenomena which help to a better un'erstanding of the true succeptibilities and tendencies of our atmosphere, and of the security conduction of our atmosphere, and of the security conductivity, and appears to obey irregular and shows mysterious impulses, to go when we say come, to come when we say go, to be subtle in will, and intractible in practice. E. R. subtle in will, and intractible in practice.

ARCHITECTURAL "FOLLIES,"

ARCHITECTURAL "FULLINS." It would be easy to discover various efforts of human labour, not only in literature, but in various departments of art, that mert the title of 'Follies." Are there not piles upon piles of books on the shelves of the British Museum, and elsewhere, so eccentric in the choice of subject, so totally useless to mankind, past or present,—so extensive and chabu-rate, that at times we have looked with wonder and dismy unon succinens of these large and unoversite rate, that at times we have looked with wonder and dismay upon specimens of these large and unmeaning tomes, and elsested them among the follees of huma-nity? The Follies which have been perpertated on canvass, and in the more enduring marble, are also numerous: examples will suggest themselves to many : we need not therefore enter into particulars. In architecture many singular devices have been reared to a substantial form, and well deserve the name of a Folly. The Chinese bridges and the placing the

haine of a Folly. Ine Chnese origins and tempers on George III.'s days were follies, and the pheing the colosed equestrian statue of the Duke of Wellington on the top of its present pedestal, was an undoubted architectural Folly. So was the Pavilion at Brighton ; and also the never-to-be-forgotteu monument once at King's crass.

parted, raise up notions of pity and contempt for the taste which there gaudily and inappropriately decks the tomb.

In wandering in London streets, it is scarcely po In wandering in London streets, it is scarcely pos-sible to perform a balf-hour's journey without baying the sight offended by objects which should be written down with those matters above recorded. Many of them are, however, devoted to such useful purposes that they must be looked at with some consideration. nsideration

Richly as they deserve it, the things we have alluded to have not received the title of Follies we have almost general voice of the public, as have those erections which it is our present object more particularly to entior

mention. In many ports of England may be noticed what seem the ruins of some ancient east boldly sur-mounting a picturesque eminence, aud on i quiring— hoping to galber the particulars of "old world verents—all feelings of romance or poetry are destroyed by the infermation—"Oh, that's Jones's Folly," or it may be, "that's Brown's Folly," or "Cook's Folly," Many have sketched some of these Folles in the belief of their antiquity, and have heen as much dis-revelations. Some Follies are called after the name of the place on which they are creeted—such as Byker Folly.

Byker Folly. Not long since a well-intentioned friend mentioned of London, of an ancient house with Tudor windows and other quaint and pendiar features. Without much and ther quant and perular leatures. Without much loss of time, we proceeded in severe los avestige of the old metropolis which seemingly had escaped our earer ulsearch ; but lo ! on reaching the spot, we found that it was a Felly, and known as such by every man, woman, and child in the neighbourhood.

It must be acknowledged that many of the Follies c picturesque, but at the same time it must not be reatten that the greater part of them are "shams," and known to be such by those who assisted in huilding them. It would have been better to have the money in building schools and cottages h a case the labourer would have felt that h speat such a case bestowing his handiwork on matters of utility have but glanced at this subject, but it is one wortby of thought

J. B. A. LASSUS. ARCHITECT.

M. ALFRED DORCEL, a friend of the deceased, has given a memoir of the life of M. Lassus, the restorer of ome of the finest structures of France. He is repre-ented as one of casy access, of a naturally kind dispo sition of heart, and of an amenity of temper even when he had to command. With hem and his assistants, in the execution of the different monuments he erected, lived on the footing of mutual respect and perfect goodwill.

Jean Bapliste Adolphe Lassus was born in Paris d entered the Academy of Arts in 1828, when the so-called Romantic contest raged fiercest in art and literature. The paintings of E. Delacroix, and the sculptures of David D'Angers, electrified also the young architect. One of the élèves de Rome, a quality of great weight with French artists, H. Labrouste, had of greatly scalad the Academy by sending in a drawing of the Greek Doric temple of Neptune at Pastum; and thus, by scoring Ruman architecture so near at his hands, appealed directly to the great Hellenic prototypes. For this the Academy never pardoned Lubronste, not even up to this day, hat he had a satisfaction that the artists of young Flance saw therein the light of brighter days. Thus three of them, Greterin, Tourlouze, and Lassus (all now dead), offered to the bold innovator to open an atelier of their own Lassus began then the study of French architectural monuments. In 1833 he first exhibited the plans of the Tuilleries, such as they have risen out of the brains of Philleries, Such as they have risen out of the brains of Philleries, Such as the turned bis entire attention to the edifices of the Pointed style, and snught to apply it as much as possible to religious edifices

conness. In 1835 he made a design for the restoration of the Ste. Chapelle. Up to 1837 he was enguged with the refectory of the priory of St. Martin des Champs, now the library of the Conservatoire des Arts et Métiers; when he was nominated, conjointly with his friend M. Greterin, architect of the church of St. Severin. He added to the western façade of this church the gate of St. Pierre-aux-Bœufs. In 1838 he presided over the restoration of St. Germain PAuxerrois, first under M. Gadde, who has left helind bim the triste fame of multilator of almost all the churches of Paris then he acted independently. "It was then," says M. Docel, "that we saw the restoration of the alars, M. Docel. and also the never-to-he-forgotteu moutunent one at King's-cross. In our modern cemeteries innumerable Follies meet the eye, and which, instead of creating are and rever-ence for the grave, and hallowed feelings for the de-tion of the structure, or ornaments and decorations-

an expedient resorted to now over the whole of Europe. It was also for St. Germain l'Auxerrois that was made the first ' virtui l'dependiere', after patterns of the thirteenth century. In 1843 M. Lassus attained of the functed trace county. In 1945 of Lassus attained, the goal at which every great mind aims, --to get rid of every extraneous fetter, and to work on this own conceptions. He became the architect of the church of St. Nicolas, at Nantes. M. Lassus died on the 11th July, 1857, at Vichy, where he had gone for the benefit of his health.

RECENT BUILDING PATENTS.*

NICOLAUS CHARLES SZERELMEY, Bermuda-place, NICOLAUS CHARLES SZERELMEY, Bermuda-place, Bath-road, Queen's-road, Peckham.— Preparing Com-binations of Materials for rendering Walls and other Structures waterproof. Dated 2nd January, 1857.—The improved "Greek cements" are pro-duced in the following manner :—The patentee takes about twelve galloas water, iwo galloas blood, twenty-five pounds ground bricks, twelve and a half pounds of conduced enner slag, twelve and a half pounds n'te pounds ground ories, twelve aud a hall pounds of powdreed emper slag, sixteen pounds and a hall of arglinecous earth, and six and a quarter pounds of gaseous matter produced from milk. These matters are boiled together for about two hours, and this is called compound or preparation No. 1. In order to are noiled together for about two hours, and this is called compound or preparation No. 1. In order to prepare another or second preparation or europound, the following matters are employed:—About ten pounds of gas or coal tar, or sometimes in place thereof linseed oil, at other times, rosin or asphelte, about six and a half pounds of hydraulie line, six and a half pounds of grit, six and a half pounds of calcined fint. These matters are boiled together in a suitable from her the about there are then by nut. These matters are contained together in a suitable icon pot for about three hours: they are then, by menns of an iron ladle, transforred to a second iron pot in such manner that the air may come freely in contact, and after the mixture has here allowed to cool, it is again boiled nntil it spontaneously bursts into combustion, and after it has burned for a very short time the fire is extinguished by means of a close-fitting cover. This combination or preparation is called No. 2. These cements, though they may be capable of separate use, are preferred to be employed in succession on the wall or other structure.

Thomas HOLMES, Pendleton, Lancashire.—Con-sumption of Smoke in furnaces or fireplaces. Dated 6th January, 1857.—The patentee mixes with the fu Is a certain quantity of a neutral or acid sait of an alkali, such as common sait. Every hundred weight of coals is mixed with three pounds and a half of solt. He also sometimes uses in the same manner mixtures of one or more of the above neutral or arid salts of the alkalies with lime, or substances containing lime, or baryts, or magnesia. CHARLES COOK, Mount-street, Grosvenor-square.

-Apparatus for generating Draughts in Chinneys, and for other purposes. Dated 6th January, 1857. - This apparatus is to be affixed to a chinney, or it may be applied in a skylight, or at the exit of any flue or channel in communication with the chamber to be ventilated. In all cases it must be exposed to the action of the wind. It consists of a kind of fan or action of the wind. It consists of a kink of while of series of blacks placed in a earn or cylinder forming, the top of the chimney. To produce the rotation of the fan, the investor places a fan wheel on the top of the syindle, which wheel is exposed to the action of the wind. He curves or incluse these blacks so that the one side presented to the action of the wind is the one such preditive activities the wind, while the back part of another blade presented in the same direction on the opposite side of the spinde is so disposed as its throw aff the wind.—Not proceeded with.

JANES HARRIS, HANNEL, Middless, — An Improved Lock, and Method of acting upon Lock-Bolts, Latches, Teps, and Valves, Railoay and other Signals, Bells, and other like Apparatus. Dated 8th January, 1857. — This invention econsists in the method of and with economescal of in a narrestus constructed of employing compressed air in apparatus constructed as follows, and for the purposes explained: ---The apparatus consists of two cylinders with air-tight pisions and valves, or of corrugated elastic air-tight ylinders secured at the ends to wood and other material, and make to expand or close after the manner of a concertina or bellows; or of clastic air-tight spheres or spherical-hended cylinders worked by semi-spherical pistons. The connections from one part of the appapistons. The connections from one part of the appar-ratus to the other are made by means of metal or other pipes. He also employs proof or test signals which indicate to the operator that the object is effected. The invention is also consists in an improved lock adapted to be worked hy his apparatus, and in carrying out this part of his invention a cylinder is placed in the lock furnished with an air tight piston proceed in the lock further when the back of the pixel at tached to the holt. At the back of the pixel spring for forcing the bolt forward, and thereby effecting the locking, and when the bolt is forced forward by the spring, a tumhler working in a cylinder with a piston, with or without a diaphragm

* Selected from lists in the Engineer journal.

nt bottom, falls into a notch in the bolt, keeping it in position as in an ordinary lock. A second tumbler is also provided with a catch to hold the bolt hack against the spring when unlocked. The other part of the apparatus connected with the lock consists of a small air-pamp, placed, say, in a bed-room above, or in any other convenient place, the distance heing of no consequence. There is also at the air-pump and of the lock an alarm acted on a tither by the classic cylinder on the piston of the pump. The same apparatus may be used much simplified, that is, with a eylinder and spring only for latches of gates and doors. The opening and shutting of valves and cocks, and the working of signals and other apparatus, may be effected by similar means. This invention is adapted to boose, factory, and other signals. The same apparatus, with the addition of self-acting equilibrium valves, and of eatches, levers, and springs, may be applied for effecting the ringing of ordinary bells, or striking once upon a bell. ALEXANDER M'DONALD, Aberdeen. — Meanflactures, of Granite, Marbles, Porphyry, Jasper, Serpentise, Sienile, and other Stones, capable of receiving a high Polish. Dated 8th January, 1857. — The improvements relate to means by which, whensuch structures have to be formed of several picces of such material, each pert may he more correctly worked in relation to the others during formation, so that when the parts are ultimately fixed in position, they may ppar as one solid mass, or as acarly so as possible. The

ALEXANDER M'DONALD, Aberdeen. — Manufacture of Columns, Pilasters, and other similar Structures, of Granite, Marbles, Porphyry, Jasper, Serpentine, Sienite, and other Stones, capable of receining a high Polish. Dated 8th January, 1857.— The improvements relate to means by which, whensuch structures have to be formed of several picces of such material, each part may be more correctly worked in relation to the others during formation, so that when the parts are ultimately fixed in position, they may appear as one solid mass, or as nearly so as possible. The several pieces or blocks to compose the finished structure, as, for instance, a column, are temporarily secured together hy a rol or rods passed through a bole or boles in the series, aided by nuts and screws or other suitable means, after they are dressed or partially so. After they are finished in the dressing they are then polished on a turning-lathe or othersuitable instrument inscried between them for some sittle distance to wards the centre. When the polishing or other finishing of the outer surface is completed, and the parts are separated for transit, the ends of the separate blocks are to be dressed down at least to the level of the saw or other out just referred do, when the parts ard beready for being put up.

Louis Julies Barthow, Tours, France.— Machinery for Manufacturing Draining Pipes, Bricks, Tiles, and other similar Plastic Articles. Dated 10th January, 1857.—This improved machine is applied to the manufacture of solid or of performed hricks, of tiles and draining pipes, and other articles made of elay having a regular cross section. A strong vertical cast-iron screw revolving freely in the middle of an upright east-iron cylinder, a rotative motion is given to the helix, either by horse or steam power, and the clay is throwa with a shovel into the upper box of the cylinder as it is dug out from the ground without any other preparation than that of being mixed with water: it is ground, mingled, malaxated, and freed from hard or filamentous substances, and finally the clay is forced down through the side monling apertures for produce gitter pipes, bricks, tiles, or other articles of that description.

JARN FRANCIS PORTER, PRE-street, Westminster, — Manufacture of Brieks and other Articles of Clay and Brick-earth, or of the like Matenials. Dated 10th January, 1857.—The first part of this invention consists in improvements in the preparation of elay for making bricks and other articles. These improvements have reference to a pug-mill described in a specification of letters patent, dated the 31st day of January, 1855. The second part of the invention consists of apparatils for moulding bricks and other articles, by which apparatus the material used in the formation of such articles is moulded at less cost from all descriptions of clay, and better effected in respect of the inferior kinds of clay, that is, the less plastic sorts of elay. The patentee performs the moulding of the bricks as follows:—The clay is delivered in any suitable manere to the machine, or from a pug-mill, in the ordinary way, through an opening of any convenient size or form, and is received on and by a series of rollers covered with a porous fabric, some to compress or roll out the clay, or to mould the same into the required form. The bricks or other articles are then divided by cutting wires disposed in ithe neard way. ErwARD Loos, Leicester-square, London.—Manu-

The enrices superstitions of the peasantry are not *isfacture of Cement, Mortar, Concrete, and artificial Soltone.* Date 20th December, 1856. – The patente umanufactures Roman mortar of different qualities, with a certain proportion of lime and a chemically author, as it doubtes will be with many tourists who ucalculated quantity of moderately fine sand, and powkadered substances of a silicous, arguilaceous, aluninous, talkaline, coagulative, and colouring nuture, as wells talkaline, coagulative, and colouring nuture, as wells the hot under notice, had a little more space been undured and artificial subplates and earbonates, as may the required. For certain more massive constructions

he unites his process with the ancient system of Roman building. He forms a double payment, or eucasing of bricks or other suitable stones, or of any artificial Roman stone, and adds any rubbish montar in this encasing, regularly building each layer. The artificial stone is manufactured from the above described cement.

artimat stone is instantiated from the above descrifted cement. JAMES ROBERTSON DICK, Altwick, Northumber-Inal.—Window Saskes. Dated 23rd December, 1856.—This invention, which has for its object to improve the form and construction of window-sashes, with the view to obviate the present dangerons inronveniences atlendant upon the painting, glazing, eleaning, or otherwise of windows from the outside, consists in the sides or outer portions of the sash frames being formed in two parts, and bolted or lacked together so as to slide within the window-frame attached to the cords and weights in the ordinary manner, and admit of the sash being easily separated when required, and lowered into the room without its removal from the frame or bending, each side of the sash being provided with a catch and pivot for uniting the sume to the sliding portions thereof, and unintaining it in a vertical position with the windowframe. The invention cannot be fully described without reference to the drawings.

frame. The invention cannot be tuly described without reference to the drawings. WILLIAM PLAYER MILES, Patent Lock Factory, near the Forest-bill Station, Surrey-Locks and Pastenings. (A communication.) Dated 11th December, 1856.—In order to ensure greater security in respect to locks and fastenings, the parts in this invention are so arranged that a piece of paper, or of eard, or of other material, may be introduced over the keyhole, and under a cover or plate of one face or side of the lock or fastening. The piece of card, or of paper, or of other material so introduced, bas through corresponding openings in the case of the lock or fastening, The bolt or instrument has heen introduced, and is locked or fastened belok or fastening, the bolt or instrument which is passed through the covering material, and such bolt or bolding instrument, the keyhole cannot be got at without destroying or defacing the piece of eard, or of other material covering the keyhole, as the covering material cannot be removed without nulocking or unfastening the bolt or instrument which is passed through the covering material, and such holt or bolding instrument eannot be with itroduction of the key. The covering material and such bolt or bolding instrument when the in troduction of the key. The covering material is under surface marked or written on it, and it may be further rendered still more secure by having is under surface. By these means a lock or fastening cannot be opened without detection, whether by the use of a faste key or by the proper key.

cannot be opened without actection, whencer by the use of a false key or hy the proper key. HENRY WIMBALL, Aldermaston, Berks.— Apparetus for the Manufacture of Bricks, Titles, Piptet, and other articles of a similar nature. Dated 12th December, 1856.—This invention relates to a peculiar construction, arrangement, and combination of mechanism employed in the manufacture or production of bricks, tiles, and other similar articles, and consists in the application and use of a moveable carriage or platform, or a series of such carriage inked together, and cansed to pass under or in conactions with a pugmill, or other brick-making machine of that class, so that the exuding stream of elay or other plastic material is carried away from the machine by a continuous solf-acting operation, the motion of the clay itsolf imparting the requisite traverse to the carriage an place of such elay being removed by land, or by an endless chain or set of rollers, as is at present the case in machines of this class now used.

Books Receibed.

VARIORUM.

MR. CHARLES R. WELD, the author of several pleasnat and instructive vacation tours, has just produced a new one tilted "Vacations in Ireluad" (Longman and Co., publishers), in which the wild and still very little travelled districts in the west of oar sister isle are sketched with a light and flowing pen, but intersporsed with fever archeelogical menuoranda than might have adorned and added interest to the author's sketches. We can add the testimony of our own pleasant personal reminiscences to those of Mr. Weld in respect to the districts visited, which the tourist will find to be full of interesting objects. The enrious superstitions of the peasantry are not overlooked; nor are their hespitality, their humonr, and their primitive simplicity. Tishing is a favourite and oft-recurring subject of notification with the follow in his footsteps; but still, after all, as we have said, we should have heen additionally pleased with the hook under notice, had a little more space been given to the many curious and interesting architeztural remains with which Liteland is studded....

In a couple of tracts titled "Dishonesty exposed: Report on Experiments made on hoard H.M.S. Impericuse, in June 1856, with Prideaux's self-closing tranace valve-door, and the common door," and "Treatment of an Inventor by the Admiralty, an instructive narrative for Englishmen, particularly for those who are shareholders in steam ships," Mr. T. S. Prideaux shows, in a graphic and descriptive way, how the engineering officials of the Admiralty manage "nort to do it." Without reference to the particular merits of Mr. Prideaux's invention, one can have little

"not to do it." Without reference to the particular merils of Mr. Prideaux's invention, one can have little hesitation in coming to the conclusion, that unless his narrative be positively and wilfolg false—which we have not the slightest reason to suspect it to bethere are officials in the Admiralty who do anything rather than their daty, either to their paymasters, the public, or their superiors at the Admiralty; and who ought not to he allowed either to "do it" or "not to do it" except for the shortest possible time. The trickery, falsehood, and injustice here positively charged against them ought to he investigated, and an example made either of those who were guilty of such malpractices, or of those who acense them of such conduct.—In "Metropolitan Workhouses and their Inmates," a little tract just issued by Messrs. Longman and Co. various letters and other documents are reprinted for the purpose of supporting an endeavour to improve the administration of our poor bouses, a much needed reform indeed. The precise object mainly aimed at may be gathered from the motto on the title-page, astracted from an article in the Quarterly Review for September, 1855.—" The poor-house, which is justly made distasteful to the able-bodied vagrant, should present a different aspect to those who are driven thisher by no fault of their own in ad the grievance we have to complain of is one which, for the sake of Short-hand, by Morris Coleman" (Wart, 63, High Holborr), is a small pamphlet containing one of those many forms which experience and fucy teach the present modification, like that of varions others, is Taylor's, but we do not say that is the case in the present motins. There is a danger of making short-hand to short, but we do not say that is the case in the present metris. There is a danger of making short-hand co short, but we do not say that is the case in the present metris. There is a danger of making short-hand to already given a few hints of our own ideas, on a previous occasion, and need not recur to them no

Miscellanea.

A DANUBIAN STEAM NAVIGATION COMPANY.— A company ou limited liability principles is being formed, under highly respectable aspices, for the purpose of fully opening np, to the commercial enterprise of the west, those rich countries brough which the Danube and its tributaries flow. Regular lines of serwe harges or other vessels are proposed to he established by the company hetween Rarb on the Danube, communicating by railway with Vienan, and New Besce, on the Theiss, the principal dep61 of that extensive cora-growing country from which Vienan and its curions are supplied; between Rash and Semlin, where there is an immense carrying trade in pigs; hetween Basish and Pesth, the line of a great coal trade; and between Kalefat and Galatz, and the Sulina har, the line of transport for the large grain shipments to this country from Wallachia and Bulgaria, reloading at the latter places goods for transit inland. The promotion of personal intercourse by passenger traffic is also contemplated. Captain will be 800,000, in 30,000 shares of 10/, cach (deposit 1/, per share). Messrs, Barnett, Hoare and Co. are the London bankers to the new company. Phoroagy Foor Binuos over Transes ar Rort.

PROPOSED FOOT BRIDGE OVER TRAYES'AT RICH-MOND.—The executive committee of the Conservative Land Society having renewed negociations for the erection of a foot-hridge across the Thames, in connection with the railway bridge, a deputation, consisting of Viscouat Ingestre, M.P., Mr. Henry Pownall (members of the committee), and Mr. George Morgan (their surveyor), accompanied hy Mr. H. G. Day, of Isleworth, waited by appointment, last week, on the Hon. Charles Gorc, Chief Commissioner, at the office of Woods and Forests, Whitchall. Mr. Morgan prepared a plan as an outgiger to the railway bridge, access to which would be gained at the Middleser and Surrey ends by light spiral staircases. Objection, it may be recollected, has hitherto been made on the part of the Government, that the hridge would intefree with the Crown forry rights. The deputation having submitted the plan and urged the great public importance of the proposed work in saving the long detour, by means of Richmond Bridge, between Richmond and Isleworth, Brenkford, &c., were requested to communicate further information with respect to the limits of the ferries at Richmond and Isleworth.

THE DECISION AS TO THE WELLINGTON MONU-MENT.-Sir, I trust that you will cantion artists against entering into competition for the future, until they know that the artistical mind will form the maney know that the artistical mind will form the ma-jority amongst the judges : now I know the following to be a fact, as respects the Wellington Monument : That Mr. Cockrerell, with his ligh scose of honour and modesty, told the judges, "that although he knew something of architecture, and had the credit of knowing something of sculpture, yet he felt that he was not capable to decide on such an important was not capable to decide on such an important affair, and hoped he might be allowed to add some four or five artists of known ability to their number;" but the judges, as they imagine themselves "judges by Divine right," had no such modesty of conscience, and declined the proposition; so Mr. Cockerell, as you saw by the report, withdrew. Now, is not this you saw by the report, withdrew. Now, is not this anything but what it ought to be? and it is seen by the report, that they own that they never took into con-sideration the site of the proposed monument or of its locality. Then, what was the use, as you have said, of Sir Benjamin Hall sending out lithographic plans, sections, and views of the proposed site, if that was not to be considered ?--A SCULPTOR.

A SELF-ACTING SAFETY BUFFER BREAK. A SELF-ACTING SAFETY BUFFER BRAK.----IIe self-acting buffer break, patented by Mr. William Lukyn, as described by the patentee, obtains its self-acting power from the collision of the buffers, which striking each other, either on collision of the earriages or at the control of the breaksman, the breaks are break by the break break break break breaks are brought upon every wheel throughout the lice in quick succession, but not at one blow, which would render the invention uscless, from the shock it would The breaks are connected with the buffer rod by levers and a regulating break screw which prevents by levers and a regulating break sizew which prevents the wheels becoming locked. In shunting a train, a lever is attached to the tender, which communicates with a rod and coupling links, and passing slong the centre of cach carriage, relieves the huffer rod from the break. In starting a train, the whole operation consists in concecting the coupling links and throwing the lever forward, so that in the event of collision, by sarprise, accident, neglect, or carelesenes, by two trains coming into collision, or any obstruction on the line, the huffers are designed to act upon each other and force the break upon the wheel of each op-posing carriage throughout the line, thus greatly

other and force the break upon the wheel of each op-posing carriage throughout the line, thus greatly diminishing the effect of fatal disacters. PUBLIC DRINKING FOUNTAINS AND PUMPS.— We have occasionally for many years arged the neces-sity of providing the public in towns with drinking fontains and pumps provided with iron emps or ladles chained to the erection; and it is gratifying to observe that gradually the general want is being sup-plied. There are already many more of these con-veniences throughout the metropolis than there were some years since, though many more are still wanted. ventues introduct the metropols that there were some years since, though many more are still wanted. In Liverpool, Mr. Melly, though no teetotaller, has done much towards the same end, and at some little cost to himself, and we now hear that the same hencvolent gentleman is taking steps to get drinking four-tains introduced into Manchester. Birkenhead and Runcern are followng the raample, and it is being urged Runcorn are following the state pile, after the set one and at Preston. Several public pumps have been of late added to those at Donesster by the Local Board of Health, and at Elinburgh the Rev. Dr. Begg has pro-lither at the selectized iron ladles, and Dr. W. Videa several with gavanized non-names, and Dr. W. P. Alison advises the provision of namy more public drinking places, especially where closes (phonetically "closese," not clozes) abound. He also, by the way, recommends the paving of these closes with waste recommends the paying of these closes with waster material from the freestone quarries st Creigleith and Hailes, and the prohibition of the rebuilding of dr-cayed close-houses except nuder a fixed rule of pro-portioning the height of the houses to the width of the inturning foctway. IGNTION OF A WHOLE GASOMETER FULL OF GAS, and ST ST LIVE's An extraording a constant of the sec-

AGNINON OF WHOLE OSCIMETER FULL OF OSS, AT ST. LUKE'S.-An extraordinary occurrence took place during the thonder storm on Friday, the 14th inst. when Cheapside and many other portions of the metropulis were cast into utter darkness, on the one hand, while on the other the church steeples, far and wide, were lit up hy the glare of an immense flame, which issued from one of the huge gasometers of the Which issued from one of the higg gasometers of the Chartered Gas Company, at their Brick-lane station in St. Luke's. An iron column of the gasumeter had been struck by the lightning, and, falling, had canted it over so far us to allow the gas to escape, and at the same moment to be ignited, unaccountably, by the flash, as scens to be imagined, but more probably by some it's diverging gas one of the generator. some jet of burning gas near the gasometer. The oc-currence has been called an explosion, but it was simply an ignition and consumption of the gas, which, simply an ignition and consumption of the gas, which, in rushing out, would not be in that precise combina-tion with the atmospheric air which is requisite to produce a true explosion, althouch, doubless, the gipition would be accompanied by an immensaly exaggerated noise, such as that produced in lighting any jet of gas. Singular to say, no one was injured, and nothing burut or damaged but the gas and gas-ometer themselves. ometer themselves

RAILWAY TRAFFIC.—The Traffic Returns of the Railways in the United Kingdom for the werk end-ing Angust 8, amounted to 527.512. and for the corresponding week of 1856 to 502,3387, showing an corresponding reck of 1856 to 502,3387, showing an increase of 25,1777. The gross receipts of the cight railways having their termini in the metropolis amounted to 224,6592, and last year to 218,6947 showing an increase of 5,9657. The increase on the Eistern Counties amounted to 2.1237; Great North-ern, 1,2107; Great Western, 2,7367; Iondon and North-Western, 3,8127, total 9,8817. But from this must be deduced 1067, decrease on London and Blackwall; 5377, on Brighton, and South Coast; L.4377, on South-Western; and L.8367, on South-Erstern; leaving the increase as above 5,9657. The receipts on the other lines in the United Kingdom receipts on the other lines in the United Kingdom amounted to 302 8567, and for the corresponding period of 1856 to 283,6447.; showing an increase of 19,2127. in the receipts of these lines.

FRESH AIR IN ROOMS. — A correspondent, "Prohe," while writing us on the hundred-times-told tale of the evils of foul air and the advantage and necessity of fresh, suggests that in the upper sash of every window there should be inserted a framed pane, that will open on binges; and that by the Building Act this should he compalsory, because in numerous instances the upper sashes of windows are fixed, compelling people to expose themselves to the evil influ-ence of draughts from opening the lower sashes of their windows. It would serve the same end, however, if it were compulsory on builders to hang every upper sash, so as to admit of its being opened at pleasure. The additional cost of doing so is very trifling, and every such sash ought unquestionably to be maile to open. BREAKWATERS AND HARBOURS FOR SCOTLAND

DIFLARWATERS AND HARBOURS FOR SCOTLAND.-In a statement of places surveyed and reported on hy order of the Admiralty, with a view to the formation of breakwaters, piers, or harbours of refuge, but where the recommendations have not as yet heen adopted, are the following :--Wick : Report and design by Captain Vetch, R.E. on the 10th February, 1857. Two break-waters recommended one from the north above of vetch, R.B. On the 10th reprinty, 1607. Two brens, waters recommended, one from the north shore of Wick bay, and the other from the south shore, shol-tering an area of sixty acres, having a depth of 12 feet and upwards, and of forty-two acres with a depth of and upwards, and of forty-two acres with a depth of 18 fect and upwards, at time of low water of spring tides. Period required for completion, seven years. Estimates of total cost, by Mr. John Coode, C.E. 175,1754. A harbour is also recommended at Peter-head, at a cost of 227,9057.; two breakwaters at Elie, in the Firth of Forth, at a cost of 200,0007.; and a hreakwater at Dunbar, at a cost of 150,0007.

A NOVELTY IN BRICK-MARING.—Among the new machines Intely exhibited at the Highland Agricul-tural Society's show was one for the novel purpose of naking bricks and tiles from common earth by pres-sure. The patentee, Mr. G. T. P. Arthur, has spent many years and much capital in hringing it to per-fection, and he undertakes, with the greatest f.cility. to make hricks or tiles from any description of earth, without any previous preparation, and in any weather. ILL-CONSTRUCTED LAW COURTS. - The Law Magazine says, - The legal profession has to sufful continuously from the injurious consequences of ill constructed courts; and lawyers, at least, should in terest themselves in seeing that the huildings in they have to spend so much of their lives should be adequately adapted to the required purposes. Amongst other annoyances of the class we are alluding to, and which have to he encountered by the practitioner, we may note the absurd relative positions allotted May a circuit town presents in its court-honse an instance of most ingenious folly in the arrangement of the above pages works of the above necessary parties. We have often seen learned counsel sitting in a well in the middle of the court, precluded from all means of communicating with their clients, or with each other, the witness-hox being so disposed that if be who is being examined books towards his questioner, who is being examine looks towards his questioner, who maswering the consel, as is inevitably the case, he then turns his back on the jury, who lose his reply." Architects, too, "should interest themselves," so that new courts may not present the same inconveniences. HALE-HOLIDAY_IN THE BULLONG TRADES AT

may not present the same inconventions. HALE-HOLDAY IN THE BUILDING TRADES AT MANCHESTER.—The master builders of Manchester MANCHESTER.—The master builders of the workpeople, and have accelded to the demand of the workpeeple, and it has now become the rule, we are informed, to leave off work at one o'clock on Saturd y all the year round. The weekly wages remain as before, and there is no alteration in the number of hours on other days of the week. This reduction of two hours a week in of the week. This reduction of two hours a week in time is equivalent to an increase of wages of about one shilling per week. There will doubless he some inconvenience to the public on the adoption of this system in the building trades in respect to calculating and charging time, but as the concession is made hy the masters in deference to a public expression in favour of the holiday, it is hoped that the public will make allowance for such inconveniences as may arise. CHAMBERS'S INSTITUTION, SCOTLAND. — Mr. Wil lism Chambers, one of the founders and editors of *Chambers's Journal*, has purchased a large buildin in P.cbles, his native pluec, to devote it to a publi library, museum, and picture gallery for the benefi-of the inhabitants of that town. In addition to the buildings already subsisting on the site he intends to erect a great hall, the foundation stone of which has just laid. It has been arranged at the n quest o the town council of Peebles, that the ancient cross o the hurgh, removed from the grounds of Sir Adam Itay, Bart, shall be placed in the centre of the quad rangle. The founder of the new institution has pro-mised to give 10,000 volumes of general literature. A SAFETY-OUARD TACKLE-BLOCK.—A trekle

A SAFETY-GUARD TACKLE-BLOCK. — A trekle block, which holds fast all it gains, without mannan holding on, or belaying, as with the common block is advertised, we observe, in the American papers, and appears to merit some notice. It is a patentic invention, and was originally called Whipple's nipper-block, but has since been improved, and is now called Ballon's asfety-guard tackle-block. A lever inserted at one side works with a ratchet so as to act as a Break upon the pulley wheels, and to clap the rope. By pulling a cord or rope attached to the lever it is set free, and the weight or burden descends with ease and safety as convenience may require, or can be suspended at any height for any length of time. As the hlock of itself holds fast all that is guined from pull to pull, it allows the freest outlay of strength, often, it is said, enabling one man to do the work of two, and with greater case. With such a block, too, acting under horse-power, the stopping short or giving back of the animal will cease to occasion the slightest danger. In setting masonay, and for the use of masons and stone-layers generally, as well as carpenters, and others in the huilding trades, such whether it is patented in this country we do not know. The patented is Mr. Adin Ballou, of Hopedale, Mil'ord, Mass. U.S. VALUE OF HIGHLAND PROPERTY.-The Duke of

VALUE OF HIGHLAND INCLEMENT. The beautiful and ro-mantic estate of Langwell, in Caithness-shire, at a price of \$0.000/. His grace purposes making it a mantic estate of Langwell, in Caithness-shire, at a price of \$0,0007. His grace purposes making it a summer retreat and converting part of the 40,000 acres, to which it extends, into a deer forest. The fisheries and shootings, which at present yield 7507, a year, are of the best description, and the property is therefore particularly desirable in a sporting point of view. As showing the value of an attractive Highland estate, it may be stated that the price amounts to about thirty years' purchase of the gross rent-1. rental.

FEES, RE METBOPOLITAN RUINOUS BUILDINGS. I am quite of the opinion of "Architect" in this matter, and feel myself and my profession to be de-graded by the miscrable scale of fees put forth by the matter, and real myster and the scale of fees put forth by the graded by the miscrable scale of fees put forth by the Board of Works. It is a new burden upon us, inas-much as we cannot refuse to undertake this peculiarly the scale and scale if we take any of these pality ouerous duty; and yet if we take any of these pairy sums it must be with loss of self-respect, and with a certainty that what we take is too little to be any remuneration at all. Surely this is not the way to promote an effective execution of duty .-- D. S.

The designs been accepted.

BLACKBURN INFIRMACY .--- We have received a com-BLACKBORN INFIGURATION We underscripted a one-plaint that the proposed extension of time for sending in plans was not advectised in the *Builder*, although it was in the local papers, so that Loudon architects would he led to send their designs before the required date. It is only fair to the committee to say that the advertisement appeared in our last issue, but, by acci-dent, under the head of "Contracts," instead of instead of mpetitions.

competitions. DAMPNESS OF FIRE-PROOP ROOMS.—A fire-proof room was formed twelve months since in the base-ment story. Two walls only were required: thy were built neement, and slit the walls as well as floor were comented. A jet of gas has heen constantly burning. No sign of damp *sppeare*, yet parchment deeds, after heing in the room about a week, feel damp. Query the cause and remedy.—X. Y. Z. [The difficulty of making underground fire-proof floors dry has heen discussed in our paper before. Change of aris is the desideratum.]

Change of air is the desideratum.

The Builder.

Vol. XV.-No. 760.

T was not our intention to revert to the Wellington Monument Competition, on the conclusion of our observations on the modern treatment of sculpture in monuments, and series of notices of the models at Westminster Hall.² The question, however, now arises, "What is to be the actual result of the competition ?" Moreover, as reforred to in our last notice, we are gravely at issue with some of our contemporaries as to the merits of the collection generally, and the position of British sculptors.

It may be quite true, that of the eighty-three models, a large number in proportion to the whole, would deserve the ridicale which they have excited, or the exception which bas been taken to them for want of originality, or their use of allegory without the requisite perspicuity. But a certain class of writers are too ready, when they come to speak of that with which they have no real sympathy, to adopt a tone of disparagement. The prevalence of this in the case of architecture, is oue of the really unfortunate circumstances in the position of that art. The fact of such prevalence rather than any inherent defect amongst the public, is what lends colour to assertions about absence of perception and appreciatiou of art in England. We believe, that to foster or ercate an art-loving people rests with the teachers,first, by the avoidance of opinions which are not formed on the basis of study ; and, secondly, by putting an end to those coutroversies amongst artists themselves-such as those about styles-which only unsettle the public mind, or prevent the perception of the true art, without compensating advantage.

The large amount of mediocrity, or of utter misconception of the first essentials of the art, which is brought to light in every competition, is one of the inevitable consequences from the offer of premiums; and injustice is done to the artists of a country, hy ascribing to them works by men who may be far their inferiors. As we may have taken occasion to assert, our sculptors, both of this generation and the last, have aebieved enough to evidence their possession of great abilities ; and, if we believe they have yet something to acquire for certain branches of their art, it will be better to recognise the merit which they do possess, than to consign them all, as our contemporaries bave done, to utter condemnation.

For ourselves, we may say that we have found much in the collection at Westminster Hall that would have deserved praise,—coven in designs which we saw did not go to realise the objects of monumental sculptne; whilst we have found as large a number of designs as might reasonably be expected, possessing claims to selection for the intended work. Some of those which we refer to,—as No.66, "Virtute prudentia Victor," (Mr. Durham), and No. 68, "Integrita," (Mr. John Thomas), could only bave been excluded from their occupying a trifle more space than the 13 feet by 9 feet, referred to in the report as "distinctly laid down in the prescribed conditions;" whilst others, as No. 12, by MM. Mariano Folcini and Ulisse Cambi, of Florence; No. 20, by Mr. Noble; and No. 21, hy Herr Ernestus Julius Hähnel, of Dresden, which we mentioned

* See pp. 415, 425, 445, and 457.

THE BUILDER.

with general approval, are amongst the designs in which premiums are given, though not the largest amounts. And, indeed, as to the three designs which stand lighest on the list, if we showed we were of opinion that those works did uot make fit use of principles which happened architectural details; or bad not the impress of architectural details; or bad not the impress of architectural details; or bad not the impress of getfulness or misconception,—not from *inability* to grapple with the requirements of the particular class of sculpture on the part of the authors.

We say that the literal acceptation of the views that are current with writers in other channels, would tend to interdict everything but simple portraitnre or representative sculptureeither of which taken aloue, we have expressed belief, would fail to afford the highest class of art. Those views would interdict poetry of conception, and offer little food for the intellectual perception in the observer. Between the sublime and the ridiculous, there may be but one step; but if so, are we to understand that the higher expression of art is never to be sought for-in short, that the something which we choose to call allegory, is not to be attempted, because in the majority of eases it is made ridiculous, or so that it cannot be read? We think otherwise. The power at least, to use allegory without the complicated action which we endeavoured to show, belonged to dramatic art rather than to sculpture, manifests itself in the works which we have particularized, as in Nos. 57 and 60 --- "Studens" --- (Mr. John Bell), and some others ; and despite the fact that Mr. Woodington's personification of Devo-tion, Energy, Order, and Decision, is such as could not dispense with the titles beneath, his work, which has received the second premium, exhibits the like power in the artist. The difficulty is to group the whole well together, so that the allegorical figures shall bear parts in a train of thought, and yet shall attempt no com plicated action. One of the most successful of the designs, in this respect (though defective otherwise), and without much use of architec-tural framework, is No. 20, by Mr. Noble. The figures of Europe, Great Britain, Ireland, and India, by grouping and position, together express a mutuality of sentiment rather than a participation in action; the success of which limited effect is aided by their simple statuesque character. Europe is represented with the sheathed sword and olive branch, and India has a large volume of the Laws of England. Herr Hähuel's work (21), which is next to Mr. Noble's, and has received an equal premium, curionsly shows how much difference may be produced through the most simple clements of figures. Were it not for the addition of a seated figure of Britannia, who holds a shield inscribed with the name "Wellington," the same written description might suffice for both models; and the merit of the figures taken separately might be not unequal. But the accessories in No. 21 are merely separate statues, with uo sympathetic hond in the sculpture; and no substitute for that, in the architecture. This last is comprised only in the pedestals, which are in a great measure isolated from one another. The four figures represent War and Peace, Wisdom and Strength,-each being a The four figures represent War and female figure. War has a helmet and cuirass; Peace an olive-hranch and a horn of plenty; Wisdom has a torch and an open hook; and Strength holds a club. Enrichments to the pedestal, such as are *sketched* on the model, would probably improve the effect of the monument.

The model which received the first premium -No. 80, by Mr. W. Calder Marshall, R.A.has now been painted—pedestals and figures— the form of a youth. The pedestal is decorated

as proposed-one of our objections to the design (the prominent use of bronze within the eathedral) would be removed. But, the objections which are made to the present monuments in St. Panl's, if of any value, would be applicable to the present design, in which the representative and the allegorical are so far mixed up, as to interfere, it seems to us, with the unity of the expression. As to allegory itself, we have admitted in a former article, that the disuse entirely of Classical allegory, might deprive the sculptor of vehicles of expression which have become the most intelligible. But after examining the emblematic personifications by Herr Hähnel aud others, showing that the virtues can be successfully represented without pagan associations, and by all female figures; we are inclined to think that the excellent sculptor of No. 80, could have arrived at a better result by a course different to that which he has taken, as he certainly would bave produced a result more satisfactory to a certain section of the public. He represents Wisdom by the classical figure of Minerva, and Valour by a figure sembling Mars. Duty is so ucarly resembling the figure of Valour, that few observers would find there was any difference of intention. Peace holds a dove and the olive branch, and is the most satisfactory of the four. Of the groups at the ends,-one is allegorical, of Commerce and Agriculture rejoicing at the restoration of peace; and the other representative, of a mother, with child, bending over the body of a soldier. The whole of the figures accessory to the statue, if not all representative, should be all allegorical; in which case the representation of events might he effected hy the rilievos. In respect of grace and elegance, the monument is scarcely equalled by any in the Hall; and notwithstanding the objection we have stated to the principle adopted in the design, we claim, in the interest of British art and fair dealing, that Mr. Calder Marshall shall creet the national monument in St. Paul's Cathedral; or at the least that he shall be one of those selected from the present competitors, who have fought the fight and run the risk, to essay to meet, more fully it may be, the national requirement.

Returning to the other designs, with the view of still further noting the injustice and ignorance shown by the ridicule and abuse which have been showered on the desigus,-Mr. Woodington's model, if it does not fully meet our theory, omits to do so mainly from eucountering t difficulty of producing in forms that are capable of recognition, qualities of which the expression has seldom been attempted by the sculptor. There is consequently uo analogy that can help the spectator to identify the qualities ; for, the most important accessories, such as the seal being stamped on the document, which marks the allegory of Decision, are not immediately detected. The military character of the Duke is alluded to only in the sword, placed in a subordinate position at one eud of the monument; and we have referred to the design of the pedestal. In other respects, the design is one of remarkable mcrit; and the figure of the Duke is excellent.---Mr. E. G. Papworth's design (36), which has the third premium, we have sufficiently mentioned.

Ou to ground can we discover why the fourth premium was given to the design (10) by Cav. Giovanni Dupré, of Florence. The apotheosis of Wellington is represented at the top of the monument,—the Duke hahited in a toga or drapery, being led hy the hand hy Victory; whilst Peace, kneeling, is placed on the left. At the angles of the pedestal are scatch figures, intended to represent the principal virtues of the deceased, each with an attendant genns in the form of a youth. The nedestal is decorated

The mouldings and general archiwith rilieros.

tectural features are of very inferior character. Of the five models which have received pre-minms of 1007, each, we have mentioned some that would have deserved better places than those given to them, and we may especially refer to No. 12. Mr. Alfred Stevens's model refer to No. 12. Mr. Altred Stevens's moute (No. 15) would be far too lofty for the cathe-dral. The equestrian statue would, we think, reach nearly to the crown of the arch. Mr. Thomas Thorneyeroft's design (63) we passed over with a very short notice. It is so entirely over with a very short notice. It is so entirely wanting in all the architectonic elements, that we marvel that it should have been thought deserving of preference. But, with the greatest defects in some of the requisites of monumental sculpture, it combines considerable beauty in sculpture, it combines considerable beauty in the merely sculpturesque features. The Duke is scated ou a camp-stool, with a lower group of figures of Victory, Peace, Science, and Industry. These are raised on a misshapen pedestal, decorated with *rilievos* in hronze, an upper range of them being gilded. The pedestal is surrounded hy bronze figures of the Duke's companies in a rms. At the base of the is surrounded hy bronze figures of the Duke's companions in arms. At the hase of the pedestal, the contrast between the colossal lions' heads at the angles and the small scale of the *rilievos* is very objectionable.

We have often pointed to the disadvantage which results from stringent instructions; and we believe that in this case an unimportant departhre from the prescribed dimensions of monument has interfered with the selection of some of the best designs.

The short-comings of the works exhibited are, we think, in the architectonic requisites of monumental senlpture; hut whilst the art of late years has made no advance in these, it has as we have said, in our opinion, progressed greatly in elements which are of equal importance.

SOME DESCRIPTION OF THE MECHANICAL SCAFFOLDING USED AT THE NEW PALACE AT WESTMINSTER.*

It will probably bave often been the case with architects engaged on extensive and difficult works or aremeets engagen on extensive and dimenti works of buildings of peculiar construction and purpose, to have to consider and devise particular arrangements in the shape of scaffolding, either with the hope of effecting some economy hy diminishing labour, or to meet some emergencies attendant on the work them-selves. When this bas happened, it must have been a matter of very great interest to inquire how bkc difficulties had been met hy others, and to examine difficulties had been met by others, and to examine the records of the'r trials for similar objects, and the results. But here much difficulty usually presents itself from the paneity of such records, which, unless under some unusual circumstances, are very seldom to be found. The reason is obvious. The main object proposed to bimself by an architect is, the perfect realization of his conception in the building, and though as each successive stage or process neces-sarily comes under his attention, it is considered very sarily contest under his attention, it is considered toty carefully with reference to its hearing on the whole work, yet when that is completed, the processes by which it has here affected—the tools used upon it, as I may say, are forgotten in the results. The scaffold, it is also a comparison in comparison as though to I may say, all logored in tradies. In the source ing is cleared away with jcalous care, as though to prepend any record of it remaining, while the struc-ture stands to attest its claims to admiration for truth or beauty in future times. It will readily occur truin or beauty in induce inters. It was reading occur to all how these remarks apply to many of the great works of past agres—the pyramids—the temples and obelisks of Expyt—the massive walls of Jerusalem— the wonderful constructions at Banbee—and in our own country. Stomebenge and other Druidical remains : all of which have exist and interest and wonder; of which the particular diversarial interest and wondry, the huge masses of which they are composed having evidently required the exercise of no ordinary mecha-nical skill, and consequently many have been and are the ingenions theories explaining how they could have been earried out. Again, we should all be gratified by being informed how the Medicard architets. been carried out. Again, we should all be gratified by being informed how the Mediaval architets erected the marvellously lofty and delicate $s_{\rm pircs}$ of Autworp and Strasburg, in which it must evidently have been one part of the problem, that the scaffold-ing should be solf-supporting and independent of the delicate work itself. It has therefore occurred to me that some interest might be attached to a short description of the various mechanical constructions. The second secon

Read by Mr. Charles Barry, Fellow, at the ordinary general meeting of the Royal Institute of British Archi-tects, June 15th, as previously mentioned.

such a des ription by the hope that other memhers of this Institute may contribute several memoranda from their own experience to our general stock of interesting and useful information our constructional subjects. In this instance, moreover, I am prompted by feelings of affection and respect for my father, the problem of an early the might to differe in Prome by feelings of affection and respect for my father, the architect of one of the mightest edifies in Europe, who never can be induced to describe bis own works, and by the desire that some record of them may nevertheless remain. To make good any omissions or deficiencies in my account, or in my own recollec-tions of what has been effected. I am favoured by the attendance here this evening of my friends Mr. Merson and Mr. Quarm; the former having been long my father's chief assistant in bis office, and the latter having occupied a similar office of trust for many years as chief superintendent at the huidling they have hold heen materially concerned in devising many years as enter supermetation at the devising, they have both been materially concerned in devising, and carrying into effect the several bold and daring constructional contrivances which have been adopted, and which it will be my endeavour to explain. The extent of the New Palace at Westminster-

and which it will be my enteriou to chain the second The extent of the New Palace at Westminster— the necessity for its being earried out in portions—and the exigencies arising from constructing the new works, in many cases, where the old buildings they works, in many eases, where the out obtaining inc.y were to replace remained in daily use, led to curious contrivances of all sorts. But in attempting to recall them, I have met with the difficulties already alluled to, for few and but seanty records exist even at the present time. Although much anxious thought and contrivance have been required, the result has perhaps contrivance have been required, the result has perhaps been a mere penel drawing, or a verbal direction, illustrated at the moment with a piece of chalk ou the nearest wall. And therefore, although from having been myself engaged for some years daily at the building I have a perfect recollection that several cutions contrivances were devised. I have found it quite impossible to describe them intelligibly by diagrams. I must therefore rest contented with briefly alluding to some of them, and invite the atten-tion of the meeting to a more detailed account of the scaffolding on all boisting machinery wendbord at the tion of the meeting of a note uncated account of the scaffolding and hoisting machinery employed at the three main towers, of which more records do exist, and which I believe are quite peculiar in principle to this building.

In the year 1840, when the commencement of the superstructure was made with the river from (the coffer-dam and terrace wall baving been completed). I may observe that, although the old-fashioned kind of and observe that, all object to be defined and to be a scalability of poles and ropes had in some instances been superseded by the so-called whole timher or frauned scaffold, with its trans way and crab engines aloft, yet the latter was uncommon, and bad never been applied on an extensive scale, and its peculiar been appined on an extensive search and its peculiar advantages and ecouomy had consequently never been nuch tested. I believe I am correct in saying that the first, or one of the very first, instances of the use of whole timber and tran-way seafold was by my father at the New Graumar-school at Birmingham, in 1833. The elaborately decorative character of the severe and the test of the laborately decorative character of the New I believe and the severe face masonry at the New Palace made it necessary either to execute the finishing in situ, which is still either to execute the initialing in salv, which is still nearly always the method alroad, or to employ a system of scaffolding, by means of which heavy worked blocks might be raised without any chance of injury, and adjusted in their places with the same precision and facility as a brick could be haid by band. I will illustrate my meaning hy remarking that in very many cases the stone to be raised weighed four or five tons, and had on its face carving or other work - the result of three months' labour in the work the result of three months' labour in the workshop. It had therefore hecome a valuable work, worth careful handling, though of course had the face work been done after the stone was fixed in the rough, much longer labour by far would have been

The principle of framed scaffolding in connection with transways, either on it, under it, or both con-bined (on which the trucks with stone and the hoist-ing engines travelled), adopted in the river front, was found so advantageous, that in one form or another the same means have been used to meet all the subthe same means have need used to meet at the same sequent requirements of more special portions of the work. For instance, when it was required to execute the internal decorative masoury of the lobby of the House of Commons, a scheme was devised by which oue small traveller was made to act on all the four des, hy an ingenious arrangement for turning round the square corner at each angle, either with or with-out its load; so that a stone might be at once lifted from the banker on which it had been worked, and carried round suspended to be set in its proper place.

Again, when the internal mesory of the central octoponal hall was in hand, a circular single line of rails was laid down, just inside that lear of the walls, on which a pair of lofty framed legs, like trestle sbearlegs, travelled, connected with a centre pole, as a platforms, was easily set by the workmen, without de-pivot, hy means of a strongly braced and trussed, pending in the least degree on any part of the work innber frame at the top, ou which again rails were already built: this was obviously a point of the utmost fixed to receive the wheels of the travelling engine, importance, arising from the delicate multion work of This framing and railway projected so far over, that the lantern windows. The raising of the materials

the tracery heads of the large windows, the courses The tracery nears of the arge windows, ine coarses forming nicks, and the argic windows in the coals all be worked below with the utmost exactness, and dropped into their places with such certainty of the mouldings fitting, that the subsequent labour of elean-

Incoming a time in the second array of the second array in the second array of the sec several novel and peculiar arrangements; one of which, I think, was, that all the stones for the valut were raised through an orifice in the exact centre of the centering itself, but I bave been unable to find any drawing or details relating to it. I will now invite attention to the means employed

to raise and set the masonry and briekwork of the three great towers of the building, which differ very materially in their form and character, and therefore materially in their form and character, and therefore in their construction, commencing with the central tower, which was the first completed. I have already described generally the means used to build it up to the vaniting over the central laul. It will be seen that the central lantern is supported npon a cone starting from the springing of the vaniting: a powerful chain bond is here introduced, by means of which the resolution of the entire weight of the stone lantern on to the hear of this course. resolution of the entire weight of the source function on to the base of this cone is effected, which of course adds to the scenrity of the groining itself. The cone, which was constructed of brickwork and afterwards eased with the stone tabling, was itself a work of some difficulty. The arrangements of the elaborate system of ventilation introduced into the building by Dr. dimently. The artialgements of the characteristic dysket of ventilation introduced into the building by Dr. Reid, which had reference to the central tower as the point of ultimate extraction of all the smoke and vitated air, required that very large orifices of com-munication with the surrounding roofs should be main-tained through the base of the lantern, as well as into the lantern itself. It was, therefore, necessary to perforate the hirick cone by large arched openings; the consequence was that the portions between them had to be built isolated from each other up to the spring of these openings, and were, therefore, obviously overhanging walls. As a second system of centering would have been very expensive, it was determined to attempt to build the cone by means of a trammel, only working round a centre pivot in such a manner that the inner surface or interior should be kept true all round. Ties or chain bond of iron were introduced, to prevent all chance of the work, afterwards spreadto prevent all chance of the work afterwards spread-ing outwards at the foot when subjected to pressure and the whole was successfully and rapidly accom-plished. The leaning portions, which looked very insecure to the unpractised eye, were duly connected by arches turned through the whole thickness of the wall, and connected with iron struts: the system of the transmel answered perfectly, and the brick cone or base for the stone lantern was completed (without the accidents confidently predicted by many), and, per-fectly true in form and plan, was ready to receive the further works about the latter end of 1841.

The cone was really rendered continuous on plan during its whole progress, by means of temporary timber struts, introduced in the openings, which, in point of fact, acted as keys or horizontal voussoirs : without these, there would have been, of course, risk of the disconnected moritons falling. These strute of the disconnected portions falling. These struts were left in till some time after the arches were turned over the openings, and the work had had time to set thoroughly: when they were removed thoroughly: when they were removed, a minute examination could not detect a trace of movement or taking any part of the work, nor is there on moments of flaw in any part of the work, nor is there any now under the load of the tower above it. The brickwork was executed in mortar, with occasional tiers of four or five courses in coment, within seven weeks from the commencement.

Up to this time all the materials bad heen raised internally through the central orifice in the stone grouing; but it now locame necessary to alter this mode of proceeding, insamuch as the furshings of the central hall, with other portions of the works adjacent, central nail, with other portons of the work suggesting, were required to be given up to render this part of the building available for public use. On the block plan of the building, the small court, called the Peer's Inner Court, will be seen. From this beneeforth all materials were boisted out to the level of the platform coinciding with the upper rim of the cone, pandotin contaction trucks running on a transvay ex-tending over the roofs of the building to the centre of the platform over the eone: from this point upwards the lautern of the central tower was built by a system of framed scaffolding. This scaffold was put up and added to from time to time as the work proceeded. Platforms were constructed at various levels to receive the materials hoisted, as well as for the use of the masons; and the stone, being always raised in the centre through a shaft or ring left in the framing and from the ground to the lower platform or tramway was effected by connecting a small engine with a drum and tackling immediately over the court below: the materials, having arrived at this height, were taken by tracks to the centre of the tower, when the same engine was connected with another set of tackling running over a palley in a frame fixed about 6 feet higher than the next intended platform. Large stones were thus raised by two lifts from the ground to their final position, 150 to 200 feet or more, without handling in any way, and consequently without risk of injury. This arrangement was continued hy simply shifting the pulley higher and higher, and lengthening the connecting gear between it and the engine drum, until the internal diameter of the spire became too small to receive it, when the platform was so framed as to extend outwards through the small incerne lights in the base of the spire sufficiently to allow a scafold in the base of the spire sufficiently to allow a scaffold of ordinary poles to be erected on it. All the re-mainder of the materials, including the metal terminal, mainder of the materials, including the metal terminal, was raised, as described, to this platform in the in-terior, and then run out through a temporary opening left for the purpose in the base of the spire itself. The same principle of keeping the scaffold clear of the work was continued: no putlogs whatever were used, hut by disposing horizontal poles diagonally on plan, the whole was firmly braced from time to time. The engine used was a portable one, known as "Gongh's patent," and its cost was under 100/.: the scaffold cost about 500/.more. I will hereafter give some interesting data respecting the economy which can be effected by the use of stam-engines for raising mate-rials for towers and like structures; hut before qui-ting the Central Tower, I may mention that its dimensions are as follow :-dimensions are as follow :-

External diameter	70	feet.
Internal diameter of the octagon hall	55	,,

MEDIÆVAL EARTHENWARE DECORATION. MEDIZVAL EARTHENWARE DECORATION. This beantiful and interesting specimen of pure Gothic tracery was found at the time of restoring an old huilding in Nuremberg, and is supposed to be a portion of an earthenware store. It is a well-known fact that at one time in that town a very flourishing trade was carried on in the manufacture of these stores (which sometimes were coloured and glided) by men who, from the beauty of the works they de-signed, may be fairly supposed to have been artists, and not common tradesmen, as Glockenthon, Prunner, and others, whose names are known to fame, speci-mens of whose art, from their beauty and scareity, are much prized. There is at present in Nnremberg a manufactory

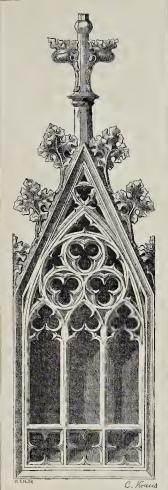

nuch prized. There is at present in Nnremberg a manufactory which makes copies of these works. The drawing is about one-third of the original size, and the relie is supposed to have formed the crowing ornament of an earthenware stove. Traces of the nse of other earthenware ornamentation in the honses of Germany have been discovered.

THE WILTSHIRE ARCHÆOLOGICAL SOCIETY AT BRADFORD.

WE left the archaeologists starting on their first day's excursion, with the Rev. Mr. Wilkinson's pony and a mounted trumpeter in a red coat at their head, f on their way to Monkton Manor House and the church and a mounted trumpeter in a red coal at their head, Ton their way to Monkton Manor Honse and the church at Broughton Gifford. The excursionists had mus-tered strongly, filling, when they reached their first destination, thirty carriages or more. At starting, some of the visitors asw, for the first time, the out-side of Kingston House (sometimes called the Duke's House), at Bradford; for, strange to say, this, the best known thing in Bradford, beyond its boundaries, was omitted in the list of objects of interest in the town set forth in the programme, the result, pro-hably, of some local jcalousy. We must punish the managers of the meeting for this by detaining the excursionists while we give a few notes about the bioase. It is one of the most interesting specimers remaining of the domestic architecture of the end of the sixteenth and beginning of the seventeenth cen-tury, and Mr. Moulton, the present possessor, has made it one of the most prefect. It was built, pro-hably, or, if commenced earlier, made to take its pre-sent form, by John Hall, the head of that family, in the reign of Janes I. "Through the marriage of " With the continuation of the paper we shall give some

MEDIÆVAL EARTHENWARE ORNAMENT.

Elizabeth Hall," said the Rev. Mr. Jones, in his paper already referred to, "the heiress of another Join Hall, grandson of the one who probably built the house (and who was sheriff of Wiltshire in 1670), with Thomas Baynton, of Chalfield, and the subse-quent marriage of their danghter, Rachel Bayoton, with the son of Evelyn, the Duke of Kingston, the property came into the possession of that ducal family, and from that time the mansion has been called Kingston House. The issue of this marriage was the second and last Duke of Kingston, the father having died before he came to the title. The second duke

and two very fine stone chimney-pieces, one in the dining-room, in two stories, Dorie and Ionie, with a very long guilloche as a mantle (the details a little mystified in restoration); and the other in the drawing-room, of the "strap and jevel" character, the naper story of which has clusters of small columns at the angles particularly elegant. The first is given in a volume of illustrations by Mr. C. J. Richardson, privately published by Mr. Vivin. A carved stone doorease, with semi-electuar head, in the dioing-room, is also very elegant. The name of the architecture to that of Longleat, and the tradition which ascribes the latter to the little known John of Padm, he has heen called the architect of Kingston Honse also. He is spoken of as "deviser of build-ings" to Henry VIII. The Rev. J. E. Jackson, in a paper on Longleat, prioted in our last volume (XIV. p. 622), has made some observations on this subject, which may he usefully turned to. It may have been John Thorpe who built Kingston House. Now, however, we must get hack to the eccursionists, simply adding that it scemed to speak well of Mr. Moulton, as an employer, when we found a very good band playing on the lawn in the evening, orgonised out of his manfactory. May field Church, the party fiel away to Great. Challfeld Church the party fiel away to Great. Challfeld Church and Manor-house. The latter is a very interesting specime of domestic architecture, built as setly as the middle of the Streeth century.

ion Gifford Church, the party field away to Great. Chalifield Church and Manor-house. The latter is a-very interesting specimen of domestic architecture,, built as easly as the middle of the fifteenth entury. The Pereys owned it early, and then it come into the possession of the Tropenells. The way in which this inaily ended in heiresses was remarkable. The only-son, on coming to man's estate, met with an unlucky accident. The had put a pair of dog couples over his head, and, leaping over a hedge, a loop in the strap hanging at his back caught a bough, and keep thim from the ground till he was strangled. This death was the more singular if the motto of the family he, a we bave heart, "*Le joing tyra* beliement /" The house has a very good oricl window, but throughout has been much injured by alterations to meet wants of the moment. The hall had its ceiling divided into-squares by the main timbers, and those squares sub-divided into others of plaster,—an early example of such an arrangement. The clurch is distinguishable by its stone pent-hones porch, and a hell cot, illns-trated, together with the Manor-house, by Mr. T. L. Walker, in "Examples of Gothie Architecture." One small fancet-hended window on the south side seems to show that the eburch was here in the thirteenth leartmy. Warshell Marcar House, the next stomping heard lart.

Wraxhall Manor House, the next stopping place, has also beeu made known in detail by Mr. Walker. It has been attributed to the early part of the fifteenth eentury, when Rohert Longe, who was M.P. for Wilts in 1433, was its first recorded possessor. The bildium endose two sides of a "plasmone" With in 1433, was its first ricorded possessor. The huidings enclose two sides of a "plaisance," and include a gatehouse, hall, and drawing-room. The latter was formed by enlarging and altering part of the old house, late in the reign of Elizabeth, or, more likely, in the heginoing of the reign of James I. A vaulted ceiling was formed, with plaster rihs and ornaments, and an claborately-carred stone chimmey-piece of the period set up, with carryaides, Corin-thian columns, and figures of Prodence, Arithmetic, Geometry, and Justice. Some of the details of the chimmey-piece are pure and elegant; but as a whole it is not equal to those at Kingston House. There are several points of interest in Wrashall Church ; hut the red-coated fugleman is blowing his trompet, and the caycleade is preparing to start for Monkton. ne conse (and way was shorn or Witshre in 1670), with Thomas Baynton, of Chafield, and the subscription of Chafield in the rear the subscription of Chafield in the rear theorement of the form of the princiption of Chafield in the second and the second and the subscription of Chafield in the second and the subscription of the second and the second and the subscription

nothing hut the site. In its original condition, the architectural style would provably be partly Norman, partly Early Euglish; and with this tran-sitional charace ar the few fragments that have been found perfectly surrespond. "The church fell, or sitional charac er the few fragments that have hem found perfectly correspond. "The church fell, or was taken down. The ground on which it stood (now forming the bank on the north side of the lawn), being eovered with beaps of rubbish, and overgrowu with grass, became a robbit warren; and some curi-osity was excited by the partial disinterment of its foundations and floor in the year 1744. A descrip-tion of this discovery, but containing some errors, was printed in the Gentleman's Magazine of that year, on which Dr. Due ref (of the Lundon Society of Antiquaries), requested a fricad, Dr. Wm. Evetts (a physician then living at Chippenbam), to visit Monk-on Farley, and send him a correct account. Dr. by abla the non-set of the processity is a set of the processity of the procesity of the processity of the processity of Webb Seymour's labourers being employed in level-ling the rabbit warren, came first upon the pillar of a church, and, ahout 4 feet under the rubbitsh, to the floor of the chuncel, of chequered tiles, ehirdly red, some with 'figing grifflus,' and other emblens. Four gravestones were found, one having the figure of a monk kneeling, the usme 'Lawrence,' and a legend, in old French, ' lei gist,' &e. 'Whover shall pray for him shall have so many days of pardon,' This was a e-memon one about 1360; and as a Prior Law-rence Archenbaul was here about that period, it was probably bis monument. On the other three stones, which were grooved round the edges, the inscription probably bis monument. On the other three stones, which were grooved round the edges, the inscription was obliterated. ated. The grooves heing an inch or more had probably been the sockets of strips of breadth, brass, on which the inscription had been written. The chancel-floor was about 24 feet square, lying

east and west. and west. At about two-thirds of it eastward steps. Here a sepulehrc was opened, containing the start wess. Here a spullehre was open it, easiwing the skeleton of a stout man, upwards of 6 feet bigh. Ou a gravestone was his burst, in *bars relief*, and at his feet a lion. This, of course, was pronounced to be the founder; but the principal founder, Humphrey Bohm III, was, with all after hum, baried (as has been stated) at Lanthony Priory. North-west of the altar, and some yards off, was found another floor, as of a small side chapel, rather deeper in the ground. It contained a basin for holy water, and its walls were perfect about a yard high all round it; in one part as high as the sill of a window. South of the altar, ahout 4 fect under the rubbish, was found another floor of tiles, about 10 feet square, but no remains. On this side, also, apparently heyond the church, were signs of a bursil-ground, with a large yew-tree; several stoue pillars were discovered, having figures carek upon the still buried." The most unions rounnent, found in 1744 (which

are known to he still buried." The most curious monument, found in 1744 (which was given away by Lord Webb Seymour, and is now preserved at Lacoek), is that of Ilbert de Chat, one of the chief hencfactors to Farley Priory. Ilbert de Chat (so called from a place of that name on the coast of Normandy, near Careutan, half way hetween Cher-bourg and Caen) was a hudholder, under the Bohuns, in Normandy as well as in England

bourg and Caen) was a haudholder, under the Bohuns, in Normandy as well as in England. In 1841, during some further alteration of the ground by the late owner, a large slah, once the cover-ing of a stone coffio, was found. On it is the edingy of a eross-legged knight, in chain armour sculptured in low relief. On the shield, which lies, not by his side, but over the whole body, occupying the full width of the stone, are the arms of Dunstanville; For the one owner who are store successful. Frety, on a canton a lion passant, surmounded by a label—the mark of an eider son. There are also fragments of a second figure in chain armoor, heati-fully sculptured, and once coloured, but there are no arms, or other token by which it may be identified. These effigies, probably of the time of Henry 111.

are singularly well cut, and in admirable preservation. It would be well to ascertain if they are of the stone of the neighbourhood. The stone obtained now from Farley Down is not thought to stand so well.

In the evening, on the return of the party, papers were read in the Town-hall, where we may as a matter for regret, a dealer in pictures had been permitted to hang amongst the articles forming the museum, a number of paintings, ticketted, noticeable impudence, after this fashion--"Tr 2/. 10s.;" "Corregain JLL" with Teniers,

10s.;" "Correggio, 4/.!" On Thursday the excursionists went to Tory On Thursday the exentsionists went to lory Chapil, Belcomb; Stoke Church, Farley; Hunger-ford Church and Cistle, and Westwood Church and Manor House. At Belcomb, Mr. Edmonds, of Brad-ford, read a paper in favour of the belief that a ford, read a paper in favour of the belief that a certain number of large stones there, in a scni-circle, tiful halo shed by luminant arborage over the crowded in the clustering families; Goswell-street, with their cluster

hodies, and Dunum, a hill-; since a great deut in the south end of it still goes by the name of Belcomb, and since other names applicable to the sun are yet of the places on the top preserved in the names the mountain. The situation, considered under all circumstances, seems worthy of the consecration it o]]] circumstances, seems worthy of the consocration it appears to have bad in pagan times, when the ancient Britons dedicated it to their god Belenus, and in all prohability creeted a Pyraen in the combe like the octostyle pavilion accident has now produced in it to maintain some of their sacred fire in honour of their imaginary King of Heaven.'" "If any weight," said Mr. Edwards, "can he attached to such evidence, the most extraordinary testimony of a traditionare elawards, can he

attende to such evidence, the most extraordinary testimouy of a traditionary elaracter can he adduced in support of the claim of this site to he ranked among the Drudical remains of this constry. The name of one of the fields, of which the copse in which the stones were found is the boundary, is to this day 'Temple Ground,' whilst that of the oth The Grove ; 'a field adjoining, around the boundaries of which large stones are found, is called 'Chilhorn', evidently an old Celtie word or compound, and which probably should be written Chilh-ior, the 'n' having probably should be written Calibior, the 'n 'having been an additional vulgar corruption, common to the lower orders; now 'Cylch' means eirele, and iôr the Deity, or more properly 'That Deity' worshipped as 'The circle of the sum moving weithin its orbit.'" At Westwood, Mr. Bash Saunders, the harrister, read a parts 'Do the United Sche Ohnerd' 'meither herd

paper "On the History of the Church," written by the Rev. W. H. Jones, pointing attention, amongst other they, we have a stand gate of the stand gate of the stand gate of the stand gates in the enancel. "The central figure of our blessed Lord npon the cross, with a vessel at the foot, out of which grows a liv, the flowers of which twine themselves round his body, the lowers of which twine themserves round us only, is unique. And 'I would add, as the lily is the well-known emblem of the blessed Virgin, to whom the eburch is dedicated, it represents strikingly Him who was emphatically 'the seed of the *woman*,' and who 'spraug from the root of Jesse.' The glass in the tracery is also most expressive. There is (1) St. John Baptist with the Lumh in bis arms, typifying the first coming of our Lord; (2) St. Peter, his first preacher to the Jews; (3) St. Paul, his first preacher to the Genthes: (4) an usuel weighting a saint and an to the Gentiles; (4) an angel weighing a saint and an eril spirit in seales (be former outweighing into mitter), a type of our Lord's second coming. The other pieces of glass collected from the tracery in the aisle are all cublems of our Lord's Passion. Amongst them are representations of the mails, the sconree, the hyssop, the buffeting, the embalming, the betrayal, the mean far. The one that correspond to the meckevil spirit in seales (the former outweighing the latter), the hysioly, the outforing the emaning, the overaging the mocking, &c. The one that represents the mock-ing, the scornful face, and protruded tongue, is (I am told by an artist in glass) uncommon." This paper and a thunderstorm closed the proceed-

ings of the congress, and sent the members to their several homes perfectly well contented and thoroughly wet.

ANCIENT REMAINS OF PICTS' WALLS.

PERVADING the thoroughfares of wondrons London there are many remnants of antiquity which receive little attention from archaelogists, and the dead walls are of them

Surrounding all original cemeteries there are lofty Surrounding all original conteries there are boty walls, bowing, tottering, and mouldering: the grounds within, swollen and elevated above the adjacent roads hy accumulated mortality, bristling with head-stones, are rarely planted: the frace around, hattering out-ward, has been raised periodically to preserve seclu-sion ; and the vicinal streets and horses seem, there-fore, to have sunken helow the level. Semultive has been for some time discontinued in

Sepulture has been for some time discontinued in most intra-urhan graveyards, therefore there exists no longer any occasion for these eircunventing hastions. The memory of the dead will be more consecrated by The memory of the dead with be more consecrated by plantation of sacred groves, the health and gratifica-tion of the living more assured by the demolition of such feaces, and the metropolis adorned in many parts by the substitution of iron railings, planted at a suit-able height upon coping, laid on footways of hriek-work

work. In the obsolete churchyards, of which every parish contaius at least one, how heautiful would be the aspeet, and how refreshing the effect of a few limes or sycamores, overshadowing the dormant remains of or sycamores, overshadowing the dormant remnums of generations long consigned to tombs, whereupon the time-worn inscription scarce records the name or title of the occupant! It needs hut to take a glance at two conneteries in the West-end, that of St. George's, Bayswater, and the other off Mount-street, Grosvenor-square, to be convinced how vegetation fourishes on the food of sureophagi; and of the bean-tiful halo shed by luxuriant arborage over the crowded lairs of departed mortality. There are mural remains in the busiest hauuts of

to the occupants of the palaces and church they were built to protect, as they are unsightly in the street range. Long habitude renders the Londoner uncon-Tange. Long halitude readers the Londoner uncon-scious of the spoliation these relies of (comparatively) barbarous times inflict upon the architectural effect, as well as upon the free ventilation, of that urble route. Burlington House presents a blashing mask wall of 260 feet range by 20 feet high,—again repeated at the rear to Vigo-street; Devonshire House, 240 feet by 12 feet; St. James's Church, 110 feet by 9 feet; and Cambridge House, near 100 feet, the last being somewholt redeemed by two porte-coelders, which stand hospitally open. It is within the memory of man and woman that some thirty years hack the Green-park washounded, along Piceadilly, hy a sullen red brick wall; that Hyde-park, along Park-lane, as well as on the north and south sides, was screeued by a bowing feare of the same description, some three miles long: all these

same description, some three miles long : all these were removed, and in place thereof light iron railings have bestowed a value and a delight that can only be appreciated by those who remember their sombre cast in the year 1820.

The value of arhorage in juxtaposition with build-ings, and of refreshing verdure along the street lines, was never understood by Londoners before. The fortified flank walls might have had their uses formerly, fortheed link walls might have had iber uses formerly, in times when no feudal lord dared to embattle his mansion without a royal letter or patent; nor moat bis castle, with access by a drawbridge, without the same hience. At present, lofty screen walls are used but for prisons; for, in fact, they render the court-yard dark and melaneholy, and the mansion ebeerless or mubalthese. were these walls removed -- for instance, Burlington

Where these wais removes - nor histance, burnington House, and some lines planted within the range-what light and grace would the change not effect The central portal might remain, hat the whole semi-circular colonande should be either swept away, or else reversed as wings opening to the street. bat huilding, by the addition of a noble story, in accord with the splendid foundation of Lord Bur-lington, might realise one of the grandest features of the whole metropolis, -the elegant colon oade forming two quadrants, would, if transposed, exactly fit side spaces, forming covered approaches at each ex-treme, and at same time masking the mean termini of the wings, and the blank walls of the adjacent house

houses. It is scarcely necessary to allude to another bastion some 30 fect high, helonging to some ancient Saxon or Celtie noble in Cavendish-square : there ore, how-ver, other Picts' walls, more unsightly, and still more projudicial, hecause they are greater is extent, and because they conceal and separate grounds of some extent and importance. Lincoln's-inn-fields, along the entire eastern race is disformed by an ownion extent and importance. Encoins sum-neurons, mong the entire eastern range, is disfigured by an environs mass of deformity. The Benchers' Dining-ball, and the open grounds to the north thereof, are divorced by the decree of law lords, as excented by Freemasons "coefficient to here are writing from the younger ²COCULIONS MATES.² This is a lamentate interposition which divides the lofty cluss within from the younger plantation without the pale of the square, and which at the same time deprives the fire Tudor Hall, by Mr. Hordwick, of the natural finish derivable from mediate contrast with natural trees and vegetation

Another, a more extensive and still more gratuitons outrage against public taste, utility, and health, is the inclosure of the *Oharterhouse grounds*, of some eight acres, by a varieoloured wall of stone, brick, chalk, and other materials, earried to a height of 9 feet throughout the whole circuit. This "enceinte" has throughout the whole cirent. This "cncente" has at least the excesse of great antiquity, some of it being as old as the foundations by the Grey Friars ; but it is not the less *Pictish* for that it is more *monastic*. The situation of this district is certainly less aristocratic, but it is more populous. There is not the same inducement to improve the surrounding region as if the neighbouring residents could afford movey to pay for the solace, or time to think of the improvement and hencift derivable from the change. They are noor and spiritless, and are therefore unthought of in their mournin

We do however think, or *affect to think*, more of the multitude—the *satus populi* is more regarded—now than was the case 100 years ago; and when it is considered how comparatively triffing is the expense of pulling down, as contrasted with building up; how very moderate the cost should be of a plain iron railand above all, when the enhancement of the value of all the surrounding property is taken into account; then, the most scropulous parish vestry would hardly hesitate to act the beneficent, and sink the expense.

keep pace with, improved taste as exemplified about them.

A wealthy merchant in No. 5 of a crazy row will not demoisls and reconstruct bis fabric whilst all the others of the range are in a state of decadence; but when, as in the old defiles about the Royal Exchange, one magnificent reformer neither stops at splendour nor exponse in erecting a mart for the sale of cakes, or watches, or wares, then the example is taken up, and places which had ueither the advantage of a direct or of a wide thoroughfare, are transformed into palace ranges, rivalling those gems of art which the Italian forefathers of architecture have founded in the constricted alleys of beautiful Venice. QUONDAM.

ON STAINED GLASS.

At the joint meeting of the Worcester Diocesan At the joint meeting of the worcester inforcean and the Birmingham Architectural Society, held in Birmingham on the 12th inst. Mr. John Powell (of the firm of Harchman and Co.) read a paper "On Stained Glass."^a Ancient stained glass, he said, pre-sents a wide field for the study and admiration of all scats a wine near low role study and admiration of all antiquarians and artists, whether regarded historically, artistically, or religiously; but he would only attempt to point out some of its many heatics, and give a general notion of the principles upon which the "dd masters in gives" worked. In saying ancient glass, he confined the term to the measie works of the thir-teenth and functionative maturize forecast the data of the second state teenth and fourteenth centuries, for soon after this period the true principles of the earlier meu were more or less violated in the luxurious compositions of the fifteenth and sixteenth centuries, though these in novations were in some degree compensated for hy the most astonishing display of artistic skill and har-monious colouring. The ancieut windows were commonious colouring. The ancient windows were com-posed of what are technically called "pot-metals;" that is, pieces of glass coloured in the melting-pot, and entrely transluced upon which the subject was and entrely transluced, upon which the subject was drawn in opaque lines, and strengthened with trans-parent flat shahows. These pieces were then set into grooved lead bands, which formed the outline; the figure, group, or ornament thus completed, having been arranged to fit geometrical or straight frames of Tschmad inverse. It which it was free he cotters: T-shaped ironwork, to which it was fixed hy cotters; 1-shaped ironwork, to which it was fixed hy cotters; and, after so many centuries, even in our own days of mechanical ingenuity, no better plan can be devised for its firm construction; indeed, many of the old windows remain from the thirteenth century in their original frames of lead and iron, still in good condition. He would take in succession the three conditions necessary for a gread window novel common. He would take in succession the three qualifications necessary for a good window, namely, colour, design, drawing, and would show how in each the old artists excelled. Firstly, colour: The first thing which strikes the eye on approaching a stained-glass window is its colour; and no one with a cultivated or natural taste for the beautiful can help feeling the translucent influence of a fair and window how it vated or natural taste for the beautiful can help feeling the translucent influence of a fair old window, how it softens the light without destroying it, preserving and assisting the architectural lines and features of the building without breaking the wall surface, and how, by its solemn light and religious stories, and by ex-eloding external objects it keeps the eye within the building and direct stoe mind by its design. Without true harmony and balance of colour the most earcful and heartiful denoming is antimaly united on Last and heantiful drawing is entirely ruined or lost this, therefore, is the most important feature. Now one of the pceuliar characteristics of the old glass is the simple, distinct tone of colouring, which, heing constantly repeated with certain variations, runs like some old melody through all their windows. This is Boustanty representation of the second state o whole. The excellence of the old work in this respect is strikingly illustrated in the east window of Gloncester, where only four colours arc used with wonderful effect; and again, at Merton College, where only one coloured hand runs through the series where only one coloured hand runs through the series of side windows, upon grisallle glass, with dowered bordering, tying them together, and becoming an architectural feature in itself. In these, and a bandred others, the eye rests naturally upon the intention of the window as a whole, instead of being dragged from the convertion starbilder activitient and beneficient at the one corner to another, astonished and hewildered at the violence and variety of colour, and which frequently looks as if a committee had chosen the best (or worst parts of a dozen competitive drawings, and had them all arranged in one window, -perhaps a not unlikely way of accounting for many failures, for no numher of elever men ean design a window half so well as only

* The meeting was presided over by Lord Lyttelton and the Mayor. The opening address was delivered by the Venerable Archdeacon Sandford, reported, with the rest of the papers were read "On Metal Work," by Mr. W. C. Aitkin; "The Church at Aston," by Mr. D. vidson; and on the Monuments in it, by the Rev. C. Boutell.

one, who, though he may he of inferior ability, follows out his single idea. Another great charm of the old glass lies in the quantity of pure grayish blue used, which generally circulates to the remotest corners, toning down and giving weight to the more vivid colours; hackgrounds are usually of this blue, for no other colour relieves the figures so well, or admits of such a variety of tints harmonising upon it. Thus he might mention each colour, showing how knowingly it was used, and its peculiar beauty of tint - the rubies streaky and hrilliant, with the colour generally mixed throughout the metal, not mercly flashed on the surface, as is usually the case in our modern glass; the Lace, us is usually the case in our modern glass; the greens always quict and used in large masses, not strong and vulgar; the whites always pearly or silvery (not thin and clear), and dispersed over the whole to give proper value to every tone; the brown purples used as a soft transition between the ruby and hlue; and over all the golden yellow as a tint of sunshine, of the vulgar orange of the hall windows of our and over all the goiner years as the values of our not the vulgar orange of the hall windows of our modern villas. And, as the seven notes of music are capable of infinite charge of melody, by juxta-position, so these few colours, varied from the palest to the Capable of infinite change of metody, by juxta-position, so these few colours, varied from the palest to the richest shade, were sufficient for endless varieties of harmony in the hands of the old paiuters, the peculiar tint of each helping very much the effect of the whole. In the deep knowledge of eboosing these arrangements of colour, the old more accelled, whether by science or events whether the science of the value of the va by mere cultivation of the eye; and so carefully did they select the tints, that the broken fragments, the together hy some thoughtless glazier (as at Lincoln in the Rose), is much more harmonious in its decay than most modern pretentious displays. It is often said "Oh ! time has done most of it. Dirt and atmo-sphere will harmonise anything !" Nothing is more false: it may be true that the more a modern failure Dirt and atmo is covered and hidden, the less its poverty and bad colouring will be observable; hut regarding an old work, the brilliancy and jewel-like effect of the glass when new must have been startling, for the scoret of their success lies in the material and its arrangement; their success lies in the material and its arrangement; the fiue, thick, unever pot-intel caught the rays of light, and held them fast, struggling and flashing in, its gemmy substance, until the whole heeame a trans-luceut picture, hut without hurting the eye of the spectator, as no ray of light could pass directly through i. The for windows in Ev transet by the Gerentés spectator spectator, as no ray of ngin could pass arcerty through it. The four windows in LP transet, by the Gerentés, of Paris, give very much of this effect, and though placed injudiciously high for their small grouping, still give a fair idea of what old glass was, fresh from the hands of the artist.

hands of the artsi. Secondly, *Design*.—In this important respect ancient glass is unrivalled; the finest designs, however full of meaning, are simple and foreble, so that the miud is led directly to the intention of what is set forth, and may be read at once by any one well versed in the history of the Old and New Scriptures, and the intimate relation they have to each other hy type and auti-type. The old windows are full of the most profound Biblical knowledge, not only of the mere facts of the history, but of their meaning and spirit. It is a very common notion that the mediaval men were ignorant of, or opposed to, the circulation of Scriptural knowledge; but these windows which they placed before the people were certainly replete with its great truths and lessons, from the first day of creation to the last vision of St. John. It would take days to speak with justice of the fine arrangement and symbolic treatment of the Canterhury glass alone, where each important event in the wonderful history of our prophetical incidents in the old law relating to it, all of which was told by simple expressive Mosaie outlines, like some rare passages of an old author, condensed in meaning, but with very few words. So at King's College, Canhridge, thongit the glass is too late to be very correct on true principles (however artistically skiful), still i preserves the old arrangement of type and anti-type. The whole story of the Christian Church is told, from the announcement of the Angel to Joakim attending his sheep, that the reproach should be taken away from his sorrowing wite, Anna, and that she should bear a daughter, who was to he the mether of the "Messinh," through revery incident of this mavellous bistory, the nativity, life, passion, and death of the Apostles, ends in the Assumptiou of the Blessed Virgin, who was considered us a type of the Church. To say nothing of lineola, Wells, and a thousand other examples of this method of illustrating either mysteries of the Faith or events of Sacred History wi

of natural way of representing them ; for glass is placed against the light, which by playing upon it and being refracted by it, changes continually its effect, and pro-duces a varying translucent brillinger to the eye. It hangs up as it were a vision, through which the light duces a varying translucent brilliancy to the eye. It hangs up as it were a vision, through which the light passes, and not a bodily substantial thing to he touched, and upon which the light is thrown. Thus all designs are hetter of a celestial rather than terrestrial cha-racter, and historic facts are better represented as portions of the church's history, elevated in feeling, and as far as possible removed from the mere earthy scene-consistently, of course, with the introduction of all the necessary people and things, to explain the story, but with as faw acces-sories as are unavoidable, either from heing mentioned in the text, or wanted for intelligibility. This con-ventionality of design is constantly attacked by those. persons who confuse the distinctive limits of glass painting with historic, landscape, and casel pictures In the latter, great part of the merit lies in a close of form; hut in the decorative arts, like stained glass, nothing so misleads the cyc, or is so false in principle; for in these the merit lies in covering a superficial plane with pleasure to the sight and in-terest to the mind, without destroying the flat ground-work; not giving a positive scene, or producing a stage deluging public priot. terest to the mind, without destroying the fail ground-work; not giving a positive scene, or producing a stage delusion, which might induce a man to try and walk through a wall, to smell a painted flower, or wait for a bird to pass a landscape. In a window these effects may astonish the vulgar, hut cannot delight the mind formed npon "true principles of att". This comproduce or of exclusive invitition of action the mina former apon true principles of art.³ This common error of exclusive initiation on nature in modern glass painting is strikingly illus trated in the Munich window at Cambridge, where the Medieval principles are cast aside as rude, un worthy guides. The handscapes are so natural that the area instand of heire source and within the truth imitation of wbere nn-thai wormy guarantee instead of being contained within the num-ing, is ranging over sunny hills and along streams. The delusions are admirable. You feel inclined to test your sight by touch. In one, a lamp burns in the denumber, where, consequently, no light is an inner chamher, where, consequently, no light is an inner chamher, where, consequently, no light is allowed to pass except through the fame : the cast shadows on the stops, imitation of metals, &c. &c. are wonderful, hut the inconsistency gross, in making what is the real vobicle for light partially dark, on purpose to introduce a false hight, with its own consequent reflected lights. How absurd to make east shadows upon a surface through which real light passes, ignoring the true direct light, or only using it as a means of introducing a false side light; and these inconsistencies always force the artist to reusing it as a means of introducing a false side hight; and these inconsistencies always force the artist to re-sort to unworthy doctorings of the glass to produce the effects so much coveted: an enamel must be used, which destroys all translucency, and is not nearly so durable as pot-metal colour; and very soon the leads come in the way of true perspective and round drawing, and must be abandoned as interrupfound that has and have be abandonic as inter dip-tions; so, in the end, white glass is chosen, cut into squares, and covered with enamel surface colours. Plate-glass is required for outside protection, as at Cambridge; and the principle of material and design Cambridge; and the principle of material and design harmonising entirely destroyed. How refreshing it is to turn from these oiled-sik-looking performances, apparently stretched tight to bursting, to the old windows, as at Cologne, where the principle of the material giving the colour, and the leads and the iron the construction, is honestly acknowledged, where six centuries have not dimmed the jewel and pearl-like translucency of the effect, and where they will pro-bahly remain, to see all their thin modern neighbours replaced hy windows of a similar character, after this delusion of natural effects has passed away, and men judge glass upon its first principles of construction and material. and material

Thirdly, Drawing.—This Mr. Powell placed third on the list of essentials of a good window, for the reason that correct drawing, though necessary to a perfect work, is not so important as an expressive design —just as proper grammar and orthography are only second to a fue conception in poetry. Who due to correct Chancer, or Spenser? So, even defective drawing receives in the old glass painting a sort of reverence, from its use in explaining grand religious ideas; not that the faulty part of it should be imitated now, merely because it is so inseparable from the talent of the old masters. He had constantly noticed that the faulty part of it should be imitated now, merely because it is so inseparable from the talent of the old masters. He had constantly noticed that the louidest attacks are made against tiff mecks, twisted limbs, goggle eyes, galoy feet, &c. by those who never see and cannot comprehead the deep symbolic meaning they may embody; but just because the severe outlines are not in accordance with the graze and correct measurements of their standard Apbilo and Venus. Thus they turn their hacks with attact or forefathers laid as much stress upon the intention of their work as we do upon our correct drawing—Hey on graze conceptions and ideas, see on measurements on a dideas, see on measurements on a dideas, see on measurements on a dideas, see on measurements on a dideas used on the principles : thus, as perspective and foreshortening are not admissable, it follows that the limbs must be disnot admissible, it bulkes the finite and the first of the played and flat—the feet shown in full or sideways— the cyes nearly full, hair painted by lines, fugers stretched out, visibly; in fact, a sort of heraldic treatment throughout. For an illustration of this, incument throughout. For an instruction of this, imagine the effect of an arm, end-on, in glass, the light having to piece through the entire arm, from the elbow to the fugers, all you would see (without painting the glass, so as to exclude enary the whole of the light) would be five bright spots for the ends of the fugers growthe out of called of light the aircrear the light) would be five bright spots for the causof the fangers, growing out of a circle of light, the circum-ference of the arm. The old men, either from their superior knowledge, or happy ignorance, avoided these defects, by displaying the arms sideways, and arranging the design so that the action intended could be represented by outline, the drawing, in fact, being suited to the material. Glass drawing, how-ever, actually requires exaggration of action, and worts of the force exarying in strength according to ever, actually requires exaggration of action, and parts of the figure varying in strength according to the distance from the eye; thus, the meaning yon could convey to a friend a few inches off by a look, requires at a few yards the movement of a finger, and at a still greater distance the violent gesture of an arm. So in glass, according as the window is re-moved from the eye, an executioner swings his sword with more than the usual circle, and St. John preaches with stronger movement than natural. So also with record to the proportion. If the or and the ass were with stronger movement than natural. So also with regard to the proportion; if the or and the ass were the real size in the "Nativity," the principal figures would be lost. In painting, all this undue prepon-derance of less important parts can be obviated easily, by a stronger light on the centre of interest, or by perspective, but in glass we have equal trans-

parency throughout, and only surface drawing. Many an artist who starts with a contempt for Mediaeval art as "rery curions," and perhaps even good for the time it was produced, "interesting for its antiquity, &c. but much too rude for our en-lightened time," comes down, after his own repeated failures, humbly to these remnants for hints-acknowledges their riches, and owns that everything that is most valuable in art is to be found in them : and England, despite the fanatic zeal and ignorant neglect which for three centuries have sacked ber treasury of which for three centuries have succed by the theory of every period. York yet hoasts of full three-parts of her glass; Solisbury, some few wonderful fragments, after the river has been twice choked with ber riches ; Gloucester, hcr giaut window still full; Lincoln Canterhury, Tewkeshury, Shrewsbury, Malvern, with a host of parish churches, chapels, and old halls, still retaining fine remains; so that while we must lament the irrecoverable loss of so much, we may still he happy that sufficient is left by which we can estimate the treasures that have been destroyed, and enough to guide us in the revival we are attempting to make

LONDON STROLLS. A DARK REGION

MANY little ronds might be planned out in Lon-don, which would, without particular fatigue, well repay the inquirer of antiquarian taste the trouble of undertaking them. As an illustration, let us start undertaking them. As an illustration, let us start from St. Paul's, and by the way, independently of the contrast between the deep gloom of the crypt and the glorious space above, and other peculiarities and heanties, it is worth while to pusse near the north entrance to the cathedral, and listen to the strange and solemn noise within the dome, when the roar of the surrounding turmilt is gathered and magnified, and forms one of the impressive voices of a great city. While near this famed eathedral, the thoughtful wayfarer will speculate on many matters connected with times far remote: he will ponder over the various accounts of this sits, and wonder that no re-mains of a temple to Diana, or other famed deities of

mains of a temple to Diana, or other famed deities of Roman worship, have here heen found. He may, however, look into the London Coffee-honse, in Lud-Roman fragment, which was found in making exca-vations on that spot. He may also, without much Notion and the spectral sector of the may also, without note trouble, trace portions of the ancient London wall at the west of "Amen.comer," and in the Old Bailey. Crossing the hustling thoroughtare, he will notice crossing the hosting thereagand, he able to trace it towards where over in the light of day that salls tributary the Fleet rolled onward to the Thames, and where it still flows in covered darkness. Crossing the way to Blackfriars-hridge, the names suggest-ing recollections of the monastic institutions which once stood where the Times newspaper now throws off, day after day, its wonderful impressions, and in other place, it would he well, in spite of the gas-works, and unpleasant crecks, to progress to the turning next the river, where, running from the castern entrance of the Temple, the notorious Alsatia once flourished. We have looked with care over this site, in a clust it. in order to discover if any picturesque fragment might be found which could be identified with that sauc-tuary of bullies and cut-throats, but without success;

consider how nor is this to be wondered at when we

Respecting the Temple, we have spoken else-there. Passing through Temple-bar, fragments where. Passing through Temple-bar, fragments of street architecture of considerable interest may of street architecture of considerable interest may be noted. Then there is the ancient street — Wych-street, and that adjoining, which, not-withstanding their old date, should be removed to make way for the increased current of business. It is scarcely possible to get past Somerset-house without thoughts of the former huldings, and the may-poles which stood in front.* The once-famed houses of the nobility have been removed from the Strand, but still many relies of these may be found in the names of the streets, &c. Then the chapel of the Savoy, and some other fragments of that establishment still remain.

We had almost forgotten to obey the pointed invitation of the hand, which invites the passenger to visit the "Roman bath,"-a curiosity. The material of this bath is evidently of the ancient Roman period, and has been thought by many to have formed a portion of a villa which once was occupied by some of our former conquerors. It seems, howby some of our former conducts. At second more ver, more likely that this fragment has been removed hither from abroad hy the Earl of Arnudel, whose house was close by. The copious spring of water which flows here is very transparent and icy cold.

Many honses in this neighbourhood connected with Many honses in this neighbourhood connected with eminent men might be pointed out, and, thinking of these, and of the building speculations of Charles Villiers, Duke of Buckingham,—the streets reared in consequence of that idea still bearing the above names,—we get towards the Adelphi, where the Adamses so worthily made an attempt at London im-provement. A view from the river here will show that it has been necessary, in order to obtain a level for the streets, to raise the roadway to a considerable height upon arches, and to form those dark vaults which, amidst life and sunshine, seem strangely out of harmony with all around. Those who have at times harmony with all around. Those who bave at times peeped into this region must have noted its Rempecped brandti brandtish and sombre effect; and formerly, at night-time, have seen pictures by fire-light formed by the most wretched of mctropolitan outcasts, which, most wretched of metropolitan outcasts, which, although fearful to contemplate, could not be exattrongen rearran to contemparte, could not be di-ceeded, so far as the-picturesque was concerned, by the wild groups to be met with in forcign lands. Even now, so notorions is the haunt that the policemen will seldom venture there singly, so from time to time we read of outrages which should induce those concerned to make some change. In these vaults, horses and other animals are kept

in the unnatural darkness which might be easily dis pelled, with the abominations of the place, by a small onlay in gaslight. We are glad to escape from the scene, and, having caught a sculler at Hun. pelled. gerford-stairs, have the pleasure of examining the fine ater-gate by Inigo Jones, and proceed pleasantly to Westminster.

THE PREMIATED DESIGNS FOR THE GOVERNMENT OFFICES

In our present number we give an illustration of Mr. G. G. Scott's design for the Government Offices, for part of which, namely, the design for the Foreign Office, a premium was awarded to him by the judges. Mr. Scott viewed the two buildings as architecturally one, notwith-termine the province of the programme and standing the wording of the programme, and both as integral parts of a vast whole; and we have therefore thought it right to give a view of the whole,—an interior view of the quad; rangle looking towards St. James's Park and Downing-street. On the subject of the separa-tion of the buildings we will let Mr. Scott speak for himself :---

"The framers of the programme," he says, "The framers of the programme," he says, "wishing, to doubt, to offer every incentive to com-petition, fell into the very unfortunate error of offer-ing separate premiums for the designs for the Foreign and War Offices, though proposed to be erected on a single plot of ground, and that but one-fourth of the entire site; thus risking the ruin of this grand architectural scheme by dividing it into unconnected hlocks, each but an eighth of the whole. Every one (yourself included) who criticized the programme yourselt included who erricized the programme protested against this; but, as it was not made an absolute rule, it was hoped that the judges would correct it hy selecting for execution the designs of some one architect, they insuring the first two instalments of the great project being portions of one har-monious and artistically conceived group.

Many architects, thinking the success of this mag-

to form a single and indivisible group. Such is the case with all of the four leading Gothic designs, and case with all of the four leading Gothic designs, and with several others to which premiums have been awarded; but, strange to say, the judges, instead of correcting the error of the programme, deliberately stereotyped it, and made it a rule that such designs as were thus united were *ipso facto* rendered unft for execution, and their merits only worthly of being acknowledged by the minor prizes! Instead of this it is manifest that the very reverse was in reality the case, and that those only were worthly of execution which treated the whole as essentially a single group, and the merits of the others just such as should be rewarded by the lower prizes.

and the herits of the order prizes. Now, what was the object for which this vast com-petition was set on foot? Was it merely a grand architectural curriculum in which certain prizes to. the amount of 5,000%. were to be awarded, and architects induced to spend some 50,0007. for the pleasure of sceing in what order a few of their names might he placed by the indges? Surely not. It was to earry ont a magnificent object for at once becautifying the neighbourhood of the Houses of Parliament and supplying a great public necessity, and, such being the case, cau it for a moment be doubted such using the case, can it for a moment be usofield that, cattering parious those designs were best which added to good arrangement and good architecture the best grouping together of the two offices first to be erected, thus making a good commencement of the magnificent group eventually contemplated?"

We have already described the design pretty fully (p. 382, ante). We will simply add what the author says in his explanatory remarks as to the windows :-

"Many of them have 6 feet width of glass, "Many of them have 6 feet width of glass, with only one mullion: others have nearly as much without any division. It has been my object to show secred of the ways in which my style will admit of the greatest quantity of window-light; —much more, indeed, than is easily practicable; or, to say the least, than is usual, in the ordinary style. No popular error is more groundless than to suppose Gothic architec-ture to be defective in the item of window-light. If, in fact admits of a greater around of it there any with in fact, admits of a greater amount of it than any other style.

I have arranged the windows so as to open as ordi-I have arranged the windows so as to open as ordi-nary sashes. In some instances, I have additional lights in the bead, which would open as ventilators by other means. Those windows which open on to bal-conies may have French cascments, or sashes, as may be preferred. All would be glazed with plate-glass in single sheets. The only exceptions to this are the upper parts of the windows on the first floor of the official residence, which above the transome are filled with stained glass. I may here mention, that though in murely Domestic architecture, on an ordinary scale. with stained glass. I may here mention, that though in purcly Domestic architecture, on an ordinary scale, I usually prefer the square-headed window — which is as consistent with my style as the arched form, — I conceive the latter to be essential to the dignity of a building of this class. I have, however, in many cases, either left the arch unperforated, or so arranged, its openings as to be unconnected with the sash-windows below.

windows below. My style is, generally speaking, more columnar and more thoroughly arcuated than has been usual in the modern treatment of the style. I am convinced that this will add enormously to the boldness and effect of the buildness? the huilding.

WELLINGTON MONUMENT.

SIR, -- The letter of "Amateur" (I have no idea who he is) in the Builder of last week, on "The Award of the Wellington Monument Designs," does to call upon me to say something. In making my design I felt that to conform to the

In making my design I felt that to conform to the conditions of the proposed monument as to site, hight, amount, and ohject, was a very difficult problem. As in the cathedral a good top light only pervades the upper portion of the arch, I arrived at the con-clusion to put the Dake's head in the eye (theradiating point) of the circle, to which, as an ornamental prin-ciple, I adhered, and in this mode of occupying the architecture of the architecture of the architecture. arch (the conditions specifying occupation of the arch) I believe some architects will bear me out.

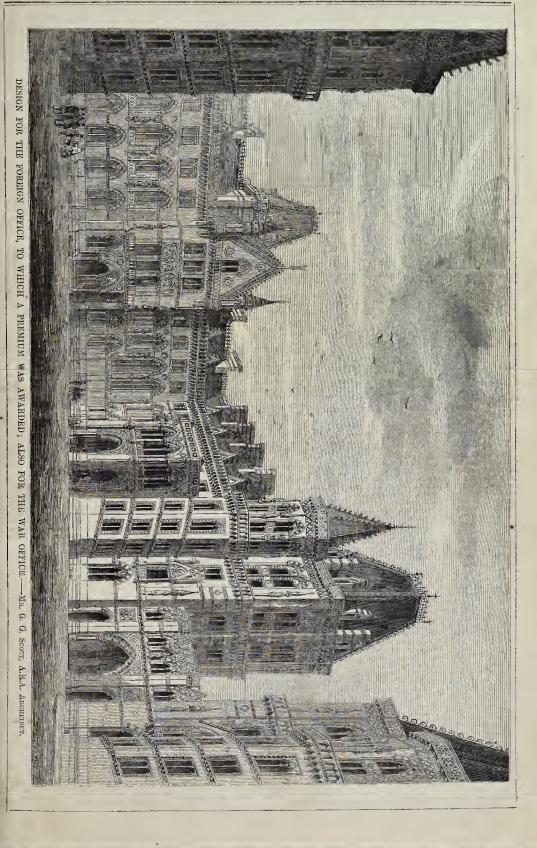

To illustrate the effect of carrying out this, I sent in two careful little drawings, presenting the monu-ment in the arch, neither of which, I nuderstand, was looked at.

That my motives in thus responding to the call of "Amatenr" may not he mistaken, I venture to add, that, as far as I know, and in my belief, the verdict was uninducenced by interest. John BELL.

nificent scheme of more importance than their per-sonol success, ventured so to combine their designs as [•] There is a valuable collection of astiguities in the rooms of the Society of Actiguaries, which is worthy of feet.

THE "SURREY SIDE OF THE METROPOLIS.

In your publication of this day (Aug. 22), I see a ter from W-'D Wykes: be remarks on the great letter from difference that exists between the north and south sides of the Thames. He is not perhaps aware that the reason that the houses there are principally of the lowest class is, that the greater part of the land is held under "copyhold" tenure, either under the "Ducky of Computal" with the land is held under "copyhold" caure, either under the "Duchy of Cornwall," or the Archbishop of Cauter-bury, who have snug little customs of inflicting heavy fines on all holders of ground under them. If a plot of ground changes hands in any way, either by pur-chase or successiou, then a heavy fine has to be paid to the "lord" or the manor, either his Royal High-ness, or his Grace; and sundry fees to bailiffs and stewards of the manor, and to the "homage," who come to look on, take snuff, and pocket the fees. Consequently no landowner has a desire to improve the property, narticularly as the fine has some mystethe property, particularly as the fine has some myste-rious way of increasing if the value of the property increases : hence you see rows and streets of a iserabl increases: hence you see rows and streets or inscrease little four-roomed tenements built to last the life of the landowner, or the lessee under him; and the former does not care what state the property is in, so long as he gets the ground-rents. If his "Royal long as he gets the ground-rents. Highness" and his "Grace" wou Highness" and his "Grace" would look into the matter, and arrange some equitable mode of enfranchising the land (which process is understood by no one exactly, as on inquiring into it, they generally stop one exactly is on inquiring most, any generally solve on finding that the necessary payments will almost absorb the value of the property), then we should see this part of London very much improving in appear-ance, and not till then will there be any great improvement take place.

Few people know how absurd the custom taking possession of copyhold property in the "Duchy of Cornwall :" it is quite a remnant of the old feudal times, and one is seized " in possession by taking across the table, the other end times, and one is served in possession by taking hold of a long pole across the table, the other end heing held by the steward; and during the process, the "homage" (a few old antediluvian gentlemen) take snaff, and look out of window; the steward's take shuff, and look out of window; the steward's secretary draws diagrams on a piece of blotting-paper and mibbles his pen; and the halliff is busy computing the fees due to the court, not forgetting his own; and then the steward, having pocketed the fine, hopes that the lucky possessor will lay out a great deal of money on the property, as he very truly observes, "it wants improving considerably," and thus the matter ends. isiderably," and thus the matter ends. A Copyholder under the Duchy

OF CORNWALL.

THE BROMPTON MUSEUM. THE WEST CORRIDOR ON GROUND-FLOOR.

It is useful, as well as interesting, to trace the It is useful, as well as interesting, to trace the progress of establishments which are now of great extent and much utility. We have already referred to the time, not a century ago, when the then compa-ratively small library at the British Museum attracted only a couple of readers, instead of the many thou-sands who annually flock there now; and many remember the early efforts of men like, Sir Joseph Barks Lobe Hurter or databasement in the sir Joseph Banks, John Hunter, and others, and how they toiled for years with little encouragement in the faith of heing able ultimately to produce important results. Those who remember the growth of various institu-Those who remember the growth of various institu-tions in the metropolis and elsewhere will have unoticed with admiration how the projectors have in most instances borne up against the coldness and doubts of the great majority who can only admire well-

developed success after a long and struggling period. A walk through the Brompton Museum and the schools adjoining induces thoughts of the efforts which in this case, as in others, have been required to be made before such an establishment could be obtained for the public use. As regards the Architectural Gallery, our readers know something of the labour of its founders, to gather together a collection of sufficient extent to serve the purposes of those for whom it is intended.

For long the necessity was felt in this country, both for instruction in art, and for exhibitions and museums of specimens of art and manufacture. bygone years we have noticed the interest which was felt in the exhibition of models of machinery be in the exhibition of models of machinery, which, like the wild beast meuageries, travelled from town to town. Then several attempts were made in intervals to form collections, which were a sort of faint forecast of the Great, yet temporary Exhibition, which was to follow; and it may be remembered, that each attempt greatly exceeded its predecessor in The achibitions got up town to town. Then several attempts were made at interest and importance. The exhibitions got up under the direction of the Society of Arts led to good results, and caused the inhabitants of several large towns to cause the inhabitants of several large towns to open Polytechnie exhibitions. As these various exhibitions progressed, they showed clearly the necessity for schools of art, and the adjunct which are

adjuncts which are necessary to render them useful. Thirty or forty years ago but few of the English schoolmasters could draw rough plans, and mathe-

knowledge of even the elements of higher art. We have assurance that in a town of from 30,000 to 40,000 inhabitants, at the time above mentioned, there 40,000 inhabitants, at the time above mentioned, there was, so far as is known, but one general teacher who could pretend to teach drawing. Some of the masters were elever in devising and excenting birds, and such things, in ornamental permanship, but thoirskill went no further. There did, bowever, rise up artists in the town from unexpected position, "who occupied part of their time in giving instruction in drawing, but that was done without system; and the "quarter's drawing," which began to be considered a necessary finish to the education, did not produce very useful results. results.

Notwithstanding the strong, yet smothered feeling for art which existed amongst the people, it is searcely twenty years since its importance was acknowtwenty ycars since its i ledged by the Government.

The first school of design was established under. Mr. Poulett Thompson, Fresident of the Board of Trade, in Somerset House, in 1838, having for its object the training of designers who should improve the patterns and designs for manufacturers. Councils and committees were appointed under the Board of Trade. The progress was, however, slow, and in the course of twelve years not more than twenty-one schools, which were chiefly kept in existence by grants from the State, had been established in the provinces. In seven or eight years the provincial schools, now on a self-supporting hasis, have increased to sixty-five, and

a sett-supporting mass, have increased to sixty-live, and at the date of the last published returns the number of persons under art instruction amounted to 81,455, at the average cost of 16s. 23d, per head. At the com-mencement of the present plan, five or six years ago, when the Department was established, the number of students traphs in the superson of the superson of the present set of the students traphs in the superson of the superson of the superson of the students traphs in the superson of the su students taught in the various schools was only 3,236, and then the average expense was 33, 23, 44, por head. Satisfactory as this increase may be, it is necessary to bear in mind that even the present number of students bear the school of accessly to be in limit the term of properties to minor of students bears the most triffing proportion to our population. We must therefore consider this establishment ouly as an infrant one, although it has the art schools, a library of 5,000 classed volumes, 100portfolios of prints, drawings, &c. and the galleries of art at Brompton as a nucleus. Omitting for a time the central hall of the Museum of Ornamental Art we will walk to the other portions of the collection, and it may be useful to those who may not have an opportunity of visiting it to say that it is divided into

opportunity of visiting it to say that it is divided into sevencton portions:— 1. Sculpture—including enrvings in marble, stone, wood, and other materials. 2. Painting.— Wall decoration, paper-hangings, &c. 3. Olyptic and Numismatic Art.—Cancos in shells, &c.; medals, scals, &c. 4. Mosaics, in stone, glass, and various other materials. 5. Furniture and General Uphol-steru, 6. Rester.work 7. Lordher.work 8. Jaother materials. 5. Physical and Generia Ophol-stery. 6. Basket-vork. 7. Leather-work. 8. Ja-panned or Lacquered Work. 10. Glass Manufacture. 11. Enzembers. 12. Pottery. 13. Works in Metal.— Wrought, east, and stamped works; chasing, engrav-ing, etching, &c.; instruments and utensils; lock-smiths'-work, goldsmiths'-work, inlaying, nicllo-work, 14. Arms, Armour, and Accountements. 15. Watch and Clock Work. 16. Jewellery. 17. Textile Fabrics.-Costumes, lace, embroidery, carpets, hang-

ings, &e. It will be seen by this list, that the Department It will be seen by this first, that the Department embraces a vast variety of materials; and it is stated that "this classification will undergo revision, and the museum is intended beneforth to include other cata-gories of art not as yet represented in our national collections." At present, the whole number of speci-mens, including those in the central hall, the side collections are and the 1.000 accounts are the second artis, including galleries, Ke. and the 1,000 examples now at Man-chester, is upwards of 4,000; and it is satisfac-tory to know that, considering that the Museum of Ornamental Art was founded only seven years since. so much has been gathered together. Its rapic growth is remarkable; the suite of rooms at Marlborough House, which were granted for its reception by her Majesty, soon hecame too small, and it was for an every to stow way very valuable matters in found necessary to stow way very valuable matters in the basement of that huliding. Besides the specimens now at Manchester, there is generally a picked selection of works of art circulating

mongst the towns in which schools of art are esta blished; and during the three years that this collee it is been exhibited at fourteen places, at periods of from four to six weeks, the number of visitors has been about 110,000.

The west corridor, which stretches the entire length of the Gallery of Mcchanical Inventions, the Educa-

* T. M. Richardson (the father of the present painted) who painted water-colours of a high character, was originally a carpenter, the introd schoolmster, and then artist at the sec of an arbitly years. matical diagrams; and, probably, not a score had any tional Museum, and the Central Hall of Ornamental Art, and which is divided into various bays, is occupied by a large collection of casts of the details of Greek, Roman, and Renaissance architecture: these bave an increased value in consequence of being placed near carcfully prepared models of the most famous temples of former times, made for Mr. Nash, the architect: There are also photographs of these remarkable runs as they are also photographs of these remarkable runs as they are at present; and time may be usefully spent in examining the high qualities of the art here exhibited, and comparing the models with the casts and photographs, which may enable many, without travelling, to form a good idea of those works which by name are so familiar. In addition to the photographs there are also numerous engravings and drawings, still further to illustrate the art of this period.

The collection of casts and illustrations of the Renaissance period is both extensive and valuable. There are copies in distinger of the compariments and pilasters painted by Raffaelle and his scholars in the Central Hall, which should properly have here placed here, but there is not room for their entire height.

A committee of three architects have been appointed by the Lords of the Privy Council to examine and advise on the arrangement of this collection of casts, and to make such suggestions to increase its value as may seem desirable; so that we shall have something so that we shall have something

may seem desarable ; so that we shall have something more to say on the subject. Amongst the objects which here meet the eye, are fine casts of goldsmiths' and other highly-decorative work preserved in various collections, which have been chiefly produced by the electro-deposit process ; many of these have been procured, by the permission of the French Government, from the collections in the Louvre and elsewhere. The ubicaramhe which find a place and elsewhere. The photographs, which find a place here, of various works in the same museums, are also very useful.

Some of the stained glass of the fifteenth century. placed in the standard glass of the interval term of the placed in the windows at the end of the conridor, are brilliant examples of colour ; there are also a number of original drawings of window glass by ancient artists, and a large collection of porcelain of Sèvres and other French manufactures, and also revivals of Italian ware and English work. Several specimeus of

Italian ware and English work. Several specimeus of inosaic must not be passed over without notice: some of these are remarkable for the pictorial effect which has been produced by this material. At the upper end of the east corridor, a collection is in course of arrangement of art manufactures,— chiefly of Indian tissues, Chinese and other porcelain, hronzes, lacquered and Damaseus work, &c. which, when finished, will be a very attractive part of the museum. museum,

ORGANS.

Your correspondent, "Crito," who writes so plea-santly on organs, will not, I am sure, object to my answering the query he propounds; and, briefly as may be, I will endeavour to reply to it. According to Hopkins and Rimhault" (who, by-the-hee how extreded verbatim the account for according

According to Hopkins and Rimhault "(who, by-the-bye, have extracted verbatin the account in "Hamilton's Catechism of the Organ," by Joseph Warren : London, 1681), the original organ in St. Patriek's Cathedral, Dublin, was built by Renatus Harris in 1697. No reliable authority that I have seen names the legend to which "Crito" alludes. The notice in the *Spectator*, mentioned by "Crito" will be found in No. 552 of that work, Dee. 3rd, 1712. Dr. Burney, as usual, has something entertaining and to the nurnese on the subject and remarkst that as

to the purpose on the subject, and remarks; that, as the paper in which it occurs is hy Steele, "it is prothe paper in whice it occurs is hy Steeler, it is pro-bable that Harris had acquired his patronage and friendship by lending or building an instrument for his concert-room in York-buildings;" adding, "if he had not been hiased by some means or other, and had been a real judge of what he recommended, he would certainly have inserted the name of Bernard Smith certainly have inserted the name of Bernard Smith instead of Renatus Harris.'

Some of the almost deserted City churches p Some of the annual desired only character possess organs of considerable size and merit, most of them but very little known in proportion to their excel-lence. 1 wish I could conscientionsly echo in their behalf the good natured observation of "Orito," as to the musical performances connected with them.

A CHURCHMAN,

While on the subject of organs, it may not be amiss to record that about a year ago, in the church of St. Giles-in-the-fields, an instrument attributed to Pather Schmidt was taken down, and replaced by an reaser Senniat was taken down, and replaced by an entirely new one. If the former constituted the "Spolic opima" of the modern builder, it is to he regretted as a loss of an old if not very beaufiful specimen. An undoubted specimen of Schmidt's workmanship at St. Clement's Danes is at present undergoing a reparation.

CHURCH-BUILDING NEWS.

Stamford.—The south-not Individue of St. Michael's Church, Stamford, was struck down by lightning on Friday in last week. The church is a modern struc-ture, erceted in 1832. It is situated in the centre of the town. The effect of the electricity, when it reached the base of the pinnacle, from not meeting with a ready conducting modium, was to uplift the whole mass, nod the base having traversed about the eighth part of the circle, fell into the roof of the tower. The irron have or spanning lower down and equate part of the circle, left faits for or of the fower. The iron tube, or spouling lower down, and hy mere accident, asted the part of a lightning con-ductor, and served to protect the other parts of the tower from most serious injury, if not entire destruction.

Wednesbury.--St. James's Church, Wedneshury, was huilt some ten or twelve years ago in a very populous aud poor district, but in a short time it was found that accommodation for those officiating in the service was required, and alterations were made in the interior from time to time, but of a very manstisfac-tory description, owing to the smallexes of the chancel and the want of proper vestries or robing-rooms for the dergy and choristers. The recent alterations, which have been made under the direction of Messrs. Griffin and Weller, architects, Wolverhampton, me calculated to supply this deficiency. The chancel has heen extended to a length of about 33 feet, and the original porch and small vestru attached to each side Wednesbury .-- St. James's Church, Wedneshury, original porch and small vestry attached to each side of the chancel have been extended, so as to form nn organ-chamber on the south and vestrics on the north. The chancel is fitted with oak stalls, and the floor laid with Minton's encaustic tiles. A stone credence niche is inserted in the north wall. The chancel arch have a subserved in the north wall. The chancel arch has been wildered to admit of the end of the stalls being placed level with the nave wall, and to throw open the chancel as much as possible. The architects a first recommended that a use chancel, &c. of good Decorated character should be erected, with a view to the ultimate rebuilding of the nave in the same style hut the difficulty of ruising the necessary funds seemed

the unique relation of the law of the same signer, but the difficulty of ruising the necessary funds seemed insurmountable, and it was at length agreed to extend the building at as little expense as possible. Tauaton.—The parish church of Staplegrove, a populous suhurh of this town, has been restored. The church at present consists of a nave and chancel, with north aisle to nave, and tower over a southern porch, and also a south aisle extending eastward from the tower and overlapping the chancel, into which it opens hy a small arch. The windows are of Early English design. Mr. C. E. Giles, of Taunton, archi-teet, has carried out the restoration of the building. The windows are now filed with cathedral glass, those in the two nisles having coloured borders, the glass for which was presented hy Mr. W. Easton. The cast window and that opposite the fout are filed with glass from Lavers's; the design of the former in the eventer light heing our Lord's ascension, with evangelistic symbols in the two wings, and the head being filled with Christian symbols. The happismal window (also furnished by Lavers) contains haptismal window (also furnished hy Lavers) contains heptemat what was further and the second sec with thorus. The henches are all open, and formed of stained deal, with plain ends, except those in the chancel, which arc of oak with stall ends. The pulpit is of carved oak, the base being Bath stone. The floors are of schore to ak, the base being pain schore. The hoots are of schore, into which various old monumucutal stones are inserted. The floor of the *sacrarium* is eovered with coloured tiles, the steps being of hlack polished lins. There are other improvements, in-cluding an areade of three pointed arches of Bath stone, which now divides the north aisle from the nave. There is an octagonal font on the north side of the nave. It is of Caen stone, with centre shaft of the same material, having eight marble columns (four each of Coruish serpentine and Irish green), with carved capitals. Three sides of the octagon are carved with haptismal subjects.

Carred with approximal surgers: Rulhan-A memorial window has recently been placed in Llanthyld Church, Ruthin, hy Mrs. Jones, of Cambaker town, to the memory of her brother, the late Mr. John Williams, M.P. for the borough of Macelssield. The window is a four-light cast window; the stone-work hy Mr. John Williams, of Newbridge. Lar source-work by Mr. John Winning, or New Druge, near Ruabou, and the glass by Messrs. Powell, of London. The subjects are—"Christ Blessing Little Children," and "The Last Supper." Another window has beeen placed on the north side of the church by Mr. George Johnson, of Llanrhydd House. *Aberhafesp.*—A stranger to this parish, Mrs. Broome of Berthau, bell Llandiages source time since

Mr. George Johnson, of Lianrhydd House. Aberhagiesp. — A stranger to this parish, Mrs. Broome, of Berthdu-hall, Llandinam, some time since presented 5007. towards the restoration of the chancel of the church, the credition of a tower, and the general improvement of the edifice. The whole of these im-provements have now been carried out. A stailed glass window, erected by Lieutenant-General Proctor, or Aberhauesp-han, to the memory of the surgitices,

the late Mrs. Bernard Coleman, has been put up. The design is included in a panel, formed by a foliated cnelosure of intermingled passion-flowers and lilies on a ruby ground. It comprises two classical figures, a rudy ground. It comprises two exastent lightes, representing an Angel conducting the spirit of a woman to its Heavenly abode, and pointing to the star of Hope unnongst the foliage above. The figures are lightly coloured on a deep blue hackground, and have at first sight rather a startling effect, as they seen to be standing out in bold relief. Messrs. Baillie and Co, of London, were the artists.

Chester — For some time past workmen have been employed on the Lady-Chapel of Chester Cathedral, in consequence of the dilapidated and critical state of the roof. Under the directions of the Dean and his the roof. Under the directions of the Dean and his architect, Mr. Hussey, the necessary reparations have been effected, and the opportunity taken to examine the walls, arches, and pillars of the interior of the structure. Where required, new stones have been inserted in the masonry, and other precautions taken inserted in the masonry, and other precations taken to arrest the further progress of decay. A discovery has been mude of unusual interest, the more so, per-haps, as it was purely accidental. Immediately over the chancel of the changel, the ground eciling termi-nated in a massive boss, which, for probably more than 300 years, had presented itself to the spectator as a mere Tudor rose. This ornament the masons were instructed carefully to clean as direstore; but it was found on examination so thoroughly decayed, that orders were eiven to remove it allocether, preparatory Was notified as a submatrix as the oblogging the start of interest and heauty. The scalinging has not yet heen taken down, hut so far as we can make out from helow, the subject appears to be, the 'Crucifixiou of our Lord.' The Saviour is represented in his last agony on the tree : behind the cross, the Father is agony on the tree: beinnd the cross, the failure is seen sustaining in his Almighty arms the dying person of his heloved Son. A dove, the emblem of the Holy Spirit, is whispering, as it were, heavenly consolation and comfort to the Cruofiled, while on either side an angel administers relief to His extended hands, lace-rated by the nails which bind bim to the cross. This rated by the nails which bind bind bind to the cross. This becautiful hoss, or rather its strange preservation, we most likely owe to the zeal of Thomas Clarke, the last Abbot, and first Dean of the Cathedral, who, when the order went forth to destroy every visible emblem of the ancient faith, succeeded in saving this eurious work from its impending fate, by hiding it heneath the shade of the then popular Tudor rose!"

The share of the start of St. James's Church has Doncaster.—The site of St. James's Church has hecu staked out, according to the local Gazette, on the vacant ground north-east of the railway schools. The outside dimensions to the face of the buttresses of this edifice, are 127 feet by 64 feet; the inside being 113 feet by 52 feet. The church will consist of what may be called two naves, one rather wider and higher than the other, placed side by side, with a bell turret rising out of the smaller one at the west end, but standing within the church. A row of pillars alternately round and octagonal runs down the middle, forming six bays of the same size, and with arches of the same character, as those in the start of the same outer of division Doncaster .- The site of St. James's Church has down the middle, forming six bays of the same barco, and with arches of the same character, as those in the old parish church. There is no mark of division hetween the nave and chancel, excepting a larger huttress externally and a larger pillar internally, with the usual steps; und consequently there will be an unbroken length of roof of nearly 120 feet. The walls are to be 30 feet high, and the top of the roof about 54 feet. The bell turret is un open octa-about 54 feet. The bell turret is un open octagon ending in a small spire, 96 feet high. The ground plan is as simple as the elevation, the only ground plan is as simple as the termination, no only projecting building being the porch; for the vestry is inside, at the west end of the north siste (or the smaller nave), by the side of the tower wall. At the cast end of that uisle is a circular window, in order to cast can of that has a solution window, in order to enable an organ to be put below it. The east window of the chancel is of five lights, and will be of the same size and general charactor as the side east win-dow of St. George's. The side windows of the great church, but rather bigher, and set rather deeper from the activitie. There is extremely a withing of a merely cauren, but rather bigher, and set rather deeper from the outside. There is scarcely anything of a merely ornamental character either inside or outside the church, as it was intended hy Mr. E. B. Denisou, who suggested the general design, to show that a truly Goblic church can be hullt, by relying merely on the great English characteristic of length, instead of the forear one of bight and we multiple the on the great English characteristic of length, instead of the foreign one of height, and on sufficient mass and sufficient dopth of shadows, and the avoidance of the modern style of "finishing," against which he has said so much in his lectures. The walls will be the modern style of "finishing has said so much in his lectures. of rough stone, like that in the believ of St. George's or rough stone, fixe that in the beliny of SL George's, the mouldings and quoins and arches alone being dressed or ashlar work. The stone to be used is not Steetley, but Aneaster. The wood-work is to be of deal, and the roofs are to be covered with Stafford-shire tiles. The church is to hold 700 persons. Mr. Scott, we understand, in the architect.

Whitby.-The consecration of Christ Church, Ugthorpe, took place on the 6th inst. The ehurch is in the Early English Deconted style of architecis in the Early English Decorded style of architec-ture. The plan is cruciform, consisting of chancel, nave, and transcripts, with a light octagonal spire from the west end gable. The length of the nave is 80 feet, and of the transcript 39 feet; the height of the ridge 32 feet, and of the point of the spire from the earth 54 feet. The roofs are open timbered, with enred rihs supported ou stone corbols. The windows, by Mr. Wailes, of Newcastle, are all hordered, und the tracery filled with stained glass. The church heing dedicated to Christ, our Lord forms the sole feature in the design of the cast window, The church heing dedicated to Christ, our Lord forms the sole feature in the design of the cast window, which consists of three lights, with tracery, and each with a full-length figure of the Saviour. A small window, on the south side of the chancel, was presented by Mr. Wailes, and is entirely filled with stained glass. It has the figure of an angel in the centre. Messrs. Oce and Goodwin, of London, were the architects; and Mr. William Langdale, of Whithy the builder

the architects; and Mr. William Langdale, of Whitby, the builder. *Biding Mill*.—The pictaresque village of Riding Mill (Broomhaugh), by the side of the Newcastle and Carlisle Railway, is now, says the *Gateshead Observer*, a place of fashionable resort, and a church is to he erected there, ou an emicance (Mr. and Lady Margsret Beaumont heing among the prin-cipal contributors to the funds). The plan com-prises nave and ebancel, with vestry, tower and spire (66 feet high), and porch. The style is preses nave and channel, with vestry, lower and spire (66 feet high), and porch. The style is Geometric Decorated. The stone will be taken from the Prudham quarries. The woodwork will he stimied and varnished; the seats open. Mr. Matthew Thompson, of Sunderland, is the architect. from ho

PROVINCIAL NEWS.

PROVINCIAL NEWS. Reading.—The lightning, in a recent thunder-storm, struck the engine-house at Messrs. Barrett, Exall, and Andrew's Foundry, and set fire to it. The flames extended with astonishing rapidity from the engine-house to a timher shed, ironmotgery ware-house, saw-mill, deal shed, &c. The value of the property destroyed is estimated at hetween 1,5007, and 2,0007.

property destroyed is estimated at hetween 1,500%. mod 2,000%. Rochester.--Alterations and additions are to he made at St. Nieholas's Schools, Rochester, Mr. A. D. Gongh, architect. The following tenders have heen received:-- Cotton, Rochester, 7071. 10s.; Dove, Brothers, London, 6052.; Spieer, Strood, 4754.; Naylor, Rochester, 4436. Some one is wrong. *Faversham.*--A short time since tenders were ap-plied for hy Mr. Higham, successor to Mr. G. New-ton, draper, &c. of the High-street, Faversham, for a proposed extension and repairs to his husiness pre-mises-to be commenced immediately, and com-pleted on or by the first day of October next, under the superintendence of Mr. Bulmer, of Maidstone, architect. The tenders as received were as follow :-Messrs. Page and Shrubsole, 7134. 18s. 6d.; Rook and others, 7357.; S. M. Shrubsole, 7302.; Redman, 7947. 5s.; Knowles, for plumbing, painting, and Baurgang, 2627. 794/. 5s.; Knowle glazing, only, 265/.

Worcester .- The new works at the County Gaol, Worcester.— The new works at the County Gao, the progress of which had beeu stayed in conse-quence of the pending question relative to the separa-tion of Dudley from this county, have uow heen actively resumed, the subject alluded to being settled by the withdrawal of the Government bill. The folby the winflawar of the Obermanics on the Ion-lowing were the tenders for the cemetry chapels, lodges, &c.:-Mr. J. Walker, Evesham, 5,1011; Mr. J. S. Wood, Worcester, 4,965/.; Messrs, J. Barnsley and Sous, Birmingham, 7,858.4; and Messrs. Cham-bers and Hylton, Birmingham, 4,8307. The last

bers and Hylton, Birmingham, 4,8307. The last named was accepted. Stoke St. Gregory.—The first stone of new paro-chial schools, designed by Mr. C. E. Giles, of Taun-ton, subject to Privy Council arraugements, and about to be creeted in this parish, was laid by Lady Anna Gore Langton, on the 20th instant. Williknek.—The foundation-stone of a new national school-house for the education of the children of this populous mining district was laid by Lady Bean-mont on the 18th instan. The schools are to be built in the form of a Latin cross; the longer and transcerse arms forming the boys' school, 60 feet and transverse arms forming the boys' school, 60 feet by 18 feet, and the girls' school, 50 feet by 18 feet; the arms, 20 feet by 16 feet, forming the infant 1. The boys' school will have a class-room red to it. The eutrances are to be sheltered by short and y construction of the school will have a class-room attached to it. The entrances are to be sheltered by porches, forming the hat and clouk closets for the scholars. Between the boys and girls' schools fold-ing doors will be placed, so that the two rooms can be thrown together for meetings, &c. They will then be in the form of a T, and will accommodate 800 persons. As schools they will be designed to accom-modate 300 children. The external construction is intended to correspond with the ragged scenery sur-rounding the site, the structure being huilt of frag-gat ered from the forest land in the

vicinity, relieved by dressings to the windows, gables, &c. or wrought stone from the Worthington and Ashby quarties. The contractors are Messrs. Cooper, of Ashby, and Mr. W. Hallan, of Whitwick. Leads,—The Town-ball Committee of the Leeds Town Council met on the 17th inst. to open the tenders for building the Town-hall organ. Five tenders were sent in for the stipulated amount 4,0007, and eventually the tender of Messrs. Gray and Davi-son, of London, was accepted. This firm hult the large organ need at the Handel Testivali in the Crystal Palace. It is hoped that the organ for the Town-hall will be completed by next autumn.

FOREIGN INTELLIGENCE.

FOREIGN INTELLIGENCE. Cologne.—The Ladies' Tapestry for the Cathedral. —The ladies of Cologne had already combined in a previous year to adorn the presbytery of the cathedral with topestry. But the side walls of the high choir also had been deprived, in the lapse of time, of their former ornament of paintings, which have been now supplied by treaty-eight pieces of fine tapestry. The subjects are taken from the Nicene creed, and were made after designs of M. Ramboux, conservator of the City Museum of Cologne. The last portion of these embroideries is now hung up in the cathedral. *Athem of the City on Crisicate.*—The merchants of

Allow of the City of Trieste.—The merchants of that important emporium of the Adviate bave pre-sented Princess Charlotte with a sphendid and original album. It is made of ebony wood, 18 inches high by 22 wide, and so covered with the most exquisite orma-ments, that little of the cover is to be seen. Its real ments, that little of the cover is to be seen. Its real artistic charm are twelver views of Trieste and its fine environs, painted by Messrs. Dell'Acqua, Fiedler, Merlato, &c., to which Dr. Kendler has written an explicative text. At each corner is a rose of Lapis

explicative text. At each corner is a rose of Lapis lazali, fixed by a button, in brilliants. All the rest of the cover forms one inerastation of garlands, arahesques, and the arms of the city of Triestle, in gold, silver, ivory, &c. Paris.—Disappearance of entire Streets.—The works of reconstruction of the Pont St. Michel are pushed on most actively, even steam power being hrought into action. The railing of the new little square, south of the Palais des Thermes, corner of **Rue des Mathurins St. Jacques**, has been completed. Of the once considerable Rue de la Hurpe, of *Ais-torical* renown, leading to the Pautheon, Leole de Wichesine & norther will remain but a small Of the once considerable fine de la Harpe, of *dis-torical* remown, leading to the Pautheon, Ecole de Médecino, &c. nothing will remain, but a small portion configuous to the Place du Pont St. Michel. The space before the peristyle of the Louvre, opposite the Pont des Arts, is, at this time, occu-pied by the status of Geoffrey St. Hillaire, the great zoologist, companion of Bonaparte in Egypt, &c. The head is of noble proportions, and all the parts of the status (2 kilom. 50 high) are well kept and exceuted. It is the work of M. Elins Robert. After being exhibited before the Louvre, it will be conveyed to Etampes, the birth-place of G. St. Hillaire, to be placed in one of the squares of that town.—The waters of the Scine have been as low Hundre, to be parter in one of the Science as low this year as in 1719—one of the lowest known levels, which is taken as the standard of observations. This year, also, the piles of the bridge of Notre Dame, and Year, may the piles of the foundations, near the Hotel des Monnais, have been visible. This, however, was surpassed in 1448, when according to Sauval, people could pass dry-footed from the Place Manbert to Notro Dame. Academic Française: Prices for Firthe, Sc.-Dardemic e conf. modern activity and are given to

These prizes are of modern origin, and are given to domestic servants and journeymon for long and faithful services, supporting their masters in old age and mis-fortune, &c. They vary from 2,000 frances (80/.) to 1,000 and 500 frances, of which latter there are seven 1,000 and 000 respectively, distributed every year. A prize of 2,500 frances was decreed to M. A. Mounier for his work, "Public (Charitable) Assistance in Augingt and Modern Times" for his work, "Public (C Aucient and Modern Times."

Ancient and Modern Times. *Caution*.—A Berlin contemporary, on seeing so many houses built five or six stories high, 75 fect from ground to corvice, asks—" Whether the *lungs* of the present generation will stand the effort of such great ascensions?"

REMAINS OF THE ANCIENT CHAPEL AND HERMITAGE ON THE ISLE OF DOGS.

WE have before now referred to the curious vestige which forms the subject of the adjoining engraving, and on other occasions have spoken at length of the Isle of Dogs.

It would seem that in very ancicat times this was a dry portion of land saved from the overflow of water by the great river embankment to which we cost 125,000 dols., the State Bank and the Albany have already allnded; and it is not improbable, that saf ar back as the Saxon rule there was a rond across stores, created by J. B. Cross, Ibubah (Brohlers), the island to an ancient ferry across the Thames. &c. &c.; the new school-bouses for the second, London historians do not, however, mention the fourth, and seventh wards, costing 16,000 dols, are foundation of a religious establishment in times so

THE BUILDER.

In most maps of London, near the centre of the Isle of Dogs, is a spot marked "The Chapd-house;" and although the name smacks of antiquity, few would think, by a glance at the dilapidated yet per-fectly modern-looking buildings which are now here, that there existed any remains more than forty or fifty years old : however, those who bave the euriosity will he repaid by a more careful examination ; for mixed up with the modern work are undoubted traces of the old hermitage, the cottages having heen fitted into the massive masoury. The original structure has evidently been of rude work ; the chief stones are large, and bave heen filled in between hy flint and rubble. rubble.

rubble. The people living here know nothing of the interest which is attached to the site. They had noticed that large stones occasionally dropped down, but were not aware that in bygone days a succession of patient hermits here dwelt to shelter and comfort the way-farer. It will not be long before the bustle and throng of population will he so great that it will he difficult to helieve that a hermitage could have here existed, or here needed. existed, or heen needed.

PROGRESS OF MILWAKEE.

SINCE the year 1832, this city has rapidly increased both in population and importance, and from being a mere Indian trading post, has become the commercial nere Indian trading post, has become the commercial metropolis of Wisconsin. It now possesses excellent schools and academics of considerable pretensions. There are seven public school-houses completed, or in course of erection, large, airy, well arranged, and of handsome exterior, and affording accommodation for upwards of 2,500 children. There is a regular in-corporated university, and a well-endowed college for famales. No less than fifty buildings are devoted to divine worship, and some of these have much architectural merit. Two Gas Companies, chartered by the Legislature, furnish the city with excellent cas, at 3 dois. 50 e. per thomsand feet. A Hydraulic Company has also been chartered to supply pure lake water. Large quantities of the clearest ice are cut in the river during the winter, and supplied at molerate rates during the summer. Milwakee enjoys an ex-cellent market, supplied with quantities of meat, fish, fowl, and vegetables.

cellent market, supplied with quantities of meat, fish, fowl, and vegetables. At present the spirit of progress is very manifest. Large numbers of stores and dwellings are in course of crection, and completed last year at an expendi-ture of two millions of dollars. The Newhall Honse, a first-class hotel, 180 by 120 feet, and six stories high, exclusive of hasemeut, to cost 160,000 dols.; the United States Government huildings for a Cas-ter bares Destroffice and United States Courts. 10 the United States Government, humangs, for a Cas-tom-house, post-office, and United States Courts, to cost 125,000 dols.; the Ostate Bank and the Albany costing each 50,000 dols.; the Ostes of sylendid stores, created by J. B. Cross, Inbush (Brohers), &c. &c.; the new school-bouses for the second, fourth, and seventh wards, costing 16,000 dols, each ;

remote; it is, nevertheless, certain, that at a very early period there was a chapel and hermitage here. June last, au official return showed 1,349 new buildings probably so placed for the convenience of those whose necessity obliged them to travel over what was then a descrt wild. In most maps of London, near the centre of the Isle of Dogs, is a spot marked "The Chapel-house;" 1856, and now amounts to 1,500,000 dols. Mil-and although the name smarks, of antiquity, few 1850, and now infoluties to input, 50,00,000,002. All wakee has a bealthful and commanding location, and univalled harbour; an unlimited river front, a per-fect net-work of railways connecting it in all direc-tions with the systems of adjacent States; a fertile and salubrious country, and an industrions population. Its lake front rivals in beauty that of Naples; its famous brick lights up its business streets; thickly planted trees shade and adorn its principal through in-faces; and the Milwakee river, flowing through it, secures a thorough drainage, furnishes abundant water power, and forms a pleasing feature. The in-land sea stretches 400 miles in length, 50 in width, and 900 fect in depth. The Milwake and Horican Railroad is one of the most promising enterprises in the State. It is uow completed to Ripon, eighty-one miles, and in a very short time will be extended to Berlin, minety-two miles, whence it will connect with Oskhosh and the lower Fox by means of steamboats. The present railroad system em-brees nine distinct lines radiating from Milwakee, and weeping round in a complete semicircle, reach-ach ender the ultime times rubing form differenbraces nine distinct lines radiating from Milwakee, and sweeping round in a complete semicirele, reach-ing Chicago, penetrating Illuois, touching four differ-ent points on the Mississipi, and counceting with lines of roads traversing Iowa, Minnesota, Lake Superior, and vorious other places. Twenty-six, breweries, employing 500 men, are in operation. Thirty-five millions of bricks, for the home demands alone, were turned out last year, 350 men being cuyaged in the manufacture. The population for 1857 is 45,000 : in 1838 it was but 700. Milwakee may hopefully contend to rival any of the eities in America. America.

RECOLLECTIONS OF THE INTRODUCTION OF ILLUSTRATED LITERATURE INTO ENGLAND DURING THE PRESENT CEN-TURY.

IT is impossible to overrate the value of the artistic It is impossible to overtale the value of the article schoolmaster now abroad amongst us, extending knowledge in all directions, and giving a double value to literature, by combining with it representations of forms and scenes which it would be impossible otherwise to describe.

The advance of illustrated literature during the last Incaurence or humaratea interature during the last twenty years is extraordinary; nor is this to be won-dered at when we notice the natural feeling which has existed amongst all nations and in all ages to produce artistic forms which would convey ideas or preserve the memory of objects and scents.

artistic forms which would convey ideas or preserve the memory of objects and events. The biereglyphics of the Egyptians and other ancient people show that thousands of years aço illustrated literature was appreciated: in fact, the stone picture-books long preceded those of paper. The great white horse in Wiltshire, and the rude earvings of human beings, heasts, birds, &c. met with in caves and remote blaces, at one time formed the in caves and remote places, at one time formed the illustrated literature of England.

Our Saxon ancestors have shown their appreciation

REMAINS OF ANCIENT CHAPEL AND HERMITAGE, ISLE OF DOGS.

of artistic illustrations by adding to their written copies numerous valuable and curious pictures of the scenes of bygone days. It is strauge now, when hearing the shake and rattle of the modern steam hearing the snake and rattle of the modern steam printing engine, to think of the patient moaks "in cloisters grey" spending a lifetime in the occupation of copying and illustrating a single volume; and in spite of the knowledge of the necessity for advancement, men at times, in the herry, drive, and anxiety of these stirring days, cannot belp casting a longing glance back to the quiet career of those carly pioneers of our literature.

As the demand for books increased in Eogland up As the demand for books increased in Logiand up towards Henry the Eighth's reign, we find the illus-trations of manuscript volumes becoming more and more scanty: and when that wonderful revolution— the introduction of printing from wooden and other types, was hrought about, books, in consequence of the inability of the printers to supply suitable pictures, became, as a matter of necessity, more barren of illustrations. However, in course of time the skill of the copperplate engraver was called into use, and rude attempts were made by means of woodcuts to deck the volumes which now in considerable numbers began to issue from the press. The practice of illustrating books by m

eans of copper-plate engravings as years passed on hecame more and more common, and yet, notwithstanding, the books were almost as much out of the reach of the poors were allost as mich out of the recent of the great masses of the people as were the illuminated volumes of former days. Amongst the early illus-trated works may be mentioned those published by Alderman Boydell and others.

We have just now before us several magazines and other volumes of about a century old which serve show the great advance we have made during that time. That venerable and still flourishing publication the Gentleman's Magazine, takes its place amongst the foremost of our illustrated periodicals, and it is the foreinosi of our mustated periodical state it is worth while to examine the ents and copper plate engravings which were sufficient at its commencement to render that journal popular amongst the higher and educated classes in this country. We have before referred to the value of the exertions of the Bowicks in advancing the art of engraving on wood, and will now glance at some of the earliest meaus of distributing picture-books amongst the multitude, and it would not be proper to omit mention of a publishing would not be proper to omit mention of spuorisaning fram, originated sixty or seventy years ago, by Messrs. Mackenzie and Dent, at Newcastle on Tyne, for the purpose of providing illustrated books. At that time, a large number of the coal-miners of Northamberland and Durham were almost as ignorant and savage as Hottentots, and in some of the large iron foundries of the neighbonrhood the "erews," as iron foundries of the neighbornhood the "crews," as they called themselves, were so clannish and formid-able that officers of justice did not dore to venture into those districts. Surrounded by such a population, the active publishers, hoth of whom are long since dead, proceeded to print and illustrate copies of the Bible, "Testament, and other religions books. These were published in numhers, at a cost of from 6d. to 1s, each. Numerons canvasers earried these through the towns villages and country, and it is worthy of is can available to a subscription of the second se thus collected were strongly bound, and then covered time collected were strongly bound, and the deverue with green baize, and n.ay be seen in the hands of those who cau read them at the present day. The cost of the numbers of a family Bhle hought in this way, would he from 3. to 3. Ios. At the present day, a very well printed Bible can be purchased for 2s. 6d.! Books of voyages and travels, illustrated with accompanying of home semantic valuation their still accompanying of home semantic valuation to the day, a . 28. 6d. 1 28. 6d.1 DOOKS or voyages and travels, illustrated with engravings of huge serpents, rivaling in thick-bess and width the tallest trees, and other animals, the drawings not being remarkable for truth to nature, illustrated books on the breeding of sheep and other domestic animals, had such a large sale, thet the plates were constantly in the course of and other douestic animals, and social acage said, that the plates were constantly in the course of reproduction and repair. The aniable novels such as "Pamela," were also in great demand. Mr. Mackenzie, amongst other works, produced histories Mackenzie, amongst other works, produced histories of his native town and county, which are worthy of great praise for their adherence to facts, and for their general interest. These were illustrated by hoth plates and woolcuts, and were published ia numbers at a large profit. There were other publishers in London and the country working in the same manner as the gentlemen just mentioned, who were, however, at the time, looked down upon with some contempt by publishers of large and completed works: the good effected nevertheless by these means was very great. these means was very great.

By referring to the title-pages of books of the By referring to the till-pages of booss of the date above mentioned, it will be seen by the pro-minent announcement, "Illustrated by copperplate engravings," that woodents were looked upon as quite inferior commodities. This is still further shown by the eircumstance that Bewick came to London to try his fortune, and met with so little

encouragement from the publishers, that he shook the London dust from his feet with contempt, and embarked on board a collier for the north.

Many of our readers will remember when they were schoolboys, the *Mirror*, which was one of the first of the cheap illustrated periodicals issued in regular weekly numbers.

of the chear materia and phrodents issued in regitar weekly numbers. Amongsi the first attempts to illustrate newspapers was the publication, in *Eel's Life*, of humorous and characteristic woodcuts from drawings by George Cruikshawk. Then came a number of views and plans of the scenes connected with the murders by Thurtcell and his companious. These had an immense sale; but the difficulty of printing woodcuts at that time with rapidity prevented their continued use. The introduction of steel plates for the use of cngraw-ings supplied increased facilities for printing large numbers from engravel plates, and led to the publi-cation of the "Annuals" introduced by Heath, and those delicate plates, "Illustrations of the Bible," "Byron's Poems," &c.), executed under the superin-tendence of William and Edward Finden. But for the use of steel instead of copper, which cambled the

the use of steel instead of copper, which enabled the printer to gct from one plate 30,000 or 40,000 good impressions, instead of a few hundreds, these highly impressions, instead of a few numbers, incompany and finished plates could never have been produced and sold at the price they were. Large sums were paid to the hest engravers for those works, which, in their peculiar way, had not heen excelled before, nor have they since been surpassed. For one of these small

pecuitar way, had not been excelled before, nor have they since been surpassed. For one of these small plates, about 3j by 3 inches, after John Martin, the engraver received 120 guineas. It is worthy of notice that when the wooden and leaden types eame into ase the quiet old pennen must, like the Moor, have exclaimed that "their occupation was goue," and still the new method which was sup-posed to be the means of producing the work required by a very anall number of hands, gave employment to an increased multitude. In like momer, when steel plates were introduced, it was predicted that the profession of engraving was ruined, and yet, in a short time, the demand for engravers was greater than ever. The same result has been caused by the introduction The same result has been caused by the introduction of wood engraving.

SUSSEX CHURCHES.

THEEE weeks since you stated that a new church had been built and consecrated at East Grinstead. Allow me to tell you an aneedote of these parts. A gentleman, being very anxious to take a house in this cautiful neighbourhood, made au excursion in various beautiful neighbourhood, made au exerusion in various directions, and at last saw a house that was shut up. After trying, in vain, to obtain admission, farst at the front and then, at the back door, he caught sight of a boy at work in an aljoining field. He made his way to the youthful labourer, and said to him, "Mylad, I want to see this house." "Wheel," said the boy, "there it he." Now, touching the new church at East Grinstead, there is no one who can reply as the work with the there is no one who can reply as the box dbl for there is no new church if the recently boy did, for there is no new church, either recently built or contemplated. There is, therefore, some aistake

While writing to yon, will you allow me to call attention to the disfigurement going on at Worth Church. There is actually being built a red-brick vestry, with stone dressings, on to this almost unique Savar, with stone cressings, on to this almost inique Savar remaio. Are the archevological societies merely dilettonit pleasure-seekers, or do they intend to be really useful? A Sussex Yorre

West Hoathly, Sussex.

*** It should doubtless have stood "East Grin-** It should doubtless have scool. Last offi-stead, *Willshire*." It is to be hoped that our corre-spondent's indignant protest against the doings at Worth Church will have the effect of preventing the mischief contemplated.

ARTISTICAL COMPETITIONS.

THE WELLINGTON MONUMENT.

THE WELLINGTON MONUMENT. Tau profession is deeply indebted to you for the spirited meanor in which you have declared war against the reck-lessness and incompetency which has become a national meanor in our school and on in all probability, have had the probability of the second protect by Professor Cockerell. Let the profession continue to rally round your standard, and distinctions, or rather noble-fordism, will be driven for vere from the field. The result of a series of suggestions by practical meau will be regulations for the conduct of competitions, based upon common sense, and which will secure to the talent and genius of our country their full reward.

trouble to make a small "pervious" model, and place it hetween himself and the window, he will discover that it is the only means hy which a fine and ploturesque chiaro-souro can be obtained in such a situation, W. L. S.

A GLIMPSE AT AN ANCIENT RAGGED SCHOOL

IN the ancient chronicles of London we read of many times of hardship caused by famine and the pestilence which almost certainly follows it; but at no period do we find a greater degree of confusion and distress existing than during several years which suc-ceeded the dissolution of the monasteries and other religious establishments in the reign of Henry VIII These houses had been for some ceuturies the means

These houses had been for some centuries the means of supplying assistance to large numbers of the desti-tute poor, and filled, to a certain extent, the place of the parochial relief which is at present afforded. In consequence of the sudden stoppage of the cus-tomary amount of behp, the poor wandered beseech-ingly about the streets, hands of dangerous persons, many driven, in the first iustance, by want, rendered both life and property unsafe, and children were left without care or good instruction, many of whom grew up as they do at the present day, to swell the regiment of sturdy thieves who prey upon the metro-polis. polis

In the reign of Edward VI. the attention of a few wise and well-intentioned persons was directed to the sad state of affairs which existed in London. Amongst sad state of affairs which existed in London. Amongst these the Primate of the metropolis, Bishop Ridley, was deeply struck with a sense of the danger which existed, and took the opportunity, when delivering a sermon before Edward at Westminster, to direct the attention of the youthful king to the evils which ex-isted, and so forcibly was he impressed with the necessity for immediate exertion, that directly after the service he summoned the bishop to his presence, and with a wisdom beyond his years, considered various plans, and during the conference wrote a letter to the Lord Mayor and other authorities of the City, urging them to proceed vigcorously in the neces-City, arging them to proceed vigorously in the neces-sary work. This letter was delivered by the bishop, and so well was the king obeyed, that in an incredibly short space of time the destitute and dangerous in London were divided into three classes.

London were divided into three classes. 1. The poor by importance, consisting principally of orphans, the aged, blind, and lepers. 2. The poor by casualty, comprising the wounded solier, the decayed housekceper, and diseased persons. 3. The thriftless poor, including the rictous, that hath consumed all, the sugabond that will abide in no place, and the idle persons of ill fame, both male and complete female

Termate. For the second (the dc ayed housekeeper being very properly relieved at houne) St. Bartholounew's and St. Thomas's were provided. As regards the first, the lepers, who had heen

As regards the birst, the lepers, who had heen accustomed to wander in the stretcs, and in order to provide food directed public attention towards them by ringing bells and clapping dishes, were taken to certain bospitals provided for them in the suburbs. certain bospitals provided for them in the suburhs. The destitute poor were accommodated in an almonry. The vagrant and thievish were well received, and according to their deserts, in the Bridewell. There still remained the *destitute children*, and for these it was determined to set apart the remains of the ouce celebrated house of the Grey Friars. This hulding and grounds were immediately made over by the king to the correction: the elevenions

over by the king to the corporation; the alterations and restorations were commenced, and so great was the zeal that in six months' time 340 children were admitted into the Institution. In the first instance the children were clothed in russet livery, which was shortly exchauged for one of blue, the same in form, &c. as that now worn by the Christ Church hoys.

&c. as that now worn by the Unist Church noys. In a few months after the interview between the bishop and the young king, the numerous children gathered eidely from the streets lanes, and alleys, attended by the bishop and corporation, progressed to attended by the bishop and corporation, progressed to hold an interview with Edward at Westminster, attended by the bisnop and corporation. Westminster, hold an interview with Edward at Westminster, when a petition was made to the King's majesty, for leave to take in more to the King's implesive to leave to take in more than a contrast without beense, lands to a certain yearly value; and a space being left in the patent for his grace to fill up with what sum he thought fit. "He looking," says blowe, "on the void space, called for pen and ink, and with his own hand wrote these words, "Four thousand ms own said wrote these words, 'Four thousand marks by the year,' and then said in the hearing of his council, 'Lord, I yield thee most hearty thanks that thou has given me life to finish this work to the glory of Thy name.'' After the foundation had been thus established, the king did not live above two dees

secure to the takent and genus of our country their full rand. The security of the work. It would be reserved as a prossinual. There seems to be no alternative normate independent of the security of the security of the security of professional men-and the security of the security of professional men-the propose in the based with cost and the security of th

Christ's Hospital, have caused it to he looked upon Christ's rospital, into cause it to be booked alon with as much respect as is the distinctive costume of the collegiate establishments. Now the sebolars of this sebool are selected from a much superior class than in former years. It has advanced in the public than in former years. It has advanced in the public estimation, grown with the prosperity of the City, and although it still most worthily performs a most important duty, the original purpose is changed, and it now requires much interest and favour to get a hoy placed in the enviable position of a scholar on this foundation. Notwithstanding, the school at its com-mencement * was intended to provide for the poor destinute children of the metropolis, an object which a concile measure the present day, and our is equally necessary at the present day, and our object in making these remarks is to direct attention onject in making these remarks is to direct attention to the circumstance that, by the united efforts of the king, clergy, corporation, and citizens of London, besides other measures, 340 were in less than six months taken from their distress and danger, and put in the way of carning an honest living. At that time in the way of carning an honest living. At the population did not amount to 200,000. If case of the poor children should be taken up with the same energy, and as much dole in propertion to our metropolitan population of two millions and a balf, we should take 4.250 destitute children from the streets, and provide them with education, and food, and shelter.

RECENT BUILDING PATENTS.

RECENT BUILDING PATENTS.; JOHN LESLE, Conduit-street, Regent-street.— Stores and Fireplaces. Dated 6th December, 1856. —A stove or fireplace is made with a solid holtom, as is described in a former patent. The front is formed with a grating or fire-bars : the back is made, by preference, of fire-brick or fire-clay. The outlet or flue into the chimney is just above the bottom of the stove or fireplace, so that the air enter-ing in front passes to the flue through the fire: that part of the air which enters the fire above the flue, for the stove and products of combustogether with the smoke and products of combus-tion from the fresh fuel, passes downwards through the well-ignited fuel near the bottom, and the smoke the weat-ignited their near the bottom, and the smoke and products become ignited and consumed. At the top of the fireplace or stove over the fire is a moveable cover of fire-clay, which closes in the fire at top. In front of the fire are air-tubes communicating with the outer atmosphere, hy which air is conducted to the fire near the bottom. fire near the bottom. GEORGE SHERWIN, Waterloo-road, Burslem, Staf-

broker. Science, Manufacture of Fire Bricks, Tiles, Cru-cibles, and other articles, when fire-clay is used. Dated 12th December, 1856.—In place of employing the fire-clay and silicious matters in the ordinary condition, they are first slipped separately, and then com-hined together, with burned clay and silicious matters. The fire-clay or mark is prepared by grinding, in the ordinary manner, and then slipped, all particles of iron ore, stones, and other substances (not clay) being removed or separated. The ernde or calcined flint, sand, quartz, or slicious matters, are also ground and slipped. These matters are comhined with suitable such, quarky, or smellows matters, are combined with suitable quantities of similarly prepared day which have heen hurned and crushed, and the combined plastic com-pound is made into bricks, tiles, and other articles in the ordinary manner. AUGUSTE EDOUARD LORADOUX BELLFORD, Bed-

Arcusri EDODARD LORADOUX BELLTORD, Bed-ford-street, Straad.—Drying, Burning, and Cooling Bricks, Tiles, and other Ceramic Substances. (A Communication.) Dated 4th December, 1856.— These improvements consist of a certain method, hereafter described, for effecting the drying, burning, and cooling of certain ceramic substances, in such a manner that the different changes from cold to heat, and, vice versá, may he perfectly gradual, thus avoid-ing a great amount of hreakage; also in the oven heing so constructed as to allow the three operations of dryine. burning, and cooling to be conducted acing so constructed as to anow the three operations of drying, burning, and cooling to be conducted without intermission all the year round. The prin-cipal peculiarities of construction of the oven are as follow:--The oven is composed of two parallel channels or vaults, one for burning and the other for cooling the materials. The furnace is placed at the attractive the burning a channel. channels or vaults, one for burning and the other for cooling the materials. The furnace is placed at the extremity of the burning channel. Over and round these channels is constructed a drying chamber, which is divided into six compartments, and nased for drying the plastic materials. Between the top of the cooling channel and of the floor of the drying chamber is left a small space enclosed between two ranges of ext-iron plates through which the water heat critical east-iron plates through which the waste heat arising from the cooling channel circulates, and by means of from the cooling enamic circulates, and by means or registers passes into one or several compartments of the drying chamber, the heat in the said compart-ments being regulated by keeping the registers open or closed. On the hrisk floors of the burning and cooling channels and of the drying chamber is laid a

The blue colour was in former years the principal dress of the poorest classes in England, and it was only towards the middle of the last century, that owing to its introduction into the navy, it heing the party colour of the "Whing," it was worn by gentlemen. † Selected from lists in the Engineer journal.

THE BUILDER.

subtrantau passages transformed by two doors about 3 feet apart from cacb other, and forming an ante-chamher. At the end of the burning channel, facing, and close to the furnace, is a turuplate fitted on to a transverse platform, on which the waggons containing the materials to be hurnt may he made to rotate in such a manner as to expose equally the different sides of the mass of materials to the beat of the furnace.

COMPETITIONS.

Foleshill New Union Workhouse .--- The plans of Mr. Edward Holmes, of Birmingham, have been selected for the above building.

Westbrownich New Cometery. — The Westbrom-wieb commissioners met on Friday, 21st, to decide upon the twenty-oue designs submitted for the above cemetery, when those of the architect last named were selected.

Medway New Union Workhouse.--The guardians here also bave accepted the plans of Mr. Holmes for their new workhouse.

Bowdon Church.-Mr. Jas. K. Colling wishes ns to insert the following protest sent to the church-warden, to aid in preventing similar occurrences in future :

future :---"I must beg to protest against the act of the committee for the robuilding of Bowdon parish church, for having awarded the second premium in the late competition to drawing a which is the interval of the second para-tic second premium in the late competition to architects for 'plans,' the words of which were apon this point as follow: 'The drawings to he prepared entirely without colour or tinting of any kind,' I further beg to assure them, without for one moment denying the superior ability which may be contained in those drawing, that they have by this selection not only violated their own words, but have committed as act of unfairness towards all the other competitors who compiled with their wishes in the preparation of the drawings.'

Books Receibed.

VARIORUM.

W. BLANCHARD JERROLD'S long-looked-for Guide to the Exhibition at Manchester, at sixpence, has just to use PAthibited, and will sell well no doubt, but it should have been outlong ago. As it purports to he only edited by Mr. Jerrold, we had no right to expect originality in all ofit; still, some will think it beneath his repeated to to publish a work of sixty-four pages of which one-half only is original matter, the rest consisting of actrony from the Tarse Microsoft of which one-half only is original matter, the rest consisting of extracts from the Twnes, Athenaum, Saturday Review, National Review, Fairbairn's Letter, &c. It will be found very useful nevertheless. — A pamphlet on the metropolitan main drainage question, titled, "The Discharge Difficulty overcome, by the ahove-ground Tbubar Sever System, invented hy William Richardson, C.E.; edited by George Clark; with Plans," has heen published by Weale, of High Holboru. Messrs. Richardson and Clark's proposal is an extension and modification of the above-ground plan of Mr. Richardson for the drainage and proposal is an excension and montaneous to be drainage and ground plan of Mr. Richardson for the drainage and sewerage of the south side of London, haid before the Commissioners of Sewers in 1852. The projectors maintain that while the cost of such a system would Commissioners of Severs in 1852. The projectors maintain that while the cost of such a system would he less, the revenue from sale and distribution of sewage would be much greater under the system than that of subtranacous severage. They propose to extend their iron tubular sewer from the point of outfall B*, at Barking-creek, to the sea at Yantlet-creek, lifting the sowage to a height of 45 to 55 feet above the level of the collecting reservoir, and gra-dually heiting it fall again as it progressed towards the above the level of the collecting reservor, and gra-dually letting it fall again as it progressed towards the sea. The idea is rather a startling one; hat the de-sirableness of avoiding the formation of an open river of fillt to meander through the constry all the way to the sea may of itself induce attention to schemes

AUG. 29, 1857.

The of rails, and the floors have a slope of such inclination as to allow the waggons used for transport-ing the bricks or other ceramic substances to be casily pushed forwards. The slope of the burning channel is above the furnace, that of the cooling channel below it. At the extremity of the burning channel or at any spot judged convenient, is crected the chim-subterrane passages leading from the furnace to the furne to subterrane passages leading from the furnace to and practical, and the smoke passes up it by means of said chimney. Each of the channels is closed by two and practical pages of small cetters. It is divided doors about 3 feet apart from each other, and forming into for more parts of some and a contense. answers.—We may here notice another book of formal instruction just issued by the same publishers, namely, "A new and complete Course, theoretical and practical, of strictly graduated Grammatical Idiomatic Studies of the French Langmage," by Auguste Aigre de Charante, French master in the Royal Mili-tary Academy. This seems to be a very elaborate and valuable work, extending to hetween eight and ince hundred pages of small cottavo. It is divided into four parts,—Pronunciation and Accidence,— French and English Syntax compared,—Gallieisms and Anglieisms,—and (written in French) Syntaxe de Construction, Syntaxe d'Accord, and Difficultés. There are said to be contained in the work 6,000 entirely original examples, besides a system of colloquial exer-cises. The War-office, it appears, have adopted this work for the use of the military cadets at Woolwich. —A Report of "the Cases of Westerton against Iddell (clerk) and Horne and Others, St. Paul's, Knightsbridge; and Beal against Idddell, Parke, and Evans, St. Burnabas, Finileo," has been drawn up by Mr. E. F. Moore, M.A. barrister-at-law, and pub-lished by Longman and Co. Thoogb full of ecclesi-astical matter of no special interest to our profession, here is an end and bare to our profession. Ished by Longman and Co. Thougo full of recess-astical matter of no special interest to our profession, there is much valuable matter here on ceclesiological questions connected with the interior decoration furnishings of churches with which every architect ought to be acquainted.

Miscellanea.

ANUSEMENTS.—Mr. Willett Beale deserves the tbanks of the public. The Royal Academy conver-sazione' is over; Parliament is prorogued; Mr. Albert Smith has shot up and gone off to Pompeli; in other words, the London season is more than over, and yet, then be to the automics of the carthuman acamed the thanks to the enterprise of the gentleman named, the pent-up Londoner may find music at the Princess's Theatre at playhouse prices, rendered by Grisi, pent-up Londoner inay find müsic at the Princess's Theatre at playhouse prices, rendered by Grisi, Alhoni, Gassier, and Mario, to say nothing of a number of other admirable artists less known to fame. The "Travitat," "Norma,"" Rigoletto, "and "Larczia," have already been given in good style, and other operas are announced. To the same gentleman, if we mistake not, London is indebted for finding all the emiuent artists we have named, with the exception of first-rate excellence for a shilling will he given for a week to come. The provision of healthful and high-class enjoyments for the people is a matter of no small moment, and therefore we repeat, Mr. Willett Beale deserves the thanks of the public. deserves the thanks of the public. BANBURY WATER COMPANY. -

- The whole of the BANURY WATER COMPANY. — The whole of the contracts for these works are now taken, and we un-derstand they are within the estimates of the engi-neer, Mr. J. Hodgson Jones, of Westminster. The tenders were made out on quantities taken out by a surveyor nominated by the contractors. The follow-ing are the parties who have obtained the contracts : ing are the parties who have obtained the contracts :-For reservoir and engine-boxe, Messrs. Davis and Sons, Banbury; steam-enginé and pumps, Mr. Charles Lampitt, Neithrop; filter-beds and pipe-lay-ing, Mr. John Aird, Londou; slaice-cocks and hydrants, Messrs. Guest and Chrimes, Rotherham; supply of mains, the Butterley Company, Alfreton, Derhyshire. Some of the tenders are necessarily upon schedules of prices and therefore the amounts Supply of mains, the batteries of our party function, Derhyshire. Some of the tenders are necessarily upon schedules of prices, and therefore the amounts cannot be given until the quantities required are ascertained.

ascertamed. DISTRICT OF ST. GEORGE'S IN EAST, AND ST. BOTOLPH WITHOUT.—At a meeting of the Board of Works held on the 21st instant, Mr. Henry Flower, district surveyor, resigned his appointment, and a surveyor was named to do the duty until a successor was appointed. was appointed.

Was appointed. DWELING-HOUSE IMPROVEMENT COMPANY.— The prospectus of the Dwelling-house Improvement Company, limited, has been issued, with a proposed capital of 200,0007, in sbares of 22, each, upon which capital of 200,000%, in sbares of 2% cach, upon which the deposit is fixed at 5s, per share. It is mentioned that the formation of the company "bas been pro-moted by an association of gentlemen desirous of proving, by example, that the dwellings and homes of the middle aud working classes may be built in an improved style, with great increase of comfort, health, and convenience, combined with economy; while at the same time the capital invested will be amply remunerative." remunerative.'

FATAL SEWER ACCIDENT .- A few days ago, three labourers were killed, and two more made inscusible, by foul air in a sewer excavation facing the entrance buoters are a sower excavation facing the entrance of the late Pavilion Theatre, in Whitechapel-road, One of the poor fellows descended after the other to give help to the first and to those who followed; and such is the good feeling which workmen display im the investment that more would have been im-School, at Birkenhead (Longman and Co. publishers). One of the poor ferows easeendee after the other to comprising, as the title-page states, "a series of arithmetical illustrations of the most important such is the good feeling which workmen display in practical trutbs established hy geometry, and designed to serve as a companion to Euclid; also as an intro-duction to land-surveying, trigonometry, and continue to nature of the accident than they did, prevented sections." It contains many clear and familiar ex-amples, a variety of novel diagrams, and upwards hooked ap, witbout more of them descending into it. Sept. 5, 1857.]

The Builder.

Vol. XV .--- No. 761.

UR Indian Empire is at this moment the engrossing subject in all minds. Thousands of our eountrymen are knit to its destinies by the presence there of relatives and friends, and wait with trembling aud fear the arrival of every mail and message; while hundreds of thonsands who are free from such ties quiver with indignation and grief at the recollection of the barbarities committed by the traitorous seoundrels-the inhuman fiends-who have revolted from onr sway, and demaud, as with one voice, the infliction of a punishment complete and terrible. Never

was the heart of England more stirred than it is at this moment, and woe to those in power who disregard its promptings. With these sad events it is not our province to deal ; hut, hearing upon them, we have advice and a warning to give, which, if attended to, will save life, lessen sorrow, strengthen our arms, and shorten the strnggle.

WE ASK FOR THE IMMEDIATE ORGANIZATION OF A SANITARY COMMISSION TO PROCEED TO INDIA WITH OUR ARMY.

We could point to a score of warnings in our pages, attention to which, in the first instance, would have saved wealth and lives : recollect, if no other, the dangers of the camp at Alder-shott; the evils which threatened the Goldensquare district, in a sanitary point of view; and the indefensible arrangements at Netley hospital, all pointed out hy us in time to have prevented the cvils before they occurred; and let the Government listen to our warning now, and act with wisdom and promptness. But what good will it do ? some may ask.

A Parliamentary report, recently published, as to the deaths in the Baltic and Black Sea fleets, shows that the deaths in both fleets, in the years 1854 and 1855, numbered 2,029, of which 1,574 were the result of disease, 228 of suicide, drowning, and other accidental causes, and only 227 of wounds in action. These figures show that in our mary, as in the army, pestilence and disease are far more fatal than the sword or artillery, and the other perils of war. The deaths by various discases amounted to upwards of 7 to 1 of those which were cansed by battle.

The report states that if the Baltic flect had not anchored in Baro Sound during the summer of 1854, and if the fleet in the Black Sea had shunned Baljick and Varna in July, August, and September of the same year, the ravages hy cholera would have beeu very much lessened. We also learn that there is no evidence to show that the elimate and soil of the steppes of the Crimea had the least effect in producing complaints approximating to cholera; but that ac-enmulated filth and effluvia, arising from the decay of organic matter, brought their sure and deadly results.

In one ship of the Baltic fleet, the number of deaths by cholera amounted to more than half of the whole of the deaths which occurred from this cause in that fleet. It would be nseful to know the position of this fatal ship at the time of the attack, the nature of its ventilation, the that by knowledge and exertion thousands of space, accommodation, &c. allowed to each man,

THE BUILDER.

parison with those who fell in the various eon- carry out their instructions, to attend the army competent authority has stated that a quarter of the British army engaged in the Indian war will fall by fever, eholera, dysentery, and similar complaints. Two of the chiefs of that army have already perished by these agencies, and hundreds of men. In the Crimea these were more deadly foce than the Russians.

If, then, we find that the pestilence is more terrible than the enemy, it is evidently necessary that we should have commanders and officers as capable of fighting the one as the other. During the long continental war, forty or fifty years ago, the princi-ples of sanitary science were but little understood; and even at the present time, we fear that the sure means of saving life by a proper attention to those laws which prevent many fatal complaints are still too little understood, or even believed in, hy the leaders of our fleets and armies. Terrible as are all the horrors of war, there is no phase of it more dreadful to contemplate than the probable death of 250 ont of each 1,000 strong men who form our army in India,-not while aiding the actual object in view,-not in the excitement of battle and with the glory of success, - hut helplessly and unnecessarily, in camps and hospitals, stricken down by rotting matter,-killed by want of sufficient pure air ! - and these not the aged, the delicate, or those of tender years, who form such a large percentage of the ordinary deaths in our population, but men in the prime of years and manhood.

At the present time in the metropolis and large cities the death of 40 persons in the 1,000 per annum is considered, and rightly, a very great excess: it is little short of murder, indeed! In some of the model buildiugs of London, inhabited by families, the unmber of deaths in the year is 16 in the 1,000. Ont of the sixteen above mentioned, if the average number of infants' deaths be the same as among those belonging to a similar class in the metropolis, we should have nearly half of the deaths under five years. This shows the value of mature lives, and that every care must be taken to save them ; especially, says the finaucier, when we recollect what it costs the country to send cach man to India.

Sanitary management must be greatly improved, and ere long become one of the chief arts of warfare. The time is not far distant when an admiral will rather place his ships within the range of over-powerful batteries than in positious which ensure the certainty of pestilence; and that in the choice of places for encampments, the sanitary condition of sites will be held in nearly as much consideration as their military fitness.

The late Sir Charles Napier, when in India, found large hodies of men dying with fearful rapidity of fever and cholera, and on more than one occasion immediately stopped the progress of these diseases by moving the camp to other A similar kind of judgment will he sites. required at the present time : hut we fear that certain saving measures have not yet been properly studied and appreciated by the heads of either our army or navy; and, certainly, measures in due proportion to our extended knowledge of the science of preserving health have not yet heen adopted.

At a time of great distress, a body of sanitary officers were sent from England to endeavour to officers were sent from Engined to endeavour to enange which is part of the process of these pages the plagnes which is part of the places of these pages. Schastapol, and much advantage resulted from Be it understood, that whatever the human constitution requires—received through the exercise of one function,—it equally demands through the exotine valuable lives may be saved, should lead at once of Nature, was designed for use; and, for the to what we are calling for, namely, the ap- same end, the power to create the beautiful hyperiation and the power to encate the beautiful hyperiation a and other sanitary particulars. In the Crimean armies, the number of those pointment of a distinct and sufficiently powerful who died irom disease was immense in com- body of sanitary officers, and also of vorkment to react the beautiful * See p. 213, ant, -on "Monuments and Statues."

flicts. This is the ease in all campaigns. A in India. We helieve that such a corps, properly organized, would, in a region like ludia, he the means of adding immensely to our available force. It is true that many of our army surgeons are quite eapable of giving advice on this snhject, but we have reason to know their opinions do not meet with sufficient consideration; and, moreover, the calls upon their attention during a campaign leave them little time for additional duties.

Thousands will die in India unnecessarily, if the course we now urgently point out he not pursued.

ART IN OUR PARKS.

Some months since-from observation of certain public statues and contradictory evidence of the merits of British sculptors—we were induced to speak of the relationship of the arts, induced to speak of the relationship of the arts, as not recognised practically, and of a required predominance in works of the first elass belong-ing to other "arts" than architecture, of those qualities of heauty which are architectural.⁸ More recently, we have had to pursue the sub-ject in connection with notices of the models for the Wellington monmont.⁴ Believing that the restriction of "architecture" to a sense which we may call the technical or purpressional which we may call the technical or professional one, involves results not favourable wholly to progress in the separate arts-we verture to consider the bearing of the inquiry upon a different vehicle of expression,—one which uncreat venues of expression,—one which though it may not have held a recognised place with painting or sculpture, is nevertheless to be regarded as art,—and as that in particular, which is of great importance to the public. We refer to what we then designate the art of landscape gardening.

The right apprehension of this art is essential to the success of improvements in our parks, in which considerable interest is taken by the pre-sent Government,—as to those similarly in our squares and open spaces,—and even, streets. In such improvements there is a vast field as yet almost untouched; and every art, general or particular, which contributes to those objects, is, at the same time, an agent in the sanitary, social, and moral amelioration of the masses who must congregate in towns. For, the influence of such works as we refer to, is not only that acting directly on the hodily and mental consti-tution of individuals, but comprises that which is transmitted from either seat of impressions to the other. The immediate sanative effect is an object second in importance to none: hut the onject second infinite relation to bone; into the indirect agency has seldom been estimated at its proper importance, as bearing upon the same end. It is not sufficient to provide open spaces; but, these must be such as are becautiful and attractive, like Hampstead-heath, or they must

be aided by some resources of art. The requirement for inhabitants of towns, is somewhat akin to that which is perceived by the commauders of armies in cantonments, or of erews in winter quarters in the Arctic regions,the need of some anusing occupation for the mind as a direct means of preserving *health*. It is, of course, now capable of clear demonstration that change of pursuit is necessary to man : relaxation of some sort is essential; and, for the majority of the people, to whom labour is of unvarying character, the choice only lies between invarying character, the choice only lies between what is harmless, or beneficial, and that which is noxions individually and socially. Therefore, the growth of populated districts, without abundant provision for the solace which the mind requires, and can receive through the eye, is to be regarded as of very doubtful benefit in eivili-

The question of providing, hy sufficient vegetation within the area of towns, for the chemical elange which is part of the process of respira-tion, has been often discussed in these pages.

art, was conferred on mau. By no means should all the sylvan heauty of a district or suburb be destroyed by the progress of building; but the trees should be retained, and patches of green trees should be retained, and patches of green sward where possible; and these would impart that clement to the architecture which it now much requires, and without which, or without association of nosition and association of position and contrast with some objects of natural beauty, our art really fails of that which is its true character and Tails of that which is its true character and full expression. Need we then say again, that merely the ample provision of parks, or other open spaces, requisite as this is, does not com-prise all that is useded, but that whilst the beauty of uatural objects—trees and shrubs— beauty of uatural objects. should be exhibited in our streets, the beauty of art should be cousidered in the design and "lay-ing-out" of our parks, and the arrangement of of our public gardeus. Architecture and anv sculpture, indeed, are never seen to greater ad-vantage than when in immediate conjunction with the works of nature; and whether, as some hold, nature is designedly imperfect, and the operation of mind in man which produces art, has scope left for it; or whether au order of images, with distinct attrihutes of heauty, is produced by the union of art and nature; certain it is, that we have never seen a combination of architecture with sylvan, maritime, or rocky scenery, where the untural element did not scenery, where the natural element and not seem to derive a special charu from the pre-sence of the art. The fact of such value from variety and contrast, is deducible from, and is part and parcel of that philosophy of art which is studied in the book of nature itself. It might be predicated from what delights in the landscape, or in natural objects alone, that the fact would be so, —by the opposition of marked re-gularity and symmetry to what is comparatively irregularity and freedom-of obvious and huma art, to art of the most elevated kind-not apparent. For, as some say,-

"All nature is but art, unknown to thee, All chance direction, which thou canst not see."

We ought, perhaps, in the opiuion of some of our readers, to give the whole of our exer-tions, just now, to the matter which might be considered of first cousequence, namely, provision of the open spaces themselves-more numerous in proportion to the inhabited disore tricts, more general in their distribution, and on a systematic plan of addition, *pari passu*, with the growth of London. This subject is even yet far from exciting the steady attention which its importance merits. Knowing that a vast majority out of the Londou residents are so circumstanced, that they must remain, day after day, as much walled in from the beauty of nature as if the existing parks had never been provided; feeling that health, alike bodily and mental, requires, as we have shown, not only the sustenance of pure air, hut that of change of scene and variety of objects; again, knowing of scene and variety of objects; again, knowing that the difficulty of getting open spaces in-creases rapidly,—whilst large tracts of ground, unfit to be huit upou, hecome crowded with habitations,—we marvel at efforts which, as shown in a recent article,[®] are so dispropor-tionate the continuents, and at the partic itionate to the requirements, and at the positive opposition which has to be encountered. Before it has been settled whether the country, or the In has been seried whether the country, of the metropolis, or particular districts should pro-vide parks, the chance of gaining ground at all, will have gone by; and ultimately, resentment against whatever power or authority is popu-larly known—of course the Government—will be loudly expressed.

Cobbet was accustomed to say that Loudon drew to itself the strength of the country, or prospered by impoverishing the provinces; but, it should be recollected on the other hand, that the metropolis, or, in fact, its inha-bitants, bencfit the nation; and these suffer even grievously, from their choice of residence, in so doing. It can be necessary only to make allu-sion here to the multifarious influences of the condition of dwellings—a condition far worse than what exists in provincial towns, and due, in great measure, to the cost of ground, or, to conveyance hetween the centre and the suhurhs. Consider also, how large and increasing a proof

* See p. 388, ante,-... Opposition to Sanitary Progress : the Proposed Parks.

portion of the people-beyond the two millions bination; and as we have considered, the aid to and a half of Londoners-spend, for business the expression of architecture, of objects of or pleasure, some part of the year in town, and the aktind, is such, that the especial character and heavy of the art is, perhaps, never tbo-the adormment or the prosperity of the capital. Recollect the positive incovenieue which is entailed on London residents, by the influx of pendaut upon what can be seen of the sky and change or all operiums of multiparters. strangers on all occasions of public interest. Bc it an exhibition of 1851, a hero's funcral, a peace commemoration, or an emperor's visit; birthday, a drawing-room, or au queen's Epsoni or Ascot race-meeting; the country pours into the town a new "tide of human existence," -is thousands, often noisy, mischievous, or unwashed to fill the best sents at places of resort, to take your accustomed corner where you are wont to diue, to crowd the public conveyances, or elhow you on the pavement; and, freed from the cbeck ou them at home, to aid in supporting the idle and vagabond life in London thoroughfares by day and uight. Seriously, the balance of account is not even, between the scat of legislation and government, or what has been described as "the centre of commerce; the beginning, end, or *route* of relations with every brighting, cut, of *vare* of relation that and a part of the globe; the resort alike for pleasure or the pursuit of knowledge," and the country— which would contribute nothing to the required improvement and decoration which all would derive advantage from, or he ready to use. Since these remarks were written, however, the claims of the metropolis have been ably argued in the *Times*, in opposition to the view taken by the country members in the prescut Parlia ment.

We apprehend that the need of doing something for London is becoming such, that the several wants referred to must be supplied, or before long there may be cousequences for which our legislators are not prepared. The true ori-ginating cause of an epidemic, a prevalence of crime and discontent, or a season of commotion and insurrection, is seldom looked into; and means of prezention, which, according to the most frequently repeated, hut least applied of proverbs, would he better than "cure," are never offered.

The requirement which mainly we are now The requirement which mainly we are now considering—not merely a common sanitary oue—directly, as indirectly, bears upon the moral and mental health of the two and a half millions, and of the whole community. We do not say that a policy to he initiated, is that of keeping the people amused through devices for making holiday, as under continental govern-ments. There is greater entertainment in holding at the forms of the created world or looking at the forms of the created world, or realizing the impression of art, than in witnessing shows and festivals,—better mauged abroad though these are, than with us,—from the promiuent element of art which is made to contribute to them. But, what is a natural yearuing should be allowed to expand,—as it might ouce have done—till " man made the *lown*," with its pestiferous streets and crowded bouses. In default of this, the substitute can-not but be sought. Vices of a degrading cha-racter, we helieve, will prevail wherever there is an uninteresting sameness of objects. Much, doubtless, is being done by cheap literature— though in the abseuce almost, in London, of public libraries with standard works, not so much of value, we fear, as is sometimes supposed; and much may be effected by the grow ing appreciation of studies, such as natural history, which, with the aid of recently iutro-duced contrivances, can afford the highest interest and iustruction in-doors, and serve to help the effect of comfort, or the adornment in a home. But, even more than this is desirable ; or rather, is wanted : variety and instruction such as there are in nature out of doors, still are required; and art is needed no less than wheu there were no books, and when science bad no inducements for the people. To such end, it has to be recognised that natural heauty is to he be provided for the dweller in towns; that variety of feature also must be presented; and that a combination of the forms of nature art cuhances the effect of each, and multiplies

the variety. Some of the peculiarly beautiful effects in flowers and foliage, iu rocks and water—as in other natural objects—are those which are seen

ronghly attained without it. If so, in English eities, as a rule, architectural effect is de-pendaut upon what can be seen of the sky and clouds, or what may be called—horrowing a term from Chevreul on Colour—the successive content which the chevre contrast, which the observer may happen to supply through his recollection of nature. It is impossible for him to realize the true beauty of architecture, who has not seen it in unclouded light, or free from the deadcuing influence of the smoky canopy which hangs still over London

Let it not be supposed that to the mere holiday-maker—the Cockney knowing we will say nothing of our art —of style, or order, or moulding—the exhibition of architecture, with trees and flowers, is useless, and without power of influence for any effect. He who thinks so should visit Rosherville, or any tea-garden about London, and note the fact of the use which is made hoth of architecture and sculpwhich is made hoth of architecture and scup-ture,--use, we admit, which is bad use, and which gives no idea of the real heauty of a combi-nation where good art prevails, but such as is suf-ficient for our argument as to the want that is felt, and the result which could elsewhere be attained. Similarly, in the terraces and gardens of the Crustel Belace on effort is mode to produce the Crystal Palace, an effort is made to produce considerable effect, by a like principle of com-bination. The details of the architectural portion of the design there might have been better,

but the rate of the principle is made obvious. Yet curious it is, that in those very "lungs of London,"—the public parks,—nothing can be culled from the same recognised principle of art to enhance the beauty of the scene, as by the use of the associated arts of architecture and handrease carding of the scene of the the use of the associated urs of a lodge or en-and landscape gardening. Not a lodge or en-trance has been added during years past, that is even wortby of comparison with the works of the time of George IV. and of Messrs. Nash and Decimes Burton. The last of these architects especially, was allowed to do just enough to show what was wanted-if only by his screen and gateways at Hyde Park-corner. Several of and gateways at Hyde Park-corner. Several of the entrances, formed about the same time, are not without merit, though not of that kind which is now appreciated. Greek architecture, peradventure, may be undesirable for future selection; and when it was in favour, it might have been managed with greater skill in numerous instances; but it is depreciated even lower than is justified by the treatment of it in such cases as we have alluded to, or in those of park en-trances in many parts of the country. The trances in many parts of the country. The doubting reader who will accept the challenge a comparisons, is referred to Albert Gate, Prince's Gate, the entrance to Keusington-gardens from the Bayswater-road; and that newly-formed, to St. James's-park from Pallmall. He will find it difficult, we think, to make out that in such matters art has offered any exhibition of advance, or that in any country Europe there is less thought given to like orks. It is difficult, in short, to discover any works. work into which art has entered, as executed in our parks during the loug interval we have been referring to. Indeed, with the exception of the Serpentine-bridge, of a building or two in Hyde-park — as the Humane Society's Receiving park — as the Humane Society's Receiving House — which it forms no part of our present object to have added to, — of the Achilles, and of a solitary resting-place and fountain near the foot of the Serpentine, absolutely nothing now appears to exist, — or belonging to the mericular heads of art which nothing now appears to exist,—or belonging to the particular branch of art which we have classed with landscape gardening. We except the new bridge in St. James's-park, as only just heing completed. But to it we can return. Scarce an effort at combination—of ground plot and grouping—is there as to the palace, and the gardens of St. James's-park. An alteration of the present arrangement about the end of the Mall and Palace forceourt, was, it is true, projected as our readers remember. it is true, projected, as our readers remember. Oue *object* at that time, corresponding with the general one we are putting before our readers,

rather than any way proposed for attaining the object, deserves to be borne in recollectiou. The improvements in the parks under the prewhen architectural forms enter into the com- sent régime, so far as they now demaud uotice,

have heen confined to the increase of garden space, the cleansing of the ornamental waters, and similar measures of very great value, but not exactly what we bave just now in view in the question of art. The broad, well-gravelled walks, interseeting the sward from gate to gate, are a boon to the pedestrian as com-pared with the former pathways; yet, be it observed, the alteration in the Green-park is considerable; the rural appearance is con-siderably impaired, and there is no substitute. siderably impaired, and there is no substitute. Let the reader fancy new roads driven straight through the beautiful and uncultured parts of Hampstead before named; and a fair idea will be given of the operation of the interfering hand—albeit not of the relative extent of the hand—albeit not of the relative extent of the changes. Now, in such cases—since good dry walks must be made, and occasionally without the fringe of flowers and garden ground which partly supplies the place of art in St. James's park,—why not have introduced in the course of that unvarying line, a few simple pedestals with statues and flower-vases, a few breaks and recesses for the seats, and (were there any spot of sudden declivity) a flight of steps, with wings, terrace, and balustrades. The interpo-sition of some such objects, or even others which are of a more simple kind, supplies a new effect in place of that which had to be sacrificed. These trifling suggestious for such a case, effect in place of that which had to be sacrificed. These triffing suggestions for such a case, however, form a very small section of the con-trivances through which architecture and art in general might be made to contribute to the beauty of our parks, as of our squares and other open spaces. The main object which we have in view, is to get the principle of the combina-tion as a point recognised where any public works are needed, in which either architecture or landscame cardening, separately, may be supor landscape gardening, separately, may be sup-posed to come into play. We would undertake to prove that such a combination for effect, beposed to come into play. We would undertake to prove that such a combination for effect, be-tween nature and art, has heen sought for in all periods possessed of any perception of the beau-tiful, and any acquaintance with the laws of **tiste**. It was this perception which made the Athenian arcbitect plant his temple on the Acropolis, and the dramatic artist and poet speak under the eanopy of heaven, amid the ambient beauty of the sea and the hill-side. It was this that produced the intermixture of horticulture with art, which was seen alike in the houses of the Romans, the Moors, and the modern Italians, and still exists with the Chinese. In the Italian villas, the garden at the hack, even where coulined in space, was made a very heautiful feature. A piece of architecture generally terminated the site, and formed a hackground to the scene; and sculp-ture and fountains were there introduced as in other parts. The main feature referred to was the grouto,—of which, the term, but not the art, the grotto, --of which, the term, but not the art, survives. Where the ground rose at the back, advantage was taken of the fact to introduce a succession of terraces and steps, like those which we have suggested in somewhat similar circum-In our own Elizahethan arebitecture, stances. statics. In own instances in the state of the balaxies of the balaxies of the balaxies of the garden for the mited result. At Haddon-hall, in Derbyshire, there is an excellent example of this combination, and it forms an annual subject for some tion: and it forms an annual subject for some exhibited drawing. Again, at Hampton-court, the comhination of forms of architectural art with trees and flowers, is illustrated; as it is also in the approach bounded by sculpture at intervals, and overshadowed with cedars, to the portice of the villa at Chiswick. Pleasing effects, such as may illustrate the argument, can be observed in Kew-gardens. Chambers, who laid out the grounds there, has left ap-pended to his "Tractise," several designs of the character which would be appropriate for the Londou parks—were buildings, rather than minor objects of architectural art, uow especially

fountains; terraces and steps; balustrades and vases; sunk gardens, grottos, and alcoves; sercens and porticos; colonades and arcades; bridges and boat-houses, are some of the subjects on which architectural art could he exercised with the greatest advantage. Many such elsed with the greatest advantage. Many such accessories—as for example, the sunk gardens and terraces—could be introduced with the greatest advantage as features in our squares. Ground such as there is in the squares, should be more frequently devoted to the public. Lakes, there are a distribute would be supplet a words to a words. streams, and waterfalls could be made to do more towards the beautiful than at present. Witness for what does exist, he very ambitous design of the emissary of the Bayswater sever, and that of the railing and boundary of the opposite or lower end of the Serpentine. What became of the columus of the Quadrant? Might they not have here act we in the reasons of the of the columus of the Quadrant? Might they not have heen set up in the manner of the Italian colonnades, roofed with trellis-work and twining plants? What has become of the fragments of many an old portico or gateway, as well worthy of heing put together in Hyde-park, as Inigo Jones's gate was by Lord Burlington at Chiswick. The columus of the portico at Wanstead House, oue of the most admired of the works of Colin Campbell, were last heard of in a dealer's vard. last heard of in a dealer's yard.

Amongst the improvements required in Hydeis that of a road from north to south, Kensington-gardeus. This want has often park. near Kensington garden. This want has often been spoken of. We notice it here to say, that the very provision of the communication— which would probably he by sunk way, as suggested in these pages—might he made to serve some of the objects we have been cou-

Alto some of the super-sidering. Also, it may be hoped that the intended memorial of the Exhibition of 1851 will be erected ou the site of the huilding of that year; aud that architecture and sculpture will both and that are necesture and scalp are will both contribute through such agouey, to the object here treated of. The present Chief Commis-sioner is fully disposed to go with us, and only needs support from without. The comments on the original plan, and those

The comments on the original plan, and those on the present appearance of the bridge in St. James's-park, help to show that our subject is very far from heing now understood. It was a view of the matter that we could comprehend, that any interruption to the prospect was uot desirable; but not so that which, on the one hand, ignored the fact that a bridge of stone or irou may be made a heautiful thing in itself, and eronomic advantaceously with the natural or iron may be made a heattild thing in itself, and grouping advantageously with the natural objects, and on the other hand, presumed that a "light suspension-bridge" would be as it were, without any effect whatever. The opiniou of some of the authors of designs in the Government Offices competition, as to the chains of Hungerford bridge, and the prospect along the river may be referred to. Giving un chains of Hungerford bridge, and the prospect along the river, may be referred to. Giving up the idea of a carriage-way, a foot-bridge à *fleur* d'eau might have auswered all objects of con-venience and taste. The present bridge inter-rupts the prospect no doubt more than those who sanctioned it anticipated. But in itself, the design does not deserve the condemnation which some writers have thought themselves justified in

expressing. Criticism of the kind just referred to, however, makes us more than ever anxious as to the future of our art — dependent so largely upon public appreciation. What is to largely upon public appreciation. What is to be hoped for, if the first care of the judge is to convict, and on conclusions not drawn is to convict, and on conclusions bot drawn from thought, or reason, or experience, but by mere *ipse dixit* of a man destitute of art-education and taste, possessing no claim to the office of the teacher, and forming his opiuions solely from the detection of a resemblance to some supposed vulgar or familiar form or object. Architecture requires now for public teachers, men at least generous and canable of heing the Londou parks—were buildings, rather than minor objects of architectural art, uow especially in question. Not only by the introduction of terraces, at warious levels, but by all the other architectural and sculpturesque aids to landscape gardening, you increase both the variety or interest, and the apparent space. But, the aim should be-in conjunction with the addition of garden-ground to our open spaces—to introduce always sories. Lodges, piers aud gates, and boundary walling, railing, and hamp-posts; statues and

profession is infected hy the disease, and the ex treme classicist or the mediævalist is incapable of appreciating architecture in the abstract, and the beauty which may exist in any style. We believe that architecture is capable of conducing beheve that architecture is capable of conducing more than it has lately done, to real public enjoyment and good. The British people must be made to feel that the art has a character and purpose beyond that which it has lately reached; and we know no means so valuable for such an office as we contemplate for it, and other cuds, as the means which we have suggested.

BRITISH ARCHÆOLOGICAL ASSOCIATION.

BRITISH ARCHEOLOGICAL ASSOCIATION. It appears to have heen reserved for modern anti-quaries to discover that the pursuit of their art may be rendered pleasant and enjoyable, and that their labours may be snoothed and enlivened by what is so agreeable to the physical organization of the student, and, consequently, so strengthening to his mental powers—a change from the narrow confines of the study to the free, broad, blooming country itself. Your antiquary is ceasing to be the isolated and eccentric individual whom the satirist has regarded as far game for his wit. He has acquired a turn for social gatherings and journeys made in company with his fellows; and although he is as deep in bis literary researches as his predecessors, he does not stop three, but, like General Suwarrow, "goos and sees." "Coup d'ail," said the old Russian veteran, "coup d'ail for me !" The antignary echoes the sentiment; and, composed as the British Archaeological Association is, there is no occasion for wonder that they make successful assoluts on ancient castles (happily without the loss of a single life), and goin instant admission

successful assaults on ancient castles (happily without the loss of a single life), and gain instaut admission into ald abbeys without asking the permission of **my** Lord Abbet, whom God assoyle 1 This was the case last week in the " cast countrie," of which Norwich is the principal city, and which was selected by the British Archevological Association as the scene of their fourtcenth annual congress. Some of the remains the Association inspected are almost entirely engulphed by the incoverble past; but the archevologic may say to Time trimmbantly. archeologist may say to Time triumphantly,-

You may break, you may shatter the vase as you will, But the scent of the roses will ching to it still."

The old associations still hang on the trembling we ough to add that some of the objects of pre-visited by the Association are in a better state of pre-visited by the Association are in a better state of preservation, and others in a state of restoration,—a circumstance which appears to excite a feeling of dissatisfaction in some minds having a strong autiquarian hias. Armed with large and resplendent pieces of

⁶ Armed with large and resplendent pieces of paste-board, the members of the Association assembled, on the afternoon of Monday, 24th ult. at the by no means attractive, so far as the exterior is enserred, Guildhall of Norvich. The council chamber, in which they assembled, to some extent redeems the building, and the fine statued roof and grim old portraits on the walls accorded well with the character of the meet-ing. The Earl of Albemark, who had been selected as president for the year, was introduced to the meet-ing by Mr. Pettigrew, and the proceedings commenced with the interchange of a few compliments between bis lord-ship and that centleman, and some expressions his lord-hip and that gentleman, and some expressions of welcome from Sir John Boilean, on the part of the Norfolk Archeeological Association.

or welcome from Sir John Boilem, on the part of the Norfolk Atchneological Association. Mr. Pettigrew next read a valuable paper "On the Antiquities of Norwich and Norfolk." The paper stated that Norfolk is 210 nules in circumference, and comprises thirly three hundreds and divisions; containing 700 parishes. The name Nofolk literally implies Northera-folk, as Suffich implies Southern-folk. The county of Norfolk, with Suffolk and a portion of Cambridge, commised the Roman province of the Iceni, and the Saxon Kingdom of East Anglia. In form the county is that of a wedge, and Canden derives the name Iceni from *Leen*, a wedge. From Tacitas seve al particulars may be learned of the an-cient history of the county. After having submitted to the Romans, it remained peaceable till the reign of Claudius Cassar, when Ostorius induced the people to revolt, and the wars with the Romans, under Boudieen, who died by poison in the year 50, were the result. Søreral Roman stations may be traced in Norfolk, with Romanu coins and other antiquities of the period. Alfred, when he subdued the Danes, cretted, in the words of an ancient chronicler, "a fortress hold of brick and stone," and the same mourten also im-proved very greatly the fortifications of Norwich.

In 1010 the Danes made a settlement in the locality, to the ground, was swinged np and down at such and re-fortified the costle, the original foundation of length that it reached at one swepe almost to the which is ascribed to Gorguntus, son of Bellinus. It was traveled by three diches, in consequence of stairs of the same, breathing out over the whole which there have been numerous disputes as to the church and companie a most plearant perfume of such original character of the building, some declaring it sweet things as burned therein." Mr. Harod has to he British, others Saxon, and a third class of dis-observed, in a very ensual peep at the Sacrist R-Ils at which there have been numerous disputes as to the original character of the building, some declaring it to he British, others Saxon, and a third class of disputants affirming it to be Roman. The charters of the City of Norwich date from the time of Heury I. The original charter was renewed by Stephen, who first gave the place a corporation. Charters were also granted by Richard L. John, Hanry III. and Henry IV. The last sovereign made Norwich and Henry IV. The last sovercign made Norwich a county of itself, and vested the government of the city in a mayor, aldormen, two sheriffs, a recorder, a steward, and a common council, con-sisting of sixty members. The walls of the ancient city of Norwich were the walls of the ancient Norwich were three miles in circumference and were flanked by a great number of towers. tions of the walls still remain. There were twelve gates, and within the city six hridges. I also tweire gates, and within the city six ninges. Mer-chan's marks are very common in Norwich, and were employed chiefly from 1300 to 1600. The monasteries and convents of Norfolk and Norwich were, in early times, very numerous; and several ancient guilds, established for the advancement of trade about and the interview flow the district ancient guilds, established for the advancement of trade, charily, and religion, flourished in the district for a very long period. Adverting to the esth-dral, Mr. Pettigrew sid, — The Norwich Cathedral Priory may he characterised as mostly Norman, having a long nave, choir with semi-circular cast end, transcept, demonstrate for the distort bell. A world dormitory, reflectory, and strangers' hall. A small portion only will be found to belong to the Early English period, and in this style will be found a portion of the strangers' hall. The chapter-house, portion of the strangers' hall. The chapter-house, closters, and cellar belong to the Deenrated period, and examples of the Perpendicular may be seen in of the cloisters. The first stone of the Cathedral Charch of the IJOY Trinity was build by Herbert de Loginga, in 1096, and sixty mouses were therein placed, and in the adjoining priory in 1101. They were Benedictines. Mr. II. II nood thinks the church of Herbert to have been built on the site of a morancient one, dedicated also to the Huly Trinity. ancient one, dedicated also to the Holy Tinity. It appears, however, that the Cathedral Church was commorly called Christ Church ; and early references are made to it by Tifed and by the chroni ler Ingul-phus, under date of 1076. It is continue that whilst in the wills of the neuer classes it is styled Church of the Holy Tinity, in those of a more humble descrip-tion it is called Christ Church. Of these peculiari-ties, Mr. Horod has cited several examples. Mr., Spurdens has proved Herbert to have been au Eng-lishman---mot a Norman, as generally supposed; that he was horne at Sylcham, in the Humbred of Hoxney in Suff.dk: and that the anocadase "de Laviara." in Suffielk ; and that the appendage "de Lezings," almost uniformly attached to his name, must have heen a nickname given to him by his detractors after his decease. The enthedral was damaged by fire as early as 1171 : a couttry later, it was again rayaged by that element. Two gates give entrance to the previnet—the upper, St. Ethelbert's Gave, built by the citizens after the The of 1272; the lower, known as Equingham Gate. Upon this the word "Pern" has been often recorded be inscribed, and the building of the gate is said to be meetined, and the burning of the gate is suit to have been eracted as a penance or punishment to Sir Thomas E pingham for his supposed Lollardy. This word, however, is not "Pena" bur Yenk" and means "Think" it is, in short, Sir Thomas's motto, "Beware." With regard to the time of motro, "Beware." With regard to the time of erection, Mr. Harrod justly infers that it must have heen subsequent to 1411, as the arms of his two wives occur upon it, and he did not murry Joan Walton until this year. His first wife was Joan Clopton. He died in 1428, and, t gether with his wives, was intered in the north aisle of the choir, but bit term he new later and the set. his tomb has been destroyed. The here stone vanling in the nave is attributed to Bishop Lyhart, whose rebus frequently courts. He was bishop between 1426 and 1136. The boyses of the roof and the closter formerly prevaled an immense number of historical figures, anounting (according to Philip Browne) to 325 in number, cariously carved. The series extended in subjects from the Creation to the Last Day of Judgmunt. The parointing and gilding of these have been entirely removed by a costing of stone coloured wish with which it was disfigured in 1806. A circular opening b tween the west door and screen, of considerable star, has often heen a subject of conjecture and discussion. Mr. Harr d has, 1 think, solved the quistion, by reference to an extract from "Watton's 11 story of English Poetry" (vol. i. From "Watton's it story of Engine Theory (your, page 240), taken from Lanbarde's Top graphical Dictionary. It runs thus := "I myself, being a child, over saw in Poule's Church, at London, at a feast of Whitsamtide, wheare the enamp down of the

Norwich, charges made for letting a man down from the roof hahited as an angel, with a c-nser to cense the rood. This feat, he observes, could have been accumplished from the hole I have alluded to. The tower, Erly Norman, must be esteemed for its gran-deur and beauty. The lo'ty perpendicular spire is also extiled to our admiration. A painted wooden reredos, formerly in the cathedral, has been removed, and fixed in a corner of the vestry. It belongs to the fourteenth century, and represents, in five compart-ments, the Scourging, Bearing of the Cross, CrueiStion, Resurrection, and Ascension. Its recovery is due to Mr. Harrod, who found it doing duty as a table for sorting paper in the treasury, tunned bottom upwards. The stalls (subsellia), or miserereas, as they are vul-garly and ridiculously called, are numerous in the Cathedral. Mr. Harvod enumerates the subjects carved upon 62 of these-the number required for prior, sub-prior, and 60 mouks. They present per-sonifications of stints, emblems, heraldic bearings, and many are very profe-que. Several exhibit much skill, and their execution has been assigned to about 1480. In a Norman niche, above the north door exteriorly is a sculptured figure of a bishop, which has been con-jectured to be a represent tiou of Bishop Herbert, the founder. The cloister has received much and descred attention from Mr. Harrod, who is warm in his expressions as to the magnificence of its area, the beau y and variety of its architecture, and its ma vello is roof. It is no', however, the Norman c'o's'er, and roof. whether that was of stone or wood is unknown. The present cloister dates no callier than the close of the 13th century, and may be considered as belonging to the beginning of the decorated period. The firs of 1272 destroyed the original rloister. There is a par-ticular account of the building of the present cloister by William of Workester, preserved in Christ Caurch College, Cambridge, and the date given to the cammemement of the work is fixed at 1297, and by Lord R dph Walpole, theo Bishop of Norwich. This is com-R-ipi Walpick, then Bishop of Norwich. This is can-firmed by a stome in the west part of the cloister with this inscription :- " The Lord Relph Walpole, Bishop of No witch placed me here." The incorport and als ignor is in like manuer distinguished on another stone by an inscription -- "Richard Upphale placed me." The door into the cathedral is re auxiable, and has been figured by Carter and Britton. Mr. Pettigrew also made some intecesting observations on the rood screens and rural paintings of the district. The examples, be said, are yet numerous albhareb many fine speci-tic specific statements. he said, are yet numerons, although many fine speci-mens have disappeared. Painted rood servens were more unmerous in Norfolk than, perhaps, other counties together. Three bundred at least, all acrordiag to a calculation made by the Rev. Richard Hart, must have been destroyed by the Puritans, and the subsequent neglect of them. They are five illustrations of mediaval art, and good examples are remaining at Worstead, Barton, Marsham, Aylsham, and Ranworth, of the latter of which Mr. Hart has given us a plot. He has also exhibited the pren-liarities in the colours employed, and the means of applying them. Of a very extended and remarkable example at the clurch of St. Andrew, at North Burlingham, the Rev. John Greene has given an accou and attempted a synoptic table to facilitate description and aid in comparison. No one has, however, yet followed so excellent an example.-The subjects on This serves are must diversified, ond present re-presentations of various shints, vitues, powers, angels, archangels, &c. The table embras s the sub-jets on the servens at Darton, Irstead, Ranworth, Lessingham, and North Burlingham. The Rev. James Lee Warner has also described a sere n at Hunghton, Maral paintings have been discovered in several Norfolk churches. Mr. Dowson Turner bas a fine Notions entreness. All obvious thirds uses a me collection of drawings of them, thirdsen relating to Catfield Church, of the time of Edward 111. It is of opinion that a large grop rition, and possibly the whole of the Notolk proofinal churches, had their the state of the Notolk proofinal churches, had their interior walls originally ornamented with paintings, and that these were the work of different hands, from and that these were the work of different hands, from the saints, &c., on the road loft screens, and were also very interior in point of excention. The Very Rev. F. C. Hussenbeth has minutely described the solucits—The Whiel of Fortune; the Tree of the Seven Deadly Sins; the Contrary Virtues; Baprism; Confirmation; Pecance; Confession; Matrimony; Extreme Unction; Grenicition; the Sumaritan Woman and the Saviour at the Well of Jacob; Sl. Loke; Nathan and David. These are not to be considered as altarether perfect, but solfriendly us to enable the Holy Ghost was set forth by a while preven the vast of the [Asthan and Divid. These are not to be considered] as it hs been noned, Bigod's towar, an area of the sast borth by a while preven th twis as altarether perfect, but sufficiently su to enable the entrance originally existed. There was no nortance by a while preven the vast of the base in the subject to be discerned. Another annal printing was into the great ice, and by a long would at Winabather perfect, herecand ng and entrance base place almost to plant with the Lubant Saviour; and at Crossvight on the great is entrance base place almost to plant with the Lubant Saviour; and at Crossvight on the great entrance base place almost to plant with the Lubant Saviour; and at Crossvight on the great is entrance based place bases.

Church there are the Deadly Sins, St. Michael, St. Christopher, Christ hefore Pilate, the Confession, &c.; at Ditchingham Church, the Resurrection, and other subjects, as at Wymoodham. At Drayton, Mr. Husenbelh has described St. Christopher, St. George, Christ appearing to May Mardland, Conservation Crosses, the Saviour. At Cawston, the Rev. James Bulwer has made out St. Agnes; whilst at Brook, the Rev. William Beal has found the Creed written in deven small barrow parallel columns, extending the whole width of the church, in colours, red and black. This was on the western wall, so that clearly at the time in which it was executed—probably about the commencement of the Reformation-it could not have been the practice of worshippers in reciting the Creed to turn towards the east. The commandments were also written on the wall, and there is also a curious representation of an alewife similar to the one graved by us from a Miserere in Ludlow Church. The ale represented as being drawn from the harrel is per-sonified by flame. An angel above is issuing also sounds by name. An anger above is itsuing also forth in free, and finners are beneath the wood-work on which the harrel rests. In the course of his paper (which was ordered to be printed in the Transactions of the Association) Mr. Pettigrew referred, in terms of high praise, to the lubours of the Norfolk and Norwich Archæological Society, who, he said, had brought to light a great number of interesting facts

facts. The parcer concluded, the company left the Guild-hall and praceeded to the eastle. Here Mr. Fiteb, who acted as circrone, pointed out that the building was placed on the top of a lofty hill, neither circular nor quadrangular in shape, but partaking a little of the character of cash of these forms, and that it was surrounded by at least one large ditch, which is still apparent and completely round it. The original shire-bures (or a cancing with Fitth's observations) stood house (we are quoting Mr. Fitch's observations) stood in nearly a straight line with the bridge in the centre of a spice now used as a ca'tle-market; and the build-ings in the ditch surrounding it, and lying to the east of it, were in the castle fee or bailey, under the juris diction of the constable of the castle, where slood the church of St. Matin in the Bailey, and where doubt-less eighty un coupied houses mentioned in Doomsday these equity in recurrent nones interference in Domasary were situated. All the castle buildings are now gone, except the great to were. The restoration of this may have been desirable, and absolutely necessary, but the autiquary can no longer discover the features of his old friend under the mark of Bath-stone with which it is now encased. The keep or great tower remark-ably resembled in arrangement that of Castle Rising, which, although smaller, is much more complete. At Rising, for instance, the main wall dividing the tower into two parts is nearly cutire. Here all trace of it is gone, except on the internal face of the west wall which has the outline of it shown by modern brickwork. The great tower stands on the south-west part of the the stairs of entrance on the eastern hill. nearly opposite the way over the bridge. It is nearly square, being 92 feet by 96 feet, the greater length being from cast to west. The walls were, as is so frequently the case, composed of stone from the nearest quarries; th se of Northampton stone faced with Caen stone. The surface of the lower compariments on the west and south sides of the exterior was o faced flints, weat and south sides of the exterior was o necesarily a facing which his entirely disappeared in the resto-ration. As it was not a mode of construction of the Norman period, this peculiarity my fairly be put down to remine two or three centuries later. The down to reparts two or three centuries Liter. The basenet: story of the thouser was plain, and was for-merly of common faced flint work, worked with small loops at regular intervals, and above that to the bat-theunents were a series of areades of Norman arches of a plain and effective character. In the lower areade, with a series of the base of the form and a primary that is its a consistent. In the lower atoms, monthy soft an inspection of the interformed parallel would have enlightened them —it is the vent of a would have empiricate the manufactor of the velocity of a drain from a small arched nicke in the interior. The north side differs from the others in having six but-tresses instead of five, and Mr. Woodward conjectures, with all probability, as a large hall occupied great part of that side of the tower, that it was original and intended to give additional strength to the wall. Both Norwich and Meiner arc suttored theorem on sectors Norwich and Rising are entered through an eastern tower, by a stain ase extending the whole of the eastern side. At Rising this is nearly in its original state: here, unfortunately, many repairs and altera-tions have takee place, and what is now presented to view is but an approximation to what it must originally have been. In one respect the modern aspect differs cotirely from the ancient for whether the stair was at any point broken by a drawbridge, or only stopped once or twice by a portcullis, there can be no reasonable doubt by a postering state of the catrance, or, as it h s been n and, Bigod's tower, an arch of entrance origin illy existed. There was no entrance

the west, or main wall of the great tower, is a double doorway, spanned by an arch of great size. This arch is all excised work, and, consequently, very early. It is supported by four columns. Upon the first empital on the left side is a huntsman, with a sword by his side, and a horn in this right hand; while with his left he holds a dog in slips, which appears to he attacking an ox. On the second expital is another huntsman, spearing a wild boar of unu-ual size. his eff side is covered hay a long north which with autorsman, spearing a wild bear of innitial size; in a left side is covered by a long-pointed shidd. The sub-jects on the capitals on the right side are doubtful. This arch, as at Ri-ing, undoubtedly opened into a large and body hall, having a range of windows on the north side, some above and by the side of Bigod's tower in the east wall, and some traces of which may still be seen in the western wall. The main wall of still be seen in the western wall. The main wall of which I have spoken as dividing the great tower in such to seen at nice western wint. The main wint of which I have spoken as dividing the prest tower in the centre, ran east and west, and the other half of the floor, of which the great hall occupied the north-side, had on the south two equally lotty apartments, the west one heing the larger of the two, and having the convenience of a larger of the two, and having an armony. It may have been the original intention here; but it will be remembered that from the time of Henry III. if not before, the exclusive use of this arger at tower was the confinement of pissoners; and therefore here, as at Newcasile and other places, this large room may have been appropriated to a better sort of prisoners, who desired better fare than the rest, and had the means of paying for it. The third at its south-east corner, an arch, opening in a recess, in which are various rude carvings, wherein one anti-net. at its south-cast corner, an arch, opening in a recess, in which are various rude carvings, wherein one anti-guary sees the altar-picce of a chap1, another only the efforts of some half-d-emented prisoner. The entrance to this oratory is through an arch, supported by two columns, the emitals of which are crumented, that on the let by an degant figure on the front at the angles are policans vulning their breasts. The espital on the right is exceedingly interesting : its style is pecaliarly Norman. Among the carvings in this oratory is the representation of the Thinty. The Father is seated, having a crewn on his head; and the infant Jesns on his right arm; and below the child, a dore. The second, St. C-therine crowned, having a small wheel in her right hand; the next is St. Chris-topher, a gigantic figure, much defaced, having a staff in his right hand; die mexi his St. Chris-topher, a gigantic figure, much defaced, having a staff in his right hand; die next is St. Chris-topher, a gigantic figure, much defaced, baving staff in his right hand, and the infant Jesns on his left shoulder. These figures appear to have been coloured: they bespeak an early period. Be-neath these on the left, is nonler sculptare, in better style. The walls and loops of the crach y are covered with armorial hearings, devices, and peris of fagures. I call your attention to the fact of the custome of galleries in the thickness of the walls, which were origically entered by the smaller of the two doors in the entrance tower. This opened by a short pressage into a newel staircuse, at a little elevation above, the gallery on the north wall commenced. This runs along, passing in front of the great windows of the angle, called the kitchen, communicieled with a wet-er gallery, which, minning behind the partires of the and passing the remarkable line at the institutes angle called the kitchen, communicated with a wet-ern gallery, which, running helind the pattries of the hall, communicated with a remarkable series of cheace The south-west angle also has a newel staircase, as at the north-east, and answering a similar purpose of communicating between this floor and the dangeons the notation of the entry of the second state of the order of the orde south wall, and ruoning into the upper windows of this room, it descends s yeal steps, and reactes the level of the windows of the gallery and armonry on the south, bending at one point to pass the flue of the great fireplane of that partment. Mr. Harrod has pointed onit that the great tower was covered in by two roofs, of high pitch, ranging cast and west, the external w-ll, to the depth of the two upper arcades, masking them. The marks of them will be easily seen on the inside of the west well. masking them. The marks of the seen on the juside of the west wall.

From the castle, into the dreary regions of which, as Mr. Fitch observed, the incursions of crimbine were as all, sited observed, the menissions of ermoline were never contemplated—the Association proceeded to the fine old church of St. Peter, Maneroft. The restora-tions of this church, which is one of the finest in Norwich, have here frequently noticed in the Builder, and they appeared to receive the approval of the visitors. In the evening a converse scione was held a statement of the statement of the statement of the statement of the visitors. Builder, and they appeared to receive the approval of The Dutch obtained a grant of the ended in 1025, the visitors. In the evening a conversatione was held at the Guildhall, at which Sir Fortunatus Dwarris read a paper on the privileges of sanctuary formerly ac-eorded to churches, and their precincts, monasteries, do not seem to have been beloved by the citizens to this paper, which displayed great eruition and served frequently as places of refuge for felons. The

research, on a future occasion. Mr. J. R. Planché also contributed a paper on "Raoul de Gael, first Earl of Norfolk." On Incsday moraing the first object visited was St. Andrew's Church was next visited, and copies St. Andrew's Hall, a poition of the old convert of the Black Friars. Here Mr. Petigrew read a paper On Tnesday morning the first object visited was St. Andrew's Hall, a portion of the old convent of the Back Friars. Here Mr. Petitgrew real a paper which stated that the great hall of St. Andrew, now used for rivic, festive, and charitable purposes, origi-nally constituted the nave of the conventual building. make on the resolve, and chain and purposes, origi-nally constituted the nave of the conventual building, and that which is known as the Datch Church formed the choir. The periods embraced by the luiding were the Decorated and the Perpendicular, and it did not, therefore, hay claim to a very early date. The extellment of the monstic orders in Nowrich must he ascribed to the thirteenth century. The Black Friars, or Dominicans, took the lead in 1226; about the same time probabily the Grey Friars or Franciscans appeared : the White Friars or Caundites were thirty years later; and the Augustine Friars as late as 1290. Limits were in 1230 assignd to the Black Friars of Norwich and those of Dunwich, the former being assigned the county of Norfolk to beg in. In 1262 the Black Friars of Norwich received a bull from Pope Usan, directing them to preach a crusade for the relief of the Holy Land, at that time overrun up the Tartars. To such an extent was the obtaining of mony carried, that by a bull the friars had given by the Tartars. of money carried, that hy a bull the friars had given to them the power to absolve all who for laying violent to them the power to ansolve all who for laying volume hands on religious persons, and for huming of charches and other religions phaces, &c. were under scattence of excommunication, provided they made satisfaction for the damages door. The Black Friars first established themselves on the other side of the river (Wensum), The onimage shows in the black grants first extentions of themselves on the other side of the river (Wensum), and, in 1307, they removed, having obtained the bouse of a smaller printential order, the Friars of the Sock. The first house, according to Kirkpatrick, was on the north side of Collegate, near the chanel of St. John the Baptist, over the water. This church they possessed about the year 1250, and there made their unoastery, extending it from time to time. In 1307 they obtained the house of the Friars de Peni-tentifi, and the former habitation was then called the "Oble Pierces Yerde." The second house was obtained upon the suppression of the Friars de Penitentifi by a charter of Edward H. Ly which they held their habitation by the payment in capita of 14d yearly. In 1333 a complaint was made on the part of the criticas to E lward H. necusing the friars of having, to the detriment of the city, obtained divers hands and tenements without inquisition. Au inquiry was ordered into the matter, but in 1345 a charter was granted hy Edward H. Lowfaraing to the friars all their new acquisitions. In the midds of the charter was granted by Edward 11. contraining to the frars all their new acquisitions. In the midst of the large extent of land they thus acquired they built their church, on the north side their cloiters, and next the river side their multhouse and brewhense. The ground on the south side of their church they heart soid the care for soft bids of their church they the ground on the south size of their entrief flags, kept voil, to serve for a large preventing yard. The church was extraordinarily large, as sepulture in such buildings was coveted by rich persons, who gave large soms of money for the favour. The earlier pert of the building belangs to the Decorated period, includ-ing the beautiful portion known as Beeket's Chappel. A frace church is consistent to be beau here built Ing the beauting porton known as becaute s Chapter. A finer church is conjectured to have been built between 1345 and 1350, but the curvent was burnt down in 1413 or 1414, and the moules were obliged to return to their former house, from which, in 1440, another fire expelled them. They then returned to St. Andrew's parish. The church was rebuilt in a more simptions meaner in the reign of Henry VI. The canvect review bencfactions from others not The onvect received benefactions from others not desiring burial in the church, and the friars parcelled out their own merits to snel as should be included on purchase them hylr iters of confraternity. The number of the credulons in such matters appeals to have been considerable. The friers carried the instruments about or the creations in such matters apreads to have been considerable. The frins carried the iost unents about with them, a blonk being left for the insection of the recipient's name. The records of the monastry showed that, in 1470. Isahella, the Qurcen of Edward IV, together with ber dangthers and suite, lodged therein. The Black F-inrs of Norwich was one of the few conventual cataldishments which escaped denolition in the reign of Henry VIII., but in 1540 a charter was granted by that king, by which, in com-pliance with a request by the citizens, the whole house and site of the convent were granted to them upon payment of 81/, and 9s. studing per annum into the Convut of Augmentations of the Herenness of the Crown. Possession of the land was not obtained, however, without a further payment of 152/, four years afterwards. In the holl, the citizens, with the mayor, ableemen, &e, were wont to assemble on public days to bear mass, but in the first year of Edward VI. the proceeding was put down by Act of Pauliament.

days to bear mass, but in the first year of howard etc. the proceeding was pat down by Act of Pailiment. The Dutch obtained a grant of the chanel in 1625, and it has continued from that time. Other parts of the conventual building were appropriated as granaenes.

was also dirreted particularly to the cost window

was also dirreted particularly to the east window. About one o'clock the party essembled in St. Luke's chaped, at the cathedral. Here Mr. II. H. Barnell gave some historical details of the saverd edited through which ha afterwards conducted his anditory, adding further view cone explanations in Jesus chaped, and at other points. With r-ference to the oriflee in the root above the nave, from which it was alleged that a man hid been let down to represent a flying angel, Mr. Bornell signed, that, from the small space, a men could not be swing safely, so that the experi-nent could have heen nave, from which experi-nent could have heen trid - ray one. The Rev. J. Builwer observent that in Ron an Cathel's churchs at Madeira and Lisbon he had seen rese leives and broom leaves florown down from the roofs over the rongrega-tions. Mr. Burnell side he had seen a shower of bay leaves from holes in the coil ng of a clourch in Rome. Mr. Planché expressed his quinion that the fact ought not to be ignored, that these was a record of a man having been paid to descend from the roof as an angel. It might have been done at a particular erromony, and not repeated.

From the cathedral the transition was easy to the epis-opal place. This building has an unpretrading exterior, but possesses some interesting historical as-ociations. It is situated on the north side of the as-ociations. It is stanted on the parth isde of the precinets, and is repart to have hece created by Bishop Solmon, in 1313, npan the site of a former building. It suffered greaty during the divil wars, and the great hall was converted into a meeting-house during that function priod, while other por-tions were bet off. In 1655 to great hall, which is 110 feet long and 60 feet wide, was demonsted ; but to the Restancing them, the world, a mained the at the Restoration Bishop Reynolds repired the building at considerable expense. The 1-pase of time-has now rendered for the repart of so of a minor character necessary in several of the apartments, which are a several of the apartments, which is the several of the several of the apartments, which are a several of the several of the apartments, which are a several of the several of the apartments, which are a several of the several of t contactor necessary in several of the aparimetics, which wear rather a dingy air. The B slop, not bring in Nerwich, was not able to receive his visitors in person. The kitchen of the palace, by the way, is a large and hely apartment, with a vaniled roof, and appears to possess great cultury capabilities. Leaving the palace, which i oscesses some pleasant cardens, the company proceed to inspect some of

Encurs, the company proceeded to the peer sound of the numerous churches of the city. The incluses heat of the weather greatly reduced, however, the numbers of the party. Those who I al sufficient persistency to press an were greatly struck with the exterior of the church of St. Mireard, at Coslans, which is a hermiful specimen of dintwork, inhibit with other material material

material. The remaind: r of the athernoon was occupied with an excursion to the Remain temains at Caistor, Copies of a letter by Mr. Hudson Garney, contending that Norwich, and not Caistor, was the site of the Venta historical and descriptive paper, in which he favoured Mr. Garney's conclusion Mr. Vere Irving (Scotlind) appeared to incline to a contrary opinion. Sir John Ballean described the results of some exervations which hed lean dwist in the source of which hed led Bollean discrime the results of some externations which had been made on the spot, and which had led to the discovery of a square building, the floor of which scened to have been correlly heaten down. No conclusion could be arrived at with reference to the object to which this building was supplied. In the evening another conversatione was held at for the evening another conversatione was held at

In the evening mother conversazione was held at Norwich, when the most question of the Venta Leenorum was again disensed, and alijourned. A paper by the Rev. Dr. Husenbith (R.C.), on sacramental fonts in Norbik, followed. The term "sacramental fonts was used to design to those baptismal fonts in old churches which are ornamented with semptures of the seven sacraments of the Roman Catholic church. A can concern use more that the Rev.

sattry old churches which are ornamented with seniprocess of a of the seven sear-ments of the Roma Cotholic church, suite, A few remarks were offered, in a paper by the Rev. as one Beele Poste, on some representations of misrtels in sende early painted glass, foran rly in St. Jame's Conrich, 1540 Norwich, and Mr. W. II. Black (paleographer) denomination be hid male of the records while the norms seribed a short examination be hid male of the records in the possession of the D.an and Chapter of Norwich to make a further investigation. Errly on Wolnesstay morning; the members entained, therd on a toffions railway journey -48 units in three hours—to King's Lyun, where they arrived shortly the date the orden of the Chapter of the Red Monot, and afterwards to the Grey Frins Tower. The Red Monot, and afterwards to the Grey Frins Tower attracts of an octagonal will of not brick, with a concilorm chapel insile, measuring, from est to west, steries in the larbor. Shortly after eleven o'clock, a steries metting was held in the a-semily room of the remembers the article which stress as a land-mark to reside entermines the methy which in the methy which stress as hand-mark to reside entermines the stress and the harbour. regali , seals, charters, and other ancient documents regal's, seals, charters, and other ancient documents were arranged for inspection. Observations were offerel on these charters by Mr. W. H. Black, who possesses an extraordinary power of reading old modkish Latin, Norman French, &c. Mr. Plauché made some remarks on the sword reputted to have been taken by King John from his side and presented to the corporation of Lynon. As regarded the bilt of the sword, Mr. Planché considered the decoration was che die al Havan VIII. the black was not of the of the date of Henry VIII .: the blade was not of the of the date of Henry VIII.: the blade was not of the time of that monarch, and was probably an older one. With reference to King John's cap (now at the Man-chester Exhibition of Art Tressures), Mr. Planché said he must throw over the idea that it was presented to the town by John, because the whole of the decorato use town by John, beened the whole of the decond-tion and the enamelled figures were certainly as late as the early part of Edward III. It was possibly an obit cup. Mr. Alan Swatman, who had communicated a good del o local information on other subjects, said he hoped shortly to be able to establish Mr. Planebé's theory by a neurosci of the records of the Trinity the noped solving to be note to establish Mr. Finite s theory by a perusal of the records of the Trinity Guild, to whom the cup belonged. A "ducking slool for scolds," which was exhibited in the room, attracted some attentiou; and the party next pro-ceeded to St. Margaret's church, a noble pile, capable of scating from 1,000 to 2,000 persons. The interior of scating from 1,000 to 2,000 persons. Its rather a metropolitan tuan a second some resentance, and in its general features presents some resentance, of Janue to St. Martin's in the Fields, although, of Janue to St. Martin's in the Fields, although, of course, the defails are widely dilierent. At the end of the chancel is a fine circular window with ten trans-verse nullions. At the west end of the church are two lofty towers, from which a wide bird's-eye view can be obtained of the town and barbour, and of the vast tract of waste land, now in course of reclamation—the Wash of former times, in which King John is said to have not with dime if the terms. have met with dire misfortunes. There is said have been originally a lofty tower or lantern at the intersection of the cross sisles, and a high spire also surmounted one of the western towers, which display Surmounted one of the western lowers, which tappad different siyles of architecture. St. Margaret's church and priory were founded by Herbert, Jishop of Nor-wich, in the reigo of William H. and dedicated to St. Mary Magdalen, St. Margaret, and all the maideo spints

After luncheon at the Globe Hotel, the party pro-ceeded in onnuibuses to Castle Rising. When they had nearly reached the Castle, the Rev. James Bul-wer, who was on the top of one of the onunihuses, was unfortuated the cap of one of the provide a sthe vehicle passed sharply round a corner. The rev. gentleman sustained a simple fracture of the right leg, and his system was also a good deal shaken. He was removed at once to Lynn, and Mr. Pettigrew followed him iu a carriage, kindly placed at bis dis-posal hy Sir W. Fiolkes, bart. The melancholy acei-dent produced much gloom and depression, hut after a short interval Mr. Data it. Castle," Sir Fortunatus Mr. Pettigrew, "On the Castle," Sir Fortunatus Dwarris being called to the chair, that is to say, to a central standing position among the little knot who assembled on the green sward, between the ruins and the monod by which they are surrounded. The writer described the Castle, in his paper, as an illus-terion of Norman castramention. Various possesshort interval Mr. Black read a paper prepared by Mr. Pettigrew, "On the Castle," Sir Fortunatus sions which the Conqueror had bestowed on his halfsions which the Conqueror had bestowed on its halt-horther Odo, the Bishop of B-year, were, upon Odo's rebellion against William Rafus, transferred to William D'Albini, to whose son the ervetion of Castle Rising was attributed. William D'Albini married Adeliza, the widow of Heory I, and then assumed the till of Let of Amruda buy was of grammade avanta title of Earl of Arundel, but was afterwards created the Earl of Arundel. The eastle passed to the four co-heirs of Earl de Warence and Surrey, in 1243; and, mon the partition of estates, the eastle and manor of Rising were assigned to Roger de Montault in right of his wife Cecily, whence it descended to Robert de Montault, of whom, and his contests with the corporation of Lyan, Mr. Statman had given a very interesting account in Harroh?'s "Castles and Convents of Norfolk." By various hands it varied themath, the family of the Dirkes of Norfolk. title of Earl of Arundel, but was afterwards created the Earl of Arundel. The eastle passed to the four and Convents of Norfolk." By various hands it passed through the family of the Dukes of Norfolk. and oow helonged to the Hon. Mary Howard, widow of Lieut.-Colouel Fulke Greville Howard, second son of the first Viscount Templeton. Mr. Harrod suspeeted, from the similarity of the arrangements in the castles of Norwich and Rising, that the same architect designed both of them. At one time Castle Rising was in the possession of "the she-wolf of France," was in the possession of the electron of change Isabella, queen dowager of Eugland, and here, by some chroniders and historians, her imprisonment and death had been affixed, but Mr. Swatana questioned the accuracy of these opinions. Indeed, it had been pretty clearly proved that her death took place at Hertford. The castle itself was huilt within a circular lett'ord. The cash i sized that her death took place as proce, inclosed by a hank and a ditch, and additions as dheco made to the cashe, east and west, under a milar arrangement of carthworks. The parts now space, remaining consisted of the great tower or keep, the chapel, the gate-bouve, and the walls of the constables lodgings, a hrick building of the time of Henry VI.

The destruction of the castle apartments was rapid, for, in the 22nd Edward IV., "there was never a house in the castle able to keep out the rain-water, wind, or snow," and in the 19th Heory VII, various parts were under reparation. With the destruction of walls, the whole area of circular work was buried several feet deep, and Colonel Howard removed many thousands of loads to level the earth about the great tower to the hase line of the building. Sum discus-sion followed on the residence of Queeo Isabella at the castle: and it annered to be the general oninion the castle; and it appeared to be the general opinion that it was a kind of honorary imprisonment. Mr. Alan Swatman having afforded some curious informa-tion with reference to a law-suit between Lord Montion with reference to a law-sub between Lord Mon-tanit and the townspecopic of Lynn, in which the latter were cast in 3,000?. damages—an immense sum in old times,—Mr. C. E. Davis added a few further *vint toose* comments on the castle, and also referred to the remains of an ancient church in the mound, probably of the date of the chosenth canture, and of the second the remains of an ancient church in the mound, probably of the date of the eleventh century, and of the same form as the small churches in Ircland. The company then passed up the broad staircase of the castle, and gazed down ioto the great hall, once, no douht, a scene of pomp and spleadour. *Quantum mutatus* 1 There were fowls "clucking" oo the floor, and straw was littered down in one niche for some domestie animal. There was, however, scarcely any time was liftered down in one mene for some uouesne animal. There was, however, scarcely any time allowed for moralizing on the scene, as the time for returning to Lynn had nearly arrived. A hurried visit was, nevertheless, paid to the parish church, which has known before restored in the highest possible which has been lately restored in the highest possible style, and elicited warm expressions of admiration. Lynn Station was reached at last, and, after three hours' tedions jolting, the combined afforts of the East Auglian and Norfolk Railways deposited the tired exensionists at Norwich. With highly commeudable perseverance and energy,

the party re-assembled at nine o'clock in the counchamber at the Guildhall, where a paper was read the gates of Norwich, interesting specimens of the protective erections of the thirteenth and fourteenth centurics. The city suffered so much by the rebellion of the harons in the time of John, that it became necessary to surround it with a wall, gats, hulwarks, &c. for its defence. The huilding of the walls was commenced io 1294, and hence the castle, as a defence of the city, hearne neglected. A murage, or wall-tax, was levied, and continued for three years, when a patent was passed for another; and various imposts of a similar character were made, until the walls were finished. Eleven of the gates or imposts of a similar character were made until the walls were finished. Eleven of the gates or houses were standing in 1786; but the twelfth had heen removed when Biomfield wrote in 1741. Eight of the gates were taken down in 1792, and the remainder in 1808. The Boom, Couis'ord-gale, Ber-street-gate, Brazın Door, St. Stephen's-gate, St. Gie's-sarte, St. Becodiet's gate, Higham-gate, St. Martin's gate, St. Augustine's-gate, Magdalen-gate, and Pockthorpe-gate, were fortified places, capable of accommodating several men, and were built evidently for defeuce, having been of substantial masonry, embattled and crenellated, with machicolamasonry, embattical and creneliated, with machicola-tions to enable those within to assail whenever might attempt to enter. They had also portcullises, lars, &c. At St. Martio's-gate there were ten hattlements; St. Augustine's, twelve; Magdalen, thirteen; Poek-thorpe, ten; Cooisford, fourtreen; Ber-street, twenty-seven; St. Stephen's, thirty-eight; St. Giles's, fifteen; St. Poreview, enter a stress of the stress of St. Benedict's, sixteen; and Heigham, four. The Boom towers constituted points of control over vessels poing up the river. A paper was next re: d hy Mr. Ewing, "On a Careing from Sir John Fastol?" House at Norwich." Mr. W. II. Black made a verbal report of his examination of the documents belonging to the corporation of King's Lynn ; and notes h heen compared of the day's proceedings, the Associa tion adjourned till Thursday morning.

Here, for the present, we must pause. arrived at a central point in the proceedings of the Association, and must defer our notice of the excur-sions to Great Yarmouth, West Norfolk, and Ely.

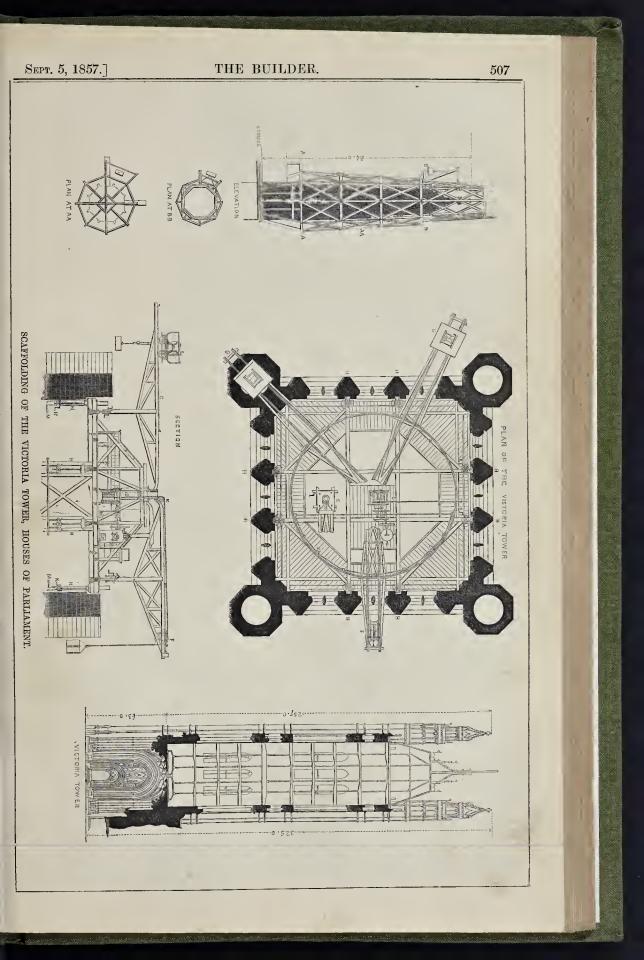

SOME DESCRIPTION OF THE MECHANICAL SCAFFOLDING USED AT THE N PALACE AT WESTMINSTER.* THE NEW

WE now come to the Clock Tower, and I have in the outset to remark, that the principal peculiarity of the scaffolding used in this and in the Victoria Tower is, that it rose with the building, being, if I may so express it, self-raising and self-adjusting. The other great peculiarity of all the tower senfolds consisted in the employment of steam power to hoist, the steam engine heing placed at the top, and close to its work, instead of at the bottom, where it would generally be fixed. In the erection of the Cluck Tower the stone fixed and other materials were raised inside from the ground to the summit, so that, there being no appearance externally of a scaffold or other contrivances, the tower seemed to grow, as it were, by some inherent

vital power. There is in the interior a shaft, iutended to be eventually occupied by the staircase and a lift

to be eventually occupied by the sufficuse and a intra-machine: advantage was taken of this shaft to raise all the materials by machinery. Main bearing beams, framed of whole timbers 2 feet 3 inches deep, and 14 inches wide, bolted and strengthened, were stretched across the tower walls from east to west, and on them rails were haid turned on at a sub-ensuring. These however, bod moints of up at each extremity. These bearers had points of support on six blocks of east iron with screws, which could be raised at will, as hereafter described. A secondary frame of timber or traveller moved on the rails just mentioned from east to west, and on this second frame other rails were laid, on which the small travelling erab or jenny, used to set the stone, &e. moved. Means were provided to enable the man &c. moved. Means were provided to enable the man in charge of the erab to move it and himself along, with or without a load, by turning a windlass, having a bevel wheel in connection with the axles of the traveller, and similar means enabled him to move also the main traveller mentioned above. Thus every facility was provided for the worked stone being lacity was provided for the worked stoole doing moved to any part of the tower walls in suspension, and without handling. A further contrivance was necessary, however, to raise it from the ground. To effect this, two strong queen-trusses, the length of the shaft or chamber above alluded to, and separated as much as its width would allow, were suspended to hunch how the same her would allow, were suspended to the main hearers by means of wrought-iron holts 13 inch in diameter, passing through the nprights and sill-picces of the trusses, and through broad cast-iron plates under the sills: 4 inch plauking was then laid oo the same sill-pieces, having in it an aperture sufficiently large to allow the stone, &c. raised to pass similarity hage to allow us block per used a perturbation of through. Immediately over this aperture, and rest-ing on the head of the trasses, was the pulley F, over which the chain tackling used passed to the ground. A portable steam-engine (Gongh's patent) of 2_2 -horse power was fixed on this platform at one extremity, with a driving band from its fly-wheel to a large with a driving band from its fly-wheel to a large drum, II, about 3 feet 6 inches in diameter, at the other side of the platform; and round this drum the chain was coiled and uncoiled. From this description it will be readily seen that worked stone, bricks, sand, It will be readily seen that worked stone, one seen on water, iron, & we were raised from the ground up to and through the apertare in the platform. In the case of a hlock of stone, a small travelling truely, moving on rails laid on each side of the aperture, was moving on rais laid on each side of the apecture, was roo under the block, which would be deposited on it to allow the chaio to be free for another descent: meanwhile, the crab first described, having been irrought over the hlock by means of the arrangements already detailed, would lift it and deposit it on the hed prepared for it on the tower walls. The small truck would be run hack to allow mother stone to be raised through the aperture in the engine platform as before, and the setting would proceed with such before, and the setting would proceed with such rapidity that, to keep one setter at constant work at tapinity that, to keep the exist at to preparing stone at the top, forty men were constantly preparing stone at the bottom. It has been found in practice that, with an ordinary framed scaffold and traveller, one man will require twenty-five masons preparing stone to keep him supplied, while, as just stated, by the use of keep bim supplied, while, as just stated, by the use of the steam-engine, one man required forty to prepare stone for him. What would be the proportion when the old system of poles and ropes is næed I have not ascertained, but it would prohably prove as far behind the framed scaffold, with the traveller worked by hand, as that is behind the powers of a scaffold where steam power is made use of. It only remains to point out the very simple means of training the whole of this have is indecise of. It only remains to point out the very simple means of raising the whole of this plotform, with its engine, erah, travelling transways, &e. the weight of which altogether, without any materials upon it, was about sixteen tons.

The main bearers were long enough to bear from wall to wall. At the six points ordinary jack-serves were placed, with solid large blocks of rinn at the top and hottom of each, through the latter of which the screw could pass. A nut or collar worked on the screw, hoving sockets to receive the ends of the iron bars used to screw it up or down, which were used in the sume way as capstan hars. Now supposing the main berers to he resting on the walls, as shown, the jack-screws, having their nuts screwed hard up to their heads, would he put in their places, the walls under three bearings being built up to their under sides. All six screws would then he worked simul-taceonsily, and the whole arrangement, platform, en-The main bearers were long enough to bear from taoeonsly, and the whole arrangement, platform, engine, and all, would he raised up at once about $3\frac{1}{2}$ feet, that being the length of the screws. The tra-vellers being then three feet clear of the tower, three feet more of the work all round could he set, and then a fresh lift would take place; though it is obvious that by blocking up the main bearers from the walls, two or more lifts of three feet each could take place before setting the masonry was resumed, when such a course was found in some cases to be more convenient. In this way the whole of the stone work of the Clock Tower was raised and set, and when that was fluished, the same power raised the iron frame-work, beams, and plates, of which the

upper part of the roofing is formed ; but to fix which,

upper part of the bound is formed, but so that where, the simple scribed of poles and ropes, elevarly braced, which still exists, was used. The cost of the senfold, with the engine and un-chnery, may be roughly stated at about 700%. It raised about 30 000 cubic feet of stone, about 300 raised about 30 000 entire test of stone, hour sour roads of brick-work, besides many toms of ir-n and other matters. It did all this so quickly and con-tinnonsly, that there was no excuse for the workmen, either below or above, wasting time; whilst its mani-fest eronomy and precision of working need no further illustration. The dimensions of the CLeck Tower are as follows :---

External dimensions on plan, average for the whole height, 40 square feel

Height to the cornice helow the click . Height thence to the top of the stanc-work 160 ft.

Reight of the metal roof containing the bell-chamber 103

Total height . . 314 ft.

Before quitting the Clock Tower I may advert to Before quicing the Clork lower 1 may accel to the extraordinary reports a short time ago created, that it would be necessary to raise the great hell from the outside, by means of a special scatfolding, at the cost of several thousand pounds,-only to say, that of course the subject hail not been overlooked as was charitab'y suggested, but that arrangements had been made from the commencement to mable a bell as mide from the commencement to fratme a term as large as was considered appropriate to be raised up the central shaft of the tower, and that at this mo-ment all the appliances of tacking, erab, engine, &c. are properted and waiting for the proper time to arrive, when there is no doubt that the bell will be raised with certainty to its permanent position in a doubt derived by the set of the set single day.

VICTORIA TOWER.

At the Victoria Tower much the same principle of At the Victoria Tower such the same principle of arrangement, as far as regards the position of the steam-engine, and the rising frame-work of the whole, was made use of, th and the much larger dimensions of the standard come important differences. The internel dimeter of the tower is 51 feet, and over to over of the tarrets. 70 feet. In the first place, a strong trusted frame, over the whole area of the machinese, and sufficiently stiff to here being the machine, and sufficiently stiff to hear being raised at once by the serve power without any racking or straining, and consequent disturbranked by the serve power without any racking or straining, and consequent disturb-ance in the position of the appratus upon it. (See diagrams.) This framing consist of single balks of timber, 51 feet long, and 14 inches squire (very num and specimens of timber). Three beins or sole picces, AAAA, consent the area as shown, while similar pieces were placed all round close to the similar paces were paced an round cover to the inside surface of the walls; disgonal braces at each corner, ZZ, tiel all tegather on plan, and the fur beams crossing the centre of the tower were strongly trussed, both above and below, the latter being neers: sary to accist the neward strain on the centre shoul all three travellers be possibly loaded at the sam should That the whole arrangement was thus rendered time. perfectly rigid and st.ff, the experience of constant use lor nice years has shund atly proved. A circular cast-iron rail was next laid on the framed platform, while part of the framing was covered with 22-inch planking, and defended by a hund-tail for the safety planking, and defended by a hrnd-tail for the safety of workmen; and on this at C the portable engine of six-borse power was placed, with its drum at D cun-nected by gene work with the driving which of the engine. As the lower part of the Victuria Tewer, which coataius the roy-1 entrance, is groined over with stone at the height of about 63 feet from the ground, the materials for hnilding the naper part could not be reised inside, as at the Clock Tower, and the made adapted as shown in the discreme was the the mode adopted, as shown in the diagram, was the An under trussed parallel framing or ler was formed, moving round a hollow pivot in the centre of the good of and extending over and dear of the walls. The kmg-posts of the under transce were in faut franced treats(s, or could share less, bolted t gether and strengthened so as to be perfectly wird as if the strengthened so as to be perfectly rigid as if in one piece. Each leg of these trestles had grooved wheels at the foot, which ran on the circular iron rai on the main platform first described, thus enabling the whole to radiate round the entre.

A pulley wheel, 4 feet in diameter, was attached to e framing at F, char of the outside of the tover the walls, and a similar one was fived over the other of the bolt over the hollow centre pivot above refer ed to: over b th of these the chain from the engine drum worked, and raised stone, kricks, smul, &r. f om the ground, which raised stone, tricks, simil, &r. f om the ground, which were then deposited tither on the walls or on the planked platform in the angles, such the chain was set free for another descent. There was also a contriv-ance, indicated in the diagram, to connect the heisting traveller, when required, with the ragine drum, and to move it and its load mand on the viscalar trau. rail to any spot on the top of the tower that might be most convenient for deposit at the moment.

To set the stone so raised, there were two other To set the stone so raised, there were two other radiating framings or travellers, 6 (5 formed in like manner, and also moving round the centre by wheels running on the circular transmitted to the main framing. These travellers were of such a length es to extend to the outside of the angle tarrets, and they could each command one-half the area of the tower, reading with the sum time with the set of the tower. could each command one-half the area of the lower, working at the same time with the setter to each. On their upper beams rails were placed, on which the crob-engine pass d to and for. It will be evident that by this arrangement every purion of the tower walls could be reached, and the stone raised by the boisting exclusions it does in the above more of for it with could be reached, and thest-merissed by the boasing machine ys at down in the place propert of or it with the great st mosty. To raise this huge platform, with its engine, radiating tracellers, &c. weighing nearly forty bus, the following means were adopted, which proved perfectly encessful to the null of the works. At the points, II II H H, guid- and bearing timbers were releast unstitution. At the points, II H H I, guide and bearing imbers were placed vertically, complet together with balt-hules at intervals. These were scarfed and braced together, in heights of 12 feet, as required, and serves very cavefully made, 33 inches in di meter and 6 feet hung, with solid head pieces to fit nucler and grip the timbers of the main datform, were placed between each pair of these guide-posts. By means of a bevel phinon wheel with a winch handle, K, working through o and at their lawar extremution the handle, K. a unt at their lower extremity, the large screws could be raised or lowered with ease and certainty, and with the need of lowers will descend the characteristic, she will be then the nin platform, the ends of whose timbers rested, as will be seen, on the serew heads. This operation was carried on by lifts of 6 feet each, a mun-being valued at each serew on the platform, M (which being valued) to the nut of the serew, rose as it rose), and all inring simultaneously, the whole mass was raised s'ep by step, as required, up to and above the top of the tower passpet. It should be mentioned, that to provide against only serions ageith ut, from dis-arrangement of the lifting screws, for in-tance, slots arringement at the firing strews, for firstance, show or chases, 14 inches wide and 9 matrix drey, were left in the walls of the tower at the ends of each of the main beams : these were earefully built up in cement as the seaffolding ruse, so that the only time any foll could occur would be during the act of servering up, when of course there would be no materials on the platform to add to the weight, and any such fall, had it occurred, would have been too limited to cause any

injury. No such accident, however, accurred, nor indiced has any happened to darange the machinery during the whole time that it has been in nsc.

The Victoria Tower scaffold has often had materials on it weighing furty (ons, which, added to its own weight, make eighty tons. The Clock Tower scaffold has frequently had to carry thirty tons of materials.

One very severe trial was experienced when the rmer tower was raised to the height of nearly 200 Fiel. The workness, on leaving work, had omitted fiel. The workness, on leaving work, had omitted their usual custom of lashing one of the radiating travellers, to prevent the wind by any chance moving them. A hurrivane arose during the night and lash d the following day, and a violent gust acting mean the avoid the provident moved them a mode on the apon the radiating arms moved them round on the when the ranking arise hoved them found of the eircular rail, and blow them together with terrific violence, as may be supposed, when it is mentioned that they were 50 feet in length. The report of the The report of the that lies were of feet in length. The report of the blow was heard at a great distance, and those ca-gaged on the work fully anticipated that the framing must have been shuttered, but when they vertured up to examine, as soon as the wind abaied, it was unst satisfactory to find that no trace of humge was to be serve the whole accomposate buying mered to be seen, the whole arrangement having proved amply stiff and strong to resist the con u-sion.

Some calculations as to the cost of hour-the coals for the engine -repairs, &c. to the unchilterup may he interesting. Tury refer to the Victoria Tower, and were the result of observations on a por-tion of it 60 fc. t in height.

In this portion there are shout 18,800 cubic feet of worked stone set, and about fifty-seven rols of brick-work. Assuming the relative cost of the labour on the stone to be two-thirds of the whole, and that on the brickwork one-third, which supposition is pro-hably unarly correct, it was found that wages and repairs cost, in all, 5727, for the period during which repairs to t, in any 5.12. for the period arming whice the engine worked—equal to farty weeks—multaking two-thirds of this amount, or 4967, as applicable to the stone, gives a cost of 64d, per foot enbe, mud one-third as applicable to the brickwork, or 767.—a cost per rul of 27s. This amount does not of curse include the first

cost of the engine, which has sufficed, not for a height of 60 feet only, but for nearly the whale tower.* And when I state that the cost of this engine and teching, with the hoising apparatus, &c. was only about 1,800, and that there are about 17,000 eulor feet of stone, 1,350 rols of brickwork, and 1,190 tons of iron in the tower, it will be seen that it is of no

* The steam-engine was not used for the first \$5 feet from the ground both of the Victoria and the Clock Towers.

moment at all so long as its use materially diminishes the time of labour of the workmen. The engine required the services of an engineer

and an assistant: it was generally worked half a day, or five hours, and consumed in that time about 3 cwt. It was calculated to raise 4 tons of coal.

The time a stone (the weight immaterial) was The time a store (are the given instantial) in the task if from the ground to the top of the tower, when 250 feet high, was $3\frac{1}{2}$ minutes, including its deposit on the platforms above and detrehment from the tackling

All delays and hindrances included, the average number of lifts actually made per hour was ten, though in some cases as many as twelve and thirteen were accomplished.

The bux used to contain materials other than stone, such as bricks, mortar, lime, such, acement, &c. was so contrived that the bottom opened in two halves on releasing a lever handle at the side, so that the con-

The surface to one deposited where required without the delay of emptying by hand. -The foregoing arrangements were continued with complete success in the irrection of the Victoria Tower null a height of about 6 feet above the parapet was reached, which was as high as it was considered disturble. The desirable to raise the engine and platforms. The pinnacles, 85 feet high from the cornice, were coning track by means of a crading scaffold. The hoist-ing traveller remained as before, raising all the mote The hoistrials and depositing them on the platform at AA. The setting travellers were shortened so as to move round their pivot within the pinnacles, and they were then able to set all the stonework of the parapet between the pinnacles; and they still remain to assist in moving the ironwork, &c. that is yet re-quired for the roof.

The cradle scaffold for the pinnacles deserves some attention, being very daring in its construction, since it is entirely detached from and independent of the

mason is work. Its whole support is derived from a framed steleton platform at AA, the t mbers of which pass through the apertares in the eight sides of the planaeles. (Diagram No. 10). They are care ully bolled toge-ther, and mphedia at each angle by raking structs bearing money the work howing of the attime controls of the target the structure of the structure of the target of the structure of the s upon the weathering of the string cornice of the tower. On this framework the braced scaffold was raised. being added to as required up to BB, with horizontal ties at each stage. The plan of the apper one BB shows the mode in which these horizontal courses were hrad is on s to leave the centre perfectly free for the pinnale to rise within it. Up to 13B all the stone was raised within the pin-

Up to 1BB all the stone was randed within the plu-nacle Hs-1V, being run into it on trucks at the level $\Lambda \Lambda$, and raised by the kling passing over a pulley at the top of the senflold and connected with a crab-cogine at the base. Above the level BB, however, the plunacle gathered in, and the stone was conse-quently raised outside from the platform AA by an ordinary tackle and lall: from this point upwards the seaffold is continued high above the cap stone of the twents in order essentially to fix the crowns, with the turrets, in order eventually to fix the crowns, with the exception of which and of the roof the shell of the entire tewer is now completed. This upper part of exception of which and of the four the such of the entire to very is now completed. This upper part of the pinnacle scaffold is formed with ordinary poles and ropes, but still keeping intact the principle that it is self-supporting, and in no way resting on or touching the work. The scaffold poles look, indeed touching the work. little larger than wires from below ; but this is hardly a matter for wonder when it is remembered that from the base of the tower to the top of the vanes is no less than 325 feet.

In concluding these memoranula, which I feel sen-sible are crude and imperfect, I can only hope that I may have directed the attention of my hearers to a subject which I am confident must be considered of interest to all architetes, and very important to those who may be engaged in works of a more than ordi-naily extensive and archinous kind. I think they may also help to prove that architetes are equal, when called upon, to devise and carry out works of construction requiring originally and during as successfully as the members of the kindred pro-fes-ing of engineers. And I trust you will agree with In concluding these memoranda, which I feel sen

fession of engineers. And I trust you will agree with me that I am justified in so characterising the works I have been describing. C. BARRY.

GRAYS THURROCK, ESSEX.

In digging the chalk for lime, at Mr. Meason's, shaft, from 3 to 5 leet to donneter, is such down from 30 to 40 feet from the sun face, and at the bottom of it branch out, at equal distances apart, three cham-bers, ahout 16 feet long. 8 feet wile, and 8 feet high, double enbes, in fact, either purposely or not. In these, urns, broken puttery, and bones (of animals), appear to have been pleeed, and then earth was thrown down the shift, and closed up the ends of the apariments. Some of the pottery is unquestionably homan, with impressed medallions and architectural ornsments, while other portions of it may be earlier. The marks of fire are evident on some, and one vase, we hear, has been quito recently found there, containing a carbonaceous residuum. The least extravagant supposition is, that the shafts were sunk, and the chambers formed, it carly time, simply to obtain chalk, and that being formed, they were used as receptacles. An objector might urge that the chalk could have been obtaived with less trouble, and would give other reasons to show at any rate that further examination and inquiry are desirable.

chais could have been obtained with fess frouble, and would give other reasons to show at any rate that further examination and luquity are desirable. The universal flatness of Essex is so generally believed in, that the noble water-view from Mr. Meason's honse, with Gravesend and Rosherville on the other side to the left, comes something like a surprise: the viver seen from this point has a lake-

the other side to the fe', comis someting inc us surprise : the river seen from this point has a lakelike aspect, which increases the beauty of the scene. Chalk lime is much less used for brickwork than was at one time the ease, but for internal work the demand is still great: and a vey considerable portion of that demand is supplied from Grays Thurrock. There is a manufactory of whiting in the euting as a matural accompaniment, whiting being prepared, as most readers will remember, by grinding chalk under a runner, then washing it to remove impurities, and, lastly, drying it in lumps. America, where chalk is not easily to be had, and the love of whitewash is strong, is a good customer to Grays Tourrock.

strong, is a good customer to Grays Hatrock. Bricks were formerly much here in large quantities: and some have said that the term "gray stocks," in its original application, meant stocks from Grays. De Foet the great novelist, who of all writers made faction read the most like truth, was a brick and puttile maker here. Up to this time, the latter half of the seventeenth en ury, tiles had been imported from Holland. In Little Thurrock there are some chambers in the chalk which are called "Cunobelin's Gold Mines;" but De Foe did not find in his chalk anything similar, and becaue bankrupt, though he ultimately satisfied all to whom he was in debted. Some ornamental moulded bricks of Italian character and superior make, have been found in the neighbourhood, and preserved.

debted. Some ornamental moniade brieks of failand character and superior make, have been found in the neighbourhood, and preserved. The church at Grays is of old foundation, a Norman door on the north side of the nave, at the west end, remains in its original condition. Two arched recesses ou the north side of the chancel, used as anubries or eredence-tables, have semi circular heads; and the chancel arch, too, and the corresponding arch to the nave beyond the transcept, are both of the same character, but have hean saily messed in the restoration which was made here a few years ago. The north transcept (in the tower) has Early English openings, and would he very effective if an ugly galleyr now in it were removed. The chancel screen, of oak, remains. Externally the stonework has hear replaced with Portland coment! It is a very good specimen by the way of the material, much better than can be made sure of at the present time, and the forms are creditably kept: nevertheless, as we need scarcely say, the result is very unsatisfactory and disappointing.

disappointing. About three years ago a Mediaval tile pavement was found just outside the churchyard, and being taken up carefully, now forms the flooring of the Vestry-room: the tiles are plain, but present several combinations. They seem to be much more durable than the modern tiles laid in the chancel, which have chanced colour soldy.

than the modern tiles laid in the chancel, which nave changed colour sadly. There were formerly eight bells here; but, if we are rightly informed, when the old tower fell some 150 years ago, a provident churchwarden aold six of them to a neighbouring parish, where they may still he heard, so that there are only two nox at Grays, the largest and the smallest of the fomily, who agree but il in the absence of their connections. An old helmet, hanging in the church, a brass or too, and a piscina of early date, would each afford a text for a dissertation to those who had the wit to preach upon them.

them. The church at Stifford, St. Mary's, not far from Grays, has several points of interest. The south chapted is Early English, with a triple, while all the prominent features of the church itself are Decorded. The windows of the latter, including are Decorded. The windows of the latter, including are needed to be so in the garrets and deus of this vast Babylon. It vigorous the severe is a construction of a right spirit into the rising race of the poor, in fifteen or transparent to be so in the garrets and deus of this vast Babylon. It vigorous the severe is a construction of a right spirit into the rising race of the poor, in fifteen or transparent to be so in the garrets and deus of the vision of a right spirit into the rising race of the poor, in fifteen or transparent to be so in the garrets and deus of the vision of a right spirit into the rising race of the poor, in fifteen or transparent to the transparent to the the formers, and night centers, the old work alone, simply remore two or three brases and incide stones, of considerable interest, in this church, including amongst the former, one to Raph Perschenk, circu 1375, "quondam vertors is tists crift," with a second of the fifteenth century, representing a prist in a shroud, serified "filt'ery," a rare specimen. The indentations

of a seroll round the head and an inscription at the foot of it remain. Amongst the stones is one in memory of a De Tilberry, with an inscription in old French. There is a good piece of fourteeath century woodwork, too, put of the chancel screen: the font is Early English, on five columns: much of the stonework still shows remains of coloured decoration under the whitewash, and the iron ring on the robing-room door, at the west end of the nave, is an elegant piece of workmanship. South Ockendon, and several other churches round about, well deserve a visit, hat we must find another morning when the sun shines, and time can be spared, to look at them.

THE POOR BOYS AND GIRLS OF LONDON. CHRIST'S HOSPITAL

I HAVE heen greatly interested in the paper published in your last number (the Bailder for the 29th ut) appealing to the common sense of the people of this vast capital on behalf of its destitute children, and repeating some most interesting facts of the last days of the excellent young King Edward VI. My sympathies have been often and deeply awakened on behalf of the class for which your article pleads, and which states facts which every statesman workly the name, and every Christian whose faith is of any real value to himself or to the community, should study, nutil the means of permaneut relief to these young and helpless creatures have heen found and aclopted. Tbe young monarch of England, in the sixteenth em.

The young monurch of England, in the sixteenth century, exhibited his talents for public business in the midst of the piblicss attacks of a hit-destroying disense; and showed his matured wisdom on the verge of the close of a life of sixteen years, in a manner which might tinge with shame the checks of many rulers and their prime ministers that have lived beyond sixty. He was about to leave his earthly kingdon, and he distinguished and digniled his departure by an act of mercy to the suffering and neglected children of his metropolis. He made an immediate provision for their rescue from destitution and vice. Alas I no other sovereign has followed this noble example; and the establishment of the admirable Edward himself has been diverted, by a gradual growth of selfishness, from its original application to the necessities of the poor, and is whally usurped by the classes farabove that for whom it was as roguly interded and endowed !

metropolis. He making and immediate provision for their rescue from destitution and vice. Alas 1 no other sovereign has followed this noble example; and the establishment of the admirable Edward himself has been diverted, by a gradual growth of selfshness, from its original application to the necessities of the poor, and is wholly usurped by the elasses far above that for whom it was so royally intended and endowed ! We should sp.ak with abhorence of such a succession of robberies, if they were committed in any other capital in the world. We should denounce the people, as we have done the American reputators of the breditary defranders of the poor boys of London. The horeditary defranders of the poor boys of London. The Royal Estate, settled on them by the Sixth, the families, and is employed to educate the sons of these, the majority of whom can well afford to pay for their instruct o. If this abase must, from its long existence, he perpetunted—if it has the constitution, then we must field the usure in its constitution, then we must field the int lity of end as ouring to destroy it. It was then and to the avert of the sons of the sons of the struct of the sons of these.

germ to the initial intervention, this constrained to the stabilishment,—redeemed, indeed, by a five conient names from the charge of educational inefficiency, but altogather unvaliable for the relief of the e'ildren whose best interests were contemplated by a five context whose best interests were contemplated by a five context of the relief of the e'ildren whose best interests were contemplated by a similar foundaries and the provide the transformation of the relief of the e'ildren whose best interests were contemplated by a similar foundaries and the royal youth desired to rescue from ignorance and degradation; and let another Edward consecrete his name to England by a similar foundation —by another semilary for the desitut to boychood to London, which shall not he perverted. That now prospective Edward has large estates as Dake of Cornwall, and there continually increasing wealth. By thus complying a comparatively small proportion of it, he would secure the in the power of statesmen to obviate by penal statutes, or any other correive means. Mea will not be frightened into perment good helaviour: they must he trained in it—and they cannot be so in the distribution of the industor it statesmen to the throne is systematically tanght—and on a religious basis—to the myriads will continue to a religious basis—to the infinite private which while onitane to courre or onnset to their youth. I do not lose sight of the continuity which have an anthority which these are not equal to most the availed for the signer form missery in childhood, no instruction or commal to their provision is unade for desting the set of the provision is unade for desting the context the effective the or make for the structure of the signer of the provision is unade for desting the context the size of the provision is unade for desting the provision is made for desting the

I now turn to the condition of the little girls of this vast city, who, in so many hundreds of families of the poor, are sent to gain their living by beggary : what is to he done for them? for parish and union workhouses do not seem to meet their case. I would venture to propose similar establishments in every district of London, for the researe of these nubappy creatures, exposed to all the missies of hunger, cold, and nakeduess, and the manifold temptations superinduced by the ordinary necessities of our common nature. In numberles, or edder sisters, to entreat alms. The most hencyolent know not what to do between the fear of encouraging a dissolute mother, or as ald son, in thus destroying the moral feelings of her children, and the frar that they by refoash shall increase real distres, and induce desperation.

of her children, and the frar that they by reforsal shall increase real distres, and induce desperation. There are some, indeed, who profess never to give alms to street begars; but, for my own part, I could never understand the humanity which resisted every plex for relief, let the appearance of the supplicant, or their tale of misery, be what it might. If there were a refuge for destitute childrs in every district in which they would be instanced *negfully*, and brought up *honestly*. I there were a refuge for prisons would he materially diminished, and the expense of convict ships an item much less onerons in our national expenditure. The *Princess logal* is should to leave us for another haud, in which she will, no doubt, have an opportunity of contenting the means of relief for the indigent with those of her own country. A Christian hely tourist* and her hesband, some years since received high gratification from the sight of the children of a Royal school for the poor entertained in the gardees of his Prusian Majesty. Such asight in this country would be unique. Can we not nationally memifest our respect for the Prussian ulliance by founding in Her Royal Highness's name a school for the distitue FEMALE, CHIEDNES of Westminster, in the neighbourhood of her Royal mother's place, to be a perpetual memorial of the interest, devoted and affectionate, which the people take in Her Royal Highness's happiness? Would not the Dean and Chepter contribute of Westminster Abbey wealth to such an object, and thus resence their locabily from the appearance of that embryo vice and that signalid archeduceduces in the infant devizens of the ancient eity, which disgraces in all eyes their stately enthedral? The countribution of 2s. only pr annum, from one ullion of persons in London, would raise 10,000/, a year. This income, at a scrifter felt huancient eity, which disgraces in all eyes their stately enthedral? The countribution of 2s. only pr annum, few or none of those in circumstances to contribute to it, would pr

THE MARYLEBONE FREE LIBRARY.

This unfortunate liberary was, I believe, closed in July last, not so much to the disgrace of the public, nor of those hence/cent rich who support dit, and would, if julicionaly cauvassed, lawe no doubt helped still more, hut from, I form, mismanagement by the working committee and officers. 1, in common with many others, took a great interest in its welfore, and, as far as my humble means well, assisted both hy many books and also morey. I have seen no account of any public meeting, preparatory to winding it up, or any financial sattement, which the public were surely entited to. It tooks as if some jobbery were connected with the matter. The Bailder seemed to take an interest in the library, and I therefore write to it for any particulars that it may be able to give as to the disposal of the books, &c.; or perhaps some of its readers can furnish this. CLAN CHARTARN,

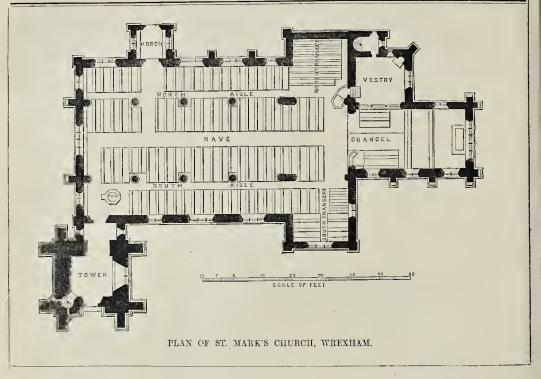

THE LATE MR. TINKLER, ARCHITECT.

Ontreany.-We have to deplore the loss of a member of the architectural profession, Mr. T. C. Tunkler, who, tafter a long and painful filess, has finished a young and struggling life. We know him to be a most persevering, amiable, and homourable man; mud at the mement he was getting into a good position, illness, which had been brought on by too much devotion to business, swallowed up his means; and, dying at last, he has lett a young wife and two children, with nothing to depend upon that the ail of those who herew him. To assist in getting up a subscription in their beh II, several gentlemen hwe volunteered their assistance; and we shall be glad to rereive the subscriptions of those when may wish to do to others as they would be done by. Some of our readers will teeolket his published sketches in Rome.

⁶ Mrs. Sherman. The Rev. Mr. Sherman, the husband of this hady, was the successor of the late Rev. Rewland Hill, of the Octagon Chapel, BlackFiars. Their reception at the Prassian Court is described in the journal of Ars. Sherman, introduced into the memoir written by her husband.

THE BUILDER.

SEPT. 5, 1857.

DIRECT RAILWAY COMMUNICATION BETWEEN ENGLAND AND INDIA.

BETWEEN ENGLAND AND INDIA. Some time ago we published a letter addressed by Mr. W. H. Villiers Sankey to the Earl of Charendon on this subject. Deplorable circumstances have since occurred to reader more apparent the necessity for has forwarded another communication to the Sceretary for Foreign Affairs, pointing out the advantages that would have resulted if the line were now in existence. "In a political point of view," he goes on to say, "such a line would be of the greatest importance because it would diminish, as it were, the distance of India from our shores, and it would then be as easy for us to protect it as it is now to defend our West Indian and Canadian possessions. We need never far its being invaled by sea; and, in the event of the should no longer have to for either foreign aggression or internal commotion.

get there at least as soon as air enemies, so that we should no longer have to fore either foreign aggression or internal commotion. The commercial considerations of my proposed route, however, are worthy of the deepest study, and are of the highest importance. I need hardly remind your Lordship that Venice, with 30,000 sailors and 3,000 commercial ships, was in the zenith of her glory as long as she could profit by the Indian com-merce through the Red Sea; and that Genca enjoyed her reign of power and maguificence during the time that she traded with the East through the Black Sea and by Constantinople; that the Portaguess hore away the prestige and the soil advantages from hoth these republies so soon as she could monopolize that trade by the discovery of the passage round the Cape; and we carselves commenced our en of commercial great-ness by availing ourselves of that facilitated commani-cation. Again, Russia, when she established the Thils route, raised Odessa, in a very few years, from a miserable fishing village to one of the most important commercial places in the south of Europe; and when, in 1831, an imperial ukase, prohibiting the carriage of goods by foreigners between Odessa and Redout kali, which communicated with Tilis, where France had already established a consul, a *portion* of that had already established a consul, a *portion* of that commerce was then obliged to follow another route, commerce was then obliged to follow another route, and the consequent suddlen increase of business at Trabizonde, in a remarkably short space of time, was quite suprising, for in 1832 exports from that place amounted to only 300,000/. Mile in 1836 they had increased to 1,760,000. Imports, in like manner, which in 1834 were only 440,000/. In two years a'terwards, viz. in 1836, amounted already to the sum of 1,720,000the sum of 1.720,000/

Again, when the Red Sea route was re-established by England, the number of letters transmitted be-tween England and our Indian empire was more than doubled by the shortening of the journey; for the year before the change, only 300,000 were despatched, while in the following year, owing to what is called the 'Orerland Mail,' 680,842 letters were trans-mitted, and goods would go the same way were it not for the expense, and constant necessity of changing of conveyance, which is always alternating between land and water. Still gold and silver, and precious stones, follow the shorter route as it is, notwithstand-ine the disadvantages and inconveniences they have to ing the disadvantages and inconveniences they have to contend with.

Should, however, the railroad I propose be exe-cuted, effecting a thorough land communication all the way from England to Iudia, our conumerce would increase to an extent unknown in the world's history, and nothing then could interfere with our East Judian doming then could interfere with our East Judian dominions. If, however, the British Government does not establish that communication, other nations most assuredly will.

In 1814, when the East India Company's monopoly was in existence, the sum total of merchandize leaving the shores of Great Britain for the account of the company amounted to I,874,000*l*; when these privileges were partially removed, the exports increased to 3,495,300*l*; and in 184I, when that monopoly was entirely taken away, they increased to 5,600,5761."

IMPROVEMENT IN STREET LAMPS.

No one would suppose that there was much room for artistic effect in the mere painting of a street lamp-post, but if the column and framework of the lamp are painted red, and the post a bronze ground colour, they have a very handsone, but by no means gaudy sppearance. Some painted in this manner may be some at Work bill Without gaudy appearance. Some paint he seen at West-hill, Highgate.

Another variety would be to paint the base of the post black, the post itself stone colour, and the column a very pale blue. Almost anything would be better than the dirty white with which they are periodically daubed.

The effect of an improvement may be seen upon The effect of an improvement may be seen upon a small seal act West-hil: if extended generally through-out the metropolis, it would produce a more remark-able change for the better in the appearance of the streets than can at present be imagited, especially in straight thoroughfores like Portland-place, Pall-mall, and others. The increase in the cost would be very trifting, as all common pigments are much about the same nrice. H. W. COOKE. same price.

ST. MARK'S CHURCH, WREXHAM.

In the middle of last year the works con-nected with the erection of this church were commenced. The edifice is situated at the entrance of the

The curve is structure to be under of the control of the town of Wrexham from the railway station, and it consists, as will he seen by the ground-plan, of a nave, 88 feet 6 inches long, by 23 feet 4 inches wide, and 65 feet to the ridge of the roof; north and south aisles, each 70 feet 6 inches long, hy 11 feet l inch wide; north and South transpis, cach 18 feet by 20 feet, and 50 feet to the ridge; and chancel, 37 feet long, by 19 feet 6 inches wide, and 52 feet to the ridge of roof.

On the north side of, and separated from the chancel hy a wood screen, is the vestry, 15 feet by 16 feet, over which the organ-chamber is constructed.

constructed. The tower, which is 26 feet square at the hase, and when complete, including the spire, will be upwards of 200 feet high, stands at the south-west angle of the nave. Through this, and a porch on the north side of the huilding, at the transmission surface set to the obverse are the two principal entrances into the church. All the walls are executed in coursed ruhhle

of Cefn stone, with Bath stone dressings. piers which support the nave arches are executed in Cefn stone, with moulded caps and bases.

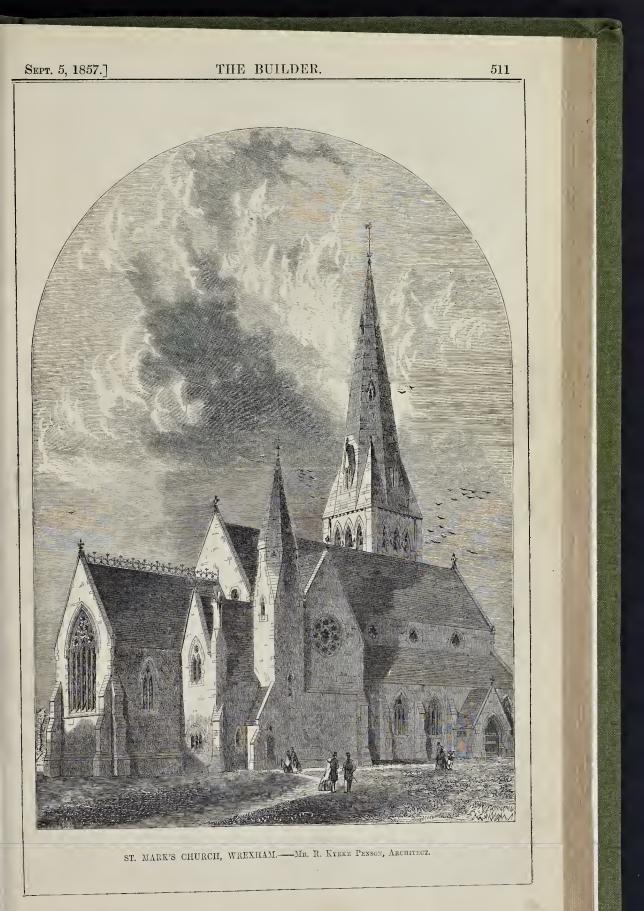

The whole of the roofs are formed of Memel fir timber, open to the ridge, and plastered between the rafters, thus leaving all the timbers exposed to view, and are covered with Stafford-shire tiles. The chancel roof is decorated with since thes. The connect root is decorated with a lofty ornamental metal ridge. The timhers of the roof, and all the internal and external wood-work, is to he stained a light oak colour. The pulpit will be executed in Bath stone. The floors are to be laid with black and red Stafford-bins the shiro tiles.

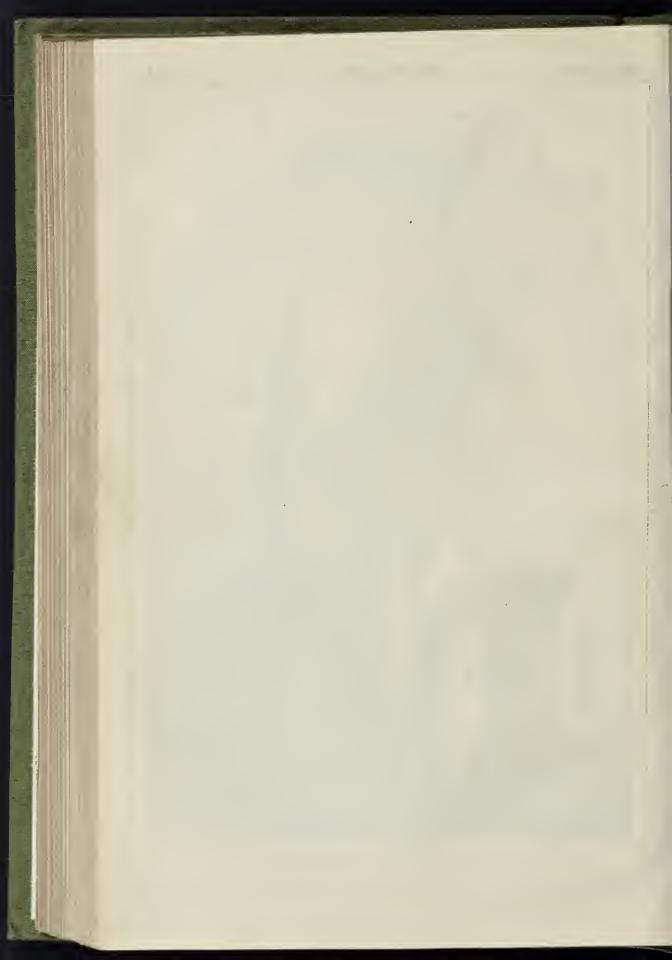

The style of the huilding throughout is the Decorated.

The works are progressing under the super-intendence of the architect, Mr. R. Kyrke Penson, of Swansea, and at the close of next spring, or the commencement of the summer, the whole will be completed.

The contract was taken by Mr. Ehenczer Thomas, of Menai-hridge. The entire cost will be about 6,000% and the church will be capable of accommodating upwards of 800 persons.

510

RAILROAD BRIDGES

In public works, now so numerous in the metro-polis, it is lamentable to see how little regard has been had to the architectural effect of those which are the most patpahle and obtrusive, the railway viaduets

has to be articled at other of those which are the most palpable and obtracts of those which are the most palpable and obtracts of the railroay vialateds that treaserss our causemasts. It is had enough that imperious accessity demands for public convenience the foreclosure of all prospect, and the barring out of the breeze; hut it is unnecessarily golling when an open crassoway is intercepted by a forwoing and de-formed mass of purposely missiappen brickwork. Railways are, in the initiative, mere matters of speculation they are subscribed to by individuals anxious to make money; contracted for by profes-sionals tolerably some to do so; and carried out hy officials, commonly not regardless of profits : therefore, beyond the solidity of structure and durability of plant and material, no attention is devoted to them; nor does the appearance or effect of masive crec-tions receive the smallest regard from any one con-cerned.

In extensive ranges of arches at high elevations, it is impossible to avoid some symmetry of form : the Roman aqueducts, of which three yet remain, extend-ing across the Campagoa, each exceeding 20 miles in length, and visible uotil the line is lost in a thread: even three, though erected for darability only, seem relieved to the eye in the sequence of arches: many portions of them are necessarily very lofty, and they show, like the long viaduct of the Southampton Railway, not the long viaduct of the Southampton Rail-way, a grace in their very simplicity; for in the arch there is an inherent beauty that can only he marred by heaping together shuppless masses of super-structure.

However potent the Romans were in great public works, they were certainly far in arrear of modern engineers; but they did know how to erect magnificent buildings, and how to ornament their Eternal City; in what way to make the waters tributary to public nee, in heaviting fountains, which flowed ceaselessly, and poured health and enjoyment upon the populace. With all our advances in science, in the rapid appli

n nor an our advances in science, in the rapid appli-cation of the railroad system to the uses of a great population, it is strange that, in the construction of viaducts across the metropolium causeways, no niten-tion has been given to commentation, nor even to symmetrical finish.

In all quarters of the town and city they cross the

In all quarters of the town and city they cross the main thoroughfares: in Camden-town alone there are four within pistol-shot range: they are the best erections of the kind extant; and yet how shapeless they are; how pleasing they might be ! The massiveness of a bridge does not preclude the idea of omamentation: on the contury, great extent of outline, if proportionately designed in a style of simplicity, would increase the effert. A emdlestick, after the model of the York or Nelson Columns, would look mean: the pillar towering to 150 feet wears noblity in its extent. Much more so of a Simplety, would indrease these. A contribute, after the model of the York or Nelson Columns, would look mean : the pillar towaring to 150 feet wears nobility in its extent. Much more so of a hridge : the simplicity of its parts, the boldness of its onthies, recommend simplicity, rather than tra-ceries, or atti or basis relievi. The like may be pre-dicated of temples : an coornons building comhered with sculptures, mionte in comparison with its great proportions, looks after all like a Persian garment, which relies more upon the pattern emblazoned in gold than on the winning grace of flowing drapery. It would appear, therefore, to he impossible (as to exteriors) to combine together great extent of dimen-sion and grandeur of proportion with the unity of a striking outline, if overloaded with ornamentation. All this has little to do with railway bridges ; still is shows that little is required heyroad a few colomus,

take a lesson from the railway directors, and strike a line of street from Fenchurch-street to the Mint; or else in a line from Canoon-street (across Timity-square) towards the great Commercial-road. This would (by a short cut of only a quarter of a mile), give a direct easement from St. Panl's to the East.

give a direct essenant from St. Paul's to the East. But this is only a word by the way: we must sporth of the bridge as we pass it: baving gone over the simpler, and therefore less obnoxions ensings of the northern metropoliton vialents, it is not requisite to particularise heyond one more of these *chef5-d*² exerce —it is the viaduet over the Marsh-road, Lambeth, Like its castern relative, this "*Are de Triomphe*" traverses the route askew, at an angle of thenty-free, or thereabouts. As all the world of London (even the *beau monde* of Belgravia on the Epson day) passes that line, it is unnecessary to describe its ohese pro-portions, much less so to give a daguereotype sketch of its pictorial perfections. All know its aspect, and with the recollections of these two examples, we would appeal to civil regimeers and the architerts wole-ope-rate with hem in building for all time, whether it would appeal to civil engineers and the architects who co-ope-rate with them in building for all time, whether it would not be more patriotic, more grateful to themselves, more enservative of the record of their exploits, and certainly more creditable to the country, if they were to expend only a little more labour in design upon works that obtrude themselves upon the moble, and the merchant, and the tradesnum, and the stranger within the civy bounds. If the example of high talent and task cloaries the grains of our generation as also and taste cleve bounds. In the example of ingle facture and taste clevetes the grains of our generation, so also such specimens as are cited me standing memorials of Gotbirm, and "our sin is ever before us." What bas been done is irremediable, and stands as a record of had taste to all posterity: what remains to be done, which will be on a larger scale, such as the intended railroad-bridge across the Themes at Chelsea, and the Plast Meller is the the theorem the Fleet Valley viaduct, should have artistical attention.

THE MARBLE PRODUCING DISTRICT IN ITALY

ITALY. IN your No. 758, page 467, I observe an mt'ele calling the public attention to the "Carrara Marble Works," which are certainly an interesting subject to builders, sculptors, and architects. Whilst a well-merited enlogium is passed on the exertions of Mr. William Walton, for improving the marble trade in these districts, by the introduction of approved machinery, I esnoot admit the correctness of the statement reflecting that Carrara and its vicinity have bitherto been unconscious of "the improvements of the age." I must also decy that the sawings mills are little better than "a few buts." and although th hthere been unconscious of "the improvements of the age." I must also decy that the sawings mills are little better than "a few huts," and although the appliances of 300 years ago, in the shape of machinery still exist, they are a cariosity very partially in use, as the generality of such mills posces excellent machinery, and from four to twelve frames, on the exact same principle as those now erecting by Mr. Walton, who has only enlarged upon models of minor capacity, introducing such innovations as all machinery admits of. At Carran- and its vicinity, there are capacity, incohering size involutions as an internetry admits of. At Carrary and its violity, there are many other important modern sawing-inills, such as Fabbrieoti's. Beato Toznio, La Gora, Ponte Bugia, Sarteschi's, Binelli's, &c. &c. besides Mr. Walton's new huilding; and on the Massa side of the duchy, narble sawing-mills, with all the latest mellorations in machine are numerate and economorphone. in machinery, are numerous and commonplace; whilst the "huts," I may say, are the *rare aves*. Hence, it is evident that the commencement of the It would apper, therefore, to be impossible (at be exception) to combine together great extent of dimension and grandeur of proportion with the unity of approving of comparison and grandeur of proportion with the unity of a size without that the commensement of the striking online, if overdended with ornamentation. All this has little to do with railway bridges ; still the schedule to do with railway bridges ; still the schedule to do with railway bridges ; still the schedule to do with railway bridges ; still the schedule to do with railway bridges ; still the schedule to do with railway bridges ; still the schedule to do with railway bridges ; still the schedule to a subschedule to do with railway bridges ; still the schedule to a subschedule the to do with railway bridges ; still the schedule to model the schedule to a subschedule the schedule to model the schedule to model the schedule to model the model the schedule to model the model the model the model the schedule to schedule the schedule to model the schedule to schedule and the schedule to schedule the schedule to schedule the schedule to schedule the schedule to model the schedule to schedule the schedule

Italian Marble Company, I am informed, does not meet with any of the jealousy, or animosity, alluded to, either from the people of the country, or from its competing neighbours; and nothing has as yet im-peded its new works from fast progressing towards completion; thanks, however, to the perseverance of all parties concerned, and to the facilities offered by the Government of Modena, which is determined to concourage every enterprise calculated to better the condition of the working classes. MARMO,

THE VOICES OF OLD BUILDINGS

IT may be noticed that the stubborn oak, the willow, and other varieties of trees, the bending reads and waving core, have each their peculiar and wall-known voice. The sea also has its grand and varied sounds, nul the rivers have many nauramings and musical notes, the memory of which is just now plea-

Those voices are not, however, confined to natural Those voices are not, however, confined to natural objects, for old huildings, the work of men's bands, have also their peculiar and, hy many, well-remembered sounds. Few of our old churches are sileut. Iu damp and uncongenial weather, the continual drip-ping, the whistling winds through doors and windows, and the heavy flapping of tattered seutcheons and such-like matters, sound like a melancholy com-plaint, which the ticking of the clock and the whir and bang of the hour striking, in some measure re-lieve. When, however, after disnul days, the sun-shine pours in amongst the tombs and carved work, the sounds become more lively, and the supersitions liver. When, however, after dismal days, the sun-shine pours in amongst the tombs and carred work, the sounds become more lively, and the supersitions might feel alarmed at the loud and mysterions cracks which may be heard in the organ-lofts, and amongst the ancient pews and panels. It is pleasant at such times to hear the fluttering of some small bird from window to window, and the cooing of pigeons in the belfy. The variety of the tones of the old church clocks is noticeable, and it is often amusing to bear the desperate attempts of the machinery hefore the elimes are struck. We like to listen to those musical notes from such towers as Chepstow, spreading early in the morning over the picturesque country. The pealing organ and choirs of some of our eathedrals come sweetly upon the ear, heard over a river, and to wander to the loft prof and to remote places. Old halls and mansions have also voices of their own, which come solemnly along galleries and stair cases. When those places have failen to ruin, they still have their characteristic voices, and we know of no sound which is more impressive than the slight but constant dropping noise of small fragments—as voice which seems cloquently to tell us of the frail and perisballe nature of the work of man's hunds.

THE WELLINGTON MONUMENT COMPETITION,

THE late exhibition of models for the Wellington THE fact exhibition of models for the weinigon mounment suggests some ideas whether such compe-titions are essential for the purpose required, and whether they could be conducted upon regulations less

whether they could be conducted upon regimentor res-wearisome and expensive to artists. As a sculptor, and not mixing or approving of com-petitions, I may say a few words. Half the sculptors in London have not competed, and among foreigners we have only a few who have forwarded designs—and why is this? From transactions in former competitions I is the transact Mr Coderell writes appon

fail in mechanical arrangement and twofold de-ign That which is not the high element of design they reward with the two first premiums; and they give a fourth premium to a model that it is deficult to discover any point of merit in; and 100? to a model displaying the best figure modelling in the collection, and well deserving, though indifferent in design; and and well deserving, though indifferent in design; and another (though they state that models that have ex-ceeded dimensions have been excluded) to one that would not go under the arch, and is totally nofit in design, or with any merit in its conception, no more than many that could he selected from old priots. These are the awards that one says are decided from incompetence in judges; and another, "exclusive of interest." I think they have much the flavour of both. Let arlists refrain from such competitions, unders conducted upon a helter system, and not from whim and fancy. They may reckon upon the true knowledge of art they have gained, and direct their efforts accordingly, and they would not then feel aggrieved by the indifferent gaining the ultimate commission. MODELLING STICK.

PROVINCIAL NEWS.

Chatham .- The new public hall, on the site of Chatham market, approaches completion. It is 60 feet long by 40 feet wide, and 25 feet high, with arched roof, and is ventilated from the roof, and illuminated from the centre by a "san-light." There is a gallery on cach side, running the entire length of the building, also one across the entrance, and a plat-form at the opposite extremity, with a concave recess. The galactics and root are supported by iron plasters. The fall are opported by the plasters. The hall is calculated to contain 850 persons seated, or about 1,100 standing, and has retiring rooms, library, &c. It will probably he opened for public purposes early in the ensuing Octoher.

Godalming. --- The foundation-stone of the new schools at Farncombe has been laid.

Stourbridge .- Tenders have been received for the erection of a block of offices in the High-street, Stonrbridge, as follows :--

1.	Freeman	± 953
	Parapet ornaments	15
2.	Pagett	870
	Parapet ornaments	10
3.	Scott	837

Parapet ornameuts

No. 2 includes laying on water from mains.

Saltash .- The preparations for the lanuching of the tube of the Saltash bridge, in connection with the Satisan.—Ine preparations for the launching of the tube of the Saltash bridge, in connection with the Cornwall Railway, having been completed, it was floated the first tube for the Cornish side. Captain Claxton, who had charge of the floating of the Monai and Conware bridges encountering adapted to the Satis and Conway hridges, superintended everything afloat. 500 men were employed, and more than two miles of large hawsers used.

Ellesmere .- The contract for building the new lock Ellessnere.—The contract for building the new lock: up house at Ellessnere has been taken by Messrs. Jenks and Cartwright, and will be commenced imme-diately. The new building will be creeted at the en-trance of the town from the Wrezhau-road. It will from the cast, and will be huilt of brick, with stone facings.

Liverpool .- The new landing-stage at Liverpool for sca-going steamers, is now nearly completed. Sir William Cubitt was to inspect the stage preparatory to its being handed over to the corporation by the con-

Tractors. Preston.—The chief stone of the new schools pro-jeted by the Wesleyan Methodist Association body in this town has been laid in "The Orchard." The site in this town has been laid in "The Orchard." The site is a plot of land behind the present chapel, in Liver-pool-road. It is intended, also, according to the *Guardian*, to rebuild the chapel, but as school accom-modation is the more urgently required, it was deter-mined to apply the funds already raised to the erec-tion of buildings to be used as day and Sunday schools. The site of the schools orcenpies an area of 690 7-10 square yards, of which 360 yards are occupied by the school-house and premises, and the remainder by play-roouds. The buildings are to be constructed of grounds. The buildings are to be constructed of hrick, with stone dressings, and will comprise a schoolroom, 70 feet long, 30 feet wide, and 24 feet high, and class-rooms, 17 feet 6 incbes long, and 14 feet wide, capable of accommodating 337 children. The wide, capable of accommodating 337 children. The style of arcbitecture is Gobie, of the Early English period. The principal front will be 102 feet in length, divided into five compartments, the middle and ends projecting beyond the faces of the other work, and terminating in high pitchel gables, the centre being crowned with a bell turret: the wind-ws are all of time, dressed and commiss triblet and couplet lights, stone, dressed, and comprise triplet and couplet lights, the former heing ranged in the projecting and the latter in the reading compartments. The couplet The counlet gabled. The principal entrance is in the centre complet gabled. The principal entrance is in the centre com-partment. The separate entrances for hoys and girls

are from Liverpool-street, and face the play-grounds. The interior of the buildings will be fitted up on the untional plan. The roof will be an open timbered initional plan. The roof will be an open timorree one. The huildings bave been desigoed by Mr. T. W one. The huidings bare been designed by 317. J. W. Carter, of this town, architect, and are estimated to cost, after including 4507. for site and sundries, the sum of 1,5007. The contractors for the several branebrs of work are Mr. James Williams, bricklayer; Mr. William Yates, mason; Mr. R. B. Huotington, flagger and slater; Mr. W. Pye, joioer; Mr. James Flake, plasterer; Mr. James Walensley, plamher; and Messes, Clark and Charnley, ironfounders.

Gateshead .- A public fountain bas heen erected in High-street, Gateshead, at the expense of the corpora-

Shields .- A public fountain is to be crected in the market-place, South Shields, according to the Newcastle Courant.

Forres. — A monument is to be crected on the Castle-bill bere to the memory of Dr. Thomson, of Cromarty, who died from over-exertion in the Crimea, after the hattle of the Alma. The foundation of the monument, according to the Forres Gazette, is a base about 24 fect square, and its height will be about feet. The site is the west side of the hill, in the 60 feet. The sit direct line of High-street, from which, as well as from every direction westward, it will form a con-spirnons object. Mr. Urquhart, Elgin, is the conof freestone are ou the ground.

CHURCH-BUILDING NEWS.

Watford.—St. Andrew's Church Watford, was consecrated on the 21st ult. The prevailing style of the architecture is Early English. The edifice covers an area of 87 feet in length by 40 feet in breadth. The walls are chiefly of fliut, with white stone dressings. The roof of the nave, which is 38 feet in height, is covered with ornamental tiles, with stone crosses at the east and west gables, and an ornamental cross distinguishing the nave from the chancel. The tower is 81 feet in height, and it is intended to add a vane which will raise it to 90. The helfry contains eight windows, two in each face of the tower. The spiral roof of the tower is covered with ornamental lead. The exterior of the church is ornamented with some carving in stone of heads and foliage. The nave has The maye has a high-pitched open roof, with circular ribs and spandrils-the ribs being stained deal, and the spaces between white. The east window has tracery in the upper part. The west window is of a similar character, hnt not so large. Between the nave and the north aisle there are five arches. The chancel is north aisic there are nive arches. The chancel is entered through a large beavily-moulded arch, show-ing three half-columns. The seats are all open, and are of stained deal with crimson cushious : fi ty-one of them are numbered, and will scat about 300 pcrsons: the rest, allording accommodation for 150 more, are free scats. The edifice stands on the western side of Church-road. It was commenced, according to It was commenced, according to the Hertford Mercury, about three or four y the *Leriora Deriviry*, about three or hour years since: the works were suspended in February 1855, and resumed in March of the present year. The structure is now complete, excepting the spire. The architect is Mr. Teulon, and the builders are Messrs. Fassuidge and Son, of Uxbridge. The works have heen carried on noder the general superintendence of Mr. Horniter. Mr. Hamilton.

Quedgley .- The parish church of this quiet little village has been re-opened, after having been nearly rebuilt upon the old foundations, except the tower, and with an additional aisle for the accommodation of increased population. This work has been accom-plished by the exertions of Mr. Curtis Hayward, the the parish, and the Rev. Erskine Knollys, abent. The edifice will contain about 250 squire of the incumbent, persons. It consists of a nave, two side-aisles, and a ehancel. The old pillars and arches on the south side remain. The chancel is fitted up with plain oak choir stalls. A painted window represents the Crucifixion and the Resurrection. The scats are all open, of oak.

and the Resurrection. The scats are all open, of oak. Cannalle Marsh, Dorset.—Saint Peter's Church, recently consecrated by the Bishop of Sal sbury, is of plain but substantial appearance, and in the Early Decorated style of the fourteenth century. The building is creeted of the local stone, with window and other dressings, of Hamdon-bill stone; the roofs and henches of red pine, stained. The north porch and external doors are of oak, with ormanental wronght ironwork. The pulpit is of eak, on a stone base, and the reading-desk, also of oak, is supported by wronght-iron brackets, resting on a dwarf stone screen, dividing the nave from the chancel. The roofs are covered with partic-oloured tiles, and the

SEPT. 5, 1857.

and devices, inclosing armorial hearings and monoand devices, inclusing armoral hearings and mono-grams. The trefoil in window-head is filled with a symbol of the Holy Trinity. An old church, very much dilapidated, was taken down to make room for the present new building, and all old remains and other objects of interest have been carefully preserved, with built is the uncent shows he computed fing other opjects of interest nave near extenting preserves, and built into the present eburch. Accommodation is afforded for seventy worshippers. This huilding was creted at the stipplated price of 4644. In a very creditable manner, by Mr. Shewbrooks, of Taanton, creditable manuer, by Mr. Shewbrooks, of Taunton, under the direction of the architect, Mr. R. H. Shout, of Yeovil.

of recyll. Wolverhampton.—It is proposed to erect a church and schools at Blackenhall. The population of St. Johu's parish alone amounts to 11,000 or 12,000, and at present there is only one church, capable of accommodating 1,660 persons. Church accommoda-tion is to provided for 4,000. A committee has heen formed to carry out the object, and at the recom-mendation of the bishop, 5002 have been granted from the Hodson Memorial Fund. Au endowment of 1,5007. has heen offered, and several sums have heen promised to the hnilding fund. About 3,0007. will he required to complete the endowment fund, in addition to aid expected from the Church Building Societies

Edgbaston.—The restoration and decoration of the Edgbaston parish church, which were commenced last year, are now completed, and the edifice has been re-opened. The walls of the interior have been painted a warm colour, the ceilings of the nave and south aisle coloured blue, and the cornice of the nave and the rcredos (which was exceedingly plain) have been deco-rated. Mr. F. W. Fiddian was the architect employed, Arted. Mr. F. W. Fiddian was the architect employed, Mr. Whitworth the decorator, and Mr. Hardwick the contractor, in the carrying out of the improvements. The ground appropriated for the

Longborough.—The ground appropriated for the ermitery consists of between seven and eight acres, and is situated on an eminence nearly a mile from the town. The lodge is excented in red brick, with Bah stone dressings. Passing through the gates, up the centre drive towards the chapel, on the right is the ground appropriated for the Established Church; on the left the unconsecrated part, with a portion for the Roman Catholics at the further end of the drive. The main huilding is placed near the centre of the whole grounds, and consists of two chapels, with vestries and a groined cloister, serving to connect the two, and a groined cloister, serving to connect the two, and form one building; the compartments at each end of the cloister forming porches to each chaped. The chapel walls are faced with blue Claypole stone, and Bath stone dressings. They are in the Geometrical Decorated style—both chapels heing alike externally and internally. The internal fittings are of oak. The architects were Messars. Bellany and Hardy, of Lin-color. The contractor for the building was Mr. John Sudburg. the stone work heing accurate he Messar Subary; the stone-work being executed by Messra. Walpole and Roberts; and for the iron-work and foncing, Messres. S. Frisby and Son, all of Lough-horough. Mr. J. Savill was elerk of the works. The consceration by the bishop took place on the 25th ult.

Chesterfield .- The consecration of the Chesterfield and Tapton Cemetery was performed on the 26th nlt. by the Bishop of Liebfield. The cemetery buildings by the by the Bishop of Lichfield. The cemetery buildings consist of two chapels, each 34 feet by 17 feet, and a lodge, appropriated as residence for the registrar, and a board-room for bolding the meetings of the burial-hoard. The whole cost has been about 3,500ℓ. The erchitects were Messrs. Boldek and Lovatt; and the contractors Messrs. Coates and Burrowes of Chester-erd. field

Salterhebble (Halifax) .- The foundation-stone Salterhebble district, was laid by Mr. W. I. Holds-worth, ou the 26th ult. The church is named All Saints, and was designed hy Messrs. Malliuson and Healey. The site is a field on the right of the road Healey. The site is a field on the right of the road from Skircost green to Salterhebhle. The style is Early Decorated, and the church will be nearly a rears of the construction of the control of the construction of th Mr. Bodorth being the expenter; Messa, Barcrott and Son, plasterers, Mr. Walsb, plumber and glazier; and Mr. Maude, painter. South Shields.—The foundation-stone of the new church about to be erected in Mile-end-road, South

Shields, by the United Presbyterian congregation of Michael Shift and Shift an comprise church, school-room, and vestry, is designed in the Gothic style of architecture. The church is erneiform on plan, with nave, aisles, and transepts, and a tower with spire at the south-esst angle, with detcon's vestry below. There will be no galleries, hut provision will be made in case they are required afterwards. The church on the ground-floor will have COM with react is a bloor would be screen, dividing the nave from the chancel. The roofs are covered with particoloured tiles, and the internal paving is also of red and black tiles, from the decon's vestry below. There will be no galleries, Poole patteries. A painted castern window, designed by the architect, and executed by Lavers, was pre-sented by Robert Willnortly e-q. of Sherhorne. The source light gives a representation of the Crucifixion, the side lights show appropria'e geometrical patterns

e trance to the church will be in Ingham-street, by deeply-recessed porch, with carved espital and arch-mould. The end windows are each four lights, and are to be filled with stained glass. The navecolumns will be of iron, and the arches above, which support the roof, of wood, iilled with ornamental iron tracery. The whole of the woodwork will be stained as well as the roof, which is to be open timber work, some portions of which is to be open times: work, some por-tions of which will be carved. The iron will be repre-sented as such, but painted in appropriate colours, and otherwise ornameuted and moulded.

THE METROPOLITAN SEWERS.

THE other day at Whitechapel three strong meu were stricken to death hy the poisonous pent-up gases of a sewer, and two more, in trying to save them, uearly shared the same f.tc.

This is a tangihe exame att. This is a tangihe example of the dangerous nature of the London drainage; and it would he well to remember that poison, more or less adulterated, exists in all improperly drained and ill-ventilated places. This necideat, and some other circumstances which have from time to time come to notice, show that great difficulty will be found in veutilating the that great difficulty will be found in veutilating the huge severs which are now necessary in the metropolis. People who appreciate the value of good drainage have also a strong dislike to gully-holes and other vents: now, it must be evident that as these vents are complained of, and one after the other shut up, those left open must emit larger quantities of gases of a more powerful description. Something must be done to remedy this, or our many miles of drainage will become as dangerous to explore or open as the worst of long-closed coal-mines. The entire closing of the gully-holes, and the proper entire closing of the gally-holes, and the proper ventilation of the sewers, also the means by which the gases may be raised up shafts harmless, are not impossible in this scientific age.

The extent of the London sewerage is weekly in-The extent of the London sewerage is weekly in-creasing, and as each cesspool is closed, and new houses with proper drainage built, so much more is Father Thames rendered unwholesome. This is a circumstance unpleasant to us of the present genera-tion, hut which will be beneficial in times to come; for the necessity for improvement will cause propor-tionate exercisents to be made. It is uccessory, how-ever, that what is done in connection with London drainage should be effectual and that we should not drainage should be effectual and that we should not ever, that what is done in connection with London drainage should be effectual, and that we should not entail continual expenses for half measures, hat we nust — to use a common expression—" take the hull by the horns," and convey the drainage to such a distance from London as will prevent any incon-venience to the const, and that, too, in close sewers, and not in the monstrous open cuttlogs recommended by the referees. The plot to accompany their re-port we may sny, by the way, is not yet published.

A RAMBLE AMONGST THE METROPOLITAN TOMBS AND MONUMENTS

FAMILY and friendly love, national gratitude, and that less worthy feeling, the love of pomp and display, have been the means of mising in this metropolis specimens of men's design and handiwork which, in have been the means of musing in this interopera-specimens of men's design and handiwork which, in some instances, cause feelings of satisfaction, and in others, those of disappointment and vexation. Not-withstanding artistic deficiencies, there is, however, much interest in a journey amongst the records which

nuces interest in a porroey amongst the records which have been placed in our churches and other huildings to the memory of departed worthies. With the exception of those in Westminster Abbey, we have, unfortunately, hut few examples in London of the more ancient syle of monument, and the chief of these are to the memory of Gower, the poet, in St. Saviour's, Southwark; Rahere, in St. Bartholo-new's the Great; and the Duke of Excter, removed from St. Katherine's-hy-the-Tower to the new chapel in the Regent's-park. In some of the churches which escaped the Great Fire are monuments older than that event, but few hefore the date of the reign of James I. In St. Helen's, Bishopsgnte-street, is a very sames 1. In St. Heren's, Disnopsignte-street, is a very fine altar tomb, on which are recoundent efficies of Sir John Crosby and his lady; there are other mont-ments here worthy of attention. In the church at St. Mary Axe is the life-like bust of honest John B: Mary Axe is the life-like bust of honest John Stowe, scated at his desk, with pen in hand, in a circular-headed niche, surrounded by hour-glasses and other emblems. In St. Giles's, Cripplegate, the monument of Fox, the anthor of the "Book of Martyrs," and some other old bits within the altar-mils are worthy of notice. Below the present church of St. Jomes, Clerkenwell, in the crypt, sur-rounded by stacks of coffus, are fragments of the tombs formerly in the original building. In old St. Pancras, notwithstanding the restoration, the old monuments have been retained : here and there the careful wanderer may trace some pieces of incised stone, or mutilated heasses. In the church of All Hallows, Barking; Stepney, and a few other places, Hallows, Barking; Stepney, and a few other places, Hallows, Barking; Stepney, and a few other places, the state of all the state, tombs

which once adorned the cathedral of old St. Paul's, only a few fire-marked stones remain in the cypt below; and all the memorials in the great mass of the City churches mot with destruction at the same tin

Perhaps the oldest monument at present remaining in the metropolis, if we except the Roman, Saxon, and one or two Danish relies, which have from time to time been turned up, is the stone which contains the rudely-seulptured figure of an aucient abbot of Westminster, and which is still remaining in the vestiminater, and when is such tenations in the south cloister of the Abbey, and is probably as old as the middle of the eleventh centary. For a consider-able length of time, the decoration of English tombs chiefly consisted of crosses and other emblems, and chichy consisted of crosses and other cindens, and rude inscriptions. As a further amount of sculptural skill hegan to be generally developed, the embirns gave place to figures of the deceased, which were rande, as nearly as the rude artists could do so, to imitate the form and costume of the person in whose memory the tombs were raised.

As architecture advanced in England, the marked improvement of the effigies of the departed is improvement of the effigies of the departed is strikingly shown by an examination of the monuments, in Westminster Abhey, which date from the reign of Henry III to the hearing of the striking of the strikin in Westminster Abhey, which date from the reign of Henry III. to the heginning of the seventeenth con-tury; and one feels, when looking at the figures of the kings, queens, and others, in this venerable eluveh, that they are correct portruits of those who have here erauhled into dust; and it is evident that the chief aim has been to make the efficies the most prominent and lasting purt of the tomb. Take, for in-stance, the tomb of Queen Elemonr : canopy and sculp-tured base have nerisked and decaved. but the lovely stance, the tomb of Queen Elennor : canopy and sculp-stured base have perished and decayed, but the lovely figure of the queen still remains. In like manner the tured base have persisted and uscayed, out the body figure of the queen still remains. It like manner the elfigy of Henry V. if it had met with no wildul destroyer, would have been preserved. The statues of the other kings and queens are also examples which show that a chief object of the monuments was to exhibit and preserve the life-shape of the persons commemorated. In the monuments of the best persons commemorated. In the underlatered so the best period of Mediavalart, the accessories are sumptions, and welt in keeping with the surrounding architec-ture, hut they neither destroy the principal object, nor detract from the heauty of the building in which

they are placed. It has been remarked that the devotional feeling It has been remarked that the devotional lecting shown in the monuments of this date is too much overlooked at present, and that in memorials placed by the living to the dead we should slik the display of the actions of the man or woman upon earth, and strive to show the weakness of humanity, and make it the chief aim of our tombs to acknow-ledge the greatness of divine power, and show our sense of humilty. The grave fiself, and the instinct which causes us to rear those comparatively frail atils to memory are a sufficient acknowledgment of our to memory, are a sufficient acknowledgment of our position; and it may be remarked that in the Middle-age tombs of both stone, bronze, and brass, although the figures are arranged in the attitude of prayer, the pomp of heraldry is not neglected, thus strangely mingling together the vanities of the world with more solemn thoughts.

The chief aim of monumental sculpture, however, is to show forth in as clear a manuer as can be do-vised those mon and women who, by the divine gift of genius of different descriptions, have conferred hencit upon their country or on the world at large, and that their portraits should be aided by such labours, and put them for many ages hefore the general view as objects not only of respect and grati-tude, but also of emulation. Having glanced thus slightly at the sncient mon-ments in Westminster Abhey, we will, without just now noticing the more modern marbles there, ramhle to St. Paul's, our other great metropolitao church, and there will be found ample matter for contempla The chief aim of monumental sculpture, however,

to St. Paul's, our other great metropolitao church, and there will be found ample matter for contemplaand there will be tound ample matter for contempli-tion. The huiding itself, in its vast and glorious proportions, is liable to make us critical of the accessories which are introduced; and although we eater helow the done with an anxious wish to find beauties instead of faults, we are obliged to give more censure than praise.

And first, twking a general view, it must he acknow-ledged that the immense sums of money which have heen expended in sculpture here have not greatly improved the general effect of the building. There are no principal groups of statury such as Micbel-angelo would have designed, and which would, like the Middle-age monuments, have incorporated them-selves with the architectural form; but the memo-rials, taken in the mass, are puny and inconsiderable, and to tat all in harmony with the genius which de-signed the building into which they have been re-ceived. Let us, however, walk round the place, and stop hefore the monument of John Howard, the philanthropist, who is in Roman costume, trampling And first, taking a general view, it must he acknownod not at all in harmony with the genius which de-signed the building into which they have been re-terived. Let us, however, walk round the place, and the leif figure with what should be the stop hefore the monument of John Howard, the philanthropist, who is in Roman costume, trampling on fetters, and bearing in bis right hand a key, aud in pedestal : at the hase is a figure of Britannia, his left a roll, on which are inscribed the words,---"Plan for the Improvement of Prisons and Hospi-tude; and on the other side are figures which are

The comparing the monuments in St. Falls with De-more ancient examples in Westminster, we cannot fail to notice that, while the latter bare much dignify and repose, they are destitute of any great amount of invention; and that the tormer show, notwithstandof invention; and that the former soow, notwithistant-ing the failures, an intellectual straining after some-thing, which may eventually produce good results. A few of the monuments in St. Paul's are remarkable for the fitness of the inscriptions: for instance, to a monument to Lieut-col. Sir W. Myers, Bart, who fell for the bluess of the interjuints' for instance, of a monument to Lieut.-col. Sir W. Myers, Bart, who fell in the battle of Alhuera, which is not in other ways particular, great interest is given by the earcful quo-tation of part of a letter to the mother of the young warrior from the Duke of Wellington, which is engraved on the base :-

graved on the base: ---" It will be some satisfaction to you to know that your son fell in the action, in which, if possible, the British troops surpassed all their former deeds, and at the head of the lusiller higade, to which a great part of the final success of the day may be attributed. As an officer, he already been highly distinguished ; and if Providence had prolonged his lite, he promised to become one of the brightest ornsments of bis pro-fescion grup a honomer to his country." fession and au honour to his country.

reason and au honor to his country." In another justance, on the meaument eracted at the cost of the nation to the memory of Major-gen. J. Dundas, the resolution of the House of Commons, which specifies the particulars of his services, is en-graved at length. But fore of the measurement in C. D. W. Co.

wed at length. But few of the monuments in St. Paul's Cathedral But level in the monument of poetical conception, but amongst those worthy of remark for this quality we way notice that by Westmacott, to the memory of Admiral Lord Collingwood. In this work, the hody Admiral Lord Collingwood. In this work, the body of the naval hero is represented lying on the deck of a mau-of-ware, shrouded in colours won from the enemy, and with his hands clasping a sword upon his breast: a figure of Fome kneels over the prow, and the remainder of the composition consists of a figure of "Father Thannes," attended by emblematical figures of other British rivers. On the guawale of the vessel there are hasso-relievo illustrations of the progress of navigation : the first shows the uncertainty of avigatiou when mariners had only the stars for a of navigation when mariners had only the stars for a guide; the second, the introduction of the compass; the compass;

guide; the second, the introduction of the compass, and the third, the forging of instruments of war. In the momunent to General Moore, figures of Valour and Victory are lowering the general into a grave with entwined lancel, while an allegorial figure of Spain plants the standard of conquest over his

It is less pleasant in other works to notice the Fome consoling Biltannia, &c. &c. In the memorial to Sir William Ponsouby, whose

In the menuorial to Sir William Ponsouby, whose death was caused by the weakness of his horse, which broke down under hum in a charge, the horse is shown falling languidly to the earth, whilst, as the guide-book says, "his master, a figure without drapery, in the loreground, is kneeling in a constrained posture in the act of receiving a wreath of laurel at the momeut of death from the hands of Vietory." The excuse the artist of this design had for placing the warrior before us without drapery it is difficult to conceive. conceive.

In wandering amongst the memorials, all must feel the difficulty there is in making the allegory suffi-ciently distinct to the multitude.

ciently distinct to the multitude. In the monument to the nemory of Captaiu John Cooke, "Britannia is represented [as we are told] monrning; and consoled by one of her children pre-senting her with her trident, and another ber helmet; while in the hackground is the prow of a vessel, to indicate the time area is a newel monument."

while in the hackground is the prov of a vessel, to indicate that the work is a naval monument." In the memorial to Lord Duccan, the pedestal re-presents in *alto-relievo* a seaman with his wife and child, designed to commercate the regard this cele-brated officer had for those who sailed under bim. brated officer had for those who sailed under him. The greater number who view this representation are not sufficiently acquainted with the bistory of Lord Dancaa to be able to know the reference these figures have to an amiable point of his character : it should therefore have here mentioned along with bis dis-tinguished naval services, and the great victory which he gained over the Datch fleet. Is many of the memory for D. D. W. D. M. D. M.

In many of the monuments in St. Paul's Cathedral

intended to represent the Ganges and another river of the East. In taking a round of modern St. Paul's it will strike many that in monumental works, which are intended for the use of the multitude, allegory are intended for the use of the multitude, allegory should not be too much refined, and that it is always better to convey an idea in a distinct form, even by the assistance of letters, rather than to leave it in doubt. It is useless to waste labour, space, and marble in figures, the intentiou of which it is difficult to undertained. to understand.

to understand. In Flaxman's memorial to Lord Nelson, although the pedestal is not exactly to our taste, it is applied to a usefu purpose, for on one part are cut, in **bold** letters, the names of his three greatest victories— Cogenhagen, Nile, and Prafalgar; and below that are representations of the North Sea, German Ocean, the Nile, and Mediterranean: and every one will appre-ciate the feeling which designed the fine figure of Britanna, which are arm partly energing two sailor-boys, and the other pointing will admiration to Nelson, who is dressed in the uniform he wore at the time of his death, with the exception of a cloak, which he received as a present from the Sultan. AN ARTIST.

INSPECTION OF LONDON DWELLINGS.

We regret that, notwithstanding the able advocacy of the Earl of Shaftesbury and others well arquainted with the subject, the Bill which was lately brought into Parliament to give increased powers to the in-spectors of dwellings should have been rejected. The necessity for such a measure has not been sufficiently appreciated.

No one can be more ready to n-lyocate the No one can be more really to relvecate the just elaims of the poor than onresilves, or to respect the opinion that an Englishman's house should be his eastle: it is, however, uccessary, for the salvation of the lives of those placed in certain positions, to inter-fere firmly, though wisely and kindly. Such interiors as those we have described in the S. and-yard, Clerken, well; Gray's inn-lane, and other places which still exist, wherein several families are haddled together, are "castles" not only dangerons to those who occurat them but also to those bring around. Since exist, whereas several isolates are included together; are "castles" not only dangerous to those who occupy then, but also to those living around. Since power was given to the police to examine public lodging-houses, we have seen something of their operation: we have seldon hard them completion of; and while we know the good which has been effected through it in various districts, it has been found that the law was not sufficient to reach many overcrowded rooms, in which from fifteen to twenty men, women, and children, of different ages, were an times collected together. Few, we think, who have observed such a condition of things, will advocate the continuance of arrangements which surely lead to immorality and erime, besides the loss of health and

The inspection of dwellings is a very delicate matter to deal with, but we are asured that some-thing must be done. We have lately made forther inquiry in the neighbourhood of Clipstone-street and other districts, and feed certain that the overand other districts, and feel certain that the over-crowding of the houses is increasing, approaching to a certain extent to the same coudiron as the dwellings which have been removed. It is true that the drainage is an advantage in some places, but the houses, both as regards general arrangement and ventilation, are unfit for the reception of numerous In some of those houses which consist of twelve rooms, including the garrets and kitchens, we found distinct families in each room, and some rooms were occupied by even more than one. We put down the numbers given to us as occupying the rooms in one We just down Here occupied by even more than one. We pint down the numbers given to us as occupying the rooms in one house—1, 2, 6, 8, 7, 8, 9, 6, 2, 5, 4, 2—60. Many of these houses are roomy, and have once been places of some consideration, but the persons who let them in tenements have made no provision of extra closets, sinks, &c. such as is made in the houses which have heen altered by the societies for improving dwellings. The staircases are closed at the top, and there are no arrangements for obtaining a circulation of air. The staircases are closed at the top, and there are no arrangements for obtaining a circulation of air. The staircases are closed at the top, and there are no arrangements for obtaining a circulation of air. The staircase how the scale staircases was very bad, and the supply of water quite inadequare for so many people. It is vexitions to the excellent arrangements of the model buildings. In perts of Islington and elsewhere, the numbers who occupy some of the houses which are let in tenements are supprising. In a row of small six-roomed houses we found in one three families, who consisted of twenty-four persons; in another there were four families, whose numbers were securices ; in another there were also four families, or eighteen pe ple, and so on. there were also four families, or eighteen pc ple, and so on.

THE BUILDER.

of premises should be held responsible for the number of persons he receiver, and that this might be managed without any particular system of examina-tion, if the landlord of each house were made liable to a fine for receiving more tenants than the space would give healthy room to. Those who felt aggrieved by the overcrowding might give information. We must concess that the subject is beset with difficulties, rhiefly caused by prejudices and ignorance which ought by this time to have been overcome. The evi-is evident, but the remedy has not yet been found.

ELECTRO-TELEGRAPHIC PROGRESS.

THE East-IndiaComputy, we hear, have agreed to pay 20,0007. a year to the Indian Telegraph Company from the date of the first mession, and till the line yields an annual profit of 6 per cent. The concurrence of Government, however, is a requisite. The Mediterranean telegraph is about to be laid, the line being now on its way in the Elbe. It is 150 miles long, and is to be unk between Cagliari, on the Sordmian coast, and w.a.v soft of when Capitari, of the Strainan coast, and Bona, on the coast of Algeria, whence it will be con-nected with Alexandria by a subterraneau line along the coast.——Mr. Limisay, of Dundee, in the Northern Warder, reminds the public of some curious experi-ments of his nt Portsmouth and elsewhere, in the formation of unrine telegraphs without any trans-native of submarine view exerct on each of the infinite of subwarine views except on each of the coasts so connected. In respect to the Atlantic tel'graph, he siys.—"One plate or sheet of copper ngight be immersed in the occan at Lizzard Point in night be immersed in the octan at Lizerd Point in Cornwall, and another at the north-west part of Srot-Inal, councetel wilb the former by a wire and its telegraphs. Here the *lateral* distance is about 500 miles, and between the parallels of 50 and 59 degrees. Nearly equosite to these are the north-east point of Labrador, and some part of Nova Scotia. The lateral distance hing 500 miles would be a *fourth* part of the cross distance, which is nearly 2,000 miles, but as much electricity would pass as would nove the needle without an excessive hatter. The this method the without an excessive battery. By this method the expanse would not be a tenth part, perhaps not a hundredth part, of that by the cable, and the clarge for us sages would be proportionally smaller. Cases may, however, occur, when lateral distance cannot be got, that a cable is necessary,"-the Atlantic line, however, not heing one of these! The experiment at Portsmonth, so far as we recollect, was indeed a re-markable one, but the idea of an Atlantic line without any Atlantic wire is scarcely conceiveable. Is Mr. Lindsay, by the way, aware of the existence of the Enclosely, by the way, aware of the existence of the following passage in a letter written by Dr. Franklin to Peter Collinson, of London?---"Spirits the same time are to be fired by a scark sent from side to side through the river, without any other conductor than the water, an experiment which we some time since performed to the an exempt of the any?" The counterprove of a K-walling is for a set of the same of z. countemance of a Franklin in farour of his very startling idea ought not to be lost sight of, but perhaps Franklin's maxing was not exactly what his words would seem to imply.

FOREIGN INTELLIGENCE.

The Restoration of the Cologne Cathedral, and the Cölner Domblatt.-On the relation which the latter journal bears to the restoration of that huge Medieval building, M. Reichensperger, Plussinn M.P., makes the following remarks:----We find here example the rest of the re complete series of the periodical reports of the lecting master (the calhedral architect), and the minutes of the meetings of the open committee, who have conducted this huge work at such a triffing and conducted this hige work at such a trilling cost. We see here how stone, as it were, was put to store, to make a grand and perfect whole; the very history of every partion of the construction is here rolled up heroe us; and all the doubts, impediments, and difficulties are faithfully recorded, as well as the wire and well-considered means by which meansed. wise and wel:-considered means by which we succeeded in removing them. It has become clear that, the cathedral being the result of so many endeavours and restorations, -- it was by no means easy to tread again, as it were, in the lootsteps of those old masters. The social organism in which they had lived had The social organism in which they had hved hear been rent asunder, their systems and rules had vanished from memory; art and workmanuship had become separated, and had taken diverse, even oppo-site divections.—all which was to be ere-organized, or at least to be newly arranged. But that *school* which has now arisen at the foot of the eathedral, has *more* than a local signification. Leaving even ont of the question that the Cologne Cathedral is a European monument leaveds which the even of architects and so on. It must be evident to all that these thick popula-tions require very great care, and we think that those houses which are systematically sublet should be placed under certain, thongh not too stringent, regula-tions. The buildings ought, in the first prace, to be adapted as far as possible to the wints of the numerous tenants; and it has been suggested that the subletter monument, towards which the cycs of architects and anuteurs are directed, this restoration forms a turn-ing point in the history of (German) architecture, and is collicitations and the second secon

that the great renovation processes going on now in the c-thedrals of Strasburg, Speyer, Mayence, Frank-fart, Ulm, Worms, Vienna, &c. have had all their common source and origin in our fatherlandish Cologae Dem.—Civil architecture also has taken the eue from our doings, and a better taste, far distant from pseudo-autique, or academic eelecticism has taken hold of the mind of architects; while our mean committees have eiven n death blow to red has taken hold of the mind of architects; while our open committees have given n death blow to red toprism, axistociatic art-bureaucracy, and the similar bancs under which of the mage constructions are labouring at the present time." Bucharest in 1857.—The following sketch of the Moldavian capital may be of some interest just at the Bucharest present to the tonrist is quite specific, as is housen and exclose it present to increase out which

is hours and gardens, its places and streets, and its population, partake both of the Oriental and some-what the fullian character. There is much difficulty to arrange into mything like order those planlessly to arrange into mything like order those planlessly acgregated strets, some dark, others with more light, erooked or straight; mostly disagreeable by either mad or excessive clouds of dust, the latter con-stauty stirred by herds of all soris of domesticated animuls. The houses surrounded by g-rdens or empty spaces, offer a picture of most glubing con-trasts. Still, here also (as in most half-civilised countries), the original type of building is obviously derived from the Walhestina *elog kut*, spreineus of which are yet to be seen in some of the outskirts of the eity. Next to them come the small, one-storied the city. Next to them come the small, one-storied louses, which, being a compound of brick and wood, rouses, which occup a composited of orres and wood, are inhibited by the inferior classes of the population. From these to the few, even palace-loaking dwellings of the itel, are several intermediate gradations. The interiors of the dwellings of the *Bojars* are literally rearmed with the most costly furniture, the finest tapestry, the most splendid gtass and China ware. Nothing is deficient in a Wallachina nuble's house—but the mind or higher eises, which may imp rt some life and novement to these exteriors of mesent social life.

FOOT-LIGHTS-COVENT-GARDEN THEATRE.

I PRESUME it is intended that in the new Covent-I PRESUME it is intended that in the new Corent-garden Theatre every improvement will be adopted which e-m add to scenic effect. Let ne recommend the abolition, or raiher modification, of those bideons objects-Foch-tights. What occupant of pit or stall has not often felt annoyed that he could only see the heads of the actors (whan half-way down the stage) over or between these unshapely obstacles, which, though sometimes 18 inches high, barely shelter his eve from the flaring, smoky glare of the gas Argands, and which form a harsh foreground which would mar the effect of the best pictorial group or stage scene ever produced. ever produced.

You must, of course, have a foot-light,* but why not have a thin, close, coutinuons, and bright line of jets an inch apart, and shaded from the andience by shallow rim running in an unbroken line alo but which front, and which need not be more than four or five inches above the level of the stage? It might be an improvement, too, to keep the grimnares and contorions of the orchestra a little out of sight. A. C

SALTS ON WALLS AND DAMP IN WALLS.

AN "Old Subscriber" complains of this old and off-complained-of grievance, and asks for a remedy, or rather a preventive. Various articles on this subject or rather a preventive. Various atticles on this subject have appeared in our pages. Thus, on 14th July, 1855, will be found some remarks by Mr. C. H. Smith, in a communication to the Commissioners on the Fine Arts. In this communication, Mr. Smith remarks that "it is subject of magnesia (common Epsi-m sail) which is occasionally found to cover the surface of newly-built walls with an efflorescence like horr frost." He explains how such sails are frequently produced newly-built walls with an efflorescence like hort frost," He explains how such saits are frequently produced in wally, or gain access to them, as through the sand, water, linne, or brick-eday entering into their compo-sition; but he considers that " under ordinary circum-stances it is searcely possible to get rid of the various saline or deliquescent substances that have once been admitted into the walls of a building." We may, however, refer for further information on the subject to Mr. S.nith's communication itself. On 30th June 1855: "An Analetical Chemist."

to Mr. Sailh's communication itself. On 30th Junc, 1855, "An Analytical Chemist" (Mr. Wentworth Scott) writes us to the effect that correspondents in asking how to get rid of this evil ought to assertain and describe the precise species of salts complained of, but offers his aid if a little of the salt be forwarded to him. "Monotime," he says, "I may as well give the process I have found quite effectual in the few instances of the kind that have come under my notice:--Take 4 hs. commercial car-

* Reflectors from above might be substituted, as sug-gested in the Builder nine or ten years since, on a plan previously put in practice, and with complete success.

bonate of soda (natron), 2½ lbs, commercial carbonate of potash (pearlash), and 2½ lbs, of finely sifted silver sand: mix intimately, and 2½ lbs, of finely sifted silver is best, if not Hessian) capable of containing three times the quantity, and fuse for two or three bours : pour out upon a stone or iron slab, and allow it to cool: theo boil in about one gallon of water, unit a saturated solution is obtained. Let the salt be scraped off the wall as much as possible and washed well with warm water ; then brush the hot solution prepared as above on all parts of its surface : give the wall another warm water; then brush the hot solution prepared as above on all parts of its surface: give the wall another coal in three days 'time, and, at the end of a week or two, the wall will be covered with an impervious glassy coaling, which will, I think, attain the desired object. If amplied to demonstrate the

glassy coating, which will, I think, attain the desired $\frac{13}{a}$, object. If applied to damp walls they crass to be so. (b-It will also prevent the white rubbing off." (b-Wards appeared in our columns, as on page 557 of the same volume; and, if we mistake not, the Crystal H Palace Company were indebted to Mr. Scott for re- wa moving the saline disfigurement on brick walls at the valace. palace

IRON TRADE OF SOUTH STAFFORDSHIRE. IRON GIRDERS.

THE iron trade of South Staffordshire may be set down as in a condition which is an improvement upon its state for the past five weeks. The advices from down as in a contrion which is an improvement upon its state for the past five weeks. The advices from the United States bave imparted to it a measure of soundness which, and this week, it has not in the time motioned possessed. From across the Atlantic the news received as to the nature of the orders to be sent thence justifies the conclusion that several houses, largely engaged in the American trade, and which have considerable influence in the iron market at home, will not be lacking orders up to a puriod beyond

home, will not be lacking orners up and the second minations of the quarterly meetings are not to be classed with the laws of the Medes and the Persia

In the midst of this state of things, it seems sur-prising to many that so little should be doing in the pig trade in the way of sales. At Biroingham yester-day (Thursday), and at Wolverbamnton the day before, the majority of the presons on Change were stock-brokers and commission-agents, all ready to sell piginou at rives which are certainly not a fair profit upon the article, in the present price of the raw material and labour. Some few transactions were effected at and labour. Some few transactions were effected at 41 for pigs, that, to have re-lized their maker a profit at all proportionate with the profit of the miker of malleable iron, should bave obtained at least 5a, more. Most of the fluished iron-makers, who order largely at quarter-day, have not yet had all the orders of lost quarter-day supplied to them, but in about a fortnight they will bave, and then pig sellers will be admitted to an interview. Another reason for the apparent duloess of the pig trade is the large increase in the make of that article now as compared with even twelve months ago. Stocks of pigs have slightly increased in the past fortnight. A further proof of the desirability of substituting

A further proof of the desirability of substituting wrought for cast iron in the construction of girders in wrought for cast iron in the construction of girders in ordinary buildings, has been afforded in the history of the accident in this district of recent date. A week or two ago, it will be remembered, a portion of an upper flooring at the server manufactory of Messrs. Grice, Weston, and Co. of Spon-lane, oo the Sturr Valley Line, fell in consequence of the breaking of a cast-iron girder which supported it, occesioning damage to the amount of 500%, and käling a work-ware. woman

woman. At the inquest Mr. Nicholls, the architect, stated that the girders had been proved before they were pat up, and were sufficiently strong to carry twonty-two tons breaking weight, whilst the weight upon it, at the time of the secideal, was only about filteen or sixteen tons. The newspaper report of the inquest ment the size a candide them. upon the girl, concludes thus :-

upon the girl, concludes thus — "The cornner suggested to Mr. Grice, in the event of their recluidling the warehouse, the propriety of their having oak beams, supported by iron columns, instead of east-iron girlders, which suggestion Mr. Grice promised to see rarried out 11" "The coroner," it is right to say, was on this occasion a deputy roroner, a young man from Devou-shire, evidently with very little faith in iron. The coroner would, no doubt, have called in such scientifie aid as would have accounted for the accident, and not have left the jury to decide upon the testi-mony of the architect, who "could not in any way account for the faith."

THE BUILDER.

PROBLEMATA MATHEMATICA

FIND the dimensions of the largest cistern that can be lined with a given rectangular sheet of lead, by soldering it only at the four angles formed by the intersectious of the sides and ends of the eistern.

intersections of the sides and cuds of the eistern. Let a and b denote respectively the length and width of the given sheet of lead, and let x he taken to represent the depth of the required cistern. Then the four pieces cut from the corners of the given sheet will be equal squares, having their sides equal to x, the depth of the eistern, and leaving the dimensions a-2xand b-2x for the length and width of the eistern. Its three dimensions will therefore be expressed by a-2x, b-2x, and $x^{(1)}$; and its capacity by (a-2x) (b-2x)x. (b-2x) x.

Let
$$u = \phi(x) = (a - 2x) (b - 2x) x = a b x - 2 (a + b) x^2 + 4 x^3$$
;
en we have to determine that value of x which makes

$$\frac{d^{2}u}{dx} = ab - 4(a + b)x + 12x^{2} = 0;$$

$$12x^{2} - 4(a + b)x = -ab;$$
and
$$x = a + b \pm \sqrt{(a + b)^{2} - 3ab} = \frac{6}{a + b \pm \sqrt{(a^{2} - ab + b^{2})^{2}}}$$

6 Upon examination it will be found that $\frac{d^2 u}{dx^2}$ is negative when we take the lower sign in the value of

, therefore a is a maximum value for

$$\frac{a+b-\sqrt{a^2-a\,b+b^2}}{6}$$
Hence, by substituting for x in (!) its value

$$\frac{a+b-\sqrt{a^2-a\,b+b^2}}{6},$$
we have the quantities,

$$a-\frac{1}{3}(a+b-\sqrt{a^2-a\,b+b^2}),$$

$$b-\frac{1}{3}(a+b-\sqrt{a^2-a\,b+b^2}),$$
and

$$\frac{a+b-\sqrt{a^2-a\,b+b^2}}{6},$$

which are the required dimensions of the cistern.

A plane reflector, of given length, is placed with one end of it tourhing the base of a vertical object, and turned about this end, as its axis, until the extremity of the reflection of the object would meet a vertical line passing through an extreme point in its opposite end; to determine the height of the object object

Let \vec{a} = the given length of the reflector, and let \vec{a} be the angle of inclination of the plane of the reflector with that of the object; then the angles of incidence and reflection $=\frac{\pi}{2}-\alpha$; the angle which the reflection of the object makes with the reflecting surface, on the side opposite to that of the incidence of the object, $=\frac{\pi}{2}-\left(\frac{\pi}{2}-a\right)=a$; the angle which depend on the set of the s

Optics, 20). Hence the beight of the object = the length of the reflection = $\hat{a} \frac{\sin a}{\sin (\pi - 2a)}$

Cambridge. A. J. TOMPKINS.

BUCKINGHAM PALACE.

BUCKINGHAM PALACE. WHEN I see in your Jornal the grand displays of architectural skill shown in the design of the intended Public Offices, I look with wonder and a sort of advination at the pinneles, turats, and long lices of elevations, decorated in various tastes, and having all some peculiar merits; but none of which, in my humble opinion, are equal to the visionary idea I had formed of a great national building which is intended, for ages to come, for runian as a prominent example of the taste of this remarkable sge. It is true, sir, that Jown not a mericinal man, and yet still can form source the taske of this remarkable area. It is true, sir, that I am not a practical man, and yet still can form some idea of the difficulty an architect may find in adapting the design of a large building to pecuative purposes. In the late competition, however, it appears that the architects have been left a wide scape for the display of their imagination: large sums have been offered a prizes, the competition was very properly left open to the workl, and yet we find that the best of the scherariog bricks. At the front of the kind architects have been left a wide scape for the display prizes, the competition was very properly left open to the workl, and yet we find that the best of the scherariog bricks. At the separating bricks, and never leave them remeans the separating bricks, and never leave them remeans the separating bricks, and never leave them remeans the separating bricks and never leave them remeans the separating bricks and never leave them remeans the separating bricks and never leave them remeans the separating bricks and never leave them separating bricks and never leave them separating bricks and never leave them separating bricks and never leav

existence. In my own mind, I cannot help comparing the drawings in connection with this competition which you have shown us with Inigo Jones's design for the building of Whitchell Palace, and have an im-pression in favour of the clegant and varied plan of that architect. It may be said that in the present instance we do not want a palace, but two Govern-ment offices, for war purposes and for the management of foreign business. In the designs, however, which you have shown to us, there is little in general appear-nace which indicates what they are, but sattered phinted, the designs off-red for the Public Offices, so far as the exterior appearance is concerned, might just as well do for palaces, and would certainly give the public a much better iden of the bome of roy-sity than the Londoners can obtain by a glance at the dingy and awkward pile called St. James's, and the equally m-pleased-tooking Buckingham Palace. As regards the latter structure, it may be worth while to notice that do for the bank of the palace, bolding pretry much the same position as regards the batter structure, it may be worth while to notice a do the stabley-rads and other subords at the whole as do the stabley-rads and other subords at the whole as do the stabley-rads and other subords at the whole as do the stabley-rads and other subords at the whole as do the stabley-rads and other subords at the whole as do the suble, and which in the eyes of strangers of insport at maxions, and which are geocrally, if semigapent on this building, when houses are being and built, and which in the eyes of strangers of taste makes us to be worse thought of than we radjud deserve to be. Now, when houses are being and submile, and which in the eyes of strangers of taste makes us to be worse thought of than we radjud deserve to be. Now, when houses are being apposed to public, and while, and an almost in creatible as of money expected in clearing away the some appearts which would enable the public to get a simule and on the prache obdite to get a simul

to suggest that it would be went to throw down't hof-tion of the brief's wall and some of the tall houses, and let us have a di-tant peep at Buckingham Pelace from these points. Considering how willingly the large grants for other purpose have been made, there is no doubt that the extra sums required would be cheer-

doubt that the extra sume of fully given. Few persons would advocate this evident improve-ment if they thought that it would in any way inter-fere with the privacy of ther Majesty or family; but by the gordener's skill we might have a view of the hou-e, and the private walks be, notwithstauding, sheltered from the view of the passing erowd. PEDESTRIAN.

T. W. G. TREEN, - FAIRVIS." T. W. G. TREEN, - Forming Sensors or Tunnels, and Galleys to Tunnels. Dated Nov. 13, 1856.— This invention consists—I. In forming a railway in the sever to gct rid of the earth. The rails are formed on the invert, and where they come the part may be bollowed out so as to prevent extra wight of ma'erial. 2. In causing a current of mir to be drawn through, so that the sever or tunnel may be carried any listance without disturbing the ground above. S. Of a cultes aluiced the for arriving of the surplus through, so that the sever of thinks the ground above, any distance without disturbing the ground above, 3. Of a gulley sluice-trap for carrying off the surplus drainage. 4. In forming pipes with longitudinal joints as well as the common traverse joints that are now used. The object of this is, that the pipes may be taken through the sever or tunnel in separate parts and afterwards pat together.—Not proceeded with.

JOHN BIRD, Chance's Fire-brick Works, near Dudley,—Manufacture of articles mildeble to be used as Window-heads and Sills, Lindeb, and other simi-lar Parts of Buildings. Dated Jan. 19, 1857.— This invention consists in manafacturing articles sui-able to he used as window-heads, sills, lintels, and other similar parts of buildings from fire or other clay, in a dry or nearly dry state, by forcing it into a suitably formed mould be a pressure sufficiently strong to emse the day to retail the form given to it by the mould after it is removed therefrom. The articles thus mouldled are burned in a kilu, in which are three or more walls or supports, across which the articles to be burnt rest, being kent apart by separating bricks. At the front of the kiln is a screw, which, as the articles shrink during the burning, is used to force forward a block long enough to rest on all the supports, so as to keep the articles constauly in con-tact with the separating bricks, and never leave them room enough to twist or get out of shape. T. C. SAIT.—A new or improved Method of JOHN BIRD, Chance's Fire-brick Works, near

Coating with Glass, or Enamelling Surfaces of Cast-iron. Dated Oct. 29, 1856.—The enamelling of cast-iron, or coating it with glass, is effected by the use or pounded glass enamed, applied by gum-water, and afterwards fused.

atterwards insci. R. A. BROOMAN.—Improvements in Machinery for Cuttiny and Dressing Stone, Marble, and similar Materials. (A communication.) Doted Nov. 8, 1856.—The object here is to imittee hand-cutting. The distinctive features lie in the manner of workin the cutting chisels. The stone is carried in a bor the cutting chisels. The stone is carried in a bori-zontal direction npon a moveable platform, while the chisels are made to act upon its upper surface in an inclined direction, and opposite to that of the feed. These chisels are supported in guides, formed in the lower cross rail of the frame. Each guide stock is connected to a toggle lever, the upper end of which is fastened to the upper cross rail of the frame, and it is by acting upon the centre joint of the toggles, whereby there are made to a induct the tradient or given to the they are made to vibrate, that motion is given to the ehisels. The motion is imparted by coms.

W. BRINDLEY.—Improvements in the Preparation Paperhangings and other Ornamental Papers. Dated Nov. 5, 1856.—These consist in reudering wall papers or paperhanging impervious to moisture by a peculiar process of oiling and drying, which has also the property of communicating to the water or Dated Nov. hody colours, with which the same are stained, much of the character of oil-painting. And in glazing paper by the china cell of the patients, which is graving heap prepared by the said process, by passing the paper an compressing it between revolving smooth surface metal rollers, as practised in calendar machines.-Not proceeded with. · and surfaecd

J. KINNIBURGH,-Improvements in Moulding or haping Metals. Dated Nov. 13, 1856.-This re-Shaping Metals. lates principally to the moulding of hollow or tubular articles of cylindrical contour, and is also applicable in the manufacture of articles resembling pipes in general structure. Core bars, capable of contracting in diametric dimensions, are used. These core bars are each composed of three longitudinal pieces of curved metal, or segmental metal plates, combined to-gether so as to form a bar of the desired diameter, with their longitudinal junction edges in contact with each other. On a spindle are keyed small eccentries. Connecting rold pass from these, and are jointent to a long, narrow, externally-adjusting wedze-shaped piece, which virtually forms a fourth segment of the core bar. Joins Fourtscore, Charles-street, Loudon.-Im-provements in the Construction of the Fur-naces of Bakers' Owns for the surnose of Con-

procements in the Construction of the Fur-naces of Bakers' Orens for the purpose of Con-staming Smoke, which improvements are also applicable to the Consumption of Smoke in other Furnaces. Dated January 26th, 1557 — The fur-nace is provided with outer and inner doors, and is furnished at the top, at the end next the over, with a block or inverted bridge extending downwards across the furnace. Over the inner door is an opening extend-ing across the furnace and the outer down is excised. ing arross the furnace, and the outer door is an opening errord ing arross the furnace, and the outer door is provided with a projecting block, which, when the outer door is closed, fits into the same op ning, and renders the same sir-tight or ucarly so. When fuel is supsince artegito where the other door is left open, and a current of air admitted, which, in passing over the top of the furnace, becomes heated, and is thrown downwards by the block or inverted bidge at the end of the furnace, and, meeting with the upward enrrent of air through the furnace bars, effectually consumes all the smoke and gasse vulved from the fael. The admission of the proper quantity of air necessary to consume all the smoke is regulated by opening or closing the outer door of the furnace, opening or closing the outer door of the furned which should not be left open wider than is next sary to admit the minimum amount of air required.

RECENT AMERICAN PATENTS *

For Improved Machinery for Escavating Rock. JESSE C. Oscoon, Troy, N.Y.—Claun: 1st. Exca-vating rock and/r water by means of the welge-shaped chis. I, whose length is greater than the depth of water. 2nd. The spring-bead, or its equivalent, in combination with the chisel. 3rd. The arrangement of the spring within the loop or strap of the turn-buckle, in combination with the slining nut.

For an Improvement in Rotary Brick Machines. Exong CRANGLE, Philadelphin, Pennsylvania.— Claim: A rylinder without movable bottoms to the moulds, in combination with a bel-picce fixed to the frame of the machine, so as to serve the purpose of said bottoms, the said cylinder and bed-piece being constructed, arranged, combined, and operated tonether

For an Improved Saw-mill for Re-sawing Boards For an Lunproceed Sate-mult for ite-souring Boards and other Lumber. PEARSON CROSEN, Fredouin, New York; patented Nov. 3, 1841; reissued March 10, 1849; rxtended October 30, 1855; re-re-issued April 28, 1857.--Claim: The mode of epretation of gaugine, guiding, and presenting hoards to the action

* Selected from the lists published in the Journal of the Franklin Institute, of Pennsylvania.

of a saw, which mode of operation results from com-bining with a slitting saw the mechanism for gauging and guiding one face of the boards, and the mechanism for making a self-adjusting pressure on the op-posite face of the boards, so that the boards will be poste late of the boards, so that the obstantiant of poste clamped between the two said mechanisms on opposite faces, and immediately in front of the euting edge of the saw, so as to prevent the gauged face of the boards, however warped or bent they may be, in a plane parallel with the plane of the saw. Also, in combination with a slitting saw, and the arrangement of the gauge and pressure rollers connecting the said gauge and pressure rollers with the mechanism from which they derive motion by means of universal joints. Also, the method of hanging and straining the saw, by the combination of the three stirrups at the cods of the saw.

For an Improvement in Combined Square, Mitre Square, and Bevel. ALEXANDER MCKEXZE, Bos-ton, Massachusetts. Claim: The arrangement of the try square, the mitre, and the hevel blade, the latter being hung so as to project npon the opposite side of the stock from the blude, and so as to form when set at an angle of 45 degrees a continuation of the mitro head

For an Improvement in Levels or Inclinometers. THOMAS A. CHANDLER, Rockfort, Illinois .--- Claim: THOMAS A. CHANDLER, Rockfort, Illinois.—Claim : The combination of an entire graduated circle, pro-vided with a pendulum and index, with the two parallel sides of the level stock, whereby I am enabled to apply either side of said stock to the surface whose direction is to be ascertained, and at the same time have the index facing the operator, in what-cver position he may be placed. Also, the level composed of the before enumerated parts in combina-tion where merca enter them there in the advent tion, whereby, among other things, either edge of the instructor, name gound times, etter euge of the instructor may be used inpermost with its face or did towards the operator, and when any two of the pointers are screened from sight hy an intervening body, the third will indicate the inclination of the surface to which the instrument is applied, and the angles at the head and foot of a rafter will be indicated at the same time. at the same time.

For an Improved Side-walk Pavement. JOHN B. CORNELL, City of New York.—Claim: Casting iu one piece a section of a street gutter and curb of in one preceasection of a stretc guiter and enro of suitable shape and proportions. Also, forming the side-walk pavement of a series of metallic plates, when sold plates are combined with each other, and with the alorestid metallic stretce guiter and earb. For an Improvement in Iron Pavements.

For an Improvement in Iron Pavements, CHARLES METTAM, City of New York.—Claim: Casting each block, or plate, with a number of hooks standing out hiterally from below the general level of the bottom thereof, and turning upwards in the form for active thereas. of vertical tenous, and with a corresponding number of montises in the lower faces, so that when the plates are laid together, the vertical tenons of one block or plate enter mortises in adjacent ones, and the mortises receive tenons of adjacent ones, while the laterally projecting portions of the blocks or plates make them

For an Improvement in Cast-iron Pavements. CHARLES J. SHEPARD, Brooklyn, New York. CHARLES J. SHEFARD, Brooklyn, New York. — Claim: Forming polygonal metallic paving blocks, with the inclines at the upper part of the straight sides, and with the projections to take the inclines of the adjuning blocks at unequal distances from the angle of said blocks.

For an Improvement in Apparatus for Boring Artesian Wells. JESSE N. BOLLES, Assignor to M. W. BOLLES, Philadelphia, Pennsylvania, Claim: The combination of cylindrical horing-rods with cuiters and valves, so constructed as to discharge the detritus upon the surface of the ground at every stroke of the drill, or any other mode, substantially the same, which will produce the same effect.

For an Improved Process for Ornamenting Daguerreotype Cases, &c. John F. MASCHER, Philadelphia, Pennsylvania.—Claim: The process of Philadelphia, Pennsylvana.--tuam: I ne process or ornamentiag daguereotype cases, or other articles, in imitation of tortwise-shell, wood, marble, or other substances, by first covering the surfaces thereof with st-inde or coloured pyper of suitable character, or staining or colouring the surfaces themselves in a or stailing or colouring the surfaces themselves in a suitable manner, and afterwards coating them with gelatine, and bi-chromate of potsh.

Books Receibed.

Architectural Economics: comprising Tables and Designs for Details for Assistance in Estimating. By the Rev. G. Scratton; formerly of the Royal Institute of British Architects. London: Long-Institute of British Architects. man and Co.

THE object the author of this little book has in view The object to eather of this hole book has to view is to shorten the process of making estimates of buildings by means of tables which he thinks almost all encerved is building might find serviceable, especially those upon whom devolves the laying out

SEPT. 5, 1857.

to advantage funds subscribed for charitable objects. Thirty-two of the fifty-three tables consist of "values computed in decimals of a pound, of the cost of the larger kinds of work which occur in huildings. Each decimal factor is a value of one square foot of the interior ground-plot of a given building, of which estimates are proposed to be calculated. In other words, take the area in fact of the plans minus the thickness of the walls, and multiply by the decimal factor given for the work whose expresses is decimal factor given for the work whose expe required to be estimated."

required to be estimated." The calculations for this class of tables have here based upon certain definite sizes of area: it will there-fore be necessary to bear in mind that these tables will only give approximate estimates in cases of great variation from the sizes here adopted, showing that the tables given are of very limited application. The various factors, such as for walls, roof, floors, &c. have to be taken from the tables and their sum multiplied by the number equal to the feet of area. The system is roundabout, and it may be a question, even in the case of the few plans given to which it could be applied, whether the result would he nearer the mean applied, whether the result would be nearer the mean of four of five builders' tenders than the jumping estimate made by the common mode of cubing in the gross. Nevertheless, there are many who will find Mr. Scratton's book of results,—the proceeds of much labour,—a useful aid well worth its cost.

he Useful Metals and their Alloys, with their Applications to the Industrial Arts. London: Houston and Wright, 65, Paternoster-row. 1857.

THIS volume contains a great deal of valuable infor-mation on the subject of the useful metals and their mation on the subject of the useful metals and their alloys, including metallurgic chemistry, mining venti-lation, and jorisprudence, in relation to the conversion of iron, copper, tin, zinc, lead, and antimony ores, and their applications to the industrial arts. The subject of iron alone, however, occupies a great part of the volume, and it includes a pretty full account of the various uses and adaptations of that metal to archi-related excitations contract and the protection. tectural and engineering purposes, with numerous engraved illustrations. The work has been written engraved illustrations. The work has been written by several authors, among whom are Messrs. W. Vose Pickett, the authors of the "New System of Iron Architecture;" W. Fairbairn, the engineer and ma-chinist; and W. Turarn, C.E. The hook resembles "Orr's Circle of the Sciences," if it be not based on it existent but is a near 6 way. entirely, but in a new form.

Collectanea Antiqua: Elchings and Notices of An-cient Remains, illustrative of the Habits, Customs, and History of Past Ages. By CHAMLES ROACH SMITH, Hon. M.R.S.L. Vol. IV. Part 4. Printed for subscribers only, and not published.

THIS part completes the fourth volume of this inte-resting and valuable archæological work. It treats of resting and valuable archeological work. It treats of Romau remains found at Petham, in Kent, Discoveries of Frankish Sepulchral Remains by M.Auguste Moutié, a Roman Sword found near Mayence, and various other discoveries aud researches. It also contains the preface, list of subscribers, and index, together with an appendix on Mr. Smith's "Museum of London Antiquities," sold to the British Museum, and other matter. The part, like those which have preceded it, i illustrated by emerging and above how advised is illustrated by engravings, and shows how efficiently Mr. Roach Smith is still working.

Miscellanea.

OUR FOOTWAYS.—I dare say that you, in common with myself and the legion of readers of your useful and instructive publication, have, in your percegrina-tious in the suburhs of London and other towns, be-moaned the absence of paved ways, anathematised the loose, sharp, rolling pebbles of the gravelled path, and hegradged the horse (so unconscious of the better provision made for his travelling, as compared with his biped master's) his smooth and pleasant road; but way has it ever converted to you or our readers that Insolved masters) insolved in a pleasant road, but pray has it very cocurred to you or your readers that by a very simple process the pathways might be made as agreeable to the pedestrian as the roadways, and thereby danger to life and limb by the nse of the roadway, or destruction to shoe leather, pain to tender feet, and most disagreeable walking be avoided? If feet, and most disagreeable walking be avoided? If not, I will endeavoor to culighten you upon the sub-ject. The simple process referred to is the vigorous use of the birch-broom. Let *long-formad*, walf-trodden, gravelled foolmays, after ten days' or a forknight's continuance of dry weather, be well swept, and they will afterwards be found to be almost as pleasant to the feet, and much more agreeable to the eye, for paving footpaths in rural districts imparts a "cockneyfied" appearance to them. Our male poor might be employed in the operation. The expense of becomes would not be much, and the thing once well become would not have to be repeated until after a due lapse of time from the application of the pickaxe and lapse of time trout too approvel. the laying down of new gravel. F. C. M. SPEARMAN.

THE OPENING OF THE FILEY WATERWORKS COMPARY.—The opening of the Filey Waterworks took place on Friday, August 7th. It was intended that the directors and shareholders should have a that the directors and shareholders should have a pic-nie beside the reservoir; but the weather being so ampropitious, the assembly-room of the Royal Hotel was engaged for the occasion, where the party had their collation. Mr. Moody was called to the ebsir. The works had been planued and completed on a somewhat large scale, far beyond present requirements. The prospective wants of the rising and prospectual town of Filey had been considered and provided for. It was calculated they had sufficient water for 10,000 inhabitants. The demand for water, too, was much greater than was anticipated; and he thought there greater than was anticipated, and he thought there was every probability that the works would pay a good remunerative interest on the outlay. The works had heen exceeded with economy, and yet in the hest and most solid style. He thought there was very great credit due to the engineer, Mr. Fairbank, for his industry and skill. Under his direction the works had heen exceeded is a work asticfacture work.

press tends to the control of the c ing of the York Gas Company was held last week, when a dividend of 7 per cent, was resolved on, and also that the charge for gos should be reduced from 5s, to 4s. 6d. per 1,000 feet. There was a warm discussion, it being contended that the company was in a prosperous condition, and able to pay S per cent. <u>PROFORED GREAT CENTRAL WESTERN TERMINUS</u>

The grand desideratum of a common centre for The grain desideration of a common center to railway traffic in the metropolis appears to be assum-ing a definite shape at last. A scheme has already been matured for the construction of an immense central station on and around the site of the basin of the Grosvenor canal, at Victoria-street, Westminster (less than 1,000 yards from Charing-cross), with a central line of railway to run along the short route of that canal to the Thames, near Battersca-park Bridge, crossing the river by an iron hridge of its own to the crossing the river by an iron hridge of its own to the Battersea side, east of the new park, and running thence through Brixton, Clapham, Dulwich, Cauher-well, and the suhnrhan districts on the Surrey side of the water, and communicating with *all* the lines of railway going south,—that is, with the lines to Brighton, Dover, the Crystal Palace, the main line of the South-Western, the Croydon, Epson, Mid-Kent, and North Kent. It is astonishing that the *Times*, in announcing the advent of this grand sm simple scheme, does not put the finishing stroke to so comscheme, does not put the fuishing stroke to so com-prehensive and desirable a work, by pointing attention to the fact, that *already* the whole of the *northern* lines are connected almost with the very site of the lines are connected almost with the very site of the central station of which it speaks, by means of the West London line, and an obvious and easy continua-tion of that line along the hed of the Kensington eanal, and through some of the streets of Chelsea hordering the river, onwards to the Grosvenor eand itself. From the Great Western and the North-Western (which in turn are already connected with the Northern and North-Eastern lines by the North London), the West London already extends downwards to the basin of the Kensington eanal, and thence one-I London), the West London arready extends downwards to the basin of the Kensington canal, and thence one-h half of the short remainder may be said to be already (formed by the bed of that canal. The entire circuit of the Metropolitan lines, north, south, west, and east, would thus be cheaply and easily connected in the one grand terminus at Victoria-street.

THE BROTHERTON MEMORIAL. - For this me-morial, which it is proposed shall be erected in the mmorial, which it is proposed shall be crected in the SSalford Borough Cometery, there has been a competi-tion of models and designs; and we learn that at a special necting of the committee, held on Friday, the 221st ult. the drawing No. 1, moto "Hyperion" (danthor T. Holmes, architect, Munchester"), was selected, provided it can be crected and completed in a astifactory manner for the sum specified in the con-ditions. The prize of treaty guines awarded bio the model No. 65, motto "Beta" (author M. Nobels senjutor, London). Special commendation was Noble, sculptor, London). Special commendation was ecceptessed in favour of the following, viz. ---Model No. 17, motto "His were deels, not words;" draw-sing No. 41, motto "For men to seek their own glory hing No. 41, motto "For men to seek their own glory" is not glory;" drawing No. 51, motto "Neulo;" wind model No. 60, motto "C." — Manchester GGuardian.

* We are asked to say that this should stand as, by

HOW ARE WORKMEN'S HOUSES TO BE BUILT IN EDINBURGH.—Under this title, the Rev. Dr. Begg writes a letter to the Lord Provost, in which he says: "To build workmen's houses with advantage, they nust, of course, he built in quantities. Land, plans, contracts, all can be got cheaper if got whole-ale; and if well aired, dry, comfortable, well situated work-men's houses could thus be creeted and sold to each workman at wholesale price, an immense object would be gained. The property investment companies have been extremely useful, especially to the class above the working men; but, inasmuch as they have not, like the English and Irish societies, done anything in the way of having land or building additional bouses, itey have, by increasing the number of purchasers, only raised the value of all the second-rate property at present in existence. They have not as yet gone by any means to the root of the mischief, nor can they and forethought in many of our citizens, and in acting as a kind of bankers for managing the money of their build workmen's houses with advantage, as a kind of bankers for managing the money of their members; but their full utility and value will only be discovered, as well as that of the savings' hanks, when a scheme is set ou foot for surrounding the whole city with new elusters of comfortable and suitable city with new clusters of comfortable and suitable houses, which the people may have it in their power to buy hy means of the existing machinery for accu-mulating money. Now, what I propose is, to raise a capital for this express purpose. Two friends of mine have offered to advance 100%, each with this view : I shall advance another; and if forty or filly men in Ediulungh will do the same,—in other words, if 4,000%, or 5,000%, can be raised for this express pur-ness. I this L see how the entire ground door of our pose, I think I see how the entire ground-floor of our society might in due time he elevated above the present level of degradation. Let this money he advanced upon the principle of limited liability, and let the issue be tested, and each subscriber he allowed to retire if there is any loss of funds ot the end of the first and of every succeeding operation : let the fands be hauded over to a committee of first-class men of skill and experience-let them begin hy erecting a number of houses upon the most approved plan, say fr-forty to fifty, in the most dense ueighbourhoods oí forty to fitty, in the most dense unglinearhoods of working much-let these houses he sold to the work-men in retail at cost price, after calculating all ex-peoses—let the men, hy means of swings' heaks and investment companies, purchase them—let the capital thus extricated he again immediately removed to another locality, and the same operationrepeated,—and let this he done again and again until the whole necesit is the one again and gain and real other the one neces-sities of the working classes of Edinburgh are supplied; or until they have so learned the art of combination for the necomplishment of such an object as to he inde-pendent of help." IMPORTANT MOVEMENT FOR THE PROMOTION OF

SOCIAL SCIENCE. — Lord Brougham has consented to preside, and to deliver the inaugural address, at the formation of an association which is a pressed, and to deriver the manging address, at the formation of an association which is about to be esta-blished for the purpose of hringing together the sup-porters of the various efforts which are now heiog made for social improvement (sanitary reform, &c.) and to elucidate by discussion the connection between and the mutual assistance they may render to each. each other. The new movement will partake to some extent of the character of the educational conference extent of the character of the educational conference recently held in London, over which the Prince Consort presided, various hranches of social science being referred to "sections" or "departments" con-ducted by gentlemen who have paid attentiou to the subjects. The inaugural meeting will be held in the Town-hall, Birmingham, on Monday, October when Lord Brougham will deliver au introduct Monday, October 12 address. On the evening of Tuesday a soirée will be held in the Town-hall. On Wednesday evening, the held in the Town-hall. On Wednesday evening, the Hath, a public entertainment will be given to Lord Brougbam and other members of the association by the mayor of Birmingham. On Thursday evening, the 15th, a public meeting will take place in the Town-hall, on the subject of the Reformatory more-ment. On Friday morning, the 16th, the coucleding enerting will be held, to receive a report from the general committee, and on other business.

took place in the Museum at Westgate-street, on the 24th ult., the Mayor of Gateshead in the chair. In course of the proceedings it was stated that the com-mittee had been in a maoner forced from their usual mittee had been in a manner forced from their usual quiet mode of dispensing the prizes, into some public display, by the extraordinary success that had attended the exerctions of the pupils of the school in the present year, during which the new regulations had come into force. In the northern district of England there were six Schools of Design. It had turned out, as the result of the examination this year, that the number of prizes given to the pupils of the Newcastle School of Design was larger than the whole number gained by the pupils of the other five schools. The report was then read and the prizes distributed.

NEW BUILDINGS ON THE CASTLE ROCK AT EDINBURGH,—There are now in course of erection, or at least about to be commenced, some new edifices on the northern section of the rock. The site of the oil the horizon chapel, taken down some years ago, is old garrison chapel, taken down some years ago, is the scene of operations. The face of the rock henceth the Mons Meg Battery has been sareped, and it is intended, it seems, to erect an extensive armoury on the original site of the chourch, to form three sides of a square, and to include Queen Margaret's Chapel in intercovers. its integrity. Other alterations, including the tion of a chapel in a more obscure port of the are contemplated by the authorities. "Here, erec the rock. tion of a chape in a nore oscure part of the rock, are contemplated by the authorities. "Here," re-marks the *Post*, "was an excellent opportunity to repair the errors of the past, and redeem the architec-tural aspect of the Castle huildings. But what is the course pursued by the Ordnance? They utterly ignore the principles or practice of architecture, and commit the whole plans and designs to Colonel Moodic, of the Gravice plans and designs to Colonci Moodic, of the Royal Engineers,—not an architect at all;" and the same course, it adds, is to be pursued in this instance which produced the contemptible fabrics on the western side. The botching of so magnificent and picturesque a site as the Castle Rock of Edinburgh by mean hulidings is much to be regretted.

THE SWERAGE OF BLENON.—This work having heen commenced by Messes. Hassall and O'Brino, of London, we give the various estimates sent in for the work;—Mr. J. C. M-Kenzic, Wellington—Contract work — Mr. J. C. M. Kenzie, Wellington — Contract No. 1, 3,4537, No. 2, 4,4357, No. 3, 4,3077, No. 4, 1,2241, total, 13,4527. Mr. John Elliott, Wolverhampton — Contract No. 1, 2,7967, No. 2, 4,3184, No. 3, 3,7632, No. 4, 1,192; total, 12,0697. Messra, J. and S. Harpur, Derby—Con-tract No. 1, 2,9007, No. 2, 4,4007, No. 3, 3,5007, No. 4, 1,2607. total, 12,0607. Mr. Handerson, Wel-liugborough (which eame too late)—Contract No. 1, 3,0337, No. 4, 1,2747. total, No. 3, 3,507, Messra, Hassall and O'Briao, London (which was accepted)—Contract No. 1, 1,7507, No. 2, 1,5257, No. 3, 2,2407, No. 4, 8367. total, 6,3517. It will be seen that the accepted konder was less than one-half of one of the others, and only slightly exceeded be seen that the accepted to other was resolved where the half of one of the others, and only slightly creeeded half the amount of any other. The commissioners agreed to maintain the sewers in repair themselves, instead of requiring the contractors to maintain them, Martin of Hamiltonia and for this the following deductions were offered :--Mr. M'Kenzie, 1347.; Mr. Elliott, 3007.; Messrs. Harper, I,4047.; Messrs. Hassall and O'Brian, 3007.: lcoving the actual contract accepted at 6,0512.

Harper, 1, 2024. ; Messrs, Hassahland O Brain, 3007. ; lowing the actual contract accepted at 6,0517. THE THRONE-BOOM AT THE LUXEMPOURG.—An engraving of the new throne-room, recently inangu-rated, will be found in our last volume (XIV. p. 434). As to the decorations of the apartment, we find in the mewspapers that "The painting of the two hemicycles has been excented by M. Lehmann, and the cupola of the sections of the central division are the work of MM. Balze, Brothers. M. Brune has painted the two outgoons and the eight modallions. The subject of the four paintings of the western gallery are selected from the reign of Napoleon I. and those of the caster one from that of Napoleon III. M. Leh-mann takes up the history of the monarehy and of French civilisation from the defeat of Atila by the Guonan general Actins, and hrings it down to the time of Louis XIV. M. Balze in the cupola repre-sents the apotheosis of Napoleon I. Six medallions, placed above the three doors and the three windows placed above the three doors and the three windows of the central division, complete the ornamentation. In the octagon of the western gallery M. Brune has represented warlike France, and in that of the eastern one pacific France—that is, France of the arts, agri-culture, and iodustry. The western hemicycle em-braces three centuries and a half. It shows France reviving to faith and independence under the reign of the Merovingians and the Carlovingians. The two extremities of the hemicycle represent war. At one Merovens repulses the fierce Attila, and behind Microvens falls Actius, bis ally. At the other Charles Martel is represented as striking down adversaries with his hattleaxe, and driving back the Saracens. The painting on the second hemicycle goes over five centuries and a half, and in the centre stands promi-nently forward the figure of Joan of Arc. One of the eight pictures represents Napoleon III. distri-buting the cagles." pacific France-that is, France of the arts, agributiog the cagles.

DESIGNS FOR THE SHEFFIELD CRIMEAN MONU-MENT.--We understand that the Sheffield Crimean Monument Committee have received upwards of seventy designs, models, and drawings, which we are informed are of a superior character, and are now at the Cutters' Hall awaiting the adjudication, after which they will he exhibited as early as possible. The judges selected by the committee are Mr. G. G. Soott, A.R.A., of London, and Mr. Edmund Denison, Q.C. BINMINGHAM ANGHITECTURAL SOCIETY.--At a meeting of the Birmingham Architectural Society, held on Monday evening at the Midland Institute, Mr. S. Hemming and Mr. J. R. Botham were elected to serve on the Council of Queen's College, in accord-ance with the elaster of that institution. DESIGNS FOR THE SHEFFIELD CRIMEAN MONU-

BLACKBURN INFIRMARY .- I begin to think that for the particulars of the competition as advertised in your pages, and have received no reply. Blackburn bas ever bad the reputation of supporting "naive talent," and this would go far to bear out that eha-racter. A new socretary may, however, he of some advantage, for I have had on a previous occasion the pleasure of writing for full six months to the present functionary without receiving an answer. I trust that none of your readers have been used in a similar manner — THOMAS D. BARRY. A MINE PARACHURE. — I desire to call the atten-

none of your readers have been used in a similar manner—THOMAS D. BARRY. A MINE PARACHUTE.—I desire to call the atten-tion of those of your readers connected with engineer-ing to an account of a mine parachute, which offers great if not absolute safety to the miner. From the account given below I should hope that it would not be difficult for some practical mind to devise a machine from the scenty particulars furnished. The extract from a moving paper runs thus:—" As eligbt miners were two days ago being drawn up with ten becloiltres of coal from the pit of St. Louis (Ande), the rope attached to the kiblub hoke when at a considerable distance from thebottom. The death of these men would have been certain, hut for the adoption in the mine distance from the holtom. The death of these men would have been exertian, hat for the adoption in the mine of the paraebute Fontaine, which is so contrived that when the rope breaks the hocks of the apparators stick into the sides of the shaft, and, prevening the fall of the kibble, keep it suspended until a fresh rope can be attached. The number of lives saved by the adoption of this measures in Encourse shared we normate to \$2.20 of this apparatus in France already amounts to 82.' I bope that a similar mechanical contrivance may be introduced to save our poor miners .-- PIONEER

EAST GRIMSTRAD CHURCH.-Permit me to explain the mistake of which "A Sussex Yokle" complains in your last number under the heading of "Sussex Churches." In the notice to which he refers, East-Grinstead should have been printed East Grimstead; Grussiead should have been printed East Grussicad; and this, as your note correctly informs birn, is in Wilsbire. I may add that your former correspon-dent was not correct in stating that the elangel of ease had heen rehuilt by the Rev. F. Glossop, the rector of West Dean, that gentleman having in fact borne a share only of the expenses, which were defraved by a subscription amongst the members of his family.— F. H. POWNALL, the Architect. RAGGED SCHOOL AT CHATHAN.—The Under-Secretary to the War Denartment having a nonanced

RAGORD SCHOOL AT CHARACTER COUCH Serverary to the War Department having announced that Lord Panmure would provide a site 50 feet by 100 feet on Charham Lines for a Ragged School, Colonel Savage, R.E. has staked it out, and handed it over to the committee, who have already nearly 3007. in hand, with many conditional promises. Mr. Charles Foord has undertaken to creet the building on liberal

Foord has undertaken to creet ibe building on liberal terms. -MANUFARCURE or IRON. — Mr. C. Binks has / obtained two more patents in connection wilb bis process. He states that his invention consists in the employment of alkaline matter, in addition to, or in place of, lime, slice, or other flux. He prefers those ore, blackbaud ironstone, &c. The alkaline matter he prefers is soda, by preference the carbonate, out plate he is carbonate may also be employed, or there may be used any other convenicut materials that, under the conditions of the operations of a blast furnace, will yield an alkali, an alkaline enter shall be sufficient of the matter is preference the arbonate, on a car-baret. The quantity of soda used varies from 2 to 10 per cent. of the fuel, it being intended that there shall be sufficient of the alkaline has to retain all the combustion of the fuel. SLATES.—In your journal of the 15 th ult, you gave a paragraph on the names of slates. In order to form a correct statement, permit ne to append the followine. Before anythoning like a systematic working tok place at the Baagor queries, the slates from the quarries of varions lengths and widths; but the greater number were from 5 indexs to 15 liches long; and separated by the slater into sorts, the numes of

greater number were from 6 inches to 18 inches long, and separated by the slater into sorts, the names of and separated by the stater into sorts, the names of which you gave, and these continue in use in this neighbourhood to the present day, and caunot well he dispensed with. The later sorts of slates ure different in every respect, being of an even surface, nearly square in shape, varying in name according to the size, but are always of one certain dimension. I may add, but show the four some care according to unbe form

bit are always of one certain dimension. I may add, that about fifty years ago a considerable number from Langallen were used, but as they have been found to last only thirty or forty years, they are not so much used as formely.—WA RUSCOE. DECAT OF THE REMAINS AT IONA.—A corre-spondart of the Soctama draws attention to the neglect and decay of the ruins on the isle of Iono, and suggests that something ought to be done to preserve them. The isle, we believe, is the property of the Duke of Argyle, whose attention, doubless, only needs to be called to this subject to ensure the doing of all that is requisite.

THE BUILDER.

HINT TO BUILDERS. - The frecstone of the great quarries of Leckhampton, near Cheltenham, is nearly 110 feet in thickness, and some of the beds are remarkable for their treacherous disposition after a frost. Last winter the shivering and splitting of win-low sills constructed of this stone was universil in new huildings, and at Redmarley Church her Majesty. lost her nose, and the Archbishop of Canterbury his hig wig and chin, entirely through the corbels being cut from the "wet stones" of this strata.—Symonds's

" of this strata.—Symonds's Stones of the Valley. THE "GREAT EASTERN."—The Canadian News states that this sbip will be launched in the first spring tide of next month (October). The day is not, as yet, absolutely fixed, but this important event will probably take place on Monday, the 5tb, the tides being highest on that day. LEWISHAM: HATCHFFE'S CHARTY.— The foun-dation stone of six new almshouses, was laid on Wed-needay, the 20th ult. by the Hon. Mrs. Henry Legge. Five of the six will be built and endowed from the proceeds of the ahove charity, the sixth by subscrip.

rive of the six will be built and endowed from the proceeds of the ahove charity, the sixth hy subscrip-tions now in the course of collection. The design is hy Messrs. Tinkler and Morphew, the former of whom, as we have elsewhere noted with regret, is since dead. The contract has been taken by Mr-William Miller,

REMOVAL OF SEWAGE.—A few days before I left Charleston, S.C. (United States), I saw at the Charles-ton Hotel a very ingenious contrivence for raising the contents of cesspools above the surface at a trifing expense, and without the usual unpleasantness on such occasions. Au old boiler was set on tressels accented a pull birth empeth for a cest to go under expense, and without the using unpresentance of such occasions. An old boiler was set on tressels against a wall bigb enough for a cart to go under-neath, and a pipe about 6 inches diameter went from the boiler into the cesspool, and a small lead pipe from the top of the boiler connected with the steam-cagine of the establishment, and by letting the steam off, it created a vacuum, and the boiler of 2,000 gallons off, it created a vacuum, and the boiler of 2,000 gallons would fill itself in about five minutes from the cess-pool; then the cert, with a large barrel in it, would back underneath, and put a piece of bose-pipe, con-nected with the holler, hy a flange into the barrel, and earry off the load; the whole operation being doue without any trouble or annoyance. Now, sir, could not this system be employed to advantage about large establishments in London, where there is steam on the premises? or would it not pay to have wells at the mouths of the large severs, and raise the contents in this cheap and inolorous way for the purposes of maanne, as there is no labour in raising, or filling the waggons.—JAMES M CONKAY.

CLERK of WORKS, capable of preparing Freedon of Workhose, kow WANED Divide Article, Workhose, kow WANED Divide Article, the purpher and the second second second second organizations, terms, do 1 do C. East What Strad. Iondon,

IN a SURVEYOR'S OFFICE, --- WANTED, a YOU'H, who can write a pood plain hand, frace draw-logs, and square dimension -- Addrew, in own handwriting, to b, J. Billow, 27, St. George attreel. Westiminater.

TO PLUMBERS, --- Notice is hereby given, that there is a VACANOY in the office of BEA.11-, to its Plumber-Ompany-Personal delivous to become Candidas are requested to send their written applications for the same, with testimonials, to Mr. 700485, at 24, Laurence Pennere-iano, Cancon-treet, City, on or before the 18th day of SEPTEMBER exit, and to attend the Court, at Plumber-Heit, Bel-iane, Cancon-treet, City, on VONDAY, the list day of SEPTE MESH user, at FWO volock in the attennous professor.

TO CARVERS. TO CARVERS. TO CARVERS. To carbon and the second state of the second st TO ORDNANCE SURVEYORS OUT OF EMPLOYMENT.

WANTED, for a short time, a first-class OLUNANCE SUBVEVOR for town work-apply by letter, the first letters and references, to 11. S. Office of "The Builder"

WANTED, in a Builder's Office, a CLERK used to keep accounts and take out quantities occa-sionally.-Apply to X. B. Office of "The Builder."

WANTED, immediately, TWO or THREE good MASONS.-Apply at the CHURCH, Braintree,

WANTED, a BRICKLAYER, to do the labour of some semi-detsched houses, at per rod, and had lding.-Apply to W.F. STEVENSON; 1, Melbourne-terrace, i-street, Camden-town.

WANTED, in an Engineer's and Iron-founder's office, a YOUTH, as JONION CLERK. He must have a good knowledge of architectural drawing. He will have to make bimself generally usrall.-Address, to A. B. care of Mr. Woolhall, is, Kolanderteret, W.

CARMAN AND ACTIVE LABOURER.

CARMAN AND ADDIVE LABOURDR. WANTED, a well-recommended Man, for taking great care of his burk, and to drive one horse and cart, make himself useful, read and write. As should so married an incombanue. Also a strong active Labourer, with respectable line cases preferred 1 fill on his line in the works; must read onta write well; married, Wage about 18 to commence with-Apply by letter to T. O. Office of "The Builder."

WANTED, by a Young Man, a SITUA TION as BRIGKLAZER, or Employment can de painting.-Address, W. B. S. Upper Boston-place, Dorset-square.

TO BUILDERS, PLUMBERS, &c. WANTED, by a well-experienced Young Man. KNPLOKMERT as PLOVMERK, will fill up has time in any other branch, if equired-Address, H. 6. 10, Robert-streel, Bedrover, W.C.

Sept. 12, 1857.

The Builder.

LTHOUGH we have already sufficiently indicated the con-elusions arrived at by the late Commission, appointed by her Majesty, at the instance of the House of Commons, to consider and report upon the question of a new National Gallery, particularly as regards the site, and have also expressed some personal opinions on this subject, there are various interesting points in the evidence adduced hefore the Commission, to which it may be worth while briefly to refer.

81 The Commission, as we may here remind our readers, consisted of Lord Broughton, Dr. Milman (Dean of St. Paul's), aud Messrs. Ford, Faraday, Coekerell, and Richmond. Mr. Ford, however, was unable from illness to act upon the Commission; whose report, moreover, so far as regarded the expression of collective opinion, was eramped the requirement of the Royal warrant by that five signatures should be affixed to it; so that the Commission were compelled, as they remark, to frame a statement to which all of them could agree, and which, therefore, could hardly contain much more than a summary of their proceedings, without the argu-ments and inferences usually to he found in similar documents.

The witnesses examined by the Commission were,-Sir C. L. Eastlake, P.R.A.; Sir Charles Barry, R.A.; Baron Marochetti ; the Chancellor Barry, R.A.; Baron Marochetti; the Chancellor of the Exchequer (Sir G. C. Lewis); Sir E. Landseer, R.A.; and Messrs. H. Farrer, J. Nieuwenhuys, J. Bentley, J. P. Kuight, R.A.; E. W. Cooke, A.R.A.; E. T. Parris, W. Mul-ready, R.A.; J. M. Smith, S. P. Denning, R. T. Smart, A. Panizzi, E. Hawkins, E. Oldfield, W. H. Commercien Science Science Rest. Letter 1975 (2019) 1997 (2 W. H. Carpenter, Sydney Smirke, R.A.; John Bell, R. Westmacott, R.A.; John Ruskin, F. Hurlstone, J. Fergusson, E. A. Bowring, John Doyle, A. J. B. B. Hope, J. F. Lewis, R.S.A.; H. Warren, T. L. Donaldson, and M. Dighy Wyatt.

It was thought by many of the witnesses, even those who nevertheless declined recommending the Kensington Gore site, that Charingcross was, to some extent, inferior to that site as regarded atmospheric impurities, at all events at present, and until the metropolis sprcad a little farther to the westward; hut that there was a class even of atmospheric impurities in a picture-gallery which were prohably more especially injurious to pictures, namely, those arising from crowds of human beings, and which were no more injurious on the present site than on

any other.* The liability of smoke also to cover the pictures within metropolitan bounds was pretty generally admitted, although some who were conversaut with the preservation of such art-works insisted that where pictures were lightly and carefully dusted, no injury whatever to their surface was occasioned either by the smoke or the dusting. As a complete remedy, however, for smoke, dust, and human vapours, the more general protection of the pictures by glass was strongly recommended by competent witnesses, as by Sir Charles Eastlake, and Messrs. Cooke, Mulready, Ruskin, and J. F. Lewis,

* Perhaps it might have been even fairly urged that these emanations, at least, were likelier to be neutralized in London, by the defecating or deodorizing carbon or smoke of the metropolis, than elsewhere.

effected in a similar way.

The combination of painting with sculpture was recommended by the great majority of the injured by the London atmosphere, but hy witnesses, and particularly by Mr. Bell, Sir damp. The colours which ought to have been Charles Barry, Mr. Westmacott, Baron Maro- whites were now hlacks. He had never seen chetti, Mr. Ruskin, Mr. Fergusson, and Mr. J. F. Lewis. A proposal, however, made by Mr. Richmoud, and seconded by Professor Faraday, to identify the commission with this very general opinion, was considered by the three other commissiouers to he unnecessary.

In his evidence, Sir Charles Barry explained the comprehensive scheme which he recommended for the union of paintings with scalp ture, &c. in the British Museum, at the sam time admitting the general accuracy of our account of that scheme in the Builder (to which the Commission referred him), as the only publieation of it (though not on his own authority) of which be knew. This comprehensive scheme, as onr readers may recollect, was projected hefore the recent conversion of the central court or inclosure of the British Museum into a library and reading-room. In reference to a metro-politan site generally for the new National Gallery, Sir Charles stated his opinion to be, that the objections to such a site had heen somewhat exaggerated.

Having now given some general idea of the prevailing evidence on important points, we may lightly turn over some of the voluminous pages of the minutes of evidence appended to the report of the commissioners, and note down a few of the more salient matters as they appear in the records of the evidence given hy the respective witnesses.

Sir Charles Eastlake was the first witness examined. The first question asked him related to the injury which pictures were said to re-ceive in a large city. Sir Charles was of opinion that in London pictures did suffer from smoke and crowds : there certainly was a state of the atmosphere produced hy these crowds themselves, the consequences of which were that dust and smoke adhered more readily to the surfaces of the pictures; and even assuming the presence of damp, surfaces so affected more readily attracted dust. The crowds he referred to were those visiting the pictures, not the general population of the metropolis. Besides such reasons as these for covering pictures with glass, it was very desirable that those within reach of children, especially, should he so protected, as some of these (and even of their elders, he might have added) had a practice of touching with their finger the surfaces to which they pointed. A hlow that would break the glass into a pieture, was likely to do still more damage where there was no glass. There was an objection to glass in certain circumstances, however, as when the lights of the picture are low and the whole effect weak : mirrored objects (as from ladies' bright dresses) are then almost as distinct as the picture. Such circum stances and conditious ought to be taken into account in considering the expediency of protecting pictures with glass. For heboof of students the glass should be removeable, except from cartoons and drawings. In the cleaning of pictures, Mr. Bentley did not touch the painted surface: of that he was certain: he only took off the surface dirt. Still the cleaning of a pieture is always more or less dangerous. Some of Mr. Turner's pictures, now in the National Gallery premises, were astouishingly chauged and much injured by his own neglect, and while they still remained in his house. Parts once white were now quite hlack, and the effect of the picture totally changed. Three or foar appeared to be completely ruined; nevertheless, Mr. Bentley had restored the colours. The injurious influences which had operated on these other collections.

abhongh, as observed hy some, much has already pictures appeared to have been damp, dust, and beeu done to purify the metropolitan atmosphere smoke: ordinary care would have prevented hy recent legislation, and more might yet he such injuries as those they had suffered.

Mr. Bentley was shortly afterwards exam-ined. Mr. Turner's pictures, he said, were not any other pictures so affected as those of Turner. This arcse from peculiarities in bis manipula-tion. There is "a great mystery" in Turner's The whites contain much sugar of pictures. lead, and they sweated in the damp. Ou Dr. Faraday's suggestion he admitted that the whites were probably sulphuretted, although he had previously used the words "oxidated like an iron railing." Several of the pietures were exhibited to the Commissioners, and Mr. Richmoud allowed that they were "skilfully re-stored." His process was a secret. As to pictures in general, Mr. Bentley admitted that they became a little brighter in the country, but he upheld the innocence of the London air from all special injuriousness of action on pictures : still, "after a certain time there is a sort of mucus upon the picture, the same as you find upon a looking-glass, which requires to be taken off. Now," he added, "I have kept pictures in London, and I believe that wiping them once in every two or three months would keep them in perfect condition, if it were for a een'nry."

Mr. Parris gave some details as to his resto ration of Sir James Thornhill's pictures in the dome of St. Paul's, and his own picture of London in the dome of the Colosseum at Regent's-park. In reference to the influence of smoke on pictures, he thought attention enough had not been paid to the vehicles used by different artists. There was a quality which he had found by long experience in drying oil that none of the resins possessed : it seemed to have a sort of liking for smoke, or whatever else was hovering about it, and imbibed it to a certain extent wherever it might be, whether in London or out of it; and he should say the smoke and dirt were as much in private houses as in public buildings. The dome painting in St. Paul's had not suffered from degradation caused by the Londou atmosphere.

Mr. Mulrcady, ou being asked whether he considered that any permanent damage had been suffered by the pictures belong ng to the Royal Academy from their residence in London, replied that he thought there might not be any permauent damage: they were darker in colour. His own pictures kept in the London collection were also a great deal darker than when painted : whether that darkness might be removed without damage to the pictures he did not know. Simple washing night be very injurious to pictures painted on gypsum grounds : water may peneirate cracks and soften the gypsum and glue, and curl up the coating from the gesso ground, or even peel it off. Glass he should use as a protector of pictures when size ard situation permitted.

Mr. Pauizzi, examined chiefly on the subject of the British Museum, said he would wish the natural history collection removed from the Museum, as they had nothing to do with the rest of the collection; hut the art collections he should not wish to he taken anywhere else. He could not in his miud detach a great national collection of antiquities from a great national library worthy of a great country. Asked whether, as things were at present, there was ground in the possession of the British Museum trustces on which galleries might he built for the reception of any accessions that might be made to the National Ga'lery, be said he thought not much, but he be'ieved there were rooms in the building alrealy existing that might he applied to antiquities without sending away any

Vol. XV.-No. 762.

Mr. Sydney Smirke, on being asked what all works in clay, all works in carved wood. Of opinion he had with regard to bringing the course that involved much: it involved all coins: National Gallery of pictures to the British it involved an immense extent. There must he Museum, replied that it seemed to him an a distinction hetween the terms "museum" and extremely proper thing: the upper gallery in "gallery," hat "museum" he thought would its present height would not he perhaps suffi-be the right name of the whole huilding: a extremely proper thing: the upper gallery in its present height would not he perhaps suffi-ciently handsome for such a gallery; but a moderate addition to the height of the present rooms, or of a portion of the present rooms, and rooms, or of a portion of the present rooms, and increasing the skylights, would render the upper floor, he thought, perfectly good, and well alapted for the purpose. Of course he did not contemplate, on this view, the retention of the natural history collection: that could not be low without believing the present of not he done without enlarging the precinets of Not needed without charging the products of the Museum : he meant an exchange of natural history for pictures,—of science for art. He had heard his brother (the designer of the Museum) say, that the original intention, thirty years ago, was to put the public collection of pictures on that floor.

Mr. Bell was disposed to think that sculpture and painting should be under one roof, or in some way connected, in the same great national gallery. Drawings, too, hy the old masters, if placed in the gallery, would be illustrative of certain points in study, and of the process of

study generally. Baron Marochetti considered it most importaut to combine works of sculpture and painting as far as possible,—those sculptures in the British Museum, for example, with those pictures which are in the National Gallery. Three sides of the present gallery, he thought, were too much erowded with private houses. Marlborough-house, Gore-house, the museums in Bromptou, were crowded in every way with works of art. A very large building would immediately be crowded. The public collections would soon be as important as any in Europe. Few people imagine what space they will want to place them in. He would put such sculb sculburgs as the Nineveh marbles under glass, as they were in alalaster, were quite flat, and suffered much from elimate; but to cover statuary with adas, though a safe mode of preservation, would injure the effect. He much preferred Keusing-ton-gore to Trafalgar-square as a site for a gallery. Whether a picture be kept in town to get dirty, or to be cleaned when dirtied, real injury was done to the picture heyond what it would be liable to out of town. People would not be prevented going to see the pictures: perhaps more go even to Hampion court to see the pictures than to the National Gallery.

Mr. Ruskin thought it most essential that sculpture of all kinds should be united with paintings, if a national gallery was to be of service in teaching the course of art. His great hope respecting such a gallery was that it might hecome a perfectly consecutive chronological arrangement; and it scemed to him that it was one of the chier characteristics of a national gallery that it should be so. He approved of the protection of pictures by glass in every case, however large the picture might be. He thought that, independently of the preservation, the effect would be more beautiful, as glass gave an especial delicacy to light colours, and did little harm to dark ones. He should ask the ladies to stand aside a little with their bright dresses; and look one by one at the pictures. Glass is essential to the safety of pictures for twenty or hirty years in London. He had found his own pictures deteriorate in a couple of years when unprotected by glass; and when so deteriorated the work suffers for ever: yon cannot get into service in teaching the course of art. His great the work suffers for ever: you cannot get into the interstices, and uo cleaning can restore it to what it was: the operation unst scrape away some of the grains of paint. He would prefer two galleries, the true and head one at some little distance, so as to prevent the great access of persons to the really precious works there only preserved. The second, or more popular gallery would give, as it were, early lessons in art, or first studies. By selection of works it might be made an epitome of the Iu a National Gallery he would grand gallery. grand gamery. In a reaction comery ne works include what might be called the handioraft of a nation,-works for domestic use and orna-ment,-pots and pans, salt-cellars, knives, and include what might be called the handicrait of a nation,—works for domestic use and orna-meut,—pots and pans, salt-cellars, knives, and in it. In short, he would have a modern no it. In short, he would have a modern Pompeian gallery, and include all the iron work, china, pottery, and so on,—all works in metal,

"gallery" was merely a room in a museum, adapted for the exhibition of works in a series, adapted for the exhibition of works in a series, whose effect depends on their collateral showing forth. In course of his evidence, Mr. Ruskin spoke of the Vatican and Florence galleries, the Lourre, and others, as amongst those he had visited, but stated that he had not seen the Munich or the Dresden galleries, not having here in Compare for theoretic reas been in Germany for twenty years.

Mr. Hurlstone objected to the intermixture of sculpture and paintings under the same roof or in the same rooms. He had seen most of the national galleries of the western part of Europe, and should be decidedly averse to such a conand should be declicitly areas to sub a com-junction, as sculpture and paiutings each re-quired their own peculiar and nice adjustment of light. Sculpture had heen injured by the union in instances within his experience. The same reasons which would urge the admission of sculpture united with painting, would equally, or even more urgently, demand the admission of numerous other departments of art, some more markly allied to painting than sculpture; and why also should not the third sister art be re-presented by all the designs of architecture of different periods of the world, and casts from all the finest parts of architecture ? He thought the same view of the object of a national gallery would equally demand that. Yet he saw no advantage in the juxtaposition of the three sister arts of painting, sculpture, and architecture, when it was essential that they should be kept perfectly distinct; and, under present circum-stances, he should be very sorry to see those departments of art removed which were at the British Mnseum, where a gallery had been specially built for the purpose, and which was well adapted in so many respects for it. Iu short, he did not see any occasion to unite these dif-ferent departments of art under one aud the

Mr. Fergusson was examined at considerably more than average length. The chairman, in the outset, mentioned that what they were at this moment more particularly inquiring into was the expediency of uniting the national sculp-ture with the national pointings. This, Mr. Fergusson said, he thought was extremely desirable. He had paid much attention to this subject and to the question of a site for a desirable. He had paid nucle attention to this subject and to the question of a site for a national repository of art. Such a repository, worthy of the nation, could only be had by a concentration of sculpture and paintings into one. His plau was to remove entirely the sculpture and the whole departments of arts from the British Museum, and either to build galleries for their reception in the rear of the present National Galler, or the webuild that present National Gallery, or to rebuild that institution on some other spot capable of pro-viding accommodation not only for the pictures, but also for the statues of the union, so as to join these two departments, and to make one great national repository of fine arts. He also suggested that the natural history depart-ment might be removed from the British Museum, and the mineralogical part of it sent to the Geological Museum at Piccalilly, which he would remove all the public records scripta of the nation would then be under one root: grouped round that great reading-room, this would be the finest thing of its class in Europe. On the question of a site of the art repositories, the witness having had lis attention pointed to Kensiugton-gore, said that in the scale of preference he put that fourth b-he did not think its good as cither the Inner Circle of the Regent's-park, or St. James's Palace, or Trafalgar-square. The fifth site in his scale was Kensiugton Palace, hut, like Kensington-gore, its increased distance cou-terhalauced its local advantages. The chief feature in the external aspect of such a building as he would suggest for the art-collections and the mineralogical part of it sent Museum,

very much exaggerated. As for the crowd, that was an element which must exist wherever you put the gallery — at Kensington gore or elsewhere; and, if it be a cause of deterioration. you cannot eliminate it from the question; hut, as far as the geographical site is concerned, the atmospheric influence of London was the point to be considered. As regarded his preference for Trafalgar square, he would so far modify it as to say that, if it could he obtained, and supposing other objections to be waived, he con-sidered the site where St. James's Palace and Marlborough House now stand a finer one. In this site he included the Ordnanee-office, which is in the hands of the Government, and is to be removed at any rate. He would give the building four sides, which a great national edifice ought to have. He also thought there ought to be a street through from St. James's square to the park, which would be a very great improvem eut.

Sir Edwin Landscer said be had felt a deep Sir Edwin Landscer said be had fett a deep interest in the question of a site for the new National Gallery. He considered the present site, as the most central, to be preferable to any other, even indeed to that of the British Museum. Keusington-gore would he less con-venient in every respect than the present site. He doubted the surposed advantage of a puper He doubted the supposed advantage of a purcr atmosphere at Kensington-gore: there were peculiar fogs which came up the flat there: he had had experience of the neighbourhood for years. He objected to the Regent's-park also, because there was a very heavy elay soil there. To the positiou of the present gallery he had no objection on the score of atmospheric influences, though it was certainly desirable to select such a site as should inflict as little dirt as possible a site is shown inner as intre the at possible upon the pictures. Those, however, at Back-ingham Palace bad, he thought, as dirty an atmosphere as any in London: the common ery there was that the ladies in waiting were always washing their hands,—that they never could keen anything door for helf on hear always washing their hands,—that they heve could keep anything clean for half an hour there; and in consequence they put veils over all the things that were procions; but, never-theless, there are some of the most attractive pictures in the world there, which are as fresh and pure as ever. To prevent dust and smoke from accumulating was an easy process, which could be effected without any harm to pictures. Professor Donaldsou was of opinion that it

was desirable to remove the National Gallery from Charing-cross, even from want of sufficient space, and including adjacent property. For pictures alone, portraits perhaps inclusive, there might be room, but, on account of the light, the site though otherwise convenieut, was not a good one, surrounded so much as it was by bouses. The area requisite for a gallery done would he about 1,000 feet by 500 feet, which would afford ample space for a central court. The site afford ample space for a central court. The site was a very fine one for a public monument, but not so particularly for a national gallery. The best position he considered, after thinking a good deal on the subject, to be Kensington-gore, which was certainly one of the best in the metro-polis. The light, too, was much clearer there and less deuse. Kensington Palace was an educable site, but half a mile forther away poils. The fight, too, was much back was an and less deuse. Kensington Palace was an admirable site, but half a mile farther away. The inner circle, at Regent's-park, was a very bad site, as a clay soil produces damp, both on the surface and in the local atmosphere, and the law there was 40 ford deen. Burlington House clay there was 40 feet deep. Burlington House was a very fine position, hut, like many others, too elosely surrounded hy houses. St. James's Palace and Marlborough House formed a very bad site, so low, — hardly ahove high-tide level. The Louvre, as recently improved was the hest recurs he could be a feature for a sub-The Louvre, as recently improved, was the hest example he could give of a gallery nearly per-fect. He had not seen the Dresden or Munich galleries, and knew very little of Germany; but Bologna was the best picture gallery he saw in Italy. Florence was very good. There was a charming one at Venice, a circular one, like the Pantheon at Rome. The effect of the recent building at the Paris Exhibition was very pleasing : it was admirably disposed, and the light eame in extremely well.

same roof, or any advantage in such union. Mr. Fergusson was examined at considerably

made subservient. If the difficulties connected and effectually overcome, that would be wisely and effectually overcome, that would be the best the metropolis could possibly afford. The disposition of the new Dresden Gallery, which he had seen, could be well adapted to a site in London. Still the Dresden is not so good as that of the Pinacothee at Munich, the sepa-ration of eabinet and gallery pictures not being so indicious, nor the arrangement of the lighting quite so good. Kensington-gore is too far removed for good. A classifying of the lower and middle classes. He should be sorry to see glazing of pictures introduced: other means might be used to palliate the deleterious effects might be fisca to paintie the detections encouse complained of, such as wire-gamze in the air ducts and ventilating valves, and open floors, on Sir Joseph Paxton's principle, frequent wiping of these floors with dang cloths, &c. The pictures might be covered with glass when not under exhibition, as by night, when gaseous vapours so much abound in the metropolis. The danger from breath and dust was no greater at Charing-cross than elsewhere. He wished to See the new National Gallery erected in the midst of London for another reason than those to which he had already referred, namely, that our metropolis is defective in fine buildings and pictorial effects, and we should rather have a noble building in the place of a number of mean bouses than leave these in the heart mean bouses than leave these in the heart of the population, and put our noble building, as it were, "outside the walls." He would rather expend a large sum for a limited site in the metropolis (though 50,000*d*. an acre was rather an exaggerated estimate), than give the same sum for a large estate out of town. Trafalgar-square, as a site, he regarded as No. 1. Next he would take Devonshire Honse : it was reasonably accessible and beautifully

it was reasonably accessible and beautifully open, and had many decided advantages. In an Appendix to the Report and Minntes of Evidence, there are varions letters, reports, returns, and plans connected with the main subjects of inquiry and consideration; and, in the minutes of meetings of the Commission itself, there is a paper put in by Professor Cockerell, stating the number of superficial feet ocenpied by the National Galleries of London, Berlin, Dresden, Munich, and Paris. The following is a copy of this document :--

London	9,720	feet superficial.
Berlia	24,200	,,
Dresden	34,500	
Munich	48,000	
Paris	82,000	
	-	

VISITS TO THE BROMPTON MUSEUM.* COLLECTION OF ANIMAL PRODUCTS AND THEIR APPLICATION TO INDUSTRIAL PURPOSES.

DURING the year of the Exhibition of 1851, it was the wish of the Royal Commissioners to form a permanent collection of matters connected with trade and manufactures, which would serve as a means permanent collection of matters connected with trade and mauréatures, which would serve as a means of reference for commercial, scientifie, and artistic purp.ses; and so cordially was this idea approved of, and so many specimens of various kinds were offered, that it was proposed that the collection should be ex-tended to all imports and exposts of the world, so that men of business might have the opportunity of exam-ining and practically testing samples of the articles in which they traded. It is to be regretted that various circumstances prevented this scheme from being carried into excention. Ther six years the mass of materials which were presented for the above-mentioned purposes, had remained unpacked in the rooms of Kensington Palsee. On eareful consideration, it was determined for the present to meke perfect one department of the trade collection, and that which heads the present artuice having been selected, the specimens have been arranged in the east gallery of the Boompton Museum by Mr. II. T. Read, mafter the valuable guid-ance of Professor Playfie. In order that the large remaining portion might not be lost, the minerals, &c. have been gathered together, and liberally supplied to the scientific insti-tutions of many foreign countries, and to numerons free museums and educationel evaluations at

together, and incruiny supplied to the science hav-tutions of many foreign countries, and to unnerous free museums and educational establishments at home; and it should he generally known, that the stock of specimens for distribution is still very large, and that they may be had on application by societies, which have for their object the advancement of general homelaics. knowledge.

The arrangement of animal products, to which we

* See p. 496, ante, &c.

have already had oceasion to refer, is excellent, and the full descriptions which are written upon the objects render them not only very useful, but also of much interest to the ordinary visitors. This museum is divided into various compartments, arranged systematically; and in order to give our readers an idea of the plan adopted, we will commence with Woor. with Woor.

with Wooz. By means of a clearly-printed placerd, herded "Wool and its Products--Class 1. Textile manufac-tures and clothing--division first--Woor,"-we are told that "Wool is modified hair; most quadrupeds possess a woolly hair as an underelothing, hidden generally by the outer course hair. In the wild sheep there is much of the woolly hair, and in the domesticated hreed the fleece is modified hy crossing, climate and pasture." climate, and pasture." * * * * Within a certain space are the heads of the various wool-

Within a certain space are the heads of the various wool-producing sheep, and the fleeces of the animals from various parts of the United Kingdom, as well as from Spain and Portugal, Russia, America, Van Diemen's Land, Egypt, &c. A fine fleece of a sheep of the Leicester breed from the latter place, is remarkable for showing the marked improvement in the quality of the wool which has been made by the transporta-tion of the animals to a different elisate. The various fleeces are runged side by side, so that it is easy to compare them with each other, and observe the effect of cross breeding. &c. The weight of each fleece, the ages of the sheep at the time of shearing, and other particulars, are marked. From the raw materials we can pass to the varied stages of the manufacture of the fluest and other sorts of wool in cloth. Here are specimens of the *Tessel*, that well-known prickly plott, so useful in preparing the manufacture of the fuest and other sorts of wool in cloth. Here are specimens of the *Tessel*, that well-known prickly plant, so useful in preparing the wool, which many Londoners have heard of, but few seen. Many attempts have heen made to provide a substitute for this valural implement, but hitherto without success—the best Teasels are im-ported from France. Close by the numerous specimens of the ray waterist's are wooller cloths produced at of the raw materia's are woollen cloths, produced at of the raw materia's are wolned cours, produced at home and abroad. Amongst three we noticed a strong useful kind of plaid, produced at the Cascades estab-lishment, Van Diemen's Land. The rougher unte-rials for blankets, &e. are in like manner collected.

From wool we turn our attention to silk, and first notice the large number of moths from all parts of the world which (in different degrees of value) produce notice the mirge minioer of motis from a parts of the world which (in different degrees of value) produce the raw material of this useful fabric,—near each moth is the silk which it produces. Some of these specimens are of large size, and so gaily oromanted with rich forms and colours, that many would pass over without notice the small homely-looking, but much more useful creature, the "Bombyx Mori," which is the chief silk producer. Properly arranged are the unspun silks of Indin, China, Turkey, Egypla, Cospe of Good Hope, Russia, France, Ita'y, England, Norway, &c. In the last-named country consilerable quantities of silk of a fine quality have been lately pro-duced, and this has suggested the idea that raw silk in preat quantities might be profitably produced in England, Ireland, and parts of Scotland; for it is now known hy experience that the silkworm thrives in Norway, where the climate is much colder than with us. We should like to see the mulberry-tree more extensively cultivated, and the experiment 'airly tried. The enture of the silkworm might be male at little trouble to add considerably to the income of many of trouble to add considerably to the income of many of the British cottagers.

the British cottagers. In order to make this department of the Brompton Museum ns explanatory as possible to the general visitor, a case of silkworms is placed here with the enterpillars netually at work, and ranged round in the same manner as the wool of the manufactured atticles, here Sec. dyes, &c.

dyes, &c. Next we come to mixed fabrics of silk and other animal materials; then to the raw materials and pre-parations for carpets. After that to the different kinds of alpean-black, white, hown, fawn, and grey, and the manuer of its manufacture. Close by are the market-black and the market set of the marketmanuer of its manufacture. Close by are the market-able goods of mohair; and adjoining are representa-tions of the animals from which the materials are obtained

obtained. Next is camels'-hair, some from Russian villages. From this a very expensive material for dress is made, which is remarkable for its pliancy and the small space into which it can be folded. From this we pass to horse-hair, from America and other places—some rough, other kinds drawn in lengths and coloured, and which are place with a record to remark other rough, other kinds drawn in lengths and colourel, and adjoining are beantiful personal ornaments, cloths, brushes, crinoline, and so forth. 'We then come to haman hair, which we are told is an important article of commerce. Here we note the material as brought from parts of France, Flauders, Getnany, &e.; examine the stages of its manufadure, and the manner in which it is made into cunningly-devised head eover-ings for hoth sexce. We must, however, move on, after observing that the various products which we have already mentioued are obtained from the animals during their life. We now turn to others, which are gathered after death.

Whalchone is well illustrated, and the visitor is told that this important utriele of commerce, cannot properly be called boae, but is actually a description of hair—course certainly in filme, hut still hair, and this is shown by microscopie drawings of parts, im-mensely magnified; and we may here mention that there are similar drawings adjoining most of the other fabrics. It will surprise many to see the numerous uses to which whalchone is applied. Amongst hem may be noticed coloured cockades, which look like ribbon, but are far more durable, which deak the beads of carriage-houses on state occasions. Her Majesty has sent several fue specimens of the ivory of the elephant, hippoptamus, narwhal, walma, and sperm whale, some of which are end that sections. Below are numerous examples of manufactured articles.

and sperm white, some of which are the most solutions. Below are numerous examples of manufactured articles. Horns of the buffalo, ox, rhinocercs, &c. &c. with manufactared articles from them, are also exhibited and explained. Amongst the latter are old drinking-

and explained. Amongst the hatter are old drivking-horns, latterns, spons, aud other articles of domestic use, which are getting rore. The plumage of birds has not been omitted. Here are cocks' feathers, dycd and arranged, for decking the head-coverings of the military. The skins of sca-birds are curiously formed liato halds: mills. Amongst the objects, a large group of flowers, by W.J. Maguite, is well worthy of notice, in consequence of the won-derful copy of nature which has been cuabled to make with such a material.

which topy of makes think to have be har beam of the source of the sourc of the Cape heaver heing worth from tweaty-five to thirty guineas; and it should he stated that this department is greatly ind-bted to blesses. Nicholay and Son, and slos to Mr. E. B. Roberts, for very extensive contributions. We are tempted to linger amongst the sluss of lions and tigers, which are here both in a natural state and also made into various kinds of dress; but must move on, and holfice the ingenious means which have been devised by Mr. Read, for showing the wet processes of tan-ning. Amongst the oily matters may be noticed a case of transparent liquid, called glycerine, an article which during the last three or four years has come into considerable notice for its use in medicine, and as a cosmetic. One of its properties is that of preserving any animal substance from putce-faction; and Mr. Read having found, by expe-rience, that fish, &c. might be kept in this mate-rial for years without change, he has had the different wet processes of tanning shown in glass care skins to numerous to mention, in different stages of tanning and eurrying. Amongst the most curious are some hides tanned in Egypt, with salt; excellent has also been tannel and blesded, and many are sur-prised at the fine grain and tough quality of the leather. We must pass over with a brief notice the cellec-tion of shells, the amiletion of mother-of-cevir to

prised at the fine grain and tough quality of the leather. We must pass over with a brief notice the collec-tion of shells, the application of mother-of-pearl to manufactures, specimens showing the artificial pro-duction of pearls by the Chinese, and other matters. As goldbacters' skin is such an important substance in the ornament-d arts, we must not omit to mention that it consists of the prepared membrane which covers the gat of the ox. Dried and withered speci-mens fail to give any idea of this matterial. By means of immersion in glycenine its nature and the pro-cess of its manufacture is clearly shown. Many visitors at p to examine the case which com-plets the manufacture of a beaver hat. We have, however, almost exceeded our limits, yet we fiel we have, even uow, hat glanced at this valuable

picto the monufacture of a beaver hat. We have, however, almost exceeded our limits, yet we feel we have, even now, hat glanced at this valeable collection. We have omitted notice of the manu-facture of vellum and parchment, the animal dyes, the large variety of lacs, glues, book liming, bind-ing, embosed and decorated leather, glove-making, and fifty other matters. We must not, however, neglect to mentions and be specimens of the various kinds of genno and other manures, both natural and manifictured, and also the fossil gunnes of Kent. We can here trace the processes by which bone is converted into phosphores, ammonis, the conversion of waste wooks, &c. into Prussinu blue. This well-arranged collection, when more generally known, will be the means of diffusing much useful knowled, and we trust that we have said enough to induce many to resort to it as a means of instruct-ing the youth ander their care in the origin and use of those common things which are so valuable; visitors of graver years will also fud much to learu.

THE BRITISH ARCHÆOLOGICAL ASSO-CLATION IN NORFOLK.

WE left the members of this association thorough! tired out by their excursion to King's Lyan.* 1 now remains for us to resome the narrative of their proceedings on their visit to Great Yarmonth and the neighbourhood. A special train left Norwich will the party at teu o'clock on the Thursday morning (Aug. 27), and the visitors arrived at the town-ball about eleven, where they were received by the mayo (Mr. C. C. Aldred) and other local residents. Th mayor deputed the task of conducting the association about the town to Mr. C. J. Palmer, the deputy about the fown to Mr. C. J. Paintr, the deputy mayor, and the well-known house occupied by that gentleman—No. 4, South-quy—was first inspected. This mansion was stated in some printed particulars, supplied, to have been built in 1596, by Benjamin Comper, eq. The date and initials of Mr. Cowper's name are caved on the dining-room chimney-piece. The house passed affertances into the prosection of The house passed afterwards into the possession o Mr. John Carter, whose son, Benjamin Carter, mar The house passed afterwards into the possession on Mr. John Carter, whose son, Benjamin Carter, mar-ried Mary, daughter of General Ireton, by his wif-Bridget, eldest daughter of Oliver Cromwell. Bridget, auchter daughter of Ireton, married Thomas Bendish, esq. of Yarm-uth. Carter took a leading part in political affairs, and was one of the bailiffs when, in 1642, the town declared in favour of the Parliament; and he promoted a subscription in money and plate for the defence of the place. In 1643 he signed the "National Covenant;" and after the execution of Charles L. he took the ennacement to the Commonon of " National Covenant ;" and after the execution of Charles I. he took the engagement to the Common-wealth. According to Clarendon, on the authority of officers who had been present, there were "many consults what to do with the king" previous to bringing bin to trial; and if we may believe tradi-tion, the final meeting for that purpose took place in here above a fit is hown now need as with. a large chamber of this house, now used as a with-drawing-room. The story is told by Mr. Hewling Luson, who was connected with the Cromwell family, Luton, who was connected with the Cronwell family, in a communication addressed by bin to Dr. Brooke, of Norwich, in 1773, published in "Hughes's Letters," vol. iii, p. 168, and in "Noble's Memoirs of the Protectoral Honse of Cronwell," vol. ii, p. 340, It says:—"When I was a boy, they pased to show a large chamber in the house of Mr. Carter, which had also been the house of Dis father, in which, as the radition wut. the infunous murdar of Charles I large chamber in the house of Mr. Carter, which hat also been the house of bis father, in which, as the tradition went, the in famous murder of Charles I. on the scaffold was finally determined. A meeting of the principal officers of the army was held in this chamber: they chose to be above.stairs, for the privacy of their conference: they strictly commanded that uo person should come near the room except. a man appointed to attend: their dimer, which was ordered at four o'clock, was put off 'rom time to time till past eleven at uight: they then came down to a very short repast, and immediately all set off post, many for London, and some for the quarters of the arm, "." Mr. Nathanie Carter did in 1722, aged SS. He must, therefore, have been about fourt con years of age when the meeting took place in his father's house. A considerable personal intimacy seems to have existed hetween those who compased the king's death, and the leading inhabitaits, who were thorough in dependents, so that there is nothing improhable in the selection of Yarmouth for such a conference. A profusion of paintings is scattered theomen the heave and the using the bays of the sum of the simulation of the simu Improved in the selection of tarmouth for such as conference. A profinition of paintings is scattered through the house, and the visitors having examined them, Mr. Pelmer directed their attention to some merchants' marks on a building near at hand, and also to the moulded ceilings in some of the other houses on the case. houses on the quay.

The party having traced the walls which formerly The party having traced the walls which formerly protected the town, next proceeded to the Toll-house Hall, the scene of many muni-ipal and legal wrangles. Here a number of old charters granted to the town were exhibited. The first of these was granted by King John, who erected the place into a free hargb, on condition of its paying a fee-farm rent of 557. annually for ever. Other charters of confirmation were granted by Henry VIII. Edward VI. Mary, Eliz heth, James I. Charles II. and Anne. One of the charters granted by the in all portrait of the king. Other charters were and "merry monaren was nighty illuminated, and han an oil portrait of the king. Other charters were also illuminated, and one of the most ancient—a decision hetween the Baron of the Cinque Ports and the burgesses of Yarmouth—had heen patched and mended, the patches themselves being more than 400 menter the parties themselves could be a judg ment relating to some alleged contrahand herring which had been seized, as having hern brought from which had been seized, as having heen hrought from abrovd, but which the fishermen of Yarmouth suc-cessfully contended had been taken within the limits of their therites. Mr. W. H. Black rendered his usual valauhle assistance in dee phering these vene-rable and musty documents. The church of St. Nicholas was next visited, and Mr. Palmer offered some remarks on the fine old structure which was restored in 1848. This church was erected by the

indefatigable Herbert de Losinga in 1123, and was greatly enlarged in 1250, when it boasted sevent: en chapels or oratories, each supported by a guild. At Chapters or oratories, each supported by a guide. A ' present the clurch consists of a nave, two aisles, and a transept. It affords sittings for a vast congregation, and very large numbers take part in the Sunday and daily services. The extensive graveyard, where the "rude forefathers of the hamlet sleep," is thickly covered with 3-by mouldering tributes in memory of preceding generations. But there is not much anonchmity for morelling.

memory of preceding generations. But there is not nucle opportunity for moralizing in archneological excursions: inexorable time is ever "moving on," and the word is ever "forward." Forward, accordingly, we go to the ruins of Caistor Castle, about three miles from Yarmouth. This was a castellated massion, formerly a residence of Sir John Fastolf, and, according to tradition, it was finished by Sir John with a part of the moucy which he received for the ranson of John II, king of France, whom he took prisouer at the battle of Verneul, in 1424. The ruins give indications of a mansion at once have and mins give indications of a mansion at once large and rous give indications of a mansion at once large and strong. The house is supposed to have formed a rectangular parallelogram, the south and north sides being larger than the cast and west. An embattled brick tower at the north-west corner, 100 feet in height, is still standing, and adjoining this tower was a diving-parlour, 59 feet long and 25 feet hroad, the event free house of which has hear observed. The west a dining-parlour, 59 field long and 28 feet hread, the great fire place of which has been observed. The west and north walls also remain, but here and there modern industry has converted the old remains into part of a cart-shed, or some other agricultaral build-ing. The dull waters of the most have been deprived of their original limits, and the glory has departed from a spot which was represented in a paper read by Mr. Pettigrew to have once heen a scene of nonusual solendour

lendour. From Caistor the company passed on to the neigh From Caistor the company passed on to the neigh-bouring Roman encampment at Burgh, about four miles W.S.W. of Yarmouth. The property on which the remains stand has recently passed into the pos-session of Sir J. Boilcan, the president of the Norfolk and Norwich Archaeological Association. Mr. Pettiand Norwich Archaeological Association. Mr. Petti-grew read a paper on the remains, which include some massive walls, built for the protection of the encamp-meot, and still in a tolerable state of preservation. The space enclosed is nearly quadrangular, and three walls, which have suffered here and there in the pro-gress of time, still remain as monuments of Roman industry. Sir John Bolleau stated that excavations had discovered a fourth wall, but on this point some disension took place, Mr. Vere Irving expressing an opinion that there might have been a quay wall ppinion that there might have been a quay wall extending to the river, hut that no defensive fourth wall had ever heen e.ected. There was, however, a general concurrence in the belief that the snot was once one of the most important Roman station the kingdom. We have hefore now spoken of it

the kingdom. We have hefore now spoken of it. The proceedings of the day were concluded with a dinner at the Yarmonth town-hall (at which the mayor presided), and a *conversazione* at the bonse of Mr. Palmer. It was midnight before the members were conveyed hack to Norwich.

On Friday, the attractions of West Norfolk again Bird them away from the old city. The Norfolk Railway conveyed them to the extreme limits of the "system" at Fakenham; and from this place the Railway coaveyed them for the uncenter in this place the "system" of a Erakenbaum; and from this place the excursionists proceeded in various vehicles to Little Snoting, Great Snorine, Binham, Walsingiam, and East Barsham. A visit to East Dercham Church— where the poet Cowper "sleeps well,"—was also put down in the programme, hut the arrangement was ahandoned on the ground that the pressure of time rendered it impossible. Mr. C. E. Davis examined the church at Little Snoring, and stated that the whole of the tower was Early English, and that thoogh it was now separate from the rest of the church, it was once the west-end tower of a building which formerly existed. The eburch tielf was of a rather later date. At Great Snoring the party inspected the rectory, cristed. The clurch itself was of a rather later date. At Great Snoring the party inspected the rectory, which is a fine specimen of ornamental brickwork, erected by the Shelton family. They next proceeded to the church, which is generally in the Perpendicular style, and the chancel entirely so. At Binham the style, and the changer entriefy so. At binnan the company devoted an hour to an examination of the ruins of the Priory. With the exception of the west front, the whole of this huilding is supposed to have heen in the Early Norman style, The original structure was erected in the reign of Henry I. ture was effected in the reign of Henry I. The nave and north alsic have been used as the parish church. The Pointed style was adopted in the exterior of the western front, which contained, in the lower part, a grand central and two side doorways, with blank scenards, butement to The nave between them, a large centre, ornamented at cause between them, a large eentre, ornamented with multions and tracery, heing over the former. The company then passed on to Walsingham. On the way, one of the "figs," which was occupied inside by Mrs. Prest, of London, Mrs. Grigson, of Winburght, Miss Miss

occupants of the vehicle were extricated after having sistained no injuries besides a few britses. At Walsinghum, the party received considerable addi-tions, being joined by Sir Willoughby Jones, the Rev. D Lee Warner, the Rev. J. Lee Warner, the Rev. G. Brydges Lee Warner, the Rev. Septimus Lee Warner, Mr. H. Lee Warner, the Hou. and Rev. D. Astley, and other gentlemen and ladies. Papers the beautiful Ruins of the Priory, were read hy Pettigrew and the Rev. J. Lee Warner. The p The plac Petugrew and the new of the national the particular everything he had before seen. Divorum adeo gemmis, auro argentoque nitent omnia ! Divorum

The Rev. J. Lee Warner, in a paper read before the Archaeological Institute at Cambridge, refers to a bellad in the Pepysian Library, which gives a rela-tion of the history of the Priory. It was founded by Richoldie, mother of Sir Geoffery de Favraches, and its establishment is ascribed to the twelfth century, as the numerical uffth were made to it in the ruine of William Turbus, Bishop of Norwich, from 1146 to 1174. Richard Yowel was the nineteenth and last 1174. Richard Vowel was the nineteenth and last prior, the Priory being surrendered in August, 1538, to Sir William Petra, commissioner for the visitation of monasteries. Portions of the Priory are attributed respectively to the Norman, Early English, Deco-rated, and Perpendicular styles. Of the earlier or Norman period but httle now remains, and it con-sists of a passage ät the south-east corner of the cloisters. In the "Peregrinatio" of Erasmus, it is stated that a chard should and from the church for closters. In the "Peregrinatio" of Erasmus, it is stated that a charpl stood apart from the church for the worship of the Virgin; but remains of this charpl have been sought in vain. Having discussed the architectural features of the remains, the company proceeded to the discussion of a cold collation, provided hy the hospitality of the proprietor of the estate, the Rev. D. Lee Warner. The Rev. G. Brydges Lee Warner occupied the

The Rev. O. Dryages Loe warner occupied use chair, and justice having been done to the good cherr set hefore the party, a few pleasant speeches of a complimentary character were made, the healths of the hospitable host and other members of the samiable the hospitable host and other members of the aminhile Lee Warner family heing, of course, duly honoured. After a hurried visit to the eborch—which contains a font of an octangular shape, covered with sculpture representing buttresses, pinaacles, niches, crocketed pediments, figures in hasso relievo, &c. and elevated pediments, figures in hasso relievo, &c. and elevated are also decorated with mouldings, &c.—the company returned to Fokenham, stopping on their way at East Bansbam Hall, a very fine specimen of ancient hrick architecture. Blomfield assigns the creetion of this interesting hall to the time of Heary VIII. The hall is now appropriated as a farm-bonse. After devoting about ten minutes to an examination of its attractions, the parity passed on for Fakenham, attractions, the party passed on for Fakenham and the railway carried them back to Norwich.

In the evening Mr. Wright real some extracts from the records of the corporation of Norwich; Mr. Pettigrew made some comments on the history of Sir John Fastolle, the original owner of Caistor Castle; and Mr. Vere Irving, nnahle to enter into the subject of "Treasure-trove," as he bad not bis notes with him, offered a few observations on the remains which Notify possesses of an incircle Roman camps and sta-tions. Mr. Pettigrew closed the proceedings of the Association in Norwich by expressing the members' thanks for the kindness they had experienced in the

thanks for the summer of the Association en-Saturday morning witnessed the Association en-route for Ely. The remains of the Abbey at Thet-ford were set down in the original programme as ob-jects to be examined, hut from various causes it was deemed advisable to devote the whole day to Ely Cathedral. The secret edifice was reached about two o'clock. Mr. C. E. Davis had prepared a paper upon the salient features of the fabric, but he upon the salient features of the fairie, but he preferred to give his explanations *vivá voce*, and at varions points. As we shall probably print the paper in extenso, on another occasion, we pass over his observations, and in lieu we will quote a few extracts from a communication which appeared recently in the Cambridge Chronicle (a pleasant county journal) the progress made in filling the eight lancets of . on The progress made in fining the eight nucles of the great east window with painted glass, an object for which the late Bishop Sparke gave 1,500, stock in Reduced Three por Cents. THE BUILDER.

THE WELLINGTON MONUMENT COMPETITION

THE Wellington competition models are now nearly all sent away from Westminster Hall, with the exception of those which have received premiums, which are retained in another part of the Houses of Parliament. retanced in abother part of the follows of Parlament. As arch (to a quarter scale, to agree with that of the models), made of wood, and painted, so as to represent that io St. Paal's Cathedral proposed to be occupied by the monument, has heren for the last week in Westminster Hall, under which it is intended to try

Westminster Hall, under which it is intended to try the premiated models in their new apartment. This application of the arch comes rather late in the day for those models which have here passed over by the judges; and it naturally occurs, "Why had not all the models this advantage?" Many of the designs which have been left undistinguished were evidently made specially in relation to the pro-posed occupation of the arch, and could not be done indice to which aver been if it he right new posed occupation of the arch, and could not be dole justice to without so trying them. If it be right now to try the premiated models under the arch, surely it was still more important to try *all* the models under the arch, so as to give the selection a wider range. This would have involved a very small amount of ex-penses and trouble to the Government and the judges in comparison to that cutailed on the profession by the competition.

It may or it may not have heen a considerate problem for the Government to set the sculptors to design a 20,0007. monument to the Duke of Wellington, to he placed under the arch in St. Paul's; but as it did set the prohlem, it was hut its duty to pernse the answers and examine the solutions. This the the answers and examine the solutions. Also the judges have not done; and therefore it may be well said, that (artistically speaking) the devision of the judges is void. I odeed, the conditions (taken in rela-tion to the report of the award) evidently put many of the competitors on a folse seent, who were thrown out by the very fact of alterating to those conditions which the judges at the last moment repudiated. Thus the very conscientiousness of these competitors was their stumhling-hlock.

their stimuling-block. The report of the award says that if the judges had specially considered the models according to the site which they were bound to do (as the conditions were equally binding on the judges as on the competitors), they (the judges) should probably have made a different selection. In arriving at this different selection, the model arch now in Westminster Hall, and applied in succession over all the models, would doubtless have here a great assistance. The time to apply this was assumedly not after thu before the award. assnredly not after but before the award

assured in the form before the available There is a Greek story that Philias and Alcamenes were called into competition to design a figure for a high place. The designs were in the first instance shown close to the eye, and the prize was adjudged to Alcamenes. Philias, however, requested that the models should ha shown at the height at which the work was required. This was granted, when the de-cision was at once reversed, and the design of Phidias chosen hy acelaniation.

In the Wellington competition the judges appear to have heen hlind to the fact, that even in art a passage should not be considered without its context; or, if they did perceive this, they did not recognise it; for, in their report, they expressly repudiated the conditions set forth by the Board of Works, and thus frankly took care to state that they had not done what they were called in to do.

Sir Benjamin Hall will no douht see this, and will not lose sight of the fact, that though the connection of the names of the judges with the memorial in ques-tion may be forgotten, his will not; hut that it is his escutcheon on which the eventual Welliogton monument will he either a har sinister or a coronet. EPSILON.

NOOKS IN THE TEMPLE, LONDON. JOHNSON AND GOLDSMITH.

GOING i going i gone i! The auctioneer's hammer is waving over the tenements on the west side of luner Temple-lane. On the 1st of Octoher, the house-hreakers will be masters of the situation, the hricks will go for what they will foth and the site heing cleared the the situation, the hricks will go for what they will fotch, and, the site heing cleared, the bonourable henchers of the Inner Temple, will proceed to improve their property hy building better houses in the place of the rubbish re-moved. Ah | but is it all rubbish ? Not quite. Some of it has a value; and, though we can scarcely offer an objection, it is record Some of it has a value; and, though we can date of Quech Infrance. In every a searcely offer an objection to its removal away parts of this fun, and many other portions (henchers, like other people, will "do what they have been removed in consequence of their like with their own," and Progress will not be dilapidated condition, and for the purpose of stayed), at least let us keep a slight record of improvement — for instance, some very old how it looked, and what it was associated with. Houses which formerly intercepted the view of the transome of the doorway, at No. 1 (there is a lamp projecting, and a large carved hood ahove), is written, "Dr. Johnson's

Staircase," and np this truly enough often went with Goldsnith, Reynolds, well, and others, of whom this present ration are never tired of hearing. They be Bos genc ration are never tired of hearing. They belong to us, indeed, though they seem to have lived in a past age. We spoke, not long ago, to a hale and clear-headed gentleman, still in the like condition, who recollected, though be was a small child at the time, seeing the pursy Doctor with his arm round a post in Fleet-street, resting for breath after some exer-tion; and who moreover had been taken up into the arms of the kind-hearted Goldsmith. Dr. Johnson lived in this house hetween 1760 and 1765, and it was during this time that the asso belong Johnson hved in this house hetween 1/100 and 1765, and it was during this time that the asso-ciation which afterwards hecame so renowned as the Litterary Club took a regular form. Joshua Reynolds, Johnson, Goldsmith, Burke, Dr. Nugent, Langton, Topham Beauelere, Chamier, and Hawkins were the original mem-bers. It was while Johnson occupied these rooms that the adventure occurred, as described by Boxwell when the dissinated but accomby Boswell, when the dissipated hut accom-plished Beauclere, returning once with Langton phished Beaucierc, returning once with Langtou from sapper, roused up the grave doctor at three in the morning, and dared him to a ramble. "What, is it you, ye dogs?" said the sage lexicographer and moralist; "Then, faith, Pilthave a frisk with you!" And so they repaired first to Govent garden, and then to Billingsgate, and had what Washington Irving, alluding to it and work with 'out' for each arm barb."

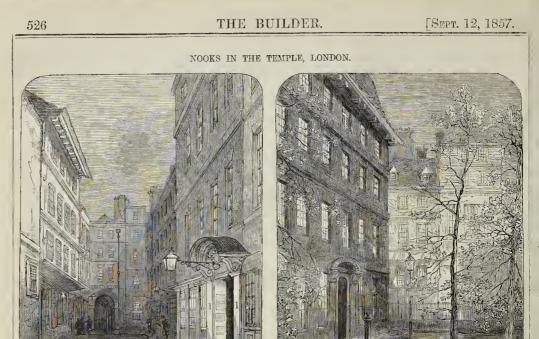

and had what Washington Irving, and and the occurrence, calls "s-mad-cap freak." Many indeed are the incidents, now common in our mouths as household words, connected with this lodging of his in the Temple. It was wrot this lodging of his in the Temple. It was here, when dressing one morning, that a mes-senger from Goldsmith told bim that poor "Goldie" was in a more bit "Goldie" was in great distress, and needed him. Going to his lodging, after first sending him a guinea, he found him arrested for rent. him a gunea, he found him arrested for feat, and, to relieve him, took a tale Goldsmith had written to Francis Newhery, the publisher, and sold it to him for sixty pounds. Newhery did not think much of it, and kept it hy him two years hefore it was published. When it apeared, however, its success was immediate, and its popularity has gone on increasing from that time to this. It has delighted, comforted, and henefited hundreds of thousands, in all countries, and will continue to do so as long as genius and wisdom are recognised. It was the "Vicar of Walchield" Wakefield.

From Inner Temple-lane Johnson removed to Johnson's-court, on the north side of F street, and then, soon after, to Bolt court. Fleet

Charles Lamb lived at No. 4 in this lane, and Boswell in Farrier-huildings, at the bottom of it. Lamh's windows looked into Harc-court, of which we give a sketch. "The rooms are delicious," says he, in a letter to Coleridge, "and the hest look backwards into Harc-court, where these is a wave always into Harc-court, "and the hest look backwards into frare-court, where there is a pump always going: just now it is dry. Harc-court frees come in a the window, so that it's like living in a garden." The pump and the trees are still there, though the pump has been made in the Temple The pump and the trees are sum take, in obgat much change has here made in the Temple since Lamb wrote. Goldsmith himself, it will be recollected, lived in the Temple, first in Garden-court, and afterwards in Brick-court, at No. 2, where he died. At the end of Inner Temple-lane, on the left-head side of the archivers short in our sketch is

hand side of the archway shown in our sketch, is the fine Norman porch of the Temple Church ; the nice Norman porch of the Temple Churte ; and farther on are the Cloisters, hull by Wren, which are effective by gas-light. Wandering in the Temple a few nights ago amid a silence un-broken by a sound, a hrilliant moon steeping the whole in light, and bringing into prominence the hole the trace and the queue turnets of

the whole in light and hringing into prominence the hall, the trees, and the quaint turrets of New Paper Buildings, we felt that Elia was not far wrong in calling it "the most elegant spot in the metropolis," though we would have used another word for elegant. With the exception of the church and hall of the Middle Temple, we do not know that there is anything to be found much older than the date of Queen Elizaheth. The Great Fire swept away parts of this 1nn, and many other portions have been removed in consequence of their dilapidated condition, and for the purpose of improvement — for instance, some very eld houses which formerly intercepted the view of the church.

Inner Temple-lane, " Dr. Johnson's Staircase."

Hare-coust.

parts the original lead glazing remains, but in most instances it has been replaced by the back, which show that timber at that time was of less consideration than glass; some of the bars are from 1½ inch to 2 inches in width. The ball of the luner Temple is a modern structure, in imitation of the Gothic, which does

structure, in imitation of the Gothic, which does not, however, hear a contrast with the building of 1570. In the hall, and some other apart-ments of this inn, are portraits of Queen Anne, George II. and bis queen; the latter has a charm-ing face. There are also several legal worthies; amongst them, Selden, Denman, and Ellen-borongh. In the Parliament-chamber, as a large and elegantly fitted room in the building is called, there is a large collection of books, which contain the records of Parliament dwring is called, there is a large collection of books, which contain the records of Parliament during a number of reigns: some of these are as old as the time of Richard II. These books were in wooden and parchment covers, very much de-cayed, but they have been substantially re-bound

Returning for an instant to the church, there Returning for an instant to the church, there is, on the north side of it, a small burial-ground, in which many interments have taken place. The level has been raised to a considerable height; and a flight of steps leads down to a chamber, now used as the vestry. In this yard are several memorials, and amongst them is one which records that Oliver Goldsmith lies huried lease by. No store or these placet were bies close by. No stone or other object marks his resting-place: in fact, all the graves are levelled, and the ground has a somewhat neglected appearance, which forms a contrast with other places within the precincts. Those who are anxions to know the spot where one of the most truthful and kindly-hearted of our writers rests, truthful and kindly-hearted of our writers rests, woold seek in vain. As we understand, how-ever, Goldsmith's grave is at a short distance from the hrick wall which surrounds the ground, directly in front of the steps of the vestry. Formerly a tree shaded the place: there is, however, none there now. Let us suggest that some indication be set up by which the admirers of the author of the "Vicar of Wakefield" and "The Traveller" may be able to recognise his last home. last home.

ROUEN, the capital of Normandy, is one of those towns of France in which can be seen many remark-able examples of domestic architecture; though there

able examples of domestic architecture; though there are not to be found here so many of these interesting houses, more Romano, of the eleventh and twelfth centuries as there are at Auvergm, in the south of France, and especially at Cluvy; in the midst of which latter stands the colossus of all Christian monn-ments, the ruins of the ancient abbey of Cluny. If there were formerly many examples in Romen of houses of this period, they have disappeared. Wo still find houses of the fourteenth and fifteenth centu-ries which fall day after day into the hands of the demolishers. The houses of this period have the upper stories overhanging the lower; the face of the valls being covered with devices, either arranged lozenge-wise or as trefoils, stars, leaves, or shells. The gable end next the street is always elegantly decented. decorated

The gable end next the street is always elegantly descrated. De la Guerère's "Description des Maisons de Rouen," "L'Histoire de la Ville de Ronen," by M. Fraine, Pignits' Series of Ornemental Timber Gables;" and "Les Edifices de Rouen, tels qu'ils étaient an XVI. Stècle," by D. Jolimoot, may be usefully con-sulted by those who would study the subject. The old houses, as we have said, are daily dissp-paring: they fall into ruin for want of repairing and altention, and are made to give place to modern sturclures, which, so far as regards the general dis-position and the comfort of the interiors, more fully met the requirements of the occupiers, hat which in point of art will farnish little for the admiration of the next generation. By way of consolation, how-ever, to the lovers of architectural antiquity, let us say, that since the formation of the Archreological Museum at Rouen, through the care of M. Beville, a well-informed antiquary, all the remains of the Middle Ages, not only of the town itself, but of the depart-ment generally, are preserved in the Museum as be-come as valuable, pertaining to the Middle Ages, and their original position. This small museum has be-tore as valuable, pertaining to the Middle Ages, not only of the town itself, but of the depart-ment generally, are preserved in the Middle Ages, not and pertine the domestic antiquities of Herenhauen and of Pompeti. and of Pompeii.

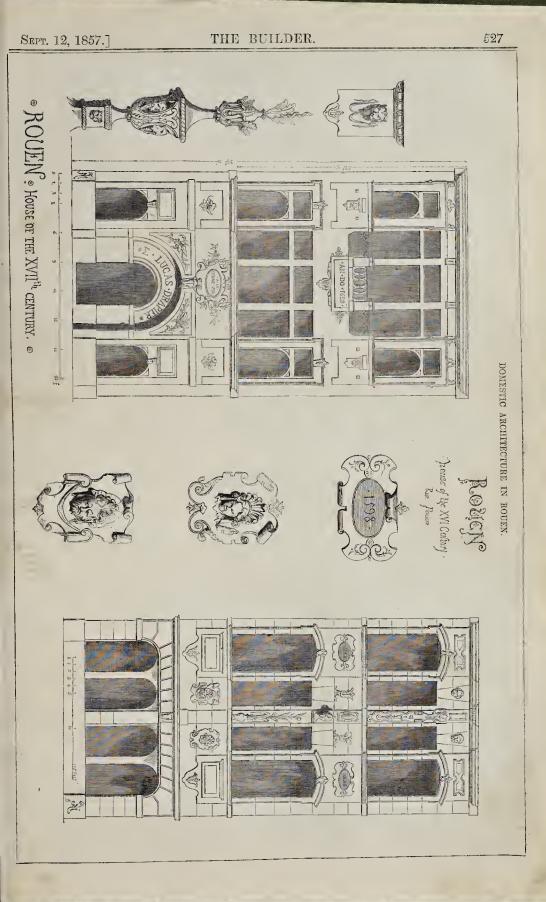

In the sixteenth century, a large number of the wooden houses gave place to elegant structures in stone, raised in consequence of the increasing pro-perity of the old and industrions inhahtants of the town. The Hôtel du Bourgtheronde, and some of the interior courts of private mansions, bear witness even now to the taste of the architects of that period; and those examples that we shall successively give of the architecture of the first half of the eighteenth century, examples chosen amongst the most heautiful spreimens of the period which exist at Ronen,—show that the arist had not heen, as is too often the case in onr day, a stranger to their production. Of Ronen Mediaveal, we have already given many fine ex-amples. On the present occasion we select the works of a more modern period.

A House in the Rue de la Grosse Horloge. No. 38. This bouse, one of the most elegant in the town, is of the period of the seventeenth century, and is remarkahle for the varied disposition of the windows in its two stories. It recalls the architecture of the Renaissance and Philibert de l'Orme, Joan Bullant, Pierre Lescot, and others. Unfortunately the roof of the house is wanting, wherehy the edifice loses much of its effect. The Muscum of Antiquities, of which mention has already heen made, has preserved in its court a small gironette in lead, which terminated the gable of the house. The arrangement of the tablet at the foot of the window in the middle of the second story, shows a certain amount of study. The house hears date 1620. A House in the Rue de la Grosse Horloge. No. 38.

House in the Rue Percière, near the new Market.

This house, of which we regret not having heen, able to see the interior, as it contains, they told us, a very fine staircase, bears date 1508, and is remarkable for the fusiho fits ornaments. Upon the raised part of the middle of the façale of the first story there is sculptured a vase, from which a floral decoration is continued through the which height of the panel. In general, in houses of this period, the mouldings are very simple very simple.

IMPROVEMENTS IN PAINTERS' BRUSHES .- Messrs. forenside, of Bristol, hrushmakers, have specified a patent for improvements in painters' brushes. The important features in this invention are considered to be the saw cuts, or openings, conjoined with the plates, whereby the handle may be firmly wedged and secured to the brush part.

CHURCH-BUILDING NEWS

Caversham .- The parish church of Caversham is about to be reopened. pened. The huge old pews, which dis-of our rural churches, have been swept about to be mady of our rural churches, bave been swept away, and uniform ranges of henches, of moderate beight, now give accommodation to one-third more beight, now give accommodation to held. The gallery in the begut, now give accommodation to one-turing more than the church used to hold. The gallery in the north-west corner has heen removed, admitting light and nir to the scats hencath; and the organ is par-tially in recess on the north side. A small vestry has been erected on the same side, to which admission invariand hen a flight of these stars. The investor is gained by a flight of stone steps. The improve-ments have been from designs by Mr. A. Billing, and the work has been earnied out by Mr. Jas. Matthews, builder huilde

huilder. Elchingham. — The restoration of Etchingham eburch, from designs furnished by Mr. W. Slater, of London, being completed, the edifice was reopened on the 27th ult. The large east window has been filled with stained glass by Mr. J. R. Clayton, of London, the treatment comprising subjects and angels in canopied and other modallions, on a groundwork of floreated ornament and grisaille. The pieces of ancient class relation in the various windows of the church glass retained in the varions windows of the church were restored by Mr. Miller, of London. The builder by whom the general works were executed is Mr. Norris, of London, and the carved *bas-relief* on the front of the pulpit, representing St. John preaching, was executed by Mr. James Forsyth, likewise of London.

Lindfield .- Difficulties with respect to the site of the new chapel, according to the Brighton Gazette, have been set at rest, and the spot selected is where the present chapel stands, with an additional pier the present enaper sumas, with an automous pressure ground adjoining. The contract is taken by Mr. Jus. King, builder, who has commenced taking down the present chapel. The design of the new chapel is Modern English, and, when finished, it will afford sufficient room for the accommodation of 500 hearers, some 200 more than the present one. e of

Coleorton .- The Leicester Advertiser announces the consecration of the new cemetery at Coleorton. The chapel is of the Decorated order ; all the windows and dressings are of freestone, and the other parts of granite. The roof is truss rafts, covered with tiles. The arches over the windows are red and white stone The arcnes over the windows are rea and watte stone in alternate courses, the red stone being procured from Alton Towers. The ground is enclosed hy a wall. The timher, stone, &c. as well as the ground, were given by Sir G. H. Beaumont, Bart. The huilders were Mr. Elliott, of Ashby, and Mr. Walker, formerly d. Colorito. The drawings were timpished by Sir leorton. The drawings were furnished by Sir G. Beaumont and Mr. Heward.

Belgrave .- The parish church of Belgrave has hen restored and re-opened. The old singing-gallery has been restored and re-opened. The old singing-gallery has been removed, and its removal has brought to view the ancient Early English tower arch, which bas been restored, and two carved cothels added at the springing. A new organ, by Walker and Son, of London, has been erected. The pillars and arches of London, has been erected. The pluars and arcnes of the nave, the plinths and hases of which had heen sadly cut and mutilated for the insertion of parts of unsightly pews, have also been cleaned and re-ed. The plastering, where it had gone to decay, stored. has been taken off the interior walls, and replaced with new stucco work. The floors have been relaid with ancient gravestones, excepting the middle aisle and nave, which have been laid with Staffordshire quarries. The font, coeval with the church itself, has and have, which have been into which solutions of quarries. The font, coeral with the church itself, has been restored to its original character. The old wooden pulpit has been replaced by a carved stone one. The restorations have heen carried out under the superintendence of Messra. Lindley and Firn, of Linearier. The church has also hear researed with Leicester. The church has also been re-seated with open sittings by Mr. Hobson, of Belgrave.

Doncaster.-The contract for the erection of St. James's Church for the accommodation of the workmen of the Great Northern Plant in this town has here of the Orex storaged to the state of the storage of the stora Society, on the 22nd or 23rd instant.

Blackburn .- A mortuary chapel to St. Alban' Roman Catholic Church bere has been recently erected and opened for service. The dimensions of the chapel and opened for service. The dimensions of the chapel internally are, 30 feet long, 15 feet wide, and 25 feet 6 inches to the ridge tree. The style is Early Deco-rated. Each end of the chapel has a three-light window with tracery head. The side windows are of two lights cach, and all of double tracery. The one nearest the altar is filled with stained glass, as a memorial window to the Right Rev. Dr. Sharples, who for cleven years was pustor of the congregation. The east window is to be filled with stained glass to the memory of the late Rev. Peter Kaye, ahout ten years parish priest of St. Alban's, as well as first reactor of that place. The idea of a mortunry chapel was suggested by his death. The chapel heing placed rector of that place. The idea of a mortuary chapel was suggested by his death. The chapel heing placed parallel with St. Athanis Church, and the whole of one side being open, all persons sitting in it have a

full view of the sanctuary in St. Alban's. The side wall of the old chapel has an areade of three arebes, The side the centre one being occupied by a carved Caen stone screen, and the two sides by low metal foiled rails with vine branches in the spandrils. The roof is boarded diagonally, and is carried by two principals, filled with tracery in the spandrils. These rest upon filled with fracery in the spaudrils. These rest upon pillars supported by carved corbels in the side walls. The altar is of Cacu stoic: the table is supported by two pillars of hlack marble, and the span underneath is occupied by the figure of the dead Cbrist. The rere-dos is divided by foliated arches, supported by black marble pillars, into three compartments, filled with monograms: the spandrils above are filled with quatrofoil diaper. The floor of the sanctnary is laid with Minious's ornamental tilles; the centre aisle with ubin tiles by the same maker. Immediately with plain tiles by the same maker. Immediately before the sanctuary is placed an ornamental rail of twisted hrass, borne upon iron pillars, from the tops of which spring vine branches and leaves of polished ng viue branches and leaves of polished The architects were Messrs. Harrison of which spring vue orangeness and reacts in furtison brass work. The architects were Messrs. Harrison and Hugbes, of Preston. Mr. Armstead, of Preston, was the contractor for the entire work, except the stained glass and the figure, which were supplied, the former hy Messrs. Pilkington, of St. Helen's, and the latter hy Messrs. Barff and Co. of Preston. The brass and metal ornaments were made by Messrs. Second of Preston. brass and metal ornaments were made by Messrs. Seward, of Preston. Maryton.-We understand, says the Montrole

Review, that it has now heen finally decided to take down the Free Church here, which has proved a most unsuccessful piece of architecture, baving neither beauty to attract nor solidity to compensate for deformity. Notwithstanding all the difficulties the deformity. Notwithstanding all the dimensional deformity is a second with, they have congregation have had to contend with, they have resolved to proceed with the erection of a new church, here a second by the liberality of the Earl resolved to proceed with the erection of a new church, being greatly encouraged by the liberality of the Earl of Southesk, through whom they have received plans from Mr. Bryce, of Ediubargh. The church to be creeted is in the Gothic style, with a spire of from 70 to 80 feet in height. A gallery is to be placed in one end of the huiding, and a vestry upon the north-cast corner. The manae is now in course of erection.

Quedgely (Gloucestershire) .- In the account opening of the new church here, the names of the the architect and the builder were not mentioned. The former was Mr. H. Goodyer, of Guildford, and the latter Messrs. W. Wingate and Son, of Gloucester.

CHURCH RESTORATIONS.

Newbourne, Woodbridge, Suffolk.-This eburch is being restored throughout. The perpendicular ham-mer-beam nave roof has been repaired and reinstated; the chancel roof, formerly hidden up by a plaster ceiling, open and restored; the church benched throughout in the style of some few old benches that were still remaining, with tracery and butterssed ends. A new three-light perpendicular west window is about to be fixed, and the remainder of the windows, doors &c. remainder of the windows, doors, &c. leaned down, and the stonework of them, where perished, restored. The external rough cast is being scraped off, and the rubble walling under it pointed up and made good. The interior walls of the church being re-stuccoed. A new pulpit and reading, t will be added as soon as funds will permit ssrs. Morgan and Phipson are the architects; and desk will be added as soon as ; and Mr. Ringham, of Ipswich, is executing the work

St. Lawrence, Ipswich .- The chancel of this church St. Lawrence, Ipswicz.—The chancel of this church is about to be partly rebuilt and otherwise restored, under the superintendence of the same architects. The east wall and huttresses have become so dilapidated as to involve their being entirely pulled down and re-built. A new four-light Perpendicular window, of rather elaborate tracery, similar in design to the original window, will be inserted. An unsightly gallery that now ohtrades itself across the chancel arch will be entirely swort areas and the chancel to involve their being arch will be entirely swept away, and the chancel benched with oak benching running east and west.

Winston, Debenham, Suffolk .- The chancel of this church having hecome somewhat out of repair, the Dean and Chapter of Ely, who are appropriators of the rectory, have urged upon the lesses of the great tithes (Mr. Thomas Pctiti) not only to put it in a good and sound state, but to restore it in a proper and ecclesiastical manner, and have promised to bear some portion of the expenses in the event of his doing so. Mr. Pettit has therefore resolved to meet their cs, and has had plans and specificatious prepared Wishes, and nas nad plans and specifications prepared by Messrs. Morgan and Phipson. The works will consist in partly rebuilding the east end, now hrick-work, and patting in a new four-light window; easing the outside walls and buttresses with fluit, work, and repairing the side-windows, priest's door, &c.; re-storing tie-heam roof and old oak benches and floor-A new oak altar-railing also forms part of the The whole will be executed by Mr. Ringham. ing. work. More that the whole will be executed by Mr. Ringham. After the chancel is completed, it is to be hoped that the good example set will induce the parishioners to hestir themselves about the nave, which is in a sad state of dilapidation.

THE PUBLIC OFFICES COMPETITION THE PARKS.

NOTWITHSTANDING the imposing announcement of NOTWITHSTANDING the imposing announcement of last year, and the extraordinary display in Westmin-ster Hall arising therefrom, the nature of the instrac-tion has marred all,—the year is lost, the money to he paid for premiums lost, and the patience and valuable time of the profession wasted—added to which, the urgent wants of the Government are altogether throwu over. If, as is now supposed, the matter is to he taken up de novo, it is to be hoped that the expe-rience purchased will not be thrown away. Had the Chief Commissioner sought for hlock plans only this year, he would not have proceeded with quite the despatch be proposed to himself, but certaidy with a better ebance of success. The error in the present despace to proposed to numeri, out certainly what as better ebance of success. The error in the present attempt cannot he better shown than by the fact that although in each of the three selected block plans the site of Westminister-bridge is changed, the very first proposal of the Chief Commissioner is to keep.it hest proposal of the Chief Commissioner is to keep.it where it is. Now, for what are we to pay the authors of the three approved block plans so unceremoniously thrown overboard? It is alike unfair to the public who pay and the competitors who receive. To Sir Benjamin Hall great credit is due for the manner in which he has endeavoured to shake off the manner in which he has endeavoured to shake off the

trammels of routine, and he has much cause for dissatis faction at the manner in which be has been supported herefore at the manufer in whice be has been supported by the Metropolitan members, more particularly in the case of the improvements in St. James's part. To hear members representing small constituencies condemuing the great benefits conferred by these improvements is really scheming, concrete by these im-provements is really scheming, more particularly since it has succeeded in postponing for an indefinite period the same solutary improvement in Hyde-park, &c. When it is recollected that London and its environs provements is re-

comprise about one-eighth of the whole population England, and of course contribute in the same ratio to is expenditure, surely something like a generous sympathy from those not doomed to pass the whole year in its crowded usighbourhood migbt be expected, and something like a nohler feeling towards the individual auxious to earry out not only sanitary improve-ment but the long-required embellishment of the first ment but the long-required embeditishment of the first city of the first country in the world. It is much to be hoped that during the recess Sir Benjamin will himself devote his abilities to the work, and be pre-pared, when Parliancent again assembles, to lay before the public a general comprehensive plan, with all needful details and estimate of expense, and thereby secure the support of the House of Commons, and head his result of the security of the secc hand his name down as, and in reality he would be, the First Commissioner of Public Works.

LOOKER ON.

FALL OF TWO HOUSES NEAR BISHOPS. GATE STREET.

ON Sunday night last the greater part of two houses in Artillery-passage, at the back of Artillery-street, Bishopsgate-street, Nos. 4 and 5, fell to the ground, hurring in the ruins the occupier of one of them and his wife, but who were eventually rescued. The inbabitants of the other house had contrived to escape in time. The front wall has not fallen, and to escape in time. The front want has not rated, and to the eye does not give the same evidence of danger as that of many houses in the metropolis does. It seems that both these houses were condemued some time ago, but were patched up and allowed to stand. The passage is not above 10 feet wide, and it is extraordinary that the bouses opposite were not injured. Several houses in the neighbourhood have since been condemned by the assistant surveyor to the Commis-sioners of Police.

VENTILATION OF ST. STEPHEN'S PALACE.

THE notorionsly bad quality of the atmosphere surrounding the Houses of Parliament, tainting as it surrounding the Houses of Farliament, chanting as in does the British constitutions of the assembled legis-lators, having caused many complaints from the M.P. as expressed in the House (and many more, which have been imparted only to their medical advisors). I am induced to suggest, for the considera-tion of the memoratic memory and purporage of tion of the pncumatic engineers and purveyors of storm to the Lords and Commons, a crotchet of my own for a hetter supply of the pure element. It is manifest that, throughout the whole precincts

of the Palace, the miasmata of the reeking Thanks pollute the element of life, and that the foul neighpointie to element of fife, and that the food neigh-bourhood, as far as Millbank, with its festering sewers and crowded slums, superadds pollutions which are noxious to an estent only secondary to the river liself; therefore, pump, fan, ventilate as you will, whatever varieties of stereor are produced, the air is an any second no purer.

Now it occurs to me that as water, so air, may be drawn from a distance. Good water is and ever has been conducted many miles for the supply of cities ; but then a gallon of the former suffices for the supply of a single individual, whereas a great many thousand

cubic feet of the latter are required for the sustentia-tion of one day's existence. Dr. Anybody could doubt-less compute the quantity of atmosphere that \$40 com-moners, and a given number of peers, might consume. This done, lay down a tube, after Samuda's principle (the pneumatic railway): let it start from the floor of the House, and on that terminus erect an engine for the purpose of exhausting or drawing out the sup-plies: perhaps the sitting M.P.s might supply the mechanism required. The other end might be con-ducted to some point sufficiently distant from Loudon fog to insure a pure country breeze. Hampstead would never do: the Epsom downs might. A three-feet pipe would give a brick gale; a six-fect tube, a burricame I Well, here you have a remedy, far-fetebed, certainly, but one that might be worth the carriage. It would be a pity that a building which, before it is finished, most cost the nation *five millions*, should be worse than useless for the want of some popular

If sca-air were deemed better or more national, the Brighton line offers a ready channel for a duct, which might be set on the high cliff. EOLUS.

ORGANS.

ORGANS. Wrnt regard to several of the City church organs, built by Mr. Sebmidt, they have been very extensively repaired, enlarged, improved, and several new stops added. The organ at Christ Church, Spitalfields parish church, has been very much improved, enlarged, new stops, and several hundred new pipes added; it has also a tremulant novement introduced to act upon the swell organ, so that it is now one of the most powerful organs in the fire happened in the steeple of this church. Improved by Gray and Davison, this organ I believe was one of Mr. Schmidt's; now I believe there is so a great deal of the original organ left. Mr. Schmidt's organ in the Temple Church, Fleet-street, as great deal of the original organ left. Mr. Schmidt's organ in the 'Hemple Church, Fleet-street, as great deal of the original organ left. Mr. Schmidt's organ in the 'Hemple Church, Fleet-street, as great deal of the original organ left. Mr. Schmidt's organ in the 'Hemple Church, Fleet-street, as great deal to the original organ left. Mr. Schmidt's organ in the 'Hemple Church, Fleet-street, as great deal to the original organ left. Mr. Schmidt's organ in the 'Hemple Church, Fleet-street, as great deal to the original organ left. Mr. Schmidt's organ in the 'Hemple Church, Fleet-street, as great deal to the organ, said to have been with by Mr. Schmidt in 'St. Glies-in-the-Fleids Schurch, when first built, was no doubt a very far in the agreesent Dr. Rimbault, a few years ago caused it to be very much regaried and inproved, and pedias sompletely worn out, and it would have cost the sompletely worn out, and it would have cost we sompletely worn out, and it would have cost we sompletely worn out, and it would have cost we sompletely worn out, and it would have cost we sompletely worn out, and it would have cost we sompletely worn out, and it would have cost we sompletely worn out, and it would have cost we sompletely worn out, and it would have cost we sompletely worn out, and it would have cost we keys. It is a very fine instrument. The organ St. Clement Dane's Cburch, Straud, built by Mr in St. Schmidt, did not contain more than about twenty-Seminat, auf not contain more than about twenty-two or twenty-seven stops. I am very glad it is undergoing a reparation--not before it wanted it; one or two of the stops was very much out of order. I hope they will add some new stops.--W. V.

ARCHITECTURAL UNION COMPANY.

AT a meeting of the directors, held last month (Sir Charles Barry, R.A. in the chair), it was resolved to circulate a statement of the present position of this company, in order that all those who may intend to company, in order that all those woo has needed come forward with assistance may see the necessity of *at once* declaring their determination without further hesitation. In this we gladly assist. Shares to the amount of f1000/, have already been

taken; besides which the directors have received numerous written offers of assistance from many other quarters, which offers, however, they cannot properly estimate unless an allotment of shares is applied for in the usual way. They consider that there ought to be n

They consider that there ought to 66 no necessity to borrow any portion of so small a capital, and that it will be better on every account that the full number of shares shall be allotted; and, if so, a part only of each 10.4 will be required, as the expenditure will not execced 11,000.4 or 12,000.4. In the present posi-tion of matters the directors are prevented entering into a formal contract to purchase the premises in the structure durated barrow. find a formal confinet to particular the particular of Conduit-street, and are compelled to trespass longer than they would wish upon Lord Macelesfield's for-hearance, besides which they cannot expect his Lord-ship much longer to refuse other applications in deferce to them. They have, therefore, determined at once to canvass

t their or

ogether such an amount of support as will enable the directors to take immediate and vigorous steps for carrying out the objects of the company, and to secure the premises in question. The directors have already received offers of rental,

we understand, which would scence the greater part of the income they have estimated, and have no doubt

of the member help have estimated, and have to data that, commercially, the undertaking will realise all that is promised in the prospectus. It is to be regretted they did not hit on a less objectionable name: "Architectural Galleries Com-pany" would have been better. The objection to this, that it would seem to apply more to the "Exbi-bition " than to the " Institute," does not appear to us a sound one

FOREIGN INTELLIGENCE.

FOREIGN IN PELIGENCE. We image --- Gothe and Carl August.--On the 3rd of September, being the auniversary of the birth of Carl August of Saxe Weimar, the foundation stone of a monument for that great man was laid. On the 4th, the statues of Goethe and Schiller by Ritschel, and the statue of Wieland by Gasser, were to be unveiled. Great national festivals will take place on the same days wiz a visit to the restorations come on at the days, viz. a visit to the restorations going on at the Wartburg, near Eisenach; a concert led by Dr. Liszt, &c. The so-called Poet's Rooms in the Grand Warbburg, near Desencer, a loss of the Grand Ducal residence at Weimar, the houses of Goethe and Schiller, the library, and the art collections, will be open to inspection. For the excursion to the Wartburg, the Grand Duke has directed *free* railway tickets to be presented to foreign visitors. *Paris.—Kiosques Lumineux. — A company* has been formed here to substitute little elegant lighted pavilions, instead of the unsighty newsrendors' holes hill be to be the following hilter to in use. On this occasion the following hilter to in use.

hitherto in use. On this occasion the following historical data have come to light. The first vendors of newspapers in Paris had only the privilege to sell them to passers-by, but not to lend them for reading In succession some one extemporised a chair, at the In succession some one extemporised a chair, at the place where this traffic was most active. There the *marchand* took his meals, &c. By and by, during rainy weather, a few boards were placed under a tree; and then, in succession, a uumber of little ugly barracks sprang up along the Boulevards. The above com-pany have now supplauted these cherils hy smart octagonal pavilions, brilliantly lighted. The walls of these kicogenes luminers are of glass, on which advertisements are painted in various colours. Some verte of the Bouley refs look very are by these seem.

advertisements are painted in various colours. Some parts of the Bouler-ards look very gay by these scen-ingly trifling progresses of the times. *Statignart General Art Congress.*—The Wurtemberg Moniteur gives the following programme of the business and discussions of the forthcoming Art Congress in the above city :—I. General exhibition of German art. 2. Petition to the German Diet (Parliament) relative to the protection of mind's pro-perty. 3. Relation of artists to the art-unions. 4. The establishment of a general fund for widows and orphaus of artists.

THE DWELLING REFORM MOVEMENT ABROAD.

To this vital question of the times our continental neighbours pay a marked attention, and the press of Germany and France discusses the subject in a fearless ncighbours pay a marked attention, and the press of Germany and France discusses the subject in a fearless and open manner. The *Clif ownridre*, Rue Roche-chau, rt, Paris, is the most extensive example, as 200 *families* are there housed; and a hath, a faundry, and a *Kinder Garlen* are annexed to it. More ideal are the hones of Mühlhausen, because a man of great taet and enthusissm (M. Müller) is at their head. There a number of workmasters have erected dwellings for 300 families, two and four being respectively under one roof; but there, besides the adjuncts of the *Clif ownrich*, the dwellings have separate entrances, and little gardens; there, moreover, a bakchouse and a *restaurant* have been added to the plan. All, however, done now in France, becomes cutralised. *A société en commandite* (firm Aublet and Clark) has started with a capital of 12,000,000 of frances, and has obtained the promise of State subsidies, which may be as much as 10,000,000 of frances. The society has entored an obligation to creet at least fa,000 new dwellings for the labouring classes in Paris alone, and wellings for the labouring classes in Paris alook new has also purchased the block of the lodgings, Rue Loutorgueil, which contains 400 berths. Sets of fur-Montorgueil, which contains 400 berths. Sets of fur-nished lodgings have also been made up, much liked by the workmen. The questions, whether these dwell-ings ought to be isolated, semi-isolated, or contiguous and barrack-like; what rate of interest the shareholders shall be allowed to receive; whether the occupiers of such dwellings should have the right of purebase by instalments, &c., have all been discussed in books and journa's. Still, there is nought practical resulting from as much digension. In one dase one system Incy bave, toerefore, determined at once to canvass journa's. Still, there is notignt practical resulting pre-task their own personal friends, and heg all those who are from so much discussion. In one place one system shareholders to make similar efforts; and if all who will work well, while in others another will better desire to assist will be kind enough to do so without delay, a very few days will be sufficient to bring man who will hit upon what is best. In speaking of The

a bigh pitch of mind, everything else is given such man will descend to jobbing, collusion, bribery, &c.—banes which destroy most of the well-projected (thought) plans of the present day.—German Quar-

HERTFORD.

THIS quiet town has for some time past been the scene of bustle, through the works which are being carried out by the New River Company, for the purpose of improving the quality of their water-surply to the metropolis. The company have, at their own expense, we are told, drained the streets and lanes of the town we are told, drained the streets and lanes of the town with brick severs, inder a London contractor—con-centrating the severs into their new deodorizing beds, now in course of construction by Messrs. Lee and Lavers, contractors, where all the foul sewnge water from the town will be filtered and passed off into the Lee Trust, in a clear state. The River Lee Trust has been closed for some time past for the annual repurs; and we understand that some d'fliculty has been found in putting in the new lock at Warc, in consequence of the springs, which are very abundant in this neighbourhood. We are glad to hear that the town of Hertford is being improved by the erection of some good houses.

MEMS.

THE committee of the inbahitants of the parish of St. Sepulchre, and others interested in the appro-priation of Smithfield as a dead ment and poultry pration of Smitheld as a dead ment and pointy market, have caused a plan to be prepared and sub-mitted to the Chancellor of the Exchequer, who, it is said, has approved of it, and transmitted a copy of it to the City anthorities for their consideration. It is to the City authorities for their consideration. It is proposed to preserve all the space which comes in a line with the north part of Long-lane, and, in order to provide a sufficient area, it is proposed to remove the property towards Charterhouse-square and lane, and to Greenhill-rents and Durham-yard : this would be an error for the proveed market of about twice. give an area for the proposed market of about twice that of Newgate-market.

that of Newgote market. Amongst the various complaints of nuisances brought before the attention of the Metropolitan magistrates, the following is of a somewhat novel character, and shows the advancement of science in rendering what were once considered waste matters of utility. It is, however, unfortunate that this of utility. It is, however, unfortunate that this improved knowledge does not prevent the manufacture of artificial guano, in improper places. The case which we wish to mention is as follows :- From time when we wish to mention is as holoss. I four the to time, particularly in the summer, large quantities of fish, from being too late for the Billingsgate-market, or from other causes, are condemned as being unfit for human food. Once upon a time these using units for human lood. Unce upon a time these would bave been taken to a distance and shot into the Thankes: the bad fish are now, however, carried away by a manufacturer to some building on Bow-creek, by a manufacturer to some binlding on Bow-creek, and there converted into manure. The terrible smells arising from this manufacture were described, and much amusement was caused by the principal com-plainant pressingly inviting the magistrate to kindly proceed to the place and take "just one sniff," which he considered would be sufficient to decide the ques-tion. As is usual in such cases, the proprietor of the place argued that it was perfectly wholes me, although it was admitted that on one occasion so large was the quantity of putrid fish which arrived at cae time that there was uot sufficient convenience for its immediate manufacture, and that a mass of putridity was allowed quantity of putrid fish which arrived at one time that there was not sufficient convenience for its immediate menufacture, and that a mass of putridity was allowed to remain for two or three days, to the great danger of the health of the neighbourhood. It was shown in the evidence that the steeping of the fish in sul-plauric acid removed unpleasant atmospheric effect. It appears that it is the practice to convey the fish from the market to the manufactory in tanks placed in earts, to the great annoyance of those living in the thorough-fares. It was suggested that the matter complained of should be carried at night : this, we fear, would not do away with the evil, for, supposing the houses to he properly ventilated, the bad gases from the tanks would find entrance by night as well as by day : a better plan was proposed, that of closing the tanks. An instance, which elearly shows the necessity for the inspection of dwellings which are let out in ten-ments, was brought before the notice of the public the other day. In Henrietta-street, Manchester-square (a portion of the cholera district in 1854), a cellid died after a short illness. It transpired that the denth took place in a small room at the bottom of the

ebild died after a short illuess. It transpired that the death took place in a small room at the bottom of the bones, into which there was no ventilation except by the door: the place was nearly dark, and of very small dimensions, and the atmosphere was searcely to be horne by those strangers who visited the place. In this unnatural darkness a family, consisting of parents and six children, had for some time been hving. It appears that in the house there were up-wards of forty residents. A nice nursery of nice things.

The reporter at the Marlborough street Police-

court has drawn attention to the bad condition of the cells of the police-stations and the court. Some of these places of confinement are situated underground —the floors lower than the drainage, which would seem to be imperfect, for unpleasant matters coze through the floors. All these places require to he earefully examined; for it should be borne in mind that a large number of those who are confined there are not convicted of crime; and at times they are obliged to remain in places not much larger than coffinement of a number of persons in these ill-ventilated vaults must spoil the air of the rooms above.

It is said that there has been much illness amongst It is said that there has been much illness amongst the crews of the ships in the river, a circumstance not to he wondered at, for nothing can be worse than the condition of some of the old colliers for the purposes of health: in many instances a quantity of "bilge water," of a poisonous description, is down below; aud, in too many instances, the sleeping-places are not very clean, and so small and conflued that it is wonderful the scamen can exist at all.

DECORATION OF COATS OF ARMS

WOULD you allow me, through the medium of your journal, to make a suggestion or two to those who mount the "Royal coat of arms," or who may here-after do so? for an alteration which I believe would who mount the "Royal coat of arms," or wbo may here after do so? for an alteration which I bolicev would materially increase the attractiveness of their respec-tive establishments. I have observed that generally the arms are mounted on a base; in cases where they are not it would be necessary to have one. The front of this hase 1 propose to glaze with stained or coloured glass, with lettering as may be desired; this should be illuminated by a line of gas jets at the back, which will, I think, present a very pretly transparency. An illustration may be seen at Messrs. Horne and Thornthwaite's, who had the alteration made in the one which they have just creted at their premises in Newgale-street. But to those who are prepared to go further, I would propose the making of the shield in the sides could also be glazed in the same way, and in such a manner (bat a rich and appropriate bloom of colour could be thrown on to the ion and unicorn at the sides. The effect, I cannot but think, would he exceedingly pleasing, novel, and of a superior cha-racter. J. CLARKE,

SUB-ARCHES FOR LONDON.

SIR,-One of the largest new and important build-Sig.—One of the largest new and important bunc-ings in London is not yet commenced, the extent of which will employ the huilders in bricks and mortar for years to come. The work has great demands and strong claims upon the trade for its nechulces and necessity, which will produce the most beneficial effects in our streets, in an efficient and permanent manner.

Some indirect attempts to begin such a work have heen made, hut, as they began in wrong doing, so they have not succeeded in the accouplishment of their designs.

their designs. The downfall of the Metropolitan Railway, as an-nonneed in their own report lately, is an event long expected, as it was got up in cunning artiface, in con-nection with the defanct Central Terminus. Both of these were hased and took their origin from the valuable and useful invention of sub-arches in streets, which was brought before the public many years ago, but which these two were intended to supersede under other names.

Brick sub-arches in the streets of London, for pas-

Drick sub-arches in the streets of London, for pas-sengers in carriages upon trucks, will make planty of room in the leading thoroughfares, without any crowd. Sub-arches, as light as day, and as full of atmo-spheric air as the open streets, by the means of iron grating on the top, will have a double line of rails for carriages of every description, in a grand trunk line through the centre of London, which will be entered upon inclined planes from the bark streets, so that no sloppages will ever occur.

stoppages will ever occur. This advantage of clearing the streets from the erowds of carriages and passeagers the Metropolitan Railway could not effect, any more than its com-pation, the Central Terminus. Therefore they have come to nothing, having uothing done. But should the streets continue to be so full and overcrowdel? Is there no remedy? Has more than million of morey heen subscribed for upon the bare proposal of a plan to get more street room even at the outskirts of the metropolis, however fallacious that plane has been, and shall the leading thoroughfores be blocked up for ever? There is a remedy, a complete remedy in these

This work is now wanted to carried on without further delay. JOHN WILLIAMS.

TIMBER SCAFFOLDING AT HOUSES OF PARLIAMENT.

I HAVE heen much pleased in perusing the interest-ing paper read by Mr. Charles Barry, at the Archi-tects' Institute, some short time since, on the subject of the timber scaffolding and travelling eranes used in the erection of the new Houses of Parliameut, hut he has fallen into a slight inadvertence in attributing the has failed into a significative reference in autrouching the first use of funders safely diduct to his respected father, Sir Charles Barry. I may be excused for correcting his paper in this particular, when I state what I helieve to he the fact, that the first use of the moveminute to be the fact, that the brst use of the move-able cranes and seaffolding in this country was by a Mr. Tomkinsou, in his stone quarries, at Runcorn, near Liverpool. It was here that I first got the idea, and also from the timber seaffolding used in the erec-tion of the Are d'Etoile, in Paris. It was in conse-quence adopted at the Reform Club-house, the Nelson Column, and at the new Houses of Parliament. I may add that I may Column, and action we houses of Farmandent. I may add, that I gave a paper on the subject, with a model, some years since, to the Institution of Civil Engineers, and thut I attribute the credit of the scaffolding used at the new Houses of Parliament mainly to two of my forement of massus, Messrs, Allen and Baker, who on my behalf made the original sketches for it, and on my hehalf made the original sketches for it, and took great interest in it, and in its adaptation to the towers and other portions of the building. My friend, Mr. Barry, will, I am sure, excuse me for correcting his paper in this respect, it heing but fair that the humble builders and masons (without whose aid architects would occasionally experience difficulty in carrying out some of their designs), should not he altogether overlooked. T. Gutssell, Norbury, nock Norbury-park.

PROVINCIAL NEWS,

Banbury .- The contracts for the water-works are now taken. The eugineer is Mr. J. H. Jones, of Westminster. The tenders were made out on quantities taken out hy a surveyor nominated hy the contrac

tractors. Wednesbury.—A new theatre has been erected here. The interior is 40 feet hy 80 feet, and the beight 45 feet. The front is of brick, with stone dressings, and in the Roman style. The architect was Mr. B. Dawes, of Wednesbury. The cost of the building will be J.5007.

building will be $J_{s}500$, Dudley—The foundation stone of the new Wes-leyan schools, in King-street, Dudley, was haid on the 27h ult. by Mr. Thomas Davis. The site selected for the new huilding is at the back of the Wesleyan for the new number is at the back of the wearboard (Chapel, recently known is Alma-place. The school is to be upwards of 70 feet long, by about 25 feet in width. The architect is Mr. George B. Nichols, of West Bromwich, and the huilders are Messrs. William

West Doministic and the handers are backets to the Holland and Son, of Dudley. *Plymouth*.— The foundation-stone of a new huild-ing, in Old Town-street, Plymouth, for a commercial hotel, was hid on the 28th ult, by Miss Adams. The contractors are Messrs. Call and Pethick. The new building, which is designed by Mr. O. C. Athur, architect, will be in the Anglo-Italian style, and will comprise five stories, 60 feet in height and 56 feet in

Chester. - The four marble drinking-fount-ins

Width. Chester. — The four marble drinking-fount.ins already presented to Chester, says the local Chronicle, will receive an addition of other four, and the follow-ing sites have been suggested, — one at each of the four city gates, one at the Cross, one at the corner of Abbey-square, one near the end of Seller-street, and one at Frodsham-street-bridge. Mantwich. — The following estimates have been sent in for the creation of the Town-hall and Corn-exchange, on the plot of land called Snow-bill, in Nantwich. — Mesrs. Denton and Andrews, Chester, 2,8001.; J. B. Latham, Nantwich, 2,0351.; Thomas Bowker, ditto, 1,9901.; Joseph Wood, ditto, 1,9182.; 10s.; Richard Boughey, ditto, 1,7707.; Henry Ray, ditto, 1,6951.; Edward Fay, Birmingham, 1,4891. 16s. The architect is Mr. James Cranston, of Bir-mingham.

to ascertain by public advertisement the possibility of doing without sub-ways. The three months' notice has expired for these new street plans, and very few, if any, have come to that Baard! There now remains no plan for the permanent im-provement of the streets of Loudon hut my sub-ways in brick arches, which will produce a perfection in. It will also become not a mere City terminus, or a It will also become not a mere City terminus for all the railways entering Loudon. This work is now wanted to be commenced and earried on without further delay. JOHN WILLIAMS. Holt, painter.

SMOKY CHIMNEYS

DEFINIT me once more in your columns to suggest a remedy whereby unsightly and unsafe zinc tubes and pots of every conceivable form and size that at present disfigure our chiffnes, public and private, may be altogether superseded. It is simply by the formation of horizontal aper-tures or side flues, and covering in the top of the flues with 2-inch York sailing over some 3 or 4 inches on either side a vargetice long in yong in the south-west

either side, a practice long in vogue in the south-west and other districts of England.

and other districts of England. The points gained are the stoppage of down dranght, the creation of an upward entrent, the keeping of the flues " dvy_i " the prevention of damage to cooking and the stoves. In places where one building is com-manded by another, and an eddy thus formed, the advantages are too evident to require comment.

THE MARYLEBONE FREE LIBRARY.

THE MARYLEBONE FREE LIBRARY. Is regretting with your correspondent the failures of the above hirary, allow me to state that placards were widely distributed, amouncing the closing of the library, and that the books would be returned to the donors. The Fitzory Teetotal Association. Little Portland-street, Oxford-market, having a free library for the use of its members, hought it an opportunity not to be let all for increasing the same. Application was therefore made to-many of the contributors, which was represented to with a cheerinhess and promptitude that was very encouraging innua a valuable work that it would not have itsen in our power to purchase, and which we have no doubt will be duly appreciated by the members. DOW OT THE COMMITTER.

TO MOUNT TRACINGS.

As an answer to your correspondent "Silvio," I heg to describe my nethods of mounting tracing-paper upon paper and linen as follows :---

hand with which I eover the tracing immediately I have laid it on to the paste. I then commence rub-bing it with a cloth, rubbing from the centre to the outer edge, to exclude ein, until I have got an over surface. When dry, I always find a mounted tracing with as smooth a surface as can possibly he had. If the tracing doe null. Use compose carticiden account with as smooth a surface as can possibly he had. If the tracing be small, I use common cartridge paper, which, owing to its flatness, does not require any stretching, but simply moistening preparatory to re-ceiving the paste. I do not in a noy case daup or paste the back of the tracing, as is usual with many. Secondly, to mount on hnew: I damp it as I do the paper in the process already described. I then stretch it on the back of a drawing-hoard by securing the is on the back of a drawing-hoard by securing the edges with small tacks, and when dry and flat, pro-ceed to paste and lay on the tracing in the same way as described for mounting on paper.

JOSEPH GORDON. THE NEW FINE ARTS ACADEMY, BRISTOL.

BRISTOL. THIS new structure, near the Victoria Rooms, will soon be completed. It consists of three principal stories, the uppermost or principal floor containing the exhibition-rooms. This floor is reached by a flight of stops from the exterior. Passing across an areade at the top of the stops is the entrance-hall, 23 feet by 10 feet, which is intended for the exhibi-tion of sculpture. Directly opposite the main entrance is the exhibition-room for oil paintings, 50 feet long by 30 feet kroad; the height of the walls to the cor-nice, or hanging space, being about 20 feet. The time of the space is the room analy or so free from the integrit of the wars to the cor-ince, or hanging space, being about 20 feet. The ceiling will be semicircular, and the room amply lighted by a continuous skylight. On this floor will be also two other exhibition rooms, 34 feet by 19 feet; be also two other exhibition-rooms, 34 feet hy 19 feet; j one being intended for water colours, the other for arcbitoctural drawings. In addition to those named, on this floor arc suitable rooms for the accommodation of visitors on public occasions. The rooms are *en suite*. To the right of the hall, an interior stone staircase leads to a room extending over the entrance-hall and colounade, where the pictures bequeethed to the academy by Mrs. Sharples will be exhibited. The middle floor, on a level with Queen's-road, is devoted entirely to the school of practical art, which has pro-viled one large room for drawing. 56 feet by 30 feet, one secondary ditto, 29 feet by 19 feet, with separate rooms for the masters, ledies' room, Sc. The entrance to this floor will be by a doorway directly under the centre of the main entrance steps. The whole of the rooms will be 18 feet high, and be lighted by nume-rous windows to the north and east. The lowest floor will be devoted entirely to the purposes of the acadray. This floor will be also 18 feet high, and will contain a large room, 50 feet by 30 feet, or drawing from the life, lectures, &c.; a students' model-room, with out-cation of the school room, with col-lection of easts, entrance-hall, stircase leading to the exhibition-floors, antist' retiring-rooms, with porter's evaluence and numerous rooms obtained moder the one being intended for water colours, the other for architectural drawings. In addition to those named, exbibition-floors, artists' retiring-rooms, with porte residence, and numerous rooms obtained under t the main entrance Hight of steps, to perform a steps of the principal fagade towards Queen's-road, with the return angle, is faced with freestone. The flight of steps before meationed as leading to the apper or exhibition-floor, forms a leading feature in the design, being 26 fect wide in front of the entrance-door, dividing before reaching the street hand into two flights, right and left. The sides main entrance flight of steps, for packing and unpack-ing pietures. The principal façade towards Qucen's-Entrance-usor, availing occure reasoning the street level into two lights, right and left. The sides of the steps will have stone balastrades, anr-mounted by vases, &. The front of the building is divided into three portions, a ceatre and two wings. Is divided into three portions, a ceatre and two wings. The centre consists of an arcade of five arches, separated by three quarter columns, surmounted by Corintifiau capitals and entablature, three of which are cuttered from the main fight of steps, the other two having balustrades. The niches at the ends of the arcade are proposed to he filled with statuse. Over this arcade, is an unarce store (Sharahes' callery) arcade is an upper story (Sharples' gallery), a presents a series of semicircular luncttes, which this arcade this areade is an upper story (Sharples' gallery), which presents a series of semicreult longtes, which are filled with exquisite pieces of sculpture. The tattic is surmounted by a balastrade, in the centre of which, rerowning the whole façade, is an allegorical group figures, 9 feet bigh, representing Architecture, Paut-ing, and Sculpture. The two wings have pilaster with Corinthian capitals, entablature, balastrades, &c. in continuation of those of the centre portion. In the centre of cache wing are large niches: one will be filled with the statue of Sir Joshun Reynolds, the paular: the other is to hold the statue of Tharman, the semptor. The niches before mentioned, at the ends of the arcade, are proposed to contain statues of Sir ywood, and J. H. Hirst, M.I.B.A. whose services are signa were selected by the architects or Bristol Mirror, the signa were selected by the architects of Bristol Mirror, the signa were selected on Messers. Underwood and Hirst's designs. The committee of management of the Fine Arts Academy, institute of which was the selection of Messers. Underwood and Hirst's designs. The committee of management of the Fine Arts Academy adopted the exterior designed which

THE BUILDER.

by Mr. Ilirst, and requested Mr. Underwood to adapt his arrangement of the interior so as to accord. This being done, both architects were invited to superintend using aone, both arentiteds were invited to superintend the execution of their designs, the division of labour into the practical and restlotical departments being throughout maintained. The whole cost of the boild-ing (exclusive of site, and of the sculptures for which subscriptions are being obtained), will be under 5,000/.

THE HEALTH OF THE JEWS OF LONDON. It is noticeable that in poor neighbourhoods which have been attacked by cholera, fever, small-pox, and similar diseases, the Jews living there have in an extraordiary manner escaped visitation. The apparent causes of this sanitary fact are worthy of attention.

Lates of this samilary late are worthy of attention. Ist. As regards food, it seems that even the poorer Jews are most particular in the food they cat. In obcdience to the law of Moses, they use none of the hood or offal of animals : they are also particular in the choice of fish, and avoid both animals and fowls which are complete conversion for the which are grossly or unwholcsomely fed. 2nd. Intemperance in driak is rare am

ongst them and even the very poor Jews are remarkable for their attention to moral family ties. There are, of course, and even the very poor Jews are remarkable for their attention to moral family itiss. There are, of course, exceptions, but this general characteristic is certain. Srd. Their religion directs them to use great per-sonal cleanliness. Ablutions are made before visiting the synagogues and on other occasions. Their houses are also thoroughly cleaned at certain periods from

top to bottom. All the abo All the above acts are important to bealth, and the good effect of attention to them is evident. The rules are so simple, that they might be readily observed by are so simple, that they highly be reading observed by the chief parts of the misses of people in the large towns, amongst whom this ancient race are scattered. In the course of investigation of the neighbourhoods in which the Jews reside, we have generally found them to be very sensible of the advantages of proper them to be very sensible of the advantages of proper sanitary conditions. It is worthy of notice that few have seen a London Jew begging, although some of them are very poor, and we helieve that they seldom apply for parochial assistance. Large sums, however, are distributed by the more allheut of their erced to those who need assistance.

NOTES UPON IRON.

NOTES UPON IRON. THERE continues a good borne demand for iron, of a qurlify that it is supposed can be relied upon ; and for sheets, some houses have in the past few days been obliged to refease orders. At the same time we know of instances in which large quantities of these have been made, sheared to the sizes most likely to be in demand, and stocked, in order that the works pro-ducing them may be kept fully on. There are other cases that we know of in which pudded bars have been made and sold to makers having a large demand for merchant iron, at rates as productive of profit to the latter as the buying of pig ron, and using their own pudding formaces. These facts are clearly in-dic tive of a varied experience in the trade. The variation, however, is not so marked as to occasion variation, however, is not so marked as to occasion complaint; and the indicatious of the different expecompaint; and the indications of the different expe-france in the trade which we have pointed out, are not patent. Almost every maker will tell you that he has got enough to do, and the greater number really are working full time. Contemporary with the home inquiry, the United States advices are inducing activity where without them, there would be available. where without them there would be partial languor. This is so in particular in two or more instances where This is on particular in two or more instances where the demands of the American market in regard to prices have been partially conceded. There can he no doubt but a reduction of 20s, per ton upon the prevailing prices would create a very large demand from America.

after some general remarks on the construction of bridges, in which he points out that a girder, to have equal atrength, requires double the metal, and to have equal rigidity, four times the metal, of a suspension chain of the same spaa, if loaded equally all over, called attention to the theory hitherto adopted on this subject of the weight of girder required to stiffen a suspension chain, viz. that of Mr. C. Clarke, who, in his work on the Britannia Tube, in speaking of the difficulty of rendering the Meaal Suspension-hridge sufficiently rigid for railway traffle, asserts that the construction of a platform 451 feet long, sufficiently rigid for a railway, almost amounts to the construc-tion of the tube itself. The author then described his various experiments on a model bridge, 13 feet right for a railway, atmost amounts to the construc-tion of the tube itself. The author then described his various experiments on a model bridge, 13 feet 6 inches in length, the results of which are catirely at variance with Mr. Clarke's theory, inasmach as they prove that a girder, when attached to a chain, by repeated experiments, established this result, whill not deflect more than one tweaty-fifth of a girder unattached, under ordinary eircunstances. Having, by repeated experiments, established this result, which, he explains, is quite consistent with the law of the deflection being as the cube of the length, he pro-ceeded to compare the weight of metal and deflection of the proposed Londondery-bridge with a girder of equal span, and select the Britamia Tube, from being nearly the same span. The weight of metal in one span of the Britamia Tube is 3,100 tons. The weight of metal in the proposed Londondery-bridge, with equal deflections, is 432 tons. This result, the author remarked, is unexpected, but quite consistent with the fact that the Derry-bridge has three times the depth, and has 2,600 toon less of is own weight to support. The author, in aumning up the result of the interview of the support. That the defloction of the wave of a girder attached to a chain similar to the Londonderry-bridge will not exceed one twenty-fifth of the deflection of the same girder not attached to the chain. That theoretically the saving of metal to give equal strength in a superpriority day is gother as haft of inclusion. suspension-index to give equal strength in a suspension-index is observed a girder; but as it can be made of great depth without practical difficulty, and as the defection varies as the each of the depth, a bridge, on the principle of such plans as the depth, a bridge, on the principle of such pairs as the Londonderry-bridge, may be made, nuder average circumstances, with at least one-fourth of the metal of an ordinary girder-bridge having equal rigidity.

CLUSTERING OF BUILDINGS.

ALBEADT there is too little space in the public buildings of London: the few that remain of old foundations can ill afford to receive additions, and those of modern performance possess reserves too limited for the erowding in of increased structures. It is refreshing to see a grand design finished throughout in fair proportion, and inclosing within a a contyard, or maying a garden: this in a hive of three nillions of souls is hardly to be found. Some-st-house, Buckingham-malace, and the several lans

three nillions of souls is hardly to be found. Somer-set-house, Buckingham-palace, and the several Ians of Court, are some of the few exceptions. The British Museum did realise all that could be desired in this respect. The façade is noble, and two years back the inner court presented a pleasing ver-dure within the quadragle, which afforded pleasure in the aspeet, and health in the use of the institution. All this bas been cleanged : the interior is now filled in by a dome, which, whatever its ntility, injures the rest of that noble pile, and, considering its vasuess and costliness, it is to be regretted that some other space had not been provided for it. Perhaps the last who ought to object to the occu-pation of the site is the writer of these observations ; as, in the year 1831, he recommended in the *Builder*

as, in the year 1851, he recommended in the Builder that a crystal dome should be raised thereupon for that a crystal dome should be raised thereupon for the reception of the reliques from Ninevch, the marbles, and other antiquities, as a sort of "Museum petreaum;" but then it was not proposed to raise the roof to so great an altitude as that of the present Library: besides that, as then suggested, the glazed surface would not exclude the light, nor was it intended to cover wholly the ground as now occuried by Mr. to eover wholly the ground as now occupied by Mr.

to cover wholly the ground as now occupied by Mr. Smirke's ideality. In the present rotomdo the temperature is generally good, and the air not deficient. An agreeable change and undulation are felt, but still there is a heaviness occasionally perceptible from the gravitation of the breathings of so many confined within the same area; and it will require the coming winter's experience to show whether a dome of 140 feet wide by as much in height can be attempered evenly as quadrangular dependent. mbers. cha

The noise anticipated from the congregation of so sioners; but some doubt in equirps of the calcu-in equirpd in a suspension experiment to be made, experiment to be made, experiment to be made, experiment to be made, trivances; and what with the kamptalicon covered hoor, and cushioned seats and desks, the readers can trivances; and what with the kamptalicon covered hoor, and cushioned seats and desks, the readers can it in loxury, whilst the attendants walk softly. Whatever may be the result of the experiments in to British Muscum,—whether it be to slow more safely literary treasures such as the world possesses

in no other collection, or whether it be to carry out and fully effectuate the objects of national study,it is only purposed to argue against the principle of covering such areas.

Suppose that the example were followed, and that in a fit of economy the Government should decide in a fit of economy the Government should decide upon raising another rotondo in the quadrangle of Somerset-house; or, if respect for the sublime and beautiful should forfead such an outrage, were it to occur to the royal architect to incase a library or hall-room within the court-yard of Buckingham-palace! There is no determining where the taste for confa-sinn-fields are already thoracued with an inva-sion of the courts of law; the squares in such case sion of the courts of law: the squares in such case must all in torm give place to exhibitions, or aviaries, or jardins d'hiver. The spirit of Cornhill, Finch-lane, and their alentours, would in such case pervade the whole capital: the brick might be turned into stone, but the inheritors of the next generation must, when raised in so many storied flats, find themselves, whilst soaring higher in flights, most incouveniently nacked in their avarues.

white searing higher in highly, host medvalutivy packed in their swarms. There is in the commercial centre of the City but little space, and that little is so much augmented in value, that there is no law nor reason for restrain-ing the proprietors of old houses from pulling them down, nor from reconstructing them in any increased number of stories. We see narrow frontages under number of stories. We see "narrow frontages under 20 feet raised seven stories bigh 1 All this is going on in the narrowest thoroughfares. The light is reduced, the air stituted; but there is no belp for it, unless, perhaps hereafter, the expedient of a windsail, such as ventilates ships' holds, be hung in narrow streets. Each proprietor may do what be wills with his own; not so in our public buildings. There is a restraining power to avert spoliations, as well as to determine non-additions and improvements: that power should be called into action in every case where unblic promoter is concerned. public property is concerned.

Most true it is there are many public structures that Most true it is there are many public structures that want modification : many others require to be removed or displaced; the most prominent amongst the latter being Northumberland.house, and of the former, the National Gallery. But, in the decision upon all such eases, the utility, the cost, the propriety, and the proper time for taking in turn every particular demolition and reconstruction, ought to be well weighed and ad-judicated. "One thing at a time" is a good maxim for an individual. The superimer now yes too may for an individual. The governing powers, too, new have their hands too full, from having undertaken too have ther hands too hill, from having undertaken too much at once. That which is most required should be done first; but every work a complished onght to be done with a view to future changes, as well as with the most stict atherence to present objects and nses.

Miscellanea.

STEFILEY STONE.—In your notice of the proposed church of St. Jumes, Doncaster, you say, very cor-rectly, that "the stone to be used is not Steetley, hut Ancaster." As the above words secun to imply a preference for Ancaster over Steetley, I think it right to say that so far as my individual feeling goes, the contrary would he the case. I believe that the ground on which Ancaster was chosen was solely because, by help of the Great Northern Railway, it is cheaper, and that the supply is probably less liable to inter-ruption.—Geo. G. Scorr. ROYAL NAYAL SCHOOL, NEW-CROSS, KENT.—IT having hem determined to place in the chanel of this STEETLEY STONE .- Is your notice of the proposed

having heen determined to place in the chapel of this valuable institution, a tablet in memory of the officers, educated within its walls, who fell during the late war, a subscription list was opened, and designs for the same submitted one has been selected, by Mr. Physick, sculptor, who is now engaged upon the work, the drawing of which can be seen in the studio of the artist.

SEATS IN THE PARKS .- Why do the authorities insist on iron seats? Iron supports and framework are very well; hut iron being very susceptible of almospheric influences, is surely the last material in the world for a seat |-PEDESTRIAN.

THE LIMPROVEMENTS AT BALMORAL.—Not a stone of the old eastle is now to be seen, while the new building is completed. At the east end of the Casit an extensive range of comfortable houses for the an extensive range of comfortable houses for the out-servants, and stables, have been erected; while and grassy terraces have been laid out. Accord-ing to the Aberdeen Herald, the most notable addition and improvement is the new east-iron bridge, which was designed by Mr. Branell, is constructed and preserving the deer forest. The bridge, castle, and preserving the deer forest. The bridge, which was designed by Mr. Branell, is constructed on the principle of the tabular bridge across the to the scale of seminons, so named, it is thought, Menai Strait, has a span of 165 feet, and contains THE IMPROVEMENTS AT BALMORAL .- Not a stone eighty-five tons of iron.

THE ROYAL ALBERT BRIDGE AT SALTASH. bridge, the first section of which was floated out last week, and which is to span the river Tamar, with a view to connect the Cornish Railway, now in course of construction, with that of the South-Devon line, is of construction, with that of the South-Devon line, is on a principle combining the tubular and suspension, of which Mr. Brunel is the originator and designer. The total length of the bridge is 2,200 feet; the span of each main opening 455 feet. The beight of the centre pier from the foundations is 240 feet; height of roadway above high water mark, 100 feet; height of ditto above low water mark, 118 feet. The centre pier is built of granite, founded on the rock, and carriel up solid to 12 feet above high water mark, from which point spring four octagonal columns of cach tube rests. The main side piers consist of solid masonry, arched over the roadway, and supporting cash thore rests. The main side piers consist of solid masonry, arched over the roadway, and supporting hed plates and rollers, on which his of the other ends of the tubes, and which allow of their free extension and the ubcs, and which allow of their free extension and contraction under varying temperatures. The tube float do not has to be raised 100 feet above its present height, which will be performed gradually, as circum-stances will admit, by means of hydraulic power, the tube being raised about 6 inches at a time, and then beind mealt a be built under it, where it will be again brickwork to be built under it, when it will be again lifted another 6 juckes.

Gas.—The Sherborne Gas Company, it appears, have realised a profit during the past year, equivaleut to a dividend of 14 per eent. but the whole is to be swept off in the payment of old debts. The old debts company, on the limited limitity principle, with a capital of 100,000/. has, it is said, been established in London for lighting with turf gas, and the Waterford Mail states, that an experiment was lately tried in that town, with gas made from turf got in vicinity, and that the light was peculiarly brill th ian Vicinity, and that the input was peculiarly orinibian and pure.—With rebellion, murdler, rapine, dis-trust, and alarm on every hand, says the *Bombay Gazette* lately received, the earcer of improvement in India still remains nucleokede. A part of Celevitz had just been lighted with gas. The natives were bad just been lighted with gas. The natives wer greatly astonished and perplexed by the new light. New ROMAN CATHOLIC SCHOOLS, with a master annulated at the

New ROMAN CATHOLIC SCHOOLS, with a master's house attached, bave just been completed at the Brooms, in the immediate neighbourhood of the Consitt Ironworks. The buildings are Gothic, and are built of stoue, with open-timbered roofs, starged and varnished, projecting over the caves, and fuished with an encouraged builder the The mailtime is built with an ornamental udge-tde. The walling is built in long flat courses, neatly pointed with dark mortar, which contrasts well with the chiselled work of the which contrasts well with the chiselited work of the windows, buttresses, &c. The school is entered by two porches, for the boys and girls, constructed of timber and stone, and set upon a stone base, the timber being moulded and stained, and filled in between with small courses of stone. Upwards of 150 children attend the school, and, with the excep-tion of a firm anomed subscribed the orthole sorts has Too of a few pounds subscribed, the whole cost bas been defrayed by the Rev. George Dunn, of the Brooms. The architect from whose designs and under whose superintendence the buildings have been carried out, is Mr. Archibald M. Duon, of Newcastle, and the contractors were Messrs. Gibson and Stewart, also of Newcastle

DE OMNIBUS REBUS. BAD AIR IN SEWERS.--I hope your correspondent's advice, p. 515, will be adopted. If is very distressing to read the details of such loss of life. I have some schemes to pro-pose. If the contractors of such works as severs, wells, and cesspools, in these over wells, and cesspools, in these cases, were provided with such tackle as is used by the Humane Societies in the case of drowned persons, if one unfortunate person fell, be might he drawn up, without others recklessly throwing away their lives in trying to save hin. I fear there is not sufficient prequition taken in this work. Some time should be allowed when an opening is made to let the foul air escape; but the most dangerous and destructive is the condensed bonic acid gas, which remains on the surface of the soil or stagant water. My method is this: get an open iroa vessel, put some small lumps of fresh lime into it, attach a cord toit, slake the lime, and lower it directly to the surface of the soil or water, play it about the surface as much as you can. After this process lower a lighted candle, and if it hurns freely on the surface of the soil or water, the

THE NEW ACT ON POLICE STATIONS.-The new Act, to roise 60,000/. for building and improving stations of the metropolitan police, and to amend the Stations of the interoportant poince, and to inneutropo-Acts concerning the metropolitan police, has been printed. The Home Secretary is empowered to raise the sum stated on security of the police-rates in the metropolitan district. It is to be boped satisfactory edifices will be raised. EXPERIMENT IN CAUSEWAYING AT EDINBURGH.

The North-bridge, as the greatest thoroughfare in the city, has just been made the subject of an experiment only has just been made the subject of an experiment in eausewaying. The traffic is coeches, carts, and other heavy carriages, is considerable along this street, and hither to the ordinary mode of causewaying with blocks of whinstone in regular courses has heen found insufficient, the pariours searcely being ever off the read. The experiment near not inusufficient, the pariours scarcely long ever off the road. The experiment now put in action consists in making a bedding for the paving-stones of mandam-ised metal converted into a solid mass by havy liquid asphalte pourch over it. The paving-stones are then arranged in wide courses, and the interstices are filled up with the same miueral substance, viz. melted asphalte.

IRON AND STEEL MANUFACTURE .-IRON AND STEEL MANUFACTURE.—Mr. H. Bes-semer has patented an invention which consists in a method of manufacturing sheets, plates, bars, and other forms direct from fluid mallcable iron or steel, in place of allowing the same first to cool and set in moulds. The forms of iron or steel thus produced may, if necessary, be passed at once from the rolls through between other rolls, in order further to perfect the manufacture, or the same may be re-heated either in the forms produced or when ent up and piled.—— Mr. Leon Talabot, of Paris, has patented an invention for improvements on that process of converting erude -Mr. H. Besfor improvements on that process of converting crude iron into malleable iron or steel, which consists in iron into malitable iron or steel, which consists in passing currents of air, steam, gas, or vapour through molten crude iron. They consist maioly in admitting the current of air, gas, or vapour into the molteu iron by means of a moveable pipe, which passes down through a crucible or vessel in which the metal is contained, the cud of which pipe is made with a head or enlargement, pierced with holes, through which the sit, cas, or vapour pass; and in forming the crucible. or chargement, pierced with holes, through which the air, gas, or vapour pass; and in forming the crucible or vessel for containing the iron of the shape of an in-verted cone, and in lining such vessel with chalk, solid of iron, or a mixture of the two together, or with any other substance which does not contain silted in a large promotion: of the correlate mere her dewith any other substance which does not contain silica in a large proportion; or the crucible may be formed of sheet or cast iron, and used without any liming what-ever, the exterior of the erueible being kept cool eiber suitable means. The last part of the invention con-sists in allowing the iron (from which all impurities have been removed by foreing air, steam, or gas through it) to solidify in the erneible in which it ean operation has been conducted, from which it ean readily he removed (by reason of the erneible being of a conical shape), and either passed between rollers, lor hammered in the ordinary war.

of a Contral soupe), and enter passed between rouers, or hammered in the ordinary way. STAINED GLASS.—A stained glass memor'al-window has heren put up in the ebancel of the old parish church of Mottram, by Mr. Joba Chapman, of Hill-end, late high sheriff for the county of Chester. The design includes life-size figures of our Swiour bearing the areas: the four Foremarkite, the Vincin Marg. bearing the infant Saviour, and St. John the Biptist, St. Peter, St. Paul, and St. James. The window was The window executed hy Mr. John Shaw, of Saddleworth.

THE GREAT LANDING-STAGE AT LIVERPOOL.— This structure was opened on the 1st in tart; the inauguration e remory being converted into the de-parture of the dock and municipal authorities, &c. on their annual round of inspection of the lights, haccons, buoys, and boundaries of the port. The landing-stage stretches from the southernmost point of the Prince's-pier, to which it is attached by four buildzes. The floor of the stage is 1,000 feet long hy 82 wide, and horizontal throughout its whole length, with the exception of a slightly-depressed portion at each end, for the convenience of loading and unlo ding the smaller class of steamers. Each of these depressed ends is furnished with an inclined plane, and two THE GREAT LANDING-STAGE AT LIVERPOOL. smale cluss of scientifies. Lett of these depressed ends is furnished with an inclined plane, and two sets of steps, by which access is obtained to the main stage. The platform is supported on sixty-three pontoons, forty-mine of which are S0 feet long, 10 feet broad, and 5 feet deep: twelve, namely, three for each hridge, are 96 feet long, 12 feet wide, and 5 feet dean and on set only mode 5 setter. each hridge, are 96 feet long, 12 feet wide, and 5 feet deep; and one at each end of rather smaller size than the forty-nine. These pontoons are rectangular in form, air-tight; and to prevent collapse, and facili-tate repairs, are each divided into four water-tight compartment. The whole weight of the stage, with its bridges and mooring chains, is 4,000 tons, which causes a displacement of 100,000 euble feet of water, it is a dwide af interview a general sector of water, causes a displacement of 100,000 enbie fect of water, with a depth of immersion amounting to only 8 fect. The whole cost of the fabrie as it now stands is 140,000*l*. The contractors for the whole are Messer, Vernon and Sons, of this town; the bridges having been sub-contracted for and excented by Mr. Fair-bein of Maubester bairn, of Mauchester.

Sept. 19, 1857.

Builder. The

HILST "the iron is hot," and our subject-the relations between architecture and the other "arts "-is before our readers, we would strike once more, and endcavour to shape out some of those implements of argument, which, if well-wrought and sound, may he used in the exertions which we all are bound to make to establish our art in its proper and intended positiou. There may be now nothing new in our saying that architecture as art, has manifold

relatious, and might be conducive to social progress more thau it has hitherto beeu; or that the importance to such cuds, of study of the

effect of a combination between objects of nature and art; and those other points which have lately been considered by us, are not pro-perly appreciated. But, in order to inenleate views of art which we will assume are those of architects, certain opinions not merely must be held, but must he capable of heing presented in such phraseology and sequence, as will hold the attentiou of the public. Truly, it is one thing to have what is ordinarily called knowledge; and it is another thing to be capable of communicating it, or doing justice to opiuionspossibly in themselves correct.

The cause cannot spare the services of one soldier in the strife against ignorance, which is prevalent notwitbstanding the fashionable study of architectural antiquities and history. The weapons must be well-tempered; and uot one flaw in the armour must be left. To the correct appreciation of the nature and capabilities of the art, each one of us—to use the common form of speech-may contribute. But the very learner can be sensible of a defect in the teach--of an inconsequential position required of ing,him to be taken up. He is easily conscious of a dropped link in the explanation, or argument; best views of buildings are merely the represen-and his attention wanders very naturally, where tation of the art, not the thing itself; they are the hold on his compreheusion has been let loose. The indispensable requisite for all teaching, as for all art, therefore is perspicuity.

The public do not perceive the real purpose of art and the scope of *architecture*, because the ART of architecture is what has been of late seldom exhibited to them; and they cannot admit, simply because they are told so, that sneh value may appertain to the art. We are thoroughly dissatisfied with the sort of interest which was shown in the exhibition of designs for the Government Offices. We confess to that art but not more, perhaps, data light were led to hope for hetter results, judging originates in an instinct, and is developed from from the number of visitors to Westminster the earliest period of life: the love of art-Hall during the first week. Few of the visitors seemed to think it necessary to do more than look at the attractive perspective views with circumstances. But we do not believe of a competitor was that which was shown common cyc, is so entirely non-existent as is only in the whole number of his drawings, or was to be pictured in the mind after the study of our country; the mansions of the olden time, a single sheet of paper. Were such to he neces- rock, or are,sarily the result of giving perspective views, we could almost doubt whether it would not be better to exclude rather than require them, or the country seats, from princely Chatsworth However that may be; to form any opinion of and Castle Howard to many a smaller house 218 architectural designs, from the one or two with trees, garden-ground, and greeu sward

works in a library from the merc inspection of the shelves and book-backs. Still, it would doubtless have been well-even for the educational result which was being served-to have had the exhibition open for a longer period.

But, the public having yet to become ac-quainted with the full scope of architecture, it is idle to complain, when the occasion arrives, that taste for the art is wanting. It has to be demoustrated that the art can raise emotions which are excited hy heautiful objects, and can be studied with pleasure and advantage equal to what architectural history or archæology, as considered apart, can afford. Show that the subject will repay such attention ; unfold the elements of the study, and direct the means to be taken in following it ; and there can be no reason why art should not be pursued as any other new pleasure, such as the study of natural history, to which so much attention has been of late awakened.

When we find how much that is beautiful and interesting in the natural world has escaped the sight of the public, can there be any surprise that art should equally have remained in great part undetected? We therefore think that there is uo real ground for the lamentations which we hear sometimes from those who have done the very most towards the production of good architecture,-regrets that after all, there should be no faculty of perception and appreciation on the part of the public This complaint is, in fact, tantamount to an assertion that architecture is an art intended for the peculiar enjoyment of one class of persons--architects. The explanation of what is remarked, resides in the more fact that the chief interest-we may even say beauty-of architectural art, requires the exercise of a certain amount of attention, for which there must he the conviction of an inducement. In this circumstance, art by no means differs from nature or any subject that cau attract the perceptive faculties. Certainly, the higher pleasures from the acquisition of knowledge, are attaiuable only after some initiatory lahour. If such be the case,-if the beauty of nature itself is not at once in all its phases discerned,---ean it be wondered at that our art does not necessarily and instantly eatch observation ? As regards drawings, there is this also to he recollected-a thing obvious enough when spoken of, but too often forgotten-that the essentially technicalities, and should not be expected to afford delight which it is reasonable to look for only from the actual work of architecture. If this last be properly presented to the public, we are inclined to think there is not the prohability of apathy-such as is imputed to the public in exhibitions of architectural drawings. There is, it may be admitted, a certain difference in the aptitude of perception of the beanty in uature, and that in architectural art-but not more, perhaps, than might the earliest period of life : the love of art-though of that which is founded upon naturemust be always a thing acquired, and varying -ignorant, apparently, that the real design that a result produced by architecture upou the supposed. Take the case of the village churches and combination of these, rather than seen ou or the "towers and battlements" that crest the

" Bosom'd high in tufted trees,"

visits which the majority of persons paid to about it; and from all these there will be requires au annual protest that it has higher Westminster Hall, seemed really as absurd some emotion experienced which must be re-aims than are sometimes imputed to it; but as it might be to give an opinion of the ferred, whilst partly to the natural scenery, which, even now, is followed as an amusement,

partly also to art. Where architecture is thus located, there is no want of power in it to impress itself upon the popular perception. Again, shall we be told that the public eye is wholly blind to the effect of the dome of St. Paul's, or the towers of many a Gothic cathedral, rising above the surrounding town, or of the almost unequalled scene of the quadrangle and colonnades of Greenwich Hospital? Recent architecture, then, fails to produce its due impression, from eauses other than defects inherent in the art, or in the public.

The chief purpose - the exhibition of art-often is not realised because the mind of the observer is pre-occupied by a "little learning" in some style, which he makes a universal standard. He judges of what is hefore him by application of a particular code or grammar, properly suited to buildings - or cousidered apart from the whole scene, or true architectural effect, which requires the element of natural heanty — and those, buildings which belong not to our own time. He is too much occupied otherwise, to discover either the real heauty of the structure, or that of the combination of nature and art. Thus it may happen that an observer, less educated in the technicalities of architectural detail, though he may realise less in some respects, may realise more of that expression of art which we have been considering. It will not be unde stood that the detail of the mere building is unimportant : on the contrary, dctail both contributes more than is suppose to the general effect, and is required to afford the progressive delight for which in its absence, there would be only a soon exhaustible impression. Detail, too, is the element of a special combination with natural beauty-the combination of art work in mouldings and orna-ment, with sunlight and shade-a description of beauty itself which can be unappreciated only because it is seen soldom in our towns, and in our climate and atmosphere. Even the professional architect, however, is apt to attach importance to details as though they held a primary place in the scenic effect : he hegins by examining these, and is delighted when he finds something curions and novel; whereas his observation should rather pursue the natural course, and descend from the general effect to the particular beautiful features. The ordinary observer-for whom, after all, the art is intended-pursues a different conrse. and one which is perhaps most consistent with reason, as with the intention of the designer of the art-work. Such an observer may not arrive the perception of all or many of the heauties at of detail; but the professional observer passes over much that is of chief importance, in his search after what is minute and technical. This mistaken view of architecture is what has been fostered by those fashionable studies to which we have referred.

Every one is becoming critical as to mouldings and ornaments, knows what is synchroaistic with a style, and vituperates the unhappy author of the slightest heresy in such particulars. Architects appear to have dreaded the imputation of ignorance, and have followed the lead,-inasmuch as they have been induced to give too little attentiou to outline, grouping, and mass; site and surrounding objects; general proportion, and breadth of shade. For one section of the public, the elements of architectural beauty which are most important are not provided; for the other-the amateur critics-an unfortunate mistake is fostered. The latter class are unlikely to discover that they are not contributing much to the advancement of art : they are absorbed in a pursuit -that of antiquarianism-which has heretofore been the occupation of narrow minds ; which yet

Vol. XV.-No. 763.

or an end, rather than as a means and as condurine to modern progress. Thus, the more antiquary is the very opposite of one possessing feeling for art. He may admire what is curious, and even beantiful, in an old work; but he is and the beam of the second sec and active mind. The predominant attention to style and detail, however, would be of lcss importance, as we have often said, were there general agreement as to the particular style which should prevail. In such latter ease, the merely antiquarias or technical view of our art having worked itself out, anateur critics would turn to the real art, and appreciate it,—would see beauty which they now do not see,--and the result would be speedily that progress which is at present impossible. Gradual advancement, rather than sudden and frequent revolutions, rather than sudden and frequent revolutions, progress, in fact, as opposed to experimental attempts at revivification; the study, and in one manner the use, of all styles—yet the improve-ment and perfection of one; these are the best means—as they have ever proved—or producing grand works in our *art*, as they assuredly are of securing that public appreciation npon which so much depends. Therefore, we are justified in re-asserting that for the proximate future of art, it would be better that the worst style that ever was invented should be taken as a heries are ever was invented should be taken as a basis, so that there were general unanimity,—than that the present condition should be maintained,— opposed, as it is, to the chance alike of development of the *art*, and to the perception of it. But we have said so much ou this subject, that we will only wind up our observations with the expression of regret at the loose views and misconception of the true art which prevail, and are engendered in our own body.

The art of architecture, then, whilst its expression can be even interfered with by technical ements and features of detail, is greatly dependent upon elements which can be appre-ciated by all, but which are most frequently left out of consideration. Often they contribute to the effect, by accident rather than design. How is it that that unpretentious brickbuilt dwelling-house, which we had in the mind's eye some sentences hack, and which may be seen in many a pleasant nook in the metro politan counties,-with little that would be called ornament or architectural detail, save a porch and simple cornice, -affords more real leasure to the observer, and impresses itself better on the recollection, than many a street front not wanting in elaboration, or in merit of details? In the one, there may even be of details? In the one, there may even be features of the worst character of that school the Adams, which seems to have attained extraordinary prevalence; in the other, dress-ings of the best character, like those of the Farnese, or the Pandolfini Palace. Yet somehow, there is some element in the first which is lacking in the other. There is, perhaps, a projecting centre, octagonal or square; and the windows, however plain, may be grouped with some attention to structure, to symmetry of the front, and to proportion in the stories : but above all, the building has an obvious base and fore-ground; and it forms one feature of a group ground; and it forms one feature of a group which takes in trees and sky, and terrace and garden-ground; and which attracts every eye, and delights every observer, unless him who begins by critical examination of the archi-tectural details. On the banks of the Thames, in the neighbourhood of Richmond, and further in the neighbourhood of Atenniona, and further up the river, there are many places which ex-emplify the effects that we have been consider-ing. A surface of grass descending towards the stream; a well-turfed bauk, or a lichen-covered retaining wall, with a simple monilded capping: trees, and objects animate and incaping: trees, and objects animate and in-animate, making np a fresh picture from every point of view; the clear running water and pure air which may be met with here, but lower down the river are unknown,—life and move-ment which charm, without the confusion and noise which distract the attention in London;

the opposite side of the river—eases which we rather prefer to quote for the present argument, from their exhibiting little of architectural detail, σ_{z} at least such as would be considered good. effect of art referred to, however, is that The effect of a relative to, bowers is that which, whether called architectural or not, the architect must set himself to produce if he would have his art appreciated, and conducive to the great ends which we have supposed were within its scope.

This lesson it is his business to have learned and to use where art is now most needed,in the architecture of streets, -- and to this branch of our subject especially, we shall next give attention.

THE GOVERNMENT COLLECTION OF RAW AND MANUFACTURED PRODUCTS.

Our notice of the collection of animal products in the Museum at Brompton having led to inquiries we find it necessary to give some particulars of the proceedings of her Majesty's Commissioners in this resneet.

At the close of the Great Exhibition of 1851, a considerable number of foreign and home exhibitors presented to the Commissioners specimens of raw and manufactured products exhibited at that period; these specimens embraced parts of each of the thirty classes into which the Great Exhibition had been divided.

The classes-I. Mining and mineral products 1. Chemical and phranaceutical products; HI, Substances, vegetable and animal, used as food; IV. Vegetable and enimal substances used in manufac-tures; and Class XXVII. (closely allied to Class I.) Munifictures in mineral substances for ornamental and bailding purposes; these five classes were most liherally contributed, and formed by far the greatest

The entire collection was then carefully removed and deposited in Kensington Palace, in charge of Mr. Read, and a small staff of assistants. Form that period the public generally lost sight of and was un-acquainted with the measures the Royal Commissioners have been engaged upon for the last five years at Kensington Palace.

Kensington Peláce. Many of the foreign commissioners having ex-pressed a wish, that in return for the specimens pre-sented they should be supplied with samples of British products, her Majesty's Commissioners readily responded to the wish, and directed their officers to collect specimens of raw and manufactured products of the United Kingdom for presentation to breign countries. These specimens were confined to complex of the four first classes, and class twenty-seven; and contained specimens of raw mineral pro-ducts: scries illustrating the manufacture of iron. ducts; solic contained specification of raw minerial pio-ducts; solicies illustrating the manificature of iron, steel, copper, and lead; chemical and pharmacentical preparations of first quality; samples of our finest cereals and legumes, and other varieties of seed; preparations of first quality; samples of our mass cereals and legumes, and other variaties of seed; samples illustrating the application of vegetable and animal matter for munifacturing purposes; and of class twenty-serve, interesting examples of the appli-cation of mineral substances for ornamental and build-commercient. These encourages are interesting to the seed of the same set of the second ing purposes. These specimens numbered in each set 708 examples, and were arranged in large trays, Jusced on sildes, and inclused in strong tradys, placed on sildes, and inclused in strong, well-faished eases. Two cases formed the set for presentation, and weighed together, when completed, nearly two tons. Thirty sets were formed, containing in the aggregate 21,240 specimens. The following is a list of the countries that have

The following is a list of the countries that bave The following is a list of the countrus that have bad collections prepared for them: --America (United States of), Austria, Bavaria, Belgium, Denmark, Egypt, France, Frankfort-on-Main, Greece, Grand Duchy of Hesse, Hanover, Netherlands, Portugal, Prussia, Russia, Sardinia, Saxony, Spain, Sweden and Norway, Switzerland, Tunis, Turkey, Tuscany, and Wurtemburgh.

The cases were accompanied with a printed cata-logue, containing particulars of the specimens, a copy of the jurces' reports, and four volumes of the illus-trated official and descriptive Catalogue of the Great Exhibition of 1851.

It is scarcely uccessary to add, that the gift has It is scarcely uccessary to and, that the girt mys-been highly appreciated by the governments of the countries to whom they were presented. A duplicate set of these specimenes will shortly be exhibited in the Royal Commissioners' Gallery of Animal Products in the South Keesington Museum. When this matter was complete, the Commissioners'

ment which charm, without the confusion and noise which distract the attention in London; attention was complete the Commissioners' all these are elements in the effect, -but such elements as the art, or the building, appear to be in larmony with, and necessary to. We may refer to the present residence of the Duckess of Garrick's Villa, at Hampton, each as seen from

mens for educational purposes, and presented to various free museums and mechanics' institutes of the United Kingdom. This idea has been fully carried out, and the following are the principal places that have received the beacht of her Majesty's Com-missioners' consideration, viz.;-Chichester, Leiesster, Sunderland, Win-Atsetr, Warrington, Canterbury, Truro (School of Mines), Birmingham (Queen's College), and the Museum of Economic Botany, Roval Gardens, Kew. Royal Gardens, Kew.

Each set of specimens contained from 600 to 800 varieties, and was accompanied with a MS. descrip-tive catalogue, containing particulars of their locality,

tive catalogue, containing particulars of their locality, uses, analysis, &c. A duplicate set of these specimens will be exhibited in the Royal Commissioners' Gollery. The public may possibly have entertained an opicion, that after the close of the Great Exhibition of 1853, the labours of her Majesty's Commissioners had ceased; but that is not the faet : ever alive to the importance of education the officers under the Com. importance of education, the officers under the Com-Importance of education, the officers under the Com-missioners have been fully engaged in carrying out their views; and one important object has been to diffuse through the specimens of raw and series of manufactured products, presented to the various free nuseums, general information to the masses.

THE HOSPITAL OF ST. CROSS, WINCHESTER. We hear that it is the intention of the trustees of St. Cross to give the "showing of the church" to the new clerk; in other words, to enforce a fee from all visitors. The *Hampshire Advertiser* has very pro-perly protested against this, and we hope the trustees will re-consider their present intention. "Such a church, helonging to a public charity, should not he churlishly shut, to be opened only by the payment of money. Such a practice reminds one of the denum-citions of the Saviour to the money-changers in the temple. St. Cross Church should be Winchester Cathedral, and it is no credit to the dena and chapter that it is not so. They have Westminster Abbey as an example, and the practice of all other countries to back it. At all events, let us hope the trustees of St. Cross will set a better example. If danger to the edifice is pleaded, we heg to refer them to the *Timess* of Wednesday, where it will be seen that although 'Alton Towers', the seat of the late Earl of Shrews-bury, was, by his direction, throwa open to the public, was the hundred was avalened doity through its THE HOSPITAL OF ST. CROSS, WINCHESTER. Alton lowers, the seat of the late Earl of one shows, bary, was, by his direction, throw a open to the public, and though hundreds wandered daily through its beautiful saloons, a shilling's worth of loss or damage was never sustained." So let it be, and so would it be at St. Cross. The church of St. Cross, as our readers know, is one of the most interesting speci-mens in England of the transition in style from Normens u Eagland of the transition in style from Nor-man to Eurly English; and, in conjunction with the enthedral, makes Winchester a place to he visited by all architects and lovers of ancient architecture and historical associations. The domestic buildings, too, at St. Cross, are full of interest. Many will regret that the establishment is not made available to a rester worked of interest. that the establishment is not made available to a greater number of persons than is the case, as it might readily be; small as the whole num-ber of brethren admitted is, five vacancies were allowed long to remain, and were filled up only in July last. The future allowance to the newly-elected brothers, subject to future modification, should it be considered desirable, is a weekly money payment of five shillings, one pound of meat, and one small load (bbb) of bread ner day, and itwo causts of table $(1\frac{1}{2}$ lb.) of bread per day, and two quarts of table beer. The former allowance to the brethren was three quarts of beer per day, with extra allowances on certain occasions. This has been reduced to two quarts per day, the saving thus effected heing to be made up by an allowance of coals. In the dining-hall of St. Cross, by the way, there

In the dining-hall of St. Cross, by the way, there is a very interesting triptycb, which deserves more care than it seems to have experienced. The Virgin and Child, with other figures, occupy the centre, with St. Barbaro on one of the leaves, and St. Catherine on the other. Some of the heads, that of St. Catherine for example, are particularly good. At Winchester College, as at St. Cross, many more scholars might he educated than are admitted, and that too, with very little increase of cost. "Either learn or be oft" (Aut disce, and discede), says the inscription on the school-room, and some of the

WELL AT THE CHATEAU DE MAILLANT, FRANCE.

WELL AT THE CHATEAU DE MAILLANT, FRANCE.

THE well, of which we give an engraving in our present number, has an originality in its form which attracts attention. It stands in front of some buildings connected with the Château de Maillant (Bourbonnais), France, belonging to the Duke de Mortemart. It is attributed to the end of the fifteenth century is well herine become dividend was repaired a and having become dilapidated, was repaired a few years ago under the direction of the able architect, M. Lenormand, who has restored it to its original condition.

AN ACCOUNT OF ELY CATHEDRAL.*

AN ACCOUNT OF ELY CATHEDRAL* THROUGHOUT all the efforts of architecture in all time, but more especially pervading the architecture of the Middle Ages, were two great elements, hoth more or less evident in the same work: when one was not supreme, the other,—the Classic or poetic, and the picturesque. In the tabernacles, chantry chaples, altars and tombs, and buildings where the *petide* was most studied, you will always find the first and supe-rior element, the ruling passion. The picturesque, which, when not earried to extreme, is as poetic as the other, is the most common attribute of Gothic architecture; so that many consider Gothic could not be Gothic without a certain rudeness, which is only the first of a too anxious desire for the picturesque. Our cathedrals and more extransive ecclesisatient buildings were hult under the direction of those whose minds were certainly much more cultivated

* The following is the paper by Mr. C. E. Davis, mentioned in our last,

than the people amongst whom they lived : their ideas were consequently more reflued, and they were less liable to admire the coarse and vulgar than those of their own day; hut equally with the accomplished writers of early days, including our great poets, who wrote many things the more civilized reader of a later day can-not but regret, the nreflicted' groups ago grayoles, bosses, miscreres, capitals, &c. were made the means of emerging the provide receiver follows and vulgar boses, miscreres, capitals, &c. word maao the means or communicating the rude passious, feelings, and vulgar wit of the day. It is not, however, of these small points of peculiarity 1 will now speak, hut more espe-cially of the different general aspect of buildings. The poetic or Classic, with minor exceptions, would render a building not devoid of the picturesque, hut ruled by a building not devoid of the flectures(ue, hut rules by a certain reflacement that would exclusive two the most ignorant. The picturesque elements would create a huilding where light and shade would form the most varied outline, with breaks in the huilding, continual and unequal, and the skyline irregular, all contriving to produce the most pleasing building, not at the same time devoid of some element of reflac-ted flat for the start of reflace. at the softlie time devolution source terms of refine-ment. The first quality was continued throughout the middle centuries, and reached its enhuminting point in the Renaissance: the second ran to seed in the grote-squeeness of the Elizabethau style; a style, a perfect child of those manners and feelings whose heterogeneousness and inconsistencies are so difficult to evolve an exterior. ment. the n

heterogeneousuess and incousistencies are so difficult to analyse or explain. I will not trouble you with the history of Ely Cathedral forther than thus far, that the building was founded in 673 by Etheldreda, who was wife of the the First Angles; that two of the historys of this dicesee have heen made Archbistops of Catrobry, and that one was a Cardinal; and that later, Bishop Goodrich, in 1543, assisted in compiling the Book of Common Prayer, and also translated St. Juhn's Gospels according to the present version; that still

later Bishop Turner, the friend of Kenn, was one of the non-juring hishops in William's reign. The church as founded, taking into consideration only the present editice, was originally drsigned, I have no douot, nearly as now planned; that is, so far as the arch separating the choir from the presbytery, where the apse commenced. The style is now varions; but I cannot hut think the out-line westward as precisely in the main feature as pro-posed by Ahhot Simeon, who was appointed by William I. The apse and chair, now gone, may have been completed by him; but I fed satisfied the tran-septs hear every mark of his time, although they may not have here limit hefore he was deprived, in 1102, as this part strikingly resembles that portion of Win-chester Cathedral as ascribed to his brother, the bishop of that see. chester Cath of that see.

The church originally consisted of an apse, a choir with a chevrt, which may have been carried round the apse, a central tower, probably not reaching any very great clevation above the roof of the church, transepts with side aisles, a nave and aisles, and a western tran-sept, which formed a serven to hide roof of nave, as is the manuer of the early German eathedrals, and that the tower was carried up to the later alterations of the fifteeath eentury, with that idea; but shortly subae-quent to these erections, it seems the intention of the original design was altered, and that it was then contemplated to build a nave more weedsward, making the church into a double eross on plan, as as quent to these erections, it seems the infention of the original design was altered, and that it was there contemplated to build a nave more westward, making the church into a double cross on plan, as at Salisbury. To carry out this deviation, the four pointed arches that ore enriched with the transitional zig-zeg were inserted under the tower, replacing, probably, arches that formerly existed of a less beight, but which doubles on three sides were somewhat like the arches to nave, forming a triforium arrange-ment across, in the same way as in some of the churches of the south of France of this date. I am inclined to believe there was a western entrance, as the entrances in the Norman style now existing were not, certainly, sufficiently important to fill all the re-quirements to such a building, and that this extrance was from a porch or Galilee, or possibly from an atrium imported from the south. The galilee of Durham has more the impræss of an atrium upon it than any other entrance in a cathedral in England, and this porch to Ely may very possibly have heen designed even more in accordance with the idea of what the marken thasilicas which were universally converted into churches.

was retained the open court or atrium, as ntached to the neniest hasilicas which were universally converted into churches. Certainly, at Ely, if the entrance was a porch, that porch could not have exceeded the width of the tower, as there are no marks in the western wall of the tower, that would at all justify the belief in a larger. The entrance, however, might still have heen from a court partially covered, of which idea I cannot entirely dis-abuse myself, as the screen entrance western fronts of Germany, to which this one bears so great a resem-blance, without dout were originated from the adop-tion of the atrium. The generally foreign aspeet of the carly portion of this enthedral, of which I will presently speak, inclines me to believe that the open court of warmer climates, although generally ahan-the original design for this huilding was framed. The Galilee of Durham is to all intents a covered atrium, and I have little doubt the chopel of Joseph of Arimathma at Glastohnery, which the Association visited last year, may have at one time served the purposes of an ntrium or galilee to that abhy, as the door ways, of which there are two, north and south, are certainly out of proportion to the requirements of so small a chapel, were it not intended they should form the entrance to the church. It is difficult, however, now to decide how the church was formerly entred, as the arches in the

The summ a charge, were a not intended they should form the entrance to the church. It is difficult, however, now to decide how the church was formerly entered, as the arches in the tower are most certainly not of a piece with the super-structure, nor do they at all assist the design of the present galilee: they are too koly for it on the one hand, nor are they of the date of that which they sup-port. I have not the smallest doubt that these arches were inserted with the idea of lengthening the eathe-dral considerably westward, and that in doing so the foundations of the tower were weakened, so that it hecame necessary, after the lapse of 200 years, accord-ing to Bentham, to entarge and increase the columns as we now see them, which was commenced in 1400. This weakness in the piers was not in consequence, I an include to think, of the erection of the present octagon, hat from the displacement of the more powerful piers.

arches, as they are **bold** and well d signed, whilst the lantern, although exceedingly pisturesque, cannot be considered as the cretion of succord a period: indeed, were it not for the tracety of the wind ws, I should be inclined to place its building, from the mouldings and the contour of its detail, nearer the dehasement of the Gothic style

Atter the insertion of the first three arches, the After the inscription of the first three arches, the idea evidently was abandoned of brashhening the church, and the western arch was partially walled up, and made only to communicate with the present beaution gallide, which is said to have been completed in 1215, hy Bishop Eustachins. This gallete is of two stories, the lower is the cotrance, and the upper lighted by three lancet windows, was formerly a gal-lery, which looked eastward into the church, where is now placed a modern percendicater window, but a modern perpendicular window, hut plared now now prace a modern perpendicata work, not which doubtless was open to the arch, as across which, when the later arches were huilt, a perforated balcony was placed. This upper story dors not now exist, although the wells are unnutilated, for the original roof has been removed, and replaced inmediately above the groining of the entrance.

The whole exterior of the gilite is enriched by four tiers of ac des stretching over the three sides, excepting only the three-light window and the entrance. They are all heattfully propertioned and well monitod, enriched with all the decontions of the style, the carving of which, including the capitals, which are without exception foliated, heing of the most exquisite execution. The arches to the side most exquisite execution. The arcness to the since read-s on the lower stages are not folisted, hut those in the front and on the upper stages are eiaque-foiled. The poorest part of this gallecies is the design of the angular buttresses, which are tike a hundle of columns tied togs ther occasionally by the string-courses; an lathough more elaborate than the simple tousses, an action of the solution of the simple huttress of the style, is poor, and destroys much of the hearty that this building would otherwise bave. "I cannot account for this, in my opinion, mal-design, except that this galile was huld in the hope of harmo-nising better with the Norman screeen. Certain it is, that Insing better with the Aorman screen. Certain it is, that although as to form this galilee is inferior in general outline to that of Salisbury, and perhaps of Wells, in the same style, no improvement can be suggested when the *tout ensemble* is considered. The en-trance to the porch, which I should mention is not square with the cathedral, but slopes northward at the masters nucle is her meet ensuit is the statement. square with the extincted, but slopes northward at the western angle, is by a most exquisite doorway, in two divisions, noder one arch, supported by a central four-centered columo. The aren, or tympanum, above these two arches, which are most admirably foiled and moulded, was formerly field with stone, which may have been enriched by a suak panel: a tabernaele for the statue of St. Erbellrein, Sr. Mary, St. Peter, or other sint, is now occupied by some decorated tracery, not in secondance with the design of the other part, hut which, whether of modera or four-teenth century date, is strictly in harmony with the whole. whole

The Galilee itself is of two hays, the groining The Galilee itself is of two hays, the groning syringing troin four detaeled columns, which bisset each side; each of which being divided into two iters, the npper taking the form of the arching risk, has a screen of six detaebed columns, supporting foiled arches, stilled or not, according to the form of the enclosing arch. The lower tire is divided by three trebiled arches, beautifully moulded, and the hollows filled with the dog-tooth ornament : the columns sup-porting them suprom from the circum earch hat the porting them spring from the stone seat, but the groining of the recesses is supported by columns growing of the fetteres is supported by contains, which fill the centre of every opening, and rest upon an upper string course or shelf, that at one time, without much doubt, contained sculpture, as indeed also the recisses above.

The entrance to the church corresponds precisely with that to the Galilee, except that it is adapted to receive a door, and that the arches themselves are a triffe richer than the inner arcbes, heing also more foiled. The same alteration has been made in the foiled. The same alteration has been made in the tympanom as has been made to the onter doorway tympanom es has beeu made to the onter doorway. Through this door you exter at orce the tower, which till Leby was hidden by a luth-and-plster groin, happily ienuved. The tower is arcaded, and is prin-cipally lighted by eight windows in the upper story, the recesses to which are so deep that only a parion of the upper part can be seen. Of the western tran-script, that to the south remains; the northern one, together with an eastern apsidal chapel, having purbled. It is singular that there is no recend of the demultions of this important part of the earthed al, which beers in its ruins every mark of heing strictly a repoduction of the trans-ept to the south: certain, however, it is, that its fall was occasioned, not as usually stated, from the irregular settlement of the Usually stated, from the entregenar settlement of the track the various syste of electrotecter and the state of the track of the state of the system of the state of the system of the s

was subsequent to the building of the arcness of the tower, or even of the erection of the upper oblegon, as there is an arch examination of the upper oblegon, as there is an arch examination of the the other aide of appuently as late, or even later due, than e there the piers or latteru. The late of the existence of this areb to the nave would be no argument in support of my theory of the lall of this part having there alone upberoper to its insertion. support of my theory of the lall of this part having taken place subsequent to its insertion, but for the fact that the fall desirayed so much of the building to the west that it wis found uccess ry to build a large hattress to support the tower, and they would there-fore have searcely weakened the remaining ruined wall by an arithway, hat rather have built an entire new wall. The huttress, also, that was built, hears upon the corriched paneling at its has every appear-ance if being a more recent exection, the arches being of a dist accitable hat in the Parcentingular particul? of a date certainly late in the Perpendicular period.* The transept that remains has been lately restored

The transept that remains has been lately restored to what was probably its original purpose, namely, that of a baptistery, a font having heen erected of a style to accord with the transept, which is the most beautiful of the Norman interior. The transept is perdiar, perhaps, in itself, as, although it bears the impress of uniformity at first sight, a close examina-tion biologic is mailing here are with tion discloses its varieties, harmonising, however, with each other, evidently the result of one design, which it was not built necessary strictly to earry out in every mioutia. The arches westward are very fine, the one towards the tower having a flat soffit to the central portion, the other having a rounded; both are enriched with the surface zig-zag, generally con-sidered au early form of that ornament. The arcades sidered au early form of that ornanicat. Interaseuts, above are somewhat as the nave. From the transeuts, projecting eastward, is a small apsilal chapel, lately reprojecting cases and, is a similar planta energy mody to stored, said to be St. Carlenie's Chapel. It is a very prety little sanctury, and forms, with the transept, a singularly interesting postion of this most interesting cathedral. The restoration of this chapel so exactly matches the old work in the interior, that it would he exceedingly difficult to ascertain if it were not the original.had the builders not neglected to copy the invariable but in a the bolinders too heree to be dependent of the key-practice of medisyral workmen of coniting the key-stone, whether in circular or pointed arches, and sup-plying its position with a vertical joint hetween the two crowning vouss sirs of the arch. I should meation forming a part of the southern pier of the arch that. to this chapel, which forms the base of the apse, is, about 3 lect from the floor, a mutilated block of stone, the former credeuce-table.

The transept is at present roofed and framed with borizontal heavily-moulded braces with square panels. I think these cannot he as the original, ras I have little doubt the transept, and perhaps the nave, were in the first place roofed upon the heams, knee-trusses ressing on the semicircular shafts which run. from the floor, and which in the transepts terminate in square capitals, and intended certainly for a framing much more bulky than that at present existing.

much more bulky than that as present cases. The nave of twelve bays, shortened one hay from its original length upon the huilding of the central lantern, is flanked on either side by ground side aisles, the lower divisions of the side walls of which are simply arcaded, as originally designed. The windows the lower divisions of the side wails of which are simply arcaded, as originally designed. The windows to each hay of aisles were in the first place single cir-cular lights, having square jambs, with an internal attached column supporting a plain soffited arch floab with jamh, the exterior double recessed, with an attached column and billet moulded jamb and hood. Those to the south have been restored, hut those iu the north are still as altered, and euriched by tracery. I think it would be unwise to disturb these windows, as the varieties of different centuries teach us the as the varied software of bunching controls that us the varied feelings of those times; and, therefore, to destroy their work, unless created to the extreme detriment of some much richer and more ancient treasure would tend to isolate the architecture of the first eras, destroying the connection which we now feel individually with the Norman and the early styles, as we can with certainty retrace slep hy step, as by a ladder, the labours of our predecessors from the work of yesterday at Sydenham to the chapel in the Tower of L ondon.

The coup d'wil of the cathedral looking towards the the coup a cost of the catedra round, then in any choir is, perhaps, as fine, or even finer, then in any other cathedral I have visited, but the building wants that severity and massiveness common to the Norman to be seen in the cathedrals of Durham, Norwich, Glonecster, or even in the collegiate church of Tewkos-It seems evident that the architect, in design-Ely in its carliest styles, aimed at the refinement In the period of the series spice, and at the relationship of the period of a colling as much as pos-sible the Grote-que. A great deal was gained in the alter-building of the cathedral trum this preface, as it must be apparent even to the most cursory observer that the various styles of architecture subservient to

[Sept. 19, 1857.

was sub-equent to the building of the arches of the the cathedral of Ely are singularly refined and studied, and I can only account for their being on by sup-posing that the early refised Norman taught the builder in the Early English period the propriety of the same course, and that this style, as the previous one, stimulated its successors.

one, stimulated its successors. The nove and arches, said to have been hull, accord-ing to Mr. Sharpe, in 1130 (by Bentham, in 1174, who I am iuclined to think was in error), are of three stages, the first consisting of semicircular arches of very small span, upon piers, which, contrary to the app-arance of Early Norman in every other unitual presenting being actions are not which is in phenoteneous of the area of the area of the set of the set of the set of the area of the area of the set of the set of the set of the area of the area of the set of the set of the set of the set of the area of the set particular, are rather late in character, as they are not the simple ponderous shaft, but are a series of partial columns, which give an unusual rectilinear effect, more common to a later style. The arches themselves more common to a later style. The arches themselves are stilted, and some even assume somewhat of the horse-hoe form. Above these arches is the open arcade of the triforium, which is rather lofty, and usus-ally light. This last may be owing to the in-sertion of the Perpendicular windows, which supply the place of the single lights. The arches of the triforium are stilted, as below, and each arch again is divided by a single shift, supporting two smaller arches. In the clerestory each division is lighted hy single lights, behind an arcade of three arches. Thronghout each hay there is a great want of corrich-ment, none heing even attempted save in the string courses. The design of this nave goes far to convine courses. The design of this nave goes far to convines me that there was an almost precisely similar style of Norman in England, coeval with the Conquest, and that native artists still continued, even after, to de-sign and direct our buildings, and that their crections were the grand Norman architecture which we have at Durham; and here I have no donht a foreign element was introduced, as this Norman hears a very strong resemblance to the sister churches of Caen, retaining, at the same time, the simplicity common to the holder architecture of the same date in Eugland. In the architecture of the same date in L081804. In the south asis, four bays from the west, is an entrance to the now rained cloister, which, on its first founda-tion, extended from the south tracespt westward eight bays, bringing the return of the square imme-diately opposite this door, which fronted the western side of the cloister stricthing towards the present side of the christer strictening towards the present deenery. The Norman cloister was areaded against the wall of church, which, singular enough, was not do-stroyed when the cloister was enlarged and rchuilt in the Perpendicular period, as this portion was never vanited, to avoid, perhaps, the destruction of the areade. When the cloister was built another hay was taken in westward, and this side is vanited with fan treasure the cloid the commercement of the taken in westward, and this side is valued with hai tracery, two shafts and the commencement of the vaniting of the tracery still remaining against wall of church. The doorway from the church is now known as the Prior's Entrance: it is inserted in the wall through a portion of the sreade, with which it does not in any way accord. I am inclined to think that this doorway and the one I will presently describe entering the cloister more castward, were removed from some other cloister more castward, were removed from some other buildings, and re-crected in the places where they now are at some very carly period; probably upon the building of the first cloister. The carving of the prior's cutrance is exceedingly rich, occupying all available space, the whole of the imposts, areh mouldings, and capitals being thickly sculptured with interfaced carving. Each jamb contains a column attached to the inner angle, the front face of the jamh projecting to form a cubater action of who is carved juth a the enter angle, the front face of the jama projecting to form a plaster, each of which is carved into a series of medallions; the western one containing figures of animals, with that of a man in the upper compariment; the other, representations of men and women playing on different instruments, or otherwise enjoying themselves, one turning head over heals in the accure of placence, each the accurated in civities a enjoying increases, one through acad over hers in the excess of pleasure; another engaged in giving a token of affection to what we will assume is a lady of the time. Surrounding these needalions, hat occupying a space heucath the capitals, is the eleva-tion of a castellated gateway; that on the right-hand heing curticled of its roof, to admit (as I suppose) its insertion in the situation in which it is now found. The columns, as is frequent in Byzantine prohitecture, but rare in Norman, rest upon the figures of some animals now too much mutil ded for me to describe. The tympanno of the doorway is sculptured in tolerable relief with the figure of our Lord within a vesica piscis, relief with the figure of our Lord within a vesica pixels, held up by two angles sitting, holding an open book surmounted by a cross, in his lift hend; his right being elevated in the act of benediction. The other doorway, which I previously referred to, leads direct into the enstern side of cloister from the cathedral against wall of transept: it is of corr sponding work with the other, but I think searcely so heautiful, although of more complicated design, the surface descention heave not outle as advantage or an unit decoration being not quite so elaborate or so universal. It has the addition of another column on It is not a start of a database of advant of a start of the imposed and the tympanine is cut away into a foliated head. At first sight it seems difficult to recegnise this form as the original design, hut on examination, I have no doubt of it.*

* To be continued.

SYMMETRY IN NATURE AND ART. HAVE you ever viewed a scene in Nature which had not been interfined with by man's hands that could be pronounced ngly? In the most barren and mucuth spots there are a wondrous variety of colour micourie spots there are a which are satisfactory even to the entity of thit, which are satisfactory even to the entity and even there are a bowever, distinct features of Nature, which, by the peculiar arrangement of forms, and by the grandeur of their proportions, have an indesciblable effect upon the senses. Amongst these, are lofty mountains, which, like Mount Arrant where they towards a satisfies forces in window or Mont Blanc, tower over smaller forms in mighty pyramids; and this pyramidal form coostitutes one of the most striking features in the composition of many of our createst works in architecture scalutors and our greatest works in architecture, sculpture, and inting. The largest and most ancient of the works pain(ing. The largest and most ancient of the barries of Egypt, some of the chief buildings of India, and

of Egypt, some of the chief buildings of Jadia, and our own old cathedrals, show, in their exterior forms, an imitation of, and couvey somewhat simular impres-sions to, the nouristin shapes jast mentioned. Grand as are those shapes which tower gradually toward the sky, the level lines of the ocean, and extended plains, have, with their accompaniment of clouds and other effects, a scarcedy less telling effect upon the muid, one are the granedly sween of bars extended plains, have, with their accompaniment of clouds and other effects, a scarcely less telliog effect upon the mind; nor are the graceful sweep of bays, and those intermediate circular and other forms which help to combine the plain with the pyramid, without their peculiar uses in appealing to the eye; and those varied lines, like the notes of music, are the first materials which are placed by Nature before artists to be used by them to convey similar pleasare to the even by their hormonicar permeanent is the same even by their harmonious arrangement, in the same manner as music does to the ear. If we look with attention at some of the finest examples of our Gothie architecture, it will he found

that a principal cause of the picturesque, or what we call artistic effect, is the grouping of both the larger and smaller masses into angular and other simple geometrical forms; and it will be observed that the best of our sculptors and painters have arranged their Works on similar principles. Greek architecture has been shown to be a skilful

combination of truthful forms, arranged by the genius of those days with such niccty that we have not since be noise days while a newy that we may not not since been able to excel their fair propositions. Handel, Mozart, and other musical composers, had but certain notes, each of simple and not anpleasant sound, but which, by skiltal combinations in these masters' hands, produced the most sweet as well as the most grand

From the most remote times, and at the very dawn of civilization, the triangle, the circle, and the cross, of divitization, the triangle, the circle, and the cross, have here considered as earced types, which have become so in consequence of their being the distinc-tive elements of truth; yand it is a feeling for truthful and geometrical forms which in a chief measure cou-stitutes the famous artist. It is prohable, however, that many painters grouped their figures by an in-stimetive feeling, and were scarcely aware that they were arranging them in such distinct angles and circles that the masses might he marked by rule and roomnas. compass

Take, for instance, some of Rembrandt's fluest works: place them at a distance, and observe in how maoy instances the broad mass which catches the eye assumes a pyramidal form; and then, on closer inpection, observe how distinctly the same principle is arried out both as regards the light and shadow aud spection, ob the outlines. It might seem, at a first glace, that the piece of armour on the wall, which just catches a the piece of armour on the wall, which just catches a glummering light, the group of objects on the table, and the books upon the floor, are placed on these spots by accident. A listle examination will show that they are placed here to perfect one of those true forms to which we have allnded. The pictures of the "Mill," one a drak and the other a light effect, by this artist, will he found to be very distinct in their arrangements. arrangemeuts.

In pictures of stirring action, the angular form of composite las, the sitiou has been chiefly used. Take, as exam-be "Murder of the Innocents," by Raffaelle, composition has been emery user. They is a pleak the "Murder of the Innocents," by Raffaelle, and the stormy sea-pieces of Tarmer, and note the number of angles into which they can be divided. In the more celebrated buttle pieces this principle has generally been obsisted. It as some, the charge and rush of armed men has been successfully given by the almost mechanical errangement of the same lines. Cleanels": "Charge of the Ganzda at Waterloo," is a successful and characteristic example. In this fine work the bodies and swords of the soldiers, the solaurs, the lines of the horses, and the sky, all bear work the body and swords of the Sidders, the colours, the lines of the horses, and the sky, all bear in the same angular direction, with the exception of a slight npright form, which not only serves to balance the composition, but also gives mution to the repeated lines. The same principle may be observed in the see pieces of Yauderveld and Turner, which are remarkable for the appearance of column which here

which gladdened the eyes of man before architec-ture or painting were thought of, were in due time imitated, and the circular principle of composi-tion has been brought into use by both architects and painters. In olden times we find such mysterious screetions as Standbream and the mean schemet erections as Stonehenge, and then arose arches and domes

Painting, as an art, is but an infaut one in com Painting, as an art, is but an infaut one in com-parison with architecture and sculpture; for it cau scaredy be considered worthy of companison with the latter, until the knowledge of perspective, harmooy of colouring, and the principles of composition, had been brought into use; and the principations of the school of the scale of the scale of the school of Refault are superset the scale of the brought into use: and like pictures of the achool of Raffaelle are amongst the earliest examples of the combination of these qualities. Io several of his pictures, Raffaelle has given an extraordinary (field of grandeur and solumily by the circular grouping of his figures. In a pen-and-ink sketch of the death of Anaoiar, by this great artist, in oce of the libraries at Oxford, the figures are grouped in such a perfect oval that it might have been struck with the compasses: the dying man is in the centre, and eyes and terror-stricken conteu-ances, and movement of haods and arms, all directed towards the noist of interest, moduce a wonderful ances, and movement of natus and arms, in uncertain towards the point of interest, produce a wonderful effect upon the imagination. In other pictures by this painter, he has arranged the figures in severe straight lines, and has by that means given wonderful effect. This stern and uncompromising composition in pictures seems to have a similar effect to the deep bass notes of music.

bass notes of music. It is somewhat an ahrupt step from Raffaelle to the late John Varley, the water-colour painter. Although, however, the mind of the latter was not to be com-pared with the lofty intellect of the former, John Varley was a man of considerable and original genus; Varley was a man of cousiderable and original genus; and we remember a drawing by bim of the Funeral of Saul, which was composed of a repetition of the horizontal and upright lines just alluded to, and which gave a most impressive idea of deep solennity. In one part of this flue work tall cypress-trees stretched upwards in straight lices, the arms branching off at its the action is the most all do introverse bridge pages upwards in straight rocs, the arms branching on a right angles: in the middle distance a bridge passes across the picture, along which the fumral is slowly passing, looking dark against the last twilight: the bridge, the lights and skadows on the water, and the sullen, bery-looking clouds, are all horizontal, and it is surprising how well the repetition of these severe lices and the sombre colouring suit the nature of the subi

Ju others of Turner's glorious landscapes, he has at used less the arrangement of geometrical lines. not used less the arrangement of geometrical lines. Notice how the eye in some of these sweetest works is enticed by bcautiful for uns from place to place, — both by colour and lines. The geometrical construction of great pictures is a matter on which much might be said: my object is, however, but to glance at it, and to recommend that students should take engravings of the best subjects, and consider the arrangement which has been here alluded to.

ARCHITECTURAL COMPETITIONS—COMBI-NATION SUGGESTED.

SIR,-The almost weekly occurrence of fresh adver tisements for competition, in your valuable paper, which are in themselves not only disgraceful on the part of the committees who issue them, but direct insults to a profession which ought to number amongst its members none but those who can lay claim to the title of "gentlemen," leads me—one of that pro-fession—to offer a few remarks on the subject of competition generally, with the view of bringing the matter into something of a tangible shape for the future

future. Much has been already said on this vexatious sub-ject, and it may almost be thought that there can be nothing further added. In this, however, I am of a different opinion ; and I believe that, if architects will only be united, the public may be brought to see that their present treatment of an honourable profession is one which is totally at variance with good faith and invariant excitation be entry to be entry in the set of t justice, and ought to be given up. What is the object, as far as the public is concerned,

of competition? Surely, to cuable them to avail themselves of the greatest talent that the prospect of a fair remuneration will bring to their aid. But what a fair remuneration will bring to their aid. But what can be its object when that fair remuneration is not offered? Perhaps one of the "povenors of the Moulton Endowed Schools" will answer that ques-tion, for it entirely haffles my ingenuity to find ont. It is, however, a well-known fact, that the induce-ments to enter into competition are, in the andjointy of instances, very far short of that fair remuneration which the profession ought to expect. But in this case why is all the blame to be atteched to the unfor-tunante public? If architects are to be found who will remarkable for the appearance of action which has tanate public? If architeets are to be found who will thin whatever, as from the excessive cost it is virually heen given on the pained cauvass. In these the sails, work for little or uo remneration, why are the public out of the pale of the competition, and proceed to the balance of the water, and the sky, all except one little fold—been the same w. The sun, the moon, the rainbow,—lovely forms the profession, who, it is presumed, are in earnest in awarding to it the first premium; but if, on the other

their wish to alter this state of affairs, would only set about them, and, looking the matter tairly in the face, determine not to give in for any competition hut those in which they may look forward to a lair remu-neration, as well as honourable treatment, the desired result would be gained. Cannot something be done at once to free ourselves from the average to groupous state of forkins." I think

from the present anomalous state of affairs? I think much might be effected by adopting a means which is in almost night be needed by adopting a main which is in almost niversal vogue, except among architects, at the present day, and that is *combination*; and I therefore venture to make this appeal to my fellow-architects. Let the profession, then, in a united body, *combine* and establish amongst themselves a sort of "etiquette" which shall hinder each of them indi-vidually from entering into any competition, unless fully assured that they do so on such terms as may be remunerative and honourable; and let them, in return, give the public such assurances of honesty and straight-forwardurss as will give them confidence that they do not wish to have all the benefit on their own side on

Allow me, therefore, to suggest, through the medium of your valuable paper, the following half dozen hints as materials towards forming a code of rules to he adopted hy the profession (both in London and the provinces) for their guidance in this matter:--

Ist. That no architect (who has now, or may hereafter signify his approval of the above, named object) shall enter billy of the tribunal or committee to decide on the capa-bility of the tribunal or committee to decide on the merids of the designs submitted. 2nd. That no architect, &c.,-unless the carrying out of the works is secured to the author of the best design, or that decided upon by the judges as the one to be carried out.

that decided upon by the judges as the one to be carried out. Area That no architect, &c,--unless the plans, specifica-tions, and drawings necessary for the execution of the vorks are achnowledged to be the property of the authors thereof, and that the committee or promoters of the undertaking have no claim whatsoever to them. Ath. That no architet, &c,--unless it is understood that the premiums are payments for merif, and not to be merged into the commission payable to the successful architect, or for the purchase of the competition drawings. Sth. That no architet, &c,--unless the premions differed are to a certain extent remunerative, and unless at least too promiums are offreed, --unless the properly under-stood that the estimates given in with the designs are merely approximate estimates.

merely approximate estimates. The four first rules it is self-evident are very much required, and might almost be adopted as given. The two last, would, perhaps, require some further con-sideration to bring them into working order. For the rate of the premiums, for instance, perhaps no arbitrary rule could he framed, as there would, doubt-less, be much difference of opinion amougst architects themselves as to what would be reminerative. I have, however, thought of this matter a good deal, and beg to offer the following table as a suggestion for consideration :—

FOR AN OUTLAY.	Under 3.0001.	Above 3,000/. and under 5,000/.	Above 5,000L and under 10,000L.	Above 10,000%, and under 15,000k.	Above 15,000% and under 30,0000.	Above 30,0' 0l. and under 50,000l.	Above 50,0001. and under 100,0007.
	£.	£.	£.	£.	£.	£,	£.
lst Premium	50	100	150	175	200 to 300	300 to 200	500 to 1,000
2nd ditto	35	75	100	125	175 to 225	225 to 375	375 to 750
3rd ditto	20	50	75	100	125 to 150	150 to 250	250 to 500

The sixth rule proposed is one of only common fairness to architects where an amount is named in the instructions, for it would hardly be expected that the instructions, for it would hardly be expected that they could, in the time given to prepare the drawings, go minutely into detail so as to ensure or guarantee their estimates. Something ought, however, in fair-ness, to be conceded to the public as a guarantee of the good faith of the approximate estimate; and it is a discredit to the profession that it so often happens that the estimate given is so much under the actual amount of the bulder's teeder. On this point, too, libere is a manifest unfairness to the other competitors whose plues may have been prepared and can be executed for the amount named. It is nother a ques-tionable point whether any anomet should be named executed for the amount named. It is rother a ques-tionable point whether any amount should be named in the instructions; but leaving this guestion for the present, in such a case as we are now dealing with, I would suggest the following plan of proceeding. That if there should he any very glaring descrepancy be-tween the approximate estimate and the lowest buildor's tender, committees shall be at librery to put aside the first premiated design without any remunerasize the ms prematch nearly without any promitten-tion whatever, as from the excessive cost it is virtually out of the pale of the competition, and proceed to prove whether the second premitted desize can be excented for the amount named, and if so, to adopt it, hand, a discrepancy should again occur, then to take the same steps with the third and other designs, until they arrive at the one that can be executed for the sum stipulated.

sum stipulated. I throw out these matters as more suggestions, and as such they will, I hope, tend to bring forward the opinions of others. I do not arrogate to myself the idea that they would, if acted upon, he successful, or that there may not be grave objections to them, or that there cootain all that is necessary; hut I do think if the public saw that the profession were deter-mined to adopt some such rules as these, it would put an end to nuch that is at presart very unplensant, and hring about a hetter knowledge as to what is due on architects as a professional body of mem. At any to architects as a professional body of men. At any rate, the appearance of this (I fear over long) letter may tend to ventilate the matter, and cannot, I think, do any harm. An ARCHITECT.

WHAT WOMAN MAY DO. A RECOLLECTION OF TWO FRIENDS.

It is pleasant to look back on associations though now passed away for ever, which not only afforded the gratification of congenial social intercourse, but the example of public spirit and untiring benevolence. I turn to the recollections of the Misses Keunett, late of Haus-place, for such example, and feel persuaded that the building profession and the Christian world at large will bear with me while I Concentrate works at large with ocar with me while 1 corespitulate, as briefly as may be consistent with the truth, the efforts of these hadies (long since departed), to alleviate unserv and to adorn this capital with two of its best and most useful institutions. The younger sister, Miss Louisa Kennett, had her sympathies awakened on bebalf of the destitute seamen of this country, by an account which she read in the *Times*, of some shipwrecked silors being lodged in the Compter, for the want of some suitable place of refuge. She was told, indeed, by some friends, that refuge. She was told, indeed, by some friends, that there was a place called the Destitute Sailors' Asylum, there was a place called the Destitute Sailors' Asylum, somewhere in the City, but on making personal inquiries and iovestigations, she found that this so-called asylum was a wretched loft, supplied only with straw for the nightly accommodation of the wandering and distressed mariner. Deeply grieved that so miscrable a shelter was all that the world-renowned mcrchants of London had provided for the destitute and homeless beings who were chiefly instrumental in bringing wealth to their coffers; deeply indignant, too, that the nation, which henefield so largely from the interval of the factor, which herehted so largely from their ill-required labours and perils, bad never supplied the deficiency which must he daily and hourly felt, she at once commenced her habour, with all the energy which so nobly distinguished her character. She called upon all her female friends, and asked, with that earnestness which apathy itself was ashamed to resist and which often character is resist, and which often changed indifference into zeal, their indefatigable co-operation in ber design. This was their indefatigable co-operation in bur changed multicrene into zeal, their indefatigable co-operation in bur chains and so well was she supported that the sum of 6007. was realized by the sale. With this sum the good work was commenced, and a subsequent sale was held, I think in the Painted Hall, in Greenwich. Under the auspices of the late excellent Captain Elliot, whose character is so deeply congraven on the heart of every sallor's friend, the Destitute Sailors' Asylum reared its unobstrusive walls, in the near neighbourhood of that noble Sailors' Home, which so long enjoyed the invaluable benefit of bis superintendence. It was opened about a year after its commencement, in the presence of a numerous assembly of persons. The mcrehants of London, awakened by these in-teresting and successful efforts to a sense of their own duties to the maritime community, have (to their bonour be it spoken) never permitted the institution to lack support since its inauguration; and to the

bondar of sports ince its inauguration; and to the day of Captain Elliot's removal from this chequered world to the cternal recompense of Christian faith and love, it was the object of his beneficent care. May I be permitted to lengthen this paper by stating also a few interesting facts in connection with the trable hearing in the both

stating also a few interesting facts in connection with that noble hospital in the Fulham-road, dedicated to those numerous sufferers from consumptive disease, these numerous sufferers from consumptive disease, who, before its establishment, had no definite refuge for their affliction. This much-needed hospitol owes in a great measure its existence to these indefitigable sisters, Conversing one evening with an intelligent and excel-leat friend, a harrister, I think, residing in their neighbourhood, and deploring with him the great chasm which remained to he filled in the medical charities of the metropolis, he at once said that he would devote 5007, to the purpase, if others would join him in the work. The recollection of former success naturally occurred, and a fancy fair in Chel-sea gardens, on a megnificent scile, was the result of sea-gardens, on a magnificent scole, was the result of the untiring efforts of the Misses Kennett. They the untiring efforts of the Misses Kennett. They colour, picked out in git. called on all their friends to lend their aid, and these The design is the production of Mr. Penrice, of soon spread amongst their respective circles the Doneaster. Mr. Phillips was the carver. The general proposal, one that was met, indeed, with especial work was entrusted to Mr. Charles Lister. The cost favour. The results were very gratifying: the Prince will he nearly 4007.

THE BUILDER,

Consort attended in person, and made purchases at every stall. Five shillings was the entrance fee on the first and select day—half-a-crown on the second. If I remember rightly there were three days' sale, and a numerons attendance to the last. Contributions of considerable amount followed these labours; and who, in contemplating the commodious building in which

in contemplating the commodious building in which the consumptive patient often obtains restoration to health, or has the slow and painful progress to the grave, smoothed by kind attentions, and cheered hy religious consolations, will not rojoice that the zeal of these sister philanthropists was thus nobly manifested? They both now sleep in their graves, the younger preceding her sister hy many years. The clder Miss Kennett possessed considerable skill as a miniature painter, and as an amateur, obliged her friends with their likenesses. One of Mrs. S. C. Hall, I remom-ber perfectly, and understood that it was an excellent her perfectly, and understood that it was an excellent resemblance. It is trusted that these reminiscences ber perfectly, and understood that it was an excellent resemblance. It is trusted that these remniscences of two ladies, who thas efficiently served "their gene-ration ere they fell on sleep," will encourage the exer-tions of others, in caases still requiring advecacy and combined exertion, and that the latter balf of the nineteenth century will exhibit to admiring posterity two cstablishments quite as much needed; one for the destitute boyhood, the other for the destitute girlhood of Loudon. If bazars be thought objec-tionable, as they are by some, small subscriptions from the unillion would quickly roise the required sum, as suggested in a former paper. Who are the from the million would quickly raise the remarks sum, as suggested in a former paper. Who are the friends of the juvenile population of London eon-demned to poverly and its associate misery? Who will put their hand to this great work? "We pause for a rentr." S. E. M.

PROPOSED COMPETITION FOR PRISONS AT TURIN AND GENOA.

We have been requested by the Sardinian Minister to make known to architects that designs are desired for two prisons in Turin and one in Genoa. The cest tor two prisons in Turin and one in Genoa. The cost of one of the prisons in Turin (580 cells) is fixed at 62,400/, and that of the other, 50,400/. The cost of the prison at Genoa is not to exceed 64,0004. One prize is officient for the two prisons in Turin, of 320/, with further premiums of 100/, and 60/, for the second and third best. For the design for prison in Genoa, and third best. For the design for prison in Genoa, the premiums offered are 2407. 807, and 487. A copy of the conditions will be found at our office, in Xorkstreet.

ELSTON MONUMENT, IN CHRIST CHURCH-YARD, DONCASTER.

The monument which has just been erected in the burial ground of Christ Church, in Doncaster, to the memory of the members of the Elston family, stands upon a solid plinth 15 inches deep, chamfered, from which rise octagonal steps up to the surbase, with mouldings and weathering, &c. returning to a square on plan, the face of which is enriched with diaper work of ivy and thorn leaves, diagonally and alter-nately arranged. Above this, there is a moulded base, from which rise buttresses, surmounted by gablets, crocketed with the leaves of the ivy, thorn, maple, vine, and columbine, having finials of the same character, the terminations of which have sculptured heads. This forms the first stage of the monument. The second stage is formed of four arches, supported THE monument which has just been erected in the needs. Inis forms the area stage of the monument. The second stage is formed of four arches, supported on attached shafts, with carved foliated capitals, having at the angles buttresses, panelled and terminated in like manner with those of the lower stage. The arches are filled in with cinque and trefoil tracery, the spandrils of the latter being piered: those of the former are filled in with foliage, the cusp terminutions being carved. The hollow mouldings are enriched with an entwining rose ornament. The gables of this stage, above the arches, are filled in with tracery, and the mouldings are enriched with an entwined ornathe mouldings are enriched with an entwined orna-ment of the ivy, surmounted hy crockets and finishs of columbine, thorn, &c. Under these gables and arches are deeply-recessed panels, upon which are cupraven inscriptions to the memory of two of the family deceased, in illuminated characters of the fourteenth century. At the springing of the gables of the buttresses are sculptured groups of angels emerging from clouds, the crockets, &c. being studied from nature [oliage. Above the gables of this stars. concepts from natural foliage. Above the gables of this stage from natural foliage. Above the gables of this stage springs the spire, in which are introduced spire-lights, with gables, filled in with tracery of delicate arrange-ment; the carving composed of convolvalus, ivy, &c., having gables, pinnacles, and angles of the spire crocketed, and terminated with finials. The finial of the spire, interminated with finials. the spire is surmounted by an ornamental gilt cross. The monument is enclosed by wronght-iron railing of Mediæval character, manufactured by Messrs. Hart and Son, of London, which is of a dark ultramarine

SEPT. 19, 1857.

THE WELLINGTON MONUMENT.

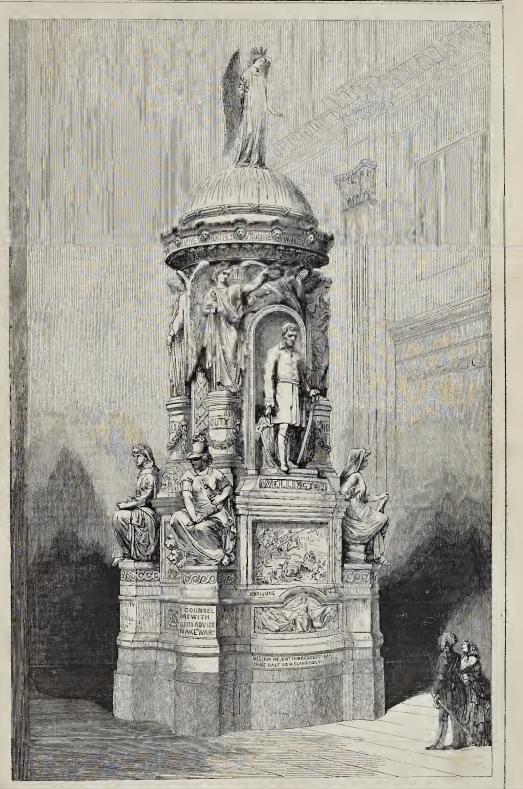

THE author of the design which we cugrave, Mr. John Thomas, claims to have prepared it in strict accordance with the plans, clevations, and perspective views, of the locality of the proposed monument, together with the printed conditions issued by the Chief Commissioner of Works. Not foreseeing that the judges, in giving their decision, would themselves ignore the instructions of the Board of Works, the sculptor studied the position which they had determined upon for the erection of the monument, little thinking they would expressly declare, in making their award, that they had not taken into consideration the all-important question of site. Had all the artists allowed themselves this liberty, their designs would probably have been different in nearly every case, and the author of No. 68 would, in all probability, have taken a different view of his subject, bad he not felt bound to consider it quite as much in an architectural as in a sculptural point of view, in order that his design might harmonise with the edifice, of which it was intended to form a part. We have already expressed at some length the opinion we entertain of this design, and on the present occasion euterian of this design, and on the present occasion will content ourselves with giving some descriptive particulars of it. The base of the monument supports a pedestal, having four alto-reliefs of the principal in-cidents in the life of the warrior and statesman, together with four bas-reliefs heucath. Those in front represent the decisive charge at Waterloo, and Europe sending out messengers of Vietory and Peace, beneath which is inscribed a quotation from the Date's measure learnet at the 10 km Jett's beneath which is inscribed a quotation from tha Duke's memorable despatch of the 19th June, 1815 :---Dake's memorable despatch of the 19th June, 1815:---"Believe me, nothing excepting a battle lost can be half so melaucholy as a battle won." In this, as in every other instance, War is marked as a necessary evil, always to be avoided, when, with-out dishonour, the laws, commerce, and religion can be properly maintained. The panels on the opposite side show the Duke standing forward in the House of Lords, on the 28th May, 1847, and manfully acknowledging that, through conviction, his former opinion upon the corn laws had changed, and manially ecknowledging that, through conviction, his former opinion upon the corn laws had changed, and thereby obtaining a large majority in favour of the measure. In the panel beneath is Britanuia, as Commerce, welcoming the introduction of foreign corn in exchange for her manufactures, with the words, "The profit of the earth is for all." The panels at the side of the pedestal represent the Dake termi-nation bic semanizin in India : and henceth are shown at the side of the preussal represent the bark cerni-nating his campaign in Iudia; a tad heneath are shown the horrors of war. Upon the opposite side, the Dake is seen presiding at Queen Victoria's first council; and beneath are shown the blessings of peace. council; and beneath are shown the blessings of peace. Above each of these subjects are the Duke's arms. The buttresses at the angle of the Duke's character, together with appropriate inscriptions, viz, War,— "By counsel and with good advice make war." (Legislation,—"Be zealous for the laws, and give your lives." Prudence,—"The prudent are crowned with knowledge." Fortitude,—"The integrity of the up-right shall guide them." We now come to the principal feature in the de-sign. The Duke, in a contemplative attitude, is

We now come to the principal feature in the de-sign. The Duke, in a contemplative attitude, is standing in front of a niche; his left arm rests on a sheathed sword, and in his right he holds a seroll. The resson for placing the figure of the Duke in this position was, that had it been placed between the eye and the window, nothing but the outline would have been seen; and the author, therefore, deemed it neces-sary to form a background, which should not deterio-rate from the prominent position of the Duke; indeed, in all eases, the figures have been so managed that they in no way obtrude, or in the slichtest that they in no way obtrude, or in the slightest degree detract from that of the Duke, who stands out as the most prominent object in the design, although each subject may be seen to bear a decided relation to the whole. In a corresponding niche at the back of the design sits a figure of Justice, with her hands the The design sits a figure of Justice, with her hands holding the appropriate emblems, and resting upon the Holy Bihle: beneath is the quotation, "Excente true judgment according to truth." The two sides of this portion of the design are embellished with the eight batons, presented to the Duke by the great potentistes of Europe. Standing on pedestals at the four angles are Victorics; those in front hold wreaths of eak and huvel in the eat of corrunning the bars. of oak and laurel, in the act of crowning the hero; while their wings cover the upper portion of the niches, and form, as it were, a canopy over the Duke. Immediately above these figures comes the cornice, the principal curichment being palm-leaves; and on the fascia, separated by the beads of lions, are in-scrihed the chief battles in which the Dake was victorious. The whole composition is terminated by Scrifted the enter parties in when the back of victorious. The whole composition is terminated by a winged figure of Peace, holding in her hand an olive-branch; whilst her glory is spreading its rays of light over our western hemisphtre,—typical of the Duke having brought peace on the world.

Sept. 19, 1857.]

THE BUILDER.

539

A DESIGN FOR THE WELLINGTON MONUMENT (No. 68, "INTEGRITA") .--- BY MR. JOHN THOMAS.

PROVINCIAL NEWS

Banbary.--The two new corn-exchanges were opened on Thursday in last week. The western por-tion only of the central exchange is yet built: that is complete excepting one window at the west end and the plastering of the interior. Thirly stands had been prepared, and shortly after the opening they were all taken. The Cornhill exchange building is less ad-vanced. The roof is complete only in the centre, leaving a considerable space at either end uncovered, and the flour has yet to be laid.

Christelarch.—A public meeting was held on the 11th instant, as to the erection of a new town-hall here. The report of the committee appointed for that purpose was read, and a plan for a new hall laid hefore the meeting. Resolutions were proposed and agreed to, adopting the plan, and a committee ap-port to cauvass for subscriptions.

Winchester .--- The new market-house here is nearly Winchester.—The new market-house here is nearly completed, and will be opened for public use on the 29th instant. It is a building of the Dorie order, with fluted columns, gateway, and cornices of Bath stone. It has five entrances,—one from the Square, two from Market-street, and two from the High-street. The front facing the High-street is surmounted by a hell two. by a bell tower. Shenstone.-Little Aston Hall, the seat of the

Hon. E. S. Jervis, High Sheriff of Staffordshire, in course of restoration and extension, is now near com-pletion. The architect is Mr. E. J. Psync, of Bir-mingham. The building (au example of the tasteless mingham. The building (an example of the tastcless Jonie of the 1-st century) was originally a parallelo-gram, but in its present restored and greatly ex-tended coulilion forms a centre, with two wings 14 feet in advance of the main portion. The style adopted is that of the fonestral Italian, claborately study of the variation and is Hollington store ched, and the material used is Hollington stone enr (similar to that employed in the Midland Iostitute). The elevation of the ground-floor throughout is rusticated, and the windows are square-headed, with jecting keystones, the quoins and dressings being vernical-du-d. The fittings of the various rooms will be of wainscut, French polished; and the floors will be of oak, with a border of Swiss parqueterie, sup-plied by Messrs. Arrowsnith, of London. All the rooms are heated by the warming apparatus of Mr. J. E. Hodgkin, of Birmingham, the hot air passing 3. D. Holgki, of brinninguan, the not ar passing through perforated hrass graings in the windows. The water for the supply of the establishment is brought from a distance of nearly a mile, being propelled by means of a water-wheel into a cistern on the roof, 135 feet above the level of the spring. The whole of the work has heen executed by Mr. Cresswell of Birwingham of Birmingham. well,

Blackburn-Il a report hy the borongh surveyor on the progress of the main outlet sewer and the works connected therewith, he says, --The progress of the sewerage works will be, for some time to come, very slow, because it is as yet confined to so limited a space; hut so soon as the present contract is com-pleted, we shall be evalued to extend the area of operations, and to embrace some important undrained districts. As the outlet is advaged there will be operations, and to embrace some important unorshice districts. As the outlet is advaaced there will be nothing to prevent the employment of almost any number of hands; so that the sewerage works may really assume such a character as to give reason for the hope that at length the whole borongh will be in-cluded in this very desirable result. Nothing of a cluded in this very desirable result. Nothing of a very extended character can be accomplished before act spring; but, by that time, the works should be in such a position as to provide employment for a large number of men, and to enable the subsidiary mains and branch drains to he extended into the very heart of the borongh. Bradford.-The foundation-stone of the Sunday

adford.and bay Schools proposed to he created in connection with St. Audrew's Church, Horton, near Badlord, bas here Ind. The schools will give accommodation for 500 children and infants. There will he three separate schools, with a class-room attached to cach, and so arranged that the three may he made into ouc large sebool-room. There will also be two residences included in the group of buildings, one for the schoolmaster and the other for the schoolmistress. The style of the architecture will correspond with that of the adjoining church, which is the Decorated of about the time of Edward JHI. The architects are Mossis. Mallisson and Healey, of Bradiori. The cost of the buildings, including the site, will be about 8,6000. The whole some required has been obtained within 3004. Seven geutlemen subscribed 1004. each towards the object.

Leeds.—It is stated in the *Intelligencer* that the municipal anthorities have resolved not to make com-mon sewers in streets which have them not already, two-thirds of the owners of the adjoining property The works of the adjoining property decorations, will amount to about 0,0007. All defines, signs have heen prepared by Mr. R. W. Moore, of make the head he franch drains from their respective houses, church, which will accommodate six or seven hua. It is naturally feared this action of the voluntary principle will be rare, and most so in densely-populated and homely streets, where drainage is most

needed. There are numberless streets, remarks the puper alluded to, old enough to have been made irbitory to the severage rate. Irom the time of its first imposition, which are still mutraued, and which must create so may a day, if the individue of the work by two-thirds of the owners is to be waited for. It ought to be remembered that the health of the whole town is in peril so long as large and populous districts are left unblained, to hread free single and population epidemics; and that the work which has already been done will fail far short of predneuge the samtary effects hoped for from it till it has been carried to complelustcad of waiting in the way resolved on, sewers tion. ought to be put in, and the owners compelled by law to drain their houses into them, —especially such bons s as those complained of.

Glasgow .- Messrs. Charles Tennant and Co. of St Bilox, are shout to build a new school-house near their works. The style of the building is to be "of a mixed character of Greecian and Roman," and the situation is to be on the south side of Low Garngad. road, on ground belonging to the firm. The principal entrance is from Garngad-road, with vestibule and lobby, the lobby sereened by gl-ss-door and side-lights. On the east is the initiatory school room; on the west, the writing school-room; on the south, the elementary school-room, with conveciences, and playgrounds for boys and girls, s-parated by a wall. The upper flat, towards the north, is to be occupied as teachers' dwell-ing-house, &c. On the sonth is a hall intended for ing-house, &r. On the sonth is a hall intended for instructing females in various branches befitting the sex. There will be accommodation for hetween 400 and 500 scholars.

CHURCH-BUILDING NEWS

CHURCH BUILDING NEWS, Stoke—The new Roman Catholic "Church of Our Lady of Angels and St. Peter," which has heen built within the last fourteen months, on Cliff Bank, over-looking Stoke, was opened on the Sth inst, with the nsual ceremonics and festival observances of the Romish Church. The pile altogether consists of the church, presbytery, and convent—the laster, how-ever, being as yet little more than a guest homse— and one half of the cloister of the intended convent. At present the presbytery is the only past of the establishment which may be said to he in a commlete establishment which may be said to he in a com state, so far as the architecture is concerned; hving been commenced subsequently to the other buildings, it will not be ready for occupation for some time. The convent or cloisters are already occupied by nuns, or Sisters of Mercy, from the establishment by nuise, of Sisters of Mercy, from the establishment at Stone, from which the present institution is an affiliation. The church is in the form of a parallelo-gram, 80 feet by 50 internally, and consists of nave, 28 feet wide, and two aisles, of 11 feet each, sepa-rated by an arcade of circular stone piers and simply moulded arches. The entrance porch is at the south-west angle, behind which is the baptisty, with entrance out of the north side. Above the porch is the entrance chamber, communicating with the choir gallery for the community, access to which is obtained by a staircase. At the west end of the north aisle, in connection with and forming a part of convent on the same level, is the chapter-room, with an arched roof, and lighted hy traceried win-dows, three on each side. The church is divided into dows, three on each side. The church is divided into six hays, and has a derestory of three-light windows with double sequent arches and tracery. A four-light window with tracing occupies the west end. The south aisle and haptistry have three-light windows of similar form to those in the elevestory. The north aisle ahuts on the cloister, and is without windows. The roof of the nave is arched and divided into panels by wood mouldings. Moulded and arched principals resting on triple shafts of stone with carved capitals and corhels separate cach hay. The aisle roofs are also divided into panels, hut are without principals. The baptistry is floored with Minton's cucastic tites, and sep unted from the nave and south aisle by a light and separated from the nave and south aisle hy a light and seep inited from the nave and south asile hy a light screen of wrought irou. It contains a font of Caen stone, resting on marble shafts, and has a sacrarium attached, which stands on a quatrefoil shaft of red Devosshire mirble. Externally the edifice is built with red and wellow hricks in stripes, five courses of yellow ur buff bricks to one of red. The windows and athen conductance for each of the difference of the stripes. yellow or buff bricks to one of red. The windows and other architectural features are of Hollington stone. Surmounting the roof of the convent there is a erocketted spire. The cloisters have ornamosted roofs, the spandrils of the arched principals being filled in with tracery, and the floors are paved with Minton's encuestic tiles. The architests are Messes. J. and C. Hansone, of Chiton, and the builder is Mr. James Bryan, of Stoke. The total cost of the entire structure colleding area of the internal fittings and structure, excluding many of the internal fittings and decorations, will amount to about 6,000/. Mr. Jeffries,

Chapel of Chester Catbedral was noticed. Attention has since then been drawn to two other massive bosses Ins since then been drawn to two other messive bosses in the same chapel, and various opinious have been hexarded as to their true signification. Of one, that in the centre, it was thoughl, there could be no doubt; for it evidently represented the "Madonna and Child," while that at the extreme cast was, as previously stuted, a symbolic readering of the Holy Trinity, setting forth more particularly the "Cruci-fixion of Obrist." The third, or western boss, was a diograminally pronounced to be the "Murder of Thomas a Becket 1" and it was so described, the other day, to an antiquare, who, in the following communication shorthy a bitwart what where the solution between the solution of the inst noss in the Lady Chapel of the cathedral as the "Morder of Thomus a Skecket." He cousiders that the three hoses describe the three most interesting events in our Saviour's life, and that this third hoss is "The Ascension", that the other two represent, firstly, "The Crucifixion—the cross heing supported by the Father is and, secondly, "The Virgin nursing the Holy Child."

Liverpool .- The new synagogue erected in Hope, place, was consecrated on the 9th inst. Newmarket.-The committee appointed at a general

meeting recently held at Newmarket, to consider as to a memorial to the late Dake of Rutland, have agreed that the scheme of a parsonage house for the poorly-eadowed living of All Saints, Newmarket, where there is no residence for the incumhent, with a commemo rative inscription in honour of the late duke, should stand aloue in the first class, as the most cligible of all the plans proposed. The other forms of memorial suggested were-1. A memorial window. 2. A statue 3. Alushouses. 4. Aa addition to the funds of Ad-lenbroke's Hospital, to be called "The Newmarket 3 Memorial Fund.

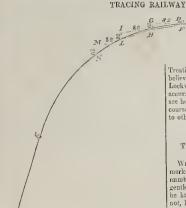

Memoral rund." Chorlton-upon-Medlock.—The first stone of a new Presbyteriau chaptel was laid in Brunswick-street, Coorlton-upon Medlock, on the 7th list, the old place Corrolation in Remote, of the (in first, the dup page of worship in Lloyd-street being inconveniently situated, and a more commodious structure required. The new chapel will be in the form of the Latia cross, with tower and spire 163 fect bigh. The principal arm of the cross will be for the chapel, and the tran-septs for schools, &c. The style is to be the Decorated Cubic. The advand for the trut will be in Removaid street. thic. The chapel front will be in Brunswick-street, and will consist of a centre gable, flauked by the tower oa one side, and the gallery staircase and porch on the other. The centre gable will contain a fourlight window, with tracery, and a wheel window above. The chapel will be five bays ia length, divided by two-light windows and buttresses. There will be entrances from Brunswick-street and Rumford-street. The inside dimensions of the chapel will be 75 feet by 46 feet, and 23 feet to the springing of the roof The roof timbers will be visible. There will be gal ging of the roof. The root timeers will be visible. There will be gal-lerics round the sides and one end. The body will sent 520 persons, and the galleries 380. There will be school-rooms, vestry, &c. cellarage, and a play-ground. The whole will appear as one building exground: The which will appear as one outlong to ternally. The buildings will be faced with parpoints and stone dressings. Mr. Mark Foggett, of Man-chester, has contracted to cretch the chapel portion for 4,469/. The design is by Messrs, Clegg and Knowles, of Maacbester. Alston.-The opening of a new Roman Catholic

chapel at Alston, near Preston, took place on the 8th inst. It is dedicated to "our Lady and St. Michael." It is of plain construction. The sile of its architec-ture is Early English, and it will seet 600 or 700 persons. Its outire length is S8 feet, wildt 35 feet. The chancel window has four lights, and is filled with green cathedral glass. A gallery extends across the west end of the church, and the west gable is surmounted by a hell-cote. The roof is high pitched the principals and other timber work composing it beiug stained. being stained. The entire structure is built of stone from the Longridge quarries. Mr. John Todd and Nor. Thomas Turner, Preston, wore the contractors, the former for the masonry, the latter for the joiners' work. The cost of the building is stated to be from 1,3007. to 1 5007.

Slaithwaite .- A meeting of the ratopayers of the for the purpose of Slaibwark-course Lingurds use been held for the purpose of considering and accepting an offer by the Earl of Dartmouth to enlarge, rebuild, and to enlarge, rebuild, and adorn the chancel of the church, where the accommodation around the communion-table has long been found inconveniently small. The chairman haid before found inconveniently small. The ehairman laid before the meeting the plans and specifications which had been approved by the earl and the archidencon. The estimated cost was about 150*l*, and it would he de-frayed entirely by his lordship, who possesses the rentorial or great tithes of the new parish. The de-signs have heen prepared by Mr. R. W. Moore, of Leeds. The offer was manimously accepted.

Treatise on Railway Curves," and the plan is ove, I believe, pretty generally adopted. Perhaps Mr. Lockwood hav found his method combines greater accuracy with its certainly greater labate. I do not see how this can be, hut it it is so, that woold of course he a sufficient reason for its use, in preference to other and more expeditions methods. T. W. P. ISAAC

TIMBER SCAFFOLDING AT THE NEW PALACE AT WESTMINSTER.

PALACE AT WESTMINSTER. WITH your permission, I wish to make two re-marks on the letter from Mr. Grissell, in your last number. *First*, that having had the pleasure of that gentleman's friutdship for many years, I an sure that he knows me well clough, to he sure that I would not, knowingly, ignore the merits of any one, how-ever humhle in position; and, secondly, I wish to remind Mr. Grissell and your renders, that my paper referred nearly EXCLUSIVELY to the peculiar seaf-folding with steam-power employed for the three great towers of the building, and the design and ap-plication of this seaffolding, at any rate (as I fancied Mr. Grissell knew) ennanted entirely from the ar-my father's designs for it were most shly worked out and arried into effect by his assistants, Mr. Meeson and Mr. Quarm. and Mr. Quarm. The ordinary

and energied into effect by his assistants, Mr. Mecson and Mr. Quaru. The o'dinary framed timber-scafiolding used throughout the rest of the huilding, was only alluded to very hriefly by ne; and not being ahle of my own knowledge to speak positively, I avid I BLILEVED that the first introduction of this system was at King Edward's-school, at Birmingham, erceted under my tather's direction, in 1834, where I an informed it was carcied out hy the courtactors for the mason's work, under the architect's elerk of works, Mr. Cow-lishaw. This occurred several years before the cree-tion of the Reform Cluh, and the Nelson column; so o that the idea could hardly have been derived from these works. I had certaivly never heard of Mr. Tomkinson's use of a like system, in his stone quar-ries, mentioned hy Mr. Grissell, and the date of this gentleman's use of such semificily in our meating my paper on this subject, was not at all to settle the date of the first use of whole timber-framed scafid-ing, in jue of the old system of poles and ropes, though I was most auxious not to misstate this fact, but to draw attention to the novel application of it to the ascending scafids of the towers of the New the ascending scaffolds of the towers of the New Palace, at Westmiuster, where its efficiency has heeu made so much more conspicuous than hefore by the combination with it of steam power.

CHARLES BARRY, JUN

staging, machinery, and steam-power, on the late John D y's plan, adapted by Mr. Turner, sou-in-law to Mr. Tomkinson.

to Mr. Tomkinson. Having had sonething to do with inventing, im-proving, and adapting during my life, in the various branches of my profession, I have long given up any idea of claiming to be original, or the first to do any-thing; and I feel sure that if Mr. Chailes Barry will mquire farther, when preparing his uext pper, which I turts will he soon, he will find that, however new to himself, some old fellow, de d and buried many years, if not centuries, had stolen his ideas. If he escape this misery, he will be far more forta-nate than your humble servant. ROMETE RAVELSON.

ROBERT RAWLINSON.

ROBERT RAWLINSON. P.S. Yon have very properly warned Government, calling upon them to give attentiou to sanitary arrangements for the British army in India. A sanitary commission, with an army actually in the field, was prob hly something new (to gah, mind, I do not claim it to he so); but most ertainly the knowledge frequently said to he new on sanitary subjects is not new. There are the works hy Sir John Pringle on "Army Discasse," Jones Liud, M.D. on the "Health of Seamen," and Dr. Mead on "Pestilential Contagion." These works may be studied with singular advantage, and a manual of instructions for army and anay may he drawn up from them for general use. The greatest men (such as Sir Ch rikes Barry) can well afford to give up the chain of incention: phain, simple, common seuse and economical adaptation, is the greatest possible invention.—R. R.

INDIAN ART IN THE WESTERN WORLD.

INDIAN ART IN THE WESTERN WORLD. WE may look for an addition to our knowledge of the great Indian cites in the west. M. César Daly, the editor of the *Revue Générale de l'Architectare*, to which excellent publication we have often referred, has just now returned to Paris, after a trip of nearly three years' length. During this time he has made a special study of ancient Indian art in the Western world. He has visited America from Canada to Panama, wherever the disorders attendant on civi war did not repulse him. In Niearagu, the strongle was even favourable to his designs, for seventeen Yankees, desirous of visiting the wilds end mountains of Seguvia in search of gold, on learning his inten-tion to join the party, chose him as captain, and gwe him considerable influence over the direction of their route; and as he had nothing to do with gold mioes, his game being routs and old mounments, he had the ad-vantage of a story gesort, and penetrated into wilds game being ruins and old monuments, he had the ad-vantage of a strong cesort, and penetrated into wilds that the Spaniards did not occupy. "But my most productive trip," he writes us, "was in Guatemda. I have measured the Acropolises, if I may so call them, with their temples, palaces, seminaries, and fortifica-tions, of three great Indian eities; and I have heen able to collect very interesting data shout their painted architecture, sculpture, and other matters, which I intend to publish as soon as possible." Knowing well M. Daly's qualifications for the task, we may safely predicate valuable results.

LONDON ORGANS.

As yon have lately inserted several communica-tions on London organs and their builders, and as the subject seems to have excited a measure of attention on the part of some of your correspondents, may I he accordid space for a brief memoir upon matters con-nected with our late discussion.

Referring then, the second second second second space for a brief memory upon matters con-nected with our late discussion. Referring then, to 'W, Vs'' letter, the face instru-ment, at Saitalfields church, was originally built, and by Schnidt, but by Bridge, Byfeldt, and Jordan, in 1730, for 6007.; a sun, even at that time, considered very little for an organ of such size and power. By-foil, Bridge, and Jordan were all able artificers, and built, conjointly, several face organs. Of course, the own point to the organ in St. Magnus, as a fine spe-erimen by Jordan, while at St. Bartholomew's the Grant-a structure greatly admired and well known for its massive Normun architecture—there is a cu-rons, and far from despicable specimen, by Byfeld and Harris. Of this, perhaps, the worst fnature is the case, of very poor design. The same remarks will excelly apply to their organ at St. Alhan's, Wood-street, both works being ascribed to ahout the same period, viz. 1720-3. Little-known organs, by Schnidd, existat St. Catherine CreeChurch, and St. James's Gar-lick, Hithe; the latter, truly grand and hole in appear-ing Aldermany, was repired, as was also the organ-quite a model of an odd-fashionel exthering instrument, except that the echor (organ) is not in front—built by England, Green, and Russell, late in

the last, or early in the present century. Its excelthe raw, or carry in the present century. Its excel-lent position on a screen, two or three bays anstward of the west wall, contributes greatly to improve its tone; in addition to which, the admirable acoustic properties of the church impart a resonance greatly conducive to nusical effect. The case, though not de-yold of clearance is heavily in more than a static the the oronducive to nuscel effect. The case, though not de-void of elegance, is hardly in accordance with the present improved standard of taste; but it is inte-resting, as showing the design of the period. The organ at St. Clement's Danes,* besides new

The organ at St. Clement's Danes," besides new keys, pedals, and other mechanical details, will be much improved by a new swell to tenor C, with 10 stops, including a double diapason and contra fagotto or donhe read. This has been undertaken by Mr. Robson. That gentleman also rehuilt Schmidd's fine organ, at the Temple Church, some time ago; substi-tuting new mechanism for the old, hut using and re-working all those invaluable pipes which charmed in their earlier dows the ever of the gradest compissence Working an those invariance pipes where charmed in their califier days the cars of the greatest connoiseurs, and which continue to do so up to the present time. The reference to the "almost hullowed" inscrip-tion in St. Paul's cathedral, to Wren's memory, "Si

tion in SI. Faul's cathedral, to Wren's memory. "As monumentum," & c., reminds me that, to general readers, it is hardly known to be from the pen of the architect's son, Christopher. This would seem to afford an additional reason, were one wanting, why its remoral should, if possible, have been avoided; and, at all events, tempts one to hope for the existence of that good feeling while would, certainly, ensure its prompt restoration. A CHURCHMAN.

P.S .- You have occasionally devoted some space to a record of epitaphs, remarkable either for singularity of thought or diction. The following, to the memory

at Though like an organ now in ruins laid, Its stops disorder'd and its frame decay'd: This instrument, ere loog, new tun'd, shall raise To God, its maker, noles of endless praise."

A CENTRAL "PLACE" IN LONDON,

UNITING TRAFALGAR-SQUARE WITH THE BOROUGH, ACROSS THE RIVER.

ACROSS THE RIVER. SEVERAL great questions on which the future development of London, as a city, is concerned, are now pending. May I claim your indulgence for the insertion of the following idea? The little "village of Charing," as it was in Eliza-theth's time, is now topographically the centre of London. Let us turn to the map. Trafalgar-square, we see, is on the north hank of the Thannes, and on the outside of the hend that is made (in the widest part of the river) about Hungerford Market. The opposite hank, therefore, at the other end of Hunger-ford-hridge, forms the *inside* of this hend. Let us cousider, now, the space at this latter point

Let us coulder, now, the space at this latter point comprised within this bend, and by the following houndaries:—On the north, by the river hetween Westminster and Waterloo hridges; on the south, by the Sonth-Western Railway; and on the cast and west, by the Waterloo and Westminster hridge roads. Keeping the eye on the mup, it is to be remarked that all the main hridges of London converge to, and radiate from, this point, making extended transit casy, and rendering this spoint, in this respect, more the centre of London than Charing-cross itself, hesides its direct necessibility by ways of the spoint of the spoint of the spoint three the spoint of the spoi

centre of London than Charing-cross itself, hesides its direet necessibility by water. The space thus indicated is at present chiefly occu-pied by tenements of a poor description and dilapidated houses, and my idea is, that it might he well for Government to possess itself at once of this area, or the major portion of it, with a view to the future development of London. This area might be terraced high above the triver a Wording whore or an orange. high above the river, affording wharfs and ware-houses heneath, and a noble river-front for such open spaces or public edifices as might hereafter be deter-mined on. This area, which affords the finest view spaces of purposed of the strength of the space of the sp square; for the present, only hy throwing down the houses in Craven and Nortbumherlaud streets, in the houses in Craven and Nortbumherlaud streets, in the Strand, hut with an ultimate view to the removal of Northumherland House, so as to extend the open space and vista from Trafalgar square down to the river side, and then across a bridge of great width, to Interstee, and then across a brage of great which, so the area show emeritorical on the south side of the river. Sir Rohert Peel is said to have characterised Trafagar-aguare as the nohest site in Europe! What would it be then? Could such a scheme he realised, it is the theory of the source of t is it too much to say that the result might he not only

Is it too much to say that the result might he not only without equal, but without parollel? F Iu the mind's eye the whole area comprising the spaces on either side of the river, and the connecting expanse of hridge hetween, must he viewed as one great space, available not only for some of the public editions now in contemposition, but for mellowing the difices now in contemplation, but for relieving the

* The interior of this church, particularly in its presen ate, is well worthy of notice, as a specimen of its archi-ct's abilities.

traffic of London just at the point most required; and also as connecting substantially the two sides of the river into one city (for which the time may he thought to be come), and as affording a grand centre and lungs to London.

In an architectural point of view, I need not dilate on the score the development of such a scheme would afford to British genius. In a more general public view I heliceve there is still more to be said. The above idea is far from a new one with me; and if you think my views worthy of consideration in

your valuable journal, 1 shall be ready to afford some details to the above sketch. EPSILON,

THE BROTHERTON MEMORIAL.

SIR .- The decision that the committee bave arrived at seems to me unjust towards those compelitors who strove to comply with the instructions fur-nished by the committee in making their designs so as to come within the son named. This is another instance of a picture design gaining the first prize, and is a violation on the part of the committee, judges, and the competitor. We must remember it judges, and the competitor. We must remember it is not a monument to be placed in a cathedral or church, but in the open ground of the cemetery. How long will it he hefore the angelic figures cast their hurden on the hosom of our mother earth ? Of what Intervent of the massive canopy resting on the hair of theheads of the eclestial figures, eight in number, each looking as if the book that is placed in its hands was the latest illustrated calition of Fox's Book of Martyrs? The whole of whom have turned their backs ou the Pagan work of which have tabled there have so in the rangen art of architecture to be treated in this style, to see these representations of celestial beings stuck up on the author's first floor (as it is called in the descripthe autor's first hoof (as it is cance in the descrip-tion which is in the gold frame) as so many dead shores. Really this is Paganism with a vengeance—a poor copyism from the heathen days of the Greeks. What would the 60,000 Sabath-school (cachers and children mentioned on the monument of our Queen in the Park, outside the Exhibition-room window children mentiones on the Exhibition-room window in the Park, outside the Exhibition-room window (Feel Park), think, if they saw their earthly Queen and the royal princesses her daughters supporting on their heads, with their slender uceks, the exhin-guisher of All Saints' Church, Portland-place,

I heg to suggest that clustered shafts, with foliated s, should take their place, and that a statue of the Mr. Brotherton he placed in the centre; it will then look like a memorial of a citizen employer, and a representative of his nation, and not of Greece. It will not take any glory from the committee ; they will see that I have not disturbed the twenty canopied niches, that I have not disturbed the twenty canopied niches, with the full-length figures, which the author has placed on his front ground floor. If they can forego these figures, the expense might he added to the sum saved hy doing away with those on the first floor, and might he given to a respectable sculptor for the Brotherton statue under the canopy.

AN EXHIBITION WANDERER IN SALFORD AND MANCHESTER.

HOUSES FOR THE WORKING CLASSES. WHEN travelling in the north of Ireland lately, I

had an opportunity of inspecting some houses for the working classes, which have been recently crected in Belfast, and whose plan, novel as it is, may not be uninteresting at the present time to many of your unitcressing at the present time to many of your readers, who are turning their attention to this sub-ject. The whole "land" of which I speak is 75 fect long by 23 wide, and consists of three stories. Through the centre of the building runs a hall, 7 fect wide, leading to the common staircase. The ground flat is divided into six tenements, one entering from either side of the grand hall, and the other four form entres sale of the grant has, and the other four From two smaller halls opening on the street, one at each extremity of the building. It is the plan of the two npper flats, however, that is particularly worthy of notice. Each of these contains six houses, all of which uotice. Each of these contains six houses, all of which open on a halcony or corridor, of 6 feet in hreadth, running the whole length of the huilding. The cor-ridors project beyond the side wall, and thus do not cueroach on the space olloted to apartments, and they are protected by a railing extending from floor to eciling. At both ends of the corridors there are stone "jaw-boxes" or "sinks," and fresh water is supplied at the same places from cisterns on the npper story. Two water-closets, one appropriated to the males, and

SEPT. 19, 1857.

morality. The proprietor of this truly "model" huilding, Dr. Bryce (who is his own architect), was led by his professional duties to consider carefully the subject of dwellings for the working classes, and the result of his reflections has been the huilding described. In a conversation which I had with him when in Belfast, he expressed his thorough conviction that even narrow streets were far less detrimental to the even mirrow streets were far less detrimental to the health of the community than the system of sub-letting self-contained houses, so generally adopted in Bellast, or the plan of crowding a dozen or more families into one ill-ventilated common stair, with which we in Edinhurgh and Glasgow are but too familiar. Vat either of these objectionable plans has hither to heen of necessity adopted by boose proprietors in large towns, who, while they are obliged to comply with the statute breadth of streets (30 feet), must at the same time attend to their own interest. I should be a sub-the second of the second of the second of the second statute breadth these "(madel 2") houses are the same time attend to their own interest. I should perhaps meution that these "model" houses are eagerly run after hy the class for whom they are intended.

MANAGEMENT OF SCULPTURE COMPETITIONS.

THERE does not appear to me to be the slightest neces sity for the adoption of any secrecy in competitions, and the use of a "motto" I believe is all fudge, and useless, unless to enable the judges to act unfairly. and the use of a "motto" I believe is all fudge, and nucless, unless to enable the judges to act unfairly. The name of every competitor of any standing is hown, diguise it how he may by a "motto?" I believe every artist should send his name, and it should be affixed to his model or drawing; then, if dishonesty was practised, the read to its detection would be open, and not sbronded by the hugher of "moto:" no doubt could then exist that the man, and not the work, was chosen; besides, Englishmen are fond of boasting of their open dealing. Why then this system of "motoes?" It is unjust towards the unsuccessful man; for however good his work may he, or however much it may be admired, he has not even the gradification of having his name con-nected with it, but a stupid "motto" is affixed, as though he feared to tell the public it was his nome publiely exhibited, giving him an undue advantage over his opponentain respect to public notriely. When a competition is first started let a number of gentlemen he named, say twelve; let these be asked, individually, to examine the works dwing their exhi-hition (but not called together); when the time arrives

Introductory to establish the works of the interaction hitton (but not called together), when the time arrives for deciding, let their names he placed together, and the first six drawn he the judges to decide—those chosen to draw one from the rejected six, to act as chairrans in this means no one could tell if he would he called upon to act. I should allow the competitors to he present, if they wished it, while the drawing was going on.

Those named should not be more acquainted with statutes then with statues, as were those chosen for the Wellington competition. Men who study the making of laws to govern

great nation, must of necessity have their minds fully occupied ; and, however powerful may he their hrain, I doubt much if sufficient is left unoccupied to enable its possessor to study fine arts; if there is, the study of law-making is much easier than the study of

sculpture. At all times the rules made at starting should be athered to, and the judges hound to observe them as strictly as the competitors, and any departure on their part should annul their decision. Ou any one of their numher retiring, his place should he filled up from the undrawn names.

BUILDERS' BENEVOLENT INSTITUTION.

A METRIC of the friends and supporters of this useful charity was held recently at the ollices of the society Southampton-street, Bloomsbury, for the purpose of taking into consideration the subject of another election of pensioners, Mr. George Bird presided. The secretary Mr. A. G. Harris, having read the minntes, reported that in consequence of the decrease of the annual subscriptions, and the donations received at the last festival, the funds were in such a state that the advantum of mensioners, which generally took place the election of pensioners, which generally took place in November, would have to be posiponed. Mr. George Bird (the treasurer), said that the statement jaw-boxes" or "sibks," and fresh water is supplied at the same places from cisterns on the npper story. Two water-closets, one appropriated to the males, and the other to the fen.ales, are attached to each story, and receptaeles for ashes are provided, hy which the refuse is erried down to the back yard, where easy results is erried down to the back yard, where easy could not take place more than he did, but the fact access is obtained hy the police carts. Each therment owing to the dath of some of their most liberal could are tay and are let at 1s. 6d. or 2s. per week. Such are the main features of the plan, which seems to me a cast improvement on the Seoth "fat." endeavours until they had placed the charity in such system; for it will at once he seen how much is gained by it in ventilation, cleanliness, comfort, and dinner, under the presidency of Alderman Rose, some of the large and influential huilders, who had hitherto refrained from coming anongst them, would become stewards, and lend their aid in the carrying out of so good a work. Under the circumstances, he felt sure that those gentlemen who had hitherto so liberally aided them, both by their presence and would again lend that aid and assistance. A support. After some remarks from Mr. Thomas Cozens, Mr. George Gray. son, Mr. J. Newsom, jun., Mr. R. Hend, Mr. J. Williams, Mr. J. Davis, and Mr. C. Fish, the minutes were confirmed, and the meeting separated.

LITTLE SNORING CHURCH

In your report of the meeting of the Archreological Association, at Nowich, you have inserted an account of the visit to Little Snoring Church, reporting, also, my remarks thereon; hut as those remarks, by some my remarks different; the as mose remarks, by some accident, are not rightly slated. I venture to correct this without delay. Little Snoring Church was one of the most remarkable visited during the Cougres, as grouped with it is a circular tower, the remains of an earlier church.

The church itself coosisis of a pave aod an Early English chaucel, formerly lighted by a triplet window, one having been destroyed to admit of the narrowing othe normal great activity of the anarowing of the chancel. The nave was originally Norman rather early in the style: to the north is an arched doorway, and to the south, immediately oppo-site, is a transition Norman doorway, the inner columns supporting a circular arch, the onter a site, is a transition Norman doorway, the inner columns supporting a circular arch, the onter a stilled pointed one. This is the first example I have seen of such an arrangement, and as a skilful combi-aation of the circular and pointed arch, it certainly deserves much praise. I should mention, that al-though it is of transitional character, the details are almost universally early Eoglish.

This doorway is upproached by a later porch. The circular tower stauds within a few fect of the The circular tower stands within a tew rect of the south wall of the church, towards the western end, it is carly Norman in character, and contains several of the recesses of the original windows. On the western side is an areb, very carly in date, proving, together with the toothed wall on the north and the the the torus are aviorable, the western sonth, that this tower was originally the western tower of the church

tower of the church. It appears, therefore, that the first church proba-bly fell into decay, but that, previous to its removal, another church was crected to the north of the earlier : the singularity in this case, however, is the little ad-vance in the style between the first and later church, which would seem to imply that the Norman style extended mere a much house vacial there is no such schede over a much logar period that is generally supposed, and that it commenced many years before the cooquest. I beg to apologise for troubling you with these remarks, but I thought so important at nn instance, as that of Little Sooring Church is of the probable prevalence of the Norman style in Saxoo times, should not be entirely overlooked by you. CHARLES E. DAVIS.

THE DESIGN FOR LONDONDERRY BRIDGE.

Sin,-The particulars of Mr. Barlow's design for this bridge are at last, before the public; and as an architect who considers bridge construction within his province, I canoot think the design possesses sufficient merit to warrant its adoption in preference to those selected in the competition.

those selected in the competition. The design consists of a suspension-bridge crossing the river in two spans—the chains supporting four deep lattice girders, which are stated to be strong enough to carry their own weight for the span of 451 feet.

I should he glad to know how the contingency of one span heing loaded, and the other at the same time nuloaded, is provided for ? Of course the chains cannot be fixed to the central

(at the height of about 120 feet above the tion). It is also evideot that the chains canfoundation). foundation). It is also evideot that the chains can-not be allowed to move freely over the towers as in ordinary suspension bridges, bocause this would lift the deep girders of the unloaded side, and destroy the continuity of the railway. The npward tendeury of the chains of the unloaded span nunst, then, he resisted by the girders. These girders are strong enough to carry their own weight of 150 tons each.

veight of 150 tons each.

the chains from variations of temperature, which will be at least nine inches in each bay, would be sufficient to ensure their destruction, for these girders must be find immunolity in the sufficient temperature of the sufficient temperature of the sufficient temperature the sufficient temperature of the sufficient temperature of the sufficient purchased by Liverpool representatives or agents. fixed immovably in their seats, and are attached to the chaios throughont their length by the suspending-rods.

THE BUILDER.

ing-rods. I can attach no importance to the experiments on the model, 13 feet 6 inches in length, of a bridge of oue span only—such experiments beiog noto-riously failacions. Posr.

RUINOUS BUILDINGS IN THE CITY

BUINOUS BUILDINGS IN THE CITY.
Twilling Act.—At the Mawion-house, on Tuesday last, Thomas Connell was summaned for nucle haring observed by the second state of the act, by remedying the diagrams observed by the second carbon of the act, by remedying the diagrams of the act, by remedying the diagrams of the act, by remedying the diagrams of the act of

shie to pay anything, and the gentiemen may do as day, like. Aldernan Hale then, in accordance with the provisions of the Act, issued orders that the expanse incurred by the Act, issued orders that the expansion of the the deposition of Sawers, amounting to 22, 23 should be pair minimum of the word hay allowed by the Act for the performance of the word hay allowed by the gerons condition of the premises were not remedied, the commissioners should forthwith take the matter into their own hands. Several othor cases were disposed of in a similar manner.

AMERICAN EXHIBITION OF BRITISH ART

A GOODLY collection of 168 oil pictures, and 178 water-colours, has been maile, and will shortly be hibited. Both lists contain some excellent speciio newhilited. Both lists cont in some exceedence will, mens of the modern art of Great Britain, and will, mens of the modern art of Great Britain, and will, have no doubt, he appreciated. The exhibition will be open in New York during the months of October and November, and may afterwards he displayed in Philadelphia and other citics, as circumstances shall suggest.

Is some respects the present time would not have been selected as particularly cligible for the commence-ment of such an undertaking; but the obstacles did not seem to the projectors, on deliberate reflection, as of sufficient importance to justify the postpoorement of the nodertaking. It is deemed far more essential to lose no time in establishing relations between the British artist on the one hand, and his brother artist nod the great public of America on the other. The projectors properly conceive that the time is fully arrived when the kindred intellect of the two constries should be interchanged in other forms he-sides those of literature. The numes of Longfollow, some respects the present time would not have

sides those of literature. The names of Longfellow sides those of interature. The names of Longfellow, Bryant, and Prescoit, are as familiar in the Old country as those of Tennyson, the Brownings, and Macaulay, in the New; and the projectors carnesity hope that if they succeed in rendering well known to Americans the best names in King British Art, they shall be no less paviog the way to the knowledge of American Art in England.

American Art to England. It is understood that, in the event of a money-success, the profits will be applied to the promotion of a knowledge of British Art in America.

NOTES UPON IRON.

THE iron trade has more than maintaiced its last the iron true as more than maintaiced its last week's position. Speaking generally, here are more orders on the hnoks now than there were then; and for sheets, the present surpasses almost every known period in the extent of the demand. On the Wolver-bampton 'change, on Wednesday, orders for this description more software on two commissions to the hampton 'change, on Wednesday, orders for this description were refused on two accounts, first, heaccorption were reduced on two accounts, may, no-cense the orders now on hand were sufficient to keep the sheet mills employed to a period beyond that stipulated by the customers; and next, because the prices offered would not justify makers in keeping back the orders hefore accepted. The orders appear to be more generally distributed this than they were het work these hence nowe genera on hand own for wreight of 150 tons each. The weight of 150 tons each. The weight of these ginders is, however, samported by the chain; and we have, therefore, for samported bithe load of one span, the strength of the two girders and the strength of the two girders is the weight span reising the opward tendency of the chains of that span—total strength, 150 tons by 4, or 600 those stating the weight to be supported at only two totons taking the weight to be supported at only two totons per lineal foot for hoth road and railway, the semough to answer their purpose, the rise and fsil of

Pigs are easier than they were last week, but they will not remain so long, as the subsidence of the they will not remain so long, as the subsidence of the sultry weather will occasion a much larger demand for pig iron than has prevailed for some time past. There will uot he that heaviness in the pig market next quarter that there has been in the current one. We heard, on Wednesday, of one firm, which its pro-prietors expect will consume as large a quantity of pigs as 3,000 tons more next quarter than they have this. The transactions in pigs at Wolverhampton this. The trausactions in pigs at Wolverhampton and Birmingham, in the latter town, on Thursday, on were few.

Miscellanea.

NEW CATHEDRAL AND PARISH CHURCH FOR MONTREAL, --The foundation-stoce of a new editice, to replace the one destroyed by fire, was haid on the 21st May last, by the bishop of the diocese. The new cathedral will he built in the Early Decorated new cathedral will he built in the Early Decorated restriction of the cross arms, tower and spire at the intersection of the cross arms, tower and spire at the intersection of the cross arms. It has been calculated to accommodate from 1,400 to 1,500 presons, and arrangements for the poor in Lepto posed plan have not been neglected. The cost of the collifice, exclusive of bells, organ, and clock, has been put down at 30,000?. The available means at the elifice, exclusive of bells, organ, and clock, has been put down at 30,000. The available means at the disposal of the building committee is about 24,0007. The late Mr. Frank Willis was the designer of the edifice, and Mr. T. S. Scott is now the architect. Messrs. Brown and Watson, builders, are the con-tractors for the works now in progress. The site of the new Christ Church Cuthedral is at the junction of Union avenue and St. Catherine-street. The ma-terials will be Moutreal lumestone with Cenn starse terials will be Moutreel limestone, with Caen stone dressings. The plan consists of oave, with orlh and south aisles, and north porch, transept, chancel, and terials will be Moutreal limestone, with Caen stone dressings. The plan consists of cave, with ordh and sonth aisles, and north parch, transept, chancel, and chancel aisle, with vestry attached. The following are the dimensions of the building:--Length (inside), 187 feet, width of nave, 70 feet; transept, including tower. 99 feet 6 inches; height of tower and spire, 224 feet. The nave aod chancelarelighted hy windows io the elderestory of two lights of varied tracery. In addition to this, there is at the chancel end a large orna-meotal window with five lights, of a highly decorative characler; and at the nave end a large wheel window, of 13 feet diameter. The aisles are lighted by win-dows with three lights, having tracery of varied d-sign. The tower is in two stages, faulted with buttresses, and the spire is octagonal and broached. The interior roof will be open, with timbers exposed and panelled. The entrance will be through the west end of the nave; north porch and doorways recessed in nave at transept ends. The naise throage the west large octagonal turrets, with tracery top, finished with crockets, finishs, & c f an oronte character. AN ANCENT ECYTAN LIBRART DISCOVERED. -M. de Soudey, a member of the French Institute, who has passed some time in Egypt, and is very con-versant with the archeology of that conotry, states in the *Courrier de Paris*, that an important dis-covery has lately heen made in oce of the tombs of Memphis, of a whole library of birarie papruses.

in the Courrier de Paris, that an important dis-covery has lately been made in ooe of the tombs of Memphis, of a whole library of bieratic papyruses. An Arab, an agent in the pay of the British Museum, was fortuoately apprised of the matter, and honght the whole lot. up

THE SCOTTISH ROYAL SOCIETY, -- The Royal THE SCOTTISH ROTAL SOCIET. -- THE ROYAL Society of Ediobarch announces the following sub-jects of competition for the award of 1858-59 :--The Keith Prize, a gold medal and from 40*l*, to 507. In money, will be given for the best communication in money, will be given for the best communication on a scientific subject. Brewster, Forbes, and other distinguished natural philosophers, have heen the gainers of the Keith medal on former occasions. The Macdongall Brisbaue Prize, a gold medal and money, will be awarded to the best biographical notice of an emicent Scotchman. The Neille Prize, a gold medal and money, will be given for the best paper on a subject of natural bistory, by a Scottish naturalist; or, to the best treatise published within the five years preceding the time of award. PARABOLIC SOND REFLECTOR.—The committee of the Great Northern Mechaoics' Institute, area the

PARABOLIC SOUND REFLECTOR.—The committee of the Great Northern Mechaoics' Institute, says the Doncaster Gazette, lately invited a few of their friends to an experimental inspection of a parabolic sound reflector, which had been erected on the plat-form, in the lecture-room of the Town-hall, for the form, in the lecture-room of the Town-hall, for the purpose of improving the sound. The reflector con-sisted simply of boards, 14 feet in height, and forming a semicircle. Several gendemen considered the plan as likely to prove successful; but that remains to be seen when the hall is filled. TEN THOUSAND POUNDS DAMAGES. — At the Liverpool Assizes, Novelle v. The Mayor of Wigan, in an action hrought by a contractor for compensation, in consequence of another person being selected to perform some work, a verdict was entered for the plaintiff-damages 10,0007. subject to a reference.

BRING THE MANCHESTER EXHIBITION TO LONDOX. —Many persons have been disappointed at their in ability to visit the Great Manchester Exhibition. Is it not to be regreted that the basy multitudes of London, its bosts of artists and skilled artisans " cunming to devise curious works," should not have the opportunity of improvement afforded by this grand gathering of the works of genns? Unless this class of persons, the *dile* of the industrious classes, have heneft of studying it ere it is scattered and comparatively ineffective. With regard to a building for the purpose, could not the Crystel Palace Company confor this boon upon the public ? The pictures might be exhibited on screens, without disturbing any of the existing arrangements : pictures, milke other goods, require hut a narrow portion of vertical space, and there is the eremose the scheders, it must be allowed the inger angements : pictures, milke other goods, require hut a narrow portion of vertical space, and there is the "Manchester Exhibition." Without detracting from the skill, energy, ingenuity, and its is more of the "Manchester, it must be allowed that the persons by whom works of taste are most likely to be apprecisted are more numerous in London than in the manufacturing districts, and if the *mission* of the undertaking has been to improve the taste of the main, it must be done in the first instance through the classes whose altention has been already in some measure directed to refinement, to a delicat discrimination of the nice shades of difference between what is merely good, and that which constitutes perfection in all that addresses itself to the eye. And even as a matter of education, such an exbibition is more likely to "bring forth first!" from among the population and visitors of London than of any ether place.—Ax

ELECTRO-TELEORATHIC PROGRESS. — The Mediterramean line has been safely laid between Europe and Africa. It extends from Caginari, on the Sardinian coast, to Bona, on the coast of Africa. The cable, which failed, weighed S tons per mile: the one now successfully laid weighs only 1½ ton per mile. The depth of water, for more than half way across, is two to two-and-a-half miles. The distance is 145 miles. The hed is soft chalk and shells. A eable is ables to be laid between Sardinia and Malta, and from Malta to Corfn. The Austrian Government propose to lay a line from Ragues, on the Adriatic to Alexandria, passing through Corfu, so as to complete the entire line through Malta and Corfn to Alexandria, bringing Bombay within fifteen days of England. In six weeks the Malta line will he completed and in six meeks the Malta line will he men issued, and well received. The capital is 300,000/ in 60,000 shares of 5/. each. The immediate object is to lay down a telegraphic cable in the Red Sea between Suez and Aden, so as to effect telegraphic communication thus far with India at the earliest possible moment. This object is expeeted to be completed simultaneonsjy with the Mediterramen telgraph to Alexandria. By this means communication with all India will be brought within one week is und by the extension to Kurrachee, which will immediately follow, hourly communication will be stabilished.— In a paper on the Atlanite t legraph. S Por Orissor Thompson, read before the British Association, at Dublin, it is stated that the eable was 5,500 miles lonz, and composed of 270 tons of gutta percha, 97 tons of copper, 240 tons of tarred yaru, and 1,692 tons of iron, making a total of 2,300 tons. It was highly prohable that in the process of time a hard roek would be formed around he cable, which would aik in this soft bed, so that when it was laid ere many years it would be a fossil which would he most durable.

SCHOOL OF ART FOR DARLINGTON. - A Branch School of Art is about to be established at Darlington.

ton. The New LANDING-STAGE AT LIVERPOOL.— A local paper says that, unfortunately, the great new landing-stage at Drince's-pier, for scalegoing steamers, loggage-hoats, and tugs, is in one respect a failure. "Owing to the shortness of the bridges hy which it communicates with the pier, they are practically useless—except a little before and after bigb water—for the conveyance of carts, carringes, or lander vehicles of any description. The angle of inclination is so acute, that no available amount of horse-power can draw the loads up, or "steady" them in going down, with safety ; and there is no rope and espisin to meet the difficulty, as was the case at the old Seacombe slip. Sir William Cubit has been made aware of the inconvenience, and, according to the statement made by Mr. Hornby at the council meeting last week, be has morely advised that the stage should be tried for some time in its present coudition before any alterations are attempted, in order to ascertain the best way of effecting them."

PILLAR LETTER-BOXES.—A correspondent says,— "Having often experienced great inconvenience, and seen others do the same, by arriving at the pillar letter-boxes about the time for clearing them, without being able to ascertain whether their contents had been removed or not, I heg to suggest that one of the puncles be made moverable, and that the man who changes the hag should place a panel in a slot in the place of the blank one, with the following words written upon it, 'Cleared for the One, p.m. post' (or whetever the post may he)."

WANT OF SEATS IN ST. JAMES'S-PARK.—A communication has been sent to us, purporting to come from "The South Waterside Walk of St. James'spark," and addressed to Sir Benjamin Hall, complaining of the want of seats on that side of the park. We feel assured the Chief Commissioner of Works only requires such a hint as the present to induce him to correct this oversight, but we think it more than likely that there are few benches in the walk in question compared with those on the opposite side of the water only because the orders have not yet been fully exceeded.

BIEMINGHAM SOCHET OF ARTESTS.—The annual cxhibition of this society was opened on the 7th inst. The private view took place on the previous Saturday, and was numerously attended. The collection of works is nearly 550 in number, and is said to be of more than average merit. The society have obtained the four pictures from the Luxembourg Museum at Paris, transferred from the recent exbibition at Edinburgh. Besides the works of members of the society, which are numerous, the exhibition contains works by Creswick, Stanfield, H. Pickersgill, F. Goodall, A. E. Chalon, A. Cooper, Cooke, Etty, Horsley, Lucy, Thomas Faed, Sat, Cox, Antboury, J. P. Knight, Sir John Watson Gordon, O'Neil, Nicol, Desanges, Niemanu, Woolmer, Wingfield, Weigall, and others.

ACTION OF WATER ON LEAD. — Dr. Medlock, formerly a student of Professor Mnspratt's, and now ia the metropolis, says a Liverpolo paper, has, for many months, investigated the action of different waters upon lead, and the conclusions he bas arrived at are entirely at variance with all received opinions. Because a water is soft, is no reason why it should act on the metal: the action, it appears, is entirely due to the presence of an acid of nitrogen. We give Dr. Medlock's conclusions from his prior, published in the *Philosophical Magazine*: "Firstly — The action of water upon lead is entirely due to the presence of mitros and nitrice acids, resulting primarily from the decomposition of orgonic matter, and of ammonia contained in the water. Secondly—Waters deprived of these acids, and of substances expable of producing them, have no action on lead, and may he conveyed with perfect safety through leaden pipes, or stored in leaden cisterns."

LIQUID MEASURES.—By the present system of beer and other measures need by publicans, the community are, I helieve, considerable losers, and never obtain the quantity paid for: they cannot be filled to the top of the measure, or the risk of some being overdrawn is incured, and do not, I imagine, reach the top by the one-eighth of an inci: even then there is generally some spilt—besides the hasty and dishorest system of removing the finnel hefore the liquid has well run through. To obviste all chance of slort measure being given, I suggest that beyond the actual limit of the measure there should be a rim of about half an inch sloping upwards and outwards: there would he then no further liability to the liquid heing spilt.—GABRIEL.

TUNNEL OVER THE MEDLOCK, AT MANCHESTER. —The Manchester corporation are taking op the tunnel which was put in about three years aço, to which is attributed the damage from the beavy floads of August 10, 1856, and August 14, in the present year. The tunnel now being removed is an arch of 10 yards span, the crown of arch being 7 or 8 feet above the ordinary water-level, and the entire length about 130 yards. This is to be replaced by a cover consisting of 100 east-iron beams, placed about 5 feet apart between centres, with 9 inch arches of purposemade radiating bricks set in lins eement. The underside of the newns, which will make the available sectional area of the new tunnel twice that of the former tunnel. The sectional area of opening of the new unnel will be 360 sparse feet, and the extreme length will be 130 vards. The contrast has been let to Messrs. J. and H. Patleson, of Manchester, who have commenced the work with activity.

COMPETITION IN THE CITY. - The Directors of the Mutual Assurance Company, desiring to rebuild their premises, have instituted a limited competition bitween five architects, including Mr. Woodthorpe, Messrs. Banks and Barry, Mr. Hahn, and Mr. Porter, arreing to pay each a certain small sum for expenses, and to employ the author of the selected design. The drawings are now under consideration.

The LIVERTOOL ART-UNION.—The annual drawing of prizes in connection with the Art-Union at liverpool, took place on the 10th instant, in the Nisi Prine Court, St. George's Hall. The report regretted that the anticipations entertained last year had not been realised, there baving heen a falling off, instead of an increase, in the number of subscribers. This was owing in part to the unfavorable season, and in part to a difference in the minds of their supporters as to the privilege now accorded to prizeholders of making their selections at the opening of the exhibition, "Now," continued the report, "it is feared that the small amount of subscriptions will lead at once to a return of the former time of selecting, as there appears a great prohability of the Academy withdrawing the privileges now granted to the society. Another year, however, every effort will be made to make it an effective support to the arts in Liverpool. The number of subscribers this year is 374: from these has been received the sum of 3824. The total expenses are 234. In sease of 504, one of 300, two of 253. three of 200. four of 157, seere of 100, and four 557." A gentleman three out a suggestion that it might he desirable to have a subre have been divided as follows:—One of 504, one of 300, two of 251. three sollows:—One of 504, one of a gurchased. The secretary suggested, that, as the choice of the pietures, on the second accession, would be a number of pietures remaining after the present prizeholders had selected theirs and the subic hal purchased. The secretary suggested, that, as the choice of the pietures, on the second accession, would be a year much diminished, the amount of the subscription, also, should be diminished. It is might, instead of heing a guinea, be half-aguinea. The report was adopted; the suggestions to be considered by the committee. The drawing was then proceeded with in the usual way.

by the committee. The drawing was then proceeded with in the usual way. RAILWAY TRAFFIC.—The traffic returns of the railways in the United Kingdom for the week ending Sept. 5, amounted to 516,2604 and for the expersponding week of 1856 to 500,1004 showing an increase of 16,1604. The gross receipts of the eight railways, having their termini in the metropolis, amounted for the week, ending as above, to 215,7094. and last year to 214,9094, showing an increase of 7194. The increase on the Eastern Counties amounted to 1,5804, on the Great Western to 6454, on the London and North-western to 1,4704.—total, 3,6052. But from this must be deducted 9804, the decrease on the Great Northers; 2674, on the London and Blackwall; 7954, on the London and South-westers; and 7044, on the South-casters; leaving the increase as above, 7194. The receipts on the other lines in the corresponding period of 1856 to 285,1104. CORK SCHOOL OF DESIGN.—The general meeting of the committee of this school took place on the 4th inst. when a report was read, stating that the corresponding beriod school took place on the

CORK SCHOOL OF DESIGN.—The general meeting of the committee of this school took place on the 4th inst. when a report was read, stating that the attendance for the present term in the central school amounted to 121, of whom 40 were female and 81 were male students, showing an equal amount with the attendance at the same period last year. 400 were under instruction in the National schools, and the free received for the term amounted to 28, 16s. 6d. The instruction, class arrangements and lectures were carried on with regularity and efficiency.

earried on with regularity and efficiency. THE STRAM FERRY, RYDE.—The works of this company on the island side of the Solent were commenced on Monday last, under the auspices of Mr., Denham, jun. who has the contract for patting down the concrete foundation. The quay, which is about in the centre of the Esplanade, will be 190 feet in witch from south to north, and 600 feet in length from east to west, from which a channel will be cut so as to enable the bridge and other eraft to come alongside at all times of the tide. Should this project answer, it will he a saving of time to those who are journeying to and from London. The contractor for that portion of the works is Mr. Bennett, one of the coatingtors of the Ryde waterworks; and the engineer of the whole is Mr. Thomas Hellyer, of Ryde. The first stone of the 20th instant.

Ryde. The first stone of the works will be laid with Masonic ceremony on the 20th iostant. GNOLL COLLEGE.—This establishment, of which we have before spoken, is to he incorporated as the Western University of Great Britain. It is situated in the Vale of Neath, Glamorganshire, and has for its objects, to complete the education of the sons of gentlemen, above sixteen years of age, in the practical applications of science, to the management of land, manufactures and commerce—to the public services, the professions, and other pursuits. The resident professors appointed include, in mathematics, Arthur Copley, F.R.S. Mechanics, Rev. C. B. Wollaston, M.A. Physies, Rev. A. Bath Power, M.A. Chemistry, J.E. D. Rodgers, M.R.C.S. Natard history, T. Spencer Cobbold, M.D. F.L.S. Human history, the Rev. Andrew Wilson, M.A.; and Design, E. H. Wehnert, member of the New Society of Painters in Water Colonrs. Sept. 26, 1857.7

The Builder.

EVER look a gift-horse in the mouth," is an old proverh, hut the advice should not always be followed. The circumstance that prompts us to make this observation we will refer to presently; first, let us ramble a bit in the fair county of Kent. Everyhody is out of town-London is empty. Is it really ? One who went to the Crystal

Palace last Saturday morning, and saw nineteen thousand persons Ko. iu the midst of wonders of art, listen-EB ing to such a concert for a shilling would have gratified the most as fastidious, or who had tried to take places for the opera at her Majesty's Theatre that night, and couldn't get

them; or who saw the Surrey Music-hall on Sunday morning packed full of worshippers, or got mixed up with the stream of life that filled the New-road in the evening of that same day of rest,-might reasonably doubt the assertion. Nevertheless, it is true, comparatively speaking : Grosvenor-square, Belgravia, and Tyburnia are desolate, and some member or other of every honschold, Smith, Jones, and Robinson, has flitted, or far or near, to unbend for awhile, aud get fresh air. When the warm weather comes, as old Chancer sings,-

"Then longen folk to go on pilgrimages."

And though we cannot literally add with him,-

"And specially from every shire's and Of England, to *Cicaterbury* they wend, The holy blisful martyr for to seek. That them bath holpen when that they were sick ;"—

we will take the liberty of pointing out this city and its neighbourhood, as we have before now done in the case of other places, to such of our inquiring readers as want an object for a jannt, and by any chauce have not seen it. Every one recollects how that the sight of three English boys, exposed for sale in the market-place at Rome, with their faces "full of light and hrightness," first interested Bishop Gregory in the people of this island, and led him afterwards, when Pope, to send forth Augustine with forty monks as missionaries, to this country, at the time that Ethelhert reigned over the kingdom of Kent with a Christian Queen, Bertha. Not far from Ramsgate they landed : then they went to Canterbury, and soon we find them worshipping with the Queen in St. Martin's, a hnilding on the east side of the the site. On the 2nd of June 597, Ethelbert was baptized, and after that soon followed the foundation of the cathedral, and the commencement of what ultimately came to be called St. Augustine's Monastery. Canterbury was the cradle of our Christianity, with the mother cathedral, and, in St. Martin's, the mother clehnreh.

A right glorious cathedral it now is, well plplaced, 511 feet long, with its central tower irising to a height of 227 feet, and displaying in the various parts of the building all the styles of architecture which prevailed from the end of ithe eleventh century up to the sixteenth, with anumberless tombs of men who have made histotory, fine specimens of early art, and undying associations. Burut by the Dancs in 1011, it Sussociations. Burut by the Dancs in 1011, it was rebuilt by Lanfrane in the eight years fol-flowing 1070. Between 1096 and 1110 the lated by Join Gough Nichols. 1810. A state of the patheners of the patheners, and sketches of hirst by Ernulf, and then by Conrad, and it was logical Album," edited by Thos. Wright, M.A.

further enlarged by Auselm in 1130. In 1175, embroidered with his beraldic hearings; and it 1179, and finished Trinity Chapel, with its crypt and circular termination, called Becket's Crowu, style in this country,-an added inducement for a visit

The nave and western transept, as we now Canon Stanley, in his "Historical Memo-see them, belong to the end of the fourteenth rials of Canterbury," a work to which we drew and beginning of the fiftcenth century (1378 to 1411), and the central tower, above the roof, was built between 1490 and 1517.

The crypt of the choir, very extensive and interesting, belongs, if not to Laufane's, to Courad's building. At the east end, in the aisle, will he seen two cylindrical columns, much larger than the columns of the crypt, which go through the vaulting, and are noticeable for having in the capital the tan, or cross of three arms, which occurs in the columns of the Norman chapel in the Tower of London, de-scribed by us not long ago. The verger tells visitors, with great decisiveness, that these columns are much older than the crypt ; but he is wrong : they were put in at the rehuilding hy William of Sens, and William the Englishman, to carry two columns at the entrance to the Trinity Chapel above, the horseshoe form of which was produced by desire not to interfere pilgrims to the shrine from every part of the with the two existing Norman towers of St. Andrew and St. Auselm, conjoined with the necessity of providing room for the shrine of out of one of the flag-stones (to which the Thomas A'Becket, to which we must allude presently.

"The crypt," says Erasmus, who visited the eathedral between 1511 and 1513, " had its own priests. There were several chantry chapels in t; one of which was founded by Edward the Black Prince in 1363, in the south transept, (endowed with the manor of Fauxhall at Lambeth, still belonging to the church of Canterbury), and which chapel became in the reign of Elizabeth the church of the French Protestant refugees."* The Black Prince desired in his curious will, to be huried "en l'Eglise cathédrale de la Trinité de Canterbire, où le corps du veray martir monsire scint Thomas repose, en mylieu de lu chapelle de Notre Dame Undercrofte." Leaving the Prince, however, for a short time, let us mention that in the crypt under St. Anselm's removed to it in 1220, with great pomp and tower, forming a small semicircular chapel, the ceremony. The shrine was placed in the certre walls are covered with some very interesting paintings of Scripture subjects, in the style of the twelfth century. The place has been long walled up, and is approachable, if at all now, by so small an aperture that practically these paintings cannot be examined. Some other arrangement should he made: there is not a more important specime of carly art in the of St. Thomas the Martyr, Archbishop of country.⁺ The tomb of the Black Prince, who country + The tomb of the Black Prince, who died "te vij, iour de Juyn, L'an de Grace Millrois cens Septante Sissme," will be found on the south side of the Chapel of the Trinity: it has upon it a remarkable rhyming epi aph dictated by himself in the Norman French of the period, commencing, as translated,-

" Wheeler thou art, with this comprest, That passest where this corpse does rest, To that I rel thee list, O man 1 So far as I to lell thee enn, Such as thou art I was but now, And as I am so shalt be thou. Death little did my thoughts employ So long as I did life enjoy."

Over the monument are suspended the surcoat, helmet, shield, and gauntlets of the prince. When examined some years ago by Mr. Hartshorue, the surcoat was found to be of one piled velvet,

545

leaving the existing crypt, they began to rebuild is worth noting that the surceat represented on the eathedral in carnest, under William of Seus; the effigy resembles the real surceat precisely in but this architect injuring himself hy a fall, one the number of *fleurs de lis*, and their position, called William the Englishman succeded him in giving us confidence in other representations of mediæval costnme. The prince lies in complete and circular termination, called Becket's Crown, in 1184. In this webave what must be considered the carliest approach to the complete Pointed sentations of the persons of the Trinity. The offigy is an exquisite work of art, demanding careful examination.

> attention on its appearance, gives some most interesting particulars in connection with the burial of the prince here, and a careful copy of his wil, annotated by Mr. Albert Way. All should read this book who wish to enjoy Canterbury. It treats of four subjects, the Landing of Augustine, the Murder of Beeket, Edward the Black Prince, as already alluded to, and the Shrine of Becket.* It has several illustrations, and of these we give two, viz.; The Tomb of the Black Prince," and "The Transept of the Martyrdom," as it was called, (on the north side of the central tower), the scene of Becket's murder. This event, which happened on Tuesday, the 29th of December, 1170, elevated the quarrelsome archbishop into the "blessed St. Thomas of Canterbury," the eathedral a holy spot in the eyes of all Christendom for centuries, and sent streams of world. The transept has been altered in its aspect since then, but a small square piece ent verger is pointing in the engraving), marks the spot where he was murdered.

The body was first interred in the crypt, and hither came the first influx of pilgrims. Here the king humiliated himself for the words which instigated the deed, and hither came Louis VII. of France, Richard of the Lion Heart, immediately on his return from the Holy Land, and King John directly after his coronation. was the age of pilgrimage. One who had been to Rome was *roamer*, and from amongst those who had visited the Holy Land, *La Suinte Terre*, we got "sumterers!"

A fire in 1174 led to the rebuilding of the choir by the two Williams already mentioned ; and then Trinity Chapel was enlarged to receive the shrine of the archhishop, and his body was of the chapel, and had in front of it, to west, a fine mosaic pavement, which still remains. This pavement is exceuted in the manner known as Opus Alexandrinum, of which there are specimens at Westminster Abbey. The amount of wealth lavished on the decora-tion of the shrine was enormous. "The tomb the year 1500,+ exceeds all belief. Notwithstanding its great size, it is wholly covered with plates of pure gold ; yet the gold is searcely seen because it is covered with various precious stones, as sapphires, halasses, diamonds, rubies, and emeralds; and wherever the eye turns something more beautiful than the rest is observed.

Eighteen years after the date of this visit the shrine was destroyed by order of Henry VIII. and all memorials of Becket were removed as completely as was possible.

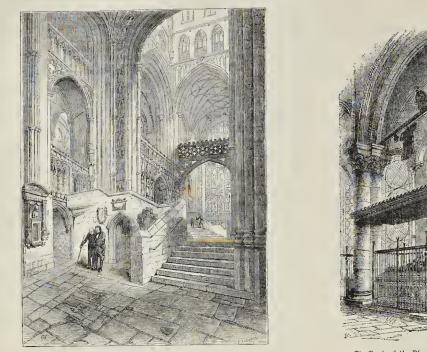

On the choir-screen, seen in the view of transept, the organ formerly stood, and greatly interfered with the view down the building. This, however, was removed, and its various movements and pipes were placed in the triforium

* A second edition, of smaller size than the first, has been recently published by Mr. Murray, Albemarle-street, + " Relation of the Island of Eugland," published by the Camdeu Society.

MEMORIALS OF CANTERBURY CATHEDRAL.

The Transept of the Martyrdom.

The Tomb of the Black Prince.

on the south side of the choir, and 92 feet from where the organist sits below, without damage it is said, to the effect of the music. Wander where you will in Canterbury, irre-spective of its architectural becauties, interest is architectural becauties and other architectural becauties and form run and brows with the issue of one a year. It be statement be correct (it came from the suprises, interest is gray cannot state, " maturally pointed it becauties of the nave, all be run offer, deserving great architectural becauties, interest is areas the induced in the suprest for architectural becauti praise. We must herefuences, and ungraching as it may seem, express in the strongest manner the hope that the Dean and Chapter will not follow the teaching of the proverb. The glass put np in Cauterbury Cathedral ought to be the fluest that can be obtained, and we are forced inest that can be obtained, and we are forced to say that this description does not apply to all the modern glass now there. Some of it, indeed—look in the clerestory of the nave, for example,—is, to speak the fruth, abonimable, and will have to be taken out again one of these

shrine; and the remains which can be traced in the houses that for more than two ceuturies have been occupied by the families of the pre-sent inhabitants, amply justify the tradition. An oblong court, surrounded by a venerable tenement, entirely composed, like bouses in Switzerland, of massive timber, chiefly oak and chestnut, received the pilgrins as they role in. In the uner store approached by stairs from ant toe modern giass now there. Some of it, chestnut, received the pilgrins as they rode in indecd—look in the elerestory of the nave, for example,—is, to speak the iruth, abominable, the ontside, which have now disappeared, is a and will bave to be taken out again one of these days. The ancient glass in the eboir is of rare beauty, and, as there are comparatively few Hundred Beds.""

The municipal records of Canterbury are very numerons and valuable. The chamberlain's accounts are complete from the year 1393, aud counts are complete from toe year 1005, and we learn from these something as to the wages paid to artizans. About 1481, the regular wages of a tiler ware 4d. a day. In 1520, we find that a tiler was paid 5d. a day, from which time the increase proceeds more rapidly. In the how her the increase proceeds more rapidly. In the chamberlain's accounts for 1546, we have the following items :-

"First, payd to Thomas Graves, tyler, and bys man, for x days tyling about the halle and the chambers, tackying by the day for mete, drynk, and wages, xijd. xs. Item, paid to a carpenter for one day's work, mendying the windows, and the stayers of the some targement x iiid

same tenement, vijd. Item, paid to a dawber and bys man for two days dawbyng of the walles of the same honse, xijd. the day, ijs."*

And the day, is. " In going round the town, the West Gate, the well-knowu Norman staircase, the Dane John, St. Dunstan's, St. Augustine's College restored and refounded, and St. Martin's Church, beautifully situated on the bill and ivy-covered, must of course be visited." The latter, although the walls contain Roman bricks, exhibits nothing of earlier date than the Norman period. Traditiou says Ethel-bert was binself baptized from the font bere, a eviluder: tangeing slightly towards the bottom ; bert was bimself haptized from the font bore, a cylinder, tapcring sligbily towards the bottom; but the sculptured decoration upon it, including a ring of interlaced arcbes, would seem to be of later date. Nevertbeless, it is just possible that the decoration may bave beeu added at a later time on a font originally plain. The view of the cathedral from the green hill, on which stands the ancient church, is beautiful in the extreme, and recalls a crowd of associations spreading over twelve hundred years!

* "The Antiquarian and Architectural Year-Book for 1844."

+ In our earlier volumes, illustrations, with notes, will be found of St. Augustine's, the Norman staircuse, and other architectural features of the locality.

ART IN OUR STREETS

In a former article-under the title "Art in our Parks," and in some observations in our last number-we adverted to the relation between architectural We adverted to the relation between projectivity detail and objects in nature, and pointed to the fact that combination was essential to the realization of the architectural effect. We then showed that whilst a more copious application of art was required in the parks, squares, and garden-enclosures; for the same reasons, in our streets, greater use should be made of natural objects, on constant attention proid to the pairs, squares, and gammericsates , in the same reasons, in our streeds, greater use should be made of natural objects, or greater attention paid to the principle involved. It may be curious that where architecture is most used, namely, in towns, it should be seen generally under the greatest disalvantages. But we believe the fact is so. It is presented without that which, in cases such as we have referred to, most conduces to its beauty; and it often has not the pure air and the illumination from unobscured sky, which are necessary, that its features should be seen, or that its chief grace and ornament, its minntely "pencilled" and cast shadows, should, we might say, exist. To understaud the importance of what we have been con-idering as elements of even architectural beauty, it is not sufficient to look at London,—at least at the west end, and certain outskirts of the town, where a con-sidering proportion of park or garden ground is met end, and certain outskirts of the town, where a con-siderable proportion of park or garden ground is met with. More, indeed, might be done for general results, by improved arrangements in open spaces; and we bave endeavoured to show in our former article, on what system the arrangements should be made. In London, however, there has always been a disposition in the quarters appropriated to the better class of residences, to bave a moderate pro-portion of ground laid out in gardens; trees which came into the line of street on the last altera-tion of Piccadilly, were fortunately saved before the whole number had hecen cut down, and plants and flowers flourish in haleonies, and the ivy and the vine are trained to cover portions of the frontage. Cou-siderable beauty of effect results in many of the cases mentioned, as may be noticed even in Piccadilly. It should not be informed from any of on arguments,

mentioned, as may be noticed even in Piceadilly. It should not be inferred from any of our arguments, that we would have the houses of London covered with creeping plants; but the lesson from the particular combination is not uninstructive. To what is it that the remined abheys owe much of their benty? Surely to the combination or contrast of the architectural details—as mouldings and window tracery—with the laafy covering of the walls, and other associated objects forming the natural heaty of the site. The well-known church of Casle-Ashby, in Northampton-shire, affords a good illustration of the effect of archi-tectural detail under such circumstances. The late Marquis of Northampton kept the ivy cleared away from all parts where details, or the manner of their union, would have been conceiled. We have been pleased to observe that the arborscent beauty of some of the subarbs of London, as several of those anthe may of the new streets, even where the houses are of an inferior class, are planted with trees—as requisite to their agreeable appearace. Our argument is, that more might be doue in this particular way, or with the same situation, in the main streets of London ; whilst of course, in the outskirts, better design might be exhibited in the architectural detail. But to understand the importance to architecture of the principle we have heen referring to, we should observe of the huildings of the norther manuficeturing It should not be inferred from any of our arguments.

But to understand the importance to architecture of the principle we have heen referring to, we should observe the huildings of the northern manufacturing and commercial towns, where trees scarcely grow, and where, usually, the atmosphere is more smoke-laden than that of London. Some of the lamentations which we alluded to, as to the want of interest amongst the public, have reached us from one of these very places ; oue, indeed, that has become remarkable for its huild-ings. Indeed we admit considering the measure in Ours, indeed, that has become remarkable for its huildings. Indeed, we admit considering the manner in which architecture has been practised during the last dozen years, in such towns, and the architectural taske manifested in some of them—and which as to many elements of effect, is greater, in proportion, than that exhibited in London—it is difficult at first not to dispute, rather than join with, the imputation as reported to ns. In fact, we do doubt some of the ersetion of and huldings as there are in liver. of the assertion. We do not thus that the merit or the erection of such buildings as there are in Liver-pool or Manchester, is to he ascribed to rivalry, and to purse-proud feeling, so much as would hus be sup-posed; though such noving causes have not been wanting. The interest which is now taken in the other arts; and the sums which are expended in the other of interest would rolter on the other arts. other arts; and the sums which are expended in the purchase of pictures, would rather go to contradict the supposition. Still, ascribing to the buildings referred to, all the merit which they have in technical details; if the object and intended effect of architecture—the decoration and adornment of cities—were attained in a degree commensurate with the attempt, people would live in the town of Man-ebester—which, it is well known, they generally do not; and would not leave if for a residence at the

lakes, or in the southern counties,—as the majority of those who make fortunes seem to do. The smoke of Manchester has heen asserted to be the reverse of unhealthy; and perhaps it acts in the manner sug-gested in the note to our recent article on the National Gallery question. Art in Manchester, as we believe, Gallery question. Art in Manchester, as we believe, to examine alike the Venues de' Medici, and the Venues of the Hottentots. Were there no other objection, owes its position principally to individuals. The town—by its smokiness, and the general absence of cutskitts—is repulsive, in spite of its good archi-methaucid favilities—people of the same time and tecture, as every stranger feels who visits it. Till been; and till trees and flowers will grow within its interimit, its architecture caunot be appreciated by its individual facility and inventiveess. Architecture as were visiting of the appreciated by its individual facility and inventiveess. the smoke can be reduced still more than it day been; and till trees and flowers will grow within its circuit, its architecture caunot be appreciated by its inhabitants, even as it deserves to be. Lest the view we take should be doubted by those who reside iu Manchester, we may refer to the surrounding manu-facturing towns, such as Bolton, Stockport, Ashton-Mannesser, we may reter bo the surrounding mout-facturing towns, such as Bolton, Stockport, Ashton-under-Lyne, and others. The smoke there seems to be more dense; and the impression of natural beauty more strictly basished to the surrounding country— which has still picturesque character. The wealth that is accumulated in some of these towns is em-siderable. Yet what has architecture done to render any of them attractive? There is so little that is refreshing in the seene, unless it be the buildings portion of in_-there is such a mass of deformily to set against the art,—even in this, and the mind is so much depressed every way, that what there is even of good architectural design, is not appreciated, and sceme out of place. Let the impression made on any of our readers be compared with that which is in-duced by the line of Piccaully, opposite the Green-park, and in many other parties of London. Here, one or two buildings excepted, there may he no very supe-rior works of art—no particular taste evidenced in architectural details; but there is symmetry and pro-portion, or masiveness in one front, and quintuess in another; one house recedes from the general line: another has helpening on the windows or portion, or massiveness in one front, and quintness in another: one house recedes from the general line; another has baleonies, or how-windows, or a porch; and the park and trees, and the plants in hal-conies, add the other element for effect. Similarly, the eastern side of the park deserves to he noticed for combinations of the like kind. There we find Bridge-water House, with its simple but admirably planned sunk garden—though that feature is not so well seen from the park as might have been desired,—and Spencer House, with its rustic-sted and arcaded hase-ment amidst the leaves and hranches, and the heu-tifel statues erowning its nediment—recarded as ment amuds the leaves and framehes, and the heat-tiful statutes errowing its pediment—regarded as models for the treatment of scolpture in sich situa-tions. Gothie of the Strawberry-hill kind, will be discovered in the course of the walk: we do not hold it up for approval; though we have seen houses in that character of taste, which when we could get ril of prejudice and precedent, we have thought not wholly worthes pictorially; whils such works have begun to acquire something of *historic* interest. Lataget howages, of cape kind are other is rubet if

Interest, however, of some kind or other, is what it Interest, however, of some sind of other, is what its should be the object to excite in our streets, by the disposition and plan of the *routes* and buildings, the grouping and the variety of separate features, and by the general study of a patieular ill-under-stood branch of our art—street architecture. Interest, such as ever can be taken in old street architeeture, at home or abroad, it is indeed impossible to afford by uew being as beer data index impossible to afford by uew huilding: we cau maintain, hut not re-create that; hut we must supply ofter matter of interst-other food for the eye and mind, --by fresh creations, --in fact, by art. There is an alternative from the unanimating, mind-leadening influence of brickwork, undecorated by proportion or ornament, and the equally deadening effect of our ordinary and art less cement.tious substitute for architecture. But, for that, it will not suffice to take the unbroken frontage in a street -- such as the ordinary streets of London afford--to regroup the openings and add archi-traves and cornices. The architect may, no doubt, do all that, with skill in his art, and the deserved approbation of his brethren. But, he must do more. Without the particular mistaken ain at contrast and Without the particular mistaken aim at contrast and variety—namely, contemporaneous use of several styles—he must give those same qualities, which can become even more obvious and striking from the bond of ageneral wholeness. For, there seem to be two kinds of contrast,—one which is absolute, like that of black to white; and the other, known to art, the principle of variety in unity. Contrast, or variety (for there is ground for the use of the words inter-changeably), is, in short, but one, though a much neglected element, in the art of the architect. We hold that the particular variety which is needed, is us got when the super several particles is used to the the particular variety which is needed, is us got that the particular variety which is needed, is uot got hy the simple use of a phurality of styles: but on the contrary we unintain that the number of the techni-hably led to the delicacy of perception as to details. The attention to real variety,—to substitute the sem-blance of originality for the fact, and to interfere even with the power of appreciating the art where it utnost degree variety. A corresponding effect is may have been supplied. No man can pass per that while we have the anticon we have abandanced country-Moresque, or Italian,—from one to another—and be, life. Having bithetto added our art to effect a

Initiate which setty inflags show on blue the individual facility and inventiveness. Architecture as we are viewing it, may be said to con-sist of two grand fields or vehicles of expression,— the technical department, necessary to the other, hat in which perception grows with study,—and another, the department more especially neglected by our pro-fession, which, like music on the ear, is calentated to tell apon the eye of the impressible, but not deeply-learned public. What can be the value of any refine-ments, or graces of detail, if the attention be not first drawn to the object? The eye must here chained; and that part of the process of observation in which the reasoning powers are concerned, will thus he set to work. As architects, we must note the impression from the combination in cases which we have referred io,—where art—chough little of what we have been from the combination in cases which is the text to to, --where art--though little of what we have been accessomed to call architecture—holds its important place in the miss en scène. And we must provide at the least, so much of the appearance of stability and

to,-where are-though little to Wink we have been accentsomed to cell architecture-holds its important place in the *mise en schee*. And we must provide at the least, so much of the appearance of stability and of use, as every observant person, undiffered by logmas and precedent, would not fail to insist on. These simple elements and conditions include all that is wanted for the upble. The extent of the application of the goiding principles may be not at once perceivable. But, that the latter hranch of requirements alluded to, first. We want porticos which will shelter, but will not darken rooms, and porticos to which we can have access. We want to see a work of art if we have it, and to feel that it contributes to our enjoyment in return for what it may have cost,—we demand that it should be well placed in a *visia*, or be visible from a sufficient with of stret; and that the hackground of sky, the medium of atmosphere, and the surface of the work itself should be not obscured and polluded by soot and smoke. We want both the fact of sta-bility, and the utmost appearance of it helped hy very distable of the site which can be generated in the cyo by the lines and curves. We require not merely space for our buildings that we may get back to view them, but hreadth of base, or the semblance of it, for works themselves. Our chief buildings should be more frequently, like the National Gallery or the Royal Exchange, placed where a hroad platform occupies the foreground, and prevents the disturbing influences which may be unavoidable in crowide stretis. But the extension of hase may be provided to by othe means: the appearance of it need never he left out or be courseled by the habitual iron *rait-ings*. Curious it is, how what might secm the bovious clements of our art, have to he learned the last. How many portices have we wilbout either ins enseried and will be required, hy Smith and Jones—provided only such individuals have theorohinary eyes and intelligence, and have not advanced merely to the "fitte learning" wh

way, and bring about the real love of our at by a rational and progressing process. The monitory lesson from Greedan art, restrains as indeed from arguing that the people can never appreciate the ut-most refluement. But the ever vocal lesson from the Athenian Acropolis-the coubination and contrast of nature and art--the architecture with the base and foreground of rock, and the background of sky and clouds; the sume combination everywhere, with

the sca-horizon, or the forest-feldes; points to another consideration not neglected, and which pro-hably led to the delicacy of perception as to details. It we have written to any purpose, it has been shown that the combination of art with nature operates on the eve and mind because it percent in the

will predominate. It art was needed to produce a peenliar beautiful expression in sylvan, maritime, or rocky scenery natural beauty is required to combine in the architecture of towns; or of the elements of effect much be presented to make up for the deficiency, and tending to reach the same cud. Thus, while parks and gardens bend he formed of former differences. should be formed, at frequent distances-and, more-over, should be planned and decorated with architectonic and sculptnr.sque accessories; other areas should he provided, where our public buildings may st ind, and The provided, where our plotted minings may so that and generally in such cases, —to gain the effective e-mbina-tion of buildings in a place, and the variety of objects to interest and contrast, and to allow the sky and clouds to come into the field of view, and the sky-line of the building to bear its part. The live and move nent of the other eo oblication with nature should be enadated th ough the introduction of formtains, and the use of scalpture not exceptionally but generally. In our article on the Parks we but generally. In our article on the Parks we omitted to aivert to the advantage of not con-fining scalpture to use of marble. Zinc, costed with bronze, and erdinary stone, could be used with csceletat effect; and without any deficiency in its own art, such sculpture would completely serve the purpose of decoration. The sculpture at Spencer House, before referred to, is no doubt but Portland stone. If some kinds of stone should be considered not suitable, after the sad evidence which our eyes are presented with, or could not be rendered not suitable, after the sad evidence which our eyes are presented with, or could not be rendered so by preserving coating, there is the enduring terra-cotta, alrendy the vchiele of some excellent attempts, nud likely perhaps to be modified in improved manufacture and firing, so as to admit of the full retention of the beauty of the modelling. Other vchieles also are fring, so as to admit of the full retention of the beauty of the modelling. Other vehicles also are to be found. In one way, or other, great use might be made of seulpture,—instead of as now, no use at all in architecture, with a very small number of exceptions, and no use compared with what might and should be made of it in our parks and gardens. Seulpture has been called "the voice of architecture:" we object to the expression, however. But it can signaly one thing, without which our at has no effect —no voice,—the life; the variety; and the contrast with the more rigid form and technical expression of our own special art, of another art—or an element of naturals ic derivation. Thus it is that we can put no limit to the sphere of architecture, properly spe king, without including many of what are some-times regarded as, and in important essentil is are, separ.te arts. separate arts.

separate arcs. In our ordinary streets, trees, shrubs, and garden-ground should be found: they should oc-asionally be met with at unexpected places,-rather than that trees should border the whole lune of streets at regular disauona observe the whole line of streets at regular dis-tances, as apparently contemplated by some,—an ar-rangement which would even oppose itself to the parti-cular combination we have been suggesting. Patches of flower-garden, however small, and plants in vaces and backones, should mingle with the architecture, and oppose the free att-work of nature, to the regular and backone at mostly of nature, to the regular and legible art-work of man. Every process or thi of nature or art which can be conducive to variety thing without that mere whin-ieality, which checks at rule; which any one can have; and which is not art, or fer-tility of mind-should he made to contribute to the re-Thus, ns we endeavoured to point out in a former suit. Thus, as we endeavoured to point out in a former article, no object of the foreground--whether the pavement, the stumps, and lamp-posts of the footway; the railing or balastrales; are undeserving of atteu-tion. In fact, with the steps of the entrance, such things, properly contrived, spread out the area of base in the eye; group and combine with the huilding in a whole; produce variety; and help in the ap-pearance of growth from a base, and of structural stability

It is not, however, by minor matters that variety in architectural features of our streets can chiefly be attained; a great aim should be variety of plau in atthest; a great and should be variety or plant in the strets and open spaces threasily, by the selection of good sites for the puble huldings; and by massing of parts, and the prominent use of recessed and project ug features in the view. As to this recesses and project up returns in the view. As to this subject, it is enough to remind our readers that we have referred to it in the papers which we commenced some time and, on the recent history of architecture-capacially where we had occasion to speak of Regent-street, and the architecture of John Nash—whose mis-these indexed are well as the scheme house house. street, and the architecture of John Nash—whose mis-takes, indeed, we could not defend, but whose percep-tion of the points we have here a treating of, we could not full to acknowledge. It is errors as an artist may show the fallary that would be involved in relying soldy on the pictorial treatment, to the consideration of which more encould we have a been dead. solidy on the pictorial freatment, to the consideration of which more e-picality we have here devoted our-selres: but his circuses, Quadrant, cressents, and open spaces in plum; his massing of parts, and the variety of general feature in his elevations; and his disposition of buildings on sites like those of the church in

nnion with sylvan scenery, we are now to study the Lingham-place and the Haymarket Theatre, where combination where forms of a structural character they might be pictorially effective, are worthy of every Implant pace and the fragmatic 1 because, where they might be pictoiniby effective, are worthy of every commendation, and have not since here equalled, or imitated. But, what London might be, can be gathered from the comparison of a plan showing the positions of its buildings, with the plan of Paris,-or, what it should have beeu, with Wreu's plan for the improvement of the City. Screens of columus, or arches, should be substituted

or the blank walling in Piceadilly, as suggested some time ago, and that of the garden of Grocers' Hall, in Princes-treet, by the Bunk; and the colonnade in front of Burdington House—semicircular on planmight be turned to the street, as spoken of by a writer in our pages, with excellent effect as regards the street architecture. Our railway violutes should not be ever unsightly excressences, designed with no reference to the streets which they intersect. By the embaukment of the Thames, there should be provided, at once, the maju attery of communication which London needs, and the finest sites for arebitectural effect. And, lastly, the gardeu enclosures should be something more than sites for trees and shrubs: but on the principle part for the start and shurts. but on the principle part for the shurt and shurts the improved by architectural features and sendpture; and should be so planned ns to contribute more to the adornment of the streets. There are, however, many objects beyond what we can here refer to through the medium of which, variety and heauty to. through might he increased.

There must be some cause for the apathy to art iu architecture, which after all prevails to a great ex-tent annuage the public. We have tried to show ou what principles and through what means, exertions for improvement should be made. The consequences for improvement should be made. The consequences of the neglect of the benutiful in our streets, are little thought of, but they are more serious than is suspected

AN ACCOUNT OF ELY CATHEDRAL.*

An ACCOUNT OF ELT CATHEDRAL." Ar the junction of the nave and transpt stood a Norman tower, which prohably, as usual to that style and in that situation, was scarcedy elevated above the ridge of the roof; but this falling in 1822, and destroying with it the whole of the eastern por-tion of the original church, the present lantern was commenced during the time of Bishop Hotham, under the dispersion of Washingham the sub-nrice. In under the direction of Walsingham, the sub-prior. In itself it is almost unique, there beiug, I think, no other example except at the monastery of Batalha in Portugal. This octagon is admirably designed an Other example except at the monastery of Stataha in Portugal. This oct-good is admirably designed an area is given by making the width of the nave and aisles form the diameter, and the arches of eentral aisles the width of the arches of the octagon, so that there is no interruption to the view either looking morth ad south or cast and west. The arches to the north and solith or east and west. The arches to the four sides of the octagon are about the height of those of side aisles, with whi h they amalgamate, as it were, by an angular groin, rendering this portion as a solid abulment to the octygon. On the exterior, from each of the inner angles formed by walls of nare, chancel, and transpits, spring two massive flying buttresses, butting actioned to the other of the inner and the site of the inner solution of the inner angles formed by walls of the site of the inner butting actioned to the site of the site of the inner angle of the inner solution of the inner angle of abutting octagonal turrets at cach angle of the Innteru These turrets were originally designed to be pinnaeled, but none of them ascend higher than the parapets. This point is rather above the main roofs, and so far the octagon is of stone, but above this the lantern is continued in wood. From the pinnacles being incomplete, and from the fact of their large size, and the well-balanced and massive substructure, I am led to supwell-balanced and massive substructure, Jan ice to sup-pose that it was first intraded to construct the upper lantern also of stone, and to support it in part by flying huttresses from the angular turrets, they being carried up, to resist the thrust, considerably higher. Whether this design was abandoned from fear of the experiment or from want of means I am at a loss to y, hut I think a careful examination would at once termine that even now it would be no difficult matter to build the whole in more douable materials. The four windows that light the lower part of the octagon are cach of our lights of good general form, but the tracety is scarcely so well balanced as some of the other windows of the style in the ethedral. Beceath each window are three tabernacles resting

Detection each window are intree tabernaces resting on a string course : they are rather deficient in orna-ment, but were probably designed to assimilate with the arch beneath, which it was found necessary to dwarf in order to e-unmanicate itself with the arches of the side ai-les. The vanitug shafts of the octagon spring from the floor in each angle, but are interrupted in their nearest the statement of the side of the s pussage by a rather singular design, which is bracketed from them on a corbel, the eight corbels containing from inch on a corbel, the eight corbes containing representations, according to Bentham and Millers, of scenes in the life of St. Etheldreda, commencing at the right side of the west arch: her relactant marriage with Egfrid; her taking the veil; her pilgrim's staff taking root whilst she slept; her preservation, with ber virgins, hy a miraculous inundation; her instal-tion are obless of Flux, her least and hered. lation as abhess of Elv; her death and hurial; a tale

See p. 535, ante

of her miraculous power after she was canonized of her miraculous power after she was canonized ; the translation of her body. These eight corbels do not support what at first sight appears to have been a tahernack; as there is no niche fur a statue. I, there-fore, fancy they were placed here merely to break what the architect might have feared was rather too great a prependerance of vertical lines. The lautern is contracted above the four windows and the four arches for transents may and object her wooden arches to trausepts, nave, and choir, by wooden groining, simply ribbed from the springers, without any cross riss, a beautiful graceful line conducting the eye to the upper lautera, 30 feet in diameter, which ascends some height in simple panelling, unenriched by anything save foiling at the heads. At this point priories, a clicht gradler, and abase the ribbe, is accents some negation simple parenting, meaning, by anything save foiling at the heads. At this point projects a slight gallery, and above the whole is lighted by eight windows, the ceiling being groined to correspond with that beneath. This upper work, although in a great measure the original, still, from its perishable materials, it cannot fail to have once, if although not oftener, required considerable renovation, not of advantage to the design. The lantern, however, as far as the interior is concerned, has not been much damaged, but on the exterior it hears every impress of repairs which might have heen superintended, if one may judge from the style, by the distinguished Beatty Langley. Too much praise cannot be to Prior Walsingham for so beautiful a feature given th to Pror Walsupham for so beautiful a feature of the exthedral although I am doubtful if the design itself does not appear what it really is not—stone rather than wood,—and, as the beauty of all Gothie is its truth. I hesitate to award unqualified praise; but if earrid out, as I folly believe it was intended, in stone, this heantiful central tower could not possibly ineur a word of disfavour, even from the most fastidious dilettante

The south and north transepts are now all that remain of that which was first commcuced by Simeon I now that the second s octagon, four arches on each side, two piers to each plain cyliudrical, the other clustered, as those of nave, only more simply. The capitals are more deco-rated than the nave, but the decoration itself is morely a slight volue at the angles; the arches her support are quite devoid of any orunnent. The triforium and clerestory to each transpet deviates very little from those of the nave, with which it seems to have ann cherestory to each transpit deviates (edy fittle from those of the nare, with which it seems to have been built, together with a gallery across either end, and au areade dividing off the western aisle of south transpit. The easteru aisle, early in this ecolury, was divided off to form the library, these three bays now lighted each by two-light Early English windows, containing a custofield in the hard work-the more the containing a quatreful in the head, probably were the eastern windows of three chapels, as the same divisions on the other side seem also to have heen thus appropriated. In the centre of this transpt nre the remnius of the paving, laid in geometrie forms of various colours, removed from gallery to Lady Chapel. various colours, removed from gallery to Lady Chapel. The roofs to each transent correspond: they are very beautiful specimens of a barnner-beam roof, with angels at the head of beams. The work bears every appearance of the Perpendicular style, but, I think, rather before than coeval with the windows of the same style in the gables, as they are inserted con-siderably above the timberings, which, had the roof heeu fixed after, could screedy have been the case. The roofs have heen beautifully decorated: the south has been restored, and the north is now undergoing repair. repair.

From the lantern we arrive at the three bays, built by Walsingbam, with the lantern. These three hays mark the extent of the old church, which renched has made the extend of the one charting works relative to the pier now remaining (between this work and the six bays of preshytery), forming the base of the appec. This is only original as far as the capital that was added in 1235. These three decorated bays are, as a added in 1233. These three decorated ways are, as a whole, uncequalled by any other decorated work of the elass in the kingdom. The arches are all well formed, and gradually couduet the design into the next stage, the triforing, with a rather less interruption than is common to the style. The triforium arches are filed common to the style. The triforium arehes are filled with the best designed tracery I ever saw : the tracery itself does not seem, however, to have been sufficient to satisfy the anxietics of the architect, for be has still for stars, we arrive to the varied for a weather the stars of the stars of the stars of the stars and the varied lives of the tracery and arch mouldings. After these hearties, it seems the architect had in a great measure exhausted his powers, for the clerestory windows do not in any degree ap proach the design of the triforium; in fact, they are proach the design of the tribrium; iu fact, they are singularly poor. The groining is simple, but the bases are good. All the sloffs, and a great many of the capitals and prominent mouldings are excented in Purbeck marble, which has lately been polished. The entern aisle, forming at one time a sort of ante-chapel to the Lady Chapel, or as it is now called Trinity Church, is built of a richness to correspond with the choir, hut the southern aisle is plainer, in-cluding also, strange to say, a portion of the arches of

the choir. The heautiful oak stalls, of about the middle of the fourteenth century, now occupy the area enclosed by these three bays, but they were originally more westward under the octagon, and were more recently to the very cast of the church. The stalls themselves are exceedingly good specimens of the Decorated, and although they do not possess the richness to be seen in later work, the carved work being cett off half way up by a series of foliated arches, and by a horizontal break for the reception of sculptured figures not now existing, but which once no doubt occupied the vacaucy which is now capped by crocketed pinnacles. The whole of this has been placed in its present position, and alapted together placed in its present position, and adapted together with much new work with considerable taste, but we with much new work with considerable taste, but we may perhaps renture to object to the scroll-form desk terminations, which seem scarcely severe enough in form to harmonise with the rest. Beyond the origi-nal cathedral, but occupying a portion of the apse, and also of the chevel, if there was one, is perhaps the gem of the whole cathedral, the presbytery of six hays, of the Early English style, commenced in the year 1235, completed 1251. The arches are very numeronsly moulded, and project eonsiderably at their springings beyond the face of the clustered column. This projection is still more increased by a detabled column being trassed out upon an elecantly carved To projection is shift more interessed by a detailed column being transed out upon an elegantly carved hracket immediately above the columns, of the aisless which is coutinued up to form a vaniting column of the roof. The triforium is a *piqueat* bit of this style of architecture, but it is nothing in actual description, as it is merely the simple form of two trefoiled arches supmorted to a clonely achieve or incide arches. It is interest the simple form of two freeoided arches supported on a slender column, comprised in an equi-lateral arch, the tympanum being enriched by another foliation. The columns of the comprising arch arc well and beautifully recessed, the hollows decorated with a crisp folinge, which runs also in the arch. The elere-ture is a truther The neuronement which is latitud for a crisp foliage, which runs also in the arch. The elec-story is a triplet. The escoinson arch is distinct from the window arch, and is supported on columns, admit-ting a passage behind. These arches are not foiled, but they searcely seem deficient in enrichment, their outline heing so perfect. The accomplished critic would feel this inability to give a really unhiased opinion as to which he considered the most exquisite compartment of this cathedral: bis mind, I am sure, would vacillate hetween the gorgeouscess of the Decorated part and the elegance of the Early English. The pre-buttery, with is side alies, was forward.

The prosbytery, with its side sides, was formerly huilt in the same style, but from various causes a part of the triforium has been altered, the windows and side walls of the aides have here renewed, and the and side wails of the cases have neer recovered, and the windows inserted in the triforium in decorated times; hut all these alterations, although giving an interest to the building, were not carried out with the judi-cionsness to be wished, nor with the taste displayed in the huilding of the case, and the fit-elight windows above nor very similar to the cast of several of above, are very similar to the east and the internet windows above, are very similar to the east end of several of the flue buildings of Yorkshire; and if my memory serves me correctly, there is a great resemblance between this one and the east elevation of Whithy Abbey. The arches on either side the triforium and clerestory are carried out in their full integrity : nothing seems misplaced or ill balanced, and all is

The variety of tints, produced by the employment of Purbock marble and freestone, is more applicable to this style than any that succeeded it, and is here made use of wherever the circumstances seemed to require, producing a most heautiful specimen of the style

Sivile. In the easiern bay of the north aisle is Eishop Alcock's Chapel, an insertion of thoroughly over-loaded work. The screen work consists of nothing hut tabernacles, that, in spite of their laced surface, are exceeding heavy and crude. I am at a loss to account for so ill a piece of work, more especially as the commencement, as far as the base of the taber-nacles, promised so well, and is in such good keeping in every respect, that the failure, when the work should have heen progressively improving, is not to he accounted for, except by the supposition that the lower part was completed maker the immediate super-intendence of the bishop, who was the comptroller of intendence of the bisbop, who was the comptroller of the works to Henry VII. and that it was not com-pleted until after bis death.

In the oposic bay is the chapel of Bishop West, cutered by very good iron gates. This chapel is a most exquisite piece of work: it is most delicately exceuted, and well conceived in every particular, and although it embraces in its details and design much of a foreign element, in fact, the Remaissance, it is so incorporated with our English Gothic, that it causes no regret at its intrusion.

eastern window is left quite open, under which formerly stood the altar, but this bas been removed, and of late years au ambitions Gothic tomb has been placed in its stead, —a sad intrusion. The eeiling is groined, in its stead, —a sad intrusion. The ceiling is groined, and is of a holder character than the tabernacles: the ribs are deep and foliated, and the panels formed by the tracery, enriched by beautiful and deitately raised sculpture. It may safely be said that this most charming chapel fully deserves a careful restoration; but so much of the smuller work has perished, together with the figures that filled the tabernacles and other spaces, that it is to be forced a faithful restoration is searcedy to be attermated

spaces, that it is to be feared a factors associated to be attempted. Trinity Church, the original Lady Chapel, I at first supposed, from its position on the north side of the cathedral, to have here the chapter-house, but I am satisfied, upon examination, that this building never was used for such purposes, although I thick it very probable that the arrangement of the stalls was at first designed for that purpose. The Lady Chapel, probable that the arrangement of the stalls was at first designed for that purpose. The Lady Chapel, commenced 1321, runs parallel with the cathcardal, joining it ouly at the extreme exstern angle of the north transcpt, from which it is now cutered by a more recent covered passage, and by a door cut through the back of the stalls. The most heautiful enriched canopy goes round entirely through three sides of the chapel, and across the castern eud also, with the exception of that part which has formed the reredos, which is in a different and later style than the other. which is in a different and later style than the other, and is evidenily an insertion. It seems singular that the most important part of the chapel should have been neglected when it was first founded, and it is this fact, among many others, that rather inclines me to believe that this huilding was not originally

Is this fact, among many others, that rather inclues use to believe that this hulding was not originally intended for devotion : at the same time 1 an quite sure the heatiful stall-work on each side the altar, forming a continuation of the reredos, was uever intended for seats, but was for tahernacles to receive statues. Again, right and left are the remains of the Purbeck shelves, marking the piscina and credence-table; and the stalls, as they approach the altar, are raised one above the other as sediha. The ebapel is of five bays, beautifully vaulted in a Transitional style, from the later groining to the later fan tracery vault. The windows on each side are well traceried, all alke, in the castera ones would seem to approach in style the Perpendicular; at the same time 1 do not imagine they are insertions. This alwoot unrivalled chapel, strange to say, bas no marked entrance, the present one is of later time, nor baye been admitted. I therefore suppose they must bave been entirely excluded from service here. The monks had two currances on the southern side, through similar arches to the stalls, but to be detected by a greensed are, and aquital. Direct from these doors ran a groined cloister, not now existing, in an oblique the the the the the first of the Born of the Decorated direction to the third the advite of the Decorated direction to the third the advite. recessed arch and capital. Direct from these doors ran a groined cloister, not now existing, in an oblique direction to the third bay, e stward of the Decorated north aisle of the catbedral, where is a most heautiful doorway in a later style than the chapel. In the westward hay of this aisle is an archway about 6 feet from the ground, the window heing contracted to receive it, and henceth are two springers for a valut. This marks the position of the former high altar, this doorway having led by a raised and covered passage from the Lady Chapel across the aisle direct to the rood in the cathedral. In 1270, the old revelos was taken down from its

Iu 1770 the old reredos was taken down from its Iu 1770 the old reredos was taken down from its original position, without a single fragment being preserved (one hay east of octagon), the choir being removed to the eastern end of the cathedral. I bare no doubt the reredos was soldy multiated previously, hut it is much matter of regret that this alteration took place, as the work of this alter and screen doubt less assimilated with the stall-work in the Lady Chapel, as they were almost contemporary, although in examining the work in the Lady Chapel it is diffi-cult to imagine anything much richer: still 1 think I may renture to assert that although this altar was in the same style, it must have hece, from its more may venuere to assert that around the same style, it must have here, from its more sacred position, still more enriched and beautiful. It is generally said that the bishop of this diocese had no throne, hut that he occupied the seat formerly assigned to the abbet; hut I am somewhat included assigned to the aboot; but I am somewing include to doubt this assertion, as the first pier on the south side at the point that supports the groining is encircle 1 by way of capital by a stone caupy: this certainly was intended as a finish to some spirelet caupy work, which must have been of very cousiderable height, and consequently much too considerable for the canopy of a sedilia or stall, but appropriate as the canopy a throne.

At the focus of the apse stood formerly the shrine incorporated with our English Gothic, ibat it causes no regret at its intrusion. The whole is most claborately tabernacled with as its costly juwelled and enamelled work formed too details exceedingly *petite* and beautiful. The taber-gret a bait for the sixteenth ceutury fanatics to with light ouly through its perforations, and formerly through the arch above the tomb of the founder; hut this has been filled with some earlier panelled work. The whole is most claborately tabernacled with stand. North and south of the shrine the roots of the aises were lowered one bay and the Early English this has been filled with some earlier panelled work, decorated windows: tibis was done to kt in a flood of inclosing the remains of seven early saints. The

the hody of one famous in early times as a princess, a queen, in abbess, and a strict and bountiful sup-porter of all that was good, upright, and generous. In passing from the contemplation of the architec-ture of the past, I should wish to draw attention to the way in which it bas been restored, ander the un-tring influence of the Yery Rev. the Dean Pescock. For whether we commence at the most simple and least important feature restored, or at the grander parts, we must all allow that the greatest and most religious earchas been shown for that which has been spared us. The eathedral, standing, as it must always have done, almost pre-eminent, is still more enriched, have done, almost pre-eminent, is still more enriched, not only by the manner in which it has been restored, not only by the manner in which it has been restored, but by the very judicions way in which that which is new has been introduced (with the exception, perbaps, of the drsign of the organ, on which there may be many differences of opinion). The screen, in beauty of design, is almost unrivalled by any ancient work; no one, upon looking at this, whether taking into consideration its detail or its original conception, can both the there are are arbitrart in these days. fully doubt that there are architects in these days fully equal to any work.

Mr. Gibert Scott, as the architect of Ely, descrives all praise; and were he not indebted to other works, this work alone would suffice to hand his name down worthily to posterity. C. E. Davus,

A PROPOSAL FOR THE WELLINGTON MONUMENT.

SIR,--The first step towards the realisation of a Wel-lingtou monument has yet to he takeu. A design is wanted. The competition has determined the class of designs which are not required, but it has not advanced beyond this negative result. Neither have advanced beyond this negative result. Weither have there appeared in other quarters any such practical suggestions as have given promise of filling the void left by the collapse of the competition. Unless we are prepared altogether to abandon our purpose of erecting a national monument to our great caption, it would be well that something should be done in ernest in the matter.

ernest to the matter. The authors of the competition designs went astray, because they took their first step in a wrong direc-tion. Instead of a sepulchral memorial to he placed in a Christian charch, the Wellington monument of these gentlemen was a commemorative structure suited (if suited to any locality whatever), to the courtered of a values the a metrorolitan park or a suited (if suited to any locality whatever), to the courtyard of a palace, to a metropolitan park, or a military parade-ground. They mistook a monument for a trophy. They may plead that such designs as theirs have heer before adopted for natioual monu-nents, properly so called,—for such monuments as they had been called mpon to produce. This, un-bapily, is but too trac. Still, this fact forushes not one title of an argument in their favor. We asked to be true of an argoment in their favoir. We asked from them a design for a monument to our Welfug-ton—a design at once appropriate and worthy,—such a design as this great country might be now expected to select for the memorial of the most honoured of her sons. And what was the reply of the artists of the competition ? They ignored the advance which the competition P They ignored the advance which art and art-feeling bave so happily made amougst us during the last half-century, and supplied ns with a series of such moonments, as might perhaps have passed muster about the period of the battle of Assaye." Of the models which lately took ns by surprise in Westminster Hall, while a few possessed high artistic qualities, and exhibited hoth the soulpturesque feeling of their authors and their faculty of skilful modeling, not one appeared to have emanated from a just idea of the monument required. In these designs the prevailing ideas, when not either commonplace or inappropriate, had already been re-peated ad manseam under some form or molification. And the allegoried and symbolical imagery was of peated ad nanseam nuder some form or monification. And the allegorical and symbolical imagery was of that kind which, while essentially worthless and in-deed often objectionable, was directly opposed to the simplicity and earnestuces of the great Duke, and to the strict reality of his character. In these designs, historical portrait sculpture and heraldry, as forms of expression of the ntmost power and value, were adogether overlooked and omitted, or they were adogether overlooked and omitted. subordinate degree.

very subordinate degree. Whatever qualities in the competition-designs may have caused them to he set aside, as being unfit to be actually adopted, will imperatively demaud a similar decision in the case of *every* design which, baving been conceived in the same spirit, it may be proposed to treat upon the same principles. The design which been concerved in the same spirit, it has be proposed to treat upon the same principles. The design which a favoured foreign sculptor did not exhibit, 1 accord-ingly classify with its compers. Certain remours connocted with this design and its anthor 1 refuse to notice, until there is proof that, in this country and at the present time, Art may be associated with did norms.

The subject of sepulchral monuments has engaged my special attention during the last ter years, and I have all along studied the monumental relies of past ages, no less with the view to derive from them some practical suggestions for the present and the future, than hecause of either their historical value or their intrinsic interest. And I, consequently, venture to hope that I may be acquitted of presumption if I now submit to you the substance of a communication which I have addressed to Sir Benjamin Hall on the subject of a design for the Wellington monument.

Preliminary Considerations.

1. The object required is such a monumental memorial as the British nation would be expected to erect to Arthur, Duke of Wellington.

2. This monument, accordingly, must he both appropriate as the memorial of the Duke of Wellington, and also worthy of the British nation.

 The monument required is to be placed in the metropolitan church of St. Paul, an editice in the Classic style of architecture; consequently, with the Classic style of architecture; this monument must be in perfect harmony.
 The sum of money actually appropriated for the

4. The sum of money actually appropriated for the production of this monument is sufficiently large to leave to artists unrestricted freedom of action.

In entering upon the preparation of a design for this monuncat, the first consideration will be the leading idea, which will govern the general character of the composition. This leading idea, as it bears upon the present special memorial, will be greatly influenced, if not actually determined, hy the type which shall have been recognised as applicable to every Christian monument of the highest order. This type I believe to be the oblong, raised, rectangular sarcophagus monument of the Middle Ages, surmounted by a recumbent effigy; and this type I also helieve to he equally consistent with every style and expression of art. Its appropriateness for sepalehral point every noble monument of the Christian era. From a numerous series of noble examples, I would

From a numerous series of noble examples, I would specify the monuments of our own Black Prince, and of the Emperor Maximilian, as authorities for such a memorial as I would suggest for an illustrious warrior and statesman. Accordingly, the sentiment of the design now required, with its accessories, will appear to be conveyed, after a manner, at ouce the most appropriate and the most effective, under the form of groups of historically symbolical portrait statues, with heraldic insignia and classical architectural details, associated with a recumbent portrait effigy. Always a most valuable, and a most eloquent form of monumental symholism, in the design for a monument to the Duke of Wellington, heraldry may expatiate with unprecedented power. In accordance with such views I now submit a sketch for a design as follows. The design to comprehead four orders or stages ;—

1. The first or lowermost order to form the plinth of the entire composition, and to consist of two broad hut shallow steps of polished grey granite, without mouldings or ornament. At each angle, on the upper of these two steps, a group of two statnes, of the size of life, in hronze, of soldiers, with reversed arms and downcast looks, as sentrices on duty before the tomh of the great general. The 'eight military figures which would make up these groups would represent each arm of the British army, thns: (I) Heavy Cavalry; (2) Light Cavalry; (3) Engineers; (4) Artillery; (5) Grenadiers; (6) Highlanders; (7) Rifles; (6) Infauty of the Line, represented by a soldier of the 73rd, the regiment in which the Duke held his first commission. These groups to stand clear and well in advance of—

clear and well in advance of— 2. The second order, which would consist of an oblong rectangular block of polished warm coloured granite, having a third step, more clevated than the other steps, and enriched with molalings and other carred work, as a plinth of its own,—the entire order constituting the plinthiform memher of the entire composition. At each angle of this block, a group of English flags, each inscribed with the name of a hattle or hattles, indicative of the "Hundred Fights" of the decensed bero. These flags to he in hronze or brass. Ranging from each of the angle groups of flags, towards the centre of either side of the composition, a group of historical portrait statues of lifesize. Of these four groups, two would consist of statues of distinguished officers, and two of no less distinguished statesmeo,—the brethren in arms of the Great Dake, and his associates in statemanship. Each group might contain perhaps sit figures. The groups would he set alternately ahout the granite block, and close to it, standing upon the third step., Amongst the military statues would be those of Beresford, Lynedock, Crawford, Londonderry, Hill, Napier, Ficton, Hardinge, Anglesea, Raglan, and Gurvähol Ahout and mervings is the Waterdon excitances hourishel shout a

in one group, including in their number the Marquis Wellesley; and in the other group would appear Peel, Lansdowne, and other statesmen, colleagues and friends of the Duke in more recent times—one of these being the present Premier. At the bead, and also at the feet of the composition, the historical portrait groups would be continued by statues of eminent foreign princes, generals, or statesmen, who had co-operated with the Duke: here there might appear Alexander of Russia, Frederick William of Prussia, the Prince of Orange, Blucher, Bernadotte, &c. All the sculpture to be in hronze: and heneath each statue, on the face of the third step, the coat of arms of the personages represented.

and static, of the fact of the state of the test of the control arms of the personages represented. In the composition, general treatment, and expression of these groups of portrait statues, the highest artistic genius, skill, and judgment may be displayed. In the centre of either side, hetween the groups of

arising genus, skiil, and loggient may be using out In the centre of either side, hetween the groups of statues, an inscription,—the one commemorative, and the other historical. These inscriptions to he cut in the granite, and the former of them to coutain the titles of the duke in full, the latter expressing with laconic conciseness the salient points of his career. The granite hlock to be represented as heing covered with the union.flag of England, which would be carved in the granite itself, and would partly fall over its uppermost portions.

In the granule itself, and would partly fall over its impermost portions. 3. Upon this representation of the union-flag would stand the third order of the composition. A second and smaller oblong block, or sarcophagus, of the purest white marble, rising from a plinth of Purbeck marhle, and supporting a slab of hlack marble; both of these slabs to he riebly wrought about with classimouldings. Each side of this block would be divided into four compartments by two Roman-Iouic columns, with which two smaller columns of the same order, carrying rounded arches, would be elustered. At each angle there would be a closter of the principal columns. At the head and feet there would be single-arched compartments. All these architectural members to he executed in screpentine porphyry, and other precious marbles, and inbid, where it might be desirable, with mosaic work. Beneath each of the countries in which the Duck held (an unprecedented honour) the military rank of *field-marshal*, with his sword and haton crossed behind, or at the hase of each shield, and the insignia of his knightly and military orders depending from each achievement of arms. Aswen head, the arms of the Duck's father and mother; and at the feet, the arms of the Duck himself, each with appropriate herablic accessories. All this heraldry to he studied with the utmost cere, and expressed in noble scilpture, euriched with cuamel,—care being also taken to show that heraldry is an art as well as a circure.

4. Upon the hack marble slah would rest the fourth and uppermost order of the composition : this would consist of a raised plate of fine hronze, parcel-gilt, and boldly dispered with heraldie and military devices, nottoes, &c. supporting the *cfBay*, which would be a portrait figure, recumbent, the head nnovered, and the hands upraised and clasped together. The figure would be represented in the full uniform of an English field-marshal, having thrown about it the mantle of the garter. At the head of the effigy, which would rest on a cushion, on either side a Bible, a Book of Common Prayer, and avolume of the "Despatches," and of the statutes of the realm: at the fect, the cocked hat and ducal coronet : and, on either side of the figure, the sword, marshal's haton, the sword of state, and other official insignin. The diaper of the plate which would support the effigy would exhibit the arms of the Duke's sons at their ladies, of the Tower, the Cinque Ports, &c. Some of these heraldic insignia would also be associated with the inscriptions in the granite. Oue or more texts from Holy Scripture would he introduced, and displayed about the effigy. The effigy, with its corcessit is to be executed in the fineat hronze.

If any canopy be needed, a enopy of open work, in bronze and brass, richly adorned with flags and heraldie devices, might surmount the whole. Such a canopy, of course, in its style, would be adapted to the monument itself, as also, at the same time, to St. Paul's Cathelral. Here would be a noble field for a most important display of historical and genealogical herality. I have prepared a design for this canopy, hat I do not propose now to trouble you with any description of it.

statues of distinguished officers, and two of no less distinguished statesmen,—the brethren in arms of the forat Dake, and his associates in statesmaship. Each group might contain perhaps six figures. The groups would he set alternately about the granite hlock, and elose to it, standing upon the third step. Amongst the military statues would be those of Beresford, Lynedoek, Crawford, Londnerry, Hil, until now, to see what other designs may have appendent and curve of the Waterloo period, flourished about and previous to the Waterloo period, the two publish my own. CHARLES BOUTEL.

A NON-PREMIATED DESIGN FOR THE GOVERNMENT OFFICES.

It is scarcely fait that the fortunate should alone be favoured,—the rewarded alone have publicity. So we give an engraving this week of the design for the Government Offices of War and Foreign Affairs, which bore in the late competition the number 112, and the motto "Omieron," to which a premium was not awarded, although it certainly land, and deserved to bave, a large share of public admiration. The author of this design was one of those among

The author of this design was one of these among the competitors who held, first, that the two offices ought to he united in one composition ; and secondly, that the fine frontage obtainable towards the Horse Guards' parade was worthy of the demolition of the present buildings of Downing-street, as part of the entire scheme of building comprehended in the block plan. Accordingly we find him taking the north front of the site from Whitehall to the Park as the main line of composition. Upon this he forms the plan of a recessed centre and symmetrical wings, each wing being an integer of design (one constituting the War-office, and the central portion (the Foreign-office), by the introduction of a dome and various accessories, being made the means of connecting the whole into one palatial edifice. The great extent of this front compared with the minuteness of the details has induced us to present in our engraving only one-half of the entire length, representing the War-office, or east wing, and the central Foreign of the Minister's residence generally symmetrical with the other. The central duce marks uncompared with the other.

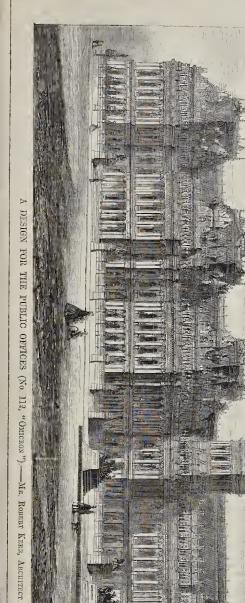

The central dome was proposed to cover the state staircase of the Forcign-office, there being a carriageentrance from behind, with a quadrangle or court of honour opening from the Charles-street or south front. On this latter front the War and Foreign Offices, without the Residence, became an integer of elevation, the Residence receding considerably as a separate huilding, with a lawn towards Charles-street. The state cutrance to the Residence was to be towards the Park on the west.

With regard to the style of design, Mr. Kerr lays down the principle that for the climate, the landscape, and the metal associations, of a northern country, the pieturesque is essentially appropriate, leaving the delicate characteristics of the Classic style to the more congecial sunshine and sympathies of the south. At the same time he objects to the details of recognised medievalism for the cliffice proposed, if ou no other ground than this,—that no one could expect medievalism to be estendedover the entire district inquestion, which alone, he thinks, would formish sufficient reason for adopting it. He therefore professes to cumply a picturesque Renaissance to present towards the classicism of Whitehall and the park, one extreme of a graduation of composition whose other extreme would he the new Houses of Parliament and the Abhey. The design, se shown in our engraving, will explain itself, hut it is worthy of heing pointed out to the student how auxionsly in this so-called picturesque Renaissance the author has endeavoured to preserve that real classicism of resthetic taste which demands the repudiation of pionant eccentricities, such as constitute not unfrequently the chief material of picturesque design. To produce the picturesque without infringing upon the sverely correct is one of the most difficult prohlems of architectural art, or, indeed, of art of any kind.

In remarking upon a design of such oroate character as this, the question of cost uccessarily desrves notice; and it may not he out of place here to advert to this question generally as regards our national editices. The public at large are prohably very much at fault upon this point. It is most commonly supposed that when we compare two designs for the same building, one of which presents an exterior of what we shall call double the emount of decoration of the other, the difference of expense upon the building is as two to one. Bat nothing can be more fullacious. The difference is as two to one—not upon the cost of the adifice, but upon the mere cost of exterior decoration, which may be perhaps a very insignificant portion of the total cost of building.^{**} This anytic the guarding the Tealend as it is

This ought to he understood in England as it is ahroad: if it were so understood in England as it is ahroad: if it were so understood, the most persevering advocates of economy would scarcely grudge the cost, properly so called, of architectural art. It may he sold to be a rare instance when this decoration reaches (externally at least) 10 per cent, on the main outlay. By all means let there be economy in respect of

Take in a needed the there we containly in respect to Take, for one instance, a large square building, may 500, by 200 feet and 70 feet high: this at is per cubic foor for a complete substantial cubic, suitably finished inside, but extremely plain, would not a to 30,000. Suppose it has one exposed front, 50 methods, and 56 feet high. Take this at 55, per superficial for a correct on the correct of a toperior order, and so that is the error cost? Only you'd - this is to say per cent. on the main outlay would in this case term the front of a workhouse into that of a place.

Sept. 26, 1857.]

THE BUILDER.

551

building,—I-t the project be really proved to he a judicious one before it is undertaken; but when fairly determined upon, let the question of economy in respect of art be properly comprehended, if no more. Our own opinion of Mr. Kerr's design we have already expressed at some length.

THE BROTHERTON MEMORIAL COMPECITION.

HAVING read your correspondent's letter on the above subject in your last week's impression, I hasten to forward you a few more particulars, and to supply one or two omissions of facts, that were perhaps over looked or two diffesions of lates, that were perhaps over-looked or innoticed by him. The competition was marked by something very like injustice at every step. There was nothing whatever mentioned as to inottoes in the advertisement; yet, when the designs were ex-hibited to the public (before decision), the designers' names were obliterated and motioes *glued* ou in their stead ; and in this condition the designs were criti scear, and in this condition the designs were criticised by the press, so that no univitiated competitor could re-cognise bis own work. Two days after the decision was made known in the *Manchester Guardian*, the draw-ings and models (with the exception of the selected drawing) were entirely removed—even the model that received the second premium; so that after the de-cision had taken place there was no chance for a "wanderer" to criticise the committee's taste. On On the way to the Exhibition-room, on this day, a door might be observed marked "Private;" but early in The hole observed marked "Private;" but early in the morning, very publicly thrown open, where the drawings could be seen, pitched pell-mell one over the other in the happiest confusion. The writer of this letter could see his own drawing, which was sent down there perfectly weather-tight, and which arrived in Salford without flaw or blemish; but it was returned on a day of heavy storm, with merely a portion of a Manchestor weekly print tied round it; two labels, glued on the face of the drawing; one even encroaching and actually on the drawing itself; with a profusion of glue and about half the hairs of a disahled glue-brush. Its transit through the weather; in the masle condition in which it was packed; cause it the conorush. Its trainst torong in the weather, in the insame condition in which it was packed, caused it to be con-siderably damaged by the rain; and I found that six tempeuny nails had heem driven through the mount and strainer, as preferable in Mancbester to the cord and ring. Your correspondent's strictures on the selected drawing are sufficient to tell of the glaring pathers of the design. nature of the design. A heavy spire is wholly supported on the heads of eight angels, who are quietly ported on the heads of eight angels, who are quietly reading books. These angels surround a Greek vase, with a rag across it, in the regular "stone-mason tomb-stone" style: under the angles are twenty niches (query, for the committee's statues?), about half the size of the angels above. The mouument was adver-tised to be cretcel for 500 guineas. The successful competitor waveringly thinks, in bis report, the monument can he put up for about the sum; but he sldy stys be leaves out the foundations, and the Gothie iron enclosure railing. VULCAN.

BIRD'S-EYE VIEW OF THE MAP OF LONDON.

CONTRASTED with Paris, or many other conti-CONTRASTED with Paris, or many other cont-neutal cities. London fails to maintain its dignify. A most happy position is lost for want of grand leading routes; a noble river multilated through sheer neglect; and many majestic buildings sarrlined, simply because they cannot be viewed at the right coup d'acid. Every artist has made up his mind that this is a most laguhrious, if not an unhappy, mctropolis; that its ways are not ways of pleasantness; and that nearly all require reformation or improvement. Were the mass of the City and its environs to he placed hefore them on probation, to stand the test of public scrutiny, it is certain that, like the *picture that pleased nobody*, the whole folio sheet would be exponged. Already that has been done in detail by various projectors, who, in condemning the narrow and crocked ways, have each of them laid claim to a sort of *patent right* for the origination of new canseways. One has dis-covered a north or a south, a north-cast, or a northwest line of intercourse; another, a great central duct; a third, an easement from St. Paul's; -but who has looked into our miserable public offices; or even into our ill-arranged and most inconvenieut (not to say ill-favoured) courts of law? Here, without wholesale demolition and reconstruction, there is abundant work demolition and reconstruction, there is abundant work for the architectural telent, as well as for the spare funds, civic taxation, or appropriations from the Exchequer. There is plenty to do in providing new offices, on a scale fairly adjusted between utilitarianism and rational artistic display; and much might still he done in opening out the better street lines, and in disencombering the many fine buildings we possess. As in a forest, the wild beauties of nature are con-cealed by its density—for "we cannot see the build-ings for houses; therefore, to redress the misfortune,

a few elearances, well conceived, might effectuate n

ore than a wholesale demolition. In the plan of St. Paul's Cathedral it was the intenaround it. Inigo Jones also, when he projected the huildings at Whitehall (of which the Bauqueting, multips at whitecail for which the badgeting house, the only portion completed, was to form but the wing), bad in view the arrangement of bis per-formance, so that it should be seen on all sides as a complete structure.

The only proof that now exists of these intentious The only proof that now exists of these intentious is the great width of Whitehall on the west front; and the fact that the cathedral presents on every side a finished front, and of such magnitude of proportion that the close obtrusion of houses never could have occurred to the architect. How could be pile up a treade see closed a critication upon and column upon temple so colossal, arcb upon arch, and column upon column, to an elevation of 200 feet, to be viewed at a distance of only 100 feet? Having receded so far a distuide of only those is intring reduced so in (and there are only there points that admit of a sight somewhat farther, Ludgate-bill, Gneopside, and Cancon-street), look up; the *façade* is foresbortened, the projections conceal much of the structural picture, and the meridian light of day dazzles the eyes of the admirer. The proportions of this noble pile are so majestic, that to study and appreciate them the be-holder should stand off at least 200 yards from its house should be a set of a set is wholly shut out

To eccase and box in a gem of great structural To eccase and box in a gent of great structuran beauty would appear ridiculous, almost as much so as the exhibition of your Claude in a railway van, or the locking up of Westminster Ahbey, lest its sculptural treasures should meet the vulgar gaze, and improve the public taste; but the occultation of St. Paul's arose from the fact that the charred ruius of the burst size which exployed the cite were printing proburut city which encircled the site were private property, the owners whereof were not treated with on the terms of a valuation jury under Act of Parlia-ment; besides that in those days grand thoroughfarcs and their advantages were not understood, the closes, alleys, and lanes, and the few small reserves of squares (as the monument) sufficiently demonstrate what were the notions of ancient Britons about that epoch

It was quite otherwise as to the plan of the White-ball, which was intended to comprehend mnny public call, which was intended to compresent annuly public edifices: then, that which led vicinage was open, from park to river, and the morsel which had been com-pleted, and which now remains, was designed in per-fect scarify that no other huilding should profanely interpose between that and the Thomes. from

Interpose between that and the Labours. There is no question but that great difficulties now oppose themselves to the opening out and improving of public buildings. The enbanced value of building sites, and the impress accumulation and subdivision of property, are barriers of no small moment even to this wealthy and powerful state; but experience has this weathly and powerin state; but experience has proved that, in every juictions dearance and renovation, the still higher increasing value of outlying plots nearly indemnifies extensive works of emendation; and as to offices for national husiness, economy is best studied by the carrying out in a hold and spirited manner upb works as are called for by the necessities of the such works as are ealled for by the necessities of the time

It is not necessary to raise a palace for the loca To is not increasing to have a particle of the refer in of every petty department, not to enrich with marbles and emhazon in gold every office; but it is esseutial that the offices or courts, or hurcaus for governmental business, should he convenient, solid, and capacious ; and, in the first coustruction of any these, it is as easy to have them well designed executed; and when the ease and despatch of public business are taken into account, it is much cheaper than to stint the outlay at the cost of a had article

The expense to the State of hiring offices on temporary leases, to bouse departments, ever on the increase with an increasing revenue, amounts to a sum total which far overtops the rental of the capital that might be required for their proper establishment and consolidation at suitable locations; and, as a rule in all way ought not only to be done well, but every such performance ought to be finished in such a manner, as that after-generations micht as that after-generations might receive them as monuments and tokens of the period of their erection.

Redundant ornamentation and gaude of finish are wholly superfluons: simplicity and unity of style, a bold outline, always in keeping with the object it subserves, should the rather characterise overy struc-ture of a public and official nature.

We are led to hope for a better order of things would pro-om the *directors* of public works of these days. plained of. Whether these expectations shall be ratified remains in doubt. Competitions have shown what may he

no appeal---none to judge our judges. No, the ver-dict awaits the final conclusion, and theu, as the motto has it, "finis coronat opus."

no appeal—none to judge our judges. No, lie ver-dist awaits the final conclusion, and theu, as the moto has it, "finis coronat opas." After all that might be advised of change in the structures bequeathed to us, a point of greater im-portance remains; and that is the river. Wread from afar, or in proximity, this is the main feature: the flood winds its devices way in might and majesty, but in filth and squader-ships, much-hucks, erank jetties, obscene sheds and warchouses, bound its stream. Everywhere else a river is a source of health, wealth, and beauty. In this commercial capital the tide is turned to thrift, and that alone. A river flowing through a rich country is the glory of the landscape: in a city, while it euriches aud aggraudizes, the varied barks and busy skifts adorn the stream. The hridges lend another majesty; but the solid quay walls and open esplanades exhibit from either side the opposing structures, across the glittering field of water! A quarter of a mile, from side to side, would also show the distat towers and steeples. All this is lost to London. The sewage question is leading on, however, to the development, which, arrive when it may, will open, as if by en-chantment, scenes that glow in every returning sun, but which must remain unseen and unknown, until the river quays and explanades disclose their versitive river quays and csplanades disclose their the reality.

SANITARY MEMS.

Water on Sundays .- The City Commission of Severs are very properly endeavouring to induce the New River Company to afford a supply to some of the poorer districts late on Saturday. It is to he hoped they will sneezed. We have shown hy elaborate examinations long ago the absence of water ou Sundays in hundreds of houses, and the great evils

Sundays in noncreas or nonsest and the per-resulting therefrom. Bethnal-green.—Two inquests have been held at Bethnal-green ; one on the body of a chill, who died in Peacock's-buildings, Old Bethnal-green road. The in Peacock's-buildings, Old Bethnal-green road. The parents of the obild were very poor, and Mr. Moore, the surgeon of the distriet, was of opinion that death resulted partly in consequence of the want of sufficient food; but that "death bad heen accele-rated through the unwholesome state of the neigh-hourhood in which the parents reside: there is a large open drain at the back of the house where the deceased died, and there were several postiferous nuisances at the rear of the house, and other manu-forduring trades carried on immediately ou the spot." facturing trades carried on immediately ou the spot." Mr. Moore said,—There were two other children at present ill in the same house, and unless they were at present ill in the same house, and nnless they were at once removed they would certainly die in a few hours. He considered that the other immates in the nonse were also in danger, and that steps should im-mediately be taken for the improvement of the place. Another inquest was held on a child who died at No. 20, Old Bethnal-green-road. The jury returned a vertice, "That the deceased died from natural a version for the place. a verdict, "That the deceased died from institutal causes, accelerated by the poisonous condition of the honse in which the parents resided." And it was re-marked that the attention of the Board of Health should be called to the place. A juror said that they paid beavy severs' rates, yet the inhabitants of Bethnal-greeu were the most neglected in the east cud of Londor. The district is inhabitant of Lordor. of London. The district is inhabited by a large number of the very poor, who require the blessing of good drainage even more than those in better eircumstances.

Scarcity of Water in Edinhurah. -A report the Edinburgh News), was given in by the Lord Pro-vost's committee, on the remit to thum, to inquire vost's committee, on the remit to them, to inquire into the cause of the deficiency of the water supply, on the occasion of the fire in Jamcs's-court. The report stated, that they bad a conference with a depa-tation of the Water Company, on the 28th ult. On the subject. Mr. Newton, on the part of the Water Company, stated that the present drought has been of nunsual intensity and duration, and to this ascribed the deficient supply on the occasion in question, as the company were unable to supply constant service the definition supply on the occasion in question is the company were unable to supply constant services for the town, and the water had unfortunately been turned off from the locality when the fire occurred. turned on from the locality when the hre occurred. He, bowever, assured the committee that, should it ever happen that the water was turned off from a locality in which there might be a fire, every effort locativy in which there might be a net every choir would be made to turn it ou without delay; but in answer to a question by the Lord Provost, did not know that anything beyond this was at present in their power. He stated that they were pressing fortheir power. He stated that they were pressing for-ward their new works, and that when they were finished, which would he on or before July, 1859, they would bave a greatly enlarged supply, which would prevent any such deficiency as that com-

It was argned that the domestic dwellings should in doubt. Competitions have shown what may have be supplied laferor the manufacturers, distillers, brevers, done, but how far the genius of architecture may have &c. but it was shown that if the public or private free scops and fair play, is still a matter of anxions works were stopped, some 30,000 persons would be conjecture—for the dread securs to he, that there is thrown out of employment. Mr. McLaren said, what they had to complain of the Water Company was, that they should be taking in

the Water Company was, that they should be taking in new manufactories and works to supply water to, when they knew they were not able to supply the public; and that their evaluate was like that of a merchant who took payment twice for the same goods, for they obtained money from the inhabitants for constant service, and yet, while they failed to dis-charge that duty, they supplied other classes. Respecting the houses of the working population, a correspondent of the same paper says.—"I have no hesitation in stating, that the working classes of Edinburgb would be amply satisfied if they could get houses with a good room and kitchen, closet, well, presses, water-closet, and soli-pipe, and I think that such houses could be oue of the greatest boons that could be conferred on the working classes j, instead of such houses would be one of the greatest boons that could be conferred on the working classes; instead of as they are just own paying 4.4. to 5.4. for one room (per annum), and 7.4. and 8.4. if you have a room and kitchen; and there is no tradesman who is able to pay 71. or 81. without baving lodgers, or some other way than his wages. I allude to such as masons, jointers, planeters, slatters, and such like, ... and I am sure that there are hundreds of work-ing men in Edinburgh who will strain every nerve to second the enterprise by purchasing the houses if they are sold at prime cost."

A SANITARY COMMISSION FOR OUR ARMY IN INDIA

ARMY IN INDIA. THE urgent appeal which we were impelled to make three weeks ago, calling for the appointment of a sani-tary board, with men to carry out their instructions, to proceed at ouce to India for the preservation of our troops (the enlistment of science and forethought against ignorance and carclessness), has been very loudly echoed by our contemporaries, but no steps have yet been taken that we are aware of to meet the requirement. The Daily News, the Morning Post, the Standard, and many other papers, reprinted the whole of the article, and the letters we have received from men best fitted to form an opinion on the sub-ject have strengthemed our convictions, and afforded fresh evidence of the good that would be done by such an appointment. The Skeffield Independent, com-menting on our appeal, says, menting on our appeal, says,-

Menting on our appeal, says,— "Such as taff might be a new thing under the sun, and its duties would be very delicate and difficult—possibly involving danger of collision with the odheers and many of the uages of service. But we conceive the thing is not imprastrable, and that it would work well. Every great and good thing carries its own perils and labours along with it, and if the plan here indicated be set aside on that of the investment of the set and the duty on the ground of the incorrelated involved, althouty on the ground of the incorrelated involved, althouty of the results would be the saving of thousands of lives."

After reprinting our observations, the writer continues

"These common sense views commend themselves to "These common sense views commend themselves to verybody"s judgment, and ought to weight both with the Becruiting-office and the Treasury. To preserve the life of cur own is almost as great a necessary in war as to them the sense of the sense of the sense of the sense that the sense of the sense of the sense of the sense and also of the neutral grave, and thus of adding immensely to our available force. The cost of such an an electron an untimely grave, and thus of adding immensely to our available force. The cost of such an an electron and the sense of the sense of the sense an includuable saving in every way.". The appointment should be made at once: not a moment should be lost; indeed, it might be desirable to give powers by telegraph to a gro lempore board of men already in Ludia, pending the arrival there of the permanent staff.

Sir, — The news from India states that the brave General Havelock, when just on the brink of great suc-ecss, was object to retire, not before the arms of the test in order to entry off his sick, a large poreess, was obliged to retire, not before the arms of the enemy, but in order to carry off his sick, a large por-tion of whom were suffering from cholera. A short time ago you suggested the necessity of express samitary measures heing employed for the preservation of our army in the *List*. I feel satisfied that each moult will show more the necessity for such an arrangement. I do not mention this for the purpose of adding to the already great anxiety of connections at home, but believing that the lives of many of the brave near who are fielding on hatties may be saved at home, but beheving that the lives of many of the brave near who are fighting our battles may be saved by the cuployment of proper sanitary officers, let me begy you again to mrge the necessity of immediately sending to tudia a body of men similar to that which was employed with such excellent effect in the Crimea. The flower of the British army is leaving our shores ope enry their arms into a daugerous climate. We vive in the days of the locomotive and the electric electronic our soldiers no locger co into hottle with vive in the days of the locomotive and the electree ledgraph : our soldiers no longer go into battle with the crosshow and buckler. Let us trust, then, in this age, which is remarkable for the progress of science, that those who have the great responsibility of pre-nerving our countrymen will not neglect, until too late, date employment of such means as will have the sure lifteet of preserving many valuable lives. VIATOR.

THE BUILDER.

CHURCH-BUILDING NEWS

Eastbourne. — The accommodation afforded by Trioity Church, Eistbourne, having become inade-quate to the wants of its district, it is proposed to erect n chapel of ease to that church, at Set-side. A lady connected with the parish has presented a site and the sum of 1 5000 are no molement. But here and the sum of 1,500, as an endowment. Further subscriptions, amounting to about 9800, have also been promised, and collections made amounting to nearly 150?. The estimated cost of the new church nearly 15 is 2,000/.

Kilkeel .- The parish church of Kilkeel, according Attacet.—Inc parsa caure of Kitker, according to a Newry paper, has been for a length of time under-going a general renovation, the nave being remodelled, the old galleries taken away, and a new gallery erected in the west coil. The work was done, under direction of the Ecclesiastical Commissioners, by Mr. Robert Morae of Newry, who is also proparing an open Magee, of Newry, who is also preparing an op Gothic roof for the Church of St. Patrick's, Newry.

France Lynch, Bisley .- On the 15th inst. at the llage of France Lynch, situated on the burder of village of France Lyoch, situated on the burdler of Bisley-common, the new church of St. John the Baptist was consecrated. The edifice bas been creeted chiefly through a gentleman unknown except to a few individuels. The church stands at the head of a dell sloping down to the Chalford valley. Mr. G F. Bodley, of Brighton, was the architect. The edifice consists of a chaucel, nuce, and north aisle. The length of the nave is 57 feet 10 inches, and width, 18 fect: the north aisle is the same length as the nave, and is 9 feet 2 inches in width; and the obancel is 27 feet 9 inches long, by 17 feet 6 inches in width. Three is a vestry, over which is the organ-chamber, which opens into the chancel. The porch is 9 feet long, and 8 leet 6 inches in width; and the height from the floor of the nave to the spex of the roof is 38 feet, and from the ground line to the top of the bell turret; of porter is a commond line to the top of the bell turret; of porter is necessarily and the spex of the roof is 28 feet, and from the ground line to the top of the bell turret; of porter is a vestry. 60 feet. There is accommodation in the nave and aisle for 228 adults and thirty-five children; and in nisle for 228 adults and thirty-five children; and in the chancel for ten adults and fourteen children. All the scats are free except those in the chancel. At present, some of the windows are filled with plain ghas; the others are filled with stamped gloss, by Laver, of London. The roof is open, the timbers being of deal, stained and varnished: the bench ends are of oak, and the sents stained deal, and all var-nished. The seats in the chancel are carved oak. The chancel floor is covered with Miuton's encaustic tiles. The chancel steps and the font are of Deronshire Chancel HOOF is COVERED with Arithue sencestic uses. The chancel steps and the font are of Devonshire marble. The pulpit is of Painswick stone. The reredos is composed of alahaster, marble, and Minton's figured tiles, and in the centre is a circular panel, in which is a cross of marble of different colours, inhald when is a cross of marke of unterest counts, unlad on a while ground. There is a curved cornice over, of Painswick stone. The corbels and cups of the arches will also be carved. There are two shafts of polished marble on each side of the chancel arch, also marble shafts at the cast window; and it is intended to have polished marble shafts to all the windows of the acharcel. the chancel.

to have polished marble shafts to all the windows of the chancel. Chichester.—At a recent meeting of the Local Burial Board, teuders were opened for the recetion of a houndary-wall and two chapels, and the lodge, for the new cemetery. The tender of Mr. Charnock, of Christoburch, Hants, was accepted for the erection of two chapels and the lodge, at a cost of 1,8204. For the building of the boundary-wall, die tender of Mr. Chase, of Marden, was accepted for the development of the recent of the constant of the second of the tender of Mr. Charnock, for the chapels and lodge (accepted), 1,8204; boundary-wall, 2154; Mr. Ellis, Chinester, chapels, &c. 1,9504; wall, 2244; Mr. Chase, of Marden, chapels, &c. 1,0401; but the tender for the wall, 157; 10s. which portion was accepted by the Board, 2,2314; Mr. Johnson, Chichester, 2,2764, for the chapels, &c.; Mr. Fabiau, Brighton, chapels, &c. 2,1764; wall, 2650; Ms. Ms. Caler, Purbrook, chapels, &c., 2,3204; wall, 2650; Ms. Sat. Caley and Bourdi-man, Hambledon, chapels, &c. 2,4509; wall, 2144; Mr. Philocoks, Brighton, chapels, &c. 2,4704; wall, 4434; Mr. Chase, Emsworth, chapels, &c. 2,7504, for heads, 2,7504; Mr. Fabiau, Barlathon, chapels, &c. 2,1764; Warl, Recalls, Brighton, chapels, &c. 2,1764; Warl, Recalls, Brighton, chapels, &c. 2,1764; Warl, Yardon, chapels, &c. 2,4707; wall, 4434; Mr. Chase, Emsworth, chapels, &c. 2,7504; wall, 4434; Mr. Chase, Emsworth, chapels, &c. 2,7504; wall, 4436; Mr. Fabiau, Barlathon, chapels, &c. 443. Mr. Chase, Emsworth, chapels, &c. 2,750.7, wall, 443. Mr. Chase, Emsworth, chapels, &c. 2,750.7, wall, 180. Mr. Reynolds, Brighton, chapels, &c. 2,523. ; wall, 439. Ug/torpe.—The Roman Catholic Church of St. Ann,

Lightorpe.--The Roman Catholic Church of St. Ann, at Ugthorpe, nine miles north of Whitby, was re-opened on the 15th inst. with great ceremony. The church was created in 1855. The chapel has been walled and foored, so that about 100 sebolars can be accommodated. The church is hull in the transition style of Gothic architecture, the chancel being a little more ornste or advanced in period. The plan con-sists of a porch, entering beneath a tower, nave and e style of Gothie architecture, the chancel being a little more ornate or advanced in period. The plan con-sists of a porch, entering beneath a tower, nave and aisles, chancel, and vestry. The total length of the building internally is 85 feet, the nave being 62 feet long. The greatest width is 39 feet, the nave being 19 feet wide. The internal elevation is 31 feet up to the ridge of the nave, and the tower rises externally to a height of 45 feet at present. A spire, which is

projected, would increase the beight to 70 feet. The nave is lit by a large western window, with geo-netrical tracery in the head, and small elerestory lights. The aisles have two light windows, with pierced beads. The nave areades are formed by stone arches, on circular sbafts, with caps and bases. The chancel has three side windows of two lights cach, and an eastern window of three lights. The roots are all open timbered and boarded. The chancel has now been beautified with a mosaic tile pavement from Messres. Maw's munificatory at Broseley. The lower portion of the chancel and its root are decorated, the bermer in timts of marcon, green, and gold, hy Mr. W. former in times of narcon, green, and gold, hy Mr. W. Stonebouse, of Whitby. The staired glass eastern windows of the chancel and south aisle, and the west window of the nave, lately put in, are by Messrs, Hardnan. The east window consists of three lights and tracery, in the Early Decorated style of archi-tceture. In the earter light is a figure of Our Lord enthrough, instituting the Eucharist, and surrounded enthrouged, instituting the Eucharist, and surrounded by ruby scraphim, surmounted by a floriated eanopy, in which are introduced hulf-figures of angels hearing a scroll, with appropriate legend. The lower part is filled with foliage, arranged in form of crosses. The whole is bordered by a coloured ornamental margin. In the side lights are figures of the Virgin Mary and St. Anne, upon dispered backgrounds. The west window, of four lights and tracery, contains the fifteen mysterics of the poart, three mysterics is a each of the St. Anne, upon chapter obsequences, the twindow, of four lights and tracery, contains the fifteen mysteries of the rosary, three mysteries is each of the four lights, and three in the circles of the tracery, the groups being connected by the branches of a rose-tree, which is carried throughout the window. Over the porch at the outside is a statutet of St. Anne, The window in the south aisle has two lights and tracery, and comprises a group of the holy family, including St. John the Baptist. The Virgin is seated ngou a throne, holding a rose, and Our Lord, standing figure of St. John, behind whom St. Joseph kneels in adoration. The groups are surmounted by an architectural detail is of the simplest possible description, but aniform in character. Whatever of ornament there is in the fittings or completion of the fairie is the site. there is in the fittings or completion of the simplex possible description, but uniform in character. Whatever of ornamed there is in the fittings or completion of the fabric is concentrated in the chancel. The entire cost of the edifice, which is cretced of stone, lined throughout with brickwork, to ensure internal dryness, and including furniture, adornments of stained glass, is about 1,500/. Mr. Wm. Falkingbridge, of Wh &c is about 1,500%. M was the contractor. Messrs. Weightman, Hadfield and Goldie, of Sheffield, were the architects.

and Goldie, of Sheffield, were the architects. *Wolsingham.*—A memorial window, by Mr. Walles, has recently been placed at the east end of the newly-erected chancel of Thoralcy Church, Wolsingham, Durham. The window consists of three lighte, the centre light representing our Lord on the cross, and the Magdaleuc clasping the foot of it: in the left light are the Virgin and the other Mary, and in the trajet light St. John and the Roman Centurion. The tracery above is filed with angels bearing emblems.

Lookles.—The Free Church, Lochlee, was re-opeued on the 10th inst. by the Rev. Dr. Guthrie, of Edinburgh, in presence of the War Minister, Lord Pannure; Mr. Hay, the architect of the building, &c. Pannure; Mr. Hay, the architect of the building, &c. The new church is situated on a rising Knoll, and forms a picturesque object in the approach from Brechin, and from Invermark, the sbooting lodge of Lord Pannure. It is a simple parallelogram, 61 fect long and 31 feet wide, with a campapile or tower, part of which forms the vestry. On the south side is an open porch, about 13 feet square. The church is Gothie in its general treatment, with semi-circular arched windows similar to the Norman, divided into five bays, a three-light window at the west, and a two-light window at the east end. The root is framed with semi-circular arched trusses, purling, and rafters. with semi-circular arched trusses, purlins, and rafters, all painted and varnished in imitation of oak. The architect's design, it is said, has not been folly carried architect's design, it is said, has not been forly carried out in some particulars, such as the building of the wall, and especially in the roofing of the church with the flue grey Forfarshire flags.

SCHOOLS IN THE PROVINCES.

Sheffield .- The foundation-stone of St. Marie's Roman Catholic schools for girls was laid in Suffolk-Broughed.— The Holdadovisions of the Marke's Roman Catholic schools for girls was hid in Suffick-read, on the 15th inst. by the Duchess of Norfolk. The site is avacant piece of land immediately opposite the Farm. These schools are intended for poor girls, to consist of an apartment 50 feet long by 30 wide, for the more advanced pupils; and a room 52 feet long by 24 wide, for infants. To both schools are attached class-rooms, and a corridor or gallery, which connects the two together, will be used for a dining-room and play-grounds attached. The buildings will be con-structed of brick, with stom facings, in a simple style of ecclesiastical architecture, in accordance with the objects in view. The site (half an arer) is the gift of the Duke of Norfolk, and his Grace is a sub-scriber to the building fund, which is raised by voluntary contribution, aided by the Privy Conneil grant. The entire building will cost 2,600?. The architects are Messrs. Weightman, Hadfield, and Goldie, of Sbeffield ; and the contractor is Mr. George Wade, of

the same town. Hull.-The foundation-stone of St. Paul's Church Hull.—The foundation-stone of St. Paul's Church New School, for boys, was hald hast week. The building, the plans of which bave been approved by the Committee of Council on Education, will be in the Early English style, of white birds, with stone dress-ings. The principal school-room will be 73 fort 6 inches in length and 30 feet in width, with desks arranged along each side capable of scating 250 ebil-dren. There are to be two class-rooms 20 feet by 10 feet 6 inches each, in one of which there will be a gallery. The roots are to be open timbered, with gallery. The roots are to be open timbered, with principals baying arched rins springing from stone corhels, and all the timbers stained in imitation of oak. At the intersection of the school and class-rooms, there will be a ventilating turret. The area imitation of

Contact, and an true timbers standed in imitation of oak. At the intersection of the school and class-rooms, there will be a veuilating turret. The area of the school and class-rooms is 2,805 superficial feet; and, according to the rate of S feet per child, on which the committee of council have their calculation as to capacity for teaching, accommodation for about 350 children will be provided, and a play-ground will be attached to the school. Mr. Botterill, of Hull, is the architect; Mr. Hull, the huilder. Humslet,—The foundation-stone of a new Sabbath and day school, in connection with Wesley Chapel, Humslet, was laid on the 14th instant. The site schetch is in Leathley-road, Pottery-field, the coutro of a dense and increasing population; and the school, when completed, will comprise a school-room 76 feet long by B5 broad, and master's residence, and will accommodate 250 boys and girls, and 150 infants, as day scholars, and a still larger number as Sunday scholars. The estimated cest is 1,706/t, of which 1,500. bave been raised, including a grant from the Committee of Council on Education, of \$367, it he balance baving been raised by subscription. Neucostle-upon-Tyne. — New Roman Catholie schools, with a most we result.

Newcastle-upon-Tyne. - New Roman Catholic schools, with a master's house attached, have just been completed at the Brooms, in the immediate neighbourhood of the Cousett iron-works. The buildiugs are Gothic, and are of stone, with open timbered roofs, stained and varnished, projecting over the eaves, and finished with an ornamental ridge tile. eaves, and finished with an originizental ridge tile. The walling is built in long, flat courses, pointed with dark mortar. The school is cutered by two porebes, for boys and girls respectively, constructed of timber and stone, and set upon a stone base, the timber being moulded and stained, and filled in be-tween with small courses of stone. Upwards of 150 children attend the school, and, with the exception of a few ponnds subscribed, the whole cost has been defrayed by the Rev. G. Duon, of the Brooms. The architect from whose designs and nucle whose super-intendence the buildings have been carried out, was Mr. Archibald M. Duun; and the contractors Messrs. Gibson and Stewart, both of Newcastle. was contractors were

THE MARYLEBONE FREE LIBRARY.

THE MARYLEBONE FREE LIBRARY. The statement made by "One of the Committee" of the above unfortunate and mismanaged institution, in the Builder of the 12th inst. is not allocather satisfactory. I do not think the placated, snnouching lis close and the petern of books to the members, could have been uffield distributed, solveged, the distributed and the section distributed, solveged, the distributed and the section time states and the comment of the section of the secretary, he said they contemplated transferring them to the formison (Archibshop's) Library, at the back of the satisfield section and solved the way face, very imperfectly known; or even preferably, the London Mechanics Institution. If Application serve made to mary of the contributory as stated, why was it not made to all the san some than they were entitled to, and displays a principie that can searcely be defended.

CLAN CHATTAN.

THE SHEFFIELD CRIMEAN MONUMENT **COMPETITION**

THE following letter from Mr. T. L. Donaldson, to the committee in this matter, dated 17th September, will show what has been done :---

We committee into indicit, valed True September, will show with this back done:—
"Green baring arranged the drawings and models sent in by the competitors, at the rooms of the Royal Institute of British Architects, Messre, Mitchell, Thomas H. Wyatt, Owen Jones, and myself, attended there on Friday, the 11th instant, and conferred and examined the several designs. Mr. 6, 6, Scott could not attend, being out of the Norday, the 14th instant, and conferred and examined the several designs. Mr. 6, 6, Scott could not attend, being out of the Norday, the 14th instant, and conferred and examined the several designs. Mr. 6, 6, Scott and Mr. Owen Jones and we will show the several designs, a paper was handed to me as umpire the several designs, a paper was handed to me as umpire to cecies thereon.
It appeared that two of the gentlemen voted for '1A. In memoriam,'s mothel with an obelisk and figure of victory, distributing wreaths—for the first prize.
Two also voted for a Cothic design, with the motto, 'Tout set pour le mieux duss le willow with the motto '1 out est pour le mieux duss le willow with the motte '1 out est pour le mieux duss le weilleur des mondes possibles."

In virtue of my office as umpire, in consequence of the qual balance of votes. I adjudge that the first prize be warded to the model, 'In memoriam' aforesaid; and be second prize to the Gothic design, 'In memoriam' foresaid.

nee second prize to the Gothic design, "In memoriam" incoresid. In consequence of the equal balance of votes among the original referes, I concerte that the committee may exer-cise a discretion in the selection of which of these two should be carried into exerction, in order to choose the one which may be the most adapted and best suited, from local circumstances, to curry out the views of the sub-scribers in the most satisfactory manner. But in either an able and suisfactory manner. The one to which I have awarded the premium requires much taste and as to require considerable modification to reuder it a stable and permanent of the Gothic design is so defective, as to require considerable modification to reuder it a stable and permanent erection."

HOUSE AGENTS' ACTIONS.

HOUSE AGENTS' ACTIONS. As a castion of my brother agents and surveyors I send for a decision of the Judge of the Brompton County Court is an action in which I was the defendant. Being the agent of twenty-two houses in one terrace, most of them centry, I put the plainiff in one to take care to be, and what he was to be pad per west, beildes acmi-tant in the second of the second second second the second second second second second second the second second second second second second that a tenant was found for. Subsequently-some six months after, eight of the houses being on mortgace, were after a general twes found for. Subsequently-some six months after, eight of the houses being on mortgace, were of the agency, leaving me but fourteen to manage. To cost of these fortreen my servart, the plaintiff, still having been reduced, I permitted him also to act for the house the own arrangements with him. This be did, wethely, and two of them having been let, he sect in a commission as I was paying him on the letting of the four-ceen houses. The mortgage de chicken dyamet, and the student me set he sect in a servart and the student we set in the meantime dismissed, then are due as a but agent for the armed in actions in written align decided that I may per I gave him on the duage decided that I may per, hecanse I had not free my securat, the plaintiff, a form and notice in written duage along along the secure has a site in service house, the two as not he agent of the mortgagee, and had and forgorten all about. The the follow, my be haw, but it certainly cannot be

to say that it was not ine egent of the mortagelet, has and has neglected to eithdraw the said paper, which, indeed, had forgotten all about. This, Mr. Editor, may be law, but it certainly cannot be ustice, to make me pay for the letting of houses of which was not the agent when let. W. MOXOK.

THE ARCHITECTURAL ASSOCIATION.

THE opening conversazione will be held on the 2nd of October, when an address will be read by the president, Mr. Wigley. Papers have been provided for all the public nights, as follow :-

for all the public nights, as tollow :--Oct. 16. " On the Public Libraries, Art Schools, Museums, and Buildings in London, with the Ad-vantages they offer in Architectural Education," by Mr. S. C. Capes. 30. "Architecture in connection with Competitions;" Mr. E. Mallandaiue. Nov. 13. A paper by Mr. J. H. Christian. 27. "Review of the Instructions on Ecclesiastical Build-ing by St. Charles Borromeo;" Mr. G. J. Wigley. Dec. 11. "The Education and Professional Lives of the early Halian Architects, Artists, and Sculptors, contrasted with the Education and Professional Lives

ARCHITECTURAL UNION COMPANY.

SUPPORTERS of this undertaking are gradually consolidating themselves, and are coming in; but in the mean time the directors find they are obliged to close with, or to reject the advantageous offer of the premisses in Conject the advantagious out of the pic-misses in Conduit-street. They must pay the whole purchase-mouey down, and have the alterations, &e. to make. Will you permit me, through your pages, to call attention to the fact that some 3,0007, are still to be provided, and that as the directors pledged themselves, in the first instance, not to proceed unless they could do so "safely and easily," they will, in duty to the shareholders, he obliged to lose an excel-

Lucas, of Belvedere-road, and Mr. Thomas Grissell Surely there are many more among the great and wealthy contractors who will lend a hand on this occasi

occasion. That part of the scheme which supplies galleries for the Architectural Exhibition and its adjuncts should be of especial interest, as it is sure to add greatly to the profits of all connected with building manufactures. The warm way in which Mr. Magous, Mr. Peirce, Mr. Jennings, &c. &c. have entered into the matter, is a proof of their appreciation; and they are able to inder. are able to judge.

JAS. EDMESTON, Jun. Hon. Scc.

ST. CROSS HOSPITAL.

ST. CROSS HOSPITAL. As one who has taken and does still take a deep in-terest in the above magnificent and noble institution, with reference to the malversation of its richly endowed property. I was much gratified in reading the peti-nent observations which appeared in a recent publica-tion. The funds of that hospital, or more properly of the two, "the hospital of St. Cross," refounded by Henry de Blois, in 1157, in the parish of St. Faith, for a prior and thirteen impotent men, as a curative hospital, and the "Alms-house of noble poverty," founded within the precincts of the former, by Cardi-nal Beaufort, in 1444, for a master, thirty-five decayed gestilemen, two chaplains, and three nurses, are, when ultimately restored, and the charities obtain their right, capable of maintaining near 400 perma-nently crippled veterans of out army and navy, inare, when ultimately restored, and the charities obtain their right, capable of maintaining near 400 perma-nently crippled veterans of our arroy and navy, in-stead of at present only thirteen non-eligible men. The charity of Cardinal Beautori has long censed to exist, and the thirteen impotents reside in that foundation, their own having been razed to the ground years ago. The church is, as yon justly observe, a most beantful specimen of art, and being public property, ought to be exhibited to public gaze without filtby here; hut, sir, it may be gratifying to your readers to know that the days of the funsies who sanction such things are numberd, for, from the mastership of the hospital being proved, and admitted to be an *ecclesiastical* benefice, the Court of Chancery have no jurisdiction over it; and Mr. Knight, the member for West Worcestershire, intends bringing the whole of this nefarious case before the House of Lormons, and an olde lord before the House of Lords, as nothing hat Parliament can, under such circumstances, deal with it for the future ; and when all the infamy is fully exposed—as exposed it shal and will he—ito public view, they will, as you int at, if not corrected, apply the "apple-twige" remedy most unsparingly. remedy most unsparingly

H. HOLLOWAY, Late Churchwarden of the Parish and Parish Church of St. Faith and St. Cross Hospital.

THE HIGHWAYS OF MILE-END.

-

MAY I ask the favour of being allowed, through

MAY I ask the favour of being allowed, through the medium of your very nesful columns, to say a few words on our public highways? I would take this opportunity to express to you the pleasure I often feel in reading the many papers in the *Builder*, in which the merits of the workers in the useful and the beautiful are discussed; and also with the severities with which you treat occasionally those offenders who will venture their filmsies and their phartagies to the public.

those offenders who will venture their minasts and their phantasies to the public. It is pleasant, sit, to note the many improvements now going on in the town--the demolition of the old hole-and-corner order of things, in the dark purlieus of which erime and infamy had so long and so securely nestiled. These are the beginnings of a bealthier characteristic of metropolital life than that

bealthier characteristic of metropolitau life than that known to the fathers of the present race, and which will, doubless, in due time, produce a sounder and worthier tone in the domestic arrangements and tendencies of the coming generation. But to my object. I would introduce to public consideration, not the peculiarities of art, or any of her deeds, but a plain fact—the disgraceful condition of some of the highways of the metropolis. The one I would particularly introduce to public notice is that of Whitchenal-road, with its continuation of Mile-I would particularly introduce to public house is line of Whitechapel-road, which is continuation of Mile-end. This road, the most sirv, spacions, and plea-sant of all our main thoroughteres, running in one broad, straight line from the town, is obstructed and disfigured to an intolerable extent. A thousand sorts they could do so " safely and easily," they will, in disfigured to an intolerable extent. A thousand sorts at the start of the shareholders, he obliged to lose an excel-lent opportunity, unless enabled to act at once by an excel-immediate accession of support? Their pasition is and all over the waste ground, from the pare-ments, and all over the waste ground, from the pare-ments, and all over the waste ground, from the pare-ments, and all over the waste ground, from the pare-ments, and all over the waste ground, from the pare-ments and all over the waste ground, from the pare-ments and all over the waste ground, from the pare-ments and all over the waste ground, from the pare-ments and all over the waste ground, from the pare-ments and all over the waste ground, from the pare-ments and all over the waste ground, from the pare-though clayed from some cause or other. I trus before Tuesday next shares for the greater part of the above sum will be applied for. The Anxiliary Donation Fund continues to receive accessions, and among the more recent are Messrs. Its combined with the forts of the subters, hawking and spitting, from the boy of twelve disfigured to an intolerable extent.

Soch is the state of things, particularly on Suodays. The pathways are then impassable; and uoless you are disposed to fight your way through the filthy crowd, and fill your lungs with the foul effluvia, you erows, and m your lungs with the fool emittin, you are compelled to give up the footpath and take to the read. No wonder that the *Times* cells us a "rough lot" at Mile-end 1 Now and then complaints are heard against the

"authorities," for permitting this mischiel; but all this is mere smoke. Why, it is the authorities themall selves—I mean the people of the district—who originate and perpetuate the mischief. Shopkcepers, organize and perpendict the missions. Snopkepers, now-n-days, are not content with a reasonable display of their goods in their shops, but fill the pathways with them; thereby giving the passengers, not only an opportunity of seeing them, but of kicking them hefore them to test their true merits. Yet this action of their goods cannot be merrits. Her this exposure of their goods cannot be to the ioterest of the owners. Who but an idiot would hay White-ehaped furniture? It to varish and joinery of which are daily exposed to the dislocating iofluences of the events of the interval

are daily exposed to the dislocating iofluences of the sun, the wind, and the rain. As I understand the law, the vestry, as consti-tuted by Sir B. Hall's Act, are vested with the power to manage the affairs of the parish throughout these details. If so, how can they look on the disgraceful state of their main thoroughfare without feeling the natural impulse to use their power in the endeavour to abate the evil? One would imagine that they would feel broud to use their power to cheave and instural implication of the evil? One would imagine that they would feel proud to use their power to cleanse and heatify this their public highway, possessing in tiself so many desirable capabilities. I am willing, however, to grant that vestrymen have some enrices the great the second to the se Napoleon, it is said, found more difficulty in the little domestic squabbles of bis own fire-side, than in his conquests of Europe; so with the vestrymen. The greatest parochial heart will throb with leniency The greatest paroental heart with three with the tenter when called upon to do its daty upon a chum, whom it sits beside in those cozy adjournments to the "Pig and Whistle," which will ever occur in the best regulated vestries. A TAX-PAYER OF FORTY YEARS' STANDING.

ENCOURAGEMENT TO DESIGNERS. ELECTRO-SILVER BEDSTEAD FOR EGYPT.

ELECTRO-SILVER BEDSTEAD FOR EGYFT. A LARGE German or electro-silver styte hedstead, manufactured by Messre. Charles Williams and Co. of Oxford-street, is now on view at Willis's-rooms, St. James's. It is one of six which were ordered by the late Vicercy Abbas Pasha, in contemplation of the marriage of his son to the daughter of the late Saltan of Egypt. Three of them are camp bedsteads, which admit of being taken to pieces and deposited in a case of very small dimensions. The dimensions of the bedstead on view are, height 13 feet, length 7 feet 6 in. and wildt 5 feet. The head of the bedstead is composed of polished pieced work out of the solid metal, and is surnounded by a rich Italian foliage. The foot partly harmonizes in character with the head, but has ou the outer side a shell-like ornament in bold yielief ioo large in seale for the rest of the in bold relief too large in scale for the rest of the design. The sides are composed of rich Italian scroll-work, the open work being shown by crimson velvet lining. The base consists of polished Guil-beke ornament, and the entire work is surmounted by an arched canopy, supported hy four light, bril-hantly polished pillars. We understand that the cost of the six articles will not be less than 10,000/.

The manufacturer seems prond rather than othererved wooden bedstend shown in the foreign depart-ment of the 1851 Exhibition. We have not the same feeling on the matter, and regret that none of the 10,000% spent is to go to art. This is encourse 10,0007, speut is to go to art. This is encouraging our designers with a vengennee. The workmanship of the bed-tead is excellent, but we do not appreciate the choice of the material for such a purpose.

STAINED-GLASS WINDOW FOR ELY CATHEDRAL.

MR. FRANCIS OLIPHANT, aided by Mr. Dyce, R.A. AIR. FRANCIS OLIPHANT, anded by Mr. Dyce, R.A., has just now excended a window for Ely Cethedral of more than common excellence in several respects. It will be remembered that it was proposed to set up here a cloristers' window, but those to whom it was mentioned fell off when money was needed, and the present work, commenced under the original proposi-tion, is inserbed, " In honour of God and his wor-bia this activity," in honour of God and his worship this window is presented by Thomas Ingram, some time chorister in this church." Mr. Dyce, we ship some range range in this current. Jr. Dyce, we understand, gave his services gratuitously, in conse-quence of the circumstances, and the painter also met the views of the donor. The window is of three lights, and is an illustration of the text "Praise ye the transmission of the text the service of the text of the service of the servi lights, and the Lord : all the Lord: and is all his angels, bolh young meu and madrow, ski men and characo press, ye the Lord?" In the centre, David, scatel, gives praise with his harp, and a crowd of worshippers behind raise their

voices. In the loft-hand light, females, and in the right males and children, earry out the idea: the whole are mader fourteenth-contury canopies. The figures, although sufficiently conventionalized, are well drawn, and the expression of some of the heads-than of the female with the musical instrument in the left. -that of the female with the musical instrument in the new hand light particularly—is excellent. The whith glass, judiciously introduced in thin lines, is very good—pearly and sparkling. We may safely con-gratulate all the parties coocerned. The white is very

Mr. Oliphaut has in hand a large east window for the church at Diss, to be creeted in memory of the Rev. Mr. Manning, the late rector.

NOTES UPON IRON.

THE iron trade has experienced a serious check in the last ten days. Nearly all communications between the British ironmaster and his very valuable customer on the other side of the Atlantic have been suspended (1) the series are supported by the series a supershall until the money paule in America assumes a somewhat different feature to that which it now presents. During the time that we have uamed, a large number of orders recently sent from the United States market have been conuternanded, and the execution of others has been suspended. The home trade, however, con-tinues tolerably good; and since our last report thore has sprug up a better demand for plates intended for girders for bridges, and other wrought-iron erections. There are now also afloat orders for considerable quantities of iron of a description which show that struc-tures of a like kind are being multiplied in this country. Material of no ordinary quality is songht country. Material of after in such iustances.

The state of the trade cannot be spoken of so favourably as the mooner in which we had cause for meutioning it last week. Most of the firms that are largely engaged in the Americau trade would now, we doubt not, be accessible at a shade lower rates ; whilst doubt not, be necessible at a shade lower rates; whilst iron of a quality equal to some sent from the larger number of those houses may be obtained at 20s. less than they are quoting. Still there is no good ground for declaring a reduction for the next quarter upon the rates which have ruled in the last, and for some time previously. Therefore, the preliminary meeting, which will be held next Wednesday at Wolverhamp-ton, will pass off with a recommendation to the quarterly meetings, that will commence a fortnight afterwards to comfirm previous rates. afterwards, to confirm previous rates.

The trade in pigs remains very quiet; and very the was done in the way of sales either at Wolverlittle was done in hampton on Wednesday, or at Birmingham yesterday (Thursday).

LONDON FOOD.

It is feared that our cattle may be attacked by a murrain or distemper, very fatal, which may be called by some other name. In fact, it is thought that this complaint has not ooly reached Ireland, hut also our own shores, for serious cases are reported to have happened in Worcestershire.

happened in vorcestorsme. It is scareedy our province to inquire how these dis-cases, which are sitollar in their effects upon certain kinds of hrute beasts to plague and cholera in human beings, are brought from place to place; but it is certain that, although the cholera is evidently not iofections, it that, annough the choice is evidently not notections, it attacks particular districts under certain eirenmstances, when people arc sticken down as if by the sword. We have conquered various plaques which have sordy beset humanity in this metropolitan eity; and it is shown day by day that we are by sanitary arrangements driving away those local ageocies which attreet melarin and bill mythered. d kill multitudes. The same good management ich saves the life of man will save that of beasts. and

Let us therefore most impressively direct the atten-tion of those who have the care of eattle to those sure sanitary laws which will save them.

Cows and horses, and singing-birds, will no more

be free from peen in fevers and pesitiences, in ill-conditioned places, than their owners. If this murrain of cattle should unfortunately spread in England, then it will demonst the con-sideration of those who have the management of these affairs, if it would not be better to remove the auimals, under the advice of those who understand the value of proper drainage and the working of these plague diseases, to neighbourhoods which may be more saluhrious.

Let us recommend to those who have cows kept in Let us recommend to those who have cows kept in London, to see that the sheds in which they dwell are well ventilated and draimed, and kept thoroughly eleansed, both for the sake of the cows and the inha-bituats: and it also will be most important that the officers of health should most carefully inspect the food of the poor, for we canoot believe, although some sintements have been made to the contrary, that animals which die from disease can be proper for the bod of chree endower or doths. The contrary cannot carry off the effects of putrefaction. It has been thought that the improved arrange-

ments at the new eattle-market would have been ments at the new eattle-market would have been sufficient to have prevented the admission of any un-wholesome oven, pigs, sheep, &e. into that place for sale. We fear, however, that discretion has not been shown on this point, for only on Friday last we saw some cows, the fag end of the market, being driven up to town, which attracted every one's attention. The backs were arched up: in parts the bone was seen through the skin: they were, in fact, in the last stage of discase; and yet, notwithstaoding the sal condi-tion of the poor hrutes, the udders were of extraor-dinary size. It is sickening to think that these ewes had been recently supplying milk, and were probably duary size. It is sickening to think that these eves had been recently supplying milk, and were probably going then to be used for the food of the poor. The driver, when asked where he was taking the animals, said "To the Zoological Gardens." The autho-rities of Smithfield market ought not to admit into that place animals which are unift for humon food : some special supervision should he established,

PROPOSED BLACKBURN INFIRMARY,

Wirm reference to the plans for this structure about to be chosen in competition, Mr. Lang, a surgeon of the towo, has addressed a letter to the *Leveston Guardian*, rightly urging that the principles acted on in the conrightly urging that the principles acted on in the con-struction of the large hospitals in Frace, should have full consideration before the plan for Blackhurn he selected,—" that each sick ward should occupy the entire width of the building, that there may be no blauk walls, but the windows opposite each other along the effitire sides: these windows should extend to the very top of the room, be exactly far enough apart to admit two beds, with an intervening space of 3 or 4 fect between them. No bed should be under or opposite a window, nor within 3 fect of the wall, nor nearer than 12 fect from the beds of the opposite side of the ward. A ward sufficiently large for thirty and nearer than 12 lect from the beas of the opposite side of the ward. A ward sufficiently large for thirty beds is infinitely preferable to five wards of six heds each. The best mode of heating an hospital is by means of large fires or stoves in the rooms, and no mode of ventilation will be successful which discourse the of ventilation will be successful which disregards the wiodow arrangement described. A finely-perforated metallic plate may be adapted to the top of each win-dow, as it will be required in windy weather. Each ward should be completely isolated, the entrance being from the open air." The writer says correctly, that some of the most recently-erceted hospitals in this country have been budly planned, and are con-sequently the cause of protracted disease and death to many of their afflicted inhabitants. The editor of the *Guardian*, in a note on Mr. Lang's letter, makes kind and flattering reference to recort articles in the *Builder*, on the subject of hospital construction, wherein we set forth and advocated the arrangement adopted by Mr. Lang.

NEWHALL-HOUSE, MILWAUKEE.

NEWIIALI-HOUSE, MILWAUKEE. THIS large and recently crected hotel was opened on the 25th olt. and a grand festival in honour of the occasion given at the Albany-holl; also a new struc-ture immediately opposite. The committee alone consisted of 500 persons, and the citizens took five thousand tickets, of five dollars each, thereby render-ing the celebration the most important of the kind that has taken place in the north-west. We under-stand the cuire cost of the building is about 160,000 dollars, and 70,000 dollars for fitting up and furnish-ing, a large portion of which eame from the East. The building has a frontage, to Main-street, of 180 The building has a frontage, to Main-street, of 180 fect, with a flank, towards Michigan-street, of 120 It is six stories in height, exclusive of hase-aud is faced with Milwaukee brick, which is feet. stated to be of excellent quality. The grad entrance is to Main-street, and leads to a spacious hall whece branch the corridors of which the principal apart-ments are provided. Suites of rooms, comprehending all the set of the space of th all the usual arrangements and accommudation in such establishments, arc provided. Situated at the rear of the building is a magnificent and very large diningof the building is a magnificent and very large daming-room, freescoled by an eminetent artist, Otto Friiz, who is also decoratiog the Hyatt House at Jancsville. Imme-diately above the Isdies' private staircase is an enclosed piazza, usually appropriated for smoking purposes. The soloon, or bar, occupies a prominent position, and is said to be "replete with all the com-forts for the inword [outward] man." A splendidly

appointed billiard-room is also added. The fourth, fifth, and sixth stories are appropriated The fourth, hith, and sixta stories are appropriated to bed, dressing, and bath rooms, &c. the supply of hot and cold water being very complete, by means of water-works, with engine, in the hasement story. Each room has its fireplace, and ventilation has heen carefully provided for. Large tanks, with a perpetual supply of water, are constructed on the roofs, and so arranged as to flood the whole building, or any portion durance in seen of accident the fine. (Solid) arranged as to note the whole building, or any portion thereof, in case of accident by fire. Cooking provi-sion is make for 500 persons, not the kinemas, with laundries, drying and ironing rooms, with accommo-dation for servants, are in the basement. All the in-

RECENT PATENTS.

RECENT PATENTS.* WILLIAN RICHARDSON, Ranelagh-grove, Pimlico. -Improvements in the use of Iron, or any other Metal, by itself or in combination with other mate-rials, for structural purposes. Dated 18th Fehrmary, 1857.—The essential principle of this invention is the use and application of iron, or any other metal, in segments holded together in combination with hrieks, tiles, or any kind of pottery, or concrete, or wood, as a lixing to the iron, so that the parts and the mate-rials heing connected with each other, and securely fastened together, and the joints made good, the whole combination shall form an air and water-tight structure of great strength, the iron being the out-side, and the other materials referred to the inside of such structure.

MARMADURE WILLIAM HALLER, SL. Georges road, Ecclesion-square. — Securing Windows, §°c. Dated 13th February, 1857.—This invention consists in an improved arrangement of apparatus for securing windows and other openings in buildings. For this purpose vertical bars are employed, and these bars are ranged at a short distance spati across the win-dow or opening to be secured as when ordinary fixed here are employed but in place of being normaneutly. bars are employed, but in place of being permanently but are employed, but it place to come permanently fixed at a distance apart, they are connected or jointed together, so that they can be folded or brought close to each other, and packed out of sight in the spaces at the sides of the window or other opening where shutters are usually fitted.

shutters are usually fitted. WILLIAN COOKE, Cornhill, London. - Ventilating. Dated 14th February, 1857. - This invention con-sists, first, in an improved method of constructing ventilators of wire gauze or other perforsted material, so that they may be suitable to he fitted to the sash of a window or door, so as to occupy the place of one or more squares of glass or other material.

HENRY YOUNG DARRACOTT SCOTT, Brompton Barracks, near Chatham, Kent. — Cement. Dated 19th February, 1857.—This invention of an improved manufacture of cemost relates to certain improvements manufacture of cement relates to certain improvements in a process previously pat-nted by the present patentee, and hearing date April 17th, 1856, wherein hurned lime is subjected to the action of sulphurcus acid, and thus a plaster stuce or mortar which will quickly set and attain a considerable degree of hard-ness is produced, the action being apparently due to the presence of a small per-centage of sulphate conse-quent upon this treatment. The object of the present invention is to impart to quick lime the properties of a cement hy means of an iucxpensive and convenient process, which is carried out in the following man-ter :--Lime prepared by any of the ordinary methods process, which is carried out in the following man-ner :--Lime prepared by any of the ordinary methods is by mechanical means reduced to a powder, and is intimately mixed with from 5 to 10 per cent. of its weight of gypsum, sulphate of lime (commouly known as plaster of Paris), or sulphate of iron, or sulphate of magnesia may be added thereto. In order to proof magnesia may be added thereto. In order to pro-duce a sufficiently pure state o' division and intimate admixture of the several ingredients, he finds it conadmitthe of the sector ingrecents, he nots it con-rement first to mix the line and either of the sul-phates shove-mentioned by hand, and then to grind them in a mill, and finally pass them through a holt-ing sieve. The line should he perfectly firsh when nsed, hut should have been drawn from the kiln a day or two, according to the state of the atmosphere, before grinding. The resulting mixture is packed in rags or casks for use, and is treated as other calcareons cements.

WIST-END TERMINUS FOR RAILWAYS. -- With reference to the suggested adoption of the site of the Grosvenor canal and hasin for a west-end terminns, Licut.-coloncl Pottinger asks us to say that its

Licut.colonel Pottinger asks us to say that its availability for the purpose was first suggested by him, and brought to the notice of the Crystal Palace Company. We comply with the request, although it is by no means evident in the documents sent to us that this really was the ess, however assured of it the writer himself may fed. Grassow HABBOUK.—One of the heaviest and most cosily works ever undertaken by the Clyde Trust is now approaching completion.—the new addi-tion to the South Qany wall. The length of the new wall is nearly one-linit of a mile, and when it is completed there will he a stretch of quay-wyll west-ward from Glasgow-bridge of 2,028 yards, or fully a mile and one-eight ho f quayage for vessels on the a mile and one-eighth of quayage for vessels on the sonth side of the harbour. The section of the wall is enrvilinear in front and vertical at back, is in thickenrymear in not and vertical at over, is in india ness seven fect at top and sixteen feet at hottom, and contains in all about 650,000 cubic feet of masonry and concrete, or short 47,000 tons weight. Some of contains in all about 500,000 cubic feet of masoury and concrete, or about 47,000 tons weight. Some of the stones employed in the wall weigh fully three tons, and the only dressing they receive is from the "pick." It is intended to give a depth of 20 feat at low water, so that the largest vessels when laden may lie affoat at all times of the tide, as in the docks of Lowdow at Limmang, and in this recent it forms to the harbour and Liverpool; and in this respect it forms the most important addition that has yet been made to the harbour. Its cost is about 50,000?.—Scottish Press

AND CARPENTERS' STRIKE SHIPWRIGHTS' SHIPWRIGHTS' AND CARPENTERS' STRIKE AT WHITERAVEN.—About ninely shipwrights and thirty joiners have been idle for a period of seventeen weeks, when, during the whole of that time, the former might have been receiving 1.4.4s, and the latter I/. Is, per week. At Maryport the hands were only off work a day, which sufficed to show them the folly off as trike. In all, 120 men have been roluntarily off, and sequences, weeks, and the loss to the comof a strike. In all, 120 mcn have been voluntarily off work sevencen weeks; and the loss to the com-munity of Whitehaven will in that time amount to nearly 2,500. A considerable number of bands are out of employment in Liverpool and other places, and the resources of the union are growing more and more inadequate to the demands upon its funds. The strike must, therefore, shortly terminate.—Cumber-land Parcnet.

Strike must, interest of shorty terminate: Candeb land Pacquet. ARCHENDLOGICAL ASSOCIATION FOR WARWICK AND WORKSFER.--In accordance with a resolution passed at the recent joint meeting of the Worcester Diocessu and Birmingham Architectural societies, a meeting has heren held at Birmingham for the pur-pose of taking the necessary preliminary steps for the atability of the Manual Statematical Construction of the theory of the theory atability of the theory of the Manual Statematical Constru-tability of the theory of the Manual Statematical Construction of taking the necessary preliminary steps for the pose to taking the necessary printmary problem is to the establishment of an Archeelogical Association for the connties of Warwick and Worcester. Mr. C. H. Bracebridge presided. Resolutions were passed to the effect that the new society be entitled the "Mid-Ind Counties Archeological Association ; " and that the subscription be 10s. 6d. per annum, members of other archeeological, architectural, or antiquarian associations being admitted on payment of 5s.

associations being admitted on payment of 5s. annually. BURNS'S MONUMENT TO BE HIDDEN.—The trustees of Barns's MONUMENT TO BE HIDDEN.—The trustees of Barns's MONUMENT At Ayr, lately requested the promoters of the new church at Alloway to suspend the contractors' labours for a little, it order that the public might have an opper rinnity of subscribing the sum nocessary to definy the expense of its removal to a less obnoxious site; but the result, it appears, has only heen that the huilding operations are now ordered to proceed with increased vigour. THE CAUNENT DEFENSE SERVER AT LIVERPORT.—

THE CABINETMAKERS' STRIKE AT LIVERPOOL THE CABLETARKERS STRIKE AT LIVERTON. Five journeymen cabinetmakers, John Griffiths, Bos Warher, James Rowe, James Harris, and William M'Millen, have been committed for trial at Liverpool, Al Millen, have been committed for trial at Liverpool, under a charge of conspiracy. They were brought before the police magistrate charged simply with inti-midation, having attempted to force one Walter J. Stevens, employed by Mr. Thomas Bradley and others, to refrain from working for them as a journey-man cabinefmaker. The case arises out of the strike which has continued since 9th May last, and has greatly obstructed the course of trade at Liverpool ever since, althouch only a small unique for the series greatly obstructed the course of trade at Laverpool ever since, although only a small minority of the men-had conspired against their fellows. Stevens had heen obtained from Plymouth. In order to earry out their illegal procedure, they had paid considerable sums advanced hy Mr. Bradley to his men, in order to secure their co-operation, or rather their co-idleness, and had threatened others who had re-sisted their pretension to interfere with them. In the summe of bic eccemination. Mr. Bradler, for the pure sisted their pretension to interfere with them. In the course of bis examination, Mr. Bradlev, for the pur-pose of showing that this strike was tyranny hy the minority of their follows, produced a list of journeymen eabinetmakers in the country. It comprised 50,000 men, of whom only 1,000 were members of the asso-ciation. In Manchester, he said, there were 600 enhiermakers, seventy of whom only were members of the association. of the association.

Builder. The

HE condition of various parts of London, in a sanitary and social point of view, the improvements required, and the results of efforts now making with a view to amelioration, demand continuous attention. So many-sided is London, so nnmerons are the points of inquiry it presents, so enormous and weighty the interests involved, that it needs many endeavours before the whole can be grasped, the co-operation of many minds before much can be effected. It is no easy task to get a clear idea, even, of this mighty maze,-

"Of London, of its strets, its bridges, crowds; St. Paul's, the broad moon sailing o'er the dome; The rich cared abby, will its thousand frets And pinnacles, religious with the dead; Of the brave spirits who go up to woo That terrible City whose neglect is death, Whose smile is fame; the prosperous one who sits Bole in the summer sun; the crowd who die Unmentioned, as a ware which forms and breaks On undiscovered abores."*

Our business has long been to make known to one-half of its denizens how the other half live, and to this second half what the first half are doing for them. As we happen to be in the neighbourhood of King's cross and Gray'sinn-lane, let us retread some of our former paths, and note what changes have been made. Near the bottom of Maiden-lane, or, as it is now called, York-road, a hospital has been commenced for the relief of the suffering poor of Camden-town, Somers-town, Kentish town, New Smithfield, Highgate, and Islington. This still infant establishment was founded by, and carried on for six months at the sole expense of Mr. Statham, one of the medical officers; but as the number of out-patients had become on the average about 300 daily, and as many of these were pressing cases of disease and acci-dent, it was resolved to enlarge the premises, and make them suitable for hospital purposes, for which more funds became necessary. These alterations have been carried out at a cost of about 600% and a number of patients have been admitted. Dr. James Copland has become consulting physician, and Mr. Skey, of hospital. During the first six months of the street to receive subscriptions. The pages of cases were attended to cases were attended to.

The number of attendances and patients amounted altogether to 28,055. Of these cases, 1 in 192 are known to have died. The above figures show that assistance is needed in this neighbourhood, although at a first glance onc would think that the Free Hospital in Gray'sinn-lane would bave been sufficient. However, when we consider the immense populations of Camden-town, Agar-town, and Islington, it is evident that an establishment of this description cannot fail to he useful. It may be a matter of consideration whether it might not be advisable to remove further to the north. Patients are admitted without letters of recommendation, and we must mention that this, "The Great Northern Hospital," is now entirely depending

on voluntary contributions for its support. Feeling as we do the great need there is of medical assistance to a large class of the more moderately paid workmen and others, partienlarly those who have families of children, it has occurred to us that it would be wise if those

* Alexander Smith : " City Poems."

who are engaged in the formation of institutions the hospital we will not now speak. such as these were to provide a department treat of that on some other opportunity. where persons of moderate means might, by monthly or quarterly payments, obtain efficient medical advice.

Additions have been made recently to the Royal Free Hospital in Gray's-inn-lane. In the winter of 1827, a wretched female, under eighteen years of age, was seen lying on the steps of St. Andrew's Cburehyard, Holborn-hill, after midnight, actually perishing through disease and famine. She was a total trious Classes, at the commencement of their stranger in London, without a friend, and died two days afterwards, unrecognised by any human removal of the numerous tenants. Matters, bowbeing. by Mr. William Marsden, the surgeon, who had heen repeatedly struck with the difficulty and in the court, and the persons living there offered danger arising to the siek poor, from the system opposition: in fact, a spirit of dissatisfaction of requiring letters of recommendation before seemed to have been created, and eventually it admission to the public hospitals, and of having only appointed days of admission; he at once determined, with the co-operation of several friends, to set about founding a Medical Charity, persons upon whom a favour is being bestowed to which destitution and disease should be snfficient introduction. On this principle the first Free Hospital was established in Grenville-Steet, Halton-garden. By the influence of the the alterations were commenced, a man kept his late Sir Rohert Peel the patronage of King donkey and dogs in the dwelling, and it was George 1V. was obtained, and the hospital went on extending in usefulness. In IS32, when the cholera first appeared in London, the governors at once threw open the doors of the hospital to all who were afflicted by the pestilence. More than 700 cholera patients were on that oceasion admitted. In the years 1849 and 1854, when the repairs required, and have improved some the epidemic again visited the metropolis, more of the arrangements. The place is much brighter than 3,000 in the former year, and 6,000 in the latter, were upon the same principle relieved by this hospital. The metropolis owes it a debt.

In 1842, the premises in Gray's-inn-lane, which bad heen originally creeted as a barracks for the light Horse Voluntcers, being then vacant, and appearing snitable for the purposes of the charity, three of the governors, trnsting to the liherality of the public, took upon themselves the responsibility of purchasing them. Since removal here, the number of patients has continued year after year to inerease. From the date of its foundation in our readers will refer back to the engraving we 1828, up to the 31st December, 1856, 565,780 (upwards of half a million) patients have obtained relief. During the last year, from January to of ruin. The house in the centre has since been December, the total number of cases relieved cleared away, and an opening made through to was 44,287.

We were glad to learn that the poor do not seem to be nnmindful of the benefits received here, as is shown by the quantity of copper coin (part in farthings) which finds its way the book in which receipts are recorded show such entries as the following :-- "Inclosing 2s. 6d. in thankfulness for first earnings from a sphere throughout the court was unbearable : the little boy." "Inclosing 2l. from J. S. and half broken pavement was recking with rotting httle boy." "Inclosing 22, from J. S. and hall broken pavement was recking with rotting a sovereign, as a tithing to God and his sick hrethren." "A thanksgiving to God, from in misery. What the minds must be that are Matilda, 10s." "A thanksgiving in time of formed in such a mould, the world should by health for assistance in sickness, 1/." "I'. Is, a free gift for legs and arms."

 Λ long list of donations, presented in a similar spirit, might he mentioned, had we space. must not, however, omit to state, that during become more prosperous: the debt has been last year a poor mechanic left a brown paper cleared off, and, what is unfortunately a surparcel at the gate of the hospital, which was found to contain his watch, still ticking. In there is a small balance in the hands of the November, 1844, a Bank of England note, of treasurer. During the year, the Benchers of the value of 100% was found in the subscription- Gray's inn have repeated their former grant of eoming. Bis dat qui cito dat." is

hospital; and even at prescut a much larger a circular, appealing for an increase of annual number of patients might be admitted if the subscriptions; and it is worth mentioning that finds were increased. Of the construction (f) one of the first replies was from the head elerk

We must

Hospitals and the dwellings of the poor come so much into view together, that we prolong our journey for the purpose of inquiring how matters are going forward in Tyndall's-buildings, Gray's-inn-lane, a spot to which we have before alluded. Much trouble has been experienced in getting the court reclaimed and put into proper order. The Society for the Improvement of the Dwellings of the Indusoperations here, were anxions to prevent the This distressing event being witnessed ever, did not work well. The society were unable to get possession of the whole of the houses was deemed expedient to clear the whole of the houses. All have now fallen into the hands of the society. It is painful to find that a body of could be so thoughtless : it must, however, be attributed to ignorance and prejudice, which will before long vanish. In this place, when donkey and dogs in the dwelling, and it was necessary to use both persuasion and force before the removal of the animals could he effected.

Tyndall's-buildings (the former condition of which we illustrated some time ago) are now More destitute of inhabitants, but are still lively with numerous workmen, who have nearly completed than it was. It is true there are here no lengthened ranges of columns or other architectural beanties, but the whole place is now in repair, the drainage is improved, and cach room is fitted with a view to the health and cleanliness of its inture inhabitants. From top to bottom the place has been put into livery of snowy whiteness, and looks quite dazzling against the blue sky, which was as bright when we were last there as can be reasonably expected in the present condition of London. One great improvement must not be overlooked. If gave of the former state of the bottom of the court, it will be found that it presented a scene the space beyond, and this has a capital effect : many of our London courts might be treated in the same way. It is intended, we are told, to build a church and schools on the vacaut ground which snrrounds the court.

Charlotte's buildings, close by, will afford a contrast. When we examined it a few days ago-the weather was warmer than it is now,it was in an abominable condition. The atmosphere throughout the court was unbearable : the

have been brought to their "conclusions," without fall consideration of the subject, and the quantity of matter accumulated by them. We have already give a the main positions at which they arrived; " and it will he recollected that one of the features of their scheme was a considerable extension of the points of outfall down the river, and provision for the flow of the sewage, in this extension, in wide channels of slight fall, and in great part uncovered. Such open channels the Referces believed would be made commantively immorians since according to their to the flow. channels of slight fall, and in great part uncovered. Such open channels the Referces believed would be made comparatively innoxions, since according to their scheme, the sewage would be largely diluted by tidal water to be admitted at Barking and Plumstead; whils the provision of these channels would serve the desired object of szwage ntilization, insomuch as the problem regarding it could be best solved through private anterprise, for which the channels would offer facilities. As to the inhabited area, the proposal of the Referces did not differ in principle from the previous plaus of intercepting severage, excepting that it provided for a larger area of drainage, and much greater increase in the population. The ques-tions of agricultural value of sewage and utilization of that to London, as well as of the influence of sewage on the river at high and low water, nt various points in its course, were referred to Dr. Hofmann and Mr. Witt, and form the subject of an elaborate report which is printed as the first Appendix. The second Appendix gives results of a microscopical ex-amination by Mr. R. Etheridge, of Thames mud and Thames water. No as expanses to have been made Thanks water. No new appears to have been made and Thanks water. No new appears to have been made of any investigations of the Sewage Commission. The Report to the Board of Health, by Mr. II. Austio, † is slightly noticed. Many schemes involving sewage utilization, and other suggested improvements in drainage, and put forth specially for London, how-ever, were inquired into, and, it would appear, rejected. rejected.

ever, were inquired into, and, it would appear, rejected. Appendix III. gives various reports and tables of ex-periments undertaken, and information collected, with a view to determining the quantity of sewage and rain-full for which provision should he made. The average discharge of the principal severs during varions durations of time was ascertained; and the discharge per arce and per head of population was estimated and tabulated. The rainfall, and percolation, and the water-supply were inquired into. One tabular stat-ment gives the population present and prospective, of the metropolitan and subsidiary districts, with the area in acres; and another shows the sewage, rainfall, and population provided for, in the several high and by diagrams, and by maps, one showing the course of the noian severs. These subjects are also illustrated by diagrams, and by maps, one showing the course of the noian severs, and the relative mortality from cholera in the several districts, and one marking the extent of ground eovered by the metropolis in the severs 1/45, 1818, 1884, and 1857, respectively. Experiments were undertaken by Mr. Blackwell on the effect of running water in moving substances such as might get into the severs is and her results, with drawings of the objects, are given in Appendix IV. Appendix V. affords information as to the river and tides; and is illustrated with plans, showing the experi-iments with foats at Burnham, on the These coast.

Appendix 4: anotas information as to the Pier and tides; and is illustrated with plans, showing the expe-riments with floats at Burnham, on the Essex coast, (applicable to the question of outfall in the German Occan), and thas made on the river in the present Occan), and those made on the river in the present year; and has a diagram explanatory of Mr. Forster's experiments in 1851. To a later Appendix (IX.) is a plan illustrating Mr. Homfray's experiments with floats, --for the opponents of the Board of Works' scheme, also in this year. From these data, the Referees conclude that a float, put into the centre of the stream at birth worker will more Works' scheme, also into appoints of an black of Works' scheme, also in this year. From these data, the Referes conclude that a float, put into the eentre of the stream at high water, will move down with the chbing tide, ascend again, and oscillate so that at the and of a fortinght, it will he found to have reached a point in the river about five miles helow that at which it was put in. But it was also found that the floats had a frequent tendency to set in shore, and markedly so about the point selected for the outfall by the Metropolitan Board. The shoals there caused eddies and slack water, so that deposits of mud, similar to those at present to be observed in the Thames, and from which the chief nuissnee arises, would he peculiarly liable to he formed. Some spot in the river where there would he the action of a strong current, would therefore he perferable, it is thought. Moreover-whilst the floats were followed up and down, in the strength of the stream,--much of the sewage flowing in at every ebb-tide, would hang ahout in slack water, and be liable to be carried with the float to a greater degree even than is recognized in the Report. The same Appendix (V), is illustrated by sections of the Thames at the points proposed for the outfalls by the Reforces, and diagrams showing the rise and fall of the tide at various places. Appendix VI, gives much information furnished by " See page 447, end, "The Naim Daimage of London."

* See page 447, ante, "The Main Drainage of London." † See page 447, ante, "The Sewage Manure Question."

in a law stationer's office, stating that he and can in any wayhelp, will hunt out the schools in his fellow clerks, twelve in number, had agreed to subscribe one penny each every week, and in aid. If we are rightly informed, the Ragged that they had doubled the first week's subscrip-tion to start fair with the new year: this is an example which might be usefully followed. If scholars; 95 Day Schools, with 13,057 scholars; 117 Scholars; 91 Day Schools, with 13,057 scholars; example which might be usefully followed. If the kind thoughtfilness shown by the twelve clerks should be imitated by the establishments is which large numbers of persons are well employed, important results would follow. It is interesting to have to relate that in the once notorious "Thieves' Kitchen," in this court, a regular religious service has been established by one of the tachers of the school. Weekly because on popular subjects are given in this one of the teachers of the school. Weekly lectures on popular subjects are given in this and many of the London ragged schools, and, at appointed times, from fourteen to twenty work, and, while so occupied, a hook is read to them. The little lending library begins to be used; and the sums subscribed to the provident clothing club, chiefly in pence and farthings, steadily increases. A ladies' working meeting has been lately commenced, to assist in nunking clothes for the children: this meeting is held at stated times, in the evening from six to eight stated times, in the evening from six to eight o'clock. Our space will not permit us just now to mention other hencess which have been caused by the establishment of this school : we caused by the establishment of this school; we have said enough, however, to show that the exertions which have heen made here are spread-ing good principles and inducing good acts in the place of those which formerly emanated from the "Thieves' Kitchen" and its sur-

scholars; 95 Day Schools, with 13,057 scholars; 117 Evening Schools, with 5,085 scholars; and 84 Iudustrial Schools, with 3,224 scholars, The Day Schools employ 163 paid instructors, the Week Night Schools, 126, and the Refuge and Industrial Iustitutions, 43; besides 2,139 voluntary teachers. The Refuges are sixteen in number, and furnish food, clothing, heds, and education, to 500 inmates, to say nothing of the large number who have been cuabled to zo to the colonies, with every prospect of a of the large number who have been endoced to go to the colonies, with every prospect of a good future. This is certainly cheering, and should encourage their supporters to persevere. Improve the homes, and teach the children, and we shall soon lessen the numbers of the it descented cheere "persever". "dangerous classes," prevent much suffering and misery, and enable men aud women to live out the term of their natural lives, and to play their proper part in increasing the sum of gene ral wealth and general happiness.

REPORT OF THE REFEREES ON THE MAIN DRAINAGE OF LONDON.

The plan for the main drainage of London, as recommended by the Referees, has been published, together with the Appendices; and the complete Report bas heen sort to the Metropolitan Board of Works. The several documents now form a hulky relation in the destination of the several documents on form a hulky from the "Thieves' Kitchen" and its sur-roundings. We have alluded thus particularly to the Fox-court Ragged School, because it was founded in one of the worst neighbourhoods and is a type of those which are now planted in so-and pelieving that the Ragged Schools will he an important means of raising the position of the more destitute classes, that they are Social Bridges over Moral Swamps, we again express an earnest hope that such of our readers as

Mr. Bazalgette; a map showing his scheme of drain-age; sections of sewers with the flow in dry weather compared with that during storms; and elevations of the exits or severs under the late Commissioners for Westminster and part of Middlesex. Appendix VII, gives the information as to local drainage obtained from the district surveyors and others, and Appendix VIII, reports by Mr. Joha Reenie, Mr. Gwilt, and Mr. l'Anson, supplying knowledge of its former condition. Appendix IX, affords information on special points in Mr. Bazalgette's phan, and observa-tions on the expeliency of uniting the drainage of the marsh lands near the Thames of the opponents marsh lands near the Thames with that of the metro-polis. It also includes statements of the opponents to the scheme of outfall na proposed by the Metro-politan Board. To these parties, the report of Mr. Iomfray was addressed. The Appendix also gives evidence from Mr. Rawlinson, and the commis-sion for the Havering and Dagenham level. Objec-tions by Sir Charles Barry to the construction of Mr. Bazalgette's proposed low-level sewer, near the Houses of Parliament, are also stated, and information is given as to similar objections by Mr. Cockcrell with reference to St. Paul's Cathedral, in a similar case in 1831. in 1831.

Schemes for the main dependence of the metropolis, submitted to the Referees pursuant to their advettise-mend, are given in Appendix X, with particulars of some clever contrivances for doolorizing and filtering some quere contrivances for doolorizing and the contri-duction of the schemes have been carefully tabulated; and the particulars and exidence are illustrated with maps and diagrams. A form of apparatus for lifting, on the principle of the Archi-median serew, suggested by Mr. Hu-band, deserves particular attention. Ordinary pumps would hardly be found to answer. Mr. Slate proposes a form of Persian wheel with the same object. Messrs. McClean and Stillcoun's plan for earrying a sever to the German Occan, is specially referred to in the report, and objected to on the ground that the sewage would deposit on the coast at the place suggested, where have by Messrs. Richardson and Clark, the prin-ripal feature is the construction of a great iron tube for the sewer, above-ground, and supported on iron columns. The idea was put forth some time ago, through our columns. Sevidence as to the use of the synhon in the drainage of Hamburgh, is give a by Mr. Lindley in Appendix XI. Appendix XII, gives evidence bearing upon the question of utilization ; and Appendix XII, with other information, gives sections and plans showing in a very striking manner, the diliendities which have to be met, a aising from the extra-ordinary number of pipes and mains which three are under the street surface. The patieular scheme itself of the Referees treats itself of the Referees trace. The partner as a metro-politan, and naturally belouging by renson of levels to the metropolitan districts"; and 2. That "heyood the metropolitan districts"; and 2. That "heyood the metropolitan districts"; and 2. That "heyood the metropolitan districts." The "addi-tional districts," or over and above the "prospective area" of Mr. Bazalgette, the plan shows extending along the valley of the Lea to Hoddesdon, heyood Waltham Abbey, and far soulh of Crwydon, and in-cluding Barking and Wildon on the north side of the Thanes, and Wimbledon and Chilstchart ou the south; whils the "prospective area" above referred to, provided for a comparatively small area comprised within the localities of Twyford, Hauvell, Brentford, Richmond, Barnes, and Chiswick. The "metropolitan districts" on both sides of the Thanes, are divided districts" on both sides of the Thames, are divided into areas to be drained by gravitation, and areas from which drainage is to be crisical by artificial means. The area of the former character on the north side of the Thames-33 square miles—includes Paddington, Hampstead, Holloway, Stamford-hill, Homerton and Bow, stopping short of Stepney and Poplar, in one p.rt of the circuit, and just takes in St. Paul's Cathedel and Hyde-park, in the southern boundary. On the south side of the Thames, the area of the same character - 48 square miles—following the outher on lower margin, takes in Rochampton, Putney, Waadsworth, Claphum, Brittor, Lewishan, and Greawich (but not Deptford), Charlton and Plumstend (without Woolvich). Nearly coinci-dect with the lower marginal lines as described, on each side the river, intercepting sewes are proposed acces what the lower marginal inter as ecsential, of each side the river, intercepting sewers are proposed to be formed, one taking the sewage to the com-necement of the main outful sewer at a spot on the river Lea towards Plaistow, and the other to a similar most of a similar. First the Rayenbourne, near Deptford. At both these places sewage would have to be raised. The areas remaining next the river, --that is, on the north, sixteen square miles, including Shepherd's-bush, Haur-mersmith, Kensington, Fulham, Chelsea, the south neighbourhood of the docks and western margin of

the Lea; and ou the south-twenty-one square miles the Lea; and ou the south--twenty-one square miles-including part of Patney, Battersca, Lambeth, Cam-berwell, Deptford, and the lower part of Woolwich and Plamstead,--require that the distance should be raised by ait dicial means. A auto point of con-fluence for the sewage from Chiswick and Hammer-smith, Whitehall and other localities on the north of the river, and from Lambeth and other places on the south, would be established at Battersca (part of the sewage being thus taken a cross the jury) whence The sounds would be established at Battersat (part of the sewage being thus taken a cross the liver), whence it would he pumped into the intercepting sower. The sewage from Bermondsey and Deptford would pass to the pumping station at the Ravensbourne; whilst that from the docks, the Isle of Dogs, and Poplar, would be taken to the similar spot near Bow and Plaistow. Sections of the line of the even while the section of the line of the Bow and Plaistow. Sections of the line of the two main outfall chancels, from the lifting stations to the points of outfall below Mucking Light-house and Stanford-le-Hope, in Sca Reach, on the uorth, and at Highma-rerek, below Gravesend, on the south, are supplied; and it is shown that the channels would have a fall varying from 1 foot to 6 inches a mile, for the main pottion of the length. A total length of six miles on each side of the river, is to be provided for in the estimates, for covered portions in the neighbourhood of buildings and public reads.

It will have heen understood that the barmlessness as regards health, of the open elaunels, cal the pro-per flow of their contents, is made degendent upon the ample supply of water admitted from the river. The idea necessarily oreurs,—what would be the effect of wilhdrawing from the river the controls volume of water which might be needel ? This point the Referes dismiss with the senteuce—"We have considered the probable effect of these works more the régime of the river, and we are of opinion that it will be inappreciable." But this is not the only point that seems to require furth reonsideration. The fall of 6 inches in a mile for ditcles—mas pointed out by Mr. F. Doulton,* less by very much than that of the river where shoals have been constantly forming,— seems to need very careful consideration ere the ex-It will have been understood that the barmlessness river where shouls have been constantly forming,— seems to need very careful consideration are the ex-penditure of the 5,437,2657. (or 3,144,300%) for the outfalls alone), is sneedineed. The scheme, as we have shown, leaves the questions of utilization, separation of rain-fall from sewage, and others, as they were; or rather, in some respects, it opposes itself to propositions of the kind allnded to. Whether any further assistance in the settlement of such questions may be got from the Appendices, we may have another opportunity for ascertaining. another opportunity for ascertaining.

RAMSGATE.

RAMSGATE has had a fair share of visitors this season, and will doubtless long continue a favourite resort—with its grand seaviews, fiue pier, good accomresort—with its grand sea views, fue pier, good accom-modation, and pleasant localities hard by for exer-sions. These who are most immediately interested in the well-heing of the town should, netertheless, lose no opportunity to increase the facilities for visit-ing the place, and neglect no means of improving it in a saminary and artistical point of view. The round-about railway to it foom London is a dreadful missince, and the company appear to take fitch pairs to smooth the journey or altract pressengers. At certain times the fares are moderate, but let the luck-less wight with tender wife and dozen olive branches he forced to hesten or delay his coming or going, and resorthes wight this has the order of a coming or going, and be forced to hasten or delay his coming or going, and lo ! the cost is more than doubled. The desirability of keeping time, too, on the line, seems scarcely to be considered, and considerable irregularity is prac-

The fainfest whisper not long ago that diarrhea The infinite interval of the and periods in the infinite and the infinite infinite infinite and the infinite in any nor one generose care, and the wisdom of ad-pling all precisionable means for ensuring as 'ar as practicable the healthfulness of the place. Wandering through-parts of it late at night recently, and on the leach, very off-assive obours were perceptible, and we were led to suppose that the drainage was searcely so well arranged for as it should be. Accertaing to the town surveyor, Mr. Hinds, there is a main saver to the principal streets of Ransgate emptying itself at low-water mark, and having two flushing-tanks, one at the top of the High-street and a second at the top of King-street, with a flushing-shole from the royal harhour. The officer houses not on the line of sever have cesspools, it appears, in the chalk formation. There is a sanitary committee, and an inspector of nuisances, exercising a supervision over the whole town, with a board of commissioners acting under a Local Act.

Why, amongst other noticeable detriments, do those concerned permit the dredging-engine in the harbour to belch forth clouds of dense smoke? They should set an example to other steamers, even if they cannot control them

* See p. 466, ante.

The penny-wise-and-pound-foolish system is exem-plified in the staircase " of a handred steps," in liter of the "Jacob's Laddr?" of old times, leading from the chiff to the saids: the stose used was too soft, and the treads are already so worh away by the young ladies of Royal-eccesent and elsewhere that they will soon be unsafe, if they are not so now. Those Romsgate sands, by the way, at least the parts where the balting takes place, are certainly unique in their appropriation,—the scene presented thereon, at par-ticular hones of the day, including erowds of idlers, a band of Nigger harmonists, peripateic merchants of inexpensive sweetments, and a guitan-playing

a band of Nigger harmonists, peripatcic merchants of inexpensive sweetments, and a guitar-playing for igner, the whole enlivened and sevenned hy the aquatic sports and frolies of mer-meidens elsed in pink or blue calico ! Frith's picture will hand it down to a word-ring, if not an admiring, posterily. Ther: oppear to he few works guing on in the town just now. In the yard at St. Angustine's, built, as our readers may remomirer, by the late Mr. Weby Pugin, the energetic inheritor of his name is erceting a chantry chapel for the family of the hate Mr. Digby. It is of the Decorated period in style, and displays some Devonshire marble in the shape of small columns. columns

columns. St. Peter's, on oue side, with its early Norman nare-arcies and other handwriting of various past periods; and Minster on the other side, perhaps the first church built for the Euglish Christians, still showing Saxon work, and with its Norman transepts altered into Early Euglish, afford points for inter-esting investigation to Ramsgate visit rs. The newly-established Keit Ar haelogical Society have an abundant harvest waiting their hands, and although we object to this influite multiplication of archee logical societies, and consequent dissipation of strength, we can but be glad that the antiquities of this conty will receive fresh attention and further elucidation. The Isle of Thranet itself is a rich mine for the archeological digger. Ou Thanet fought elucidation. The I-le of Thranet itself is a rich-mine for the archaeological digger. On Thanet fought the Romans and the Britons; and here the Auglo-Sarous first landed, and were isolated some years before they spread over the rest of the country. Fo Thanet, as we said in our recent notes on Canterbury, earne the first missionaries of Christianity; and here, if St. Martin's at Canterbury was an existing stuc-ture converted for their use, the first Christian church was *buill*. The men of that period, however, have not left us such tangible memorihs of their presence as the ture converted for their last, the first Constant church was built. The men of their period, however, have not left us such tangible momorials of their presence as the Romans have at Richborough and Reculvers. The remains of Richborough Casle are amongst the most interesting relies in this country of that wonderful nation, the conqueries and teachers of the civilized world.

WORCESTER CATHEDRAL.

The renovations long since undertaken, and still in progress, in the building of which I propose to present a brief sketch, have at length expanded into a partial reconstruction. The work has naturally been watched with anxions attention by the many to whom the condition and upholding of our sacred edifiess are, happily, no longer subjects of indifference. The interest which must in all cases attach to the conser-vation of the monumental glories of our land has, in this metriculus instance, hear as creately heideltened by vation of the monumental glories of our land has, in this particular instance, toem so greatly heightened by the circumstance to which I have alluded, that the present eccasion enuous be deemed an inappropriate one, to endeavour to recall to recollection the pristice becauties and paculiarities of this interesting cathedral; and the less so as, without a previous knowledge of these, we can scarcely hope to arrive at an accurate estimate of the merit of what has here effected in the way of restoration and substitution. As, in presing in review the various parts of the edifier, I shall neces-sarily be led to speak of every architectural style which has prevailed from the eleventh to the sixteenth century, it may be uccessary to premise that, in century, it may be uccessary to prenise that, in affixing to each one the distinctive design tion of the noncucla'ure almost universally accepted, am

ndiving to each one the distinctive designation of the moneuclarizer almost universally accepted, 1 am guided by no treastworthy documentary evidence (which, indeed, 1 do not posses), but solely by the intrinsic evidence of the successive phase exhibited is mediawal architecture, and of the mutations traneigh which it possed to its final disappearance. The Lady Chaplel of Worester Cathedral 1 believe to be ene of the more speciesn in plan, as it is un-doubledly one of the purest in style, of the paried to satisfactory propartions, the excet symmetry and correspondence of its parts, the eare and consein-tionsness with which every detail, moulding, and correspondence of its parts, the eare and consein-tionsness with which every detail, moulding, and correspondence of its parts, the eare and consein-tionsness with which every detail, moulding, and correspondence of use parts, the eare and some energy acceful in their vey plan, representing a quater-field, with further every plans, representing a quater-field, with furth intervey plans, representing a quater-field, with further every plans, representing a quater-field in their vey plans, representing a quater-field, with further every plans, representing a quater-field in their vey plans, representing a quater-field in the representing the plans, and some events and the event of the fully, and continued over the event of the pire, is a bold, pro-unicent, fill ted r.pl, the uba us and base ereular : the

former, of the section of the best period of Early English, an overhanging round, deeply undercut; the latter, of the usual profile, remarkable for its horizontil spread. The errentr online is retained to the very floor, the tail plinth being of this form. I hay the more stress upon this circemstance because it constitutes a striking diversity between Early Pointed es exhibiting itself in Energy and non-ear contry. ary the note stress upon this errennessate breaks in constitutes a striking diversity between Early Pointed as exhibiting itself in Fra-ee and in our own country : there its adoption appears to be quite exceptional, the old Bonn me que squ reness and augularity in the plan of piers and obsens clinging to it to its last period. The greater beauty of the arrangement adopted by or own archite ts must, I think, be obvious to every one by our The pier arches, des riked about on zeute-angled triangle, are of three orders, each order of four clus-tered rolls (one fillered), and the depth and richness of these compound arches may be imagined from the fact that the sofiit is moulded into no less than seven They have plain dripstones springing from dy-sculpturel leaves. The triforium openings rolls. rolls. They have plain arrigeones springing from delicately-sculpture 1 heaves. The triforium openings consist, in every compartment, of two obtues arches, each hisected by a bearing shoft supporting lancet-headed arches. This is the internal face of the wall, while the corresponding external face is relieved by an admirable arcade of six pointed arches on attached administer artes of six pointed artes on activity of a shifts. The elevistory opens noon the central able by means of a gravelul sciece of three pointed arches (the middle one st lied shove the lateral ones) on bearshafts. the initial discretions of the initial of the second secon triforium, the hearing sha'ts of this and of the ciercs-tory, the rings around them, with the exc-ption of a few encircled by a narrow bia-s band, the abacus, the hase modulings, are all of Purbeck marble, hrought to light by discubarrassing them of the accumul-ted coats of whitewash which had been applied to mar their beauty. The removal of this filth, as well as scraping of the walls and parially revealing the beauty of the foliage of the capitals (to restance en-tirely the sharpness of the capitals (to restance entirely to entirely the sharpness of the capitals (to restance entirely to entirely the sharpness of the capitals (to restance entirely to entirely the sharpness of the capitals (to restance entirely to entirely the sharpness of the entirely the sharpness of the capital (to entirely to entirely the sharpness of the entirely the sharpne ow hopeless), will be generally approved; though I confess the painting, oiling, and variabing to which the mrble has been subjected, appear but a poor substitute for the polish of which it is susceptible. substitute for the polish of which it is susceptible, and a little too user akin to the finen-honored bar-barism of whitewash. How infector the bue com-municated to it by this process to the natural dark tooc which contrasts so findly, and is itself contrastes by a comparison with the new Purcheck employed in the great east window of the Ledy Chapel, of which I speak hereafter. mus

The surface of the side aisle walls of the Lady Chapel, of its end, and of the smiller or eastern transcept, is enriched by a very well designed areade of trefoil-boaded arches (the upper foil pointed), formed of three rolls, resting on single shifts, not quite clear, and surmouted by a dripstone, with terminations of heads and various flowered designs. Every spacifihas its sculptured representation of foliage, plants, grotesque he-ds, fahdous being, legend of monastic origin, or event of authantic history, the variety of which displays actouishing fertility of invention, and opens a source of grat fraiton-carcely to be exhausted. The beauly of this areade was originally enhanced hy colour, in which pred aninate the deep vermillion and green. I have everywhere found so a largedy introduced into the polychrone decorati us of Mediae al artists. The original windows of the aisles have been replaced by others of Perpendicular character, but those of the sides and of the north front of the smiller transcept remain unaltered, with the exception of the tracery, inserted, perhaps, in the filt-eath ceatury. A somewhat minute description of this part of the building is necessary, description of this part of the south end of the Eastern transcept, and of the eastern termination of the Lady Chapel, and so must materially inducence our judgement of the propriety of the scienting in the propriety of the assisting the advection.

Judgimin of the adaptation. The internal face of the wall, then, is pierced into an opcu arcade of two stories of three arches each ; those of the lower tier of equil height, the entral once of the upper range height and intervening read-like Purbeck shaft, with as many intervening read-like filtes, the shaft in front rising uninterruptedly to the spring of the arch mouldings of the upper story. The thickness of the wall affords space for an ambulatory or gallery, divided into two stories by a ceiling on the even of the super store and the same form. In the external face of the wall, corresponding to the screens, are opened windows of the same form. In all accesssories, as the rings which encircle the piers, theround

* All the plers are not precisely of this plan, but in all the circular outline is adhered to, and this is the point to which I with to direct attention. Perhaps the closest resemblance, in this particular, to the Eastly English practice, inty be found in the fine open porch at the west end of pentiding the provided of the provided of the provided pentiding press, occurs this identical one.

abacus and hase, the foliation of the capitals, the grouping of the multiplied slender rolls of the archnouldings, we find couplete parity with these members already described—the same pure, beautiful, and well-developed Lardy English. The vanising of the central aisle of the Lady Chapel

The vanifing of the central aisle of the Lady Cbapel is four-celled, with the addition of the longitudinal ridge rib. The transverse, diagonals, and wall-rib, all rest upon the capitil of a marble shaft at the height of the elsersory-string, which is itself supported by a second shaft of less diameter, descending to a rich eorbel in the spandrils of the pier arches. The triforium and elserstory-strings, a filleted round, form the upper members of the abacus of these shafts. In the side-aisles the ridge rib is omitted, and the groups of triple vaniting-shafts rest upon the floor.

The state of the eastern portion of the building being such as has been described, and the reconstruction of the south transcut rout and eiter termina-tion of the south transcut rout and eitern termina-tion of the Lady Chapel heing confessedly called for hy their dilapidated and dangerous condition, the question naturally arises, ----on what principle should the new work be based, and in harmony with which of the pre-existing architectural styles should it be of the pre-existing architectural styles should it be sought to phare it?-with the earlier or the later? And, first, it may be remarked that, except its comparative antiquity, the loss of the great east window leaves little to regret. It was of the geometrical tracery period, of nine lights, with a trauson at mid-beight, and two very insignificant roses in the head, the whole as poor in design, as meagre and ineffective in mouldings, and as coarse in a correst of the conceived-a little, and but a little superior to the one still remaining in the west front. It remains an east effect of inacipation to front. It requires no great effort of imagination to pieture the embarrassment which may arise in the construction of a part of an edifice into which have been adopted the features of sneeessive styles as they practice invariably followed by the Middle arose, a Age architects. A portion thus surrounded by examples of every period of architecture, perhaps equally prominent and equally beautiful in kind with tisel, renders selection a replay beauting task, and pre-ference not to be justified by any very conclusive reasons. But I approhend that where, as in the Persons. But I approach that were, as in the instance we are considering, the architectare of so much of the huldling as can be embraced in one view is perfectly homogeneous (and this would be the case, even if the choir itself were laid open by the removal of the screen which shuts it out from the Lady (hereal) and of the alifentity residence are labor of the screen which shuts it out from the Lady Chapel), much of the difficulty vanishes, and that really but little liberty of choice is left. To give the preference to a later style, merely hecause it happens to prevail in a comparatively remote part of the structure, would be nunceessarily to introduce dis-cordance, and hreak the unity of a consistent and perfect whole. I think, then, that judgment to be commended, which, without allowing itself to be acduced by a straining after originality, has con-tented itself with the humbler praise to be gained hy a faithful imitation. In working out the south from tented itself with the number praise to be gauge any a faithful imitation. In working out the south from of the transept, the architect has simply copied in al of the transcryt, the architect has simply copied in all its mioutest det its the opposite one; and in the Lavy Cluppel, for the triplet, has aubstituted a quintuplet of lights, the lower story of uniform height, and graduated only in wildh; the upper ones diminishing both in height and width from the centre. The execution, in general, is creditable to the skill and intelligence of the workmen employed. It would be the much the affirm that in working out the foliage of intelligence of the workmen employed. It would be too much to affirm that in working out the foliage of the capitals, the exact spirit of the original has been transferred to the copy. Of these exquisite enrichments of the edifice I have in the previous description said nothing, because I feel that to convey an adequate oftion of their beauty is beyond the power of words, an assertion in which I shall be borne out by every one who has examined the esthedral of Wor-cester. It would, indeed, he wonderful, if the attempts of modern workmen, called but at rare intervals to exercise themselves upon this species intervals to exercise themselves upon this species of decoration, should vie with the productions of those "master masons" whose eve and hand were trained

" master masous" whose eye and hand were trained by constant practice in a sculpture which catered into every conception and formed a component part of every building,—eivil and ecclesissical. However skillal the imitations of our own day, they are still but imitations,—the sickly bloom of the exotie, not the fresh and hardy flowers of the indigenous plant.

The choir, an elevated plat'orm, so to speak, being raised by a flight of six steps above the eastern and western transents, is, with some slight variations, identical with the Lady Chapel. Thus, the pier-arcbes are obtuse, and the two unost western ones on each side are enrich-d with two bands of the tooth orniment in the hollow mouldangs. The second pier from the west, on the north side, differs from all the rest in plan, the shafts being much more bulky and attached, and the capital of different de-ign. I am numble to offer any satisfactory explanation of this singular discrepancy, for it seems equally unlikely that this

isolated pier should be the remains of an earlier building, or that it should have been interpolated at a subsequent period. The windows of the elerestory, like those of the Lady Chapel, are of the Perpendicular cra, as are also those of the side aisles, and these are preceded by the like screen of triple aroudes on shafts, except in the most western compartment on the north side, where it takes the form of a pointed untifold arch, a variety not unfrequently met with in the Saracenic or Moorish architecture of Spain. With the debig code the norm Calu Double have

With the choir ends the pure Early English construction. The four archways at the crossing of the western travespt are of Decorated character, being composed, both the vertical and curved portions; of an accumulation of circular bowtells, with intervening half-circle hollows and squrre fillets; short capitals of foliage, woven horizontally around at the impost, and base of the proper section. The siles and fronts may be dismissed in a single word; they are unnistakeable specimeus of "Charchwardens" Golkia;" with the exception of the windlow in the south front, which is a restored triplet of lights. The preservation of the groups of triple vanling shafts descending to the floor is pretty good evidence that this part of the building was in its origin conformable to the Early English of the choir and Lady Chaped.

Of the nine compartments of the nave and sistess seven are also of Decorated character; and though the detail be not in all respects of the best kind, the general proportions and aspect are satisfactory, and the whole und an unworlby accompaniment of the eastern part. The piers are composed of bundles of circular howtells, treaty-four in number; three of these in front and helmind being appropriated to the support of the vaulting rins. The trilorium has no marked characteristic of the style, being simply two pointed arches in each bay, sublivided into two pointed arches is the entries of the style, being singly two pointed arches is of the nave; but there are some neticeable distinctions, which may guide us in conjecture as to their comparative antiquity. The bowtells of the archway mouldings on the south side are of equal distinction Decorated. Howtells and hollows run together without the relief of any rectangular portions, and there is no clear distinction of orders. The foliage is various and wellmarked orders. The foliage is various and wellmarked account over the whole outline of rolls of different diameter: one is filted, another carries the double fillet; and the introduction of restangular portions have no drip stone, which exists on the port. Again, on the south side, the pier arches and triforium have no drip stone, which exists on the north side, which is omitted on the opposite one. Finally, the validing of the scroll avoiding on the north side, which is omitted on the opposite one. Finally, the validing of the scroll avoiding on the north side, which is omitted on the south are introduced othe shorte ribs parallel to these, os as to make a sort of retientlated pattern. I possess no makes a sort of retientlate

The two bays on each side nearest the west front are relies of a much earlier epuch; a very characteristic and pleasing example of the Transitional era, marked by the interwixture of circular and pointed forms, and the use of pure Norman ornament. The pier-arches are obtasely pointed; it the capit-lis of a sor of fantastic folinge, which has no type in nature. The triforium presents there eircular-beaded openings, enriched with a variety of the chevron ornament, very well cut, included under a pointed arch, and the solid will hetween them is occupied by a decoration of which I can give no description. The elerestory consists of three isolated round-topped apertures, the central one broadest and highest; opposite to which is opened a window of the same form. The larger opening has its shaft in the sides, and Norman ornaments in the arch mondlings. The original vanilting safts of this part silf remain, and the vaulting itself of the south aisle is a genuine Transition example, the transverse ribs ouly being Pointed, the diagonals circular.*

* To be continued.

A CENTRAL "PLACE" IN LONDON. UNITING TRAFALGAR-SQUARE WITH THE BOROUGH ACROSS THE WATER.

THE ebief point in the previous and the following letter of onr correspondent "Erstion"—the proper utilization of that part of Lambeth which lies usar the ends of Waterloo and Westminster bridges—also the choice of Waterbook and Westminister pringes—also adverted to by others who have written to us on the subject of the property on the "Surrey side of the metropolis,"—being one of very great importance to London, it may be well to refer to our leading article of Decomber 13th, 1856, on the subject of West-minister-bridge and sites for other bridges, in which table it is alwardness to conclose the conmanster-bridge and sites for other bridges, in which article, it is prilaps due to ourselves to say, the point in question was prominently advanced; and we may also say that it was steadily kept in view (perti-neciously, as may have appeared to some readers) in our notices of the designs for the Governmeot Offices. Our exertions for the prosecution of the works of Westminster-bridge have been successful; but the objects to be served by the provision of but the objects to be served by the provision of hridge-communication will be falleu short of, uotil hrdge-communication will be failed short of lotti there are provided other and ample means of saccass to the quadrant space, as we called it, which is again in question. The objects referred to by us, as in the well-timed letters of "Epsilon," were the appro-priation of which we showed was really the heart of the metropolis, to some of those purposes for which ground was greatly needed, -- purposes, such as the erection, in the needed central situation, of public erection, in the needed central stitution, of public huildings and improved dvellings for the poor, and the removal of an Alsavia for the lawless and alon-gerons classes—who were just so much out of the main *routes* as to he free from observation, yet suffi-ciently near to be capable of affeting the pance and morals of the metropoles. Such objects, we felt, required not only the maintenance of all the exist. required not only the maintenance of all the exist-ing communications, as well as the removal of all tolls, hut the complete *iclairage* of the district, and the equalization of the opposite sides of the river, by a considerable increase in present and proposed bridges. We adverted to different schemes which had been put forth for a new bridge from Charing-cross-thoses in-volving the removal of Northumberland House, or otherwise--ond we have some reason to believe that we were successful in drawing the attention of archi-tects who seem talons in the Government conmetition we were success'ul in drawing the strength of archi-tects who sent plans in the Government competition, to the sites for bridges open for scleetion, and to the general importance of what we have here reverted to—as to which as noticed by us at the time, the plans showed the unanimity of opinion which was fail. The subject is one to which on every ground the attention of the Government should he at ouce closely directed. The only real difficulty that we discovered as to the utilization of the district, was that arising from its lowness; and as regards this point, the form-tion of the embankment, and the level to be chosen for the principal floors of build-ings, suggestions are much useded.

In contiouation of the remarks, on the above subject, which you kindly inserted in page 542, of a previous number, I would again draw attention to the map of London. Tue scheme that suggests itself to me would create

The scheme that suggests rised to me would eracle in the centre of our great town a kind of twin *Place* de Ia Concorde, one on either side of the river, such as exists in Paris ooly on ooe side. The bridge that would connect these two portions should not be less than from 100 to 200 feet wide, and horizontal like than from 100 to 200 feet wind, and horizonial inte Waterloo-bridge. The extreme length of visit abus gained, from the present National Gallery to the centre of the area above described on the other side of the river, would be about half a mile or something more, and around this double spot might arise some of those great public huildings the sites of which are now more now mooted

I am well aware that the above idea may raise a Tam weri aware that the above face any tasks a smile a visionary, and especially so hecause it is so large; and it may be one that even despotie power could with difficulty every out; but my individu-impression is, that if the Emperor Napoleou hal a similar architectural card in Paris to play, he would play it.

I cannot see why we should be desirous to carry I cannot see why we should be desirous to carry our architectural and attistic schemes so much to the zessi, and why the must accessible part of London, the centre, should not receive our chief care. The river itself (in abeyance, as regards passenger traffic in great measure since the days of Charles the Second) has now again resuncd its natural office of Second) has now again resumed its natural once of heing a great highway, and a highway on which each year witnesses a great increase of transit. Any re-moval of the nucleus of London from the river will be removing it from its greatest, and, what is of vast importance to the mass of the people, its *cheapest* birthwar. highway.

Ingraway. The river has certainly now got a had name for want of cleanimess, and with reason; but if London is to go oa increasing as a city in *any* direction, the swage improvements *windt* be carried out, and to trade more ou your indulgence. Eventors

doubt that our energies will be successful in this point at last is absord. It will be a work of time, of course; but, that it will be done, and that the river of the metropolis will eventually become a clean river,

here the topological states and the second states a second be second be a second be second be a second fa probably be found much more easy to abate the smoke of furnaces and workshops than the aggregate smoke of private houses; and the banks of the Thames may in consequence become eventually one of the clearest parts of London.

parts of London. I allode to the above points because it is probable that two of the readiest objections raised to a scheme that would cambasize the centralization of London on the banks of the Thames, would he the present unclean state of the river and the snoke of the factories. But neither of these appears to me available objections, especially in relation to the above scheme, which would probably take many years to carry into full offset effect.

I alluded in my former letter to the influence such a central arrangement as I indicate would have on relieving the traffic of the metropolis. This going from west to cast along the Strand begins to elog about Somerset House; hut people will not avail themselves of Waterloo-bridge because there is the themserves of viateroor-male occase where is an solit to pay: besides, it makes a great angle coming from or to the west. On the other hand, did there exist a toll-free hridge for vebicles direct from Tra-falgar-square to the Borough side of the water, somehat to the west of the Suspension-bridge, maoy what to the west of the Suspecsion-bridge, macy heavy waggons, besides other earringes, would avail themselves of this route, especially as part of my plan is that on the Borough side there should be highways, radiating or otherwise, direct to all the other metro-politan bridges, for which a glance on the map will show that the spot indicated offers pendiar advantages. As regards the main traffic of Loodoo, viewed in its broadest aspect, it now travels along the other local of the other out of the other spot. If an the other

bend of the river, on the north side. If, on the other hand, the best facilities were afforded for inviting it cross the river to the inner bend at its centre, which across the river to the *inner* bend at its centre, which occurs near Trafalgar-square, and conducting it away (towards the cast especially), there can be no doubt that the present elogged state of many of the thorough'arcs in the City would be much amended. These points, however, can he judged of only by refer-ence to the man.

ence to the map. According to the above scheme, it is evident that a great in rovement in value would accrue to the property on the horough side generally. From the central area on the south bank would radiate roads, central area on the south cans would realise roads, not only to the various bridges, hut to Kennington, Camberwell, Brixton, &c. which by this measor would hecome, as it were, portions of London, all which places at present seem, as it were, to be ignored by the north bank. In fact, the north bank of the Thanks seems to regard the south bank rather as a cert of poor relation to be ashmed of 1. It is quite Thanks seems to regard the south same ratio as a sort of poor relation, to be ashamed of! It is quite time, I think, to get over this prestige, especially as, by a scheme so substantially uniting the two div-sions, the north bank could lose nothing, while the south bank would gain immeasurably, and a very few south bank would gain immeasurably, and a very low years would show the force of such a change in a more bealthful and better ventilated class of buildings, in the borough generally, taking the place of those already in existence. In fact, as soon as the aristo-eratic brother on the north side had thoroughly ac-knowledged bis more diogy "confrict," being substantially hand in hand with him across the river, be, betterword hearin to hearb himself up in bocom the latter would hegin to brush himself up in hooour

of the companionship! As I mentioned in my former letter, the full development of the above scheme would include the removal of Northunberland House (as the best spot, on the map, for the north and rules of the brots plot, from, seems to lie between Scotland-yard and the Suspension-hridge), and Northumberhaud Honse would stand in the line between this and Trafalgar-square stand in the line between this and Tratalgur-square : but in the first place I would asggest that sufficient openings might he made towards Whiteball on one side, and through Northumberland-street in the Strand on the other, to answer, for the time, all practical purposes. Thus the main architectural effect of an expanded half-mile vista from the present National Gallery across the river to the south area might be left for after efforts.

Supposing the above scheme to have reason in it as Supposing the above scheme to have reason in it as affording facilities for the *just* development of London, then I repeat it might be well for Government, with this view, to possess itself of the area indicated in my last letter, viz. the space lying between the river and the South-Western Railway, and the Waterloo and West-misster-bridge roads, or, at least, of a considerable portion of it, and to do this while it is occupied in its present way, and before some great commund have its. present way, and before some great compiny lays its giaot grasp on it.

THE UTILIZATION AND ADORNMENT OF RAILWAY BANKS.

The railways of London are raising new ueigh-bonrhoods into existence, and along the line which skirts the north-eastern extremity of the metropolis, sarts the north-eastern extremity of the metropola, a fringe of houses is in course of rapid erection. It is curious to reflect upon the change of feeling which has taken place since those days when the land-owners and others dreaded the approach of the loco-motive as much as they would have done that of some dereview moneters some devouring monster.

Now, however, lordly owners of lurge estates will rather coas the railways through their domains than drive thum elsewhere. This rapid grouping of houses rather cons the railways through their domains take drive them elsewhere. This rapid grouping of houses and other buildiogs about them is a subject worthy of consideration, for it is certain that hefore many years are passed, the metropolitan and suburban railways will be imputant thoroughfares, which will be daily traversed by thousands. It is true that the pro-gress through distric's is rapid, but, notwithstand-ing, it is necessary that the architectural houodary of these iron roads in streets should be made as agree-oble as measible to the even. It is sourcely necessary able as possible to the cy. It is sourcely necessary to allode to the unsightly appearance of our great water thoroughfare, yet, what a magnificent frontage might have heren there displayed, if timely measures had been taken

might have here there displayed, it that michailes had been taken. At the present time, the views from most of the railways in the neighbourhood of London is soything hut agreeable. Look, for iostance, at the dilapidated and dangerous groups of dwellings which are seen from the earringes in passing over Beroundsey, Rober-hithe, Lambeth, Vauxhall, &c. This, under existing eirennstances, is scarcely to be avoiled, except by heightening the palings; hut in new neighbourhoods a great deal might be done. Along the line from Chalk-farm to Blackwall, the eubackmeot is very extensive, and falls at a moderate gradient. This is owe covered by weeds and other matters, which cover an idea of the greatest neglect. In the neighbourhood of somo railway stations, the embackments are beautiful with shrubs and flowers; in other parts, good crops of grass, have heen gathered; and this appearance of aultivation is better than the weels just alluded to. Of course, in some soils, we cannot expect much ver-dure, but in those cases nature generally presents features which, be their torms of colour of course, in some soils, we cannot expect nuch ver-dure, hut in those cases nature generally presents features which, by their picturesque forms or colour, are pleasant to the eyo. Passcogers by several of the lices of railway near the metropoles, may note that pardens and pretty terraces, which come close to the cubankment, and then we see the weeds. Might there not be some arrangement made between the railway companies and the proprietors of the adjoin-ing property, that by the huilding of soure wall and ormamental railings, those living in the houses near might be permitted to enlive the now waste places? places ?

places? It is a pity to see the waste of land on cm-bankmeuts, which are generally well drained. Iu all the surrounding market gardens we see places cultivated which would not be so good as cultings or banks, for certain products most useful to Loodon. A little dressing of proper manure would make many of our railway banks most fertile. Once upon a time the Bishop of Ely's garden, near Holborn, was famous for its strawberry-beds, and why should not some of those banks along the rail (now in the subhres as the other place was), which present a favourable plain towards the suu, become equally celebrated for these and other matters? Sceing the attraction which railways have for

Secting the attraction which railways have for dwellings, we ought to give attention to what faces those important thoroughfares. We should not, for intrance, see the blank and sham-built portion of a church, or other public building, turned towards the well. rail

il. Our best taste has led us to cultivate landscape Our best taste has led us to contribute nuoscape gardening, and in this art the professor has made it his study to hide objectionable matters "discretly from the view." Why should we neglect so wise a discretion in connection with railways, for many thou-ands will trace by the suburhau lines, simply for the order of ubeaver and recreation; and those who thousands will travel by the suburhau inters, simply for the sake of pleasure and recreation; and those who do so will be more likely to he attracted hy what gives pleasure to the eye than by deformities. Unless attention be awakened to the subject, the railway banks will be as disgraceful to us of this generation, as the banks of Father Thanes are to those who lived before us.

WOOD SALE AT HULL.—On the 24th ult. Mr. Edward Chaloner, the timber-broker, of Liverpool, offered for sale by anction, the eargo of the Szezdera, just arrived in Hull. There was a good attendance of huyers, and everything went off at good prices, except a few loads of hirch. For these only one bid of 70s, per ton was made, and it was, therefore, re-served lor sale by private contract.

ON CAUSES RETARDING THE IMPROVE-MENT OF THE WORKING CLASSES.

MENT OF THE WORKING CLASSES. In a lecture by Mr. P. A. Frascr, recently pub-lished, *this geotheman maintains that evil example, arising ont of our present commercial system gene-rally, and more particularly out of contrast com-petition and over speculation, along with the public and eleemosynary character of the interest taken in the wolfare of the working classes, retard their moral and intellectual moreress infinitely more than do the and intellectual progress infinitely more than do the want of education, industrial training, and recreation.

want of education, industrial training, and recrection. The lecturer, one of whose former discourses, it may be remembered, was noticed some time since in our columns, modesly urged, as a claim on the atten-tion of his audience while treating of the welkre of the working elusses, that for six years of his carly life his associates were principally those of the work-ing classes, and that the personal superintendence he had given to various works on which he had occasion to employ workmen during the past ten or twelve years, must have afforded him good opportunities for renewing his acquaintance with the wants and feelings of working men. of working men. The want of practical knowledge among these who

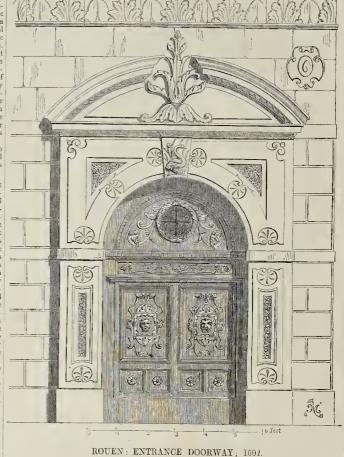

now undertake contract works is one of the first and most important points to which the lecturer draws attention

"I believe most sincerely," he remarks, "th our indifference as to whether contractors and trade " that Our industrence as to whether contractors and traces-men generally are or are not practically acquainted with the works they undertake to perform is produc-tive of serious consequences to us all. I cannot sup-pose there are many, if any, here ignorant of the fact that the non-practical contractor of all work cannot trace bis descent far back in the genealogical annals of time. So it is an or it must have trace bis descent in back in the generalogical annals of trade. Sixty or sevenly years ago it must have been a circumstance of rare occurrence that of a contractor undertaking the performance of work with which he was not practically acquinited; for although 'bubble schemes' had shaken commercial society 'bubble schemes' had shaken commercial society severely in this country more than seventy years he-fore, tradesmen as such kept their attention directed to the attainment of what was then considered the highest aim of their ambition, that of perfecting them-selves in the arts and mysteries of their crafts, and in performing faithfully the daties of their crafts, and in performing faithfully the daties of their crafts, are allongs. Then it was that a contractor agreed to perform certain works for such an amount of money as. from his experience and uracitical acousticance perform certain works for such an amount of money as, from his experience and practiceal sequentizance with his business, be considered a sufficient runu-neration. Then it was that the employer agreed to pay the amount asked without stipulating for penal-tics for non-performance, he in general having no reason to doubt either the honesity or skill of the tradesman. In short, business coutracts were then, and for long, long before, simply agreements be-tween parties possessing confidence in each other, and were not considered, as they now are, essential for the growth of energy and enterprise, nor adopted as safeguards against imposition. as safeguards against imposition. But those were times differing from the present

in many ways. A trademan contractor does not now require to waste his time in acquiring practical know. ledge. Provided he can obtain the use of enpital, he will be at once considered capable of undertaking the will be at once considered capable of undertaking the performance of all and every conecivable sort of work, subject, however, to these qualifications and restrictions;--be must not yet intermedile with either the conduments or the duties of those engaged in the practice of law or physic. Lawyers and medical men may, as contractors, undertake to build ships and houses, and construct railways and horbours; but were a tradesmao, even aided hy au experienced foreman or manager. to offer to conduct a lawsiit were a tradesman, even aided hy au experienced foreman or manager, to offer to conduct a lawauit or to cure the sick, he would ecritainly find the good old prejudice in favour of practical knowledge a barrier to his progress. And is it not right that he should? If so, why should any houses tradesman who, by patient industry in the exercise of his talents, has acquired a practical acquaintance with his busi-ness, he driven into competition with, as it may be, an untarght adventurer - a man who may never have spent one hour of his life in endearouring to under-stand practically the nature of the duties he so readily end so recklessly undertakes to perform?" Few. he supmosed were improved of the fact that

The so recares by undertakes to perform r Few, he supposed, were ignorant of the fact that many contractors rely quite as much for remuneration on the opportunities that may eccur for *exading* their obligations, as on the faithful performances of their daties. Gambling, bankruptey, and other exils fol-lowed in the train of such malpractices, and beso considerations led him to another of the causes at present retarding moral and intellectual improvement amongst the working classes, namely, the growing

• "On some of the Causes which at present rotard the Moral and Intellectual Progress of the Working Classes : a Lecture delivered to the Members of the Arboabb Scientific and Literary Association, on 15th February, 1657. By Partick Allan Fraser, of Horpitalfield, Edin-burgh : Edmonston and Douglas, 1857.

disposition to view manual labour as derogatory to the dignity of the sons of respectable people, and arising out of this feeling the neglect of bonest and industrious parents to tach their children the duties of some industrial calling.

^a Many a decent bonest working man now believes he does the number extent of good within his power for his sons when he gives them a little more education than he bimself received, and aftenwards places then as apprentices in hanks, shops, writers' or railway offices, and allows them to trust to any knowledge they may perchance pick up there for making their way in the world."

There is unfortunately far too much truth in these and other remarks made by Mr. Fraser in his very sousible lecture, which we quote mainly for the pur-pose of inducing our readers to peruse it for them. selves

SCHOOLS OF ART.

Torquay and Bricham.—A provisional committee, consisting of representatives of all classes, has been appointed to organise a school of art and drawing for Torquay and its neighbourhood, Dr. Harris, the rector, as chairman; Mr. E. Vivian, as treasurer; and Mr. Edmonstone as honorary secretary, have agreed to act provisionally. act provisionally.

are provisionary. Greenock.—For some time past drawing has been tanglit at Greenock by masters from the Paisley School of art; but the demand has so much increased, we are told, that a committee has been named to establish an independent school for the town. Dunfermline.—The school of art here, it is re-

DOMESTIC ARCHITECTURE IN ROUEN. ENTRANCE-DOORWAY OF A HOUSE IN THE RUE SALAMANDRE.

THE RUE SALAMANDRE. THIS semicircular-headed doorway has a large amount of character; and, although of impure taste, the details of the pier and of the arch render it elegant. The open pediment allows the oroanental work to escape like a plume: the swan sculptured on the key-stone of the arch, by the naturel grace of its form, tends to angument the elegance of the whole. The interior of the arch is fitted with a wooden door, the decorntion of which real's the last moments of the sixteenth eeniury.

of the sixteenth entury. The house bears on a shield placed at the top the

THE PREMIATED DESIGNS FOR THE GOVERNMENT OFFICES.

MESSIES, DEANE and WOODWARD'S design for the Foreign-office, to which the fourth premium was awarded, was mainly distinguished by the profuse and peculiar use of sculpture on the façades. We have been led, therefore, to cugrave a portion of the front at large, in pre-ference to a concert wire. A check description ference to a general view. A short description of the general design will be found in our detailed notice of the competition (p. 270, ante).

THE BUILDER.

PORTION OF DESIGN FOR FOREIGN OFFICE, TO WHICH FOURTH PREMIUM WAS AWARDED. MESSIGN DEANE AND WOODWARD, ARCHITECTS.

MEMORIAL OF THE LATE SIR CHARLES HOTHAM.

THE monument about to be erected in the Mclbourue Cemetery, under vote from the Legislative Council of Victoria, of which country the deceased Control of relevance of the second se the head of a plain sarcophagus of the same material, duly inscribed. The base of the column is relieved by working in of Portland stone, a band of the same crial bisecting the shaft. The bead is of Portmaterial bisecting the shaft. The bead is of Port-land, foliated, and surmounted by four niches-in the small columns of which grauite is again usedfigures of Mercy, Wisdom, Justice, and Fortitude filling each respectively; bas-reliefs embodying cach attribute being introduced in addition in the foliated filling each respectively, de addition in the fotiated head; the "Woman taken in Additory," being: the subject heneath Merey; Christ disputing with the Doctors, Wisdom; the Tribute Money, Justice, and the Overthrow of the Money Changers, that of Fortitude. The whole is crowned by a richly-corred cross. The entire height of the memorial is 32 feet, of which 22 feet are devoted to the head. Lady for which 22 feet are devoted to be head. Lady Hotham has berself largely contributed to its im-portance, baving, amongst other things, determined on enclosing an area round it of 100 feet, with a granite curb te curb, and an appropriate wrought-iron rail-The cost will be about 2,500/. ing.

MELBOURNE, VICTORIA.

STONE and hrick are rapidly taking the place of wood in Melbourne as materials for huilding : inland, wood is still much used, and I must give colonial carpenters credit for building a house of decent appear-ance, and tolerahle durability, in a very short time. Study and hattens are obtained from the saw-mills; shingles for roofing, and palings for walls, from the "bush" where they are split; doors and windows "bush" where they are split: doors and windows are brought up from Melbourne with the furniture, and in a mooth the earpenters are gone and the house inhabited. Basalt is the prevailing stone: some works very freely, and some yields metal for roads of a first-rate character. There are several freestones in the colony, but until this year they have not been much used. Gum (red, white, or blue) is userly the universal timher: it has the peculiarity of being heavier than water, and of sbrinking longitudinally to a considerable extent. Blue gum, from Van Diemen's Laud, and Kaurie pine, from New Zealand, are far hetter timber

The building of banks absorbs the skill of the Alchourne masons. They are goesrally very elsho-rate buildings, but having no sympthies with the neighbouring structures, do not produce a good effect as a rule. The front elevation of the Bank of New as a rule. The front clevation of the bank of 1500 South Wales, now in progress, is very costly, but unfortunately the sidewalls of brick tower above the adjoining bouses. I think simple designs for edifices to stand alone would add more to the beauty of the city. The main streets are one and a half chain wide: in populous parts they are metalled, channelled, and eurbed: flagging is wanting in too many places. flagging is wanting in too many places fine huildings of nuiform character, with A street of fine colonnades, would have a grand effect and be suitable to the elimate.

to the elimate. There is bardly one decent piece of Gothic archi-tecture in the city excepting the University, which is a face building, unfinished as yet, in the Perpendicular style. St. John's was a happy specimen of Norman, the zigzag moulding being very eff citrely rendered in white bricks. The stone used in this church is hasalt. A chancel of wrought stone has been lately added, it is ware centre and the target and the stone of the stone added. added: it is very costly, and very tame compared to the nave. The Honses of Parliament are waiting for a façade to remove their gloony appearance, oceasioned by the carcase consisting of a mass of becasioned by the cargase consisting of a mass of beavy blue stone: they occup a magnificent site. The Library, also, without its front, is built of free-stone externally, with plaster columns, and stone stairs done in wood internally. The doors, also, give a very good idea of bow bronze would look. To make an first these prioritizes them is a real terminate make up for these mistakes there is a real tesselated pareneat for the floor downstairs, and really good books up. The library is free and well attended, especially in an evening, when chairs are at a pre-mium. The wholesale stores are very good spreimens of warehouse building in solid stone. Colonial bricks of warehouse building in solid stone. are not burnt sufficiently to be very good, but their

There is improving. There is a fine stone bridge, 120 feet span, over the Garra, hult before the discovery of gold. Until the railway to Sandridge and St. Kilda relieved it, the traffic was inconveniently great.

The roads round Melhourne are metalled for four niles. To Bendigo the road is made through-miles. Ballarat is supplied from Geelong out, 120 by a road also made, the last part being formed of planks, which seem to answer well.

The railway from Williamstown to Geelong is now on the opening day, by stretching his hody more than eighteen inches from the line of carriages, where it sas struck by the uprights of a hridge. I will wind up with a few "facts" this rather dis-

ive commu ration Melhourne is in Victoria, which is no part of New

South Wales or South Australia. A very comfortable house, with a quarter of an acre of guiden, verandab, shed, &c. may be had within four miles of Melbourne for 20s. a week. Onuibuses,

every bonr, 1s.; or by the wock to and fro, 9s. Firearnas are very abundant and very useless Slop clothes are che p; so are boots and shoes. Mel hourne contains all manner of shops, in which tool Mel. adapted to the colony are to be obtained with far greater facility than in London, as the United States bave supplied their inventions as well as England. Bush-ranging is about as common here as garrot-

Instruction to be a boot as control and the second second second second bring such tools as they are sure to want, hat not any with the idea of their not being obtainable here.

Mechanics earn from 14s. to 16s. for an eight-bour day; labources, 8a. to 12s. without rations, or 20s. to 30s. a week with rations, that is, board and lod-ing. Meat is ahout 6.1. a pound; bread, 2s. the 4-lb. loaf. G. B. P. Victoria, July 4, 1857.

ARTISTIC CULTURE IN BELGIUM AND PRUSSIA

In the circular intimation of the commencement of the sessional courses in Architecture and Construc-tion at University College, on the 13th inst. Professor aldson says,

Donaldson says,— "In a short visit that I have recently made to Belgium and the Rhenish Provinces of Prausia, I have been much struck with the ample provisions made by the Govern-ments generally of these countries, and by the local unneiphilies, to provide the means of artistic instruc-tion for all cla-ses. An exercest and intelligent spirit of enterprise is moving all, part of multi-structure provided and works of art. They are therefore making corresponding progress in their endearours to equal and even to surpass other nations.

Antwery, Bohent, Lakes, Brut even to surpass there Antwery, Bohent, Lakes, Brutsels, and Dunseldorff, has each its well-appointed schools, with first-rate professors in all branches, and directors of the highest emineues. At Antwery there are 1,300 (1:1) upplisin the Art Schools, preparing to carry the fruits of their teaching and studies into the active purposes of after life, and who are dis-tributed throughout the various productive classes of the painters, scalptors, architects, engravers, or carrers; others contributing to the embeliabinement and refinement of the manufacturing industries,—all tending to clevate the testse.

of the manufacturing industries,—all tending to elevate the taste. I resture to call attention to these striking facts. Architecture also in there very thorogoly taught in all its branches, and young men are rising up who pirrsue an active, zesolus training, to fit them for a future successful carec

Such a preparation is not as yet sufficiently app ciated in this country, where the course of study is more desultory, and the combination of artistic and industrial skill slow in its development.

KESWICK WATERWORKS.

As there are many small towns in Great Britain without a public wider supply, or any other form of sanitary arrangements, we pre-ent the following ab-stract, from a report on the subject, because it shows strate, from a report on the sumject, because it shows how much may be done at a comparatively small cost in a small place. Keswick, as is known to thousands of tomrists, is the capital of the lake district, and is becautifully situated in the Vale of Derweat. Words-worth, Coleridge, and Southey, have made the place famous : the Marshalls, the Stangers, and the Lietches, have done much for the residents, with marginal data and the standard states and the states of the stat purse and pen. These gentlemen, with Mr. Joseph Hall, solicitor, and some others, have given the place the blacking of a the blessing of a good water-supply. The following analyses show the relative hardness of the pumpwing waters, and of the new supply :---

ARALYSES OF LOCAL WATERS.	
Degrees	of Hardness
Mr. Hall's Pump	9.5
Royal Oak Hotel Pump	28.2
Pump near Museum	16.4
Loke Derwentwater	2.05
River Greta, near Keswick	3.05
New Waterworks	0.38

The traine was incouverniently great. Across the same river are several other bridges,— at Richmond, Hawthorn, and Collingwood. The Iast is 170 feet span, consisting of three laminated arches, springing from stone abutments. I think its of st is 17,000%. hardness.

ГОст. 3, 1857.

The works were projected in the autumn of 1855, the promoters at that time intending to apply for Par-liamentary powers to construct them. The cost of the promoters at that time intending to apply for Par-liamentary powers to construct them. The east of such an application was, however, a serious obstacle, and it was determined to abandon the idea of a special Act, and to earry out the works by a Joint Stock Company, with a capital of 3,000/. in 600 sbares, of 57. each. Arrangements were entered into, by Joseph Hall, esq. solisitor, of Keswick, with Sir John Walsh, for a supply of water from springs arising on his land, on the west side of Skiddaw, and the work was commenced in March, 1856. Early in July following, water was delivered in the town, and at present npwards of 300 bouses are supplied by the company. 60

mpany. Dr. R. Angus Smith reported the water to be about one-third of a degree of hardness, and free from vegetable and other impurities.

The water is collected in earthenware pipes from the several springs, and is conveyed to the service reservoir, and thence in cast-iron pipes to the town. Nearly two miles of carthenware pipes, and about 2½ miles of cast-iron pipes have been laid. The service resermilesof cast iron pipeshave been hid. The service reser-voir (which is arcbed over) is capable of holding about 80,000 guilons. The total expenditure of the Company has heen about 2,9007. The works were designed and carried out by Mr. Rawinson, C.E.; Mr. John Lawson acting as managing engineer. At the first annual meeting of the snareholders after the comple-tion of the works, held on the 31st August, a uividend of 21. 10s. per share was declared. The directors' of 27. 10s. per share was declared. report sets forth,---

"The reservoir having been completed and the main pipes laid at Midsummer, 1856, the directors commenced supplying their customers with water on the 2nd of August, 1856, and the supply has since continued without interrup-

supplying their customer's with water on the 2mio A Augus, 1866, and the supply has since continued without interrup-tim. Equal to the expectation formed of it, and will be found adequate to the supply of any amount of demand which may reasonably he expected to arise for some years to come. The quality of the water has, the directors believe, given entire satisfaction to every class of customers, and they are gratified in heing able to addy since the opening of the work, and they currections the opening of the work, and they currection and by any com-pany in England, the poorer class of customers being curred only one pany per vect. and they are statisfaction to the starges for water supplied by this company are amongst the lowest made by any com-pany in England, the poorer class of customers being curred only one pany per vect. and nucelletted, amounted to 3,1217. So. 1114.; and the expenditure, in incident appeares, & S. 0177. 183. 114.; leaving a balance of 1037. 105. 0142. The supple of water will be constant; and no tanks or cisterna will be required.¹

The volume of water at command in the driest season is not less than 100,000 gallons per day of twenty-four bours. The mains are espahle of deliver-ing 240,000 gallons per day of twenty-four hours. The pressure in the tower is about 130 feet. The reservoir, which is of the stone of the district, and reservoir, when is of the solute of the district, and arched over with Borrowdale slate, holds about 80,000 gallons, 'serving to equalize the day and might yield of the springs in the very dry scason. The whole of the mains helow the reservoir aud within the town, are of east iron: the whole of the branch and house services are of wrought iron: so manch and house services are of wrought iron; so that the inhabitants ran no danger of lead poisoning. The capacity of the mains and the pressure are suffi-The capacity of the mains and the pressure are suffi-cient to throw water over any house: there are sfre-cocks throughout the town. The softness and purity of the water afford a great luxury, and there is not the slightest inconvenience felt in the use of water so soft. An addition of lime bas not heen found necessary to health, as some advocates of hard waters have asserted would be the case. Two house-fittings are found cheap, casy of manipulation in putting up, and efficient in use. The taps are Messrs. Guest and Chrimes' patent screw-down, and are perfectly tight in use. in use

BLIND WICKET TO THE GREEN-PARK.

Sour: twenty years hack there was an access to the Green-park from Park-place, St. James's-street, always open to the public : it was a solace to the inhabitants of St. James's-square, Pall-mall; and, indeed, to thousands of others migrating by St. James's-street to the Hyde. It has been closed for several years; the privilege of *entrée* being reserved only to a few who may have gained the ear of the Woods and Works, and the key of favour. Now, small easements are sometimes of great value

-more useful, if not more prized, than broad con-cessions. How could the multitude dispense with the little duct at Spring-gardens ?-or what might be the effect of a forcelosure of the alley (locked one day only in open mutiny ! There was in the decliniog years of the poetical

banker, Sam Rogers, some little turnult, occasionally, in the wicket passage adjoining his house. Numerous

and partinacious wandering *houris* were wont to waylay and assail the hencevolent old man on issuing from, or returning to his door. He never resisted their elamours, which he daily hought off with golden arguments; but they baunted the wicket passage, in which a single annzou might defy the whole St. James's police. Authority might theu have interposed to check scenes so indecorous; and so the public user of the way was obstructed; hut now that the poet is safe from these troubles, surely the luxury of a short cut to the people's parks might he thrown open to valetudinarias, nursemids, children, and innocent idlers seeking an escape from noisy streets. The number of inhabitants is vasily swollen: the parks are beautified and much more sought after: officials and pertinacious wandering houris were wont to are beautified and much more sought after: officials are, or seem to he, more studions of the health and welfare of the people:--why, then, cannot this strait and narrow way be opened? PERAMBULATOR.

CHURCH BUILDING NEWS.

Cambridge.—The atte-chapel of Trinity College is to be adorned by a statue of Dr. Barrow, the cele-hrated theologian and divine, who was formerly the Master of Trinity. It will be the work of Mr. Noble, to whom the commission has been given by the Mar-mie of Langlawan.

to whom the commission has been given by the avar-quis of Lansdowne. Braintree.—The repairs and restoration of Brain-tree Church are in progress. The roof has heen com-pleted, under the superintendence of Mr. Pearson, of Loudon, architect; and a new porch is in course of formation. The edufice will afford additional accum-relation to chear 100 warsons. The repairs of the formation. The cdufive will afford additiousl accom-modation to about 100 persons. The repairs of the chancel, which are much needed, rest with the owner of the great tithes. Bedford.--The subscription for a memorial to the

late Mr. Isaac Hurst having heen closed, it was deter-mined to apply the proceeds towards the erection of a mined to apply the proceeds towards the erection of a monunent over his grave in Bedford Cemetery. A design was placed in the bands of Messrs. Miller and Son, of Bedford, who have enriced it out, and the monument has heve completed and placed in the cemetery. The design was taken from the ancient monument in Iona, known as Maelean's Gross, which was constructed of whitstone, but the new monument is cut from a single block of Sicilian marhle. The form is by some regarded as a Saxon cross, and the original is supposed to have been contemporary with original is supposed to have been contemporary with St. Columba, and the oldest monument in Iona-prohably the oldest Christian monument in Scotland. The marble shaft of the cross is 9 feet 4 inches in

The marble shaft of the cross is 9 feet 4 inches in height: the pedestal, a piece of Portland stone, is 2 feet 1 inch in height; and the whole rests on a large York landing 8 inches thick. The shaft is carred on the front and back. Ou the side of the pedestal facing the south is the inscription. *Telmersham.*—The old church of Felmersham, which has just undergone an extensive restoration, was re-opened on the 17th ult. It has had a new roof, new seats, and new windows : some of the latter are of stained glass, with symbolical figures and various emblems. Some of these windows are the gifts of persons at Felmersham and neighbourhood. The floor has heen raised and re-laid, and improvements made in the churchyard. The expense of the work of restoration, exclusive of the windows, and the repairs of the sercen, which cost 700, amounts to about 1,2000, nearly 1,0000, of which have been raised by private subscriptions and parochial rate. The stained windows are the work of Mr. Clutterhuck, of Strat-ford ford

ford. Lindfield (Brighton).—The foundation-stone of the new Congregational Chapel was laid here on the 21st ult. Messrs. Habershon are the architects. The estimated cost of the chapel and schools is 1,2001. of which 8000, have here subscribed. Landford (Wilds).—The Dowager Countess Nelson has contributed 1,0001. towards the erection of a new church at Landford, the old edifich having been taken

church at Landford, the old edifice having been taken down and removed, in consequence of general dilapi-dation, and uot affording sufficient accommodation for the inbabitants. The new huilding is to afford seat room for 129 adults and 54 school children, the popu-

ornamental embossed glass. The chapel is lighted with hullet-proof shutters. with gas, from six standards, each bearing twelve lights, with crown and other ornaments of hurnished brass work of the Medieval period; there are other branches from the walls. The architects were Messis. branches from the walls. The arcbitects were Messra. William and Sanuel Horton, of Wednesbury. Messra. Trow and Sons, also of Wednesbury, were the con-tractors; Mr. S. Jellyman, derk of the works. The total cost, including the purchase of land, gas fittings, ornamental pelisides at front, and architect's com-mission, was 1,700!. *Clifton*.—The tower of Clifton parish church is about to be rebuilt. *Chefford*.—An ew chancel to the purish church of Chefford having heen creeted hy Mr. Johu Dixon, of Astle Hall, it was resolved hy his tenants and neigh-hours to obtain for its large east whole one of

Asue rule, it was resolved by nis tenants and beign-hours to obtain for its large east window one of painted and stained glass, and the work has just been completed by Messrs. R. B. Elmundson and Son, of M.mchester. The principal subjects are the Birth of the Savion; the Crucifixion, and the Ascension; there being underuenth each a figure of a kneeling angel being underneath each a figure of a kneeling angel hearing a scroll. The upper part of each light is filled with canopied tracery, and the Agnus Dei occupies the centre of the head of the window. The promi-nent colours throughout are ruby, hlue, and yellow, with various tints of these and other colours. Wittington. — The foundation-stone of the new Wesleyan eburch, at Whittingtor, near Chestofield, was hid on the 23rd ult. The edifice is expected to accommodate 300 people, and it has heen originated by working men, who have heen supported by the employers of labour at Whittington.

Holbeck.—On the 23rd ult. the Bishop of Ripon consecrated that portion of the Holbeck cemetery set consecrated that portion of the Holecck centery set apart for the burial of members of the Clurch of Eugland. The whole of the cemetery, which is situated on the top of Beeston-hill, covers an area of 11 acres 2 roods. The division between the con-secrated and the unconsecrated portions of the cem-tery is marked by small granite pillars, placed at dis-tances of the uncol-

tery is marked by small granic pluars, placed at dis-tances of ten yards. Stockton.—The foundation-stone of a church for South Stockton and Thornaby was laid ou the 22nd ult. hy Mr. G. Gilpin Browa. The church is to be creted in a field given by the Earl of Harewool, situate opposite to the Stafford Pottery. Conduct The place of mombinin Lenther church.

situate opposite to the Stafford Pottery. Carlisle.—The place of worship in Lowther-street belonging to the Wesleyan Methodist Arsociation, which has heen rehuilding, was reopened on the 20th ult. The exterior of the building, says the local Journal, is a great improvement upon the old oue. The style of the front is Early English, and is divided into three parts, a centre and two side wings. The chief window is in the front, and consists of five are two princip.1 entrances, one in each side wing, and each of the porches is lighted hy a two-light window above the entrance. At each angle of the and each of the porches is lighted by a two-light window above the entrance. At each angle of the front there is a buttress erowned with a roof-shaped eauopy. The front rises in a pyromidal form. The interior is also improved. Some parts of the old work remain, although altered in arrangement. The ceiling is supported on two ranges of pillars, its central portion curved and ribbed, and the sides rather include from the horizontal. In the centre is an central portion curves and runcing and the substanties inclined from the horizontal. In the centre is an elliptical dome-light of plain and stained glass. The improvements will cost about 500%, and have been carried out under the superintendence of Mr. Johu Hodgson, architect.

PROVINCIAL NEWS.

St. Alban's.-The new corn exchange here has heen completed, and was formally opened ou the 23rd near completely and was to hand, obcase of the book out. The huiding is a light structure, 74 feet long, 21 feet wide, and 26 feet high. It is lighted with gas, by two sun-hurners let into the ceiling. The light is diffused over the huiding by connected iron regas, by two sub-intrates for into the central, interagin is diffused over the hullding by economelled iron re-flectors. The total cost of the building, exclusive of the lighting, is hetween 1,400, and 1500,, 1,200.

of which were raised by subscription - order and horrowed by the corporation. Dudley. - New County-court buildings are in course of erection in Priory-street. Mr. Charles Reeves, of London, Surveyor of County Courts, is the architect, and Mr. Burkit, of Wolverhampion, and the Nelson of Dudley, are the contracture. The

The architect is Mr

Thomas Smith, of Stourbidge. Cliffon.—Colonel Serrel, an American engineer, of emsiderable reput tion, says one of the Bristol papers, has lately, revived the Clifton suspension-bridge prohas lately revived the Chiron suspension-bridge pro-ject, and is now in this city, making an engineering investigation, aided by a local engineer, Mr. Ashneend, with a view to the commencement of the work. The work, it is said, can be completed at a compartively small cost. The existing piers cost 45,000%, but the old bridge committee are said to have agreed to make them over for 2,000%, and take the amount in shares, the mode in which then accessent a viul will be reized the mode in which the necessary capital will be rais The mode in which the necessary capital will be raised. Colonel Serrell, after eximining what is dono, has offered to complete the structure for I7,0007, asking for no money till it is finished, only sitpulating that the requisite shares shall be paid up, so as to secure him his money. He will return in the spring if called upon to do so, *Burraham.*—The *Bridgeater Times* announces the laying of the foundation-stone of the new pier here by Mr. G. Reed, the founder of the Burnham railway will new view.

Mr. G. Reed, the founder of the Eurnham railway and new pier. Plymouth.—The corporation of this town bave resolved to obtain plans for a new Guildhall by com-petition, and to proceed to its construction, according to the plans approved of, as they may find it conve-nient to lay out the inner, so as to rear the huilding by degrees. A councillor angested 20,000. to 25,000. as sufficient for the purpose. Cardiff of late years that not a foot of ground is to be obtained whereon to build hetween the Glamorgan-shire Cand and the West Bate Dock, and the profits realised from the tenements, according to the Gwar Jaan, from which we quote, is in may instances as

reason from the tenements, necerching to the Owar-dian, from which we quote is in many instances as high as 15 per cent. In the neighbourhood of Canton also almost all the ground belonging to the Freehold Lond Society has been taken, and villas are in course of creation, several streets are formed, and building is progressing with rapidity in every direction. A street has been formed, called the Cathedral-road, from the West Turnpike-ga'e across the fields as far as the Halfway-house at Poutgauna, and which will in all probalility reach as far as the city of Llandaff. On the Roath side of the town houses are also rapidly huilt, Basth side of the town houses are also rapidly hull, and the Splott and Adamsdown bid fair to be sur-rounded shortly by a herge solutin, as nearly 100 houses are in rourse of ercetion on the Splott estate. Two streets have been made diverging from Plucea-lane to the east, known by the name of Miton-street and Shakspeare-street. Towards the north of the town also building is heining earried on. There is scarcely a shop in the principal streets that bas not been made more market accommodation required, additional docks have here constructed, and more are in course of construction. A viadnet, extending from the Rhymney Railway to the Tuff Vale side of the East Bute Dock, is now in course of construction, along the whole length of Tyudal-street.—The first stoue of a new building here, for the Young Men's Christian Associ-tion, ws is alion the 24th ult. The cost of the building was estimated at 1, 130/. exclusive of 300/. for fittings. was estimated at 1,130. exclusive of 300. for fittings. The architects are Messrs. Huhershon. Mr. Daniel Jones, of Cardiff, is the huilder.

Jones, of Cardiff, is the huilder. Skreuchurg—At a recent meeting of the local Improvement Commissioners, according to the *Chronicle*, the suggestion of Mr. Edward Jeffreys for the erection of a hridge over the Severn to Kingsland, and a market near the Cresent, was taken into comsideration, and the merits of the design discussed. Other plans for a new market were also placed before Other plans for a new infract were also place occide the commissioners, including the site at the top of Pride-hill, top of Wyle-cop, and Mardol-head. It was nitimately resolved that a report should be presented to the council at their next meeting, upon Mr. Jeffreys's plan, and generally as to an improved communication over the river, and also as to a new market.

Warrington .- A local conneil was held here lately to consider the report of the paving and severage committee, recommending the immediate adoption of the scheme of Mr. Coxon, the borongh engineer, room for 129 adults and 54 school children, the population of the parish height of the paris lington, crossing the Skerne, says the Gateshead Observer, has been washed away. It was not out of

Doserver, has been washed away. It was not out of the hands of the contractor. *Carlisle.*—A brick building for a theatre is to be creeted here shortly, in the Botchethy.rr ad. *Hawick.*—A meeting is about to be held at Hawick to consider as to the plans and specifications of a new here the statement of the town-hall

town-hall. Drugfree.—The members of the Durnfries Mechanics' lustitute, according to the local Courier, have decided apon building a hall, capible of accommo-dating an andience of 1,200 persons, on the garden ground in Nith-phac, behind their present premises. Bathgade.—The foundation-stone of a cora-ex-change has heen laid here. Bernere Unare. A use noticed some time since

Parmure House. —As we noticed some time since, Parmure House, one of the scale of Lord Parmure, has just been almost rebuilt, newly dressed up in front, and the interior entirely gutted and renewed. Four, and the interior cutting guited and relevence. This latter part of the work was excented by Messra, Wm. Thomson and Co. huldlers, Stirfing. The build-ing is fire stories in beight, and, including the wings, 500 feet in breadth. A considerable drawback to the elegance of the interior is, that the floors are in the same places as in the old edifice, thus rendering the edificience of all the minimal means which have same places as in the old edifice, thus rendering the eeflings of all the principal rooms ridentonaly low; and, in the case of the large dining and drawing rooms, griving a feeling of oppression which is dis-agreeable, and doubless something more to those who may be honoured with a long sederunt in them. The whole of the woodwork throughout the edifice is new. The mason work of the mansion was excented by Mr. Marsing of Falloureb.

The mason work of the mansion was excented by Mr. Morrison, of Edinburgh. Bridge of Linn of Dee. — The ceremony of the opening of this bridge by her M-jesty took place week or two ago. The builders were Messrs, John Fraser and Son, of Aberdeen. The arch is a Golhie one, with embrasured pnapets of dr:ssed granite from the district. The designs were furnished by Messrs. A. and W. Reid, of Elgin, architects. The approaches to the hridge bave been all reconstructed, and ornamented with Shubbery, fauced with harch railings on both sides, and painted white. The posi-tion of the new hridge fully commands the romantic scenery of the Linn, which was formerly very much concealed by the old one.

FOREIGN INTELLIGENCE.

Hanover : New Streets. - This German town is Hanover: New Streets. — This German town is shedding, as it were, its former appearance. The northern part of the town has been already trans-formed into a new town, and now the west end is to be similarly changed. A long street is projected, which will pass over the filled up rampurts, and terminate at the great railway station. The street is to be 100 feet broad, with an avenue of trees 16 feet wild heaving mean fer a wilkaw connecting two of wide, leaving room for a railway, connecting two of the principal railroads of Hanover, &c.

the principal reminds of randow to exc. Berlin: a Hinge" Dom."—It is contemplated to build in the Prussian capital, a cathedral, which should be the St. Peter's of Protestant Germany. The style of building is not yet decided upon, but the

The style of building is not yet decided mpon, but the estimates are laid down at several millions of balers. Cologne: City Muzeum. — There is a perma-nent committee sitting here for the purchase of art objects. They have offered the wildow of the elebrated painter, M. Begas, 1,000 thalers for bis portrait, and some eartooas, &c. For the sake of the large exeavations for the foundations of the perma-nent bridge over the Rhine, the very ancient Fran-kenthurm has been demolished, by which Cologne losses one of its old city tokens. The statues have been earchilly deposited in the Wallraffenm. This destruction is much to be regretted. *Reserved Scats in the Alps.*—The barefaced grasp-ingness of the age unmittest itself in the fact, that unclosed galleries have been erected in many of the

enclosed galleries have been erceted in many of the finest localities of the Bernese Oberland, &c. whenee only certain ensembles and other fine sights can be viewed. By the erection of these shels the *genius loci* is completely expelled from these charming localities.

THE EGYPTIAN STATE BEDSTEAD.

THE EGYPTIAN STATE HEDSTEAD. **BERHAPS** the only way in which, with our Western ideas, we may be able to appreciate the fieling which prompts an Eastern ruler to convert silver or gold into beststeads, is the consideration that in all probability the taste for such articles is a remnant of ancient Expe-tion magical rites, in which "the sacred sleep" of entrancement took place on "the beatiful conch." of the reposing god ; or, as in the magical rites of Buby-lon (alluded to some time since in the *Builder*), in the "elegant bedstead" of which Herodotts speaks, and whereou the entranced or "God-possessed" lay in state, to be consulted as an oracle. It may even be a

EXHIBITION OF ART TREASURES AT MANCHESTER.

It is now definitively fixed that the last day upon which the Exhibition will be open is the 17th of October, and on the 19th will be commenced the work of restoring to their generous owners the valuable treasures which have alforded instruction and gratification to about one million of our popula-tion. These works of art should values to their the permeasure of a should return to the permet-tion. These works of art should return to their proprietors with enhanced value, from having been appreciated and enjoyed by so many, and the grateful good wishes of thousands of bearts will attend them on their return to the measions of royalty, of the nobility, and the gentry of our land. Such an occa-sion proves the genuine sympathy which exists in England between all classes of the community, and program to strengthen good feeling and kindly can-sideration for each other. Those who confer and those who receive generoons sacrifices are equally benefited, for, like merey, such noble generosity

" is twice bless'd ; It blesseth him that gives, and him that takes."

The following is a general statement of the num-bers of persons who have visited the Exbinition, during the last few weeks :---

Week ending	Friday,	11tb	September		56,396
Do.	do.	18th	,,		67,479
Do.	do.	25th	,,,	•••	63,326

On Saturday, 26th, there were 10,907 persons; on Monday, 13,664; aud on Tuesday last, 11,196. Should the number of admissions daily increase, as they seem to be doing, there will in probability be no deficiency to be made up by the guarantee subscribers.

ELECTRO-TELEGRAPHIC PROGRESS.

IT now appears that the telegraphic announce-ment of the successful laying of the Mediterra-nean line was not quite correct, the cable laying fallen short by about twelve miles, and the end of it actually lost, altbough a buoy has been placed as an indication of its whereabouts, till a drag, which has been invented for the purpose, be used in fishing it up, if it can be got bold of. Surely, the end of the cable ought to have been beforehand so connected with a buoy as to allow of its beine end end of the cable ought to have been brforehand so connected with a buoy as to allow of its being got again in the event of its running out too soon. Failing the drag, could not the cable, as laid down, he simply overrun by means of a rope and a ring, till the over-running vessel arrived within lifting distance of the lost extremity? Might not the lost end of the Atlantic cable also be thus fished up again, and 30,0007, sivel by the simple process? The Atlantic cable is to be stowed away in the Government dock yard at Keyham during witter, and carefully over-haulde and tarred. The company are said to be immadated with hundreds of designs for laying the cable, and for improving the machinery for that pur-pose; and since the commencement of last month numerous applications have been mide for patents in puse; and since the commencement of last month numerous applications have been mide for patents in connection with machinery for submerging sub-marine cables.— The portion of the Mediterranean Extension Telegraph Company's cable already com-pleted, consisting of 582¹/₂ miles, has been tested at Birkenhead, by Mr. H. V. Physic, telegraph congineer, and Mr. Audware, surprising the degraph confineer, Birkenhead, by Mr. H. V. Physic, telegraph engineer, and Mr. Andrews, superintendent to the Mediter-ranean Company. The new line will connect Cagliari with Malta and Coriu, and the entire length to be manufactured will consist of nearly 1,000 miles. The despect to faibs the work by the mildle of October, and the whole line will he submerged by the end of that month. The cable consists of a single conducting wire, with an other protective sheath of iron wire; but be outer wires, unlike those of the Atlantic Com-pan's cable, are not subjivided into a number of whereou the entranced or "God-possessed" has in both of the order where units, thinks there of the Adamte Control state, to be consulted as an oracle. It may even be a small fiburants, but each strand is a solid mass and question whether our own stately Britisb royal or state distinct in itself.——A French paper states that an bedsteads be not a vestige by implication of similar immense telegraphic line is about to be commenced, ancient and pagan rites, practised as they were by the starting from Marseilles, extending to the islands of

[Ост. 3, 1857.

Hèyres, thence to Corsica, and from island to island uutil it reaches Constantinople. It will thus unite to Frauce the whole of the East. The line which is to auite Marseilles to Bastia is to be finished in less than a year, on the 1st of July, 1858. This gigantife undertaking has been conceeded to M. Balestriai.

REPORT ON RAILWAYS.

The report of Captain Galton to the Board of Trade, on the railways of the United Kingdom for 1556, has just been issued, and is calculated, on the whole, to strengthen the bope that, with improved management, the recovery in the value of this descrip-tion of property will be steady and continuous. Not withstauding that the preferential and loan capital constituted 43 per cent. of the whole of the rollway capital roles to the end of 1856, and that the in-terest payable on this, owing to the state of the constituted so per cere of of 1856, and that the in-terest payable on this, owing to the state of the money-market, was bigher than during any former period, the per-centage having been 5.08 against an average of 4.72 for the preceding seven years, the average rate of dividend available for the ordinary sbare capital was 3.12 per cent. being equal to that of 1855, and considerably higher than the average of the pre-eding seven years, which was 2.59. In 1854, however, the rate was as high as 3:30. Of the total 308,775,8944, now embacked in railways, 77,339,4104, have been raised by loans, 57,037,171V, by preference sbares, and 174,353,3044, by ordinary share cepital. This represents an expenditure of 35,4389, per mile, the cest of the English lines having been 40,2884, per mile, of the Scotch, 27,7307, and of the Irish, 14,8087. The period of extravagant onliny, however, was prior to 1840, the 27,7307, and of the Irish, 14,5087. The period of extravagant onlay, however, was prior to 1849, the average cost of lines constructed since that period baving been only 0,5687, per mile. The working expenses last year experienced an increase of I per cont, in England, and a diminition of 2 per cent, in Scotland and Irichard, the average being 47 per cent, as compared with 48 per cent, in 1855. The develop-ment of the goods traffic bas gone on mon a rapid ratio, and its promotion to the mescencer traffic is next or the group stands our group of passenger traffic is nuw 53 to 47 per cent. whereas eight years ago it was only 44 to 56 per cent. The total of passengers conveyed in 1856, was 129,347,592, being an increase conveyed in 1856, was 129,347,592, being an increase of 10,752,457 on the previous year; and the number conveyed per mile of railway open was 15,213 against 14,503 in 1855, the receipts per mile being 1,1944, against 1,1644. The general effects of the raising or lowering of fares are detailed, and the re-sult appears to be against the polley of high charges. The length of bioe open for traffic in the United Kingdom on the 30th of June, 1856, was 5,506 miles; and the persons employed amounted to 102,117, or twelve per mile. There were also 963 miles in course of construction at that period, of which about 205 were onened before the end of the which about 20 S were opened before the end of the year. The whole are double lines, excepting 2,511 miles. Between 4,000 and 5,000 miles authorised by Parliament remain to be constructed. The total will then be 13,173 miles, namely, 9,700 in England and Wales, I,647 in Scotland, and 1,826 in Ireland.

THE ARCHITECTURAL UNION COMPANY. Youn kindness in giving insertion to my letter of last week, emboldens me to furnish further particulars of our progress, feeling sure that they must interest very many

York hindness in giving insection to my letter of last week, emboldens me to furnish further particulars of our progress, focing sure that they must interest very many of your reders. As a proof of the steady advance making, I append and the of shareholders who have found the company shared of these Mr. Thos, Grissell, Messrs, Luens, Mr. C. H. Smith, and Mr. A. Waterhouse (Munchester), are donors to the availary fund-the latter specially in favour of the Architectune Exhibition; --and from this fund alone It is prohale that some 700, or 800, a year at least will be vanishile, to be permanently applied for the advancement of architecture. It is erfait the ground will the total capital is not much more than one-half promised, and the directors will no boliged to borrow the remainder, unless more help is afforded. Surely the profession will not permit this it will be strange indeed if the budden is to fall upon the faw, when the good of all is equally considered, it is seen about the force, that if the whole 15,0004, share capital is used the force in the sum and the share of a sub-set of the strange indeed if the bar on the faw, when the good of all is equally considered. It is seen about the force, that if the whole 15,0004, share capital is used the force, that if the whole is 5,0004, share capital is used the other of the search and the share of a sub-best per share, is all that would be vanted; and the whole would be done easily, instead of by taxing all the cheerful esign and put the interest, when hand may be ablotted before the start exists in the sub-start is to permit the start with the estable is the method is a start will be strated to the orticity of the directors. ⁴⁴ Drawing for Elementary Schools: being a Manual of Method of Teaching Drawing, specially adapted for the Masters of National and Parochial Schools: published under the sanction of the Science and Art Department of the Committee of Council on Education," Svo. pp viii.-65: ents. By ELIS A. DAVIBOON, Head Master of the Chester School of Art, and Professor of Drawing at the Chester Dioceson Training College. London: Chomman & Hall. Chapman & Hall.

This is a very concise hand-book—intended less for the ordinary student than for the masters of schools of general education, who may not have had the advantage of systematic instruction themselves, but who still see the desirableness of introducing drawing into their establishments. To such persons the methed, of tritice are successful woirth of the drawing into their establishments. To some persons the methods of tuition are succently pointed out, as well as the means by which they may instruct themselves. Thus the best methods of placing the as well as the means by which they may nutract themselves. Thus the best methods of placing the pupils opposite the black heard, marking out the copy from the example, inspecting the work, explaining the nature of the subject, and interesting the pupils in their labour, are pointed out. It is pleasing to find that the home practice of the pupils of the Chester School has heen the means of interesting their parents also in the acquisition of drawing as a desirable accomplishment. The examples supplied in the work, and suggested for delineation, are chiefly the forms of the most familiar objects, as capital letters, tools, wooden gates, steps, kettles, fre-irons, and leaves. This selection is advisedly made; but in some of the examples, very important details of form are omitted, --- so that the selection could perhaps he further improved, in order that inaccuracy, and in unuty cases also inapprehension of beauty or and in many cases also icapprebension of beanty or fitness, might be avoided. But we recommend the nears, might be avoided. But we recommend the work for the purpose for which it is intended. The production of a considerable number of good books the same kind testifies to the progress which is being made.

"Ornamental Drawing and Architectural Design; with Notes, historical and practical. Upwards of 200 Illustrations." Svo. pp. 122. Edited by ROBERT SCOTT BURN, Editor of the "Hlustrated Drawing-Book," "Mechanics and Mechanism," &e. &e. London: Ward and Loek.

THIS work appears to belong to the series commenced by the same publishers with a re-issue of the "Hus-turated Educational Works," 'Intely published from the Office of the *Hinstrated London News*." A didistinct claim on our attention to the "new editions" is made by the announcement that they "have been and make by the announcement that they inverse most credibilly revised, and in their present state matrixe as near perfection as possible," and by the privated option of one of her Majesty's Inspectors of tschools, who will "not fail to recommend them." in purposance of his daties. We are placed in some difficulty in the case of popular works of this class, which is offer a close wise objudget works of which seem to offer at a low price, abundant matter most to be obtained with the same facility otherwise, but which put forth some errors such as it may take much time to unlearn. The profuscress in illustra-tive cuts, which is desirable for the student, involves tronble in editorsbip, added to the ordinary duties as connected with the literary matter; and it is seldom that the much is in the literary matter.

connected with the literary matter; and it is seldom that the supervision of draughtsmen and printers is what the case should demand. As regards the work now before us, we are sorry that it is not to be held quite free from imputation on grounds above referred to. The gen-tleman whose name is placed on the tille page, who is known as an industrious compiler and author of works on kinderd subjects. con hardly have of works on kindred subjects, can hardly have been allowed to give the full benefit of his excitions. At the opening page, the two first diagrams are trans posed; the engraving, as in the profiles of mould poser, the engineering as in the produce of module, ings and in the ornaments of the Greek orders, is such as is calculated to mislead the student who may ex-deavour to make copies at large: at the last page, the Italian trasses are quite out of drawing; and much of the Gothie tracery is drawn, as to mitres and eusps, so as to tend to misconception of the peculiarities of detail in the style is question. "Indian Architecture" should have heen noticed with a refer-ence, however slight, to a Mahomedon as welt as a Hindoo style: we apprecised it is incider correct to date the Saraceoic architecture from the time of Mahomet (seeing that it is doubtfol whether, before they became acquinited with Greeks, the Arabian artifists had much ard), nor to speak of the "Remis-smee" sdyle as having for its matters, Son Gallo, Palladio, Perrault, and some others; and the doorway, figure 184, is not Elizabethan, hut pure Italias. We ourselves, notwithstanding, have derived interest from ings and in the ornaments of the Greek orders, is such agure 185, is not Edizabethan, but pure' Italian. We ourselves, notwithstanding, have derived interest from the book, — though it lays "no claim" "to be considered as an exhaustive tractise," or on the score of "any originality in its arrangement and matter." It is put forth as "an attempt to em-body a series of lessons, and of bistorical and practical notes, culled from various authorities, which may serve as the groundwork for more complete and elaborate practice, and form an incentive to the sys-tematic study of the principles and negative of decomemotorate practice, and form an uncentive to the sys-tematic study of the principles and practice of decorn-tive and constructive art." The work has three divi-sions. Of these, the first division shows the method of delineating ornament in which right lines, or seg-ments of circles, or free curves may be chiefly met with, and gives a few illustrations of ornament from the proceeding and tartific fabrics with curcle for the pavements and text like fabrics, with quotations from various authorities on the principles applicable to such drsigos: the second division gives very short notices of the ebid styles of architecture; and the last division supplies a few examples of reduced plans, working division details. working drawings, and details. Paying regard to the reservation we have made, the work may afford useful ioformation, and it is obtainable at slight pecuniary cost.

Miscellanea.

FALL OF A HOUSE AT BIJSTON .- On the 22nd FALL OF A HOUSE AT BIJSTON.—On the 22ad ult a bones in Lester street, Bilston, fell to the ground. The cause was one not unfrequent in this district, the subsidence of the ground from mining operations. The occupant was badly burised and cut about the face, but no other personal injury was sus-tained tained

WEST-END TERMINUS .- Sir: Lientenant-colonel, WEST-END TERMINUS.—Sir: Lientenant.colone), Pottinger is not correct when claiming to he the first to suggest the Grosvenor canal and basia as the site for a West-End Terminus. One of the present pro-moters, Mr. Thomas Jackson, as long since as 1545, had surveys and drawings made for the same, which are now in his possession; and had it not been for the panic, which occurred immediately after that time, a West-End Terminus would have been creted on the promeded site avec area.—W. LAUSE

time, a West-Eod Terminus would have been crected on the proposed site years ago.-W. JAMES. THE WELLINGTON MONUMENT.-I perfectly agree with Mr. Perkius that something should be done to prevent the Wellington models heing lost to the na-tion, by being buried in the studios of the different artists. Doubtless the Crystal Palace would in some respects be a good depository for them; hut it is a question whether many of the competitors would like to incur the expense of conversance thereto. and as superior of the competitors would like to incer the expense of conveyance thereto; and as for making an additional charge for viewing them there, that would, I think, mar its success, much less ruise a sum at all adequate for the purchase of them. En passant, would not the preservation of these models constitute a very good memorial of the Duke P To accomplish this, a large fund would be required, which could only be raised by subscription. I am rather surprised this matter has not already been taken in hand by some of the influential sculptor com-petitors. The members of the Sculptors' Institute seem very quiet about it. Suppose they selled a meeting at their rooms to elicit the opinion of the alogted for the above purpose. Perhaps they are waiting the final decision of the Chief Commissioner, E. G. PINTSTER, Sen. E. G. PHYSICK, Sen.

TASTE AT HALIFAX: THE PROPOSED PUBLIC BATHS.—It is intended to expend the sum of 1,500. in the ornamentation of the snite of baths to be created in the People's-park, at Halifax. Promises to the amount of 500°. have been received by the committee having charge of the matter, and arrange. committee having charge of the matter, and arrange-ments are being made for a thorough canvass of all the inhabitants of the horough, as it is considered de-sirable that the amount should be made up not from harge sums alove, but from the small contributions of the humblest. The corporation will, of course, erect the baths : the above has reference only to the external decoration of the building. RAILWANT TRAFFIC. — The traffic returns of the mileaves in the United Kinedom for the week ending

RAILWAY TRAFFIC. - The traffic returns of the railways in the United Kingdom for the week ending railways in the United Kingdom for the week ending Sept. 19, amounted to 518,799/, and in 1856, to 499,683/, showing an increase of 19,1157. The gross receipts of the eight railways having their ter-mini in the metropolys amounted to 214,6957, sand last year to 213,491/. showing an increase of 1,204/. The increase on the Eastern Counties, amounted to 1,557/; on the Great Workern to 1152, jon the Great Western to 1,2877, on the North. Western to 1,043/. total, 4,002/. But from this must he deducted 86/., the decrease on the Blackwall; 343/. on the Brighton and South Coast; 1,1244, on the South-Western; and 1,1457. on the South-Eastern, The receipts on the other lines in the United King-dom amounted to 304,1037. and for the correspond-ing period of 1856 to 286,1027, showing an increase ing period of 1856 to 286,1927.; showing an increase of 17,9117.

ARTIFICIAL LEATHER.—Mr. F. Charles Jenne, Greshau-street, City, bas provisionally specified an invention for producing an elastic material having the appearance of patent leather, but not liable, like it, to erack or peel on the surface. He prepares an elastic compound, composed of masticated india-rubber, or india-rubber combined with gutta percha, and mixed with sulphuret of antimony and woollen dust or waste. This compound, which forms the base of the fabric, he spreads upon thin cotton cloth, and then subjects the same to heat, in order to effect what is called the "change" in the india-rubber compound. The fabric is then ready to receive japan varieb, which is laid ARTIFICIAL LEATHER .- Mr. F. Charles Jeune. enage in the india-rubber compound. The fabric is then ready to receive japan varnish, which is hald on in the usual manner, and subjected to a dry heat : when the first coat is properly set a second coat is applied, and submitted in like manner to a dry brat, and so on, until the required finish or smoothness is imparted to the face of the fabrie.

COATING IRON WITH METALLIC ALLOYS. -Mr. seph Poleux, according to the Scientific America. has patential, in the United States, an invention for preparing iron to receive the coating, hy immersing it in concentrated minoral acids. As soon as the articles to he cleaneed are immersed in the acid, one, two, or to be cleansed are immirsed in the acid, one, two, of more small pieces of speller are dropped among them, or the speller is passed into the acid with the articles. The acid acts at once and rapidly on the spelter, holds in solution what it dissolves, and precipitales the film of it on the minutest portions of the iron surfaces the instant the acid bas cleaneed them, and this film pro-tects such portions from any further action of the acid while xeruing in it. The action on the acid while remaining in it. The articles are next taken out; and, without beiog washed, dried, or undergoing

out; and, without beiog washed, dried, or undergoing any other treatment whatever, are passed immediately, though slowly, into the bath of melted alloy that forms the ceating. A New MODE OF APPLYING MR. BESSEMER'S INVENTION.—Messrs. T. Brown and G. Parry, Ebbw Vale, Monmouth, propose a mode of refining, purifying, or decarbonising melted east iron by means of currents of air, in a covered or partially covered furnace, without coal, or other fuel. The metal being in a melled state forcefreed from the blast furnace as in a melled state (preferred from the blast furnace as being the most economical), they run it into a char-ber or furnace, which is closed so as to prevent the temperature of the contents being too much lowered. temperature of the contents being too much lowered. They introduce air tuperes from a hlowing apparatus into the interior of the chamber above the level of the melted iron, and in such a position that air shall be blown down with considerable force upon the top of the melted metal, so as to produce a combustion of the earbon combined or mixed with the iron. The blast may be either hot or cold, and they continue has means with the iron. In the blast means the iron is the the pro s until the iron bas heen brought into state similar to that called finery metal, or refined iror

IRON SHIPBULLDING ON AN EXTENDED SCALE, A model of a steam-ship, on a far more gigantic scale than the *Great Exstern*, has been exhibiting in Liver-pool; and, if all the excellent qualities ascribed to it be accomplished, the ship will outsirip both it and all others that have been yet constructed, both in the rate of speed, internal accommodation, and safety. It is alleged that a ship built upon the principle of the model, of 30,000 tons, 1,000 feet in length, breadth 70 feet, depth 30 feet, would reach Iadia in about 25 days. It is also contended that when ready for sea she would not draw more than 20 feet of water. The projectors will, doubtless, wait a hit till they see how the *Great Exstern* gets on. IRON SHIPBUILDING ON AN EXTENDED SCALE.-

OPENING OF THE MIDLAND INSTITUTE AT BIR-MINGHAM.—Lord Brougham has consented to preside at the opening of the Theatre of the Institute, in Paradise-street, Birmingham, on the evening of Thes-day, the 13th of October. It is proposed that the etrificates and prizes now heing awarded to the students of the Institute, be distributed that evening publicly by Lord John Russell and Lord Stalley. The members of the Institute, the pupils of the classes, and such of the members of the National Association for the Promotion of Social Science as are non-resident, will be admitted to the ceremonial. MICHI TESTIMONIAL.—About unlety friends of Mr. Sheriff Mechi dined together at the London Tavern on the 22nd ult to present him with a testi-monial in apprecision of his exertions to promote the interest of agriculture. The testimonial consists of a centre table ornament in the Remaissance style, of massive design. There are figures of Agriculture, OPENING OF THE MIDLAND INSTITUTE AT BIR-

of a centre table ornament in the Renaissance style, of massive design. There are figures of Agriculture, Commerce, Peace, and Pleuty, seated upon a plat-form, supported from the basis by a centre column, decorated with agricultural produce. There are eight hranches for eandles, and the centre is fitted with a lamp. The design was presented by Mr. Digby Wyatt, and the plate has heen manufactured by Messrs, Smith and Nicholson, of Deke-street, Linceln's-in-fields. The plate weight 500 cunces, and cost 400 guineas. The testimonial hore a suit-able inserption. able inscription

ANTIQUTTIES ON THE ARRAN ISLES.—The ancient structures on the main island here were visited when the British Association were at Dublin. The dates assigned to these are from 500 A.C. to 100 A.C.; in assigned to these are from 500 A.C. to 100 A.C. in other words, they were more than 2,000 years old. They consist of four forts, two of which are circular, called Dun Onagh and Dan Oghill; the latter the most perfect extant. They are huilt of lonse stones without mortar, the main rampart varying in height from 16 feet to 25 feet, and having a thickness of latter 15 for the servering card they work From 10 feet to 25 feet, and mong a forekness of about 15 feet, the ascending steps and the watch-towers on the summit being in some cases still dis-coverable. The diameter of the structure is about 100 feet, but an outer wall of some solidity encloses a much larger space. The other two forts have taken advantage of promoutories, two sides of which are protected by inaccessible cliffs, washed by the Atlantic, protected by innecessible cliffs, washed by the Atlantic, and bave thrown up ramparts of the like Cyclopean structure, in a semicircular form, to defend the ap-proach from land. Of these Dubh-Chathair is the oldest known, and Dun-Aengus the largest aud mest striking. Bebind it the cliffs are 300 feet in height, overhanging the sen. The whole defences occupy about eight acres. Who built these massive works, and what may be their date, is matter of debate and speculation. That they are pre-Christian and pre-historie seems all that is certain. VALUE or LAND AT ALDERSHOTT.—The Govern-

VALUE OF LAND AT ALDERSIGNT.—The Government bought the land at Aldershott for, on the average, 171, an arce. Instead of erecting the present barracks in the centre of the 8,000 or 9,000 sent ourracks in the cente to the 5000 of 5000 acres bonght, the engineer pitched inpose a spot on the artrene edge of the Government lend, and byond which, of course, the military authorities have no control of any kind. There sult is that a swarm of pub-lic-houses and beer-shops is herming in the new build-ings, while others are heing built, and will of course the barger sensitivity theorem of cull more decain. soon be accompanied by houses of a still worse descrip-tion. Of course the land in the rear of the barracks bas risen in value more than 5 ftyfold since the buildings were commenced, and it is said that Government surveyors who came into the market the other day to purchase two acres on which to creet a bospital, had to pay upwards of 2,000% for what eighteen months ago they would have obtained for 34/.; or have had for nothing, if the site had heen chosen in the centre of their own land l

SMITHERED IMPROVEMEN'S.—""e plan of the proposed dead meet and poultry ...arkets, prepared by Mr, L. H. Isnacs, the surveyor to the Board of Works for the Holborn district, for the committee, for the appropriation of Smithfield as a d-ad meet market, and which has been laid before the Chan-cellor of the Exchequer, and by him submitted to the City authorities, comprises several improvements of the streets forming the approaches to the market. Amongst these are the formation of a new street 60 feet wide, from Holhorn-bridge to Long-lane, which would do away with the pre-ent circuitons and timeonvenient road by way of Snow-hill, and at the same time open up a view of the new structure from Far-ringdon-street and Blackfriars-bridge. It is also pro-posed to make Long-lane 60 feet in width for its entire length, and to straighten Smithfield bars and increase its width to the some extent.—City Press. SMITHFIELD IMPROVEMEN'S .- "" e plan of the

entire length, and to straighten Smithfield bars and increase its width to the same extent—*City Press.* STRIETS.—The whole of the masons employed at the railway works and hridges, says the *Forres Gazette*, have struck work, in consequence of the navvies having precedence in payment.—The Whitehaven shipwrights were to resume work on Monday last, at the wages offered by the masters, viz. 24s. per week. week

THE BUILDER.

GAS.—At the half-yearly meeting of proprietors in the Bristol United Gas-light Company, it was an-nounced that the receipts for the past year were up-wards of 27,000/, and the profits about 8,750/, which enabled the directors to recommend the usual dividend at the rate of 9 per cent. per annum, earrying forward nearly 5007. to the credit of the current half-year. nearly 5007, to the credit of the current half-year. The salary of the secretary was muanimously increased from 4007, to 5007, per annum.— The Kidsgrove Gas-works, at Tunstall, have heen completed. At present the gas bas only heen introduced amongst private consumers. The works have cost about 3,0007.—A new gasometer, said to be the largest now in Scotland, has just heen erected at the south back of Canongate, at Editburgh. It is 37 feet in height, 130 feet in diameter, 390 feet in erremn-ference, and will contain 500,000 cubic feet of gas. For the construction of the gas-balder itself, 120 tons of mall cable iron have here employed, and eight tous of the same metal for each of the fourteen columns which support the girders and guide the rollers on the gas-holder as it rises; so that for the construction of the whole 232 tons of iron have been employed. Though five months constituted the period required for its crection, the whole operations have extended

for its crection, the whole operations have extended over two years. The tank was constructed by Mr. James Bow, of Pollokshields, near Glasgow; the gas-holder by Messrs. Horton, of Birmingham. A New VIEW op THE SEWAGE AND THAMES QUESTIONS. — At the last meeting of the British Arsociation, held at Dohlin, Dr. Barnes and Dr. Odling read a paper "On the Condition of Thames Water as affected by London Sewage." The authors had work tworth for earble corruptions mutero. had made twenty-five weekly examinations, micro-scopical and chemical, of the water at high and low scopen and chemical of the water of high and low ide. From their experiments it appeared that the sewage poured into the river was, for the most part, destroyed by the innoxious processes of axiadion and vital development, and that a very minute proportion only underwent the putrefaction, properly so called. The amount of organic matter existing in the water of organic matter was evidence of the offensiveness of the water, inasmuch as the greater proportion of the organic matter was in the state of living beings. High water invertably coutained a larger amount of

rganic matter than low water. SANITARY IMPROVEMENTS AT WORTHING. -- All SANTIARY INFROVEMENTS AT WORTHING. — All ecsspools and places of deposit for refuse matter bave been removed, the whole of the sewage, which was before conveyed into the sea in front of the town, being now enriced away by means of a trunk sewer to a long distance eastward. A supply of water of the purcest and most wholesome quality, drawn from the chalk strath of the South Downs, at a depth of nearly 400 feet has been wereided on the constant service 400 feel, bus been provided on the constant service system. By this water supply, also, the drains are fushed, night and day. In point of health, the town was before ranked by the Registrar Grueral as the second in the kingdom, and under its present more favourable conditions its salubrity is vastly increased. Engineer

OPENING OF A PUBLIC PARK AT LEITH .- This OPENING OF A FUELCE TARK AT LEME THIS park was opened by the provist, magistrates, and conneil, on the 19th ult, in presence of a large con-eourse of spectators. The provost, in addressing the assemblage, stated that till very recently the Links be-longed to the city of Edinburgh, but that the corpo-sition of Link burging unphased them and rended the ration of Leith having purchased them and rented the park, consisting of several acres, resolved, with the view of affording the people an opportunity of annusing the source is a important of the source of the source is the source of t event

NOTRE DAME AT BOULOGNE .- The statue of "Our Lady" has heen placed with great eremony on the summit of the dome of the new esthedral at Bonlogne. All who have visited the neighbourhood on the summit or the mome or visited the neighbourhood Bonlogne. All who have visited the neighbourhood bave seen this large and imposing structure, which has grown up gradually, chiefly through the efforts of one individual. Some time ago we gave a few particulars of the building, and pointed out that good architectural assistance was wanting. The details are very bad. Beneath part of the eathedral there is a very curious available torut. ancient crypt.

WESTMINSTER ABBEY .- In the late tion in Westminster Hall, I particularly noticed how little attention was directed to the necessity of comlittle attention was directed to the necessity of com-pleting Westminster Abbey, hy the erection of the central tower, that is waiting; for, besides com-pleting that venerable building, the finest old reli-gions edifice in Loudon, and rendering it a still greater object of attraction and interest than it is at present; it would blend harmoniously with the three heautiful towers of the New Houses of Parlia-ment. London has not so nany fine public buildings, as that she can afford to neglect the (gw that she possesses.-O.

possesses.-O. *** The asserted insufficiency of the existing piers bas long stood in the way of this proposition.

ГОст. 3, 1857.

FALL OF TWO HOUSES.—On Wednesday last alarm was occasioned by the falling in of two houses in Bartlett's-buildings, Holborn. For some days past the workmen of Mesars. Lneas, Brothers, builderg, Belveders-road, Lamheth, have been engaged in re-pairing the houses in question, for which purpose the beaution. pairing the houses in question, for which purpose the inside of each had hear astripped, leaving the bare walls and roof alone standing. At six o'clock in the morning the workmen commenced operations as usual, when they were suddenly terrified at hearing a eracking noise, indicative of danger. They lost no time in endeavouring to make their exit from the building; but ere they reached the exterior the whole fell in with a tremendous erash. Fortunately, all occurd with their lives escaped with their lives.

AN ATLAS GRATIS WITH THE DISPATCH.

ON and AFTER SUNDAY, OCTOBER 4th, 1857, each Copy of the DISPATCH, will be accom-panied with a Coloured Map, a Chart, or the Plan of a principal Town, so as to furnish to each Subscriber, GRATIS, a most Comprehensive, Complete, and useful Atlas.

useful Atlas. The size of the Engravings will be that of one page of the Newspaper. Six Maps and two Plans, in each year, will he of double the size. It is hoped, in the course of a short time that the DISPATCH ATLAS will contain more names and positions of places than any other English publica-tion of the kind. The counties will he given sepa-rately and when tion of the kind. The counties will be given sepa-rately, and where large, divided. Within the first four months, India will be more accurately and com-pletely delineated, in a Series of Nine Maps, than in av British Atlas.

The names of the artists will he the best guarantee for perfect accuracy. The engravings will be in the highest style of art, involving a cost of MANY THOUSANDS OF POUNDS.

Mechanics' Institutes, Educational Establishments, Hotels, Reading-rooms, and Coffee-houses, will, in possessing the Dispatch Atlas, be supplied with a daily ant.

The DISPATCH ATLAS will be forwarded gratis with the Paper at the nsual price—5d. per copy, or 6d. stamped.

The Friday Evening Edition may be received in the most distant parts of the Kingdom on Saturday morning.

Office, 139, Fleet-street, London.

VOL. XV.-No. 766.

RIGHTLY shiues the sun, the air is fresh and invigorating, and, opportunity occurring,

"One who long in populous cities pent, Where houses thick and sewers annoy the air, Forth issues on a summer's morn, to breathe Among the pleasant villages and farms Adjoined." An

Will you with us, good reader, not expecting too much in the way of information, but content to while away a day in walking through an old church or two, and loitering amidst the beauties of We may be less technical nature f than is usual in these pages, and say a word or two about a fine view if it strike us, not restraining an

exclamation of delight if a noble clump of trees, or a piece of man's handiwork call it forth. and yet find time enough to pick up sufficient knowledge to redcem the ramble in the eyes of those who think it necessary to be always working. The trees are still green, showing as yet but little of the autumn brown ; the sombre yew is full of red berries, and the hedges and the fields are enlivened with flowers, -the elegant pimpernel, charlock (troublesome but sparkling), the harebell, the yellow tormentilla (who would guess it had its name from tormentum, because it cures the toothache?) wild gerauium, and many others. And who will look at any one of these with the mind, and say there is nothing to be learnt from it by "artist or artizan ? "

"Your voiceless lips, O flowers, are living preachers, Each cup a pulpit, every leaf a book, Supplying to the fancy numerous teachers From lowellest nook."

You might get a lesson from each, hut we cannot stop so long, for we are in face of Lingfield Church, and would see what it contains. Lingfield is on the borders of Surrey, close to Sussex. The daughter of William de Hevere, of Hevere Castle, married-Reginald de Cobham, in the thirteenth century, and the grandson of this Reginald, in 1342, founded in Lingfield, Sterborough Castle. The church contains many memorials of the Cobhams. One Reginald Lord Cobham founded a college in Lingfield, in 1431, but we did not see any remains of it. Aubrey mentious an inscription, formerly in the cast window of the church, in memory of Reginald Cobham, fundator. There is a very fine brass on an altar-tomh in the north aisle of the chancel to Sir Reginald de Cobham, who died 1403, which is figured in Mr. Bontell's "Monumental Brasses." It is a very interest-It is a very interesting example, because it shows the transitiou then taking place from the use of chain-mail to plate It has the acutely-pointed bascinet armour. and camail (cap-mail?) in connection with the cuirass and taces. His head rests upon his tilting helmet, from which the crest, apparently a head in profile, has been removed. The in-scription in full is given in the Oxford "Manual for the Study of Monumental Brasses." Near to this hrass, in the same aisle, is an altar-tomb with a sculptured effigy of a knight upou it, in mixed armour of nearly the same period, and wearing the garter. Manuiug and Bray, in their history of Surrey, and Brayley after them, say the head of the effigy is resting on a cushion

THE BUILDER.

seem to show a connectiou between this effigy, which has no inscription, and the hrass last mentioned. The feet of the effigy rests on a small figure of a man with a long beard, and turban on his head, probably with reference, together with the head above, to some exploit in the Crusades. The offigy is in a very had state, and should receive attention. It was originally elaborately painted and emblazoned. The church is full of nohle and costly memorials. Mr. Brayley, we suspect, could scarcely have examined them for himself, or he would have given fuller particulars. In the centre of the transept is a large and handsome altartomb, of the Perpendicular period, on which are the effigies, in white marble, of a knight aud lady, formerly painted and gilt, with numerous heraldie insignia, but uo inscription. A large Purbeek marble altar-tomb, with panels full of tracery as sharp as when first executed ; a brass of a female the size of life (the part representing the hair destroyed), and the brass of John Hadresham (a contraction of the last syllable makes it a difficult name to read), " Qui obiit in festo apostolorum Symonis et Jude, 1417," together with an ancient oak lectern, deserve attention. Even more so, from its greater rarity, does an incised memorial at the east end of the chancel, 4 feet long, and I foot 4 inches broad, formed of three tiles, and representing a figure with the hands elasped, and in the costume of the first half of the sixtcenth century. It is curious as an imitation of earlier work without the skill of the early workers. There are two tiles remaining in the pavement of a second memorial of the same kind

The hody of the church-it is dedicated to St. Peter and St. Paul, by the way—shows nothing earlier than the Perpendicular period; but the failing tower, heavily buttressed, preceded it. The north side of the church externally presents a handsome range of seven windows. Between the third and the fourth of these there is a turret as high as the roof, with a door into it, which the historiaus of the church say does not appear to have any internal communication. We may add, however, that the turret may have led to the rood loft.

The views about arc beautiful, and on leaving the church, you will find in Plaistow-street, as the road is called, where another road crosses it, a picturesque structure of two stories (with a modern "cage" tacked on to it), called St. Peter's Cross, belonging to the last period of Pointed architecture. According to Manning, it was at one time surmonnted hy a cross, with a basin for holy water on the top of it ! A picturesque old oak spreads itself over the structure, and forms a charming picture.

We journey sonthward, over the Sussex frontier, and find ourselves at West Hoathley, where the views are superb. Looking thence northward, in a most luxuriant valley, nestles an ancient residence, formerly called Gravelye, and now Gravetye ; while the tower of East Grinstead Church, every where seen, helps the distance West Hoathley Church has a lofty shingled spire. Rickman says the chancel is of the Decorated period, but this is an error: the chancel is Early English, and has three handsome sedilia, and a piscina The font is of the same period; it had originally a central stem, with four smaller columns round it, at the angles, hut the latter have disappeared. The original east window was destroyed when a flat cciling was put up in the chancel. The church altogether has been sadly dealt with, but offers facilities for satisfactory restoration, which it may be hoped will he taken advantage of one day. The "priest's door," in south wall at east end, has a semicircular head; but whether

ings in the upper story of the tower, on both sides, is circular headed, and the other pointed, may strengthen the first supposition.

In front of the west door of the tower are memorials of the fact that there were iron foundries in Sussex at an early date, in the shape of two cast-iron monumental slabs, one Richard Infeld, who died 11th September, to 1619, and the other to a second Richard of that name, who died on the 11th of March, 1624. The former of these, when Horsfield wrote his history of Surrey (1835), was in the floor of the church. The ancient house of which we spoke just now, Gravetye, was formerly the property of the Iufelds. Mr. Cutts, in his "Manual of Sepulcbral Slabs," mentions an earlier example of cast-iron slabs at Burwash, in this county, but does not speak of these at West Hoathley. There is one also, he says, at Crowhurst, Surrey, dated 1591.

Nearly opposite to the church, is a stone house, consisting of a centre, with two gabled wings, which is counected hy tradition with Anne of Cleves, and would seem to be of about the date of that lady. The centre has on both stories a long window, straight-headed, like all the other windows, divided by upright mullions into nine lights. The inside is much altered; the staircase is more modern than the building, and is not in its original position. The hall however, is plainly accognizable, with its dais and there are some stone chimuey-pieces and earved woodwork, in other parts of the house, worth seeing.

The great features, however, of West Hoathley, are of nature's providing, and were turned out of hand before any distinct style of architecture had been thought of. We speak of what are called Chiddingly Rocks, which will remind the visitor who knows Fontaineblean, of the charming forest of that wonderful place. Years ago Governor Pownall described in the Archeologia one of these rocks long known as "Great upon Little," and thought to he a work of the Druids. He pointed ont discriminatingly what most persons believe now, that Nature had probably done the greater part of the work, whether the Druids had afterwards adopted it or not. This mass of rock, which we may call roughly 20 feet high, 15 feet one way, and 20 feet the other, and weighing probably more than 500 tons, stands on what in some positious looks little more than a point, and in others a ridge. Initials, dated in the beginning of the seventeenth century, are observable on the face of it, and some monograms, which belong, perhaps, to the previous century.

Elsewhere there are the Cave of Adullam, and the Pieture-frame Rock (a title more expressive than poetic), the Cave of Vishnu, the Druid's Seats, and many other beautiful points ; while seen from the other side of the brook the rocks take a more regular form, and look like those---

"Massy and mysterious giauts Of architecture, those Titauian fabrica, Which point on Egypt's plains to times that have No other record."

The present excellent owner of the estate is proceeding with vigour and taste to develop its capabilities, and none, who will first ask per-mission, are refused access to its heauties.

Still going to the sonth we reach the church of Horsted Keynes, known for the curiously small sculptured effigy of a cross-legged knight, armed, which lies in an Early English trefoilheaded niche on the north side of the chancel. The stone out of which the effigy, with lion at the foot, is ent, is 2 feet 7 iuches long : the niche is 2 feet 10 iuches. A writer in the "Jonrnal" of the Archæological Institute originally supported by two marble figures, this marks an earlier period for the first erection (vol. iii.), seems to think that the network of the surver, that a spect. The first erection it rests on the turbaned head of a Turk, would, or is a caprice, can scarcely be said. The figures are the short head of a turk, however, that one of the two small openbably for the purpose of an Easter sepulchre. The effigy probably helongs to the reign of Henry III. and has the causail indicated, but Henry 111, and has the canadi indicated, mit the mail is not scalptured: i twos, doubtless, represented hy colour, as was often the case. The hands were probably brought together over the hereast in an attitude of devotion; hut these, with part of the arms, have disappeared. It has been surnised not interasonally, that diminutive effigies of this kind were placed where a *portion* only of the remains of the person commemorated were interred,-as, for example, the heart. In the present case the effigy may have held a heart hetween the hands, an occurrence not uucommon.

The writer alluded to, with others, describes the building as an Early English church; and this is correct as respects part of it, but it will he found that it is essentially a Norman cross The semicircular chaucel arch of small church. dimensions, the arches to the transepts, the tower above, and the north doorway to nave, arc all of that period. The semicircular head of the small opening in upper part of tower is cut out of a stone. The tower contains three bells, and we should also mention that on the south side of the abnormal theorem. the chancel there is a Purheck marhle slah, with a floriated cross. In the north wall of the church, outside, at the cast end, is a sculptured stone, outside, at the cast end, is a scherent dealer apparently a stoup, though the hasin has heen destroyed. The stone is pediment-headed, sur-mounted by a small Greek cross in relief. The mounted by a small Greek cross in relief. The upper part of the stone contains a trefoil-headed panel, and at the bottom, just above where the basin would come, is a trefoil-shaped sinking. On the other side of the church an altar tomb has heen recently put up in memory of Bishop Leighton, who died 1684. However, we may no longer stay :---

"The sun is dying like a cloven king

and we must back to the busy town-its cares, and claims, and charms.

HOW TO REFORM ARCHITECTURE

THE proposals of "An Architect" (Sept. 19), for establishing an "ctiquette" in his brethren's practice, establishing an "conduction in its orienter is practice, that is, a standard of honourableness, — a moral *diploma*,—a thing a thousaud times more important than the mucb-discussed koowledge-diploma,—seem Into the independence of the second s show him involves far more fatal error; had he confined himself to the first four proposals, the bioding ourselves to submit no competitive designs unless to a tribunal in whose competence we believe, — unless secured the exclusive execution of them (which, indeed, we can always secure for ourselves at the Copy-right of Designs Office for a tax of ten shillings per drawing),-unless guaranteed the continued pro erty of our documents, whether used or not .-and ss the premium offered to induce competition, it large or small, he distinctly april from, and addi-tional to, the regulated price of our services had they head given non-competitively --had he confined him-self to these, I should hope all architects, with any prefeuce to respectability, would have rushed to sub-orche his proposale or scenar are connection in the scribe his proposals, or escape any connection in the popular mind with those who would gainsay them.

Certain I am that, till men, architecturally edu-eated, and hundreds of them, can be found to endorse, work upon, not only these terms but some still newer ones (of which more anon), neither will Englishnen obtain building not to be ashamed of, nor will heir "treatment of this honourable profession" be their in the least degree more pleasant or less contemptuous than your correspondent (like filty before him) finds the honourable profession be at all released from this necessity, apparently so peculiar to it, of incessantly proclaiming itself by that title, aod re-minding a wicked public of its own exceeding hooourahleness

The fact is, that this naughty public cannot help reasoning, I helieve, somewhat after this mauner:successively detached from the trunk,-from being every man's occasional business, to be a few men'

bear viewing near enough to extract either pleasure or profit. The professed architects, whether of ancient Rome or modern Europe, are found to have left nothing as architects; nothing decorated; worth even notanig as architects; notanig accontact, work over the attention that the mere mass or expense may cheat us out of; nothing save a little blank engi-acering (as the Poote S. Trinith, Eddystone Tower, or Dee Viaduct), that has in it enough of human or Dee Viaduci), that has in it chough of love reason, and certainly nothing with enough of love or wit, or other human quality, to interest or in the least repay human examination. The things are only found available to furnish satirists with omnipresent illustration of every kind of failure, and every absurdity conceivable or inconceivable without their aid. These conceivable or inconceivable without their aid. These works of the *profession*, then, are called "art" by courtesy, every one understanding that, for the things which earned the title, and alone caused aod ustify the expression justify the expression, we must recur to times or places that had no architectural profession; to the designs of bishops and mook-missionaries, of savage barons, khalifs and khans, med self-deifying tomb-huilders, Brahmins and their Juggernaut-worshipping ipping dupes. It appears, then, that the profession has not answered the end for which it was detached from men's general affairs. Unlike any other division of labour, this has not justified its separation. After a or four centuries' trial, the experiment is found three a failure.

Now, hesides this, the same wicked public observes another striking peculiarity in the professed archi-tect's position, unlike that of any other professor; the sponton, unner that or any other processor, and, therefore, one that it persists in connecting, rightly or wrongly, with the above. The remnnera-tion of all other workers, whether with hand or head, is, or is meant to he, or aims at being, roughly proportional to their results, or success; but that of the architect proportional to his failure, or inversely the state of the second second second second second second the second se to his work. Let me explain a little more.

A good analogy has somewhere been drawo hetween A good sharogy has somewhere been done been on here ear architecture and the art of war, for this reason,— that both are exclusively directive, the director not employing his own hands, because no more efficient therewith than the lowest of his agents. It is a parallel confined to these two arts, I think, and that of navigation. Well, then, the general's work, the navigator's, and the architect's (the latter being constantly here understood in the sense that includes the somity here to erroto in the sense that includes the civil engineery, each consists in the economizing and directing of other men's work to a required result. Now we see the care everywhere taken in the former aris to adjust remuneration to the measure of success, that is to the ends attained with given means, or inversely to the means spent in attaining a given end; to make the general's whole reward, for instance, pecuniary and honorary, vary with his results. not inversely to them. Suppose, however, if it be conceivable, that the whole were made proportional, not to results, but to the means expended. This not to results, out to the means expended. This might be managed by allowing the general full pay for the days only of actual fighting; adding an "honora-rium," calculated on the amount of ammunition spent, and a head-money on the numbers lost. What spent, and a head-money on the numbers lost. What sort of men do you think they would get for generals, and io what state would military art be among a nation rewarding it on these principles? Bo you say the supposition is too absurd to be followed into its regults? But this is necessably the noise mode of so the supposition is too absurd to be followed into its results? But this is precisely the only mode of re-muneration taken by your architects and engineers ! They are placed in the exact position of the general here supposed; and are used that make no objection to it; but, if you ask them, will commonly say it is quite the proper mode of pay, the best or the ouly nessible.

It is as if a stoker or engine-driver were paid tione by time nor distance, but by a sum propor-tioned to the coals he coasumes; or, to come nearer, as if a steward or hand-agent were made dependent simply on a per-centage of the moneys spent on his employer's estate, without any reference to incomings. The architect's or engineer's functions are all redu cible to the economizing (in the broadest sense of the term) the labour of all others concerned. Now, if you make his pay proportioned to the amount of that same thing which he is paid to economize; you make it his duty to save that which it is his living to spend 1 Where, in the whole chaos of your society, -in men robbing you in order to he imprisoned, or hreaking machines for saving their lahour, or iding get n ore wages,-will you find the absurdity to match this ?

Aod men wonder (hat architecture declines,-that hired architects design worse than owners designed

their own property ! One of the functions of the "architect" is to n every man's occasional business, to be a few men's work and profession,—all sere plaindly seen to have heen bettered by the separation, with one exception: trities and the world are now preify well agreed to regard no architecture but that which was non-pro-fessional. It is found at length that no other— fessional. It is found at length that no other— on thing produced where designing was a profession or anywhere since it became ooe everywhere—will

and valuing this, is a hundred times more important than that of the carpenter's work, to every one but the carpenter himself, and perhaps even him. On this depends the whole character of a nation's architecture, -artistic and economic, -for on this depends absolutely and eotirely, what manner of men become its designers, and hence what kind of design will be obtainable

obtainable. The sculptor-architects, from Giotto downwards, to whom we owe the roin of the Gothic in Italy, and then Reoaissance, "Kunst" (or independent fine art), and all debasement,—these men. I believe, and certainly our Jones and Wren, were paid time-salaries like the present "clerk of works." It was then found works proceeded too slowly, and the present wonderful expedient was devised i "the architect" (as a late Government paper has it), "to receive a commission of five per ceut. on the *outlay*." To save the trouble of estimating *his* work, let it be paid hy a per-centage on the cost of all other mer's;—a sum per-centage on the cost of all other men's; --- a sum proportioned, not indeed to what he does, or gets done. to what toil of others he makes the doing of it require.

Under either system then, Recaissance or Modern Under other system then, Recoarsance of Moorn, the designer, whether paid by the time of others, or *labour* of others, required by him, is simply rewarded *inversely* as his utility to the holdling-owner; and directly as his utility to that other fuoctionary of equally modern invention, the middleman or "con-tractor," It is this latter who ought to pay him, and shows him. Ho is not the constant condition equally modern invention, the middleman or "con-tractor," It is this latter who ought to pay him, and choose him. He is not the *owner's* architect, but the *contractor's*; for he is his *partner*. Which of their servants he is considered—whether paid directly by the former, or through the hands of the latter—and whether said to receive a twenty-first part of the eatire outly, or a twentieth of the trades-men's bills—matters not a straw. If his receipts he what these expressions denote demondent on and prowhat these expressions denote, dependent on and pro-portional to the trader's, this makes, to all intents portional to the trader's, this makes, to all internets and purposes, virtually, and I helice *legally*, a part-nership. Yet we have actually architects gravely writing (as Mr. R. Kerr and Mr. Papworth bave each done in your pages), of their office being, among the rest of its maguideences, that of an "umpire" be-tween the cootractor and his employer I---a jindge in the second back of the second back of the second back of the tween the cootractor and his employer I---a jindge in own partner's cause !-- an umpire hetween that partner and their common customer

Some time hack, there was an action hy a wine-merchant against a nohleman's butler, for failing to sell, according to agreement, his master's custom. The practice is said to be common for the servauts of the great to be thus paid hy, or be in partnership with, the traders that supply the house. It is held, I believe, a dishonesty in them, the tilt renders their position the only perallel I know to the normal and sole recog-nised one of every "architect" or "engineer." These fallacies in remuneration have given its face

to be entire art of the last three cooluries. Every the least detail is stamped as legibly as with these words, *Per-centage-paid Design*. No matter what syles are minicked, there is as perfect a unity of character as throughout the Egyptian, or the three Gothic centuries; and the style will have its name and be just as distinct and unmistakable in after ages, to they the common perception of the vulgar: though the common perception of the vulgar: though they may need an antiquary to distinguish the fashions,— Renaissance from "Classic," or "Strawberry-bill" from Pugioian. In no fragment with indication" of structure or ornament,—whether we call it engineering or architecture,—nothing beyond dea "filling," will the popular eye fail to recognise instantly the mind and hand of an *expenditure-paid* desiguer;—to assign the relie at once to the Per-ceutage Age, and pass it as such with careless eon-tempt, or some ejaculation at the wondroos follies of antiquity. antiquity.

The new art, by the way, of De-decorative or Manhas had as yet, no critic. When it has, it will be seen to have corrupted faster under this fallacy than even the decorative art; having, from Smeaton's time even the reconstruction of the one century, failen very nearly as deep a plunge as the older profession in three. Bartholomew remarks on the extraordinary nature of the "decine of skill," shown in the recourse (if that can be called *re-course* which was never hefore pos-sible to iron "girlders." It would be interesting to know the authorship of this invention, or rather *when* such a stroke of true cogineer eraft was first ventured on. Indeed, it was an event of no small moral and social significance, when first the expenditure of that work and iron to save one head a few figures hecame practicable. On another notable production of the art, an architectural critic exclaimed, as to the won-derful relations of the manual and mental labour,—

am paid according to their labour and iron ; then why complain that I give you plenty?" Will men never learn that if you pay people in proportion to this or that, lines, or letters, or iron, you will get lines, or letters, or iron; especially if it costs them nothing?

thing? These two professions must perish in contempt, or this whole system he repudiated, and designers he-come, like all other workers, result-paid. The result is to be regarded in a triple relation. "Well build-ing," says old Sir Henry Wotton, "hath three cou-ditions—commodity, firmness, and delight." Now of these, the first is quantitative—a foreknown measur-able quantity—so much space to be inclosed, divided, and sheltered. The second element is one of degree, and affecting the first as quality, thus: how is that amount of space to be inclosed, divided, and shel-tered? In the frailest mode allowed by law? or in some stabler mode defined by a stricter law? as, for in-stance, the Mcdieval and Remissance one, that notimber support masonry; or Solomon's (1 Kingsvi. 6), that the stance, the Mcdievel and Remaissance one, that not imber support massionry; or Solomon's (1 Kingsvi, 6), that the carpentry be all removable, as by fire or decay, with-out affecting the stonework; or the old freemasons', that no piece of material receive cross-strain; or Wren's, that the massory all poise itself without iters of iron; or Fergasson's, that the shelter be inde-pendent of timber, as at Milan Cathedral; or by combining the two last excellences, imperisable as the Pantineon. In times of real architecture there the Pantaeon. In times of real architecture there must have been certain recognised degrees of stability, structural "orders," defined by rules like theso, universally taught or known as "common things;" structural "orders," defined by rules like theso, aniversally taught or known as "common things;" and so it must he again; and for each order, from the current one, or freest, easiest and frailest, up to the strictest, bardest, and most mooumental, its own scale of designer's pay; or factored, to be applied to the price for given accommodation. The third element, Decoration, again, is quantitative, and independent of hoth the former, being simply so much (or rather, so many designs of) ornament; no repetition of course counting for anything in the designer's hill, If C, F, D, then be the figures arpressing these three elements, quantity of commodity, degree of firmness, guantity of Decorative design; the whole charge will have the form C F + D. Now even the Building Act tells us how to reckon C. The fees to district surveyors vary jointly as the huilding's area and number of stories. This is the rule I adopt and could propose, as to the charge for the utilitarian part of the architeet's work: only the area should he *internal*, to be proportional to results independently of means; and thus it becomes simply a barge of so much per square (or areal unit) of flooring, stairs included. But there must he, for universal extension of the rule, at least four prices per square; the lowest applying to the current order of

square; the lowest applying to the current order of structure, or frailest allowed by the Acts; the second where masonry is not allowed to rest on timber; the third to uniofianmable (or what is commercially called fire-proof) hulding, *i.e.* independent of timber except in non-essential fittings, and the highest to the really fire-proof or monumental order, independent hoth of timher and metal, for essentials. Next observe that where portions exactly i

one structural design, from any floor upwards, this is not as with mere decoration; but the designer's work must neither he valued so high as if they were all different, nor so low as if only one were huilt : for, he idea the superintendence, it is often harder to con-trive one design that shall suit two or more compari-ments of plan, than a design for each. Moreover, one mode of valuation would make it the architect's interest to design crystal palaces; and the other, such things as the new canonries adjoining Westminster Ahhey. But as common sense dictates that the more times a pattern is to he reneated, the more valuable Anney. But as common sense actates that the more times a pattern is to he repeated, the more valuable should it be, I charge in these cases for a mean proportional hetween one and all of the compartments; that is, the floors of so many only are measured as do not exceed the square root of the whole number that case using the square root of the whole number that case using the square root of the square so that so the square so the square so that is the square so the square so that is the square so the square so that is the square so the square so the square so that is the square so the square so that is the square so the square so the square so that is the square so that the square so the square so the square so the square so that the square so the square so the square so that the square so the square so that the square so the are similar.

that are similar. Thus we dispose of CF, the charge for any first general design, fulfilling written instructions. If the instructions be then altered, charge for a second, half as much as for the first. It will teach people to know their minds. Again, the childish trick of getting one man's design executed by another, we can check hy letting it be understood that if we promise to obtain no copyright we double the charge.

For the second stage, detail design, including spe-cifications and all working drawings, except of orna-ment, either the same charge CF, or some fixed por-tion thereof (but for the present say the whole), is

tion thereof (but for the present say the whole), is to he repeated. Thirdly, for the decorative detail, we can only have a fixed price per drawing or model, of such as does not represent any natural object; a second for such as is vegetable; a third for animal; and a fourth for human form. Of course a design has no right to de-pend on anything the designer himself cannot model, and indeed this was never dreamt of till quite re-

cently. Observe, again, that hy a just valuation, no mock features, or what Professor Willis calls "Decora-tive construction," from a Victoria-tower down to a "huttresset," finding any place in the designer's bill, either as utilitarian design or ornament; all these things will consider downers. When and readers

either as utilitarian design or ornament; all unese things will speedily disappear. When only real orna-ment pays, real alone will be designed. Instity, for Superintendence and successful com-pletion, there must plainly be a charge in a fixed ratio to the sum of the two last, or the whole detail design, structural and decorative together; and I should think their identical price repeated, not too much, provided always that this payment he deferred till the success he in some slight degree tested. It should not hecome due till the work have been an agreed number of years in use uninterrupted hy any repair.

due till the work have been an agreed number of years in use uninterrupted by any repair. By any just system, and by this, any projector who really knows his wants, would be able to fix at the outset his precise expectiture on design and superin-tendence, however ignorant of that required in any other hranch of the work. Again, in inviting a com-petition, the fixing a maximum cost would (far from being *necessary*, as at present) be hardly advantagous to any one. The things to fix, hesides the amounts of room, are (1) the Order of stahility; (2), whether the construction he without reference to air or smi-tary laws,—as at present_—or how much space. If the construction he without reference to air or sani-tary laws,—as at present,—or how much space, in any, made self-veutilative; (3), whether "decorative construction" be admitted, and, if so, the mass thereof in cubic feet; (4), whether decorative material— uncarved—he admitted horeto; (5), whether plastering, or plaster imitations, he admitted internally, or exter-nally, or both, and the amount of either in cubic feet; (6), the order of decoration, namely, whether admitting no natural representation, or vegetable only, or animal, or human; and (7), the ratio the decorative outlay may hear to the whole, it being always necessary that separate estimates of the necessary and the decorative work he insisted on. No competition where these work he insisted on. No competition where these particulars, at least, have not been fixed, can be particulars, as reass, have not been need, can be regarded as anything but a silly and mischievous kind of lottery; and if the State put down lotteries, it might consistently make such rules as to prevent them in this absurd disguise.

this absurd disguise. There is one more great fallacy in your correspon-dent's scheme. He advises architects not to compete "unless at least two premiums are offered." But no projectors, unless grossly deluded as to their own interests, or diskonestly sacrificing those of the public, would ever offer a second premium. I know of no other throwing away of money so demonstrably a pure mischief. For observe: in every memorable competition, the second "premium" (as it has been description ended, and the scheme the drawiness deceitfully called, for no purchase-money for drawings has any right to be called a "premium" at all),—the scoond, if not the first (for ia the Westminster Palace case. I helivan it was the first).—the simular some the case I believe it was the first),—has simply gone to nurchase the largest number of strokes. Of conrec it has : nothing more natural or more just, if a second to use including more inducts or more just, in a sector set of drawings was hound to be bought and only one building to he erected. "Look," say the judges, "what unwearied industry is here, what talent and 'enterprise'? Can we have the heart to leave all this unrewarded, and wasted to the world, merely hecause it seems yonder rough draught, of not a tenth the labour, and no striking ability, would have answered about a de bestrand about the source of the short of the

nearted. If prize contests in architectural fancy drawing are thought desirable, give then by all means, O noble art-patrons, but *don't steal the money.* Raise it openly for this purpose, —not under preteuce of expenditure on a public building. But, now ohserve what this "second prize" necessarily comes to he,—I am not speaking of sculptural, or pure fine-art contests; they are another aflait,—but in architecture it amonts (if made a rule) to nothing in the world but the sale of a name by auction; any man may buy it, as Didus bought the nothing in the world bit the safe of a hance by auction; any man may buy it, as Didlus bought the name "Imperator." The hatter who bought the first choice of a scat to hear Jenny Lind would be most useful in this capacity. Well, then, what 1 would propose is, that every huilding committee should save the community all this waste of Indian ich and utilize this capacitons emition he simply should save the community all this waste of Indian iok, and utilize this superfluous ambition, by simply advertising thus, "A single premium only; but the trile of '*First of the Architects rejected*, for this building, will be sold at the Auction Mart, at twelve, for one precisely." Thus the victorious hatter, or what not, would "be called Darins his cousin," a handsome contribution would be clicited, but, above all, this would as the data of of signs and debauching of public taste therein, by such designs and the majority of those lately hung in Westminster Hall ; half of which, accer heing meant for adoption, hut only for a high place among the fourten great that of which, according means for adoption, hut only for a high place among the fourteen great rejected, never would have been produced had no secondary rewards been held out.

E. L. GARBETT.

ST. MICHAEL'S CHURCH, BOLDMERE, SUTTON COLDFIELD, WARWICKSHIRE.

SUTTON COLDFIELD, WARWICKSHIRE. THE foundation stone of this church was laid by the Contress of Bradford on the 10th of September, 1856, and the building, which is in the Early Deco-rated style, was consecrated on Tucsday, the 20th of September last (being St. Michael's day), by the Right Rev. the Lord Bisbop of Worcester. The church is situated about two miles from the town of Sutton Coldfield, and with the church-gard occupies an acre and a quarter of land, which, together with a site for the parsonage and 55 acress of glebe land, is the gift of the Rev. W. K. R. Bedford, rector of Sutton Coldfield, and patron of the new dis-trict. The church at present consists only of a mare, chancel, and towr; but provision has heen made (by introducing shafts and arches-for the openings into the aisles), for the further extension of the building, as the increasing population may require. The total the aisles), for the further extension of the building, as the increasing population may require. The total length from east to west, including the chancel, is 102 feet; and the width, 25 feet. It contains 350 sittings, 275 of which our free. The material of the outer walls is grey limestone, with white Hollington stone dressings; and the interior masonry is of Bath stone. The roof is of timber, stained and varnished, that over the chancel being formed into an arched and panelled ceiling. The floor is paved with Minton's black, red, and buff tiles, in an appropriate pattern. The cast window is of elegant design, and contains five compartments, which we should much like to see filled with stained glass. The sittings are open, and made of deal,

glass. The sittings are open, and made of deal, stained and varnished, as are also the stalls and reading desk, which are decorated with poppyheads, well executed : the communion-table and lectern are of only, and there is a store credence on the south side. The chief ornament of the nave consists in a very handsome stone pulpit, the gift of the architect : the font was presented by the incumbent, the Rev. E. H. Kittoe, a heaotiful altar cloth by the Countess of Kittoe, a heaotimi altar cloth by the Countess of Bradford, the very elegaot communion-plate was the gift of Miss Pinnm, and two tables of the Command-ments, illuminated, by the Rev. W. M. Gregory. The architect is Mr. J. F. Wadmore, of London, and the work was executed by Mr. Highway, of Vulsall, to whom praise is due for the excellent way in which the design has heen carried out. We regret to hear that, although the countext amounted only to 2,6657. there is still a deficiency of 700% to he collected from friends and well-wishers to so good an undertaking; A parsonage-bose has lately been creted by the incumbent, the grounds of which adjoin the church-yard. yord.

A SHORT CUT BY A LONG ROUTE.

ABOUNDING in fine street lines which require hut ABOUNDING in nue street lines which require hut little opening or extension, this Loudon of ours is a standing reproach to us. It is needless to recite how many improvements have been suggested by the Builder in all quarters of the metropolis; suppose, then, we take them up point by point, or line after line; and that, for the sake of facility in dealing with them, we only suggest such as demand not wholesale clearances, but short extensions, or partial eulargements.

That we should remain wholly stagnant whilst our neighnours are modernising and embellishing Paris, is wholly unaccountable: every blut, such as the Temple-bar gate, Middle-row Holhora, Oxford-street, and Tottenham-contriburiers, this who and Lincola's inn-fields *impermeability*, with other "disgraces," too numerous to mention, are exactly as they were

too numerous to meation, are exactly as they were hequicathed to us! Well, we can't help it. There is no fund on which to draw for great public improvements, and there seems to be no authority constituted for the purpose of carrying out grand metropolitan structural pro-jects. Some that are in process of gestation, such as Farringdon-street, and Victoria street, Westminster, lie in chaotic roin : so be it. With such facts before us, it may be thought idle to talk of any advance in the arrangement of great thoroughfares; nevertheles, as an introduction, and

thoroughfares; nevertheless, as an introduction, and superadded to the hundred and one leading routes of superaded to the handrade and one leading routes of intercommunication already haid down, there is a grand truck line, central 10 the west cad, which, as it leads direct from the north from Hampstead, and from Regeat's-park, is worth jotting down by the way; it is tac direct cut of Baker-street and the Andley streets (up to Andley-cud) into Curzon-street, If this way were cut on in a right line, it would strike out on Piccadilly, straight through Hamilton-place, disclosing the Green-park at one end, the Urgent's at the other! Lines of street like this, revealing at either ead verdure and fine trees, are the greatest ornaments to a city. Baker-street, heing now converted, or rapidly merging, into gay shops, is the main arteey from the densely-peopled neighbourhood of John's-wood, Port-land-town, &c. : it bisects the great quarter extending

Picerdilly to Hampstead A little care and a little money expended on the

opening out of such a causeway would not he thrown away. The crooked strait of Park-lane has been an away. The crocked strait of Park-Inne nas occu-old blain, mid a chronic e mphoint; the equipages of nobles, as well as the cabs, have borne with it philosophically: it was too crank and circuitons for ommilness, and the same faults consign it, so for as the public is concerned, to the average traffic of a the public is conthird-rate street.

Whilst wars and romours of wars disturb the minds and shuke the inter-sts of the community, it is not very probable that extensive plans of draudition and reconstruction can be carried out; but improvements of existin, routes, which require only n little elongation or existing routes, which require only infine bong time and emeridation, might in a measure redeem the time; meanwhile, by such relvances the metropols would be the more prop red for the commencement of grand structures, and for these open vincung-cent places without which mer borious achievements in architecture are uscless or molenlous.

architecture are inscless or inclusions. Whatever improvement he made at the issue of Park-lane into Piecedilly—and three is no great thermuch are of the west end so inadequate to the traffice—that same line would go in sid of the great morth line of Baker-siret. Itamilton-place is in the direct range, and it would also come into the slightly pressure of the large three supressions. direct range, and it would also come noto the slightly sweeping curve of the lane; but as there are some costly mansions in the way of the And'ey-street con-tinuation, that note migbr, by a slight enreature, strike it randing Little Standape-treet into HettCarl-street, and so by Down-street to Piccadily. As to the conservancy of retired state in favour of some algbt residences in Hamilta-place, it ean scarcely be maintained that the population of London must be restained from using an one street already.

must be restrained from using an open street already paved, dagged, and complete, that street being in the direct line of way: that thy must continue an in-creasing traffic by the old uphill, crooked, and narrow lane, in order that those few magnates may enjoy un disturbed repose in their "cul de sec?" If so fare, in order that those law magnates may enjoy un-disturbed repose in their "end de see?" If so, Acts of Parliament and valuation ju is e-n be viewed as engines of public administration so far only as re-lates to the property of merchants, of traders or of the mole. Men in authority have a great repugramee to the practice of their own favourite m xim, "Abellu conservation". " debellare superhos

The Dean and Chap'er of Westminster, to w'om the little intructing garlen strip helongs, are too will known for their *liberality* as to *public free aod missions* to cause any nucasiness with regard to their chari able concession of a great public necessity.

MR. SCOTT ON THE PRESENT POSITION AND FUTURE PROSPECTS OF THE RE-VIVAL OF GOTHIC ARCHITECTURE.

Ar the meeting of the Yorkshire Architectural Society At the meeting of the Yorkshire Archite-tural Society held at Donessier, on the 23rd ult. Mr. Scott read a paper on this subject. First neging the import-ance of the movement against "the vertraenlar architecture of the dy," he pointed on the Mt was re-quired of a national s'yle, and proceeded thus :----I woold ask how our prevaiting archite ture has fulfilled the conditions demanded of a national style?

It is into any the that fulled in the full filment; it is absolutely reversed every one of them. In-steal of imbuing the popular usind with an instinctive love and perception of heavily, it has utterly extinguished those perceptions, and apparently substituted a preference of everything mean and ugly; so that whilst formerly the bumblest structure evinced an While formerly the buildless structure evincet an innate securitient of pre-priety and correctness of form in its designer, such buildings are now disgusting to any cultivated eye. The churches boundation to by our forefathers, and which are beaund with by our loreatners, and which once bearing with beauty, every part of which showed the utmost ever for nobluess of design, and which in the humblest villages were perchaps models of pleasing and impre-sive simplicity, became degraded and disfigured by sive simplicity, nearing a graviou and a disrighted by meannesses of every description, and were treated with no more love or veneration than if they had been stables or every-sheds; while, if a niw church was needed, unless, indeed, its position redered it an ohject worthy of the high-pressure system before named, it was in nine cases out of ten erceted without the smallest regard to heauty, and often iu a style of the most abject b seress.

(The paper then referred to the cost of churches in the Greek style, put up when the first movement was made in favour of church building, and of the debased works which followed in the era of "the p churches." Better feelings, however, hegan to hecome more general.)

It so happened, as if hy an over-ruling Providence, that about this time a secret and almost unconscious The about the time a server and annost mechanism progress was heing made in the study and apprecia-tion of our ancient churches. Some few architects, chiefly young men, who had hardly commenced prac-tice, had been drawn towards them by an irresistible

from Tottenham-court-road to Notting-hill, and from attraction, not with any thought of making any practical nee of their study, but by a spontaneous opening out to their apprehension of the hidden beauties which the ancient remnants contained. They began to make long pedestrian tours from village to village to sketch and study the architecture of the churches, and their minds and their sketch-books became filled with the details of true Christian architecture, almost before the thought occurred to them of turning them to practical account. At the same time, but qui unknown to these humble architectural students, At the same time, but quite Intrinoval to these number are interesting statuting, a feeling of company-ion began to become prevalent at the low estile to which the houses of prayer were being reduced, and a noble spirit began to show itself here and there for remedying their dishonour. The usion of these two germs of better things has led to the revival which is now happily rife among us.

the revival which is now happing rile among us. About the time I are referring to, an immense im-pulse was given to the reformation of architecture by the carlier publications of Pug n. His "Contrasts," published in 1835, most vividly expressed the abject meanness which pernaled the architecture of the day, and while it earaged the majority of our architee's, it excited others most strongly to press forward towards he'ter things. His "True Principles of teels, it excited others most strongly to press forward towards helter things. His "True Principles of Pointed Architecture," which apprared in 1841, was a gisanfie step in nd. ance. It grappled at ouce with all the f.Hacies which had corrupted modern archi-tecture, and estal lished a code of rules founded upon converse access. Willier and terwith, mile his common sense, utility, and truth; while his "Apology," which came out a little later, showed ¹⁴ Apology," which came out a bitle later, showed the necessity of falling hack upon our national slyle, and its ready applicability to every requirement of our day. In the mention, the snecess of bis own personal labours was tray actualishing; not only were the advances he made in the revival of Pointed architecture mest rapid, showing genius in every tonch,—this was in fact the smallest of his achieve-ments,—he actually revived hy his own band, or his own percend learning north acters, one of its who ments,--- he actually revived ny his 6×n outd, of his some personal exertions, nearly every one of its sub-sidiary arts. Architectural carving and sculpture, stain d glass, de-or nive punkting, metal work wheth er in hrass or wronght iron, geld and silver work, jewelery, e-annelling, embroidery, woven textures, paper-hangings, ereaustic tiles, the manufacture of transformed and solver the mathematical and the solution puper-linkingings, ereaustic tites, the installarding of invariance, and even of ordinary house-hold corekery-wure, all firlt the impress of his hand and of los genius. Sherdly after Pigin became publicly known, the same cause hegan to be vigorously taken up in our own church. The societies formed in connection with both miversities were fillowed up by others in all parts of the sourt of The transmission and in the fille. orn universities were in lowed up by otherwise all parts of the court y. That vigorous periodic if, "The Eeclesi-ologist," the up is zeal (in its early days) often out-stepped the dicates of disretion, and its critiques too often evidend the effects of party-felling and imil-vidual partialities, did immense service in exposing the descenation and degradations to which our old charaches meas subjected, and in provulgation, average the directation in the plasmost of mining our out of churches were subjected and in promulgating correct principles of ceclesiastical architecture and arrange-ment. A noble feeling for the subject rapidly spread itself arrong all classes whe zeal for church-building and rest ration greatly outrun the increased know-ledge. Acts of individual munificence multiplied on all hands, and an entirely new state of things came

The latest, perhaps, among the steps taken hy the more connest-minded clurch architects was a due appreciation of the necessity for truthfulness of matedue rial and genuineness of construction. Internal details were at first in plaster or coment instead of stone; deal was grained to imitate oak, and plaster jointed to how like stone. These inconsistencies were but slowly grt rid of. Those, however, who followed church architecture with carnes/ness and with a worthy sense of its claims (and they were and are still but a little band) at length attained to the courage requisite to onno) at tentin manual to the confige requisite to follow it up in all the truthfulness and substan-tialty of ancient work. Our wills became as thick and more solid; our timbers often as stout, though not so often of the time heart of oak; our setting as mastive; our arches, columns, and internal ornaments as uniformly of stone as in the ancient churches. But as anothing of scale as in the anothin structure but what was the coust quence to ourselves 2—simply that we could not produce a chartch, though we huilt at prices so how as would have astoni-he dowr fathers, at anything like the estimate of the multitude of our inpetitors, who cared for none of these things, and no brought forward showy drawings of highly ornanew order it orders, backed by estimates 20 per cent. lower than those we could venture upon for much plainer and more homely-looking huildings. It is this which was and still eminary the hinderance to the progress of gennine church architecture, and which makes our revival appear to many a thing of frivolity and fashion rather than of deep and earnest feeli

Ост. 10, 1857.

remarkable writer. This, however, is quite certain, that no man, Pugin alone excepted, has so atrongly influenced the undertaking we have in hand, and no single individual, not binu-elf a professed artist, has in our times exercised so wonderful an influence over the art of his day. Our opponents detest him as they did Pugin and the ceclesiologist before him, and find in is writines abundant errounds for referenting, accordhis writings abundant grounds for reiterating, according to their custom, the charges of enthusiasm, e geration, inconsistency, and the like. It is probable that all unflinching reformers are more or less open to such charges; but in spite of all this, the effect of his writings has been conrous, and, in the main, most heneficial. Among the mmy directions in which Mr. Ruskin has influenced our revival, may be mentioned one which, though liable to be exried to excess, is nevertheless of considerable importance-I mean Is nevertheress of consideration importance—I mean the attention he has called to the merits of the mediceval architecture of Italy, which had hitherto heen viewed as an impure style meeting little atten-tion, but which is now found to contain a moss of material, which, if judicionsly used, will supply many bistue in our our architecture and mostly side side material, which, if judicionsly used, will supply many a histus in our four northitecture, and greatly aid us in our future developments and adaptations. More important still is the study which bas of late ytars been given to the French architecture of the thirkanth and fourteenth centuries, especially the former, which for vigour of sentiment and masenline bothness is un qualted among the works of the Middle Ages, and being as it wore the great central two of Pointed being as it were, the great central type of Pointed architecture, claims from each nation of Durope an amount of study and attention second only to that demanded of each for the indigenous art of his own country.

country. Let us now consider for a moment what is the position in this great revolutionary movement which we have succeeded in attaining. I think I may, in the first place, say that we—that is to say, such of ma as have followed up the subject with zeal and ere—have sup action is obtaining a full defining a snei eeded in ohtaining a fair knowledge of Mediæval architecture whether at home or abroad, and of mastering its general principles So far as this goes we have fairly cleared the ground before us, so that there is no more difficulty for a student in making himself acquainti d with Goth'e than with the so-called there is no more with Goth's than with the so-called Classic architecture: this is no small achievement, to have thoroughly mestered the grammar of our art. Secondly,—We have revived a general feeling in favour of the study of Mediceval architecture, and a feeling most strong and wide spread in favour of its revival. Thirdly,-We bave actually succeeded, its revival. Thirdly, We have actually succeeded, and that to the fullest extent, in the revival and reestablishment of our style, so far as relates to eccle-siastical purposes. No revolution was ever, so far as establishment of our poses. No revolution was ever, so not es-sitatical purposes. No revolution was ever, so not es-it goes, more complete; for while furly years ago no one in building a new church would ever have dreamed of making it Gothie, no one now dreams of making it anything else. Whatever may have been the we have been moving it anything it Solute, in other how drawns or making it anything else. Whatever may have been our failures or short-comings, in this we have been thoroughly and perfectly successful, that we have completely reading and end of the second anything may publicly deride it as a fashion of the day—an-affectation of high churchmen, or a dream of senti-ment.dists: but say what they will of it the fact ment-lists; hut, say what they will of it, the fact remains that the base architecture of the churches of thirty years back is overthrown, and the noble style of our Mediaev-I forefathers re-established on its of our of our Mednev-i loreistners re-establisher on the ruins. This fact is a sindisputable as the Renais-same of the sixteenth century. It is too late for our opponents to winke, and object, and hring forward spient arguments which are as putent against their own Remissance as against ours ;---the revolution is completed, and ne ther their wrath nor their lamentations will reverse it.

The next point which we may chronicle is this— that we have a staff of architects who are well able to carry on the success which has been achieved. Tree it is that, therefore un movement is yet young, I the hand of death has not spired our ranks. Our leader has long since heen taken from us, and several of the most zerolous of our fellow-labourers have been removed. Yet, thank God, we remain a have been removed. Tel, thank bod, we tendent a zealous and vigorous band, and our ranks are con-tinually being stringthened by earnest-minded and talented recruits; so that the number of really-effi-cient chaupions is ever on the increase. There is, too, a goodly number of young men, as yet unknown to the world, whose whole soils are devoked to our react, and more whole soils are devoked to our work, and whose whole some are devoted to due work, and whose whole time and energy are expended in its fartherance; these yong architects form a noble army in reserve who will speedly come for-ward and do battle in our cause, and will form most efficient successors to those who first lifted np its standard.

Still more important evidence in favour of what we When it had arrived at this slage, our revial was strongly influenced by n uew and most wonderful champion—I need hardly say that I refer to Mr. contemptious neglect with which they were formerly Ruskin. I connot trust myself with the task of com-treated, we find them now everywhere heing restored menting upon the works of this most eloquent and revivalists

to its conditions, when it comes into the hands of our revivalists. Thus far I have dwelt only upon the bright side : I will now point out some of the drawhacks from which our cause is suffering. The first of these 1 believe to be architectural compatitions. At first sight nothing would appear more likely to serve as incentives to progress than such competitions, and in any be that in a healthy state of art such might really be the case, and even now that it may be so in a few exceptionable instances; but at a time like the present, when, by the long prevalence of a foreign style in which no one took a personal interest, all feeling for architecture, and all instituctive perception (on the part of the public) of beauty of form, had been extinguished, it must be clear that little is to be ex-pected for competitions in which a chance assembly of persons, probably without knowledge or taste, are to be the judges. So obvious has it herome, that in nine cases out of the those who have had the selection of designs in such competitions lave been interly lin-capable of distinguishing what is good or bad, and that of act judge the architecture, of wall compatible and the selection of act is reaching to a for any low an estimate an-blushingly low, would beat the most meritorions work of act if the architecture of a reaction for any all libers of desgas in such competitions have been nitrely in-capable of distinguishing what is good or bad, and that a certain trashy showiness, backed by an estimate ma-blushingly low, would beat the most meritorions work of art, that architects of real feeling and skill have gradually withdrawn themselves from an orkeal from which so little was to be hoped. The consequence is that, with all the success which I have elaimed for our revival, the great majority of works which it has given rise to are not the productions of those who have promoted or care a straw for it, but of men picked up by ebance, who only follow our style as the lashino of the day, have never studied old examples, much less worked out any original developments of their own, and are quite incupable of producing anything above the very tamest medicarity. The works carried out hy the leaders of our movement, or by those who have devoled heart and soni to it, are but a more fractional minority so that, thong the success of the revivi-as a great moral fact is only the more indi-mutally proved by those who care nothing for the matter, being compelled by the force of public opinion to follow it,—its actual artistic success is most seriously impeded and its chure are deborably lowered by the unfortunate eircu natured: a hourds by the appointment of architects from motives wholly unconnected with their professional competency. A particular architect is the son or nephew of a member of the committee,—a fixed of so the ange subscriber, —a townsma,—a native of the conntry, —a pleasut follow,—or anything in the world is too office con-sidered a reason for his appointment, provided only that skill in his profession be not named i—if it is so a huddred objections rare to meat one even in London its effort, produced is after an one area included its my chance only ally and even in London its defined to include is and the even in London its defined to include is and the set include it and

are whole districts in which a real clutch architect is never by any chance employed; and even in London itself they are almost systematically excluded; and there are at this moment men of the highest tolent and knowledge doing next to nothing, while mere tyroes and adventurers are excending the works which are unjustly withheld from them.

are unputly withheld from them. A second hinderance of the same class is, that a multitude of architects who join our ranks seem to have little or no appreciation of intrinsic benuty. This arises from the low condition to which architectural art had generally fallen, and it has become so engrained into the Baglish constitution, that nothing but a da-termined effort on the part of each student of archi-tecture and of each individual architect—an effort weakers will not aver if

utonched, be the works of man never so degraded, and ever remain as the nucleus and germ on which at may be regenerated. I now come, however, to the great hinderance to the perfect success of our revival, and the great object which we must set before us in all our future efforts. The hinderance referred to is the absurd supposition that Gothie architecture is exclusively and intrinsicilly codesisatical. Every form of architecture may in some sense bes aid to be eleficies, for each succe ding style has both arisen and eminiarided in the temply-and has thence spired listed through all other classes of building. How little do we know of the architec-ture of Egy not Greece but for o their temples! We searedly know even what their houses we o like. Of the Romans we possess, it is true, many stopendous secalar works, but their architecture may be travel to the *temple*. And it is only in the same way that that of the Middle Agree was ecclessified. Thue it is, that its most glorious efforts we devided to reglorious as its religions building, were the more glorious as its religion were pure, but the same architecture perv did every other class of building, and we know infinitely more of the sendar works of our Mediceval lorefutures than of those of any of the nations of antiquity whose archite ture we absurdly suppose to he as suited to seedar uses. We posses in numbers the town-holds, the parces, the town and courty houses, the warehouses, and even the agricu-taral buildings, built and male use of both same men who enverted our eathedrals and parish churcles ; and we find the same architecture pervoling them all, only shaping itsel' in each in same to the require-ments and uses of the partoular structure. Why, then, should we call the size which produced all theso, varied buildings, ''Ecclesiantic A,'' or imagine it only assumed a character almost extensively code-in-thing. I regiore in this, be ranse it is following the caure is shown that is not reform this if the tour revived sits is not built and there which f that reformation was to be effected. We have, so fur as churches are concerned, completely revolutionized our architecture, and completely revired a lost style. So far as that is concerned, our duty is now to press forward, to devel up, to make the revived style our own, to adapt it in every way to our own waits, to our own ritual, and to the demands, whatever they have been each that the maximum and the term our own ritial, and to the dominants, whatever they may be (so only that they are legitimatic and just), of our own day. In this a noble prospect lies before us, and, with all our hindermaces, think we are in a fair way for realising it. What I have now to urge is, that the reformation thus snecessfully effected in church architecture must be carried into other basedber of building * * * * branches of huilding.

The remains, however, which are 1. It to us, : re-not so scarce as to full in fornishing elements and A second hinderance of the same class is, that a multitude of architects who join our ranks seem to have little construct a glorious style of and unobserving practice of all the architects officers, bare fittle on a paper disting of and in the terment "init styled, and conventious, suggestions on which to construct a glorious style of and unobserving practice of all the architects" officers, are architects officers, of setting Gathe a style of architect and its architect officers, of setting Gathe a style of the density of the architect officers, and conventious, are the year of the architect officers, are architect and its architect of the architect officers, and conventious, are the year of the architect of the architect officers, and conventions, are the set of the architect officers, are architect and the set of the architect of the architect of the architect of the architect officers, and conventions, are architect of the architect of architect of the arch

tion, the majority of them simple structures, as suits the enormous practical denands of the dsy, hat others on a more magnificed scale, proving that while not other losing sight of the urgent d-manads of a teening population, we are not, on the other hand, unmindful of the exalted claims of the tomples of God. Church arrangement, again, once so utterly lost sight of, is restauced and anderstood. The wretched failacies and shameless shams of the day are by the failacies and shameless shams of the day are by the failacies and shameless shams of the day are by the failacies and shameless shams of the day are by the failacies and shameless shams of the day are by the failacies and shameless shams of the day are by the failacies and shameless shams of the day are by the failacies and shameless shams of the day are by the failacies and shameless shams of the day are by the failacies and shameless shams of the day are by the failacies and shameless shams of the day are by the failacies and shameless shams of the day are by the failacies and shameless shams of the day are by the failacies and shameless shams of the day are by the failacies and shameless shams of the day are by the for the decoration of a huilding, are making advances or work, encaustic 'Us, and everything which is wanted into a consense we are as contrary influence. The shall the sature is a contrary influence to enhance the heavy of our multidings. Though these and this can be concered. We should sciese every orthic which are there and shall the sease on percentions dealer the works of a heater age, particularly of those which is explored at the period of our reviral, and have reassimed the impartance which holongs to the sease on a contraction, the great practelad the shall construction, the great practelad the to enstruction, the great practelad the the aver so on nature's producing and diagen on the sease of varied heavy to or wind have a so on the works of man never so degraded in the the sease to varied have an explored the spin the sone scope, ing each on a different hasis, but must strive to work upon the same data, and press forward in the same direction. We must not one as-nme the Elizabethan as our ground work, another the Todor style, and a third that of the fourt-enth contury—this indecision as to our point de départ has been hilderto the great hinderance to our success. What I have already said of the unreasonableness of supposing Gothic architecture good for churches, and clussic for houses, applies also to the varieties of Gothic architecture titelf. We have by almost univer-sal consent alopied the style of the Inter part of the thirteenth century, or the heginning of the fourteenth, as the ground work on which to rede-velope our ce lesiastical architecture. Consistency, then, demade that the same basis bould be chasen for our secular developme ets. It is the noblest period of our indigen us art, and, as 1 am convinced, the noblest style of architecture witch has ever provided, added to the fact that it is our own; why, then, should we fit from style to style, thus dissipating our energies and bringing frively into our moven at P. The style we have by common consent chosen for our churches is not only in itself the noblest, but it is so flaxible as to shape itself to every other new with the subtex obsequence. On this transhould is noblessequent varieties may readily be transhated hack into this rablest puese. On this transhated hack into this action is to sum to their locary that insufficient varieties may readily be translated hack into this noblest pluse. On this, to endre, let us all hegin, as the firm formhaling on which all have agreed to build, for without a emmon ground-work no mitted effort can exist, and no new style be generated. Having one, however, agreed on a common hasis, our conree must be perfectly free and n infettered. Our aim, it is tan, must still be one-to constant on this basis a style which will meet every exigency of our day ; but in following up that aim there is the utmest se pe for individual talent, and for the most exalted efforts of individual genoms. The greater the number of minds brought to be ar up on this work, the more copions will be the regeneric entry is up that all wark upon the same four lation and aspire to the same result. That one four lation being the highest paint yet attained by the grout cars of nucleur civilization. result. That one contrained original angues plane yet attained by the grout carrs of modern eivlikation, and that result the development n non it of a style at once be utiful and gloroos, truthfully symbolizing the greatness which belongs to our period in the his-tory of human progress; and investing every require-ment, every a t, muterial, and investion of our uge, with a howite promotioned to its infinise and unacment, every a t, initial id, and invertion of our ligg, with a b-mity proportioned to its initiasis and prac-tical worth, and accordant with that of our ecclesias-tical structures; thus uniting our religious and scenlar architecture in one perfect, usely, and harmonious whole. This-this is an object worthy of the highest efforts of art; nor is it a chineria dor a visionary aim, but one which needs only our united labours for a few short years to ensure iss perfect realization.

MR. E. B. DENISON ON MODERN GOTUIC AND DONCASTER CHURCH.

AND DONCASTER CHURCH. At the meeting of the same soriety be'ore whom Mr Scott's puper was real, Mr. Denison make an address of considerable length in the new church on the Gathic characteristics of the building, with incidental observations on modern Gothic work and its short-catings. The althras is 'fully reported in the *Don-caster Gazetle*. We could conselves the portion of it under the latter heading. After commenting on what be termed "that stupid, and conventional, and mubserving practice of all the architest's officer, of setting Gothic windows, as the yeld balan coaes, twice as near to the outside as to the inside of the wall," the speaker proceeded :---In this church another of the common Gothic

This again has arisen from the same teudcocy parts. This again has arisen from the same teudoocy which I spoke of hefore, to mistake the fundamental distinctions hetween Gothic and Grecian building for distinctions hetween good Gothic and bad. People have funcied that hecause you do not appreciate the real size of St. Peter's at Rome, till you find that an angel's thumh is as thick as your own leg, or some such measure, whereas the length of St. Alhau's Ahbey and most of our great Gothic churches, appears almost inficite from the arches being quite beyond the source of the area to count them at once therefore. almost inforte from the arches being quite beyond the power of the eye to count them at once, therefore, yon have only to cut ap a building or a window into a great many distinct parts, and it must ueeds look large and Gothic. And on paper of course it does. Nobody could tell from the drawing of the church that this cast window is forty-eight feet high, for instance, especially from those deceptive aboundations called "elevations," which flatten everything to one dull and dead level, so that one can hardly wonder that those who are continually employed in making that those who are continuinly employed in making and looking at them, and accoding them down to be worked from, and faceying they have then down to be busicess, should always lose the power of appreciating the value of depth and shade, and massiveces, and think no more of a Gothic building as a picturesque thing, which ought to harmonise with nature, them I should io making the working drawings of a clock. But this notion of producing a cheap effect of great size by a multiplication of little bits, is a merc vulgar and ignorant mistake, and is, as it ought to be, always visited with the severe retribution of making the building look really worse than it need do, and not bulking look rat the curtery chapted here—or pro-bably anywhere—with its paliry little wioldows with gingerbread-looking tracery: a splendid result of competition plans, by the way. On paper that thing would look like a good-sized church; and if all its parts could have been about twice their present size, and therefore the huilding eight times as hig, the details would have been about the right size for such a church. But as it is, it is a sort of Gothic babyhouse; and so are these chapels generally; and they will contioue until this mischievous modern notion of getting great effects out of small materials is eradicated : which of course it never will be so long as architects find that the most showy drawing for the money is pretty sure to be selected in a com-petition. I am far from meaning to charge the original plans of this church with any conscious tendency towards this error; hut I am covinced that the three east windows would bave had nothing like their present character, if they had beeo divided into nine and six lights respectively, as originally shown, instead of eight and five as they are now.

There is another of the same family, and arising from the same cause, that of working from drawings from the same cause, that of working from drawings which represent nothing as it really looks, and still worse, of drawing the details on one scale, and the whole on another. Of course I know very well that large detailed drawings must be made at last to work from. But uotil architects, or their elerks, understand better these there generally do have the course it duri hetter than they generally do, how to carry in their eye, if they will not draw upoo their paper, the relac size of the whole, and the distances and positions of the parts, we must not be surprised at seeing, as we so often do, ornaments and details of all kinds version of the state of the sta hand, at gigantic ornaments being put close to the eye and overwhelmiog everythiog in their neighbourhood. Of these faults also I am bappy to say we have very little to show you here. Although, howhave very little to show you here. Although, how-ever, there is not enough to do us much harm, there just eoough to serve me for an illustration. Look when you go outside at that hand of diaper running up tl e west gable. You would hardly guess that that in the west game. To would arrow guess that that is all real carving, and that when it was had on the floor here it looked very well. I should have been glad to keep it there, or rather to have it inserted over the west door, where it would have been very effective and beautiful; and if that west end had now to be pulled down in order to be extended, I do not think there would be any further opposition made to such a removal; for where it is, it is almost thrown away, aod docs not more, hut less, than would have been done hy some strong masonry diaper work without any earving, such as that most excellent and effective decoration of that kied which you see below the lantern windows, superior to any that I know in aoy similar situation, and curiously ecough giving an appearance of additional strength to the tower walls, by its lines falling into that arrangement of "diagonal traciog" (as the engineers call it), which the eye at once recognises as the form of peculiar Gothic styles, which has no pretence of buttresses, and strength and resistance against vibration. In that yet is as truly Gothic as King's Chapel, with its respect, and indeed in complete appropriateness to buttresses deep enough to contain a little chapel be-its position. If think it very superior to the arcading showo there in that iote and view of the church most architects seem to think th.m., essential to which was exhibited in the Riyal Academy three years Gothiciam. But when they exist—and they should a go, and is copied in Mr. Jackson's book. I am not he added without some reason—they should he

sorry to he ohliged to say that due attention has not cen paid to the proportioo of the details to the fabric of which they form part, in one other very important feature, and one which ought to have heen among the best in the church; I mean the vaulting of the Formao chapel. The ribs are obviously either too Forma chapel. The ribs are obviously either too this or too few; and this vaulting altogether forms a painful contrast to that of the chancel of Naotwich, which is of about the sume size and in the same style of architecture. This defect, also, I suspect has arisen from the same cause, of drawing sections of de-tails by themselves without sufficient reference to the whole of which they form a part. There is no place in which modern architectural engineering is so often unsuccessful as in adapting the timbers of the roof to is distance from the normal to the index of the roof to its distance from the eye, and to the size of the building generally, and therefore it is right to eall your and generally, and therefore it is not to can you attention to this roof, which is, I think, free from that fault. You must remember, however, that the beauty of proportion of parts to the whole is just that which from its very nature can only be illustrated by failure, and not by success. For as the most per-fect health has been defined to be perfect unconscious-ness of the separate existence of any member of the hers of the separate existence of any memory of the hody, so perfect proportion in a huilding consists to your unconscionsness of there heing any part of it which particularly strikes your attention, except by any intrinsic heauty it may possess. I can therefore any no more of this roof than to remind those of you who saw it while it was hid on the ground, how coorno saw it while it was and on the global, how coor-mons, and, perhaps, wastfoll, you then thought the expenditure of timber in it. And yet it would now be easier to find out some places in it where one wishes for a little more substance than any where it could be reduced without spoiling it. But it suggests to me another point in which I helieve that very erroneous notions are entertained. Some persons-perhaps most, have beard or read somewhere of the wonderful skill of the Gothie builders io raising such prodigious vnuits, and towers, and spires, on such apparently small foundations; and spanning great widths of roof with nothing that strikes the eye as ossessing the security of a tic-beam. And so it has een inferred that Gothic architecture ought to display a great deal of engineering skill, and to do everything in the way most consistent with mechanical science But this, too, is all wrong; so wrong, that it is hardly too much to say that any ostentations display of engitoo mean of say that any oscinations analysis of char-neering is totally destructive of Gothie effect. As a matter of mere mechanics, the vaulting of aisles springing from balk-way up the nave pillars is un-doubtedly as wrong mechanically as Sir Christopher Wren thought it; and you cannot meet the diffi by flying bultresses, as you cannot meet the difference the nave. And yet, if you are only to have either the aisles or the main roof vaulted, it is always the aisles that arc and were preferred. Again, the Medieval huilders must have known just as well as we do that a rafter five inches by four is stronger if laid do that a raiter nice incise by low is stronger in and edgeways than flatways: and yet they generally laid them flatways. Once more, if you had to preseribe the strongest arrangement for walling, you would certainly require long and raiter thin stones rather than short and thick ooes of the same bulk; nevertheless those are bettern enough of the same bulk; nevertheless those are what you see much oftener io the old and especially in the oldest Gothic buildings. I am not concerned at present to inquire why they did these things, except that they had evidently some kind of iostinct that they looked hetter. They knew they had abundaocc of thickness aod weight in their nave pillars to prevent them from heing thrust over hy the valling of the aisles, even when not halaneed hy the weight of a stone roof upoo the clerestory; that their rafters were such thicker than was requisite to hear the lead or the tiles they had to carry (blue slates were either not invected or not tolerated in the Gothic times); and that their walls were so thick that it did not signify whether the stones were long or short, or thick or thin, and that they might safely use them just as they came, large when it was convecient, but more generally as small as a man could lift. Whereas now-a-days we build churches which tumhle dowo hefore they are huilt, and roofs which push their own walls down, io spite of the engineering and mechanical skill which we hoast of so much as the characteristic of this century.

of this century. Oddly enough, however, there was one mechanical feature in the Gothic of old times, which we have io-geniously cootrived geoerally to avoid--1 suppose hecause attention to it is really essential to architec-tural effect; though we do not sufficiently remember that a building may be perfectly Gothic without possessing that feature at all. There is many an old term and counter obuve decausting the area older

good. If you ask what is good, I can only answer that all sizes may he good, and that it depends on the size and style of the huilding and of the huttresses that an sizes may be good, and that it depends on the size and siyle of the huiding and of the huttresses themselves, what is the right proportion for them. I must add, that in my opinion some of our huttresses are the worst things here. They are almost all too square in their plan, at least too square for their general character and arrangement. Compare those of the aisles of the nave, which are 3 fect hy 2½ fect, with the chancel nisle oces, which are 4 feet by 2½ fect, and you will bave no difficulty in deciding which are wrong. Or to return to our usual repository for illustrations of defects, compare the large huttresses of the transepts with those, I will say, of the Bolton Abbey transepts, which are lower than these, and you will see a tonce that depth of huttresses (if they are of the styles to which deep huttresses (if they are of the styles to which deep huttresses (they are of the characteristics, as yon see in that gandy and pretentions church (not of the Church of England) just holt near the Hulifax railway station, with a spire just huilt near the Halifax railway station, with a spire as high new Wakefield, stuck over as thick as it can carry with crockets, and swelled in the middle to pre-vent its showing its real dimensions hy a too sharp point, and set upon a hase no wider than these aisles-the approved modern fashion of tower-huilding to from which hetter architects have not yet the delivered themselves, even where they have not excuse of being required to sacrifice everything to the nonsense of verticality and to work as cheap as possible hesides. * * * *

a surface as they can; a somewhat costly process when there is much beyond flat-walling to do, and ecrtainly here is much beyond net-warms to do, indertainly helonging to that class of operations which a departed alderman of this town rather happily called spolation. I have said so much ahout this elsewhere, and so has Mr. Ruskin, that I am anwilling to dwell apon it now, beyond very shortly pointing to ut a point or specimens both of Gothic and un-Gothic surfaces which are provided for us here. The inside ashlar is made of the stone of the old church, which came from Brodsworth ; a bad stone for external work, but forunately having that variety of colour, that it pro-duces a very pleasing effect in these walls and in the inside window joints and arehes, making nearly every stone appear distinct; and so the cleaning down inside has, as it happens, done no harm. But you may see the effect it would have produced on the Steetley stone outside, which is of a more now you may see the effect it would have produced on the Steeley stone outside, which is of a more nuiform colour, hy looking at the inside of the porch, which I suppose the huilder and clerk of the works considered a sufficiently douhtful terri-tory to exteed their scrapers to it, bough it had been strictly prohibited outside. Then, again, look at the outside, and compare it with any other outside of a new church you like, and you will see at once bow much more Gothic and how much better this is with the work left just as it is done, and no subse-quent pointing up or scraping over. The stones heing all worked with none of that prim and formal tooling. bow much more vouse at is done, and no super-with the work left just as it is done, and no super-quent pointing up or scraping over. The stones heing all worked with none of that prim and formal tooling, the lowest of all forms of art, hut which huilders think the highest, and put together "promiseuously" and not touched afterwards, they do in that way pre-sent the same kind of mottled surface, only got in a sufferent way, which the Brodsworth stone presents a the same kind of mottled surface. We have here, inside by its natural variety of colour. We have here, too, a single illustration of the dead aod formal effect of after-pointed joints; for the nave pillars were done so, whereas the tower pillars are not. The consequence is, that the former look as if they were painted round with a thin white line, like plaster divided into sham stone; whereas the latter, like the walling stones outside, have got a peculiar and irregular change of colour, which you see at the joints from the effect of the mortar penetrating the stone while fresh; and it is worth notice that wherever you exe that, the stone itself has become barder and less 1 able to decay. In this, too, we have improved as we have gone on.

THE ARCHITECTURAL ASSOCIATION. OPENING MEETING.

THE opening meeting of the session a zione were held on Friday, the 2od inst. in the held at Lyon's ion; Mr. G. J. Wigley, president for the sessioo, in the chair. Mr. J. A. Buoker, hou. see, read the report, which, after alluding to the proposed amalgamation with the Institute, proceeded lows :----

• The subject of competitions has been forced upon the attention of your committee by two of the most prominent cases of want of integrity upon the part of the respective committees. Your committee field it was their duty to interfere, and they are glad to say that the members of

the Architectural Association unanimonsly adopted the protests submitted by the committee, and afterwards sent interpretation of the sentence of the sentence of the liverpool Free Public Livery to the committee of the matter of regret that the Royal Institute of British Architeets did not think it necessary to co-operate with the Architectural Association proof these coessions. In contrast with the last-mentioned cases, your committee desire to call attendion to the result of the competition for the Madway Union. In this case architects were informed When, however, innount to be expended was 11,000. Out the design eslected, the lowest was found to be 23,004. When, however, interpret was found to be 22,004. Or more than double the stipulated sun. The gancdians immediately rejected that design, and have determined to obtain tenders for that which received the second promum.

to obtain tenders for that which received the second premium. Before leaving this versed question of competitions, your committee are desirous of stating, that they have determined to do something more than look on whilst many acts of injustice are being done; they have, therefore, instructed your honorary screetaries to obtain all possible that any state of future competitions. Your committee which is a so future competitions. Wor committee that are also future competitions, the earliest opportunity, at an ordinary meeting, of making the same known to the members; if, on the other hand, it should appear there are reasons for entertaining a different opinion, your committee will amounce it in the same way as before, your committee will amounce it in the same way as before them to arrive at the restate of facts that caused them to arrive at the restate of facts that caused them to arrive at the restate of facts that caused them to arrive at the restate of facts that caused them to arrive at the restate of facts that caused them to arrive at the restate of facts the contained the members of the Architectural Association, but also of the profession generally. It is needless here to point out the methers of the Architectural association, but also of the farther of the architectural association, but also of the her hest in this matter; committee are determined to obter hest in this matter; of any member of this Association. [The recort farther mentioned asynget them and the states

Cratton, [The report further mentioned, amongst other matters, that the committee had been in treaty with the Architeztural Union Board, as to a place of meeting in the proposed building, but found the rent required would be beyond the present means of the Association; also, that the establishment of classes was in contemplation. It closed with an appeal for contributions towards the formation of a circulating library.]

closed with an appeal for contributions towards the torma-tion of a circulating library.] The President said, in considering the prosperity and position of the Architectural Association, they must place hefore them the precise objects for which they were associated, namely, the constant study of their profession and the cadeavour to progress collectively, as memhers of the same calling, instead of keeping in an isolated position. He was not unminful of the fact, that in expressing his own opinions on this sub-ject, he exposed himself to hoth public and private eriticism. Professional men should be students all their lives, and the spirit on which all their studies should he hased was a feeling that to do honour to their own position, they must aim at the fullest development of the faculties which led them to adopt the arcter of an architect. Nothing that was indis-pensable to it should be left out of the enriculum of their studies. If their general education had heen incomplete, they must endeavour, hy private study, to or literary knowledge, would impair their espacity as virisits. There was no doubt that the oper-marking make up for it; for any general want of mathematical or literary knowledge, would impair their expacity as artists. There was no doubt that the over-practical character of every pursuit in this country affected very much their architectural education. They should not rest satisfied with the quasi material teachings of daily office practice. More attention to the study of theory would save them much useless hahour, and teach them the better to what points to direct their practical studies. Time should be de-voted at the outset to thereading of the elementary pro-fessional works. It was difficult to point out any standard works. It was difficult to point out any standard work for the purpose. Perhaps a series of lectures on the art and science of architecture—such lectures on the art and science of architecture—such as University College afforded—was the hest means of acquiring this. A common defect in the archi-tectural education of this country was the little atten-tion hestowed on the means of expressing our designs. Such advantages as perspective and colouring might, perhaps, be too much sought after thy architects on the continent, to the detriment of more serious studies. Still they might serve out so much to exit the Still they might serve not so much to catch the public eye, as to enable as to realize fully the effects and defects of our own compositions. As regarded the question of studies for artistic compositions, he the question of studies for artistic compositions, we believed that, besides a general study of styles, it was extremely useful for the junior student to habituate himself to the study of a special style, as it was difficult without to acquire a perfect harmony of composition. This should be done without too much exclusiveness, to sen at the investion encoding form And should be one without too much exclusiveness, so as not to impair our capacity of learning from every style, the heauties of architecture being scattered throughout every school. Travelling and more ex-tended professional experience would impress on us the fact, and would lead us to study the several features of architectural composition by themselves, and resure them into articulating and hermony instead features of architectural composition hy themselves, and weave them into originality and harmony, instead of accepting ready-made the arrangement of any special style. In fact, no cycle of artistic studies could he complete until we had arrived at the point of analytic capacity, that enabled us to study instead of merely copying. Thus we should no longer pay so much attention to the decorative details with which early studies had stored our memory, hat the main outlines of our composition would receive more of our

attention, and we should become architects in truth, instead of mere architectural decorators. The advantageous result of this would be, that we should pr duce more real effect at a much less material cost. J He had often been struck with the manner in which the ancient Italian architectural masters arrived at the proper point of self-denial, of hardly doing more than indicating the general lines of huildings, the decora-tion of which they left to the warm effect of paintings, instead of endeavouring to acquire too much prominence by the design of much more expensive and much colder architectural carving and sculpture. From the consideration of such rules of study he would advert to a more real and most important part of their education, namely, architectural travelling. His experience per-haps entitled him to he heard on that point. Ample time should he hestowed upon travelling, and the wart of it was one of our national defects. It was the general fault of the profession to travel too quickly. Other professions were not given to this fault. It was necessary to acquire gradually and properly the experience of foreigners in a profession embracing so many minute details; to live with them and learn their language. Much more real profit was derived from spending the same time in a suitable centre of architectural note, than in subdividing it among a number of localities. It was atsonishing how real intelligent travelling showed the new studies they had to make, and led them to appreciate duly the ancient schools of truly artistic countries ; while the mere passmore real and most important part of their education, schools of truly artistic countries; while the mere pass-ing hurriedly through them often left them in hlissful ignorance of their own deficiencies. Painters and ignorous of the function of the left them in hissful ignorrance of their own deficiencies. Painters and sculptors usually resided a long time in Rome. One great professional drawhack was the national fault of expensive travelling which was certainly the least incidentaal travelling of all. True artistic feel-ing enables us to satisfy ourselves without so many material means as non-artistic persons resort to: we should learn that public estimation appreciates very differently the dignity of a true artist, and that of an individual who, for wont of any other title to social utility, is called a gentleman. We should soon see in such a cosmopolitan artistic centre as Rome how thoroughly this was understood by the artists of every other nation. They ought to he able to under-take real professional travels at the same rate of ex-pense as at home. In conclusion, he would call stien-tion to the immense advantage to be derived from mutual exchange of information, such as was idforded. tion to the immerse advantage to be derived room mutual exchange of information, such as was afforded them by the Architectural Association. The task of preparing papers for meetings compelled them to put more order into their studies—hrough together as into a nucleus the scattered notions of bygone studies, and a nucleable development of the information of others, reflected new lights for the information of others. With a view to the proper development of the re-sources of the Association, be thought they should endeavour to carry out a code of rules in connection with matters of professional ctiquette and professional competitions. The Association had already made a highly laudable effort to establish some sort of legislation on these matters, and he hoped the question would he taken up again and successfully carried ont After recapitulating the topics for papers to be read in the syllabus for the session, the chairman resumed his seat amidst applause.

If Kerr congratulated the members on the comimencement of another session, and was pleased to hear what had fallen from the president respecting the very important subject that formed the basis on which the Architectural Association. Many of more profession of equal importance in this country in vhich there was the same amount of what he would sign in the schools of the Arsociation, and appear in the Architectural Association. Many of more profession of equal importance in this country in version of education. Architecture in the present day occupied a position miwang professions and argocations which was somewhat singular. They were architects, scientific men, and men of husiness all in one. They occupied a position miwap telveen pure argonet to be as purely scientific men as those who were scientific meri, and as men of business they required to be as purely scientific ducation—that was to say, an education on statistic and elementary priuciples—was the rule of the age, as it classical school ; hut gradally this was lost, for the unquestionally was, *d*/artior; it was necessary tha the yiele of achitecture, a system of the yiele of acquire knowledge that was threefold, and which was, is noom degrence, atagonistic in its principles. If not in its application; and they had to possess, or if not to possess, to acquire, a threefold practical mode of instructing the systematic in this principles. If not in its application; and they had to mode action should be established; seeing tha day during the least the influence of the descing and it would have heen altogether and which was, is noom degrence, attagonistic in they and a go, if not to possess, to acquire, a threefold practical mode of instructing the systematic in this principles. If not in its application; and they had to possess, or if not to possess, to acquire, a threefold practical mode of instructing the systematic in this practice in another avocation or profession. And the systematic and agnitic to mere another aphalic to the systematic prescilcal

ments of another as the basis on which itself should work. However, in the absence of this scientific education, the Architectural Association held an im-portant place in relation to the profession. When the Association was first established, it was established in the full science of another to be an other to be able in the full view of a want of proper means of educa-tion,—as an indifferent means, perhaps, yet still the hest that could be commanded, to obviate the want and supply the desideratum. As they could find no masters who could instruct the applie, they called the pupils together to instruct each other. For a good many years the Association had met there with great success. Papers had been read and able remarks made, and a class of design had heen established; and a class of design had heen established; and in the full view of a want of proper means of educamade, and a class of the mathematical on that occasion, he hoped it was not out of existence. ("No, no.") The class of design had been operating many years with very gratifying results, and a feeling of good fellow-ship and friendship had heen created amongst brethren in the profession within those walls which would, no doubt, produce lasting benefits for many years to come. There was a point to which on the present come here was a point to which on the present namely, that there were two great classes of designers in their profession. So rspidly did the progress of change their projects of their profession, so much more rapidly did fashion advance and progress than in any other art or science, that a generation which, in ordinary human science, that a generation which, in ordinary human life, and in the ordinary history of human thought and development of human action, was heretofore a cycle of some thirty years, was now, in the present ratio of accelerated action, hrought within five or six, ratio of accelerated action, hrought within fave or six, or ten years at the utmost. We should find the man who was now amongst us in the full vigour of imagination would in ten years' time he thought one of the old school; while, on the other hand, a man who ten years ago was at the head of his profession, was now—and they could recall half a dozen names— numbered among those of the old school. Conse-quently, a man who has advanced heyond a certain point of the profession, has got so thoroughly into the oldolets school of design, that if he does not pro-gress with new principles, he cannot expect to keep up with those whose imagination is newer, and more up with those whose imagination is newer, and mor fresh and fertile. The two great elasses of practice practical designers in the profession to which he alloded, were those who designed for themselves and those who de-signed for others; and the explanation he had given regarding the rapid progress of art was the excuse that should be made for those more able men who are now obliged to work by the hand of others. Many remarks he had seen in print were tainted with great ill-feeling and discouragement towards those who were more advanced in life than some of those prewere more advanced in hie than some of those pre-sent; and he therefore took that opportunity of referring to the subject if for no other reason than to show that those of them who were not advanced beyond middle life did not wish to cast discredit on those who were more advanced in years, or who were unable to do the work of imagina-tion by their own bandle. If they lacked around the years, or who were unable to do the work of imagina-tion by their own hands. If they looked around the Architectural Exhibition, they could distinctly trace the handiwork of one and auother that they knew; and they could, moreover, trace, and see recorded on its walls, the valuable fruits that had resulted from the Its wais, the valuate remistrat had resurted from the influence of the Architectural Association. Many of the young men who sent exhibitions there had heen members of the Association, and many of those who were unknown to fame, and did not appear in the drawings or in the leading designs worked out for others, had acquired the style and spirit of that de-sign in the schools of the Architectural Association. The peculiar circumstance from which this had arisen The pectual creations and error which this had arised was this—the style of a rehitedurur progressing during the last ten years had heen essentially the Picturesque. Fifteen years ago, at any rate, they were brought up in the classic school of their art, and were taught certain severe principles of criticism and were taught certain severe principles of criticism and eschetics, consistent with economy, hut inconsistent with the Picturesque. When the Gothic was first in-troduced into general practice, they would remember how classical it appeared, how symmetrical it was, how dependent on mere form and proportion, and on that style of design that had heen practised in the classical school; hut gradnally this was lost, for the classical school; hut gradnally this was lost, for the Ficturesque is the essential principle of the Gothic. The Gothic hecame more Gothic, and still more picturesque, until now we had reached the limit of the Picturesque; and it would have heen altogether landed on abstratily had it not been for the overruling influence on the part of young designers, in which he saw very much the influence of the Association. They remembered how the Ronans having nut the Pic-

useless to ait, and retarded rather than advanced it It would have been the same in the country during the last ten years in the practice of designs, if it had It would have need the same to the couldry during the last ten years in the practice of designs, if it had not been for our young men, and that was very much the reason to which they might attribute the success of the Association's operations. It had pained him very much within the last year or more to hear of the deceder ce of the Association. He would, how-ever, remind them, if periodically sersons of de-cadence appear, not to be dis souraged thereby, as it was the uncre natural process of cause and effect, to be observed in all societies, of much more importance and of less importance than their own. Old members had their eaergies and interest exhausted, and younger members were not found to come in with the same interest. The stone set rolling at first on newel of that impetus form time to time to keep if rolling, and so it would be here. They would find practically, in every year of their carrer, that they rolling, and so it would be here. They would find practically, in every year of their earcer, that they would have to establish some new principle of policy, or some new phase of practice, to he worked out with a reduplicated vigour, and so gather round them neurly a new class of that membership for which the Insi'i u ion was origin illy founded. He was glat to hear that the Association was seriously entertaining the question of education. Some twelve months ago be memori-lized the Insti-tute of B itigh Architerts on the question of educa-Some there is the hardward of the interview of the second thte of B itish Architerts on the question of educadegree harren of results, or that it was a failure or a blunder. On the contrary, he con-idered that e mpebinnot. On had it been allogether a delusion, was one of the most important bo as the Government cond confer on art. He sand expressly, and the expressly would be better understood here, and have a more significant for c-that it was a class of design on the very grandest scale : architects were called upon from all quirters of Europe, and this country, to join in a competition on a subject which he undertook to say—there might le a difference of opiuloa on the matter, they understood to be a palace of the grandest character, and of the high st architectural order When one coasilered the large number of artists and of all ranks of merit above a certain class, who colle ted their contributious there, and who made lounge of it for so many weeks, contemplating cach works, comparing each other's views, oriti sing each other's principles, ick would sy this for the archive turid pofession, that he never heard of any coulest where more good-will or brotherly feeling was displyrid, and it could nut fail to operate as a powerful stimulus to the progress of at for many years to come. If we solly one in twenty-face years that such a competition on an arcore for using that such a competition, on an average, occurred. No doubt the competition that hed lat by conder was very for in advance of the competitions that took p'a c for t'e Houses of Parliament, t c last that took place for t'e Houses of Parliament, t e last in the sume class hefere it; and nod nbt t'e mixt that would occurs, perlops twenty-five yers hence, would be as far beyond that which bad lately been held. An other campe ition that had given great gratification was that for the Welsington Monoment. Sufficient was, of all other arts, the one beside their own in which they necessarily took the greatest intract, but that which main'y excited their attention in the Wellington Monument comp tition was the protest of Professor Co-kerell against the decision of the judges." Professor Cockerell was a man whose word er iel very great weight in the highest quarters. He was not only a man of great ceu tition and of gr at necessarily but he was a man of boldness, a man of artis is feel-ing, and a man they were proof for many years to consider as the l'adle of their polession,—and not (a) a main a site ball of their polession,—and not consider as the baller of their polession,—and not only so, but as a prominent hader in fine at gene-rally. Now, Professor Cackcell accome forward with reference to the Wellingt n competition, and entired reference to the Welfingt n competition, and entred against it a most grave and serious protect. It became, therefore, of the greatest importance, that they should consider what was the cause of this protest, and what was the object of it. The enne of it, said Professor Cockerell, was that the principle that secured to be engraved on the Governmental mind of this country was that Government man should dride questions of att. This could be no doubt that the minorible was art. The could be no doubt that the principle was canicently a surd at the very best, in thus declegating decisions on high art to Dukes and ALPs and Doctors of Divinity, and that sort of thing. They were all

THE BUILDER.

very well in their particular vocation, but when they came to the question of sculpture and architecture, what were they ?--it was a mere mockery to say they In their competition they put on one were julges. architect, but in the competition for scalphere they put on no scalptor at all. They conferred with Pro-fessor Cockerell, and he did not marvel that Professor feesor Gockerell, and he did not marvel har rolessor Cockerell, prized in that p sition, should feel in his own heart his responsibility to his profession, to the puble, and to bistory, and that it was incombent on him, perhaps, against other feelings that induced him to be silent, to come before them in the hold manuer that he did, and to deneuture a system that was absolutely ro ten at the core. Mr. Bernal that was absolutely rotten at the core. Mr. Bernal Osborne, famous for his witty sayings, said the other day h - never hid attained to much influence in the conucils of this country hecause he was not a Brahn. Thire was a great deal of truth in that with who were Brahmins as well as others, and it was min. their dity to follow up Professor Cockerell's protest and leading, both privately and publicly, and to ex-press their aggregate opinion that they were not con-tent to rest any longer under the judicial decisions of the Brohmins in ma ters of art. He had been happy the Brahmins in ma ters of art. to hear suggested what had in indeed been suggemany times before, and which was a grave matter if projectly carried out, al hough perhaps open to objection and citicism—that a trades mino—he used a plain expression, for it went furthest in the end— should be established among these of them who were more engaged in competitions than others, in order defend themselves against the system of decision that p evailed. If the profession were to taise some that principle of law for the processor were of competitions, now was the time. There was a law for competitions, there was a law for exception, only it required to be written and acknowledged. The law of natious might be supposed to be the most incomprehe sible of laws, and yet there had been men who, in the solitude of their studies of 6 feet square, had p and red on the e volue es which now formed the code of k gd and, and which were quoted in senates and discussed in c blinets. Whether this was the time to make a pactical move he would not take upon hinself to say; but he would only say that as the Institute seemed to decline to do only say that as the here the state of the state of a state of a state of the state something effective might be done

Mr. E lueston had li-tened with much pl asure to Are, Education and increase with mean pit as the to the professional comments that had faile a from Mr. Kerr, offering, as they did, some decidedly gold un rudes for the benefit and better progress of the Asso-ciation. He agreed with him in all that he had itation. He agreed with him in all that he had uttered, and more particula ly in that portion of his remarks that pointed to the necessity of consol during then a had as a resulted in the second sec and establishing on as firm a basis as possible all the different elements in connection with a chitectural progress, education, and improvement, and for which there were at present no effectual arrangements. One age handed down, comparatively speaking, very little to the next : the process of change was continuelly going on, and nun h that was good was lost, ev n if much that was equally so was found in the future. Wathout doubt, the mental efforts that took place in discussions force were productive of great gool, as well as what mose out of the class of design. He finally helieved that the Architectural Exhibition did the greatest good in that way. It might not be very appunent, but its bench-ial effects were, so to speak, in-ensidy felt, as, y ar after year, the collections of designs and inventions were brought together, and thought over and considered, and a fresh status of perfection and improvement reached. The alluded to another effort that was making, on The report which he would say a few words, namely, the establishment of a suitable place where all the arch tectural societies night meet together. It was a matter that bac most important hearing ou the question before the It was a matter that bad a and he wished to earset a mistake as to what had been shill about the terms on which the Architectural Association should join the Union. No terms had been proposed, but it had been intimated that the been proposed, but it had been infinite that the so lety was axions to have them there, and as they were going to build large galleries, 120 feet by 40 fred, it was thought that 50% a year, or a guint as an infi-would not be too much. He huped, therefore, there would he no misapprehension on the matter, and that the proposal would not be allowed to fall a dead letter. A go d d al had passed with reference to giving the A-sociation the use of rooms at the Institute, the Association the use of rooms at the lostitute, the library, and so forth. That negociation was not very well managed, but an opportunity was now offered of doing something else, in which the dignity and inde-pendence of the Association would not be compro-mised, and where they would not be the tenants of autoher society. No one was looking to profit in the maiter, but the main object would be saily defeated if an association like the Architectural Association, he can reacon a butere wave left out of the Union. by any reason whitever, were left out of the Union,

which was working slowly, but certaioly if all set their shoulders to the wheel; and he hoped that by this time next year the *conversatione* would be held under the roof of the Architectural Union.

The Chairman s id they were all desirous to dwell together as hethren, and he considered that the scheme of the Architectural Union would benefit, not only the Architectural Association, but the profession generally. The great end was organization and unity, and identity of place was one of the casiest means of effecting it. Mr. C. H. Smith saw around him many young

here no makes of the architectural profession, and he was induced to offer a few observations, fearing that they might be detered in their professional pursuits by some remarks that had been made pursuits by some remarks that had been met-with to much weight on the subject of architec-tural education. It might he unbecoming, pertural education. It might be unbecoming, per-haps, on his part, to say anything about education, seeing that there were some of the older members of the profession, now numbered with the illustrious dead, who had deemed, not himself, but such as he, am ray the un-ducated class of the community; and, as regarded what his own individual education had cost, he might perhaps be ranked in that class. But he had had his eace one all his life and had tried to tural education. cost, he might perimps be ranked in that class. But he had had his frees open all his life, and had tried to make good use of his head, and he would impress on the younger members of the profession that those who waited to be instructed and tanglit would know but little. They must teach themselves and learn, for those who learned by their own efforts and pour suits were generally the best informed and educated suits were generally the best informed and educated. If we looked at times past, what was it taught the Greeks to arrive at their perfection? The Romans did not copy what the Greeks did; and what grew out of this P—something more refined in the science of architecture, the Gothie of the Middle Ages. No ore, he thought, would diffar with him in opinion that the architecture of the Middle Ages poseesed m-re real science in it than architecture at any time more real science in it than architecture at any time in the world. There was no style of architecture at any period ever brought to such perfection with such seanty means. Again, what was the education of the class of people, the monks and eccle-iastics, and great cathedrals ?--why, he believed they never passed the threshold of their own doors, or, at any rate, the threshold of their own country. Learning was common among them, but they did not have a classical education. If we looked at the precise of those men in this country who had received a high education, we should find that generally speaking, they had done less for a chitecture than those who had seen an busic of tandt there the the the set of the risen up by their own self-taught streng'h, and t who had cloaded themselves. There as an architect n w de d who had a number of capitals at the ead of his name, and even the initials R.A. who basted that his education had cost 10,000?. He had spent It's name, and even the number K.A. Who obsated that his education had cost 10,000%. He had speat many years in colleges, and prided himself on his schola ship, and yet that gentleman in many com-petitions was supposed and defeated by those archi-tests he termed whally unclusted. With all his 10,000% worth of education he was not able to competc with the men who had been educated, as it was called, in the chindler's shop style; while the men who were so designated bad risen to the head of their profession. There was far more to be done by self-culture than by all the colleges in the world. One important thing was to know one's own country -----

" Abroad to see wonders the traveller goes, And forgets the fine things just under his nose."

There were miny in the profession who had spent years alroad, withent going over their own country. He had just sufficient relish or taste for travel to enable him to value the pleasure and facilities it gave to those who were disposed to benefit by it; hut as regarded the necessity for professional education, be thought it was considerably overrated.

regarded the necessary for procession enteration, he thought it was considerably overrated. Mr. Edmeston would add one fact respecting the Architectural Union. The don-tion fand was a nutter of g cat interest: it was first of all formed to meet Earl de Grey's desire, and it h-d received considerable accession. The fund would amount to 1,000/, and there would be 60/, or 70/, of this that would be devoted periodically to giving medals and rewards to students in art. A fecture like this was calculated to commend itself to the Associetion, composed as it was of young men and students.

composed as it was of young men and stabents. After some observations by Mr. Rickman, the proposals of the Sardinian Government (first made known in this ensurity through our columns), iaviting designs for prisons at Turin and Genoa, were referred to."*

The Choirman remarked that, with respect to prisons, those of Italy were considered quite models of their kind: one at Rome especially, was spoken of as myst complete; so that in competing in the matter of these prisons at Turin and Genos, they

* See p. 538, ante. The programme may still be examined at our office. We may add, that a schedule of prices of materials and workmanship is appended. must not overlook the ability displayed by Italian architects in that department. Mr. Kerr explained that, by what he had said on

the subject of architectural education, he did not mean Latin, Greek, or Italian, bot practical systematic in-struction. Witbout that, how could any man he said to he instructed at all?

said to be instructed at all? Mr. Benvell recalled to the recollection the career of Sir Christopher Wren. That luminary of archi-tecture began the profession at a late period of bis life, and we might he perfectly sure that he never would have succeeded in the brilliant way he did, had he not bren primarily educated in the bighest posside-manner. It was the primary education of that great man that laid the basis of his fame, and contributed to the splendour of his career. He commenced bis studies at college, and went through all the curried lum of the known sciences of that period. but these studies at college, and went through all the curriculum of the known sciences of that period; but these sciences were not entirely supreme. He studied the arts as well as the sciences, and it was because from this early career he made himself an anatomical draughtsmao, that he became such a master of his peried, that when he took to their own profession as an abstract study, he had the best bisis to work on, and was, in reality, a scientific and arhistic man before he came into the profession. Now, if we went on in the system of education that prevailed in this country in the present day, the great fault we were most likely to fall into w s, that we should make our architectural students too scientifie; that they would be directing their studies to geography, chemistry, mathematies, and mechanies to too great an extent, and we should be fold of the geal leman on whose education 10,0007. and mechanics to to great an extert, and we should be told of the gen1chmon on whose churation 10,0007, was spent. U at his education was too seicentific, and not sufficiently artistic. If in our studies the study of art was made pre-emimor, as, indeed, it must be, to succeed in the profession, and to gain the appro-bation of the public, the result would be to show that the schools of drawing and colouring and art-study were in excellise over these of science, as far as architecture was concerned, and that a system of edu-ction unread upper the priority for a science for the star study were the trainciple could not foll of

architecture was concerned, and that a system of edu-cation prevent upon that priociple could not fail of being eminently suc essful. Mr. Ash, art-workman, thought th+t one link in the chaiu of edu-ation and improvement had alto-gether been lost sight of and forgotien. The Archi-tectural Mnseum, originally est-blished in the metro-polis for the study of art, had been, comparatively speaking, annibilated, in his opinion, by its removal to Bromption. Architecture embraced not only artists, but artizans : the fingers of the art-doce did what the emind of the at-thinker thought. but artizans : the fingers of the art-doer did what the mind of the art-thinker thought. There ought to be a class for practice and working drawings, where the artizan might join with the junior architect. There was no booe, no muscle in modern French and Roman art, while, if we looked at home and saw Gobbie rising, it was Gothie with its errors perpe-tuated. The architect of the pr scut day had to do his work too much by contract, by yard, and by square; and if they intended to move in this new question of education, they onght to sund circulars round to every building firm, stone-masou, and brick layer, and cach, in his class, should be called on to give an elementary lecture; and then we should not want class-education, and should hear the practical thoughts of practical men. thoughts of practical men.

SANITARY CONDITION IN THE NORTH.

SANITARY CONDITION IN THE NORTH. The progress of the country is at the present time wighhourhoods are springing up: many towns, a sbort time since insignificant, are inercasing to a wonderful extect. Some pl ces, however, seem to be standing still, although the rai ways have been brought to their doors. Durham, for instance, has not advanced. In York, although the rai ways whistle is constantly challenging the Minster bells, the place may be considered as almost dead. Men stand at the owner, or move listkssly whout the strets, who menue the change which has taleen place since the charlon horn of the coach-guersleechood in the smeart stretes. Once upon a time, the King's Periament was held at York, and for long after it was con-didered a capitel eithy the raiw and fashion of the orthor of Edgland were costent with this far-famed town, instend of altempting to reach London. In-this particular gradually decimed. Still it continued to a bustling place: the innew were throughed to to the place. It was also the chief thoroughtare for goods both to and from the save that who were gluid to rea-tion along place in the institute of the place. It was also the chief thoroughtare for goods both to and from the save the the attribution of the place. It was also the chief thoroughtare for goods both to and from the save the the attribution of the place. It was also the chief thoroughtare for goods both to and from the save the the attribution of the place. It was also the chief thoroughtare for goods both to and from the save the thoroughtare for goods both to and from the save the the save enditions people do not now particularly are deside end the save difference and and show the tolook at the antiquities, in many

The now elmost neighborring town of Darlicgton is sprading in various directions. Large manufactories are rising up; they are, as a gentleman observed, "waking up." Newcastle-spon-Tyne, Sunderland, and other places too numerous to neution, are basy secces of industry, which are adding to the wealth and power of the nation. In York, and some others of the cathedral cities, the larger and pooler part of the population seem to he sinking into powerly and illeness. No sole can admire more than we do the symmetrical beauties of the Minster. We also like the glimpses of the ancient wall, the gates, and picturesque clumps of houses, &c. but cannot fail to regret, that when other towns are prospering. York, and places which are similarly situated, should be allowed, so far as the population is concerned, to fall into sleep, more particularly as we feel sure that manufactories may be made handsome architectural features, and more particularly as we feel sure that manufactories may be made handsome architectural features, and that they can, by using proper means, he carried on without giving annoyance from smoke. It is said that the fer of smoke has weighed with those who have the leasing of lands in the old cities, which has been the means of preventing their advancement. However this may be, there is no doubt the manner in which dan and chapter lands are let, requires great improvement. It is availatedory to think that, notwithstanding the dulness of York, sani-tary ingrovements are going forward. In various parts large severs are in progress, and these are con-structed by shafts so situated, that the streets are not obstructed. obstructed.

obstructed. When looking at some of those things in a pic-turesque part, we were startled by the loud tolling of a hell, and the sonorous voice of the city hellman, who was proclaiming the loss of a child; this func-tionary was dressed in a gold-laced east which is not suprassed by any London bendle (alwage cocked hat added to the dignity of the costume); this officer politely offered as his escort through the o'd parts of the city, and visitors to York who have only a short time to stay would do well to avait them-elves of his services as a sudde.

time to siny would do well to avait them-elves of his services as a guide. We found that those prris occupied by the very poor, although still requiring care and attention, are out in the deporchic condition of many places: the authorities should see, as the sewers are completed, that the inhabitants, both rich and poor, communicate with the main drain; the innkeepers should be very careful on this point, and also in providing a better system of ventilation; for it is very dangerous for travellers through fresh air to be lodged in houses where the atmosphere is inpure. Many will have experienced the heavy oppressive air, if they rise carly in the morning, before the doors and windows are open, which fill some of those places of public enter-tainment. The water-supply of York is greatly im-proved. proved.

At Darlington, an extensive scheme of drainage is in course of progress; the water has been brought from a fresh source. It is arranged that all the drain-age shall be taken quite clear of the town. Here, also, the drainage of each bonse into the moin sever should be strictly unsided upon for the name show a very indithe drawings of each bonse into the mini sewer should be strictly usisted upon, for the place shows every indi-cation of soon becoming a large manufacturing town, of considerable population. The clurch here, which has a very fine spire, has been saily disfigured by some ngly-looking bonses which have been built very close to it.

close to it. It is really terrible, when taking a sanitary glance at the adjoining towns—New, astic-upon-Tyne and Gates-head — which have twice been farfully rawared by the cholers, to hear the accounts given by the yeople and the picture drawa: the streets desolate, the people ha-coming so reliasi that they refused to assist unightoms in distress; a son has been obliged to perform the last sad offices to mother and sister: those connected with the graveyards extortionate to the poor; those who could afford it inshing to surrounding places, and fluiding there a difficulty of obtining shelter if they came from Newcastle; many wisely commod on the finding there a dimensity of obtaining statute if they cane from Newcastle; many wisely concamped on the adjoining moor; business was at a complete stand-still. We will not enter into harrowing details, but the accounts have all the peculiar features of the Great Plague, of which we have such faithful reports.

It is now four years since the disease visited this neighbourhood, and mu h longer since the first outneighbourhood, aud nut b longor since the first out-brak; we had hoped, however, that, in the course of time, since even the last attack, vig rous measures had been used by the officers of he lth, and also by the corporations of the two towns to prevent future visit. Such, however, does not seem to be the case, for nothing that we have seep use equilled the state of filth and neglect which met the cyc during walk, particularly through some of the sirrets on the borders of "Coaly Type," — Fipsedl=gate, Gatshead, for instance. This street thom near the south end of the o'd bridge westward, is so narrow that at the same time, without the latter being crusted at the same time, without the latter being crusted

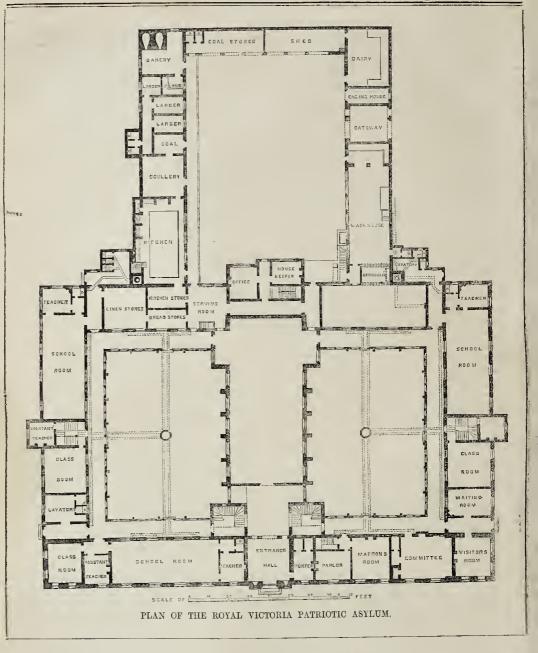

instances make a survey, and are off again without much profit to the place. The now slowest neighbouring town of Darliogton almost precipitous manarer, but notwithstanding houses almost precipitous manner, but notwithstanding houses have been built in many instances quite to the summit, which are reached by an arrow sleps almost as steep as ledders. To convey any idea of the dwellings, which stand on platforms one above the other, would be im-possible. Here and there small torrents of a most stand on platforms one above the other, would be im-possible. Here and there small torrents of a most unpleasant description rush down the guiters towards the streets. Some of this refuse finds its way arcos to the Tyne, a large part lodges on the rotten povement, and forms stagnant pools. This should not be so, for surely if the drainage is difficult, the pavement might e silv he made good, the streets kept properly swept, and parties punished, if they will not be cleanly, hy fue. Other parts of Gatrsherd are in very had condition. In Newesble affairs are but little better, and yet the people do not express any wonder at it. In places where the cholera raged, so far as we could gather information, but few attempts have becu made In places where the choices raysd, so far as we could gather information, but few attempts have been made to improve the distinger. As an instance of the con-tunacy--we may almost say moduess--which exists, it will be worth while to mention a court leading from Rosemary-lane, new St. John's Church, which shows how little real care has been t-ken to prevent evil. Twenty-five years or so ago, on the first appear-ance of cholera, a portion of the ramifications of courts and little squares which exist here was occu-pied by a school, below which, and on all sides, in the most curions manner, were small temments. Opposite the school was a "midden-stend," about three yards square, and close to this a closet --the only one for the accommodation of a very large number of persons--the school was a "midden-stend," about three yards square, and close to this a clost — the only one for the accommodation of a very large number of persons-is situated. There was no drain from it, and the soil and refux were let to ting. On the first attack of cholera not a single room which surrounds this nu-drained spot escaped. Many desthe happened; and this was the case again, we are informed, on the last occasion. Surely, we thought, an improvement must by this time have been made. It cannot be pos-sible that this open cesspool has been permitted to remain after so much surfice of life: a drain bas by en made to the sewer, the payment is made good, and the sink-holes are all trapped. But, alsel such is not the ease. There is the same arrangement of the closet, the soil collected as of old. Other sp-ts may be mentioned where the same nethanged coulditons may be observed. Have the authorities been asleep for a quarter of a centry? What is the use of sam-tary inspectors and officers of hea'th, when such things are allowed to continue? Our readers would not be intersted in detailed accounts of the unsani-tary state of various parts of the town : suffice it to say that the place wants great and immediate attention. In one part nerr Summer-bill, an unbuilt area of some extent is left between two rows of acely-finished drainage, from the backs of which streams of black water were flowing, and collecting in pols, and in some drainage, from the backs of which streams of black water were flowing, and collecting in pools, and in some instances running down the centre of the adjoining street. Why do the people of Newestle-upon-Tyne and G deshe id allow such a state of things to continue ? It is both discreditable and da grons. We have con-fined this notice to those ports which are chiefly occupied by the working people, and those more poorly off, hat will reture to this subject more in detail. North Scields which at one time was snoken

poorly off, hit will return to this surjeet inter in detail. North Siddds, which at one time was spoken of by the people of Neweastle as a vey dirty place, has been surprisingly improved. We believe that a proper system of disinage has been carried out--the gully holes are trapped, and the streets will swept, the back-slums, too, are well kept, and it is easy to perceive that a careful supervision is persevered in a what seems to be chiefly wanted is the provision of closets to the houres. Many are wholly without a comm dation of this kind, and see-faring men complain of the various matters which are thrown upon the shore at morning and night at low tide. The water for general use should also he laid into the houres of the poor; it is not so now. The evl, however, is putly me by numerous plugs which are stationed at the corner of streets, in courts, &c. where water can he hought at a farthing a "skeel"; full, a vessel containing about three gallons and a balf

DISTRICT OF ST. GEORGE IN THE EAST AND ST. BOTOLPH WITHOUT.

AND ST. BOFOLTH WITHOUT. At a meeting of the Micropolitan Board of Works, held on Friday, 2nd inst. Mr. John Billing was elected to the vacant district.surveyorship. There were eleven candidates, who were first reduced to six, viz. Messrs. John B1 ing, Tress, Redman, Artchison, Bornett, and Barlet : and these by successive votings were climinated.

THE ROYAL VICTORIA PATRIOTIC ASYLUM. THE Foundation stone of the Victoria Asylum, it may he remembered, was laid by her Majesty, on Saturday, the 11th of July last, at Wands-morth-common. The cost of erection is being defrayed out of the surplus of the Crimenan patriotic fund, which fund in all amounted to 1,446,9554. and the surplus, and 140,0004, to its endowment. The design of the new asylum is based on The design of the new asylum is based on the surplus based on the surplus to the the surplus to the surely the surplus to the surplus to the surplus to the surplus to t

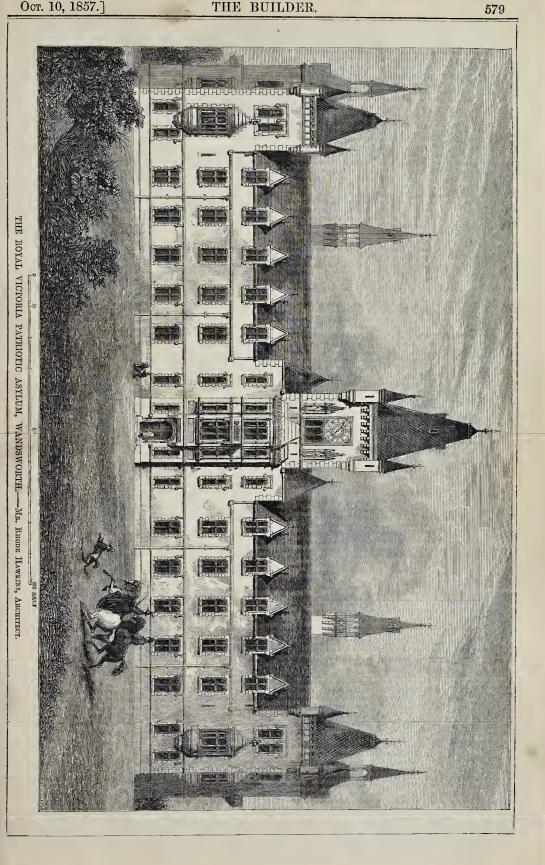

The design of the new asylum is based on that of well-known hospitals in Edinburgh. The view we now give, together with the plan, will explain its arrangement. Mr. Rhode Hawkins is the architect.

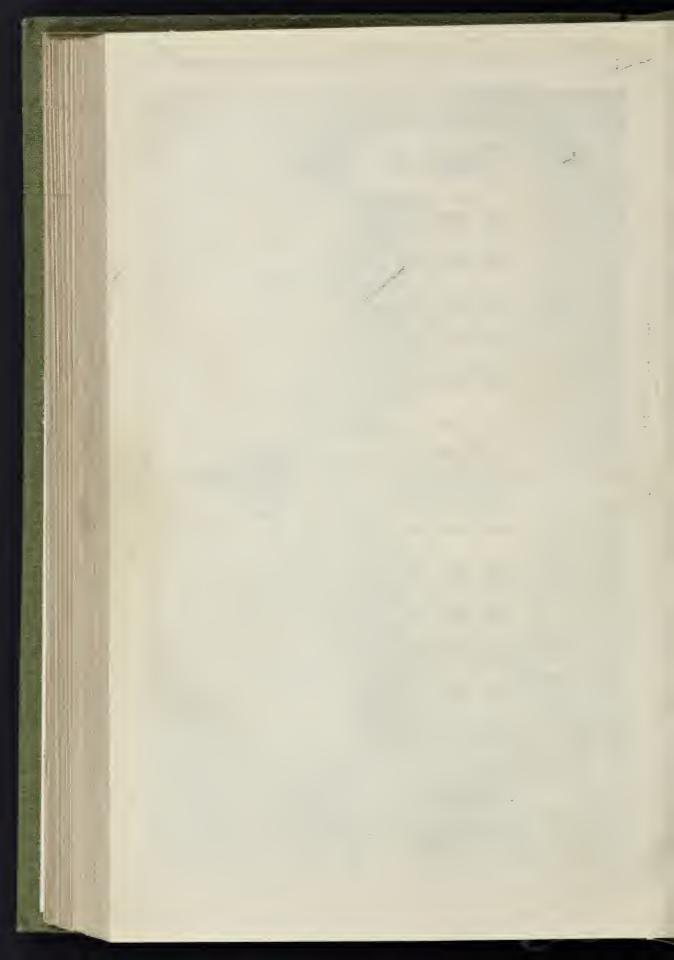

An inscription is to be placed in front of the edifice, in Latin, and in English, to the following effect :-

A TOWN WITHOUT A NAME. Your correspondent of last week, "A Tax-payer of forty yens' standing." lives in the most populous horough in England, containing the longest, broadest, and what might be made the handsomest street, broadest, and what might be made the handsomest street. England, running in a straight line completely through the horough. But the borough, though coutaining half a million of people, has uo name of its own as the other metropolitan horoughs have. Though it contains the richest port in the world, it met world, it met the street, like the horough, has no name, being in one place called

Ост. 10, 1857.]

THE BUILDER.

Ост. 10, 1857.]

THE HOUSE OF GEORGE STEPHENSON. THOUSANDS have travelled miles to visit the birthplace of Shakspearc, Newton, and other men of genius who have passed away-hnt whose names and works are held in grateful recollection-and it would now be considered a sort of sacrilege to destroy those memorials. It is to he regretted that there are not more of such relics, and that so many have been carelessly destroyed. It is generally thought that we carelessly destroyed. It is generally flotgen that we possess a hetter feeling for these matters now than we did formedy,—hut this is not certain. We arstold, for example, to the contrary, that the picturesque cottage at Wellington-quay, near Newcastle-upon-Tyne, in which George Stephenson, the engineer, for some time lived, and in which his son Robert was born, is burst to burstlebulg and acheoled it is cail will be time invest, and in which his solve to be the solve of the set of spots which render necessary the removal of mattlers of intercst. In this case there is plenty of ground of no great value close by, on which the schoolhouse may he built, and the existing huilding, which is so intimately connected with one of society's henc-factors, and his searcely less eminent son, he secured (with care) for centuries to come. It should he borne in mind that, as years roll on, the fame of George Stephenson will increase. Let the school be built as near to the residence as the anthorities think fit, and then the teachers' from generation to generation may then the teachers; from generation to generation, may point to the place and mention that in that humble point to the place and mention that in that humble eottage a great man once dwelt, who, by his perse-verance and genius, 'benefited the world, and raised himself to a high condition, and advise them that they have the same opp-titunity, provided they follow his example. Surely the corporation of Newcastle-upon-Tyne, to whom this property helongs, and in whose hands we are told the fate of the dwelling rests, have not sufficiently 'considered the subject, or they would not have samethout the "mound of this memo-rial of two of the borough's most eminent citizens.

THE BROTHERTON MEMORIAL, SALFORD.

I AM induced to ask you to allow me the oppor-tunity of replying to some portion of the granublings of your two anonymous subscribers, "A Wauderer" and " Vulcan," whose grievances you permitted to he ex-pressed in your papers of the 19th and 26th nlt. respectively

respectively. As a reader of your Journal for many years past, I have observed many complaints on the subject, and have been impressed with the feeling that com-petitors were not generally dealt with in a fair and liberal manner; and when I found myself in the posi-tion of having, as one of the honorary secretaries of the Brotherton Memorial Committee, some responsi-tive the secret is accounted in a desired liberation of the secret in the secret is accounted in the secret liberation of the secret liberation of the secret liberation of the secret secret in the secret is accounted in the secret liberation of the bility in regard to competition designs, I determined that no just esuse of complaint should, as far as my

That ho just cause of companie should, but the my power extended, exist in this case. The direct and flagrant misrepresentations of "A Wanderer" and "Vulcan" hvec completely removed from my mind the impression hefore referred to, and bave from my mind the impression heliovereletted to, and base caused me to believe that it is *not* generally the want of fair play and justice in the committees having to decide upon competition designs that deceasions these continual complaints, but that it is the impossibility of deciding so as to satisfy the unsuccessful and un-rewarded competitors, that anything his justice, con-sideration, and judgment, have here exercised. "A Vanderer" commences by stating that the de-cision of the committee second to the singlated any "

cision of the committee seems to bim "unjust to those whose designs could be created for the stipulated sam," and that it is "another instance of a picture design gaining the first prize," multi is a "violation on the part of the committee, the judges, and the competitor." He then asks, "Of what use is the massive canopy resting on the hair of the heads of the cright celestial figures?" See. He then elevates himself to the seat of judgment, and in the language of mortified vanity ex-claims, that "it is too had for the noble art of archi-teeture to be treated in this style," and he then goes on in a most extravariant manner about "Pseamism

testure vanity ex-lecture to be treated in this style," and he then goes on in a most extravogant manner about "Paganism with a rengeance!" a "poor copyism from the heathen days of the Greeks!" and other equally abusive and improper language. I might simply answer the above hy declaring that every assortion above quoted is false, and all the indig-and totally inapplicable. But I may add, that the eanopy is supported on eight columns, at the back of, respondent ought to have seen hy the drawing and the basement plan along with it, if he had wished to criticise with fairness. I will he satisfactory to your cor-

It will he satisfactory to your correspondents to know that the scleeted design can be creeted according the specification for the amount specified; and that tender to do it at that sum has already been sent in. tender If it could not be erected for the sum specified, the committee would certainly not feel hound to retain it. Your other correspondent, "Vulcan," appears to

have had his indignation and mortification aroused, and his judgment hinded, by "A Wanderer's" com-plaints, and repeats more confidently bis misrepre-sentations that "a heavy spire is wholly supported on the heads of eight angels," &c. "Vulcan" even condeseenads to notice that his design was returned to him "in a heavy storm," and therefore inalying that the committee maliciously scleeted such a day for the purpose of spotling bis valuable design. The "six temperny nails" he mentions were small tin tacks. The "give" he so often refers to as used for the labels and for his direction, was the ordinary gum The "gue" he so often refers to as used for the labels and for his direction, was the ordinary gum arahic; and the "glue-brush" was a camel's-hair peneil. I need not repeat his senrilous language in describing the design, as it is only a very impotent attempt to add greater force, by more positive asser-tions, to the exaggerated mis-statements of "A Wan-demen" derer

As this subject appears to have been considered hy yon of sufficient importance to give so much space to it, I think your readers and the public will be glad to know whether it is possible to prescribe regulations so as to be astisfactory to any except the winners of the prizes P-and, if so, what are they, and how should such competitions be conducted P. Inclose you here-with a copy of the advertisement, and a copy of a printed circular issued to all applicants. A printed copy of the descriptions appended to each drawing, with a number substituted in the place of the name (where such was given), was sent to each competitor whose address was known; and a copy was hung up in the room, with the drawings and models. The whole of the designs were exhibited to public inspection in a convenient room of the Royal Muscum, Peel-park, daity, from July 18th to Junguis 21sh, hefore As this subject appears to have been considered by

inspection in a convenient room of the Royal Muscum, Peel-park, daily, from July 18th to August 21st, hefore the committee made any selection. The selected design, and the model to which the second premium was awarded, have remained open to public inspection in the exhibition-room to this date, having nover been removed from the room, notwithstanding your cor-respondent's assertion to the contrary. In this competition every member of the committee base here decisers of a dring with the createst furness:

In this competition every member of the committee has been desirons of acting with the greatest firmess; in proof of which I may mention, that the author of the selected design was personally unknown to myself and to every member of the committee; and when the selection was finally made, and the scaled covelope opened which contained his name and address (Mr. T. Holmes, architect, Bury and Manchester), none of the committee know him, or had ever heard of him, except that his name was the same as the architect's to whom: the orde hundred-ordiness mire had been except that his name was the same as to entruited: a to whom the one-hundred-gaineas prize had been awarded for a competition design for the Liverpool Free Library and Museum; and on further inquiry it was found that he was a Liverpool architect, who had heen some years in business at Bury, and that he had heen some years in Manchester, and was the author of the one-hundred guineas prize design at author of the one-hundred-guineas prize design at Liverpool. After the severe criticism by his hrethren in the profession, I think it would be ouly fair to the successful competitor, and a proper termination of this subject, by your engraving, for the benefit of your renders, the selected design for the Brotherton Mermorial. If you will do so, I shall be glad to fornish you with a copy of the original drawing for that purpose.* DAVID CHADWICK, Hon. Secretary of the Destructor Mermuilton

Brotherton Memorial Committee

Brotherton Memorial Committee. P.S.-I have made this communication solely on my own responsibility, and without consulting the committee of selection, appointed at a public meeting of the sub-scribers, consisted of the following genetimens --Stephen Heelia, esg, Mayor of Salford; Sir James Watts, Mayor of Manchester; Sir John Potter, M.P.; Sir Elhanah Armitage, J.P.; Mr, Alderman Kay, J.P.; Mr, Thomas Barley, J.P.; Mr, Alderman Higgins; Mr, C. H. Rickards, J.P.; and Mr. Alderman Langworthy, J.P.

THE CRIMEAN MONUMENT, SHEFFIELD.

THE CRIMEAN MONUMENT, SHEFFIELD. We have already printed the award of the referees in this matter. Let us add that the model to which the first prize has been awarded by the nupire is by Mr. Edward W. Wyoo, of London. As the site to be occupied is at the junction of three reads, the com-position is triangular. Its main feature, says the *Sheffield Ludependent*, is an obalisk, which, with a lofty base, would he 40 feet high. At the foot of the oheliak stands an angel, 11 feet high. The figure stretches forward, with each hand giving a wreath, designed to recognise the services both of our array and navy. At the back of the monument are dons significant of a tomh. On either of the two sides of the triangle are bas-reliefs, which it is suggested should consist of representations of Alma and Bomar-sund. At the foot of the obalisk, but not at the hase of the streeture, are canon and other military endoms.

The second prize is nwarded to Mr. Goldie, of the firm of Weightman, Hadfield, and Goldie. Its base is * This we will do .-- ED.

oetagonal. There are four ascents of steps, with four occagonal. Lucre are four escents of steps, with four histions interposed, each hastion supporting cannon. The pedestal has four faces, on each of which are has relicits representing Crimean actions. The names of the fallen are inscribed hencath suspended garlands on projecting battresses or plasters at the angles. The pedestal has its base moulded (with store seats Ou projecting ontresses or pinasters at the angles, The pedestal has its base moulded (with store seats between the hattresses), and its cornic sculptured with the national emblems. At the four angles over the buttresses rise square detached pedestals inlaid with marble, and having moulded hases and foliage capitals. These support niches earried hy marble shafts, and protecting statues 7 fect high representing the allied kingdoms. In the centre of these four nicbes rises the main feature of the design. Upon a cluster of coloured marble solutuns, with an octagonal granite shaft in the centre, is a large enopied niche. It is richly moulded, arched, crocketed, &c. with angels bearing the shields of the allied kingdoms in the pedi-ments of the eanopies, with lions on marble shaftlets supporting gilled vances at the angles. The canopy consists of a pyramidal store roof, hearing as its final the erown and or bo fingland. Beneath the groined of of this eanopy sits thorned upon lions a colosal female figure representing England victorious, resting female figure representing England victorious, resting on her half-sheathed sword and erowning ber heroes. on nor nan-sneamed sword aud erwang out nerves. It is proposed to adopt the portrait of the Queen as the head of this ideal figure. An inscription gene-ruly commemorative of the objects of the monument runs round the pedestal at her fect. The materials for this structure are Aherdeen granite, Comemara and Derbyshire narbles, and Darley Dele stone. We heliane the the competition here uput inscende adopted helieve that the committee have unauimously adopted the latter design as that which shall he erected,

BLACKBURN INFIRMARY COMPETITION.

More than severily designs have been received, we anderstand, and have been open to public inspection. Mr. Lang, to whose letter on the subject we have already referred, says, "A very few are excellent in their internal arrangements, superior indeed to any loopsital erected in this country. These evince great lahour and eareful study on the part of the archited, and a complete appreciation of the requirements of a receptacle for the comfort and cure of the sick. ... The erest maiority although very comment, and there

and a complete appreciation of the requirements of a receptacle for the comfort and cure of the sick. . . . The great majority, although very compact, and there-fore sitable for a mansion or a hotel, could never the adopted as designs for horizon the numerous sick without dropping their character as 'charitable institutions.' Pray let the huildings for the numerous sick without dropping their character as 'charitable as yon would the plaque, and hate a passage hetween rows of wards as I do hospital gangrene." Great complaints are made as to the manner in which the drawings are hung. One writer says, -"Five of my plans are missing, not exhibited at all, and one of the five lappeness to be the important. In addition to this, four plans of those which have charact to receive exhibition are hung in one place, and two in another. How, then, is it possible for public opinion to estimate one justly? Instead of my plans being hung in a series, here are four in one place, two in another, and five not to be seen. Nor an I alone haldly treated. Of soveral descriptions I notice palpable omissions. Of one I vaily endea-voured to find the ground plan." The editor of the *Preston Guardian* confirms the truth of these statements, hints at the exhibition of much undaïturess in the hanging, and colls upon the committee to refer the designs for selection to a small number of surgeous and architects, and accept their decision. We can scarcely believe a statement whigh has reached us, that the detision has already

their decision. We can scarcely believe a statement which has reached us, that the decision has already been made

A hazaar has been held in the town in aid of the funds, and has produced the handsome sum of 2,5007. A larger amount will be available for the building that was at first anticipated.

WELLINGTON MONUMENT.

WHILE reading Mr. Bontell's remarks upon the designs for the Wellington mouument, exbinited in Westminster-ball, I hoped be was showt to remove all doubt as to what kind of monument would be really suitable to perpetante the memory of the noble duke; for I conceive there must he much nucertainty of the muon this patie. If I may index from the average ² duke; for I conceive there must be much nucertainty felt upon this point, if I may judge from the various opinions which have been expressed. I was, however, much disappointed when I had read the description of his own design. In fact, I feel more assured that the sculptors are not so very far wrong in their notions of what a monument should consist of, as some of the critics suppose. It is manifest that monumental design should not usurp the place of history; nor should a monument be expected to record the events of a man's life. This is one fault in Mr. Boutell's design. It enters too much into detail, attempting to commemorate, it would scem, others as well as the duke. I should object also to a reelining statue, it heing a long worn out idea, repeated ad nauseam, conveying the idea of neither life nor death. I ask if the duke was ever known to he in the position and dress at the same time, as Mr. Boutcli would repre-sent him. If not, and often so, such a description must econvey a false notion of the man. Then his design could not be properly executed for the sum proposed, and if it could it would he much too crowded to he chaste and elegant. I agree with him that the moumment should be classical in its characthat the monument should be classical in its charac-ter, but I cannot perceive this in his design. What is the character which is snitable to St. Panl's Catheis the character which is suitable to St. Pani's Cathe-dral? I reply, by saying that most of the hest monuments there already are suitable to the huilding, and that nothing hut want of taste and ignorance could have denounced them, as some critics have lately done. I believe that no man now living has a better notice of white a mourment outbut to he than http://www.intervertient.no.main.now.interverting has a better notion of what are monument ought to he than Flaxman had; and what do we see in his designs? A grand outline of the person and character of the deceased, as they appeared in the life. All little matters, such as trilling events, family descent, &c. are regarded as unworthy of the one grand idea. With this groundwork a lesson should be taught to With this groundwork a fession should be taught to the living: and I cannot hut think that the lesson the duke's monument should teach, may well be founded upon the motto of his own coat of arms, 'Virtuits fortuna comes,'' i- D. H.

THE SANITARY STATE OF CLERKENWELL.*

-

THE population of the parish of Clerkenwell, in 1851, was 64,778, and at the end of 1856 is esti-mated to have heen between 60,000 and 70,000. The number of poor in the district is large, the population heing almost entirely engaged in manufacture. Coster-mongers, in considerable number, here live in the midst of dirt and filth, intractable in sickness, and a pleutiful source of metropolitan thieves and ticket of leave men. They spend the least possible money in rent, and hence live in the most wretebed hovels, quite nufit for human habitation. The other sanitary conditions under which they are placed are equally conditions under which they are placed are equally had. The number of inhabitants per arer in the dis-trict, is about 180, which is by means so dense as various other parts of the metropolis, such as St. Giles's, 221, or East London, 290. The number of houses in 1851, was 7,549, giving eight persons to each house. To have preserved this relation, 647, par houses output to have preserved this relation, 647 of nonses in 1994, was porty giving output provide the real to each house. To have preserved this relation, 647 new houses ought to have heen built by the end of 1856; but while very few have actually been receted, many have heen pulled down, so that the district is many have heen pulled down, so that the district is more crowded than in 1851; and many of the houses are close and crowded, as in courts, ill-ventilated and extremely dirty. Walls of rooms covered with stains of destroyed vermin are quite an ordinary sight. Drainage there is either none, or it is very imperfect. The soil is saturated by foul cesspools evolving the most offensive odours, and sometimes there is but one closet for fifty or 100 persons; ofteo none at all. In some houses donkeys occupy the lower rooms and hnman beings the upper. Two-thirds at least of the houses in the district are de-scribed by the medical officer, from whose report we scrihed by the medical officer, from whose report we quote, as heing in an unsatisfactory state in regard to such particulars as those instanced. Even were many of the houses eleaned, they would be quite nnfit for

of the houses eleaned, they would be quite null for human habitation, being so small and eonfined. "It seems," remarks Dr. Griffith, "as if there were some difficulty in general in providing proper dwelling-honses for the poorest elasses. The model lodging-houses and model huildings are beyond the reach of the very poor. What we require is the pro-vision of two rooms, at a rent of hetween Is, and 2s. This of two rooms, at a rent of netween 18. and 28. per week. Why does not some philanthropic indi-ridual organize a company to provide these? If the present dwellings of the poor were in a more perfect sanitary state, more rent would he obtained than at present, even if the charge were less; for the inter-untion to employment correspondent with new dott present, even it the charge were icss; for the inter-ruption to employment, occasioned by sickness, death, and burials, arising from their wretched condition, would be done away with. Onesmall model lodging-house exists in the district; hut the rent of the apartments (5s. 6d. and 6s. per week), is too great for the poor to pay." The New River water forms the general supply of

The avent diver water to me one general supply or the district, and on the whole this is, perhaps, one of the hest kinds of water to he had as yet in London. The amount of organic matter in it Dr. Griffith considers to he as small as possible, and the water is clear and sparkling when filtered, as in the New River Teservoir. He, therefore, does not agree with the Board of Health report of its impurity. No article of dict, he remarks, is absolutely free from impurity— a slice of the finest hread contains millions of fungi— the entomostrance are **bat** minute lobsters which die as soon as they enter the stomach, or if hoiled, they hecome red, and are undouhtedly nutritive. This is

* General Report upon the Sanitary State of Clerkenwell for 1856. By J. W. Griffith, M.D. Medical Officer for Clerkenwell; printed by order of the Vestry.

precisely what we semi-seriously nrged some time since, while speaking of the New River water. The very air we breathe abounds with the germs of the lower plants and animals. Microscopic organisms taken into the stomach, nrges the reporter, have never heen known to exert any injurious action on the human health. Living animalculæ, too, have the merit of consuming the dead and decomposing organic matter which would otherwise abound in almost all water,-even in distilled water exposed to the air. The quantity of the New River water, however, is still miserably deficient. The company refuse to sum macratic densities and the company reduce to transmit a more frequent supply, and insist that the landlords of the dwellings of the poor ought to pro-vide larger eisterns. Doubtless they ought, but the company ought also to give more frequent supplies, company ought also to give more request supplies, and the failure of landlords to supply some thousands of larger eisterns only renders it the more essential that the company should do their duty. The report of Dr. Griffith, on which the present article is based, is an elaborate document, which treats of more entired a contract with the walfows of the

of many subjects connected with the welfare of the district of which he is the medical officer, such as its manufactories, its slaughterhouses, cowhouses, and manufactories, its singular nonses, cownouses, and other nuisances, the sickness and mortality of the district, its edihles, the state of its churches, &c. &c. During the year 1856, 350 missances had heen remedied, such as choked up drains cleared out, offensive cesspools filled up, fond bones, &c. removed, But it would have four years the growther adde at this But it would take ten years, the reporter adds, at this rate of diminution, to remove all the enumerated and specified nuisances which still exist in Clerkenwell

DOINGS 1N WISCONSIN.

A NEW theatre, called the "St. Charles" theatre-was recently opened at the Market Hall in Mil-wankee. Messrs. H. Friend and Brothers, of East Water-street, in that eity, have crected a new iron front huilding to their commercial establishment. The La Crosse and Milwaukee R-ilroad has heen opened to Columbus, and the Milwaukee and Horicon been to Colomba, and the aniwance and Horcoo line extended to Berlin. Sheet-iron cars, eushioned inside, are io use on the Baltimore Railroad, and in one instance, one of them, loaded with eighty barross of four, was precipitated down a steep embankment of hour, was precipitated town a seep throaden. Job without doing it material damage. The village of Horicon has gained 800 in population within the lost year. Nine miles of track of the Watertown and Madison Railroad are laid, and eleven more and Madison Rainroad are may, and cleven more ready for the iron: the entire road to Hanchet-ville will soon be in efficient operation. The Directors of the Fox River Valley Railroad Company are about constructing the line from its intersection with the Milwankee and Belvil Railroad, near Harrisburg, to its Milwankee and Belvil Railcoad, near Harrisburg, to its junction, at the State line, with the Fvx River Valley Railroad of Illinois, a distance of thirty-two miles; Mr. Charles Paine, engineer. Martiu's celebrated pictures of "The Last Judgment," "The Great Day of His Wrath," and "The Plains of Heaven," are heing exhibited at Milwankee. Three palatial resi-dences are in process of huilding at Madison, on Puckoey-street, near Mendota side; one for Alder-nean Yan Sleka built of Milwankee briek and man Van Siyke, built of Milwaukee briek and Prairie du Chien stoce, to cost ahout 15,000 dollars; that of Mr. McDoald wholly of sand stone, at least 20,000 dollars; and that of Judge Cole, mosily of Milwaukee brick, something like 4,000 dollars. The first two were designed by Messra. Doonell and Kotzboek of that eity, and the last by Backus and Brothers of Chicago. A fire on the night of the 5th of September destroyed a manufactory of Messrs. Sawyer at Fittsburg, and property to the amount of 12,000 dollars, whereas insurances were hut efficeted to an amount of 4,000 dollars, and which fulls on the local offices. Gray's tannery at Chicago was hurned lately at a loss of 40,000 dollars, insurance Van Slyke, built of Milwaukee briek was nurned lately at a loss of 40,000 (lolars, lisurence 12,000 dollars. Rembrandt Peale, the distinguished artist, and the only one living to whom Washiogton sat for his portrait, is now in his 80th year, and living at Boston : he visited Europe in 1809, and painted Thorwaldsen. The new church of 8t. Demas and 8t Dires was concard on the first Sunday in 12.000 dollars. and St. Dives was opened on the first Sunday in September: a few of its published recommendations are very ludierous, and we note the following from the "Evangelist Journal." "The liberal construction of the pews in regard to size is intended to accommodate the pews in regard to size is intended to accommodate the prevailing expansions in the matter of *feminite* costume; and they will be furnished with moverble antique chairs, enabling occupants to direct their vision to any part of the charch; and those of an inquiring mind to inform themselves as to the regular attendants at church. An honour entitled the 'Drivi-legium Ecclesia' is conferred on certain subscribers of 500 dollars per annum, who have the right of entrance and exit by a private door most enriously constructed, leading into a beantifully furnished apartment communicating with the main entrance; and by which means persons of nice and refined tastes and hy which means persons of nice and refined tasks, may avoid the crowd and dust consequent ou a large congregation, &c. &c. The worthy doctor (Good-

as-the-hest) insists that a short nap is admissible and preferable to an unequal combat with Morphens; and therefore the antique chairs above alluded to are provided, and so constructed as to afford every facility for its enjoyment uninterruptedly."

NEW STREETS IN SUB-WAYS.

THE Metropolitan Board of Works having disap-pointed the expectation of the public during the first eighteen months of its existence, the inquiry arises, Why is it so?

This is a Board composed of gentlemen selected from the various districts they are authorised to improve, especially the streets. it is to carry out new views in our old capital, with active determination to accomplish them promptly, and without delay. But instead of examining the new proposals for improving the streets, the whole generation of surface paring has poisoued the deliberations of this Board, and nothing new or modern is properly attended to. Of course, sub-ways are not to be considered of for a moment, because there is too much in them that is new. So that gas and steam could have had no place in their assembly; and Mr. Rowland Hill's admirable plan for posting letters would have heen lost.

This old leaven must give way to the progression of science, and modern intelligence must win the day. We do not now want old worm-out fooleries,—no oil We do not now want our worr-our looseries,—no oil to light the streets, or horses to draw earriages on roads. This Board must keep pace with the times, and accomplish improvements they were established to introduce, hy new plans for new periods. My experience with the Metropolitan Board of Works is a decided case of the truth of these remarks, is the fact of their blick performance for add factioned

in the fact of their blind preference for old-fashioned ideas. If y cannot forget them, and forsalt them they will not, until the folly of referring to them is too ma.nest to be longer continued.

too maximum to be longer continued. After some previous communications with the Board, I wrote a letter, in May, 1856, somewhat his-torical of sub-ways, with reflections on the difficulties at that moment attending their introduction into London, an extract from which is here given :--

"The rise and progression is are gradient of the superior of the superior of the superior of the streets of London, and all large commercial forma, from the stoppages in them, for access to the pipes in the ground, and to the sewers, which called for a

remedy. This presented itself to me in 1817, hy the conthem, without opening the ground and stopping the therm, without opening the ground and stopping the

This invention was acknowledged by the public and all scientific men to he quite sufficient for preventing the stoppages in the streets. The full account of this I published in a volume,

and dedicated it to the king. Since this patent was obtained, the beautiful inven

tion of railways has been established, which has largely increased the importance of sub-arches. The construction of sub-arches in streets was, pro-

the work of the Government, under an perly, the work of the Government, under an Act of Parliament; but at that period there existed a Board of Sewers, consisting of ahout 800 nohlemen there with a purpersus Paying and gentlemen, together with numerous Paving Boards, of two or three thousaud influential men, throughout the metropolis. All of these would be interfered with, should sub-arches he made; eon-sequently the ministry and a state of the second sequently the ministry could not stir in the matter at that instant.

that instant. Iu my volume on suh-ways, at page 424, I sug-gested the entire aholition of the Sewers Commission, and of the numerous Paving Boards." This hold suggestion in 1828 has since then been adopted. There now are no Commissioners of Sewers, and no Act of Parliament Paving Boards: they are all gone

But this letter, in May 1856, having new matter, has received no attention from the Metropolitan Board of Works! No inquiry was made into the subject as to the merit of it, or any investigation into the truth of its statements !

Having showo you, sir, how the past has been em-ployed for improving the streets of London, and paviog got rid of the ohnoxious sewer commission; also of the many-headed commissions of London also of the many headed commission; paving; what remains to he done for the completion of the work?

There still is a difficulty, a considerable difficulty, There still is a dimetility, a considerance of industry, which exists in the very system itself; in a fondness for old plans, however erroneous and bad. This system must give way to modern views and enlight-caed knowledge: this corrupt system must be abolished and the schoolmaster come forth to plant usefulness its our wenceding, which has a long here lost into our proceedings, which has so long been lost sight of, to the hindrance of our progress. This is the holdest of all the proposals to improve the streak of Londow

the streets of London. What! destroy the system itself, which has directed

the management of the streets for so many years? Yes; because it is a had system, and the streets are in a shameful condition as to their capacity to receive the erowds who throng into them. They are all on the old plan of surface paving, which would do: better one must be substituted. The method of making new streets upon the surface in old eitics, by rulling down houses and accountifue treat urous to subling down houses and pulling down houses and committee in out energy pulling down houses and committing great wrong to the inhabitants, must now give place to the modern plan of making subway streets helow the surface, which will benefit all and injure none.

This can be done by the Metropolitan Board of Works, whose powers, under their Act, enable them to do so. JOHN WILLIAMS.

CHURCH-BUILDING NEWS.

Leicester .- A considerable addition has lately been Letester.—A considerable addition has lately breen made to Gallowire-egate chapel, icelester, by the creation, in the rear of it, of a huilding of two stories, the lower one intended for a Sunday-school for boys, and the upper for an infants' and girls' day-school. Two class-rooms adjoining, for elder scholars, are also provided, and below these ministers' and deacons' rooms

Chelford.-Messrs. R. B. Edmundson and Son, of Chefford. — Aresists it D. Latinuitson and Son, or Manchester, have just finished a stained-glass window for Chefford parish church, Cheshire. It is of three lights, and about 12 feet high. The subject of the window is the birth, erucifixion, and ascension of our Saviour, and the whole will be surmounted with tracery. At the bottom of the window is the followtracery. At the holtom of the wholow is the follow-ing inscription, which records to whose honour, and by whom it was erected :—" In gloriam Dei. Pre-sented to the church out of regard for John Diron, esq. by his tenants and neighbours. Anno Domini 1857." The window is to he placed in the new chancel, and on the sides there will be four single-thet honor window cho set stained here new merlight lancet windows, also of stained glass, one repre-senting Faith, and the others filled with ornament. Messrs. E. and Son have since received a commission to execute two windows for Manchester Cathedral

Chesterton (Newcastle-under-Lyne) .- A Wesleyan hapel, the corner-stone of which was laid on the Chesterion (Neucassic-inner approximate and the Chapel, the corner-stone of which was laid on the 19th of May last, is so far completed as to he now open for public worship. It is is the Gothie style. The structure was designed by Mr. Robert Edgar, of Steke; and the work has been carried out by Mr. John Sale and Mr. James Sale, of Chesterton. Colessfull.—The church of Colesbill is about to be restored at the expense of the view and his brother, Mr. Digby of Sherbourne Castle, in Dorsetshire. The cost will be 6,0007. The church is to be restored will be 6,0007.

Testored at the expense of the view and his bother; Mr. Digby, of Sherbourne Castle, in Dorsetshire. The eost will be 6,0007. The church is to be restored after the manner of Trinity Church, Coventry. There are to be no gorgeous pews for the rich, nor sit-tings near the door for the poor, but the pews are to be open and free, with enshinons and hassocles in all. The readers of Enclish bistory will know that it was be open and free, with cushions and hassocks in all. The readers of English history will know that it was in the churchyard of Coleshill Oliver Cromwell planted his cannon and sent forth his thunderbolts against Maxtoke Castle, now in the possession of Mr. John Fetherston Dilke. Baldersby.—The Church of St. James the Apostle, Church and and and and and her the htt Lord

Baldersby, --The Church of St. James the Apostle, at Baldersby, erected and endowed by the late Lord Downe, with ecmetry attached, has been consecrated by the Archbishop of York. The church, which is situate midway between Baldershy and Raiaton, and about an equal distance of five miles from Ripon and Thirsk, bus on the side of the west end a tower and spire 160 feet high, and is visible from a considerable distance. The style of architecture is the Early Decorated. The architect was Mr. Batter-field. The east window, of stained glass, represents armorial bearings of the founder, and the families to whom his ancestors have been allied. The chancel is lined with nabaster, and on the floor in front of the choristers' seats is a slab of white marble, inlaid with brass, in memory of the founder. In the place of

choristers' seats is a slab of white marble, iulaid with brass, in memory of the founder. In the place of pews there are open benches and ecclesiastical chairs capable of seating considerably more than 500 per-sons. A peal of eight bells, by Taylor, of Lough-brough, is placed in the tower of the church. *Doncaster*,—The foundation-stone of St. James's Church, Doneaster, according to the local Gazetts, was laid on the 1st inst. The contrast, undertaken by Mr. Wilson, of Grantham, is for 4,000. The area of the edifice, asys the paper just named, "is almost the same as the nave of St. George's, Don-enster, though the dimensions are different, St. James's being 113 feet hy 52 feet, while the nave of being 113 feet by 52 feet, while the nave of St. George's is 643 feet wide, but only 91 feet long. Not only has the church the same architect as St. George's, but the same clerk of the works is to St. George's, but the same clerk of the works is to be employed. The contract is entered into with the chairman of the company, but it is understood that he is represented for all practical purposes by his son, Mr. E. B. Denison, Q.C. who, in the first instance, suggested the general design of the church, Mr. Scott, of course, undertaking the architectural details."—The first memorial window in the new

parish church has been completed. It is erccted (in the south aisle) by the surviving brother of the Rev. H. Cape, for many years head-master of the grammar school. The window consists of three compartments. 11. Cape, for many years head-master of the grammar school. The window consists of three compartments. The design is the production of Mr. W. Holland, of Warwick. In the tracery there are six different representations, that at the top being "The Holy Father," and immediately below, on each side, "Angels, with harps in their hands." Across the centre, are oak, vine, and thorn leaves, and the base is occupied at each end by two angels bearing motions." In the middle is an angel bearing a rown of glory. In the "Consecration of the Temple," King Solomon is seen standing before the altar invoking the helssing of God, surrounded by priests and the children of Israel. Above is "David despisia." The side light on the left is appropriated to the representation of the prophets Isaaia and Jeremish, and David skying Goliah ; whilst the opposite one contains the prophets David and Exekiel, the historical scene being "Stime's structure at Rychill, Gesigned by Mr. Beighning Green," asys this authority. "promises to be one of the Rych and Structure and the structure and the structure and the structure and the structure at Rychill, Green Structure and Structure and the structure at Rychill, Green Structure and Structure and Structure and Structure and Structure and the structure at Rychill, Green Structure and Rychill, Green Structure and Structure and

Green. " says this authority, "promises to be one fluest architectural works of the ancient of the fuest architectural works of the ancient town of Newcastle. With its steeple (uot yet com-menced), it will be nearly 200 feet high; and when, in addition to the hospital (already build), the school and master's mansion mer reared, and the grounds (about four acres in extent) are laid out, the eye will have few spots in Newcastle on which it can rest with more pleasure. We would particularly draw attention to the sculptured work of the church, excented with so much softness and feeling in the ordinary freestone of the local quarry. The whole hears the impress of thought and taste. If has that indescribable charm which is communicated to rude stone by a refined through and taste. It has that indescribing charm which is communicated to rude store by a refined mind and a cunning hand; and the Chirch of the Virgin will survive in after ages, to hear, witness that art was not degenerate in our own. The sculptors are, we believe, Lincolnshire men of the name of Peele."

Kelso.-The Kelso Chronicle states that the erection of a new Roman Catbolie chapel in this town will be proceeded with immediately. The site will be on be proceeded with immediately. The site will be on ground belouging to the Roman Catholies at the head of Bowmont-street. The contractor is Mr. Black, of Kelse

Kelso. Myth (Perth).—The consecration of St. Ninian's. Church, Alyth, took place on the 16th nlt. It had been recently creted by four of the congregation, at a cost of 1,500. It is built on a site, comprehending a burying-ground granted by the Earl of Airlie. It is seen on entering the village from the south. The style is Norman; the architect, M. Bryce, of Edinburgh; the contractors, Messrs. Kinmont, mason; Macintosh, corrector, and Walker, alter. The adverbe cougits of a is Norman; the architect, bit hype, or analysis, the contractors, Messrs, Kinnond, masson; Maciatosh, earpenter; and Walker, slater. The church cousists of a nave and semicircular ape, extending about 70 feet in length and 40 in breadth, with a vestry on the north side, and on the couth a porch surmonted by a tower. It has an open timber roof, which, together with the open benches and the rest of the woodwork, is deeply stained ; the whole of the floor is paved with encaustie tiles.

CHURCH-BUILDING NEWS FROM WALES

CHURCH-BUILDING NEWS FROM WALES. *Llanfair-yn-Eaboll.*—The church here has been re-opened, after having been restored. It is situated within half-a mile of the Valley station, neur Holyhead, and now forms an object visible to the travelling spec-tator from the Chester and Holyhead Railway. The church is in the Tbird Pointed style. It consists of a single nave, 47 feet 6 inches long, by 20 feet wide, outside the walls. The western gable is surmounted by a bell-cot or turret. The church, by the restora tion and re-arrangement effected, has been made to necommodute about 100 persons, at a cost of about 250. In the principals of the roof, the eurred pieces are continued from the collars downwards, in the thickness of the walls, to within 2 feet of the ground. The other timbers of the roof, together with the slates, have been entirely renewed, and in the north, and south walls, new square-headed windows, ground. The other timbers of the roof, together with the slates, have been entirely renewed, and in the north and south walls, new square-headed windows, with foliated lights of the Third Pointed period, have been inserted. The east window has been dressed over, and the upper compartment filled in with stained glass, representing the lamb and banner. The whole of the internal fittings have been replaced with more uniform ond commediance sittings of dual stained and of the internal fittings have been replaced with more uniform and commodious sittings of deal, stained and varnished. The architect employed was Mr. H. Kennedy, of Bingor, and the contractors were Messrs. Idoyd and Co. of Llanfair yn-Eubwill. *Chepston*.—That portion of the Chepstow cemetery appropriated to the members of the Established Church has been concerned by the Bichon of Llanda".

appropriate to the members of the Dischord Dandall. This has been considerable portion of which has been con-naise of Mathern, and consists of five or six acress of ground, of Mathern, and consists of five or six acress of ground,

with a porter's residence at the entrance. Passing with a porter's residence at the entrance. Passing through the entrance-gates, up a centre drive towards the chaptels, on the left is the ground appropriated to the Established Church; on the right, the unconse-crated part. The main building is placed near the centre of the ground, and consists of two chaptels and vestries attached, with an archway connecting the whole. The chaptels and entrance-lodge are hull with native Blue Lias, and Bath stone dressings, in the Middle Pointed style of architecture,—both chaptels being nearly alike. The internal fittings are of deal, stained and varnished, and the timbers of the roof are stained and show below the ceilings. The build are stained and show below the ceilings. The build-ings have been erected from the designs and under the superinteudence of Mr. S. B. Gabriel, architect, and the ground laid out from the plans of Mr. Fenton

superintereduces of Mr. S. D. Ganner, architect, and the ground haid out from the plans of Mr. Fenton Hort, of Hardwick Honse, Chepstow. *Merthyr-Dowan*, -On Monday, the 21st ult. the parish church of Merthyr-Dovan, near Wenvoe, after heing restored, was reopened by the lord hishop of the diocese. The celebration of this event was attended by a large congregation. The church is an example of the local Welsh type of a village church, and con-sists of a nave with western tower and south porch and chaneel, of the Perpendicular period of Gobie architecture, with a few fragments of earlier work. The charic had fallen into a lamentable state of decay, absolutely unfit for the performance of Divine worship. It has been restored by Messrs. Prichard and Seddon, the diocesan architects, at a cost of about 427. The original ehrareter has been presser of, the diaplidated 'portions of the walls having '-- archuilt with more additional windows: the roof of the nave is entirely new, and the several gables have here neoped with additional windows: the roof of the nave is entirely new, and the several gables have here coped with stone, and provided with crosses. The chancel has been refurnished with a vested altar-table standing upon a foot-pace, with stalls for the officiating clergy, and screen at the chancel areh, with a lectern. The nave is furnished with chairs made for the purpose, and a temporary lectern for a pulpit, and the old stone font-bowl has been mounted upon a new base and steps, and fitted with an oak cover, with ornamental wrought fromvork: the bells have been rehung in the tower, and the charehyard put into good order, with the surrounding wall repaired, and new oak gate. *Felin Fole* (*Llanelly*). — The new church at this

Velin Vole (Llanelly). — The new church at this place (dedicated to the Holy Trinity), is now nearly completed. The edifice, says the *Cambrian*, is of a eruciform plan, consisting of nave and chancel, north place (dedicated to the Holy Trinity), is uow nearly completed. The edifice, says the *Cambrica*, is of a cruciform plan, consisting of nave and ehancel, north and south transepts, south porch, and vestry on the north side of chancel: the space between the west end of vestry and the east wall of nearly transept, which is now left open, will breatter be formed into an organ chamber (for which preparation is made in the construction), with arches in the transept and chancel walls for the sound to pass through into the body of the church. The external dimensions from west to east, exclusive of the projection of buttresses, are 102 feet 6 inches, by a breadth of 24 feet 6 inches, and the extreme wild hacross the transept is morth to south, is 54 feet 6 inches. The tower, which is at the junction of the nave, transepts and chancel is of the full wildt of the building, and is carried up a few west to east, exclusive of the projection, making a total beight of 105 feet from the ground to the top of the vane. The timber work forming the spire is con-structed on framed transers resting on the lower walls, and these trasses or principals are attached and bolted to open arched framing, which is supported on Bath stone corbels built into the tower walls. These arched rises of framing, are exposed to view from the doors and windows, porch, & are of Bath stone. The whole of the roofs are covered with Staffordshire tiles. In the east wall of the chancel is a 3-light window, filled in with painted glass. The subjects are " Faith, Hope, and Charity," represented by female figures, each occupting one light, and in the travery of the upper part of the window are the Agnus Dei, the Holy Spirit represented by a dove descend-ing to the earth, and other emblems. The windows at the west end are also of painted glass, of a seroll pattern, as also the small windows in the upper part of tower. All the remainder of the glass is of a vellewish tint. There heag 23-light windows of varied composition in the gables of north and south transe varied composition in the gables of north and south transcpts. The root finihers are wrought, exposed to view, and stained and varnished. The scats are open throughont. There is accommodation for about 320 persons, including seats for children, which hold about 100. The pulpit and foot are of Bach stone, The passages and the chancel are floored with Staf-fordsbire paving tiles, and the church is heated with hot air. The work has been excented from the designs and under the superintendence of Mr. K. K.r.k. Pouson of Swansea at a cost of about

whole of the work has been executed without contract or contractor, Mr. Richard Nevill, of Velin Vole, having devoted much time to a supervision of the works, in order that the architect's design might be efficiently carried out; and the arrangements made, adds the *Cambrian*, have resulted in a satisfactory completion of the structure -- much credit being due to the local mechanics who have been engaged on the work. Her Majesty's Commissioners for Building additional Churches contributed 100% towards the additional Churches contributed 100% towards the funds, and the Incerporated Society for the Bailding and Balargement of Churches and Chapels made a grant of 150%. The style of arebitecture adopted is of the Early Decorated period. The consecration will take place about the middle of this month.

PROVINCIAL NEWS

Whittlesey.-The town-hall of Whittlesey has been re-creeted, from a design by Mr. R. Rowe, of Cam-bridge. The building has been carried out hy Messrs. Bennett and Son, of Whittlesey. The style is Modern Italian, and the material white bricks, with moulded brick dressings: the tympanum over the entrance-bane in cf. Wintersch the

brick dressings: the tympassion door is of Minton's tiles. Dundry.—The huilding of new schools for this parish has been in progress during the summer, and the 29th ult. heing the festival of St. Michael, the Secol mon as suitable for the 29th ult. heing the festival of St. Michael, the patron saint of Dundry, was fixed upon as suitable for The schools, huilt from the design of the opening. B. Gabriel, of Bristol, consist of one room Mr. S. B. Cabriel, of Bristin, consist of one from, 36 feet 6 inches by 18 feet; eless-room adjoining and master's honse attached. They are in the Gothic style of architecture, and cost about 7507. The dif-ferent works bave been completed by the several contractors, Mr. Broad, of Winford, Mr. Weeks, of

Chew Magna, and Mr. Henry Milson, of Bristol. Whitehaven.—At a recout meeting of the White-haven Town and Harbonr Trust, Lord Lonsdale said the trustees at previous meetings had determined to erect a floating dock, hut some difficulty existed on to erect a floating dock, but some difficulty existed on account of the money. They were authorized to borrow to the extent of 130,0007, for an unlimited period, but of late years, since railroads and extensive docks were heing constructed, people had hetter oppor-tunities of investing their money, and for short periods, than when the Act was passed. It is would therefore ask the consent of the nuceing to a resolu-tion, that samilastion hereds to Parliament the next. tion that application be made to Parliament the next session for an Act authorizing the trustees to borro money on the credit of the harbour dues, ou security repayable at such periods as may be agreed upon. The resolution was maintonally agreed to. The serr-tary read a letter from Messra. Rendel, stating that during the operations connected with the making of a new wet-dock, &c. they would expect a salary of 3007. per aonum, exclusive of all actual travelling and other expenses. They also proposed to charge 500% for the expenses. They also proposed to charge 500% for the drawings and sections which the works would from time to time require. The chairman considered 500% too large a sum for the working plans, and it was moved that a committee be appointed to confer with Messrs. Rendel respecting their charges. Mr. Burdh was instructed to proceed with the quarying of stones. stones.

stones. Sunderland. — The Gray Schools, which were founded in 1823, having been found inadequate to meet the pressing demands of the populous district in which they are signated, have been rebuilt. The old premises have been sold, and the money realized by heir sale being added to private subscriptions, and their sale being added to private subscriptions, and agrant from the Privy Council on Education, has en-abled the managers of the school to provide accounto-dation for 500 children, viz. 250 boys and 250 girls, with a master's residence attached. The site occupied by the new buildings is the north-west ancel of the with a master's residence attached. The site occupied by the new buildings is the north-west angle of the Sunderland Town Moor. Each school consists of three rooms, one of which communicating with the other two is fitted up with a gallery, and need as a class room. A play grown!, play-shed, and lavatory, &c. are attached to each school. The character of the building it Eachiel Constitute of the school of the huldings is English Domestic of the middle of the thirteenth century. The work has been executed by Martings is Joineste of the induced and thirteenth entity. The work has been excerted by Mr. Alexander Thouson, of Sanderlant, from the designs and under the superintendence of Mr. Austin, of Newseatle, architect. The amount of the contract, including all the school-fittings, &c. is 2,400/.

WORKS IN IRELAND.

Dubling St. Joseph's (R.C.) Institution for the Deaf and Dumb at Cabra, designed by Mr. Chrises Geoghegran, architect, and built by the firm of Bear-wood, Brothers, is now nearly completed. It stands in the centre of a fertile and well-enclosed tract of between fine and its mean is not a distribution. in the centre of a fertife and wate-actioned that of consists in simplicity with regard to consists in simplicity with relation to the modern style, being lofty and the north or front side is covered over with plaster, beautiful suburb hounded by the Cabra road and the showing the principals. The pows have carved Gothic Surely the parishioners of St. Mary Major only high road to Navan. The building is in the Tador hench eads, and are without doors. The windows, of require to have their attention directed to the im-style. It is constructed of solid granite masory, which there are as in either side, are glozed with proved appearance of St. Lawrence's Church, to and rises to an elevation of three lofty stories, inde-pendent of the basement. The front, which faces

due south, is relieved from all sameness of aspect hy of the chapel have borders of various coloured ornadue south, is releved from all sameness of aspect by pinnacled gable tops, and by rounded turrets at either end. The windows in each story are faced with red hrick, with corhels and mouldings, after the fashion of the old French chateaus and English manor-houses. The chimneys are made to subserve a decorative pur-The entranceys are made to subserve a accorative pir-pose, heing highly ornamented, and the turrets, when complete, will be crowned by machicolated battle-ments. The front entrance is approached from what will be a spacious lawn. The ground rises gradually to a terraced embankment in the front, allowing of a wide arrang heftore the creat most which is eminal wide sweep before the great portal, which is gained hy a flight of steps, adorned with balustrades in cut ay a new of steps, normal with calustrates in granite. The central portion of the building is l out specially as the conventual dwelling of Christian Brothers Community. It is complet laid constant promers community. It is completely apart from the section of the house appropriated for the deal-muts inmates, yet intimately and imme-diately connected with the asylum department, through the medium of entrances reserved solely for the transit of the community. The school-rooms, chapel, refectory, &c. where the children will be con-stantly under the care of their teachers, are entered by doors leading to the turrets of which we have spoken. These turrets rise to the full height of the huilding, and each encloses a self-supporting geome-trical expined tempers of slows with headings and huiding, and each encloses a set-supporting geome-trical spiral staircase of sloce, with landings and doorways opening into each story. After passing the entrance-ball, there is a long corridor traversing the entrance-ball, there is a long corridor traversing the entrance ball, the bailding. At one end of this corridor, to the left, is the great school-room, some (and, indeed, all the ethers) is fully 20 feet in height, the ceiling crossed by iron girders, above which is hid the jointed and variabled floor of the apartment above. At the other extremity of the corridor is an apartment of equal extent with the school-room. This will be need as the chaple of the institution until the committee shall he enabled to creet a more suit-able edifice. It is already in course of de-oratioo. The intermediate space on this floor is occupied by meeting-rooms, library, &e. of the hardtherbod. trical spiral staircase of slone, with landings aud meeting-rooms, library, &c. of the hrotherhood. Ascending a staircase to the next floor, there is a long corridor, as below; and at either end, over the schoolcorridor, as below; and at either end, over the school-room and chapel, are two domitories, capable of huding thirty heds each. The intermediate space is orcupied by the cells and oratories of the community. There are glass doors at each end of cach corridor. The children have no access within these doors. The upper floor presents a precisely similar arrangement, and there are attice store-rooms, &c. The basement story contains the grand refectory and the suite of kitchens and offices at the other end of the lower cor-ridor. There is a wide shoot or passage unade in the There is a wide shoot or passage made in the ridor. ridor. There is a hot and cold hathing department, wherein the haths are constructed on the newest principle

Portrash.—The ceremony of laying the founda-tin-stone of an obelisk to the memory of the late Dr. Adam Clarke was performed by Mr. James Johnston Clark, M.P. at Portrush, on Mouday before Johnston Clark, M.P. at Portrush, on Monday before last. The B.Hast and Ballymena, as well as the Lon-dorderry and C Jearine, and the Ballymena and Port-rush Railway Companies, having reduced their fares coas derably on that occasion, a great number of persons, says the *Coleratine Chronicle*, aveiled them-selves of this opportunity to with ss the cerem ay. The obelisk stands at an angle of two reals-midway between the Hurbour and the Railway Terminus-ou an elevated plot of the ground on which the late Dr. Adam Chrke hinself built a school-house, which is still standing and well attended by children. The belisk will have a base *T* fort square and 8 feet high, from which the monument will rise to a height of 42 feet, which will, taking into consideration the de-vation of the site, give it a mean altitude of at least vation of the site, give it a mean altitude of at least 120 feet above the level of the sea. Close to the base of the obelisk will stand a life-size statue of Dr. Clarke, contributed by his American admirers. The Clarke, contributed by his American admires. Lie de pel to he eracted at Portstewart is from a plan hy Mr. W. J. Barr, who is also the architect of the ohelisk. Mr. M'Laughlin, the builder of the new Town-hall at Coloraice, is to build the moviment.

Tuam.-The foundation-stone of a new Town-hall has been laid at Tuam. Mr. James J. Boylan is the architect, and Mr. A. Egan the huilder.

Omagh.—The opcning of the New Wesleyan Chapel at Omagh took place on the 25th ult. It is situated in the west end of the towa, immediately beside the site of the former chapel. The design of the building is Gothie in style, and the principal feature consists in simplicity with regard to detail. The roof is constructed in the modern style, being lofty and

mental patterns. There is a hisement story, con-sisting of school and committee rooms. The contractor was Mr. William Mullan. Wexford,-Tae first stone of the Crimean Monu-

Wesford,--Tee first stone of the crimen aroun-ment was haid on Thursday, the 8th iost, by his Ex-cellency the End of Carlisle. The site fixed for the monument is at Ferry Carrig, near Wexford, on the ruins of King John's Castle or Cont, and opposite Fitzstephen's Tower, the first castle hull by the English in Ireland. The monument is to he creeted Fitzstephen's Tower, the first castle huilt by the Euglish in Ireland. The monument is to be creeted to the memory of the Wexford men who fell in the Grane of one of the old Irish round towers. Some of the cannon captured at Sebastopol are to be placed at its hase, and the names of all the persons who fell belonging to the county engraved on the round tower. The castrole all scored rate the histefully idented The grounds all round registric on an explanated Mr. Willis is the architect. — Four statued glass windows by Hardman and Co. have been set up in the church of the Lumaculate Conception here. The great cast window has seven lights and tracery. In the centre light is represented the Crucinsion of our Lord, with figures of the Virgin, and St. John the Evangelist, the Holy Ghost descending from above, Evangelist, the Holy Ghost descending from above, and angels weeping, surrounded by figures of fifteen saints, standing upon foliage of vine work. In the tracery are balf figures of Abraham, Moses, and Issiah, and cherubin with appropriate texts. This was presented by natives of Wexford now in America. *Ballymilty*. — Two stained glass windows were creted in the R.C. church here last week, by Mr. Michael Hoghes, of Wexford.

BOILER EXPLOSIONS

NUMEROUS accidents of late have called my atten-NUMEROUS accidents of rate have called in y anten-tion to the means necessary for showing when the feed-pump is st work, and what quantity of water is passing into the boiler during the working of the pumps. I, therefore, propose the use of a valve similar to the throttle-valve, or, what would be hetter, does more with a lower error on the outside of the a flap-valve with a lever arm on the outside of the box (forming part of the feed-pipe), with a counter-balance having a tendency to close the valve, and working against a quadrant face to indicate the posiworking against a quantativate to indicate two posi-tion of the valve within. This box should he a triffle larger than the feed (and placed so as to be seen by the stoler), but having an area (after deducting that occupied by valve) equal to the diameter of feed-This box should he a trifle

Pipe. It will at once he seen that the water pressure must keep the valve open, and the arm outside will indicate its position on the face of the quadrant; hut, if by partial stoppage of the area of feed-pipe the pressure on the valve bee mess diminished, the arm will at once indicate, and to what extent. I trust this will be the means of calling scientific men's alten-tion to the evil. EDWIN MOORE, Eugineer.

RESTORATIONS IN EXETER.

SIR,—May I he permitted, through the medium of your next inpression, to direct public attention to the improvement recently made in the exterior of St. Lawrence's Church in this city? The old plaster which so much disfigured the building has been re-moved. The walls of the tower and church are half with Haldon conglomerate, and the stones, having heen r-eq, are of a fine colour. The tower has been orna-mented with Bath stone battlements, with a figured cornice. The walls of the church are also ornamented corner. The waits of the church are also ornalifields with embrasures of the sime kind of stone. A new porch, ap₁r prince in design, has here erected, and an *old* figure of Elizabeth is placed in a niche over it. The altered appearance of the severed edifice readers it an ornanent to the higher part of the city, as it is one of the area day inverse of the severed the research here. of the greatest improvements that has recently here made in it, contrasting well with the sneeds that ex-hib ted in the fine specimen of architectural restorain the interme specified of interface and the interface tion and plasterers' work seen in the new prehendal residentiary, near the vest end of the cathedral, and to some extent removes the stigma from the city which the alteration of the registry-office to the prehendal residentiary had cast upon it

The restoration of the church referred to is a practical rebuke to those church surveyors and churchwardcus who have a mania for plastering and tewashing: the last mentioned is characteristi-y uamed "churchwarden's polish." Another incally uamed stance might he given where the stonemason's skill could be exercised to advantage. St. Mary Major's Church is in the Ca'bedral-yard, and in proximity to that fine old huilding St. Peter's Church. The south side of this clurch exhibits a stone exterior, whilst the north or front side is covered over with plaster.

ago a workman was seen laying a vile mixture of lime and sand on the walls of St. Olave's Church; lime and sand on the walls of St. Olave's Church : hetter for tolet them remain untoched; as, in addition to the depraved taste and offensive appearance of plaster, it tends to promote decay in the stone." St. Olave's Church is as expable of heing made au ornament to the lower part of the city as the church of St. Lawrence has become to the higher. In the name of common sense; I would ask, what are the members of the Exciter Architectural Society engaged about, that they do not exert themeelves in such matters ? AN OBSERVER.

DEVON AND CORNWALL BANK, PLYMOUTH.

DEVON AND CORNWALL BANK, DEVON AND CORNWALL BANK, DEVMOUTH. THIS building, which is situated in the leading thoroughtare of Plymouth, was, in its original form, designed by Mr. Wightwick, and carried out under his superintendence in the year 1847. It was creeted on the site of old premises, which were entirely taken down, being insufficient in size for the then business of the Banking Company called for a further exten-sion of the building; and architects in the neigh-bourhood were invited to compete, and furnish designs for the culargement. Messrs. Dumant & Red, of Plymouth, architects, were the successful competitors: and, under their superintendence, the building was completed early in the present year. The building as excended by Mr. Wightwick, in-cluded one of the porches and three compariments of the hank windows on the ground-floor, and the super-structure. The architects of the extension have com-trived, by a very slight alteration to the further window, to convert it into a portion of a central feature, which is to the placed a group of character-istic, on which is to be placed a group of character-istic sculpture. The new portion was erected by Mr. Johu Marshall.

isti seulpiure. The new portion was erected by Mr. John Maxhall, builder, of Plymouth, for 2,600′, and contains on the basement floor a pater's residence, with strong rooms, laxstories, and other offices. The ground-floor is devoted to bank purposes; and on this floor is also the main catranee to four commodious sets of chamhers, which occupy the first and second floors. The hover floors of the new building are fire-proof. The material for the wells is the limestone of the neighbourhood. The front above ground-floor is covered with stuceo, and the ground-floor portion, including piers between the windows, is of granite-from the Gunsilake quarries. The piers and balas-trade, which are part of the new design, and enclose the areas, are of Penchyn granite.

LORD COLLINGWOOD'S MONUMENT AT THE MOUTH OF THE TYNE.

NEAR the beautiful and far-famed mins of NEAS the besuifial and far-famed mins of Tyne. mouth Priory is the celo-sal statue of Lord Col-lingwood. The figure of this great almiral, in whom Lord Nelson put so much trust, stands on a hasement of considerable height, and looks granolly over the sea: the features have an expression of great self-reliance and vigilance. The taste which placed this effigy near to the spot on which the warrior was born, and in the sight of thousands of hoth Englishmen and funciences who much this important coses the effigy near to the spot on which the warrior was born, and in the sight of thousands of hot'h Englishmen and foreigners who plough this impotate ocean thoroughtare, is worthy of praise. The hasement of the figure is well composed and forms a small fort; and in suitable places cannon brisile towards the sea. Most pressons who wish here will take the opportunity of making a close inspection of this work, and viewing if from different points; the path, however, is not the most convenient; but, having surmonnted these triling difficulties, and wishing to see the effect from the work, I proceeded in that direction, when a voice, loud as if a speaking trumpet had heen used, hailed and asked, in a farce voice, "Are you aware you are a treapassing? what's the one of putting up boards with-out people read hem." We mentioned that boards, as the called them, were placed in all directions, and yet hundreds of persons were there, and must consequently the trespassers. "But you see, sir, that's not this functionary to depart, we net two ladies endeavorning, with great difficulty, although they were not core-hundreds of some anyigh to see sure and you do the scensission of some anyigh to see sure and you do the scensission of some anyigh to see sure and you do the functionary to depart, we net two ladies endeavorning, with great difficulty, although they were not core-hundreds of some anyigh posts cumingly placed in a circle, with one in the centre. The ladies complained to the poleeman that the passage was aurrow. "Yary, main, vary, it's to keep the donkeys out." It could not conceive the use of this entrance at all. If therapassers; it would be better under the present "this was obvious on the reasonal of the plaster from State Lawrence's Cluret.

* This was obvious on the removal of the plaster from St. Lawrence's Church.

THE BUILDER.

circumstances to shut it up, so that noither Christians nor donkeys could find admission. But then, sir, its is a public monument of great interest; and, knowing the consideration which has on all occasions been shown by the dnke of Northum-berland, to whom the land adjoining helongs, to give pleasure to the public, I venture to hint, in the hope that it may, through your pages, reach his grace's eye, that a little inclosure could be made with very little trouble to which the adjoires of holt ext and workly. that is intro income come to indee when the inter-trouble, to which the adverters of both art and warkke genus might hid easy entrance, and that if this were done it would give satisfaction to numbers of visitors to the mouth of the Tyne, and at the same time put a stop to trespassing. LONDONER

NOTES UPON IRON.

IN consequence of Wednesday last being the day of In consequence of wearsensy list being inc aby of national humiliation and prayer, the quarterly meet-ing of the iron-masters which should have been held there on that day, was held on Thurstedy at Birming-ham. It was then determined to adopt the decision of the preliminary meeting of List week, in regard to the prices to be demanded by the trade in the ensuing meeter. which becaused by the trade in the ensuing the prices to be demanded by the trade in the cassing quarter, which have nominally been 94. for bars, 104. for hoops, and 104. 10s. for sheets and plotes. We ary nominally, breause the houses that have professed to be guided by those rates have maintained them only so long as they were tolerably well supplied with orders. When this was not the case, they got the best prices that they could, and there are instances in which a lower price was quoted by a "trade" house that of the preliminary meeting, mean that the best prices that the determination of Thurslay, and that of the preliminary meeting, mean that the best prices that can be obtained shall be scenred. Most of the works continue tolerably well employed

Most of the works continue tolerably well employed upon the general descriptions of mcrehant iron. The orders are certainly for small quantities, but they are scarcely worked ont before others come in. There is a marked absence, however, of all orders for rollway purposes; and an order for a thousand tons of manu-fedured iron word to use baring do a for a rollway. purposes; and an order for a thousand tons of manu-fedurad iron would now be viewed as of a nsiderably more unagaitude than it is generally regarded. It has been some time since an iuvitation for a contract excited so much at ention as that of the East-India Company for 1,500 tons of plates and bars, which was decided upon by the Directors on Thursday last we presume, Wednesday, the advertised day for the decision, having been the National Fast and Hum-Hia-tion-day. Most of the bousses in South Staffordshire have tendered for it. No work was done at the dec sion, maing been the balance rest and reaching tion day. Most of the balance is bound staffordshire have tendered for it. No work was done at the several forges in South Staffordshire on Wednesday last from six in the morning till six in the evening. A ditermination, contrary to all precedent, was come in a the weaking should to at the preliminary meeting that the works should be closed during that time.

THEATRES AND SCENERY.

THEATRES AND SCENERY. Royal Princes's, London. — The rapidity with which theatrical decorators effect their work is often very surprising, and this we think will be felt on Monlay, when the public see what has been done in Mr. Charles Kean's theatre. It scenes, and indeed, is but a few days since Grisi and Alboni were singing there, in the midst of its dirtiness, and now from top to bottom a new face has heen put upon it, and the who'e looks sparking. The general tone is light, cream colour and gold. The collog displays alle-gorical figures of the seasons. The panels under the private boxes, present a series of paintings in encustic, ecomprising on the Queer's side, "Falberrian lightes backs, presents as series of paintings in encaustic, comprising on the Queen's side, "Tal-staff over the Body of Hot-par," Prospero sum-moning Arie!," "Hubert and Arthur," and the "Caldron scene in Macbeth;" and on the opposite side, "Hamlet and the Ghust," "Titunia in her Bower," "The Trial of Hermione," "Richard H. resigning his Crown," and the "Vision of Queen Katherine." Between the panels, extending also round the dress direle, is a series of Shakaperian kings, John, Richard H. Henry V. Henry VI. Elward IV. Richard H.L. Henry VI. Enwry VI. Elward IV. Richard and very wull painted. Mr. Kuckuck has executed the work. The chandelier has painted a new drop, wherein drapery half open discovers a statue of Shakspeare on a pedesial. The general effect will be best judged of when the house is lighted for a performance. e is lighted for a performance

Theatre Royal, Dublin. - We hear that at last rangements are on foot for re-decorating and modiarangements are on toot for re-decorating and modi-fying this structure, which for many years past has heen in a tattered and filthy state. The present lessee, Mr. Harris, has done much towards the im-provement of dramatic exhibitions in Duhlin, and it is not doubted that with his characteristic spirit, we shell one the tatterime to be a state of the s provement of armanic exhibitions in Dimini, abut it is not doubted that with his characteristic spirit, we shall see this structure, in point of taste, ronk with the hest of its designer's (Beazley's) works. Mr. John McCardy is the architect. We also hear of alterations, additions, and decorations to the Queen's Royal Theatre, in the same city.

The Arrangement of Theatres.—Sin: It has long struck me that the inner form of our theatres is very imperfectly adapted for the purposes of secoie representations. This is particularly to be remarked in the construction of what are called the horses (a very inelegant and inappropriate term by the way): the side-backs near the stage command a too-close view of the operations going on at the wings. As we are about building ancew a theatre on as extensive a scale as old Covent-garden possessed, it is worth while discussing the best form for its recon-struction. It has occurred to me that if the anditory portion were of a coniel shape, having its base at the commencement of the stage, the stage being also contail, decreasing to the back—the bases of the two comes maching—the imperfections from a too close cover meeting-the imperfactions from a too close survey might be removed .- Thurso.

RECENT PATENTS.*

RECENT PATENTS.* CHARLES COWPER, Southampton-buildings, Chan-cery-lane, London.—*Making Drains*. (A communi-eation). Dated February 17th, 1557.—The patentee claums, firstly, the improvement or improvements in making drains hy boring or making aseries of vertical holes and boring a horizontal or nearly horizontal hole from one vertical hole to another by means of a boring tool or mole worked from above the surface of the ground by means of machinery or appardus communicating with it through the aforesaid vertical hole substantially as bereinbefore described. Secondly, the improvement or improvements in making drains by boring or making the vertical and horizontal holes as aforesaid, and drawing in the drain-pipes by holes substantially as bereaubeline described. Secondly, the inprovement or improvements in making drains by boring or making the vertical and horizontal holes as aforesaid, and drawing in the drain-pipes by attaching them to the boring har as hereinafter de-scribed. Thirly, the improvement or improvements in making drains by boring or making the vertical and horizontal hol s as aforesaid, and then liming the inside of the horiz natal holes, or of hoth the vertical and horizontal holes, with a phastic composition intro-duced round a mandil, which is afterwards withdrawn as hereinbefore described. Fourthly, the improve-ment or improvements in making drains by horing or making the vertical and horizontal holes as aforesaid, and then biking or hardening the inside or the liming of the horizontal hole, or of both the horizontal and vertical holes, by ucans of fire, as hereinhefore de-eribed. Filhly, the cambination of parts forming the machine for boring the vactical holes, hereinhefore described in reference to fig. 1. Sixthly, the combi-nation of parts forming the machine for boring the vertical holes, hereinhefore described. J. H. HEADEX-—An Improved Mode of Manu-fucturing Intificial Granife in various Forms, and Plating or Vencering the same with Marble, so as to present an Erlevior of Marble, and a vertical holes, hereinhefore described. J. H. HEADEX-—An Improved Mode of Manu-fucturing Intificial Granife in various Forms, and Plating or Vencering the same with Marble, so as to present an Erlevior of Marble, and as therein of Stone or Granife. Datad Dec. 12, 1856. —1. Take good clean sand, and to this add a portion of fresh-burnt line, reduced by grinding to an implable powder. Incorporate these two sub-stances intimately. The natural dampness of the sand wil slack the line, which, in heating, will can-trise the sili-on, and form a thin film or pellide of the over end, sand form a thin film or pellide of whe water unil sufficiently domp to pack. This composition forms the granute or carse base of the s

line over each grain of silica. When the composition has become cold and analysis. When the composition has become cold and analysis is moistened with water until sufficiently dump to pack. This composition forms the granute or coarse base of the particles to be moulded. 2. Take granulated marble (pulverised earhonate of line), and mix it with ground unslacked line in the same proportions and manner as the silicions matter above described, and moisten the same until sufficiently damp for packing. When it is desired to employ these two compositions in monkling any article, place them in a smooth inster mould, so as to leave the sand and line in the interior of the block, and a thim lawines of the marble and line on the outside. Then subject the marble and line on the outside. Then subject the marble and line on the outside. Then subject the marble and line of earboin cald gas from the press: the moulded block will then gradually harden by the absorption of earboin cald gas from the atmosphere. E. Loos.—Improvements in the Manufature of Cement, Mortar, Concrete, and Artificial Stone, Dated D.c. 20, 1850.—The patentee manufactures Roman mortar, with a certain proportion of line, and a chemically calculated quantity of fine sand, and powdered substances of a sincions, arguilaecous, du-minous, alkaline, congulative, and colouring nature, as well as matural and artificial sulphates and carbonates. R. A. BROOMAN.—A Method of, and cartain farnishes or Compositions for, rendering Mood and other Substances Uninformable and Fire-proof; applicable also to the Indurating of Calcarous Earths and Stones, and to the rendering of Paper

* Selected from the lists published in the Mechanics' Magazine, the Eugineer, and other sources.

and Fabrics Damp-proof, logether with Apparatus for manufacturing such Compositions. (A communica-tion.) Dated Nov. 20, 1856. — This consists in employing certain vitreous compositions for the above purposes.

E. NEWTON, Chancery-lane, London. - A Preparation of Materials for Coating Roofs or other Portions of Buildings to render them Impervious to Wet. (A communication.) Dated March 3rd, 1857 .- This invention consists in forming a com 1857.—This invention consists in forming a compound of certain materials hereafter mentioned, which, combined and applied in the manner and proportion described, and applied to any slate, metallic, or wooden surface, will form a hard and durable covering, impervious to water and the action of the distribution. It is readily a formation of the random set of the set of t atmosphere. It is peculiarly designed for roofing. The following are the ingredients used for the purose :- Caoutchouc or india-rubber dissolved in spirits of turpentine, or some other suitable solvent ; gum shellac dissolved in alcohol; gutta percha dissolved in linseed oil or other suitable solvent; a mixture in inseed oil or other suitable solvent; a mixture which the inventor calls puzzelan, composed of pul-verised glass, quick lime (pulverised and sifted), and plaster of Paris, or marble dust, or any kind of elay well vitrified and pulverised, or any equivalent sub-stances; and another mixture, which he calls smalt, composed of virified glass, send, fint, gravel, pounded carthenware, or any equivalent pulverised substances which will withstand the action of the atmosphere. To these are to he added naphtha or coal tar. coal tar.

cool tar. F. N. CLERE.—Improvements in Metallic Roofing for Buildings, and in Appendages to Roofs. Dated Nov. 26, 1856.—This consists: 1. In constructurg roofing plates in the ordinary way, excepting that a projection is raised in such part of the plate as it is intended to pass a nail or other fastening through. 2. A rain-water head for receiving water from the eaves gutters of the roof is constructed in the follow-ing manner:—The front and sides of the said head are formed of one piece of metal, which is fashioned into the required shape by stamping or by pressure. 3. A moveable car for fastening rain-water pines to and the required shape of stamping or of plessure. S. A moveable car for fastening rain-water pipes to the wall or other portion of the building. 4. A bracket or holdfast for scenring or building eaves gutters, and preventing them from leaking. The bracket is made of wrought-iron, and has constructed thereon a shoulder, to allow the gutter to go up close.

Mr. B. W. Owan, Dunalk, has provisionally spe-cified a mode of scentring together the extremities of pipes, so as to form a junction in a simple memory. tion. The improvement consists in the employment of a ring or collar, the inner surface of which is conical, so as to act as a wedge, either with or with-ont the application and use of a suitably formed filling for placing between the outer surfaces of the pipes and the inner surface of the ring or collar, which is and the inner surface of the ring of county required placed around the joint. When the pipes are required for liquids, eccent is used for the filling; but for most other purposes the packing may be formed of most other purposes the packing may he formed of lead or other soft yielding or compressible metal or substance

Proceedings of the Royal Society, Vol. VIII., No. 27.

THERE are some interesting and important articles in this issue of the Royal Society's Proceedings. Amongst them is a paper by Professor W. Thomson, R.S. on the electric conductivity of commercial copper of various kinds. It is an important and values and the source of the source o notable eircunstance, and surprised the ex menter himself, to find that there are differe experiof resistance between different specimens of wires manufactured for submarine telegraphs, so great as most materially to affect their value in the electrical operations for which they are designed. None of the circumstances, such as twisting of wires, or covering with indiarnbher, peculiar to each strand, produced any qualities of the copper-wire itself were proved to he the real cause of difference, and while the conducting Let rear cause of unterence, and while the conducting power of a wire from one manufactory was as 100, that from another was only as 54'91 Professor Thomson's inference from these experiments is, "that a submarine telegraph constructed with copper wire of the quality of the manufactory A of only is of The rate case of the frame root manufactory was as 100 papers of any accuston themselves to work that from another was only as $54^{\circ}91^{\circ}$ Professor Thomson's inference from these experiments is, "that a submarine telegraph constructed with copper wire of the quality of the manufactory A. of only j_1 of an inch in diameter, covered with gutta percha to a diameter of a quarter of an inch, would, with the same electrical power, and the same instruments, do more telegraphic work than one constructed with copper wire of the quality D, of j_0 of an inch diameter covered with gutta percha to a diameter of a the same instruments, do more telegraphic work than one constructed with copper wire of the quality D, of j_0 of an inch diameter covered with gutta percha to a diameter of a thick to eccupy a site on the south side of Highwire of the specimens of copper wire with low conducting power was found to contain lead '21, irron '3, and tin or antimony '01, the remainder being copper y975. All the samples were described by the manufacturers as remarkably pure. Doubtless even

though copper were considerably adulterated with a hetter conductor than itself, this would only diminish *its* conducting power all the more: purity of metal appears to be the essential principle. Brittleness from tension does not alter the conductivity $\frac{1}{2}$ per cent. There is another paper by the same author on the electro-dynamical qualities of metals, showing the effects of macroaction on the electric conthe effectively name a quantical to means, about a fute effects of magnetization on the electric con-ductivity of nickel and of iron. It had been shown by Professor Thomson that iron, when subjected to magnetic force, acquires an increase of resistance to the conduction of electricity along, and a diminution of resistance to the conduction of electricity across, the lines of magnetization. By experiments more recently made, he has ascertained that the electrical conductivity of nickel is similarly influenced by magnetism, but to a greater degree, and with a curious difference from iron in the relative magnitudes of the transverse and longitudinal effects. With the same With the same agnetic force, the effect of longitudinal magnetization, in increasing the resistance, is from three to four times as great in nickel as in iron, hut the contrary effect of transverse magnetization is nearly the same in the two metals, with the same magnetic force. I magnetic force is applied to iron, we may When observe, it is along the bar that the magnetic attrac-tion operates, each successive series of particles in the being a kind of minor magnet with its poles in irection of the length. When electric force is line, the direction of the length. applied under such circumstances, is it not simply because the electric force is ubsorbed, and assumes the because the electric force is absorbed, and assumes the form of magnetic force itself, *augmenting its intensity*, that the passage of the electric force, *as such*, appears to be resisted? The magnetic force not operating across the line of polar direction, the electric force of course cannot be so absorbed in that direction, or assume the form of magnetic force, and hence appears a due in that direction without dimension and all to flow in that direction without diminution, and all the more freely that the metal is magnetized already in the contrary direction, and may not afford so facile an opportunity for its diversion and absorption, or assumption of the magnetic form itself, in the contrary direction, as when the metal is not yet maguetized. direction, as when the metal is not yet maguetized. In nickel again, it would be interesting to know whether the absorbed electricity has really rendered it more capable of magnetization and more com-pletely magnetized, than when only exposed to the operation of the magnetic force. The relationship of diamagnetism to these phenomena would be a curious and important subject for further experiment. These papers are not the only ones by the same author in the multichet transactions under notice, and there is published transactions under notice, and there is a variety of other subjects treated of hy other savans.

Miscellanea.

PHOTOGRAPHS FOR ENGRAVING ON WOOD .-- WC PHOTOGRAPHS FOR ENGRAPING ON WOOD.--We have been long looking for the discovery of a mode by which representations of objects might be placed on the wood, ready for engraving, by means of pho-tography instead of the artist. It would seem that something has been done towards it by our friends on the other side of the Atlantic. The Scientific American says, "A platent was issued, on the 5th of May last, to R. Price, of Worcester, Mass. for a process of photographing ou wood in lieu of drawing by hand, which has since heen so for developed by the proprietors, C. J. B. Waters and Co. of No. 90, Fol-ton-street, in this city, as to he pronounced successful proprietors, C. J. B. Waters and Co. of No. 90, Pul-ton-street, in this city, as to he pronounced successful by some of our hest engravers. The surface is so prepared as to be sensitive to light like the glass or paper employed in the ordinary photographic pro-cesses, and the image of any object is thus impressed upon the block with greater accuracy than it is pos-sible to accomplish by human skill. We have seen some wood hlocks hearing very fine pictures produced by this means, and a number of such pictures bave been engraved and printed, showing that it is prati-cable so to use them. The principal defect of such cable so to use them. The principal defect of such 'sun pictures' for this purpose is their too great delicacy and faintness. If this can he overcome, and 'sun pictures' for this purpose is their too great delicacy and faintness. If this can be overcome, and the pictures he produced with the vigour and strength of ordinary Iudian iak work, the invention will very greatly facilitate the production of illustrated hooks and newspapers, and it is quite probable that, with practice, eugravers may accustom themselves to work

paucity of the attendance of the working classes at the paucity of the attendance of the working classes at the Exhibition. It was not that they were not interested in it, he said, but because they had not heen properly clucated to appreciate its treasures. He would im-press upon the Society the necessity of giving greater instruction in art, and providing some means for making the schools of art more intellectual, and fur-obling the schools of art more intellectual, and furnishing the students with some acquaintance with the records of the past, which would enable them to enter more fully into the spirit of the seene which they more inity into the spirit of the scene which they attempted to portray on canvass. After passing a panegyric upon the late Bishop Blomfeld, his lordship said he referred to his deceased friend hecause he had occupied an office which had heen for years a sinceure, and with respect to which the Society of Arts should carnestly arge npon the attention of those who elected to it the necessity of making it officient. Why were to it, the necessity of making it efficient. Wby were the professors of the Royal Academy never permitted to lecture, except on painting and scalpture? There had been the discourses of Reynolds, Pbillips, Opie, and Flaxman, on subjects connected with art, and why should not the highest branch of historical art be duly

should not the highest branch of historical art be duly developed by the person appointed to teach bistory in the Royal Academy of England? He hoped this subject would receive the attention which it deserved. HEATING APPARATUS.—At the Liverpool Poly-technic Institution on the 29th of September, the paper of the evening was read by Mr. Henry II. Hazard. It was upon the subject of his "Patent Hoat Extractor," and suggestions for improvements in producing artificial heat. After referring to the early modes of imparing warmt to buildings, Mr. Hazard explained the construction of the Belper Cockle, invented ahout 1790, by the late Mr. Strutt (father of the present Lord Belper). The principle of Cockle, invented ahout 1790, by the late Mr. Strutt (father of the present Lord Belper). The principle of warming hy this cockle was that of passing a quan-tity of air over a red-hot surface of iron; and, although hy this means a most powerful heat was produced, the injury done to the air was such as to reader it totally unfit for respiration. Mr. Hazard then showed by diagrams that the warm air appara-tures since introduced, and those now in use in our tuses since introduced, and those now in use churches and houses, were nothing hut copies of the Belper Cockle; that some of them were even worse, having a less extent of surface; and that those that presented any improvement were only better in construction, and not in principle; that all of them heated the air, but destroyed its purity, and hence the unpleasant effect of confinement in rooms so heated. Mr. Hazard then introduced the Patent Heat Ex-Mr. Hazard then introduced the Patent Heat Et-tractor, as invented by his father, and explained its advantages, which are said to consist in passing a very large quantity of air over a most extended surface of very moderately heated iron piping. The extent of the improvement may he judged of from the com-parison he made between his own apparatus and the largest sized Liverpool Cockle, which he said was the best embodiment of the Belper principle he knew of. The Liverpool Cockle of the largest size made, pre-sents a surface of 90 square feet to the air to he warmed, whereas the Patent Extractor of the size that he would recommend to do the amount of work for which the Liverpool Cockle of 90 feet of surface is usually employed would contain upwards of 310 feet usually employed would contain powards of 310 feet of surface. The effect of the fire being divided npon so large a surface was, that no hurning of air could take place.

take place. A SMALL BUILDING FUND WANTED IN BER-MONDER. — The Snowsfield's Sunday School and Preaching station in Bermondsey is a useful and commendable institution, which has now been a good many years diligently at work in this worst of all the distribute of the metromolis and in exponented herits. districts of the metropolis, and is supported hy its own teachers and two or three other good people; districts of the metopols, and is supported by its own teachers and two or three other good people; but a new huilding has become absolutely necessary for its extending operations, and that is heyond the personal resources of its supporters. The estimated for its creation governments, and that is neglow the personal resources of its supporters. The estimated sum (600%) can only he raised hy contributions, however small, from well-wishers, and even a few postage stamps would be welcomed by Mr. Fillow, of 2, Wellington Chambers, London Bridge, the treasure. There is already a hopeful list of subtreasurer. Inere is ancay a nopen is of sum-scriptions, ranging from twenty guiness downwards, so that there appears to he every probability of an active canvas, and a willing contribution generally, proving very soon successful, and we hope shortly to see the building in progress.

DR. JOHNSON'S STAIRCASE, TEMPLE .- At the sale DR. JOHNSON'S STAIRCASE, TEMPLE.—Al the sale of the houses in the Temple, the aucironeer announced that the henchers had withdrawn "Dr. Johnson's staircase" from the sale, and did not intend to let it go out of the Temple. We may take eredit for having, by our gentle remonstrance, and comments on the staircase, adopted by a great part of the press, awakened the attention of the henchers to the desi-bilite of redisting as interasting a memorial of the rability of retaining so interesting a memorial of the learned doctor and his well-known associates. WORCESTER DIOCESAN ARCHITECTURAL SOCIETY. —The annual meeting was held on Wednesdav, the SOth ult and Tbursday, the 1st inst. at Worcester. At nooa on Wednesday the society met for the transaction of business in the Natural History Society's rooms. The very rev. the dean presided. The report, which was of a satisfactory character, pointed out the restorations which had been effected or were in progress in the diocese, and gave a rósumó of the procedlings and excursions of the year. The company atterwards proceeded to the cathedral, the principal features of which were described by the Rev. C. Boutell. In the evening the party diaed together. In responding to the toast of "The Vice-previdents," Sir T. E. Winnington strongly nrged the necessity of combining with the Birmingham and Midland Couuties Arolkaological Society. The proceedings of the day terminated with a conversatione in the lecture-room of the Natural History Society. Oo Thursday the members and friends visited Pershore Abbey, when papers by Mr. Galton and Mr. Hopkins on the building were read. The Rocyt, PotryPercurve L SUSTING

Galton and Mr. HOPKINS ON THE GUILDER, — Mr., THE ROYAL POLYTECHNIC INSTITUTION. — Mr., Pepper has provided for the Michachnas Session various novellics, which we mean to take an early opportunity of seeing, such as a new series of dissolving views of the Indian multiny, Myers's system of railway signals for trains in motion, an attempt to realize the long-desiderated "reservoir penholder," rad a new philosophical entertainment on the subject of illusions. His continuous energy deserves success.

DISCOVERY IN CROTDON CHURCH OF ANOTHER WALE PAINTING.—The recently discovered painting on the south walf of the Old Church (in addition to the continuation of the St. Christopher legrad) is St. George, elad in armour, mrmed "cap-hpid" with his visor up—mounted on a white palitey richly caparisoned, and charging with his lance a dragon, the fore paws of which only are visible. The champion has evidently issued from an archwny under a tower; and it may he inferred that he is about to effect the deliverance of a damsel, who elegantly attired, and bound by the arm and hands, is seen on the vestern side. The colours are tolerably fresh, and some remains of silver illuminating can be traced. Opinions are divided as to the date of these relies, but it is supposed that they are of the fourteenth century—Edward 3rd's time, when the order of the Garter of St. George was instituted. Whether the plastering over the storps, and covering the paintings took place at the Reformation, or during the commonwealth, when "one Blesse was hired to break the stained glass windows at halfserown a day 1" is not determined. The churchwardens, it seems, have promised not to oliterate this interesting relie. The re-opening of the church, "repaired and beautified," was to take place on the 11h instant.

11th instant. SWINONS.--It may be justice, that persons on mere suspicion of crime should be submitted to the depressing, indeed the dangerous, influences of petileotial cells, before examination; but it is nore the less the province of the committee to reader wholesome the cells of the lock-up, which are hereby presented as foul and offensive," and the foulness of the station probably hwing been the cause of Mr. Superintendent Haynes's serious, apparently cholernic, sufferings. If anything could be waiting to display the utter absurdity of the Nuisnees Removal Act beigh rate of mortality such as Swindon suffers, it is but too palpahle there: with two solicitors as churchwardens, acting as members of the local authority, desirons to give the parish the full benefit of the Act, they cannot even take steps to render their own committeeroom in the police-station hearable. The little attempt they have made at sewering the town seems likely to be paid from their own purses, the view baving appearse contrary to common sense that parties, temata for the causes but of the year, should be realled upon to pay heavily for benefits to he derived by their successora. The Public Health Act, 1845, cumowarde the payment of sanitary works out of mound to be raised on mortagae of the rates, and munning the repayment of sanitary works out of mounds to be raised on mortagae of the rates, and munning the repayment of sanitary works out of mounds to be raised on mortagae of the rates, and munning the repayment of sanitary works out of mounds to be raised on mortagae of the rates, and munning the repayment of sanitary works out of mounds to be raised on mortagae of the rates, and munning the repayment of sanitary works out of munning the repayment or

⁶ Mr. Haynes, who holds the joint office of Police Superintendent and Sunitary Inspector, has recently been sumate of a London houghth. His wife a five days since stands asevere attack, fairly attributable to the overpowering stence? pervading their dwelling at the police-station, imbere, notwithstanding copious slucing with water and the mase of chlorides after sadden storms of rain, the life of rarry unfortunate prisoner is jeopardised without trial by arry.

PROCRESS OF THE BRADFORD WATER WORKS.— The principal portion of these extensive works have for some time heen in progress, and the local Observer of last week reviews the present state of the whole. The Grimwith reservoir and the portion of the line from Barden to Holden Beck (ahout §§ miles) are let to Messrs. Duckett and Staad, of Ripon and Arthington. The Barden reservoir is io the hands of Messrs. Swire, Blair, and Parratt, of Shipley and Apperley. The Chelker reservoir, the Silsden reservoir, and a portion of the conduit from Holden Beck to Morton (3‡ miles in length) are let to Mr. Samel Button, of Leeds. The remaining portion of the line from Morton to Heaton (upwards of 5‡ miles in length) is let to Mr. William Barker, of Wakfeld. The scheme was laid out by Mr. J. W. Leather, of Leeds, and is now being corried out by him as the engineer. It is calculated that this scheme will yield Så to 9 millions of gallons in the driest seasons. This added to the present supply, and the high level supply from Thoraton Moor, will ensure apwards of 10 millions. The quality of the water respect. The works now in progress are only a portion—though the chief portion—of the corporation water scheme. There must be ndded the high level scheme, for supplying the highest portions of the horough, and which is an extension of the oldy Mater works. The Stohden reservoir is to be constructed on the Thornton Moor, wit a height of nhove I_000 feet ahove the level of the sea. The Doe Park reservoir is to be constructed for compensating mills on the Hewenden Beck. MONUMENTAL TARDET IN WOLVERINAUTON.—

MONUMENTAL TABLET IN WOLVERITAMPTON-A monumental tahlet, designed and executed by Mr. Thomas Earp, a young metropolitan sculptor of rising fame, has hece crected to the memory of Mr. J. Barker, in the Congregational Church, Snow-hill, Wolverhampton. It includes representations of the Sermon on the Mount, and the Feeding of the Multitude, as emblematioal of Christian teaching and henevolence. Each of these subjects in alto-relievo is contained in a small arch, both heing surrounded hy a larger arch, the corbols of which are formed by a girl reading and a boy writing. The trefoil ahove these minor arches bears the heraldic device of Mr. Barker, and his monograph is inserted in the spandril above. The whole is included to memorialize his piety and usefulness, especially in the religions instruction of the young, and is well spoken of hy the local Chronicle.

The SEWERACE WORKS AT BILSTON. — These works, which will involve an outlay of from 9,0004. to 11,0004, are now heing proceeded with by the contractor, Mr. Hassell, of London. They are divided into four separate contracts, comprising the town of Bilston, Halfields, part of Bradley, and Ettingshall New Village. The total amount of earth to be excavated for these severs is 5,200 enbie yards; the quantity of timber to he used is 5,600 superficial feet of 3inch red deal plauking; 1130 enbie feet of 14inch de la plauking; 1130 enbie yards of furnacecinder wallor; 2301 enbie yards of brick work, taking 600,000 hricks for construction. The whole of the works have been designed, and the plaus, sections, specifications, and estimates prepared, by the through which some portions of the sewers pass, materials the best calculated for the purpose have enselected. For about 1,050 yards from Queenstructed of a hrick invert, walls of furnace cinders, and the top covered with timber. This plan has heen adopted to enable the sewers to be readly the falling in of a portion of a sewer, but for loading in of a portion of a sewer, but for loading in of a portion of a sewer, but for loading in of a portion of a sewer, but for loading in of a portion of a sewer, but for loading in of a portion of a sewer, but for loading in of a portion of a sewer, but for loading in of a portion of a sewer, but for loading in of a portion of a sewer, but for loading in of a portion of a sewer, but for loading in of a portion of a sewer, but for loading in of a portion of a sewer, but for loading in of a portion of a sewer, but for loading in of a portion of a sewer, but for loading in of a portion of a sewer, but for

thouted we bookers were broken and no ine loss, though one of the workmen, in attempting to save bis cap, was completely buried for a time. IstINGTON VESTRA-HALL.—We understand that seventy-seven designs have been submitted io reply to the advertisement, and we are told that the committee propose to come to a decision on *Tweeday next*. We hope, however, this is an error, as it is quite certain that the decision sould not be properly examined with a view to decision by that time. The plans will be open to the pablic at Myddelton-ball, Islington, on Wedoesday, Thursday, and Friday next.

DRAINING IN LINCOLNSHIRE.—The Venratts new outfall sluice, for draining the district of Deeping fea, near Spalding, Lincoloshire, was formally opened hy the trustees on Monday last. The works were commenced in August, 1856, and the foundationstone laid in May last, by the chairman, Sir John Trollope, Bart. M.P. William Lewin, Eaq. of Boston, is the engineer; and Mr. William Lissons, of Hull, the cootractor. "HOSPITAL ARTANGEMENT."—The evils lately pointed out by journals like the Lancet and the Bailder call loadly for remedial measures wherever they can be devised. "What cannot be cured must be endured," saith the proverb; and hospitals have been so constructed that a proper system of ventilation cannot be obtained; hut to creet others apon such faulty plans would be unvise to the last degree. It would be crucl and inhuman. To immure "poor sufferers in public institutions to their destruction" is an officane against morality that ought to be severely punished. Such a course pursued with the eyes open to its results—under the pretence of charity—is virtual manslaughter. Perhaps a stronger term ought to be applied to this proceeding. We do not have our ancestors for the errors of judgment arising from their ignorance of the laws of nature; but the fatal bundering of the dominant class of the present generation, who shut their eyes to the light of science, provokes strong animalversion. They manage such matters better under a despotism on the continent, and our principles are disgraded by the earlessness or studiely of the ruling spirit among ns, who follow the precedents of their ignorant forefathers to this day. The Victoria hospital, now in eourse of erection—which has hardly energed from the ground—has econsumed the econtones sum of 70,000.; and it is already ascertained to he planued on such croneous views, that it must he altered and amended, at an enormous cost. It is, perhaps, consolatory to reflect that the hundering exist in Paris, Bordeaux, and Brussels. That in Bordeaux is admitted on all hands to be nearly perfect: the Netley hospital is the grandest failure of its kind. The editor of the Builder, in criticising the plan, said that "more diseases would he generated than cured in such an edifice." This was strong language, but it has since here justified hy a Government commission, who, in condemning the original the other hand, will rear an institution that scientifie me nean admire, and that

The other hand, with rear an institution that scientific usen can admire, and that Government may hereafter copy with advantage.—*Preston Guardian*. BRIDGE AT COLLINGWOOD, MELDOURNE,— Having read your remarks in last week's paper respecting the improvements going on in the neighhourhood of Melbourne, the last-mentioned being the bridge at Collingwood, I should be obliged by your stating that the said bridge was designed and carried out by Messrs. J. Anstin and Co. late of Shrewsbury, and Cleveland-square, London. It is the colly bridge of the sort that has heen creeted in the colony. You can, on referring to the *Melbourne Argus*, of June the 6th, see a long account of the opening of this bridge, which took place on the bit of June, by his Excellency the Governor, and a large party of the principal gentlemen of the place, when the conjecens were highly complimented for the ingeneity, skill, and promptitude displayed throughout the orection.—D. C. The LIVERPOOL COLLECTATE SCHOOL OF ART.—

The LIVERPOOL COLLEGIATE SCHOOL OF ART.— A list of those to whom prizes were adjudged by Government last Midsummer, in connection with the various branches of the Collegiate School of Art at Liverpool, is published in lane, by Mr. Wylde, of the Department of Science and Art. Very various classes of the community it appears are now receiving instruction in drawing of all kinds, through the agency of this school. Among those who have obtained prizes or medal. Are carving, which would student (J. Rimmer), is especially mentioned, as having deserved a prize for carving, which would doubless have heen given to him had this subject heen within the Government arrangements. The female classes are not beld in the Collegiate Institution.

ELECTRO-TELEGRAPHIC PROGRESS.—Sir William O'Shaughnessy has, it is said, left England for India, by way of Constantinople, where he will arrange with the Turkish government for the construction of a telegraph from that eity to Bagdad. This line will be constructed by the Turkish government, he under its sole control, and he connected with the East-India Company's telegraph down the Persian Gulf to Kurrachee. The necessary arrangements for establishing a direct line along the coast between Midras and Calcutta were being vigorously proceeded with in August last.—Water-tight and covered taxks have heen prepared at Keyham steam-yard, Plymouth, for the Atlantic cable, which is to he payed out through holled oil, as it is delivered on shore from the Nigara and Agamemon. There is still 8,100 miles on hand, hut a much greaterquarkity willbe seed of in thespring. ACCIDENT AT THE SALTASH BRIDGE WORKS.— It having been thought desirable to push on the work as in connection with this part of the Cornwall Railway, active stops have recently been taken for the building of the second tube, and the massive se schölding to support the structure was in a state of forwardness. On Saturday night before last it was, though incom-lete, apparently quite secure, but during the next day it blew rather violently, and the whole erection fell into a mass of ruins. A NEW INTENTION FOR CONSENTS SHOWN — AN

day it blew rather violently, and the whole erection fell into a mass of ruins.
A New INVENTION FOR CONSUMING SMOKE.—An ingenions pamphleteer, Mr. Peter Spence, of Man-chester, says a provincit paper, " proposes the aboli-tion both of chimneys and smoke altogether. Not only of smoke but of chimneys. The plan is, to have smoke drains under the streets, just as there are drains for water at present; and the only difference is, that whereas the latter require a fall, the former will be all the better of a rise—the specific gravity of water eausing it to descend, and of smoke to ascend. Mr. Spence restricts his project to Man-chester, for which he would build one chimney accor-ding to the specifications of the Tower of Babel. A Dunde paper invites Mr. Spence 'to come and try his plan in Dundee. We should need hor chimney-houlding here. The Latw (a conical hill), behind the become one of the finest natural chimneys nossible. Almost all our great factory chimneys are in a line ast and west, and one main smoke drain would answer for them, then the ascending drain might he carried up by the side of the Newlyle Railway, and through the centre of the Law, from which the smoke would emerge like another Vesuvins'!"

A CANADIAN SUSPENSION BRIDGE BLOWN DOWN A CANADIAN SUSTENSION BRIDGE BLOWN DOWN-—The suspension bridge which spans the Burlington Heights, at the entrance of the Desjardine canal, was lately blown down by a burricane. The bridge was completely smashed. The wind had lifted the whole structure in the air, turning it in its descent, and, as if simultaneously, snapped it precisely in the middle. The bridge heing thus dividel, one-bolf lay on one bank of the canal, and the other half on the other.— Dundas (Canada) Warder.

Oct. 17, 1857.

The Builder.

E fear it eannot be said that the subject of "Metropolitan Drainage " is greatly advanced by the couclusions of the Referees in their report lately issued. Laborious as the inquiry has been ; and much as we owe to Captain Galton, and Messrs. Simpson and Blackwell, and to all who have assisted them with evidence or suggestions; it is impossible to help the impression of dissatisfaction and pain at the position in which first principles in this complicated question are yet left. The plans and the appendices to the report, of which we were able to give some particulars at the time of their

publication, represent so much patient research, that, even after having gone through the five hundred closely-priuted pages, we could well feel dif-fidence in a present expression of opinion on the recommendations which are made. But, not only are there reasons for regret, arising from the present state of knowledge in the agricultural and chemical branches of the inquiry-a position which was perbaps inevitable, but which in a few years may cutail a complete reversal of the present plan, and the loss of the expenditure, supposing the scheme earried out-but it is apparent that the time lately given to the digestion of the subject has been inadequate to its magnitude. At least, we would say that we are justified in inferring so from the want of reference in the report, lengthy as that is, to many important points, raised by surveyors to vestries and district boards, or authors of plans submitted, or to other points which are suggested in reading the appendices,—also from parts of the report of Dr. Hofmann and Mr. Witt, and from the entire omission of particulars as to structural features and details which are of moment to the working of the suggested sewerage. What the Referees have done will probably be found mainly this,-that they have put hefore us an enormous mass of evidence which it was necessary should he considered, and much of which would not otherwise have beeu generally accessible. It is possible—so pressing is the case—that the millions of money required for the construction of new outfalls to the Thames, may have to he expended, as a measure of mere expediency, or only to show that a particular plan is not that which should have been adopted. But, the public know just enough of the subject to he dissatisfied with any course which they feel is not the logical solution of the difficulty

Much, we see, is heing done towards settling the abstract question of the principles of town sewerage; but the case of London is peculiar, and the existing conditions of its site are unfavourable. Supposing the subsidiary question of ntilization as settled-though commercially, it hy no means is so in "deodorization" and the formatiou of a solid manurc, and in many points of view relating to London is not more so in the application of liquid sewagethere still are difficulties from the low levels and consequent necessity for collecting and raising the sewage, and from the unequal demands of sewage and ordinary drainage, and of storm waters. Respecting these, as we under-stand the particulars of the plans, neither Mr.
 Bazalgette, for the Board of Works, nor the Referees, propose to intercept wholly the storm waters. As shown in Appendix VI. plate 2, in

THE BUILDER.

the existing sewers, the ordinary and general have received insufficient attention from the Thus, supposing provision for every contin-geney in sewers the same, an enormous expense as contrasted with that of the ordinary requirements, would be demanded, and merely for the sake of ten or a dozen days in the year, when the dilution of the sewage would, in the opinion of the chief authorities, he such as would render impossible any noxious effect.

The ordinary flow of sewage and rain-water, however, having to be provided with outfallaccording to both of the plans mentioned, without making use of the river-the nature of the levels requires that part should he raised ; and whatever the mechanical contrivance resorted to, considerations of practicability and costliness, and possibly also those of a sanitary nature at the places chosen as lifting stations, require that the area which is under these latter couditions should be limited in extent as far as possible. Thus, some of the diffi-culties in the case of Londou, in the way as well of the direct utilization of sewage, as of the withdrawal of it, hecome apparent to ns; and also we are able to see how a cousiderable difference of opinion may exist, such as that which mainly occasions the discrepancy hetweeu the plan of Mr. Bazalgette and that of the Referees.

To relieve the low levels as much as possible from the flooding to which they would continue to be subjected-perhaps to even a greater extent than they are at present,--sewers of interception, to take the flow of the upland districts, suggest themselves, and are adopted in both plans; and the course of the drainage of that character in the Referees' plan was re-ferred to in our last. Such sewers were not originally suggested hy Mr. Forster ; for, the reports made by Mr. John Rennie, in 1807 and 1808, and which are given in Appendix VIII. adopt the same principle. We wish, however, we could feel satisfied that the intercepting sewer-with or without reservoir at the place of exit-would uot substitute, for distributed vomitaries of nuisance, an intensified dissemiuator of disease, an apprehension we have long felt, and which is cehoed in the report of Mr. Freebody, the surveyor to the Shoreditch Board, who goes so far as to say that "the outlay necessary for the construction of these long lines of intercepting sewers, in their entirety, will be an injudiciou expenditure," and who even would preserve the present outlets, considering, perhaps with reason, that the Thames water in the vicinity of London will never he bright as anticipated, and that, in a great degree a heneficial action, chemical and mechanical, is constantly in progress in a river having such an immense volume : and he is "prepared to assert that it is quite practicable so to arrange the whole regime of the river Thames in its course through the metropolitan districts, as to preclude the deposit of offensive districts, as to proclude the deposit of offensive which "something number done." We cannot representations would serve to show the difference of opinion which exists, even on primary quession of the difficulties attend int upon a low terms which with the rival plans before us had are told the whole town was raised "five feet." to take as settled by the Act of Parliament. It is very true that there are wide traces of However, the opinion that, whilst minute streams ground in London, covered during the very are comparatively innoxious, the larger streams may not benefit the public health, or, that so long as the pernicious properties of sewage remain unchanged, the collection and conduction of masses of it across and under the metropolis, would merely transfer the baneful action from one locality to another, is deserving of attention. With reference to this, it is impossible to avoid remarking that certain requirements of vital importance appear to

* For instance, in the Ranelagh sewer, Gloucester road-Sivet 6 inches from bottom of invert to crown of arch-the ordinary Now is 1 foot 12; inchin the centre of the channel, whils the height of water during storms is called 7 feet 6 inches.

flow has a depth of very few inches, whilst in Referees. We allude to those helonging to the some cases the flow will be several feet in depth.* whole subject of ventilation. It should be scarcely necessary to say—only that the subject is again and again misuuderstood,—as, indeed, it appears to have been by those who framed the Act of Parliament,—that sewers must he venti-lated. If they are not so, they are not merely unsafe for those who will have oceasionally to enter them, but they will ventilate themselves into the houses, —as they did in the case of the Croydon epidemic, as shown by Mr. Page, in the report by him and Dr. Arnott. We do not say that this point has been wholly presed over, hut that it has not received the prominent attention from the Referees, which the nature of it demands. The additional distance of flow given to the sewage is, taken by itself, such as we apprehend may add to the influences towards deleterions exhalation, which are peculiar to the sewerage of London. We say peculiar, hecause it appears by the parti-culars afforded to us, that whilst in the towns lately sewered and supplied with water, the excretory and other matters are ejected hefore time has been allowed for decomposition, and are, perhaps, chemically in a condition favour-able to "deodorization;" in London sewerage, from the greater distance to outfalls, a very differcut condition of things will exist. The Referees indeed say, "We helieve the proposed main drainage works, by ensuring a continuous flow in the sewers, will relieve many districts from the effects of the alternate compression and dilation of the air in the sewers,"-which is assuming the continuous flow : but whilst they "attach great importance to the ventilation of all the sewers," they have to "regret that the time allotted " to the inquiry was "too short " to permit of their "investigating the subject more fully ;" and they suggest that the Metropolitan and District Boards should institute experiments to determine the best plan for re moving the gaseous emanations which must prevail more or less

We cannot but feel, then, however humiliating the confession, that the plans of Mr. Bazalgette and the Referees, agreeing as to the provision of main intercepting sewers, and the intention of an ultimate discharge into the sea, are at hest those which the present state of the inquiry will admit of, but do not present the satisfactory solution of the difficulty.

Still, it is impossible that the subject can be allowed longer to res' in the present state of The very deprecation of these plans, inactivity. which profess to do away with outfall into the river within the metropolitan area, is accompanied by uo tangible proposition in lieu of them. Of suggestions there are many in the book hefore ns; aud of evidence there is much, true and false. But the question is one in which time is the essential-the truly vital element; and the whole matter is in that unfortunate condition in ground in London, covered during the very time that this subject has been discussed, that should never have been built npon. These, as others helow the level of high water on one side and the adjacent country on the other, it is impossible to drain continuously, except by artificial means. To make the case worse as to dwellings in such situations, the description of house property which exists is usually that which, for sanitary reasons, requires the best drainage. It may be well to bear in mind that the fitting use of the low ground would have been to preserve it for market gardens, or to have appropriated it to meadows irrigated by the sewage of London. And we must say, it is

VOL. XV.-No. 767.

with some chagrin that we observe that the facilithe solid engrine that we observe that the facili-ties of communication with the outskirts of the metropolis, notwithstanding the development of railways, continue to offer to a large class no alternative to the occupation of localities which are at present children and a children which alternative to the occupation of localities which are at present abiding places of discase, and which must under any circumstances continue to he so, ito some considerable extent. But who is to in-terfere to stop the huilding at Rotherbithe and the Isle of Dogs; or we might say, to raze the half of Loudou in Southwark, Lambeth, and Westminster? Knowledge of the subject, and public opinion, have not progressed enough to assent to decided and sweeping measures of remedy, or to coufide their exceuse for this attliexisting agency. There is excuse for this atti-tude of the public, hoth in the devious and mistakeu course of legislation and government, and in the progress of the sanitary inquiry itself.

in the progress of the sanitary indury inset. Having got to this elementary stage,—per-ceiving what should be the position of things, yet knowing the actual position,—we come to consider the question of outfall (the place of outfall, and the manner of getting to it) in the aspect in which it must be viewed. We have seen that, under any circumstances, a considerable proportion of the sowage of London must he raised. Under the present system, of the discharge at a low level juto a tidal river, the discharge at a low level ruto a tiad river, the couchts of the majority of the severs have to be closed during a considerable portion of every day: they hecome "elougated cosspools;" and rainfall is ponded back, and the basements of houses are flooded. Now, in deciding upon the outfall, a main point is, whether the sowage should be used or wasted. When "the general reader" is told that the value of constituents of the Lowdon sexage is unwards of a milliou of the London sewage is upwards of a milliou of moncy aunually, he naturally exclaims against what he thinks the madness of sending ships half across the globe, whilst the same con-stituents of guano are in existence at home. But, as it is well remarked by those who have contributed to the chemical part of this inquiry, the public mind has to be disahused of the notion that the sewage of London, and what are some of its coustituents, are the same thing. The prospect ultimately, of the production or the application of those constituents is in every the application of those constituents is in every respect a hopeful one; hut up to this time, in the words of Dr. Holmann and Mr. Witt, the constituents are "like the gold in the sand of the Rhine," the "aggregate value must he immense, hut no company has yet succeeded in raising the treasure." We have carefully con-sidered the prospect of the disposal of the London sewage hy couverting it into a solid maure. It appears, firstly, that this does not attain the object of entire purification; and, attain the object of entire purification; and, secondly, not the commercial and agricultural a manuer to recommend itself in the ease of London. Some of the processes that are in use, appear to be well worthy of attention in the case of sualt towns, and of workhouses, asylums, and public huildings in the country, of the like character. But the cost of the material which is inclusively the cost of the material one in which is mixed with the sewage, in many cases, is such, that the production of the manure cannot in those cases be looked upon as a source of profit—on whatever other grounds a desirable; and it seems questionable whether much more is effected by elaborate and ex-pensive means, than by the simple deposition and filtration, and mixture with the ashes of the town, as practised at Cheltcuham. Particulars of the Cheltenham works will be found in the report hy Mr. Austiu, --- who has given plans, with some modificatious, of an arrangement of works suggested hy himself. Taking into consideration cost of the added materials, and the valu the cost of the added materials, and the value of the manure obtained, the line process patented by Mr. Wieksteed, and earried out on a great scale at Leicester, is that to which the authors of the chemical report attach the most value. But a comparative table which they give, shows that the concentrated form of the constituents in a ton of guano makes that material actually cheaper than the lime deposit. Six tons of the cheaper than the lime deposit. Six tons of the latter appear to be required for one ton of the other. Hence, without reference to the greater severage of London, and the dispollution of charge for "spreading," and the positive disad-the river; and some of the number are even vantage that there may be us portion of the yet far from heing conclusively settled. The material, if only assumed as inert,—a difference, for example, of about 50 per cent. on the ton, is discovered when the rival manures have been that they dealt rather with the rate-paying

conveyed a distance of twenty miles. The conconveyed a distance of twenty miles. The con-clusion as to the *London servage*, from all evi-dence, seems to he, that it is very douhtful,—on the one hand, whether the commercially valuable form of "deodorization" could be carried on at the outskirts of the town, without what, from the maguitude of the operation, would become even there a serious nuisance, -- and, on the other hand, whether the best of the processes which could he used at the mouths of the number of sewers—such as those existing—could he made commercially valuable. And it must be recollected that none of the processes are allowed, by the hest authorities, to have attained the full oh-They leave the bulk of the valuable constiject. They leave the bulk of the valuable consti-tuents, or of the six-sevenths which are in solu-tiou, in the super-nataut liquid; and this last, it is affirmed, is particularly susceptible to putre-faction—though we see Mr. Dover states the contrary as the result of *his* process. The question of outfall, however, is clearly narrowed, and is divisible into the disposal of the severe-wasting it by clearing into the

the sewage—washing it by ejecting into the susposal of sea, or utilizing it on the land. Now, on the latter head, the reporters on the chemi-cal arctice for the second s eal question, after mentioning some of the cases of successful irrigation with sewage water,— say,—"Notwithstanding these remarkable results, say,—"Notwithstanding these remarkable results, it is extremely doubtful rehether any projuble use can be made of the London sexuage for the pur-pose of irrigation." But they go on to refer to so many points, tending to show that such application could be made to succeed, that we shall deem it necessary, shortly, to go more into the subject to see whether such utilization — if it did not rehum interest of mone as it. -if it did not return interest of money as it has done clsewhere-would not at least supply the outfall, without disadvantage sanitarily, which is the thing required, a question, however, on which we must gnard ourselves against a present conclusion. The report, how-ever, leaves so nuch musaid on the agricultural hranch of the subject, and on irrigation of the subject. that we caunot but regret that in that direction the inquiry did uot extend further.

The position in which the abstract ques-tion of utilization of sewage in the liquid form is left, seems to be this :--is there obtain-able user 1 and 1. form is left, seems to be this :---Is there outant-able near London, ground on which this great and increasing volume of sewage water could be hid, and can such irrigation be carried on in all scasons, and under all circumstances? In the agricultural question is involved that of the quantity of sewage that can he absorbed by par ticular soil, beneficially, —that is, obviating the the necessity for storage, or supplementary outfall, whether to meet the exigencies caused by generally intermittent demaid, or those of sudden accumulation. Such questions the Referees being mable to settle, they have felt obliged to provide in some way, those particular outfalls which they could not be satisfied would be otherwise than needed. All that they felt in the position to aim at was, what would *permit* of the utilization of the sewage,—and in the country lying due east of London. Now, if what appears in the necessity for storage, or supplementary outfall, Now, if what appears in the east of Loudon. blue hook, and in the report of Mr. Austin and elsewhere, will disabuse the public of the ex-pectation of any great commercial advantage from "deodorization" and the production of solid manure, the same authoritics tend to show the ease with which ordinary towns, favourably placed as to levels and adjacent laud, might be dispossessed of their sewage, and how consider-ahlehencfit to the laud might result; and with this limited expression of opinion, for the present we leave the subject.

The large water-supply, and area of rainfall in the metropolis; the different conditions as to sewage and rainfall of theurban and suburbau distriets; the drainage of the marshes, itself a desir-ahle thing for the health of London, and necessary and integrating in containing and necessary to their heing in a coudition to be, as it were, a market for the sewage; and the necessity for considering not merely the "additional" area of the Referces, but possibly every form which is at present draining into the Thames, are so mount points in the meanline modem of the

area, judging by the supposed pecuniary com-petency of Loudouers, than with the true ques-tion, which has no exact connection with the geographical demarcation of the Board's juris-diction. The *physica*, accorrection diction. The physics of the Data spin-lice of the physics of the physics of the the short of the short of

The discharge of sewage into go hal cholign. The discharge of sewage into the river, at points at which it appears it could not hut have returned with the tide; the storage in reservoirs, and the great area from which the sewage was to be raised by artificial means, were the weak points in the schemes of the Board. We fear, however, that the Referees, in seeking to amend these defects, have not thoroughly considered and matured a scheme of their own. They reduce the portion of the area from which They reduce the portion of the arts which which the sewage is to be raised artificially, and add to the area for gravitation,—whereby the outfall sewers and channels have very slight inclination, as noticed in our former article. But further, if we can understand the very imperfect sections-in place of discharge from reservoirs, the emissary (in each case cousiderably below low-water) will admit the tide to flow up, just as it does up the Thames, only with a more dense concentration of the sewage. Supposing, bowever, that the particular feature at the outfall he merely the low-level of the invert, surely the discharge would he possible only about low water, and the sewage would flow up the river with the flood instead of down with the ebb tide; and Mr. Instead of down with the ebb tide; and Ar. Bazalgette is quite justified in the opinion which he has expressed on that part of the proposal. The return to sewers of greater dimensions than have heen lately advocated, on the ground of pro-vision for a larger rainfall, is also a noticeable feature in the design

feature in the design. The plau is put forward as fulfilling the following couditions :-

Ist. The scheme must relieve the low-lying dis-tricts from foods, and from the evils attendant upon a tide.locked drainage. 2nd, The scheme must cleanse the river to the greatest practicable extent. And, 3rd. While removing the muisance from the metro-date of the scheme for the metro-date of the scheme for the scheme for the metro-sch.

polis, the proposed system of drainage should he attended with as little practical injury to, or inter-ference with, other towns as possible.

The plan of the Metropolitau Board adopted The plan of the Alertopoutau board adopted the first of those conditions; hut in the opiniou of the Referees, it would appear did not sceure the other objects. Besides that plan, the Referees considered a large number of other proposals,—the majority of them, how-ever, not sufficiently detailed, or bearing the evidence of practicability. Atomogst the plans and communications were suggestions on many special points; but the majority were classified into schemes, proposing :-

Ist. That the sewage of each house should be col-leted in cesspools, or moveable receptacles of various constructions, reserving the ordinary drains for rain-fall.

tail. 2nd. That the metropolis should he divided into districts of greater or less extent, and that to each district a reservoir should he supplied, into which the swage should flow, to be there decodorised or prepared for utilisation

For diffusion. Srd. That the sewage should flow down to the present points of ontfall in the river, and he there either run into harges, or econverted into manure at these points, the liquid heing allowed to flow into the river.

4th. That the sewage should, after heing collected in central positions, he pumped along lines of pipes into the country, and there be applied to the irrigation of land.

5th. That the mouths of existing sewers should he 5th. That the mouths of existing severs should be connected either with a main drain on each side of the river, or with one central drain in the bed of the river, hy which the sewage would be conveyed to some point down the river, where it would be deedo-rised, or be discharged into the river without deedorzatio

zauon. 6th. That a portion of the sewage should be inter-cepted at a high level, and the rest he intercepted and raised by artificial means from a low level, so as to enable it to gravitate to decolorising works, or to an outfall at some distance down the river, or at some winter on the ore const.

fulfil the conditions of the complete drainage of London. They do not see the advisableness of a return to the cesspool question, or the practica-bility generally of a separation of the sewage and the rainfall. To the low-level conduits, suggested with or without a scheme of Thames embankment, they object that the lower parts of Lon-don would remain subjected to floods, and that the *whole* of the sewage would have to be raised at enormous cost. They also do not conraised at enormous cost. They also do not con-sider that the sewers following the course of the river are practicable. The schemes of other kinds are rejected for reasons which will be here apparent, and the principle of interception advocated by Mr. M'Clean, Mr. Bailey Denton, and others—shown in their plans sent in to the Sewers Commissioners in 1849, and adopted by Mr. Forster—is taken as the basis of the system.

The main question left after consideration of points which we have referred to, was whether the discbarge should be directly into the sea, or in the river, near the month. The Referees dein the river, near the month. The Referees de-cide against the former, for the reasons alluded to in our last article, and which hecame appato in our last article, and which hecame appa-rent from the experiments with floats by Capt. Burstal; and they adopt the other arrangement on the ground that at a particular point in the river, the obb tide is very strong, and that a considerable period of slack water occurs during the flood. But-apart from other matters for further consideration,—bearing in mind that there are two outfalls, one for the northern sewage, and the other for the southern apposite sewage, and the other for the southern, opposite to each other, we hardly understand, since the requirements as to emission are the same, why circumstances chosen as to the tides should not be analogous. Yet we read that "while the ebb tide sets upon the uorthern shore of Sea Reach, the flood tide sets upon the southern shore." Perhaps this only work Reach, the flood tide sets upon the sourcern shore." Perhaps this only needs explana-tion; but the questions which occur to us would not be exhausted even in an article of considerable length. Still we must now of considerable length. Still we must now suggest for consideration, whether every approach towards the sea — advantageous in our respect—may not tend in another way exactly otherwise. The evidence which could be called at a represented to be collected at many seaport towns-and which even is supplied in some parts of the blue hook itself—wouldsbow that sewage does not mix with itself—wouldsbow that sevage does not mix with sea-water, but that the latter tends to increase the deposition on a coast. If that be the case, the question of Loudon sewerage would, as we feared at the outset, he still very far from having arrived at what we called *the logical solution of the difficulty*. What that solution is, it may be beyond our power to state and certify: all that we can now do is to point out some features in the report before us, which appear to have been hastly deduced from the evidence, or on which the latter is weak, and admit that immediate operations are required, though some few millions should be though some few millions should be in an experiment. Such is the result rcquired, swamped in an experiment. Such is the result. which long negligence of the first couditious in the formation of towns has entailed upon us.

COMPETITION DESIGNS FOR MUSIC-HALL AND BATHS, CAMBRIDGE.

AND BATHS, CAMBRIDGE. CAMBRINGE is one of those places which are placed in the awkward position of having outgrown their town-ball. For a long time its public audience has, so to speak, here presenting laterally against the walls of its present assembly-room, and, as a place for public meetings, its days are numbered. With a population of 30,000 souls, the maximum of packing and physical endurance will only find room in the want of increased accommodation became so urgent, that a commany bas started into cristence to correct that a company bas sorted into existence to correct the evil. Since the formation of this company, a counter project has been set up with the object of demolishing the present town-hall and building a new composing the present contribution and building a new one on its site; and it is only to be regretted that the corporation do not feel themselves justified in adding to the already heavy rates for recent improvements, by giving the proposition their hearty and manimum to the already heavy rates for recent improvements, by giving the proposition their hearty and unsatimous approval. The Market-hill is unquestionably the proper locus for the proposed structure, and it is a pity that reasons before mentioned should deter the corporation from taking the matter into their own hands. There is yet a possibility of the scheme being extertained by the authorities; but, in the men time, the company bave scenared the offer of an eligible site in nearly the centre of the town, and in the Builder THE BUILDER.

of July 11th appeared an advertisement inviting architects to send in plans, &e. for a music-hall, haths and washhonses, &c.

The excessively small sum of 50/, was offered as a The excessively small sum of 50% was offered as a premium to the successful competitor, with the pro-mise of being employed as architect of the structure; and it was further made a condition that at least ten competitors should enter or the prize be void. In answer to this invitation, only six geutlemen have come forward, and we have beard it sold that the premium will be divided anongst two or three of those whose designs may be considered most merico-rious. The designs have been publicly exhibited during the present week. No. I, "Alpha," is in style the Classie of Sir W. Chambers. The exterior is rusti-cated Dorie, and curved on plan to obtain width. The interior of the Music-hall has a surhase (or pedestal course), whence rise Corinthian pilaters to support the Museum of Economic Geology, but is deficient in strength. The room is lighted by eurved skylights

strength. The room is figured by Current and the follow the form of the roof. The Musie-hall is figured, 87 feet by 47 feet; but on the floor the plan ouly measures 67 feet by 47 feet, if taken to the square part of the end opposite to the orchestra.

A staircase, 6 fert wide, is the only approach to the room, which is entered by three doors under the orchestra : this latter arrangement eauses the orchestra to be more than 20 feet high in front.

to be more than 20 teet nign in front. In No. 2, "Loodon," the style of which is Italian, the approach is by a staircase, 8 feet while: the orchestra at end of the room is semicircular: the exiling is a segmental briek arch, 51 feet span, rising 6 feet, springing from the top of a brick-and-a-half wall (without buttresses), 26 feet above the floor of the hall! Some of the rooms, &e. would appear to the hall! Some of be without daylight.

be without daylight. When the author deposited his plan, be was asked for bis name, and refused to give it. This is the only desigo by an unknown author. No. 3 is marked "Industria." The style is Italian.

The approaches are not exactly what they should be, recollecting the panie and rush at the Surreythe entrance to the Musie-ball, is by gardens : gardens: the entrance to the Music-ball, is by a pas-sage 5 fert wide and 158 feet long. A second door-way leads into the same passage through a lancheon lobby. The grand staircase is 7 feet wide, and the doorway of the Music-hall is 8 feet wide, so that for exit the passages gradually narrow towards the street. The room is to hold 1,400 person, so that they would pass through the firstum of a wedge, commencing their journey at the base, and making their sortie at the apex.

the apex. The music-hall has a coffered and coved ceiling, instant on a surbase : be-The must-hall has a contered and cover dening, resting upon Corinthian pilasters, on a surbase: be-tween each pilaster is a window of the Ionic order. The lighting generally appears defective, and the roof springs from a brick and a half wall, 63 feet bigh, and spans 63 feet without any apparent tie; it clearly cannot be made of timber.

No. 4, "Quoi qu'il en soit ?" is in style Italian Ionic. This plan provides for a *porte cookber*, with a rather awkward turn at right angles. The author, in a MS. appended to the drawings, says, "the design is Italian in character, and your town possessing so many splendid structures, I can but think that these public rooms should present a creditable appearance."

It does not appear that this design has any refer-tee to a "splendid structure." The music-hall is ence to a irregular on the plan, with transepts: from their junction rises a dome, 30 feet in diameter, and bulbous finial to match. The ceiling is a semicircular vault, ingeniously arranged with bypethral fenestration, and ingeniously arranged with oppetiated tenestration, and supported upon Ionic columns. The music-hall has evidently been eramped to obtain some light for the swimming-bath below. The author writes, "by a practical arrangement, the haths, although apparently covered by the music-hall, are amply lighted and ven-tilated." The "practical arrangement," so far as we could discover, consists in thing some rays of light

conductory consists in the data ground rays of figure where they can never fall. No. 5, adopts the Venetian Gothie style. The approach is by a parte cochère, having au easy curve from the entrance to the exit, naving an easy curve from the entrance to the ext, and hid down with a tramway. In the middle of its length is placed the grand staircase, two flights of *curved winders* (implying danger) lead to a landing, whence rises a staircase, 8 feet wide, for approaching the saloon and music-hall. The swimming-baths are adopted from our Journal, with radiating dressing-boxes in the centre of each bath, and approached by a

The roof of the music hall is a pointed waggon vault, boarded and ribbed, with a boarded cove be-tween the plate and the end of the hammer-beam. The author proposes to support the roof by iron columns from the floor to the hammer-beams, or by iron fie-rods, not shown to the drawing. The hall is lighted by wheel windows in the gables, and small windows in the sides : the windows are too small.

No. 6, "To be or not to be," in style, enriched Italian, ains at less than the others, and perhaps effects more. The music-hall is on the ground-floor, with side galleries after the manner of St. George's with side galleries after the manner of St. George's Hall, Liverpool. The plan is a double cube, with a Hall, Liverpool. The plan is a double cube, with a some circular end: the celling is elliptic and coffered : some of the coffers are glazed. The room has two approaches from two streets; hut the corridors and retiring-rooms are dark. The swimming-baths are retiting-rooms are d lighted by skylights.

The sum to be expended is limited to 7,0007. in-eluding fittings of orchestra, warming apparatus, eluding fittings of orchestra, warming apparatus, chandeliers, gas-fittings, and seats for audieuce.

COMPETITION DESIGNS FOR THE PRO-POSED VESTRY-HALL IN ISLINGTON.

The seventy-seven sets of designs received have been The seventy-seven sets of designs received have been carefully hung in Myddelton-hall, and will remain open to the public till nine o'clock this evening (Friday). Much trouble has been taken by many of the com-petitors, and time and thought have been expeuded, in the preparation of the drawings; and the vestry have reason to be satisfied with the ability elicited and the preparent of work done for them since the end of the preparation of the drawings; and the vesty have reason to be satisfied with the ability elicited and the amount of work done for them since the end of Angust last 1 In return, they will be expected to take the most effectual steps to arrive at a just deci-sion. The advertisement says—" The building is to be ercreted and completed (including the architect's commission, salary of elerk of works, drainage and euclosure) for a sum not exceeding 5,500." This must be remeubered in making the scheetion. The amount is too small : it is doubtful if the accommo-dation required can be obtiful if the accommo-dation required can be obtiful of the scheeting. If conditions do the competitors have forwarded designs which could not be carried out for half as much more. If conditions de laid down, justice demands that the selection should be made with the strictest references to the designs, with blank space for observations, has been printed by the vestry. Twelve designs have: already been selected, it is said, by the committee, and will be proposed to the vestry this, Friday, evening. Glaneing round the two apartments in which the

will be proposed to the vestry thus, Friday, evening. Glaneing round the two apartments in which the drawings hang, and without that eareful examinations of plan, and comparison of effect with eost, which will have to he made, we may notice the variety and fair amount of invention observable in the elevations. The use of the Gothie style was expressly debarred by the advertisement: the Venetian element is largely ob-servable; coloured bricks for the arches, strings, and comises are much word, and a turter time of the and corvices, are much used; and a turret gives cha-racter to many of the designs. The plans mainly oscillate between two arrangements, depending on the

and to the many of the designs. The plans mainly oscillate between two arrangements, depending on the entrance being either io the high road or in the centre of the side. In two cases the entrance is made at the angle; but this arrangement does not recommend itself. Some of the most showy designs depend on the use of "cement." The feeling against the employment of this material, in the way it is ordinarily used, is growing stronger every day: we carnestly advise the vestry to do without it, or at any rate to use it as sparingly as possible. No. 6, "Premeditatus," has a tower (display-ing red and white bricks), and the hall has a domical ceiling, which, remembering that the apart-ment is for talking in, would be a very hazardons form. 18, "Progress," is original and elever, as much so as any design in the collection. The author of it in his descriptive particulars says justly: ---" It may give more trouble and require more pains to supply a design of an original character, and such a one may, notwithstanding, have more faults than a mere copy of some known work, proved already to be excellent; yet in the latter case not one step is gaioed in the progress of srt, hut on opportunily has been lost; while, in the other, if among many faults there are some new heatness or combinations to be found, at least something has been done in addition to what has gone before, and firsh food is presented for the mind of the observer, and some new fieling awakend." The vestry may usefully hear this observation in mind of the observer, and some new feeling awakened." The vestry may usefully hear this observation in mind in making their solection. 32 and 33, "Isling-ton;" 34, "Merrie Isledoa;" and 65, have excellent points, and coll for examination; the latter, however, has the fund server of a work and instruction of the latter. mind of the observer, and some new fe eling awakened. points, and cell for examination ; the latter, however, has the fatal error of a room not right angled. 36, "Lex," is an able design, but, through its three stories of windows all round, does not give the im-pression onicide of the purpose of the building. Several of the designs fail in this respect. No. 37, "Why tington," makes some "turu again" in their passing round the room, for the sake of its arrange-near and will dualities have sufface, themat.

ment, and will doubtless have suffrages, though would not have ours. The want of union between would not not entry. The want of union between the Hall proper and the front building is a grave objection. 20, 37, and 46, have merit in parts. 66, "Faith," gives a good room, but at greater cost ban the conditions permit, and the elevation is somewhat clumsy. 75, "Utilitas," using coloured bricks, shows a elever arrangement of windows; and 77 is an able design, hut must be out of the question, we should think, on the score of cost.

Fir,—You have inserted a notice or two of the competition for the I lington Vestry-hail, and I think now is the dimensional control of the control of the

HAMPTON COURT PALACE.

ALTHOUGH the members of the London and Mid-dleax Archie logical Society spent an agreeable and not uninetra-tive day when they met there on the 5th inst. and wandered through the hall, the court, but next and watered through the hand, the but, the chapel, the picture-galleries, and the garden, we must take the liberty of saying that it was not the right place for the occasion, and that the proceedings were not of a character to forward the purposes of the were not of a character to forward the purposes of the society. No papers were read. The Rev. Thomas Hung gave some particul rs of the foundation of the palace, and Mr. A. White, in the chapel, nitered by Wren, mentioned the construction of the wooden roof which spans the apartment, and carries the sham-valided ceiling if presents, as very peculiar, and calling for illustration. This ceiling is very vividly polyebromed, and the walls are covered with exquisite carvings of the period, from the hands of Grinling Gibhons, the drawing in which is singularly pure and beautiful, and deserves the study of architects. The effect of the room is allor ther mared by the white effect of the room is all of the many of architects. The glass of the windows. Attention was dir, etad to this by a visitor, and the ab-ence of stained glass was pointed to as one instance of the want of completeness pointed to as one instance or one want of compared in in our public buildings :---we always fear to go far When the mediavalists painted every inch in our public buildings:---we always fear to go far enough. When the medievalists paiuted overy inch of woodwork in their churches, covered the walls with paintings, and laid the floor with brilliant tiles, they took care also to fill the window-openings with glass of "many dyrs," so that all was harmonious. In a new edition of Felix Summerly's "landbook for Hamuton Court" as translart little mach

It is now edition or reix symmetry so than over for Hampton Court, an accelent little work, some most valuable extracts from public records are printed, illustrative of the original building and extent of Hampton Court Palace, the state of the arts, and the value of artisans' labour during the Tudor period. These class are mounted than things that the great These show, amongst other things, that the great hall, though constantly called Wolsey's Hall, was not and, using close and can diverse it where a start was not commenced till five years after Wolsey had given up Hampton Coart to K ng Henry VIII. in exchange for the manor of Richmond. He surrendered it in 1525, and in the tenords of expenses, under the date 1531, we find, for example, these entries :

^a Three swers of tynaker (by lacke) for the new scaffalde to take downe the olde hall [were paid] at 12d, every hundred foot. 16 Oct, Anno 22. Carpenters makying of a franyd scaffolde to take down he rouff of the olde ball, every of them [paid] at fd the day.^a

at 6d. the day."

Further :-

"Laborers helping to take down the olde hall [received] 4d. the day." And .-

"Warden and seiters takyng down of the freeston of the olde ha'l [paid] 3s. 8d. the week, each of then

Our readers will thank us probably for a few items, as to the labour of bricklayers, masons, and car peuters, in eracting the present hall :---

"Bricklayers working in and uppon the founda-ions of the New Hall, every of them at 6d, the day. March, anno 23 H. VIII.

Free masons, at 3s. the weke, every of them working in freston uppon dores, wyndowes, coynes for buttresses, and gresse tables for the Kynge's New Hall

Carpeaters working uppon the flowres of the said Hall, every of them at 6d, the day. In March, anno 23.

Carpater's for working in their howre (ymys and dynkyng trunys upon the H-II rought for the hasty expedicion of the same—every of them rated for every 0 hoves 7d, in all unougs them."

Jeiners were paid at the same price. In May,

The following entry refers to portions of the hall which are obvious, and increases the interest of an examiuation of it ---

severalle fre stones for the repryses of the Kynges New Hall, whereof two of them curyously engraved severale the stones for the reprises of the Krigers New Hall, whereof two of them curyonsly engraved wyth the Kynges arms, wyth the crowce, and two of the Kynges beste stande at the upper ende of the sayd H.dl, and ten other of the sayd stones imsing H-HI, and ten ohter of the sayd stones in-graved, five of them wyth roses, and other five wyth potteolos, every of them wyth two of the Kynges bensis counteryng one agenst an other, stand on ether syde of the sayd H-HI, and other rest of the sayd 16 stones ingraved with the letters H and R; every of them wyth the erowne stand in the four anguls of the same Hall, takting for every of the sayd stones soo brought, elensyd, and fully fyn-yshed, by convensyon, 22». 64."

Jopners.—The Master at 13d. Seventeen others, who are named, received 7d. the day. One 6d. who are named, received 7d. the day. One 6d. Two 4d

Paynters.-The Master at 121. Three at 8d; ad one 'grinder of colors,' at 5d the day."

Want of space prevents us from going further with these records. The gardens were in heautiful order, and the day, as we have said before, was spent very pleasantly

NEW MUSEUM AT THE INDIA HOUSE, LONDON

Some considerable alterations, to give in creased space for the collection of models and works of Indian art, have beeu going on at the India Ifouse for some time past, under the direction of Mr. Digby Wyatt, the present architect of the Company; and though the Directors have now something else to think abont, the works are being completed, and the collection arranged for public inspection. What was the Tea Sale-room has been transformed

ГОст. 17, 1857.

"Payd to John Wright, of Southe Memys, fre nson, for workyng, karvyng, and intaylling of 16 veralle fre stones for the repryses of the Kynges ew Hall, whereaf two of them curyonaly engraved yth the Kynges armes, wyth the erowne, and two f the Kynges beste stande at the upper ende of the yth Hall, Mark and the upper ende of the yth Hall, where is and the upper ende of the yth Hall with the stand the upper ende of the yth Hall with the stand the upper ende of the stand the up The deputy sccretary's residence, and other parts, have been thrown into the Museum; and he whole now occupies a considerable s ace The amount of the contract is about 2,500%. with the fittings, the sum will prohably amount to 3,5007. Messrs. Hack and Son, of Poplar, are the contractors. The collection at the Iudia House is one of

great interest : those who would study Indian architecture must go there to do it. Of minute carving and metal-work, there are some beautiful specimens.

The first establishment of the East-India Company, we may remind our readers, was by charter of Queen Elizaheth, dated December 31, 1600. This was renewed by James I. in 1609, and at other times by other sovereigns. 1609, and at other times by other sovereigns. About the year 1773, money was lent to the Company by the country, and the Company was placed under the control of the king's ministers. The present huilding, on the site of an older structure, was commenced in 1799, from the designs of Mr. H. Jupp, architect to the Com-pany. Parts were alterwards added by Mr. pany. Parts were alterw Cockerell and Mr. Wilkins.

Dreadful as the recent much-to-he-deplored events in Iudia have heen, they will prohably hring great advantages to the humau race India will be more entirely ours, and the pro-gress of Christianity and civilization more certain and rapid.

WORCESTER CATHEDRAL.*

WorkESTER CALIFORNIA CALIFORNIA (IN NOR CONTROL OF A STATE OF A ST choir, made first into three principal divisions, of which the central and widest one terminates to the east in a semicrele: this is again subdivided by two ranzes of bearing shafts into three avenues, and the middle one bisected again by a row of shafts down the middle. The shafts are of moderate diameter, the section of the abaens, the usual Early Norman one, and the eaplied evided by a row of shafts down the middle. The shafts are of moderate diameter, the section of the abaens, the usual Early Norman one, and the eaplied evide in assess overhanging the shaft, nud rounded off at the corners--what has been called the cushine capital, -to be found, I believe, in the Romanesque of every country in Europe. These earry flat, broad, transverse bands, which the them together, and bound every compartment of the roof, together, and bound every compariment of the roof, which is Roman quadripartite vaulting. I remarked on some parts of the wall very well-preserved painled disigns, one an architectural design of a trefoil-headed prode and some scanticectural during with distances. usigns, one an architectural design of a freforl-headed arcade, and some escutcheous quartered with *flears de Us* and lions rumpont, so that these can scarcely lay elaim to an antiquity higher than the twelfth ceutory. To the crypt itself is attributed, as in the case of all similar localities, a fabulous, or rather a legendary origin, St. Oswall receiving the honour of heing the founder. This is manifestly alawal its data chard founder. This is manifestly absurd, its date clearly not heing carlier than the Conquest, and perhaps not much later than that event. There is no part of the building i viewed with greater interest than this sub-terranean relic of a remote age, once the scene of the worship of our forefathers-now the receptade of their ashes,-nubecded by all save the inquisitive explorer, though in truth it may be regarded as the mine containing the rugged ore which the genius and patient thought of successive lahourers gradually elahorated into the richest and most cherished gems of Mediceval architecture.

Of the screen of Portland cement which closes the choir to the west, -hideous beyond the power of words to describe-affecting an imitation of Early works to deserved—attecting an imitation of Early English below, and running up into vertical panel-ling and hattlemented parapet above—of the similar obstruction which shuts up the sides, and breaks the connection between the choic and the Lady Chagel— a little less offensive in style and material,—I shall content myself with remarking, that the only senti-ment excited by these differences is different to the sentence. content anysen with remorking, that the only selfi-ment excited by these disfigurements is an earnest hope that the day may not be far distant when every Cathedral shall possess a dean and chapter with suffi-cient love of the art, sufficient knowledge of its prin-ciples and taste in their application, to prevent for all time to come the perpetution of similar har-barisme

Of the numerous tombs, to be found in this cathedral, I shall designedly omit all description, because, though of great interest and value in an archeeological

* See p. 559, ante.

view, my present purpose is to confine myself to sub-jects strictly architectural, in which category the cele-bratel Morknary Chapel of Prince Arthur may be fairly included. This monument is raised in the south brated Mortuary couplet of Finice Aroan may be fairly included. This moument is raised in the south branch of the lesser transept, and the proximity of the scene of the prince's death. Ludlow Caslle, Sidon, to Worcester, may account for its eathedral having been selected as the place of his interment. This chapel is said to have been completed in 1504, two years after the death of its occupant. It is a very elaborate and perfectly preserved specimen of what I should call a happy compromise between French Flamboyant and Daglish Perpendicular, avoiding alike the stiffness and formality of the vertical lines of the one, and the extravagant waving forms of the other. I an much mistaken if it be not the work of a foreign artist. The design of the tracery of its oprn-work parts is very pleasing,—the stander buttressets dividing the compartments with their ogee-formed overhanging vertadeau with decoration, and the general result is a combination of richness and sobriety not often overlåden with decoration, and the general result is a combination of richness and sobriety not often attained in productions of the stateenth century. The parapet which crowns the chapel is unnsually lofty, and in this perpendicular lines predominate. The in-terior is roofed with a flat ceiling, made the field for a display of elaborate stone-enting, and from it hangs a pendant near each end, sustained by a stone rib rising from the wall, and abuting at its uper rad against the pendant. The solid part of the chapel is literally covered on the exterior with very well out and deep carvings, smidst the variety of which I discovered the rose, portcullis, fetterlock, the garter with its motto, the angel with expanded wings and scroll, hundles of arrows, prince's feathers, and feathers, and and scroll, hundles of arrows, prince's feather the pomegranate-badge of the house of Arragon

gater with its motto, the arget with expanded wings and scroll, hundles of arrows, prince's feathers, and the pomegnanate-badge of the house of Arragon. Of the exterior it is not necessary to asy much. Of few of our exthedrals is the general outline so little siti-factory, and the details present, indeed, a mednachdy aspect. It is quite impossible to fix upon a single feature which can be offered as a plessing i dilustration of any period of architecture. Not a frag-ment of a pierced parapet to lighten the heaviness of the walls,—not a single buttress betokening acquaintance with the fact that these members may contribute to the beauty as wall as to the solidity of an edifice—not a turet or pinnacle of the origical construction. Here and there are some slight indications of an earlier building; coveral perbags with the transitional part of the interior,—omong which may be named some immines of the porch on the north-west side, and a few buttresses of very shallow projection, with a shaft at each correr. The circretory windows of the choir are of the mort disagreeable form, two straight lines i meeting at the apex, slightly curved at the lower extremities. The oally portions of Early English construction retaining their primitive form are the windows in the side, and one front of the smaller transept; and even these are marred by the intro-duction of tracery of the Preparaicular period. The central tower, though not displessing in its proper-tions is hut a poor example of a style so rich in this ine extremal feature = nothing cas be more meagree than the panelling of its roof stage; more unsightly unadored with creckets or finids; more insignificant then the states and enopies of its belify stoy. The angular buttresses and turrets I presume to be emaan-tions of the great masspir into the preside divide the interior of the great transept into the preside due to the sing in the avector spoke. The external restorations just completed are briefly that the avelar to the preside donie of which i have heave and the

The external restorations just completed are briefly The external restorations just complete are break, these. At the west front the galie has been rebuilt, and the angular buttresses replaced. These are very plain, but perfectly suitable to the character of the front—of three or four stages upwards, mirked by Fout-of three or four stages upwates, make sy-plain set-offs, or triangular enapy, carrying large crockets and finials. The south front of the castern transpt has been restored, in strict accordance with the opposite one. The east wall of the Lady Chard crockets and finits. The south front of the eastern transet be such on what house - it will descend in the source of the constant of a source of the constant of the source of the source of the constant of the source of the source of the source of the constant of the source of the

our Early English churches as the imagination can figure to itself.

Ingure to itself. The cloist rs, situated to the south of the cathcdral, will not repay a lengthened examination. The tracery of the arches which once surrounded the quadrangle bas heen cut out of every one. The vaniting of the corridors, however, still remains, a very good example of the Perpendicular period, and there are other parts of the old Norman work which are worth looking at. There of a cimular ended document the others of These are a circular arched doorway, the entrance on the south side, with five shafts in the sides, carrying the south side, with five shafts in the wider, carrying as many concentric ritring orders, with roll-formed edges, some of them carred. The wall of a covered passage leading to the cast end of the cathedrel is relieved by an arcade of round arches on attached shafts, with rule cushion capitals, and is another pas-sage, conducting along into the north side of the cluster, there is a pointed transverse arch, orun-mented with the Norman zig-zag, and a few compari-ments of Transitional valiting, with chamfered diagonal ribs ribs

But the most interesting and important relie of the Norman era is the Chapter-house, nearly in an unal-tered state. Externally a regular decagon, it assumes the circular form within. In the centre rises a single shaft, from which radiate the roll-formed ribs of the vaulting, and fall upon shafts attached to the wall, hetween the windows (Perpendicular ones replacing the old ones). Above each window subordinate vault-ing cells rise into the princip d vault, intersecting it at a point helow its vertex, after the manner of Welsh vaulting cells. A billet-cott string runs hencath the windows, and helow, the wall is ornamented with an a reade of interlacing semicircles, every pointed com-pariment thus produced euclosing a smaller round-But the most interesting and important relie of the arcade of interlacing semicircles, every pointed com-pariment thus produced euclosing a smaller round-headed panel on attached shafts. Thence to the floor shallow circular-headed niches are scooped out of the solid surface. The capitals are of the cushion form, and the arcade is formed by sunk surfaces, without the addition of mooldings; and yet nothing can be more pleasing than the effect produced by the employ-ment of means so simple. In this elected of the acthedral of Warrester I

In this sketch of the eathedral of Woreester, I In this sketch of the cancelat of volcest, a hope I have conited no important architectural feature which can aid in arriviog at a comprehension of its various styles, and that I may have succeeded in con-veying some idea (an imperfect one it must precessarily be) of its most conspicatous heauties. I ought perhaps earlier to have noticed the fact of the total disappear earbin to have noticed the fact of the total disappear-ance of the ancient stained glass, of which I do not believe a single square survives. As a compensation, we have three or four modera painted windows, but as my recollections of the glorious specimens of this heautiful art in continental charches, and in many of autiful art in continents: chircles, using the disparagement r own too, incline me somewhat to disparagement the efforts of the revivabsts, I will express Viaron. Viaron. our opiuion upon them.

CHOLERA THREATENING.

HAMBURG has ever heen our warning; and now again Hamburg has been attacked by the dread king HANDURG has ever heen our warning; and now again Hamburg has been attacked by the dread king of epidemics. It may be a nice question, for the moment, whether the precise degree of cold which has now superseded the summer heats be sufficient to check the growth and progress of the ferment till next year; but there is too much reason to believe that next year will be a time of slaughter in England scarcely less horible, and far more extensive, than that which now is delucing the towns and fields of upper India with blood. In the midst of this sad prospect, however, there is hope that in many fowns throughout England, where sanitary efforts have heen made, there will be a decided triumph over the great enemy, although in others a deally defeat. The direct and powerfol ioffucuee of cleansing processes in paralyzing this fell destroyer has been proved over and over orgain. Nay, we now know precisely what class of persons will furvish by far the greater number of vietins to cholera, and on what street—i may almost be said on what house—it will descend. We can lay our fingers, without the slightest liability to error, on the weak places which it will assail and invest. If such knowledge as this had been imparted to us without power of averting the changer, we must

the most important suggestions offered. "First, that the air with mad about dwelling-places he not con-taminated with offensive organic effluxia, such as arise when the houses themselves are ill-ventilated, over-crowded, and unclean, or when their refuse is not properly removed from them by drainage or otherwise, or when any Bithy accumulations exist in their neigh-bourhood, or when the local sewerage is defective. Secondly, that the public supply of water be, as far as possible, anpollnted by any kind of animal or vegetable impority; for where cholera is present or impending no house can be considered safe for habitation in which there is any offensive smell of animal refuse, or of other putrefactive animal or vegetable mater; and no water can be considered safe for drinking into which there flows (as is often the ease with hivers and with wells in the neighbourhood of houses) any which there nows (as is often the ease with rivers and with wells in the neighbourhood of houses) any habitual discharge of town refase or any accidental soukage or leakage from drains or ecespools." Full details are also given of the powers possessed by the local boards noder the Public Health and

by the local boards moder the Public Heatin and Nuisances' Removal Act, and which ought stringently to be exercised at this time. They relate principally to matters of severage and drainage, and generally to the prevention or removal of all impurities which taint the atmosphere or hinder the diffusion of per-soual and domestic cleankness. The following obser-soual and domestic cleankness. soul and domestic cleanlaces. The following obser-vations can scarcely be too widely circulated and re-garded at the present moment :---

"It is possible that no human efforts may suffice to avert the course of that epidemic ferment which thus, avert the course of that epidemic schedules, as it were, to test at certain intervals of time, comes, as it were, to test the sufficiency of our sanitary defences. But public authorities, armed with the existing powers of the law, can do ahnost everything to render the mysterious influence innoceous, by removing those local condi-tions through which alone it is enabled to destroy life in this alignet. in this climate.

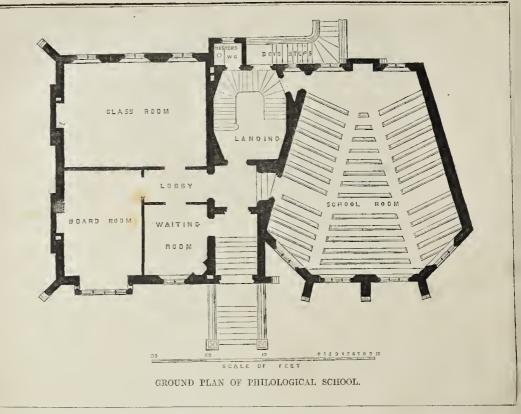

in this climate. Local hoards may be well assured that, if any precations adopted by them against cholera should bereafter seem to have been superfluous in relation to the epidemic—if the augested possibility of another visitation should happily not now he realised—the paios and cost which may have been given to senitary improvement will in no degree have been wasted; since oudouhtedly such exertions will have horne fruit in preventing other disease, and in lessening both the misery and the expense, the waste of life, and the waste of money, which are now the consequence of defective sanitary arrangements." defective sanitary arrangements,

Other authorities hesides the Central Board of Other authorities besides the Central Board of Health are already moving in this matter throughout the country. The Health Committee at Liverpool have had some discussion on the subject. At Tyne-mouth, the town-council, as the local heard of health, are said to he adopting measures for the conservancy of the public health, and none know better than the Tynemouth people, from happy experience, the immu-nity from attecks of cholera to berealised by attention to the proper sanitary measures. In London itself, the medical officers of health have been calling attention to many nuisances which ought forthwith to be abated; and particularly to the disgusting condition into which the arches and other portions of the Tarringdon-street or Clerkenwell "improvements" Faringuon-street or Cierkenweit improvements have again fallen, as well as to the accumulations of filth in such waste places as those in Aogel-alley, Bishopsgate-street; Willis-court, Brackley-street; Haif Moon-alley, Little Moorfields; Feather-hed-hill, Moor-lane; and Sussex-place, Leadcahall-street.

Moor-lane; and Snisex-place, Leadenball-street. All this is in the beginning, of course; and doubtless within the next few monihs there will be such a elcausing process going on throughout the country as it has not had for some years. Botter late than never; but were such processes to become perennial, as we have long laboured to render them, they would im-mensely contribute so to promote the general health as to caable it to withstand and defy the cheleraic virus at all times or at any time or place it might bancen to annear. happen to appear.

THE BUILDER.

[Ост. 17, 1857.

PHILOLOGICAL SCHOOLS, NEW-ROAD, MARYLEBONE.

594

THESE schools are huilt in the style of the Domestic architecture of the fourteenth century. The materials used are red brick facings with Bath stone dressings. A handsome flight of steps leads to the entrance-porch opening to a lobby, from which rises a star-case of Portland stone ascending to four spacious class-rooms, arranged for various purposes on the respective floors. The ceiling to the starcase is of oak, with earved bosses at the intersection of the paaels. On the ground-floor is a theatre or lecture room, eapable of ac-commodating 200 pupils, in the form of an elongated hexagon, roofed with massive arched ribs springing from the angles resting on stone corbels, the whole heing surmounted by a ventilating turret. By this arrangement a picturegne elevation is obtained ex-ternally. A plaground for the boys in wet weather is formed under this portion of the building. Besides THESE schools are huilt in the style of the Domestic the theatre and class-rooms, there is a board-room, panelled with oak, lighted by an clahorate oricl window. There are various other rooms and conwindow. Here are various other rooms and con-veniences suitable for the domestic arrangements. The building has here creeted from the designs and under the superintendence of Messrs, W. G. and E. Haber-hon, architects. The builders are Messrs. Thompson and Crosswell, of Islington. The contract was taken at 3,093/.

WARMINSTER ATHENÆUM. A HINT.

WE are not of those who would altogether decry eclecticism, but those who select and join must at any electicism, but those who select and join must at any rate select what is good and produce harmony in joining. A huilding is in course of crection at War-minster, Wiltshire, for the purposes of the Athenwum and Literary Institution, at the cost of 1,3257, which, if finished in accordance with the view of it given in the *Illustrated News* last week, will be a constant cause of ridicule and vexation. Such a strange mixture of the mandulterated forms of the late Gothie and the London Dwelling, house Italian style was weak-blt and Literary Institution, at the cost of 1,3257, which, if finished in accordance with the view of it given in the *Illustrated News* last week, will be a constant that it was soundly carried ou, and at the end of the cause of ridicule and vexation. Such a strangemitture of the madulterated forms of the late Gothie and the London. Dwelling-house Italian style was probably and Iothie strings, are joined with rusticated quoins and Italian balusters: a horizontal piece of Gothie hay window, label mondling over some of the windows is carried on trusses, and, most incongruous of all, the doors,

We speak more harshly than usual, in the bope as the building is in progress only, that we may induce reconsideration, and so prevent what would certainly prove very unsatisfactory.

DISTRIBUTION OF MEDALS

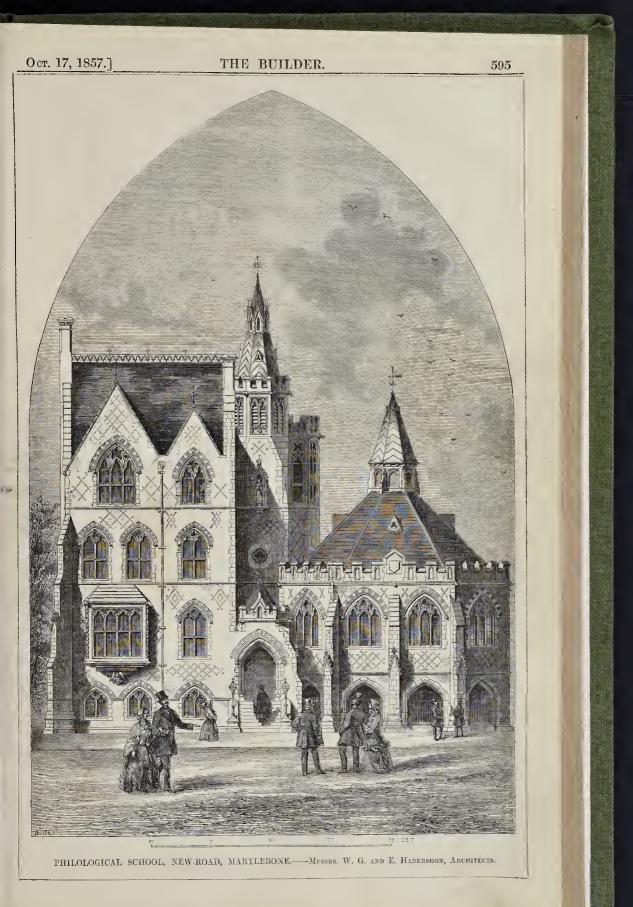

BY THE DEPARTMENT OF SCIENCE AND ART. MANCHESTER.

MANCHESTER. THE annual distribution of the national modals for drawing among the students of the Schools of Art of the United Kingdom took place in the Manchester Town-hall, on Friday evening, the 9th instant, under the prize designs by students in all the schools of art in the kingdom had previously been opcoed at the Manchester School of Art. Mr. Edmond Potter, the chairman of the com-mittee of the Mauchester. School of Art, having com-menced the proceedings.

menced the proceedings, Mr. Redgrave explained the course followed in schools of design or schools of art, in order that the schools of design or schools of art, in order that the system on which the awards were made might be pro-perly understood. A system had here adopted by which education was now given in all schools for the poor, and so given that any town in the kingdom ingist avail itself of the opportunity to receive this instruction. Any town which chose to take the trouble of registering 500 students, or 1 per cent, of the population, who were willing to pay 6d, for in-struction for oce year in drawing, might have a master recommended who would undertake for that small sum the instruction of those 500 children for one year, giving them one lesson per week. The State forther nadertook to test this instruction, to see that it was soundly carried on, and at the end of the year would send an inspector down, and hy means of papers from which there was no escape would examine those boys who chose to ecome up for examination.

one on each side of the façade, have a "frontispicee" to the master, which was in sid of the mere 6d. he of columns, entablature, and a broken pediment, with a bust in the opening. We speak more harshyl than usual, in the bope as

The top by the twelve twelve has instituted, as a reason for not delivering the medals that evening, that de-siring to give the very hest work of art that could he-or-sined, they had been obliged to go to a foreigner to produce the die. He hoped that on future occasions 25 " b art would stand well enough to produce its-ow. adals, hut on this occasion the medal would be the work of M. Vechte, whose works stood forth pre-eminent in the great exhibition in Paris. M. Vechte was engaged to give them one of the finest medals be-could produce, and aid he was using all his efforts to produce one of the choicest works. Several years ago the Art-Union of London set forth in a special report, which was extensively eiter-lated, and received the attention of a committee of the House of Commons, the want of encouragement in this contry to medal-die engravers, and the conse-quent fewness of artists in that department, and the Art-Union commenced a series of medals in honour of British artists, which has heem regularly pro-ceeded with, and is now of some extent. There is still little encouragement for the prosecution of the art, and the number of efficient professors is singularly small. Returning from this digression,----Lord Granville delivered a very interesting address, showing the need there was for the establishment of followed the efforts already made. " I believe it is a result," said Lord Granville, "to find that the students, in these schools in the last ten years have become exactly ten times more numerous than they were ten year ago. I think it is a result to find at an opsitive fact, that almost all the most eminent porec-lation manufacturers, almost all the most eminent porec-lation manufacturers almost all the most eminent porec-lation manufacturers almost all the most eminent porec-lation manufacturers almost all the most eminent seven years ago. I think it is a result to find, as a positive fact, that almost all the most eminent porce

CHURCH-BUILDING NEWS

Higham Ferrers.-The church of Higham Ferrers is to be thoroughly restored under the direction of Mr. Slater. The works will comprise the rebuilding of the north aisle and arcade, and the removal of the roofs throughout: it is also intended to resear the whole with open seats. The amount to he expended is about 5,0007. The contract has been taken by Messrs. Ruddle, of Peterborough. Walsoken.—At n meeting lately held in the vestry

of Walsoken church, the new rector, the Rev. G. Davies, laid hefore the meeting plans and estimates for the restoration of the church and the erection of schools, the sum required being about 1,200/. The schools, the sum required being about 1,200. The rector commenced the subscription with the sum of 2007. Mr. R. Young followed with 1257.; Mr. E. Jackson, 757.; Mr. W. Sharp, 357.; and before the meeting separated the sum exceeded 500?. *Tranmere.*—St. Paul's Church, Lower Tranmere, has been consecrated by the Bishop of Chester. The church, which stands io a field near the Old Chester-end, is how the strong of the Taylor Chester.

control, which is taken to a mark the Carly Decorated style. It consists of a nave and transport, with chancel and organ aisk, with steeple at the south-east angle of the chancel. The nave is 38 feet wide, by angle of the chancel. The nave is 38 feet wide, 75 feet in length, and 52 feet high. The transept 75 feet in length, and 52 feet high. The transept is 70 feet by 28 feet, and the chancel 30 feet by 26 feet. The steeple, which is not yet built, will be 147 feet high. The roof, which is simple, is supported by oaken beams and joints, burnished of a natural colour. The church at present holds 700 per-sons, but when galtries are placed in the tran-septs, there will be room for 350 persons more. The architects of the church are Messra. Hay, of Liver-pool. The total cost was 3,100′, all of which has heen raised by the committee and the residents in the neighbourhood, who also previously huilt a parsonage neighbourhood, who also previously huilt a parsonage and schools, which cost upwards of 1,000/. The steeple has yet to be huilt, at a cost of 500/.

Glouester.—The cemetry for this eity has now been consecrated. The ground is situated to the south-east of the city, towards Robin's Wood-hill, and near Tredworth and the road to Painswick. Messre. near Tredworth and the road to Painswick. Messra. Medland and Maberly, of this city, were the archi-teets employed; and Messrs. Wingate and Sons were the contractors for the erection of the chapels, lodge, mortuary chamber, houndary walls, and entrance-gates; and Mr. Thompson for the road-making and drainage." The cemetery is ubout thirteen acres in extent, eight of which are appropriated to the Church of England, four for Dissenters, and the romaining portion is occupied by roads and footpuths. The approach from the Painswick-road is by a new mac-adamised road and footpath, and the boundary consists of a dwarf stone wall, with uiers and iron railing. The of a dwarf stone wall, with piers and iron railing. The entrance-gates are of wronght-iron, executed by Mr. Rogers, of Tewkeshury. The chapels are in the De-Rogers, of Tewkeshury. The chapels are in the De-corated style of thirteenth century: they are placed side by side, and connected by two vestries and an archway. Each chapel is 35 feet long and 18 feet wide, with open timber roof, stained onk, and var-nished. Over the central archway rises a stone spire, nished. Over the central archway rises a stone spire, upwards of 80 feet high, sarmounted by a vane. The tower contains a bell weighing 6 cwt. and a stone staircase is provided for access to the belfry. Each gahle of the chapels in the east elevation is pierced with a three-light window, filled with Decorated which as three-figure which which which become tracery of a Geometrical character. The goldes in the west elevation are each pierced with two two-light windows, and cache gable is summounted by an ornamental eross. The side elevations of the chaples are broken by the porches; one can the south side forming the entrance to the Dissenters' chapel, and conders on the averth forwing the external to the another on the north forming the entrunce to the Episcopal chapel. By this arrangement the chapels Episopal chapel. By this arrangements the same are kept entirely distinct and separate as regards religious rites and coremonies: at the same time, being connected by the vestries and archway, they units to form a whole. The ground has been drained unite to form a whole. to a depth of 10 feet. The ground has been

to a depth of 10 feet. Berwick.—At a meeting of the trustees of Golden-square chopel here, for the purpose of deciding on a plan for the proposed new chapel to be erected on the Parade, the plan with the signature "La Vérité" was fixed upon. This plan was furnished by Messre. Hay, of Liverpool. The resolution was carried by a majority of two votes, the numbers being dight to six, the rest of the twenty-four trustees and twelve clares burning decimal to reft. Another substitution of the size of the decimal to reft. Another substitution of the size of the twenty-four trustees and twelve clares. having deelined to vote. Another plan, that signed "Theory and Practice," had six votes. Mr. Ifay Incory and Fractice, had BX Votes. AT. HSy submitted two plans, or rather one plan with a modi-fication. The first includes a spire, which, however, would iovolve an ontiay of 6000, over the 3,0000, to which the coverygation have restricted the expense : the other is identical with the first, exclusive of the spire, and this is the one accepted. The building will the other is identical with the first, exemise or no spire, and this is the one accepted. The building will be constructed in the Middle Pointed style of archi-tecture, and will be capable of accommodating on the ground-floor 770 persons, and in the golleries (which are small) 238, making a total of 1,008 sittings. The huilding will be cruciform in shape.

THE BUILDER.

Llandinorwig.—The ecremony of consecuting a church, newly erected in this mountainous and com-pratively unknown region of Carnarvonshire, was performed on Thursday in week before last, by the bishop of the diocese. The site of the building is an elevated spot on the left hand side of the road, between the two performed of the has here hitter to have no elevated spot on the feit hand side of the road, between the two portions of what has here hitherto known us the village of "Ebenezer," just before arriving at the turning towards the slate quarries, on the road leading to Llanberis. It commands an extensive view of Caranyon harbour, Anglescy, and the Menai and tubuler bridges. The school, --a structure ut the right side of the road, and south-west of the church,--was first erected, and a minister licensed to hold services and preach there till the more pretentious ed designed for the congregation could be completed This school is calculated to contain 800 children. The ld be completed. church is designed in the Second Pointed style, and consists of a nave, which is 56 feet 6 inches long, by 18 feet 6 inches wide; north and south aisles the same length as the nave, but 15 feet wide, and divided from it by arcades of five arches; a channel, 25 feet 6 inches long by 16 feet 6 inches wide; a south porch; robingroom on the north side of the chancel; and a tower sad spire, which are placed at the west end, the lower story being thrown into the hody of the church, by means of a lofty arch. The whole length of the church is 93 feet 6 inches internally, from east to near the second sec course is to be the binders internality, from east to west. All the dimensions gives are internal dimen-sions. The sittings and fittings throughout are of pitch pine, lightly stained and vurnished, and the sittings are calculated to accommodate from 550 to strings are estimated to accommonate from 500 or 600 persons, although on the occasion of the opening there were many more than that number present. The east window, of tracery, is filled with stained glass. The architect was Mr. H. Kennedy, of Bangor, gues. The arcmet was Mirit. Reinford, to Bankov, and the works have been antirely carried out by Wedsh workmen, nuder the direction of Mr. Jaha Jones, foreman of the building department at Port Dinorwic. The whole of the carving has been excented by Mr. Evans, including the font and corhels in the chancel, representing angels holding sacred emblems. The representing angels holding seared emblems. The corbels and bos cs in the remaining part of the editee are carved in a variety of devices and patterns. The roofs are of deal, stained, and opened to the ridge, which outside has an engrailled slate ornamental ridging. There are double and single lighted windows in the aisles, the larger once heing placed east and west, the smaller ones north and south. The external elevations cards and west, show there carbles. The west, the smaller ones north and south. The externoil clerations, east and west, show three gables. The floor of the chancel is hid with encaustic tiles, and the furniture is by Mr. Griffith Davies, of Bangor. The churchyard is surrounded by a suck fence, and an iron railing next the road. The entrance-gates, which are of wood and iron, are placed back from the road in a semicircular recess. The warming of the church, but the semicircular recess. are of wood and iron, are placed back from the road in a semicircular recess. The warming of the church, which is hy heated air, was laid down by Mr. W. Bennett, of Liverpool. In addition to the church and school-room, with the sites, the graveyard, and an endowment of 2004, per annum, Mr. Assheton Smith, to whom the congregation are indebted for the errotium of the whole, has caused to be built, at the north-cast end of the churchyard, a bonse for the conductor the advergent and and the whole work has residence of the chergynary, and the whole work has been designed and accomplished without regard to amount of expenditure. The exection of the church and parsonage, we hear, will cost 7,0007.

Kilkenny .- The Roman Catholie cathedral of Ossory has just been consecrated. The edifice is crucilorm. Its length from the grand portal to the recess behind the great alter, is 162 fect. The nave is 30 feet in width, and the aisles 15 feet wide each. The total width of the nave and aisles is 60 feet, and the breadth of the building at the transepts is 100 feet the breadth of the building at the transcripts is 100 feet. The tower, which springs from four symmetric urches at the junction of the nave with the transcripts, rises to a beight of 186 feet 6 inches, measuring to the top of the pinnedes. The crypt und chancel of the church form a space describing five sides of an ota-lit herits in hereafted whether shows and fine gon, lit by nine lanccolated windows above, and five helow. Three of the upper windows, and ull the lower, are filled with stained glass. The transepts are lighted by triplet lanccolate windows of stained glass, with smaller windows at the sides. The transept doors are enclosed by monlied Gothic portals, comprising eut pillars nud urches, somewhat similar to the side doors of Christ Church Cathedral, iu Dublin. Beneath the crosses on the gables are carved niches, with eanopies, for the reception of statues. There are also niches above the doors. Each of the transepts is fanked by two towers, surmouted by open panel-work in cut stone, and carved pinnacles. The grand window over the principal extrance at the front gable is fluuked by towers. This window is divided into six compariments by stone multions : these compartments inclose panels of stained glass representing the stages inclose panels of standed glass representing the stages of the Passion of the Redoemer. The interior is Mr. Sibled's tender was accepted, conditionally with divided into nave, aisles, choir, transepts, crypt, and side chapels. The nave is divided from the aisles by five stone arches, supported by symmetrical pillar, commention of on the system, remarks the *Gateshead Observer*, commention of on the system, remarks the *Gateshead Observer*, commention of on the system, remarks the *Gateshead Observer*, and Above the searches supported by symmetrical pillar.

ГОст. 17, 1857.

lanceolate arches, giving a borrowed light to galleries running above the ceiling of the aise. Above these opes are placed triple Gothic windows, corresponding with the arches. From brackets hetween the windows, trellissed raiters support the carved ceiling of stained and ornamented wood-work, with a coraice running the entire length of the nuve. The floor of the church is a mossic of black marble and white stone. The chair is approached by steps of black marble. The interior of the tower is open, and ornamentally ceiled at a high elevation. The sanctuary is approached by two farther steps of black marble. The high altur is constructed of varieties of Italian marble, gilded at the margins' mouldings of its parelled coupartments. It is surmounted by a carved marble tabernade. In the centre, over the tabernade, is a large gold cross. At either side of the church are voive changels, one of At either side of the church are voite ethnics, one of the Virgin and the other of St. Joseph,—the altar of the Virgin's chapel being similar to the high altar, hut of smaller proportions.

PROVINCIAL NEWS

Norwich. --The statue gallery and class rooms of the Norwich Government School of Art have been re-coloured during the vacatiou, and the ventilation made complete. The casts have been classified and made complete. arranged so that visitors can more conveniently the collection.

Brainfree.—The new factory of Messrs. Walters and Co. of London, which has been creted in this town by Mr. Laver, builder, for the manufacture of figured silk, is just finished : it is 75 feet long, 30 feet

wide, and it has two floors 12 feet high. Wootton Wamen.-The new national schools and *hootion waren*, - The new national schools and teacher's residence which have here lately built here were opened on Michaelmas-day. They are crected on a commanding situation hetween this place and Henley, such form a pleasing object from the road. The buildings were designed and crected by Mr. G. Clork of this values Clark, of this place.

Bristol .- Messrs, Cox and Daniel have laid before lesses. Popes and Bindon, architects, of this city, decisions: rupes and Bindon, architects, of this city for the formation of a new road to Clifton. The pro-posed new road would sturt from the Deanery, Col legge-green, and be carried across College-street, Lime are the terminois a field value of the case re-posed new road would stort from the Deanery, Col-lege-spreen, and be carried acrossCollege-street, Lime-kin-lane, Queen's-parade, at the end, and the lower part of Brandon-hill, to Woodwell-crescent. Crossing Woodwell-nane hya sindauct, it would enter the Gydney property, passing through it to its termination at Chiton-hill. The distance from College-green to Cluton church, by the present circuitous route, is 6,000 feet; by the new route 3,800 : the gradient by Park-street is 1 in 11; that of the more direct route 1 in 25. Nearly all the land required for the forma-tion of the proposed road, that is, from Limekin-lame to Cliton-hill, belongs to the corporation and the pre-sent possessor of the Goldney easter, who, it is said, will present her portion of it to the city. A subsi-diary part of the scheme is a road from Clifton church to Cumberiand basin and the Howells. to Cumberland basin and the Hotwells

to cumperand bain and the richwells. Garston.—Ak a recent meeting of the load Board of Health, the surveyor, Mr. Standing, submitted plans, sections, and specifications for making severs in Mersey-road, Aighneth-road, Grassendals-tool, and Garstou Old-road, and it was resolved that tenders be obtained for segme and for lower annuntime to build of the severe and for hours, amounting to 6,500% ou the security of the special district rates for Aigburth and Grassendule, for terms of five or seveu years, in sums of not less than 500% for the purpose

of carrying out the plans. St. Helen's.—A water-'ountain, for the use of pedestrians, has been placed in Church-street, St. Helen's

Sheffield.—The Duke of Cambridge has named Wednesday, October 21st, as the day on which he will visit Sheffield, to lay the foundation-stone of the Crimean monument.

Lacds.—The Leeds Board of Guardians, at a special meeting last week, resolved to build a new workhouse for the township. The old workhouse, in Lady-lane, had long heen looked upon as doomed.

Gateshead .- A correspondent, says the Northern Express, has forwarded us a list of the tenders received hy the board of guardinus for pointing the union work-house; we insert it as a cariosity: comment on such "wide" estimating is superfluous :--

Mr. James Anderson, Newcastle	£26	19	0
Messre, Firbank and Son, Gateshead	25	0	0
Mr. William Laidler, Newcastle	24	0	0
Mr. Thomas Cummins, Gatesbead	22	10	0
Mr. George Rohson, Gateshead	19	19	0
Mr. Rohert Rawlings, Gateshead	10	1.0	0
Mr. James Sibbald, Newcastle	9	0	0

are assured, would yield little profit at the highest sum named Derby .- The Arboretum Committee bave received

several designs for the proposed soloon, and selected that of Messrs. Giles and Brookhouse, architects. The same is already in progress, and will accommodate about 5,000 persons. The estimated cost is 3,000?.

THE PROFESSORIAL CHAIR AT THE ROYAL ACADEMY. " THE PRESENT POSITION OF GOTHIC ARCHITECTURE."

ROYAL ACADEMY. "THE PRESENT POSITION OF GOTHIC ARCHITECTURE." SIR,—On did, that Mr. Scott is desirous of occupy-ing the professorial chair at the Royal Academy. If this be so, he could not well have shown his ulter unfitness for the office in a stronger light than he has recently done by his paper on "The present Position and future Prospects of Gothie Architecture," read before the Yorkshire Architectural Society, at the Mausion-house, Doncaster. The Professor of Architecture at the Royal Academy should above all things have a truly entholic mind. He should us to bigoted, hat willing and able to recognise hearity in whatever style it might be displayed. He ought, moreover, to have such an insight into universal at as to be prepared to point out to the student the characteristic features and beauties, as well as the failings and inherent defects of the several known styles. He need not love all alike, but assuredly, on the other hand, be must not hade any. No logaided man, no party man—in short, no higgi, can he a fit tutor to the architectural youth of England; and that Mr. Seott is tainted with bigotry, I think none who have read his paper can deay. What an accumulation of deprecatory epithets does be hurl at all architecture that cannot hay claim to the falacious stile of "Christian!" My, sir, neording to his argument, we are not only much worse artistically than were our middle evil (Midewal) forfathers, hus heamse he Englishman of the present day does not have Pointed windows and galhel roost to his house and warehouse, he is, forsoth, immoral—

worse artistenly than were our middle evil (Middwan) forefathers; hat because the Englishman of the present day does not have Pointed windows and gahled roofs to his house and warehouse, he is, forsooth, immoral-not to be compared with "the monks of old-what a saintly race were they l"—"a Pagan villa," with little hetter than a Pagan tenant. I fancy few Pagans ever had such domiciles as the modern English, and certainly, as the rule, I think we may say, in favour of our countrymen, that in on foregone sage have there been so many bappy and Christian homes. "Christin art is a misnomer." thus saith the *Quarterly Review*; and most heartily do I endorse this opinion,—merely observing that I shall be ready to aller my views on this subject when Mr. Soott and his Mediavelist brethren can prove that the style of which they are such ardout lovers' owes its direct origin to Christian abrit to the various editors required in our age. There is nothing "mer, who are ever enjoy out the whole may its pophet. I would not any one word against the heautiful eache-drais and churches of the fatherland," methan the Phartissical pride of a tw "good-old-times" in mer, who and is the *true* art, and Pogin was its prophet. I would not any one word against the beautiful eache-drais and churches of the fatherland, neither do I object to the application of the style of those struc-tures in modern ecclesiastical huldings. If we want a church, and our architects music cony, better far that they should take for their pattern some building which they can sce, than copy from published plates of Greek and Roman temples. But I have wandered far away from my theme; merely took upstep en to call attention to the virue that subs of general architecture to be found. they can see, that copy note posterior posterior ways and Roman temples. But I have wandered far away from mytheme; merely took up the pen to call attention to the virulent abuse of general architecture to be found in M. Scott's paper, and to ask whether an artist with sech an evident animus is suited for a "master."

I should indeed be sorry to say anything to injure the feelings of so accomplished a mau as Mr. Scott: I helieve that of all the revivalists he has best turned to account the doings of our mediaval forefathers, and more than this I think that, beyond other eccle-sistical architects, he has been successful in adapting sinstical architects, he has been successful in adapting a style evidently papitical in its ancient treatment to the requirements of our Protestant Creed: that he has quite succeeded, I do not faucy Mr. Scott himself would by any means admit. I wish him all success in his endeavours to push forward and onward his favourite style, but for the sake of art I do sincercly trust that while he is thus a sincere hover of one style, and a thorough hater of all else, he may never speak as professor from the Architectural Tribune at the Royal Academy. Chiracters.

THE "OFHER EXFENSES" OF THE EAST LONDON UNION.—Under the mysterious heading of "Other Expenses," there are four separate amounts, viz.,— 5391. 0a. Ild.; 2601. 2a. 9d.; 2271. 10a. IOd.; 344. 2a. 3d.; all in one year's accounts! This is a very objectionable mode of accounting for public moneys. It is feared that the old parish disorder for-merly known as the "select vestry," is now raging under another name.—TAXES.

COMPETITION DESIGNS FOR LAYING OUT SURFACE AND SUBSOIL OF STREETS.

In reply to the offer of six prizes made by the Metropolitan Beard of Works for designs showing the best mode of laying out the surface and subsoil of the new street in Southwark, as an example of a first cleas street, and also for the street in Westminster, as a second-class street, showing the disposition of the prirate vaulds, severs, gas and water pipes, telegraph wires, with any parts of the soil appropriated to other useful purposes, viz.;

For first-class street	100 6	uineas.	
11	50	.,	
And for second-elass street	$\frac{10}{50}$,,	
ind for becond class sproot	20	33	

,, thirty-uine competitors sent in plans, and these were referred to a committee of seven persons, consisting of four professional men, and the chairman, and two other members of this Board, assisted by the enother members of this Board, assisted by the en-gineer and superintending architect. Mr. Alderman Cubit and Mr. Wright were the members associated with the chairman, and Mr. R. Stephenson, Mr. T. Hawksley, Mr. G. Lowe, and Mr. T. H. Wyatt were the professional men. The following is a list of the plans :--

Next week the designs will be open to the public

at the Society of Arts', Adelphi. It does not seem that anything of great value has been elicited by the competition.

THE METROPOLITAN BOARD OF WORKS.

"That the reports of this Board submitted to the Com-missioners of Her Majesty's Works and Public Buildings, show the report of Messrs. Golton, Simpson, and Black-well, be referred to two eminent ongineers and the en-gineer of this Board, to report thereon at their earliest coursenience."

Major Lyons seconded the motion, and Mr. Wright moved the following amendment :

Major Lyons seconded the motion, and Mr. Wright moved the following amendment:---"That this Board regrets that the First Commissione of her Majesity's Works has rejected the Plan D'without "That this Board, with the seistance of its engineer, has carefuly considered the scheme proposed by the referees sprointed by the First Commissioner so far as the mate-rials furnished have enabled them, and that, while enter-taining great respect for the emisent engineers consulted by the First Commissioner, so far as the mate-rials furnished have enabled them, and that, while enter-taining great respect for the emisent engineers consulted by the First Commissioner, by them cannot be adopted by the Board. In trying the great samitary work of the main drainage, is gratilled to find by the report of the referees that they have adopted the principles of the place of this Board as a basis for their scheme, notwithstanding the latitude of investigation given to them in their instructions by the First Commissioner, and that the differences upon this board damited by the First Commissioner that the Board cannot with justice be called noon to defray out of the metropolitan raics.-Breoonmandations of works the expense of which it has been admitted by the First Commissioner that the Board cannot with justice be called noon to defray out of the metropolitan raics.-Breowners, with diminished falls. The weetern saves, with diminished rails. The weetern saves, with diminished rails. The weetern saves dara and rainfall.'' The amendment was seconded by Mr. Turner, and after some discussion the motion was lost by twenty

The amendment was seconded by Mr. Turner, and after some discussion the motion was lost by twenty votes to eight, and the amendment agreed to by a majority of eightere votes to nine. Mr. Alderman Cubitt then moved the following resolution:

Mr. Bristow seconded the motion, which was agreed to unanimously

Mr. Bristow then moved-

air, pristow them moved— "The spontament of a committee for the purpose of drawing up a written communication to be made to the First Commissioner, based upon the preceding resolutions, preparatory to a conference with him on the subject." The motion having been seconded, was strongly opposed by Mr. Hawkes, Mr. Leslie, and Mr. H. L. Taylor, but was carried without a division.

Taylor, but was callence never named as the com-mittee ---Mr. Bristow, Mr. Wright, Mr. Alderman Gubitt, Mr. Doulton, Mr. Turner, Mr. Offer, Mr. Denuis, Colonel Kennedy, and Mr. D'Iffanger.

A HINT TOUCHING FOUNDATIONS AND THE REMOVAL OF GRAVEL.

THE REMOVAL OF GRAVEL. IN hard where the subsoil is clay, the vegetable mould holds the rain-water until it passes off by evapo-ration. In localities where this is the condition of the soil, vegetation will probably be luxuriant, and the kitchen-gardener will thrive; but a humidity will hang about the atmosphere, and it will be evident that the soil which is most conducive to vegetation is least favourable for babitation. On the contrary, in land where the subsoil is graved, the mould parts with its moisture in two ways-upward by evaporation, and downward by absorption. In localities thus circum-stanced vegetation is retarded, and the kitcheue-gar-dener has small profits and slow returns i but the atmosphere is clear, and the quarter hecomes deservedly popular for residence.

atmosphere is clear, and the quarter hecomes deservedly popular for residence. In urban districts, the above distinction, in a great measure, disappears, for the houses are close together : what ground they have in rear is mostly paved over: the streets are entirely so; and the drainage of the entire surface is provided for. In the suburbs, how-ever, hardly any of these points bold good; and the question as to the nature of the subsoil is consequently ever recentring, e-pecially in the newer neighbour-boods. Unless fashiou interferes, the land which has gravel for its subsoil will have the pr-forence. Not only in a sanitary point of view is the gravel

land to he preferred to the clay land: structurally, it is, beyond comparison, the best. On clay, if you do not put in a tough artificial rock--that is, concrete-to build on, the drought of every hot summer will erack the upper portion of your clay subsoil, and for every erack you will have a rent in your walls; but on gravel, unless it he loose, the artificial rock is not desiderated: your foundation is unchangeahle. Hare, then, are conomy and security along with health. In the country, suppose the subsoil is gravel, and the circumstances happen to be such that there can be no severage, building is not prevented, seeing that dry circumstances happen to be such that there can be no severage, building is not prevented, seeing that dry-boilt cesspools, or absorbing.wells, serve the purpose of drains; but where the subsoils is clay, and there are no means of drainage, since a cesspool would hold water like a tuh, and run over when full, the laud had hetter he left in the hands of the agriculturist.

Now, with respect to our suburbs, it bappens that there is such a demand for gravel, for road and foot-path making, that whoever gets hold of a piece of bailding ground with gravel in it is tempted to turn to help every cube yard he possibly can into eash, to help him on with his building speculation ; and I think I have known instances of unprincipled parties taking a lease of such ground ostcosibly to build on, whose only object was to steal the gravel; and I believe I could object was to steal the gravel; and I believe I could also point out an estate, every builder of a house on which had to pay down 107. for the gravel, -- a fomous contrivance for testing his good faith. It is this temptation to make more than enough of the gravel from the foundations which is the object of my writing these few remarks. I could point out the writing these lew remarks. I could point out the evil consequences of this practice in many suburban properties. The gravel is dog out beyond the proper depth for building on : a notice is put up--"*Rubbish may be shot here*," and the refuse sittings, vege-table mould, &c. form a basis for the future houses to the hold of the start of the start of the hold of the superiority of the gravel soil subverted, in the structural point of view; and a more damp and more unsound house built over it than would be built on the elay, where the interposition of ample concrete footings would he inevadable.

The lessors of such ground should adopt means to prevent this ahuse, which is one of the causes of so many "crack" houses. By so doing, they may guard against a few of the houses "falling in" before the leases. JAMES WYLSON.

*** The evil bere pointed out is a great one, and cannot be too strongly reprobated. We have before our eyes at this moment a number of houses the walls of which are being constructed within two or three feet of deep excavations, now loosely filled with rubbish, from which sand for mortar has been removed. The dis-I for which and to mortar has been removed. The dis-trict surveyors do what they can to prevent it, short of summoning the builders before a magistrate (often they are not aware of the fact), but they must now see what view magistrates will take of the wording of the Building Act in this respect. Can it be said of walls in such a position that the foundations "rest on the solid ground?"

BLACKBURN INFIRMARY PLANS.

On Monday the Infirmary Committee met at the Town-hall, for the purpose of egain inspecting the plans sent in for competition, the number having beco-advant to fur a competition, the Reactor Confirm plans sent in for competition, the number having beco-reduced to four. According to the *Precision Guardian*, after examination, they were reduced to three, viz.— "Solus," 16 votes; "Le Plan Francis," 15 votes; "Templar Munditus," 5 votes. The committee then adjourced until Saturday, this day, when we pressume they will agree upon their report; and it is helieved that the selecting committee will refer the choice between the two favourite designs to the general com-mittee, or to scientific arbitrators.

CONFLICT OF OPINION BETWEEN SUR-VEYORS AS TO CHARGES. TRIMEN V. LINDUS.

TRIMEN V. LINDUS. TRIMEN V. LINDUS. MR. DE LA MARE appeared for the defeedant. This was an action in the Westminster Courty Coart, before Mr. Francis Bayley, the judge, io which the dy communica-prietor of considerable property at Strafford, for the dotser willage of Upton, a mile beyond. The property, it appears, is in chancery, and in compliance with some order of that court, the defendant listrated Mr. Trimen to survey ahout forty small cottages, the purpose of determining whether they were worth any, and if so, what repairs. It appeared from the plaintiff seidence, that he went down a twice hinge before he could determine the matter. Not being par-fectly assissed with is own option, he sent down a twice hinge. Most of the word the premises. He subsequently sent is his bill to the defendant amounting to 147. I38. 64. fees and ex-with promptitude.

penses out of pocket. The defendant resisted the claim, and paid 5/. 5s. into conrt in satisfaction of the plaintiff's claim. For the defence several surveyors were called, and amongst them Mr. Lloyd, and they all stated that one day's time was sufficient for the survey of the property in question; and that five guiness was a fair and reasonable remuneration. His Honour, after hearing the evidence on hoth sides, found a verdiet for the defendant, with costs. Verdiet accordingly.

RAILWAY COMPANIES AND THE METRO-

paid. It was then agreed that notice of appeal should be given, and that a case should be prepared for the opinion of the Court of Queen's Bench. Mr. Seeker is unquestionably right.

ROAD BETWEEN EAST-INDIA DOCK-ROAD AND BOW-ROAD.

Ar a meeting of the Metropolitan Board of Works, on the 9th, the following report from the Committee of Works and Improvements was brought up, and it was resolved by seventeen to three—" That the recommendations of the committee, with the plans and estimates for the formation of a new street to the Bow-road, he agreed to;"—

Bow-road, he agreed to;"---"That the necessary steps be taken by the Board for forming a road between the East-India Dechroad and the state of the state when by the the coincident of the state of the state when by the the coincident upon the plans produced, and for improving the bridge of the Eastern Counties Ruikway in the Grove-road, and the bridge over Sir George Ducket's Canal, in the Grove-road, provided the several proprietors give up for the purposes of the proposed road and improvements the hand comprised within the points A and B upon the plans, to a with of 70 feet at the least; that Mr. Cotton, one of the a ductor of the properties the make the road for the land to 000 towards the stypens of making the bridge over the Lanceu; and provided further, that the owners of the land, or the parishes, undertake the formation and making of the roads between the points A and C on the plans, and to provide all the expenses required for their com-pletion : the total estimated cost of the said road and works to this Board being 27,204."

NOTES UPON IRON

Notes OPON IRON. Ox Thursslay, at Birningham, and on Wednesday, at Wolverhampton, matters wore a gloomy aspect that will not, it is feared, be removed on this side of Christmas. There was exceedingly little due, and prices both of pig and mallcable iron had a downward tendency. This is mainly attributable to the alarm-ing state of things in America, accompanied with the rise in the rate of disconnt, and the Iodian matters. In America, although 60 per cent. per annum, upon second-class paper is the rate of discount, yet he disasters are not supposed to have reached their

the disasters are not supposed to have reached their worst. There are no orders coming across now, and worst. There are no orders coming across now, and the only communications received are countermands. The only communications received are continermants. Firms on the other side of the Atlantic, which by the previous mail were spoken of as firm, were by the last referred to as highly uosafe. Then, whils no failures in New York have affected South Staffordand us in New York have anceted South Stanford silve immediately, some firms in that district will, it is expected, suffer from the effects of the paule upon creditors in this country who have large transactions with the United States direct.

Must obe United states aread, but this cannot hast long unless the demands of buyers are yielded to, and rates accepted considerably lower than those now demanded.

Wednesday was factors' quarter-day at Wolver-mpton. The accounts for the most part were met

ГОст. 17, 1857.

THE HOUSE OF GEORGE STEPHENSON. I ORSERVE a paragraph in your last week's paper expressing great regret that the house so interesting as the residence of George Stophenson and the birth-place of Rohert Stephenson should he destroyed. I an glad to inform you that the schools which are about to he built, and which are intended as a memoabout to be boult, and which are interact as a memo-rial to George Stephenson, will not actually stand upon the site occupied by the house, but it is intended either to preserve it within the bounds of the play-ground, or, if removed, a *fac-simile* model of it will be made and placed in a suitable part of the building. This latter course will most probably be adopted, * as

 RAILWAY COMPANIES AND THE METRO-POLITAN RUILDING ACT.
 Tra directors of the South-Eastern Railway Comparison of the automatic the comparison of the south-Eastern Railway Comparison of 22, 128, 64, fees to which he was entitled under this during to pay him iter course will most probably be adopted,* as the ranges of time are fast elling at the population of the comparison of the schools, in which Mr. Robert Stephenson takes a very active interest, will consist of two large school-metroparison of the railway, at the parper during the pay him of the schools, in which Mr. Robert Stephenson takes a very active interest, will consist of two large school-metroparison of the railway, at the south of the directors.
 Trom the evidence of Mr. C. Bey and the avery schools, in which Mr. Robert Stephenson takes a very active interest, will consist of two large schools, in which Mr. Bohert Stephenson takes a very active interest, will consist of two large schools, in which Mr. Bohert Stephenson takes a very active interest stables. There were schemed in respect of the railway, at the ta service indice were chimed?
 Mr. Badger replied the 6th section, the work is question being at building which was used for the purpose of trade.
 Mr. Badger replied the fits schemet and section of the Act of Far. Rese contended that the work is question being at building which was used for the purpose of the act of the section of the Act of Far. Rese contended that the work is question being at building which was used for the purpose of the act of the purpose of the act of the purpose of the act of the section.
 Mr. Beek contended that the work is question being at building which was used for the purpose of the act of the section.
 Mr. Badger replied the fits work is question being at building which was used for the purpose of the act of the section.
 Mr. Beek consistent at the question bad been and and the section.
 Mr. Beek consist tiously issued, it is almost unnecessary to do more than intimate its reissue; but the hook is almost a new one, and we must at least add that it cannot but new one, that we must at teast and that it cannot obe enhance the author's repute for curious research and entertaining as well as instructive writing. — A new issue of "The Haudbook to the Metropolitan and District Board of Works" has been published by and District Board of Works - mas been published by Abbot, Barton, and Co. of Upper Wellington-street, Strand. Iu this revised edition, the compiler has added the levels of the principal thoroughlares in and around London from actual survey, which must be of advantage to architects, builders, and surveyors, be of advantage to architects, builders, and surveyors, as well as interesting and useful to general readers. —A tract on the sale of land has been published hy Kerbey, 118, Whiteelapel-road, the useful and desirable object of white may be gutared from the title, which is,—" Vendors and Purebasers : a short Epitome, giving reasons why the present em-brous and expensive mode of transferring land and house properly should undergo a modification; to which is added Votes and Votes, a glance at our county registration." The author is Mr. W. R. Jackson. Jackson

Miscellanea.

FATAL ACCIDENT AT BRICKLAYERS' ARMS STA-TION .- Richard Membrey, a masou, was killed at the Bricklayers' Arms Station of the South Eastern Rail-Bricklayers' Arms Station of the South-Eastern Bail-way last week. On Tuesday morning deceased was chipping ahlock of stone, when the sheer-legs suddenly fell, one of the poles smashing his face upon the stone, and fracturing his skull. The sheer-legs had been used to raise the stone work, and were secured to a guide-rope, which was fastend to a stone of great weight, moved by three men. One of the legs was lifted accidentally too far off the ground, which over-powered the men, and thus caused the accident. A coroner's jury returned a verdict of "Accidental de (h," hut expressed au opinion that any workman employed willin reach of sheer-leves, when heios employed within reach of sheer-legs, when heiog moved, should be cautioned to retire to a safe distance.

moved, should be califord to refire to a safe descale? The New Westerstan Chapter in The Hollo-wAY-ROAD is now opened. Mr. C. Laws was the architect; Mr. Cowell, elerk of works; and Mr. Cleaver, huilder. Messrs. Hart and Son furnished the gas (forty jets), coroore, gas standards (183 jets), communion standards, &.; and Mr. J. Daymond was the architecteral architecture of the carried communion standards, &r.; and Mr. J. Daymond was the architectural sculptory, who executed the carving of the cap of the columns, corbels, and the two entrance doorways: cach cap and corbel has a dif-ferent treatment of its foliage. The gas standards and the corone were designed by Mr. J. Ash. APPOINTMENT OF BOROTGH SURVEYOR FOR SOUTH SHIELDS.--NR. John Ayris, of Westminster, has been appointed by the corporation of South Shields to act as their surveyor.

Shields to act as their surveyor.

* To this conrse we must continue to object. Admitting the interest attaching to the house, we trust the committee will not fail to preserve it.

ST. MARGARET'S, WISTMINSTER. — As the wet weather has commenced, would you be so obliging gs to counsel the laying of a little more paving in St. Margaret's Churchyard. If money be scarce in that rich parish, a coutinued footway from the Abbey and to the front door of St. Margaret's Church would suffice at present; but in these days of improvement it is rather reflective, on the authorities to allow this great improvement to remain unfinished.—JOHNNY.

THE ALTERATIONS AT EDINBURGH CASTLE.—The operations of the military engineering authorities are, it seems, suspended in the meautime, and the plans have been shown to the City architect, Mr. Consins, and others interested ; but the Government authorities have not promised that the public shell have an opportunity of seeing them before anything further is done. The Lord Mayor, who bas seen them, states that they, at all events, show a manifest desire to do justice to the site, and it was stated to him that the Government authorities wished to make the alterations of a character to correspond with the buildings already arceted.

The COVENTRY SCHOOL OF ART.—The annual meeting of this school took place at St. Mary's Hall, which was crowded in every pair: four-fishs of the andieuce or spectators, according to the local *Herald*, were ladies, whose influence is not to be despised. Lord Leigh presided. His lordship begins to doubt whether foreigners still even in the forms and colours of their fabrics: he rejoiced to observe that great progress was now being made even in these particulars. The report congratulated the subscribers and friends of the school that the progress of the institution since last annual report had been steady and satisfactory. The number of students entered on the hooks during the past year, however, was only 371, against 384 in 1855-63, and 340 in 1854-5. The late exhibition of the works of students had heen visited by upwards of 3,500 persons. It was now necessary to make an effort for the erection of an adequate building for the accommodation of the school, and a convenient site was bring looked out, when a meeting would be convened, and a scheme for mising funds submitted. The finances of the school were now in a better position than they had been in since the Government grant for the payment of the masters was withdrawn. The balance in hand, however (184/), was insufficient to meet current

hand, however (134.), was insufficient to meet current cryeness, and increased subscriptions were pressed for. SOUTH WALES INSTITUTE OF MININO AND MECHANICAL ENGINEERS.—An important meeting of engineers and mineral proprietors, interestel in the railways and works of South Wales, was held at Merthyr, on the 30th tult to consider the desirability of forming an institute. All the principal iron works of South Wales were represented at this meeting, and the principal engineers of the district were present, or sent letters in favour of the proposed institute. Appropriate resolutions were passed after an inferesting discussion, and a committee was appointed to draw pa a code of laws for the government of the institute, naming local columittees, &c. &c. The meeting was then adjourned to the 29th inst. Merthyr, often celled the radie of the iron trade of South Wales, and the place where Trevethick built and set to work the first iron are annually manufactured in South Wales; and desides, the Velsh works import largely from other districts, and coavert an immense quantity of pig into har and rail iron, nearly one-third of all the wrought iron me in Britaiu being produced in South Wales.

The BROTHERTON MENDIAL — In justification of myself, I must trouble you for a very small portion of your valuable space in answer to Mr. Chadwick's letter in your last. You will notice the more important queries are entirely omitted by him. My last letter to you was a plain and true statement of simple facts. When the design is cugraved, every artist and architeet can judge of its merits himself, hut I have a clear and distinct recollection freading the designer's own paticulars, wherein he said, the spire rested on the heads of the angels, and not on columns, as Mr. C. srys. A sregards the moticos, I never heard of them till the designs were exhibited; the alverisement in the *Bailder* was so clear and perfect that I, with others, acver thought of applying for further particulars. Respecting what Mr. C. says as to fust, & being sent to cach competitor, it is entirely untrue, as regards at least one; and I will conclude all I have to say of this affair by assuring you, sir, that gun arabic in Manchestor is numfactured from horses' hoofs, and, unlike Sir Benjamin West and his cat, camel-hair pencils are happily secured there from the back of the hog. He says, sir, my drawing, mounted on canvass, on a thick strainer, with a thickness of lining paper and an ordinary mount, was attached to the wall with a "small that tack." Is not this preposterous? By that one assertion may Mr. Chadvick be judged, for a difficulty of that sort could not be surmounted by the god

A CENTRAL "PLACE" IN LONDON, UNITING TRAFALGAR-SQUARE WITH THE BOROUGH AGDOSS THE WATER.—I have just returned from a rustic tour, in which I had not the opportunity of seeing the Builder, and have only just seen the numher of Oct. 3, in which you so obligingly introduce my second letter on "A Central 'Place' in London, uniting Trafalgar-square with the Borough." I an extremely gradified to find that I hold a somewhat similar view with yourself on this subject. It was, if you will allow me to say so, probably long in both our minds before it appeared in print. As, however, in your prefatory remarks you allude to the number of the Builder of Dec. 13, 1856, I may also draw your ottentiou to the September number of the Art-Journal of that year, page 277, in which I first mentioned in print the general idea I entertained (at that time in relation to the National Gallery chiefly). It venture to intrude my suggestions on your journal; hut this non-professional position of mine may hold out a greater chance of value in the idea in question, instanuch as a similar result in opinion has heen arrived at from more than one point of view. Encouraged hy the kind words you have sai, I shalt venture to a few daya.—Ereston.

ASTON HALL AND PARK, AT BIRMINGHAM.—The owners of Aston Hall and the remainder of the park have made a new urraugement with the working meu's committee appointed to secure its purchase. If the committee can pix a deposit of ten per eent, on the purchase-money at Christmas next, according to the local Gazette, the sale will be completed, and two years will be allowed for the payment of the remainder of the purchase-money. Between 16,000 and 17,000 shares have heen applied for (Mr. C. H. Bracebridge taking 400, and other gentlemen large numbers), and the Aston Hall and Park Company is being enrolled. Messrs. Chance, Brothers, sive 1004.; Messrs. Lloydø, 1004.; Mr. Charles Retellif, 504.; and donntions have heen promised by others.

COUNTY AND DISTRICT SURVEYORS IN IRELAND. — The Select Committee of the House of Commons on this subject, report that the institution of county surveyors, under the Act 6th and 7th William IV. (hepp. 116, for the superintendence of county works, has been attended with great public advantage, both as regards the improvement of county roads and works, and as regards the comonizing of the county funds. The mileage of roads under repair had increased from 13,101 miles in 1834 to 36,073 miles in 1854, while the cost of repair had increased only from 228,3104. to 312,2977,; and at the same time the percentage cost of superintendence was reduced materially in almost every county. An efficient class of county officers has been formed, taking charge of rearly every county work, and controlling an expenditure of her visual is duites and its removeration, with the time has arrived for reconsidering the office, both as regards its duites and its removeration, with the view of placing it on the most efficient footing for the public service. It is thought that the surveyor ought to be supplied in every case with adequate local assistants, an increase of salary being recommended in hoth instances. SANITARY PROCEDURE IN CLERKENWELL—The

SANTARY PROCEDURE IN CLERENVELL,---The anthorities in Islington, are still actively engaged in abating nuisances, aud some important procedure has just taken piace at the local Police-court, under the Nuisance Removal Act, several owners of houses in Pophana-street, Islington, having been finad for allowing their houses to be crowded with more families than they could properly accommodate. The stemeh in some of the rooms from this cause alone is said to have been most offensive and projudicial to health.

TEXTS IN LIVERPOOL. — In a describing among-t other important structures now in progress in Liverpool (of which we gave some particulars und long ago), Insurance Buildings, in course of construction, from the designs of Mr. Cockerell, the *Allion* says, —'' Some notion of the value attached to this site will be oblicined when we state that for the basement, beneath the offices, a rental of 3007, a year is required; that for a small office adjoining (in the basement), not more than eight yards by six yards, and approached and lighted solely from the arca, a rental of 944. a year has been oblianed; that one large firm in the town (cottou-brokers) have taken the offices on the ground floor, at the north-east corner of the building, at a rental of 5007, and that half that amount is to be paid by the local agent for the distribution of stamps, for a range of three rooms on the ground floor, with a frontage to High-struct, taken on a long lense. At the north-east corner on the three-pair floor there will be a large, well-lighted room, suitable for general hrokers' sales, to which purpose it will probably be devoted, as a great want of such accommodation is continually experimend. The contract, which amounted to 35,0007, was taken by Messrs. Haigh and Co."

THREE CARRIACTS IN A RUNNING TRAIN CON-SURD BY FIR.—On the Great Western Railway, on the 0th inst. a carriage took fire while occupied hy passengers, and from the utter wat of that which has heen so often and so urgently insisted on by the press, and early by ourselves amongst others, namely, some mode of communication between the passengers and the guards and drivers, the train ran on for neadly half an hour, in the midst of female scremes and suffocetting smoke as well as frautic efforts to attract attention by passengers in others of the carriages who happeued to see and hear what was going on ; and it was not iff the train draw up at Kenal-green that the terrified ladies and others escaped from the hurning carriages. They had managed so far to smother the burning wood hy means of cloaks, hut not a minute clapsed after they did escape ere the carriage first on fire was in a blaze, and those adjoining it were also very speedily destroyed. It is really fearful to think of the peril which the pablic are ever and atoo incurring in consequence of the contemptious and most culpable neglect of railway managers and direotors to provide means of communication between passengers and guards, and between guards and divers. There is no difficulty, whatever may be preteuded. In America, carriages in a train communitate from end to end of the series : wy should it not be a join England too? A guard might then really be a guard. As it is, he might almost as well be " a succo image," for all that so helpless a mortal can do, even if he accidentally happen to become aware of any peril in which the passengers would probably be the hest of all modes of accomplishing all that is required. It providentially happens in the "gands "may stand while his train is in transit. There are many practicable ways of effecting a communication between passengers and guards, and between guards and drivers, but a communication whereby to pass from earriage to carriage would probably be the hest of all modes of accomplishing al

THE WORKING-CLASS CONCERTS AT Sr. MARTIN'S-TIAL——It is satisfactory to know that these refining and elevating ammissements for the people have heen highly successful so far as regards attendance, although scarechy what they should be, and what they undoubtedly will yet be, in a financial point of view. The annual report for 1856-7 states that "from the commencement to the close of the present season, the commencement to the close of the present season, the courserts have heen attended by 50,000 persons; and u doubt this number would have heeu largely inereased had it not heen for the general distress which prevailed atomog the operative classes in London daring the past winter. The average attendance at (each concert of) the second series has been upwards of 1,200; and one or two cessions us many as 2,300 were admitted. * * The tollowing are the three most important items, viz.:--urisizes, 5107, rent of hall, &c. 3477, printing and advertions, 3157. The expenditure has exceeded the receipts by more than 2007. This appears to have been the case, also, with the 'Beople's Concerts' in the provincial towars, which, dathough they are *now self* supporting, almost invariably experienced a similar difficulty at stating." Subscriptions are received by the treasurer, Mr. Nicholay, churchwardeu of St. Marylebone, 82, Oxford-travet, JN. Anderton, Under-Sheriff of Middesex, 20, New Bridge-street, Blackfriars; and others. The Prince Consort is a subseriber of 257.

The WELLINGTON MONUMENT.—Sir : Permit me to assure your correspondent, "D. H." that I am very far from being alone in the opinion, that a national monument to a great historical personage ought to he and indeed, to be consistent, must be bitself historical in its character, and in some respect and degree "a record of the life" of the man thus commentiorated. I do not propose to occupy your valuable space with any prolonged comments on "D. H.'s" sontiments on the matter of monumental art, but I cannot resist his objection to my recumhent effigy of the great Duke, this attitude when in his uniform and when wearing his knightly mantle. I did not expect any such reguence he inconsistent in bis memorial. Does "D. H." have his assumed approbation of the competition designs upou the theory that the Duke ordinarily wore the habiliments of a Roman imperator, or that in British miform he was accusioned to form one of a' group in which the "allegories," winged and wingdes an their uniforms, a certain lion, &e. occapied prominent positions? CHARLES BOUTELL. THE ARCHITECTS AT LLANDAFF CATHEDRAL. We have been favoured with copies of a correspon-dence as to the giving up, by the dean and chapter, of one of the architects heretolore engged in the restoration, but not in time to make any analysis of it should it seem desirable.

It seem desirable. A DEY DOCK IN THE MAUGHTUS.—The 13th of July was signalized in the Mauritius by the opening of a vast dry dock. The dock was planned by Mr. T. Hourslow, and the design carried out by Messrs. Fry and Blondeau. The dimensions are as follows— by Lorent of the dimensions are been done T. Hounslow, and the design carried out by Messis. Fry and Bondeau. The dimensions are as follows— vize, Length of keel, 250 feet; entrance, 48 feet; width inside, 68 feet. The basin may be lengthened to 300 feet, and larger if found desirable; but in the latter case the government would have to make a concession of land. The same week was signalized by the laying of the foundation stone of a new Pro-testant church at Pamplemouse.

Builder. The

Vol. XV .--- No. 768.

EALTH-SCIENCE, if we may use a new compound, has heen very considerably advanced by the successful establishment of the National Association for the Promotion of Social Science, which held its first meeting in Birmingham on the 12th iust.

and four following days, under the presidency of Lord Brougham. Its object, as may be inferred, is to aid the development of the social sciences, and to guide the public mind to the hest practical means of promoting the amendment of the law, the advancement of education, the prevention and repression of erime, the reformation of eriminals, the establishment

of due sanitary regulations, and the recog-nition of sound principles in all questions of social economy. The association is accordingly divided for the present into five depart-ments, the fourtb of which, that of "Public Health," will consider the various questions relating thereto, and to the prevention of disease : it will collect statistical evidence of the relative healtbiness of different localities, of different industrial occupations, and generally of the influence of exterior circumstances in the production of health or disease : "it will disenss improvements in house-construction (more especially as to the dwellings of the labouring classes), in drainage, warming, ventilation; public baths and washhouses; adulteration of food and its effects; the functions of government in relation to public health, the legislative and administrative machinery expedient for its preservation; sanitary police and quarantine; poverty in relation to disease ; and the effect of unhealthiuess on the prosperity of places and nations." We say it will do this; but we ought also to say it has commeuced to do it, and the proceedings at Birmingham show that the importance of this department of the association is fully understood.

Lord Stanley, in his inaugural address as president of the Department, defining Sanitary Seience, apprebended that it meant that science which dealt with the preservation of health and the prevention of discase in reference to the cutire community, or to classes within that community, as contradistingnished from medical science, which had for its object the restoration of health when lost, and dealt with the case of each individual separately. The knowledge which warded off preventible disease from the naturally healthy was one which might be, and onght to be, possessed hy every educated per-This knowledge ought to be diffused, not merely because, in matters which coucerned the public in its collective capacity, such as the cleansing of rivers, the drainage of towns, the exclusion from populous districts of noxious employments, and the like, those by whom sani-tary reforms were imperfectly appreciated would be found hostile to them on the ground of expense; but because a large proportion of those remedial sanitary measures which it was in the power of society to apply to physical ills were of such a nature that no police regulation, no Board of Health, no legislative enactments, could successfully interfere to enforce them without the co-operation of the parties con-cerned,-such as the cleansing and ventilation of private dwellings. Henceforth the fact mnst are properly discharged. be known that we ourselves were the cause of Not to dwell longer on the proceedings of large towns would follow the example of the be known that we ourselves were the cause of

THE BUILDER.

a large proportion of those physical sufferings the department, we repeat our congratulations which most of us had been accustomed to on the recognition of the importance of sanitary

The speaker said he had faith in the good sense and good feeling of the public as to the fnture: it is quite ecrtain, nevertheless, that the said public must be spoken to on the subject many times hefore it will allow its life to be lengthened to the extent practicable, under higher permission-to that extension in the aggregate, as Dr. Southwood Smith said in the conrse of a memoir " On the Prolongation of Life," during the eighteenth century, to which it is not possible as yet to assign a definite limit.

In that paper it was shown by the record of tontines, that in the year 1690 the expectation of life of a man aged thirty would have been as 26.565, while in 1790 it would have been 33.775: while the actual addition of the excess of years which the persons engaged in the latter tontine had over the former proved that in 1790 the expectation of life was increased by fully one-fourth; that is to say, that if in 1690 a person aged thirty could expect to live thirty years, iu 1790 a person of the same age eould reasonably expect to live thirty-seven years. An increase in the duration of life is a proof of increased comforts, or increased enjoyment of certain elements upon which buman life is dependent, such as air, light, food, warmth, and shelter. At that period special attention began to be paid to the wellordering, cleaning, and paving of towns. The narrow streets were widened, slate-roofs snhstituted for thatch, hricks for timber, and the attached to the houses were several separate manufacture of glass somuch increased that glass windows, even in the poorer towns, hecame common. Agriculture made a surprising advance, multiplying a hundred-fold the pro-duction of fresh vegetable food, and increasing in a still more remarkable degree the amount of fresh animal food by the extensiou of the comparatively new art of collecting and storing fodder for cattle in winter. The increase of manufactures gave improved and cheap clothing to the people, not only conducive to warmth and health, but almost equally so to cleanliness, epidemics in particular hecame much less formidable.

Mr. Jerrick, in illustration of the facts given in that paper, said that the average duration of life in Loudon at present was twenty-seven years, whereas in the last century it was only twenty-two.

Papers on the influence of habitations, on the density of population, and localization of dwellings, ou the ventilation of buildings, and many other cognate subjects, were read. Mr. Tom Taylor and Mr. Arthur Helps, both remarkable mcn, took part in the proceedings, as did also Mr. John Simon, Dr. Farr, Mr. Slaney, Mr. M. D. Hill, Sir Benjamin Brodie, and others, who have long lahoured in the cause. Mr. Taylor's paper was ou "Central and Local Action," and Lord Stanley summed up its arguments, when times. Inhabitants of houses which have the ad-be said at the close of the discussion upon it, vantage of proper drainage, should see that the the general feeling seems to be that indicated in Mr. Taylor's paper-namely, that so far as any general rule can he laid down, the local body should have the power of action, and the general hody that of instruction and supervision -that is to say, that the position the central government should assume in regard to all local authorities is, that it should say, So long as you do your work well you shall be left to do it in your own way; we will not interfore with heen formed, of the carelessuess of tenants who you; but if during a long series of years you allow improper matter to choke the drains. decline or are unable to do it, it will become Care should be taken to avoid this: a choked

dition of humanity. Science by the new association. Quietly and continuously labouring as we have done for years to establish this, with less sympathy than might have heen expected,—our efforts, indeed, often received with ahuse instead of favour,-it becomes almost a matter of personal triumph to find opposition disappearing, and sound prin-ciples generally accepted. The sanitary investigations, of which reports have been published from time to time in this Jonrnal during several years, have been made at some personal risk,--we might almost veuture to say, of life. Endeavours have been made as well during the night as the day to learn the real condition and results of the neglected and poisonous homes with which certain districts abound, and the facts thus gathered have been spread far and wide. In addition, information has been gained from clergymen of all denominations, and from the City missionaries; from medical men performing their useful office, uot only for the rich hut amongst the poor; from the police, and many others; and we have reason to hope that the information disseminated bas not been without its frnits.

An epidemic again gives reason, we fear, to quicken the precautionary movement. The iuvestigation of the first outhreak of it, at West Ham, Stratford, by the Association of the Medical Officers of Health, shows, as in previous cases, a removeable cause. The row of houses where it broke ont was found to consist of buildings in tolerable repair, and not inhahited by the very poorest class of persons; but, cesspools, including a large one into which some of the other houses drained : at a distance of 70 feet from the cesspools is a well which supplied water for the inhabitants to drink, and for other purposes ; and, the soil heing gravel, it is supposed that the poisonous matters from the cesspools have drained into the well. The place is situated near a marsh, which is said to be greatly impregnated with sewage matter; and not far off is an open stream which carries off the drainage of a considerable district. Here we have all the evil conditions likely to produce the texture compelling frequent washing. Ac-tordingly discase assumed a milder form, and the present moment has been the sudden seizure of fifteen persons, and the rapid death of seven or eight of that number.

Men of experience have watched the progress of the cholera for the last two or three months, and noted its usual course, and it is to he feared that we can scarcely escape a visitatiou in this country. It behaves all, in the short interval which may elapse hefore the scourge is npon us, to take those steps which are known to he efficacions.

The inspectors of unisances in large parishes aud towns should have assistance: careful examinations should be made, and all offensive matters carried away. Wells of water and the pumps throughout the metropolis should he viewed with suspicion, for the water of few, if any of them, can he wholesome even in healthy vantage of proper drainage, should see that the drains are in good order, and that the traps in sinks and closets are clear, and in working con-They should permit no had smell to dition. exist.

When the drainage is not complete, no faith must be placed in flushing the drains with water: often, indeed, more harm than good is done by it.

Complaints arc often made, where drains have heen formed, of the carelessuess of tenants who our business to see that the duties of the office drain in the time of an epidemie is very dangerous. It would be well if the inhabitants of Jews in their sanitary, arrangements; cleanse constantly the walls and ceilings of their rooms, and be attentive to the nature of their food and drink.

In Bridgewater and some other towns house to house visitation, to ascertain the state of the premises and condition of the people, has of the premises and conductor of the profile, has been most wisely determined on. In some places this would not be an easy task. At a neeting held in Newcastie the other day, with reference to building a new church in Slield-field, the incumbent, Mr. Irvine, said that when he first came to the parish, he proposed to him-self the formation of a list of all his parish-ioners, and the establishment of a routine visitation. He put his note-book in his pocket, and started out. But in one single house, near the church, he found twelve families; and, giving a quarter of an hour to each, he was altogether three hours in this one house! And this house, let us add, has thousands of parallels.

On another page will be found a continuance of our notes on the condition of the town just mentioned, and other places in the north. The mentioned, and other places in the north. The statements in our first paper (p. 577), have awakened attention, and will, we trust, lead to advantage. The editor of the *York Herald* has been moved to great anger by the few observations we were led to make therein on York, and in a lengthy leader applies to them the epithets "natrue," "mischievons," "un-justifiable," "utterly false," "without the shadow of foundation," "unserapulous tirade," "simply absurd," "malicious" and "hase slanders!" "simply absurd," slanders !"

standers!" Making all allowance for the feeling which prompts the writer to place his city in as favourable a light as possible, we must express our regret that the editor of "so respectable a journal" (as he says of the *Bailder*) should have stooped to a course which is seldom the in a factor of a course. Which is seldom the have stooped to a course which is setucin the sign of a good cause. Nothing is stated in our columns "maliciously," or without inquiry. We are forced at times, against our will, to say what may be deemed unkind by individuals, what may be accenced unkind by individuals, and, impressed by the mighty importance of the subject, may speak with carnestness; but we renture to helieve that our statements have never been couched in offensive language, or found to be mijustifiahle. As regards York, it is quite obvious and certain that it has not ad-vanced in the same proportion as other large torms which some vers som were greatly invanced in the same proportion as other maps towns, which some years ago were greatly in-ferior to it. The particular object the writer had in view was, without the slightest ill feeling, to suggest the inquiry whether those towns, districts, and even plots of land, which are under the management of Cathedral Chapters, dealt with in the way most likely to be antageous to the community. There are advantageous to the community. certainly many instances before us to the con-

trary. The ancient *prestige* of York, its important position, the circumstance of its heing the capital of the largest county in the kingdom, its place in the great highway through the length of the county, together with other advautages, head and on other correspondent here insured should, under other arrangements, have insured for this ancient city a very large amount of popula tion and business. The increase in the former, vanntingly shown by the cditor of the York *Herald*, is comparatively small; and observation and inquiry compel us to reiterate what we have said as to the condition of the poorer classes in that city.

Along the northern coast busy centres of industry are heing formed, and large towns are growing up; and it is after viewing such secues growing up; and naking visits to the huge works going on in many parts of the land, that we have heen led to form the opinion as to York, which has excited the anger of the *Herald*. As to the sanitary coudition of York, we gave the autho-rities full credit for what had been done, but we would use that measures should be taken to

able, zealous, and persevering fellow-lahourers in the cause of sanitary reform, the *Builder*, has, we are glad to see, been visiting the North of England, and did not overlook the claims of Newcastle and Gateshead npon his attention. His report appears on audher page, and we might hope that it would prove of service to us, had we not so firm a faith in our apathy ns, had we not so him a hint in our aparty our contentioness with a hint in our aparty some extent, indeed (as we said the other day, when speaking of the smoke nuisance), our love of them. Here is the mouster-difficulty— our self-satisfaction. We cannot "see ourselves as others see ns "--as (for example) the *Builder* secs us. And we should not be surprised were we to receive, for our uext number, a shoal of letters wondering at his want of admiration for Pipewellgate! Hillgate, its worthy comper, was hlown and burnt to pieces three years ago; and there the ruins lie to this day. We have neither the wit nor the energy to rebuild the one nor to get rid of the other. Our poverty, we know, has been pleaded as our exense; We know, has been pleased as one excluse, our if we east our eyes across the river, where the people have an estate—and a Ratepayers' Association to boot—we see the same state of thiugs existing. It is truly lamentable; and the worst feature of it is, we are so willing that it should be so." "Everything is done amongst us by driblets. Improve we do. Gateshead, we rejoice to know, has gone on, extend-ing and improving, from year to year. Its proing and improving, frow, has gone over. Its pro-gress, however, has not been all improvement. Much of it has heen quite the contrary. Streets have come into existence, within the last twenty nave come nuo existence, within the last twenty years, setting the laws of health at defiance; and even now, when unsanitary plans are re-buked or rejected, they find apologists in high places. Remember! it was neither in Hillgate nor in Pipewellgate, nor in any old locality, that cholera broke out in 1853!"

There is no fear for Gateshead with so excellent a monitor.

THE CLOSE OF THE EXHIBITION OF "ART-TREASURES," MANCHESTER.

Or the thousands of strangers—men of cultivated taste—who have crowded to Man-chester during the last few months, we trust there are some of our readers who have given thought to the "mission" which the manu-featuring dictater more the about to outer on facturing districts may be about to enter on. Art and manufacture should be always hand-inhand; the perfection of mechanism and pro-ductiveness should be married to the beantiful; the heautiful should he served, and the objects the neutral should be served, and the objects in which it exists, should be multiplied, by the resources of the mechanism. So, however, it has not been; and the artist has heen known to regret the existence of what should be vehicles and media for design, and should offer to him recurring opportunities for the dissemination of his art his art

Manchester, the capital of a district which is perhaps the most important in the industry and commerce of the country, has not yet given to the world much of beauty along with its manufactures. In this it is not singular: its woven and printed fabrics have not made worse manifestation of art in their day, than have the mannfactures of Birmingham and Sheffield,--maintactures of Brinninghan and character, towns where considerable improvement lately may have taken place. So long as there is the market for the goods of a particular character, it is hardly to be wondered at that the supply should go on. The demand for Manchester code areceast to a cauttor from all parts of the goods proceeds to a centre from all parts of the world,-from climates the most diverse, and from nations dissimilar in their manuers and predilections.

Many had designs applied to textile manu-factures therefore have come out of the Lanca-shire district; but we are not aware that the home consumption is on a par for the extrava-regard in forms, and wrat of homeony in the compet the owners of houses to open communi-cation with the sewers when formed. We leave the settlement of the question at issue between ourselves and the *Herald* to those who have the is not obscured by local attachment or interested. The *Galeshead Obsercer* has received our other spirit. The editor says,—"One of our most Manchester has been slow to learn has been, exquisite effect which is attainable hy attention to outling, and architectural principle, and in the set demand from places the globe. And other districts are equally at is not obscured by local attachment or interested manufacture, that we have seen, were some that spirit. The editor says,—"One of our most

that there exists a market and a money value that there exists a market and a money value for *art*, as well as one for excellence and cheap-ness of manifacture,—tbat miud can work on the meanest material, and change it to a costly gem, or an "art-treasure." Artists, or mauu-facturers, we all, have, for the interests of each of our objects and pursuits, to effect a better union than has lately been maintained be-timen means. tween us.

Not that there is wanting a value iu art, apart from the combination with manufacture. To the perception of this, indeed, the opening of the Exhibition, which came to a successful termination on Saturday last, may be due. No small number of the works in the collection, were contributed by people connected with the town, or the trade of the district; and the development of our own art in the huldings of hundlester has been the subject of frequent Manchester, has been the subject of frequent comment in these pages. The amount of build-ing which appears generally, to be going for-ward; the prominence of the structures them-by the architects, or arising from other canses,-are so many conditions which are favourable to the architecture of Manchester. Favourable therefore, likewise, at this juncture, is the posi-tion of the district for influencing, in a beneficial and powerful manner, the circumstances in the future of those arts, industrial and ornamental, which are hased on the principles of com-biued beauty and use that belong to the art of architecture, and which have a claim for attention now, inasmuch as they have not ntilized the particular resources of our day. Such

attention now, maximum as they have how inflized the particular resources of our day. Such resources are those which we referred to at the outset, and the materials of all kinds in example and precept, which were never so abundantly poured forth for general use as they are at present. Much will be expected from Manchester: and, from the position which the city is taking up, the Exhibition of 1837 may inaugurate an era-mot less important than that which has heen dated from 1851. Looking at some of the more attractive of the works in the branch of art which more especially concerned us, the contrast of effect helween those applying the good and the had principles was very considerable. This could he observed in the extraordinary collec-tion of plate exhibited by the Earl of Stam-ford and Warrington, where the decadence from the seventeenth or eighteeuth century work of inferior handicraftsmanship—but gene-rally correct design—to the naturalistic style which has prevailed in the naturalistic style which has prevailed in the present day, was exemplified the *art* in the latter case, bore no proportion to the outlay. Some pieces of presentation plate also, recently executed, were, however, still more remarkable for their defiof older works. Branches of plants, and petals of flowers; the stem and base wanting in every of flowers , the stem and base wanting in every really structural feature, and in properly formed details of ornament ; and figures thrown around, or crowded, rather than grouped,—such were the characteristics of many of the articles of British production, which certainly did not speak favourably for native art, as excapilified in the silversmiths' work of the day. That art could, at one time, he put forth in the precious metals, as in iron and brass-work, was abmdantly shown by the exhibition of a large number of articles, many of which have heen seen in London, at the Society of Arts, and in different collections. To show, however, that art need not be held to have gone from the workers in gold and silver, we were rethat art need not be need to have gene nom the workers in gold and silver, we were re-minded of what it might be, by the fine series of productions by Vechte, and the Prince of Wales's shield. These are indeed, remarkable in their regard for the elements of the beautiful which are seared by attention to outline and which are served by attention to outline, and

to the principles of ornament observed by Mahometaus was strikingly showu-especially in nne rug, placed near to the door from the transept

transept. To have attempted in our pages, any review of the large collection of articles in glass, enamel, porcelain, and ornamental clima and majolica ware; of sculpture in bronze, marble and terra cotta; of the medallions and glyptics; the exquisite carvings in ivory; the armour and arms from the Meyrick and other collections; the Early British, Celtic, and Anglo-Saxon antiquities; the furniture; the specimens of book-bindine: the lace, and saccrdotal vestbook-binding; the lace, and sacridotal vest-ments, and the other numerous articles in the branch of ornamental art alone, would have occupied considerable space, and would have been of little service, without engravings,—if it would not have interfered with our attention to philoset mean meanership in the parene of a solicits more manageable in the pages of a journal, and which were more immediately in-teresting to our readers. Like others—induced to visit Manchester, whether for pleasure or information—we lament the necessity entailed on these minor here in Landau of a hortz. information—we have the necessity entailed on those whose home is Loudou, of a hasty inspection of such a collection. Were we, how-Inspection of such a concentration of the such as the correct, to judge from the efforts made hy those who have had the best opportunities, to get their examination completed by the closing day, we should doubt the possibility of deriving the advantage which is contemplated without longer time than here there has been on quiet days, with good light—for the inspection. Hurried visits, such as are the hest that can be paid—even by those who take deep interest in art—to collections of this character, are in some degree, productive of effects in the reverse direction to that which appears to he expected. It is not now the first time that we have binted the bypothesis, that, without rest, the vision and mental perception undergo a process of and mental perception undergo a process of deterioration by every fresh object presented to them, analogous to the effect which is produced in the case of mere colour. If so, it is something more than the quantity of the works in a gallery, that will operate against the chance of appreciating them indi-vidually. The writer of an able article in one of the incurrence sets down the number of against the chance of appreciating them indi-vidually. The writer of an ahle article in one of the journals, sets down the numher of pictures that might have been seen in a day, as about fifty ont of the few thousands which there were in the huilding at Manchester. As regards many of the schools of art, it might be more safe to speak of *fice* as the number of works that could be studied and fairly appreciated. For Londoners, the chance of see-ing such a collection, therefore, has been very ing such a collection, therefore, has been very

slight. The Soulages collection was exhibited at Marlborough House, and we hope may yet become the property of the nation; and the Bernal collection and other works forming the Government contribution, and many of the works hy modern artists, have heen or may be works by modern artists, have need of may be seen under ordinary circannstances in London. Besides these, however, were 1,079 pictures, forming the gullery of ancient unsters; and forty-four, the Marquis of Hertford's contri-bution; the 969 water-colour drawings, and fifty or sixty frames of miniatures; drawings hy the old meeters. Inty or sixty frames of influences a large number, including several rarc and interesting works of Allrecht Direr; the photographs; the archi-tectural drawings (a poor collection), and a series af nearly 400 portraits of individuals celebrated in English history. What manifested itself to us as worthy to be borne inuind, was the value of the chronological arrangement in hang-ing pictures as contrasted with other arrange ments suggested for a national gallery. The method affords the advantages, not only of ex-hibiting the development of the schools and the hinting the development of the schools and the changes in art, but serves to chicidate general history, and also the hiography of individual painters. In the gallery of ancicut masters at the Manchester Exhibition, the carly schools were fairly represented; the collection of Yaudykes was extensive and interesting; and by Velasquez and many artists with whose productions there has searche here are ouvertruit for the nublic and many artists with whose productions there has scarcely been an opportunity for the public to become acquainted, the works were of the first mder. The chronological arrangement was perhaps most interesting in the collection of water-colours, beginning with the earliest at tempts. The works of Girtin and Torner uf

early date, have, in many respects, hardly been surpassed

Is there no hope of the advantage which there would be from the exhibition of such well-arranged collections in London? It was useless to expect that the Exhibition could be trans-ported, as some have proposed, hodily; and we have intimated a doubt whether the step could be desirable. By sections, however, we should trust that the object may be attained. The liberality of the owners of the reacher

The liberality of the owners of the works of art demands the highest praise. The pic-tures and drawings have heen exposed to admission in many parts of the building. It must, we think, be now apparent that iron huildings, as at present constructed, are ill adapted for the reception of works of art of a valuable character, for however short a period. The lighting in this case has appeared to us insufficient in quanthis case has appeared to us insufficient in quan-ity; and in the smaller galleries, the skylights in the middle of the roof allowed the works on the upper part of the walls, to remain in dark-ness during much of the afternoon recently. We have been asked to draw attention to the offer of the building for sale. There are, of oner of the building for said. There are, of course, many purposes for which it might he well fitted. A proposition is mooted for an in-dustrial exhibition; but residents in the vicinity of the present building who are opposed to the scheme, it is thought, will defeat the project. On the last shilling day, 25,984 persons were duritted; and on Schucher the choice duri-

admitted i and on Saturday, the closing day, there were 17,988 persons. We have much reason to believe that although the statements as to want of interest amongst the operative classes have some fnundation, the collections classes have some fundation, the contextual bave been well examined by the educated people of Manchester, or so far as the time would permit. It was impossible to visit the building without feeling that the works were the subject of even more serions study than a subject of even more serions study than would have been allotted to them in L ondon : and we shall look for the results, both on art as practised in Manehester, and in a wider field, - one of national importance.

SANITARY CONDITION IN THE NORTH.

SANITART CONDITION IN THE NORTH. SINCE the last notes on Newcastle-upon-Tyne were written, we have caused a more earchd inspection of the place to be made, and feel it a duty to give some farther particulars to our readers, for we caunat quietly witness the carcelesmess of human life which is shown in this great and important town. The public buildings in Newcastle are handsome; the new streeds and markets, carceled and markets.

The provice outstandings in reversate of a matusaine, the new streets and markets erected under the direc-tion of Mr. Grainger are good; the charitable and other institutions are admirable; and yet there is he-bind this fair curtain a neglected, uwholesoue, and biad this fair curtain a neglected, unwholesoue, and dangerous district, which, when witnessed, takes away from the pleasure which would otherwise be felt in viewing the streets and houses of comparatirely recent date. Look, for example, at some houses in the Back-row, not far distant from the aucient casile. A large portion of the north side of this street and some other houses in this neighbourhood bave been fortunately removed. The dwollings in the Back-row are for the most part substantially unit, and in tole-able repair. Passengers this way moy constantly see are for the most part substantially unit, and in fole-able repair. Passengers this way may constantly see refuse thrown without ceremony on to the pavement in front of the houses, where it is allowed, until the periodical visits of the seavengers, to thate its course. On inquiring at several of these houses it was found On inquiring at several of these houses it was found that they were entirely without water supply. In a house occupied by large numbers of men, women and children, each person is obliged to carry the water he may require from n part (conduit) at a con-siderable distance. This is bad conduit) at a con-this, the street is totally destinute of a drain, it has tims, the street is totally destinue of a draft; if this not even surface drainage, except by the open gutter just meetioned; and in the dwellings looked at, there were no closets at all. It must be evident that such arrangement's must cause constant outrages against common decency, not to mention the serious effects such neglect must have on the health of families. At the back of some of these houses was a very small, meovered space, surrounded by tall buildings. The poor creatures complained bitterly of the occupants of other houses throwing off, usive matter into this place; and well they may, for never was there a scene more filthy. These dwellings, without water and drainage

Since the last outbreak of cholcra, as it seems to us, the work of draioage has been earried languidly forward, and it is greatly to be doubted if a complete

forward, and it is greatly to be doubted it a complete and effectual system has been adopted. In some of the houses in Eldon-street, which are large, and occu-pied by a respectable class of persons, they are in constant trouble with the drain. It has not sufficient fall, and is frequently stopped. Similar complaints are made in other querters. Even in streets which have been recently improved, the hudlerds of the property in poor neighbourhoods refuse to commonicate with the adjoining sever. This is the old story, but really it is time that measures should be taken to prevent the loss of health and life which arises from this evil; and if those who have clarge of the dwellings of both the industrions and other classes of the poor in large towns will not perother classes of the port in large towns will not per-form an evident duty, some further powers will be required from the Legislature, which should declare that no dwellings in our large towns shall be cou-sidered fit for human habitation, either in tenements

sidered fit for human habitation, either in tenements or otherwise, which are not provided with water, proper drainage, and closet arcommodation. The ballast-hills, and the large eastern portion of Newcartle, are in a shocking state; so is Sandgate, Silver-street,—in fact, nearly all the aucient parts; and, as we have already binded, the more modern localities are in an equally dangerous condition. Tripe-dressing, glue-making, traning processes, and other mawholesomeworks are carried on with impurity. The eows, after leaving the town moor, are often kept in very improper places. Indeed, this large popula-tion is little less prepared for the reception of the chol'ra than it was four or five years ago. It will startle many of our readers to learn that

chol rathan it was four or five years ago. It will startle many of our readers to learn that the commissioners appointed by the Government to inquire into the samilary condition of Newcastle in 18:33-4, discovered that out of 9,453 honese which formed the whole borough, only 1,421 had water-closets: the remaining 8,032 or five-sixths of the popu-lation, had no other provision than certain public conveniences which are placed in different parts of the term town.

town. In the district of Sandga'e, out of a population of say 4,600 persons, it is stated that not more than 100 had right of access to any private convenience,—nine-tenths of that resident population being unprovided for in this important particular. The consequence of such a state of things is evident: the broken pave-ment absorbed the most poisonous matters : from time to time it was necessary to raise the doorsteps of the houses, in consequence of the rise of the footways by the accumulation of filth.* The report just alloued to states that out of the 9,453 houses, only 5,461 were drained to any extent. We will, however, take the figures exactly from the report of the town and road surveyors, published in October, 1855 :---

" Houses in the ancient Borough of Newcastle-on-Tyne.--Number of houses, 6,680; houses drained 3,976; houses not drained, 2,704.

Houses in the Parliamentary Borough.—Number of houses, 37,31; houses drained, 2,108; houses not drained, 1,653.

Total number of houses in 1855, 10,441; total number of houses drained, 6,084; total number of houses undrained, 4,357." It will be seen that the number of undrained houses

in 1855 is greater than that mentioned in the missioners' report, which gives 3,992 as the number of undrained houses.

It is a circumstance which should be recorded, that It is a circumstance which should be recorded, that when Mr. Grainger commenced his new buildings, he most carefully provided for their drainage: he also provided all the houses with water supply and closed accommodation. Mr. Grainger states in evidence before the commissioners that be created 1,062 closets. The commissioners say that they found only 1,421 closets in the town at the time of their visit; if we deduct the number created by Mr. Grainger it will resource the theory and they for more result 350 mirvate

agness that hef-re his day there were only 359 private elosets in a population of from 70,000 to 80,000. In the report of the town surveyor for 1835 and 1856, we find the number of undrained houses stated It is a most remarkable circumstance to be 3.996. to be 3,906. It is a most remarkable circumstance, that while the town surveyor acknowledges that there are close upon 4,000 out of 1,bont 10,000 (approach-ing towards hall) of the houses in the Borough un-drained, he should state as follows:---"It will be evident, I think, that notwithstanding the erromeous impression, made upon the minds of mony persons by the late melancholy visitation of cholers, of that event having arisen from deficient drainage, that Neweastle will converge in this respect advantareously with will compare in this respect advantageously with almost any town in the kingdom." It appears that in August 1854, there were in the town 30,494 lineal yards of sewers, which at an average cost of

• When the cholera was raging, so had was the nature of the pavement and parts below, that the medical officers found it necessary to spread thick layers of fresh soil from the adjacent country-and spread it thickly-over the surface, and this had some effect in stopping the pesilience.

35s. a yard, amounts to 53,364/. 10s. How does it happen that with this length of sewers hat little more than half the houses in the town are drained?

It may be worth while to state, that during seven years, viz. from 1849 to 1856, 14,1307. I6s. 7d. yers, viz. from 1849 to 1836, 14,1307. I6s. 71, have been expended on the improvement of the severs: this is at about the rate of 2,0007, per annum. The rate which has been levied has evidently been inadequate for the required purpose, for the surveyor states that a debt of over 3,0007. has been in veyor states that a debt of over 3,0007, has been in-eurred, and that to the great regret of the committee, about the middle of the last year (1585), they "felt themselves under the necessity of discontinuing opera-tions in constructing a very important main sever; extending from the river in the direction of the Tut-hill-stairs, Westgate-postero, Rosemary-lane, &e. &e. and lance adjoining, a great portion of which, although the calls for its greention are elements. the ealls for its execution are elamorous, must course for a time he deferred. This is the case with other works of eoosiderable importance in the town-

other works of coosiderable importance in the town-ships of Elswick, Wetsgate, and Bytker, the excention of which is nrgontly required by the inhabitauts." We will also quote the following from the sur-veyor's report: ---"Owing to the want of a sufficient outlet for the water discharged from the dustriet of Ord-street, Elswick-termee, &c. it is quite impos-sible to keep the macadamized road, leading from Ord-street to the river at Elswick-quey, in proper prain. The old express from the Drughin med at repair. The old sewer from the Township-road at Elswick-terrace to that point is frequently broken nt and forced by the pressure of the ware, and the road metal carried into the drain and lost. A similar work of equal consequence, is required at Tyneside-terrace: the sever outlet to the large districts, ineluding Rye-hill, and adjucent streets, has for some years been inadequate to receive and conduct the drainage discharged into it. The result is, that about 150 yards of its length, next the river, has got broken and filled up. The water, now a very full stream, runs over the surface, and in summer is very offensive." Although frequent complaints have been made, it appears that the identy has arisen "from the difficility of obtaining the pecuniary guarantee from the proprietors interested in the work." The bursting of those sewers, and other circumstances which might he in the drainage of the town; for what can be worse than the practice of making tributaries without having sufficient space at the exit? Such conditions are very dangerous, and it is painful to think, that while the proprietors of dwellings are wasting time in hargain-

ing, the unfortunate tenants are suffering. With reference to the township districts where the With reference to the township districts where the cholera was very fatal, the inspectro of roads syss, "So few of the streets are at present in a fit state for sweeping, are so imperfectly bottomed or formed, that frequent differences will be likely to arise hetween the inspector and the contractor as to the amount of refuse to be taken up in seavenging, the mod varying, according to the traffic, from 3 to 15 inches in depth.

It appears that at the present time it is not neces-ry to license the slaughter houses in the borough ; and that the animals are brought where the inhabi-tants, in the dwellings surrounding them, are not tadis, in the dwenings surrounding time, are not only anoyed by the foul effluvia arising from the receptacles of blood and refuse while in process of being cleaned; but also nightly disturbed by the bellowing of the animals kept purposely without food previously to being shughtered. Some of these places are situated close to and even under dwelling rooms. many are very badly provided with sufficiently tight vessels for the reception of the offal, and are not aceasible to proper entits for conveying it away. The inspector of nuisances very properly observes that "it is desirable that the committee should have control over these establishments by obtaining a bye-law conferring the power to grant licences for keeping them on certain conditions or regulations by a second seco the new slaughter-bouses in Lower Frints' street (which are kept in excellent order), nearly all those in the town deposit their refuse in the ash-pits attached to the dwellings. In these re-eptades, when the refuse is covered and mixed with askes, the dangerons and exceedingly offensive character of the effluxin does not ensure that mean the mean is disturbled for the star. appear ; but when the mass is disturbed for the par-pose of being removed, the steneh becomes quite in-sufferable." It is very evident that various and more proce on being reinhord, the science becomes quite in-sufferable." It is very evident that various and more stringent caredinents than those at present in use are required, not only in Newsells, but in other large towns, before the lives of a large portion of the popu-lation can be rende, ed sofe. The bint by Mr. Dawson is monthly activities of science of the bint by Mr. Dawson is worthy of consideration :--" With respect to the management of unisances arising from the keeping of I beg to observe that the bye-law at present a distance of 30 feet from a dwelling-house or public footpatb would be much more effective if extended to distances of 60 feet or 100 feet. Swine are now kept commanded from this pirt of the south bank of the in certain narrow lanes and courts, baily ventilated, 'Thames, it is equally evident that the cuhancing of the cubance of the points to which I have berefore allowed with a time hand below. In my next fetter I will, for the chance of your inserting it, append a bittle map of the immediate neighbourhood, with the footpatb would be much more effective if extended to distances of 60 feet or 100 feet. Swine are now kept commanded from this pirt of the south bank of the reformed of the points to which I have berefore alloued. Events and courts, baily ventilated, 'Thames, it is equally evident that the cubancing of alloued. in

where the sir, from their presence, is often in a very foul state. Such cases rannot he reached by the pro-sent byc-law, because the contiguous footpath or pas-sage is not a public one. So strong is the desire to sage is not a public one. So strong is the desire to keep these animals, that notices have heen served to keep these aumais, that notices have here served to remove from situations forbidden by the bye-law no less than 386 during the last year. Six of these offenders have been summoned hefore the magistrates and fined. Proceedings, after having been com-menced, have been evaded in many cases simply by measured the acheers or their fur for the mission removing the enhouse or sty'n few feet, the nuisance virtually continuing the same as before."

As regards the smoke, which in grim and mighty volumes astonishes all visitors, to this town, it would appear that little bas been done in preventionhe magistrates having, iu many instances, refused to commit offenders on the clearest evidence. This is to be regretted, for this is not the way to encourage is to be regretted, for this is not the why to encourage the health-officers of the town to do their duy effec-tually. Messrs. Stephenson, Hawthorn, Burnup, Armstrong, and a few others, have set the laudable example of eonsming their smoke; but in other places the blackness is wonderful. We could say more in connection with this important sub ject, but have already exceeded our limits: we must, however, urge that medical men of great experience and ability have pointed out, both in the Town Conneil and elsewhere, the danger which havgs over this ancient horough ; we fear, however, without much effect.

At the time of the last visitation of cholera a anitary committee was formed: this useful arrange-ment was, however, broken up within a twelvemonth. Having taken some trouble to get at the sanitary

facts in connection with this important town, we feel able to state that it would be easy to provide the necessary funds for carrying out, with rapidity, the improvements required; hut that there seems to be a want of inelination to go thoroughly and steadily to work. We do hope that what has been said, with work. We do hope that what has been said, with the sincere wish to do good, will be received in the same spirit; and that the corporution, the magis-tracy, and the inhabitants will unite in their exertions, and remove the plague-spots which are so disgraceful the theore is the part spart of such an array of citizens of distinguished ability, both in art and science, as Newcasite can point to. At the present moment it is a painted scpulehre.

A CENTRAL "PLACE" IN LONDON, UNITING TRAFALGAR-SQUARE WITH THE BOROUGH ACROSS THE WATER.

IN resuming the Actors with a the bole of a Actors THE WATEL. In resuming this subject, I would ask your metro-politan readers to take a walk to the Borongh end of Hingerford-bidge, after clutreh on Sunday, for on that day the factories are not at work making suoke. If the sky be propitous, and there is a little wind abroad, they will be rewarded by one of the finest eity views in the world. The situation they will then ocenpy in part of the front of the "Quadrant soace," to adopt your own phraseology, between Westminster and Waterloo bridges, commands the great central head of the river. The eity on the north brack fies extended before the view, iu a semi-circle, or as one-half of a panorama, embracing St. Paul's to the cast and the Houses of Parliament to the west, while the ionumerable spires of the metro-polis adorn the sky-line of the prospect as you sweep news, whe the fundamental spires of the herbor poins adorn the sky-line of the prospect as yon sweep your eye along hetween these two objects. The whole eity seems spread out before you, while the river helow is busy with life and steam-hoats. The greatest highis busy with mean scenar-noais. The greatest high-way of London is there beneath your graze, and all along the opposite hank you may perceive sites and buildings, instinet with recollections, hound up with the history of our country. A finer spot for historibuildings, institute with reconstructions for histori-the history of our country. A finer spot for histori-cal musing could not be afforded to our lately en-nobled historian. And these sorts of suggestions are not to be left out in considering a city. He who is not to be left out in considering a city. He who is not to the left out in considering a city. He who is not to the left out in considering a city. He who is not to be left out in considering a city. He who is not to be left out in considering a city. He who is not to be left out in considering a city. He who is not to be left out in city. He who is deed to them is no patrict. Myriads of human beings are born, live, and die within the hounds of Loodon. How much do they depend upon their associations ? Those are but small judges of human nature who do not admit at once that grand areas nature who do not admit at once that grand areas and grand buildings have a vast effect in ennobing the thoughts and expanding the ideas. The plan of a vast eity is a grand thing, and reacts on those who build it and dwell in it. If its streets are elose, dingy, and confinel, the head droops, and the shoulders fall logether as one erceps along them; but come to a fine, open "place," the form becomes more creet, the clust diales, the head is raised up, its agree hole along the baset is theorebild. A grand is even look about, and the beart is thanked 0, a rand space fit for such inspiration, would I have, as I have said, in the centre of London, fraternelly nuiting the north bank and the south bank, and the river, in one

that spot (by ils complete "éclairage," to use again your own word) and elevating it terrace wise to the level of the footway of the present Hungerford-bridge, the whole quadrant space would be a corre-sponding henchi to those parts of the north bank which form so fine a prospect from the south. mean that the advantage would be reciprocal. Invest that the auxiliage vote of the receiver. The terracing and opening out of the quadrant space would afford from it a yet finer view of the north bank of London than that already attained from Hun-gerford-bridge, while it, with its grand sweeping river front, its wide spread area, and the noble buildings which we might hope to arise in future on it, would present the finest possible object from all points of access on the north bank, stretching from Westmin-sler Palace and St. Paul's, including all the bridges. No Jorm or situation of area could offer more advantages to the noblest effects of architecture than this segment of a eircle, with its bold sweeping river front, significant of a circle, which is our a weeping if yet hour, and lit up frequently, as it would be, in various gra-dations by the westerly sun. Alluding to the effect of this, I have never seen so magnificent an evening eity view as from this spot (I mean the Borough end of linngerford-bridge), one afternoon, when look-ing towards the west. The mass of Gothie structuics at Westminster came out against the setting sun in the most magnificent manner !

Sur in the most magnificant minder i. This is far the finest point of view from which these gorgeous piles can be viewed, especially if the Westminster-bridge could be removed. No kind of structure, not even a Gothie bridge, can span the river scrucure, not even a workle bridge, can span the river at the spot occupied by Westminster-bridge, without, I apprehend, injuring the effect of the Houses of Parliament; and according to the plan I have sub-mitted to you, I do not think it is three that a bridge is wanted. I would have the bridge to eross the is wanted. I would have the bridge to evoss the the river above, instead of below, the Houses, uniting the rever above, instead of beyon, the Horses, taking the quarter about Lambeth Palsee with the opposite side. A bridge must soon be hull there, at any rate, as has been often proposed. I would, in that ease, do away with Westminister-hridge altogether, and would absorb its traffic among other traffic, by a hridge (I have said before of 100 or 200 feet wide, but I will now say of 300 feet wide) stretching from Charing-cross to the "Quadrant space" ou the Lambeth side of the water. The true centre of London appears to be about the middle of the river at this appears to be about the minite of the river at this spot, and would be therefore in the centre of such an eventual bridge. This bridge being so wide, would indeed no longer be a mere parage, like most bridges, but would be a continuation as well as junction of Tarialger-square and the Lunheth-terrace in one great parallelogramic area.

A bridge structure of this character and magnitude would, I believe, be unexampled, and would probably be susceptible of novel as well as expanded architeche susceptule of novel as well as expanded iterinte-tural effects of a high quality. It would, of course, connect Trafalgar-square and Lambeth-terrace on a level (like Waterloo-bridge), and might be manel after our honoured Queen. Perhaps it would not be too much to say that Trafalgar-square, Lambeth-terrace, and Victoria-bridge would then afford one of the fines views, if not the very finest view, in the whole world, as a metropolitan centre. I conceive that the level requisite to be obtained on

I conceive that the level requisite to be obtained on the Borongh side for the new ternace would afford beneath it a range of warehouses of great value; and as regards the structure of the bridge, it might, I should think, he supported on a forest of vast pillars, so as, to those passing beneath in boats, to seem like a "temple of Karnak" on the water, or a "light and airy eave of Staffa;" so as to have the grandest effect possible. These nillars would be of such dimensions possible. These pillars would be of such dimensions as to reach from high-water mark (up to which the possible. as to reach from high-water mark (up to when the pirrs would be built) to the roadway above represent-ing the entablature. The width of the bridge (100 yards) would of itself lend slability to the structure, so as to allow its character to be less ponderous, so that these pillars alone should offer sufficient support. This width would also allow of light being provided from above in combination with architectural and sculptural decorations upon the bridge for which it

scuptural decorations upon the bruge for which at might alford fine opportunities. The above idea is probably only one of various architectural devices by which a hridge of 100 yards wide, crossing the Thanes at Charing cross, and miting Trafagar-square with the Burough-terrace, might offer features of an effective character.

My object is to draw attention to this expansion of the "Heart of London," now that the question of the improvement of the metropolis is forcing attention on the public from so many quarters. In this letter 1 have only alluded to the architectural effect within the compass o, such a scheme, and not to the practical advantages in the way of traffic, &c. on which I have touched with a timid hand before. In my next letter

DESIGNS FOR SUBWAYS IN METROPOLITAN STREETS.

STREETS. THE designs for laying out the surface and subsoil of streets submitted to the Metropoltan B-ard of Works, as mentioned last week, are now on view in the large room of the Society of Arts. We have already given a list of the thirty-nine sets and the names of the successful candidates. Further ex-amination has not removed our impression that little novely of value has heen produced by the competi-tion, remembering the plans made public many years ago in this country, and in France by M. Horeau and others.

others. Looking to the rewarded designs for a- *First-class street*, in the design to which the first prize is awarded, No. 19 (Mr. Davis), the whole of the ground hetween the composite rows of honses is cleared away, and the valits of the houses composed of 14-inch hrickwork, are extended across the street, leaving an interval hetween the back walls of 9 feet. This is arched over, and forms the subway, in which are placed, on corbels, the gas mains and the water mains, running along the bottom on the paving. Below the paving, in the centre of the subway, is the source of a holf-care shane, in brickwork, and covered becowe use paying, in the centre of the subway, is the sever, of a holf-egg shape, in brickwork, and covered with stout Yorkshire paying, 2-inch intervals being allowed between the stones, to permit the water or drainage, should the flow be suddenly great, to rise into the subway itself, which is, in time of need, to serve the purposes of a sever. serve the purposes of a sewer.

serve the purposes of a sewer. The cost of this is estimated by the author at 367. per lineal yard, which is to include constructing the vaults to the houses, and covering the roadway, number the metalling, with an clastic material—pateuted for the purpose of deadening sound. In the second rewarded design, No. 32 (Mr. J. T. Knowles), the house vanits are similarly extended, leaving an interval of 15 feet hetween the back walls, in which are placed the sever and the water wain, the case mains are unlead on either side the

walls, in which are placed the sever and the water main: the gas mains are placed on either side the street by the side of the footways, an improvement, eertainly, if we would avoid a weekly blow up : pre-paration is made for vertilisting the sever by means of shafts; gas being introduced for the purpose of producing or increasing the circulation; and light is thrown into the vanits by openings under the curb of footways, which are raised higher than those in present use present usc.

The estimated cost is put at 22/. 14s. 7d. per lineal yard, but this is exclusive of the house vaults.

lineal yard, but this is exclasive of the house vaoits. In both these designs the road, in fact, standing on archea, ready access to the private drains, and for the arrangement of gas supply, is obtained. In the third design of this class, No. 11 (Messre, Warren), the hones vaults are as usually constructed, and a gangway. 4 feet or 5 feet while, is formed against the ends of them, in which are placed the water and gas muins. The sever is in the centre of the read, vertilated by openings in the road, or by humn-nosts and shafirs carried up u the chinner-

the road, vertilated by openings in the road, or by lamp-posts, and shafts carried up in the chinney-stacks of some of the houses abutting on it. The houses are to be drained in pairs by 6-inch pipes, running into a 9-inch pipe, which is to be connected with the sever; and the water-supply is to be by a 9-inch main on one side, with a 4-inch rider ditto on the other, always charged at every hamp-post in case of fare, for road-watering, &c. The cost of this arrangement, including a esti-tion paring for the arring one of the far of the

iron paving for the arringeneut, including a care iron paving for the earringe-way, but exclusive of the water aud gas main castings, is computed at from 38% to 390, per lineal yard.

Of the designs for second-class streets, in the plan to which the first prize was awarded, No. 3 (Mr. Cul-lingford), the sewer is carried on both sides of the road, outside the house vaults, with a passage way over, to contain the water and gas mains. The venover, to contain the water and gas mains. The ven-tilation is by means of gas fires burying at the end of the passage, shafts being carried through the area walls, and up the party-wylls, by the side of the *kitchen* flues, as often as required. The road is to be drained by means of gully-pits, with outfall into sever. The cost is called from 124. In the second design of this class, No. 26 (Mr. Reddall), there is a continuous usarge-way below

To the second design of this class, No. 26 (Mr. Reddol), there is a continuous passage-way below the footpaths, in which are placed the water and gas mains, and which affords access to the sewer: light is introduced to this passage by means of deck-lights in the introduced to this passage, by means of deck-lights in the introduced to this passage, by means of deck-lights in the introduced to this passage, by means of deck-lights in the introduced to the footways, the passage is also arrange to receive the telegraph wires, in all other eases con-yeyed along the subways. The sewer is ventilated by 12-inch drain-pipes, built in helind the fines in the party-walls. The outhy at which this is estimated to he carried out is 32, per lineal yard. In the third design, No. 24 (Messrs. Hugbes and keing used for the subway; but, unlike the other infunctions, this proposes that the sewer, instead way, the interval between the backs of the valuts, heing sunk, shall staud or the paving of the passage, way, being, of course, perfectly water-tight, the gas

and water mains resting upon it. The cost is calculated, with the vaults under the road, as at 452, per lineal yard, exclusive of the vaults, but with tunnel communication to each house as at 592.

commitmization to each house as at 3M. Some of the designers appear to have forgotten the depth at which our severs are occasionally formerl, and others the amount of accommodation which the water-mains, &c. in some of our roads would require.

THE MINERAL STATISTICS OF THE COUNTRY.

A MOST useful and elaborate volume of mineral statistics, by Mr. Robert Hunt, the Keeper of Mining Records, has just been published, by authority of the Treasury.*

In the introduction, Mr. Hunt expresses his satis-faction in heing enabled now for the first time to ena-hence every important branch of our mineral industries, Sir R. I. Murchisan, the Director of the Museum of Sire R. I. Murchisan, the Director of the Museum of Practical Geology, appends a Notice, in which he speaks of the value of these returns, and ramarks that they are perticularly important in showing that the produce of coal in the United Kingdom has now reached the enormous annual amount of 663 millions of tons (money value at the pit-month, L6;663,8622). With respect to the statistics of building stones, elays, hricks, &e., io which we are more proteinlarly interested, the returns, though considerably increased, and very valurablermd useful in detail, are not so com-plete as to afford any correct general results that could easily be embedied within molerate limits. This is not especially the case in respect to clays manufac-

easily be embodied within molerate limits. This is most especially the case in respect to clays manufac-tured into hricks, titles, & e. Still the volume contains many important details even as to these. We find, for example, that 54,552 trues of clay were shipped in 1856 from the port of Poole to twenty-one home ports, such as London, Brivtol, Liverpool, Hull, Glasgow, &e.; and that 3,061 tons were shipped there to Autverp, Stockholm, Seville, and various other foreign ports. To London 582 tons were sent by South Western railway. other foreign ports. To by South Western railway

ny Sonth Western railway. The statistics of huliding stones begin with the granites; elvans, porphyries, and slates of Cornwalt. From about Penryn and Penzance alone, 244,600 cubic feet, or 22,050 tons of granite were produced in 1856. The linestones, slates, and granites, &c. of Devonshire, are next given. Peculiurities in the slates of Launceston are described, some heing good only for faboring, others for chinone-pices, &c. The oulites, conglomerates, sandstones, slates, &c. of Somerset and Wilks, come next under notice. The total value of the Bath oulites, heiter, and the slates of Devonshire, being and the slates of OO/. In a note it is remarked that the value of the Bath oulite, hefore any delivery charges are incurred on it, is about 9s, per ton of 16 fect. Of the oolites of Portland, &c. at Weynouth, Dorset, at Last 2,000 tons a day are used for the Portland hreakwater, Under healt of Surroy, it is stated in a note that lime from Reigute chalk is sold at the pits for 9s. a square yard, and the chalk, when dug in large pieces, is sold at 3s.64, the wargoo load. Quarrise hardwater, Lowestoft harbourt, and some works at Chathan, beides served metroduction and other charches. The statistics of huilding stones hegin with the In a note it is remarked that are works at Chathain, Lowestoft harbour, and some works at Chathain, besides several metropolitan and other churches, are built of Ragione from the Igurnodon quarry at Maid-and and the stafford. Of the Stafford sone, and an analysis of it is given. Of the Stafford-shire limestone, got at Castle-hill, Dudley, about 3,500,000 tons are used in the Staffordshire iron. works alone. Under Staffordshire also it is noted that works alone. Under Staffordslive also it is noted that the Rowley rag has been employed by Messrs. Chance in the maudiscture of artificial basaltic stoce, and a description of the process is added. Some interesting information is given as to the adbasters and marbles of Derbyshire. Under "Aberdeenshire," it is noted that the prices of the Aherdeen and Peterhead granites in the quarrice vari d, in 1856, from 2s. to 5s, the cubic foot. At Aberdeen, 50,000 tons had been pro-daced, of which 30 393 tons were shipped; and at Peterhead, 2,400 tons were produced. Of the Oban slates, in Argyleshire, 10,000,000 are anually pro-duced, In short, there is something of interest, or of practicel value, in every page of these statistics, incomplete as they still are; and doubless every year will increase their comprehensiveness and general

mean average price of iron ore, computed from the sales of all the districts, has here 11s. per ton. This will give 5,095,815/ as the value of the iron ore pro-duced in 1856 in Great Britain. The total produce of pig iron, at the mean average market price, or 44, per ton, will give a money value equal to 14,545,3087.

The quantities of metallic copper produced from the mines of the United Kingdom iu the last three years were as follows.

	185¥	1855.	1856.	
Cornwall and Devonshire Sold at Bwansea Purchased by private contract	Tons, 11,979 1,245 6,493	Tons. 12,578 1,276 7,440	Tons. 13,533 1,215 9,179	
Total	19,717	21,294	24,257	Ī

The fine corpret in 1856 was the produce of 278,792 tons of corport ore, obtained from the mines of Great British and Ireland, the moury value of the ore being 1,744 5167. This exhibits, in 1856, minerease in our produced in 1855, and of 4,540 tons more than the quantity yielded in 1854. To the same periods, the properties of a produced at Swansca fram forcign and colonial ores, sold at the prolitedistering at the properties of the money value of the corper produced at States and the same periods, the properties of the properties of the properties of the produced at States and the produced at the produced at our British smelling works was, in 1854, 2,331, 504, 1, 1855, 2,857,2077, 1855, 2,856, 8,032. The mean average market price of the sevent varieties of metallic copper was, in 1855, 130, 5s. and in 1855, 130, 257. The flue copper in 1856 was the produce of 1856, 1257.

The following comprehensive table will show the value of the whole of the unineral produce of the United Kingdom in 1856:---

Tin Ore	£663,850
Copper Ore (the produce of all the sales, ex-	
cluding foreign ores, but including private contract purchases)	2,313,960
Lead Ore (as sold, containing silver)	1,431,509
Zino Ore	27,455

RESTORATIONS IN EXEFER.

RESTORATIONS IN EXEIER. Some remarks made in the Builder of the 10th instant, in a laudahle spirit, on the churches of Extery, should not pass unnoticed. "Observer" asks what the members of the "Archi-tectural Society" are about, whilst church towers are allowed to wear costs of staces, and to shiver in slap-dash, whilst the old registry-solifice close to the eather drait has been undernized with a plastered facing. The fact is, that the Exter churches, and too many other huildings (including the registry-office referred to, where some good cinquefoli-headed lights were done away with), are repaired without the advice of an architect. Even the cathedral is in the same pre-dicement; and although the dean and chapter renew partions of the exterior from time to line, and have lately replaced two statues that were broken in the western screen, the want of the eye of a master over the whole huilding is apparent, and the Atchitectural Society h is no control over the improvements. The parishes are small, and represented by citizeus not wealthy; so that, anxious as the servations and ments and and the society are to remove had word and the of parishes are small, and represented by eitheus not weakly; so that, anxious as the servertaries and mem-bers of the society are to reprove had work and encourage good (8t. Lawrence's Church was inproved through the assistance of a member), they have very little power over the repairs of the parisit churches. Still there are some diffices which evince that the church-restoring disposition is not so dead in the "semper fiddis" city as your correspondent's sensible researches might head us to suppose.

remarks might lead us to suppose.

ONE OF THE E. D. A. S.

Ост. 24, 1857.

INSTITUTION FOR THE DEAF AND DUMB, CABRA, IRELAND .---- MR. C. GEOGHEGAN, ARCHITECT.

ST. JOSEPH'S (R.C.) INSTITUTION FOR THE DEAF AND DUME, AT CABRA, IRELAND.

DEAR AND DOMP, AT CADRA, IRELAND. Nor long ago, we goue some particulars of this edifice (p. 584), which has been erceted from the designs of Mr. C. Geoghegan, of Dublin, and we now add a view of it. The plan of the building is an elongated parallelogram, having a centre projection heyond the limits of the wings at fronts and rear appro-priated to the use of the "Christian Brothers," prate to the use of the "Consume Drohers, apartments for masters, servants, cellars, and elosets. Each floor contains four rooms, with principal stair-case, situate between the back chambers facing the hall entrance.

hall entrance. In the wings, which are counceted with the centre by corridors, having glass doors, are contained the schools, chapel, reflectory, dornitories, play-room, kitchen, staricase, and inferior offices: a covered amhulatory, extending the entire leugth of the back clevation, and thence to a depth of 160 feet heliud the huilding, serves to divide the garden from the play-ground, hall-court, &c. to which it offers a con-venient shelter and approach to the out-offices from the main edifice. the main edifice.

The style selected for the institution may be termed the Gothie of the Tudor period; the quoins, window dressings, arches, coruices, &c. are formed of red bricks from Wexford, of sizes and moulds made corressly to suit the various purposes. The string-corress, sills, copings, ornamental carved crosses, finials, and niches are of granite, with entrance steps and halustrades. The walls are hult of linestone masonry, plastered and pebble dashed, with which the red bidment and demonstrated means for the start of the start. red hrickwork and dressed grauite form a contrast.

The chinneys are of turn-colta, varied in design, forming the apex of end gables of each wing. The entire roof is finished with crested ridge of file-clay. Entre root is missind with created ridge of file-clay. The schools, dormitorics, chapel, &c. will measure, at completion, 68 by 32 feet. The flooring is formed of full-sized deals, tongued with iron hooping, sustained upon wrought-iron trellis girders, thus obviating the necessity of joists, columns, plastering, &c. and giving additional height to the apartments. Alternate flues for freeh each full have here. Alternate flues for fresh and foul air have been provided in piers situated between each tier of windows, with warm-air chambers in connection with fire-place of central building.

building. The contract for the present works, taken hy the Messrs. Beardwood, amonats to 7,000/.; the iron-work in which has been skillully executed under the direction of Mr. Anderson, of the firm of Messrs. Courtney and Stephens, each girler having fully realized its calculated strength under the required test, in mersone of the capitatest.

The presence of the architet. The institution, in its present state, provides beds for 100 children, and when the wings are fully com-pleted, will accommodate 100 more.

"VIATOR'S " ACCOUNT OF WORCESTER CATHEDRAL.

Ir would be well if every "Viator," while pausing on his way in one of our citics, were to devote an hour or two to the investigation of the eathedral. In every instance the time would be found to have heen bestowed. But there is a vast difference hetween well bestowed. But there is a vast difference hetween a traveller's passing visit to one of these grand churches, and such a diligent, sustained, and thought-ful examination of the same edifice as will justify the subsequent appearance of a descriptive and critical notice in the *Builder*. The "Viator" who has recently been writing in your columns upon Wor-cester Cathedral, will pardon me, I trust, if I correct ceriain inaccuracies which detract from the value of his papers upon Worcester Cathedral, as they have appeared in the *Builder* of the 3rd and the 17th inst. After convending the scene transcel of the white

After commending the recent removal of the white-After commending the recent removal of the winter-wash from the Purheck shafts, strings, abaci, &c. in the choir and Lady Chapel of the eathedral, "Viator" expresses his opinion that " the painting, oiling, and varnishing to which the marble has been subjected, appear but a poor substitute for the polish of which it is susceptible." Nother paint nor varnish has touched the marble. In many instances, the con-dition of the supraser readered polishing invasable. dition of the surfaces readered polishing impossible: in other eases, eircumstances did not admit of polish being applied; and some of the shafts, &c. have been polished. All the rest of the cleaned marble has here

carefully rubbed with oil. "Vistor" has imagined that the south face of the "Viotor" has imagined that the south face of the lesser transcept has heen rebuilt after a design, core-fully copied from the opposite face of the same tran-sept towards the north. Instead of this being the fact, the restoration (absolutely necessary from the condition of the building) of the south face of this headiful and singularly interesting transcept has be a effected by replacing every stone of the original work in its original position, in exact accordance with the time-worn hut still legible expression of the mind of the great ariset this portion of the brind of the face. The pinlegado expression of the mand of the great arist who originally raised this portion of the fabric. The pin-nacles, indeed, are *new*; but this was an inevitable necessity, all traces of these members, as they were at the first designed, having long disappeared from every part of the cathedral. "Viator" pronounces these new pinnacles to he "immoderately heavy," ad "as uolike the graceful turrets of our Early as unlike the graceful turrets of our Early English churches as the imagination can figure to itself." I do not know to what " graceful turnets." English churches as the imagination can figure to iiself." I do not know to what "graceful lurrets" "Vintor" alludes: these pinnacles have been care-fully studied from one of the hest original examples, and they differ from the model only in their heing somewhat *lighter* than that model may be seen to he at heme the

position of the eastern end of the cathedral itself. "Viator" represents the new group of ten lancets with the galable teriodi to have taken the place of the "grat east window of the geometrical tracery period, of nine lights, with a transom at mid-height." The loss of this window, however, "Viator" con-siders to be a subject for but little regret, except on account of its "comparative antiquity." I will only remark upon this, that "Viator" may be quite at ease as to the "comparative antiquity." I will only remark upon this, that "Viator" may be quite at ease as to the "comparative antiquity." I will only remark upon this, that "Viator" may be quite at ease as to the "comparative antiquity." I will only remark upon the second Norman Cathedral, together with the relies of the *first*, which yet linger about the great transept, "Viator" does not notice, hut he indicates the existence of early members, which he considers "good evidence that this part of the huilding was, in its origin, conformable to the Early English of the choir and Iady Chapel." A more extend examination would, I am persunded, convince "Viator" that the early portions of this transept wer inshed before the choir was even contemplated. It is the first, not the "second," pier from the "west. on the north side" of the choir, which differs in

Instance actors the choir was even contemplated. It is the first, not the "second," pier from the "west, on the north side" of the choir, which differs in so singular a manuer from the other piers of the areade in both bulk and section. It is to be regretted that "Viator" did not give an exact description of this anomalous pier. What is to be understood by the statement that the windows of the choir-aisles are "precedied be a screen of triple acceles on shafe"? "preceded hy a screeu of triple arcades, on shafts"? arc

"Viator" considers that a quarter of a century "Viator" considers that a quarter of a centryy must have "intervence between the completion of the opposite sides of the nave." Such an interval would searcely have produced such marked changes. The remarkable manuer in which the two western Transitional.Norman bays of the nave have been made to range with the Gothic bays, and the much earlier remains which are to be traced where the actual junc-tion was effected are not noticed by your owns tion was effected, are not noticed by your corre-spondent. Of some of the late Norman decoration he says that he "can give no description." "Viator" would find, on examination, that the ornaments in question are formed by groups of spiral shells : shells also are introduced into the eurichment of some of the caps

the caps. The extension of the Early Norman crypt towards the south, beyond the southern range of the choir-aisles, and the closing up by masoury of the apsidal aisles of the main crypt itself, your correspondent does not describe; but he speaks particularly of some will relating in the cryst computing an "orchiwall-painting in the crypt, comprising an "archi-tectural design of a trefoil-headed arcade, and some for 100 children, and when the wings are fully completed, will accommodate 100 more. STRIKE AND INTIMIDATION AT DERBY.— There being a turn-out at the Victoria Foundry, and new out, one of these was threatened hy two of the turn-to one month's imprisonment each with hard labour.

606

the four principal arches is the figure of a hishop, in full vestments, in benediction, with a nimbus. One of the figures is tolcrahly perfect, but the other three are much defaced: all were evidently drawn by an accomplished hand. The double piscina yet remains is this gree beautiful deaded. This well writing is an accomplianed hand. The double piscina yet remains in this once beautiful chargel. This well-painting is on the northern side of an Early English bay, which now terminates towards the east the (otherwise) Norman erypt hencath the chapel to the south of the southern choin-aisle. A recent excavation has shown that a ery in hereaf the endpertor the south of the souther in choir sails. A recent excavation has shown that a similar Norman crypt once existed towards the north. The whole of the Norman crypt is evidently the work of Wolstan, the first hishop of the see under the Nor-

of Woistan, the first hashop of the see under the Nor-man dynasty. "Of the exterior it is not necessary to say much," writes "Viator," and he then proceeds summarily to declare that "it is quite impossible to fix upon a single feature which can be offered as a pleasing illus-tration of any period of architecture." Certain parti-culars follow, all of them about as correct as the de-scription of the heraldic wall-painting in the crypt. The Tower here arither these the northouses of its form. scription of the heraldic wall-painting in the crypt. The Tower has neither lost the nobleness of its form, nor have the "efficing fingers" which have been husping themselves with its surface obliterated all traces of its original rich and efficative decoration. The fine effect of the exterior of the cathedral, while it yet retained the character which the Gotbie artists had at the first imparted to it, has, indeed, been sadly impaired; but it has not disappeared; neither has it left us without sure guidance for conducting rightly the work of restoration. "Viator" couples with his mistakes statements which might detract from the re-nutation of the worknew who have excented the putation of the workmen who have executed the restorations. He eannot refrain from indulging in the habit of reflecting upon the Dean and Chapte he omits all mention of the architect who is so sati The only all means an inclusion of the architect who is so satis-factorily carrying out the comprehensive views of the liberal and enlightened guardians of this noble cathe-dral; and he advances opinions which demand criti-cism instead of conveying information. C. B.

ARCHITECTURAL ASSOCIATION.

ON Friday, the 16th, the first business meeting of On Finally, the 10th, the first business meeting or the sossion was held at Lyou's 1nn Hall. Mr. Wigley, President, who was in the chair, said that since the last meeting a fortunate event had happened to their treasury, and which had brought it nearly to par. After correspondence with the Architectural Exhibi-tion, with reference to the advance of funds that was and bu the Association each tere of funds that was made by the Association, on the occasion of the first Architectural Exhibition, in I849, altogether originated by the Association, which dvanced something like 15/. for the purpose, that sum had been refunded by the Architectural Exhibition to their treasury.

by the Architectural Exhibition to their treasury. This gave the Association the double satisfaction of baving a public acknowledgment of their having originated that useful public institution, and enabling them to face their creditors. Mr. S. C. Capes read a paper "On the Public Libra-ries, Art Schools, Museums, and Buildings in London, with the Advantages they offer in architectural Educa-tion," which we print in full. Mr. Penfold made some observation at the close of it, wherein be re-ferred thankfully to the lectures of Professor Donald-son at the London University, and showed their value, as did the chairman also. as did the chairman also. Mr. Herring, Hon. Sec. then said it was a well-

known fact that many of those engaged in architec-ture had not proper time, although they might bave ture had not proper time, attooigh they might bave the means, for study, and he would propose that the meeting should express its feeling to the architectural profession at large, as to the desirableness of letting their pupils have the benefit of the Saturday after-noon. Ultimately, a resolution was passed expressing as the opinion of the Arebitectural Association that the privilege of the Saturday ableace believe the privilege of the Saturday afternoon holiday should be accorded to the pupils and assistants of architects in London and the United Kingdom, and recommending the subject to earnest consideration.

ON THE PUBLIC LIBRARIES, ART SCHOOLS, MUSEUMS, AND BUILDINGS IN LONDON, AND THE ADVANTAGES THEY OFFER IN

ARCHITECTURAL EDUCATION.

THE metropolitan citics of other countries may have solid means of instruction in every branch of science and art afforded to its inhabitants. Rome and Athens, and art anorded to its innobiants. Nome and Athens, with their temples, palaces, and ruise; Paris, Vienna, Munich, St. Petersburgh, and others, have each their charms, and several objects of study; and London, unpootic and unaristic as it may appear to forcigners and strangers, possesses as much larger amount of archi-tectural demonstrations. tectural adornment than is generally acknowledged, equal, if not superior in general character, to that contained in some of the nucle-praised foreign cities. It will be my object to endeavour to draw the attention of the junior members of the architectural profession to its best and most instructive buildings, and to

point ont to them the various sources of study placed to this association hy Mr. Bailey, the curator, and is within the grasp of its inhabitants, as well as to show placed for reference of members at the office of the how every student may obtain instruction in what-registrar. The Sydenham Palace, containing a school of archiprofit or fame.

Do not suppose that I undervalue the advantages of foreign travel, or deny the great beneficial art re-solts derived therefrom : such I consider one of the essentials for their perfect education. My present wish is to describe how they can procure in this wish is to describe how they can procure in this metropolis a large amount of professional knowledge not to be acquired in an office, and at a small money cost, and can profitably employ those hours not occu-pied in the ordinary office routine, which routine is absolutely necessary in order to acquire a therough knowledge of the laws and business of the profession, and which can only be obtained by going through a proper course of training in the office of an architect.

I know you will advance as an argument the difficulties under which they labour in obtaining sufficient time to follow up the advantages I am about to describe, but I do not think that any architect who receives with his pupils sufficient remuneration to compensate him for the trouble taken in imparting office instruction would be nnwilling, for the interest of his pupil as well as his own reputation, to allow him such opportunities of pursuing those studies which the progress of the present age demands, and not expected to be acquired in an office. which are Which are not expected to be acquired in an once. It is not to be supposed that in those extreme cases where no, or only a very small, premium is given with a pupil, and where it is understood that the latter should, in compensation, devote his whole time in making himself useful to the architect to whom he is writed he should he architect to whom he is making himself useful to the architect to whom he is articled, he should be enabled to obtain equal oppor-tunities as those who have not, as it were, imme-diately upon leaving school, to assist in providing means for the completion of their own education; yet for this latter class, and for those engaged as assistants, by a more diligent use of their mornings and evenings, they can acquire by the same means of instruction the same amount of knowledge as those in apparently more favourable circumstances. I have prepared a list of some of the art schools, libraries, museums, and societies of London, with their rules for admission, which, after an explanation of

rules for admission, which, after an explanation of their contents and objects, I will read for your guidance, and which can be consulted daily at the guidance, and which can be consulted daily at the office of the registrar of the Architectural Association, one of whose duties it is to assist architectural students

office of the registrar of the Architectural Association, one of whose dutiest its to assist architectural students in their educational pursuits by obtaining for them iatroductions, or by giving such information as will best enable them to carry ont their views. The thoughts, precepts, and works of the learned men of all ages must form the grammar for our edu-cation, and the opportunities of studying the books wherein they are contained and the drawings which illustrate with life-like reality the embodiment of their ideas are afforded to ns in the numerous public and private libraries which. London possesses; bui, sur-rounded as we are by them, how little do we seem to appreciate the advantages of this, the greatest boon we can receive, and which it is impossible too much to appreciate? And yet how often do we thear com-pliains of the difficulties which surround us in our pursuit after and our endeavour to queneb our thirst for knowledge. The thrains of the British Museum, the Department of Science and Art, Soane Museum, Museum of Economic Geology, East-Iudia Museum, the City Library at Guildhall, Institute of Architects, and Iustitute of Engineers, and many others, are all casy of access to students, and in these bivaries are obtainable works of all ages and of all countries, of all kinds and descriptions of art, science, and lite-pareauch a collection as no other city did or does posses, and so undeservelly neglected by those who are aware of the richs they contain, but are too possess, and so undeservedly neglected by those who are aware of the riches they contain, but are too iudolent to seek for them

For schools of ornamental and practical drawing, For schools of offantienta and photocard and they modelling, and sculpture, there are the classes at the Department of Science and Art, the King's College, London University, Royal Academy, &c. with the most talented artists to assist your studies, as well as the drawings and models contained in these schools, the sculp-tures and ornamental works of various nations contained in the British Museum, the splendid collection of casts belouging to the Arebitectural Museum and Museum of Ornamental Art relating to the Greek, Roman, French, Mediæval, Renaissance, Italian, Cinque-cento, and Elizabethan periods of ornamentation, with drawdraw and Einzaberhan periods to diministration, with draw-ings and eartoous illustrating the coloured mural decorations; the more than 4,000 articles of furni-ture, decorations in glass, metal, leather, markle, and other works, all treating of decorative art, and the models of the original designs of St. Paul's, and of various buildings designed by Wren and other great masters.

masures. Do not forget the Soane Museum, containing easis and models of Greek and Roman ornaments and buildings. A catalogue of the books and description of the contents of the museum have been presented

registrar. The Sydenham Palace, containing a school of archi-The Sydenham Palace, containing a school of archi-tecture and sculpture, is well known to you all, and with the aid of its well-written guide-hocks, affords a large store of instruction, comhining under its vast roof the architecture of several ages and the sculpture of all nations, enabling you to contrast in art-history the exthetics of one nation and of one age with another, and to follow up the gradual development of the several styles. It also, in its courts of mannfac-ture, exthibits to you the huidling materials, fittings, and decorative art-furniture of the present day, bring-ing prominently before you many of the latest iming prominently before you many of the latest im-provements of each class, and oftentimes showing you

ing prominently before you many or an eases here provements of each class, and oftentimes showing you the detail process of monufacture, thereby affording you practical information in the easiest manner. Under its roof and in its gardens, and also at the Botanical Gardens at Kew and Regent's-park, you can skotch and study natural foliage—a study requisite for orunamental design; and opportunities are there afforded to you for acquiring a knowledge of landscape garden-ure for in markies we are often called upon to supering, for in practice we are often called upon to super-intend the laying out of ground to the best advantage, to enhance the heauty or picturesque effect of our

buildings. In the history of our art you can have the advan-tage of the lectures given at the Middlesex and the two other archicological societies in London; the Antiquarian, and several other societics; and in the instruction in the practical part, and various sciences instruction in the practical part, and various sciences bearing upon architecture, you have the Museum of Geology, with its lectures on geology, mineralogy, metallurgy, mining, physics, applied mechanics, natural history, and ebemistry; with laboratory prac-tice and schools; the Department of Science at Ken-sington, with its schools, lectures, and practical mm-seum of building materials; its patent museum and library; its aducational collections, with the models of schools and school-fittings; its Economic Museum, with its models placerums and drawines, rewith its models, plans, diagrams, and drawings, re-lating to the dwellings, building materials, furniture, and fittings for the working classes; the very excellent course of instruction, both as regards fine art and construction, given by Professor Donaldson at the London University; and the System adopted at King's College, with their workshops, laboratories, &c.

The Royal Academy, Institute of Architects, Insti-tution of Engineers, and the Society of Arts, all offer considerable inducements for the advancement of your studies, by their system of hestowing books, medals, and homorary rewards for drawings, designs, and essays, on various subjects, thereby raising a spirit of homourable emulation amongst their students and the younger members of the profession. The Royal Academy gives to those who have obtained Royal Academy gives to those who have obtained sufficient clementary knowledge of drawing and de-sign, upon submitting satisfactory specimens of their previous study, and upon proving themselves suffi-ciently advanced by performing test drawings in the schools of the Academy, a free studentship for ten years, during which period they are at liberty to cater any of the classes of the particular school to which they belong, and to attend all the lectures of the several professors, as well as the free use of the library. Of late years rule has been caforced, that several professors, as well as the free use of the library. Of late years arule has been caforeed, that only those architectural students who have availed themselves of the advantages of the library and of the classes, consisting of perspective and treatment of shadows, are eligible in competing for their medals. For this year they offer a gold medal for the hest de-sign for a National Gallery; two silver medals for drawings of the west front of Spencer House, made from actual measurement: a silver medal for an archidrawings of the west front of Spencer House, made from actual measurement; a silver medal for an archi-tectural subject, tinted in Indian ink or sepia, exhibit-ing the scientific projection of shadows; and one for a perspective drawing in outline. Each receipient of the three first-named medals receives also a free ad-mission to the schools, library, and exhibition for the remainder of his life. The receipients of the gold medals are eligible to compute for the travelling studentship, held for three years, at 130. per annum, with 80. allowed for the travelling expenses.

The Institute of Architects admit, for a subscrip-tion of one guinea per annum, the pupils of their reliows and associates to their library, and to all their ordinary meetings, and have formed for them a class of design, in which a premium of books is given for the best sketches made during the session. The medals, which they also offer, are not confined to students, and for this year are as follows :--The Soane Medalion, with 50/, to enable the successful candidate to study abroad; for the best design for a marine sanitarium; a silver medal and five guineas for the best geometric drawings, from personal measurement, of a Medieval huiding in Scolland not previously illustrated; and a similar premium for the like subject in Ireland; with three or more silver medals and The Institute of Architects admit, for a subscripin Ireland; with three or more silver medals and premiums of books for essays. The Institute of Engi-neers offer medals and book rewards for the best papers

read at their ordinary meetings, and essays forwarded

The tart of the starting procession, and compared to the starting upon their profession. The Society of Arts offer medals, both gold and silver, for drawings and essays submitted to them on art, including architecture; and on construction, facture, &c

I have brought the subject of rewards prominently before you, to show that, should inducement be required for study, there are specific objects placed before junior students, which, if carnestly pursued, will not only students, which, if carnesity pursued, will not only tend to future advantage, but present howour and repu-tation. You may say that themony public invitations to architects to submit designs in compatition, as advertised in the newspapers of the day, afford equal attractions, but I deny they afford equal instruction; for being discretized with and anext longing the biblity for, being dissufished with, and questioning the ability of the class of mon, oftentimes totally ignorant of our art, who have to decido upon the merits of the draw. it is almost impossible to bestow that interest on the subject to carefally collect the same amount of information, to weed all errors in construction, pro-portion, and style, as would be done before submitting the work to a competent trihunal composed of members of the profession.

bers of the profession. The Architectural Exhibition is an institution of great value to the student, enabling him to examine and study the works of the present day, as erected in the various parts of this empire, and making him acquainted with the various improvements in manu-facture, building materials, house fittings, and furni-tare, as soon as introduced. The exhibition is one of the proven work of the advantance which have accurred tare, as soon as introduced. The exhibition is one of the nany proofs of the advantages which have occurred the many proofs of the advantages which have occurred from the Architectural. Association, which, in earry-ing ont its principles, has been enabled to originate and firmly establish so excellent an Iostitution, affording not only information to the profession, but art education to the puble. This Association, insti-tuted for the study of design and construction, is been added to be and the association instifounded on the principles of mutual instruction, and is dependant upon the active co-operation of the is dependent optimized the active co-operation of the junior members of the profession, who, the more eager they are, by countining, to avail themselves of its benefits and support its usefulness, must continue to increase its advantages. That the class of design, to increase its auvantages. That the these is a pro-which forms one of its attractions, has been pro-ductive of great gain to its members, is evidenced by the leading position which those who formerly by the leading position which those who formerly belonged to it are new taking; and there is no reason why, if other classes were organised for the study of other specific objects, that they should not prove equally beneficial; for, where students show them-selves desirous to learn, many will have equal pleasure

imparting instruction. The provide the control pressure in imparting instruction. If you will allow me to digress a little from my subject, I may mention that it is the earnest wish of the committee that more should be done, and they for committee mark note around so does not not one fact that, although this is a young society, three is no obstaele why, by energy and persoverance, it should not become one of the most prominent institutions of the age, for the advancement of our professional knowledge, and a school for fine arts. The aunual enbscription is fixed at a small amount, so as not to exclude earnest students, however poor ; and it is only exemite entries students, nowever point, and it is only by increasing the number of its members, and by an extract spirit of combination amongst themselves, that its sphere of usefulness can be extended; therefore, it is for you all to use your utmost endeavours to advance its interests, for by so doing you advance your own. All meet here on equal terms : all are students in art ; for, however much we have acquired, we have yet something more to learn: it therefore behaves those who, through the means of this Association, have obtained the knowledge for which they sought, still to remain on the list of its men-bers, and employ some of their spare hours in importing that knowledge to others as a donation for what they have gained through its instrumentality.

Let those who have seceded from it again join and for the common good : let the iterest of one be unite for the common good : let the interest of one be the interest of many ; let usell uphold the national art interest, and endeavour to relain, if not raise, that position which the late foreign and native competi-titions have gained for us, and that Europeon distinction in matters relating to art which we are beginning to acquire

You must excuse my running away from the subject of my paper, to which I now r.turn by giving the list of societies and institutions mentioned at the mencenicut. Here followed a list of societies and institutions.

with their rules, objects, and subscriptions, or means of admission.

By this list you may observe that there are upwards of thirty institutions in London, all bearing directly or indirectly on the study of your profession, are try of indirectly of the study of your proteston, ugans the truthinness of some portons of its con- the bining and such having periods between, illustrated with drawings struction, but you cannot justly deny its grace and the designs of Mr. E. Manual dingrams, which fix the subject-matter more elegance, both externally and intern-lly. Had the engraved illustratious, was firmly in the mind than any printed reports are interior only the benefit of good polychromatic deco-firmly in the mind than any printed reports are interior only the benefit of good polychromatic deco-capable of. There is no branch of art neglected, and ration, it would, in my opinion, show itself the finest every facility is afforded to these willing to accept of temple that man has yet produced. Instruction. Museums have been formed and fur-

nished, books collected, societies instituted for all Institut, books contexter, location in this metro-polis they necessarily hecome more advantageons to its inhabitants, as being more accessible than to those living at a distance. The value of these institutions to students will necessarily he in propertion to the system individually adopted for their own education : it is impossible without the aid of an architectural college to hy down a course of study for each dif-ferent brauch: they are, therefore, left to strike out their own paths to knowledge, or depend upon the guidance of each other: and it is only by being unde acquainted with the different means of study, that they are enabled to avail themselves of their advantages. classes of men, and by their location in this metroadvantages

We will now proceed to the buildings of London, and see what instruction they offer; and in so doing will commence with the most ancient that have escaped destruction by the great Fire or the torages of moderu improvements; and, although the greater number of the buildings of autiquity have been de-stroyed, yet many remain of great uso and interest to student. the

the Norman period there are fine examples in the Tower of London, consisting of the chapel other portions of the so-called White or C , with Cæsar's er; the remains of the priory of St. Bartholomew Great in Smithfield, creeted in the early part of Tower in Smithfield, erected in the early part of the twelfth century, hy Rahere :---the portion in the best state of preservation is the chancel of the old church, now used as the parish church; the circular part of the Temple Church, one of the four remaining round churches of that period in England, with its fine doorway, heautiful preade, and triforium.

Waltham Abbey, within a few miles of us, may also he included in the buildings pertaining to London, and will well repay for the small labour of a visit; the erypt of Baw Church; the Confessor's crypt at West mi ster Abbey, and portions of the south transept.

The Endy English of St. Saviour's, Southwark, the chapel of Lansbeth Palace, Temple Church, and the Early Geometric of Westminster Abbey, afford au endless supply of information to those desirous of studying the buildings of that style.

Of the Decorated period we pessess Austin Friars Church, Lambeth Church, portions and several monu-ments in Westminster Abbey, St. Steven's Clois-

of the Perpendicular and Tudor styles, that mar-llons work, Henry VII.'s Chapel, Westminster all, Grosby Hall, Elthen Palace. vellons work, Hall, Grosby Hall

Than, torsay limit, Bahan Fance. Churches of St. Helen's, Bichopszatc ; St. Andraw's Undrishaft ; St. Olave's, Hart-street, and portions of many other churches and tombs in and about London are well worthy of examination. Hampton Court may also be included, and contains many valuable

of the Elizabethan, Holland House, Charlton Several portions flouse-both very five examples. Several portions of the ancient hostels and private dwellings in the east and sonth-east of London.

And should any wish to follow up their studies of And should any vish to follow up their stables of Mediawal architectors; there are many modern repro-ductions in the above styles, evincing the greatest talent on the part of their authors. The Falaeaof Westminster fissel is a valuable school, which you would prize all the more had you to make a long pilgriunge to study from it. London possesses churches and domesic buildings innumerable, teaching out by the avancience of others no only the ture you, by the experience of others, not only the true spirits of the several styles, but sometimes what to avoid; for it is not always setting before you the best copies that enables you to become perfect in your art : it is also necessary that the faults of others should be pointed out to you, so that you may avoid falling into the same errors. As our Government thought f have a room of horrors in their late Art Exhibitic As our Government thought fit to Marlborongh House, so have our architects raised up in London objects of dread : a wise man, however, learns by the experience of those who have preceded him in the same path; and oftentimes the study how to remedy an evil will lead to more earcfal thought and investigation than making an original design. It is also an excellent practice in studying a building not only to admire and sketch its heauties, but to endeavonr to invest yourself with its spirit, and to design additional portions which you judge will add to its effect

In the Classic and Italian'styles of architecture there are works of which we may well be proud. The massing and grouping of the buildings of Greeuwich Hospital and grouping of the buildings of off-constant respon-form a p-disc equal to any for grandcor of effect; and where will you find any temple approaching in beauty of onthine to Wien's St. Paul's? You may declarm against the truthfulness of some portions of its con-

ГОст. 24. 1857.

scope for those picturesque corners and small groupings of details seen in Gothio buildings; but for grandeur of effect and impression produced on the mind it is copal to any. No matter from what point, whoever views it cannot fail to admire it, and feel either promil or jealous that London contains so fine a masterpiece. Look at all of Wren's churches: exmasterphece. Look at all of wreus enumerics: ex-amine the plans: study the position of the ornamental details on their exterior; and you will not only have received valuable lessons in skilt and geometric science, displayed in overcoming irregularities of sight and the posing of weights, hut an issight into ordistic and uncleasing of weights, hut an issight into arlistic and picturesque grouping for the adornment of a town. His great object in the external design of a town. His great object in the external design of his churches was not so much to please the mind butting with a close inspection in the narrow and hustling streets, but to obtain clegance and life scen at a strets, but to obtain clegance and life scen at a distance rising above the dirt and tramoil of the city. Take the towers and steeples of St. Mary, &c. Bow ; St. Mary, Ludgate-hill ; St. Bride's, St. Vedast Fester, Christ Church, St. Stephen's, Walbrook, and and many others, together with his attempt at Gothic, and you cannot fail to neknowledge the master-mind which designed them, and the valuable baccon they affoul in them aviation of design. Insect-mind which designed users, and the valuable lesson they afford in the true principle of design. St. Stephen's, Walbrook, is, I think, one of the finest ex-amples of interiors that he has produced, though most are admirable for the purpose intended, namely, the assemblage of large numbers.

the assemblage of large numbers. Let me call your attention to St. Mary, Woolnoth, a singular and pleasing design by Nicholas Hawks-moor, which may be studied with advantage; St. Mary-le. Strend; St. George's, Bloomsbury; St. Mar-The Budgeting-Boltzmin State of the State of S

small specimen of a design, which, if carried out in its integrily, would have greatly contributed to make Londm an art-city.

To those who have travelled abroad, I ask, where will you find a finer and more suitable building for public offices than is exhibited in Somerset House, with its benatiful Strand front, its atrium, its spacious quadraugle, and its hald river frontage,—save and scept the exerciseence of the dome ? Our British Museum, Bauk of England, Royal

Bank of England, hug-Mausion House, Horse University College, Our British Mieelin, Baik of Digitad, toyat Exchange, India House, Mausion House, Horse Guadas, Burlington House, University College, Geological Museum, Post-office, Custom-house, have each considerable merit. Newgale, as a prison, is a masterpiece of its kind, and our Waterloo and London beilders unvert always creite our admiration. bridges must always excite our admiration. Our modern banks, fire-insurance offices, show

alrancement in art. Our City halls, such as Gold-sniths', Fishmongers', and some others, are worthy and our new streets exhibit buildings, vealth in studying which we may profitably employ our time, Our railway stations, baths and washhouses, markets, prisons, hospitals, and institutions, afford us a large field of instruction ; and I may here remark to those who may he desirous of examining our public institu-tions for the purpose of study, that they will in most tions for the purpose of study, that they will inter-instances, upon application, receive the greatest atten-tion from the officials, and every information that their time will allow. I myself have been over a great many, and have never received any great hinderance.

many, and have never received any great binderance. On theathers and their scenery give us lessons in internal decoration ; and, for vistas and picturesque stret architecture, we posses the views from both of the Regent-circuses, that from Oxford-street, over-looking Hanover-square, towards the church (net sufficiently recognised), "trafalgar-square, the Poultry, Westminuter, New Cannon-street, many portions of Bedgravia, Raddington, and the suburbs; the Temple, Lincoln's-inn-fields, Piazza, Covent-garden, &e.; and the badgene mericoning was posses our univalled for landscape gardening we possess our unrivalled parks and Sydenham Palace.

parks and Sydesham Palace. If we are deficient in fountains and statues (but of the latter we possess a large number, of great merit), and other street decorations, which many continental towns contain, we have in lieu thereof the freshness and verdure of our squares, and the quiet which per-tains to them : and it we have not our public buildings so well situated for attracting the popular admiration, we have them in greater numbers, and they possess all the meens for furnishing attinisterion e menos for furnishing art-instruction. If my humble efforts he the cause of drawing more

a toy motion enous no use cause of drawing mote serious attention to the riches which surround us, and induce only to make use of the advantages placed within their grasp, it will greatly enhance the pleasure I feel in coming hefore you. S. C. CAPES.

BIRMINGHAM AND MIDLAND INSTITUTE. -Part of BIRMINGHAM AND MIDIAND INSTITUTE, ---Part ou the Birmingham and Midhan Institute, huilt from the designs of Mr. E. M. Barry, and of which we engraved illustrations, was opened on Tuesday crea-ing, the 13th inst. We are glad to hear that many of the speakers expressed their satisfaction at its acoustic properties, which are always a cause of

THE USE OF INDIGO. TURNER'S DRAWINGS.

In the days before cohait and French blues were invented, water-colour painters had searcely any alternative between indigo and Prussian blue. The use of indigo was, however, the rule, and that of the prussiate of iron the exception, because no pigment is so capable as indigo of representing airial inter and tones, or so available in the formation of landscape greeces and greys in every variety of tenderness or intensity. This otherwise valuable pigment has, however, one

full of such magoinde as ought totally to exclude it from a place in the matériel of the conscientions artist. It is one of the most evanescent of pigments. artist. It is one of the most evanescent of pigments. I speak, of course, of the indigo of commerce, simply ground and made up for use as a water-colour, and not of the sulphate of indigo, which, although it will stand, is violently intense, and acts chemically upon other colours, so as to preclude its use in works of high art. The ehromo-lithographists, whose produc-tions are exposed to the continuous action of light in shop windows, can best tell what their experience is as to the durability of indigo, but it will be as to the durability of indigo; but it will be more to the purpose I have in view in writing, if I were to relate a portion of my own experience, hecause I feel that the relation is imperatively required incates 1 feet that the relation is imperfuely required to induce the immediate rescue from *further* deterio-ration and fuel ruin of certain works, which consti-tute in every sense the most valuable public and private artistic possessions of this country in particu-lar, and of the world. It is now some twelve years world. It is now some twelve years ago that an ardent admirer and collector of Tu ago that an arcan sampler non collector of himses water-colour works, on taking one of the England and Wales drawings out of the frame in which it had heen exposed to the action of light for only a few months, was struck by the novel appearance of a elearly deflued marginal band of colonr, "fresher" or hiner than the rest, and extending all round the drawing. The fact was, the drawing had been put into a forme somewhat two small for it and comes drawing. The net was, the artawing nan deen put into a frame somewhat too small for it, and conse-quently a portion of the colouring had been covered by the "trobate," and thereby protected from the bleaching power of light from which the rest of the bleeching power of night from which the rest of the drawing had evidently suffered. It was, however, equally evident that the component pigments had faded unequally, from the fact that the faded portion had become decidedly redder than the portion pro-tected by the rebate. The pure bright yellows had gone hut little, though perceptibly. The mailder tected by the rebate. The pure bright velless had gone hut little, though perceptibly. The malder lake, as well as the ferriginous reds, remained in all their original power. The proprietor of the drawing to which I have referred decided at once upon what was afterwards proved to he the real cause of mischief, and was thereby enabled to understand how it was that he had so often been perplexed, in revisiting various collections of Turner drawings, hy fresh discoveries of red clouds, &c. where he thought he used to see grey ones. An appeal was, however, made to Turner himself, who requested to see the drawing which it was alleged had faded. It was shown to him at his honse in Queon Aune-street, in the presence of a gentleman well known to almost shown to him at his honse in Quon Auroe-street, in the presence of a gentleman well known to almost every collector of Turner drawings. On taking it into his hand Turner exclaimed, "I will never make another water-colour drawing,"— a resolution which he did not very long maintain. On being asked if he would have the kindness to blend the finded and un-fielded portions of the damged drawing a little, the answer was equally decided and characteristic. "Oh name portions of the damaged drawing a little, the answer was equally decided and characteristic. "Ou nol if I were to do that I should have all my draw-ings brought to be restored." He admitted that he still adhered to the use of indigo, having supposed it ings brought to be restored." He admitted that he still adhered to the use of indico, having supposed it to be a permanent material. Ou asking him whether he had not observed that all, his early drawings, and those of Girtin, which had been long exposed to light, bad become rusty, or what is called foxy, in colour, he made no answer, but said. "Well, what um I to use for greys?" The rendy was, coladt. I do not suppose that Turner used indigo from that time. By far the greater part of his drawings have been, however, made with this very fogitive pigment, and I write in the hope that you will exert your influence to induce those who have the care of the Turner draw-ings, now exposed to view in Marlborongl-house, to take such means as may resens them from certain and not very slow destruction. The writer of this well spread out for his examination on the floor of Turner's dining-room, and believes that in colour they are not now what they then were. It is at least worth while to test the matter by covering one of them for a while with an opagne screen, having a few hules cut in it here and there. On a recent visit to the Man-chester Exhibition, I was greatly moved by the un-plessant fact that some of my old enquaintances (Turner drawings, which I had not seen for years) have assumed decidedly new faces. Our out of the grand-est of the England series is charged in such a way, and to such an extent, as to have lost all its value as a authoritative lesson in art. I also take this oppor-

tunity of protesting against a fashion which has spring up of lete years of framing Turner and other well-toned and harmonionly-coloured drawings with a staring stripe of white paper, as a line of demarcation between the colour of the drawing and the gold of the frame. I believe Turner always contemplated the union of the gold of his colour with the gold of the frame, and 1 know that he enjoyed it, and used to urge the hanging of frames containing his drawings in groups, without intervals between the frames, so that nothing but gold might be seen in connection with the drawing.

Indeed, what but gold can harmonize or not interfere prejudicially with such exquisitely delicate balancing of light and colour as we see in his marvellous works? Ile knew perfectly how to deal with the eye, either as regards the quantity of pure white, or the quality of his extreme lights: very often no pure white at all is, or can he admitted into his composition, and, in such cases especially, none can be brought in contact with it excepting injurionaly. But how often do we see the whole of the artist; wisely-planned and delicately excented scheme counteracted by the effect of these white margins. The eye is so mastited by the giare of these new-light Bristolhoard mountings as to be inequable of secing any light at all in the highest lights of many of Turoar's drawings--lights which, in contact with gold, and in the absence of the white mounting, would have seemed perfectly luminous. I know of no stronger instance of the injurious effects of this frame-makers' fashion, than that of Turar's large drawing of the Wreek now exhibiting at Manehester. I well know how riehly parmonious the effect of the colour of that picture is in contact with gold; whereas, in contact with its present abomiable white margin, it looks vulgarly 'mainty,'' and positively disagreeshel. The case of vignettes maile expressly for book engravings can afford no valid reason or excuse for this prattnee, for in them the greatest ingenuity is exercised to brack up and reader as little ohtrusive as possible the lines of demarration between the picture and its necessary ground, and thereby to lead the eye from dwelling upon the white ground itself.

yound and conserve to have the type and the set of the

THE DISTRIBUTION OF NATIONAL MEDALS.

FROM THE DEPARTMENT OF SCIENCE AND AFT. Sour few months since, the Department of Science and Art amounced its intention of awarding annually to the Local and Provincial Schools of Art, in connetion with itself, a number of "silver antional medvis," in addition to the bronze ones usually distributed; and, that the directors of the schools should feel an interest in the matter, it was at the same time determined that a presentation of works of art, to the values of 10. should be made to every school, a student of which was successful in the national competition. If 1 did not, in common with many others, greatly mistake the Department's intention, it was, that, as the beel bronze prize was a mark of comparative merit among the works of each school, the silver national media should indicate the relative standing of the schools themselves. If such was the purpose of the proposers of the new prize, it was undoubtedly proiseworthy, and well calculated to proluce the best effects, by stimulating at once the committees, the masters, and the students. But I regret to say that the first distribution, which took place at the Town-hall, Manchester, on Friday, the 'bh,'' does us the number which may be awarded in our "stop" is not lead one to believe that this or any other principle has been acted upon by the gentlemen who awarded the meduls. The greatest number to be distributed in one years is arbitrarily fixed as 100, but the number which may be awarded in one "tage" is not only minimited, but two or more students of the same series and your of the sources is not be students at using a tony of the site only minimited, but two or more students of the same series and but only minimited, but should an on "students and the inducida in on "students and the medula.

The greatest number to be distributed in one year is arbitrarily fixed as 100, but the number which may be awarded in one "stage" is not only unlimited, but two or more stadents of the same school may receive (or rather have received) national metals in the same stage. Thus, there are une medals awarded in stage 2; and of the five uwarded in stage 14, three are taken by the students of one school. But this is not the worst teature I remerk. The erowning fully is, that one student is in many cases allowed to compete in two stages. A student of the Macelesfield school is rewarded in stages 19 and 8; so that if any advanced student resolves to obtain a piece of silver which will be of considerable value as a work

*. See p. 594, ante.

of art, he has only to heat a retreat to the earlier stages of bis lahour to be tolerably sure of surcess. I am aware that there must always be meny difficulties to contend with in this matter : such, for instance, are the consideration of the student's age and the time which be has studied in the school. In stage 5 the ages of the successful competitors ranges from sixteen to thirty-three years; and the time in the school from one year to three years and four months. But if prizes are to be given, some principle must govern the distribution.

The total number of medals awarded this year is nincty-two, and these are very unequally distributed. Whilst the ladies of the Gower-street school, London, take tou, the Metropolitan Training School and the Mine district logether take but eleven : the Potteries have as many as sevence.

The advance of the second seco

are awarded to fem-le students. I enouch, however, pass stage 23,—" Applied design," without commenting apon the works sent from the Shefiidd school. Shefiidd is scarcely the district from which one would expect to receive designs for porcelair, yet a student of that school has obtained a medal for designs of cups and saucers: the same student has also obtained a medal for designs of scisors. In oue print, the handles are formed of two human figures, and the pivot works in the interior of a head of "Silenes," the second has handles formed of grotesque animals with wings. A medal has hean awarded to a design of a water-urn, by G. Theaker : this work, notwithstanding it exhibits considerable' taste in the excention, is too evidently copied from the worst examples of the modern French school. A design for a water nrn, by R. Towaroe, has also creeived an eddal. This leddyn as exsecutiat to be observed : three dolphins, two of which tied together by their tails hite the sides of the third, form the spont : the lid is surmounded by a farmed fragere bearing a corancopia; and the body is surrounded by sit vanied, youths. Is in to astonishing tht such works as the abuild meet the approval of the Government examiner? But the Department is for ever silfting its ground : what it professes one month it wholly repudiates the uext, and a history of the workings of the institution during the past cight years would form a valuable and eurions addition to the conic literature of the day.

of the day. I now come to the least successful part of the Exhibition—the modelling steges. In these there are but five works: three are from the Potteries, and to each is awarded a national medal. Whatever may be the work of demention of the distinction awarded them, there is little excess for the position they occupy. Two are phased on the ground; two more (has-reliefs of the discobolus) laid flat on a table; and the fittle (a vase), placed in such a position that a view of the interior is the best to be obtained. But this treatment of the modelling stages may be in particle of the by the little encouragement given in the treatment of the modelling stages may be in part accounted for by the little encouragement given in the Twining School is, that modelling is an at included in the power of drawing, and, therefore, it is unnecessary to train men specially as masters for that department; thus any man who has taken a certifieate (or painting has no difficulty, *after theem andts*); it is very little better. In the Potteries, the classes are carred on in a corner of the general elass-room, and the sume space of about 6 square feet is considered and he some of work from the head school. Unit very lately the modelling elasses there extended to absence of work from the head school. Unit very lately the modelling leases there exbiended on the some work have been excented or sinflicient merit for exhibitiou. The successful caudidates of the "Aktional Com-

The successful candidates of the "National Competition "received an invitation from the Department of Science and Art to attend in Manchester for the purpose of receiving in person the certificates of their success. Ahout eighty were induced to respond to this invitation upon the terms offered by the Com-mittee of Council on Education, viz. a payment of "3d, per mile, reckoned on the distance by rollway of the student's school from Manchester. Thus a student from Birningham would receive 1/. 1s. 3d.; a student from Sheffield, 10s. 6d.; and a student from Exeter, 27, 18s. 9d. If the total expenses of a student exceed 27. 185. 9d. If the total expenses of a sculent excess the sum allowed, the excess must be paid by such student." Upon such a liberal arrangement it is not surprising that several students came from Ireland for the purpose of receiving their national medals, and it must be a matter of regret that M. Veethe was unable to complete his work in time for the proposed distributions. distribution.

distribution. I would now beg to make a few remarks upon the nature of the "10% worth of works of art " given to cach sehool. Nothing would seem more simple than to have made the 10% worth of works of ait bear some relation to the staple of manufactures of the some relation to the staple of manufactures of the town to which they are given. Yet such an arrange-ment does not seen to have suggested itself to the authorities of the Department. The things exhibited are shields, tazzas, and salvers ; but however beautiful these works may be as works of art, they are hardly calculated to improve the taste of the students of the Manchestr, Liverpool, or Coventry schools. I helieve it is even a question whether these Medieved specimens of metal work, beautiful area doubt they are, are the best description of mizes for elementary are, are the best description of prizes for elementary schools of art

The isome apology is necessary for employing so much of your valuable space, and I offer it in the statement that this annual distribution of medala costs the nation many thousands of pounds. C. II. W.

THE CHAPEL OF HAMPTON COURT PALACE.

To the description of the chapel of Hampton Court Palace, by Mr. A. White, in a recent visit of the Middlesex Archeological Society, I trust he will permit me to add some particulars, which, I helieve, are not generally knowu.

In the summer of the year 1845, I was engaged in the similar of the year 1999, i was charged in making various surveys and sketches in the charged of Hampion Court Palace, and other parts of the building. At the cast end of the south wall 1 dis-covered one of the original stone multioned windows, evereal one of the original stone mullioned windows, in a very perfect state, but without any glass in it: the window was, and I believe now is, cased up be-tween two 9-inch walls: part of one side was suffi-ciently opened for me to make earceful sketches and measurements: within the casing I found many frog-ments of glass, hut none that would indicate that stained glass was *largely* used in the chapel. At the same period I also surveyed the roof, from a suspended scafiolding and an opening in the boarded vaniting. I took careful sketches of this curious and interesting piece of construction, the whole of which is put together with mortises and tenoos, and oak interesting piece of construction, the whole of which is put together with mortises and tenoos, and oak pines; these pins, in part, holding the numerous pieces together. I found several indications of colour and gilding, hut extrainly not to that extent to war-rent the present masaisfactory taudriness, as a resto-ration. In the original painting there was no attempt to conceal the material of which the roof is con-structed; hut the "polychrony" was of lust judi-cious character that relived the architectural details, defined the construction; and, by leaving portions of the material in its natural state, the evidence was the material in its natural state, the evidence was certain that the vaulting was no merc trumpery polychromed plaster, or gimerack chinaware, good, solid, honest English osk. but

In continuing my survey I ascertained that the allery at the west call also underwent alterations, under the anspices of the great Sir Christopher. The present gallery floor is considerably higher than the anchient floor, and the panelled walls conceal two good chimney-pieces, strings, mouldings, and other things, which, if opened now, would add another "wonder" at the princely magnificence of the "wonder" at the

Sticklers for ancient precedent will be, perhaps, somewhat surprised to find that many of the orna-ments used in the state rooms are made of a composition something like papier måché, and that the leaves at the junctions of the panelled ceiling of the stair-case, and in other places, are stamped in lead.

case, and in other places, are stamped in read. No doubt many drawings exist of the palace in its original state, hefore Sir Christopher Wren merci-lessly swept away so much of this once stately and extensive building. It is to be regretted that his great skill and talent were not in this instance directed by better taste; that he, who must have studied the works of the Medieval architects, did not endeavour to hlend his architectore with that of the cardioal, and without experior with har of the tarious lessify swept away so much of this once stately and again to compete with Messrs, Peek and Stevens, the extensive building. It is to be regretted that his guardians being desirous of reducing the accommo-great skill and talent were not in this instance directed dation from 750 to 650. If of course protested by better tasts: that he, who must have studied the against this procedure on the part of the guardians, works of the Melineval architects, did not cadeavour to hlend his architectore with that of the cardioal, and, without copping, molte harmoniously the two Messrs. Peek and Stevens have accordingly submitted followed a Medieval example worthy to he followed.

THE BUILDER.

There are still many interesting and instructive worthy of careful examination—things that I have no nearly forgotten—as my sketches and notes are parts of Hampion Court Palace but fittle known, worthy of careful cramination-things that I have now nearly forgotten—as my sketches and notes are not in my possession; and a continual exonination of the aneient architecture in many parts of the country, and the distance of time, have, in some messure, obliterated many genus of the old palace which ought to have here hetter stored in my memory; ret, in spite of Mr. Ruskin's invective against "Perpendien-lar," and archicedorgist' tinde against "debased" architecture of the period of Hampton Court Palace. E. B. L. E. B. L. the theatter was fusible of the store of the morths from architecture of the period of Hampton Court Palace. E. B. L.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE session will commence on the 2nd of next month, and the honorary scoretaries have addressed a circular to the members, inviting them to contribute papers, or information in another shape, to the general etings. They say :-

¹⁴ Interestings. They say :—
⁴⁴ If, as is highly probable, you may have recently made some particular subject your especial study, or if, an is not less likely, you have been engaged upon the design and superintendence of some works involving novelikes in architectural composition or construction, you would be communicated and the or construction of the second study of

As these observations apply as well to those who are not members as to those who are, we give them the publicity of our pages, in the hope of inducing contributions to the general stock of information.

At the opening meeting of the session a paper hy Mr. Wyatt Papworth will be read, "On the Introduc-tion of Deal, and of Painting (woodwork), into this Country."

MEDWAY UNION WORKHOUSE COMPETITION.

THIS competition appears to offer another illustra-tion of the necessity for immediate co-operation by the profession generally, to ensure a more satisfactory tion of the necessity for innecase evoperation by the profession generally, to ensure a more satisfactory position than is usually awarded to architects who may feel induced to devote their time and experience to future competitions of a similar nature. It will be embrance that an advertisement appeared in the in : In remembrance that an advertisement appeared in the Bailder of January last, inviting architects to send in plans and specifications, together with detailed esti-mates, for the erection of the new workhouse for the Medway Union, according to instructions prepared by the Board of Guardians, and in accordance with the requirements of the Poor Law Commissioners. This advertisement also active the intended pather was not advertisement also stated the intended only was not to exceed 11,000%. Thirty one sets of designs were accordingly submitted for the approval of the guardeans, when the first premium was awarded to Messay. Peek and Stevens, and the second to Mr. Edward Holmes. Some idea may be formed of the importance Notices. Some loca may be formed of the importance that was attached to the printed instructions, by the fact that the lowest tender for the erection of the design for which the first premium was awarded was exactly double the amount of the contemplated outlay, namely 22,0007. Thus situated, the guardians abanand the idea of proceeding with the design of Messra, Peck and Stevens, and wrote to Mr. Holmes, asking him if he were prepared to guarantee that his plan could be earned out for the stipulated sum. The could be carried out for the supplicated sum. The architect requested a forthight to prepare estimates, at the expiration of which time he waited upon the Board with a guaranteed estimate from a highly respect-able builder, that the work could be done for the sum of 12,0004. Mr. Holmes was informed, however, after howing how put to much avance and deviating a mich having been put to much expense and devoting a whole for the problem of the main expense and according a whole for the pith in getting out the quantities and preparing the estimates, that his gnarantee would not be required. He, however, received a communication from the Board of Guardians on the 2nd of Septemher, inviting him again to compete with Messrs. Peek and Stevens, the

NEW ROYAL ITALIAN OPERA-HOUSE, COVENT GARDEN.

the theatre was finished in line months from that time. On the 2nd of December, 1846, Mr. Albano commenced the entire reconstruction of the building, and produced a fine interior, of which we gave an engraving in our volume for 1847.* On Wednesday, March 5th, 1856, this shared the fate of the earlier building,

1856, this shared the fate of the earlier burding, and was burnt to the ground.⁴ The Opera-house, which has now been com-menced for Mr. Gye, is to ocenpy a portion of the site of the old theatre, and that of several houses at the rear. The remainder of the site will be devoted to the purposes of a flower-market, the prohable elevation of which is suggested in our view, although the design is not yet fully devided on The portion (logastyle: Corindecided on. The portico (hexastyle; Corin-thian) faces towards Bow-street, and we helieve thian) faces towards Bow-street, and we believe it is not intended to complete this portion of the work until after next season. The grand entrance is under the portico, the lower story of which will be used as a carriage-porch, enclosed with glass, while the upper portion will be available as a promenade, in connection with the Crush Room. Entrances to the gal-lery, upper hoxes, and stalls, are in Hart-street, but the pit, hoxes, and stalls, are in Hart-street, but the pit, hoxes, and stalls can likewise be approached by the grand entrance. An entrance to the theatre will be also provided through the flower-market, and a balcony is contemplated, flower-market, and a balcony is contemplated, to overlook the latter, in case it should be to overlook the latter, in case it should be thought desirable to use it as an adjunct to the theatre. Her Majesty's private entrance will be in Hart-street, by a separate stair-case, anteroom, &c. A private entrance and staircase for the Dnke of Bedford will also he provided. There are separate stair-cases to the various parts of the house, and well-belse and winders are avoided in every case holes and winders are avoided in every case. All stairs and corridors are to he fire-proof. The supports of the boxes are to consist of wronghtsupports of the boxes are to consist of wronghl-iron cantiferers, resting on east-iron columns at the back of the boxes. The honse will be larger than that destroyed by fire, and will be so con-structed that the stage and the auditory can be tbrown together whenever desired for hanquets or balls. The accommodation generally will be on a more lhearal scale than in the old house, and cach tier will possess retiring-rooms, and other conveniences. The roof is to be of wronght-iron, covered with slab slate; the floor girders will be also of wronght-iron. The ceiling of hoxes and anditory will be formed of firegraders will be also of wrongn-tron. In decaming of boxes and anditory will be formed of fire-proof fibrous material; and the wood, which will be very sparingly employed, is, we under-stand, to be rendered fire-proof by a process belonging to the lessee, Mr. Gye. The works are rapidly progressing, the walls being nearly up to the ground level.

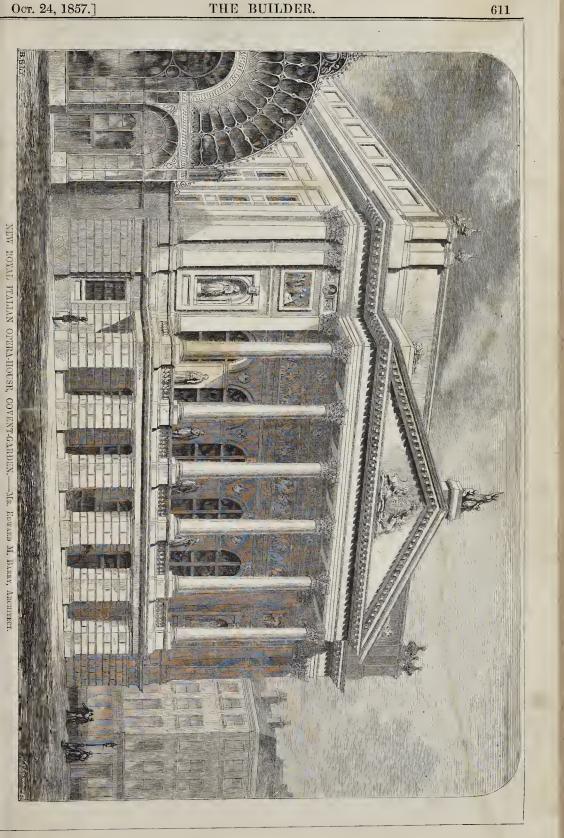

Mr. Edward M. Barry, of Old Palace-yard, is the architect, and Messrs. Lucas (Brothers), the contractors, Messrs. H. and M. D. Grissell, are the sub-contractors for the iron work, which forms a large portion of the contract. Let us add that the bas-reliefs under the por-tico, and the statues on each side of it, are the well-know works of Flaxman from the old It is fully intended that the theatre theatre. below the solution of the second seco

THE PAVILION DESIGNS, BUIGHTON .- The selection has not yet been declared, and writers are still calling on the committee to obtain the aid of a professional man hefore coming to a decision.

* Vol. v., p. 165. The view and particulars are also given in "Buildings and Monuments, Modern and Me-dieval," by George Godwin, together with some observa-tions on Acoustics, as applied to theatres.

† An elaborate inquiry into the still unknown cause of the disaster will be found in our volume for that year.

CHURCH-BUILDING NEWS.

Boxley .--- The parish church has recently been restored and reopened. The old high-backed pews Botteg.—The philos Council has recently been restored and reopened. The old high-backed pews have been replaced by open sittings. A new pulpit, ke, has also been crected, the walls scraped and eleansed, and the dilupidations in the windows, root, and other parts of the building renovated. The expense has heen defrayed by asbeschption. Mr. Balmer, of Maidstone, was the architect, and the work has been excouted by Mr. Thompson, of the same town, builder. *Oxford.*—The chapel of Buildio College, which has been recently rebuilt under the superintendence of Mr. Butterfield, and just now hrought to completion by Messrs. Ruddle aud Thompson, of Peterborough, builders, was opened on the 15th inst. *Marston.*—The foundation-stone of a new church at Gean Hill, near this place, was laid on the 12th inst. The architect is Mr. Butterfield, and the builders are Messrs. W. Brown and Sons, of Frome. *Meugissey.*— The new Frome. Wesleyan Church

are Messes. W. Brown and Sons, of Frome. Mewapissey. — The new Free Wesleyan Church erected in this place by those who secoled from the Conference party, about the time that Messes. Dunn, forfitht, and Everett were expelled by the Conference, has been opened. The chapel (land inclusive) cost nearly 350/, according to the Cornish Telegraph, and is now nbour 2004; in debt. It was built chiefly by subscription. It is erected on an elevated spot (Dreanner Hill)

grant, has heen given by an Building Society. Derdy.—The new chapel recently creeted hy the Wesleyan Reformers of Derby, in Becket-street, has heen opened for Divine worship. The building is calculated to afford accommodation for 800 persons, and has been renered at a cost of about 1,800, in-cluding the site. Messrs. Giles and Brookhouse, of cluding the site. Messrs. Giles and Brookhouse, of the site. Messrs. Giles and Brookhouse, of and has been return to see and Brookhouse, or Olding the site. Mesars. Giles and Brookhouse, or Derby, are the architects, and Mr. Porter the builder. The chapel is 60 feet long and 45 feet wide. The elevation is of a plain Italian character, faced with builde and stone dressings. School-rooms and attached at bricks and stouc dressings. School-rooms and vestrics, with requisite conveniences, are attached at the back. The heating is effected by the introduction the back. The heating is effected by the introduction of fresh air passing round hot flues, and admitted into chapel through iron-gratings in the aisles. The ventilation is formed by means of a large shaft at-tached to an ornamental open centre-piece in the ceiling, and to n flue in the chimney-shaft, heated from the formace flues, under the direction of Mr. T.

of Leeds. In the centre is a figure of Sanctus Johannes, the Patron Saint of the Order, who holds of Leeds. Jonannes, the Fatron Saint of the Order, who holds the Bible in his right hand, and the square in his left. He is entering the porchway of the tample, on each side of which are two pillars supporting the royal arch, with the monogram J. H. S. forming the key-stone. Above the figure is a circular compart-ment with the "All Sceing Eye," the Bible opened at 2 Chron, and the square and compasses laid thereon. Below the figures are three medallions. The floor of Decover the nervices are three medalitons. The hoor of the porch is laid with mosaic pavement, and the work-ing tools are grouped thereon. The window is sur-rounded by a horder composed of an endless chain, and radiating ribbon of blue and red, and encircling the border are words, "Let there he light, and there was light," also "Bortherly Love, Relief, and Truth." In the bottom of the window there is a slab of black marble, nn which is engraven, in gold letters, the

mattic, on which is engraven, in gold letters, the inscription. Battlersby.--O'the church of St. James the Apostle at Baldersby latley opened and consecrated, fuller details have been forwarded to us than those in our previous notice. The edifice, as already moted, is in the Early Decorated style of architecture. It con-sists of a tower, placed on the south side of the western cattremity of the south asile of the maxe, 160 feet high, of which the spire is 72 feet; a mave with aisles, 75 feet by 40 feet; a clanaed, 35 feet by 19 feet; an orgen-room on the north side of the chanel i a vestry east of that; and a heating department be-yond the chancel-aisle or organ-room. The tower also forms the porch, which is groined. In the north-east angle is a circular staticnes leading to the bell-ringers' noom, which is lighted by a window of two lights in the west wall. The spire is pyramidal in form, and oranemeted with bands representing scales inverted. The nave is divided into aisles by locorated is read pires supporting on cach side five urches. The windows are all according to the Early Decorated tered piers anpporting ou each side five urches. The windows are all according to the Early Decorated style, and are slightly varied. A double vesica piscis window lights the eastern extremity of the south aisle. At some future period it will be filled with staioed glass. The two tall windows in the west gable, and the wheel window above them, are from the works of Mr. Wailes, of Newasite-ou-Tyne. The wheel window has an *Agnus Dei* surrounded by winged angels. The lower windows display the armo-rial hearings of the foundar (the late Viscount Downe) rial hearings of the founder (the late Viscount Downe) and others. The east window of the choir is of three and others. The east window of the end is of three lights terminating in geometrical tracery. The stained glass, represention the "Transfiguration of Christ," is hy Mr. O'Connor, of Loadon. The two side-lights in the south wall of the chancel are nt present covered with calico--the stained glass not keing ready for them. A low stone screen separates the chancel from the nave. It has a gate of scrolled irou-work in the the nave. It has a gate of serolled irou-work in the centre. An iron screen separates the organ-room from the chancel. The pulpit is of carved oak, ou a base of stone. The seats in the choir for the officiating elergy and the choirsters are carved. Ou the floor in front of these scats is a memorial of the founder. It is a slab of white marble inlaid with brass. The ebancel up to the bases of the windows is lined with alabaster, and under the cast window is a correct precise of the same material. The floors are is meet with atabaster, and under the east withdow is a carred recides of the same material. The floors are of Minton's decorated tiles mingled with the fossil-spotted grey marble of Derbyshire. The rool of the chancel is not finished, but is to be coloured in approprinte devices. The walls throughout the charch The floors are

pitch. The roofs are slated, tile ridged, and the gables surmounted with crosses. The old walls have all been pointed, and the decorations touched up and restored. The doors and windows in character with the original church are circular-headed, and the mouldings are enriched with the chevron or zigzag, billet, block, lozenge, beak's head, and other ornaments peculiar to the Norman slyle. On the south side of the nave are two pointed windows, the incongrouss insertions of a later period, which have heen allowed to remain. The principall entrance on the south has four mouldings, principally chevron, and the label is curiched with men, beasts, birds, and fishes. Some thick it is intended to represent the twelve signs of the zodiac. Most of the windows have small attached columns. In the east end of the new chancel a Catherine-wheel window has been introduced, with irradiating tracery. Estending round the nave and pitch. The roofs are slated, tile ridged, and the gables surmounted with crosses. The old walls have Cancerne-wheel wheely wheely have and the nave and the chancel is a block-cornice with corhels, principally representing human heads in the most grotesque posi-tions. Round the chancel are strings of billet and lozenge ornament. The interior of the church hears tions. Round the chancel are strings of billet and lozence ornarent. The interior of the church henre its restoration had a very primeral appearance. The walls are of immense thickness, and the openings of the windows narrow, but gradually opening inwards. The most striking object is the arch between the nave and the chuncel, which is of considerable span. Ahove this arch an arcade of three lights has heen intro-duced. An old pointed arch in the tower has been opened out. All the old wooden furniture of the church has been removed: the pews have been re-placed with stalls, which with the reading-desk and altar-table are of out. A new stone pulpit, in Caen stone, has been placed near the chancel arch, and the floors have been laid with cucanstic tiles. The church is ventilated, and warmod with hot air. The roofs are open to the ceiling with stained timbers. The churchyard has been lowered and levelled, and new walks have been and restorations have been ead ball and explicitly of this sum 1,500. are been bard Malone, of Hull. Mr. Emery acted as clerk to the works 2,500. (7 this sum 1,500. are borne by Sir Thiton Sykes, and the rest mised by voluntary works bas been executed by Messrs. by Sir Tatton Sykes, and the rest raised by voluntary eoutributions and a church rute.

by Sir Tatton Sykes, and the rest raised by voluntary contributions and a church rate. Middlesdorough, --The foundation-stone of a chapel at Tees Tilery, near Middleshorongh, was laid on the 12th inst. The ground upon which the chapel is about to be creeted was given by Mr. B. Samuelson, who also bears a part of the cost of its creetion, Mr. Caw-thorne, of the Tees Tilery, having contributed the whole of the bricks required. Carliste.--Mr. Willis, the organ-builder, and his assistants, have commenced the monipulation of the instrument in Carlisle cathcdral, and are now husily engaged in removing the dust which has accumulated in the pipes. Nearly the whole of the dirt had entered the pipes during the restoration of the huilding. It is included to apply hydraulic power to the bellows, hui the present hand-powerwill still be kept in reserve. There is to be a cistern capable of holding 1,500 gallons of water, the daily consumption being esti-mated at 500 gallons. The men are now engaged in laying the necessary pipes, the flags in the south aisle heing taken up for the purpose.

PROVINCIAL NEWS

sider the different tenders sent in for the erection of shore the inherent tenter's sent in for the fetches to the new school and master's residence. There were eight tenders, varying in amount from 1,680/. 7s. 6d. to 2,594/. 3s.; and that of Mr. John Fulton, of Hetton-le-Hole, amounting to 1,680/. 7s. 6d. was accepted, subject to certain conditions. The architect is Mr. Ferrey (who was also architect of the church of st. James, recently built at Morpeth). The site of the set builton is a river of slowing ground on of its manes, recently built as independ, and the set of the new building is a piece of sloping ground on the northern horder of the town, lately purchased by the trustees from the Earl of Carlisle. The Gothie style of architecture bas heen adopted.

PROGRESS 1N SOUTH AUSTRALIA.

THE population of this thriving colony in 1850, was 63,700. At the close of 1856, according to an article, in the South Australian Register, on the state article, in the South Australian Register, on the state and progress of the colony, the population had in-creased to 104,700. In 1850 there were 108 manu-factories, of different kinds, in the province: in 1856 the number had risen to 228. In 1850, there were twenty-seven flour-mills; in 1856, seventy, whils the actual mill power had advanced in a still higher degree. In 1850, the total tonnage of shipping risting Port Adelaide was 36,533 tons: in 1856 it was 106,741 tons. The imports of 1850 (retained for colonial consumption), amounted to 124. 17a. 44a. for colonial consumption), amounted to 12ℓ , 17_5 . $4\frac{1}{2}d$, per head of the community. The corresponding im-ports of 1856, amounted only to 10ℓ , 9s, $11\frac{1}{2}d$, per head. The exports of colonial produce, in 1850, amounted to $545,039\ell$, or 8ℓ , 11s, $1\frac{1}{2}d$, per head of the population; in 1856, to $1,304,904\ell$, or 12ℓ , 14s. $11\frac{1}{2}d$, per head of the population. In 1850 there were (including rooms for preaching), 142 places of worship, calculated to accommodate 20,173 persons, the actual average attendance being 14,463. In 1856 the number of places of worship was 215, adapted to accommodate 34,459 persons, of whom 1856 the number of places of worship was 21S, adapted to accommodate 34,459 persons, of whom 23,713 were calculated to be in attendance. In 1850 there were sixty-six Sunday schools, and 3,354 scholars; in 1856, 130 schools and 7,622 scholars. The Government day-schools, in 1850, were sixty-four in number, with 1,867 pupils, educated at an expense to the State of 1,5567, in 1850, they were 147, with 6,516 pupils, at a charge of 8,9797. We have not much news as to new building opera-tions from this colony by last mail.

tions from this colony by last mail. A new Roman Catholic College has lately been

A new Roman Catholic College has lately heen erected at Clare. It is large and commodious, and entirely built of stone, with gardens and grounds leading up to it. The huilding at present consists of a study, hall, dormitory, chepel, and dining-room, and apartments for professors, hut it is in-tended during the ensuing year to carry up one wing of the building one story higher, in order to give increased accommodation.

Increased accommodation. There are at present two lines of magnetic tele-graph in operation, of an aggregate length of about forty miles, the line from Adelaide to the Port and sca-coast (eleven miles), being opened on February 18, 1856, and the north line to Gawler Town, including a hranch to the Dry Creek Slockade (twenty-nine wild) miles), was commerced in the mildle of January last, and opened on the 14th of April. A small station has been erected at Gawler Town. During the ten and a helf control with D During the ten and a half months that the Port line was in operation last year, 14,738 messages were transmitted, and in the first three months of the present year, 7,253. The sum of 20,500/. was voted by the late Legislature, for the erection of the South Australian portion of a line to connect Adelaide and Melbourne, and contracts have been entered ioto for carrying out the work. Ten miles of submarine cable arc to be laid under Lake Alexandrina and the Goolwa channel, to connect Goolwa and Pelican Point of Lake Albert Peninsula. Lines are in course of erection between Melbourne and Sydney.

THE CRYSTAL PALACE AS A TEACHER.

REGRETING that so little nse, comparatively, should be made of the wonderfol collection of examples brongbt together at the Crystal Palace, we have urgol, on more than one occasion, the desirability of arrang-On more than one occasion, the desiration or arrang-ing for the delivery of occasional walking lectures on the various branches of knowledge there illustrated. The editor of the *Railway Record*, impressed with the fact that the great mass of the visitors have uo adequate conception of the historical or artistic value of the works which the company have been at so much wins to hime together is making the same strage. bit the works which the company have been aces inden pains to bring together, is making the same sugges-tion, pointing out how much information would be given by the "untechnical and free commentary of a man of judgment and taste who should walk through any special department of the building, and, with such graces of conversational discourse as the occasion such graces of conversational discourse as the occasion might saggest, point out and dwell upon the pocalisr works most fit to he admired; and, by adorning his lecture with such decorations as history and biography supply, awaken an interest in the mstbetics of the

minute acquaintance with its varied contents. To meet this, it would be the duty of such a lecturer to To meet toos, it would be he days of suit a security to pointout hy names the books which have been writ-ten on the literature of a period, and the like; to recite some stirring ballad, or fix the attention on some bright act of the hero of any age, as a point from which all future acquired information connected with the subject of his discourse would radiate as from a centre; and we may rest assured that the light though studied words of such a teacher would not float upon the air in vain, but, resting at length upon the virgin soil of many a young brain, would be certain to bring forth fruit in due season."

We hope before long to see what so many are desiring carried into execution. When we were last in the Crystal Palace, 23,000

valt, on the Fast Day, to hear an carnest preacher. It was a sight that will not soon be forgotten by those who saw it. We mentiou it mainly to note that all the arrangements within the palace were excellent, and reflected the greatest credit on Mr. Grove and the other officials.

ON TRACING CURVED TUNNELS.

Your correspondent, Mr. Isaac, appears to imagine that the common formulæ used for tracing an ordinary railway envre on the surface will do equally well for fixing the points of a tunuel. I, for one, should not much like to have the re-archibitive correct with an envel of third.

1, for one, should not much may be have the re-sponsibility of constructing a curved lumach, if obliged to set it out by the method proposed in your cor-respondent's article. It is perfectly true that the rule is easy to calculate, and equally easy to mani-pulate on plain ground: there would be no dificulty in using it to trace a curve on Newmarket-heath, or In using it to frace a curve on Newmarkermenth, or Doncoster Rac-course, or on the ordinary lie of country usually selected by engineers for a line of railway; but this, my practice tells me, is a very different affair from tuonelling. I did not send the method pointed out in my article, as one claiming any pre-amignet posit, but as heing age by which sensed method pointed out in my article, as one command any pre-eminent merit, but as being one by which several curved tunnels had heen actually set out, and success-fully excented, and that too, under very difficult cirtemstances, my object was merely to put on record the method adopted by myself, and fellow-labourer, Mr. J. T. Hay, in the practical execution of several curved tunnels, which fell to our lot on the Continent.

curved tunnels, which fell to our lot on the Continent. Nearly all the known methods, or proposed methods for tracing railway curves of any kind, were exam-ined and considered. There are plenty of mathemati-eal conundrums published for this purpose, all pro-fessing to be very good, but after examining the merits of most of them, they were passed by as use-less for our purpose. The method proposed in my article was worked out, and considered to be suitable to our circumstances, and was therefore adopted. No clouds there may be othors much hatter, but if so 1 doubt there may be others much better, but if so, I have not had the good fortune to meet with them, nor, if so, 1 iudced, have I ever, to my recollection, seen any method proposed, in print, for tracing curved tunnels,

Your correspondent asks, what is the advantage of the method pointed out in my letter. The first ad-vantage to my notion is, that it has heen both prac-tically and severely tried,—and was not found want-ing : it has therefore the advantage of not heing a mere theoretical prohlem proposed for consideration, but a method received up conclusion in the cetual but a method practically employed in the actual execution of several tunnels of sharp radius.

Another advantage 1 think is, that it affords an instrumental and mathematical check on the measured tangential liocs and offsets to the axis of sure targeting nots and outs to the acts of the curve-one mutually assisting to check the other, which is certainly not the case on the common tan-gential method of setting out a curve. I consider this a very useful advantage in practice.

The country where these curved tunnels were excented was exceedingly mountainous and rugged, and 1 feel tolerably well assured that no sane man, having the responsibility of such works on his shoulders, would have ventured to set them out and keep them in operation by what your correspondent seems to cal the common method of setting out railway curves to eall From the nature of the country, even the straight tuonels could not have the assistance of an observatory to set out the lines, because we could find no place in the monntains whence the two ends of the tunnel tunnel could be seen; consequently crows' nests and obser-vatories, with transit instruments, did not figure as prominent features in the works, to excite the curiosity or admiration of the gaping unltitude of gobemouches in their neighbourhood. It is usual to have a fixed observatory, with a transit

instrument, in the 'construction of tunnels, to prevent any mistake iu the lines or deviation from the axis of the tuunel. 1 believe most engineers adopt this method, to keep things safe and surc. If, therefore, good instruments are thought necessary in a straight various writers for findir tunnel, how much more are instrumental checks points of railway curves.

Crystal Palace, and thus provoke the desire of a more necessary in curved ones, especially, too, when there are several shafts on the line of wor

are several sharts on the nue of work. If your correspondent were to trace the surface line of curve on the ground by the method he pro-poses, I think he would find it a very difficult matter in practice to trace a corresponding curve under ground, so that one should be cracity vertical to the other which would have are to would the twender the several several the several the twender of the several the twender where the several several the twender of the several the twender the several several the twender of the several the twender of the several several the twender of the several the twender of the several several the twender of the several the twender of the several several the twender of the several the twender of the several several the twender of the several the twender of the several several the twender of the several the twender of the several several the twender of the twender of the several several the twender of the twender of the several several several the twender of the twender of the several several the twender of the twender of the several several the twender of the twender of the several several the twender of the twender of the twender of the several several the twender of twender of the twender of twender of twender of twender of the twender of twende ground, so that one should be exactly vertical to the other; which must be the case to work the tunnel correctly, and keep the central axis of the shafts in the same vertical plane with the axis of the tunnel. In ordioary ground this would not be an easy matter in practice, but in rugged mountain districts, like the Cevenues, it would be exceedingly difficult: it is one Ceremics, it would be exceedingly diment: it is one thing to draw these curves on a sheet of paper glued on a board, but quite another to trace them over a series of gulleys and ravines, encumbered, as in our ease, with multitudes of stoke walls in the shape of artificial terraces, for the purpose of utilizing every series of such as the stoke of the series of the stoke of the series of the

scrap of soil for viceyards. It was a matter of no ordinary difficulty to trace a straight line over these gullies and terraces, much less to trace an accurate curve without an in-strument, both carefully and auxiously handled. Ilad someth, both carculary and advisory matter in the respon-sibility of these tunnels, I think he would not have trusted to the common method of tracing curves on the surface of the ground, for curves which had to be accurately traced many yards into the rocky bowels of our mother earth.

our mother earth. In the latter part of my article, your correspondent will find that 1 have actually noticed the common method of tracing enrves, and alloded to it as a means of putting in a few intermediate stumps, if required during the progress of the works, though in the transche in question it was never made use of, as the trigonometrical points given by the method indicated were found sufficient.

Most of the schemes concocted for the purpose of tracing curves are modifications of each other, and may be reduced at last to the same principle and expression

expression. Some gentlemen have written whole pages to prove themselves the inventors of the method they advocate, but they are mostly new combinations of old forms of algebraic expressions, the original inventors of which had "gone where all good uiggers go," long hefore railways began to "witch the world with nohle horse-marship"

marship." This heing the case, 1 do not claim to be the "sole This heing the case, I do not chain to do the inventor " of the method I have ventured to recom-mend and apply, nor do I know who is. I suspect it mend and apply, nor do I know who is. I suspect it is that illustrious person known as "nobody,"—for, like the electric telegraph, it is no one person's invention, but made up hy patchwork hits from many sources, neatly dovetailed together to make a practicel sources, nearly doverned together to make a practical scheme it hears a strong family likeness to the "common " method, silly married to a method that may perhaps have heen at the time a little uncommon, the two together thus producing a very useful bantling.

I repeat that I do not pretend to elaim for the method explained in my article any wonderful or pre-eminent merit: I sent it for publication not as a mathematical theorem, or trigonometrical conundrum, hut as a practical metbod by which several curved tunnels had heen not only accurately traced on the ground but successfully executed, - and this, after all, is an advantage over merc theorems, howsocver pretty on paper.

I may here observe, that these tunnels were con-structed with "side shafts," so that the axes of the shafts were not sunk in the axes of the tunnels; this was a matter calling for a little extra care in the setting out, to keep all the lines in their true position, so that the curve of the tunnels should not be brokenhacked.

While on the subject of curves, perhops the following rule may be useful to some of your young readers, as it requires neither algebra, trigonometry, uor loga-rithms: it is not a bid approximation for "common"

rithms; it is not a bid approximation for "common" work, and may be called a rule of thumb. Rule-The square of the tangents in chains, mnl-tiplied by the constant 33, divided by the radius in chains, will give the offset in feet and decimals of feet, which may be thus concisely expressed-12

$$\frac{1}{10}$$
 × 33 = offset.

If now we refer to a book of tables containing the facts calculated according to the "common" offsets calculated according to the "common" method, we shall be able to compare the results given hy this short rule of thumb.

by this soort rule of normal. Let the radius of curve be ten chains, the length of taugent two chains, we shall find the offset per table to be = 13°20, and hy the rule above given we have— $\frac{T^3}{R} \times 33 = \frac{4}{10} \times 33 = 1320$, the same as by the rga tables.

Your young readers may amuse themselves by com-paring it with any of the other formulæ given hy varions writers for finding the offsets for tracing the

Ост. 24, 1857.]

Who the inventor of this rule may be I know Who the inventor of this rule may be I know not, and care less: it was given to me by a brother chip one stormy day, while munching bread and grapper ander the sheller of an uofinished culvert, during a pelling shower of rain, at Vahrouche, Herault, France. He gave it to me, as being easy to carry in the head, and a good 'un to go, when idle, in a hurry, or not "scientifically" disposed to dabhle with trigo-nometry and logarithms ,—but mind, my learned friend did not say it was to he used for working curved tannels, although it is an uncommonly common method. Josern Lockwoon. JOSEPH LOCKWOOD.

FAILURE OF PIPES AND RESERVOIRS.

The state of the Nene Valley drainage works is exciting some alarm. Mr. R. Stephenson, heing called upon to report on the subject, has said,—"I think it essential to make a suggestion as to what should be algoin to report on the subject, has sam,— I think it essential to ranke a suggestion as to what should be immediately done to avert disasters which may at any period during this season of the year overwhelm the adjacent lands. The proper spirit in which this ques-tion should be approached by all parties affected should he merrigo gill Nene Valley drainage questions and the conflicting interests incidental thereto, to view it rather as if a great calamity were imminent, against the consequences of which all parties should most strenuously combine to provide a remedy.... The two main sources of danger are of conrsc—first, the land floods; secondly, excessively high sea tidas. I a my opinion, the proper course would be to construct at or near the proposed hridge at Wisheeh a strong substantial wooden slanch, with two self-acting tidal gates opening seewards, with an aggregate waterway of 50 fect, and provided with slackers of sufficient dimensions to admit tidal waters....... The first cost of a stanch of this description cannot

The first cost of a stanch of this description cannot he safely estimated at less than 3,000/."

We have reason to believe that the danger is im-

minent. Last week alarm was excited in the neighbourhood of the valley lying hetween Cowley-hill and Denton's-green, hy the bursting of one of the huge Rivington water pipes, by which Liverpool is supplied. All the small brooks, ponds, and ditches in the neighbour-hood were soon overflowing, and in two hours there was an extensive river of about 200 yards wide, eovering potato, pasture, and stubble land, and reach-ing past Dentou's-green-lane to the brook, up-wards of half a mile. Some idea of the force may be imagined when it is known that the pipe hurst under-neath. and the water threw up the earth, sand, and minent.

imagined when it is known that the pipe hurst under-neath, and the water three up the earth, sand, and soil, and carried it awny, leaving a hole of 11 feet 6 inches deep, and 48 feet hy 36 feet 9 inches wide. A few months ago we expressed objection to the mode in which some of the reservoirs in the north for new water works were heing constructed, and we were hlamed for endeavouring to excite alarm. We hope, nevertheless, that it led to extra precautions, and, moreover, that engineers in charge will keep an eye on the embankments.

CONSTRUCTION AND USE OF THE TURKISH BATH.

As there has been much talk lately about Turkish baths, and whether it is possible or desirable to bring them into common use in this country, and as we know that there are most erroneous notions prevalent with respect to their cost and comfort, a short account of a visit to one recently constructed at South Preston Cottage, North Shields, may possess some public interest

The residence is one very common among the middle class in this country,--a small dwelling-house, surrounded by a garden, and having a vinery attached to the house. Behind this vinery is a small ohlong apartment, S feet high, about 16 feet long, hy 6 feet wide. At one end of this a furnace is constructed out-side, and a flue, 10 inches hy 12 (in height md hreadth). apartment, S feet high, about 16 feet long, hy 6 feet wide. At one eud of this a farance is constructed out-side, and a fine, 10 inches hy 12 (in hight and hreadith and suggested hight and hreadith and suggested incidental sign. and a small aperture is in the chinner to earry of the and a small aperture is in the chinner to earry of the over-heted in: Thus, it a cost of from 10/. to 207. and with two or three hours' firing, the fuel eosting and the public to the condition of the donuring poor of the metropolis. I, therefore, think that you will be interested in hear-induct 41, you are able to obtain and maintain, for 150 degrees, and in the outer from 50 to 100 degrees, two hours being the namal time to com-plete the processes. On a fine clear, cold, rather treeshing to the knews, a loose flowing enprise for the thermometer at 85 degrees, we were soon in a most genial glow. Thus prepared, we entered the that approns), the atmosphere at 125 degrees. Seating small aporons), the atmosphere at 125 degrees. Seating small aporons), the atmosphere at 125 degrees. Seating sourselves, à *la fa* Turk, on a low wooden hench, we

waited in profound silence the moment when all our skin impurities should "melt, thaw, and resolve them-selves into a dew." Nor had we long to wait. Soon a most copious shower of perspiration ran from every a most copious shower of perspiration ran from every pore. One attendant commenced a hrisk friction with hands and feet over the whole surface of hody, and produced a result that we confers we were not prepared for. Accustomed to daily use of the ordin ry warm and cold baths, and the constant use of "field gloves," we fancied that we had left little to be re-moved; but under the skillah hands of our manipu-lator, we were soon divested of a rough coat of dead endermine lead on the surface here a terrible obtricele to lator, we were soon divested of a rough coat of dead epidermis, that must have been a terrible obstacle to the delicate process of respiration, which nature in-zends to go on constantly over the whole surface of the body. Next we were rubbed from head to foot with soap, followed by a delicate stream of warm water poured over us, which produced a delightful glow of invigoration such as we have rarely experienced before. A sense of purity over the whole body, and a deep calm as of settled peace fell upon us with all the freshness of a new birth. Next a hracing stream of cold water, and we stepped again into the first anartment. When the body had been maning stream of com water, and we seepped again into the first apartment. When the body had been rubbed perfectly dry, we were conducted into the vinery, where, reclining on a couch, every muscle in repose, we were exposed to a current of cold air, with

repose, we were exposed to a current of cold air, with the loins only girded. The night, we have said, was frosty; such a night as your comfortable and well-clad Englishmen shudders at the idea of exposure to. Yet, as we imbibed a fragmat cup of coffice, and watched the soft light of the moon through the overhanging vines, there was no feeling of chill, but one of perfect health and renewed emergy vibrated through the body; while, through the mind, sympathising as over with her carthly dwelling, passed rapid visions of all that was pleasaut in the past or hopeful in the future; and we left the dwelling of our friend convinced that few of the blessings of modern civilization, as auxiliaries to health and com-fart, are to he compared to this English version of the furt, are to be compared to this English version of the Turkish bath, and glad that there are few martyrs to remain and disease of the overlaxed respiratory organs among our countrymen who may not, at a trifling cost, possess themselves of this which would really seem to be a blessing.

ISLINGTON VESTRY-HALL COMPETITION Ar a media of the vestry, held on the 16th inst. the committee presented their report on the designs submitted in competition, and recommended twelve designs for the consideration of the Vestry. The following is a list of the numbers and mottos:---

8.	L'Espérance ;
32 a	and 33. Islington;
35.	Utilitas;
46.	Con Amore;
47.	(A Device);
50.	Utility;
	Dum spiro spero ;
57.	Whyttingtou ;
	Faith ;
69.	Nemo ;

- 71. A. B. C.; And 72. Bravo.

After some discussion, the recommendation of the committee was adopted, and the further consideratioa of the matter was deferred for a week.

The authors of several of the selected designs are freely named, and a simple struggle of interest appears to be going on. We may have something more to to be going ou. say next week.

Some of the eleverest designs are not included in the committee's list.

NOVA SCOTIA-GARDENS, BETHNAL-GREEN

play-ground was about to he taken away from them, and I helieve they intended that the parties concerned should receive some very decided indication of their disapproval of the proposed loss. At all events, each hillock had its knot of oppositionists, and the "monn-tain" indicated in your engraving, presented a somehillock had its knot of oppositionists, and the "monn-tain" indicated in your engraving, presented a some-what threatening aspect, as its erowd of occupants slood darkly prominent, against the clear sky helind them. One sturdy fellow, bent upon mischief, was hacking fiercely at a post as sturdy as himself, which had been fixed deep into the carth, as a land-mark long before. I found that a large number of similar posts had been torn up, or hewn down, and earried away in triumph by the lawless crew, only an hour or two previously. Whether uy energetic friend was a mute or not, I cannot tell: I only hope that be was not deaf, for youchsafing an or reply to my request to know wear, for vouchsafing no reply to my request to know why he wasted his strength to anuoy me, be put on his coat, and joined a numerous *endowinge* which had assembled to see a fight, or bear a speech. As there was no fight, the architect delivered his "maiden speech," and my friend was all the time. deaf, for vouchsafing no reply to my request to know why he wasted his strength to anuoy me, be put on was no light, the architect derivered his maden speech," and my friend was all attention until its close, when he was pleased to signify his approval of its sentiments by joining in a "hooraye," which wel-come demonstration at once scryed to establish the

come demonstration at once served to establish the popularity of the movement, and I have now reason to hope that, instead of the opposition which was ex-pacted, it will receive protection if not support, "a consummation devoutly to be wished." I will keep you an courant with our progress, and, doubtless, when the buildings are faished and occu-pied, some of the many rich and henevolent, who will be tempted to visit them by their benevolent foun-der, may be induced to follow her steps to the dens of the warched and noverty-stricken, and lend their aid

the wretched and poverty-stricken, and lend their aid in the recovery of other waste places. Congratulating you that all the bread which you have "cast upon the waters," has not heen lost, and that evidences of "its return after many days" are at last becoming mauifest,-I am, A FELLOW-WORKER.

THE CLOCK TOWER OF THE NEW PALACE AT WESTMINSTER.

WE are glad to hear that the four quarter-hells are We are glad to hear that the four quarter-hells are now east: the great bell, as our readers know, has heeu completed some time. As all the structural arrangements in the tower and the ironwork for hanging the bells have hear ready for several months, we trust we may soon be able to judge of hotbe clock and hells *in situ*. We make this note, because an unfair idea of the state of the clock tower has heen eirculated. The quarter-bells have uot yet reached the building. the building.

STATUES AND MONUMENTS.

A STATUE is to heraised in Cork to the late Father Mathew, the upostle of temperance. At a meeting of the committee last week, Mr. Hogan, the sculptor, after some remarks as to whether the proposed statue after some remarks as to whether the proposed status should he of marble or hronze, stated that bronze would he much hetter suited to this elimate, and it was agreed that hronze should he the material used. The cost of a hronze should he the proposed size, namely 8 feet high, was stated by Mr. Hogan to he 1,000/. and the cost of the pedestal was estimated at a little over 100/. making about 1,100/. alto-gether, as it was calculated that the corporation would give a foundation free of expense. Mr. Hogan stated that he proposed to make the statue 8 feet from the beel to the head, and that the plinth would be 6 iuches, which, with the pedestal, which is to he 10 feet high, will make a height of 18 feet nitugether. nltngether

nltugether. The statue to Moore, recently crected on the east side of the Bank of Ireland, in Dahlin, was inaugn-rated last week, in presence of the Lord Licutenant, who made a charming speech on the occasion, and suggested, incidentally, that a mountent should be raised to another Trish insistel,—Oliver Goldsmith, within the shadows of his own Trinity. A statue to Madome Sevigné, by Kesrs. Rochet, has just heen cretted at Griguan. According to the Lienzur Gazelle, it is proposed

Venice against the Austrians, in 1849, was one of the most gallant events of recent times. The Athen

most galiant events of recent times. The Atheneaum says, the statue of Handel is getting ready for Halle, and that of Luther for Worms, and a statue of Cor-reggio is now spoken of as in progress for Parma. The temporary pedestal in the court-yard of Bur-lington House, Piccadilly, for Mr. Foley's excellent equestrian statue of Lord Hardinge, is now ready. The statue is east, and will shortly be put np. Sculptors and others are leginaning to thran their attention in earnest to designs for the proposed memorial of the '51 Exhibition. In this case the committee seeking to afford every hatitude, have

committee seeking to afford every latitude, have made no stipulation as to scale, and will receive either models or drawings.

THE ARCHITECTURAL EXHIBITION.

Our advertising columns have already shown that as Exhibition will be opened to the public, in the the Suffolk-street Galleries, on the 17th day of December next, and will remain open till the 20th of February of December All drawings, models, photographs, &c. unst he de-livered at the Galleries on the 1st or 2nd of December, before six o'clock, p.m. and none will be received later. The regulation that drawings before exhibited in London are inadmissible, is temporarily waved, in favour of the competition designs for the Government Offices, and for the Memorial Church at Coustantinople

In the department for models, carvings, decorations, specimens of manufactures, and investigations connected with building, all contributions must he delivered and fixed in the spaces allotted, hetween November 2nd and December 1st. Two rooms, as before, will he retained for the above.

tamed for the anove. The names of gentlemen who will deliver lectures on the Tuesday evenings will be announced in due time. Professor Donaldson, Mr. Orace, and others,

time. Protessor Dona/don, Mr. Orace, and others, have already consented. Subscriptions in aid of the Exhibition are still sought, and should any gentleman be led to forward the excellent example set has year by Mr. William Herhert, we will gladly hand the amount to the trea-sure surer.

ST. PAUL'S SCHOOLS, NOTTINGHAM, COMPETITION.

In answer to the advertisement in our journal for these schools, numerous designs were sent by archi-teets from all parts of the country. The committee, after consideration upon the merits of each design, selected those with the motto "I take Aim for the Mark," which, upon opening the letter accompanying the scnee users found to be be Ju. Charles H. the same, were found to he by Mr. Charles H. Edwards, of St. James's-terrace, London. The schools are to be commenced without delay

THE BUILDERS' BENEVOLENT INSTI-TUTION.

WE would again claim attention to the interests of this excellent institution, involved in the successful result of the annual dinner, which, as will be seen from our advertising columns, is fixed to take place on the 29th inst.; and we hope that not only builders. but architects and all other members of cognate trades and professions, will do what may be in their power, both individually and by their influence with others, to ensure a successful result.

THE DECORATIONS AT ALNWICK CASTLE.

THE works in Alnwick Castle, the seat of the Dake The works in Aluwick Usite, the set of the Dase of Northmolerland, having arrived at a certain stage in the progress, have been thrown open for a time, and thousands of persons have passed through the apartments, under the supervision of Mr. F. Wilson, who has the works in charge. The Neucastle Chronicle says,-

"The three principal apartments thrown open on the occasion were the saloon, drawing, and diuing rooms. Their ceilings, which have passed out of the hands of the artists, are arranged in geometrical com-partments, most elaborately carved in the highest style of the cinque-cento era of ornamentation, and style of the cimput-cento era of ornamentation, and which, in magnificence of arrangement, elegance of design, and richness of resource, conveys an expres-sion of dignity and grandcur, coubined with exquisite delicacy and finish, which could searcely be surpassed. The style and design of the carving seem difficult to describe, consisting of the must fancinkl, yet graceful, combinations of the human figure, with fruits, flowers, and animals, ground together, or fouring in acc combinations of the burnan figure, with fruits, flowers, and animals, grouped together, or flowing 'n ever varying and harmonions curves. The saloon and drawing-room are most gorgeous in the'r appear-nee, the eavrings of the ceilings heing richtly gilded : their most delicate members and intricate curves stand cut in bold and distinter richt from the dorker ground on which they are raised. In the magnificent dining-

room, which is grander in its proportions than the others, but simpler in design, the carvings are to remain the natural colour of the woods of which they remain the mathrai colour of the woods of which they are composed; and as these are arranged with the purpose of producing contrast and variety, their com-hination has an imposing and superh effect. The friezes have hene executed at Rome, and are finished in the highest style of Italian art.¹⁹ A full description of the interded description if

in the highest style of Italian art." A full description of the intended decorations, it will be remembered, has appeared in our pages, and the majorily of our readers, admitting the magnif-acence, and perhaps elegance, of the work, will sigh with us over its inappropriateness. A very few years will pass away hefore all who have hene concerned in the matter will see the error and regret the misuse of a noble computative. a noble opportunity.

NOTES UPON IRON.

For all the husiness that was done in the two great iron-making and iron-working towns of Wolverhampton and Birmingham, at the customory weekly gather-ings on chauge at these places respectively on Wedneshigs our charge at news places respectively of vocus-day and yesterday, the makers and commission agents might have remained at their works or their offices without sustaining loss. Both meetings were toler-ably well attended. Whilst the dearness of money bad prevented any orders being given out that were not of a very pressing uature, and, coupled with the state of things which occasioned the rise, had pro-duced the languor referred to, still there was a geneunced the halfwor reterred to, suit there was a gene-rally expressed approval of the step which the Bank of England had taken. That step, it was considered, would tend to check the spread of the evil, which it was feared would otherwise grow with rapidity. Some was fear-d would otherwise grow with rapidity. Some shrewd matters went so far as to say that another one per cent. would be more an advantage than an evil, as it would put an earlier period to a condition of affairs which could not be otherwise than most inju-rious to trade. "We shall then see the worst quicker," was the expressive remark in which the opiniou was enunciated. Although, however, no-thing was done yesterday and the day hefore, yet the reports were few in which it was not stated that the hones had enough to do to keep them fully employed on a from-hond-to-mouth sumply. But there was a nonses and chong to do to keep taken intro the constraints of a from hand to mouth supply. But there was a confident belief that, before Christmas, "things would be worse than they are now," whilst this holief was accompanied by a kido of vague option that "Christmas turned, matters will soon right themselves." It would be difficult to quote prices of malleable iron, as Tf. Would be dimension to quote prices of materiale tron, as they vary with the circumstances of the makers, the recommendations of the Preliminary meeting and the determination of the Quarterly assemblies being but little regarded in present transactions. Fig iron of 47, 58, and 44, 28, 64, rates a month ago, is not quoted at 44, but it may be obtained for the latter sum; and 33, 108, is now accepted for what at that time was avorded 34, 158. quoted 3/. 15s.

GAS.

GAS. Thre half-yearly report to the Imperial Gas Company states that there has been a failing off in the profits of the company during the last half-year, which has rendered the payment of the customary dividend of 10 per cent. on the present occasion im-possible. Various causes had contributed to this, the chief of which was the reduced price of coke, as com-pared with the cost of exals. The report was adopted, and a dividend at the rate of 7 per cent. agreed to. ——The Surrey Consumers Gas Company has just deel-red a dividend at the rate of S per cent. per annum for the last half year.——On the subject of gas in Denmark, says the *Gat-shead Observer*, "a eorrespondent writes us from Sunderlaugh) in the firm of Missis. Little, gas-engineers, Newestle-upon-Tyne, has arrived on there with a staff of workmen, to com-plete the erection of works for the lighting of this lete the erection of works for the lighting of this city with gas from plans prepared and survey made by the above-mentioned gentlemau. The buildings are in an advanced state, and the works are expected are in an advanced state, and the works are expected to be lighted up the latter part of this month, which speaks volumes for the contracting parties, as they have only here commenced since June last."— The Loudon Gas Company have rescived on a dividend at the rate of six per cent, per annum ou the preference shares of 1840, commonly known as blue preference shares.——The South Metropolitan Gas Company have agreed to a dividend of three per cent, for the half-year jost past, with a bonus of 7s. per share.——The Sheffield Gas Company's directors, according to the *Latependent*, have announced in their report, just is used, that they recommend a divi-dend, at the rate of ten per cent on the old, and eight per cent. on the new stock, leaving a halance of 594/. or of the new stock, leaving a mannee of 3942. A sum of 7007, had been expended in altering mains. The in-creasing demand for gos induces the directors to pre-pare for still further storage: tanks for two other large gas-holders are required, besides other additions

to the works, and power to horrow money is to be asked for at the forthcoming meeting of the company. — Kirkburton has heen lighted with gas, and the workmen employed in the completion of the works were last week treated by the contractors and the directors to a supper on the occasion.—— The streets of Milford have been lighted with gas.——At Pres-teign the whole of the majos have been laid, and most of the houses fitted, and the tow, it is expected, will be lighted by the 5th proximo.——The *Galway Tin-dicator*, in some able articles on the gas movement. It is urging the cause of check and upon gas at Galway. The directors of the local company resist, and have re-fused the courteons request of a deputation of consumers that some reduction of price from the Ss. still charged be grinted. This they do on the absurd and fake pretence that they are a set of private tradesmen, with whose business prices no one has any right to inter-free. We trust the *Galway Timilator* and those who are aggriered will very soon open the eyes of this public commany to its responsibilities and duries, inst are aggreed will very soon open the eves of this public company to its responsibilities and duties, just as those of hundreds of other companies have already heen, — as well as to their own best interests, in fact ; been, —as well as to their own best interests, in lace; for no axion can ever be hetter established than this has been in the ease of gas-light,—that, to an extent far beyond the usual conception of gas directors, low prices induce a high rate of consumption, and an increased amount of profit to the company

IMPROVEMENT AT COLCHESTER.

TO-MORNOW'S sun will set for ever npon the last ves-tige of an old abomination called "Middle-row," lately occupying a central position in the chief thoroughfare occupying a central position in the chef thoronghater of this town. The removal of this harrier will increase the width of this part of the street from 30 feet to 83 feet; and I esk leave to call the attention of your readers to the fact that the compensation fund for this improvement was raised by voluntary contribu-tions. Why should not similar means he resorted to to get rid of like abominations in London? Lon-doners are liberal enough in contributing to any biser to which the neuron of abority is usually at concess are neeral enough in contributing to any object to which the name of charity is usually at-tached; and when we come to look into matters closely, we shall see that this public spirit is, in some matters, even more meritorious than private charity. In the first place, there will be no ground of accusation that the contributors' motives were using angless are available of inter- and in the of accusation that the contributors' motives were public appliance, or a reputation of piety; and in the mext place, there is no scetarianism in it: you cannot pull down Middle.row, Holborn, and then ordain that only members of this or that religion, or natives of this or that county or parish, shall walk over the site thereof; and, lastly, it benefits an unlimited number of people.⁸ But the chief nuisance of this kind in London is one where many of the occupiers and owners deserve to lose their property and business without recompense. There is a street more Holy in name than in nature, with a church at each end of it, many of whose inhohitants live chiefly by corrupting name than in nature, with a church at each end of if, many of whose inhabitants live chickly by corrupting the moral health of the community; and though they would think it moustrous and diabolical if an Act should be passed for burning down their tenements at night, without either notice or compensation, it may be asked whether even this expedient would be more dreadful in its consequences than the traffic that is carried on in this fifth morket. I must excuse my-self for applading the public spirit of the twm in which I reside, by stating that I am only a temporary resident, and by confession that I was not one of the resident, and by confessing that I was not one of the contributors to the compensation fand .- SCARGILL. of the

CONDITION OF OUR COURTS OF JUSTICE.

GREAT trouble has been taken, and expense incurred, in providing our legislators in their new honse with that necessary element,—wholesome air. A glance through the Parlimentary reports of the last few years shows the various and pitfel complaints which have from time to fine been made. Sometimes there has been too little air; at others, the blasts were too strong rat one moment the air has heen too hot, and at another too will be are necessione complaints have how made noment the air has been tools, and where too too too cold; on some occessions complaints have been made of hoth heat and cold at the same time, by those situated in different parts of the houses; and lately the members have been in danger of being poisoned by the gases from sewers and the bone-hollings of Lamheth : even Father Thames himself has not Lamheth: even Father Thames himself has not cosenged without suspicion. The remedy, however, is in their own hands; and, although worthy of com-niseration, they are not so much to be pitted as those who have no means of helping threaselves. Looking into some of our metropolitan courts of justice, let us remark that the "Temples of Justice" in a great state should be constructed and designed in a manner equal to the importance of the functions which are block to be carried forward. At the present time, there to be carried forward. At the present time, nothing can be more contemptible than the architee-

both inside and out, by our Courts. Take, for in-stance, the Courts of Chancery in Lincoln's-inn : can the most remote and ill-devised of small and insigni-ficant railway stations show anything to the eye worse than the view which is presented after passing through the gateway leading from Chancery-hane to the chief English legal tribunal ? Look on the pictures pre-sented by the buildings in ancient times appropriate to the dispensation of justice. The Court chieff at presents aftor the set of the lise of Wight than that to the dispensation of justice. The Court chieff at presents aftor device of the lise of Wight than that to the dispensation of justice. The Court chieff at present aftor does of the lise of Wight than that to the dispensation of justice. The Court chieff at present aftor does of the clief of approximation of the set of the of the odder means of adfoining where the indexe often at the some of a station is progress of the set of competities into close (fine of competities into close (fine of competities into close (fine) competities of the set of competities into close (fine) competities of the set of competities into close (fine) competities of the set of competities into close (fine) competities of the set of competities into close (fine) competities of the set of competities into close (fine) competities of the set of competities into close (fine) competities of the set of t ceopied by the Lord Chaucellor when here, and that adjoining where the judges often sit, are somewhat quaint in their interior arrangements in the former there is an indifferent painting behind the judgment-seat, and a markle statue of a departed lawyer ou the floor. The chief ornamental feature, however, which cathets the eye both here and in the other chamber, is an array of the shields of arms of worthies who have flourished here. These halls should be made places in which to display the skill of the printers of this country. Some object to our churches being used for such purposes : to the introduction of art in our Coarts of Justice there can he no objection. We should have there the best representations which can be produced by British rists of such events as King be produced by British artists of such events as King Alfred delivering his laws to his Senate, the signing of Magna Charta, &c. and also portraits and hasts of men just and emineut in the administration of our statutes.

Impressed with such an opinion, let us look at the courts attached to the Old Builey, where may be seen on the roof that abortion, excented in iron or zine, the equal of which is searcely to be met with else-where. Many will have noticed in the Loudou streets, where and, will not note in the notes and it has often sur-prised us that some enterprising smoke-curer, who deals in chinney-cowls, has not attempted to copy this work, and attach it to his premises, as a means of attracting notice.

We need scarcely remark upon the Clerkenwell Sessions-house, nor on the Courts of Bankruptey, or

Sessions-house, during of the Courts of Mankringhey, or those in Portagal-street, as any exception from the uniform agliness of these public buildings. It has been said that the difficulty with the venti-lation of the Houses of Parliament has, in a great measure, arisen from the vast extent of the edifice, and from the necessity, in many instances, of making the hert courtiers, curvements of the state of a in the the best sanitary airangements, secondary to the beauty and harmony of the architectural features. In be ourse of law just mentioned, there can, however, be no such excess, for the beauty of the architecture need searcely he taken into consideration, and yet the need scattery in classed into consolitation and yet in ventilation of these places is very imperfect. As re-gards the Chancery-courts of Lincola's inn, passing through them on a winter's day, the difference of the temperature will be found extraordinary: one court temperature will be found extraordicary: one contribution is at times intensely hot, and another of chilling coldness. It will probably be found, on inquiry, that this is in a measure cansed by one learned lord liking warnth, and another preferring the cold, and there would be no great harm in this if it were not that the numerous council who are obliged to attend here, day after day, are constantly called from one court to the numerous content who are content to factor in the other, and these shrupt transitions cannot fail to be other, and these shrupt transitions cannot fail to be regulatical to health. Besides the fault of heating, the 'entitlation here is often very imperfect. The courts in Portugal-street, particularly that in which Mr Commissioner Phillips usually sits, requires very great improvement. At times, when the place is erowded, the atmosphere is shocking, and the cur-rents of nir driven in, with a view towards improving it, are very daugerous, heated as the people generally are hy crowding and artificial warmth. The desperse remedy adopted at the Old Bailey has not rendered that place healthful, and the arrangements made for the reception of witnesses, &c. who are obliged to wait here for perhaps two or thre days, are very im-perfect. The police-courts are little better: what, for instance, can be much wors than the arrange-ments even at the Mansion-house? The condition of these places requires to be carefully considered, for most of those who come to them cannot help it; and avait here for the subscience of the aready and the place is the second of the subscience of the mean the place is the subscience of the subscience or meand the bit; here a subscience of the subscience or subscience of the subscine of the subscience of the subscience of the su most of those who come to them cannot help it; and traily, the troubles of the law are generally hard enough to bear without the additional infliction of an offensive and unwholesome atmosphere.

ST. LAWRENCE ESTATE, UNDERCLIFF, ISLE OF WIGHT.

Some fifty acres of ground adjoining the miniature Soars fifty acres of ground adjoining the mininture St. Lawrence Church, in the Underelift, at the back of the Isle of Wight, have been lotted out for huilding villas, in plots varying from half an acre to two acres. A new road has been formed, commencing neur to the Earl of Yarborough's marine cottage, and string access to the estate intended to be built on. Plots have been reserved for a church and for au hotel. Leases for a thousand years, at a ground rent, will be granted by the Earl of Yarborough, the owner of the property. The acteur turescee alceade formed by the broken

The natural terraces, already formed hy the broken and the strumit terraces, anready portice by the provent of the backword of the backword in the sector of the backword to the south, offer Magazine, the Engineer, and other sources.

necessity of establishing more special communications with the southern coast of the Isle of Wight than that at present afforded by the hilly roads must become more than ever-noivions. Let the nodern means of bringing distant localities into close (time) connection with the metropolis he introduced, and the day cannot be far distant, when the whole extent of the Uudercliff may become a second Brighton, hnt with a bolder sea and a far richer country to recommend it.

THE ROYAL POLYTECHNIC INSTITUTION ADDED to the many sources of anuscenet and in-struction for which the Polytechnic is celebrated (now more than ever), the indefatigable lessee and manager, Mr. Popper, has provided, as we lately hinted, a variety of new and attractive entertainments, as well as several noveling of a more constition and interactive as several novelties of a more scientific and interesting as several interest on a more scientific and noteresting class, the whole forming a congeries of attractions which it is really not possible to go over, even with a more glance at each and all, at a single visit. Many of them, besides, are of so enduring an interest, that they are sufficient of themselves to induce one to return again and again to see them. The last novelties of the more showy and popular description comprise a stereoseopic and polyoramic exhibition in a new room just added to the premises, a series of dissolving views of places and events connected with the Indian mutiny, and a new philosophical eutertrimment, explan-ative of the tricks of modern "wizards." Neither have the enormous magnifications of the oxhydrogen microscope, nor the skilled art wax-work figures of Moutanari, lost their attractions in the midst of nuch that is more recent in novelty and interest to the erowds who scen to visit the Polytechnic. Several new mechanical and other ventions, also, have been added. Amongst th are Myers's system of railway signals for trains in motion, some of which, If we mistake not, have and obsolute some of which a we histake not, have already been described in our columns; Stevens's patent bread-making machine, for doing away with dirty and disagreeable processes of manipulation ; and Osmotr's pocket reservoir penholder, contining sufficient ink to write 100 letters, and sold at so mosufficient ink to write 100 letters, and sold at so mo-derate a price as a couple of shillings, which seems to show the faith of its inventor in its essential merits. So far as a brief trial of it can enlighten us, this instrument seems to bid fair to be the desideratum locked for, at least for out-door clerks and others. In respect to the Polytechnic as n whole, we may add, the evident unsiety, and the liberal and enlightened efforts, of the present lessee to multiply and accu-mulate its attractions, and to enhance its general interest, disarm adverse eritieism, even where ore

interest, disarm adverse eriticism, even where ore is not quite satisfied, here or there, with the efforts of those whom the lessee employs to carry out his ide

We may here remark that at the Polytechnic school of art class in free-hand mechanical, per-spective, and architectural drawing, was to be com-menced on the 9th inst. This school is to be con-ducted by Mr. H. Hagreen, of the Department of Science and Art.

RECENT PATENTS.*

W. E. NEWYON.—An Improvement in Centrifugal Pumps. (A communication.) Dated 19th November, 1856.—The object here is to obviate unnecessary friction, occasioned by the changes in the direction of the water that takes place in centrifugal pumps. To effect this the water is made to pass through the pump in the direction of a spiral of gradually diminishing To pitch.

pileh. WALTER MACFARLANE, Glasgow.—Moulding or Manufacturing Cast-iron Pipes. Dated 26th of February, 1857.—The patentee records eight special claims, amongst which are — 1. the simultaneous formation of the moulds and cores for casting pipes, or the surfaces for shaping or producing both the in-side and outside surfaces of pipes, the said moulds and cores being formed in a vertical position, for the pur-pose of casting pipes on end. 4. The system or part of the surfaces of pipes on propose of casting pipes on end. 4. The system o mode of moulning and manufacturing east-iron pipe mode of moulding and inautificaturing est-iron pipes in a horizontal position, in which the casting is pur-tially uncored by means of the expansive force of stemu or gaseous matters, as thereinhetora described. 5. The system or mode of forming the moulds tor easting pipes, in which the pattern of the pipe serves the twoloid purpose of forming the moulds and the cores, the said moulds and eores being formed in horizontal position, as thereinhefore described. 7. The system or mode of moulding and manufacturing bends,

clbows, bracehes, heads, and other pipe fittings, in which the pattern is m de to form the mould and the core, as described. 8. The system or mode of mould-ing or manufacturing cast-iron pipes by the agency of moulds and cores which have not heen subjected

of moulds and cores which have not heen subjected to the action of heat.] WILLIAM PEDDER, Savage-gardens, Tower-hill, London.—Strengthening Melallic and other Struc-tures. Dated 2nd March, 1857.—This invention consists in strengthening plates, planks, and beams, employed to form metallic and other structures, at the parts of such structures where the ends are hrought together by means of strengthening joint lates having a rike or fourther wreising theoreform. plates having a rib or feather projecting therefrom, ngainst one side of which feather or rib one end of one plate is made to but, and against the opposite side of which one end of the next plate is made to butt: the projecting rib or feather is greater length than the thickness of the plates, is of a and after the plates are rived to the strengthening joint plate, the projecting rib is heaten in to form a solid mass between the plates, and may be burned down so as to form a rivet over the ends of the plates.

CHARLES PAUVERT, Chatelleranlt, France .*acture of ron.*—Dated March 2, 1857.—The object of this iuvention is to deprive or drive of from pud-dled irou snlphur, phosphorns, and other metalloids by cementation : it is applicable to puddled iron in by connentation: it is applicable to puddled 1.0n in any of its stages or states. The patentee employs a concut, composed of the following substances:— Fourteen parts (by weight) of oxide of iron; thirty of highly aluminous clay; fifty of errbonate of lume or wood ashes; four of finely divided charcoal; one of earbonate of polassa; oue of earbonate of soda. The iron is placed with the eement hy layers into a cement-ing former wald the forces is harded in the actiony from is placed with the cement by layers and a concar-ing furnace, and the furnace is heated in the ordinary manner. This iron, after cementation, is welded, and then drawn into bars, when it is said to hecome as soft and tenacious as iron made with charcoal.

A. CLARK .- Improvements in the Application and A. OLAR. - improvements in the Approximation of Records Withows and Rinds and Metal Window Saskes. Dated Nov. 21, 1556. - This relates to window shutters and blinds composed of a series of laths hinged together so as to up and unroll, and consists in applying strips of roll up and unroll, and consists in applying strips of steel as springs across the laths, so as to give them a tendency to coil themselves up, which springs may either be sufficiently strong to coil up the shutters altogether, or only to assist that operation, and may or may not form the econcetion between the laths. Springs of india-tubber may be similarly applied. Further improvements are also included. The im-provements in metal window-suches consist in apply-ing a thin covering of brass, or other metal, on a body of irea plate. of iron plate.

Books Receibed.

A Memoir of the Rev. John Hodgson, M.A. F.R.S., Sc. Ticar of Hartburn, and Author of a History of Northumberland. By the Rev. JANES RAINE, M.A. Rector of Meldon, Author of a History of North Durham, &c. In two Vols.; Vol. I. Lon-don: Longmun and Co. 1857.

The Rev. Mr. Hodgson was a well-known antiquary; and archaeology is much indebted to him for his cluci-dations of many interesting remains in the north of England. He was a contributor to the "Beauties of England and Wales," and author of various treatises, Englaud and Wales," and author of various treatises, poems, and other literary and scientific productions, Ilis most important work, however, was his History of Northumberland, based on his elaborate article in the "Beanties of England and Wales," on the same county. As a botanist, geologist, and philosopher also, he was well known, especially in the north; and he took an active and prominent part in those inqui-ries which led to the invention of the Davy lamp for miners, as recorded by Sir Humphrey Davy himself, Mr. Hodyson was a native of Swindale in Shap, West-moreland, or "Westmerhand," as le maintained that this word should be suck, having originally signified moreland, or "Westnerland," as he maintained that this word should be spielt, having originally signified the lands of the western merces, or lakes: if so, one would think that "Westmereland," or Westmoreland simply with an s in the place of the s, would be still more correct. The account of Westmorland in the "Beauties of England and Wales," by the way, was also written by Mr. Hodgson. In his youth he became first a schoolmaster at Bompton, and afterwards at Matterdale, and elsewhere in the north. In 1802, at which time he was about twenty-two years of are, he Matterdate, and elsewhere to tue north. In 1802, at which time he was about twenty-two years of age, he appears to have obtained a title for holy orders; and in 1804, he became sub-curate of Esh and Satley, in the parish of Lucaster. In 1806, he was appointed curate of Gat-shead, nuder Dr. Prosser, Revio. In curate of Gateshead, under Dr. Frosser, Jones J. H. 1807, he published various poems, one of which was titled "Longovienm, a Visiou," in which the archroo-logical hent of his unitd was manifested in stanzas on the history of Longovienu under the Druids, Romans, Saxons, and early Christians. The living of Jerrow while Heworth was next entrusten to his earc, sour the

archaeological remains of Jarrow Slake and its vici-nity were soon overhauled and elucidated. A good many years afterwards, in a communication to the Society of Antiquaries of Newcastle, Mr. Hodgson pointed ont that the Roman road-remains at Jarrow consisted of a branch of the Wrekendyke; and, when consisted of a branch of the Wrekendyke; and, when requested by a builder of a village on the line of road near Gateshead to give a name to the new settlement, he called it by the apprpriate name of Wrekenton, which it will now always retain. In 1810, Mr. Hodgson married, and in the same year his connec-tion with the publishers of the "Beauties of England and Wales" commenced. This connection led to bis generating with Mr. John Beitten who kindly and Waiss" commenced. This connection let to his acquaintance with Mr. John Britton, who kindly offered him his aid and good wishes. Mr. Hodgson's account of Northumberland in the Benutics of Eng-land and Wales" extends to 243 closely-printed octavo pages ; and his account of Westmoreland, afterwards pages; and his account of Westmoreland, alterwards written, to 245 pages, exclusive of a copious index. In 1812, the Newcastle Society of Antiqueries was established, and Mr. Hodgson, at its second monthly meeting, read an essay on "The Study of Antiqui-ties," which was published in the first volume of the Society's Transactions. He afterwards wrote and read many papers for the same society, and, indeed, hecame its scoretary, and was eventually elected one of its vice-presidents. The more extended history of Northumberlaud was first thought of about the year 1812, but it encountered many difficulties and delays, and the first of its six projected volumes was not issued till the year 1820. The advertisement of the work In the year 1520. The advertisement of the work first appeared in the Gentleman's Magazine and the local newspapers of 1810. Though the first that appeared, the volume of 1820, however, was in fact "Volume V, being the first volume of Part 3." The pcared, the work turned out to be an unfortnustespeculation for the author, in pecuniary respects : it was not supported hy attator, in preclamary respects : it was not supported in the county as it ought to have here. In the Confle-man's Magazine of 1522, there are contributions by Mr. Hodgsou on Coopeland and Bethal easiles, Warkworth Bridge, and Willimoteswick. In the same year a new courch at Haworth, designed by Mr. Hodgson, and intended for his own occupation as preacher, was finished and opened for divine service This edifice is capable of accommodating 1,500 persons, and is enricitorm in plau, with a tower at the west end, but without nisks, and with a low roof, flat ceiling, and numerous pointed windows of poor design. At the close of 1822 Mr. Hodgson comdesign. At the close of 1822 Mr. Hodgson com-municated to the Transactions of the Newcastle muncated to the Transactions of the Newcastle Society of Antiquaries an essay on the Mithraic antiquities discovered in that year at the Roman station of Housesteads. In this essay he expresses his opinion that "the secrets to which the aspirants were admitted in the orgies of Isis and Osiris in Egypt, of Ceres at Eleusis, of Adonis in Pheneica, of Determine is Sacrathere of the Determine of the Bacchus in Samotbrace, of Hu in Britain, and of Mithras in Persia, all emanated from one common Mithras in Persia, all emanated from one common fontain," and that the primary object of the Nithraie severities " was to prepare the mind and bodies of the apirants to undergo every species of self-denial, and, by an exhibition of that part of the pagan creed which relates to the passage of the soul from life to immortality, to impress upon them the necessity of that great moral regeneration which was to fit the soul for entering upon a new, happy, and eternal existence." existence

The volume now published of the memoir of Mr. I be volume now published or the memory of all Hodgson brings down the history of his life to the beginning of 1828. It contains many letters written by Mr. Hodgson and others, but particularly by him-self, and a great majority of them addressed to Mrs. Hodgson, containing minute details of bis every-day life while absent from home. Indeed, it is doubtless for behoof of those readers especially who reside in the north of England, and have their interest in the subject of the memoir enhanced from that cirin the subject of the memory enhanced from the ca-eumstance, that so detailed a memoir is more par-ticularly intended, otherwise we should feel inclined to think that the whole work is on rather too ex-tended and detailed a scale to have a very large circulation or n profitable sale.

Miscellanea.

SMORY CHIMNEYS .- Although I occasionally see the Builder articles headed "Smoky Chimneys," I in the Builder articles headed "Snoky Chinneys," I have looked in vain for any contrivance of their cure founded on sound principles of Natural Philosophy to a deal of a single practical suggestion of any kind worthy of a moment's scrions attention. And I cannot help thinking that this fact reflects consider-able discredit upon the profession. One may obtain no end of learned talk about the fitness of this and that exterior and interior decoration; but no one who will build the start of the s that effection and interior decoration; but no one was will build a house and guarantee any particular chim-ney to smoke only at the top. But what is the value of an elegantly decorated room to the man who, through the long winter nights, is obliged to sit in it, filled with the smoke that is heing constantly emitted from the fire-place ?--J. G.
