

THE J. PAUL GETTY MUSEUM LIBRARY

AN

ILLUSTRATED WEEKLY MAGAZINE,

FOR THE

Surchitert, Eugineer, Archeologist, Constructor, & Artist,

CONDUCTED BY

GEORGE GODWIN, F.R.S.

Fellow of the Royal Institute of Architects, and Honorary Member of several Societies.

"Every man's proper mansion-house, and home, being the theater of his hospitality, the seate of selfe-fruition, the comfortablest part of his own life, the noblest of his sonne's inheritance, a kinde of private princedome, nay, to the possessors thereof, an epitome of the whole world, may well deserve, by these attributes, according to the degree of the master, to be decently and delightfully adorned." "Architecture can want no commendation, where there are noble men, or noble mindes."——SIR HENRT WOTTON.

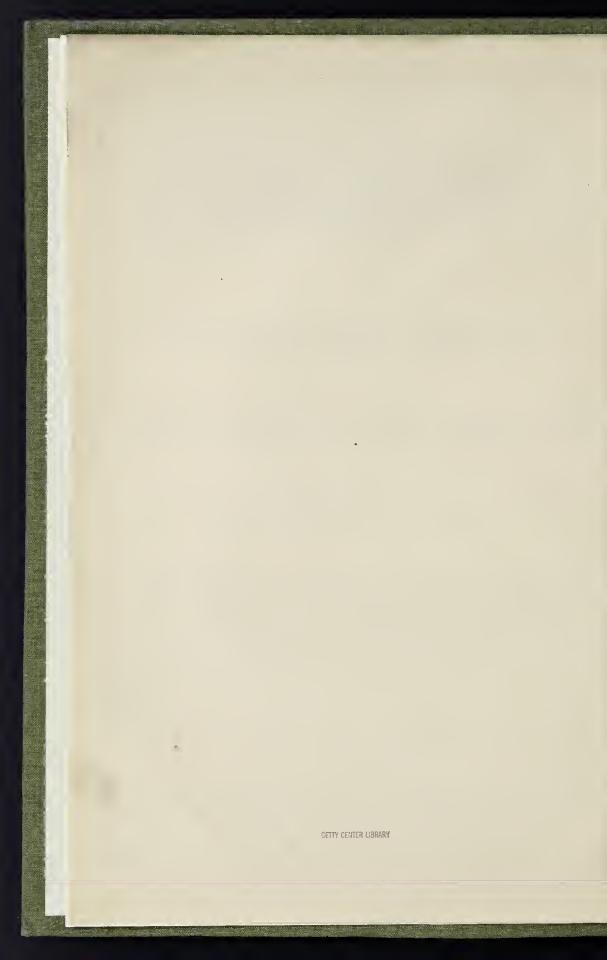

"Our English word To BULLD is the Anglo-Saxon Bylsan, to confirm, to establish, to make firm and sure and fast, to consolidate, to strengthen; and is applicable to all other things as well as to dwelling places."-DIVERSIONS OF PUBLEY.

VOLUME FOR 1857.

LONDON:

PUBLISHING OFFICE, YORK STREET, COVENT GARDEN.

-

NVENTIONS for facilitating building operations, improved materials, and modes of cheapening those in general use, offer themselves every day for consideration ; and, what is equally important, bave a greater chance of examination and trial than has hitherto been the case. The

Architectural Exhibition affords the means of publicity in this respect to all who desire it, and will gradually, we have no doubt, be largely taken advantage of, as well by the public as by manufacturers, inventors, and merchants. In the year now opening upon ns, we have reason to expect we shall have many improvements

and new modes of construction to examine and chronicle, and we shall lose no opportunity to do so.

It promises, indeed, to he a busy and prolific The Government Offices Competition; year. the Manchester Art Exhibition; the drainage of London (especially as it is now taking a business-like shape) ; the National Gallery question; the general adornment of the metropolis; the artistical education of the people, and the more special education of architects, are amongst the subjects which already put in claims for earnest consideration. The last-named questiou will probably he agitated strongly; the want of systematic instruction for the profession being more and more universally felt every day. The proposition on this head, made by Mr. Kerr to the Institute of British Architects, namely, that the Council should draw up a list of books conveying a complete system of education, and admit, as graduates, with certain advantages, those who proved themselves perfect in the prescribed course of study, is a very different thing to the call for a Diploma as brought forward some time since, and commends itself to us more strongly. Of this, bowever, on another occasion,-simply saying in the meantime to onr youngest readers that the most valuable education is that which a mau gives bimself, and that will and determination on their own part will go far to overcome any difficulties in the way of acquiring knowledge that may now exist. As Charles Swain asks and advises, in his last published verses,-

- " Is it wise to rest contented With this half-instructed state ? Lost time ne'er was unrepented-
- But regret may come too late!
- Work then, youth, while yet 'tis morning, Broad the land he'ore you lies, Neither task nor labour scorning,
- Which the fruit of thought supplies. As you work so choose your station, Knowing life and its demands,
- Knowing 'tis through cultivation That the living Mind expands !"

But all this is a digression, and we return to what we bad in our mind at the commencement, the collection of materials and inventions connected with building now in the Suffolk-street Rooms.

ment, and the specimens sent more thau fill the that particular situation."

two rooms at the disposal of the committee for this purpose. At the top of the stairs on entering,

The Architectural Pottery Company, of Poole, to whose productions we referred some time ago, exhibit a selection of their glazed and coloured bricks, with a drawing of a villa (Parkstone, Dorset), the exterior of which is faced with the stoue-buff bricks and dark grey quoins. The arches, brackets, and cantilevers arc also formed in their coloured material. The buff bricks and a coruice have been used, we understand, for the facing of a house in Park Village West, Regent's-park. Inside the Exbibition rooms are laid specimens of their iulaid mosaic for floors and hearths,-even for table tops. The quarries, 4 inches square, are inlaid in squares ranging from one inch to onc-eighth of an inch to form the patterns, and theu burnt, so that it is in truth a mosaic pavement, though at first sight it gives the impression of being an *imitation* of As in other ornamental tile pavements, one something has yet to be doue to keep the quarries square and uniform, so as to make the lines range. Near the bricks on the landing is No. 50, a very good piece of stone carving by Mr. Earp, in the shape of part of a monumental tonib to the memory of Archdeacon Hodson, designed hy Mr. Street, for the south aisle of Lichfield Catbedral. Passing into the first room, we come against-

The metal-work seut by Messrs. Hart (48). This enterprising firm make a smaller show on the present occasion than they did last year, but it includes some excellent work of Mediæval character, in the shape of standards, fingerplates, and other fittings. The capital decorated with the convolvulus, in iron, painted in exact imitation of nature, is not a success, and must be viewed as an example of what to avoid. It is not desirable that we should mistake the metal decoration of a capital for a convolvulus, hut that the mind should recognise and appreciate the skill of the artist in the conveyance, by means of the material at band, of the effect produced hy a work of nature. Close by,-

Mr. Magnus, of Pimlico, by whom the process of enamelling slate was discovered about sixteen years ago, maintains his supremacy over his imitators : he exhibits amougst other things (36) a moveable cabinet formed stove of Louis XIV. design, with blue engraved ground, and flowers and landscapes in panels, which is very elegaut

Messrs. Botteu's collection deserves examination: their patent Regulator Closets appear to handle of a common closet is pulled up and let down again immediately, without being held up long enough to charge the service box, a very inefficient wash of water is obtained, and as this is how elosets are too often used, stoppage of the trap is the frequent result; whereas, in the Regulator Closet, if the handle is pulled up ever so suddenly, the regulator must be charged with air, and therefore take a given time to go down again, during which a copious supply of water is running into the hasin; and this time is regulated when the closet is fixed, to cusure There are about fifty exhibitors in this depart- any quantity that may be thought necessary in

Mr. Gilbert's Terra Cotta (46); Mr. Chapuis' Reflectors (49); Mr. Leake's specimens of "Relievo Leather" (44); Horuer's Self-dis-charging House Cistern (40) for cleansing drains, should all be looked at. No. 42 is a very fairly carved altar-table in oak, exhibited by Francis Smith and Co.

The Lizard Serpentine Company (13) have ome excellent specimens of their beautiful material, to the value of which for the adornment of buildings, hoth ceclesiastical and civil. bave on more than one occasiou borne testimony. It is obtainable in large blocks, and of infinite variety in colour. It ought to be largely used.

Lambert's Careless Bib Valve (38), whereby water cannot be let to run to waste, might be usefully applied in many situations.

Of Ransome's patent Silicious Stoue, number of specimens are exhibited (37). Professor Ansted's evidence, and the experience of twelve years, appear to show that, as a material, it is durable and good. The process of Common fliuts, with canstic soda, are dissolved into a fluid state by the action of great beat in close steam boilers, forming a silicate of soda or soluble glass, which is mixed with about 92 per ceut. of sand. This plastic composition is then pressed iuto moulds, dried, and subjected to the action of intense heat in kilns or chambers, causing the silicate of soda to form a glass cement, connecting the particles of sand together. The chief specimen exhibited, a bighly-ornamented chimney-picce, is not successful in execution. The figures are very had, the foliage has no sharpness, and its aspect alto. getber is little better than one of cement.

The specimens of wood carving from the Lamheth Company's works (33) include some rough from the machine, which show strikingly forgation: it has adopted Jordan's patents, and is prepared to carry out work to any amount.

Near these carvings will be found specimens of the patent Fibrous Slab (32), the qualities of which were described by us some time ago, and hrought a pile of inquiries, to which (as it turned ont that the company was not then formed) we were unable to reply. This material has been used very largely in the new reading-room at the British Museum. It offers an admirable face for painting on, can be beut to any curve inexpensively, as compared with wood, and, if it he all like a portion ou which we have experimented, may be regarded as incombustible.

For theatre-building it would be very useful. In connection with a specimen of Mr. Tyerman's patent hoop-irou for building purposes (29), the patentee gives the following account of some experiments made upon it, in com parison with the ordinary hoop-iron bond. He says :-

says.— "Some strips of plain hoop, of the tarred and sanded hoop, and of the patent boud, 14 inch wide, No. 15 gauge, were built in mortar in the ordinary method, into a wall, 1 foot 6 inches thick, 10 feet long, and were weighted to the extent of four tons. The plain and the tarred and sanded hoops were easily drawn out; but the Patent boud, although submitted to eight times the test to that at which the tarred and suded hoop was draws, remained from until the iron sanded hoop was drawn, remained firm until the iron

was severed three times, where not built into the brickwork. On the last occasion, previously to the iron breaking, the patent bond bad been drawn about a quarter of an inch. The above experiments were carried out a few hours after the erection of the brickwork. The same experiment was tried after the mortar had been allowed ten days to set. The plain hoop, and the tarred and sanded hoop, were again easily drawn; but it was found perfectly impossible to move the patent bond, although the iron was broken as before.

before. Again, some strips of the plain boop, and of the tarred and sanded hoop, 10 feet long, 2 inches wide, and a strip of the patent bond, 5 feet long, 2 inches wide, were built in cement into brickwork, and weighted as before. At the expiration of ten days, the plain and the tarred and sanded hoops were drawn, but the deet lawork of the materix how demaind but the short length of the patent bond remained perfectly firm, although the iron was broken in the same manner as in previous experiments."

These experiments would seem to assert the comparatively little use of the ordinary hoopiron bond, in opposition to many elaborate and well-known experiments on brickwork constructed with it, when it was first introduced some years ago.

Passing to the iuncr room, we find in the centre several pieces of walling, affording specimens of Mr. John Taylor's patent facing, hoth in stone and brick, aud a model, showing the method of cutting the facing out of the block without The system was fully illustrated in our waste. pages when first patented, and has since been applied extensively by the patentee at Springgrove, Middlesex.

Mr. George Jeunings, of the Blackfriars-road, exbibits a large number of his excellent patents (15), from his now largely adopted shuttershoes and fasteners, which led us first to make him known to our readers, down to propositions only a few weeks old,-his lavatories, closets, valves, substitute for wood-hricks, his pumps, and drain-pipes. The last, as we have before taken occasion to say, are certainly the hest in arrangement that can be used.

There are a number of specimens of parquet floors and borders, wooden tiles, and vencered decorations, from the London Parquetry, Whitefriars; grates and stoves from Mr. Pierce; specimens of glazing without putty; and of Nixou's oil-stains; a self-acting water-bar from Mr. Thomas Smith ; examples, from Messrs. Jackson and Sons, of their beautiful Cartoupierre; some famous bricks from Eastwood and Sons (No. 1), of Lamheth, together with crest ornaments.

Mr. Looker's Imperishable Ground Indicators and Garden Labels (4) are useful things. They are made hy machinery, under steam pressure, and hurnt to great hardness, with any required inscription or indication upon them

Beadon's Patent Eaves Gutter Tile, specimens of which are near the last-named (3) may he very usefully employed in many cases, though its appearance might be improved. An illustration of the tiles which occurs occasionally in our advertising columns (suggesting, by the way, at first sight, a reading-desk rather than a way, at miss signs, a reasing-uesk rather that a gutter), will explain the construction. As the patentce says,—"In many cottages, where for the sake of coonomy the walls are only carried up to the tops of the windows, common spouting cannot be used without preventing them from being opened; but, since with the Patent Gutter the water-course is placed over instead of under the caves, the windows are perfectly free from any interference with their proper action, or with the admission of light. In agricultural buildings it is essential to have the headway as low as possible, to cut off the wind, and the Patent Gutter is the only contrivance that can give a sufficiently low headway with the roof properly spouted."

this we must couclude our present With notice of the inventions and materials connected with building which now form part of the Architectural Exhibition

ATHENS.

FOREMOST amongst the numerous distinguisb-ing features which mark the progress of refine-ment and eivilization in modern nations, and which constitute the greatest charm of the times we live in, may be cited an intense love for in-vestigating and laying bare the bistories of migbly nations long since passed away, the visible records of whose existence consist but in crumbling runs and grass-grown mounds, and the annals of whose greatness are limited to the conflicting and scant authority of early writers, or the still vaguer and more doubtful testimony of mere tradition. The antiquary, the artist, and the scholar vie with each other in the delightful tasks of exhumation, description, and illustra-tion; the appliances of modern science, the mexhaustible stores of modern learning, are daily employed in unravelling the tangled thread of ancient history, unfolding the perfection of ancient history, unfolding the world of the surpassing interest of fact over faction. The lapse of 3,000 years, though an obstacle and grass-grown mounds, and the annals of whose

The lapse of 3,000 years, though an obstacle, is no preventive to the obtaining au extended is no preventive to the obtaining au extended knowledge of the languages, arts, and domestic babits of mighty natious long since removed from the scene of their power, the very site of whose territory is wrapped in uncertainty; for the astounding revelations of modern research hut increase the zest for the study of the records of the great rations of automities in the increase of the great nations of antiquity in an inverse the period elapsing between their exist-l our own. Thus has modern enterprise ratio to ence and our own. ence and our own. Thus has modern brack explored the classic clines of Ltdy, and restored in idea the architectural grandeur of the Eternal City, or traced its regal offspring in the ruins of Balbee and Palmyra, Spalatro, and the widely-scattered monuments of its extended rule, or settered in compare reordeur to Researching. followed its waning grandeur to Byzantium, and marked its dechning lustre to its fall. Thus has it traced the courses of the Ganges and the Indus, the Tigris and the Euphrates, the Nile and Indus, the Tigris and the Euphrates, the Nile and the Niger, examined the pagoda of the Hindoo mythology, and the rock-cut temples of Elephanta and Ellora; penetrated the recesses of the pyramids, followed the African savage to his inland home, and exbunned the sculptured wouders of Assyria: thus crossed the Atlantic and investigated the temples of Mexico and cities of Yucquer, thus followed the Samera into Smith of Yucatan: thus followed the Saracen into Spain, and gazed in rapture upon the fairy encoded in the and gazed in rapture upon the fairy encoded in the Alhambra : thus tracked the matchless tracery of the Gothie art through the dark period of the Middle Ages, and finally welcomed the return of classic design in the masterpieces of the Baving. of the Revival.

of the Revival. In all profane history, the beginnings of great nations are generally caveloped in the mists of mythieism. Gods, demigods, and heroes, beings having their type in the eternal works of nature, the sun, moon, and planets; — her convulsions, the storm and the earth-quake; — remarkab'e unen, warriors, legislators, poets; — these, combined with small portions of historic truth, mixed up with fragments of universal tradition, as the Delnge, the Fail, make up the history of the carliest times. The testimoup of early writers with regard to dates is so conflicting, that we can only arrive at an approximation to truth in that essential par-ticular, the weakness of claiming long descent approximation to truth in this essential pa-ticular, the weakuess of claiming long descent applying as much to nations as to individuals. Egypt, according to Manetho, who is referred to by Josephus, Julius Africanus, and Eusehius, after the gods. This initiation of driving the mortality, which constitutes so beautiful a feature in the poetry of history, rohs it at the same time of its value. The mystic Buddha of Iudia, the Saturn of the Pheneicians, the elementary doities of the Pelasgians, the Naith and Scrapis of Egypt, the Ornuzd of Persia, the Bel of Babylon, the winged Genii of Elzuria, the harbarous Edda of Scandinavia, and the also gravitationy of Greece, if wrested the classic mythology of Greece, if wrested from the respective lands of their creation, from would rob history of half its charm, and yet not help us in our search after truth. It is singular that there is no hint in Scripture about the that there is no mint in Scripture about the Pyramids, which could therefore hardly have been effected by the Israeltes, but subsequent to their quitting Egypt. For similar reasons we would refer hicroglyphics to a mysterious cypber of the priests, and ascribe them to a

later epoch than the alphabetical writing of Moses.

How the attributes of the gods were per-verted and distorted to snit the depraved ideas of the poets and their readers, was apparent even to the ancients themselves, as proved by the language of Cicero, where be says, "Qui et irâ inflammatos et libidine furentes induxerunt rra minaminatos et indinie intentes inductation Deos ;--feceruntque at eorum bella, paguas, sidia, valnera videremus; odia præterea, dis-sidia, discordias, ortus, interritus, querelas, lamentationes, effusas in omni intemperantia libidines, adalteria, vincula, cum humano genere concubitus, mortalesque ex immortali procre-

But, waiving these considerations of mistaken but, waiving obsect considerations of initiated notions of divine rule, there is one country whose claims, above all others, to the admira-tion, gratitude, and imitation of posterity seem, by universal consent, to be admirted; — a country which comprised within itself all that was perfect in art — all that was noble in matrictions. patriotism-all that was masterly in eloquence ; -a country whose mythology, language, poetry, and history will form the theme for scholars to and instory will form the theme for scoolars to expatiate upon for all agest, whose architecture is allowed to have been the most symmetrical, chaste, and dignified that the invention of man has produced, —a country where selfsheness was more repudiated, vice more loathed, and virtue more applauded than any other in the world :----that country is Grassa

has produced j—a country where schemass into more reputated, vice more loakhed, and virtue more applauded than any other in the world i— that country is Greece. In shape a rude triangle, bounded on two sides by the sea, on the third divided from Becotia by the mountain-range of Parnes and Cithara, is the small tract of land known as Attica. Its principal mountains are the Cape of Sunium, Hymettus, and Pentelicus; its chief streams, the Cephisus and the Ilissus; in its extremest length, not exceeding sixty miles; in its greatest width, twenty-four. Between four and five miles from the sca-coast, in the central plain of Attica, surrounded by Mounts Parnes, Pentelicus, Hymettus, and Ægaleos, washed on the east by the Ilissus, on the west by the Cephisus, stands the city that called forth the legislation of a Solon, the devotion of a Miltiades, the splendour of a Pericles, the ourage of an Alchindes, the philosophy of a Plato, the cloquence of a Demosthemes, the dramatic genius of an Æschylus and an Aristo-phanes,—ATIENS. It is of this city, its history, topography, and ideparted architectural grandeur, that we would principally confine our observations ; and amongst the numerous works that itreat of if, there is none more interesting in its matter, more distinguished for the profundity of its learning, than the claborate notice of it con-tained tu the "Dictionary of Greek and Roman Geography," edited by Dr. William Smith, now on the eve of completion.*

on the eve of completion.* The well-known and received opinions as to The well-known and received opinions as to the origin of the Greek nation are patent to the world. It was not till the first Olympiad, about 776 B.C. that writing was employed by them for the perpetuation of facts; therefore their early history may be considered as not much more than a beautiful legend. It would he an endless task to more than allude to the fables that adom the writing or hereic area fables that adorn the mythical or heroic ages, whose improbabilities procured for ber, at an early date, the epithet of "Mendacious."

"Quicquid Græcia mendax audet in historia."

"Quiequid Greeia mendax audet in historia." The recognition of the Pelasgi as the most ancient inhabitants of the land, their division into several tribes, as the Hellenes, Leleges, Dryopes, Caucones, &c. — the dominant supe-riority amongst these of the Hellenes, or sub-jects of Helleu, — the hirth of his sons and grand-sons, Dorus and Æblus, Ion and Acheus, the founders of the four great divisions of the Helle-nic race, — the peculiar settlement of the Pelasgi root in Attica and Arcadia, — the discussion as to whether the Pelasgi were anciently a foreign or a Greecian race, and the consequent derivation of the Greek language, —the immigration into Attica, of Caerons and his band of Saites, the Greek language,—the immigration into Attica of Cecrops and his band of Saites,— the foundation of Argos, by Danaus and his fity daughters,—the settlement in Peloponnesus

of Pelops and his followers; and, lastly, the introduction of letters from Phœnicia, by Cad-mus, are canons in Greek faith, that all delight in helieving, but whose anthenticity the learned or not always warened in admitting.

in helieving, but whose anthenticity the learned are not always warranted in admitting. — The Pelasgi were the oldest inhabitants of Greece, and, according to Herodotus, spoke a barharian language, which, from their alliance with the Irani, had some affinity with Sanserit. To this oldest element Latin owed its parentage, now considered the more ancient of the two. Subsequently, when the Helleness of Ionic race took possession of Attica, the two hecame commingled, and, donhless, in their reconstruction, formed the early Greek lan-guage. Of the mythical poets, Orphaus, Eumolpus, and Maszens, and their disciples, we know nothing but their attributes. "Sylectres homines ascer, interpressue Deeram

" Sylvestres homines sacer, interpresque Deorum Cædibus et victu fædo deterruit Orpheus, Dictus ob hoc lenire tigres rabidosque leones."

The classic literature of Greece may he divided into two eras:—Ist. From the infancy of literature, written and unwritten, to the time of the Pissitratide. 2nd. The era at which national literature attained its climax,

which ational literature attained its climax, commencing with Simonides and ending with Aristotle; during which period tragedy arrived at maturity, and stopped! Comedy flourished, and history and philosophy culminated to their highest point of excellence. The three above-named poets were mythical bards, and composers of hymns, and with a number of wandering minstrels, who, it is known actnally existed, occupied a high position in public estimation, being at that time the only depositories of historic legend and family pedi-gree. Parnassus, Helicon, Lihethra, and Hip-poerene hecame consecuted to the Muses, pro-bahly from the settlement of these hards in their locality. The love of Orpheus for the ill-fated Eurydice forms one of the most beautiful passages in the Georgies of Virgil.

Autheutic Greek literature commences with Homer and Hesiod. Modern scepticism would assert that the former existed but in name, and "Qnis doctior iisdem temporihus aut cujus eloquentia literis instructior quam Pisistrati, qui primus Homeri lihros confusos antes, sic depossuisse dicitur ut nune hahemus."

depossusse dictur ut nunc hahemus." It is, indeed, a difficult question, for as easily might we ascribe a various authorship to each of the great epic poems of Virgil, Dante, Tasso, and Milton. There can be but little doubt that Homer was an Asiatic Greek, but whether Ionian or Æolian is not so clear. The time when he flourished is also nuknown, but Hero-dous makes it about fore centuries before his. dotus makes it about four centurics hefore his dotus makes it about four centuries hefore nus time. The place of Hesiod's birth, or the home of his adoption, was Bœotia. He was supposed to have heen contemporary with Homer. The title of the Epic Cycle was given to the collec-tion of epic writters made hy the Alexandrian grammarians in the second century B.C. It consisted of the Hiel and Odyscer, and all the consisted of the Iliad and Odyssey, and all the inferior epic poems of the Homeric form con-trasted with those of the Hesiodic monld.

The dissertations on this subject, and on the great works of Homer, are a favonrite theme of scholarship. Elegiac and iamhic poctry succeeded.

The first of the former poets was Calliuns, of Ephe-sns; and Archilochus was the inventor of the latter, the chief characteristic of which, as opposed to the epic, was rapidity.

" In celeres iambos misit furentem."

The Lyric period followed, a style insepa The Lyric period followed, a style mespa-rately connected with music. As the Greeks knew nothing of harmouy, hut only sang in unison, their term $ap \mu or x \dot{u}$ could only apply to melody. Terpander was the first who applied science to music. For a critical account of the string of Greek music, the schemes much of state of Greek music, the elaborate work of Burney must he consulted.

interest. Though called by Plato $\dot{\eta} \kappa \alpha \lambda \dot{\eta}$, Maximus Tyrius makes her swarthy, and Ovid diminutive, where she writes to Plaon,—

Sum brevis, at nomen quod terras impleat omnes Est mini."

Stesichorns first invested bucolic or pastoral poetry with a classical character, afterwards more familiar to us in the pastorals of Theo-critus and the celogues of Virgil.

The great feature in Pindar was rapidity in secing analogy,---

" Monte decurrens velut amnis, imbres Quem super notas aluere ripas, Ferret, immensusque ruit profundo Pindarus ore."

Of Anacreon, we need only remark that the graceful odes that hear his name were not by him hut after him.

The flourishing era of Greek literature com-menced with the time of Pisistratus. Thespis is considered the inventor of tragedy, Æschylus, Sophoeles, and Euripides its greatest writers. Sophoeles, and Euripides its greatest writers. The drama was of Attic growth, its writers Attic, their language Attic. Comedy and tragedy in Greece had similar origins. As the latter was the offspring of the Dithyrambic chorus, so was the former of the phalle song. The hand of revellers ($\kappa \tilde{\omega} \mu c_2$) danced round the $\phi a \lambda \lambda \tilde{\omega} \phi o \rho o_1$, or hearers of the $\phi a \lambda \lambda \tilde{\omega} c_2$, the emblem of increase, whilst joining in rude chorns the song of their leader. Hence the etymology of the term comedy—the ode of the Comus. Of a series of 104 comic poets, Epicharmus was the first whose works took a written form. What is termed the old Attic comedy finds its chief representative in Arricehener. His getant works are eleven in Aristophanes. His extant vorks are eleven in Aristophanes. His extant works are eleven in number. The remaining poets of the old and middle comedy form a long list of names, hut of their works only a few fragments remain. The poets of the new comedy are of a subse-quent date.

Unlike the Egyptians and Assyrians, who, by their hieroglyphics and cunciform inscriptions, preserved the records of the great events of their empires, the Greeks, until the flourishing era of their literature, had no regular history. Of the four great Greek historians, heginning

with Herodoths, and ending with Ctestas, Thu-cidides and Xenophon were Athenians. Of the ten Athenian oradors, the highest rank is accorded to Demosthenes and Eschines. Of the numerous schools of philosophy established at Athens, Socrates, Plato, and Aristotle were the most renowned. The two former were Athenian hy hirth, the latter hy adoption.

This short digression npon the poetry and literature of Greece is exensable, for, with this act are of orcece is exclusion, for which this extraordinary people, arts, architecture, poetry, and history seemed so linked together in perfect unity, that to expatiate npon any one of these points, without so much as alloding to the others, would be to do violence to the subject,

and leave our work hut half performed. It is singular how a style of architecture known to be the parent of that of ancient Rome, could have remained so long unvisited, or at least uninvestigated, like some mythical creation of legendary lore, instead of the actual and tan-gible remains of the most world-renowned city in Europe. But so it was. The earliest Eng-lish travellers of pretension to this classic ground were Messrs. Wheler and Spon, who, in 1676, were Messrs. Wheter and spon, who, in 1070, visited Athens, and subsequently gave the result of their labours to the astonisted world. To them succeeded M. Le Roy, who, in this work entitled "Les Ruines des plus beaux Monuments de la Grèce," embraced all the errors of his Facility neuroscoperson units that wire observe English predecessors, using their prior observa-tious as convenient stepping-stones for his own. The third and the most important visit to the same classic regions was that of Messrs, Stewart and Revett, who, in 1751, first landed in the ancient harhour of the Pirres, and at once proceeded to take accurate measurements and make graphic delineations of those master-pieces of art that were afterwards destined to create a new era in the annals of modern architecture. In their critical analysis they exposed the inac-Greek lyric poetry was peculiarly of that race of under the poetry was peculiarly of that race two hranches. The nine great lyric poets were the surpassing heauty of Greek form over Aleman, Alexna, Sapho, Stesichorus, Ibycus, Anacreon, Symonides, Bacchyledes, and Pindar, design, that the lapse of a century has only of these, Sappho naturally excites our greatest

The example thus set, a host of enlightened travellers have since explored the ground; artists, architects, poets, and scholars, have in legions drunk inspiration from the lands that nurthered this marvellous people, so divided hy race, so united hy sentiment, and poured the varied results of their lahours into the store-house of general knowledge. For architectural purposes, the publications of the Dilettanti Society, of the researches in Ionia of Chandler and Revett, those of Hittorf in Eleusis, Rham-num, Suniam, and Thorieus; and Penrose's "Investigation of the Principles of Athenian Architecture;" Inwood's work on the Erec-theion; the supplementary additions to Stewart and Revett, hy Cockerell, Donaldson, &c.; wilkins's "Antiquites of Magna Greeia," and other works, have effectually preserved the The example thus set, a host of enlightened other works, have effectually preserved the crumbling monuments they describe from the chance of heing for ever obliterated from the

memory of mankind. South of the plain of Athens rises the Mount South of the plain of Athens rises the Mount Lycahettus, a prominent object from the city; and south-west of Lycahettus are four hills of moderate height, all of which formed part of the city. Of these, the nearest to Lycahettus, and a mile from it, was the Aeropolis, or citadel, a square eraggy rock, rising abruptly about 150 feet, with a flat summit of about 1,060 feet here the south to feet based from Lat recr, with a lat summit of about 1,000 feet long from cast to west, by 500 feet broad from north to south. Immediately west of the Acropolis is a second hill, the Areiopagus; to the south-west rises a third hill, the Puyx, on which the assemblies of the citizens were held; and to the south of the latter is a fourth hill, known as the Museium.

The Ilissus on the east was joined hy the Eridanus close to the Lycœum, ontside the walls, and then flowed in a south-west direction through the sonthern portion of the city. The Cephisns, on the west, runs due south, at the distance of about a mile and a half from the walls. South of the city was seen the Saronic Galph, with the harbours of Athens. The city stands on a bed of hard limestone rock, in most stands of a bed of nard intestone rock, at most places thinly covered with a surface of soil From this surface the rock itself frequently pro-jects, and almost always is visible. The sur passing hearty and clearness of the Atheniau atmosphere is noticed by Euripides, as well as her modern travalles. hy modern travellers.

If modern trackers. The Acropolis was the boundary of the original city, and hore the name of Cecropia from that of its fonnder. From the limit of the city to this one point, it is indiscriminately termed in the historical period, $A\kappa\rho\delta\pi\delta\lambda c_{s}$ or $H\delta\lambda c_{s}$ hence Zeus of the citadel, was termed it have a data the Maximum dedition. Holds is, and Athena Holds of Holds and the definition Holds = Holds and Holds = Holds. Erectleus dedicated to Athena a temple on the Acropolis, in which he placed a state of his patron saint, eated to Athena a temple on the Acropolis, in which he placed a state of his patron saint, and being afterwards interred there, it took the name of Erectheium : Athena was the Minerva of the Greeks, the tutchar deity of the Atheniaus. The Pelasgic inhabitants, afterwards styled Cecropida, were now called Atheniaus. Theseus was the national hero of Attica, in whose-honour the Theseium was hnilt; his exploits need not be repeated. His advice to the ungodly when in Tartarus,—" Discite justitian moniti, et non tennere divos," is, perhaps, the most valuable part of his history. It was in the mythical age that the Pelasgi fortified the Acropolis, a portion of which long retained their name. It was during the administration of Pisistratus (B.C. 560—514), that, according to Thucydides and Aristotle, many temples were huit; amongst them that of Apollo Pythens, and that of Zeus Olympins, which latter, however, was not finished for centuries. It was during the interval hetween the battle of Salamis and the Peloponnesian war, that the first public buildings were erected by Cimon and Perioles. Previous to this Themistedes had surrounded the city with a fortified wall, sixty stadia in eigenufference, and at and Pericles. Previous to this Themistocles had surrounded the city with a fortified wall, sixty stadia in circumference, and at the same time fortified the harhour of the Pyreus. It was nucler Cimon that the Theseinm was built, and the Stoa Poecile adorned wilt paintings, the Academy and Agora planted and adorned. To Pericles, however, the splendour of Athens owed its heing; and the Parthenou, the Erecheium, and the Propylea will ever attest his taste and muni-Propylea will ever attest his taste and muni-ficence. Various other huildings are attributed to him. After the naval victory over the

Lacedemonians off Cnidus, the Athenians again tried to improve their eity and restore the damage sustained in its capture, and it was then that the Dionysiac Theatre, the Stadium, and that the Dionysiae Theatre, the Stadium, and Lyceium were completed. After the battle of Cheronica (B.C. 335) Athens became a de-pendency of Macedonia. Upon two occasions Athens sustained serious damage, —mon the invasion of Philip of Macedonia, B.C. 200, who destroyed the suburths of the city and temples of its plain; and npon its capture hy the Romau general, Sulla, B.C. 56, when the long walls and the fortifications of the city and effects. general, Sulla, B.C. 56, when the long walls and the fortifications of the city and of Piræus were destroyed, and the commerce of Atheus as a mari-

time place was for ever annihilated. Under Roman rule Athens continued the centre of Greeian philosophy, and was irequented by her conquerors as the school of learning and refiuement ; and many of her finest public build

Tendement; and many of the mass plante outdotting data from this period. Hadriau (A.D. 117—138) was a great henc-factor of Athens. He not only completed the temple of Zeus Olympius, hut adorned the eity with numerous other public huildings,—two temples a cumumium a bibmer and a tratemples, a gymnasium, a library, and a stoa,-and gave the name of Hadrianopolis to a new quarter of the city, which he supplied with water hy an aqueduct. In the time of the Antonincs, Herodes Atticus, a citizen of Athens, emulated the imperial munificence hy creeting a magnificent theatre on the south-west side of the Aeropolis, dedicated to his wife Regilla, and also covered with Pentelic marble the seats in the stadium of Lycurgus. Nor, says Gihbon, was his liberality confined to the walls of Athens. The most splendid ornanents bestowed on the temple of Neptune, in the 1sthmus, a theatre at Corinth, a stadium at Delphi, a bath at Thermopilæ, and an aqueduct at Cannsium, in Italy, were insufficient to exhaust his treasures. Tany, were mainteen to exhaust his treasures. The people of Eprins, Thessaly, Eukora, Boetha, and Peloponnesus experienced his favours, and many inscriptions of the eilies of Greece and Asia gratefully style Horodes Attiens their patron and benefactor.

Athens was never more splendid than in the age of the Antoniues. The great works of Perioles and of his period still retained their original froshness and perfection. The Olympieium, the most colossal temple in Greece, had been completed; and the city had yet lost few of its unrivalled works of art. It was to the visit of Pausanias so that the value of the value of Fausdahas at this epoch, that we are principally indebted for our knowledge of its topography. From that period Athens received no further embellishments, hit her buildings appear to have existed in undiminished glory till the third or even the fourth century of the Christian era. Their gradual decay may be attributed partly

to the declining prosperity of the city, which could not afford to keep them in repair, and partly to the fall of paganism, and the progress e new faith.

The walls of Athens ruined by Sulla, were restored hy Valeriau, A.D. 258; and the fortifi-cations protected it from the attacks of the Goths and other harbarians. In the reign of Goths and other harbarians. In the reign of Gallienus, A.D. 267, they effected an entrance into the city, but were driven out hy Dexippus. In A.D. 396, Alaric appeared hefore the city but heing uuahle to take it by force as an enemy, he accepted its hospitality, and entered it as a friend.

Notwithstauding the edicts against Paganism issued by Theodosius, Arcadius, and Hono-rius, in the fourth and fifth centuries, the Pagan ion continued to flourish at Athens till abilition of its schools of philosophy by Jus-tinian, in the sixth century. It was probably at this time that many of its temples were con-verted into churches. Thus the Parthenon, or temple of the Virgin Goldess, became a church dedicated to the Virgin Mary; and the temple of Thesens was dedicated to St. George of Cannadoeia.

During the Middle Ages, Athens bad degcuerated from its once high estate into a mere provincial town, and its subsequent alternations of fortune excite a painful feeling of regret. After the capture of Constantinople by the Latins in 1204, it became a dependency of the king of Thessalonica, and subsequently remained in possession of the Franks till its incorporation into the Turkisb empire in 1456. The Parthenon, walk, Crahtree-row, Grove-place, Primose-which had braved the lapse of 2,000 years with street, Forest-road, Roso-place, Arbour-square,

impunity, received its severest injury during the siege of Athens by the Venetians. It was before this siege that Wheler and Spon visited it, and at that time, says Colonel Leake, the Parthenon a chart thic, any solution induct, the ratio and a few figures in the pediments; the Propylaca preserved its pediment, the Temple of Victory pterus was complete, and the Freetheium hut little injured.

Iu 1834, Athens was made the capital of the new kingdom of Greece; and, since that time, the increased knowledge displayed by modern the increased knowledge displayed by modern scholarship has enabled the ahle and persevering investigators of its topography and ruins to clear up many doubts that before existed, give to the world the results of their invaluable abours, in the elaborate and learned descriptions we now have the advantage of possessing We must here hreak off for the present.

PROPOSED ALTERATION OF NAMES OF LONDON STREETS.

THE proposal made by the Metropolitan Board to change the names of our streets should be looked at very jealously, and accepted with much caution, great as the inconvenience may be which results from the multitude of repeti-tions. The time was when the streets of London were without properly recognised names, and it is only as it were the other day that the houses in the metropolis and other large towns were numbered. The previous state of things must have been very inconvenient, and ex-plains why a gentleman directing a note to a young lady would say,-

These for ye hands of ye fair Dame Matilda, at y Golden Fleece, over against the Roaring Lion and Seven Crowns, nigh unto the Conduit in Chepe.

We wish we knew the name of the person to whom we are indebted for the introduction of the system of numbering the bouses : he should be hononred.

Named without concert and according to the impulses of individuals, the same names have been applied to streets in all quarters. There are thirty-three New-streets, thirty-eight Queen-streets, forty-four King-streets, fifty-five Charlesstreets, and sixty-two George-streets. This is very nuclesirable: we would gladly have it other-wise, and arrangements should he made to prewhich and all adjusteries should be sub-vent further multiplication. Nevertheless we should much regret to see the names of esta-hlished streets changed : in many instances they have a historical and peculiar interest, ----as, for instance, Watling street, Kuight-Ryder-street, Crutched friars, Feuchurch-street, the streets named from the City gates, Cheapside, Giltspur-street, and a hundred others, which tell a story, aud cause the passenger to reflect. Take, as an example which occurs to us, the streets built on the site of York-house, in the Strand, -Georg street, Villiers-street, Duke-street, Of-alle Of-alle street, *Fulliers-street*, *Date: Street*, *e.g.*, *and* and *Buckinghum-street*, preserving the name and title of the last Duke of Buckingham of the Villiers family and last possessor of York House, and telling a long story of how Henry VIII. took York Honse, afterwards Whitehall, from Cardinal Wolsey; how Queen Mary, in recom-pense, presented this York House in the Strand, then called Norwich House, to the sec of York, and many things besides.

The seheme i. oroughly carried out would deprice London of all its significance and suggest-iveness, to say nothing of the difficulties and annoyances it would cause for a long time. Our own Great Queen-street, Lincoln*siun-Our own Great Queen-street, theory report fields, is marked down in the committee's report to be changed into Brougham-street. duc admiration of the wonderful man to he thus commemorated, why should we lose sight of the fact that this street was named after Henrictta Maria, the queen of Clinrles I. or give up the association with it of Inigo Jones, Sir Godfrey Kneller, and others, in connection with whom it is referred to hy name by the writers of their period ?

Even in newer neighbourhoods the names of streets are not without significance, and as time advances will become more curious. In places which are now pent in by heaps of bricks and mortar, we have such titles as the Grange-

Pleasant-row, Wilderness-row, Short's-garden, and even Whetstone-park,—*Pench's* preserve,— which smack of the country, and sustain the memory of the original condition of the place. Then there are names which record the pass-ing events at the period of their erection,— Trafalgar squares and streets, Nelson streets, Wallis event streets, Viewet, California

Wellington-streets, Vincent-squares, Colling-wood streets, and so on, commemorating, in a certain way, the men of the long war.

Passing over the places which are of the date of the regency—when Charlotte-streets were common in small neighbourhoods, and Regentstreets sprang up-wc will take a glance at another and the most numerous class of London street names. In one locality, joining each other, are Ernest, John, Alfred, Henry, Louisa, and Marian streets. There are numbers of streets called by Christian names which have heen given by some thriving man as a mark of affection for the different members of his family, as the north country and other ship-owners call their vessels the *Bouncing Sally*, the *Eliza*, or some other name which is suggested by affection. As a natural consequence, too, we have many Church-lanes, Church-streets, &c. which are so called from their position, like some of the roads, such as Tottenham court-road, W chanel-road, and others. White-

The names of the late royal family (Glou-ster, Cumberland, York) have been given to cester. streets and rows of houses.

Those who notice the names of streets in the neighbourhood of London-wall—such as Basing-hall-street, Redeross-street, Whitecross-street, Jewin-street, Cripplegate—will find that all have significance. Bridgewater-square was formerly the site of the residence of the Bridgewater family, and was the first regular square built in London. Near it is the ancient "Gruh-street" of the poets, in which it is said that the Sifed: " of the poets, in which is is also that the family of Milton once resided. After his time the street fell into decay, and poets of less note there pursued their precarious calling : and then other tenants occupied the place, and the name of *Grub-street* was considered dis-mentally and it has therefore hear recently. the name of *Grabstreet* was considered dis reputable, and it has, therefore, heen recently changed to Milton-street. So far as feeling i heen recently concerned, we should have preferred that the of Gruh-street should original name of Gruh-street should have remained, and that some other street should have been invested with the name of our great poet. have

been invested with the name of our great poot. The Maide-Jane from King's-cores scenes to he changing to the York-road. This thorough-fare, not long since a rural road, has been a Maden-Jane from Battle-bridge since the Saxon time. Why change the name? The monstrous effigy of George IV, to which we have referred on more than one occasion has been the means of giving the name "King's-cross" to one of the most important positions in the metrop Before the erection of that figure of a king s in the metropolis. place was called Battle-bridge—probably from the circumstance of a great struggle having taken place on this spot between Queen Boadice from having

and the Romans. Would it not have been better to have pre served the memory of this historical event, and called this station "Battle-bridge," rather than called this station after the abominable work of no-art which has

been so properly removed? Some of the recently constructed lines of way have heen well named; the Commercial-road for instance, which leads towards the Docks and for instance, which relations and solve and the poles and other great mercantile establishments. The road through Islington which leads off towards the north, and which, before many years are past, will be as busling as Oxford-street, has been well named the Caledonian-road. As in influence makes the province of Rozmu. And in Islington, where the remains of Roman work were formerly to be seen, a large street has been called the Roman-road.

In glancing around it is easy to observe that more discretion in naming of streets is now shown than was at one time excreised; and while acknowledging that inconvenience has been caused by the haphazard mode pur-sued, we must reiterate the necessity for the All greatest caution in making changes. England would protest against re-christening Runnymead: the whole world would flont the notion in the case of Marathon. Many of our streets have the same claim in a less degree to be allowed to retain their ancient appellation.

London must not lose its memories.

SOME ACCOUNT OF ALNWICK CASTLE, NORTHUMBERLAND.*

Trus important stronghold formed a species of frontier fortress hetween Scotland and England, being only at the distance of about 30 miles from the Scottish border, and lying within 4 miles of the sea coast: it therefore commanded the high road from one country to the other. It is placed on a plateau, partly natural and partly artificial, midway up the hill, which rises from the River Alme to the south. On the west side is the principal entrance with its barbican, affording access from Almwick. This town is attached to the castle, and is itself surrounded in a strandard is interest in write. by a strong wall, and entered by gates, one of which, an old one, still remains in tolerable pre-servation, the two others now standing being comparatively modern. The fortifications of the town in their present extension are attributed to the second Earl of Nortbumberland, the son of Hotspur, ahout 134; but doubtless so in-portant a place, and one exposed to the continued incursions of the hostile Scotch, and the not very scrupulous raids of the Borderers, must have been surrounded at an earlier date by a eircumvallation or some degree of fortification, to protect the inhabitants from surprise, and enable them to resist for a time an advancing host.

The mediæval castles of Great Britain may he divided into four classes : the simple fortified tower (a tradition of the remoter periods and similar to the outposts sculptured on the Trajan sufficiently large to receive a small body of warriors, and afford accommodation for their provisionment and their arms. These may have provisionment and their arms. These may have stood singly, as towers of observation, to watch and harass for a time an aggressive force, and may have been surrounded by a temporary ditch, or a space enclosed by a stockade to receive cattle at night, or those of the countrymen near, in case of attack. They thus formed places of shelter even to the peasantry in times of danger. Such a fower was most likely the cardiact area Such a tower was most likely the earliest pre-decessor of Alnwick Castle. A second class of castles consisted of a large

square donjon or tower, like those of London, Rochester, Richmond in Yorkshire, Bamborough Castle, Newcastle, and others, nsually attributed to our Norman invaders. These were divided into several stories in height, and each story distributed into one or more central halls, and several chambers and galleries gained in the thickness of the walls. A fortified curtain surrounded them, enclosing a considerable space, with intermediate towers, and one or two entrance gateways, with barbican, and postern, and sally gates. Some of these, as at Rochester and Newcastle, received considerable architec-tural decoration in the interior, the monidings being carved in the doorways, chapel, and halls. A third class of castle consists of a central group of distinct towers of considerable size, surrounding a middle court putied by outfain rounded them, enclosing a considerable space,

surrounding a middle court, united hy curtain walls, and each tower more or less extensive, according to the distinctive purpose for which it was intended, as the entrance gate, with its It was intended, as the entrance-gate, with its porter's rooms and marshal or constable's accommodation, and with the prisons. Another was appropriated to the haron; a third to the baroness communicating therewith; a fourth to the officers of the household; a fifth to guests; and another to the hall, kitchen, hutteries, cellars, and offices for inferior retainers. The whole formed in itself a position of great strength, enabling the chief, his warriors and family, when the outwork's wree in prosession of strength, enabling the chief, his warriors and family, when the outworks were in possession of the enemy, still to hold ort, until the means of resistance or the patience of the besieged were exhausted. Of this class is Alnwick, as likewise Couway and Caernaryon, and the old Bastille at Paris. They were generally surrounded by ex-tensive areas, like the previous class, consisting of what are called the outer or entrance ballium or ward, middle haily, and so on; but occa-sionally, when attached to a town, as at Conway or in the case of the Bastille, these outer courts or in the case of the Bastille, these outer courts did not exist.

Our notice on eastles in general should not stop bere, and we may be permitted perhaps to From a paper (compiled from materials furnished by Mr, Salvin, the Commendatore Canina, and other sources) read by Professor Doundson at the ordinary meetimes of the Royal Insti-tute of British Architeets, on the 3rd and 17th of November 1ast. See also p. 64/ Vol. XIV.

notice cursorily another class, consisting of a large square or circular court, having a fortified entrance gateway flauked hy towers, with cir-cular towers at the angles, or in the circum-ference of the precinct, united by curtain walls, against which were attached within the court subordinated buildings for residence, and offices of all diverginations of the presidence and offices subordinated buildings for residence, and ounces of all descriptions, and the whole castle sur-rounded by a fosse. Such is Barnwell Castle, near Oundle, in Northamptonshire, and Roth-say, in the Isle of Burte, N.B. both which are very interesting examples, and deserve special study

To resume, however, our history of Alnwick, for which purpose I avail unyself of the elegant quarto volume, published by Charlotte Florentia, the present Dowager Duchess of Northumber-land, illustrated by effective views, lithographed by Hugling from here Grand's available by Harding, from her Grace's very clever draw-ings, and accompanied hy text written hy Arch-deacon Singleton, which is the authority for the annals it records,-

At the period of the Conquest, 1066, the castle and barony of Aluwick belonged to Gil-hert Tyson, who was slain at the side of Harold. The Conqueror gave the granddaughter of Tyson in marriage to Ivo de Vesci, a Norman favourite, the inheritance continued in the family till 1297, when it passed, in default of legitimate issue, to Anthony Bec, Bishop of Durham. The precise extent and features of the earliest castle under Tyson, it is impossible to ascertain; but it was enlarged by De Vesci, and it may he assumed that it consisted generally of the parts assume that it consistent generally of the parts now standing, varied from time to time as neces-sity or expediency required, and which we shall find involved changes in certain parts, though not so radical as to alter the general aspect. The Castle consists of a central keep, formed for general for any consists of a central keep.

The tastle consists of a contain keep, tornar of a group of towers surrounding a cont-yard about 100 feet square inside. This keep is eucircled by a considerable plot of open ground, divided into two large courts, both which divided into two large courts, both which served as "places d'armes" for exercising and nanceuvring the troops, as we find drawn on the plans of about the middle of the seventeenth prais of about the induce of the sevencement century, and probably in the outer one, was a jousting-ring and space for the tournaments, without doubt occasionally held here upon occa-sions of Royal visits. The whole contained ahout five acres within the walls, and was inclosed by a curtain wall fortified at distances by square and circular towers, with a principal barbien and entrance-gate next the town, by which access was given to the interior of the fortress

The Curtain is the construction of various periods, the earliest portions being considered to be those of De Vesci; and the courses, instead of being stepped up into horizontal courses, follow the varied surface of the ground, in curved and parallel lines, and generally there are no projecting footings to form the founda-tion. There are very obvious traces of the De Vesei walls quite distinct from those of his successors; and signs of reparations, alterations, and additions are apparent in various parts. The curtain wall did not at first entirely inclose the keep, one of whose sides to the N.E. next the river, at the part where there was a steep ascent, was exposed to the country; hut after the report of Clarkson, in 1556, who recom-mended the donjon being entirely disconnected and free from the park without, a portion of the and free from the park without, a portion of the ontside ground was inclosed by constructing a curved curtain wall from the postern to the armourer's tower, and thus the keep was there-after surrounded in its entire eircuit by a con-tinuous court. Originally, as we shall presently more particularly observe, the dwellings and offices for the retainers, and the subordinate domestic erections, were inside the outer and middle balliums or wards, but in more peaceful recent times they have been removed outside to give more space to the courts, and more freedom give more space to the courts, and more freedom to the noble's dwelling.

We will now take our snrvey of the circuit of the castle, and enumerate the several parts, with some short remarks on each division of with some short remarks on each division of of the keep. In its conrise it is divided into the subject, following Clarkson's description of 1556, and certain plans now in existence, appa-in each. The two first divisions have hattle-rently made about the middle of the seven-teenth century. It may here be mentioned, that we have some very remarkshile records of the condition of the castle at eertain fixed

periods, about a century apart; -A survey hy Bellysis and others in 1537; Clarkson's survey in 1567, in consequence of which considerable works were done by Earl Thomas; and one of about 1650; and the middle of the last century is marked by the alterations under Hugh, first Dates 6 Justice Lender Duke of Northumherland.

The Entrance Gate from the town is preceded hy a barbican, or outer enclosure, like the eity gates of York up to a recent date, which gave grate strength to this part as forming the approach. There was the outer gateway open-ing into a narrow way hat each two lofty walls, so that if an enemy had passed the outer gate, the warriors could be hermed in, and he here exposed to the weapons and missiles of the hesieged on the walls above. Clarkson in his survey, 1556, states, that there was note at this part a drawbridge, for further security. It is evident that a fosse, or ditch, ran along this western face of the curtain. Then there was a portcullis and several pairs of wooden gates, as mattioned by Clarkson, and inside is the mentioned by Clarkson, and inside is the porter's lodge, as of old. The architectural features of this gate-house and its harbicab are very bold and striking, and the date may be assumed to be about 1350, at the time of Lord assumed to be about 1350, at the time of Lord Perey, who added, it is supposed, some of the stone figures on the tops of the parapets. The only old figures are upon the middle gateway, and the half octagonal towers of the entrunce-keep, and are in quiet altitudes is but the later ones are in all sorts of violent fantastic action. This gateway is a very striking feature, with the two advancing turrets of rongh stonework rising up to a noble height; the parapets pierced with enbrasures, and surmounted by figures in various attitudes; the return wall enclosing the narrow passage-way, backed by the gate house rising above all, and hy its frowning aspect forbidding approach to the foc. Clarkson notices this gate-house as two stories high, and as being in a very dilapidated stories high, and as being in a very dilapidated condition.

condition. Exchequer House.—Immediately within the gate-house, or porter's lodge, and in the court, there was a large building, two stories high, named the exchequer -house, but not now existing. It served for lodging, and possibly uay have been appropriated to receive those strangers whom it was not expedient or predent to allow to enter the inner part of the castle. To the right hand, immediately within the gate, was another large two-storied huilding, the lower part appropriated to stahling for the

lower part appropriated to stahling for the houses of strangers or retainers, or common uses; the upper floor for grain. This Clarkson represents as having been recently built (1567). *Abbot's Toucer.*—Turning northward, or to the left, on leaving the porter's lodge, the curtain wall follows in a straight line from north to south for a distance of 180 feet, np to a large square corner tower, 40 feet by 30 feet, called the Abbot's Tower, and supposed to have served as place to receive the abbot of Ahnwick Abbey, when that place was threatened or pos-sessed hy the enemy. Clarkson notices this fower as being, as it now is, three stories blich; sessed by the charge of the set o the curtain wall has an enhattled gallery all along, with parapets and emhrasures, and mid-way between the gate house and the tower is a way between the gate-house and the tower is a turret, sometimes, and now-a-days, called a garret, and, according to Clarkson, covered with freestone and two (houses) stories high. These small interior garrets served as abutnents to the walls, from the face of which they pro-ject, and thus afforded an opportunity to the warriors of enfinding the outside of the walls from tower to tower from tower to tower.

from tower to tower. The Abbot's Tower forms a noble and com-manding object at the angle, and rises up high above the curtain, with a turret at its outer angle, and its stone figures on the parapets. Thence the enclosure wall pursues another north-easterly direction, almost at right angles, but in a sweep, towards one of the lofty towers of the keep. In its course it is divided into the assertions by two carrets with a chamber

small square stones. The third division, next small square stones. The third division, next the keep, had no battlement to walk upon, a precaution probably adopted in consequence of its proximity to the keep, so that the top might not form a gangway, affording easier means of access to the tower of the donjon.

As this forms the conclusion of the entain wall on this side of the eastle, we must resume the survey of its circuit by starting afresh from the Porter's Lodge Honse, in the same manner as Clarkson. On the southern side of the Gate House, the enclosure wall proceeds southward for about 80 feet in a straight direction to a for about 50 test in a straight direction to a square garret or turret like the ones already mentioned rising above the wall, the lower part acting as a buttress to the wall, and the upper part forming a small circular chamber. In a slightly slanting direction the circuit wall runs 50 foot to the average which is already

slightly slaving direction the erreuit wall runs 70 feet to the corner tower, which is eirenlar with a square base, consisting of three stories. The various towers, the chapel, and the con-duit were then described. The Keep or Donjon, as Clarkson cells it, formed a polygon, with a court-yard in the centre, which was excircled by seven round towers and one square tower, under which was the gateway. The approach was by a draw-bridge over the moat, and on either side, in advance, semi-octagonal towers, added by the second Lord Perey, about 1350, to the original square Norman tower. These semi-octagonal square Normau tower. These semi-octagonal towers rise four stories high, and contain on the eutrance-floor accommodation for a porter, and, cutrance-floor accommodation for a porter, and, under the chamber, to the right, is a deep dungcon-prison, the only access to which is through the bothe-shaped ceiling by a trap in the floor, and there are loop-holes in the walls. The outer face of the archway next the court consists of a noble series of Norman mouldings, carved with enrichments, and there were origin-ally two celumns with their capitals ou each ide. Within the cont, to the right, is a draw-well in the thickness of the wall, with three pointed arches, summounded by one large dis-charging arch, forming a very picturesque object; beyond which is a doorway, leading into a vanifed chamber, called by Clarkson "a fayre vanite, which is the butterye, in length xuj yards, in breadth vi." Above this "fayre vault" was the hall, approached by an external flight yards, in breadth vi." Above this "fayre vault" was the hall, approached by an external flight of steps, and over the hall was the peculiar feature of two chambers. In the tower next that of the hall were contained the kitchen, sculleries, huttery, larder, &c. The lord's and lady's lodging was over the gate-house. The other towers contained the accommodation for the household. They were all detached, except in one case forming senarte dwallings united The nonsenous They were all delached, except in one case, forming separate dwellings, united by curtain walls for the purposes of defence. And again, to use Clarksou's own words, "uppon the sayde lead ys a trimme walk and a fayre prospect." "There is raysed on the west side of the said destination. of the said donjcone one lyttle square tower, called y^e watche towre, above the lead xiv yeard, wherein ys place for a watchman to be and a heaken to be sett or hung."

But there is one curious paragraph highly illustrative of the economy of the times, which we shall quote literally. " And because throwe extreme wind the glass of the windowes of this & other my Lords Castells and houses here in this muttic ducths ductors and more a traver & other my Lords Castells and houses here in this cuntric doothe decaye and waste, yt were goode the whole height of everie windowe, at the departs of his L. from lyinge at any of his said Castells & houses & dearinge the tyme of his L. absence or others lying in them, were taken down & lade appart in safetic; and, at sooch tyme as cither his L. or any other sholde lie at anie of the said places, the same might then be sett uppe of newe, with small charge to his L. where nowe the decaye thereof shall be verie costlie & chargeable to he repayred."

werie cosilie & chargeable to be repayred." We will now pursue the history of the castle of Alnwick, with occasional reference to some of its lords. As we have already noticed, iu of its lords. As we have already noticed, in 1297 it cause into the possession of Lord Henry de Percy by a deed of conveyance, the original of which is preserved among the family muni-ments of his Grace, now in the charge of Mr. Wil-liams, as record-keeper, who has most obligingly called my attention to this very valuable and remarkable record. It is from Anthony Beck, Bishop of Durham, who, it is said, always wore a suit of armour under his bishor's role. and remarkable record. It is from Anthony Bock, was found shot dead in the Tower of London, part of the administrators in public works,— Bishop of Durham, who, it is said, always wore a suit of armour under his bishop's rohe, and was called the fighting hishop. It hears date

19th November, 1309, and two days heuce will High Admiral of England, and had the charge he 547 years old. It conveys to Henry de of the children of Charles I.; and during his Percy and his heirs the barony, castle, manor, life the large drawings appear to have been and town of Alnwick, with the towns, bamlets, made, which give the plans and views of the whatsoever else the said bishop had of the gift of the noble Lord William de Vesey within the that time. Atterwards the castle with castle for the castle for the castle for the said bishop had of the gift aroun aforesaid and elsewhere in the count. of the noble Lord William de Vesey within the barony aforesaid, and elsewhere in the county of Northumberland; and also the reversions of the dowor hands of Isabella, widow of Lord John de Vesey the elder, and Isabella, widow of William de Vesey, expectant of the deaths of these hadies respectively. The son of Henry de Perey defeaded and took prisoner. Devid, Kime of Sordbud et Navillée

risoner David, King of Scotland, at Neville's cross, where 15,000 Scotchmen fell. He constructed the semi-octagon towers to the keep, as an advanced work, put up stone figures on the parapets, and added the barbican to the

The gradeway, and many other works. The grad grandson of the first Henry de Percy was created Earl of Northumberland at the coronation of the wretched Richard II. and, the coronation of the wretched Richard 11, and, after vanguishing the Scots at Hamilton, in 1462, was himseli slain at the battle of Bram-ham Moor, 2nd of March, 1407. His son was the valiant Hotspur, whom Shakspeare has im-mortalized, who was slain at Shrewsbury, 21st July, 1403, that is, four years before, and the son of Holspur succeeded to the grandfather's inheritance. He repaired the eastle, and forti-fed the town of Ahwide. Then succeeded the inheritance. He repaired the eastle, and forti-fied the town of Ahwick. Then succeeded the crucl and disastrous times of the civil wars, in which the Pereys took always a conspienous part, and paid with their blood their devotion to their allegiance for their sovereigns. The son of Hotspur fell at St. Alban's, and was buried in the Iady chapel of the abbey: his son was slain at the battle of Towton, and Henry Perey, the fourth earl, was murdered in a popular immult at Coeklodge. in Yorkshire.

the lourth earl, was murdered in a popular tunult at Gocklodge, in Yorkshire. Mr. Dick, iu his "Inscriptions and Devices in the Beanchamp Tower of the Tower of London," recently published, has the following remark-able paragraph in connection with this unble family, p. 28. Immediately below the above names is the following inscription:---

SARO : FIDEL1 :-INGGRAM PERCY 1537.

(I will be faithful, lngram Percy, 1537.)

(1 will be faithful, Ingram Percy, 1537.) During the year 1537, being the 28th of Henry VIII. we read of several rehelitons in different parts of the country, caused through the great disikke that was generally felt to the alterations, which were being introduced in the religion of the country. In the latter part of the above year several of the northern gentlemen joined in a conspiracy (Aske's) to oppose the measures that were then heiner massed. Among others a conspiracy (Aske's) to oppose the measures that were theu being passed. Among others, were the two sons of Henry, the fifth Earl of Northumberland, (Sir) Thomas and Ingram Perey. This robelion was quickly suppressed, and the anthors of it apprehended. Thomas Perery and conducted at Thomas Percy was condemned and executed at Tyhnrn, Percy was condemned and executed at Tyhnrn, the same year; but Inggram (the author of the above inscription) after being in confinement a short time, was liberated, and died in the latter end of the following year, I538. The title and estates then seem to have been estreated for ninetcen years, but were restored, in 1556, to Thomas, the grandsou of the aforesaid Sir Thomas, and he became seventh Earl of Nor-thumberland, by a grant of Philip and Marc. thumberland, by a grant of Philip and Mary, He executed considerable works to make good the dilapidations into which the eastle had fallen during the period so disastrous to the family; and it was during this period that Clarkson's survey was made. The ravine tower was taken down, and the reparations and alter-ations carried out in pursuance of his report. This carl seems to have maintained the faith of This fathers, not adopting that of the Reforma-tion. He was beheaded at York, August 22, 1572, under Elizabeth, avowing the Pope's supremacy, and was huried in the church of St. Crux, outside which he had suffered, and his ion headest still have supposed on the St. Crux, outside which he had subject of the his iron helmet still hangs suspended on the wall near his grave. His son and successor was found shot dead in the Tower of London,

that time. Afterwards the eastle fell into great decay, and at the time of Charles II. 1649-60, it is described by Ogilvy, the cosmographer, as "once large but now ruined." No incident of any importance is recorded as occurring in connection with Alawick Castle from the middle of the seventeenth century till the widdle of the back when Lady Flingheld

from the middle of the seventcenth century till the middle of the last, when Lady Elizabeth Scymour, the heiress of this nohle line, married Sir Hugh Smithson, hart. who, on the death of his wite's father, Algernon Duke of Somreset, became the thirtcenth Earl of Northumherland, and was created Duke of Northumherland in October, 1766. In his time were excended, by Adam the celebrated architect very important works that

In his time were executed, by Adam the celebrated architect, very important works, that materially changed the aspect of the castle. The chapel, and all the domestic huildings which existed in the middle ward or ballium, where taken down, as also the exchequer-house in the outer hallium near the porter's lodge, and the large two-storied building opposite to it, so that the two wards were left quite free and disen-eumbered of buildings, and the moat round the keep was filled in, and earth piled up high against the donjon tower and its curtain walls. Numerons domestic offices were erected walls. Numerons domestic offices were erocted outside the south curtain wall from the south-west eorner tower to the Garden tower. * *

There was the desire to retain the Decorative style of the Mediaval times; but it assumed style of the Mediaval times; but it assumed the faste since so expressively attributed to Batty Langley; and in order to gain more light, the narrow apertures of the original times were widened, and the upper range exhi-bited a series of quatefoils, which destroyed the sentiment of the earlier character of the castle. But still, although the sizes of the dining-hall and reception-rooms were spacious, and they were lofty in height, they were devoid of facility of access one moon after servine as of facility of access, one room often serving as passage way to ...hc other. Such was Alnwick about 1780.

THE WESTMINSTER-BRIDGE QUESTION.

THE WESTMINSTER-BRIDGE QUESTION. A CORRESPONDENT, who signs himself "A Competitor," complains that in our article of December 18th, urging the prosecution of the works of the New Westminster-bridge, we had acted inconsistently with our constant advocacy of "justice to architects in the management of competitions"—and remembering that the ques-tion of the site of the bridge has been left for suggestions by competitors for the Government Offices, whose laknowr might be thrown away in case of any present decision ,—and he argues that a delay of a few mouths might he tolerated even should the bridge afterwards go on. Now, as we urged in our number of Angust 30th,— just one month before the particulars for the Government Offices were issued,—that Mr. Page should "he permitted " then " forthwith to earry ont hisdesign to completion," werather think that the inconsistency would have been in our omitting to lend any additional force to an opinion which obviously must he formed hy all who may balance the opposing arguments. Sconer or later, such arguments would have been hrought to the case; and we really thought that in dis-closing them some three mouths hefore the Officer. We officer the officer. We closing them some three mouths hefore the time for sending in designs for the Offices, we

We were doing our duty every way. We were guided by the desire that we ever have for justice to our profession, as to another interest which we claim also to consider,—that of the tax-paying public. Indeed, it is not for the advantage of the profession that more the advantage of the profession that more money for public works should be *wasted*.

Onr plea for justice involves more than our correspondent may at first perceive. Justice to the profession requires that we should expose these constant blunders and vacillations on the

THE BUILDER.

THE ORIGINAL ABODE OF THE ARCHITECTURAL MUSEUM, CANON-ROW, WESTMINSTER.

object with us when we claim, as in the case of correspondent; but we do not think with him the New Westminster-bridge, that professional that anything is gained, but that rather much knowledge should be deferred to, that professional object would be lost, hy couceding for any time the storage and phinons after study of a subject should be preferred to opinious after study of a subject should be preferred to opinious given after no study. Justice to the whole profession, again, requires that we should support an individual member of it when called to defend himself from erroneous imputations. We must look to interests beyond the pre-cent hour and sum baread the accuration.

sent hour, and even beyond the competition that is in question, which last, our readers know we think is not appounded in terms know we think is not announced in terms ealculated to scenre the objects on either side. All the competitors, like ourselves, have gone through the same course of reasoning that we have done, if their designs can be based upon correct data,—which have been known to be in blue books and plans just as they were found by us. Probably many competitors will be misled, and will feel as though the conditions required the removal of Westminster-bridge, just as they may have been mistaken as to the just as they may have been mistaken as to the limits of the street improvements. We shall limits of the street improvements. We shall regret these cases; but having done our part in warning competing architects as to their posiwaining compared are interests as to inter posi-tion through the confused instructions, surely we might uext consider general professional in-terests and the interests of the public. No good, altimate or immediate, will come to our profession from keeping back the truth. This simply is that several bridges are required, and that good sites have been named for them; that the existing route must be maintained as well the existing route must be maintained as well, for London communications as for the interests of the districts joined by the hirdge; that massive upright posits of wood, with planks; that ground for approaches is provided,—and must, for the Middlesex side, by the very nature of the site, he left mhnilt on in all the plans,—and that the bridge works should and will go on, whatever may be the plans sub-mitted. The actual necessity for the continu-ance of the hridge we think is perceived by our

THE FIRST HOME OF THE ARCHI-TECTURAL MUSEUM. THE ARCHITECTURE OF THAMES-SIDE.

As it appears certain that the Architectural Museum will speedly be removed to Brompton, we have heen led to engrave a view of the ex-terior of the Imilding, or rather aggregate of buildings, in which the scheme has been nurbuildings, in which the science has been nur-tured, and the collection brought to its present size. It may be added, too, to our series illus-trative of the architecture of Thames-side, and will serve to show bow happily, in some in-stances, the most unlikely locality may be ren-dered serviceable. In a former number, we gave river of the interior and some of its walki a view of the interior, and some of its multi-farious contents. The present view will show that it is a primitive and many-gabelled build-ing of wood, similar to those which we have described, as forming a very large portion of old London hefore the Great Fire of 1666. If the picturesque block had heen situated in some foreign place, we should probably have had numerous sketches of it hy travelling artists

In the foreground of onr sketch "Father Thames" hrings up the coal-barges to con-venient piers, from which the contents of the vessels can be landed. On the right-hand side is a building with about a dozeu peaked roofs,

parpose of bringing together, for the use of stu-dents in the metropolis, casts, &c, of the choicest specimens of the carver's skill. However, as no other offered, and it being found that the nation would do notbing in the matter, it was determined by a few resolute individuals to take possession of this ark-like huilding, and bring into it those specimens of art which now so thickly occupy the long perspective of the gallery.

7

It has not been an easy matter to get the Institution recognised. Throngh perseverance and a good cause, however, the merits of the Architectural Museum have been acknowledged by the Government, and soon the Institution

by the Government, and soon the Institution will be provided with larger space and a more certain status. It is nevertheless doubtful if it will produce the same effect in its new shell that it does in the picturesque though incon-venient building we have illustrated. Amongst the recent additions to the Museum, Captain Tapper, of the Atheneum Chb, has deposited a carefully-painted set of heraldic shields of the arms of England, from William L to the present time; also a portion of a carved chinney-piece, from a house in King-street, Covent-garden. Mr. Mocatta has added to the collection a series of easts, of Greek and Roman ornament, very carefolly taken; and Mr. and Roman ornament, very carefolly taken ; and Mr. W. P. Griffith has presented to the Museum the W. P. Griffith has presented to the Museum the whole of his collection of fragments from the Temple Church, London, as well as a set of casts from St. Alban's Abbey, and some specimens taken from Roman candelabra, &c. What of space sufficient for the proper exhibition of such valuable additions, has been one of the chief difficulties of the Museum.

THE CONVENTIONALISM OF ORNAMENT. In the course of the discussion which occurred

at the close of Mr. Owen Jones's paper "On Ornament," printed in our last and previous numher, Mr. Donaldson said he concurred with the lecturer in stating that all ornament should be derived from nature, and also that in adopt so userved from some enventionalism matter ing natural forms some conventionalism must be introduced. To merely copy any leaf, for instance, in stone or marble, would he incon-gruons and unsuitable to the material. The subject efficient instance in the material. gruons and unsuitable to the material. The subject of initiation in art, in respect to paint-ing and sculpture, had been ably treated by M. Quartemere de Quincy, who showed how vulgar it was to copy literally natural objects. The highest effort of the mind, and the greatest proof of its creative power, was to he found, not in copying, but in the realization of certain not in copying, but in the realization of certain impressions in a way that should not he dif-ferent from that which nature had produced. In adapting any leaf or flower to the purpose of architectural ornament, some conventionalism must be used,-not a mere caprice, hat a good. sound, sensible, philosophical development, in order to make it answer the necessary purpose, and produce a similar impression to that of nature itself. Probably in Mr. Owen Jones's complete work this idea might be illustrated by Exprise work the late in the initial of the Egyptians, the acanthus or the parsley of the Greeks. The lotus in particular allorded great variety of form for ornamental purposes, both in the leaves, the bud, and the expanded flower; and the Egyptians had most fully availed them selves of it

Mr. G. G. Scott said the only point on which he had intended to offer a remark bad heen anti-eipated by Mr. Donaldson; namely, the con-ventionalism of foliage. This was an exces-sively difficult subject, and it was hardly possible to determine the right principle. It might however, be hoped that while each person earnestly worked in lus own course they would It might, get right in the end. The line of thought which he had himself generally followed, was based upon observing that during the Mediæva period, up to a certain point, a purely conven-tional foliage was employed. This was not nature conventionalized: it was not derived from nature at all: it was derived by insitation from the carliest periods of antiquity; from the Assyrians through the Greeks and the Eastern Romans, or later Greeks, and theore from the Byzantines and the Early Gobie artists; and this process of initiation had led to the exquibeautifully style illustrated ou the pre-occasion by the specimen from Stone ch, Kent. Mauy other specimeus of the sitely sent contran, Kent. Many other specimeus of the same era existed, which were as beautiful as conventional foliage could possibly be. In France, however, at the middle of the thirteenth century (and in England a little later, about 1280 or 1290), that conventional system century (and in Engrand a little later, about 1950 or 1990), that conventional system was abandoned, and a very direct imitation of nature was adopted; but it appeared to him that the success which attended the change was hardly such as to bear out Mr. Owen Jones's remarks. The instances of copying in the latter part of the fourteenth century were not direct imitations of nature, and were, in fact, very inferior to the earlier specimens. In the Sainte Chapelle in Paris, nature was initiated abso-lutely, and there the effect was infinitely supe-rior to the works of the latter part of the four-For for the works of the latter part of the four-teentb and fiftcenth centuries. The question, however, whether this direct imitation was equal to the earlier and purely conventional foliage, was not so easily settled. He himself thought the absolutely conventional was the best. The great point to which he wished to all attentions are that ratius meet the only call attention was, that nature was the only source from which they had a right to copy at source from which they had a right to copy at all. Beautiful as the specimen from Sione Church was (and there were thousands of examples equelly beautiful), it would be wrong to copy any of it; but if they could invent an equally conventional foliage, they would do right. Util this could be done, they should study nature, and how to conventionalize it, — e. Mr. Donudean, here and exid - whicearchicality equally conventional foliage, they would do right. Uutil this could be done, they should Architects generally specify great things, that study nature, and bow to conventionalize it,— as Mr. Donaldson had said,—philosophically. No conventionalism could be excusable for which there was not a reason. If leaves were more heautiful than any other object for orna-mental purposes they should be adbered to; ordinary moulding npside down,—aud theu all Architects generally specify great things, that the interval the readered more head more head there are the value of the there would not think of, even to the putting an mental purposes they should be adbered to; and the there are an of the there are an of the there are the there are an of the there are there are the there

but it was natural to suppose that as they were not intended for ornameuts for capitals (al-though they might suggest beautiful forms), some adaptation of them was essential to suit their forms to the place and the material in their forms to the place and the material in which they were employed, and especially to make np for the want of colour which they pos-sessed in nature, and which must always affect any imitation of them. The little lines and markings of a natural leaf were merely the result of colour, and this was necessarily represented in carving by relief, more or less promi-nent; and this mode of conventionalism formed a style by itself. Another system of conven-tionalism was that of making ornament abso-lutely flat, so as to destroy all idea of relief, both heing equally reasonable and philosophical. He thought Mr. Owen Jones's remarks a little too sweeping in speaking against the direct imitation of nature; hut he agreed most en-tirely with him in the results which he was aiming at.

BAD CEMENT CAST.WORK

MUCH has been said of late with truth npon the subject of bad plaster cast work and its chief cause, but I think there is still greater enice cause, but I think there is still greater reason to complain of the coment cast work-goodness being more important, as it is subject to influence of weather. It is not only had indeed, in appearance, but in durability, the latter heing seldom thought or eared about : this is in consequence of the builders or con-tractors getting it done in the cheapest manner, rearedless coverally of the quality frequently regardless, generally, of the quality, frequently not understanding good from bad, and the archinot understanding good room bad, and the archi-teet earnot discern the difference as regards durability: in fact, that which looks finest to the eye is frequently the worst to stand the weather, owing to the general practice of east-ing with little or no sand with the emenent, architector considerable corrige of behave and crusing a considerable saving of labour, and producing the smoothest surface, while a cheaper quality of cement can be used than if a proper quantity of sand is used : but the system of every trade being contracted for by one person, generally a earpenter by trade, or a painter, or no trade at all, so that anything fair to eve passes for good in quality, is the chief cause; — thus it is we see so many failures in the use of eement, not only in east-work, but in external work generally, for it is frequently the ease that the best *apparently* executed joh is the worst to endure; therefore, no architect or contractor knows when he is right with it. This arises out of several causes, as cheap, had cement, of which there is much sold, cemeut only in name, too little sand used, sold, cemeut only in name, too little suid used, quanity being, as I am told by journeymen, demanded by builders more than quality. Sometimes too little sand is used in ignor-ance, with the idea of greater durability. The system of sub-leiting to task-masters, so prevalent, I need not comment upon, being notorionsly bad. It requires all the vigilance of a scenarible moster plasterer who is inteof a responsible master plasterer, who is interested in the work he has to do, and will insist on every care being used to seeure good cement work; hat your last correspondent says masters of note are searce, therefore it need be no wonder that the trade of plasterer is degene-rating, for there canuot be so many apprenticed to learn their trade properly; for an apprentice to a builder is at the mercy of the men in general, and if they are a "wet lot," as too many are, he must join with them or he despised. Many call themselves plasterers now; they start up when they become overgrown hawk hoys, and pick it up as they can in the erowd, for a builder seldom knows, with a large number of meu of different trades, the abilities of one man more than another, and it is impossible for a foremau el the interest and credit at stake, to urge the care that is constantly necessary with most plasterers in the use of cement uow, like a master who cares for his reputation and bas the responsibility.

pass as certified; but dilapidations are found out when the contractor is paid, and it is too late; hut cemeut work should be guaranteed for durability.—for a man who understands his trade can do it with the cements of the present da

Perhaps I may digress a little to say that it is a pity that cemeut is used at all for east-work, as terra-cotta is to be had at little or no more expense than well executed cement, and its expense than wen exceeded cement, and its superiority and durability are well known : it is capable, too, of higb finish and hold relief, im-possible with any cement, and may be made to match with it in general appearance for the decorative parts of a building. Jas. PULHAN.

THE BUILDING ACT

THE first careful perusal of the "Metropoli-tau Building Act, 1855," suggested to me some sins hoth of omission and commission; and I could but reflect how the offences of commission aggravated the laches of omission; also bow aggivated the heates of ministage and a solution very preferable the Act would he with much of it expanged, selecting for excision those portions which were meddlesome with trifles, which were unnecessary, and which cramped the artistic unnecessary, and which cramped the artistic design and constructive skill of the architect We have now had a year's experience of the Act, and it has been my lot to note its working in divers districts, and from the somewhat pecu liar character of my practice, under a great variety of circumstances. The observation has in no degree mitigated my objections, and has in addition manifested imperfections and absurdities which I did not foresee. I am all conscious of the difficulty of making

prospective laws to meet every point in the in-finite change of shape assumed by common events. I am aware how circumstances, like events. I am aware how errennistances, like faces, are never precisely similar in all their features. The inference I draw is, that it is an error to attempt to bring about such uni-formity by legislation. The peddling spirit that would interfere hy Act of Parliament, with all the small incidents of existence, is now rampant. Individual members vigorously (with a greek horea?) their respective Illipuition "ride a cock horse" their respective lilliputian hobby; while questions of universal social im-port are left to resolve themselves.

The district surveyors are in a more or less confessed state of obfuscation, for which they are in no sort to be hlamed, because they are m no way accountable for their perplexity. The brightest intellect has the sorriest task, inasmuch as it grasps the larger quantity of incon-sistencies and contradictions with which the Act teems. To the district surveyors my ex-perience prompts me to award praise for the general intelligence and urhanity with which they perform their thankless duty; but the Act ot be earried out literally; therefore, despite all the common seuse and politeness of these officers, there exists the fatal waut of uniformity in their views, and the practitioner has to con-tend with, or yield to, each peculiar interpreta-tion. Hence arises the very usual prefatory retion. Hence arises the very usual prefatory re-mark before an opinion on any point of the Act is ventured, "Who is the district surveyor ?" This amhignity in the Act deters me now from setting forth some of the follies and grievances which have been forced on my attention, for I feel my statements and application of the clauses, would meet many assailants; and it would be indeed unreasonable to occupy your columns with a hattle of words which, from the very nature of the combat, must result in confusion. It may be said, in cases of differences of inter-Pertailon, a power of reference to the Board of Works is provided; but this, in small matters, is a vexatious, dilatory, and expensive process, and in important matters, the tribunal, to my mind, is also inadequate.

The Board of Works have likewise power to modify some of the rules of the Act; but the constitution of that Board does not inspire a helief that the wisdom of Imperial Parliament will be rendered more lucid and reasonable by

receive information and opinions by whomsoever tendered, and especially to incite the district surveyors to furbish up their intellects, and send laconic clear statements of faults in the Act; with their impression of a remedy. Let the committee weigh well the few—the very few points on which it is expedient to legislatc, and then, from the eareful digest of all their in-formation, prepare the necessary schedules as lucidly as practicable, to enforce what is expe-dient, and no more. The scheme, when mature, should be submitted for discussion and adoption by the Institute, and presented to Government. receive information and opinions by whomsoever by the Institute, and presented to Government, with a petition for the repeal of the present and the substitution of a new Act in accordance with the resolutions.

Let the Institute do this work well, and they will raise themselves in the estimation of the publie, and do good service to the State. CF

THE METROPOLITAN BUILDING ACT. OPENINGS AND RECESSES.

Your correspondent, "An Observer," with refer Your correspondent, "An Observer, with refer-ence to his observations on the stack of offices in Fenchurch-street, has made them somewhat pre-maturely, and not with that circumspection which an observer addressing a public journal should exercise; for if he will take another observation when the building is completed, and then reckou in the area of the cornic and bat portion of the substructure below the level of the ground-line not apparent to the essnal observer, he will then find that the thirteenth section of the Metropolitan Building Act has been complied with. Although in this case I am enabled to show that

Although in this case I am enabled to show that the requirements of the Act have been complied with, I entirely concur in your observations that in City buildings,—built as they are for purposes of busivess, trade, or manufacture, where every particle of light in the dark and narrow streets is of the utmost im-portance, and where, as every foot of ground attains its maximum of value, large open spaces for light are practically unattainable,—it is in some instances im-mendable distingt the activation to accord acting the its maximum of value, large open spaces for light are practically unattainable,—it is in some instances im-possible, without serious detriment, to comply strictly with the thirteenth section of the Act before referred to. EDWARD I'ANSON, Architect of the Fenchurch-street Offices.

You have inserted a communication from a cor-respondent, under the head of "The Metropolitan Building Act," which appears to reflect upon the manner in which the district surveyors perform their duties

The Building Act is, no doubt, very defective, and there are many of the regulations which it is ex-tremely difficult to enforce, but in the case referred to the "contraveution of the Aet" is so far from *clear*, that it is the opinion of many district surveyors, besides myself, that the legal effect of section 13 is only to prevent any recesses being made in a wall when the openings exceed one-half of the whole area of the wall

The words are " taken togetber," and any other The words are "taken togetter," and any other interpretation would prevent any windows being made on the upper story of a house when the whole ground story was a shop-front, and there was only one story ahore of less height than the shop. A DISTRICT SURVEYOR,

THE MAIN DRAINAGE QUESTION.

SINCE our last notice of this matter, the names of the three engineers, one military and two civil, who are appointed by Sir Benjamin Hall to consider the plan B* of the Metropolitan Hall to consider the plan B* of the Metropolitan Board of Works, to receive any other plans, and to review the whole subject preparatory to the application to Parliament for the funds, have been mentioned. They are, Captain Douglas Galton, R.E. Mr. Simpson, and Mr. Thos. E. Blackwell, of Clifton, Bristol. Of the special qualifications of the first we know little; the second has had much experience, and is now quantications of the first we know inthe; the second has had much experieuce, and is now conducting the drainage of Stockholm; and the third has a certain reputation, and is the engi-neer to the drainage commissioners for the lower level of the county of Gloncester, for which he has constructed a new ontfall in the Severu, in conjunction with Mr. Brnnel and the late Mr. Rendel. Mr. Robert Stephenson and Sir Win, Cnhitt were, we helieve, considered as already pledged to a particular conrse.

Thus, after the lapse of a year, the question is just in the same state as when it was taken np by the Metropolitan Board. No satisfactory result was to be expected from giving over such

THE BUILDER.

a subject to a body of men-very well meaning, perhaps but—hardly possessed of professional experience or the special scientific knowledge. Sir Benjamin Hall now does just that which we advised the Board to do,-he has submitted the whole case to the jndgment of two or three engineers. The gentlemen named will of conrse in communication with the Treasury Comof the communication with the Treasury Com-mission, appointed to inquire into the most effectual means of distributing the sewage of towns, and of applying it to beneficial and pro-fitable nses; and which eonsists of Lord Port-man, Messrs. H. Ker Seymer, M.P.; J. K. Brunel, Robert Rawlinson, Professor J. T. Way, Mar L. B. Larger, and D. Schuberd C. With Mr. J. B. Lawes, and Dr. Sonthwood Smith. The sneecess of the lime process of conversion, as noticed in our last number but one, has been least such as lends great importance to this hrauch of the question, which was very in-adequately attended to by the Metropolitan Board. The plans of the 150 cr more engineers who were induced to soul in their projects to the first Metropolitan Commission of Sewers, will perhaps be brought forth, and for which noue of the number have yet received any reward.

The pnrification of the river cannot he con sidered as complete till the same process of di-version or conversion which is adopted for Loudon is applied in the case of towns ou the upper part of the river, where the new system of sewerage has not always avoided the substitution of one evil for aucher. Some reference has already heen made to this question at the Board, as also to the provision of sub-ways.

A PARK FOR SOUTHWARK.

CONSIDERING the unhealthful pre-eminence of the south side of the metropolis, and especially of Bermoudsey and adjoining districts of South wark, there is no quarter of the metropolitan bounds which can urge such strong elains to the immediate formation of a park in which something like vital power to resist the debili-tating ageneies peculiar to the district may be inhaled by the chousands who inhabit its tecming and pent-up courts and lanes. The vestry of Bermondsey have shown that in this excel lent canse they have at heart the good of their hrethren, as well as their own, inas humbler much as they some time since caused their surveyor, Mr. George Elkington, to prepare a plan of an available site for a park within a mile-and-a-half of Loudon-bridge, and therefore easily accessible to the densely-populated districts in the parish of St. Saviour, St. Olave, tricts in the parish of *zt.* Saviour, *St.* Olave, *St.* John, *St.* George, and Bermondsey, lying between it and London-bridge; and within a mile of the populous parts of *F* otherbithe, and hy means of the Thanes Tunuel easily accessible even to the parishes on the north bank of the Thanes. This site is at present principally occupied by market gardeners, and may there-fore now be purchased at moderate cost, although shortly, as buildings increase in the parish, it will become valuable as building land. Having had the blan printed, the vestry

Having had the plan printed, the yestry eansed an application to be made to Sir B. Hall for aid from the Cousolidated Fund to carry out the object in view. Sir Benjanin expressed a strong opinion as to the desirableness of some such large open space as that suggested but such large open space as that suggested, but stated that the Commons would be certain to refuse any sum from the Consolidated Fund even for this purpose, and requested the vestry to lay the matter hefore the Metropolitan Board of Works, who had power to deal with it. This the vestry have done, and we rejoice to

learn that their plan is now under the careful eonsideration of the Board, and that the ehairman, Mr. Thwaites, with other members, have personally inspected the land proposed to be purchased for the public. They were also, we helieve, about to view the intended Finsbury-park and Hampstead; and, at a period when the subject of open spaces for public recreation is about to be discussed, the advocacy of the *Builder* shall not he discussed, the advocacy negative pleading for the interests of the working population.

At present there is no open space appropriated for the public use within the sonth-eastern district; and as the site shown in the plan has heen selected hy the vestry as the nearest avail-

able spot to the most crowded localities in the Borough, we earnestly hope that all interested will, if possible, unite with one accord in insist ing on its speedy conversion into a park for Southwark.

PROVINCIAL NEWS.

Norwich.-The guardians appear to be in no hnrry to carry ont the adopted designs for the new workhouse (those of "Humanitas"), and it is even hinted that the execution of the works is to be postponed for the present. This, how-ever, appears improbable. The new free library building is very nearly ready for opening, great progress having been made lately with the interior fittings.

Morville (Bridgnorth),-New schools have been lately erected in Morville. They stand on a pirce of ground to the right of the road from Bridgnorth, nearly opposite Morville Hall, and are built of stone in the Early English style. The architeet was Mr. R. Griffiths, of Quatford. The huilding comprises a selool-room, accom-modating about seventy boys and girls, and a residence for the master and mistress. The ground on which the bullding stands, as well as the stone of which it is composed, were given hy Sir John Acton, of Aldenham. The school is intended to accommedate the children the three parishes of Acton, Morville, and Round Acton. Since the opening the number of scholars has amounted to seventy, so that, in fact, there already is no room for more. in fact, there already is no room for more. Industrial training is to be practised, and a piece of land at the side of the schools is to be laid out in allotments of 5 yards by 4, for purposes of gardening. The profit realized hy this kind of industrial employment will be given

to the scholars as prizes. West Bromwich.—It has been resolved by the local Commissioners to advertise for a site on which to erect a new market-place.

Liverpool .- Mr. Milner baving added, to his already extensive safe-works at Windsor, a large hall 100 feet square, called the Phœnix-hall, the new huilding was inaugurated on Friday last, when the proprietor, several of his friends, and when the proprietor, several of his friends, and 350 of his workmen, together with their wives and sweethearts, took tea together. In all about 800 sat down, in the light safe department, which is on the third floor of the hall. The extension of the works of the New Phomix-hall as described in the local Lowed consists of hall, as described in the local Journal, consists of three stories, about 100 feet square cach, and the height of the floor is from 14 to 16 feet, but the area will be doubled when another contem-plated addition is effected. The gable of the principal front is summonited with a pheuix, and there is provision made for a clock tower, which is not yet creeted. Attention has been paid to light, ventilation, and the comforts and conveniences of the workmen. The has been erected in three months: The huilding Messrs Jones and Jump were the eoutractors. machinery to he creeted in this hall embraces every appliance for carrying out the manufacture of Messrs. Milner's safes, and in it 350 work-men can pursue their calling with case.

CHURCH-BUILDING NEWS.

Stowmarket .- The chapels in the new cem tery at this place, were completed ou the 20th ult. The design is Early English, and the materials used are red and black brieks, with The roofs are covered with green cut flints. Bangor slates, and ornamental ridge tiles. windows are glazed with eathedral glass. The All windows are gnaced with is stained oak, and var-nished. The roofs are plastered hetween the rafters, and tinted a slight blue. The contractor for the works was Mr. Suith, of Ruttlesden; and the architect, Mr. Edwin G. Pennington, of London.

Halesworth -- The parish church of Holton, enlarged. The enlargement consists of a north aisle, the length of the nave and nearly half that asse, he refigue of the new and nearly that that of the chancel. In the restoration, the south wall, eastern jambs, areh gable, and south arch, were nearly rebuilt, and the roofs re-framed. The interior has been fitted up with new henches, the aisle floors had with small red-and-buff tiles, and the pulpit, desk, vestry, screens, and doors, executed in oak, with iron-work. A small artistic window, executed by Heaton and Butler, of London, bas heen fixed in the west side of the tower, open to the church, through the western archway. The chancel has also heen improved, the walls plas-tered with stone copings, new floor, benehes, and altar rail. The entire works were carried out by Mr. J. M. Hakewell, of London, furnished by Mr. J. H. Hakewell, of London, architect.

Newport (Isle of Wight).—The monument to the memory of the daughter of Charles 1. which the Queen commissioned Baron Marochetti to the Diverse commissioned Baron Marochetti to execute, has just heen erected in St. Thomas's Church, Newport, where the Princess, who died in captivity at Carisbrook Castle, lies buried. The monument represents the figure of a youth-ful woman, reclining in a recess, resembling the cell of a prison. The pillow ou which the head of the figure rests is an open Bible, in which can be seen the following words:—"Cone unto me, all yet that are weary and heavy laden, and I will give you rest.", The following inscription is on the monument, viz.;—"To the memory of the Princess Elizabeth, dangitter of King Charles I, who died at Carisbrook Castle, on Sunday, Sept. S, 1650, and is interred beneath the chancel of this church. This monument is creeted, as a token of respect for her virtues and of sympathy for her sufferings, by Victoria, R. of sympathy for her sufferings, by Victoria, R. 1856." The figure of the Princess is of white marble. The recess or cell is of Caen stone.

Worcester .--A monumental slab is shortly to be placed in the eathcdral here, to the memory of members of the St. John family. It is of be placed in the esthedral here, to the memory of members of the St. John family. It is of black marble, inlaid with brass, and is 7 fect 6 inches high by 3 fect 9 inches wide. The centre represent's a floriated eross, on Mount Calvary, and on either side are the arms of the late Canon St. John and his wife. The emblems of the four Evangelists are wrought in the angles of the slab. Messrs. Hardman and Co. of Birmingham, excented this memorial under the direction of Mr. Perkins, the architect of the Dean and Chapter. When the new east window has heen completed, the slah will be laid flat on the floor in the Lady Chapel, above the graves of Canon and Mrs. St. John. *Wimborne.*—The minster, to which we lately made a hrief allusion, is, it seems, about to

Windowne.—The muster, to which we lately made a brief allusion, is, it seems, about to undergo a complete restoration. The chancel and its uisles having recently been repaired, under the superintendence of Mr. W yut, at a cost of 5,000L raised on the titles, the necessity of restoring the remainder of the edifice has be-come more apparent. Mr: E. G. Banks, Sir R. P. Glym, Mr. W. Digly; the Earl of Shaftesbury, and other leading nersons of the county of Given, Mr. W. Digly, the Earl of Shaftesbury, and other leading persons of the county of Dorset and vicinity, have offered their aid, and it is fully expected that the work will rapidly progress

Bristol .- A new church is about to be hnilt in this city, chiefly for the accommodation of mariners; at the cost of the Rev. R. H. W. Miles, son of the late Mr. P. Miles, of Leighcourt

Morville .- The church of Morville. Bridgnorth, has been reopened, after having heen under repair since June last, during which time service has been carried on in the chancel. The roof of the nave has been raised to the old pitch, and a clerestory, with three triplet-pointed windows, added. The gable is coped with Westwood stone, and terminated by an ornamental stone cross. The south wall of the ornamental stone cross. The south wall of t church has been recased, and the windows ag inserted. A new porch has been added on the south side. The roof of this porch is in open timber work, and the floor is laid with encaustic tides. There is an old Norman entrance from this porch, and the timber which disfigured the program the phone moved the covider and upper part has been removed, the capitals and columns eleaned up, and a new stone arch filled iu. The interior of the ehurch consists of a nave, two side aisles, and a commodious chancel. The architecture is of au unusual character. The nave is separated from the aisles by high The nave is separated from the aisles by high Society of Glass Pauters, in monory of his son, better the structure of the song matrix of the song

ashlar, a course of brickwork directly surroundashlar, a course of brickwork unceuty surveying ing the arch has come to light, which gives an unusual effect. The nave had formerly a flat ordinary ceiling at a level with the top of the nave arches; hut this has been removed, and a high peaked roof substituted, showing the conhigh peaked roof substituted, showing the con-struction timber, the trusses having arched ribs carried on moulded stone corbels. The chancel was re-roofed about two years ago (at the joint expense of Lord Sudeley and the Rev. G. L. Waysey, the incumhent) with open timher work, but of rather later date than that of the uave. The chancel is lighted with plain perpendicular windows. The floor within the communion rails is slichtly varised, and haid with varished is slightly raised, and laid with varnished encaustic tiles. There is also a wainscoting of panelled oak.

West Bromwich .- The money requisite for a new cometery and chapels (not to exceed 7,000*l*.) is to be borrowed by the local commissioners, who have fixed upon a site for the same of eight acre

Doncaster .--- The parish church building committee, at a conference held at the Mansion House, have pointed out to the town council that they have paid to the contractors for work The they have paid to the contractors for work done, the sum of 20,446, with the further liability of 6,525, making a total of 26,971. The subscriptions amount to 29,2014; leaving a probable halance in hand of 1,229. The estimated cost of the final completion of the burght is an additional sum of 10,749. Contract cost in the number of 10,749.; making a total amount of 37,720. So that a further sum of 8,519. is now required. It will be found, says the local *Gazette* in allu-It will be found, says the local Greatle in allu-sion to these figures, that the burgesses and the inhabitants generally will be almost unanimous in their opinion that the tower should be thuilt forthwith. We, therefore, it adds, confidently trust that the means will be shortly preserved for at once completing the edifice, firmly believ

for af once completing the editice, itruly neuv-ing that the funds of the town council, under these unprecedented circumstances, cannot be devoted to a more useful or hetter purpose. *Wigan*.—The local burial board has found it necessary to horrow another 1,5000, in order to complete the new cemetery. The sum previously horrowed was 14,6002. The preliminary ex-manses had and transite commensation amounted complete the new concretion. The preliminary ex-corrowed was 14,000*l*. The preliminary ex-conses, land, and tenants' compensation amounted to 3,950% and there have been paid on account of contracts, architect's and surveyor's commisor contracts, arcmutet s and surveyor s commis-sions, laying out and planning, &c. 9,667. The balance due on the contract for chapels and other work is 1,1167, commissions and charges for plans, &c. by architect and surveyor, 4007.

Buckie .- The new chapel for the accommoda Backic.—The new chapel for the accommoda-tion of the Roman Catholic congregation here is heing pushed towards completion. The interior has of late heen fitted up ; the chaucel, in par-ticular, is heing finished. On either side of the altar appear what are intended to he highly-finished copies in oil of the Nativity, of Christ Stilling the Tempest, of the Taking Down from the Cross, and of the Resurrection. These are nearly 20 feet high. The artist who is painting these is a Mr. Russell.

STAINED GLASS.

Portsea .- The north window of the transept of the church of the Holy Trinity, Portsea, has be the children of the flow ranky, foreset, has been filled with stained glass, to the memory of the late incumbent, the Rev. Richard John Scobell Valentine, M.A. The window contains four subjects from the New Testament. The artists were Messrs. Walles, of Newcastle. Springfield (Chelmsford). — The churches in

Springfield (Chelmsford). — The churches in Springfield have just received some offerings. A memorial three-light window, executed by Messrs Powell, has been creeted ou the north side of the nave of the parish church, placed there by Mr. Wyndham Holgate and his sisters, in memory of their mother. At Trinity Chapel a tribute of respect and sympathy has been paid to the Rev. G. B. Hamilton and his family, in the shape of a window placed there by the sub-scription of friends, aided by the Amateur Society of Glass Painters, in momory of his son, who last year lost his life in the wreek of the

saint, viz. — "The journey into Bethlehem," "St. Joseph with the infant Christ in his arms," "The journey into Egypt," "The dis-putation in the Temple," "Christ in Nazareth, subject to his parents," and "The death of St. Joseph." Choirs of angels are introduced in the heads of the lights, bearing texts. The tracery lights are filled with emblematical foliated ornaments and scrolls. The window was designed and executed by Messrs. Filking-ton, of St. Helen's, Lancashire. . Oldham.—In the new Lyceum building, lately opened, is a stained-glass window, consisting of one large central plate (of ahout 40 superficial feet), with allegoried group of Science, Art, and Literature, treated in monochrome, producing the effect of basso-relievo. Above and helow are two smaller plates; the upper principally com-posed of appropriate ornament, the lower also ornamental, but additionallyinelosing the "arms" of the town. There are also a series of plates surrounding the three thus mentioued, forming surrounding the three thus mentioued, forming an ornamental border or setting thereto. The ole were designed and executed by Messrs. Pilkington.

While were espinetr and electrical by Arcons Littlington '(Warnickskire).—In Littlingtor Church, Mr. Holland, of Warwick, has put up a staiued-glass cast window, in the Decorated style, containing the following subjects, namely. the Baptism, Last Supper, and Cruefixion of our Lord, under canopies, with the figures of the-twelve apostles. In a small side window is the figure of our Saviour, as the good shepherd, supported by St. Peter and St. Paul, with appro-priate enblems; also a single light, containing the subject—our Saviour appearing to Mary Magdalen, to whom the clurch is dedicated. *Various.*—Mr. Holland bas also put up painted windows in the following churches:— In Brotherton Church, Yorkshire, dedicated to the memory of William and Arabella Ramsden; at North Minums, Hertfordshire, to the memory of Harriet and Richard Gould; at St. Mary's: Church, Lancaster, to the memory of Joseph

Church, Lancaster, to the memory of Joseph Dockray; a stained-glass memorial window in North Kilworth Church; a stained-glass east window, containing the principal subjects in the life of Christ, in Addingham Church, Yorksbire; and a stained glass window in the church of St. Denys, Sleaford, Lincolnshire, to the memory of Henrietta Banks, of Hicklington, near Sleaford.

THE GALLERY OF THE BANK OF FRANCE.

RUE DE LA VRILLIERE, PARIS.

THE Hôtel de la Vrillière was huilt by François Mansart, in 1620, and restored in a

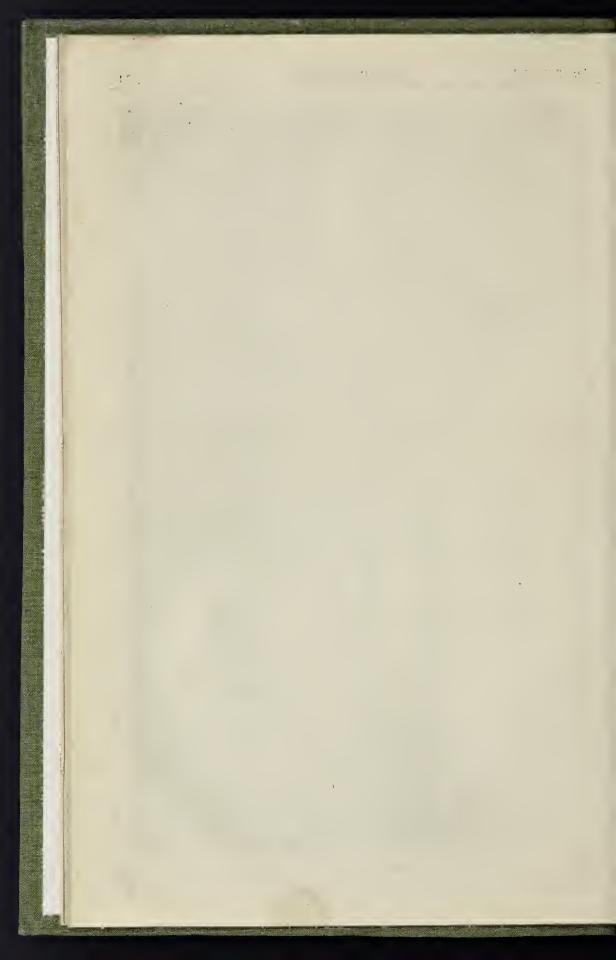

François Mansart, in 1620, and restored in a splendid manner, in 1719, by Robert de Cotte. François was the uncle of Jules Hardouin Man-sart, who built the dome of the *Intalides*, in Paris. François is mentioned with great com-mendation by Quatremère de Quiuey, in his Memoir of Jules Hardouin. After the Duke de la Vrillière, the Count de Toulouse, brother of the Duke du Maine, and son, like him, of Madame de Montespan and Louis XIV. inhabited this hotel, which took his name, and remained in his family until the resci-lution of 1759. At that epoch it was the resi-dence of his son, the Duke de Penthievre, and of his daughter, the beautiful and unfortunate Priucess de Lamballe, who withdrew to he near her father on the death of her hushand. Florian her father on the death of her hushand. Florian also iuhahited this hotel, aud composed many of his fables beneath its elaborate ceilings

The gallery, the only portion that has not undergone change, is a superh specimen of the magnificence of the interiors of that age. How-ever much we may miss the admirable hangings, screens, and furniture, which made up the deco-rative whole of this gallery, an idea may be formed, from our engraving, of the effect the

richness of its decorations must have produced. In 1812 the Bank of France gave up the Hôtel Massiae, and took possession of this In Fig. the bank of France give up the Hôtel Massiae, and took possession of this structure, which, since that period, has been considerably increased in size. It is in the gallery here represented by us that the Bank bolds its meetings.

THE BUILDER.

FOREIGN INTELLIGENCE

"Leonard de Vinci et son Ecole." Par A. F. to. 'Paris, 1855.—M. Rio is an art-historian Rio. advantageously known hy the seriousness of his observations, and the wide bearing of his views. observations, and the wide bearing of his views. The present work forms the second volume of his "*drt Chrélien.*" There are persons who ascribe to Leonardo the highest pitch of general information and inventiveness, and M. Rio com-pares him with Schelling, and states that he had, a bundred years hefore Bacon, uttered some of the finear bulkerschipe of the Euclide score a bundred years hefore bacon, uterou some-the finest philosophies of the English sage. His practical skill was of equal extent, and thus he could write *maïvely* to Lodovigo il Moro, in Milan,—"I can execute any sculpture in clay, Milan,—"I can execute any sculpture in clay. marble, and bronze; and every painting like any one, whoever he may he." At the same time one, whoever he may he." At the same time he offers his services as a military engineer and inventor of new war-machines, and as a hydraulic architect : later he undertakes the construction of large churches. On the top of all his acquirements come his thorough knowledge of mathements come ins increased in writing, hy which also matics and his case in writing, hy which also he became the founder of a great school of painters. Leonardo da Vinci's literary MSS, and designs lie untowched (/) in the Paris library, and M. Rio does not much enter on them, without does he day arise in fourment to Leonardow neither does he do so in reference to Leonardo's nother does he do so in reference to Leonardo's engineering and architectural labours. On the unmatched Last Supper of Mikan new light is thrown, and the similar pictures hy Ghiotto, Raffaelle, in St. Onofrio, and Florence, where, also, in the refectory of St. Marco, the same subject is painted hy the haud of Ghirlandajo. In this pice, we way state, that the original subject is painted by the hand of criminancago. In this place, we may state, that the original sketcbes of the heads of the apostles, by Leonardo, arc in possession of the present Grand Duchess of Saxe Weimar, prohably directed thither by Goethe. Leonardo da Vinci was one of the few men who could *afford* to be was one of the law men who could apprect to be universal, without merging into superficiality. It was the pupils of Da Vinci who, for a while, stayed that decay of the art of painting, which those of Raffaelle and Michelangelo could be in the stayed that decay of the art of painting, one on the same subject by M. Passavant, in Frankfort, who possesses the richest materials on the old Milanese masters.

Transylvania. - National Museum. establishing of a sinilar institution has been broached before, but the present plan is one much improved, as it comprises an *ensemble* of literary, historical, archaeological, and natural collections and activity. The chief inducement was the late Count Kemenyi, who left his whole collection to his fatherland, and Count Miko presented his summer palace, near Clausenhurg for the same purpose.

The Winckelmann Festical, Bonn.—This yearly celebration took place on the 9th ult. Professor Welcker spoke of the merits of Winckelmann in connection with his great contemporary Goethe. He then gave a description of two mural paintings in the Ternite collection-one representing ings in the Ternite collection—one representing a famished father nurtured hy the breasts of his daughter. Professor Jahn showed representa-tions of other wall-paintings of a Columbarium of the Villa Pamphili, Rome, which affords some new information on the public and private life of the Romans. M. Frendenberg spoke of the bed of the Rhine as a source of archeo-logical specimens, and stated that on occasion of a late dragging for a new quay huilding near Bonn, many valuable specimens were found to a late of form 5.4% for the amongst them a of a late dragging for a new quay building near Bonn, many valuable specimens were found at a depth of from 5 to 7 feet; amongst them a nnique specimen of a *Gladius Hispanicus*, the blade being 22 inches in length and 2 inches in width, and the handle 7[±]/₂ inches in length. The next number of the "Transactions of the *Verein*" will contain engravings of the most interesting of these Blunched transmitter of these Rhiue-hed trouvailles.

Egypt .- Public Works .- As the telegraphic line betweeu Sardiuia and Africa seems imp ticable, on account of the great depth of the sea, one from Candia to Alexandria is now consuch one from Cambra to Hexandra's how con-templated. In the interior of Egypt, the lines from Rosetta and Damiette to Alexandria and Suez, and that from Cairo to Upper Egypt, are in progress. The contract for an iron malway-bridge across the Rosetta arm of the Nile, near Kafr Laiss, has heen entered into. It is to be 40 feat head with two lines of with head 40 feet broad, with two lines of rails, heside two tram-roads for camels. The income of the railroad from Alexandria to Cairo is most

on i

Munich: Collection of Vases .- It has been long regretted, that the collection of painted vases given hy King Ludwig to the Pinakotheka did not produce its adequate advantages, either to art-study or art-practice, for want of a proper catalogue. This has been remedied of late by Professor Otto Jahn, whose work, hesides a de-tailed description of the single specimens, contains an introduction of some extent (246 pages) where not only the history of this department of art is treated with great acumen, but also the place assigned which the vase painting of the ncients occupies in the whole economy of art. The Wittelsbach Museum.-King Max. has

endeavoured to add to the many art-collections of the Bavarian capital, one hearing on the his-tory of his own family, hut which has heen lately enlarged into one of *Bavarian national anti*into one of Bavarian national anti-A number of specimens have thus hequities. quitties. A number of specimens never the ne-come collected, amougst which are basso-relievos of Ludwig the Bearded, found at Kufstein, a sculpture of the famous Altenhof church, repre-senting Emperor Ludwig and his wife. The sculpture of the tallous Attendor entrol, repre-senting Emperor Ludwig and his wife. The collection of seals is very considerable, and it is intended that hy the multiplication of casts, the now almost exploded at of the die-sinker may be somewhat revived.

THE STRENGTH OF WROUGHT AND CAST IRON

INSTITUTION OF CIVIL ENGINEERS

We have already mentioned that on the 9th of December, a paper "On the Laws of the Strength of Wrought and Cast Iron," hy Mr. William Bell, was read.

In this paper, it was stated that the chief point had In this paper, it was stated that the chief point had been the consideration of the longitudinal, as compared with the transverse, strength of wrongbt and cast iron. For this purpose the whole of the experiments made up to the present time, on tearing asunder, or crushing, bars of cast iron, and those made by break-ing hars transversely, had heen taken, and from them, and the known formulae of elasticity, such values of the constants in the formula bad heen dedaced, as used active neglection of the stream of the transversely. the constants in the formation of a new data and a secondary would satisfy each experiment individually. And by comparison a general view of the accordance or non-accordance of theory with experiment bad been obtained, and some general laws arrived at.

The mathematical theory of elasticity, as given by Poisson and Navier, was assumed. By finding, for each experimental beam, the centre of gravity of the area of cross section, through which, according to this theory, the neutral axis passed, and calculating the moment of the forces with respect to this axis, the application of the formulæ to the experiments was easily made.

The first constant obtained, was the weight per uare inch of the modulus of elasticity, and this, squarc when deduced from the transverse strain, was taken from the deflexions produced by small weights, and in from the deflexions produced by small weights, and in all cases where the beam, or bar, was very little strained. For wrought iron, the most comparable experiments were considered to be those detailed in the "Iron Commissioners' Report," which gave, by transverse strain, from 12,200 tons to 12,750 tons per square inch, and by extension of bars, from 12,200 tons to 12,900 tons per square inch. For east iron the averages of Low Moor, Blaenavon, and Gartsherrie irons were, from tension 6,305 tons, from compression 5,698 tons, and from transverse strain 5,968 tons per scanare inch. Other experiments on the transverse square inch. Other experiments on the transv spane held. Other experiments on the transverse strain of wronght iron gave from 9,000 to 14,000tons per square inch; whilst with cast iron the results were found to vary from 4,000 to 8,000 tons. On this point, it was stated, that Mr. W. H. Barlow, F.R.S. in some experiments on the neutral axis, recently laid before the Royal Society, found results nearly agreeing with the higher number.

Another mode of arriving at the value of the modulus Another mode of arriving at the value or toe monutus of elasticity, by means of the heading or irraking weight of "long pillars," was also examined; the ratios of the lengths of the pillars to their diameters being taken as abscissæ, and the bending weights, obtained both from theory and experiment, as onti-nates. It was thus found that, for the experiments are superiment in a pillar irres in the force mentioned on wrought-iron pillars, given in the before-mentioned Report, the curve of theory agreed very well with the euror of observation, until the length became sborter than 70 times the tbickness. The experiments on cast-iron pillars examined were those in the second volume of "Tredgold on Cast Iron." The correspondcommo of theory was very good for those with the ends rounded, until the length hecame shorter than 20 times the diameter; and for those with the ends flat, until the length became shorter than 50 times

concerned. One constant obtained was the value in tons per square incb of the tension and compression of the outside particles, when the beam hecame ruptured by trausverse strain. For wrought iron the experiments on solid iron bars were fewer than could be wished, and gave results varying between 144 and 184 tons per square inch. In this material it was thought that it might probably be the compressive, rather than the tensile, force which determined the fracture. The only experiments on the direct compression of only experiments on the direct compression of wrongbt iron were those on two hars, given in the Iron Commissioners' Report, where one gave way under a strain of 14.5 tons, the other under 13.8 tons per square incb. The quality of iron was not stated, hut it was helieved to have been soft. It was asserted that the better kinds of wrought iron were able to sustain a greater tensile force, the worse kinds a greater compressive force. According to Mr. Eaton Hodgkinson's experiments, wrongbt iron might be de-Hodgkinson's experiments, wrongbt irron might be de-fund to have its tensile to its compressive force nearly in a ratio of equality; cast irron to have those forces in a ratio of about 1 to 6. This being so, it was thought worthy of consideration, whether in the plates of a large wrought-iron bridge subjected to compression, a slightly inferior quality of iron might be used, not only as more economical but as better in itself. itself.

With regard to riveted iron, the results from all the With regard to riveted iron, the results from an tag wronght-iron these in the hefore mentioned report, gave from 7.1 to 24.8 tons per square incb. The lower numbers were apparently caused by using thin plates for tubes of comparatively large diameter. If this were avoided, it was thought that in calculating the strength of wrought-iron tubes, 15 tons per square might he allowed for the breaking force on the outside particles.

When the experiments on cast-iron were examined in this manner, the following fact became apparent : experiments on small bars broken transversely gave results of 20 tons, and even more, for the tension and compression of the outside particles, when the experi-ments were examined by the ordinary theory. If these results were diminished by 20 per cent. which it appeared would more than make up the difference caused by assuming the ordinary taw, there was still appeared would more than make up the difference caused by assuming the ordinary law, there was still a result of, say 16 tons, while by direct experiments on the tensile force of cast iron, 7 or 8 tons was found to be the attnost that it would bear. In regard to this subject, Mr. W. H. Barlow had alinded to the alternative hypothesis that the neutral axis shifted its position as the beam hecame strained, and that when rupture took place the neutral axis was "at, or above, the top of the bear." This hypothesis was con-sidered by the author to the contrary to the clementary principles of mechanics; for as the sum of the com-pressive forces on one side of the axis must be equal to the sum of the tensile forces on the other, therefore the sum of the tensile forces on the other, there fore if there were tensions on one side of the axis, there must be an area out of which to get compressions sufficient to balance them on the other.

In experiments on the direct tensile strength, it was assumed that the outward force was uniformly was assumed that the outward force was uniformly distributed over the area of the bar; in other words, that the resultant of the external forces acting on the bar passed through, and had the same direc-tion with, the axis. This probably obtained in wrongbt iron from its great extensibility before rupture; but in east iron there was no such extensibility, and this point was, therefore, to some extent, doubtful. If a for experiments were made in which the If a few experiments were made, in which the force deviated from the axis by certain large and measurable amounts, and then were made to approach the axis, until some law was obtained which could be tested, this point would be set at rest. A table was then given, showing the values of the forces on the outthen given, showing the values of the infects on the out-side particles at the time of rupture, in tons per square inch, from which it appeared that there was a diminn-tion as the size of the beams increased. Beams 3 inches by 3 inches, as compared with those of 1 inch by 1 iuch, showed a falling off of strength to the extent of about 4 tons per square inch. The results derived from Mr. Hodgkinson's and Mr. T. Oblithe arcmetiments care about 10 tons per supre-Cubitt's experiments gave about 10 tons per square incb, when the sound beams only of the latter experi-menter were included in the calculation, or 9 6 tons menter were included in the calculation, or 90 tolls per square inch when the ansound beams were taken into account. From this table it appeared, that the hreaking weight of tolerably large girders might be calculated with considerable accuracy, by using 7 or 8 tons per square inch as the force of termin on the outside particles, when rupture took place.

In conclusion the anthor expressed the hope that

he had succeeded in establishing the following propo-

sitions st. That in experiments where the materials were slightly strained, theory and experiment coin-1st. cided.

ended. 2nd. That where the ordinary theory was applied to the rupture of heams, and especially large beams, of wronght iron, theory and experiment practically coincided.

3rd. That there appeared to be no good reason for supposing that the neutral axis shifted its position, to any extent worth noticing, even up to the time of

any extent worth notenes, fracture. 4th. That in cast iron, although theory seemed to 4th. That in cast iron, when the transverse strength 4th. That in east iron, although theory seemed to differ from experiment, when the transverse strength of small bars was compared with the direct tensile strength, assuming the latter to be correctly stated at 7 or 8 tons per square inch, yet when the transverse strength of large zirders was compared with the direct tensile strength, the concidence of theory and exper-ment was nearly exact. 5th. That the ordinary theory of the strength of materials was more trustworthy than was generally summed.

supposed.

COMPOSITION OF ORNAMENT: ANGLES IN NATURE.

I AM glad to see Mr. Owen Jones's very able I Ar glad to see Mr. Owen Jones's very able beture, on the composition of ornament, given in your pages; but at the same time I cannot egree with him entirely, and there is one point more especially, which I cannot help noticing. He states that, "All junctions of curved lines with curved, or of curved lines with straight, should be tangential to each other;" that this is a natural law, and "that in the whole range of vegetable productions; it will be impossible to find a line hutting on another line."*

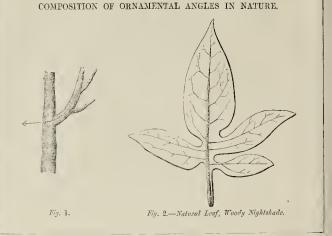

to find a line hutting on another line.""" Now, I have studied nature pretty closely for many years, and in all my observations I have found, on the contrary, vegetation to be full of angles, butting lines, and enves directly op-posed to the tangential, and instead of nature "abborting an angle," she literally appears to revel in augles. She even condescends to use the right angle, which perhaps may be con-sidered the least beautiful of all angles. The ferms grow by forking in angles, and the leaflets are usually at an angle with the stem, often at right angles. The mistletoe grows by forking, with the herries growing in the angles : the terminal leaves are curved, and opposed to the tangential.

the terminal leaves are curved, and opposed to the tangential. The common poplar grows with its branches opposed to the tangential, that is, the branch issues with a curve from the parent stem in such a manner, that if the curve were con-tinued it would directly cross the stem. And, further, the branches issue one out of the other so constantly in this manner, as to form curves issuing from curves opposed to the tangential. (See fig. 1.) (See fig. 1.)

(See fig. 1.) It is also common in many other trees and plants hesides the poplar, as in the horse chest-nut, where the brauches issue in pairs, and at the top of the tree may be seen forming nearly an inverted semicircle across the centre stem. The leaf hnd issues from the axilla or angle, formed by the branch, and the contrary entre is for the cryptes nutrose of civing room for the

The leaf hild issues from the axilla or angle, formed by the branch, and the contrary curve is for the express purpose of giving room for the leaf bud to expand and grow. The branches of the clm and oak, besides smary others, all issue in angles, and at this time of the year may be dis-tinety seen, and I imagine require only to be mentioned to be recognised. In the accaic the leaflets, which are arranged in pairs, with one terminal one, often issue at right angles to the centre stem. In the reticu-lation of leaves it is more common still. An-nexed is a tracing from a natural leaf of the woody nightshade, in which, from the main rik which runs up the centre, issue ribs at right angles, which run into the side lobes, and in the upper part of the leaf small rihs issue from the centre in curves opposed to the tan-gential; and so often is this the case, in leaves, that it would almost appear that the tangential is the exception. (See fig. 2.) I shall probably be told that there are still minate curves which join these angular lines to "When the part of the leaf small rike stage of the stage stage of the reserves which is the case in leaves.

• When the paper was read, Mr. PARION tool the same objection to the remark, and the leaturer in explanation replied that he only intended to say that Nature abhored an anale, not Me angular. However angular the leading lines of any natural production midtle be, there was always a curve at their point of junction. Modern artistic too often forget the curve, and jut the ungle instead. -ER.

the parent stem : in some cases this is so, but in many cases, in the leaf I have sent you, for instance, I cannot detect it even with the aid of a powerful magnifying glass. Now, this angular manner and opposition to the tangential, should be taken advantage of in art; and if it were, I do not doubt but that, being in accordance with nature's laws, we should find in it another element of the beau-tiful; while, if we confine ourselves, as has tiful; while, if we confine ourselves, as has hitherto been done, to the strictly flowing and tangential lines, we shall probably never get bey oud the heaten track.

In one of my own designs for ornament, which I exhibited at a lecture,* I gave last year at the Architectural Museum, I formed the at the Architectural Muscum, I formed the hranching, or leading lines in the foliage, in an angular manner, concealing the junctions of the stems with stipule, as in nature, and I have since put the principle into practice in several cases, with (according to my own opinion) a good deal of success. There is one great fault in the classical com-positions of ornament of the present day, which is entirely opposed to natural laws. I should have liked to have seen this particularly noticed by Wr. Jones: it is the constant practice of

have liked to have seen this particularly holdcal by Mr. Jones: it is the constant practice of making folinge grow two ways. There is a large lamp hracket now in the Architectural Exhi-bition, with au animal balancing a lamp ou its head, and with its tail twisted round the scroll, in which the folinge is made to grow two ways twice in the same scroll. This practice is such a violation of nature, that it cannot he too strongly condemned. JAMES K. COLLING. strongly condemned.

THE STAGE AN INSTRUCTOR IN ART.

We have some early impressions which are as fixed in the memory now as if the matters had happened vesterday, and the most vivid of these are—the first sight of a great English or these are—the first signed of a great balging eathedral; the first peep of the sea from a rocky coast; a glimpse at a glorious picture by Vandyke, in an aneient hall; and the first visit to the theatre, fitted with what seemed magical views, enlivened by actors in sparkling costume. The name of the play has goue out of memory, and yet we could sketch the wood scene, the ancient castle, the garden walk and wrought-iron gates, the cottage, mill, and stream; the daugeon-like interior, in which were stream; the daugeon-like interoot, in which were grim iron bars and massive clamps and chains, and a room of the fashion of thirty years ago. No doubt there were many discrepancies in the dates and styles of things, and that the same castle represented the keep in "Macbeth" and that which belonged to the libertine marquis in the play of 1790. It was all one then. Neither the value of theses of costume nor of pic-torial representations was generally feld. The torial representations was generally felt. Fine

* On form, light, and shade in architectural foliage, and given in the Builder, vol. xili, p. 620.

prints were not then to be seen in every shop-window, and the *Penny Magazine* and cheap yet carefully illustrated histories had not fallen into the hands of the rising generation. There were no exhibition of pictures in the pro-vinces, no schools of art, so that to thousands

These were a schools of art, so that is the pro-vinces, no schools of art, so that to thousands the only pictures of any merit at all were those which were presented upon the stage. Owing to various causes, so great has been the spread of information, that at the present day there are few who visit the boxes and pits of the hefter theatres, who have not a strong notion that the accessories of a play (the scenery, dresses, and music) ought to be correct and in keeping with the time and place portrayed. The day was when Garrick played all characters in a dress-wig and laced coat, and our painters painted, in subjects connected with modern English history, the figures dressed in Roman and other classical costume. If the best actor at present in existence were to attempt what Garrick did, he would surely he hooted off the stage by the most ignorant in the theatre. Long after Shakspeare's time, it was from the

stage by the most ignorant in the theatre. Long after Shakspeare's time, it was from the stage alone that the populace could acquire a glimmering idea of bistory, and, when scene-painting was introduced, some notion of the power of pictorial art. Many of our great plays have the power of fascination in themselves, and certain fasti-dions persons would rather read than witness their performance. The stage, however, has still a mission to fulfil, for in another and im-portant way it has become almost as much a portant way it has become almost as much a means of diffusing taste and love of art as, hefore the days of books, it was the means of convey-ing other instruction.

We have of late years seen pictures on the London stage as powerful in effect and other high qualities of art, as can be found ou more permanent canvass, and this is not without its use, not only to those who winces them, but far heyond, for the taste inculeated reflects into near herman where a concile of the heautiful many byways, where a sparkle of the beautiful irradiates, and is useful.

There seems to he a natural taste for heauty in every sensible human creature that is born; but this is too often marred, quenched, and polluted. It is astonnding to witness the avidity with which those who have had no education rush off to supply the want by various musical and other amusements. At au early age they run to the penny concert and theatre, and we have heard more than one city missionary express his gladness that cheap pauoramas and other harmless yet amusing things, which keep many of their visitors out of worse places and give fresh lideas, were being opened to them. No doubt much viee is assembled in some of the lower metropolitan theatres; but the vicious are likely to be improved, rather than otherwise, by having good things put hefore them, and as the snaller theatres follow, accord-There seems to he a natural taste for heauty

THE BUILDER.

ing to their means, the larger ones, it must be a natural consequence that the greater the amount of perfection attained in the better houses, the greater will become the artistic skill which will be bestowed upon those who so much require every good aid.

CHRISTMAS has given the scene-painters an opportunity to exhibit their skill and fancy, and biportanty to can be then then skin ad matage of. We hear great praises of two scenes in the Pantomime at Drury-lane, and of Mr. Fenton's doings at the Lyceum, hut have not yet scen them.

them. At the *Princess's*, where "Aladdin and his Wonderful Lamp" have been taken for the subject, the crowd was so great on the night we visited it, that with the exception of a glittering scene of the descent of the Flying Palace, built means of the of section of barde of lowers. scene of the assessed of her rying Frinke, but apparently of mother of pearl and jewels (Qnery: Should the architect have 5 per cent, on the cost when such materials are used ?), which we glimpsed over the heads of a lobbyful of people behind the upper hoxes, we have as yet seen little of the little of it.

The artists of this theatre, and some extra hands, are all husy on a play of the "immortal Williams," as the French critic called him the other day, which will introduce a large amount of architectural scenery. Mr. Kean is uever tired, and deserves his success.

At the Haymarket, Mr. Callcott has painted At the *Legentree*, Mr. callectt has painted some charming scenes for the opening story, written by Mr. Buckstone, and founded on "The Babes in the Wood." Mr. Beverley must look to his laurels, for with much of the skill of the latter in mechanical arrangements, Mr. Callectt, in natural scenery, will heat him if he choose to "durd." Pure a denore of actors the methods here. study. By a glauce at nature he might have made the seene of "a Blackberry Brake, at the fall of the leaf," perfect—as it is, it is a beautiful picture. The transformation seene, with a Turner-like hackground, and the apo-theosis of the Babes, is highly creditable to bin and vary chemet.

theosis of the Babes, is highly creditable to him, and very elegant. For *The Olympic*, our Aristophanes, Mr. Planché, has taken the outline of the fairy tale, *Jeune et Belle*, for his groundwork, and under the title of "Young and Handsome," has, with language delicately nice, and sentiment so pure it would not soil hookmuslin, contributed to the stace a perfectly original noem full of ublic. stage a perfectly original poem, full of philo-sophy aud wit, which will be dug up in a time to come, and commented on as a composition irrespective of its acting capabilities. Mr. Gray has painted for it two or three very pretty Gray has painted for it two or three very pretty scenes, especially the Valley of Violets and the Castle of Flowers, although not quite such as the author's compositious were usually set in by Madame Vestris. The last sceue, which has a number of beautiful candelahera of Dresden ware, is marred by some dark "flies" close to the flat canvass, which produce a gloom where all should he light. Robson is admi-rable in a new line, and though some of the actors are manifestly unequal to the parts assigned them, and prevent the recognition of assigned them, and prevent the recognition of the completeness of the allegory throughout, the whole is a great success.

LONDON MECHANICS' INSTITUTION.

FROM the great interest you at all times take in any matters connected with mechanical and ornamental art, I think it will not prove altogether uniteresting to yourself or subscribers, to be made acquainted with the fact, that the members of this Institution will hold an exhibition of drawings, on Friday, Jauany 2nd, 1857, and three following days, to which the public will be admitted free, by tickets, to be obtained of myself, or by application at the library of the Leviturian of the Institution. The exhibition will be entirely confined to the pro-

The exhibition will be entirely confined to the pro-ductions of members, and I believe that most of them will possess sufficient merit to convince the public, that although the Institution has suffered much in consequence of its heavy debt to the family of its great henefactor, the late Dr. Birkbeck, to whom it owes, for principal and interest, the sam of about 3,0007, which we are now compelled to appeal to the public to assist us in paying, — it is still pursuing a carere useful to the community at large, and worthy of the public support it so-much stands in need of. I and my colleagues feel confident that the public will never allow the parent Institution — the founder of upwards of G00 Literary

AN INSCRIPTION FOR THE WEST-MINSTER BELL.

GREAT Tom of Canterbury was thus inscribed :-

"In magni Thomæ laude, Risono bim hom sine fraude."

Allow me to suggest the following for the Westminster Bell :-

"In Beeketti, Q. C. laude, Risono Big Den sinc fraude."

CLAPPER.

IRON AND STEEL.

THE preliminary meeting of the South Stafford-shire ironmasters was held at Wolverhampton, on Wedneaday in last week, when it was decided to retain present rates. The attendance was greater than for present rates. The attendance was greater than for many previous neetings. These prices, nominally re-cognised, are 94. for best common bars; hoops and sheets, without being more definitely fixed, being— the former from 10s. to 20s.; and the latter from 30s. to 40s. above the price of hars. It is felt that these rates are likely to cause the American demand to continue limited, as, with the addition of the import duty of 30 per cent. exacted in the country, the American ironimaters in Pennsylvania are able to compate with English iron. Pig iron has heen framer for the last few weeks. No attempt will now be made to rednee wages. The Uchatics steel appears to be favourably re-

COMPETITIONS.

Scarborough. — In reply to some inquiries we are able to say that a design, by Mr. T. Oliver, jnn. has heen adopted for the new Congregational Church and Schools, proposed to be erected on the North Cliff, Scarborongh. The Venetian Gothie has been selected as the basis of the style of architecture for the buildings. They will display alternate hands of coloured brickwork, with terra-cotta enrichments and decesion: dressings.

dressings. Foleshill Workhouse Competition.—In reply to the queries of A. M. in your issue for December 20th, I can only state, in answer to "What next?" that having heen in Coventry on purpose to make some inquiries, with a view to further proceedings, I found there were twenty-four sets of plans sent in on Monday evening, and that the hoard of guardians met on the Wednesday at eleven, and separated at four o'clock, having in five hours thoroughly examined each of the plans, as they were justly bound to do. Their mode of selection was as follows. The chair-man took one plan apparently promiseuously from the pile, and pheneng it on the table, said,—" Gentlemen, I propose this plan stay at the top of the table till a better he found." The plan remained there: one other was selected; and the authors of the others were informed, per circular, that their plans " might he informed, per circular, that their plans "night he had for fetching !" The author of the first-named had for fetching !" The author of the first-named plan was then invited to the bouse of the chairman, whose gnest he remained for some time, and returned bone; from whence, on the 16th of December, a *fresh ground-plan*, nucle smaller than the one selected, was sent, together with a letter, in which he stated that, " by doing away with the first ground-plan, and adopting the one now sent, he tolinks he can reduce the cost of the building to the sum men-tioned." can reduce the cost of the building to the sum men-tioned," and alleging as his reason for so doing, that during the preparation of the original design he was so busy he could not devote that attention to it he ought to have done. Under these circumstances, would it not be well for the competitors whose designs have been thus summarily disposed of, to meet in Coventry, exhibit their designs to the ratepayers, and consult as to the hest mode of forcing the guardians to adopt some fairer method of dealing with those who in good faith replied to their advertisement? I send you my name, and am, ONE WHOSE DESIGN WAS "SENT TO COVENTRY."

TO COVENTRY

The sufficient waterworks, and to empany under lime in a sufficient quantity of water to form a creasen : the new Limited Liability Act. Mr. John Wbichcord,

as engineer, poioted out the probable cost of the scheme, and drew a comparison showing the great saving which will be effected by the consumers if the company is carried out, as they will then obtain an abundant supply for a merger doile. Mr. Frend, contractor, gave his opinions as to the practica-hility of carrying out the proposed scheme, and re-solutions were unanimously passed by the meeting, expressing its sympathy with the morement, and pledging itself to support it hy every means io its power. power.

" NATIONAL GALLERY."

THE point as to where and how the new National Gallery is to be creeted is now variously mooted.

As one who is much devoted to architecture and the fine arts, I beg leave to throw in a suggestion which, to my thinking, if adopted, would put us nationally on somewhat as good a footing as our continental neighbours

Three things appear to be first in consideration, first, the site; secondly, the arrangements; thirdly, the style. As to the first, the nation has a good right to say, this ought to be "Trafalgar-square;" as to the second, that the structure should consist of a grand marble hall of entrance, a grand marble stair-case, with steps having risers of only 4 inches, which makes ascent easy for the weakest, and is—architec-turally—the only proper scale of stair for buildings of consequence. The building to be otherwise occu-pied by three grand galleries; the whole paved with cencausite tiles, in plain chiarcoscron, and to form a grand quadrangle. The three galleries to be divided, by way of distinction and for effect, into saloons. The lower gallery to he devoted to sculpture. Three things appear to be first in consideration,-

The lower gallery to he devoted to sculpture, ancient and modern, with copies by our best sculptors of ancient chef-d'œuvres in that art from all parts of of ancient *chef-d'œuvres* in that art from all parts of Europe; the archeological relies,—curious objects without exhibition of hish art,—to be kept in their appropriate place, the British Museum, where the broken wonders from Nineveh and other places are well placed for the research of the learned antiquarian. The second gallery, or first-floor, to he devoted to the sciences; and the third gallery—the lotifiest of the whole, lighted from above—to he devoted to ancient and modern painting, and copies of the first merit from the great works of all the calleries in existence. At the four angles, I should say there ought to be four stairesse, to give access and geress for the officials, or for such of the public as might wish to ascend or descend in such direction. For accommodating this arrangement, I should say

ascend or descend in such direction. For accommodating this arrangement, I should say Government cannot do hetter to meet the national wish than elser the ground north of the present gallery, and realise a grand area for constructing "a magnificent quadranucle," being composed of the three galleres showe described, and in the area within, to place a splendid foontain, to he called the "Foun-tain of Neptune," formed by a figure of Neptune, of heroic size, culminating a group, composed of the four nearters of the globe, with secondary tis by Tritons. quarters of the globe, with secondary jets by Tritons, and with tributary ones by dolphins round. The third point to consider is the style, and this I should third point to consider is the style, and this i should say onght to he Romans: the Romans having the credit of introducing the line of heanty into architec-ture, by the adoption of the arch, and thus getting rid of the monotonous character of Greeian structure, which presents to the eye only perpendicular and tal lines.

horizontal lines. With the Roman style comes in all the noble enrichment of high art, in all its branches; and in my mind's eye, I now hehold a palatial building rising much seve, 1 now heading a patienti uniffing rating lofty to view on the site of our present galler, which hy altitude should inspire the sublime, and by the richness of its pillared, arched, and sculptured front disclose, by its glorious combination, the beautiful; which would make it vie with any structure raised for like purposes among the nations of the earth. If Parliament, for its own use and benefit, does not seemels to expend a willing of monar on the Palece stratament, for its own use and benefit, does not seruple to expend a million of money on the Palace of Westminster, the nation bas a good right to demand a million of its own beins to or westmuster, the nation has a good right to demand a million of its own levies, to give expression to its own riews as to high art and the sciences. The nation never ought to submit to having its accumu-lating treasures put into temporary subbish recep-tacles, where multitudes of the poople, who help to pay for every national expenditure, would have to make a day's journey to get to them. If such design poolate the national will is earnind

The set ways sources to get to them. If such design against the national will is carried out, I, for one, who have to contribute a good sum annually to the exigencies and exchaquer of the country, shall, with multimades of others, no doubt, necessarily feel deeply indignant.

WM. MASON, Lieut.-Colonel.

THAMES TUNNEL. — During the week ending 27th December, 24 870 passengers passed through, and paid the sum of 1037, 12s. 6d.

THE WESTMINSTER CLOCK HAMMER. MR. LOSERY may depend upon it that he will find some little regard to truth expedient in the long run, even if he gets people to believe him for a week without it. In instification of his foolish and malicious charge, that I designed the Westminster clock for a hammer of only 120 lbs. he now goes back to a table of sizes of bulls and hammers furnished to the Astronomer Royal by the late Mr. Dent, in 1846, with which I had no more to do than Mr. Losely binself. And of this table he knows the following things as well as I do

I. The hammer there set down with 120 lbs. oppo-site to it is not a hammer of that weight, but is the reduced weight of a heavier hammer for the angle of 35 deg.

2. It was expressly stated there to be proposed as 2. It was expressly stated there to be projected as the hammer for a bell, not of 14 tons, like Mr. Vulliamy's 150 lbs. hammer, but for a hell like the Oxford one, which is the worst large bell in England, and therefore has a much lighter hammer.

That plan never was adopted by any contract whatever

4. It was proposed six years before I was consulted about the clock.

5. As soon as I was consulted I prepared a ne 5. As soon as 1 was consume a prepared a nor-plan, with the consurrence of the Astronomer Royal, which the Company of Clockmakers themselves de-scribed as so different from Mr. Dent's former plan, that it ought to have been, in their opinion, thrown

The says that my statement that I contemplated a learner of nearly eight times the nower represented by him, is not confirmed by the Parliamentary papers He knows perfectly well that that was not the place to

He knows perfectly well that that wos not the place to which I referred him to find it but to the Easyclopedia Britannica Treatise on Clockunking, written by me in 1854, and sold by Mr. Dent. Nothing at all appears about it io the Parliannentry papers, hecause that and all other details were left to the judgment of Mr. Airy and myself by the contract. Ite says that Mr. Vulliamy's plan, adopted by the Company of Clockunkers, was stronger than mine, hecause the great wheel of their striking part was 3½ feet, whereas mine is only 3 feet. But he knowsthat in that plan the great wheel was not the striking wheel; and he ought to know that that was one of the most glaring defects of that most defective plan. It was actually intended to raise the bannume for a 14-ton bell by pins set in the second wheel of the

It was actually intended to raise the hammer for a 14-ton bell by pins set in the second wheel of the train, acting on a lever consisting of a half-inch round rod, where mine is 2 inches square in section. His rage acquisit cast-iron wheels is only the old Clerkenwell clockmakers' prejudice, with which they have steadily resisted every improvement in clock-making, and I shall not enter into that here. When any of them can make a turret clock on their plan, equal in performance to Mr. Dent's east-iron ones, it

"ill be time enough to discuss it. Mr. Loseby has really outdone himself in his desire Mr. Loveby has really outdone binself in his desire to give a finishing stroke to my plan, by saying that the Government is to pay Mr. Dent, for excenting it, as much as they would have paid Mr. Vulliamy, if they had adopted bis. Even if that weres o, I do not see what the Government, or the public, would have to complete on the strong of the strong that the stronomer Rayal reported) was nothing hetter, in point of acentracy, than "a large village clock," and it was totally unift for its work besides. But the fact is, as Mr. Loseby again very well knows, Mr. Dent's contract is for 1,900.: and Mr. Vulliamy's estimate (which he never would eive notil he know it could not be accepted) was 3,500!. This is a pretty fair amount of "fibrication" for

This is a pretty fair amount of "fabrication" for one letter, I think. If Mr. Loseby prefers bad bells, like the Oxford one, and most of the large English bells, which will only bear a clapper of their weight, or less, to good ones, like the Westminster bell and some of to good ones, like the Westminster own and some the great continental bells, with clappers two or three times as heavy, that is a matter of taske, on which the must have his own way. I with the Clockmakers' Company, and the opposition bell-founders, joy of their advocate's taste, as well as his veracity. E. B. DENISON.

we think it is also to be regretted that the illustrations were not more numerous. The present part is devoted to Stebhing Church, with ground-plan, and a view of the chancel arch ; All Saints' Church, Stanway, with ground-plan, and a sketch of the tower basement ; and to St. Allbright's Chapel, Stanway, with ground-plan. The title-page, index, and preface, are also comprised in the part now issued.

The Transactions of the Institution of Civil Engi-neers of Ireland, Sessions 1849-54, Vol. IV. Parts I. H. and III. Dublin : S. B. Oldham, S. Suifolk-street. London : Weale, High Holborn.

Curiosities of History; with now Lights: a Book for Old and Young. By JOHN TIMES, F.S.A. Bogne, Flect-street. 1857.

WE could not have opened our list of books dated "1557" with one more generally suitable to this holiday season of relaxation from pro-fessional duties, than Mr. Timbs's little volume : it is, indeed, a suitable one for old and young; and its curt little sections of historical curiosities afford a never-ending fund of refreshing "living waters" to dive occasionally into, and to clear the mind of jading wrinkling cares

England's Greatness; its Rise and Progress in Government, Laws, Religion, and social Life; Agriculture, Commerce, and Manufactures; Science, Literature, and the Arts; from the earliest Period to the Peace of Paris. By JOHN WADE, V. P. Institut D'Afrique (His-torical Section), Paris. Longman and Co. London. 1856 London, 1856.

It is not our part to enter here into any elaborate exposition or criticism on the contents of this very interesting and able volume, although there is not a little in it that is professionally interesting to architects, as well as generally interesting to men of mind in all professions, as indeed any work on such a subject, displaying anything like research and reflection, cannot hut be.

The author's aim has been to supply a deficiency in English literature, and compen-diously, but in sufficient breadth of facts and pbilosophy, to exemplify, to the historical student or the more elaborate inquirer, the mystery of England's power, diversified interests, and re-splendent name. The work is not a mere Eligantics power, diversined interess, and te splendent name. The work is not a metre abridgment of British history, or a brief nama-tive of political progress with which every one is familiar; but a condensed embodiment, in spirit and form, of national development, as characterised by its most remarkable epochs; illustrated by individual traits and memorable transitions, and exemplified in the contemporary growth of art, industry, intellect, social life, and gradations. The national picture has been comgradations. The national picture has been com-pleted by laying under contribution, history, hiography, science, art, and literature; and in the art-review, neither architecture, ongineering sculpture, nor painting, is overlooked. On the whole, this rather bulky little volume of SOO pages, small octavo, cannot fail to be regarded and treated as an important subject for discussion and quotation by our hiterary critics.

VARIORUM

Bioaks Riccetior. The Churches of Essex Architecturally Described and Illustrated. By GEORGE BUCKLEE, Architect. Bell and Daldy, 185, Fleet street, London. 1856. Eighth and concluding part of the volume. WF regret to find that what was designed to he an acount of the Essex churches has resolved tiself into a volume containing descriptions of which suggests a fear that the work has not which suggests a fear that the work has not met with the success which it merits, although "Notes on Toll Reform and the Turnpike

suggested hy Mr. Bradfield appear to be well worthy of close consideration. He proposes to worthy of close consideration. He proposes to remove all the gates, to a radius of six miles from Charing-cross, so as at once to free, as it were, the "lungs" of London of the incubus, and at same time consolidating the districts into five or six instead of sixteen, as at present and that a head office be established in a central situation, such as Charing-cross, whence tickets shall be issued, running by the month or quar-ter, freeing all the owners' horses, day tickets being similarly issued at each gate, for say six-pence cach; and by these and other arrange-ments, the author is of opinion, that in five, or at least in the years, the whole of the tampikes in Middlesex would be got rid of altogether. The merits of this and other suggestions, how-ever, must be gathered from the author's own words, and not from the imperfect outline which alone our space allows us to give. To any additional tax on horses we may add, Mr. Bradfield strongly and justly objects. — A little shilling tract on "Domestic Economy, the School Series edited by the Rev. G Ŕ Gleig, M.A. Inspectrate by the Prov. Gr. M. Gleig, M.A. Inspectrate of Military Schools, has been issued by Messrs. Longman and Co. It seems to be full of useful hints, recipes, prescriptions, &c. specially intended for families with small incomes

Miscellanea.

YORN SCHOOL OF ART.—On the evening of Wednesday in last week, Mr. J. C. Svallow made public lis last Free Lesson on Drawing to the working men of York. The lecturer was nided by a series of white child drawings on a black ground, which he said were the actual drawings he had made upon the black hoard at previous lessons, having heen able, after various experiments, to transfer them in the state they then saw them. The lecturer drew line after line on the black hoard, his pupils copying each line and touch as it was done, till the design was developed, explaining and describing as he proceeded. At the close, he made some remarks on the stelly of art. This study, as he observed, possesses the great and peculiar charm, that it is absohately meconceted with the contests of ordinary fife men are often deeply divided and set at variance by philosophical problems, whilst they are attracted and mitted by a taste for the headtful in art. It was the high privilege of art that it had fallen to its to to contribute to the harphiness and prosperity of man in the most different epochs or states of society. Art had shed its spletdours over the Roman empire and the Greek commonwealth, and had flourishde equally in the hoosen of the turbulet republies of the middle ages, and under the majestic sway of Louis XIV. But if it be true, as we learn from his fory and experience, that free governments afford a soil most suitable to the production of native talet, to the maturing the powers of the human mind, and to the growth of every species of excellence, by opening to merit the prospect of reward and distinction, ne county could be better adapted than our ow to encourage every one, from the linghest to be lowest, to pursue the study of the fine arts.

Inon One DISCOVENTS AT SEEND.—The mineral treasures recently discovered at Scend, Wilts, exist to a far greater extent than was at first anticipated. The whole of the village is situated on an outlier of the lower green sand, and it appears that the greater portion of this stratum consists of a ferreginous sandstone, more or less rich in peroxide of iron, yielding in some cases as much as 50 per cent, of pure metal. A geutleman largely cugaged in the row ore trade, has already extrated 4,000 tons of one, which have here sent into Wales for smelting. There is not the slightest symptom of the existence of coal in the iron fields at Seend.

SUPPORT OF FREE LIDEARIES BY THE WORKING CLASSES. — AL Preston, the working classes are efficiently seconding the efforts of the Working Men's Committee there, to ohtain 1,000%. from their own elass. The whole of the hands employed in the cotton mills and other establishments are making collections among themselves. The spinners in one mill have ananimously agreed to give ten shillings each, by four weekly instalments of 23. 6d. At another mill the spinners determined to outstrip their neighbours, and agreed to give ten shillings and sixpence each, to be paid as above. At a third establishment, seven of the moulders promised 1/. each : five of them have paid already, and the other two have each have ta durated the contrast hetween such conaduct as this and certain recent doings in the metropolis is rather humiliating to the latter. ROYAL INSTITUTE OF BRITISH ARCHITKETS, At the next ordinary meeting of the lastitute, which will be beld on Monday evening, the 12th of January, a paper, "On the Ruin of Heidelberg," will he read by Mr. E. l'Anson, Fellow. At the last meeting, held on the 15th December, the following gentlemen were elected:--Mr. John Billing, Mr. Henry Astley Darbishire, Mr. Goorge Devey, and Mr. Samuel Struton Markham, as Fellows; and Mr. Alfred Porter, as Associate. Mr. Perrey exhibited some very elaborate wood earvings; and Mons. Desachy some specimens on his method of forming plaster casts of large dimensions, in which strength and very great lightness are combined. It consists in backing a thin layer of plaster with canvas, or other similar material, which gives great strength and toughness.

lightiess are combined. It consists in backing a thin layer of plaster with cavarss, or other similar material, which gives great strength and tonghness. LECTURE ON "THE ECONMY OF THE WORKING CLASSES."—At the Birmingham and Midland lastitute, on Mooday in last week, Mr. W. L. Sargant read a paper on this subject, founded on an elaborate work published in 1855, by M. Le Playe. Mr. Sargant remarked that M. Le Playe had furnished or suggested matter enough for twenty or thirty papers such as the one before them. He proposed to consider the relation existing between the working man and his employer in Europe generally. They were so accussioned to see the working elasses amongst themselves employed by capitalists and paid wargos, either by the day or by the piece, that they were apt to lose sight of the fact that the relation elsewhere was quite different. Agricultural labour was mainly treated of. Formerly the ordinary condition of a farmer in France, Spain, and Haly was that of a metayer, who was a working partace in the business. Then they had the more primitive relation of landowners, with peasants too, namely, the *adroxé* (or habour given for land tenanted), which was the ordinary condition of a fertile parts of Russia, there was another organization, namely, the *adroxé* system, by which a seigneur gave up his land to a community in consideration of the community, even after they had migrated to other towns. The lecturer mear termarked upon the right assumed by men of appropriating land to themselve, and showed that the grand princeple of the Mahomedans was that the hand was the property of the Divine But his principle was greatly modified in practice, and indeed society could scarcely evit without something like an assignment to individuals of property and land, for who would build a cottage, or lay out a garden, if the could not be scarer of enjoying them. In England, and most Christinn countries, the landowner hald great control over his estate, and could ance the subject in ouchers, und

STRIKE OF SHIPWRIGHTS ON THE WEAR.—An anticipated strike of the Wear shipwrights has unfortunately taken place. The men had previously adopted a resolution, and sent notice to the masters, that, unless the proposed reduction in their wages from 6s. to 5s. per day was ahaudoned, they would strike work. Several of the masters gave way, but the great majority refused. The number of men on strike, added to those previously unemployed through dulness of trade, will amount to about 300. A meeting of a number of the shipbuilders has since been held at Bishopwarmouth, when it was resolved to adhere to the proposed reduction of wages. The shipbuilders, however, are said not to be unanimous on the subject.

THE ANTIQUITIES DISCOVERED AT BATH.—The Beth Chronicle enumerates the many Roman and other antiquities turned up from the soil on the site of the ancient city, even during the last twelve months, and regrets that there is no local society having for one of its objects the collection and preservation of just such remains. As it is, many valuable relices have passed away from the city, which, with timely interference and proper care, would have enriched the local museum. THE ARCHITECTURAL EXHIBITION.—I quite agree

The ABCHITECTURAL EXHIBITION.—I quite agree with your remarks respecting the darkness of the Suffulk-street rooms, where the Architectural Exhibition is at present held. Do you not think that they ought to be kept open later than dusk, as many young men are unable to see the drawings except on leture nights, which of course they cannot do when they go for the direct purpose of hearing a lecture ? G S OPENING OF NEW SALLORS' HOME AT SUNDER-LAND.--The new Sailors' Home at Sunderland has been opened. It is a fine huilding with a Flemish froat, erected on the edge of the Town Moor, contiguous to the docks, and, including the purchase money of the site, has cost shout 4,0002, :one-half of which has heen raised by subscriptions from the inhabitants of the borough and neighbourhood. It contains accommodation for seventy scamen. The husiness of the shipping office is transacted in a portion of the building.

business of the shipping office is transacted in a portion of the building. FALL OF A BULLDING IN HULME.—The roof and the upper walls of a two-story building at the lower end of Blake-street, Hulme, gave way and fell on Wednesday in last week. Surrounding an open yard are three huildings, the lower story of each of which is occupied by butchers as slanghter-houses. One of these buildings, from 16 to 18 yards in length, had one of its side walls only 4½ inches thick, and the accumulated snow, which had fallen heavily during the evening, broke in the roof and forced ont the walls. There was a dancing party in an adjoining building, and the vibration caused may have contrihuted to the downfall. The building belongs to the King's Head Building Society, Salford, and is said to be a fair specimen of "Jerry work."

LECTURE ON ARCHITECTURE AT ALINWICK.—On the 17th December, in the Town-hall, Mr. F. R., Wilson, Associate of the Royal Institute of British Architects, now superintending the works at Alnwick Castle, delivered a lecture to the members of the Aluwick Scientific and Mechanics' Institute, on English Gothic Architecture, its historical associatious, origin, successive periods, decline, and contemporary revival. The hall was completely filled, and the Rev. R. W. Bosanquet, one of the vice-presidents of the Institute, was in the chair. CONSECRATION OF ST. MATTLEW'S CHURCH, ST. PANERAS.—On the 22nd ult, the conservation of

CONSECRATION OF ST. MATTIEW'S CHURCH, ST. PANCRAS.—On the 22nd nlt. the consecration of another church in this densely-populated district took place. The site for this church was a gift of the Duke of Bedford, to whom the property in the neighhourhood belongs, and who sloc contributed 7504. towards the building, and 2504. more on condition that the edifice was provided with a spire. The dake , has also contributed 1,0004. a year, for ten years, towards the Diocesan Church-building Society, out of which sum that society have this year contributed 4004. towards the huiding, and 6004. more on loan. The edifice is in the style of the more florid period of Gothic architecture. The estimated cost was 7,5004, and with extras, about 9,0004. The work has been done under the superintendence, and from the design, of Mr. John Johnstone, of Adelphi, architect. The windows are of green glass, surmonated hy florid borders. One of the principal stained glass windows in the east aisle was a memorial present from General Sir Henry Brown, K.C.B. The number of seats is 1,240, upwards of 550, or nearly half, free. A bronze medallion, commenorative of the opening, has been extended by Wr. Wyon medallist to the Mint

created by Mr. Wyon, medallist to the Mint. CONSECRATION OF ST. PAUL'S CHURCH, MAS Beel worrH.—This church, which was mostly created about three years since, is now completed, and was consecrated on Christmas-day. The church stands in the centre of Lorrimore-square. It is huilt of Kentish rag, in the Early Englisb style of thirteeuth century, It consists of nave, chancel, and north and south niskes, and is 77 feet in length, and 52 feet in height to the centre of the root, which is galled with oak; the width, including the aisles, heing 62 feet 3 inches. The vestry robing-room is sinate on the south-east side of the chancel, about 4 feet from the ground. There are two galleries, one over either nisk, but the light from the western window will be left free. There are sittings for 1,204 persons, 602 free. The scats are open varished oak. The church is warmed and lighted by Messrs. Strevens' gas appartus, erected by Messre. Deane and Dray, of Loudon-bridge; and lighted by de astindards, erected by Messrs. Dehaufer rand Co. of Creed-lane. Messre. Myers, of Belvedererroad, were the contractors; and Mr. H. Jarvis, of Southwark, the architect. The contract for the creetion of the edifice amounted to 6,0007.

ACCIDENT AT THE NEW COAN EXCHANGE, CHELMSFORD.—Last week an accident occurred at the New Corn Exchange, but fortunately none of the worknem were injured. It appears that the last of the seven iron griders which are to support the roof was being hoisted by means of a windlass, when the rope broke, and the immense weight of iron fell to the floor, shattering the holts, which were about two inches thick, and injuring one of the piers.

The noor, shattering the holts, which were about two inches thick, and injuring one of the piers. NEW MANSION IN SOMERSER.—The Right Hon. II. Lahouchere, Colouial Sceretary, is about to creet a new family massion on his property at Stowey, Somerset. The contract has been already taken by a London firm, and amounts to about 16,0004. The works are to be proceeded with immediately.

TESTING THE SHOT PROOF POWER OF PLATES.—Experiments have been made at Woolwich to test the resistive power of timber lined with 4-inch irou plates.—the combined materials being of the from pantes,—the combined matching builds of the same thickness as the floating halteries constructed during the late war; and also to test the durability and quality of irou plates manufactured by rolling, as compared with iron turned out by the hanner. After compared with iron turned out by the hanner. After the first few rounds, at 600 yards distance, the tim-berwork gave way in several directions: at the last ten rounds, fired at 400 yards, the timberwork of the target was completely broken and splintered, and the plates of iron made by the rolling process were ent up and split, having mpacently but little adhesion. The iron plates which had been made by the old process resisted the solid wrought; iron shot mucb more successfully. The last shot fired went com-pletely through the target. — timberwork, iron. process resisted to the last shot fired were common successfully. The last shot fired were common successfully the target, - timberwork, iron, pletely and all.

ROAD REFORM IN SCOTLAND .- Lord Eleho's Bill for the aboliton of tolis in Scotlands – Loffi Jenero's Bill for the aboliton of tolis in Scotland has been pub-lished. It proposes to constitute county boards with a superintending general hoard. These county boards are to consist of all persons qualified to act as comare to consist of all persons qualified to act as com-missioners of supply as an present, and, in addition, representatives from the different burghs and parochial boards within each county. The county boards are to be vested with the courtol and management of all public highways and roads, with power to classify them. All tolls and statute labour assessments are proposed to be levied of 20a, on horses above four years, and 10s, on other horses and on mults, and also on all lands and heritages within the county, at such rates as the local hord's shall determine. WORKMEN COMMITTED IN 1854 AND 1855.— A Parliamentary return shows the number of work-

A Parliamentary return shows the number of work-men summarily convicted and committed to prison in the several counties of England and Ireland for breach doring 1854 and 1855. The total numbers for England were, in 1854, 2,427 workmen; in 1855, 1,541

RENT NOT TO BE WITHHELD AGAINST EXECUTION REAR AOT TO BE WITHIED ADARSE EXECUTION OF REFARS.—In a case before the limity Sheriff Conrt, reported in the *Bangfshire Journal*, it was lately found that the occupant of a honse must pay the rent, and bring a charge if he chooses against the landlord for damages for not executing repairs accord-ing to agreement; but he cannot withhold the rent on that account.

BATTLEFIELD CHURCH, SHREWSBURY.--An effort ow being made to restore this record of the battle is now being made to restore this record of the obtite of Shreesbury to something like its original state, as erected after the battle of 1403. For this purpose the sum of 2,600, it is estimated, will be required. The Shreesbury Chronicle of last week advertises the intention, and gives an engraving, showing the present state of the church, with the portion roofed in. WHITEHAVEN TIMBER TRADE.-Within the last

three or four weeks there have been several cargoes of Quebee and other timber discharged at this put. The Comberland Pacquet says that, though the price of timber has undergone a considerable advance in most of the leading towns in the kingdom, the brokers here find it difficult to obtain more money. The rates are about the same which prevailed at the corre-tional test lead to are sponding date last year.

RADWAY RETURNS.—The traffic returns of the railways in the United Kingdom for the week ending railways in the United Kingdom for the week ending Describer 20, amounted to 420,400.t; and for the corresponding week of 1855, to 416,787.; showing an increase of 3,6634. The gross receipts of the eight railways having their termini in the metropolis amounted, for the week ending as above, to 181,444.; and for the corresponding week of last year, to 191,728.t; showing a decrease of 10,284.t. There was an increase, however, of 1,160/t on the Great Northern, and 115/t, on the London and Blackwall. The total receipts for the second half of 1856, were \$,213,022.t; those for the corresponding period of 1855, were \$,425,061.t. The following are a few of the more important items in this return :— 1856.t

HOLYHEAD CHRISTMAS EVE .--- The harbour work HOLTHEAD CHRISTMAS EVE.—The harbout works contractors, Messrs. Rigby, provided a hounithil Christmas distribution, in the shape of seven prime heeves, ent up into " junks" for the family dimers of their numerous workmen. The meat was dealt out on Christmas Eve, after a meeting, presided over by the Hon. W. O. Stanley, M.P. who addressed the workmen, as did Mr. C. Rigby, who said, amongst workmen, as did Mr. C. Rigby, who said, amongst other complimentary remarks on his men, that it was but an set of mero justice to them to declare that not in any part of England, Ireland, or the British Isles, had he met with new who had shown so much of that virtue they possessed in Wales,—sobriety. "I have had no less than 1,000 or 1,500 men employed on these works," he added, " and not one of you for ten of those employed by me on other works is "neelend or development is." me on other works in England or elsewhere, dru akard

"THE MODERN VANDALS IN EDINBURGH."-In a long article nuder this title the *Unnes* points attention to the fact that the dissenting majority of the Edinburgh town-council have passed a series of the Edubatria town-council nave passed a series of resolutions disavoing the obligation and intention to restore the old church of Trinity College, one of the most ancient and remarkable Gothie fabries in Scot-land, but which, in 1848, fell a sacrifice to railway innovation falthough the stones, marked, we believe, innovation (although the source, harlow), for the restoration]. In doing so, continues the Times, they have not only refused the appeals of the Clurch of Scolland, but resisted the combined influence of almost sectiond, but resisted the combined influence of almost every representative of law and learning, of orts and antiquities, in the eity. At the council meeting referred to, it was urged by Mr. R. Johnston that the neceptance of the 16,000. And upwards from the roll-way company as a "compensation" nullified any obligation to restore the church; that the restored church would be quite unsuitable for the purposes of the poor and necessitons of the parish; and that the site on the Calton-hill was innecessible to the neurint the poor and necessitons of the parish; and that the site on the Calton-hill was inaccessible to the parish; and he quoted Mr. Ruskin's views to the effect that it was us impossible to raise the dead as it was to attempt to restore an ancient building. He proposed resolutions which, ignoring the alleged statutory obli gation, proposed to build a suitable church within the parish. The Lord Provost maintained the existence of the building and projected the object of the parish. The Lord Provost maintained the existence of the obligation, and vindicated the choice of the Calton-hill site as the best that could be got, after-many attempts, on which to restore the church. On the vote being taken, counter-resolutions by Mr. Mac-kuight were negatived by 28 to 12, while the first resolution of Mr. Johnston to build a "suitable" church, was earried by 26 to 14; and the second, negativing the Calton-hill site by 28 to 12. In the majority of 26 there was one Churchman, the rest being Free Churchmeu and Dissenter. In the uninotity of 14 there were nine Churchmen, two Free Churchmeu, and one Dissenter. The subject, it is parish. Initionity of 14 there were time contributed, two free Churchmen, and one Dissenter. The subject, it is a large number of influential eitizens, to determine the question of obligation; and, if necessary, the interposition of Parliament will be called for to pre-The subject, it is the the council acting upon their present resolutions.

ZING AND ZING WHITE .- Mr. Chas. Titterton, of ZINC AND ZINC WHITE.—Mr. Chas. Titierion, of Rochampton, proposes to improve the manufacture of zinc and zinc white by.—1. Employing the refuse, skinmings, and dross, obtained from various branches of manufactures where zinc is camployed, and in using such natters, they are introduced into a multe or retort, mixed with broken cocke or earbor. The numfle or retort nsed is provided with a tube or passage at the upper part leading to the white zinc chamber, and a tube or outlet at the lower part for the passage of the melted zinc.—2. When using ores of zinc in the manufacture of zinc white, in order to obtain cadmium the melted zinc.--z. When using over of zinc in the manufacture of zinc white, in order to obtain a calmium for the most part separate from the zinc white, the apparatus is arranged with two chambers, one to receive the first products, which contain the cadmium, and the other clumber to receive the zinc white. The and the other clamber to receive the zine white. The passages leading to the separate chambers are provided with valves or slides, to close one passage when the other is open. By this arrangement, the first vapours, passing off, which are for the most part cadmium, will pass into the cadmium chamber, and are there con-densed, the air or gas passing through a suitable screen: such passage being then shut, and the other opened, the vapours of zine will be oxidized and received into the proper chamber.—A. In construc-ing the screen in the chambers, it is important that the surfaces thereof should be kept free from oxides, for which purpose the screens are each suspended on for which purpose the screens are each suspended on leather or other snitable flexible material around the frame of the screens, and there is in each case a rod frame of the screens, and there is in each case a rod or wire passing through the frame which stops thereon; hence by moving or pulling the frame at intervals, against the stop, the whole of the frame is so com-pletely shaken as to detach the oxides from the sarface of the screens.—4. The invention consists in subject-ing white zime to hydraulic pressure, in order to obtain "body" when using it as paint.

[JAN. 3, 1857.

TESTINONIAL TO DR. SOUTHWOOD SMITH. — A private meeting was recently held at Lord Shaftes-hury's residence, to consider the hest mode of testify-ing personal esteem for Dr. Southwood Smith. The mode adopted was, to present a bust of Dr. Smith to some public institution, as a neuronial of his services in promoting legislative reform on the subject of the public health; the bust to be extend by Mr. Hart, the American sculptor. The movement is supported by the friends of smitary reform in all parties and iu the triends of sanitary reform in all parties and in social grades.

A great part of the old building forming the Douglas-room and the governor's hones, which was some time ago destroyed by fire, is to be taken down and re-erceted as nearly as possible in the same style as it was originally. The *Stirling Observer* says nearly thirty men are now employed at the work. The north wall, adjoining the governor's garden, has been entirely taken down, a foundation levelled out, and it inversion the same of the constraints. is now in the course of re-erection.

THE ROYAL ACADEMY OF TERN. -- The Royal Academy of Sciences at Turin at its last meeting, on the 7th inst. cleeted Mr. William Fairbairn, F.R.S. the President of the Literary and Philosophical Society of Manchester, a corresponding member of the Academy.

LUBICATING OIL. — Messrs. James Young Simpson, M.D. of Edinhurgh, and Wyville Thomp-son, of Belfast, have patented some improvements in the manufacture of lubicating oil from asphaltum (especially the asphalte of Trinidad).

(especially the asphalte of Trinidad). WARSAW WATENWORKS.— The Emperor Alexander, it is reported, has presented Mr. John IIcad (son of Mr. Jeremiah Head, of Ipswich), engineer of the waterworks in Warsaw, a magnificent gold ring, set with eight diamonds, for his zeal and energy in the construction of the works. The engineen were manu-factured by Messrs. Ransomes and Sinus, of Ipswich, under the superintendence of their late engineering manager, Mr. Henry Warriner, and consist of a pair of bilp-pressure, condensing, expansive heam engines of 40-horse nower. of 40 horse power.

The Builder.

120

OVELTY of effect is so far the aim marked in the designs in the Architectural Exhibition, that any oue judging from the collection in Suffolk . street could hardly eudorse the old complaint against modern architects-that they are wanting in inventiou. The general character of our street and suburban architecture, however-in forming which, as we have always been at pains to state, architects have less opportunity of influence

than they should have-may tend to keep alive an imputation of the kind referred to, as made by the public. True, it may be allowed that-as we have also urged at every convenient

opportunity-even in buildings from the designs professed architects, mere style too frequently is offered in place of, or becomes more prominent than, that art which, capable of being expressed through every language of style, is ever the requisite and proper chject of effort. Such effect upon the public as may be produced simply by a change of style, is really unworthy of *artists*, and is prejudicial as to all its nltimate consequences.

However, in the Architectural Exhibition, the growth of a different species of novelty-through the treatment of form and the frequent introduction of colour-is generally manifest. Indeed, we have some apprehension lest this sort of ten-dency, even, should run to excess. Observation and study of old models should never he neglected,-for, in many of these the best effects of architectural art have been produced; and the objects of such art-in delighting the intellect and the sense-require in the work, not merely the evidence that there has been a certain mental action of design, hut also the presence of beautiful features,-which last-acting through natural emotious and perceptions - may he limited in available number, or may depend upon the principles sometimes said to be the same in all styles. Novelty, therefore, though essentially requisite, is but one aim, and perhaps not the highest; and however we view it, every disadvantage to art is encountered in neglecting what may be derived from study of the best models,- or by recommencing a course in which principles which it has taken time to certify. being nnwittingly lost, will have to be painfully wronght out afresh. That this apprehension of the tendency—when novelty prevails, weakly allied with the other elements of good art—is no nnwarrantable apprehension, we think is shown by that which is still the condition of ornamental and decorative art,--in which the great variety of patterns, and the constant demand for novelty, become subversive of priuciples, and destructive of the real effect upon the intellect and taste where principles are observed. We have noticed many instances in the present exhibition, where only from the desire in itself commendable, of doing something in a different way, a positive ugliness is produced,-such as the principles which were understood-and perhaps even ou other occasions advocated by the architect in question-should have prevented. We may refer to the curves struck from different centres, in the pediments above some of the windows in Mr. Huggius's drawing, amongst the

accustomed details of styles, for which reason [Corn Exchange now creeting at Eye, Suffolk" can be given, should not be departed from in (133). The latter is noticeable for the treatprinciple, nuless reason equally satisfactory than the regard for novelty, can be furother nished for the change. Thus, when in the New Corn-Exchauge and Public Rooms, Chelmsford,-shown in a view (25) by the architect, Mr. F. Chancellor,-we find monldings which belong to the archivolts, carried horizontally, iustead of their usual arrangement, springing from the impost, we anticipate that in the build ing, whilst the curve of the arch must be impaired in offect, there is no adequate gain. In the same drawing the columns to the windows appear recessed, so as to be flush with the reveal and the front; hut whatever may be the method adopted with Gothie shafts, the analogy with them is not complete, and the defect of the innovation is very striking.

Mr. J. K. Colling, in his design for Merchants' Offices, now erecting in Old Hall-street, Liverpool (53 - 98), a work still commendable in its design, has one or two of what we must consider like defects,-as in the form given to the heads of the principal range of windows, and in the stepping-up of the coupled columns, which there are in an effective cortile, or passage-way, from which the staircases ascend, one on each side. In the exterior, red brick and stone, with granite aud coloured marbles, are used; but the drawing conveys a somewhat unfavourable representation of their effect, from the unnatural brilliance of colour given to some of those materials,an error observable in many other drawings in the exhibition, and which should be avoided in future. The ornament, which is in itself exceedingly well designed, is somewhat in excess. The same gentleman has also a well-executed sketch of his "Second Design for new Church at Hooton-park, Cheshire " (244 A). "Ashwicke Hall, near Marshfold, Gloucester-shire, now erecting" (409), by the same architect, is in the style of Windsor Castle.—Mr. J. M. Lockycr exhibits "House in course of erection in Henrietta-street, Cavendish-square" (55), where he adopts red and black bricks in patterns, terra-coita, ecment, and panels of encaustic tiles, as materials, but with inferior effect to that which, spite of the constant diffieulty of a shop front, he has produced in the "Premises erected 1554, for Messrs. Heal and Son, Tottenham court-road" (149). No. 317 is the "Monument creeted at Kirkby Mallony, Leicestershire, in memory of the late Countess of Lovelace," designed by the same architect. Mr. Wyatt Papworth exhibits (58) "Façade to the Hall of a City Company;" designed in accord-ance with the details of a building at Venice. The work is profusely ornamented in the style of the Renaissance, the details being not in all cases such as should be copied; the design, however, has greater merit than is immediately seen in the unobtrusive drawing. A mere elevation, as expressing only part of a design, fails to do any architect justice. A "Design for a Steeple and ornamental Casing to the present Brick Church on Clapham-common " (377), in the Italian style, is exhibited by Mr. John W. Papworth.-Mr. E. B. Lamb has several works, all having the merit of character, though with a slight tendency towards heaviness in details. His church now creeting at Castle Douglas (59), and that about to be erected at Egham (60), have effect with simplicity; and like feeling is displayed in the drawing of Thornham Hall, Eye, now erecting for Lord Incmiker (102)—in a modern Elizabethan style—groups of mouldings and carved enrichments, which has a good clock and bell tower, and where Mr. Charles Gray's designs are less to he con-there are a few novelties of detail, as in the use sidered as efforts in "ornamental brickwork" of wooden mullioned window-frames in the windows in Mr. Huggius's drawing, amongst the upper half only of the window, in the case of tiles, and brickwork, —in which, however, whilst designs for the Liverpool Museum. We, how- the principal rooms. The same architect ex- each material is used generally in its fitting ever, referred to innovations of a more general hibits "Sanatorium and Chapel now erecting place, and good projection is obtained, the pro-character; that is to say, we hold that the at Bo uncmouth" (120), and "Town-hall and perties of no one material strike the attention

ment of its red and white brickwork in courses, with flints in diagonal patterns, for the plan, and the design of its tower and entrance. Mr. T. L. Donaldson's " Design for a Temple to Victory, according to the ancient usages, combining all the edifices connected with the sacred games, &c. supposed to be erected on Mount Ithome, Messene, in the Peloponnesus, at the time of IIadrian " (65 and 66), embodies the results of elaborate study, and will be doubly interesting to those who heard his lecture, on Tnesday, noticed in a subsequent

page. The "Carpet Warchouse" at Kidder-minster, by Mr. J. G. Bland (69), illustrates at Kidderseveral observations which we have made as to prevalent characteristics of architectural design, meritorious and the reverse. The design here is expressed in colonred brickwork—chiefly red—but with white and dove-coloured bricks in the arches— and by cornice and strings of notched and angular bricks, and broad bands or fascias of chequers. The ornamented mouldings of Norman architecture appear to have furnished many suggestions for designs of this character, as it is supposed they did also for the old Tudor brickwork. Further, respecting designs of which No. 69 may be an example-we have apprehended before, that dark or brilliant colour and strong contrasts were becoming attended to, to the exclusion of the beauty of light and shade, and form; and that singularities of detail were being preferred to breadth and grouping. The last word-grouping-we use very often, because the element of effect that it represents is one which is indispensable in good architecture, and one which has been long neglected; and because the direction of architectural studies often, as now, tends to the search after curious details, without reference to their combination, and even with neglect of the elements in architectural effect comprised in proportion of divisions and subdivisions, and in outline and mass. Mr. Philip Brannon, who exhibits "Designs for Brickwork on Æsthetic Principles" (162, 163, 164, and 293), in an effort which is praiseworthy, has not escaped the fault alluded to, of exalting certain good principles at the expense of others, and thereby failing to see the laboured ugliness of many of his details, such as the wooden barge-boards, and the heavy finials. It is no casy matter to design good brickwork, though many think otherwise; the work must he well bouded,-therefore the place of every brick will have to be considered,-though it does not follow that every brick should show. And in the estimate of architectural effect, there being several elements of importance; where certain of them are deficient, we are not certain of them are deutern, we are not necessarily satisfied with the substitution of such forms as can be expressed by the regular sizes of brieks, or even with the knowledge that if we have not projection in a cornice, or wellproportioned monldings, we have good construction. How far by introducing stone, projection may be got, and how far artificial stone may serve as material for ornament, will require careful consideration : it is clear if such materials attain any prominence, the design is no longer what was intended — a characteristic example of architecture produced in the regular forms of bricks; it reverts to a brick and stone building, and as such will demand the ordinary than as general combinations of stone, coment,

VOL. XV.-No. 727.

as forming the proper key-uote, and therefore | teet gives to his design a general Gothic chanarrowing the scope of the design in proportion and ornament. Mr. Gray, however, we think fails in auother element of his required effect, hy want of sufficient attention to grouping of divisions, and to the proportions of his openings. Still, in the " Corner-honse in course of re-erection, 22, Heurietta-street, Coveut-garden " (116), there is as usual something to interest the observer,-that which there is not iu too many of the common street elevations.

In the "House now erceting for the Hon. W. H. Yelverton," iu South Wales, by Henry E. Coe (76), half-timbered work is used : the huilding has a square central tower, with lofty roof, and has considerable effect .- No. 77 is the "Front Elevation of Messrs. Wheeler's Premises, in the Poultry, hy Mr. T. Burton. It is spoiled hy the evident want of room for the full semieircle which ought to have been the form of the arch to the central opcuing in the first-floor,—hnt has a good lower story, in which the two door-ways and the general treatment of the shopfront, with the windows over it, nearly prevent any appearance of weakness. This unstructural character, referred to as observable in most de signs where shops are introduced, quite destroys the satisfaction which would be derived, in the case of the " Retail Shops for S. Hyam and Co. New-street, Birmingham," J. J. Batemau (146) There, the basement is a mere sheet of glass; and with such a starting point as a condition, it is difficult to say what an architect could do. It should be noticed, however, that the requirement of apparent support is increased by the very attention drawn to the necessity for support, hy the columus and the hold trusses which latter carry a wide halcouy. Above this halcony is an attic aud a lofty roof with dormers. Matching is an attle auto Anty for with construction With a good hasement, the design would have here one of much merit. No. 154, "The Scottish Equitable Life Assurance Offices," in the Pontury, by Mr. J. W. Penfold, has shafts to the arches and pages to the plasters of polished Peterhead granite. The requirement of ample light appears to have dictated another design from the same hand as No. 77, "For a Warchouse in Wood-street" (200), which seems all window opening, and as though it would provide the particular for 70^{-1} require to he entirely of iron. There is, however, some effect of grouping as well as ornament, small as is the wall-space. Greater strength in the angles would, however, have improved the effect

Mr. G. Aitchison, jun. in the "Drawing of a Bank, to he erceted in London" (159), shows a building of red brick, with a great semi-circular headed arch, to the height of two lower stories, aud to the upper stories smaller arches, filled in with Gothic work. The rainwater pipes, which appear very hulky, are combined with the modelings, as in Mr. P'Anson's Colonial Life Assurance Office, in Lomhard-street (as noticed hy us some time hack), of which also a drawing is exhibited (415)

Illustration of many questions adverted to above would he afforded in looking at Mr. J. H. Chamberlain's "Busiuess Premises now in course of erection, Union-street, Birmingham " (143), the style of which may be called Italian Gothic and in which colonred materials are used. The lower story for the shop, in this case, has two segmental-headed windows, which not only spoil the doorway, hut snggest structural weakness in the augle piers .- The Gothic style for buildings adapted to husiness purposes, is also shown applied in the "Banking Premises of Messrs. Seale, Low, and Co. Leicester-square" (81), hy Mr. J. Billing.

Amongst the churches, we should mention a design by Mr. H. J. Paull, in brick and stone (75), which, with little modification of the tower and its terminatiou, would be successful; also a "Mortuary Chapel, now erecting in Portugal" (82), M. D. Wyatt, iu which, whilst the archidesign by Mr. H. J. Paull, in brick and stone

racter, he shows the masonry in large blocks, even omitting the ordinary small areh stones. Also should he named Mr. T. E. Knightley's "Trinity Preshyterian Church, De Beauvoir Town" (113), remarkable for very narrow aisles; and the same architect's several designs for "Cometery Buildings" (108 and 130), which have much morit. An "Interior View of St. Michael's Church, Cornhill," by Alfred Bell (132 A), shows the refitting and decoration, designed by Mr. G. G. Scott, in conjunction with Mr. W. A. Mason, by which the late Italian architecture is converted into the Byzantine, by the iutroduction of shafts aud sub-arches to the aisle windows, aud similar forms rayonnans to the circular windows, and by the character of the coloured decoratiou. The problem in such a case, it should be observed, is a difficult one. The new porch, of which a drawing (245) is exhibited by Mr. J. D. Wyatt, as being executed from the designs of the same gentleman, is in the Italian Gothic style, with the arch is in the Frank Gothe spring with the atten-members helow a gable, springing from red-marble or granite shafts, on pedestals. By the same hand, is also "Anstey Church, Warwick-shire" (406), showing the steeple, from Mr. Scott's design, lately erceted in memory of Major-General Adams, who fell at Inkermann.

In the "Design for the Restoration of St. Dauici's Church, Hawarden" (156), R. P. Pullan, some good decorative work, including a pulpit, is shown. "St. Luke's Church, Nutford-place," hy Mr. E. Christian, illustrated in our pages, is represented in a transverse section (257), which serves to explain the peculiar difficulty, hoth as toplan and levels, in that work; and the five graphic sketches of "Tylehurst Church, Berks" (256), hy Mr. G. E. Street, show its author's skill in the forms and expression of mediæval architecture. After looking at such drawings, and those from the Lille Competition, it wonderful how in the same day could be de-signed and huilt the "Church, now heing erected at Old Ford," at a cost of 5,000*l*. (155), with details intended as Early English, a low-bears obviously no relation to its vature as in pitched roof, two western towers, and strutted the drawing, however, Mr. Jones shows his spires, or lanterns. Moreover, when classical masterly hand.

architecture is attempted, as in a "Design for New Synagogne, Birmingham" (244) with a had portico of Grecian Doric columns, equally singular is it, that the cspecial character of the style and its scope and effect should he so lamentably missed. Commonplace also are more of the designs with Italian window-dressings than we care to notice. There is, however, a good interior of the "Entrance Saloon, at Bylangh hall, Norfolk," hy Messrs. Banks and Barry (165), which has the centre and the arcades lighted from the top through coffers, and is tastefully decorated. Other drawings illustrative of interior decoration, with the competition drawings, and, perhaps, some other works, we may find room for in another number. The most prominent drawing of the exhibition, however, is one which we have left to almost the end of our notice,namely, Mr. Owen Jones's large view (84) of his design for the interior of St. James's Hall, which we reduced iu an engraving in the Builder setting of the hrilliant apse, with red and blnc coloured ceiling with gold bands, and the hlnc and white ceiling of the body of the hall similarly handed, are certainly calculated to realize a very fine effect. The forms in the ornamentation are perhaps less elegant. Of Mr. Jones's "Design for the Exhibition Building of Manchester, submitted in competition, June 4, 1856 " (111 and 112), we cannot speak with equal approval. It is simply a sort of wig-wam externally; and within it is a vault-indifferently lighted, we should think, from the end windows and the apertures in the crown-and with just so much design (except in the polychromy) as might he produced hy the industrious turning in of semicircles. Even granting the realization of a fine perspective effect, surely we have not here the work of Mr. Owen Jones, an artist-architect. And there is some point in what is so obvious in the drawing, that the usufruct of such a vanit

THE LATE MR. JOHN BRITTON.

ON Thursday, the first day of the uew year, toccasions. at ten o'clock in the morning, died John Britton, the author of "The Cathedral Antiquities of England," at his house in Burton-street, Burton Ten day Engind," at his house in Burton-street, burton-cressent, in his eighty-sixth year. On the 2ud of December, he sent a proof of the last com-pleted sheet of his autohiography to the printer. Early on the following Thursday morning, he first felt a sensation in his throat indicating the

occasions. This, however, was not to be, and gradually he succomhed to the universal con-

queror. Ten days hefore his death, he expressed his conviction to the writer of this notice that he should not recover, and desired him to convey his remembrances to the friends they were in the habit of meeting together, to separate from when mere but the greatest main

quary), where his father was employed as baker, maitster, shopkeeper, and small farmer, hut he saak into poverty, and his son John had not much of a school education. In his Antohio-graphy, Mr. Britton says of his birthplace, "the inhabitants were undisciplined, illiterate, and deprived of all good example;" and again he observes; "I do not think there was a paper or magazine purchased by one of the inhabitants hefore the year 1780, when the London riots were talked about, and wondered at." His time from his thirteenth year to his sixteenth was spent either in assisting his parents or in play. The cottages of the village were of the hum-blest and poorest kind, with walls of rough stone and roo's of thatch. The house in which he was born, which was one of the hest of them, the outside heing rough-east and whitewashed, is represented in the accom-panying engraving.

<image><image><image><text><text><text><text><text><text><text>

frequented debating societies, where he attained a fluency of speech which never failed him. As a social speaker he never disappointed; and those

social speaker he never disappointed; and those who heard bin the oftenest were the most sur-prised at the constant variety in his happily-turned and well-rounded sentences. On the death of Mr. Simpson, in 1798, he made an engagement with Messrs. Parker and Wix, solicitors, and then became a member of several dehating elubs, and was led to recite the writings of Peter Pindar, George Colman, and others. In 1799 he was engaged by a Mr. Chapman, at three guineas per week, to write, recite, and sing for him, at a theatre in Panton-street, Haymarket. Chapman had assisted De Loutherbourg in preparing and exhibiting his "Eidophusikon," which had proved very effective. The scenes and machinery were purbe "Eidophusikon," when not prove effective. The scenes and machinery were chased by Chapman, to combine with objects for an evening's entertainment. scenes and machinery were purwith other De objects for an evening's chervalment. De Loutherbourg was seene-painter to Covent-garden Theatre, and is well known by many interesting easel pictures. Being also a skilful and tigenions nuclinist, he invented several and tigenions functionis decortomet of the and ingenions muchinist, he invented several novelties for the scenic departument of the theatre; and for the purpose of displaying his skill and ingenuity, he fitted up a small theatre in the street above mentioned, and, conferring on it the name of the "Eidophusikou," he exhibited some exquisite paintings of scenery, both stationary and in motion, with the varied effects of sunshine and gloom; worn, mid-day, and wight; thunder lichtning, run, hall, and effects of sunshine and gloom; worn, mid-day, and night; thunder, lightning, rain, hall, and snow. Mr. W. H. Pyne, in "Wine and Wahnuts," has given a graphic account of the exhibition. Britton now fell much amongst theatrical per-sons, and in his Autobiography he gives some curious ancedotes of this period. It will be seen that, from the time of ending bic apprendiceshin to the vare 1800 bic carcer

It will be seen that, from the time of ending his apprenticeship to the year 1800, his career was involved in perplexity; he had neither fixed income nor occupation. His first literary cssay was some observations on "Bachelorship," written whilst in the wine-cellar, and, one moru-ing, dropped into the "ietter-lox of the Attic Miscelhany," in Shoe-lane. This being printed, he was tempted to write comments on plays could be new with partices of frequencies he was tempted to write comments on pays and players, with notices of free-and-easy and odd fellows' clubs. These appeared in the "Sporting Magnatine," which was published by John Wheelle, of Warwick-square, who became a kind friend to him, and was the cause of his being Market and the state of the second second second second different to him. ultimately an author. A sixpenny pamphlet called "The Thespiau Olio," with frontispiece, called "The Thespian Olio," with frontispiece, was the first attempt, and next appeared "The Odd Fellows' Song-Book," price 1s. with an engraved title-page. For Mr. John Fairburn, a print and hookseller in the Minories, he com-piled several annual song-books, for the frontis-pieces of which the father of the present George Cruikshank made designs. For the same publisher our author wrote a series of "Twelfth-Night Charaeters," and in Af99, veutured upon a volume on "The Life and Adventures of Pizaro," which extended to 150 octavo pages.

octavo pages. Mr. Wheble, before mentioned, had issued a prospectus for "The Beautics of Wiltshire," and persuaded Britton to undertake the work. Couaud science of his own deficiencies he hesitated, but strengthened by Brayley, he accepted the com-mission, and together they made two walking tours, and endeavoured otherwise to prepare tours, and endeavoined otherwise to prepare themselves for the task. In due time the "Beautics of Wiltshire" were completed in 2 vols. svo. (1801) to the satisfaction of the publishers; and at their invitation the joint authors immediately set to work on the "Beau-tics" of Bedfordshire." Eventually the "Beau-tics" of all the other counties of Encland were of all the other counties of England were tics." of all the other counties of England were published in 26 vols.; but only the first nine volumes were written by the original authors. Of the "Beauties of England and Wales," Mr. Britton says, in the notice of Brayley, before referred to :--- "Mr. Brayley wrote the greater part of volumes one and two, whilst I travelled over parts of Bedlordshire, Barkshire, and Buck-inghamshire for materials, and directed the whole of the embellishments and correspondence. The bistory of this once popular publication, which, though at first announced would be 'com-prised in about six volumes' and finished in prised in about six volumes,' and finished the space of three years, extended to no less tban twenty-five large volumes, and was in pro-gress of publication for nearly twenty years,

would involve a curious and rather lamentable exposition of 'The Quarrels of Authors,' and their dissensions with publishers, as well as certain caprices and forbearances of the latter. My own personal share and miseries in this drama were often painful, always perplexing and oppressive, as well as replete with anxiety and solicitude. At length the anthors separated, and engaged with the booksellers to undertake and be responsible for the writing of certain and engaged with the booksellers to undertake and be responsible for the writing of certain counties and volumes of the work. Hence Mr. Brayley agreed to produce the accounts of Herdrodshire, Hunturgdonshire, and Kent for volumes seven and eight, whilst I wrote Lan-cashire, Leicostershire, and Lincolnshire for the ninth volume; also Norfolk, Northamptouslire, and Wiltshire. London and Middlesex were next assigned to we have nearther but he finished next assigned to my late partner, but he finished only one large volume and part of another, on London, when he was superseded by Mr. London, when he was superseded by Mr Nightingale, who was employed by the pub isbers to continue and complete the history of the metropolis

the metropols." In 1805, Mr. Britton showed Josiah Taylor, the architectural bookseller, some drawings of ancient buildings, which it was thought were not e deulated for "The Beauties of England," and after a little consultation and deliberation, and after a liftle consultation and denormation, it was agreed to publish a new quarto work, entitled "The Architectoral Antiquities of Great Britain." A plan was digested, a prospectus was written, and Longman and Co. eugaged to take a third share in the work, and be the blacker ultrace rubbication. to take a third share in the work, and be the publishers. Hence originated a publication, which not only extended to five quarto volumes, and brought hefore the public 360 engravings, representing a great variety of old buildings of the country, hut many historical, descriptive, and critical essays. This work gave origin to a new schoolof artists, both draughtsmen and engravers, and to are concorting and size in subjections. aud to many competing and rival publications. It obtained great popularity, and was profitable both to the publishers and to the author.

The "Cathedral Antiquities of England," a anguificent work, was commenced in 1814 by the publication in a detached form of the "Antiquities of Salisbury Cathedral," and ultimately embraced a series of claborate illustra-tions of the entire cathedrals of England. In its completed form the "Cathedral Antiquities" occupy 14 vols, fol. and 4to. 1814-35, with occupy 14 vols. fol. and 4to. 1814-35, with npwards of 300 highly-finished steel-engravings. The ontay upon it appears to bave heen 19,008. The outlay on five volumes of "The Architectural Autiquities," was 17,002. The outlay ou "The Beauties of England aud Wales," is stated at 50,000. The production of these works was carried ou throughout under Mr. Britton's immediate uncontent leaves areas of the artister reaching in

The production of these works was carried ou throughout under Mr. Britton's immediate superintendence, many of the artists working in his own honse, and being trained to their task by himself; and the facility he thus acquired in the production of this class of publications led to the preparation of many other books of a similar kind. Among the illustrated works of which he was either author or editor may he named an "Historical Account of Corsham House," 1806; "The Fine Arts of the English School," 4to. 1812; "Historical Account of Redeliffe Church," Ko. 1813; "Illustrations of Fonthill Abbey," 1523; "Historical Account a staint kille, "Among the matched works of named an "Historical Account of Corshau House," 1806; "The Fine Arts of the English School," 4to. 1812; "Historical Account of Redelific Church," 4to. 1813; "Historical Account of Borth Abbey, 'D233; "Historical Account of Both Abbey, 'D233; "Historical Account of Both Abbey, Church," 1825; the "Public Buildings of London, from Drawings by A. Pugin," 2 vols. royal Svo. 1825-25; "Archi-tectural Autiquities of Normandy, drawn by A. Pugin," 1852-37; "Rietaresque Autiquities of English Cities," 4to. 1830; "A Dictionary of the Architecture and Archaeology of the Middle Ages," 4to. 1832-35; "A flistory, &c. of the Ancient Palaces and Houses of Parliament at Westminster," Jointly with E. W. Brayley, Svo. 1831-36; "Historical Account of Toddington, Gloncestershire," 1841; "Historical Notices of Windsor Castle," 1842; &e. &c. But bosides these Mr., Brittou has written on many subjects these Mr. Brittou has written on many subjects Lucse Ar. Britton has written on many subjects connected witb general literature, either as distinct works, or as contributions to literary journals. In biography, he published, in 1845, at Memoir of John Anbrey," and in 1848 an essay eutitled "The Authorship of the Letters of Junius Elucidated, including a Biographical Memoir of Colonel Barré, M.P." He also wrote the articles "Avchury," "Stone-henge," and "Tunnlus," for the "Penny Cyclonedia" Cyclopædia.

On the 74tb anniversary of his hirthday (July 7th, 1345), a number of his friends co-operated to invite Mr. Britton to a dinner at the Castle Hotel, Richmond, when eighty-two geatlemen were present, and Mr. Nathaniel Gonld, F.S.A. in the absence of the Right Hon. Thomas Wyse, M.P. presided. Letters were read on that occasion from men of the highest standing, in addition to those who were present, desiring to give him, in the words of the Mardesiring to give him, in the words of the Mar-quis of Nortbampton on the oceasion, "a proof of the sense his countrymen cutertained of his important services to the knowledge of mediæval architecture." His friends also determined to architecture in the for bin by a permanent testimonial, and a social gathcring called the "Britton Club" was organised to carry out the project. The testimonial, at Mr. Britton's project. The testimonial, at Mr. Britton's own suggestion, was eventually made to take the form of au "Antobiography," which he was to prepare and to print with the testi-monial funds, and on this he continued to lahour to the last moment. It will form a book of very considerable size, containing much eurious matter. It gives evidence, amongst other things, of the power the author of it possessed of making friends, and, better still, of retaining them. The social meetings of the Britton Club* have been held up to the present time, and will doubtbeen held up to the present time, and will doubt-less be continued in memory of one whom the nbers all regarded as a friend, irrespective of his claims as the pioucer in a course since followed hy so many, and with such good results. None cau question the important part Mr. Britton's works (produced in the face of difficulties) have played bringing about the present improved state of blie feeling with reference to our national public ' autiquities, in making obvious the excellencies of medieval structures, and leading to an improvement in our architectule. In the last letter addressed hy him to the conductor of this journal, -a letter written with the heartiness of feeling —a letter written with the heartmess of lealing that characterized lim, to express the pleasure with which be had read some observations in these pages on the completion of the Victoria Tower by Sir Charles Barry, and to praise the view of the Peers' Staircase,—he said,—"I am also gratified by the illustrations and account of the improvements at and about Glucester Cathedral. What a contrast does that edifice ensured extra-ple and interrells, the what Lond. present, externally and internally, to what I had to witness when I was there with young artists, and what is the state of information and of feelings in bishops, dcans, and others now compared with what it was then? Had 1 met with cordial receptions and courteous conduct from those persons at the heginning of the century, the 'Cathedral Antiquities' would bave heen the 'Cathedral Antiquities' would have been a different work, and the author's writings and opinions would have been different to what and opinions would bave been different to what they were when he produced fourteen volumes on so many cathedrals. It is also likely that his finauees would have heen mucb better at the age of 55 than they are." Mr. Brittou was a member of many Societies. He was connected for more than thirty-seven years with the Literary Fund, and for a great wert of the ime was one of its officers. He was

years with the Literary Fund, and for a great part of the time was one of its officers. He was shown in the second state of the second state Topographical Society," and was a member of the Council of the Art-Union of London. He was a follow of the Society of Antiquaries for "many years, but after his second marriage, when be saw a necessity for reducing his expenditure, withdrew from that and some other associa-tions.

His services to the national antiquities were recognised, when Mr. Disraeli was Chancellor of the Exchequer, by the grant of an annual pension of 757. His other resources were small, pension of 737. The other resources were solarly, and these have ceased with his life. Enclasvours are being made to obtain for his widow, who has ministered most materially to the happiness of the latter years of his life, the continuance of the pension, or, at any rate, the grant to her of any liter to go and moviment has will a smaller one, and we sincerely hope these will prove successful.

Mr. Britton was buried at the Norwood Cemetery, on Thursday, the Sth inst. and a depu-tation of the Council of the Institute of British

⁴ The club includes at the present time, the could', i Adder man Gubits, M.F.; Mr. P. Cunningham, F.S.A.; Mr. Godwin, Mr. Gould, F.S.A.; Mr. Grissel, F.S.A.; Mr. Charles Hull, F.S.A.; Mr., W. Tooks, F.R.S.; Mr. Thre, M.P.&s. i His farst wile clud on the olds of a draft, is:s.

Architects, including Professor Donaldson, Mr. C. C. Nelson, and others, in acknowledgment of bis services to their art, met the funeral on the ground. Mr. Petigrew, Mr. Gould, Mr. Lovell Reeves, Dr. Joseph Williams, &c. were also present

present. Let us add, as an act of justice, that Mr. Britton was attended in his last illness by Dr. Williams, who for five years has been his medical attendant, with a sou-like care, and has resolutely refused fee or reward. Nearly tweaty years ago, the writer of this brief memoir, then a student, received a testimonial from the Institute of Architects. Mr. Britton, at that time a stranger to him, followed him out of the meeting-room, cave him

followed him out of the meeting-room, gave him encouragement, and offered him his friendship. From that moment to the day of his death the intimacy thus commenced has been uninterrupted for an hour. We lament a dear friend w record the death of a public benefactor. We lament a dear friend while we

EXPERIMENTS ON DANTZIC TIMBER.

THE following results of trials of strength of heans of Dantize timber, under different con-ditions, although perhaps of small value to those happy ones of my professional brethren who luxuriate in the fruitful ways where restric-tion is unknown, choice of material abundant, and the fetters of a mutable price current are uuforged, may yet interest those who, like my-self, "Grandescunt aucta labore," more in the close walks of an economical practice, hedged in narrowly by thorny \pounds s. d. and also those who, like myself, consider timber a most useful and highly trustworthy servart, used within the "possible" of its elasticity. The trials to which I refer were made with

good samples of Dantzic, taken from the dock of Messrs. Lucas, Brothers, Belvedere-road, who obliged me with attentive assistance during who obliged me with attentive assistance ouring the experiments. The timber was 28 fect long, 14 in. by 14 in. cut straight, halved, reversed, and bolted together with No. 6 incb bolts: the pieces were blocked $1\frac{1}{2}$ in. apart. The stuff was strong, with the usual complement of long, sound knots, and one or more which would long, sound knots, and one or more which would not have been had for choice. So it is always with large Dantzic in long lengths. The bear-ing was 26 feet 10 inches. No. 1 had a l_{\pm}^{\pm} in. wrought-from serewed bolt, with inch plates, $3\frac{3}{2}$ in wide, $l\pm$ in. loug at each end, and the bolt was turned under a 2-in. iron roll, secured beneath the beam. The beam was then cam-bered an inch. No. 2, had no such adjunct and new cuite

No. 2 had no such adjunet, aud was quite straight. Irou straining-rods have but a dubious reputation, and it was to develope their real value that the experiment was principally made.

On loading No. 1 uniformly, with a dry brick wall, 18 in. thick, it lost its camber with about 4 tons, and then behaved as follows :---

|--|

in tons.		Inches.
6	deflected	.85
8	33	1.85
10	23	2.38
14	,,	3.25
15	,,	3.22

The load was borne passively otherwise than the deflexiou, and ou removing the load the beam sprang into its original straight form.

	No. 2 :-		
Uniform load in tons.	•	Inches.	
8	deflected	2.65	
10	22	3.20	
14	33	4.25	
15	33	4 80	

The load was not so graciously endured by No. 2 as by No. 1. With S tons it shook its cars, and spoke audibly; and witb the 15 tons, a knot or two had half a mind to opcu, aud the way was cleared for a let down, hut in a low days it may and the better town with it here

half at least more than should be permanently inflieted on so long a hearing, the tension rod saved 1 25 in. in deflection, certainly worth having. Had cast-iron ahutments been used,

With respect to No. 2, it appears that '4750 is the multiplier for elasticity, with good Dantzic; but no end of multiplication will be saved, and danger avoided, by using '4000. HENRY ROBERT ABRAHAM.

THE MAGNIFICENCE OF ROME. THE ARCHITECTURAL EXHIBITION.

ON Tuesday, the 6th inst. Professor Donald-son delivered the first lecture for the present session at the Architectural Exhibition in Suffolk-street, and illustrated it with uearly 100 drawings and diagrams. His object, he said, was to impress his hearers with clear ideas of the Magnificence of Romau Architecture; and he addressed his observations *ad populan*, and not as to a professional body. Dividing the buildings of Rome into two classes, sacred and scular, and these again—first, into temples and tombs; secondly, into fora, baths, aqueduets, theatres, and triumphal arches, the lecturer proeccided to describe examples of each, known to the majority of our coaders, pointing out in re-spect of temples the colossal size of the columns in some cases, the euormous amount of decoration applied, and the large expenditure : the shafts of applied, and the large expendence: the sharts of some of the columns must of themselves have cost thousands of pounds. The money for these works was obtained from conquered provinces, so that the outlay did not press on the Roman people. The columns of the Temple of Jupiter Stator were 60 feet high, and of marble. In some discass discussion, the Roman works were Stator were of rect high, and of marcle. In excellence of execution, the Romau works were never excelled. The Temple of Vesta, at Tivoli, was probably the work of a Greck architect, possessing all the refinement of the works of that people. The lecturer dwelt some time on the Pantheon, with its dome, 142 feet in diameter (that of our St. Paul's is about 100 feet), lined with brouze, its columns of yellow marble, and walls covered with a similar material. This was executed about 25 B.C. The hronze was partly gilt, and had an effect of which we know nothing here, such is the parsing of our Government their low ideas in matters of art. The eupola of the new reading-room at the British Museum is as uearly as possible the size of that of the Pantbeon; but our Government thought they had done much when they permitted an expenditure upon it of 5,000/. Passing on to the Baths, the professor showed that at one time there were more than S00 baths in Rome. The principal establishment occupied a site 1,300 feet square, or nearly as have a site 1,300 foct square, or nearly as large as that surrounded by the houses of Russell-square, and included noble halls, trees, colounades, statues, fountains, and seats of marble, produced without regard to cost, and forming a whole of which, in modern times, we have nothing to give any idea. The Pantheon formed part of the Baths of Agrippa. The Pantheon formed part of the Baths of Agrippa. There were libraries, too, and reading-rooms, and although, probably, they had no papers like the Times and the Builder, they there heard poets recite their verses and critics comment on the new works.

Describing the Forum of Trajan, the original condition of which is made evident to us by existing medals and other records, be alluded to the countless statues set up in honour of their the counties statues set up to nonour of their warriors, legislators, poets, architects, and others, and showed the inducement to exertion thus held out. The ancients had fewer books than we had. It was an old saying, beware of the man of one hook, and he sometimes feared that with the number of books that were produced, and we were forced to read, wisdom be-came more rare. Trajan's column, 125 feet high and 11 feet in diameter, covered with a spiral line of sculptured history, afforded him another theme. It was formed of solid blocks of marble Moral.—With the weight of 15 tons, once the section of the section

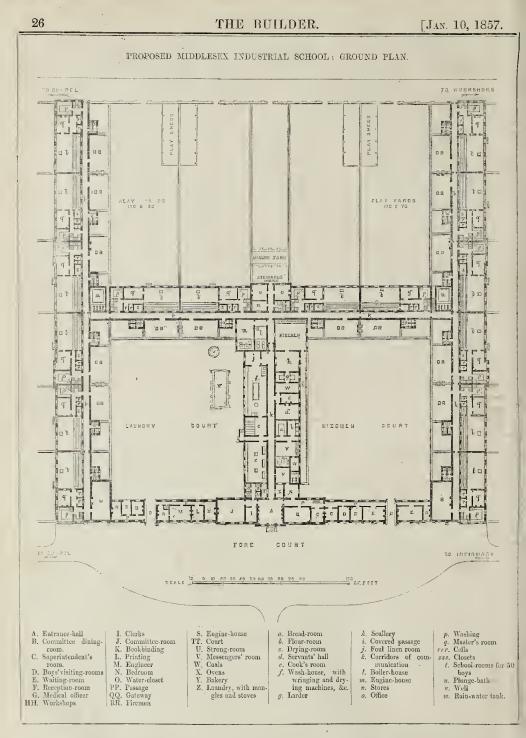

countless statues, and seats for \$0,000 persons. There were obelisks in all quarters : we quibble and hesitate at the outlay of a few thousands to bring home one that helongs to us. There were miles of aqueduets 100 feet high striding over the Campana, which brought floods of water into the city, and called into life hundreds of noble fountains.

Need we say anything more to convey an idea of the magnificence of ancient Rome?

GOTHIC AND CLASSIC.

In this age of mediavalism, one is not much surprised to read such an article as that by Mr. Surprised to read such an article as that by all. Scott, in your number for the 29th of Novem-ber, but I had certainly expected to have seen a complete reply to it in your pages, from other than the party concerned, as it is a subject in which all are interested. The writer seems to intimate that architecture consists of seens to intimate that architecture consists of but one style, and that style Gothie, subdivided into the Norman, twelfth, thirtceult, fourteenth, and fifteenth centuries, &c. and which is to be adapted to our multifarious wants, from the palace and cathedral downwards, throughout every grade of public and private requirement, from the most extensive manison to the smallest hut, and on through furniture, fittings, to, of course, "middle pointed" collars. But what really is the fact? what is the purpose of architecture? Is it not to enwrap our actual wants in the folds of *appropriateness* and beauty? architecture? Is it not to curve our actual wants in the folds of *appropriateness* and heauty? Very well, but are all other forms of heauty to be utterly ignored heside those prevalent during the twelfth, thirteenth, and fourteenth centuries, in the churches and other ecclesiastical buildings ? Are we to feast our eyes upon uought but pinnacle, and gahle, and buttress, and bool-winked windows? Are we to be coutinually mistaking theatres and other public buildings aud manorial residences for churches, schools, and colleges? Are our minds to be continually bent to the contemplation of ecclesiastical sub bent to the contemplation of ecclesiastical sub-jeets, granting, of course, that Gothic *is* the appropriate ecclesiastical style? Our patrons are too apt to be led by a pretty set of draw-ings, not having inclination to trouble them-selves much about the matter heyond the ex-tent of required accommodation; but I say, happy is the architest who has a client who does take a lively interest in the progress of does take a lively interest in the progress of art, and who has resolution and foresight enough to see beyond the passing fashion of enough to see beyond the passing fashion of the day, therehy setting an excellent example, and studying his present comfort, as classic architecture (when properly understood) will, I have no doubt, again become the adopted style of this country for public and private buildings. It has uever heen properly un-derstood and practised in this country but by the few, and, indeed, by them in most eases as servile copyists of the details of old Greek and Roman buildings—the same course eases as service copyrists of the details of our Greek and Homan buildings—the same course as that pursued in the present day by "Gothic architects" in churches, even to the reproduc-tiou of uscless pupistical piscinas, obsolcte screens, and disease engeudering sedilla—but any one who has had opportunities of *studying* of what classie architecture is capable, will readily perceive the universal fitness it possesses for the requirements of a rick, enlightened, and for the requirements of a rich, enlightened, and progressing nation, the readiness with which it adapts itself to the advancing inventions of the day, its chasteness when unadorned, its majestic presence when euriched, its adaptability to "common" wants in light, warmth, and venti-lation: all these render it far more likely to be (when there are architects employed capable of designing them), than the hard stony Gothie of the fourteeuth or any other century, as advo-eated by the "one-brauch" hands. Gother mansious erected in the present day

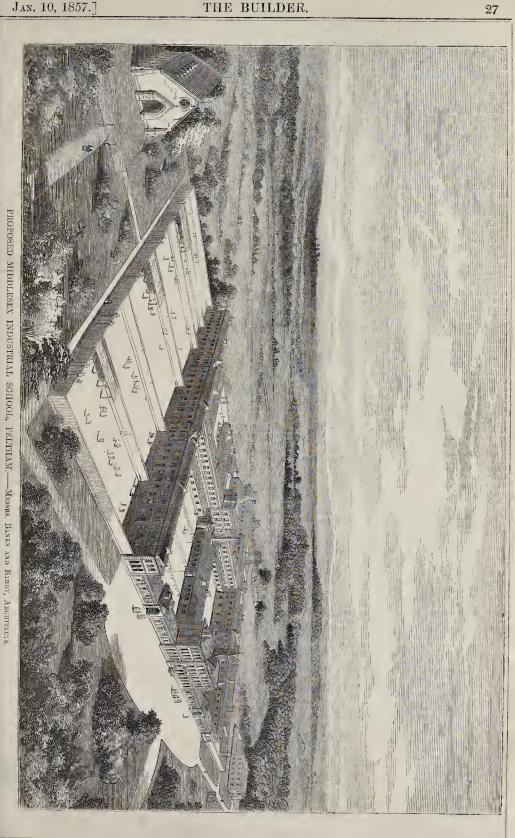

are a failure in the essentials ;- easements ad-mitting the external air in all seasons; fireplaces nitting the external air in all scasous; fireplaces so large that all the heat generated upon the comfortless "firedogs," is immediately trans-nitted to the nother heaven; open ceilings and stained joists, giving a general cold church-like air to them, very depressing and upleasant, and mixed with gaudy illumination with more colour than meaning, and certainly quite ont of place in a social establishment. THOMAS GOODCHILD.

The committee appointed by the Court of Justices for Middlesex, to provide an industrial School for Juvenile Offenders, have reported their proceedings, and have selected plans for adoption. The report says, a competition having been decided on as the best mode of obtain-ing decime ing designs,-

"Instructions were accordingly drawn up and circu-lated for the guidance of the architects; and, upon an ap-

MIDDLESEX INDUSTRIAL SCHOOL. THE committee appointed by the Court of Justices for Middlesex, to provide an undustrial School for Juvenile Offenders, have reported their proceedings, and have selected plans for adoption. The report says, a competition having for a schoel of obtain ing designs,— instructions were accordingly drawn up and circu-hated for the guidance of the architets; and, upon mark

THE BUILDER.

mittee to the designs selected by the appointed ferees, but to three designs selected by emselves, showing what we are forced to referces, themsely want of ingenuousness which will, call, a want of ingenuousness which will, doubtless, lead to reproof. In awarding the donotiess, lead to reproof. In awarding the prominus, they passed over not merely the plans selected for them by the architects they had called in, but the design that they now find "embraces all the attributes of au Indus-trial School," and is one they "can with con-fidence commend to the Court for adoption."

fidence commend to the Court for adoption." We would carefully avoid even seeming to cast a slur on the authors of the design ulti-mately selected : our objections apply only to the course pursued by the committee. Presided over by Mr. Edmand Antrobus, himself an artist, and a friend of artists, and consisting of gentlemen of the highest character, the inquiry, nevertheless, cannot be avoided,—" How is it that you have discrearized the onioin of those that you have disregurded the opinion of those you paid to advise you, and have awarded the premiums to three designs which you now de-

clare were not the best in the designs which you have de-design, and the plan of the ground-floor: the description we condense from the particulars given by the architects. 90 acres, 2 roods, and 27 poles of freehold land, at Feltham, have been purchased, as the site, for the sum of 6,0007.

The site being ocarly level, and therefore without much natural drainage, the architects have kept the ground floor of the building sufficiently above the ground, to allow of a free ventilation under it from side to side, as in their opinions, the best preventive against damp or deay of the floor timbers, or damp-ness in the walls or floors. The walls are promoved to be (for reasons of

agains animp or decay of the floor timbers, or damp-ness in the walls or proposed to he (for reasons of economy) exclusively of brick, advantage being taken of the use of red brick for the general surface, and white hrick for the quoins, strings, plinths, cornice, margins to windows, &c. The whole of the walls in-ternally are proposed to be painted on the hrick, to about 5 feet above the floor, to allow of washing being simply coloured or whitened. Since the entire editice is to be composed of a number of blocks of building, each suitable to the separate accommodation, by night and day, of fifty boys, with their master, the accommodation for each section is arranged on two floors, the ground floor con-taining the school-room opening on to the play-yard. There is a master's room overlooking both the school-room and also the play-yard, and a washing-room fitted with metal basins, and also with a copper for There is a master's room overlooking both the school-room and also the play-yard, and a washing-room fitted with metal basins, and also with a copper for hot water communicating with a such trough or bath, for washing the feet, or the entire person. It being left underided by the committee, whether day-rooms distinct from the school-rooms may be required, the assude trout the school-rooms may be required, the size and position suggested for these is indicated by the lighter tint on the plans. The upper floor con-tains the hoys' dornatory, calculated for fifty beds, cach 2 feet 2 inches wide, and 6 feet long, having spaces of 12 inches between each bed at the sides, and a wide accurate the feet and the field. and a wide gaugway at the foot, and providing 378 feet cube of air to each occupant of the room. Adfeet cube of air to each occupant of the room. Ad-joining, and overlooking the dormitory, is the master's bed-room, and outside the dormitory door, on the landing of the statictase, is a closet for use by the boys at eight in case of illness. Doors, dividing this corridor into lengths, are placed so as to perfect the division of the sections, and such doors would have one key in the possession of the master of the section to which they belong, and a master-key passing them all for the superintendent or steward. The school-rooms would he lighted from hoth sides, but chiefly from the outside *lenged*, so that the master, stand-ing on that side, would see all his boys at their desks. The size of the hlock of building, in each section, required for all these arrangements, is 72 feet long.

The size of the hlock of biniding, to each section, required for all these arrangements, is 72 feet long, by 28 feet deep, and two stories, or 35 feet high. The clear height of the school-rooms, &c. being 14 feet, and the clear height of the dormitories heing 14 feet. Separate play-yards are provided for each section, such play-yards heing about 170 feet long and 72 feet wide.

It may be here noted that the provision in each section of separate play-yards necessarily causes the huilding to he a good deal spread ont, and dictates also that it be only two stories high.

also that it be only two stories high. Six sections, of three pair each, as above described, are placed in each of the side facades of the building, giving accommodation together for 600 hoys, while 200 more (unking the entire 500) are provided for with like arrangements in the transverse building. The various domestic offices are placed in the range of building, extending between the steward's office and the entrance building, arranged on each side of a corridor lighted from above, and communicating thereby with the rest of the establishment.

The centrance front is occupied in the centre by the main or entrance huilding, three stories high, in which is provided a spacious cutrance-hall, on one side of which is the visiting committee's room, clark's room, washing-closet, water-closet, and fire-proof room for papers; and on the other side a dining-room for the committee, and the superintendent's or chap-hui's office lain's office.

lain's once. Plaos are also given for the chapel, the industrial work-shops, the infirmary, and the entrance-lodge, all in separate buildings. The entrance will be from the road between Feltham and Bedfout.

Feltham and Bedfout. The water-supply is proposed to be drawn from a well to be dug in the kitchen-court, ocar the steam-engine, whence it would be lifted into tanks in the hyper part of the carter building of the north and south fronts, containing together 15,000 gallous.

The estimated cost is 38,950%; and if the Day-rooms be added, 41,760/.

COPYISM AND DESIGN.

IN a few instances the assertions with regard to designing by copy are not convincing. Though an architect be dependent on examples for his first efforts at any production, he may be indefirst efforts at any production, he may be inde-pendent of everything previous in the result of his compositions. All the designs extant at the present day have not originated in their respec-tive authors, but rather, it may be said, they represent the conceptions of great men in di-ferent ages of the world; and these premises may be established throughont all time, should we even go hack to the earliest records. And e cveu go back to the earliest records. And is evident that the form and construction of the first classic temple, built, according to Pliny, several years before the Trojan war, was faithcarried out by every conqueror and archi-

fully carried out by every conqueror and archi-tect for subsequent centuries, until the Christian doctrine was established in many Pagan basilies. The Parthenon was not the original idea of the Greek quadrangular temple, any more thau Salisbury Cathedral was the first effort at Gothicism in England. Architectural study was scholastic long before; and from the cir-cumstance of Carpio having written a treatise descriptive of the edifice, it would appear that the Acropolis exhibited the glorious result of infancy when artists were found who could carve such pediments, and work to the models of a mater gemins, leaving to posterity an of a master genins, leaving to postcrity an almost indestructible example of classical perction. That there were earlier temples of the mc form is not only evideut, but it is certain at, in the transfer of art to the Roman empire fection. that. in subsequent contricts, the other bound contri-rectly copied, and very little improvement was found necessary, save in mouldings and decora-tions. Unlike some other efforts at progress, tions. Unlike some once caora a provide a some one of the some of huilding has left historical monuments of its advancement on the surface of the carth. These are visible to all persons who choose to study or admire their principles or beauties; and from their very position they influence the student, insomneh that copyism is the natural consequence

Apathy may lead a mau astray, with respect Apainty may read a that astrong, new representation of the previous of the greatest error possible is to imagine, that because a first class edifice has some similarity in its outlines to ancient models, it is no longer original on the part of the designer. The moment some critics perceive any parallel between an elevation and an existing palace or between all carefulct and an extra place it temple, the architect becomes service in their estimation; and he is reproached as a copyist because details of the same description may be seen in a well-known city. Though aware that seen in a well-known city. Though aware that architecture is, more than the other arts, limited within impassable barriers, and hounded by straight and visible outlines, they argue in an indefinite seuse, as if absolute originality in design were intuitive, without learning or practice. But, by the very programments proceed in the But, by the very arguments upheld in the canse of novel variety, the reader is often brought into a narrow compass of reflection, and is compelled to acknowledge that definable axiom, which paralyzes many an effort at heterodoxy, in the words of St. Augustine, " pulchritudinis forma unitas est." " Omnis porro

Edinburgh showed a spirit to emulate Athens without derogating the talent of the artist ; and 20

[JAN. 10, 1857.

The entrance front is occupied in the centre hy the London owes the best of its modern improve Longon owes the dest of its hotern improve-ments to an innovation, wherein copyism took the lead, and talent completed what was necessary to harmonize fine ideas with imme-diate utility. Where beautifully applied, the reiteration of former works to nodern edifices, second the called service activation and more cannot be called servile copyism, any more than the use by Hermodorus, in Jupiter Stator, of the forms in the Temple of Diama at Ephesus, by Chersiphire, built eight centuries previous to the Augustan age. Otherwise the citize to the Augustan age. Otherwise, the citics of England would still be adorned by Laugley's Gotbic varieties, or the cubical masses of i gance proposed by Morris, in his theory of har-monic numbers. The Colosseum of Regent'spark is surcly not copied from the Coliseum, and if it bear any significant resemblance to what has been ealled the Pautheon, it must be in the inaggitation of persons who are influenced by mere outward shape. Many other modern institutions hear the impress of similarity to ancient structures, which, on account of their fitness for the purports required, lose the fault of being so with servilism. Therefore, it is of person consequence to the world, where a nubles of being so with servitism. Therefore, it is or no consequence to the world, when a public building is heautiful, nseful, and economical, if some of its outlines have been borrowed from the wreak of ages. It is immaterial whether the genins of Michael Saumichelli has suggested a new hall in Manchester, or that the Stones of Venice have been translated to an extensive Vermee have been transition to an extensive warchouse in the same eity when one has the merit of being externally characteristic of its internal application, whilst its sculptures are indiciously effective, and the other is a landable effort to render mereantile pursuits aristocratic; but, apart from all feelings of originality as to design, such buildings seen upon a foreign shore would command much admiration.

Not only were the principal outlines of classio nes carried out successively in buildings, but imitations were made in the carvings, proving imitations were induc in the carvings, proving that a similar spirit influenced the architects. The metopes of the Temple of Theseus, at Athens, were ten panels of figures, showing the lybours of Hereules, in bas-relief, and on the eight metopes in return were the achievements of Theseus; casts of which may be seen in the British Museum. In the Temple of Minerva, on the Acropolis, the frieze of the exterior wall on the Aeropous, the frace of the extends wall of the cella is decorated in bas-relief, by a pro-cession to the same temple, during the Pana-thenaie festival. The melopes contain two figures each, in alto-relievo, illustrating the battles of the Centaurs and Lapithæ, at the muprials of Pirithous. One of the pediments represents the Birth of Minerva, the other, the Dispute between Neptune and Minerva con-cerning Attica. And, in later years, the frieze of the Forum of Nerva was decorated, in bas-relief, with Minerva superintending the Manufactare of various Articles. In like manuer, the fathers of mediaval architecture knew too well the value of such embellishments; and, setting aside the mytho-logical, they indirectly copied the ancients, sub-stituting subjects from the Pentateuch, the is decorated in bas-relief, by a of the cella

logical, they indirectly copied the ancients, sub-stituting subjects from the Pentateuch, the psalms, the prophets, and the parables. Three arches at Malmesbury are carred with scrip-tural lessons, the first with *tableaux* from the Creation to the death of Abel; the second thence to the building of Solomous's Temple; and the third, from that period to the termina-tion of the abcord mylitert. The sangeding for and the third, from that period to the termina-tion of the church militant. The spandrils of the arches, in the chapter-house of Salishury Cathedral, exhibit Abraham entertaining three angels, and Sarah standing in the tent, Isaac blessing Jacob, and Kehckah standing beside; the patriarch's hand on his son's breast, Jacob hiessing his sons, Pharoal's two dreams, and fuelter on-sail scuburing. the general of the second sculpturing the genealogical on. Michelangelo boasted of further on--all sculptoring the genealogical line of redemption. Michelangelo boasted of taking the dome of Milan as a copy, and sus-pending another in the air, over St. Peter's, at Rome, aware that he gained more than he lost by initating such eminent masters as Bramanle and della Francesca. Cano transferred the architecture of Italy to Madrid, and Guarini to Prague, Lisbon, and Paris, preferring the modi-fication of what they studied to grotesques designed for novely. Sr Christopher Wren was tormented about bis initiations, and also in other ways, during further on-all

his initiations, and also in other ways during his professional career. Though not altogether agreeing with him, in bis mauner of bandbing

the art, it may not be amiss to note a few of merely in practical and theoretical architecture, his observations in refuting some charges brought against him. The reason why he used two orders in St. Paul's Cathedral was because he could not find stone large enough in our quarries, being at length compelled to use Port-land, and there the strata nearest to the sea. Bramante had the quarties of Tiroli for St. Peter's, and could follow out one order of that magnitude : whereas, were Wren to make his columus larger than 4 feet in diameter, he could find no stone sufficiently large for eutablatures. He doubled the pilasters on the outside, to make space for larger windows, and to regulate the areades of the roof. He doubled the columus of the portico, to make doubled the columns of the portico, to make room for doors, because the same was done in the Temple of Peace at Rome, and the cupola of the Temple of Bacchns, near St. Agnes's Gate, at Rome, was supported inside by twenty-four coupled composite Oriental granite columns; and because Bramante and M. Angelo used coupled columns wherever they wished to do so. He set the centre columns further apart for the doorway, an example heing found in the partico. doorway, an example being found in the portico of Sta. Maria Maggiore, at Rome. The archi-trave within the cathedral is cut off by the by the arch, because the architrave does not lie from column to column, but from column to wall, the same heing done in the Temple of Peace; and where there are no arcades, and next the dome, he continued the establature. He incor-porated small pillars of the same order into larger, observing that Vitruvius, in the basilio pillars to support the galleries. The pitch of the cupola is thus determined : the Pantheou is the cupot is thus determined, the random is only one diameter of the dome, which he con-sidered too low; St. Peter's was elevated to two diameters; and Wren, imagining the latter too high, chose a mean proportion between both, for St. Paul's Cathedral.

These quotations will be found in the Parentalia, by any reader who wishes to make re-ference; but still, who can look upon that magnificent edifice as a whole, and fancy for a moment that its illustrions architect was in-fluenced by meagre copyism?

FRANCIS SULLIVAN.

THE ARCHITECTURAL PUBLICATION SOCIETY'S WORKS.

VII. of the "Dictionary," PART now issued, containing a portion of the letter C, shows, like the previous parts, a care which, if continued, will cause the work to be an acknowledged standard for reference on all subjects connected with architecture. The wile range of its contents should he sufficient to place it on the shelf of all the members of the profession; and amateurs and others interested, profession; and annueurs and onners interescent whether in the art or science, ought to aid the society hy subscribing. We are glad to see that the hist of members lately issued has the advau-tage of many new names; but the total number is much below that which a publication of really mational importance domands and each to here national importance demands, and ought to have This occasions, of course, a comparatively small quantity of text to be issued, for the committee can only spend the amount which is received anually: double the quantity could he issued to each member with double the number of subseribers. After the reiterated complaints for many years of the absence in England of a professional work of the same extent, now that one so complete has heen commenced, it is most injurious to those concerned that there should by any lack of support; and we trust that the example so creditably set by his Royal Highness Prince Albert, who, we see, has subscribed for three copies, will be immediately followed by many of our readers. It is announced that *illustrations* for the

current year are in the hands of the lithographer, and that a title-page will be sent out in the next part, so that members will be enabled to bind up the letters A and B with their illustrations, which will tend materially in making the work mattle. readily accessible.

but in timber, geology, and chemistry relating to building : the biographical notices are interesting, from their completeness and novelty, and would form a valuable work in themselves, especially if arranged according to the form shown hy Gwilt, in his "Notitia Architectonica Italiana". Scarcely any cothedral town but is Italiana." Scareely any eathedral town but is illustrated by a series of its dated buildings, and great interest attaches to the descriptions given of the works of people whom it has hitherto been the fault of our best writers to regard as barbariaus in art. The Asiatic and American remains are particularly noticed; and we are glad to have clear explanations of those Oriental terms used in building which are now becoming familiar in art publications.

SCULPTURE.

THE statue of General Sir Charles Napier, which has been set on the pedestal in Trafalgarsquare since our notice of August last was written, is not more satisfactory in effect than we feared would be the case from the model. to back difficult to see on what grounds our contemporaries of the daily press award their praise in matters of art, as it has been to underpraise in matters of art, as it has been to under-stand their censure. The statue is ill placod : it fails as a public mounnent, because it wants architectonic character; and the senlpturesque treatment, which was heavy in the plaster, is more so, and is false in very principle, in the bronze. Truly, our sculptors lately, though second to none in Europe, have not becu acquit-ting themselves creditably, at least in monu-ments out of doors. The necessity, and at the ments ont of doors. The necessity, and at the same time the good æsthetic principle, of a modification in the form, when there is a change in the material; and certain requirements of grouping, very obvious to architects, which belong to the effect of every statue on a pedesbelong to the effect of every statue on a pedes-tal, and every public momment, are becoming habitnally neglected. Those who would infer that we should do hetter by employing foreigners, may observe the momment to officers of the Guards, erceted in St. Paul's Cathedral, with its own fanlts, in the use of contradictory principles as to initiation, —not to mention the ill-out lettering of its inscription. We must take some opportunity to inquire into the course for correcting these growing defi-ciencies in a noble hrauch of art.

BUILDING TRADE PATTERN-BOOKS.

WITH reference to the endeavours of manufacturers to bring the articles they produce under the notice of architects and others, hy means of illustrated circulars and trade-lists, to the waste of time, trouble, and therefore money, cansed by the inadequacy for practical purposes of the information they generally supply. Mr. Digby Wyatt has addressed the following obser-vations to the Society of Arts :--

" Witbin these last few weeks I have received, as "Within these last few weeks I have received, as have, no doubt, very many others in my profession, some half-dozen picture-books, many evidently got up at very considerable cost, and evidencing a most satis-factory progress in design and technical ingenuity. Of this half-dozen, scarcely one gives any notion, either by scale or figuring, of the size and substance of the objects represented: prices are either not at all indicated, or, if indicated, are expressed so raguely as a for more mule whether to the scale ace of the

to form no guide whatever to the real cost of the

What an architect really requires, if these pattern-books are to be of any nse to him, are the following conditions :---

Each object (if in the least degree complicated) to be given in plan, section, and elevation. 2ud. Each object to be drawn to scale, and the

scale put npon each plate. 3rd. Each object to bave its leading dimensions

figured as well. -4th. The hest mode of attachment of each object to

adjoining work to be clearly shown. 5th. Such a concise description of each object to he given, as to enable the architect to define the same in his specification, without risk of confusion or

or any neecssary process not included in the first price quoted

quoted. Illustroted price-lists of articles for the use of all persons connected with the building trades, prepared in accordance with the preceding conditions, become most valuable sources of reference to professional men ; whereas, if only pretty picture-books, they are just looked over, thrown on one side, and then either put way the becknown on one side, and then either put way the becknown on one side, and then either put note a very other on one sing, and then either put upon the holosbleves, perhaps never to be taken down again for years, or, after lying about for a week or two, are therown into the waste-paper basket, as of no use. On the other hand, in an architect's office, a well-arranged pattern-book is constantly referred to, and articles are drawn and specified from it, of course and articles are drawn and specified from it, of course to the bencfit of the manufacturer. If an architect knows that Brown's No. 3, or Jones's 24, or Robin-son's 102, are just the right style and size for Mr. Smith's bouse, which he has got to build, and will cost such an amount as he thinks Mr. Smith can afford to pay, he at once determines to introduce the decreased products. aforcsaid numbers 3, 24, or 102, although, very possibly, some other manufacturer may, at the very same time, be making hetter and handsomer articles at a lower price,

Let us suppose that, seduced by a pretty picturehook, without scales or prices, the architect is tempted to write respecting some work he wants done, to the person who sent him the aforesaid picturehuok. He receives a reply, giving bim the particulars book. He referred a tepy, group out to have supplied, and from the mannfacturer's note he learns that the article he supposed to be about 4 feet long is 0 feet 6 inches; and that what he expected would cost 5/, will cost and that 77. 10s. 77. 10s. He thea writes to know if size and price can be modified. The manufacturer says, in return, that any modification can be made; will the architect send a sketch? The architect makes his sketch, and send a sketch? The architect makes his sketch, and the manufacturer finds that the alteration, although diminishing the quantity of material, will, through the additional halowr, eost more than the original 77. 10s. The architect does not think the article worlb the woney, and, in his client's interest, declines to purchase. Every one has had his trouble for nothing, and discontent is, of course, the result. If even the article should he procurable at the architect's price, 57, the 5s, his commission will procure him in return for his own and his derk's time wasted, offers no very for his own and his clerk's time wasted, offers no very great premium to future transactions with the sender

great premium to inture transactions with the sender of the pretty but foolish picture-hook. Pray, believe that I an drawing no fanciful picture, but one of daily occurrence. My only inducement to sketch it has here my sincere belief that, in the rapid introduction into the building trade of improvements in the quality and technical treatment of old and new materials, lies the secret hope we can have of an ulti-mate escape from the enfeebling tradition in architecture to honourable and national originality.

MENTAL CALCULATION.

THE interesting exposition of his system The interesting exposition of his system of mental calenation, which was made hy Mr. George P. Bidder at two meetings of the Insti-tution of Civil Engineers in February, 1556, and noticed at length in our last volme, page 133, has been set forth in the printed "Proceedings," with considerable ability on the part of the editor, Mr. Charles Manby. We need only remark, after having looked through this report of the facts and argenments which were broncht forfacts and arguments which were brought for-ward, that it is clear more might be done in arithmetic by mental calendation, were proper attention given to it in schools. This, however, attention given to it in seniors. This, however, is not the only matter of suggestion which we derive from Mr. Bidder's arguments. The iden-tification of numbers with defined ideas—as, for example, the numerical dimensions or divisions of an area, with its visible dimensions or parts the suggestion of a rational system of nemoria technica which opens out; and the intimacy of the relation hetween number and form, seem to us to extend the subject to matters not more closely counceted with the professional ealling and the study of architecture than with the now admitted desirableness of general instruction in drawing, and even through every bearing of the question of education.

THE BUILDERS' BALL.

Willis's Rooms, St. James's, on the Aт 12th February, the annual ball in aid of the Builders' Benevolent Institution will take place, as our readers may have seen from the first To those of our readers who may not he aware of the scope of the "Dictionary," we would mention that its object is the statement of *facts*, and not of *opinions*, upon the old and new words, which at the present time occur not be aware to prohable cost of faing, painting, gilding, a little hard cash to its funds; but one cannot

feel satisfied with even this measure of success, so long as it is remembered that the huilders, who are ever occupied in the crection of substantial almshouses for all sorts of of showing an annual annual and a set of the object of their philanthropic amhition, hut such meetings have already proved hemselves to he highly canable of aiding towards the speedy attainment of the object in view, and all in-terested in this ought to regard it as a sacred terested in this ought to regard it as a saturd duty to assist all legitimate means of exciting a common feeling in its favour. In the present instance, what they can do is to swell the list of stewards themselves, and to canvas amongst their friends, so as to extend the common mterest on bchalf of the Builders' Ball.

PROVINCIAL AND CHURCH-BUILDING NEWS.

St. Ives. - The improvement of the church St. *1ees.* — 100 miprovement of the entropy here is going on, and an addition has just hecon made by the crection of a reredos, of carved stone, with illuminated panels, having the sacred monogram in the centre. The Decalogne, Lord's Prayer, and Belief are inscribed on each its of the centre. Lord's Frayer, and benef are inscribed on labor side of the reredos, in the old church text. The stonework is by Mr. Hide, of this town, from a design of Mr. Scott's; and the illuminated writing, decorations, & have here accented by Messers, Harland and Fisher, of London.

Messrs. Harland and Fisher, of London. Market Harborough.—The project for a Cora Exchange, at Market Harborough, is said to be likely to be successful: 200 out of the 300 shares are now taken up and a deposit paid upon them, and it is expected that the other 100 will shortly he allotted. A number of donations have also been given, which will in-ergon the funde. crease the funds.

Beaconsfield. - Attention is directed to the Determining which are being made to restore the ancient church of Beaconsfield, in Bucks. The Beaconsfield churchyard contains the tomb of Edmund Waller; and within the church itself is a Edmund Waller; and within the chiffer itself is a poor tablet in memory of Edmund Burks, whose remains arc deposited heneath. It is a reproach to the country of Waller and of Burks that no fitting memorial has yet been placed above their ashes. The church itself is in a half-ruinous condition. Rymer's inscription on the tomb of Waller is the underlaid in the Walley itself works. condition. Hymer's inscription on the tomb of Waller is mouldering into illegibility. The Rev. John Gould, rector of Beaconshield, has made an appeal in behalf of the edifice and its illustrions dead; and an ample fund will, doubt-less, he raised. A committee has been formed for the purpose of earrying ont Mr. Gould's plan of restoring the church, and replacing the monuments by others more worthy of their objects objects.

objects. *Quarrendon.*—The Rev. J. C. Wharton, vicar of Bierton, is endeavonring to organise a fund for the fencing round of the church of Quarren-don, so as to protect it from further mutilation and spoliation.

Alcester .-- It has been resolved to erect a new Corn Exhange here, on a site adjoining the Bear Inn, in High-street. The sum required

for the project is 1,500%. Shretosbury. — A memorial window of stained Shrevebury. — A memorial window of stained glass, is in conres of crection in the inner vesti-bule of St. Chad's Church, Shrewsbury, to the memory of the late Mr. T. Smithenan Edwardes, of this town. The subject of the window (which is 15 feet long and 6 wide), is "the Ascension." It was executed by Messrs. J. Hardman and Go of Birmingham. This memorial has been provided by Sir Harry Edwardes, hart. a rela-tive of the deceased. tive of the deceased.

Wednesfield Heath. - A few years since, Wolverhampton gentleman provided for the spiritual wants of the inhahitauts of the rapidly growing village of Wednessfeld Heath, by erecting, at a cost of 6,0004. the church dedicated to the transfer decistate of the existing feeling on the subject, that two intervals to the church dedicated to implement the Holy Trinity. The necessity of a parsonage house and schools then became apparent, and the varying out of the latter object the requisiter time is grievously increased. And the foundation of the schools has in any case the requisite time is grievously increased.

been laid, and the works are being proceeded with as expeditionally as the weather permits, hut funds are still wanting. It has heen deter-mined to erect the schools large enough to accommodate 120 boys, 80 girls, and 150 infants

Ladywood (Birmingham). — The new schools in connection with St. John's Church, Lady-wood, were opened on Monday before last. The total cost of the erection was 3,100%. In addi total cost of the erection was 5,100. In admittion to school-rooms, there is a residence for the master, and land for three separate play grounds, each overlooked by the schools. The building consists of one large room, to be for The building consists of one large room, to be divided by a wooden partition into a boys' and girls' school.

Stockport .-A window has just been erected in the parish church of Stockport, at the cost of Mr. James Newton, of Cheadle Heath, to the memory of bis mother. The subject is the three Marys with the Angel at the Sepulchre, after our Lord's resurrection. The window bas been executed hy Mr. Hedgeland, of St. John'swood.

Cawood (*Yorkshire*).—Gasworks have been erected and opened at Cawood. The capital is 1,2002, and the shares amounted to 22, each; 1,200*l*. and the shares amounted to 2*l*. each; and they now bear a premium of about 10s. The works, according to the *lork Herald*, were contracted for by Mr. Knapton, and they have been completed within about two months of their commencement, at a cost of nearly 1,000*l*. They are situated in Sherbnrn-street, close to Bislop-dyke, and near the old castle; and the hrickwork has been excented by Mr. Bedford, of York. The patent dry gasholder stands on iron pillars: it is 25 feet in diameter, and 10 feet in depth, and will contain 5,000 feet of gas. By having a dry casholder, formed partly of feet in depth, and will contain 5,000 teet of gas. By having a dry gasholder, formed partly of the gas does not condense so much as in the ordinary gasholder. The expense of making a tank, &c. is also saved. Gasworks on the same clark ellowerd, Newbrough Park, Lord Wharn-ellöres and other places in the conducty, and gas eliffe's, and other places in the country, and gas has been introduced into several coal-pits has been infroduced into several consist of lim. The street mains at Cawood consist of 243 yards of 4-inch, 132 yards of 3-inch, 950 yards of 2-inch, and 740 yards of 1-inch iron pipes. There are twenty-eight public lamps in the town, and all the shareholders are gas consumers

North Shields.—A gentleman belonging to North Shields has offered to head a subscription for building au infirmary in that town with the sum of 2001.

Gourock (near Glasgow.)-The ceremony of tourock (near Glasgow.)—The ceremony of laying the foundatiou-stone of Gourock Episcopal Chapel took place on Saturday week. The stone was laid by Bishop Trower. The chapel will he in the Early Decorated style of archi-tecture, and will be seated for 120 persons.

THE EDUCATION QUESTION

I SIALL feel glad at heing permitted the use of a small space in your columns, in order to contradict an impression which appears to prevail in some quarters, viz. that it is the object of the Architectural Associaviz. Insi it is the object of the Architectural Associa-tion to revive the question of a professional diploma. That such is in no degree the aim, or even the wish of the present committee. I can confidently assert, and I wish to do so, hecause I conceive a contrary impression calculated to do harm to the cause of architectural education, to which alone their efforts are directed. cause of architectural education, to which alone their efforts are directed. The recent letter of the Asso-ciation to the Royal Institute, published by you, is identical in principle, and in no way goes beyond the memorial of Mr. Kerr. It asks for the esta-blishment of "examinations founded ou certain ac-haowledged principles, and defined courses of study." This, while it probably involves the ultimate granting of degrees, by no means does the institution of a mea-This, while it probaby involves the animotogramous of degrees, by no means does the institution of a pro-fessional diploma. It is worthy of notice, as indi-cating the existing feeling on the subject, that two memorials to the same effect should have emanated

It is this right direction, permanently afforded, which the junior memhers of the architectural profession It is this right direction, permanently afforded, which the junior memhers of the architectural profession are seeking from the elder, and which in every other they receive. If the Royal Institute will take the position it has the power to do in this matter, it can scarcely full to greatly increase its influence and con-sideration, and in my own opinion the recent question of analgamation will speedily receive a natural and desirable solution. desirable solution.

A MEMBER OF THE ARCHITECTURAL Association

HOUSE-BUILDING.

HOUSE-BUILDING. Onservine in your valuable paper of last work a in the present Building Act, I beg to suggest the secessity of inserting a clause obliging builders of the surface of the ground-joist at least two clear feet above the surface of the ground, and likewise of hyground-joist, to prevent it ar rising of damy, the proor occurrent of wheelings, and is the mother with ground-joist, to prevent it ar rising of damy, the proor occurrent of the dawning of the surface of the ground-joist, to prevent it ar rising of damy, the proor occurrent of state or lead under the plate of the ground-joist, to prevent it ar rising of damy, the surgestions will be obvious; for the meaw ho gene-them, and is nine cases out of tm, build to sell; and they capitalist who may purchase ten or a dozen, or the proor fregal artisan who may purchase one, is alike viate of or running out of it; and the damp, once in the plate, is perfectly incurable, and the tenant is obliged leave; so that the landlord, instead of getting a fair inter and all other expenses, just because the abip has here poilt for a half-penny worth of tar. T. T.B.

THE GUILDHALL LIBRARY.

THE GUILDHALL LIBRARY. We have hefore now referred to the very great value of the hooks, manuscripts, drawings, and plans which are stored up in the library at the Guildhall, and which at present are almost mused. We have never seen more than three or four readers, and that was at a time when the reading-room at the British Museum was closed. No one can he more attentive than the gentleman who fills the post of librarian, but there is something here so quiet, so close,--something which it is so difficult to, cxpress, but which must have struck most readers who go to this place--you fiel that the books are so little looked at, and the worthy librarian so filted accustomed to visitors, that you are afraid of giving trouble. At the British Museum, one thinks nothing of smaling up the tickets for filty or sixty little accustomed to visitors, that you are arraid or giving trouble. At the British Museum, one thinks nothing of sending up the tickets for fifty or sixty hooks in a day, and also availing oneself of the use at the same time of any of the 10,000 or 12,000 volumes which are in the reading-rooms. The value of the Guidhall library is not sufficiently known, otherwise it would he more visited, a note from a common conneilman, or any known functionary of the Give here areflicing the values

the City, heing sufficient for admission.

the City, heing sufficient for admission. It has here recently determined (we are glad to hear) that measures are to be take ut the City library more generally nseful. A catalogue of such books as are proper to circulate is to he made out, aud measures taken to lead certain volumes to the *members of the corporation*. This is well, so far as it goes, hut it would he hetitor to extend this privilege, under proper restrictions, to the families of respectable elitzons generally, although not members of the cor-poration. poration.

RE-NAMING THE STREETS.

RE-NAMING THE STREETS. As the author of a pamplet on "Metropolitan Street Nomenelature," which by a portion of the press has heen recommended as "well worthy the attention of the Metropolitan Board of Works," and concerning which I have a letter in my possession from a gentleman of the highest position, and eapable of judging of such matters, wherein he says, "I am sure any one who reads your pampliet will be satisfied that the present state of things ought not to exist longer than is absolutely necessary," — I trust I may consider myself entitled to trespans briefly upon your columns, in reply to your remarks of last week upon this subject.

"Brougham." I am not surprised at this. There is no necessity for disturbing either Great or Little Queen streets: they are each specific names; hut in my pamphlet I have suggested how to deal with the two classes of streets so frequently repeated. "King' and "Queen." By my plan the "memories of London" would not have heen destroyed, but perpetuated. I have proposed to append to the several King and Queen streets (leaving those at Cheapside to remain) the names of the several kings and queen of England. I have a precedent for this. We have already the following.—King William, Heury, Edward, and John, streets: we might have James, Charles, Richard, Stephen, &c. Ann is the only instance in respect of the Queen street. According to my plan, Queen-street, Tower-hill, might he called Queen Jane-street ; to the remainder we might append the names of Adelaide, Charlotte, Caroline, Mary, Elizabeth, Katberine, Eleanor, Henrietta, Boadicea, &c. Queen-square, Allomshury, might remain, and to Queen anglat, without contais: the badded. There is another class of streets—Charch-streets— about sinty-six in number,--numerous, it must he ad-mitted,—but as they have reference to so many

There is another class of streets—Charch-Streets— about sirty-six in aumber,—numerous, it must he ad-mitted,—but as they have reference to so many churches, and consequently localities, they are still not so numerous as the churches of the metropolis. In my plan I propose to prefix the localities, or names of the parish churches; as Paddington Church-street, Jimehouse Church-street. Here again the "memo-ries of London" would be preserved. Another instance, of revising the productions of

ries of London " would be preserved. Another instance of reviving the recollections of London would follow from adopting my suggestions. I will give two. There is Queen's-road, Bayswater, recently so named, out of a false notion of loyalty. I would, in the revision, place that back to its original name, Black Lion-lanc, so called formerly from the Black Lion Tavern, in the Bayswater-road. Several of the nobility, and royalty itself, do not dislain to oreside in a lane (Park-lane); therefore the inhabitants of old Black Lion lanc could have nothing to complian d. The other instance is in regard to Cambridge. of old black laon have could have nothing to complian of. The obser instance is in regard to Cambridge-road in the cast, formerly called Dog-row, from a tavern named the Black Dog, which, too, is now altered to that of Albert. I need not say that this road should return to its original name.

road should return to its original name. If, as I have suggested, in undertaking this matter, the Board of Metropolitan Works had availed them-selves, or were now to avail themselves, of the services of a few gentlemeu of "historical knowledge, research, and taske," the "memories of London" would he revived, and an entire revision of the streets of London, rub as the Lorich turn based in the sheed in their such as the Legislature last at length placed in their such as the Legislature has at length placed in their hands, if judiciously managed, would (allowing ample time hefore the various changes were made) give in the long run general satisfaction.

Bull run general satisfaction. Should you now, sir, take up my book. I heg to make this one observation,—it was written last Sep-tember. The Post-office plan of dividing London into ten districts had not then heen made known. Following my own notions. I had divided the metro-polis into eight geographical districts, with the view of the reduction of the names of the frequently-repeated streets, so that there should have been hat repeated streets, so that there should have been hat none left standing in each district. Now the town is divided into ten districts, I should be inclined to forego that plan, and adopt that intimated by the Legislature, of baving but one of each specifically manned street in the metropolis. And so confident do I feel that such a plan is practicable, I would, as I thave intimated to the Board of Works, readily under-take the task, satisfied that it requires only applica-tion and expressions in clifet it. ition and earnestness to effect it.

W. GALLAWAY.

** The pamphlet referred to, which is published by Clements, 21, Little Pultency street, deserves atten-tion. We repeat our exhortation to retain for the ustreets of London their associations.

A LECTURE ON ARCHITECTS.

"ENGLISH ARCHITECTS" formed the subject of a "ENGLISH ARCHITECTS" formed the subject of a electure dolivered recently in Brighton, to the mem-chers of St. George's Instruction Society, by Mr. J. T. Bunce. The lecturer selected the lives of Inigo Jones, Sir Christopher Wren, and Sir John Van-rbrugh, architects specially identified with the ora of helassical architecture in England. An additional thattraction was found in the circumstance that these agreest men were distinguished for something beyond their mere profession. More interest, the lecturer sthought, attached to Jones, the architect and deviser of masques, to Wren, the architect and philosopher, and to Vanbrugh, the architect and dramatist, uhan would have been felt for either had they heen simply architects. The lecturer sketchei the carcer there profession. Note interest, the rectired and devises of an English theatre. To masques, to Wren, the architet and devises of an English theatre. The describing a temple at Pootoo, near than would have been felt for either had they been infingo Jones; his birth in London, his journeys to thange L to construct masques for the annsement of the court, his numerous public and private huildings, the author says, "I u the centre of oue of the courts was an elegant and elaborately carved the courts was an elegant and elaborately carved the court with sumerous public and private huildings, the courts was an elegant and elaborately carved to leave the chareb. Indeed, it in diately dismissed the congregation.

dyke, and finally his disgrace by the Long Parliament, and his death. As Jones passed away, Wren was preparing to supply bis place. Though a firm Royalist, preparing to supply bis place. Though a firm Royalist, and belonging to a family who suffered much for the Royal cause, Wren took no part in political affairs, but remained quietly at Oxford until the Restoration. The chequered and active life of Vanbrugh formed the next and last part of the lecture. He was considered in his triple character of an architect, a dramatist, and "a fine geutleman," andacious enough to nuder-take any project, and so able as in all to hring him-self off with credit. His curious dispute with the Duchess of Marthorough was commented upon, and illustrated by quotations from the correspondence : bis theatrical speculations were narrated : bis ready assumption of the herdi's tabard, though knowing bis theatriest spectrations were turrated : to be ready assumption of the herald's tabard, though knowing nothing of heraldry, was alluded to: the sneers he endured from Pope, Walpole, and Swift were re-counted; and the lecturer concluded with some critical remarks on his comedies.

Books Receibed.

Was Yang Jin: an Eight Months' Journal, during Tisils to Loochoo, Japan, and Pooloo. By ALFRED L. HALCORAN, Master, Royal Navy. London: Longmau and Co. 1856.

THIS is the modest but entertaining "yarn" of a sailor. There is no attempt to dive under the a sailor. There is no attempt to dive nuder the surface of the strange and antiquated style of eivilization to be met with in the far East; hut even here, in the midst of light-spun narrative and anusement, there is much matter for reflec-tion. How oddly ancient traditionary practices and observances, habits and eustoms, in our own country, are associated with the Orientals of the present day. At Nimon as the author of this present day. At Ningpo, as the author of this little work tells us, the Joss-houses, or temples, are not merely used for the ordinary religious ceremonics, or "Chin-chin to Joss," but one of these very chin-chins, or religious ceremonics, Ouviets in plot acting. How we have acting these very elim-ennas, or reagone very elim-eonsists in play-acting. Here we have some-thing exceedingly like the origin of our own theatrical entertainments, in the miracle-plays of ancient times. The Joss-houses appear to have a special stage and green-room set apart for the purpose. These Chluese temples are the purpose. These concerns one court in the for the purpose. These Chinese temples are generally hult with a square open court in the centre, and the principal gate is in the middle of the side nearest the street, with a smaller door, sometimes arched on the top, at each side door, sometimes arcned on the top, at each side. Right above the principal gateway, but opening inwards to the square, is the stage on which the religious plays are acted. There are two doors at the back which open into the green-room, and through the right-hand door the actor always are acted through the left are to The merethrough the right hand door the actor always enters, and through the left exits. The grecu-room contains insually splendid dresses, and most artistic false heards, moustaches, &c. Near the centre of the open square stands usually a very old iron censer or urn, in which incense is hurned or offerings of "a sweet-smelling savour" made to Joss. In allusion to these ancient censers, the author himself ob-serves that "it is remarkable, as showing the high autiquity of Chinese customs, that the vases in front of their ancient temples are very uneh like, both in shane and position, to some vases in front of their ancient temples are very much like, both in shape and position, to some figures which appear in the representations of the ancient temples of Korsabad, as given by Bonomi, in his work entitled, 'Niueveh and its Palaces' page 164,---a fact brought to my attention hy my friend J. Couch, Esq. F.L.S.'' At the back of the square court there is usually an all'ar (or which are nalcad increase of Nin and an al'ar, on which are placed images of Xin and Quey, the good and evil Joss, exactly alike, but the one white and the other black, the latter, in the old white an the other mack, the latter, in this respect at least, in strict accordance with our own nursery notions of the old "gentleman in black." The ceremonics observed at the altars struck the author forcibly from their close resemblance to the Roman Catholie Mass. There are open piazzas round two sides of the square, and the upper story of the Joss-house is pro-vided with seats for the spectators, like the boxes of an English theatre.

flict with a large snake, whose folds were entwined round him." From an engraving of ound him." From an engraving of handsome screeu, the open-work this really appears to be cut in the form of a modification of the Greek fret, which, as we have hefore noted, constitutes so frequent and remarkable an element in Eastern architecture. The openan element in Lastern aremicecure. Ine open-work is gracefully entwined with representa-tions of something like palm-leaves, with fruit resembling the pomegranate, and round the horder are scrolls, and designs closely resembling "Wac Yang Jin" will be found a pleasant book to spend a leiser of two two with.

Laxton's Builders' Price-Book for 1857. Lon-don: Arundel-street, Strand.

For the new edition (the thirty-fourth) of this now standard Price-Book, the index has been re-written; an index added to the Building Act, and au illustrated Appendix given, containing description and prices of new materials and in-ventions. There is also an account with prices, of seventy-eight huilding stones.

Miscellanea.

THE SEWAGE OF PENNITH.—The Local Board of Health here are said to be in a fix as to how to get quit of the town sewage. The old Board bad put the main sewer into the beck above Carleton-hall, so the the sewage passed through Mr. Cowper's farm-yrad. He served the Board with process for a nuisance, hut an understanding was come to that he (Mr. C.) would take the sewage if the Board would earry it to a certain point in bis holme. The Board went to con-siderable expense, and were at last informed that Mr. Cowper declined to take the sewage. On the part of Mr. Cowper, it was stated at a meeting of the Board that he had, at his own expense, had Mr. Newlands down from Liverpool, and that Mr. Newlands down from Liverpool, and that Mr. Newlands down would necessitate a wheel to be put into the river to pump off the sewage. A member of the Board said he believed Lord Lonsdale would take it if the Board would earry it to him on the French Field estate. THE SEWAGE OF PENRITH .- The Local Board of and other of the boost of the state of the the Board would carry it to him on the French Field estate. Another thought the hast mode of getting rid of it was to run it into the river as they had done at Car-lisle; and a third member said if they did so Lord Lonsdale would bring an action against them. The Board funally agreed that the matter should remain in rate was been as were been as the should remain in statu quo for a week.

Board finally agreed that the matter should remain in statu quo for a week. A NEW MODE OF SMOTHERING SMOKE. — At Pendleton, the small fires of a hleach-work, as well as its large boiler furnace, are said to he now rid of hlack smoke hy simply throwing over the replenish-ment of fuel a few spadefuls of a cheap mineral ecom-pound, which is said to absorb the carbon or blacks of the smoke, and to increase the heat and flame to a brilliant while. There is no saving of cost, it ap-pears, but the ashes are expected to have some value. The process reminds one of the practice amongst cools of sprinkling salt over a smoky fire to give it a clear flame, and also of the intensification of heat in frace by means of fire-clay halls, or lumps of chalk. Doubtless the substance used acts mainly, in its pulverulent state, the entangling the blacks and accumulating the heat in a way quite practiceable with various earthy substances, not impregnated with various earthy substances, not impregnated with various earthy substances. The store new heing pro-mineral alone.

mineral alone. ArSTRALIAN STONE.—The stone now heing pro-cured near the spot where the new Court-house is to be built, at Kilmore, says the Kilmore (Australian) Eccaminer, and with which it is intended to construct the hase of that building, possesses the singular quality (non being subjected to the action of fire), of melting like lead. During the process of fusion it hecomes bigbly elastic. When suffered to ecol, after-wards, it presents the appearance of coke on the inside, but on the outside it retains a shiring black polish. It is no doubt immergenated with bituminous polish. It is no doubt impregnated with hituminous matter.

matter. NENE VAILEY DRAINAGE WORKS. — The com-missioners have appointed Mr. John Fowler, C.E. as their engineer-in-chief to carry on these works, origi-nally commenced by the late Mr. Rendel, C.E. EVILS OF DEFECTIVE CUUREN STOYES. — The congregation of St. Peter's, Dorset, says the *Dorset Chronicle*, on Sunday last, were well nigb suffering most seriously from the effects of a mismanaged store. The poisones gas, which was quickly spreading its dangerous influence, affected many persons, who tried to leave the church. Indeed, it is not casy to say what might have occurred had the rector not immeRECOVERY OF SUNKEN VESSELS, &c. — A company, under the Limited Partnership Act, has been formed, with a capital of 60,0007. In 107. shares, to earry out the patent of Capit. Stephen Rendoll Smith, for sub-marine purposes. Out of 1,141 wrecks and easualties in 1855 on the British consts, 385 vessels were sunk without means of raising them. The power brought to bear in Capit. Smith's sub-marine liftingapparatus is steam applied in two flat-bottomed iron vessels. The sunk vessel is sought for in deep water by the surveying apparatus, with divers on stages, with chain ladders, and drawn aloog by a screwsteamer, the chain ladders having on either side the ordinary air and speaking apparatus of divers. When the vessel is found, the flat-hottomed screw-vessels are placed one on each side, and powerful steam machinery, with enber of each vessel without lurching or disturhing their vertical position, and by direct action and a dead pull upon the vreck or other weight to be lifted. When raised to a sufficient elevation it may be earried ouward to a beach, or other destination, by the screw propellors of the lifture; or the wreck, it is said, can be floated by further processes.

FALL OF PART OF A STUCCO CONNICE.—As yon kindly noticed my letter relative to the heavy overhanging cornices so frequently observed on new build ings in the City, I heg to inform you that, passing through Fenchurch street, on Christmas-day, I ohserved the attention of people leaving church, attracted to the building occupied by the Marine Life Insurance Society. It is a new building, with a heavy stucco cornice, a portion of the upper edge of which, about 6 feet in length, had fallen upon the footpath: the defiris might weigh about helf a ewt. Efforts should be made to check these monstrosities. As pleasing contrais to them, and good examples to be followed, I beg to call attention to the new Mark lane Chanbers, and to a building recently areced at the Fleetstreet end, and west side of Chancery-lane.—R. S. T. Larcourse ox Loczes.—Ms. E. M. Davine.

street end, and west side of Chancery-Iane.—R. S. T. IECTURE ON LOCKS.—MI. E. B. Denison gave a lacture on locks lately at Doneaster, in which he reviewed the various principles of lock construction, concluding with an account of a new lock invented by himself, and a which he exhibited a specimen, manefactured by Mr. Chubb. In this lock, said the lecturer, the tumblers net without springs, being pushed one way by the handle which shoots the bolt, and the other way by the bey. The key is not used for locking, so that the owner of a door with this lock may leave any person to lock if for him without entrusting him with the key. The tumblers have thin plates lying between them, and the frietion, which is an impediment to the action of most locks, and sometimes makes them stick fast altogether when the lock gets dirty, is an assistance to this, and uo high finish of the working parts is required. The key not having to move, the bolt may be very thin : the key of the large lock exhibited weighs just a quarter of an onnee. It pushes in a spring curtain, which gloses the keyhole compiletely when the key is out; and when it is pushed in ever so little, it prevents the holts from heing pressed against the tumhers, there being a square plug behind the curtain, which glose through an outch in the dege of the bolt, every twhen the curtain is up against the keyhole. You must, therefore, uot only turn the key about half round, but take it out again, hefore you can turn the handle and open the lock, and it cannot be opened while any instrument whatever remains in the keyhole. Mr. Denison added, that he did not know that the lock described was manufactured by anyboly : he believed not, although it was not purtured, and although it was stated on the anthority of Mr. Hobbs, in his Treatise on Locks, to be sceure against any Ronners's ButerKAMAKING MACUINE.—The contrest

Romers's Buicrows Krive MACHINE.—The convesel material, it is said, can be made into pressed brields or tiles by Mr. John Roberts's invention. There is a cirenlar track on which are fixed a series of cost-iron molds at regular intervals, and a roller, which may vary in weight from one to ten tores, moves round on the track by steam, or other power. This roller, or wheel, is connected with a heam, which is moved in the frame by means of a shaft and eog-wheel. The clay or brick earth is filled into the moulds, and the roller presses it firmly in. The wheel is followed by a scraper, which removes any excess from the surface of the moulds, a smaller roller acting as a balance, to prevent the scraper from rising. On a pressing-plate, attached by hinges to the moulds, any design can be cast or engreed. This plate is turned down upon the clay in the moulds, and the wheel passes over it a scenond time, and raises the manufactured bricks from the moulds. Brieks of any platter, it is said, can be manufactured by this nuchine, and any design or tessere, by slight modifications, can be also made.

"LIQUID STONE." — A Mr. Hardinge, of New York, has patented the manufacture of what he not very correctly calls "liquid stone." Quartz rock is roasted, and then made friable in cold water. It is then pulversied, and thrown into a peculiar stamtight cauldron, containing caustic lyc. Here it is acted upon by steam hent and the chemical solvent, and brought to a state of solution. When this solved silicate is applied to any substance, its water of solution evaporates, leaving a coat of crystal glass. In fact, it seems to be mainly a silicate of potash, or soda, such as was known and made centuries since. See "Salmon" for silex, and this, when roasted and calcined, can readily with potash form a soluble silicate, which in aqueous solution has an oily or gunny aspeet, and was hence, oild, "cauled" "oil of flints," and some times "oil of crystals," quartz or silex having heen formerly called "crystals."

Polygraphics" on "liquor or oil of flints." Quartz rock, and sand, or flint, are almost convertible terms for silex, and this, when reasted and calcined, can readily with potash form a soluble sileste, which in aqueous solution has an oily or gunny aspect, and was hence, of old, called "oil of flints," and sometimes "oil of crystals," quartz or siles having heen formerly called "crystals." MaxCurstrem Extuntrorss.—The exhibition of modern paintings at the Royal Manchester Institution, which has recently been closed, was open for seventeen weeks.—seven at one shilling, when 4,174 persons paid for admission; and ten weeks at sixpeuce, when the visitors numbered 3,507. In the evening the exhibition was open during ten weeks at threepence, when 8,454 persons inspected the works of art. There were also 178 season tickets sold. Upwards of 16,000 visits were made to the exhibition,—a large numher, but not equal, says the *Courier*, to previous years. The number of catalogues sold was 2,642 in the evening, at threepence, and 8,180 in the day, at sixpence. Thirty-one pictures have been sold in the rooms, and tweuty taken by the Art.Uuion.—The number of visitors at the Manchester Mechanics' Institution Exhibition on New Year's Day was 6,000. An eccursion train from Sheffield bronght 1,000 visitors. Nearly 1,000 catalogues were sold during the day.

CHURCH BURNT AT MONTHEAL.—Christ Church, the Protestant Episcopal Cathedral, in Montreal, was destroyed by fire on the 10th ult. A dry goods store and the nuns' huilding adjoining were also somewhat injured. The church was thought to be one of the most elegant and costly buildings in Canada. The damage by the fire is estimated at 120,000 dollars: the iosurance is 68,000 dollars. The church possessed an organ nearly as large as that of Haarlen, in Holland.

scace an organ nearly as large as that of Haarlem, in Holand. ARTISTS' AND AMATETRS' CONVERSIZIONI.—At Willis's Rooms, King-street, St. James's, this anunal series of artistic conversation are shortly to be held, the first on Thursday, the 5th February ; the second on Thursday, the 5th of the February ; the second on Thursday, the 5th of March ; the third on Thursday, the 2nd of April ; and the last on Thursday, the 7th of May. The annual subscription from each member is 1/. Is, which entitles the member, besides his or her personal admission to the meetings, to four visitors' tickets of admission, each admitting oue visitor to a single meeting only ; hut members are at liberty to issue as many tickets as they please for any one meeting, subject to farther subscriptions of one guinea for three. THE RIVINGTON WATER AT LIVERPOOL. — The

guinea for three. THE RIVINGTON WATER AT LIVERPOOL. -- The Rivington water is at length being delivered into the Keusington reservoir, says a local paper of end of last week, and very few days, it indeed hours, will elapse before the inhabitants will have an opportunity of judging for thermselves as to the quality of the water, about which so much has been sud, and respecting which there has been such an unparalleled local agitation

While there in the area of the second second

RE OPENING OF THE COLOSSEUM. — Under the auspices of a limited company, the Royal Colossent, Regent's-park, with all its varied attractions, has heen re-opened, under the patronage of Her Majesty and the Prince Consort. Mr. Parris's remarkable picture of "London by Day" is exhibited in the morning, and Mr. Danson's "London by Night" in the evening as before, and the Lishon panoramas, the Apollonicon, the Swiss cottages and secuery, stalactific averas, Greik saloon, conservatories, aviary, &c. &c. are all resurrected, none the worse for their recent entombment, the whole exhibition being graced by music, instrumental and vocal, discoursed by the Crystal Palace Orchestra and Orpheus Glee Union, and wound up by grand pyrotechnic displays, all for the certainly exceedingly small charge of one shilling.

LOW CONTRACTS.—At the Alfreion County Court on the 23rd ult. a case between a contractor and certain overseers was tried. The plaintiff, Mr. James Addrews, claimed 42/. 18s. 3d. for work done in the crection of a bridge across the river Erowsh, belonging to the parishes of Pinxton and Salston. It appeared from plaintiff's evidence that the defendants (overseers for the two parishes) invited three tenders for rebuilding the bridge, and that his tender of 36/. 10s. was accepted by them without any written plan or specification, but that they verhally agreed the bridge was. Defendants had been several times while the work were in progress, and also expressed approval. At length, on the 22nd of Scytember last, plaintiff received a note from defendants discharging the the work were in progress, and also expressed approval. At length, on the 22nd of Scytember last, plaintiff received a note from defendants discharging the that great complaints had heen made as to it) at that time two or three days would have completed it. He now claimed 42/. 18s. 3d. as the value of the work, he could not have the superintendence of the work, with damages for delay, &c. Mr. Benjamin Wilson, architect, Alfreton, one of plaintiff's own witnesses, said, bad he had the superintendence of the work, he could not have passed it as a good sound job, but that he thought there was already too meak work done for the money. Mr. George Hall, arebitect, Derby, agreed with Mr. Wilson. For the defence it was contended that the verhal agreement had not heen fulfilled, and that the hridge was unsound. Mr. Barber, in croas-examination, said he was surprised that the defeudants should have let a contract belonging to the parishes in so loose a manner, and that for the sake of saving a few pounds in employing an architect, they had incurred all this expresse and trouble. In his opinion also the plaintiff and Mr. Wilson had adopted every reasonable and proper course to avoid lifusition. The judgment he should give was 28. with all costs, to be paid fort

With. Gronwric IRON-CASTING NEAR GLASGOW.—Ou the 30th ultimo, at seven a.m. sixty tons of pig iron were put into the cupolas of Finuieston Iron-works, and by four o'clock of the same day this enormous mass of metal was poured into the mould. This mould contained in one mass the engue hottom of a colossal steamer, including two condensers, two chambers to receive the air pumpa, as well as feed and hilge pumps and pillow block for main shafts. The length of the mass which had to be east was 24 feet 6 inches, the breadth 10 feet 6 inches, and the beight 9 feet. The ensting, when taken from the mould, — tixty cons of six or seren days, will he 47 tons 10 ewt. "Let our readers," soys a Glasgow paper, "imagine this mass of iron thrown into the mould—sixty tons in all—pouring in a torrent which is exhausted in one minute and fortyfive seconds, and they will have some idea of a work which all the iron-workers in England refused,—the like of which none of the ironmasters in England evers saw [nonsense],—and which was arcomplished as an everyday job, under the superintendence of Mr. John Nailson. We have only further to add, that this is the second casting of the sume kind in the same work, and the engines for which it was cast are to be fitted p for the new Australian line of steam vessels, by Messre, J. and J. Thomson, of Clyde Bahx." A Joss-HOUSE IN VICTORIA.—One of the most striking and remarkable recent events, says the *Mattourne Argue*, was the consecration of a joss-house for

A JOSS-HOUSE IN VICTORIA. — One of the most striking and remarkable recent events, says the Metbourne Argus, was the consecration of a joss-bouse for the use of the Chinese residents in this city and its suburks. The wooden edities in which this singular erecmonytook place has been erected and decorated, at neost of about 1,000. on an elevated plot of ground, some distance beyond the Orphan Asylum, at Emerald-bill. The temple is from 60 to 70 feet in length, and about 85 feet in width. It has two stories, the lower one heing apparently that which is devoted to religious ecremonies. The upper story is surrounded by a gallery, lighted from the roof, and is apparently schapart as an assembly-hall. The whole interior is painted and ornamented in the Chinese style, and hung round with hanners. In the lower story is a picture enclosed in a carved case, and to this all the external erecmonies of adoration were paid. The pointing posities of three figures, the centre one being that of an off am of riverned appearance, and in a sitting postner: on one side of him stands a young man, and on the other a man of mature years.

HASTINGS BOLED OF HEALTH.—The Local Council and Board of Health have determined on carrying out and completing the extensive works of severage and drainage of the town. At the usual monthly meeting held on Friday in last week, the surveyor, Mr. John Laing, C.E. presented the plans for divisions B and Q, which were approved of, and it was ordered that tenders chould be advertised for. JAN. 17, 1857.]

THE BUILDER.

Builder. The

accustoming the eye to fine forms, hy comparing and the ing, the taste is formed, the opportunity for this should be afforded to the whole nation,--must be afforded, if we would raise the general taste. It is in this point of view that such a collection as that purchased from M. Soulages, and now to be seen in Marlborough Honse, is especially valuable. We have not mercly to act on our artists and manufacturers, but on the public, wbo put these artists and manufacturers in motion. It is to be hoped the collection will be retained

for the country. The council of the Institute of British Architects, recognizing the value of such works, bave appointed a committee of their body (excluding from it such of their members as may have aided in bringing it to this country) to examine and report upon it, with the view of memorializing Government, if it should be thought desirable to urge its purchase for the nation.

The remainder of the catalogue, by Mr. J. C. Robinson, is published, so that the whole collection can now he examined with his light. We have already given some general particulars, and may now refer to two or three specialities The specimens of Majolica ware are particularly fine; and there are two good specimens of Della Robbia ware, sculpture in terra-cotta, which lead up to it. The great point achieved by Luca della Robbia was in glazing clay sculpture with a white enamel, which gave it the dura-bility and brilliancy of marble. Some say he merely re-applied a process employed by the Arabs long hefore. In either case he greatly benefited architecture ; for his works were eagerly applied in the decoration of churches and other buildings. He afterwards found a method of colouring his white enamel. His hrothers, and then his sons, aided him. Mr. Rohinson, who gives Luca a more recent date than Vasari does,* and is disposed to consider the glaze was generally used in Luca's time, says,

"It is moreover, highly probable, that others, besides Della Robbia, were, during the quattrocento period, in the hahit of executing similar enamelled seulptures. Evidence to this effect s indeed indirectly given in Baldinucci, and more recently in the notes to the life of Della Robbia, appended to the edition of Vasari now in process of publication at Florence ("Vite dei pittori, Se. di Giorgio Fasari, publicate per cura di una società di amatori delle arti belle. Firenze, 1846, &c."), and that, in consequence, the secret of the enamel covering and its application was not exclusively confined to the Della Robhia family, as preteuded by Vasari : many concurrent circumstances, indeed, leave little doubt on this point. It seems at any rate impossible to draw any other conclusion from the fact, that the stanniferous enamel was everywhere in Italy, during the fifteenth century, currently applied as a covering to elay in the shape of plates and vases : its application to relievi in the same material could not therefore have remained a mystery.

The Majolica ware followed, whether imitated from this, aided by the Moorish workmen, or, altogether from that brought from Majorea, it is unnecessary for us to determine.

⁴ Mr. Robinson says he was born in 1899 or 1400, and died in M 1481. Vasari, in his first edition, says ho was born in 1835, in the mesoned 1999.

specimens, and particularly those of the most celebrated producer of this kind of work, Macstro Giorgio, of Gubbio.

The personal information we possess concerning Giorgio may be condensed as follows :--"Giorgio Andreoli, a gentleman of Pavia, already ennobled in his native place, migrated to Gubbio with his two brothers, towards the close of the fiftcenth century; and in or about the year 1498 obtained the rights of citizenship at the latter place: he acquired a high position, and filled many offices of trust in his adopted city, and is said to have heen living in 1552. Giorgio had two sons, one of whom only, Vincentio, called Maestro Cencio, followed his father's profession.

The earliest date with the signature of the Master on Giorgio's wares hitherto observed by the writer, is 1518, and the latest, 1537. The Pasolini Collection (now dispersed) contained a piece purporting to have been signed by the Master, and dated 1541. This instance, however, cannot be implicitly relied on."

During the fiftcenth, sixteenth, and, in a less degree, iu the seventeeuth century, Majolica ware, of which before we have often spoken, was great staple manufacture of Italy. Manufaetorics were fostered hy princes, and the artists enjoyed widely extended reputation. Faenza, Urhino, Castel Duraute, Gubhio, Pesaro, all eities comprised within a limited district lying towards the east coasts of Italy, are the five great centres of the maunfacture. As to the lustred specimens, let us say that the metallic lustres are simply various pigments, in reality metals, deposited or painted on the surface of the ware in a state of solution; the beautiful iridescent lustre resulting in some manner, not easily explained, from peculiar atomic arrange-ment. Strange to say, the attempts of modern chemists and mannfacturers to re-produce some of the most remarkable have hitherto almost uniformly failed !

Of the ordinary Majolica ware there are some remarkably fine and interesting specimens. Of the latter class is No. 9, a large plateau, with a portrait of the painter Pietro Perugino, on a deep hlue background, dating about 1520, which must be regarded as a unique piece.

No. 88-a small ewer, date about 1540-50-is an exquisite specimen of the Urbiuo manufacture. "Neither Sevres nor Dresdeu," says the editor of the Catalogue, "has ever produced in porcelain any thing finer in respect of glaze and colour. Pieces like this, which combine almost every excellence which the Ceramic art is capable of displaying, are those ou which the reputations of the ancient Maestri were justly fonuded-reputations acquired not in the character of artists, but of potters."

No. 144 is a singularly fine oval ewer of Palissy ware-an exquisite specimen.

We may not, however, give more space to this department : let us look at the specimens of *Fenetian Glass*, which exhibit a great variety of forms, modes of decoration, and manipulatory processes.

Apparently there are few specimens of Venetian glass extant of an earlier date than the eud of the fifteenth century ; though the manufacture of glass there dates from a very early period, certainly from the end of the thirteenth century, and the state took special interest in the progress of the art. For several centuries the republic received immense sums of money from the rest of the world for its glass. At the eud of the fifteenth or hegiuniug of the sixteenth century, the Venetian glass makers introduced the mode of decorating vases with *filagrees* of glass. They had other inventions, too, also of their own.

The following definitions given in the catalogue, of a few prominent varieties and pro-

The present collection is remarkable for a cesses, may interest those to whom the subject particular class of Majolica wares, - the lustered is entirely new :-- "First ' Latieinio,' or filigree glass, of which there is a great diversity of pat-terns, is characterized by coloured threads (generally opaque milk-white, hence the word 'Laticinio'), included in the mass of transparent glass, which, by various methods of manipulation, are twisted or woven as it were, into regular spiral or reticulated patterns, producing, in some specimens, a kind of network of delicate lines spread over the piece (' vitro di trina,' or lacework glass): this latter term, however, is generally applied to specimens in which the white threads are crossed at an angle, forming lozenge-shaped compartments, each of which sometimes contains a small air-bubble. 'Millefiore' glass has a rich variegated appearance, exhibiting au infinity of eccentric patterns, stars, circles, &c. produced hy mingling small cylindrical pieces of various coloured filagree glass, cut from thin rods, with the melted mass from which the vessels are blowu. 'Schmelze,' and Schmelze-Avanturine : the former of these varieties is a semi-opaque glass of a rich varie-gated brown, green, or bluish colour, which, when seen through hy transmitted light, takes a deep blood-red tint. Patches or globules of gold, sometimes seen on the surface of this kind of glass, constitute the schmelze-avan-turine. The 'Avanturine' is obtained by turine. mingling metallic filings or levigated leaf-gold with melfed glass, in the mass of which it is seen suspended in the shape of brilliant particles."

One of the causes of the progress of the art in Venice is to be found in the position which was given to those who practised it. Venetian patricians might marry the daughters of the master glass-makers without derogating in any manner from their dignity. Further, when Henry III. weut to Venice, in 1273, he granted nohility to all the master glass-makers of Murano.*

Passing over the works in honze, to some of which we have already alluded, the other metal works (including a wonderful knocker), the medals, and tapestry, we are brought to the decorative furniture, which includes almost all that was used in an Italian house of the sixteenth century. The chairs and the mirror-frames must he especially noticed. Several of the earved cahinets are also remarkable works of their kind,-but it is not the best kind. The piece of farniture we call a Cabinet appears to have originated in Germany, in the latter half of the sixteenth century, and was called Kunstschrank, or art-eahinet. It was architectural in its form, and artists of all kinds cooperated in its decoration. There is a specimen in the Chamber of Arts, at Berlin, made in 1610, which was designed by Hainhofer, the architect, executed elucify by the well-known Ulrich Banmgartner, and on which twenty-five various artists, whose names are all recorded, worked. The cost of these productions was necessarily very great, and their value now is even greater. Our readers may perhaps remember that for the mahogany and or-moln cabinet exhibited by her Majesty at Gore House, Kensington, two or three years ago, a dealer would gladly bave given 4,000*l*. simply because he knew that the Marquis of Hertford, or some other great collector, would have given him a larger sum for it.

The value of artistic furniture appears to be increasing every day. We hear that even in Warwick Castle, always a show place, and known to contain objects of great interest and beanty, a well-known dealer in rare objects has recently astounded its noble owner by the value put hy him on various tables, dishes, and cabi-nets, comparatively little cared for; information which will probably lead to the examination and re-arrangement of all the collection.

* Labarte's "Arts of the Midd'e Ages."

Vol. XV.-No. 728.

The mirror-frame in the first room at Marlhorough House (671), the decoration of which is entirely in the revived classical style, exhibiting heantiful renderings of palmette ornaments, guilloche aud acanthus leaf mouldiugs, and has within the triangular panels of the foot four circular medallions, carved with emhlematical devices in relicf, is considered to have been the property of Sigismund Pandulpho Malatesta, lord of Rimini, or of his celebrated mistress, Isotta degl'Atti (called Isotta da Rimini). He employed the well-known Leon Battista Alberti build him a church at Rimini (Sau Fran cesco), which is still quoted as one of the earliest and most important monuments of the revival; and as that mirror-frame agrees with the architectonic sentiment of the church, it is suggested that it may have been executed from a design of that architect. Alberti, a poct, an architect, a gentleman, a musician, an orator, a writer, was one of those models, as Quatremerede Quincy says, of whom nature is unfortunately hut too sparing. His celebrated Treatise on Architecture was written in Latin, and was afterwards translated into various languages. He was horn in 1395, and attained great age, but the exact time of his death appears to he unknown.

The frame of another mirror, in the middle room, is of a more elaborate kind, iucluding two serolls of foliage, starting at the hottom, and meeting at the top, and holding in its involutions an angel, death, birds, animals, and other figures. What is called a flaming grenade, at the top of the frame, is thought to have heen the device of Lucrezia Borgia, of whom the mirror is said to have been the property.

Connected with each figure is a capital letter. The curator, for once a little at fault, says, "It is difficult to devine the meaning of the disconnected capital letters so quaintly scattered throughout the scrollwork." He will find, however, that reading these from the hottom upwards, heginning with the dragon on one side, and what would seem to be a pig on the other, they form the words Bonum and Malum, the last letter of the first heiug held by the angel, and that of the second hy Death. The Literary Gazette has forestalled us in pointing this out, though not in the detection. Let us further suggest, that what the enrator calls a great Y, at the hottom, where the seroll on each side commences, and whence emerges a youth, may be a V, and stand for vita, while what is called a grenade, which occurs between the angel and death-the end of good aud evil-may possibly be intended to typify the end of all, a globe in flames, when good and evil find their reward.

No. 672, a metallic mirror in chony frame, inlay of the decoration of which consists of an narrow fillets of ivory, forming interlaced Italian fretwork, or knot patterns, is interesting as one of the earliest examples of the use of ebony, which afterwards hecame such a favourite decorative material.

The eistern in cast brass (405), belouging probably to the commencement of the fiftcenth century, should not he overlooked. It is of German or Flemish work, and represents a castle, the turrets battlemented and crowned with conical roofs. It is made to be suspended against a wall, and has a tap. Similar utensils may often be noticed in illuminated MSS. and early pictures. There are many other objects which might he pointed to : suffice it, however, to say, that the Soulages collection, rightly viewed, will afford many valuable lessous, and that its domiciliation amongst us will tend materially to the improvement of decorative art in this country.

SCULPTURE-ROOM AT THE NATIONAL GALLERY. SOLIFTUR-ROOM AT THE NATIONAL ONLEAF. Sculptors will be glad to learn that plans have been obtained by the Conneil of the Royal Academy for coavering the halls into a soulpture gallery. Height seems the main difficulty, and should be kept in view.

ATHENS.

ATHENS: DISTINGUISHED amongst the goodly throng of travellers whose devotion to art has prompted them to grapple with the ignorance and narrow-minded prejudice of the Turk and the bad accommodation of the country, in order to in-crease with their classic scholarship or topo-graphical science, their architectural knowledge, or graphics skill, the general stock of informa-tion upon this absorbing subject stand Singet tion upon this absorbing subject, stand Stuart aud Revett. We may remark that four years and Revet. We may remark that four years previous to Messrs. Spon and Wheler's visit, a foreign nohleman, the Marquis de Nointel, French amhassador to the Porte, accompanied by a Flemish artist, named Carrey, visited Athens, and investigated to some extent the remains of art that it contained. No lished work resulted from this visit; but No puhome of the sketches were engraved, and three or four are to be found in Mountfançon. De Nointel, therefore, may he said to have set the example in the adventurous ernsade, and Stuart and Revet to have reduced theory to practice. In addition to the works named in the first part of addition to the works named in the first part of this article,* that have emauated from the host of visitors who have in greater or less degree contributed to the general architectural result, we may add Chandler's "Travels in Asia Minor;" De Quincy's "Restitution des deux Frontous du Temple de Minerve et de celui de Jupiter Olympien;" Witkins's "Atheniensia;" Visconti's "Scalpture dn Parthenon;" Dod-well's "Classical Tour;" Wordsworth's "Athens and Attica;" Leake's "Topography;" Muir's "Journal;" Barrow's "History and Topo-graphy of Athens;" Bente's "L'Accopole;" Pittakys' "L'Ancienne Athenes; "Gailhahaud's "Ancient and Modern Architecture;" and some valuable works by German writers. This spirit of inquiry seemed to have seized the more enlightened countries of Europe at a fortunate moment, for the same masterpieces of art that moment, for the same masterpieces of art that had braved the elements for so many hundred years have heen unable to hold their ground against the famaticism of an illiterate and semiharbarous people, and the lapse of each modern century has effected more mischief than five times that period in earlier times. For instance, when Sir G. Wheler visited Athens, the Par-thenon was entire; whereas, when Stuart first beheld that building, a century later, much damage bad accrucd to it, for though the western portico, "the majestic appearance of which," he says, "cannot he described," was still standing, yet the figures in the pediment still standing, yet the figures in the pediment and the sculptures in the metopes were defaced and ruined; and even in the interval between Stuart and Revett's first visit in 1752, and Revett's second visit in 1765, the single column left standing of the west front of the Temple of Jupiter Olympius was gone, having heen pulled down to barn into line! (Fig. 1.)

At the present day the antiquities are tolerably well looked after by the Atheuian Archaeological Society, who, as our readers may remember, have even restored in plaster some well-knownportions, removedhy different nations.

Stuart may be justly considered the father of Greek architecture in England; and the nice of Greek architecture in England; and the moc feeling evinced in the restoration of the original forms out of the erumbling and faded materials hefore him, proved how well he was adapted for the task he had set himself. Of the four volumes comprising his work, only the first (in 1762) was published by himself; the second did not appear till 1787; the third in 1794; and the fourth in 1816. The first volume was well calculated to excite public interest in this balour of classic revival, containing, as it did, a lahour of classic revival, containing, as it did, a specimen of each of the Greek orders ;---in the Doric portico of the Agora, in the exquisite Ionic temple on the Hissus, in the ruins of the Corinthian Stoa, and in the charming creations of the Choragic monument of Lysierates, and the octagon tower of Andronicus Cyrrhestes. But it was the second volume, containing the But it was the second volume, containing the Parthenon, in its matchless proportions, its soutpured metopes, and the remains of the continuous frieze of the peripterus; the remains of the Temple of Jupiter Olympius; the Choragie monument of Thrasyllus; and the Tropylæa, which last was added to the volume by the Dilettanti Society, for whom it was measured

* See p 2, ante,

and drawn, that convinced the most sceptical

and arrawn, that convinced the most septem of the deep importance of the subject, and the surpassing merit of the work. Ancient Athens was divided into three parts : the Acropolis ($\dot{\eta}' Aspono N_L$), the Asty ($\dot{\tau}^{\circ} A\sigma \tau n$), and the port-towns, Peirzeus, Munychia, and Phalærna. From the original limits of the city had a not be the original limits of the coupling confined to the Acropolis, it was frequently being confined to the Greek writers. The Asty being confined to the Acropolis, it was frequently termed Holve by Greek writers. The Asty signified the npper town, in contradistinction to the sea-ports or lower town, and therefore in-cluded the Holve. Sometimes, however, it is called the lower city ($\dot{\eta} \kappa \dot{\alpha} \tau \omega \pi \delta \lambda c$), as opposed to the Acropolis, or upper eity. Pierraus and Munychia were surronneded by the same fortifi-cations, and united to the Asty by the long walls. Phalareum, the ancient port-town of Attiea, was also united for a time by the Phalaeric wall. The position of the walls of the Asty has occasioned much discussion. The two able topographers, position of the walls of the Asty has occasioned much discussion. The two able topographers, Leake and Forchhammer, are at issue; for whilst the former supposes that the walls of Themistocles ran from the gate Dipylum across the crest of the bills of the Nymphs, the Pnyx, and the Muscium, and then north of the Ihssus, which would thus have flowed outside the walls; the latter, on the other hand, main-tains that the remains visible on the line described do not helong to the walls of Themistocles, but to fortifications of a later period; probably those created by Valerian, when the population of the city had diminished. In proof of the greater extent of the walls of Themistocles, numerous considerations are ad-duced in Dr. Smith's "Geographical Dictionary," hased upon the descriptions of Theoydides, Xenophon, Pausanias, &e. and inductive reason-ings of nuch weight; the conclusion arrived at heing, that the walls of Themistocles extended from the gate called Dipylum, along the western descent of the bills called Pnyx and Muscium, including hotb those hills within their circuit; that they then crossed the Ilissus near the western end of the Muscium, and ran alone the that they then crossed the llissus near the western end of the Museium, and ran along the heights ou the left of the river, including Ardettus and the Stadium within the city; after Articities and the Standard which the city i after which, making a turn to the north, they again crossed the Ilissus, and leaving Mount Lyca-heitus on the east, they ran in a semicircular direction till they rejoined the Dipylum. It may seem at first sight startling that no traces of the walls of Themistoeles remain, but a little reflection will remaind us that the walls

a little reflection will remind us that the walls and huge buildings of numerous other cities of

and huge buildings of numerous other cities of antiquity have hecu as completely obliterated. It is impossible to determine the exact popu-lation of Athens. It is stated hy Thueydides and Xenophon to have heen the most populous eity of Greece, and the latter says that it con-tained more than 10,000 houses. In the "Fasti Hellenici" will be found all that can be said upon the subject said upon the subject.

The position of most of the gates of Athens is doubtful. On the west side were the $\Delta i \pi \nu \lambda \sigma \nu$, originally called the $\theta \rho_{i \alpha \sigma \sigma \alpha} \Pi^{i} \lambda^{\alpha}$ (leading to originally called the $\Theta_{\mu\alpha\alpha\sigma\nu}$ If $\delta\lambda\alpha$ (leading to Thria, near Eleusis), called also the $\kappa_{i\rho\alpha\mu\kappa\kappa\dot{\alpha}i}$ $ii\dot{\delta}\lambda\alpha$ (communicating between the inner and outer Cerameions, at the north-west corner of the eity; south of that were the Sacred Gate (ai teçai II/ $\lambda\alpha$), which terminated the Sacred Way to Eleusis and the Peiraie Gate (η Ite $\rho\dot{\alpha}i\kappa\dot{\eta}$ Ite $\lambda\eta$) from which ran the carriage-read between the long walls to the Pieraus. At the south-west corner was the Meltian Gate ($Mi\lambda\alpha_ir\ddot{\alpha}i\kappa\dot{\eta}$ It $\dot{\alpha}\lambda\alpha_i$) caching to Meltic. On the south side west corner was the Melitian Gate (Melitian Gate (Melitian Gate (Melitan), leading to Melite. On the south side was the Itouian Gate (as Irwarian Itolar), leading to Phalærum. On the east side were the Gate of Diochares (αι Διόχάρους Πυλαι), leading Gate of Diochares (at $\Delta i \psi \dot{x} \dot{x} \phi cover \Pi \nu \lambda at$), leading to the Lyceium, and the Diomeian Gate (at $\Delta i \phi \mu at$ ($\Pi \dot{\lambda} a \lambda a$), leading to Diomeia. On the north side were the Herian Gate (at $H \dot{\mu} \dot{a} a$ $\Pi \dot{\lambda} \lambda a d$), or Gate of the Dead, the Acharnian Gate (at 'Axparrat II $\dot{\mu} \dot{\lambda} a d$), leading to Acharna, the Equestrian Gate (at $I \pi \pi \dot{a} \dot{d} \epsilon G H \dot{\lambda} a d$), and the Gate of Eggess (at $\lambda i \dot{z} \dot{\mu} a$ H $\nu \lambda a$). Besides these were others where were are unknown

the Gate of Egeus (a' Aiyiog IIvAa). Ecsides these, were others whose names are nnknown. It would appear that during the time of Athens' greatest eminence in arms and arts, her private houses were mean and unadorned, in striking contrast to the magnificence of the public huildings: the same sentiment of patriotism which made an Athenian devote his life to the public good, rendering him also care-less of private luxury. It was at a later period, when public spirit had deelined, that the

JAN. 17, 1857.]

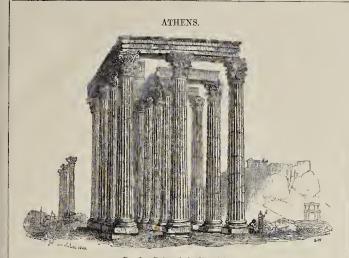

FIG. 1.—Ruins of the Olympicium.

FIG. 2. - The Acropolis Restored.

domestic architecture of Athens hecame more cultivated. "Formerly," says Demosthenes, "the public had abundant wealth, but no indi-vidual raised himself above the multitude. If any one of us could now see the houses of Themistocles, Aristides, Cimon, or the famous men of those days, he would perceive that they were not more magnificent than those of ordi-nary persons, while the buildings of the Stata are of such number and magnitude that they cannot be surpassed."

The conclusion arrived at from the scant passages of Homer are the same, with the difference only of the women's apartments heing on an upper floor, and with the addition of a great court in front of the house. But the whole of the information we possess on this subject is discussed in Dr. Smith's "Dictionary of Greek and Roman Antiquities."^{**} One infer-ence is plain, that it was in their public build-ings alone that their architectural grandcur consisted.

consisted. According to the position of the walls of the Asty as we have described, and as shown in Dr. Smith's plan, the Acropolis stood in the centre of the city. Within its space was con-centrated all that art could offer. It was to this revered sanetuary that the Panathenaic procession moved its majostie length once in four years, its chief object heing to carry the *peplus*, or embroidered robe, to the goldess Athena Polias in the Erectheum, as contra-distinguished to Athena of the Parthenon. The Acropolis (ig. 2) being a citadel, was forti-fied, the original walls being ascribed to the Pelasgi, and after its capture and destruction hy the Persians, the foundations no doubt remained,

the Persians, the foundations no doubt remained, and the name Pelasgie continued to be applied to a portion of the fortifications to a late period. the Persians, the foundations no doubt remained, and the name Pelasgie continued to be applied to a portion of the fortifications to a late period. When the Athenians returned to their city, after the Persian occupation, they commenced the restoration of the walls of the Acropolis and of the Asty. The road up the western slope of the Acropolis led from the Agora, and was paved with slabs of Pentelic marble. At the summit, Pericles caused a snitable cutrance ($\Pi \rho \sigma r \lambda a a a b$, b) be erected by the architect Minscieles, which resulted in the huilding known as the Propylea. We need not recapitulate the well-known features of this building — its two Dorie hexastyle porticos facing eastward and westward, with their een-tral diriglyph intercolumination, — the two un-equal wings, with their porticos in antis, facing-each other,—the marble ceiling of the west por-tice, 50 feet deep, supported upon its six elegant Ionic columus, &c. There is no sculp-ture forming part of the design of the Propylea. "The present ruined state of the Whole,' says the dictionary of the Architeetnral Publication Soeiett," is owing to its position, which neces-sarily made it a fortness from the Middle Ages, till the time of the War of Liberation, during the progress of which both the Propylaea and the vast portico of the Parthenon suffered deplorably." "The little Ionic amphiprostyle tetrastyle temple of Nike Apteros, on the west front of the south wing, though existing in 1676, has since been utterly destroyed, nothing remaining that some traces of its foundations, fragments of its masonry, and four slabs of its sculptured frieze, now in the British Museum. The sub-sequent discovery of its stones and most of the frieze have led to its re-construction on the fouries of the or the ware four fourt of the fouries a site. On the wester fourt of the frieze have led to its re-construction on the frieze have led to its re-construction on the

tricze, now in the British Museum. The sub-sequent discovery of its stones and most of the fricze have led to its re-construction on the original site. On the wrestern front of the northern wing of the Propylea, stands at pre-sent a lofty pedestal, 27 feet square, which from its size, probably supported equestrian figures, and agrees with a passage in Pausanias, descrip-tive of such.

tive of such. Towering in proportions as in locality over the rest of the Acropolis, stood the Parthenon ($\Pi a \rho \delta tr \omega^{\alpha}$), the Temple of the Virgin Goldess Athena, built of Pentelic markle, and standing mpon a basement of limestone. Its cella was ampliprosiyle, and divided into two parts, the paos and opisthodomos, separated by a wall. In the naos was the Chryselephantine statue of Minerva by Phidias, and round it a row of twenty-three Doric columns formed alsies, the light being obtained from the roof. In the opisthodomos were four columns supporting the roof, probably of the Ionic order. The whole number of external columns was forty-six. The sculpture in the pediments represents the birth sculpture in the pediments represents the birth of Athena from the head of Zeus, and the conof Athena from the head of Zeus, and the con-test of Athena and Poscidon for the land of Attica. The ninety-two metopes of the frieze contained, in high relief, the exploits of Minerva, the wars with the Centaurs and Lapithæ, and other subjects. The continuous frieze round the cella, beneath the ceiling of the peripterus,

Published by Taylor, Walton and Maberly, and Murray, and tready mentioped.

The mirror-frame in the first room at Marl borough House (671), the decoration of which is entirely in the revived elassical style, exhibiting beautiful renderings of palmette ornaments, guilloche and acauthus-leaf mouldings, and has within the triangular panels of the foot four eir cular mcdallions, carved with emblematical devices in relief, is considered to have been the property of Sigismund Pandulpho Malatesta, lord of Rimiui, or of his celebrated mistress, Isotta degl'Atti (ealled Isotta da Rimini). He the well-known Leon Battista Alberti employed to build him a church at Rimini (San Francesco), which is still quoted as one of the earliest and most important monuments of the revival; and as that mirror-frame agrees with the architectonic sentiment of the church, it is suggested that it may have been executed from a design of that architect. Alberti, a poet, an architect, a gentleman, a musician, an orator, a writer, was one of those models, as Quatremerede Quiney says, of whom uature is unfortunately but too sparing. Ilis celebrated Treatise on Architecture was written in Latin, and was afterwards translated into various languages. He was born in 1398, and attained great age, but the exact time of his death appears to be unknown.

The frame of another mirror, in the middle room, is of a more elaborate kind, including two scrolls of foliage, starting at the bottom, and meeting at the top, and holding in its involu-tions an angel, death, birds, animals, and other What is called a flaming grenade, at figures. the top of the frame, is thought to have been the device of Luerezia Borgia, of whom the mirror is said to have been the property. Connected with each figure is a capital letter.

The eurator, for once a little at fault, says, " It is difficult to devine the meaning of the disconnected capital letters so quaintly scattered throughout the scrollwork." He will find, however, that reading these from the bottom up wards, beginning with the dragon on one side, and what would seem to be a pig on the other, they form the words Bonum and Malum, the last letter of the first being held by the angel, and that of the second by Death. The *Literary* Gazette has forestalled us in pointing this out, though not in the detection. Let us further suggest, that what the curator calls a great Y, at the bottom, where the seroll on each side com mences, and whence emerges a youth, may be a V, aud stand for vita, while what is called a grenade, which occurs between the angel and death-the cud of good and evil-may possibly be intended to typify the end of all, a globe in flames, when good and evil find their reward.

No. 672, a metallic mirror in ebony frame the decoration of which eousists of an inlay of narrow fillets of ivory, forming interlaced Italian fretwork, or knot patterns, is interesting as one of the carliest examples of the use of ebony, which afterwards became such a favourite decorative material.

The eistern in cast brass (405), belonging probably to the commencement of the fiftcenth century, should not be overlooked. It is of German or Flemish work, and represents a castle, the turrets battlemented and crowned with conical roofs. It is made to be suspended against a wall, and has a tap. Similar ntensils may often be noticed in illuminated MSS. aud early pictures. There are many other objects which might be pointed to: suffice it, however, to say, that the Soulages collection, rightly viewed, will afford many valuable lessons, and tbat its domiciliation amougst us will tend materially to the improvement of decorative art in this country.

SCULPTURE-ROOM AT THE NATIONAL GALLERY .--SCULPTURE-ROUG AF THE NATIONAL OWNER, SCULPTURE-ROUG AF THE NATIONAL OWNER, SCULPTURE WILl be glub and the learn that plans have been obtained by the Council of the Royal Academy for converting the halls into a sculpture gallery. Height seems the main difficulty, and should be kept in view. ATHENS.

DISTINGUISHED amongst the goodly throng of travelers whose devotion to art has prompted them to grapple with the ignorance and narrow-minded prejudice of the Turk and the bad minded prejudice of the Turk and the bad accommodation of the country, in order to in-crease with their classic scholarship or topocrease with their classic scholarsinp or topo-graphical science, their architectural knowledge, or graphie skill, the general stock of informa-tion upon this absorbing subject, stand Stuart and Revet. We may remark that four years previous to Messrs. Spon and Wheler's visit, a foreign nobleman, the Marquis de Nointél, Frends ambassador to the Porte, accompanied the Diractio, cavid, mand Carres, visited by a Flemish artist, named Carrey, visited Atlens, and investigated to some extent the remains of art that it contained. No pub-lished work resulted from this visit; but some the sketches were engraved, and three or four De Nointel are to be found in Mountfauçon. De Nointel, therefore, may be said to have set the example adventurous erusade, and Stuart and Revett to have reduced theory to practice. In addition to the works named in the first part of this article,* that have emanated from the host this article,* that have emanated from the host of visitors who have in greater or less degree contributed to the general architectural result, we may add Chandler's "Travels in Asia Minor;" De Quincy's "Restitution des deux Frontons du Temple de Minerve et de celui de Jupiter Olympien;" Wilkins's "Atheniensia;" Viscouti's "Sculpture da Parthenon;" Dod well's "Classical Tonr;" Wordsworth's "Athens and Attica;" Leake's "Topography;" Muir's "Journal;" Burrow's "History and Topo-graphy of Athens;" Benle's "L'Aeropole;" Pittakys' "L'Aneienne Athènes;" Gailhabaud's "Aneient and Modern Architecture;" and "Aneient and Modern Architecture; some valuable works by German writers. This some variable variabl moment, for the same masterpices of art that had braved the elements for so many hundred years have been unable to hold their ground against the famaticism of an illiterate and semi-barbarous people, and the lapse of each modern century has effected more mischief than five times that period in carlier times. For instance, when Sir G. Wheler visited Athens, the Par-thenon was entire; whereas, when Stuart first beheld that building, a century later, much damage had accrued to it, for though the western portice, "the majestic appearance of which," he says, "cannot be described," was still standing, yet the figures in the pediment and the sculptures in the metopes were defaced and ruined; and even in the interval between Stuart and Revett's first visit in 1/52, and Stuart and Revett's first visit in 1752, and Revett's second visit in 1765, the single column left standing of the west front of the Temple

of Jupiter Olympius was gone, havin pulled down to burn into lime ! (Fig. 1. At the present day the antiquities are tolerably well looked after by the Atheuian Archeological Society, who, as our readers may remember, have even restored in plaster some well knownportions, removed by different nations. having been

Stuart may be justly considered the father of Greek architecture in England; and the nice feeling evinced in the restoration of the original forms out of the erumbling and faded materials before him, proved how well he was adapted for the task he had set himself. Of the four volumes comprising his work, only the first (in 1762) was published by himself; the second did not appear till 1787; the third in 1794; and the fourth in 1816. The first volume was well calculated to excite public interest in this labour of classic revival, containing, as it did, Taoour of classic revival, containing, as it did, a specimen of each of the Greek orders; ---in the Doric portico of the Agora, in the exquisite Ionic temple on the Ihissus, in the ruins of the Corinthian Stoa, and in the charming creations of the Choragic monument of Lysicrates, and the ordered target of Arbenium Cartholator of the Choragic monument of Lysicrates, and the octagon tower of Andronicus Cyrrhestes. But it was the second volume, containing the Parthenou, in its matchless proportions, its sculptured metopes, and the remains of the continuous fricze of the peripterus; the remains of the Temple of Jupiter Olympius; the Choragic monument of Thrasylus; and the Propylea, which last was added to the volume by the Dilettanti Society, for whom it was measured

* See p 2, ania

and drawn, that convinced the most sceptical of the deep importance of the subject, and the

surpassing merit of the work. Ancient Athens was divided into three parts: Ancient Athens was divided into three parts: the Acropolis (i') $k_{2}\phi^{i}\alpha v^{i}c^{i}$) Λcr^{i} , and the port-towus, Peiraus, Munychia, and Phalerum. From the original limits of the eity being confined to the Acropolis, it was frequently termed HoAc by Greek writers. The Asty signified the upper town, in contradistinction to the sca-ports or lower town, and therefore in-cluded the Male. Sometimes however, it is cluded the $\Pi o \lambda_{1G}$. Sometimes, however, it is called the lower city ($\dot{\eta} \kappa \dot{a} \tau \omega \pi o \lambda_{1G}$), as opposed to the Aeropolis, or upper city. Pieræus and Munychia were surrounded by the same fortifications, and united to the Asty by the long walls. Phalarum, the ancient port-town of Attica, was also united for a time by the Phalaric wall. The position of the walls of the Asty has occasioued position of the walls of the lasy in Social Themistocles ran from the gate Dipylum across the crest of the hills of the Nymphs, the Puyx, and the Museinun, and then north of the Ilissus and the Musemu, and then north of the Inssus, which would thus have flowed outside the described do not belong to the walls of Themistoeles, but to fortifications of a later period; probably those created by Valeriau, when the population of the city had diminished. In proof of the greater extent of the walls of Themistoeles, numerous considerations are ad-Themistocles, numerous considerations are ad-duced in Dr. Smith's "Geographical Dictionary," duced in Dr. Smith's "Geographical Dictionary," based upon the descriptions of Thucydides, Xenophon, Pausanias, &c. and inductive reason-ings of much weight; the conclusion arrived at being, that the walls of Themistocles extended from the gate called Dipylum, along the western descent of the hills called Pnyx and Muscium, including both those hills within their eircuit; that they then crossed the Hissen near the including both those hills within there errort; that they then crossed the Hissus near the western end of the Minscium, and ran along the heights on the left of the river, including Ardettus and the Stadium within the city; after which, making a turn to the north, they again crossed the Hissus, and leaving Mout Lyca-bettus on the east, they ran in a semicircular the set of the related the Direction

direction till they rejoined the Dipylum. It may seem at first sight startling that no traces of the walls of Themistoeles remain, but a little reflection will remaind us that the walls and huge buildings of numerous other cities of

antiquity have been as completely obliterated. It is impossible to determine the exact popu-lation of Athens. It is stated by Thueydides and Xanophon to have been the most populous city of Greece, and the latter says that it con-tained more than 10,000 houses. In the "Fasti Hellenici" will be found all that can be

^{ex} Fasti Helleniei" will be found all that can be said upon the subject. The position of most of the gates of Athens is doubiful. On the west side were the $\Delta i \pi \upsilon \lambda \sigma \tau$, originally called the $\theta \rho a \sigma \sigma \sigma$ H $\vartheta \lambda \alpha$ (leading to Thrin, near Eleusis), called also the Kroputerád $u \delta \lambda \alpha$ (communicating between the inner and outer Ceramcicus, at the north-west coruer of the city; south of that were the Sacred Gate (*ai trai H \data*), which terminated the Sacred Way to Eleusis and the Peiraic Gate ($\eta \Pi a \rho a \tilde{\alpha} \vartheta$) $H \delta \lambda \vartheta$ from which ran the carriage-road between $\Pi v \lambda \eta$) from which ran the carriage-road between the long walls to the Pierzens. At the south-west corner was the Melitian Gate (Μελιτίδες Πόλαι), leading to Melite. Ou the south side was the Itonian Gate (αι'Ιτωνίαι Πυλαι), leading to Phalærnm. On the east side were the Gate of Diochares (αι Διόχάρους Πυλαι), leading Gut of Diochares (a $\Delta i \diamond \dot{\alpha} \dot{\alpha} \rho o \phi$ IIv λa), leading to the Lyceium, and the Diomeian Gate (a $\lambda \dot{\alpha} \mu a a$ Ii $\dot{\alpha} \lambda a$), leading to Diomeia. On the north side were the Horian Gate (al Hpian Ho λa), or Gate of the Dead, the Acharnian Gate (al 'Axapyncai Hi $\dot{\alpha} a$), leading to Acharna, the Equestrian Gate (at $1\pi \pi \dot{\alpha} \dot{\alpha} \xi e$ Hi $\dot{\alpha} a$), the Gate of Egens (at $A \dot{\gamma} \dot{\rho} \phi$ Ho λa). Besides these, were others whose names are unknown. It would annear that during the time of

these, were others whose names are unknown. It would appear that during the time of Athens' greatest eminence in arms and arts, ber private houses were mean and unadorned, in striking contrast to the magnificence of the public buildings: the same sentiment of patriotism which made an Athenian devote his it is the uplic seed modeling building also care. life to the public good, rendering him also care less of private luxury. It was at a later period less of private luxury. It was at a later period, when public spirit had declined, that the

FIG. 1.-Ruins of the Olympicium.

FIG. 2.-The Acropolis Restored.

domestic architecture of Athens became more cultivated. "Formerly," says Demosthenes, "the public had abundant wealth, but no individual raised himself ahove the multitude. If any one of us could now see the houses of Themistoeles, Aristides, Cimon, or the famous men of those days, he would perceive that they were not more magnificent than those of ordinary persons, while the buildings of the State are of such munder and magnitude that they cannot be surpassed." In book vi. chap. 10, of Vitruvius, is found divisions were on the same floor.

The conclusion arrived at from the scant The conclusion arrived at from the scant passages of Homer are the same, with the difference only of the women's spartments being on an upper floor, and with the addition of a great cout in front of the house. But the whole of the information we possess on this subject is discussed in Dr. Smith's "Dictionary of Greek and Roman Antiquities."⁸⁹ One infer-ence is plain, that it was in their public build-ings alone that their architectural grandeur consisted. consisted.

consisted. According to the position of the walls of the Asty as we have described, and as shown in Dr. Smith's plan, the Acropolis stood in the centre of the city. Within its space was con-centrated all that art could offer. It was to this revered sanctuary that the Panathenaic procession moved its majestic length once in four years, its chief object being to carry the *peplus*, or embroidered robe, to the goddess Athena Polias in the Erectheium, as contra-distinguished to Athena of the Parthenon.

procession intern the interact parameters for years, its chief object being to carry the peptus, or embroidered rohe, to the goddess Athena Polias in the Erectheium, as contradistinguished to Athena of the Parthenon. The Aeropolis (fig. 2) being a citadel, was fortified, the original walls being ascribed to the Pelasgi, and after its capture and destruction by the Persians, the foundations no doubt remained, and the name Pelasgic continued to be applied to a portion of the fortifications to a late period. When the Athenians returned to their city, after the Persian occupation, they commenced the restoration of the walls of the Aeropolis and of the Asty. The road up the western slope of the Aeropolis led from the Agora, and was paved with slabs of Pentelic marble. At the summit, Perieles caused a suitable entrance (Hoorthaata), to be created by the architect Mnesicles, which resulted it the building known as the Propylæa. We need not recapitulate the well-known features of this building — its two Dorie hexastyle porticos facing eastward and westward, with their central diviglyph intercolumniation, — the two unequal wings, with their porticos in antis, facing each other, — the marble ceiling of the west portico, 50 feet deep, supported upon its six elegant Iouic columus, &c. There is no sculpture forming part of the disign of the Propylea. The rost the inter of the Wast portico of the Artenses from the Middle Ages, till the time of the War of Liheration, during but some traces of its foundations, fragments of its masonry, and four slahs of its sould are indeveloped by its position. The Artense of the Stoute of the Stout wing, though existing in 1676, has since heen utterly destroyed, nothing remaining but some traces of its foundations, fragments of its measonry, and four slahs of its seeling the there is one traces of its foundations, fragments of the morthern wing of the Propylea, stands at present a lofty pedestal, 27 feet square, which from its size, probably supported equestrian figures, and agrees with a p

and agrees with a passage in Pausanias, descrip-tive of such. Towering in proportions as in locality over the rest of the Aeropolis, stood the Parthenon (Iaq0tuw), the Temple of the Virgin Goddess Athena, built of Pentelic marble, and standing upon a basement of limestone. Its cella was ampliprostyle, and divided into two parts, the naos and opisthodomos, separated by a wall. In the naos was the Chrysclephantine statue of Minerva by Phidias, and round it a row of twenty-three Dorie columns formed aisles, the light being obtained from the roof. In the opisthodomos were four columns supporting the hight being obtained from the roof. In the opisthodomos were four columns supporting the roof, probably of the Ionic order. The whole number of external columns was forly-six. The sculpture in the pedianents represents the birth of Athena room the head of Zeus, and the con-text of Athena root Descible for the level of of Athena from the head of Zeus, and the con-test of Athena and Poscidon for the land of Attica. The niuety-two metopes of the frieze contained, in high relief, the exploits of Minerva, the wars with the Centaurs and Lapithe, and other subjects. The continuous frieze round the cella, beneath the ceiling of the peripterus,

* Published by Taylor, Walton and Maberly, and Murray, and already mentioned.

was also filled with sculpture representing the Panathenaic procession. Sixteen of the metopes, and a large number of the slabs of the frieze were brought to England by Lord Elgin. The seniptures of the Parthenon form the subject of numerous valuable works. The stylolate, of three steps, mon which the temple close is foot in build to define the senior of Parthenon

sytometer, of three steps, non-when the tempter stands, 51 feet in height, is also of Peutelie marble. The investigations by Mr. Peurose, at the instance of the Dilettanti Society, awakened fresh interest in these time-honoured remains. The suspicion of deep thought and subtle re-forment in outload when heights before numerical. finement in optical principles before unnoticed; the fact, since satisfactorily demonstrated, of the euryature of the horizontal lines and juckthe curvature of the horizontal lines and incli-nation of the columns; —of varictics in the size of caps in the same structure, with positive evidence of great mathematical knowledge in the form of the moldings, couvex, concave, and compound, and especially in the hyper-bolic entasis of the columns,—resulted in a minite investigation of the Parthenon, Pro-pylaca, Theseinm, and other buildings, in 1846-7. It was ten years prior to this, that Mr. J. Pennethorne discovered the curvature in the stylobate of the Parthenon rubbish and want the stylobate of the Parthenon, rubbish and want of convenience having concealed this fact, now apparent, so long from the world. The most important of the curves are those which form the horizontal lines of the huilding where they occnr, such convex eurves of the steps lying in vertical plaues, and corresponding eurves of the

vertical planes, and corresponding curves of the epistylia, in vertical planes, parallel to the steps. The inward inclination of vertical surfaces is also satisfactorily established. "When we con-sider," asys Mr. Peurose, "the long interval that elapsed between the visit of Stuart and that of Professor Cockerell, during all which time the entasis of the columns of the Par-thenon was undiscovered, and that it was re-served for Professor Donaldson to establish the Vitravian inclination of the columns, we need Vitruvian inclination of the columns, we need not be greatly surprised that this curvature in in the horizontal lines was not found out until a still later period."

Vitruvius first calls attention to these matters in the chapter "De Substructionibus," in the passage beginning "Stylobatam ita oportet passage beginning "Stylobatam ita oporlet exequari uti habeat medium adjectionem per passage beginning beginataan adjectionem per scamplios impares," &c. recommending that the sylobate should have a gradual rise towards the centre from botb ends, and the inconvenience arising from it to he obviated by means of scamilli impares; and further, that the abaci-are to follow the direction of the upper members of the epistilium, which will follow the envre of the stylobate. The vexed question of the scamilli impares seems thus to be explained. Certain difficulties, owing to the various uses of the terms "Hecatompedon," "Opishhodmos," "Ec. are learnedly discussed in Dr. Smith's "Dictionary," and are well worthy of attention. Calibrates and Lefinus were the architects, and Phidias was appointed by Pericles to superin-tend this magnificant building. Of very different style and form to the two bnild.

Of very different style and form to the two build-Of very different style and form to the two bnild-ings we have glanced at, was the Ercehtheium (fig. 3), a temple intimately connected with the earliest legends of Attica, situate to the north of the Partheon, and within a few yards of the wall of the Acropolis. It is difficult to arrive at a clear knowledge of the history of Erceh-theus, called also Ercehthonius. Homer de-scribes him as horm of the cast theus, called also Erechthonius. Homer de-scribes him as born of the earth, and adopted hy Athena, and by her installed in her temple at Athens as her companion ! Poscidon Erechtheus was the name under which he was wor shipped in the Erechtheium.

'he first and only conception of Athens and the sacred Acropolis," says Grote, "places it under the special protection, and represents It as the settlement and favourite abode, of Athena, jointly with Poseidon; the latter being the inferior, though the chosen companion of the former, and therefore exchanging his divine appellation for the cognomen of Erechtheus." The temple of Athena, in which he was iuappellation for the cognomen of Ercelthens." The temple of Athena, in which he was iu-terred, was named after him. It contains the statue of Athena Polizs, or the guardian of the city, and was the tonb also of Cecrops. The building hore the general name of the Erceltheium, but, in fact, contained two temples, that of Athena Polizs and that of the nymb Pradrosus, daughter of Cecrops;— the latter for this reason, that the infant

Erectheus heing entrusted to the care of her-Erecheus heing entrusted to the care of her-self and her sisters, Aglaurus and Herse, the two latter betrayed their trust, whilst Pan-drosus remained faithful to it. This beautiful temple stood npon the site of the original one burnt by the Persians. Though commenced long before, this building could not have heen completed till about 400 B.C. Its irregularity of plan forms a relief to the nsual outline of the Greek temple. It had here porticoses of varied position; the principal one, facing the east, is a prostyle of six columns, five of which are still position; the principal one, facing the east, is a prostyle of six columns, five of which are still standing, the west end being terminated hy four half columns in antis. The north portico is of four columns in front, and two at the sides, enclosing a highly curiched doorway to the cella of Pandrosus;— the third, to the south, is merely an colosure, the roof of which was sup-ported by six Caryatides, each 7 feet high, stand-ing on a Podium. In this building the curvature of the hori-

In this building the curvature of the horiand here and inclination of the columns has not been detected. The whole of the building was executed with wonderful finish and delicacy, proving how well its coustructors loved their task. The statuc of Athena Polias was of olive task. The statue of Athena Polnas was of olive wood, and its position was the cella, and in front was the golden laup made by Callianachus, which was kept burning day and night: the position of the tombs of Cercops and Erecthous, of the olive tree and the Salt well, is matter for learned conjecture. The building was left in a nost ruinous condition after the War of Libera-ticas in 10.07. tion in 1821-27. Amongst the minor temples and works of art

that covered the surface of the Acropolis, we will only allude to the colossal statue of Athena Promaclus ($i_{\chi} \chi_{\alpha} \kappa_{\gamma} \ i_{\mu} \epsilon_{\gamma} \alpha \lambda_{\gamma} \ A \theta_{\gamma} \kappa_{\gamma}$), standing nearly opposite the Propylæa, of gigantic size, towering above the roof of the Parthenon, the point of its spear and crest of its helmet being visible off Sumium to ships approaching Athens. It was still standing in A.D. 395, and is said to have seared Alarie from his projected sack of

We must reserve our concluding remarks upon the subject of Atheus until a future number.

VENTILATION, WITH ESPECIAL REFERENCE TO HOSPITALS.

PERMIT me to resume my observations PERMIT inc to resume my observations on the interesting subject of variliation, especially of hospitals, and to make some remarks on the reply which Mr. Rosser has given to my former communication.⁴ I must be allowed to reiterate emphatically my previous statement, viz. that the true origin of infectious and therefore delc-terious air in hospitals, &e. is to be traced up to to the general merium value in which is norm. "to the general noxious malaria which is con-stantly passing off from the bodies of indi-viduals labourng under the most severe and oftentimes malignant forms of disease," and not mercely to earbonized air, which is only the pro-duct of exhalation from the lungs of healthy individuals congregated in any large edifices.

In hospitals, where ventilation is imperfectly carried out, we find that certain diseases, presentiug a well-known type, originate in a and traverse floor after floor; whereas in the association of numerous healthy individuals no malaria is given off, and therefore no disease of a peculiar type is generated. Allow me to make a few

to make a few remarks on this important subject. A condensed body of human heings shut up in a large edifice--as Exeter lacings suite up in a large center as Lacut Itall,—will not only thorongly contaminate the air, which should be used for respiration, with impure exhaled gases, lut likewise with solid particles of human origin, detached and solid particles of human origin, detached and diffused through the respired atmosphere. Dr. R. A. Smith ohtained 200 grains of condcused moisture from one window in Mauchester after a concert; he burnt 150 grains, and a strong smell of human perspiration came off, continuing until the substance was dry. When this was heated, it smelt like hurning flesh, and was very disagree-able. This product may he viewed as the impure exchalation from hundreds of healtly beings, and would, not give rise to contarious disease. would not give rise to contagions disease. Neither can we find that such diseases originate would from any putrefactive products which arise from the earth's surface. Diseases, such as fever,

* See p. 663, vol. xiv.

ehclera, hospital gangrene, erysipelas, &c. are most probably "highly organized particles of fixed matter, which finds its way into the atmosphere, like the pollen of flowers, and rc-mains for a time suspended in it,—a condition which is consistent with the admitted difficulty of reaching and detrouing these bodies by

which is consistent with the aumitted dimension of reaching and destroying these bodies by gaseous chlorine, or with washing the floors as a disinfectauk."—(Prof. Graham.) "I have long been of opinion that the cause of endenic diseases, if disseminated in the air, must exist there, either in the condition of solid particles, or in a state allied to the vaporific form,"-(Dr. R. D. Thomson.)

"The first material cause of cholera is a specific poison which may be present in all situations in Iudia in a dormant state, hut which requires for its development certain accessory causes, such as sudden meteorological changes; animal and regetable effluvia; emanations from Inrge bodies of men; effluvia from persons erowded into insufficiently ventilated buildings." --(Mr. Rogers, Surgeon of the Madras Army,

There can be little doubt but that the morbific matter of such diseases is thrown off from the bodies of the sufferers, and passes into the air with the noxious gases which emanate from the skin of such patients. It will be an important inquiry, therefore, to ascertain the number and the character of such gases, and to obtain a practical aequaintance with their behaviour (if one may so speak), when they are thrown off from a human body, because in so doing we may follow the course of the animal poison; since the latter is to be found in the former impurity, inst as the detritus of human excrement

The states is to be found in the former imputivy, just as the detritus of human excement of the London sewerage is to be met with in the on-flowing mndky Thames water. It may be observed, that the leading causes of sensible aerial impurity in the wards of an hospital, are the constant exhalation of the fol-lowing gases : — I. Phosphuratted hydrogen. 2. Sulphuretted hydrogen. 3. Carbonic acid. 4. Carburetted hydrogen. 5. Cyanogen, with some of its compounds. To those well ac-quainted with the penetrating effluvium of the first gas, I may remark, that it is recognised always in excess in the medical wards, where diseases of internal organs are present, especially in all affections of the liver, stomach, and howels, and in fever, dyscntery, & e. &.; whereas the blackening of the lead plaster strappings used in the snrgical wards to stumps after amputation, and to sloughing ulcers, & endily informs us of the prevalence of the second gas, whilst the and to sloughing ulcers, &c. readily informs us of the prevalence of the second gas, whilst the stupor, headache, and sleepiness produced in a bealthy person, who remains some time at the copions exhalation of Nos. 3, 4, and 5 gases. By a wise and mysterions provision in the economy of nature, all gases have a tendency to diffuse themselves into the surrounding atmos-phere; they are governed by unalternable laws, and their diffusion cannot be "prevented," nor "retarded" by "scientific ventilation." as vonr "retarded" by "scientific ventilation," as your correspondent implies, although they may be diluted by artificial means.

The diffusion of each gas is always inversely as the square root of the density of such gas (Prof. Graham.) Now the density of the gases enumerated as the special products of discases in hospitals, is as follows, air heing 1.000 :---

Dr. Mitchell found that the law of diffusion of the gases was only feely interfered with even when a thin humin membrane intervence hetween the gas and the pure air; thus to tra-verse the membrane,—

Ammonia required	1	miunde.
Sulphuretted hydrogen	21	minutes.
Cyanogeu	31	23
Carbouic acid	51	37
Hydrogen	$37\frac{1}{2}$	23
Carbonic oxide	160	37

and a much greater time with nitrogen

The law to which the diffusion of gases is subject appears to be misunderstood by many persons, it we may judge by the examples which they give us, and the analogies which

they draw from such examples. It has been urged that the instance of the diffusive odour of camphor, musk, &c. may be employed as a type of the diffusion of gases, and that the secnt of the drug is found to remain even some time after the windows and doors have been opened. This is a comparison brought forward of fallacious grounds. The odoriferous power of drugs depends on a volatile and essential agent, which appears to strike the air as sound does, and is conveyed as so many indulations from a centre to an indefinite circumference. This agent cannot be caught hy the most subtle means, nor analyzed by the most experienced chemist; and it is a well-known fact that a grain of musk loses none of its weight after it has hecu exposed and has scented a large room for many months; whereas, a putrefying animal or vegetable substance emits certain noxious gases, which we can collect and analyze, becomes less in substance, and eventually decays or dwindles away through an unalterable law of dissolution or of putrescence. There are no gases evolved in animal putrefaction which are There are no gases evolved in annual partourctted hydrogen lighter than air, except carburctted hydrogen and this is not hy any means so common a pest in our wards as arc phosphurctted hydrogen and sulphuretted hydrogeu. It is a great error to suppose that hydrogen, the lightest of gases, is er given off from human hodies as pure nn mixed hydrogen; but, on the other hand, it is always combined with some base, the resulting product of animal putrescence, as phos-phorus, sulphur, ammonia, &c. and with the exception of carbonic acid gas, it may be questioned whether any elementary gas, as nitrogen, a hydrogen, carhon, is really eliminated from the bodics of the sick and discased in our hospital wards. Every pa-tient suffering from a contagions disease, as typhus, hecomes "anidus" from whence contagion springs. If, therefore, the noxious particles which enanate from the body become mixed with the animal gases already conmerated it is evident that whatever agent tends to dilute these gases, will also dissemiuate them rapidly into circumanhicut pure air, aud thus render the morbific matter weak and innocnons. As there is no liquid poison which may not he

rendered harmless by copious dilution with fresh water, so there can he no aerial poison, the action of which may not be similarly influenced by dilution with fresh air. The exhalations from putrescent animal surfaces are always specifically heavier than the upper warm strata air of the ward, so that they are confined to lower portion of the room, where, like oil floating on floating on water, with pure air above, they stagnate, until copious streams of cold and lighter air glide along the floor from doors and windows, and thus the acrial poison is driven to the columny-flues and to the ceilings. This fact is borne out hy daily experience; for, if several diseases such as fever, hospital gan-grenc, pyamia, Sc. are erowded together in one word and vanification is immediate the diseases ward, and ventilation is imperfect, the discases nsually spread. In one public institution with which I am acquainted there is a fever department, or "fever wards," aud when these rooms hecome filled with such cases, fever shows itself in some of the attendants and servants; whilst in our metropolitau hospitals these patients are indiscriminately mixed with other cases, and yet muscriminacity inxed with other cases, and yet we never hear of fever spreading. This hene-ficial result is not entirely owing, however, to the dilution of gases by good ventilation, but to the fact that the worst forms of typhus are counterpoised, in their baneful influence, by the pungent emanations of other diseases, as acute the pungent emanations of other diseases. rheumatism, &c. or the feetid exhalatious of a sloughing back or a gangreuous lung; so that when "the spotted fever" raged in London in 1347, and our wards were unusually filled with such cases, the disease spread in two or three instances to the attendants; hut it was to the attendants of the surgical patients, and not to the nurses who waited on the fever cases.

It has been observed, that "any agent which interferes with the integrity of the morbific molecule, destroys its capability of inducing a regular disease." The fact seems to be well authenticated (Bonssingault), that the inhahitants of South America are enabled to withstand the attacks of endemic diseases hy mechanical applications, such as veils placed hefore

It has been the organs of respiration, so as to sift the air fibsive odour from morbid solid particles, "which supports aployed as a that the poison." (Dr. R. D. Thomson's "Researches on and that the poison." (Dr. R. D. Thomson's "Researches on such an indiscriminate mixture of endus to a bealthy man, whilst more of materies from sover and essential of its deally power to propagate itself; so the same mauner that a tenespondiul of nuclear is counterbalanced by another which emost subtle counterbalanced by another which experied contracts in the same temperature.

But to return to the subject of the diffusive power of gases. The stagmant nature of all animal exhaustions of a gaseous kind requires that the diffusive force of such gases should be aided by mechanical force, especially when these exhalations are the product of endemic diseases, which may spread through a community. Just as oil with water requires to be shaken vehemently together in order to diffuse itself, so does the aerial impurity now under consideration require to be heaten about from all quarters (if I may use such a phrase) by pure air, before it can he so diluted as to become no longer deleterious to healthy persons. Now the tripartite windows of the Middlesex Hospital are capable of being left open all night, without giving rise to a downward current, and the zine perforations are rarely closed, unless the weather is intensely cold, aud then such a measure is not wanted, as a low temperature is always coexistent with a scanty amount of fetid emanations.

Mr. Rosser observes, "Everyhody knows that offensive smells are much less perceptible to windward than to leeward, and that the volatile gaseous exhalations from a coke fire are much less perceptible when there is a good draught towards the fireplace thau when the draught is imperfect, and hence it would be reasonable to infer that the spread of infectious disorders is lessened by arrangements the tendency of which is to retard the diffusion [*dilution*?] of the 'materies morbi,' and to remove them at once from the spot where they are generated."

This mode of reasoning is highly injurions, simply because it is hased on fallacions principles, for I have already attempted to show that the poison of contagion is wrapped up in the bosom of other noxions exhalations of a gaseous uature, and that the rapid dilution of the latter can alone ensure the non-propagating influence of the former; and I would humbly suggest to architeets and huilders generally, whether the inattention to this graud principle in the generation of aërial impurities has not led to so many serious errors in ventilation in our public asyluus, &c. &c. "There are many facts," observes Dr. Arnott, "to show that the impurity of retained breath, scarcely hereded in general, has been the chief element of the foul atmosphere which has led to cholera ontbreaks. Thus, in England, it has been in public institutions, clean to the cyc, not very offensive to the nose, and where the immates were well for nnder frequeut public inspection, hut where ventilation was overhooked and defective, thatsome of the most shocking scenes of destruction from eholera have ocentred; such was the school at Tooting, of 1,000 parish children, among whom about 300 cases of cholera suddenly occurred; and various union workhouses, hunatic asylums, prisons, &c. in London and elsewhere, were similally visited : such places in the end of 1849, produced more than half the cases of eholera." The very erowded school of the union-house at Taminon, heeame a remarkable example, where thirty cases suddenly appeared in the room of the girls in which the glass windows remained entire, while in the adjoining room of the hoys, where panes of glass were broken, and fresh air was annitted, not a single case occurred; and there was only one other case in the town.

Case in the town. Whenever, therefore, we can by ventilation drive the aerial impurities np the heated flue of a chimney, by the forcing, beating, slapping influence of a series of columns of pure air from all quarters, rushing towards the rarefied air of

* Arnold's prize essay's motto.

the fireplace, we then greatly diminish any tendency of contagious diseases to spread; the morbid matter, in lieu of hecoming "retarded" in its diffusion, should be quickly and largely dibuted, when we may inhale it with impunity, in the same manner that a tea-spoonful of Prussic acid in a wine-glassful of witer would prove fatal to a bealthy man, willist more than a wine-glassful of the same poison, dibuted in a gallon of water, would not prove in anywise injurious to a dozeu sickly persons. It has heen demonstrated that the virus of small-pox, cow-pox, &c. loses none of its property by exposure to gases. It is evident, therefore, that the retardation of any gascous impurity, which carries ou its hoson morbific matter, will aid the latter to propagate its baneful influence. The extrinction of suphurretted hydrogen, one of the most poisonous gases with which we are acquainted, or of phosphuretted hydrogeu, would not he followed in a mushy district by ague, but another agent uust be present to give rise to misam; and this agent is a certain morbid exhalation, now generally considered to consist of solid particles floating iu noxions gases, and generated by vegetable decomposition in marshy lands, aud hy animal decomposition, and by endemic discases amongst humau heings.

I will now pass on to a brief notice of the excellent system of ventilation adopted in the east and west wings of the Middlesex Hospital. The boiler furnace dues conjointly meet in the base-neut, and ruu up the east wing; ontside this flue is a chamber, and at the distance of 6 inches from the celling of every ward is an opening into this chamber, so that it is computed that 10,000 cubic feet of impure air are extracted from each ward per minute. The same plan is earried ont in the west wing by a coke furnace only; and this system, aided by the tripartite windows, has rendered the wards so sweet that, to quote a remark once made by a visitor, "You would not discover any appreciable difference helween the air in them and in that of the passages."

passages." In conclusion, let me quote a well-known authority on this subject :—" To form just con-ceptions of what ventilation is, and of how it is in general to he accomplished, an enquirer has to consider that the occan of air, called the averaging which pasts on the surface of the atmosphere, which rests on the surface of the earth, and at the hottom of which men live, as certain aquatic animals live at the hottom of the sea, is about fifty miles high or deep, and that the portion of this oceau which can be con-taminated by any process of animal or vegetable life, or by the decomposition of organic hodies when dead, may be regarded as less deep gene rally than the fiftieth part of one mile, estimated from the surface of the earth. This comparatively insignificant layer or stratum, therefore, may be regarded as the bome or lurking-place of all epidemic diseases and insalubrions air, the are generally confined to the still much smaller portions of air contained in houses or other inclosed places. Then the fact is to he kept in mind, that the whole mass of atmosphere at any moment over a city or other place is always tra velling away to leeward with the speed of the wind, and is earrying with it whatever impurity may ascend from below, which impurity is then resolved quickly into the pure elementary oxygeu, earhon, &c. of which all effluvia consist Man can no more contaminate permanently the deep atmosphere over him by his proceedings at bottom of it, than he can contaminate Atlantic Sea, by what he may do on the shores. Then he has to learn that with the same uechanical certainty, as he can substitute the pure water of a passing tide or river stream for defiled water near the shore, he may substitute pure air from the atmosphere for any air near him that has become unfit for his usc."-(Dr. N. Arnott.

I will close this communication by observing, that to the practical working of the present system of ventilation adopted at the Middlesex Hospital, since 1849, to the substitution of nonabsorbing Pariau cement for the old plaster walls, and other valued improvements in the closets and sculleries, may be attributed, as a means, the entire absence of all endemic dis-eases, whilst the oft-repeated outbreaks of such calamities previous to these alterations, war-rants me in saying that it is by far the most effectual system of veutilation that I am ac-quainted with amongst our public bospitals and GEO. CORFE, M.D. asylums.

asymms. GEO. CORES, M.D. Since writing the foregoing remarks, I have ascertained that the *Builder* has lately given a very favonrahle review of Mr. Robertson's ex-cellent paper, read at the Manchester Statistical Society. In this *brochure*, Mr. R. speaks of the Middlesex Hospital as heing nearce "a model" for hospital ventilation, than any public edifice of a similar nature with which he is ac-ousing the this construct, and he emphatically quainted in this constry, and he emphatically denounces mere "scientific" ventilation for demonrees mere "scientific" ventilation for hospitals, however admirahly such a mode of aëration may be adapted for dormitories, &c. and that nothing but the ceaseless flow of the and that housing out the conselects now of the external air through the wards, can effectually carry off the fetor from ulcers, wounds, hurns, and vitiated sceretions from other sufferers. Such an arrangement as the zine plates afford in many of our wards, Mr. R. speaks of in well-world provide

merited praise. Permit me also to refer your readers to the which Dr. Thomson has given some striking in-stances of disease and death arising from effluvia and imperfect ventilation, ten years ago, in the very establishment which Mr. Robertson has now, in its remodelled state, spoken of in such high terms.

ARCH, CONSTITUTION-HILL, GREEN-PARK,

THE Iron Dake, on the Corinthian Arch, has been so long a *fuit accompli*, that we may regard him as a fixture for aye in bis clevated position, however ill-chosen by those in autho-rity.* Would there be anything amiss in now completing the ornamentation of the arch, to correspond with the equestrian figure which surmounts it?

I allude to the spaces between the pilasters on the body of the structure, left *en bossage* to receive trophics or other enrichment.

Much cost would not he occasioned hy sculp turing on these rough blocks wreaths, to contain bronze inscriptions, simply and concisely cummerating the victories of the Duke. See the completeness of the Parisian Are de

PEtoile, in this as in its other details, and then look at the arch crowning Constitution-hill, and say whether there is aught to find fault with in the suggestion of Q.

STRENGTH OF IRON BEAMS : THE NEUTRAL AXIS.

Mr attention has been called to a paper hy Mr. Bell, on the "Strength of Irou," read at the Institution of Civil Engineers, an abstract of which is published in your journal of January 3rd.

In this paper there occurs the following pas-sage :—" In regard to this subject, Mr. W. H. Barlow had alluded to the alternative hypothesis, barrow had annued to include the spontaneous hypotness, that the neutral axis shifted its position as the heam became strained, and that when rupture took place, the neutral axis was 'at or above the top of the heam.'" Mr. Bell, having referred, in another place, to we repose on the strength of income

my paper on the strength of iron, read at the Royal Society in 1855, I feel it necessary to correct the error in the passage above mentioned

tioned. The words quoted hy Mr. Bell do not occur in my paper, hut are taken from a book of my father's (Professor Barlow), written many years ago, before the tensile strength of cast-iron and the position of the neutral axis had been clearly ascertained. Referring to the anomaly pre-sented between the supposed tensile strength and the apparent resistance of the outcr fibre, in a solid reetangular bar, when strained transversely, my father states, that even if the neutral axis be assumed to be at the top of the bar, the direct tensile resistance must be 10 tons per inch, in order to account for the strength per inch, in order to account for the strength exhibited, to which he adds the remark, that "unfortunately the exact amount is not known."

* We have better hopes .- ED.

In my paper I gave an account of experi-ments which I had made, and which established the position of the neutral axis hy actual measurements of a large rectangular cast-iron heam, under varions degrees of transverse strain. By these measurements the neutral axis was found to be in the centre of gravity of the section.

The section. Having heen the first person who ascertained the position of the neutral axis hy actual measure-ment, and thus rendered it no longer a matter of opinion, but an established fact; and having published this fact in the paper alluded to by Mr. Bell; it is rather an inexcusable blunder on his port that he chould use a paper and Put, Den; in is rainer au inexcusable blunder on his part, that he should use my name as alluding to the neutral axis being uear the top of the heam, and conclude hy expressing an opinion (after the fact has been proved), that "there appeared to he no good reason for sup-posing that the neutral axis shifted its position." W. H. BARLOW.

CLASSIC v. MEDLÆVAL

CLASSUC v. MEDILZVAL. You will perhaps allow mc to express my cordial approbation of what was said in your last number hy Mr. T. Goodchild, in hehalf of what, for want of a more precise epithet, must be designated Classic in unmistakahle contra-distinction from Mediæval. Still, though I heartily thank him for what be has said, I am by no means satisfied with it, simply because it was too hiref to produce much officet unless it iron. was too brief to produce much effect, unless it what too brief to produce a product stock, and a true of the same side of the question. The Chassic, or 1 would rather call it the Neo-classic style, it heing considerably modified

Nec-classic style, it heing considerably modified from its antique original, is surely more in accordance with our present requirements, and likewise with the element of modernism or non-medievalism in our sympathies with literature and art, than is a style formed and fashioned during a quite differently constituted state of society, of which it is now incongruonsly requirements. reminiscent.

remniscent. At all events, before it can again be rendered, even in a tolerable degree, applicable to secular purposes of every kind—as we are told by its nltra-advocates it ought to be—Gothic must be greatly modified, perhaps almost metanorplosed, or soon would be so, were it to become employed on all occasions, even the most ordinary ones on all occasions, even the most ordinary ones. When resorted to only in special and exceptional when resorted to only in special and exception and eases, where, after being carefully studied, its mediaval costume can be well got up, Gothie may serve the particular purpose; but it has now become an architectural exotic, and the making use of it is now too much like the affectation of archaisa. Z.

CORK.

The arcbitectural doings at Cork have not been large lately; still, some little has been done. The Great Southern and Western Rail-way has heen opened to the water-side within way has heen opened to the water-side within the past year; and a goods station—substantial buildings—heing over 365 feet long hy about 140 feet wide, built from the designs of the Com-pany's engineer, Mr. Miller. The passenger terminus was designed hy Sir John Benson. It consists of arrival and departure platforms, waiting-rooms, with the naval offices, a con-venient space for cabs and onnihoses, so that passengers can be taken up or set down under cover: this is a colonnade, 200 feet long and 30 feet wile at each end, and 13 feet wide hy columns, 14 feet 6 inches high, supporting the roof. The entablature is plain, with block in cornice, and a low stift to screen the roof.

conice, and a low attic to screen the roof. The Cork Exhibition Building has heen per-petuated by a more substantial building by the last-named architect, which is called the Cork Athenaeum. The building has been in use some time. The aclavanda to antraneo in net your The colonnade at entrance is not yet time. erected, for want of funds.

The tower to the Roman Catholic catbedral The tower to the Roman Catholic extrema is finished, but nothing as yet is done to the spire: the quoins and dressings and tracery are in limestone, well executed; the walling in the red stone of the district. A new dock, 350 feet long, 18 feet water on sill, 60 feet gate, bas been built by private enter-prise. Mr. Wheeler is the proprietor. The works

[JAN. 17, 1857.

were carried out by Mr. Alexander Dean: the original design was by Sir John Rennie; but local eircumstances caused Mr. Dean to modify and alter this somewhat. It is a very successful work

Another dock has been also constructed by Another dock has here also constructed by private enterprise on this river by Mr. Brown, with 24 feet water on sill, gates 80 feet 6 in. wide, in length nearly 400 feet. These works show the growing importance of this port. A new Roman Catholic Church of St. Vincent D. Under Low concerned also this ware, built

A new Roman Catholic Church of St. Vincent de Paul has been opened also this year, huit from a design hy Sir J. Benson. Queenstown has been very much built on within the last two years, huit in a somewhat questionable style. The new Queen's Hotel is almost half window. Small drawn up piers separate a multitude of openings, and to crown the whole, it is surmonnted hy a clumsy cornice and parapet. Still from the barbour the town looks much improved, and was lighted with gas and parapet. Still from the barrout the town looks much improved, and was lighted with gas for the first time on the 1st inst. The shops and streets of Cork are every day improving, and in some of the shop-fronts there are a character and style very creditable. They are about to rebuild St. Patrick'shridge, which was carried away, or rather injured, by the great flood of 1853, in one arch of 180 feet span, in iron

PROPOSED MEMORIAL CHURCH AT CONSTANTINOPLE.

IT will interest some of our readers to hear that forty-six designs have been sent in to the committee for the competition for the Memorial committee for the competition for the Memorial Church at Constantinople: several of them have great merits. An architect who has re-sided at Constantinople responded to onr invita-tion, and expressed himself willing to give any information in his power to competitors. His intimation, however, came too late to be of service. service.

THE LIVERPOOL ARCHITECTURAL SOCIETY.

The seventh meeting of the society was held on Wednesday, the 7th inst. the president, Mr. S. Huggins, in the chair, when Mr. J. A. Picton read an interesting paper entitled "Notes on Arebitecture in Holland, Cermany, aud Switzer-land." land."

THE LIVERY HALL ABOUT TO BE ERECTED FOR THE CLOTHWORKERS' THE COMPANY.

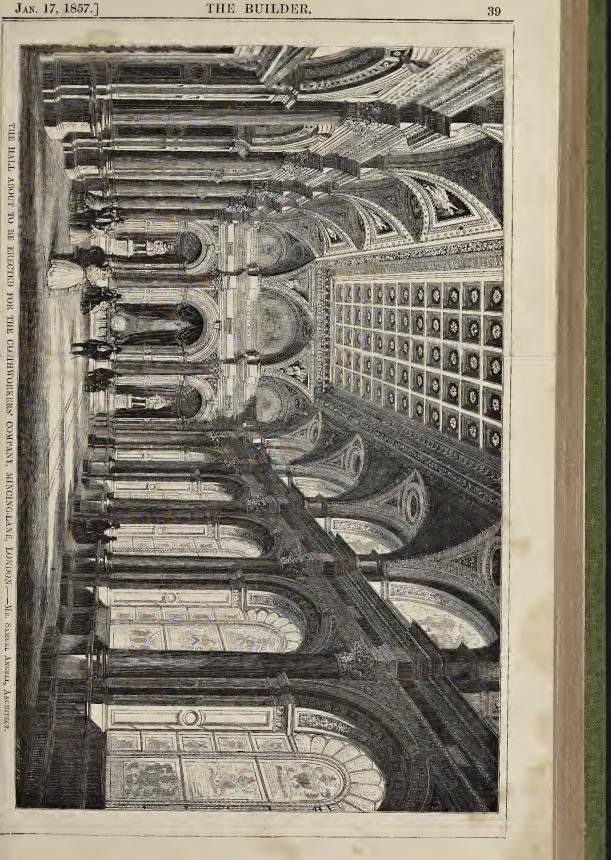

The view represented is taken from the south end of the room. The sides are each divided into five arches by piers with attached Corin-thian columns. On the east side the arches will contain windows filled in with stained glass from the old hall, and on the west side there will he

the old hall, and on the west side there will he three entrances and two large open fire-places. The buffet will occupy the centre of the north end, and at the opposite end there will be a screen and music gallery. The arches springing from the attic above the order will groin into the vanht of the ceiling round each of the four sides, and it is intended to fill these with stained glass, with the royal arms and those of the principal city companies. In the spandrils will be figures in relief, em-blematical of the most important commercial cities and towns of the United Kingdom. The columns are to the of Peterhead or Abery

The columns are to he of Peterhead or Aber-The columns are to be of recentration and deeu red granite, with grey granite bases, and capitals of Caen stone. The stylobate is to he of various English marhles. The ceiling above the vaulting will be framed in wood for the

purpose of assisting sound. The extreme length of the room will he 80 feet, the width and height both 40 feet,—a double cube.

double cube. It promises to be a fine addition to the Halls of London, and will worthily connect with the City the name of its architect, Mr. Samuel Angell. In our last volume (p. 610) we gave a view of the exterior of the hulding, and some memoranda concerning the Clothworkers' Com-pany. We may add that the late Sir Rohert Peel and Lord Hardinge were both liverymen of the company, and that the present Mr. Justice Willes is at this time one of the members of the court and livery. court and livery.

THE BUILDER.

RAILWAYS ON COMMON ROADS.

In has been well observed hy an eminent French angineer, in relation to locomotive faci-lities, that " to retrograde is sometimes a pro-gress i," and this apparent contradiction of terms gress ;" and this apparent contra is really true in many instances.

is really true in many instances. It is undonbtedly applicable to the formation of a series of what may be termed secondary railroads, or tranways, on common roads, worked by horse-power, now energetically de-manded by one French allies, and usefully employed in America; — for Brother Jonathan can go shiek ahead, as far and fast as anybody when it suits his upmane, and retroards with when it snits his purpose, and retrograde with equal facdity where an advantage is to be gained. And why not? Why should people deprive themselves of the pleasures and advantages of cheap conveyance, because they cannot allord to construct a spick and span new locomotive railway, with deep cuttings, high banks, showy bridges, and splashy stations?

It will not pay to make expensive locomotive railways everywhere, to every village and ham-let ambitious of being introduced into the world on a railway of its own : however, where locomotive lines cannot be made, tramways can, at one-tenth of the cost of the former, and quite a pacific linet so rand and raine Winserik at one-tenth of the cost of the former, and quite as useful, if not so grand and noisy. Where it will not pay to put down a tramroad, the inhahi-tants must be content to jog on in the even tenor of their way as usual, — tradge through muck and slusb, stick in ruts, or stop at bome ont of harm's way.

Where towns are placed at a moderate dis-nee from the main trunk line, and the traffic where towns are placed at a moderate the tance from the main trunk line, and the traffic would not be sufficient to pay for the construc-tion of an expensive locomotive branch, they may be readily tied to the main artery by an improved transway, and thus at small cost reap the benefit direct by railway transit.

It is better to have a serviceable transay It is better to have a serviceable transay thau he cut off from the main line; for a town in the latter predicament is isolated, checked in its progress, and kept behind the age, all for the want of a few yards of rolled iron! Why should transroads be despised in prac-tical England, and ignored in Loudon and its endless submrls? Why should people hugh at the idea of horse railwars—of transwars on our

contess subtrus: Why should people haugh at the idea of *horse railways*—of tramways on our common roads? Perhaps because they are old-fashioned, and have been put in the shade hy locomotive lines. But this is sheer nonscuse. fashioned, and have been put in the shade by locomotive lines. But this is sheer nonseuse. All are useful in their proper place. No one in his senses would recommend a horse transvay from London to Bristol, while be can fly along by the "Iron Duke" on the Great Western dure not hope to penetrate: it is here precisely valear the frequence take on the business and where the tramways take np the business, and would do a paying trade. Many of our out-of-the-way places are worse

Many or our out-or-the-way places are worse off for cheap and easy conveyance than they were before railroads eane into fashion : the grand trunk lines pass at a distance from them : coaches have been taken off the roads : convey-ance is scarce ; and inter-communication difficult. Much time is lost to the unlucky inhabitants of withing the start of the start of the start of the start withing the start of the start start of the start start of the start of ontlying towns, in tradging to and from the railways; some three or four miles away from onlying county in this is to be a say from them. Who likes to trudge to or from a rail-way station up dusty roads or muddy lance? No one, certainly, if he can help it: even omni-bases are a hore, although put in the line of route hy cumning publicans and others for the special comfort and conveyance of their cus-

It is no unusual sight at a railway station to see half a dozen shaky omnibuses, with ricketty horses, and noisy eads, touting for enstomers on the arrival of a train at a place where pas-sengers disembark to find their way to a town some miles away from the line. Here are half a dozen omnibuses and a dozen horses, where

luggage, coals, ores, slates, and granite blocks, as on the Dartmoor transway,—not for the con-veyance of passengers,—pushed along by sweaty men and boys, not drawn gullantly on hy horses *i la poste*. The carriages need were sembly trucks, short, thick, and stampy, with pullies for wheels just big enough to lift them elear off the rails or plates. No one ever dreamt of nsing them for passenger traffic, or of carrying them through toyms and cities.—but why, is a mystery. They were neglected, and at last almost forgotten. No one thought of *improving* transvays, while they had locomotives to im-prove, spoil, or patent, as the case might be. They stood stock still in their native rudeness and mysteric and hosterd as venerable as if they. and rusticity, and looked as when their numerable as if they had been formed by Tubal Cain himself, in his 'prentice days; while railroads rushed a-head, prentice days; while railroads rushed a head, and carved the country into gridirons, with rails and roads of every size and shape. Yet they have liggered in the memory; and now, after a grand flourish with the locomotive lines, enter prising men bethink themselves of the trams:" why not smarten them an why not smarten them np ; why not them where they have never heen put before; go where their rivals cannot go, and, like the jackall, provide food and avery that, like the locomotive line

locomotive line ? Brindley said one day to a committee of grave wiseneres in the House of Commons, that "rivers were made to feed navigable canals;" and so we may say that trauways may be made to feed locomotive lines. The "old trans"—with a new face, with new-fashioned flanged wheels (not pullics)— to remain a subscription of the subscription of the subscription.

new-tashioned hanged wheels (not pulles) -smart, roomy omnibuses for fifty people; good luggage-trucks properly built, and well turned out, secundum artem, in their most civilized form, will be readily patronized by the rambling public, in consequence of their couffort and economy. The Yankees have taken them in hand, and brought them largely into play. They are well known in many of the American cities, and in that land of progress are going rapidly ahead. Horse railways are found useful in America, and why should they not in Eugland?

Our French neighbours bave taken them up : engineers have devoted time and trouble to engineers have devoted time and trouble to their improvement; and improved specimens of the "old trans" were exhibited in the "Pala's de 'Industrie" during the last year's display. Many pamphlets have been written upon them, several patents taken out, many improvements made, and a line actually laid down in the Champs Elysées, Paris, to let the gallant Parishus see what can be done on common roads. Besides all this stir and "waking up," carged companyies have been started for the roads. Besides all this stir and "waking up," several companies have been started for the purpose of carrying the idea of horse railways into practical execution. Many of the principal cities of France, as Bordcaux, Ronen, Havre, &c. hy the medium of their municipalities, have

Act, by the internation of the principle, and recognised the merits of the improved transway system. And why should they not? At Rouen, for example, when these transways are faid down alongside the quarys, merchandise can be at once received from the vessels, and sent direct to the railway ontside the town, and thus bring the shipping into direct and facile communication with Paris; and the same arguments apply to the busy quays of Bordeaux, which, by means of tramways, will be united with the Cette, as of transveys, will be united with the Cette, as well as with the Paris line. In this point of view improved transvays are exceedingly useful, and bid fair to be fully employed for such par-poses on the Continent,—not only for mer-chandise, but for passenger traffic. Many lines, even of twenty and thirty miles length, have been earcfully studied for transvays, and have been earcfully studied for transvays, and have been very favourably received by the French Government,—as little or no objection seems made to their being laid down on the imperial and communal routes of grand communication. The Belgians might naturally enough be expected to follow the French in these matters. Our worthy friends, the good Mhyneers of phlegmatic Holland, have even taken up the cae, rubhed a dozen onnibuses aud a dozen horses, where one good roomy omnihus and two horses would do equally well with a tranway. This is a waste of money, time, and power, which should be remedied by the introduction of the tranway. Tranwoads were invented long before steam and Stephenson cause forth "to witch the world with noble horsemanship," and whiri through the wind at a mile a minute. They were, how-ever, confined to hleak and dreary mining dis tricts, or huried in the twists and twirls of our great slate quarries,—used for heavy loads of

self nods assent,—then why should not the Londoners and men of "Cheape" give the "trams" a fair and honest trial?

The improved tramways must neither be con-The improved trainways must here de con-founded with the cheap go-ahead " plank" roads of America, nor with the rolled plates of our old collier trams. They are now, in fact, complete railways, with a guard-rail and fanged wheel to the vebicle traversing them, so that they really possess all the advantages of a rail as used on locomptime lines, their form, here they really possess an the advantages of a rat as used on locomotive lines; their form, how-ever, being very different. The hest form is that patented by Monsieur Loubat, eivil en-gineer, and employed by him in the line tra-versing the Champs Elysées, from the Place de la Concorde to St. Cloud. In appearance it de la Concorde to St. Cloud. In appearauce it is something like a semi-circular gutter, but on closer inspection it will be seen to consist of a rail and guard. The wheels of the omnihus which are flanged, run on the rail—and not in the hollow part of the gutter, as it may he called. Although placed in the common road, crossed and re-crossed in every direction by the erossed and re-crossed in every direction continuous traffic, it never becomes choked nor offers impediment to the free passage of omnihuses specially made to run up it. omnihuses specially made to run up it. It offers no obstruction whatever to the other traffic, and, in fact, is scarcely seen on the road, as it is level with its surface; and, in fact, forms au integral part of it. A simple rail would not road would be worse than useless, and the old plate trans, with their sharp upright flauge, would he dangerons for borses, and easily damaged by the passing traffic, which is uot the case with the improved trans-rail. The carringes are large, and capable of carrying forty or T_f case with the hipbord transact. In the character are large, and capable of carrying forty or fifty passengers, which run lightly along the rails, and are easily worked with two horses: they are made back and front alike, with a shiftthey are made back and front nike, with a simil-ing pole, so that when they arrive at their journey's end, the pole is shifted, which saves the necessity of turning, or using turn-tables. In case of necessity arising from any obstruc-tion on the read, they can be readily thrown out of the real, pass the obstruction, run on to the evilone and continue they way with the rail again, and so continue their way with-out let or hindrance, which is a very useful feature in the improved tram-rails as now employed in France.

These kinds of railways,-for after all they are really railways, - may be advantageously em-ployed, especially on the continent, where the grand net-work of railways is not so closely interwoven as in a small country like England. intervoven as in a small country ince England. They will make adminishle tributaries to the main lines, and give great locoinotive facilities where none now exist, in consequence of the distance of the main lines from many of the mighborring towns. They are of easy applica-tion in Holland, many parts of Belgium, Nor-thern Germany, and would render good service to Russia. As the principal roads in France are nuder the control of Government, there are no old-fabilitiened combergame "furninketurnis." no old-fashioned, cumbersome "tnrnpike trusts, as iu England, to throw obstacles in the way.

as u England, to throw obstacles in the way. The Brench Government admits the utility of the principle, and will not raise objections to well-selected lines, on any of the rankes im-périales. They have latterly made much way, in the estimation of the communal and departe-mental authorities, who have not thought the subject heneath their notice, or unworthy of dis-cussion in their comments.

cussion iu their conncils. The question relative "à l'établissement sur ces The question remarks in transmission with the denx lignes du systeme de chemin de fer arec cheranz," has been discussed and approved in the "Conseil générale" of the departement, du pas du Calais, as well as in many others of these important assemblies.

The municipal conneils have not been hchind-hand in these matters; for, in many of the prin-cipal cities, they have hecu freely discussed, and their ntility as well as economy fully ad-

contractor in France would be glad to furnish a ine complete, including rolling aud working tock, for 50,000 frances, or 2,000 frances the cilomètre. This is in fact a rather high esti-nate, and they may be laid down complete for 50,000 to 40,000 frances the kilomètre, whereas l locomotive line could not be executed under 50,000 frances, or 10,0000, the kilomètre. And ince the traffic in the two lines would be pretty nearly equal for most places where trans would be useful, the economy and pecuniary advantage s evidently in favour of the trans. Then why of employ them more freely—why not bring hem into use more rapidly, and open up uew neilities for locomotion and inter-communica-ion? ontractor in France would be glad to furnish a

ion ? Their safety is indisputable, and speed suffi-iently great for ordinary purposes. The ordi-ary rate of haggage-tracks is from ten to welve kilomètres the hour, and for passenger, rom twenty to twenty-four kilomètres, which is juite fast enough for ordinary purposes, where ramways can be judiciously employed. No one of course would pretend to put them in competition with locomotive lines: they are not lawinged for any such surgeone. they are not Their safety is indisputable, and speed suffi Solution with reconstruction in the structure for essigned for any such purpose : their object is o open up new fields of traffic to feed the grand ines, especially where locomotive hrauches rould not pay for working ; and in this alone consists one of the greatest merits of the prin-ple. Rivers are fed by minor streams flowing whet them , and so are truth lines to hyperpole. offisite one of the greatest merits of the plan-ighe. Rivers are fed by minor streams flowing into them; and so are trutk lines hy branches; and a large stream of traffic may be made to low into them, through the small but useful hannel of well-selected transvays. They are ound useful in France and America, and why iot in husy, bustling, restless England? Time will bring them into favour, thoogh now despised a the native land of railyays. n th e native land of railways.

will bring them into favour, though now despised in the native hand or railways. What can be said of their eligibility for the analyse lerizent factor of the senicircle, and the circumference of the senicircle, of which the base of the rectangular part of the window is equal to the diameter, and, therefore, the side of the rectangular part of the window is equal to the diameter, and, therefore, the side of the rectangular part of the window must be capale to the radius of the senicircle, and to be remainder, which is the diameter. There, the side of the rectangular part of the window must be capale to the radius of the senicircle has do to the mainder, which is the diameter. There, the side of the rectangular part of the window must be capale to the radius of the senicircle has a solution if the window must be capale to the radius of the senicircle has a solution if the single of the fared above a table, so that a small portion of the senice of the light, may receive from it the grantest degree of illumination. aken up by men of eminence and ingenuity in france; and ere long. I have no doubt, from the apid strides they are making in public estima-tion, that they will be more generally employed than at present; and that when once the im-pulse is fairly given, its march will be con-innuous and onward. They will be improved as they advance in favour; and, when their merits and utility are better known, they will be better appreciated, even in England. JONET LOCKWOOD.

JOSEPH LOCKWOOD.

COMPENSATION CASE, NORWOOD.

COMPENSATION CASE, NORWOOD. Ox Friday, the 9th instant, an inquiry took place before a jury, at the Sessions House, New: Strotfprd and West Ham.—It is intended, it is said, to creet workshops and factories for the is said, to creet workshops and factories for the is said, to creet workshops and factories for the is said, to creet workshops, near Plaistow-account of which we are indebted to the Allian. The Large y, belonging to M. T. E. Savage, taken by grove, where it is also proposed to creet a viatue, which shows the increase in the value of laud there. The plot of hand in question was parchased by Mr. Sarage in 1840, by auction, by 3400. On the part of the claimant, Mr. Wm. Allen Boulnois valued it at 4,752L; Mr. Belaward PAnson, at 4,424/; and Mr. Edwin

Nash, at 4,438*l*. On the part of the company, Mr. Charles Lee valued it at 799*l*.; Mr. R. Å. Witball, at 761*l*.; and Mr. Wm. Rogers, at 766*l*. The jury gave for the whole, 1,200*l*.

MATHEMATICA QUÆSITA CUM EXPLICATIONIBUS.

PERITAPS you may consider the tendency of the following resolved quasita calculated to give them a place in the columns of your journal:---

Required the dimensions of a Norman window, of a given perimeter (a), so that it may admit the greatest possible amount of light.

The whole perimeter is denoted by σ_i let xrepresent the radius of the semicircular head of the window; then we have $\pi x =$ the eir-cumference of the head; and the area of the window may be expressed by the function

$$(a - 2x - \pi x) x + \frac{\pi}{2} x^2,$$

= $a x - 2 x^2 - \frac{\pi}{2} x^2,$
(by hyp.) must be a maximum.

Denoting the latter function hy ", we have

which

whi

$$\frac{dx}{dx} = a - 4x - \pi x,$$

ch = o, when $\pi + 4$. $x = a$, and as
 $\frac{du}{dx}$ passes through +, o, -...

Therefore, when $a x - 2 x^2 - \frac{a}{2} x^2$ is a maxi-

where $\overline{x} + 4$, x = a; i.e. the whole perimeter equals the circumference of the semicircle, and twice the diameter of the semicircle, and the base of the rectangular part of the window is equal to the diameter, and, therefore, the sides of the rectangle taken together are equal to the remainder, which is the diameter. There-fore, the side of the rectangular part of the window must be equal to the radius of the semicircular head.

$$\alpha = \frac{1}{r^2}$$
, and $\alpha = C = \frac{1}{r^2}$. Sin $\phi = \frac{1}{r}$, and $r = \frac{1}{r}$, $\alpha = \frac{1}{r}$, $\alpha = \frac{1}{r^2}$, $\alpha = \frac{1}{r^$

and denoting it by *u*, we have

$$\log_{x} x = \frac{1}{2} \log_{x} (a^{2} + x^{2});$$

$$\frac{d}{dx} = \frac{1}{x} - \frac{3x}{a^{2} + x^{2}} = \frac{a^{2} - 2x^{2}}{(x^{2} + x^{2})};$$

which = 0, when $x = \alpha \sqrt{\frac{1}{2}}$; and $\frac{1}{dx^2}$ is negative; therefore u has a maximum value

when $x = a \sqrt{\frac{1}{2}}$. Cambridge. A. J. TOMPKINS.

PROVINCIAL NEWS.

Bardney (Lincoln).—The Bardney Wesleyan Day School, designed hy Messrs. Bellawy and Hardy, of Lincoln, architects, was opened on

ments and alterations, at an estimated cost of 2,427. for the pavilion, &c. and 7,6184. for the north property, making together 10,0454, which sum the committee suggest should be raised by a new loau for 57,0004 paying off the present debt, and extending the redemption of the new loan to thirty years, at 4 and $4\frac{1}{2}$ per cent. By this plan the present rate will not be increased. The committee state that they feel confident the Pavilion estate, thus applied, will realize in point of revenue the expectations of the most sanguine. A suite of reception-rooms, musichall, and antheum, or conservatory in the dome, free public library, museum, and picture-gallery are all comprised in the projected improvement of the property. ments and alterations, at an estimated cost of

free public library, museum, and picture-gallery are all comprised in the projected improvement of the property. *Glaucester*.—The new corn-exchange was opened on Saturday in last week. Owing to the irregular form of the ground upon which the huilding stands, and the narrowness and obliquit of the frontage, a departure from the ordinary rules of street architecture was neces-sitated. In order to avoid interference with some established lights on the north side the building was set back, and a circular portico thrown out to the extent of the line of frontage. Four detached Cointhian columns, with two pilasters, 26 feet high, spuppert an eutablature of the same order, on the top of which is a balus-trade, surmounted in the centre by a colossal figure of Ceres. Carved vases are placed on the balustrade immediately over the four columns, the centre space being filled in with the eity arms. The total height from the pavement to the starease communicating with Minton's encanstic tiles; ou one side of which are the offices of the cirveryeor and his assistant, with a stairease communicating with Minton's encanstic tiles; ou one side of which are the also of the cirveryeor and his assistant, with a stairease communicating with the upper floor, on which are located the town clerk and the clerk to the Board of Health. The dimen-sions of the corn-exchange is through a cer-ritor 13 feet. A committee or settling room is attached to the corn-exchange are 62 feet by 52 feet, and the height from floor to top of lantern 45 feet. A committee or settling room is attached to the corn-exchange are 52 feet by 53 attached to the cornexchange, measuring some 32 feet hy 14 feet. The corn-exchange is intended to he used for concerts and public meetings of all to be used for concerts and public meetings of all kinds: it has, therefore, heen fitted up with gas. The exchange is heated by hot water, on Haden's principle, by whom the work has been executed. The contractors for the exchange are Messrs. Jones and Son. The carving is by Mr. H. Fritb, of this city. The architects of the building and the general market are Messrs. Medland and Maberly.

Noterly. — The foundation-stoue of Alderman Davies's Charity Schools was laid last week. The schools are to be built in the Early English style, and will provide accommodation for about 600 scholars. The architect is Mr. E. Moxham, of Neath.

for about 600 scholars. The architect is Mr. E. Moxham, of Neath. Leicester.—A memorial has just been creeted at Bow-bridge, Leicester, whereon it is recorded that near that spot lie the remains of King Richard. It is set in the gable of a new huid-ing there. The monument is in Kelton stone. Birmingham.—The opening of the Adderley-park Library and Museum took place on Mon-day in last week. There was a dinuer, the proceedings of which were not open to reporters. At the dinner were present—Lord Lyttelton, Lord Leigh, Sir Robert Peel, hart. M. P.; Mr. C. B. Adderley, M. P.; Mr. J. Rateliff, mayor of Birmingham, & A feature of the pro-ceedings was the presentation of a testimonial to Mr. Charles Rateliff. The testimonial con-sisted chiefly of a piece of plate. *Liqubaston.*—The new vestry-hall, for the parish of Edgbaston, has been recently com-pleted. The architect was Mr. F. W. Fiddian, and the builder, Mr. John Cresswell. It is alculated to hold about 400 people. *Liverpool.*—There are various street huidings of some pretensions in progress, and for some account of which we are indebted to the Allion. The large structure belonging to the Liverpool

the north wing, fronting the Exchauge-build-ings; and the central mildings in High-street and Exchange-street East. These four blocks have an open area in the centre (to he covered have an open area in the centre (to he covered by a glass roof), which not only gives light to the inner portions of the structure, but fur-nishes ready means of access to the varions floors hy steps and galleries. The second floor will be supported by cast-iron columns, rising from the basement, and bearing cast-iron widden butters with the state of the second floor will be supported by east-iron columns, rising from the basement, and bearing east-iron pirders, hetween which and the floor fire-proof brick arches will be formed. A number of these columns are hollow, and are made to serve as chimney-flues. The plinth of the building is granite, supplied by Newall and Co. of Dum-fries; and the external masonry is Darley Dale stone, of which St. George's-hall, the Brauch Bauk of England, and other edifices in the town have been construction. Bank of England, and other edifices in the town have been constructed. The arches over the entrances in Dale street and High-street, and entrances in Dale-street and High-street, and the carvings, are in Caen stone. The masoury to the ground-floor story consists of large hlocks of stone, the piers which carry the arching to the ground-floor windows being in one stone from window-sill to impost, measuring about 4 fect wide and 8 fect high. In the principal entrance, in Dale-street, there will he adversers of pulshed and street ranks. a doorway of polished red granite, upplied by Mr. M Donald, of Aberdeen. It will consist of two Doric columns and entablature. Over the entrance to the basement, from Exchange-street East, there are some large York landings, one of them being upwards of 13 feet by 9 feet, and S inches thick. These, and the masoury in general, were raised by two travellers, or jemmics, on a double set of staging. The building, when completed, will be 60 feet high. It covers an area of abont 1,500 yards. The cost of the land was upwards of 70,000%.; and cost of the land was upwards of 70,0007, ; and the contract for the crection is over 35,0007 to which there will be some slight additional cost. The carving is chiefly by Mr. Stirling, of Liverpool, portions heing in the hands of Mr. Nicholls, of London, who executed the carving for St. George's-hall; the masoury, by Mr. Wells, of Liverpool; the carpentry, by Messrs. Haigh and Co. the sole contractors; and the brickwork, by Messrs. Junp and Son. Pro-fessor Gockerell is the architect.—The new block of offices on the site of the old iron ware block of offices on the site of the old iron ware-house, at the hottom of Water-street, belonging to sur Joseph Bailey, is also ready for the limit floor, and the cast-frou columns and girders are fixed for its reception. The style of this build-ing is perhaps more that of Florentine Reuais-sance than anything cles, although very freely treated by the architect, Mr. Councillor Picton, of Liverpool. The remund floor, is clicking to Sir Joseph Bailey, is also ready for the first of Liverpool. The ground-floor is slightly form Water-street has a polished granite doorway, surnounted by sculpture, representing a wreath of fruit and flowers, the design for which is borrowed from St. George's-hall. The Venctian windows have polished red granite pillars, with capitals, composed of natural foliage, conventionally arranged, designed by foliage, conventionally arranged, designed by Mr. Pictou and his son, as stated by the former gentleman at a recent meeting of the Liverpool Architectural Society. Mr. Hugh Yates has the contract for the masonry Messrs. Jump and Son, the brickwork; and Mr. Borrows, the earpentry.— Mr. Picton, who, adds the *Albion*, is professionally doing so much to beautify and ornament the town, has also erected the new pile, in the Italian style of architecture, at the corner of Rumford-street and Water-street, for the Cunard Company. — Another block of stone buildings, the property of Mr. John Naylor, banker, is being creeted in Oldhall-street, covering about an acro of land. The architect is Mr. J. K. Colling, of London, who restored Hooton-hall. He has made a very free treatment of the Renaissance, with Arahesque variations. There is a central area, having a grand entrance from Oldhall-street, with blocks of buildings ranged Oldhall-street, with blocks of buildings ranged around. Messrs. Holme and Nichol are the coultractors, and Mr. Parker has the masonry. The design for this building was in the Archi-tectural Exhibition in London.—The Roman Catholic cathedral in St. James's-street, for which Mr. Pugin is the architect, is progressing gradually.

-Government, it is said, has accepted Perth. tenders for the erection of extensive additions to the General Prison at Perth, which will cost

nearly 30,000%. The works will consist of a new wing of four stories or galleries, containing 204 cells, with suitable association-rooms for the couliuement of female convicts upon the princoultement of temate convicts upon the prin-ciple of association : improved accommodation for juvenile prisoners will also be provided, and the chapel is to he enlarged. The plans were prepared by Mr. Matheson, architect for H.M.'s Board of Works, and operations will be immediately commenced.

CHURCH-BUILDING NEWS.

Castle Rising.—The restoration of the chancel of the church of St. Lawreuce, Rising, was com-pleted on New Year's day. This work is suppleted on New Year's day. This work is sup-plementary to the complete restoration of the nave and tower some years since; and the only part of the building now requiring re-edification appears to be the south transpt, of which no remains are visible except the beautiful arch which formerly opened into it from the tower, but is now blocked np. In the chancel resto-ration, the style of architecture throughout adie in how more a particular the architecture throughout adhered to is the Early English. The walls have heen re-cast and partly rebuilt, the old roof removed, and replaced by a new one at a higher ed with lead, with gable copings Internally the roof is of English covered pitch, and cross. oak, raised upon a carved stone cornice having a runuing ornament of three different patterns. A new laucet window has here inserted in the uorth wall, filled with painted glass by Mr. Lamb, of London. Thus with the two new windows on the south side, and the three-light windows on the south side, and the three light eastern window, already existing, the chancel is entirely lighted with painted glass. The reredos consists of five elaborately diapered panels of Caen stoue in an arcade, the shafts of which are of dark-coloured Devonshire marble. A similar of dark-coloured Devonshire marhie. A similar arcade is continued along the castern wall, meeting, on the north, the credence-table, and meeting, on the north, the creating and on the south the piscina and sedilia. The floor-ing of the chancel is of Minton's tiles. The chancel is warned by hot water, the pipe trenches being covered with perforated tiles, patented, we understand, by the hrother of the trendes being covered with periorated hiles, patented, we understand, by the horther of the rector. An improvement has been effected by the removal, from the chancel into the tower, of all the monumental tablets, the memo-rial of the late Colonel Howard being also re-moved to the otherwise nearly hlauk north wall of the nave. The whole of these works have here preputed at the safe converse of the How of the nave. The whole of these works have been executed at the sole expense of the Hon. Mrs. Howard. The builders employed were, for the stonework, Mr. Brown, of Lynn; and for the woodwork, Mr. Taylor, of Norwich. Mr. Street, of London, was the architect.

Mr. Street, of London, was the architect. *Worester*—The consent of Sir George Grey has just been obtained, to the land presented hy Mr. W. Laslett, M.P. being used as the burial-ground for the eily of Worester; and Mr. Purches, the surveyor to the Local Board of Hooth hese resoluted instantions to make of Health, has received instructions to m e a survey of the site, with plans, sections, &c. for the use of the Burial Board.

the use of the Burnal Board. Nucleon—A monmment has just been erected in the church at Nunton, by Messrs. Osmond and Son, of Salisbury, to the son of Major-general Buckley, M.P. who fell before Se-hastopol. It is of Gothic design, and is embel-block with willters embloys. hastopol. It is of Gothic desi lished with military emblems.

Inshed with military emblems. Charleombe.—A restry meeting of the inha-bitants of this parish was held on the 2nd inst. " for the purpose of taking into consideration the propriety of authorizing the rector and churchwarden to apply to the Bishop's Court for a focult for rational remaining and three for a faculty for restoring, repairing, and alter-ing the parish church, according to the plans and specifications to be then produced, and also figuring a rate for the same. The churchwarden figuring a rate for the same. The churchwarden proposed "that the plan and specifications of Mr. Scott be adopted; that a rate, not executing 2007, be made for the purpose of carrying out the repairs; and that the rector be authorized to apply to the bishop for the proper faculty." The rector explained that Mr. Scott's proposi-tion was, to leave the tower standing, to take down all the walls and the roof, but leaving parts of the porch and the Norman arch oppo-site the door. All the rest Mr. Scott had pro-nounced, through his chief manager, to be unsafe. After some discussion the resolution was agreed to by a majority of 14 to 3. unsafe. After some discussion the resolution was agreed to by a majority of 14 to 3. *Ripley.*—The Burial Board for this town have

[JAN. 17, 1857.

selected designs for their proposed erections' from those sent in in answer to advertisement. The designs chosen having been approved of by the hishop of the diocese and the Secretary of the inshop of the aboves and the Scoreary on State, tonders were advertised for, and the result of those sent by five different builders was, that Mr. G. Roe's was accepted, he heing some 40% lower than the architect's estimate. The architect employed is Mr. Charles H. Edwards, of London.

Doncaster .- The town council have agreed to Doncaster.—The town council have agreed to give the 4,0007. requisite towards the comple-tion of the parish church, in yearly instalments of 1,0007. Mr. Denisou, Q.C. guarantees the balance, towards which be gives 1,0007. The sculptured figure of the Saviour, in Portland stone, the production of Mr. Phillips, to whom the whole carving of the edifice, both externally and internally, has been cutrusted, has heeu placed in the ornamental niche prepared for its reception above the great western window. The reception above the great western gare is nearly 5 feet high, in a sitting posture. The left hand holds an orb snrmounted hy the ross. The right arm is elevated, in the act of nencdiction. The figure is the gift of the The left cross. The hencdiction. architect.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE LATE JOHN BRITTON

At a meeting of the Institute of Architects, held on Monday evening, the 12th inst. Mr. G. G. Scott, V.P. in the chair, after the routine basiness, Mr. Digby Wyatt announced the death of Mr. Britton, an honorary member of the Iustitute, and read a sketch of his useful life, and a warm and well-written eulogium :—

"To estimate the value of John Britton's Inhours aright," said Mr. Wyatt, "we runst remamber that hefore his time popular topography was unknown. The ponderous volumes of couoty histories were valu-The ponderous volumes of condy histories were valu-able as record rooms, but useless as libraries. The text-books—Gough's 'Camden,' King's 'Munimenta Antiqua,' Cox's 'Magna Britannia,' and Buck's 'Casules,' were heavy and opaque. The facetions Captain Grose was the leading antiquary, and Gliphin furuished a sample of the florid style of picturesque description of scenes and localities. Price, knight, and Repton, did much to draw attention to other de-tails. then these of greenlories and the descent for and repton, du muce to araw attention to other de-tails that those of genealogies and the descent of hereditaments. Any thing, however, like a fusion of the two styles had not heen attempted at the period when John Britton commenced combining antiquarian with topographic description. The pictorial illustra-tions of our national monuments at the close of the thet exercise means of the most here and insure field tions of our national monuments at the close of the last century were of the most loose and impercet description. Since the careful prints of Hollar, searcely any engravings of architectural subjects had appeared worthy of notice or relinace; and the carly productions of the Antiquarian Society presented the the second sec appeared worthy of notice or former; and use carly productions of the Antiquarian Society presented the only approximation to accuracy. James Basire, Rooker, and Lowry, were the fashionable engravers of such subjects; and John Carter, and Fowler, who illustrated staioed glass and ancient measies, almost the only trustworthy dranghtsmen. It was mainly through John Britton's energy that a reformation was effected. His activity and euthusiasm soon gathered about him all those rising men whose names are now so familiar to us. He saw from the improvements which had heen effected, mainly by Stothard, and Heath, the engraver, the capabilities of copper-plate engraving; and speedily brought to bear upon the long neglected antiquities of the country, that artistic ability through the exercise of which they could alone he popularized. Samuel Prout, Frederick Mackenzie, Edward Blore, George Catter-mole, W. H. Bartlett, R. W. Billings, Heary Shaw, and many more, were at various periods in-duced to bestow their earnest efforts upon the proper delineation of those views which were so successfully transferred to copper by the hrothers, John and duced to bestow their earnest efforts upon the proper definediation of those views which were so successfully transferred to copper by the hrothers, Johu and Henry Le Keux, and other cognavers, for the most part pupils of Basire. Public attention was captivated by the excellencies of the cugravings of the architec-tural antiquities of the land, and the excitement which at first took the form of vague admiration, has in our time reached its hanve consummation in more in our time reached its happy consummation in pro-found investigation into the true principles upon which they depended for grandaur and effect, and in a wise and wholesome spirit of conservancy. For much of this, the country is deeply indebted to that friend we have so lately lost. His labours were in-cessant, his memory extraordinary, his system ad-mirable, his clearness of understanding, and liveliness of fancy in no common wise vigcous, his affections warm, his habits exemplary. Had he hene less honest he might have heen far richer; had he heen more selfish he would never have henefited his country as in our time reached its happy consummation in proThe council then submitted a proposition to the members present, to the effect, that it would be a graceful tribute of respect to the memory of one whose services to the profession have been of an unexampled character, if a memorial tablet were crected by the Institute a to commende user were elected by the institute, to commende those services, and to record their regard for Mr. Britton: and it was fur-ther suggested, that it would he expedient to make an application to the Dean and Chapter of Salisbury, expressing the hope that permission would be granted for the erection of the memo-rial in that cathedral, which is at the same time the mother church of the diocese, and ecounty in which he was horn, and also the first eathedral of which he undertook the graphic illustration. The proposition was received with acelamation, and will be acted on forthwith.

Mr. I'Anson then read a paper on "The Castle of Heïdelberg," to which we shall refer hercafter.

BRITISH ARCHÆOLOGICAL ASSOCIATION.

A MEETING of the Association was held at their rooms on Wednesday evening, the 14th, Mr. Gedwin, V.P. in on weathers of the later state is the state of the county when the names of various new members were announced. At the request of the Council, the chairman aunounced the death of Mr. Britton, and sketched briefly his career, --a career, he said, which teaches us that the greatest disadvantages may be overcome by integrity, a clear head, and a determined will and their it is not measurement to a citben become overcome by integrity, a clear head, and a determined will; and that it is not necessary to be either learned or rich to make a uame that posterity will regard. Mr. Pettigrew addressed the meeting feelingly on the

Mr. Fedgrew autresset the needing reeningly of the same subject. Mr. Planché then read a very acute and elaborate paper "On the Sculptures in the West Front of Wells Cathedral," in reply to the work on the subject pub-lished by Professor Cockerell. Written in the mildest Isince by Professor Cockerell. Written in the mildest tone, and with an evident desire to avoid the least appearance of hostility, the paper was so complete a denial of the theory, and even of the facts, put forth hy Mr. Cockerell, that it will demand the immediate attention of the learned professor if he desire to main-tain the character of his book. Thanks, of more than ordinary strength, were voted to Mr. Planché for his Essay.

DEPARTMENT OF SCIENCE AND ART. EXAMINATION OF TRAINING MASTERS.

It is somewhat noticeable that within the last few years examinations should have come to be regarded as the most efficient tests, wherewith to discover the competency of men who are candidates for Govern

ment appointments. The system is a healthy one; for, although it may sometimes result in barring from the service of the contry, me possessing great though perhaps eccen-tric genius, yet it closes our Government depart-ments against those who have no abilities, and whilst it is no survey for obtaining the best men for public services, it is a safeguard against the worst.

The axist shown by many architects for examina-tion for diplomas in that profession shows how deeply the feeling for such a test has taken root, and it is to be regarded as a morally healthy sign, indicative of systematic study. For the knowledge which thus voluntarily seeks for a test must be conscious of its own power; although, perhaps, influenced to ask for the criterion by the undue success of those who posscss neither knowledge nor power. As a practical result of this movement, we may in

futare expect to find, in our public departments, men possessing *positive* as well as comparative merit.

possessing positive as well as comparative meric. Allowing all this es an argument for exanination, we couless we were iu some degree surprised in hearing of an examination in general knowledge having taken place at Marlborough House in Octoher the of the article who as masters in the London having taken place at Mariborougn mouse in boundan last, of the artists, who, as masters in the London schools of art, and school, com-schools of art, and school the Denartment of Science pose the training-dars of the Department of Science and Art. For we believe that previous to this there has been no iuslance of an examination, embracing branches of knowledge which have not in a great degree been necessary for the efficient discharge of those dutics which devolved upon successful candi-

dates ; whilst this test, although comprising subjects which are regarded as very important items in an artist's education, yet had no very radical influence on the application of his art.

the application of his art. The examination embraced the ordinary subjects of a general education,—English history, arithmetic, &e.; and we subjoin Dr. Playfair's report :— "As the result of a first examination, the returns may be considered satisfactory. Noue of the students will be registered as having altogether failed, but those who stand with the letter (in the scend class nucle come on first examination).

C in the second class must come up for a new exami-nation in all those subjects in which they are marked

nation in all those subjects in which they are marked above 3 in the column of the table. In subsequent examinations, those who only dis-play the knowledge indicated by the letter C in the second elass will not he admitted to the paid list of the training class until they have obtained a higher maintion " position.

The table of results is so constructed that the lowest marks indicate the highest positions--1 repre-senting a high degree of attainment--so that the figure 3 would show comparatively a failure in that

particular hranch. The letter C being the third division of the class, where it occurs in the second class, stands as a low mark

In an examination of forty-two men, four only had this mark, and three of these through their bad penmanship-a common failing amongst artists.

THE ACCIDENT ON CORNHILL.

On the 5th instant an accident occurred at Messrs. ON the bit histonian accused occurred as Aussiss. Sar's premises, on Cornhill, which caused loss of life. The workmen in raising or setting a stone at the top of the house, without taking proper precau-tions, threw it off its halance, and it tail over the seaf-fold and killed a poor fellow who was standing below just under the edge of it. The seaffolding was formed as is now multip the case, in approxy thoroughfores Just inder the edge of it. The sensioning was formed as is now swally the ease, in narrow thoroughfares, so as to allow passengers under it, and not to stop the pathway, the shop being kept open; and some correspondents of the newspapers have attributed blame to those concerned, for not making a tem-nerative with in the readment. Variate come of parary path in the concerned, for not making a tem-porary path in the roadway. Kceping open an attractive shop in such a positiou is decidedly objec-tiouable; but it has heen shown that the scaffold was a perfectly good one, and the arrangement the hest under the circumstances.

BERWICK CORN-EXCHANGE COMPETITION

A CORRESPONDENT, on the part of the company, writes,--"As the hest practical answer to certai strictures which appeared a short time ago in th Builder, on the instructions to architects, issued for the proposed Corn-Exchange, in Berwick, it may he stated that fifty-four designs have heen lodged. A definite selection has not yet been made."

WOLVERHAMPTON WORKHOUSE COMPETITION.

THE plans of Messrs. Bidlake and Lovatt were selected on Friday, the 9th, from four sets of plaus submitted in competition for the extension of the Wolverhampton Workhouse.

MEETING OF UNEMPLOYED ARTISANS CONNEXION WITH THE BUILD. ING TRADE.

ON Monday, the 12th, a very large meeting of unemployed artisans was held in Smithfield. The meeting was ealled for the purpose of taking into consideration the present distressing

Laking into consideration the present distressing position of that hody. Mr. Hugh Pearce was voted to the chair. He said at the present time there were upwards of 25,000 persons connected with the building trade in London unemployed. He should like to know how this de-pression had been brought about. It was all very well for the Government to state, and to blazon abroad to foreign nations, the glorious prosperity of this country; but let it look at home, and see the number of nuemployed actisms, before there entered number of unemployed artisans before they entered into costly wars for what they called the iudependence and welfare of a people who, he (the hurpendence and welfare of a people who, he (the chairman) had no doubt, were much hetter off than the workmen of this country. His suggestion was that they should apply en masse to the various unions for relief. They appy to masse of the various whom so the relet. They must remember that the poor-law was a national right. Let them ask what could be granted, —like men of common sense, —for what they required, and not waste their time and labour in discussing the Utopias of vaim men, or the political crotchets of professional agitators. Hitherto Englishmen appeared to be agitators. Hitherto Englishmen appeared to be actuated hy false pride, for when out of work they seemed to think it a degradation to apply for relief at the union; but they should remember that the poor-

construction of useful public works The following resolutions were afterwards proposed and earried :-

and carried :-"That the unemployed workmen here assembled, being
to bjects for relief under the Poor law, should forthwith
apply in masses at their various parishes and demand such
assead support while out of work as they are by law entitled to, and in the meanime the Executive Council shall
draw up a puttion in the name and on behalf of the unemployed, praying her Most Gracious Majesty the Queen to
imploying the on of the Government to the necessity of
maloring the surplus revenue for draining and tilling the
same, to the end that their present impending ruin may
to prevented, and core produced in sufficient abundance
to meet the wasts of all."
"That the Government open an extensive system of
emipration for all these who, being unable to procure
employment, do not wish to be put upon the land, tut
prefer to leave their native constry; thereby to add to the
evalue of the colonies, and be esabled to better their own
condition at the same time."

HOLYHEAD HARBOUR.

This great national work, which is heing carried out, under the immediate direction of the Board of Admiralty, by the Messrs J. and C. Righy, of Westminister, affords periodically, to the civil and military engineer, as well as to the scientific and intelligent inquirer, an opportunity of witnessing the effect of large quantities of powder brought to hear in the dislogament of immense masses of the hardest descrip-tion of quartz rock, amounting in several instances to upwards of 100,000 tons, another of which stupen-dous blasting operations was to take place on the 16th acus onschig operations was to take place on the 16th instant, at woon. This operation was to act upon a face of rock 115 feet in height, 210 feet in length, with an average line of least resistance of 25 feet, and was calculated to throw down upwards of 100,600 tons of rock, for transmission to the breakwater, with an aggregate charge, in the four compartments or chambers, of not less than 16,000ths of powder. Jowards of four million tons have here already dis-lodged by this means for the construction of the harbour, without failure and without accident.

SCENERY AT THE LYCEUM THEATRE.

THE transformation scene of the extravaganza-pan-The transformation seeme of the extravagance-pan-tonime at this theatre, "Courad and Medora," has been very much praised, and not improperly. As a series of mechanical arrangements and a piece of colour it is equally excellent. It presents five distinct movements, and is glittering and gorgeons, without glare or vulgarity. Some of the other secuery is also are nored. Mr. Nechenich for the secuery is also colour to be equally exhibitering and gorgeous, without glare or vulgarity. Some of the other scenery is also very good. Mr. Frederick Fenton has long been favourably known, hut has never done anything so good as this hefore. Mr. Dillon, in his efforts to maintain the character of the theatre, in several cases good and the character of the theatre, in several cases very successful, must strive for accuracy in his scenery and costumes. He must not permit any more such blunders, for example, as some that were apparent in the piece called "The Cagot," for which, though laid in the fifteenth century, we had rooms of the seventeenth and eighteenth. The last scene had a Gothic screen and a Louis XVI. ceiling. We mention this, not to disparage, but to awaken attention.

THE PHOTO-GALVANOGRAPHIC PROCESS OF ENGRAVING.

LIGHT and electricity have been put into harness by Mr. Paul Preisch, lately the manager of the Im-perial Austrian Printing Office at Vienna, and trained to perform the united functions of the artist-draughtsman and engraver. The first steps of this photo-galvanographic process

The first iteps of this photo-galvanographic process are similar to those adopted by the glass-plate photo-grapher. The operator coats a glass plate with a gelatinous solution, smitably prepared with themical ingredients sensitive to light. These compounds form the glass or other plate which is coated with it. When dry, the coated plate is exposed to the light in a copying frame, in contact with the print or drawing which is to be copied. After exposure, the plate ex-hibits a faint picture on the smooth surface of the sensitive cating, and it is washed with eertain sola-tions, when the whole image comes out in relief, whils the tints of the original are still maintained. When sufficiently developed, this relievo plate is dried whilst the tints of the original are still maintained. When sufficiently devolved, this relievo plate is dried and moulded. The mould is prepared for electric conduction, placed in the electrotype hatbry, pro-ducing a thin copper-plate or matrix, which is used for producing finally the intaglio printing plate. With this printing process there is no fear of fading, as the plate impressions are in ink, and the

attention of an ordinary printer suffices to keep the pictures to the proper colour. We have seen some remarkable specimens, especially from Gothic buildings, and look for great things from the process. The Company, amongst other works, propose to publish, from photographic originals "The Cathedral Autiquities of the British Empire ?"-the plates to be engraved by the Company's patent process, on a scale of great magnificence.

Books Receibed

Descriptive Essays; contributed to the " Quarterly wiew." By SIR FRANCIS B. HEAD, Bart. two volumes. Murray, Alhemarle-street. Review.

THIS " brood of literary chickens," as the LHIS "mood of interary enlickens," as the author, with that pleasant pen of his, describes them, were all, save one, brought forth in that celebrated hatching-machine, "the *Quarterly*," and now they "migrate from their coop, to fare, in the wide world, for themselves." There is no fear of such lively chickens helius much and now they "migrate from their coop, to larc, in the wide world, for themselves." There is no fear of such lively chickens being unable to "pick up a living." Few of Sir F. B. Head's numerons readers will think it supercoga-tory to purchase a collected edition of his graphic essays merely because they have already perused them in their original "Quarterly" nidus: on the contrary, these are likely to be their mere ensured numbers. The back conmidus: on the contrary, these are fixely to be their nost assured purchasers. The book con-tains several articles of special value to our own professional readers, such as those on "The Britannia Bridge," "The London and North-Western Railway," "The Air we live in," "The Electric Telegraph," and "Locomotion by Steam," There are also very interesting prindse on the "Corrish Miners in America." by Steam." There are also very interesting articles on the "Cornish Miners in America," on "English Charity," "The London Post-office," "The Red Man," "The Printers' Devil," "The Battle of Waterloo," and "British Policy,"—a "strange story," in which Canada, Lord Durham, and Sir F. B. Head prominently figure._____

The Business Man's Note-Book and Desk Direc-tory for 1857. Edited by JAMES Hogo, jun. Fellow of the Statistical Society of London, &c. Edinburgh: Hogg. London: Groombridge.

Ar the end of last month Mr. Hogg's welcome aid to business was issued in a much enlarged and still more valuable form than heretofore. The Direc-tory has grown into a thick volume of nearly 800 pages, containing an immense amount of inschil matter. Unreadable and nnreferrible hlne-hooks are here by the score transmuted into a readable red-book of casy reference, teeming with the statistics of trade and commerce, agriculture, statistics of trade and commerce, agriculture, fisherics, mines, transport, banking, revenue and taxes, stocks and shares, foreign commerce and finance, British and foreign weights and mea-sures, and calcolating tables, tarilis and trade usance, &c. &c. From Mr. Hogg's known cha-meters for accuracy and industring research rater for accuracy and industrious research, every confidence may be placed in the correct-ness of the vast mass of statistical and other information here embodied into a most valuable ion to the desk and the writing table. With the Directory there is a cloth case, containing various tables and maps,-statistics of the the Unrectory there is a cloth case, containing various tables and maps,--statistics of the British colonies,--map of the electric-telegraph system of Enrope,--balance-sheet of nations,--table of Indian territories,--table of treaties and partitions,--war-tables, &c.

Useful Information for Engineers, with Appen dices, By WILLIAM FAIRBAIRN, F.R.S. &c Second edition. London : Longman and Co. 1856.

THE first edition of this valuable work, issued in December, 1855 (and noticed by us at some length shortly afterwards) has heen already ex-hausted, and the present edition being called for has been issued in a cheap form, so as to secure the volume a still wider circulation, espe so as to secure the volume a sch wider circulation, espe-cially amongst those working engineers for whose advantage the lectures were originally deli-vered. For facility of reference, the order of the lectures has been changed, and at the end has heen placed a short notice of the results of has near place a short more of the stars of y_{ande} conducted, at the request of the Royal Society v_{and} and the British Association, on the resistance of tract eyjindrical vessels to compression from an way.

external and surrounding force. These experi ments, it is believed, will modify generally received opinions as to the strength of hoilerother cylindrical tubes similarly and placed.

Visits to Remarkable Places. By WILLIAM HOWITT. Third edition. London: Longman and Co. 1856

MR. HowITT's two elegant volumes, on old halls, hattle-fields, and scenes illustrative of striking passages in English history and poetry, have reached a third edition, issued, however, with ont note or comment, other than the brie brief advertisements of 1839 and IS41, which accompanied the two volnmes as they were respec-tively first issued. The work is illustrated hy numerons sketches of scenes and places, most of them exceedingly well known and appreciated. Alnwick is one of the places visited, and the graceful and original pen of Mr. Howitt is well adapted to enhance the interest which recent discussions have excited in respect to this famons spot in England's history. But indeed the whole work displays a rich field of historical and archeeological matter, as must be evident from the mere mention of such names as Lindisfarme, Culloden and Flodden, Stratford-Bindistane, Outdoth and Folder, State and Brancepeth, Winchester, Scaton Delaval, Ber-wick and the Borders, and many more that Castle and might he named with these. The hook is beau-tifully got np, and full of the interest attached to our ancient architectural relics and ancestral homes.

Miscellanea.

THE LATE MR. THOMAS SEDDON, ARTIST .- Not THE LATE MR. HIGMAS SLIDIOS, ARISL- NOU very long ago we spoke of some pictures of great merit made in the Holy Land by Mr. Thos. Seddon , and we bave now to mention, and we do so with great sorrow, that Mr. Seddon set off last autumn on a sorrow, that Mr. Seddon set of last automo on a second professional journey to the East, and, very shortly after his arrival, died at Gairo, from an attack of dysentery, on the 23rd November. Unbappily, too, he leaves a widow and an infant daughter. Mr. Holman Hunt, Mr. Madox Brown, and other gentlencu who knew Mr. Seddon's worth, are anxious to do something which shall be homourable to list to do something which shall be honourable to his memory as an artist of elevated nims and of undaunted memory as an artist of elevated aims and of undaunted energy, and which shall at the same time be useful to the wife and child who have so suddenly become widow and orphan. It is proposed to hold an achi-bition of the works which Mr. Seddon has left, to purchase from his widow, by subscription, the prin-cipal work, an oil-picture of Jerosalem, for presenta-tion to some public institution; and, if any surplus funds should accure from subscription, to request Mrs. Seddon's acceptance of them. Resolutions to this effoct will be submitted to the meeting, which is fixed for the 2nd of February. Mr. W. M. Rossetti, of 5. Upper Albare-street Recent's-angle. this effect will be submary. Mr. W. M. Kosseus, of fixed for the 2nd of February. Mr. W. M. Kosseus, of 4-5, Upper Albaoy-street, Regent's-park, has agreed 4-5, Upper Albaoy-street, and will receive the known secretary, and will receive the good ues of any gentlemen willing to assist in the good object proposed.

coject proposed. A ButLerk'S CLAIM.—In the Court of Passage, at Liverpool, on Thursday in last week, William Bate-man, a Liverpool builder, claimed from Mr. John Moss the sum of 2917. 11s, 49d, for altering and re-pairing his residence, Beech-house, Aigborth. The sum of 1507, had been paid into court, and to the rest of the claim the defendant pleaded that the plaintiff agreed to complete the alterations before the 10th May, 1856, or in default to forfeit seven guineas for every week's delay beyond that data, and that pecalities had occurred under that agreement sufficient to cover the amount. The plaintiff replied that the delay was occasioned by the defendant's own default, he having ordered other alterations to be made of such a nature as to render it impossible to complete the alterations originally contemplated within the specified time. The plaintiff's case having proceeded for a short time, it was agreed that the matter should he referred to Mr. A BUILDER'S CLAIM -In the Court of Passage. was agreed that the ma Colshaw, architect and surveyor, and a verdict for the plaintiff was entered, subject to his decision.

plaintiff was entered, subject to his decision. THE LATE MR. BUENNER, CONTRACTOR. - WC are sorry to announce the death of Mr. Brebner, railway contractor, which took place last week, at his residence at Badenscoth. Mr. Brehner has been in delicate health for some time, but the disease under which he fell was a virulent form of typhns fever. Mr. Brebner was contractor for the Banff, Macduff, and Turriff Extension Railway, which is far ad-vanced, and which should be opened by the 1st of June next. He was also contractor for the Alford Valley Railway; and hospidas a share of the con-tract of the Inverness and Aberdeen Junction Rail-way.

FALL OF AN OLD HOUSE IN SPITALFIELDS .-

FALL OF AN OLD HOUSE IN SPITALPIELDS.— On Sunday last a dilapidated huilding, one of a number of extremely old bouses, in Dorset-street, families, and, occupied by no less than sixteen families, and, occupied by no less than sixteen families, was destroyed by the fall of its lofty stack of chimneys through the floors, killing a child and seriously joinring a number of the poor residents. An inquiry will be made.
 THE GRYSTAL FALACE.—Many, we dare say, have wondered and inquired what could be the use of frequenters must tramp — we had almost said for miles—ere the glories of the interior open on their gate. Such of them as have visited the Palace within the hast week, must have had this important question presented itself to the eye, and the not quite so inter-esting sounds which Adat² d in their ear. Sir Joseph Paxton must have clearly had visions of poultry ex-hibitions in his mind's eye (as well as flower-shows and picture galleries), when he planned these "long drawn" corridoric appendages to the Crystal Palace. They are admirably suited to their purpose, and vasts as the dir expanse, the wider parts were more than biled with thousands of not very "dumb animals," the eternal chatter and screech of which was (at first) really amaing, but at last scarcely tolerable. We do not pretend to be judges of poultry, at least in their factory dresses, hut this is said to have been one of the most important chibitions, at least in number, that ever was held.
 THE ARCHYLTCHARL EXHIBITION.—On Tucsday evening last, the Rey, J. L. Petit, gave an elaborate

THE ARCHITECTURAL EXHIBITION .- On Tuesday This Antimiter trade Exhibition - Ou Thrand evening last, the Rev. J. L. Peitt, gave an claborate lecture "On the Application of Gothic Architecture to civil and domestic Purposes," which was illus-trated by a very large number of his own sketches. We shall print a portion of it in Mr. Petit's own words in an ensuing number.

SALE OF MODERN DRAWINGS .- We go a little way SALE OF MODERN DRAWINGS.—We go all fille way out of our course to point attention to a sale of draw-ings and other objects of art by Mr. Fredk. D. Godwin, advertised for Thursday, the 29th inst. in Old Bond-street, because we happen to know that the collection is genuine, and includes some good specimens. There are drawings by Farrier, Robus, Dewint, Herbert, Howes, Varley, Sidaey Cooper, Weigall, E. Corbould, Williams, David Cox, Dujardin, Warren, and Others, together with some hronzes and Stores and Dresden china.

ABCHITECTURAL INSTITUTE OF SCOTLAND. — A meeting of the Architectural Institute of Scotland was held on the 13tb, Sir Johns Stuart Forbes in the chair, when Bishop Terrot read a paper "On the Elements of Architectural Beauty, in reference to the recent Structures in Paris" on Perers's Councer, Nor

Structures in Paris." CONSECRATION OF ST. PETER'S CHURCH, NOT-TING-HILL.—The new church of St. Peter, which has just heen erected in the rapidly-extending district of Notting-bill, was consecrated last week by the Bishop of London. A district for the new church has been assigned out of the parish of Kensington.

assigned out of the parish of Kensington. CRESTER ARCH.ROTOGICALSOCREST.--The monthly meeting of this society was held in the City News-room, Chester, on Mouday evening before last. Dr. Moffat, of Hawarden, read a paper on "The Origin of the Arch," tracing its use back to the most remote antiquity. Mr. Hicklin followed with a paper on "The Benedictine Abley of St. Werhurgh," announcing it as the prelude of a more important dissertation on the nonastic system generally. Mr. T. Hughes then introduced some particulars relative to the "Cowpers of Overleigh," a family long connected with the local government of Chester. LINCOLN DIOCESAN ARCHITECTURAL SOCUTY.

LINCOLN DIOCESAN ARCHITECTURAL SOCIETY.--As the new rooms of this society in Lincoln are not ready, its bi-monthly meeting was held on Friday, January 2nd, at Mr. Loder's, near the Stone-bow, which was largely attended, and, in the absence of Sir Charles Anderson, the Rev. F. Massingberd took Sir Charles Anderson, the Rev. F. Massingherd look the chair. A total of forty-three members have joined the society during the last two months. Various plans and designs of proposed works were exhibited, and a large number of designs for head-stones was submitted by the honorary acting secretary, which he proposed should form a portion of a manual for the use of Burial Boards, masba, &c. The secretary announced aproposal that had heen made to endearour to save the west front of Croyland Abbey from feilure. falling

ment! when some (possibly ticket-of-leave) man has actually constructed an order of columns, on trusses, in the first-floor of the elevation of the two large houses on Lord Harrington's property, on the very spot which is to be consecrated to our art treasures After this the garotte will lose its terrors — the new horror will be the suspended columns of South Ken-sington. The criminal is still at large.—MARY SYKES, School of Design,

JAN. 24, 1857.

The Builder.

)W that the Department of Art has actually quartered itself in Brompton, -or"South Kensington," as it is erroncously called in the mood for changing which rather tends to characterize the Department, we may be allowed to look at the arrangements so far as they are completed, and to gather what are some of the prospects for the national work of arteducation,-already commenced, and lately progressing, on the whole under judicious management, and with euconraging success. The rooms at Marlborough House, doubtless, were inadequate as to space, and un-

suitable,-except regarded as tem porary accommodation : but something in architectural and structural provisions immensely better, and in other advantages extraordinary, there should be at the new local habitation, to compensate for abandoning the power to act directly upon those for whom the instruction as we may suppose is intended. These classes we assume to he art-students of all descriptions, ample, will be as useful in its newly chosen teachers in schools, building artizans, and persons engaged in handierafts and trades, who are residing, necessarily, in all districts of London. For the building artizans, or "art-workmen,"they are more likely to be found in Gray's-inn-lane, Clerkenwell, Hoxton, Spitalfields, or Lambetb, than in the agreeable suburh of Brompton, where they cannot hope to reside, and which is too distant, if not too expensive, to get to, for any number of visits. As to such visits, we may observe that the argument from the Exhibition of 1851, which, if we rightly understand, is still adduced, we believe is quite beside the present question,—in short, another of the false applications of statistics. On that occasion, the objects of interest were so multifarious, the field of instruction was so vast, and the passing time was so short, that all persons were induced to make great sacrifices in the hope of seizing something whilst there was the chance. We should like to know, however, after deducting all the official staff, and all who neglected their private affairs but would not encounter such risk again, and all the moh of holidaymakers and country cousins, how many there were who got rid of the hewilderment of the scene, and used the Exhibition in the proper manner, as contemplated by those who set it going. Neither is the average success of the Crystal Palace at Sydenbam so great,-commercially and as to the number of visitors, compared with the attraction for them,--or educationally and as to the use made of the wonderful collection of works of art,-as to supply any argument for another case.

The point to be considered in the removal of the various schools and collections of works of art, to Brompton or Kensington, is not what can he provided for people who can take a day's boliday, but what should be made available to those with whom art is a continuous study, and to those who have daily avocations requiring oecasional reference to a museum and library, which last object is, perbaps, of most import-ance in the question. The library of the British Muscum, with all the inconveniences, to a great degree inseparable from its magnitude, is largely

of subject,-as that of art or science. Indeed, teet of the Houses of Parliament been misrepre the very objects comprehensive, which are rightly provided for at a central home of learning, involve some disadvantages which render desirable, separate collections iu departments of knowledge and study, --- but equally if for purposes of reference, in central situations.

The position contra we understand to be (omitting for the moment, consideration of the supposed site for a new National Gallery, and any asserted requirement as to union with it), that the present buildings are merely for headquarters, which it is not very material to place in a central situation, seeing that for the future, instruction must be carried on at metropolitan district schools and towns in the provinces, to which hooks from the library and objects from the Museum would be lent as wanted. To this latter course as a principle, we should be wholly opposed : London aud constantly accessible materials at some one spot, form the first object for consideration ; and only duplicates, or transcripts and copies, are what should pass out of doors. If the collections are worth a tenth of what they have cost, one purpose must he their preservation,-regarding both commercial value and the reference to them. To move the books and specimens about, would be not to ensure their accessibility anywhere. In reality, however, instruction in art, equally with the other objects, forms a purpose of the buildings on the new site; and regarding what has been said above, it must be admitted there is great doubt whether the Architectural Museum, for exquarters as in the old. The committee, howwer, were obliged to weigh circumstances

Let it not be considered that we are either tardy or premature in referring now to the question of a locality. First, it was not announced that the removal of collections to that most discreditable thing-the Museum huilding-which the Department is so anxious to shift the blame of, was to involve either a permanent location thereabouts, or the removal of the Department from London. The National Gallery question was unsettled ; nay, the immediate prohabilities before and after the debates in Parliament, seemed against the Kensington site. And we cannot now see, even were a site out of town best for the National Gallery, that it should uccessarily carry all the appliances of the Department of Art along with it, to the sacrifice of the advantages which that departmeut especially must have and afford in a central situation. In short, if it could have been the purpose of the Department to take us by surprise, they have completely succeeded. If, on the other hand, it were supposed that such observations as those we make, would embarrass exertions which are honestly and zealously made for the public good, it could not be against us that accusations could be preferred. We animadvert, or observe, only upon the appearance of concealment where none is required, ---on a course, too common in public affairs, where a question upon which opposition is apprehended, is not met, but settled out of sight, and before proper arguments can be heard,-a dangerous course which may answer for the time, but which we helieve to be damaging to the morale of public men, and ultimately burtful to the good object which may have been intended. It is because we would preserve the great objects of art-progress and, if need were, the persons officially or influentially connected with the Departmentfrom the dauger which they run from the upshot of a debate in Parliament, that we counsel a revision of what may now be intended. Nowhere have we seen so much misapprehensiou of the nature, purpose, and value of art, as in the Between these huildings and the museum there British House of Commons,-nowhere so many is a considerable interval of ground, on which is resorted to for more reference. Such alvan- damaging reflections upon individuals engaged creeted a long, low brick building, with projec-tages would he far more within the scope of in contributing to art, who had no chance of a tious in the plan back and front, chiefly appro-provision by a collection devoted to one range reply. How often, for example, has the archi- priated to the offices. Mr. Pennethorne is the

sented, with no one courageons or houcst enough to say a word in defence

Regretting that there should be any occasion for going out of town at all, we accept the present arrangement as the temporary one,for which, indeed only, the buildings are fitted. Thus looking at them, we regret that they are not quite finished, and that a portion of the appliances of the Department are not somewhere iu operation. There is still vast scope for the agency of the Department upon public taste; and important as we helieve such influence to be, and judicions and patriotic as mainly have been the exertions in that direction, there are not wanting those who impute motives which we neither believe, nor do we discover could apply iu such a case. Public opinion, we say, must be openly courted; objections must be heard and met by argument-not by what would hear the aspect of concealment or evasion. With such views only do we enter upon an inspection of the premises at Brompton.

Yet, we have heard it suggested that it would he inadvisable, for common objects, to draw any attention to certain works in progress-considering that a fair opinion could not be formed nntil their completion. Were the question one merely of architectural design, as capable of being critically estimated from an unfinished structure, we should at once assent. Too many instances would occur to us, showing the danger of any opposite course. Nay, were this the proper opportnuity, we should seize it to show the impossibility of judging of a huilding during its early progress. What could the opiuiou be worth, passed upon some of the finest church towers in Eugland or Italy, without taking into view their upper stages? and let our readers note with us en passant-for, the lesson is worth interjecting even here-how great is the change in the proportions of the towers of the Houses of Parliament hy the completion of their terminations. No question of such a kind, however, is involved in what we would now inquire into,-but our question is, how far the calm and fair consideration of the locality for the permanent site of the Schools of Art, if not the National Gallery, is to he prejudiced by what is now done, or hy some conclusion in the minds of individuals.

In the present working state of the arrangements at Brompton, the schools are iu operation; but the library is being arranged; and the museum building is only now being made after some fashion to suit its purpose, at additional expense; and its future contents are not visible. The schools occupy some temporary wooden huildings, and rooms in certain houses which were standing on the ground. The latter have been converted to use with considerable skill onthe part of Captain Fowke and others attached to the Department. Some of the attics are even picturesque; and the apartments of the female school have a look of comfort which has been very properly made au object. A sage green colour in the painting and paper, under he direction of Mr. Redgrave, has been adopted thronghout. The temporary schools are snitable for their purpose, hoth as to lighting and the arrangement of the casts; and the examples placed before the students and the methods of tuition adopted, seem to have been chosen with care, and to be tending to the desired results. In the room occupied by the architectural drawing class, are a number of models of roof-trusses of unusual form, from buildings on the coutiuent,-perhaps not in every case quite correct as to details,-yet giving much valuable information.

VOL. XV.-No. 729.

arebitect. A passage-way, lighted from the top, architect. A passage-way, lighted from the top, runs thronghout, and forms the communication from the schools to the mnsemm, and will afford ample room for easts. The main entrance transversely, to a central hall, has on one side of it the library, projecting from the general line of front, and in the corresponding position the hoard-room; and necesspanning position the hoard-room; and passing through from the hall, the theatre is reached. The latter is a circular hall, 42 fect 6 inches in diameter, lighted from the centre, the roof heing framed without tie, the principals meeting at the apex, and springing from a double curb with inch plate inches in width, bolted through, forming it. The suitableness of the circular form iron. a eireuit. a circuit. The suitableness of the circular form for sound remains to be sec.n. Otherwise, this portion of the huildings is the only portion that could be considered as quite satisfactory. Externally, it is true, the design-for a plain brick building—has some degree of effect. The projections from the front, forming the library and hoard-room, have gabled ends, with roofs of low pitch, and windows areh-headed with roof bricks. Internally, however, the rooms are lowy. of low pitch, and windows aren-heated with to bricks. Internally, however, the rooms are low, and in some cases dark. The library, as first completed, was deficient in wall-space, and otherwise inconvenient,—so that eertain side windows have hately been blocked np; the ecil-ion has been recovered and the root funders ing has been removed, and the roof timbers exposed, and a skylight has heen put in. During these alterations, the wet appears to Jurney these attentions, the wet appends to have got into the wells, and we question if it will be safe to range the books near them for many months to come. A height of about two feet additional was at first intended; hut funds were wanting, or had been applied to other pur-

were wanting, or had been applied to other pur-poses. The huildings have been designed to last about ten years. The passages are plas-tered in three eoat work, finished by the hand-float. Some of the doorways, as to the library, are rather narrow. The mascum has been the subject of an abortive attempt at external improvement by decorative painting, which is applied in green and white stripes. The addition of a spacious portice, with light iron pullars, at the end, has a better result. The original errors in the design, bowever, remain, and tell in the result, as they do in all such cases where there is a mistake at bowever, remain, and the in the result, as duey do in all such cases where there is a mistake at the ontset. The interior—which, as completed, did indeed realize considerable perspective effect —heightened by the precision with which the work was excented, and the regularity of all the lines and parts-isundergoing considerable modi-fication, to now first render it suitable to receive its valuable contents, without injury to them from condensed moisture, and to allow of their from condensed moisture, and to allow of their classification. Plaster ceilings have been added to the roof, and to the spaces under gallerics; and the area is divide.] in all parts by quarter-partitioning. Thus, so far from baring a non-combustible huilding, we get one which is not only of the most combustible kind within, but which would inevitably get into a blaze were there a charge of fire externally in contact with there a chance of fire externally in contact with its thin skin. Such is the consummation of the Its thin skill. Such is the constitution of the lesson which, in 1851, we architects were told σ_{c} accded as to the use of iron. The truth is, that in the profession there has been no discthat in the profession there has been no disre-gard of the peculiar resources and capabilities of iron and other metals. But, hoth in struc-ture and decoration, iron has been grierously misnsed, and by these who assumed to know better than others its advantages. Much may yet be done towards the proper manner of applying it; but much also has been done to clucidate the subject; and the fact that iron has great capabilities is nuclerstood and aeted upon. Au architect, however, may well acted upon. Au architect, however, may well have acquired cantion, from the frequent failures in materials presented to his notice-materials which he is called prejudiced for not admitting the advertised advantages of as entitling them the advertised advantages of as entitling them to general and miversal application. Every material has its special properties fitting it for particular structural offices, and for particular forms in the expression of heauty; hut it re-quires time and thought to understand them,— to use the material for that alone to which it is adapted, and to avoid using it for that to which it is not. which is first needed, if we would both use the question might be settled gently, and with a proof. The upper floor (for the gallery) is lighted resources of our time, and so use them that our show of deforence to public opinion, a temporary from the top, and appears to have been designed art shall not ever he in contrast with the 'building ouly was asked for. The money heing 'with great care as to lighting and general fulfi-wealth of our resources. Who does not recol-, got—thongh not without opposition—the next meet of its purpose. Externally, piers and reit is not. It is appreheusion of this truth which is first needed, if we would both use the

leet the patriotic exultation of Lords and Acce the parrote extitation of Lords and Commons, 1851 commissioners, members of the Society of Arts, engineers various, newspaper writers and quill-drivers everywhere, at the advent of what the very professor at the Academy termed *the iron order* of architecture ? We were to have meas not writestable. Academy termed the iron order of architecture? We were to have glass roofs universally,—to lize in houses of iron and glass : onr profession had been fast asleep, or blindly prejudiced, and bound to briek and mortar. A feeble voice was just heard to doubt the value of iron bouses ; but if died away like childhood's treble in the metallie elang and noise around it. What matter that the speaker was Mr. Tite? In the matter that the speaker was Mr. Tite? In the public mind, a professional opinion was fast giving to be of no worth,—all the more so if given within the Institute of British Archi-tects, or because professiond,—that is, be-cause grown out of experience and educa-tion. Very melancholy would it he, yet instructive—though the case would be again soon forgotten—eould we here hring together all the absurfit of the naceverie of one individual soon forgotten—ecould we here hring together all the absurdity of the panegyric of one individual (jnstly deserving much), which is scattered through the newspaper reports of meetings and Parliamentary dehates "of the period." How the sublime ignorance of art, which is found too often in men occupying high places, and having a great nance, would he found set in lines of type erowded with superlatives, in number and intended force of the praise doubling and reintended force of the praise doubling and re-doubling all that was ever read in equal space of any one ont of the greatest intellects of ages One possessing even the varied and the vast acquirements of Lord Brougham would hold a foremost place in this number of adulators. is a practice too common with those who would is a plactic connection of the supposed to appreciate art, but do not, to apply thickly their praise when the occasion seems a safe one: the quantity of the praise shows so much their great knowledge of the subject.

The public heing told by those who should The public heing told by those who should have known better, were coavined that a great discovery and stage of progress had been reached in architecture; and that in house-huilding, for brickwork or masonry, iron and glass would well nigh always thereafter be substituted. In the lamentable exhibition of the museum 1 blick the Departure we now see use or dot In the functional exhibition of the independence on end of the persistence in such a course,—we find a building intended for the convenient arrangement of objects, and presented as a nuscam of art, which, thong completed at considerable conserver requires ending the persister personal line. expense, requires entire remodelling, and still remains unsuited to its purpose, and in which, as finished, barely a feature of architec-tural beauty can be detected. What the building is, it became, simply becanse certain essential work in design and contrivance, necessary to the good result in any building, was altogether omitted, -work which we do not eare to urge is that of any calling or profession, -yet still work for the artist and practical architect. Such, then, is of the attitude in which, through a public building the national reputation is made to stand hy the management of those to whom such reput management of those to whom such replacation is entrusted.—a system of management which expects good results to follow from hurrying to a conclusion by means of omitting the very design and logical process of conception essential to the production or successful issue of any work, no matter of what kind or nature.

The worst of these several instances of ar The worst of these severin instances of alt-management referred to is, that you never reach the source where the responsibility really was. Oue thing, at least, is perfect, namely, the manner of shifting blane, so that at length it is found nowhere. When you think you have the Descriment of Art you are referred to the manner of shifting plane, so that at length it is found nowhere. When you think you have the Department of Art, you are referred to the Commission for the Exhibition of 1851; and that way, we should perhaps get where most people will look, namely to the Government; and we should doubtes he sent hack again along the same channel. That duties in more then are of the official positions, belong to indithau one of the official positions, belong to indi-viduals, of course is not obtended on our notice. Within s, of course is not outchied off out means un-recorded, it hecame understood that a build-ing on the ground pareliased by Parliament and the commissioners, was wanted. That a certain question might be settled gently, and with a $\frac{1}{2}$ control to be settled gently, and with a

step was to pnt something on the ground as quickly as possible. Sir William Chhitt being on the commission, in a perfectly disinterested and non-professional spirit, andertook to set the thing going. Sir William Cubitt bas a well-earned reputation as a eivil engineer : hat we earned reputation as a civil engineer: hut we may be allowed to say that in the present ease, we should reasonably have had more confidence as to the work from giving it to a properly appointed architect. The whole thing was, how-ever, despatched in the most easy, good-humoured sort of way. It so happens—"quite promiscuously," as the phrase is, that at the same address in Great George-street, where the able environmend has his offices, are also those of address in Great George-arcter, while the abe engineer named has his offices, are also those of Mossrs. Charles D. Yonng and Co. of London, Liverpool, Glasgow, and Edinburgh, builders of "Iron Structures for Home and Abroad,"--as their pattern-book continues to say, "eonsisting of stores dwelling-houses, marky, arades, railway-stations and roofings, &c. &c. constructed of wrongbt iron and east iron and corrugated sheets." They have their correspondents ahroad, sheets." They have their correspondents and any and have supplied we know not how many iron honses to the English colonies and America, besides barracks and hospitals, and have suc-cessfully carried out large and important works at home. What so easy as to leave the whole at home. What so easy as to leave the whole business structural and architectural in such hands? We have now before us one of their books. Take one of their arrangements of the most simple execution, nsed for common Ans-tralian houses and the plainest barraek, which can he put together with the least possible tronble : the only difference betweeu it and the Brompton huilding is in the number of pieces of framework and corrugated plates. Looking at the comparison of structural sufficiency, it is clear that iron, as a rapid con-

sufficiency, it is clear that iron, as a rapid con-ductor of heat, is not a material which would be chosen after any consideration of points con-nected with elimate. The iron houses in Cali-fornia and Anstralia have required precisely the same process of fitting for the purpose, after constitution with the hermital the purpose, after erection, which has been required in the case at erection, which has heen required in the case at Brompton. We have received seores of letters at different times on the subject. Here, how-ever, there was not the argument for the iron hnilding which is found in the colonies—where, let it be recollected, the only chance for the emigrant to have a dwelling anywhere but in "CanyassTown," was to take one with him,—and of course one that would not into small record emigrant to have a dwelling anywhere but in "Canvass Town," was to take one with him,—and of course one that would pack into small space, and could be put up as an external shell as quickly as possible. But, why blindly follow the same plan where the oceasion and the need are wholly different? Thus, in short, we get ont of this lamentable yet instructive case, a truth which poor Theodore Hook expressed in awork which should be essentially a work of architecture, with no regard to its purpose, and a work which should be estimating a work of architecture, with no regard to its purpose, and none to its æsthetic effect : we omit, in short, all planning and design. On such a system, in place of a process of art, the production of this muscum building was a matter of more multipli-cation, and the employment of trade-capital. We immension was a super the public against the comcasion, and the employment of trade-capital. We impressively warned the public against the con-templated erection when the design was only in progress; the appeal was disregarded; onr con-temporaries gave no aid; and here we have the result—the Brompton Boilers, a lond-speaking disregate to the country. disgrace to the country.

We have said so much of this lamentable case. We have said so much of this similation case, in the hope that we might help to show at last the true reason of such failures, which we have some ground to claim shall not be visited, as is the fashion, npon the architectural skill of the country. In so speaking we have left un-named a few other matters as to the state of the 1 blue of the Directment. buildings of the Department.

buildings of the Department. Our readers may learn with some surprise that there is now ready for roofing-in, a gallery for the Sheepshauks collection of pictures. The structure is not visible from any of the main roads, and stands on one portion of the ground immediately at the end of the Museum hulding. with which the lower of its two stories will, we believe, be connected, as a place of deposit for some of the more valuable works of ornamental art. The structure is called temporary, and is fire

JAN. 24, 1857.]

eesses, and red briekwork with patterns in dark brieks, form the medium of decoration, and it is proposed to cover the roof with tiles. The draw-ings were made by Captain Fowke. The build-ing, at a rongh guess, may be some 70 fect long, hut can be readily extended,—as it has already been once; and a site is planned for a similar block of buildings in a corresponding position at the same end of the mnseum. As many will see in this structure, the thin end of the wedge that is to end in the National Gallery itself, we bave thought it right not to conceal what we know. It should be recollected that the pictures were cesses, and red brickwork with patterns in dark

It should be recollected that the pictures were given by Mr. Sheepshanks, on the express con-dition that they should be out of town; but there are many who do not scruple to say that dition that hey should be out of fown; but there are many who do not scruple to say that this condition had been suggested to the donor in order to influence a question which should certainly not be influenced by such expedients. It is also very freely said what the decision of the commission appointed will be, judging from views which are believed to have been those of the individual members. We must certainly repeat our hope that the question will be de-cided in a manner that may be perfectly con-vincing in argument to the public. If it can he shown that the pictures are injured by smoke, or by the accumulation of people, let these sources of injury be lessened in the best way that may be open for the preservation of works of such value. This, however, has to be shown; and so long as private collections suffer no injury in London, and if, as we under-stand, it is no object desired, to lessen the number of visitors, we must require the question to be fairly stated, and brought to our con-victions. Let the object be parsmed openly, the arguments stated, and time be given to consider them. If they are such as would earry weight, they will be easily assented to; and for ourselves we should be prepared at once to lend such weight as we may possess, to the prosecu-tion of the object. Unprejudiced examination will however, he demanded. We shall return to the subject, and consider two or three propo-sitions which are hefore us in an early number. Let us add, that some required additions to the buildings of the Department are about being commenced, to be devoted as refreshment-rooms and to other objects. They will stand at the

buildings of the Department are about hemg commenced, to be devoted as refreshment-rooms and to other objects. They will stand at the angle of the ground next the Brompton-road, and will be joined to the runsem building by a covered way. They are to be half-timbered buildings, and are from drawings by Captain Fowke. The Metropolitan Building Act pre-vents the use of this mode of construction, nuless in specially exempted cases. If the values the use of this mode of construction, unless in specially exempted cases. If the building in question be thus not subject to the control of the Act, we would suggest, without a spark of captious feeling, that it surely cannot be desirable for the Government to do that which the Legislature prohibits in the more of individuals case of individuals.

THE ABERYSTWITH CLOCK-TOWER. THE competition for a design for the clock-tower at Aherystwith, South Wales, excited nucl discussion at the time, and we have thought it desirable to give a view of the struc-ture that has been erected. Mr. E. Trevor Owen was the architect.

ON THE USE OF ANCIENT ARCHI-TECTURAL EXAMPLES.*

BEFORE we begin to discuss the use of nacient examples, it may be as well to say a word on the necessity of preserving them in a state of usefulness. I am not going at present to speak in behalf of only the antiquary and historian. Repairs cannot be avoided; but needless altera-tions, and what are called restorations, may very possibly cause the architectural student to pass an erroneous judgment, 'or to relax in his atten-tion, from a feeling that his groundwork is un-certain. He will not look out for subtle and alciate characteristics, when he supposes the the probability of their being oblictated by the hand \mathbf{x}^* The following preservith the addition of some measure BEFORE we begin to discuss the use of ancient

* The following paper, with the addition of some passages, omitted to bring its more within our limits, was read by the key of L. Petita the Architectural Exhibition on the 13th instant, as already mentioned. In commencing, the rever ad geuleman acknowledged his use of suggestions in the writings of others, in-cluding the opening address of the President of the Liverpool Architectural Society.

ABERYSTWITH CLOCK TOWER .---- MR. E. T. OWEN, ARCHITECT.

depended on. No one would ever trouble him-self to observe and work out with nicety the curious forms and proportions of a Grecian temple, if he thought the structure were a copy or restoration, instead of the genuine production of the age to which it professed to belong. The feeling does not arise only from a respect to antiquity, though that may have something to do with it. It is chiefly the desire of drawing our knowledge from the fonation-head, be that remote or near at haud,—he it abundant or scanty,—instead of taking it secondhaud. The restoration may give some idea of the original,

of the restorer. Time may destroy much, but beantiful, subline, or refined. Every work of it also *leaves* much, and what it leaves may be imagination appeals to the mind through the depended on. No one would ever trouble him-est of to observe and work out with niecty the If it presents what is wholly new and strange, curious forms and proportions of a Greeian what cannot even be compared or contrasted temple, if he thought the structure were a copy with familiar objects and idea, it will not be or restoration, instead of the genuine production understood nor appreciated. There must be of the age to which it professed to belong. The some common train of ideas, as a common laisome common trun of necks, as it commends haves or mage, to admit the communication of thought between one and another, to enable the writer or artist to convey his own ideas fairly to the reader or spectator. If an architect could create a wholly new style, altogether independent of any hitherto known, it would probably he a long time before any one but himself could compre-hend its merits. We are always pleased or affected by having an old train of thought affected by having an old train of thought awakened, and are often so prepared for the introduction of something new, which, if pre-sented to us abruptly, without such process, would startle and perplex rather than instruct or delight; and, instead of connecting itself with the memory by a series of known and checished images, would pass away like a strange dream. Hence, the study of the past is neces-sary for the establishing of a communication hetween the artist or poet of the most creative genius and those to whom he addresses himself; even assuming, what I suppose we have no right guage, to admit the communication of thought of a number of the state of the original itself. The contributious of past ages are the pro-perty of the present age.—a property which is is true in literature, is science, and itself or all bar age in the strange of the original itself. The contributious of past ages are the pro-perty of the present age.—a property which is struct and perplex rather than instruct in sister to full itself. The contribution of the original itself. The contributious of past ages are the pro-perty of the present age.—a property which is struct and perplex rather than instruct in sister to full the interature, is science, and is any full and handed down uninpaired to future genera-will not hesitate to borrow largely from the streasures open to all, but by the use he makes borrowed more freely than the Greeks : to uo uation is posterity more indebted for all that is

47

external aid. It is no disparagement to the look to them for antbority. Unless we are merits of a design that we can casily discover its prototypes. On the contrary, the knowledge of them often enhances our appreciation of the talent and power of the designer. * * *

Nothing gives a greater air of originality to a work than any evidence of its designer having always gone straight forward to his professed object, from whatever source he may have drawn his materials. This is what constitntes the difference between servile imitation and bold and bonest adaptation.

and bold and bonest adaptation. A fortile invention, as we all know, is a some-what rare endowment. Many painters, sculp-tors, musicians, nay, even poets, who have not been eminently gifted with it, have yet trans-mitted to postcrity works far beyond an average standard of merit, and likely to endure and event an active influence on many generations. Architecture from the users actures of the advince Architecture, from the very nature of its objects, is much less indebted to brilliancy of imaginain than to sound common sense and habits of I not near to some to be sense and native of independent thought. If we want a house or a church, and have before as a good type, we should be very foolish if we refused to avail our-selves of it for the sake of some new experiment. Should we see a defect or want of suitableness in our part or suppose we could device an in-Should we see a detect of wars of earlier of an im-in any part, or suppose we could devise an im-provement, the change should be made with much cantion and forethought. When archimuch cantion and forethought. When archi-tects worked in this spirit, we find the buildings teets worked in this spirit, we find the buildings of the age to exhibit an extraordinary variety, and, at the same time, a strong affinity to each other; so that although no two can he found actually althe, all may be pronounced as belong-ing to the same group or species. And this I believe to be owing to no other cause than singleness of purpose on the part of the builders. Their object was neither to produce elever initiations nor incremions movelies. but clever imitations nor ingenious novelties, but simply to crect the best huilding they could; the most adapted to its end, the most pleasing to the eye, and the most suitable to its position pleasing

Any one who has made a tour through a dis-trict in which the village churches are tolerably trict in which the village churches are folerably free from modern repair, will note holt the prevalent adherence to one approved type, and the variety of character which shows the indo-pendence of the architects. In Somersetshire we see a vast number of lofty ornamented towers, all having a strong resemblance to each other, yet each preserving its individuality by distinctive marks. In Devonshire the family likeness is still stronger: the plain embattled tower, slightly tapering to the top; the long unbroken body, with an aisle nearly reaching its full length, and the rich rood screen, forming a substitute for the channed arch, are features all substitute for the chancel arch, are features all universal; and yet the traveller who visits one church after the other need not complain of one church after the other need not complain of monotouy. In Jersey, every one of the old parish churches has a central tower, and most of them have an aisle nearly as long as the whole building. Yet there is quite sufficient individual character, notwithstanding the injury done by modein alterations, to render a visit to each particular church interesting. The four-sided spire-mot a common feature in most sided spire—not a common feature in most countries—is there a favourite finish to the as many as six ont of the twelve have it. The stone barrel roof, to the steepie: as many as six ont of the twelve charaches have it. The stone barrel roof, to the outside of which I understood the tiles were attached without the intervention of timher, give a good idea for the construction of an im-perishable building.

The flint churches of Norfolk and Suffolk, many of which have round towers, and the Kentish churches with their bold staircase thrrets, afford well-known examples of this varied uniformity. In some parts of France this is still more striking. I scarcely ever pass be-tween Paris and Boulogue or Calais, without giving np a day to the group of churches lying near aud round Creil aud Clernont; and I have never done so without lighting upon some specimen that was new to me, and which I should he sorry to have missed. I may say the shound he solve to have missed. I may say the same of certain groups upon the Marne, upon the Loire, and that interesting group of churches with domical roofs, of which Perigneux aud

took to them for autoprity. Unless we are content to do so for a time, we shall not, I suspect, make much progress in fixing an in-dependent style of our own. Architects are not now in a different position from those of former ages; neither more nor less bound by precedents and conventional rules. We know precedents and conventional rules. We know that the architects of the best periods regarded the rules of their predecessors with no small degree of veneration, while they neither con-sidered them to be infallible, nor felt themselves to be debarred from any innovation or attempt at improvement. The establishment of Doric,

at improvement. The establishment of Doric, the purest and most perfect of all columnar styles, did not prevent the Ionic and Corinthian from coning into existence, and taking a pro-minent part in the progress of architecture. Had the designers of these looked on the Doric as a precedent not to be departed from, they would never have given the fruit of their ideas to the world at all had they thrown aside the precedent altogether, they would most likely have missed many of those beauties and pro-prieties for which the Greek orders are so remarkable. And this has been the case throughout the whole range of architecture. The architect of genius and judgment has never The architect of genus and magment has never ceased to keep in sight authority and precedent when he has attempted his boldest inventions. Anthority is like the string that enables the kite to rise, and keeps it steady: out the string, the movements of the kite become at any measurements of the kite become at song, the inventions of the kills become in the once uncertain and irregular, and it presently fulls to the ground. The restraint of rules, if they be reasonable, so far from cramping the genins, are often useful in strengthening it, and giving it a definite purpose and action. If there were no laws of neutron such as the here of accessite it a definite purpose and action. If there were no laws of nature, such as the law of gravity, no laws of beanty and harmony would inques tionably exist, and must be learnt and obeyed even though we may be unable to define them no laws dictated by convenience and usefulness no laws dictated by convenience and userniness, what would be the scope and aim of the archi-tect? how could his geoius embody itself in a definite form? The laws of precedent should be founded upon these; and we shall always do well to examine whether they actually are, or whether at least they are not at variance with them; for no precedent will justify either false construction or inconvenient arrangement.

Again, rules and precedents are usually esta blished upon the practice of the greatest mas-ters, and when the art is at its best; and they ters, and when the art is a fits best; and they are the result of nucle experience and careful observation, so that, by disregarding them, we are debarcing ourselves from the advantage of a tried and approved path to excellence, and one that must in general be trodden hefore we are entitled to venture, with any hope of success, upon the new and nutried paths still before us. However we may wish to strike out a uew style of architecture, we must, I believe, be content to begin by conforming with an old and recognised oue-studying its examples, and

recognised one-studying its examples, and acknowledging its authorities. We need not bind acknowledging its authorities. We need not bind ourselves to them slavishly, nor consider con-l'miny as the test of merit; indeed, unless we look to a far higher standard than correct arehitecture worthy of the name; but we should not break them lightly and without reason; and even while transgressing the rule itself, we should be careful to show that we can still even should be careful to show that we are still car-rying out the principle on which the rule is grounded. As for details, we should adopt those which prevail in the style we choose, unless we can substitute something better in itself and harmonising equally well with the rest of the composition of the composition.

rest of the composition. If we work with a determination to advance, we shall be sure to attain ultimately a style of our own, distinct from those which have pre-ceded it, yet plainly manifesting their influence. Changes will come, slowly and gradnally, or rapidly and suddenly, as circumstances may call them forth. Our style will pressarily have much of the Gettie and work of the Generical much of the Gothic and much of the Classical; as much probably of each as is valuable, and capable of combination; and I think it will be schie of certain groups upon the Marne, upon as much probably of each as is valuable, and case, it is very certain that much has been said, the Loire, and that interesting groups of churches, capable of combination; and I think it will be and much will be said, on both sides; and no have will be said, on both sides; and no have will be said, on both sides; and no have will be arguments, and a still and much will be arguments, and a still carguments, and a still carguments, have been and will be arrayed against each other. The open steeples of Brittany, mostly of a interior decorntions of Aluwick Castle will be arrayed against each other, servicely from ancient examples, yet we must aspect; though there is no doubt that be skill,

of the designers, and the intrinsic excellence of their work will be put to a severe test; for both on one part and the other they must look much more to the true principles of architecture, those which are the same through every style, than to a more conformity with the fashion of a day. If both architect and decorator do what they are assured is positively and essentially right in itself and does not owe all its merit to authority, even though they derive their mate-rials from different styles and periods, the harmony between their works will perhaps he much more complete than we imagine

I have said that our new style, when it comes, must contain much both of Italian and Gothie; hut the fusion will be a matter of time : we are not called upon, in every building, to indertake that trial of skill which was necessary in the case of Aluwick Castle, and the results of which case of Ahwack Castle, and the results of which cannot fail to be instructive. We must conform to some one acknowledged style, and whatever we borrow from another we must introduce cautiously, and by degrees. The styles with which we are familiar, and between which we have to make our choice, are the Classic and the Gothic. The links by which the one is connected with the other,—for the transition was gradnal, uot sudden, namely, the Romanesque and Rezoutine—are of extreme the Romancsque and Byzantine-are of extreme value and interest, and their study will be be found essential found essential towards any development to which we may look forward, but in themselves they offer scarcely a sufficient basis for the groundwork of a style. Indeed, the first Roman-esque is debased Roman, imitating the Roman, and failing short of it from the ignorance of the workmen, and the later Romanesque is inceipent Gothic. It may be that a new style will be worked out more like the Romanesque than is either the Gothic or the Roman; but if we commence with it as a groundwork, we shall really find onrielves at a loss for those rules which are necessary towards securing a steady which are necessary towards securing a steady and permanent progress. The question, then, is, whother the Classic or the Gothic be adopted as the style on which we shall work, with a view of establishing a national architecture worthy of an age which in most respects betrays no symptom of retrogression.

You will observe the question is not which we shall adopt, and preserve constantly in the state in which we find it, with little or no change beyond what may be caused by the manner of individual architects, but which we shall take as a basis for future operations. I dare say the favourers of Gothic looked npon the Classical party as auxions to preserve the style of some particular era, say that of Palladio, without any party as auxious to preserve the style of some particular era, say that of Palladio, without any important alterations, and to make all our buildings spiritless reproductions of his works and those of his contemporaries. It may be on the other hand that the revivers of Gothie are supposed to be desirous of establishing per-manently the style that prevailed in England, say during the reigns of Henry III. or the three first kdwards. If was because I thought this yeas the case that I expressed my opiuion, and I do not wish it to be taken at more than its worth against the revival of Gothie; and I should equally protest against the revival of any phase of Classical architecture, as a per-manent, meltawgeable style. But the question is, I repeat, which shall we choose as the ground-work of a style, perhaps of a series of sneces-sive styles, according to the wants tastes, or scientific discoveries of future generations. And the Gothie architect who professes to develop the style he bas chosen takes a very different tered from the architect tarbox are in is merging to the style he has chosen takes a very different stand from the architect whose aim is merely to to restore or reproduce the buildings of the thir-teenth and fourteenth centurics.

teenth and fourteenth centuries. Looking at it, then, in its true light, I do not know that anybody has a right to say that it is not still an open question. Sir Roger de Coverley's conclusion, "that much may be said on both sides," is generally considered to be more said than satisfactory; but in the present case, it is very certain that much has been said, and much will be said on both sider, and we

and in the right spirit, they will come very much element of material decay, is also adverse to the life and character. It ran a rapid and brilliant nearer to each other in opinion, and in the course permanency of any principle of composition. I carcer, and expired as auother age, one of of time join hand in hand in accomplishing the am certain there are very few large windows in different thoughts, habits, and manners, was nearer to each other in opinion, and in the course of time join hand in hand in accomplishing the same object. The existence of two opposing architectural parties may, after all, conduce to the progress of architecture. Though 1 cannot sce that the Gothic movement has yet taken the line that will lead to this advancement, and though I am strongly impressed with an idea that we shall do more towards it if we work upon a classical basis, yet I fully appreciate the high and honourable position which the restorers of Gothic have attimed, and which the resolvers of Gothic have attimed, and which they must ever occupy in the history of architecture. They may not, perhaps, succeed in reviving Gothic architecture, that is, in giving it, together with the same forms, the same life and spirit that it possessed in the few centuries from which that define their models, but there will underlast they derive their models ; but they will undouhtedly have done much towards the revival of the art of architecture itself, into which their zeal, their talents, and their exertions have breatbed a new energy. It may be that the attempts to reproduce Gothic buildings have been necessary, to give us a clearer insight into the principles of that noble style, just as we acquire a keener perception of the beauties of ancient poets by occasionally excreising ourselves in the compo sition of Greek and Latin verses; and, viewing them in this light, we ought not to regret that they have been made; for the study and know ledge of Gothic cannot be too much cultivated but some higher annot be thouse the intervention of the had in view than the production of works which may be mistaken for those of another age. At the first revival of Classical architecture

the form and spirit of the original was more truly exhibited than those of the Gothie were for many years after the imitation was attempted among ourselves. The works of Alberti, who died considerably before the close of the fifteenth century, present us with pure Roman. When I was sketching the cathedral at Rimini, I thought I had hefore me some ancient building, within which a Gothie church had heen formed; and I did not feel sure that such was not the ease till In ordiocal among the ornaments some medieval shields. I can conceive nothing grander than some of the works of this master. At Mantua is a church, the nave of which is 60 feet in is a charter, the have of which is do feet in wildb, covered with a cylindrical vanit: it has no aisles; but the sides have at certain intervals large and deep arched recesses, the piers heing ornamented with pilasters. The effect of this church is much injured by its painted decora-tions. It was not till I visited it in the dask of the expanse that I avail indee what it results the evening that I could judge what it really was. It will readily be perceived what an ex-cellent plan this is for securing sufficient ahutment for the cuormous span of roof. The idea may have been partly taken from the Temple of may have been partly taken from the rempt of Peace at Rome—I mean in giving the internal abutment. But the men of those days felt they had otber work to do beyond reproducing the style in its original purity and majesty. They style in its original parity and majesty. They had to adapt it to their own purposes, and also had to adapt it to their own purposes, and also to add to it much that succeeding ages had placed at their disposal. Thus they struck out combinations unknown to the ancient Roman and to the mediaval architect. If the style degenerated into a dull and feelbe uniformity, we must look to other causes hesides its own poverty of resources. By making a strict adherence to conventional rules our prime object and our highest standard of morit, we shall spoil any style, whether ancient, modern, or mediaval. or mediæval.

The Gothic style prevailed in this country for In period, we may say, of about four centurics. In Daring this time it underwent at least as many wvery decided and remarkable changes; so that there is a greater difference hetween any two phases of Gothic thau hetween any two orders phases of Gothie man hetween any two orders of Greek architecture, and perhaps than hetween any two aspects of Roman architecture from the rearliest days of Roma to the end of the first or second century of the Christian era. And these are all changes of progress 1 do not say neces-are all changes of progress 1 do not say necesare all changes of progress; I do not say neces. College Chapet at Campringe. It due say to sarily of improvement, for it is very possible to has its faults, but it will be no easy matter to apush a principle too far; bat every step tended fluid many huildings that can bear comparison more and more to develop the resources of the with it, he their style what, it may. Astyle, to exhibit fresh combinations, and to Bat, whether for the hetter or the worse; it meet what night appear to be faulty. To go is certain that a change was going ou during, no farther than one characteristic, the windows the whole period of Gothic architecture; and bidivided hy multions and tracery, as it is an to this constant change, I suspect, it owes its,

which, among many beauties, some decided faults are not to be found; faults easily looked over when we are studying the general effect, or the excellence of the workmanship ; hut not to he tolerated in a system to which we are called upon to conform with any degree of strictuess.

I have lately read carefully Mr. Freeman's very valuable and comprehensive work upon window tracery ; and it convinced me that through the whole progress of Gothic art some-thing was felt to be wanting in that department, which the architect was continually making an effort to supply. Sometimes there was a heavi-ness, sometimes a feebleness and indecision of liue, sometimes a defective construction, sometimes a bard and unpleasing intersection, some-times a want of harmony in the sizes or shapes of the principal openings; sometimes au nngracefulness of form in the subordinate ones; sometimes a stiffness and formality ; sometimes a want of variety: all these I have no doubt were felt, and many were the attempts to correct them. The architects knew and fully apprethem. ciated the beauty of the traceried window they were constantly eudeavouring to make it perfect. The result is, an inconceivable variety perfect. fine designs, hut none which furnishes definite rule for our guidance. Now I do not deny that Classical architecture

has grave faults-far graver than any which can has grave halls—har grave than any whete can be charged npon the heantiful windows of the Gothic; hut they are faults which, if we see them, we can avoid. They are not so inherent in the style as to force themselves into our designs against our judgment, even if we wish to conform to it other are nor inverse. to conform to it strictly: we may imagine a pure huilding, free from every thing that we could condemn as an incongruity or deformity: we are not obliged to mix two different kinds of construction, or to make what ought to he constructive features take a part only in decoration: if we think this a fault, we may keep clear of it, while we yet build in a correct Roman style; or we may make both the arch and the colonade really perform their work, in barmony with each other, as Sir Christopher Wren knew so well how to do, and did, in his exquisite composition of St. Stephen's, Walbrook.

That the development of the Gothic style was carried too far by the mediaval architects, or else that it took a wrong direction, is evidently the opinion of those who look upon the early or Geometrical Decorated style as the nearest to perfection. For my own part, I think that in several respects a steady inprovement took place up to the period of the Early Perpenback in to the period of the Larry Perpen-dicelar melosive; and that this style, worked with purity, would he found to afford scope for very noble designs. The clongated plan of the piet, giving a greater depth in a direction transverse to the aisles thau in the direction of their length, suggests a very bold composition in the and is favourable to construction. Beautiful varieties of vaulting are admissible; or, if it is more expedient to use the timber or, it it is more expedient to use the timber roof, fine examples are not waiting. Externally the opportunity of varying the pitch of the roof enables the architect, if he pleases, to attain a squareness and severity of outline very condu-cive to dignity. Of this the central tower and during of very Wingford office a comparison of the second squirebass and severity to outline every condu-cive to dignity. Of this the central tower and choir of York Minsfer offer a magnificent ex-ample; and the interior of the latter would have heen still finer, had it been more thoroughly Perpendicular, and less partaking of the cha-reater of the wave. racter of the nave.

That the advance beyond this period to the That the advance beyond this period to be latest Perpendicalar was altogether a down-hill course, I am not prepared to admit, for though some symptoms of a dehased art may have appeared, yet some new and becautiful features were unfolded,—for instance, the fau-roof. I course not get across weld admitting of Kingda cannot yet get over my old admiration of King's College Chapel at Cambridge. I dare say it has its faults, but it will be no easy matter to

career, and expired as another age, one of different thoughts, hahits, and manners, was commencing. Its relics are most valuable to us, in whatever light we view them, wbether as historical records or as incentives to grave and religious contemplation. In this respect our old churches have a value which more than compensates for many inconveniences in arrangement; and no architect, to whatever branch may devote himself, can dispense with the study of them. He cannot acquaint himself too thoroughly with their principles both of conthroughly with their principles both of con-struction and decoration,—nay, he should also learn their symbolical meanings wherever any are expressed, that be may not attribute to one idea or motive that which has heen suggested by another. But the rapid changes of the style seem to afford an argument why we should regard Gothic rather as a rich magazine of resources than as a school from which we are to derive cortain rules and minicides of art * derive certain rules and principles of art.*

CHOIRS AND CHANCELS, PARTI-CULARLY AS REGARDS THEIR USE IN SOUTHERN EUROPE.

At a recent meeting of the Society of Anti-quaries a paper was read by Mr. Ashpitel on this subject. He commenced by commenting on the difficult position an architect finds himself in while designing chancels for churches in the revised mediaval styles;—that any onc, with any feeling for Gothic art, must see how necessary it was to the effect of the building to have a long chancel ;--that iu ancient buildings they were seldom less than one-third of the total length of the edifice, and that often the chancel was equal in length to the nave ;---that ought to he always excluded from the chancel, while at the same time, by a strange auomaly, in all our eathedrals the laity were all huddled into the choirs, and the naves left vacant, so that it was a reproach on the part of the utilitariaus that one-third of our churches, and tbree-fourths of our cathcdrals, were utterly wasted.

The reader then said that, impressed with these notions, he carefully noted, on a late visit to Italy, the construction of choirs and chancels, The uses made of them, and the traditions attached to their uses. He would first call their attention to what the choir or χ_{OPO} was in the early Christian Church, then to its changes during the medieval period, and last, to its present state and use in Southern Europe

The Christian Church was not a copy of, or The Christian Church was not a copy of, or derived from, the Pagau Temple in any way, but from the Roman Basilica, or Hall of Justice. From worshipping in caves and cutacombs, the early Christians were permitted by wealthy converts to occupy their halls (which were attached to most great men's houses) for the purposes of worship, and the form was found so convenient that, in the time of Constantine, many were converted into, and many buildings similar form crected as, Christian Churches. of s

He then went into a close description of most of those still existing at Rome, and exhibited a of those still existing at Rome, and exhibited a plan of San Clemento, which still retains in every respect all the features it possessed in the days of Constantine. There was a large semicircular niche at the cut of the huilding, in the middle of which the altar stood; the seats for the hishop and presbyters heing close to the wall bebind it. This was on a platform raised some steps, never less than three: at the top of this was a railing called "cancelli" or sycakee. In front was a space enclosed κιγκλιδες. In front was a space enclosed by marble slabs about four feet high, extending by manne stats about four tee may, extending a short way down the nave, in which the "chorns psallentium," or choir of singers, saf, and from whence it derived its name of choir. On each side of this were the ambones or pulpits reading the gospels and epistles, and for aching. Within the enclosures were sung preaching. Within the enclosure the psalms, hymns, and doxologies.

"Ite then remarked on the usage of the words "Pagan" and Christian Art," as regarded architecture, and explained how the use of these terms originally intended to do honour to mediaval art, were ridiculous and offensive in the ex-

To be continued

treme, to the ears of Italians. "What," hav treme, to the ears of Italians. "What," have they often said, "are those huildings in which the holy aposites, and their successors, have preached, which have been imbued with the blood of saints and martyrs, where synods and councils have sate, and which exist to the pre-sent day unaltered—are these to be called Pagan? while that style which we know to have been brought from the East by the Crusa-ders, and however it may have flourished in the the north, has never even taken root in Rome. the north, has never even taken root in Rome : is this the *Sarasime* to be called *Christian*, while the type Early Christian, the style of the the true Early Christian, the style of the apostone age, is to be called *Pagan*? Mahom-medau called Christian, and Christian Pagau? medau called Christian, and Christian, and it is insulting to our common sense." It was it is insulting to such remarks. The reader it is insulting to our common sonse." If vass difficult to answer such remarks. The reader took a rapid sketch of the rise and progress of the monastic orders, and particularly of the custom still observed in the Romish Church, wherever there was a "convention," or assem-blage of the elergy, of meeting every third hour of the day and night, in the church, and meet-ing and singing certain services, called the Cranoucal Hours, or more commonly the Bre-viary services. These were sang in the choir. viary services. These were sung in the choir. The great Roman authority, Carranza, attributed The great router in the Pope Damasus the First (A.D. 371), but onr learned divines, Bingham and Joseph Mede, thought them to be later. Soon after their introduction, choirs seem to

Soon after their introduction, chores seem to have hence neclosed. The best authority on this point is, the celebrated Durandus, who says in his "Natiourle," — "In the primitive church, the periobolus, or wall which encircles the choir, was only elbow high, and which is still observed in some churches" (this wall, of course, stood in the uniddle of the nave before the altron, "thet in this time the savel almost course, stood in the unddle of the nave before the altary), "but in this time [he says], almost always a veil is hung,"up, or a wall interposed, hetween the elergy and the people, lest they should mutually look at each other." From this system of raising the periobolus, or wall round the choir, may be traced the present state of choirs and chancels, the great difference being that the rails, which formerly separated the altars from choirs, now senarate the choirs the altars from choirs, now separate the choirs from the naves

That the laity in olden times were admitted I nat the choirs, is proved by many instances, in none more so than by Barclay, in bis "Shippe of Fooles," several passages from which were read, one of which in particular, alluding to the read, one of which in particular, and any of the indecent behaviour in churches, talks of men "elapping with their heeles in churche, and in quedre." Besides the custom in our own country, in France, and in Belgium. In Haly, the laity enter the choirs and take their seads in the stalls just as they do here, and it is not dure a therese here a done so. The word

neur scats in the statis just as they do here, and it is said they always have done so. The word "chancel" is unknown in Italy as applied to a part of the building, "cancelli" meaning only the gates or rails hefore the choir, or "coro." What we call chancel, or choir, they call by the primitive term of tribune. The word "coro" is applied to any part of the huilding, side chapel or otherwise, where the choir assemble

applied to any part of the huilding, side chapel or otherwise, where the choir assembles, such being shifted from place to place according to the weather or to convenience. But *rhile* the choir *are* assembled there, and *it* is a "coro," the gates are shut (ofteutimes curtains are drawn), and the laity are carefully excluded. Mr. Ashpitet then explained how a friend of his was puzzled by talking of the choir as of the east end of a large church, when the sacristan said, "No, sir, this is the tribuue : the choir is now in the second chapel on the right of the nave : next week it will be in the Spanish Chapel, in the green cloister." And he also instauced the most striking illustration, that the churches built by the Jesuits have no choirs nor instanced the most striking illustration, that the churches built by the Jesuits have no choirs nor chancels: Ignatius Loyola, finding how the recital of the breviary services at every third boar interfered with the active life he required of his followers, would not suffer-them to do so, and consequently choirs were useless, and are uever built in his churches. The near used that the notion that the

The paper urged that the uotion that the ity should never enter the choir was quite laity novel, and had arisen since the publication of a translation of part of Durandus, who says, "that the Council of Mayence had determined that part which is divided by the rails from the altar should be open only to the elergy while chanting:" "psallentibus tantum patent elericis."

Now, curiously enough, this dogma is not to be found in the cauons of the Council of Maynee, but it is in those of the second Council of Tours (A.D. 560), and would quite agree with the notion of the present practice, if we suppose by "psallens clericus" was meant, as it is in the pre-sent day, the choir while the breviary officers are going on: in other words, the choir rehile it is suggestions, should at once announce that their own officers will not he allowed to compete. M. Marable (the superintending architet) bas recently made some important statements itself, it goes on to say, "but for praying and for communicating, let the Holy of Holies itself for communicating, let the holy of noise itself be open to the laity and to women as the custom is." He then entered at length into the ques-tion of the canons of the fourth Council of Toledo, and of the sixth of Constantinople, and described the use of the elurches in Rome, that different services are held in different parts of the adifferent services are the number of persons succent to the edifices, as the number of persons present or the editices, as the uumber of persons present or other conveniences may require, the laity being freely admitted to all parts of the building, with one exception only, that they are always ex-cluded from the chapels while the breviary ser-vices are celebrating; but as soon as these are over, the gates are thrown open, and masses or other public services said, and the laity admitted areain. again.

Allusion was made to some traditions extant among the English Catholics at Rome; oue, that the separation of the sexes in churches was said to have been an iunovation of Zuringhies The passage in St. Augustine de Civitate Dei, he was told, alludes to a practice still in use at Rome, that on certain occasions men aloue go to certain churches and women to others : not that certain childrenes and women to outlie in the same there is a separation of the sexes in the same clurch. It was also stated, that there is no "Orientalism," as it is called, of churches in "Orientatism, as it is called of characteristic of the framers of the Trayer-book used the phrase, "north side of the altar," disbking the use of the word, "gospel side." Another tradition was mentioned, that the encourage introduced

modern pronunciation of Latin was introduced at the time of Elizabeth, that those who had at the time of Dizadeth, and the table who had received a foreign culculation, and to be respected as seminary priests, might be detected as soon as they quoted a classic authority. He concluded with a hope, that the subject might be more carefully investigated, and more particularly electric proving particular and openigned services whether morning prayer and occasional services might not still be held in chancels, rather than scattering people thinly over a large, cold church; and also whether the fact of the Church of England having determined that the altar should be *moreable*, may not have had, and may not still have, a most important bearing on this subject.

METROPOLITAN BOARD OF WORKS. Public Bridges and Thoroughfares.—On the notion of Mr. Deputy Harrison, the following resolution was passed at the meeting of the Board on the 16th:—

The member gave various reasons why the present time was opportune for such a reference: among others, was the fact that several of the among others, was the fact that several of the railway companies were bringing Bills before Parliament for constructing roads within the metropolis which might interfere with the im-provements to be carried out by the Board.

Premiums for Laying-ont Streets. The follow-ing motion, proposed by Mr. Wright, was Wright, was carried :---

"That prizes he offered for public competition for designs showing the best mode of laying out the sur-face and subsoil of the new street in Southwark, as an example of a first class street, and also for the street in Westminster as a second-class street; showing the in Westminster as a second-closs street; showing the disposition of the private vaults, severs, gas and water pipes, telegraph wires, with any parts of the soil appropriated to other useful purposes. Prize-First-class street, 100 guineas, 50 guineas, and 10 guineas; second-class street, 507. 207. and 57. That the details of this "competition he carried out hy the works committee."

Mr. D'Iffanger, in voting for this motion, de-colour draw sired it to be understood that be did not wish to of January.

[JAN. 24, 1857.

Mr. Marrable (the superintending architect) has recently made some important statements as to erroneous decisions by magistrates on cases brought before them by district sur-veyors, — decisions tending to paralyze the efforts of public officers. The evil is an in-creasing oue. Directly reverse options have been given on enses precisely similar, and before long the district surveyors will find the proper discharge of their duties impossible, and so the public will suffer. We must return to the subject. In a pecuairary point of view the district sur-veyors have been materially injured by the new Act, in the diminution of fices, the transference of the survey of ruinous haildings and other steps.

Act, in the communitation or rees, the transferree of the survey of ruinous huildings and other steps, --at least, 25 per cent. Builders and the public may say, "So much the hetter for us." If, however, the alteration should so far lessen the value of the office as to lead to the substitution of men of an inferior order and standing, the advantage may not be so certain.

BUILDING IN CANADA

WE have received a view of a large huilding at present received a view of a range mining at present erecting in Montreal, Canada, for Mr. Alfred Pinsoncault. It is five stories high, and the façades are constructed of hrick and stone. The ground-floor and basement will be stone. The ground floor and basement will be used for shops and storage, the upper floors being appropriated to public rooms, &c. The building will have three fronts, the principal one faning a large square, which, with the contem-plated improvements, will form one of the most attractive parts of the eity. The dimensions of the block are 92 feet by 65 feet, and 70 feet high. The interior is for the most part con-structed of iron. The roof (from which an ex-cellent view of the city can be obtained) will be det and surrounded with an iron railing. The cenent view of the city can be obtained) will be flat, and surrounded with an irou railing. The building was commenced in April last, and is to be completed early in the ensuing spring. The cost will be about 6,000. The architects are Messrs. Hopkins, Lawford, and Nelson, of Montreal.

MIDDLESEX INDUSTRIAL SCHOOLS.

Ar the last meeting of the Court of Justices, the design of Messrs. Banks and Barry (of which we gave illustrations recently) was approved.

approved. Messrs. Aickin and Capes, to whom the first premium was awarded by the magistrates, have circulated a lithograph of their plan, with a letter showing their objections to the adopted design, and the advantages of their own. They urge that, their design having been selected as the best, they ought to have been employed te erect the building — in which, as a matter of course, admitting that they have complied with the conditions, we fully agree.

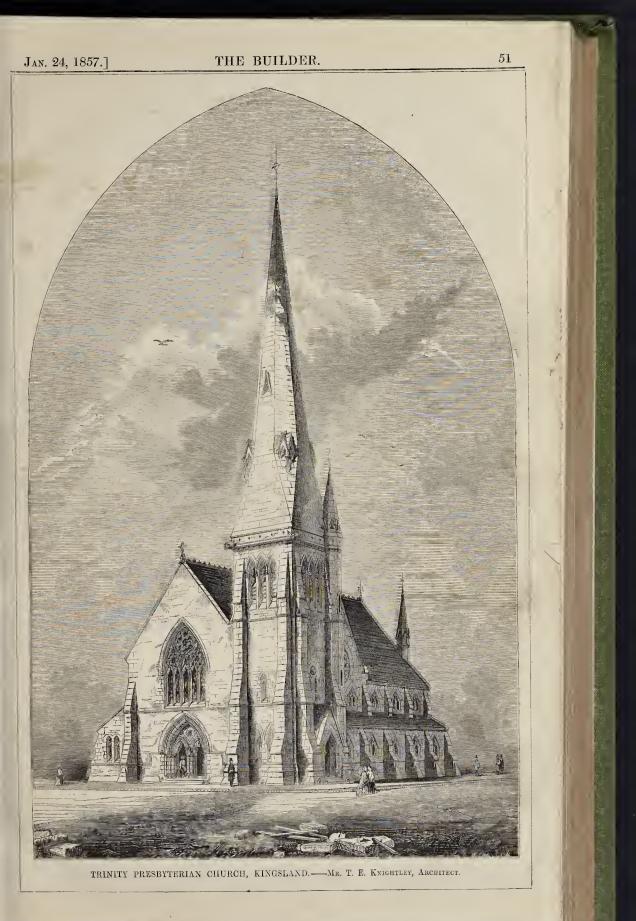

TRINITY PRESBYTERIAN CHURCH, KINGSLAND.

OUR engraving shows the new Presbyteria

Our engraving shows the new Presbyterian Church now erecting at the junction of the Southgate and Church Roads, De Beauvoir town, Kingsland, for the London-wall (the oldest Presbyterian) congregation in London. This church, as we have before observed, i remarkable for very narrow aisles, which serv-as passages only, the henched portion of the building being in one span. Space for 600 wor shippers is provided. Galleries are uot eor templated. Mr. T. E. Knightley, of Cannon street, is the architect, and Mr. E. Clarke, c Tottenham, is the builder. The building is in the Ceometrical style, an promises to be an ornament to the neighbour lood.

ENGLISH PICTURES. — Messrs. Foster, of Pal mall, have announced an important sale of wate colour drawings and paintings, for the 28th and 29th

PROVINCIAL NEWS

Norwich .- The workmen have nearly left the Free Library building, which will be opened very shortly. About 2,500 volumes of books have been purchased and presented for the library, and additions are received daily.——It is now stated that the new workbouse will be -It commenced in the spring.

Devices.—At a meeting of the town council, held on Friday before last, the Corn Exchange Committee reported that the funds in hand amonnted to something like 2,400k which is about sufficient for the building expenses, and it is arranged that the borough treasurer shall advance 1,000%. for the purchase of the site, to be repaid by instalments.

be repaid by instantents. Blymkill (Salay),—The opening of the new schools in the parish of Blymlill, Salap, took place on the 5th. The design of the building is by Mr. Street. It is so arranged as to supply a boys' schoolroom, placed at right angles to the girls' room, a class-room standing at the angle. The style is Decorated. A school-masters' honse is attached, as well as a laundry and industrial school and industrial school.

and industrial school. Upton-on-Severn.—The new bridge, a fertile source of expense and litigation, says the Worcester Chronicle, is again prominently brought before the public. This morning a large party of engineers, connsel, and schicitors entered the quaint old town, and proceeded to make a minute survey of the bridge. We were not a little surprised to observe the elumsy manner in which the running bridge was opened, and were informed that the process of one-nic and were informed that the process of opening and closing it nsually occupies from ten to twenty minutes, and that it is not an uncommon occurrence to have it op in for half-an-horn at a time. The survey being made, the parties returned to Worce:t.r, and proceeded to the Sbire-hall, where they commenced upon the long-pending arbitration between the county justices and the Messrs, Nowell, who, it will be justices and the Messrs. Nowell, who, it will be remembered, were the contractors for the stone-work of the bruege; but the only particulars we could obtain up to the time of going to press were, that the sum in dispute was between 2,000*L* and 3,000*J*. Three eminent engineers are sitting as arbitrators and mapires. *Birkenhead.*—At a recent meeting of the Birkenhead Commissioners.

Birkenhad Commissioners, a memorial was ordered to be presented to the Treasnry, praying for peru ission to take a lense of part of a new updimension of the purpose of a for peri 1 sion to take a fense of part on a new building in Conway-street, for the purpose of a new library and museum. It was stated that the principal room was 44 feet 6 inches by 32 feet, and 14 feet high, containing eight windows and four fireplaces. The rent will be windows and four fireplaces. The rent will be 80% per annum. The committee have already upwards of 3,000 volumes of books, and after all expenses are defrayed, there will be a snm of 300/, to carry over to the credit of next year. The library-rate was levied this year upon an assessment of 111,145%. At the same meeting a report was read from the surveyor, stating that the average erection of new buildings, and alterations to old ones, had been 7 4 per annum for the last ten years. In 1847 the number was 59, while last year it was 241. The smallest number was in 1848, when the

The summers muscles number was only 21. Halifur.—The inauguration of the new Hall Halifur.—The inauguration took place last week. The building has its principal front to one of the new streets now being made through the centre of Halifax by Messrs. John Crossley and Sons, and will form one of a group of public buildings (including the New Swan Hotel, the Halifax Joint Stock Bank, the Swan Hote, the Hantay one block hope, now proposed Exchange), and numerous shops, now being concentrated in this locality. The front alone has been made architectural. The ground alone bas been made architectural. The ground story, to the height of 20 feet from the canse way, consists of panelled and moulded ashlar piers, from the centre of each of which springs moulded and carved bracket, supporting a monified and carved tracket, supporting a lamp and globe. Upon the piers rests a block cornice, from which rises a balustrade, with a corners balcony over the central window, sup-ported by enriched trusses. The upper parties of the front is divided iuto five compartments, by three-quarter columns of Composite design, supporting a full entablature; while the winby three-quarter columns of Composite design, ployed in or available for the erection of the supporting a full entablature; while the win scaffolding, inasmneh as there are now on the weeks ago had a very narrow escape from being dows between are circular-headed, with carved ground upwards of seventy poles of various consumed by fire, has sbrunk, it is said, so much

imposts, archivolts and keys, and semicircular panels in the window-beads. The whole front is surmounted by a balastrade. The entrance to the large room of the Institute is at the upper end of the principal front, by a corridor avian access to a stairces, theraching richt and ing access to a staircase branching right an giving access to a staircase branching right and left, and leading to the landing on the first floor. The large room is about 8S feet long, 43 feet wide, and 32 feet high, with an orchestra placed at the farther end, and with a separate access for the reserved front seats. In connec-tion with the large room in front is the saloar; and underneath the orchestra accommodation for sincers and the chores. The lideting of the for singers and the chorus. The lighting of the room is on the principle known as the snnlight. The lighting of the The ground floor of the building, with a base The ground nor of the building, with a obse-ment story, is appropriated for elass-rooms to the Institute, with a large room for library and a reading-room, also for the hall-kceper's apart-ments, and other convenices. The large room will seat about 600 people, with an orebestra in addition of about 100. The orchestra framing is so constructed that the whole is removable, is so constructed that the whole is removance, thus leaving a clear level platform for dioramas, or other purpose requiring space. The building is erected after designs and details prepared by Messers. Lockwood and Mawson, architects, of Bradford, and Mr. Bull, of Halifax, has acted as clerk of works.

clerk of works. Dumpfress.—The firm of Caldow and McKinnell, Palmerstone Ironworks, according to the local Conrier, have contracted for the erection of a weaving-sheed in connection with the factory about to be creeted in St. Micbael's-street by Mr. Robert Scott. The building is to be 310 feet in length and 110 in breadth within the walls, which are to be 12 feet high; the roof to be divided into five connartments, supported on wails, which are to be 12 the inguity for the de-be divided into five compartments, supported on cast-iron pillars; the northern sides of the roof to he covered with glass. The masou-work has been sub-contracted for hy Mr. Crackston, and been sub-converter for my art. Crackston, and the joiners' and slaters' work by Messrs. Grie-son and Son; and the contractors are bound to have the building finished by Whitsmiday. The larger huilding for carding and spinning, of several stories in height, will also be commenced without date. The accion of these buildings without delay. The creetion of these buildings, and the building of the bridges and viaduct on the Castle-Douglas and Dnmfries Railway are likely to afford full employment to the masons of this district during the coming spring and summer.

Wick .- There is every prospect, it is said, of Government agreeing to a vote of 20,000/. to-wards the erection of a breakwater in the hay of Wick, in the estimates of 1857

CHURCH-BUILDING NEWS.

Abingdon. — At a vestry meeting held on the 9th inst. the contract of Mr. William Walters, hullder, at the sum of 3394 for the repairs and restoration of the tower and spire of St. Helen's Church, was finally accepted, and the terms of Clurch, was intally accepted, and the terms of the contract arranged for the performance of the work. The other contractors were — $M_{\rm T}$, James Thomas (538, 15s, 6d) and Mr, Henry Peymar (5794, 15s, 9d.). The work is to be completed by the 1st of Jame. *Burnsail*.—A vestry committee is engaged in soliciting contributions for the restoration of the old partial edurch. The subscriptions announced

old parish church. The subscriptions announced exceed 200%. It is contemplated to commence exceed 2007. It is contempted to commence operations on the 1st of April, when the sub-scription list will be closed. Mr. Varley, of Burnsall, has been appointed architect and superintendent of the work, and empowered by the committee to examine the timber in the roof of the nerves of closed. of the nave and chancel.

Worcester. — In consequence of the sad acci-dents which have recently occurred at the eathedral, Mr. Bennett, the contractor for the cathedral, Mr. Bennett, the contractor for the repairs and alterations, employed Mr. Pashby, of Birminghan, to investigate and report on the state of the scaffolding there. Mr. Pashby has accordingly done so, and in his report he says, —"I am of opinion that the materials used therein are of a good and sound quality, and the whole of the scaffolding strongly and properly constructed; and I think that no complaint can with justice be made against you, by the work-men or others, as to the want of materials em-loyed in or available for the erretion of the

JAN. 24, 1857.

sizes, which the workmen might have used had they thought that greater strength was required. In reference to the ledgers or cross-pieces, in the scaffolding at the end of the south transept, to which my attention was particularly called beg to say that they are amply sufficient for the purpose for which they were intended, namely, braces for staying the upright poles; but I cousider that the workmen improperly applied them in using them as supports for stages, and thereby cansed the accident."

Winchcomd.—On Monday before last, the new church schools were opened. A day school bas existed in the town for five years, with an average attendance of about 130 scholars; but average attendance of about 130 scholars; but there was no suitable scholarom. After some attempts to raise the necessary funds for such an edifice, Mr. W. Smith, solicitor, who had promised a subscription of 251 commenced the crection of a schoolhonse at his own expense, and he has just completed the schoolroom, mas-ter's residence, &c. at a cost of nearly 3,0004 and the necessary additional buildings will in-volve an ontlay of probably 1,000 more. The new school, of which Mr. W. H. Knight, of Cheltenham, is the architect, stands near tbe curtance to the town from the Cheltenham-road, and is capable of accommodating about 250 and is capable of accommodating about 250 scholars. The late Mr. John Dent, of Sudeley Castle, left 2,0007. to endow a school at Winch-comb, and no doubt this snm will soon be ap-plied to the endowment of the school now erected.

Edgbaston .- The parish church is about to be Edgaston.— The parts church is about to be re-opened. A south aisle, terminated by a porch adjoining the tower, has been added, and the gallery has been extended across the whole of the west end, thus affording 325 new sittings, of which 100 are free. The aisle (which is 72 fear here are 40.7 for this from flower to yidrow of the west end, thus allording 322 new sittings, of which 100 are free. The aisle (which is 72 feet long, and 27 feet bigb from floor to ridge) is divided from the nave by five arches of the later Perpendicular period, in accordance with the general style of the building. The windows formerly on the south side of the nave have been inserted in the aisle wall, and at the east end is placed a new window of four lights. The floor of the church is laid with white octagonal tiles, interspersed with small hlack tiles, diamond shaped. The new aisle bas been erected by Mr. Hardwick, from the designs of Mr. Fiddian.

Manchester, —The New Barus Cemetery re-cently opened consists of $21\frac{1}{2}$ acres, $11\frac{1}{2}$ being set apart for consecration for members of the Church of England, six acres for the Dissenters, and four for Roman Catbolies. Chapels in the and four for Roman Catbolies. Chapter in the Dissenters, Early Decorated style of Gothie architecture have been erected for each denomination, the Episcopal one being the largest and most richly decorated. It has a spire and lantern 96 feet high, and its internal dimensions are 36 feet by high, and its internal dimensions are do feet by 20 feet. The cost of the three chaptels and lodge was 2,460!. The contractors were Messrs. Pritchett and Sons, of Darlington. The total cost of land, buildings, &c. will be 16,0004. The masonry was done by Messrs. Ellis and Hinchliff, of Hulme; the woodwork hy Mr, Dallow, of Pendleton; and the general laying out of the grounds by Mr. Forcester, clerk of the works.—The consecration of St. Paul's shurch. Streetford New, road took induce on Satur. out of the ground consecration of St. Frances the works.— The consecration of St. Frances ehnreh, Stretford New-road, took place on Satur-day before last. THE BUILDER.

that it will have to be taken down and rehuilt, entailing an expense of from 70*l*. to 100*l*. *Edinburgh*.—At a late meeting of the Lord Provost's committee, the subject of Trinity College Church was discussed at some length, and two motions were submitted, the one by Mr. Forrester, to the effect that the council should creet a church, according to the style and model of the old one, on some suitable site at the head of Leith Wynd or Ireland's Woodyard, or in some other situation; the other hy Mr. Johnston, to the effect that a suitable church should be erected, at an expense not exceeding 7,000% exclusive of the cost of the site, and 7,000% exclusive of the cost of the site, and appointing a sub-committee to make inquiries on the subject of a site. The motion of Mrr. Johnston was carried by a majority of five, nine members having voted for it, and four for Mr.

Memory networks Forrester's. Kirkwall (Orkney).—The cathedral church of St. Magaus is now fitted up for public accom-modation. The plan has here executed by Mr. Samuel Baikie, under the superintendence of Samuel Baikie, under the superintendence of Mr. Richard Spence. The screen which span rates the choir from the nave and transcrts was designed hy Mr. Spence. The church is lighted with gas, fitted up by Mr. John Rendall. The choir while gas, the dup by Mr. John Kendahi. The choir is heated by pipes leading from a furnace under the vestry. The gallery, which is placed in the north aisle from the grand east window, west-ward, issues into three fronts hetweeu the pillars; the pulpit heing so placed, with its back to the easternmost pillar of the south side of the choir, and its front towards the north-west, as to enable the greatest possible number of the congregation to see the officiating minister.

STAINED GLASS.

Overton. - A stained glass window has recently been put up in the church here. It is of three lights, and contains medallions, with sub-jects from the Old aud New Testaments, with mosaic backgrounds and borders. Two of the tracery lights contain angels with scrolls, the reactly lights contain angels with scrolls, the remaining openings heing filled with ornament alone. The window has been erected by Miss Bennion, of Wrexham, in memory of her sister, and was executed by Messrs. Pilkington, of St. Helen's.

Crencester.— A stained glass window has been placed in the new church as a memorial of the late Mr. Hugh E. Strickland. The expense has been horne by a few friends of the deceased gentleman living in Cirencester.

Methaghen. — St. John's Church has been lately ornamented by the addition of some stained windows, two of which were the gift of the Rev. W. W. Pulman. The eastern one is dedicated to the memory of the late vices and define with "the four course lights contain the dedicated to the memory of the late vicar and his wife. The four centre lights contain the figures of the four Evangelists. The second window, which is the workmanship of Mr. J. Toms, of Wellingtor, contains three compart-ments filled with pattern quarry glass; and the centre light shows the figure of the Saviour with the embens of the passions, whilst the side lights represent the "Agnus Dei" a dove, and the Holy Trunity. Mr. Toms, it is said, has received orders to execute two corresponding windows for the north side. windows for the north side.

Eyton.—At Eyton Church, near Wellington, Mr. Evans, of Shrewsbury, has vecently placed a window in the chancel, the subject being St. Zatherine, to whom the church, the subject being St. Zatherine, to whom the church is dedicated. The figure of the saint is after Ruhens. The xindow has been creeted to the memory of Mr. Thomas Eyton, of Eyton, hy his son, Mr. C. C. Eyton, who has considerably enlarged and upproved the chancel.

mproved the enancet. : Thraxton.—The Rev. Donald Baines, rector of Thruxton, near Audover, gave Mr. Evans, of shrewsbury, a commission for two windows, shout 9 feet high and 2 feet wide, for the north the static field and states of the old aburdance the static states and the states of the states of the states the state states of the states of the states of the states the state states of the states of the states of the states in the state states of the states of the states of the states in the state states of the states of the states of the states in the state states of the states of the states of the states of the states in the state states of the states of the states of the states of the states in the state states of the about 9 feet high and 2 feet wide, for the north and south sides of the chancel of the old church if that village. These windows have been executed, and are now in course of creetion. The figures are Moses and Daniel for the north ide, and Auron and 8t. Paul for the south. Whitnash.— A western window on the north ide of the chancel of Whitnash Church has the figures are think offering. It were noted ide of the chancel of Whitnash Church has the figure are the figures.

Hawsted.-A window of stained glass has been placed in the chancel of Hawsted Church, to the memory of the late Sir Thomas Cullun, Bart. The glass is by Mr. Heaton, of London. The subject is "The Ascension."

"BRICK-OLOGY."

WHAT is the meaning of the following names as applied to bricks :—*Cutters* (*firsts*); *Malm*; *Paoiors*; *Fellow and White* (seconds); *Common Place*; *Rough Stocks*? Is the same material used for these varieties? CENTURION.

The first four descriptions of bricks mentioned are varicties of the same manufacture, and are all eon posed of the best earth, technically known as "marl 'marl," carefully washed and prepared, and the brieks are hurned invariably in close kilus. It is by the firing, careonly washed and prepared, and the breeks are burned inversibly in close kilus. It is by the firing, &c. that the different results are accidentally pro-duced. When the combustion is perfect, the result would be "cutters," so called from the facility with which they may he cut with a hrick-axe, and rubbed to any required form : they are also remarkable for their evenness of colour; but where the heat is too strong,—too much heat tending always to vitrify,— "paviors" would be the result, their name explaining their purpose; and when scarcely strong enough "seconds," they not having colour enough to be classed as the first, nor the harduess necessary for the other. "Place" brieks and "stock" hricks are made of inferior materials, and without the care needed in the former cases. They are burned in clasups, of which the "stocks" constitute the iuner, or better portion, and the "place" the outer codings, or parts where the combustion has heen the least perfect. *Place* bricks, in other words, are *bad* bricks.

COMPETITIONS.

Rughy Torn Hall. Company have adopted the design of Mr. Murray; the cost heing estimated by the architect, with certain addi-tions, at 2,800. The design by Mosses. Clarke and Worthington was put aside, their estimate being 1002 4,107/.

SECOND MEETING OF UNEMPLOYED BUILD-ING ARTISANS IN SMITHFIELD.

ON Monday, the 19th, another meeting of the uncombined relations counter meeting of the in-employed arisans counceted with the building trade-was held in the open space of Smithfield-market, for the purpose of cousidering their present depressed condition.

Mr. Hugh Pearce, a carpenter, who was voted to the chair, contended that the workmen were not responsible for their present position, and they cou-sidered themselves entitled to relief from the Poorlaw, as a right. They had no wish to be out of work; hut, if none was given them, their depressed condition should be taken into consideration, and something done for them by the Government. He carnestly looped that they would do all in their power to dis-prove the assertion that there was a want of nuity prove the assertion that there was a ward of mitry among them, and that, in whatever they did, they would use their best endeavours to preserve the public peace. The best course that could he adopted would be to proceed *en masse* to the inition-house, and there demaud relief: at the same time, they must hear in mind they were not asking for charity. Mr. Murray then moved the following resolution,

which was afterwards earried unanimonsly :---

afforded we fall back upon our ancient and indisputable right to parochial assistance, unaccompanied by the in-sulting, debasing, and infamous conditions at present per-

Mr. M'Heath (the hon secretary) read a lengthy address, calling on the employed not to work any overtime whilst one man was out.

The address was adopted, and a resolution, pledging the meeting to support the National Association of the Unemployed, was also earried, after which the meeting adjourned.

DISTRESS OF THE BUILDING OPERATIVES.

Sin, -The meetings which have recently taken place with respect to this object, and the resolutions entered into at the one held in Smithfield, on Monday, the 12th inst. naturally direct public attention to the subject, as one of very serious import. It is essential, how, ever, that the workmen themselves should really understand the position of affairs, and the utter uselessness of one, at least, of the remedies which they propose; and that they should be led to consider whether a wiser solution may not, in fact, rest with themselves.

I am myself one of the craft ; for, being an architect I am myself one of the erat; for, being an architect and surveyor, my interests suffer when the building trade is depressed, and enterprise in that department is put a stop to. Therefore I desire, as earuestly as the operatives, that matters should improve, and that, in common with them, I myself should be able to hail better times. better times.

There are two great eauses of the present want of There are two great eauses of the present want of employment for the hullding mechanic,—the employ-ment of capital in more profitable investments, and the conduct of the operatives themselves. Persons can now realise from 5 to 6 per cent. very readily upon loans, or merely by deposits at Joint Stock Banks, and therefore are not willing to he satisfied with 4 or 5 from builders, enembered with the business of mortgoges or other securities; and unless interest is as low as the building meretions cannot

Interest is a low as that, building operations cannot allow the builder any profit. And why is this? Materisls are cheaper than they used to he, and houses are no less in request, but the *labour is so* costly that it keeps up the price of production ahove arket value

Some years ago a first-rate carpenter, hricklayer, or Some years ago a first-rate carpenter, hricklayer, or mason would have been satisfied with his 4s., 4s. 6d. or at most 5s. a day; hut the artisan finding that huilding prospered, that there was a great demand for lahour, immediately increased his elaim for wages 3d. a day, and then advanced again and again, until at length the wages came to 5s. 6d. But not content with the increase, they have claimed their Saturday holiday. So that huilders, if they yield to these large wages, cam make no profit for their heavy outlay on lahour, and can only realise something for themselves out of the materials. the materials

But this is not all, for the trade unions have heen productive of immense injury. They prevent the builder from paying his workmen according to their standard, that is, the highest. They refuse to work with non-autonists; thus driving all men, whether willing or not, to hecome aniouists. And I recollect one instance of a master bricklayer, who was in a way of moderate husiness, and used occasionally to work himself on the scaffold, although he employed several nimeti on the scatton, annough he employed several men; but he was not allowed by his own workmen to work ou the same scaffold with them, hecause he was not a unionist. In fact, the regulations of the unions are most oppressive tyranny to workmen and their employers, and have completely disorganised the relations which once existed hetween the operatives and the employers. One of the remedies for immediate distress pro-

One of the remedies for immediate distress pro-posed at the late unceing was the application to the parish for relief. How great a fallacy ! As if the parish were hound to find bread or money for mothing. To the *adle-bodied* applicant they will offer labour at perhaps 1s. a day, or probably breaking stones at so nuch a eahic yard, or picking oakum. Are the skilled artificers prepared to do that, when they know they can always have at least 2s, or 3s, a day wiges for their usual work? The truth is, that the operative must he willing to conform to the times, and to narrow this expenses, till a more uncoperous period. Then his expenses, till a more prosperous period. Then will the building trade revive, and the builder he able Then to afford interest on the loans hy which he may go on with his operations and continue in work the on which have themselves aided to stop short huilding euterprise by reason of their claims for wages, for Salurday relaxation, and conformity to regulations that paralyse themselves and their master under the iron Let them for a moment consider oke of the unious. yoke of the unions. Let thin for a moment consider the moderate pay of the policeman, for example, who is bound to be able to read well and to write a good hand, and to have no underniable character; exposed iny and night to all weathers without any weekly holiday, and ofteutimes, when in the discharge of his dutics, his life and person placed in the greatest

jeopardy. Yet the policemen, as a body, are most decent and well-behaved, and generally bring up their families well upon a weekly remuneration much less than that daimed by the building operative, —in fact, with wages little better than those of the bricklayer's Yet the policemen, as a body, are labourer

labourer. These are, perbaps, hard truths; but they are truths, and well meant, and proceed from one whose interests are the same as theirs, and who has for them the kindest feelings of a fellow workman in the building eraft. T. L. D.

THE MODE OF HANGING THE WEST-MINSTER GREAT BELL.

MINSTER GREAT BLD. MR. W. L. BARER, C.Z. the patentee of certain modes of effecting the turning of large bells so as to present new points on which the clapper may strike, thus preventing the destruction of the hell by the wearing of holes in any one part of it, has published as tract, in which he re-arges is a claims to be regarded as the true inventor of the plan adopted by Mr. Denison, or rather, as he might, perhaps, have more correctly said, the first enuciator of the principle of turning the bill as as to mesent a succession of points turning the bell so as to present a succession of on which the clapper may strike, to prevent its the bell so as to present a succession of points turning the bell so as to present a succession of points on which the clapper may strike, to prevent its wear-ing out any one point by constant action on it. Mr. Baker says of the mode adopted by Mr. Denison, it is " but a trifling modification of the third method described in my specification." He claims the turn-ing on an axis generally, for the purpose specified, although he seems to admit that it is impossible to patent a principle. Towards the closes of the tract, which assumes the sbape of a letter to Mr. Denison, Mr. Baker says,—" The 'short round neck' of your hell, is precisely the same as the 'tail, ' projection,' r 'axis' of mine; only that you have reduced the length, and, instead of serewing on the projecting portion or flange, you east the whole in one piece. However this be supported—by four or six boils, or by the stock itself—this it is that supports the bell. T aced say no more to establish the fact, that your plan is taken from mine, with the very slightest diteration, one merely of the proportion of the parts. By making your 'nxis' or 'nack' somewhat shorter than it is shown in my drawing, you produce what you call an original design, and approprinte the frui-ster are balvers are calver with weith and the fact that from you call an original design, and appropriate the fruits of my labours, not only without acknowledgment, hat while contemptuously decrying my invention."

THE NEW ROADS IN THE PARISH OF PADDINGTON.

KNOWING the interest you take in everything con-nected with huildings, and the approaches, permit me to call your attention to the disgraceful manner in which the vestry of the parish of Paddington always attempt to evade the taking to new roads, in order that they may shift the expense of repairing from the interest of carried the expense of repairing from the attempt to evade the taking to new roads, in order that they may shift the expense of repairing from the highway-rate (to which yon must know all houses in any new street, whether kept in repair by the parish to not, are assessed, and are compelled to contribute to pass a resolution that the road shall become a parish road; in confirmation of which, I unyed have pro-perty, some of which has been rated seven years, some ten years, and some thirty years, the same having been rated to the highway rate, whils the vestry have not expended one penny upon the roads. And as a further illustration of the manner of doing husiness in this model parish—for you may he aware they will never endure a comparison with any other—I will just state the following case.—Last Judy the whole of the foot-ways and road running between a row of houses on one side, and a new clurch on the other, and forming about on-half in length of a new street, were put in proper repair agreeably to the roads of the restry, and according to the instructions of their surveyor. An application was then made to the vestry, signed by the freeholder, dedicating the road to the parish as a public highway. The highway board surveyed the same, and reported that it was properly constructed, a timelar the surve to take to it, with a stimula-son the surve to take to it, with a stimula-ter surve to take to it, with a stimula-ter surve to take to the surve to state to the surve of the same, and reported that it was properly constructed. same, and reported that it was properly constructed, recommending the vestry to take to it, with a stipularecommending the vestry to have to it, with a simpla-tion that the freeholder should keep up a bar, to pre-vent any one passing over it to the vacaat ground beyond. This ho very properly refused, as an inter-ference with his private rights, and an unusual request. The vestry then appointed a surveyor on the part of the parish—the lessees one on theirs—who reported

THE BUILDER.

four-one-third of the whole vestry; and since they bare heen elected, they have expended, out of the bighway rates, to which my property contributes equally with themselves, the very moderate sum of 1,100, in reparing and widening certain hys streets and a square in this higbly-favoured ward, where yon seldom meet any other than the inhahitants of that begins and an another 1,000, in new severs; so that they are to have wider pavements and new severs in one corner of the parish out of the parish money, but in the more recently built parts, where the owners have properly paved the reads and constructed new severs at their own costs and charges, they are not even to have them kept in repair. It some of your readers can saggest a legal remedy

If some of your readers can suggest a legal remcdy for this disgraceful conduct of the vestry, they will confer a lasting favour upon the inhabitants of the loI new streets in the parish; otherwise they must look to the men they elect next May, and in the mean time organize for carrying out so important an object. Thos. MAYNARD.

THE HYDE-PARK DISTRICT.

A one.r improvement is about to take place in the neighbourhood of the Marble Arch, by widening the road from the gate to Hyde.park-place, throwing the rails 20 feet into the park-the increased traffic the real from the gate to Iryde-park-place, throwing the rails 20 feet into the park—the increased traffic requiring more space. This has here decided upon by Sir B. Hall, and the parish of Marylebone have come forward to make the road and meet the expense, which will be immediately carried into effect. It has here proposed to surmount the Marhle Arch with a group, consisting of the Quren as Victory, in a trimphal ear; and a committee is about to take up the matter, consisting of several solutemen and gentle-men in the neighbourhood. It is reported that the Marquis of Westminster refuses to renew any of the leases in Park-lane, it being bis intention to erect a number of detached mansions of great magnifecance.

mansions of great magnificence.

CANADA.

THE Grand Trunk Railway Company of Canada have now made arrangements for booking passengers have now made arrangements for boosting passengers from the chief ports in Europe to various parts of Canada and the United States. Emigrants may thus know precisely what their voyage and journey toge-ther, to their destination, if within railway reach, will cost. Various other advantages are provided for hy-the company. The Canadian News of the 21st inst. cost. Various other advantages are provided for hy-the company. The Canadian News of the 21st inst. we may here observe, is accompanied by a map of the Grand Trunk Rallway, also showing the site of the Canadian Government's free grants of land. The paper contains a leading article on this subject, from which it appears that the terms of the Colonial Government are highly favourable to all disposed to seek their fortune in the Canadian colony. Indeed, the main coulditons on which 100 access of land are obtainable by any man are, that he take possession within one month after the grant is made, and erect a log-hut, or "house," of at least 20 feet in length by 18 feet in breadth. In the course of four years certainly he must have twelve acress in cultivation, by is rect in breach. In the course of hour years certainly he must have twelve acress in cultivation, and reside upon his lot, but these can scarcely be called conditions. The Government make the roads, but the settlers keep them in repair.

FALL OF CEILING AT MANCHESTER CATHEDRAL.

DURING the service at the cathedral on Sunday afternoon the occupants of the pews in the westerph portion of the north gallery were startled by heaving a slight crack over head, and almost immediately a slight crack over head, and almost minimum deep afterwards the whole of the ornancetal plaster mould-ing which covered a beam crossing the gallery from front to hack suddeely separated from the beam and fell upon the pews below with a loud crash. We learn from the local *Guardian* that all the plaster learn from the local Guardian that all the plaster which had covered the caken heam with monling fell away from it, leaving the heam bare; and that it would be from 15 to 15 feet in length, and weighting probably 12 to 14 cwt. That so large a mass of plaster should fall from a height of unary feet among the peaks without injuring a single person is remark-able; but it seems that the line of the beau was pre-cisal way the kine of murities. The vestry then appointed a surveyor on the part of plaster should have been as properly formed, made, and draiued the pose without injuring a single person is remarking the proper materials, and fit to be taken to as a cisely over the line of partition which separates the parish road. The same was read at the vestry last the vest plast. These mane of our liberal members, in the appoint end to propose and carried the prose when some of our liberal members, in the separate the parts that the road be not taken to, on the ground that the land heyond would be huilt upon at some fature time-arg next year, or it may be twenty year. It is supposed that the plaster was applied to ever the parts in the fallow parishineers: they are the representatives of the South-east Ward, and I believe about twenty-

DONCASTER CHURCH.—Allow me to correct a tement which has appeared, to the effect that, beincreasing my own subscription to the deficiency, be guaranteed the remainder of the deficiency, are on behalf of the building committee or myself. rer on behalf of the building committee or myself. the contrary, the fact is, as you will see by the fosced circular, that if something like 5,000ℓ. more not raised very speedily by general subscriptions, work must stop; and this (so far) magnificent with be left a mere shell without its central tower, he was the great glory of the old church, and will larger than any other central tower in Eogland, ept in a few of the cathedrals; and, moreover, re is good reason to helicve that, if the present tract is not made absolute within a few months, tower will cost half as much more to build at any ure time. The public outch to know that no more tower will cost half as much more to build at any are time. The public ought to know that no more a three-fourths of Mr. Scott's original estimate was scribed before; and there is no doubt that if we enabled to proceed under the present contract, whole work will be done within the original mate—a most unusual circumstance, I should ak, and one which cutitles both the architect and committee to some credit.—E. B. DENISON.

eommittee to some credit.—E. B. DENISON. TUSHING SYFILON BASIN.—In the very excellent appropriate article with which you commence a volume, you draw attention to the collection of terials and inventions connected with building now ble Suffolk-street Rooms. One of those which you the Suffolk-street Rooms. One of those which you act," which leads not to address a few words to you act," which leads not to address a few words to you abell of another closet, worthy of public notice, and ich, though as yet not much spoken of, is not the steadily working its way into public from. The cle to which I alliade is the *Self-acting Fluxibing*, set, manufactured by Stephen Green, Lambech, apparatus is put in motion by means of a more-sent, which, when pressed down, causes a quantity water to accumulate in a service-box, and on the b discharged into the pan, and clears all hefore -L W.

Loadon streets might be removated with advan-at the same time, for in some instances the rs scent to have dropped, and in others they are catherbeaten that it requires younger and sharper than mine to decipher them with comfort even the daytime: at night it is a hopeless task, for in the gas lamps are so arranged that not even a tray is shed upon the street-mark; and this imstance is just as inconvenient for eab as foot gengers: might it not be possible to devise some of lamp which would show us up the name of attreet, and at the same time illuminate the foot-? Corner lamps, too, would he, in many in-ses, a means of breaking the tiresome uniformity re miles of post, with their lanterns all of the f fashion.—ONE WHO TRAVELS IN LONDON.

The hines of post, whe there have be a very set of the stabion. --ONE WHO TRAVELS IN LONDON. ILL OF TWO HOUSES, HOLTWELL-LANE, SHORE-R.--ON Saturday, the 17th inst. the inhabitants is the narrow end of Holywell-lane, Shorehiteb, were were and the state of consternation by discovering a two large old bouses, both nationated, one of the was undergoing some repairs, had bulged for-in a most alarming manner. Information was inducted given to the authorities, and an efficient of the police, who were speedily in attendance, indust stopped all vehicles and foot passergers from grag up the lane, which, although an extremely we and unconvenient through the sine of the cag outlets from the Eastern Counties Railway ton. These precentions had searcedy been taken both the houses foil in with a tremendous L, had fortunately without doing any material .ge. It appears than the tenant had left the place. -ge. It appears that the tenant had left the phace light due notice from the anthorities of the dis-a and workmen had been set to work to erect field in front of the bones, for the purpose of ig down the premises, as they had been con-led by the surveyor.

EFFECT OF GAS-WORKS. -You often in the Builder EFFECT OF GAS-WORKS.—You often in the Builder remark on things calculated to injure the public health, and 1 would now call your attention to the state of the fronts of the houses built under the direction of Messers. Hunt and Stevenson, for the Duchy of Cornwall, in Lambeth, near to Vauxball-bridge. The light painted work is turced by the gas a complete lead colour, and 1 do not think one of the shops is let, although completed source time. The inhabitants must breathe the same poi-sonous air that bas changed these fronts, and were you to see them 1 am convinced you would remark

the The inductable must breath the same po-sonous air that has changed these fronts, and were you to see them 1 am coavinced you would remark upon the effect.—A. B. GAS 1N DUMIN.—The Dublin Daily Express, of the 7th inst.has a leading article on this subject, in which it says.—" Private advantage arbitrarily con-flicts with the public interest. How else can we account for the startling fact contained in the state-ment that has appeared for some days past in the daily press of this eity? According to that state-ment the price of gas, per thoosaud cubic feet, is, in —Loudon, 4s.; Liverpool, 4s.; Whitehaven, 2s. 6d.; Bolton, 3s.; Rochale, S. 3d. to 4s.; Sheffield, 3s. 6d. to 4s.; Birmingham, 2s. 10j.d. to 3s. 10d.; Bristol, 4s.; Belfast, 3s. 9d.; Dublin, 5s. 10d. From this statement, the accuracy of which cannot, we believe, be questioned, it appears that the linhabilants of Dublin are charged one and tenpeace more for each thonsand cubic feet of gas consumed by them than is paid for a similar quantity in some parts of the United Kingdom, and as much as 2s. 10d. and even 3s. more per thousand cubic feet than is charged in other places. Then there is another point to be considered, viz. the quality of the gas consumed; and we find it further stated that the gas supplied in Dublin is in point of quality greatly in error to what oight to be provided, so that, in fact, the price actually paid by the consumer is 7s. per thousand cubic feet, or thereabouts. Doubtles, local circum-stances will operate to vary both the current price and the quality of gas in different towns, but it sel-dom happens that serious fluctuations arise on either of these scores. Coal is the raw material from which to use gas. Either let the present scale of prices be usitified, or the public at large have the benefit to which they are justly entitled." justified, or the public at large have the benefit to which they are justly entitled." NEW TOWN AT MILFORD.—The papers say, plans for the creetion of a new town at Milford have been

A low form a new town at Millord have neen prepared, and application is to he made in the next session for an Act to carry the same into effect. It is laid out in front of Millord Church, and is ultimately to he extended to Castle Pill. The surveyors have town anyoned in marking out the ground. The plans to be extended to Castle Pill. The surveyors have been engaged in marking out the ground. The plans comprise terraces, slops, and detached villas, with a complete system of lighting, water, and drainage. The erection of public baths and an assembly-room has been settled; and, in conjunction with the line from Johnstone, it has been determined to erect a new pier, heidenteen have no ded

number of houses built last year is not a third of the number erected three years ago, and is not even up to the average of the ten years ending 1851. A return of the building plans registered with the borough surveyor from the 1st of January to the 31st of December, 1856, shows this. The Journal then proceeds to give a table of these plans for the four past years, from which the following few items are extracted :--

	1853.	1854.	1855.	1856.
Houses	2,781	3,219	1,253	803
Churches Chapels	0	0	1	0

Alterations and additions	56	33	53	34

THE KLERENNY AECHEOLOGICAL SOCIETY.— The January meeting of the Kilkenny and South-east of Ireland Archeological Society was held in the Toboles, Kilkenny, ou Vednesday week, the connty surveyor, Mr. Sampson Carter, in the chair, when eight use members were admitted. The anoual report was read by the secretary, and from which it appears that in the six meetings held in 1856, there were 112 new members elected. Amongst the subsequent prowas read by the existence of the line lists of there were 1122 that in the six meetings held in 1856, there were 1122 new members elected. Amongst the subsequent pro-ceedings of the meeting was a communication from the Rev. Jobh O'Hanlow, to the effect that the Mining Company of Irelaod, who had become possessed of the ioteresting runs of the aucient church of Glendalough (of which we some time ago gave an council) had resolved to take measures to prevent

the loteresting ruins of the ancient church of Gleuduogh (of which we some time ago gave an accouot), had resolved to take measures to prevent them from going to total ruin, a circuostance highly rerditable to a more commercial and money-making concern such as this company of course must be. The thanks of the Kilkenny Society were accordingly given to the Mining Company of Irelaod for the laudable crantple they had thus set to others. MESSEN, MARE AND Co.'s PROFERT.—The works lately the property of C. J. Mare and Co. are about to be carried on, under the Limited Limblity Act, by a Joint-stock Company, to be called the Thumes Iron and Sijp-building Company. The shares are to he of 5,000/. each, to be paid up in cash within a month, and the entire amount has been subscribed by fourteen persons of good commercial standing in London. The property was purchased of the estate of Mage aod Co. by Mr. Peter Rolt. ANCLENT SCLEPTURES FIDM CENTRAL AMERICA. —Messes. J. and A. Tregoning, two geuthenes from Cornwall, connected with minug in Central America, returned from that country in the steamer La Plata. Uring their stay there, they visited the celebrated ruined city of Copan, described by Stephens in his "Travels in Central America." They have collected from these ruins varions specimens of sealpture, which they have brought with them, and which, it is to be boped, will find their way into the National Meson.

Museum. GAS REFORTS IN ENGINE FURNACES.—Mr. Ni-colas Delanaoy, of Tournay, Belgium, has patented an investiou, by which he proposes to introduce into the furnace of a steam-engine, about an inch from and below the generator, a receiver, placed through the latter, and occupying the whole length of the furnace, with exit outside the hrickwork, and escape-pipe at the extremity. to allow the gas generated to pass on with exit outside the hnexwork, and escape-pipe at the extremity, to allow the gas generated to pass on to the purifying apparatus. The receiver is to rest on the masonry in the interior of the furnace, and face the fire, guaranteed from its action hy a refrac-tion-plate where the fire is furcest. COPPER TRADE OF SOUTH WALES.—The copper the of South Wale is a consent our height and

COPPER IRADE OF SOUTH WARS.—The copper trade of Sauth Wales is a present very hrist, and, as the advance of 1d. per lh. has been established, the price is now the same as it was before the reduction. The plant of many large establishments is about to be extended, to meet the increased requirements of .-the trade

The plant of many large establishments is apout to be extended, to meet the increased requirements of the trade. THE BOYS' REFUGE, COMMERCIAL - STRETT, WHITECHAPEL.—The third annual report of this nsetful institution, 27 of whom are orphans, 19 with-out mothers, 34 without fathers, 17 have both parents in the institution, 27 of whom are orphans, 19 with-out mothers, 34 without fathers, 17 have both parents living, and 3 have been descrided; 11 have step-fathers, and 3 have been descrided; 11 have step-fathers, and 45 have left. Of those who have heft 14 have been bound apprentices, 11 restored to their friends, 3 provided with situations, 11 have left irregularly, 2 have heen each away by their parents. By the balance-sheet it is seen that the total expense (1,865/, 143, 4d.) for an average of 95 hoys has been 14/. 35, per head, and that the food has been at the rate of 28. 44, per week for each in-mate. Mr. Charles Buxton is the bonorary secretary. The CHURCH OF ST. PHILP THE EXANGELET,

"THE MAGNIFICENCE OF ROME." — A COTTC spondent, "G. A. Jermyn, C.E." has forwarded to us some observations on Professor Donaldson's lecture on this subject, objecting to some of the statements made. It should be remembered, however, that it may are advanced discourse meast as the professor on this subject, objecting to some of the statements made. It should he remembered, however, that it was an extempore discourse, meant, as the professor said, not for the profession, but for a general audience, and in which he songht to treat matters largely, and not with the minute accuracy of the class-room. The only part of Mr. Jermyn's remarks which touches the meticaleus circan in our your penort, refers to the the particulars given in our own report, refers to the beight of the columns of the Temple of Jupiter Stator (or the Cornizio), called in the lecture, hreadly, 60 feet ; but Mr. Jermyn says they are 45 feet 3 inches in beight, with a diameter of 4 feet 5 inches. nches in beight, with a difficult of a field of indice. According to Twylor and Cresy, havever, our corre-spondent himself is not quite right, for these authors call the height of the columns 4S. 4. 9, and the diameter 4. 10. 2. Mr. Jermyn continues,—" The beautiful Corinthian columns in the basilite of St. beautiful Corinthian columns in the basilice of St. Paul (hurnt 16th July, 1524), the lecturer stated were taken from Hadrian's unanaleum; hut St. Paul's was built in 396; whereas, the nansoleum, with its columns and statues, was perfect in 506; besides, the height of the columns, which is 34 feet, is much too great for them to have shod on the nansoleum. It is also incorrect to say the metal vice news in the carden Belvidere, eres stood on the pine now in the garden Belvidere, ever stood on the top of the mausoleum : it is 12 feet in height, and top of the mansacleum it is 12 feet in height, and was covered with a canopy supported hy eight columns, surmonated by two percocks and four dolphins, all gilt: it stood before the old basilica of St. Peter, and served as a fountain." THE INDURATION AND PRESERVATION OF STONE.

work.—At the next ordinary general meeting of the Royal Institute of British Architects, to be held on Monday evening, the 26th of Junary, the discussion on the various methods of indurating and preserving stonework will be resumed. IRON MANUFACTURE.—BESSEMER'S PATENTS

TRON MANOPACITIEL-BLESSARGES TALEADS. Two additional patents have been specified by Mr. Bessemer, one a modification of the ordinary squeezer, in place of rolls, in order to prevent his malleable iron "heing crushed or hroken when put between rollers;" as, when ingots of malleable iron and steel are formed by his process, they are "more or less spongy or cellular, and that owing to this, and their erystalline condition, they are apt to be erushed or broken when put between rollers of the kind now ordinarily used for rolling malleable iron." The second patent is for improvement upon his already patented furnace.

THE ARCHITECTURAL ASSOCIATION .- At the Con THE ARCHITECTURAL ASSOCIATION.—At the Con-generations of the Architectural Association to be held at Lyon's Ion Hall this Friday evening, the 28rd instant, Mr. Ruskin will read a paper on "The Use of Imagination in Modern Architectural Design."

of Imagination in Modern Architectural Design.³⁷ MONSHEUR HITTORFF, Architect, HIONORAY and Corresponding Member of the Royal Institute of British Architects, has just been cleated President of the Class of Fine Arts of the Institute of France. Monsieur Rohault de Fleury, another architect and correspondent of the Institute of British Architects, Vice-President. REPORT or LIVERFOOL BULDING SURVEYOR.— The speed of Mr. Bichten the hubbles surgeout.

The report of Mr. Rishton, the huilding surveyor, to the Health Committee of the Liverpool Town Council, for the past year, has been made and circulated. From this report it appears that the total number of bouses creeded in 1855 was 1,855, and in 1856, 1,703, giving an increase of 348. The report states houses erected in 1555 wis 1,355, and in 1556, 1,708, giving an increase of 318. The treport states that the main increase has been in houses varying from 201. to 407, per annum rental, which heame occupied as soon as finished; a proof, as remarked, that more houses of that class ner required; but from a table appended, it at appears that while the number of dwellings from 257, to 357, and upwards, was 231, and we have a subscription of the state of the of dwellings from 207, to 507, and upwards, was 207, the number at 127, to 257, was 1,455, — on immense proportion of the whole 1,703 erected and in course of crection. Sixteen warehouses had been created, 230 separate cellar dwellings had been constructed during the year. Although not very desirable, the during the year. Although not very desirable, the reporter considers them better than the old dwellings reporter considers them better than the old dwellings in confined conts, as they have each a separate yard and closet, and are well clevated above ground, and ventilated. Through the co-operation of the horough engineer and inspector of nuisances, a vast number of nuisances caused by cesspools used ashpits had been obtaind abated.

THE COST OF NOT KEEPING A PROMISE .--- Last The COST OW ACT THE ACT AND A THE ACT AN owing to the non-formation of a street which the council had covenanted to make. The amount claimed was 17,000%. The matter was settled by compromise. was 17,0007. The matter was sectice by comparison of the section o

THE BUILDER.

DEMOLITION OF THE OLD BRIDGE AT ROCHESTER. -The Royal Engineers bave now destroyed nearly one-half of the bridge, and the remainder will be one-half of the bridge, and the remander will be demolished as specify as possible. The quantity of gunpowder used in the first of the two experiments made was 300 lbs. weight, divided into six charges, and therewith ha pire, 45 feet long, 21 feet deep, and 13 feet wide, was shivered to pieces, and the founda-tions loosened. The pier was huilt on piles in the river bed. The object was to shake the while with-out tumbling it into the river, a result completely effected. A still larger portion of the bridge was demolished on Thursday in last week, consisting of the pier aed shutement on which the large act on the The quantity of the pier and abutment on which the large arch on the Strood side rested, and calculated to contain several thousand tons of masoury. The weight of powder used in the explosions was nearly 1,000 lbs. and was divided into the same number of charges as in the previous experiments. Sioce Novemher, the sappers aud miners have been eugaged in sinking two shafts aud miners have been engaged in sinking two shafts in this portion of the bridge, to the respective depths of 24 feet and 21 feet, oue in the pier, and the other io the abatment. Captain H. Schaw conducted the work. At the hase of each shaft sprang two galleries, ench 9 feet in length, and in these were deposited the charges. The powder was contained in tim wate-proof eaces, suches di mooden hores, 500 lbs. weight for the pier and arch, and 300 lbs. weight for the for the pier and arch, and 300 lbs, weight for the abutuent. The charges in the arch were first ex-ploded: the ground for some distance reverberated, as if from an earthquake, while the pier ernmhled to pieces and disappeared. The charges in the galleries pieces and disappeared. precess and disappeared. The charges in the gar-on the pier adductment were afterwards fired, and that portion of the hridge destroyed. The large areb of the hridge was blown into the river, and the abut-ment on the Strood side entirely removed, the sight of the massive stonework of the arch being blown high into the air being very grand COAL-BURNING LOCOMOTIVES.—In allasion to the

interesting experiment in progress on the South-Western, the Mining Journal snys, --- "Ao invention Western, the *Mining Journal* snys,—" Ao invention of the greatest importance to railway companies generally has for some time past heen successfully employed upon the London and South-Western railemployed upon the London and South Western ran-way, by which, calculating upon sevently engines being in steam daily, a saving of 25,0004, per annum will be effected. The honour of the investion is due to Mr. Joseph Beattie, the locomotive superintendent of the line." There are now seventeen locomotives upon bis system in daily operation. Mr. Benjamil Fothergill, of Machester, has severely tested the Fothergill, of Manchester, has severely tested the contrivance, and the average result obtained showed a difference in fuel of 4/01 lbs. in weight per mile in favour of the coal engine, and Mr. Pothergill con-siders the subject one of serious importance to ruil-way companies. He considers, however, that these results are parily produced by Mr. Bentile's patented arrangement for heating the feed water before it is pumped into the hoiler. Mr. Fothergill further states that the coal engines are fully capable of hurning their own smoke, that they rapidly generate an abundance of stem; and that the hurning of ceal, according to Mr. Beattie's plan, is far more advan-tageous, as regards the durability of the fire-hox and tabes, than coke could possibly he. tubes, than coke could possibly he

THE TOWER OF ST. MARY'S, TAUNTONhad put into type the report of the architeets, accord had put into type the report of the architects accoun-ing to promise last week but, having received a letter signed by the churchwardens, protesting against the publication of it hefore it has been submitted to the parish, we willingly postpone its insertion. IRON v_{c} GOLD. — M. de Carnall, the inspector of

mines in Prussia, after a carcful collection of statis-tical facts, has shown that in 1854 the total value of the produce of all the gold mines in the world was only 600 millions of frames (24,000,000/.) whereas

only 600 millions of frames (24,000,000/) whereas the value of the iron produced in the same year was from 750 to 800 millions of frames (30,000,000/, to 32,000,000/).—Gateshead Observer. A New BOILER.—A public trial of Mr. M. Atkiu-son's new patent boiler, recently advertised io our columns, took place at the Grove Boiler Works, in the Borough, on Thursday in last week. The pur-pose for which the boiler exhibited was principally designed, is that of beatine larce quantities of an fropose for which the other exhibited was principally designed, is that of heating large quantities of air fur warming and ventilating bospitals, churches, or other large buildings. The holicr is of the npright eircular form, quite independent of hrickwork, or chuncersorm, quite independent of hriekwork, or chimocy-stalk, and has no appearance of the ordinary furnace or stokiog hole about it. The fuel, coal or coke, is dropped through an aperture in the dome, into a small cockle furnace, in the centre of the apparatus, and is entirely surrounded by the water space. This water space is appeared. entirely surrounded by the water space. This water space is also surrounded, horizontally, by an accular air chamher, and this is again surrounded by another water space. These two water spaces are connected by means of a series of 2-inch irru pipes or tubes, by means of saids of the air chamber, and radiatiog passing through the air chamber, and radiatiog outwards and npwards from the central formace, near to the surface of which the lower ends of the tubes are situated, thereby conducing to rapidity of circulation.

[JAN. 24, 1857.

THE ELECTRIC TELEGRAPH IN JAVA. THE ELECTRIC TELEGRAPH IN JAVA. — The clector-magnetic telegraph has heen introduced into Java, and a line of wires completed hetween Batavia and Buitenzorg, the first intelligence by it having heen transmitted to the Governor-General on the 22ad Octoher in the space of four minutes. The line is to he immediately extended to Somarang and Sourahaya, and afterwards in different directions, such as to Anjer, Cherthon, Tekalongan, Rembang, and Bauuwangie. The natives are said to be very wurde accounted and are the fricthened at the insuch as to Avjer, Cherihon, Pekalongan, Rembang, and Bauwangie. The natives are said to be very much astonished and rather frightened at the in-vention, which they call "bichara angin" (wind-speech), their Oriental and hyperholical language falling thus somewhat short of the wonderful ce-lerity and subdety of the reality. It is rather sur-prising that they did not compare it to the lightning itself, whose swiftness is indicated in the Oriental lan-guage of One who said, "As the lightning shineth from the casi even unto the west, so shall the coming." Ke, he. coming," &c. bc.

SMOKY CHIMNEYS. - I should feel obliged if you SMORY CHIMNEYS. — I should feel obliged if you could, through your numerous correspondents, inform me of any means for the cure (or to produce an up-ward draught), of smoky chimneys, without the use of cowls. I have lately huilt a house, and all the chimneys smoke, to my great annopance. Do you think the building in of an iron or earthenware fine, say from 6 to 7 inches in diameter, in connection with the register of grate, and letting it run some feet up the flue, would be of any service?—Z.

Inon PLATES FOR THE "GREAT EASTERN."-Mr. S. Beale, of Mashro', deputy-chairman of the Midland Railway Company, is now supplying Messrs. Scott Russell and Co. the builders of the monster ship, with impression plate the builders of the monster ship. with immense iron plates, to be used in her constru what immense from plates, to be used in her construc-tion. Some lately on their way from Mr. Beale's Parkgate Works, at Mashro', to fhaekwall, have been expressly rolled for the bows of the "great ship," and vary in size from 2 to 2½ tons, the largest plate being 27 feet long by 4 feet 3 inches wide, and 1½ inch their. The uslates which have been plated are wide being 2/ net tong by feets inclusively, and 1/ net thick. The plates, which have been planed, are said to be quite free from blisters and blemistics, and the edges perfect. The difficulty in the manufacture of plates of these dimensions is in having to deal with such a large mass of iron in a welding heat, and to such a large mass of iron in a weining near, and to pass it under the rolls the requisite number of times. As far as we know, says a Darhy paper, these plates, in combined size und weight, have never heen approached. The heat given of dhring the process of rolling from such an immense surface and mass of iron is so great as to prevent the workinen approach-ing within one or two yards of the plates without their clothes heing set on fire or the skin hurnt off their clothes heing set on fire or the skin manut our their hands and faces 1 in the ordinary process of rolling iron, a plate weighing 9 out, is ensidered a very large oue. The largest plate that had ever been rolled previous to those to which we allude was oue exhibited at the Paris Exhibition, weighing 1 ton 6 ext. and which clietted so many remarks. Oue of 6 cwt, and which clicited so many remarks. One of the plates was 5 feet wide, and 17 feet 10 inches long,

GAS IN DOWLAIS .- The gasworks at Dowlais are GAS IN DOWLAIS.—The gasworks at Dowlnis are in operation. Improvements have here introduced in the purifying process. Several private honses now use gas, as do also Mr. G. T. Clarke, at Dowlais. Honse, and the schools. The mains running through the hack strets have enabled the local Board to put up many public lights in that thitterto darksome region. The designer and chief constructor of the works is Mr. John Vicary, gas engineer, of Exeter. The post is under 5,0002.

ST. JOHN'S SCHOOLS, LEWISHAM.-The ST. JOIN'S SCIEDOLS, LEWISHAR.—Ine Inflame school, with residences adjoining, to the district of St. John's, Lewisham, was opened at the commence-ment of the year, which completes the side of the quadrangle, formed by a large and handsome group of schools. The room is large, 55 feet hy 25 feet, with an open roof of stained deal, and has a cluster in the freed forwing the astronome. This school has how an open roof of statued deal, and has a cluster in the front, forming the entrance. This school has been built at the cost of Nr. G. Wheelhouse, aided by the grant from Government. The buildings are of Kentish stone, with Bath stone windows, from the designs of Mr. Peacoek. The whole are sufficient to entrance nearly 600 children, with residences for all the teachers.

c teachers. FALL OF A CORNICE. — A large portion of a pro-FALL OF A CORNER.— A large portion of a pro-jecting stone corrise placed on the top of a new five-story huilding, on the east side of Dacie-bridge, says the *Munchester Courier*, fell down on Monday (in last week). The brickwork is being doue by Mr. Davidson, and the mason work by Mr. Batley. The heavy coping stones from the use huilding burst through the roof of another manufactory, and forced in the dimension of a nontine which a your wan should in the floor of a room, in which a young man stood, nearly sufficating him with the fallen ruhbish : hesides various bruises, he has suffered some injury to his hack, hut fatal consequences are not anticipated The engineer, who was in the firing up place, was also hruised, and cut about the bead. The accident scens to have occurred from the absence of sufficient halance, in the placing of the cornice.

JAN. 31, 1857.

Obe

Vol. XV.-No. 730.

HE Clock Tower of the new Palace, Westminster, is now approaching completion; the elock-faces are about to be fixed ; and, when the four quarter hells are east, "Big Ben" will he raised to his destination, and the elock will he brought from Mr. Dent's manufactory, at Millhank, where it has been going a long while, and will tell, far and wide, not mercly "the time o'day," hut the time o'night. Following up the extensive series of illustrations of Sir Charles Barry's great work which has already appeared in onr pages, we have thought this the

Builder.

right moment to give a section of the upper part of the tower, and a view of a portion of it, the latter on a sufficiently large scale (8 feet to 1 inch), to show the details clearly.**

The clock tower is situated at the north-west angle of the Palace, adjoining Westminsterbridge: three of its sides are disengaged from the ground to the top, and the fourth is conneeted with the huildings on the east side of New Palaec-yard, which contain the residences of the officers of the House of Commons. The west side is not yet finished, as it is proposed that the new buildings, designed hy the architect to enclose Palace-yard, and to complete the new palace on that side, should adjoin it. The walls of the tower, 3 feet 6 inches in thickness, are built of hriek, with a facing of Anston stone. The clock-face is of east iron, filled in with a new description of white semi-opaque glass, supplied hy Gardner, of the Strand. The dial, which is 22 feet 6 inches in diameter, will appear entirely opaque hy day, it is hoped, hut will, neverthe-less, be available for illumination by night. The clock hands will be of copper, made as light as is consistent with the requisite strength to resist the action of the wind. The clock and bells, as every one now knows, have been constructed under the superintendence of Mr. E. B. Deuison, Q.C. with whom Professor Airy was, only for a short time, associated. Let us hfirst, however, confine ourselves to the structure

The roof of the tower is of cast-iron, gal-avanized, and the ornaments upon it are for the mmost part of the same material. The finial is of wrought copper, and is gilt, as are also the various crockets and other ornamental details. The whole weight of the metal roof is ahout 3300 tons. The lower part of the tower conatains eleven stories of rooms, which are approapriated to various purposes, and include a prison ofor refractory members of the Honse of Commmons, and others who may incur the Speaker's august displeasure. Those who are incarcerated wwill have the advantage, at any rate, of heing a able to count the hours of their captivity. The upper part of the tower is entirely devoted to ththe clock, hells, and lighting chamber, to which th there is a separate staircase, enabling visitors to ascend to the lantern in the middle of the roof. IIThe external width of the tower, which is square, is 35 feet (exclusive of buttresses), and its total height from the ground to the top of the finial is 310 feet. The foundations are formed of concrete, about 15 feet thick, the upper surface of which is 14 feet below the ground. The tatwo lowest footings are formed of stone landings, 6 inches thick, the area of the lowest of which

* Bec pp. 62 and 62,

is 1,846 feet, upon which it is calculated there The second train wheel in each striking part is a pressure of rather more than 41 tous per foot, exclusive of the weight of the roof, clock, and hells. The building was creeted by Mr. Grissell, up to the corbel course under the clock story, and the portion from that level to the caves of the roof by Mr. John Jay, the present contractor at the New Palace. The iron roof has been constructed by Mr. Jahez James, and the ornamental metal-work, partly hy James and partly by Hardman of Birmingham. The gilding is principally by Mr. Crace, and the stonc earving, like all the carving at the Palace, has been earried ont under Mr. Thomas.

The great hell, of which we have before spoken, and which is nearly 16 tons in weight, is now hung temporarily at the foot of the tower, and will be hoisted to its place as soon as the four quarter bells, and the necessary ironwork for fixing them, are prepared. All the hells will be raised hy the shaft, up which the whole of the materials used in the tower have been lifted. Our readers will remember a cry raised some time since, that the architect had forgotteu to provide for hoisting the hells, and that an external scaffold would consequently be required, at we know not what expense : we need hardly say how groundless was such a silly assertion, or how little such a state of alfairs would have been in accordance with the evident. care and forethought hestowed hy the architect bearing quite flat upon it. on every portion of his immense work, at this time so rapidly approaching completion.

Let us now give some particulars of the who are well informed on the subject, hut into Clock, referring to Mr. Denisou's own de-this we do not propose to enter.* scription of it, in the eighth edition of the "Encyclopædia Britannica." The four dials, the clock and hells as yet undetermined, and "Encyclopædia Britannica." The four dials. as we have said, are to be 22 feet each in diameter, the largest, it is believed, in the world with a minute-hand : the larger dials on the Continent have only an hour-hand. The minutehand, on account of its greater length, velocity, weight, frietion, and the action of the wind upon it, requires at least twenty times as much minster elock satisfactory in this respect. Some force to drive it as the hour-hand. The effects of friction and wind with such hands as these offer difficulties in the way of the clock going even as well as an ordinary ehurch clock ; to overcome which, what is called remontoire work is used, part of the arrangement heing for the purpose of giving a visible motion of the hands at every half-minute, when the point of the minute-hand will move nearly 7 inches.

The great wheel of the going part is 27 inches iu diameter : the pendulum is 15 feet long, and weighs 680 lhs.; and the seape-wheel, which is driven by the musical-hox spring on the third wheel, weighs about half an ounce. All the wheels, except the scape-wheel, are of east iron, i.e. with the teeth east, not eut, and all have five spokes. The barrel is 23 inches diameter, hut only 14 inches long, as this part will not require a rope above 1 inch thick, and 55 turns in the 81 days, for which that part is to be capable of going, though the striking parts go only 71 days, so that in case of an accidental omission to wind it up on the proper day, the clock may not stop, hnt proclaim the neglect hy silence. The second wheel is 12 inches in diameter, with a lantern pinion of 12, driven by 180 teeth ou the great wheel : it has 120 teeth, and drives the pinion of the spring remontoire and the fly. The size of the hour-hell fixes the size of the striking parts; for that determines the weight of the hammer, which was proposed to be not less than 4 cwt. according to the usual proportion, with a rise of at least a foot, but must now be 12 ewt. The striking cams are eighteen in number, east on a wheel of 37 inches in diameter. There is to be a contrivance for stopping

the winding when the elock is going to strike, as the winding of each of the striking parts will prohahly take two honrs. The second wheels are a little more than 18 inches in diameter.

drives a hevelled wheel, which drives the fly above the clock on a vertical arbor, as in the Exchange elock, in order to keep it out of the way of people winding or examining the clock The great wheels all have 180 teeth: the second wheel of the honr-striking part has 105, and a pinion of 15, so that it turns two-thirds round at each blow, and the lifting cylinder upon its arbor has three segments cut out of it, and two of them are passed at each hlow,-prohably a novel arrangement, but thought the most convenient here with reference to the numbers of the teeth. The great wheels are $3S_{\frac{1}{2}}^{\frac{1}{2}}$ inches in diameter, and the whole mass of the harrel, great wheels, and cam wheels, weight no less than 17 ewt. The whole of the wheels, except the fly wheels and winding pinions, lie on the top of the great frame, which is a trussed girder frame 19 inches deep (like the girders of the Crystal Palaee), resting on two walls 11 feet apart, which come right up from the bottom of the tower. The frame will be 151 feet long: the striking pulleys will be about 21 feet in diameter, and pivotted in. Mr. Denison adds, with reference to the question of the strength of cast-iron teeth, that a segment of one of these great wheels was tried up to breaking point, and it bore a pressure of six tons, and then only hroke from the pinion not

The desirability of employing east-iron wheels is questioned, as cur readers know, by some

the elock and hells as yet undetermined, and the position of the hells shown in the sectiou may not be adhered to. For illuminating the dials, we understand electricity will probably he used. The art of illuminating dials is not yet in a quite settled state, and we shall be prepared to find that time will be ueeded to make the Westcommunications on the subject in a former volume of our journal may be usefully referred to. Dials illuminated from within in the ordinary manner always look very ill hy day, when they are more seen and more wanted. As noted in the Encyclopædia article already referred to,-Another objection to illuminating large dials from the inside is, that it makes it impossible to counterpoise the hands outside, nuless, perhaps, the counterpoises could he made of glass. And if they are only counterpoised inside, there is no counterpoise at all to the force of the wind, which is then constantly tending to loosen them on the arhor, and that tendency is aggravated by the hand itself pressing on the arbor one way as it ascends, and the other as it descends ; and if it once gets in the smallest degree loose, it becomes rapidly worse hy the constant shaking. It is mentioued in Reid's hook, that the minutehand of St. Paul's Cathedral, which is above 8 feet long, used to fall over above a minute as it passed from the left to the right side of XII, hefore it was counterpoised ontside." In the conditions to be followed in the Westminster elock, it is expressly required that "the hands he counterpoised externally, for wind as well as weight "-a very necessary precaution.

Some few notes on the introduction and carly employment of clocks, may prove interesting.

Various inventions for the measurement of Various inventions for the measurement of time were in early use. Mention is made in the Bible of an instrument to show the pass-ing hours. In the reign of Hezekiah, king of Judah, the king refers to the dial of Ahaz, his father, who died about 726 years before the Christian era. In the year of Rome 595 (157 years B.C.), a water elock was erected hy

* We have reactived a long letter from Mr Loseby in reply to Mr. Demison's last, but cannot find space for it. The writer ascrla, with reference to the wreight of the clapper, "that 120 hs, for the hammer, and 6 inches for the fall, is the greatest quantity of work the clock should be allowed to do,"

Scipio, and, acting in all weathers, and at night Sciplo, and, acting in all vectories, induce infer-as well as day, it was of the nimost utility and importance. Pacificns, archdeaeou of Ve-rona, who lived in the minth ceutury, is said to have been the inventor of clocks worked by wheels. It is by some however, strongly con-tested that the eredit of the invention is due to but the descent to how made the discourse Boethius, who is said to have made the discovery

Documes, who is sain to have made the discovery about the year 510. Mr. Bowle, in the "Archaeologia," vol. vii, p. 218, remarks, "That clockunsking was brought to sneh a degree of perfection at the end of the thirteenth, or very carly in the fourteenth cen-tury, that snall house clocks, may, probably table-clocks mere them in use seems apprend from clocks, were then in use, seems apparent from what follows :-

'Et puis fait sonner sts orloges, Per ses salles et par ses loges, A roes' trop subtillement, De pardurable movement.' Roman de la Rose.''

This passage indicates good and serviceable workmanship, and the modern edition tells us that the poem was finished before 1305.

Although it appears to be a matter of uncer-tainty at what period large clocks, now so familiar to every one, began to supersede the sun aud moon dials, tapers, and other measures of time, we find certain accounts of clocks me-clauically constructed in England at a remote date. In 1288 a stout stone clock-tower was date. In 1288 a stout stone clock-tower was crecied opposite to Westminster Hall, out of a fine of 850 marks imposed upon Ralph de Hengham, Chief Justice of the King's Bench, in the 16th year of Edward I. In this belfry tower, which was still standing in 1715, was a clock which struck the great hell called Tom of West-minster, so as to be heard by the people (judges as well as others) in the courts of law. This clock was kept in use until the time of Queen Elizabeth, when it was reconstructed. A clock Jate. Elizabeth, when it was reconstructed. A clock was also put up in Canterbury cathedral, in 1292, at a cost of 30/. In 1368 three Dutchmen, who were or logiers, obtained the protection of Edward III. Chancer, the poet, who lived in the fourteenth century, when he speaks of a cock's crowing, says :--

"Full sikerer was his crowing in his loge, Than is a *clok* or any abbey orloge."

In the reign of Queen Elizabeth the use of clocks had become familiar. Shake to them in the following instances : Shakspeare refers

Shakspeare makes meution, in Love's Labour's Lost, of clocks of German manufacture, nor is Los, of clocks of definition manifestication of the het he only one of the contemporary dramatists who alludes to these productions. In Ben Jonson's Silent Woman, first acted in 1009, he says :—"She takes herself asunder still when says :--- "She takes herself asunder still when she goes to hed into some twenty boxes, and about next day noon is put together again, like a great German clock, and so comes forth and rings a tedious larnm to the whole house, and then is quiet again for an hour, but for her quarters."

At or near the year 1340, Dufydd ap Gwilym, the celebrated Welsh Ovid, ahuses a clock for disturhing him during a delicious dream, and thus, as Captain, now Admiral Smyth translates his elaborate memoir in the Archæologia, he perorates : - " Confusion to the black-faced clock by the side of the bank, that awoke me ! May its head, its tongue, its pair of ropes, and its wheel moulder; likewise its weights of dhilard halls, its orlices, its hummer, its ducks quacking, as if anticipating day, and its ever restless works! This turhulent clock clacks ridiculous sounds, like to a dranken cobbler, a cobbler too in angearance, cumung and false rationious sommas, the to a driftee toobact, a cobler, too, in appearance, cunning and false blindgut ! the yelping of a dog in a pan echoed ! the caseless chatter of a cloister ! a gloony mill grinding away the night !"

Froissart, in one of his carliest productions ("Horloge Amonreuse "), says :-

"In the clock is, if considered truty, An instrument very fair and very notable, And it is also agreeable and profitable; For night and day it teaches us the hours, by the sublity which it comprises, In the obsence ereo of thoughter, and the obsence of the structure count we should the more prize its con-structure.

The should be should be more prize if con-struction. Which the other instruments do not, However they may be made by art and by compass; Who first found the use of it. When by his scenes he began and made A thing so noble and of such great profit.

I will now talk of the state of the clock."

The poet then gives a long account of its complicated machinery.

Leland mentious a famous astronomical clock, made by Richard Wallingford, the son of a smith, who for his learning and ingenuity be-came Ahbot of St. Albans in the reign of Richard II. This clock continued to go in the start of the second the letters and I leand's time, who was born at the latter end of Henry VII.'s reign, and who speaks of a tradition, that this famous piece of mechanism

was called Albion by the inventor. Dante, who was born in 1265, and died in 1321, mentions au *orologio*, which struck the hour

The great clock at Paris was put up in the year 1364, during the reign of Charles V. having heen made hy Henry de Wic, a German.

The oldest clock, of English manufacture, extant, is perhaps that which was made about A.D. 1340, why Peter Lightfoot, a moult of Glastonhury, for Adam de Sudbury, lis abbot. The face of this machine is divided into twentyfue fine of this matrice is which in bound in the motions of the four hours, in two divisions of twelve hours each, motions of the and it showed time, hunar and solar movements, And so, ha and four knights ou horseback, tilting in rapid and,—strike.

circunvolutions. After the dissolution of the ahbey it was removed from Glastonbury to the Cathedral at Wells, and still remains in an old chapel in the north transcept; but the works were so completely worn ont, that about 1835 they were replaced by a new train, made by Messrs. Read and Thwaites, the long-established Clerkeayed firm. The environs original frace wo Clerkeawell firm. The curions original face or dial-plate, and the autique equestrian ligures, were carefully adapted to new bodies, and are still

We could give other accounts of old English clocks, but will on to the time when the in-creased skill of the workman enabled them to construct the machinery on such a small scale as to produce pocket clocks or watches. It is evident that, in order to construct them, a new moving power was required as a substitute for the weights which set in motion the wheelwork of the fixed clocks: it was uccessary that this power should act of itself, independently of external forms and irrespective of position, and that the source of it should be compact. Such that the source of it should be compact. Should a power is found in the expansive force of a coiled spring; and it appears that it was not until the end of the fifteenth century that this improvement was effected, at which time clocks had become of general use in the honses of the

had become of general use in the honses of the wealthy. "The best and most portable," says Admiral Smyth, to whose memoirs in the Archaeologia we have been mainly indebted, "as well as the most general in shape, is the celebrated clock helonging to the Queen, which is the actual one presented to the fair, accomplished, and un-fortunate Anne Boleyne on their marriage in Novemher 1532. Her Majesty gracionsly per-mitted me to examine this interesting horo-logical relic at Windsor Castle, with leave to handle the works. It is uow placed ou an ornamental bracket at the foot of the staircase leading to the Queen's clock, generally known ornamental bracket at the foot of the starrease leading to the Queen's closet, generally known as the 'Panel-room,' where it will prohably show the taste of the sixteenth century for many ages. On taking it down from the bracket with my friend Mr. John Hubbert Gloves, her Majesty's zenloss librariau, I regretted to find that this valuable machine had been 'done up,' or the tempoing with improving the refer to the root of the tempoing with improving the refer to the starthat this valuable machine had been done up as the tampering with ingenious works is often too truly termed. The interior wheels are now all of brass, and the whole train is evidently of comparatively recent date; while, from the style of the mechanism, a contrate wheel heing style of the momentum, a contact where hori-used to keep the arbors of the others hori-zontal, and the adaptation for a peudulum, an inference may be gathered that the 'doing np' took place about the year 1680."

"It is not only her Majesty's clock which has this hot only let indicity stoke which has this heen altered, but almost all the specimens I have seen of the reigns of Elizabeth, Jaines I. and Charles I. have had the balance removed and the pendulum applied, and the innovation is so meritorious that even an antiquary must excuse it."

Excuse II. In the 3rd of James I. a watch was found upon Guy Fawkes which he and Percy had bought the day before, "to try conclusions for the long and short burning of the touchwood with which he had prepared to give fire to the twin of worder."

with which he had prepared to give fire to the train of powder." In 1631 Charles I. incorporated the clock-makers, and the charter prohibits clocks, watches, and alarums from heing imported. About the middle of the seventeenth century, Huygeus made his great improvement in clock-work, which produced many others from our own countrymen, the latest of which was the introduction of repeating watches in the time of Charles II. This king was very enrious with that watchmakers (particularly East), used to attend whilst he was playing at the Mall, a watch being often the stake. being often the stake.

Charles V. of France was so much pleased with time-measurers, that be used to sit after his dinner with several of them on the table amore while several of them on the darks his both being in the centre; and when he retired to the monastery of St. Just, he continued to amuse himself by keeping them in order, which is said to have produced a reflection from him on the absurdity of his attempt to regulate the sections of the different powers of Farmer motions of the different powers of Enrope.

And so, having tieked our time, we wind up

THE UNEMPLOYED WORKMEN.

HOWEVER futile the advice may be which bas been tendered, by their so-called friends, to the large body of operatives connected with the building trades now unfortunately out of employ, and however dangerous the doctrine taught by some of their leaders, expressions of sympathy, and earnest endeavours to assist them in their need, should not be withheld. Builders suffered fearfully during the war, especially the elass engaged in the erection of houses for the elass engaged in the creetion of houses for sale, and have been suffering since. The *Gazette*, for many months, showed teo elearly what was going on; and even at the present time there are no buyers, bouses remain on hand, and the interest of money borrowed, together with the ground-rent and law ebarges, in a constant supersubary of the present is in some quarters swallowing them up. As a matter of course, workmen have been dismatter of course, workmen have been dis-charged, as well because of this as of the winter, which necessarily stops building operations, and thus we find a large number of deserving arti-zans out of employ, and requiring aid. Whether or not the number is so large as has heen suspected, we are unable to say: we sincerely hope not. The statements as to the number of persons who attended the second meeting in Smithfield, were certainly much exaggerated. Some of the newspapers called it 16,000; but looking with our own eyes, we were mable at any time while the chairman was speaking to count a thou-sand Lotte been it have been it become sand. Let us bope, therefore, that the numbers of those who are in distress may be less than has been feared. Taking the best view of it, however, they are unquestionably very numerous, and something should be done to aid them. Emiartison has been urged as the most effectual step, and would doubtless be advantageous to many. In the meantime, however, they need assistance, and we should he very glad to see a respectable committee organized to receive subscriptions, and devise some means of giving useful help.

We have received several letters in reply to one signed "T. L. D." in our last, and two or three taking nearly the same view as the writer of it. Of the former, we have printed one of the earliest that reached as, and next week will give attawing to others. give attention to others.

In reference to the want of employment so loadly complained of by many mechanics in the building trade, and in asswer to the letter which you publish from "An Architect and Surveyor," in which he exposes the fallacy of applying to the unions for relief, and attributes their present distress principally to their own acts, permit me to say that very many, probably a large majority in the trade to which I belong, whilst agreeing with your correspondent on the absurd and degrading nature of such a course, caunot help feeling that his remarks on the subject of wages and the conduct of trade societies are opposed to truth. He asserts that when wages were lower reference to the want of employment so loudly cattor help constant of tradesocieties are opposed to truth. He assorts that when wages were lower there was more constant employment than now, which he attributes to the mischievous interference of trade unions, which raise the price of labour to such an extent that employers can only realize a profit on the material, and not on the labour. In the first place, there are other causes operating to produce such an one-fifth of the meu in my trade that helong to them. Nor is it a condition of membership that a man shall receive the highest rate of wages. The employers themselves make a standard rate, by refusing to pay a superior workman more than an ordinary one. As for the logic which says an employer can only get profit on the material, and not on the labour, it needs superior workman more than an ottomary out. The for the logic which says an employer can only get profit on the material, and not on the labour, it needs nothing to prove its absurdity. Were I to compare profit on the material, and not on the labour, it needs nothing to prove its absurdity. Were I to compare the remuneration your correspondent receives for bis labour with mine, be would probably tell me that the outlay for his education was greater than mine; that it required more study and talent of a higher order to fit him for his profession than are requisite for mine, and, as a necessary consequence, he is justly entitled to a higher remuneration. I great he is; and by the same rule I maintain that serven years devoted to acquire a business, with a premium paid into the bargain; an expensive lot of tools to provide, subject to constant wear, and loss hy fire or robbery; together with the uncertainty of eruployment,—are together with the uncertainty of employment,—are sufficient reasons why we should have more pay than policemen. It really is too bad that the working sumerar reasons way we show and that the working policomen. It really is too bad that the working classes should be continually told they receive good wages by those who never knew want, nor how far a workman's wages procure for himself and family the means of snpport, after contending with want of

employment, sterkess, intrus, of denots in instanting. Were they to try the experiment with all the ecouony they recommend to us, I think they would form a different opinion of what were high wages. Why, the very fact of so many being destitute proves that our wages are insufficient to meet the requirements of life under all circumstances. They meach economy, but wages are insufficient to meet the requirements of life under all circumstances. They preach conomy, but our scale of living is already too low. With low wages, a married man is in a measure compelled to allow his wife to compete with the single women in needle and other work, and again producing low wages and starvation to those who depend upon it for a

It is the full helief of your wish to do justice to It is the full held of your wish to do justice to both employer and the employed that causes me to trouble you with this; and I beg as a favour, should the length or style of this letter preclude insertion in your columns, you will give the substance, as it is in accordance with the opinions of many who, like myself, think a man who is both able and willing to heards hit ime to halve a head process the means of like devote his time to labour, should procure the means of existence without the charity of any one, public or private, A JOURNEYMAN CARPENTER.

FEW WORDS TO BUILDING OPERATIVES ON THE PRESENT DEPRESSION.

SIR,—Observing, in your last week's publication, an article on the above subject, from a correspondent who calls himself an architect, I submit the following remarks.—You are no doubt aware that working men who calls himself an architect, I submit the following remarks:— You are no donh aware that working men regard with suspicion anything, spoken or written by those who move in a higher sphere of life, that has a tendency to throw discredit on their conduct. To state in plain terms who I am, and my position in life, the following will suffice. I have wrought as a mason nywards of thirty years, in ten or twelve diffe-rent counties in England and Wales. I have received as little as 26 for ared ay, and as much as [8, 1] salittle as 2s. 6d. per day, and as much as 6s. I have lost as much as two, and sometimes three months' habour in winter, for want of employment : in summer I have made as much as eight, and some in summer I have made as much as eight, and some times even nine days' wages during the week. I have, during the thirty years, been married twice, and each wife has borne me six children. The first family has been trained to get their own living; the second are progressing towards the same de-sirable end. During the above-mentioned period, I have not obtained anything higher than that of a jouroeyman; neither have I received from any other source anything of consequence to supply my own and the wants of my family. As a double share of domestie duties has fallen to my lot, and as I am only a working mau emoge working men, let them heed the following remarks. d the following remarks.

The building trade has always heen a fluctuating trade, and always will remain so, owing to circumtrade, and always will remain so, owing to circume stances which are very difficult to control. The pre-sent depression of trade is owing chiefly to the high price of provisions, and the large amount of war taxes which have yet to be removed. For instance, a very large number of houses in and around the suburbs of London, are finished, and fit for occupation; but the supply is f.r greater than the demand, not that London has been depopulated—population still in-erenases, but the cause lies here. The war has en-bauced the price of provisions—these must be obtained at every other sacrifice. The working man, who for-merly had two or three comfortable rooms, at the present time makes shift with one. Many of the middle elass give up their houses, and take apart. iniddle class give up their houses, and take apart-ments; thus, in thousands of instances where a house ments ; thus, in thousands of instances where a house is only just convenient for one family, it is over-crowded with five or six. This, then, is the cause that house property has become such a drug in the market. It must be evident, if the builder could borrow money at 3, or even 2 per ceut, and men would consent to work for helf wages, if the builder had no reasonable prospect to let or sell those houses when finished, he bimself would be in the sure road to ruin.

Your correspondent of last week, makes som severe remarks on the conduct of trades' unions. severe remarks on the conduct of trades' unions. I am as averse to the principle on which those trades' unions are conducted as your correspondent. But let me state, once for all, clearly and distinctly, the cause of these trades' unions attaining such a for-midable and threatening aspect as they do at present. Many of those who contribute their pence and shill-ings to support these unions, do it not willingly, but grudgingly, not as a matter of choice, but of necess-sity. For instance, a man not belonging to the trades' union applies to a master for employment : if the master employs him, and he refuses to join the traces union applies to a master for employment: if the master employs him, and he refuests to join the society, a deputation is sent by the mnion, to state that the society men refuse to work with him; or, in other words, they demand the master to discharge him: the master, to avoid a temporary inconvenience, discharges him. We hear much in the present day of the tyranny of capitalists and employers: those who live in glass houses should not throw stones. I speak, is and it is prime to recover and establish eers.

have from employers. When I first came to London I hired a small fur-I nove from employers. When I first came to London I hired a small fur-nished room ou the fifth story of a ten-roomed house, for which I paid 5s, per week. A teu-roomed house, thought I to myself, and each room worth 5s, per week,—1300, per year. I soon shifted, and laid out a few poinds in furnitore, and hired an unfurnished room at is, per week in an eight-roomed house. An eight-roomed house, each room worth 4s, per week,— more than S30, per year,—too much, I thought. I soon left this, and eugaged au eight-roomed houses on my own account at 422, per year; let off sit rooms at an average of 3s. 6d. per week each, which enabled me to live ront-free. But 422, per year for a house which nost about 3500, was, at any rate, 10 per cent. for the outlay,—too much, thought I. By dint of persverance and striet ecoundy the mitted savings of myself and wife, in the course of fourteen or fifteen years, amounted to the sum of 1200. I formed a resolution.____ will horrow 2000, and add to or fifteen year's, amounted to the sum of 120%. I formed a resolution. I will borrow 200%, and add to my savings, and build a house for myself. A good eightroomed house was soon built; ground rent, 5% per year, and per-centage on 200%, cost me 15%, per annum. I could, in these circumstances, let off as much as when I rented a house at 42%, per year. I have made the above statement simply to show my fellow-men how they might hetter their coudition. I thiok I am sufficiently skilled in reasoning to show them one cause of the present distress of many. In-stance a cause: there are many innkcepers sufficiently

them one cause of the present distress of many. In-stance a case: there are many indicepers sufficiently kind and obliging to trust men for the liquors they are disposed to take upon credit during the week. A, very moderate week's account in this way often amounts to 7s. or Ss. I have observed that most men are sufficiently honest to pay of a Saturday night, that those kind favoars of the innkceper may be continued. The landlord "stands his pot" for favours received: this calls for another, and another, until the man, who has laboured hard during the week for his sceanty caraings, forgets he has a wife and children waiting with enger expectation for the support they stand so nume in model waiting with eager expectation for the support they stand so much in need of.

The result of such conduct is simply this. On the Sunday morning hundreds are strolling to market in the purlicus of Marsh-gate and other similar localities

The gin shops, the pledge offices, and the loau offices, all bear witness and give ocular demonstration which way the poor mar's money goes. To those working men who can take advice I

give

First. Observe, when you can obtain employment-oid Saint Mouday. Work the whole six days, if avoid possible.

Sceondly. Don't speud your money hefore you get

Secondly. Don't spend your money hetore you get it,—or, in other words, don't take anything on credit if you can avoid it. The man who pays ready money for excrything will generally take care of his pocket. Thirdly. Carry home the whole of your week's wages, and provide on Saturday night for the com-forts and necessities of your families. In conclusion, a few words to those who consider themselves the guardinas of the workman's right. You have shown a vast amount of zaal in forming reades' unions — in levying contributions to support trades' uuions, -- in levying contributions to support strikes, sometimes of a rivolous nature. Here, then, atrikes, sometimes of a frivolous nature. Here, then, is a subject at which you may employ your zeal to good account: thousands are out of employment owing to the depression of trade: thousands of inno-cent children are sufficing the pangs of hunger owing to this depression: you have societies already organized, resources at command, in realiness to combat with any employer who chooses to infringe upon your alleged rights. Cannot these resources be brought to bear upon the present existing emergency P. A work of charity,—a work of mercy presents itself hrough to bear upon the present existing emergedey r A work of charity,-a work of mercy presents itself to your notice, in which you are deeply interested. Such a step on your part, I am persuaded, would meet with public approval, and, in addition, public co-operation. A STONEMASON. co-operation.

"GOTHIC AND CLASSIC."

I SHOULD not have troubled you with any re marks upon this vexed question, had not the letter, which appeared in your impression of the 10th, heen likely, from its type and position, to earry with it nove than its due weight with the mass of your non-professional readers. Those who are acquainted with the style it condenns, will not be in the least affected by it.

to restore that train of thought which, by patieucs and perseverance, produced such struc-tures as the nave of Westminster, the elapter-house of Salisbury, the abbey at Tintern, the spire of Lostwithiel, the north porch of Red-cliff, &c. And I am traly surprised to find that any one should infer from the remarks in the Builder, of November 29, that the writer was anxious to revive or restore the "obsolete" fashions of a less civilised age, simply because they happened to be clothed in artistic forms. It is neither "freedog," nor "hoodwinked windows," nor "open ceilings," nor "but treesses," nor "pinneles," — no, nor even all these things combined, which the architects of the movement desire to see revived; but it is that groupriety which the Anglo-Roman, Saxon, to restore that train of thought which, by the movement users to see reflect, but it is that propriety which the Anglo-Roman, Saxon, and Norman all observed — conformation to the laws and local characteristics of nature, with the addition of the spirit of Christianity infused. But your correspondent would have us believe that Gothic architecture consists of " nought but pinnacle and gable, and huttress, and hoodbut pinnaele and gable, and huttress, and hood winked windows;" that its domestic """ *tials*" are "casements, admitting the external air in all seasons; fire-places so large, that all the heat generated upou the comfortless firedogs, is immediately transmitted to the nether heaven, open ceilings, and stained joists, giving a general cold church-like air to them, very depressing and unpleasaut." Now, as there are, I dare say, some amongst your numerous readers who would be led almost to believe this summary, from the reflections which precede it on "useless papistical piscins," "disease-engendering sedilia," &c. I think it would be wrong to let even such people remain in the belief, that Mr. Goodchild's *Golhie* is the Gothie belief, that Mr. Goodchild's *Goltic* is the Gothie of what he is pleased to call the "oue-branch hands." It was to be hoped that the question, — What is Gothie architecture? had been decided, for one and all, but the communication in the *Builder*, of January 10th, 1857, contain-ing direct and indirect coussures upon its lack of "appropriateness" and beauty, shows that this hope was vain. Every one who knows anything at all of Gothie architecture, is aware that its very first element, without which it caunot exist, is "appropriateness" or utility. It must not be forgotten, however, that there are approx not be forgotten, however, that there are appro-priate and useful features in the world which have no *direct* hearing upon our *physical* wants, and it is this dual approximates, i.e. the mate-rial utility, coupled with the *expression* of the religious or moral *feeling*, which constitutes architecture. This "expression" is only mother word for symbolism; and, from the Druidical temple downwards, it must and will exist. I ask, then, what shall the works of the latter half of the nineteenth century be symbolical of our Christian faith or our scepticism-our unity or our sectarianism—our higher or our lower nature? One of the great errors of the day is the supposition that Gothic or Pointed architecture must be mediæval, and that it is made up of "buttresses," "fire-logs," "piscinas," and the like; things which have no more to do the like; things which have no more to do with this style than the toga, the tripod, or column flutings, have to do with the Classic. I fully agree with Mr. Goodchild, that the great mass of buildings "created in the present day," which go by the name of Gothic, are failures; but the style per se would not be allected one iota if we went on failing for a century. What we really want is more *self-reliance*, more *thought*, more spirit-life, more faith, more unity, more love, and then both the Classic and Gothic of history may sink to their proper level, as food for the antiquariau aud archwologist; for we ourselves should have a land-mark in the world's history, which would vie with either in originality, propriety, or beauty. Culmore, co. Donegal.

E. W. GODWIN.

LECTURE ON COLOUR AND ITS LAWS .- A lecture LECTURE ON COLOUR AND ITS LAWS, —A lecture on this subject was delivered tast week at Ipswich, before the members of the Mechanics' Justitution there, by Mr. George Taylor, of that town. The lecture successively buched upon the theory of light, lacturer successively touched upon the theory or ingur, the theory of colour, the properties of coloured rays, and the influence of coloured light upon vegetable and animal life, mentioning under the latter head the results of the numerons, interesting, and practically useful experiments made upon plants growing under solutions of the succession of the succession of the succession. coloured media.

ATHENS.*

THE connection of Athens with Peiræus and Mnnychia was effected during the administration of Pericles, by the erection of the two long walls of Petiers by while creating the transformation of tran the intermediate long wall and the Phalaric were built first, and after the erec-tion of the intermediate long wall the Phalaric tion of the intermediate long wait the rhateric was suffered to go to decay, as the Lacedemo-nians are only described as destroying *two* long walls; and when, after the battle of Chidus, Conon rebuilt them, he probably used the mate-rials of the Phaleric in their construction. These matheric miners of the theorem of the intermetion of wals, ruinous at the time of the invasion of Philip, were destroyed by Sulla, and never after-wards rebuilt, their ruins being noticed by Pau-sanias, who flourished about A.D. 200. Their ruins may still be traced.

The most recent discovery of importance con-nected with the Aeropolis is that of M. Beulé, who, not satisfied with the old entrance on the south side of the west ontworks, has brought to light an ancient gateway, about 6 feet wide and 12 feet high, surmounted by a Doric entablature, the tween two flanking towers, at the west eud of the Acropolis, exactly in front of the Propylea. The surface of the rock appears to have been The satisfies of the tock computed in a state occu-divided into platforms, communicating with one another by steps, and a recent distinguished author has called attention to the want of parallelism amongst the several buildings upon summit

The Pelasgie fortifications of the Acropolis, which defied the Spartans, having afterwards been partially dismanticd, could not resist the Persians, who destroyed all the huildings within the eitadel. The foundations of the ancient walls doubtless remained, but the walls after wards built upon them retained but the wards and wards built upon them retained but the name of the mighty founders of the Athenian race. The restoration of the north wall, called the Pelasgic, is ascribed to Themistecles; and imbedded in its masnry are portions of marble columns, and a complete Dorie cutablature of limestone, without doubt the remains of the carlier Parthenon

We pause a moment to contemplate in thought the numerous remains of Pelasgic or Cyclopean construction scattered over the states of Greece, and by the same giant race implanted in the distant regions of Etruria, as shown at Norba, Cora, Signia, Alatrium, Fiesole, Arezzo, and other places—imperishable records of the Volsci, the Marsi, the Hernici, the Sabini, and other tribes.

The impressions of Pausanias, sixteen cen-turies ago, were probably much the same as those of the tourist of our own day; for the ruins remain much as they were. In solitary grandeur they attest the power of those who placed them there. placed them there.

" Rarus vacuis habitator in arvis Monstrat, Cyclopum ductas sudoribus ar

"Their handwriting is yet upon their walls ! A restless and various people, overrunning the whole of Greece, found northwards in Dacia, Illyria, and the country of the Getre, colonising the coasts of Ionia, and long the master race of the chirest lands of Italy, they have passed away amid the revolutions of the elder earth, their ancestry and their descendants alike un-known ;-yet not indeed the last, if conclusions are rightly drawn if the primitive population of Greece — themselves Greek — founding the lauguage, and kindred with the hlood of the later and more illustrious Helenes—they still made the great hulk of the people in the various states, and through their most dazzling age : enslaved in Laconia-hut free in Athens-it states, and through their most dazzling age: enslaved in Laconia—hut free in Athens—it was their posterity that fought the Mede at Marathon and Platea,—whom Miltindes lod,— for whom Solon legislated,—for whom Plato thought,—whom Domostheues harangued."

The Cadmeians, says Herodotus, were famed their architecture, which they introduced Greece, and there erected lofty strucinto Greece, and there erected tures dedicated to the sun, under the name of Pelorus, whence the term Pelorian was given to anything stupendous; and as by their works they judged the builders, so did they represent the Cyclopes as giants, and pursuing the same

* See pp. 9, 34, ante.

[JAN. 31, 1857.

latitude of reasoning, termed anything vast Cyclopean.

" Quicquid magnitudine sua nobile e Cyclopum mauu dicitur fabricatum

Among the most celebrated ruins of this description, rank Tiryns and Mycenæ, in the plain of Argos, whose remains are composed of rough quadrangular blocks of stone, the interstices being filled in with small stones. Of Tiryns, being filled being filled in with small stones. Of Tryns, only the walls of the Acropolis remain, which Dodwell considers must have been full 60 feet in height, judging from the fallen stones about them. Of Mycenz, the capital of Agamemnon, the Gate of the Lions and the Treasury of Atrens excite intense interest. The linted to Atreus excite intense interest. The linkel to the doorway of the latter is composed of stones in size only equaled by the masses of Egypt or Balbee. The eircular chamber, 50 feet in diameter, and about 60 feet high, formed of parallel courses of breccia, averaging 2 feet in height, neatly jointed without mortar, and con-verging to the centre, not by radiating bods, but by hargroutel courses projection before each beight, teachy jointed whore in the case verging to the centre, not by radiating beds, but by horizontal eourses, projecting before each other as they rose, and then smoothed by the cutting off of the lower angle, instead of typify-ing the future arch as some have thought, only goes to prove the principle was not even hinted at by these rude architeets. The Treasury of Minyas, at Orelomenos, of which but ruins re-main, the vault having fallen in, was, doublless, of far greater size, and of martle. Pausanias fully describes it, whilst he only alludes to that of Myceae. It is supposed that all the subter-raneous chambers of Greece, Italy, and Sioly, were similarly constructed. Of the four kinds of masonry into which the Cyclopean remains are divided, the first has its type at Tiryns and Myceae; the second where the stones are irre-gular polygons, fitting nearly into each other, as Auycene; the second where the stones are life-gular polygons, fitting nearly into each other, as at Julis and Delphi; the third, wherein the stones are laid in regular courses, but of un-equal lengths, as in Bootia, Phoeis, and Argolis; and the fourth wherein the stones are always rectangular, whereof examples exist in Attica.

Sir William Gell asserts the second method Sir William Gell asserts the second method only to be Pelasgic, and to have hear practised several hundred years hefore the Cyclopean manner. Thus, he says, the Pelasgi built Ly-cosura 1800 years B.C. and Argos even 56 years earlier; and that Tiryns was fortified by foreign artists from Lycaic, called Cyclopes, above 400 years later. But our limits will not allow us year hear a mean new the most intrasting. years later. But our limits will not about to linger longer upon this most interesting subject. We will only refer the reader to Dod subject. well, Clarke, Hamilton, and other investigators,

well, Clarke, Hamilton, and other investigators, and return to Athens. The remaining places and monuments of the lower town, whose identity is not disputed, are the Arciogaus (5^A Aetoc Itáyee), or hill of Arcs, the Pury, (IIvit), or place of assembly; the Hill of the Nymphs; and the hill called the Museinm (r⁵ Meverier), after the poet Museus, who retired thither for contemplation; the Dio-nysiae (Theatre, and the Odeium of Herodes; the cave of Apollo and Pan, with the fountain Clensvirta, and the cave of Ackarurs; the temthe cave of Apolio and Pan, with the foundam Clepsydra, and the cave of Aglaurus; the tam-ples of Theseus and of Zeus Olympius; the Horologium of Andronicus Cyrrhestes; the choral monument of Lysicrates; the Stadium; the gateway and aqueduct of Hadrian; and the Ago

on a and Cerameicus. The Council of Arciopagus sat as judges The Council of Arciopagus sat as judges in the open air, on the south-east summit of the rock. Sixteen stone steps and a rude bench of stones mark the spot where they held their meetings. At the south-east angle of the rock is the chasm which formed the temple or sanc-tnary of the Eumenides. What structure there thary of the Eumenides. What structure the may have been in front of it has disappeared.

The identity of the Pnyx was first established Chandler, Wheler and Stuart having both by Chaudler, Wheler and Stuart naving of the remains. It failed in their appropriation of the remains. It may be loosely described as a semicircular area, on a sloping ground, the chord of which is the highest point, the centre of the are the lowest; the latter being bounded by a wall of huge polygonal blocks. The chord is marked by a line of vertical rock, hewn flat like a wall, in the centre of which, and projecting from it, is the Benna (Bayaa), or public, often called the the centre of which, and projecting from R, is the Borna ($\beta_0\mu\alpha$), or pulpit, often called the stone ($\dot{\omega}\lambda i\theta oc$), from which the orators ad-dressed the multitude in the area, which, con-taining 12,000 square yards, could accommodate the whole of the Athenian citizens. Eloquence

was innate with the Athenians, and oratory flourished at Athens only. The fine organiza-tion of this remarkable people was such, that au nngraceful or unadorned style was repugnant Cicero hears witness to this to their sense. exquisite susceptibility where he says—"Since rum fuit sie eorum judicium ut nibil possent nisi incorruptum audire atque elegans." Statesnus meorraphin addre adque clegals. States-nue, generals, poets, all were orators, though hut few of their orations have reached ns. Of the remains that are extant, those of Lysias, Isocrates, Isæns, Demosthenes, Æschines, Demades, and Hyperides, rank highest; Auti-phon, Antisthenes, Andoeides, and others, take computer rank a secondary rank.

The Mnseium Hill was sonth-west of the Accopolis, and of not very inferior elevation. It contains nothing remarkable, if we except the remains of the Roman monument to Philoremains of pappns (for the description of which see Leake and Stuart), and the traces of numerons houses. Of the poet Musæus, supposed to have nouses. Of the poet Museus, supposed to have here brief on the hill that hears his name, none of the ascribed writings remain; hut Diogenes Laertius has preserved to na a prin-ciple of his philosophy in the words—EE ives ra rawra yiveda, sat is rawraw analysedat.

Beneath the sonth wall of the Acropolis lay the Theatre of Dionysus, commenced B.C. 500; heing the first theatre huilt of stone in Athens, all previous ones having heen of wood, and temporarily creeted for the Dionysiac festival; it was within such that the first drama of Æschylus was performed in the same year. After the discarding of these wooden moveable theatres, stone ones were erected in all parts of Greece and Asia Minor; Athens at the same time remaining the centre of the Greek drama and birthplace of Greek dramatic literature Many of these theatres, although all of them Main of these theates, although and of them constructed after the Athenian type, were not devoted to the drama, but to various public purposes; and even at Athens, the Theatre called $\lambda \gamma \rho i \pi \pi i \iota \sigma \nu$, and that of Herodes $(i\pi^{1} P \eta \gamma i \lambda \eta S i \sigma \tau \rho \sigma \nu)$, were used for the de-elamations of the Sophists. The prodigions size of some of these huildings, as at Argos, Ephesus, and Epidaurus, is attested hy the de-scriptions of Clarke, Dodwell, Leake, and others. Scriptions of Clarke, Foldweight Flacke, and Cherke, They were nsually erected upon a declivity, the part for the audience heing hewn out of the rock, thence called $\kappa_0 \lambda_{0'}$, carea. The seats for the spectators, arranged in concentric circles, and occupying about free eighths of the circumference; the broad passages (διαζώματα), præcinctiones, at intervals hetween these seats, and parallel with them; the stairs, at intervals, radiating with them; the starts, at intervals, radiating from the centre, and communicating hetween the upper and lower seats, but breaking joint at each præcincto, hy which the seats were divided into plots resembling on plan the section of a truncated cone, hence called $\kappa\kappa\rho\hat{i}\hat{e}\epsilon_{c}$ cause; the covered gallery forming the finish to the huilding, and following the sensitivele of the theatre; the orchestra $(\delta\rho\chi_i)\sigma\tau\rho a)$, the circular area within the inuermost seat. round which the theatre; the orchestra $(\delta \rho \chi \eta \sigma \tau \rho a)$, the circular area within the iunermost seat, round which the area within the lubermost seat, round which the chorus performed their dances, and in the centre of which stood the $\Im u i \lambda \eta$, or altar of Diony-sus; the stage ($\lambda \sigma \gamma i \omega \eta$), raised above the orchestra, and terminated by the $\sigma \pi \eta \nu \dot{\eta}$, and, on cach side, the $\pi \sigma \rho \sigma \kappa \eta \nu \omega \gamma$; these formed the principal features of the Greek theatre as gathered from the cydence of Vitravius, who likewise clearly marks the distinctions hetween the Greek and Roman theatres. "But these," says Donaldson, "and other statements of the aucients, have heen somewhat twisted out of shape hy architects unacquainted with the aushape hy architects unacquanted with the au-cient dramatists; and philologists, in their turn, have hundered sadly for want of a knowledge of architecture." The whole hody of the theatre and orchestra was open to the sky, and the performances took place in the daytime. The altar of Bacchus, as typical of the worship upon which the Greek drama was founded, occupied the centre of the whole huilding.

repre It is remarkable, that the theatrical repre-sentations of Greece retained to the last their original character; and even in the days of Sophocles those representations formed part of a religious festival: the theatre was sacred to a height and his worship as much regarded as the amusement of the people. The origin of the chorus helongs to the Dorians, who, adding appropriate dances to their hymns, thus insti-

tuted that important adjunct of the drama; and the Doric dialect is preserved in the lyric poetry of the other Greek tribes. Their dauces in honorn of Apollo, god of war and mnsic, were either gymnastic or mimetic: the former, when intended merely as an exercise ; the latter, when corresponding by gesture with the meaning of the chorus. Of the former class was the Pyrrhic, a dance peenliarly Spartan, accompanied hy the flute, and the gymnopædian : the hypor-cheme was of the class mimetic ; and in these three dances we may trace the origin of the lyric element in the Attic drama. How Dionysns came to he the object of a worship formerly paid to Apollo was doubtless this : the Dorians worshipped besides Apollo a female form of the same deity. In the elementary worship of the same deity. In the elementary worship of the Pelasgi aud Achaians there were also two leading di inities, the snn and the moon, worshipped as Helios and Sclenc; and by the Pelasgic inhahitants of Italy as Janus or Dianus, and Diana. In Greece, however, the original names of these deities fell into disuse at an early period, and Bacchus or Dionysus became the adopted name for the sun-god, and Demeter for the goddess of the moon. Connected in their attributes with the old elementary worship of the Pelasgi, they became blended with the gods of the country. Dionysus was the Winc-god, of the country. Dionysus was the Wine-god, Demeter the Earth, whence sprang the vinc, and a natural transition invested *him* with the attributes of the sun that caused its growth, and translated *ker* as his sister to the moon, thus both hecoming types of the celestial hodies that ruled the harvest and the vintage. As gods of the earth, attendant deitics were ass them; thus, to Bacchns were given the Sileni to Diana, the Naiades. To these were added added

THE BUILDER.

d

to Diana, the Isaades. To these were added satyrs (from $\Sigma a \tau \nu \rho o c$, a goat), heings half man, half goat; defied representatives of the old wor-alippers, who prohably assumed for their costume the skin of the animal they had sacrificed to the God. Thus did the religion of Bacchus become incorporated with that of Apollo, and hecome the accepted creed of the Dorians. The signification of the word Dionysns (th

god of Nysos) proves that some word of which $\Delta \epsilon$ or $\Delta \epsilon$ was the root, was the generic name of the deity. The etymology of the dethyramh is a donhtful point; hut it consisted of a chorus of fifty men or boys, who danced round a hlazing altar to the music of the flute, and was thence termed the Cyclic Chorus; its subject, the hirth and misfortnnes of Bacchus.

But the first step towards the Drama in its nltimate development was extemporaneous nar-Habited in goat-skin, like a satyr, the rative. reciter debated upon the adventures of Bacchus. Hence arose the term Tragedy—or the Goat-ode, from $\tau \rho \alpha \gamma o_c$, $hyrcus, -\omega \delta n$, cantus, -even asComedy, or the Hevel-song, drew its parentagefrom the Koupos.

Thus arose that tragedy which, shadowed forth hy Thespis and further developed hy Chorilus, Phryniens, and Pratinas, found its great exponents in Æschylus, Sophoeles, and Enripides. As regards Comedy, from the first exhibition of Epicharmus to the last of Posidip-me a precised of 950 regars, one hundred and pns-a period of 250 years-oue hundred and four anthors are enumerated, of the works of a few of whom we possess intragments only— the only complete plays that have reached us being the eleven of Aristophanes.

Two rows of seats at the top of the theatre of Dionysus are now visible, the rest heing hidden by the accumulation of soil. The accurate Dionysus are now visible, the rest heing hidden by the accumulation of soil. The accurate dimensions of the huilding cannot now he ascertained: the upper part is evident, hut its lower extremity is not visible; hut it is sup-posed to have heen large enough to contain the general mass of the Athenian eitzens; and for heauty, Dicearchun ascerts it to have heen the most heautiful theatre in the habitable earth (bbc ip $r\bar{a}v$ ir $r\bar{q}$ or conjunction), $d\bar{s}(bhoyor, upta acad acquaration).$ άξιόλογον, μεγα και θαυμαστόν).

The subject of scenery, costume, machinery, &c. we could not allude to here; and the dis-cussion of the Greek drama itself is and must ever remain the province of profound scholar-ship. Nor would it he possible to enter upon the differences presented hy many theatres still extant from the general description we have loosely sketched. Whether women were present at theatrical performances has been a matter of work diverging as these is secred. loosely sketched. Whether women were present at the atrical performances has been a matter of much discussion, as there is searcely any provement for the public convenience; hut

passage in ancient writers that alludes to it ; hut Jacobs and Passou have placed it almost heyond a donht that they were present at tragedy, hut not comedy. If so, their seats were separated not comedy. If so, their seats were separated from those of the men. The Odeium (@@@@@w) was a hnilding allied to

a theatre in form, and sometimes called βεατρον, hnt was much smaller in size, and roofed over, and was first invented during the flourishing period of Greek art in the fifth century hefore Christ, for musical contests. Vitruvius makes Christ, for musical contests. Vitruvius makes a passing allusion to the Odeinm of Pericles. It stood at the foot of the south-east part of the Acropolia, and was burnt by Sulla B.C. 85. No ruins remain of it. The most magnificent edifice of the kind in the whole empire was that hnilt hy Herodes Atticus, at the western extremity of the Acropolis, heneath the sonth wall. greatest diameter was 248 feet, and it is Its is snp. posed to have furnished accommodation for 8,000 persons. According to Pausanias, it surpassed all other odeia in Greece, as well in passed an other odda in Greece, as wen in un-mensions as in other respects; and its roof of edar wood was particularly admired. There are still considerable remains of this building, hnt, says Mure, "in spite of their extent, good pre-servation, and the massive materials of which servation, and the massive materials of which they are composed, they have a poor appearance, owing to the defects of the Roman style of architecture, especially of the rows of small and apparently nseless arches with which the more solid portions of the masonry are perfo-rated, and the consequent number of insignificant parts into which it is thus sub-divided." Stuart's greatest mistakes and divided." Stuart's greatest mistake perhaps was assigning the remains of this comparatively small Roman building to the great Dionysiac theatre.

The other principal odeia were those of Corinth Patræ, Smyrna, Tralles, Mycenæ, and Nicopolis. There are also ruins at Laodicea, Ephesus, and other places in Asia Minor. The Cave of Apollo and Pan lay at the north

western angle of the Acropolis, or, as described by Herodotus as situated helow the Acropolis, and hy Pausanias as a little below the Propylæa. The worship of Apollo in this cave was probably of great antiquity. The worship of Pan in this cave was not introduced until alter the hattle of Marathon, in consequence of the services he rendered the Athenians upon that occasion. Miltiades dedicated his statue, and Simonides wrote the inscription to it. A statue of Pan, found in a garden near the cave, and now in the found in a garden hear the cave, and now in the public library at Cambridge, may possibly be the identical statue dedicated by Miltiades. The cave measures 18 feet by 15 feet, and is 30 feet in height. The fountain mentioned by Pausanias was called Clepsydra ($\kappa e \psi \psi c \rho a$). Taisanda's was called claps and the second standard the second standard the second standard standard subtransposed to have had a subtransposed to have had a subtransposed communication with the harbour of Phalerum.

The Cave of Aglaurus in the µakpan or Long-rocks, said to be the point whence Aglau-rus and Herse threw themselves. Eastward of the Cave of Pan are two caves, one of which contains thirteen niches, proving it to have heen a consecrated spot, and one of these was prohably the Aglanrium. Leake assigns one of these caves to Aglaurus, and the other to Herse. The Athenian Ephehi, on receiving their first suit of armour, were accessomed to take an oath in the Aglaurium that they would defend their conntry to the last.

We must couclude our remarks in another number.

CROWN FERRIES IN THE WAY OF IMPROVEMENTS.

On the 19th instant, as our readers may have noticed, a deputation of the committee of the Conservative Land Society and of the inhahit-ants of 13eleworth, attended the Chief Com-nissioner of Woods and Forests, for the purpose of obtaining permission of the Crown to land on the Surrey side of the railway hridge across the river Thames, at Richmoud, a project having heen formed to creet a foot bridge as an appendage to the existing railway hridge.

The Society had already obtained the consent

although the deputation informed the Chief Commissioner that the inhabitants of Isleworth and Riehmond were prepared to construct the proposed bridge by voluntary subscription, and devote it to the public nse, in order to save a detour of nearly a mile; they were met with the objection that the proposed bridge would inter-fere with ancient ferry rights, and that the Crown revenues could not be sacrificed. These "revenues," it is stated, amount to only a *fee pounds* a year; and it was urged (in vain) that by the development of the neighbourhood, the two ferries in question would actually be en-hanced in value. Mr. Gore, in reply, merely asked the deputation wby the promoters did not purchase the ferries then. But this, it seems, would be too costly an affair for the proposers. A few old women, who lived by knitting stock-ings for those who could afford to have them in times gone by, would have prevented the manifacture of that necessary article of apparel by methinery, which placed them within the reach of all. Are not the Woods and Porests and all. Are not the Woods and Porests and share on the view of the public shall not have improved means of transit: the two sides of the view shall not be connected, and so improved, for fear we should lose our pennies. Surely, this is a very wrong position for them to take. for them to take.

FRESCO IN NEW PUBLIC OFFICES,

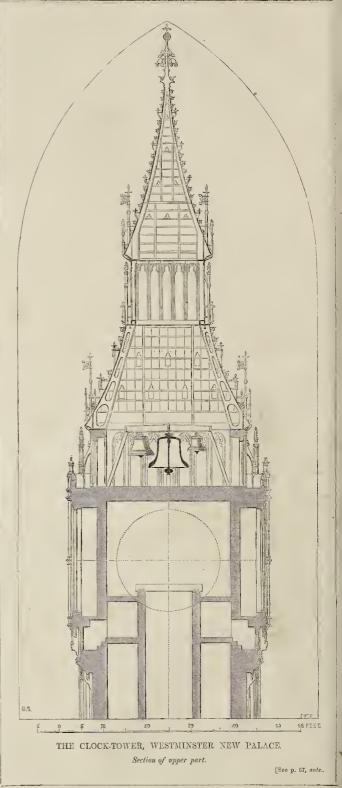

FRESCO IN NEW PUBLIC OFFICES. ALTHOUGH the remarks I am now about to make may be slightly premature, I hope it may draw your attention and that of others to this most important fact. As we all know, the new public buildings in Berlin and Munich have not a mass of bare walls, but they are all decorated with freeco. What impression did the staircase of the Museum in Berlin make upon you?---those glorious compositions of Cornelius and Kaul-haeh--equal in mind to Michelangelo? What think you after this of our British Museum, with its cold blank walls? What say you of the Glyptothek, in Munich, with Overbock's perfections of lovelliness, compared with the ball of the National Gallery? The want of freeco in our clubs and leatmed societies is a glaring defect, as also in the portie of any of our theatres. How splendid are those in Munich in a similar position!

a similar position! I now most earnestly desire that, at least, the halls and stairenses of the new Government Offices about to he competed for, may, at least, be decorated with freeso of grand hibitotial subjects; and I sincerely hope this may lead our talented artists and connoisseurs to press this most necessary subject for the benefit of art, in order that we may have as grand works as Berlin and Munich, and that our buildings may not have those horrid blank walls so unclassical and unusual in the firest specimens of architecture. CULPTER are Vers

THE USE OF IMAGINATION IN MODERN ARCHITECTURAL DESIGN. THE ARCHITECTURAL ASSOCIATION.

THE use of imagination in modern architectural design was the theme of the paper read by Mr. Ruskin at the Conversazione of the Architeetural Association, on Friday evening, the 23rd inst.—when there was a very full attendance of members and visitors, and the walls displayed a number of interesting drawings and sketches.

Mr. Ruskin commenced hy observing that on reading over what he had written it seemed have taken too much the form of advice. was sorry for hat, hut he had heen told that the paper he was to read was for young archi-tects, and he must shelter himself hebind the pleat hat a man night be **gnalifed** to give advice. plea that a man ongot be quanter to give tarties him-to others merely by having made mistakes him-self. If they were asked abruptly, and required to answer shortly, what were the qualities which to answer shorty, what were used quantum which distinguished great artists from mean artists, he believed they might reply,—first, their ima-gination; second, their industry. Some of them might doubt the justice or the necessity of attaching so much importance to this latter walk to reserve there wight he doll man who attaching so much importance to this latter quality, because there might be dull men who were industrious, and elever men who were quality, indolent; hut though the industrious man might be dull, and the indolent man might be clever. he had never known a great man who was not industrious. During such investigation as he had heen able to give to the lives of the great artists who had influenced the world by their career, no fact ever loomed so much upon him, and no law was so universal in its application this,-that they were all great workers. One of the unfailing characteristics of great artists was the astonishing quantity of work they accomplished during their lives. When they heard a young man spoken of as giving early promise of future excellence, the question the ought to ask was, "Does he work?" Bu bught to ask was, boes ne work: But though this quality of industry was essential to an artist, it did not make an artist; for many people were always busy whose doings are of little workt. Neither did feeling make the artist; but the gift which distinctively made the artist,---without which he would be feeble in life and forgotten in death,---was that of imagination. He would not occupy time by attempt-ing to give any close definition of what the word imagination implied - we have all a sufficiently distinct and general idea of it, in our minds and in our hearts; and all pay au involuntary respect to that power wherever it can be recognised Imagination was not manipulation, or calcula or attention ; it was something more, sometion thing higher than all or any of these. If an architect lays his bricks and stones well, we praise him for his manipulation; if he keeps well within his contract, we praise him for his calculation; if he arranges his beams so that nobody drops through his floors, we praise him for his caution. But, if he is to be a great for his calling, but, it let is to be a great architect, he must do something more than possess and exercise these qualifies,—he must in the meantime be telling farry tales out of his head. Then it remained to be considered what fairy tales in and by architecture, can be told, and what can be done hy the architect by the heart as well as by the haod. Perhaps the first ea of a young architeet in these days was to think that it was incombent upon him to invent a new style wortby of our times and country ; but if there were any of his hearers who had been impressed with that responsibility, he would ask them whether every inventive architect amongst them was to invent a new style? or whether every inventive architect was to invent a piece of the new style, and then to put their styles together afterwards hy subscription? If so, who was to be the Colomhus destined to lead them to the undiscovered islaud which was to be the El Dorado of new styles? After all, when a new style was invented, what were they to do after that? Could they do more than build in it? or what could they secure in build-ing in a new style that they had not in the styles already known? Their new style might be different from cvcrytlung ever known before; all the orders of architecture might be entirely reversed,—hut what next? He thought that if they quietly considered the subject they would see that if they were not content with a Palladio,

they would not be content with a Paxton, and he prayed them to get rid of the idea of there being any necessity for the invention of a new style. Ile would not address himself to those, style. The would not address minisch to holds, if there were any, among his hearers who hoped to obtain celebrity by the invention of some strange way of building, hat to those who would be content with that degree of celebrity which had satisfied our forefathers. The architect of had satisfied our forcitations. The architect of Salisbury Cathedra might he well content with having erected that huiding, though he was not the invector of Gothic; and one might be satisfied with such fame as Titian enjoyed at Venice, though he was not the invertor of oil vicitize "Day and requires the whet seem painting. They must consider, then, what room was left for the exercise of the imagination painting under such conditions. First, it would h said that the principal exercise of the architect Said that the philophi sections of the standards of the said mouldings in agreeable proportions. But he would ask what invention or imagination was necessary to this? What degree of fancy was necessary to this? What degree of fancy was called forth in the arrangement of the symmetrical lines and agreeable proportions of Whitehall Palace? Did the symmetry and Whitehall Palace? Did the symmetry and hearty of that building ever inspire with a feel-ing of hravery the mounted soldiers who gaze upon it for bours together while on duty beneath the arches of the Horse Guards? or did they think that the lovers of London ever go down to the shadows of Whitehall for consolation when their mistresses are unkind? Proportiou was shadows of Whitchall for consolation when their mistresses are unkind? Proportion was dull, to say the least of it, and he would ask men of genins on the proportionate system upon what achievement of the past would they in their old age look hack with satisfaction? Nearly every other art and profession had the pleasure of doing some good attached to it, either to the professor houself or to others, while the profession of architecture now left its professors in a position in which they could t nor feel nor see. He thought they neither act nor feel nor see. He thought they might abandon the theory of architecture being in proportional lines, and find something better npon which to feast their fancy. In choosing their way of working, the young architect should endeavour to bring out all his faculties, and not he satisfied with expanding only some of them. If architectural designing led to no of them. If architectural designing led to no pleasant journeys, if it did not excite life and emotion, and passion, it sank into a condition in which those who practised it were neither numerators not denominators, but mere common fractions. Their inagrination should exhibit faculties of sympathy with hiving creatures, and all the varied beauties of nature around us. Iu order to show more clearly what he meant hy imagination, and to contrast the works of our great forefathers with the commonplace and dull productions of the present day, the lecturer illustrated his remarks hy exhibiting two photographs, one representing the sculptures south transept door of the cathedral at A in the Amiens, the other the sculpture over one of the doors of the cathedral of Notre Dame. The sculptor, in the former of these, had represented with life-like accuracy the principal incidents in the life of St. Houoré, from the period of his heing made Bishop of Amiens to his death, and the fungal correspondencement thereare. funeral ceremonies consequent thereon. in truth, was the work of the imagination of a great artist. In contrast to that he exhibited drawing of a hole-in-the-wall building a drawing of a hole-in-the-wall building on the lines and proportions system, which did not require the ail of imagination in its design, and which any one might find in the "Encyclopedia Britamica," from which the drawing was copied, "according to scale." He regretted in modern times the separation between sculpture and architecture, the former, indeed, being that in which their imagination should be shadowed forth. In order to give their imagination and the other powers of their soul full scope, archi-teets must themselves be sculptors; they must not study huilding without sculpture, and must not study huilding without sculpture, and must themselves use the chisel. In fact, the lecturer weut on to show that sculpture alone architecture ! Nicolo Pisano sculptured alone was panels and monidings with his own hand; but our modern architects ordered hishops at so our modern architects ordered insingly at so-nuch a mitter, and cripples at so much a artiteh. The great painters of old did not disdain to paint small pictures as well as the freescores of the colossal gallery, and why then should the modern architect disdain to fill up the spaces of

his great building by sculptures of his own instead of trusting such a work to others who instead of trusting such a work to others who had not, perhaps, the same imagination as him-self. It might be said this would require much time and labour ; doubtless it would, but nothing great, or worthy of a great man, was ever accom-plished without hoth these. What a field was opened to the fancy by the junction of sculp-ture with architecture ! Nearly every other ture with architecture! Nearly every other anything within the range of sight, or thought, or conception, which might not be of use to the architect, or in which an interest might not the arenized, of in writen an interest input have be awakened to the advantage of his art? The whole animal, vegetable, and mineral kingdom heat down hefore and was at the disposal of the architect; and as there was nothing in life, so there was nothing in lifelessness which had not it have a bin and it writt. Now that their its lesson for him and its gift. Now, that their art presented all those materials to them, they had already much to rejoice in; but they had more to rejoice in hecause all these were submitted to them not to be dissected and analyzed, but to he sympathised with, in order to hring out what might be called the moral part of their imagination. They had seen that if they kept our wat might he caned the moral part of their imagination. They had seen that if they kept among lines and proportions only, they should have cause to envy the naturalist, because he was conversant with facts ; hut they would have conversant with facts; in they made themselves conversant with feelings arising out of his facts. conversant with reeining arising out of instance. Their work was always with the living creature; the oue thing they had to get at in him was his way of living,—his mode of going ahout things; hut in order to sympathise with living things, you must be familiar with them. We frequently we called them we consider the responsibility yon must he familiar with them. We frequently are silent when we consider the responsibility that may attach to words, of which he chance is that icw will he heard at all, or, if heard, will be forgotten; hut none of our words would be unheard or forgotten if we takked well. Let him talk well in his works, and the artist would he remembered long after he was gone; let him build large euougb, and carve boldly enough, and all the world would hear him. Let him see that his work was happily done, or it never would make any one cles happy; let him be influenced but by one noble impulse, and let that impulse he love—love for the art he prac-tises, and for the creatures to whom he ministers that impulse he love—love for the art he prac-tises, and for the creatures to whom he ministers it. They might rest assured that if over any other motive than love for the art they practised became the leading one in their mind, that mo-ment it was all over with their art. He did not say that they were uot to desire mocey, or fame, or position; they could not but desire all three; nay, they might (if they were willing to allow him to descemate the word love for a moment),—they might love all three,—that was, earnestly covet them; but they must not do that in the first place. The question was one or did their desire for gain lead them? They or did their desire for gain lead them? They They if it or did their desire for gain lead them? They might like making momey exceedingly, but if it came to a fair question of whether they were to make 5007. less upon a business, or to spoil their building, and they chose to spoil their building, it was all over with their art. They must love art for its own sake, and if they allowed the desire for money, for fame, or for position to take precedence over the love of their art, they were not in the true score artists, their art, they were not in the true scnse artists, --they were mechanics and drudges. In the next place, they must love the creation they work in the midst of, for wholly in proportion to the intensity of feeling with which they approached to the subject they had chosen would be the depth and justice of their percep-tion of its character; that perception was not to be gained at the moment they wished to hring it to hear, but must be the fruit of au intimate feeling of love and sympathy. He hring it to hear, but must be the fruit of au intimate feeling of love and sympathy. He could not caution his hearers too forcihly to keep clear of petty, mcan cares; whatever they did, let them not fill their heads with little ohagrins and little desires. It was possible they might get into a habit of saving money; that at a time of great trial they might yield to the temptation of speaking ill of their fellow artist; but they would shorten their powers and dim their brightness even hy this. Let them dim their brightness even hy this. Let them keep themselves quiet and peaceful, with their eyes open. They might be anxious for the good opinion of Mr. So and So; hut it did not matter what Mr. So and So thought of their

work: it mattered only what the hirds were work: it mattered only what the birds were doing up there in their nests: it did not matter whether the workman would do what they wanted him to do, it did matter what that little ragged urchin was doing at the corner of the struct, or the children who were gambolling in the down Unless they mere in the held of the doorway. Unless they were in the habit of long watching hirds and children, they could not sympathise or feel with them. In order to have a duc appreciation of nature, they must accustom themselves to see it in all its phases. arctision inclusives to see in an in phases. The highest nobleness was commonly among the poor, the aged, and the infirm. It was not the strong arm of the soldier, or the health of the young heauty, that were the hest studies for art. It was not in the church pews, where the gay dresses were, hut in the church free scats, where the widow and the mourner were, that they would discover the finest feelings of nature por-Lastly, they must love the creatures to trayed. Lastly, they must love the creatures to whom they ministered,—their fellow-men,—for if they did not love them, they would he little interested in the passing events of life, and he apt to he struck only hy the outside form, and not hy the interior. If they would be great, let them he also kind. So soon as they desired to build largely, they would find that their work must be associative; one could not earve a whole cathedrah himself,—either their own work must he disgraced, or they must raise their traved. must be disgraced, or they must raise their fellow-designers to some correspondence of power. They would take the lead in disposing of their building but they must the table power. They would take the lead in disposing of their hulding, hut they must trust to the genius and inventiou of others in the disposal of its detail; and in doing this, too, they must rejoice in the very powers that may promise to rival them. If they endeavoured to depress or disguise the talents of their subordinates, they were lost to their art, for it was their own pro sperity they were seeking, and their own pro-sperity they were setting to perpetuate. He placed no utopian standard hefore them; he had said that they must surrender their own pre-eminence to their love of huilding, and whom-soever they found hetter able to do what would odown it that they must be the sure the adoru it than they were, that person they were to give place to, and rejoice at seeing their cellice growing more heautiful under his elisel, and next rejoieing that they had done kindly and next repoteng that they had done kindly. The man who sees expacitly in another, and does not acknowledge it, or assist in hringing it forth, is not the refuser of a kindness, hut the com-mitter of an injury. They had the sweet con-sciousness that as their art embraced a wider field than all others, so it was more profound and holy than all others. The artist when his pupil is perfect, must see him leave his room that he may nursue his destiny perhaps as an pupil is perfect, must see him leave his room that he may pursue his destiny perhaps as an opponent in toil; the man of science wrestles with the man of science; hut architects alone were called hy kindness to fraternity of toil. Those massive piles which rise above the domestic roofs of our ancient eithes have a meaning more profound and true than is com-monly attached to them. Men say they are good for worship,—but so is every mountaiu, iglen, and rough sea shore; they have the indis-patchle and distinguished glory that their mighty walls were raised hy men who have given and to each other in their weakness, and the tstrength of their structure has its foundations om manly friendship which conduces to awaken non manly friendship which conduces to awaken the sweeter cadences and symmetry of the uhuman soul.

CHURCH-BUILDING NEWS.

Kingston-upon Thames.—The church of St. Mark (Surhiton), in the above parish, has heen oppened for evening service, having been fitted up for gas hy Messrs. Hart and Son. The fifthings include ten hrass coronas in the nave, of whelve hurners each, and three larger in the transept. The chancel has two rich brass pen-alants, containing thirty-six jets, with foliage of while passion-flower leaf. The coronas arc sus-epouded from ornamental hrackets, fixed under the elerestory windows, illuminated with ver-dmillion, ultramarine, and gold.

) Wishech.—The parish church of St. Peter and St. Paul, Wishech, in Camhridgeshie, was meepened on the 20th instant, after a thorough restoration of the interior. This clurch is an sectoration of the interior. This church is an hybject of interest to antiquaries and ecclosiolo-izists. It consists of a double nave with aisles,

and a double chancel. The tower is attached of Mr. R. Drury. The design is foliated in to the north side of the church. The work is of various dates. The charcels are both of the Decorated period, to which also helong the exterior walls of the aisles, hut the aisle windows are of very late Perpendicular work. The areades of the nave are of three distinct dates, viz. the north areade, Norman, with very slender shafts; the central areade, Perpendicular; and the south areade, Decorated. The church has for a long arcade, Decorated. The church has for a long time heeu in a most unsightly aud even dangerous state, crammed with hideous pews, and two tiers of galleries, and hanked up outside with soil to the window-sills. In 1853, plans were obtained from Messrs. Clover and Smith, of Norwieh, architects, for refitting the interior, and effecting the state of the state of the state of the long the repairs most urgent, but it was not till 1856 the toparts more to gette, but it was not entries that the parish was in a position to commence the work, which was then placed inder the control of Mr. Slater, of London, and executed under the immediate superintendence of Mr. W. Smith, one of the architects originally employed, and Mr. J. Butler as clerk of works. The and Mr. J. Butler as clerk of works. The whole of the galleries have heen removed, and the church has been reseated with oak henches of simple design, with pulpit, prayer-desk, lectern, and chancel-seats of richer character. The chancel ceiling has been fresh panelled, and the ancient carvings, which had fallen into the the another carvings, which had rated into the possession of a townsman, have been restored by him, and replaced, and the requisite uew supplied. The east window, a special gift, has heen renewed, from a design of five lights hy Mr. Smith, and filled with stained-glass hy Messrs, Hardman, of Birmingham. The church is lighted with gas, the standards heing from Messrs. Skidwore's, of Coventry. The organ, an old and valuable one by the celebrated Harris and Greene, has been removed to the east end of the south aisle, and refitted by Messrs. Hill, of London. The cost of the works has been about 3,000/. hesides the cast window, 400/. about 3,0007. hesides the cast window, reset. The general contractor for the works was Mr. Ringham, of Norwich. The elnrch affords accommodation on the floor for 1,600 persous. Watsall.—A special meeting of the local

Walsall.—A special meeting of the local Burial Board was held at the Guildhall last week, for the purpose of opening and consider-ing tenders that had been received for the week, for the purpose of opening aud consider-ing tenders that had been received for the crection of chapels, entrauce-lodge, &c. on the grounds of the new cemetery. Ol six tenders, the choice lay between those of Mr. Walter Heaps, huider, Walsall, aud Mr. C. Burkett, of Wolverhamp'on; the former offering to do the work creditably for 1,5442. the latter for 1,5432. The Board resolved on accepting Mr. Burkett's tender. tender.

tender. Sheffield.—The parish church was lately re-opened. The changes made are chiefly the removal of obstructious, and a step towards restoring the church to its original form. For many years, the centre arches under the tower have heen blocked up hy the organ, thus making an entire separation hetween the chancel and the nave of the church. The gallery of the north transect and a number of useless of the north transept, and a number of useless pews in the transept, have now been removed, and the organ is placed near the floor of the north transept. The arches under the tower are again opened, revealing the old view of the artign opened, revealing the old view of the entire church from east to west. A further obstruction to the view is removed in the old pulpit-a heavy and cumbrous structure.

has been replaced by a light pulpit, which stands at the foot of one of the piers of the tower. The western pews are carried forward, so as to fill up the old passage hetween the doors which have heen closed, and the space it occupied is

colonrs

Eston (Yorkshire).—A Congregational Chapel is about to be erected at Eston, a rapidly in-creasing village in the heart of the Cleveland ironstone district, situate hetween Redecar and Middlesborough. The edifice will be hull of the storm of the district in the New Ford English Middlesborough. The edifice will be hull of the stone of the district, in the Early English style of Gothie architecture, and have a helfry on the north galle. Mr. Oliver, jun. is the architect.

DISCOLOURATION OF STONEWORK

In the last number of your journal I observe a prespondent complains of the formation of a green these or mose (a microscopic specimen of an alger) on some recent stonework. I should recommend that the walls be washed over with a dilute solution of bichloride of mercury (corrosive sublimate), say, half

bichloride of mercary (corrosive sublimate), say, hali an ounce of the salt to one gallon of water. Arsenious acid, also, dissolved in a weak solution of common pearlash, wond most probably effect what your corre-spondent wishes. The cause of the "green" appearance would be various. It may rest with the stone itself,—the latter heing perhaps, from its chemical composition or physical structure, especially adapted for the retantion of organic matter, and the germs of minute crypto-remous place. gamous plants.

Again, the presence of hygroscopic moisture may tend to encourage vegetable life, or the drain to which your correspondent refers, having some slight leakage or gaseous emanation, may furnish the predisposing infl icnec

It might be well to know more concerning the nature of the stone, and of the class of diseases most prominent in the neighbourhood.

WENTWORTH L. SCOTT.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

At the ordinary meeting of the Institute, on Monday, the 26th (Mr. Godwin in the chair), Mons. Didron, ainć, of Paris, was elected Hon. and Cor. Member; Mr. Henry Shaw, Hon. Memher; and Mr. John Thomas Christopher, and Mr. Joseph Gale, Accounts Associates

The discussion on the various methods of indurat-The unknown on the various factorial mathematical and preserving stonework was then resumed, by the reading of a paper by Mr. de Witt, on the chemical part of the subject, in reply to Mr. C. H. Smith. Papers by Mr. Huskisson (Tonbridge Wells), Mr. Ransome, and Mr. Daines, on their several pro-Cesses were read, and statements were made by Mr. Barrett and Mr. Page. To these we shall refer here-after. Mr. Jennings, Professor Tenant, Mr. Burnell, and others took part in the discussion.

and others took part in the discussion. Reference heing again made to the stone work of Buckingham Palace, Mr. Dines, on the part of the representatives of the late Mr. Thomas Cubitt, de sired it might he understood that Mr. Cubitt had always objected to the use of the stone which was

always objected to the use of the stone which was employed, and merely objected orders. On the announcement of the subscriptions already received for a memorial of the late John Britton, to be placed in Salishury Cathedral. Mr. Ferrey suggested that, as works were going on at the church of Kington St. Michael, the place

of Mr. Britton's birth, the restoration of a part of the church would he a hetter mode of appropriating the subscriptions.

GAS WARMING AND VENTILATING APPARATUS.

THE great extension of the use of gas in dwellings THE great extension of the use of gas in dwellings and places of husiness now absolutely requires the general adoption of something like a civilized mode of gas-ventilation,—as requisite in rooms lighted of heated hy gas as chimneys are in those containing grates and sloves. Nothing but the general introis have heen closed, and the space is occupied is allotted to an inner porch, crossing the western end, for the convenience of the three new doors. The alterations have heen carried out under the direction of Mr. T. J. Flockton, architect, under whom Messrs. Dutton and Heald have heen the argues ase, mere smoke is more on less converted into the well-known means by which, in France especially, Shaw, of Saddleworth, has furnished the new pulpit and reading-desk. The churchyard at the western end of the church has heen lowered and asphalted hetween the grave-stones, so as to give good access to the new doors. These alter-tations have heen earried out by subscription, and have cost between 600?. Alt 700%. It is the intention of the Rev. Dr. Sale, the vican. The window is already in progress, in the hands

relates to the warming as well as ventilating of apart-ments through the ordinary chimney, by means of gas apparatus. This double purpose is at present pro-posed to be effected in a mode which has been patented by Mr. Adolph, of St. Mary axe, who recently exhi-bited his apparatus in operation at Bucklershury. The invention, as described in the *Morning Herald*, com-cists of a arroll here, or the hearth containing the ras bitch his apparatus in operation at Bocklersbury. The invention, as described in the Morning Herald, con-sists of a small hox, on the hearth, containing the gas jets, the top covered with tale. At one end of this hox there is an aperture to admit the air for support-ing the combustion of the gas. Another aperture at the opposite end communicates with a tube passing in a spiral through the bot-air hox, and finally out at the chinney. Through this tube the whole products of combustion pass, raising the temperature of the air surrounding it, without in the least contaminating it. The dry air as it is heated passes out into the room through two perforated plates at the top of the hox, its place heng supplied by cold air admitted at the lower part. There is also an aperture at the top of a manner as to occupy the position of an ordinary store. It is also contemplated to distribute the light from the gas-jets about the room by means of com-pound reflectors. Au equal temperature of 60 deg. Fahrenheit may thus, it is said, be maintend in a large room at the cost of about ½d. per hour.

ON SUBMARINE ELECTRIC TELEGRAPHS. INSTITUTION OF CIVIL ENGINEERS.

As a meeting of the Institution, held on the 13th inst. Mr. I. K. Brunel, Vice-President, in the chair, the paper read was "On Submarine Electric Tele-graphs," by Mr. F. R. Window. In a hrief relation of the early history of the Suh-marine Electric Telegraph, it was stated not to have heen the invention of any one person, but rather the result of the combined researches and exertions of mean expressionedness. The first meeting that the result of the combined researches and exertions of many experimenters. The first mention that the author had been able to find of any method of suffi-cically insulating wires as to enable them to conduct a eurrent when submerged in water, was, in an account of some experiments made in India by Dr. (now Sir W. B.) O'Shanghnessy, in IS30, recorded in the Journal of the Asiatic Society. In these experiments the wire was covered with tarred yara, and cuclosed in a split ratan, which was again enveloped in another coating of tarred yara. Shortly after this (in 140), Professor Whentstoner

euveloped in another coating of farred yarn. Shortly after this (in 1840), Professor Wheatstone gave it as his opinion, expressed hefore a committee of the House of Commons, that a submarine commi-nication between England and France was practicable. And in Octoher of the same year, a paragraph in the "Balletin de l'Acadfanie Royale des Sciences de Bruxelles," stated, that Professor Wheatstone had discovered a means of joining Belgium and England by a submarine telegraph. The nature of the dis-covery was not, however, mentioned. All these ex-periments were made previous to the suggestion of Professor Faraday to use as an insulating agent gutta pereha, which, up to the present time, has heen Professor Faraday to use as an insulating agent guita percha, which, up to the present time, has hean universally employed. An extract from an American newspaper was given, containing an account of a sub-marine tolegraph stated to have been successfully con-structed by Colonel Colt, from Hell Gate to Fire Island, and in which it was also said that the same gentleman had applied to the United States Govern-ment for funds, for the purpose of forming a tole-graphic line from America to Earope. In 1848 a submarine telegraph wire, insulated with guita percha, was laid by Lientenant Siemens, of the Royal Prussian Artillery, under the Rhine, from Deutz to Cologne, a distance of about halfa-mile. And in January, 1849, Mr. C. V. Walker towed a similar wire two miles in length out to sea, of Bover, and sent signals to London through it.

towed a similar wire two miles in length out to sen, off Dover, and sent signals to Loadon through it. In August, 1850, a gutta percha covered wire was laid hy Mr. Wollaston from Dover to Calais, through which signals were sent with success, but it lasted perfect only about twenty-four hours. On the 25th of September, 1851, a cable, con-sisting of four insulated wires incased in a sheath of ten No. I iron wires, was laid down from Dover to Calais, hy Mr. Crampton, assisted by Mr. Wollastou, and was stated to have remained perfect to the pre-sent time. sent time

sent time. The author discussed the respective merits of the compound cable system, or the collection of many insulated wires into one cable, as in the Calais and Ostend telegraphs, and the simple cable containing but one wire, as in the lines of the International Telegraph Company to flolland and Ireland: the greater facility which these latter afforded for repair, and the less chance of having the husiness stopped by rupture, since one wire only, and not all, would be affected by the cause, was pointed out; and it was shown that the cost of the two systems did not materially differ. mat

then theoretically investigated, and it was shown that a considerable difference as to time existed between the transmission of signals upon suspended wires, and upon insulated wires immersed in water, or huried in the earth ;—that while with the former it appeared that the only limit of practical speed was the possibility of decipiering the signals; in the latter the electric current required an appreciable period of time to arrive at its destination, and an-other longer period to escape from the wire into the earth, and that this period of time intereased regu-larly with the length of the wire; consequently, upon a line formed of submerged wires of considerable length, there would always he a limit of possibility any with the formed of submerged wires of considerable length, there would always he a limit of possibility of the number of signals that could be transmitted in a given time. These effects were stated to he caused by lateral induction, the insulated wire as-suming the nature of a Leyden arrangement of vast dimensions, where the copper wire represented the inner coating, and the film of moisture surrounding the gutta percha acted as the outer coating. The author argued, that since submarine lines were more costly than suspended lines, and nevertheless a smaller amount of business could be sent along them in an equal time, it was important that no paius should be spared, whereby this lateral induction, and consequently the evils arising from it, night he reduced; though, being in accordance with a law of nature, it could not be entirely avoided.

BERWICK CORN-EXCHANGE COMPETITION.

WILL you kindly, by circulating this little ditty WILL you kindly, by circulating this little anty amongst your readers, give a chance, to such of them as competed for the Berwick Corn-Exchange, to get rid of their superfluons indignation by singing it to the tune of the sum expended by them on their design? <u>A</u> COMPETITOR.

- Sing a song of Corn Exchange, Barley, wheat, and rye, Pive-and-fifty architects Competing for "my eye?" Now the drawings are seut hack, Needs must that I sing, The Berwick competition As a very noble thing.

- The treatment is at his desk, Grinning at the money; Directors sitting at the Board, Looking very funny; To think so many architects In greeness were agreed, To make ont plans, and pay their freight To Barwisk-upon. Tweed.
- To Berwick-upon-Twee
- " I'll tell you," quoth a jolly man, " The only way that we " Can show our sense of this expense " And labour that we see.

- "And isour that we see. "We must choose one from this here lot, "I'm very much afraid : "That done, we'll then send hack again "The rest, with freight unpaid."
- The resolution passed *nem. con.* The Board were much amused, To think how all these architects Would feel themselves ill-used.
- Wolld teel them read this song, If any of them read this song, I'm sure they'll wish good speed, To the Corn Exchange Directors At Berwick-upon-Tweed,

the noyal Prussian Artillery, under the Rhine, and Durt, and Ling, a distance of about helfs, the And in January, 1849, Mr. C. V. Waker Moor, and sent signals to London through if. WOLVERHAMPTON WORKHOUSE COM. PETITION.

As it was announced in your Journal of the 17th instant that the design of Messrs. Bidlake and Lovatt, of Wolverhampton, was selected from amongst several submitted for the inspection of the Guardinas, we wish it to be understood by the profession at large that none of us submitted designs for the competition in concetion question.

question. The Guardians having determined upon allowing to the successful competitor a commission of *four per cent. only*, we declined acceding to their terms, and, at a meeting which we held upon the subject decided upon, and addressed, the following letter to the Recet. the Board

the Board. [The letter urged that the time allowed for sending in plans for the enlargement of the workhouse should be extended, and also that the architects' commission should be at the usual rate of five per cent. upon the outlay, instead of four, as stated in the advertiserreut. It said.-

You will perceive that Messrs. Bidlake and Lovatt tached their signature to the letter; and yet, with a coss violation of good fuith towards us, they ultimately gided upon accepting the terms of the Board by nding in designs

This useless for architects to complain of the unfair extment they receive as competitors, if there be not little unaumity of action amongst themselves. That our letter addressed to the Board of Guardiaus

et with responsive feelings from the majority of ofessional men in this neighbourhood, is made bickstona men in this reignoutraood, is made likat by the fact of there being but four designs at ic, not one of which met with the full approval the Board, or was considered as adapted to their uposes; in fact, on this account several of the nordians declined voting for any of the plans sub-lified (Simred). itted.

(Signed) ROBERT EBBELS, GRIFFIN and WELLER, Architects, J. R. VEALL, EDWARD BANKS, Wolverhampton, Jau. 27, 1857.

STAINED GLASS

South Wales.-Mr. Clutterhock has just completed é casteru triplet for the new church of Llandugwydd, ar Cardigan, rehuilt in the First Pointed style. The ree lights contain nine medallions, illustrative of ir Saviour's life ; intermixed with geometric patterns. recompose containing metadomics, inflattative of its Asiour's life; intermixed with geometric patterns, ne subjects are arranged as follow: --1. "The numeriation;" 2, "The Birth;" 3, "The Bay-n;" 4, "The Last Supper;" 5, "The Agouy in a Garden;" 6, "The Crucifixion;" 7, "The ital;" 8, "The Resurrection;" and, 9, "The scension." The same building is also being curiched th eight painted windows, from Mr. Lavers's hadio. The four side lancets of chancel and south nations to the church. The two west lancets and rge sixfoll over same are memorial windows to a te parishioner, and exblitt in the two lancets four of a works of charity; viz. "Hungry, and ye fed me;" "Hinsty, and ye gave me drink;" "Naked, and clothed me;" "Sick, and ye visited me;"-well awn, richly coloured, within geometric patterns, of uich the sixfoll is also composed. For the neighbour-; church of Llanfair, Nantgwyn, restored in the awn, richly coloured, within geometric patterns, of wich the sixfoll is also composed. For the neighbour-g church of Llandri-Nantgwyn, restored in the hiddle Pointed style, Mr. Lavers has also excende e windows, all heing the gift of the lay-impropriator. are cast window, of three lights, contains the subject I the Crucitistico in the centre, and on either side the are Marys, and SS. John and Joseph of Arimathca, d the good centurion, under rich campies and isalle background. The south window of chancel tains armorial bearings; and the two west windows ϵ q quarry glass, with the cablems of the four Evan-mists. The third church in the same locality, which now being filled with Mr. Lavers's glass, is the new area of Aberporth, rehuilt in the Middle Pointed clc, and containing three painted windows; the two-th windows, south of chancel and west of nave; her tacety, are filled with geometric glass, both is; and the cast of chancel, a three-light window, the three quartefolls in the head, is also filled with barnetize glass; the ceatter light containing a large awing of the Assension of our Lord, with the liblems of the Triuity, Holy Lamh, and the Peclican, set of Mr. Withers, architete.

LAYING OUT NEW STREETS. BOARD OF WORKS.

BOAID OF WORKS. It's a meeting of the Board, on the 23rd inst. Mr. gight moved the adoption of a report from the Con-tate of Works and Improvements, recommending—-"That the designs which may he sent in to the ard by the several competitors, showing the best de of laying out the surface and subsoil of the v streets, and other particulars described in the control of the Board of the 16th of January, he marred to a committee of seven persons, consisting folur professional men, and the chairman und two ere members of this Board.

"I' That the Committee of Works he authorised to thet four professional men for that purpose, and that B Board do nominate the two members to he asso-ted with the chairman."

effed with the chairman." Mathe proposition led to an animated conversation, in which it was urged that if this proposition was adopted awould be a public declaration that the Bourd was hithing of common sense, and could not decide which the the best plan that might be submitted to them. "Major Lyon moved, as an amendment, that two origonization in the scletted, instead of four, to assist communities

THE BUILDER.

in Paris, he felt impressed with the fact that the sub-ject of sub-ways was by no means developed. Ultimately the original motion was earried by a majority of 13 to 10.

BUILDERS' BILLS. HANNAFORD V. HILL.

This was an action at the Sheriff's Court, Mid-dlesex, hefore Mr. Undersheriff Barchell, brought by a slater, to recover the sum of 182. from the de-fendant, who was a builder, for a large slate eistern espable of holding about three tons of water. The defoudant resisted the claim on the ground that the eistern was inefficient for the purposes for which it was intended.

estern was incellicent for the purposes for which it was intended. It appeared that the defendant contracted to do certain work for the General Apothecaries' Company, 49, Berners-street, Oxford-street, amongst which was the fitting up of two slate eisterns, one a small one, and the other large enough to hold 900 gallous of water. The plaintiff undertook to make and fix them up for the sum of 18. 18s. He put them up; but when the large one was finished, objection was taken to it as too weak to hold the water. Some strengthening bolts and fillets were then added to it; but when it was fully charged, it leaked at the side and at the bottom. The plaintiff was applied to, and he had something further done to it to strengthen it, but the defendant ultimately rejected it, bad it taken down, and another put up by another tradesman. The plaintiff accounted for the leakage by the settling of a new wall apon which it rested, which opened one of the joints of the tank; while the defendant's wit-nesses said it was beceuse the sides and ends did not fit into the grooves, hut, on the contrary, they were filled ub with nutty. A hore amount of evidence It into the groove, but, on the contrary, they were filled up with puty. A large amount of evidence was given on both sides, when the jury returned a verdict for the plaintiff for the amount elaimed, 18/.

THE BLASTING OPERATION AT HOLYHEAD HARBOUR,

THIS operation, meutioned iu our last but one, took place ou Friday, the 16th inst. under the personal direction of Nr. Charles Rigby, assisted hy Mr. Reithei-mer, the resident augineer of the firm. It is computed mer, the resident engineer of the firm. It is computed that above 120,000 tous were hrought down and hroken into masses ready for londing by this explo-sion. The aggregate charge in the four chambers, acting npon a face of 210 feet in length, 115 feet in height, with a line of least resistance of about 25 feet, was 16,000 lhs. of ganpowder. The voltric battery was placed a sbort distance from the quarries, and the spectators were within a protected hattery or observatory in front of the unountain at a distance of and the speciators were within a protected haitery or observatory in front of the montain, at a distance of only 600 yards from which they were enabled to witness the explosion without danger, not a stone having been propelled 100 yards from the face of the quarry. We may here mention that nearly 6,000,000 tons of stone have been already dislodged by this means for the construction of the harbour, without failure and without accident. In the mining opera-tions which take place for this purpose, the quantity of gunpowder used annually exceeds 500,000 thes or more than 250 tons, and the stone deposited in the sca. for the formation of the rubhle foundations and The second secon

small portion of which is walled in and finished, the rest heing a rough emhankment covered with piles and senfolding. The present cost to the country is about 700,000. The water shelter now provided by the new harbour is about 370 aeres, in which upwards of 200 vessels have at one time anchored. About 280 earth waggons and trucks, and eight loceomotive engiues are in regular use; and employment is given to about 1,000 persons, at a cost of about 1,000, per week in wages. The consumption of powder is about 200 tons per annum: the quantity of rock thrown into the sea is about 4,000 tons per working day, or over 1,000,000 tons per annum. The length of em-bankment already made is about 7,000 feet, and it takes ahout 1,000 tons of rock to extend it 1 foot into the sea. into the sea.

a committee. IMT. Alderman Cubitt, M.P. seconded the anneld, Lat, and said from what he had seen of subways in R. Rue de Rivoli and in the Boulevard de Schastopol, at their half-yearly meeting on the 5th of February.

THE SHEFFIELD NEW SCHOOL OF ART. THE SHEFFIELD NEW SCHOOL OF ART. THE SCHEFFIELD NEW SCHOOL OF ART. THE acw building for the Shefield School of Art was occupied by the annual meeting of subseriburs held on Thursday in last week. The entire cost of the new premises, including site and fittings, is 7,1007, of which 1,6007, are still to be realized. The ground is of irregular form. Fronting to Arnudel-streed it ins a width of 47 feet, and at this width it extends backwards for 55 feet. Then the ground widens to the extent of 72 feet, and at this width it extends backwards 78 feet to Arnudel-lane. The principal frontage, therefore, is 47 feet, the back frontage 72 feet, and the depth from front to hack 133 feet. The matural position of the ground is a very steep descent from front to back, and this bas afforded the facility for a basement story behind, ou the level of Arnudel-lane. The front of the building is in the Byzantine and Romanesque style. It is built of coloured brick, relieved by stonework. The front door opens into a hall 25 feet 3 inches, by 18 feet 3 inches, and 16 feet high, lighted by two windows on the right side of the door. From the front door a corridor runs through the front and centre portions of the building is into the due at the Arnudel-lane front. To the left of the door is the council-room, 34 feet by 19 feet, with windows to Arnudel-street. Brhind the entrance-hall, and to the right of the corridor, is the ground the annual contracted for the skord of the stairrase the original staircase. From the foot of the stairrase the ourdit-room, to the left of the corridor, is the principal staircase. From the foot of the stairrase the ourdit-room, to the skord the stairrase the ourdit-room the back and iffe school. At this part the huilding is contracted to the sake of leaving on each dank a court for the backel at the store at the brich is the ourder the skord of the stairrase THE new huilding for the Sheffield School of Art principal statutes. From the root of the staturesse the corridor crosses the centre portion, which contains the lecture theatre and life school. At this part the hulding is contracted for the sake of leaving on each flank a court for the hencht of side lights. On the left is the lecture theatre and life school, 35 feet by 33 feet. This theatre, and also the corridor, open into the elementary room, which, according to the local *Ludependent*, from whose columns we here quote, presents the greatest flat floor in the town. Its big to the floot of the statures, which is lighted from the root, we ascend by wooden starts, 6 feet wide, enriched by newells and oak moulded hand-rails, to the first floor. The staircase terminates in a corridor, eorre-sponding with that on the ground floor. Opening out of the corridor at the head of the stairs is the prin-cipal master's room, 19 feet by 18 feet. The Arundel-street front is occupied by the female school, 45 feet by 25 feet, with nine windows to Arundel-street. Adjoining this school are bonnet and cloak rooms, lavatory, and other conveniences. Over the theatre und life school is the painting room, 35 feet by 27 feet. The sculpture gallery is situated over the elementary room, and of the same dimensions. This room, 60 feet long, 39 feet wide, and 21 feet high to the flat ceiling, is lighted by a counter light from the root. An attic over the front part of the build-ing is divided into a number of studies for the prin-cipal and more advanced students. There are various other accommodations. The principal means of warming are two Gill stoves, manufactured hy Measra. Jobson Smith, and Co. of Scheffield. Two ventilating shafts, into which there are communications from the element of the various rooms, traverse the building from bottom to top, and with the aid of the Gill saints into the arcea are communications from the ceilings of the various rooms, traverse the building from bottom to top, and with the aid of the Gill stoves in winter, and of a small fire in summer, main-tain a current which carries off the foul atmosphere,

and allows its place to be supplied by pure air. Messrs. Manning and Mew were the architects, Mr. Mycock, the contractor, and Mr. French clerk of the works. Mr. Mycock's contract was 4,400*l*; extra charges about 1827.

charges about 1827. The annual meeting was held in the council room, and the report was read by Mr. Young Mitchell. It stated that during the past year the school bad fully upheld its high character. The council hoped the national schools of the town would avail themselves of the advantages held out by the Government for introducing art-education. The income for the past year had heeu 9847. of which 5107, was a grant from Government, 2557, were from sludents' fees, and 2037, from subscriptions. The report was approved of and adopted. of and adopted.

Miscellanea.

PROPOSED STATUE TO THE LATE MR. BROTHER-PROPOSED STATUE TO THE LATE MR. BROTHER-rox, M.P.-A large and influential meeting was held in the Town-hall, Manchester, on Monday in last week, presided over by the mayor of Salford, when it was agreed that a marble or bronze statue in honour of Mr. Brotherton (who died so suddenly in an omnibus a few weeks ago) should be creeted in Peel Park, Salford. Between 9007, and 1,0007, were sub-scribed towards the object at the meeting, the mayor of Manchester and several other geutlemon con-tributing 500, each.

NEW COTTON-MILLS AT BOLTON .- In 1856, five NEW COTTON-MILLS AT ISOLTON.—In 1856, 1976 new cotton-mills were commenced in Bolton and the neighbourhood, says the *Manchester Courier*, namely, a large and handsome mill at Gihow, for 65,000 spindles; one in Westkoughton, for 30,000 spindles (all by Mr. Woodhouse architect). and is Genet Helter spindles; one in Westhoughton, for 30,000 spindles (all hy Mr. Woodhonse, architect); one in Great Bolton; and one in Little Bolton. There are about to be erceted at least four other new mills, one in Halliwell, for 40,000 spindles; one for 30,000 spindles, near Tamper's Hole; one at Farnworth, for 30,000 spindles (all hy Mr. Woodhouse, architect); a large one in Halliwell (by Mr. Holt, architect); and the Mount Pleasant Mills, which have been standing a considerable time, are undergoing alterations, under the superintendence of Mr. James Lomax, surveyor. will make an addition of ten mills, and others are spoken of. LABOURERS' DWELLINGS IN LIVERPOOL.

LABOURDER' DWELLINGS IN LIVERPOOL. — The block of buildings in Northumherland-street and George-street, Totteth-park, creeted by the local association for the improvement of such dwellings, has now here completed. This is the first hlock of forty model üwellings to which the project ex-tends. The company was formed in 1854. It was originally under the metropolitan charter, hut was the first hlock of originally under the metropolitan charter, hut was subsequently registered as a limited liability company. Albert cottages, a similar undertakin Inc Albert cottages, a similar undertaking, in Frederick-treet, had conferred a great social benefit, and proved estisfactory as a pecuniary investment. For the Northumberland-street scheme, nearly 800 shares, of 254, each, were taken. The plaus were submitted to the Health Committee of the Town Council whe encoursed of them and we have subsubmitted to the Health Committee of the Iown Council, who approved of them, and male some sug-gestions as to the arrangements. The huildings have cost nywards of 6,000t. Detailed plans and a sketch of the elevation, have been lithographed. The dwell-ings are various in accommodation : they contain, healtds the living room, one, two, or three hedrooms. Gas is introduced into the living rooms throughout, the intermediate of the scalled with a conflorm with Gas is introduced into the living rooms throughout, and each dwelling is supplied with a scullery, siuk, water-tap, shelves, plate-rack, larder, coal-place, and water-closet; and there is a common dist-shaft. The access is by a fire-proof staircase. Ventilation and drainage have heen specially attended to. There are general washing-rooms in the basement, and dry-ing-rooms in the roof. Near the washhouse there is a bath-room, and a large room is maneoristical to pr a bath-room, and a large room is appropriated to an infant-school.

FALLING IN OF THE PORTWOOD NEW BRID FALLING IN OF THE PORTWOOD NEW DAIDES, STOCKFORT.—Oon Monday in last week considerable alarm was created by the giving way of the new stone bridge now in the course of creation over the river Goyte. The bridge was in a very forward state, having been turned on each side nearly to the centre, ready for the key-stone. Five of the workmen were engaged on the arch, when Peter Wilson, the for-men bestime something crack under him ou the man, hearing something crack under him ou the Portwood side, communicated his fears to the person next to him; and, on looking, observed that one of the holted heams had split, and the dependent framework was giving way in consequence. The next moment he felt the stone work sink: he gave a sudden spring into the water, and instantly the bridge sudden appring into the water, and instantly the of tage fell, leaving nothing but the butteress stauding. Two of the men escaped, and the other three were but slightly injured. The npper portion of the arch, having fallen inwards, struck the corbels of the hut-tresses, and hroke them off. The damage, it is ex-pected, will not exceed 2007, and the contractor is not limited as to time.

SCOTTISH AGRICULTURAL DWELLINGS IMPRO SCOTTSH AGRICULTURAL DWELLINGS IMPROVE-MENT ASSOLATION.—The anonal meeting of this Association was held in Edinburgh last week; the Duke of Buccleuch presiding. Sir John Forbes read the third anuual Report, which stated that the Di-reetors had, in different parts of Scotland, been rectors had, in different parts of Securad, been urging the necessity of increased accommodation for agricultural labourers, and bad sent plans for cottage accommodation. He congratulated the meeting on the beneficial results which had followed the operthe benchmain results which had followed the opera-tions of the Society during the three years of its existence, and the warm interest which was now be-ginning to be felt in its proceedings by noblemen and gentlemen in every part of Scotland. The Report was approved of, and the progress declared to he highly satisfactory.

BENDING SHEET IRON FOR BEAMS .- Mr. John Le Cappelain, ot New Bridge-street, has invented some alleged improvements in machinery for heading n into corrugated forms for constructing On the main shaft or axis of the power iron beams. there are three wheels with rounded rims. The axis or shaft is carried hy parallel bars, capa axis or snart is carried my parameter orfs, capable of being moved to or from each other. Above the three wheels there are two other similar wheels espable of adjustment. The sheet iron to be heat is placed on ledges or supports attached to the two side bars, and as; the iron is progressively heat, the two upper wheels come more and more between the lower wheels wheels,

VITAL STATISTICS .- An interesting return of the vital statistics of the metropolis during the past year has just been published by the Registrar-General. In has just been published by the Registrar-General. In the fifty-two weeks terminating on the 27th of December, 44,159 hops and 42,674 girls were born, and 28,894 males and 27,892 females died. Assum-ing the population in the middle of 1856 to have heen 2,616,248, the mortality during the past year was twenty-two in 1,000, which is lower than in any year except 1850, when it was a little under twenty-one in 1,000. It is computed that, with the addition of soldiers and scamen who have retarned from the scat of war, the population of London at the close of seat of war, the population of London at the close of 1856 was 60,000 more than it was at the close of

EXPERIMENTS BY THE PATENT TIMBER-BENDING EXPERIMENTS BY THE PATENT TIMBER-BENDING COMPANY --Some experiments in bending timber for various useful purposes, lately took place in the pre-mises of Messrs. Collinge and Co. Bridge-road, Lam-beth. The experiments are said to have hece carried the adoption of the new node of bending into a per-manently set form every kind of wood into any shape. Amongst tosse present were, Admiral Best, Admiral Sharpe, Captain Carnae, R.N.; Captain Edmunds, R.M.; Captain Mackinaon, and several others. One experiment consisted of a small specimen of oak; R.M. Comparison consisted of a small specimen of oak, which is said to have heen quickly hent into the form of a hoop, which was afterwards straightened, and eventually turned inside ont. Another experiment consisted of a large oak ship's floor timher, 12 inches by S inches, which was in a quarter of an hour bent into a right angle. The cost of curved wood con-sumed in the British islands under the present method sumed in the British islands must be provided and of supply in its natural condition amounts, it appears, to at least 5,000,000?. sterling per annum, partially and be the waste of that method. The new to at to at least a joynous set ing per annum, per any per an occasioned by the waste of that method. The new process of hending timber will it is said, reduce the cost of ships of all sizes 25 per cent, and greatly increase their strength and durability, by avoiding the necessity for using cross-grained wood

RAINARY MATTERS. – A railway from Durham direct to London, is talked of; capital, 4,000,0002. it is desigued exclusively for the earriage of coals and other minerals, bully 2004s, cattle, and agricultural produce, and to be named the "Northern Coal Rail-way." — The traffic returns of the railways in the other minerals, hulky '27ds, cattle, and agricultural produce, and to be named the "Northern Coal Rail-way." — The traffic returns of the railways in the United Kingdom, for week ending January 10, amounted to 387,9512. and for the corresponding period of last year, to 364,2517, showing an increase of 23,7007. The gross receipts of the eight railways having their termin in the metropolis, amounted to 161,4017, and last year to 154,6377, showing an increase of 6,7647. — The increase on the Eastern Counties amounted to 2,2457, on the Great Northorn to 7898, on the Great Westorn to 0592, ion the London and North-Western to 3,5427, on the Lon-don, Brighton, and South Coast to 2569, iotal, 7,1044.; hut from this must be deducted 917. the decrease on the London and Blackwall, 347, on the Great South. Western, and 2157, on the South-Eastern. The receipts on the other lines in the United Kingdom amounted to 22,65507, and last year to 209,0147, showing an increase of 16,0367. — Mr. E. Talbott, of Spring Vale, Staffordshire, has invented a peculiar construction of split or com-pond rails, "evolting him to manufacture half or split bars with perfect hearings or flanges, and which, when combined, have the required strength and struc-ture of ordinary raib.". — Mr. W. Rey of Manches-ter, has invented certain improvements in fixing or fastering rails of railways in their chairs. S. MARY'S, MOORTELDS.— The chapel of the "Stered Heart," in this church, was opened on the "Stered Heart," in this church, was opened on the "Stered Heart," in this church, was opened on the "Stered Heart," in this church, was opened on the mines and bus, green, havender, and deed white, with the dentils and capitals etched with gilding. The pinaters are of Sienan marble, and the lower portion of the walls in initiation of pauelled blocks of proger,

pliasters are of Sienna marble, and the lower portion of the walls in imitation of panelled blocks of jasper, Irish green, and Italian antique, with bases of Verd antique and Egyptian green. The altar is painted dead white, and has gold relieved with colours on the several mouldings. The panels are filled with arabesque ornaments, and the door of the tabernack arabsque ornancers, and the usor of the user lack has a painting of "The Sacred Heart," and instru-ments of the Passion. There is a painting on the wall above the cornice, of a "Pelican in her Piety," on a gold background. The works bare been in pro-gress for three mouths, under the direction of Mr. has a painting of "The ments of the Passion.

John Young, jun. architect. A Ilint on Lighting the proposed New Ilint NATIONAL GALLERY.—While lately travelling in Italy, I noticed a most excellent plan of lighting picture-galleries from above and helow; but I am picture-gainers from above and helow; but I am sorry I cannot remember for certain what towa it was in, but I thiuk Bologna; and I hope this will call the attention of architects to it, that they may visit and study it. It is decidedly a great "dodge," if I may use the vulgarism.—C. DE V.

[JAN. 31, 1857.

BRISTOL ATHENÆUM SOIREE .- A soirée was held in the Victoria-rooms, on Wednesday in last week The whole suite of rooms was engaged, and pictures, The whole suite of rooms was engaged, and pictures, drawings, pholographs, steroscopes, and other works of art and amusement diversified the proceedings. There were also music and dancing; and the president of the Athenaeum, and the Mayor of Bristol, and other gentlemen briefly addressed the assembly. On the following day the rooms were thrown open to visitors at a nominal charge, and large numbers of the inha-hitants availed themselves of the opportunity to inspect the numerous objects of interest collected within the building.

building. ART MANUFACTURE EXHIBITION AT EDINBURGH. ART MANUFACTURE EXHIBITION AT EDINBURGI. —After a hrief season, the first annual exhibition of the Art Manufacture Association of Scotland, in the National Gallery at Edinhargh, has closed. From its openiog, on the 13th of December last, it is esti-mated that it has been visited by considerably up-wards of 00,000 persons. In the course of the exhi-bition several evenings have been devoted to conser-saziones and lectures. Among the speakers and sah-jects have been,—Professor G. Wilson, "On the Application of Ornamental to Industrial Art." Mr. M. Wellwood, of Pitliver, "On the History of European Porcelain;" and Mr. C. H. Wilson, Glaggow, "On the Improvement of Ornamental Art."," and the concluding lecture was to be given Glasgow, "On the Improvement of Ornamental Art," and the concluding lecture was to be given by the hon. scoretary, Mr. A. Christie, "On the Objects of the Association in forming the Exhibi-

THE SOCIETY OF ANTIQUARIES OF SCOTLAND. THE SOCIETY OF ANTIQUARIES OF SCOTLAND. At the last meeting of this society, a paper was read, eutified "Poetical Maxims from a Painted Room in the Old House at Culross, called 'The Palace,' with Notices of the History of the Building and its pro-halle Foundar," by Mr. A. Jervise. In this paper Mr. Jervise described the old house at Culross in which the painted roof in question occurs, and adduced some reasons for sunvosing that it was erected by Sir which the panted root in question occurs, and annuclea some reasons for supposing that it was erected by Sir George Bruce, third son of Sir Alexauder Bruce, of Blairhall, in the end of the sixteenth century. One of the rooms, which has a carved roof, is lined with wood, divided into eighteen panels or compartments, but the filled with eighteen panels or compartments. all of which are filled with enriced y painted pictures illustrative of morality and virtue, with appropriate and quaint maxims in verse. Of these Mr. Jervise deciphered thirteen. Mr. Cosmo Iones suggested the propriet of opening communications with all the schoolmasters in Scotland, with the view of obtaining information and reports from time to time of any objects of historical interest found in their several au 100

objects of historical interest found in their several districts; and a committee was named for the purpose of carrying out the proposal. FAIL OF A RAIEWAY BEIDGE.—The traffic of the line of railway between Coventry and Nuncatou (a branch of the London and North-Western), was stopped on Monday by the falling in of a vialuet at Cowden, a short distance from Coventry. The line from the latter city communicates direct from Leam-incten with Tanwarth Derby and the north. The from the faitfer ery communicates after from Lean-ington with Tonworth, Derby, and the north. The hridge, which is of several arches, is of stone, and earries over the rails a very important old turnpike-road of the district; bnt, fortunately, at the time the accidant occurred, owing to the absence of traffic, not the slightest injury befell either the road or railway tavaplare. travellers.

Travellers. New IRON WORKS AT WORKINGTON AND HAR-RINGTON.—The Harrington Iron Company are con-structing two blast furnaces which, when in full structing two biast formaces which, when in tun operation, are expected to give employment to about 700 hands, to whom on an average 750/L aveck wages will be paid. About 1,000 tous of ore will be weekly smelted by this company, and should they commence as ironfounders, the importance of these works to the district will be greatly increased. At Workington a company for the smelling of iron ore

Workington a company for the smelting of iron ore has been formed ou the principle of limited liability, under the title of the Workington Hematite Iron Company, with a capital of 30,0007. The works are to be forthwith commenced. THE CHURCH OF ST. VINCENT OF PAUL, CORK. -We are asked to say, with reference to our mention of the clurch of St. Vincent of Paul, that the internal completion of the building, and all the fittings, in-cluding benches, stained glass, and a very richly-sculptured reredos and altar, in Caen stone and Irish-parches has been carried out under the direction of marbles, has been carried out under the direction of Messrs. Weightman, Hadfield, and Goldie, architects.

Insucation or London.—I perceive a manifest spirit for general improvement in every department which is advocated by your publication, which I, in a great measure, attribute to its powerful and legitimate great measure, attribute to its powerful and legitimate influence. Might I suggest to you the propriety of the general irrigation of London streets and pave-ments by three o'elock in the morning? So many persons heing now out of employ, and the object being a legitimate one, I hope you will urge this point, being so solutary and so hecoming the dignity of one of the greatest cities in the world. W STREEP, MA.

W. SHARPE, M.A.

Feb. 7, 1857.]

The Builder.

Vol. XV.-No. 731.

HE competition designs in the ARCHITECTURAL EXHIBITION comprise but a small portion of the number which were originally sent in competition for the several projected buildings. But they form, perhaps, the most interesting and useful feature in the collection of works in Suffolk-street. Wc had less reason to draw attention to them than we had to other portions of the Exhibition : for, we had long previously been urging npon our professional readersso pertinaciously almost as to be offensive to some of themthat there was a store of mate-

rials in such works, deserving of far more careful study thau appeared to be given generally hy architects when the opportunity offered. The justice of the selection in any of the present cases, we do not propose to inquire into ; indeed, that object is not the one for which means are afforded to us in the Exhibition. In the collection of drawings for the Lille Cathedral-thc subject of one of the competitions referred tothere are only seven designs out of the fortyone that were submitted by English and foreign architects. The design which received the first premium is not exhibited ; and of the designs which gained medals, or bonourable mentiou, several are equally wauting, —whilst the foreign architects do not present themselves at all. Also we may observe that some of the exhibitors show only a portion of their drawings, and those selected are not always correspondent as to other sets. As regards the Liverpool Free Library and Muscum competition, the case is much the same, with the additional inconvenience of the differences of seale hotween skctches made in the preliminary competition and drawings at large. The Rotberham Grammar School and the Middlesex Industrial Schools competitions, and one or two btbers may be said to be harely represented.

For any considerable proportion of the com. petitiou drawings of the year, however, as we have also remarked, the space in the galleries would be insufficient. Arrangements will, rarger collection, as well as with reference to cacility of comparison. This last is of far more importance, as regards the purposes of study, shan for the means of ehecking the decision of a committee. Such a decision is of course often Izlariugly nujnst; hut it is fair to committees to avay-and there will be no loss in admitting itthat there are often cases where it is most diffimult for any architeet to name the design which, ou the whole, includes the greatest nummer of points of merit. Therefore, demanding, as an adjudication of premiums does, both mechnical knowledge and rare judicial ability, we titill believe that it is to such advantage as may ce got out of an exhibition, that a competitor behould mainly look. That seems to be, indeed, helic state of the ease as to more than one of the monipetitions from which drawings are exhibited ouow in Suffolk-street .- It is curious to note mow the several essentials of a good building often are found distributed about the competitors' drawings,-one design providing the requisite rrawings,—one design providing the requisite the happy balance of many different require-accommodation,—another what would at first ments and qualities of effect, that the whole pappear to he the best elevations, -whilst, going what in a partial sense would be so masterly, wall-surface. Soane, at the Bank of England, author's well-earned reputation. It presents an

and sanctioning what is not attained without an got the desired ornamentation and relief, only pool huilding, with the motto "Con Amore," already described in onr pages, we may observe, without entering into the question of general merits, itself has a portico characterised by the special defect of that of the National Gallery, in the absence of a visible base of steps. The provision of these, it is true, was attended with difficulty in consequence of the slope of the ground,-hut the main object seems to be attained in a design (213 to 222), hy Mr. S. Hewitt, one of the sixteen selected for final decision, where the steps appear above a dwarf wall of rusticated masonry, on which there are lamps-and behind which there are side flightsthus in front of the portico and its proper steps, instead of as in the arrangement at the National Gallery. Mr. Hewitt's design is a bold one. It has the motto "Cupola," which indicates the main part of the scheme. There is a great rotonda, with an inner circle of columns. The latter earry a sceond circle of eolamns, — but in this case with arcbes—and these earry the dome, which has a span of over 70 feet, and with no abutment that we can discover, at the springing at least. Otherwise, such a rotonda with the coffered vault could be made to realize a grand effect; and there are many decorative details in this design internally, which display taste. The dome, as seen externally, is weak in treatment; and wiudows at the hack of a portico, at least if they arc at all numerous, we have frequently observed can hut suggest that the portieo should not be there .- The matter of the slope of the ground has heen the grand difficulty with the designers in most cases. Some of the desigus have a earth; whilst in other designs, by providing a plain soubassement, and keeping the main apertures and the chief ornamental character to the stories above, and by some artifice of ciple in the constitution of such tribunals enclosing wall or balustraded flights of steps at the entrance, the objection is overcome.

Mr. Truefitt's large drawing (178) is one which, hoth from its elever exceution and the arrangement of the soubassement, and the steps eharacter of its design, claims notice. A long chapter might he written of the points of discus-sion which it would suggest. Thus,—How far can the purpose of a building, be it museum, prison, mausoleum, or whatever else, he made to speak from the face of it? Were we to assent to all that has sometimes heen said on this subject, every one of the thousand uses of structures, and iu places of worship every scetarian difference, should be so made manifest that there could be no need of an inscription. But these shades of distinction never have been attained, and they are doubtless beyond the capabilities of art. The mind of the designer indeed is far more likely to imprint *its* pervading likeness on all his buildings, whatever their object. At the same time it is too obvions to need showing, that certain characteristics are popularly conceived as belonging to parti- of a low building, areaded along the front, with enlar huildings; therefore, where the design is for a different object, although that object may not be expressed, anything that would convey the expression of the opposite, should he avoided. Common sense, in the person of one of "the public," pauses before this design hy Mr. Trucfitt, and takes it to be a "prison, or a "mausolenm," or anything rather than a mnsenm, and will pay no regard to the eonsideration that the lighting of muscums, libraries, and picture-galleries, from the top, necessarily entails blank wall-surface. It is upon success of architectural art depends, and we to the component parts of architectural effect, do not know that there is any subject for design to certain peculiarities of detail, is not on that erequently we hesitate between condemning more difficult than that of decoration of mere account to be regarded as unworthy of its

associated quality obviously unsuited to the by offending against ntilitarian and structural object. The design (172 to 177) for the Liver- principles. But in regard to the grouping of masses and parts, and the manner in which the coloured materials are moulded with the architeeture without the colour predominating over the form-points just now so little observedthe design we have heen noticing lays elaim to praise.

In No. 179, hy Mr. J. Nicholls, the plan has a rotonda, with semicircular recesses, opening out from it,-but, externally at least, could the design have justified the selection of it as one of the sixteen? Mr. F. Gompertz's design (180) for the same Т. building, has eonsiderable merit in the internal arrangements generally, and in the lighting and decoration, and the anthor deserves credit for the manner in which he has presented his design in plans and sections to a small scale. In the design of Mr. E. W. Tarn, M.A. there is a long colonnade ou a podium : a semicircular portico and two salient columns at each end project from it; and the latter arc surmonnted hy turrets, -so that the support of columns appears insnfficient. Mr. F. Wallen's design (182) deserves elose inspection, at least as regards the main elevation, which has the stories well grouped, the principal feature being an arcade of windows on the upper floor, of Byzantinc character, which manner also pertains to the details, in which colour is introduced. The centre is formed by three of the arched openings, gronped under a pediment, but is injured by the interference of the hood of the door with window over it. There are some good features in the section,-but the dome in the centre of the ground would not show as apparently indefect common in such cases, where one end of tended. This is a mistake which is more serions the building appears as though plunged in the in some other designs, and is one which, as of the ntmost importance, and as liable to escape the notice of non-professional judges, we have often referred to, to show the erroneous prin-

Mr. T. E. Kuightley's two designs (183 and 184) display considerable taste. In the first, the difficulty of the gronud is well met, by the ascending two ways, with a dwarf wall, on which is a group of sculpture and caudelabra. In the basement proper, the rustication is pleasingly varied. The other design (184) is somewhat too close in its intercolumniation, hut has great merit. Mr. G. O. Laue's design (189 to 195), also of the sixteen, has a teu-eolumned portico, and lacks novelty in the exterior,though its author has shown in the elevation a variation from his design, as though hesitatingly, but which variation is really the best of the alternatives he offers. The plan, however, would he suitable, and highly effective ; a central hall, with columns and staircases, forming a main feature. Mr. H. P. Horner's design (196), though a modestly drawn elevation, evinees great taste, and might have been expected to be mongst the sixteen. It takes the arrangement square piers, five of the arches opening to a loggia in the centre ; and the front terminates with an Italian eornice, with an inseription worked into the frieze. In Mr. Lewis Stide's sketch (200) a Romanesque character is adopted. There is not sufficient unity in the design. areaded loggia of two stories, forms the best portion. Mr. John W. Papworth exhibits (223) sketches of plans only. Mr. T. A. Britton's design (224) is one of those which well illustrate the mistake referred to as to the design of a dome in intended combination with a facade, and which could not possibly have the effect sbown in elevation. Mr. S. IInggius's design, mentioned in a former number by a reference

economic distribution of the ground, and capability of extension without alteration of the design. The portico, projecting tetrastyle be design. The police, projecting contactions between square angle piers, without pediment, but with a statue on the top, and carefully designed details, has both novelty and merit, which may also be said of other parts of the building. The whole is surmounted by an octawhich may also be said of other parts of the building. The whole is surmounted by an octa-gonal dome, which groups with the portico. Mr. G. E. Grayson, in his design (233 to 235), places his library in the centre of a circular reading-room, the former heing terminated hy a lofty dome, from the tambour of which there projects a square hlock of building, which ap-pears to be a portion of the staircase. Messrs. J. W. and J. Hay's design (236—237) is not favourably represented by the drawings. It consists mainly of one story of windows, with Florentire arches, and a dece catifever cornice. consists mainly to be solved with the consistent mainly of the consistence of the solution of the solution of the site by introducing a grass slope, on which the ground line is level. There are two wings, each with four columns in *antis*, and a recessed centre, with hexastyle portieo, and a dome. Some colour is introduced.

The principal designs for the Lille Cathedral, now exhibited, were noticed briefly in our last volume, p. 169; and the result of the com-petition was stated subsequently, pp. 218 and 233. Referring to that and other records in our volume, we cannot hut again express regret that even those designs which are in the cata-logue, could be displayed in Suffolk-street, in so small a number of drawings compared with what small a number of drawings compared with what were first sent in at Lille. Our correspondent there, spoke of twenty-four drawings under the motto, "Quan Dilecta Tabernacula," that of Mr. G. E. Street, who gained the second pre-mium; and we cannot make up any such num-ber as now exhibited in London (343 to 331). Under the motto, "In Domino Confido," ber as now exhibited in Lohdon (35) to 531). Under the motto, "In Domino Confido," there were twelve drawings; but three only are exhibited (352 to 354) by Mr. T. E. Thrup, to whom the catalogue awards a "silver medal," erroneously, it would seem, though the drawings have high merit. The design with the motto, "Ad Æthern Tendens," which the motto, "Ad Athera Tendens," which gamed a silver medal,—though it is not so stated in the catalogue,—was shown iu no less stated in the catalogue,—was shown in no less than thirty-one drawings; but Messrs. G. Evans and R. P. Pullan, have but five in Snf-folk-street (355 to 359), besides an "Interior of a Cathedral; a Study in Decoration" (360). And Mr. C. Brodrick's design, with the motto, "Spes," which gained a silver medal, is shown in five of the six drawings (336 to 340). Of the extra drawings Mr. John Bohinson's (320 to in five of the six drawings (336 to 340). Of the other drawings, Mr. John Robinson's (330 to 332)—the design bearing the motto, "Excel-sior,"—may be named as having received "hononrable mention,"—though it is not so stated in the catalogue. The only other designs for the same building in the Exhibition, are one by Messrs. F. G. Lee and R. J. Jones (324 to 329), a work having some of its fea-tures too obviously suggested by the west end of Peterborough, and the spire of All Saints, Mar-garet.street, and otherwise inferior in character and detail; and a design by Mr. C. F. Kelly (334 and 335), which also is spoken of as having received "honourable mention;" but we think (334 and 335), which also is spoken of as having received "honourable mention;" but we think in this case also, hy one of these numerous errors—which surely are without excuse. Looking at what we have, we now feel no surprise that the Exhibition at Lille excited so much interest. The drawings of Messrs. Street, Thrup, Brodrick, and Evans and Pullan, are uset homourable to the Encilis school and are most honourable to the English school; and as designs, the several works display considerably more of inventive talent than we have been in the habit of secure of late. And it is deserving of notice, that this skill is shown alike in the architecture of the fabric and in the fittings and furniture. The question arises,—What is there that should bind the exercise of this skill in any British architect, within the range of a certain style or of a single class of buildings, or should as too often is the case, prevent the exercise of as do other is the case, provide the constant of a state of anything more than elever initiation or adapta-tion. If really it is only prejudice that inter-feres with the development of art, no matter whit be the style,—let us hope that the archi-tectural skill, here so abundantly manifest as in tectural skill, here so abundantly manifest as in that the Exhibition should be located in larger, some state existing, will be able to transport amply lighted, and more comfortable rooms,— itself to any other field of operation, or embody if not also in such as can be had at a hetter itself in any other language that may happen to period of the year. We do not profess to have

be in common use and familiar to the public. To the architect it should matter little what be the style of the day—that which is of house-hold use : but to art—and to the public, if they non use: but to at-anto the phase, it may are ever to become lowers of art-it matters much, that no sudden violence to popular percep-tion of art, should be done hy mere change or contradiction of style, ---which in such case exerts contradiction of style, — which in such case carties an influence of its own,—such as, perhaps, it may be thought onght not to be within the capability of mere style, — but which operates, and appears to be distinct from, and to usurp the place of, the *art*. The best of the designs we have mentioned are

well contrived for excention in brick and stor without clahorate external decoration, hut with all the regard for the beanty of outline and grouping which should be found in a cathedral." The apsidal east ends with pinnacles are in the chicf cases tracted with great ability. We may espe-cially refer to Mr. Brodrick's design in this point; thongh whether in the west front with its three doorways, its noble tower and spire, and the open screen work which aids in the pyra-midal outline, or in the general details (which are very elaborate), this design will repay long examination. Perhaps, however, it may not have been thought calculated for the local materials. Two western towers are adopted in ing which should be found in a cathedral. materials. Two western towers are adopted in all the other designs,-though Messrs. Evans all the other designs,—using horses. I have and Pullan terminate theirs at no great height, by open canopy work,—but they have a lofty tower and spire at the intersection of the cross. The western towers in Mr. Street's design would, we think, be capable of improvement, the spire portion being insufficiently developed. The whole of Mr. Street's drawings developed. The whole of Mr. Street's drawings are claborately shaded in pen and ink, and there is no lack of pains and taste in his unmerous drawings of fittings.—Mr. Thrup's drawings also descree praise for design and excention. The western towers terminating in octagons and capped by spires are amongst the best features of the design. The interior is highly effective. of the design. The interior is highly effective; though the choir arch is somewhat cramped in

appearance of width. We do not profess to notice all the drawings in the Exhibition, and many which would well descrive examination we may have altogether omitted. Some of the few designs for the Middlesex Industrial School have the plan on an antices a functional school nave the pian on the concentrating principle,—Messrs. Reeves and Butcher (299 and 303), placing the kitchen in the centre of a general octagonal distribution of the parts of the plan, and Messrs. Morgan and Discuss (2004 ± 2004) of the parts of the plan, and Messrs. Morgan and Phipson (300 to 302) having a large swimming-bath in the centre, with the dining-rooms around it. Had we space, also we might mention many meritorious designs for accessories of buildings, and for objects of ornamental and decorative avt, and many drawings of old examples. Mr. T. E. Knightley, in the decorations of the Parish Church, Shoreditch (464), Mr. Ashpitel, Mr. Digby Wyatt, Mr. Prignot, Mr. L. W. Collman, Mr. H. B. Garling, Mr. J. T. Irvine, and Mr. W. P. Griffith, contribute works of merit, and of various kinds. The practical decorators exhibit as in former

The practical decorators exhibit as in former years, and manifest considerable taste and know-ledge of resources, with, as before, not unfre-quently the lack of structural principle. Also quently the lack of structural principle. Also we would say, that we are obliged to pass over, as their merits would not deserve, many draw-ings of buildings,—such as those which are contributed by Mr. P'Anson, Mr. Hesketh, Mr. J. T. Christopher, the Rev. J. L. Petit, and others. The several drawings by Mr. R. N. Shaw, the Academy travelling student, are some of the best that we have ever seen; though in recognising their merit, we regret to see evi-dence of exclusive attention to one hardfoular dence of exclusive attention to one particular school of architecture. We should, perhaps, have mentioned a plan by Mr. Bruce Allen, for building the National Gallerics of Art and Science, partly on the Kensington Gordens, with a junc-tion with the reach white to this we may have across the road; but to this we may have another opportunity to refer.

We cannot couclude without again pressing upon the attention of the committee, that it is indispensable for the attainment of their objects,

given the attention to the collection, which in When the according to the source of study, it would describe from architects; but we happen to have felt obliged, even for present purposes, to spend much time in the rooms. We would merely observe that such is the cold and discomfort of the place, that it is Is the containt discontor of the pince, that it is now painful to spend an hour there in looking at drawings; and that of many of the drawings placed in corners or on the top line, not a detail can be discerned without the greatest difficulty; and the result is, we are well assured, that visi-tor go averaging moment of the intervent which the the new route way is no and of the interest which there really is in the collection, or unwilling to suffer the inconvenience which has to be endured in discovering it. The only opportunities just now of properly seeing the drawings, are the lecture evenings ; and even then, the lighting in the small We know we may be rooms is not sufficient. beld excused for laying so much stress upon these matters; for they have their influence in rendering less speedy the general popular recog-mition of the real character and value of our art.

ATHENS.*

LET us now carry to an end our account of

The Network of the Heracleide, in the eleventh of this world-famed eity. The Return of the Heracleide, in the eleventh century, B.C. and conquest of Pelopomesus by the Dorians, forms an event in Greeian history, to which the ultimate eminence of the whole race may be clearly ascribed; an event that formed the conclusion of the mythical age, and the introduction to the period of authentic his-tory, which commences with the first Olympiad, nearly three centuries after that most important revolution.

One of the great characteristics of mythical history is, that the events that it records are instory is, that the events that it records are wrapped in an uncertainty as to date and cir-constance, to attempt to penetrate which would be to destroy the beautiful but tottering fabric npon which it rests; and hy exposing the frail nature of the materials of which it is composed. destroy the faith that for ages has leant on it for support. To maintain, then, a belief in events having no parallel in existing times, it was necessary to affix periods of indefinite dis-tance, in order to preserve unbroken that halo tance, in order to preserve unhroken that halo of obscurity which alone could prevent the eye of incredulity from detecting those fallacies in construction that might expose to the world the worthlessness of the whole. To pry too closely into the early ages of Grecian history—to rob the realms of mythnisism of the bright and glow-ing imagery that constitutes its sole beauty and value—to analyse too minutely those national mythi, that entwine their beautiful and flowery featured each lowedwar more of a bistory. fictions round cach legendary page of a history, handed down from generation to generation through the medium of memory alone, and com to generation, mnuicated in the figurative language of poetry only, would be to strip the tree of knowledge of verdure, and reduce it to a sapless, lifeless its trunk.

"Historia quoquo modo scripta delectat."

The aphorism, doubless, applies to *authentic* history only; but where authenticity is unavail-able for want of a written medium of convey-ance, we must be careful lest in despising too much the shadow we lose the substance also.

"As one who has been journeying through the dark," says Bulwer, by a finc figure the dark," says Bulwer, by a fine figure, "begins at length to perceive the night break-ing away in mist and shadow, so that the forms things, yet uncertain and undefined, assume an exaggerated and gigantic outline, half lost amidst the clouds, so now, through the obscurity amidst the clouds, so now, through the obscurity of fahle, we descry the dim and mighty outline of the Heroic Age." Alike removed from the darkness of early fable and the broad daylight of written narrative—the period of demi-gods and heroes, superhuman provess, daring adven-ture and loft or rime—like the superhuman heings whose deeds invest it with the romauce that moles its cherm it forms the connecting makes its charm, it forms the connecting link between mythology and markind. Accord-ing to mythical chronology, it constitutes a period of about two centuries from the first appearance of the Hellenes in Thessaly to the conclusion of the Trojan War, and amongst the chief incidents that adorn it are the story of Dauaus and his descendants, the labours of

See pp. 2, 34, 60, and

Hercules, the exploits of Theseus, the institu-tion of the Laws of Minos, the expedition of Jason and the Argonauts in search of the Golden Fleece, the story of tedipus and Joeastr, and the "Seven against Thehes," and the Siege of Troy,—the last and crowing achievement of all. The hero, however, whose bittors was inserted by compared with thet of Athens, was Theseus. In his history, by Plutarch, we seem to recognise the type of Intradui, we seen to reading the type of the romances of our own days of chivalry; but laying aside the events in it that arc purely fabulous, his uniting in one hody the twelve independent states of Attica, and making Athens their capital;-his institution of the Panathenaia and Synoikia in honour of Athena; his division of the citizens into the three classes

his division of the citizens into the three classes of Expatrides, or nobles, Geomori, or husband-men, and Demixarji, or artisans;—bis extension of the Attic territory to the confines of Pelo-ponnesus, and establishment of the Isthmian games in honomr of Poscidon or Neptune, and his increase of the capital to the south of the citadel, are deeds worthy of record. The Thescinm (θ_{pricor}), or temple built in his honour, is the best preserved of all the monuments of ancient Athens. It was com-menced B.C. 469, as a receptadel for the bones of Thesens, hrought from Seyros hy Cinnon, and is consequently about thirty years older than the Parthenon. It is a Dorie hexastyle perip-teral, having thirteen columns in the flanks; the is consequently about thirty years oncer than the Parthenon. It is a Dorie hexastyle perip-teral, having thirteen columns in the flanks; the cells is undivided, the pronaos and postieum are listyle in *ardis*; the columns of the former alone are wanted of the total number forty-eight. It stands upon a stylobate of two steps, the total length of the upper one being 104 feet; the breadth, 45 feet. It was only the metopes of the east portico of this temple, with four additional ones on each return, that were sculptured, all the rest being plain. The friezes of the pronaos and postieum, continned right across the anhu-atories, were also sculptured; the sculptures of the pediment have entirely disappeared. The abjects of these sculptures were the exploits of Theseus and Hercules, and, though much muti-ted, evince a high style of art. The develop-nent of Greek sempture is divided into two eriods. Not taking account of the falters of the art, as Dradalus of Athens, too deeply allied a the fabulous by his connection with the the art, as Dædalus of Athens, too deeply allied o o the fabulons by his connection with the "axen wings of learnes; or his pupil Endens; r later, Dipmens and Seyllis, of Crete; or iter still, Buphalus and Anthermus; the first eriod of Greek sculpture, in its ultimate evelopment, is that of Phidias, the Æselvlus of the plastic art, and his cotemporaries Myron hd Polycletus. His chief works were the tatue of Nemesis, after the battle of Marathou; nat of Minerva, in the Parthenon - and that of table of Nemesis, after the battle of Maranon; rate of Minerva, in the Parthenon; and that of dympian Jove, at Elis; the latter 60 feet high, had so calculated to awe the spectator by its appressive majesty, that the Homen historian xy_{5} —"Ejus pulehrithdo adjecisse aliquid etiam montor which in ideation. the operator spectra eceptæ religioni videtnr, adeo majestas operis izum æquavit." The fame of Ageladas rests num acquavit." The fame of Ageladas rests aicfly upon his having instructed the above assters in their art. Many others, as Alea-renes, who excented portions of the sculpture the Elis, and probably aided Phidias in that of he Parthenon, held high position in this period. krior to Phidias flourished Onatus, Hegins, anachus, Calamis, and others included in the nanachus, Calamis, and others, included in the me sehool

nme school. In the second period of Attic sentpture, which isceeded to the Peloponnesian war, the suffer-ses and privations attending that trying period muced a proportionate change in public feel-ig; and the calm majesty of Jove, Hera, and achena, gave place to the more violent passions Dionysus, Aphrodite, and Eros. At the

quest to the time of Lycurgus and date of the first Olympiad, during which history presents isolated facts, with but little connection with each other. It was at Corinth, during the period of the Derive that are recovery one of the second other. It was at Corinth, during the period of the Despots, that art reappears upon the seens, but changed and transformed in its features. "It is no longer," says fergusson, "the elegant and ornate forms of Mycenæ and the cognate Asiatie art, but the rude, bold proportions of Egyptian art, and with almost more than Egyptian massiveness." It is the Dorie order of architecture, which, drawing its origin from the rock-cut touch of Bouil-Hassen followed the the rock-ent tomh of Beni-Hassan, followed the bold race that first adopted its massive proportions, and left the imperishable records of their presence wherever that enterprising people had pushed their extended rule. The temple at Corinth, of which only a few columns, with their architrave, exist, is supposed to be one of the oldest temples of the kind, and may prohably date from 650 B.C. The pillars are less than four diameters in height, and the architrave is proportionally massive

Next in age to this is the Temple of Egina, dedicated to Jupiter Panhellenius, to which, from the character of its sculpture now at Munich, we may assign the middle of the sixth century before Christ for its date.

It is probable that in the progress of the Persian war most of the temples of Greece, which, like the earliest Parthenon (some of whose remains we have already described as existing in the walls of the Acropolis) must have existed prior to that invasion, were swept away; and that even those that remained were cither pulled down or rebuilt to suit the augmented greatness of the state. It is for this reason that all the great temples now found in Greece were built subsequently to the victories of Solomia and Platas. They are reised the Greece were built sunsequences of Salamis and Platea. Then was raised the Theseium, succeeded by the Parthenon (the only octastyle Dorie temple in Greece), where the style octastyle Dorie temple in Greece), where the style octastyle is culminating point. To it succeeded attained its culminating point. To it succeeded the great hexastyle temple of Jupiter at Olympia, that of Minerva at Sunium, the larger temple at Rhammas, the Propylera at Athens, the Temple of Ceres at Eleusis, and the Temple of Apollo at Bassæ.

Closely connected with the Dorian invasion was the colonisation of the western coasts of Asia Minor, from the Propontis on the north to Lycia on the south. The cities thus founded hy them were divided amongst the three great races of the Æolians, Ionians, and Dorians, who at the same time colonised the neighbouring islands. The later Greek colonies were those planted in Italy, Sicily, Gaul, and Spain; A frica, Epirns, Macedonia, and Thrace. The race that main-Macedonia, and Thrace. The race that man-tained the dominant superiority in Asia was the Ionian; and of its numerous cities Miletus, and afterwards Epilesus, were the most powerful. The origin of the above colouies is legendary, and it is not until after the first Olympiad that

the history of Greek colonization becomes anthentic; and first in importance as in period were those established in Sicily and the south of were those established in Sicily and the south of Italy. The earliest Greek settlement in Sicily was founded B.C. 735; and from that period arose a succession of flourishing eities, of which Synause and Agrigentum, both Dorian eclonics, became the most powerful. The connection of Athens with Sicily, commencing with their esponsal of the part of the Egestans against the Solumetimes and major is the study determined Selinnntines, and ending in the total destruction by the Syracusans of two of the most powerful armaments that ever left the shores of Attica, was a blow from which the Athenians never recovered.

Sieily was peculiarly rieb in Doric temples. At Agrigeutum were three-two small hexastyles

The war between their two most powerful eities, Sybaris and Croton, and the total destruction of Byoans and croom, and the total destruction on the former city, is one of the chief events in the history of Magna Gracia, which rapidly de-clined in power after the fifth century B.C. owing to the destruction of Sybaris and spread owing to the destruction of Sybaris and spread of the warlike Samnites and Lucanians, who, in course of time, deprived the Greek eities of the whole of their inland territory. Among the other Greek eities of eminence, Locri, Rhegium, aud Tarentum held a foremost rank. The group of temples at Pastam has for ages delighted the beholder. The oldest of them is a beautiful hexastyle, prohably of the fifth century B.C. aud of a bold and pure style of architecture; the other two are more modern and less pure. the other two are more modern and less pure, one of them having nine columns in the fronts, the central pillar being meant to correspond with an internal range of pillars supporting the ridge of the roof.

ridge of the roof. The instances of the Ionic order that we have left to us are scant. The oldest example, probably, was the temple on the Ilissus, found by Stnart in the last stage of ruin, and since en-tirely swept away. Fortunately its proportions are preserved to serve as the type of Ionic heanty for all ages. This benutiful temple was but 42 feet long by 20 feet broad. In arrange-ment it was amphiprostyle, tetrastyle;—the shaft of the column I foot 9 inches in diameter above of the column I foot 9 inches in diameter above the base. Leake supposes it to have been the temple of the statue of Triptolemus; Forchhammer, that of Eucleia. If the latter con-jecture be correct, we have in this temple a building erected immediately after the battle af Marathon. Next in date was the little temple of Nike Apteros, which we have before mentioned as recently restored; and last and largest was the Erectheium, deriving its exist-ence from the great epoch of Athenian art. The temple at Tegea, in Arcadia, built about a cenry afterwards, according to the description Pausanias, must have been one of the largest tury of of the style.

It was in Asia Minor, or rather in Ionia whence it derived its name, that the greatest, number of temples of this style were to be found, but what buildings of the kind existed before the Persian invasion, were probably swept away by that disastrons event. The most ancient example of it is that of the temple of Juno, at Samos, which, according to Herodotus, was one of the most stupendons colfices on rewas one of the most superations enness on re-cord, and an account of whose ruins is to be found in the "Ionian Antiquities." The temple of Bacclus, at Toos, which Vitruvins describes as having been originally intended for Dorie, but afterwards changed to Ionic, was probably raised after the Persian invasion. Of the The second state of the refersion invasion. Of the temple of Diana, at Ephesus, 425 feet long by 220 feet wide, even the site is matter of dispute. The temples of Apollo Didymæns, near Miletus, huilt about 376 B C, and of Minerva Polias, near Prime dedicated by the state of th hult about 376 BC, and of Minerva Polias, near Priene, dedicated by Alexander of Mace-dou, may complete the list of the chief temples of this order in the colonies. Of the Greek Corinthian order, the works ex-

Of the Greek Connuthan order, the works ex-tant in Greece are still more meagre than those of the Ionic, being comprised, at Athens, in the little Choragie monument of Lysierates, and, perhaps, by a still further straining of the point, that of the Horologium of Andronicus Cyrrhestes; the magnificent temple of Jupiter Olympius heing, in fact, a Roman huilding. The connec-tion of the term "Corinthian" with this order, seems to rest upou no better foundation than the well-known story of the basket of the Corin-thian virgin, converted by the taste of the seulptor, Calimachus, into the beantiful capital that graces the style; hnt modern knowledge is able to offer a far mere natural solution of the diffi-

period of nearly 700 years clapsed. From the period on nearly row years clapsed. From the terms of admiration used by Diccarchus, Aristotle, and Livy, we may presume that a considerable progress must have been made by the Peisistratida, before the work was abau-doned, and as the Dorie order was that in use at the preside the advised. It he made must a the period, the whole of the uarble must have been reworked to mould it in the Coriu-thian form closen by the architect, Cossutius, upon the resumption of the undertaking. Upon the death of Antiochus, B.C. 164, the work was informed and index the second second interqueta, and eighty years alterwards some of its columns were transported to Rome, by Sulla, for the use of the Capitoline temple. Augustus resumed the building, but it was re-served for Hadran to complete it, dedicate it, and easet the other set the Code within the and creet the statue of the God within the and ended the stand of the God within the cella. This temple was 354 feet in hength hy 171 feet in breadth; its columus, 120 in num-ber, 64 feet in diameter and above 60 feet high, and was, doubless, the most magnificent Corinthian temple of the uncent world. It was decastly district. decastyle dipteral, having a triple range at either cud, and three columns in autis at each end of the cella, and its huge masses of masonry must have furnished building materials huge masses of

for the Athenians for centuries afterwards. From fragments found amongst the Ionian remains of Asia Minor, it is probable that the

remains of Asia Annor, it is produce rate the Corinhian order was used there prior to its iu-troduction into Greece Proper. In the Lonie temple of Alhena Ales, at Teges, in Arcadia, built by the architect and scalptor Scopes, the hypactural cells was surrounded by two ranks of Doric columns, surmounted by others of the Corinthian order.

Before quitting the subject of the columnar architecture of Greece, we may just allude to that beautiful substitution of the buman figure that cocurrent substitution of the human figure for the column known as Cariatides, which attains its perfection in the southern portice or enclosure of the Izectheium. The well-known tale of the treachery of Caria in aiding the Persinas after the battle of Thermopyley, and the according according the linear of the consequent employment of the figures of Carian women by Praxiteles and other Athenian sculptors in columnar decoration, may have had its foundation in fact; but even there again Egypt had rudely foreshadowed the same idea in some of its internal columniation. Auother and a beautiful variety of the same decoration were the Canephore $(\kappa \alpha \tau m \rho \phi \rho \sigma \epsilon)$, or basketbearers, which in after times became so univer-sally adopted. These had their origin in the Sally adopted. These had their origin in the Athenian practice of employing virgins to carry to the altar (generally upon their heads), the *kinew*, or cauistrum, being the basket contain-ing the cake, chaplet of flowers, knife, and frankingense, when a sacrifice was to be made. In the Panathenaes, the Dionysia, and other public festivals, two virgins of the first Athenian families were appointed for the purpose,—

" Illa forle die casta de more puelle, Vertice supposito festas in Palladis arces, Pura coronatis portabant sacra canistris."

With the examples we have enumerated, we may conclude our remarks upon the Greek orders. Of the Choragic monument of Thra-syllus, whose well known form has been applied to modern fronts, usque ad nauseam, we need

say nothing. The Panathenaic Stadium (τὸ στάξιον τὸ πανα $\theta\eta\nu a\bar{\imath}\kappa ur)$ was situate on the south side of the Hissus, and, as Leake observes, is at once recognised by its existing remains, consisting of two parallel heights, partly natural, partly com-posed of rough substruction, connected at the two parallel heights, partly natural, partly com-Paritenus decorated the warh found the statute posed of rough substruction, connected at the of Jupiter, at Els, with allegorieal paintings. further end by a third height more indebled to brought light and shade, and chier-oscaro, to any semi-circular extremity essential to a stadium." degree of perfection. Play said of him, "Neque it is usually ascribed to Lyeurgas, but it is antic cum tabula ullius ostenditur que teucat probable he only completed it by construct-occulos." Zeuxis was capally famed for his ing a podinun, and levelling the hed of the talent and his vanity: the story of his appearance arena. The spectators sat, however, upon at the 0Jupite Games in a mantle embroidered the bare turf for five centuries afterwards, with his uame in gold is cited in proof of it. Of till the seats were covered, by Herodes his mamerons works, he considered the ability of the foot-ace, but other countest. These seats have disappeared, the first, and his perpetual exhibition of skill with slopes above. The Stadium was originally in his rival Partnasius, although defended in the art 60,000 persons, and as many more on the slopes above. The Stadium was originally in his rival Partnasius, although defended in the ontest. Partnasius was a native of Ephesus, were carried on in it as well. Horse-races were but exercised his art at Athens, and, according confined to the Itippodrome (immétrepuer), a to Play, was the first to observe rules of accu-

Stadium was an oblog are, terminuted at one end by a straight line, at the other, by a semicircle ; and often formed part of the buildings of the granusium ; but sometimes shoed by itself, as gymnasium; but sometimes stood by have, gymnasium; but sometimes stood by have, at Athens. Difference in size in these buildings applied only to the relative amount of accom-modation for the public, the length of the course,

Modation for the plante, the length of the control, 600 Greek feet, being fixed The establishment by Forchhammer, of the fact of there being only one Agora iustead of two, as used to be supposed, has cleared away a difficulty in Athenian topography. After weighing the testimony of numerons Greek authors, the conclusion arrived at is that i stood in the valley between the Acropolis, Arciopagus, the Pnyx, and the Museinm. Arciopagus, the Pays, and the Miseinn. With regard to the Dorie portico described by Staart as the entrance of the new Agora, a elearer un-derstanding of the matter assigns it to the temple of Athena Arclagedis, as shown in the dedication on the availance and the start. dedication on the architrave, and refers its tion to the late date of Augustus, as indeed its debased propertions sufficiently indicate.

An important feature in the clicks of Greece was the stoa, or portico. Its definition may be given as a covered walk, the con being supported by columns on one or both sides and given as a covered with, the tool being supported by columns on one or both sides, and it was either attached to a temple or other public building, or built independent of any other edifice. Those attached to temples were either constructed only in front of them, or surrounded the building, and such were intended for the con-verse and meeting of the worshippers at such verse and meeting of the worshippels at such particular temple. Independent of these, how-ever, most of the Greek cities had large de-tached porticos, some of which public places of resort were not only built in a maguificent style, hut were adorned with paintings and sculpture of the highest class of art that the period produced. Of this kind were the Paceile (groa

duced. Of this kind way a Athens, and the v $\sigma \cos(i \pi \eta)$ and $\sigma roi \beta a \sigma i \lambda \cos \eta$. Athens, and the v $\sigma roi \pi \pi \rho o c \eta$, at Sparta. The Stoa Poecile was the one that gave the c name to the Stoic philosophers. It had three a walls covered with paintings: the middle wall had two representing scenes from the mythical age, and one at each end containing paintings from Athenian history. The subjects of these paintings, were the battle of Oenoë, hetween the Athenians and Lacedemonians; the Athe-mians, under Theseus, fighting against the violation of Cassandra by Ajax: and the battle of Marathon, painted by Polyguotus, Micco, and Pentaenus. Painting in Greece was de-veloped later than subjure. The materials and remained. Taking in Orecec was de-veloped later than soulpture. The materials used were water-colours or wax: oil-colour period the art was confined to colonring statues d architecture, of which traces are the ruius mentioned. About the time of Peisis-tratus, Cimon, of Cleonæ, introduced great im-provements in the art, and prepared the way for

It is ultimate development. In the era of Cinion and Pericles, the art attained its full development. One of the first of this period was Polygnolus of Thasos, whose of this period was Polygnolus of russos, whose improvements upon his predecessors formed an epoch in the art, the old stiffness of countenance and rigidity of drapery giving way to becanty and flowing outline. In Athens he assisted in adorning the temple of Theseus and Procile Stoa, and at Delphi the Lesche of the Chidans. Stoa, and at Delphi the Lesethe of the Crattans. Pontarenus decorated the wall round the statute of Jupiter, at Elis, with allegorical paintings. Apollodorns, of Athens, was the first who brought light and shade, and chine-accure, to any degree of perfection. Plips said of him, "Neque ante cum tabula ullius ostenditur que teucat coulos." Zeuxis was equally famed for his talent and his vanity: the story of his appearance at the Olympic Games in a manile embroidered

building of similar form, only longer. In form the rate symmetry in portraying the figure. Of a Stadiuunwasan oblong area, terminuted at one end later period were Timanthes, Pamphilus, and by a straight line, at the other, by a semicircle; Eupompus: the latter so exalted the art in his native Sicyon, that the old term Heladian be-came divided into the Sicyonic and Attic schools, whilst the Asiatic school was termed Ionian.

The above were the precursors of Apelles and The above were the precursors of Alpenes and Protogeness, contemporaries in the art in the time of Alexander, of the first of whom we need only say, that by the general consent of the ancients, he ranked as the first of painters; his name being by the later Latin poets used as a concerne for the art itself.

ans hance occurs by the later Latin poets used as a synonyme for the art itself. Thus have we roughly traced the history and progress in Art, of that portion of the Hellenie root, that most preserved in its descendants the ancient germ of the Pelasgi. "Not hese in Itale them in General"

"Not loss in Italy that in Greece," says Bulwer, "the parents of an imperishable tongue, and in part, the progenitors of a glo-rious race, we may still find the dim track of their existence wherever the classic civilisation denviewed, the classic arguing backhold. If it fourished-the classic genius breathed. If in the Latin, if in the Grecian tongue, are yet the indelible traces of the language of the Pelasgi, indelible traces of the language of the literature of the ancient, almost of the modern world is their true descendant." The world is still taught from Athens.

ON THE USE OF ANCIENT ARCHI-TECTURAL EXAMPLES.*

However freely I may adopt, in my present paper, the remarks and observations of others, paper, the remarks and observations of others, inv intention is to restrict myself, in their illus-tration, to the examples with which I am per-sonally acquainted; and therefore I bave little to say on Greek arehitecture. Not having travelled in Greece, I have never seen its best meminence and alticentie when I can the Teacher specimens; and although when I saw the Temple of Neptune at Pæstum I thought it the noblest structure I had ever hcheld, yct I can well constructure i han even minut, yet i chi well com-ceive the Parlhenon, even in its present state, and despoiled of all its hearties of senthyture, to be still grander. I do not suppose it possible to convey by a drawing, model, or imitation, the effect produced on the mind of the spectator by the access simplicity to a Greek termine and the severe simplicity of a Greek tomple; nor would it be easy to note all the subtle and delicate refinements which contribute to this effect. I remember that at Pastum I was struck with the massiveness and extreme plain-ness of the architrave, and the manner in which it was set apon the pillar; also the boldness of the cornice, and the deep shadow it east over the whole of the frieze, even at a rather early hour of the day. Then the line of shadow over the npper part of the fluted column appeared to me extremely beautiful. The shape of the echinus, or part of the eapital immediately below the square abacus, is doubtless a necessary element in the composition. The triforium range of smaller pillars gave me rather a picturesque struck with the massiveness and extreme plainof smaller pillars gave me rather a picturesque bit for sketching, but must, I think, be faulty in principle. It involves a construction too slight in appearance for an edifice in other respects of so great solidity and massiveness, as well as openings of an unpleasing shape. It may, how-ever, have been the only way of meeting a different as difficulty.

We do not want to revive Greek temples, nor, in all probability, could we revive them. If they were necessary to us, the power, no doubt, would sooner or later be developed; but there is much to render their form inappropriate for a church or public building.

To attempt anything like a pure reproduction of the Greek in domestic architecture would, I fear, give rise to a tame and formal style, without much meaning or interest; one no doubt very different, in this respect, from that of the ancients. As far as we are acquainted with the Greek style, we can safely rely on its rules and principles as grounded on a true feeling of beauty in form; but in our present state of knowledge we could not adopt it without sacri-

knowledge we could not adopt to whom satur-ficing much that we can ill spare. I do not know what attempts have been made, or with what success, to combine the genuine Greek orders with the arch. It has sometimes struck me that even the pure Dorig column might, by a modification of the enta-

* Continuation of paper read at the A chitectural fixabilition , the Rev. J. L. Petri, See p. 47, ande. by t

The introduction of the arch, from whatever quarter it may have been borrowed, is what, gives its life and energy to Roman architecture. I believe it is not only in a mechanical sense that "the arch never sleeps;" for it certainly infuses spirit into a building that, hut for its use, would have heen tame and lifeless. A square-headed door or window, in an architec-tural composition of any importance, mostly re-quires some ormament; an arched one may be thrai composition of any importance, mostly re-quires some ornament: an arched one may be left comparatively plain. The simplest and most natural arrangement of architectural lines will he vertical and horizontal; and in all good

and in some cases scarcely noticed, may for this purpose be found to be indispensable. It is not merely that a curved line is more suggestive of life than a straight line. The contrast is the object. Look at a sky covered with clouds of the most varied and indeterminate orms : the straight line of a smabeam gives it it once a life and force it might not otherwise lisplay. A range of the holdest mountains is minated by the introduction of a flat valley, or small expanse of water. It is by such combi-

using a summate by the introduction of a flat valley, or small expanse of water. It is hy such combi-ations and contrasts that the imagination is ept awake; and many a scene, the elements of hich are of the grandest character, fails to interest us from the want of contrast. The fault which is most justly chargeable on a Roman style, is the incongruity between a sconstructive and decorative fautures. The instruction is arcuated, and the decoration dibits the colounade horrowed from the reeks: and yet we cannot say that the colon-ade altogether misrepresents the construction. he greater part of most buildings intended for he is on a system of vertical pressure and suphe greater part of most huildings intended for le is on a system of vertical pressure and sup-ort; and, therefore, a columnar decoration is it quite incougrnous, even although the prin-pal openings are arches. The mediaval eade, so profusely used as a mere ornament, in fact, liable to the same charge of incon-uity, when it adorns, as it most frequently ees, a purely vertical piece of construction; ough we never think of condemning its use, cause it repeats the usual forms of the open gs. Now I take it that the highest order of bitectural ornament is that which harmonises the the construction, without repeating or Bitectural ornament is that which harmonises the the construction, without repeating or producing it. It may suggest construction, at does not constantly obtrude it on the eye. Is frieze of a Doric entablature is not filled up le frieze of a Doric entablature is not filled up th a miniature repetition of the range of umms helow, but with a certain kind of orna-nit perfectly harmonising with them, and sug-iting at the same time the real construction. It horizontal strings and cornices of Roman ark always deserve attention, whether they he policated and elaborate, or plain and simple : ese which mark the spring of the arch are in extremely hold and effective.

en extremely hold and effective. Last year I expressed an opiuion that many nour railway-sheds might he found to contain, e elements of a very grand style of architec-. I did not know at the time that there ted an ancient huilding which exhibits the net elements, disposed nearly in the same aner. The hasilica at Trèves, which is given MAR. Fergusson in his Hand-hook, has essen-ify the same features with the sheds to which an alluded. It is a large brick building ; h both from its size and position, it is one of b, both from its size and position, it is one o T osorry to say I could not see the interior, as

under a course of restoration, and entrance mtrangers is strictly prohibited till such time where we have a structure of the second seco

blature, be adapted to the semicylindrical building, as seen from a distance, as common-yanter it may have been horrowed, is what guarter it may have been borrowed, is what if believe it is not only in a mechanical sense fat "the arch never sleeps;" for it certainly infuses spirit into a building that, hat for its square-beaded door or window, in an architec-tral composition of any importance, mostly re-Ing two rollad-leaded windows placed one above the other. The same arrangement is continued round the apse. According to Mr. Fergusson, the building is 90 feet in width internally, and double that length; the height of the walls about 100 feet. You will see at once what an left comparatively plann. The suppose that for the value of the vertical and horizontal; and in all good abont 100 feet. Yon will see at one what an architecture these must predominate. But if the effect will he most formal and mono tonons; hence straight oblique lines have their state. A Greek temple requires its pediemath lines; and the some straight present themselves in its composition, few and subordinate as they are, and subordinate as they are, and subordinate as they are. It is not merely that a curved line is more the strate of life than a straight line. The its projection, such as we mostly find in Romau work, the effect must have been very fine. Some ideas might have been taken even from the neighbouring monument of Igel, which, among other merits, has some strings and cor-

among other merits, has some strings and cor-nices of excellent character. The great width of this edifice, and its donble tier of windows, natarally suggest the nse of gallerics, which might either be made an im-portant architectural feature, or treated as fit-tings, and made subordinate to the original design. In either ease they ought to add to the beauty of the whole rather than to detract from it; indeed, we can hardly conceive such a building to be perfect without them. If we from 1; indeed, we can hardly conceive such as building to be perfect without them. If we intend our new clurches to accommodate a large congregation, we onght surely to look with favour upon plans and modes of building which would admit the addition of the gallery as a positive improvement, instead of rejecting it as a doirmin. a deformity it as

The ancient work that is left of this basilica positively presents no orunament at all, -- nothing but mere construction : perhaps some persons would deuy it the title of au architectural work at all. Yet it is evident from its compositiou at all. Yet it is evident from its composition and proportions that beauty, as well as nac, was consulted; and if there is no ornament, the design by no means excludes all ornament. Supposing the present face of brickwork to remain, it is easy to see how it might have been diversified either hy string courses, monklings at the edges of the orders, architraves, discs of coloured marble, or slahs of white marble, or stone sculptured,—and all this, without any admixture of the Greek columar style. I shall always protest against the confounding of architecture with sculpture. The two arts are totally different, and have an independent existarchitecture with seulpture. The two arts are totally different, and have an independent exist-ence. If I had ever doubted this, I should have been convinced by another example in the same eity, the Porta Nigra, a noble archi-tectural work, but, so far from having any seulp-fure, it is devoid even of the commonest mould-ings, all the capitals and cornices being sinply blocked out, you will writher notice nor support blocked out : you will neither notice nor suspect blocked out: you will netther notice nor suspect this till you examine it pretty closely. But at the same time I will always admit that the character of a huilding may be ennohled, and its interest increased, by fine sculpture; and if we are able, without detriment to the huild-ing, to turn the labour and cost that would have been expended on mere mouldings or con-ventional comment to the production of a have need expended on the production of a higher style of work, occupying, indeed, a smaller space in the fabric, yet equally contributing to its adornment, and equally subscr-vient to the effect we wish to obtain; we may vient to the effect we wish to obtain; we may he snre we have got a style, or plan, worth some consideration, and the development of which is likely to lead to great excellence. So that the very plainness and absence of architec-tural ornament (not of architectural beauty), in the addition as here beau pathicing may prove to the edifice we have been noticing, may prove to be one of the great recommendations of the style The plant, and accognetice in turson when the the context we next recommendations of the style in from the glimpses through the windows, to which it belongs. I cannot help thinking whilely consist of painting. All marks of that Gothie exacts too much in the way of multiply seem to he as carefully obliterated as architectural and conventional decoration, to hible; and a very meagre cornice gives the leave room for the free expansion of sculptural

art. You may, indeed, sacrifice the former to the latter, but as you do so, you weaken the genuine characteristics of the Gothic, and par-tially adopt those of the classic. The Italian Gothic does this, and is an ex-tremely heautiful style. From its refinement it would harmonise hetter with the present age than the more decided northern Gothic. It is content with a less generally differed entropy of content with a less generally diffused system of ornanent, and more favourable to the intro-duction of works of the highest art. And it presents ns with specimens that might be presents ns with specimens that might be studied to great advantage hy the architect who consults usefuluess in his designs. Such churches as St. Dominico, in Sienna, and the Eremitani, in Padua, which, like the basilica of Trèves, contain a wide area under a single roof, may he regarded as valuable models. But the style appears to offer ns liftle or nothing that eannot be obtained in the Roman, or some style immediately derived from it, with more units of design. unity of design.

We will now take another ancient example of great simplicity (at least in its present state), and consider whether it may not be turned to account as a model,—the hall or chamber of Roman architecture which is entered from the Hotel de Cluny, in Paris : this contains a nearly square area, of about 38 feet by 36 feet, to three sides of which are attached oblong rectangular spaces, the longer side being that of the central area, and the shorter one about 15 feet.* The whole is covered by two cylindrical vaults crossing each other; consequently the roof of the central part is a cross vaulting of nearly equal cells, such as we see in large German Romanesque churches. The interior arrange-Romanesque churches. The interior arrange-ment, it is clear, affords good abutment to the vault in three directions. I am unable to say I am unable to say whether there are any corresponding abutments attached to the fourth side, which has not the oblong recess which the other ones have, hut consists of a wall, in which are three small arched recesses, the central one apsidal, probably not affecting the external outline. But the weight and thickness of the wall, aided by the Not interesting the extension of the wall, aided by the tenacity of Roman mortar, may be sufficient. The walls, up to the spring of the vaulting, seem about 30 feet high. Here again there is little or no ornament remaining, the construction fully making up for the want of any. The effect of the interior may be somewhat heightened by the roughness of its present condition; still, even if it were thoroughly repaired and hrought to a smooth surface, its aspect could not fail of striking the spectator. It actually requires no more ornament than it now has, but still it would give free scope for artistic decoration of the highest order. Now here is at once an excellent design for a church, in which no room the highest order. Now here is at once an excellent design for a church, in which no room would be lost, and every member of the congrewould be lost, and every memher of the congre-gation could hoth see and hear the minister. Galleries might he introduced without cansing Galleries might he introduced without cansing any disfigurement, and every ritual arrangement observed that could possibly be required. From the way in which this specimen is surrounded and huilt up against with houses, it is impossible to judge of the exterior : in fact, the room was only part of a large range, such as is exhibited by the baths of Dioeletian, and those of Cara-calla, in Rome. But if we adopted the model, it could hardly he found very difficult to devise suitable elevations," suitable elevations.+

ASTROLOGICAL CLOCK IN STRAS-BURG CATHEDRAL.

In connection with the notes of early clocks, Is connection with the notes of early clocks, given last week, onr readers may like to see the shape which is presented by a celebrated clock made in 1573, and set up in Strasburg Cathedral, where many of them bave doubtless seen it, in its present form. Lacroix, in his admirable hook on the "Arts of the Middle Ages," gives some particulars of it. He calls it the wonder of wonders. Angelo Rocca, he continues, who wrote at the commencement of the serie earlierd. A the cathedral a tower inside the cathedral. A moveable sphere, on which were marked the moveable sphere, on which were marked the planets, the constellations, &c. was the prin-cipal piece. It accomplished a rotation in

* It forms, in fact, the centre and three limbs of a Greek close, t To be continued.

365 days. On each side and above the dial of the clock were represented, in the shape of personages and allegorieal figures, the principal f/deo of the year, and the solemulities of the church. Other dials, distributed symmetrically over the face of the tower, marked the days of the zodiac, the age of the moon, the rising and setting of the sun. Each hour two angels as over, the clock struck the hour, and then a concert was over, the clock struck the hour, and then a concel clapped his wings with noise, and erowed twice. There were various automata, too, exceuted with much art. Rocea says the construction of this wonderful machine was attributed to Nicholas Copernieus, and adds, that when this distinguished mathem attician had finished his clock, "the city author of the means.

ON THE RUINS OF HEIDELBERG. THE RENAISSANCE IN GERMANY.*

THE RENAISSANCE IN GERMANN." LAST session I had the honour of reading paper describing some of the principal Chateau of the Renaissauce period in France,[†] and have now to bring under your notice the wel known Chateau of Heidelberg, a work of th samo period in Germany. Besides the Belvy dere on the Hradselin, at Prague, built in th latter half of the sixteenth century ; the portic of the Townhall at Cologne, 1509-1571; an the Townhalls of Augsburg and Nurember both of the beginning of the seventeenth cen-

* The following is a portion of the paper read by Mr. PAnses at the Royal Institute of British Architecta, on the 12th align stalready mentioned. The more minute descriptions of the rule would be uniteresting without views. † See the Baüder, vol. ziv. page 14

tury,—I am not aware whether that country contains many palatial monuments of that time and character; but if, as I believe, it is not so rich as France in this respect, this one mour-ment is so fine and so well preserved, as to afford an excellent opportunity of comparing it with buildings of similar durates of confiaming in equilation of the same age in that or other countries. As a pictur-esque ruin Heidelberg is highly appreciated by the many tourists on the Rhine. Its beautiful situation, its perfect condition as a ruin, its rich deep thus of colour its account concert as how more the deep thus of colour its account as a second second situation. ich deep toue of colour, its apeet enbowered in thick woods, the towering background of wooded bills, its ersgy bold base of rock, the quaint forms of the town of Heidelberg stretched out below, and the rich landscape which extends beyond westward to the valley of the Rhine, traversed by the noble river Neckar, all unite to excite in the mind those sentiments of romance which we experience in looking back to what bas been, in contemplating the ruined monu-ments of our forefathers.

The landscape over which the eye wanders is classic ground, for the distance beyond the Rhine includes the rich flat alluvial plain in which the formerly important towns of Spires and Worms are situated. It is a district im-mortalised in the Niebelungen Lied, and the mortansed in the Niebelingen Lied, and the Minnesinger called it Wonnegau, or the Land of Delight; another instance of the very dif-ferent manner in which beauty of scenery was understood in mediaval times. As to the ruin of Heidelberg itself, there can bowever, be no question; for certainly I never in any place saw so many artists expressing their appreciation of the romantic interest of a locality, as might be fairly inferred from the numbers who were

fairly interred from the numbers who were seeking to record on their tablets the beautiful effects of this noble ruin. The building is still in its general features very porfect, and although quite a ruin, is in some parts so well preserved that there is enough to indicate its former well-studied mag-ificance. It is yet as much de parts adindicates the rule agencies of war or time by which it has been partially destroyed, as to furnish abundant scope to the imagination; and, in its mingled groups of ruined strength and graceful beauty, to afford the most picturesque combination of form, light, and colour.

The carrier provide the source of the source which the portunits suff remains suspended, into the inner court. But the more interesting approach is by a steep and picturesque path through the hanging wood, and thence through a subtrannean part of the building to the north terrace, from which a partial view of the build-ings and a flast increasing of the interview of

ings and a first impression of their character-istic architecture are obtained. The Castle of Heidelberg was built by the ancestors of the present reigning family in Bavaria. The first foundation of a eastle at or mear the locality dates back earlier than the fourteenth century, and down to 1801 it was still beld by the descendants of the family by whom it was built; but at the peace of Luncville it, together with the Palatinate of the Neckar, was incorporated with the Graud Duchy of Baden. It is recorded that a certain Conrad von Hohenstauffen, brother-in-law of the Emperor Barhaprossa, had his domicile near the site of the present castle in 1142: of this, however, all material trace has ceased to exist, it having trace has ceased to exist, it having section of the sectio works. In I329, at the treaty of Pavia, the inulding is first conspicuously mentioned. In initialing is first conspicuously mentioned. In 11346 its then owner added a chapel, since discistroyed: he also formed the fine platform l'allel dthe Galerie du Chateau, cut ont of the lialliside towards the town. Robert Count Pala cince, who hecame emperor of Germany in 1400, izmary to accommodate the court of the emperor did not notably increase the castle platee of a double story of arcades above, of four arches on count palatine. In 1415 it became the prison if the Pope John XXII. It was further

cularged by Count Louis III. some time before embiazonea smearer shield is dated 1549, and his decease in 1436. Louis V. between 1508 foliage. The centre shield is dated 1549, and and 1533, made the important addition of the great round tower, and the still more important one of the great terrace, which rises to a very one of the great terrace, which rises to a very on the brief than side are the armorial bearings and initials of the count Palatine Frederick; and on the other the arms and initials of the cceded him in 1544, built more than any of his predecessors, and completed the works still left imperfect. The walls which united the square tower with the tower of Frederick Victorious, were raised and thickened in 1545; following his brother's example, but with and, much more magnificence, both withiu and withand the old palace, he continued the stone facings to the older parts. The round tower which Louis V. had erected near the chapel of Jetta was improved by him, and several upper stories added. In 1554 a large bell was placed in the tower, after which it was called the Tower of the Bell until its ruin took place. It then continued to receive additions from its successive owners until the seventcentb century, after during which it was several times devastated the thirty years' war, 1620—1648, aud nearly ruined in the war of Louis XIV. 1689—1697 ; but it was restored after each of these periods, and fell ultimately into its present state of ruin, of form the affords of more that former not from the effects of war, but from ouc of those visitations of Providence over which man has no control. Ou the 23rd of June, 1760, it was struck by lightning, and for the most part destroyed, and since that time it has never been restored.

The west façade, that next the court, is a very remarkable work, and I know of no piece of Palatial architecture which surpasses it, or even equals it in richness of decoration, notwithstanding the ruin to which it has been exposed. So much as remains is still in a very fine state. The masonry is well and solidly executed, and the stone remarkably perfect, the delicately sculptured decorations being even now

delicately sculptured decorations being even now in a good state of preservation. The general proportions of this façade are very satisfactory, as well as the grouping of the windows, and the horizontal divisions of the string courses and cornices : it is placed on an elevated basement, and the whole is on a scale sufficiently large to make it a noble and im-vasing front. posing front

The details of the pilasters, cornices, The actains of the phasers, connects, and dressings to the windows, show a wide departure from classic proportions, and are not happy, but there is an exuberant richness of decoration conceived and executed in the very best man-ner, which more than redeems these defects, and is meritible to make with the hest work of the and is worthy to rank with the best work of the same time in Italy. As a very near approxima-tiou in Italian work, 1 may refer to a chimney. piece forming part of the Soulages collection now in this country, of about the same date. I do not, however, claim for it all the grace and delicacy of some of the highest class work of that country, but it is very masterly, not only in the arabesque, but in the supporters and other figure decorations of the armorial bearings, both animal and human, nude and draped. The central doorway, once approached by a line flight of steps, with caryatides supporting wellflight of steps, with carvatides supporting well-proportioned entablatures, and remarkably rich, effective, and skilfully treated armorial bearings above the door, is a very remarkable and artistic work

The new buildings of Frederick II, were built on the foundations of a much earlier building, and intended at first for the library: they were burnt in the war of 1689, restored by Charles Philip in 1716, and destroyed in 1764; but since then they have been in great part re-fitted, and are now used partly as a habitation and partly as a museum, containing some relics connected with the castle aud its founders. That part of the building which has not been restored is altogether in a state of ruin: the exterior fronts are plain, like all the rest of the building, but there is one fine projecting bay window on the The Tun Room, part of the palace of Frederick IV. The Tun Room, part of the palace of Frederick IV. between the years 1601 and 1608, and finished by his son and successor, Frederick V. from 1610 to 1619, and burnt in the Orleans war in 1620. Of the sold hunt in the Orleans war in 1689. Of the celebrated Tun it is not necessary here to speak : its wooden framework is handsomely constructed, but its dimensions are, I believe, much surpassed by some of the wooden vats used in the London brewerics.

The gallery of the chateau was originally built in 1346, and re-modelled in 1601-1607, when in 1346, and re-modelled in 1601-1607, when the palace of Frederick IV. was built, but the balastrade and corner turrets are of later date. This terrace, which is the first part of the build-ing reached in ascending from the town by the footway, already mentioned, is in itself a very noble work: the imposing north frout of the castle bounds it on one side, and on the other

castle bounds it on one side, and on the other there is a most clearning view, extcuding over the valley of the Neckar, and the town of Hei-delberg almost immediately below. I feel it right to observe that I have availed myself of the description published by Monsieur de Grainberg for all the details I have been enabled to offer, and that the prints on the walls form part of a work published by him. This gentleman, many years ago, seeing how totally the building was neglected, constituted himself the guardian of the place: he has col-lected a very respectable museum ; and his un-wearied attention has done much to arrest the further progress of decay.*

further progress of docay.* In this building there is certainly much to remind us of the style commonly called Elizabe-than, which prevailed in this country from the time when Longleat was built, until that in which there were further there and much the full. the works of Ingo Jones, and especially his facade of the banquetting-house at Whitehall, in 1619, opened the way to a uew era in architecture. opened the way to a uew era in architecture. There is not an unfrequent application of the strap ornament and the flat jointed band, which are applied as decorations to the pilasters, par-ticularly in late buildings of the beginning of the seventeenth century. There is also the same somewhat exaggerated entasis of the pilaster, but all the features are much more boldly marked than with us: the strap orna-ment, for example, is made to project in bold masses at its extremities so as to moduce great masses at its extremitics, so as to produce great variety of light and shade : the flat-jointed bands are not so small or complicated, nor so much like panel-work, as in our specimens at Holland House or Dorton House, 1596. The entasis of the pilaster assumes a remark-

able boldness, and gives great vigour to the Doric order used in the lower story of the north front in the building of Frederick IV. The same feature I have observed in one of the buildings at Strasburg, but uowhere elsc so effectively carried out. The use of the reversed column or pilaster is comparatively rare in the German phaster is comparatively fare in the dermain work, and only used in very subordinate fea-tures. The niche with the peculiar shell form of the head, which is also not uncommon in French buildings of same style, takes the place of the flat arched panel with which chiefly the interior of our Elizabethan is frequently deco-vated rated.

The departure from the previous national type in France is less decided in outline and general In rando is obtained with us-fee the burner and genetic form than with us-fee the French retained the lofty roofs of the late Gothic, and the eastle of Heidelberg has its stepped and decorated gables, as all the old houses had from Vienna to Ant-werp, while the English adopted a substitute for the Italian behavior and cornica for which its the Italian balustrade and cornice, for which it must, however, be admitted that the flat roofs and embattled parapets of our later Gothic had prepared the way.

* This suthmainstic artist is mentioned by Eulwer, un his " Pil-grims of the Rhine." Some years ago, rambing with M. Graim-berg over the choteau, he desorbed graphically the gradual increase of interest which the ruins had imapited. He lived amongst them for some years during which a visit from a simager was an ereat.-Exp.

There is throughout these buildings no want of evidence of a very rude departure from the proportions and rules of classical architecture; propertons and rules of onessed atomication of or it might, perlaps, be more properly said, that classical models were erudely and ill-applied. The focade of Otho Henry, next the lance Court, although full of beautiful work, is espe-Court, although full of beautiful work, is espe-cially full of such defects: the attenuated pro-portions of the Ionic pilaster—the dispropar-tionate height of the window pediments, and the setting back of the moulded head behind the horizontal cornice below, are all crudities which show but a very imperfect acquaintance with the Italian types of the age, or at least an im-ident encoder of any income them; but near from perfect power of applying them; but, apart from these defects, the general balance of parts is parts is very happy, and the decoration generally in very good taste.

The ornament, indeed, of this period appears to me the most perfect which has ever been used for architectural purposes; being sufficiently conventional to be used as architectural decoration, and yet sufficiently approaching to natural forms to suggest the vigour and movement life, the flow even of sap in the veins of the plants, and more developed life in the lizards and birds which fill up the blank spaces in the

dage. The finest specimens of this kind of decoraof which there are many beautiful specimens in the Renaissance Court of the Crystal Palace, the most perfect in my judgment, in matter of orna-ment, being in the two doors in the screen next the central nave : the case of one is copied from a doorway presented to the Doge Andrea Doria by the Senate of Genoa, and supposed to be the work of Pierino del Vaga, who was engaged with Raffaelle on the Loggie of the Vatican,

with framelie on the Loggie of the valuear, which work the left in 1527. The decoration which, however, I would more particularly mention, is that of a small ornament inserted next the pilaster of the door from the church of Santa Maria dei Miraeoli, at Venice : it is perfect of its kind, and entirely free from the less happy compositious of the same time, in which, as in the decoration in the Valiaan, In which, as in the decoration in the violation, saftry, empids, and monsters, supported on im-possible bases, balance each other on opposite sides by a still central stem. In the frame of one of these doors is a function each other from the tomb of the Cardinal d'Amboise, at Rouen, of the 1 ± 0 Leo 40. If instances work of the same date of 1520-26: it is not a work of the same delicacy as the Italian one just referred to, but it displays great beauty and masterly workman-

ship. The works I have been referring to at Heidelberg arc, as a whole, worthy to be classed with any of the Renaissance school. They have well-marked individuality of character, fine taste in ornamentation, and are unrivalled in the adoption of heraldic decorations. So far as I know, they are superior to any we have in England, fit to stand in equal rank with the best works of France, and not unworthy examples of the style which grew up in that great eradle of the arts in modern times-Italy.

At the close of the paper,

Mr. Dighy Wyaft observed, that considering the early period at which German artists went to Italy to stady, and carried the Tedesco style into that country, it was remarkable that, after their return hone, Germany should have been the last to adopt the features of the Remissione style in architecture, and reaures of the Hennissone siyle in arenitecture, and then even to a much less extent simularity than any other country in Europe. The principal artists in the Reanissance style in Germany were the fault, of Fischer, both Peter Fischer and his sous having solution in Italy ; and it was through the examples at Nurem-herg and in its neighbourhooit that the Reaniss ner ether men interloyed bits Germann. These however In Italy junct is neighbourhood that the Remains are style was introduced into Germany. These, however, were only examples of the details of the style. Mr. TAnson had enumerated all the principal examples in Germany, and uot in one of these were the revived antique orders carried out in their integrity. The Townhall of Cologne was in a very vitated style, the columns throughout resembling a row of very thin gentlemen placed close together. In Heidelberg Castle there was very little attempt at a regular order. It was further somewhat enrices that the very time Peter Fischer was excanning his besi Renaissance work, some of his contemporaries and imitators con-tinged to work in the Gothie style; and the wood timed to work in the Gottie style, and the wood engravings of the period showed the disincilization of the Germans to alopt a pure Renarisance character. The arts of engraving on copper plates and armour, as

well as of damasconing, were transferred from Florence wcl) as of damasconing, were transferred from Florence, Milan, Venice, Ferrara, and other eities of the north of taly, to Angsharg and Naremberg. A picturesque style was subsequently adopted which had not impily been designated "the Rubers;" for in it wood, store, hrick, and plaster were alike made to assume that rotandity of form allied to a general heaviness of pro-portion frequently to be observed in the paintings of the great Sir Peler Paul. Under these circumstances it was peculiarly interesting to dwell upon one of the very few monnments of Germany presenting the characteristics of Renaissance art. Mr. Socies said he auite concurred in the opinion

characteristics of Rennissance art. Mr. Scoles said he quite concarred in the opinion that the Rennissance style was never acelimatized in Germany, the detail being much inferior in delinesy to that of France. Heidelberg, bowever, must always be almired for the benuty of its situation, its palatial grandeur, and its picturesque effects. The clairman, Mr. Scut, said that he had not studied much the interesting question of the different ways in which the revival of classical architecture showed itself in different countries. In Italy, it ap-meend that the, sensent form and nutling of huildings

ways in which the revival of classical arcmicedure showed itself in different countries. In Haly, it ap-peared that the general form and outline of buildings had never departed much from the classical model. At a very early period, buildings assumed an abso-lutely classical form, but the details remained nutil long afterwards of a Gothic character. North of the Alps the contrary was the case. There, the details Alps the contrary was the case. There, the details were meant to be classical, whilst the general form was farther removed than ever from the classical was forther removed than ever from the classical type, as if the courty was resisting with all its night the adoption of the new style. He differed somewhat from the opinion of Mr. Wyatt, that the Remaissance style had not been common in Germany. In the street are bitecture of that country, the style He differed prevailed to an enormous extent. A profusion of gables and other forms, of every shape that imaging galies and other iorns, of every shape that magnetic tion could device, and as far from the elassical outline as could be conceived, distinguished these German honses. The Town-hall of Brenen was especially re-markable for its immense towering gables, and the intricate forms of the detail. Every imaginable fundary nutrates torms of the detail. Every imaginable holdsy of ornament was introduced, and there was not a foot of plain surface throughout. At Hamburgh and öther towns the same features were found, proving, as he thought, that the style has pervaled the country to a great extent; and that, instead of being poor in Benefacence and Generate are full of the poor in

to a great extent; and that, instead of being poor in Remainsance art, Germany was full of the most gor-geons specimens of it, although the detail was not equal to that of France and Italy. Mr. Wyatt said, that he ought to have made the distinction between the kind of at produced by the struggle with Gothic architecture for the admission of the Renaissance, and that of the period when antique was imitaled with exactitude. The maj the The mujority antique was imitaled with exactifuide. The mijority of the buildings referred to by Mr. Sectut were based as to their main structure upon ordinary Mediaval practice, and as to their details, which were of a dehased einque-cento character, upon the precedents for the design of ornaments of every description, for the design of arnuments of every description, made popular by the class of prolific congravers known as the "Petits Moitres," such as the Behams, the Hunfiers, Theodor de Bry, Virgil Solis, Altdorfer, Aldegravetr, and others. These were the class of men who multiplied patterns of application for the Remainsment forms to every branch of art and indus-try throughont Enrope, during the end of the six-teenlb century, and the whole of the seventeenth. Ite believed, therefore, he was correct in saying that there are accordingle little nume Renaissance architectures beheven, therefore, he was correct in so ing that there was exceedingly little pure Renaissance architecture in Gernany. The gables and other features referred to by Mr. Scott belonged to what he (Mr. Wyatt) had termed the Rubens' sityle, the houses themselves being mostly of lath and plaster, and the designs founded upon the school of facile drawing which areas from the engencing alleradt mentioned. arose from the engravings already mentioned

THE APPLICATION OF GOTHIC ARCIII-TECTURE TO CIVIL AND DOMESTIC PURPOSES.

ARCHITECTURAL EXHIBITION.

ON Thesday evening, the 20th January, the Rev. Thomas Hugo, M A. F.S.A. delivered a lecture "On the Application of Gothie Architec-tare to Civil and Domestic Purposes," at the Society's rooms in Suffolk-street.

After some words of apology that a mere After some works of a prolessional andience amateur should address a prolessional andience on the peculiar subject of their study, the lectnrer proceeded to state the question which he intended to discuss :--

"First, let me explain what I understand by the "Trist, let me explain what I understand by the terms of the subject itself,--indeed, the only meaning which, to such an andience as this, could be at all interesting. I take it to mean, not that Gothie archi-tecture is applicable to civil and domestic purposes, but whether, and how far, it is applicable,--and not so much the mode as the question of its applicability. I do not understand it as requiring me to speak of the

production of artistic details, or to endeavonr to teach any of my audience the way to construct the parts either of a Gothic town-hall or of a Gothic dwellingthere of a Gother towards of a other towards bonse. The practical application of the art is a pro-fressional subject uot only entirely beyond my powers, but, 1 presume, unnecessary and out of place amid the present anditory. Rather would 1 apply myself the present anditory. Rather would 1 apply myself to that questio versata, practically put, and practically decided about, day hy day,—a question which an architect asks an employer, and an employer asks his architect,—a question on the issue of which, espe-cially in commonities like our own, the most important results are depending,—how far, and in what way, may Gothic architecture be applied to modern require-monts? Shall the edifice, whatever it may be be may contact reducture be applied to income a type. monts? Shall the editor, whatever it may be be Gothic or not? Shall we have a Gothic eity,—a Gothic street,—a Gothic hulding? or is there some other style which is preferable, and more worthy of acceptance ? The answer to these queries, I repeat, is influencing, day by day, the face of our country And, as there is a wondrous similitude between the and, his there is a wondross similation of the inflaence may, probably, be exhibited in ways of which, at present, we may have hut little conception,--ways which shall affect the moral and material nature of gen

nerations yet unborn. If I am not trespassing too much on my auditory's good temper, I would say a few words, in the first place, on Gothic architecture in general. This will go some considerable way in answering the queries as to how, and how far, it is applicable to modern. works

Gothic architecture owed its existence to the deep-Gothie architecture owed its cristence to the deep longing of the human mind for the permanent expres-sion of its choicest feelings. The hardy intellects of simple, true, and brave meng giving free range to their faney and individual taste, were its parents and in-ventors. Instead of the storeotypel lorms, therefore, to which the carlier architectural schools were devoted, the Gothie builders roamed freely, and huilt as their minds dictated, untrammelled by any influence save their arcs built will. the Gothic builders roamed fredy, and built as their minds dictated, untrammellod by any influence save their own locally will. The natural element came in afterwards, when the architects felt that they could afford to relax a little from their digity, and to add the loxury of natural emholishments to the stern forms of which they had, at first been eamoured. But natural forms, exquisitely as they increased the, charm, were engraftments upon the original design. The plain, nuadorned wall, the round areh and circular-headed window, the square expital, and other evidences of carly work, take no loveliness from the addition of natural forms, but are the language of minds looking even higher than nature, and of meu thinking of eternity while they built for time. By-and-hy, Natare lent the grace of her forms to the severity of the carlier fancies. Gothie builders pressed into their service the multitudinous shapes which the animal-nud vegetable worlds afford; and theo ponderous and unorasmented structures of carlier times were suc-ceeded by edifices in which, although the rendering from the fields, and gardens, and woods around. A character was thus given to the works of man mer than ever really savoring of the works of God, and structures creeted by human ingenuity breathed the. character was thus given to the works of man more than ever really savoring of the works of God, and structures crected by human ingenuity breathed the same language of advartion as the fowls of the air and the lilies of the field, and united with them in a. *Benedlicite annia opera Domini Domino*, 'O, all ye works of the Lord, bless ye the Lord; praise Him, and magnify Him for ever.'"

He continued :-

" All this corroborates the truth that Gothie archi-tecture was the petrified expression of the builders' thoughts, seeking rest and finding none, fanciful, almost capricions,--the production of free minds exulting in their freedom. With marvellous advortiness is accommodated itself to all requirements, and con-structed matebless objects of every class. It could structed matchless objects of every class. It could throw arches of exquisite taske over the portal of a building, or ornament the walls with arcades, or diversity the windows with forms by which the light was admitted through a thousand varying, yet ever heantful traceries, or rise into the noble roof, with its assemblage of graceful timhers or moulded vault; or, leaving the interior, could mount into the tower and shoot into the snire, ever could to the need then and shoot into the spire, ever equal to the need then and shoot into the spire, ever equal to the need then present, and ever giving evidence of minds cognismy alike of the requirement, and of an ability to axisity the same. Hence it is, that all the finest Gotthe buildings, although so like, are yet so diversified, and present such conspiceous evidences of the action of individual minds. All sprang of hope'or lappreduction of a free gift. All were the offspring of love without for. fear

The forms, then, of Gothie architecture, are those in which men of old expressed their holiest, deepest, sublimest thoughts. These men were not barharians, as some of the moderns take delight in hinting. They had absorbing thoughts of God, His power, greatness,

holiness, and truth ; and they ohliged the very stones to ery out the same. They built religiously, look-ing through what they saw to what they saw not, like those old painters, as I have said elsewhere, who worked upon their knees, each line hallowed by an aspiration, and every stroke sametified with a an aspiration, and every stroke sanctified with a prayer. They possessed and venerated the Faith, and they wrote it in every detail of the buildings which they reared as that Faith's material ahodes. They, and to shrink from deformity, whether near or remote. And they had, besides all this, that priceless gift, the noble heart to lavish all the results of their varied powers upon the visible ahiding-place and worship of that great and glorions Being, who had so riehly amobled them and nuade them what they were. They gave Him hack in love the spirit which they had anglif from Him in knowledge."

The lecturer then contended, that the use of Gothie forms should be limited to churches, colleges, hospitals, town-halls, &e. He allowed that the churches of Sir Christopher Wren were much of a considered that they were deficient as art, hut considered that they were deficient as shurches from the absence of the religious prinsiple in their construction.

Mr. Hugo spoke strongly, however, in favour of the selection of the style of the Renaissauce or domestic edifices :---

"With regard to domestic edifices, I am willing to With regard to comeste cances, i an wring to dmit that where practicable, a Gottic house is a very karming thing hoth to look upon and to possess. Nothing lovelier, in many a village of England, than one late Gottie mansion of the Elizahethan or facebean age, full of comfort, breathing of hospitality and goodness, and reddent of home. Who of us is face who has not those than an easy spice in our mind with these who has not those than an easy spice in our mind with here who has not more than once such in our mind's ye? Who of us knows not of some hanket which ooks almost the same as it might have done two cen-arries and a half ago, basking in the sualight of a urners and a half ago, basking in the sunlight of a summer's morning, or illuminated through every uddy window on some tempestuous winter's night ? det, must I needs say, addressing myself to a Landon nulience, that we have, in uw humble opinion again, nut few opportunities for the introduction of such diffees into the erowded streets of our enorunons own. Nor, as I think, do we need them, besuiful hough they are. The taste of our forefathers, or ather, I ought to say, the taste of the all-accom-lished architect of London rising from the ashes of the great fire, has given us some clorious houses, which. which is bound of the same of the animate in the same of the great fire, has given us some glorious houses, which, is dwellings for intelliguent men. I can never hope o see arrpussed. At this moment I have oue in my mind's eye still standing in Mark-lane, the very model of a city house, every detail containing some widence of the mind of the workman, stamped with he impress of a certain creative energy, which could orm nothing trivial or mean; hut which, possessed of noble idea, pursued it into executiou, and made it fields that and the dilpitted eyes of others. I have class-there shown that I am not blind to the attractions; and it is impossible to reproduce such structures mong us, and the mere longing for them is little relater than a weakness. The application of Gothie relater the subject itself admits not of discussion. We cannot apply a thing which does not allow of We cannot apply a thing which does not allow of pplication. And that is the case with us here, and ander our present circumstances."

And the lecturer concluded with the enunciation of two technical axioms in cases where the Nothic is selected as the style of modern edifices : I. Buildings are to be constructed according o fixed and rigid rules. He said :-

o fixed and rigid rules. He said :--" "Any kind of application of Gothic architecture to my purpose whatsoever, which is intended to he investigation of the same set of the same

the ground, and reminded me of some of those extra-ordinary little Roman baths sometimes discovered. There were several little square compartments about two and a half feet in breadth, little corners here and there,—in fact, a labyrinth. I had the curiosity to make inquiries about the intention of the work of what seemed the presiding genins of the place, and was answered, with a stare of the most edifying comwas answered, with a stare of the most edifying com-passion, that the tangled ground-plan before me was, in fact, the foundation of a row of Gothie villas. Gothie! It was a base prostitution both of the term and of the thing! The building was (to use the word which solicits me) a sham! And I think I should not very far err in asserting that the generality of modern Gothie houses are unrealities and shams. Now, if there he an enemy against which I would more vigorously set myself, and desire more vigor-ously to set you---it is an unreality. Unrealities of ously to set you-it is an unreality. Unrealities of all kinds are at this very moment our curse and baue. An Anice are at this very moment our case and base. Shows abound in literatury and in art, as well as in things still higher and still more precious. And I verily believe—though some, perhaps, would deride the assertion, and more would wonder at it—that such edifices as those to which I have just alluded excretes an immoral influence on them who have the suffections to be accurated with them. An atoms misfortune to be connected with them. An atm phere of falsehood is around them, and pretence An atmostheir characteristic. They affect to be that which they are uot, and affect to be not what they are. They are hypocrites in plaster, ---as d way as hypocrites in flesh and blood. -as despicable in their

PUBLIC PLAY-PLACES.

A QUESTION was raised the other day by Alderman Rose, as to what should be done with the street boys, with a suggestion that the site of Smithfield Market should he made a public playground. Some suggestions on this subcct, made by Professor Hosking, in the Supplement to his article on Architecture, in the "Encyclopædia Britannica," are worth quoting :

In laying out a towu," says the writer, " there " In laying out a town," says the writer, " there need be no mere loanging-places provided, such as the place so common in the towns and cities of the Continent. Markets should be provided for in shel-tered and inclosed huildings, and not held in a place; y and a more time equivalent for the place, or even the village-green, ought to be provided for out-door recreation, and it may be, rest, but wholly irrespec-tive of business. To this effect plots of from five to ten areas each, making in all not less than one-teuth of the whole area, should be reserved in laving out a ten aeres each, making in all act less that one-teuth of the whole area, should be reserved in laying out a town, or in adding to a town; such plots being so disposed as not to be more than a short half-mile apart, or so that there shall be one such plot within less than a quarter of a mile (a sufficiently long walk at once for a child, or for a woman, or a girl, carry-tions being the such approximation of a girl, carryaround the accessible on every side, and load wery such plot inclused, hut accessible on every side, and laid out in the hest manner to make it a pleasant resort at all times for men and women seeking rest or healthful recreation, and as a playground for children. With such a provision in a town, idle meu and boys may be reasonably required by the police to "move on r" and, with almost equal advantage to children and to the community at large, the transling of hoops in the streets may be prohibited; whilst river or sca-side quays for business, or terraces for p easure, need not be the permitted haunts of thieves and heggars. Out of a ten-are plot (the size of the whole area of Russell-square, in London, and ahout that of Lin-cola's-iu-fields, up to the inclosures before the houses), one acre disposed in four distinct quarters of an acre may be assigned to the four esseutial requisites an acre may be assigned to the loar esseutial requisites of every hundred-area erac in a town,—a church, a school, a horary with reading-rooms, and a building to contain baths and wash-houses,—oue at each of the four corners of the town-garden, in its own quarter-acre plot, and each communicating directly with the garden as well as with the streets by which, if hones or other buildings front towards it, the guiden should be belted, without taking them out of the truncare area. The town-carden need not super. a deformity and a monster. To give, therefore, if a longes of outled so is a longe to one or two circuments, which supposed to give any rales for the production of a section section with a source of the ten-acre area. The town-garden need not super section with a super section with a super section with a super section with a super section with the strength of the whole section section section with the strength of the whole section section

park, than like the too elaborately beautiful ground of St. James's-park. The town-g-arden should rot be too delicate for cricket and quoits; nor should it he supposed to render the suborhan park a super-fluity;--the town-garden for children in the day, and for wurk-day evenings for men and women, and the park for building? park for holidays.'

THE PROVISION OF DWELLINGS FOR THE LONDON POOR.

So great is the size of London, that it is not an easy task even to glance once a year at its various districts; and yet it is important that those who wish anxionsly for hencificial progress sbould make themselves acquainted with the sanitary and educational movements which are going on amongst its vast population.

From time to time we have revisited various localitics, and would now look once more to the ueighhourbood at the bottom of Gray's-inn-lane a spot which has been more than once referred to in the Builder.

While viewing the miserable rooms in Charlotte's hulldings and some of the contrs adjoining, it is impossible not to feel anxiety about those who are here and in other parts of the metropolis so thickly crowded together.

In these neglected spots a new generation is springing up, without care for education, decency, and in some instances we fear bonesty; and nothing cau he more disheartening than 50 next, is appeted to the large groups of lads, from seven to eighteen years of age, visible in obscure corners, with sentinels posted to give notice of the approach of the police, busily engaged in gambling and using language shocking to the ears. The have never had the chance of useful employ They have never had the chance of useful employ-ment; are learned in all misebicf, but waiting in such knowledge as would fit them to he useful memhers of the community; and unfor-tunately it cannot be donhted that these dan-gerous weeds are increasing in an nudue ratio, not only in London, but in other large towus. No this increases on chance without fealings

No thinking person can glance without feelings of pity at the several thousands who are thus thrown upou the world without a chance; and many good men are endcavonring to find some remody for the evil. Various plans have been snggested; and great as may be the disputes on this subject, all will agree as to the impossibility of rearing useful men and women in such dens, of rearing useful inclusion and women its such datas, and under such conditions as it has been our painful duty to describe. Charlotte's-bnildings, Fox-court, and some of the alleys adjoining, have been greatly improved by the efforts of the been greatly improved hy the efforts of the sanitary police; and yet these are still sad

In providing dwellings for the industrious elasses in large towns, one of the chief efforts necessary is to get rid of the prejudices which exist, and make it difficult to persuade those who have been accustomed to certain dwellings who have been accustomed to certain dwellings to change them for others which are evidently better; and in consequence, persons who own the inferior description of house property can point with a sort of trimuph to the appreciation, by their transts, and the profits of their dwell-ings, in comparison with some of the model buildings which have been put up in London. We cannot, therefore, look without great interest at the working of these institutions, and feel that those who have their unangement hold a the transt respectively. and those who have then management both a great responsibility; for capitalists are watching the experiment, and money will not be wauting to rear any description of dwellings which will return a fair profit upon the outlay.

From time to time, and in so many varions quarters, the £. s. d. consideration has been submitted to us, that we are induced, with the best feelings, to allude to one or two circnm-stances in connection with the new buildings

for whom this place was intended, and the style, approaches, and staircases, are not sufficiently attractive for those who can afford so much. Three or four years ago it was rare in this building to find any apartments to let. As we bave before stated, the rents have been from time to time raised; and since the last increase twenty and more sets of rooms have been empty at ouc time, and some of the more expensive have been empty for npwards of a year.

Before leaving this part of the subject it is necessary to allude to Tyudall's-buildings, in Gray's-inn, referred to in this Journal; and here, unlnckily, things have not so far worked well There are, however, causes that have produced this effect, which, when explained, should not disbearten those who take an interest in this disbearten those who take an interest in this movement. At the time we heard of the pur-chase of this block of houses, we knew that there was a most difficult population to deal with; in fact, we do not remember seeing together such a dangerous company as has been gathered here on some evenings when we have ventured to look in. They were not the starway and missrable nore but strong not the starved and miserably poor, but strong and healthy men and yonths, warmly dressed in velveteen coats and showy neck-tics, who get a living, as a police-officer said, "goodness knows how; though you and I can guess, sir." The ma-The majority of the dwellers in this place did not care about changing, neither did they like to have much inquiry made; and it must be borne in mind that a large number of persons in London who have an interest in the property let who have an interest in the property for use much influence with them, are opposed to all changes, as entailing upon them expenses which they must, as a matter of necessity incur, when improvements are made near them.

It unfortunately happened that the Association did not succeed in purchasing the whole of the houses in the court, and this, in varions ways, led to much annoyance and difficulty. ways, led to much annoyance and uncenty. Notwithstanding, the necessary repairs and alte-rations were proceeded with, —the eisterns and closets were arranged; the cellars cleaned; ventilation cared for; washing places made in each honse; rooms which might be let to families were indicionally fitted with partitions; in fact, the alternet mode in the annorance and whole. the change made in the appearance and whole-someness of the place was wonderful : and yet a number of the inholitants scent to have opposed this beneficial arrangement. Although the colthis beneficial arrangement. Although the col-lector had formerly felt little difficulty in collect to say, not easy not concern when the place was a secon of dilapidation and ruiu, it has become, strange to say, not easy now to collect the rent; and many doors are fastened with a padlock, the tenants having left. This sort of wilful and ignorant contempt for the means of health and confort eases minufed feelings of exerction. comfort, canses mingled feelings of vexation control, cannot miniple feelings of vertaktion and pity. We must not, however, be dis-heartened, for although amongst the old the chance of a change for the better is not great, still we have hope that if proper exertions are used we shall be able before long to act to mean are fittle acted twong the rough that the some profitable extent upon the young.

It can only be want of knowledge, or the most dreadful poverty, that will cause men and women with families of little children to prefer rooms poisonous from stagnant drains, dirt, and want of air aud water, to those which are healthfully arranged, and not more expensive.

Ill-arranged dwelbings, want of proper education, and of honest employment for the children of the poor in our great cities, are the chief causes of crime and shortened life, and it is difficult to know which of the above-named items is the means of producing the greatest amount of cvil. Every one will, however, be doing good work who will endeavour to rid of any of these bad conditions. get is clear that a certain amount of education will create a wish for better dwellings, and the improved homes will lead to an increased desire for advanced education. We were, therefore, glad to notice in the long passage which leads from Gray's-inn-lane to Leather-lane, on the front of a house which in former days had been a residence of some importance, the words "National School." A considerable part of "National School." A considerable part of these premises seems to be let out in tenements, and it and it would be well if the proper authorities in the eathedral should take the s were to look at the overflowing dust and the screen, much needed there he thinks.

rapid progress which is being made in filling the should be attended to, for when a number of children are gathered together for several hours in the day, it is impossible to take too much care to ensure health.

This school is here in a most useful position. A part of the ordinary dwelling has been, at very moderate cost, converted into a place where 300 or 400 scholars, boys and girls, can be necommodated; and it was pleasant, after howing the average which here how a black leaving the seenes which have been alluded to, to see such a large number of children cleanly dressed, and being trained to be orderly.

The school seems to be well managed, and it affords a contrast to compare the boys and girls and teachers with those playing not far off. It was satisfactory to find that drawing had not been neglected, and specimens were shown of the work of hoys who, in an incredibly sbort time, have acquired a degree of skill which would surprise many who have either neglected this useful branch of education, or been tanght on old-fashioned plans.

In this and other National schools in London, the charge is from 2d. to 3d. a week for each pupil, and an extra penny or so a week is charged for drawing. Constituted as these schools are, and intended for the use of the children of our mechanics and persons of small means, whose boys one day are expected to take part in the production of some of our manufactures, it seems to be question for the serious consideration of the managers whether it would not be advisable to abolish the extra charge for draw artistical to rough the extra charge for inter-ing,—a branch of education nearly as important as writing and arithmetic. On inquiring the places from which the boys had come, we learn that from Tyndall's-buildings there were none, from Charlotte's-buildings, uone; and from Poldmiric condense solid. Thus proving that Baldwin's-gardens, eight. Thus showing that the nature of the dwellings has a great deal to do with the inclination for instruction. There are 148 boys on the school-books.

In the Thanksgiving building in Portpool-lane, several of the apartments for single women were empty; and we were snrprised to find complaints made by some of the tenants of a very insufficient water-supply, caused by some leakage of the pipes, left unattended to.

If the improved dwellings which have been erected are not remnnerative to the builders, or appreciated by those for whom they are in-tended, it is time to think of some other plan which may supply shelter to a large class which must be cared for.

PROPOSED MEMORIAL OF THE LATE JOHN BRITTON.

I ODSERVE in your paper of the 10th Jannary, an interesting account of John Britton, whose death took place on New Year's Day. That account was evidently written by one who was intimately acquainted took piace on Aven Tar's Spir. This account was evidently written by one who was intimately acquainted with him, who knew his worth and talents in all matters of archeology and literature. I observe that there is a proposal made of placing some suitable memorial of him in the cathedral of Sarum, but would it not be peculiarly appropriate in the church of his native village, Kington St. Michael? That church 1 hope will be restored shortly to somewhat of its former beauty; and might not the many archi-tectural and archeological friends of Mr. Britton take the opportunity of restoring some part of the edifice, most of which is at present in a sally dilapi-dated condition, yet exhibiting specimens of that architecture, Norman, Early English, and Decorated, which John Britton's works so well illustrate? A "Britton Aisle?" or a "Britton Wiodow," after some examples given in his own works on church archi-fecture, would well perpetuate the name of the de-parted in his own native village, and in a neighbour-hood of Witshiric to which he was naturally so much attached. I should feel nucb obliged, if, by means nood of Witshite to Witch at was material so material attached. I should feel mucb obliged, if, by means of your valuable publication, you would bring this subject before his friends, and especially "*The Britton Club.*" A WILTSHIRE FRIEND.

 $\ast_{\ast}\ast$ The suggestion has already been made, and if • the suggestion has already been made, and it not adopted by the Institute, who seem to desire that the memorial in Salisbury esthedral should be put up wholly by themselves, will he, we have no doubt, by others. The Wilshire Society have already discussed it, we'are told. Mr. Markland suggests that the memorial in the eathedral should take the shape of an altar-seenen much maded these he thinks.

THE "CONSERVATOIRE DES ARTS ET METIERS," PARIS.

IT was the 19th Vendemiaire, in the third year of the Republic (October 10th, 1794), that a decree ordered the creation of the "Conservaa decree ordered the creation of the "Conserva-torie" of Arts and Sciences, on the suggestion of Gregory, Bishop of Blois, but it was not till four years after (1798), that the council decreed that the buildings of the ancient Abbey of St. Martin-des-Champs, in Paris, should be appro-meteral for its numerical priated for its purposes.

This structure, as it formerly stood, was com-posed of a principal building, between the court posed of a principal durining, between the court and the garden, with two wings projecting from either side, the one enclosing the garden, the other the fore court, which was shut in from the Ruc St. Martin by a wall. Of the two wings on the fore court side, both built by Pierre de Montereau, the architect of the Sainte Cherefle, in the first helf of the University Fierre de Afontereau, the architect of the Samble Chapelle, in the first half of the thirteenth century, the one to the south was consecrated, as the chapel; the other, the northern, being used as the refectory. The interior of the chapel, which is appro-printed to the scathereau race the south of the sampro-

The interior of the chapel, which is appro-priated to the machinery, was a beantiful speci-nen of Gothic architecture, and we can still admire it amid the works that are now being executed there. The refectory is at this time used as the library. Externally it is a fine Gothic edifice, adorned with rose and pointed-headed windows, but which to the south they have bad the bad taste to wall up for the pur-page of constructing an ambifuncture it of the neve one the ball tasks to wait up for the phr-pose of constructing an amplificatire : to the north the walls have strong buttresses. The interior, a magnificent nave, 42 mètres by 7 mètres, is divided into two by seven columns, of marvellous lightness and elegance, the shafts being hereded withere

being banded midway. From each angle of the capital spring groinings which, meeting similar ribs springing from ings which, necturg similar nos springing trom each side above the engaged columns, form pointed valitings. The engaged columns on each side are supported on brackets, placed at the same height as the band on the columns in the same height as the ball of the other of the sector, seven paintings, by M. Gerome, deco-rate the walls, the subjects being Art, Draw-ing, Painting, Science, Natural Philosophy, ing, Painting, Science, Natural Philosophy, Chemistry, and the patron of the Abbey of St. Martin.

At the eud of the north side is the reading desk (as at Chester and elsewhere), the star-case to which is formed in the wall. The building was fitted for its modern use by the architect, Vaudoyer.

THE WOLVERHAMPTON WORKHOUSE COMPETITION.

THE WORKHOUSE COMPETITION. As a communication respecting the Wolverhampton Workhouse Competition, in your sat publication, is so workhouse and the second second second second workhouse competition, in the second second second second plans appearing, finding the time to be very limited, we to one commenced our drawings, at the same time indi-visually by letter to the Board, protested against the ercanaseration offered i some few days after, and which by nuch personal excition we had matured our plans, we were asked to join other architect in a cong up the letter in their remarks to you. But on their requiring us to lorego all our labour, and to which for the guardisas' reply, thus allowing the time to ebs, and so shart is out allo-gether (which we believe was their sim); we said that we hould, as our scheme was in a forward state of com-pletion, much prefer sending in promising, if thy maind the work, should our plans be selected. But in maint of the work, should our plans be selected. But in probate. But the same course, even to the abandom-prely, with great apathy they remarked, they would rather . On this we finished our plans and sent them in, with a

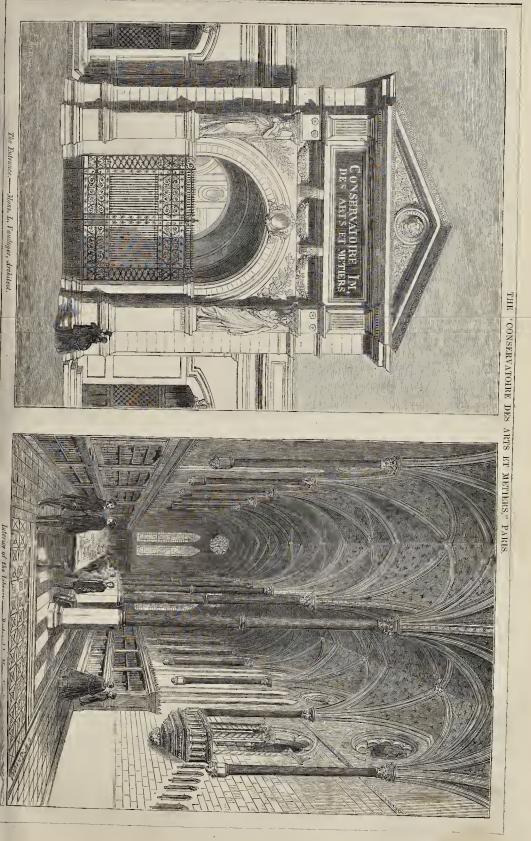

not compute. On this we finished our plans and sent them in, with a result of success; but we have not as yet met the guar-dians, to bring the matter of remuneration before them, therefore the "Architects" remarks are gratuitons and premature. But we rather discover a reason for their addressing, you just at this time being from interested motires; a competition being open for another public building in the town.

town. The worth also, of their remarks you may judge when we acquint you, that for the public buildings erected during several years past in this lown, gratitious offers of services have generally been made; and for other works, may per centage, even as low as 21, has been accepted. That not more plans were sent in, is attributable to the limited time, and the difficulties attendant upon this com-petition. BIDLARS and LOVATE.

SOMERSET COUNTY SURVEYORSHIP.—Mr. Charles Knowles, of Bridgwater, Mr. J. Leversadge, Mr. C. C. Corfield, of Taunton, Mr. Arthur Whithead, C.E. of Exceter, and Mr. S. Pollard, of Taunton, are candidates for the office of county surveyor, which will be vacent at Lady-day next by the resignation of Mr. Carver.

FEB. 7, 1857.]

THE BUILDER.

79

PROVINCIAL NEWS.

Norwick.—A special meeting of the local court of guardians was held on Wednesday before last to consider the subject of a new workhouse. A report by the committee was read, in which it was stated that in compliance with the order of the last general court, the committee had further considered the plans of Messrs. Medland and Maherley, sent in by them under the motio of "Humanitas," and to which the court awarded the first premium of 100*l*. the court awarded the first premium of 100/ they considered the arrangement of the building hy such plans well suited to the post-ponement agreed to at the last conrt, of the erection of the boys' and girls' wards, and the addition of such wards at some future period, if thought necessary; and had such parts of the building as are proposed to he deferred denoted on such plans.

Shoreham .- It is in contemplation to supply Shoreham, by means of waterworks of an in pensive character, with pure spring water, taken from a spring rising at the foot of a range of chalk hills about half a mile distant. A survey has heen made, and plans and estimates drawn. It is proposed to establish a company, and to raise about 1,500% in shares of 10% each.

raise about 1,500. m shares of 10. eaco. *Llanelly*.—The Nevill Memorial Committee offered a preminu of 10. for the best design and specification for a building to he erceted in the town of Llanelly, in commemoration of the deceased Mr. R. J. Nevill. The particulars were as follows:—*Ground*—Frontage, S0 feet to 100 feet, and not less than 100 feet in depth. *Reviews* of our como of an area of Building—To consist of one room of an area of 1,250 feet, for the use of benefit societies, &c. room for savings-bauk, room for committees, room for savings-balk, room for committees, and three rooms for housekeeter, with conve-niences for the whole. Front—Ornamented, with a tablet for inscription. The subscription list amounted to 1,165. The 31st of January was the period limited for the designs for the building being sent in by the different competi-tors, and on the 6th of Fehruary the committee were to meet to consider thrm.

Ware.—In speaking of local improvements, the Herts paper states that the flagging of the footpaths which has for some time occupied the attention of the Board of Health, has heen determined on, and will commence in March. Mr. Ekins's tender was accepted on the 6tb January. The estimated cost for the contemplated works is 1,300/. and the sum proposed to be borrowed is 1,500/. The expenditure will include the out-

1,3000, and the sum proposed to be broken at 1,5000. The expenditure will include the out-lay for sewerage where most required, and improvements in Star-hane. The repayment will extend over a period of twenty years. *Sherborne*.—The new parochial school build-ings in Westbury were opened a fortnight ago, by the bishop of the diocese. The total cost of the buildings will be 2,4500, exclu-sive of the site, which was given by the hate Earl Digby, and which is valued at 2454. In subscriptions 9300, 173c, hard been raised. The Committee of Council give 1, 1932, 0s.6d.: the National Society, 1202, and Lord Digby allowed for the old school-room in the abbey 1000. About 753, more are required to complete the undertaking. The architect is Mr. Henry Hall, About 751. more are required to complete the undertaking. The architect is Mr. Henry Hall, of Islington. The buildings comprise three large school-rooms, one each for infants, hoys and girls; several class-rooms; and houses at either end for the master and mistress. The school-rooms are calculated to hold each 200 oblidren, with an allowance of S square feet per obild. The field in front of the buildings will be laid ont in gardens, which the boys will cul-tivate. tivate.

Worcester .- Messrs. Hunt and Fletcher, of Birmingham, have contracted for the execution of the sewerage in this city. The total amount of the contract, according to the local *Herald*, or the contract, according to the local Herdia, is 15,4971, which has been accepted. The total of the previous contract (which was repudiated on a technical disagreement) was 14,6847; and it remains with the Local Board to decide it remains with the Local Board to deeded whether the first contractors shall be proceeded the balance of \$13/. The new

which, when completed, is to the site is on the at Harrow, Rugby, &c. The site is on the westerly side of Skircoat Moor. The college, it is said, will be a massive building with a large it is said, will be a massive building with a large spire and four small towers. When completed, there will be accommodation for 130 pupils and nine resident masters, with the principal. The college is to cost 20,0007. The works are to be pushed forward with rapidity, and it is antici-pated that the college will be opened in about

but that the contege will be openet in addit two years from the present time. Ediubargh.—Mr. John Steell, the sculptor, has suggested the centre of Melville-crescent, Melville-street, as a site for the monument to the late Viscount Melville. He recommends that the present garden is hould be changed into a *place*, in which the statue should be changed into object. This has not yet, however, been decided upon by the memory of the present of the statue upou by the proprietors. The state, which is a bronze figure, 11 feet 6 inches high, will be ready to put up as soon as the pedestal can be crected.

Peebles .- Lord Elcho has resolved on the re huilding of the necesitation as resolved on the re-huilding of the necesitation of the resolution of fitting it up as a place of residence for his family. Great repairs and additions will require to be made as a subject of the resolution of the tamity. Great repairs and additions with reduce to be made, as a century and a quarter have elapsed since Neidpath formed a residence for its proprietor, and ever since the grass has grown within its courtyard and the ivy round its grined multiple. The means are to be proceeded The works are to be proceeded ruined walls.

with during the ensuing spring. Wick and Lossiemouth.—The directors of the Lossiemouth Harbour Trust bave almost manimously earried a resolution to extend their harbour accommodation by an erection which will involve an outlay of 25,0007. The contemplated improvements embrace a breakwater, a steam happroximities contract a break water, a seam-boat quay, and a basin for fishing-boats. By this extension they contemplate the establishment of steam conveyance with Sntherland, Caithness, &c.

CHURCH-BUILDING NEWS.

Great Saling (Essex).-A new parsonage is to be built here, the church eutirely restored and

be built here, the church entirely restored and remodelled, and new schools erected, from the designs of Mr. R. J. Withers, architect. W_{are} (Herts).—A small church is to be built at Ware, Herts, for the Rev. F. Layton: Mr. George Truefitt, architect. The following tenders, exclusive of chancel and fittings, have heen received :---

W. Hitch £440 0

Eynsham (Oxon) .- Considerable repairs have lately been carried out to the church, the service lately been carried ont to the church, the service during the time heing held in the chancel. The nave and south aisle have had new roofs put to them: the clerestory walls, parapets, and east end walls have been taken down and rebuilt, and the freestone work to the piers and arches on one side of the nave restored. Two of the collogies which wars in the shored to restore galleries which were in the church previous to the restorations have been removed, and it is intended to take away the one remaining there, intended to take away the holes of sittings, hy enlarging the north aisle. The whole of the interior fittings of the church require to be removed and re-arranged with new work, and there is but little doubt it will soon be done. and the church put in a perfect state of repair. The works were contracted for by Mr. J. Long, of Witney. Mr. W. Wilkinson, of Oxford, was the architect.

the architect. $Withey (Oron). - \Lambda$ portion of the hurial-ground which has lately been provided for the parish was consecrated by the Bishop of Oxford on the 26th ult. The site appropriated for the cemetery contains about three acres of ground, and is simulated when the provided the provided of the second second the provided second the second against for the balance of \$137. The new and is situated a short distance out of the town, and is situated a short distance out of the town, and the chapels are on nearly the highest portion of the west bank of the river, *i.e.* the St. John's lodge have heev built upou it, and it has been by an archway, 15 fect wide: their dimensions and St. Chemen's severage is to be commenced before the rest of the city. It is in contemplation to widen Stockton bridge by removing the footpath, and lodge, where it is a low wall, having iron pali-

placing it on that part now occupied by the abutments. The magistrates in session, at ownthallerton, have given instructions to the Surveyor of Bridges for the North Riding, to the annex of Bridges for the North Riding, to surveyor of Bridges for the North Riding, to the annex of Bridges for the North Riding, to meanine and report thereon. Italijar.--Mr. John Crossley has commenced preparations for erecting an Independent College, writch, when completed, is to vie with the schools at Harrow, Rugby, &c. The site is on the it is said, will be a massive building with a larce

kinson, architect. Iffley.—Some improvements have just been effected in 1ffley church under the direction of Messrs. Buekler, particularly the restoration of the Norman front, which was deformed towards the end of the fifteenth century, hy the oblitera-tion of the eircular window in the centre. A considerable portion of the circle in the interior was spared, corresponding with the frame of the was spared, corresponding with the frame of the side windows. The clear diameter of the circle is 4 fect 8 inches: it has been filled with a feet 5 melds : had been and Co. In painted glass by Messrs. Hardman and Co. In the centre is the Dove, with two angels on each side, the whole surmounted by a horder. This side, the whole surmounted by a border. This window is a memorial placed by the incumbent to the memory of the late Mr. Eliot Warburton, who was lost in the *Amazon* steam-vessel, in January, 1552. The gallery at the west end has been removed, and the organ is placed on the floor. The oak seats have been reduced in height, and to a simpler form than before. The base of the cestern arch of the tower, previously hidden, has been strengthener the ord erestored. restored hidden, has been strengthened and restored. The oak doors at the west end, with the orna-The oak doors at the west end, with the orna-mental ironwork, are to be replaced according to the originals which existed till 1543. The various operations have been executed by Messrs. I. and W. Fisher, of Oxford. *Warminster*.—The re-opening of the chapel of St. Lawrence, Warminster, took place on Thurs-day before last. The chapel has been restored, the study of mediation pring the Early De-

day before last. The chapel has been restored, the style of architecture being the Early De-corated. The interior is fitted up with open seats, and the root is of open work. Several of the winders are filled with steined are

scats, and the roof is of open work. Several of the windows are filled with stained glass. *Salisburg.*—The new cemetery for the parishes of St. Thomas, St. Edmund, and St. Martin, Salisbury, was consecrated by the Bishop of the diocese on Thursday week. Mr. J. Cartis, of Salisbury, contracted for the eutire works at 2,7371, and they were executed under the per-ceed superinterdence of Mr. John Hardhur. sonal superintendence of Mr. Jobn Harding, sonal superimendance of Dr. Joon Hardidg, also of this city, from designs prepared by Mr. Henry E. Coe, of Loudou, architect. Spetchley.—The parish church of Spetchley is likely, it is said, to be restored. Lash—A few continuous assembled in the

Leek.—A few gentlemen assembled in the Town-hall of Leek last week to consider of the Form-Hall of Leck last week to consider of the erection of a new church and schools at Compton. The plans of the proposed new church, with parsonage house, schools, and master's residence, were laud hefore the meeting. The estimated expense of the whole is 5,2897, odds. Co-opera-tion was invited.

Walsall.—At a meeting of the Walsall Burial Board, held on Tuesday in week before last, the tender of Mr. Burkett, of Wolverlampton, the tender of Mr. Burkett, of Wolverhampton, to crect the chapel, lodge, and entrance of the new cenetery had been accepted ; hut that gen-tleman wrote to say that he had since found that he had by mistake omitted 1000. from his estimate, and therefore declined to accept the contract. The estimate of the town surveyor was 1,704. olds: Mr. Walter Heap, of Walsall, had tendered for 1,544., and Messrs. Taylor, of the same place, for 1,7057. 5s. At a subse-quent meeting it was proposed that Mr. Heap's of the same place, for 1,7057, 5a. At a subse-quent meeting it was proposed that Mr. Heap's tender he accepted. The Board, however, seemed generally to be of opinion that "if Mr. Burkett, who was so wall accupieted with scener generative of the optimization of the second with such burkett, who was so well acquainted with such work, could not perform it for the sum of 1,5454. his first tender, it was not likely that Mr. Heap could complete the works for a less amount; and Messrs. Taylor's tender was accepted !

Tewkesbury .- The new cemetery for Tewkesbury has been consecrated. The ground is on the eastern side of the Cheltenbam-road, a short distance from the town, on rising ground, and Episcopal chapel, and on the south side of that Episcopal chape, and on the south size of that of the Dissenters. Externally, the vestern elevation presents three gables, the centre one being the archway, which is crowned with an ormamental belt turret with a carved and crock-etted spire. The gables of the chapels are picreed with three-light windows filled with decorated tracery of flowing character, and above each window is a small trefoil opening. The roofs are of open timber work stained and varaclt window is a small frefoil opening. The roofs are of open timber-work stained and var-nished. The seats are open, and also stained and varnished. The floors are laid with red and black tilles disposed in patterns. The entrance-gates have been executed by Mr. J. Rogers, of flewkesbury. About two-thirds of the cemetery a appropriated to Episcopalians, and the remain-ng third to the Dissenters. Messrs. Collins and Knight were the contractors. The enrying was excented by Mr. H. Frith, of Gloucester. Mr. Thompson was the contractor for the roads and drains. The architects were Messrs. Med-and and Maberley, who have been engaged on and and Maberley, who have been engaged on imilar works at Birmingbam, Leicester, and Pymouth, and are now employed in carrying mt the cemetery for the city of Gloucester. The cemetery stands upon ground rich in the their demeter is a standard of the sta toried memories of the past.

Manchester .- In our notice of the New Barns be " contractors," instead of the pcn, are called be " contractors," instead of the *architects*.

THE MEMORIAL CHURCH AT CON STANTINOPLE COMPETITION.

THE committee have selected thirteen designs but of the forty-six submitted, as possessing laims for distinction, and have thus placed hem :-

Bem :— Prizemen.—Ist, W. Burges; 2nd, G. E. Street; G. S. Bolley. Prozimé Accessit, recommended for extra Prize.— V. Sinter. Especially Mentioned (alphabetically.)—C. Gray, In to Domine Sperayi," R. P. Pullan, G. Truefit, Veightman, Hadfield, and Goldie. Honourably Mentioned (alphabetically.)—A. Bell, Prancke (Meiningen), Howell and Budd, Prichard ad Seddon.

The report offers several points for comment, ut we prefer to see the designs before making ay observations beyond this, —that both the rst and the third of the selected designs are maded on the church of St. Andrea, at Vercelli !

GOTHIC AND CLASSIC.

GOTHIC AND CLASSIC. Is my letter, published in your impression of the 10th ultimo, it was not intended to convey a entire condemnation of Gothic, but rather to totest against its universal application to all apposes for which "architecture" is employed, ike for buildings for religious, secular, domes-a, and other purposes; for surely one should a able to tell, at a cursory view, pretty nearly what use such and such a building is appro-ciated, whether as a college, mansion, theatre, build a substantian and the advancement in these atters, besides cramping as it does genius into a set form, and ignoring the use of materials, which not a little of the advancement of the assent age is attributable; for Gothic is a values, the absence of which in certain ac-taives, the absence of which in the re-timements of the present day.—but not in a mit has taken in some few instances, viz.— one hardequin-esque structures of red, yellow, tek, and blue, with cautuat towers, the kernet. ose harlequin-esque structures of red, yellow, hek, and blue, with gaunt towers, like keenlyand all other, with gathe towns, like kenny-anted gigantic carpenters' peueils. These opear as if Gothie were very much strained to boduce "something new:" beauty of general three is overlooked in what seems to be an oxions desire to cut up the surface into party-noured rays, bands, &c. This, I think, is a nong step. The sight of a church should rather going step. The sign of a church should ranger the vectoring the until the road is made which it is the residue of the senses. The grandeur and exalting dig-years bence." A provide the beautiful simplicity (a we must content ourselves with having stated the it is more suitable for the fopperies of of it.

age worship than for an eulightened nation image worship than for an culichtened nation adoring the Great One. No. If Gothie is to be modified and perpetuated at all, it must be rather in hetter adapting it to our mode of worship, making the *form* of our churches more suitable for *seeing an hearing*. These im-portant points have yet to be satisfactorily established. These will be found an attain-ment worthy of cultivation and study; and these, combined with snitable adjuncts, so as not to exhibit a puritanical meagreness, will, when accomplished, form a type for them for when accomplished, form a type for them for

when accomplished, form a type for them for some time to come. Now, the "train of thought " (mentioned by your correspondent, E. W. G.) which produced the nave of Westminster, the north porch of Red-cliff, and others, was brought to bear upon the only materials which were available for the re-quired purposes at the date of their creetion, coupled with ingenious designing powers, which altered, improved, and progressed, century by century, and so distinctly that we are enabled to tell the date of particular buildings by mere inspection of certain features and characterunspection of certain features and character-istics; but when Mr. Macaulay's New Zea-lander explores the land, being "well np" in "ancient architecture," from *Brandon* and "ancient architecture," from Breadon and other sources, he will be sorely puzzled to tell— " how it is that while one building, of (say) the fourteenth century, leaves' only a few vestiges to mark its date; other specimens, with eractly similar features and details, are found—in as tolerable a state of preservation, as the selec-tion of stong in the vesset centure them it tion of stone in the present century allows them to be." And as he will in all prohability search the columns of the *Builder* for information, we will tell him that the twelfth, thirteenth, and fourteenth century architects originated, and the nineteenth century architects drew rather largely from the *repertoire* thus created for

With reference to the "obsolete" iten With reference to the "obsolete" items, I ouly jndge from what I see creeted, whether architects are *anxious* or *not* to revive them; and if we do away with buttress, and pointed arch, we shall not have much of "Gothie" left. That it was, is, and always will be, "mediaval," there ean be *no* doubt; that it can be tho-roughly adapted to all our wants in the nime-teenth century, there is *very great* doubt; and that it will be superseded by a style that will do boutonr to our time, and admit of the free use hononr to onr time, and admit of the free of nincteenth century materials there is little or no donbt. Thos. Goodchild.

THE PADDINGTON VESTRY AND THE ROADS.

WITH reference to the letter on the subject of the new roads in Paddington (p. 54), one of the corre-spoadents, whose letters on the subject are now before

"The new Metropolitan Act, in clause 105, gives "The new Metropolitan Act, in clause 105, gives estrics not only power to make or complete roads for the public use, but renders it inemphent upon them to do so, on reacting a requisition signed by the majority of the owners in any new street. As the vestry appears to disregard such requisitions on the part of owners whose property is immensely domaged thereby, and will permit the ratepayers of the parish to be sub-jected to the annoyance of not haring their roads eleaued, ligbted, watered, or repaired, the aggrieved parties have a remedy in the vestry's liability to a vrit of *wandemus*; hut as legal expenses of this kind for any single individual to bear would be oppressive, let one and all of the aggrieved parties nuice and try the question."

A second, who writes in reply to Mr. Maynard, and signs himself "A Vestry-man of the Sonth-east Ward," says ;---

Ward," says ;— " The facts of the case are pretty fairly stated, so far subcy go, by Mr. Maynard; therefore it is unnecessary the peat them now: he should, however, have stated the peat them now: he should, however, have stated the should be arried by the parish was vert hald on it, anless it could be arried recommended it; by the parties interested at the last moment declined the completed with, and not because that condition was not completed with, and not because that condition was not he information of your readers, thut the roads adjoining not even being parish roads, and it will he no accommoda-tion to the public util the road is made which it is the parity entry of the should be arried or some weat the information of your readers, thut the no ad signing not even being parish roads, and it will he no accommoda-tion to the public util the road is in mode which it is the parity in the next year or some twenty years hence."

The trade of British Honduras, said Mr. Temple, has hitberto heen confined to logwood and mahogany. When, and under what circumstances, mahogany was-first introduced into Europe it is not casy to say. Some bave supposed that it was first discovered in the siland of Trinidad by the encpetter of one of Sir-Walter Raleigh's vessels. When he eame to work it up he was surprised at its hardness and heanty; and drawing attention to it, it was soon very greatly in-demand for articles of furniture. This account is scarterly to he helieved. There are many articles of furniture now in existence which were manifactured in the days of Elizabeth and the Staarts, but I do not think one can be found which is made of mahogany. Some say it was not introduced into Eagland anth about 1802-3. It is said that a Mr. Gibhons, of London, had a hrother who was master of a vessel-trading to the West Indics. This worthy skipper, hearing that the doctor was building a new house in King-street, Corent-garden, very fraternally scut him a quality of wood, which he had hronght in his ship as ballast. This wood was so hard that the carpenters could not work it up, and it was thrown axide as use-less. But one day Mrs. Gibhons resolved to have a sumale-hook which he made and polished, it was so heantiful, that the doctor determined to bare a bureau made of the same material. The bureau, when finished, was show to the Dunkes of Bucking-am, who was equally charmed with the wood, and The trade of British Honduras, said Mr. Temple,

was so heaulful, inst the doctor determined to bave a bureau made of the same material. The bureau, when fuilshed, was shown to the Dachess of Bucking-ham, who was equally charmed with the wood, and determined to have a jewel-case made of it. By these quick gradations—from the eandle-hox of a citizen's wife to the jewel-case of a peeress — maho-gany became kaowa in England. It is hordly likely, however, that the eaptain of a West-India trader, lader with sugar and rum, and also much spice, would take a quantity of wood into his ship for balast. Besides, we are informed that many years previous to the treaty of 1786, the settlers 'had taken the liberty of euting mahogany,' without the pormission of the Xing of Spain. There-must, then, have been a 'good market for that article in Eagland long hefore 1803 or 1804. The time-allowed to me will not admit of my giving a particu-lar account of the mode of finding, cutting, and pre-paring the mahogany. I will merely state that the, euting commences in the month of August. In April and May, in which mouths the ground has become perfectly hard, from the continued dry weather, the wood is carried upon trucks, drawn by bullocks, to the water's side; and about the middle of June, when the rivers are swollen hy the floods, the logs are to doated down to about the nuile of from the mouths of the different rivers, where they are confined by a heavy boom drawn across the stream. Here the owners boom drawn across the stream. Here the owners select their respective logs, form them into rafts, and so float them down to the sea. The mabogany is always trucked in the middle of the night, the eattle not being able to perform such laborious work during the heat of the day. It is a picturesque and striking seene-this midnight trucking.

An impression has latterly existed that almost all, the mahogany in British Hoaduras has heen eut. This, bowever, is a mistake. There is sufficient wood in the coatarry, both on granted and ungranted lands, to supply the European as well as the American markets for many years to eome. A considerable quantity of mahogany has been, within the last few years, cut in the state of Honduras and on the Mos-pulus shore: but the maharcare works in the former years, can in the state of Honduras and on the Mos-quito shore, but the malogany works in the former country have heen almost entirely ahandoned, partly on account of the wood which is accessible heing mearly all cut, and partly on account of the extra freight and insurance which are required when vessels are loaded on that coast. From the Mosquito shore start for accurate here her between the for the medare backed on that coast. From the Mosquito shore very few cargoes have been lately sent; for the wood which grows there, although it is very large, is of an inferior quality. The mahogany is found to the north of the river Belize. In consequence of the nature of the soil in that district, in which there is a great quantity of limestone, the mahogany is longer in coming to materity; but, when fully grown, it is of a barder and firmer texture than that which is found in the southern portion of the settlement. There is no wood more durable than mahogany, and non-which is so generally useful. It is stated in a little book called "The Mahogany Tree," that furniture is being maale in the royal deckyards ont of the beautiful mahogany found in breaking up the old line-of-battle being make to try a letter by a decynate ont o'n the benntlin malogany found in hreaking up the old line-of-battle ship the *Gibraltar*, which was built in Havana 100 years ago. The English and French Governments purchase yearly a large amount of mahogany for their

dockyards. During the last year the British Government required 12,000 tons, paying 10/. 17s. 6d. per ton. The French Government took 3,000 tons at the ton. The rener covernment took 3,000 tons at the same price. The Royal yacht is built principally Of Honduras mahogany. Private shiphuilders are, how-ever, reluctant to make use of mahogany for their vessels, as Lloyd's Committee exclude all ships of twelve years' standing in which certain parts are made of mahoreary. Mahogana reached it uses of the ships. of mahogany. Mahogany vessels of ten years' stand-ing they admit, but even these, 1 am informed, it is tention very shortly to exclude. The reason which they assign is, that mahogany differs very much which they assign is, that mahogany differs very muces in quality, and it is impossible to know where a ship is huilt of good or had wood. But this difference in quality depends entirely upon the district in which it has grown. If they restricted the shipbuilders to the northern wood they might admit vessels of twelve years' standing without any risk. The qualities of mahogany which render it peculiarly fitted for ship-building, are its lightness and buoyance, its freedom from dry-rot, and its non-liability to shiruk or warp. The avise of mahogany varies geording to the size. The price of mahogany varies according to the size, figure, and quality of the wood. One tree from the northern district, which was cut into three logs, sold northern district, which was cut into three logs, sold for 1,500, or 10s, per superficial foot of oue inch. Southern wood, of a small size and inferior quality, has heen sold at 34a. a foot. The present prices in London for small-sized plain mahogauy are from 5d. to 6d. per foot, for large-sized plain from 7d. to 10d.; and for large of good quality and figured from 9d. to 1s. 6d.

The yearly average quantity of mahogany exported from Honduras during the last ten years was about \$,000,000 fect, equal to 20,000 tons, or 200,000 tons in the whole ten years, requiring 160,000 trees.

ADAPTABILITY OF STYLE FOR MODERN WORKS.

THE Classic v. Mediæval question being again raised, I would offer a few remarks.

I do not believe that the style of a huilding, whether Classie or Mediæval, in the slightest ; and degree affects its convenience or propriety

degree affects its convenience or propriety; and I am equally convinced that Gothie architecture is as applicable to all purposes as Classic. When I speak of Gothie, I do not at all mean that if we are about building a house, we are, for fireplace and chimney, door and window, buttress and gable, to produce copies of these features of some ancient Gothie building; but I weare the ac a heait the Gothie state AcideW mean, taken as a hasis, the Gothic style, chiefy for the reasons that it is the most advanced of any time in the science of architecture, ---of couany time in the science of arcontecture,—of con-struction (though falling sbort enough of perfec-tion for us to do better); and as a guide, taking the principle of the Gothie architects, and indeed the same, as Mr. Bartholomew proved, that guided the designers of the best architecture of all ages,—that true taste in architecture is nucles science. purely structural.

For example, if in a window we imitate the glazing of the Gothic architects, with justice we may imitate the system of mullions and tracery; but this construction is infinitely helind our modern appliances, and no less helind our modern requirements. In a dwelling-heuse, with our system of wood-sash and plate-glass no mullions in one of its windows need be nearer together than some three to five feet; and it is direct violation of Gothic principle to crowd in in areast violation of Gothie principle to crowd such a window with inconvenient and useless multions, obstructing the light—to admit which is the purpose of the window itself—merely for external beauty, which there are plenty of Classic and even Gothie examples to show is to be obtained without them. A grin before which be obtained without them. Again, lofty pointed arches in a small huilding, as a modern street house, are surely inappropriate, both from the extra expense of window frames to snit their form, and the greater proportional width required torm, and the greater proportional width required from the size of the spandrils, to admit an equal amount of light with a square-headed aperture of the same height. but this applies to a semi-circular-headed opening also; this greater width seldom increasing the elegance of the window. I should, therefore, prefer a flat-headed window in such a case. such a case; a segmental arch, with a rise of 3 inches or so; a splay round the window, or with jambs and head formed of moulded bricks, which are said to he of no more expense than plain ones, the difficulty only being, the few weeks' uotice required hefore they can be supweeks' unter our anneulty only being, the few weeks' notice required hefore they can be sup-plied. In many cases the high arch might be used as a relieving arch, and the flat one (which

might he constructed with a point) used as the support to a thin shell of hrickwork, to form the tympanum of the Pointed arch.

And in fact mullions are as suitable to classic architecture as to Gothie. In country towns, houses, upwards of a hundred years of age, which have classic cornices, and windows of ordinary size, divided hy a wood mullion (often with a transom as well), have casements, after the fashion of little squares, and that mullions and tracery apply as well to classic erections of and tracery apply as well to classic freedons of more ornate character, the dome at the British Museum will show; hut these mullions are reasonably spaced: had the dome been Gotbic, there is uo reason the mullions should have heen more numerous.

If not to others' satisfaction, —to my own, I have proved that there is no reason for a Gothic window to he more inconvenient than a classic one, iu any case ; and I do not doubt that it may be shown that every other feature in architec-ture is applicable to our uses, in the Gothie

thre is applicance to our uses, in the obline skyle as in any other. That I approve of Gothie architecture for its greater science and heauty, is, perchance, matter of opinion and taste. I believe that the Gothie science is greater than the classic, of any times, perhaps excepting several such quasi classic examples as St Paul's.

My opinions are not, however, immutable are the less so as the beauties of classic so eminent, that I can never fail to admire they are are them.

THE ARRANGEMENT OF A NATIONAL GALLERY.

Some remarks in a recent Builder, on "The Past and Future of Picture Galleries," in-duce me to mention a few thoughts on this importaut subject for the consideration of your portant subject for the consideration of your readers : and first let me submit that a national gallery of pictures, collected by a powerful and wealthy nation, should he worthy of the name, and euable those who visit it to trace the progress of this department of art, and to derive the greatest possible amount of pleasure and instruction from the various works there exhihited.

In our present so-called National Gallery, we have some glorious works, which, however, are so arranged, that to a certain extent they create confusion in the mind of both the student of art contrained in the influe of both the source of this, Corregio, Rembrandi, Claude, &c. are foiled one against the other, without any fixed plan. In a private gallery, where we cannot expect to meet with more than one or two examples by the same artist, it is necessary to arrange them so that each may best assist in showing aud harmonizing with the beanties of the others. Delicately-coloured pictures should not be mar-shalled alongside of those of powerful tints and hold execution.

It is well known that Turner, in the Royal Academy Exhibition, could, hy the power of his colouring, make pale, for some space around, the pictures of his brother artists. On one occasion it is said that this great painter covered

occasion it is said that this great painter covered down with water colours a painting which, by its hrightness, interfered with that of a young man of merit, which was close by. In passing along our Gallery in Trafalgar-square, we see in one room a picture by Rem-brandt, rich in all its splendid depths,—uext it a clear handscape by Claude, then a scene by Nicholas Poussin, and hy the side of Rubens and Titian some of the indifferent specimens of Sir Joshua Reynolds, which so inadequately represent this artist, and cause his genius to be improperly appreciated by those who have not seen his best works.⁸ In each of the large rooms of the National

In each of the large rooms of the National Gallery the arrangement is similar to the above. It cannot he questioned that in a gallery for

the artistic instruction of the people we should have arranged in their order, according to date, examples of art from the carliest times, showing its growth and progress. To effect the re-quired purpose numerous examples of ancient works, if well selected, would not be required.

In a new National Gallery, care should be taken to provide sufficient space for the great mass of materials which must, as a necessity, he brought together, and continually increased. This and good lighting having heen managed, it Ims and good lighting having need managet, it will been be a matter for consideration how best to arrange the pictures. Of course, we should place them according to their dates; and it seems to he desirable that while hanging the works of the various schools,—for instance, works of the various schools,—for instance, Italian, Spanish, Flemish, &c.,—the works of each artist, if in sufficient numbers, should he placed togetbor; and it would give much additional value to such a collection if with these groups there could be placed an authentic portrait of the painter (if possible by himself). There ought also to he plainly written up the time of his birth and that of his death, and on every picture it would he well to put, if it can be fixed, the date of its production. The visitor would thus be enabled to observe the progress of the skill of hand and power of thought of each paivter, and also see the image of the man who, on the bare surface, and with pigments useless in uneducated hands, has created works which delight the prince and the peasant.

If such an arrangement could be made as would enable us to see at once the pictures in the present National Gallery in the manner above mericond it would be above mentioned, it would be more interesting to even those unacquainted with art.

to even those unacquainted with art. There might be also one room in which the best specimens of the various great artists might be hing: these should be selected from the collection with the greatest care and intelli-genee—not depending on one opinion, but he chosen by the voice of such a committee of artists and persons of taste as would ensure a proper selection. In the arrangement of a National Gallery we

In the arrangement of a National Gallery we In the arrangement of a state space for water-ought not to forget separate space for watercolour drawings and engravings. The first of these arts may be said to be of English growth, and in the latter we have produced examples which will bear comparison with those of any AN ARTIST. other country.

THE METROPOLITAN BOARD OF WORKS.

PROJECTIONS BEFORE LINE OF BUILDINGS. WIDTH OF STREETS AND ALLEYS

AT a Meeting of the Board on the 30th ult. At a Anceing of the Board on the 30th all, the Superintending Architet (Mr. Marable) hrought up the following report on the opinion of counsel, on the application of Messrs. Broad-wood and Son for permission to creet a work-shop four feet in advance of the regular line of building: buildings.

"On the 19th of December last the hoard refused "On the 19th of December last the hoard refused their consent to an application from Messrs. Edwards, architects, ou behalf of Messrs. Broadwood, for leave to erect a portion of their manufactory situate in the Horseferry-road, Westminster, about four feet in advance of the line of the dwelling-houses on either side. They submitted a plan with the application, which was found upon examination to be correct, by which was funder the appeard that all the houses on thuldings of the supersort that all the houses or huldings. which was found upon examinator to extern which plan it appeared that all the houses or buildings on that side of Horseferry-road, extending from Earl-street to Regent-place, a length of 628 feet, although broken up into several blocks, maintained a regular broken up into several blocks, maintained a regular and uniform line, with the exception of ore small shop, about eight or nine feet high, and 17 feet wide, which projected up to the public thorongulare, and a stack of deals approaching to within three feet of the foot.put. In reference to the Ordnance map it appears that no such deviation from the regular line of the to not contemplated without form the the promises that now contemplated existed hefore the premises as that now contemplated existed hefore the premises were lately destroyed by fire; and, looking at the im-portance of keeping the Horseferyr-road (which is likely to hecome a great thoroughfare) as open and as free as possible. I recommended the board not to consent to the proposed projection, in which view of the case the dis#ict hoard of works concurred, and the application was accordingly refused. Since then a case has hear submitted for the onion of coursel as the apparation was accordingly relased. Since the a case has been submitted for the opinion of conusel as to whether the contemplated erection would be heyoad the regular line of buildings in the street; and if the regular line means the two or three bouses on either side of Messrs. Broadwood's premises ? or if a straight line is to he drawn from the point of the houses at the corner of Earl-street to those at the corner the corner of Earl-Street to those at the corner of Regent-place? or is the regular line of buildings to be determined by a straight line drawn from one end of the street to the other along the side of the foot-path, parallel to the line on the other side of the way? or, in other words, are the boundary walls of the garden and fore courts to be taken as constituting the regular line of huildings? Upon which ease the following opinion has been given :—

following opinion has been given :---"Copy of Opinion. " "Copy of Opinion has been started and the started opinion has to be a started opinion has to be a started opinion that if the word "handlings" is not in the started opinion of the started opinion of the started opinion of the started opinion opiniono

", FITZRON KELLN. " 'Temple, Jan. 3, 1857.' "

The report thus proceeds :--- "I will now make a few The report has proceeds :--- 1 will now make a rew comments on the case as submitted to counsel. The plan which accompanied the case is not correct : it does not agree with that submitted to the Board with the application, and which was verified hy the sur-veyor attached to my department, nor is it in accord-ment with a Ordnance survey, with which it has veyor attached to my department, nor is to it is ance with the Ordance survey, with which it has heen carefully compared, nor with the detailed plans belonging to the engineer's department, nor with my own observations. * * The opinion suggests own observations. * * * The opinion suggests that the word 'huildings' is to include walls, that is, the houndary walls of the fore-courts or gardens, which are to be considered as constituting the regular time of fronts. A reference to the 143 rd section of the Local Management Act will show the fallacy of this argument, or why are the words 'notwithstandthis argument, or why are the words 'notwithstand-ing there heing gardens or vacant spaces between the line of the buildings and the highway 'introduced ; and if the houndary walls of the gardens or fore-courts are to be considered as huildings constituting the regular line of frouts, as the learned coursel in this case opice, then have the Metropolitan Board of Works the extraordinary power of grauting permission to project buildings over and obstructing the high-way. But, from various other analogous Acts, it is learn the Learnighter nearning interacted houndary way. But, from various other analogous Acts, it is clear that the Legislature never intended houndary walls to mean 'huildings.' In the Building Act they are expressly exempted from the operation of the Act. But if a houndary wall is a 'huilding,' how is the required space hetween the huildings and the highway ato be defined? Similar enactments exist in the Metrovol a denied. Fundate interface states in the Metero-polis Roads Turnpike Trusts Act, in the Whitechapel wAct, and other local Acts of a like nature. With aregard to the present matter before the Board, I am for philon, that if ever there was a case in which they were called upon to prevent any encroachment on the regular line, this is oue; and if they consider a astraight line extending for 628 feet from one street oto another sufficient to constitute a regular line accord-ning to the spirit and meaning of the Act, they will not know rescind their former resolution, hut let the matter trest where it is, as far as they are concerned."

After a discussion the Board passed on to the enext business, but notice was given of a motion to resend the refusal of the Board to allow the projection.

Major Lyon brought up the subjoined-

" " BYE-LAW AS TO THE FORMATION OF NEW STREETS IN THE METROPOLIS.

The Bye-Law is to be discussed on Monday, the 9th inst. by a committee of the whole Board. Although at present but a proposition, we have printed it in full, that such of our readers as are interested may have the oppor-tunity, should they desire, to communicate their views to the Board. The requirement of two entrances in the case of every street or mews, no matter how wide it may be, the full width of such street, and open from the ground up-wards, although nequestionably desirable, will be found a headship be found a hardship.

WANT OF EMPLOYMENT FOR BUILD-ING OPERATIVES.

WE give insertion to another letter in reply to "T. L. D." :---

SIR, - For the last ten years, a society of car-penters and joiners have been subscribers to your paper, and during that time have put up with much paper, and during that time have put up with much upplateble matter, hut perhaps none more so than that which appeared in your impression of the 24th ult. from your correspondent, "T. L. D." The first impulse of their indigration was to dis-continue taking in the *Builder*; " but the better source advanted was to really to your correspondent

course adopted was to reply to your correspondent and show that his "hard truths" appear falsehoods to us

With regard to the first " great cause scarcity of employment, namely, the high price of capital, we, as a class, do not know anything about it; but what we arc sure of is this, that there are ousauds of able and willing hands ready to huild houses; and we are equally sure that there are as many thousands of operatives who are almost house-less, or pent up in such crowded, ill-couditioned houses, that really they are not worthy the name of home

And yet this sad state of things is brought about by the "pernicious influences of trades unions." Is it so? Well, let us see! We are told that we must "conform to the times," and accept work at a and accept work at a lower rate of wages, without stopping to inquire into the injustice we should commit on our fellow-work-men who were in employ at full wages, or the consequences of giving to unscrupulous employers the power to estimate for work to be done at ten or fifteen per cent. less than the more conscientious ones would do.

Suppose we accept the lower rate of wages, and wait "till more prosperous titues:" they arrive, and the more independent apply for full wages: what is the result? "Oh, no ?" (experience tells ns) " we the result? "Oh, no 1" (experience tells ns) "we couldn't think of such a thing: if we grant it to yon, others will require it." Of course they would, and have an undoubted right to it, which we can prove. What is the consequence? Men combine, and de-mand it. What else could they do? Individually they are powerless; but the many refinsing to work upon such and such conditions, is at once simple and effectual, and the employers are harassed and annoyed with they comply. Then comes the force outry on upon such and such controls, are harassed and annoyed effectual, and the employers are harassed and annoyed until they comply. Then comes the fierce outcry on

* Very sensible and fair, certainly. These who happen to think with "T. L. D." may on like ground, have the same im-pulse as the society in quasitor, on reading what follows. Thus, it would seem, that setting to hold the saces with an impartial hand, and allowing both adds to be hard, is the ware way to be the same of the same set of the same set of the same terests and better the condition of the working classes of this contary. think country

the injustice and madness of the working classes taking the insanc advantage of a little prosperity to destroy all the hopes and calculations of the great contractor, and lamenting the sad necessity of the capitalist taking his capital to a land where the laws are more stringent, and the operatives more sub-

Trades unions, as your correspondent would have Trades unions, as your correspondent would nave ns believe (and I now write more precisely in refer-ence to our own hranch of the huilding trade), do not in reality exist. "A society man" is the exception, and not the rule, in builders' employ; and those steps that have heen made in the advance of wages' unove-ment, or for shortening the duration of the hours of the bare here here result of sonataneous preanizalabour, have heen the result of spontaneous organizalabour, have need the result of spontaneous organiza-tion, which has decayed with the success or failure of the object they sought. But if the demands are not founded in justice, it is impossible they can be main-tained. And we assert that the advance of wages was a necessity arising out of the progressive incre Was a necessity mission of the progressity interprogression of the provision of provisions, and we totally deny that it makes "labour more costly," hecause the improve-ments in machinery have kept pace with the advance of wages; and with the assistance of machinery, employers can produce a larger amount of work for less money than they could when workmen's wages were lower. And is your correspondent to employ his superior education and position in inducing ns to accel the policeman in respectability on the smallest possible amount of wages? But we reply, that the policeman's superior decency and heaviour is not the result of his superior intelligence or lower wages, the result of his superior intelligence or lower wages, hut to the rigid discipline and organization invented by his employers. And who cares about the decency and hehaviour of the bricklayer's labourer, so long as he can toil up the ladder with his hundred weight of bricks ou his back ? No, sir ; it will he time cough for your correspondent to lecture us on the "per-nicious influences of trades unions." when we see employers emulate each other in providing for the welfare and happiness of those in their employ, in-stead of amassing wealth, and rivalling each other in obtaining the largest amount of work at the least possible cost. pos

THE NEW TOWN-HALL, BURSLEM.

THE NEW TOWN-HALL, BURSLEM. THE inauguration of the new town-hall at Burslem took place ou Wednesday in last week, when a han-quet was held in it. The hall is an isolated building, in the centre of the Market-place. Its fronts particle of the same general character, hut differ slightly in detail: generally they are divided into two stages, the lower one being battering and deeply " maticated," with arched windows, having covored jambs and moulded sills. The upper story consists of pilasters of the Coriutian order, grouped in combes. having howen them semi-circular headed windows. The angles of these fronts have a detached column in lieu angles of these fronts have a detached community of the ordinary square angle pilasters. The we frout has for its main feature an entrance porch, The western consisting of au arched and groined earriage way. Ahove sisting of au atoms of the second portion, with its pillars grouped and this is a colonnaded portion, with its pillars grouped and fours: from this a clock turret rises, the lower stage of which is supported by eight earyatides, and the upper one formed hy an octagon hell turret, orna-mented with festoons of fruit and flowers. The whole mented her a vane of wrought iron. The interior contains in the basement waiting-rooms for prisoners of hoth sexes, a heating apparatus room, and a kitchen. The ground floor bas a corridor running from end to end, communicating on the one side with the offices of the surveyor and the town clerk. The hoard-room is 20 feet wide by 29 feet long, furnished in oak and green velvet, the chairs being in the form of those used by the senate of ancient Rome, that of the chief bailiff being supported by figures of Industry and In-tegrity, and surmouted by the arms of the town painted on china. The news-room, 20 feet wide, and 27 feet long, is furnished in oak and green moreco. On the onposite side of the corridor is the noblec The ground floor bas a corridor running from end to In the tong, situation the corridor is the police court, 50 feet long and 20 wide, fitted with doek and bench of oak, and intended further to be decorated with figures of the Angels of Justice and Mercy. The remainder of this side is occupied by the apartments of the hall-keeper and a private staircease to the orchestra. The entrance-hall hus two dights of stone steps leading to the main hall. The main hall is steps leading to the main hau. The main marks entered from this staircase by three doors, and is 50 feet wide and 80 feet long. The walls are panelled by doubled Corinthian pliasters, as on the exterior, and the whole picked out in various colours. The room is lighted in the evening hy means of sunlights. At the east end is an orchestra, capable of containing about 100 nerformers. and an orcap. The contractor At the case we want to be a start of the sta

iron work, Messrs. Hardy and Padmore, of Worcester; for the furniture, Mr. Chapman, of Newcas1le; for the heating apparatus and gas-fittings, Mr. White-head, of Preston. The china door furniture was made had nearing optimized in the china door furniture was made by Messra. Mayer, Brothers, and Elliot, of Dele Hall; and the iron-work for the vane by Messra. Skidmore, of Coventry. The modelling of the figure of the vane and the carving of the cargatides, were by Mr. Wood, of Liehfield. The whole has been carried out under the surveillance of Mr. Relph Hales, the surveyor to the Local Board, from the designs and under the superintendence of Mr. George T. Robinson, of Lanwington, archited of Pre of Leamington, architect.

ON SUBMARINE ELECTRIC TELEGRAPHS. INSTITUTION OF CIVIL ENGINEERS

ON January 20th and 27th, Mr. J K. Brunel in the chair, the discussion on Mr. Window's paper, "On Submarine Telegraphs," occupied both evenings. A description was given of the two kinds of sub-marine cables employed,-the simple cable, composed of one wire in each non-conducting envelopie, a certain number of them being laid down side by side, so that number of them being laid down side by side, so that in ease of a easually occurring to one wire the others might be made use of; and the compound eable, wherein a given number of wires were eovered by oue envelope of iron wire. The recent easualties occur-ring to these eables were quoted in support of the advantages offered by the simple cable; as, it conse-quence, the Calais eable, which was of the compound kind, being torn asunder by the anchor of a vessel during the late gales, there had ensued considerable inconvenience, until the transit of the messages could eables, although partially injured, had never ceased to be capable of conveying messages. The chief point suggested for discussion was the

Cables, atthong parton primer, and be capable of conveying messages. The ebief point suggested for discussion was the difficulty of working, at a satisfactory rate, through such a length of cable as that now being constructed to connect Enrope with America. There was reason to believe that the effects of the phenomena of induc-There was reason tion and retardation were exaggerated. The electrical eonditious of an underground wire coincided with those of a submarine wire. The first English underthose of a submarine wire. Too first building and a submarine wire. Too for the submarine wire and the submarine wire of any importance coated with gutta percha was that laid by the Maguetic Company in 1851, between Liverpool and Manchester. Some time since Mr. Charles Bright, in conjunc-

tion with Mr. Whitehouse, had made some experi-ments through 2,000 miles of wire, connected so as to form a continuous circuit, terminating at both ends in the earth. Intermediate instruments were placed . Intermediate instruments were at each loop, to test the thorough action of the elec were clearly defined at a rate of tco to twelve words per minute. Two large ioduction coils, three feet in length, excited by a powerful "Grove" hattery of fifty pint cells, but connected for quantity in sets of ten, were used to generate the currents, which were very powerful. From all that bad been shown in the very powerful. From all that bad been shown to the paper, it was contended that no difficulty was likely to arise in working from Ireland to Newfoundland that eould not be effectually dealt with. It was observed that, although Mr. Crampton's name had been provincently mentioned, in connection with the first successful and permanent application of the bas 24 days in a start is not not able to be

submarine cables, he did not in any way claim the merit of the invention, and was most anxions to bring forward the legitimate claims to priority of all those betwind the logitimate chains to photon of the topset who had made the investigations upon which the system was based, and to give their shore of merit to all who had eo-operated with him, in the actual opera-tion of laying down the first working cable. The invention, or discovery, resulted in fact from the com-bined investigations and experiments of several gentle-, as had been observed in the paper; and, in oboration of this, a tracing was exhibited of a men. men, as had been observed in the paper; and, in corroboration of this, a tracing was exhibited of a drawing made for Professor Wheatstone in 1840, showing the submarine eable in its details of con-struction, insulated by tarred yarm and covered with iron wire; and the mode of laying down and picking up was also shown. There could not be any doubt of up was also shown. There could not be any doubt of the authenticity of the drawing, and it was known that Lutwiche, who made it, went to Australia in 1841, and had not since been in this country. It 1941, and had not since octain this country. At was always said of him that he had alded Professor Wheatstone in working out the mechanical details of the proposed system of submarine telegraphs, stated by the professor, before a Parliamentary committee, he practicable. The names of Mr. Wollaston, an early labourer in

The names of Mr. Wollaston, an enry labourer in the field, --of Messrs. Wilkins and Weatherly, who attended to the machinery for constructing the cable, --of Mr. Newall, who made the eable,--of Mr. Statham, who effected the guita percha issulation,--of Messrs. Davis and Campbell, solicitors, to whose emergy and confidence the ultimate success was so greatly duc, -- and of Mr. Brett, whose indominable perseverance had kept the satijet constantly hefore the public, were successively mentioned, and their re-

spective shares in the merit of the submarine telegraph duly apportioned.

From investigations it appeared, that without any direct trial in long subterraceau or submarine wires, but by reasoning on the known facts and measureunit of reasoning of the and the second through experi-nents regarding electric conduction through expect, and electric induction across solid insulators, there were strong grounds for confidence, in expecting that a message of twenty words would not require more a message of twenty words would not require more than seven minutes for its delivery, and that 200 such messages could be seut during the day of twenty-four hours, through such a cable as was proposed laid across the Atlantic. There was even reason to think that rate might be ultimately exceeded, by the perfecting of the system introduced by Mr. Whitehouse

In some experiments tbrough a length of 1,600 In some experiments torough a rength of poor miles of wire, made with varying hattery powers, gradually increased, by successive additions, from thirty-oue cells to sixteen times thirty-one cells, there was no sensible variation in the velocity of the arrents, which was found on an average to be about

currents, which was found on an average to be about 1,000 miles per second. It was observed, that the statement of Professor Faraday, that different and distinct waves of clec-tricity might co-exist in any long submarine con-ductor, at the same instant of time, was fully horne ont by the recent researches of Mr. Whitehouse. In a length of wire of 1,020 miles, three signals of a signal stroke bell had been distinctly heard after the hard had excend to transmit, and in a length of wire hand had ceased to transmit; and in a length of 498 miles, two such signals in arrear had been heard.

It was remarked that the subject under discussion It was remarked that the simplet induct induction involved two principal questions, which should be dis-ensed separately, namely, the mechanical one of insulating, shielding, and submerging the metallic conductor, and the electrical question of transmitting messages through the same when laid. With regard to the 6rst, it was shown that Mr. Werner Sicmens With regard of Berlin, discovered the non-conducting property of gutta percha in 1846; and that in the spring of 1847 he proposed to the Prussian Government the establish he proposed to the Prussian Government the establish-ment of underground line wires, coated with that material. In the autumn of that year an experi-metal line of 20 noiles in length, from Gros Beren to Berlin, was completed, and was found to work so successfully, that in the years 1848-9, about 3,000 miles were laid on this system. In March, 1845, several miles of copper wire, coated with guita pereba by means of the cylinder machine, were submerged in the harbonr of Kiel, for the purpose of establishing an electric communication between the shore and an electric communication between the shore and several points in the deep channel, and this was asserted to be the first attempt ever made to establish submarine communications. It was suggested that the passage of an electric wave through a cable might the passige of an electric wave can begin a cache mig-be accelerated to nearly four times its untural velocity, by simply returning the current through a second in-sulated wire within the cable, instead of through the earls. The present successful submarice cables were carto. The present successui submarice cances were a combination of a perfectly insultated wire, contained within exterior strong iron wires, running in a longitudinally spiral direction. The invention of this kind of cable was elaimed for Mr. Edward Highton, on the authority of a judgment stated to have been given in the Cour Imperiale de Paris, and it was usserted that the Solicitor General for Eogland concurred in this opinion. Although gutta percha, when buried in the carth, and acted upon under peculiar circumstances, was subject to decay, yet, as far as past experience bad gone, sea water seemed to be a preservative of that gnm. It was suggested that the preservative of that guin. It was suggested that the conducting wire of a subterranean or submarine tele-graph nught be protected from oxidation or decay at any point of leakage, by means of an electric enrreat.

DANGEROUS STRUCTURES UNDER THE METROPOLITAN BUILDING ACT. IN Mr. Haywood's last annual Report to the Commissioners of City Sewers, he says, under the head of "Dangerous Structures";-

In the year 1855 the Amended Metropolitan Building Act placed the control of ruinous huldings swith the commission. Upon the 1st of January, 1850, the Act because operative. The commission immediately organized the system of carrying the provisions of the Act into effect; and, throughout the provisions of the Act into enece; and, introduced the year, their transactions, consequent upon this addi-tional power, have largely increased their business. During the year 1856 the number of structures reported upon by surveyors appointed by the commis-reported upon by surveyors appointed by the commis-

reported upon by surveyors appointed by the commis-sion was 256, the number of enses heard before magistrates was 24, the number of buildings shored up during the year was 150, the number of enses certified by the surveyors as being completed was 170. Almost the first eases dealt with by the commission Almost the first eases during the of the commission were the most provident of those structures which had been shored np previously to 1856, and had been long standing nuisances. I may mention Nos. 98 and 99, Cheapside. The engineer then proceeds at some

Г ГЕВ. 7, 1857.

length to treat upon the subject of hoards and scaffolds, and then says,— Projections over public ways have given the commission their usual amount of trouble during the past year, and although convictions of offenders have sometimes ensued, still projections over public ways remain a difficult subject of management, public ways remain a dimension subject of instangements, and are, in my ophiuon, likely to become more so. I can only see one remedy for it—which I am convinced must be applied at a future day—the entire prevention of all prejections over the public way within certain limits as to height."

NEW HOSPITAL AND OTHER BUILDINGS AT ADELAIDE.

THE new hospital at Adelaide (South Australia), or rather, a portion of the final edifice, has now been creeted, and, by last accounts, was shortly to super-sede the old hospital. The new building is in the Italian style of architecture, and is said to unite excellent internal arrangements with a handsome exterior. Its extreme length from east to west is 196 feet, and its depth from north to south 108 feet. The elevation is 38 feet, and the area covered hy it is 1,277 square yards, or about a quarter of an acre. The It contains four large wards, two upstairs and two below, 56 feet long by 30 feet wide, each capable of in addi containing at least twenty beds. There are, ion, tweaty-three rooms on the ground-floor, in-luding two commodious accident wards, and an eluding two commodious accident operating theatre, surgeon's rooms, committee-room, drug-store, bath-room, dispensary, and apartments for wardsmen and nurses. Out are sixteen rooms besides the Ou the upper floor there for wardsmen and nurses. On the upper floor there are sixteen rooms besides the wards, with every necessary accommodation for washing, &c. and con-veniences for isolating patients. The upper floor is reached by three starcases, built of Sydney cedar, with balastrades of Singapore cedar, which lead to two corridors, 36 feet and 44 feet long, respectively. On the ground-floor there are two corridors, the main one beiog 124 feet, and the miuor 00 feet long, and one deng 12.4 neet, and the minor of neet origi, and there is also a vernada extending for 60 feet. The building is finrished with a system of veutilating pipes. Water is supplied to all the rooms. The centre of the building, as complete, is surmounded by a square tower 64 feet in height, enclosing a tank capable of containing 1,500 gallons of water. Imme-dicate height the neutre are the hitchens but there diately behind the centre are the kitchens, but they are not yet complete. The fault of the building appears to be, that the portion which will be the centre of the complete hospital is too low, nod much out of keeping with the rest of the structure; a defect which is said to appear the more striking from the altitude of the tower above the rest of the edifice. With this qualification, the new bospital is regarded as a creditable production. The architect is Mr. who this qualification, the new obspiral is regarded as a creditable production. The architect is Mr. Edward Hamilton, and the builder, Mr. Farr. The total cost of the building is, we understand, 10,000/. The more recent buildings of this city, fortunately, give promise of an abandonment of the goal style of

building; and, even in two or three story houses, says a local anthouty, flights of stairs are now seldom omitted. "There is the Supreme Court, an imposing-looking structure; the Baok of Australia, both imlooking structure; the Back of Australia, both im-posing and elegant; the chapel in Prire-street, with an agreeable appearance, not often seen in so young a country. These, indeed, show that there is some taste in the colony, and the most recent dwelling-houses make a nearer approach to convenience and comfort than any that have preceded them. The Legislative Council-chamber is a pretty building, be-cause it is a copy of a picturesque town-hall in one of the Midland Counties of England. The Police Bar-racks and Armoury, whatever may be their internal arrangements, are bare and ansightly in the extreme. The Lanatic Asylum is intended to be an elegant The Lunatic Asylum is intended to be an elegant Gotbic building—but its harsh and attenuated pro-portions, and narrow windows, give it a gaol-like and elose appearance."

Ornamenting or Decorating Glass. Dated Sth July, 1856.—The designs with which the surface of glass is to be ornamented or decorated are cut on blocks with a raised surface, after the manner of blocks used

with a raised surface, after the manner of blocks used in calico-printing, paper-staining, &c. Or the desigues are cut out of thiu metal (or other material), as in stemeiling. If cut on hlocks, the hlocks are dipped and receive the colour from a sieve or roller as in paper-staining. If eut out in metal or other plates, the colour is applied with a brush, and may be applied at once to the surface of the glass after it is prepared. 1621. D. W. HAYDEN, Glasgow,—*Eastenings for Windows shulters*—Dutaed 9th July, 1856, but not proceeded with.—Instead of loose and complex fastenings the present invention provides for the obtainment of complete scenity by means of details, which are always retained in their place, and can never be mislaid or lost, whils the acts of fastening or unfastening re simple and almost automatic.

never be inislaid or lost, whilst the acts of fastening or infastening are simple and almost automatic. 1576. Jews Foss, Manchester.—Cutting and Saving. Dated 5th July, 1856, but not proceeded with.—The cutter is formed of two thin sicel hlades, the edges which are made plain or indented according to the nature of the substances to he operated upon. These two blades are brought in contact with one mother, or nearly so, they being passed hetween two pairs of adjustable rollers, placed the one pair above, und at a convenient distance from, a table or support for the material that is to he cut, and the other pair mder the said table. The blades are stretched over wo pulleys, the one pulley above the top set of wo pulleys, the one pulley above the top set of ollers, and the other under the hottom set.

is the two hades are cutting in opposite directions, or against one another, it will be seen that the mate-ial, being pulled against the edges of the blades, will e acted upon in a manner similar to that produced y n pair of shenrs or seissors.

RAILWAYS ON COMMON ROADS.

RALLWAYS ON COMMON ROADS. I HAVE read with much pleasure the able letter of our correspondent, "Joseph Lockwood," and entited Railways on Coumon Roads ;" and, as it is a subject thich I have had under my consideration for some cers, I venture to trouble you with a few remarks. I am glad to lind that some attention has here ad-oded to this matter, and that our continential neigh-ours are really awake to the fact that large lines squire feeders, and that they are using legitimate easns to increase their traffic, and develop the assuress of the districts through which they run. I n convinced that an arrangement of this sort is one essures of the districts through which they run. I neowined that an arrangement of this sort is one each required in this ecountry, and that even if the secutives of the main lines do not examine and de up the subject, probably, when public attention is been called to its advantages in your valuable per, something may yet he done, either with or the their assistance.

Thout their assistance. If the outlying towns hecome awake to the fact lat they, by a noderate outly, may embrace the vantages of railway communication even in a modi-d shape, you may rest assured it will not be long fore some inquiry be made into the advantages and pabilities of "transways," and easy travelling, over rammped husses" (sometimes not too clean) and cortain necommodation, or, in eight cases out of 4, ou your arrival at the station per train, you find d alternative but to leave your hugage and make use mature's "locomotive," or to be politely fleeced and the guise of special hiring.

anternative but to leave your luggage and make use parature's "loomotive," or to be politely flecced addr the guise of special hiring. Although the towns in the United Kingdom wing railway stations are numerous; and that, assidering the network of railways now spread over lagland and Scotland, it would appear to a casual injurier that ample accommodation was provided, and at there was hitle room for any auxiliary stations, peareful examination will at once convince that a le field is open to carry into eminently matterial For call examination with at once convince that a fine screen of which is a famed example of the Eliza-theration a system of intercommunication, as suggested to the state was a system of intercommunication, as suggested to a great which is a famed example of the Eliza-thethan style. From the Treshams the estate was "A view and devils of this curious stracture will be found in vol iii. of the Backler, pp. 528, 539, and 553.

number of towns, still the places having such advan-tages only amount in the aggregate to about 2,000; ; and if the population returns he examined, it will he found that, although the principal towns have heen especially eared for in the establishment of the rail-way system, there are yet nearly 5,000 towns or villages without a railway station, and in the majority of instances without even the "shaky omnihus" so of instances without even the "shaky graphically described hy Mr. Lockwood. shaky omnihus" so

There are many towns to and from which even a tramroad would be an unprofitable speculation, but tramroad would he an unprofitable speculation, but there are also a great number of towns which would only to be too glad to varil themselves of tram-roads, and to contribute a considerable portion of the required cost of laying down to hring themselves within regular and certain communication with the main line of the nearest railway; and I think it only requires a comprenensive plan to be submitted fur consideration, to meet with approval, and ultimate adoption. The old saying of "Herven helps those who hulp themselves" would apply in this particular instance; and those towns which are now in a com-paratively isolated state, hy adopting a proper system of horse railways, might emerge from their isolation, of horse railways, might emerge from their isolation, and, by re-connection with the main stream of communication, rub off the rust accumulated by partial uon-association, and hecome valuable feeders, and part and parcel of a system in a secondary, if not able to attain a primary position. C. W. K.

Books Receibed.

The Cabinet Lawyer: a Popular Digest of the Laws of England; with the Criminal Law of England, a Dictionary of Law Terms, Sc. Seventeenth edition, extended and corrected throughout. London: Longman and Co. 1857. "THE CABINET LAWYER" is so standard and well known a work for popular use, and so useful a hook to keep people out of difficulties, that is it is only requisite here to record another proof of popular estimation, namely, the issue of the

of popular estimation, namely, the issue of the seventcenth edition. For masters and workmen, landlords and tenants, inventors and patentees, sanitary reformers, business people in general, and a host of others, this is one of the most valuable books of reference possible. Besides all that is indicated slightly in the title as here given, it contains assessed tax tables, stamp and house duties, cost fees and charges in the superior and county courts, &c.; and the present edition, besides being enlarged and revised. contains the statutes and legal decisions to Micbaclmas term, 19th and 20th Victoria. Special reference should be made, or attention drawn, to a useful section on the working classes, fricually, industrial, provident, and loan societies, &c.

VARIORUM.

The Quarterly contains a long and interesting article on "The History and Antiquities of Northamptonshire, with Suggestions for County Histories." Speaking of the picturesque old manor-houses of the county, the writer gives the following notice of Sir Thomas Tracham. following notice of Sir Thomas Tresham :

"Sir Thomas Tresham, the builder of the trian-gular lodge at Rushton," appears to have heen the architectural Durandus of his day, and in his 'New Buildiug' at Lieveden has left another no less fancifor the second s sacred monogram, the instruments of the Passion, and invocations to our Lord and the Blessed Virgin, There can be little doubt of its destination to domestic, not, as is usually asserted, monastic purposes; and it seems to offurd an admirable, though expensive model, for a middle-sized house. It owes its present forform condition to the same party of Cromwell's soldiery that ransacked Nicholas Ferrar's house at Little Gid-ure. The marked, base at Bethwall memory fields dug. The market-house a Rothwell, never finished, and inadequately restored in 1827, is another monu-ment of Tresham's architectural taste, and, if we may trust the inscription running round it—*mihil preter* irust the inscription running round it—mihil preter bonum commune questivit, nihil preter deens perenne amicorrem—of his public spirit and private friend-ship; the arms of ninety families of the coundy form the cornice. A fine alshester monument, unique as to costume, now removed from the destroyed church of St. Peter's to All Saints', Rushton, represents Sir Tbomas in the rohes of Prior of the Order of St. John of Jerusalem. There can he little doubt in assigning to him the main part of Rushton Hall, the fine screen of which is a famed example of the Eliza-betian style. From the Treshams the estate was

hought by Sir William Cockayne, ancestor of the Lords Cullen. It is to the marriage-feast of Bryan, the second Viscount, that the familiar legend belongs. The backbard vsection, that the raminiar legend belongs, He had been betrothed, at the age of sixteen, to Elizabeth Trentham, a great heires, but had, while trawelling abroad, formed an attachment to an Italian lady of rank, whom he afterwards deserted for his first hetrothed. While the wedding-party were feasting in the great hall at Rushton, a strange car-tizer down how here how me a feast feasting in the great hall at Rushton, a strange car-riage, drawn by six horses, drew up, and forth stepped a dark lady, who, entering the hall and seizing a gohlet, 'to punish his falsehood and pride,' drauk perdition to the hridgeroom, and having uttered a curse upon his bride, in stronger language than wo care to chronicle, to the effect that she should live in wretcheduess and die in want, disappeared to he traced no further. The curse was in a great measure ful-filled. She hecame a heauly of Charles H.'s court, was painted with less than his usual allowance of dranery hy Sir Peter Leby, twice gave an asylum to drapery by Sir Peter Lely, twice gave an asylum to Monmouth in the room at Rushtou still called the "Dake's Room,' and, as might he inferred, living un-happily with her hushand, died, notwithstanding her enormous fortane, in comparative penury, at Kettering, at a great age, as late as I713."

"The Monthly Review" (Mitchell), the new volume of which is to include political articles occasionally, contains a discriminating paper on the Sonlages Collection, urging, properly that "in the present we must do present things; we must work for present uses with modern appliauces and advanced scientific light." The appraaces and advanced scientific light." The writer, however, is too good-natured to the present, when he suggests that a walk through the collection shows "the great advance in most particulars of similar arts and productions of our own days." In the majority of the de-partments the very reverse onght to be the impression given.—— "The Boardsof Healthand Burial Boards Officers? Pocket Almanacand Guide for 1857," has appeared (Knight, Fleet-street, Burial Boards Officers' Pocket Almanacand Guide for 1857," has appeared (Knight, Ficet-street, publisher by authority to the Board). Besides other matter to be found in almanaes generally, it contains lists of the members of the Metropo-bian Board of Works and General Board of Health, an article on Sanitary legislation and progress during 1856, a list of burial boards and of places under the Public Health Act, with names of officers, population of districts, &e. From the article on Sanitary legislation and progress, it appears that during the last three years, sanctions for necessary works of water years, sanctions for necessary works of water supply and drainage to the extent of 1,600,000. have been granted, being more than half a million have been granted, being more than half a milhon sterling beyoud the amount granted during the preceding 5¼ years, namely 1,056,000.— "The Literary and Scientific Register and Almanac for 1857," by J. W. G. Gatch, M.R.C.S.L., late Foreign Service Queen's Mes-senger, and dedicated to H.R.H. the Prince Consort (Bogue, Fleet-street), appears to be one of the most generally useful of the host of almanace nous multible J. It contains an extenalmanacs now published. It contains an exten-sive mass of condensed matter relative to sciensive mass of condensed matter relative to scien-tifie, art, and literary subjects, in very small compass, and bound up as a handy little pocket-book.——"The Post Magazine Almanac and Insurance Directory for 1857," is a well-esta-blished and a useful sixpenuy almanac, this heing the sixteenth yearly issue : it is published by Mr. Pateman, at the "Post Magazine" office, Wire office Court Elect streat and contains Wine-office Court, Fleet-street, and contains besides the more permauent matter, lists of projected Assurance Associations, and notices of Assurance Office changes, np to the time of publication. — In the current *Bdiaburgh Review*, besides an able and kindly notice of Mr. Fer-gusson's "Handbook of Architecture," there is a actical on Human Lowenith in article on Human Longevity, interesting to sauitary reformers. The writer will not assent an article on Human Longevity, interesting to sauitary reformers. The writer will not assent to the doctrine that a century is the natural term of human longevity; but admits "that individual habits may be made to contribute much to the healthy prolongation of life; and we can affirm," he adds, "with assurance, that these habits are such as best accord with the happiness, diguity, and higher destinies of our species."

From relevance of Landar-Nautgwyn, in South Wales, and mentioned in our last, we are asked to say that the cartoous were designed and prepared by Mr. Alfred Bell, as they were also for some of the windows at Aberporth

Miscellanea.

DAMAGE TO BUILDINGS .- At the County Court, DAMAGE TO BUILDINGS.—Ai the County Coart, Bolton, last week, Mr. Thomas Lane sought to re-cover 200, as damages done to a bouse in Bridgeman-place, Bolton, by the defendants, Moses Kirk and Thomas Brown, erecting a warchouse adjoining his premises. In sinking for foundations they had gone about 5 feet below the scullery foundation of the plaintiff's bonse, consequently it was necessary to anout b feet below the scenter, ionucation of the plaintiff's bonse, consequently it was necessary to 'underpin' it, but recently it bad become damaged by the foundations giving way from an engine gearing being connected to the wall. The judge, after going through the evidence, directed a verdict to be given for nominal damages. A verdict was according for nominal damages. A verifier was an given for one shilling, with common costs. of appeal was given against the decision.

of appeal was given against the decision. ACCOMMODATION AT THE MANSION HOUSE, LONDON.— Recent investigations at the Mansion House bave more clearly proved the inconve-niences resulting from wort of accommodation iu the place, and its remarkable inaptitude for the transac-tion of the public basiness. There is but one room appropriated for numerons athlabrits and declarations made by mercbants, hankers, and others, and, when witnesses are required to be out of court, they are crowded into one room. hy no means have enough trowded into one room, hy no means large enough. The small room allotted to the chief clerk has been, The small room allotted to toe enter clerk mas occu, on each occasion, occupied by the galors and con-victs. It is believed to be the only police-court in London in which such meagre accommodation is given, and Captain Williams, the Government 1n-spector of Prisons, is said to have severely condemned it.

demned it. Ancurrecrs' BILLS.—In the sittings at Nisi Prius, at Westminster, before Mr. Baron Bramwell and Common Juries, on Thursday in last week, Mr. Ltc, an architeet and surveyor, such the solicitor to the officers of the parish of Epsom, for 49/. for work done on his order. The plea in defence was, never in-dehted. The plaintiff's case was, that in 1852 a new bed. of the plaintiff's case days that in 1852 a new dehted. The plaintif's case was, that in 1852 a new valuation of Epsom was made by Mr. Penfold, and a poor-rate made on that valuation. That rate, how-ever, was appealed against by the gas company, the owner of the Grand Stand, and another. Mr. Pen-fold was instructed by the defendant to find an arebi-teet and surveyor to confirm his own vuluations, and he accordingly communicated with the plaintif, who valued the properties, and it was for the time and labour expended in so doing that the present action was hrought. It was also said, on the part of the plaintif, the his charge was a fair and reasonable one. The defendant's case was that he was not per-sonally liable, but that the parish officers were, who one. The defendant's case was that he was not per-sonally liable, but that the parish officers were, who were bis employers. The parish officers had not disputed their liability to the plaintiff's claim, but had refused to pay it, as it was considered by them to be excessive. The jury found a verdict for the plaintiff for the amount claimed; and the Judge gave the defendant leave to move the court upon the question of low. of law.

DILER EXPLOSIONS.—From the second annual re-BOILER EXPLOSIONS.—From the second annual re-port of the Association for preventing Boiler Explo-sions and Economising Steam, lately published in the Mechanice' Magazine, it appears that there are now 462 members in the Association with 1,301 holiters in use, 193 members with 458 boilers having been added since last report. During the past year, 2,216 wists have been made, and 1,456 boilers examined hy the chief and sub-inspectors. These visits disclosed the 129 being on genetic to may each of the whole the enter and sub-inspectors. Incee visits uscosed that 143 boilers, or nearly true per cert, of the whole, were in a dangerous couldition. Thirty-one boilers bave exploded during the last year, causing the loss of fifty-eight lives, and scrious injuries to upwards of seventy persons, but no explosion occurred on works belonging to members of this Association. Surcharged steam is said to be a frequent cause of such explosions. "BIG BEN."-In the section of the Westminster

¹⁰ BIO BER,"-—In the section of the Westminster Clock-tower, given in your number of last week, Big Ben is shown suspended in the most sensible way possible, that is, by a single bolt passed through his central top. Termit me to suggest, that a suitable number of small spherical rollers be introduced be-tween the collar of the holt and the inside of the erown: the rollers may be kept equidistant, by a simple earringe made to receive their aris. Key a ring of teeth, or wheel, into the flanch of the neek, on the ton of the bell. stated a serve or worm computhe top of the boll: attach as crew or worm gearing into the ring of teeth, and furnished with a capstan bead into the under side of the heam, from which the beau motion encours side to the mean, from which the bell is suspended: then a man standing on a suitable platform will, with a lever, easily work the capstan, and turn the bell. The rollers will greatly reduce the friction, and, consequently, the labour of turning, and also the objectionable twist on the central holt. The object of turning a bell is now too well known to need explanation.* W. L. BAKER, C. E.

The sore w may be inclined in order to suit a wheel, cast with traight teeth. A precedent for this will be seen in Messra Raudalay and Field's pattern disconneting apparatus for paddle-theels, which has been successfully used for many years in Jovernment stammehing.

ACTION FOR REPAIRS, UNCOMPLETED FROM TRADE UNION INTERFERENCE. — At the Grimsby County Court, in the course of last month, a ship-builder, Mr. Keetley, sued the owner of a Whitby vessel, Mr. Issue Mills, for payment of 407, odds, for vessel, Mr. Isaac Mills, for payment of 400. odds, for repairs in dock at Grimsby. The owner had in-structed one of Mr. Keelley's foremen to send ear-penters on board, who accordingly proceeded to repair the vessel, but left her on understanding that the voxer had a dispute with the Whithy carpenters, the repairs being uncompleted, and the vessel iu a dan-gerons state was sent up the river to have the work finished, Mr. Keelley reinsing to employ his appren-tions that bettered writer to go to init than obce gerons state was sent up the river to have the work finished, Mr. Keetley refusing to employ his appren-tices, who threatened rather to go to juil than obey said, that there was no contract proved, and that "Mr. Keetley could not force either his meu or his apprentices to work. And he had done all he reason-ably could under the circumstances." The vessel was herefore by the angunt of remains done to her, and would

ably could under the circumstances. The vessel was better by the amount of repairs done to her, and would cost that amount less when a he was taken to com-plete;" and as none of the charges in the amount claimed were disputed, he should leave it to the jury to consider their verdict. After retiring for a short period, the jury returned a verdict for the plaintiff for the amount elaimed. the amount claimed. THE DOCKS NAPOLEON COMPANY P. FOX, HEN-DERSON, AND CO.—The Tibunal of Commerce at Paris have given judgment in two actions, in which Messra. Fox, Henderson, and Co. were respectively the plaintiffs and the defendants, and their opponents were the Docks Napoleon Commany. The judgment the plaintiffs and the defendants, and their opponents were the Docks Napoleon Company. The judgment is a lengthered document, but the conclusion is to the effect that Messrs. For, Hunderson, and Co. and the directors of the dock company, Messrs. Cusin, Lecendre, and Duckhene & Vere, with whom they had arranged for the construction of the dock for Legendre, and Duchéne de Vere, with whom they had arranged for the construction of the docks for 24,000,000f, on a secret nuderstanding that the directors should have 1,500,000f. commission, were equally hiameable, and their secret transaction was therefore declared to be "null and void, and of no effect, as stimed with frand (estable de fraude): the tribunal "condemns the defendants [Messrs. Fox, Henderson, and Co.l to restore to Torohet. Firand. the tribunal "conterms the decoding Latesia, too Henderson, and Co.] to restore to Torohet, Picard and Labot, in the quality of directors, the 32,000 dock shares they have unduly received; and in the event of their not doing so within a fortught from the signification of the present judgment, and withou

event of their not doing so within a fortuight from the signification of the present judgment, and without any other formality, condemns them personnelly, by all the neeaus provided by law, and even under pain of im-prisonment, to pay the sum of 4,000,000 instead of the said restitution , declares the counter-action of Fox, Henderson, and Co. unfounded, dismisses it, and con-demns them to all the costs." NEW CAMPET-WEATING PROCESS. — Mr. T., Wheeler, of Leicester, has patented a new wearing process, and has it in extensive operation at the Abbey Mills. The principal features in which the method differs from that once universally employed, has been described to us as follows:—Instead of wires introduced in the ordinary manner, a bar with a double row of hooks, and a knife working between them, is supended over the fabric, the hooks taking up each separate warp-thread as brought up by the facequard, and holding it perpendicularly on the face of the work, until the loops are cut by the action of the knife. A pile of any depth required is thus pro-duced, as well as a speed, a uniformity, and an even-mess of surface not attainable by any methods ordi-narily used. The effect is said to be excellent.

IMPROVEMENT IN CANDLE LAMPS AND CANDLES. I send you some suggested improvements in the paratus connected with artificial light, which I I show you sould with artificial light, which I helieve practicable and important, as ensuring us a better prease of illuminositon than any at present in use, with the exception of gas. First, as to the candle: this is to be made with a hollow aperture or eand running through it, its entire length; and to effect this it will be necessary for the moulds to have running down their centre a circular piece or pipe of metal, attached to the mould by a cross-piece of metal at the end where the tallow or other compometal, sition is poured in. This will thus form a hollow or pipe throughout. The caudlestick is to be so conpipe infragment. The caldreshift is to us to be deep) there shall run from the centre of it a hollow metal pipe (of some kind that will stand heat well). The hollow of the candlestick, which will feed the fame with a stream of atmospheric air,—aeting on the same principle as the Argand lamp does, and also cnsaring stability of the position of the candle, thus doing away with the necessity of a deep socket,—a slightly-raised ledge being sufficient. The wick must be circular, and spread round the air-tube. The "spring" principle, as applied to the candle-lamps already in use, must be used, because the pipe or air tube would be *necessarily* a faxture. A commoner candle might be made on the same principle by dipping straws, covered with a wick, into the tallow or other composition employed in the manufacture of structed that, besides the socket (which need not be

FEB. 7, 1857.

candles; the straws being previously steeped in a solution of borax to ensure the construction of the wick (as in the case of composite and other candles which require no saufflog): the straw would supply a stream of air, equally with the metal pipe or tube, fixed to the candlesite. The suggested improve-ments sent occurred to me some three or four years ago; and very soon after I saw an account of the same principle being in use in Russia, in the serial called " Household Words." The writer there ex-pressed bis surprise that it had not made its way to called " Household Words." The writer there exit pressed bis surprise that it had not made its way to this country; and, after being redliched this country; and, after being published in that popular miscellany, it seems strange that no one has ed to introduce it in this country .-- AN attempt UNEMPLOYED CLERK.

UNMERTONED CLERK. THE TURNER WAREN-COLOURS, about 100, are now exhibited at Marlborough House. They consist chiefly of the drawings from the Liber Studiorum; of the well-known series of drawings called "English Rivers;" of those which illustrate the course of the Science, and of the drawings for the sciencies to HWVERS;" of those which illustrate the course of the Seine; and of the drawings for the vigneties to Regers's "Italy." These, with the landscapes of Edinburgh, painted in the year 1800, the "Capture of Fort Bard' in 1805; "Ivy-bridge," also an early drawing; and "Folkestone," will be found to exhaust the number second the number specified.

THE SWANSE A COLLEGE COMPETITION — In IA43 THE SWANSEA COLLEGE COMPETITION — In IA43 was awarded to me the second premium of 15 guiness, in competition for designs for the Normal College, Swansea. I have just received the second instalment from the secretary, after corresponding with him during the whole of the intervening period, accom-patied with law proceedings, and finally issuing a writ against him. You may recollect, the first de-sign chosen was not executed; I was never applied to, my trawings were retained, with the under-standing that in all probability they would be carried out for the purposes of an agricoltural college in the district, of which I have since heard nothing. Per-haps the above may prove useful to some of your readers, and may procents cance explanation. **B. H. POTER.**

THE BUILDER.

The Builder.

ENSINGTON GORE, as a site for the National Gallery, is not popular. Situated at the western extremity of the metropolis, it is felt that to locate the national collectiou there, would be to withdraw its heucficial influences, and its ever-fresh delights, from a very large proportion of the population, particularly as respects the working classes. The desire of His Royal Highness Prince Albert to concentrate all that relates to art and science in one Institution is, in the abstract, admirable ; and while we dissent from those who would adopt Kensington as this centre, we desire not

to be considered as joining any common cry of objection to views cutertained by the Prince. If hut for the part played by His the deposition of dust on the pictures, while Royal Highness, in what must still be called The Great Exhibition, the kingdom is most deeply indebted to him, -as it is for other acts also. With more information, -shall we say, too, good advisers, in respect of the artistical and in Trafalgar-square for artistic or educational literary professions and professors, His Royal purposes, would retain the national collection in Highness might, with case, become the most popular personage in the country, and, while doing an immense amount of good, create for himself a reputation which posterity would title of "The British Museum of Art and not let die. This, however, is not uow onr theme.

eight acres, of which about fifty two acres lie the north, and has eighty two acres of open between the main roads, forming its principal sub-division; npon which are proposed to he erected the National Gallery, the Colleges of Art and Science, and the Museums of Industrial Art and Patented Inventions, in the whole the surrounding property, with additional buildnearly 6,000 squares of building. About ten ings upon it, might be increased to 3,269 squares acres of the site appear to be devoted to roads, of building and 131 acres of ground. It has and the remainder, about twenty-six acres, to already cost the country little short of a million outlying plots of ground of irregular form, pro- of money: it is in a good neighbourhood, well posed for the accommodation of the learned calculated for residences for professors and societies, a music-hall, official residences, &c. &c. The wedge-like plot of ground, the midst of the site, forms no part of it,having a frontage of about 320 feet to the high road, and extending about 1,100 feet into the road, and extending work spread a serious principal sub-division of the ground, is a serious drawback upon any architectural display that might he made towards Hyde-park. The estimated extent of building is calculated roughly from a design in the hands of the Royal Commission for the Great Exhibition, and understood to embody the views of those members of it who desire to see the National Gallery on their land at Kensington. The design is of money ; while the other huildings, including of the present huildings. laying out the grounds, would prohably cost two millions more.

It has been urged amongst the objections that, large as the site is, it is not sufficiently so institutions as has heen shadowed ont, and

the land already in the hands of the Commis- eight times its present amount, or more than ways across the Kensington high road. London, however, is not disposed to give up any of its open space here, even were it determined that the National Gallery should be brought to this end of the town.

Our only objection to the scheme rests on the removal of the collection from its present contral situation so far to the west of the whole metropolis. It was shown some time ago that by taking in the workhouse and other property at the hack of the present National Gallery, a site could he obtained sufficiently large for the purpose ; but this would he an expensive affair, and, moroever, would necessitate the destruction of a building which would otherwise serve a useful purpose for many years to come. The assertiou that the pictures must necessarily be more damaged hy the impurities of the atmosphere in the centre of the town than at Kensington, is not generally entertained. Private collections in London are not found to suffer: the tendency of inventions and opinion is to lessen the amount of smoke allowed to escape into the atmosphere ; and good ventilation would prevent glazing the paintings would set this part of the question altogether at rest.

A scheme has been suggested by Sir Charles Barry, which, while leaving the present huilding a central position : and this we would now lay before the public. It consists in the appropriation of the British Musenm, with the enlarged Literature."

This Institution occupies a central portion of It appears by the plan of the land at the metropolis: its site is lofty and commanding. Kensington that it consists of about eighty- the soil good, and well drained; it is open to space in the squares, which adjoin, or arc immediately contiguous to it. It contains at present 1,460 squares of huilding, and stands upon 81 acres of ground, which, by the addition of officers of the Institution, and it has the advantage of the Loudon University as an adjunct in towards Kensington Gore, which, although in its immediate locality: it is, moreover, a very popular Institution, and only requires the clearing away of a portion of the shabby ueighbourhood to the south of it, and the opening up of a new approach to it in that direction, to render living specimens of the animated kingdom. it an unexceptionable site for a great National The valuable collections in the Department Institution.

It is proposed that this institution should not only be devoted to art and literature, but also to the accommodation of the learned societies. For this purpose it would be necessary to purchase the whole of the surrounding property, extending to Montague-street and Rossell-square on the founded on that of the Palace at Caserta, and east, to Montague-place on the north, and to would cover I,900 squares. The cost of it has Bedford-square and Charlotte-street on the west; been roughly estimated at a million and a half and erect additional buildings on the west side

The quadrangle and the ground story of classes of the community. the huilding might then he appropriated to the antiquities, the whole of the principal floor to the library, including the manuscripts, for such a concentration of artistic and scientific prints, and drawings, with the reading-rooms; and the upper floor to the national pictures, which some think should include the National which floor, with certain modifications that Library and the collection of antiquities at the could be made at moderate cost, might be admi-British Museum. Mr. Bruce Allen's project, rably adapted to receive them, and would to which we referred last week, would meet this uot only accommodate the present collection, objection by adding to the site a portion of including the cartoons at Hampton Court, but present portico and other columns and pro-Hyde-park and Kensington gardens opposite to afford space for a future increase of it to nearly jections, which now break up its front, and

storers, creeting thereon the national galleries double the extent of space allotted to the pic-of architecture, sculpture, and painting, and con-necting the two sites by decorative arched gate ments, it would he necessary to remove by degrees, as other accommodation could be provided, the whole of the natural history collection, which at present occupies a large portion of the one-pair floor, as well as other portions of the building, to Kensington. The cost of the additions and transformations recommended has been calculated at 130,000% which, however, might be spread over a period of two, or even three years; hut upon such an arrangement as would allow of depositing the present collection. of national pictures in the rooms proposed for their reception, and providing for the pressing wants of the library, at the end of the first year

The Institution, it is maintained, even in such a limited and incomplete state, would even then exceed the accommodation for galleries of art and books provided by the Parisian Bibliothèque Impériale and Louvre combined.

For the realization of the entire project ultimately, it would be desirable that the Government should immediately purchase the fee simple of the whole of the property which surrounds and is immediately contiguous to the present building.

The site at Kensington would then remain for a "National College of Science," in its various applications to arts, maunfactures, and commerec. For this purpose the distance from the centre of the metropolis would be of less importance, for the feeling of the country at large as regards art is still wofnlly deficient, and can only be fostered and improved by placing the finest examples of all ages in a central position, as in the haunts, as it were, of the whole metropolis, so that all its inhabitants and all who visit it from the provinces, particularly the industrial and working classes, may have the henefit of heing able constantly and easily to inspect them, and thus become familiarised and even imbued with their principles and excellence. With respect to science, the country is already pre-emineut ; and the distant locality, therefore, of an institution for its encouragement is not likely to deter that portion of the community who are interested in it, and are anxious to profit hy its advantages, from being obliged perchance to go out of their way for the purpose

The only buildings that would be required, according to this suggestion, would be museums for the exhibition of zoological, hotanical, and mineralogical specimens, and for patented inventions, and menagerie for living specimens in the department of natural history; a library of science and theatres, with laboratories for public lectures in every hranch of science; combined with a hotanical garden, and accommodation for

of Natural History, at present at the British Museum, the entire collection of the Museum of Economic Geology, the Trade Museum of the Society of Arts, the collection of patented inventious under the charge of the Patent Office, and possibly one or both of the private collections of the Regent's park and Surrey Zoological Gardens, if concentrated upon this site, would form such a valuable, instructive, and interesting collection as would not fail to excite a great interest in the institution amongst all

If fully carried out, it might then vie with the Jardin des Plautes, which it would much exceed in acreage, and the Conservatoire des Arts et Métiers combined, of the French capital, aud bear an honourable comparison with these uohlc institutions.

The present National Gallery contains, it is calculated, 278 squares of building, which could be increased to 448 squares, hy removing the

Vol. XV.-No. 732.

building upon the wasted forecourt a fresh façade; and it might then be devoted to the teaching of art in all its branches, and the periodical exhibition of modern works and the other purposes of the Royal Academy of Fine Art, who would doubtless be willing to pay, at any rate, part of the outlay incnrred.

The objection to Kensingtou Gore, to which we attach most weight is, as we have already said, the removal of the fine art collections from the centre of the metropolis; the necessity for this step not having been proved. It is most desirable to gather them together in a position within easy reach of the toiling workers in "populous city pent," and it secure to us that sufficient appropriate space to secure a complete and satisfactory arrangement may most readily, and with the least pecuniary outlay, be provided by rendering the building in Great Russell-street

> THE BRITISH MUSEUM OF ART AND LITERATURE.

SO-CALLED MEDLEVAL v. SO-CALLED CLASSIC

LIASSIC. Is the controversy which has been going ou as to the respective merits of Mediaval and Classic Architecture, there are several points materially affecting the main question, which, although occasionally alluded to, are not kept enough in view in weighing the arguments on either side,—points especially relating to fitness and nse, in meeting the many needs of modern national requirement, whatever style may even-tually prove to he the best fitted for our use. And unleas there is some sort of agreement And unless there is some sort of agreement amongst us as to principles of construction, and true treatment of available materials, it is use-

true treatment of available maternals, it is use-less to enter into arguments as to the supe-riority of any certain school of design. But, first, as regards the spirit of the two styles. It is impossible to put side, as though it never existed, the whole of that which has formed the staple of early associations, and which most men have been taught, from child. which most men have been taight, from condu-hood upwards, to regard as perfect and bean-tiful. Moreover, it is impossible not to see a certaiu amonat of heauty and dignity evon in the monotomous repetition of the same form, or in a long line of straight or curved cornice, as is seen in Regent-street or Park-eent. And every one who has had the ereseent. opportunity of judging, agrees in giving to Classic architecture its due meed of honour on its own native soil, and under its own native sky. The clear atmosphere of Italy and Greece, sky. The clear atmosphere of Italy and Greece, the intense and pure light, the genial climate, all combine in bringing out to the atmost per-fection the fine flowing lines of the sculpture, delicate shading of the mouldings, the im-ing effect of graud massive outline, and an posing effect of grau uncompromising uniformity,---and the very pas-siveness of the style scems in accordance with, siveness of the style seems in accordance with, and expressive of, the elimate, the country, and the people; just in the same way as the austere and changeable climate of Northern Europe seems suited to display the especial characte-risities of the Gothie style; the comparative lack of light requiring deeper hollows and broader and bolder lines, in order to obtain equal rich-eres of effect or dusth of shedow while the ness of effect or depth of shadow, whilst the coldness of the climate and ruggeduess of the coldness of the climate and ruggedness of the scenery seem to suggest the suitableness of warm colours and picturesque forms; and the erispness and energy, and the bold severity of the Gothic spirit seem suited in every respect to its own place and purpose. But now for more practical matters. I. Iu our climate and country, with occasionally deep snows, and frequent driving rains, a steep roof is less liable than a low one (cetteris paribus), to let in the wet: the tiling or slature is less

to let in the wet; the tiliug, or slating, is less liable to be ruffled, or torn up; the timber is less liable to decay from the reteutiou and con-stant condensation of moisture. It may be said that a steep roof is in itself more costly than a

are wanted, and of being made only of the need-ful proportion and size, is generally far more accommodating to domestic requirement than the employment, for every purpose of windows, of an oblong shape and uniform position. As regards the use of sashes and easements, it is uo question of style at all, but only of construc-tion. Moreover, it is as absurd to say that casements always let in the weather, as it is to urge that sashes always do keep it out. It depends not npon the nature of the thing, but upon the "make" in each particular instance.

The Gothie style is in no wise dependent 3. b. The Counce style is in no wise dependent upon the size of stones, or even upon the nature of materials at all, for effective treatment; whilst Classic architecture, when truly earled out, does depend very much for its effect upon the horresses of the natural structure. ont, does depend very much for its effect upou the largeness of the materials used; the majority of such buildings now being constructed of hricks, or small stones, cemented over to repre-sent larger blocks. And seeing that bricks are abundant, and that small stone is much the most casily procured, wrought, and fixed, and so the least costly, too, the Gothie can claim some little advantace over the Classie in this respect little advantage over the Classic in this respect; and nuless the Classic makes good speed in modifying some of these incousistencies, it will be fairly beaten out of the field in a few years. If it does mean to undergo modification, it must do it quickly. The iutroducers of the Classic style are said

to have derided the works of the monkish archi-tects of onr mediaval cathedrals, in that such lofty structures were earried up of stones no bigger than could be carried from scaffold to scaffold, ou men's shoulders: surgery the deriders nuconsciously paid the greatest possible com-pliment to the science and ingenuity which pliment to the science and ingenuity which could carry ont such noble works of art with such sleuder means, instead of being dependent upon mechanical force for the employment of such materials as the introduction of the new style uccessitated. Let their successors look to that similar inconsistencies do not attach to them.

It is not to be wondered at that the advo-cates of Classie architecture have neither time nor inclination to enter deeply into the sindy of the principles of Pointed arehitecture. No one can reproach them for not throwing either their No And it is heart or their mind into its spirit. And it is only by the principles of true art—independently of its being Classic or Gothic, or anything else —heing brought out and presented to their notice, that any architeets are likely to ehange their own beaten track. So that the same may be said, perhaps with equal truth, of all those who have been wholly taken np with the study and practice of either style; and, hence, we may grieve, thongh we cauuot wonder, that there is so small agreement hetween the two parties heart or their mind into its spirit grieve, thongh we cannot wonder, that there is so small agreement hetween the two parties even upon points connected with construction and practical nsc—npon the first principles and elements of architecture; and that such vague notions do prevail as to the true nature of many things which hitherto have hardly come within the sphere of each individual architect's pursuit or provide

or practice. Yet surely it is in the settlement of such questions as these, numerous as they are, that we must look for a hopeful issue in the vitality and true growth of art. If the foundations are bad, there can be uo permauent building, how-ever fair the superstructure may be. Such Such questions as these ought to form the subjects of our controversies much more than they do; indeed, the consideration of them comes pro-perly prior to any question of mere style. These cannot all conform to style. Style may arise ont of them. The Classic style does as yet fall short in many such patientars: it disregards many of these so-called minor considerations. And it may be urged more justly against the Classic than against the Gothic, even as now earied out, that an architecture which sets aside circumstances of time and nace.—which questions as these ought to form the subjects of aside circumstances of time and place,—which is unable to localise itself,—which is much de-pendeut upon extraneous sources for the very means of its success, or existence,-which is powerless in its attempts to make efficient use that a steep root is in risen more cost, which are powertess in its attempts to make chicket use to be considered as by Construction, by Copy. The section on tiles, equal amount of accommodation, the steep root is actually the least costly of the two. 2. The freedom of the Gothie style, which is that men may well doubt if it does the paris Exhibition, almost all of which are from allows of windows heing placed only where they really possess all the truth and energy which it France itself, may be considered as belonging to

are wanted, and of being made only of the need-ful proportion and size, is generally far more answer fully the ends of a mere ntilitarian existence.

Again : the Gothic spirit is even more pliant than the Classie in making use of modern in-ventions. Failures in individual instances have ventions. occurred, in consequence of the imperfect state of the art, not from any defect in it as a style; but the advocates of the Gothic, so far from being unconscious of occasional imperfection on being unconscious of occasional imperfection on such accounts, are every day discovering the means of rectifying such evils. Happy the style which has no incongruitics, or inconsistencies to lament !-or, it may be rather at the present time, happy those who are not quite blind to their own state of imperfection, whilst they see

ther own state of imperfection, whilst they see ther road to remedy its evils. As to the relative capabilities of the two styles, each in its modified state, to answer every purpose of eivil and domestic, as well as collegiate and ecclosistical nsc, much possibly may be said ou either side. I will not venture to call the Classic positively incapable of uni-versal application. I can only confess to not having found ont its universal iftness. Webreas the Gothie is, to say the least, as fully capable of general adaptation as the Classic, besides being much more expressive of the purpose for which the particular building is designed, not-withstanding the supposed absurdity of using the same style for all purposes, after the fashion of all former ages.

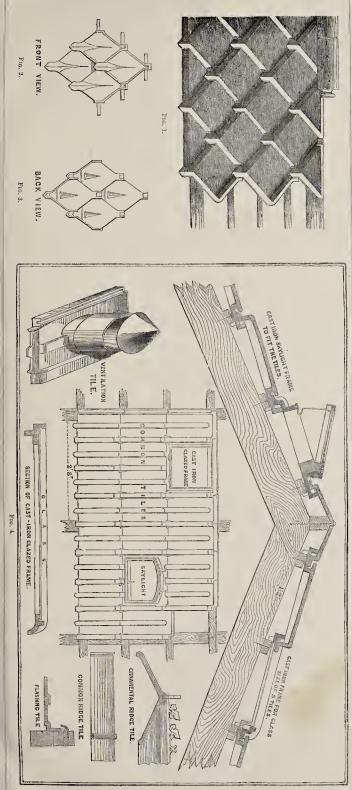

The Gothie style is pre-eminently comprehen-sive and Catholic; and although the Mediaval architects did universally use the same style for all phrposes, —as always must be the ease with high art, —yet their buildings did truly and high art, -yet their builtings due tay and evidently show, at first sight, what their purpose was, as is still the case with all buildings con-sistently carried out. There is no mistaking the castle for the cathedral, the parsonage for the parish church, the manor-bouse for the village school, nor yet a public institution for a private residence a county scourt for a college, a grunnaphilai charles vet a public institution for a private residence, a county court for a college, a gymna-sium for a gnildhall, where each one tells, as it may and ought to tell, its own proper tale. These are wholy and entirely distinct from each other in their general form and feature when the same style and even similar detail are used in all. It is the outline chiefly which distin-gnishes their several purposes; but if purpose is disregarded in the design, if a church is hult with a grand caster vestibule, or if a house has a well-defined chancel, nave, and porch, then, indeed, all distinctiveness is utterly lost, and all character is swallowed up in numeraning forms. character is swallowed np in numeaning forms.

And lastly, as to style itself. I quite concur with "Z" that in order to render the Gothic in all respects suited to the age, it must be much modified, or, as some call it, "developed." Yet not more so than either the modern or the antique Classic. But I cannol see why the reantique Classie. But I cannot see why the re-production of such a style must be, primá facie, more incongruous thau the introduction of a new style from sonthern Enrope in the sixtearth eentury, or even a continuation of the same style, or some debased phase of it, from that day to our own, nuless it is generally acknow-ledged that art had not degenerated prior to its present revival. Still less can I see how or why a genuine "Protestant" should eonsider our own Medieval architecture to be, iu its nature, more "Papistical" than that style which has been used by the Church of Rome for all her buildings, from that day to this, which has been used by the United of this, for all her buildings, from that day to this, nuless, indeed, the Papal element bas been unless, indced, the Papal element bas be banished from her pale for the last 300 years.

WILLIAM WHITE,

CIVIL IVIL CONSTRUCTION AS REPRE SENTED IN THE PARIS UNIVERSAL EXHIBITION.

REPORTS on the late Paris Universal Exhibition continue to be published, and will serve to make it more and more nseful. Several of them should have our attention. At the preusem soonid have our attention. At the pre-sont moment, however, we would refer spe-cially to the last issued, an able document on "Civil Construction," by Capt. Fowke, R.E., and confining ourselves to the section on tiles, will let the Reporter speak for himself.

one of five different classes, the first of which includes the original flat tile, the examples of which differ merely in the material of which they are com-posed, and in their greater or less thickness and weight, governed in great measure by such material. The other four classes or general forms of tile are the results of different attempts which have been made from time to time to divide the great childright of the

weight, governed in great measure by such material. The other four classes or general forms of tile are the results of different attempts which have been made from time to time to obviate the great objection to the employment of flat files, namely, the necessity of laying them so that the roof is covered at every part of its surface with three thicknesses of tile, and the consequent enormous weight of this description of covering, an evil so great as to have almost entirely busished it from all large modern structures in this country, as more than counterbalaucing its undoubted and great advantages of durahility, great strength, resistance to the action of the wind, cheapness, and perhaps the most important of all, the fact of its being so bad a conductor of heat as to render the attrees of busidings thus covered, less sensible of the extremes of heat and cold, which are so much fell where metal or even slate is employed. The flat tile is kpt in its place by pegs or nails driven through holes in its upper part, and each tile is hy this means attached to the lath without being dependent on its neighbours for support. The same rule applies to the next class, which is, as well as the first, flat, and attached in the same way, and in which the attempt to reduce the weight consists merely in rounding of or pointing the exposed part, so as at the same time to courtibute more or less to its orna-mental character; the result is a tile somewhat in the shape of the hade of a sin whe flat tile, by a peg driven through a hole; in the short stalk or handle at its appre extremity; these tibes are further orna-mented in many enses by the introduction of figures or patterns in relief on their stalk or handle at its appre extremity in the tore when the alwart point flat tile, but still necessitate a very high pitch of root or enable the laps to be perfectly weatherprof. The first departure from the ordinary Burgundian pattern is illustrated by the tiles extilk or handle at its appre extremity on the part which is hilden by th

taken out of the part which is hidden by the super-posed tiles. Some of these tiles are more or less ornamented in relief ou the surface, and when fixed have a very pretty effect. * * * * The the fourth elass we have the edges inclosing one angle of the tile taives we have the edges inclosing one angle of the tile bairs of that the joints shall run iu a diagonal direction, by this means continuing the vertical lap all round the tile, which thus cuables it to be employed at a much less inclination, and with so little overlap as to have only one-sixth of the surface hidden or useless for purposes of actual cover-ing; in this tile the peg is also dispensed with as mode of fastening, the tile having a small projection on the back, at its upper part, by which it is attached to the lath, a slight increase of projection in the ledge at the lower angle, which fits into a corresponding depression in the tile next below, serving still further to secure each in its place. (Fig. 1.) This class may be sub-divided into such tiles as are square, and those that real lozenge-shalped; of these, the former, known as the tile Courtois, from the name of its surface exposed in the lower angle, which it is surface exposed into a lozenge. Tach one of the tile Courtois weighs 4-5 lbs. and 18:0 of them are required for a square of 100 super-final feet, so that the weight of this amount of cover-ing would be \$10 lbs. and its cost 44s. We may the single stile the align and its cost 44s. We note than are required for a square of 100 super-final feet, so that the weight of this amount of cover-ing would be \$10 lbs. and its cost 45s. We note than are required for a square of 100 super-final feet, so that the weight of this amount of cover-ing would be \$10 bs. and its cost 45s. We note than are required for a square of 100 super-final feet, so that the swight of this amount of cover-ing would be \$10 bs. and its cost 45s. We note than are required for a square of 100 super-final feet, so that the swight of this generity which anabl

(Figs. 2 and 3.) But, perhaps, the hest and most complete exhibi-tion of rooing tiles is that of Messrs. E. Muller and Co. of Paris, who provide not merely for a covering, but also give the means of introducing skylights, either to open or fixed, ventilation tiles, and of em-ploying tiles as flashing, round chimneys, and in similar situations. The form of the tile seems a little complicated, but not at all so as to render it

vaore difficult to be fixed, or to require a more skilled description of lahour for that operation, and this slight complication does not seem to affect the manu-facture in any way, their price not differing from that of the average of the tiles exhibited. This file, which may be better understood by a reference to the cut (fig. 4), has the fillets or flance along its lower edde slightly returned parallel to the face of the tile; this return being locked into a corresponding recess in the tile action of the wind, and at the same time gives a water-tight joint without the necessity of a high pitch. The longitudion diot to the secosity of a high pitch. The longitudion diot is formed by two small illets on the face of the next, thus being secured by three edges lapping over two, instead of merely out over one as in the tile controls. The method of pro-viding for the insertion of a skylight is extremely iron trame, with edges made to correspond with these of the tiles and of the iron of a two these of more difficult to be fixed, or to require a more skilled simple and ingenious, it consists to having a cast-iron trane, while deges nualed to correspond with those of the tiles, and of the size of one, two, three, or more tiles; this frame forming the skylight frame is fixed in any part of the roof with the same facility as the tiles themselves, and is, of course, in every respect as weather-proof at the joints. Is had in any part of the food with returne facility as the tiles themselves, and is, of course, in every respect as weather proof at the joints. Should light without air he required, recourse is had to a still simpler cast-iron frame, with a pane of glass inserted to it; and should ventilation alone be the object, special ventilating tiles can he in-troduced as often as necessary while laying the ordi-nary tiles. In the construction of roofs with the tile of Messrs, Muller, not only is the steep slope of an ordinary tilde roof avoided, hat the pitch is reduced far below that of an ordinary slate roof, heing only one-eighth of the span, or at a slope of one in four. The weight of a single tile ou this system is 55 fbs, and as it takes 150 to cover a square, it follows that this quantity of covering weighs \$25 bs, or some-what more than with some of the lozeoge-shaped tiles, but this is more than compensated for by the decrease in amount of covering consequent on the decrease in amount of covering consequent on decrease in amount of covering consequent on the alterative of pitch, by the additional security alforded against wind and weather, and by the facility obtained in the fitting of skylicibts, &c. by the employment of the titles of Messrs. E. Muller and Co. whose merit the jury of this class lins ackowledged by the award of a first-class medal, and whose productions are well worthy the attention of constructors in this country.

M. Vollant, of Chateaurouge, exhibits several speci mens of pareneut, some in patterns formed with diamond shaped tiles, imitating dark and light mar-bles, interspresed with white, red, and black, the price of which is 6d, per foot superficial, one a chess-board pattern io black and white at 5d. per foot superficial, also one at the same price in which white octagonal also one at the same price in which white octagonal tiles are filled in with small square red ones, a sample

at 4d. the foot, in which white hexagonal tiles and diamond - shaped initiative marble make up the figure, and finally a very pretty herring - bone brick pave-ment in which engli autoends of the other bricks, the price heing 6.1, a foot.

We shall return to the report at greater length hereafter

HE SOULAGES COLLECTION RESPECT OF DECORATIVE ART THE IN

WE would call public attention to the follow ing able and pertinent report of the committee appointed by the Council of the Royal Institute appointed of metrics to examine the soulages collection, and report their opinion whether it would be expedient to recommend its purchase by the Government, which was read at the meeting of the Institute on the 9th inst. :-

meeting of the Institute on the 0th inst. — Your committee have to report that, pursuant to your instructions, they have attended twice at Mari-boronab House, and have also at various periods indi-vidually inspected the Sonikages Collection, and rom-pared the specimens contained in it with those derived from the sale of the late Mr. Bernal's effects, and obser sources. They have experienced the utmost attention on the part of the auhorities and officers of the Department of Science and Art, who furnished them with copies of the admirable report drawn up by Mr. Robinson,* and alforded them every facility of access. Belore entering upon any criticism of the collection itself, your committee think it desirable to allude hriefly to the influences which such a collection *. The influences

The instructive notes and observations appendict to each class of objects introduce the readers thomes fully a brief history and analysis of each division. It is impossible to correctioned the additional instruction which the public be objective figure confers, you not its easiest instance of muneeums and collections in any way analogous to the Soulayes.

may have upon the tastes and studies of the architect, and to the share which architecture, as the controlling spirit of decoration and ornament, has had in eliciting spirit of decoration and orbitation, has had the deciding productions in which art and industry are harmo-nionsly combined. For the illustration of such ques-tions, the collection now under noice, containing specimens, ranging generally letteen the fifteenth and seventeenth conturies, of cluberate works in almost every material applicable to domestic use or embellish ment, offers subjects of rate importance, meriting the most serious consideration of all, who would fain anticipate for this country an advance in the arts of design coincident with the great strides which have been made of late years in science and material prosperity.

The Soulages Collection.

The Soulages Collection. The calarged views io regard to architectural deco-ration, which have recently revived the taste for orna-mental design that some centuries ago was so prevalect in England, render it necessary for the architect of the present day to enter upon new fields of study, to seek for new sources of inspirition; and to acquaint binself with all the formulas of concep-tion to be found in the productions of other hanches of science and art than those which are directly struc-ting in order to qualify binself to take that lead in of science and art than those which are directly struc-turel, in order to qualify himself to take that lead in directing public taste which his position and vocation call upon him to assume. It is iodisputable that in every age the sources of design for all classes of manufacture have been identified with the productions of the archited can forwardly derived from his can. of the architect, and frequently derived from bis con-ceptions. Among the ancients the fictile vases and exprises. Among the ancients the field evases and the bronzes may be quoted io illustration of this fact, as constantly horrowing their ornoments from the huildings of antiquity; and, in the Medieval period, the pillars, the buttresses, the carving, the pauchling and architectural divisions, all of which were applied to *fittings* of every description, were adopted from the structural details of the edifices, often with little or no reference to material, or other proprieties of adaptation. As the architect's development of the artistic elements is the highest applicable to the common purposes of fic, it is obvious that the revival of obsolce sources

is the highest applicance to the control purposes of life, it is obvious that the revival of obsolct sources of decoration demands the utnost circumspection. To acquit himself consiscitionary of such a respossibility, he must neglect no means of information—be must underrate no style, no object, no department, which may contribute to those harmonious effects which its may contribute to those harmonious offects which it is his province to endeavour on all occasions to ensure. He must enter upon a new career of thought, and acquisit himself with the bistory and fluctuations that have distinguished each phase of the origin, develop-ment, and decay of every class of applied ornament: so as to adopt it with propriety, taste, and originality, as an ever fresh idea, and not as a mere "rifaceia-mento" of existing forms. Collections like those of M. Soulages and of the late Mr. Bernal, are of the utmost value to the archi-tect, reflecting as they do the arts, manufacture, skill

late Mr. Bernal, are of the thinost value to the archi-tect, reflecting as they do the arts, manufacture, skill and taste of various conotries and periods; and show-ing their application to the ordinary uses of life in the several grades of society. No less remarkable are they when set in contrast with the industrial practice of the first suggest of the several excents of social they when set in contrast with the neutrini practice of the first quarter of the present century, a period of singular barenness in technical design, since they serve to bear only a more vivid testimony to the ex-tent to which art was applied in the most triling and ordinary ntensils and objects, during those palmy days ordinary bichasis and objects, during those paimy days of Italian grandour when were exceuted the mojority of the specimens of which these collections consist. During such periods the sentiment of art would appear to have been absolutely necessary to commend to productions of the skilled mechanic to general acceptance. And it is remarkable to observe that taste never heeme the exclusive property of any one dwartment or class of uvednetions. but reized a department or class of productions, but reigned a universal element; the decline of purity in any manufacture being hut the sign of a general and concurrent deterioration in every other. Such collec-tions represent a world-wide school, in which to form a universal rather than a particular standard of national a universal rather than a particular standard of notional taste; and thus the student is freed from the tranucla of that coufined view of style which the traditions of any one period, linked within a narrow geographical circle, would hiod around him. France, Italy, Ger-wany, and England, bave fursished their quota of excellence io many ways to the specimens now brought together in Marlhorough Honse; and from the very distinctive peculiarities which characterize the various productioos, a wider field is afforded for the wares of the manufacturer of the present day. Presh tastes are excited, nod an carnet longing is created in the purchaser for the possession of more refined and excellent productions, raising them above

ereance in the parturn of the possession of more refined and excellent productions, raising them above mere unchanical results, enlarging their sphere of application, and necessarily stimulating production. There can be little healthy progress in national manufactors so long as the commonest and mere unsterial wants only have to be satisfied, but directly ultimated index subs for commons merities and insterial would only have to be satisfied; but directly * It is said that some were purchased by Englishmen, and are cultivated tasts socks for superior execution and more reflect directly in this sourcer, and exposed in the Great service to the arts in about to be opened at Manchester.

the gratification of these tendencies, progressive improvements constantly arise, industry and commerce gain by the movement, and the material prosperity of those engaged therein necessarily follows.

Enamels.

There are many arts which once flourished in this country, and which bave been applied only in a very limited manner within a century or two, while there are others which have never received in Great British the development of which they are capable, and which other countries have been productive of very im-rtant results. Enamelling was at one time exten-In other conditions have been productive of very in-portant results. Enanchelling was at one time exten-sively used in England, as we may see on the metallic monuments in Westminster Abbey, some of the re-enanched figures of which were covered with dahorato comments of this nature, as also the heraldic shields orcasionally inserted in brasses. It is now already entirely confined to smaller works of the jeweller's craft, or elaborate reproductions of choice pictures and portraits: whereas in the Bernal and Soulages ollections are to he found medallions and plates of onsiderable dimensions, and the art applied to tazze, colle considerable differences and the art applied to take, instands, and salt-cellars, coriched with most deficited arabesques and historical subjects. Such specimens give renewed hopethat we may altimately realize, at moderate cost, the process of enancelling on slabs of law, brought under the attention of this Institute some years since under the attention of this Institute some years since by ao honorary and corresponding member, Mona. Hiltorff, now President of the Section of Time Arls of the Institute of France, or medallion portraits of a nature somewhat similar to those introduced in the fuqade of the Academie des Beaux Arts, at Paris, by Mons. Dohno. There seems no reason, if public taste afforded the encouragement, why enamelled pauels unight not be snccessfully introduced as an architec-tural decoration, durable as to material, brilliant in estance of soch an application of enamel existed in the famous Chatteau de Madrid, in the Bois de Boulogne, Paris, which has been the theme of praise hy all writers who bave mentioned it. The façade Boulogue, Paris, which has been the theme of praise by all writers who have mentioned it. The façade was adorned with enamels 5 feet high by 3 feet 4 inches wide, nine of which still exist in the Hôtel de Cluny.* Were such pawels capable of being anti-tiplied at a moderate cost, we might from time to time introduce io our buildings a series of all hut imperishable portraits of our sovereigns, of eminent men, and historical characters; not, as in past times, coulding the subjects of such enamels to the twolve Cassars, the Labours of Hercules, or such pedantic abstractions, but adopting themes from our own puets, abstractions, but adopting themes from our own poets, abstractions, but adopting themes from our own poets, writers, and historians; and these would come more home to the feelings, and commemorate for popular honour and respect those celebrities who have illus-trated our own bistory and have reudered eminent services to our country

Medals.

Modal die engraving is at present of very restricted application, being generally limited in this country to too small a class of objects; and little patronage is bestowed upon what was, among the encients, and after the revival, a most inaportant department of net conduction. The model cost and organization For the territy, including the production. The medials and colonge of antiquity are upon a par with the productions of Phildias, Lysippus, and Prixiteles; and the coins of Sieily, and many towns of Greece, the medials of Alexander and his successors, as well as the Roman Inperial series, his successors, as well as the Koman inpersistence, reflect the genuis of the brightest eras of antique tasks and skill. Of scarcely ioferior merit were the Iulian medals; and the medallions of various sizes—whether cast or struck—of the fiftcenth and siztcenth cen-turies, are full of intense meaning, handing down to us, with the tunnest vigour and refinement of expres-sion, the lineaments of the great, the noble, or the illustrience of these nerice.

sion, the meanners of the great, the none, of the likations of these periods. Of such gens, the Soulages collection contains 106 specimeos, chiefly of Italian and Freuch art, struck or cast, presenting many varieties of treatment, and sug-gestive of an useful application of such nurmorials in modern times, conhicing valuable exhictiv results with historical records of an almost imperishable nature.

Glass

Class. The brilliant progress which has been made in the manufacture of glass in this country within the few years that have elapsed since the removal of those fiscal restrictions which arrested all improvement, and threw this conorry behind others, invests the articles of this class in the Soulages collection with great interest. Without entering into the technical pro-cesses of the "laticinio," "vitro di trina," "mille-fori," "aventurine," and "schuelee," souce of which are already practised in England, we may at once confidently predict that the study of choice specimens like those presented to view in Mariborough Houses will lead to the development of new combinations.

THE BUILDER.

which will some day distinguish our English manufac turas as nucleas, if not more than, their Italian or Bobemian predecessors. The rapid advance in the scientific manufacture of glass, and the uew applica-tions of that material which have recently been brought to light for the supply of architer because the supply of architer to envince us that this art is capable of the utmost development through Eaglish enterprise.

Bronzes.

The 106 objects in bronze, comprised in the Soulages collection, illustrate a class of manufacture hitherto of very limited application in England; hitherto of very limited application in England whereas, in her Eastern dependencies, the artists in bronze for ecaturies past have produced, even in common utcasils, elegance of form and unrivalled decoration in metallie inlay. This latter elegant pro-cess, which was of essentially Oriental origin, was cogerly adopted by the Venetians, and reproduced in their Dam eir Damascened ware. Tens of thousands of French artizans are maintain

Tens of thousands of Frenen attizates are hundralined by their skilled treatment of bronze, now an essential article of furniture in that country, and purchased with avidity in England, and indeed througbout Europe and America. So unpractised are our founders in the successful casting of such delicate objects, and so deficient are we in educated chaesrs and for bars. Unct we have to depend mainly on and finishers, that we have to depend mainly or foreigners for the supply of small bronzes. Then production by English manufacturers is, indeed, so costly, that the Art-Union of London (who for many years devoted much attention to the subject, and al great expense brought out various statuettes and busts), anxious as that body are to encourage the art have been almost compelled to ahandon the attempt to ave neer atmost compared to anamon the attempt to any great extent, and only persever under the most discouraging eircumstances. The heantiful works of art in bronze, so abundant in Paris, find no rivalry here. And we feel, therefore, that the acquisition of the [specimens in this collection, although far too limited for the urgent necessity that exists for the supply of good models in this branch of industry, would be desirable, as tending to draw public attention to this important and neglected branch of art manu-factures. We do not venture to class them in design actuates. We have been appreciated to be such a many second secon high st class of art-but still there are many objects suggestive of improvement in these are many objects suggestive of improvement in those departments of domestic economy into which they might be introduced with propriety.

Decorative Furniture.

Decorative Furniture. There are 100 pieces* of furniture and textile fahrics, cousisting of chairs, cahinets, coffers, tahles, huffets, dressoirs, metallie mirrors, a magnifecent lanthorn, the cornice of a room, three pairs of bellows of tasteful design and execution, and an elaborate chinneypiece. These present a store of useful and applicable articles of various merit. Some few are carved with considerable skill, others are distinguished for their mereral design or arrangeful prioroptions. Some carred with considerable skult, others are usubugunsue. for their general design or graceful proportions. Some have been considerably repaired or modified by inferior hands, but others remain infact. The buffets and armoires are suggestive, and admit of easy application to our present uses. The chestant wood coffers, the to our present uses. The chestnut wood coffers, the marriage chests of Italian history and romance, have maringe-calculation framean indery and romance, nave evidently originated in a superior class of artists, and the metal mirrors, with their carved frames, are graceful illustrations of a eurous variety of domestic utensils. In all these articles it is necessary to discriminate between the production of the manufac-turer who repeats, and the treatment of his material with a strict who arguments. We never will hence the hy the artist who originates. We may still be cuahled to recognise elearly those forms and expressions of original ideas, vulgarised hy the common taste of those who repeat, or demand repetition ; for, although coarse in parts or gross in detail, they may still retain some of the elements of that antecedent period, when livelier imagination, more refinement, and truer sentiment prevailed. The textile fabrics contain some very elegant ornamental patterns, and several eurious specimens of embroidery.

Majolica.

We have reserved for our concluding remarks the most numerous and most important section of this collection, namely, the Majolien, and ecannelled earthen and stone wares, consisting of 168 picees.⁺ We shall not enlarge upon the mutual relations of art and material, nor npon the extent to which all branches of fine art are influenced by the materials employed. This is especially perceptible in the

* A riside in general effect are 660,600,601,698. earthenwares of Greek art and Majolica, in contrast enchenwares of stretce are and singlines, in contasts with the porcelains of Asia and Europe, and their works in this class are as distinct as the earths of which they are composed. Nor do we pretend to review the various processes of manufacture, nor the mysterics of the glaze and brillion lustres, which does not be attention to these denirable product. mysteries of mysteries of the graze and orman involves, which give so much attraction to these admirable produc-tions, such as the metallic reflexions, the changing colours, the mother-o'-pearl of Gubbio, Urbino, Pesaro, Caffagiolo, Facenza, Castel Durante, or of other towns or states of Italy, where the enlightened patronages of the dukes and princes to these wares realized a reputation that could hardly otherwise have realized a reputation that could narriy differences in aver-been acquired by places of such secondary im-portance. The earlier picess of M-jolica retain much of the nohle simplicity of form and richness of decoration of their Hispano-Moorish origin; and the later ones have a higher aim than the porcelains of Germany and Erange whose art decorations acca-Germany and France, whose art decorations occa-sionally present a fantastic and capricious application, and generally a minute and highly-wrought elabora-

and generally a minute and nighty-would choose tion by superior artists, almost too precious for the frail material upon which it is bestowed, limiting the products to the tables only of the most affluent. The Majolica on the contrary, admits, when once the design is settled, of a rapid execution by prac-tised secondary hands; by this economy in the pro-tised secondary hands; by this economy in the production most carefully designed objects may be brought within the means of the humbler admirer of t. This series includes sonic choice specimens ernard de Palissy's skill, and embraces every of of clas of object fitted for the table, or to adorn the buffet or of object fitted for the table, or to more the base or dressor; --such as platean, plaques, vases, plates, frutticre, tazze, trays, or baskets, cups, flasks, bowls, evers, sance-boats, salt-cellars, and other articles. The finest of these are grouped in one ease, and con-stitute a series of the highest resthetic value, as arrest this form, the combinations of colour, and regards their form, the combinations of colour, and treatment of decoration. They are available as types, or may be considered educationally as specimens to he followed, improved, or varied : there is not one which is not valuable for the one or other purpose is not one The success may be problematical of any attempt to derange the predilections and established favour with which the public have been accustomed to regard certaiu articles of use in common life; but we believe that the public mind is prepared and anxious to adopt a higher state of art-treatment in such objects.

Without advocating for a moment a hind adhe-rence to any of these forms, or the modes of decora-tion of the starts and the modes of decora-tion of the starts of the modes of decora-tion of the starts of the starts of the modes of decora-tion of the starts of the sionally the execution may not rise to the dignity the subject-in which extravagance may now and then have usurped the place of good taste, and in which noble forms may be here and there applied to inferior uses,-we may clearly recognise so much that is noble and brilliant, so much that is full of feeling and expression, and such an appeal to a higher intelligence, as to warrant our maintaining distinctly, that access to such examples must improve the taste of the people, and clevate the aspirations of every mind for something better than those we already possess. This consummation we are indeed justified in prognosticating (from the successful indeed Justine in prognosticating (from the successful efforts in Majolica made by the firm of Minton for the Paris Universal Exhibition of 1855), our own countrymen on the hanks of the Treut and the Severn are fully able to attain. From these exer-Seven are fully able to attain. From these exer-tions we nave reasonably contemplate that in a few years, by the teaching aid of such examples as those contained in the Soulages Collection, by the union of manufacturing skill in the manipulation with artistic power in the emhellishmeot, and by due encourage-ment from the publie, Majolica will become in this country a most attractive and very important branch of art production, and eventually compete with the

or art production, and eventually compete with the corranic works of any period and of any country. In conclusion, we have to report that we are unable to contemplate, without the deepest regret, the pos-sibility of such a collection heing broken up and seattered into various channels. Each individual piece has its own peculiar value or merit; but when combined with others, as illustrating either the theory or history of art, so as to complete the ebein and counexion of manufacture and art illustration, and thus forming a series of the progressive excellence to which such productions have been carried in times past, their worth is much enhanced. If Government were to rely upon the chances of a sale, they would pro-bably he outhid for the best articles hy wealthy in-dividuals, who would gratify a taste at a fancy price, and thus the museums of the uation would have in such an event only the chance of obtaining secondary

such an event only the chance of obtaining secondary articles, purchased at greatly enhanced cost. In making this report, the committee have deemed it more advisable to submit their opinions, based, after a cavefal examination of the objects, noon a broad and general consideration of their important as a whole, aud as a commencement and very desirable

* Very high in style of conventional ornament, in design, recution, and effect, are 139, 149, 143, 144,

contribution, with the series obtained from the Bernal Collection, towards a large and complete historical and artistic museum, rather than upon a minute eriticism of any individual specimens. And they have come to the conclusion, that it would be an irreparable loss of a great opportunity to improve our manufactures, to eularge the sphere of art application, to increase our commerce, and instruct the public mind, if the Government did not accept the offer to sell the whole to the nation at cost price ;--an offer so nobly made by the disinterested and publicspirited men who, with singular generosity, and on their own responsibility, have at all risks afforded the opportunity to the country of securing the col-lection in its entirety.⁸ T L Down poor Chairman P. 124 and

BRITISH INSTITUTION

THE annual exhibition here of pictures by living painters is now open to the public. If there be any difference, the collection is rather helow its average difference, the collection is rather below its average standard of merit, there heing few works of particular excellence, although the exhibiting list comprises the names of many who have been designated "rising artists," for these twelve years past; nor are there many showing promise or progress of that ambitious character likely to encourage the expectation of those who have the discover that the effect of ingramming who hope to discover that the effects of increasing patronage, amongst other advantages afforded to th resent generation of aspirants, will produce a stock of fine painters. Nor is such expectation unreasonable with efficient organization of our Fine Art Schools on the contrary, it is a matter of surprise that season on the contrary, it is a matter of surprise timat casso after season should elapse, with no perceptible change in the character of our exhibitions, after all that has heen said, written, and done to aid improvement. Opportunity, it might reasonably he surmised, would awaken effort; and surely there are some able, if only willing, to do as much as their precursors at least, they would eonecutrate whatever ability and sk they may possess on one or two important under-takings, rather than dissipate the same throughout some dozen trivial perfections; or if these same dozen emhodied a single new thought in each, it would be a decided advance, and a theme for congratulation. The deficiency in this respect is would be a decided advance, and a theme for congratulation. The deficiency in this respect is more than usually suggested by the absence of Linnell's powerful landscape pieces, and the three or four excellent dramatic potrtaits with which Mr. J. Sant has been wont to delight its frequenters,— which indeed, with the considerable assistance of Mr. Ansdell's delineations of animal life, have lately been amongst the chief attractions of this scalery. galle

gailery. Taking first into consideration the comparatively scarce "subject pictures," Mr. L. Hoghe's (2) "Sunny Hours" is a very conspicuous performance, foreible in colour, well composed, and oxly wanting in that delicaey,—aeriral perspective,—for which he is so renowned as a "water-colour draughtsman." Lust detectey,—aerial perspective,—tor which he is so renowed as a "water-colour draughtsman." Mr. J. Gilbert's (76) "Regiment of Royalist Cavarly at the Battle of Edgehil," would also be the better for some of the attributes of his drawings: so loose a style of excernion, although accompanied with an im-pressive dash, is more akin to carclessness than power, fault to be regretted the more in an otherwise lever work, reminding one of Velasquez. The title of (180) "The Pliant Hour," by W. P. "rith, R.A. is appended to a version of "Othello

Frith, R.A. is appended to a version of relating his Adventures to Desdemona." Th The personrelating his Adventures to Designmon." The person-ages are not Shakspearean, and yet are components of a successful and charming picture, in a technical sense. (455) " Molière Reading his Cometies to his Housekeeper" is agreeably portrayed by Mr. T. P. Hall: the result, somewhat marred by theatical treat-ment backbeage somebol, which is its convolution ment, betokens careful study in its compilation, embracing almost too many good points to appear a probable and natural incident.

Amongst the pictures most deserving of examina-tion will be found (1), "The Colossal Pair, Thebes," tion will be found (1), "The Colossal Fair, Incoes, F. Dillon, presenting the well-known gigantic statues looming through the dusk of au Egyptian sunset, sufficiently invested with poetic and artistic treatment to excite the imagination. (22), "The Pet Rabbit," R. Buckner, evidently a portrait arrangement, in-ferior to the artist's ideal conception of (348)

After baving here solution to undergrade of (202) * After baving here submitted to public erichins at Mark-solution of the solution of the provide solution at Mark-solution of the solution of the solution of the solution of the important, it is baven in underst evidence at the season. Among here visitors as many as 5129 persons have paid for admission, which have been in the strength on the solution of the solution of the here visitors as many as 5129 persons have paid for admission, here constant data been made to the Govern sent for 13.8884, with he recommendation that if bought for the mation, it may be end to Nauchester.

"A Roman Boy with a Pitcher of Water," though in this the beautifully painted head seems to be out of tone, and uot to belong to the figure. (27), "The Island of Murano, Venice," G. E. Hering, is a favour-able specimen. (33), "The Molo," Venice, is one of five contributions of the indefatigable Mr. E. W. Cooke, A.R. A. and an exquisite little bit for finish and local truth. (34), "The Convalescent," J. Gow, shows us a boy in bed, paying off in part his great debt of kindness and attention by amusing his little brother with an accordion, and at the same time how the simplest episode in every-day life may furnish a subject for an epic. (42), "Co-rinne," H. Weigall, a head characterised by much heatty and classic taste. (52), "Cochem on the Moselle," G. C. Stanfield, is the most stirkling and "A Roman Boy with a Pitcher of Water," though in rime," H. Weigall, a head characterised by much beauty and classic taste. (52), "Cochem on the Moselle," G. C. Stanfeld, is the most striking and perfect of his three landscapes exhibited here. (57) "Athems," W. Linton, an expansive view, imbued dolorously informs us of M. G. Lance's peacock having heeome defunct,—that wondrous bird, with whose telling tail, so often dilated, everybody is acquaited and many know by art. Few can conjecture the amount of size and tears (of the best mastic) spent upon the creature from first to last, and never to amount of size and tears (of the best mastic) spent upon the creature from first to last, and never to better purpose than on this the occasion of its demise; we may hope that galvaoism, or some resuscitating appliance, may be resorted to, and that we shall find the tail spreading wider and wiler still in a finue to come. (65) "The Evening Drink in a Mountain Lake," ", Danky, is extremely luminons, in fascinating lines, verging perhaps upon the meretricions, and decidedly less truthful as a transcript from Nature than (364) "A Summer Evening," in every respect a delightful landscape by the same painter, Mr. E. Dunen has "immortalized " (75) "The gallant Action fought by the British I's pounder 36-gun frigate Perseloge, Gapt. Henry Blackwood, and the French National Ship Guillaume Tett, Octa, Saulmier, bearing the flag of Rear-Admiral Dècres, on the morn-ing of the 31st of March, 1800," with a gusto and power, entitling hin to respectful salutation from all Greenwich pensioners. In (82) " Rain Clearing OG," H. Dawson, a difficult atmos-pheric effect has been well comprehended, and suc-cessfull dealt with; and 900 "The Evening Hour," E. J. Niemann, bearing the impress of truth in its deep mellow tones, helps to prove that the collection predominates to this department in other points than number. (172) "A Refreshing Draught," C. Dukes, (197) "The Hay,field," H. Jutum; and (207) "Early Summer Morning," by the same. (247) "Through the Welsh Woods," H. J. Buddington; (256) "Innegen," W. Fisher; (268) " Interior of a Welsh Faram Hones; (374) " Dairy Maid," or rather the cleverly-painted " Calves," in which its excellence exist, by G. W. Horlor; (259) " A Summer Morning on the "Thames," H. J. Boddington again; (256) " Catus," "in which its excellence exist, by G. W. Horlor; (259) " He Music of the Stell," F. Underhill; (310) " On the Coast of Amalf," M. Joohson; (341) " Love's Strategem," T. M. Joy; (350) " Holding as it were the Mirror up to Nature," W. Homeley; (374) " Unterior, West-field House, Ryde, Isle of W upon the creature from first to last, and never better purpose than on this the occasion of its demi to we live in, and moreover is a good picture of its class In (483) "The Two Extremes—The Post-Raffaellite," and (485) "The Pre-Raffaellite," Mr. H. O'Neil contrasts, not too invidiously, careless case with pains-taking labour, to the advantage of neither, io spite of the executive ability displayed in both cases, as far as he himself is coocerned. To (496) "Pretty Polly," E. J. Cobbett; (499) "The Talking Oak," W. How Egley, (525) "A Little Scarcerow," T. F. Dicksee; (539) "A Letter requiring an Answer," W. Cave Thomas; (540) "The Lesson," D. W. Deane; (546) "In the Chinney Corner," T. Earl, and (554) "Gems of the Sea," H. C. Sclous, we can hat briefly allode, as we have arrived at the himits of space re-served for this uotice. trasts, not too invidiously, careless ease with pains-taking labour, to the advantage of neither, io spite of served for this notice.

COMPETITION.

Plans for Laying out the White Horse Estate, Norwood.—The first premium of 150 guineas has been awarded to Messrs. Morgan and Phipson, Danceina, Strand; the second, of 100 guineas, to Mr. J. A. Bone, of Maidstone; and the third, of 50 guineas, to Messrs. Coe and Beetholme, of Dance-ina, Strand,

ST. JAMES'S, WESTMINSTER.

Some considerable works, as our readers know, have been recently executed at this covered the entrances to the church at the western end, unsightly, and long a disgrace to St. James's, have hecu taken down and replaced with substantial erections in brick and unortar. These occupy the space on each side of the tower, and the clevations heing made to assimilate an general character, and earried up uniform in height with the body of the church, the appendages assume the appearance of having formed a component part of the original structure. Internally they are made to communieate through the tower vestibule, the bricking up of the basement arches of the latter heing removed for the purpose,—the three apartuents together thus forming a continuous ambulatory, extending from the footway of Jermynstreet along the cuire width of the western front of the church, giving access hy doors therefrom direct to the aisles and the nave, and hy stairs to the galleries. The remaining lateral entrance from Jermyn-street (originally there was a corresponding doorway on the north side, removed in 1803) has been done away with, bricks and mortar and a window being made to accup the place of the old door.

The various interior lobby inclosures to the calrances, the stairs and the wainscot cases, which presented numerous ugly bulkhead projections into the interior of the clurch, detrimental to uniformity, and an encroachment on the congregational space, have all heen swept away. The upper western gallery, hitherto occupying the central portion only of the church, has been extended over the aisles to the side walls; the latter a somewhat doubtful improvement, but that the creation of fifty sittings were directly or indirectly involved in it. The arrangement of some of the pewing has been altered, conomising the space to the gain of a considerable number of scats;—matters, the importance of which must be judged by thic fact, that the ouly limit to the number of cougregation here is the capacity of the church to accommodate. Some further ventilation has been introduced, and the whole interior thoroughly cleansed and re-embellished. The churchrard has been raised, levelled, and

The churchyard has been raised, levelled, aud repaved, and the old dingy hlank wall fronting Piceadilly is to be immediately taken down and replaced with a handsome iron palisade.

replaced with a handsome iron palisade. When the present active and estimable reador, the Rev. John E. Kempe, M.A. entered upon his duties in this important parish in 1853, the lamentahle inadequaey of 650 free sittings for adults in all the Cluurch of England places of worship in his parish, for the wants of a population of 37,000, and more than half the uumber poor, engaged his serious attentiou, and, putting forth a comprehensive scheme for the amelioration of the evil, he appealed to the benevolence of the more wealthy of the parishioners for the means to work it ont. The appeal was quickly and liberally responded to by the higher clusses of the inholitants, a list of little more than a hundred names yielding an available fund of nearly 12,000? the principal subscrihers being the Bishop of Londou (Blomfield) 1,000? the Marquess of Bristol, Earls Derby and De Grey, Wilbraham Egerton, esc. (since deceased), and Sir Walter Farquhar, 500?, each; the Archhishop of Armagh, Earls of Eglinton and Speneer, 200?, each; the Dukes of Norfolk (since deceased) and Clevelaud, Earls of Ellesmere, Aherdeen, Falmouth, Enfield, Redesdale, Mrs. Byng (since deceased), Mr. Hudson Gurney, Mr. John Fisher, of Duke-street, the Londou and Westunister Bauk, "A Penitent," and the Branch Bank of England, each 100?, and under the nomenclature of "A Parishioner" (supposed to be the Earl of Derby), 4,000?, specially towards the building and eudowment of a new elurch.

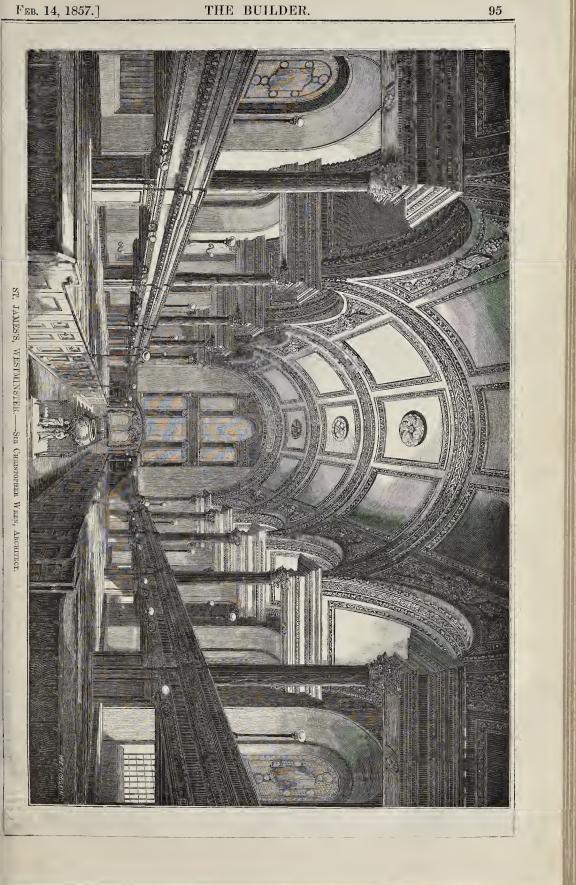

The primary object set forth in the rector's think it practicalle to make a single room so scheme was the creation of an additional church, capacious, with pews and galleries, as to hold to be situated if possible in the castern division of the parish, to be built to accommodate about 1,200 persones, half of such accommodation to be free; hut the progress of the way of obtaining, a suitable site. Covered as the entire area

of St. James's is with houses or other closely packed valuable buildings, the procuring of the mere half rood of ground on which to creet it, involves an outlay far greater than the comhined expense of building a handsome church and furnishing it, and supplying the stipulated endowment for the incumbent. Hence, liberal as the subscritched fund seems, it is as yet insufficient to justify practical operations on this head. It is to be hoped, however, that the opulent traders and manufacturers with which the parish abounds, and whose fortune is the produce of the labour of those who constitute in thousands, the spiritual wants of whom it is now sought to supply, will yet, emulating the example the nohility have set, come forward in liberal support of this good work. The second object in the scheme was to convert into free sittings certain portious of the pew accommodation of the existing elurehes and chapels of the parish. This has heen effected in respect to the district clurch of St. Luke's, Berwick-street, and Archishop Tenison's Chapel, Regent-street, and 500 additional free sittings have in that way heen permanculty provided.

and 500 additional free sittings have in that way heen permanently provided. The works just completed at the parish church, projected by the present churchwardens, Mr. Frederick Crane, of Regent-street, and Mr. Rice, of Charles-street, originally without any view to the object, have nevertheless been made subservient to the furtherance of the rector's scheme. Among the improvements the proposed alterations in the church were to effect, was the gain of considerable interior space, on which it was intended to set up pews, and the rental arising from the letting of these was to compensate in some degree for the ontlay. But the rector, feeling that additional church accommodation was more needed by the poorer portion of his parishioners than the richer, made a proposition to the churchwardens to obtain from the committee of his " Free Church Accommodation Fund" a grant of the stimgs. The offer was accepted, the stimgtations have been fulfilled, and 150 free sittings have been fulfilled, and 150 free s

tioned, under the superintendence of Mr. Charles Lee; and excented by Messrs. Patrick and Son in a very satisfactory maaner. This church, as every hody knows, stauds on the sonth side of Piccadilly, and, architecturally considered, is remarkable, externally, ouly as a mean-looking dark red brick huilding. It was consecrated in 1684.

Comparatively few of the many thousands who make up the living throng that daily inverse this great western thoroughtare, are eware of what an elegant interior these ugly brick-cased walls inclose — light, airy, and capacious. That Sir Christopher Wren himself—who, besides St. Paul's, huilt more than half a ceutury of parish churches-regarded this his *chef-d eastre*, is seen by his letter to a friend, printed in "Elms's Life of Wren," as follows:—" Churches must be large; hui still in our reformed religion, it should seen vain to make a parish church larger than all who are present can both hear and see the preacher. The Romanists may indeed huild larger churches, as it is cough if they hear the murmurs of the mass, and see the clevation of the host, but ours are to be fitted for auditories. I can hardly think il practicahle to make a single room so capacious, with pews and galleries, as to hold above 2,000 persons, and all to hear the service and see the preacher. I endeavoured to effect this in building the parish church of St. James's, Westminster, which, I presume, is the most capacious, with these qualifications, that hath we them built: and yet, at a solema time, when

the church was much crowded, I could not discern from a gallery that 2,000 persons were present, in this church I mention, though very broad, and the nave arched up. And yet as the are no walls of a second order, nor lanterns, nor buttresses, but the whole roof rests upon the pillars, as do also the galleries, I think it may e found beautiful and convenient, and, as such, the most economical form of any I could in-vent."*

The plan of St. James's is the Basilical, nave and aisles being formed by two ranges of six piers and columns, in two stories. The piers, which are of the Doric order, panelled, carry the galleries, the fronts of the latter of oak, with earved enrielments, forming the entablature of the order, with a low atic above, to complete the hreastwork. The npper order is the Comintum. Columns rise from the breastwork of the calle-Columns rise from the breastwork of the galleries, and the highly-enriched entablature of these, stretching across from each column to the side walls, serves as imposts to a series of transverse wais, serves as imposts to a series of transcript arches from column to column, forming the covering of the aisles; whilst from the abacuses also springs the great somicircular vault that covers the nave; the whole roof being divided also springs the whole roof being divided into sunk panels, ornamented with festoms of drapery and flowers in relief, "producing," as Mr. Gwilt observes, "by its unity, richness,

Mr. Gwalt observes, "by its unit, incluses, and harmonious proportions, a result truly cachanting."† A slight prolongation eastward of the central portion of the body of the cburch forms the altar recess. The end above the altar screen is nearly all occupied by a Venetian window. This is made into two tiers by a massive transome, which, with a pair of columns in the lower por-tion, and a pair in the upper, serving as mullions, subdivide the window into six compart ments

The lower tier is uniform with that of the upper story of the body of the cburch, and the architecture the same, *i.e.* Corinthian-the entablature of the order forming the transme of the window. The upper tier is composite. The centre intercolumniation is connected by a semicentre intercolumniation is connected by a semi-circular arch. In 1846 this large window was filled with stained and painted glass. The win-dow is illustrative by six principal pictures,— one to a compartment,—of the Narrative of our Blessed Lord's Sacrifice for the Redemption of Mankind. In the lower central division is dis-played the Crucifixion, with the praying in the Gardnen of Gethsemane, on the left; and, the Bearing of the Cross on the right. The upper central compartment is the Ascension, with the Entemphenent to the left and the Resurrection central compartment is the Ascension, with the Entombment to the left, and the Resurrection on the right. Very wide mosaic borders sur-round each of these pictures, in which, as well as in the other parts of the filling in, are numerous minute representations of other scriptural subjects; with idetails of immense variety, comisiting of religious exablena, symbols, monograms, &c. &c. This glass was the pro-duction of Mr. Wailes, of Newcastle, who received 1,000.1 for the work. It is intended also to fill in with stained and painted class the whole of the ten gallery win-

It is inferded also to him m with stanted and painted glass the whole of the ten gallery win-dows. The work is to proceed gradually, as funds shall arise for the purpose; or by accepting of windows from individuals in the way of offer-ings, — mortuary, or obituary. The whole is windows iroa individuals in the way of oner-ings, --moveluary, or obituary. The whole is designed to form, when completed, a series of paintings, illustrative of the history of our blessed Saviour's life and ministry, commencing with the "Nativity," in the easternmost win-dow on the south side,—the succeeding win-dow to account on the subject measurements for dows to carry on the subject, progressively, as follows :-

- No. 2. The Adoration of the Magi.

", 10. Entry into Jerusalem. Thus connecting the narrative with the Passion, as represented in the great altar window. Nos. 2 and 4 have been executed (also by Mr. Walles) at a cost of 1257, each.

Wailes) at a cost of 125.4 each. The altar screen displays a most exuberant piece of carving, in alto-relievo, executed in lime-tree, by that inimitable artist in that way, Griniling Gibbons. The principal group repre-sents "The Pelican in her Piety." Bishop Fox's favourite device, typical of our Saviour having shed his blood for us (though the allega-tion of the ancient naturalists as to the habit of the nelican being to feed her young with her the pelican being to feed her young with her the period delug to teer food was not inme-diately procurable, on which circumstance this long popular symbol was founded, is now dis-proved). In this beautiful work of art, the pelican occupies the centre, over the altar table pelican occupies the centre, over the attainance - is represented as sitting in her nest, and in the act of wounding her breast with the point of her beak to draw the blood, whilst the young ones beneath are gaping for the food. The bird is covered with a beautiful combination of V. loliage, among which are two doves bearing olive brauches. In addition, a noble festoon ending in two pendants, which extend nearly the whole height of the screen, displays all the varied representations of fruit and flowers in the highest relief. This elaborate and delicate work having become much injured by the casualties of 160 years, was in 1846, thoroughly repaired by two Italian artists—a work of prorepaired by two Itahan arbits.—a work of pro-tracted labour; several thousand bits of carving, of more or less minuteness, requiring to be added, in order to restore the groupings to their pristine state.

The font, which stands in the central passage, opposite the principal entrance from the west, is an exquisite work of art, in white marble, from the chied of that same admirable artist. The sculp-ture is intended, by the representation of four scriptural subjects, to tell the story of the fall of man-his subsequent restoration to Divine avour, and bis regeneration by baptism, viz .the stem or support to the basin is the tree of good and evil; Adam and Eve stand at its foot, whilst the serpent, coiled round the trunk of the tree, is presenting to them the forbidden fruit. On the side of the basin, which is circular, and 6 feet in circumference, are, in basso Figure 1 and 5 feet in circumstension, and 5 feet in classic relievo, Noah's Ark, with the dove bearing the chire-branch of peace in its beak, St. Johu baptising our Lord in the Jordan, and Philip baptising the Euruch. The powing and other wood fivings of the church, are of Dutch oak, mean set with 1803 and east inclusion of some were set up in 1803, and cost, inclusive of some repairs to the church, upwards of 11,000?. Ar reparts to the church, input of 11,0004. An upper tite of gallery, at the western end, con-tains the organ and seats for the choir, as also the school children. The organ is in two oaken cases, standing one before the other, the organist's place being between them, his face to the great organ, and his back to the smaller one, to the latter of which the action passes how each big fort and sord. The creat area one, to the latter of which the action passes beneath his feet and seat. The great case is in the florid style of the period of its original construction (Louis XIV.). The carrings of Fanes, angels, cherubs heads, &c. with which it is adorned, strikingly mark, hy their great beauty, the master-hand of Gib-bons. This favourite old instrument, originally made be the adolered Reastow Horiz made by the cclebrated Reuatus Harris 1675, was entirely rebuilt by the late Mr. Bishop, in 1852, on a much more comprehensive scale, but retaining the old pipes—for these, the mellowing hand, of time had rendered of more hardwing name of this hard reflected of more than ordinary value,—when also the old case was restored, with the original decoration, and the detached front choir added. The expense of this work was 1,000/, and the organ is now one

THE ARMOUR IN THE MANCHESTER EXHIBITION.

MANY antiquarian friends will be glad to hear that Mr. Planché has accepted the invita-tion from the Committee of the Exhibition of Art Treasures, to superintend the arrangement Art Treasures, to superintend the arrangement of armour and arms. We may therefore feel certain that in this department we shall have a correct chronological arrangement, to instruct as well as please. It would be a fortunate thing if, when this matter is finished, Mr. Planché could be led to give his services at the Tower of London, where the national collection appears of the direction that the interf. So for a way to be left pretty much to itself. So far as can learn, no person having knowledge of IS We subject ever pretends now to exercise any control there, or has any interest in making it complete and available for public instruction."

PROVINCIAL NEWS.

Smethweick. — A parsonage house for St. Mat-thew, Smethwick, heing about to be erected (Mr. Joseph James, architect), the following tenders have heen made for the erection :--

Cornish, Brothers (Birmingham) ... £896 Harley (Smetbwick) Ramsny (Smetbwick) 850 847 Stockton and Field (Oldbury)

Stourbridge.—The new National Schools at Amblecote were recently opened by Lord Lyttelton. These schools are built on a site given by the Earl of Stamford and Warrington. Nearly 1,700/. have been secured for the cost of section

erection. Llandudno.-The commissioners under the Linnaudao.— The commissioners inter due local Improvement Act have entered into a contract with Mr. Knight, of Manchester, for the dramage of the town. The plans and speci-fications have been prepared by Mr. T. M. Smith, of London, C.E. under whose superintendence the whole is to be carried out. The works are being commenced, and are to be completed by Angust next.

-Under the Limited Liability Shrewsbury .. Shreesbury.—Under the Limited Liability Act, a project has been started for erecting a public hall in this town, to accommodate from 250 to 300 more persons than the Music-ball. The room is designed to be capable of heing di-vided, without injury to its architectural deco-ration, so as to render it suitable to small or hare assemblies.

harge assemblies. Breamod.—The Wolverhampton Chromicle states that the newly-erected church for the distate of Coven, in the parish of Brewood, was conse-crated on Thursday in week before last. The edifice is in the Transition style. It consists of a nave, 62 feet hy 24 feet 6 inches; two tran-septs, 15 feet by 15 feet each; a chancel, 16 feet $h = h^2$ feet 6 inches, toucher with restur south 16 feet 6 inches; together with vestry, south porch, and gallery at the west end of the nave. At the south-west corner is a turret terminating above the roof octagonally, and surmounted by above the root octagonally, and surmounted by a small spire. The ground-floor contains 326 sittings for adults, and the gallery upwards of seventy sittings for children. The stone used in the building is from the Brewood quarry, and is the gift of Thomas William Giffard, esq. of Chillington. The woodwork, except the pulpit and dodi is all deal triand and the mainted The and desk, is all deal, stained aud burnished. and desk, is an deal, scalar and burnshear. Inc roofs are open and high-pitched, with arched braces to the principals. The architete was Mr. E. Banks, of Wolverhampton; and the builder Mr. Godfrey, of Birmingham. The whole cost has been estimated at 1,900l.

Licerpool. — At a recent meeting of the Tox-teth-park Board of Health, a draft plan, pre-pared by Mr. Newlands, the borough engineer, of a sobeme of sewerage for the district, was submitted. The estimated cost for carrying out the plan was 9,000%. The proceedings were confirmed, and the clerk instructed as to farther commed, and the clerk instructed as to lattice procedure. — The new large floating landing-stage, for Prince's-pier, is drawing towards com-pletion. It will be brought over in four sec-tions from Birkenbead, where it is being con-structed by Messrs. T. Vernon and Son.

Estington .- Lord Ravensworth is now making numerous improvements at Eslington House amongst which are conspicuous a terraced wall and a gateway in the centre, adorned with vases, designed by his lordship. The execution of these designs has been intrusted to Mr. D. McMillan, of Alnwick, sculptor.

SCHOCLS OF ART

The Norwich School. — On Wednesday evening, the 28th ultimo, a meeting of the students in this school was held at the rooms to receive prizes awarded by Mr. Redgrave, the Government inspector. The mayor, who presided, said he had attended at the request of Mr. Nursey, the master, to distribute the prizes. He was glad to see so large an attendance notwithstanding the roughness of the weather. He ensuidered that it was birbly creditable to the phrzes. The was grad to see so large an atteaunce notwithstanding the roughness of the weather. He considered that it was highly creditable to the students that out of 200 students seventy-nine of them should have received prizes. The Rev. J. Crompton briefly addressed the students, advising them not to stop at the outwardly heautiful, but to aim at whatever was beautiful in the highest sense. Mr. J. G. Johnson said the number of students who had received marks of distinction was highly credit-able. He hoped soon to neet them in the new build-ing with a free library under the same roof. *The Reading School.*—The provisional committee appointed at a late public meeting, to take the neces-sary steps preliminary to the establishment at Read-ing of a school of drawing and design upon the Government plan, havo nearly concluded their labours. At a resent meeting of the committee, however, it was reported that thronghout the country the damand for able masters was greater thau the

however, it was reported that throughout the country the demand for able missters was greater than the supply, and as there was no possibility of obtaining an efficient and approved master before March, it was concluded to wait for rooms till that date. The Newcastle-under-Lyne School.—The annual meeting of this school was held in the lecture-ball of the location of the school was held in the lecture-ball of

this losituation on the 27th ultimo. The chair was occupied by Mr. Adderley, M.P., and Mr. Child, M.P. the president, was also present, with the mayor of the horough, and various other influential gen-Information of the horongin and various other information gen-themen. The room was densely filled. The walls were decorated with works by the students and others. From the report it appeared that the receipts were about 60.4 and the expenditure the same for the year. The committee regretted to state that the school had The committee regretted to state that the school had not received the support and encouragement which they had hoped it would, and also that the number of students had not been so large as they could have wished; Mr. Child had placed in the sccreatry's hands a chrque for 10% which was to be offered in four prizes—two during the present year, and two during the following year. The meeting was ad-dressed by the chairman ud by Mr. Child and other gentlemen. The chairman in his address said he helieved that in the matter of education it was the address saids the the improvement of duty of Government to assist in the improvement the industrial arts, and to educate those engage through the instrumentality of their occupation. this respect to the thrught Government had made a sad uistake, and that that might help to account for the complaints which had here made of the absence of a thoroughly hearty support of such institutions. If throughly hearty support of such institutions. He floroughly hearty support of such institutions are a support of the support without a demand, and grants of public money had hear lavished upon the country in order to stimulate the demand. The education adapted to the people was not an education in the highest branchesofphilosophy, hut such an education in the arts of industry as would quicken and strengthen the intellect; and to pass over this training was, he was convineed, a great mistake, which he at the root of national education. He hoped the country would see this mistake, and would urge its correction upon the Government. The chairmon then called the attention of the meeting to chairman then called the attention of the meeting to the efforts made by Prince Albert to spread corr et chairman then called the attention of the meeting to the efforts unade by Prince Albert to apread cor of iprinciples of taste, and expressed his conviction that the country was mainly indehed to his Royal High-ness for developing this hranch of colcustion. He had not merely encouraged isolated efforts, but had grouped them together in one great national scheme, naving its centre in London, communicating with the occal schools throughout the country, but not having a them under its control, as the schools of France were ander the central school at Paris. That was not a "arountry principle in this country, and he thought shall Government was quite right in asying that it would not do more than all the schools of art. The Sheffeld School.--The opening of the new validing was inaugurated on the 26th altmo, by 1 public conversacione, at which Mr. Rochnek, IMP, presided. In his address to the meeting the chairmau made characteristic allusion to his own reculiarities as a public man in their relation to art. There issuching, "he said, "in all that pertains to that of such a perennial and ever-flowing nature that it sever palls upon the senses, that it never in any way miminishes in its power to exalt and hiess bamanity ; und, therefore, if we make that the daily avocation of the rises, we do much to exalt the nature of man and is increase our own welfare. This may appear to you as somewhat flue-drawn and sentimental view of things,

THE BUILDER.

hut I speak to you as a practical man, whose life has heen passed in the turmoil and boiling up-stirring springs of life; for my life bas been that of one who has had to combat with his fellow men, and I have found that that which has heen to me the solace of my life has heen art. For though 1 am an humble pupil of art, still I am an adoring pupil. I love her for her goodness to me; 1 love her for her elevating influence upon the human race." Mr. Cole, C.B. was also measure and whicessed the meeting and crubined upon the human race." Mr. Cole, C.B. was also present, and addressed the meeting, and explained what Government was doing in order to assist schools of this description. He spoke favourably of the Sheffield School, and stated that whilst the highest unmber of medals awarded in one year to any school was thirty, the students in the Sheffield School were about to receive that include the short of the second school were the short to receive that include the short when the short of the short were short to be short on the short of the short were short on the short of the shor about to receive that night twenty-eight; or rather they were not about to receive these, though they were entitled to them, in consequence of the die of the reverse side having broken in striking it. The whole reverse sine naving proven in strang it. Ine whole of the art-works for which these medals were given throughout the country it was intended to bring together into one exhibition, and in order that they might not be thought too metropolitan it had been might not be thought too metropolitan it had been determined that these exhibitions should be held in the provinces. Next year it was intended that the students' works of art should be exhibited in Man-chester, and to award for the best types of art 100 of what they were going to call national medals. To get a medal worthy of such an occasion they had sought all over Europe for an artist, and they had succeded in ohtaining the services of a foreign contleman of great celebrity. Each of these medals would repre-sent 100, for which the student would receive a work of art equal in value to that amount. The speaker of art equal in value to that amount. The speaker then exhibited one or two specimens of the works of art intended to be given to such students as gained the national medals.

Carlisle School.—A soirée in connection with the Carlisle School of Art took place on the 27th nltimo, iu the Mechanics' Lecture Hall, Carlisle. The nume, in the meenances Lecture Hall, Carthie. The only cause of regret was the comparatively small attend-ance, notwithstanding the attractive onnonneement that a hall was to follow the tea-driubing and speech-making. The hall was grantitously leat for the pur-pose by the committee of the Mechanics' Institution.

RUSH, surveyors, rush; why your talents hiding? Forward, in a crush; storm the Western Riding ! Eighty ponnds a-year, open for conteution; Duties, trifles mere, hardly worth the mention.

Only land-survey, (pastime 'mid your revels); Then to fill the day, take and plot your levels; Working plans then draw, fit for bigh inspection; And secure *éclet*, with the parts is a section.

Engineering skill, relative to highways, Time will help to kill,—not forgetting byeways; Then, by way of change, in your morning rambles Anti-nuisance range, 'mong the slums and shambles

Then, from door to door, thus your modley vary; Rate-collecting, hore needy folks and chary. Only think I the small surety claim'd for safety, worth name at all, only poor two-fifty

For eight postage-stamps (justasses are sticklers) Send, you seedy scamps, for detail'd partic'lars. Mind and state your age; old uns, don't be nervous; Haste, ye green, and sage-grown grey in the service.

Oh, what sinceures ! cheering 'tis to quote 'em ; Such enticing hures captivate factotum.

Then, surveyors, rush ; why your taleuts hiding ? Forward, in a crush ; storm the Western Riding 1 STONEY BATTER.

PROTESTS BY THE ARCHITECTURAL ASSO-CIATION AGAINST THE DECISION IN RECENT COMPETITIONS.

THE following protests by the Architectural Asso ciation have been forwarded as addrossed :---

February 10th, 1857

February 10th, 1857. To the Chairman and Committee of the proposal user Free Philic Library and Almeem, Liserpool. GRENTERTEN,—We are directed by the committee of the reduction of the second the second second second to the late association to request your earnest atten-tion to the following expression of their optimon in regard to the late competition for your proposed over bailding. The committee of the Architectural Association viewed with sincere pleasure the earnest expression of your degree to easure, as far as possible, a fair and howest for Liverpool another building of which you might justly be proud. Your subsequent selection of a limited number of sketches, thus assing a vast smooth of labour and degreense to the unanceesful competitions, the committee tink was most judicious. A design having been the second ay, upon your heing and han its sucher was capable of undertaking a work for such anginude; that he is capable has been sufficiently proved. The decision flagly arrived at caused erout survives and

proved. The decision finally arrived at caused great surprise and locomotives.

estisfaction, not only to the committee and members of e Architectural Association, but also to the profession large, when, by a resolution passed at one of your retings, it was determined to give the work into other events.

meetings, it was determined to give the work into other hands. Whilst the committee of the Architectural Association sincerely recret that a member of an honourable profes-sion could be found willing to undertake such a commis-sion, they feel that this act of injustice cannot be passed over without protesting against your decision. Is conclu hon, the committee of the Architectural Asso-ciation hope that before it is too late, you will reconsider the matter, and by placing the design into the bunds of its surther, give him the reward that is sojustly his due ; thus securing for the town of Liverpool a building that shall commemorate the noble generosity of its founder, the justness of its building committee, and the ability of its architect. (Signed) J. A. BUNERS, B. A. C. HERRING, Secretaries.

February 10th, 1837. To the Chairman and Magistrates of the County of Middleess. X LORD AND GENTLEWIS

To the Chairman and Magintrates of the County of Middless. To the Chairman and Magintrates of the County of Middless. MY Lown ANN GENTEMENT,—We are desired by the committee and members generally of the Architectural Association, to request your attention to the following architectural differences of the committee and members generally of the Architectural Association, the system of the Architectural Association, which the ancious interest the progress of the recent competition, view with extreme surprise and the profession, which with a strice interests the progress of the recent competition, view with extreme surprise and the profession which with the profession, but also of the applicit that they feel it incumbent on the profession with the profession, but also of the applicit, that they feel it incumbent on the profession with the full the association of the advisability of calling is professional sestiatase to devide upon the final result, and that on the full the full the full the strategramming and the second and rejected the devide upon the final result, and that on the full the second the profession, with a the result and the second and rejected the devide upon the final result, and that on the full the result of the profession with the strategrammic and rejected the devide upon the final result, and that on the full the second the result of the second t

allimitely desire, may be inferred non-large do not ester, may be inferred non-allegations made by the architects to whom was awarded the tables premuma. The second second second second second second matrix the second second second second second matrix the hole question, and, if you were right in awarding the premiums, then do they hope you will ask in any second second second second second second the subtract of the best design, by giving them that which they worked for in common with all who com-plete, viz. the honour such dremuneration of carrying out such a building as is proposed to be erected. The com-mitter of the Arcother are without secting unjusty, either to the architects to carry out another design and if it was not the best, then it is an at of injustice to the architect. Hong you will give the aubject your earnest consideration. [Signed by the Hon. Sees.]

NOTES ON THE METALS.

Mr. D. MORNESON, of Bordesley Works, Birming-ham, has patented the use, in malleable iron casting of moulds of metal, by preference of cast-iron. By thus employing metal moulds, the same may he used thus employing metal moulds, the same may he used again and again, and the articles east therein will be more smootb. There is now in progress, at Broomia-law, Glasgow, the largest chain, it is said, ever made in Scotland. This chain is for mooring the buoys of the River Trustees. The iron har from which the chain is formed measures two and five-eight buches in dismeter, and each link weights 430bs. The entire account is the 100 for them. Discovering in diameter, and each link weighs 43lbs. The entire length of the chain will be 120 fathoms. Discoveries of iron in the ueighbourbood of Secud, Wiltshire, are going on, and several furnaces are about to be erected.

In the manufacture of Steel, Mr. Chenot's inven-In the manufacture of Steel, Mr. Chenot's inven-tion which is at present attracting much attention at Paris, consists in the use of an electro-sorting ma-chine (electro-trieuse) to raise the crushed ore to its maximum standard of richness; in a system of comentation, whereby the most opposite qualities of steel may be produced with certainty; and in the compression of the ore after its transmitution, and before and after cementation into a sponge. By his before and after cementation into a sponge. By his process, it is declared, can be manufactured from Spanish ore, steel which will not cost above 324, per ton, and be superior in quality to that sold in Paris at 1002. 001. per ton. An iron-bridge to carry the East-India Railway

An iron-bridge to carry the East-ludia Railway across the river Sone (the ancient Eranahoas), has heen constructed at the Elswick Engine Works, New-castle, and is thus described in the Gateshead Ob-server, — The tentative arch is of iron lattice work, as light to the eye as a fabric of cane. As you pass along the roofed roadway, you have on each side a double-lattice; and over head is the railroad for locomotives. The bridge will be double; that

will be two parallel footways and two there is. is, there will be two paraller advances and palanquing parallel railways. Foot passengers and palanquing will use the lower bridge. The Elswick arch is 202 feet long; and though in principle it involves to novelty, some new mechanical devices have no novely, some new mechanical devices have been resorted to, resulting in a combination of great strength with great lightness—contrasting regreat strength with great lightness—contrasting re-markahly, in this respect, with the wondrous High Level Bridge across the Tyne—which, were it now to be built, would probably consume not more than one-third of the iron actually employed. The num-ber of double arches, resting on piers, will be tweaty-uine. We shall thus have a double bridge, with palanquin roads below, and roads for railway traffic above; a footnath also on each marrin of the unnerpalanquin roads below, and roads for railway traffic above; a footpath also on each margin of the upper way; the whole in ronnd numbers 7,600 fect (or mearly a mile and a half) long—six times longer than the "High Level." although, literally speaking, the structure will consist of fifty-eight separate bridges, each of which can contract and expand with the temperature, without danger to the stability of the viaduet. viaduet.

At the Sheffield Exchange last week, a number of files of various sizes, cut by the French machine of Messrs, Prignet and Bernot, were submitted to the inspection of the local merchants and manufacturers. inspection of the local merchants and manufacturers. It appears that the patentee has disposed of the license for the use of the machine in France, and is now desirous to do so in this country. The files are said to be of a serviceable character, and the raising of the tooth satisfactory. It is stated by the patentee that the machine is so portable that it can be carried by two men, and that a small engine of one borse power suffices to work six machines. Each machine is said to cut in a day 64 dozen. Mainet, source rubbers cut in a day 61 dozen 16-inch square rubbers,

to ext in a day 64 dozen 16-inch square rubbers, weighing 91bs. each. At the Wildlard Institute, Birmingham, on the 20th ult. Mr. H. Wiggin read a paper on the manufacture of copper. The lecturer took copper ore at that point when it is ready for the swelter, and traced the various processes through which it passes until it hecomes good marketable copper, either as tile, eake, or hest selected. The mining, raising, and dressing of the ore belonged to the miner and mineralogist only. The principal sources from which our copper smelters obtained their ores, were from Cornwall and Devonshire in this country, from Chili, Cuba, and the Burra Burra and other Anstralian Cuba, and the Burra Burra and other Australian mines. Cornwall alone produced upwards of 1,200 tons of copper annually. It was from this county mines. Corrivat mode product a divates of spore fons of copper annually. It was from this county the greatest quantity was obtained. Mr, Wigdia afterwards alluded to the term "standard," used in the copper trade, and remarked that be bad never met with any one who understood it. Mr, W. Bayliss, of Birmingham, has patcuted the

Mr. W. Bayliss, of Birmingbam, has patented the manufacture of ornamettal metallic tubes, by pressing a plain tube into contact with a mandril, the said mandril having upon it the ornamental figure to he given to the tube, the pressure being applied as de-scribed. The invention is applicable especially to the manufacture of taper tubes, as there is difficulty in removing the tube from the mandril if the mandril be during endiments throughout. The tube however removing the time from the mainth in the table in or of uniform diameter throughout. The table, however, may be removed from a mandril of uniform diameter by heating the said tube suddeuly, and thereby ex-panding the same.

ELECTRO-TELEGRAPHIC PROGRESS.

Two or there years since we heisitated, like mass others, to speak of the Atlautic Telegraph as a really practicable project, or anything but a grand idea, which might, at some distant day, he realized. In this hesitation, however, we folt actuated far less by an error consistions that here a resurpose that these our own convictions than by an assurance that these our own convections than by an assurance that these convictions, if candidly outspoken, would be scouted by many of our readers, as partaking of the most extravagant credulity. At that time one felt (in a small way) somewhat in the position of Mr. Ste-phenson, when he was compelled, by the force of opinion, to pretend, before the Commons, that he had the most discreely moderate idea of running he had the most discreedly moderate idea of running railway trains at some eight or ten miles an hour, all the while silently multiplying the ten by five in his own mid, as the true measure of his well-founded expectations. Much so was it with Gublico Galilei, when compelled to pretend to subdue his nucenquer-able helief that the earth moved round the sun, and, with erroneous denial of its motion on his lips, to whisper to himself, in the silent depths of his own soul, "hat it does move though !" Wall the extrement like of this time there a series

Well, the citravagato tida of this time three years, is the actual work of to-day. The elne of clnes is now being spun, and in a few short months it will dip into the middle of the great Atlantic, and settle miles beneath its troubled surface.—" a way for the lightning flash," laid down hy the God-given power of burnan series genius.

The cahle selected for the Atlantic telegraph [we volume rely on the authority of the *Engineer* Jonrnal], is composed, internally, of a central core of seven copper eulogy.

wires, No. 22 gange, twisted together so as to form a wires, No. 22 gange, twisted together so as to form a strand, which is surrounded by three consecutive layers of the fnest guita-percha as the insulating medium. By applying the guita-percha in three distinct layers, one after the other, any flaw or imper-fection in one coating is certain to be overlaid by either of the others. A lapping of yarn saturated with a mixture of tar and pitch is then wound round when the artifa-merche covering to serve as a helding with a mixture of tar and pitch is then wound round about the gptta-percha covering, to serve as a bedding upon which the external protecting wires are placed. The protecting strands are eighteen in number, each composed of seven charceal annealed iron wires— No. 32 gauge. There are, therefore, 133 milles of wire employed in the formation of each mile of eable; —or, for the entire length of 2,500 miles to be con-structed. no less then 325,500 miles of wire must be --or, for the entire length of 2,500 miles to be con-structed, no less than 332,500 miles of wire must be drawn and twisted into 47,500 miles of strand, 2,500 miles of which will be embosomed in a thick insu-lating conting of gutta-percha, to which the remain-ing 45,000 miles will be applied as a prot.ction against strain or external injury. The diameter of the cable, when completed, will only be about three-quarters of an inch, and from the way in which it is made, it will be so flexible, that it may be tied in a knot round the arm without in-juring it.

juring it.

The weight of the cable is slightly under a ton to the mile. Many of the cables hitherto laid have weighed eight to nine tons to the mile.

weigeed eight to mue tons to the mile. The cable is capable of resisting a strain of ahout four tons; and as the greatest depth is 2,072 fathoms or 23 miles, the maximum of vertical strain npon the cable, which loses about one-third of its weight in water, will only amount to a ton and a half—the dif-ference of specific gravity between the water and the cable. eable.

cault: The cahle will, probably, be strengthened towards the middle by the substitution of steel wire for iron wire—so as to bear a strain of ahont ten tons. The enormous cost of steel wire, and the difficulty of pro-caring it in any quantity, would preclude it being employed for any considerable distance; and as there is an ample marries are called of a transit in the interemployee for any considerance distance; and as date is an ample margin or surplus of strength in the iron wire coating, it has not appeared necessary with the mere view of employing the former to postpone the operation for several years and treble the capital

operation to several years required. The calle is contracted for, in equal portions, by Messrs. Kuper, of Greenwich, and Messrs. Newall, of Gateshead, both firms well-known nuckers of sub-marine cables: both are bound to complete their contracts by the end of May. The machinery employed to spin the cable consists of a large borizontal wheel, round the circumference of which are arranged a series of bobbies of the iron wire strand which is to constitute the protective wire strate which is to constitute the protective of which are arranged a series of booms of the rou-wire strand which is to constitute the protective armour of the cable. The gutta pereba covered copper wire, made by Mr. Statham, at the Gutta Percha Works, and subsequently wrapped over with the layer of tarred yarm, is passed through the centre of the vertical axle of the wheel to which the bobhins of whire strand are attached, and is enveloped by the wheel in revolving with a spiral covering of the outer strands.

The distance to he traversed by each of the two vessels in laying down the cable, is hut little more than double that already passed over, without diffi-culty, in laying the line between Varna and Balaklava.

THE "CRITIC" ON ARCHITECTURE.

THE report on architecture as a fine art, founded on the illustrations given in our journal, is still ably continued in the *Critic*. We extract a portion of the article in the current number. Speaking of our view of Canina's entrance to the Villa Borghese, the writer says :-

writer says:----"We are by no means inclined to advocate the general appliance of strictly imitative design; but exceptional circumstances may arise which fully war-rant its occasional practice; and, at all events, we cannot but admire the example before us, considered per se, and as tending to keep alive the reverence which is due to the idiocratical perfection of ancient art. Speaking with stern truth, the gate-lodges of a palace should be 'affined and kin' to the palace itself; and such is not the case in the relationship borne hy Canina's proylenum to the manison in pertains to: Canina's propylacum to the mansion it pertains to hut, as the error is on the side of superior heauty, we must be critically indulgent, and then we are left to acknowledge the 'beautiful exceedingly.' The question is, whether, with the same amount of substance and decoration, so charming a result could be obtained and decoration, so charming a result could be obtained by the application of any other style, as Canina has produced by his Borghese gateway? What an elegant majesty pervades! how chastely ornate,—how un-affectedly refined,—how simply elequent! What mental cultivation may we imagine in the hody of the volume so gracefully prefaced? We will hut refer our readers to the woodcut in justification of our

ГГЕВ. 14, 1857.

The front of the Clothworkers' Hall, London (see Builder for Nov. 8, 1856), would seen to indicate another regal meeting on the 'Field of the Cloth of Gold,' so ornate is it in emblems of civic splendour. Gold,' so ornate is it in enhlems of civic splendour. It is another proof to the growing appreciation of the Anglo-Venctian Classic, and will greatly enhance the richness of the London street architecture. Its clas-tered pilastral reliefs, ornate cornice, and fanestral efficiency, are accompanied by much proportional beauty; and the façade is altogether bighly creditable to the repute of Mr. Saunel Angell. We could almost wish the uppermost window-openings had been approxto the repute of Mr. Samer Angel. It would share a square-headed, since, after all, the architect has fail the accessity of finishing their top-dressings parallel with the sofit of the entablature immediately above; and the sofit of the entablature immediately above; and and the sofit of the entablature immediately above; and we would, deferentially, submit to Mr. Angell whether some gain of light to the rooms might not be had consistently with no decrease of beauty to the win-dows. It may be that the keystones of the three arches have some relation to the support of a largely beauty of the songer but the songer arches have some relation to the support of a largely-projecting entablature of long bearing ; but the square-headed openings might be crowned with a cornice which would still more efficiently support the super-incumbent architrave. The gradual increase of rich-ness, as the building ascends, is, we think, in the best taste taste

In another woodcut of the Builder, for Jan. 17, 1857, is a perspective of the interior of the Cloth-workers' Hall, the aspect of which is splendidly scenic. Though the general arrangement of the com-ponent features is pretry much according to book, there is a superadded force which removes it above the level of common-place. A more well-informed student of Sir Wm. Chambers might have similarly employed the arcsaded 'order,' the elere-story, groin-ings, and ceiling; but Mr. Augel has shown the accomplished artist in certain superaded details, in their ornamentation, and in what may be termed the In another woodeut of the Builder, for Jan. 17 their ornamentation, and in what may be termed the emphasis which marks those passages of his composi-tion which are most susceptible of effective treatment. The red granite columns, with their grey granite bases, cannot fail to be imposing, though the material of the capitals (Caen store) seems to be something under the mark for the crowning member of such costly appendages, unless, indeed, they are to be heightened in effect by colour and gliding. This interior, however, is, at the least, a very excellent specimen of academie Roman design; and as such we rejoice in being able heartily to command it. Nothing can contrast more remarkably with the their ornamentation, and in what may he termed the

rejoice in being able heartily to commend it. Nothing can contrast more remarkably with the last-mentioned interior than that of the Gallery of the Bank of France, Paris, illustrated in the Bailder for Jan. 3, 1857. The scenic and theatrical character of the latter, having more to do with the upholsteral dias the architectural, depends on the abjuration of all severe criticism, and on an abandonment to mere decorative prodigality. It is of the period of Louis XIV. and emblematises the florid profligacy of his court, in its excess of carving, gilding, and paint. Trinity Presbyterian Church, Kingsland. — The view of this building given in the Builder, 2 th Jan. 1857, is comforting to the critical perceptions, for,

view of this building given in the Builder, 24th Jan. 1887, is conforting to the critical perceptions, for, in connexion with the evidence of an educated taste, it shows invention and considerate judgment. It would, perhaps, be difficult to find so well composed and pleasingly proportioned a steeple among the genuine Medieval examples of its kind. The but-tressing of the tower is far better than is usual. Artistic feeling and constructive propriety go hand-in-hand from base to apex. We only wish the lower galited enopies near the base of the spire could have a little more projection, so as to allow greater length to the little pillars that support the outhanging angles."

SOCIETY FOR IMPROVING THE CONDITION OF THE LABOURING CLASSES.

I HAVE permsed with much satisfaction your valu-able article headed "The Provision of Dwellings for the London Poor," contained in the Builder of the 7th inst. and fully concer in the justice of your remarks. Permit me, however, to state that you have remarks. Permit me, however, to state that you have been led into a slight error in that portion of your article which refers to our "Model Building" in Portpool-lane. I immediately referred to our "In-spector of Dwellings" on the subject, and desired him to write his explanation, which he has done, and which I now enclose to you. I am sure that you will desire to render our society, for which you have always maufiested a deep interest, the simple justice of giving insertion to Mr. Holeroft's note.

II. HARWOOD HARWOOD, Hon. Sec.

STE,-I notice in the last number of the Builder a state-ment that at the "Thanksgiving Building," in Portpool-lane, there is an insufficient surply of water, occasioned by leakage of the pipes. Allow me to state in reply, that there has always been an abundant water supply, but owing to a temporary disarrangement of the raives some fittle inconvenience has been unavoidably experienced, although they were not "left unattended to." During

the necessary repairs, plenty of water was always obtain-able at the other end of the building. JANER HOLENT, Inspector of Dwellings to the Society, H. Harwood Harwood, Soy, Hon, See.

*** We willingly comply with Mr. Marwood's request, but it will be seen that there was no error on request, out it will be seen that there was no error on our part. We simply stated what was the case, namely, that "we were surprised to find complaints made by some of the tenants of a very insuficient water supply," &c. The complaints unquestionably were made. We willingly believe the cause has been removed removed.

"WOLVERHAMPTON WORKHOUSE COMPETITION.

Having received a letter frinthox. Guardians of the above workhouse, informing me that the Guardians considered my plans to be the second-best, I sheuld wish it to be understood that though I competed, I was under a pledge with Mesrs. Bildneke and Lovat,-likewise they with me,--that, in case of success, we would each abandon it unless we obtained the full per centage. EDWARD HOLMES, Birmingham.

** We have also received a letter signed "Robert Ebbels," "Edward Banks," "Griffin and Weller," and "J. R. Veall," wherein they "indignantly reputiate "the motives secribed to them in Mesers. Bidlake and Lovatt's reply (at p. 78, ant/s) to their first letter (p. 60), and renew their assertion that the latter gentlemen have not keep the motive of the second second second second second the motive of the second second second second second above note from Mr. Holmes,

Books Receibed.

The Year-Book of Facts in Science and Art, for 1856. By JOHN TIMBS, F.S.A. Bogue, Fleet-street. 1857.

ANOTHER year brings round another record of scientific and art valuables, gleaned by Mr. Timbs from many sources, and forming a most useful hook of reference iu all that relates to the most hook of reference in all that relates to the most important discoveries and improvements of the past year, in mechanics and the useful arts, natural philosophy, electricity, chemistry, zoology and botany, geology and mineralogy, meteorology and astronomy. Thus many im-portant steps in general advancement, which might he swamped by subsequent events and subjects of interest, are rescued from oblivion, and so placed as to be casy of access, and likely to he ever and anon turning up again into notice, and fructiving in inventive minds into new disand fruetifying in inventive minds into new dis-coveries and improvements to be hereafter also recorded. We are glad to note that Mr. Timhs begins to hreak through his too modest rule of begins to break through his too modest rule of refraining from the expression of personal opinion. The comments of one who is cou-stantly in the labit of reviewing the general progress as Mr. Timbs does, cannot hut add value to a work such as this. To the present volume is prefixed a portrait and memoir of Professor Graham, the present Master of the Mint.

Miscellanea.

EVENING CLASSES, CROSBY HALL: HOPE FOR THE DESERVING.-Mr. Thomas Brodribb and Mr. Edward Chaplin, two of the members of this insti-Latvard Chaptan, two of the members of this insti-tution, have just been appointed clerks of the third class in the Educational Department of the Privy Council Office, after a competitive examination by the Civil Service Commissioners. The number of candi-dates admitted to compete for five appointments was twenty-one. This is the second occasion upon which the Lord Decederation dues admitted to complex to reaction upon which the Lord President has placed at the disposal of the Rev. Charles Mackenzic, as honorary secretary, the privilege of nominating members of the evening classes as caudidates for clerkships, and on the former

ODO WAS SUCCESSIU. MEMORIAL CHURCH AT CONSTANTINOPLE,---We are informed that the four prize designs for the church at Constantinople, will be shown at the next meeting of the Architectural Exhibition (Thesday,

Technig of the ABERYSTWITH.—The Clock-tower at Aberystwith, of which we gave a view lately (p. 47, ant-2), is in the market-place, being the most central and elevated point available : the dial will he illuminated with gas. The blue lime-stone of the locality is used for plain walling, and the dressings are of free-stone, from the Stourton-hill quarries, in "Cheshire. The diameter of the tower is 15 feet are of free-stone, from the Stourton-nut quarter Cheshire. The diameter of the tower is 15 feet above the plinth course, slightly hattened up to hal-coury, and from thence to main cornice. The total height is 72 feet 2 inches to the top of the vance staff. A An archway, with ornamented cast-iron gates, leads to to a circular staircase to halcony, from which the states accent to the clock-chamber and top of tower is by a cast-iron staircases.

THE BUILDER. SMOKY CHIMNEYS .- In reply to our correspondent,

"Z." (p. 56), six or seven gentlemen have requested ns to hand their names to the inquirer as ready and able to do all he wants in the way of cure, however, we decline. When we give insertion t able to do all he wants in the way of cure. This, however, we decline. When we give insertion to such an inquiry, it is with the hope of eliciting information for the general good. In the matter of smoky chim-neys, however, each case requires to he judged of This separately. The Building Tranes at Birmingham,-

THE BUILDING TRADES AT BIRMINGHAM,—There is a continued depression in all the hranches of the building trade at Birmingham. Few, if any, public works are in progress, and at no former period did so many "tramps" pass through the town in scarch of cuployment. Hundreds of applicants have heen relieved by the officers of the various friendly and trades societies existing within the borough. AUCTIONNERS' EXCHANGE.— An "Auctioneers"

AUCTIONNEERS' EXCHANGE. — An "Auctioneers' and Land Agents' Subscription-room and Exchange" has been established in London, at No. 2, Prince's-street, opposite the Bank of England. The rules and regulations agreed to fix the aunual subscriptions, from January to January, at 34, 38, for individuals, and 44. 4s, for firms, payable in advance. Mr. C. C. Roherts is the sceretary. One of the chief objects of this new association is to supply a perfect system of registration, to enable the members more readily to registration, to enable the members more readily to find purchasers for what they may have to sell and obtain investments for those wishing to buy. Another object is the raising of the position and public stand-ing of the profession. The bringing of hayer and seller to one central point is itself an important object for the facilitation of business. THE LIVEBROOLTIMER TRADE.—Mr.E. Chaloner, a Linear of the traditional statements of the second

of Liverpool, in his annual wood circular, dated " 30th January," on the timber trade since the 31st January, 1856, states that the import has been the largest on 1850, states that the import has need the targest on record, the aggregate import of all woolds showing a total of 477,250 tons, or an average of 1,310 tons per day; it has increased 52 per cent, within the past is y cars. This difference is almost wholly in spruce deals; square timber has remained almost stationary. Spruce deals have advanced within five months from 87, 15s. to 107 5s, and account of the months from Spruce deals have advanced within five months from 8.4. Iss, to 104, 5s, and again declined to the present price of 84. 5s, per standard. A spirit of speculation has for some time prevailed, and a secret system of withholding the prices of wholesalc operations. Re-turns of colonial fir, in logs and planks, show an increase in import of 1.206,507 feet, or 7 per cent, and in stock 1.444,520 feet, or 17 per cent, whilst the consumption is about the secret starts. the consumption is about the same as the previous year.

ENGLISH ENGINEERING IN BRAZIL. - On the athority of Mr. Neill, the Consul-General for Honduras, we are enabled to state that the works of the duras, we are called to state that the works of the Pernambuco railway are progressing favourably under the superintendence of Mr. J. Bayliss, C.E. the repre-sentative in Brazil of Mr. Purness, the contractor; that Mr. Penniston, the company's chief engineer, reports most encouragingly as to the solidity of the execution of the works; and that they will be com-pleted hefore the time originally contemplated; and, from the integrest displayed by the neonle of the from the interest displayed by the people of the country in the undertaking, that the traffic is likely country in the undertaking, that the traffic is likely to considerably exceed the prospective estimate. Mr. Bayliss, on the part of his principal, it appears, had heeu exercising his engineering skill by sea as well as hy land, the wreek of the *Marquis of Olinda* steamer, of 1,000 tons, having heen purchased as it stood in its wreeked state, forty-five miles from Pernambuco, for Mr. Furness, and half of the hull reised and floated safely to shore hy Mr. Bayliss, who was en-gaged, hy last accounts, in recovering the remainder, in the unidst of impediments deemed insurmountable. The Box Tarum - In Stoffweideing the two is the stored in the stored stored in the stored stored in the stored stored in the stored stored stored stored in the stored store

THE IRON TRANE .- In Staffordshire the trade is reported to he quiet and steady; prices pretty well maintained, but no chance of any advance.

THE NATIONAL MUSEUMS AND THE SOCIETY OF Arts. - At a meeting of the council of the Society of Arts, on Wednesday, the 4th instant, the following resolution was adopted :---

We are forced to admit our inability to divine the exact object its promoters have in view.

SHAKSFEARE'S HOUSE.-We fearn that a meeting of the trustees of Shakspeare's house has heen held at Stratford-upon-Avon, when several tenders were re-ecived for the demolition of the houses and cottages which surround the birthplace of the poet; and that which surround the birthplace of the poet; and that the tender of Mr. William Holtom was accepted, and a contract entered into for the removal of the premises within one month. It is to be hoped that the trustees are advised by an architect, or much intreparahle harm may be done. When we were last at Stratford a carcful eye seemed wanting. ST. PETER'S, STEPNEY.-The new church-schools

ST. PFTEF'S, STEPNY,...-The new church-schools of St. Peter's, Stepny, were opened on Saturday, 31st ult. hy the Bishop of London. The district consists of 13,000, mosily of poor and lahouring people, chiedy dock labourers, and the room which has heen built, will enable the Rev. P. J. Rowsell to assist and instruct those who, from various causes, do not go to church. The building was erected under the direction of Mr. Chas. Barry and cost 1.5500. These will be of Mr. Chas. Barry, and cost 1,550*l*. There will he here 1,000 children under instruction in this one dis-trict connected with St. Peter's Church.

tract connected with St. Peter's Church. HOLLOW-WICKEN CANDES.—Having seen the article on hollow-wicked candles, signed "An Unem-ployed Clerk," allow me to say I tried the making of the same candles in 1849, and then found the follow-ing obstacle signist them;—That the tallow will run into the tunk, and stop the air, independent of burning away very fast. If the unemployed clerk will spend as much time over it as I have done, he will fund after derwhoade heide the which Leve will find other drawhacks besides that which I have mentioned.-W. J. W.

mentioned.--W. J. W. INSTITUTION OF CIVIL ENGINEERS.--On the Srd of Fehruary, Mr. G. P. Bidder, V. P. in the chair, two papers were real; the first, "On the Varieties of Permanent Way, practically in use on Railways," by Mr. W. Bridges Adams; and the second paper, "On some Recent Improvements in the Permanent Way of Railways," by Mr. P. M. Parsons. LIVERPOOL ARCHITECTURAL SOCIETY.--The night meeting of the session was hald on Webrecker

meeting of the session was held on Wednesday evening, the 28th ult, at the Royal Institution, Mr., Huggins in the chair. Mr. Chantrell exhibited several specimens of Staffordshire briek and terra cotta tile, as well as a large terra cotta chimney flue, suitable for dwelling-houses, which, on account of its suitable for dwelling-houses, which, on account of its heat-retaining properties, was said to he an excellent contrivance for creating a draught, and thereby pro-moting ventilation. Mr. Picton introduced the sub-ject of the action of water upon lead, which led to an interesting discussion, in which Mr. Verelst, Mr. Horner, Mr. Weightman, sceretary, and Mr. Dawson took place. A paper hy Mr. R. Rawlinson, "On Factory Chimney Construction," was read in his absence by Mr. Picton.

STATE of TURNER.—The great painter left by will 1,0000. for a monument to his memory in St. Paul's. It is to be a statue, and it is stated that Mr. M'Dowall, R.A. is chosen to creeute it.

Mr. M'Dowall, R.A. is chosen to crecute it. BryEntzy MecTANICs' INSTITUTE.—Last week, Mr. Charles Broreton (the mayor) delivered a second lecture here, on "Ecclesiastical Architecture." Not-withstanding the inclemency of the weather, there was a large and respectable audience present. SMTHPHENL.—I hope you will protest against employing the site of Smithfield as a dead meat market, with its reeking carcasses and disgusting sights and smells, the site being an excellent one for a bandsome fruit and regetable market, instead of that in Farringdon-struct, allorned with fountains and that in Farringdon-street, alorned with fountains and other emhellishmonts, so as to make it an attractive promenade as well as a place of business. Surely, even at the eleventh hour, such a desceration of one of the firest sites in the metropolis may be prevented : should it become a meat market, it will prohably remain so for generations, with all its nuisances and adominations.—G. H. ahominations .--

NEW PARK FOR GLASGOW .- By the casting vote of the Lord Provost of Glasgow, —By the casing vote of the Lord Provost of Glasgow, the corporation have purchased ground on the south side of the river for an additional park, at the sum of 30,000*l*. have

purchased ground on the south size of the river tot an additional park, at the sum of 80,0007. THE LATE MR. T. SENDON.—A meeting has been held to express the sense entrained of the merits of the late artist, Mr. Thomas Seiddon, whose death we announced a short while ago. The chair was taken by Lord Goderich. Mr. Ruskin mored, and Mr. Hunt seconded, the first resolution ,—" That an er-hibition be held during the present scason of the works left by the late Mr. Seddon, which shall be open to sale." Mr. Tom Taylor moved the second resolution ;—" "That out of the public subscription which it is proposed to raise, 400 guineas be given for the purchase of Mr. Seddon's principal work, the oil picture of Jerusalem, from his widow, for pre-sentation to the National Gallery; and that, if any surplus remain after the purchase and payment of the necessary expenses of the exhibition, &c. Mrs. Thomas Seddon's acceptance of it he requested." Mr. Ruskin has consented to act as treasurer, and Mr. W. M. Rossetti, of No. 45, Upper Alhauy-street, as secretary. as secretary.

A MONUMENT TO THE PILGENM FATHERS.— The Pilgrim Society of Plymouth, Mass. are making efforts to raise funds to erect a monument to "the Pilgrim Fathers" on Plymouth Rock. The height is to be 150 fect: it will be crowned by a figure 70 fect in beight, and four others, sealed upon the hnttresses of the pelestal, will have a height of 38 fect. The panels helow the figures are filled with alto-reliefs of "The Departure from Delft Haven," "The Signing of the Social Compact in the Cabin of the May Roveer," "The Landing at Plymouth," and "The First Treaty with the Indians."

THE TRIGONOMETRICAL SURVEY.—Upwards of 2,000 persons are now employed in the trigonometrical survey of Great Britain. Nearly 400 of them are stationed at Southampton, and are chiefly computors, draughtsmen, and engravers. The following maps have been completed, viz.;—Maps of the whole of Ireland, several counties, and large towns in England and Scotland, on a scale of 6 inches to a mile, and of nearly the whole of England, and parts of Scotland and Ireland, on a 1-inch scale. The I and 6 inch maps are to be continued for other counties; and large towns will in future be mapped on a scale of an inch to every 40 feet. Plans of all the cultivated districts in the country will also, in future, be made upon a scale of ahout 25 inches to a mile.

Bace upon a scale of about 20 status for a back SECURING CELLINGS, &C.—A patent has been taken out by Mr. Newton, of Chancery-hane, for securing the plastering of ceilings and walls. The object is to cause the first layer of plaster to adhere as firmly to the laths as the second layer does to the first, and for that purpose it consists in applying to the joists or girders, or to a ceiling of boards, laths having inclined edges forming an angle with the horizontal place of the floor, to which the mortar is to be applied, and sprend on in the usual manner, so that the tongues of mortar which pass hetween the interstices of the floor, and overlap the tops, and are clinched thereto, whereby the mortar is held and prevented from failing.

LEEDS. — A correspondent says, — Several new buildings of great beinty are being creted here. The town-hall, when finished, will he a good specimen of Renaissance work, while the new iron buildings in the market place, in the Gothie style, are noticeable. General education seens to be properly appreciated here: for that purpose a number of Mechanics' Institiations have been founded in various parts of the town: in some of the schools the members of the town in some of the schools the members of the town in some of the schools the members of the town in some of the schools the members of the town in some of the schools the members of the town in some of the schools the members of the town in some of the schools the members of the town in some of the schools the sees the would there by advance the cause of civilization and hetter the mechanic's position, by opening to his eyes the world of machinery which is to be seen in drawings and engravings: models of the objects represented he might never get a chance of seeing. The majority of the committees wished that mechanical and archithe students were ignorant of even the radiance to drawing, the master, Mr. Charles Ryaa, had to begin by teaching frehand drawing from the black board, hut have forwarded an application to London for "Dyce's Examples." The schools are getting on very well; and the students, on the whole, are attentive end intelligent. The local committees applied at the contral school for a teacher; then the central committee, fuding that Mr. White's time was so occupied that he could not attend at these Institutions, applied to the Department for another teacher, and he teacher

ETESIGHT OF WORKING MEN.--Nr. G. Y. Heath has addressed a letter to the Northern Daily Express, in which he says, alluding, we presume, to what have been called "railway spectaeles," now commoly sold by opticina,---" What I want, then, is to call the attention of all workers in metal--fitters, holter-plate makers, showed-makers, forge-men, chain-makers, &c. of milistone-dressers, stoneumsons, fire-briek workers, plasterers, stone-irreakers, or of any others in whose employment the sight is endangered by accident, to the fact that a convenient and chenp form of protection is sold at most of the opticinal' shops, capable of effectnally warding off either sparks of hot iron or chippings of cold steel, large pieces of metal, or fragments of brick, coal, &c. or hot plaster, and which interferes so fitle with the perception of objects, that the anallest print may be read through them. And I would arge them most strongly to provide themselves with this simple means of protection."

CRIMEAN MONUMENT AT SHEFFIELD.—A spirited movement is being got up at Sheffield for the erection of a monument to our Crimean herees who fell during the late war, and the Commander-iu-Chief has agreed to lay the first stone. A design has been prepared by Mr. Edwin Smith, of Sheffield.

ERECTION OF CONVICT ESTABLISHMENT AT NOR-TOLK ISLAND.—The Government, it appears, have decided on the erection of a large prison at Norfolk Island, for the reception of conviets under sentence of transportation, and an order is said to have heen forwarded from the War-office to Colond H. Sandham, director of the Royal Engineers' establishment, Chatham, directing him to hold in readiness one company of that corps, to embark forthwith for Norfolk Island, for the purpose of assisting in the erection of the convict establishment at that station.

erection of the convict establishment at that statuo. THE BUILDING TRADES IN ENGLAND AND IN AUSTRALIA.—The strangest of all strange things is that, with our forty colories, one and all craving for labour, three should be a single man unemployed in the country. From the accounts in our daily contemporaries of the proceedings of the nameployed building trades in Smithfield, we tarn to the file of papers from Australia, and we find from New South Wales that masons there, working eight hours per day, receive 13s. 6d. daily wages; hricklayers, 14s. to 16s. per day; carpenters are receiving 11s. to 14s., joiners, 13s. to 14s.; plasteres, 12s. to 15s. per day. But it is also stated that the bricklayers, and oue or two other trades working eight hours per day; are holding meetings in order to obtain still higher rates of wages. How strange the contrast—wide as the antipodes. In London, 10,000 men meet daily to arrigo Providence, abuse red tape, declaim against the aristonery, tak communism, and chant the old strain—" We're got no work to do."—Australian *and New Yeing the strained the strained the old Strain*-

oue or two other trades working eight nours per day, are holding meetings in order to obtain still higher rates of wages. How strange the contrast—wide as the antipodes. In London, 10,000 men meet daily to arraing Providence, abuse red tape, declaim against the ariatocrary, talk communism, and chant the old strain—" We're got no work to do."—Australian and Nev Zealand Gazelle. ThEL-GROWING.—M. Millot Brulé is said to bave discovered that the bilurcation of trees is efficient by enterpillars and other leaf-eaters eating the buds through the centre. Ite found, further, that fruit might be dealt with in the same way as the wood, and that by iotersection of hads two or four may be made out of one, and the fruit branches multiplied. In the place of those assidnous prucers and intersectors, the insects, he uses bis penknile or a bit of stiff paper, and arranges the trees in a way at once the most picturesque and fattatie. Under his fingers the obedient branches assume the most varied and developes the formation of bads according to his wish. Good news for landscape gardeners, if true; but that there is a biltreating principle in usture, apart from insect action, is evident, even in mineral sublimations : sublimed, a heautiful golden *branch*, and there are various other chemical combinations which crystallize in arborescent forms. The blood-vessels of the animal organism are surely not bilturented or arboresced by insects 1. There is donbless a natural tendency, in vegetable usatter, as well as in animal and in mineral, to arboresce.

Goopler's Air PROFELLER.—An immense concourse of persons, it appears, lately assembled at the Docks, Leikh, to witness the departure of Mr. Goodlet on his trial trip in an experimental air-propelled vessel, which proceeded at a very slow rate to the extremity of the pier, about a mile we should think from the docks, when Mr. Goodlet deemed it prudent to return to the docks. It is said that he had discovered some defect in the air-valves or other parts of the complex apparatus by which he expects to attain a creat speed.

of the complex appareds by which he dependent attain a great speed. THE ART-MANURATTRE ASSOCIATION AT EDIN-BURGIN — A prize of twenty guineas is offered by this association for "the hest original design modelled, of some object combining ornament with hullity," conditions to be ascertained from the secretary, at Georgestreat. Fellowerb.

ditions to be asceriminal from the secretary, at decree street, Edihurgh. Correstrion To PROTECT IRON OR PAINTED SULFACES, &c.--A preservative composition, patented by Mr. J. E. Cook, of Greenock, is described, on the authority of the *Practical Mechanic's Magazine*, as affording protection to the hottoms of iron ships, and for other purposes. A thin coat of it is said to prevent the efflorescence of salt from strong brine; to keep out damp when applied to oil-painted work, Roman cement, and brickwork; and to shield exposed stonework from the actions of varying temperatures, and the alternations and severities of the weather. It is also held to he useful as a coating over the plaster of rooms of honesw where paper is laid on.

Use of GLASS IN FARM STRADINGS.—A homestead bas just been erected on the farm of Buklerhole, on the estate of Rockball, on a plan which is new in this district at least, and deserving of the attention of proprietors and farmers. The whole hulldings, in fact, snited for a farm of about 200 acres, are comprised in a shed 90 fert in length, by 72 feet in breadth. The shed is divided into four parts by three rows of iron pillars, which support the roof. Each of these parts is 18 feet in hreadth and 90 feet in length: each part is covered with a ridge roof, one half of slate and the other of glass, so that ample light is given through the whole interior without any windows in the walls. The outer walls and interior supporting pillars are 11 feet in height, and in addition to this there is the hoight of the sloping roof. Each pillar is hollow, and the rain, falling upon the roof, descends through them, and is carried off by drains below the flooring. Once within the steading accordingly, there is light, dryness, and complete shelter from the weather for animals and implements; while, under such agreeable circumstances, a considerable portion of the operations of the farm can be carried on. Ample ventilation is secured by openings. Gas AT BERNTROND.—The inhabitants of Brentford complain that the Brentford Gas Company charge them 6s, a thousand cubic feet for their gas, while they charge the Hammersmith people only 5s. A meeting was lately held, at which a deputation was appointed to wait upon the Brentford Gas Company for au explauation of this acomalous state of things, and to demond a reduction. Meantime an inspector of meters than merismith people only 5s.

GAS AT BRENFORD.—The inhabitants of Brentford complain that the Brentford Gas Company charge them 6s. a thousand cubic feet for their gas, while they charge the Hammersmith people only 5s. A meeting was lately held, at which a deputation was appointed to wait upon the Brentford Gas Company for au explanation of this anomalous state of things, and to demand a reduction. Meantime an inspector of meters at the meeting gave *bis* explanation of the arithmetical puzzle by asying that Hammersmith took three times the quantity of gas which Brentford consumed, and it was, therefore, that Brentford was surcharged by its own gas company. The gross humbug of this explanation, however, had previously been made manifest by the hint of oce of the maleontents, who explained that the real reason was, the Brentford Ges Company bad the fear of the Folham Gas Company before their eyes at Hammersmith, while they felt boenselves quite song at Brentford. Incipient and granubling threats of a new company for Brentford were hinted at, but it is to be hoped the company will at reasonably in this matter, more especially as they may depend upon it that it will promote their to the level of that of Hammersmith. In fact, were the meter inspector's tastics to be carried ont by the Brentford people, they would insist, and with some reason, too, on having their gas from their own company at a positively lower rate than the more distant Hammersmith people.

Hammersnith people. IRON SLAO, ITS APPLICATION TO COMMENCIAL PURTORSE-I Trust it will be admitted that I have proved that bricks, tiles, pipes, and pottery, can be made cheaper and more durable from iron or clay slags than from any other material, having neither drying nor burning to contend with, wherein lies all the difficulty to be yet overcome hy the advocates of Machinery versus Handmaking, by the common process. And is it not reasonable to cone, de that as iron ore is pleniful in the neighbourhood of London, it will soon be manufactured where the articles produced are required, whether coal is found in the neighbourhood or not, as the estimate for brieks alone for London is 200,000,000 per aunum, and it appears they are now supplied within a circuit of 100 miles? If the carriage, coals, and labour attending the drying and burning of bricks, &c. are saved by the use of use their dust and ashes for disinfecting the greater, part of their present seavage materials, or rather, preventing infection taking place, by mixing and removing the same in a dry state, hefore they are washed into of the severs for disinfecting, instead of line, being much cheaper and on the spot, and I sloud think with far more henefit, particularly if ased for agricultural purposes, as all earths are found to be the best for disinfecting notions materials.--W. G. ELLIOPT.

Builder. The

Vol. XV .--- No. 733.

INCE we last referred to the question of the Thames bridges and the Government Offices, there have been several indications that the importance of greatly improving the commu-nications between the opposite sides of the river is being viewed hy the Government, and in other quarters, with increased attention. The works at Chelsea-bridge are in active progress; one of the chains is now fixed, aud it is expected that the bridge will he open this year. We shall have another opportunity for noticing any points of interest which there may be in this case, in the method of construc-

In regard to that portion of the metrotion. polis to which more especially our recent observations applied, it appears to be now admitted that three bridges for carriage traffic are urgently required in the distance between Vauxhall and Waterloo hridges. Whether the sites which are contemplated are quite accordant with the views which we expressed, especially as to the site of Westminster-bridge, is not, however, sufficiently clear. Sir Benjamin Hall, in the course of his reply to questions from Mr. Locke and Mr. Williams, on the 9th, informed the House that nothing could he decided upon as to Westminster-bridge till after the designs in the competition for Government Offices had been received; hut the proceedings of the Government throughout, show that their opinion tends to a modification of the present route from the Middlesex side. Indeed, according to the report in the Times, Sir Benjamin Hall said in the House,-"If they decided that it should not be removed, they would then have to say whether the bridge now heing constructed should be proceeded with." So that one seriously important point in the question,-the loss from abandoning the present works,-appears to be left out of the first consideration. Are we also to nuderstand that the question of the principle of construction is once more to be thrown open? One question, at least, seems from the rcply of Sir Benjamin Hall, to be as little understood as though halfa-dozen different committees or commissions had not recorded evidence upon it. Cau any fresh point for consideration have arisen between the date of the last investigation, and the present time? If not, the system here illustrated is far more serious in its effects than it is presented to us in the case of a single public work, for, as we have before shown, it is inconsistent with all progress. And can the statement he correct, that there has heen no survey of the river since that of Telford? We might venture to refer to the First Report of the Commission for Improvement of the Metropolis, if there should be no later record to strengthen our doubt. With reference to the site of the bridge, the very wording of the particulars to architects is calculated, we fear, to hias them,-so that in place of what might serve the question-a calm view of it, in which the outlay already made would have some weight-the competitors are rather likely to mould their designs according to what so much appears to be the acceptable opinion.

THE BUILDER.

Pimlico end of Victoria-street to Millbank, is the increase of the collections, for which puragain under consideration, as also that the poses it might be necessary herefter to pur-Government support the scheme for widening chase the surrounding property referred to. One Hungerford-bridge in lieu of the bridge to result of the completed arrangements might be which we referred as designed some time back, an amalgamation of all annual or other periodical and which was to cross from a point nearly opposite the Horse Guards, with one access to it from Charing-cross. The Hungerford Bridge, or rather as they are called "Charing-cross Bridge Company, after widening the bridge on the present piers to 48 fect, with the requisite additional chains and strengtheuing trusses, propose to get their access by removing the market,-but the alternative has been considered, of forming a curved access from Whitehall, using the present line of Whitehall-place, if we understand the scheme as set forth, by which there would he the disadvautage of an approach with conidentials eurorature and a steep gradient. On the Lambeth side, the proposal is to work in with the line of the street intended by the Metropolitan Board of Works, as well as to furnish an access to the Sonth-Western Railway on arches to its own level. This proposition, however, assumes that the scheme of the Metropolitan Board will be preferred to that of Mr. Pennethorne, whose plan, it should be observed, was made in connection with the site then proposed for the bridge before referred to, with approaches from Whitehall and Charingcross.

On the same evening on which the proceedings in the House took place, Sir Benjamin Hall annonneed that 1,791 copies of the particulars for the Government Offices had been sent ont, 1,371 of them heing in reply to appli-cations. This, of course, hy no means implies that the persons who compete will be numerous,-though, no doubt, the event will be an extraordinary onc in the history of architectural competitions.

Competitors are most anxious as to the selection of proper judges with reference to the designs for the new Government Offices, and for laying out the neighbourhood, about to he sent in. In the House of Commons, on the 16th, Lord Rohert Cecil said he should be glad to know from the Chief Commissioner of Works whether the judges of the approaching competition, with reference to the new Government Offices, would he appointed before the day on which the plans were sent in. Also, whether he intended, in appointing the judges, to confine his selection to those who were unentangled hy any personal connection with the profession, or whether he intended to include among them practising architects. In reply, Sir B. Hall said it was not his intention to nominate any of the judges until after the plans were sent in. With regard to the selection of judges, it was his intention to nominate some gentlemen who were not connected with engineering or architecture, and to associate with them others having a thorough knowledge of those professions. It would, however, perhaps he difficult to select competent persons who were not at all connected with the competitors; hut he would certainly endeavour, in the selection he should make, not to nominate any persons who were competitors or were connected with competitors.

As we are speaking of Government works, let us refer in a dozen lines to the proposition set forth in onr last, at p. 89, to adapt the British Museum for the reception of our Art Treasures, in order to remove the impression of some of onf readers that Sir Charles Barry's scheme requires the immediate purchase and appropriation of the surrounding property. This is by no means the case, as all the accom-modation that may be required for years to come may prohably be obtained within the limits of the existing building. It is proposed Regarding other required bridges, it is re-ported that a bridge from the Horseferry to be devoted to Art and Literature, but to the that the institution ultimately should not only

exhibitions of modern art and science, in the building in Trafalgar square, with a grand hall for national demonstrations and displays of music, in those times to come when the provision of intellectual enjoyments for the people will be more considered thau it is now. Let us add that, although last week we appropriated the quadrangle of the Muscum to antiquities, this might still remain appropriated, as is now intended, to readers. The scheme as set forth in our last, has been received with considerable favour, and we are therefore anxious that no wrong impression in respect of it should exist.

ON THE USE OF ANCIENT ARCHI-TECTURAL EXAMPLES.*

TECTURAL EXAMPLES.* The temple of Minerva Medica must have becu, when complete, a building of considerable beauty, and of a finer and more varied outline than the Pantheon. Here the buttress is adopted without disguise or concealment, as in mediaval huildings,—and the area is expanded by a series of apsidal recesses; a hint not lost upon later architects, for it is acted upon in the polygonal part of St. Gereon's church in Cologne. At Tivoli are two circular temples; one, the well known Sybil's temple; sur-rounded hy a circle of columns with their en-tablature,—in fact, a Greek temple of around rounded hy a circle of columns with their en-tablature, — in fact, a Greek temple of a round instead of rectangular form; and one in hrick, on a plan somewhat similar to that of Minerva Medica, but smaller and simpler. It has eight arched recesses within, of which the alternate ones are apsidal: over each of these on the out-side of the wall are deep arches, so that the upper part is lightened, without diminishing the ablament required for the dome. The temple at Baie is of the same description. This has some corhels of a very mediaval character, but there seems no reason to suppose they are not original. original.

From such temples as these we readily pass to the early circular haptisteries, which were, no donht, suggested by them. * * * It is impossible to enter the Pantheon at Rome without heing struck with the advan-tages of its plan, as well as the magnificence of its appearance, and I never saw a church lighted in a more perfect manner. I have been in it ou a rainy day, when the opening of the top was covered with a cloth, and on a fine day, when it was open to the sky, and cast a single hright spot on the surface of the wall : in either case it displayed the grandeur of the interior, and appeared fully sufficient for the congre-gation. From such temples as these we readily pass gation.

We cannot wholly deny to the aqueducts of the Romans the title of architectural works. They must have been intended, as they were calculated, to form a magnificent feature in the scene through which they passed. I will at present only refer to that of Jouy and Arches, in France, about six or seven miles from Metz. You pass it on the line of railroad from Paris. The reader is a station of the statistical from Paris, and there is a station pretty near. The aque-duct was earried across the valley of the Moselle, and its remains appear on both sides of the river : the principal and most imposing part is a line of arches which crosses the street of Jouy, on piers, taller than ordinary village church towers, and of great massiveness. The peculiarity of these piers is that they are divided into several stages, each less massive than that heneath, iustado t apering gradually their whole height. I suppose the strength in each case is pretty much the same : the form of these I think more pleasing thau that of our usual viaduet piers. The arches are semicircular. Although decorative art, from the decline of the Roman empire to the twelfth or thirteenth gentury, was of a rude, rather than a refined

the komman empire to the work of minteening century, was of a rude, rather than a refined character; yet we can during no period find huildings of better design, hoth in plan and out-line. The hasilican plan expanded into the

Lambeth Palace, joined hy a road from the Royal Academy of Art, Schools of Design, and by the Rev. J. L. Petit. Conclusion. See p. 72, and

Latin cross, a form never abandoued by the church builders of any age or country, and to which we are indebted for the grandest, the most imposing, and the most picturesque edifices that exist. That magnificent addition, the that exist. That magnificent addition, the tower at the intersection of the cross, has, I believe, no prototype in classical architecture; and however this may have been enriched or earried up in height as Gothie architecture advanced, it uever appears with greater majesty than in the large conventual churches of the eleventh and twelfth centuries. Notbing can be really finer in general outline than St. George, Boolgeveile in Normouds, which is nearly, if Booherville, in Normandy, which is nearly, if Booherville, in Normandy, which is nearly, if not entirely, unaltered; or, in our own country, the abbey church of Tewkesbury, which, though the choir was rebuilt in the fourteenth century, the choir was rebuilt in the fourteenth century, and consequently with Decorated details, still retains, in all essentials, its original form and proportions. As the choir was lengthened, a greater height was felt to be requisite for the central steeple; and Salisbury alfords a very perfect example of proportion. But on the whole I caunot help thinking that the long nave, the masive central tower searcely exceeding a square in height, or even much lower, with a choir and transcepts differing but little in their extent from the square of the intersection, form enor and transpose unitering out itset in their extent from the square of the intersection, form a composition which gives the greatest dignity both to the whole outline and to each part independently. We may like to see other arrange-ments for the sake of variety, hut this is oue to which we always revert with pleasure. The massive Norman tower, in its proportions, though not in its details, is preserved throngh every change of style. We see it in churches of every sive change of style. We see it in churches of very degree of importance or richness; sometimes with not enough ornament to give an idea of its date; sometimes, as in Merton College, with all the enrichment of its style. The square central tower, though it survived the fall of Gothic arbitrative gameser scale in cluurches of the architecture, appears rarely in churches of the revived Italian : the circular dome and octagon, also owing their origin to the Byzantiue aud Romanesque period, are of constant occurrence : though the former was dropped during the reign of the Gothic, the latter prevailed through the whole of it. Both are beautiful features, exterwhole of it. Boto are becautin relatives, exter-inally and internally, and capable of great variety, particularly in combination with other towers. Of the octagon one might give an interesting series of examples from a rather early Roman-esque period to nearly the present day. One of the most effective I know is that of St. Cydrone, heterear Difference of the series a church of the hetween Dijon and Sens; a church of the

hetween Dion and Sens; a church of the eleventh century. * * * * To the period between the deeline of Roman art and the full development of Gotlie, we are to look for many striking groups and comhina-tions of towers. The low central lanteru with a lofty campanile attached to some part of the church, or altogether distinct, is common thronghout Lombardy. The combination was a very favourite one in Italy after the revival, and twordd to direct the clurches of that farmality tended to divest the churches of that formality tended to divest the clurches of that formality which we are apt to attach to the style. It is, however, quite a mistake to suppose that for-mality is necessarily a characteristic of revived Italian: not only the churches of Italy, which are as varied in their plan and outline as any group of Gothic churches, but those of Sir Christopher Wren in our own country, thoroughly disprove any charge of monotony or dull nni-formity

disprove any charge of monotony or dum mi-formity. St, Mark's, at Venice, is a true type of the style, as well as the city to which it belongs; an inexhansible magazine of treasures, full of spleudid ideas, and suggesting enough to fill out aud enrich the architectural systems of ages and nations; yet if we look to it for the establishment of a fixed rule or principle, we shall find the foundation as unsteady as that of shall had the followards in as instance as a start of many of the towers which nod over the canals and lagunes. We go to Venice to admire, not to criticize; to give ourselves up to the fasci-nations of the sceue, and allow the imagination to wander through all the endless vistas which

St. Front has the actual plan of St. Mark's, the five domes forming a Greek cross, with a decided barrel roof between each, so that if the present roof were removed which covers the domes, they would appear distinctly, as in the Venetian edifice, without heing crowded toier. get

The buttress, we have seen, was used in the temple of Minerva Medica, in Rome; but it does not appear to have been in frequent use, at least externally; nor is it employed to any great extent during the prevalence of the Romanesque style, for the flat Norman but-tress is little else thau the ancient pilaster; and bough it may in some degree strengthen the wall at the point where it is applied, its use is mostly to form vertical liues at certain dismostly to form vertical lines at certain dis-tances, and thus give an increased effect both of extent and height; and even when decided buttresses with the set-off were used, they were edden of buttresses with the set-off were used, they were seldom of any great depth. The immense vanlings of Anjou could not dispense with them, hut, though large masses were applied externally, much of the buttress was often in-ternal, and the architects did not employ them as if they liked them as a feature; in fact, they seemed auxious to avoid as much as possible the appearance of lateral thrust or pressure, and retain the idea of a wholly vertical support. Uence the segmental arch was rare, and the and retain the idea of a wholly vertical support. If eace the segmental arch was rare, and the stilted very common. The Gothic architect, on the contrary, delighted in his buttress, enriched it with lis best ornaments, erowned it with an elaborate piunacle, and made it the great characteristic of his style. The architect of the Renaissance learnt from him to be less afraid of disclaving, lateral, pressure and corresponding displaying lateral pressure and corresponding abutment: segmental arches became common, and these are a greater inuovation upon the semi-circular arch than even the Pointed arch. And circular area than even the Foniced area. And hittresses were used freely, though not always successfully, as far as appearance is concerned : a good revived Italian buttress is still a deside-ratum. There is a church in Rome to which the masses used as buttresses give a very universe utilized. curious outline.

curious outline. As a Romanesque composition, which might suggest a very pleasing front, I may call your attention to the palace of Theodoric, in Ravenua, The recess in the upper stage of the central compartment, the ledges on which the flanking arcades are supported, and the simplicity of the lower part, give this front great character. I could upreduce abundance of examples show.

I could produce abundance of examples show-ing bow one style of architecture uniformly affected that which succeeded it; and how even when on the decay of the Gothic a revival of Roman art was undertaken, the principles of that which had just reased away more written Noman are was indereased, the principles of that which had just passed away were neither forgotten nor rocklessly abandoned. Whether he endcavours to revive an old style that has been superseded by some other, or to

that has been superscated by some other, of to invent altogether a uew style, the architect ought to learn how to make the most of the range of examples which he already possesses. No sound mode of construction, no convenient plan or arrangement, no beautiful outline, ought to be plandward on the more ground of inconto he abandoned, on the mere ground of incon-sistency with the style he adopts. He must retain sistency with the style he adopts. He must retain all the good that he can helouging to former styles, and add as much as he is able. If he rejects anything it must he because he really and truly likes better what be substitutes in its place. His art and genius will be shown in amalgomating the becauties of dif-ferent styles without inconsistency. There may be some heauties that cannot possibly be com-hined, but I believe the number of these will be found to be much smaller than we supfound to be much smaller than we be pose, if we can divest ourselves of prejudice, or set up some other standard of merit besides archieological correctness. I do not suppose of set up some other standard of net burpose archaeological correctness. I do not suppose the Romans rejected, upon principle, anything that was Greek. They may not bave always been skilful in their manner of combining Grecian clements with the other parts of their The order of the sector is the index of the magnitude of the sector is of the sector in the sector is setting in the mathematical sector is the sector is t

tbey could dispense with the entablature. They saw also, or supposed, that this centainture. They saw also, or supposed, that this beauty was increased by giving the arch a particular form, and therefore they rejected, in great measure, the round arch in favour of the pointed. They did not reject it altogether, for when they conceived that the construction or composition received that the construction or composition re-quired a round arch, they introduced it unhesi-tatingly,—as in bridges, and they even resorted to the traheal system when beauty or conve-mience demanded it,—as in the porches and other parts of Chartres Cathedral, in the trau-soms of continental doorways, and in our own Edwardian doors and windows. Nor did they reject the concard column or pulsets of the reject the engaged column or pilaster of the Roman pier, hut turned it to good account as a vaulting shaft. Again, as we have seen, the revivers of the Classical styles made ample use of the intervening Mediaval styles. Much of their early work might readily be mistaken for Romanesque or Byzantine. They availed themtheir early work might readily be mistaken for Romanesque or Byzantine. They availed them-selves freely of every mode of construction exhibited by their predecessors. They frequently gave their buildings a lightness much more accordant with the Gothic than the ancieut Roman character. Had they wanted, or liked, the Pointed arch, they would have used it. I think a church near Pavia, which has Pointed built archet are they represent is entirely of ier arches, hut in other respects is cutirely of Returns an e character, is contemporary with buildings that are purely of revived Italian. And pointed vaulting cells, the advantage of which is clearly obvious, are used in revived C

assical huildings throughout Italy. Our first revivers of Gothic architecture put Our next reviews of Gonne architecture put Grecian and Halian temples into a Gothie dress. Their fault was that they did it clumsily. Had they made the dress sit better, and more grace-fully than the old one, they would have achieved a great triumph: as it is, they did not come so near the mark as the architects of the last period of the Gothic in our own country, whose works deserve more commendation than it is period of the Gothe in Goth Control, whose works deserve more commendation than it is just now the fashion to give them. If we can-not adopt the Gothie skyle without abandoning forms and plans of beauty and convenience, or any decided advantages, whether of construction or arrangement,—if we caunot make it apparent that the requirements of the style involve no sacrifice, or the least possible amount of sacri-fice in anything that can be deemed important,— them I say, the sooure the style is dropped the better; there is no hope of an effective revival. But if such a development is really going on, as will enable us to retain all the heauties of the Gothie, without the loss of any of the heauties or solid advantages of other styles, then there can be no doubt the movement is for good. But the architect must not pass over even the dehased Gothie as worthless. Faulty and in-cougruous it may be, yet it contains gens that ought to be preserved. Its study may enable us to effect an union between elements we have us to effect an union between elements we have always considered as at ntter variance with each other. Many French churches of the earlier styles are enlarged by additions of the Flamhoyant verging towards Renaissance, and even of the Renaissance itself, without disfigure-ter the state of the second state of th even of the Renaissance itself, without disngure-ment. There is a beautiful little specimen of this latter style at Caen, the Maison des Gen-darmes, which, had it appeared among the Edwardian towers encirching Almwick Castle, would have offended the eye hy no inconguity. Like those towers, it is ornamented with armed figures on the parapet, from which it derives its

I will now, in a few words, repeat the con-clusions to which I have wished you to arrive.

That if we would have good architecture, or indeed any architecture at all, we must conform to the laws of some recognized style. That to the laws of some recognized style. That this conformity, bowever, does not imply a system of slavish imitation, nor a rejection of any change; and that our aim and object should not be the retaining in its integrity of the style we have chosen, but the general advancement of art. That the style we choose should he a refined one, and that its rules should be grounded on principles whose value is inde-pendent of local circumstances, the manners or notions of any particular age, or merely conpendent of local circumstances, the manners of notions of any particular age, or merely con-ventional opinions. And, moreover, that its intrinsic merit he such as to cuable it to bear the most searching tests,—such as the gloss of newly-cut materials, the neatest finish on the

part of the workman, aud decoratious of the

part of the workman, and decorations of the highest order of art. That we may nevertheless draw largely upon other styles, of whatever age or country, whose principles are less firmly fixed; but to adopt any such style, except as a mere exercise to enable us to become better acquainted with its beauties, is not calculated to advance true art. It may hereage he a ctill better accercing to The may, however, be a still better exercise to attempt the translation, so to say, of a building we admire from oue style to another; and as this will be done more frequently on paper than in stone, the Architectural Exhibition will give the public an opportunity of judging as to the pro-bable success or failure of any such attempt. That in observing established authorities and procedents, we shall be following the example

precedents, we shall be following the example of the greatest men, the master-spirits of the age in which they lived; but that unless we look upon rules as the means of arriving at further excellence,—the foundation of a super structure yet to be designed, and uot as being themselves the standard up to which we are content to work, we shall altogether deprive art, and especially that of architecture, of its life vicour and energy

That up recedent whatever can justify us in the repeated commission of acknowledged faults, without an effort to correct them: the very effort, even if unsuccessful, may tend to the

development of new becauties. The formation of a new style will most pro-bably be gradual: some idea may possibly he struck out which shall cause a sudden and rapid advauce; but then we must take care to secure the step we gain; and in art a slow progress, if we can make sure of holding our ground, is better than a brilliant start, with the risk or certainty of its being immediately followed by a retrograde movement.

THE NEW STREET LETTER-BOX.

WE have often called attention to the glaving the latter client cancel attention to the glacing inconsistency with which many of our public works are couducted ; and when good materials have been at hand how little inclination there has been to use them.

have been at hand now infrie merination there has been to use them. We should have thought, for instance, that when there is a Government Department of Science and Art, with a large and well-paid staff of artistic professors connected with it, in the event of a public work being carried out which needed their professional assistance, their skill would be called into requisition. Hitherto, however, this has not been the case, and our last year's illuminations, the letter-box at present in our thoroughfares, and to crown all, that Brompton abortion, called the Museum, at Cromwell-gardens,*—all these are lamentable instances of the absence of that guiding artistic power which the country has had, and still has, in its own pay and at command, if Government chose to avail itself of such service. In the present instance we have to bear test-imony to a somewhat original line of coulduct on the part of the Government.

The part of the Government. The engraving accompanying this notice is from a street letter box now being prepared to from a street letter-box now being prepared to replace that one at present in our principal streets, which we have before referred to. In this instance Mr. A. Cooper, C.E. of Great George-street supplied the constructional de-sigu, and, the Department superintending the ornamentation, the working out of the deco-ration most strangely found its way to the De-partment's own ornamental modelling master, Mr. W. J. Wills, who, as our readers will agree from the energating was a very argoer present

Mr. W. J. Wills, who, as our readers will agree from the engraving, was a very proper person to excente the design. The plan of the box is a bexagon, and the top has a useful little article in the shape of the compass let into the surface. The chief deco-rations are fostoons of flowers banging from masks at the augles of the hexagon. Altogether, if the metal castings are sharp and clear, we are inclined to think this will be a satisfactory work.

a satisfactory work.

THE BUILDER.

NEW STREET LETTER BOX

MICHELANGELO BUONARROTI.

Who will not hail with pleasure a fresh tribute to the memory of that great man whose name—so long as menory endure or art human-ize—shall live exalted in the aunals of those arts that draw their deepest inspiration from his works? Who will not respect the endeavour to be before the work are the endeavour to lay before the world new features, or at least present, from fresh points of view, known episodes in the life of one who united in himself the highest excellence as poet, painter, sculptor, aud architect, whose soaring genius, alike ac-knowledged by friend and foe, could neither be bought by price nor coerced by threat, but found its true field of action where, unfettered by prejudice, it was left to assert its own supre-macy in those works of grand conception and religious fervour that have received the flat of universal approval? So agreed is the world in its appreciation of the transcendant merits of Michelangelo Buonarroti, that the terms of to lay before the world new features, or at least its appreciation of the transceudant merits of Michelangelo Buonarroti, that the terms of ordinary criticism degenerate into commouplace platitudes, in judging of the monuments of his geuins by the ordinary standard of excellence. The nobility of blood *claimed* for him is totally echipsed by that of intellect *accorded* to him; and in the immortal designer of the eupola of St. Peter's, nobody cares to recognise a descendant of the old Counts of Canossa. To write the history of his life requires an

of the old Courts of Canossa. To write the history of his life requires an education to the task—a thorough knowledge of his works —a ni utimate acquaintauce with the history of his times: to analyse the works of his genius has employed the talent of a Vasari, a De Quincy, a Lawrence, a Flaxmau, and a Fusali, and a host of competent commentators, whose thorough knowledge of the subject could

alone give weight to their appreciation, and without that knowledge it may not be lightly attempted.

The first of the two works before us* does uot profess to contain a strictly critical notice of his works as au artist, but rather an exposition of his works as an artist, but rather an exposition of his qualities as a man; and the author, a gentleman well knowu for his love of art in general, comes armed for his task not only with the principal passages in the life of the gifted man at whose altar he offers the inceuse of his homage, but with all there are receive the lines of athem with collateral passages in the lives of others whose contact may in any way have influenced the fortures of the great object of his laugation. These subsidiary portions of the work, though constituting its chief claims to originality—ior little can now he said of Michelangelo that has not heav wild before act machine it as a whele

constituting its entir claims to originality—tor little can now be said of Michelangelo that has not been said before—yet weakcu it as a whole, especially in the case of the biography of Savouarola, who, however he may have influenced his contemporaries, Luca della Nobbia, Coruiola, and Cronoea and others, yet could exercise but little influence upon so strong-minded a man as Michulangelo, "whose good sense and mental independuce," says the author, "raised lim far above any of the extravagancies of Savouarola." For the biography of Vittoria Coloma, Mar-chioness of Pescara, a better reasou may be given in the intimate friendship that he had cemented with that distinguished woman during the latter portion of his life; hut even them his age (sixty-four) precluded the notion of auy great chauge resulting to bis career in at from it; nevertheless this one episode in the life of this most unselfish, though lowely man, proves his high appreciation of the eharms of feminine refinement. It was her genius that held him avell hourd and the sequiment was recourse This high appreciation of the charms of feminine refinement. It was her genius that held him spell-bound, and the sentimetr was recipro-eated. His real feelings towards her are recorded in five poems inscribed with her name; and, though proving her great influence over him, they breathe nothing hut exalted senti-nents of attachmeut, produced by kindred nobility of soul, and perfectly free from earthly alloy. The mistress whose sway aloue he acknowledged was his art, and in solitude he wooed her. "Ne para muovo à nessuno che Michelagnolo si dicitasse della solitudine, come quello che era inamorato dell' arte sua, che vuol l'uomo per se solo e cogitativo." In describing the career of such a man, it is impossible to discard entriely from the biography sketches of remarkable men, his contemporaries, and still more important crents, inextricably

and still more important events, iuextricably interwoven with the texture of the narrative, and to omit which would do violence to the eutre fabric. Surrounded by a circle of emineut men, amongst whom he moved the chief amongst chiefs, at once student and master, he drew inspiration whilst be dispensed it; and in him thermical of classical states of the stat inspiration whilst be dispensed it ; and in him the revival of Classical art may recognise at once its offspring and its parent. Well might Vasari describe him as "Uuo spirito ebe nuiversalmente in ciascheduna arte ed in ogni professione fusse able." How truly he followed his art for its love, uot for its pay, is best evidenced by bis only accepting the direction of the works of St. Peter's npon condition of receiving no re-muneration for his services, and that during the eighteeu years that he held the office, he never could be induced to change his determination. Thus the writer of the life of Michelaugelo is bound to prepare the reader for his task of dis-

Thus the writer of the life of Michelaugelo is bound to prepare the reader for his task of dis-passionate judgment, by the introduction of such traits in character and events in history as may have contributed to the development of the genius of the great subject of the memoir. And first in order, as in importance, we see again before us the Court of Lorenzo the Mag-iftenet height, and officient could the again before us the Court of Lorenzo the Mag-nificent, bright and effulgent amidst paler planets; one of the chief points of concentra-tion for those arts and letters that made Italy in the fifteenth century the focus of intellectual-light for the world. Worthy descendant of his predecessor Cosmo,—an elegant scholar, and not only devoted to the furtherance of Greek literature, but still more renowned for his advancement of that of his own country : keenly advancement of that of his own country; keenly

^{*} We have some difficulty in keeping up with our friend Mr. Cole's lave of nome-changing. A week ago the Department dated from South Kensington, now its locals is Gromwell-gardens.

alive to the faults and beauties of existing art, and devoted to its progress,—he rivalled his graudfather in the task of collecting the finest

grandfather in the task of collecting the finest works, ancient and modern, in punting and sculpture, and celipsed him by the foundation of the Floreutiue Academy of San Marco. His induction to this academy, by his master, Ghirlandajo, first brought the youthful Michel-angelo to the notice of his future patron, and the charming story of the faur's head, so cha-racteristic in its incidents of both patron and avertised formes a prophetic method to the secure protégé, forms a prophetic prelude to the sequel of his u'timate success.

angelo, and Raffache;--succeeded hy a short dissertation upon the freescores of Giotto, we follow Michelangelo into the palace of the Medici, where he found his home until his patron's death, and may study at our leisure a series of portraits of the leading men who fre-quented it, commencing with Pohitian, and ending with Fichno. angelo, and Raffaelle ;-succeeded hy a short

Of this list of eminent literati we only pause upon the name of Ficino, indissolubly connected as it is with the Platonic Academy of Florence, to the philosophy of which school the anthor refers much of the tendency of the works of Michelangelo. "There is," says he, "oue hranch of critical investigation connected with the mental history of this great man, which is the mental history of this great man, which is full of interest, but which has hitherto heen imperfectly touched npon,—I refer to the inti-Init of micros, but which has micros that imperfectly touched upon, — I refer to the init-mate alliance which may be traced between the lofty tendencies of his art and of his poetry, and to the powerful influence exercised upon hoth by the Platonic philosophy, a deep attrachment to which he appears to have imbined in early youth, through an intimate connection with the Platonic Academy of Florence." He describes the transfer into Italy by the refugee Greeks from Constantinople of the force context that had long raged on the shores of the Bosphorus, between the rival partisans of Plato and Aris-tolle. He uarrates how Cosmode' Medici hecame a convert to the eloquence of Pletho Gemisthus, the result of which was the foundation of the Platonic Academy of Florence; and further, by what fortunate chance he selected the youthful what fortunate chance he selected the youthful Ficino as the future exponent of his doctrines to the multirude; and uarrates the unflagging industry of the pliant youth, who, to the mas-tery of Plato in the original Greek, added that of his commentators, Proclus, Ploinus, Jam-blichus, and Porphyrius, the whole of whose works, with those of the great philosopher him-self, and numerous other Greek philosophical writers, he translated into Latin, accompanied by conjous comments aflexwards printed and by copious comments, afterwards printed and given to the world hy Lorenzo de' Medici.

The lectures of Ficino, supported by the scholarship of such men as Politian and Mirandula, long formed the attraction of the academy and it was hut at the eleventh hour that he and it was not at the eleventh nour that he binself was extincted from the mists and errors of a false philosophy, and restored to the light of revelation by the preaching of Savonarola. A chapter in explanation of the peculiar dog-mas of the sects of Platonists, which, originating

A chapter mass of the sects of Platonists, which, originating at Alexandria in the third century, exercised so potent an influence over the whole Roman empire, concludes a digression from the history of the great artist for which, perhaps, there is fair warrauty, in the opinion of the author, that the influence of the Platonic Academy "is dis-tionate to be traced in the artistic works of the labels a love Michelangelo, inducing a lofty idealism, a love of allegory, and mystical views of nature and art.

The death of Lorenzo, in 1492, cast a tempo-rary shadow over the career of Michelangelo, whose feelings of gratitude for past favours rendered him inconsolable for his loss; and the rendered him inconsolable for his loss; and the invitation to the resumption of his residence in the palace of the Medici, by his son Poerio, proved hut the prelude to further misfortunes. Upon the invasion of Italy hy Charles VIII. in 1494, the rash conduct of Poerio eaused a cevolution in Florence, which resulted in his ment of a site for the monument in the then being obliged to fiele for his life, accompanied by existing fabric, and San Gallo and Bramante

his brothers; and the consequence of the downfall of the Medici was the total dispersion of the pictures, statues, and other exquisite works of art, purchased at enormous cost, and selected with equal taste, by Cosmo and Lorenzo de' Medici

edici. Fearing he might be involved in the proretired first to Bologua, and then to Venice, whenee want of incurs obliging him to return to Bologna,-at that time in much agitation from the presence of the Medici family, —where he found a new friend and patron in the Councellor Aldovrandi, who made his house his home during his stay in that eity. Two figures heing want-ing in the tomb of St. Dominic, in the desuits church, executed by Pisano, Michelangelo sup-piled the deficiency in the style of the original design, which justly ranks as one of the best works of the revival. The return of Michelangelo to Florence, in

The return of Mindrauge of Protect, in 1495, was at a period of great political excite-ment. The leading character of the day was Savonarola, a long sketch of whose life, however interesting in itself, forms a disconnection in the chain of Mr. Harford's narrative. The heneath his popular government of Florence heneath ! anspices-the invasion of Charles VIII.,-Say auspices—the invasion of Charles VIII.,—5avo-narola's political and religious schemes,—his exposure of the vices of the papal court under Alexander VI. and rejection of their offer of a cardinal's hat as the price of his silence,—his ex-communication, trial, condemuation, and death, form the leading incidents in the history of Florence till 1494. Long previous to the death of Lorenzo, the jealousy of the popular element had prompted the endeavour to shake off the had prompted the endeavour to shake off the yoke of nobility, but which, after a struggle of thirty-cight years, terminated in a far worse the person of the notorious Alextyranny in th ander Medici.

ander Medici. It is to the incident of the statue of the Cupid, as told by Vasari, which, being pur-ehased by Cardinal Giorgio di Riario as an antique, was traced to the authorship of Michel-angelo, that the first visit of that great man to Rome may be ascribed; and of his numerous mode in conductor during his true record pairs works in sculpture during his two years' resi-dence there, the Pictà, for the chapel of St. Petronilla, in the ancient St. Peter's, and afterwards removed to the first right-hand eliapel on entering the great door of the modern St. Peter's, was the most eclebrated, and raised his

reputation to the highest rank. The conversion of the block of marble of the court-yard of the Palazzo Vecchio at Florence into the statuc of David, was his next work of importance; and still greater interest was after wards exited hy his rivalry with Leonardo da Viuci in the decoration of the great councilchamher of the Palazzo Vecchio. Both the great artists were commissioned to furnish Both these cartoon preparatory to an oil painting. Each cbose for his subject an incident in the battle of Anghiari, and each produced a masterpiece. "While the cartoons of these two great mas-ters," says Beuvenuto Cellini, "hung opposite to each other, they formed the school of the world. Although the divine Michelangelo afterwards painted the great chapel of Pope Julius, he never again fully realised the force of these his earlier studies." The intention of the Florentine government, in having paintings executed from these cartoons, was never realised Both were destroyed after serving as studies for numerous admirers, — amongst them Raffaelle, — "in whose works from that period," says Sir C. Eastlake, "a closer study of anatomy is appa-

It was his second summons to Rome, in 1504, by Julius II. that formed the most important epoch in the life of Michelaugelo, as from that visit resulted those crowning efforts in connec-tion with which his name will live in honoured memory when the works of his inspiration shall have long passed from the scene of their triumphs

were commissioned to report upon the state of were commissioned to report input the state of the editics accordingly. The inscence condition of the old building had heen long known, and the reconstruction and emilargement of the tri-bune had consequently heen commenced by the architect Rossellino, under the command of Alexander V.; but at the death of that pope the works were supported works were suspended. It was this locality that Michelangelo selected

for the site of the mansoleum, which, judging from the descriptions of Vasari and Condivi, would have been indeed a noble work of art. It was of tetragon form, standing detached, substructure being eovered by a light marble pavillion; beneath which the sareophagus was pavilion; beneath which the sarcophagus was to be surmounted by two angels. Forty statues, including eight colossi, with numerous bas-reliefs and enrichments, were to have been its principal embellishments; and the abandonment of the scheme after the selection and carriage of the marble, the partial finish of several of the figures, and endless preparations, owing, it is surgested to the iselences of Bramante derived supposed, to the jealousy of Bramante, deprived the world of the largest and most unique specinen of his genius in scalpture that it ever had the chance of possessing. One reparation, however, Julius made the

One reparation, however, Julius made the world for the grievous wrong done it and art together by his change of purpose, and that was the painting in freese of the ceiling of the Sistine Chapel. On the occasion of a marked indignity from the pope, Michelangelo had quitted Rome in disgust; and it was some months before the messages of Julius and advice of the freeds could normal the remew their of his friends could persuade him to renew their former relations. The reconciliation took place at Bologna, where he executed a colossal statue in bronze of Julius for the façade of the great elurarh of St. Petronius, but which was destroyed by the mob in 1511. On returning to Rome in 1508, he found the wind of Julius still estremand 1508, he found the mind of Julius still estranged from the subject of the mausoleum by scheme for the rebuilding of St. Peter's u under Bramante, even then commenced, in addition to the enlargement and decorations of the Vatican, upon which latter Raffaelle was extensively eugaged.

According to Vasari and Condivi, it was again the covert scheming of Bramante that induced Julius to force Michelangelo into the execution of a project from which he had an unconquerof a project from which he had an unconduct-able aversion, and to which a possible failure might attach, resulting in the discredit of so formidable a competitor in court favour. We need not repeat the oft-told tale of the ceiling of the Sistine Chapel. The brilliancy of its success, and the celerity of its execution, prerved its great author from the further attacks of malice or incompetency; and for the last two years of the life of Julius he enjoyed the friend-ship and favour of that pontiff undisturbed. Chapter 13 of Mr. Harford's work is devoted

to a critical and particular description of the painting of the eciling; and for a view of the ceiling itself we refer our readers to the large chromo-lithograph prepared under Mr. Harford's superintendence.*

The time wasted to Michelangelo and to the world in the fruites preliminaries for com-pleting the church of St. Lorenzo, at Florence, and other commissions of small importance, occupying the whole of the pontificate of Leo X forms a dark stain in that pontiff's history. His death took place in 1521, the year after that of Raffaelle.

Adrian VI. reigned but eighteen months, and was succeeded by Clement VII. Michelangelo returned to Rome, bent non completing the tomb of Julius upon the reduced scale arranged with his executors hy that pontiff. On the other hand, Clement was equally bent upon his completing the statues for the sacristy of San Lorenzo, ecommenced under Leo, and again the great work of the artist was postponed sine die.

great work of the artist was possibled sine fact. We must leave the events of this reign to the pen of the historian, and follow Michelangelo in his flual visit to Rome in 1533. The story of the tomb of Julius II. was terminated by its erection ander Paul III, in the church of San Piatzo in Vinentie - actioned to three stetures Pietro, in Vinculis, reduced to three statucs only, by the hand of Michelangelo. The painting only, by the hand of Michelangelo. The painting of the Last Judgment, commenced in 1533 and completed 1541, and the subsequent decorations of the Pauline Chapel, must terminate our sketch

Published by Colnaghi.

St. Peter's as it is,-that church which, in the words of Professor Cockerell, "was commenced words of Professor Cockerell, "was cominenced by Bramante in 1506, elaborated till 1514 by that master, and successively carried on to 1520 by the immortal Raffaelle, and his co-adjutors Juliano San Gallo and Fra Giacondo; then hy Perruzzi and Antonio San Gallo alone till 1546; by Michelangelo till 1564, Pirro Ligorio assisting during the last seven years; then hy Vignola till 1573: Jacomo della Porto with Fontana then carried on the work to 1590, when the cuncla was completed by relays of when the cupola was completed by relays of workmen night and day; then by Fontana and Maderno till 1613; and finally by Bernini till 1680; comprising 177 years in the accomplish-ment of the new structure."

Thus do we see the relative duration of each Thus do we see the relative duration of each successive architect's connection with the build-ing, but the part each played in its erection forms a remarkable example of the mutability of human intentions. For the study of the ancient Basiliea of St. Peter, whose time-honoured site the present building encloses, the Templum Vaticanum of Fontana should be consulted; and for the arrangements and injunctions for the general Basiliea of Constantine as handed down to us by Euschius and other early writers, the pages of Canina should be studied. The subject of that symbolism which formed

The subject of that symbolism which formed so leading a feature in their sacred structures, and to which architectural beauty and symmetry were subordinated, is learnedly discussed in Professor Cockerell's "Explanations."

Although Nicholas V. had consulted Rosel-lini and Alberti upon the subject of the new huilding, it was Bramaute who first planned the vast edifice under Jalus II. In Plate I. of Mr. Harford's "Illustrations"

are shown to the same scale the plan of the old Basilica, those of Bramante, Peruzzi, and San Gallo, and that of the church as it is. The death of Julius in 1513 was succeeded by that of Bramante in the following year; and we are indehted to Serlio for the publication of the plan and clevation of the dome as we possess them. In the beanty of his plan all agree, and foremost amongst its appreciators was Michel-augelo. "Ancun plan," says De Quiney, "ne présente une plus parfaite unité, une plus belle harmonie dans ses lignes, uu meilleur accord entre toutes ses parties et n'eut douné l'idée d'un Plus vaste intérient. Le Saint-Pierre d'aujourd-plus vaste intérient. Le Saint-Pierre d'aujourd-nui paraît moins grand qu'il ne l'est en effet. Le Saint-Pierre de Bramante anrait certaine-ment été plus grand encore en apparence qu'en réalité

To the conception of the dome of Arnolfo, realised by that of Brunelleschi, we owe the conception of the dome of Brunante, realised by that of Michelangelo. The knowledge of the instability of his fubric was saved to Brunante, by his down in Father The shift or constitute of by his death in 1514. The chief occupation of the uext six years was the strengthening the piers under Raffaelle aud Ginliano San Gallo, the design remaining unaltcred. The death of Raffaelle, in 1520, transferred the direction to Peruzzo and Antonio Sau Gallo. Peruzzo ad hered to the conception of Bramante, of the dome raised upon four vast piers, hut his wish was to make the cupola the graud feature of the design, and uot a mere appendage to it : he, therefore, abandoned the nave, and converted the Latin into the Greek eross, thus chauging the hasilica, or elongated form, into the cubical or concentrated form, of vertical tendency, having its type in the Mosque of St. Sophia, or Baptistery at Pisa, &e. Peruzzi's heautiful plan (pl. 1), was approved by Michelangel) and Dapiset, plan (pl. 1), was approved by Michenning of both San Gallo, and the eloqueut testimony of both Canina and Cockerell to the superlative merits of the Greek eross over the Latin, in the case of the Greek eross over us the necessity of de-In duction, may save us the necessity of de-we have thus roughly alluded to the more scatting upon it. As in the case of Bramaute, important doings of Michelangelo: for the the only portion of Peruzzi's design preserved remainder of has many works in architecture, is the plan as given ns by Serlio. The death painting, and senlpture, we refer the reader to of Peruzzo left the building in the hands of the work of Mr. Harford, whose industry and San Gallo alone, who, by the instruction of the scholarship have been equally taxed in this Pope, prepared a model of his own conception labour of love, which is well entitled to an of its ultimate execution, 28 feet long by 18 feet honourable place in its branch of literature.

of his history as senlptor and painter : there broad, publicly exbibited in 1544. In this proof ms makery as semiptor and parater : there aread, paneley exhibited in 1344. In this pro-is hut to notice the remaining braneb of his career in art,—that of architecture. Amongst his works, we must confine our Solves to the part he parded in the creection of pended to the principal front, for reasons not St. Peter's as it is,—that church which, in the conclusion of the period of the period of the principal front, for reasons not

quite conclusive. The exterior was cut up into numberless parts, showing that San Gallo had never dreami of lureadth : a triple order of Doric on a podium, lofty attic above, and above that an Ionic order formed the main building. The dome was surrounded by two orders of arches and columns, and surmounted by four tiers of decoration, in columns, attic, eandelabra, and de pressed spire, and the belfry towers were i fonrier orders or stages, also surmonnied by depressed spires. To this design, so broken up, M. Angelo opposed one as remarkable for sim-Plicity. He proposed externally one vast Corin-thian order corresponding in size with that of Brananate internally, and the tambour of the dome he surmounted with sixteen pairs of coupled columns, each pair being crowned by statue. a

"As seen," says Cockerell, "in plate 1, arrangement of Michelangelo's design comthe mends itself to the understanding as the conclu-sion of a master mind. We admire the decastyle portico, with the tetrastyle in advance, in harmony with the tall expression of the editice, as a feature of the utmost magnificence, the non-excention of which, by a lamentable versity, we must ever lament, and for which the actual excention in bas-relief is but a miserable substitute. Antonio San Gallo died in 1546. The building had now been forty years in hand, four popes and six architects had died in that period, when Faul 111, conferred the direction upon the unwilling Michelangelo, then in his seventy-third year. Ilis plan (plate 5) is a model of sim-plicity and unity. The piers of Bramante being indicated on the plan, the vast increase in size of those of Michelangelo is shown by the com-parison, and the consequent change in the form of the great arches, the impost necessarily re-maining the same. The Paultean had been when Paul III. conferred the direction upon the maining the same. The Pantheon bad been the model for the dome with Michelangelo's the model for the dome with Michaelangelo s predecessors; the interior hemispherical, the exterior segmental, the base surrounded by a peristyle and attic. Highly imbued with the merit of Brunelleschi's dome, he made it the type for his own, whilst greatly improving upon it. Instead of an octagon, he adopted a circle, and any nucled the perturn for his actual and approached the centers for his external cove nearer to each other, thus forming a curva-ture less acute; to this the peristyle surmounted by an attic formed the abntment; and the addi-tion of a lofty tambour raised the whole struethre above the roof, and completed a perfection thre anove the root, and completed a perfection of outline hardly likely to be surpassed. The forty-eight dormers gave scale and richness to the dome; and the lantern, thongh light, is no less than 86 feet high. Such was the St. Peter's of Michelangelo as he would have had it. In plate 4 of Mr. Harford's work we see it in all the cublimity. The heavility leastion (chica fi)

plate 4 of Mr. Harlord's work we see it in all its sublimity. The hentiful scettion (plate 6) shows at once the superlative merits of Perawi's Greek cross and Michelangelo's wondrous dome. Snelt was Michelangelo's councetion with this project sub equent to his death in 1653, form no part of our criticism; their value may for a set in the councerding in their value may be seen in the comparative views from the same point in plate 7. "Originality," says Cockerell, " was the character and aim of M. Angelo in all his productions. He showed little sympathy with his predecessors or his contemporaries manifesting neither service reverence for the elassical models, nor entire fellowship with the erassical models, nor entrie herowship with the majostic, the terrible, predominate in his design-in all the three arts of which he was so great a master; and though his taste may be sometime-questionable, his productions cau never fail to inspire the architect with exalted notions, far manored from the commonplace of constances. removed from the commonplace of customary invention."

The subject of his poetry forms a study distinct from our province, but is handled by Mr. Har ford with considerable taste. The volume of "Illustrations" contains (be

ides the beautiful plates of the ancient and modern Basilicus of St. Peter, with their able and learned descriptions from the pen of Pro-fessor Cockerell) the bas-relief of the Centpurs and Lapithæ, the cartoon of the Battle of Pisa, and certain groups from the ceiling of Sistine Chapel, and the Last Judgment.

THE ART-TREASURES PALACE, MANCHESTER.

THE works connected with the Art-Treasures Palace, at Old Trafford, have not proceeded so rapidly as was at first promised : there have been two or three as was at mist promised i there have been two of three accidents, one of which has caused some slight delay; and those who know no more than can be learned from gazing at the creetion from outside the hoarding, have conjured up for themselves visions of disappointment. But when was such a huilding as the Art-Treasures Palace completed strictly within the limited ment. Treasures Pance completed strictly within too mileco-tine? And was such a one ever erected without more and more serious accidents than those upon which the excentive committee and Messrs, C. D. Young and Co. the contractors, have to look back? We are assured that the huiding will be completely Ve are assured that the mining will be completely closed in within ten days from the present time : for several weeks the picture galleries have been so far closed, that experiments in decoration have been carried on ; and we helieve that the executive committee entertain no doubt whatever of heing enabled to perform their promise to throw open the exbibition

early in May." Such is the opening passage of a long description of Such is the opening passage of a long description of the exbibition building, contained in the *Manchester lanardian* of February 5, being, as is stated in the article, the first account of the progress of the huilding which has appeared in that paper since the beginning of Novemher. How comes it bat the Manchester public has for three months been without information on the progress of this great work, through the medium of the leading local journal? One would have thought that the progress of this specimen of constructive art would have formed one of the most popular topies for the newspaper readers of Man-chester. Surely this cannot arise from a want of interest on the part of the Manchester public in the undertaking? For the information of our readers we avail ourselves of some of the particulars alluded to. The great hall is about 700 fet long, 104 feet wide, and 65 feet high; and consists of a centre and two side aisles, respectively 56 feet and 24 feet wide,

The great hall is about 100 feet long, 104 feet wide, and 65 feet high; and consists of a centre and two side aisles, respectively 56 feet and 24-feet wide, the houndaries being formed by the inner walls of the picture galleries, which lie upon each side. The aisles are marked out by lines of coupled irou pillars, octagonal for about 4 feet from their hases; the octagonal for about 4 feet from their hases; too cylindrical portion being divided into stages by rings. The pillars, as coupled, are a few incbes spart, and they stand athwari the line of their range. Each coupled column is surmounted by a neat capital; and the capitals support open girders. The semi-circular roof principals, 15 inches deep, are only 12 feet apart, for they rest alternately npon the columns, and upon For principals, is notice seen, are only as needed particular, and upon an ornamental hracket supported by the girder. The columns are 33 feet high, the remaining 32 feet of height being represented by the girder and the rise of the principals; and the semicircular roof thus formed spans the central aisle only. The side aisles are 6.6 for d is the height sensed with rider mode tring

the principals; and the semicircular roof thus formed spans the central aide only. The side aisles are 36 feet 6 inches higb, covered with ridge roofs, rising 8 feet 6 inches above the pillars. The westerly end of the great hall is crossed by a transept. It does not extend beyond the line of the building; but it is carried to the side walls (the picture galleries heing thus terminated), and it is 104 feet wide, corresponding with the three aisles of the hall, at the intersections of the control wide there are At the intersections of the central aisle there are groups of six pillars; and from these, open roof principals, 21 inches deep, are thrown across diago-nally. At the transpet cuds, the semicircle of the roof is filled in with a bandsome open-work window iron.

Commencing 72 feet on the easterly (or façade) commencing 72 feet on the enserty (or logand) side of the transpt, is a gallery covering each side aisle, and therefore 24 feet deep; and from these points the gallery coutinues round the transpt, and also round the westerdy end of the hall, for a length also round be westerly end of the hall, for a 'tength of 72 feet. The front is filled in with open iron-work, in panels between standards; and there is a substantial mahogany hand-rail. There will he four very substantial wood statreases. The height from the gallery floor to the roof (which is, of course, that of the side aisles) is 15 feet. The gallery will, no doubt, be found very useful at all times during the cribibition; but it will have particular value during the opening or any older special ceremony; for from it a great number of spectators will be enabled to have a good view of all that passes at any point near the intersection of the hall and transept; and that,

[Feb. 21, 1857.

upon all such occasions as we have indicated, will be

the noise of attraction. The exterior of the palace is almost entirely of iron,—wrought standards and corrugated sheets. In-ternally, the iron is lined with \$-inch pine; and to the wood is affixed, first a covering of cavrass, and then one of prepared paper, which serve eithe to make the roots, &c. water-tight, and to prepare the interior for a demonity.

the roofs, &c. water-tight, and to prepare the interior for decoration. The widths of glass are as follow:--Great ball, central naise, glass 24 feet; each side aisle, 10 feet; the picture galleries, each 24 feet. The galleries will be lighted wholly from the top, through the glass named. The great hall, near the transpet, will have additional light from the glazed transpet ends; hut at the points not thus affected there is a supply of light from the roofs.

the points not thus affected there is a supply of light from the roofs. The scnicircular side roofs terminate with the transcept; but the space covered by them is sufficient to form, in the whole, six galleries, each 120 feet long and 45 feet wide. There are three of these galleries upon each side of the great hall. On the westerly side of the transept, npon each side of the great hall, is a room, 72 feet by 48 feet, covered with a ridge roof, hut in all other respects agreeing with the picture galleries hefore described, and intcaded for the same purpose. Running along the back of the palace, there is a room or gallery 24 feet wide and 200 feet long, which it is at present contemplated to devole to the collection of water-colour drawings. The curtances to this place are under the gallery which runs round the transept. Adjoining, and in the rear of the water-colour gallery, there is another apartment, 24 feet wide, but only 240 feet wide site. The forgade will extend more than 450 feet, which must be thus dividel — Frontage of palace, 200 feet; some offices and stores (on the side next the Botanieal Gardens), 100 feet. As to the front of the palace, it will the sufficient to say that all the iron-work and

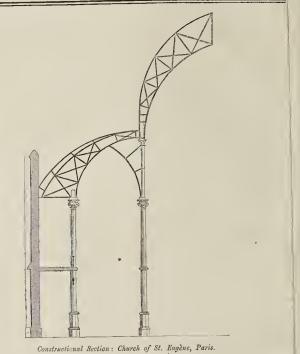

some offices and stores (on the side next the Bolanneal Gardens), 100 feet. As to the front of the palace, it will be sufficient to say that all the iron-work and much of the wood-work for the arches are up, as regards the great ball and the picture gallery to the south or railway side; and that all the material for the north arch is upon the ground. This is an altera-tion from the original inteution, consequent upon the failure of the north arch (in brick) after its completion ; but a for as supresence areas the original design will failure of the north architectury, consequent upon the but, as far as appearance goes, the original design will be closely carried out. A good deal of the work for the exterior gallery, running across the openings of the three arches, has been completed; and it and other points are heing pressed on vigorously. All the brickwork for the corridor is up, and so are the roof-principals: the railway offices are rising rapidly; and the groundwork (including the flooring, beams, &c.) is quite completed at this point. There will he a slight rise in the corridor, for a portion of its length adjon-ing the station. For the offices and stores (ale, porter, &c.) on the northern side, the walls are more than half up. The railway station is to be S00 feet lang. The

The frait up. The borthern such the wans are more than half up. The railway station is to be 800 feet long. The platform is to be 15 feet whic; and it is advanced so far as to he quite ready for the flooring. The double line of rails, for the special use of the exhibition trains, has been laid down; the junction for trains, being provided to the west of or heyond the plate. The first-class refreshment-rooms are to form three sides of a quadrangle around the huilding which was formerly the pavilion of the criekt club, and is now used as the general offices for the employés of the contractors. These rooms will thus stand directly opposite the uorthern transept. The second-class refreshment department will he in the rear of the railway corridor, and apart from the place: here the brickwork is lightly advanced.

brickwork is slightly advanced. A drain, 25 in. by 17 in. and 11 feet deep, is heing laid around the building. It will serve for the general drainage of the ground, as well as for the reception of the rain-water from the roofs, which, passing down the pillars (all of them being hollow) and into pipes which serve to tie all the underground iron-work com-pactly together, will pass into the drain at the north and sonth angles of the faede. The exterior of the huiding has been painted ; and all the iron-work in the interior has bad three coats of the same, as "priming." The arrangements connected with the valueble

The arrangements connected with the valuable objects of interest which are to be assembled are said to be proceeding satisfactorily, and the arrivals of articles are now numerous. The shell of the building, let us add, is now completed.

ARCHITECTURE AT THE ROYAL ACADEMY.—The architectural lectures of the season will be given by Mr. Sydney Smirke, A.R.A. on Monday, February the 23rd, and March the 2nd, and Mr. G. G. Scett, A.R.A. on March the 16th.

the result of it. This church, sitnated in the Faubourg Pois-sonairer, near the Conservatoire de Musique, is the church of SL Eugène, the architect whereof was M. Boileau, a gentleman who has long made the composition of sacred edifices his study, combining art with economy of cost. The Church of SL Eugène, which is not a perfect realization of M. Boileau's system, has, neverthèless, appeared of a description suff-ciently novel to excite public discussion, in which architects and engineers of eminence have taken part. It is in the Pointed style of the

taken part. It is in the Pointed style of the taken part. It is in the Pointed style of the thirtcouth and fourteenth centuries, and the architect chains to have made use of the modern resources afforded by the science and industry of our own age. The external walls are com-need of human measurements with the science of the science on the science of the science o of our own age. The external walls are com-posed of hewn masonry, with fillings in of rubble. The internal columns, rihs, and gal-leries, are of cast iron, as are the fittings to the windows and the circular openings. The ribs or groins of the arch are in wrought iron, with fillings in of masonry in two thicknesses, form-ing a cavity for air, to preserve an equality in the temperature—iron ribs replacing the ordinary woodwork of the roof. The hollow east-irm columns are 32 acestimizers mean disputs. ordinary woodwork of the root. The bollow east-iron columns are 32 centimètres mean diameter. The superficies of the building is 1,350 square mètres, being 50 long, by a width of 27, taken at the projection of the buttresses, and 25 bigh. In the interior the length of the nave is 40 mètres; the width, as shown on the section, of the centre nave. 10 mètres from centre to contra-

mètres; the width, as shown on the section, of the centre nave, 10 mètres from centre to centre : the side aisles 5 mètres, measured in the same manner. The height to the crown of vanlt in the sentre nave is 23 mètres, and in the side aisles, 15 mètres,—a height more considerable than is found in the majority of the French cathedrals. A good effect is produced by the slightness of the columns, which enables the eye to embrace at ouc time all parts of the structure and its decoration, from whatever point of view it may be looked at. This also enables the words of the preacher to be perfectly heard in effect.

THE CHURCH OF ST. EUGÈNE, PARIS. Ar the end of the year 1855 a church was opened in Paris, which had excited a lively in-terest in the public mind, from the mode of con-struction adopted, and the new effect which was the result of it. This church, sitnated in the Faubourg Pois-te church of St. Eugène, the architeet whered was M. Boileau, a gentleman who has long nade the composition of sacred edifices has study, combining art with econouv of cost.

square metre. The use of iron ribs, which have scarcely any thrust, for the arches, admits of increased height, supersedes altogether the necessity for height, supersectes altogether the necessity ior flying buttresses, and the timber for the roofs, as well as the need for massive buttresses and thick walks; and it is this which brings about an economy that becomes the more per-ceivable in proportion as we increase the height of the vanlangs.

of the vanishings. Polychromy is used in the decoration of the interior. With the space obtained by the addi-tion of galleries, the church is able to accom-modate 3,000 persons. The library of the Conservatoire des Arts et Métiers, it will be observed, has afforded the architect a type.

COMPETITIONS.

COMPETITIONS. Synagogue at Manchester.—In answer to adver-tisements for designs for a new synagogue for the Holrew congregation of Manchester, a number of de-signs were forwarded to the committee from Loudon, Liverpool, and Manchester; and the committee selected those produced by Mr. Bird, architect, of Manchester, whose design is to be carried out forth-with. The site chosen by the congregation is in the iownship of Cheetham, purchasad from the Earl of Derby, immediately opposite the Cheetham Townhall, a building creeted three years ago from designs by the same architect.

a building erected three years ago from designs by the same architect. Lickfield...-We are again asked in more than one letter not to allow our twice-repeated question as to the settlement of the "tichfield birary" competition to be forgotten. The drawings were sent in at the end of September, and not a word of information has been returned to the candidates. Is there no one at Lichfield who can state what is being done? We have to the committee on the subject without written

THE BUILDER.

THE CHURCH OF ST. EUGENE, PARIS. - MONS. BOILEAU, ARCHITECT.

EQUESTRIAN STATUE OF THE LATE LORD HARDINGE.

It has been our misfortune to find so little satisfaction in recent public statues and monu-ments, that we have the greater pleasure in offering congratulations to Mr. Foley for his very concessful amendment to the state of the left Low down so as to show the face of the hero, is espe-cialty well modelled; and the tail lashing inward serves to connect the hind legs, and materially improves the composition. A broken Indian gen under the horse plays in like manner a useful part, while it marks the locality of Lord Hardinge's exploits. There is a weakness, as it seems to us, in the upper part of the near fore-leg, which it may not be too late to reconsider.

The group is being cast by Messrs. Elkington, and will be about 14 feet in height. It has been proposed by a number of influential per-sons that a second cast should be made, to be set up in the metropolis. We shall be glad to see their desire carried out: the work will do honour to all concerned in it.

WESLEYAN CHAPEL AT HIGHBURY. Or the 4th inst. the foundation-stone of a new Wesleyan chapel at Highbury, was laid by Mr. F. Lycett. The building is of the De-corated period of Gothie architecture, and con-sists of nave, with aisles and transcripts. A corated period of Gothie architecture, and con-sists of nave, with aisles and transcrits. A semi-octagonal aspc, for the communion service, is at the end of the nave, with open timber root. The minister's vestry is adjoining. The tower stands at the north-west angle of the building, and is surmounted by a timber spire, covered with ornamental tiles, the entire height being 110 feet. This is used for the purpose of venti-lation, and also forms one of the principal en-trances. The claspel stands about 8 feet above the level of the road. The basement story is formed for class-rooms, and there is a large The level of the road. The basement soily is formed for class-rooms, and there is a large meeting-room nuder the transept, which is capable of accommodating 500 persons. Ac-commodation is also provided for the chapel-kceper. There are two entrances, one in the kcoper. There are two entrances, one in the tower and one in the centre of the front gable. There are two galleries for the Sabhath-school children, one over the vestibule at the entrance, and one in the west transent, each having a direct communication from the basement. The roof is formed of open timber, the ends of the minimical being supmorted on orrangential stome roof is formed of open timber, the ends of the principals heims supported on ornamental stone corbels, clustered columns, with carved cups, supporting the clerestory. The materials used are Kentisb rag with Bath facings. The in-ternal fittings are to be of stained deal. The building is to be heated by the warm-air appa-ratus of Messrs. Stewart and Smith, of Sheffield. Automomodulous is not stained deal. 1000 porcess Accommodation is provided for Loodo persons, and the total cost of the erection, exclusive of heating and lighting, is 3,9007. The building is being erected from the designs of Mr. Charles Laws, architect: the contractor is Mr. Clever, of Hachree of Hackney.

CEMETERIES.

Reigate .- The new cometery at Reigate was consecrated on the 24th ult. It adjoins the conseirated on the 24th ult. It adjoins the present churchyard, and contains three acres of ground. There is no chapel for the Established Church, as the old church itself adjoins the cemetery; but on the unconsecrated portion a chapel for dissenting bodies has beeu erected, in the style of the old cdiffice. The designs for the chapel and laying out of the ground, and the plans and register, were furnished by Messrs. Page and Lees, of Reigate, The chapel was built, and the fencing and entrance formed, by Mr. W. Carruthers, of Reigate, builder. *Backing* — The Bocking Cemeter, has been

Mr. W. Carrithers, of Reigate, builder. Bocking.—The Bocking Cemetery has been consecrated by the Bishop of Rochester. The cemetery consists of about two acres, fenced in on three sides by a briek wall, and enclosed next the road by a dwarf wall, with iron palisades, and brick piers capped with stone. The ground is divided in the centre with an iron fence 3 fect bigh, and each portion has a central entrance by folding iron gates.

-The portion of Atherton Cometery Atherton. designed for the use of members of the Church, has been consecrated by the Bishop of Manchester. There is only a broad gravel walk to divide the consecrated from the gravel wark to divide the constrained prime the naconsecrated ground. The connectory consists of about two acres of land, purchased from Lord Lillord for 400!, and two-thirds of which were consecrated. The two elapels, the largest heing the Episopal one, were designed by Mr. T. D. Berry D. Barry. Т

Walsall .- The local Burial Board have re *b alsalt.*—The local birth borth have be ceived the following tenders for levelling and preparing the gronuds of their new cometery :— Mr. H. Inghes, 452*l*.; Messrs. Davey [Deway?], of Cheadle, 195*l*. Ss.; A shmore and Batler, 195*l*. Cheadle, Sharp, Einheidel, 242*l*. Mr. H. Hughes, 4527; Messrs, Davey [Deway :], of Cheadle, 1957 Ss.; Ashmore and Batler, 2487. 7s.; Cole and Sharp, Birchfields, 2457.; Mr. Cowdary, Birmingham, 4037.; Mansfield and Priestley, Wednesbury, 9967. 12s. 6d.; John Boys, 2957. The tender of Messrs. Davey did not include any estimate for the pipe-drainage, of which it is said a large quantity will be required. The tender of Messrs. Cole and Sharp was accepted.

PROPOSED RAILWAY COMMUNICA TION WITH INDIA.

writer says :---

Writer says :---"In a few years the coasts of France and Eugland will be united by rail, either by a tunnel under the hed of the Channel, by a viaduct of new construction spanning the Channel itself on moles, or, what would be better still, by a holdwow iron passage, laid on the sufficient of the ground under water, like the submarine telegraph; and this latter plan could he easily and economically carried into effect. In the event of such a railroad heing established, the whole of the East is cepable of being connected with England by land. Railway communication is already made hetween Calais and the valley of the Daunhe, and what is now required is to continue that line from near Donnauworth to Vienna, along the banks of the Danuhe, and following the same valley to Drolong the railroad by the shortest and best route containople : there the narrow channel which separates the capital of Turkey from the mainlend of the Asiatic continent might he crossed in the manner I have alluded to for effecting the communication the Asiatic continent might he crossed in the manner I have alluded to for effecting the communication between the neighbouring shores of the British Channel. From thence the shortest practicable route should be taken to reach the Persiane Gulf, after which the line should skirt the shores of that hay, that hay, which the line should skirt the shores of that hay, and ther follow the coast of the Iadian Ocean, and thus into the very heart of India. This would be a real 'overland' route,' one which must he carried out at no very distant period, and which would he of incalculable advantage to our great Indian Empire, as well as to England and the world; and I would at once earry ont my project if I could obtain a concer-sion for the line, guaranteed by England in concert with the other powers interested. I am convinced such a work of public utility would yield an immerse retarn on money invested, and on such conditions I such a work of paule utility would yield an immense return on money invested, and on such conditions I am ready to undertake the completion of a through railway communication direct from London to Cal-cutts, and fin 1 all the capital for the same."

The writer urges that, extraordinary as is the project, it is eminently practicable, and calls upon Lord Clarendon to give his aid to the scheme

THE PREVENTION OF "OVER-TIME."

At the meetings of mechanics out of employ-ment, great stress is frequently laid, by the speakers to their various associations, on an injunction to their more fortunate and seldom less deserving fellow workmore obtained and school test descring relieve work-men, to request or demand was, or could be, carried into practice, the result would ineviably be angumented niti-mate distress for those who had urged or compelled their neighbours to act in a manner so prejudicial to the interests of those by whom they are employed; for, hy the now so generally adopted system of contracting ny tao how so generally adopted system of contracting to complete certain operations in a limited time, a huilder is forced to see that all energy shall be profi-ally exerted. While, therefore, he may usefully have 30 or 100 meng, &c. engaged in the erection of a par-ticular huilding, and find it of advantage for them to

he occupied and paid for 14 or even 14 day each day of the week, he might, nevertheless, suffer great loss hy sending a few hands beyond the number so dis-tributed, and paying the whole gang for ten hours only per day; as, from want of space, or other adequate eause, they would find leisure "to tread on each other's toes." Of the two evils, to many men crowdad on one contract is worse than a deficiency of opera-tives, for if not ahle to get to work with advantage, men quite as readily as boys become *inoperatives*, and will play, to the great injury of their own future powers of willing exertion, and sometimes blight the character of their master, while making him "pay the "Again: the two or three clerks of an architet or surveyor, accustomed to the mode of conducting hasi-ness in his office, and knowing nuch respecting the

Again : the two or three clerks of an architet or surveyor, accustomed to the mode of conducting husi-ness in his office, and knowing much respecting the recent transactions therein, can advance his interests in a higher degree hy the additional application of an hour or two daily, than double the number of tempo-raily eugaged assistants could in twice the time. While depresenting the coveted restriction on the extent to which a man shall enjoy the privilege to sell or give away his time, and talents it blessed with them, it must he admitted that the employers derive the chief advantage from long-continued labour—thosewho would put the veto upon it, the supplementary headit; since, after the principal has profitably prosecuted husiness with the workmen, &c. at present engaged, he is enabled to increase his staff, instead of discharging the whole of his corps through hos; and the mentaf or manual labourer reags no such fine harvest as the dissatisfied are apt to imagine, his only read and enor mannat prover reaps no such no farvest as the dissatisfied are apt to imagine, his only real guin con-sisting in securing the goodwill of his master, and pre-venting as substitute heiug found, who eagerly takes his place, and will comply with the necessities of commer-iation of the security of t cial life

place, and will comply with the necessative of conner-cial life. So far from a great pecuniary gain accruing to the man whose energies are often taxed beyond the usual time, and at high pressure, the consequence is, on account of loss of recreation, and, consequently, injured health, increased cost of clothing, medicine, &c. and the withdrawal from social enjoyment when his home is calculated to afford him confort, a heavy and sometimes irreparable loss, and not unfrequently it hurries him to an untimely grave; thus creating a vacance for another who may have found time to watch the labources put him under the turf. In spite of this, every person of right feeling will study the interests of his master so long as he is such, in prefe-cuee to his own case, thinking himself comparatively fortunate should he secure the esteem of him he serves, and who, in his turn, serves another; considering that if we do not all fulfi our destiny, we were all bora to serve each other. serve each other.

STRIKE OF THE OPERATIVE CARPENTERS IN MANCHESTER.

IN MANCHESTER. Is consequence of certain proceedings on the part of the Operative Carpenters and Joiners' Union about three mouths ago, the huilders of Mauchester considered it necessary, in self-deficience, to establish an association of masters. One result of this asso-ciation has been the production of a new set of work-ing rules for the trade, based on the old rules of 18346 in which the masters have made certain altera-tions, chieffer, as they altere, to the advantace of the tions, chiefly, as they allege, to the advantage of the workmen. The workmen, on the other hand, contions, ehiefly, as they allege, to the advantage of the workmen. The workmen, on the other hand, con-tend that, although these new rules may he in some respects hetter than the rules of 1846, they are not so good as the last rules made by the union 1852, but which the masters have never acknowledged. This difference of opinion has led to a dispute, and at a meeting of operatives, it was resolved to "strike" the shops, one at a time, until the new rules were withdrawn, the first attack being made on Mr. Robert Neill, of Strangeways. The operatives met Mr. Neill in a body, and demanded the removal from the shops of the new rules. This was refused, and the whole of the men struck work. The difference hetween the old and the new rules is said to he very little. little

The following letter on the subject has been addressed to us :-

STRIKE OF CARPENTERS.

STRIKE OF CARPENTEUS. Sta,-II seems that we are going to have the joiners' shops of Machester dows the workmon, the pay-ment of wages stopped, and families thrown into a state of minory and wand, by one of distributions in their effects upon the operatives and their families. Are there no means of setting the dispute or misunderstanding in some way more in accordance with the advanced state of educa-tion and sciling the dispute or misunderstanding in some way more in accordance with the advanced state of educa-tion and sciling the dispute or misunderstanding in some way more in accordance with the advanced state of educa-tion and sciling the dispute on the state of the published notice of the occurrence it is said. "The differ-mastery is said to be two there." The committee of the operative society any, in the notice they have advertised, that the new rules issued by the master builders cannob the countenanced by the workmen in any way. "because they are a direct infringement upon what has been the vorking customs for some years past." Surely the Intelli-gent workpeople of the middle of the nineteenth century

are not taking the serious step of "striking" on a reason of this nature, which would equally apply to the arrange-out the Statered high hold equally apply to the arrange-out the Statered high hold and the series of the striking in the series of the striking in the st

There are one or two highly suggestive points in this letter, especially the one about "light to dark" working in winter. This has been a constant source of misuaderstanding, and we should rejoice if a remedy could be devised.

WORK FOR THE UNEMPLOYED.

WORK FOR THE UNEMPLOYED. The breaking of stones for the public roads is doubtless, in its way, n useful acough work, but it is one that not only is unfitted for the skilled artizan, but units him for the proper manipulation of work more hefitting his skilled and educated hand and eye. There is this to be said in favour of stone-breaking, however, for the unemployed, that in presenting it to him who seeks for "leave to toil" at it, the autho-files thereby admit his right to einr his livelihood hy labour, on hehalf of the public as his paymaster, at intervals when private enterprise fails to provide him the means of doing so; and the only excuse imaginable for restricting the public works so offered to the unemployed industry of the artizan to so imaginable for restricting the public works so offered to the unemployed industry of the artizan to so low a description of public requirement as the hreaking of atones, appears to be that such work is supposed to be level with the capacities of *all* the able-bodied poor, and a good test, even from its general repulsiveness, and its liability to injure both the hands and the eyes, of the actual need of the applicant for it. But why should not a willingness to labour for his daily hread, under the moral stigma of the "workbouse." be a sufficient test in itself, with-out any further degradation or any personal injury to the poor man who applies for it? There are many forms of public works hesides stone-breaking eligible as tests without its objectionable features. Such arms of punic works nesides stone-breaking eligible as tests without its objectionable features. Such would be paving for masons, drainage for bricklayers and navvies, and so on; and why should not the public authorities in towns be obliged, hy law, as Queen Elizabeth intended by her institution of work-houses, to "ise the poor to work" during just such a hall in the state of their respective trades as the memory is the build. present in the building trades of the metropolis. The demand which the unemployed as a mass are now making, that the authorities should "set them to work," is an honour to men who might have thrust their hands into their pockets and demanded of these authorities, under the circumstances, to fill their mouths for them with the bread of involuntary and leads to immense social as well as national conse-quences; hat let us well consider the common sense quences; hat let us war consider the common sense and reason of the thing, and being satisfied of that, let us go a head, in spite of imaginary fears of future and far-off consequences. So loug as there is a stigma attachable to workhouse work, there is little fear of resolving all labour into workhouse employment and socialist communities. These few remarks occur to us, while, pen in hand, and about to note the circumus, while, pen in hand, and about to note the circum-stance that a writer in the Sun newspaper suggests this as a fitting time to push on the power of the Metropolitan Board of Works and local hoards and vestries, hy the 79th section of their Act, to carry out various sanitary works connected with house drainage of or the owners, by borrowing the noney and paying of the twork as an improvement rate, or otherwise; semploying the nemployed thereon, and as benefiting the whole community while providing for thousands of poor families at present without the means of sub-sistence. The suggestion is, in many respects, a cool sistence. The suggestion is, in many respects, a good one, and we bope to hear more of it.

BALL FOR THE BUILDERS' BENEVO-LENT INSTITUTION.

THE annual ball in aid of the funds of this very useful and growing Institution took place at Willis's Rooms, St. James's, on Thursday, Lawrence, Mr. Jacob Bell, and a number of gentlemen connected with the building trade, were present, and the general feeling was creat vere present, and the general feeling was grati fication at the result.

THE BUILDER

The Institution is indebted, on this as on previous occasions, to the exertions of Joseph Bird as honorary secretary

THE ARCHITECTURAL EXHIBITION

THE series of lectures in the Suffolk-street Gal leries closed on Tuesday evening, the 17th, with some observations hy Mr. James Edmeston, jun. one some observations by Mr. James Edmeston, jun. one of the hourary sceretaries, on the Articles exhibited in the Department of Materials. An apology was previou-ly read from the lecturer of the preceding week, for some most improper personalities in which he had indulged. We have received a considerable number of indiganat letters on the subject from the officers, members of the committee, and others con-nected with the Exhibition, hut will content ourselves on the present occasion with urging on the committee the nhsolute necessity of preventing the recurrence of such proceedings. If they do not, this excellent feature of their Institution, calculated to effect much good, is inevitably doomed. No man would think of attending a lecture-room with the possibility Incen good, is inevitably doomed. No man would think of nttending a lecture-room with the possibility hanging over his head, that for some perhaps imagi-nary slight he would hear himself or his friends vilified. As the most obvious amongst the precanwhom appeal could he most our buds always appointed to whom appeal could he made. We have reason to believe that the committee fully concur in these

THE SANITARY STATE OF SHOREDITCH

ANOTHER of those useful quarterly reports which we have before noticed has been made to the Shore-ditch Vestry by their medical officer of health, Dr. Barnes, and printed for circulation.

Dr. Barnes, and printed for erreination. Dr. Barnes expresses his satisfaction that for the future he will have the Registrar's weekly mortality returns from which to obtain some current light as to the causes and localities of death in and the ease already makes of these is the eduction of certain conclusions in reference to the Thumes and its sewage, to which we shall advert in his own words.

Intreaty makes of these is the culture of extent of the senses, to which we shall advert in his own words. "It is held with great perinacity in some querters," arys the reporter, "that the great prerentise remedy of the diversion of senses for the Thames. That the dwelling immediately exposed to the exhaltions from the muth-fanks, left at every etb, are especially nurbole-some, is indeed anyly proved. But we have seen from the preceding statistical analyses, that the deaths from fever in the fast division, including Shoreditch, which was been and in the over intervent the view react conductably the set of the we most acek for the discess-producing quarks. Discase must he pursued in its shiding-places : it can only be ex-plied by the vigorous application of anitary remedies at the whole of that matter which renders the river turbid is and vater-tail or raised from its bed, and tup-medies and vater-tail or raised from its bed, and tup-medied gain matter attracts and entangles the server abbances and the asset of the discrement. It thus ever a bay disting even which is endered to be abbanced from the the server above the tream. It thus ever a bay and a the server in the tream. It thus ever a bay and a the server in the treams and the banks. The con-duct and the server in the the tream is a state that the distington of the treat and opted by the banks. The con-duct fails and ever in the the tream is a more of the distingt in a solver of the tream is and incharging may miles of the tream which in the tream is a state and the results the flat as a sit is not deposited on the banks. The con-duct fails and ever in the tream is a compared by distingt in the flat servers in the tream the flat and and verter which here an and on the servers of the there and the servers in the there and one discred inter-for the server in the flat servers in the share and there results. Concentrated in

This special difference we ourselves pointed out at a time when it was argued in the daily press that the inhabitants of Erith had no real cause of complaint Innovative of Linth has no base takes of comparing in reference to the new sewage scheme inasmuch as the whole quantity of sewage had all along passed by this very district, all the difference being that by the new scheme it was to issue into the Thamea at a certain point above Erith. This, indeed, made all the difference; but it was a difference widely distinct from the present state of matters. Mr. Barnes refers to a matter often urged in our columns, the necessity of

hut it is not possible, notwithstanding the protonsions of patent stovemakers, to burn it without creating that poison in volumes exactly proportioned to the extent of the com-bustion. Besides carbonic acid, during the hurning of gas, a great and injurious quantity of aulphuric acid is also evolved. Many striking examples of the destruction of locks, turniture, and goods from this eules, are given in locks, turniture, and goods from this eules, are given in locks, turniture, and goods from this eules, are given in tically, that it is quite as irrational and dangeroous to burn gas in a close inhabited room without providing a veri for the vitiated air, and means for the supply of fresh air, as it would be to burn a coal free in a room without a chim-ney. There are invisible vapours far more poisonous than smoke."

As regards the "patent stove-makers," a scrious case in point appears from the following paragraph to have recently occurred at Brompton :---"*Two Men* have recently occurred at Brompton :- "Two Men suffocated through Joyce's Patent Fuel.-Au inquest and recently occurred as isomption in the theorem in aquest way fooded through Joyce's Patent Fael.—Au inquest was held on Tuesday, at Brompton, on the hodies of Thomas Barton and Alfred Rose, two farm labourers, employed by Mr. E. Dodd, of Gillinghna, who died last night from the effects of inhaling the fumes of carbonic acid gas, emanating from an article known as 'Joyce's Patent Fuel.' The deceased men stept in the farm-house, and the weather on Sunday night being severely cold, Woolley, the halliff, placed one of Joyce's portable stoves in the room in which the deceased were to sleep, some hours before they went to hed, for the purpose of heating the apartment. Three was no pipe to carry off the poisonous funes. Mr. Weekes, surgeon, was promptly in attendance, Mr. Weekes stated that the cause of death resulted from inhaling carbonic acid gas, given off by the patent fuel,"

We cannot advert to such stoves as these with the cannot avert to such stores as these without stating, that, scarcely helieving it possible that they could be recommended for nso without special warn-ing us to the absolute necessity of "a pipe to carry off the poisonous funes," we personally called at one or other of the several store-makers in Newgate. street, and there, to our astonishment, we found that it was hut too true, that not the slightest warning or even simple intimation of the necessity of such a pe was given by the attendant employed to sell the pipe pipe was given by the attendant employed to sell the article: on the contrary, we were confidently assured that the stove was a "self-consuming" one; and when we responded,—"So much the worse, inasmuch as the faci, if thoroughly consumed, is only all the more thoroughly converted into the deally poison carbonic acid gas," what do our readers think was the facing rejoinder?—"Oh but this is patent fuel,— purified fuel,—twice purified!"

RAILWAY MATTERS.

RAILWAY MATTERS. Our of twenty-eight arches, of which the viaduct near Coventry, alluded to on a recent occasion, consisted, only five remained standing after the accident, and even these appeared to be ready to share the same fate of total destruction. The foundations are said to have given way. The river was turned from its hed and swamped adjoining property. The viaduet, says the *Coventry Herald*, was shout a quarter of a mile in length, and consisted of twenty-eight arches, each 40 feet span, and 15 feet rise. The piers in the valves, which averaged about 15 feet, were huilt of a stone obtained from a quarry near the residence of Mr. C. Bray. The first atone of the structure was laid in ita hed August, 1848, and the last store was laid in its hed on Jane 29, 1849; so that little more than ten months elapsed in completing it. It was creeted months elapsed in completing it. It was crected under the superintendence of Mr. Warriner, the engi-ncer to the company; Messrs. Shaw and Hayton heing contractors, and Messrs. Nowell, Robsou, and Ainsworth, sub-contractors.

Ainsworth, sub-contractors. The Linnelly and Llandilo Railway is now opened for public traffic. Mr. J. Samuel, the engineer, states that the cost of the line, including land, works, stations, permanent way, sidings, law, engineering, and parliamentary expenses, the electric telegraph, and every item from its commencement to its opening for traffic, has not exceeded 6,800/, per mile. The line is seven miles in length, emhraces 180,000 cubic yards of executions, two over and four ander road hridges, two parish road bridges, nine river bridges, one of which, over the river Towy, is of 150 feet bridges, two partsh road bridges, nute river forbiges, one of which, over the river Towy, is of 150 feet clear span, and all the hridges are either of wrought iron, cast iron, or masonry. The line is laid with rails of 70 lbs. to the yard. The Vale of Towy line to connect Llandilo with Llandovery, and form the first link in the main line from Manchester to Milford, is now in an advanced state, and will, it is said, he completed for less than 5,500% per mile.

The traffic returns of the railways in the United treery useful and growing Institution took place tat Willis's Rooms, St. James's, on Thursday, the 12th inst. and passed off in a manner that providing means of escape for the products of gas inst. have been satisfactory to all concerned. The company was numerous (nearly 600 persons) "The prover as profitable to the Institution as analy of its predecessors. Mr. Alderman Wm."

ILLUMINATED CLOCKS.

THESE clocks, which are now becoming more general, and are found to be most nseful, have hitherto general, and are found to be most insertio, have index of had this great disadvantage viz. that the dials are not sufficiently distinct during the daylight. This incon-venience may now be obviated. Sir Benjamin Hall has recently had an experiment made on the face of the clock on the north side of the lodge at Hyde parkthe clock on the north side of the lodge at Hyde park-corner, in front of Ratten-row. This side was made of the glass generally in use for such purposes. The figures were gilt, and by no means distinct; and the hands were also gilt. The figures and hands are now painted a dark colour, and the face is made of glass which is as white as a sheet of paper, and perfectly transparent. The clock has been highted for three or four nights, and the time is indicated most distinctly. four mights, and the time is indicated most distinctly. The experiment is thought so successful that the other face of the clock opposite Grosvenor place is now undergoing alteration; and it is to be hoped that the owners of other clocks may be induced to adopt the improvement. It is understood that the dial of the great clock of the new Palace of Westminster is to be made of a similar description of glass, so as to be with advert both by above and wight be made of a similar description of glass, so as to be quite clear hoth by day and night.

LIABILITY OF SURVEYORS.

BIRCH V. JURY. THIS was an action brought (and tried on the 16th instant) by the Liverpool and London Insurance Company, against Mr. Jury, of Dowgate-hil, sur-yeyor, for neglect of duty when employed by the said company to report upon and value property at Misiley and Manningtree, Essex, helonging to Mr. Howard, for the purposes of a loan. The damages were laid at \$,500.4

were laid at 8,500%. It appeared that Mr. Jury was asked in the begin-ming of 1851, by Mr. Hubbard, of Bueklershury, solicitor, to ohtain a loan of 8,000% on two grama-tries, two warchouses, workshop, and wharf at Mistley; also, five houses and six cottages at Man-ingtree (the adjoining parish), helonging to Mr. Howard, a fish-factor carrying on a very large busi-ness there, who himself occupied the granaries, ware-houses, wharf, &c. at Mistley. Tor this purpose Mr. Jury visited Mistley and Maningtree, and made a valuation. On his return he applied to the Liverpool and London Insurance Com-pany to advance the money, — he hoing the company's

Mamingtree, and made a valuation. On his return he applied to the Liverpool and Loudon Insurance Com-pany to advance the money,—he heing the company's agent for settling fre claims, but not their surveyor; which was astifactory. Mr. Jury then again visited Mistley, and on his return made a formal report and valuation amounting to 8,000, sale value, and recommending a loan of 7,500/, which he haid before the sceretary of the company, at the same time telling him that he was employed by Mr. Howard, that he could not ast independently for both harties, and that an independent surveyor hal better he employed by the company to value the property. The directors, however, signified they were satisfied to take Mr. Jury's valuation, provided he looked to Mr. Howard for payment, and agreed to lend 7,500/. On the property, if Mr. Howard would pay 5 per cent, interest, and insure his life for 4,000/. These terms were accepted by Mr. Howard, (the moncy lent, and the insurance kept up for three years. It was clearly shown that Mr. Jury never received a shilling from either party, not even his expenses: he told Mr. Hubbard his charge would be 20. Soon afterwards, in consequence of the large trade carried on by Mr. Howard with London, he was in-

Soon afterwards, in consequence of the large trade carried on hy Mr. Howard with London, he was in-duced, hy the Great Northern Railway Company, on receipt of 5,0000. to remove his business from Mistley to Grimsby, where he afterwards failed.

The result of Mr. Howard's removal was to throw The result of Mr. Howard's removal was to throw all the said property at Mistley out of occupation : this, with the opening of the railway to Harwich, which railway passes through Mistley, comhined with the depressed state of all uncreantile and warehouse property during the last three years, contributed to depress the value of the property in question; and on its being put up for sale in 1856, no hiddings were obtained.

htained. After some negociation with Mr. Jury to take he property at his valuation, and 8007, arrears of iterest, which he refused to do for this reason,—that the property uterest, which he refused to do for this reason, — that he was not employed or paid by the company, nor had he heen paid by either party; that the property was fully worth the amount he valued it at in 1851, and that he could not have forescen the changes that had taken place, — this action was brought. Mr. Cook, Mr. Penn, Mr. Thompson, the sur-

taken place,—this action was prompting the surveyor to the company, and Mr. Thompson, the surveyor to the company, and Mr. Clarke (Earchorbher and Co.), surveyors, were called on behalf of the company, who respectively put the present value at 2,700/, 3,800/, 3,880/ and 5,2004—this being Mr. Clarke's valuation

Clarke's valuation. On the part of Nr. Jury, Mr. Charles Lee and Mr. Snockc, surveyors, were called. They valued the property as it was in 1551,—which they main-tained was the proper time to value it, as the pro-perty had since heen much depreciated as hefore described,—at 8,100. and 8,550. Lord Camphell, in charging the jury, held that the defendant was the agent of the company, although not paid, hecause he volunteered the valuation, and the source more induced to rely on it, and he so

not paid, hecause he volunteered the valuation, and the company were induced to rely on it, and he so made himself linkle. This he left first for the jury to decide; and if they decided it against the de-fendant, they then were to say what damages he (the

defendant) would have to pay. The jury retired, and after an absence of two bours returned a verdict for the plaintiff, with damages shilling ! 1

one sutting i This case and ruliug of the judge raises a serious question of responsibility, as it has always, heretofore, heen considered necessary to pay for a valuation before making the party responsible for any error of judgment, or loss, arising from depreciation in the value of promety.

value of property. The positiou of architects and surveyors is becom-The position of architects ing anything hut satisfactory

SCHOOLS OF ART.

The Penzance School.—At a recent meeting a report from the School of Art Committee was read. A circular had been received from the Department of Science and Art, asking the opinion of the committee as to the eirculation of hooks from the art library to as to the circulation of hooks from the art library to local schools. The committee expressed their approval of the plan, with certain modifications applicable to distant schools. The Department having offered to lend—on easy terms and for a short period— two sets of photographs taken in the Paris Universal Exhibition, the committee resolved that the loan be accepted; also, that the Chancellor of the Exchequer be memorialised to purchase the Soulages collection. The committee reported the invariably good attend-ance of the classes, but recommended continued efforts to augment these classes. The report was adopted. to augment these classes. The report was adopted. The Birmingham School.—The annual meeting of

The Birmingham School.—The annual meeting of this school took place on the 3rd inst. in the rooms, at New-street. Lord Ward presided, and addressed the meeting at great length. In more especial allusion to be state of the school, his lordslip observed that he had looked round the room, and although the works were very carefully and heautifully finished, yet be thought it was not such an exhibition as should be through it was not such all exhibited as such as found in the town of Birmingham. They must have a higher standard for their works, or the good to be derived from them would be very inconsiderable. In reading the report of last year he found that there had heen a difficulty with regard to a modeller. Now, a modeller in the Birmingham School of Design was of the first necessity. He did not think it was sufficient to send a young man already under probation, who, to say the least of it, finished his own studies at the cost of those whom he ought to instruct. If a who to say the least of it, fushed his own studies at the cost of those whom he ought to instruct. If a modeller had not yet been found worthy of being scut to a school of that sort, no peace should be given Mr. Cole, who had undertaken the management of these institutions, until that wait was supplied. Mr. Wallis, the head moster, afterwards spoke. He said had never taken any part in the proceedings of the annual meetings. But he foli it his duty, in conse-quence of what had been said, to make a few brick remarks. The impression conveyed to his mind he the speeches was that there was a felling that there in the school. Moving among the people as he did he should he very sorry for his lordship to go away with that felling. He believed sincerely that there was a very strong feeling existing in the town in the cost of those whom he ought to instruct. If a modeller had not yet been found worthy of being seut to a school of that sort, no peace should be given Mr. Cole, who had undertaken the management of these institutions, until that want was supplied. Mr. Wallis, the head moster, afterwards spoke. He said that he had conducted the school for five years, and had never taken any part in the proceedings of the annual meetings. But he felt it his duty, in conse-quence of what had been said, to make a few brief remarks. The impression conveyed to his mind hy the speeches was that there was a feeling that the people of Birmingham did not take sufficient interest is the school. Moving among the neonle as he did.

1,309

1,300 At the close of the exhibition of the stdcat's works, on Friday in last week, Mr. Wallis delivered his usual locture illustrative of the course of instruction pursued in the institution. The object of the address was to give those persous who might be desirous to enter the classes useful information as to the various stages of study, and thus to combat that impatience of results which so frequently manifests itself in the earlier attempts of learners in drawing. The York School.—The head master of this school, Mr. J. C. Swallow, delivered a lecture on Tuesday, the 10th instant, to an audience of 250 working men, on the importance of mechanical drawing. A

men, on the importance of mechanical drawing. working man was in the chair at this lecture. It It was the introductory lecture to a class the master had formed, the first lesson of which be gave on the Thursday to a class of eighteen working men-engnursday to a class of eighteen working inter "clight necrs, forement of works, and joiners—several of whom belonged to bis free class, so that a practical result is following the free class: many more were expected to attend the next lesson.

ELECTRO-TELEGRAPHIC PROGRESS.

ELECTRO-TELEGRAPHIC PROGRESS. The walls of the New York Exchange were lately adorued with an interesting map, prepared by Capt. Berryman, showing the profile of the bottom of the Atlautic on the route over which it is designed to lay the eable. We append the figures, showing the depth in fathoms, beginning at St. John's:--06, 150, 08, 120, 370, 460, 752, 1,060, 1,650, 1,630, 2,070, 2,000, 1,500, 1,564, 1,600, 1,650, 1,630, 2,070, 2,000, 1,905, 1,513, 410, 255, 410, 715, 114. The English and Irish Magnetic Telegraph Com-many have declared their dividend at Liverpool for the past half-year at the rate of 6 per cent. per annum,

part half-year at the rate of 6 per cent. per annum, free of income-tax. From the last half-yearly report of the directors of

From the last half-ycarly report of the directors of the Electric and International Telegraph Company, it appears that 7,0000, and upwards have been expended in extension of the company's lines of telegraph on vorious railways; and that the net earnings appli-cable for dividend give a per centage on the larger capital expended, at the rate of 7 per cent. per annum, as against a per centage of fi per cent. per annum (free of income-tax) for the previous hali-year. For the detection elegraph in Australia, according to the Australian factor of the term of the second secon

For the electric telegraph in Australa, according to the Australian Gazette, six tenders were sent in. The total cost by Mr. H. Butcher's tender, the suc-cessful one, will be 10,015.7; the cost of the line from George Town to Launceston (40 mills), being 627, 103, per mile; from Launceston to Hobart Town 627, 103, per mile; iron Ladneeston to Iroaart Jown (120 miles) 527, per mile; Irobart Yown to Mount Lewis (20 miles), 577, per mile. Apparatus, 7357, That of Messrs, Falconer and Fleming involved a cost of 12,5557, including apparentus. A tender was put in for Messrs. Henderson and Co. for 12,8477. Mr. In for Mesars, fienderson and Co. for 12,8477. Mr. Joshua Higgs tendered for the line from George Town to Launcestou alone, at an estimate of 1487. per

. Ingham said he agreed with Mr. Clark as to the fee ed for alterations, but for additions he could not Mr.

charged for alterations, but for additions he could now agree. Mr. Clark then said he could prove that in this case the works done were alterations. Mr. Mosely was called, and proved that an entrance was made in the old walls for a communication with the new; and many other alterations were made. Mr. Mansel, the builder, was called by Mr. Martin, to show that no alterations had been made; but he uti-show that no alterations had been made; but he uti-nately admitted that a window in the old premises had nately admitted that a window in the old premises had nately admitted that a window in the old premises had allow the rec. Mr. Ingham hed that was an alteration, and he must allow the rec.

allow the ice. There were some objections to the other fees, but an order was made for their payment.

"THE REGULAR LINE OF BUILDINGS."

"THE REGULAR LINE OF BUILDINGS." MUTROPOLITAN BOARD OF WORKS. THE "Regular line of Buildings" question is get-ting precisely into the position we forctold long ago, namely, that the determination of the Board in such cases is altogether disregarded. A builder applies for leave to erect a building in a certain position, --some-times, by the way, when no consent is necessary, but the Surveyor of the local Board has forced him to apply. The Metropolitan Board refuse assent --some-times with reason, sometimes without : the luilder, nevertheless, proceeds. The local Board, who are the parties to cuforce the decisions of the Metropolitan Board, think the decision wrong, and refuse to inter-fere. The huilding is therefore allowed to remain, and the law is brought juto contempt, a number of fere. The huilding is therefore allowed to remain, and the law is brought into contempt, a number of persons having previously been much annoyed.

The Board refused to take any steps in the matter. On the 12th instant, in the case of Broadwood's manufactory, of which we gave particulars, p. 82, Mr. Leslie moved that "the resolution of the Board of the 19th December last (No. 21), refusing the upplication of Messrs. Edwards, for the consent of the Board to the crection of Messrs. Broadwood and Sons' workshop, in Horseferry-road, Westminster, 4 feet in advance of the regular line of buildings, he rese inded." Mr. Ware seconded the motion, and urged that it would he no possible detriment to the public. After a long discussion, the chairman put the ques-ion, when there appeared— For resenading ______ 20

For resending	20
Against it	16
Majority	- 4

The chairman ruled that the numbers, according to he Act of Parliament, must he two-thirds of the Board to reseind the order, and he declared the motion

Joara to reserved. not to be earried. Nevertheicss, Messrs. Broadwood will doubtless to to be carried. Nevertheless, Messrs. Broadwood will doubtless rect their building in the position desired by them, as he local Board could scarcely venture to cause it "to e demolished" (the remedy given them) in the face if the opinion of Sir Fitzroy Kelly, and the above one on the part of the Metropolitan Board.

SOMEMSETSHIRE ARCH.FOLOGICAL SOCIETY.—The outh conversatione of this society was held on fonday evening before last, at the Muscum, Taunton, nder the presidency of Mr. W. E. Surtees. Among ne objects deposited were various illu-trations of the covarians of Ponpuei, with examples of frescees, ottery, ashes, &c. by Mr. Surtees; oil paintings and rawings niter Turner, by Mr. W. F. Elliot, &c. The resident read a paper on Pompeij, after which Mr. Hiot followed with one on "Turner and his focks."

THE BUILDER.

Miscellanea.

LONDON AND MIDDLESEX ARCH.EOLOGICAL SOCUETY — A general meeting of this society was held on Wednesday nicht, the 18th, in the Gallery of British Artisis, Suffüksteret, the Very Rev. the Dean of Westminster, one of the vice-presidents, in the chair. A large assemblage of ladies and gentle-men testified to the growing interest which is felt in this subject. The papers read during the evening were — "Middlesex at the Time of the Domesday Survey," by E. Griffiths, Esq. F.R.S.; "Walks in the City — No. I, Bishopsgate Ward," by the Rev. Thomas Hugo, M.A.; and "Monumental Brasses of London and Middlesex, Part 2," by the Rev. Charles Bontell, M.A.

Boutel, M.A. SOUTH AUSTRALIAN SOCIETY OF ARTS.—A meet-ing of persons interested in the formation of a society for the promotion of the fine arts, according to the *Adelaide Observer* of the 18th October last, was held on the previous Monday evening at the Adelaide School of Arts, when it was resolved unanimously.— "That a society to be colled the South Autority". "That a society, to be called the South Australian Society of Arts, be now formed." The annual pay-ment of oue guinca is to entitle the subscriber to all the benefits of membership, consisting in free admisthe benefits of membership, consisting in free admis-sion to all fectures, meetings, and exhibitions of the society; and a donation of painting, soulpture, or other such grant of not less value than 100, sterling, or of 100, in money, entities the donor to all the advan-tages of membership for life; the society reserving the right to decline any unsuitable object. METROPOLITAN COMMUNICATIONS AND TLAMES BEIDING Social Conductions and the first

the right to decline any unsultable object. METROPOLITAN COMMUNICATIONS AND THAMES BRIDGIS.—The article under this head in "The Companion to the Almanac," to which we referred in to ar notice of "The Companion," has been reprinted for wider circulation, with the name of the author, Mr. Edward Hall, F.S.A. architect. It is a very able paper, and should have the attention of the author, whr. Edward Hall, F.S.A. architect. It is a very able paper, and should have the attention of the author, rities in the case of Westminster-hridge. MEETING OF WORKNE MEX.—A meeting of working men was held on Friday evening, 13th inst. at the Temperance-hall, Clerkenwell, Mr. Neale Porter in the chair, when several resolutions were agreed to, having reference to the present distressed condition of the working men of the metropolis. The first resolution called the attention of Government to the "severe, wide-spread, and alarming distress existing in the metropolis and its suburbs, the result of a long tagmation in the building and other trades." The other resolutions spoke of the "aente and almost in-tolerable privations" now endured by working men, their wives and children, and stated that the only hope of the men who could not find employment was emigration to Australia, New Zealand, and Candan, and they therefore prayed the Government to grant them a free passage to the colonies. Petitions to the duess of Parliament, based upon the resolu-

THE BURNING AND RE-BUILDING OF WALLASEY CHURCH, LIVERPOOL - Wallasey Church having been destroyed by fire on the 1st inst. a public meet-ing was held at the Egremont Hotel, Liverpool, on Monday in last week, for the purpose of initiating a movement for the raising of funds to rebuild the edifie. The Bishop of Chester occupied the chair, and in opening the proceedings, expressed the gratifi-eation he felt at seeing so large an assemblage. His lordship then dwelt on the solid satisfaction that the church was partially ensured for 1,700. and 300. moon the organ. Messrs. Hay, architects, of Liverpool, had heen requested to submit slight plans and esti-mates of the prohable cost of a restoration, and they had anered 5,0007. as the probable amount for an erection adjoining the present tower, capable of ac-commodating from 700 to 800. Appropriate resolu-tions were passed by the meeting, and subscriptions, amounting to 1002 handed in, besides 1004, presented by the bishop. There are considerable difficulties, it appears, connected with a satisfactory restoration, from the circumscribed mature of the size required for the increasing population, recommending that the tower be substantially repaired, and used as a bier-bouse and bell-tower for the entrefw and funcate, and cast angles to become naturel buittress. to wreek, we hear that the collection of the small sum requisite to keep it in repair is now despinied of. Poor Nelson! His "glory" seems to be "departed." BRITISH (OPUBAITTE) ENCISEERS' BEREVOLENT ASSOCIATION.—The annual meeting of this society was held at the London Tavera, on Monday in last week. The objects of the institution are to exercise benevolence towards its members, and to cultivate the heast feeling with the employers, who on their parts

WESTMINSTER IMPROVEMENTS. — The standing orders have been complied with in the case of a Bill to alter and enlarge the powers of the Westminster Improvement Commissioners, in reference to making a street leading from Vietoria-sircet to its junction with Palace-street; to reseind and vary the objects, contracts, and arrangements entered into between the Treasury and the Commissioners of Works and Public Buildings, and to enable the Commissioners of Works to advance money to the Westminster Improvement Commissioners in aid of improvements; to enable the Westminster Improvement Commissioners to sell, with the approbation of Chancery, all or any part of the property vested in them; to settle and pay off mortgages, and to cancel securities now held by judgment and other creditors, and substitute other securities, approved by Chancery, and for other par-poses. The standing WESTMINSTER IMPROVEMENTS. -

scenitics, approved by Chancery, and 100 ofter prine pores. INVENTORS' MUSEUM AND LIDERARY AT KEX, SINGTON GORE.—In compliance with memorials to Brine Albert, the Commissioners of Patents, and the Board of Trade, from the Society of Mechaniea Engineers, and from Manchester, Clasgow, Birming, ham, Sheffield, Leeda, Nottinglam, and other large towns, the Commissioners of Patents, have undertaken the formation of a Museum of Models of Patentad and other Inventiona, and of a Library of Works on sub-gets relating to the Industrial Arts. Space has accordingly been allotted in the Museum mulding being now ready, such possessors of models as desire to have the methilted in the Museum mulding being now ready, such possessors of models as desire to have them exhibited in the Museum may secretin what space can he allotted them, on application by letter to Mr. B. Woolerof, superintendent of the Patent Marence.—A society has heen organized for the repair and enhellishment of the catcherial of Mayence, a structure of great interest, ranging in data from tors.

MATENCE.—A society has heen organized for the repair and emhell shment of the cathedral of Mayence, a structure of great interest, ranging in date from the tenth century.

a structure of great interest, indicing in cate from the tesh centry. ARCHITECTURAL SOCIETY OF THE ARCHDACONRY OF NORTHAMPTON.—At a committee meeting held February 9th—Lord A. Compton in the chair— Mr. Trollope's letter, proposing a united effort among the associated societies to bring out a manual of Sepulchral Memorials and Epitaphs, for the use of stonemasons and others, and with especial reference to the daily-increasing cemeteries, was discussed and agreed to, and a sub-committee appointed to co-opperate with him in this work. Lord A. Compton explained his plan for an improvement in the manu-facture of encaustic tiles, drawings of which, designed for Theddingworth Church, were exhibited. Mr. Bigge explained a new system of heating by gas at present in operation at Northampton. A letter from Mr. Scott, with reference to St. Sepulche's Church, was read, and from Mr. Ireson, making a rought esti-mate of 3,0007. for the enlargement of the church, irrespective of the restoration of the Round part.

irrespective of the restoration of the Round part. TIRE UNEMPLOYED : BROXERS. — Every lover of the fine arts must be grateful for the smple report on the Soulages collection, published in the last number of the Builder, and there is one suggestion arising out of it that I beg to offer, viz.—the opportunity for the unemployed painters and decorators (whose hands are likely to suffer by stone-breaking), to "chase and finsh " brozzes. I am persuaded that they in most instances would soon learn the art, and also that they could be produced; and when they became competent workmen, it would not be difficult to fad masters who would employ them : by this means they could find employment in the winter until their regular trades came into play.—W. THOROLD, M. Inst. C.E. THE DEALIN ART-UNON.—About ninety pictures were lately placed on view at the local agents". Of

THE DUBLIN ART-UNION.—About ninety pictures were lately placed on view at the local sgenis'. Of these pictures a considerable number have been selected by the committee for distribution in prizes : the remainder are to be purchased as the funds io-crease. Two of the principal works illustrate the war in the Crimez. The names of Stanfield, Braid, J. P. Booheur, W. Sant, Henshaw, Isabey, Fischel, Kendrick, and others, are among those whose works make np the chihilion. The print given by the Art-Union is engraved by Mr. Simmons, from Mr. Frank Stone's "Old, old Story." fe

THE ST. BARTHOLOMEW'S LITERARY INSTITU-TION.—In Gray's-inn-lane, adjoining the Free Hos-pital, there has for some time here established an institution, baving for its object the education and advancement of the working classes of the metropolis, and on the 10th, the auniversary meeting was pre-sided over by Lord Rohert Grosvenor, who was sup-ported by the Rer. Canon Dale, Mr. Payee, and others. The large room was crowded in every part by a most intelligent company (both male and female). The noble chairman expressed the pleasure he felt in meeting in this manner the working classes in London, and being intimately connected with large districts. Several of the members of the Insti-tution, Mr. Dale, &c. also addressed the meeting, all THE ST. BARTHOLOMEW'S LITERARY INSTITUlarge districts. Several of the members of the Insti-tution, Mr. Dale, Sc. also addressed the meeting, all agreeing that important good must result from the agreeing that important good must result from the establishment of places like this, where the working men and women of this vast metropolis can gain amusement and instruction. At the St. Bartholo-mew's Literary Institution, series of lectures on in-teresting subjects are given; and the managers, feel-ing the necessity there is for attracting, provide amusement in the shape of concerts, &c. There are also evening classes for instruction in the various departments of education, and a birary. The amount of subscription to ohtain admission to all this is buit a trile, and the working men of the district should pay a visit to the Institution, and judge of its advan-

four tons.

four tons. AUSTIN'S STREET INDICATOR. — With reference to a recent article in the Builder on the necessity of providing direction panels illuminated at night for the corners of streets and elsewhere, so as to be useful at all times, our attention has been directed to Austin's "Street Indicator," which has been chibited in work at the corner of Wellington-street, Strand, for several months past. A correspondent justly says..." No greater necessity for these panels exists anywhere than in the Pimlico and Belgravian dis-triet at night: it is then a great maze, and go where you may at night through it, you will meet with persons complaining of its intricacies, which will be worse when all the streets are filled in." This in-vention consists of a strong cast-iron rebated frame, with doors to open at each end for lighting or extin-guishing gas. The front panel is filled with alter-nating strips of coloured and ground glass, having ances of streets on them, which show out white on a dark ground by day, and at night the whole he-comes a pretty and attinetive particoloured panel, the letters having a silvered appearance, forming street-lamp and guide at the same time. On the im-dicator fixed at the corner of Wellington-street and the Strand, the name of the street is shown in large letters at the top, and the street is reaching from it are uamed in smaller letters below. Vol. XV.-No. 734.

OCKS and safes have been treated of in a large book hy Mr. Price, now hefore us.* The most ancient lock ever scen in modern times was that described by Mr. Bouomi, as having secured the gate of an apartment in one of the Khorsahad palaces. Like those still used in the East, this lock was a wooden one, with a key so large, prohably, as to require to he the carrying of keys on the shoulder is a practice which is still adopted, and has loug prevailed, in the East.

This practice is thus alluded to in the book of Isaiah: "The key of the bouse of David will Ilay upon his shoulder." Primitive as such a key may very naturally be regarded in these times of lock-picking, lock controversies, and lock improvements, the ancient and modern lock of Egypt and other parts of the East is by no means a despicable invention ; indeed, it is a remarkable circumstance that some of our most celebrated moderu locks are hnt an elaboration of the principle of the Egyptian lock, which is an invention of a superior order altogether in comparison with the warded lock of modern times, so far as real security is concerned. The holt or har of this lock when shot is fixed in its position hy a set of pins or slides, which require to he lifted hy the proper key with corresponding pins, in order to enable the key to shoot hack the holt. Donbtless onr skilful modern lock-pickers could mauage to pick such a lock, just as they have picked the lock of Bramah, which is, in fact, essentially Egyptian in principle ; hnt, for all that, it is a very notable circumstance that one of the most celebrated and approved of modern locks is but a modification of so ancient and primitive an invention. We have frequently pointed attention, however, to the fact that in many very ancient inventions we seem rather to have the effete or worn-out remains of a still more ancient and a still more advanced state of science or art than the mere germ or primitive form of such inventions. So

docs it seem to he in the present instance. Were we able to trace the progress of such a principle as this of Bramah's lock, through such modifications as those of Mordan and Cotterill, onwards to its culminating point of perfection, and heyond that still through an era of deterioration and decay, iu the extreme lapse of ages, we should expect to find it at length assume just such a vestigial shape as that of the Egyptian lock,-cssentially the principle, hut stripped of all clahoration, and of all other trace of high art advancement than that implied essentially in the very existence of the principle, as one in itself involving evidence of some previous state of high art development of which it was but the worn-out vestige. But is it not a cirenmstauce still more notable than that displayed by the ancient wooden locks of Egypt and Assyria, that there is a Chinese wooden lock, of very superior character to the Egyptian, and, as Mr. Denison remarks, "exactly similar in principle to the long celebrated Bramah lock, inasnuch as it requires a number of independent sliders to be pushed in to different depths hefore the lock can be opened."

* Treatise on Fixeand Thief Proof Depositories, and Locks and Revs. By George Price. London: Simplain, Marshall, and Co. Stationers'-h locust. 1950. Lecture on Locks, by Mr. E. B. Denison, reported in *Doneaster Genetic*, 2nd Janary, 1897.

THE BUILDER.

This very interesting and remarkable lock, Mr. produce a word or snm which will be the "open Denison says, was shown to him hy Mr. Chubb, Sesame," by means of which the spindle studs to whom it had heen given by a gentleman who brought it lately from China. He did not know "how many years, or thousands of years, the invention had existed there, but He did probably," he adds, "long hefore Branah's time, just as the recent invention here of that very neat and useful instrument, the spiral or corkserew drill, was found to have heen anticipated long ago in India." That this Chinese "Bramah" must be an invention of extreme antiquity, the stagnation of art and science for ages in China would seem to indicate; if, as is probable, it existed at all in China previons to Bramah's time ; and this is but one of scores of instances of a like order, in which the most modern and advanced, and apparently novel and original, inventions have heen found to have been anticipated for ages carried on the shoulder. Indeed, amongst that wonderful people, the Chinese. As for the kindred Egyptian lock, it may here he noted that the figure of such a lock, sculptured among the basso-relievos of the great temple of Karnac, proves it to have been in use in Egypt for above 4,000 years, during which period it does not appear to have undergone auy appreciable change. The same sort of wooden pin-lock, we may also remark, has for centuries heen in use in the Faröe Isles; aud it is said that a lock similar in character has been double acting tumblers. Most of this latter in use from time immemorial in Cornwall, intro-class are called either tumbler or lever locks. duced thither, doubtless, from Phanicia, hy the tiu traders of ancient times. Another Eastern lock had a key formed like a large sickle, and also worn on the shoulder, as the sickle itself is to this day by reapers in some parts of this country.

warded oucs, and these are still the commonest of locks in this country, although, as respects security, they are of a very low order, and have long heen superseded, for more important purposes, by locks of quite another principle. keys of the old warded locks, however, were often very clahorate and heautiful art-works, as is proved by the fine examples of Early English keys now in the Museum at Brompton. locks themselves comprise, hesides the holt and key pipe, a series of fixed or stationary obstacles, which are the wards, or wheels, in and about the key-hole, or hetween the key-hole and the bolt. and round which the key, with its correspondent slits, is turned, while any other instrument was supposed to he prevented by the wards from doing so; but in reality, a hunch of skeleton keys is hut too likely to possess some one or more capable of giving the slip to the most cunningly-devised wards, and of turning the bolt the gating was exactly opposite to the stump, as if there were no such obstacles in the way to and neither higher nor lower, the stump could it; and even failing such a contingency, it has always been open to the lock-picker to take an impression of the wards in wax, or smoke them out of their secret otherwise, and so to make a key that will fit the lock precisely "as if it were made for it." Warded locks, therefore, are much more suitable to keep out the prying eye of mere curiosity than the light-fingered hand of the thief who seriously sets about the task of lock-picking. To the class of warded locks belongs the common padlock. There is a species of padlock, however, of a very different description, namely, the puzzle or letter lock, which, though of a far superior order, as regards security, to the warded padlock, is in fact one of the oldest locks in use in Europe. Not only so, hut there is a curions affinity, which we have not seen adverted to, between its principle and that of the Bramah lock, which, as already noted, is in principle akin to the most aucient of all known locks. The puzzle lock usually consists of rings strung on a harrel enclosing a spindle, with studs corresponding with grooves in the harrel, ou which the rings can be set to different letters or figures engraved on them, so as to free by overlocking the bolt a little with the

arc enabled to slip along the grooves, and so alone to open the padlock. Ouc of these puzzle locks belonging to the first Napolcon remained in this country from 1815 to 1856 nuopeued, notwithstanding reiterated attempts to do so, but in 1856 it was at length opened by Mr. C Aubin, who discovered the combination of figures to which it was set.

The puzzle lock has been regarded as involving one of three distinct principles of lock constructiou; but its analogy to the Bramah principle, which admittedly helongs to another of the three alleged principles, tends to resolve the three into only two distinct principles. One of these is the ward; the other (in the words of Mr. Price) "consists in the insertion of such impediments to the retraction of the holt as are not fixed or stationary like the wheels or wards, hat moveable, and of various combinations, and which prevent other instruments than the true key from opening the lock." To this class helong all the locks which have been invented, from the first of Barron's, the patent for which was enrolled in 1778, downwards to the present year. To this class also belong the ancient Egyptian, Assyrian, and Chinese locks already referred to. Barron was the first to improve cu this ancient principle, by the introduction of his The two principles,-fixed or stationary wards, and moveable wards or tumblers,-are applied in combination as well as separately. To the warded lock the single trumbler was first of all added, this tumhler heing merely a lever with a The earliest known English locks were the notch in the bolt, so that the holt cannot be moved until the pin is lifted out of the notch. In this, however, there is hut little additional security heyond that of the common warded lock, as any kind of pick or false key that will clear the wards will readily raise the tumbler. The requirement of raising the turbler to a certain height only, and neither higher nor lower, to let the bolt pass, introduced a new element of security; and this was managed very simply by putting the square pin in the bolt in place of in the tumhler, and by making a gating and two wider holes or chambers in the tumbler (more or less like the letter H as a whole), the gating just the width of the holt-pin or stump, as it is called, and the wider holes intended, the one for the stump when the lock was bolted, and the other for it when the lock was nubolted. Thus, nuless the tumbler were lifted exactly to such a height hy the key, or its counterfeit, th: t not pass from one of the wide holes or chambers, through the gating, into the other chamber, and thus the lock once bolted would so remain till this was done. But pressure applied to the holt hy a wire through the keyhole while the tumbler was gradually lifted by another wire or picklock might effect the purpose: nevertheless, the gated tumhler was a decided improvement on the mere drop tumhler. The next advance was Barron's multiplication of the tumblers, since adopted in all lever locks with any pretensions to security. levers or tumblers now required to be raised each to a particular height of its own, so that the gatings of all would coincide, and thus allow the stump to pass from the one chamber to the other. This is the principle of the Chubb lock, although, superadded to this principle, there is the detector, the great and peculiar feature in Chubh's lock, and to which it had mainly owed its celebrity. This detector is merely an additional lever, which lies over the tumblers, and locks fast into the bolt if any of them are lifted too high, and it can only be set

Price is of opinion that the detector true key. springs are of positive advantage to the lockpicker.

Scenrity being added to scenrity in course of successive steps of progress, it was till lately imagined that all these many-tumblered locks were impregnable, the difficulty of raising all the tumblers or levers so as precisely to open the griting being manufactor and an encounter the the tamblers or levers so as precisely to open the gating heing regarded as unsurmountable, and the hellies or lower edges of the tumblers giving no chee by incaus of wax impressions or required to be lifted. The idea that pressure could be so applied to the bolt through the key-hole, while the levers were heing successively lifted, that the gatings of all could he made to coincide, seems almost nucre to have occurred coincide, seems almost uver to have occurred to any one in connection with the picking of lever locks till it was announced in the Society of locks till it was announced in the Society of Arts in 1851 that this had actually been done in America; and shortly afterwards Mr. Hobbs came to London as an exhibitor at the Crystal Palace, and began picking the *erack* locks of English makers right and left, till at length bis own "Protector" lock was picked by an Englishman, one of Mr. Chubb's workmen, named Goater, who, however, in attempting to pick an English lock of a new construction, in-vented by Mr. Parnell to meet and obviate the startling disclosures then being made found if starthing disclosures then being made, found it scaring unscoveres then being made, found the necessary to resort to practices reproduction not only by public opinion, but by judge and jury, to whom the circumstances were referred, and who decided hollow against Mr. Goater and his plea of having *fairly* picked Mr. Parnell's lock; indeed, it was shown that be had surren. indeed, it was shown that he had surrep nuccen, it was snown that he had surrep-titiously got possession of the lock, and tam-pered with it, so as to enable him to make a duplicate of its proper key, with which, of course, it was as easy to open the lock as with

Courses, it was as cash to open the time and the key No. 1. These and other important proceedings, under the general name of "the lock controversy," led to great improvements in the construction of locks. But, first of all, Mr. Hobbs succeeded in picking both Bramah's lock and Chubb's, as well as others. And here it may not be amiss in picking both Dramar s tock and Chubys, as well as others. And here it may not be amiss more particularly, to explain the construction of Bramah's locks, so far as that is possible without diagrams or drawings. The principle of it, as Mr. Denison lately remarked in his interesting lecture on locks,-

interesting lecture on locks,— "Consists in a number of slides having to be pushed in to different depths by the key, which has slits of different lengths in it, and is resisted by a spring which pushes up the slides. These slides are set in a cylinder or barrel, which turns with the key, and can only turn when the notehes in the slides are all brought into the same plane as a steel plate which surronds the cylinder and has corresponding notches in it. This lock was pronounced hy the in-ventor absolutely unpickahle; but it was, never-thcless, picked withiu a few years, and, strangely enough, by a method identical with that used by Mr. Hobbs in 1851, when he gained the 200 goinces for picking the challenge-lock which had hung for years in Messrs, Brannal's window in London. It was supposed until then that the addition of what are called fails notehes had prevented that woole of called false notches had prevented that mode picking; but Mr. Hohhs showed that to be of mistak

And, finally, by way of proving whether Messrs. Bramah's present locks are easier or harder to open, Mr. Denison added, that he had latcly seen Mr. Hobbs open one of their best and newest large locks in three minutes and a balf ! Mr. Chubb had also shown him a very neat little Mr. Childs hid abo shown him a very near near instrument which a man can carry in his waist-eoat pocket, and hy which anybody who gets hold of a Bramah key for half a minute may take an exact copy of it without your even socing what he is doing. Nevertheless, there is great scientific beauty

Nevertheless, there is great scientific beauty as well as symmetry in the principle of Bramah's lock. That of Mr. Cotterill is very analogous, only the slides in this case radiate from the keybole, as a centre, instead of lifting cylindrically. Mr. Holbs, we may add, ex-pended several honrs in a vain attempt to pick one of Cotterill's locks. In allusion to this last and other locks, Mr. Denison says,—

"Cotterill's lock is a modern one substantially on the principle of Bramah's, only with the sliders pushed out radially hy the key acting as a wedge. The consequence is that, whether that lock is secure

or not, the enormous thickness required for the key in order to get a moderate range for the sliders will he a fatal obstacle to its coming into general use. The order to get a moderate range for the shders will he a fatal ohstacle to its coming into general use. The action of pushing in the wedge-shaped key against the friction of the shders is also unpleasant. It is remarkable that though the inscentity of the Brannah lock, without false notches, was known and published that Chubb's and all the other many-tumblered locks could be opened in the same way, and they were never made with false notches in the tumblers and stimp until after Mr. Hobbs's exposure of them in 1851. Nay, when it was stated some years before at the lusitution of Civil Engineers that the Chubb lock was not regarded asfie in America, and could be picked easily by this tentative method, as it is called, nohody would believe it. All the best tumbler locks are now made with false notches, and there is no doubt that they do add very considerably to the diff-culty of picking by any hut first-rate hands." The tentative method of picking, alluded to

enty of preking by any nut instrate hands." The tentative method of picking, alluded to by Mr. Denison, and which has lately acquired such celebrily, though actually published in the "Encyclopædia Britannica," nearly thirty years ago, consists merely in applying some pressure to the harrel of a Branah lock or the bolt of a Chubh or other tumbler lock which would Chubb or other tumbler lock, which would make it open if the sliders or tumblers were all free; and then the sliders or tumblers are tree; and then the sinders of the moving any ex-cept those against which some pressure is felt, and at last they are all got into the position in which the notches or gatings will allow the harrel or the bolt to move, and the lock then opens of itself. *False notches* are notches shorter opens of itsen, raise morenes are noticities similar than the real ones, made in the sliders and the plate which surrounds them, and so when a slider is pushed down as far as a false notch, it allows the barrel to move a little, but no more; and for many years it was supposed to be im-possible to feel whether a slider was at a false noteh or a true one. But Mr. Hohhs showed that that made no real difference ; for whenever the lock cannot open it must he because there The fock cannot open it must be because there is a pressure upon some one or more of the sliders, and that pressure can be felt by gently moving or *tickling* them, and so one knows if it is in a false notch, and has only to work on till he gets it into a true one.

ome recent locks are very complicated ; such Some recent locks are very completed, such as the parautoptic lock of Messrs. Day and Newell, of New York : with this twenty-guinea changeable-keyed-lock Mr.Hohbs's name hasbeen associated. Messrs. Day and Newell's lock, however, was also picked, and by a mere wooden key, and Mr. Hobbs had to add a kind of wiper to its revolving curtain, in order to frustrate the mode adopted of picking it, with what result we do not know.

The year 1851 was a grand turning point in lock construction. So much so, indeed, was this the case, that all locks invented previous to that year have been regarded as old locks, and only those since invented as the new order of locks. Of these latter, however, there are not many, hesides the improved Chubb, Bramah, Hobbs, and other locks. But though not nume-rous, as Mr. Price remarks, they are "effective, to the purpose," and decidedly "good locks." In his preface, he remarks that, except in his own work now published, "the improved locks, which were the fruit of the 'lock controversy' produced by the Great Fublishign of 1851 have produced by the Great Exhibition of 1851, have produced by the Great Exhibition of 1851, have not heen described, with two or three excep-tions, although many of them are far superior in security to nearly the whole of the locks known prior to the year 1851." It was, there-fore, to be expected that any one of these new locks which had in any way become distin-guished, would be found described in Mr. Price's porthy and rather diffuse volume of most the ortly and rather diffuse volume of more than 900 pages. One of these very locks (patented in February, 1856) has just been selected by the authoritics acting on behalf of the Board of Trade Department of Science and Art, as the most suitable for the new Museum at Brompton, and we naturally turned to Mr. Price's pages, in order to enable us to give our readers some account of a lock selected for such a purpose; account of a lock selected for such a purpose; with hasps and stables and pandots. Intese but to our disappointment we find there simple contrivances, however, were effective, for not a word ou the subject, although the in those days robbers were less adroit than now, patent is included in the list of those to and Mr. Price adds that "the oak chest was which, as a class, Mr. Price refers in the favour, quite as safe as the iron one now, because the able terms just quoted. We have therefore strength of the chest itself would generally been at some trouble to obtain a few particulars resist violence, while a lock of the most simple as to this lock, and to study its peculiarities a construction alforded sufficient security, from

little, so as to enable us to give some account of it. The patentee is Mr. Parnell, to whose two previous inventions of a similar kind since 1851 (and which two he has since sold to his former partner, Mr. Puckridge), Mr. Price devotes con-siderable space, as well as to the notorious case of Goater, to which we have already allhaded. suderable space, as well as to the not not call to the obtained shall be of Goater, to which we have already alluded. The lock selected by the Board of Trade officials, however, is a third and still more recent inversion than these, and is named "the universal lock," the patentee having aimed at such simplicity in construction and lowness in price, combined with new and effective modes of account, see would entitle it to be regarded as a consider would entitle it to be regarded as a lock for general and uot for mere special uses. Mr. Parnell is known to have been in the van of those inventors who endeavoured to give van of those inventors who endeavoured to give that seenrity which the controversy of 1851 so clearly proved to be desirable and necessary to restore the public confidence, which had been so sadly shaken in the use of locks hitherto deemed secure. The two first inventions of this patentee doubtless contributed, so far, to remove the feelings of insecurity and fear which the controversy bad engendered; bnt, with all due acknowledgment to the merits of these in-ventions something more was wanting to satisfy ventions, something more was wanting to satisfy the most scrupulous; and the new lock just selected by the Board of Trade does seem to be selected by the Board of Trade does seem to be capable of fulfiling its purposes, so as to obvince all idea of insecurity, at least till some new mode of lock-picking shall be discovered besides that by pressure on the bolt, with which so many wonders have been accomplished. The invention, in fact, was expressly devised in order to obviate the possibility of its being assallable by pressure on Hobb's scientific and celebrated principle of lock picking. The lock appears to be so constructed that pressure obtained against the bolt, without the proper key, entirely slops the action of the levers, an end accomplished by giving the lock or bolt two actions, namely, a forward and a backward one in the simple act of locking or unlocking. This is done by a of locking or unlocking. This is done by a single revolution of the key as in locking any ordinary lock. The levers are adjusted twice by a simple mcehanism ere the lock can be unlocked; and this must be done in the first place before any pressure is applied. The stump of the bolt is original and peculiar, and is pro-pelled into a special or third chamber, formed ned in the levers, and which the stump enters in locking : this is effected by the back action locking: this is effected by the back action already mentioned. To make this important feature clear, we may add, that after the bolt of the lock is shot out, and held there by the levers, the bolt, in the further revolution of the key, recedes, and locks down the levers; thus entirely frustrating the modus operandi of the scientific and experienced lock picker, as also does the safegnard of a shield supported upon a high circular ward, upon which it revolves; which entirely closes the key-hole during the operation of locking or unlocking. This shield being connected, by a stump, or notch, with the lock picker even from attempting to raise the locked levers. locked levers.

Mr. Price's book, although its leading title relates to fire and thief proof safes, mainly treats of locks and keys, inasmuch as only the first 170 of its 900 pages relate to safes, with which, as a tradesman, he appears to be personally more interested than with locks.

In the outset the author enters upon a brief In the outset the author enters upon a bried history of iron safes and chests, which are of quite a modern date, having had their origin within the present century. "Our forefathers," he observes, "in the simplicity of their arrange-ments and requirements, were satisfied to place he observes, "In the simplicity of the analysis ments and requirements, were satisfied to place their valnahles in an oak chest, secured by one or more locks in front, or in a brick or stone closet, with either a wood door studded with busics, while there are not a first base secured by a common warded lock, or a lock without any wards at all, or with the usual iron bands with hars, and stanles and padlocks." These any wards at all, or with the usnal iron bands with hasps and staples and padlocks." These simple contrivances, however, were effective, for in those days robbers were less adroit than now, and Mr. Price adds that "the oak chest was

the circumstance that at that carly period the means of picking such locks were not under-stood." Descriptions are afterwards given of the various patents taken out for the manufac-ture of iron safes, and of Mr. Price's improve-ments more them for the nature of which we ments upon them, for the nature of which we ments upon them, for the hadne of which we must refer our readers to the work itself. Among the other topics discussed are the requirements in an iron safe to make it secure against thieves and fire; the construction of those in general use; the two principles on which safes are made firencoof: the preservation which safes are made fireproof; the preservation of parchment deeds from destruction hy steam and damage by water; fireproof closets and strong-rooms; the hest places for fireproof safes strong-rooms; the nest pinces for inteproof safes to occupy; powder-proof locks; and the com-parative prices of wrought-iron fire-resisting and thief-proof safes;—on all of which much useful information is given, although some of it douht-less must be taken *cum grano safis*, since oue cannot close his eyes to the fact that in this protion iteration by a practical man there is cannot close ms eyes to the fact that in this practical treatise, by a practical man, there is not a little of the nature of advertisement in-volved. Nevertheless, Mr. Price's "little work," as be rather oddly calls this bulky volume, con-tains a large amount of interesting matter on the subjects regarding which he writes, and the whole is fully illustrated by engravings of locks, keys, and safes.

With one observation of practical applicatiou we close our remarks. The majority of the locks used in our ordinary dwelling houses are of the most trumpery description, heing usually out of order within the first six months. A good serviceable lock at a moderate price is much wanted; hut, heyond that, there must he a determination on the part of buyers of houses, and occupiers, not to put up with such locks as are now too often used, and which prove a con-stant annoyance and cause of expense.

THE MEMORIAL CHURCH AT CONSTANTINOPLE

WE have already anuounced that forty-six We have already anuounced that forty-six designs were thrown in by architects, in this one of the lotteries, or *little-qoes*, which are offered to aspiring talent. The "prizes"—as they are called in phraseology revived from days of other lotterics—were drawn, as our readers know, by Messrs. W. Burges, G. E. Street, and G. S. Bodley, and it was recom-meuded that au "extra prize" of 351 should he presented to Mr. W. Slater. The other designs have not yet been exhibited.^{*}—Such grounds of objection as we have to architects' competitions big of the set of the upon hy competitors, can be expected, ---whether chance, or showy drawings, or anything rather than design and constructive skill, has not more to do with a selection than actual merits,--and whether, in short, gain which there may be to some competitors—styled, as it happens, successful or unsuccessful—includes any of a pequatry nature. If on the evidence of such cases as the present, it appear that adjudication can be made according to merits, or if any adequate object, such as mutual improvement, is served by the system, architectural competition may be defended; hut if it affords, in the majority of cases, none of these advantages, it the uniforty of cases, none of these advantages, it becomes pre-cisely that which it is often designated, mere gambling, and as such, a vice delusive and inju-none to those who are possessed by it.

That the tendency is now towards delusion and unfairness, we tried to show in our recent and unfairness, we tried to show in our recent remarks on what are called "Instructions." The giving anything more than suggestions, is for the committee, or adjudicators, to the their own hands; and after having placed a limit upon freedom of desigu, is almost invariably the forerunner of some injustice. The judges in the case of the Memorial Church, possibly have chosen designs, one of which may be the hest for the purpose; or they may have rewarded such as were the best of those submitted; but they have certainly re-

* With reference to the design marked, "In Te Domine Speravi, "given ha the list of those especially mentioned (see p. S1 ande), without the architect's name, we are asked to say that it was by Mr. William White.

warded designs which were inconsistent with their "instructions." These were hy no means perspionously worded. The style to be adopted was "a modification to suit the climate, of the recognized ecclesistical architecture of Western Europe, known as the 'Pointed' or 'Gothie'," and it was added, "the neglect on the part of any architet of this provision will alsolutely ex-clude from competitiou;" and further (though after a reference to "the numerous and beauti-produced upon himself in ageing a southern. Europe, after a reference to "the numerous and beauti-produced upon himself in ageing a southern. Europe after a reference to "the numerous and beauti-ful instances existing in Southern Europe of this modification of Pointed architecture," as amply justifying "the preference thus given to it"), it is stated,—"Any approximation to the specific features of Byzantine architecture is prohihited, as being objectionable in many re-spects," and,—"Still more must the compe-titors abstain from the imitation of any forus connected with the relievings architecture of the spects; and, — but note must decompe-titors shatain from the initiation of any forus connected with the religious architecture of the Mahometans," which, as it is correctly suid, is "at Constantinople based upon Byzantine models," and which indeed everywhere, was an offshoot from the same style. Lest these aud other stipulations might not he sufficiently clear, it was added, — "Non-compliance with the above regulations will absolutely exclude from the competition." Now we apprehend that from these words there follows some little inconsistency. The examples of the I talian Gothic exclude, indeed, much of the Greek symbolic sculpture and decoration; hut they are Byzantine from the influence of the Greek at as transplated through Venice and

Greek art as transplauted through Venice and Raveuna, and Byzantiue-Saracenic from the influence which likewise spread from the south. The surprising development of late Greek art, even to the remote borders of Europe, is a subject which deserves the particular attentiou of every architectural student

or every architectural student. Therefore, the "instructious" of the com-mittee were coulradictory,—or at least, we should say, were calculated to *embarrass* the archi-tects who had to prepare designs;—as similar interference with the logical process which is that of all *design*, must inevitably do. The index in the present case have reisold be interference with the logical process which is that of all design, must inevitably do. The judges in the present case have rejected, per-haps with reason, designs which introduced "forms which too much resemble those of Byzantine or Greek architecture;" but they have awarded their chief premiums to designs which every one at first sight pronounces to he Byzantine. Thus the design to which they have given the second place,—looking at their "instructions," is that which might have heen expected to stand first. Compared with the design which is first, and with that hy Mr. Slater, it makes limited use of coloured mate-rials externally. The tendency of the "instruc-tions" was obviously to interdiet the use of coloured materials in horizontal hands, to the extent to which they are applied by Messrs. Burges and Slater. The horizontal hands are a feature most marked in the Saraeenie styles. That they are emphatically a Maho-metan feature, will appear to those who inquire styles. The they are comparison to the set of the inquire into their origin. The rich dresses of the Arahians, and the manufactures of Damascus, Aranans, and the manufactures of Damascus, were so greatly influential in the forms and colours of architectural detail, that no student can acquire a proper knowledge of the Eastern styles, without taking them into con-sideration; and Professor Semper, if we re-member rightly, traces all such poly-hromatic architecture as that which prevails both in the mosques of Cairo and the Christian churches of talk to the homeines of coloured denserve used Italy, to the hangings of coloured drapery used by the nomadic races, of which so large a number became Mahometaus.

numer became Manometaus. There are particular symbolic forms and sculpturesque details in Byzantine works which certainly should find no place in a Protostant church,—though we are not sure that some of them have not been adopted in English edifices. But there are other details, equally Byzantine or Mahometau in their origin which Byzantine or Mahometau in their origin, which there was no intention to exclude in the present ease, and which lend themselves most advantageously to architecture where colour in matetageously to architecture where colour in mate-rials is used. So much, theu, for the tendency of an attempt to bind and trammel the expression of design hy needless mandatory "instructions." A considerable excess in external colour, over what we would consider to be satisfactory in England, is rightly enough introduced in a

produced upon himself in passing from place to place, by the local materials, even in England. The party-colouring, therefore, which gives the main character to Mr. Burges's design,

although it may be in excess, is not so much so as might at first he supposed. In Mr. Slater's design the effect is jujured by the execution of the drawing. The church of St. Andrea at Vercelli, on which

The church of St. Anarca at verschi, off which the designs placed first and third are regarded as founded, is certainly a very good example-of the development of the Italian Tre-cento architecture,—where some of the essential Byzantine elements of the carlier styles were excluded and is one which well deserved to be excluded and is one when deserved to be studied. What precise use has been made of it, in the absence of the memoirs, to which the judges refer as accompanying the designs, we are not aware of,—but the designs are oh-viously much varied from the supposed model.* Competitors may do themselves real injustice

by an attempt to forther there are by quoting a precedent. It is the misfortune of the present system, that judges heiug afraid to go wrong, are still sometimes influenced by a named ex-ample: designs, therefore, are submitted by architects, on a basis even inconsistent with sequine art, and the proper use of precedent. Something which is of most value is sacrificed, and a lower level is sought as acceptable to the

contenting order is of notes take scienced, and a lower level is sought as acceptable to the men in authority. Mr. Burges's design has, indeed, as the most prominent feature in its plan, a semi-aircular apsa, springing directly from the intersection of the transepts, with an ambulatory carried round, suitable for monuments. The opeu pier arches to this anhulatory from the choir proper, evi-dently owe more to the study of Beauvais Cathedral thau another huilding. The general plan has uave and aisles, and transepts, and a detached campauile, placed askew with the south front. There is a ground stone-ceil-ing and timher-framed roof, of low pitch, covered with red tiles. Flying buttresses, it is to be observed, spring mainly from the roof covering, instead of from a hase of greater apparent sufficiency. The west front has a rose-window, and three deeply recessed doors. apparent similarly, the deeply recessed doors. To the latter there is a broad pent-house roof, covered with tiles. The piers and arches on covered with tiles. The piers and arches on each side of the nave, arc coupled; that is to say, the hay hetween the external buttresses occupies the width of two arched spaces in-ternally, the main ribs of the groining heing arranged accordingly. Iron ties are introduced, as in usury of the Italian buildings,—with doubtful advantage in point of taste. In the doubtful advantage in point of taste. In the exterior, as we have intimated, colour in hands and patterns, plays au important part in the

design. Mr. Street's design has few, if any, Italian features. It is a cross church, without aisles; hut features. It is a cross church, without aisles; hut in their place, along the nave, there is a cloister, with which the projection of the buttresses re-sisting the thrust of a stone groined ceiling (said to be nearly equal in span to that of King's College Chapel, Cambridge), corresponds; and the same cloister continues along the west front. Thus the church is lighted altogether from windows in the upper part. These gene-rally are grouped in three narrow lights, with externally, arches, — coupled so that there is a central shaft—and, further, a bold arch, from huttress to buttress, forming a deep shadow. The depth of the windows allows of the intro-

The depth of the whiddows allows of the influe-* In a note to us Mr. Bodley save, on this matter :-- " Will you allow me to state that, as far as 1 an aware, the only point of resemblance between my design and the church of M. Andrea, as 'dopoing it is expossible factors when the list that, as a 'memorial' church, the building should bear evidence of its history, and remarked, in our proort, that when in the Middle Agess church was built at Vercelli under Fnglish Indisence, and therefore under similar circumsatures to the proposed church at Constantinople, the square sast end was adopted. I do to think there was any other point of reasmalance what-ever. The oburch at Vercelli, indeed, is a large grous church, intent from the proposed church, and for which the preserbed estimate would have been imadequate."

duction of an external passage way round the nave. There is a good monified cornice, with which the weatherings of the buttresses are conjoined by the introduction of an elegant conjoined by the introduction of an elegant foliated enrichment. At the east cnd is an octagonal apse, with long windows, the groining internally being partly supported by the shafts of the inner order of tracery. The building has two oetagonal turrets, one on each side the in-tersection of the cross. The design is put forth as for a menorial chapel rather than a church. Parts, may be found which rescue the control. Parts may be found which resemble conti-nental models; but there is great merit of design in this production. In the internal details, more colour is introduced; and some of the fittings, as might be expected, display much care and taste.

Mr. Bodley's design had made a less marked impression upon us, during the short time we had for examining it at first, than it has since doue. Perhaps justice is not done to it in the drawis, as will have been already inferred, ings. 'It'is, as will have been already informed, 'Italian Gothic; and the chief study seems to have been given to the interior, which is rightly praised by the judges, who also say that the , design is "remarkable for great simplicity of plan." It has a tower at one angle of the building, with a high-pitched roof; and generally has the plan of an ordinary church, with the addition of a long *merthex* or porch at the west. A waggon-headed vault, of timber, with a principal arches of stone, covers the central division,—similar construction being adopted in the ajelse, which are without windows. The the aisles, which are without windows. The principal arches are stilted, in the manner more frequent in Siely than the north. The decorative character is expressed mainly through surface decoratiou.

Mr. Slater's design has the regular cruciform plan, two western towers, with tiled roofs, is in mauner approximating to Early English, and has many of the details of the masonry and orugment of very good character. Its chief ex-ternal effect is derived from its bands of coloured masoury, and tiling to the roofs and spire cap-pings, and the boldness of its flying buttresses pings, and the boldness of its flying buttres The wall buttress, we may observe, in this The war buttless, we may ensure in this do-sign, and that first on the list, appears to be studiously made of very slight projection ex-ternally. One feature which is attempted in this design, it is singular has not been intro-duced in any other of the instances before us. duced in any other of the nustances before us. We refer to the true stone roof, so appropriate to the climate, and so often found in Eastern huildings. Mr. Slater, however, we rather think, has not applied the principle in the best form. His roof—of low pitch—hoth in the case of nave and its aisles, is formed of blocks of stone, which in the aisles might exert considerable theret upon the wells in the base considerable thrust upon the walls in the bays, where unresisted by buttresses. The better system would, we think, have been to use thinuer slabs—though joggled together in much the same good fashion as the blocks—bedded upon a considerable thickness of pumice-stone, or other material of the lightest descripstone, the vanishing is all waggon-headed, the diagonal ribs and others being planted on the surface; and we believe this arrangement— simulating the other where the diagonal of forces is directed to the position of the buttress and where the latter has a distinctive use in Gothic architecture—was held by the judges to lessen the merit of the design. The design, however, appears to us deserving of study. Altogether, even with the limited opportunity for examinizing mildic has have a fighted are

for examination which has been affe urded, we may pronouuce the designs as marked by much beauty of effect, although, as must need happen, each oue of the competitors may derive something from the observation, of which he has the chauce, of what is done by others. Of the justice of the selection, it would be necessary for us to see the other designs before speaking; but we have already said something of the difficulties which committees make for them-selves in addition to those which are inevitable.

The successful designs were exhibited at a converration successful designs were exhibited at a conver-sation", at the rooms of the Society for the Propa-cation of the Gospel in Foreign Parks, on the 13th inst when Professor Willis delivered an address, clicitly descriptive of these designs, and supplying not many particulars of the competition havond what we bad is aviously galaered,—as we have noted these bad in eviously gathered, -as we have noted them above. He began by stating the character of the

problem which had required working out,--namely, to design a building suitable to congregational pur-poses and public worship, yet suitable for a memorial, and for the reception of monuments. Towards the attainment of the object, the conmittee had deter-mined upon a competition. Architectural compe-titions were not new things; and, as he sold, had led to the hest results,—as in the case of Canterbury Calhedral, when a foreign architect brought over ideas which we enew to Eugland. By such fresh elements applied with local materials and details from the hands of the native workmen, new combinations were lauds of the native workmen, new combinations were formed, and steps of progress were the result. In similar manner constantly, features of architecture were transplanted, — by mediaval architects — who as priests had no particular nationality. Lincolu Cathedrel, and its points of resemblance to the Burgundiau churches, afforded illustration of this sort Burgundian churches, afforded illustration of this sort of influence. The present project would lead to results of the like character. He then referred to the church at Vercelli, adopted as a study by two of the successful competitors, and which had heen erected, as it was said, by Euglish workmen and English money, or, at all events, for one who had lived in England, where he held as a henclice the priory of St. Andrew at Chester Andrew, at Chester.

Bagland, where he held as a henchice the protoy of St. Andrew, at Chester. In considering the style for the new church, the professor said it was thought desirable to allow of no features which were Byzantine, or which were derived from the Byzantine, in order that the new edifice unight have a distinctive Christian character. The architecture of the churches of Justinian was shu out, ddifaces of that character being now appropriated as mosques; and other buildings such as those used by the present Greek church, were couceived to be likewise inappropriate. The Lombard style of Nor-thero Italy also was not suitable, as partaking of the Byzantine, as well as from its heaviness of uppearance. Thus the field of selection became a narrow oue. The character appropriate to the edifice, was also much governed by the naterials,—such as were available at Constantiuople, including rich mathles,—the use of which, having regard to sunlight, would dictate flat surfaces, supplying the place of deeply-cut mondings, which, indeed, were comparatively speaking, inadmis-sible. The judges, therefore, had not been surprised at the particular choice made of models. In the course of his explanatory description, he re-formed to the feature of the and enders.

at the particular choice made of models. Ia the coarse of his explanatory description, he re-ferred to the feature of the apse and ambulatory, as not general in Italy, though one church, that of Saint Antonio, at Paulaa, might be named as having an apsidal termination; and with reference to the tower which the architect of the first design had show wholly as an adjunct.—it was doubtfail whether they would be allowed the use of bells in Constan-tionals. The upperson deep narticular distribution they would be moved the use of beins in Coostain-tiopole. The professor also particularly directed attention to the ambulatory in the design, as suitable for the monuments, and carrying out the intention of a memorial ; yet at the same time he spoke somewhat a memorial ; yet at the same time in spoke somewhat disparagingly of the propriety of the treatment in the second design (in which a considerable portion of black wall under the windows is provided, with a similar intention), and which was less a church than a monumental chapel. He, however, proised highly the artistic conception exhibited in the drawings. Expressing the pleasure which it had been to the judges to find that the first nud second awards of pre-minons had talten to architects who had held similar places in the Lille competition, where Messra Cluttu and Barges gained the first premium, and Mr. Street the second, he said the committee in that case had not fairly carried out their commitmes.

Street the second, he said the committee in that ease had not fairly carried out their emploitons; but he hoped that here they should act with greater justice. He also hoped that those who had not gained pre-nums, would not find their labour valueless, but that their disigns might be turned to account in the of some other church

Case of some other church. This a lvantage, it is needless that we should re-mark, is not very likely to accrue. Anything that can be gained is more likely to result from a scheme t ilked of amongst some of the competitors, for litho-graphing the whole of the sets of drawings, and pro-viding each competitor with a copy of each set. This graphica the where on the sets of orawings, and pro-viding each competitor with a copy of each set. This would effect what was proposed in our pages in the case of the harrack competition, but not then carried out. Why, in that case, should not the thing still be done, or photography he called in to aid. The designs and particul rs are, we suppose, lying stowed away somewhere; whilst no architect amongst the compeand particle its are, we suppose this source any sourcehore, whils to architect amongst the compe-tiors on that occasion, we can discover, has been employed in any of the barreck-luidings for require-ments of the line, that have been lately creted, ments of the line, that have been lately creeted,-ercreted, too, as we must infer, with many of the diffects of the old coordenmed system. As we urged on that memorable occasion, by following such a course as we have now advocated, great mutual benefit might be made to accrue from every computition. It should be especially urged in the forthcoming Government competition.*

A correspondent suggests, that in exhibiting the esigns re-ceived for the Government Offices, the Classic and the Gothi should not be mixed up together, but form two separate divisions

R. SYDNEY SMIRKE'S FIRST LEC-TURE ON A&CHITECTURE, AT THE ROYAL ACADEMY.* MR

By the kind permission of the council, I proby the kind permission of the council, if pio-pose to address you, the students in architec-ture of the Royal Academy, on the subject of our common profession. On this occasion I occupy, for a while, the place of one who for many years has wou your respect and esteem, hy his thorough knowledge of our professiou, and by the freedom and perspicuity with which he imparted to you that knowledge, and geneby those elevated views of the nature and rany by those elevated views of the nature and mission of our art by which he invited ingenuous aspirants to join bim in the path of meritorious exertion which he has trodden so successfully himself. I feel, therefore, a deep sense of the difficulties of my position, and of the disadvan-tage I labour under in following my distinguished friend.

Nor would I have contended against the con-Nor would I have contended against the con-viction of my own comparatively limited powers, did I not entertain a belief that on this, the only subject with which I can pretend to any intimate acquaintance, by an houest and disinterested expression of opinion, I might contri-bute, in some slight degree, to advance the in-terests, and, may I add, to sustain the character of that profession to which I feel it a great honour to belong. I have, therefore, undertaken to address you on the subject of architecture, and to impart to you my experiences and the result of my reflections on some of the matters to which it is allied.

The task of a lecturer on architecture, some The task of a lecturer on architecture, some thirty years ago, would have been an extremely light and simple one. When dealing with the history of our art, he would have probably been content to repeat the olt-told tales of the paternity of Grock art, and of her less distin-guished offspring, Roman art, and, hastening through the mists of the Middle Ages, passing by, with working target and hold covered backs, the with hurried steps and half averted looks, the with nurrice steps and han averteen looks, the forms of a period in which the types of elassic ages appeared to bave been well nigh lost, he would have emerged, with rekindled delight, into the daylight of Palladian art, when he sceined to breathe again the atmosphere of re-turning sense, reason, and taste.

Theu, in dealing with the principles of our Then, in detaining with the principles of our art, the lecturer would have arrayed before you the five orders; nor would he have failed, like a true disciple of Vitruvins, to point out for your admiration the matronly curls of the Ionic, the virgin delicacy of the Corinthian, and the uanly dignity of the Doric; nor have forgotten the time-honoured fable of Katatech-rea and he hortionitural statics. s and his horticultural studies. Such would have been assuredly the sum and

substance of his discourse; and if, for the purpose of completing his subject, he had indulged in a passing notice of Mediaval art, it would have been probably to treat it as a transient fashion, as little to be regarded as the evanescent caprices of a modern modiste.

Great, indeed, arc the changes that thirty years have effected! Our art has taken her stand upon a far wider base and a loftier platform; and from this more elevated point of view, the horizon of our art has become greatly and from this more elevated point of estended : with these changes, the chiar oscuro of her wide domain has also changed : objects hitherto lost in obscurity and neglect have been hrought to light, revealing beanties hitherto unnoticed, and kindling renewed feelings of ad-miration, whilst a cold shade has been cast over some of those objects which once took rauk among the fairest of architectural forms.

I am quite conscious of the enormonsly increased difficulties of the task of him who ventures, in these changed and still changing ventures, in these changed and still changing times, to treat of the principles of our art and their practical application. But, with these increased difficulties, the task acquires increased honour and a new dignity; whilst the compara-tive novelty of the cornse which lies before us awakens an interest which it would be van for me to attempt to excite in you whilst pursuing the trite path amidst the old familiar scenes.

But other difficulties beset the path of him who, in these present times, would vorture to assume the office of a teacher. We are dazzled by the excess of light that is being thrown upon

* Read on Monday evening, the 23rd last

our art. Expositors of art, issuing from all our art. Expositors of art, issuing from an ranks and professions, are as minerous as our students; and such grandiose terms as "first principles," "fundamental truths," "general laws," and the like, have become almost house-hold words. These attractive terms are caught hold words. These attractive terms are cought hold of as the keys to open to our view the anysteries of the art we seek to acquire; to reveal the hidden sources of harmony, and to introduce order, symmetry, and certainty, into the domain of taste

I am sorry that I cannot promise to feed your Tain sorry that I eithing promise to lear your gearnings for truth, by announcing any such unerring criterion of taste, any such authentic formula, that shall command the approval of every observer, or satisfy the requisitions of every critic. I shall lay before you principles and systems with a zero cartions parsimone. and systems with a very cautious parsimony. I will tell such truths only as I think I can find vouchers for, and give yon such opinions as I feel well assured have their foundation in have their foundation in icel well assured have their foundation in common sense; but I beg that yon will not he disappointed if I do not even attempt to take wing, and plant you, *per saltum*, on the acro-polis of art.

The student must be the artificer of his own fortune: the teacher may, according to his ability, arm the student with the appropriate weapons of his profession, point the way, and administer some facilities for advancement; but the art-student must expect progress only in proportion to the toil of his own bands, and the inspiration of bis own genius.

The literary student has, doubtless, as wide a field to cultivate, but his labours are wholly mental; whilst the student in our department of practical science has to exercise his hands - 85 social order on the second sectors in the second sector of the second sector of the second se which the very name of architecture is derived, with a perception of those graces of form and decoration to which architecture owes its place in the circle of academical fine arts. Our proin the circle of academical fine arts. fession is peculiarly complex, and comprises obligations essentially different, nay, sometimes apparently discordant.

We have not only to conjure up a thought, and express it on paper; but we have also to make it a reality, and in that task we are liable to be embarrassed by a thousand difficulties of cost-of construction-of deficient materialof limited and prescribed site: a weight of serious and lasting responsibility lies heavily on us; and we are not seldom sorely tried by those whose tastes we find ourselves called upon at once to submit to and to control. Such are the difficulties which await you -- which

beset your path with pitfalls and with thorns. But I offer them to your notice, with no fear that they will dismay or discourage you: to a mind of energy and spirit, difficulties to be overcome tend hut to strengthen the resolution and heighten the courage.

You will ever let it be present to your minds that the study of our profession is no light thing, and you will not fail to enter upon that study with a becoming carnestness and a thorough appreciation of the gravity of your vocation. I need, bowever, scarcely remind yon, that the utmost diligence will be of little avail unless that diligence he wisely directed. That unless that diligence he wisely directed. That a proper direction he given to your studies is indeed absolutely and obviously essential to their future success. There must be no impatience under the restraint of rules : the mind must be disciplined and recon-ciled to subordination, for he who would com-mand must first learn to obey. Our great master, Reynolds, bas said, with his wonted sagacity,—" The impetuosity of youth is dis-gusted at the slow approaches of a regular sizeg, and desires from precimentioned clubers to and desires, from mere impatience of labour, to take the citadel by storm: they wish to find some shorter path to excellence, and hope to labour, obtain the reward of eminence hy other means than those which the indispensable rules of art have preseribed." We often hear "rules of art " condemned as

if it comes at all; hut let us by no means be led hastily to infer from thence the iuutility of such rules. They will not suffice to give life to school copy any more than they will animate a school copy my note charactery or minimate a lay figure; yet sound rules of art serve to in-spire the best artist with confidence, and, above all, will enrb the erratic tendencies of even genins itself, ever prone to overlook the line which distinguishes the hold from the extravagant, the sublime from the ridiculous, even the right from the wrong. Let no student suppose, in whatever amount of conscious strength he may indulge, that be can with safety trust him-self to the trackless wastes of his own imagina-

THE BUILDER.

tion, and shut his eyes to the lights that been set up by long experience, or to the land-marks which the *pass* has left for the guidance of the *future*. It is a false and vulgar opinion that rules are the fetters of genus. " He who begins by presuming on his own scnse," says Sir Joshua, "has ended bis studies as soon as he bas commenced them." Now, the orders of he has commenced them." Now, the orders of architecture are instances of such rules of art, and have been instances. and have been instituted, not as fetters to em barrass, but rather as helps to strengthen the judgment.

It is no uncommon thing to bear these orders spoken of with disparagement, as tending to inculcate a servile adherence to arhitrary rules, destructive of originality and of inventive talent. I think that this impression is founded on a missipprehension of the nature of these orders; a missipprehension I am ready to admit likely enough to arise from the dogmatical tone in which the proportions of the five orders are often laid down. The truth is that the artists of ancient Greece

in its best days, endowed with an numatched perception of beauty, and of the most reflued cultivation, were led by their observation and experience to adopt certain general forms and proportions, and students, struck with their beauty, have sought to trace it back to its original sources by an analysis of those forms and pro-portions—that is, by their exact measurement and delineation,—a very legitimate, natural, and indeed necessary process.

In thus deducing a system of proportions from the practice of the best architects, we arc surely acting as reasonably as the student who would deduce rules of poetacel composition from the poetry of Milton or of Pope. It is thus that the orders of architecture have

been instituted; but it is an error to regard them as composing an infallible standard of taste from which any deviation must be heresy With a preiseworth value of the second the second s tion miunte fractions-very hairs' breadths,-and thankful we should be for their laborious a superstitions reverence: this was far from the practices or interactions of the great authori-tic procession of the great authori-

ties themselves. Vitruvius tells us of the diversity of practice that prevailed even in his own times. In truth, many wide diversities exist even among the best examples.

In the relation of the diameter to the length of the shaft of the Greek Doric order there is a difference of 33 per cent. between the heaviest and lightest examples even in the best times In the Ionic order a similar, though perhaps not so great, diversity provals; and every tro is aware also of the extreme variety in the form and character of the details existing between even pure examples of these two orders. Similar comparisons might easily be multiplied, abundantly sufficient to show that the best masters of Classie times held the reins with a loose hand : indeed, under the easy sway of these five orders, we recognize a regimen so mild as to satisfy any reasonable love of liberty.

The value of these great examplars has been not. nufrequently tested and proved by the fantastic variations which have been sometimes holdly grafted upon them. In these attempts at new or We once here "rules of at "condemned as grated upon them. It internet here here here, perhaps, the surface of created beings and things, will lifeless formality. True it is that no mere rules— suggest themselves to your recollection), we become revealed to all mankind. The Omni-no prescriptive teaching—can supply the want of that innate perception of grace which is not the parent forms, but, on the contrary, we the infinite wonders of bis own erention. But made but born, which must come nucalled for, recognise in them more clearly the convenience as it certainly is in morals, so in asthetics it

and wisdom of adhering pretty closely to known standards, which the cyc bas learnt to appre-ciate as acutely as the cultivated ear distinguishes the intervals of scientific harmouy. To set at naught the architectural forms which the age of Pericles has bequeathed to ns, is about as rules of counterpoint, or the musical scale which has descended to us from Guido of Arczzo.

If we turn to the other great system of archi-tecture, that which grew up in the Mediaval period, we shall find artists still acknowledging certain general and leading principles; singu-larly differing, indeed, from those which guided their predecessors, but still rules of art.

is true that, so far at least as relates to ecclesiastical structures, these rules have been influenced in a material degree by the dogmatic influenced in a material degree by the dogmatic teaching of the Christian Church, which, if it has on the one band inspired many very striking and sublime conceptions, so on the other hand it has imposed some restraint on the crratic tendencies of Mediaval genius. I confess that I am unable to assign to the favourite symbolism of the early Church many of those forms and features which were in truth of carbiar courth. We recording in the Boundary

of earlier growth. We recognise in the Romansque church the familiar forms of the Roman Basilica, and no amhignous tendency to Roman pasinca, and no aminguous tendency to Roman architectural decoration: yet we cannot fail to see that a symbolism, grafted on pre-existing forms, which sought to appropriate, and to sanctify, the most admired features of Pagan art, did in fact gradually pervade the whole system of Christian architecture, and impressed upon it a decorator mitch denote the interfect. upon it a character which departed widely from e types of ancient art. Thus it is that architecture has ever sub-

mitted itself to a wholesome control, without opposing any impediments to the exercise of inventive genins. No art has stagnated less than onr art : perpetual change has rather heen the law of ber existence. The student, there-fore, as I have already urged, should learn to reconcile himself to the discipline of the schools, and use it as the safest foundation to receive the superstructure of his subsequent education and practice.

Au important portion of his preliminary studies should be the acquisition of a compre-hensive knowledge of the works of past times. A large and conscientious survey of such works exercises the jndgment, forms the tastc, and fertilises the mind, of the observer, and promotes the growth of new thoughts and new eomhinations.

Sir Joshua, with his usual felicity, "The student nuacquainted with the attempts of former adventurers, is always apt to overrate his own abilities, to mistake the most trifling excursions for discoveries of moment, and every coast new to him for a new-found country, and "to congratulate bimself ou his own arrival at regions which they who have steered a better course have long since left behind them."

It may perhaps be superfluous to urge these considerations on you now, when, I fear it must be admitted, that the leaning of the present day is rather towards an excessive admiratiou and a somewhat undiscriminating revival of a bygone age. Of course it would be a very serious error to stop short at the acquisition of such knowledge, which should rather be regarded as the means and materials for further develop-

ment, and the bases of your future operations. Our art has been often subjected to the re-proach that it has not advanced pari passa with broken that it has not advanced pars pass will other branches of human knowledge; and it is uscless to deny that æsthetics have not kept pace either with physics or the exact sciences. We must however, bear in mind, that there are important heads of human knowledge which are not in their measurement the clinitation

arc not in their nature susceptible of indefinite extension, and in which it is idle to expect progressive discovery. There is every reason to believe that the

Incre is every reason to believe that the works of nature supply, and will ever supply, an inexhaustible field for the research of human ingenuity. We can hardly contemplate the time when the facts, which hie concealed beneath time when the nexts, which he conceated bolleach the surface of created beings and things, will become revealed to all markind. The Omni-potence that made can alone fully make known the infinite wonders of bis own creation. But

may he, that no new important principles remain to be discovered, and that we can look only for new combinations, for the employment of new materials, and for the discovery of new con-structive inventions. A basty retrospect will, I think, confirm this supposition. Upwards of 2,000 years ago a more refined and delicate taste, and a more through mastery of the power of representing beauty, existed, than the world has since been able to acquire; nor was that extraordinary resthetic development confined to a few rarely-gifted artists, for there is not wanting good ground for helieving that it pervaded the general unind of the Greek people.

altists, for hiers her winning several mind of the Greek people. Again, 1.700 or 1,800 years ago, the grandeur of the Roman empire was well typified hy a corresponding grandeur of architecture, which has never since heen equalled. We are compelled to acknowledge that 500 or 600 years ago workmen wrought with a freer spirit, a bolder genius, and a more genuine artistic ardour thau distinguishes the workmen of the present day. We find, 1,200 years ago, in the Gregorian chants, musical compositions conceived of a grander character and deeper feeling than the music of the modern school can lay claim to. It seems to be in accordance with these general views, which I have ventured to express in extenuation of the supposed tardy ad-vance attributed to our art, that a great musical composer of the present day has attempted to composer of the present day has attempted to account for the admitted want of originality in modern musical composition, hy expressing his opinion, or at least his suspicion, that all the material changes of which the notes of music material changes of which the notes of music are susceptible may have heen already rung out. Is cannot indeed adopt this theory, even in re-spect to music, and I am still less disposed to damp the aspirations of young *architects* by cominenancing any such doctrine of exhausted originality.

I believe, indeed, that the fundamental prin-ciples of architecture leave hut little room for important future discovery; hut the combinations

important future discovery; but the combinations which the component materials of art pernit— their variation, composition, and decoration—are practically infinite and iuexhaustible. May we not discern some relation hetween the progress of fine art and the corresponding development of the individual man? Our first pleasures are all sensuous : our carliest efforts are limited to the scrucing and crutification of presentes are an isolatous : our cannest choice are limited to the exercise and gradification of our seuses. The cyc and the ear are, I believe, as acutely sensitive in early youth as in the after man : it is not until the faculties of the mind are somewhat matured that it begins to dimensioner to extrame nature with a purch is discriminate; to survey nature with a more in-telligent observation; to take a deeper interest, and to recognise a more prognant meaning, a more mysterious harmony, in its forms, its

more mystericus harmony, in us to any sounds, and its colours. And so it may be that, in the earliest ages of civilization, men mainly cultivated those arts which address themselves to the scases. It seems, iudeed, to be conformable with our ideas of the Divine will, to suppose that we should be instinctively supplied with the power of enjoying the pleasures arising from these of enjoying the pleasures arising from these simple elements, whilst purely intellectual plea-sures, such as are derived from acquired knowledge and matured experience, are left to he gradually attained by the slower process of selfculture.

culture. These inquiries, bowever, are scarcely fitted for the present occasion, and must not be here pursued: hut the fact can hardly be disputed, that not in this country only, hut elsewhere, and everywhere in our hemisphere, — whatever may be the cause, whatever the remedy—the fine arts, or at least our art, has not kept pace with time; and, I may add (although I hope that there is no inherent connexion between the two nheromena) that these countries in which two phenomena), that those countries in which, in modern times at least, political and com-mercial improvements bave been most remarkahly developed, have been perbaps the least fortunate in the cultivation of æsthetic talent.*

EXHIBITION OF THE SCOTTISH ACANEMY .- This exhibition is now in form after some delay. The Scotsman says it will probably not be inferior to any of its predecessors.

* To be continued.

CHURCH-BUILDING NEWS

Noreich. — A new congregational chapel is about to be erected at Norwich. It is under-stood that the design of Mr. James (a son of the Rev. J. A. James, of Birmingham), has been accepted for the huilding.

accepted for the huilding. Bary.—A painted window has heen placed on the north side of the communion-table, in St. Mary's Church, Bury. The subjects of the six principal compartments are Christ's Entomb-ment, Resurrection, and appearance to Mary; and groups representing the three Acts of Merey.—'I was in prison, and ye came unto me;' "Naked, and ye clothed me,'" "Sick, and ye visited me.'' In the tracery of the head of the window are the figures of Moses, Aaron, Samuel, and Joshua; David, Gad, Elijah, and Solomon; surmounted hy the monogram of Solomon; surmounted by the monogram of Cbrist. At the foot is the inscription. Cbrist.

Cornst. At the loot is the mscription. Aylsham.—At the parish church, Blickling, on removing the old window at the chancel, it was deemed advisable to erect a new gable for the receptiou of the present one, and to Mr. John Freeman, of Aylshan, was entrusted the rebuilding of the east end and furnishing the stonework of this window. Messrs. Hardman and Co. of Binnickey sumplicat the window

stonework of this window. Messrs. Hardman and Co. of Birmingbam, supplied the window, which was sent to the Paris Great Exhibition, and there obtained a silver medal. The style is Decorated, divided hy four mullions with a multifoil heading, in which is represented the Resurrection of our Saviour : in each divi-sion surrounding are angels, &c. The five lights are divided into two compartments, with St. Andrew and the Evangelists. In the lower the subjects are, "Bearing the Cross," "The Cruci-fixion," "The Dead Christ;" the two outside divisions having the armorial bearing of the Hobart and Harbord families. Underneath is the inscription. the inscriptiou.

the inserption: Lee(Kent).—The enlargement of the Baptist chapel, together with new school-room and ves-tries, have just been completed and opened, the former huildings having been found too limited for so increasing a neighbourhood. Messrs. Piper and Sons were the huilders, from the designs, and under the superintendence of Wessrs. Bidlake under the superintendence of Messrs. Bidlake and Lovatt, architects.

Exeter .--- The Roman Catholic church of St *Excler.*—The Roman Catholic church of St. Nicholas, Exeter, which has heen enlarged by the addition of a transcpt, 54 feet 6 inches, hy 17 feet, also of au angular apse, was re-opened on 19th iust. The original building was Italian, and its sash windows have been replaced with Normau two-lights, of Bath stone. The west front, stripped of its stuceo, wood cornice, and *classic* doorway, and having undergone the ex-tinction of three circular "Christopher Wren"; windows now replaced by locitimate Norman windows, now replaced by logitimate Norman apertures, and surmounted hy a new gable, ex-hibits a façade of the real red stone. The flat mots a lagade of the real rod stone. In e nat ceiling, carried on into the transcept, is orna-mented with polychrome, skilfully done hy Mr. Dipstall. The interior is re-seated with stained deal open benches. Mr. Morton, of Exeter, has earried out the work, Mr. Ashworth heing the architect the architect.

Westleigh .- Mr. Wilmshurst has finished and Westlergh.—Mr. Winshurst has funshed and fixed a unervial window in the church at West-leigh, near Bideford, North Devon. It is a perpendicular window of three lights, and con-tains the figures of Faith, Hope, and Charity, beneath which are the armorial hearings of the family and in the tracery applement devices. family, and in the tracery emblematic devices. At the hase of the window is an inscription, At the hase of the which is an inserticion, stating that it was erected to the memory of the late Jane Torr (widow), of Eastleigh, hy mine surviving children, of herself and the Rev. John Torr who was thirty-two years vicar of Westleigh.

Westeight. Barbage.—A memorial window has lately heen erected in the church of Burbage, Wilts, to the memory of Dr. Denison, late bishop of Salishury. The quatrefoil contains the arms of the see, and a text (Philippians ii. 29), in oblique hands, runs across the two principal lights, commenorative of the bishop's conduct when the ebolera raged at Salisbury. There is a subscription on foot, it is said, for the pur-pose of erecting à painted east window. Hereford.—A Bill for the restoration of Hara

and decay, the late Dean Mcrewether devoted and decay, the late beam herewent autore about a solution is energies for many years to procure its resto-ration and repair. He succeeded in raising con-tributions, with additions from various sources, amounting to something like 26,000.; and the amounting to something like 26,000k; and the result was the partial restoration of the edifice. But the funds proved sadly inadequate to the contemplated purpose of a complete restoration. A sum of 15,000l, or 20,000l, more is abso-linely necessary; and the Dean and Chapter have resolved to raise a loan for the requisite purpose, on the sceurity of the Chapter pro-nerty. perty.

Birkenkead.—The congregation for some time past worshipping in the Congregational Chapel, Grange-lane, Birkenhead, are ahout to erect a more commodious edifice at the junction of the Woodchurch and Oxton roads. The new church will be hull of white Stourton stone, and will he 100 feet long, 45 feet wide, and 60 feet high, and will accommodate 500 adults on the groundand will accommodate 500 adults on the ground-floor, and about 100 in the gallery, provision heing made for subsequent enlargement either hy gallerics or transepts, or both, so that, while retaining the harmony of the design, the build-ing may be increased to twice its present capa-eity. There will be vestries, and a lecture-room which will seat 250 adults. It is pro-posed at first to erect only enough of the steeple to provide for the principal entrance at the posed at first to erect only enough of the steeple to provide for the principal entrance at the front of the church. The estimated cost of the edifice, including the first part of the steeple and the laud, comprising 1,800 square yards is about 3,000%. Towards this amount about 1,700% have been subscribed. The architect of the new building is Mr. N. Cole, of Birkenhead. It is expected that the foundation-stone will he laid next month. laid next month.

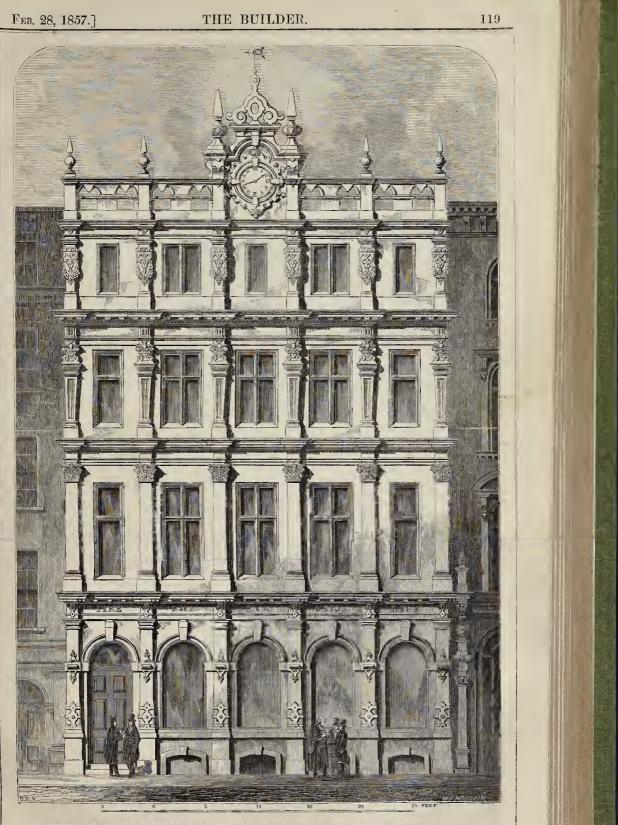

Leyland (Preston). - The Catholic chap Leyland has lately had a new sanctuary a - The Catholic chapel at dded to it. The addition comprises a large reredos consisting of three compartments of decorated Gothic work, and a large centre with two small nes, one on each side. Under the arches on each side of the altar it is intended to place large statues of St. Andrew and St. Benedict. The work has been executed by Mr. G. Swarbrick, of Preston.

THE LAW UNION INSURANCE OFFICE.

OFFICE. THE Law Union Fire and Life Insurance Company, which numbers, we helieve, upwards of 500 members of the legal profession among its shareholders, have taken on lease from the City of London a spot of ground in Chancery-lane, within one door of Fleet-street, a locality better adapted to their peouliar requirements than the present place of husiness in Pall-mall. We present our readers with a view of the new offices just completed hy the company. The front is entirely of stone, and Elizahethan in character, which gives an opportunity for pro-ducing attractive effect, aimed at in erections of this description, without rulgarity.

character, which gives an opportunity for pro-ducing attractive effect, aimed at in erections of this description, without vulgarity. The building, though possessing a frontage of nearly 40 feet to Chancery-lane, is, owing to the narrow and inconvenient shape of the ground, somewhat cramped as to its internal accommodation, and has required study to make the most of so limited a space. The arrange-ments comprise, on the ground-floor, the public office and secretary's room; on the first-floor, the hoard-room, 28 feet by 20 feet, and 15 feet high, and ante-room; on the second-floor, securities, committee-room, and waiting-room; on the strong-room, porter's-room, and hed-room-cellars, clerks' office and housekeeper's rooms; and in the hasement are placed the strong-room, porter's-room, and hed-room-cellars, clerks' avatories, &c. The archited's-estimate, exclusive of fittings and fixtures, was 2,5007, and the cost, we are told, will not exceed that sum. The works have heen carried out hy Mr. Geo. Myers, under the superintend-ence of the architect, Mr. J. Wornham Penfold.

SALOPIAN SOCIETY FOR IMPROVING THE CONwhen the ebotera raged at Salisbury. There is a subscription on foot, it is said, for the pur-pose of erecting a painted east window. Energe A. A Bill for the restoration of Here ford Cathedral has heen brought into Parlia-nert. Having fallen into grievons dilapidation | a 5/, share.

PROVINCIAL NEWS.

East Dereham, - The new corn hall here has heen opened. Old shamhles and slaughter-houses have heen cleared away, and the space appropriated to the new huilding is in the most central and open part of the town. Mr. J.B. Goggs, of Swaffban, was the architect; and Mr. Huhhard, of Dercham, the contractor. In May last the huilding was commenced. If con-sists of four walls and a flat glass roof, the prin-cipal front presenting a colonnade of Corinthian cipal front presenting a colonnade of Corinthian columns, with projecting cornice, and sur-mounted hy pilasters and cornice of the same order. The whole of the columns, pilasters, and archivolts are of Ancaster stone, and the panels of red hrick. A peculiar feature in the front is a space forming an entrance lohby, which will he enclosed by a pair of east-iron gates, and covered hy an arch, intended to carry the proposed hase and statue of the late Earl of Leicester. This statue is to he of colossal size Leicester. This statue is to he of colossal size in stone, and will he the work of a London sculptor. The whole area of the hall is covered in hy a wrought iron roof in one span, formed with semi-circular rihs and principals. Outside, the roof is covered with Hartley's patent rough plate-glass. A panelled ceiling of obscured glass, of which the rihs are formed hy the tieglass, ot which the rins are formed by the lie-heams, is placed at the springing of the arched rins of the roof. In summer, the ceiling will prevent the direct action of the sun's rays into the hall. The internal dimensions are 80 feet by 50 feet, and the height 27 feet from floor line to glass ceiling. The floor is of hard timher. The cost of the huilding has heen about 1,800.

Wolverhampton.-The plans of Mr. Banks for the new library huilding have been selected. The directors now require tenders for the huilding.

Bradford .- The foundation-stone of the aque-Bradyord.—The fondation-stone of the aque-duct (under Contract F) was laid on 10th inst. at Draughton, near Addingham. The total length of tunnelling will be 17¹/₂ miles. The con-tractor for the Draughton periton is Mr. Barker, of Washefield ; the sub-contractors are Messrs. Boocock and Benson, of Bradford. The sub-contractors and friends afterwards celebrated the oceasion at the Sailor Hotel, Addiugham. The first portion of the tunnelling was keyed on the following day.

West Hartlepool.—The new market place has heen opened. It is 470 feet long from east to west, and 138 feet 6 inches hroad from north to south, and contains an area of ahout one acre and a half. It has large cutrances, and is fitted

and a mail. At mass large currences, and is inter up with small shops, shocks, &c. *Shields*.—The pier on the south side of the Tyne is making perceptible progress, and already extends as a mar into the sea. A wharf is nearly finished on the south side of the Narrows, for this prime transition includers and used as of:

for shipping stone into lighters and small craft. Alston.—A town hall or public huiding has for some time here a desideratum in this town, and a committee has here formed for the collecand a committee has heen formed for the collec-tion of subscriptious. The Commissioners of Greenwich Hospital have granted a piece of ground for a site, at the Vicarage, in the low part of the town. The huilding will be com-menced early in the spring, and will contain savings' bank, public room, mechanics' institute, news room, &c. The subscription list has, within a few days, reached 440. and the esti-mated cost is about 1,200.

Edinburgh .- Captain Fowke, R.E. was here Edinhurgh.—Captain Fowke, M.E. was here lately, examining into the propriety of acquiring Argyle square as a site for the Scottish Indus-trial Museum, on which subject he was to report to the Board of Trade.—A new street is about to be constructed from the High street to the railway termini, at Waverley-bridge. It is to he called hy the name of the interest which he in commemoration of the interest which he always felt in the improvement of the city.

Montrove — Plans of the proposed new markets have heen received by the treasmer's committee from four architects, —two helonging to the town, and two residing elsewhere.

Guernsey .- The tenders for another section of the new harhour works were opened by the of the new harhour works were opened up the committee on Tuesday hefore last. Report, says a local paper, states that four tenders were sent in, and adds that all the competitors were very close to each other in their estimates. One of the tender we have very sent the very says and the tenders, we hear, requires three years and four months to complete the work.

CHIMNEY CONSTRUCTION.*

CHIMNEY construction may appear to many a very humble theme, and if we examine most of the struchumble theme, and if we examine most of the strik-tures erceted to pass smoke and foul vapours into the atmosphere, we shall find such structures are as bald as the theme is humble. To be "as hideous as a factory chimney" has passed into a by-word, or proverh of comparison; and most certainly huge piles of brickwork, without hereak in line or contour—bare, bald, and grimy—cannot he said to present to the eye with the present to the eyet the root rest factory and baid, and grany—enhant he sant to present to interve much to admire. For the most part, factory and ather tall chinneys have one form—a vertical base finished with a plain string-course; then a uniform batter, finished at the top hy a plain stone string-heavy, over hanging cornice finishings, cramped and bound in place. Many of these are, however, humpy and painful to sight, and dangerous to the structures It is not my wish to throw censure broadcast, o or

It is not my wish to thraw censure broadcast, or to recommend any suggestion now made hy reviling existing structures. I rather state opinions wilely entertained, namely, that factory and other tall chim-neys, as now erected, cannot be considered emineut for heavy. If the question "Who is to hlame?" is fully sitted, I expect the great mischifeworker "nobody" designs all the tall chimneys; for I presume it rarely enters into the mind of a cotton lord to employ an architect of known reputation to design a chimney. There are, however, exceptions, and it is to he hoped that which is now exceptional may hecome the rule. It will be no new thing to add design to a tall chinney. This fact may bave weight with some minds. In Italy and throughout the East, towers and minarets have had the best architets of the day for their designers. They have stood for the day for their designers. They have stood for ages monuments of heauty, and have heen admired by connelless thousands. If "a thing of heauty is a joy for ever," then have such towers and minarets given for ever," then joy incalculable.

Campaniles, watch towers, and minarets exist as tall and as slight in sectional area as many of our tall chimn

In Italy and throughout the East, a hare or positively ugly chimney shaft or group of chimneys is rarely to be seen. I do not remember to have seen such, but I saw hundreds which in design and form pleased the eye. A first vision of British chimery, as contem-plated from our railways, must, I fear, have caused many a nightmare to sensitive foreigners. Our house

participation from four indivisy, first, it is a subscription of the provided sensitive foreigners. Our house chimneys are for the most part hrick abortions, made more frightful hy pipes and cowls of pot, zine, and iron. To he ngly is an evil, hut such chimneys are not only ugly, they are also dangerous. It has been said, "there is a time for everything." In Italy during the Middle Ages, there was a time of huidding tall towers. In 1159 there were about 10,000 tall towers of Asinelli and Garisenda, at Bologna, show how tall chimney-like they were in appearance. The Asinelli tower remains almost entire, and is 376 feet high. Mr. Gally Knight designates towers first as a means of define, but subsequently in trivially, as a symbol of illustrious hirds. They towers first as a means of defence, but subsequently in rivalry, as a symbol of illustrious birth. They were fashionable ; and what will man not do to head a prevaiting fashion ? The trade requirements of modern times necessitate the building of tall chim-neys; and Mauchester can match the 10,000 tall towers of Piss, as the manufacturing towns can match the other cities of Italy. I sincerely hope it may he-come fashionable to strive after grace and ornament. A tall chimney need not be ugly. Mediated Chimneyr

Mediaval Chimneys.

Mediaval Chimneys. The chimney constructions of mediaval times are only tamed for the purpose of directing the attention of the student members to their heatties. Examples are to be found in castles, baronial residences, and in mansions, duting from 1400 downwards. Britton may be ensulted relative to brick constructions and chimneys in the second volume of "Arclutectural Antiquities," page 95: engraved representations are also to be found in other well-known architectural works. Old English mansions may also be inspected, but there are many modern imitations in pot, in terra-cotta, and in cement. Few are worked out as they were worked out in the honest all times. *Tall Chimane Construction*

Tall Chimney Construction Foundations

The foundation of any building must he the first instructive care of an architect. The foundation of a tall chimney may require extraordinary precentions. Rock will be excavated and dressed off to a level and Rock will be excavated and dressed off to a level au even bed. Clay, marl, gravel, saud, or varying mix

* The following is the paper by Mr. R. Rawlinson, read at selling of the Liverpool Architectural Society, as mentioned in

arkylons number + + Ms anthony is Gally Kuight. But I think there must be some mistake: 10,000 towers in one lown is a large number. Upon invaligation, the cat sussible may be equalled. We know, how ever, there were inore than two.

tures of these may tax all the resources of the engineer tures of these may tax all the resources of the engineer or architet. Au unequal or uneven foundation, part soft and part hard, is most to be dreaded. A com-pressible fuundation is also unsafe—that is, day, mari, or shale, compressible hy weight. Many of the oolitic and tertiary marks are compressible to con-siderable depths, and ought not to be trusted, however solid they may seem to be. The probability is that most of the leaning towers of Italy are founded on such strata. Some of them may stand as designed— architectural tricks—but most of the leaning towers are no doubt foundation failures. are no doubt foundation failures. The modern architect has at his command means

and appliances of the greatest utility, which were un-known to meu in former times. Steam can be brought to aid in driving timber piles, and simple applications of water or air will sink hollow iron piles with com-parative ease. The old Eastern plan of forming deep wells and then filing them up with concrete has been too much neglected. Modern well-sinkers will go too much neglected. Modern weil-sukers will go down in any strate almost to any depth—certainly to any depth required in practice; and a secure founda-tion may thus he made for the loftiest structure in the most difficult ground. Masses of concrete or of brick or stone work placed un a compressible sub-stratum, however eramped and bonnd, may prave un-safe. Solidity from a considerable depth can alone be relied on relied on

Enlarging the area of a base or foundation by foot Linninging in arts of a one of route and of not ings can be resorted to; but mere enlargement of area may not in itself be sufficient. A lofty struc-ture which is to stand secure must have solidity sufficient to maintain each part in the position in

the words is to statul sector must be position in which it is first placed. Foundations are too frequently slighted, or labour and material are wrongly applied. The compressibility of collitic and tertiary clays can only he overcome by pillag, deep sinking, heavy ramming, or heavy weight-ing. The point of hearing must be carried helow any possibility of npward reaction. A heavy embahament or heavy pile of building frequently disturbs the sur-face ground at a distance of many yards, the sub-sidence causing a corresponding rise around on either side, as the case may be. A tall chimney or tower of like proportions, huilt on such a foundation, if not made sole to a sufficient depth, would most fikely be-come a "learning tower," if not actually a fulling tower. Probably the depth of a foundation in com-pressible ground ought not to be less than one-fourth the intended beight above ground; that is, for a shaft of 200 feet the foundation should he made secure to a depth of 50 feet. This could easily be done by piling, or by well-sinking and concrete. by well-sinking and concrete.

Bricks and Mortar.

Bricks and Mortar. The lofty towers of Italy and the minarets of the East are for the most part constructed of bricks and mortar. I have examined the hricks, and I have tested the mortar, and found that neither the one nor the other is hetter than, if so good as, the modern architect may have at his command. The proportion of brick to mortar in the foreign structures differs, however, most materially from modern practice. The bricks of Italy and of the East are very thin in proportion to area of bed—9 inches square by inch, or at the most inch and a quarter, in thickness. These bricks, or (as we should almost designate them) tiles, are frequently set or hedded in mortar as thickly pared as the brick, so that there is almost as much motar as brick. From my examination I have no hesitation in saying that the permanence of the work is in a great measure dependent on this liberal use of hard-setting, tough mortar. The tornado's sweep and the earthquare shared have alike failed to overthrow these slender and lofty piles; though many times the earthquake's shock have alike failed to overthrow these slender and lofty piles; though many times they must have shaken, vibrated, and beat under the furious effects of the contending elements and dread tremblings of the earth. The elasticity and tenneity of the mortar have, in my opinion, aloue preserved the structures from sudden overthrow. It is a modern practice to sint the use of mortar. Specifications generally set forth that a bed of mortar shall not ex-ceed one eighth of an inc. It will be a use chuse ceed one-cighth of an inch. It will be a uew clause, but not any less nseful one, if at times we specify that a hed of mortar shall not he less in thickness that half of motial sharhow he test intervences than half or quarter of sain inch. In tall chimneys or towers the mortar should be of the hest quality: it should be ground by horse or steam power, and should be used liberally.

should be used likerally. Those who wish to ascertain the quality and power of mortar have only to visit the Liverpool docks, and inspect the works of Jesse Hardley. They will there find river and dock walls having in their composition almost as much mortar as stone, and the one as en-during as the other, although that stone is the hardest and best gravite. With thin brieks and thick heds of mortar the like area of the order of the other of and score of the

With thin bricks and thick heds of mortar the Halans used iron holts for bond, and some of the Eastern minarets have poles of timber enclosed ver-tically in them. Timber cannot, of course, he used in tall chinneys, hut hoop-iron for bond is well known to the profession, and its aid is highly desirable

for many purposes. Rods or holts of wrought iron, to give vertical tic, may be used; hut all tall struc-tures should depend on the strength, enhesion, and gravity of the materials, for stability and permanence, rather than on iron or other aids. than on iron or other aids.

rather than on iron or other aids. Tail chimneys have elements of destruction to con-tend with which are absent in Italian tower and Eastern minaret, namely, great heat, and gases which may affect and destroy both hricks and mortar. The only remedy against these elements will he so to design and construct the chimney as to have an inner lining of the flue, which may he ent out, taken away, and he replaced without endangering the structure. A space or air chamber betwirt the true shaft and binne will be of great service in merscript the whole

A space of the connect betwise the transmission liming will be of great service in preserving the whole. Towers and minarets have, for the most part, iu-ternal stairs, or means of access up them. Our Inrgest and tallest chimneys may easily have means of access provided, as also means for erecting temporary scaf-folding for examination and repairs, should repairs be required. This hiut will, I doubt not, be sufficient. An architect or an engineer should provide for all conti architect of an of build a tower or chinney 300 fect in height, and remove his scaffolding, without having considered the means of future examination and reconsidered the means of future examination and re-pairs. A recess, with step and hand-irons, and put-lock holes at regular stages, properly formed for easy use, may furuish means within the shaft. Openings through the shaft may form part of the design, such openings having the character of surk spaces, the formed space being filled in, but affording means for the removal of the filling without fracturing the main work of the shaft. All tall ehinneys or towers must have proper electric conductors, secured in the best manner. manner.

Colour and Ornament

Colour and ornament may be used in tall chim-neys: contrast of colour may be made to produce ornament. The common hrieks of almost any dis-triet may be sorted so as to produce contrast in tint the may be sorted so as to produce contrast in this or tone—red, and yellow or recan colour. This tint of the bricks may be preserved and heighteued by using mortar of the same tone or tint. Furnace asbes and line will produce a dark mortar; pounded red brick or red tile mixed with line will give a red tone to mortar; and cheap mineral colours may be added to matter for noiting. The acteur of warts added to mortar for pointing. The colour of mortar is sadly neglected, as the same white lime and sand are used for all topes of colour in bricks, and not unare used for all topes of colour in bricks, and not un-frequently while putly mortar is used for jointing the reddest as well as the lightest-coloured bricks; the light-coloured work having harmony of breadth and keeping—the red hrick portion being frittered and broken up by the contrast betwixt bricks and beds and joint. and joints

and joints. If precedent may be our guide in outline it may also be a guide in the use of coloured contrast; and although the use of marhles of various colours; with stone and with bricks is designated "strange and preposterous," I nust confess to a leaning in favour of colour, and most strongly advocate its use where dingy monotony may be reflexed. There are the strange that the strange and preparing the strange that the strange and preparing the strange that the strange and preparing the strange that the strange that the strange and preparing the strange that the strange that the strange that the strange that the strange the strange that the stra favour of colour, and most strongly advocate us use where dingy monotoay may he reflexed. There are plenty of brick and stone fronts dreary and wearying to the imagination. The oppressive feeling produced by a red brick-built town—if I may indge by my own by a feet offex-out town—at 1 may indee by my own sensations—is one of lasting disappointment. My curliest sensations were matured in Laneaster, a clean stone-built town. My first journey was to Preston, a town of red brieks. At this distance of time I do a town of the disagreeable feelings which came over mc, and which I suppose I never shall forget. I would earnestly recommend all architectural students to study the best brick structures of England

students to study the best brick structures of England and of the coutinent, as also the buildings in which alternate courses of hricks, stone, or marbles are need. I would not shrink from using " white, black, red, browu," or any other colour, if monotony could be prevented, and the cyc and mind gratified. The classical man may call me a Saracen if he thinks proper—I hold to the use of colour. In advocating colour, I need scarcely say that at the same time I advocate breadth and bernown, that is

same time I advocate hreadth and harmony, that is "keeping." The laws of colour must be well under keeping. The taws of color miss of even a stood, and these laws must be attended to. As in music so in outline and in colour, the student must learn well the gamut, and attend to his thirds, fifths, and octaves, or discord will be the result of his labours,—and discords in architecture are quite as disagreeable to the feelings as discords in music.

Ju recommending the use of monkled and coloured bricks, as also terra-cotta, I would direct attention to the Architectural Exhibition nov open in Suffolk-street, London, where specimens of these materials may be seen. The catalogue furnishes full informa-tion both as to makers' names and places of mann-

cahle, not only to the maker, but also to the brick-Any new form of brick must work in hond, layer. or in course, with common bricks. The dimensions of any new forms in hrick or terra-cotta should also of any new forms in mice of terra-order should also not exceed the easy manipulation of the material from the clay state to the finished and hurned brick or file; and the form in all eases should be one of strength, hoth before use, and after it has been set in surgit, not before use, and atter it is such set in any building. The form and dimensions of a com-mon hriek are perfection : there are strength, facility of handling, and adaptahility to work any useful bond. Common brieks may also be arranged to form a vast variety of ornament

Mr. Rawlinson submitted s series of very clever designs, illustration of bis views. In his description of these, he

in illustration of bis views. In his description of these, he sid: --In the designs now submitted, vertical lines are, for the most part, used where existing structures (ull chim-neys), invariably batter. There is, I conceive, great beauty is a vertical line used as proposed. For precedent I must refer to Italian examples, the obsete campaniles and theres, which is would find more than the second theres, and the second structure is an end of the second structure, and is defined the signal for the second structure, and is defined the second structure is and the second on their own base. A special foundation must then he prepared, and the obtimely will not depend on any build-ing for support, nor injure or be injured by vibration, or partial settlement in the foundations, or in the materials used. The vertical form adopted almost throughout may be objected to, as offering a larger area for the wind to set npon. My reply is, the wind will not injure a sound structure standing on a good foundation. The forces of the wind in our greatest storms araty reaches 30 h. on the square foot ; the gravity of any chimney is much and not only storms of wind, hut sho shocks of earth-in.

time of body and whether the set of the set

Thought and judgment in the design and care in the recution of any work will tall more than more expense in ornament. To the student I must reiterate the necessity of thought. Examine all the prints and drawings of build-ings you can find access to. Examine all the buildings you nee with the ercutest care, to understand, if possible, the meaning of the architect or builder; and, above all, never put a line on paper at random, nor because it is to repre-sent a form taken from some other building, and the reason for which you have not thought about. There ought not to be any chance lorms or chance deflect, but one uniform, clear, and distinct result of thinking.

BUILDERS' BENEVOLENT INSTITUTION.

BUILDERS' BENEVOLENT INSTITUTION. A special meeting of the directors of this excellent tharity was held on Monday, 23rd task, for the purpose of aking into consideration the propriety of having another bettern of pensioners in May next, the treasure, Mr, the strike of the funda would not allow of more than two pensioners being added to their present number, thirty-tak election, in November, 1850, there were nine unusu-cond be active in the strike of the second strike and the strike of the fundas of the second strike the strike of the funda would not allow of more than two stat election, in November, 1850, there were nine unusu-cond be active in the strike of the second strike thirty to idea there form, deeply regreting their ina-thirty to idea the nore, appealed to the builders generally, index a ho had not yel contributed towards the support to be institution, to nit the met the present moment, and pensioners, and extend the benefits of the charity. The baid, it was stated, would produce about 1860. On the intermediation, on many strike that as election of two builts of the last there are ended by Mr. 4. Richardson, it was resolved that as election of the baid to had not pension the strike hould be hald at the London Interm, on Thurday, 20th May next.

NATIONAL ART COLLECTIONS.

I READ in your last number a well-digested report from a committee of the society of architects, strongly recommending the purchase of the Soulages collection. Is it not wonderful that our Government, admitting, as it must, not only the advantages of art education with reference to the industrial welfare and the social and moral improvement of the people, hut its neces-sity, if we are to keep pace with the progress of street, London, where speciments of these materials sity, if we are to keep pace with the progress of may be seen. The catalogue furnishes full informa-of the furne. The time is ripe for originality of design in the new of hrick, if our young architect will ouly grapple boldly with existing difficulties. Manu'acturers may be found who will second his wishes if this plans and a katches are only practicable. They must be practi-d action of the second his wishes if this plans and a katches are only practicable. They must be practi-tion of the second his wishes if this plans and a katches are only practicable. They must be practi-tion of the second his wishes in the practi-tion of the second his the plans and the second his secon

renewal of the stand-up fight hetween the British Museum and Marlborough House. What proportion of our national art-treasures has heen supplied by collectors is shown hy the statement lately made in the House of Lords, and the records of the British Museum, much as they are often disgosted by the conduct of Government and trustees. Their patriotism has heen of late sorely tried by the refusal of the trustees of the British Museum to nuclease for a small curve. has need of late sorely fried by the remisal of the frustees of the British Museum to purchase for a small sum, the interesting, genuine, and English collection made by Mr. Faussett, notwithstanding the entreaties of the public; in consequence, some say, of their officers having too zealously pressed it upon them : there may he other and better reasons for their decision, which he denirud the construction from the new subshla he other and active reasons for their decision, which bas deprived the country of more than one valuable donation. The spirited purchaser of the Faussett eollection has very properly, in the title-page of the catalogue, registered the decision, the error of which is established by the text and illustrations of his heautiful volume. May it be a warning for the future. Q. P.

PROPOSED NEW ROAD IN SOUTHWARK

At the meeting of the Institute of Architects on the 9th, Mr. Donaldson gave a description of the streets proposed to he formed by the Mctropolitan Board of Works.

With reference to Southwark, he adverted to the importance of a direct communication from the western parts of Loudon to the Borough, the railway western parts of Loudon to the Borough, the rulway termini at London-hridge, &c. in order to avoid the difficulties of the route through the eity. He called attention to the fact, that the existing lune, on the other side of the river, of the York-road and Stam-ford-street, constituted the greater portion of the com-munication now projected by the Metropolitan Board ; and that a continuation of the latter street castwards to the Borough would complete the line. It com-mended at a point next both the Theorem Laboratory and the street of the Theorem Laboratory and the street castwards to the Borough would complete the line. It commenced at a point north of the Town-hall, Southwark, and terminated opposite the east end of Stamford and termining of piposite the case end of isolational street. This line is necessarily curved, in order to avoid, whilst clo-ely infringing upon, the College, Almshouses, Messrs. Barelay's premises, Messrs. Potts' Vinegar Works, Hopton's Almshouses, the pre-mises and market of the Hop Plauters' Company, Messrs. Eiston and Amos's Foundry, &c. The esti-meters for the line mers are follow-ry. mates for this line were as follow :-

OUTLAY.

Parena	ase oi	property	**********	• • • • • •	
Sewer					8,875
					0#30 404

RETURN. £165,390

Sale of ground-rent..... Property re-sold, and sale of old materials 33.363 198.753 Difference, or net cost...... 320,671

£519.424

L519,424 But towards this cost there were already about 90,0007. In the hands of the Government. Contrasted with the above plau, Mr. Donaldson described fre-ferring to a mop1 the route laid down by Mr. Penne-thorne in 1853, heing a straight line from a point near the Lambeth side of Hungerford-hridge, which it is proposed to widen to a carriage-way, passing close to the north side of Surrey Chapel, direct to the Town-hall, in the Borongh. This line it was also proposed to entiance castwards to Bermondsey, and westwards by a curved line to the Surrey foot of Westimister-bridge. Westminster-bridge. The main portion of the line passed through a very inferior description of property. The estimate made by Mr. Marrable was as follows:

OUTLAY

Purchase of property, good-will, and£895,104 cost of sewer

RETURN

Difference, or uet cost £263,310

Difference, or uet cost 2205,310 Mr. Donaldson briefly referred to another project by Mr. Pennethorne, in 1844, for a line direct from Westminster-bridge to St. George's Church, in the Borough, on through Bermonisey, which would then be opeared up to general traffic; as also to another scheme for widening the existing line of the New Cut and the streets beyond Surrey Chapel westward to the Borough, as a cheap method of meeting the required object. The concluded hy impressing upon the meeting the superiority of Mr. Pennethorne's plan over that about to he submitted to Parliament, as being shorter, more economical, and as bringing into more direct play and communication Wesimininto more direct play and communication Westmin-ster, Hungerford, Waterloo, Blackfriars, and London bridges, an opinion in which we fully coincide.

THE BUILDER.

[Feb. 28, 1857.

Bridgnorth New Market Buildings .- Mr. Griffiths, Architect.

BRIDGNORTH NEW MARKET BUILDINGS AND HALL.

THE new market building, which is composed entirely of bricks, in colours of red, white, and blue, is in the Italian style, after a style by Mr. one, is in the activation style, studen a style by art. Griffiths, architect, of Quatford. The main block of the huilding is square, with a tower at the north-west angle. The markets extend down Listley-street. Being a corner building, it pre-sents two facades, the one in Bank-street, the Instey-street. Being a contr binking, it pre-sents two forades, the one in Bank street, the other in Listley-street, with the tower at the angle. The general walling is of hlue brick, banded with white; the quoins, strings, and plinths being also in hrick of the latter colour. The huilding is two storied. In the main body the ground-floor consists of shops and cutrances presenting, in the exterior, a line of screa circular arches, the middle three having a pier of double width on either side, thus making them central. The arches are in alternate blocks of blue and white brick, springing from piers also in blue, banded with white. The annexed rough view must be considered as simply indicating the arrangement. The base of the tower, which is divided into two compartments by the continua-tion round it of the string of the huilding, pro-jects slightly. The compartments from the identified in the string of the human, pro-jects slightly. The compartments from the ground to the string are carried up in white hrick, banded with hlue, and have a window with circular areb in cach of the two faces. From the string to the main cornice—which is also continued cond the targen_area relations of white hunded round the tower—are pilasters of white, handed with red, with a window hetween them corre-sponding with those helow, but rather narrower. Above the cornice—which is continued from the Above the cornice—which is continued from the main building—is a hlocking of white hrick, from which the tower is raised to a considerable height, with the pilasters of red and lilue con-tinued at each angle, leaving in the four faces a receding panel of hlue. Each of these panels bas three light circular-headed windows, with a circular opening for the clock face above them. The public hall being huilt over the centre of the markets, and not being so wide, leaves two side aisles in the latter, which are roofed in with rough-rolled plate-glass. rough-rolled plate-glass.

The principal entrance to the building is iu Bank-street, through two archways, fitted up with ormanental iron gates, opening into an entrance-hall, the floor of which is haid with encaustic tiles of plain design. There is a central stone staircase, with cast-iron balustrades, conducting

central avenue by piers and arches, which support the public hall.

SURVEY OF THE THAMES.

SURVEY OF THE THAMES. Is the leading article in the *Bailder* of last week, yon ask, "Can the statement be correct, that there has been no survey of the river since that of Telford P" Allow me to say that in 1852 the Navigation Com-mittee of the Corporation of London caused a survey to be excented, extending from Battersea-hridge to Woolwich. The special object they had in view was to have an anthentic record of the existing state of the river, so that future comparisons could he made, in order to ascertain the extent of the deepening of the bed of the river which is in progress from a variety of the survey was excented quer my direction bed of the river which is in progress from a variety of causes. This survey was excented under my direction by Mr. T. Macdougall Smith ; and as the utmost the longitudinal and the numerous cross sections was taken with the spirit level ; and, by a process origi-nated I helieve by Mr. Smith's assistant, Mr. May, the precise position of each sounding was observed in such a manner that it can be exactly found at any future time. S. W. LEACH, future ine. S. W. LEACH, Port of London,

Port of London.

COMPETITIONS.

Chapel, Leeds. — Mr. William Hill, archited. Leeds, is the successful competitor for the proposed Methodist New Connection Chapel to be creeted in Woodhouse-lane, Leeds, at a cost, with boundary Woodhouse-lane, Leeds, at a cost, with boundary Sunderland Cometery.—In answer to advertise-ther task without ments offering 20%. for the hest design for chapels, badges, and from these the committee have selected a

to a landing, from which are reached the various rooms above the shops. This upper story contains a reading-room and library for the new Literary and Scientific Iastitute, a magistrates' room, and clorks' office, and the large public hall, the latter being situate at the back, and, a laredy stated, over the centre of the markets. The hall is a parallelogram of SO feet by 32 feet. The markets, which are at the back of the building on the ground-floor, are approached ither to have batched's something out of there are approved in the training out of them a pard with brick, fitted up with stalls, counters, & e, and have the gas and water liad on. Books Receibed.

The New Palaces of Administration. By A CAM-BRIDGE MAN. Cambridge: Maemillau and Co. London: Bell and Daldy. 1857.

London : Bell and Daldy.⁷ 1857. The object of this pamphlet is "an earnest appeal to the competitors, the public, and the committee," in favour of Gothic, as the style to be adopted in building the proposed Government Offices. On the ground of unity and harmony, putting aside Whitehall, the Horse Gnards, and the Privy Council Office (which latter, moreover, may come down), the writer urges, as they will be most viewed in connection with the new Houses of Parliament and Westminster Abbry, Gothic should be the style. But when so vast a pile of huilding is about to be creted, the very hest style should he adopted irrespective of neighbourhood,—and this, with strong feeling, he declares to be Gothic ... " If formality the writel, transness, mathed, square

this, with strong lething, he definites to be countries "If formality [Le write], issueness, method, square-ness, be most beautiful, then is Italian architecture most beautiful, but if bolaness, freedom, grace, if buoyant Hio and freshness be beautiful, then is Gothic the queen of styles. In short, if a straight line of rails the more lowely than the wild woods and the damaful sea, buoyant he wild woods and the damaful sea, the damaful sea, the damaful sea and the damaful sea and the damaful

The tormatrices of man." The appeal falls upon us rather as an echo than a voice; and, coming thus late in the day, can operate only as advocacy for those of the competitors who have adopted a Mediareal style. It is to be hoped that the judges, wheever they may be, will enter upon their task without any prejudices as to style, and, with the conviction that " whate'er is best adminis-tered is best," look for those who have best expressed the best thoughts.

Miscellanea.

SOCIETY OF ARTS: STREET TRAM AND RAIL WAYS. - At the meeting of the Society of Arts on the 11th inst. Mr. W. Bridges Adams read a paper on a 41th Inst. Mr. W. Drugges Audias reas a paper on a subject which we have frequently treated of,—namely, "On the Application of Rails for Horse Transit in the Streets and Environs of London, and also for Railway Branches." The paper was illustrated by diagrams; and a discussion ensued. Some idea of Wr. Adams's mode of treating the subject may her subject the subject may her subject may her the subject may her subject the subject may her subject may her subject may her subject the subject may her subject may her subject may her subject the subject may her subject may her subject may her subject the subject may her subject may her subject may her subject may her subject the subject may her sub MI Adams's mode of treating the subject may gathered from his reply to the observations advance scattered not not repy to the observations advanced in course of the discussion, and which we quote from the report of the whole in the Journal of the Society of Arts. Mr. Adams said, "It had uever been con-templated by him to cover all London at once with templated by hun to cover all Loudou at once with this system of railways—mon did he think it practi-cable to iutroduce them into narrow thoroughfares, although perfectly practicable in some localities. He thought, as regarded the traffic of London, they would ultimately have to make streets on the first floor—the face floor for the light traffic and the lower level for first floor for the light traffic, and the lower level for the heavy traffic. With regard to the railway itself, the heavy traffic. With regard to the railway itself, he looked upon it only as another mode of paving, and a strip of iron rail passing down a street would oceasion no more obstruction than the iron gutters occasion no more obstruction than the iron gutters through the pavement to carry off the water from the houses. With regard to the rails, there was no occa-sion for a deep channel—a very small one would suffice to keep the wheels in their place. He believed the plan needed only to be seen in operation to be appre-cisted and his chief in the present paper must for ciated, and his object in the present paper was to draw attention to the subject. He thought it desirable that it should he tried over a short distance, and when that it should be tried over a short distance and whom proved to be practicable there would be no difficulty in following it np. Ile saw no reason why the ex-periment should not be tried in such thoroughfares as Oxford-street or Holhorn. With regard to stopping the carriages at any required moment, there was no difficulty in adopting mechanical appliances to effect that object. Ile thought the rails ought to be laid that object. The indight is that a length requiring to be replaced could he removed with facility. He thought the cost of repairs would be small. The load upon the rails would he so much less than that on ordinary railways, that the abrasion of the rails would be very slight indeed."

The AncHITECTURAL INSTITUTE OF SCOTLAND.— AT a meeting of this Institute, held last week, Mr. Charles G. Reid, W.S. read a paper on "Primeval Architecture and its Remains"—Mr. Cousin, architeet, in the chair. The lecturer said it could not fail to have occurred to men's minds, pondering upon the Antelilavian period, to consider under what a totally different economy to ours men them lived, hreathed, and acted. His opinion was, that the people of that age had reached an infinitely higher degree of progress in science, mental and natural philosophy, and particularly mechanics, than now-a-days commonly entered into the imagination of most who had written on this subject. If this was so, on what possible ground could it he assumed, as it had often been assumed, that the first great diluvian particuce merions is aquired by himself, his family, and his competers? Was it to be supposed that all knowledge and skill possessed by the metediluvian world had perished in the Flood? This, in his opinion, was impossible. They must, therefore, fairly conclude that when the ark rested upon the mountains of Armenia, Noah and provided for the accomplishment of the great mission attrusted to them, and that they did not enter upon that mission as harharous savages beginning the work for divilization. Their great work would he to revive and emhelish and to improve the ruins of those cities und mechanical works which the Deluge had thrown down. They had thus the means of accounting for some of the lotiext specimens of architecture, and the marks of advanced eivilization discovered in ancient cities discustomhed by the moderns.

Coloured Washes For Ourstor Walls.—A Coloured Washes For Ourstor Walls.—A correspondent, signing himself "Casariensis," soys,— " As a Memher of the 'Jersey Working Men's Association, which takes in your excellent publicaition, I would feel greatly obliged to you to give the mame of any firm or manufacturer of any liquid (if there he any), which, heing applied to outside walls in the manuer of an ordinary wash, has the power to watain them *permanently* of any desired tint." No such a name occurs to us at present; but we may refer our occurs to us at present; but we may refer our execution to the description, by Mr. Wentworth Scott, of his "lachoracic paint," more than once figure in our pages. Might not soluble silicate of wooda form a basis of coloured stains P An old helymical author, who seems to know what he is evolours from all minerals." How this is done he does wood say, but the hint may suffice for new experiiments.

UWARDS OF 150 LAYES LOST BY A PTT EX-PLOSTON.—At Laud-hill collicry, near Barnsley, ou Thursday in last week, adreadful explosion took place, while nearly 200 persons were in the pit. After the explosion the pit took fire, nud hurning masses were projected even then 20 yards above the pit month. Measures were taken to subdue the fire, but it was anticipated that it would be some days hefore the pit could be entered. Sixteen persons had been hrought up alive, but some of them seriously injured, and about a dozen dead badies were picked up in the tranwoys, but as to the fate of the remainder, there is but too much reason to fear the worst. The pit, it is said, was considered one of the best ventilated in the district, and had just heeu pronounced perfectly safe hefore the poor miners had descended.

LIVERPOOL LABOURERS' DWELLINGS SOCTETT.— At a general mercting of the shareholders held last week, a report of the progress of this society was read by the secretary. It stated that the company's buildings in Northumberland.street had heen uearly completed, from the plans by Mr. Williams, the architect. The total amount of subscribed capital, including the forfeiture of 1704. on shares conditionally relinquished, was 20,9704. Of this amount the sun of \$,3407. had heen paid up: 5,3357. had been paid on account of the buildings in Northumberlandstreet, leaving about 1,0007. still to be paid. The Chairman stated that of the forty houses of the society, ninceteen were already let. He had had an application from Hull, and from Salford, asking for plans and information as to the mode of conducting such a society. The report was unanimously adopted. LIVENFOOL ARCHITECTURAL SOCIETY.—At a meet-

LivERPOOL ARCHITECTURAL SOCIETY.—At a meeting, on the 18th, a copy of the protests from the London "Architectural Association," in the case of the Museum and Middlescy Schools competitions, and a suggestion that the Liverpool Society should interfere; was received. According to the local papers, some discussion took place, in the course of which Mr. Picton said, in reference to the letter so far as it alluded to the Liverpool competition, that it proceeded on two assumptions, both of which were incorrect. The assumptions were, that the rewarded design was being carried oat, and that the committee of the Liverpool Free Library had the control over it. That design was not heing carried out, but another plan had been adopted which would make the huilding much less expensive. It had been selected by Mr. Browa, and was under his control. On the motion of Mr. Horner, it was agreed that the communication be acknowledged with thanks, and that the Architectural Association he in 'cormed that, after n full discussion of the question, the society, under all the circumstances of the case, did not feel it desirable to interfere in either of the matters alluded to. A paper, by Mr. Leeds, entitled "Modernism or Mediavalism," was read.

MODELLING CLASSES AT BIRMINGHAM .- ID YOU MODELLING CLASSES AT DIBMINGHAM.—If your notice concerning the Birmingham School of Art, published in the last impression of your journal, you have reported certain remarks delivered hy Lord Ward at the late annual meeting relative to the master of the modelling classes in that institution. As a president may reasonably he supposed to speak As a president may reasoning as suppose to speed the sentiments of a committee of whom he is the head, and as, therefore, the speech of Lord Ward, by the wide circulation which it will now obtains, is calculated to do me serious injury, I trust you will be good enough to spare me space in your columns for the insertion of this letter. Some time previous to the aunual meeting 1 had tendered my resignation, but it has sivee, notwithstanding the president's speech, unanimously voted hy the committee, that it is highly desirable to retain my services in their school. The following extracts are from the principal local papers. [We need give only onc] :---"At the public meeting remarks were made deprecatory of the modelling class From an inspection of the specimens and its tutor. exhibited, and considering that the class was only revived nine mouths ago, after becoming we are hound to say that considerable credit extinet is reflected upon the master, Mr. —, who, what-ever may be his youth and inceptorience, numistake-ably knows his work." The subjoined is an extract from a report of the public lecture delivered hy Mr. Walls, art superintendent of the district. Speak-ing of Lord Ward's speech, he remarked,—" If he had heard what was said, he should most certainly have defended Mr. —, for, as far as he was con-cerned (and he helived he spoke also for the puplis of the modeling class), he was well satisfied with the result of the seven months' work. * * * Although the specimens exhibited did not display that high per-fection which some neople scened to expect in a class is reflected upon the master, Mr. -----, who, what the spectrums exhibited du not display that high per-fection which some people seemed to expect in a class recently established in a school of nrt, still there was that in the work which plainly testified that the teacher knew what he was about.

THE MASTER OF THE MODELLING CLASSES, BIRMINGHAM SCHOOL OF ART.

Instand,—A large ragged school-house has heen recently built at New Combe, according to the Dathia Newstelter, and was opened last week. It is of stone. Mr. Maguire supplied the design, and Mr. Bolton erected the building, on a contract for 1,0707, of which 6707, have heen realised by subscription.— Steps are being taken, according to the Belfast Newsletter, for the creetion of a public hall at Belfast, capable of holding J.500 to 2,000 persons, the wast of such a huilding being most felt.—For the new town-hall of Coleraine, according to the local Chronicle, four tenders were received, two from twusmeen, Mr. S. Kirkpatrick and Mr. James H. Coyle'; one from a Derry man; and the fourth from Messrs. M'Laughlin and Harvey, of Belfast. After a careful examination of the tenders, it was found that the two latter were nearly equal, and on a division of the Board of local Commissioners, Messrs. M'Laughlin and Harvey were declared the successful contractors at 3,0217.

THE DEMAND FOR LABOUR IN AUSTRALLA, AND THE SUPPLY IN ENGLAND.—Mr. William Howiti urges, in the Times, that Government ought to he saked the plain question,—" Are there not funds in yont hands to send out the lohour so called for in Australia". And if so, why are these starving pircklayers, masons, plasterers, &c. who are so greatly needed, not sent out?" The fact is that the proceeds of the sales of lands in Australia are appropriated (or profess to he so) to this very purpose. The public immediately met by the surplus supply in England, whether it he a mere "circumlocution" hitch, or one of a more onerous description. "With this wait of labour here and this pressing demand for it there, with starvation on this side of the water and 10s. .-day for even working on the roads there, with all kinds of workmen connected with building out of work here, and there offered 14s. and 15s...day, what is the reason," Mr. Howitt tasks, "that our destitute nen and women cannet get to this land of promise from this purgotory and destitution to that paradiss of lahour ? There are alumdant funds provided for this very purpose." Meantime there is another sort of "circumlocution" at work, as a hindrance to this great good to our unemployed, hesides that of Government. It does not suit the purpose of certain political demagogues that the starving population should obtain employment : they are therefore husy in the endeavour to persuade them, hy all sorts of circumlocutory arguments, not to emigrate : the unemployed, however, appear to be awake to, the real motives at work with such advisers, and have treated them with the contempt which a total disregard of the hest interests of the unemployed deserves.

TUNSTALL NEW MARKET HALL.—I shall feel much obliged if you will favour me with a short space in your columns, to state as hriefly as possible what I consider to he most unfair conduct on the part of the constractor for the above works. In compliance with an advertisement which appeared in your paper, I sent in a tender to the Local Board of Health at Tunstall, for the ironwork required in the erection of a new market-hall, which I undertook to supply and fix for 1.750. At the request of Mr. Chapman, of Newcastle, the contractor for the huilding, I also sent him an estimate of the same amount for the ironfounders' work; and on learning, through your paper, that the Board had accepted his lender to the ironfounders' work; and on learning, through your paper, that the Board had accepted his lender to serve the *work*, which was the same amount as my own, I, of course, supposed that he had made use of my estimate, and that he would give me the job. His reply, however, was, that he intended to reserve the *cast-*iron work to himself, and that my price for the *cast-*iron work was too high. Feeling strongly the unfairness of auch treatment, and helieving that all was not straightforward and above-hoard, I wrote to the elerk of the Local Board on the subject, who said.—

"In reply to your letter of the 14th instant, I beg to inform you that Mr. Chapman's original tender was 1800. for irowavek. It was accompanied by a letter addressed to the architect, dated January 18, 1857, in which Mr. C. says,-'I no consequence of an offer which I have only this morning received, I am enabled to reduce the amount of my tender for the irowavek contract to the Tunstall market, by the sum of fifty pounds.'"

You will observe that Mr. Chapman's original tender to the Board was 50%, ahove mine, and that be addressed a letter to the architect, offering to reduce it 50%, thereby hringing it precisely to the same amount as mine. It is for you and the public to judge whether Mr. Chapman has neted fairly in throwing me overboard, after having obtained the contract through the medium of my dender. For my part I think the Board ought not, in fairness to the parties tendering, to have taken cognizance of a private letter sent to the architect, but should have decided upon the estimates such in to them npon their printed forms, and in compliance with their public advertisement. Derby. JAMES HAYWOOD, Jun. THE IMPROVEMENTS AT COVENT-GARDEN AND IN SOUTHWARK.—The City authorities are preparing to petition Parliament against the Metropolitan New Streets and Improvements Bill of the Metropolitan Board of Works. The City Improvement Committee, in their report to the Court of Common Council, recommend " that the Metropolitan Board of Works should be restricted in any charge to be made upon the surplus of the London-bridge Approaches Final to the sum which is actually required for the purposes of the improvement," and state that, "by direction of your committee, Mr. Remembrancer has been in communication with the promoters of the Bill, to far the sum to be charged upon the surplus of the London-bridge Approaches Fund at 30,000. the amount required for the Covent garden improvement," not support to agreed to the reasonable request of your committee, and we have therefore directed Mr. Remembrancer to yrepare the draft of a petition against the soid Bill, which we recommend to your bon, court for adoption." Deputy Bower, in moving that the report he agreed to, and a petition presented, said he trasted that the Legislature would protect the corporation from so scrious an attack upon their finances; and he helieved that if the presented oppor-tualty were not taken to appeal against the contem-plated injury, there would be a repid succession of uroads, which it would be a trender draft of a petition, founded upon it, was ordered to he presented to the House of Commons forthwith. The Thereforth agreed that of Canadian Meers, employ 326, personal, and have 2,788 miles of the THE IMPROVEMENTS AT COVENT-GARDEN

THE TRIEGRAPH IN CANADA. — The Montreal Telegraph Company, according to the Canadian News, comploy 326 persons, and have 2,783 miles of tele-graph fine in actual operation, and 148 more in ourse of erection. The main line is 1,100 miles in length, and there is an independent line of 660 miles, extending from Quehee to Buff.ib. Lateral lines are thrown out to the extent of 1,019 miles, and there are now 4 miles of submarine telegraph. In 1856, 000,000 messages were sent over the wires. The capital of the company is 70,0007. currency. The stock stands at 15 per cent, perainum. It has paid, besides bonuses, a dividend of 10 per cent, per annum while constantly engaged in the construction of new lines.

lines. Bisuop BURTON.—A monument, the principal feature of which is a shrouded female figure, was rocted about 200 years since by the Gee family, in the Bishop Barton Church. This monument had gradually fallen into decay, and had been laid in a yault during the last forty years. The viezar having discovered the monument, has, with the aid of descendants of the Gee family, hece neabled to restore the monument, and replace it in the church. The figure is the only part which was capable of restore-tion: this has been placed on an altar-tomi), the design of which is taken from one in Beverley Minster, called the Sisters' Tomb, and the old indesign of which is taken from one in Beverley Minster, called the Sisters' Tomb, and the old in-scriptions have been re-cut on the tomb in Old English characters. The tomb has been creeted, and the figure restored, hy Mr. Jacolino Wilkin, of Beverley

COMPENSATION TO RAILWAY TRAVELLERS .- The COMPENSATION TO RAILWAY TRAVELLERS.—The sum exponded during the last six months by the Eastern Counties Railway Company in "compensa-tion for injuries to passengers, and costs incident thereto," was 547(.2s. 94). In the purvious hal-year the amount expended under this head was upwards of 9,000/.—T. THE DOWNHAM MARKET "COMMERCIAL HALL." —An architect in a not care flattme account of

THE DOWNHAM MARKET "CONNERCIAL HALL." —An architect, in a not very flattering account of this building and its designer, informs us that it has appended to its heavy "balastrade in burnt elay made to resemble stone," which "runs along the front, returns along part of both eods," and is "tied up with ropes to keep it from fulling !"

ROADS IN ISLINGTON .- Unfortunately the Padington vestry is not the only one which neglects or refuses to do its duty. I have been a house occupier and owner in Charles street, Islington, approaching two years, and cannot get the vestry to put it into a decent state. The whole of the owners of the houses decent state. The whole of the owners of the houses composing the street are willing to hear their fair share of the expense of having it properly made, but the owners of the houses at the corners of the street neglecting, to pay their quota, the vestry refuse to proceed against them for it, shielding or excusing themselves by the statement that the Act of Parlia-ment gives them no power to compel payment of the amount from the owners of the four houses alluded to. I have read with some attention the Act of Parliament, and consider the vestry have, by the 105th, 215th, 216th, 217th, 218th, 221st, 225th, and other claises, abundant power, but the yappa-rently do not possers the will. I may say that from Mr. Pratt, the surveyor, and Mr. Layton, the ve-try-clerk, I have always received very counteons attenclerk, I have always received very contreous atten-tion; but the vestrymen will not move, though we bave memorialised them several times.

H. J. PHILLIPS.

THE BUILDER.

ARCHITECTS' COMMISSION. -On the subject of ARCHITECTS' COMMISSION. — On the subject of architects' commission, which is occupying so much attention just now, unless a very determined stand is made against the growing system of *reduced* comuis-sion, the rule will soon he to "get what you can." I believe that architects themselves are more to hlame then correlations. It is nown not however, for I believe that architects themselves are more to haime than committees. It is now not uncommon for architects to voluntarily offer to take work at reduced commission, even as low as 24 per cent, sooner than lose the job. Something should be done. What can be more vexing than for a strongling but honourable architect, who deems it wrong to take less than 5 per cent, to see? others carry off almost every matter, because they will take the work for less ?—Ax Accurrent ARCHITECT.

ARCHITECT. CAFTAIN SCOTT'S IMPROVED CEMENT.—Captain II, Y. D. Scott, of the Royal Engineers, has patented a metbod of preparing, from common quickline, a substance which, when ground to powder and made p with years, will stir acid act rounder after the up with water, will, it is said, set somewhat after the manner of Portland cement, and gradually attain a very great degree of hardness, thus differing essentially in the said the set of numer of Portana coment, and grandaty stand a very great degree of hardness, thus differing essentially in its action from the preparation of lime as ordinarily used. According to the *Mechanics' Magazine*, he takes quickline, and reverberates it in a kiln: iron pots containing iguited sulphur are then introduced, and an equable distribution of the sulphurons acid generated is obtained when the lime is placed on perforated horizontal floors. The lime may he used in lumps of the size of a cocoa.nut; and, in a properly-constructed dry kiln, one pound of sulphur is a fair allowance for each bashel of hime operated on. DRAINAGE, NOWNCH.—Extensive sewage works are contemplated in Norwich, and the question was discussed on Tuesday afternoon in the Local Board of Health. The cost of the works is estimated at \$,000?. A lengtby report by Mr. G. Donaldson, C.E. was real to the Board.

Health. The cost of the works is estimated at 5,0007. A lengtby report by Mr. G. Donaldson, C.E. was real to the Board. SOLUTION OF QUARTZ, PETREACTION OF WOOJ, &C.--COAN Dembinski, in allusion to his mode of dissolving quartz by help of carbonate of soda, for the more easy extraction of gold from the quartz, says,--one of the products obtained is silicic acid, which, besides a variety of industrial purposes, can be em-ployed in silicatising or petrifying wood artificially. Wood having by means of hydraulic pressure been saturated by it, is thus protected from rot, and from heing worm-caten or destroyed by ants. Wood, simply wetled with dissolved silicic acid, is penetrated by it to the depth of about one-cipth of an inch, and will now take a fine polish of narble or rather agate. Nixed with lime, the dissolved silicic acid, is penetrated by its to the olight of about one-cipth of an inch, and will now take a fine polish of narble or rather agate. Nixed with lime, the dissolved silicic acid forms an extremely hard, insoluble, hydramlic cement. In solution, the silicic acid is most readily reducible to silicinum—a metal perfectly similar to silver in colour, brightness, malleability, and other qualities. It is, however, nobler than silver, heenuse, except by funchydrie neid, it is, like gold, not attacked by acids : the price is at present five times that of silver. When calcined and need as a powder, silex, or silicic acid, forms, mixed Mr. Jobnson, have patented an improved system or mode of treating metal for effecting the production of cast steel at a catternely low price; also a peculiar constructi n and arrange-ment of firmaces camployed in the process of manu-facturing cast.steel. According to this invention, the hammering, rolling, and working of the metal, after having been decerburised in the pudding furnace, and the several re-heatings attendant on such opera-tions, are entired varies of the fusing granebles, wherely a saving of time is effected, or it is planged into a tark or running stream of

OFFICE TAILET.-Experiencing at times, on calling of offices in the City, a difficulty in heing unable to leave my name, or know when the party with whom I have business may return, it has occurred to me that the following plum would be appreciated, as a beneficial saving of time and disapproximent, viz.--Let there be inserted in the muniting, or panel of the Let there be inserted in the muniture, or panel 01 the door, a piece of white parcelin, or other slate, with a lead puecil attached, engraved ou the top thus; "Return * | * o'c'ock." "Please leave names." The two spaces marked * to receive the time of the intended return, by twelve figures, showing the bours, and five figures, the decimal parts of the hour, thereby preventing waste of time in ringing hells and inquiring if hourshows only a state in the hour, thereby preventing waste of time in ringing facils and inquiring of bousekeepers, who, nine cases on i of ten, canuot give the necessary information. It bring lef into the door would prevent the same being stolen; and now that many offices are being built and altered. I think it might be very advantageously used. WHITE PORCELAIN.

- On Saturday, the 21st, n con-SOCIETY OF ARTS.-Society of Aris. On Database of the Institution, in the Adelphi. The attendance was very numerous (too much so, udeed, for comfort), and the tables and wells were covered with interesting specimens of art and industry.

MARCH 7, 1857.

The Builder.

N Monday evening last, as our readers will find in a notice of the proceedings on another page, the Institute of British Architects resolved unanimously to recommend to her Majesty that the Royal Medal for the present year should be conferred on Mr. Owen Jones, for his published works, including the "Alhamhra" and the "Grammar of Ornament." The recommendation, we have no doubt, would be endorsed by the profession, not

only in our own country, but throughout Europe. In the production of his magnificent work on the Alhambra, Mr. Owen Jones

expended his fortune, 7,000% it is stated, with little prospect then of a pecuniary return, and, probahly, in opposition to the opinions of his friends, who may have thought that he was devoting his time in an unprofitable study. Strong feeling and determination, however, earried him through it, and the results have fully justified his course as respects the services rendered hy it to art, while personally, he has now probably no reason to regret it. The value of his labours in inducing a feeling for colour, and elucidating the principles of decoration, has long been felt by his professional hrethren, aud it has been wisely thought that the completion of his last work, "The Grammar of Ornament," made the present a fit moment for the hestowal of the highest reward they had to offer. most cordially concur in the compliment paid to him, and will take the opportunity to make known the scope of "The Grammar of Ornament" to those of our readers who do not already know the work.* We have already expressed in warm terms our admiration of the hook. It divides itself iuto,-Chapter 1. Oruament of savage trihes, with three plates : 2. Egyptian ornament, with eight plates: 3. Assyrian and Persian ornameut, three plates 4. Greek ornament, eight plates: 5. Pompeian ornament, three plates: 6. Roman ornament, two plates: 7. Byzantine ornament, three plates: S. Arabian ornament, five plates: 9. Turkish ornament, three plates : 10. Morcsque ornament, from the Alhamhra, five plates : 11. Persian ornameut, five plates : 12. Indian ornament, seven plates : 13. Hindoo ornament, three plates : 14. Chinese ornament, four plates : 15. Celtie ornament, three plates: 16. Mediæval ornament, five plates, and illuminated MSS. three plates : 17. Renaissance ornament, niue plates : 18. Elizabethan ornament, three plates : 19. Italian oruament, five plates : and 20. Leaves and flowers from uature, with ten plates. The leading principles in the composition of

ornament of every period enunciated hy the author, have beeu already set forth at some length in our pages. + In the prosecutiou of this work, and the study of ornament, he says he has gathered these main facts :----

" First. That whenever any style of ornament commauds universal admiration, it will always he found to be in accordance with the laws which regulate the distribution of form in nature

Secondly. That however varied the manifesta

* "The Grammar of Urnament," by Osen Jones. Illustrated by examples from various soyles of ornament and follo plates drawn - os toos by F. Beddock, and printed by Day and Son. Fublished by Day and Son, Lithographers to the Queen Gatesteret, Lincols's-inn-fields, London. † See Vol. xiv, pp. 683 and 684. Also in previous volumes.

tions in accordance with these laws, the leading

ideas on which they are hased are very lew. Thirdly. That the modificatify and develop-meats which have taken place they is order style to another have been caused by a sudden throwle to ing off of some fixed transmel, which set thought free for a time, till the new idea, like the old, hecame again fixed, to give birth in its turn to fresh inventions.

Lastly. He has endeavoured to show, in the twentieth chapter, that the future progress of ornamental art may he hest secured by engrafting on the experience of the past the knowledge we may obtain by a return to nature for fresh inspiration. To attempt to build up theories of art, or to form a style independently of the past, would be an act of supreme folly. It would he at once to reject the experiences and accumulated knowledge of thousands of years. On the contrary, we should regard as our inheritance all the successful labours of the past, not blindly following them, hut employing them simply as guides to find the true path."

His great object is to aid in arresting the unfortunate tendency of our time to he coutent with copying, but in the first instance the work will probably have a contrary tendency, and will he used hy many as a dictionary rather than a "Grammar,"-a storehouse of available examples, instead of materials for reasoning. The Manchester manufacturers, we have no douht, will, amongst others, put many of the Egyptiau patterns, iu plates, 9, 10, and 11, on to dresses for all the world.

It is curious to note the use of the fret as an ornament hy so many nations. Although popularly viewed as a characteristic of Greek art, it is to he found in every style of architecture, and amongst the first attempts of ornament of every savage trihe. Perfect specimens will he seen in some of the patterns from the ceilings of Egyptiau tombs, resulting, apparently, from their heing representations of mats-formed hy plaiting together straw, reeds, or hark-with which tents in earlier times were eovered. 'The Arabian, Chinese, and Mexican frets, although strongly resembling those of the Greeks, may have had this same independent origin. From a twisted rope, again, we get the guilloche.

In what is known as the Greek honeysuckle, our author finds it difficult to discover any attempt at imitation, and is induced to helieve that the various forms of the leaves of a Greek flower have been generated by the brush of the painter-according as the hand is turned upwards or downwards in the formation of the leaf would the character be given,-and that it is more likely the slight resemblance to the honeysuckle may have been an after recognition, than that the natural flower should have ever served as the model. The prevalence of a precisely similar form, however, in Assyrian ornament, might be quoted as affording a more immediate suggestion to the artists of Greece.

Mr. Jones is so satisfied that all ornaments on the mouldings were coloured by the Greeks in a manner to render them distinct, that he has supplied the colour in several patterus which have hitherto heen published only as gold or brown ornameuts on the white marble

Greek art " earried the perfection of pure form to a point which has never since heen reached ; and from the very ahundant remains we have of Greek ornament, we must believe the presence of refined taste was almost universal, and that the land was overflowing with artists, whose hands and minds were so trained as to enable them to execute these beautiful ornaments with nnerring truth.'

The selection of Greek (painted) ornament is very full and heantiful. The chapter on Roman ornament, and the illustrations of it, are less satisfactory than some others. The amount of design in Roman ornament, consisting univer-

"The Romans ceased to value the general proportions of the structure and the contours of the monlded surfaces, which were entirely destroyed hy the claborate surface-modelling of the ornaments earved on them; and these orna-ments do not grow naturally from the surface. but are applied on it. The acanthus-leaves under the modilions, and those round the hell of the Corinthian capitals, are placed one hefore the other most unartistically. They are not even bound together hy the uceking at the top of the other held but are not the units in this of the shaft, but rest upon it; unlike in this the Egyptian capital, where the stems of the flowers round the bell are continued through the meeking, and at the same time represent a heanty and express a truth."

Until this principle of leaf within leaf and leaf over leaf was given up for "the adoption of a continuous stem throwing off ornaments on either side," pure conventional ornament reecived uo development.

In the mosaic pavements of the Romans we find the types from which may be directly traced all the variety of Byzantine, Arahian, and Moresque mosaies.

The examples of Arahian ornament contrihuted hy Mr. James Wild, from the mosques of Cairo, are very interesting, exhibiting, if the date given to them he correct, types of those forms which reached their perfection in the Alhamhra. One feature introduced hy the Moors into their surface ornament should be noticed, namely, the number of planes, sometimes three, on which the patterns were drawn, the ornaments on the upper plane being holdly distributed over the mass, while those on the second interwove themselves with the first, by which arrangement hreadth of effect was given when viewed at a distance, and beautiful decoration obtained for eloser inspection.

The chapter on Moresque ornament, illustrated mainly by the Alhamhra, is, as might be expected, one of the most complete and diseriminating, involving many of those points which were set forth by Mr. Jones in his paper printed in this Journal, already referred to. was, indeed, a wonderful system of ornament, in proof of which nothing more is needed than a journey to the Crystal Palace, at Sydenham.

Of Iudian orunment, a number of elaborate and admirable specimens are given, and our author refers, as a matter of course, to the wonder which was excited on the opening of the Great Exhibition in 1851, by the gorgeous contributions of India, exhibiting, amid the general disorder every where else apparent, so much unity of design, skill, and refinement.

"Whilst," he says, "in the works contri-huted by the various nations of Europe there was everywhere to be observed an entire absence was everywhere to be observed an entire assence of any common principle in the application of art to manufactures,—whilst from one end to the other of the vast structure there could he found hut a fruitless struggle after novely, irrespective of finess, that all design was based upon a system of couries and mismolizes the prrespective of finces, that all design was based upon a system of copying and misapplying the received forms of heauty of every hygone style of art, without one single attempt to produce an art in harmony with our present wants and means of production——the carver in stone, the worker in metal, the weaver, and the painter, borrowing from each other, and alternately mis-nulping the forms meaningly unworride to applying the forms peculiarly appropriate to each, there were to be found, in isolated collections at the four corners of the transepts, all the principles, all the unity, all the truth, for which we had looked clsewhere in vain, and this hecause we were amongst a people practising an art which had grown up with their civilization, and strengthened with their growth. United hy a common faith, their art had necessarily a common expression, varying in each according to the influence to which cach nation was subject ;- the Tunisian still retaining the art of the Moors, who created the Alhambra; the Turk exhibiting the same art, but modified by the acting in normal ornament, consisting univer-sally of a seroll growing out of another seroll, they rule; the ln han, uniting the severe forms to he small. finement.'

Vol. XV .--- No. 735.

this beautiful book, which, we may add, is admirahly printed and bound. The ornament on the outside of the cover is an illustration of eclecticism worth notice. The Egyptian lotus and papyrus plaut form the centre : on each side of these opens the Greek honeysuckle, with, farther to the right and left, the Gothic trefoil and einquefoil and Moresque scroll-work, with Roman acauthus leaves as a hase to the whole.

Mr. Bonomi and Mr. James Wild (in the Egyptian section), Mr. C. J. Richardson (Elizabethan specimens), Mr. J. B. Waring (essays on Byzantiue and Elizabethan ornament), Mr. J. O. Westwood, Mr. Dresser, Mr. Digby Wyatt (by an admirable essay on Renaissance ornament), have rendered aid in the production of the work. The drawings have been chiefly executed by Mr. Albert Warren and Mr. Charles Auhert, the author's pupils, and by Mr. Stubbs; while Mr. Francis Bedford and his assistants, with their accustomed skill, have drawn the whole upon the stone, and have executed the 100 plates in less than a year. To Messrs. Day and Sou, the printers, and at the same time the publishers, of the work, we cannot give too much praise their own energy and enterprise, and the great resources of their large establishment, are shown by the rapidity and excellence with which so vast an amount of colour-printing has been executed. It is necessarily a costly hook, and should he bought hy the directors of public libraries as a matter of duty. The Government should also purchase copies for all the provincial schools of art, and to present to foreign libraries.

THE CHURCH OF ST. ANDREA. AT VERCELLI; AND THE GOTHIC ARCHITECTURE OF ITALY.

THAT version of Gothic architecture which is found in Italy is becoming the subject of more attention than it has hitherto received. We are attention thau it has hither or received. We are led to hope that the study of it may not he delineation, or to a simple effort after reproduc-tion, such as has in many another case militated fatally against art viewed in any aspect. The eircumstances of the introduction of the style into Italy, and its position there, deserve to be viewed for the lessons which we may now derive; and a fair comparison of the merits of the English and Itahan manners should he ard at he best exemplification of the value of art and the best exemplification of the value of art and the Oese exemplaneation of the value of the Gothic principles. If the Gothic style is to be a system of architecture for use during the future, should we not consider whether in importing what is called the Italian Gothic, we importing what is called the Italian Gothic, we might not repeat a passage in the recent history of architecture of too frequent occurrence,— when the style in favour has here abandoned just as its forms and principles were hecoming understood, and the course pointed fair for ex-tending the domain through the region of art? Such a mosnet as this last, surely now is non-Such a prospect as this last, surely now is open Such a prospect as this fast, surely now is open to the systems, the forms and principles of which have become—during the improved resources for study lately—more familiar to the sight and responsive to the grasp of our architects.

The new love of the Italian Gothie muticates a proper waut, hut likewise offers a snare. After allowing all importance to the inducements of an archaeological sort—and those which even there are heyond question, pertaining to fresh ara to as the prescut advocates of the style might production in art,—and after admitting what there is the to the language of some writers, there is the to the language of some writers, there is the to the language of some writers, there is the to the language of some writers, there is the to the language of some writers, there is the to the language of some writers, there is the to the language of some writers, there is the to the language of some writers, there is the to the language of some writers, there is the to the language of some writers, there is the to the language of some writers, there is the to the language of some writers, there is the to the language of some writers, there is the to the language of some writers, there is the to the language of some writers, there is the to the language of some writers, there is the growth of the frechige that reproduction—as especially in church architecture, of forms in the insolt the date of a style and manner;—of acts ufficient itself to raise write that first impression conveyed is one of their exact similitude to others—is an object write that the superior of a style and manner is ever imprediction of a style and manner is ever style and another. The influence of the Cru-sades, which brought many Eastern forms and prealiar value may, we think, be learned from The new love of the Italian Gothic indicates The new low of the Italian Gothic indicales a proper want, but likewise offers a sarc. After allowing all importance to the inducements of an archaeological sort—and those which even there are heyond question, pertaining to fresh production in art,—and after admitting what may be due to the language of some writers, there still is, if not a justification, an explana-tion, of the use by some of our best architects, of features which are common in Italy. In which

We must take another occasion to refer to minedly, or during a long period, avert their is beautiful book, which, we may add, is there are a set of the cover is an illustration of the outside of the cover is an illustration of lecticism worth notice. The Egyptian lotus classical elements and details structural and classical elements, and details structural and decorative of even the Northern Gothic. For For the architect to pass hy anything that such a country could produce, would be to deny him-self proper material of his art, —as also to manifest himself unsusceptible of impressions which should be those of artists.

But it may happen that neither the discovery of the fact of the waut, nor the admiration of beauty elsewhere, suffice to supply the precise thing wauted. Passing by the difficult question-"what old style has most claim to attention as the base or the vehicle of art ?"—a question which would sink in importance were *art* prowhen would sink in importance were *art* pro-perly estimated,—we may venture to say that the course is not through the subversion of eurrent practice,—as in the matter of *style*— which may be called the language of art. In the English Gothic system (as, indeed, in the Italian Classical) we have a contenue and consideration English Gothic system (as, indeed, in the Italian Classical) we have a copious and a productive language—one which need only he enriched, as all language may he, consistently with itself, by the importation of foreign materials. The analogy between language and style may not be complete; but it is sufficiently so to justify our use of it for present purpose. Thus, we can complete; but it is sufficiently so to justify our use of it for present purposes. Thus, we say, it is when the study of the language is ended, that we are ready to begin to use what we have gained. If the moods and phrases of English Gothic have been used up, so much better ought it to be for *architecture*. Instead of progress, will not the change to Italian Gothic merely shift the basis or vehicle, and place us once again at the bottom of a new and different course? course ?

Do we conceive that style chosen is a matter Do we conceive that style enosen is a matter numportant? Compare the Gothic of England with that of Italy. Settle the question of "Classic versus Gothic," either way as to merits,—the English Gothic affords a suc-cessful expression of the principles of the general style in regard to which, although we may not essint expression of an entropy of the guidant style, in regard to which, although we may not have the fragment of a sublime cathedral like that of Cologne, or a choir with the altitude of that of Beauvais,—if, in short, we have less

that of Beauvais,—if, in short, we have less grand though executed designs, less vastness in parts and less intricacy in detail, we have what is of more value towards progress, namely, the perfect use and demonstration for ns of what has been referred to --the " true principles." The Irbiton Gothic is we holive model.

The Italian Gothic is, we helieve, vasily in-ferior as architecture, or as the foundation of new art, to the English,—and for the reason, that it pursued no self-consistent or deterthat it pursued no self-consistent or deter-mined course. Neither the Gothic principles, nor the garb in which they are placed, were ever dominant in Italy,—either the true principles, or the particular style. Italy exhibits the specor the particular style. Italy exhibits the spec-tacle, so remarkable to one acquainted with their contemporary English architecture, of several concurrent styles,—of exotic or native styles taken up, and laid by, and again taken up and relinquished. When the church at Vercelli was commenced, the Romanesque and Byzantine styles, under various forms, were in use. Yet styles, under various forms, were in use. Yet after the introduction of a Gothic style in that after the introduction of a cottine scyle in that church, the building was completed in the Romanesque,—which, indeed, is the style of the whole exterior, the builtresses hardly excepted. The high-pitched root, with galle, was, we might almost say, never, fairly used; the archi-nge of the builting chains of the prob-

the interference with regular progress which the interference with regular progress which was effected by the partial and temporary acceptance of the Gothic in Italy. To achieve great works in art, as in every other course of exertion, the line of action must he direct, and the guidance resolute. It is impossible to accept a leading principle in part, or to pursue contemporaneously several courses, each claim-ing to he placed as principal. Judgment must be exercised; but action and the result equally require that selection should be made; that be exercised; but action and the result equally require that selection should be made; that objects should be placed in an order of relation; and that the course should be taken with deter-mination and self-relinner. The English Gothic and the Italian classical styles each have leading dimension course of an conceite objected or the selection. principles, some of an opposite character—but the relative value of these last is of less moment so long as the principles are directly acted upon. The choice of a style should he made mainly as to what is most in unison with existing taste.

Thus, whilst all materials should be known to the architect, good art may he served in the very act of rejecting some of them. We do not mean to say that the buildings which arc called cxamples of Gothic architecture in Italy, are nuworthy of attention, or that they are abso-lutely wanting in some character of their own. But we would show what we believe was the fact, that the style operated in the manner of interference with the development of archi-tecture in Italy, and that it did so simply because the true Gothic was ueither holdly chosen, nor absolutely rejected, as principal or fundamental in the huildings which were designed. In short, in every work of architecture, a guid-ing principle, say that of style, should be present; hut on this, modifications may be grafted We do not very act of rejecting some of them.

In short, in every work of a holm converse space ing principle, say that of style, should be present; hut on this, modifications may be grafted from other styles, and might or should be viewed as infinite. When, however, opposite principles contend for prominence, the result is what has ever been disconntenanced as example by all the best writers. Hybrid and nonde-script works are produced, and if the result in these is often a really new style, of a certain script works are produced, and in the test in these is often a really new style, of a certain ment, no artist would recommend an effort to do that designedly which results rather from accidents. It is essential to art that there should be defined principle dominant.

The two principles which are opposite to one another in the Classic and Gothic systems, are those of the horizontal and veropposite Gothic systems, are those of the horizontal and ver-tical line; and it is curious to observe how, in distinct parts of the same building, the two may be found, yet how they war against each other when it is sought to mingle them in equal proportions. Such intermix-ture is thought to constitute one source of the description of the optimization in the description of the theorem of the optimization of the description of the description of the description of the optimization of the description of the descriptio the standard of the constitute out source of the decadence of the Gothic style in England. In the Italian or rather English forms of the bell-tower in classical Italian architecture, any con-siderable interference of the horizontal line with the verticality which is the required leading fea-tion of the detand from the amounting Inthe verticality which is the required leading fea-ture, is felt to detract from the composition. In fact, the arrangement of elements in a work, as principal, secondary, and subordinate, is a re-quirement in architecture, of whatever style,---just as Reynolds pointed out that it should he, in other species of composition. It is such a want of a dominant and defined principle which makes the defective character as it appears to want of a dominant and defined principle which makes the defective character, as it appears to us, of Italian Gothic as compared with the Gothic which we have in England. The Gothic-of Italy is, in many details, similar to that of Wren, and is defective as Gothic for much the same reasons. Comparing it with the Gothic of the back comparing the time which Betty same reasons. Comparing it with the Gothic of the last century, or that for which Batty Langley has the credit, it is impossible to avoid the idea of a certain resemblance. It has a greater likeness, we think, to these than to the best Northern Gothic contemporary with it. · Looking at the history of art in Italy, there is much in this which would tend to fortify the opinious here varianted on . The Italian

inventions to Western Europe, the foundation inventions to Western Europe, the foundation of the orders of meudicant friars, preparations for the building of Salisbury Cathedral, and the chief monuments in a style which was imitated, though in au exceptional case, in Italy, may all be said to have had more or less concern with the new innovation. Of all these causes, the chief was the rise of the Franciscans and Do-winners who conceillut the form such that effect an entire reformation in the Church. By them the pointed style, first introduced at Vercelli, was re-introduced, as in the church of San Francisco, at Assisi, bearing date 1228; and the same order retained an especial regard for the state which we don't it.

for the style which they adopted in that building. Vercelli is in Piedmont, and is situate at about equal distance from Turin and Milan. The first stone of the church was laid in 1219 (or one year earlier than the dates of the commencement of Salisbury Cathedral, the rebuilding of Westminster Abhey, and the catbedrals of Amiens and Friburg), and the cathedrais of America and Friendry, and the church and the monastery were finished in 1222. The plan is a regular cross, with aisles, a central tower, and two western turrets, four chapels to the transepts, and an atrium before the western end. There is placed askew, ncar the angle of one of the transepts, a de-tached bell-tower. The features which are those of pointed architecture, are those of the piers, arches, and groining, and the buttresses so far as the presence of them may be deemed impor-tant. The choir or chancel is not apsidal in its termination, but has the square end usual in

termination, but has the square end usual in England. There seems to be, we may observe, some error in the statement reported in our pages last week, that the majority of the Italian Gothic oburches have not the apsidal termina-tion. We think the reverse would be the case. The *chapels* at Vercelli have polygonal ends. But the choir has the square end and laucet windows of the English Gothic; and the round piers and clustered shafts with moulded bases of Early English character, and the quadripartite groining are sufficiently near in their resem-blance to disclose their origin. The imitation, indeed, is markedly such; the work is not one of fresh and life-like art, and therefore may not deserve all that has been said of it favourably. The nave arches have a small chamfer, or some thing of that nature, but otherwise are not enriched, and in place of vaulting shafts in the usual English manner, the face of the pier itself usual English manner, the lace of the pier itseuf is carried up—which gives the appearance to the elerestory of being built in subsequently. But the central tower—octagonal above the square of the intersection—which has a diminished stage and pyramidal capping; the lofty turrets at the west, square with pyramidal cappings; the three western doors with shafts, but circular heads; the small circular-headed windows in the aisles and elsewhere; the circular window in the aisles and elsewhere; the circular window in the west front, and the small arcade along the clerestory, repeated in two stages at the west; the low-pitched rol, and the atrium — are all features characteristic of the earlier, or rather the then existing style, — though they were completed after the Gothie portion of the building.

The story of the origin of this structure interesting. There was born at Vercelli, at the end of the twelfth ceutary, one Guala Bicchieri, who, after devoting himself to the study of eccle-siastical and eivil law, and adopting the clerical profession, removed to Rome, where he was at length raised to the purple by Innocent III. Guala was sont as legate to France in 1208, and again in 1215, when the pope was trying to dissuade Philip the Fair from attempting the conquest of Eugland. When the invasion under The story of the origin of this structure is dissuade Philip the Fair from attempting the conquest of Eugland. When the iuvasion under Louis took place, Guala went at the same time to England, and was energetic in the support of King John. On the death of the latter, lie took an active part in establishing Henry III. ou the throne, for which the king gave him several benefices, and amongst them the priory of St. Andrew, at Clesster. Gaala afterwards returned to his native eity, and, passing through France, en-gaged as his architect a Freuch priest, Thomas, afterwards at Vercelli the first abbot of the con-vent, and at Vercelli he founded the Collegiate Church, which he dedicated to St. Audrew. There is sufficient evidence, besides the dedica-tion and the style of the church at Vercelli as

THE BUILDER.

commenced, that Guala had acquired English habits and prepossessions. He makes bequests in sterlings; relics of English saints were amongst his gifts to the church; and a collection of his own, and adopt the style that may seem good Auglo-Saxon poetry which helonged to him is in his own cyes, is to be lamented as tending to now in the cathedral library, the chief picce being the metrical legend of St. Andrew, well hown to Auglo Saxon poetry which helonged with the source and our buildings being the metrical legend of St. Andrew, well hown to Auglo Saxon shelpes a durbid

being the metrical legend of St. Andrew, well known to Anglo-Saxon scholars, and which may have been published. The church at Vercelli, we may thus see, was a building wholly exotic in its style. As an example of the Northern Gothic, it is of no value beyond the interest of the story connected witb it; and an exemplification of Italian Gothic it is not.—being in another version and not having is not,-being in another version, and not leaving any impress behind it. But even at a much later period, the German Gothic cathedral of Milan was built, and was coëval with a style very different to it—the classical architecture revived by Brunelleschi.

During the interval between the date of this last building, belonging to the close of the fourtcenth century, and the building of the church at Assisi, previously mentioned, a con-siderable number of Gothie churches were erected, and amongst these was the cathedral at Sienna, in the thirteenth century, as to which we helieve there is some positive evidence of its we helieve there is some positive evidence of its having supplied a suggestion for the octagon at Ely Cathedral, and thereby for the similar arrangement of the piers and arches in our present St. Paul's Cathedral, the Campo Santo at Pisa, completed in 1283; the small chapel or oratory of Santa Maria Della Spina, at Pisa, by Giovanni Pisano, profusely enriched with cano-pies and sculpture; the church of Sant' Anatonio at Padua, by Nicolo Pisano, dedicated in 1231, and having domes modified from those of St. Marc's; the interior of the church of Santa Maria Novella, at Florence (1279); the cathedral at Orvieto commenced in 1290, aud remarkable for the mosaic of its exterior; the church of Or San Michele (1284); the the church of Or San Michele (1284); the church of Santa Croce, at Florence (1294); the cathedral of Florence, founded in 1296, or 1298, of which the dome, founded in 1290, or 1290s, of which the dome, designed by Arnolfo, and executed by Brunelleschi, probably with little variation, may be regarded as a better applica-tion than those at Padua, of the form to a Gottie building; and many others.

We should also name the town-halls of many We should also name the town-halls of many of the cities, some of them with marked Sarace-nie features, and the noble Loggia dei Lanzi, by Oreagna. The last of these bas circular arches, the form of which had nover been laid aside. But, perhaps, it has little beyond a few details to characterise it as Gothic. The Italian Gothic architet was think had

The Italian Gothie exhibits, we think, had treatment of those details, which are mainly architectural, though something which may be of value in the use of coloured materials. The sculpture and the architecture were in an union of could be but not to consolitions and arbitrary of position, hut not of associatiou and relationship. The architects were sculptors who prac-tised as architects, - men indeed, the Pisani fised as architects, — men indeed, the Pisani, studious of the antique, and constituting a noble school, — yet rather by accident than hy study, architects. They came too early for the union of their real art, with the architecture of the Revival, and joined their sculpture to the architecture which circumstances, political or likense reas to their heads. religious, gave to their hands.

R. SYDNEY SMIRKE'S FIRST LEC-TURE ON ARCHITECTURE, AT THE ROYAL ACADEMY.* MR

It this country, architects are not untre-quently asked, in a somewhat disparaging tone (and the same inquiry may be made in other countries), "What is the style of the nineteenth century? We know with precision the dis-tinguishing style of the eleventh, and of the thirteenth, and of the fitteenth is the style which is claimed as distinguishing the nine-style which is claimed as distinguishing the nine-style which is claimed as distinguishing the nine-In this country, architects are not unfre-Size which is claimed as distinguishing the nine-tcenth century? " This is a question which I am bound to admit it is extremely difficult to answer; for huildings from every climate under the sun, and of every period since the Pyramids, are candidates for our admiration, and find spec-trors willing to be absend. If we wolk in the supertators willing to be pleased. After making every allowance for the charm of variety, and the

* See page 116, ante

In his own cyces, is to be lamented as tending to make our architecture moltcy, and our buildings incongruous with each other; causing our gables to he of every conceivable angle, and our columns of every incaginable proportion. But so it must be until the republic of taste shall submit to a dictator, or the vision of an eminent writer of the present day shall be realized,— who dreams of some happy future when we shall all. by common consent. arcree to build in accord. all, by commou consent, agree to build in accord-ance with the canous of the thirteenth century.

But there is another class of enthusiasts with but there is another class of churchess whose whose views it is impossible not to sympathise. Full of hope and confidence, they watch day and night, in the full assurance that a new style will night, in the full assurance that a new style wur one day spring up, freeb and bright from the mint of genius, ready for the current use of the remainder of the nincteenth century. I have already said enough to show that I can hold out little hope of such a new birth, or that

the effort to generate such a phenomenou would be productive of any creditable result. The experience of all ages shows that the fluctuations of style are the result of causes over which man can exercise but slight control. The varieties of soil—of climate—of available materials,— the history of our art.

It may not be unprofitable to occupy a few moments in noting some instances of the operation of these external influences.

The style now hown as Byzantine owes its real origin not to the inventive labour of any individual artist, but to the struggles for imperial power in Rome, which led Constantine to esta-blish the seat of his government on the Bos-phorus, and so brought Eastern and Western this to each combine many inclusion. art into such combination,—each imbuing the other with many of its peculiarities,—that this "Tertium quid," the Byzantine style, came into existence.

The style known as that of the Renaissance The style known as that of the Renaissance is traceable not to the mere ingenuity of artists, but to the extraordinary growth of the power of the Turks, who, sweeping before them the de-generate remnants of Roman power, pillaged Constantinople, and seattered its comparatively polished inhabitants over Europe, there to sow the seeds of a taste for Classic literature and art.

art. The style of architectural decoration called The style of architectural decoration cancer Raffaellesque, after the great artist who first practised it, really owes its origin, not to the uventive powers of that master, but to the eager excavations in search of Classical anti-quities, which led to the accidental discovery of the Baths of Titus.

Then, if we turn to another class of architec-Then, if we turn to another class of architec-tural design, we shall find that castellated struc-tures, with their lofty towers and frowning machicolations, totally altered their style and aspect at about the fifteenth or sixteenth cen-tury,—not from the caprices or ingenuity of artists, but because some unknown person had chanced to discover the chemical effects of com-bining in certain promortions uitre, subdur and bining in certain proportions nitre, sulphur, and

If we descend to times nearer to our own, we shall find like examples of the influence of accidental causes over the fate and fortunes of high art. Napoleon for awhile found it his policy to take Imperial Rome as his model, and to obliterate as far as possible the reminiscences to obliterate as far as possible the reminscences of the ancient regime: hence Percier and Fon-taine, following out, not an asthetic law, but a political necessity, inundated France, and by consequence, Europe, with representations of curule chairs and the lictors' fasces; and at once the florid school of Louis XVI, was superseded by the severer forms of classical autionity autiquity.

auteganty. If I could safely venture on such tender ground, I might draw further illustration from the ardent revival of Mediceval art in our days. An enthusiast which all the lahours of a [Carter, a Lysons, a Britton, and the elder

Pugin failed to kiudle, burst, hlazed forth at the call, not of archaeology, but of a class of religionists, who sought to feed the eye and the imagination with the materials of a more object the worsbip. But I have adduced enough to show how secondary a part mau's inventive powers seen to have played in bringing about the revolutions that mark the history of art. He may seek to lead, but he finds hinself con-demued in a small deeme to follow here here He may seek to lead, but he must hunden to be demned in no small degree to follow: he may each the favouring gale, but the helm is held by other hands: he may cultivate, and graft, and train, but the seed has been sown for him. In saying this, I would not be thought to depreciate individual aspirations to originality,

but I would dissuade you from being misled, by the specious cry for something new, to tempt the dangers of that wild and perilous pursuit

Seek rather to become thorough masters of

pursuit. Seek rather to become thorough masters of the styles of our forefathers. Seek rather for that which is good, than for that which is new; and in this search you may perchance fall in with something new which is good. The genuis of our forefathers has conceived two great styles, into which all architecture, as hitherto developed, may be ultimately resolved, the Classic and the Mediaval. These are the two great mines in which you have to work : they are not only not exhausted, but they are practically inexhaustille. They are two systems which, however gradual in their growth, how-ever originally intermingled, have now become perfectly distinct and widely different. Yet both are alike true and simple; both are alike rational aud consistent, for both are hased, more or less, on the laws of ma'ure, and the rational ways of man. rational wants of man.

The spirit of party, which is apt to enter into most of our speculations where the mind is free, enters somewhat too largely into the republic of art; and architects, as well as con-noisseurs, are too apt to rauge themselves as partisans of this or that style. So long as this partisans of this of this size. So long is this spirit tends only to promote enulation, and to raise up zealous patrons of art, it is not to he lancented; but when, as such a spirit is apt to do, it narrows our view, or warps our judgment, the effect becomes injurious to the cause of art and of truth

At all events, you shall find in me uo exclu-ve partizan. I see no reason why both styles Sive particular. I see no reason why both styles should not flourish together in like houour. There is no monopoly of style in the works of nature. She excites our and initiation — awes us -delights us, with every possible variety of means, with all the magic of colour, figure, and dimension

From certain laws, it is true, she never departs : certain principles are with her fixed and immutable, but heyond those of truth and of aptitude, what hounds does she submit to? She loves to resort to a thousand expedients : she is fain to adopt a thousand different modes of doing the same thing, surprisingly varied. Why, then, should we, though humbly following her, as becomes us, at a remote distance, why should we conceive ourselves under any obligashould we concerve ourserves under any obliga-tion to adopt, as our rule of design, one special system? We see her expatining over the whole material world, importing heavy from endless sources; why should we rule in a groove, and hold our own to be the only orthodox line.

in which but out to be the only obtained to run? Other more suitable occasions may present themselves for a detailed comparison of the two styles just referred to, hut there is one point of distinction so broad, and so unquestionable, that I cannot refrain from here adverting to it,--I mean the subordination of horizontal lines to vertical lines in Pointed architecture, and of vertical to borizontal lines in Classic architec-ture. If we regard the latter in its whole range from the primaval efforts of Egypt, down to the latest vagaries of the Borromiu school, we find horizontal lines always dominate: the entablature, in some shape, is scarcely ever wanting: cornice, coping, halustrade, string-course, all have a horizontal tendency; and, when vartical lines are resorted to there anears to course, all have a horizontal tendency; sind, when vertical lines are resorted to, there appears to be a perpetual eggences, as it were, to inter-rupt their continuity; --whilst, when we turn to Mediaval architecture, from its explicit distinct development to its final extinction, a stined, never-failing tendency to vertical lines and up- I re

necessity occurs for a horizontal feature, it is kept insignificant by faint projection and fre-quent interruption. Height, in fact, appears to have been the dominant thought of all Medizeval architects.

This striking and fundamental distinction is the chief cause of that impassable line of sepa-ration which now exists between these two systems of design-each so beautiful-yet great so different.

I should be ill expressing my own feelings if I were not to urge on you a close, diligent, study of both these styles; for both are alike deserving of our attention. The younger style ueserving of our attention. The younger style we may pronounce, as compared with the elder, more free and picturesque; more plastie and managenble; more varied and copious in its details; more intimately associated with our biggore and in contact of the state biggore and in contact of the state of the s deserving of our attention. and in ecclesiastical structures the habits of six centuries have interwoven it with our religious feelings. On the other hand, the elder style we may regard as more symmetrical, solid, and severe; more polished, and in some of its later phases more applicable to festive and

cheerful purposes. The great aim and object of all style, as such, is to produce certain forcible impressions on the mind, which impressions are usually classed the mind, which impressions are used by closed under the two leading heads of the sublime and the beantiful. I shall not launch out into any metaphysical inquiry on the nature and sources of these two wide topics. The field of inquiry of these two wide topics. The field o has been so often and so ably trodden has been so often and so ably troaden, that it would be difficult to gather ainy new flowers in such a search. The subject has been amply discussed : from Longiuns to Burke and Alison, the sublime and heatiful have been favourite topics with the highest intellects and the profoundest thinkers.

To such sources, then (if you should have the To such sources, then (if you should have the curiosity to pursue an inquiry from which I cannot promise you very much fruit), I would refer you for the study of the two great instra-ments by which our art is supposed to acquire its power to affect the spectator's mind.

Ou some future occasion I may be called upon again to refer to these great qualities of art; hut it will be for the philosopher, and not for the artist, to trace out the nature of these affections of the mind: enough for me, the humbler task of pointing out some of the uncaus hy which these mental emotions are physically produced.

I hope, however, it may not be held pre a nope, nonver, to hay not be need pre-sumptions in me to say, that amidst the pro-fusion of written learning lavished on these topics, not a few fallacies may occasionally be encountered.

You must, therefore, read with thought and You must, therefore, read with thought and attention, remembering that what is well said is not always truly said. Thus, Alison, too eager to prove his favourite dogma, that there is no such thing as inherent beanty in any object, will advance opinions to which all the refine-ment of his polished pen will scaredly avail to command our assent. He states, for example, ment of his poinsned pen win scattery avail to command our assent. He states, for example, that "what we call heauty in colour is not due to any original or independent beauty in the colours themselves, but to associations we the colours themselves, but to associations we connect with them." When we enter upon the subject of colour, it will, I trust, he clear to

Just that this is an unfounded theory. He tells us, too, that " no forms, or species forms, are themselves originally beautiful; or forms, are themselves originally beautiful; but that their beauty, in all cases, arises from their heing expressive to us of some pleasing or affecting qualities." Against this theory we have but to set up the very opposite theory of another rest when the very opposite theory of have but to set up the very opposite theory of another writer, that great and original gouins. Hogarth, whose whole book is devoted to prove the inherent beauty of one particular line,—the one, curvilinear, line of beauty! As if the sources of beauty were not endless! as if a line to the indication beauty were not endless? had an intrinsic heauty independent of the use to which it was applied, or the nature of the object of which it forms the external boundary!

With no greater violation of truth, we might attempt to define the hue of heauty,—in paint-ing; or the uoie of beauty—in music. Again, it is a prevalent and plausible story, that the true beauty of an object consists solely in its fitness for the purposes for which it is de-

ward extension is manifest. When a constructed is a fundamental defect to which nothing ever can, or ought, to reconcile us. But to urge that utility is all that is required

but to arge that houry is an that is required to impress us with a sense of hearty, would surely be going too far. In nature, the mother and mistress of all arts, there are many illustrations to which I wight arcs.

might appeal

might appeal. The legs of a peacock, for instance, are surely more directly useful than its tail; but how un-seemly are they, when compared with that gorgeous appendage. No doubt there is great beauty in the fitness of the leg for its purpose, but there is a beauty in its plumage,—cf another in producing lively pleasure in those who con-template it. The beauty of the leg speaks rather to our reason than to our feelings, whilst that of its plumage needs no exercise of reason to command our admiration. It is that latter kind of heanty which the Germaus, horrowing the ormand our admiration. It is that latter kind of heanty which the Germans, horrowing from Greek sources, have taught us to call æsthetic, and which, I think, meeds your chiof study; for it is a kind of beauty far more diffi-cult to nuderstand, or define, or hold in our intellectual grasp. The heauty of fitness may be measured and weighed by the casy standard of common sense: the other, more subtle-more immaterial-may he perceived, and yet not measured, or even explanued. Like a wreath of mist-the rainhow-the mirege, or the northern aurora--it is a reality--it is there, hefore us, in a thousand forms of loveliness, yet the vision chides that closer serutiny we desire, and refuses to submit to the test of a lesire, and refuses to submit to the test of a stricter investigation. Unfortunately for the teacher of art, it is far

Unfortunately for the teacher of art, it is far more easy to say what is heautiful, than to say wherein that heauty consists. A sense of what is beautiful in the physical world operates like the couscience in the unoral world, which impels or deters, often without the intervention of reason. We often, perhaps, indeed, usually, perceive what is morally right or wrong at once and without any process of examination. So the recognition of heauty is an intuitive re-sult, at which we ought to he able to arrive, before we have formed any definite idea of the before we have formed any definite idea of the cause, or have sought to investigate the motives upon which our judgment is founded.

A true student, however, will not rest satis-A true student, however, will not exist satis-fied with this vague impression, lutt will endea-vour to search out its causes; and whatever may have beeu the errors into which usen of genius may have here misled by their confident reliance on some favourite theory, the student should be thankful for the hitts which philoso-ble in the here of could to aid theory in them. phic inquiries have afforded to aid them in their scarel

scaren. It is of course an essential part of the task of a lecturer on our art, to hring before your notice examples of the highest qualities of the art, practically presented to as in the master-pieces which time has spared. Our art may boast a proud pre-eminence among the sister arts, in its capacity to present such examples. In addition to the durability of its monuments, has been truly said of architecture, that she alone is able to excite emotions similar to those excited hy the contemplation of the great works of nature. If such be true, it is, indeed, a very noble incentive to genius, that it should be per-mitted to the architect so to distribute and deal with mere inert matter, with fragments of rock or pieces of burnt clay, and so to pile them up as to make them the source of a high intelice-

tual pleasure. Besides the two primary qualities of subli-mity and beanty, a claim has been set up for a third attrihute, or quality, as worthy to be classed with them, as forning one of the great aims of art, though I am by no means satisfied of its claim to be treated on a footing of equality with them. I allude to the pictures-que--a word of modern Italian origin, desig-nating that which is well suited for the painter's art. I helieve it was Uvedale Price who first attempted to define distinctly the attributes of the picturesque, and claim for it an independent Picturesqueness seems to be a term in an

Picturesqueness scens to be a term, in OUR It is a prevalue and phasmic story, that the returnesqueness scens to be a term, in Our neess for the purposes for which it is de-ined. I readily admit that unfitness for its purpose beautiful, or even sublime, but it can hardly be sant to he picturesque. There must he a variety hard lines, unsightly angles, heavy, graceless of lines, or of tints, or of chiaroscuro, in order forms, imposed on us by structural require-to constitute the true picturesque. One of the ments. It would be a mischierous error to most eminently picturesque single objects I suppose that, because in our social conduct there has the Pharos at Genoa; but even here should be no deception or concealment what the structure itself can scarcely be so designated : ever, we are therefore bound to expose to the structure. and its access sorics, which impress it with that peculiar character.

It is this dependence of the pieturesque on a happy combination or grouping of forms, rather than on the artful design of any one form, which renders it a dangerous object of pursuit with the architect. It can rarely be the result of premeditatiou : it should come unbidden. Certainly the happiest and most charming instances of this quality of art have been the result of accident. Perhaps the eastles of the Middle Ages, especially those of the thirteentb and fourtcenth centuries, abound more than any other class of buildings in the ingredieuts of the pictnresque. Which of us, for example, could ascend the long flight of steps leading to the higher and inner gateway of the great eastellated monastery of S. Micbel, near Avranches, without fancying that some sublime genius, pregnant with all the poetry of architecture, had designed that gate and moulded its scenic turrets with ano other object than to fill the spectator with awe? Yet we may be sure that uotbing could have been more remote from the mind of these the keep, the mean and a picture. The barhican, the keep, the mean and a picture. The barhican, the keep, the mean and a picture should be the broad chiaroscuro, are all features happing inci-broad chiaroscuro, are all features happing inci-tant to be a willow a grant and a piceprise of dental to the *military wants* and exigencies of those times, and yet who is so utterly and almost necessarily regardless of the picturesque

as the engineer? Even in domestic architecture, if we Then in domesuic architecture, in We ex-amine any highly picturesque buildings—Haddon Hall, for example,—we shall not fail to find that the agreeable effects in which it abounds are by no means the offspring of studied irre-gularity, or of any finesse of art. The embayed window is thrown out just phase there the year window is thrown out just where the view invites one. The fireplace projects in hold relief, and its smoke-tunnel is carried quaintly off to one side, simply because the ease and comfort of the occupant required that these objects should be placed in these situations. The result happens to be highly picturesque, but it is so, as it were, by accident. There is no reason whatever to doubt the ability of the old builders fully to appreciate the effect of all their arrangements; but there was no straining after that effect: a bold and almost careless freedom of design characterised all their works

I need scareely repeat that a laboured imita-tion of these happy results would be sure to lead to follow and discursive and

tion of these happy results would be sure to lead to failure and disappointment. I do not counsel the young practitioner to music, nor letters, nor any of the arts which disregard those superficial arts of design which and first consideration so to do his work that footing within the domain of social usefulness. The consideration so to do his work that footing within the domain of social usefulness. The consideration and the very doubtful whether he can must be content to take rank with boot or wells; and it is very doubtful whether he can must be content to take rank with boot or adopt any process better calculated to scenre a pleasing result.

Before quitting these general views, I think t it incumbent on me to advert to one of the deniable, but which is attended with some difficulties.

Painting and sculpture are so fortunate as to have in nature a standard of excellence for ever before them, a frequent recurrence to which a keeps them on their true course.

But architecture is less able to draw her inspirations from that pure source : her wants are to too artificial : she is too dependent on the requirements of man to enable her to look

minpbicitly up to nature. But architecture still has a ruling principle, I which is truth. From Vitruvius to Pugin this graceful inutilities? s which is truth. From Vitruvius to Pugin this is has ever been taught, although in practice it bas

a flastever heen haught, although in practice is the all often heen grievously disregarded. There is an houest simplicity, a plain manli-moss, about truth, which wins our regard, whether in ethics or asthetics. But whilst we recognise truthfulness as a cardinal virtue in

cannot escape; whilst to depart from the form that is mechanically right and expedient, only to make it more agreeable to the eye, would be a still graver error.

That there should be a politic concealment sometimes studiously resorted to: some ingenious art practised occasionally, seems, there-fore, an unavoidable condition of our calling. the painter, who has both subject and Even materials more completely under control, cannot with safety trust entirely and exclusively to the more correctness of his transcript. If it were so, photography would take a higher place in the rank of fine art than, with all its wonders, if is ever likely to win.

In the most naturalesque schools, nature is not, and never has been, copied with a stern adherence to exact truth. The simplest leaf requires treatment to fit it for the purposes of decoration, and treatment implies some modifi-cation of form or of colour,---in short, some departure from nature. Nearly allied to this is another principle of

sally acted upon, justly claims our most re-spectful submission. We should have a care how we design anything which does not serve some useful purpose.

I do not mean that mere utility would justify a deformity; nor do I mean that every archi-tectural feature in our design should be a struea tural necessity, nor even of structural utility; hut that, although it may not be to add strength, or to afford support, it should at least have appropriate purpose: a valid reason should be assignable for it; some good end must be sought to be attained by it; some offensive angle or feature to be removed; some unsightly blank to be relieved; some monotony of line to be broken; some needed light or shadow to be introduced; some discord in form or colour to be allayed.

Doubtless it is a maxim worthy of all accept ation, that utility is one of the most important elements of beauty; yet those who recognise architecture as a fine art will admit that simple bare utility is not the sole aim of our art. qualification of the really valuable and impor ant principle of usefulness will, I fear, scarcely energy with general sympathy: the utilitariau eurrent sets in so strongly in some minds that it well nigh carries all other considerations before it.

buttonmaking.

With all respect for so inestimable a guide in With all respect tor so mesumance a gunce me the common business of life as utility. I will venture to encourage you by pointing out to you the prodigal munificence which has arrayed the lily of the field, which neither toils nor spins, in a raiment of surpassing glory; which has given to the birds of the air not merely their needful feathers, but a plumage of jufinite beauty; bas lavished on the shellfish of the deep seas tints which uo art can reproduce, and the pearl which princes are proud to wear. Nay, virtue itself has found a fit companion in the beauty of the human form.

"Gratior pulchro veniens in corpore Virtus

It is the fear of excess and abuse that alone renders this indulgence dangerous; and to arm the student against such danger is one of the foremost dutics of the art-teacher.

Truthfulness and usefulness must indeed be taken as our guides in the highway along which we may travel unwarily and without danger. It wheter the second secon that we most I have now detained you quite long enough on these general views. Our art is a peculiarly practical one, and uceds to be dealt with in details rather than iu generalities

The mind of the true student is soon impatient at these distant views, and he longs for a closer, clearer, and more practical survey of bis subject. I shall therefore now close my present discourse by addressing to the student a few partiug words.

You are set out on a pilgrimage which will need much preparation and a large fund of enthusiasm to cheer you on your way. Set out on it with a conviction that an abundant store of knowledge is the hest provision you cau

of knowledge is an make for the journey. Besides obtaining a thorough mastery over your own art, cultivate an acquaintance with the sister arts. It will be wholesome to bear the sister arts. in your memory the very intimate relation which subsists hetween all the departments of high art which find their home within these walls. Together they will ever flourish or decay. Each needs the aid of the other. It is for Architec-ture to build the sanctuary : it is for Painting and Sculpture to spread out their treasures for its perfection. It is for them to give life to its inauimate walls by peopling them with the story of past times; by refreshing us with the clarms of natural scenery, and by making them the depositories of those memorials which link the living with the dead.

Above all things, in your pilgrimage, especially anxious to dismiss and discard for ever from your minds all petty feelings of perever from your minds all petty feelings of per-sonal jealousy. Pull at no man's skirt: outrun him, if you can, in the race of bonourable rivalry; but, depend upon it, your progress will be impeded, not promoted, by the indulgence of professional jealousy or censorious criticism. Let not your spirit be weighed down, nor your course turned aside, by any such sinister, un-worthe objects. worthy objects.

The rivalry in labour is the best and only useful rivalry. Yon will find the buoyancy of self-reliance wonderfully assisted hy that light-uess of heart, and cheeriulness of spirit, which uever fail to accompany au habitual goodwill towards others.

A BRIEF MEMOIR OF THE LATE ALEXIS DE CHATEAUNEUF, ARCHITECT.*

DE CHALBAUNEDF, ARCHITECT." ALEXIS DE CHALBAUNEDF was born 16th of February, 1799, at Hamburgh, where his father, one of the old French nobility, had taken shelter at the Revolution, and married. His only son, the subject of this memoir, after completing his school education, was, by his own desire, afforded an opportunity of learning the practical part of his future profession in the workshop of a builder, while he devoted his spare hours to the study of unthomatice. In 1816 he the workshop of a burner, the boars to the study of mathematics. In 1816 he acquired the rudinents under M. Wimmel, town architect, and in the following year went to Paris to pursue his studies at the Academy, but finding that he did not derive the advantages explicited, he removed to Carlsruhe, where he applied himself as-iduously for three years in the *atelier* of Oberbaurath Wein-

bremer. Having thus thoroughly grounded himself in the clementary knowledge of his art, he commenced, in 1821, a tour through the south of Germany and Austoia to Italy; where he visited all the most im-portant remains of autiquity, and devoted himself to their study, remaining in Rome ahove a whole year. In 1823 he r turned to his native city, and com-menced his professional career by carrying out the town residences of Syndle Sieveking, and his borbler, the senator, besides minor works. He also spent much time at the neighbouring Hanse town, Lubeck, the interesting dd buildings of which he appears to have studied very carrelly.

have studied very carefully. In 1828 he visited England and France, and part of Germany. On his return he designed and carried out the Town Post-office, the country scat of the Syndie Sieveking, and other works. In the first-named building, which abuts upon one of the prininduce building, which about a point out of the prim-cipal canals, he made a boil experiment by omitting the foundation of piles, universally used in the old town, and substituting an arrangement for floating the structure on the soft bogay ground. This, though not alloggether successful, at least shows that M, de Chatraument was not content to plod on in the beaten teach but thot has accessring do a dott all wastes track, but that he endeavoured to adopt all modern advances in scientific construction.

Read at the ordinary general meeting of the Royal Institute British Architects, on the 9th ult. by Mr. Charles Fowler, jun

In 1832 be again visited Italy, and soon after his In 1002 be egan unstread taily, and soon after his return (ahout 1835), while the impressions of his visit to that classic ground were fresh, he designed itle residence of Dr. Aheadroth, an eminent concoisseur and liberal patron of the arts. This huilding, although not on a year here again way he agained by the and nheral parton of the arts. It to similar a model in the original model is chief work, as it affords evidences of great skill in adapting a very effective arrangement of plan to an irregular site, and of refined taste in combining Greek purity of detail with the structural forms of Italian Renaissance detail with the structural forms of Halan itenatsance. In the interior especially, every part, even the smallest detail, bears the impress of a master hand. In the years 1888 and 1839, M. de Chateanneuf passed much time in Eugland, engaged, in conjunction

passed much time in Eugland, engaged, in conjunction with Mr. Mee, non a competition design for rebuild-ing the Royal Exchange, to which the second premium was subsequently awarded. He was also, I believe, assisted by the same geneluman in the publication of a 4to, work, "Architectura Domestica," Loudon, 1839. To auother smill work, "The Country House," by Lady Mary Fox, published in 1843, be contributed some creellent designs for a country mansion. The letters which accompany these designs contain many remarks showing bow carefully he had studied the general principles of his art, and the correctness of the views he entertained of the vexed question of style in architecture.

in architecture. The great fire, which, in May, 1842, destroyed a large portion of the old town of Hamburgb, opened a wide field for the labours of the architect, and it a wide field for the labours of the architect, and it may be safely affirmed that no one strove more assiduously or successfully than M. dc Chateanueuf to carry out the restoration of bin native city. A commission having heen appointed to remodel the plan of the destroyed quarter, he was nominated pre-sident, and many of the important inprovements effected were originatel by him , among which may be specially mentioned the arcaded porticose by the side of the Alster Canal, and those flauking the square of the Exchance: the former were also subsequently of the Exchange: the former were also subsequently carried out from his detailed plans. From this time to about the end of the year 1850,

From this time to about the end of the year 100%. M. de Chateaneouf was largely engaged in the erec-tion of numerous buildings, both public and private; among them the rehulding the great church of St. Peters, in which he was associated with Professor Fersenfeldt, the residences for the clarge, and other huildings connected with this church, the new post-huidings connected with this church, the new post-Fersenfeldt, the residences for the elergy, and other huildings connected with this church, the new post-office, the large warehouses, with residences for Messra. Schulte and Schemmann and for Mr. Daven-port, the Hall of the Tailors' Company, al arge ware-house for the Cahinetmakers' Company, and aumerous private houses in the town and suburbs. Many of these buildings show great originality in arrangement, and particularly in the details of the mouldings and enriebments, for which M. de Chateauneuf always made numerons studies. The heautiful details of the English Mediaeval architecture appear to have made a strong impression upon him, the fullence of which may he clearly traced in the works executed subse-queutly to his visits to this country. Iu 1846 he married a Norwegian lady of Christiana,

Jul 846 he manical a Norwegian lady of Christians, and, on paying a visit to that eity, the restoration of the "Church of The Redcemer" was entrusted to him; he was also employed to prepare a design for him: he was also employed to prepare a design for another church, which was subsequently carried out from his plans hy a former pupil. Although still in the prime of life, he hegan now to feel the effects of constant application upon his naturally exancts and somewhat excitable temperament, which, combined with some domestic afficients, caused his health visibly to decline. He made, however, auchter great effort, and produced one of his graudest architectural conceptions in the design subm ttell in competition for the Storthing Haus, at Christiana, which, how-ever, was not carried out, as the estimated cost exever, was not carried out, as the estimated cost ex-ceeded the proposed expenditure. This was his last work, and it formed a worthy termination to his pro-fessional labours.

Iu 1850 it was found advisable to place him under the care of Professor Sessen, in a private asylum near Kiel, which had heen erceted from his designs: he subsequently, however, returned to his native city, where he died on the 31st of December, 1853.

Throughout his life his energetic character led him Throughout inside in scaling part in the local real num to feel a lively interest in all public affairs, and he took an active and leading part in the local Kunst-verein (Art-Union), and the Society for encouraging Arts and Manu'actures : he was also an honorary and Area and Malu acures: he was also ad homorary and corresponding member of the Royal Institute of British Architects. He was thoroughly devoted to his profession, and, an accomplished artist himself, he took great delphi in the society of his hirtchrea of all classes, whom he frequently consolted on the subject of his principal designs, thus promoting that recipro-city of action so desirable hetween the sister arts. Those of foreign countries always met with the kindest attention and hospitality at his hands, and he bad thus procured the warm attachment of a large circle of friends, by whom his premuture death will long be regretted.

CIVIL CONSTRUCTION IN THE PARIS EXHIBITION.

RETURNING to Captain Fowke's interesting REFERENCE to Captain FOWE'S interesting report on eivil construction, as represented in the French Exhibition, we find some particulars of M. Coignet's concrete, used by him in the construction of a house, near St. Denis, and which has excited much interest.

" M. Coignet bas, as the results of a series of expe AL COGRET DAS, as the results of a series of expe-riments, given us the recipes for making two kinds of concrete suitable for house huilding, which be dis-tinguishes by the epithets of economic concrete, and hard and solid concrete. The first is composed ofof and

Sand, gravel, and pebbles 7 parts. parts. 1 part.

This concrete, he says, properly heaten up and mixed, bas given walls nearly as hard as the common soft rubhle masonry used in Paris: in price it competes with ordinary pisc work, over which, however, it has the advantage of being able to resist moisture. The bard concrete is composed of—

Sand, gravel, and pebbles parts. Common earth, burnt and powdered I part. Common earth, burnt and powdered I part. Unslaked hydraulic lime 1 part.

The materials to be perfectly heaten up together. Their mixture gives a concrete which sets almost im-mediately, and becomes in a few days extremely hard mediately, and becomes in a few days extremely hard and solid, which property may be still further in-creased by the addition of a small quaotity, say one treased by the authon of a similar quarket, as but part, of cement; and the price, depending principally on that of the time and labour, was, in Paris, under unfavourable circumstances, $3\frac{1}{2}d$. to 4d. per cubic foot; with more favourable conditions, 2d. per cubic foot. A house, three stories in height, 65 feet hy 45 feet, standing on a terrace, having a perpendicular retaining wall 200 feet in length and 20 feet high, has retaining wall 200 feet in length and 20 feet bigh, has been actually constructed, with every part, including foundations, vaults of cellars, retaining wall, all walls exterior and interior, without exception, of this hard concrete (Becton Dur), as well as the conrice, mould-ings, string courses, halustrades, and parapets, and without hond iron, lintels, or wood thronghout : the use of plaster in the interior is also avoided, as the concrete takes a surface sufficiently fine for papering. The retaining wall measures 29.750 tubic feet of The retaining wall measures 22,750 cubic feet of masonry, and constructed of Paris hard rubble (meulières), or ashlar, it would have cost from 1,200. feet of to 1,500% and in common soft rubble (moëllons), and stone coping, from 650% to 750% : on M. Coignet's principle it bas cost—

22,750 cubic fect of concrete laid at 2d.

£190 er cubic foot per cubic foot Balustrade in moulded eoncrete 18

In France, iron is being extensively used in the place of wood in private residences, being rolled at once into form for girders and beams. Captain Fowke gives a description of various sorts of floors used, to which we will confine ourselves :-

Ourselves :---"The employment of rolled iron in girders and joists for floors, which is almost unknown in England, and which is now very largely adopted in Paris, over its origin to the circumstance of a very extensively organized strike of earpenters which took place in that city in the year 1546, hefore which time iron was, even to a greater extent than in this country, debarred by its wice from entering into connection with wood by its price from entering into competition with wood in the construction of buildings and private dwellings. In order to extricate themselves from the position in which they were thus placed by such an event, and with a view of preventing its recurrence for the future, the Parisian architects and builders turned their attention to the substitution of iron for wood, both in wood, hoth in the roofs and also in the flooring of huildings, and weight and cost of the moting of mutually, and weight and cost of the material, which, as stated above, formed the greatest obstacle to its general

comployment. Much of the difficulty experienced by the French which of the unneutry experienced by the French architects in perfecting this new construction was occasioned by the fact that, according to the custom which obtained at the time, the iron was transmitted from the manufacturer to the builder through the in-

MARCH 7, 1857.

tervention of a dealer, who was totally ignorant and caraless, both of the requirements of the latter or of the capabilities of the former to meet those require-ments; and it was not until the manufacturer and huilder were brought directly into communication that the best forms of iron were uade, especially for the purposes of construction, forming what are called in France "fers speciaax." The eross-shaped girder of M. Bleuze being, as might have been expected, weak in proportion to its weight, recourse was had to a girder which was first adopted in the construction of the St. Germain rall-way station, and which was a slight modification of the common I reil, but which being made a great deal too beavy, fell to the ground from its consequent high price; and it was not till the month of February, 1849, that the I girder, as now used, was produced, and first applied in Paris in the flooring of a house, No. 18, in the Boulevard des Filles du Calvaire, for a hearing of 18 feet. A number of experiments were instituted by M. Zoré, for the purpose of obtining No. 18, in the Bouevard des Files du Catvare, for a hearing of 18 feet. A number of experiments were instituted by M. Zorés, for the purpose of obtaining the best possible section for these new rolled iron girders, which resulted, first, in proving the useless-ness of a third flauge which had heen introduced by some makers are in the assent M. Blaweich exident of ness of a third flagge which had heen introduced by some makers, as in the case of M. Bleuze's girder, at the centre or neutral axis of the \mathbf{I} girder, and after-wards in the gradual development of what are now considered in Paris to be the hest and most practical forms of rolled iron girder, and which are described heave

The principle of the substitution of rolled iron for wood having now been established, numerous modifi-cations were proposed in the manner of its application application cattons were proposed in the monotor to apply and arrangement, as to the ties, struits, and connection with the remaining parts of the floor and ceiling, for hotb which a variety of methods of construction bave hear from time to time adopted, and of which some of what are considered the best forms are here

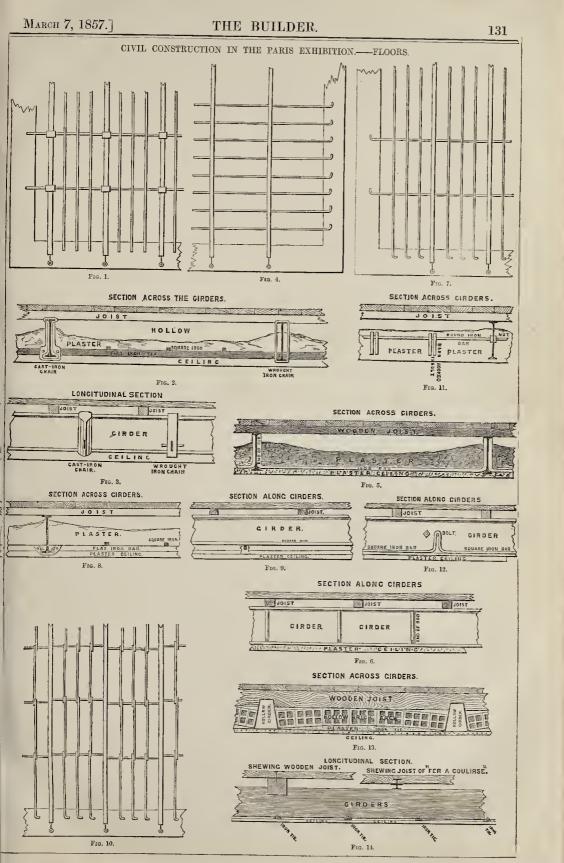

described. The first (figs. 1, 2, and 3) has the girders of I shape, sightly arched, having a rise of '06 inches in each foot, placed at a distance of 3 feet 3 inches from centre to centre, and connected at intervals of 3 feet 3 inches throughout their length by ties of flat har iron on edge, resting on the lower flange of the girder, and fastened one to another either by wrought-iron straps or cest-iron chairs. Upon these ties are placed square hars, three he-tween each pair of girders, running parallel to them from wall to wall, into which their ends, turned down, are huilt. The girders are further tied to the from wall to wall, into which their ends, turned down, are built. The girders are further tied to the walls at each end hy iron straps fastened to vertical iron holts in the wall, and in a lateral direction hy the ends of the eross ties being also huilt in, in the same way as the longitudinal hars. On the iron framework, so formed the thick plaster ceiling is formed without wooden laths, a wooden platform heing held under it while the plaster is thrown in from above, and removed after it has firmly set. Small square wooden joists are laid over the girders, and the wooden floor laid on these in the ordinary way.

In the second method described (figs. 4, 5, and 6), the I girders are also placed at from 3 feet to 3 feet 3 the I griders are also placed at from 3 feet to 3 feet 5 inches from centre to centre, and are tied, or rather shutted, at intervals of 1 foot, by small square bars, reaching from girder to grider, and resting on the lower flance, having their ends turned up in an clowe the beight of the web of the girder, and kept upright merely by the plaster with which they are filled in: this, as will be set by definite a definite the into with these methods, hut it is deficient in the tics with which the others are strengtheued.

The third method (figs. 7, 8, and 9) differs from the first merely in the mancer in which the cross-ties are connected together, being a simplification of the chair already described.

The fourth method (figs. 10, 11, and 12) is The fourth method (hgs. 10, 11, and 12) is that which has generally bad the preference among the principal huilders: in it the girders are tied together in pairs, at 3 feet intervals, by round iron bolts $\frac{4}{10}$ of an inch in diameter, passing through holes at the neutral axis of the girder, and nutted up at each end. Small square hars are hung on to these tic-holts hy hooks at their extremities, of sufficient length to permit them to bang nearly level with the hottom of the girders, to which they are parallel, as described in the first method, the description of the floor and ceiling of which auswer for all four methods.

In speaking of the gradual development and im-provement in form of the rolled iron girder, an allusion was made to forms now in use in Paris which allusion was made to forms now in use in Paris Which are considered superior to the I section commonly employed, of which the four methods above are applications. These were exbihited by M. Borie, and were of two forms, called by the inventor "for thuhaire" and "for a coulise," the first heing, per-haps, more strictly speaking, agrider, and the latter a joist, where only a single floor is required. "The "for tubulaire" (figs. 13 and 14) may be de-

scribed as being in section of the form of a capital **A** without the small triangular ton : those exhibited are said to be for a borning of 20 feet, and are of the following dimensions, viz.—4 $\frac{3}{4}$ inches high, $\frac{3}{2}$ inches wide at top, 4 inches wide at bottom, exclusive af a small flange of $\frac{3}{2}$ inch projection on each side. The sides of the girder are $\frac{3}{10}$ of an inch in thick-ness, and the top and flanges $\frac{3}{2}$ these. These griders are placed at a distance apart of 2 feet 8 inches from centre to centre, and are tied together at intervals of 3 feet by flat bur iron ties of $\frac{3}{4}$ inch $\times \frac{3}{10}$ inch bolted to the huttum of the flanges. in section of the form of a capital A acribed as being

ON INDURATING AND PRESERVING STONEWORK

STONEWORK.* This decay and preservation of slone heing in a great measure a chemical question, it is very necessary that an architect should be acquainted both with the first principles of the chemical action of the nir in the disintegration of the different stones, and with these which should guide him in forming a just opinium on the various processors suggested for their preservation; so that he may unliker be led away by the specious statements of intersted parties, nor induced to pass a hasty condemnation on all alike, without either understanding their mode of action, or testing them by experiments of a dereisive and satisfactory character. The destructive action of the atmosphere upon the

by experiments of a decisive and satisfactory endedther. The destinctive action of the atmosphere upon the various kinds of building stones may be classified under two heads. In a llenses it is the solvent action of water and carbonic and which effects the decay. or water and estronic and while encess the heady. These agents aftert stones in different ways, according to their composition, which, however, nay generally be referred to one of two classes, viz. the earthy carbo-nates, and the earthy and alkaline silicates.

Under the first named may be included the larger Under the first uamed may be included the larger number of common building stones, the linestones and dolonites of the "oolite" and " magnesian line-stone formations," which are chielly carbonates of line and magnesia, and also the sandstones, for in these the sand is agglutinated by carbonate of lime. These neutral carbonates of lime and magnesia are insoluble in pure water, and would remain cotirely unated upon it the atmosphere consisted only of pure ultrogen occerm, and anoueus vanour : that it alsways

unateed upon it the atmosphere consisted only of phre uitrogen, oxygen, and aqueous vapour; but it always contains enroucic acid, which being soluble in water is carried dawn by the rain, and these earthy enro-nates are dissolved in an aqueous solution of this arid; nates are dissolved in an apieous solution of mission, moreover, whence are rain fails upon a surface of enfo-nate of lime (Ca $O, CO_a)$, a portion of it is dissolved in the form of seid, or bicarbonate of line (Ca O, CO_a), OO_a , HO, CO_a), hence the presence of considerable quantities of enclosure to line in spring and river waters passing through chalky and linestone districts. waters passing through charge and intestore entropy of a such solutions he raised, or if they be long exposed to the sir, the carbonic acid is evaporated and the earbunate of lime carbonic add is evaporated and the carbonic of third precipitated; it is thus that incrustations of natural objects used with in the neighbourhood of these springs are formed. A curious illustration of this fact. I have also observed when examining the action of the weather on the sunth-western side of the church of the wenther on the shufth western since of the clinical of St. Lake, Chelsea: wherever there is a sloping ledge the rain, in running down, has dissolved a certain quantity of earhonate of line in the form of bicarbo-nate, but on arriving at the edge it has collected in nate, but on arriving at the eage it has robected in drops, or been drawn under it by explicitly attraction, and heaug prevented by the same force from falling to the ground, it has remained a sufficient time exposed to the air for the earbonic acid to exaporate, and the earbonate of lime to be deposited in droplets or multipling establisher, this is shouldes a common miniature stalactites: this is doubtless a common phenomenon, which has been frequently observed, but it is an interesting proof of the accuracy of our views respecting the action of rainwater upon such stones, for there we have the very same carbonate of lime which has been dissolved out of the edifice in one place, dropsited in another.

place, deposited in another. The granites, porphyrics, clay slates, and such minerals, are acted upon by the atmosphere in a dif-ferent way: the general nature of the process may, however, be well illustrated in the case of granite, a rock which heing often very hard is popularly decmed indestructible; but that such is far from being the ease is obvious in the waster-worn erumbling sur-faces of the masses of granite rock on our own coasts, as in Coruwall. The action of water and surbouin acid on granite is different in nature and slower, but as certainly destructive ultimately as in the case of the linestones. the case of the limestones.

the case of the linestones. The compution of granite, or at least of fclsparits largest constituent, may be thus represented (KO, SO₃; Al₂; O₃, ₃SO₃), that is to say, a double silicate of potsh, and alumina; and wheu carbonic acid, dissolved in water, is brought repeatedly in coatact with it, the potsh is dissolved out from the silicate of potsh in the form of carbonate of potsh,

Read by Mr. Henry M. Witt, F.C.S. Asst. Chemist, Government School of Mines, at the ordinary general meeting of the Royal Institute of British Architects, on the 23th January.

leaving the silica in a floceulent partially soluble in fact, considerably less than that of the stone—as state: the silicate of alumina, though unacted upon, much so, perhaps, as wood is less lasting than stone. If the sintegrated state; so that hy the mere and their existence is but ephemeral.

The foregoing remarks apply to the action of the pure air of the open country upon stones. These a destructive influences to which all buildings, even These are the purest and most screne atmosphere, are con-stantly exposed, and from which no stone, however stantly exposed, and from which no stone, however good and well selected, can be free. But in large towns, where enormous quantities of coal are hurnt, stone is subjected to far more adverse influences: the particles of carbonaceaus matter (sooi) constantly float-ing about in such an atmosphere, are enrifed lown by the pain denovited on the stone and there emmented hurain, deposited on the stone, and there cemented h the rain, deposited on the stone, and there comented by the enroboate of line which is simultaneously precipi-tated, in cussequence of exaporation from the rain-water in which it had been dissolved off other parts of the huibling in the form of hierbounte. Thus the huiblings become covered with a funereal enerusta-tation, producing that sombre appearance which ocea-sions such a striking contrast hetween the public huiblings of our metropolis and those of Paris and other continental towas where wood is the common fuel. This conting, thonch marring the beauty of other continental towns where wood is the common fuel. This conting, thongh marring the beauty of the architecture, conduces to a certain extent to the preservation of the stone by forming a layer imper-vious to water, and thus preserves the subjacent car-honate of lime from further contact with the acid solution. Sometimes, however, moisture penetrates through cracks in the surface layer and permeates behind it: then airy or frost weather setting in , the through cracks in the surface layer and permeates behind it, then dry or forsty worther setting in, the coating becomes loosened, and whole masses fall off at a time: the result is necessarily very destructive, but it is one which may be frequently observed. Moreover, the atmosphere of these coal-consuming districts contains, besides earhonie acid, also sul-plurons and sulphurie acids, which act upon ear-boante of time much more corregically, and in a more injurious manner than the carbonic acid. Some stones being more readily acted upon by

more injurious manuer than the carbonic acti. Some stones being more readily actical upon by these agencies than others, on account of peculiarities in their physical structure, with which the architest can only become familiar by practice, it is obvious that the utmost caution should be exercised in the choice of stone for public buildings; nevertheless, since even the hest sclerted stones are linkle, and must ultimately yield, to the same destructive agencies, the difference heing only one of degree, it is hut natural that attention should have long since been drawn to methods for preventing the mischief; many of which, to judge on elemical principles, merit the serious attention of the architect, and the most uppre-

They may be divided into two essentially distinct classes. In the one the object is so ever the stone with a layer of some unterial, organic or inorganic, vegetable or mineral, having no chemical action on the stone itself, but serving only to cover it with a surface which, not being affected by or having a repuisive action towards water, shall preserve the sub-jacent stone from the contact of the act solution, preent stone from the contact of the acid solution, just as wood is preserved by a contacting of paint. Although these methods wary much in detail, they have all the same object, and are all more or less useful, though less valuable than the second-class of processes to be hereafter alluded to.

The most obvious method is to cover the hullding with a cording of paint, as in the case of the new fiquale of Burkingham Palace. This is obviously hetter than allowing the stone to decay, hut it is a very temporary expedient, and liable to the objection that, if the paint be made of lend, it specify becomes block from the subhurgted bydrogen of the atumes. black from the suphuretted hydrogen of the atmos phere of au English town.

phere of an English town. Many patents have been taken out, to which Mr. Sunth alluded at length in his paper, read here on the 1st uit, which cousist in soaking the stone in, or covering its urface with, a layer of an oily body of some kind: motives of chapmess and convenience may, to a certain extend, influence the selection. These are all valuable for a certain length of time. So hence the with coeving does not itself deray it iself deray itself deray itself deray itself deray itself deray itself. So long as the oily coating does not itself decay, it must afford important protection to the stone heneath : and no doubt there are many here present who can testify to the practical value of one or other of the processes of this class which have been suggested. betry to the base which have been suggested. But it must not be forgotten that all regetable bodies —indeed, organic compounds generally — are subject to a process of decay quite different in character from these to which I have before alluded. All these hodies, which consist essentially of earbon and hydro-geo, are combustible, and, when burnt, are converted into earbouic acid and water (the compounds of these two elements with oxygen—viz. CO₂, and HO), and, hy long exposure to the air, the very saure result ensues, only more slowly; so that in process of time they entirely disappear, being converted into invisible gases, and no trace of them remaining. Their action , an therefore he but temporary, their durability being,

and their existence is but ephemeral. Besides, in selecting the oils, it should be remem-hered that there are two classes—one distinguished as

hered that there are two classes—one distinguished as drying, the other as non-drying, and it is the former which are of the greatest value. These drying-oils (oil of threpetine and linseed-oil are common ex-amples), on exposure to the air, absorh oxygen, and are converted into resins, which are more durable, and form a more immeriate, eaching than the oils. and form a more impervious coating than the oils

It has been already mentioned that all the methods

It has been already mentioned that all the methods which consist in coating the stone with organic mix-tures, composed or oils, resins, fats, &c. though more or less valuable, are but temporary expedicatis com-pared with others to be subsequently mentioned. Under this first class may be included those of "The Indurated StoneCompany" (François Prycheme), and of "The London Stone Hardening and Preserv-ing Company" (Mr. Barrett); Mr. Henry Clinton Page's Patient; and lastly, Mr. John Benjamin Daines's. D

Dames's. Having recently seen the trinks of Mr. Daines's process at the Houses of Parliament, I may be allowed to make a few remarks specially in reference to it. It differs in no essential respect from the allowed to make a few remarks specially in reference to it. It differs in no essential respect from the others of the same class, consisting essentially in easing the stone with lineced-oil, to enable it to resist the action of moistre. The only variation from the others is in treating the stone with a solu-tion of sulphate of zine or of alum, previously to applying the oil, and also in dissolving in the oil sal-phar or liver of sulphur. I am ot a loss to inder-stand what advantage is sought by this modification, and in what the superiority of this over any of the other processes for coating the stone with a layer of oily or resinous matter consists, or, indeed, why it is preferable to paiot, especially if zine instead of lead colours he used. But it certainly has many serions disadvantages; for in the first place, the action of the sulphur, upon either the imparities in the sulphate of zine applied, or on the iron in the stone, produces a black sulphide, which gradnally darkens the colour of the stone, and will doubtless soon render it almost hack; a result certainly anything but desirable in London, where the atmosphere generally performs black; a result certaily anything but desirable in Landon, where the atmosphere generally performs this office hut too rapidly. Secondly, it is rather a dangerous experiment to introduce into the stone an evencet like sulphur, which, by oxidation, is gradually converted into sulphrecous and sulphurie acids, --the very acids which, as products of the combustion of coal, render the atmosphere of London and other large towns so much more injurious to stone than that of the open constry : it is, in fact, sowing within the stone the prolific seeds of its destruction. The second class into which I have divided the various processes embraces those the object of which is, either to convert the surface of the stone itself into a chemical compound less readily affacted by an aqueons solution of erstonie acid (min-water), than the original stone, or to deposit a less destructive

e original stone, or to deposit a less destructible

the original stone, or to deposit a less destructible chemical compound in or upon it. The first suggestion of this kind, and, I believe, after all the most valuable, is that much by Professor Puchs, of Munich, for the preservation of freeso paiotings, and successfully applied by Kaulhach (of which an example axists in the Museum of Practical Geology). It was subsequently employed for the preservation of ordinary stone creations by M. Kuhl-mann, of Paris.* It consists in washing the stone surface after erection with a solution of silicate of soda (No. SO $_{20}$) but, in order that the process may be successful, its mode of action should be un-carated and all the necessary mecantions should be of soda (NaO, SO₄); but, in order in should be uu-may be successful, its mode of action should be u-derstood, and all the uccessary precautions should he adopted in carrying it out. When the solution of Silicate of soda (NaO, SiO₄) is applied to a limestone (CaO, CO₂), a double decomposition takes place,-silicate of time (CaO, SiO₂) and actionate of soda (NaO, CO₂) are formed: that this is really its mode of action, 1 have satisfied myself by experiments made on piecess of stone treated in this manner by my friend, Mr. Henry Barnell. The establishment of stables in the satisfied in the stablishment of made on pieces of stone freated in this manuface by my friend, Mr. Heary Burnell. The establishment of this fact is one of considerable importance as affecting the theory of its action, as it proves that we convert the carbonate of lime, which is so readily acted upon by an aqueous solution of carbonic acid, into one of the most insoluble of mineral bodies,—the silicate of lime; one, moreover, which is searcely, if at all, affected by carbonic acid, and this without in the least degree injuring the structure of the surface. It is income that at the same time another action zone

least degree injurng the structure of the surnace. It is true that at the same time another action goes on : earbonic acid is capable of decomposing silicate of soda, as I mentioned when speaking of the dis-integration of granite, and by this means free silica is likewise deposited on the surface and in the pores of the stones : this silica, thus deposited, is more or

See "Memoire sur l'Application des Stitentes Alestin - s Solu bles su durceissement des Pierres Calcaires Poreuses," Paris, 185

less insoluble, but by prolonged exposure its solubility to flow for years together over the surface to be for next and strong work, are in these days still a increase: still it is never all absolutely insoluble, and coated? In fact, to produce a covering of compact delight to look at ? the stonemasons, who could select it appears to me that the great value of the silicate of soda arises from the formation of the silicate of be deposited quickly, it would be uo better than the edifice, exhibit it many cases as clean work as the imme from the very line of which the stone itself is well-known process of whitewashing. Indeed, even day it was done, and which will still endure for years of the innel cleaning if it were possible to veneer a stone with compact which are the the process of a triannal cleaning if it were possible to veneer a stone with compact which are the the process of a triannal cleaning if it were solves of a triannal cleaning if it were solves of a triannal cleaning if it were solves of a triannal cleaning if it were the possible to the topset of the the process of a triannal cleaning if it were solve the the process of a triannal cleaning if it were solve to the the process of a triannal cleaning is the solve th

composed. Thet, as I said, certain precantions must be carefully ritended to in its application: the secondary product, the earboante of soda, which separates in the form of a saline efflorescence, must be carefully removed by washing from time to time, if sufficient rain does not full to effect this result: moreover, it must not be imagined that one coating is sufficient; it should be repeated two or three times at intervals of several mouths, and the washings performed frequently during the intermediate periods; for this conversion of the soluble carboante of potash, takes place but gradually, and unless it be at first effectually performed it is useless; but if it be thus carefully carried out, judging on general principles, as well as from experiments, which I have carefully watched, carried out by Mr. Henry Burnell, at Cheises, Leannot but feel convinced that the process is likely to prove most valuable. I cannot, however, too strongly recommend that experimental trials should be made with the uccessary care by persons who are hoth unprejudiced, and, from their understanding the principles of its mode of action, commetent to decibe unon its meets

uccessary care by persons who are both unprejudiced, and, from their understanding the principles of its mode of action, competent to decide upon its merits. I would merely ask Mr. Smith whether the single experiment to which he allnded in his paper, of which the results were exhibited to the meeting (to which the results were exhibited to the meeting (to which experiment reference was made almost in the same words by the Rev. Mr. Barlow nearly two years aco), was performed with all that earc, and whether all those presentions were adopted which are meessary to enable him to eone to a fair decision on the merits of the process? I could point out to him spots on the church of St. Lake, Chelsen, which have, under treatment with the silicate, becomes ohard that one can scarcedy scratch them with a walking-stick, whils the stone close by the side of it erumbles to powder under the pressure of the futumb-nail.

There are two other processes to which I must briefly allude, viz. Mr. Ransome's and Mr. Smith's own novel suggestion.

Mr. Ransonic's process consists in treating the surface of the store first with a solution of silicate of potash or soda, and then with a solution of chloride of harium or chloride of calcium, hy which means an insoluble silicate of baryta or lime is deposited in the pores of the stone. This process, if judiciously carried out, is undoubtedly likely to prove valuable, but a priori reasoning would certainly lead us to give the preference to the use of the silicate of potash alone, and subsequent washing with water, for the following reasons:—

If the action of the silicate consisted merely in the deposition of silica in the pores of the stone, as imagined by some, then undoubtedly Mr. Ransone's method would he not merely similar in mode of action, but perhaps superior, to the use of the simple silicate; but I have before shown that the silicate converts the very substance of the stone itself into a hard insoluble mineral compound—the silicate of lime; and it is on this account that I am inclined to anticipate more favourable results from it than from Mr. Ransome's.

Mr. Ransome's. Moreover, the silicates of baryta and lime, which are deposited by Mr. Ransome's method in the stone, will, I fear, be in a finely-divided pulverulent state, and in that condition afford but slight protection to the subpacent carbonate; ualess it be that the gehtinous silica deposited simultanconsly from the silicate of soda by the action of the air serves as a binding material, uniting the whole into a compact surface; experience alone can decide this point, and I would strongly recommend Mr. Ransomo's process, as second to none but the simple silicatisation, to the impartial judgment of those who are willing to give these two processes toose careful experimental trials which their intrinsic marits so well deserve.

Mr. Smith's own suggestion, notwithstanding its ingenuity, is I fear, not likely to offord very satisfactory results. He proposes to initiate these natural processes by which earbonate of lime is deposited in a compact form, as in stalactites, tafas, and other native enerustations; hut how is this to be carried out on a building? In nature, the surface which hecomes coated with carbonate of lime, remains for months or years construitly exposed to the action of water saturated with hierarbonate of lime, and the very compactness of the mass arises from the extreme slowness of its formation. But how are we to initate artificially such a process with success? Could we submit the wall of a huilding to the action of a constant but uniform current of a saturated solution of bierafonate of lime for years? In the first place, what would he the expense of transporting a calcaroous spring, or of forming one artificially § and then, by what mechanical appliances could it be made

to flow for years logghher over the surface to be coacted? In fact, to produce a covering of compact massive carbonate of lime is impracticable, and if it be deposited quickly, it would be no better than the well-known process of whitewashing. Indeed, even if it were possible to veneer a stone with compact carbonate of lime, it would be only equivalent to the choice originally of a good compact stone; for it would be still hable to the same destructive action of water and carbonic acid as all other varieties of carbonate of line, though somewhat more slowly; whils the effect of the silicate of soda is to convert the stone superficially into silicate of lime, a mineral almost entirely unaffected by these agencies.

whilst the effect of the silicate of south is to converthe stone superficially into silicate of lime, a mineral almost entirely unaffected by these opencies. In conclusion, allow me to observe, that while it is the duty of the architect to select the hest possible stone, it must not he forgotten, that even the best will always be liable to the same process of decay, the difference being rather one of degree than of kind, and therefore, if processes are from time to time suggested for protecting stone from this decay, it would appear both the duty and the interest of the architect to give them a fair trial.

Moreover, it can hardly be true that the necessity for preserving our buildings from prenature decay is entirely an evil of modern date, for carbonate of line must always have possessed the properties which it now has, and have been subject to the same kind of decay; but the fact is, that it is only in modern times that the attention of scientific, as well as practical men, has been directed to the discovery of processes for preventing that decay to which all building materials have been liable from the earliest epochs, and will continue subject, to the end of time.

THE DECLINE IN SKILL OF BUILDING OPERATIVES.

Difference resp. If you and your readers are not yet entirely deeided that enough has heen said and written on the questions raised by the unemployed nuchanics, perbaps you will permit me to advert to one topic which seems peculiarly adapted for the pages of the *Builder*, constituted as the sufference are of the trades more immediately connected with building operations. The wild proposal of converting 35,000 (2) unemployed mechanics into "ploughmen and agriculturists," hy sending them to cultivate the waste lands, whilst so many colonies require the assistance of their labour, appears most inconsistent with the general fact that all employment requires at feast some previous education.

Is there any member of these 35,000 tradesmenwho can state how many of that number have received any education for the parsuit they profess to follow ? Are uot a vast number of them persons taking up such trades merely because for a few years huilding operations have been carried on at a rate heycoud all precedent, creating a denuand for habourers, the want of whom might alone have stopped much of the recklessness of speculative builders. It is chiefly these builders not heing able to get their houses off their hands that has thrown so unany trades out of work at the present moment. The larger houses are employing but few less in number, but then they employ the skillin workman —the workman worthy of his hire; and as they are often obliged to pay a higher rate for wages than their workman is worth, they are the more cautions whom they employ. The many has had a proper education in his trademust of necessity be a more useful person, and therefore, more likely to have constant employment than the one who has merely taken to the trade on account of some immediate demual for assistance. This easy undur the benefits, persons who carried on or followed any trades (then existing) without having served an apprenticeship of seven years thereto. There are many now living who can received the first deterioration of joiners' work, when mere recommended a "mate" to their master, and employed his time in fitching and carrying, because he was not worth the pay which he shared with his introducer.

There can be no doubt that this repeal has been or inestimable service to the country as far as commerce has been concerned; but, as regards the *art-workman*, as he is now called, in contradistinction to the mere workman in thas been of great nijury. The master workman is thas been of great nijury. The master workman is thas been of great nijury. The master workman is thas been of great nijury. The master workman is the previous period, have not only deterionated the quality of work generally, hut have assisted to introduce the system of contrasts, whereby each master seeks to undersell his neighbour, which ean only be done in a majority of instances by loose workmanship and inferior maiorials. What else but this has destroyed the race of the art.workmen of the middle and end of the eighteenth century? Where

for next and strong work, are in these days still a delight to look at 2 the stouenn-sone, who could select stone which, fifty years after the completion of the edifice, editibit in many cases as clean work as the day it was done, and which will still endure for years without either the process of a triennial cleaning down, or of covering over with five or six coats of paint ? the carpenters, with their joists, roof, and doorings, adapted to all requirements, without the additions of ironwork, to render small scantings efficient for the daty of proper ones ? the carvers of all kinds, yet putting to shame all our modern makehelieve attempts in composition and papier micht? The plasterrors, with their ornamental work, exceuted by hand, on the wall or ceiling itself, rendering the modern "decorator" a porson of no eonsequence? These were all art-workmen, and truly so, and we shall not have them again until the building trade, leaving the control of one man, who undor takes all trades " by contract," shall again be carried ont by the master workman, with his assistants, as formerly practised. It is thus only that the best work is performed, even in the present day, in England, and by all trades in foreign countries. When Sir William Chamhers, and the other architects of his period, had made the designs for a building, they calleid together the several unster-workinen, and explained the work to them : the building was erceted in the best manuer, constructively and ornamutally, was paid for by measure and value, and the occupier found, offer inhabiting the house for twenty or twenty-five years, that he had not had to pay for any substonial repairs. Now, however, in too many eases, every three or four years, a house requires almost as much to be laid out upon it to render it again decent in appearance, as would have been at first sufficient to have made the work efficient for theirty of forty years. Under such an arrangement as this, the ma-ter-workman would be counder it again decent in appearance, as would hav

It is only for the last quarter of a century that the want of art-worknen (1 do not mean artists, as Flatman, Stothard, and others who were employed by the great houses for designs) has heen commented upon, and the fault of their non-existence or searcily has been laid at the door of the Government, for not providing schools to teach drawing and design; when, in fact, these very schools—as *achieves* uhrond—had been in existence in the houses of each of the master workmen, who, hy his indentures, was bound to teach his apprentize "the art and mystery" of his calling ; and this in reality, and not as at the present time, hy suffering the youth to pick up a good, bad, or indifferent education as he hest may from the people he has to associate with during the few years it may be considered necessary he should devote himself to such "upprofitable" labour as *learning* his business. Covernment, however, after much uressure, did, in

⁴⁴ uppofitable " labour as *learning* his business. Government, however, after much pressure, did, in 1837, commence a " School of Design," as an upper school for the many good institutions for teaching drawing then it existence; and, under the able direction of Mr. J. B. Payworth, it answered its object most efficiently. But, resigning the appointment on his arrangements being interfered with, this establishment has gradually been altered in character. In the hit valueme of the Builder.

In the last volume of the Builder, page 666, in the report of a lecture given at the Coalbrookdue Literary and Scientife Institution, Mr. George Wallis, head master of the Birmingham School of Art, stated that "some twenty years ago the Government of this country, conscious of our national defects, undertook to remedy them. They began, however, by teaching design, 'an unfortunate term to select, sceing that it includes invention, which it is out of the power of such schools to teach. We have now, however, arrived at the point from which we ought to have started : the object of the Government now is to teach the whole people that tbey may appreciate works of merit, as well as to educate students in these schools that they may create them." These remarks are extraordinary as coming from a person in bis position, and if it be the opinion of all the other head masters of these Government schools, it certainly proves one thing,—and that is, their general incapacity of the pupil, design is as easy to be faught as any portion of an art or of a trade." and with all these twenty years of Government teaching, has there heen any advance upon the works mentioned in the first portion of these remarks? I doubt it.

applied the works increases a conception of the works of the second s

able arrangement for their committee to class them according to their previous callings, if any, when perhaps something more tangible could be held out for relieving their distress, than that of the conversion of waste lands? At present, an agriculturist does not want a stomemasour or a hricklayer as an assistant; nor does a manufacturer require the daily services of a carpenter or decorator. I urge this, because the eyes of those who are placed at the head of our affairs are hlinded by what are called "principles of political economy," which are a convenient screen for doing nothing to help such a body of men. <u>A WELL WISHER</u>. able arrangement for their committee to class them

TESTIMONIALS TO CLERKS OF WORKS.

TESTIMOVIALS TO CLEARS OF works. Among the numerous difficulties attendant on the practice of an architect, that of obtaining elever, steady, and honest clerks of works, is not the least. How many huidings and architects suffer from the deficiency of one or frequently all of these very essen-ing the steady of the steady of the steady of the steady of the deficiency of one or frequently all of these very essen-tions are steady of the steady of deficiency of one or frequently all of these very essen-tial qualifications; and how much Hiejation is pro-duced by the ignorance, inattention, or roguery of those who should assist to hinder it, most architets have experienced in a more or less degree. Some course should be adopted to remedy the evil. Persons who call themselves clerks of works are numerous enough, as all have found who tried for one by adver-tisement - but of the annihilarant, have very few would enough, as all have total who tried not one by an er-tisement; but, of the applicants, how very few would be employed even by the most undiscriminating or confiding architect? as two-thirds consist of men who are too lazy to work manually at their own trade, or prefer (naturally enough) supeior pay, position, free-dom of action, and builders' gratuities (either in meal or mate) for some service they should not but do

prefer (naturally enough) superior pay, position, free-or mat() for some service they should not but do ender to them. Now the real case of so many improper petrons reting employment is the system of "testimonials," to readily and frequently given by architects before they have had opportunities or time to know the real people are most feasible: talking is much more easy than working, and this said talking is turned to good be considered either clever or circumspect, as one to the building. They been the source of the many at estimonial has then strong either of the source of the source of the considered either clever or circumspect, as one to found the building. They been informed that many at estimonial has then shown they have been used years after, when the avoid the building. There are two ways by which the profession may five a testimonial was given. Thave experienced this may self on several occasions; and, in communicating with the ator great on the building. There are two ways by which the profession may five a testimonial was given. These experiences the source of the part who proposes to engage time. That will any different be derived works, as in three sing the different is be derived works, as in three how they have been to a circumstances to a to great or works by which the profession may five a testimonial was given. The derived works, as in three how they have been to a circum stances to a determent to obtain them; the three will be indicated much any circumstances and the shared the indicated much any circumstances and the indicated much any circumstances and the sate the building. trouble to avert. ONE WHO SPEAKS FROM EXPERIENCE.

KENSINGTON DISTRICT SCHOOL OF ART.

KENSINGTON JUSTICE Schools of art, that at Gore House, Kensington, was closed on Friday, the 27th ult, in order that the row of buildings in which it was situated might be given up to the commissioners of the Exhibition of 1851, who are about to yull it down and throw open the site to the Kensingtou-and road.

A short time previous to the closing of the Gore Honse School, the students signed and sent a memo-rial to the Department of Science and Art, deploying This is the Department of Schede and Art, depointing Anoth the centre of Sir Charles Darty's grand date 200 scholars. A detached residence for the the circumstance, and requesting that another school building a square tower rises, with steep roof and master adjoins the school premises. In the lowered sides; and, out of said tower, deuse volumes Bardyay—The ground upon which the Corn-Gardens is inaccessible to them, on account of the with millions of "blacks," each black forming a hill coru exchange building is to stand is being

largeness of the fees; that in the event of no school being established to replace their old ore, it will be a scrious blow to their progress in the various trades to which they belong, and in which, through the assistance of their articulies, they have some bopes of distinguishing themselves. This being a bonest arowal, it would seem,—and we are glad to find it so,—that the influence of the Department will do well to encourage and foster such a spirit, by complying with the students' request. This looks something like vitality. The utmost good feeling seems to have prevailed between the master and mistress and their male and female classes, for at the leave-taking on Priday, an address and testimonials were presented to both master and mistress.

master and mistress.

SANITARY STATE OF ST. JAMES'S, WESTMINSTER.

THE first annual report of the medical officer of health for St. James's parish, Westminster, has been made to the local vestry and printed. As was to be expected from the well-known tact and talent of Dr. Edwin Lankester, the report is both interesting and Edwin Lankester, the report is both intervalue the instructive. It appears from it that while the average mortality of the parish from 1846 to 1855 inclusive was 790; that during 1856 was only 682, or 108 less than the average,—one on hndred and eight lives having thus been saved to the community in one year, doubtless mainly by the operations of sanitary agency.

agency. "It is multe possible," remarks the reporter, " to cal-mute the rule of 108 lives, at all ages, and in all ranks and conditions. Founding such a calculation on the annual income of the country, the lowest value that you could attach to 108 lives would be 0,0000. To this sum must be added the cost of 108 funerals, and the sitemance of medical men, surses, and to be sitemance of medical men, surses, and to be sitemance of taken ill and recover. If yon remove the cause of the dest of one individual you will probably save the sickness of the other persons. It is by calculations such as this that the enormous cost of disease and done formed of the reckless extravagance of a neglect of sanisary arrangements, and of the immease economy of an effective system of sanitary organization."

system of sanitary organization." This, however, is not the only point to which we would wish to draw atteution. While the deaths in 1856 were only 12 to 100 of the population in the St. James's square division of the parish, those in the notorious Berwick-street division were 23 to the 1,000. The Berwick-street district of St. James's parish contains no less than 432 persons to every acre, heing a more crowded population than is pre-sented by any district in the metropolis so large as that of Berwick-street and even including, with the St. James's-square division, that of Golden-square, with 22 deaths to 1,000 of the population, if the mortality of the Berwick-street district were as low as the average of the other two divisions of the parish together, the deaths in the whole parish during the the average of the other two divisions of the parish together, the deaths in the whole parisb during the past year would not bave been so great as it has been by 115; in other words, from sheer overcrowling it would seem, combined, of course, with the still im-perfect sanitary condition of the locality, ane hundred and fifteeu persons have died last year in this district, who, had they only been spread over a wider surface of the same average description, would have been still divet. still alive !

SMOKE AND THE NEW HOUSES OF PARLIAMENT.

THERE are " Smoke-consuming Acts," and " smoke-THERE are "Smoke-consuming Acts," and "smoke-binning patentis," and "smoke-binning orders," and the fines for allowing smoke. Smoke is, however, neither "hinred," "prevented," nor "fined,"-that is, all the cases, and some of the most notorious which occur, are not so dealt with. Smoke is made by the lay-makers and fine-enforcers in definee of the good law-makers and nne-enforcers in defance of the good old prover b which says—rand, we must confess, with some show of justice—that "Law makers should not be law hreakers." Let any one of the three peers of the blood royal, the two archbishops, the twenty dukes, the twenty-one marquises, the 111 earls, the twenty-two viscounts, the interest first neutron bishops, the 202 harons, the sitteen representative peers of Sect-202 barons, the sixteen representative peers of Sect-luad, the twenty-eight representative peers for Ireland, the four Irish representative prelates, the officers of the House of Peers, the 490 members for England and Wales, the fifty-three members for Sectland, and the 105 members for Ireland,—just look at their own smoke-making, and say if the British Houses of Parliament have any right to make laws agoinst the intolerable missance, smoke. About the centre of Sir Charles Barry's grand budding a same to nove rises, with steen roof and

[Макси 7, 1857.

floating record, for the time, against the legislative feating record, for the time, against the legislative wisdom and justice of the three kingdoms. "Phy-scien, heat thyself," may be thundered forth against this abountable smoke-producing tower by every eitizen who has been fined or censured for making smoke. There are many ancient privileges connected with Parliament, and some modern ones, and we pre-sume it is intended to claim the right to smoke. The Abaurelue at the present orand nearl variew, issued sume it is intended to claim the right to shoke. The Admirally, at the recent grand naval review, issued orders against steam-hoats making smoke. The com-mercial steamers complied: the Admirally steamers alone sent up black volumes of defance against "My Lords" orders. So now Parliament first proves, by cientific evidence, that smoke can be hered and pre-scientific evidence, that smoke can be hered and prescientific evidence, that smoke can he hurned and pre-vented ; it then most properly frames and issues, as-law, clear and stringent clauses against smoke, and then the British Houses of Parliament smoke worse than the Lanheth Potteries. This should not be so. Messrs. Nohles, —Lords, Spiritual and Temporal, and Counsoners of Great Britain,—if the smoke of coal cannot be consumed in your fires, then burn eoke ; but don't hid definec to your own laws, and persist in ruining your own beautiful new huilding hefore it is fairly completed.

THE "CATHOLIC APOSTOLIC" CHURCH AT LIVERPOOL. THE Irvingite, or Catholic Apostolic Church, in Cauning-street, Liverpool, of which we gave some account in our last volume (p. 146), was also his own employer or paymaster. The edifice stood for some time after being ouly partly creeted, but at length was put into the hands of Mr. Trevor Owen, of Birmingham, architect, for completiou, not entirely according to the oricompletion, not entirely according to the ori-ginal intention, but so as to accommodate a

ginal intention, but so as to accommodate a larger congregation. The masoury is in freestone, from Stourton-hill. The length of the church is 121 feet; width, 39 feet; height, 60 feet. The nave and transepts-are covered by an open timber roof, stained and varnished; the windows are glazed with mellow tinted glass. There are large traceried windows in each transept, and over the west door, which, together with the smaller ones, and the building generally, is executed in the Flamboyant style of architecture, as nearly as circumstances of architecture, as nearly as circumstances would admit, in accordance with the more expensive richness of the eastern portion. The tower rises over a baptistery, with a window designed for a baptismal subject in stained. glas

The edifice is now complete, together with The edifice is now complete, together with several additional works in contemplation at the time we last noted its progress, and amongst in oak, of the chancel and choir, the floors being relaid with Messrs. Minton's encansite tiles. A spacious new vestry and council-room have been added. The aisles have been groined, and the church is lighted by richly-ornameuted gase-licrs. The organ has also been completed, and encased with a new organ frout. The total amount of contracts, with other

The total amount of contracts, with other works, amounted to upwards of 4,000/. Mr. T. Hughes was the contractor, and Mr.

B. Brierly executed the stonework : Mr. R. Grey. was clerk of the works.

PROVINCIAL NEWS.

Portland.-Government, according to the Dorset Chronicle, have appointed Mr. John Coole, C.E. as eugineer in chief of the break-water works. The post became vacaut through the death of the late Mr. J. M. Rendel. Mr. Coode has been the resident engineer from the commencement.

mmencement. Croydon.-The new national school building, in the Church-road, approaches completion : It will supersede the building in George street. The architecture is in the Tudor style. The building will contain two school-rooms, a class-room, lavatory, two large lobbies, and two porches. The large school-room is 51 feet room, lavatory, two large looses, and two porches. The large school-room is 51 feet 6 inches by 20 feet, the other, 39 feet 3 inches by 20 feet; both being 19 feet bigh. The class-room is 20 feet by 13 feet, and contains a gallery. The whole will be warmed by a new patent process. It is calculated to accommo-date 200 scholars. A detached residence for the envelop elicing the actual warming

cleared, preparatory to the erection of the exchange. *Blithfield*.—The foundation-stone of Blithfield schools was laid on Thesday in last week. The idea of erecting national schools for the parish

135

for the building. The designs were prepared by Mr. H. Bowman, of Manchester, who designed Mr. H. Bowman, of Manufaster, who utdefine the episcopal church for the cemetery. The style of architecture in which the school is created is the Middle Pointed of the thirteenth century. The ground-plan of the huiding is century. The ground-plan of the humaning described by the local *Advertiser* as resembling the form of the letter L, the louger arm forming the form of the letter L. 40 feet 6 inches long the principal school-room, 40 feet 6 inches long (including rooms at the end), and 18 feet 6 inches wide. The shorter arm forms a second school-room, 18 feet 6 inches hy 18 feet 6 inches, entered out of the former by a wide open archway. At the lower or south end of the large room, a portion, ahout 10 feet wide, is parti tioned off hy a wood screen. An external pro-jecting porch forms the ouly entrance into the jecting porch forms the ouly entrance into the building. Over the area, screened off, and occu-pied by the master's room and lobby, is a gallery, 10 feet wide, forming a library and class room, open to the school-room, and access to which is obtained by a circular newel stairease, in the centre of the wood partition or screen. Both the school-rooms are covered by open timher roofs, having an ornamental timber bell turret, or louvre, with a conical spirclet roof. The large school-room is lighted by a pointed win-dow, in the north gable end, three lights in width, with stone tracery in the head, and by three other two light windows in the side walls. There is also in the south gable, over the gallery, a circular window, 6 feet 6 inches diameter. a eircular window, 6 feet 6 inches diameter The smaller school-room is also lighted by a three light pointed and traceried window, in the west gable end, and a low three-light window on the south side : all the windows have stone mullions. The external walls are faced with Yorkshire wall stone, and the doors and windows, buttresses,

stone, and the doors and windows, outcresses, and angles, with white ashlar stone. North Bierley.—The foundation-stone of the North Bierley mion workhouse was laid on the new site on Friday in last week. Messrs. Lock-wood aud Mawson are the architects.

wood and Mawson are the architects. Leeds.—The new covered market is now being rapidly proceeded with. It is constructed almost entirely of iron and glass, somewhat after the style of the Crystal Palace. The form would be a parallelogram, if it were not for an oblique end on the Kirkgate side, which follows the fine of the street. It is ahout 300 feet long by 130 feet wide, and contains cighty shops in two prove-the onter facing into the several by too receivence, and contains engaged subject in streets by which they are surrounded, and the inner facing into the interior space. They are surrounded by a glass sereen, and the entire space is covered in by three longitudinal roofs. The building is closed by survey and the source and space is covered in by three fongitudinal roofs. The building is closed by seventeen pairs of ornamental gates, and the design, so far as an architectural character is admissible in such a structure, is of the Tudor style. It will be ready for occupation ahout faster. It was designed by Mr. Charles Tilney, late borough surveyor, and is being constructed by Messrs. Nelson and Sons. Nelson and Sons.

Wick .- The British Fishery Society intend to Wick.—The British Fishery Society intend to commence immediately to build a long-projected river-wall, opposite the John O'Graat Journal office. This, and the several buildings contem-plated in Pulteneytown, says the John O'Graat, will prove more than sufficient for all the avail-able labour of the district. The wages of masons are consequently on the rise: 20s. a week is buots the largest former that will be accounted. almost the lowest figure that will be accepted.

CHURCH-BUILDING NEWS

CHURCH-BUILDING NEWS. Roade.—The chancel of Roade church, Northamp-tonshire, has recently been restored, at the expense of the Duke of Grafton. The south wall, being much dilapidated, has been rebuilt as before, with the addi-tion of two buttresses; and in the north side a tbree-light Perpendicular, and also a low side window have heen opened. The brick floor has been replaced with red and black tiles, and the low flat ceiling with an open high-pitched roof. On February 19th, the par-tition between the chancel and the tower (which is celebrated with divine service.

central) having been taken away, the re-opening was celebrated with divine service. *Faringdon*,—1t has been resolved that active and immediate steps shall be taken to restore the Pro-tostaut chapel in the village of Watchfield, which was pulled down in 1788. A subscription has been set on foot, and Viscount Barrington and the Rev. Edward Berens have given donations of 1007, each. *Tunkridge Wells*,—The proposed new church for the Calverly district, Mr. B. Ferry, architect, is to

accommodale 800 persons, to be erected without gal-leries, the usual number of sittings being free, and it is estimated that it will cost, with a pursonage house, and an eudownent for repairs, about 5,000%. It will be built in the Gothie style of architecture, with a square tower surmonuted by an octagon spire. The plan consists of a uave and aisle, a chaucel, &c. with a granied part of the state of the a ground roof. Petersfield.—The local vestry has authorised the

Pretragenter-ince local vesity has authorised the Burial Baard to borrow a sum of money for forming the new cemetery. The estimated expenses amount to something over 1,1007. The contract for erecting the mortuary chapels has been taken by Messrs. Minchin and Wetherspoon, whose tender was the lowest of five sent in. The architect is Mr. J. Colson, of Win-

Bristol .-- A new church is to be built in a situation Bristol.—A new church is to be built in estimation to serve as a place of worship for Pill. An anourmous friend (according to the *Mirror*) has offered 1,0007, towards the structure. Mr. Miles gives a site, and other gentlemon have promised to contribute.— New schools for the parish of St. Niebolas are about to be erected in Back-street.

about to be effected in Electricity. Leck.—The opening of the new Wesleyan Chapel here took place on the 13th ult. The building is supposed to have cost the donor, Mr. Wardle, with the site, about 4,0007. The trustees have made some additions to the original plan, involving an expense of about 2507. The site adapted is Early Pointed, of the tensitional chaperder meaning during the raisen of about 2007. The syste adopted is fairly contest, or the transitional character prevailing during the reign of Edward 1. The materials used are red and white brick, with Hollington stone dressings. The elapel transitional character prevailing during the reign of Edward 1. The materials used are red and white brick, with Hollington stone dressings. The chapel is 64 feet by 46 fiete outside the walls, but exclusive of the buttresses, which divide the sides into five huys each. Two light laueet-headed windows, which run through the galleries, light each bay. The entrauce-front is divided into three bays. Over the stained glass. At the east end of the chapel is a vestry, 25 feet by 15 feet inside, for private meetings, with orchestra over. The body of the chapel is a pproached from inner lobbies. The roof is 42 feet is raning beam. The entire with is spanned by in span, without any horizontal block is spanned by straining beam. The entire width is spanned by laminated ribs suringing from monided stone responds. The spandrils between the ribs and principal rulters are cusped, and the ribs are relieved on the under side are cosped, and the ribs are relieved on the inder side by continuous pendentive tracery following their curve from side to side. The longitudinal timbers of the roof are so disposed as to divide the celling into panels, which are plastered, and will afterwards be coloured. The seats are frunced in deal, with inclined backs. The whole of the joiner's work is statised and varnished. All the wiodows, except that over the culture, reglazed with Harthy's diamoud plate-glass. Lighting is effected by two sun-lights in the million curving here as verifiators by tubes from them celling-available as ventilators by tubes from them through the roof. The building is heated by hot water. The works have been carried out from the arrough the book. And boundary and the book and the second the *Waret have been colle by Messie Johnson and Soli-Wareted-An effort is being made to carry out* certain mucb-needed repairs and alterations in St., Mary's Church, Warwick. The estimated cost of the undertaking does not exceed 500/, and more than half the required amount has been already promised.

the required amount has been already promised. *Hasingden.*—The new chapel for Weslcynas, in Manchester-road, has been opened. The ebapel is 95 feet long by 50 feet wide, including vestries and ages. It covers an area of 4,800 square feet. The style is Gothic, of the Perpendicular period. The chapels estimated a scale 1,100 persons. The roofs, internally, are ceiled to the cross-pieces. The platering between the puncle is coloured blue, and the coved ceiling of the anse is, is oldition, illumi-nated with gold stars. The chapel has been creeted by Mr. William Waddington, of Padiham, at a cost. by Mr. William Waddington, of Padham, at a cost of 3,000%, exclusive of extras, from the designs and under the superintendence of Mr. James Wilson, of Bath

Doncaster .- The last stone, under the first contract at the parish church, taken by Messrs. Ireson and Son, has been hid; and when the interior of the Son, has been buy, and when the include of the church is cleaned on, says the Gozette, their engage-ment will have been completed. Consequently, a number of workmen will be discharged, as the cou-tractors have received us instructions to proceed with the tower. This pause in the work, however bene-ficial it roays roave to the building riseff, will, to many the tower. This pause in the work, however bene-ficial it may prove to the building itself, will, to many persons, be a matter of deep regret; and it has been arged on the building committee that there is no necessity for forther delay in giving their order to Messrs. Ireson for the second contract, viz. the creetion of the tower.

North Shields.—A new Wesleyau Reform Chapel was opened on the 19th ult. in Howard-sircet, North Shields. The chapel is built in the mixed style, upon au Italian base. It will seat 650 persons, and, with

ГМаксн 7, 1857.

large schools, to be built, will cost 2,500%. Mr. Green of Newcastle, is the architect. *Edinburgh.*—Workmen are now employed upon the ground purchased by the Free Tolbooth congregation in St. Andrew-square, preparatory to commencing building operations. The cost of the new church is in St. Aharew-square, preparatory to constrain the hulding operations. The cost of the new church is estimated at 4,4504 exclusive of pointing, gas fittings, &c. This, when added to 5,4004, paid for the ground and the Exchange Bank premises, which are to be retained in front of the church, and 1501. for some includental expenses, will make the total outlay 10,000/.

FOREIGN INTELLIGENCE.

Telencience City Galery.—The Society of Agri-enitare, Science, and Arts of the above city has had the happy idea of establishing an Historical Gallery, to coutain historical mountents relating to the city. Amongst the specimens lately deposited in the collec-ultration of the invitance mount in bursts. As are the coultain historical monament's relating to the city. Amongst the specimens lately deposited in the collec-tion, already rich in pictures, portraits, busts, &c. are copies of the psintings of the Datal Palace, Venice. The immense Hall of the Great Concil offers much attraction by the hage paintings of Paul Verouses, and other artists of the Venetian school. Four of the pictures of the hall bave been lately copied, relating to Baldouio I. emperor of Constantionolle, born at Valenciences in 1171. They are, "The Sarrender of Zara in 1202," by Dominico Thioretto; "The First Surrender of Constantionole in 1203," by Falma the younger; "Young Alexis Conneous imploring the aid of the Crusaders in favour of his Father Isaa," by Andrea Vicentino, pupil of Palma the elder; "Election of Baldouin as Emperor of Constanti-nople," by the same master. The important task of copping these fine pictures had been confided to M. Charles Crauk, sceoud great prize of Rome, born at Valenciennes. The originals being of huge dimen-sions, M. C. has reduced them to one-third. Theses superior conceptions of Halian mind have been little taken notice of hitherto, as they are placed at a great height on the wall which looks towards the Quay. Varions conflicting lights also make the viewing very irksome, and the giltering of the waves reflected on the mobilged M. Crauk to interrupt his work at eer-tain periods of the day. I was only after eight months of persevering labour that he succeeded in completing these copies, which were hulph spoken of by the Italian press, and at Paris, where they remained a few days. Improvement in Boring Apparatus.—M. Kind, the a few days.

a few days. Improvement in Boring Apparatus.—M. Kind, the German engineer, has devoted the last twonty years to the improvement of an especial branch of his profes-sion, namely, he horing of rock to great depth. The main feature of his improvement consists un this, that the boring ethies it fastecod to a round of 5 to 6 ext. which is alternately elevated to a height of 1 or 2 feet by a monder, nod, and thus fulls by its absolute weight The boring cluster is natecosed to a romrod of 5 to 6 eWt, which is alternately elevated to a height of 1 or 2 feet by a wooden rod, and thus falls by its absolute weight on the rock, by which even the bardest is reduced to powder. In the old apparatus the rod was made of iron, which amounting, at a depth of 1,000 feet, to 100 or 150 eW. imparted to the falling chisel vibrating motions which nearly annihilated its action. The wooden rod, on the contrary, swims in the water of the borchole, and rods of from 1,000 to 2,000 feet leogth do not consilerably augment the weight of the apparatas. The progress of the work varies, according to the quality of the toox, from 1 to 10 feet daily, but hard rocks do not must be protected by tubes of strong sheet iron. The very weight of the tubes, which is from 15 to 30 lbs. to the running foot, causes their descent, if lonse rocks weight of the tubes, which is from 15 to 30 lbs. to the ruoning foot, causes their descrut, if loose rocks of sand, day, or grit are to be perforated. The work thus proceeds downwards, as the iron tubes obtain from to descend by the removal of the detrikas from the depths of the borehole, and do not re-quire the fastening or ramming down of wooden tubes. Greater difficulties arise when hanks or blocks of hard rocks are placed between the mrin loose geolo-ment of the detrice are a difficient instrument logical formations. In this case, a dilating instrument is used for passing the tubes, which are 10 or 12 inches

wide, through such an impediment. Munich.—Archaelogical Discoveries.—Even this art-loving capital of Bavaria has been surprised by the appearance of an archeological work, containing a description of the Roman villa excavated near Ingolstadt, and which has been issued by the firm of Curtis, in German and Latin ; with much typographical Curtis, in German and Latin; with nuck typographical elegance. It contains a very fine map of the sar-rounding country, in which the Roman road and the Vallum Romanum are haid down, and a very detailed plan of the important building, which represents a villa of a very elaborate and well-arranged design, with the indication of its various rooms. &c. A coloured drawing of delicate design shows the mossic pavement, which occupies the middle of the building. Hitherto, the knowledge of the Roma nutiquities of Transdambis, which stretches along to Vindelica and Rhätia, consisted only of some scanty records, or roads and their ditches lined with piles. The dis-coveries near Winterhoven prove now, that Roman

civilization and art had also reached to this remote corner of the great empire of old.

The Panama Railway...A Swiss engineer employed on this line writes as follows:...' This railway is the most adventurons work ever undertaken. We proand all the state of the set of the set of the state of the set of up and down with the windings of a scrpent, but always a head; until on a fine morning the locomotive always a-head, until on a nne morning the lecomotive was whisting where hefore but the howling of the jaguar and haboon had been heard. Now, in a few short hours a journey is accomplished which hitherto could only he performed with much expense and danger. But what a railway! I wonder how stokers and firemen can be found to expose their existence to such constant venture. I feel frightened in con-templating these bridges, spen, like cobe els, from one more inclusion that a tarting on moving which is templating these tringes, spirit, has cookens, from one precipies to another, and resking on moving, rickety ground. It is true the trains go very slowly at times, at the rate of hardly 12 miles. On the other hand, nothing can surpass the heauty of this scenery, the bold volcanic rocks decked with the unst gorgeous and varied vegetation," &c.

ROYAL INSTITUTE OF BRITISH ARCHI-TECTS : AWARD OF MEDALS.

A SPECIAL general meeting of the Institute was held on Monday, March 2nd, Mr. Bunning, V.P. in the chair, when it was resolved unanimously, "That it he humbly submitted for her Majesty's gracious consideration, that the Royal gold medal, for the year 1856, he awarded to Owen Jones, Fellow, author of the 'Alhambra,' 'The Grammar of Ornament,' 1850, ne invalues to over steers, renormality, and the 'Alhambra,' 'The Grammer of Ornament,' and other works." The recommendation was sup-ported by Professor Donaldson, Mr. T. H. Wyatt, Mr. Seoles, Mr. Digby Wyatt, Mr. Papworth, Mr. Jennings, the Chairman, and others. "The survey of the sound" an assure and dewring

The reports of the council, on essays and drawings received in competition for the Institute medals, and the Soane medallion, were read; and, in conform with the recommendations therein contained, Institute medal was awarded to Mr. E. W. Tarn, M.A. for his essay on the Mathematical Sciences, in their relations to architecture; and a medal of merit was conferred on Mr. Augustus Heary Parken ("Con Amore "), for his design for a large metropolitan

ing the award of the Royal medal. The Institute medal will be awarded to the author of the hest essay "On the application of wrought-iron to structural purposes;" — On the influence of local material on English architecture;" — or "On the principal harhours of the Roman empire, and the monuments by which they were alorned." The uncals of the Institute, with the addition of five gninces, will be also awarded for the best illustrations eccentricity drawn, from actual mea.

Illustrations, geometrically drawn, from actual mea-surement, with descriptive particulars, of a Mediaval building, hitherto unpublished in that manner, in Ireland, and for the like subject in Sectland.

The Soane medallion will be awarded for the best "Design in not less than five drawings for a marine sanitarium, or building, for the temporary residenc of a limited number of the middle and upper classes."

The successful competitor, if he go abroad within three years after receiving the medallion, will be entitled to the sum of 50% at the end of one year's absence, on sending satisfactory evidence of his pro-gress and his studies.*

COMPETITIONS

North Shields Mechanics' Institution .- In your number of the 21st ult, is an advertisement to which I think the attention of the profession should be par-ticularly drawn, because, among all the gross cases of attempts to get the henefit of other people's time and talent, this is the worst I have seen. I allude, sir, to the advertisement for designs for a new building for the North Shields Mechanics' Institution, which, after stating the accommodation required, says that the cost is to be limited to 1,500%. A premium of 307. is offered for such design as the committee shall select for construction; but the person receiving the premium will he required to prepare all sufficient working drawings and specificatious, and to find a contractor willing to perform the work for the sum uamed in the report and estimate accompanying the design; and in case the bost design, sent in, shall not be adopted for the construction of the building, then

157. only will be paid as the premium. The plan of the ground is to be had on payment of 18. 6d.

sir, I presume that the committee of the Now, North Shields Mechanics' Institution are aware that the regular commission for what they wish to hind an architect to do, is 5 per ceut. on the amount ex-(including the superintendence), and, there pended fore, that they are sceking to get somebody to do the business at very much less than the fair and usual basiness at very much less than the fair and usual charge,—a charge which everybody knows, for a building to cost 1,500% is quite little enough for the time expended and expense incurred. [Moreover, architects are to make drawings for nothing, for the *chance* of getting this reduced pay-ment. PEO:

ED.] ment.

I presume, too, that some of the committee are professional men, or tradesmen, and I would ask them to apply the same rule to themselves, or to any them to apply the same rue to the ansatzer of the solicitor or medical man, or to any shopkeeper, with whom they may deal in the town, and in that way test the honesty of the proposition. But unfortunately this is not an uncommon case,

and in all such cases there are some members of the profession who, from necessily, or a wish to obtain practice, are induced to send in designs in reply even to such advertisements as the one in question; and, therefore, perhaps, I should not have taken the trouble to write to you, or have sought to occupy any space in your valuable paper, but for another fact in the case, which is, that in your number for the 28th April, 1855, an advertisement appeared for the same April, 1853, an adverse same partice, of which the purpose, and from the same partice, of which the present is almost a verhatim copy, the principalindeed, almost the only-differences being that the amount for the huilding was then limited to I,200/. the that there was a second premium of 37, and the charge for the plan of the ground was 2s. 6d. I suppose they are now getting rid of the old stock at al luced price

a reduced price. I happen to know two young men, one being a pupil of mine, and the other a friend, who sent in designs on the former occasion, and who had them sent hack some time afterwards without any sort of acknowledgment, and had the carriage to pay into the bargain. I think, therefore, it is only a duty to my

* At the next meeting of the Institute, to be held March set a paper will be read, "On the different theories respecting th Forum of Rome"- perturbative those of the Commendator Canina,-by Mr. Arthur Ashpitel.

younger hrethren in the profession to let them know, younger includent in the protestorie of the international and in designs, what sort of treatment, judging from the former proceedings, they may expect in this instance. W. R. GRITTEN.

Lichfield .- We are informed by the committee that "the delay in selecting the design is owing to the general disapproval of the site by the architects,— another not having been obtained."

Sunderland Cometery. — The Sunderland Daily News expresses surprise that the offer of the Burial Board was responded to by so many architects.

Notes Capresses surprise that the other of the burning board was responded to by so many architects. "The well-merited philippia," asys the editor, "to which a correspondent of the Baidler treated this magnifi-cent proposal, and which we transferred to our columns, will not be forgotten. But what are the poor architects to do? They are at the mercy of all the ignorant and liberal public bodies whose united cranitums, on such and-nore than the little finger of any of the lessi competent of the men on whose predictions they are in a super-time of the second second second second second second the subject these a wider and more general significance-tion of plans, specifications, and estimates in competitions with act with provide their talents and time to the produ-tion of plans, specifications, and estimates in competitions with act with provide the proceeding in gross injustice upon professional men, who have to be at great expense and labour in preparing designs, out of which only one can permitly receive any payment. But in the case where the previous is a mere pittance, scarcely sufficient to cover the actual outlay for the mechanical labour of copying the daming the they are being and the stand which only one can permitly receive any payment. But in the case where the actual outlay for the mechanical labour of copying the daming are they are designed, the injustice is greater still."

We shall be glad to find the general press awakening to the errors of the conrec pursued by public hodies in this respect, and writing upon the subject so clearly and sensibly as the editor of the Sunderland Daily News

Tamworth Union Competition.-Competitors are asking for information as to progress.

GAS.

A PROSPECTUS has heen issued of a County and General Gas Consumers' Company, with a capital of 50,0002. in 57. shares, to supply gas to villages and towus with populations varying from 2,000 to 5,000-and upwards.—The Norwich Gas Company have just declared a dividend equal to six per east. exclu-sive of an addition to the amount of the shares, hy which the 237, shares were advanced to 257.—At sive of an addition to the amount of the shares, by which the 33, shares were advanced to 25i, --Atthe general half-yearly meeting of the West-Ham Gas Company, after a sum had been appropriated to the reserved fund of the company, a dividend of $3\frac{1}{2}$ per cent, lear of income tax (being at the rate of 7per cent, per annum) was declared, and the Chairman congratulated the shareholders on the future prospects of the comeany holding out a probability that while of the company, holding out a probability that while the price of gas would be less, or at a minimum rate, the future dividends would no doubt he remunerative to shareholders. The supply of gas for the last compared with the previous six months showed an in-erease of 34 millious of enbic feet.——The coremony of lighting up the village of Weedon with gas took place on Tuesday in last week. On Wednesday a supper was given to the men employed in creeting the works, when upwards of 90 assembled. The quality of the gas was considered to he satisfactory.—At the usual gas was considered to be astisfactory. — At the usual meeting of the Wolverhampton Gas Company, the report stated that the progressive increase in the basi-ness and improved condition of the company enabled the directors to advise the declaration of the maximum the directors to advise the declaration of the maximum dividend (10 per exct), authorised by the company's. Act, and they at the same time felt pleasure in stating their ability to accomplish a reduction in the price of gas. The reduction took place on the 1st of January last. The dividend having now reached the parlia-mentum purpum are increase in the company. meutary maximum, any increase in the company's profits from this time forward would be principally

The paragraph simply states, that it is understood the dual of Westmin-ter clock " is to be made of a similar description of ss, so as to be quite clear, both by day and night,"-ED.

applied towards further reductions in the price of gas. applied towards further reductions in the proc of gas. — The chairman said that the Board saw no reason to anticipate that they should not be able to maintain the rate of dividend. This result was consequent upon the increased consumption of gas, which fact would no doubt increased consumption of gas, which fact would nodoubt enable the Board to effect further reductions in the price, and to make additions to the guarantee fund. The report was adopted -----The Burslem and Tunstall Gas Light Company have just announced their inten-tion to reduce the price of gas to 4s. 6d. per thousand feet. This company it is said has also made great reductions in the charges for meters and fittings, in order to give every facility for the use of gas.----At the meeting of the York Gas Company, a dividend of six per cent. was declared.----About three months ago, a company was formed for the erection of gas works at Essingwold, and a contract was entered into ago, a company was formed for the electron of gas works at Easingwold, and a contract was entered into with Mr. Wilson, of Castleford, near Leeds, who has since completed the works. On the 18th ult., the town was illuminated with gas for the first time. The works consist of a wet gasometer, 30 feet in diame-The works consist of a well gasonicel, of left in called ter and 10 feet high, supplied from five reforts. The whole of the works have been completed for 1,000. The company is formed under the recent Limited Liability Act.—Opposition is to be made to hills in The company is formed under the recent Limited Liability Act. — Opposition is to be made to bills in progress for the Giasgow Gas Light Coupany, and the Giasgow City and Suborhan Gas Company, on the ground that they do not provide that after payment of 10 per cent. dividend, the surplus profits shall be applied in reducing the price of their gas, and that they do not stipulate that the gas shall he of a certain making of 10 per cent. which price of their gas, and that they applied in reducing the price of their gas, and that they do not stipulate that the gas shall be of a certain quality and periodically tested.—The rapid increase in the consumption of gas in Dundee is such that, in order to ensure an ample and regular supply, the Oil Gas Works' Company have resolved on erecting a uew gasometer capable of containing nearly half-a-million cubic feet of gas. This reservoir of gas will be 100 feet in diameter, and will be of telescope construction, in whole 50 feet in beight. The excavations have commenced, and the estimated expense is 6,000,—— Messrs. Little, of the Newcastle Gas Apparatus Works, asys the *Gateshead Observer*, have entered into a contract with the Danish Government for the lighting of the town of Sonderburgh with coal-gas. The works are to be of the most approved construc-tion, from plaus prepared by Messrs. Jobn II. Little, G.E.

GE

BOYAL ITALIAN OPERA, COVENT-GARDEN.

The position of the new theatre is now settled. The Duke of Bedford has leased to Mr. Gye for minety years, not only the ground upou which Covent-garden Theatre stood, but also that which is covered by the Pinzza Hotel, together with other teaments in the rear, extending into Hart-street—the whole being equivalent to upwarks of an acre of land. The heave heremess the more advantacenes to the bullet lease becomes the more advantageous to the helder from the fact that it is unfettered by any of those drawbaeks, such as renters' privileges and property boxes, which weighed so heavily on former administrations

According to the present plans, prepared by Mr. Edward Barry, the area of the theatre will be con-siderably larger than previously, comprising an en-closure of 240 feet by 100. The roof is to constitute a span of 100 feet, without any intermediate supports, so that the scenery and stage appartenances may be removed at the shortest notice, and the whole in-

removed at the shortest notice, and the whole in-terior converted into a vast concert-room, an idea of Mr. Gyc's. Nearly half the site will be appropriated as a flower-market, in the shape of a glass hazar. 80 feet in diameter, and 250 feet in length, for the exhi-bition and stel of flowers, plants, and all the objects and conveniences that incidentially relate to them. This idea, suggested by the well-known Marché aux Pleurs, in Paris, formed part of Mr. Gye's scheme for a glass-covered street through London, set forth in a previous volume of the Builder. The flower-inarket would show in Bow-street, sonth of the theatre-

BUILDERS' BILLS. GWILT F. FITCH.—At the Court of Qaeen's Bench, Guildhall, on Fehruary 25, Mr. C. G. Addison ap-peared for the plaintiff, and Mr. M. Chambers, Q.C. and Mr. T. Chitty, for the defendant. This was an action in which the plaintiff, Alfred Gwilt, a hulder in the Borough, sued the defendant, Miss Fitch, to recover the sum of 337. 11s. 8d, heing the amount of the plaintiff's hull for making a watercloset and doing other repairs, at a house belonging to the defendaut, next door to the plaintiff's own premises. The plaintiff's case was, that he was employed to repair a drain, and so to prevent a unisance at the

said this was unnecessary, so far as his comfort was eoneerned. According to the plaintiff's own state-ment, the defendant's brother, an attorney in Union-street, had told him to do what was necessary, and to make a good job of it. He denied that he had ever strete, had told in a be a stretch of the state of the st than 57

Mr. Fitch was called for the defendant, and stated Mr. Fitch was called for the defendant, and succe that he had entered into a special contract with the plaintiff to do the job for 5*l*, and that he had entered a memorandum in his diary to that effect. The memorandum was read, and he positively denied that he had given the general authority alleged by the $\frac{1}{2}$ before the general authority alleged by the plaintiff.

Lord Campbell left it to the jury to say whether Lord Campbell left it to the jury to say whether they believed the evidence given by the plaintif, or that given by the defendant's brother, Mr. Fitch. If the entry made by the latter was a false one, certainly the fraud attempted was a most scandalous one, and one for which he ought to be struck off the rolls. But the jury must decide which side they would helieve. The jury retired and finally found for the defeudant.

FALSE MEASUREMENT 1N DEALS, &c. A PROFESSIONAL correspondent, under the signa-re, "Architeetus," writes us as follows :---

tree, "Architectus," writes us as follows:— "The trial mentioned in the *Times* of Saturday, 21st ult. in the Court of Queen's Bench, Shepherd v. Engstrom and Co. is so important, and the observa-tions of Sir F. Thesiger and Lord Camphell so just and worthy of attention, that 1 trust yon will, for the benefit of the profession and the trade, give it a place in your journal, for I am sorry to say the very im-proper practices there referred to are not confined to deals. Two instances of late introduction (and which ought to be put a stop to by architects, as in my proper practness there referred to are not commed to desls. Two instances of late introduction (and which ought to be put a stop to by architeets, as in my practice 1 invariably do), at present occur to me, viz. calling slatus of intermediate sizes, not by dis-tinguishing names, but by the name of the larger size, and to which name they have no right. Thus calling slates 9 by 18, countess instead of large countess. For myself 1 never allow a higher charge for these intermediate shan for the inferior sizes to which they properly belong; and in contracts 1 always reject them, even to the taking them off again if substituted for the larger description. Again, secondly, calling cast-iron rainwater pipes by the diameter, outside measure, instead of the clear hore, as in all other pipes, and drains, &c. thus 4-inch rainwater pipes are only about three and five-eighths." The case referred to we condense from the *Times* columns. columns :-

The case reletion to we contain our new remer hand, the second se

brokers to find a dar penind the other hard beam of the state of the

was very much to be reprobated. His Lordship enlarged on the importance of merchanis maintaining in their tran-sactions a character for that *inderrima files* to which Eng-lish merchants had been hitherto celebrated. He hoped that such practices would be abstained from in future, not only by the defendants, but by all traders. A juror was then wildbawn on the terms above stated.

INSTITUTION OF CIVIL ENGINEERS.

ON the 24th ult. Mr. G. P. Bidder, vice-president,

on the 224 mit, but of F. I. Bader, vice restant, in the chair, the paper read was "On Chain-cable and Timher-testing Machines," by Mr. T. Dunn. The hydraulic press machines, for testing chain-cables, had been generally so costly in construction, and required such expensive foundations, that few of and required such expensive noundations, that itse of the chain manufactures had on their premises any means of testing their chains. Messrs. Dunn, Hat-tersley, and Co. of the Windows Bridge Iron Works, Manchester, having had their attention directed to Minimised, having not then attended unleaded to this want, designed the simplified testing-machine, the description of which formed the subject of the paper, and which could be produced for 2007. to 3007, instead of 1,1007, to 1,6007, the cost of the $T_{\rm eff}$ Government and corporation testing machines. It was illustrated in our pages some time ago. The arrangements for the main hydranlic cylinder, the arrangements for the main hydrandic cylinder, the valves, and the levers, are very simple and effective, and the results of very numerous series of experi-ments, which were given, demonstrated the power and uniform action of these machines—one of which was used at the Paris Universal Exhibition in 1855, for making a loging series of experiments on the strengths of colonial and other timher, under the direction of Captain Fowke, R.E. part of whose report was encoded

direction of Captain Fowke, R.E. part of whose report was quoted. In the course of the discussion it was remarked, that the hroken links showed, in almost every in-stance, that the fractures had arisen from an imperfect mion of the iron of the links in welding. It was considered that sufficient force and rapidity of blows could not be obtained by hand lahour, and that tilt hammers with the requisite speed had not yet been employed , neither had stean-hammers, which were merely lifted by steam and fell by their own gravity, sufficient speed for heavy chain anking. A descrip-tion was given of Naylor's single or double-acting steam-hammer, which could be changed at pleasure, by merely moving a lever, and by which any amount of steam, from a mere hreathing upon the piston to that of the full pressure of the holier, could be applied, and he varied whilst the hammer was in full work. Two of these hammers were employed in the work-shops of the Eastern Counties Railway at Stratford, and one at Norwich. They were somewhat like the "Nasmyth" hammer, but comprised several modifi-cations, having reference particularly to the valves and yalve againg. The heavent is the the valves and yalve againg. "Namyth" hammer, hut comprised several modifi-eations, having reference particularly to the valves and valve gearing. The hammers weighed 10 cwt, each, and when worked with a length of stroke of 12 inches, and double-acting, 230 blows per minute could be obtained, or more than twice the numher that could be given by an ordinary hammer lifted by steam, and falling by its own unaided gravity. The same principle was said to be applicable for rivetting iron plates for ship-huiding.--also for bollers, tanks, wrought-iron hridges, rivet-making, &c.

RECENT AMERICAN BUILDING PATENTS.*

RECENT AMERICAN BUILDING FATENES." For an Improvement in Mixing Wheat Flour with Paints. IsaAC GATTAAN, Philadelphia, Pennsyl-vania. Claim.—The manufacture of paints hy grind-ing crude colours in a composition of water, flour, or its equivalent, rosin, or its equivalent, fish oil, or any drying or undrying oil, in order that the paint thus manufactured may he produced at a cheap rate, and afterwards thinned with water to the required con-sidence." istency.

For an Improved Method of Bending Wood. EDWIN KLIBURN, ARTEMAS KILBURN, and CHENEY KLIBURN, Burlington, Vermont. Claim.—The hend-ing of wood by forcing it endwise of its fibres into a mould, which is closed on all sides, but has an open end, is curved longitudinally in the required form, and has the dimensions of its internal transverse seetion of the piece of wood, thus easing the wood to be confined in a lateral direction during the bending process, for the purpose of preventing the separation of the fibres.

of the fibres. The proved Method of Bending Wood. For an Improved Method of Bending Wood. THOMAS BLANCHARD, Boston, Mass. Claim.-1. Subjecting the timher to pressure upon all sides, and coutinning the same while it is heing transferred from the straight trough to the enrved mould. 2. The machine for heading timber, consisting essentially of the following elements, or their equivalents, in com-bination:--1. The hending here. 2. The device for compressing the timber while it is being hert. 3. The enrved mould in which the pressure is continued, and in which the timber is renoved from the machine after the hending operation is completed. after the hending operation is completed.

* Selected from the list of patents published in the Journal of the Franklin Inst tute of Pennsylvania.

frame, having one or more turning slats or dampers hung in it, said frame being provided with a rudder, so as to be always turned to a proper position by the action of the wind, and the dampers being combined with a spring mast with sail on top, so as to be closed more or less by the action of the wind, and automatically opened during a calm."

For an Improvement in Cust-iron Pavements, GEORGE M. RAMSAY, City of New York. Claim.— The iron bezagonal paving blocks with legs or lugs below, when united and secured by the iron elips or bands, so as to form the flexible pavement.

For an Improvement in Bridges. ISAIM ROGERS, Cincinnati, Ohio. Claim.--1. The formation of an arch whose roussoirs consist of one or more ranges of tubes in vertical planes, held in position by the doserihed radial plates with confining fanches, the tubes of each component arc heing gradually displayed and cultarged from the crown of the arch each way, the cultargement in one direction and the contraction in the other direction and the conversion and the conversion of the other direction being such as to preserve a cir-cular section throughout, or gradually oralling from the haunches by a vertical enlargement towards the ends, and a corresponding contraction towards the centre of the arch, according to eircumstances. 2, In comhination therewith, the described mode of staying and bracing together the several ranges of such tubular voussoirs.

For an Improvement in Machines for Mixing Mortar. BENJAMIN F. FIELD, Beloit, Wisconsin. Claim - The use of a revolving box of a cylindrical or other form, made to roll upon the ground for the purposes of mixing the mortar by the action of the cross-rods, whilst at the same time it serves to carry the material from place to place, in combination with the method for discharging the mortar from the revolving box.

For an improvement in Artificial Stone. Sr. JULIEN RAVENEL, Charleston, South Carolina; patented August 12th, 1856; re-issued October 14th, 1856. Claim.-The composition of marl and slacked lime, substantially in the proportions for producing an artificial stone, or a substitute for stone and bricks.

Books Receibed

VARIORUM.

"What is to be done with our Criminals" is an important and anxious question, not only asked, but ably responded to, by Mr. Charles Pearson, the City solicitor and late M.P. for Lambeth, in a shilling pamphlet under this title, published by Hall and Virtue, of Paternoster-row. It is in the form of a letter to the Lord Mayor, and also contains the report of a speech by the author in the House of Commons on the same question. Classing the subject under three beads, Mr. Pearson graphically doscribes — 1. The system of past days, or the cheap and cruel system. 3. The present, or the expensive and effenti-nate system. 3. The future, self-supporting, or "labour and appetite system." He urges—and in this we need not tell the readers of the *Builder*, that we perfectly agree with him —that eriminals onght to "What is to be done with our Criminals" is an this we need not tell the readers of the Builder, that we perfectly agree with him --that eriminals ought to work for their own provision, that prices ought to he self-supporting, and not an eternal and intolerable burden on the ratepayer. This ought to be so even with the honest hut unfortunate poor in the work-houses,--much more with the dregs of the population in the prisons. The amiable and excellent Howard voodd seem to have not only at last done all the good to eriminals that he intended, but much more (and that not all good even to them) than he ever even dreamt of. Such is the power of a single determined will over auccessive generations: the amelioration of the "cheap and cruel" system has resolved itself, under the well-meant exertions of Howard, into "the expensive and effeminate system." expensive and efferminate system," and now prison life is a state of luxury and idleness, when contrasted, not only with the miserable provision and accommodation for the honest panper in the workhouse, but even with those of the employed labourer and artizan. Witness the progress of the Lord Mayor and the City architect, and other City authorities, the other day, first to the workbouse and its "easnal ward," and then to the prison: here was in itself a virtual protest against was absurd a state of things. "Look bere," as the l'Anakces say :-At "Reading prison palace," as Mr. 2Pearson caustically styles it, a prisoner is "not com-pelled, nor even persanded, hut only permitted" to swork. "There are only two cases of refusal to work ; "one was I hardwork if the last of refusal to work ;

For an Improved Mode of Securing Sheet Metal Coverings for Roofs. W.M. H. TRISSLER and JOIN BYEWART, Fairview, Pennsylvania. Claim. — The onble lapping joint for uniting the sbeets of metal without solder. Also, the combination of the serol and wing edges, for uniting the strips of covering. For a Self-Regulating Draft for Chinney Tops. JOSIAH A. BOYCE, Lee, Mass. Claim. — The appli-two). Under Government regulations, therefore, a eation to the top of a chinney or a draft flue of a course the strips of a claim. — The appli-two). Under Government regulations, therefore, a eation to the top of a chinney or a draft flue of a course the stript of a claim and the strips of covering and the solution of the serol of a self-regulating one or more turning stats or donness avail spring one or more turning stats or donness avail spring with the based "to the series". any recreated intensives at the unresponse matter $k^{(n)}$. Under Government regulations, therefore, a London thief is kindly aided in his landable desire to avoid spoiling his "skilled hand" for bis trade, while at the same time luxurionsly fed and attended, so as to is provided starting to the same worthy. sustain his physical stamina to the same worthy d. While this state of things prevails in the end eriminal prison, what have we going on at the work-house? The honest and able artizan must cither , harden, and destroy his skilled band, and his watchful and educated eye, hy breaking hlister blind his watchful and educated eye, by breaking stoues for a mere pittance, or must starve and die— he and his wife and family! Can the publie "look on this picture and on that" without the excitement of strong indignation and disgust ? So ridiculous and absurd a subversion of all right principle can no longer couline: something must he done; and Mr. Pearson, or any one who will help towards that end, well desarres the netional thanks for his acations. blind well deserves the national thanks for his exertions. -----In the very next publication which happens to

—In the very next publication which happens to come hefore us, we have various interesting details of prison life abroad,—that is, when those princes in erime who laxuriate in the "prison palaces" of England go ahroad at the public expense to recruit their health and dispel their *exnui*: we allode to a field officer's very readable volume on "Ber-muda" as "a Colony, a Fortress, and a Prison," just published by Messrs. Longman and Co. In describing the life of the felon at Bermuda, the author involuntarily exclaims,—"f How many thousands are there of good character in London, whose hours of labour exceed those of these condermed felons! The printers' devils, for instance, who work from eight in labour exceed those of these condemned felons! The printers' devils, for instance, who work from eight in the morning till eight at night, with only one hour's relaxation for dinner, undergo more severe and un-healthy toil than any ont-of-door convict labour prac-tised at the present day." And again, when the con-trast forces itself upon his professional notice, be-tween the duties of the gallant defender of his country and those of its vile plunderer, or even murderer, the "field officer" says,—" If we compare the food and work of the convicts with those of the solidiers on guand and on sentry in the same island, the position guard and on sentry in the same island, the position of the former will excite no compassion in the tenderest incast. The convict is allowed, doily, one pound and eleven ounces of bread (!), one pound and a quarter of meat (!), and haif a gill of rum (!). He has cocco sweetened (poor fellow) for breakfast, and a supper equally good. The soldier is limited to one a supper equally good. The soldier is limited to one pound of bread and one pound of meat (!), and huys his own groceries and liquor. The writer was assured by an eye-witness, that on the first serving out of the increased allowance of bread-for it used to be only increased allowance of bread—for it used to be only one pound—the convicts, in contempt, threw the surplus overboard." Can it be wondered at that under such a system, "these facts have long been so well appreciated by soldiers that erimes were for-merly not unfrequently committed by them with the express desire of being transported."—a contingency which it required the lash to put an end to,—the lash which nexer falls of course, num the saced shoulder: which never falls, of course, upon the sacred shoulders of the true " devils" of society. One does not need to go to Bernuda bowever, nor even unnongst the military for such instances, and such *Government* minitary for such instances, and such Government enticements to erime: they are hut too plentiful at hones and in eivil life.—Amongst Educational hooks received, we note one; titled "Every Child"s Scripture History," adapted for junior classes, from Dr. Kitto and Miss Corner's Scripture History, sim-plified, by Edward Farr (Dean and Son, of Ludgate-hill, publishers); and "The Stepping-Stone to French History," by "A Teacher" (Longman and Co. pub-lishers). Both of these scent to be cood of treir hit, pursuance of the second of the second of the lishers). Both of these second to be good of their kind; but why does "A Teacher" exclude the kind; but why does "A Teacher" exclude the second of t kind; but why does A reacher exclude the Bonapartean as a reigning dynasty from those enumerated as the French dynastics; is it because the Committee as the French dynakties : is to because the Bompartee are relever rather than mere reigners? —A second edition of Mr. Peter Burke's "Com-pendium of the Patent Law as now amended" (Benning and Co. 43, Fleet-street, publishers), has been called for, and has now appeared. The an-nonnement of the issue is all we need say of such a work, by a methon like Mr. Burket. work by an author like Mr. Burke,-giving wholesale warning as to "The -A Tract sale warning as to "The risks to life giving wholesale warning as to "Inc risks to lie and property attending the practice of racing on the ocean," has been published by Nissen and Parker, of Mark-lane. In these *first* times such a warning is certainly needed.—We must place amongst the books received a very complete and beautiful edition of the "Poetical Works of Lord Byron," in one volume of 655 nears int which by Margaret we absurd a state of things. "Look bere," as the Wankees say:—At "Reading prison palace," as Mr. Pererson caustically styles it, a prisoner is "not com. Byrou is the architectural traveller's poet, and this pelled, no even persuaded, but only permitted "to is exactly the version for the bag or the knapsack. wwork. "There are only two cases of refusal to work : It has the advantage of a very full index; and for zone was a London thief, who came from Ascott, and

poet, now in the library of Trinity College, Cam-bridge.----Adeock's Engineer's Poeket-Book, for 1857 (published by Simpkin and Marshell), contains many valuable tables, formulæ, and other knowledge, including a very useful chapter on the strain and stress of materials.

Miscellanea.

SUBMARINE TELEGRAPH VIA THE RED SEA.-SUBMARINE TELEGRAPH VIA THE RED SEA.— There is a project, sail to be supported by influential names, for establishing a telegraph to India in con-tinuation of the system of telegraphs decided upon by the English Government for the Mediterranean, and which is to terminate at Alexandria. The pro-posal is to lay a number of wircs across Egypt and down the Red Sca to Adea, whence they will run narallel to the south coast of Arabia, and terminets at parallel to the south coast of Arahia, and terminate at Kurrachee, to which the Indian telegraphs extend. Complete powers are said to have been very lately obtained from the Ottoman and Egyptian Govern-

ments for the purpose. SALE OF A QUARY BY AUCTION. — Messes. Winstandey submitted for sale by anction, at the Mart, on Tuesday in last week, a freehold estate, consisting of about seventeen acres of land, bounded hy the river Derwent, on the road from Cromford to Bakewell, about two miles from Matlock, Derby. The auctioncer described the land as possessing an ahund. ance of limestone of a very superior quality, contain ing properties peculiarly desirable in the process of ing properties peculiarly desirable in the process of smelling iron. Two quarries, he added, have heen worked, and there exists a great demand for the stone. Fine marble of various kinds has been discovered, and no doubt, could be worked to great advantage. Con-vergance is foulitated Matlock veyance is facilitated by proximity to the Matlock and Bath railway station and the Cromford Canal. There was a good attendance of capitalists, and a spirited competition. The hiddings commenced at 2,000', and the lot was eventually sold for 4,690', or 2,0007 and the for was eventually sold for 2,0007. upwards of 2757, per acre. STRIKE OF MANCHESTER OPERATIVE CARPEN

STRIKE OF MANCHESTER OPERATIVE CARPEN-TERS.—A meeting of master hulders was held at Manchester on Monday week, to receive a deputation of workmen respecting the strike in the shop of Mr. Robert Neill. Five of the workmen attended as a deputation, and requested the suspension of the new volum. The master after a lowerhood discussion ules. The masters, after a lengthened discus Resolved, as this meeting atterly disclaims discussion, any intention of taking the slightest advantage, and be-lieves the new rules have been drawn ont in a spirit of fairness to the men, and certainly contain nothing which can justify the extreme step taken by the workmen, the masters decline to withdraw the rules. At the same time, if the men on strike resume work, At the same bank, it the men on sirke resume work, they have no objection to listen to any proposals which may encoate from the men; and, if it can be shown that any infringement has been made on the rules of 1846, the masters are ready to listen to the representations of the men, and, if necessary, to make an alteration."

REPAVING HIGH HOLBORN .- This great thoroughfare will be closed to carriage traffic for several weeks, in order that the wood pavement may be taken up, and the carriage way haid with Aherdeen granite cubes and the carrage way ind win Aleraces granite cubes on a held of concrete filled up with grouting, and new footways laid down from the city houndary to Brown-low-street. A resting-place is to be made in the carriage-way opposite Chancery-lane for passengers crossing. The works are to be executed within fify-six days, nnder a penalty of 50/, a-day.

htty-six days, nuder a penalty of 50%, a-day. LECTURE ON ART.—On Wednesday evening Mr. Henry Ottley gave, at the Marylebone Institution, a very interesting lecture, entitled "An Hoar with the Old Masters." It was a history of painting, in which he traced the growth or development of the art from the darlier ages to the time of its greatest glory in the days of Correggio, touching in each instance on the distinctive merits of the respective schools, and on the works they have left belind them. P. R. B.-ism came in for a fair share of this comments amongst came in for a fair share of bis comments amongst other art topics of the present day.

other art topics of the present day. MOULDED BRICKS.--It is surprising that so little use appears to be made of moulded brick for orvament in architecture in the metropolis, although it is a sin-gularly heantiful material, having a rich colour, and taking a very sharp edge. It is also extremely dorable. I have used moulded bricks very extensively in build-ing myself a house in Surrey, and should be most happy to show specimens of them to any architect or builder who would take the trouble to call at my house in town hetween five and six o'clock on any day builter who would take the trouble to call at my bouse in town hetween five and six o'clock on any day in the week. They are not simply common-sized bricks, cut in various shapes, but are in large masses as heavy as a man can lift. This adds greatly to the value of their appearance. My hope is to see them used in place of sluceo,--one of the vilest materials that her one discussed architecture. that has ever disgraced architectu

CHARLES BUXTON. 7. Grosvenor-crescent, Belgrave

EXETER HALL - The annual meeting of members of the Sacred Harmonic Society was held at Exeter Hall, on Tucsday evening, February 23th. In the course of the evening an appeal to the directors of Exeter Hall was unanimously agreed to, colling on Exeter Hull was unanimously agreed to, colling on them to give attention to the representations so fre-queetly made by the public press and by the various societies meeting in the hall, to provide additional means of ingress and egress, and expressing a strong opinion as to the day of the directors of Exeter Hall to yield to representations so frequently submitted on the archived the

the subject. THE SOULAGES COLLECTION. — Messrs. P. Graham, J. G. Crace, John Jackson, and E. Bond (of Gillow's), have addressed a letter to Sir Benjamin Hall, calling strongly the great importance of the formation of a muscum or collection of such objects and examples of industrial art, and the immense advantages that would necessarily result therefrom in the progress of many branches of our manufactures. They mge joudy that "the study of objects such as are comprised in this collection is as necessary to the education of the art-workman as the study of ancient monuments and to the sculptor, or the works of the old masters to induster," and call upon Sir Berjamin to lend the influence of his judgment and taster, and his voice as the representative of a numerous and important eco-stituency, to induce the Government to become the parsite of the Soulages Collection, and thus to consist in rendering an important service to the public. THE FREE SEATS IN ST. LANES'S, PICCADILIZ. e subject. THE SOULAGES COLLECTION .-- Messrs. P. Grabam,

asist in rendering an important service to the public. THE FREE SEATS IN ST. JANES'S, PICADLEY, -Seeing the article in yoar publication about the alterations in this church, wherein no small parade is made of the additional free sittings gained for the poor by such alterations, I am induced to inquire of you whereabouts and of what sort are these free sittings? No one would suppose, from the article in your paper and from previous articles in other publi-cations on the same subject, which I have scen, that these much-vanuted free sittings are, after all, nothing more than "a joke", — fit receptacies only for the coh-weak, dust, breaks, and old matting of the section, they being in odd, out-of-the-way corners, at the ex-treme western ends of the sistes, and of very different construction to the high, pert pays in their front. It is the old story over and over again—a great ery and little wool. There will he no free accommodation for Bonarmetion to singh, per pose in unreliable and is the old story over and over again—a great ery and little wool. There will be no free accommodation for the poor in the parish church of St. James, in the proper and true sense of that much-abused term, unless and notil that church is thrown open to all alike, free of charge,—as also of the frowns or suiles of sour-looking, fusty pew-openers,—until, indeed, it may be truly written over the doors, — "Here the poor and rich meet together: the Lord is maker of them all." All hesites is a never make-shift, invi-dings, trumpery, half-and-half, and waste of money affair. Let we add, that I know of no church less adapted for a solemn rite of the church,—such, for i-stance, as a confirmation,—as this so-called *chef d'envere* of Sir C. Wren, who certainly would have been muable to see from his gallery the compants of these newly-gained sittings, as they, poor souls, are d'arrore of Sir C. Wren, who certainly would nave been nuchle to see from his gallery the overpants of these newly-gained sittings, as they, poor soils, are as little able to "see or hear the preacher," which is said to have heen a sine guia non with him in the arrangement of his churches. I attach, however, more importance to the doing away with all invidious and indecent distinction in the House of God, then to

and indecent distinction in the roots of order, that of the more seeing or hearing the preacher. - G. H. THE SOIL IN ST. JAMES's-SQUARE. - A corre-spondent, "Geologiens," says, "Some three years ago a sewer was formed in the southern portion of St. what James's-square. Can you tell me to what depth the excavations were made, and what was the thick-ness of the bed of *sand* through which they worked ? ness of the bed of sand through which they worked ²⁷. Mr. Lowick obligingly informs us, in reply, that from imquiries of the parties who superintended the works, and examination of the contract sections, the depth of excavation for the saver appears to have been from 21 to 22 feet; that 5 feet of metalling and made ground were first met with; and then sand, which continued uninterruptedly to the hottom of the sever. The thickness of the saud-hed ent through was from 16 to 17 feet; but its limit was not reached. THE PROFILE'S MONDAY EVENING CONCERTS, at 54. Martin's Hall, are still proceeding, and afford

HE PEOPLE'S MONDAY EVENING, and afford Martin's Hall, are still proceeding, and afford St. innocent pleasure to many at a low cost. The I Mayor has forwarded a donation of 5% after attend one of the concerts, and has promised to pay another visit with the Lady Mayoress.

CAMBRIDGE ARCHITECTURAL SOCIETY .- The first CAMBRIDGE ARCHITECTURAL SOLITI. The mes-meeting of the above society for the Lent Term was held on Thursday, February 19th, when Mr. H. T. Kingdon, Trinity College, read a paper " On Erith Church, Kent," the purport of which was to discuss Ringdon, Trinity College, read a paper "On Erith Church, Kent," the purport of which was to discuss the question whicher a recess in the east wall above the slar was a credence or not. The Rev. G. Williams exhibited a design for a stained glass window, by Mr. A. Bell, to he pheed in St. Columha's College,

IRON, HARDWARE, AND METAL TRADES PENSION SOCIETY --- This society, established in 1843, for the purpose of affording permanent relief to deserving and necessitous members of the several trades and their widows, and which now numbers twenty-five men and whows, and which now numbers tweaty-here men and forty women peusioners, at an average annual cost of 1,2757. I.5s. held its first hall on Monday evening, at Williss-rooms, under the patronage of his Grace the Duke of Norfolk, &c. The zcal and energy of the members of the trades in forwarding the interests of this society may be inferred from the fact that nearly 400 upon meant.

this society may be inferred from the fact that many 400 were present. OXFORD ARCHITECTURAL SOCIETY. — At a meet-ing on the 18th ult. in consequence of the indisposi-tion of the reader of a paper announced, Mr. James Parker read one on the "Study of Architecture Historically," in which he proposed that the society should turu its attention more than it had done to this branch of the subject. He reviewed the exertions of the society during the last seventeen years, and, according to the Oxford Herald, gave it credit for having gradually instilled into builders and architects a love for, and an appreciation of, the forms of Gothic according to the OrDO's lists, and an exhiters having gradually instilled into builders and architects a love for, and an appreciation of the forms of Gothie rachitecture. It seemed to bim, however, that the society had another work to enter upon, it bad to teach the proper application of these forms, which he contended were still often misunderstood. He con-sidered that, by studying the history of architecture more closely, we should comprehead the origin and meaning of these forms, and so apply them more truthfully. And "truthuluess" he considered to he the great thing still wanting in many of our finest modern Gothie edifices. He went on to show the many points in which history was, as it were, the key to architecture, and how by its study much light would be thrown upon the plans and designs which it would be thrown upon the plans and designs which is did the thrown upon the plans and designs which we find remaining, and from which we copy. In conclusion, he proposed that in the course of the many gene the should make Oxford their especial study, and in the history of the lines while history of the times, or with some of their great leading men, such as Merton, Wykcham, or Wayne. I dead give them the history of his own colleges, and conneet its architecture, as far as possible with the history of the times, or with some of their great leading men, such as Alerton, Wykcham, or Wayne. I did, they would produce such a history of its university and eity as in no other way could be produced; they would aid those historical studies in finally, while assisting the study of architecture, make the nows cominently reviving in Oxford; and finally, while assisting the study of architecture, make to globy of mean. a love for, and an appreciation of, the forms of Gothic their society once more to be felt as an earnest, work-

ing hody of men. THE ROYAL ACADEMY .--- The subject selected for the gold medal competition of this year, both in sendpture and painting, is "The Good Samaritan." The number of competitors will be large, and we hope that the modification of treatment necessary and peculiar to each branch of art will be well studied by the students, for if such be the case the similarity and the students, for if such he the case the similarity of subject in hoth branches may afford a valuable lesso

THE MANCHESTER MECHANICS' INSTITUTION EXHIBITION.—At the 33rd annual meeting of the Manchester Mechanics' Iostitution, and the last to he held in the old buildings in Cooper-street, a report,

he held in the old buildings in Cooperstreet, a report, read by Mr. Hutchings, the secretary, mentioned that the receipts from the Exhibition of Industrial Art in support of the fund for defraying the cost of the new huilding had resched nearly 7,000% and would pro-bahly leave, after defraying all expenses, the sum of 4,000% towards the reduction of the debt. Nortice To WORKEN on Discussee, the sum of 4,000% towards the reduction of the debt. Nortice To WORKEN on Discussee. At the last County Court at Walsall, an action was tried in which Charles Bott, a carpenter, such Messrs. Lloyd, Foster, and Co. in whose employ he had been, for 5% is wages. Judgment had, is a prior action, here given for the defendants. The point on which the question turned was, whether masters could discharge workmen when from any cause they had an owrk for them, without giving them a fortnight's notice. It was proved to he the practice of the defendants to require that notice from their workmen before thy require that notice from their workman before they left. The jury gave a vardiet for the plaintiff for the whole amount claimed, -5/. 1s.

PHOTOGRAPHY AND EMPLOYERS .- A correspondent PHOTOGRAPHY AND EMPLOYERS.—A correspondent suggests that photography might be neefully resorted to in the case of applications for situations of trust, seeing that the character of an individual can so readily, in the majority of instances, he determined hy his outward appearance. LITERFOOL REGEATIVE CONTANY (LIMITED).— The objects of this society are to establish a house of entertainment for the working man, similar to that in dimensione and where at a triffice set the artisen

entertainment of the vorting that, subtration that in Birmingham, and where, at a triling cost, the actions may enjoy physical and mental exercise (chess, gran-nastics, &c.), hear a popular lecture, read a light periodical, drink a enp of coffee, and indeed he enabled to indulge in every soher and rational enjoy-ment at a small cost.

LEICESTERSHIRE ARCHITECTURAL SOCIETY .- At a meeting of this Society on the 23rd ult, the Rev. Mr. Gresley read a description of what was said to be prohably the most ancient mansion in Leicesterto be predative the most ancient mansion in Leterster-shire, accompanied by two views of it, with ground-plan and details. This is Donington-on-the-Heath, in the parish of Ibstock. In the time of King Henry III, the heiress of William de Sces, of Don-ington, married Alexander Villiers, of Brookshy. To the acalier net of that Vinde sound the margine the earlier part of that king's reign the mansion was the earlier part of that king's reagn the indusion was ascribed. It consists of a square buildings, with smaller projecting buildings from it at the back. On the ground-floor was the kitchen and store-room, and the ground-floor was the kitchen and store-room, and above this the hall or apartment ordinarily occupied by the owner and his family. The entrance to the mansion led into this npper room, and was accessible by means of an external staircase, prohably of wood, all traces of which are gone. The original windows are unrow lancets, with plain and trefolied heads, while others are square headed. This mansion has not heen noticed by recent writers upon domestic architecture. The views of it mentioned will appear in the xolume of the Amastitic Drawing Society. for the volume of the Anastatic Drawing Society, for in

STRIKE AT THE BIRKENHEAD DOCK WORKS .-STRIKE AT THE BIRKENHEAD DOCK WORKS.— From some cause of disagreement the navvies em-ployed by Messrs, George Thompson and Co. the contractors, in carrying out the works for the deepen-ing of the Great Float, at Birkenhead, recently struck work. It seems that last week until eight o'clock on Monday morning these men, the tippers and drivers, were at work, but that after the hreakfast half-hour they refuged to turn to mulest sheir worse where reliad priorday morning these men, the tuppers and dirvers, were at work, but that after the hreadkast half-hour they refused to turn to unless their wages were reised from 2s. 8d. and 2s. 9d. a day, of winter working hours, to 3s. for the longer day's work, from six to six, with half an hour for hreakfast, and an hour for dinner. They urged that their work is more arduous than that of the platebyers and mechanics, who receive 3s. 4d. a day. The police were first of all called into requisition, for on Monday the turnouts compelled by threats all the men who remained at work to desist. On Wednesday morning 600 of the turnouts came down to the works in a hody, and, inding a few men at work, ron after them, but no-violence was used. Riotous proceedings, however, having afterwards taken place, a detachment of the uillitary was called in to check the disposition to violence which was manifesting itself. Messrs. Thompson had mada arrangements for bringing men from their various contracts in different perts of the country its reaches these place, a detachment of the sufficient perts of the Thompson had made arrangements for bringing men from their various contracts in different parts of the country to replace those out on strike. The men comploin that it was falsely represented that they resisted the introduction of Eaglish labourers, the fact, as they say, being that hoth English and Irish were on strike for a rise in wages. The magistrates and police repeatedly pointed out to them that what-ever was the cause of the strike, they had no right to intrimidate any one or to force themselves upon their former employers. They have since retarned to work. WORKING Max's Face ExtracARTON AID So-

Working Max's FILE EMIGRATION AID So-CIETY.—A meeting has been held at the Temperane-hall, Broadway, Westminster, to explain the objects of this society to such of the working classes as chose CETT.—A meeting has been near at the rempetative hall, Broadway, Westminster, to explain the objects of this soriety to such of the working classes as chose to attend. The society has heen started by some few working men who have taken part in the recent pro-ceedings of the unemployed, and who have obtained the patronage of several iofinential gradienter in sup-port of the object in view. The hall was crowded hy a very orderly and attentive audience, almost exclu-sively of the lahouring class. On the platform were several gentlemen, who take a warm interest in their Wellare, including Mr. H. Drummond, M.P. the Rev. F. D. Maurice, principal of the Working Men's College, and others. The chair was filled hy Captain Neale Porter, and several resolutions, promotive of the objects of the association, were passed, and a list of subscriptions was read. One geneleman, it appears, has offered 500%. If the society will raise 2,000%. WIDTH OF STREFTS IN THE MERTOPOLS.—The Metropolitan Board of Works proceeded on the 27th ult, to discuss the proposed hye-law as to the form-tion of new streets, and got through three out of the enclasses.

ten clauses. THE GENERAL FEATURES OF PORTSMOUTH HAR-BOUR.—On the 20th nlt. Mr. H. Wood, Director of Works in H.M.'s Dockyard at Portsmouth, delivered a lecture to the members of the Philosophical Society there on the General Features of Portsmonth Harhour, Mr. B. W. Carter, presideat of the society, took the chair. In the conclusion of his lecture, Mr. Wood pointed attention to the fact that Portsmouth is a tidal harhour, and that for its proper preservation it is absolutely necessary to admit as great a tidal volume tidal harbour, and that for its proper preservation it is absolutely necessary to admit as great at idal volume into it as possible; for it is by the hack scour of the water that its various channels are kept open and free; and he added that a great henefit could be rea-dered to the harbour by introducing more "back to the harhour by introducing more "back " by the Portshridge channel from Langstone, water and that the narrow tongue of land at Haslar-heach, insignificant as it might appear, was the salvation of Portsmouth harhour.

THE BRITISH PORTRAIT GALLERT.—A trust has been appointed for the formation of a gallery of por-traits of the most eminent persons in British history. The Government bas assigned apartments at 29, Great George-street, Westminster, for the present accommodation of the board, and the reception of the Set partrick which then was obtain either the data This portraits which they may obtain either by dona-tion or purchase. Mr. W. H. Carpenter bas under-taken the daties of secretary protein, the permanent appointment not having yet been made.

appointment not naving yet occa made. THE SHEPTIELD CHIMEAN MONUMENT. --- The movement set on foot by a hody of working men in Sheffield was fairly brought before the public by a meeting at the Town-hall on Monday in last week; convened by the mayor. The requisition was signed by 400 to 500 working men, and the attendance was numerous

THE MILITARY HOSPITAL, NEAR SOUTHAMPTON THE MINITARY HOSPITAL, VEAR SOUTHARTON. The Portsmouth Times says.—"The military hospital which is bring created at Nethey was to have cost 150,000/ but the requirements of the medical officers for the comfort of the patients have so much exceeded Not the control of the patients have so much execute what it bas hitherto been the practice to provide in military bospitals, that the expense of the huildings will now amount to 260,000." We shall he glad to find that our suggestions with reference to this hos-pital, although scaredy received at the time in the spirit in which they were offered, have been attended to

pital, although scaredy received at the time in the spirit in which they were offered, have been attended to. OLD SCULPTURE FOUND AT WARWICK.—The sewerage operations at Warwick have, it appears, brought to light many matters of interest to the archeologist; and among these is a figure found iu Mill-street, a specimen of the sculpture of the earlier part of the fifteenth century. The drapery is arranged in broad folds, slightly broken, but it has unfor-tunately suffered from wilful mutilation : it is draped in a rochet and olh, and has a wallet suspended under the left arm by a strap crossing the right shoulder, and huckled on the hreast. It is believed to be a state of St. James the Apostle, in his pilgrim's habit. Being uncarved at the back, it most probably occupied a prominent position in the elurch of St. James, over the West Gate. Traces of polychromatic decoration yet remain visible. The place where it was found was once a quarry, which was gradually filled up by THOBS in the tories of the once in the tore. Atoms of the other the tore of the twelve the tore it was found was once a quarry. The annual summer investing of this concerts of the back in the tore.

ARCHITECTS³ BENEFOLENT SOCIETY.—The annual general meeting of this society will be held in the rooms of the Royal Iustitute of British Architects, on Wednesslay, the 11th inst., to receive the report from the council, and to cleet officers and council.

CHIMNEY CONSTRUCTION .- In reference to a state CHIMNET CONSTRUCTION.—In reference to a state-ment in Mr. Rawlinson's paper, printed in our last number, to the effect that "tall chimneys have ele-ments of destruction to contend with which are absent in Italian tower and Eastern minaret, namely, great beat and gases which may affect and destroy both hricks and morta;" a correspondent, under the signature of "James Lark," states that he has recently secured a patent which includes the remedy suggested in Mr. Rawlinson's paper. IRON.—The trade is getting on steadly, with a fair source of orders. The general hardware trades of the South Statfordshire district are suffering, however, from a degree of slackness ascribed to advance in prices of copper, zinc, brass, &c.—The plan of Mr.

South Staffordshine district are sufficing, however, from a degree of slackness ascribed to advance in prices of copper, zinc, brass, &c.—...The plan of Mr. M. S. Salter, of New Jersey, for making wronght-irou direct from the ore, is said to have been reduced to successful and profitable practice in New York. For some months past, says the *American Miners' Journal*, the process of making wrongth-iron directly from the ore has been in operation at Mott Haven (eight miles from the City Hell), where is exbibited wrongth-irou direct from the ore, in a furnace of three com-mained elounders, one above another, all actuated hy desame free whereof the upper channelse is used for meeting and doxidising, the middle channel for bedom and substing the iron." 1 First Arrs at THE ANTPODES.—Art begins to abloom in Australia. At Melbourne, an exhibition of maining, sculpture, and photography, was lately open, worver, for the lest design for a six-roomed cottage, uvarny. Premiums were to be awarded for the best specimens of paintings in oil, water colours, and on waiting, sculpture, and photography, was lately open, if the prosentity of which the local papers speak avarny. The exhibition was under the best specimens of paintings, in a six-roomed cottage, uvarny. The exhibition was under the patronage if the acting governor, for the best specimens of painting sculpture, and solve sunder the patronage if the acting governor, the judges, the bistops, the was of departments, university professors, and thers. The architects of Vietoria bave established the institute in that city.

THE BUILDER.

LECTURE ON ROADS AND RAILWAIS.—At the Coalbrookdale Literary and Scientific Institution last week, a lecture "On Roads and Railways" was deli-vered hy the Rev. John Hayes, In describing the different modes of construction, or, rather, the differ-ent rules observed in the construction, of roads at different periods, the lecturer axiomatically remarked that the ancient British, for example, avoided the bills, the Romans passed over them, and the modern British went through them. The modes of conveyance were described, as well as the roads, from the armed chariot of the ancient Brition to the first-class railway and saloou carriages of the modern Briton. LECTURE ON ROADS AND RAILWAYS .-- At the

Charlot or the ancient billion to the first-cases ranky and saloon carriages of the modern Briton. TORONTO...-We confess to some little surprise on baving received a pictorial supplement to the *Drondo Clobe*, dated January, 1857, with an "Account of the Rise, Progress, and present Position of Toronto." Although quite aware that these who went to Canada and a the date the the date had bind observe these here are the source of the second seco Although quite aware that those who went to Canada under the idea that they had little else than log huts to see, even in its cities and towns, were destined to find themselves rather pleasantly surprised when made cou-scions of their mistake, we really were not prepared to find Toronto so well worthy to be regarded as a city, and a capital, as it appears to be, if this pictorial illustration of its more important edifices be correct. Some of these are really handsome structures, and the dimensions of others are notice extraordinary for Some of these are really handsome structures, and the dimensions of others are quite extraordinary for such a city. Amongst the illustrations are the City Hall, erected in 1845; Osgoode Hall, erected in 1829-32; the new General Hospital, erected in 1856; St. James's Church, erected in 1849; the Provincial Lunatic Asylam, erected in 1849; the Provincial Lunatic Asylam, erected in 1845; Knox's Church, erected in 1847-48; the Normai and Molel schools, erected in 1847-48; the Normai and Molel schools, erected in 1847-48; the Normai and Molel schools, erected in 1852; John-street School, built in 1853- si Institute, erected in 1852-5; the Post-office, built in 1852; the Excharge, built in 1855; and Rossin House, built in 1856. Many of the principal build-ings of Toronto, it will thus be seen, are of rather recent date. recent date.

recent date. Lower THAMES STREET.—Dr. Letheby presented to the City Sewers Commissioners on the 24th ult. a report on the state of the locality known as the Barracks, or Wilson's-buildings. Low or Thames-street. The premises are situated bebind the houses No. 68, 60, and 70, in the main road. They consist of a suc-cession of wood balconics, and suall rooms placed one over the other against a dead wall, so as to exclude the light one is exceent in one direction. In all these the light and air except in one direction. In all there are 34 rooms, occupied by 20 families, consisting of 16 men, 25 women, and 30 children. Almost all the sleeping-rooms are without windows, and have no slceping-rooms are without windows, and have no occupants obtain their livelihood by clothes-washing, and are compelled to dry the things in the close dark rooms in which they live. Sickness is generally pre-valent in the place, and the inbubitants complain of its close and confined condition. The closets also are 'out of repair, and in one instance there is a soakage of the soil into the room in which a widow subsect of the same has the form in which a which and six children are residing. Orders were issued for a destruction of the partitions that shut out the light and air from the dark bedvoms, and for a thorough elecasing and repairing of the closets and drains.

THE ROAD FROM KNIGHTSBRIDGE TO BROMPTON. THE HOAD FROM KNIGHTSHADDE TO BIOMPTON. --It has often struck une, since Cromwell-road has been opened to the public, how very desirable it would be to improve the present approaches thereto, if not even to increase them. It seems to me that too much attention caunot be devoted to that part which will eventually form the main road of commu-stance of the provided of the second of the second of the second second of the second of the second of the second of the second second of the second of the second of the second of the second second of the secon which will eventually form the main road of commu-nication to this property. You are donbtless aware that one-half of the very wide space in the Brompton-road is now only used for traffic, the other half being cut up into unsightly patches of grass, railed off separately in front of each house, and studded here and there with trees, &c. By throwing the whole of the open space into the road, a great public improve-ment would be effected at a very triffing expense; and I think that, if the matter was urged upon the Metropolitan Board of Works, together with the Roads Commissioners, this great desideratum would soon be earried out. I cannot but thick that the Inadowners would readily assent to the proposition. soon be earried out. 1 cannot but thick that the landowners would readily assent to the proposition, as it would so much improve the honse property, especially on the north side of the Brompton-road. As a question of expense, the suggested improvement might stop short at Lancelot-place; but if it was continued up to the junction of the Knightsbridge-road, and the obtruding houses set back a few feet, in order to make the road of one uniform width, this road would become one of the fluest in the metro-rolis. polis.

polis. * **Without going so far as our correspondent in his suggested improvement, the proprietors of the ground in question, as we have before now remarked, micht greatly hencift themselves as well as the public, were they to make the most of the open spaces referred to, short of giving them up entirely to the public for the wideaing of the read, which it would be difficult to induce them to do.

MARCH 14, 1857.

The Builder.

INY, doubtless, remember the

time when the only shape in which India-rubber showed itself in this country was that of crooked and twisted little bottles, off which slices were cut for the use of those who desired or required to obliterate pencilmarks on paper. Even the first decided step towards the final management and mannfacture of this highly promising hut then somewhat tough and refractory material displayed itself to the eye of the general public in the shape 妆 5.90 merely of neater square cuts in the place of the old bottle slices, but still with the sole purpose of rubbing out pencil-marks. It was but natural,

under such circumstances, that this singular substance should acquire the name of "rnbber," which it still retains, although from no want of specific names of its own, such as the "hevee" of Esmeraldas, the "siringa" of Gniana, and the "caoutchoue" of the Mainas, with which last rather repulsive choker of a name it has been somewhat nnavailingly baptised, notwithstanding the possession of more euphonious cognomens, both in America and in India, such as jintarvan, saikwah, doll, and others bosides either hevee or siringa

Rubber, as we shall continue to call it (and for so doing we have the authority and example t of one who has bimself beeu called "the father the India-rubber manufacture," namely, Mr. Thomas Hancock, of the firm of Macintosh and Co.), is an inspissatiou of the creamy juice of more than one species of tree ; and, as already hinted, is found rather pleutifully in parts of the tropical world widely asunder. There are even vines which yield a similar juice. In the estnary of the Amazon, on most of the great cluster of islands there, it is obtained in large quantities, and the mode of procuring it ou these islands is thns described in a recent work on South America : " The season for the lahour is from July to January, for the river is then low, and at other times the water is so high as to overflow all the low lands, where the India-mbber tree grows, so that the process canuot then be carried ou. The tree is tall and straight, with a smooth bark, and sometimes grows to the diameter of 1 18 inches and even more. In order to collect the juice a longitudinal gash is made in the tree with a hatchet or tomahawk, and a wedge of wood being inserted, to keep the incision open, a a small cup of clay is stuck to the tree just b below it. These incisions are made all round If the tree, and the little cups form a circle round the trank. In these cups the juice, of the colour of milk continues to run four or five hours, and each cup is found to contain from three to five table-spoonfuls."

India-rubber came first into special notice about the beginning of last century, moulded it into the bottle shapes already referred to, and e even into those of animals. It was sold as high as a guinea an ounce ; but searcely anything was a knowu as to its history or origin at that time, a except that it then came from America (as well as prohably inland, then and previously, from India), till De la Condaniue sent an account of it to the French Academy in 1736, describing it as the inspissated joice of a tree, and called by the natives "hevee." It is now known that

THE BUILDER.

Amazon, the hancornia speciesa of Pernambuce, | feetly transparent, colourless, and elastic body," and the *urceola elastica* of Borneo, Pulo-Penang, except in thick masses, when a trace of colour and other East-Indian islands. The cultivation (that is, of white opacity) still remained. of these or other sources of this most useful, aud, indeed, now almost indispensable, article and of great importance. In America the destruction of the rubber-trees is probibited by law, a practice baving once prevailed of strangulating and killing them while withdrawing the sap. In some of the East-Indian localities where they abound, also, care is doubtless taken of the trees; but in other districts it is but too likely that the well-known fate of many of the gutta-percha trees may bave been shared hy the india-ruhber yielders. It may turn out, as we have ere now suggested, that organic chemists may discover how to make an artificial rubber from some inexhaustible source, since a substance very similar has been produced in ex perimental ebemistry, from bitumen, and, if we but, till so fortunate a discovery be made, there cannot he too much care and trouble taken in the preservation and cultivation of the rubbertree

The importation of the milky or creamy juice of the rubber-tree was at one time regarded as a great desideratum. Some of it was imported by Mr. Hancock, but he found that before it reached this country the solid and fluid portions had separated, so as to frustrate the intention in view. As, moreover, the solid part, or the congealed rubber, formed less than fifty per cent. of the whole bulk, it was at length looked upon as a hopeless task to import the juice. Compensatory processes afterwards rendered this failure of less importance, perhaps, than it ouce was; but still it would seem, from a scientific exam ination, by Dr. Faraday, of the properties of some juice which was safely imported (in the hollows of hamhoo canes, if we mistake not), more than thirty years since, that great advantages would accrue from baving the opportunity of dealing with the raw material in the shape of the creamy juice; and in these, our own, days of daring and eosmical schemes and speculations, it is surprising that no enterprising India-rubber manufacturer has gone to the fountain head, by establishing the requisite works in convenient vicinity to the native treemilking process itself, either in South America or in the East Indies. In confirmation of the idea that manufactures, of the beauly-and purity of which we have as yet little conception, might he realized, were we only able to act freely aud by wholesale on the raw juice, as it flows from the tree, we shall just dip a little iuto Faraday's report on the juice which he examined.

One most important feature was the facility with which the ruhber-juice and rubber could thus be washed with mere water, over and over again, till both rubber and water were left perfectly pure. In this condition the creamy juice hecame "perfectly white," and portions of it so continued even for a twelvemouth, the sap being thus more easily preserved in a diluted than a concentrated state. When evaporated, either on paper, or on a capsule or otherwise, the rubber was left in its elastic state, and perfectly un-altered, except as regarded purity. On absorbent surfaces such as plaster of Paris the water was rapidly abstracted, and the rubber congealed into a mass retaining the form on which it was cast, and beautiful medallions were thus made. At first the rubber congealed as " a soft white solid, almost like curd." From this the residual water could he partly extracted by mere pressure, when it contracted, became compact, and assumed the elastic state, though still soft, white, and opaque. The opacity was not an essential property, bowever, being attributable to water the best kiuds of ruhher-hearing plants in the not yet exuded. Exposure to air completely desiccated it, and then it appeared "as a per-

"No appearance of texture," continues the report,* "ean be observed in the pure transparent has become a question of anxious consideration caintchone: it resembles exactly a piece of clear strong jelly. All the pheuomena dependant on its elasticity, which are known to belong to common caoutchouc, are well exhibited by it. When very much extended, it assumes a beautiful pearly or fibrous appearance, probably be-longing to the effects which Dr. Brewster has observed elastic bodies to produce when in a state of tension upou light. When it has been extended and doubled several times, until farther extension in the same direction is difficult, it is found to possess very great strength."

In trials made to give it colour, the body colours were found to answer best.

"Indigo, cinnabar, chrome-yellow, carmine, lake, &e. were rubbed very five with water, then remember rightly, sulphur, in the acid form; mixed well with the pure caoutchoue, in a some what diluted state, and coagulation induced either upon an absorbeut surface or otherwise. Perfectly coloured specimens were thus ob-tained."

A very instructive and interesting volume of personal experiences, difficulties, and discoveries, in the management and manufacture of ruhber, has recently been written by Mr. Hancock, whose name is so intimately associated with the origin and progress of this manufacture. + The anthor, who is now npwards of seventy years of age, and appears to have survived all his original partners and compeers, has been engaged for the last six-and thirty years in the manufacture of Iudia-rubber. He attributes his success in this branch of manufacture mainly to a practical knowledge of mechanical manipulation which he had acquired in early life, and he thinks that this, much rather than chemical knowledge, was what was required in the circumstances: indeed, the peculiar difficulties which he had to overcome, and the result, on the whole, both of chemical and mechanical manipulation, as applied to rubber. seem to corrohorate Mr. Hancock in this opinion. Of chemical knowledge he says he had almost none; and it is probable that, had he had more, those curious and unlikely mechanical operations by means of which the rubber was made to assume so many shapes, and particularly the mechanical process of "mastication," or "cbawing up." into integral masses, would never have been discovered at all. At first, however, he was imbued with the uotion that to make it useful, a good solvent was what was wanted, and he fortunately, but almost nnaccountably, failed in then obtaining such a solvent, although be used oil of turpentine, which, when pure, and heated, is a good solvent, and dries perfectly off it.

First of all, the original "bottles" were merely cut up into various elastic strings, or tapes, and other forms, adaptable to wearing apparel, such as the hacks of gloves, to, draw these together, so as to cause them to fit neatly In course of time, the waste became a matter for serious cousideration ; and, failing the discovery of an adequate solvent, various modes of procedure were adopted in the attempt to "work it up." Papin's digester only yielded him "a thick fluid of the appearance of treacle," doubtless containing the since-discovered solvent, named enoutehoucine, which is obtained in the distillation of rubber itself. Newly cut

pieces, it was soon found, would unite, but the great source of perplexity was the outside cuttings of the irregular and small bottle forms. Small squares were punched out of the wates in bolling water, and thus solid blocks got, whence thin shects could be cut wilh proper knives, supplied with water, which Mr. Hand cock had soon found to be au indispensable the outside waste cuttings the rubber. Still, however, the outside waste cuttings the fresh ent or torn smfaces wonld be greatly multiplied, and he invented a wincing machine, not unlike the recent invenwith. It occurred to the melatigable experi-menter that were he to make mince-meat of these cuttings, the fresh ent or torn surfaces would be greatly multiplied, and he invented a mincing-machine, not unlike the recent inven-tions of the second second second second second second the second sec mincing-machine, not unlike the recent inven-tion wherely legs of beef are minced for sausages, in order to test the utility of his idea. The result was a very odd one: instead of thus being embled to tear the waste cuttings into still smaller picces, he was astonished, on look-ing for the shreds, to find that not a vestigo of a shred remained in the unicing-machine,— nothing, in short, but a single solid hall of rubber! This was even more than he had stipnlated for or anticipated: he found that the ball when cut open presented a marbled or stipulated for or anticipated : he found that the ball when ent open presented a marbled or grained appearance, exhibiting the shreds complete. The ball was wisely put in again to see what the machine meant to do with it. The result was that the ball became very hot, and on enting it open at length, all the graining had disappeared, and the whole had become a solid homogeneous integral mass, which Mr. solid homogeucous integral mass, which Mr. Hancock soon found out how to pass under Inneces such to that out the set of the set "masticating machine," or "pickle," as it was slyly called, which converted the whole bottlestyle canted, while converted the whole obtrie-ribber into solid cylinders, which ultimately contained 180 to 200 pounds weight of rubber cach, to be "squelched" into square blocks 6 fect long and 6 or 7 inches thick, whence beautiful sheets were cut, sometimes not more than the statistic burt of one inch in thickness.

slicets were can bound in thickness. While the "masticator" was thus being brought to maturity, various other improvements in the manufacture, and numerous adaptations of the material to new purposes, and patents thereancent, were simultaneously in progress; but the grandest discovery of all was the vul-This, however, Mr. canization of the rubber. This, however, Mr. Hancock would appear to admit, was not made Hancock would appear to admit, was not unde first of all by him, although, acting on a hiut originally got in the shape of a few bits of evi-dently vulcanized rubber brought from America, he set to work, under the idea that sulphur seemed to he somehow used in its preparation, and at length, after a long conrese of experi-ments, found out for himself how to "vul-emize" therubber, so as to render it independent, in its elasticity, to a great degree, both of cold and heat. The vulcanization of rubber is a coverous subject, inasmuch as chemists are of and heat. The vulcanization of rubber is a curious subject, inasmuch as chemists are of opinion that the unchanging elasticity thus prooption that the unchanging elasticity thus pro-duced does *not* arise from any permanent com-bination of the sulpbur used with the rubber liself, but from an allotropic change in the molecules of the rubber alone. When hard and borny rubber is the rubber alone. When hard and borny rubber is thus made, however, by addi-tional doses of sulphur, there doubtless must be a specific combination of the sulphur with the rubher. Mr. Haucock found that along be a specific combination of the sulphur with the rubher. Mr. Hancock found that when rubber is blended with melted sulphur, the absorption of the sulphur takes place at about 240 deg, and then, by raising the temperature to 270 deg, or 280 deg, and allowing the rubber to remain in it for about an hour, it becomes "vulcanized." This, he says, is certainly the most simple mode of producing "the change," as he calls it, and also as effectual as any. There are other processes analogous to this of vulas he calls it, and also as endedund as any inder are other processes analogous to this of vul-cauzation, and called galvanization, mincraliza-tion, metallization, thouization, &c. by all of which the process of vulcanization is said to be meant, and in all of which sulpilar, in oue form or another is said to be used. One of the best meant, and in all of which sulplur, in one form or another, is said to be used. One of the best of these other processes appears to be that of Mr. A. Parkes, patented in 1845 (Mr. Hancock's discovery was patented in 1843). This the patentee called ' converted rubber."

The hard vulcanized rubber Mr. Hancock ms to have produced as well as the soft; but seems to have produced as wen as the soft, but the former, if we mistake not, is exclusively the patent of Mr. Goodycar, who is the American Hancock, if we may so speak, and has also done an immense deal for the mbber manufacture, an incmense deal for the rubber manufacture, both in soft and in hard material. We are somewhat inclined, however, to agree with Mr. Hancock, in thinking that too much use may be made of a restricted material like India-rubber, in a form such as that of bard or horny vulca-nite, in which its peculiar and invaluable pro-perty of elasticity is disguised or reudered use-less and even its inverneeshilts is made of no ess, and even its impermeability is made of no There are plenty of other materials, of a avail avain. There are prenty of other indections, of a non-clastic nature, which will come to be sub-stituted for hard vulcanite, should rubber be-come scarcer or dearer; and it is, perbaps, a question whether the innumerable products into which hard vulcanite is already being converted which hard vulcanite is already being converted be not even now enhancing the price of the clastic and impermeable products of the rubber manufacture. Besides, hard vulcanite is really not so well adapted as other and cheaper mate-rials are, at least, for some purposes: bair combs, for instance, made of vulcanite, are by no means so pleasant or effectual in use as the old horm ones, and are sometimes, we know, east asile on that account. cast aside on that account.

It will easily be imagined that the introduc-tion of so new and useful a material as vulca-nized rubber would soon attract the attention nized rubber would soon attract the attention of the ingenious and inventive. Without con-sideration of what has been done in patents of applications since the Great Exhibition of 1851, Mr. Hancock mentions that there had then beeu upwards of filty patents taken out by various persons, who had adapted and applied it to their various purposes. To ecumerate these, or even a selection of these, and of the innumerable other purposes to which Indiarubher has been devoted purposes to which India-rubber has been devoted from first to last, is here out of the question, more especially since it would seem that almost more especially succe it would seem that almost everything but good tender legs of multon have been, are being, and will yet be, made of this protean material. We have sometimes even ruminated on the possibility of superseding the silkworms by the production of artificial silk from purified rubber in combination with some-thies that markle the seem its markles the from purheer would *take away* its peculiar clas-thing that would *take away* its peculiar clas-ticity while creating its powerful tenacity and perhaps contributing the silky varnish. This idea suggested itself, we remember, upou one occasiou while experimenting with India-rubber solution and asphalte, or resin, for the produc-tion of an impermeable coating for damp walls. The *tripulares* of the composition while laying tion of an impermeable coating for damp walks. The stringiness of the composition while laying it on the wall with a brush was such as forcibly to suggest the idea of silk being so produceable by wholesale, the resin being substituted, per-haps, by gun lac, or it might be also with some albuminous ingredient. Not being very likely to appropriate an idea which has been floating in our brain for some years without the realiza-tion of even a single experiment towards the end in view, we hereby make a present of it to end in view, we hereby make a present of it to others who may be less pre-occupied. We would recommend the use of chloroform as the solvent (should any other solvent besides heat and some fluxible resinons ingredient be found requisite, along with sulphur), from the exceed-ingly rapid evaporation of cbloroform being likely to enable the experimenter to obtain the stringy floss in a dried state, especially if it were produced in the midst of an atmosphere of steam

One of the most delicate and beautiful products

One of the most delicate and beautiful products already realized in India-rubber (as the medal of 1851 will testify) is the thread of Messrs. Nickels and Co. the first patentees and mann-facturers in this country of India-rubber thread for braiding and weaving processes, elastic tissues, cords, belts, and other such articles. The idea of producing an artificial silk, either in floss for spinning into thread, or at once into thread itself, in the way suggested, is a totally different thing, and, besides, is as yet a mere idea, requiring, no doubt, an immensity of hard work, and no little eash, to realise it as fully as the thread of India-rubber "pur et simple" bas already heen. already hcen.

But our suggestion bas led us somewhat astray from the subject in hand, which is Mr. Hancock and his very instructive volume: it has also helped, moreover, to exhaust our space for that subject; but we cannot take leave of this author without recommending his narrative, to our younger readers especially, as one which strongly illustrates the immense advantages of perse-verance, and a stort and unquenchable faith aud enthusiasm while labouring through difficulties and disappointments suffered in a reasonable and north as well as a still hear of the sume useful as well as a still hopeful cause.

ROME.

WRAPPED in the mists of a legendary birth,-WRAPPED in the mists of a legendary birth,-veiled in an atmosphere of mythical uncer-tainty,-alike the wonder of the unlearned, the markind in general, is the origin of that city whose name, once the synonyme for the world's dominon, by a just retribution now constitutes list moral and its lesson ;-that city, whose history forms the connecting link between times past and present; and which, though so fallen history forms the connecting link between times past and present; and which, though so fallen from its once high estate, still presents in the ruins of its graudenr a shrine for the world's pilgrimago, to which an endless stream of votaries resorts to linger fouldly on each spot hallowed by the preseuce of its statesmen and its warriors,—to restore in thought its palaces and its tendles.—to trace its toporrably from and its temples,—to trace its topography from its infancy to its fall, and to draw poetic inspira-tion from the scenes of its greatest desolation. Seen through the dim obscurity of a remote antiquity, its heroes and their achievements assume gigautic and distorted forms, or fade in utter indistinctness from the view; and where the light of truth seems to penetrate the general the light of truth seems to penetrate the general darkness, and point to bright spots on which the eye of inquiry may love to dwell, even there the many-coloured mantle of poetry invests the objects that it envelopes with tints of such exaggerated brilliancy, as to confound the ealm conclusions of sober judgment. "In no history is it hater before we reach what is actually certain;" so said Niebuhr, who, following in the footsteps of Peizzonins, Bayle, and Beaufort, gave that blow to the in-discriminating faith of ages which has proved the prelude to a sounder and juster comprehen-sion of old theories, once so implicitly trusted,

sion of old theories, once so implicitly trusted,

but now so suspiciously regarded. But though the erudition and ingenious solntions of Niebuhr have roused the spirit of inquiry so long domant, and doubtless paved the way for the better appreciation of Roman legends, and better writing of Roman history, yet bis successors are by no means bound to subscribe to his conclusions.

The general untrutbfulness of the old Roman legendary tales, was even more apparent to the writers of the Augustan age than to the legendary taics, was even more applatent to the writers of the Augustan age than to the moderns, who, seduced by a burning zcal for the study of classical antiquities upon the revival of letters, delighted in giving, at least, the semblance of an implicit belief to any ab-surdity, if only handed dowu to them through the medium of a classical language. Cleero and Livy were mistrustful of their authorities, but treated them with the respect they paid to an cavally doubtful mytholegy.

but treated them with the respect they paid to an equally donbtfal mythology. In the eleven books now extaut of the twenty written by Dionysius of Halicarnassus, and in the thirty-five remaining of the 140 of Livy, we find our only detailed account of the first ages of Rome. Living in the Augustan age, they of necessity wrote from the information of earlier writers and in the first ten books of his and simple one, and consists in immersing the rubber denotes the rubber in the suggestions, it they of necessity wrote from the information of earlier writers, and in the first ten books of his gestion of producing thread from India-rubber. work Livy quotes from Fabius Pictor, Calpar-

Piso, Claudius, Ciucius, and Valerius nius Antias, all of whom were more or less infected with exaggeration and partiality. Of these, Fabins Pictor, considered to be the most ancient Valerius Antias, frequently referred to hy Livy, is termed hy that author the most lying of all the annalists. Plutarch, in his lives of Romulus, Numa, Publicola, Coriolanns, &c. describes par-ticular periods, and incidental mention of varions historical facts occurs in Polyhius and Cicero. The other prose writers lived at much later periods, or, being poets, sacrifieed truth to effect. To connect the broken chain of a narrative thus gathered piecemeal, monumental in scriptions and public and private records would doubtless supply many a wanting link; but in-correct transcriptions of the first, and the notorious falsifications that family vanity introduced into the last, would sadly deteriorate

their value The wooden tablets upon which the *Pontifex Maximus* annually inserbed the leading events of each year, thence called the *Annales Maximi*, and which had been continued down to the time and which had been contended fown to the time of Mutins, were destroyed hy fire at the inva-sion of the Gauls. The Leges Regiæ were saved; also many of the treaties of peace and the Libri Lintei (on linen), preserved in the temple of Juno Moneta, also escaped destruc-These, with the journals of the Censors, tion tion. These, with the journals of the censors, corrupt family memoirs, funeral orations—pane-gyrics, by which Cicero says history had been completely falsified, old heroic ballads, mpon which Ennus built his *Annales*,—and the like, made np the chief sources of information when Fabius Pictor wrote :—traditional legacies "ad ostentationem scenæ gaudentis miraculis aptiora, quam ad fidem."

Next in antiquity to Fahins Pictor was Cato Next in antiquity to Fahins Pictor was Cato the Censor, to whom a large portion of what has come down to us is due. Of his great work, the "*Origines*," the second and third volumes of which contained the origin of the Italian towns, hut fragments remain. When Cato wrote, the Edruscans, Oscians, and Sahellians still existed as nations, and their *fasti* and chronological registers might have been con-sulted, which must have given great value to his work when extant.

his work when extant. "What moved Livy to write," says Niebuhr, "was that nature had endowed him with a brilliant talent for defineation of character, and for narration, with the imagination of a poet, hut without either the power or love of versifying. He wrote without positive feeling, whether of doubt or conviction, bringing down the marvels of the heroic ages into the sphere of history," &c. His sole wish was to elevate his Instory," AC. This sole wish was to elevate his countrymen, even to the perversion of facts, and whilst borrowing largely from Polybius, dis-torted his plain traths without acknowledging the 'source whence he drew them. Allowing, nevertheless, for all defects in exaggeration and over adjource to produced a closes I mestan. over colouring, he produced a colossal master-pice anequalled by the Greeks; and we may agree with Niebuhr, that "of all the losses which have befallen us in Roman literature, the greatest is that which has left his history im-perfect."

Polybius was an author of a different kind. Living at a much earlier period, he was not only more conversant with the subjects that he treated of, but studied deeply and described the dentally and briefly he speaks of remote ages, he proves that early traditions were less corrupted when he wrote than when Dionysins and Livy improved upon them.

Improved upon them. Had Cicero written an early history of his conutry, the discriminating talent of such a man would have been of signal service to the world in weighing conflicting accounts, and the highest respect would have been paid to his optimons, but as it is have worker facts to illustrate hut as it is, he mercly quotes facts to illustrate arguments.

Of the historical compendium of Paterculus, written about A.D. 30, the first part, commencing apparently with the siege of Troy, is missing; and the single manuscript that has come down

own time (Adrian), into four periods : first, its own time (Adrian), into four periods: first, its infancy under its kings, struggling for very life round the mother city; second, its youth, from Brutns and Collatinus to Appius Claudius and Quintus Fulvius; third, its manhood, np to Cæsar Augustus, during which period it sub-dued the world; fourth, its old age and decrepi-tude, experiencing, however, a transient return of pristine vigour under Trajan. The epitome of Florus abounds in the prevail-mer corruption of Bonnan bistory, being tured.

The epitoms of Florus about as in the prevai-ing corruption of Roman history, being turgid, florid, and panegyrie rather than faithful. The chief work of Scrvius is an elaborate commentary upon Virgil. This work is still extant, though much interpolated by different authors, as shown by the creat differences exist. authors, as shown by the great differences exist ing in the different mannscripts that have pre-served it to us. Even in its present condition, however, it is regarded as oue of the most important and valuable of all the Latin scholia.

Of the Abridgment hy Festus of the work of Verrius, De Verborum Significatione, one imp fect manuscript only has come down to us, the numerous blauks in which have been ingeniously filled up by Scaliger and Ursinns. It contains treasure of learning upon many points a rich connected with antiquities, mythology, and grammar. He was supposed to have lived in grammar. He was supposed the fourth century of our era.

One of the most voluminous of Roman authors was Varro, Romanorum doctissimus, authors was Varro, Romanorum doctissimus, famed for his vast and varied erudition, hut of whose 490 hooks two only have come down to us, and one of them in a mutilated form. His work upon agriculture ranks him first among the Scriptores Rei Russicae veteres Latini, In the remains of his treatise, "De Lingua Latina," we find much curious information connected we had material curious information connected with the ancient usages of the Romans. His great work, npon which his reputation for pro-found learning was based, was his "Antiqui-tates;" but we possess but a few fragments of it; but, says Niebuhr, the loss of Varro's writings are not of much importance, his state-ments accounting the card bittory of Italy ments concerning the early history of Italy heing for the most part worthless, if we except

the list of the cities of the aborgines. Such were the principal sources from which early Roman history has assumed the uncertain forms in which it appears to us after the lapse of nearly 3,000 years ; but the principal tradi-tions of which resolve themselves into three tons of which resolve themselves into three leading varieties, namely, that the foundation of Rome preceded the Trojan War; or that its foundation by Zheas immediately succeeded that event; or that it was founded by Romulus several centuries after the Trojan War. The speculations as to the origin of the name of *Halia*, originally confined to the southermost part of Builtium being derived from the Spectantions as to the online of the southermost part of Bruttinn, being derived from the unmerous oxen $(ira \lambda e_i)$ which the district pro-duced, would seem to he sufficiently unprofit-able, when so much more likely an origin is found in the land of the *Hali*, so called after Italus, a law-giver of the Enotrians, which people, according to Greek accounts, were Italians, and under which name, in its more extended sense, all the tribes of the same race, Tyrrheenians, Siculians, and Latins were in-ended. Dwelling in the earliest times to the north and south of Latium, were the Umhrians and Oscans; the former possessing all Lom-bardy and Tuscany, the latter known under various names, as Volscians, Ansones, Arnneans, &c. The languages of these two nations, ac Various names, as voisents Antones, Arincans, &c. The larguages of these two nations, ac-cording to Lepsius, pervaded Italy, and were allied to each other by sensible affinities. A third and most important element was added to these in the Helenes, Pelasgi, and Etrusci. Cumæ was considered to be the earliest

Greek colony in Campania. Numerous other Greek colonies were formed, and, indeed, South Etruria exhibits Greek influences throughout its extent

The emigration of the Enotrians, or Pelasgi dates back from a most remote period. They were also called Aborigines and Siculi, who, as we have already seen, were the same as the Itali or Vitali. The spread of the Pelasgi seems to have been as extended as that of the and the single manuscript that has come down Celts in later times; and to their language-to us abounds so with errors, that his text is much corrupted, hut his relations of character exhibit discrimination and judgment. Florus divides the history of Rome, up to his

By learned quotations, says Professor Newman, it is satisfactorily demonstrated that the Ionians and Æolians were Pelasgian; that the Selli, or Helli, were Pelasgian; that the Helli were Helenes; and Helenes, Dorians : there-fore we may presume the Dorians were Pelas-Generation and Statistic Learning and Scaling and Contrains and Latins, were all Pelasgian. "All we know of them" says the same writer, "is, that they were closely akin to the Trojans; and while rejecting all the rest of Nichuhr's speculations, we may accept his conjecture that the migrations of the Pelasgians by sea from the coast of Troas to Sicily and Italy, carrying with them their *Penates* and worship, generated the poetic legends concerning Æncas and others

hers." The well-known habit of the Roman poets in lling the Greeks indiscriminately Pelasgi, The well-known hant of the Roman poets in ealling the Greeks indiscriminately Pelasgi, doubtless much influenced the world in con-fonding the two races together. The Etruscans were a third people, foreign in Italy, called by the Romans Etrusci, or Tusci; hy the Greeks, Tyrrheni, or Tyrseni; and hy themselves, Pacene Ra

The country between the Tibur and the Mare Inferum, or Tyrrhenian Sea, and bounded on the north and north west by the Apennines and the river Macra, was their seat. Their early history has given rise to much discussion in modern times, and it is now admitted on all sides that the people known to the Romans as Etruscans, were not the original iuhabitants of the country, were not the original lukabitants of the country, but a mixed race. The most ancient inhabitants appear to have heen Ligurians on the north, and Siculians on the south, both of whom were subsequently expelled by the Umbrians. From this point two opinions have prevailed. The first (that of Herodotus) ascribes them to a colony of Lydians nuder Tyrsenns, son of the King of Lydia, from whom they took their name, and in this opinion Givero. Strab. Patereulus. in this opinion Cicero, Strabo, Paterculus, and Sences, Pliny, Plutarch, and Servius follow; the second is, that a Pelasgic race, called Tyrrheni, subdued the Umbrians, and settled in the country, who were afterwards in their turn conquered by a powerful Rhestian race, called Rasena, who descended from the Alps and the valley of the Po. Hence it was from the union Tyrrheni-Pelasgians and the Rasena the Etruscan nation was formed. Dion of Halicarnassus considers them aborigines, hat admits that a tribe of Pelasgi passed from Thessaly into the heart of Italy prior to the Trojan war, who set of the aborging in the result way why as assisted the aborging in their war with the Siculi, whom they forced to fly to Sicily, the seat of the ancient Sicani. Gibbon agrees with Dion. Gorius derives the Etruscan element From Egypt or Phenicia, which he considers the original scats of the Pelasgi; thence driven out into Achaia, Thrace, Arcadia, &c.; and from thence passing into Italy. Mazzochi follows the Oriental theory. Maffei hrings them from Canaan, and Gnarnacei derives them from the event of the Pela de Debd exercise them from the East after the Flood or Babel, asserting that the Umbri and aborigines were the same people; that they spread over Italy, and some tribes of them, called Pelasgi, thence emigrated to Greece, &c. Being entirely ignorant of their language, it is impossible to arrive at a definite knowledge of their origiu, hut we know them to have heen a very powerful nation when Rome was still in its iudancy, having extended their dominion over a great part of Italy. Through the attacks of the Ganls in the north, and of the Sabines, Samnites, and Greeks in the south, they became confined at last to the limits of Etruria Proper, and long flourished there after they had Proper, and long flourished there after they had disappeared from the rest of Italy. Of the twelve cities that formed the confederation, no list is given by the ancients, but they were probably Cortona, Arretium, Clusium, Pernsia, Volaterre, Vetulouia, Rusella, Volscinii, Tar-quinii, Valerii, Veii, and Cære, more anciently Agylla. The latter part of the history of Etruria is a struggle against the growing power of Rome, into which natiou it in time became absorbed. absorbed.

absorbed. The name *Italia*, from its early signification of the southernmost part of Buttinm only, at last, abont the time of Polybius, included in its widest extent the whole country from the Maera and Rubicon to the Straits of Sicily, the country thence to the foot of the Alps heing called Gallia Cisalpina. Italia and **Enot**ria, Ausonia

or Opica, Tyrrhenia, Iapygia, Ombrica, Hesperia, Camesne, Argessa, and Saturnia, are poetical names derived from the Creek names of the tribes inhabiting the peninsula, in the fourishing times of Magna Guzcia.

fourishing times of Magna Greeia. Dionysius states, that Latium was inhabited at the carliest times by the Siculi, a portion of whom were forced to give way to the Prisci or Sacrani, an aboriginal people, who had been forced from their seals by the Sabines, and who, uniting with the Siculi, who still remained, formed together the Prisci Latini, or Prisci et Latini, or simply Latini. Thus, the population of Latinum was a mixed one, consisting, on the one hand, of Siculians, aborigiues, and Oseans, all of whom belonged to the Pelasgian race; and on the other of Sabellians. The Siculians had sprend along the east coast of Italy, from oroth to south, one brauch of them only having north to south, one brauch of them only having crossed the Apenuines, the progenitors of the future Latins. In proof of this relationship, a similarity in the scnee of words, between the portion driven into Sicily and the Latins them selves, has teuded to the conclusion that their whole language was fundamentally the same language was fundamentally the same, that of Latinm was destined to realthough that of Latinm was destined to re-ceive further changes from new immigrants; for, according to Dionysius, they were afterwards conquered by another people from the Apennines

The Latin lauguage is allowed to be one of the Indo-Europeau group, to which German, Greek, Welsh, and Irish belong; and prevailing opinion assigns to the latter a more remote position than to the others; and the composi-tion of Latin from Siculiau, Umbrian, Oscan tion of Latin from Siculiau, Umhrian, Oscan, Greck, and Sabine, and perhaps Pelasgian and Etruscan clements, adds to the embarrassment. Bat we may conclude, that one of the compound dialcots that make np the Latin language, may fairly be termed Celtic. Among the arts of Latium, was a system of massive fortification. Precueste and Tusculum, Ferentinnm and Ala-trinm, Norha, Cora, Signia, Arpinum, and many other places, attest the mode of massive but other places, attest the mode of massive but rude construction, ascribed to Pelasgie origin, though the mere fact of its Cyclopic style does not always establish its claim to a remote age; Signia, for instance, having been planted by Tarquin, and its Cyclopic walls, therefore, to be imputed to him

The Romans, upon the subjugation of Etruria and Latiuu, adopted many of their rustic deities as well as their local customs and superstitious : Saturn, Janus, Faunus, and Picus were Italian gods. The natural phenomena of Italy gave rise to numerous local deities: "Nullus lacus sine fonte, nullus fons non saccr propter attri-butos illis doos qui fontibus præesse dicuntur." The mythology of Etruria was more pure than that of Greece, but its fables were not so ingethat of Greece, but its fables were not so inge-nious. "When the Romans were allured by the arts of Greece, the rade and simple tradi-tions of Italian mythology yielded to the enticing and voluptuous fictions of a more polished people. The spirit of polythesism did not restrict the number of gods, and the ministers of supersti-tion connect layers reacting to reace the the more tion seened always ready to reconcile the most discordant systems." Thus the Creek Kronos becauce identified with Sature; the Ernriau Fanuus became confounded with the Arcadian Pau, and Fauns and Satyrs indiscriminately commingled.

Respecting the foundation of Rome, oue tradition, very prevalent, ascribes that event to Evander, about sixty years before the Trojan war. Evander is supposed about that period to have led a Pelasgian colony from Pallautium, in Arcadia, into Italy, and there to have built a In Areada, into Yany, and there to have built a tinc-hill, which was afterwards incorporated with Rome. The appellation of this town is by others derived from Pallas, grandson of Evander, by his daughter Launa and Herenes. Of the deep faith promend in this tradition

Of the deep faith reposed in this tradition, proof is shown in the divine honours to a late period paid to Evander and his mother, Car-menta. In addition to this, both Livy and Tacitus ascribe the introduction of letters and eivilization to Evander,—an opinion very pre-valent with the Romans. The second tradition, and one very prevalent amongst the Creeks, regards Encas, or one of his immediate successors, as the founder of Rome. We need not recapitulate the story of Æneas and his Trojaus,

as told by Livy and Dionysius, and adopted by Virgil, with all the embellishments of poetry. Cophalon, who lived about 350 years after the building of Rome, seems to have been the first to introduce Zeneas into Latium; but whilst the general tradition places several centuries between his arrival in Latinm and the founda-tion of Rome, Cephalon calls one of his sons Romus, and ascribes to him the foundation of the city. There are other varieties of the same the city. There are other varieties of the same legend that we cannot here allude to. The third form of tradition, which ascribes the foundation of Rome to Romulus, was that most universally The third lieved by the Romans.

This version of that important event, as re corded by Fabius Pictor, and adopted by other ancient historians, may be regarded as the great national tradition of Rome, and there can be but little doubt that it was of native growth, incidents serve to explain as many of its Roman rites and institutions, such as the worship of Vesta, the Lupercalia, Larentalia, Lemuria, Fratres Arvales, &c. By this account, too, no violence is done to the received opinion of the councetion of Æneas and his Trojans with the origin of the city, as its ancestral parentage is still connected with his name. The radition is that he was succeeded in the government by his son, Ascanius or Iulus, who, thirty years after the foundation of Lavinium, three years are the foundation of Lawman, founded the town of Alba Longa. The sne-cessors of Ascanius now reigned at Alba for 300 years; but upon the list of Kings as given by Livy and Dionysius, but little reliance can be placed, having evidently been made up in later periods, to fill up the interval between Earce and Houvalue Æneas and Romnlus.

Possibly the last-named immigrants into Latium, as related by Dionysius, may have caused the distinction that existed between the Prisci Latini and the others, who, apparently, ean only he the Latins that adhered to Alba to Alb Longa as their leading city. As many of thirty townships inhabited by the Prisci Lati As many of the called colonies of Alba, were older than Alba itself, we must infer that the *populi Albenses* were the colonies founded by Alba, and not the other and more important towns. From these preliminary observations we see

that long before the time assigned to the foundation of Rome, Latium was a flourishing country, containing numerous towns formed into a powerful confederacy. Of the three periods ssigned to the foundation of Rome, the last, from its entire adoption by the Romans them selves, and the collateral evidence of circum is the one alone worthy of attention stances. and although discrepancies exist as to the year of the event, still the main feature of the inter-vening period between Zeneas and Romulus remains the same. And as we may have occa-sion frequently to refer to the admirable article upon Rome contained in the "Dictionary of Greek and Roman Ceography,"* alluded to in our late papers on "Athens," we will adopt the summary of dates which the writer there inverse and which indeed is strictly accuthe event, still the main feature of the intersummary of dates which the writer there gives us, and which, indeed, is strictly accu-rate. "The sum of the reigns here given (Dionysius and Diodorus), allowing five years for that of Æneas, who died seven years after for that of Zhneas, who died seven years atter the taking of Troy, is 439 years, ——that is, down to the second year of Numitor, when Rome was founded by Romulus, in the first year of the seventh Olympiad. Now, this agrees very closely with Varro's era for the loundation of Rome, viz. 753 B.C. For Troy having been taken, according to the era of Erntosthenes, in 118 th G. the divergence Later and the second 1181 B.C. the difference hetween 1184 and 753 leaves 431 years for the duration of the Alban kingdom. Varro's date for the foundation of Rome is that generally adopted. authorities place it rather later: Cato in 751 B.C.; Polybins in 750; Fabins Pictor in 747."

Another and a prevailing opinion among the Romans was that of assigning three centuries only to the Alban monarchy before the time of Romalus. Of this opinion was Virgil, where, in the prophetic promise of Jupiter to Venns, he says

Hic jam ter centum totos regnabitur annos Gente sub Hectorea ; donec regina sucerdos Murte gravis geminan partu dabit Ilia prole Thus have we briefly traced the leading features in the legendary and mythical history * Published by Walton and Maberley.

MARCH 14, 1857.

of the origin of this great people, whose moral influence in the ruins of their grandeur still binds mankind by as potent a spell as when by their martial might they swayed the sceptre of universally acknowledged supremacy.

We must defer the consideration of Rome itself to a future number.

MR. SYDNEY SMIRKE'S SECOND LECTURE ON ARCHITECTURE AT THE ROYAL ACADEMY.*

IN my last lecture I addressed to you some general remarks on the position of our art, and on its leading principles.

I should have been glad in the present lecture with you the practical application of these principles; hut such a duty could not he satisfactorily fulfilled nut such a duty could not ne sais actoring infinite without many diagrams, I therefore postpone that task to a uure opportunity. I think that I cannot employ the present occasion more usefully than by tracing the course of our at, through its various phases, from the early practice of it down to late times. Besides the intrinsic interest of such a view, I think it essential to a right understanding of our

1 think it essential to a right understanding of our position as artists that we should be well acquainted with the course that our art has run. Nor is a knowledge of this history unworthy of the attention of the more general student. Our dis-tinguished historian, Hallam, truly says, that "no chapter in the history of national manners would illustrate so well, if duly excented, the progress of social life, as that dedicated to domestic architecture." And as this social process is intimated. connected if social life, as that dedicated to domestic architecture, if And as this social progress is intimately connected, if And as this social propress is minimized connectes, we the environment of the second countries respecting which we have the written tradi-tions of their bistory, no material serviving evidence can be adduced as affording a stronger collateral confirmation of its truth than their architectural remains. The barbarity or refinement of a people,—their pro-sperity or decline,—the derivation of their races,— the extent and character of their commercial relations,—all these exercise so marked an influence on their architecture, that it would scarcely be an exaggeration to say of such a people that their history may be read in their buildings as plainly as in their hooks.

Let mc, then, devote this evening to a cursory Let me, then, above this evening to a clustry glance—for such only will our time permit—at the history of architecture. The rapidity of our survey must be such as to forbid our entering at all into antiquarian research; nor have we time to amuse our-selves with any endeavours to penetrate the obscurity primæval times.

of primewal times. It is, indeed, curious to mark the traces of the early trogholyte, and to recognise in the cablu of the Indian or the kraal of the Hottentot a reflex of the primitive efforts of builders when the world was young, and art, in its higher sense, unborn. It is highly interesting in its higher sense, unborn. It is highly interesting thus to detect, as it were, the print of the naked foot-steps of primæval man,—but such speculations are ill

steps of primeral man, --but step specificitions are 11 solide for the present occasion. Nor, indeed, do I think it expedient for us to bestow more than a pessing regard on the labouts of the early builders even in those more advanced periods when men spread and settled over the teening continent of had learnt the secret that architecture afforded a Asia, has rearry the server that are uncorrective anotaed a potent auxiliary in overawing and subduing the human mind, and making it amenable to the mysterious im-pressions of a religious consciousness.

essions of a religious consciousness. It is heside my present purpose to inquire when, or what point of the horizon, the rays of our art first wind. Antiquaries give this honour to Egypt, hut dawned. dawned. Antiquaries give this honour to Lgyp, hau the dates of the antiquary are often based on far more prearing foundations than we, as builders, love to rely on: and I am happy in the belief that it forms no part of my duty to entangle you, or myself, in the abstruse deductions of the astronomer, nor in the elaborate science of those who would dive into the

mysteries of bieroglyphics. It is enough for me to say that any remote dates are assigned to many amorphous piles of decayed architecture on the plains watered by the Tigris and the Euphrates, and still more remote dates are confidently attributed to many less decayed piles of archi-tecture scattered along the course of the Nile; whilst on the great promotion of India, also, exist many solenn monuments of man's hundiwork that have been left by the retiring ide of civilzation—often without a date or even a name to guide us with cortainty as to

a date of true and the second second

* Read Monday evening, the 2nd inst.

grandeur in form, and not always without a strong sense of the heautiful, —especially delighting in works of a broad, robust, and masculino character; little acquainted with the graces of art-not at all with the

finesse of construction, or with dynamical science. It is certainly well worthy of observation how soon men perceived the capabilities of our art, and acquired the precive the calculation of our st, and explore the science of so piling up slones as to produce a powerful effect on meal's minds. "Go to," said the rebellious descendants of Noah, exulting in their newly-acquired atts of construction; "let us huld a newly-acquired atts of enstruction; "let us huild a city and a tower, the top of which shall reach nuto heaven." and from that day to the present time, throughout the world, one of the chief exponents of a country's pride, or its opulence, has been the great-ness of its architecture.

ness of 18 architecture. I leave to the antiquary the consideration of the style and character of the buildings of these pre-historic times. But Egypt, the reputed cradle of the world's civilization, demands of me some short uotice. However deficient the early architecture of the some short uncession was here here in their grade this remarkable country may have heen in that grace and elegance which were reserved for another people and elegance where were reserved for another people and a later period, it is yet certain that the art here acquired much of the character of a fine art; and I think we must admit that the Egyptian builders pro-duced works marked by a dignity of conception which, in the lapse of 3,000 years has been searcely exceeded. The carliest development of Egyptian art is found about the delta of the Nile, and its chromologieal progress is up that river, for the ruins about the eataracts are of later dates. It is natural, indeed, cataneous are on inter dates. It is natural, indeed, that those most accessible and most readily cultivated districts should be the first settled, and that there communities would be first founded. As population increased and cities multiplied, the human tide ran upwards towards the mountains. Abundant archi-tectural remains attest this fact, and show that Egypt offers no exception to what I hold to be the rule, that our art affords a safe index of the progress of civili zation

The Egyptians, however, were not a progre In the heyppiants, however, were not a progressive people; their civilization did not advance with time; and to this our art clearly testifies, for the cra of the Shepherd Kings is marked hy even nohler remains than those of the Ptolemeine period. To a hasty ob-server there is no wide difference in the style or aspect of their buildings during perbaps thirteen or fourteen centuries or more: a strange phenomenou this, when we reflect what extraordinary changes have been since effected in our art within a much shorter period,

among recess of a more active spirit. But while the swarthy worshippers of Memon were piling up their ponderose masses of granite and basalte, after the fashion of their remotest ancestors; while with more patience than genius unsumberd enverse were labouring over and polishing the surface of their colosal, yet still lifeless and conventional sculpture, a seed had been walked to a more genial soil, and had struck root among the marble moun-tains of the Peloponnessis; au art was there houn destined soon to give the law to all after time.

Beculiar mental endowments characterise nations as plainly as individuals: and special mortal aptitudes seem to have their geographical limits almost as clearly defined as those which govern the vegetable world. The dilicacy of taske which early distinguished the Dorie reas was a wurveling ubenomenou. cearly defined as toose when govern development world. The delicary of taste which early distinguished the Doric race was a surprising phenomenon. A population very smell, and apparently without much unity of origin, fostered by no favourable circum-stances, scattered and broken up over a hundred islets and along rugged coasts, constautly contending for personal scentrity against the indigenous races— these hardy warriors and intrepid seamen hexane, in two or three centuries, the most refined artists that the world has yet produced. Wet these Greeks had not, in the arts at least, any very futifully inventive genins. To Egypt and Assyria may he traced much of the raw material of Greek art. Their wonderful power ky in the purify-ing, clearating, subtilising, and idealising art. They did not create the body, hut they modified its mem-bers, and hrenthed into it a soul. They eminerty possessed that alchemy, hy which the hase metal of their predecessors became in their hands a pure gold. It was no long period of gestation which preceded

It was no long period of gestation which preceded the birth of true Greek architecture. In the eighth the birth of true Greek architecture. In the eighty century before the Christian era, there is, I believe, an evidence of its having acquired any very high assisted character. The singular structures which have been transferred by Sir Charles Fellows, from the coast of Lycia to the British Museum, give but a faint foreshalowing of the grace and heauty that were to follow; and the well-known gateway at Myceue varours more of Assyrian than of Greeian design. Yet as early as 600 years hefore Christ, a nohle Dorie temple was creted in Sicily, near the modern Sollunute, differing in uo essential respects from that consummation of Greek art, the Partheuon itself, which arose in the middle of the fifth century. Much diversity of opinion exists as to the moral

dignity of the Greeks : some are disposed to regard them as little better than successful brigands; whilst others as little less than a race of demigods. It may others as little less than a race of demigods. It may be that undue proportions are imparted to the form of men dimly seeu through the haze of remote anti-quity, for "Distance lends enchantment to the view;" and possihly were it given us to know the truth, divested of fable and hyperbole, some of those whom we have learnt to look up to as godlike heroes might shruk into the dimensions of bold gladiators. All this, however, may be the ease, and much of Grecian history itself may be mythic; hat Grecian at stands forth as a palpable, appreciable fact. Their works are hefore us; and even now, after the lapse of more than 2,000 years, which of us will venture to deuy that in architecture and sculpture no other men have since architecture and sculpture no other men have since wrought as they wrought. In the slight historical sketch which now eng

ns, any detailed consideration or analysis of style would be misplaced. For this, other more appropriate would be misphered. For this, other more appropriate occasions may, I trust, present themselves. The course of events leads us on to the period when the wonderful light of Greek art hegan to wanc. All that was of purcet and highest quality was produced within the narrow limits of little more than a single century; namely, from about the middle of the fifth century before Christ to the death of Alexander. The generate that more means the largest of the first

The career of that conqueros made known to Greek artists mony new and strange forms of art among the conquered reces, and the low of novelly inherent in our nature would naturally lead to their adoption. Lord Aberdeen, many years since, pointed to the East as the probable source from whence the arch was derived which ultimately so materially influenced our art; and his lordshift's supposition has found a re-markable confirmation in the recent discovery of the arch in Assyrian sculpture

Up to the period last referred to, we are, I think, instified in assuming that the styles, or orders, taking their names severally from the Dorian and Iouian their names severally from the Dorind and Jolian States, were exclusively used; hat whether the merit of priority is due to the former, as Vitruvia avers, may admit of doubt. The rude but undeniable repre-sentation of Louic columns, which occurs in the Assyriau sculture now in the British Museum, must be at least as old as any known example of a Doric building

The third order, the Coriuthian, bears every mark of a later origin : its rich exuberance was the natural result of that maturity which preceded its decay. The result of that maturity which preceded its decay. The date attributed to that union of grace and beauty, the Choragic monument of Lysierates, at Athens, is 335 hefore the Christian era; and this is held to be the earliest authenti-ated example of the style : although it cannot be supposed that so perfect and symmetrical an order could have issued at once in all its maturity and perfection, like the goddess of Athenian idolatry, from the brain of even a Greciau artist. The gradual steps by which men of genius elaborated the elegant Corinthiau capital from the lotas-shaped surmit of the Egyptian columns are lost to its its true, but may be conceived and even traced in the imagination; and such a parentage seems far more natural than the one assigned to the order in the familiar story handed down to us hy Vitruvi

Whilst, however, the application of this order to Whith powerer, the application of this order to temple architecture was certainly late, it is equally certain that its adoption was general and rapid. Within a century after the date of the small moun-ment just named, the order had almost monopolized the attention and favour of architects.

It was long after its attainment of eminence and ower, that Rome sought to augment its dignity hy cultivation of the fine arts.

To meet the ampler means and wants, hut less fastidious taste, of the couquerors of Greece, architecture laboured not in vain.

Woulderful as was the progress of her arms, Rome may lay claim to almost an equal triumph in the arts. It was not, however, in a painful study of the refinements of art, nor by the generation of any striking uoveltics, that the Roman people sought to indulge uovelties, that the Roman people sought to indulge their love of architecture. As they hestated not to enlist men of all races and clinates inds of their armies, and even to adopt and maturalise the very divinities of their vanquished enemies,—so also were they nothing louth to avail themselves of the artists of other countries when they desired to adorn their own capitol; and the ready supply of cultivated artists which Greece was able to afford, though it uust have tended to improve and clevate the tone of art in Rome, can hardly have tended to the practical encouragement or growth of a race of native artists. It seems to be generally admitted, even by their own writers, that the Roman genius was less encousing in the cultivation of fine arts, and, notwithstanding the the cultivation of fine arts, and, notwithstanding the cagencess of opulent proprietors and public hodies for the possession and display of such monuments, that people never attained to the exquisite acumen of their teachers

Yet over the whole Roman world, from the Thames to the Tigris, are scattered in profusion the evidences of their love of architectural splendour and luxury; and their temples and palaces, their theatres and villas, hear testimony to their all-pervading *political* power, as decisive and palpable as any that can be drawn from the written records of bistory. In the reigns of the Antonines, Rome appears to have reached what in the language of geology would be called the anticlinal line of her grandeur. It is of Yet over the whole Roman world, from the Thames

he called the anticinal line of her graduur. At is of this period that Gibhon speaks when he says, "If a man were called to fix the period in the history of the world during which the condition of the human race was the most happy and prosperous, he would, with-out hesitation, name that which elapsed from the death of Domitian to the accession of Commodus." and it is precisely to this period that we must refer the highest excellence of Roman architecture, and to which some of her finest examples may be attributed.

The Pautheon and Coliseum, however (although of quite of that date), are the two huildings which not quite of that date, are the two huldidgs while perhaps excretised the mass direct and powerful infla-ence on the architecture of all succeeding times: the former may be regarded as the parent of all the domes that base since been creeted, whether in the cast or the west, and the form in architecture which, in the opiuion of mauy, may he said to posses, in a higher degree than any other, the attribute of sublimity. In the latter, the Plavian amphitheatre, we recog-nise one of the carliest known examples of that

wedded union of the arch and the column whence has descended such a fruitful progeny of grace and beauty.

The religious architecture of the Romans did not indeed very materially differ from that of their pre-decessors in Greece; but the last-mentioned colosal structure, widely differing from any known Greeian structure, whely annering from any known orectan type, seems to have greatly influenced design in all subsequent civil architecture. The idea of an areade strengthened and relieved by columnar construction had perhaps long previously

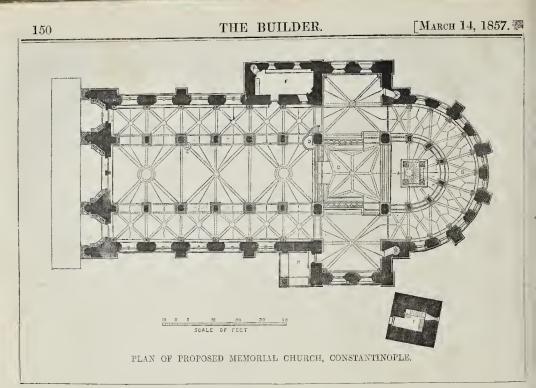

eloped itself, as in that interesting ruin known as Villa of Mecænas, at Tivoli, and elsewhere; hu the Vi the vina of McGeness, at 1700, and elsewhere, init this wast amplitheatre, still the most conspicuous and popular aucient building in Rome, so well calculated to gratify at once the pride and the pleasure of the Roman citizens, perpetuated the idea; and the arrange-Roman enzers, per penneet of a succeeding ampli-theatres, and seattered over the Roman world, but it struck deep root in the general practice of Roman architects, and has never ceased, down to our own times, materially to influence architectural design. The arcades, indeed, lost their breadth and grandenr as art declined, hut some form of arcade was rarely aftervards omitted in any important composition. It would be a curious, although perhaps a sou

It would be a currons, attolga perages a some-what tedions task, to note the degradation of archi-tecture step by step. True to the law that our art is an index to the state of civilization, as the Roman character degenerated, Roman art sank pari passu; and by the age of Diocletian, when the empire was merging towards its close, the days of classic archi-tecture, prese numbered tecture were numbered

Its fate after the fall of the Roman empire is a subject that has of late engaged many pens. Til hetly, indeed, only assual and superficial attention was paid to the subject of the state of art in its declemion. But a very different feeling has since arisen, and writers who, a few years ago, would have deemed the topic hardly worthy of investigation, will now descant with lahorions and reverential attention upon its minutest detail

Still the subject remains obscure, and authorities differ widely both as to the date and to the parentage of many notable monuments; aud, although I again difficient polaries you will, perhaps, permit me to detain you a very few minutes in its consideration. Before the fall of the empire, the architecture of Rome maintained an undivided authority over every ortion of that vast empire. From Thule to the extreme south, an almost uni-

portion of that vast empire. From Thule to the extreme south, an almost uni-form style prevailed; varied; it is true, by provincial peculiarities and exigencies, yet essentially uniform. Wien, however, the ligatures, which bound together the imperial Colossus, hereame lossened, and the empire wes disnembered, act also soon lost its unity, and a very different fate hefel its eastern and itsy western extremities. In the esst if fell into the hands of the descendants—sodly degenerated and cor-rupted, no doubt, yet still the descendants—of the greatest artists that had ever lived. In the west, it fell into the hands of invading hordes, ignorant, and for the wost part regardless of art; yet allected, as we know, and even awed by the pressige of that great that fallen empire. Thus differently circumstanced, and separated hoth by geographical position and by unitonal antipathies, castern and western art soon hegan to wear very different aspects. In the east, Greak traditions infused into the architecture of Byzantium a character of its own, desguat and omnet, yet somewhat flat, and grave, and qu'et. In the west, Roman art, in its decadence, was less metamor-

of the western empire. A distinction has been drawn between the Roman-esque of Lombardy and that of the Rhine, but, not-withstanding the uncertainty that prevails in the dates of the carliest examples during this obscure period, I believe that, except those differences and rully arising out of the difference of chundt, we pos-sess no early evidence of any such marked distinction. In those districts where examples of Roman archi-tecture most abounded, as in the south of France, the Romanesave savoured most stronely of the classical

In those districts where examples of Roman archi-tecture most abounded, as in the south of France, the Romanesque savoured most strongly of the classical type, for among the early converts to Christianity no unwillingness was felt to adopt the architecture of their Pagan predecessors. Some Christian emblems were invented and introduced into the ornamentation of their buildings, but all else remained essentially Pagan. Indeed, it was the policy of the early Chris-tian Church to facilitate the abandomment of the old worship, not only by the adoption into its ritual of certain old forms calculated to render the new doe-trine palatable to the eatcchumens of the Church, but by the consecration of existing Pagan buildings to the new service. Thus we learn, from an inscription on the frieze of the Pantheon, that that building, which had been erected by Agrippa, in honour of Jove and all the gods, was by Boniface IV, conse-erated to the Virgin and all the saints. So, also, a temple of Apollo became a Christian church dedicated a to S. Apôllinaria. Dr. Middleton tells us, too, of a church dedicated to S. Baechus, and many similar in stances might be adduced. Even the music chanted before the idols of Paganism was appropriated (as Burney surmises) and converted into Christian hymma. Judeed, as early as the fourth century, these equi-vocal practices of appropriation had extended so far as to have become a scindal in the minais of some stricter and more simple-ninded Christians.

strictor and more simple-minided Christians. We may readily assume, therefore, that the sub-version of Paganism was altended by no very appre-ciable change in the prevalent style of architecture. The circumstances of the times, however, ultimately wrought their effect, and a sort of transition style slid, as it were, into use, which, as I have already said, has been designated Romanesque. Perhaps one of the most curious as well as most authentic speci-

phosed, but exhibited strange departures of the Roman type, arising more from the ignorance and the rode impetions energy of the age than from any new element of design; for nothing is more generally admitted than that those Huns and Ostrogoth, and even the Longobardi, brought with them hut few art-traditions of their own. This western (or rather this north-western) phase of Roman architecture has been aptly named the Romanesque style, and probably existed nearly contemporaneously over a large portion of the western empire. A distinction has been drawn between the Roman-esque of Lombardy and that of the Rhine; but, not-withstanding the uncertainty that prevails in the dates of the carliest examples during this obscur-period, I believe that, except those differences nato-relly arising out of the difference of lomate, we po-sess no carly evidence of any such marked distuction.

MEMORIAL CHURCH AT CONSTAN-TINOPLE.

THE accompanying engravings illustrate the selected design (by Mr. Burges) for the memorial church at Coustantinople, referred to in previous articles. The author of it, as already stated, founded his design on a study of the church of St. Andrea, at Vercelh. We shall best set St. Andrea, at Vercelk. We shall best set forth his views by quoting part of the memorial which was sent with his drawings :--

"A detailed by the idea conveyed by this model, the first care of the author of this design was to ascertain what materials were to be readily found at Constantinople suitable for an edifice worthy of the nation by whom it was to be hull, while the expense of re-opening quarties or of long hand transit would forbid the introduction of any materials not in common use. From entedd inquiries, meteral years in building operations at Constantinople fit would appear that the choice of materials limited to the following somewhat scanty list...

The St. George's limesions, of a consistency between Portland and Bath stone. The Malayes limestone, three one stones, and the state of the st. George's And a built black timestone, used principally for rubble and state of the state of the state of the state of the state and state of the state of the state of the state of the state and state of the state

And a bluich black innestone, user principus, in walling. The Marmora marble, of a dull cloudy whits. Italian marble, used for paving. A red marble, from a quarry recently opened near Con-stantinople, and (now that a good understanding is established between the Turkish and Russian Govern-ments) the Balaclava marble, which resembles the Siran, may possibly be obtained. Bricks may be had of all colours, as well as terra cotta. The tiles resemble those of Italy, and the lime is to be had remarkably good. For the roof, prince fir is used, which comes from the term the black Siza.

* To he continued,

The design for the proposed church must naturally be indexed by the properties of these materials. The church is statistically a memorial church, and should therefore be provided to the preservation of the statistical stat

Many of the flat ornaments on the façade are to be formed simply by the stones being incised aud filled up with a dark coloured cement : glass mosaics would also be introduced.

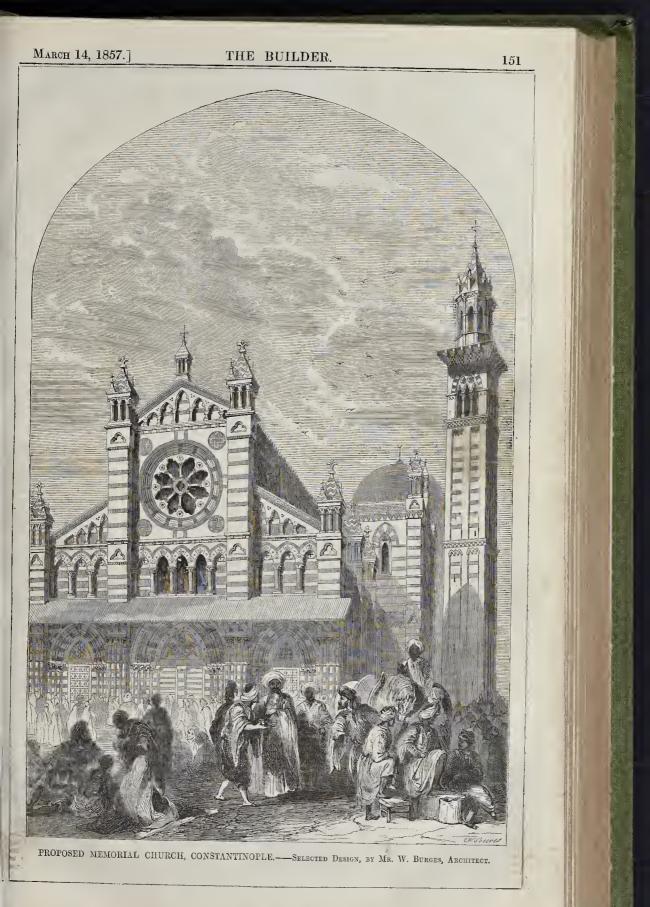

The cost is estimated at 20,000*l*. : the tower, if added, would entail an expenditure of 3,000*l*. more.

MR. BROWN, OF LIVERPOOL .- The commission for MR. DIOWS, OF INVERSOL. The Commission to the portrait, to be painted, of the munificent friend of the Liverpool Free Library, Mr. Brown, M.P. has been entrusted to Sir Watson Gordon. The choice of the sculptor for the statue was not decided when we last heard, hut tay, we believe, hetween Messrs. Foley, Marshall, and MncDowel.

It is proposed to cut the names of every officer and man who fell in the late war upon the panels of this dado; in fact, to follow the example of the Assyrian architects, who covered the alabaster dados of the palaces with inscriptions.

THE ARK ON MOUNT ARARAT.

MAJOR STUART'S description of the ascent of Monnt

MAJOR STRAFT description of the ascent of Monnt Arrart by five Euglishmen, published in the *Times* of August 22, 1856, is nost interesting. It appears from a letter in the same paper of a subsequent date, and from other statements, especially those in Dr. Kitto's work, that the summit of Mount Arrart was reached in 1829, and that it was then slightly covers, and almost *circular* in form, the diameter being then about 200 Paris feet. Major Stant's description of it, as he found it in 1856, is different, and seems to me to give occasion for some of Mount Arrart hears evidence of having been sub-ject to violent voleanic action; " also "the windesurface of Mount Arrart hears evidence of having been sub-ject to violent voleanic action; " also "the impression left on my mind is, that the summit is an extinct or the fill is nearly level, of a triangular shape, the base heing shout 200 yards in length, the perpen-dicular about 300." It is obvious that Major Staart found the summit different both in form and dinno-sions from what it was in 1829: this would be con-sistent with the idea that probably it was much higher, and in 1839 (from the accentual viole and the sum and high shape, the base heing shout 200 parts in length, the perpen-tional 300." It is obvious that Major Staart found the summit different both in form and dimen-sions from what it was in 1829: this would be con-sistent with the idea that probably it was much higher. sitent with the idea that probably it was much higher in 1829, from the accumulation of snow and ice; and sistent with the idea that probably it was much higher in 1829, from the accumulation of snow and ice; and as it is known that the mountain was shaken by a great earthquake in 1840, which threw down east the state probably earried away by the weight of the iee which might have heen accumulating about 4,000 years), and as it does not appear that any lava has flowed from the summit, either at that period, or at any other time since the Flood, so far as I have heen able to learn, it seems to me probable that the form and dimensions found by Major Stuart are much nearer to, and perhaps not very different from what they were at the period of the Flood, whither the ark rested on that mountain or not. Now, supposing that this is really the place where it did rest, is it an idea without some reasonable foundation to suppose not only that the ark may be there yet, but that the importance of the purpose for which the ark was used. If we were ided that a nicer of append word had here

Importance of the purpose for which the ark was used. If we were told that a piece of good wood had been preserved 3,000 years, nuder favourable circumstances for preserving almost anything, it would not seem to be so very improbable, especially to those who are in the habit of finding black oak under the soil of low "car" or "fen" land,—which oak they call "old Noah,"--that name intimating how long they think it has been where they find it. Whether they are mistaken or not as to the cract period, the oak must have been there many centuries. A rough outline in the triangular form, described by Mijor Staar, may be made in a minute on a separate piece of paper, and hy holding the paper highest where he states that the particular part of the mountain's summit is highest, some of the following remarks may seem deserving of attention. Major Staart states that "the highest point is the apex of the triangle: separated from it hy a hollow is another point of nearly equal altitude, and the base of the triangle is an elevated ridge form-ing a third eminence." ing a third eminenee

ing a third eminence." Dr. Kitto had difficulty in supposing that the ark could become fixed on the top of a mountain, and therefore he thonght that a word had been erroneously translated, but if he had seen. Major Stuart's descrip-tion of the form, and his dimensions of the summit of the larger Ararat, as it appeared in July, 1856, or sixteen years after the aerthquarke of 1840, perhaps he would have agreed with others in thinking that they are strikingly consistent with what we may suppose they would have been if the mountain, and the crater at the top of it, had been made for the especial purpose of receiving and retaining the ark. What is said in the Bible about the ark is in few words, but they are remarkably explicit. Noah was What is said in the bible noout the ark is in rew words, but they are remarkably explicit. Noah was not to use his own discretion or judgment as to the pro_k er dimensions of the ark, or even as to what wood he was to use; he received on hoth points clear directious

Dr. Kitto and others state that there are different opinions as to whether the mountain described by Major Stnart is really that on which the ark rested, but they all admit that there is a very general belief that it is; so we may fairly suppose that before the recent escent it was at least as likely as any other mountain

Dr. Kitto intimates that for animals to come down it in safety would he almost as great a minacle as the Flood itself; but if we are to helieve that five gentle-Fided isent; but if we are to hence that five gentle-men have recently come down it in safety, and that none of them (Major Fraser) had previously shot down 1,000 feet of the most dangerous part, "now head, now feet forenes)," and was so little injured, that he patron and incumbent have in contemplation that remarkable descent, surely we may believe that the animals could descend when their Preserve intended them to do so? Thus, Major Stuart's state-

ment of facts tends to remove two of Dr. Kitto's greatest difficulties: some others mentioned by him may be got over hy plain reasoning from well-known facts. The question rears, is the place at the summit of the mountain now called Mount Ararat apparently well adapted for the parpose of receiving the ark, and presoring if? Major Sturnt states that it is in the form already described, and that the base is 200 yards, or 600 fect; the perpendicular is 300 yards, or 900 feet. The ark was to be 300 eahits long, equal to 547 feet, and 50 cubits wide, equal to 91 feet. Do not, then, the dimensions of the summit correspond with those of the ark in a remarkable manner, after we have allowed for the "earthwork" or uside of the supposed erater? If the ark floated in at the lowest we have allowed for the "earthwork" outside of the supposed erater? If the ark floated in at the lowest part of the triangle summit, when there was just sufficient water to float it over that part of the summit of the mountain, the "elevated ridge," or base of the triangle would be likely to so impede, or alter the course of the ark as to hold it over the cratter as in a wet dock. The wet dock would become a dry one as the water subsided, and if the ark really rested in it, is there not a probability that it is still there pre-served in dry suow? served in dry snow ?

served in dry snow? As five gentlemen have reached the summit, I wish to ask the question whether it may not be yet prac-ticable to ascertain whether the ark really is there? A. M. R. I.

CHURCH-BUILDING NEWS.

Ipswich.—The following tenders have been received for a new Congregational Chapel about to be erected at Ipswich under the direction of the Mr. F. Barnes, arc hiteet :-

Wright, Ipswich	£2,701
Ringham, ditto	3,019
Gibbons, ditto	3,055
Baldiston, ditto	3,355
Luff, ditto	
Simpson, ditto	3,503
Colls and Co. London	3,800
Cons and Co. Hondon	

The building about to be removed is of the ordinary meeting-house character of a century and a half ago, but there is a residence attached to it, containing some very interesting oak carving, and an ornamental some very interesting onk carving, and an ornamental plaster ceiling of the seventeenth century in good con-dition. The new chapel is calculated to huld nearly 1,200 persons, and is designed in the Decorated style of Ecclesizatical architecture, in accordance with the advancing ideas of the leading members of the Dis-senting interest. *Rickmansworth.*—Several lahoueres employed on the works at the egnetery which is being formed at

Rickmansworth.—Several lahourers employed on the works at the cemetery which is being formed at Rickmansworth, had a very narrow escape from acci-dent hast week, while engaged taking away the centres from underneath the arch of the entrance-galeway. One of the buttresses was observed to give way, and the men had searcely time to get out of the way when the erab fall. the arch

Llandaff .- The restoration of the interior of the eathcdral has been nearly brought to a close, after an ontlay of nearly 23,000%. An eminent Welsh iron-

eathedral has heen nearly brought to a close, after an i outlay of nearly 23,000. An eminent Welsh iron-mater, says a contenporary, heing recently solicited for his subscription, asked the probable cost of the vorks. "23,000. sir," sid the applicant. "Good God 1—two miles of railway 1" emphatically exclusing the ana of iron, with a shug of the shoulders. *Coventry*.—The memodal window in commemora-tion of the death of the Hoa. Colonel Hood, of Whit-ext end of St. Michael's Church. The subject is "The A-cension," and its execution was entrasted to Messrs. Heaton and Butler, of London. The stone-work was by Mr. Platt, of Coventry. St. Helens.—The church of the Holy Trinity, erected on the north side of Traverse.street, Parr-mund, St. Heleus, as a chopel of case in connection with St. Mary's parish church, has been consecrated. If is a eruciform building in the Gothic style of architecture, and is hult of the black slag produced from the copper farances, which, contrasted with the red sandbrone quoins and tracings of the windows, t gives the edifice rather a striking appearance. The windows of the nave are ornamented with stained glass borders and texts. The clurch contains about 6 50 stitugs, 639 free. It has been ereted at a cost of about 2,5004. My Messrs. Harris and Sherrat, builders, St. Helcus; Messrs, Harris and Sherrat, builders, St. Helcus; Messrs, Harris and Sherrat, builders, St. Helcus; Messra, Harris and She

and minute scattery in which solution and minute are being doily educated; and it is intended to erect a par-sonage-house adjuicing. *Doucester.*—In reference to improvements at Christ Church, Doucaster, the local *Gazette* states that the patron and incumbent have in contemplation the scatter of the scatter window solution.

The lights will he filled with stained carved finials. carven nnias. The fights with he filed with schned glass. The design is the production of Mr. Scott. The work has been lat to Messra. Ireson, of North-ampton, for 2457. The earviog is to be executed by Mr. Philipa. This alteration will not interfere with amption, for 2457. The earling is to be exceeded of Mr. Phillips. This alteration will not interfere with the service, as the stone will be prepared before the window is removed, and the new one will be erected in the eourse of a week. It is also intended to have a new pulpit and reading desk of wood, after draw-ings hy Mr. Scott.

PROVINCIAL NEWS

PROVINCIAL NEWS. Banburg.—The site for the Cornhill Corn-exchange, says the local Guardian of last week, will appareally the cleared by the end of the week. To the accepted tender of Mr. Kimberley, should he addad one of Messrs. Thorpe and Pounder for enring, 1357. An alteration is the design as first exhibited bas been made, by elevating the base of the building, so as to give an approach to the various entrances by steps. The architect is Mr. Hill, of Leeds. Portsmouth.— In reference to the garrison gates for the Portsmouth Duckyard Railway, a Hampshire paper says.—Mr. Bushby has, in econnection with his contract for making the railway, a curiosity on his bit thehampton premises, in the garrison gates. They price doed, solid, and of 6 inches thickness through-out, except that the fuths panels, which are moulded, are in two thicknesses, of 3 inches sceh, in order that the plank on one side might he put in diagonally. The gates are of the weight of 3j tons a pair. The raydray is now menely completed as far as the doek long yards. Barding yards.— An effort is being made to erect in Stationards.— An effort is being made to erect in yard itself. 1,800 yards.

Jan 1986. It is being made to erect, in Satisfury.—An effort is being made to erect, in St. Edmund's parish, schools for boys, girls, and in-fants, together with residences for the matter and mistress. The probable cast of the buildings will be about 1, 800/. and if a moiety can be raised by private subscription, the other half will probably he supplied by the Committee of Council on Education. A site in Bedwin-street has already been purchased at a cost of upwards of 200/. and more thus 350/. have been subscribed towards the object. *Pembroke.*—The extensions and improvement of the dockyard at Pembroke are this year to be carried out to the extent of 120,000/. The widening of the entrance dock is to cost 8,000/. and the lengthening

out to the extent of 120,000/. The widening of the entrance dock is to cost 3,000/. and the lengthening and widening of the dock, so long in hand, 20,000/. The two new slips and boat-hasin extending along the wharf are also to be carried on, and these, with provision for securing away much in front of the dock-yard, will cost 30,000/. The erection of larger saw-mills, engine-house, workshops, a new foundry, and plumbers' shops, is to cost apwards of 20,000/. The saw-mills are advancing towards completion and out to the extent of 120,000/. plumbers' snops, is to cost apwards of 20,000. The saw-mills are advancing towards completion, and sheds are being extended. The foundry is to be creeted on the site of the old iron store. New slips are being constructed. The work of each contractor is performed under the superintendence of an in-sacetor spe tor.

Mansfield .- The Bentinek monument, some years

mangield.—The Bontinek morument, some years go created in the market-place, is said to he in a neglected state. The monument itself wants com-pletion hy the introduction of a figure of Lord George, in the opening left for that purpose. The eburch of St. Johns, lately created in this town, with the two chapels now in progress for the eenctry on the Notingham-road, asy at he Notingham Guardian, when completed, will strongly contrast with the dingy appearance of the monument. Liverpool.—The contractors for the landing-stage, Messra. Thomas Verson and Son, have made such progress with the work, that within a few weeks from the present time the whole of this gigantie work, according to the Journal, will be completed. All the air-tight pontoous, or floating tanks, have heen com-pleted and placed in relative position. That connection also has heen fixed by the placing of the longitulinal kelsons; and the wood framing for supporting the stage has likewise been finished. The deck or floating of the stage has been nearly all laid down, fastened, and calked; ahout a fourth part only of the deck re-maining to he laid. The stage is 1,000 feet, or nearly a quarter of a mile, in length, perfectly level to within a first to yeagels. Gommanizively small size: and a few fert of each end, where a gentle slope allows easy access to vessels of comparatively small size; and at two points, near the centre, similar accommo-dation is afforded by short flights of steps. For the convenience of launching and floating, the stage has heen disconnected at three equidistant points. The counceting hridges, four in number, are ready at Man The

Norwich .- The free library will be thrown open to the public on Monday.----- A railing has just heen placed round the Wellington statue, in the Marketplace, under the direction of Mr. Benest, the city surveyor.

FOREIGN INTELLIGENCE,

FOREIGN INTELLIGENCE, Manich.—Restoration of the Dome.—Although the cathedral of Munich is not one of the most important in Germany, its restoration has been taken in band, but the way in which it is to be done is not yet quite settled. Messrs. Bergen and Foltz, architects, are engaged to assist the meetings. It has been resolved that the arch, of the Renais-ment of which intercents the unicidal page, is to It has been resolved that the arch, of the itenas-sance style, which intercepts the principal nave, is to be removed, as well as the old rubbish of closets and platform, surrounding the choir. After the effect thus produced has been ascertained, the demolition of two lateral altars and the principal altar encom-bering the choir will be hegen.

bering the choir will be hegen. *Humburg.—Demolition of an old Building.*—The so-called Baunhaus, one of the oldest huildings of the Hanse eity, will be removed. It was huilt by the architect, Itans Itanelin, in 1622, in the Netherland style; and from its appermost story, surrounded by two verauchachs, one of the finest views of the city, and the Eibe harbour, is to be enjoyed. Being situate at the end of the Steinhöft, the surrounding streets will profit by the demolition, still it was a ine memento of the traffic of old, once carried on within its walls. *Paris - Nure Scientific Largetings -* The he

of the traffic of oid, once carried on within its wans. Paris.—New Scientific Inventions. — The ba-rumeter (of Toricelli) consists in the method of mea-suring the pressure of the atmosphere. The Father Seechi, of the Observatory of Rome, has invented an instrument to weigh the pressure of the atmosphere column.——M. Seguin has invented a steam-cogine, which utilizes the heat of the steam after it has exer-fierd its moving force — After 1.300 patents have orical dimines the near of the stem after it has exer-oised its moving force.—After 1,306 patents have been taken ont in France and England, for the con-sumption of smoke in steam-engines, a new grille à gradius promises to supersole them all.—A new mode of panification,—the making of cheap bread of perfect whiteness,—has been invested in France.

THE ARCHITECTURAL ASSOCIATION.

THE meetings of the Association are continued with regularity, and some interesting papers have been read. The condition of the fuances has heen brought hefore the Association, and it has been shown that at the cud of the session it will be in debt 500. The the cut of the session it will be in debt 50%. The expenses of the Architectural Exhibition first caused the deficiency, and the cost of the *conversationi* given during the present session has increased it. The fol-lowing resolution, proposed by Mr. T. J. Rawlins, and seconded by Mr. B. A. C. Hogring, was passed at the last meeting ----the last meeting :---

The considering is that the full benefits to be derived from the Architectural Association cannot be realised antil the existing delth be cleared off, it sequeliont that a sub-scription he entered ioto forthwith, and that the friends and members of this Association be solicited to aid in enlarging its sphere of action. That the amount of sub-scription for the above purpose shall not exceed the sum of M. each person."

It is most desirable that the Association should he elieved from the embarrassment of debt, and we trust that its friends will come forward in aid of the endenvour now being made to effect this. The treasurer, Mr. Bunker (1, Danes-inn, Strand), will receive subscriptions.

THE ARCHITECTS' BENEVOLENT SOCIETY.

THE ARCHITECTS' BENEVOLENT SOCIETY, ON Wednesday, the 11th, the general meeting of this excellent society was held in the rooms of the Royal Justitute of British Architects, by the per-mission of the council. Mr. B. Ferrey presided, and addressed the meeting in favour of the objects of the society. The report of the council which was read congratulated the members on the fact that no dimi-unity had tabas shear in the area to the fact that and iminution bed taken place in the amount of the subscrip-tions, and proceeded thus :---

members. Amilist the eager competition, and occasionally opposing interests, which are too upt to disunite the members of our profession, this society appears to form as a greenable spot of neutral ground, on which all may meet with no feeling but that of kindness, and no object but that of mutual assistance.

The b.dance showed that during the year the sum such famous works ?

of 244/. 11s, had been received in donations and sub-scriptions, and that 170/. 5s. had been paid to applicants for aid. The sum funded amounts to 707/. 13s. 8d.

[10]I. 155, 54. Donations were announced from Messrs. M. D. Wyatt, 5/, 5s.; H. E. Kebdall, jun. 5/, 5s.; T. E. Kendall, 5/, 5s.; David Braudon, 5/, 5s.; C. C. Nelson, 5/, 5s.; Grorge Mair, 5/, 5s.; H. B. Hodson, 5/, 5s.; and W. W. Pocook, 4/, 4s. The committee and officers were re-elected; and 57

arious voies of thanks, including one to the honorary secretary, Mr. John Turner, were passed ; Mr. Charles Mayhew, Mr. Sancton Wood, Mr. Puecock, Mr. Pap-worth, Mr. Tite, M.P. Mr. Hesketh, Mr. Simmons, Papworth, and others, taking part in the Mr ŵ

The number of members onght to be very much larger than it is, and we invite our readers to help in making it so.

THE REVEILLE ! (As sung in the Fens, near Spalding.) (After Shakespere, --- a long way.) HARK ! Acter at Moulton sings, And two pounds is the prize He offers for those trivial things, The architect supplies ; And winking governors begin To close their knowing eyes, And hope for plans that pretty hin; Sweet architects, arise 1 Arise, arise!

THE CASTS IN THE GOVERNMENT MUSEUM.

MUSEUM. A VERY competent authority writes to us as follows : The authorities at the new Exhibition building at Brompton are now arranging their classic casts, but the classification sceme to be confided to inexperienced hands; for, instead of the visitor being instructed by the proper classification of the objects, the Greek and Mediaval are mixed up with Roman; and the por-tions of the same cdiffee, instead of heing kept toge-ther, are promisenonsly mixed. Thus the visitor will be bewildered and led astroy, and the judgment of the guides of the public taste be a subject of great ridicale.

BURLINGTON HOUSE

THE new meeting-room and library for the Royal Society, which have hern formed under the direction of the Office of Works, Whitehall, in the western wing of Burlington House, are now ready for the decorator. The meeting-room is an apartment of large size, 77 feet long, 42 fort wide, and about 30 feet high. Here the fine collection of portraits, belonging to the society will be open to the public at stated times. It will be heated by bot water. The library is a room of good size, hut comparatively low. Mr. Myars and Mr. Smith, of Pinilico, have excented the principal works.

THE LONDON HOMES OF EMINENT MEN.

IN various of the old parts of London, inscriptions The values of the out parts of London interruptions are to be found, which from time to time have been renovated by well-disposed persons, and which help often to give an interest to the long and monotonous walks some are often obliged to take along London

while some are often conged to take along London streets. This goodly existent has not late years been almost abandoned, although many matters might be noted at small expense which would give nuch interest to what are at the present time unmeaning blocks of hrick and mortar. In particular, it would be well worth while to affix small tablets to houses in which originant page here here a lived. On the here, where where to ank such a solution of houses in whence emiant men have here horn or lived. On the house once occupied by Milton, in Westminster, a store has been put up, on which is inscribed that the house was formerly the residence of the "Prince of Poets." This, however, is phaced at the hack of the premises, and is of course not visible to the generality of passengers

It is surprising often to find the great-difficulty there is, particularly in London, of getting information in the neighbourhood respecting places which have historical and other associations. We went a little while ago in search of the birthplace of Turner, the landscape painter; and, although provided with the number of the honse, though it better to inquire how much of the prophet was known in his own land. The respectable man of business who actually occu-pies the place in which the greatest landscape painter to world has yet produced was born, was not aware of the circumstance; nor were other persons living It is surprising often to find the great-difficulty the world has yet produced was born, was not dware of the circumstance; nor were other persons living round about hetter informed. Would it not be world while to place a record on this house (24, Maiden-lane, Covent-garden), and also on No. 47, Queen Anne-street, where he so long resided and produced arch (crowner works 20).

Scores of houses in London could be mentioned which might with much advantage he treated in a similar manner; for instance, the house occupied for long by Woollet, the engraver, in Green-street, not far from the National Gallery, on the top of which the engraver was in the practice of fring a small piece of ordunance on the completion of an important plate. plate

There is also Hogwrth's house, in St. Martin's-lane, where he resided hefore his removal to the square. The residences of Newton, Reynolds, Law-rence, and others, are well worthy of a mark; so is the house in Brook-street, in which poor Chatter-tou unhappily died. There is also the poet Dryden's house in Even service served with Reviewing. tou unhappily died. There is also the poet Dryden's house, in Fetter-lane; places connected with Benjamin Frankliu, and a hundred others. Many of the London streets are dreary enough, and would he much en-livened by such memorials, which, in many instances, would add to the value of the premises. We throw out this hint, not for the first time, in the hope that is many he warene of inducion we of the premiser. it may he the means of inducing some of the owners of property which has a public interest to state, shortly, the circumstances, in a visible and permanent mauner.

THE BUILDING TRADES.

WE have received staticed readers to Trades-men of all Callings, and signed Thos. M'Anaspie, pro-posing the formation of a "Trades' Protective and Grievance Society." The following will show the ob-ject of the proposed association :--

THE ART-UNION OF LONDON.

THE ART-UNION OF LONDON. Our advertising columns have shown that the sub-scription lists will close on the last day of the present month, and we take the liberty of suggesting to such of our readers as may not already be members of the Art-Union of London, the desirability of becoming so forthwith, not uncrely hecause of the personal advan-tages, equal to much more than the amount sub-seribed, hat hecause of the great good which has been effected, and is being effected, hy the Society's opera-tions. By its means more than a quarter of a million of moncy has heen spent in aid of art and artists, not one sixpence of which would otherwise have been so spent; a lowe of art has heen widely induced, and a a love of art has heen widely induced, and a for knowledge of it spread. Each subscriber spent; a love of art has heen widely induced, and a desire for knowledge of it spread. Each subscriber for the current year will receive, on payment of his guinea, two prints, "The Clemency of Court-de-Lion," by H. C. Stenton, from the picture hy John Cross, which gained the Government premium of 3000, ; and "The Piper," hy Edward Goudal, A.R.A.; to say nothing of the chance of obtaining one of the prizes to he allotted in April next, which will include the right to select for binnelf a work of art from one of the public exhibitions: statettes in brozze and porcelain, medals, spent ; exhibitions, statuettes in bronze and porcelain, medals, mezzotints, and lithographs. Should the prints of the year not suit the taste of the subscriber, previous works may be taken in lieu. "The Piper," by the way, may be taken in lieu. "The Piper," by the way, cngraved by the father after the son, is a very charm-ing specimen of the art of both, and is sure to be popular

WORK TO BE DONE.

THAT bread, &c. may fall, let us no longer be dependent on forcign supply for our daily wants, hut eviltivate the waste lands, most particularly those near the metropols; such as our Wimbledon, Wandsworth, the metropole's such as our Wimbledon, Wandsworth, Tooting, and Barnes commons, all within the reach of its manure and sewage. Look at Homelow-heath as an example. 2ndly. For remunerating employ-ment, and level these and other waste. Suppose we tried the exporiment with a few. Could you find ten times as many hands, in shape of discharged prisoners and others, there is work for them, hy which the cause of humanity would be essentially served, the noble horse saved his suffering, and the country henefited by your do befef. It is, in a word, hy laying down the granite kerhistones of the streets, in a doable line, for the wheels of all carriages to run on, as in Friday-street, Bread-street, Cheapside, the Commercial-road, our Reigate-hill, the Corso of Milan, &c. ; or, perhaps, large blocks of semi-virified elay, or other hard, impervious substances, might answer the purpose. In streets of great traffic, these double lines, on the near and off sides, leaving the middle for passing, of gravel, if yon please. In streets of less traffic, two lines in the centre would suffice. At one blow, yon abolish the distracting noise of the City, its dust, dirt, and, I had almost said, dra't of the horse. Mr. Jessop proved, before the Lords, that one horse, on the Darlington railway, drew 12 toas, three miles an hour; that one gig-horse drew fory-one people eight miles an hour. Thus, half the num-ber of horses would be dispensed with,-much of the lost traffic, plessure, and convenience of the public roads would return,-the produce of the landconsumed by horses,-and Sir James McAdam assured me, "it was four acress per borse per nanum,-enough for eight men," -would afford employment and hread for the poor,-and there would "be no complaining in the streets." Dr. WALKER.

ARCHITECTURAL INSTITUTE OF SCOTLAND.

SCOTLAND. A XEETING of the Architectural Institute of Scot-land was held in Glasgow, on the 25th ult, when Mr. John Murray, of Murrayfield, advocate, read a paper on Church Towers, with special reference to the towers of parish and lesser churches. He said that the original type of the church towers of this country was to be found in Italy. The northern architects, however, introduced an important change in the dis-position of the building, and the tower was generally mads an integral part of the plan of the church iu-stead of being detaebed as in Italy. This modifies-tion of the plan of the Romanesque church and eam-panile had always been a distinguishing feature of northern church architecture, though it might with some ground be maintained that it was not adopted by the Cellic trihes. The lecturer proceeded to point towers of England and Scotland, and concluded with some hints regarding modern adaptations, condemning in strong terms the sover aurono avecidies of duction some hints regarding modern adaptations, condemning in strong terms the very common practice of adopting the Gothic steeple and applying to it Italian details. In the course of the conversation which followed, it was observed that many of the Collic towers referred

to by the lecturer were in reality more ancient than any of the campaniles of Italy. Mr. Honeyman remarked that the nomenclature

adopted by Rickman, when applied to Scotch archi-tecture, was quite minitelligible, and that a perfectly different and independent classification was absolutely necessary to prevent confusion.

SMOKY CHIMNEYS.

SINCE to abler per that interface to furnish your correspondent, "X." with an answer to his question, I will, with your permission, trouble your readras with a few remarks; but do so more in the hope of eliciting further information than with the idea that my mite of knowledge will be of much we to them. use to them

use to them. Smoly chimneys are the architects' bughear: they cause more trouble between them and their clients than almost any other subject. As such, sarely they should be dealt with bolly, and an attempt be made to exterminate so great an evil, instead of allowing it to remain as it is, uncramined and unbeeded. The cause of smoky chimneys is usually, if not always, down-dranght. A body of heated air ascends, but being arrifed, cold air has a tradency to rush into it to keep up the equilibrium. There is, therefore, I mersume always approx down-drampth in the far of

but official the could brinn. There is therefore, I presume, always some down-dranght in the top of every chimney; but it is only when it overcomes the tendency of the hot air to ascend that a chimney smokes

The various methods in use for supplying cold air direct to the fire appear to me to be useful; thus, by

Infinite Dofference.
<p anote, inco draught. It will pass up one side of the division, and carry the cold air which has descended on the other up with it. Cold air will, to a certain extend, descend in certy flue; therefore let us make an eutrance especially for it. A. F.

ILLUMINATED CLOCKS.

THE attention of the readers of the Builder having recently been directed to the subject of illuminated clocks, perhaps the following suggestion for their im-

In the science of optics it is an admitted fact that white on a black surface is visible at a much greater In the schede surface is visible at a much greater distance than black on white. In accordance with this axiom I suggest that the usual mode of construct-ing illuminated clocks be reversed; that is, instead of the entire face being illuminated and the figures and hands showing black, the figures and hands are pro-posed to be illuminated and the face black. To effect this object, the dial mush be of copper, or some other opaque material painted black j—the figures and hands heng perforated, and filled in with wbite transparent porcelain; —the dial to be constructed of the figures, to be fixed, and the other two parts, with the openings in them to serve as hands or pointers, to revolve. It is obvious that there is the further advantage, in this arrangement, of avoiding the necessity of counterpoising the bands. CEO, CULLAUME.

GEO. GUILLAUME.

LOCKS AND KEYS.

<text><text><text><text><text>

^{*} It will be remembered that the notorious lock-picker Agar asid the robhery would be impossible unless copies of the keys could be taken. By the contrance of Tester this was accompliabed, and yet the duplicate keys thus made were useless until Agar had travelide serven or eight times to Folkestone with the chests, altering the keys until they fitted.

of such areas or mease, have intranced or use internation of such areas or mease, and shall be open from the ground "4. The measurement of the width of every street shall be taken at a right angle to the course thereof half on the external will or front of or errow of the roadway to the external will or front of the intended bouses or build-ings on each side thereof, but where fore-courts or other pacee are intended to be left in front of the houses or buildings, then the width of the street, as already defined, realing, or boundary dividing or in the public way. "The house enter the up to divide and fore-courts, gardens, or present y move street must ourse or buildings, than enter or erown thereof, at the rate of three eighths of an inch, at the least, for every foot of breadth. "To nevery new street the our to lease in height above the channel of roadway, except in the case of crossing apared of forotrath must be half an othes in height above the channel of roadway, except in the case of crossing apared of forotrath must be half an othes the a square of a course for the width of the foros the pared. "A in these by laws the word 'street' shall be inter-arriageway of any turnylke road), and any road, lane, thoroghtlare or not, and a part of any auch highway read, lane, footway, equue, court, alay, or passage."

INSTITUTION OF CIVIL ENGINEERS.

INSTITUTION OF CIVIL ENGINEERS. On the 3rd inst. Mr. I. K. Brund, V.P. in the chair, the paper read was "On the Results of the Use of Clay Retorts for Gasmaking," by Mr. Jabez Church. The substitution of fire-lay for metal, in the construction of retorts, was attributed to Mr. Grafion, and dated back as for as the year 1820. Originally they were square in transverse section, but that form was soon chauged for the O, or oven-shape, which had heen since adhered to, both in this country and abroad; this latter form of retort admitting of a stratum of coal being distributed of an equal thick-ness throughout.

and abroad juiker folm field targets and abroad juiker folm field targets and thick rese throughout. The comparative quantities of gas made by iron and clay retoris, of the ∩ form, of 15 inches by 13 inches in section, and 7 feet 6 inches in length, had been found by the author to be as follows:— The iron retoris lassing 305 days, and working off 15 evt. of coal for each charge, effected the earbonization of 2,190 evt. of coal, which, at 9,000 cubic feet of gas per retort; whilst the clay retorts lasted 912 days, canbauized 5,472 evt. of coal, which, the 9,000 cubic feet of gas per retort. It would thus be seen, that the clay retorts picked are retored the same weight of coal, than the iron retorts built submitting power was diminished, in consequence of the increased temperature of the gas to be decomposed. decomposed.

decomposed. The most practical method of working clay retorts in large works was with the addition of an exhauster. This reduced the pressure on the retort, and pre-vented the escape of gas through the pores and fissures; and by that system the quantity made was increased about 200 cubic feet per ton of coal. In small works, the expense of an exhausting apparatus, and steam machinery to work it, would not be com-pensated by the gas saved.

THE EMBANKMENT OF THE THAMES.

THE EMBANKMENT OF THE THALES. IN a paper read at the Society of Arts on the 11h ult. Mr. Bridges Adams spoke of the great accom-modation afforded by railroads in several cities of the United States, and advocated that similar ones abould be established in London, recommending the way in which they could be conveniently constructed. In the discussion on this subject, objections were raised to such railroads on account of the narrowness of the trates, but theoret this might be the case in some streets; but though this might be the case in some localities, it was not pretended to hold good in other justances. Mr. Bennoch proposed, instead of such

railroads in the streets, to construct one on an ombank-ment of the Thames; but these two plans need not interfore with each other. For instance, a proposal of Mr. Page's for this purpose was entertained by the Government Commissioners for the Improvement of the Part of Loadon between the Improvement of Government Commissioners for the Improvement of the Port of London about a dozen years ago, and they said the necessary funds might be raised by a tax on the coals imported. This appearing objectionable, I ventured to submit to the commissioners a proposal by which the expenditure might be rendered self-paying, as in several works of the late Sir Samuel Bentlam.

Bentham. Iu the first place, instead of a sewer on the lowest story of the embankment, it was suggested that this portion should be appropriated to warehouses for in-fianmatory stores, such as tar, &c. which could be easily submerged, such storehouses being well dried and ventilated. Sir Samuel gave a convincing proof of their efficiency in Portsmouth Yard, where the sub-terraneous cellars over the resorrois were used for or toest entreately in forsmouth fard, where the sub-terrancous cellars over the reservoirs were used for the desiccation of block shells. An upper tier of warehouses was proposed by me for such goods as timber and planks, likewise capable of being flooded, and a portion of the chambers always above water were intended for rooms for refreshments, such as negative order restaurance & a. The surface of the pastry-cooks, restaurants, &c. The surface of the embankment was proposed to be strengthened by Si of the at the same time protect foot passengers from the railroad carriages. This embankment was to be on a furfoad curfages. This choatkinent was to be on a level with the street. Another feature of this plan was the leaving the existing wharfs and warchouses within the embankment (thus obviating one of the most powerful objections to the scheme) by keeping the water up to a convenient height, and avoiding the emanatious from muddy banks. There are various details in the proposed plan which might be worthy of consideration, should this embankment be carried out M. S. B.

Books Receibed.

The Kirk and the Manse. By the Rev. ROBERT M. FRASER, M.A. Fullarton and Co. London, Edin burgh, and Dublin.

The twentich part, just now published, concludes this work, which consists of sixty illustrative views in tinted libbography, of parish kirks and manses in Scot-land, by Messrs. A. and J. Macpherson, with descrip-tive and historical notices, and an introduction. Mr. Fraser remarks, in the latter, on not only the want of faste as to Ecclesiastical architecture in Scotland, but the positive prejudice against it which has prevailed, and rejoices in the great change for the hetter in that respect which is now evident. Considerable improvement has been observable in

the views during the progress of the work.

VARIORUM.

VARIORUM. THE "Essay on Libourers' Cottages" for which the Royal Agricultural Society awarded their medal to Mr. T. W. P. Isaac has been printed in their journal and reprinted in a pumphlet form.—"Anstralian Essays, on subjects Political, Moral, and Religious," hy Mr. Janes Norton, Sen., Member of the Lexis-lative Conucil of New South Wales (Lougnan and Co. publishers), are interesting, from their antipolal origin, and show that literature is making its own way in the wilds of the true new world of modern times. Indeed, one cannot well conceive a position more suit. In the wars of the trie new world of moment times, Indeed, one cannot well conceive a position more suit-able to the exercise of the reflective facilities than the solitate of "the bush," unless, by the way, some hungry hushranger, native or transported, happen to have his eye upon the reflective adventee. We aus-pect, however, that even though an Australian, our pect, however, that even though au Australinn, our present author is much more familiar with the "legis-lative council" than the "bush." His essays, at all events, display no Crusocan isolation from his mother country, as his interest in the Gorham and other Euglish questions of the (waning) day will testify. The most interesting to us amongst his essays, uevertheless, are those which relate to Australia itself. Mr. Norton complains of the apathy of his co-exiles in respect to the advantages of railway and telegraphic communication, and urges then to reflection and to caction on the subject. One of his essays contains an caccount of Paripet. One of ins essays contains an account of Pari Jackson and the City of Syluey, in iwhich it is painful to be remunded that the town of Sydney is still "totally undrained," and still ful of spallid ghost-like faces which proclaim the malarious

power, he appears to appreciate, but although the changes of convertibility in such forces may be rung ad infinitum, his ideas seem to be exceedingly dejective so far as regards not only the power autitheticel to attraction, namely, repulsion (if, indeed, it be proper to use such hypothetical terms as either of these), but also as regards the forms (or whatever else tbey may be) on which those *differences* depend, which they may be) on which those *differences* depend, which plainly show themselves amid the *identity*, iu light, heat, achiusm, &c. and their correlative and co-operative antitheses. The causes of *difference*, in the midst of *identity*, while treating of uncchanical force, hydro-static force, and pneumatic force, Mr. Smeesees, so far, clearly enough, where be says that "when a new attraction is excited, the force emanding thereform may be propagated through actiform bolkes, when it is termed pneumatical force; through fluid bolkes, when it is called hydrostatic force; through solid bolks, when it is called mechanical force." Wby does be not endeavour to point on the wilch there is a bounds, when it is cannot incomminant force. We yoose the not endeavour to point out how light, heat, &c. differ in a similar way, as they plainly do, though not cracely from the same causes? In fact, however, be has not cought the identity in these forces, far less the difference.

Miscellanea.

MANSFIELD CEMETERY .- On Tucsday, the 24th ult the first slow of the chap's proposed to he erected in this cemetery was laid by Sir Edward Samuel Walker, the chairman of the Alansfield Burial Sourd, amidst a large assemblage of people. bottle, containing the current coin of the realm, a a seroll of parchment, inscribed with a statement Δ inscribed with a statement of the event, was deposited under the stone, after which a suitable address was delivered by Sir Edward, who spoke of the beautiful site which, under the Act for inclosing part of Sherwood Forest, had been set apart for the purposes of a cemetery, and which, in a few years, when the shrubs had become well rooted, would he second to uone in England, its natural heautic be second to note in England, its natural heatings being such as to require little aid from the landscapp gardener, and heing adorned with a few relies of "merrie" Sherwood's rare old oaks. The ground con-tains ten acres, situated about a mile south of Mans-Finds that acress situation about a finite south of Mans-field, on the Nottingham road. The architects are Messrs. Pritchett and Sons, of Darlington. Mr. Lindley, of Mausfield, is the builder; and Mr. Mansell Powell, the elerk of the works.

Powell, the clerk of the works. THE SEWERAGE OF TYNEMOUTH AND NORTH SUIEDS.— Mr. R. Rawlinson, C.E. has reported to the local Board of Health for the horough of Tynemouth on the completion of their public sewerage works, of which he was the engineer. The following extract from the report will show generally what has heen done, and at what cost :—"The estimate given in my report of October, 1854, provided for 16,162 lincal yards of cast-iron, brick, and earthenware pipe sewers, together with 150 meaboles and lampholes, 600 gullies, and three fushing chambers. The toth cost was esti. and three flushing elambers. The total cost was esti-mated at 13,6684. I have before stated that the General Board of Health suggested some additional works and alterations in the arrangement of severs. General Board of Health suggested some automous works and alteratious in the arrangement of sewers. The cost of these was estimated at 800?, making a The cost of these was estimated at 500%, making a total sum of 14,4688. as required for the completion of the public severs. The total length of public severs actually hid down amonats to 18,046 yards; the number of macholes and lampholes to 276; and the gullies (fixed) to 559-42 remaining in stock making a total of 601. The cost of these wor works. iucluding payments amounting to 304/. 17s. 11d. for previously existing sewers which have been adopted, together with all engineering and other expenses, will not exceed the sum of 12,500?." Two outlets have been provided for the Tynemouth village discharge, aud seven for North Shields.

THE LONDONDERRY MONUMENT. - The founda-THE LONDONDERRY MONUMENT, -- The founda-tion-stone of the monument to the memory of the late Marquis of Londonderry was laid on Saturday week, and was witnessed by a large assemblage of people from Belfast and the Londonderry estate, in-cluding the Marquis and Marchioness, and a party from Mount Stewart. The spot selected for the site is the summit of one of the loftiest hills of the Scrabo range, within a mile or two of Newtownards. The monument is to be a fower source in shore and monument is to be a tower, square in shape, and rising to a height of 130 feet. There will be a guard Hsing to a fietent of 130 tect. There will be a goard channer, and a winding stair will conduct to the battlements, which are to be at a height of 95 feet from the base. At the east corner of the square a round tower is to rise, which will form a conspicatous

who have supplied the place of the malcontents. The LONDON OPERATIVES AND EMIGRATION.— There have been other meetings of the unemployed besides that reported in our last. At Bethnal-green, between 4,000 and 5,000 persons were present. A resolution was passed appeaing to the Government to recognise the urgency of the present crisis, and to take prompt measures to enable those who are starving here to emigrate to the colonies, where their labour out this fell, while reining themes from their labour here to emigrate to the colonies, where their labour and their skill, while raising themselves from destitu-tion to the enjoyment of an abundance of the neces-saries of life, would, by the development of the rags resources of these possessions, give a healthy stimulus to the industry and u sound and safe expansion to the commerce of the mother country. One speaker very each would be a so many millions had been reasonably urged that as so many millions had been freely given to feed the poor in Ireland, and to liberate

reasonably urged that as so miny millions had been freely given to feed the poor in Ireland, and to liberate the slaves in Jamoica, surely a single million might, if requisite, he given to supply our colonies with labour and our unemployed with work. GAS.—At the half-yearly meeting of the Birming-ham and Staffordsbire Gas Company, the usual divi-dend, at the rate of ten per cent. per annum, was declared.—The Bingley Gas Company have issued a notice for the reduction of the price of gas, from 5s. 6d. per 2,000 cubic feet to 5s. from the 21st of December last. The quilty of the gas, it seems, is not first-rate at present. The consumers may as well have cheen and bad gas as dear and had, but the com-pany would fluid it to their advantage to improve the quality of their gas while affording additional induce-ment (in price) to use it in private dwellings.— At the meeting of the Grimsby Gas Company, the inverse been constructed; that they intend to offer the value works for sale by auction during the spring, and hope to he in a position before long to reduce the rate of 8J per cent. per annum, was declared, leaving a considerably increased balance in had,——The Banff Gas Company have entered into a portion of the contracts for an addition to their works. The StaxSFERE'S HOUSS.—A meeting of the Birth-

Contract for Hunder, mason, Bauff. SHAKSPEARE'S HOUSE.—A meeting of the Birth-place Committee was held last week, and the Birmingham Gazette says, that "it was unanimously resolved ham forzette says, that "It was unannously resolved to proceed up further in the work of conservation until the opinion of some eminent architect has been taken upon the subject." We are glad to find our advice has not been thrown away.

CANADIAN EXHIBITION AT THE CRYSTAL PALACE. —The Parliament of Canada voted last session a sum of 2,0001. for procuring a proper exhibition at the Crystal Palace of the products, both raw and mana-Crystal Palace of the products, both raw and manu-factured, of that country, together with models of almost all the important public works there. A large space has been allocated for this purpose, and in a short time, says the *Canadian News*, an exhibition, exceeding in extent and interest that displayed by Canada at the "Exposition Universelle" of 1855 will be completed. A sum of about 5007, a year will be expended in maintaining and adding to the collection.

JOINERS' STRIKE AT DUMFRIES .--- The journeymen joiners of Dumfries struck work for an advance of 3s. a week. The present wages vary from 16s. to 20s. a week—18s. being the general rate for good work-men. Except one firm, the master joiners refuse to agree to a general advance of 3s. but some of them state they are wilbig to give an increase where they thigh the wardmen serie it. joiners of Dumfries struck work for an ad

think the workmen merit it. HOLYHEAD HARBOUR.—Mr. John Hawkshaw, C.E. bas been appointed, by the Admirathy, eugineer in chief of the New Harbour Works at Holyhead, vice Mr. Rendel, deceased.

THE WELLINGTON MONUMENT AT LIVERPOOL. We We understand that the committee appointed to superintend the Wellington monument at Liverpool bave resolved to adopt the design of the Messrs. Watson, of Edinburgh

NOTICES UNDER THE BUILDING ACA. — In the ease of the militia depôt about to he huilt for the city of London, the authorities refused to give notice to the district surveyor, Mr. Hammond, claiming it was exempt on the assertion that it was a huilding "em-tering for her. Maissiva use or service." It was NOTICES UNDER THE BUILDING ACT. loyed for her Majesty's use or service." It was gued before a magistrate on the 10th, who decided ployed argue before a magnetize on the 10th, who decided that the building is not exempl from supervision of the district surveyor; and who fined the builder, Mr. Jay, after three days' bearing. The Court of Lieuze-nancy have given notice of appeal to the Court of Queen's Bench; but this, it appears, the builder compliates epudiates.

Sr. EUGENE, PARIS.—A correspondent writes,— "When in Paris I saw the church of St. Eugène, recently illustrated by yon. To the lovers of outand-out polychromy, it must be a treat: every imaginable colour (except black and white) plays its part: this, with gilding and stained glass windows, gives a curious effect. Were it not for the style of architecture, it would be a very appropriate building for a hazaar. There is no solemnity about the place : the mind is excited and disturbed with this grady colouring, and it does not seem that it would he a desceration to commit a polka therein. Very different are the feelings with which we enter and leave the old Gothic eathedrals in our country and in France."
