will be decorated. Mechanics' Institution, North Shields. — The foundation-stone of the Tradesmen's and Mechanics' Institution, Howard-street, North Shields, bas beeu laid. The library-room will be 50 feet in length by 25 feet in width, and 22 feet high to the springing of the arched glass roof. The building, which has been designed by Mr. John Johnstone, of Newcastle, will be of brick, with dressed stone facings. The eleva-tion is of an Italian character. The contractors are tion is of an Italian character. The contractors are Messrs. Scott and Reed, of Newcastle. The amount of the contract for completing the building is 1,500/. The site has cost about 260/.

CHURCH-BUILDING NEWS.

Fulletby.—The church of Fulletby was lately re-opened. The new edifice is in the Early English style, and consists of nave, chancel, and porch. It has single lancet windows on the north and south sides, and triple lancets in the east and west ends, of however, the other areas of the actioner areas Ancaster stone. The walls are of the ordinary green sandstone of the neighbourhood. The east window is sandstone of the neighbourbood. The east window is of painted gleas, containing the birth, crucifixion, and accension of our Lord, with the emhlems of the Holy Trinity, St. Peter, and the sarerd monograms filling up the ground-work, and the north window in the chancel containing the raising of the widow's son, have been presented by friends of the rector. The south windows of the chancel contain the emblems of the Holy Econcelists and the north-west windows of the Holy Evangelists, and the north-west windows of the nave contain the figure of St. Andrew, to whom the church is dedicated. The floor is laid with Minthe church is decleted. The hoor is laid with Min-ton's tiles, and the seats throughout the church are open. The works have been executed by Mr. Carter, of Horncastle, under the direction of Messrs. Mangban aud Fowler, of Louth, architects.

Sittingbourne .- The Vicarage of Bapchild, this place, is about to be enlarged, on plans furnished by Mr. E. C. S. Blake, of Westminster, architect. The following were the tenders for the work to be done

Shadgett, Boughton Monchelsea	£949
Saymell, Borden	
Smith, London	797
Taylor and Co. London	790
George, Sittiugbourne	513

day in last week. Messrs. Andrews and Delaunay, of Huddersfield, were the architects. The dimensions are rather larger than those of Westgate Chapel, the length within the walls being 76 feet, the width 50 feet 6 inches, and the beight 34 feet. The entire cost of the edifice, including the site, will be nearly 4,0007. About 3,000% bave been already contributed.

4,000. About 3,000. bave been aircay contributes. Jarrow .—The United Presbyterian Church here recently erected has been opened. The obserd, with sebool-room attached, stands on the Jarrow Grange Estate, and adjoins the new road leading to the engine works of Messrs. Polmer and Co. The huild-ing is of brick and is in the Gothie style of architec-ture. The upper part forms the clurch, capable of scating above 400 persons: the under comprises a school room and a vestry. The site was presented by the Ellicon and Messre Palmer Erechters provided scating above 400 persons: the under comprises a school room and a vestry. The site was presented by Mr. Ellison, and Messrs. Palmer, Brothers, provided the woodwork. Mr. Robert M'vey was the architect of the building, and Mr. Charles Miles the builder.

Datchet, Bucks .- Datchet Church is about to be almost entirely rebuilt and cularged. The new works will comprise the extension of the nave westward, and the erection of a south aisle, about double the size of the present one, entered from an open-timber porch. The roofs throughout will be all new, and porch. The roofs throughout will he all new, and open to the ridge : the areades, doors, and windows open to the ridge: the arcades, doors, and wholews will be also new, so that the only portions of the old structure that will remain are the chancel walls and the tower. The architect to whose care the works are entrusted is Mr. Raphael Brandon, of London. The contrast is taken by Messrs. Dove, of Islington, for the sum of 1.8272. for the sum of 1,8271.

Broomhaugh.—A new Episcopal church is about to be created in the beautiful village of Ridding Mill, adjoining the estates of Mr. W. B. Beaumout, M.P. who, with his lady, contributes largely to its funds. who, with his hady, contributes largely to its functs. The plan of the church comprises nave and chancel, with vestry to the north, and a tower and spire 60 feet high at the west end, adjoining which is a south porch. The style of building adopted is that of the "Geometric Decorated." The stone is to be the Durah of the control of the method of the method. or the occumente occorated. The stone is to be from Prudham Quarries. The whole of the woodwork will be stained and varnished—the seats open : in the chanced will be placed four stalls, and on the opposite side the distance of the stalls. and the placed for scars, and or the opposite ector. The chuich will be beated by bot and thoroughly ventilated. Accommodation is, ed for 160 persons. Mr. Matthew Thompson, the choir. water. provided for 160 persons. N of Newcastle is the architect.

Lincoln .- The coverings have been taken down from the windows put up in the south-east transcept of the cathedral. Allusion is made in the three upper windows to the system of ecclesiastical polity under the patriarchs and the Jewish dispensation by under the patriarchs and the Jewish dispensation by means of single figures, the use of which, in preference, to groups, was necessitated by the position of the windows. These figures denote Adam, Enoch, Mei-chiesdee, Abraham, Isaac, Jacob, Jadoh, Moses, Aaron, Joshua, Samuel, David, Isaiab, Jeremiab, Ezekiel, Dauiel, Malachi, and John the Baptist. In the middle tire are the Annucciation, the Baptism, the Last Supper, the Crucifixion, the Resurrection, and the Denoted of Theoretic Loncolution: middle ter are the Annuceation, the Bapison, the Last Supper, the Crucifician, the Resurrection, and the Reproval of Thomas's Incredulity; and in the lowest tier are Christ Blessing the Apostles, the Day of Pesteeost, the Death of Anauias, the Conversion of St. Paul, the Delivery of St. Peter from Prison, the Bindness of Elymas the Sorcerer, the Appointment of Descons, and the Consecration of Thmothy as Eveness of Edvers. The variabore heave been received of Descons, and the Consecration of Timothy as Bishop of Ephesus. The windows have been excended by Mr. G. Hedgeland, of London.—The tender of Mr. Wm. Huddleston, of Lineolo, amounting to about 2,7007. has been accepted for the building of Binbrooke Church. Mr. R. P. Pope is the architect. —The tender of the same builder has also been accepted for the building of Firsby Church, for which Mr. G. E. Street is architect. Stonehouse (Dercon).—Steameter builder

Stonehouse (Devon) .- Sixtenders have been received Stonehouse (Devon).—Sixtenders have been received for the crection of a small chapel, in Stonehouse, Mr. A. Norman, architect, ranging from W. H. Pettuek, 8104. to R. Dingle, 5604. (accepted). Each tenderer took out the quantities for himself. Derby.—The foundation stone of a Wesleyan Reform Chapel, to be crected in Becket-street, Derby. were leid en by 20th inter. The plue will consist of

was laid on the 20th inst. The plan will consist of a parallelogram, 60 feet by 45 feet. The elevation will be simple, of the plain Italian character: the materials are bricks, with stone dressings. The building is calculated to accommodate about 800 per-

AGAR-TOWN, ST. PANCRAS.

ON Thursday, the 21st inst. the first stone of a Church School, the commencement of a series of con-On Thursday, the 21st list, the first stole of a Clarech School, the commencement of a series of con-templated buildings, of church, parsonage-house, and schools, for this densely populated district, was laid by the Right Hon, the Lord Robert Grosvenor, M.P.. The vicar has taken the whole responsibility upon limself of accomplishing these works, and has placed them in the bands of Mr. Tculon, architect, to carry them out. The work now in progress is nchurch sebool, 60 feet by 25 feet, with a sanetnary to the ensi, screened and railed off. The class-room, scrving also for a vestry, is north of this. The entrances are north-west and south-enst, so as to divide the chil-dren who, during the week, will use it as a school. The building will be of hrick, hoth externally and in-ternally, with some constructive colour, very par-tially applied. The east and west windows, set in pointed arches, will have square tracery and eusping, a mode of treatment calculated for its conmetion with hriekwork. The be'll turret, over the west gable, will have a hipped roof or canopy, of wrought iron, will have a hipped roof or canopy, of wrought iron, with a cresting.

ARCHITECTS' CHARGES AS WITNESSES.

A QUESTION has arisen in my practice lately which I think the interests of the profession require should be set right.

be set right. A party employed me to take an account of dilapi-dations in a house in the City, for which he paid. But the case went to trial, and I was engaged three days at the Exchequer. For this I made a charge of two guineas per day, the payment of which is refused, the solicitor of the party saying that nothing is legally chargeable heyond the guinea paid with the subprona. My own solicitor also tells me these charges cannot he recovered cannot he recovered

If this be true, it is very hard that in consequence It this be true, it is very nate that the consequences of having done husiness for which perhaps two or three guineas have been paid, a surveyor must sacri-fice possibly not only two or three but four or five days, with no remuneration except the guinea which accompanies the subprena. JAMES EDMESTON.

_ We never heard of a charge per day for attendance in such cases being questioned : it would be manifestly unjust, and would act most injuriously. We shall be glad to hear from some of our legal friends on the subject.

THE DECORATIONS OF THE ART. TREA-SURES BUILDING,

As I find by your statement in the Builder of Saturday last that you are incorrectly informed as to the decorations of the Art-Treasures Building at Manchester, I feel it due to myself to correct the error. The decorations throughout the building were beinged by me and resultd much and informer. designed by me, and executed under my direction, and, with slight exceptions, by my own artists and workunen. In the side galleries, the Manchester firm you mention painted the ceilings, cornices, and dado, according to patterns first put in for their gaidance by my workunen, and they papered the walls; but the arches, which are the main decorative feature of these milleries. gelleries, were executed by my own artists. JOHN G. CRACE

*** The statement in question (p. 287) was made at the special request of the Manchester firm named, who pledged themselves for its correctness.

DRAIN-PIPES

DRAIN-PIPES. I THINK it will be generally admitted that pipe drainage for honses is a very great improvement on the old drains, provided they are properly laid; hat the great drawback is the opening them to examine and clean them out. Several attempts have been made to overcome this difficulty, hut, generally, the pipes have to he taken up, or cut open, in order to ascertaiu the state of the drains: some have half, socket pipes, but then you must remove the pipe. Jenning's plan is a great improvement, as you can remove the upper part of the connection to examine the drain; but there is not space to clean it out propedy. Single junctions are often placed upright or the same purpose, as also sockets in the bend of the dunin; but there is not space to clean it out properly. Single junctions are often placed upright for the same purpose, as also sockets in the bend of the syphon traps; but I would propose n simple method of overcoming the difficulty and inconven-ience. If the makers would always keep some pipes made in two parts, lengthwise, with a finage or robate in the lower half, the upper part could be taken up at any time without disturbing the pipes. Ict one of these be placed at the principal junctions, or such other places as may be convenient, with a mark on the pareneat, or wall; there would be a great avaing of expense and unconvenience, and a sweep's machine would geourally do all that is required. The dif-ference in expense could not be much, and the advantage would be great.

I hope you will consider this hint worth a corner in the *Builder*; and as you have so many sketches of drain-pipes in your advertising columns, I hope to see another added to the number before long. E. O. S.

SOUTH KENSINGTON MUSEUM

WE understaud that the following rules, amongst others, have been sauctioned for the admission to this Museum, which will he opened to the public in June :-

June :-June :-1. The collections of objects relating to education architecture, and trade, of pictures, sculptore, ornamental method mode of patranted inventions, will be open to the end of the object of the sculptore of the scale end of the object of the scale of the scale of the scale even to ten in the evening, on Monday fund and duily during the Easter and Christmas weeks, the public will be admitted frees, but on these days, books, cramples, methods, casts, &c, cannot be removed for study. The scale of the scale of the scale of the scale of the scale scale of the scale of the scale of the scale of the scale will be admitted on payment of aigned Fullys, the public sum during the day-time will enable any person to con-sult any books, diagrama, sc, in the collections of educa-tion, and to copy any article in the collections of admission in writing must be obtained. In the evening, works cannot writing must be obtained. In the evening, works cannot collections, maniang and evening, may be obtained for ten sbillings.

Books Receibed

Essays from the Edinburgh and Quarterly Reviews, with Addresses and other Pieces. By Sir John F. W. HERSCHEL, Bart. K.H. &c. &c. London : Longmans and Co. 1857.

Dolignants and Co. 1097. PERHAPS there are uone of Sir John Herschel's well-known works and discoveries which impress one more completely with a sense of the versatility of his italents than this collection of essays, addresses, and pieces. Besides his various lighter yet still profound discursions in the Reviews, ou Terrestrial Magnetism, Iodustrial Science, Prohabilites, the Mechanism of the Heavens, Kosmos, &c. and his memoirs and addresses to the astronomical and other societies, we have here his various potical translations from the have here his various poetical translations from the German, and even his original effusions of a kindred order; and amongst these latter, like that other verorder; and amongst these latter, like that other ver-satile but much more dreamy genius Coleridge, we have a series of stanzas partly composed during sleep 1 and noted down on waking; here, in short, we have a bright luminary in all his varied phases, though much more especially as a leeper of the "night watches" than a sleeper while the stars are up. To say one word here in recommendation of such a work as this would be sheer impudence: we shall therefore leave it to speak for itself, however templing the occasion might elsewhere be to review a reviewer such as Sir John Herschel.

The Manufacture of Iron in Great Britain; with Remarks on the Employment of Cupital in Iron Works and Collieries. By Groace WILKIE, Assoc. Inst. C.E. A. Fullarton and Co. 106, Newgate-street, London. 1857.

Newgate-street, London. 1857. The anthor of this small volume states, in a hrief preface, that he has had some years' experience in the iron trade and manufacture, and has something to say as to the heavy losses frequently incurred by capi-talists in this hraneb of manufacture from want of practical knowledge of the subject. The treatise is entirely practical, and although, doubtless, there may be differences of opinion on some points amongst practical men, it nppcars to he both instructive and meeful, comprising, as it does, a succinet view of the main principles and practice of the iron manufacture as at present conducted in this country, and also the author's ideas as to the chief canses which usually prevent such undertakings from being successful.

VARIORUM

VARIORUM. "A Sclection of Vases, Statues, Busts, &c. from Terra Cottas "(Weale, Holhoru), by J. M. Blashfield, the well-known terra cotta mauflacturer has jus-the well-known terra cotta mauflacturer has jus-the well-known terra cotta mauflacturer has jus-terra cotta, or baked clay, which in many instances, it appears, can be made to rival even mere stucco in cheapness, while of far more permanent darability of Glagow Neuropolis," by George Binir, M.A. (Maurice, Ogle, and Son, Glagow, publishers), is an ahly-written and pleasaut account of the subjects of the more public and generally interesting monuments and tombs in that earliest of British ornamental hour on S cemeteries, the Neuropolis of Glagow. As regards the truthfulness of the volume in respect to those less universally known characters who have once here celebrated in Glagow and the west of Scolland, and now rest their respected remains in this Necropolis, perhops the strongest evidence is the favourable way the 29th.

Miscellanca.

Histellanca. BUILDERS' BENEVOLENT INSTITUTION.—A Special General Meeting of this prosperous and useful insti-tution was held at the London Tavern, on Thursday, the 26th inst, for the purpose of electing two pen-sioners, one male and one female, from a list of ten candidates. The president, Mr. Alderman Lawrence, was in the chair, supported by Mr. George Elird (the treasurer), Mr. Joseph Brid, Mr. Thomas Cozeus (the founder), Mr. W. Hutcheons, Mr. J. Williams, Mr. G. Burge, Mr. J. Thorn, Mr. R. Williams (Brighton), Mr. Thomes Stirling, Mr. George Grayson, Mr. Thos. Todd, juo, and other geutlemen. The last annual report stated that the subscriptions and donations received during the past twelve months amounted to I,354/. 1s., and 700/. stock had been added to the sum invested in the Three per cent. Consols. The large number of deserving cases presented at each hoped the funds would come in more liberally. The charity was ably managed, and if the subscriptions would hut place the meaus at the disposal of the com-mittee, they would, on the next occasion, be enabled to elect a large number. Mr. Gorge Bird said be hoped the subscribers would exert themselves to en-able the subscribers would exert themselves to en-table the subscribers would exert themselves to en-able the subscribers would exert themselves to en-table the subscribers would exert there port to the council, which showed the society to be in a prosperous condition, was read and approved, and the version of the asterious the adaptioned in the society to be in a prosperous condition, was read and approved, and the

the 18th inst. Mr. W. Harris in the chair. The report of the council, which showed the society to be in a prosperous condition, was read and approved, and the question of the establishment of an Architectural Exhibition was referred to the coancil. Annonneement was made of the formation of the Birmingham Archi-tectural Photographic Society. Office hearers were elected, and a resolution passed to pay a visit to Oxford to examine its architectural monuments during the vacation. the vacation.

WIGAN SEWAGE WORKS .- During the past quar WIGAN SEWLOE WORKS.—During the past quar-ter 5,191 lect of severage have been constructed, chiefly in Scholes, at a cost of 1,8094. making a total of 14,2004, since the works began. Notices for the drainage of 250 houses in Scholes ward have been served, and many dwellings reported by the surveyor as null for babitstion have been doomed.

as dual for bankation have been doomed. CHELSEA.BRIDGE.--In reply to a question put by Sir John Shelley, in the Commons, last week, Sir B, Hall stated that it was expected this bridge would be open by August. The Act declared it a toil-paying bridge; and that the toils be first applied for the maintenance of the bridge, next, for the expense of construction, and any surplus for the carrying ont of metropolitan improvements. THE VIVIAN MEMORIAL AT SWANSEA.—For some

The VIVIAN MEMORIAL AT SWANSFA.—For some weeks past the concrete foundation of this status was ready, and on the 10th inst, the first or foundation. stone of the pedestal was laid by the Mayor. The contractor, Mr. Renden, will now proceed with the statue 8 feet bigh. The sculptor is Mr. J. Evan Thomas of London

Thomas, of London. Thomas, of London. STRIKES.—At Liverpool the stonemasons are on strike for an udvance from 258, 6d, to 30.a, aweek in summer, and 26s, to 27s, in winter. Several emsummer, and 26s. to 27s. in winter. Several em-ployers complied, but there is no prospect of an early settlement of the question. A similar dispute has occurred between the enhinetmakers and their employers. At Manchester, the joiners and car-penters are on strike for the Saturday halt-boliday, and have appealed to the trade operatives in Brad-ford, Leeds, Sheffield, and five or six other towns, for aid, which has been promised. Two hours a-week during summer would, it seems, he the maximum of the time asked by the workmen. At Nottinebare a At Nottingham, a the time asked by the workmen. At Nottingham, a similar strike to this last has taken place, amongst the joiners, masons, bricklayers, and labourers, for an hour on Saturday. Some masters have consented, and others have offered half-an-hour, which has been

THE FALL OF HOUSES IN TOTTENHAM-COURT-ROAD.-The inquiry was resulted on Tuesday, the 26th iust. and was again adjourned till (this) Friday,

OLDBURY CEMETERY COMPETITIONS. - Fifteen OLDBURY CEMETERY COMPETITIONS. - - Fricen sets of desigus were submitted to the Burial Board for the chaples, lodges, &c. from which that by Mr. W. Wiggington, of Dudley, was selected for the first prize. The six selected in the first instance were by the following :--1, Wiggington; 2, Bidlate and Lovatt; 3, Fidlan; 4, Middleton Brothers; 5, Holmes; and 6, Nikolale. Nicholls. and 6,

and o, Nenolis. Issuer of Civil EventNERS. --Mr. Robert Stephenson, M.P. the president of this institution, gave the annual conversazione on Tucsday night, at its house, Great George-streek, Vestimister. The company began to arrive about nine o'clock, and con-tinued to flow in till near midnight. Men of the birdest emissione in create denaitment, of esimes and

its house, Grad George-treek, Weshuinster. The company began to arrive about nine o'clock, and continued to flow in till near midnight. Men of the highest cmineace in every department of science, and as anthors and arlist, were present. — Mr. WinLAM RUSSELL ON THE WAR.— Hr. Russell, to whom, as the *Timed* correspondent, the country is largely ind-thed, is giving an account in graphic language, at Willi's Rooms, of the stirring scenes be witnessel in the Crinca. We advise sub of our readers as by e the opportunity to go and hear him orthwith. — THE LATE MR. HILL, BOROTOH ACCHTERT, Or BURKNERAM.—On Friday in week before last Mr. Daniel Rootlinson IIII departed this life. Among the principal of his works at Eirmingham are the Borough Caol and Lunafie Asylam, and the Baths and Washhouses in Kont-street. Besides, there is some of his work. But it was in the erection of prisons elsewhere that the had lately distinguished thimself. The Surrey Gaol was bis work: he was also engaged to erect the County Prison at Laws; and at the time of his detth. It is said, he and his partner, Mr. W. Martin, were employed in designing to executing the alteration or erectant of *the soledy*, which and the bath lately distinguished this is a sancely as the or any pretone that deves also engaged to erect the County Prison at Laws; and at the Line of his soleth, it is said, he and his partner, Mr. W. Martin, were employed in designing the soletaristic or erection of *several* of the space and the business of the meeting should be the part of the soleidy, at its annual meeting since held, manimously resolved,—"That in consequence of the death of the respected member and first president of the soleidy, Mr. Hill, all the business of the meeting should be designed within six weeks after receiving the designs." We have not heard the result.
Mr. WAALEX COLLER, MCENDAN, SUBREY.—A cavalary college, or training school for cavalay of the advertisement in your paper. I have heard nothing since of the matter, although the constructed with

351

of Derivative road, will be constructed with after offices, and store dressings, upon a somewhat extensive scale. THE WINDSOR ROYAL SOCHETY. — The annual meeting of this landable institution, with the Prince Consort as president, established for budding cou-venient residences at a moderate rent for the working man, was held at the Town Holl, Windsor, a few days ago. Col. F. H. Seymour presided. The financial report was very satisfactory, and showed that the total amount of paid-up capital was 6,5007. The chairman congratulated the shareholders on the success of the establishment of lodging homes for single meu on an improved system, which they had attempted shout three years, but were now compelled to abandon from the loss the system entabled on the society. A dvi-dend of 57, per cent. less incoments for the year, was declared on all the paid-up shares. LIMEHOUSE CUITERL. — The restoration of Lime-house church having at length been completed, it has

house church having at length been completed, it has been re-opened for divine service. The work has been finished under the directions of Mr. A. W. Blomfield,

finished under the directions of Mr. A. W. Blomfield, son of the late Bishop of London. The BULLING SEASON IN MONTREAL. — An extraordinery degree of activity is beginning just now to dwelpen itself in house-building at Montreal, according to a local extrespondent of the Canadian News. New rows of dwelling-houses and capacions stores are being run np as if by ungit. SL An-drew's Charch, one of the fneest in the city, will be completed this year by the cretchin of the steeple. The Unitarian Church, just opposite, is now being dem-lished, for the purpose of enlarging and improv-ing it. Ground has also been broken for the new dem-inshed, for the purpose of enlarging and improv-ing it. Ground has also been broken for the new Anglicon Cathedral. Everything betykens a busy season for architects and builders; end before the year closes many hundred buildings, public and private, will have been added to the city, alfording ready em-ployment to hundreds or mechanics and labourers. It is also stated that the Grand Trunk Company in-tered memi-term blue the interfarmed company intend running a track into the city.

HINTS TO WORKMEN: TO REMEDY THE EFFECTS or DRAM-DRINKING.—Whoever makes the attempt to abandon spirit drinking (and the same is the ease with smokers), will find, from line to time, "a rank-ling in the stomach," with a sensation of sinking, coldness, and inexpressible anxiety. This may be re-lieved by taking often a cupful of an infusion of elves, made by steeping about an onnee of them in a pint of boiling water, for six hours, and then straining off the liquor. In a state of permanent languor and debility, an onnee and a half of cascarilha bark in powder, and six draburs of syrup of ginger, should be added to the above infusion. This mixture taken three times a day, will be found a useful strengthener of the six drachms of syrup of gringer, should be mater-the above invision. This mixture taken three times a day, will be found a useful strengthener of the stomach and bowls, when they have been disordered by frequent excess and intoxication. "Undiluted spirits," says the Lancet, "poison the system;" therefore, let all beware of strong drinks, whether for thirst or for pride! A teaspoonful of grated giuger in a little bol-water is a good substitute for spirits.— I, B, W. J. B. N.

THE BUILDER.

Builder. The

VOL. XV.-No. 748.

EFORMATORIES, Ragged Schools, and similar institutions, have been called " Social Bridges." The title is a happy one.

God's blessing," writes Longfellow,-

God's blessing on the srchitects who build The bridges o'er swift rivers and

abysses Before impassable to human feet, No less than on the builders of cathe-drals,

s, massive walls are bridges Wh Whose massive walls are bridges thrown across The dark and terrible abyss of Death. Well has the name of Pontifex bees

given Unto the Church's head, as the chief builder And architect of the invisible bridge That leads from earth to heaven."

And there are dark and dangerous

places in the social world which

need bridging over, to afford a way out to the miserable dwellers amidst degradation and filth Blessings to those who build and maintain such bridges, and afford a chance of light and bopc to the poor souls born in darkness and misery. Lately public attention has been strongly directed to these and other means for the prevention of crime ; and we may, perhaps, be excused, viewing the matter as part of the great question to which we have long given consideration,-the social condition of the working-classes,-if we here make some few observations npon them We have before now shown the extent of the dark places in London, the nurseries of crime, the hotbeds of disease, and bave pointed to the enormous number of the children occupying our streets nneared for and untaught. It is time that measures commeusurate with the magnitude of the evil were taken. In all large cities there is to be found a considerable amount of distress, and a condition of things, which, if left neglected, is sure to lead to danger, trouble, and expense. Improved medical knowledge, increased opportunities of supplying information and instruction, and the progress of the science of statistics, will be the means, ere long, of sweeping away the dwellings that disgrace the metropolis, and raising up the classes which now are so difficult to deal with.

During the last twenty years good has been done in patches; hut only enough to show that improvement is practicable. Londou missions, national schools, ragged schools and dormi tories, and infant nurseries, have become estahlished institutious in this great city, hut not in sufficient numbers to meet the enormous requirement.

Foremost amongst the causes which lead to the increase of crime in London are-

1. Ignorance reared and encouraged in neglected neighbourhoods.

2. The want of the means for teaching children some useful trade; and

3. The neglect of parents, who, hy dissipation, and other ill conduct, leave their offspring to shift for themselves, or else drive them into the streets to thieve.

Take an instance or two. A boy, now in the Reformatory in Britannia-street, said, when asked,-"I am between fourteeu aud fifteen years old. 1 have a father and stepmother, aud two sisters, younger than myself. I have been in prison three times. I stole once a loaf of bread. I was very hungry, and could get nothing to eat. I once stole some bacon, and took it home to divide with my sisters. My father, however, took up the poker and hit me with it, because I would not give him all."

in course of time he was driven away by his unnatural guardians) were too shocking to relate. The superiutendent of the refuge said he did not know a letter in a hook nntil he came there, and that he is now a good and iudustrious boy.

Out of uineteen boys in this "refuge," nine go out in various ways to work, the others are eugaged chopping wood, &c.; and out of ninety boys admitted since the opening of the school, sixty have been put in the way of earning their hread in au honest manner : some have cutered the navy, others have become soldiers: some have been apprenticed to trades.

The boys, when first brought to these institutions, are in most iustances ignorant of everything good. The superintendent of the Britannia-street Ecfuge says-" Of the large number of hoys who have passed through the school, very few have returned to their former habits." He knows many who, if they had been left in the street, would have been a pest to the country, are now growing into young men, filling situatious in life, and becoming useful members of society. The cost at which this amount of good is done seems very small.

Salaries	£25	10	0	
Food	104	1	5	
Coals, gas, and washing	11	4	0	
Boys' treat	1	17	6	

Printing, and the expenses of a public meeting, come to about 9%. The whole cost of the refuge for nineteen lads is 1651. 17s. 7d. If we take from this sum such items of expenses as might be avoided if the system were differently organised, and the produce of industrial work, 277. Ss. 1d. the actual cost is little more than 61. 11s. per annum, or 2s. 6d. a week, for each lad. When we find criminals transported at a cost of from 30%. to 40% a year, one feels astonished that the various ragged-scbools and places of refuge are so little cared for, and allowed to remain in struggling circumstances.

Questioning a group of lads of from twelve to sixteen years of age, at the Field lane Ragged School, not long ago, every one of them, without the least appearance of compunc-tion, acknowledged that he had been three, four, six, or seven times in prison. They had in most instances stolen food, aud none of the balf-dozeu lads had either father or mother. Useful knowledge, when they first came to the school, they had none : how could they have it ? The report of the schools would afford dozens of instances of the mode in which children are forced to become thieves and vagabonds. Take one case. J. N. aged sixteen, says,—"Father dead : mother a very bad woman. When I was dead : mother a very bad woman. a child I was taught to steal, aud if I returned home without something for mother, I was sure of a good beating, and was turned out for the night." This lad had slept in arches and on the stones, and been nine times in prison, ouce for throwing stones. He is now in work and doing The larger portion of the 200 or 300 cbildren who here assemble day after day, are clean and tidy ; and it is satisfactory to contrast the appearance of the great bulk of the children with the state of those who are persnaded to come to the ragged schools, when first established in new neighbourhoods.

In the Field-lane school great good has been done by a society of ladies, who give clothing, and receive from the children part of the value of it in very small payments. The first properlyshaped articles of dress with which some of the children have been clothed have heeu obtained through this medium.

In the domitory, a temporary night shelter is provided for the most destitute, either old or young, in which 12,220 have slept with tickets (that is, those who have attended the Bible classes regularly); 6,708 without tickets, who have attended the Bible classes casually : 1,092

The sufferings of this lad in the streets (for strangers to the school: total, 20,020, or about 55 per night during the year, to whom nearly 60,000 loaves of bread have been given. Out of the number above meutioned, during the twelve months, 113 have obtained employment from the refuge; 60 have been admitted into permanent refuges; 18 have enlisted, aud 21 have been restored to their friends: so that 212 youths and men have heen taken from the streets and prisons and provided for. Much of this good is effected by the moral power and kindness of the Sunday-school teachers.

The above facts show that there is a class to deal with, amounting to a cousiderable number, who are totally neglected, without a shelter, and are obliged to break the law at a tender age in order to obtain the commonest necessaries of life. It is clearly shown that some of the wildest of them, if caught iu time, can be trans formed into nseful members of society. It seems certain that ragged schools, in connection with dormitorics and industrial training, if instituted to a sufficient extent in the proper neighbourhoods, will give a right impress instead of wrong, and effect much good. At any rate, it is but proper to try the effect of kinduess and persuasion before taking other measures. It is an act of injustice to allow thousands of iguorant and destitute childreu, both male and female, to go to almost certain destruction, without an effort.

Care should he taken in connection with reformatorics and places of refuge not to make them seem to he places of punishment, for undoubtedly much of their present success is owing to the feeling of independence and thank-fulness experienced by the inmates.

Let us look at the matter in a practical point of view. We want good artisans,-our colonies want them even more-offer any money for them. Would it not he better, wiser, cheaper for the country to turn the neglected iufaut population of our cellars and streets into men of this class, instead of allowing them to become, as they unquestionably must become if uncared for, rogues and thieves, if nothing worse, to plunder honester mcu, and to be nltimately caught, tried, convicted, and maintained in prison, or a penal settlement, all at the cost of the State?

THE GOVERNMENT COMPETITION DESIGNS.*

The design, No. 86, with the motto, "Tenax Proposite Vir," has come from Munich. Though it has little of the invention in details, for which the German works mostly are remarkable, and for which the author complains, allowed no opportunity — it yet deserves to be looked no opportantly — It yet desives to be looked at, considering that the points which have re-ceived attention, namely, the general disposition on the ground, and the grouping of buildings, are those in which the architecture of our towns is most deficient. In these, one object to be attained is *variety* of character; and to which architecture of courses gain this, whilst eschewing the use of several different *styles*, which would rather injure one another in their effect—occasional use of circuanomer in their effect—occasional nse of circu-lar and oblique lines in the ground-plan is desirable. The author of No. S6, has sent a street plan of the immediate locality only, a detailed block plan, and drawings for the War-office and Forign-office, as one design. Looking at the general arrangements—he obviously would pursue the present plan of the works commenced for the new Westmuster budge. but even for the new Westminster-bridge; hut, again like many of the competitors, is misled by the plan and instructions, so that be shows only the site of the old bridge. The Offices are arranged in the block plan, in symmetrical groups, with free intercommunication; and in place of the Freen arrangement, where a new site for the bridge becomes the centre line, Parliament-street is made the starting-point of the design. At the south cud of Parliament-street, is a splayed or straight-sided recess—a "cres-

* See p. 302, ante,

cent," the author calls it —in the ground, with projections with small porticoes on the oblique sides, and a Roman trimphal arch with side openings, across the street in the centre. In the "cresceut" are fountains; and an obelisk in the middle of Parliament-street is seen beyond the arch. At the position of the obelisk, a broad place intersects. The front towards the river has embattled towers at the ends; a centre with pediments, one over the other, and a dome sceningly suggested by that of St. Paul's Cathedral. A projection in the form of a semicircular bastion occurs in the river wall, in the centre, and round this the landing-stairs wind. Low domes are placed on the obliquely disposed fronts in the "crescent." The author's decorative details appear to be conceived with the view of assimilating them with the present Board of Trade, which huilding would be preserved—as also that of the Treasury facing the Parade, attrihuted lately to Sir Rohert Taylor, hut sometimes ascribed to Kent. The plan of the War-office and Foreign-office has two large courts and several smaller courts. Apparently it provides a considerable unber of rounds; about which part of the plan the sufficiency of the lighting is not evident. The Foreign-office and residence have a peculiarity of plan noticeable in some other cases, and which here may have originated from the position of the State Paper-office, which is preserved,—that is to say, the north-west angle of the block is splayed off, and the graud entrance to the residence, with the staircase, as well as a carriage-way through to the court, are provided at that angle.

and the grant entrinee to arriage-way through to the court, are provided at that angle. No. 87, "Palmyra," generally pointed to as by Mr. Bardwell, is worthy of uotice, chiefly for by Mr. Bardwein is workly of horder eithery of the suggestions in street arrangement that may be derived from the general plan—which, how-ever, is hung where we are unable to read much of the writing upon it. Besides the plan referred to, there is one to a smaller scale, showing a more restrict on the scale scale scale showing a proposition as to a site for a museum at meeting of the main *routes* ou the Surrey side, as the central locality of Londou; and there is a general block plan of the Offices, and a design for the War-office and the Foreign-office, which are connected, as iu many other cases, hy arcades with colonuades above. The drawing of the general plan is remarkable for the extensive provision of trees lining the streets. The author apparently would complete the plan for aution apparently would complete the plan for new Westminster-hridge, hut again, like others, shows the site of the old bridge, and also the width marked on the Government plan, of Mr. Walker's proposed addition; but does uot indi-cate in any way the site of the works in pro-gress. This error would throw out the whole line which would seem to be contemplated by the author, so far as the south side of Bridge-street is concerned. He nromoses a new Bridge-street is concerned. He proposes a new bridge from Charing-ross, with one approach obtained hy the removal of Northumherland House, and with a junction from Whitehall-place; and he has also a bridge at the Horseferry. The bridge from Charing-ross is intouched to correct a reliver as well as Honce; and he has also a bridge at the Horseferry. The bridge from Charing-cross is intended to carry a railway as well as the road. A street through the centre of the National Gallery, joining Tottenham-court-road, a portion of the new Gallery bound-ing the new line; the junction of the Mall and the Strand; the provision of a wide avenue to the Strand; the provision of a wife variant and the Strand; the provision of a wife variant io emharking and lauding stairs, opposite the Horse-guards; the addition of a dome to the Horse-guards; the removal of St. Margaret's Church to the south side of Bridge-street, in south side of Bridge-street, in Church to the south side of Bindge-street, m line with the Clock Tower; and the formation of a larger place, with groves of trees opposite the Abbey, are the chief of the other suggestions. The originality which there is in some of these as shown, degeuerates to eccentricity in the designs for the two Offices. In the War-office designs for the two Offices. In the War-office plan, the entrance leads to a rotunda of S0 feet diameter, and 116 feet in height, surmounted by a dome, and having a gallery of 10 feet wide on the inside, on the level of the first floor. The covering of the dome, externally, is panelled, and ornamented with various military devices, not ou the best principles of ornamentatiou. In the Foreign-office there is no large dome; the plan has a cressent shaped recess in the centre, next the "Great Courtyard," which is between the Offices. But the chief peculiarity of the designs

consists in the very large area given to window opening, and the salieut columns of the upper stage. The author says, — "The columns being detached, would, if seen in perspective, present a rich line of architectural grandeur, almost entirely hiding the windows, and illustrating the motto, 'Palmyra." The angles of the plan are terminated hy domes of subordinate character, the rooms in each floor there being octagonal.

octagonal. No. 88, "Vitam excoluere per Artes," re-taius the site for Westminster-bridge, but otherwise offers no point for uotice No. 89, "Ars longa, Vita brevis," as th as the work of a Frenchman, though unequal in the designed decorative effect to works previously named, is important as hased on the usual English propositiou as to the bridge, just referred to. The shift as to be origing just retaries. The author exhibits a street plan of a limited area, a block plan, and a design for the War-office and Foreign-office in one building. He provides a "Place Victoria" opposite the west end of the Ahhey, from which five ways radiate, the Sessions House and Hospital being removed ; and forms a garden, with a fountain in the centre, hetween Abhey and Great George-street. The Board the Abbey and Great George-street. The Board of Trade would be preserved, and Dover House would be removed. The general Offices are grouped in four hlocks, with recesses and courts, and would he symmetrical in plan were the suggestion for the appropriation of Rich-word tigs are appropriated. Devicement the suggestion for the appropriation of Rich-mond-terrace carried into effect. Parliament-street, widened, is intersected by the "Rue des Ministères," forming a junction between the river embankment and the park. The western portion of this "Rue" is itself intersected by the "Place des Ministères." Thus there are two similar fronts in the park, with gates in the centre to Charles-street, and two similar fronts centre, to Charles-street, and two similar fronts in Parhament-street. This reproduction of de-signs—as distinguished from the treatment in symmetrical portious of one general design to which parts are subordinate—has been prac-tised hy too many of the competitors. We can understand how the circumstance referred to has come to pass, considering the inadequate time allowed for any grand comprehensive design; hnt at present the aspect of affairs would go towards justifying our correspondent, M. Garbatt in his contraction of the second seco Mr. Garbett, in his application of the name per-centage style. We might lay down as a principle that, where there is no really comprebecause design with one central feature and other prominent features of the whole, what then become individual huildings should not he formed in duplicate, but should be designedly different. At the same time a good general design, with the required duplication, would produce the fuest effect. In that case, however, though the ends of a front should correspond, the separate fronts should present greater variety than English architectural works have usually exhihited ; aud it is, in fact, on the happy coujunction of the qualities—unity and variety— opposed to each other in the vulgar perception, opposed to each other in the vingar perception, but really hoth possible and essential in archi-tectural art, that the effect of any building depends. The plan in No. 89 of the building for the War-office and the Foreign-office has a deeply recessed contro next the "Rue des Ministères," and five conts. The entrance in the control is by a locaria of five coches can wride the centre, is by a loggia of five arches on a wide flight of steps; each end of the loggia giving access to the hall of oue of the Offices. The Residence, next the park, has its entrance be-neeth an archerer which which the terms of the neath an archway which unites two of the courts, --- archways of ingress and egress being of conrsc provided to the courts from the park. All portions of the plan are in communication : but this is not always effected by corridors. The deficiency here, like that in lighting, seems, as referred to in our last, apt to characterize the "academic plan," which is either Italian or studied in a great degree from Italian nodels. There is, we believe, as much to learn from the continential architects, as they can learn from us; but there are parallel deficiencies. The style of the design is French Renaissance, with they paralling Marcard architecture. the pavilos, Mausard roofs, and dormers; with a rusticated basement and verniculated quoius, and segmental-headed windows, and within the upper stage a Roman Doric order of pilasters and columus enclosing two stories; but the decorative treatment is not equal to that of

If one wished to see whether bad architecture could be produced out of England, reference might be made to No. 91,---

" Lust und Liebe zum Dinge Macht alle Müh und Arbeit geringe;'

a design for the War-office with poor archheaded windows and rusticated wall-surface, and a large pilaster all hy itself at each of the angles of the façade, and of the centre division.

For the next number in order of rotation, 92 we must pass to the opposite eud of the hall, where, under the motto "Confido," in a wreath, drawings of a design for the War-office and Foreign-office, in one, are exhibited. An ob-long court, with archways at the sides, is the prominent feature of the plan; and into this, at one end, projects a two-storied building, leaving sixteen to twenty feet of width for the lighting to the sides there adjoining. The discrepancies between the plans of the competitors, in certain between the plans of the competitors, in certain points, are very remarkable. In one design there may be space for all purposes, and room to spare for a very unusual area in halls and staircases; whilst in another case, the courts are too confined for the required lighting; or they are left of larger dimensions than necessary, without between the second sec without adequate use made of them in lighting the corridors. A detailed comparison of such cases would he instructive; it would be a work of some labour, hut one of great value in results; but it is one that we must perforce leave unbut its one that we may be note ave all finished. The exhibition, indeed, is about to close before there has heen any time for the chief advantages of study which could be de-rived from it, and for which there will not for many years he au opportunity similarly capable of being made conducive to excellence in archi-tecture. We may at present observe, that disreparties arise in some cases from different reading of the "instructions." This circumstance it is essentially requisite should be considered, with a view to fair adjudication. Some of the best designs have certainly trespassed beyond the prescribed limit of the ground; other dis-ercpancies have resulted from the want of figured dimensions in the Government plan; and in many of the plans, the *ins* and *outs* of the red line are corrected with every advantage as to the Government object, but clearly in defiance of the "instructions," and to the injury of other competitors should these "instructions" be not head binding. In chest we chead hot he cur beld binding. In short, we should not be sur-prised to find that the designs which are the best for the object, in all points, are precisely those which cannot fairly receive premiums. This position of affairs would be precisely what we pointed out in the very first instance as the we pointed out in the very first instance as the we pointed out in the very inst instance as the necessary result of the course which was taken. In the design now before us, the plau is of a curious wedge-shape; hut many of the compe-titors similarly alter the angle of the south and east sides of the ground, though not to the same extent as the author of No. 92 has done. There are however, other discovering in designs - of extent as the author of No. 92 has done. Incre are, however, other discrepancies in designs—of the nature referred to—from the comparison of which valuable information could have been derived. The decorative design in No. 92 is more meritorious than the plau. In the ground-story the fronts have arch-headed windows with enriched spandrils, and with the piers panelled, and enriched with horizontal mouldings in lien of rustization. Above — the height of two of rustication. Above, — the height of two stories, — there is an order of three-quarter Corinthiau columns, with broken entablature, balustrade, and vases : to the first-floor there are arch-headed windows with enriched spanare an activity windows with chronest span-drils; and, to the upper floor, are windows, with dados or pedestal bands, grouping with the windows helow, enriched with festoons. No. 94, with a motio—"Utilitas"—not unfit-

No. 94, with a motio—" Othicas" —nol unittingly chosen for a design which displays prominently, decorative character, is spoken of as by Mr. Coe, and the drawings include a general street plau, with a plau to a smaller scale showing—what it is necessary to cousider—the connection of proposed *rowtes* with the communieations to and from far distant localities; a block-plan of the Offices generally, and a design for the Foreign-office. The author is one of those who would remove Westminster-bridge altogether; and probably he has put the case of the removal party in the best light. He has a "new Trafagar-hridge," opposite the Horseguards, with one of the main approaches from opposite Cockspur-street; whilst on the Lambeth side he would provide two streets, one to Stam-ford-street and the other to the angle of the Bridge-road. For another bridge, he proposes the site south of the Victoria Tower,—the *roate* on the Middlesex side commening from the angle in Victoria-street, and on the from the angle in Victoria-street, and on the Surrey side crossing the arcbhishop's garden (whereabouts, a street at a right angle is sug-gested to the York-road), then running straight by the Obelisk, using the portion of the West-minster-bridge-road heyond the Orphan School, and the Borough-road, passing on to Stones'-end, Blackman-street, which is crossed, --after-mends groundser-street and ultiwards crossing Bermondsey street, and ulti-mately joining the Bermondsey Low-road, mately joining the Bermondsey Low-road, -whilst, farther on, a road often proposed, is indicated, cutting off the corner of Paradise-row with the Deptford Lower-road. At the Victoriastreet end, the new street would connect with a sbort route northward to the St. James's park a soor route northward to the St. James spark foot-bridge, and with one southward to Regeut-street, Westminster. There can be no doubt that the route proposed would be one of the most important for the metropolis. We would wish, however, to urge, as we have done he fore, that the arguments in favour of particular *routes* and bridges, whilst showing the advantages of these lines, do whilst showing the advantages of these, lines, do not at all controvert the arguments in favour of other lines, which equally and in addition re-quire to be opened. Like most of the competi-tors who would contemplate having no hridge on the present site at Westminster, the author of No. 94 leaves the approaches as they are, thereby, as it seems to us-without referring to the more already seent in foundationsto the moncy already spent in foundations— wasting an opportunity of getting at the most economical rate, one of the many hridges which are still needed. For, whilst the approaches of a bridge often cost as much as the bridge itself, it cannot be too generally made known that the approaches for the hridge—with increased width on the up-stream side—at Westminster, are so nearly complete, that the purchase of one small block of houses on the Lambetb side, would be alone required to make them so. Referring, however, to what may be an inde-pendent question, namely, the crection of a to the money already spent in foundationspendent question, namely, the creetion of a bridge next the Victoria Tower, it may he well to state that the levels are even less favourable there to the effcet of the Houses of Parliament there to the effect of the Houses of Parliament than they are at the opposite end. The Victoria Tower stands, in fact, on lower ground than the Cloek Tower; and, therefore, it would be exceedingly difficult to get the gradient for the approach to the bridge, proposed by the author of No. 94, without serious injury to Sir Charles Barry's work. We need not refer to the Barry's work. We need not refer to the author's other suggested improvements; but proceed to the design for the Foreign-office, which is prominent in the exhibition, by its bold and effective perspective view. First, re-marking that "the written description" to high the outhor recents particular attention which the author requests particular attention, does not accompany the drawings, we observe that the plan has two internal quadrangles, that the plan has two internal gardens; and with such areas and ornamental gardens; and that these quadrangles light, besides the trans-verse corridors, a grand gallery, of 20 feet wide, on each floor in the residence, through a loggia or recess, which may be filled with flowers at evening receptions. The priucipal corridors to be evening receptions. the official department would seem to be lighted only at the ends. The Office has the principal entrance at the east, and a second one in Downing-street, and the entrance to the Residence is from the park under a wide carriage porch, formed of clustered and rusticated pilasters. In the residence, beyond the entrance-hall, is the grand gallery, north and south, before referred to, and a similar corridor, with the reception-rooms on the floor above. In the reception rooms on the nort accentral half " (44 feet square and 50 feet in height), for occa-sional use; it is lighted at the sides, that is, from both courts, and is reached from the landings of the stairs both of the Office and the Residence. As regards the decorative design, the style may he called a rich pure Italian; the masses of the brokes, and on the Lamheth side, they propose huilding are crowned with curved roofs; and House; and on the Lamheth side, they propose there is a turret having much the character of one of the Anglo-Italian bell-towers, at the north-west angle. Besides the porches to the residence, there is a portico in two stories of provide the Offices. The lower story gene-the fact of the Charing-cross bridge, southwards field a rich pure Italian ; the masses of th number of the Angle Italian bell-towers, at the orbited the of the Angle Italian bell-towers, at the norb-west angle. Besides the porches to the residence, there is a portice in two stories of columns to the Offices. The lower story gene-rally bas three-quarter columns of the Italian.

Ionic order rusticated, and quoins and window dressings; the first floor has a Corinthian order and arch-headed windows, and to the upper floor there are windows with dressings and garet's Church, and get a place 600 feet square, pediments. The cornice to the building is surmounted by a balustrade, interrupted by the dormer windows, which have curved pediments, and there are attics to the chief masses of the buildings from which rise the curved roofs, which have railings at the top. The prominent parts referred to, in the front, bave Venetian Venetian windows, bordered by elustered columns bearing The interior deco a nediment and sculpture.

rations have been well studied. For No. 95—"Stranger"—we must go back to the south end of the Hall. The drawings to the south end of the Hall. The forawings under the number, represent designs for the War-office and Foreign-office in one building, and the residence in a separate block. The whole group extends over the preseribed boundary about 170 fect,—a mistake which is made in several designs that are more important than the one we are noticing. The author disregardseveral designs that are note infortant that the one we are noticing. The author disregard-ing the instructions, places the Foreign-office along the Downing-street side, and the War-office chiefly along the south. It is impossible to make out the decorative character, the clevations being placed far from the cyc, and being very full of work. No. 96, at the north end of the Hall, includes

under the motto "Apropos," a general street plan, and a detailed block plan, and nuder the motto "Pense à bien," designs for the Waroffice and the Foreign-office in separate build-ings, which are joined by an archway. In the general plan, Westminster-bridge is removed, general pin, westminister-bridge is labora, but a foot-bridge out the suspension principle is placed on the site. For this hridge, the chains and other materials of Hungerford-bridge are proposed to be used; for, as the authors provide a carriage-hridge approached from Trafalgar-square, they conceive that two hridges elosely distinge are another would not be needed. adjoining one another, would not be needed. The new suspension-hridge would, it is thought, solve the difficulty of the depreciation of the property in the Bridge-road; and as to the loss of the moncy already expended in foundations for the Westminster bridge, the anthors think the sacrifice of that, or of ten times the amount, should not stand in the way of a comprcheusive public improvement. This, however, is assuming but the plau now hefore as world, effect an improvement, as contrasted with the maintenance of the earriage route, and the completion of the bridge which has been commenced, -an opinion which we need hardly say, is not ours. For, our original argument in favour of the bridges north and south, being admitted by all parties— preserving a hridge at Westminster or not—the real question is, whether, with the other bridges, a third carriage route—namely, the existing one, —is desirable; and this is generally admitted. The economy of construction in the present site is a subordinate argument. The chains of a suspension-bridge would be more destructive to the effect of the Houses of Parliament, than would any hridge on the plan which is approved of by Sir C. Barry; and the expression of an opinion hy the author of the design No. 99, touching the present Hungerford-bridge, and the view of London, may indicate what the architect of the Houses would say as to any sus-pension bridge at Westminster. With reference to the view that there is no necessity for two bridges, so uear together as the Hungerfordhridge and a Charing Cross-bridge, we may just observe that their distance on the plan would not represent exactly the case. For, there would be considerable difference in level,—the Hungersiderable difference in level,ford-hridge would be a high-level hridge, serving the South Western Railway, and the other bridge would be a low-level bridge for different purposes. The distance also, of the hridges on the Middle sex side, would uot be so trifling as to lend an excuse for doing away with the Hungerford route. -In the plan under No. 96, the authors seen to provide an approach to their Charing-cross bridge, by the destruction of Northumberland

of the Victoria Tower by a street from Victoria-street, crossing Dean's-yard; remore St. Mar-garet's Church, and get a *place* 600 feet square, opposite the north side of the Abbey; arrange the parade, with additions to the adjacent build-ings, on a symmetrical plan-removing Dover House; and repeat the Banqueting House, with a central feature, and an archway on the same right line as the archway of the Horsesame right line as the archway of the Horse-guards, leading to the court of a building for the use of scientific societies. A new National Gallery, and an alteration of Trafalgar-square; a street north to Leicester-square; and one from Chandos-street to Jermyn-street, Regent-circus, Chandos-street to Jernyli-street, Regenericities, are also projected. For the emhankment, it is proposed there should be two levels,—one *route* passing under the bridges, and in front of the Houses of Parliament, and another at the level of the bridges, terminating at Bridge-tard. The Oliver generally are proposed to street. The Offices generally are proposed to be arranged in regular blocks, the Board of Trade front heiug preserved; and the Admiralty, with a dome terminating the vista from the street, on the present line of Charles-street, with a dolle terminatory are that not all street, on the present line of Charles-street, being next the river. The masses of building would be connected by servens and triumphal arches. The War-office and Paymaster-general'sarches. The War-office and Paymaster-general s-office, would have similar clevations in Par-liament-street, connected by an archway and Exchequer, cach surround three sides of a quadrangle, with a resideuce, filling in the side next the park. The *plans* of the War-office and Foreigu office have heen well studied and care-fully drawn; but the clevations and perspective views have evidently been hurried. The corritaily grawn; but the elevations and perspective views have evidently been hurried. The corri-dors seem to be partly lighted hy borrowed lights. A large area of window-opening, exter-nally, is provided. In the War-office plan, there are two archways from Parliament-street to the cont, and under these are entrances to to the cont, and numer increase are entrances to the building. The principal entrance is on the opposite side of the court. In the Foreign-office plan, the entrance to the Office is by a portico of superimposed coupled columns on the east, and there is another entrance from the central court. The residence is entered from the central court, to which there are entrance from the the court-to which there are carriage-ways of the court—to which there are carriage-ways of ingress and egress—and from the park; and it has a grand staircase which winds round the space inclosing the private stairs. In the Office, the staircase is well planned, with middle and side flights, and handing all round on the floor above, and the corridors are well lighted from the open courts. The decorative features comthe open courts. The decorative features comprise semicircular and segmental headed win-dows-some with lahels-curiched friezes, cornice, aud halustrade, loggias or porticoes in nee, and neurstrade, toggins or porticoes in several stories in re-entering angles; and parilions with orders and curved roofs with balustraded terminations; but the merit of the design would have to be looked for, as we said, in the place

in the plans. No. 07, "England expects every Man to do his Duty," at the south eud of the Hall,—ascribed to Messrs. Wadmore and A.J. Baker,—includes a large street plan, a block plan, and views of all the Officer unbight one in a connected design large street pink, a block pink, and the office the offices—which are in a connected design,— and drawings of the War-office and the Foreign-office. The general plan has received the chief attention. Westminster-bridge, the authors proattention. Westminster-bridge, the authors pro-pose to remove—whilst leaving the approaches — and they would subsitute a hridge opposite the site of Dover House,—removed in conmection with Mr. Pennethorne's direct ronte to South-wark. In this proposal they would scena to intend hut oue hridge; but they also suggest two bridges, one at Charing cross and the other south of the Vietoria Tower. They would open a communication he a incluse heaveen the park sonth of the Vietoria Tower. They are the park a communication by an incline between the Mall and Waterloo-place, and one between the Mall and the Strand; would remove the National Gallery to the site of Burlington House; at Westminster, would take down the south side of Great George-street, and remove St. Margaret's Church to the angle formed by Great George street and Prince's street; would move the Sessions-house to the site of Gwydyr

arrange in two buildings, one on each side of Parinament-street, which they would make 180 fee in width, planting rows of trees along it. They would preserve the Board of Trade buildings They and have endeavoured, in the general Offices west of Parliament-street, to follow the style of Inigo Jones's Whitehall Palace; not, however, we think, with as good results as those which are attained with as good results as those which are attained by other competitors who have had in view the same or the original Palladian style. For the Offices on the cast side of Parliament-street, "a style to harmonise with the New Palace of Westminster" is proposed. The rooms of the two Offices are argumed round three much two Offices are arranged round three quad-rangles; and the corridors are lighted by areas at each end, and through ornamental gratings along the sides from the skylight of the top story. A shaft for ventilation, by the aid of which also the smoke of the fireplaces might be consumed, is shown.

No. 98, with a monogram of the letters A. and V. R. (at the north end of the hall) includes a general plan, a block plan, and designs for the War-office and Foreign-office in separate build-ings. These designs are good specimens of the treatment of the subject in the Palladian style; the architecture is greatlent in general compose the architecture is excellent in general compo-sition and proportion of details; and might fairly be put forward to show the effect that can be produced in a style which has not unfrequently of late years been rated at a low level. But, as the drawings are hung, they have per-haps not heeu properly noticed. Thotographs ently of late years been rated at a low level of them accompany the written particulars. In the general plan, it seems to be the author's in-tention to keep Westminster-bridge much as at present commenced; though in that case, like others, he must have mistaken the position of the new works. He proposes a reconstruction of Hungerford bridge for heavy traffic, and a second approach to it from Whitehalt place; and he indicates a bridge at the Horseferry. The embankment of the river-as to which de are points which do not seem to have been studied by any of the competitors—the junction of the Mall and the Strand, and of the park and Waterloo place hy an ineline, arches being erected at each of the entrances; the removal of St. Margaret's Church, the Sessions house, and other buildings, aud formation of a grand square next the Abhey; a communication with this place from Regout-street, skirting the park; a new street opening the south side of the Abbey, and ending in a vista of the Victoria Tower, near which is a grand state landing-place, and other improvements are sug-The Board of Trade would be pregested. served, and an addition made to it at the back. The plan of the War office has an entrance-hall, from which corridors lead out, and an inner hall and staircase projecting into the one large court, which is intersected on the ground level control is a colonado leading to the range of building opposite—where there is a back entrance. The corridors, 15 feet wide, are lighted in great part by openings in the floors and ceilings. These seem to be about 18 feet in length, and 4 feet 9 inches to 5 feet in width, and to be about 42 feet apart,-of course, lighted from the top by skylights. At the present Board of Trade, where there is a similar method of lighting, we believe the apertures in the floors are about or third the dimensions just quoted, whilst the lights are about 18 feet apart. Considering that in the latter ease, even in the first floor, that in the latter ease, even in the first floor, the light is not by any means greater than neces-sary, we apprehend that a length of 42 feet, even with large apertures, would involve dark places in the ground-floor corridors at least. The useful hints which could be drawn from examina-tion of the plaus, would be very numerous; but the early closing movement of the Govern-ment allows no conservativity for the word beceft ment allows no opportunity for the real benefit from an exhibition, of this kind. The principal is a consolid of the state of the principal starcase has a domient estimation and is well treated decoratively, as are all parts of the inte-rior; and it is surnounted externally by a euryed roof quadrangular on plan. The build-ing which equal and an area of the staring, which, as we have said, is of good Palladian design, is in three stories, and has masses at the angles covered with truncated roofs, and a pro-

turrets with salient columns and lanterns. The general decorative effect is produced by super-imposed coupled columns, chiefly three quarter columns, with additional elustered columns to the centres of the angle-masses or pavilions, where also the windows are larger, and the central group has a curved pedimeut at the top, and sculpture,—the lower order being rusti-eated,—whilst the intercolumns have archivolts and imposts euclosing windows with architraves and pedimeuts. The whole design shows what a good effect may be produced with the most simple, and even with long familiar, materials. Seu lpture for the pediment is shown in a sketch, Scuppure for the pediment is shown in a skeleh, and is designed to illustrate the origin of war, and the hlessings of peace. In the Foreign-office plau there is one court, from which the corridors could generally be lighted; but the defect which we believe would exist in the other case may also be found. The Residence has a feature which is a manual next 1. feature which is very well treated hoth ieuo graphically and decoratively, namely, a logging in two of the principal stories facing the park. We regret to find that this design occupies ground extending considerably over the boun-dary of the space coloured yellow in the Governwhat, perhaps, are the hest designs—have fallen into the same error, — as we have already observed.

No. 99, marked "Δελτα 27" - the authorship of which has already been ascribed-has attracted much attention since the opening of Exhibition, both from the eareful illustration th of the proposed street improvements which the drawings afford, and from the idea that they drawings allord, and from the fuer that they represent the views of Sir Charles Rarry. No doubt the chief of the improvements suggested are the result of many years' attention to the subject by the architect named, and they have this advantage as compared with the propositions of the former comparison with the propositions of the foreign competitors,-that they make getat use of the existing *routes*, instead of alto-gether ignoring them; whilst they suggest a number of works, trifting in themselves as to eost,-but of great value as to the thorough-fares, and as to architectural effect. The drawhares, and as to arentectural elect. The draw-ings include a general street-plan, with a number of sections and elevations, showing the gradients and the different lines of buildings along the embankment aud various streets from Mill-hank to Leicester-square; a block-plan of the general arrangement of the Offices, and separate drawings of that portion of the main design, which comprises the War-office and Foreignoffice. The author or anthors, at starting, say they have been guided as to the block-plan by the *spirit* rather than the *letter* of the instructions "which they consider to be incompatible with the best realization of the object in view." Will the best realization of the object in view." Thus they have planned one comprehensive building for the whole of the objects required to be included in the "block-plan," excepting the offices for the commissions—which would be located in the buildings contemplated by Sir be located in the binkbugs contemplated by Sir Charles Barry to euclose New Palaeeyard, and excepting the Somerset House branch of the Admiralty, which is very properly placed in an addition, on the north side of the Parade, to the "Admiralty, Whitehall." The offices which are left, however, in some parts transgress the boundary of the red line. We should say that the west side of Parliament street only is the west side of Parliament-street only is appropriated,—the ground on the cast side being left as at present, or to be gradually eleared of buildings.---By every one of such deviations from the letter of the 'instructions,' the pro-ject of the Government tends to get hitched nto the exact position in which we anticipated it would be placed: here, the objects are attained in a plan which possibly more than any other demands attention, but which cannot re-ceive a premium without injustice to com-petitors who have adhered to the "instructions." The authors rightly seeing that the present front of the Board of Trade is worthy of preser-vation, and even that the Treasury front, next the Parade, need not be demolished, adopt the Board of Trade as the wing of a building ex-tending along Parliament-street. The State Paper-office next the park, would be the only huilding of any importance removed; and even the Board of Control, it will he observed, could

which form part of the general design, the inwhich for a part of the general using, the he structions as to site are strictly adhered to; and it is shown that these buildings could be built either in anticipation of, or distinct from the other offices. Reverting to the general street plan, in which the authors conceive it necessary to catter herealt into the subject of the improve to enter largely into the subject of the improve to enter largely into the subject of the improve-ment of that part of the metropolis,—as to West-minster bridge, the authors propose it should be completed on Mr. Page's plan,—the present site being considered the most convenient, as well as the natural line of communication with Bel-gravia; and it is urged as most important that the largel of the neutron density of the Parliament, should remain unaltered. The pro-posed bridge at the Horseferry is indicated; and for the third bridge, the authors offer either a reconstruction of Hungerford-bridge, or a new bridge from Charing-cross, with a second approach from the Horse Guards. If the Hungerford-bridge site were preferred, they hope that the reconstruction would involve removal of the ehains, which they well say detract from one of the best views in London. The embankment is shown in some places at a high level on arches, and elsewhere—as in front of Somerset House, and ensemble—as in front of Somerset House, and Whitehall-gardenas—at a low level, and adapted for promeundes. Thus there would not be a *continuous* carriageway,— though we should observe that this desired provision, in the opinion of some parties could not be made without greatly interfering with Not be made without greatly interfering with the commercial interests. About the end of the present Craven-street, a good site is sug-gested for a large hotel; and the space reclaimed in front of the Adelphi, would serve for a large basin, or a metropolitau railway terminus, which could be joined to the proposed Farring-den terminus, by turnelling under Flord term don terminus, by tuunelling under Fleet-street. The raising of the river terrace of the Houses of Parliament, is suggested as worthy of consideration. Amougst the general improvements, are the junction of the Mall with the Strand, and of the Haymarket with the park, along with the formation of a road skirting the Parade, to Vietoria-street; the enclosure of the Parade, with an open screen next the park-au improve-ment couducive to architectural effect, and offering advantages as to the location of the troops during periods of popular excitement; a new line of street, south of the Abbcy precinets, conjoined with a removal of houses opposite the Victoria Tower, to form gardens and open ont a view of the Chapter-house; the formation of a garden on the river side, south of the tower; the removal of St. Margaret's Church, to a site between Cabill density of the Eucled. hetween Tothill-street and the Birdcage-walkthe schools to be in proximity, and the Stationary-office between Tothill-street and Vietoria-street; the hospital being placed in a more central locality, and the Sessious-house transferred to the Westminster Bridewell; the western towers of the Ahbey improved by details of better claracter, and a spire raised at the intersection of the nave and transepts, whilst the Chapter house would be restored, and a new palace added within the "precinets," for a future bishop of Westmisster. Moreover, the National Gallery would be altered and greatly enlarged, and a new street to Leicester square would be formed at the back and a sector would be formed at the back; and a central gateway and wing would be added to Whitehall Chapel, to form a symmetrical group, the ad-ditional building being, it is thought, an appro-priate location for the National Portrait Galery. The Horse-guards would be improved in architectural character, by the alteration of the kuntern-turret, and new wings to the build-the kuntern-turret, and new wings that Dover ings might be added, supposing that Dover House were removed. In all these arrangements, as well as in the plan of the Offices themments, as well as in the plan of the Olices them-selves, the authors have been impressed with the importance of large open spaces—at all events as an ultimate object—both for sanitary reasons and for the due display of what would be fine groups of buildings,—but at the same time they have arranged their Offices with due perard to the monnor in which enders in which are regard to the manuer in which public money is usually voted. For the buildings themselves, taking the Board of Trade as the basis of their design, and raising the roof, they propose a similar hlock as an opposite wing, and a reagies cortect with remeater rors, and a pro-in three stories, and a pediment flanked by be left for some time standing. As regards the portions of the front, which are carried up as

 gested with the view of marking the Public Offices, and as one that would contrast but not compete with the Victoria Tower. The quadrangle is enclosed by a serven of arc 320 feet by 150 feet. The central build gene the east would be the Wareffice-the tower and root being appropriate for the stowage of papers. The entrance archways though to the Foreign-office, which has also an entrance from the park. The Resi-and agaleries, and a staircase at the end, the full height of the two floors, with columns and galleries, and a staircase at the end, the full height of the two floors, with columns and galleries, and a staircase at the end, the full height of the two floors, with columns and galleries, and a staircase at the end, the full height of the two floors, with columns and galleries, and a staircase at the end, the full height of the two floors, with columns and galleries, and a staircase at the end, the building is entered from the park. The Rest, the building is indeed, have two floors, with columns and galleries, and a staircase at the end, the corridors in the Offices are elifely light with entrances and passages of their own. The several departments are self-contained in plan, with entrances and passages of their own. The building is carried appropriate further that where a contained in plan, with entrances and passages of their own. The several departments are self-contained in plan, with entrances and passages of their own. The builting is indeed approprine is ample in area. The several departments are self-contained in plan, with entrances and passages of their own. The several departments are self-contained in plan, with entrances and passages of their own. The several departments are self-contained in plan, with entrances and passages of their own. The several departments are self-contained in plan, with entrances and passages of their own. The several departments are self-con when entrances and passages of their own. In places for business, elaborate finishings are not deemed appropriate. In the park front, the building is carried up to a consider-able height, and a long gallery with columns and arches is provided to afford a view over the park on occasions of national comme-caration. It will be choing that he the archi-It will be obvious that hy the archimoration tectural design before us, a certain effect both of grouping and mass would be insured, which is hardly attainable by leaving the Board of Trade and the new buildings distinct and separate. on the other hand, the design starts from a lower key-note than the architect of the Board of Trade would have chosen under different eir-zmustances, namely, from that of a design which, admirable as it is, was not conceived, we apprewhich was itself in some degree a reconstruction of an original very inferior work.

Before the present notice reaches the unjority of our readers, the exhibition at Westminster-hall will have closed,—long hefore it can bave effected any of the great ends which we con-templated from it. We regret the loss of the opportunity much; it is a loss in which the competitors will feel decply interested; and it should point to the necessity of having, ere long, a place are more scribble then Westerington a place even more available than Westminster hall, for exhibitions and the like purposes. We hope to find means of completing our record of an event in architectural progress which cannot but be deemed the most important of our time.

ARCHITECTURE OF GREAT BRITAIN.*

In the fulness of its capacity for rich decoration, the Anglo-Talladiao has already shown itself quite equal to the most gorgcous Tudor Gothic; while, in its more simple forms (particularly in external effect), it is to com minds far more impressive. We are speaking, be it remembered, of the two styles in their realization to any exclamation in the strength of the start of the st application to non-ecclesinstical structures: for, simple as the church may be in superficial character, simple as the church may be in superficial character, it will assert, in its towers, spires and large traceried windows, a majesty peculiarly its own. But take, for instance, Inigo Jones's Banquetting-room in White-hall; Gothicise it with orly the same amount of orna-mentation: in other words, convert its columns into huttresses, its window dressings into labels and moulded work, its balmstrade into a pierced battle-ment; and see whether a noble and handsome Pal-ladian facade would not be reduced to a mengre 6: this front. There is not in this a swerd neuring 6: this fatian tagade would not be reduced to a mengre 6. the front. There is not, in this, a work a gainst G thic design in its right place, but merely an averment that, supposing the general outline of this huilding and its included solids and voids are arhitrarily fixed,

and its included solids and wolds are arhitrarily fixed, the Classic mode of deenvative finish is far preferable to the Gothie employed in like measure. We shall, however, leave Whitehall for finer and more recent examples ; and, as we have alluded to the New Houses of Parliament as failing to substantiate the supremacy of Gothie design, apart from the cherch, we will take a less spacious, though scaredy less not-d huilding, in support of our classic plea—St. George's Hall, Liverpool. We advance it, as we did the former, with allowance for its impurfections, stating, however, our impressions that the defects of the Westmioster edifice are mainly attributable to the prescribed style, while those of St. George's Hall are referable, in great while those of St. George's Hall are referable, in great measure, to the death of its accomplished architect ere

severa interations of adultions care ingoing any of the pro-this grand exterior : we look with generous adultration upon the general development of a grand idea, the offspring of antique love and native invention; and we lument the architect is not living to hear " his intry's praises poured down before him.

country's praises poured down before him." We must, however, anticipate the objection that may with reason be taken to the inclusure of a Roman interior within a pure Greek shell. It is as though the nave of St. Peter's were honsed in the cell of the Parthenon. Without, all is square; within, all is circular. The arched nisles and the waggon-headed winht of the nave, are too directly opposed to the cubical character of the exterior; and the mere super-ficial adornment of the nave estimating realities of the field adornment of the nave ceiling is of too distinct a character from the more substantial realities of the columned piers and solid vaulting of the work ou either hand. The interior, then, is not, per se, so perfect a composition as that of the building out-wardly. But, if the former had been as complete in itself as the exterior, would here harmonised? Certainly not; and then the question remains, whether the structure should have been pervadingly Greek, or Genera Dourse? We apprehend the purposes of the Greco-Roman? We apprehend the purposes of the interior, os affecting acoustic requirements, have been best considered hy the form adopted ; and, there'ore much as we may regret the loss of that simple grandeur which would have impressed us, had the granteer when word neve impressed is, and the square form been observed throughout, we are com-pelled to ucknowly dge a difficulty in the application of pure Greek design, which leaves us to full back on the more accommodating and plastic architecture of the Greeo-Roman period. The remarks applied to St. George's Hall, equally refer to the church of the Madeline at Paris; though we admit there are cases (as sufficiently shown in the British Museum) where (as sufficiently shown in the British Anselian) where the Athenian character may be fully carried out in all its integrity. There may indeed be many occasions in which one foo-model will not only be completed without the necessity for a single arched opening or eoved ceiling, but in which such forms would prove inconvenient; and thus the artist will be at least free inconveniency and the measurements who be at case the to choose between the severer post-and-bram medi-tecture of Greece, and the lighter forms of its Roman modification. In the very great majority of instances, however, the naioo of the square and the circular will

however, the introd of the squire and the circular win-be desirable; the only imperative care being, that the exterior shall not be all of the one, while the interior is all of the other. Each may be participative in both, and the externor of the Army and Navy Club-hours, in Londoe, is a worthy illustration of the prin-ciple just advanced.

Not merely decontree, and other was which is been a What right have you, in your utilitain severity, to admit mything more ou your façades than the moulded work on your door and window frames, the "cornice which has its type in the caves of your roof, "cornice which has its type in the caves of your root, Club-house, shows how we can roote onrech in trial and such few other decorations as your box develop- splendour; but which, with most dignity, can wear ments may honestly permit?" We reply, in the the modest garb? or even that of denaded heggary? first place,—"The same right which you have to the We leave Suisbary Cathedral to attest the supremased application of buttresses, pinuades, blind arches, and of Gothie design, in all its fulness, for the church; other passedo features, without which your walls hut we still ask, where is the Gothie gable-end, of equal night be blank as those of a barn. Is there any ornate amount, which will impress the eye of a lateral pressure from vanit or roof to justify mural beholder like the Tuscan portal of St. Paul's, Covent-prop or vertical pressure? Is not your Tudor build. garden—"the handsmusst barn in Europe?" Or who ing a mere thing of walls and flat floors, Gothicised? shall coutrive, with the same contents of unwronght

To resume the surface desoration of a piece of architecture, Gothie or Classic, should have typical reference to some constructive feature indigenous to its practical development, or to some extrinsic appliance which may have been costomary. Thus the column and entablature represent the post and beam of the early Greek cabin; and the festoon of flowers sculptured oo the frieze typifies the true floral adornseminine to increasing up on fastal occasions. The buttress and pinna le of the molern Gothie edifice relate to the direct and indirect resistance necessary to the sustainment of a ceiling-vault or roof without a reme to the ancel and indirect resistance necessary to the sustainment of a celling-value or roof without a tic-heara, —the *figing* buttress more especially. Now, though it would be most absurd to apply such an obviously constructive means as the latter to a build-ing no way requiring it, the engaged column and entabilature of Classir, and the common buttress and pinnacle of Gothie design, may be retained with a purpose of honest meaning. An ordunary gerden-wall, instead of being 1½ brick in thickness continu-ously, will be the stronger, as well as the less unpictu-ness, will be formed in bays of one brick, with buttresses of two bricks; and thus the cupaged columns or buttresses aforeasid acrew for the sustain-ment of a wall which should otherwise be of an increased substance throughout. The entablature form of the Greek ellifice is pres rved as the hori-zontal bond of the vertical work below; and the some crowning member of n vertical feature, enu-iating gracefully the genuins of the Gothie style. But we now come to a point on which new Gothie

But we now come to a point on which our Gothic opponents must be left to speak for themselves. Take oppoints must be left to speak for formerves. Take away their buttress from every building not requiring it, and thry will frequently, at least, have a most depreciating less to humont! On the contrary, deny to the Classic architect the use of his unjustified to the Classic architect the use of instantial subjustment e durant and fall intributions, such the falls back, -how? Why, as Sir Churles Barry did ou his 'Travellers' and Reform Clu'-houses, where, with his hold and en-riched cornics, warmattel fenestral decoration, balas Reform Club-houses, where, with his hold and en-riched corrice, warrnette ferest-fid decoration, balus-trade courses, and rustic quius, he stands definut of all Gublie rivelry in respect to the conditions of his chillenge. Here is no portice; no engaged columns or pilasters, sho thing up from basement to eet-bla-ture; no convoing kalustrade; no pseudo architec-ture of ostentatious kind; nothing but decorated cares, cariched fascins and string courses; one range of pedimented windows, requiring the columous that flank them; and other modest graces, as b huging to the parts they decorate, as the brows and lashes to the parts they decorate, as the brows and lashes to the operatively decorate, as the brows and lashes to the system of the instantian participant of the string courses; and see what a pauper hospital his building would become! "Bar", he answers, "the genius of his style admits and requires all these discarded mem-hers, with their decorative apportunities." Just so: while our style admits, yet does not require, an equality of ornamentation. The Army and Navy Clab-house, shows how we can robe oursel in rival splendour; but which, with most dignity, can were the modest garb? or even that of denuded heggery? We leave Salisbury Cathedral to attest the supremacy of Gothie design, in all its fulness, for the church; int we still ask, where its the Gothie cable-end, of equal

stone, a Gothic cowshed, equal in service and effect to stone, a count cowshed, equal to service and effect to what may be produced by a back wall, two low end gables, and a front of three openings, formed by two unhewn granite posts, supporting a continuous little-course of the same maternal? If we still refer to Gothic design, it is because the

allusion is necessary to our more immediate subject. The window is a most iofluential matter in our theme. In pointed architecture it is the primary taling feature, separately considered; nor shall we compare with the woolen bars of a square or circular-headed such or casement, the fascinating heauties of the Gothic window, with its moulded stone tran-somes, and mullions ramifying into richest tracery. In a church, the maximum size is given, governed only by the proportion allowed io the most attainable height, or width, as the case may be; for the remaining light, uoobscured by the mullions, transoms, and id that often subdued by deep colour in the tracery (a) glass), will never he more than enough for those who are not over sentimental ou "the dim religious." The plazing, too, is not to open, but to remain fixed with lead and iron in the stonework. The winds and waters may do their worst. But in all other huildwaters may do their worst. But in all other hund-ings, there will be many of the windows requiring hinged easements or shiling shes; and then these mullions and transoms become fearful conductors of multions and transoms become teartut conductors on the tempest. By expensive means of wooden extra frames, machinery, and copper slips, it may be kept at bay; but the means are makeshifts, and insulting to the integrity of the architecture which is especially one of stone. In a Greek or Hallan building, as before stated, we may consult our climate, in re-quiring a maximum of light and air through a minimum of general opening; and if that opening he more than admissible for the ordinary proportions, we employ intermediate columns, and introduce the trink-light Vacatian composition—ouly to an occa-of the mullion,-and having a legitimate right to the of the multion, — and having a legitimate right to the use of wood, &c. The engaged columus, also, and their covering entablatures, which may be applied on each side and above the wind w architares, are greatly protective, while they form a decorative ad-junct more than can be possibly afforded by the stone-work of a Gathie window admitting only equal light; and, since the classic window is thus shown to be the best for all ordinary purposes, it follows, that the style of architecture which alone admits it, has one more credential and a sever stone one, in its favour. credcutial, and a very strong one, in its favour.

The doorneay, in Gothie and Classie art, is equally susceptible of pictorial treatment; or, we may in-deed admit, that, individually, it may assume au im-pressive character in the great Gothie stracture scarcely to be equalled in any other: its cavernous depth of pillars, mouldings, and concentric rings, unrrowing as it recedes, alicording most available opportnoity for ornate display, and efficience contrast, or speak of that which may be required to stand before it. To the doorway of every building the close poorch is commou; and both Roman and Gothie portal may be protected by the open areaded inclosure: hat the portice of columns and entablature is only to be had The doorway, in Gothic and Classie art, is equally

portico of columns and entablature is only to be had portico of columns and entablature is only to be had from Greece. A shed, for the brief temporary con-venicoce of the coming or departing visitors, is often a necessity to which the simple close porch is in-adequate. The larger opeu areaded appendage, in consequence of its solid spandrils, and the broad square angle piers demaoded to resist lateral pres-monstration a uncar of unconvergently obtuneting sure, presents a mass of masonry greatly obstructive of the windows behind it, darkening the entrance westbule and the room above to a much greater amount than will he occasioned by slender round columns preserving the entire alliade of the light, comms preserving the entre alliance of the light, which arches would secure only a their crown. Thus we select the shed of post and beam, and artistify it into the portieo. The proportion of the Roman orders—Louie and Dorie—are more slight thu those of Greece,—the Cortothian the same in hoth cases,—and we therefore find another reason for eabeling the Green believe the selecting the Green-Italian style

The Classic portico is unquestionably the most heautiful single feature in architectural desigo; comheatiful single feature in architectural design; com-plete in itself; comprehending, in fact, an entirety,— the whole front or flank of the Greek temple. That porticoes are often mere ostentiations appendages, ill connected with, or wrongfully applied to buildings not requiring them, is most true; and we quite par-ticipate in the aversion of our severe crities to the bable of worked withing on the and of a Comb habit of wantonly sticking up the end of a Greek tcmple against the side of a modern structure. But the error has resulted from the just estimate of the portice as a thiog in itself surpassingly beautiful; the error has resulted from the just estimate of the portico as a thiog in itself surpassingly beautiful; and, in our admiration of it when finely exemplified, we care not to know whether Mr. Witkins was, or was not, justified in the noile and elegant specimen which adorns the London University. It has, however, no less justification than the Victoria Tower of the West-mirator Place. min ter Palace

"Wightwick's "Palace of Architecture." The mention of the London University, without a Praser, London, 1840.

more eloquent prompter, would have suggested our next consideration,—that of the dome,—the imperial crown of Roman majesty,—and for the loss of which, the towers of Gloucester, Canterbury, and Victoria, the spires of Salishury and Licbfield, and the lautern of Ely, would he inadequate compensation. The elevation of the dome of the Pantheou on the vault of the Tompla of Pacewas a concerding worthy of of the Temple of Peace, was a conception worthy of Michelangelo; though, by the way, it was no more than a modification of what had bern already done by Bruuellesch. The Donno of Florence was parent of the copola of St. Peter's. Our determined resolve Bruuelleschi. The Duomo the copola of St. Peter's. in favour of the Gothie style for the church may excompuoicate St. Paul's from ecclesiastical position but the dome of that building remains, none the less, the most majestic *piece* of architecture in the world; and, when we can transfer its bishop to a new eathe-dral, which may show how Christian Pointed design is compatible with the spirit and character of the Pro-testant faith, the present cathedral may he converted permanently, as the Church of St. Genevieve was for a time, into a econtaph, "Anx Grands Honmes la Patrie Reconnoissante." The great men of philo-sophy, poetry, literature, science, art, and war, may there repose in marble efficy; leaving Westuninster but the dome of that building remains, non the le there repose in marble effigy; leaving Westminster Abbey as the mausolenni of monarchs "by the Divine Graec of God," and ecclesiastics of "apostolic descent." The mountain amplitude of the Dome exter-nally, and its internal firmamental expanse, are prenally, and its internal firmemental expanse, are pre-sentencets too nobly impressive to be forfeited; and the frequent necessity for its use, as the natural admissible only in the Greeo-Roman edifice, is at ouce a vast additional reason for Greeo-Roman design in our non-ceclesissical buildings. And bere we may refer to a thoughtless objection often taken to the external dome of St. Paul's, as being a falschool,—a mere show and sham of wood and lead work, over an internal and lower employ of brick 1 As well might eritiesing demonance the wood

As well might criticism denounce the wood and lead covering over the vaulted enlings of nave and aisles. In both cases, the sub-masonry is covered and asies. In both cases, the sub-masoury is covered by a fitting wood roof, however, in either, the cover-ing might be of stone lying close upon the work underneath, and, certainly, the upper dome of St. Paul's bas as legitimate concession with the brick cupola henceth, as the high-pitched wooden roofs of the Gothic esthedral with the vanited ecology below them. (The the Thereic's concentrations below them. The late Pugin's contemptuous reference to the "fictitious dome" of St. Paul's, only occasioos and bigoted critic; and by no means the most suc-eessful of our Gothie architects.

And this brings us to the final consideration of the of question. Much has been said about the advanroof question. Much has been said about the advan-tage of the high Gotbie pitch, in throwing off the snow and the wet more readily than the low pitch of show and the wer make reachy main the tow pictu of the Greek or fathan building; and where there is no parapet, the advantage is admitted. But, inasmuch as the parapet is invariable in all first-rate Gothic structures, and is never seen in the Greek temple, nor required by the most perfect Roman buildings, the rgmoent falls to the ground much more readily the wet, which, on the contrary, fills the Goth's gutters more quickly than the water-pipes can carry it off, and hurls avalanches of snow down to his the parapets faster than spades can relieve them. I practical results of the two forms being thus dispo The of, we come to the economic consideration, that the highest Gothic pitch doubles the quantity of timbering, and oearly doubles the amount of lead or required hy the lowest pitch of the Greek roof. lead or slate no necessity to enlarge on this all-sufficient fact, which is addreed simply in favour of " Classic as applied to non-eecl siastical designs; and not with any view to lower the Gothie gable, which, in its proper place, is no less to be cherished than the Greek

Enough has been urged in support of our conclusions on the universal admission of Anglo-Classic architec-ture for everything save the church and its immediate alliances; and much more than we have advaced might he said in explanation of our exceptive reasons for the Gothie as applied to ecclesiastical structures. for the voltne as applied to exclesizatical structures. All, however, that remains for us is to state the con-viction that much bas yet to be done in the modifica-tion of both styles to their respective present uses. During the last tbirty years we have been gathering precedents and making experiments, some of the latter heing highly successful. Our country has hecome a precedents and making experiments, some of the latter heing highly successful. Our country has hecome a very moscum of architectural design; and the courts of the Sydenham Palace (substantially illustrating the idea of the author of "The Palace of Architecture," published some seventeen years ago,"), form hut an epitome of the court which architecture has held in Great Britain during that period. She has had assembled before her, the old and modern Goth in every guise, from the Norman to the Florid Tudor; the veritable and the invitative "Old English Gentle-James

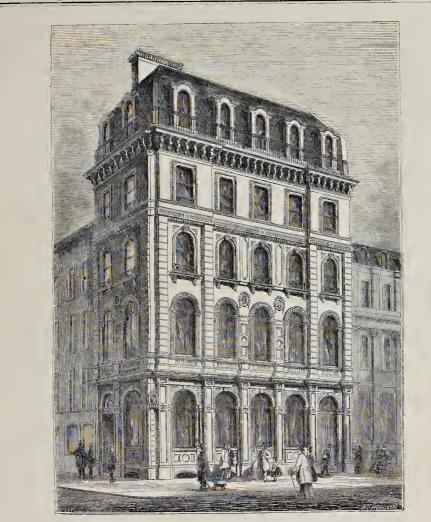

man;" the Italian, in all his costumes of Rome, a ocient and modern, of Venice and Vicenza, palace and villa, Lombardie and hasilical; the Greek in his bor attle dress, or with Romanised if de creek, in his Egyptian, the Mahomedan, and the mongrel of Byzan-tium; and one remarkable and fantastic original, the Soancan. In London and its immediate vicinity all these are presented, to the wonder of observance the perplexity of selection.

It is conforting, however, to see, that the vast numerical preponderance rests with the Goths and the Greeo-Romans; and it is only to be hoped these two great parties will soon settle their differences by taking to itself what to each most fitly belongs each Our religious dissenters are becoming, on each succ Our religious discatters are necoming, on each success sive occasion, more inclined to emolate, with the Esta-blished Church, the use of Gothie detail; and ere long every place of Christian worship will, in common, wear the Gothie garb in friendly ailiance. In their ehurches, chapels, colleges, schools, and the residences of their ministers, there will be abundant opportanity for the full development of *Painted* devices, the size for the full development of Pointed desigo ; the circ for the full development of *Pointed* desigo; the circu-lar Norman or Romanesque being, perhaps, consigned to the prison, in regard to the severe expression, for which it is so admirably calculated. Indeed, in every respect practical as well as pictorial, the Norman architecture is peculiarly suitable to the goal. Its simple semi-circular vaulting, stardy piers, plain square buttersets, and small windows, so obviously suggest themselves, that we are left to wonder there by yet hem are expressed. has yet been no example (so far as we are aware) of its adaptation to such a building.

A few words more on the subject of a certain par-ticular virtue ascribed to Gothic design. We have We have iterative with a subject to boothe design. We have just seen advanced by an anneter lecturer, that it is advantageous in admitting irregular clustering, and the placing of windows, doors, and ebinneys, any how, without regard either to horizontal or vertical regularity ! egularity ! Now, in the first place, this is making a rirtue of the evident carelessness or want of ingenuity to other busic curves of want of high and to often most curves of want of high and who, having learced to work out the details of the structures on which they were eugaged under archi-teets, presumptuously undertook the plans and eleva-tions of other buildings, without any ability for their proper composition; and it has struck us as pecu-lical physical to are the avarantial coursen with which absurd to see the reverential accuracy with which such manifest abortious have been measured and deli-neated by modern teachers and students. Ground-plans acrocce by modern cancers and soundaries. Ground-plans of old houses, without a right-angle in their rooms, and elevations obedicut to the most clumsy internal arrangements, have been engraved with all the ex-treme nicety of the plates in Stuart's "Athens," till a contempt for all order has become the order of Gothic But all the irregularity, which is legitimate in it, is equally obtainable in the modern Italian villa ; the same clustering of differing parts; the same variations in their forms and altitudes; the same opportunity for large and small windows on the level; for bays, external projections and imopportunity for large and small windows on the same level; for bays, external projections, and internal recesses; for chimney display, open parapet, and, in short, for every charm of freedom, including the belvi-dere tawes in dere tower as its crowoing appendage. The clumsy builder of the present time has just the same right to avoid placing windows directly over each other in his Italian willa, that his clumsy predecessor had in the old English manison; hut we should decidedly object to any such violation of common constructive pro-priety, even if we were bent on the determination of

priety, even if we were bent oo the determination of building the most ordinary Gothic farm-house. Lastly ; having regarded the Gothic and Classic apart in hotlic rivalry, let us briefly consider them in an amicable and conjunctive point of view. A walk through Oxford and Cambridge will show how pleasingly the two citeds more screens. pleasingly the two styles may associate; and we ask any man, of reasonable Gothic predilection, whether he would not think either University much deteriohe would not think either University much are an and the would not think either University much are and the set of the se dalence and St. Mary, the coronal pride of Oxford. Its dome is more effective in the distant view of the Its donne is more effective in the distant view of use eity than any equal addition to its towers and spirce could have been: its Corinthian peristyle agreeably contrasts with the Pointed and Tudor architecture immediately around it; while the imposing eircular arcade and cupola of its interior give a new interest to the observation which has possibly been sated with a churcher af Gathie mountary. Even the famed an ahundance of Gothic monotony. Even the famed High-street derives no small amount of its charm from the pictures are mingling of the two styles; and Wren's mongrel architecture in the west front of Christ-church College, wherein they are united, is at least an illustration in favour of such variety as may he justified by the changeful application of appro-priately differing materials. Again, at Cambridge, the Corinthian Senate House neither deteriorates, nor is deteriorated by, the nohle obapel of King's College. With other buildings of rich Romau design, it asso-

ciates (like the theatre, and its brothers in siyle, at Oxford) in no more than admissible variety with the Golhie structures near it. We have admitted the exclusive application of Pointed design to all colifices allied to the Church ; nor would we evade the principle as it affects the colleges and other culcuctional build-ings in our Universities. True, "town and gown" are very different things, as sufficiently shown in some particular instances not very creditable to either party ;--bot the architecture of the oue may differ from that of the other, on terms of less hostility. Our object has been merely to show how two styles of art, respectively the most appropriate to two grant classes and in the of the onless of the solution of the solution of the operations of the solution of the operations of the operations of the solution of the operations of the operations of the solution of the operations of the operations of the solution the solution the solution the solution the solution

LONDON BUSINESS HOUSES. THE ROYAL INSURANCE COMPANY.

A MONGST the new business premises recently erected in the City, are the offices of the Royal crected in the City, are the offices of the Royal Insurance Company, just now completed, at the corner of Lombard-street and Clement's-lane, and of which we give a view in our present number. This huilding has been erected from the designs of Mr. John Belcher, and, with the exception of a granite plinth, is entirely faced with Portland stone. The ground-floor is appro-priated as the general business room, and is partly covered by a mezzanine floor. On the first floor is the board-room. The success of the Royal Insurance Company, and

the kingdom can equal. In the life branch the number of policies issued last year exceeded 700, assuring about 350,0002, and producing new premiums alone, of more than 10,0007. This amount of busi-ness is attributed in part to the large life house declared by the company in 1854, being at the rate of 22, per cent, per muum on the sums insured, which averaged in reversion 80 per cent, upon the premiums paid. It may be added, that the amount of realized profit requisite for such a bonus could only have accrued from the circumstance that the magnitude of the fire hranch of this company left the life depart-ment almost nuweighted by the general expenses of management. Indeed, from the published returns of this company, it would appear that in the ten years preceding the declaration of their honus in 1854, the fotal amount of expense charged against the life accounts for the amount available for division at the and of that period. After the recent painful revelations of extrawagent companies, the economy of management by which the "Royal" appears to be favourably distinguished is noteworthy.

319

THE "PER-CENTAGE STYLE."

As I expected and intended, the "malignity" of my mode of trating styles has, even without ndvanc-ing heyond so initial a matter as Uode-plonning throught down the thunders of professional wrath upon that one neglected but vital point which it was n object to get ventilated, the mode of psying the d signers and directors of others' labour. ωу

I should not have begun comments on the West-I should not have begin comments on the vest-minster plums at all, but for the gool occasion this seemed to afford for concentrating on that point such attention as I find nothing, how ver important to public interests, can hope to goin. ill passions are aroused upon it somewhere; and this being alrendy the case, I am gladly spared the very thankless task of wading through to numask such a dreary waste of vading through to numask such a dreary waste of pretentious imhacility as the 300 non-Gothic elevations

The " Competitor for the Block-plan " (who need The "Competitor for the Biotx-Inan (wao need not have said whether he was a competitor, hat might have signed his strictures as I do, and not treated your office as a Venction lion's month), thinks I " insinuate" that " mea have selected thinks \mathbf{I} ' insinuate'' that 'men have selected their style, on the base, pair, contemptible principle of its combining,'' &e. Now, first allow me to assure him, that if stooping to insinuate this or any selection, on the part of the non-Gothic competitors, that I do not helive them capable of any. Nothing in their works chiness to me that they could have competed in another style; so that their selection of a style was simply. I conceive, that kind of choice to which one Holison has left his immortal mame. In short, I hold that they have not chosen or appropriated their style, but the style has appropriated *them*. Without it, no ench near-that is, no such designment-would have that they have not endeed of appropriate verses, but the style has appropriated *them*. Without it, no such men-that is, no such designers-would have existed, or hen possible. False and corrupt art, like every other fallary or corruption, hereds tribus of well-meaning mischievons mean; just as dirt seems to wein-meaning microlevous near, just as out seems to generate well-meaning vermin. First, a snoke from the pit darkous the air, and then out of the snoke come locusts. Thus without the Reomissance archi-tecture (or some other development of the false and directly autichristian principle of *fashion*), no such race as these modern " architects" could have arisen. These nen would never have touched pencil, and, instead of standing hetween a mystified people and truth, they would now he hetter employed, perhaps

truth, they would now he hetter empiyes, perhaps harmlessly, possibly even neeffully to markind. But next, 1 cannot see the "malogaity" of the supposed insituation, if made. "The base, paltry, contemptible principle," of combining "the least amount of labour with the largest amount of pay 1" Why, merey on all this is the very principle on which 1 dways work, always intend to proceed, and thenche other add. Since it was call. "In the which fitways our, aways intend to protect, and thought others did. Since it was said, "In the sweat of thy brow," I really thought the seeking a minimum of sweat to a maximum of bread, was a principle never overlooked, either in selecting styles or any other human work. But it scents the disp are indeficiel for it to a hand of 218 hencheent angels,— I beg a thousand pardons of your correspondent and his 217 celestial colleagues, and admit that to *kim* the principle may be have and entemptible. It cannot be so to me, nor those on whom the public must in general, omitting this very exceptional case, depend for their architecture. I can quite echo his disinterested sentiment, that he had rather early at a grach in his 2 mark? A mark it for a size his dismicrested settiment, that he had rather carry out a work in his "grand" style "for one per cent. Lemma ratio," than some Gothie creations, "for ten time, sthat monout." I will go so much further as to t.11 bin, "from the botton of my beart," that I would rather he the unarearded author of No. 35 or No. 106 (not that 1 form the former of her areas and the 100 for the bottom. author of No. 35 or No. 106 (not that 1 fear the former will be unrewarded, but 106 is as likely as not to be so,—I had rather, I say, be the author of one of these, and "fal," than own the paternity of any work the nation has yet obtained by competition, together with its percentage, and get the two first prizes most likely to be awaided on this eccesion, and the "5 per cent, on the outlay" to boot. Men who can produce such designs as those two, or even as the second-rate Nos. 24, 26, 100, 129, and 140, can afford to "bade their time." It is the apmenance of so much true at as this (even of Nos. 35 and 106 alone) among the bare score of Gothic designs; a on the other hand, the total absence of any sign and, this sort in the whole delage of Renaissance that floods the Hall ;--it is this astonnoing phenomenon House the flat, in it is assuming presentation that has conversion, after lunch waver-ing, to the creed that we must now he content, in all public works, to take Gothie or nothing; and I be-lieve this exhibition, whatever may be its immediate result, -- no matter what may be the paysical result, -no matter what m-y be the decision as to these two buildings,-will have given the effectual coup-de-grace to Classicism, one way or another; most specify perhaps if the choice fall on a Classic design, which in that ease will have the honour of heing the last of its race in England. And, indeed, it will he far hetter, totb for the "Gothic interest"

and for that of truth (for pray do not think I hold these identical), that our gullible country should thus pay, like Milton's imps, one more pilerimage to the dust-apples,—have one more sab-rhewing on a national scele, than that some modern-spirited, pseudo-Gothir, as the Palace of Westminster, or No. 116, should raise hepse whose certain failure would at once mortify as much as the former, and raise disgust against the Gothie neme: a so if Charles Barry has alvena't done. Gothic name; as Sir Charles Barry has already done, to the great hindrance and throwing back of true to the great hindrance and throwing back of true progress in this connery perhaps half a century. In the absence, therefore, of any *living* design, or having in the Hall only invitatious of dead styles, I quite agree with the Saturday Review, not indeed in its very natural delasion by No. 116 (whose selection, I think, would be, on many accounts, the greatest mis-fortune that could hypen), but in its dogma that, 'Not to be a failare, the building could be fortune that could happen), but in its dogma that, "Not to be a failure, the building must be Gothic, and Gothic of the first order of " talent. I alter the last word, the reviewer having written it " genius," because I have always held, since thinking on the matter at all, and still hold, with Mr. Fergusson and your correspondent "Forward" (though, nulke him, an intense " Philogoth"), that if we had a particle of genius, we should not build Gothic at all. But it is ide discution of the tale.

But it is idle disputing of styles, while we are in a radically fa'se position, and have only to open our cyes to see that our "distinguished reputations, living or dead," nover carry with the jublic a particle of respect, but rather the more they are distinguished. respect, but rather the more they are distinguished, the less repetch,—that their piace in the popular Pauthcon is as far as possible from any Poet's or Artist's Corner, heing simply among the Hudsons and Barnama,—and that the very name of architect is often enough, as a speaker at a meeting lately re-ported hy you observed, to raise a hardly suppressed succr. Of course your "Compettor" correspondent does to thic the "arainus displayed," in talking of a "Per-centage style;" but he caunot observe society mach without nerveivue that it, is the animus wonea reference and the precising that it is the aximus gene-rally held towards him everywhere, and one which he can easily extinguish any day,—one which it lies entirely in the power of architects themselves to terminate, any day they please. If he does not know how, or if any of your readers hid "practical" difficulties in it, I will gladly show them, only ob-serving here that I helieve in a sort of infallibility attaching to the popular instinct that in such matters, "where there is a will there is a way."

Now, to return to the competition, can any one seriously believe the report that Messrs. Angell and Powuali, or any other respectable men, have acce the task they are said to have done (and which cepted certhe task they are said to have done that which di-taily it is very natural the judges should wish to delegate)? I cannot helieve it. Without the least count nance to the wild idea of making competitors their own judges, I must maintain that they are the ther own judges, I must manual use in persons best fitted of all men, or rather the only fit persons to be each other's assessors, and this is what I imagine must be meant by their voting in those old Greek competitions. If the tribunal be indeed a competitions. If the tribunal be indeed a fied ' one, let them call on every competitor dign fied up net one it then on one every competitor who will, to make a separate written statement which of the designs he accepts as fair astrogonists, and the reasons why each of the others appears to him unfair. Then the judges, by sticking out first the d sign that Then the judges, by striking out first the design that h is the greatest number of challengers on the same ground (not on different grounds), then the design that has the next greatest number and so on, may soon, if I mistake not, reduce them to a very manageable number; perhaps to any small number they may like to stop at. stop at. Of course, there is the risk that the ign most usuall to the public might thus be excluded; but only, observe, from the alvertised prize-list. The public need not lose the hest building, as Government is nowise bound to execute any of the prize designs; and it was easy enough to foretel (as you, I believe, did) from Sir Benjamin Hall's wellyou, I believe, otc) from Sir Benjaann Hall's well-ueant but most hasy instructions, that this is a case where the prize-giving, and the choice of a building, must he totally distinct and independent. The Saturday Review cares not who gets the prizes, but "is nextonaly anxious about the antial building" is next onally anxious about the antial building".

-a most short-sighted nervousness : for it is not the actual building, but solely the manner of prize-that will decide what manuer of meu shall be at tracted to future competitions-whether artists, or adventurers, or quacks, shall be our future architects or and this is far more important than what style of Foreign or War office is built. Some such proceed-Foreign or War-office is built. Some such proceed-ing as above indicated is certainly now due, as a reparation for the hreach of fatth already committed in stating folsely that shadowed elevations, super-nutmeary perspectives, bird's-yev tworks, dec. would not be "admitted;" which, if it meant anything, meant, not viewed by the judges. True, a selec-tion elevations would be a merg free hordle more

cause no saue man would require the tiots to be em-broidered with lines rather than washed, without giving a reason. Of course Government might have required all lines to he dotted, or every word to be whitten eight times, or every stretcher to be dore. tailed; hut then these conditions would have been unambiguously set forth.

After all, however, it will he found, by failure upon failure, and mortification after mortification, that no tailere, and mortification after inortheotion, that no drawings afford the means of comparing more than the very simplest every-day designs. *Models* (as used in the middle ages) *must* he required; and all drawings, except plans, excluded nutletly, hefore a real benefit will be got from competition. Another grand follaey is the offering of minor pizze, under the idea of getting two or seven really studied designs, for *less* of getting two or seven incaily studied designs, for *lease* than two or seven incuts the price of one; a thing plainly impossible hy any dodge whatver. This oversharp explicitly outwits itself, and the only effect of secondary prizes is to foster a production specially meant to meet the case, a class of designs like Nos. * or ", counting on John Bull's worship of what he calls "Industry," to insure a prize of some sort at ll events by above cantilalist entermine, of a kind all events industry, to insure a pize of some sort as all events, by sheer capitalist enterprise, of a kind that a contemporary paper calls rather coalsely "over-reaching"—and, indeed, two or three cases of a first prize obtained in this manner would suffer to aller the entire art of the country, and reduce it to over-

the cautre art of the country, and reduce it to over-reaching pure and simple. But, after all, no carefulness of instructions will avail while the absurd clause of remucration by Per-centage "on the cuttay" remains. It is sofficient to neutralize all provisions, no matter how wise, and hlast all hopes for an architecture that the public can appreciate.

appreciate. E. L. GARBETT, Non-Perceutage Architect.

1. In ORDER, ROCCOUP of Control of the internet of the inte and I cannot but think that had their authors studied that capital volume, Mr. Ruskiu's "Foundations," that capital volume, Mr. Ruskia's "Fourdations," and especially the chapter entitled "The Material of Ornament," they might have learnt what they have to do, and possibly have done something. Even their present elevations, or at least No. 93, I am con-vinced, would, if excented, give more satisfaction than any classic buildings we could event at them the vinced, would, if excetted, give more satisfaction than any classic buildings we could erect,—though like them niterly false and affected. I have noted Nos. 39, 46, 48, 50, 52, 69, 76, 78, 81, 103 (War-offec only), 110, 113 (Interior), 114 (Dome), 124, and 146 (the last being a very elever hork-spite apparently directed against receat taste), as containing original fectures or comhinations that imply a possibility of their authors producing respectable work, if they should happily he led to ahaudon all classician, hut not otherwise. Observe, by the byc, the perfect malogy of the classie 146, to the Gothic 54, the temple-front inserted hetween the divided halves of the former, like the church-front in the laster! the former, like the church-front in the latter !

A SANITARY FACT. THE FEVER HOSPITAL.

E. L. G.

A FEW years ago, when the Fever Hospital was removed from King's-cross to its present site in Islington, those living in the neighbourhood of the proposed new hospital were in the greatest state of alarm at the idea of a pestiential disease being brought to their doors. Some recent inquiries respecting the feeling of those who surround the hospital at the present time show that the sort of panic which had stricken the people has, after some years of expe-rience, vanished. The houses in all directions are let; and, although a formidable number of fever patients are brought here in the course of the year, the general bealth of this part of the Islington district is said to be very good. Since the establishment of the hospital, we

believe only one fatal case of what is considered infectious fever has occurred within a wide circle round the hospital; and it is not unlikely, judging from an examination of the place, that

Judging from a examination of the place, take the fever here was originated by the ill-condi-tion of the particular locality. Thinking of many spots,—the hot-beds of fever,—one of our assistants recently examined the institution which kindly-minded persons have established for the purpose of relieving one of the most terrible "ills which field is heir time elevations, would be a mere farce, hardy more of the most terrible "ills which ficsh is heir rational than a choice from written specifications to," and it would seem from his account that without a drawing; but this is what Sir. B. Hall the medical men who advised in the construction meant: "In line only," meant, in *outline* only, beof sufficient space for every patient-good ven-tilation and cleanliness. The visitor here will admire the wide and spacious staircases and admire the which and spatious staticities and passages, and the ingenious means which have been taken to provide a sufficient quantity of pure air, so much needed for the recovery of patients, and also for the safety of those who are in attendance upon them.

This building principally consists of a frontage, in which are situated the dwellings of the resi-dent medical attendants, nurses, &c. Here are also offices for the transaction of husiness, and all this seems, by the arrangement of the venti-lation, to be kept clear from any dangerous miasm which might arise in the fever wards.

From the front, with a large open space he-tween, stretch the male and female wards. Each of these is divided into two apartments of great length hy a wall, which is pierced by circular openings; so that, although a feeling of separa-tion is given, the breathing room of the patients is not decreased. This does not meet our demand for windows on each side of a ward open to the air, so as to get the most complete natural ventilation, but approaches it. These wards are pleasantly lighted, and in each wing

are four rows of beds for the patients. The cases which come here are from the neighbourhoods whence they might be expected. and would convince the most obstinate of the bad results of uusauitary arrangements. Behind the wards there is a large garden, with steamwashing apparatus, and other accommodations. Viewing the results of this establishment as important evidence, and anxious to aid work it has in view, we insert a statement from the resident medical officer :--

Fever is pre-eminently one of the preventable dis rever is pre-innerity one of the previous end its rarity in other of the metropolitan parishes, and we shall be at once satisfied of this. Without entering into a minnte discussion of the causes of force, let us ask wherein do these parishes differ from each other? On the slightest examination our attention is at once called to three important conditions—ventilation, drainage, and cleanliness. It is precisely where these are most deficient that we see fever most prevalent.

In the management of fever cases we, therefore, aturally expect that these conditions should be spenaturally expect cially attended to; and that the patient should be removed from the hovel where he canght fever to an abode where he shall be only a most account for a star abode where he shall be under the most favourable conditions to bealth. This is, perhaps, the most important part of the treatment; for frequently the administration of medicine is of little avail, so long as the patient remains under those conditions to which his fever is due. This heavitable is a recent exection having heavity

which his fever is due. This hospital is a recent creation, having been removed from King's-cross to its present site in Liverpool-road, Islington, in 1849. In its con-struction all points relating to vontilation, drainage, and cleanliness, were attended to. It occupies about three aeres. The bulldings cover about an acre and a quarter; and there is a large garden of an acre and a laft in which the accurations. half, in which the convalescent patients take exercise. bail, in which the converse patients take exercise. The wards are in two wings, one on each side, and are distinct from the centre building, in which are contained the apartments of the resident medical concentration of the production of the restrict interface officer, scentary, matron, and servants. Attacks of fever among the occupants of this centre huilding are now rare; whereas in the old building, which con-sisted of one block, the officers and aervants were not unfrequently attacked.

Each patient on admission bas a bath, and pro-vision is made to couvey the patient directly from the bath to hed.

The wards are very spacions and airy: 2,300 cubic fect are allotted to each patient. The hospital bas accommodation for 200 beds.

The majority of the patients are paupers. Pro-vision is made, however, by a distinct set of wards for a superior class of patients, who pay according to agreement. These wards would, I doubt not, be more frequently used if their existence were more fully known.

It may he taken as evidence of the efficiency of the It may be taken as evidence of the efficiency of the arrangements, that I am not aware of a single case of fever having occurred in the neighbourhood referrible to contrajion from the hospital. While we constantly get cases from Isington, they are soldown or never from the vicinity of the hospital. The importance of the hospital to the average

The importance of the hospital. The importance of the hospital to the general health of London must at once be evident. What would have been the result of leaving the 1,800 cases, heither host year, at their own homes, to generate admitted last year, at their own homes, to generate and spread the contagious disease uoder which they were suffering.

While fever is, on the one hand, preventable—on the other it spreads rapidly, if precautionary measures are not adopted. How can fever be expected to be cured under the same circumstances as those under which it arose ?

Which it arose? To provide an institution into which these unfor-tunate cases of fever ean he placed, and the best chance of recovery given to them, is not only a boon to the patients, but also a great contribution towards the health of the inhabitants of this metropolis.

As such an institution, this hospital demands and As such an institution, this inspiral version as a such as institution, the support is the support greater than that it has hitherto met with, and from want of which the sphere of its operations is limited. JOIN D. SCURRAH, M.B.

THE SCIENCE OF THE BUILDING ARTS. CRUSHING WEIGHTS.

AT the late meeting of the Architectural Publica Ar the late meeting of the Aromeeting relation to tions Society, I endeavoured to call the altention of the profession to the unsatisfactory character of the recorded observations upon the subject of "crushing weights," and yon were so kind as to notice briefly the remarks I then made. I fear, however, that I did not then sufficiently explain myself; and I there In no their summerity explain any set, and 1 three-fore venture to trespass again upon your attention, whilst I endeavour to lay before you and your readers the reasons I have for urging all practical and scien-tific men to examine this particular detail of the science of the building arts.

tific men to examine this particular detail of the science of the building arts. Tae various tables which appear in recent works upon construction, are mostly copied from the papers originally communicated by Mr. G. Rennie to the Royal Society, by M. Vicet to the "Annales des Ponts and Chausées," by M. Belpaire to the "Annal-s des Travaux Publiques de la Belgique," or from the works of Tredgold, Barlow, Navier, Holg-kinson, Fairbairn, Clark, &c. In these various cesaps there is, no doubt, an extraordinary amount of information; but I confess that I cannot consider the hulk of it to he of a practical nature. For instance, Mr. Rennie's experiments upon the resistance of building stores, were made upon cubes of still smaller dimensions. Vicet's experiments were nucle upon cubes of one centulerte on a side (0.5937 inches); and Belpaire's npon prisms of 2 luches on the side; and Scharie's npon prisms of 2 luches on the side, and the indications given by such carefuly selected samplea may differ scriously from those which would be found to represent the resistance of the heterogeocous materials used in building. The erush-ing which would be found to honds must then. I conceive heterogeoeous materials used in building. The crushing weights given in the books must then, I conceive,

ing weights given in the books must then, I conceive, be simply regarded as approximations. In practice, also, the indications given by the ro-sistance of a small cube of stone or hrick, can be of little use in guiding the builder's proceedings, because the manner of making the joints, or of bedding the stones, & c. must entirely alter the whole of the con-ditions of their resistance. Roudclet's observations attons of their resistance. Inductors on ordervations upon the cruching of the pillars of St. Generiève (copied by Genievs, in his tubles), and Mr. E. Clark's experiments, at the Britannia-bridge, arc, indeed, in my opinion, the most valuable ones—I had almost my opinion, the most valuable ones—I had almost said the only valvable ones—we possess on the real, practical conditions of huildings in this respect.

But the particular reason for my bringing the sub-t forward is this. I have lately observed, even in et forward ject forward is this. I have lately observed, even in the best works on construction, some of the most re-markable blunders, errors, and misprints; and as the tables, which are issued with the authority of a great name, are usually received without question, and blindly followed, these errors may, I fear, produce disastrous results.

Thus, for instance, I find in the Report of the British Totals for missince, I and in DRACPITE of URE DRIVE Association for the Advancement of Science, 1840, p. 205 of the "Transactions of Sections," a mispiritu of some kind in the seathence beginning, "In solid pillars, whose ends are flat, we had, from experiment, phases, whose check are not a to have the experiment, as before, strength in tons = $44 \cdot 3 \frac{0.384 d.85}{417}$;" because evidently, as D= the external, and d = the internal diameter of the ring of metal, the formula must apply the function of the solid columns. On the next page there is, however, a more serious error. The resist-ance of east iron to a cutushing weight being given in p. 205 thus:—Strength in tons = $4\pm16\frac{438}{112}$; that of oak is given in p. 306, = $69\frac{D4}{i\pi}$; or, in other words, the strength of oak (to resist a crushing weight) is thus stated to be more than one-third greater than that of cast ice where a been and the three greater than that of cast ireo ; whereas, by the sub-sequent paragraph, it is said to be only about one-tenth of the same resistance. I thought at first that the error had arisen from the ourision of the decimal point between the 6 and the 9; but it is too great for

70.00;" whilst at p. 228 he gives it = 70,000. lbs. Evidently the two last discrepancies arise from mis-prints. It is not so easy to explain the error in the Transactions

I cannot help suspecting that the alteration Mr. I cannot help suspecting that the alteration Mr. Hodginson has made in the paper thus alluded to, upon Ealer's formula, is hardly of sufficient practical importance to compensate for its awkward character. Assuming the co-efficient for east iron to be correctly given as 44·16, there is really so little difference between the results of the formula,— $R=44/16 \frac{0.44}{1.72}$ and $R=44·16 \frac{0.4}{1.9}$, that, for my own part, I should not hesitate to adhere to the latter. It will, however, be found that both of these formula are, after all, morely empirical, and that if the value of D (the dimension of the smallest side of a equare column) be taken either as a maximum or as a minimum, the results in hoth eases will differ

side of a square column) he taken either as a maximum or as a minimum, the results in both cases will differ in such an extraordinary manner as to prove that no reliance can be placed on the formule. They are tolerably correct when the value of D = 6 inches; but when D = 2, or = 12 inches, they cease to apply. Of course this must be the case when the member of the equation D4 is to be affected by another member, 21, on account of the great difference in their powers. I trust that the importance of this subject will serve as any excuse for questioning the aubority of men for whom I have so profound an esteem as I have for those named, and for occupying your valuable columns. Gro. R. BURNELL, C.E.

THE NEW READING-ROOM, BRITISH MUSEUM.

ITS OPENING TO THE READERS.

DUFING the few days that the new room was thrown open to the public, the number of visitors day throw open to the poole, the humber of visitors any after day increased in a surprising u anner, and many have expressed disappointment at not being able to avail themselves of the chance of viewing this inter-esting example of modern construction. It has been suggested that the new room might have remained absed to the readers for a week or two longer, so that the make which we had the encourtunity of access to the public might have had the opportunity of access to it. This would have interfered with the labours of many 1. In swould have interfered with the L-bours of many who are engaged to providing matter for the periodical literature of the day, and others who are employed upon works which it is important to produce at a stated time. It has been arranged, however, to admit the general public for an hour or a such empirical. the general public for an hour or so each evening in the readers bave left.

The general plane for all note of so excluded that the second sec

are marked A. B. C. and S. Dar, and ten tepestore seat and portion of the tables is numbered from one to the number of persons for which each table affords accommodation. It is requested that on each ticket for banks the letter and number of the writer may he

for nones the electr and domined of the winter half me marked: this plan enables the attenduits enably to bring the volumes to "R 2 " or "A 16." At the end of the various tables and in other parts of the room are plans printed on caldboard, and distinctly coloured, of the arrangement of the hooks, which enable any one to know in what dirn tim to which can be been an electronic plane and the the books. look for the books on anatomy, botany, or other sub-

The space devoted to the use of each individual is The space devoted to the use of each individual is ingeniously arranged. On the right hand is a move-able easel: the front surface can when not required for use be tidded up three times, and then by side joints be unde to fit into a recess. This casel is socontrived that it can be raised to any angle, or turned by a circular move-ment as required. In the centre of the scat is the letter and number of it: below that is the ink-well and rests for pens: on the lett.hand is a lettler cushion, which sluts up with a spiring, on which books may be rested; and on the table there is plenty of room for names and other matters. A hollow partition divides rested, and one matters. A hollow partition divides cach row of readers, end is coverel by an open brass wirework grating, along which, something in the same manner as the pites of a church orean, various greater tuan that of cast iroo; whereas, by the sub-sequent paragraph, it is said to be only about one-trucks, which are in connection with a main pipe, rice tenth of the same resistance. I thought at first that up, and can be manazed by the turning of a srew the error had arisen from the omission of the decimal any such explanation. Mr. Fsicheim, also, in his altogether. The ventilation of buildings is still a " Useful Information for Enguners," gives, p. 232, "the resistance per square inch of wrong't iron in positive opinion on slight experience, some fear that, in spite of the endeavours made, the new room will he hot in summer and too cold in winter.

The arrangement of the various catalogues round in a circle is excellent, and they can now he consulted without the crowding and inconvenience which formerly took place.

without the crowding and inconvenience which for-merty took place. In the old room there was a small square window to which all the reading-tickets were taken, and through which all the books had to be delivered to the room and returned; and although the gentleman who had for a long time hept his post there was re-markable for careful attention, at times, particularly lowards the closing hours, some inconvenience might be experienced. In the new room, hy a simple arrangement, the possibility of inconvenience has been lessened; for the circular space now devoted for the reception of tickets and the delivery of books is di-vided into compartments, which are lettered from A to D. E to G, &e.; and to such of these divisions the tickets and hooks of readers are to be taken as they correspond with their names. It was often difficult in the old rooms for ladies, it on in the new roon, however, certain tables are marked, "for ladies only." in fact, great eare bas been taken and a strong feeling shown on the part of the managers of this portion of the British Museum to accommodate the public, and at the same time to provide for the increased numbers which as a matter of course will year after year consult the British Museum to

THE BERN COMPETITION.

NOTWITHSTANDING the unsatisfactory conditions offered, twenty-three sets of designs for the proposed (R. C.) Church of St. Peter and St. Paul, at Bern, were sent in to the committee, six or seven of which came from foreign conn-They were publicly exhibited a short The *Ecclesiologist* says, the jury have the first prize to the design hearing the time. given the motto "Petrus janitor cœli et Panlus doctor gentium "----iu the Romanesque, or Transitional, style---by MM. E. Deperthes and H. Marcchal, style—by MM. E. Deperthes and H. Marcchal, of Rheims. The second prize has heen assigned to M. W. F. Torgjiner, of Soleure, for the design "Nou est hoe aliud," &c. The third to M. J. U. Lendt, of Freiburg, for the design "Onne tuilt punctum," &c. The fourth, a third gold medal, to Mr. Goldie, of Sheffield, for the design "Nisi Dominns." The following designs were classed as equals, and rewarded with silver médals :--"Timor Domini," by J. C. Boissonas, of Genera; "Preis dem Höchsten," hy Kasper Jeuch, of Baden (Argau); "In hoe signo," by T. Zeer-leder of Bera; "Palman qui meruit," by J. L. Pedley, of Sonthampton; "Der glanbe," hy G. Mossdorf, of Lucerne. G. Mossdorf, of Lucerne.

THE MANCHESTER EXHIBITION.

THERE has heen considerable improvement in the general arrangement of the Art Treasures contained in the Ekibilion building' during the last few weeks. In the Picture Galleries the numbering has been entirely re-arranged, and a new and more correct edition of the eatalogue has been prepared, in which the paintings by Ancient Masters are numbered pro-gressively from 1 to 1079; the Heritord Gallery from 1 to 44; Paintings by Modera Masters from 1 to 659; British Potriati Gallery from 1 to 337 (to be continued); Water Colours from 1 to 353. This enumeration gives a good idea of the extent of the collection of pictures; and when it is remembered that the cheft-al-average of every age of ant are in-cluded thereio, the rich treat that a survey would afford to the lover of art may be imagined. A cen-tral group of sculpture has here uplaced in the tran-THERE has been considerable improvement in the anova to the over of art may be imagined. A central group of sculpture has here uphaced in the tran-sept, and the busis, figures, and groups have here fixed in good positions in the main building and in the picture gulleries, affording an agreeable variety to the effect of the general coup d'ceil of the interior. Additions are constantly being made income to the effect of the generial coup & cet of the interior. Additions are constantly heing made in several de-partments, more especially in accient furniture, broozes, statues, and tapestries. The armour, arms, and warlike accounterments, are particularly well arranged, and excite great juterest. It is very interesting to follow some of the hard-handed mechanics, and hear the wondering remarks they make upon the splendid workmanship shown in the enriebupon the splendid workmanship shown in the enriceb. the working classes, --by removing them into a more ments, embossies, and engraving of the ornamental healthy atmosphere, instead of the confined courts suits of armour, and upon the mechanical provisions and alleys they now occupy. If these said factories for protection, and for allowing free use of the limbs were removed from town to country, the working dissertation) on this subject by Mr. J. R. Planchć, given in the catalogue, is well worthy of attentive reading. The furriture, brozzes, medallons, speci-mens of Palisy and Majolica ware, articles in glass

and tapestries known as the Soulages Collection, are now distributed in good order in various parts of the building. Some excellent specimens of wood earving hy modern artists will be found under the galleries on each side of the organ: a sideboard of good work-manship and design, having figures emblematic of rural sports; a bedstend of elaborate design, adoreed with fine earving, fit for a queen to sleep in, the work of Charles, of Warrington; some charming little hits of dead game by Wallis, of Lontb; and a delicate and poppies. A comparison of these, and the ancient earvings with which the Exhibition shoulds, is not much to the disadvantage of the works of our own

day. The attendances last Saturday amounted to 9,702; on Whit-Monday to 9,514; and on Whit-Tuesday to 10,398. As the latter part of the week is the great annual holiday in Manchester, it is expected that the numbers will increase,

MODERN PICTURES IN THE THE MANCHESTER EXHIBITION.

SIR,-Apart from the vapid adulatory cri ticism with which our press at this moment teems, in reference to the modern school in the Art-Treasures Exhibition at Mauchester, let us take a numerical comparison of its contents, and of their relative disposition.

It appears, then, from the catalogue, com-mencing with the more recent school in saloou E, that the Royal Academy supplies 243 of these that the folgar reacting supplies 245 of these treasures, whilst the great mass of artists— non-members, but supporters of that institution, whose numbers are, if I mistake not, computed at from 5,000 to 6,000—are represented by so small a quota as 142, of which 57 are placed

above, or otherwise unfavourably. "Oh, monstrons! one half-pennyworth of hread to all this sack." So packed and partial hread to all this sack." So packed and partial an aftar is it, that one would suppose himself within the rooms of the Academy, were it uot for the superior accomundation of velvet-enshined seats over school-forms. Aud I could but reflect that in this stronghold of freecould but remert that in this strong non to rec-trade such a close-horough system was an anomaly quite ont of harmony with that liberal spirit which marks the generous "Cheerybles" of Manehester. But for this fresh eruption of the old sore, the Art-Treasures Exhibition claims our high admiration for the good taste claims our high admiration for the good taste and excelleut judgment prevailing therein. All interested in art should see it. The light is admirable, and enables us, by comparison with the great of old, to study our deficencies, pain-fully apparent in chalkiness, weakness, gaudi-ness, and spottiness of the general effect. It is doubtful, perhaps, how far the import-ance given to that fascinating branch, water-colour drawing, and its gaudy counterfeit, chromo-lithography, is likely to elevate art in this country. As ARTIST.

IMPROVEMENTS IN LONDON.

IMPROVEMENTS IN LONDON. OBSERVING Alderman Cubitt's remarks on pro-viding anitable lodging-houses for the poor, I would suggest, as one remedy, that all manufacturing trades, such as policitries, glass-houses, tallow-nuclers, bone-bielers, and varnish unkers, and, in fact, all objec-tionable trades not actually required in Loudon, should be removed at least treaty-live miles from the metropolis. This plan would sentier the working classes over a large space of country, and prevent the necessity of retaining so many small houses for the poor in London, and it would allow of the worst portion of small dwellings to be cleared away ato-gether, and make room for the contemplated improve-ments, in forming new streets of a superior grade, on the same plan as in Paris. There is no more necessity for objectionable trades and manufactures to be carried ou in this metropolis than there is for bricks being made and burnt in any of our West-end squares. It only requires the good sense of the inhabitants of this great eity, and the resolution of Parliament, to eradi-cate at once all the nuisances from the heart of the town, and, at the same time, confer a lasting boon on the working classes,-by removing them into a more

the means of enjoying good health. And, again, why should not the hanks of the Thames (on hoth sides) should not the hanks of the Themes (on hold sides) he a pleasant promenade above Westminster-hirdge, instead of having the disgusting appearance presented at Lamheth ? What an exhibition of poverty, ruin, and wretchedness on one side, and on the other a costly palace,—the New Houses of Parliament. What in-consistency I Such is London; but ought such a state of things to be tolerated any longer?

Millions of money are squadered on war, and much of it wasted: let one quarter of it he spent in the general improvement of the banks of the Thames, and it would become at once one of the greatest orna-ments of the metropolis. The authorities should know that there is much need of a row of plane trees it has after of the fructual next the river, from show that there is much need of a row of plane access at the edge of the footpath next the river, from Milbank-row to Vauxhall-bridge; and if the path was paved with flagstoose it would make a very plea-very please it would make a very please of the state of the s was paved with flagstones it would make a top person start evening walk; and a few seats might be added R. M.

ARCHITECTS' CHARGES AS WITNESSES.

You appeal to your legal friends for information on the subject of the statement of your correspondent, Mr. James Edmeston, which appeared in your numher of May 30. Your own observations are very correct, and I think Mr. Edmeston must be under a misap-prehension as to what his " own solicitor" told him as to big above. to his charges.

to his charges. The taking the account of dilapidations was a pre-liminary matter to qualify him to hecome a witness in the cause. The ordinary charge for this falls apon his employer, and cannot be brought agoinst the oppo-site party. For attending as a witness on the sub-ption for three days he is cutited, as against the opposite party, to a guinea a day,—that is, two guineas besides the guinea paid him with the subproma. If he had attended a trial at a distance from his home, he would have been entitled to from 27. 28, to 37. 38, a day (besides travelling, hut no other expenses) at the would have been entitled to from 2/. 2s. to 3/. 3s. a day (besides travelling, hut no other, expenses), at the discretion of the taxing-master. Although 1/. 1s, per day in a town cause may only he recoverable hy a witness from au opposite party, 1 think his own employer, if Mr. Edmoston was his witness, should himself pay an extra guinca; at the least, I helieve this is the practice. Many of your readers, who are arehitects, know that their employers do not look to the taxing-master's accele for their renunceration. hut the taxing master's scale for their remuneration, hus judge for themselves whether, though not recoverable Judge for Liensches wirdnet, though nor recoverable from the opposite party, their services as witnesses are worth two, three, or five guiueas a day. Where, however, an architect has keen paid for preliminary services, it may not he unreasonable to take this into consideration. But I think, under any eircemstances, two guineas day for an architect attending a trial but reasonable, though, perhaps, not recoverable from the converte narty. the opposite party.

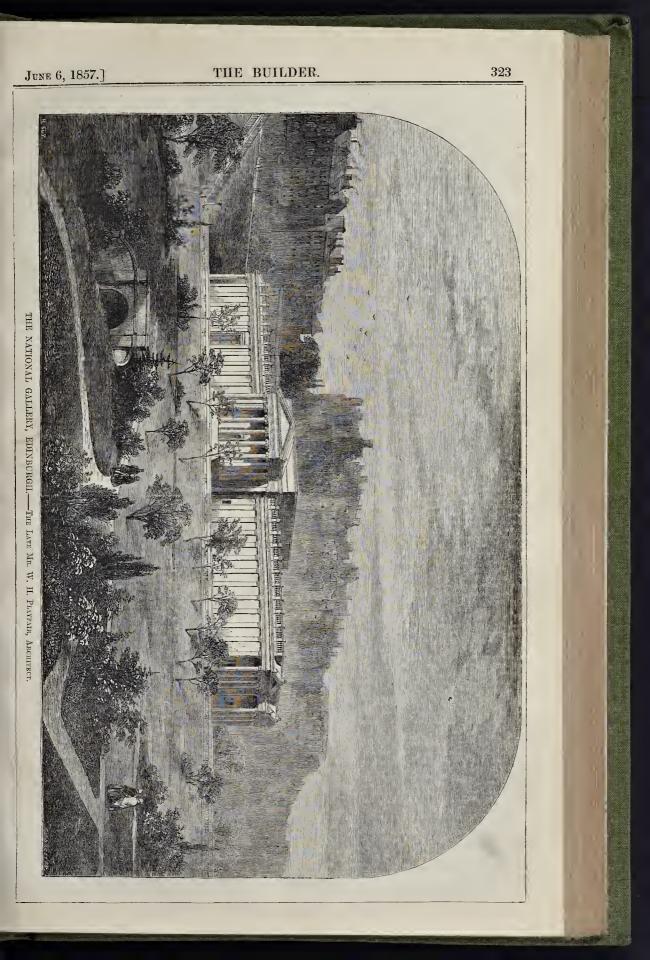

I have no doubt the party who subpromed Mr. Edmeston, whether the opposite party or his own employer, is liable to pay him two guineas, hesides the guinea with the subproma, for his three days attendance in the Court of Exchequer, and he can sue him for it in the County Court.

A LEGAL READER OF THE "BUILDER,"

THE NATIONAL GALLERY, EDINBURGH.

In the valley which separates the old and new In the valuey when separates the old and new parts of Ediuburgh, on the earthen mound thrown across it as a means of communication between the two, stand the Royal Institution— a Grecian Doric building of striking aspect— and the new Scottish National Gallery, both erceted from the designs of the late Mr. Play-Protect from the designs of the fact and the ray-fair, to whose skill and taste Edinburgh owes so much. The Royal Institution was completed in 1836. The National Gallery was finished externally in 1854, at which time we songht to obtain from the architect the means of property inductions the discussion. The Plasfor how illustrating the structure. Mr. Playfair, how-ever, shrauk from publicity, and declined to afford the requisite materials. Recently, through the kindness of Mr. J. A. Hamilton, we have been enabled to engrave a small view of the building from a photograph which, though it does not quite working set forth the building, shows its character and, to some extent, posi-tion. It is Grecian Ionic in style, and has a contral mass, with a large hexastyle portico to the east and oue to the west. On each side of this portico is a range of antæ, carrying entablature and balustrade, and terminating on the face of each end of the building with two tetrastyle porticoes, with a recessed portico between the two.

The Castle and part of the old town form the background of our view.

OPENING OF THE CRUMLIN VIADUCT. This extraordinary structure, probably the largest railway bridge in the world, has been formally opened. It has been raised for the purpose of extending the Newport, Abergavenny, and Hereford live to the Taff Vale, thus opening up the oreans of communication between the rich mineral districts of Mommouthshire and Ghamorganshire. Its beight is 200 feet. It is almost wholly constructed of iron : the piers, which rise above the valley beneath to the elevation already mentioned, present, in consequence of the material nsed, a singularly light and symmetrical appearance. The centre piers consist of an arrangement of 140 east-iron columns, each 17 feet long by 12 inches in diameter, placed in tiers of fourteen columns each. The heads of the columns are retained in their positions hy cast-iron girders, and the area of hase is 60 feet hy 30 feet, forming an irregular desegon tapering upwards 24 feet by 16, the whole being laterally and vertically strengthened by a complete system ot cross tracing. It is difficult to convey an idea of the gigantic scale on which the whole design has been carried out; hut it may assist the formation of an opinion relative to the strength of the piers if we state that there are no these thor 500 words' trion thesi in each. The top of OPENING OF THE CRUMLIN VIADUCT. it may assist the formation of an opinion relative to the strength of the piers if we state that there are no less than 540 wrought-iron ties in each. The top of each pier is surmounted by a triangular frame of east iron, upon the aper of which the ends of the main girders are carried. The entire superstructure con-sists of 10 spaces of 150 feet each, which, with the approaches, make its length one-third of a mile. In each space there are four main girders, on the top of which a platform of 6-inch planking is bolted, for carrying the permanent way. The entire work has been designed and carried out by Mr. T. W. Kennard, of London.

by Mr. T. W. Kennard, of London.

PROVINCIAL NEWS

Winchester .- The officers' new barracks are nearly Winokester.—The officers' new barracks are nearly completed. The plan is simple, the four floors which constitute the elevation being traversed through their whole length by corridors, from which open the entrances to be different rooms. The new building is of bright red hrick, with stone dressings. *Clifton*—The old "Royal Hotel," at Clifton, has now been converted into the Clifton Subscription-roome by a literations and additions corrised out on

rooms, by alterations and additions carried out on plans hy Mr. J. II. Hirst, architect, at a cost of between 4,000*l*. and 5,000*l*. The ground-floor has rooms, by attentions and additions carried out on plans hy Mr. J. II. Hirst, architect, at a cost of between 4,000*l*. and 5,000*l*. The ground-floor has heen partly converted into dwellings and stops. The fronts are in the Venetian Italian style of architecture, and are ahout 25 feet in height. Each window is a hay forming three sides of a polygon, fitted up with plate-glass and glass cross bars. The carving of the stonework has heen executed hy Mr. Divall. A corridor, 10 feet in width, divides the shop premises from that portion of the building which has been appropriated to the purposes of the subscription-rooms. The flooring of the corridor is composed of inlaid tesselated and Mosaic pavement, supplied from the works of the Patent Architectural Pottery Com-pany, at Poole, Dorset. The principal staircase springs from the corridor, and leads by an easy flight to the public rooms, which comprise a drawing-room, &c. The contractors were, Mr. Thorne, mason, Mr. J. N. Harris, carpenter; Mr. Ashumed, smith, Mr. Allan, gasfitter, Messrs, Lewis and Sons, painters and plasterrs; Mr. Williams, glazier. *Plynouth*.—The corner-stone of a new Wesleyan Sunday-school was laid on Saturday last. The plan comprises on the more floor a schoal, room.

Plymouth.-The corner-stone of a new Wesleyam Sunday-school was laid on Saturday last. The plan comprises on the npper floor a school-room, 75 feet by 38 feet, with sundry class, committee, and other rooms on the ground-floor, and with two dwelling-honses adjoining, for the use of the resident ministers connected with the Ehenezer Chapet, S. Itash-street. Ten tenders were received, and the trustees bave accepted that of Mr. Thomas Clift. Mr. John Foster is the architect. The elevation will he plain in its character; the walls limestone, hammer-dressed, with white fire-brick dressings, from the Morley Clay-works. Lee Moor, Devon. works, Lee Moor, Devon. Worcester.—The new waterworks are progressing

at Pope Iron, on the Severn hank. The boiler house is about to be roofed with iron hy Mr. Rutter, of Birmingham. The machinery is trom the Haigh Foundry, at Wigan. Two of the three filter-beds are is about to be rooted with iron by Mr. Ruller, of Birmingham. The machinery is trom the Hargh Foundry, at Wigan. Two of the three filter-beds are laid, and the subsiding tanks are nearly completed. The bricks used in the works are blue and brown, from Tipton and Oldhury.—An arboretum is con-templated in the neighbourhood of Worcester. Nearly 2,000/. have already heen subscribed towards the subscribed towards the object.

Birmingham .- The News room, in Bennett's-hill, has been purchased, for the sretion of a new Comity Court upon the site. The designs for the new huild-ing, which is expected to be commenced in about two months, have been supplied by Mr. Reeves, of London, architect.

Liverpool.-All Souls' Schools, Eaton-street, Vaux- old chapel, hall-road, were opened on 28th ult. They are attached the design.

to All Souls' Chnrch, in the new parisb of Vauxhall, and have been built by public subscription. They will accommodate 550 children. The grisf' sebool is above that for the boys. It is more than 24 yards long, and about one-third as broad, with drapery for the separation of classes, and facilities for the forma-tion of a class-room. The infants' school is a sepa-rate building, about two-thirds the size of either of the others. It is lighted with platea glass along the roof, and also by two windows, the ebildren being accommodated in side galleries. The cost of the land, schools, and two residences for the master and mistress, was 3,700!. of which the Education Com-mittee of the Privy Conncil contributed 1,453!. and

Inad, schools, and two residences for the Defination Com-mistress, was 3,7002. Or which the Education Com-mittee of the Privy Conneil contributed 1,4537. and the National Society 1007. *Carlisle.* — The Laversdale new schools were opened on 25th ult. The school bas heen creeted at a cost of about 5807. towards which Government contributes 2847. Mr. Robert James, Mireside, land valued at 717.; two-thirds of the cartage done gra-tuitously, viz. 650 carl-loads, valued at 567.; sum raised already by contributions, 1567.—Icaving a de-ficiency of about 133. The contract for the huilding was taken by Mr. Robert Irving, of Newtown, Irthington. The huilding was designed by Mr. Jobn Baty, architect, Brampton. It consists of a principal school-room, ahout 38 feet by 18 feet, estimated for sixty-three colidren; a class-room, about 18 feet square, for thirty-six children; and a master's resi-dence, with six rooms, out-offices, &c.

CHURCH-BUILDING NEWS.

Pershore .- The Chapel-of-Ease at Drake's Brough-road. It consists of a simple obling, with a simal turret at the south-west angle, sustaining a belfry chamber and a wooden spire. The porch is also at the south-west. The chancel is divided from the hody of the church by an ornamental truss, forming a fattened arch, supported by carved stone corbels. A geometric three-light window appears at the east end, and in the west two lancets and a rose window. The side windows are of two and three lights. The open timber roof is covered with blue and red Broseley tiles, with cross tiles on the ridge above the chancel, and ornamented with a faliated cross on the eastern and ornamented with a failuted cross on the esstern gable. The porch is of timber, fitted in at the hot-tom with stone work. Linestone from the Wolver-ton quarrics in the neighbourhood, with free-stone dressings, and lined with red and white bricks, form the materials of the walls. Neither plaster nor paint is used on the walls of the building, and the planness of the measure is projected by an experiment of of the masonry is relieved hy an arrangement of various coloured bricks, forming ornamental designs, especially at the east end. Minton's encaustic tilrs especially at the east end. Minton's encaustic tiles cover the chancel floor. The seats are merely henches, with 1 w inclining backs. The church is warmed by an underground apparatus supplied by Messrs. Rim-mington and Co. of Skipton. Mr. Lacy, of Droit-wich, was the contractor for the building, and also supplied the carpenter's work. Mr. Snow, of Droit-wich, was the mason. The carvings were exceuted by Mr. Mexano of Birmincham: uniting and yarwhen, was the mason. The envirge were excented by Mr. Moyson, of Birroingham; painting and var-nishing by Mr. Wells, of Worcester; and the orna-mental iron-work by Mr. Watkins, of Lowesmoor. The cost of the building will be about 1,000/.

The cost of the building will be about 1,000*l*. Neveratle-under-Lyne. — The foundation stone of a new Methodist Chapel, at Newcasile, was hid on Tuesday in week before last. It is to be erected on a site not far distant from the old chapel, and is intended to be eapable of seating 900 or 1.000 persons. The total cost will be upwards of 3,000*l*. The architect is Mr. Singmon, of Lweds; the contractor, Mr. R. Chapman, of Newcastle. Weethere (Weite) — The contractor is a start of the second sta

Chapman, of Newcastic. Westbury (Witts).—The connetery here was opened on the 12th May. There are two chapels and a lodge erected on the ground, the designs of which are of the character of the fourteenth century. The cent-tery has been laid out by Mr. Smith, of Westbury Leigh. The architect was Mr. Edward G. Braton, of *Mathematical the health Mr. Sci. Braton*, of *Mathematical the health Mr.* Ox'ord; and the huilder, Mr. Davis, of Frome.

Cheltenham. - The opening of St. Gregory's (Roman Catbolic) Church, at Cheltenham, took place on the 26th uit. The clurch which is situated in St. James's-square, near the Great-Western Railway Station, has here built mader the superintendence of Mr. George Hauson, of Clifton, architect. It is in Mr. George Hansom, of Clifton, architect. It is in the Geometrical style, ascribed to the latter half of the thirteenth century. Its plan is cruciform, and it consists of a nave and a'sles, with a porch into the western aisle, transcept, chancel, lady chapel, sacri-ties, and organ chamher. The orientation of the church is at variance with ancient examples,—the chancel being at the south end. A tower and spire, it is said, are hereafter to be senset. chancel being at the sonth end. A tower and spire, it is said, are hereafter to be erected on the site of the old chapel, which this adjoins, in order to complete

Bromsgrove.—An effort for the restoration of the parish courch of Bromsgrove has been commenced. At a meeting of the inhabitants recently held, a unanimous resolution was adopted to make an imme-diate and carvest effort to effect its complete restoradiate and carnest effort to effect its complete restora-tion; and Mr. Scott has supplied a plan, and a general outline of the work required to be done, which will involve an outlay of 4,2001. Besides the com-plete restoration of the building, hoth within and without, as nearly as possible to its original design, especially as regards the mutilated windows on the north side, the work includes the opening out of the roofs of the nave and the chancel, the improvement of those of the asiles, the re-laying of the floors, and the entire re-peving of the charch in oak, by which a large addition of free sittings will be obtained for the use of the adult poor, and suitable accommodation be use of the adult poor, and suitable accommodation be provided for the children of the Sunday schools. At

a subsequent meeting Mr. Scott's plans were ap-proved, and the committee empowered to carry the same into effect as speedily as possible. The sub-scriptions promised have exceeded expectations, although there still exists a deficiency of nearly 800?.

scriptions promised 'have' exceeded expectations, although there still exists a deficiency of nearly 8004. Manchester.—The Higher Broughton Congrega-tional Church, Manchester, was opened on the 28th ult. It is in the Decorated style, eruciform on plan, with nave, sistes, transpits, and channel. The nave is divided by ion columns, which are extriced up to and support the roof. The chancel and com-munion-place are raised 18 inches, and baid with encaustic ties. The pupit and communion-rail are of the Ancaster stone, and the whole of the windows have margins of stained glass and ornamental pattern quar-ries. Mr. Thomas Oliver, jun. of Sunderland, was the architet.——Tenders bave been received for sundry additions and alterations to, and for the entire completion of, the Catholic Apostolic Church, Stret-ford to Sur-road, Manchester, from designs hy Mr. E. Trevor Owen, architet. The principal or cutrance whole of the west end will consist of new porches, with organ-chamber over; also, a new haptistry. The whole of the west end will be entirely re-creted and anrounted by a lofty and decorated bell-gable. The pre-fitted, which will include an organ-galley; also, new stalls and other furniture to the chancel. The east and baptistry windows will be stained glass, and the floors paved with Minton's tiles.— The new allar-screen and bishop's throne in Man-ebester Cathedral, some particulars of which were The new altar-screen and bisnops introne in balan-chester Cathedral, some particulars of which were Intely given, are now completed. The stone screen is pierced with seven arches, filled with plate glass. It is in the Perpendicular style, of Caen stone. Its length across the choir is 25 feet; its beight nearly 14 feet; measuring about 3 feet 8 inches to the sills of the plate across to that nercons massing behind 14 feet; measuring about 3 feet 8 inches to the sills of the gl.zed arches; so that persons passing behind it will not be seen by those within the choir, which is considerably higher in level than the neighbouring aisles, &c. The screen is supported by a moulded hase course of Vorkshire stone. The erving has been executed hy Mr. Williams, of Manchester. The bishop's throne stands on the site of the former tem-porary throne, at the end of the stulls on the south bishop's throne stands on the site of the former tem-porary throne, at the end of the stills on the south side of the choir. It is of eareed oak. The throne is octagoonal in shape, and ecasopy, also octagonal, at a considerable altitude, carved, with pinuaeles, Ke. The base stands upon a plain double plath. The style of the throne throughout is Late Pointed. The earving has been excented by Messrs. Banks and Co. of Man-chester, and the joiner-work by Messrs. Halme and Harone of Chestlewarbill.

chester, and the joiner-work by Messrs. Halme and Heron, of Cheetlam-hill. Ashton. —The first stone of a new chapel for the Wesleyan New Connexion was laid on 23rd ult. at Hooley-hill, a village about a wile and a half from Ashton, near Guide-hridge, with a population of about 1.200. The present chapel, hall by Mr. John Whit-taker, will he used as a school. The new one is to he built near it. It will he of Greeian architecture, 20½ yards long by 12½ yards wide, with a gallery two paws d-ely, and a class-room. The archit-ct is Mr. Joseph Lindley, and the cost will he 1,4004. Doncester. —It has been decided to build a church at Doncister for the spiritual instruction of the ser-

Doncester.—It has been decided to build a church at Doncester for the spiritual instruction of the ser-vants of the Great Northern Relway Company em-ployed there. The edifice will cost about 4,000, the funds for which, and for the endowment, bave been provided by private subscription. *Hestington (Tork)*.—The laying of the foundation-stone for a new church at Heslington, near York, took place on the 28th nlt. The Decorated style, accord-ing to the *Tork Herald*, bas heen adopted for this edifice, and it will possess a tower, with spire, and chancel. The size of the church inside will he 65 feet by 25 feet, the chancel being 24 teet by 16 feet. The chancel. The size of the church inside will he 65 leet by 25 fect, the chancel heing 24 iet by 16 fect. The seats will all he open, and accommodation will be provided for about 270 persons. The roof will be an open timber one, the inside fittings of oak, and the pulpit ornamental. The east and west windows will be composed of painted glass. The tower and spire will be 110 feet high, and the beight of the church ontside to the apex of the roof will he about 46 feet, and inside 44 feet 6 inches. The tower is to he 17 feet square at the outside, and the walls 3 feet thick. The side walls of the church will he 2 feet 6 inches thick. The nasoary is to be composed of Bradford wall stones, and the window tracery of Ancaster stone. The cost of the new charch, which is named St. Paul's, will be about 3,000%. The orehi-tects who have been engaged on the work are Messrs. Atkinson, of York. Mr. Weatherley, of Boothma, is the huilder, Mr. Bellerby the joiner, Mr. Hodgeson the plumber and glazier, and Mr. Perfect the painter— all of York. all of York.

planter and glazer, and AF, Ferfet he pandet all of Yok. Matton. — The foundation-stone of the Notton Wesleyan Chapel was hid on 27th ult. The "archi-teet and huilder" is Mr. William Lovel. The new chapel is intended to be a Gothie huilding, 28 fet by 49 feet, to accommodate 380 persons. Demotes — Euclid-street Chapel has just been com-pleted for the use of the Old Social Independent congregation, lately assembling in Borraek-street. The building is two stories in height, having public offices on the uground-door, — the chapel and refiring-room heing on the upper floor. The main entrance is on the west side, by a wide corridor and stairease, the latter finished with a groined plaster ceiling. The style adopted throughout is the Early Euclish Gothic. The chapel is seated for 150 persons. Mr. James Soott was the architect. The contractors were Messre. Annan, Kidd and Son, M'Conschie, and Stavat.

THE CONSTRUCTION OF FLUES

IN a recent number the danger arising from the In a recent number the angle a sing from the bal contrivence of flues is adverted to in consequence of a fire having been caused by the ignition of soot at the bottom of a flue adjoining to and in connection with another fireplace them in use. To those who are acquaited with the origin of fires, it will be no fresh information to read that this cause is of constant the average of the source of the will be been fresh information to read that this cause is of constant

hefore it is discovered, either from the smell, or by setting the skirting on fire. In illustration of this subject, I am trupted to send a very interesting account, given in the volune, for 1815, of the "Transactions of the Society of Arts," &c. p. 131, wherein is stated that " the thanks of the society were voted to the Riv. Thomas Ridge, of Vineous ever that there to fire, big methods of

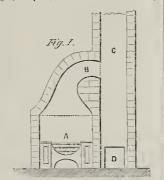

be ellow cuterel it. 3rd. In visting different manufactories, and other places where there are long flues, I have always learnt that they were continually hursting from the accumulation of soot. Considering the causes of therefore, I was induced to make an experiment, by which, toggether with other circumstances relative therefore. I was induced to make an experiment, by therefore about twenty times in the year. The result in other about twenty times in the year. The result in four of five months was, that in the first the whole body of soot was found in the receiver, and not half a print of soot and dust together in the chimney. It

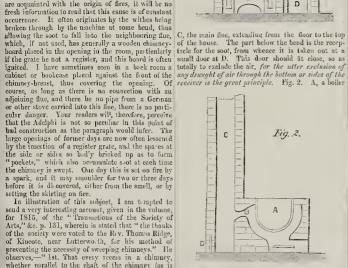

there remained for seven or eight months, when again there remained for seven or eight months, when seal the soot was found deposited in the receiver, and an equally small quantity of dust and soot in the ebimacy above. On opening the other at the end of neuly two years, when I left the house, the soot was found in the receiver, and none in the chimney. 4th, In my present residence, the same experi-ment has here, made for two years, with the same result as above."

result as above

He also relates that another person had confirmed He also relates that another person had confirmed: the plan from experience, though the reason had not occurred to him hefore. After seven years' use a chimney was pulled down, when it was found that above the flue no soot adhered to it, and the greater part was searcely coloured with it,—the whole of the soot having fellen to the bottom, and been taken out oceasionally from a hole left for that purpose. The cuts will explain the arrangement at once

Fig. 1, a fireplace ; B, beud or clbow of the chinney ;

or copper: the other latters as above explained. It is recommended that the sour recentarile should be made in all races rather wider than the part above the cloox, where the such centers, in order that the damp or cool air of the recentacle may have a greater effect upon the smoke as it passes. The cloox, or part hetween the fire and the main chinney, should occasionally be swept with a common house-boom. Wyarer B auvorus WYATT PAPWORTH.

DRAIN PIPES.

DRAIN PIPES. SURLEY, Sir, your correspondent, E. O. S. must have been grievonsly handted during a post-permidial nap, by the unar rous ing nious devices which adorn your advertising pages. He appears to hrve entirely basished from his memory the sound old practical maxim, that prevention is better than eure. The first principles which regulate the employment of pipe drains—the essential condition of their existence is, that they should have sufficient fault, a good supply of water, and he property trapped. If these con-ditions are followed here will be no need for any of

to construct a tube with the fewest possible joints in proportion to its length—every joint is an *outlet* for the liquid contents of the drain, and an *inlet* for the surrounding soil—while it is of the utmost importsurrounding soil—while it is of the timost import-ance wholly to retain the one, and wholly to exclude the other. Your correspondent E. O. S.'s suggestion would greatly increase the quantity of joint, and considerably tend to produce the very evil he seeks to remove. His form of pipe would, moreover, be very difficult to burn truly, and all but impossible to fit accurately. A Pipe-Layer of 15 Years' Standing.

** We have received letters from Mr. W. Austin, Mr. Jennings, and other makers, setting forth the advantages of their system in respect of the point urged by E. O. S. but are forced to decline inserting them. Mr. Jennings denies the assertion of E. O. S. that by his plan sufficient space is not given to clean the denin urgent! the drain properly.

THE CARVING AT ST. MICHAEL'S, CORNHILL

THE CARVING AT ST. MICHAELS, CONHILL. Ma. EDITOR,—A new doorway is in the course of completion to this church, by Mr. Gilbert Scott, the orchitect, as I am informed. Whether the style of the architecture and decoration, elegant as it is, he snitable to the character of the building. I do not wish to express an opinion; hut I leave it to the great is disturbed by it. What I beg to call your attention to, is the sami-figure in a circular frame introduced over the doorway. It is intended to represent the Almighty, or our Saviour, I know not which. It is the usual Roman Catholie representa-tion of a figure, with an imbus, or gloy, round the head, holding up the right hand,—the two forcefingers raised, and the rest closed,—the act of hlessing of the clonnan Church. The this proper for a Protestant church? Although the citizens of London, not loug since, in a spirit of theration, effaced the inscription from the Monument, charging the Papists with the Great Fire, will they sanction this superstitions emblem at the entrance door way of one of their great City. Joux KNOX.

THE DEVONSHIRE GEMS.

THE DEVONSHIPE GEMS. A conrespondent, with reference to the remark-locke of Devonshire, which has here narranged and monated as a parare of jewels by Mr. Hancock, of Bruton-street, asks us for some information concern-ing a fine amethyst intaglio, " which looks so like asyrina." It represents the head of a king, with a speainent of Sassanian act, and to represent the period heard and ringits of hair, and has, indeed, a speainent of Sassanian act, and to represent the period hard and ringits of hair, and has, indeed, a speainent of Sassanian act, and to represent the period hard and ringits. There are two lines of in-seription at the side of the head. Similar gems have heen found in Bugdad. The Sassanian dynasty of he sevent becattery, when the Arab became masters. Thadbr, are of Sassanian architecture. Mr. Fergasson, who gives a short chapter to Sassanian architecture in bit of Haudbook." asys, "There can be very little outbut that these halls are copies, or intended to be so, of the halls of the old Assyrian pulsace." Some of the other gems are of rare heauty and affer, as it scens to us, by their present appro-priore in the reached *Jacons and Lagarers*, but could be better examined if kept singly in a calinet.

CONCRETE.

On reading Mr. George Rennie's paper on concrete, in the *Bailder* of the 23rd ult. it brought to my recollection several experiments made twenty years ago on the best material for forming that nselal anticle. recollection several experiments made townly years age on the best material for forming that useful attick. We are in the habit of taking the gravel just as we find it, by no means a good plan, although for filling a trench is does very well; but to make con-crete what it ought to be, all the water-worn stones should be broken into two or three picces, so that they should not be too large, and have as many angles as possible. Now, at very little expense, when con-sidering every builder has a portable engine, all con-crete might be properly done, and, at the same time, while the gravel is being put into a proper shape, the sand that comes off is of the sharpest and heat kind. Indeed, gravel, properly prepared, would make hy far the best sand : it would be free from salt, and much sharper than what is raised in the Thomes: sand must only he the angles of the larger stones, and subject to heing round the medves. To get fine enery sharp is very easy, and the same process would make sand sharp also as well as dry. I have often wondered that geutlemen in the country, on making their new roads, do not adopt a better plan: instead of putting the round stones on just as they find them, if they were to give them a crush into an angular form, with the fine stuff amongst them, they would have a road fit to walk npon iu half the time. J W.

ABERDEEN GRAMMAR SCHOOL COMPETITION.

At a meeting of the town council of Aberdeen on Monday, the 4th of May, the Lord Provost stated that the plans had been estimated by four respectable bnilders, and that it was found that one and all of the designs would considerably exceed the stipulated sum designs would considerably exceed the stipulated sum proposed to be laid out on the school buildings; but the council in committee having decided not to allow excess in price to determine the council to reject the plans, a remit was made to a sub-committee to report in which of the plans the accommodation and internal arrangements are best suited for the purpose in view, and they were empowered to consult three gentlemen of great experience on the question remitted. These eventlement provided and ultimately two designs were chosen, No. 1 being by Mr. George Smith, Edin-burgh, premium 100/.; and No. 2, by Mr. Matthews, gentlemen reported, and ultimately two designs were Aherdeen, premium 50%.

A SUGGESTION FOR STEREOGRAPHERS.

Course not a stereoscope be easily so invented, and stereographs so arranged in it, as to display in succes-sion different phases or aspects of oue and the same edifice, or of one and the same statue, or (by help of strengraphs prepared with several binordiar cameras at once) even of one and the same living person ? Let us suppose, for example, that the stereoscope is so made that it will receive four distinct stereographs, representing the four sides of a church, and united at *right angles*, the two erosed and mortised cards being stereographed on each side, and mounted on an axis at the crossing of the two eards. So long as one of the cards stands crossing the other at right angles to the line passing from eye to eye, it will not be visible at all while looking through the two lenses of the stereoscope; the other, which is displayed in a line parallel with the cycs, being aloce visible, or rather the view depicted on it. By some slight rathet movement and guide, the visible stereograph could then be rapidly turned round into the place of the invisible one, and that be made to display the next phase or nepect of the cdiffee or status stereographed, made that it will receive four distinct stereographs. phase or aspect of the edifice or statue stereographed, and so on till the four sides of it were all made to appear in succession, in one and the same central position, as various aspects of one and the same solid reality. y. The effect would be very much like that of ing round the actual building or the statue in the solid, and in the same way all the peculiarities of form and attitude in persons stereographed might be seen in succession, one and the same attitude being realized from different points of view, so as to constitute a perfect likeness, in profile right and left, and in froot For an event of the perfect likeness, in profile right and left, and in proof face and back view, seen in succession, embodied as it were in one and the same central form and posture, as they simultaneously existed. The study of statues in this way would be particularly interesting, and so the buildings - instructive indeed as well would that of buildings, -instructive iddeed as well as interesting.

Since I suggested the possibility of applying Since I suggested the possibility of applying the stereoscope to stereographs mitached to or printed on the ordinary page of the *Builder* or other illustrated journals, I find that a very simple and cheap stereoscope now exists, whereby this can at once be done. The article in question coosists of two magnifying lenses, simply set in a piece of flat wood, and used like a double eye-glass: it may be had at Fleming's, in Oxford-street, and other photo-graphers,--cost, 9d, to 1s.! It is even regarded as in some respects superior to the bored stereoscope. I scapics,—cost, out to its it it is even regarden as in some respects superior to the boxed stereoscope. I am still hopeful of the possibility of dispeosing with any stereoscope, however, by the almost instinctive arrangement of the eyes in the way indicated, and this my own experience still leads me to prefer to stereoscopie assistance. J. E. D.

RECENT AMERICAN PATENTS.*

For an Improvement in Excavators. WM. PRO For an Improvement in Excavators. WM PRO-VINES, Columbia, Missouri,—Claim: Io combination with the scoops that cast their contents from them, the trigger and spring, for the purpose of regulating the point at which the scoops shall direct themselves of their load, so as to raise it higher, or cast it farther from the transh that is being art from the trench that is being cut.

For an Improvement in Instruments for Measur-ing Boards, JAMES JONES, Rochester, New York-Claim: My means of so adapting the instrument, that it may be applied to the actual surface--whether of a board or other article--such means consisting of the outer and inner disks, combined with the two indices, one of said indices heing intended to regu-

Selected from the lists published in the Journal of the Franklin Institute, of Pen. sylvania.

late the position of the friction roller on the inner disk, and the other for indicating the quantity measured.

measured. For an Improved Machine for Pressing Hollow Brick, or Building Blocks. M. and J. H. BUCK, and F. A. CUSHNAN, Lebanon, New Hampshire.— Claim: Operating the plunger, by means of the pecu-liarly-constructed cam, in combination with toggle and cross-pin-when the same are constructed and arcanced to overste in relation to each other. arranged to operate in relation to each other

For an Improvement in Baces for Pise-work Walls. Oris NEEDILM, and WALES NEEDHAM, New Haven, Connecticut.-Claim: 1st. The con-Struction of the box with the inovable end-plates fitting to grooves in the side-plates, and with a roller at one end near the top, and another at the other end near the bottom, the one to run on the floisbed part of a course of work which is in progress, and other on a finished course or on the foundation of of the other on a finished course or on the foundation of the wall, to guide the box in a horizontal line, while the plates keep it from deviating laterally from a straight line. 2nd. The plate applied and operating in com-bioation with the other parts of the box, to produce window-caps, mouldings, or projections. For Roofing Cement. R. 11. SMITH, Cincinonti, Ohio.—Claim : A cement formed by materials, whereby a centent may be made and applied to roofing and other purpases, without the aid of fire to render if fuid as herefore, and by which the offensive smell

and other purposes, whose the data is the because it fluid, as herelofore, and by which the offensive smell arising from the use of coal tar, &c. is neutralized. For an Improved Mode of Incorporating Bitu-minous Liquids with Wet Earths for Cement. WILLIS H. JOHNSON, Springfield, Illinois. -- Claim : The combination of bituminous liquid and aqueous cements or mortars

For an Improved Mode of Lathing and Plaster-ing. JOHN G. VAUGHAN, Middleborough, Massa-chusetts, Assignor (by mediate transfer), to ISAAO M. SINGER, City of New York.—Claim: Plastering ceilings, or other surfaces, on lathing formed and secured, so as to leave interstices between them, with parallel them, with para sides oblique to the surface of the plastering when put ou.

¹ For an Improvement in Staircases. ACUSTUS: ELIATERS, Boston, Massachusetts.—Claim: Forming separate and independent "string picces," between which the trends are beld and griped; the whole being secured by a screw bolt, that forms a part of, or is attached to, the balaster. For an improvement in Bridges, D.C. MCULIUM, Oswego, New York.—Chim: So combining the arch brace with the arched cord or beam, the top horizontad surface of the abutment or pier, and the lower cord or tie, by means of the iron shoe and tensiou rols, as that the through of the role cord shall be thrown For an Improvement in Staircases. AUGUSTUS

that the thrust of the arched cord shall be three down upout the abutuent, and any deflection in the lower cord be counteracted by an upward furce at each end of the tension rods. Also, the method of lower cord be counteracted by an upward furce at each end of the tension rods. Also, the method of lengthening or shortening the braces of a bridge truss or girder by which the truss may be elevated or depressed as required, by means of the yoke, the plate on the end of the brace, and the straining pieces with their mete with their nuts.

For an Improved Machine for Cutting Teneers from the Log. JOSEPH H. GOODELL, Bridgeport, Connecticut. - Clrim: The combination and arrange-ment of the resproceding log-carrying slide, unsupported by trunnions or axles for its curvilinear play, with the fixed guiding strips and stationary knife, with the fired guiding strips and stationary knic, when soil guiding strips serve as the sole guide to give to the log carrier its curvilinear movement and simultaneous side action, whereby a steadier and more reliable united double bearing is given to the log in its movements, the log may be secured with facility to the earlier, and the driving power is com-municated to the log in a more positive and direct manner for cutting with increased ease and precision thin veneers. Also, hunging the knife-holding frame to the main knife-feeding side or frame, for the easy and double adjustability of the knife. For an Inverse Method of Adjusting the Rife.

For an Improved Method of Adjusting the Bits of Curpenters' Planes. THOMAS D. WORDALL, Lowell, Massachusetts.—Claim: The arraugement of Lowell the rack and pinion, and the clamp, so that, while the pinion is piaced within the clamp, the rear or dove tailed sides of the rack bar shall serve as bear-

400°C-failed slides of the rack our shall serve as own-ings for the clamp to work against. For an Improved Method of Adjusting the Size of the Month in Planes. THOMAS J. TOLANN, South Scituate, Massachusetts.—Claim : The application to the common plane, of the serew attach

the common plane, of the serve attachment and key through the same, thereby regulating the month, and greatly increasing its value. For an Improved Tubular Augor. J. A. REY-NOLDS, Elmira, New York.—Claim. The employ-ment of an anger, whose shank or stem shall form a grean when carbinal with a milting the target of the screw when combined with a guiding tube surround-ing the screw shank of the anger, but not covering the head thereof. Also, the use of the guide tube when combined with the sliding carriage-riage constructed with the slide. -said car

A BUILDER'S CONTRACT OF THE FIFTEENTH CENTURY. JESSE ALTAR IN ST. CUTHBERT'S CHURCH,

WELLS,

THE church of St. Onthhert, in Wells, is a large huilding chiefly of the Third Pointed period, and consists of a nave, aisles, chancel, and north aud sonth transsepts. A writer in *Notes and Queries* has given the following par-ticulars in connection with an accient context. ticulars in connection with an ancient contract

finest examples of tower architecture in Somersetshirc. On each side of the chancel, and in each transept, are chantry chapels with separate dedications. In the year 1848, Mr. H. Powell, the then church warden, commenced some exten-sive restorations, and, in the course of his labours, made some most interesting discoveries. Against the castern wall of each of the tran-septal chapels were found reredos, hronght to light on removing the plaster from the walls. Each reredos consisted of tiers of niches with canopies, &c. the sculptured ornaments of which were of the richest and most elegant designs. That in the sonth transept was apparently of a later date than the other, and not so elaborate in it is details. It was intended to illustrate the genealogy of our Lord. At the hase was the recumbent figure of Jesse, from whose body the stem could be traced, and no doubt rau through the whole series of statnes which formerly stood in the niches above. The figure of Jesse was boldly and beantifully carved; but portions of where they projected from the wall, had heen chopped off, the figures broken into fragments, throw n into the niches, aud then plastered over, so as to present an even surface, —an example of the mischiefs effected by the iconoclastic Vandals of the Reformation. Nothing was known of the history of these heautiful remains until a short time since, when the following curious document was found among the city records :-

" The Model of ye Blessed Virgin's Alter Piece.

n Iudenture made betwixt Mr William Vowell, Master of yr Towne of Wells, Willyam Stekylpath An Master of y Lowe of Weis, might of early fail and Thomas Coorset of the one parte (Chosen Wardens for Our Ladyc's Alter), and John Stowell freemasan of the other parte; For the makinge of the frounde of the Jess at our Ladyes Alter at St. Cuthbert's Church in Welles aforesaide.

This Indenture made at Welles in the Shire of Inits Interesting made at Westers in Inter-Sinte of Somerset yr 25th daye of Febr in yf yeare of our Lord 1470 and yf yeare of Kinge Heurye yf VI from yf beginninge 49 heitwene M'r William Vowell Master of yr City of Welles, William Stekylpath and Thomas nrset, Wardens of our Ladye's Alter in the Church St. Cutbbert iu Welles foresaid on that one parte, and John Stowell of Welles foresaid ffreemason on that other parts. Witnesseth that the said John Stowell hath take to make and shall make or do to Stowell hath take to make and shall make or do to be made well sufficiently and warkemauly and pleymorly performe and within 16 Moneths next suing the date of this Iodenture. All the Workman-shipp and Masonry Crafte of a Frounte Innynge to y^{e} Alter of our Ladye within y^{e} Churche of St. Cuthbert in Welles foresaid in y^{e} South 11e of the same; The which Froundt shall extend in breadth fro the Koyne of the Arch beioge the North parts of the wind Alter unde the Amell beinger in y^{e} south side of and Alter unto the Augill beinge in y^* south side of the Alter foresaide. Also y^* said Fronte shall arise in heighte from the groundinge of y^* saide Alter unto the Wall plate of y^* yle foresaid or else littlelake so as it may moste convenyentive be proportioned and moste stablish'd. In which Frounte shal stand three moste stablish'd. In which Frounte shal stand three stasis of Imagery accordinge to y* geneology of our Ladye wyth theire basyngs, hovelis and tabernaelis, well aud workunaulye made and wronghte. There shal also arise from the basyngs of y* said Frounte bytwene Image and Image, Coorses well and worke-manlye wronghte trayles ranninge in the said Coorses accordinge to the workes foresaid with two wyngis comying out from the said frounte after the hreith of the Alter, freight with Imagery such as can be thought by the Master and his brothers moste accordinge to the story of y* saide frounte. In y* lowest y'te of y* which stagis shall be a Jesse; the which Jesse shall linially runne from Image to Image through all the foresaid frounte and coorses as work-maulye as it can be wroughte. To all the whiche an operation of the second rounter and coorses as work-manlye as it can be wroughte. To all the whiche workes and businesse the foresaid John Stowell shall finde or do finde all maner of Stuffe, as well freeston fair and profitable as rough stone, lyne, sand, yron, lead and seafold Tymber and all other stuffe uccessary to the said work is to be had. For the which work-

JUNE 6, 1857.7

manship and stuffe as it is above writ the foresaid manship and stuffs as it is above writ the foresaid John Stowell shall have and receyve of the said Maister or Wardens or theire deputies Forty poundes pay in good and lawful money of England, in suchewise and at such tymes as it sayth hereafter: First at the scalinge of this Indenture, forty shillinges and after that weekly as it may be understood that the worke goeth forth. All the residue to he paid at the end of the foresaid weeks, save alwayes before that the said Master and Wardens have remayuinge in their hands till the foresaid workis bee perfectlye ended five pounds. For all the whiche Covenants well and truly to be performed the said John Stowell bindeth himselfc his errees and his excentors by obligation in range to be performed the said John Stowell hindeth himselfe his eyres and his executors by obligation in Twenty pounds to be payd to y said Mr. William Vowell or to his assignees so that the sayd John breake any of the Covenants foresaid. In witnesse whereof the said partys foresaid have putt theire scales &c.'"

AN AMERICAN INSTITUTE OF ARCHITECTS

An architect, writing from New York, says,--" We As architect, writing from New York, stys,— we have just been founding an American Institute of Architects bere: after failures in years gone by, the hour has arrived. All the leading architects have coincided: we have bad meetings for organization. Trustees have been cleeted, funds subscribed, an opening address has been made by Mr. Upjohn, the Nestor of New York, aud another by Mr. Walters, the arebitect pitol." At the next meeting-the first regular the transaction of business-Mr. Calvert of the Capitol. Vaux was to read the paper of the evening.

TASTE OF THE WORKING MAN

For some time past-and perhaps from time immemorial, --there seems to have prevailed an opinion with reference to the taste of the working classes in this country,—calling in question their capacity to appreciate the beautiful in works of art. Very much also is insisted upon the necessity of means being afforded them for the cultivation of this taste, and of afforded them for the cultivation of this taste, and of extending among them a knowledge of art, — a remark, by the way, which may appropriately apply to the critics themselves. We are inclined to think that the working classes, taking them generally, are *not* destitute of a taste for the fine arts, or for any object whatever that has a power of charming the eye. That this sensibility to feel and perceive beauty when pre-sented to them requires constant enthure, and is an-ceptible of continual improvement, we readily admit. The miods of this, as of every other, class ceptible of continued improvement, we readily admit. The miods of this, as of every other, class receive differently, and are differently acted upon by, impressions from external objects, and vary in this respect like the nature of various soils; and, as dif-ferent soils must be prepared to receive seed sown into them so it is with minds — whatever is resolved there them, so it is with miuds,—whatever is received there, whatever emotion of pleasure, whatever refining in-fluence objects of art infuse into that receptacle, is This cant about the deficiency of taste in the work.

ing classes is an iojustice to them and to their peculiar character, which is favourable to the insight of the cause of hearting effects ratio that using to the easier of hearting effects ratio that easier of hearting effects ratio that the principles and working of those very arts or handieraits connected with art about which their decires are so elamorons. No one who has mixed much with them but, with ordinary discernment, will soon discover that the elements of this taste, of which critics think they are the sole this taste, of which critics think they are the sole possessors, are possessed by them in a greater or less degree. Apart from considering the deterity, genus, and ready contrivance they show in their work (take any department), they give evidence of it in their attempts at decorning, as far as their means will allow, their little household or garden (if happily they have one), taking great pleasure in the cultivation of flowers, and scattering around them ornaments, it may be of a cheap kind, yet all that they can afford, for the purpose of breathing something of an air of poetry, under difficulties, and having a recollection of fair Nature, whom they would fain see more fre-quently. This element, it is true, often smoulders quently. This element, it is true, see more true quently. This element, it is true, often smoulders from hard circumstances, till perhaps it dies away, and is thought by some never to have existed: it is often sacrificed to the demands of necessity. But, though this occurs, there is a field of exertion open; and we wish there was a stronger meeting and race of competitors. And the best vindication of the working competitions. Not the best indicates of the state, is the desire manifested by them to visit the art-trea-sures exhibited with such suitable *éclat*. This stimulus sures exhibited with such suitable *éclat*. This stimulus they long wanted, and it is now added. Some examples they long wanted, and it is now anded. Some examples of workmanship, in joinery, carving, for instance, pronounced by the best judges as no less monuments of industry than of talent for design and skill in execution, have been the work of some unknown, perhaps half educated, working joiner, hut he had *laste*, and determined to excel some production which

THE BUILDER.

he saw, and so achieved fame. How many an obscure, he saw, and so achieved rame. How many su obscore, hard-working man's talents have been hrought forth by the spirit of rivalry which such an exhibition nurses, and the issue of his skilled haods and fine hrain combined has heep presented to the admiration of royalty, and the workman has been brought before the great of the land 1 All of us loving and interested in the arts, and those who pursue them with success, must bope that these exhibitions, the instruments of must object that these exhibitions, the inside making of public and artistic education, will remain a permanent resource and encouragement. When we withese the multitudes of working men pressing eagerly to con-template the treasures opened to them, and find them template the used is obtain a of an and the such a set of the set cent dome in the metropolis; we think such met the pioneers, may probably become the directors, of public taste. FREDERICK LUSH.

Biographies of Distinguished Scientific Men. FRANÇOIS ABAGO, Member of the Institute. Trans-Inted by Admiral W. II. Smyth ; the Rev. BADEN POWELL; and ROBERT GRANT, Esq. Longman and Co. 1857. London

THIS volume of the series of English translations of Trus volume of the series of English translations of M. Arago's works consists of his own antobiography, and a scietation of some of his memoirs of eminent scientific men, both Continental and Britisb. The latter comprise the lives of Bailey, Herschel the elder, Laplace, Fourier, Carnot, Malos, Fresnel, Thomas Young, and James Watt. The volume, therefore, is one of very general and micellaneous interest. Sup-ported, however, as we here find, by the translators themselves, we no longer refrain from examine portent, nowaver, as we nere and, by the transitions themselves, we no longer refrain from expressing a regret which we formerly felt, and which there is here new occasion to fed, that a man of Arago's celebrity should have betrayed occasional symptoms of a narrowspirited jealousy, and an unfairness of judgment where, by some slight twist of facts and circumspirited jeauousy, and this of facts and circum-where, by some slight twist of facts and circum-stances, he could diminish the glory of a foreigaer by exnggerating that of a fellow Frenchman. Such is the ease in respect to Watt. In the midst of very magnanimons-looking enlogy, M. Arago actually so magnanimons-looking enlogy, of the "digester," as magnanimous-looking enlagy, M. Arago actually so starts his countryman, Papin, of the "digester," as a coadjutor of Wati, or *co-sharer* with him in the merit of inventing the steam-engine, as to give to Papin a degree of prominence which is quite ridi-culous. Papin laboured in the same field as Savery, in experiments on the effects of steam as a motive power, but, as Mr. Fairbairn remorks, in a note on this very subject, appended to the volume under notice, we have yet to learn that that power was ever applied by him to the organic parts of an engine, cal-culated to overcome the resistance of a load, such as the prophision of machinery or the raising of water from mines. It is, indeed, "unbecoming in a great from mines. It is, indeed, "unbecoming in a great man and a great nation," as Mr. Fairbairn adds, "to attempt to drag forward competitors where no com to attempt to drag forward competitors where no com-petition exists,—where, in fact, the invector stands alone as the benefactor of the human race." We remember the pain with which we noted, in a previous volume of Arago's works, the laboured, if not very judicious, mixture of magnanimity and detrac-tion with which Sir Jobs Hierschel was haudled. The translators, in their very brief preface to the present volume, cannot refrain from alluding pointedly to the "doubt" which " could not but be felt." as to the "doubt" which " "doubt" which "could not but us rate as to two "perfect furmess of Arago's judgment" in "pronouncing on the claims of distinguished individuals." It is long since considerations such as these led the writer of the present notes to suspect that Arago was him-self somewhat overrated as a mao of first-rate ability. sen somewhat overrated as a mao of irst-rate ability; for no such man ever displays anything like a pality; jealonsy of the greatness of others. As regards his own autohiography, too, there is a defect somewhat parallel, though of quite another description, but just such as one might expect from a mere second-rate mind. There is, as his translators themselves almositadmil, "an is of programe?" in it here and there which "literated in it, here and there, which "invests air of romance" in it, here and there, which "invests some of the adventures" with a "suspicion of occa-sional emhellishmeot." In relation to the history of science, this memoir gives some interesting particulars which disclose to us much of the interior spirit of the Academy of Sciences, not always of a kind the most ereditable to some of Arago's former contemporaries; but a far higher interest belongs to those eloquet i memoirs or *éloges* of eminent departed men of science who had attained the distinction of heing members of the Academy.

VARIORUM.

A SECOND edition of Mr. Ruskin's "Notes on A SECOND entrol of Mr. Rusan's Poles on some of the principal Pictures exhibited in the rooms of the Royal Academy and the Society of Painters in Water-Colours," has been issued by Smith and Elder

(Cornhill), hut does not contain any additional matter. The Notes this year are pleasant and suggestive read-ing, chiefly remarkable fur the praise of some hereto-fore found fault with, and the condemnation of the work of one hitherto his idol. "The pre-Raphaelite eause," he says, "has been doubly betrayed, hy the mistimed deliberation of one of its leaders, and the inefficient haste of another."—A "Report to the Hon. the Commissioners of Sewers of the Giy of London, of the results of the Gauging of the Seyers discharcing within the limits of the of the Sewers discharging within the limits of the City of London during the year 1853," by Mr. Wm. haywood, the engineer to the commission, has been made and printed. This is an elahorate piece been made and printed. This is an elaborate piece of work, containing the result of some millions of figures in calculation and in registration of observa-tions, proving, as we freely grant Mr. Haywood, that he has *not* had on his nightap, even at times when it ought to have been confortably drawn down over his no longer wakeful cyclids. We believe we did insinuate, in a scarcely serious way, that Mr. Hay-wood scemed to meditate putting some such stopper on the oursetion of sover ventilation in the City - but on the question of sover ventilation in the City; hut Jove himself occasionally "nods," and our readers know very well that we have willingly, and oft, done justice to the exertions of the active engineer to the City Sewers Commission. It appears from his report, now under notice, that the total average discharge Now moder notice, that the total average discharge from the City sewers in dry weather, per diem (Sun-days excepted), is 3,255,400 cubic feet, or 20,316,442 gallons, the maximum discbarge heing hetween 11 A.M. and 12 A.M. when its average is 349,750 cubic feet per minute; and the minimum between 2 A.M. and 3 A.M. when its 1,033 cubic feet per minute. The nost laborious portion of the report is in a tabular form.—We lately gave some account of a hopeful project for the formation of a college at Gnoll Castle, in the vale of Neath, South Wales, The scheme is now completely developed in a small volume published by Stanford, 6, Charing-cross, and Westerton, Kaightsbridge, under the title of "The Principles of Collegiate Education discussed and Principles of Collegiate Education discussed at elucidated, in a description of Gaoll College, national institution adapted to the wants of the age discussed and The volume contains a map showing the central posi-tion of the college and some of the facilities afforded ou ; and a lithographed view of Gnoll hy such a position Castle and Neath The programme bas now the Castle and Neath. The programme use now use names of the Resident Executive Council appended to it, namely, William Ballock Webster, Lewis C. Herstlet, and Trelawny Sannders, and in an appendix is a list of local supporters, containing many highly influential names.——Mr. Liddell, of Hull, a gentle-ment the area at its interact in praceed and indus. 18 a fist of local supporters, containing many many influential names.——M.Y. Liddell, of Hull, a gentle-man who takes an active interest in ragged and indus-trial schools, has prepared "A Brief Account of the Hull Ragged and Iudustrial Schools," which has been pub-lished by Messrs. Longman and Co. the profits, if any, for behoof of the school. This tract may be regarded as a tractice on such schools in general, and the hest a treatise on such schools in general, and the best mode of conducting them. A very creditable new building has beeu crected at Hull for the Ragged and Industrial Schools there, from plaus by Mr. Botterill, architect, Messes. Hall and Sous, contractors. At this school there were ninety boys and seventy-six girls during the past year. The new haildling bas this scool torre were much over an energy of a second print during the past year. The new hailding bas dormitories, baths, clothing stores, industrial schools, master's residence, and various other appendages. "A Slice of Bread and Buitter cut by G Cruikshak" (Tweedie, Strand, publisher) is a tract bearing on Rarged Schools and Reformatories, in which the author, in his own poculiar way, urges the necessity of going to the root of the evil which calls for such institutions, which root he regards as, above all else, drink and dissipation amongst the parents of those for whom Ragged Schools and Reformatories are founded; and there is too much truth in what Mr. Croikshank urges. Intoxicating liquors are the cause of ninc-tentbs of all the crime and all the starvation which darken the lot of this properous nation. They convert industry into idleness, sanity into mad-ness, and goodnature into murderous malice, masking and transforming all who partake of them unduly into and transforming an who partake of them dualy into devils incarnate. The practical instigation to crimes excited by the contrast between the bonest beggan-boy in rags at the Ragged School, and the convicted thief in suart costame at the Reformatory, is pointedly and graphically described by Mr. Crukshank in the little tract before us: this is just a ministure copy of the sad picture presented by the contrasts between the workhouse and the prison for the adult : when will the workhouse and the prison for the adult : when will such national *isiquities* he adolished?——Amongst the more generally useful of the "hooks received" since our last, we may note "The English Bread-hook for Domestic use ; adapted to Families of every grade" (Longmans, publishers), by Eliza Acton, author of "Modern Cookery." This little volume, heides practical receipts for many varieties of bread, contains notices of the present system of adulteration, and its consequences and of impresed heims notes. and its consequences, and of improved baking pro-cesses and institutions established abroad, the hest forms of oven for bread-baking, &c.

Miscellanea.

328

"VENTILATION OF SEWERS." - Your article, "Where there's a Will there's a Way," is confirmed, hy admission, every day; but circumlocation and pro-contraction have been the set of the set crastination have become the leading features of management and neglect in every department. We hecome so inured to abuses and evils, that the talking over them is considered sufficient ; the remedies sub over them is considered sufficient; the remedies suf-mitted by thoughtful, inventive men, for curatives, are admitted to be good, but the habit is such, un-fortunately, that "the lock is never put on the stable door nutil the horse is stolen." So it is and will be with our "sewago nuisance," daily getting worse and worse, as every man with a sense of smelling can have proof by getting near or passing over the gally grates or yents in mid streets of London and Westminster, the latter flatting here or worse hs the flatness of the or yents in mid streets of London and Westmanster, the latter district being worse, by the flatness of the district sewer inverts. Cholera and typhus are there engendered and bred, and when the burst out of disease arrives, all is then panic and confusion, and the chances are that the worst, most ineffective, and useless remedies are then hadly applied. "Trapping by proper water-supply and attention to the gully grates;" "introducing chemical (approved) fluid out other disinfectants into the seware." "annihilating of annihilating ail other disinfectants into the sewers " destroying the accumulative gas of sewers eesspools ; hy chemical agency, and burning off residue in fur naces and cooducting shafts by exhaustion ;" these are the remedies, but then they are the things desirableand auchter 'but' comes in the way: " they are pro-tected by patent, and the how is raised as against a mad dog, by those who had no brain to invent, but who would avail themselves of it surreptitionsly, evade it, or, as they generally do, neglect to apply it until forced hy clamour and the powerful voice of the Press." Pray follow on with loud and determined ealls to action .- W. AUSTIN, C.E.

PREPARATION OF LARCH FOR BUILDING.-The rood manager in Scotland for Lord Seafield, Mr. wood manager in Scotland for Lord Scaueld, MT. Brown, of Grantown, states that trees of from seventy to eighty years old, in every respect sound, may be used for beams, lintels, joists, and couples, with every certainty that a century will elapse ere they decay hut in order to ensure this, the trees must be felled between November and March, and immediately after-wards ent np and properly laid past to dry for at least wards ent np and properly laid past to dry for al least twelve months. To the using of young lareh, and to want of seasoning, are chiefly to be attributed the early decay of larch when employed for building purposes. The utility of generally employing pine timber, of home growth, for the purpose under notice, he adds, ia very questionable; unless in the north, where there is pine timber to be had of quality equal, if not superior, to any imported. The utility of steeping in corrosive sublimate, & to prevent decay, he thinks, is very questionable. For the finer boarded meets of a building as the other is may hiera board to warn. he thinks, is very questionable. For the finer boarded parts of n building, as larch is much disposed to warp, and is somewhat difficult to work, foreign deal should be used.

DEVELOPMENT OF THE MINERAL WEALTH OF IRELAND.—It is well known that Ireland is parti-enlarly rich in valuable minerals, such as lead, iron, copper, and other metallic ores; and marble, slate and other building materials. So unfavourable, how other metallic ores; and marble, slate, and other binding materials. So tunkontator, how-ever, has the state of the country possessed of such sources of wealth been till lately, that almost nothing has ever been done to realize these valuable products. But a very different future appears to be opening on But a very different future appears to be opening on Ireland. One of the signs of these happier times seems to be the starting of a new scheme for the working of the minerals in Mayo, and especially of lead, mathle, and slate, by a company called "The West of Ireland Mining Company," who are issuing a prospectus on the subject. A least has been granted by the Marquis of Sligo to Sir James Donbrain, on favourable terms, of a tract of land 200 square miles in area, and embracing all the mines and minerals in western and south-western districts of Mayo, the which is very favourably situated both as regards water power and sea frontage; and it is anticipated that a monopoly of the American trade in slates, marbles, &c. may soon be secured by the company, to whom this lease is to be made over. Among the directors we observe Mr. Dargan's name

THE LIVERPOOL TIMBER TRADE .- In his monthly Wood Circular, of 29th ult. Mr. Edward Chaloner states that the arrivals from British America during the month, consist of three vessels, 2,209 tons, against one vessel, 534 tons, in the like month last year. Owing to the continued high rate of interest, and the near approach of the import season, there has been a marked failing of in the consumption of all wood from the Baltic and Builish America; and as e stocks beld over are more than have heen expected, a general decline in prices for the forthcoming im may be reckoned on. At auction, two-thirds of the cargo just arrived per *Elizabeth Ann Bright*, from St. John, were sold at equal to an average of 87. 8s. e reckoned on. for the cargo. Deal ends, 6/. 2s. 6d.; fourth-quality, 7/. 6s. Scantlings, 7/. 10s. to 7/. 12s. 6d.

ARTIFICIAL PETRIFACTION OF WOOD. Count Dembinski's method of dissolving quartz by the aid of exhonate of soda, to facilitate the extraction of gold from the quartz, was found to he objectionable on account of the costliness of the process. This on account by the bosiness of the process rate objection, it is said, has been removed by a subsequent discovery. A product of this process is silicic acid, an effective anti-rot application. Timber impreg-nated with it by means of hydraulic pressure is, in fact, artificially perified, and is not only protected from dry-rot, hut from the attacka of worms and ants, and is rendered susceptible of a polish equal to that of marble.

GAS. - A trial of Mr. Knapton's invention for lighting railway earlings with gas has been made hetween York and Milford Junction, when a first-class carriage of the Great Northern was lighted with gas : each of the three compartments had an argand gas: each of the three compartments has at algand burner, allowing newspapers to be read with ease. The apparatus is exceedingly simple. Underneath the flooring of the carriage is fixed the "dry gasome-ter," composed mostly of galvanised rubber. When inflated, it contains 75 cubic feet of gas, which lighted three argand burners for rather more than eight hours, thus affording ample time to proceed from York to the metropolis, without any want of gas. A carriage with three gas lights, travelling fr York to London, cost, it is said, a fraction un 24d. whilst oil would he consumed, amounting travelling from under 214 1s. $7\frac{1}{2}d$. Some railway companies have given Mr Knapton orders for his apparatus. Mr. J. T. Thompof Newry, has also patented a method of lighting railway carriages with gas, which, is said to have proved successful on several trials. During the win-ter of 1856, the Galena and Chicago Railway (U.S.) had some carriages fitted with India-rubber gashol carriage, invented by Messrs THI ders under each and Demerest, Rochester, New York, which led Mr. Thompson to endeavour to introduce a system he considered would be practicable on English railways. considered would be practicable on English railways. The gasometer is made of thin wronght-irou platea, merely requiring sufficient water to form an bydrau-lie packing, 1 inch in breadth, round the gasometer. 9s. to 12s., although the works must be enlarged. The immediate extension of the works, adds the journal named, would have enabled the directors, while manufacturing nearly double the present quantity of grs, with about the same outly for management, and with the saving from waste, to have reduced the price instead of raising it, whereas the raising of the price will diminish the consumption, and lower the price will diminish the consumption, and lower the income. Perhaps the desire of the sagaeious direc-tors is to reduce the consumption till the present works he no longer too small, so that they may save the outlay necessary to chalarge the works 1 This is hut too likely to be the result, whatever be the desire of the directors.

of the directors. NitrROGEN IN STEFL.—At the meeting of the Society of Aris on 27(h ult. Mr. Fairbaira, F.R.S. in the chair, the paper read "was "On some Combina-tions and Pheuomeua that occur among the Elements engaged in the Maaufacture of Iron, and in the con-version of Iron into Steel," hy Mr. Christopher-Binks. The author began by remerking that the generally received theory of the formation and compo-sition of steel was not satisfactory. Theveryold practice of using ferrogyanide of potnesium as magentof converas nn agent of conver of using ferroeyanide of potassiv sion was worth consideratiou. This compound contained nitrogen and potassium as well as carbon. He then p ceeded to give the details of a series of experime He then pro made by exposing commercial malleable iron to the action of various substances at a high temperature, and remarked that as far as those trials extended there had always heen a co-operation of both carbon and nitrogen whenever steel was produced, though it still remained to be determined whether this was absolutely necessary to its formation. It was also remarkable that various nitrogenous matters, s horn and leather shavings, animal ebarcoal, and other abstauces, were commonly used, either in the manu facture or in the tempering of steel. Analyses made by hinself proved that the best kinds of steel con-tained about one fifth per ceut, of nitrogen. In course of his remarks allusion was made to the fact that in the formation of the celebrated East-Indian steel, called Wootz, highly azotized or uitrogenized table substances were used. At the close Mr. Bi table substances were used. At the close Mr. Binks acknowledged the deep obligations the iron world owed to Mr. Bessemer, were it merely for the prac-tical development of the vivid reaction of atmos-pheric air and molten iron, at same time expressing Mr. Bessemer's exertions. A discussion ensued, in maner, let down a whole family, --wome, children, which Messrs. D. Mushet, F. A. Ahel, T. M. Glad. sick, old, and infirm , and, at last, lower himself down stone, F. Braithwaite, C. D. Archhald, R. Fletcher, hy holding the same open in his hands.

JUNE 6, 1857.

THE SEWERS .- In your obliging notice of my THE SEWERS.—In your obliging notice of my receut publication, "Facts and Fallacies of the Sewer-age System of London," yon conclude your observa-tions by saying, "Mr. Rogers's panacea is pat char-coal." Pardon me, if I say this is a misconception. My proposition is, "that a metal pipe be laid through the sewers, into which all the water-closets shall all-charge." If this were done, "peat charcoal" would not be an actual *essential*,—although now admitted to be the best decodorant: there are others which would nuswer the nurrose heavase the matter in the would answer the purpose, hecause the matter in the pipes would be hut slightly decomposed, being propipes would be hut slightly decomposed, being pro-tected from atmospheric action, and when discharged into the filtering chamber at the sever mouth, other means than "peat charcaal" might be used to effect decdorization to a sufficient extent, —if there be any well-founded objection shown to its use. My proposed system is, in fact, the separation of excretary matter from the surface and onlinary water, thereby preventing the accumulation in the sewers of that which no quantity of water can wash out of them, at the same time per-mitting the unchecked discharge of such matter at all mitting the unchecked discharge of such matter at all times of tide, inasmuch as that the influx of water into the sewers would not affect the influx of water into the sewers would not affect the closed pipes, and stoppage in them would he immediately remedied by the action of "vacuum." You will, I am snre, do are action of "vacuum." You will, I am sure do me the justice to insert this, as your observation alluded to might be read in a servour observation alluded to might be read in a sense which I cannot believe was intended.—JASPER W. ROGERS. THE FIRST CRYSTAL PALACE FLOWER SHOW.— The flower show at Sydenham was held on Saturday,

30th ult, and the result was more than ordinarily satisfar ortin and thereaft was under the indicate many satisfies tory, the number of competitors heing large, and the display of flowers more magnificent has on former occa-sions. Azaleas, roses, geranums, heaths, calceolarias, eactures, and fuchsias, all in their most delicate or most gorgeous hncs,-the varied and graceful ferns, and a collection of orchids,-not forgetting that forgetting extraordinary product of nature, vulgo, the pitcher plant, -- contributed, much to the beauty of the exhibition. The whole system of water-works was hrought into use for the first time this acason, but unfortinately the two great essentials to their per-fectness, still air and snnshine, were wanting.

COMMON LODGING-HOUSES .- From a report a dressed to the Home-office hy Captain Hurris, the Assistant-Commissioner of the Metropolitan Police, it appears that the Act for the well ordering of comnon lodging-houses has now been in operation since the year 1851, and has been attended by most hene-ficial results. The houses are much improved and daily improving : the keepers are of a hetter class daily improving: the keepers are of a neuter chass; and the accommodation provided for the poor, without being dearcer, is, in all respects, of a higher standard. Cases are adduced to illustrate the nature and extent of the evils arising in houses not controlled by law, and at the close of the report there are a numher of letters from medical officers of health and others, urging the advantage of applying such an Act to single apartments let separately, and occupied by the poor. Under the present Act, 14,570 keepers have here served with "noties to register," and 6,292 of poor. Under the present Act, 14,570 Keepers have here served with "notices to register," and 6,292 of these houses have been surveyed and measured to ac-commodate 91,106 persons; 2,355 houses have heen "permenently" registered, and are used as common lodging-houses, wholly or in part; 6,275 houses, nufi-er monitories, have head given and a second and a second to a second a second a second a second a second a second base of the second and a second a seco loaging-noises, wholy of in part; 0,275 houses, into for registration, have been given up; 3,897 casual houses are under strict supervision. The number of model lodging-houses is 104, accommod-ting 989

moder longing loads is low, accommoding boo families, and 882 single persons. We may return shortly to the subject of this very interesting report. Music,—" Operatic Proverbs." — Mr. val. Morris, favourably known both as a composer and executant, has written and composed for Mr. and Mrs. Henri Drayton a drawing-room opera, or, as he calls it, "A Proverb," for two performers only, which is exceedingly elever, and should increase his reputation greatly. Two or three of the airs ought to be very greatly. Two or three of the airs ought to be very popular : for example, the first romance in the second part "There is a charn," sung by Mr. Drayton. part, "There is a charm," sung by Mr. Drayton Mrs. Drayton acts with much spirit and intelligence.

FIRE ESCAPES .- Drive a strong staple into the upper part of every window-frame, citber in one or every floor of the house: provide two blocks, with two or three pulleys in each. Now put a rope through two or three pulleys in each. Now put a rope through each pulley, of a length sufficient to reach the ground each pulley, of a length sufficient to reach the grounds from the top of the window. Provide also a strong bag, or sack, of about 4 fect deep and 18 inches wide, with a wooden bottom, and a few baops to keep the sack open. When an unhappy occasiou requires the use of these, let the hoop of the upper block he hung in the staple; then, the person or persons must stand in the wooden bottom, draw the sack up about them, and hang the string of the sack on the hook of the under block when any none merson may with the under block, when any one person may, with the greatest ease and safety, let another down into the

"COZENS TESTIMONIAL,"-The "Cozens testimonial," ensisting of a service of plate, will he pre-sented to that geutleman, as founder of the Builders' monial. sented to that gentleman, as tounder of the Builders' Benevolent Institution, at the London Tavern, on Tuesday, the 9th inst.; cn which occasion Mr. Alderman Wm. Lawrence will preside, supported by Mr. Alderman Wm. Cubitt, M.P. and other gentle-men; and the subscribers will afterwards dise treatment. men; a together.

SOCIETY OF FEMALE ARTISTS.-A number of ladies have formed themselves into a society for the and in the contract the insertion in the above sent 358 works of art to 315, Oxford-street, where they are now on view. What has led to this step we have not heard, or how the movement originated. The start

might have been better managed. ALUMINIUM. — In the eolumns of a scientific jour-nal, wherein unmitigated ridicule was recently cast upon those who have been hopeful as to the luture upon those who have heen hopeful as to the future uses of this somewhat anomalous metal, we now find the tables turned, and a new and hopeful spirit mani-festing itself, which vies with anything we have ever said on the subject, as will appear from the following extract :--- "We learn that the preparation of this metal, according to the system proposed by Dr. H. Rose, a celebrated German chemist, in 1855, has now hecome an important munifacture, and our informant remarks that this novel branch of industry, which owes its development entirely to France, is worthy of a position among the most interesting discoveries of modern times. This metal, which has hitherto been so extremely scarce, is said to have been made up into articles the lightness of which astonishes those most difficult to be atonished. difficult to be astonished. The most works have been pursued almost without interruption at Amfreville, and it is said that difficulties no longer at Amfreville, and it is said that difficulties no longer exist. Notwithstanding the high price of sodium, aluminium is delivered from Amfreville at a price which will admit of its being applied in a great num-ber of instances. The price of aluminium would, of course, be reduced in proportion as improvements are made which will reduce the cost of sodium, the manu-facture of one being subservient to the other. Then the manufacture of sodium is no longer dependent upon circumstances requiring the study of chemists, but is an industry which time will more fully deve-lope; and at Amfreville slow, but sure, progress is being made in perfecting the manufacture." TALL OF ARCH, SUGBDON-COURT.—Some incorrect statements of this accident having appeared, the

statements of this accident having appeared, the architect, Mr. Alexander Milne writes, --- It was a segarchitect, Mr. Alexander Mine writes,—It was a seg-ment arch: the span was hetween 15 fect and 19 fect, and the rise from the springing to the soffit from 4 fect 6 inches to 5 fect. One of the abutments, above 3 fect thick, consisted of the main wall of the honse, which rose about 35 fect above the springer. The other was a new wall, 3 fect thick, the back side of which work a many the net the network of the back side The other was a new way, or next incy the back side of which rested against the natural soil. Neither of these, it should be added, gave way, resting, as they did, not on any was, imperfect, or 'old '' foundation, hut on solid rock. The facts of the case were these :--The arch was keyed it on the 23rd, and on the 23th the centre was slacked for three hours before striking, the process of which was, anonly, acound to during process of which was nearly completed, when the without giving any kind of warning, the arch fell. There is no question as to either materials or work-manship: both were of the best quality. The acci-dent was caused by the removal of the centre in too short a time after the keying in of the arch, sufficient allowance not having been made for the moist nature of the groat pourced on a few hours previously, and for the rain which had just before fallen in torrents, as to cause the green mortar to become almost lio rid

liquid. ARCHTECTURAL CONGRESS AT LINCOLN.—As notified by us on the 23rd nlt. the congress of various provincial architectural societies was held at Lincolu on the 25th and subsequent days. The meetings were beld in the city Assembly-rooms, the walls of which were covered with drawings, photographs, &c. The Rev. G. A. Poole read his paper on "The Fabric of Lincola Cathedral." On the second day of the con-ress nearby filts of the congressionis, nade an ex-of Lincoln Cathedral." On the second day of the congressionists made an ex-gress nearly fifty of the congressionists made an ex-e cursion, as arranged, to Coleby, Somerton Castle, Navemby, Wellingore, Welbourne, Temple Bruer, Ke.; and in the evening there was a brangnet in the Cora Exchange, Lincoln, the Bishop in the chair; and a meeting in the Assembly-rooms, when several papers were read. The Mayor of Lincoln closed the congress with a banquet on the following day.

ENLANGEMENT OF GEORGE WATSON'S HOSPITAL, ENLANGEMENT OF GEORGE WATSON'S HOSPITAL, h EDNRUNGENT - Mr. Lessels, the architect of John h Knox's Clurch and other buildings at Edinburgh, has a prepared plans for the improvement, alteration, and andargement of George Watson's Hospital, an exten-ksive educational establishment in the submits of the site educational establishment in the submits of the site educational establishment was estended and more liberal system of culcation adopted. The works, which comprise two new wins, extending works, which comprise two new wings, extending southword to the meadows, are to be at once proecceeded with.

EARL DE GREY'S CONVERSAZIONE .- On Friday, the 29th ult, Earl de Grey received the members of the Royal Institute of British Architects at his house in St. James's-square, and invited a large number of

The boyal instruction of the Architects in shores in St. James's-square, and invited a large number of persons eminent in art, science, and literature, in-cluding many ladies to meet them. Pietures, draw-ings, and books, afforded matter for conversation, and the whole evening was a theme for praise. The Discoverner or THE COLLODION PHOTO-GRAPHIC PROCESS.—Her Majesty the Queen, having heen informed that Mr. Sout Archer, the discoverer of the application of collodion to photography (a process which has supersold all others), had died, process which has supersold all others), had died, process which has associated for, has been pleased to head a subscription by a gift of twenty guineas. The Photographic Society of London have followed with a grant of fifty pounds, and from the general estimation in which Mr. Archer's discovery is held, a very handsome testimonial is expected to be raised. The committee-room is at 226, Regent-street, and Sir William Newton, R.A. has kiudly undertaken the office of treasurer.

and Sir William Newton, R.R. Bas Along the office of treasurer. JOINERS' MOVEMENT AT HALIFAX.—A large meeting of house and ship joiners was held at Hali-fax on 25th March Last, when it was resolved to solicit from their employers a rise of wages, from 7.8. 6d. 05.8. 6d. a day currency, and a promise on their part not to employ any one incapable of caru-ing 6s. 6d. a day as the lowest rate of wages, to run bas has weet to La November, and at the same ing 6s, 6d, a day as the lowest rate of wages, to run from 1st May next to 1st November, and at the same rate per hour during the ensuing winter. A committee of thirteen of those present was then appointed to carry out the resolutions so come to.

[Advertisement.] TO THE EDITOR OF THE "BUILDER."

June 2nd, 1857.

Sin,-In the last number of the "Builder," your correspondent E. O. S. has the following paragraph :---"Jennings's plan is a great improvement, as you can remove the upper part of the connexion to examine the drain, but there is not space to clean it out properly

As the latter part of this statement is incorrect, I trost you will allow me to remove the impression entertained by E. O. S., and that which it may have given rise to in the minds of your readers.

given rise to in the minds of your readers. Before determining the length of the chair and saddle-pieces ("not being restricted by my patent"), every contingency was imagined, opinions were taken, and experiments tried, as to the introduction of such an apparatus as would he likely to be used in cases of stonaers.

of stoppac. With every respect for the opinion of your corre-spondent, I think " single junctions and half pipes" might be forgotten, and a " mark on the pavement or and to consolid, and a mink out the parement of wall' might disspear; but a line of my pipes, with-out record of any kind, will admit of examination very two feet, if necessory, when the present readers of the Builder shall have passed away.

I claim other, and greater advantages than that of Examination ;" but as these more properly belong to your advertising columns, I respectfully reter your re iders to th em,

And sm, Sir, your obedient Servant, GEORGE JENNINGS.

[ADVERTISEMENT.] TO THE EDITOR OF THE "BILLDER. 86, Regent-street, June 2, 1857 MESSRS, CLARK AND SON,

MESSERS, CLARK AND SON, GENTLEERS,—La reply to your inquiry as to my opition of your sbutters and work, I beg to say, that the brass front, &c. you put in for me, I think, is equal in finish, and, indeed, altogether such as is not to be excelled by any other in London; it werrs well, and I think the colour of the brass is excellent. well, and I think the colour of the brass is excellent. As to the shutters, it is now npanets of seven years since they commenced work : I believe, for repairs, a few shillings will cover all charge, except a small annual one for oiling. They do and have worked well during all that time, and no accident has oc-curred to them; and I believe them to be in perfectly sound condition now.

I beg to remain, yours obediently, JAMES MEDWIN

JUNE 13, 1857.

Builder. The Vol. XV.-No. 749.

TER seven sittings, the jury empanelled to inquire as to the deaths of the six persous who unfortunately lost their lives through the falling of the houses Nos. 146, 147, and 148, Tottenham-court-road, brought in the following verdiet :---

"That the deaths of Frederick Bing, Ann Driscoll, John Garnett, Richd. Turner, James Kevil, and Joseph Taylor, were caused hy the falling of the houses Nos. 146, 147, and 148, Tottenham-Ľ court-road

That eutting the holes in the well of 147 and 148 was the immediate cause -0 of the accident, the party-wall of 146 and 147 being very indifferent, requiring more than ordinary caution, which in this case

was not observed. That the cutting away the party-wall hetween 147 and 148 was done in an unskilful and

That the jury cannot separate without expressing their strong condemnation of the present conflicting state of the law as to the district and police surveryors, whose duties appear to be quite independent, and even antagonistic; and the jury sincerely hope that an immediate alteration will be made in the Building Act as at present constituted."

The last witness examined was Mr. Marsh Nelson, who had surveyed the premises, by direction of the eoroner, and who read a lengthened report on the cause of the disaster, with observations suggested by it. First describing the circumstances under which the alteratious were being made, he said the front wall of Mr. Maples's house was in a most nusafe conditiou, cracked and split in the middle by the front casing having parted from the hacking, and that the materials (for the most part) of which it was built were of the worst description. The north party wall was fractured and bulged, aud the chimney shafts overhanging. The party-wall on the south side was not fractured in the basement story, but the materials of which it was composed were equally bad; further, that the new brickwork in the parts he saw where the work bad heen made good was also of a most inferior kind. Old brieks had been used without being properly bonded, and the cements did not possess the adhesive qualities of common mortar.

"The huilders," he remarked, "iu explanation, mentioned the names of well-known manufacturers and merchants by whom the cements were supplied, and it is much to be regretted that respectable houses will countenance the sale of such rubbish under the name of cement."

The work that was being douc he considered very ill advised, and he came to the conclusion that the immediate cause of the accident was the cutting of the front hole in the party-wall between Mr. Hunter's and Mr. Maples's houses. The remainder of the report we give in the witness's own words, as printed in the daily papers :--

THE BUILDER.

We must be permitted to question the cor-

The state is the second server as a detailed survey of the front under the party wall, but has been that the back and are the party wall of Mr. The Mr. reetness of the impression sought to be con-

<text><text><text><text><text><text><text><text><text><text><text><text>

Mr. Nelson very properly points to the divi-sion of authority, in respect of ruinous buildings caused by the present Building Act. He says, sioners of Sewers (in the city), and the Police Commissioners, - " The Commissioners of minister the Act," &c. : but, "The Police Commissioners employ surveyors, and the result is

have done so, but the Commissioners of Sewers have neglected so to do, and have left the district surveyors to take their own way."

The fact is, the two bodies in question are not called upon to "appoint surveyors to check the proceedings of the district surveyors; the police commissioners have not done so, and have no power to do so. As we have again and again pointed out, the district surveyor is bound hy Part II. of the Buildiug Act, to make known to the commissioners of police (if the structure be not in the City of London), or to the commissioners of sewers (if it be), any information he may receive with respect to any structure being in a dangerous state, and the commissioners are then to require a survey to be made "by the district surveyor, or some other competent surveyor." The police comnissioners determined, on the passing of the Act, to employ a surveyor of their own, not "to check the proceedings of the district surveyors, hut to make these surveys; and a district surveyor, having sent off to Scotland-yard the notice he may have received, has nothing more to do with the matter, has uo power to interfere iu it, and knows nothing whatever of the steps taken until he receive from the builder notice of an intentiou to do such works as may be necessary.

The district surveyor ought, at any rate, to receive from the police commissioners a copy of the notice given by their surveyor; hut this is never sent to him, probably because of the large amonut of work there has been to do. The same excuse would prohably be pleaded for occasional great delays, for the loose wording of many of the notices from the police authorities, and for non-attendance afterwards to see that the notice has been carried out. From statements which have been forwarded to us hy more than one correspondent, it would seem that, in consequence of the illness of the surveyor to the police, the duties have heen discharged for some time by a deputy, at a small salary, who has found twelve or thirteen hours a day insufficient for the work, and who has had at times twenty or thirty notices in his pocket waiting to he attended to. We are told that since the Act came into operation, January 1st, 1856, 2,600 such surveys have been made, representing fees to the amount of at least 2,600% so that there can be no reason for the non-employment hy the police commissioners, of a sufficient number of competent surveyors to discharge the duties imposed by the Act efficiently and without delay.

ROME.*

ALTHOUGH of small elevation, the hills of Rome appear originally to have heeu abrupt or precipitous in their sides, which characteristic may still in many parts be observed—their summits forming level surfaces detached from the other parts of the city, except in the case of the Quirinal, Viminal, and Esquiline, beich ere write a off hearts from the waverutes which are rather offshoots from the more exten-sive platean towards the east than isolated Swamps occupied the lower portions hills. the intervening valleys, and a portion of the Forum itself was traditionally a mere marsh, of which the Lacus Curtius was one of the last remnants

¹⁴ Hoo ubi nunc fora sunt, udæ tenuere paludes : Amne redundutis fossa madebat aquis, Curtius ille lacus, siccas qui sustinet aras Nunc solida est tellus, sed lacus anto fuit."

Nuce solid set felias, sed facus and full? These marshes were particularly prevalent in the valleys separating the Capitoline, Palatine, and Aventine hills, the broader portion of which was known as the Velabrum, and for the drain-age of which the Cloace of Tarquin were doubt-less originally designed. Of these Cloace, that called Maxima still presents a remnant for our instruction. The valit is formed of three cou-centric arches, making an accreate thickness. centric arches, making an aggregate thickness of about 6 feet, and the sewer altogether is about 13 feet in width and height in the clear.

wards supplanted in public buildings by the finer quality of the peperiuo. The portion of the cloace Maxima, built by Tarquin, com-menced user the arch of Severns, then passed under the Via Sacra to the Temple of Julius, theues, following the course of the Via Nova at the hase of the Palatiue, it crossed the Form Boarjum, and ran straight to the Ther, which the hase of the Palatiue, it crossed the Forum Boarium, and ran straight to the Tiber, which it entered near the Ponte Rotto. Subsequent additions were made to this sever as far as the Suburra, vestiges of which were discovered in 1742. The expense of cleansing these sewers was defrayed partly by the treasury, partly by the assessment called *Cloacarium*; and under the republic the ecusors, and under the empire officers called *cloacarium curatores*, bad the ad-ministration of these works.

ministration of these works. After the occupation of the valley between the Palatine and Aventue by the Circus Maximus, the name Velabrum became gradually restricted to the street through which the processions passed from the Forum to the Circus, iu which sense it was known in the Middle Ages, and still survives in the title of the old Ages, and shill survives in the title of the old church of S. Giorgio in *Feldadro*. The cou-tiguity of the Forum Boarium to the Velabrum is proved by the passage of Livy, "Inde vice Tusco Velabroque per Boarium Forum," &c.; and also by the inscription on the arch of the Colducities etild structure pars C. Giorgio To Goldsmiths, still standing near S. Giorgio. To a late period the Vicus Tuscus was the great line of communication between the Forum and the Circus Maximus and Forum Boarium, and through it, upon the occasion of the Circensian aucs, passed the magnificeut processiou called the Pompa Circensis

Another point of interest in the neighbourhood of the Forum is the position of the once busy and crowded quarter called Suhurra. It the north cast of the Forum, in the broad is to the north cast of the Forum, in the broad valley helween the terminating points of the Quirmal, Viniual, and Esquiliue, whence two long and narrow valleys separate those hills from each other, whilst a third valley pierces the Esquiline itself in an casterly direction, towards the Arch of Gallienus, that we must look for this celebrated locality. Marliano and the earlier Italian topographers took a far more correct view of this and of many other disputed points than Nardini and the later ones; the points than Nardini and the later ones; the difficulties of the latter being mainly owing to dimension of the latter being many owing to their reliance upon the spurious catalogues of Victor and Rufus, which remove it from the fourth region in which it is found in the "No-titia," and place it, for no possible reason, the one in the second and the other in the third. The position thus assigned to the Suburra at the back of the range of imperial fora, and through which the Transitorium would form a direct communication with the Forum Romanum, is communication with the Forum Romanum, is supported by many local proofs, such as the small piazza at the foot of the Via di Sta. Lucia, which still bears the name Subnrra, and in the appellation of the ancient church of Sta. Agatha in Schurra, on the hrow of the Quirinal, in its immediate neighbourhood, &c. The doubts that have been raised as to whether the term was anyliad to a courts as cody, a single stread was applied to a quarter or only a single street is but of small moment, as it probably was first one and then the other; but at all events, so one and then the other; but at all events, so early as the sixth century it bad reassumed its more extensive signification, as St. Gregory speaks of the church of St. Agatha as "in regione urbis illa, que Subarra dicitar." To the valley which separates the Quirinal from the Viminal we can assign no ancient appellation; but in the valley between the latter and the Esquiline was the Vieus Patricius, for which we have the testimony of Anastasius and

which we have the testimony of Anastasius aud of the Anonymous of Einsiedlen, both of whom clearly state that the aucient clurch of Sta. Pudenziana, which still exists, was built in vice Patricii, which must thus have occupied the line of the present Via Urbina. The position of the Vicus Patricius established,

The position of the views Fabricis established, those of the Cispius and Oppius—hoth offshoots of the Esquilinc, but included in the original seven hills—by an important passage of Varro, given us by Festus, become equally established. By the same passage of Varro, the Carime is placed upon the westernmost point of the

The stone of which it is huilt is of itself a proof of its extreme antiquity, being the $t_{H/2}$ likelide in the later ages of the republic one of the most of Broechi, one of the volcanic formations found in many parts of Rome, and which was after-to the above evidence of Varro, that writer in the later ages of the republe one of the most aristocratic quarters of the city. In addition to the above evidence of Varro, that writer states that it was comprised, together with the Cælian hill, in the Regio Suburra of Servius; and the fact of this quarter bearing the name of *Le Carra* throughout the Middle Ages, and as late as the sixteenth century, is another con-furmation of its locality.

Ite as the sixteenth convergence of the sixte brace its whole extent. They were denominated the Subarcana, the Esquilina, the Collina, and the Palatina, and, amongst other omissious, did not include the Capitoline hill or the valley of the Forum, or of that of the Velabrum or the Aventine. Various conjectures have been addifferent readings of passages in Varro and Livy, relative to certain chapters instituted by Numa, which iufluenced the limits of the Regions, bave added this to the list of unsettled questious.

Augustus made a fresh division of the city into fourteen Regions, each consisting of a certain number of vici. Each vicus consisted of a certain collection or plot of houses surrounded by streets (whence the term became applied to the streets themselves), each vieus being com-posed of two classes of houses, called respec-tively *insula* and *domus*. The law for huilding tively insula and domas. The law for huilding each house detached, which had been disregarded during the republic, was again enforced by Nero after the fire, a passage, called *ambitus* or *cir-cuitus*, being left round each for the purpose of disconnection. The *issulæ* were the habitations of the middle and house closure and of the middle and lower classes, and were gene-rally let ont in floors; the *domus* were the habi-tations of the rich, and were cousequently comparatively few. Each region was composed of a certaiu number of vici, aud were distinguished for a long period by numbers only,—the period when names were first applied to them being impossible now to determine; hut as late as Hadriau the numbers only were still in use, as shown in the Basis Capitolina. Though the exact boundary of these regions cannot be traced with certainty, a general view of the situation of each, and the principal objects of autiquity

of each, and the principal objects of adapting within it, may he given in a few lines. *Regio* 1, *Porta Capena*, included the suburb beyond that gate, east of the Baths of Anto-ninus, and contained the Temple of Mars, Tomb of the Scipios, and the Arch of Drusus.

Regio 2, Calimontana included the Calian hill, and contained the Arch of Dolahella, and the arches of the Aqueduct of Nero.

Regio 3, Isis and Serapis, comprised the Valley of the Colosseum and the offshoot of the Esquiline, originally called Oppius, and con-tained the Flavian Amphitheatre, and the Baths of Titus and Trajan.

Regio 4, Templan Pacis, or Sacra Via, com-prised the greater part of the valley between the Palatine, Esquilue, Viminal, and Quirinal, and contained the Colossus of Nero, the Temples of Venus and Rome, Antoninus and Faustina, Peace, the Sun aud Moou, the Basilicas of Constantine and Paullus, the Forum Trausitorinm, &c. and included also the Suburra aud the greater part of the Sacred Way. Regio 5, Esquilina, included the Cispius and

the Vinital, and a large tract of suburbs lying to the east of the Servian walls and Agger, embracing the Amphitheatrum Castronse, and the building called Minerva Medica, and amongst its principal contents, were the Gardens of Mizcenas, the Arch of Gallienus, the Nymphæum of Alexander Severus, Baths of Olympia, Helena, and Againing Circum Variant Contents and Agrippina, Circus Varianus, &c. Regio 6, Alta Semita, embraced the Quirinal

Regio 6, Alla Semila, embraced the Quirnal, and extended to the cast, so as to include the Pratorian Camp, and contained the house and gardens of Sallust, baths of Diodetian, Con-stantine, and Paulus, the ancient capital, and Temples of Flora, Quirinus, aud many others. *Regio 7, Fia Lota*, hounded on the east hy the Quirinal, on the north hy the Pineian, on the south by the Servian wall, and on the west hy the Via Lata, included in its chief objects the Temple of the Sun, Arches of Gordiarus, Claudins, aud Verns, Tombs of Bibulus, of the Claudian family. &c. Claudian family, &c.

Regio 8, Forum Romanum. - This important

and its contents, embracing those important buildings in its circuit which we have already described, from the Temple of Cesar, along its south side to the Capitolme Hill, which was also included in it, together with the valley between it and the Palatine, as far as the Velabrum, and there extending on the south which was and the Palatine, as far as the Velabrum, and thence extending on the north side of the Forum as far as the Transitorium, includ-ing the Fora of Cæsar, of Augustus, and of Trajan, with the Basilica Ulpin, and numerous temples and monnments that we need not enumerate.

cummerate: Regio 9, Circus Flaminius, comprehending the district lying between the Via Lata ou the east, the Tiber on the west, the Capitoline on the south, and the Piazza Navona and Colonna on the north, included the theatres of Balhus, Pompey, and Marcellns; the Pantheon, the Baths of Agrippa and Nero, porticos of Octavia and Philip, and many other monuments. *Regio* 10, *Palatium*, coutaining the whole of the Falatine-hill. This bill, at once the cradle of Rome, and the chosen residence of its em-perons, is a scene of peculiar interest, from the extensive ruins that occupy so large a portiou of it; but the arrangement of which, into any-thing like pristine form, must remain a problem

of it; but the arrangement of which, into any-thing like pristine form, must remain a problem not easily to be solved. Although long subse-quent to the reign of Nero, the Notitia and other authors still speak of the *Domus Augus-tiana* and *Tiberiana*, as applied to portions of the new palace, it by no means proves that those portions retained their original character, or the revence formed to form and the array of the second those portions retained their original character, as the expressions of Tacitus would argue almost a total destruction by fire of the original buildings. Many subsequent alterations were made to the palaee of Nero itself; and Domi-tian, Severus, and Elagahalus are all recorded as baving added to its extent and splendour; but of their individual labours the only portion whose founder is matter of certainty was the whose founder is matter of certainty, was the Septizonium of Septimins Severus, at the south-east angle of the palace, near the Porta Capena, where a large portion was standing till near the end of the sixteenth century, when it was demoend of the sixteenth century, when it was denou-lished by Pope Sixtus V. A spot of greater interest for the general scholar, as connected with the earliest legends of Rome, was the Germalus, the part of the bill hallowed by the presence of the Lupercal, or grotto, in which the twin-founders of the city were nursed hy the she-wolf. The Germalus was one of the ancient seven *montes* of the Septimontium, which we must remember was very different from the "Septem domini montes" of the Imperial City; and in the same relation to the Palatine was the Veha, another member of the Septimontium, but whose situation is not so clear, as Niebuhr and Bunsen place it north-east of the Palatine, and the later Italian anti-

of the Palatine, and the later Italian anti-quarians, north-west. Regio 11, Circus Maximus, was principally composed of the valley between the Palatine and Aventine, and included the Velabrum on the north. It comprised the Circus Maximus and temples to Ceres and Proserpine, Mercury, Portumnus, Vesta, Juno Matuta, &c. Regio 12, Piscina Publica, was bounded on the north by the Caclian, on the east by the Region of the Porta Capena, on the west by the Aventine, and on the south by the Aurelian walls, and the chief object in its circuit was the Batbs of Caracalla. Regio 13, Acentinus, comprised that hill and

Regio 13, Acentinus, comprised that hill and adjacent parts, and included in its extent the sepalebre of Cause Cestus.

Regio 14, Transtiberina, was the largest of the regions, including the Vaticau, Janiculum, with the district between them and the river, and the Insula Tihcrina. Such were the famous regions of Augustus, as instituted hy

him for the better administration of the muni-cipal regulations of the city. We have found it impossible to allude to more than a very few of the disputed topogra-phical points in this favourite field of antiquarian polemics, where every inch of ground has been disputed, where an argument has been found for every theory, and every fresh theory has found a train of zealous adherents. Nor can we, by the same rule, venture to touch upon found a train of zealous adderents. Nor can came the senators and matrons of found to the we, by the same rule, venture to touch upon butchery. A virgin always gave the signal for more than one or two of those architectural slaughter; and when glutted with blood-hed, divisions into which the monuments of the city those ladies sat down in the wet and streaming may be divided, and which Canina has classified arena to a luxurious supper."

region included in its extent the ancient Forum into walls, temples, fora, and buildings helonging and its contents, embracing those important to them, porticos, theatres, amphitheatres, circi, buildings in its circuit which we have already baths, aqueducts, bridges, triumphal arches, described, from the Temple of Casar, along its honorary and sepalebral monuments, and private

buildings. Of the works of ancient Rome there is none Of the works of ancient Rome there is none of equal antiquity so well preserved as the Pan-theon, which may partly be ascribed to its having hear converted into a Christian church so early as the reign of Phocas, and it is not one of the least of the proofs of the noble scale upon which the Romans constructed their regal edifices, that this magnificent rotunda, with its noble portice, which Forsyth pronounced to be "positively the most sublime result that was ever produced by so little architecture," should be considered by many, and amongst them Canina, to have been a mere vestibule to the Batbs of its founder. "Glorions domet "Shalt thon not last ? "Inferious domet Of art and piety--Rantheoral pride of Romet!" As in the later styles of architecture that

As in the later styles of architecture that have prevailed, a taste for redundancy of orna-ment and nunatural combination has enfeebled and effeminatized until the masculine dignity and real symmetry of the original type has disap-peared beneath the weight of riches that has helped to erush it, so was it with that of Rome. The arts of Greece, transplanted into this new soil, found a style already established with which it was forced to combine. The Greek column and entablature became united with the Roman and entablattice became target with results for the result arch and vault; and though a style of much beanty was evoked from the combination, yet the antagonistic principles that stamped its parentage produced at last a taste for incom-patible ornament, the vigour of the originals was lost in the ill-assorted nuico, and beauty are preficed to the fourt of our parichment was sacrificed to the fault of over-enrichment.

"Another enemy," says Forsyth, "to the beautiful, and even to the sublime, was that colossal taste which arose in the empire, and colossal taste which arose in the empire, and gave an unnatural expansion to all the works of art. In architecture it produced Nero's golden house and Adrian's villa; in hydraulics it projected the Claudian emissary and Caligula's Baian bridge; in sculpture it has left at the Capitol such hands and feet as betray the emperor's contempt for the dimensions of man ; in poetry it swelled ont into the hyperboles of Lucan and Statius. This exaggerated spirit

Lucan and Status. This exaggerated spirit spread even to the games. Nero drove ten horses yoked abreast to his ear, and douhle that number appear on an ancient stone." The same colossal taste is evinced in the varions thermae of Agrippa, Nero, Titus, Trajan, Caracalla, Diocletian, and Constantine; in the imperial palace, which, taking root in the modest mansion of Hortensius, covered the whole pala-tipe and branched over to the Esquiline, also in tine, and branched over to the Esquiline, also in the mansolea of Augustus and of Hadrian, in the theatres of Pompey and Marcellus, and in the Colosseum.

the Colosseum. The ercetion of an amphithcatre in the midst of Rome was one of the designs of Augustus, but it was by Vespasian and Titus that the Flavian Amphithcatre was begun and finished. From its vast size, the subsequent ercetion of any other such building in Rome was rendered unnecessary. It stood on the site previously occupied by the Lake of Nero, hetween the Velian and the Esquiline, and was capable of containing \$7,000 persons. In the reign of Macrinus it was so much damaged by a fire occasioned by lightaing, that it was necessary to occasioned by lightning, that it was necessary to occasionce by ingrating, that if was necessary to exhibit the *gladiatores* and *evantiones* for several years in the Stadium. Its restoration was com-pleted by Alexander Severus, and the *venationes*, or combats with wild beasts, were continued in it as late as the sixth century. In the Middle Area it was used as a fortness and a century it as late as the sixth century. In the Middle Ages it was used as a fortress, and a portion was at a later period destroyed by the Romans themselves for materials for the Cancallaria and Palazzo Farnese. Here sat the conquerors of the world, coolly to enjoy the tortures and death of men who had never offended them. "Two aqueducts were searcely sufficient to wash off the human blood which a few hours' sport shed in theme imparied sheaples. Twice in one day in these imperial shambles. Twice in one day came the senators and matrons of Rome to the

From the silence of Vitruvius upon triumphal From the silence of Vitruvius upon triumphal arches, we may suppose that those that existed in his time, it any, were few and insignificant. Of twenty triumphal arches recorded by different writers as erected in Rome, but four now exist, namely, — that of Drusna, crected to Nero Claudius Drusus, on the Appian Way; that of Titus, at the foot of the Palatine, crected to his honour after his conquest of Judæa; that of Septimius Severus, at the end of the Via Sacra, crected to that empeore and his sons Caracalha Septimius Severus, at the end of the Via Sacra, erected to that emperor and his sons Caracala and Geta, ou account of his victories over the Parthians; and that of Constantine, creeted to him by the Senate after bis victory over Maxen-tius. Of the Arel of Therius, at the foot of the Clivus, no remains exist. The same may be said of the Arens Novus, or of Claudius, on the Via Flaminia; that of Verns, that of M. Aure-lius, and that of Gordian on the Via Flaminia. Tobe term acress seems to have been applied to hus, and that of Gordian on the Via Flammia. The term *arcus* seems to have been applied to arcbes of trimnph only, and that of *formix* to those of entrance; and as the nse of the former was to receive the conqueror returning from the scene of his achievements, so was it the custom to place these arches on the Via Triumphalis only, on the route to the Capitol, where be deconsited the snoils of his victorics, and where deposited the spoils of bis victorics, and where the triumph terminated in sacrifices. A Roman conqueror found his greatest reward in this public ceremony; and if the triumph was decreed by the Senate, by so much was the honour enhanced; hut if the triumph into Rome was denied, he contented himself with the minor honour of a procession to the temple of Jupiter Latialis, on the Alban Mount, to which we before alluded (page 182), and where, upon the hasaltic pavement may still be read the letters N. V. -- Numinis Via.

letters N. V.—Namius Fia. Of the triumphal processions of the empe-rors, who, upon the concentration of the supreme power into their own persons, chose to exhibit themselves in this manner—the description of that of Aurelian, as given by Vopiscus, and paraphrased by Gibbon, with all its barbaric splendour and eruelty, and which may be taken as an average specimen. As these arches are splendour and erucity, and which may be taken as an average specimen. As these arches are so well known to architects, we shall offer no description of them, nor, indeed, will it be possible to touch upon the architecture of Rome in the present limited series of papers. Of the exceedence, there were upie universit

Of the aqueducts, there were nine principal ones in the time of Frontinus-the Appia, Annio Vetus, Marcia, Tepila, Julia, Virgo, Alsietina, Claudia, Annio Novus, and the subsidiary ones, called Augusta and Rivus Herculaneus.

Between the time of Frontinus and that of Procopius, they had considerably increased in number, since the latter historiau relates that the Goths destroyed fourteeu aqueducts that were within the walls. The "Notitia" enumerates ninetcen, hut to give a history of these would far exceed our limits, and we must content ourselves with one or two general observations upon them

upon them. It is to S. Julius Frontinus, curator aquarum, under Nerva and Trajan, who wrote a treatise upon the subject, that we derive our chief know-ledge about these aqueducts. The facts of the ledge about these aqueducts. The facts of the Greeks not having had aqueducts, and of the Romans having had them instead of pipes, which facts used to be accounted for hy the summary reasons that the Greeks, not knowing the prin-ciple of the arch, could not construct them, and that the Romans, uot knowing the laws of hydrostatics, could not do without them, has of late years received fresh solutions in the more late years received fresh solutions in the more probable reasons, that the Greeks, having an abundant supply of water, had no need of them; and that the Romans, though well aware of the grand leading principle of hydrostatics, still preferred them. As regards the Romans, Vitravius not only expressly speaks of the law, but describes its application in a particular in-stance; and Pliny, in describing the passage of water through pipes, states the law clearly in the terms, "Subit altitudinem exortus sui." Of these aquednets, four helong to the time of the Republic, whilst five were built in the reigns of Augustus and Claudius.

Republic, whilst five were built in the torgals of Augustus and Claudius. The Aqua Appia (so called from its founder, Appius Claudius Czeus) was the first of these public works, and commenced near the Via Prenestina, hetween the seventh and eighth milestone. The Anio Novus was the longest and most lofty of them, being nearly 59 miles

long, and its arches occasionally 109 feet bigh. To complete the fourteen described hy Procopius, five more must he added; hat two only of these arc certain, —the Trajana and Alexandrina.

Of equal interest is the subject of Vie or Roads. They were divided into private or publice, the former being those the use of which was free, while the soil itself remained private property; the latter, those of which the use, management, and soil were alike vested in the State. The vie publics of the highest class were distinguished by the terms militares, consulares, and practoria. Vitravins gives no details for road-making, hut gives minute directions for pavements; and the fragments of ancient pavements still existing correspond so exactly with the remains of military roads, that we cannot doubt that the processes in each case were identical. The most elaborate treatise upon the Roman roads is that of Bergier, published in 1622, which must be consulted for the details, extensions, and changes of the varions roads that issned from Rome, and to which the researches of numerous local antiquaries lave added oueh. The following were the principal roads starting from Rome itself,—the Appia, Latina, Labocana, Pracestina, Collatina, Nomentana, Salaria, Flaminia, Aurelia, Portnensis, Ostiensis, and Ariceatina. The excavations and discoveries upon the

The excavations and discoveries upon the Via Appia, under the superintendence of the Iate Canina, are too well known to require more than a passing allusion. His volumes descriptive of all that he had done upon that extraordinary line of road, with his views of the monuments that adorned it in their ruin and in their perfection, were the last result of his indefatigable industry and versatile invention.

A slight skelch of the authors to whose labours, from the revival of art, we owe our knowledge of all that appertains to Roman architecture must he of interest to the architect. Our insight into the hygone splendours of Rome, after the long night of darkuess that had veiled them from the world, were principally derived from various drawings of Roman monuments hy Alberti, Bramante, Perruzzi, San Gallo, and their contemporaries, though these were mostly unpub-lished. Labacco was one of the first who published with some accuracy, at the beginni the sixteenth century, some of the ancient build-ings-such as the Mausoleum of Adrian, temples of Mars Ultor, Antoninus and Fanstina, Venus in the Forum of Cæsar, &c. Serlio, of Bologna, architect to Francis I. furnished several plans and drawings of ancient Roman huildings, in the 3rd book of his work on "Architecture." Buffalini's great plan of Rome, as it was in 1551, most important for Roman topography but all that now remains of it is an imperfect copy in the Barbarini palace. Pirro Ligorrio, about the middle of the sixteenth century, treats of circi, theatres, and amphitheatres, but from his works, says Canina, one caunot derive much precise knowledge. Bernardo Gamneci also published several views about same time. In 1570 appeared the great work of Palladio; as Canina observes, showing greater diligence and knowledge of ancient art than had yet been evinced. Afterwards were published all the drawings of Palladio, from the ruins of the thermæ of Rome, with his restorations corrected and improved by Cameron, and reproduced in Italy by Scamzzi, whose "Discorsi sopra le Antichità di Roma" contaius sonic good views, have by obtaining the Roma" contains some posteriar to Antichità di Roma" contains some good views, but insignificant letterpress. In 1574, Ursinus assisted the French architect, Du Perac, in drawing up a plun of the restored city, which was published by Giacomo Lauro; it is, however, remuneurs and of Little sources. erroneous and of little service. Of more value the views of ancient monuments of are Dn Perae, published in 1573. Of Vignola we bave only a few interpretations of certain parts drawn from ancient monuments. Other authors have contributed in various degrees to our knowledge, as Sulpicio, Giacondo, Leto, Cesariano, Durantino, Macheropia, Filandro, Cesariano, Durantino, Machere Barbaro, Caporale, Fontana, &c. Fabretti illustrates the writings of Frontinns on the aqueduct, Bosio in his Roma Sotteranea, Aringhi, in his Roma Subterranea Novissima, Cassio, Barin banlt, Biauchini, Overbeke, and many others, swell the list of contributors to the illustrated literature of Rome.

Desgodetz was the first who, whilst seeking to

parge the art of building from the bad practices introduced in the sixteenth and seventeenth centuries, showed with exactness and consummate ability the remains of the ancient fabrics of Rome. He contented himself with leaving the rains as he found them, only showing the portions that appeared above earth, measuring and restoring them with great exactness, and exposing the inaccuracies of Palladio, Serilo, Labacco, and De Chambray. His work, published in 1682, commenced a new era in arobitectural restorations, and in many respects has hardly been surpassed.

Piranesi gives drawings of several momments not previously published, reproducing also with some previously published. According to Cauina, he represents generally wilb much truth all that be saw existing in the ruins, but where he had to supply deficiencies from imagination, be produced results, *tanto lontane dal nero e cosi* capriciose che difficilmente si sarebbero potate eseginre in qualunque genere di architettura.

expire in qualumpue genere di architettura. Mirri, Bianconi, Uggeri, Durand, Cipriani, and Il Piroli, have followed in varions degrees, and a host of others down to the present time have given the produce of their labours in this fruitful field for the benefit of the world in general.

One more only can we cite. Though temples have changed their names, for a their limits, and excavations disclosed the fallacies of mere scholarship since Messrs. Taylor and Cresy published their volumes upon "The Architectural Antiquities of Rome," still their excellent drawings and accurate measurements are not deteriorated in value in the slightest hy such changes, and it is, and must ever be one of the most valuable of our works upon this subject.

And here, for a time, we must leave the engrossing subject of the topography of the Eternal City, the foregoing sketch of some of the leading points of its controversies being prepared solely for the benefit of those who have heen accustomed to regard the subject of Rome iu an architectural light only.

Study it, however, as one may, whether as architect, topographer, or simple traveller, one cannot fail to become moralist; and beautiful but sad is the reflection of the bistorian, that "the art of man is able to construct monuments far more permanent than the narrow span of his owu existence: yet these monuments, like himself, are perislable and frail; and in the boundless annals of time, his life and his labours must equally he measured as a fleeting moment."

ALEX. FRED. ASHTON.

THE GOVERNMENT COMPETITION DESIGNS.*

Is the design for the Foreign-office, numbered 100, and having the motto, "Vixat Regina," the Gothic style is adopted. The drawings show a very lofty inner hall, with a grained ceiling, and crowned externally by a spirelet and pinnneles, the ceilings generally being groined, or waggon-headed, whilst the exterior displays a profision of pinnades, canopies, and traceried oriels.—No. 101 having also the motto "Virat Regina," hat with a red cross on a black ground, has been attributed to Mr. Knowles, jounand has some points of resemblance in plau and decorative character to No. 60 already noticed. The drawings include general plans (two alternative saygestions), a block plan of the Offices, according with the proposition in one of the general plaus, and designs to the War-office and the Foreign-office, in two similar buildings, with arcbes and a carriageway between. One of the general plaus, and designs to the War-office and the Foreign-office, in the object of the general plans offers an arrangement not hased on the instructions, and proposing a place 700 feet in wildh, extending from the Abbey to the Nelson Column, and with semicircular ends, The Offices are proposed to be arranged on each side. In the other general plau, the author proposers to move Westimister-bridge opposite to Clarles-street, placing mother bridge, and to prolong a "New Mall" through the park to the present Buckhrighwm Palace, which be would give to the National Gallery, and boild a new place at Kensington. In the block plan, the Offices are arranged symmetrically, the present Board of Trade building being preserved. Is a the plan of the Wats, and tor hall, 47 feet by 36 feet, gives access, from Parliament-street, to a hall of 182 feet by 52 feet, ranged transversely, which has a staircase at each end, 28 feet by 25 feet.

* See p. 313, ante.

Arcades, and galleries with columns, surround this portion of the plan. Across the inner hall, another of similar obstrater is entered at the end; and this ball contains two long flights of stairs to the first floor. With the halls and galleries, corridors communicate—generally well lighted from two open courts. The exterior shows a rusticated *sou-bacement*, an arcented ground story, with niches in the pirse, and enriched spandrils (except in the towers or masses of the angles, where the arches are misticated); a first floor with Corinthian columns, rich window dressings, and festoons; and in the floor over, enriched arch-headed windows. The angle masses, curried up a story higher, are like many other parts of the design, much enriched with sculpture. Executheous are suspended at the angles/pfestoons. The different cornices arcrowned by balastrades, and the towers also by low domes. In the Foreign-office plan the arrangement is similar, as to the first pertion of the building entered, but beyond the transverse hall is a wide staircase, with lateral galleries, by which last a connection is formed between the landing of the staircase of the residence and the corridors of the Office. The residence two entrances, one in each angle tower, next the park; and the entrance halls are joined by a certilor, with columns, and 240 feet long by 21 fest in wildly; 277 feet long, and the same width as the corridor below. The chief staircase of the residence has present to the receptionroons ahore, near which is a grand reception gallery 277 feet long, and the same width as the corridor below. The chief staircase of the Office has Persian figures, supporting a wageon-headed vacult, with ribs and coffies, and is lighted by lanettes.

No. 102, " Detar digniori," comprises a general plan, block plan, and drawings of the War-office and the Foreign-office, as portions of a general design. Westminster-bridge moved to be in line with the new Charles-street; and bridges at Charing-cross and tho Horaeferry: a new street erossing Dean's-yard to the Victoria-tower (with gates at the yard): the Westminster School removed to a site in a place formed south of the Victoria-tower; and St. Margaret's Churob to a site due north of the Abbey transept, are contemplated improvements. In the block plan, the principal existing buildings are retained: archways crossing the routes are shown as prominent features; and from the centre of the western portion of the ground, a terrace, clliptical on plan, projects, with an archway and a building for the Siate Teaper-office in the certer. As to the decorative design of the exterior, the Italian style is adopted; but an alternative design shows in certain parts, columns which are giganitie in proportion to the adjacent features, and discutat. We see many indications of the forered excitement in which the proparatory work for this competition has gone on; and it is plainly to be inferred, that creditable as the imajority of the drawings are, they do not represent the baset designs that could be got from the authors, English or foreign.

The drawings under No. 103—"E lasciata Speranza "—which in many respects display considerable beauty of design, include a general plan, a block plan, and drawings of the War-office and the Foreign-office in separate buildings. Westmi-ster-bridge, is proposed to be mored in line with Downing-street, which is, as in most cases, carried through to the park, and no bridge is provided northward. For the approach to the bridge, as shown, a portion of the offices ad Montagne House would have to be destroyed. It is certainly to be regretted that parties apparently *intecreted* in the questions of site for the Offices and communications should have been chosen as judges. At the present is proposed to be there placed. The plan provides for the removal of St. Margaret's Church, to the west of the Abbey; and the Chapter-house is disposed on a regular plan, new buildings are added to the Offices guerally, is the recommendation of two different styles—Hulain and the style of the Houses of Parliamet—for different portious of the ground. The War-office and are of the Houses, and to the Offices guerally, is the recommendation of two different styles—Hulain and the style of the Houses of Parliamet—for different portious of the ground. The War-office and are so columns. The centre is carried up to a considerable height, and is domed over and erowaed with a lantern. The chief front towards Parliament-street is remarkable for the treatment of is masses at the angles with truncated roofs rising higher than the general line, and euroyed inwards Parliament-street is remarkable for the treatment of is masses at the angles with truncated roofs rising higher than the general line, and euroyed inwards or the lance; for its two tower-like and spire-enpped projections in the centre of the front; and for what is is best feature, its pirgaza between the wings, with projecting carriage-porch of columns and sidearches. The windows are pendurt, having several

imposts, and shafts in the jamhs. The frame imposts, (and shafts in the jambs. The frames of the windows are treated architecturally, as we ap-prehend they always should he, in preference to plaz-ing with one or two sheets of glass. The Gothio style has especial advantage over the *wineleenth con-tary* Anglo-Italian in this point; and it is thought by many, that the French essement in various forms, im-parts by the effect in the windows, a general effect to the hubitors of Frame which we equand hours to many, that the criter in the windows, a general effect to the buildings of France, which we cannot hops to equal whilst we use the sash. It is curious as bear-ing on this point, that at Chatsworth, in the old r huilding by Tahman, the substitution of plate class for very small power with gill sash-hars, did certainly not add to the effect. Bratablature strings, and a Vignolu-ies, namels between the windows and shields in very smart prices with prices and so, but be reading no add to the effect. Entablature strings, and a Vignoli-eornice; panels between the windows and shields in the spandrils; to the angle masses, central features breaking forward and formed of clustered plusters. columns, and iches, and terministic phase of the second se merits-indicating the possibility, eventually, of that habit of combination of materials from several styles, of that had to combination of materials from several styles, with fruits of new ideas, along with that general con-currence on the subject of style, which would serve bolt the production and the public appreciation of art, and which, all of them, as we helieve, are required to set our architectural practice on the direct road of progress. The design for the Foreign-office has not quite the same kind of merit.

No. 104, market "Par," includes a general plan, a block plan, and a design for the Foreign-office. The site of Westminster-bridge is preserved, but with the additional width placed on the down-stream, or The additional which placed on the *down-stream*, or north side; there is a bridge approached from Charing-cross,* and one at the Horseferry. The coincidence as to the provision of three earringe routes in a space where there is now one, and where, we be-lieve, not more than two had been suggested previous to any stelling much application as matching as more when lieve, not more than two had heen suggested previous to our taking up the subject, is certainly remerkable. The author of the present design proposes to clear away the whole of the huildings hetween Whileball and the park, except the Horse-guards and the Board of Trade. The design for the Foreign-office is not a bad one,--subject to this exception, that some of its forms and details are too obviously studied (rom Sir Charles Barry's Italian huildings,--as, for instance. Bridgewater Hon.c. Bridgewater Hon.c.

The author of No. 107 contributes a general plan a hlock-plan, and a design for the two principal offices in a connected huilding. The site of West-minster-bridge is retained; Hungerford-bridge is minster-bridge is retained; Hungerford-hridge is widened, and a bridge is provided at the Horseferry; the Mall and Strand are connected; St. Marguret's church is moved; and the Law-courts are placed to the south of Henry the Seventh's chapel. In the hock-plan there is a recessed quadrangle on the east side of Parliament street; and otherwise, the usual arrangement is observed. In the War-office and the Foreign-office, the corridors, though they are described as well lighted, do not appear to he as described; for, there is a length of 85 to 90 feet with no appearance of lighting arrangements. The style is Ver Cinque-Cento.—No. 108, with the motto, etian

* * * * res antique laudis et artis

Ingredior,

is a design for the War-office and Foreign-office, with a central quadrangle and archways. It ers greatly hy the employment of nniform rusication over pilasters and wall surface, throughout each front. A motto from "As you like it"—the words spoken hy Orlando—"I come hut in as others do, t two with him the detected to fur wordt?"

spoken by Orlando----'' come but in as others do, to try with him the strength of my youth,'' is attached to a design for the whole of the offices, in the style of the Banqueting-house. The number, 109, includes a general street-plan, a block-plan of the Offices, with general views and elevations, and de-signs for the War-office and Foreign-office, in symme-tical block. The author has not into the block with great care. The author has gone into the subject with great care. The site of the new Westminster-hridge is proposed to he at "100 feet from the face of mage is proposed to be $a^{(*)}$ 100 feet from the face to the present clock-tower—to the centre of the roadway; and the width of the bridge to be 85 feet," which is nearly the same as preserving the present site with an addition on the *down-stream* side,—as to the advantage of which arrangement, as well as the economy, we have so often expressed donhts. There advantage of There is a hridge at the Horseferry; and that intended to serve the traffic from Charing-cross, is a skew hridge serve the traine from Charing-cross, is a skew mrdge —placed starting from a point nearly opposite to the Banqnetiug-house, with curved approaches to it, around a place enclosed by gates—one approach com-mecting in Whitehall at a point opposite the south end of the Board of Trade, and the other from a place formed at the junction of Whitchall and Charing

* It may be well to state, that we have in all cases splied the designation of a site approached "from Charing-froms" to such bridges as had their approach suitable to the traffic from Cockspure. A bridge with approach and apwhere on the east site of Northumberhand House, should hardly be called a Claring-cross-bridge; though the present Hangerford-bridge has had that title.

cross. The Mall is joined to the south end of the eross. The Mall is joined to the south end of the place mentioned—instead of to Charing-cross en route for the Strand. Wings are added to the Horse-guards, ways to the park being left at the ends, and Dover House heing removed. St. Margaret's Church it is proposed should he removed, and built to the north of the present site. The gret additional width given to new streets by the authors of the best designs in the collection, shows a proper appreciation of the growing wants of London. The present author divides the traffic in his new Parliament and Buildre Streets hy dwarf-wallice and groups of author divides the traffic in his new Parliament and Bridge streets by dwarf-willing and groups of sculpture at convenient points. In the block plan, the general principle of arrangement is one seeking the effect produced by one comprehensive build-ing—on the west side of Parliament-street at least. The author, however, as will have been inferred from the nature of the style, does not include the present Board of Tadie in the arrangement here referred to, thong he preserves that huild-ing. The ordinary division into blocks, which follows from the instructions as to the two principal diffecs, and from the position of Charles-street, is observed, as well as symmetry on the west side of Parliament-street, are appropriated as corfiles, or arch-Parliament-street; but the ends of the present streets, as Charles-street, are appropriated as *cortiles*, or arch-ways, and huilt over so as to gain the central feature of the elevation; whilst, in the centra, is placed a tower, decorated with orders in two recessed stages, and erowned by a pyramidal capping. This tower enuld he seem from the ebier points of view. Two other towers are placed on other portions of the greened Aspenda the drawings are good views. the ground. Amongst the drawings are good views the quadrangle next Great George-stre eet, of one of the quadrangle next Great George-street, of one which opens from Downing-street, and of Parliament-street, looking north, hosides a view of the Foreign-office from the parade. These certainly place the capabilities of the style in a clear light; and the deco-ration of the internal courts—a point not to he dis-regarded as it has heen by many of the competitors— has been studied hoth in the architecture, and by the introduction of groups of sculpture. In the Warof regarded as it has head by many of the competition-has been studied hold in the architecture, and by the introduction of groups of sculpture. In the War-office plan, it is right to say that corridors may he found, running for 80 feet without apparent light-ing; but in many parts the decorative effect has been well studied, as in the staircases. In the Foreign-office there are two open courts (as there are also in the other Office), and the north-west angle is ronded off. The entrance to both Office and resi-dence is at the routh. The Office has a staircase to the state Paper-office, which last is preserved. The chief rooms in the residence look to the north. We have succeeded in preserving a few other memoranda of the designs, and of the impressions which they made upon us; and shell in a future number proceed with our record. It happens that;

number proceed with our record. It happens that several meritorious works are placed in the order of order of the hanging, so as to come later into our notice than they otherwise might have done. The interest taken in the exhibition has, however, not subsided; and no doubt for many years—more than in the case of the Houses of Parliament—the designs which have attracted any attention will be frequently referred to

CORRESPONDENCE ON THE WEST-MINSTER DESIGNS.

IN my letter to you on the subject of Mr. E. L. In my letter to you on the Westminster Improvement Garbett's remarks on the Westminster Improvement Plans, I disclaimed any wish to enter upon a contro-versy, and his commanication in your last number fully coultrains my opinions on this point. I agree with the poet,-

Far more congenial to my taste would have been the passive acquicscence above described,-but as E. L. G has withdrawn what appeared to me his original withdrawn what appeared to me his original charge, and substituted another in its place, I must crave the opportunity of making a brief reply to that.

The disclams having charged us with choosing our style on the hase, paltry, contomptible priorities or tis combining the least amount of work with the largest amount of pay,—nay, he gally assumes that principle as his own, assuring us that it is the very one on which he shways did work, and always intends to proceed. Bs it so. The principle is still, to my anind, an ignoble one as applied to art, and I cheer-fully resign it to him.

It is present charge (divested of certain repulsive accessories, of which more hereafter) is, that he never accessories, of which more dereatery is, that the fever thought us capable of selecting any style,—that the style has appropriated us,—and that without some such corrupt style, no such men could have existed, or would have touched a pencil. My own reply to this is,—my pencil was (what I trust it always will be) my joy and solace, long hefore I knew anything of

architecture; and when I entered on my pupilage in that art (pure Grecia architecture being then the fashion, and the Mediaval architecture being then the fashion, and the Mediaval revival not dreamt of). I instinctively turned to Gothic, copied all delineations of it with avidity, and examined its remains with delight; and a fortnight spent under the sholow of Interne cylicities else the action with the actight; and a forfnight spent under the sholow of Tintern, exploring, sketching, and gazing with rap-ture on its majestic ruins, still stands ont as the brightest spot in my artistic life. Nor will I yield to Mr. Garbett, or any one else, in earnest, hearty, reverent admiration and love of the expusite relies of Gothic art. Hene, however, I part company with him. I never fielt the fervour for Chinese-like repro-ductions of it, or the still more mischivous manita for its (so called) restoration. To me, even its adop-tion for ecclesiastical purposes, without prodigious modification, is inconsistent with the pure Christianity of the Gospel, and its application to civil purposes is at variance with the dictates of my common sense and notion of the fitness of things. and notion of the fitness of things.

I believe the age of Gothic architecture to have passed I believe the age of Gothic architecture to inverpassed away, almost as earlierly as that of chivaly, and in my eyes, he who sallies forth on his Medieval hobly-horse, intern upon restoring it, whether he blazon on his hanner the bold motto, "A vaillants courts ricen impossible," or "Thou hast covered my head in the days of battle," is a verifable Don Quixote in the domain of architecture; with much, doubtless, of the true heart and gallant spirit of that redoubtable height, hut with the same unmistakeable flaw at the cost of the whole performance. And to such true knight, hut with the same unnistakeable flaw at the root of the whole performance. And to such true knight, I ween, Mr. Garhett is a right trusty and doughty squire (I crave pardon for being ignorant whether he has yet won his spurs ou this hloodless hattle-field), with much of the spirit of the iumortal Saneho,---witness that unctuous adage, "A miximum of hread to a minimum of sweat," which has the genuine Saneho flavour.

This is not the place to enter upon a statement of why I helieve Italian architectare to be adapted to the purposes of our times; and your able correspon-dent Mr. Wightwick has rendered the attempt superfluous, hy doing it ten times better than I could, in a paper which I carnestly commend to the study of paper ELG

"L. L. G. Such is my plain reply to the twofold charge of Mr. Garhett. I do not say that I am right. Solomon tells us, "The way of a fool only is right in his own eyes," hult see nothing in the process hy which I have arrived at my convictions, necessarily connected with "per centage," or at all analogous to "the choice of the immortal Hohson." It seems to me as clear and deliberate an exercise of the understand-ing as Mr. Garbett is enable of and with int as ing as Mr. Garbett is capable of, and with just as ing as Mr. Garbett is espable of, and with just as hearty an appreciation of the heauties of Gothic architecture as he can lay claim to. As to the coarse illustrations which accompany his charges, the "dirt," "vernia," &c. &c. I pressme these are meant to offend those whom his logic fails to convince. I can scause him ther do not -compand-offend me. My assure him they do not-connot-offend me. My favourite poet supplies me with an ever ready shield against such assaults :--

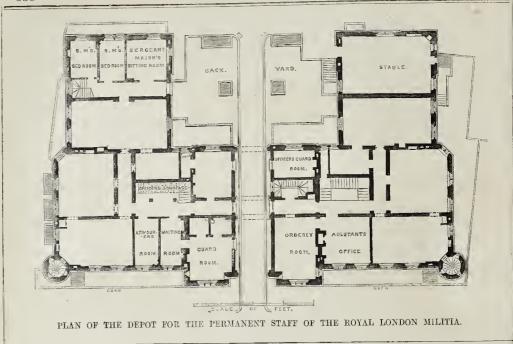

"An honest, sensible, and well-bred man, will not offend me, And no other can."

One word only as to Mr. Garbott's views on the present pos'tion of the architectural profession. He says, that I cannot have observed society much with-out perceiving that the "animus" displayed in his out perceiving that the "animus" displayed in his communications is that held towards me everywhere. I can assure him I never met with such an animus on any subject; nor do I expect to, within the pale of polite society.

By way of illustrating his views, he makes allusion, somewhat in the style of Mrs. Nicklehy, to a certain speaker at some meeting, who observed that the very name of architect often "raised a hardly suppressed sneer,"—though what is the precise signification of sneer, — indugit what is the precise signification of that expression I cannot say. In any own experience of many years, and among almost all classes, I have ever met with respect, cordiality, and confidence,—a large measure of which I attributed to the profession ever mer wich respect, cordanity, and conhence,--a large measure of which I attributed to the profession of which I am a humble member rather thu to my-self. And when I look to the highest walks of that profession, I see such men as Sir C. Barry, Mr. S. Smirke, and the necomplished (reputed) author of No. 116, enjoying an amount of distinction and emolument more than sufficient, I dare say, to atone for the missiles occasionally hurled at them fram less fortnante, but, as it would scen, more deserving rivals. But I have sufficiently "observed society" to know that in all professions there are men occapy-ing positions far below their own estimate of their morits,---and such men look with a jauxoided eye upon the whole thing, and freely indulge in snears (not of the suppressed kind). To such I would re-echo Mr. Garbett's words, "I et them lide their time," but let it be in patience and silence. The wisest of men tells ns, "He that bath knowledge apareth his words, and a man of understanding is of an excellent

THE BUILDER.

[JUNE 13, 1857.

spirit." With which sentiment I take my leave of struggling for money or money's worth, hut in the Mr. Garbett, recommending it to his serious conside-happy hope of standiug, perhaps at a heavy cost, the last in the list, if it he ao more, among those thirty or forly most honourable names which are to form

A correspondent says, with reference to some of our remarks last week,—" Not only must the careful impartiality and moderation of a criticism such as yours give it great weight with every uobiased reader, hat at the same time any one who is inte-rested in the matter is placed, more at liberty to offer explanation, than with those who, if they are more emphatic and brilliant in their decisions, are less painstaking aud reliable. Now you seem to have been measuring our plans with a foot-rule: but this is surely more specious than coaclusive; and when you tell us, for instance, that we go beyond the limits of the site, let it be suggested, first, that we had in a great measure to guess at the dimensions of that site from a printed map; secondly, that what is commonly great measure to guess at the dimensions of that site from a princip maps and the dimensions of that site called a sixteenth scale may not by any means hear the test of checking 600 feet by the foot-rule; thirdly, that some people's paper-straining would itself add 20 to 30 feet on this length; and fourthly, that the site itself is obviously capable of extension, practically, hoth in length and breadth. Moreover, when you speak generally of our 'departures from the instruc-tions,' let in othe forgotten, that so little is this a fault, that in almost every prominent ease of archifault, that in almost every prominent case of archi-tectural competition it will be found that some happy tectural competition it will be found that some happy improvement upon the necessarily crude idea of the instructions is the actual test of merit of a high class. If we go into the region of the impracticable, this is another thing; but when, for example, one transforms the site *in toto* for his 'royal way;' when another trespasses upon the Park, as you seem to think, and still another oblicentes Downing-streek, and so on, all this is honestly and nearcieoly done think, and still another obliterates Downing-street, and so on, all this is honestly and practicably done for the best; and if it is to be described as 'clearly in defance of the instructions,' then we must consider ourselves no longer as men of a noble art in 'grande certamen,' but as school-hoys in petty contest for a pedagogue's prize. Where a man is houest, give him the advantage of this principle to the full; that de-signs must not he criticized like working plans—that they are but the joiting down of general ideas, and must he looked at accordingly—that there is a large volume of reconsideration intervenes between the mere project and the perfect work. And while I have pen in hand, let me be hold ecough to speak for our good eraft at large, and protest against that yoor style of Subscription of the advantage of this principle to the full; that does a space of the advantage of this principle to the full; that does advantage of this principle to the full; that does advantage of this principle to the full; that does advantage of this principle to the full; that does advantage of this principle to the full; that does advantage of this principle to the full; that does advantage of this principle to the full; that does advantage of this principle to the full; that does advantage of this principle to the full; that does advantage of this principle to the full; that does advantage of this principle to the full; that does advantage of this principle to the full; that does advantage of this principle to the full; that does advantage of this principle to the full; that does advantage of this principle to the full; that does advantage of this principle to the full; that does advantage of this principle to the full; that does advantage of this principle to the full; that does advantage of this principle to the full; that does advantage of the does does advantage does adv

or forly most motivation that where we we we we we the order of merit in this lordly game-rivals for a day, and peers for ever. Let us take high ground ; for there are half-a-handred of those works of ours, any one of which, twenty years ago, would have made a modest man's fortune; and it is a proud thing for an Englishman to walk up and down our great Old Hall, and think how triumphaulty, in all that concerns the mighty craft of the Builder, old England stands upright among the nations.'

Upright among the nations." I not to thank you for the evidently careful and im-particl remarks (though they were not alogether landa-tory) which you made upon my designs. It is very gratify-ing to a competitor to know that the ideas which deprived him of many a night's sleep are understood, and in some measure appreciated, by a competent authority. What I know to be true in my own case, I helieve to the true are interest the criticism as they appear. You axid, however, in last week's number, that, if the judges kept by the "instructions," the best designs would not be premiated: this is very much to be repreted, but it is their author's wownfaults. The "instructions" for designs 2 and 3 are perfectly clear and definite: the sites are distinctly defined, so that those who simply took as much addi-trating from competing. Again, with reference to hadowing the context, could understand it otherwise that by are to be "in *live only*," to say that ahadow-ting with the same as Chins ink k hadowing. I need only add there adding is permitted is a mere quible, for its evi-dentify the amen as Chins ink k hadowing. I meed only add there adding is permitted is a mere quible, for its evi-dentify the amen as Chins ink k hadowing. I meed only add there adding the context, could understand it otherwise there there is permitted is a mere quible, for its evi-dentify the amen as Chins ink kadowing. I meed only add there are destations, correctly phane on enterties as to here adding the outext. Such the competitor who honest many there there in the adding of the competitor who honestly kept by the "instructions." A competitor who honestly kept by the "instructions." A competitor who honestly kept by the "instructions." A converting who is a single adding the sing

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

AT the ordinary general meeting, held on Monday, the 1st June, 1857, Mr. J. B. Bunning, V.P. in the

DEPOT FOR THE PERMANENT STAFF OF THE ROYAL LONDON MILITIA.

THE building erected in the City Road for the London Militia, became necessary in con-sequence of the old head-quarters, at the corner of the artillery-ground in Bunhill-row, having been occupied by the church and parsonage-bouse; and as the militia had a right to the use of a portion of the artillery ground for exercise; it was determined to secure the re-mainder, with a site adjoining, for the depôt.

The building is not in any respect a barrack, but consists of eight rooms on the top story for infirmary, &c.; thirty-nine rooms on the se ond floor for non-commissioned officers and their families; on the first floor, twelve rooms and ness-room for non-commissioned officers, ad-jutant's quarters, commanding officer's quar-ters, officers' mess-room, reading-room, washingrooms, and others.

The ground story contains the guard-rooms, armouries, adjutant's office, waiting-rooms, room for examining recruits, serjeant-major's quarters, and officers' stables.

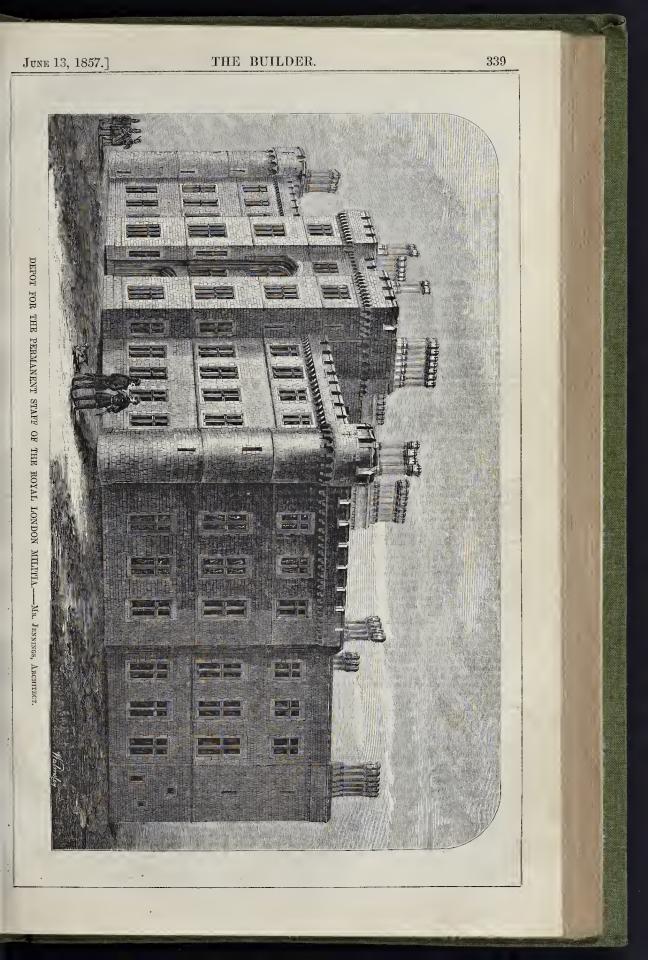

The basement contains the kitchens, wash-houses, and various conveniences required when the milling has three fronts faced with rag and Portland stone—the fourth is of brick.

The corporation of the City, as such have nothing to do with the ulittia, which is entirely under the management of the commissioners of licatenancy, who are appointed by the Crown. The alderman and deputies are *excepticio* mem-bers of the commission; and the directors of the Bank of England, East-India Company, and South-Sea Company, have always been put on the commission, with such other merchants connected with the city as may be thought desirable. desirable

The depôt is paid for by a rate called a trophy-rate, levied by warrant from the Crown, but the men, we are told, are paid by the Crown, and all the arms and ammunition on the pre-miscs are the property of the Crown.

The whole of the floors are fire-proof, with iron joists of Fox and Barrett's patent. A con-tract was entered into with Mr. Jay as the end of November, and as soon as the weather per-mitted, the work was commenced, and has been carried on with the utmost practicable rapidity. Mr. Jennings is the architect.

PROVINCIAL NEWS

Norsciok.—At a recent committee meeting, the tenders for the new workhouse, according to the plans approved, were opened. They varied in amount from 20.000/, to 25,000/, and some were sent in by several Norwich budders and a Lynn firm. The tender of Messis. Curitis and Balls being the lowest, the committee agreed to recommend it to be accepted by the general court. The site selected is near the iclery.

Dudley .- The following tenders for the new schools in King-street, Dudley, Mr. Nichols, architect, have been sent in :

Beddoe				£789	0	0	
				700	0	0	
Cox and	Son			682	4	0	
			(accepted)	652	T3	Ó	
ironand	and	LIOM	(accolinea)			-	

Shreusshury, -- The Est-India Company have re-solved to appropriate the sum of 500% towards the erection of a su table monument of the great Lord Clive in the town of Shrewshury.

Malvern .- The foundation stone of the new schools Malvern.—The buildation score of the new seconds at Malvern was hald on Srd inst. by Lady Emily Foley, instructed, as a pupil, by the Grand Master Mason of the province, assisted by grand officers of the craft, and in presence of the assembled lodge. The land for the schools, residence, and playground, is three furlo-gs in extent. Something Ices than half of the area will be occupied by the huildings and yards: the rest will form an open space in front. The hailding will he 160 feet from end to end. The plan contains a mixed school in the centre, 83 feet in plan cootains a mixed school in the centre, 83 feet in length by 40 feet in witht, the parallelogram broken in upon by two class-rooms, each 18 feet hy 14 feet. The west end of the building is necapied by the infant school, which has an area of 65 feet by 28 feet, and n class-room of 18 feet by 14 feet. The school-rooms and class-rooms have open roofs. At the west end are residences for a married couple, as tachers of the wired eachers and real residue or room who is to teach mixed school, and for a single person who is to teach the infant school. The mixed school will accommothe intant school. The mixel school will decommo-date 300 scholars, and the infant 200, allowing a square yard of floor to each in the large school, and 7 feet 6 inches to each in the smaller one. The style of the huilding will he Gothic, with numerous gables. and many breaks in the outline of the walls and roofs The walls will be of brick, with Bath stone dressings The walls will be of brick, with Bath stone dressings, and the roof of Broselcy tiles. Each of the principal windows hes a gable above it, and there are ventilating turrets, with octayonal roofs, above the schools, in keeping with the style of the building. The height of the large school is about 26 fect from the floor to the apex of the roof. That of the infant school is about 30 fect. The residences, being two stories high, have a still bigher roof than the rest of the alfine. Mr. Duris of Wales will be constructed edifice. Mr. Davis, of Malvern Wells, is contractor for the huilding at 2,435/. exclusive of boundary-wall. The architect is Mr. E. W. Ehuslie, of Malvern

Bristington.—The gentlemen promoting the erec-tion of the new schools at Brislington, have chosen the designs of Messrs. Pope and Bludon, of Bristol. Alcester.—The Board of Directors of the Alcester

new cora-exchange met on 4th inst. to decide upon the plans sent in for their new exchange, when the design by Mr. Edward Holmes was selected. There when the the state of the state were twenty-one competitors. Rugby.—The town-hall shareholders have resolved

were twenty-one competitors. Ruqoy.—The town-hall shareholders have resolved that their directors he empowered to enter into a con-tract with Mr. Gascoigne to huid the town-hall for 3,0734; and that the directors he empowered to ex-pend a sum not exceeding 3,5004. in the whole, and to raise the amount hy mortgage or otherwise. It was also resolved that a lerk of the works he appointed for the company. The work has already here com-menced, hat there will he no ceremony at the laying of the foundation stone. of the foundation stone. Horsington. — The designs for the Horsington

schools were furnished by Mr. Henry Hale, of Isling-ton. The schools were erected for I50 children, and comprise a boys' school, 30 feet by 18 feet; girls' school, same size, communicating with large sliding doors. There is a class-room, 20 feet by 12 feet, common to hoth schools, and separate entrance, with places for caps, bonnets, &c. The cost has here 8000, more than half of which has here raised in the parish, the rest obtained hy grant from the Council on Educa-tion. This sum does not include the value of the This sum oes not include the value of the site, which was given.

site, which was given. Newosatic-neyon-Tyne.-The opening of St. Mary's Roman Catholic echools, Neweastle-upon-Tyne, took place on the 1st inst. The ground was given by Mr. Wm. Duan, and the schools were built from designs by Mr. Archold Matthias Dunn, of this town, archi-tect. Messrs. Gibson and Howard were the con-tractors. The schools, when completed, will form an open quadrangle of 150 feet across. The masters' house, containing accommodation for two masters, with a hell furget attoched convince the contract the teet. Messrs, Gisson and Howard were the con-one operated with, about 10 iete in diameter, being tractors. The schools, when completed, will form an equal to 7 toos, so that guide-ropes being in the first open quadrangle of 150 feet across. The masters' house, containing accommodation for two masters, with a bell-turret attached, occupies the centre; it tion required under the one operation. At the hoys' and girls' schools forming the wings at either

Between two shops, as described in the *Falkirk Herald*, is the entrance to the corn-exhange : showe the two shops is a hall, lighted from the front by five windows, and on the top of the building is to he a halcony, with ornamental balastrade. Immediately at the back of the exchange, lighted from the top, is a hall, 52 fect 7 inches in length, by 39 feet is a back which the orlinary business of a market a main, do not in market in the ordinary business of a market day is to be conducted. At the back of this hall there are six small rooms, and on the right is a grain store. The building is after a design by Mr. A. store. The huilding is after a design by Mr. A. M'Gregor, of Edinburgh, architect.

CHURCH-BUILDING NEWS.

Ipswich .- The first stone of a new Congregational chapel in Tacket-street, Ipswich, was laid on 29th ult. Competent detect-strets, provide, was and our 20th dist. It is myon the site of the meeting-house cretced in 1720. The contrast price of the hulding is 2,7004. Mr. Whight is the hulder, and Mr. Prederick Barnes the architect. The style is Decorated. Datchet.—The works in connection with the enlargement of this church have been commenced. Investige 0, 6004 have been required but there is

Upwords of 1,600Å have here promised, but there is still a deficiency of 4007 which is guaranteed by Mr. Hall, the vicar, in case it he not made up by sub-

Dorchester .- In St. Peter's Church an antechapel has heen built for the organ, which will no longer hide from view the monument of Sir John Williams, of Herringston, in the Herringston aisle. The work has been executed by Mr. Wellspring, under the superintendence of Mr. J. Ilicks, architect, hoth of Dorchester.

Dorehester. Crick.—The foundation-stone of the new church about to be built at Wessington, in the parish of Crich, has heen laid by Mr. Edward Radford, of Tansley-wood, near Matlock. The plans of five architects were sent to the committee, and Messra. Hockton and Son, of Sheffield, were the successful flockton and Son, of Sheffield, were the successful

Plockton and Son, of Smitheld, were the audetsatin competitors. The estimated expense is 2,2507, of which 1,9607, have been already subscribed. *Walsall*,—The chaptels is the centre of the new cometery, designed by Mr. Clark, the borongh sur-veyor, approach completion, and except the central spire, the material is brick, faced with white stone. The design is Early English. The new burial-ground The design is Early English. The new ourse-ground extends to about thirteen aeres, eight of which will he appropriated to the Established Church, three to the Disseaters, and the remainder to the Roman Catholics. It is heing laid out under the superintend-ence of Mr. Cole, of the firm of Cole and Sharp, norserymen.

Matton .--- The restoration of St. Michael's Church mattom. -- 100 restoration of St. Marmer s Canren, Malton, has at length here hegun. Preparations are being made for pulling down the chancel, which is to be entirely rehuilt. The slorations are from plans by Mr. Chantrell. The subscriptions amount to upwards of 2007. the estimated cost heing 1,0007.

THE NAUTILUS, OR IMPROVED DIVING-BELL

On Thesday there was a large musler of the scientific world at the Victoria Docks for the purpose of wit-nessing some experiments as to the capabilities of this new and effective machine, and which were of a most satisfactory nature, as showing the complete control under which it would he in sabmarine works, and that, too, at the will of the person descending, the whole of the ascending and descending power being regulated from within, and not as in the old diving-bell, dependent on the persons left on the surface, the age being, of course, air and the water. Apart from this great desideratum and safegnard from aerident hy inter-rupted communication, the machine also serves the purpose of its own craae, the suspending power of the one operated with, about 10 feet in dismeter, being JUNE 13, 1857.

testimony to the theoretical value of the invention, and to the perfectness with which it had hern carried out, while Mr. Bidder, the engineer to the docks, stated bis entire satisfaction, practically, some work having heen accomplished through its agency in a space of two days and two hours, that would have been under the old two mours, that would have considering near accompliance through its agency in a space of two days and two hours, that would have taken, under the old system, more than three weeks. Among these who took notice of the experiments were Messrs. Looke, M.P., Yignolles, C. Manby, Scott Russell, John Leslie, Sir S. M. Peto, &c.

THE MANBY TESTIMONIAL

THE members of the Institution of Civil Engineers had, for some time, entertained the intention of ac-knowledging the services of Mr. Charles Mauby, as had. snowledging the services of Mr. Charles Mouby, as their paid secretary during eighteen years; and advan-tage was taken of the opportunity of his retiring from that post to carry this intention into effect. A com-nittee was accordingly formed, and in a new first mittee was accordingly formed, and in a very short period newards of 2,000/, were subscribed, with which it was determined to muchae and to present the balance in cash. The ceremouy presentation took place in the theatre of the Institu-tion, on Saturday, 23rd May, in the presence of a large assemblage of the members and of Mr. Manby's private friends.

prvate friends. Mr. Rohert Stephenson, M.P. the president of the Institution, took the chair, and Mr. Bidder, as trea-surer of tho fund, explained that, owing to the enger-ness with which their call was responded to, the doties of the committee had hene comparatively light. amounts subscribed varied from half-a-guinea to 1007, and up to the present time there had been received 2,0197. 10s. from 417 subscribers, of whom 358 were members of the Institution, and 59 were 358 were members of the Institution, and 50 were the private frieods of Nr. Manby; hut as many more subscriptions had heen announced, the accounts would not be finally closed until the publication of the list of the contributors to the testimonial. The testimonial consisted of a timepiece and a pair

of candelahra supplied hy Messrs. Howell and Ja aud the sum of 2,0007.

and the sum of 2,000. Mr. Mauby, in thanking the subscribers, asked as a favour to be permitted to devote a portion of the amount of the testimonial to establishing an annual premium which should hear his name. The engineers, he added, were the only professional hody not posses-sing some kind of a mutual aid society. Would it not he possible to originate some plan for thus doing good? His time and means might be freely com-manded, and he should feel happy in devoting to such an object a further portion of that which had heen so generously placed at his disposal.

an object a link point of the unit when the heat of generously placed at bis disposal. Amongst the speakers at the meeting, besides Mr. Stephenson and Mr. Bidder, were Mr. Locke, M.P. Mr. Field, Mr. Forrest, Mr. Giynn, and Mr. Scott Russell, which last gentleman incidentally stated that the for a state of the formation of the f three-fourths of the 700,000%. of shares in the Great *Eastern* ship undertaking were held by memhers and associates of the Institution of Civil Engineers, —a fact which spoke volumes for the safety of the structure.

THE VICTORIA MILITARY HOSPITAL, NETLEY.

Ir the statements made both in the House of Commons and the public prints he correct, others have now discovered, somewhat late, the fatal errors in the plan of the Victoria Hospital, which were

in the plan of the Victoria Hospital, which were pointed ont by ns, nuwlingly, but with a strong sense of duty, in the autumn of last year, when we published a view and plan of the proposed building." We referred to mistakes which had heen made, especially "to the placing of the haths and the latrines together, and the position of the latter hetween sick wards," and maintained that, "should hencement he carried out whenever the proposed arrangement he carried that, should the proposed arrangement he carried out, whenever this bospital shall he fall of patients, more disease will be generated there than cured." What do we hear now ? In the course of a dehate in the House of Commons last week, Mr. Stafford

affirmed that the hulding was "heing constructed in defauce of all those satisfy precations which our bitter experience in the Crimes ought to have taught us." And in the British Medical Journal, of the 30th of May, we find it stated that, "This imposing huiding, calculated to hold one thousand patients, having just emerged from the ground to a sufficient height to show its outlines, and having absorbed 70,0007. of public money, is stopped by order of Government, and now stands in the open day a con-spicnous engineering hlunder, calculated 'to point a moral and adorn a tale' to all those who believe in the efficiency of our army medical government." affirmed that the huilding was "heing constructed in the efficiency of our army medical government.

The writer repeats our aserty meana government. The writer repeats our assertion allinost in our own words, that "the Nellcy Hospital as at present de-vised will kill more patients than it will ever cure," We have shown that hitherto all our hospital wards

* Vol. xiv. pp. 458, 510, 544, &c. &c.

have heen treated as though they were mere sleeping-rooms, and as if the namel means of ventilation neces-sary to remove air simply rendered impure by healthy respiration were sufficient to change the bosp tal atmosphere charged with the thonsaud impurities which are given off from the bodies of sick patients. "To order to keep the air of sick apartments sweet, two things must be attended to: in the first place, each ward should be thoroughly ventilated in itself we means of onen firendaces, anonsite windows ranging been ward should be too support environment of the hy means of open frephaces, opposite windows running to the top of the room : secondly, each ward should be entirely separated from its neighbours. The in-terior of a ho-pital should be treated, with respect to so divided noto compartments that the element, when deleterions, may be confined within its own bounds, and not allowed to bring destruction into adjoining ones. On this plan the great Military Hospital at Bordeaux (of which we gave an eugraving) was con-structed, some thirty years ago; and on this beautiful plan nearly all similar establishments have been erected in France, and even in Belgium." "If any man winder to assertion for binself the

"If only man wishes to ascertain for himself the errors that have been committed at Netley, he has only to consult the plan. All the wards communicate with one commoo corridor, which will serve as a pipe to conduct the contaminated atmosphere of one ward to the comparatively pure air of its neighbour. It would seem that this vind error was not sufficient: Would seem that this vine error was not similarity in the latrice also communicate with the wards; hence we have a double source hy which an 'hospital atmosphere' is provided for." Returns in connection with this structure have

been moved for in the Honse of Commons, so that we may hope hefore long to learn the exact state of affairs. The returns should include a plan of the building as now determined on.

LONDON BURIAL-GROUNDS.

THE TOTTENHAM-COURT-ROAD CHAPEL GRAVEYARD. In the Rolls Court on Jane 5th, judgment was given in the ease of Moreland v. Richardson. The plaintiffs claimed to be entitled through their ancestors plantilis elsimed to be entitled through their ancestors (who purchased it more than twenty years ago) to the right of hurial in the graveyard. It appeared that the trustees or deacona of the chapel have, since the pass-ing of the Act for the classing of the London grave-yards, removed the tombstones from the graves of the plaintilf's ancestors. This was thought by the plaintif's ancestors. This was thought by the plaintif's decestors and an injucction was obtained to restrain the proceedings of the deacons or trustees of the chapel in this respect, and the nersent motion of the chapel in this respect, and the present moti of the chapter in this respect, and the present motion was that such injunction should be made perpetual. The Master of the Rolls beld that it had been esta-blished, to his entire satisfaction, that the defendants had improperly interfered with the rights of the plaintiffs in the hurial-ground in question, which the Secretary of State had made no objection to, or in any way interfered with. After a very earcful atten-tion to the featured line of the secret o tion to the facts and arguments on hold sides, that was the conclusion he had arrived at. The injunction would therefore be made perpetual, to restrain the defeudants from interfering with the hurial rights of the plaiutiffs or any members of their families in this churchyard, which was not objected to under the Act by her Mojesty's Secretary of State. It will he seen by the above statement that it is illegal for the by the above statement that it is illegal for the managers of graveyrads to remove the monuments, and also that, in such buriel-grounds as have not becu-formally elosed by order of the Sceretary of State, parties having claim to ground can demand the reopening of the graves for fresh interments. This is a matter which requires the careful consideration of the Government authorities, for the reopening of graveyrads as thickly occupied as that in Tottenham-court-road might cause much misshief. We are glad, bowever of this achnowledurant of the richt to controlat ingut cause much meener. We are grand, however, of this acknowledgment of the right to preserve the monuments, and hope that those inter-ested will, in case of necessity, interface and prevent such cases of spolintion as we have been obliged to notice.

THE TRUE BASIS OF SANITARY PRINCIPLES.

PRINCIPLES. In your last number you have introduced what is there called a "Saniary Pact." Let this he rightly understood. Your publication is not the arean for the discussion of medical questions ; yet, in the construc-tion of public hospitals, a knowledge of the value of ventilation is highly important, as well as the arrange-ment of a perfect system of sewers. In these all-important points we shall not attempt to dictate to the ingroundly and skill of the architect : we shall only point out oce or two facts, which will be nschl, as proving the necessity of a careful consideration of proving the necessity of a careful consideration of ventilation and sewerage,

Fever hospitals are an error in principle, and tend to eucournge prejudices : they accumulate a number

of discased subjects together, which vitiates the atmosphere, and causes a scrions disadvantage to the sick. The writer of this has been nearly thirty years sick. a physician to the largest provincial public hospital in the kingdom, where all cases of typhus fever are in the kingdom, where all cases of typhus fiver are placed iodiscriminately among the other patients in beds only 2 feet apart, yet no instance has ever been known in the course of a whole centory of the disease affecting the next person, who has been constantly living and sleeping within 2 feet of the typhus disease. This is purely the effect of venthaltion and eleniliness. A few words more of explanation will show the truth of this fact, —typhus fever is produced by a malaria and not from contagion. The respiration of air con-taminated by the admixture of gases which are pro-duced from the decomposition of vegetable matters (aminated by the admixture of gases which are pro-duced from the decomposition of vegetable matters causes ague or typhus fever (diseases which often pass from one to the other): when the respired air is contaminated with the gases which result from the decomposition of animal matters, it causes a violent diarrhoma. The mucous surface of the air passages is as susceptible of being poisoced as is the mucous sur-face of the atomach. Those fevers termed gastricare a distinct class of diseases. A gastric fever is nothing more than an inflammatory state of the lining surface of the bowels, which is disposed to run into a state of ulceration or shourhing. This form of disease is of ulceration or sloughing. This form of disease is easily cured by those who understand it.

When the air is intermixed with foreign matter, it When the sir is intermixed with foreign matter, it becomes specifically heavier than pure air, and will, therefore, gravitate to the lowest situations, and will stagoate in a hole like water. The ventilation of all low and confined places becomes proportionately diffi-cult, and requires skill and practical experience to expel the beavy vitiated atmosphere. The philosophy of organization ought to he culti-vated as a part of polite education by all well-educated men. it would be producting of great heavier to the

men: it would be productive of great benefit to the eommunity, and would dissipate much of the preju-dices and follies of mankind. W.

THE HANDEL FESTIVAL AT THE CRYSTAL PALACE.

THIS musical congress, the greatest ever yet assembled, will take place on Friday in next week, and owes its existence to the auxiety of the Sacred Harmonic bies, which are both it was a lack wear all draws its existence to the auxiety of the Sacred Harmonic Society of London to promote by their example the commemoration, in 1850, of the Centeoary of Handel's death in such a manoer as would he alke worthy of the Great Master and of the widely.dif-fused musical knowledge of the present day.* In carrying out this object, it was found that the central transcept of the Grystal Palace officed a *locale* for this display far beyond any other existing building. The space appropriated to the orchestra alone occupies a clear area of 168 fect in width by 90 feet in depth. This extent exceeds the entire capacity of any other nusic-hall in this country, and has the additional advantage of great height and of ample means of approach and for general arrangements. The orches-tra, which has been constructed in a somewhal flat-teced curve, rises from the floor at a frout elevation teocd curve, rises from the floor at a front elevation of 8 feet, and is from thence continued in a scries of of S feet, and is from thence contuned in a series of semi-circular steps, varying from 10 to 15 inches each, to a total height of 47 feet. These rises are thirty-four in number, of which eleven are appro-priated to the hand, and the remaining twenty-three to the chorus. The band consists of 385 performers in all, who are arranged at 202 desks. The chorus, originally intended to consist of 2,000 voices, slightly versede the number. exceeds that number. The entire orchestra, therefore, is, as near as possible, 2,500. The great organ, erected is as near as possible, 2,500. The great organ, erected by Messrs. Gray and Davison, of New-road, is itself an unprecedented construction. In the centre, hetween the organ and the band, the large drum made by Mr., Distin for the Festival, will be a conspicous object. It is between 6 and 7 fact in diametor, and, whea gently struck, produces a tone resembling the houm-ing of a deep pedal-pipe. We need bardly claim for thus festival the support of all lovers of music throughout the construthroughout the country.

CHISWICK GARDENS.

The *felo* at these justly celebrated gardens last week was more what such a meeting ought to be than any one which has yet been given, either there or elsewhere.

An addition-and a most useful onc-to the display of marvellous flowers and magnificent fruit was made in the exhibition of horticultural implements and appliances; and we were glad to see that many ladies, as well as memhers of the more agricultural sex, appeared interested in it. Several conservatories were temporarily erected, and filled with plants, to show the effect when complete, and the price of

An account of the intended Festival has been pub-lished in the form of a Letter, addressed to the members, subscribers, and assistants of the Sacred Harmonie So-ciety. A lithographed plan of the orchestra has also been published.

each was given ; a commendable practice that will lead to the extension of artificial cultivation. We noted several marked improvements in con-struction, produced by sjudicious combination of iron and wood, by which greenhouses are rendered much lighter and more elegant in appearance, than 0 old. One nethod of opening and elosing all the saches simultaneously hy means of a lever was also worthy of observation: this system might, perhaps, be applied with advantage to schools, hospitals, and churches.

On the green sward, several tents were pitched, offering useful suggestions for future necessities : the unbrella-tent, especially, seemed to combine the desirable qualities of being portable, spacious, and sectice

With regard to the flowers, too much cannot be suid; trey were beyond and above praise. The mode adopted in one tent, of hreaking the too porgeous line of hrilliant colours by a hed of soher dark-green excite plants and ferns, gave great relief to the eye, and should, on physical grounds, be more frequently adopted. It struck us that the too extensive aggregation of hright colours, without an oceasional rest—so to speak—of eool, green foliage, does great injustice to many of the marvellous blooms with which most of the plants were literally covered. The heavy showers which drenched the London streets on that day, fortanately did not extend to Chiswick; and though the low temperature had in-duced many of the ladies to diseard their light summer dresses for richer and warmer costomes, tho With regard to the flowers, too much cannot be

duced many of the ladies to disert their high summer dresses for richer and warmer costumes, the toilettes were elegant and appropriate, and did no dis-hoocur to the perfection that pervaded the gardens. One thing only we missed—the delicious perfume that, of old, the recently-mown grass used always to exhale: hut perhaps, on account of the previous dry weather, the grass was too short to cut, though the multitudinous disies would have been hetter away. However, that is a trifle only worth mentioning to show how perfect was everything, when this was all with which fault could he found : and we most heartily wish success may attend the reaewed exertions of the Horticultural Committee. Admire as we may the heauties of Sydenham, and husuriate in the proximity to London of the Botanic Gadees, we must ever remember with grati-tude, that to Chiswiek and its enterprisug managers and originators we are indebted as being the pioneers in the once difficult path of horticultural importation

in the once difficult path of horticultural importation and development, in which so many followers now tread with case, thanks to their previous exertions.

THE COMPETITION DESIGNS FOR LONDON-DERRY BRIDGE.

Sin,-The following questions are heing very generally asked, among the members of the pro-fession of eivil engineers, with reference to the late

lession of eivil engineers, with reference to the late competition for designs for this bridge. Is it true that Sir William Cubitt gave himself very little trouble shout the matter, and handed over the examination of the designs to a gentleman who, how-ever respectable as a mechanical angineer, has neither knowledge nor experience as a civil cogineer? Is it true that the first prize area enached to Sir

Is it true that the first prize was awarded to Sir William Cubitt's drawing-clerk ?

William Cubitt's drawing-clerk ? Is it true that the same gentleman who has ob-tained the first prize was employed some years since by Mr. Chatles May, of the Pernanent Way Com-pany, to make a design for Londouderry Bridge, which design of Mr. Charles May resembled closely in its leading features that to which the first prize was awarded in the late competition ? Is it true that the holder of the first prize having, throngh Sir William Chitt's influence, obtained an appointment in India, Mr. Peter William Barlow, of the Permaaent Way Company, has been selected to make a design, under Sir William Cubit's directions, to the exclusion of all the other competitors ? Is it true that Mr. Peter W. Barlow hrought for-

to the exclusion of all the other competitors? Is it true that Mr. Peter W. Barlow brought for-ward the design that he has prepared, at a recent meeting of the Institution of Civil Engineers, and that the principle of the design was condenned by the first authorities in the profession? Is it true that this design is, notwibstanding its defects, being forced on the bridge commissioners on the plea of economy, though the estimate has never here submitted to any moof?

the plea of cenomy, though the estimate mass here been submitted to any proof? Is it true that a large number of gentlemen were commissioners, on the faith of the terms named in the advertisement for designs, and from confidence in the high character of Sir William Cubit, who was appointed umpire, and that these gentlemen now versalism with reason, that the statements made in complain, with reason, that the statements made in the advertisement have not been adhered to, and that what was called a public competition has been per-verted to the private advantage of a few individuals? C.E.

RECENT PATENTS.*

STEWART, R. — Improvements in Catting Stone and other Mineral Substances. Dated July 25, 1856. (No. 1,769).—A sole or hed is laid down, and a car-riage carrying the cutting tools traverses upon rails upon the sole or hed, heing supported upon whechs, toothed to gear into racks upon the rails or sole. The cutting tools are arranged in a line one behind the toothed to gear into racks mon the rails or sole. The enting tools are arranged in a line one behind the other, and each tool is fitted into a socket in the lower end of a vertical or slightly include dar, capable of sliding easily in guides attached to the carriage framing. The cutting action is made to take place by raising and letting fill this bar. The bar is lifted to its inner side a short lever or eccentric piece, which grips the tool har when the lifting action takes place, taking hold of it higher up as the cut gradually deepens.

taking note to to asymptotic action of the asymptotic action of the

the npper end or centre of the brace or horing har in drilling or boring by hand, hut it requires engravings to illustrate it clearly. HOLGROFT, G. and P. JOHNSON.—Inprovements in the Manufacture of Cament, and in the Applica-tion of a known Material to Cementing Purposes. Dated July 31, 1856. (No. 1,505).—This consists in manufacturing cement of sulphar combined with sand, gypsun, &c.; also, in the application of sulphur alone for cementing the joints of stones, or as a general substitute for cement. substitute for cement.

substitute for cement. MENNONS, M. A. F.--A New Composition, appli-cable to the Coating or Covering of Metallic and Non-metallic Surfaces. (A communication). Dated August 25, 1836. (No. 1,976). --This consists of a composi-tion applicable to the coating of walls, partitions, steam-holiers, &c. The patentee takes argillaceous elays of different kinds, and containing alumioia. These clays are kneeded with water, and to the mass he adds in succession to 100 parts of elay oily sub-tances or residues 6 norts. oil sediment 5 parts : stances, or residues, 6 parts; oil sediment, 5 parts; fat, 2 parts; animal charcoal, 2 parts; vegetable charcoal, 2 parts; mucilaginous substances, such as glue, &c. 1 part; wood saw-dust, or ground wood, already employed in the purification of oils, or in drying processes, 10 parts; waste hair, well heaten, 4 parts this be adds a decoction of logwood, treated ted with nitrate of iron (to deepen the colour), together with a small proportion of soot. The whole is thoroughly

a similar population solution of the consistence required. FERRY, BENJAMIN, Trinity-place, Charing-cross-Producing Ornamental Platering or Slucco Work. Dated Oct. 27, 1856, (No. 2515).—This invention consists in so performing such work that indented or impressed ornamental patterns are obtained on the impressed ornamental patterns are conducted on the surfaces as the plastering proceeds, and whilst the materials are still sufficiently plastic to admit of the desired impressions or indents heing made. For this

desired impressions or indents heing made. For this purpose ornamental pattern-plates are formed with the pattern cut through them, similar to stencil-plates, hat sufficiently strong to admit of their heing pressed into the finishing coating of plaster. The edges of the pattern are inclined. BRODE, WILLIAM, Behaven.— *Roofing Tiles*. Dated October 27, 1856. (No. 2524).—Iu making roofing tiles according to this improved system, the elay or other apparatus, from which it is made to exude through a die of a horse-shoe form. The issuing horse-shoed stream of clay is cut into lengths hy any suitable apparatus, such as is used in because note-since-since any end stream of cary is Cut fillo lengths hy any suitable apparatus, such as is used in drain-tile machines, the lengths so cut forming blacks to be subsequently moulded in the fusished roofing tile. The finishing operation is effected by means of a frame arranged to turn or swired upon a vertical axis, and fitted with two mould plates at diametrically converte with two mould plates at diametrically

3218 and interest with two mount places at subscription opposite points. GEFEREY, WILLIAM, Glasgow. — Apparatus for Sawing or Cutting Wood. — Dated Oct. 17, 1856. (No. 2429).—This invention relates to an arrange-ticular sawing-tame, as nited up for a stationary circular saw, has upon it a horizontal slide piece set in a recess running in a line parallel with the saw's disc. The further end of this slide has a graduated ledge piece upon it, set accurately square, so that when the operator has to saw a hoard, be presses one encourse advanted by the same state of when the operator bas to saw a hoard, be presses one square end against this ledge, and the slide is then traversed forward to bring the wood into ent in an accurately straight line. A connterweight is attached to the end of the slide, so that it returns to its original position in readiness for the succeeding ent. * Selected from the lists published in the Mechanics' Magazine, Engineer &c

McDowALL, JOHN, Johnstone, Renfrewshire.-Saming or Catting Wood. Dated Oct. 17, 1856. (No. 2430).--This invention relates both to plain straight ent sawing, and to differential sawing for curved work, such as ships' timbers. As regards straight enting, the apparatus employed according to this invention consists of a contrivance wherehy a series of saw-frames may'be simultaneously worked from one single prime mover, whilst provision is made for the occasional disconnection of any one frame without disturning the action of the rest.

FALL OF THE NEW (R. C.) CATHEDRAL AT PLYMOUTH.

A large building, exceeding in size most of the churches recently erected in this neighbourhood, and intended as a Roman Catholic cathedral, has been of Call this focus as a Roman Catholic cathedral, has been of late in course of construction at the corner of the road leading from Eldad, into Ceell-street. It had so far advanced as to enable the architect, Mr. Hansom, of Bristol, to fix the 4th of August next as the period for its consecration. The edifice was completely roafed in, and the interior fitments were being pro-ceeded with, but on the 3rd inst. au accident occurred which will occasion hold dely and expense. The eburch was formed with side aisles, and from one end to the other the roof, which was an extremely lofty one was sumparted by arches which sprang from one, was supported by arches which sprang from pillars. These pillars were formed of Bath stone, and the arches springing from them were of hick. On Toesday in last week some de/ects were observed by Mr. Roherts, the builder, in the southern arch of the Mr. Roherts, the builder, in the southern arch of the nave, which caused him to telegraph for the architet to come down immediately. That genuleman at once left for Plymouth, and on Wednesday morning he inspected the building, which be found in a very unsafe condition, so much so as to render immediate stops necessary to sceure it from falling. The Batb stone it appeared had proved too weak for the weight which it had to sostain, and some of it had split, and was thus endangering the whole structure. A number of men were set to work to shore up the arches of the nave, previously to removing the defective work, which was found to be immediately over the piers, and consisted of brickwork and limestone. Before the measures for shoring up could be matured, the architet observed indication that the edifice was falling. It e at once warned the workmen to leave, which they did, and before he was enabled himself to architect observed indication that the connec was falling. He at once warned the workmen to leave, which they did, and before he was enabled himself to get entirely free the southern arches of the nave and the large eastern arch fell, bringing down with them the southern elerestory. A small portion of the aver coof only remained; but a fartber fall took place on the following day. It is impossible at present to say what will be the ultimate cost. The damage done by the first fall has been widely esti-mated from 4007. to 1,0007.

GAS.

Ar the fifth annual meeting of the Sutton-in-Ashfield Gas Company, a dividend of 7[±] per cent. per annum, free of income-tax, was declared. The growing demand for gas having rendered it necessary to extend the works, 100 new shares have been ercated. — The price of gas in Warrington (5s. per 1,000 feet) is considered to be unreasonably high, and 1,000 feet) is considered to be unreasonably high, and its illuminating power not even good at that price. The gas company thinking themselves safe from compession to the popular demond for hoth cheapness and goodness. The board of guardians have taken the matter up, and several firms are talking of making their even grace. Carl Thes Cook ERS, has the matter up, and several urms are taking of making their own gas.—Capit. Thos. Cook, F.R.S. has invented an improved lump, and apparatus connected therewith, for lighting coal mines with gas. The principal feature in the invention appears to be the forcing of air from the surface through the lamp. He pronses reflectors to throw the light into the forcing of air from the surface to be light into the IIE proposes reflectors to throw the light into the intricate workings of the mine.—Mr. S. Nibbs, of Dismingham the inventor of "the People's Solo, Birningham, the investor of "the People Lamp," has produced a new "safety lamp," Mr. Wm. Gossage, of Widnes, proposes the sep ration of the hydrosulpharet of ammonia and su ration of the hydrosulphuret of ammonia and sui-pluncted hydrogon from coal gas, by employing sulphure acid, and therewith converting the hydro-sulphuret of ammonia into sulphite of ammonia, and decomposing the sulphuretted bydrogen, so obtaining two valuable products—sulphur and sulphite of ammonia, and depriving the gas of its injurious sulphur compounds.——" Recently," says an Ameammonia, and depriving the gas of its injurious support "successful experiments, the characteristic interest, the rican paper, "successful experiments have been made in the manufacture of illuminating gas from wood. A patent was first applied for in America, in 1853, association of enrious subjects which then startled by a German chemist, the assignee of the discoverse, Finil Briesach. Under this patent different gasworks have heen erected in that country, and with satis-factory results. Where wood is cheap, it is believes this gaseous product will he cheap. The residuum consists of charcoal and tar, and creosote and pyro-

igneous acid may also he obtained. Different kinds ligneous acid may also he obtained. Different kinds of wood may he used for this purpose. One cord of ordinary plue wood of 128 enbic feet produces gas-bight equal to 800 h. of spermaceti enndles: one cord of oak or maple of good quality will yield gaslight equal to 900 h. of spermaceti candles. This esti-mate is upon wood used without a careful drying."

ANGLO-ROMANO GAS COMPANY.

THE dividend declared at the recent half yearly meet-THE dividend declared at the recent half-yearly meet-ing of this company was at the rate of 5 per cent. for the past half-year. The progress of the works has been very successful since the declaration of the last divi-dend. The company was established in Rome, under statutes, in 1852, and its working operations have given unmixed satisfaction. We may remind our relations that Rome was first lighted with gas, January at the The works are corrected unon the site of the reacters that itome was first igneted with gas, damary 1, 1554. The works are created upon the site of the Circus Maximus, rendered memorable as the scene where the Sahine women were carried off by the Romans. They are constructed of a capacity to fur-nish from 170,000 to 200,000 euble feet of gas are therefore have with the scene believes nish from 170,000 to 200,000 enbic feet of gas per twenty-four hours, with two gas-holders of 65,000 enbic feet each, and are situated within 200 yards of the Tiber. All the leading streets of Rome are lighted, and the company are extending their pipes to the streets adjacent to the principal mains. The courts of the Vatican are brillionity illuminated (the Pope having libreally supported the company since its formation), and the Grand Square of St. Peter's, the Quirinal, the palaces of the nobi-lity, the chief hotels, and other public establishments. The social and moral effects of this change are felt by all classes. all classes

Mr. Shepherd, the gérant and engineer, has been Mr. Shepherd, the gerant and engineer, has been honnured with frequent marks of approbation from his Holiness, who has on several occasions visited and inspected the works, and expressed bis desire for their success. Mr. Shepherd had earned elebrity in his profession before visiting Rome, having erected the gas works at the Hague, Cadiz, Bologna, Modena, we have a loce and other places,

PROPOSED TOLL ON THE WAY TO "THE PEOPLE'S PARK," AT BATTERSEA.

PEOPLE'S PARK," AT BATTERSEA. THE announcement made on the part of the Government, that they intend to set up a bar on Chelsea new hridge, and to charge a poll-tax on every man, woman, and child either going to or coming from Battersce-park across that bridge, is exciting no little ferment amongst the pent-up crowded deni-zens of the hack strets in Chelsea, Brompton, Pimlico, and surrounding districts. That so bad an example should be set by the Government, at a time when metropolitan toll-bars have become an intoler-able nuisance and abomination in the eyes of thonable nuisance and abomination in the eyes of thou-sands even of those far hetter able to hear such taxes sands even of those far hetter able to near such taxles than those poorest of the poor with whom Chelsea and its vicinity are well known to be crowded, is much to be deplored. And this, too, all the more, that the very same end, namely, the redemption of the cost of creeting the bridge in question, could ob-viously he effected hy a process the very reverse of the obnoxions one which the Government appear to the buoxinite, inspanned as a free way to and from the obnoxious one which the Government appear to think requisite; insanuch as a free way to and from the building sites which surround the new park, and which helong to the Government, would enhance the value of the property, and promote its speedy conver-sion into an equally efficient and much less obnoxionas means of redocming all cost in the course of time. A means of redeciming all cost in the course of unit. A movement is being made for the purpose of urging on Government the propriety of giving up all idea of taxing the public health as contemplated ; and an energetic address, which eannot but meet with the cordial concurrence of all disinterested persons, is cordinal concurrence of all distinterested persons, is now being wildly distributed by the committee who have taken up the cause of the public on this question. The address is signed by Mr. Walter T. Jones, of 93, Cambridge-street, Warwick-square, as hon, secretary, to whom all communications and subscriptions in aid of the very desirable object in view may be addressed.

Books Receibed.

Memorials, Scientific and Literary, of Andrew Crosse, the Electrician. London: Longman and Co. 1857.

No one who can recall, with scientific interest, the

the grand feature of interest to the sacans, and which eclipsed all else for the time, was the sudden blaze of a scientific count; in the form of A. Crosse, a great electrician, of whom scarcely any one had ever beard before, although be had long experimented with the electricity of the almosphere and the thunder cloud upon a scale of grandem totally unprecedented, and had succeeded in imitating many of nature's processes of mineralization and totally unprecedented, and has succeeded in imitating many of nature's processes of mineralization and crystallization, in a way that had scarcely ever been thought of, fur less attempted. The excitement and *delat* with which the solitary electrician thus made bis reluctant *début* in the scientific world, had scarcely time to cool and settle down a little, when a still more intense interest and excitement mose on the announcement that Mr. Crosse, in course of an experiment undertaken for the purpose of erystallizing silex by means of long-continued electric action of low size by inclusion to long-continued electric action of low intensity, had, to his own astonishment, produced, in place of quartz crystals, something exceedingly like insect like, in the midst of caustic solutions of finit, and with the exclusion of atmospheric air. That the product consisted of true acari or mitse of some description, there could at length he no doubt, but how they came there on bus light he modents. there could at length he no doubt, but how they came there, or how they were produced, remained a mys-tery, as we believe they still do to this day, notwith-standing Ehrenherg's scarcely less curions and inte-resting microscopical discovery, that the chalk with which flint is generally found covered, consists of myriads of the shells of microscopic insects. How the ovan of any insect, however, that might be sup-posed to exist in flint itself, could withstand the white heat applied by Crosse in calciantion while producing the 'oil of flints,'' or solution of silicate of potash, with which his experiments were performed, and could afterwards be doveloped into the perfect insect by electric action, under such circumstances as those in could afterwards be doveloped into the perfect insect by electric action, under such eirenmustances as those in-dicated, was almost as astonishing as the creation of animal life itself. Absolute *creation*, Crosse warmly disclaimed, as indeed he did all hypothesis or theory whatever on the subject : all he did was to announce and to stand by the fact. Vet he speaks of the acari in such a way as to show to some extent his inner mind on the strange subject, as in his letter to Harriet Martineun at the time of bis discovery. "There is a considerable the strange subject, as in his letter to theric Martineau at the time of bis discovery. "There is a considerable similitude," he remarks, "between the first stages of the birth of acari and of certain mineral crystalliza-tions electrically produced. In many of them, more especially in the formation of sulphate of lime or sul-phate of strontia, its commencement is denoted by n whitish speck: so it is in birth of the acarus. This mineral speck enlarges and elongates vertically: so it does with the acarus. Then the mineral throws out whitish flaments: so does the acarus speck. So far it is difficult to detect the difference between the incipient mineral and thé animal, but, as these flaments become more definite in each, in the mineral they

incipient mineral and the auinal; hut, as these filaments hecome more definite in each, in the mineral they become rigid, shining, transparent, six-sided prisms : in the animal they are soft, and having filaments, and finally endowed with motion and like." The present volume has been written by Cornelia A. H. Crosse, as a labour of love and reverence towards her deceased hushand; and, without much literary pretension, it is replete with interest. Mr. Crosse was a poet of no despicable ability, ns well as a man of science: and the volume is interspersed with not a few of his pocifical effasions, as well as of his prose productions; which latter, however, are chiefly in the form of notes and letters.

Miscellanea.

NEW SOLDERING TOOLS. — Messrs. Whitchouse and Laws have invented an improved construction of tools for soldering metals, whereby they are kept constantly heated in a simple manner. The "hitl," or soldering end of the tool, is heated by a jet of gas, placed either inside or externally to the "bitt," the gas for supplying such jet being frought to the soldering tool by menns of a fixible tube. One mode of effecting this object is hy converging the gas through a tube in the handle of the tool. NEW SOLDERING TOOLS. - Messrs. Whitehouse

PRINTERS' ALMSHOUSES (WOOD-GREEN, MID-DESEX.).—The annual meeting of the subscribers and friends to this institution was held on Tuesday evening, at Andertou's Holel, Fleet-street; Chas. Wyman, Esq. in the chair. From the report, it ap-Wyman, Esq. in the chair. From the report, it ap-peared that a large measure of support had beeu swarded to the society during the past year, in the course of which it will be rememhered the Asylam was publicly inangurated by the President, Earl Stan-hope, when a public breakfast took place on the grounds, which was largely patronized. The receipts during the year were 1,257/. 108, 74. and the expen-diture, including 4006, invested in the public funds, amounted to 1,1457. Ils. 7d. leaving a bolance at the bankers' of 1117. 16s. The report having been re-ceived and ordered to be printed, Mr. William Clowes was appointed vice-president of the institution; Mr. Vincent Figgins, treasurer; and Messrs. W. H., Cox, T. R. Harrison, H. Hansard, and W. Rivington, the trustees; and after votes of thanks to the secrethe trustees; and after votes of thanks to the secrethe trustees; and after votes of thanks to the score-tary and ekaimman, the meeting separated. Prior to the annual meeting, a second election of immates took place by hallot, the close of which showed the fallow-ing as the successful candidates: Rohert Hall (aged 78, married); George Conway (aged 67, married); Anne Roe (63, widow). The aniversary of the opening of the institution will be celebrated by a *soirée* on Monday, June 15, nt Highbury-harn; and on Sunday morning, June 28; the Viera of Tottenham will advocate the claims of the Justitution at St. Michael's Church, Wood-arcen. will advocate the claims of ... Michael's Church, Wood-green.

IRON BUILDING, MANGHESTER.—A building has been put up recently ucar the Art Treasures Exhibi-tion, which has excited some attention, in consequence of the rapidity with which it was done. It has been built at a cost of nbout 400/. by Messrs, E. T. Bell-house and Co. for Mr. Ogden, of Long Millagete, Man-chester, for the nurness of resciving a caluable collubuilt at a cost of nhout 400ℓ, by Messrs, E. T. Bell-house and Co. for Mr. Ogden, of Long Millgate, Manchester, for the purpose of receiving a valuable collection of paintings, antiquities, and curiosities, which that gendleman wishes to bring mder the notice of the visitors of the Art Treasures Exhibition. The building consists of a cellar and npuper room, and is 55 feet long, and 32 feet wide : the cellar is 5 feet bigh, and the vall share free for pictures and other objects. The shell of the opper portion of the huiding, above the floor, is composed of corrugated iron sheets, attached to pilasters and rolf prioripals. The interior of all the wall is lined with boarding, npow which are paper and maroon-coloured calico cloth. Thirteen working days only elapsed between laying the first hrick and the complete erection of the suiking; and this short time includes the manufacture of the same. The building is of very creditable external appearance; and when it has served its present of the nearby by make values the during and when its present purpose as a fine art gellery, it may be made valuable to the neighbourhood by being district. district

ADDITION TO THE MUSEUM AT PEEL'S PARK, ADDITION TO THE MUSEUM AT PERL'S PARK, MANCHESTER.—The new wing, added since last year, is now complete. It consists of one large room, on the ground-floor, divided into two compartments, and, over it, a gallery, 80 feet to long hy 80 feet wide, which is now filled with the works of local artists. There is also an entrance from the park on the south side. Leading from the southern door to the main staircase, is a corridor, with fluted pillurs, the ceiling of which is being painted in freeco. A small portion only of this work has here completed, but the local Courier speaks favourably of it. The room leading from the speaks favourably of it. The room leading from the corridor is called the engraving-room, and contains all the engravings previously in the old gallery, with additions. Among its contents, also, are numerous architectural models, and several pieces of sculpture by Mr. Westmacott. The semi-division of the room by all, Westmacott. The semi-avision of the room gives additional wall-space for the purposes of exhi-bition. There is another room in the new wing, underneath the engraving-room, hut it is not yet completed. It is intended to be used as a geological and model-room.

Completion of the Louvre at Paris.—On 15th Angust, the anniversary of the Féte Napoleon, the Emperor, the Empress, and the grand dignitaries of the empire will attend a solemn inauguration of the Palais of the Louvre, which will then be entirely

faished. THE VIVIAN MEMORIAL, SWANSEA. — The memorial in honour of the late Joha Henry Vivian, F.R.S. and M.P., was ioaugurated at Swansea on 2nd inst. The statue, which stands on a peciestal of Cornish granite, was cast at the foundry of Messra. Robinson and Cot-tam, Pimlico, in one piece. The hronze contains a large proportion of copper. The precise height is 8 feet 6 inches, including a hronze plinth, and the weight is about a ton and a half. The pedestal weight least twenty tons. weighs at least twenty tons.

STRIKES.—At Liverpool the stonemasons' dispute is still nosettled. One of the local papers gives the following summary of recent proceedings...—The architects and master-hilders of the town lately held a meeting in the Clarendon-rooms on this subject, when it was resolved to recommend both parties to leave the settlement of the question to certain well-known and disinterested gentlemen, each party agree-ing to ablied by the decision. The masters readily adopted the recommendation for themselves; but the operatives, thinking that no *ablication* to ablied by operatives, thinking that no obligation to abide hy the decision of the arhiters should be insisted on, refue details of the armers should be mained of the gradie-men named further than merely to consider the advice which might be tendered. The masters, believing that no harm could arise from a discussion of the which might be tendered. The masters, believing that no harm could arise from a discussion of the subjects in dispute, agreed to meet the men in confer-ence on their own terms. The meeting took place on Friday, when the Rev. II.S. Brown, Baptist minister, Mr. William Rathbone, J.P., and Mr. Councillor J. R. Jeffery, met a deputation from each of the disputant parties. It was understood that neither masters nor men were to be bound by any opinion of the mediators. The men were not prepared to recede in any degree from their previously submitted demands, so that the things which seemed to be most objectionable to the employers was the men's requiring the masters to accept their terms as to apprentices. The mediators recommended the men to reconsider their domands, with a view of their heing modified, and they pro-mised to do so and report. An agreement, we may add, to settle wages *part hear*, was strongly nrged by Mr. Jeffery.——The Tyne shipwrights, who were on strike in consequence of a reduction of wages from 6s. to 4s. 6d. have resumed work on a compromise that the reduction be to 5s. only. The Wear men were to submit to the same arrangement, and the Blythe shipwrights have alrendy doue so. OTENING or THE ASTATIC SALORS' HOME.— On the 3rd inst. the new Home for Asiatic Scemen,

Shipwrights have alrendy douc so. OrrENNO or THE SALATIC SALDES' HOME.— On the 3rd inst, the new Home for Asiatic Stamen, lately crected in the East-India-road, Limchouse, was formally opened by Lord H. Cholmonddy. The building was completed in January last, but could not be opened until the present time from want of funds. It is a large red brick building, having about from 150 to 200 leet frontage. The internal arrange-ments are fitted to necommodate 130 immates. Separate portions are set aside for superintendent's apartaments, hospital, registry, sbipping, and secre-tary's offices, all of which are provided with appliances for lighting, warming, hot and cold baths, and lava-tories. The total cost of the building, not including 1,2204, for the site, and 3004. Trehitects' commission, was hetween 8,0007. and 9,0007. The other expenses was helween 5,000/, and 9,000/. The other expenses connected with the erection were hetween 2,000/, and 3,000/, making a total of 13,000/, expended: of this sum only about 7,000/, were subscribed, leaving the promoters of the scheme 6,000/, in deht on its account. The proceedings took place in the principal room of the new building, one side of which was occupied by Asiatic scamen from almost every norting of Asia. portiou of Asia

was occupied hy Asiatic scamen from almost every portion of Asia. LAXING THE FOUNDATION STONE OF THE CLOCK AND WATCHMAKERS' ASYLUM. — The foundation stone of this asylum was laid last week, at Colney-hatch, near the Great Northern Railway Station, Mr. T. S. Duncombe, M.P. (for Finshury, officianing. The asylum, which will be in the Tudor style of architec-ture, formed of red hrick, decorated with stone dress-ings, is from a design by Mr. Rohert Palgrave, archi-tect, and is intended to provide a home, with fuel and light, and an annual pension of 20%. to the men, and 13% to the widows, for such as may be elected by the subscribers. It is proposed to build thirteen bouses immediately, and ansequently to increase the num-her, and with this view an eligible piece of freebold land of two acres in extent, has been purchased; plans, huilding estimates, &c. ohtained, and a large amount subscribed for building purposes. FALL OF A BULIDNG AT WOLVERHAMFON.— Last week a portion of a warehouse in Temple-street, which is the stone of the part of the purchased in the stone of the purchased in the purchased in the purchased in the purchased in the stone of the purchased in the purcha

FALL OF A BULDING AT WOLFERHAMFON.— Last week a portion of a warehouse in Temple-street, to which extensive additions are being made, fell, and buried five workmen under the ruins, one of whom was not expected to live. The upper floor of the huilding was supported by au arch, strengthened by an ron girder. The girder broke, and the floor gave way, carrying with it the next floor.

THE NEW CONVENT, ARMAGH.-Mr. M'Gaughey, of Omagh, has been declared the contractor for building the new convent at Armagh. The Armagh Guardian gives the amount of the tenders as follows -

PROPOSED MEMORIAL TO JOEN BRITTON IN KINGTON ST. MICHAEL CHURCH.—The proposition to perpetuate the late MF. Britton's name in his native parish, by erecting some kind of memorial to him within the church, has taken a shape, and a list of subscriptions is published. It is not out of any spirit of dissatisfaction or rivalry with the proposition of the Institute that the present proposal is made; but, as Mr. Britton was a native of Kington St. Michael, rose by his own crettions from very humble einemastances to a position of literary eminence, and, PROPOSED MEMORIAL TO JOBN BRITTON IN

of the Institute that the present proposal is made;
 but, as Mr. Britton was a native of Kington St.
 Michael, rose by his own certions from very humble irremstances to a position of literary eminence, and, as it is also well known to his more immediate frends, that he was very much attached to his native place, and was desirons that his name and history might not be forpotten there; there is no doubt in the minds of those with whom the present proposal originates, that in critical was desiron that his name, and history might not be forpotten there; there is no doubt in the minds of those with whom the present proposal originates, that in gravitying their own fedlings they are also doing that which would have gratified his.
 LEZEDS EXTOOL OF PRACTICAL ART.—The annual meeting of the friends and supporters of this selool took place on the 37d instant in the hall of the Mechanics' Institution and Literary Society at Leeds. The attendance was limited but select. The hall was fitted up for the oceasion, with a display of works of art. Mr. W. B. Denison, president of the school, was in the chair. The report stated that there were also gether 104 pupils attending the central school. The instant in the present has under bis personal charge, besides the central, eight other schools wherein he gives besons—namely, Ackworth schools, 200; Wackfeld Mechanics' Institution (bors' school) 90; Leeds Ladies' Educational Hostitution, 150; Marahall's school, Holheck, 150; St. Matthew's do, 150; St. George's do, 180; St. Peter's do, 30, 194; Halfax Working Man's College, 22; Kirkstall do, 9; Halfax Working Man's College, 22, Kirkstall as chool, 196; Halfax Working Man's College, 22, Kirkstall as chool, 196; Halfax Working Man's College, 22, Kirkstall as chool, 196; Halfax Working Man's College, 22, Kirkstall as chool, 196; Halfax Working Man's College, 22, Kirkstall as chool, 196; Halfax Working Man's College, 22, Kirkstall as chool, 196; Halfax Working Man's College, 22, Kirkstall a

Wood and Mr. Woodhouse (a deputation from the Institute of Mining Engineers), ascompanied by Mr. Robert Stophenson, M.P. and Mr. Joseph Locke, M.P. had an interview wilh Sir George Grey, on 30th uft, at the Home-office, oo the subject of the estab-lishment of a Practical Mining College.

the at the homeomete, on two subjects of the terms of the lishment of a Practical Mining College. THE DARK ARCHES OF THE ADELPHI.— Some alarm has been excited amongst the inhabitants of the Adelphi, in consequence of the pestilential stench which, during the few days of hot weather, proceeded from the well-known "Dark Arches," the filty state of which has been so frequently described. In the streets into which the arches immediately open, the stench is almost mendurable, and, if not at once checked by some cleansing process, hitherto almost systematically neglected, the result will probabily he the breaking out of some malignant form of fever amongst the inhabitants. The disaster at Washington, U. S. ought to aid as in enforcing the necessity for sanitary arrangements. The principal hottl there, the National, is now closed, having Killed some thirty of its guests, and poisoned, less effec-tually, about 500. The exact cause of the said occur-remence is still a mystery. The investigation made has taally, about 500. Ine exact cause of the same occur-rence is still a mystery. The investigation made has not been satisfactory, but the medical and other authorities have decided that it was only had air and choked drains. A subscription is on foot to defray the expense of a more searching inquiry—a little too e, it is to be feared. NATIONAL COLLECTIONS. - In the year 1856-57

NATIONAL COLLECTIONS. — In the year 1856-57 the sum total of 202,4677, was expended on national collections, against 228,8667, in 1855-56. 46,4907, were appropriated to the British Museum establish-ment, 49,7687, to the buildings, and 20,4547, to pur-chases; 12,0777, to the National Gallery; 5,8157, to scientific works and experiments; 5007, to the Royal Geographical Society; 58,9667, to the Department of Science and Art; 7,3127, to the Museum of Practical Geology; and 1,0007, to the Royal Society. The total amount expended on the purchase and laying ont of the Kensington-gore estate from 1851 to 1856 inclusive is 277,3092.

ont of the Rensinguous of estate from 1531 (0150) inclusive is 277,3092. ELECTRIC LIGHT.—Prof. Way has specified his improvements in obtaining light hy cleetricity. "What I claim," he states, "is, the use of a flowing electrode of mercury in combination with apparatus for regulating the distance upart of the two electrodes; and I also claim the combination of a small overflowing cup or regulated surface of mercury, as a second electrode with a flowing electrode of mercury in apparatus for obtaining light by electricity."

ANOMALIES IN THE TIMBER TRADE.—Mr. Ed-ward Chaloner, of Liverpool, in his circular of 29th ult, remarks, in reference to a cargo of New Branswick and Nova Sectia deals.—"The duty on this eargo of sawu wood is 2002 and, if exported, must be paid; whereas any other sawn wood, except colouial, can escape all Customs duty whatever; all other sawn wood may be bonded.—colonial cannot !" And again.—"Baltic sawa stuff can be now exported to Anstralia and elsewhere much beneath the cost of all American, and also thesper than colonial deals; for even under a declared system of free trade these last cannot be exported or even bonded without first paying a Customs' duty of 7s. 6d. per stundard, or S9 per cent. on the first cost.—say on S1. John spruce deals. They eannot even be transshipped to another colony without this imposition. On the contary, all foreign wood, sawn or ansawn, may be houded or ANOMALIES IN THE TIMBER TRADE .- Mr. Edforeign wood, sawn or nisawn, may be houded or otherwise transshipped free of all Customs' duty, such loreigo wood, save or unsawn, may be honded or otherwise transshipped free of all Customs' dnty, such being equal to about fity per cent, on the first cost of those foreign or Baltic deals which are those more in competition with colonial. So that the staple manufacture of the colonies cannot here escape the S³ per cent. tax, while the foreignee can save, or in-deed in a way recover, about 50 per cent. on his manufacture—as it were on declared neutral ground." Further,—"It is somewhat iteonsistent that the ship wrought of pitch pine in her masts, spors, planking, &c. and employed to escryt he like material to our own artizans while rewarded with freight may herself be sold free of duty in Great Britain, while the raw material thes hrought must be taxed as above for the essential repairs of the like or any other ship in England; and further, whilst all furviture and most ship-building woods are admitted duty free, pitch pine, extensively used for hoth purposes, is subject to the bigh dute of 5. of the pare near the sub pine the sub parts of the pine, pitch pine, pitch

ship-building woods are admitted duty free, pitch pinc, extensively used for hoth purposes, is subject to the high duty of 75. 6d. to 108, per load." CARE FOR THE DOOS.—When improvement in the condition of man, or the beast under his eare and control, is the object in view, your excellent publica-tion is always open to advance and advocate it. With-out forther preamble, therefore, I would suggest whether some plan could not be devised during the present, and still more so the coming bot season of the year, to provide receptacles of some kind for water in the public streets and highways, to which dogs might have constant and easy access. There is little doubt but that the want of this prime neces-sary of existence to all animals is, in a much greater is little doubt but that the want of this prime neces-sary of existence to all animals is, in a much greater degree than is generally supposed, the cause of canine madness. A paragraph, however brief, in your columns, on this subject, would, I am sure, call forth suggestions from friends to dumb animals, and to dogs in particular, that might lead to results greatly to be desired both as regards humanity as well as expediency.-E. C. THE COPERS TRADE.-The smellers have resolved on the price of copert Id, ure Ib.

THE COPPER TRADE.—The smellers have resolved on further reducing the price of copper 1d, µer lb, making tough cake and tile, 1177. best selected, 1207. per ton; copper sheathing and braziers' sheets, 13d, per lb. This has been followed, as usual, at Birming-hem, by a reduction in the price of brass tubes, rolled brass, and brass wire, of three-farthings per lb.

[ADVERTISEMENT.]

TO THE EDITOR OF THE "BUILDER." 86, Regent-street, June 2, 1857.

MESSRS, CLARK AND CO.

MESSIS. CLARK AND CO. GENTLEXES, — LA reply to your inquiry as to my opinion of your shutters and work, I keg to say, that the hrass front, &c. you put in for mc, I think, is equal in finish, and, indeed, altogether such as is not to be excelled by any other in London; it wears well, and I think the colour of the hrass is excellent. As to the shutters, it is now upwards of seven years since they commenced work: I believe, for repairs, a few shillings will cover all charge, except a small annual one for ciling. They do and have worked well daring all that time, and no accident has oc-curred to them; and I helieve them to be in perfectly sond condition now. I beg to remain, yours obediently.

I beg to remain, yours obediently, JAMES MEDWIN.

THE BUILDER.

The Builder.

ROFITABLE things for consideration are not necessarily pleasant things. If we are to observe silence touching abouinations which demand reform through fear of offending delicate sensibilities, instead of pointing them out and denouncing them, the ahominations will remain to the end of the chapter. The first step towards obtaining a remedy is to make the existence of the disease known. Once more, then, let us dive into the hackslums of London-the social morasses, the shadowy corners - and

recent walk. We have hefore now during a endeavoured to bring strongly hefore the public the miseries which cows and sheep endure in London, and the evils which result to the community in consequence. London cows, as we have hefore said, are in many cases kept in places where the poor hrutes are not only destroyed themselves, hut are made the cause of destruction to those living around. All who dwell near a cowkeeper know the abominable smells which proceed from his sheds and pollute the atmosphere during both summer and winter : there can he no douht of the unwholesomeness of such places. Although great improvements have been made lately, something more must be done. A number of influential cowkcepers, acknowledging the evil, have formed an association having for its object the improvement of the cow-sheds of the mctropolis. One of the regulations of this society is, that all the premises belonging to the members shall he open to the inspection of the others; and that reports shall he made of bad conditions, with hints for improvement when neces-This is a praiseworthy step, hut one sary. which will not he sufficient to satisfy the At a recent meeting of this association, public. a gentleman connected with it stated that a case had heen hrought hefore a magistrate to settle the size of apartments in which cows might be placed. The magistrate recommended that a room 10 feet long should he 10 feet 6 inches wide (the height was not mentioned). It was argued hefore a large attendance of practical men engaged in the milk trade, that if the sheds were made of that size it would he quite impossible to keep them clean, that the large amount of additional room required would be a great evil, and that 6 feet or 7 feet wide would be sufficient, if the sheds were made 8 feet long; and it was eventually arranged that sheds 8 feet long should be 7 feet 3 inches in width. When we consider that most cows are from 5 to 6 feet in length, it seems that the space of 8 feet is not an extravagant extcut. The breeders of race-borses, hunters, and the best kinds of cattle, show hy their practice that they are aware that hreathing-room is as necessary for brute beasts as it is for human creatures.

In parts of the metropolis which we could mention, cows are kept standing closely side hy side in sheds placed in narrow lancs amidst a crowded population. The pen is not so effective in conveying an impression of such places as the pencil, so on the next leaf we give a view of a "dairy," sketched on the spot in the heart of the metropolis, where, as will he seen, families reside in the rooms above. The alley in which it is situated is so narrow, that Scott's ance rendered it necessary that the dairies would scarcely he discovered hy those unaware

description of another sort of locality in should be either in the metropolis or in the im-Rokeby" will apply :-

" For though the sun was on the hill, In that dark dell 'twas twilight still."

Besides the unnatural gloom, confined space, and in some instances want of drainage, the food of the London cows, which consists mainly of grains and other refuse from the hreweries, is not good; and, although it may add to the quantity, cannot improve the quality of the milk. When we consider what an important part this is of the food of young children, it will be seen to be a matter of great importance. Visitors to Smithfield towards the elose of

the market, may see numbers of attenuated cows, hlcar-eyed, and with countenances which are as unpleasant in their way to the sight as those of worn-out habitual drunkards. The spines of these beasts are arched up, and all the points of heauty and health are gone. These animals have heen hought chiefly from such cow-sheds as we have sketched; and many cows, when it is considered that they are no longer able to supply milk, are not even fit to make an appearance hring into the light the one or two amongst the leanest kine of Smithfield market. points of good and evil found there but are taken away and melted, or in other seays disposed of. It is painful to have to mention what is

unpleasant, and even injurious to individuals, but feeling strongly the necessity of certain changes for the public good, we are forced to place facts hefore onr readers. It would be well often, if those who may feel aggrieved were to consider the times, and apply, without heing forced, the means of improvement which increased knowledge has placed in their hauds. Even when improvements can be easily made, however, and the necessity of them is acknowledged, it is long before a large number of persons can be induced to change. About thirty years ago, at Newcastle-upon-Tyne, with the exception of the statute fairs, which were held three or four times in the year, there was no market for sheep and cattle; and the hutchers were obliged to go every week to Morpeth, a place fourteen miles distant, where a weekly market was held. In order to get there some of the butchers, with their money in their pockets, would start in the middle of the night, even in the most inclement seasons, to walk the dreary Instances have occurred of their being road. knocked down, savagely treated, and rohhed ; and owing to the numerous calls for refreshment on the road, some were not sufficiently intelligent to make a very good hargain when they reached the market-place; some of the butchers travelled hy stage coach and other conveyances; hut at the hest, in wet and wintry weather, it was a lonely, uncomfortable, and expensive journey; and hesides, when the sheep and oxen had been bought, they had to he driven then 14 miles home. Great was the grumhling, too, ahout the toil of these journeys, and often was it mentioned, in order to enhance the prices of meat. However, the population of the ancient town of Newcastle having much increased, the corporation determined to provide weekly cattle-market close at hand, and it was curious to note how the butchers immediately set themselves in opposition to a market close to their own door, and gloried in the 28 miles' journey, with all its expenses, incon-veniences, and perils, and for long the new market was left without either stock or buyers. Iu course of time some of the most obstinate of the old hutchers died off, and the advantage of the change became so evident, that the cattlesellers were glad to bring the animals the extra come in Gray's inn-lane,—a Social Bridge which 14 miles. Things advocated stoutly hy parties has heen erected there. It is hut a small one, in the metropolis at the present day, will canse, it is true,—hut a little hole will let in a deal of a few years hence, as much surprise as does the conduct of the Newcastle hntebers now.

mediate suburhs; but the means of transit are now changed, and for 50 miles round this great eity the cows can be milked at early morn, the milk brought by swift trains to town, and delivered at our doors in time for breakfast. It must he admitted that several of the London dairies, where capital is not wanting, are managed as well as the circumstances will admit; but at best, the keeping of such animals in the midst of a huge

population is had, and should be discontinued. Leaving the "dairy" (the words suggest a very different place, with "neat-handed Phillis" directiug), we passed some of the London slaughter-houses, and have illustrated the gentle means used to persuade the poor brutes to enter places altogether unfitted for the purpose to which they are applied. Measures should be adopted to put a stop to the tail-twisting and other barbarities resorted to.

Our walk hrought us to Lncy's-huildings, near the north end of Leather-lane, Holborn, mentioned hy us some time ago; and we inquired how matters were going on in that neighbourhood. At the time of our previous visit it was eminent for neglect and filth ; and it was therefore with no small pleasure, that on reaching the approaches to it we found evidence of care. At the time of our call some scores of costermongers and their assistants were carefully arranging their goods on trucks for the Leatherlane and other markets ; and we could not help giving that somewhat ahused body credit for the exertions which they were making to obtain an honest livelihood under circumstances of very great difficulty. It should he horne in mind that this class of the Londou population are the means of not only preventing great waste in the London wholesale markets, hut of also affording many little luxuries to the poor. We found that after the costermongers have trimmed their cabbages and other wares, provision is made for the immediate removal of all refuse. The drainage, we are told, has been all set to rights, the courts which hranch off are white. washed, and the pavement is cleansed. A large tank has been provided for water, and other things cared for, which will undoubtedly have a heneficial effect upon the population. The water supply on Sundays is a great hoon, but in Lucy's-buildings the provision for its reception is quite inadequate for the large population. In these huildings there are about population. thirty six houses, thickly peopled, and hut two tanks of any consequence for the whole. While here we met with a curious arrangement, shown in the engraving. Having heen asked by a woman to go and see the spring she got her water fron, she showed us a place, not in a very good condition, "but which," said she, "looks to-day as if the Queen herself was expected; and you see that wooden spile, sir " (marked A in the engraving), "we take that out and get the water as we can, and the plagues of hoys often take it out for mischief, you see, and then we bave no water at all." Before proceeding upstairs in search of this mysterious water supply, we noted that no means except the chance overflow of the water had heen provided to flush the eloset. Upstairs, we were invited to a corner by the inhabitant, who lifted up, in a solemn manner, a woodeu trap-door, which operation gave us a sight of the eistern, "and here," said she, "we draw our water up, hut it is dangerous for the children, you see, when I am out."

Continuing in the same neighbourhood, we will look at an indication of a hetter time to light,-a narrow causeway may save au army. conduct of the Newcastle hatchers now. As regards the London supply of milk, time held at No. 5, Fox-conrt. It has little of the was when the slowness and difficulty of convey- appearance of an educational establishment, and ance rendered it newcastle that the data was used to be the data was appearance of an educational establishment, and

Vol. XV.-No. 750.

of its existence. The basement consists of a dilapidated shop, part of which is occupied by a mender of which is occupied by a mellifer of shoes. On the rough planking which has heen put up to cover the rents of the window, are several printed bills, setting forth that it is possible many residing in this vicinity may not be aware of the ignorance, vice, and wretchedness which prevail almost at their very doors, and inviting the well-diswhich prevail almost at their very doors, and inviting the well-dis-posed to make an examination of this unfortunate locality, where many families are so destitute, and many so degraded, as to be un-willing, or unable, to pay for the education of their children, and thus he enabled to judge of the value of a ragged school amid the scenes of sonalor around. — a scenes of squalor around, - a school which is constantly available for the gratuitous instruction of these otherwise wild and undis-ciplined children. Another placard amounced that arrangements had been made for the delivery in the school of a course of free lectures to the working classes, on alter-nate Wednesdays, and that the ubject for that present wall the subject for that present week was "The House I live in," with coloured illustratious, by Mr. F. R. Rose

On the occasion of our first visit, On the occasion of our first visit, the sleet and rain were pelting down, but this did uot prevent uumerous little hoys and girls flocking from various directions, many of them without hats or caps, and very badly shod: their faces and hauds, however, in most in-stances, were clean, and their hair in good order. Passing through the dark and

In good order. Passing through the dark and dingy shoemaker's shop, and as-cending the staircase, we found cending the staircase, we found that the partitions of the first floor of the house had been removed, and a room of considerable size formed, capable of accommodating tormed, capable of accommodating upwards of 100 boys. Unfortu-nately, at the time of our first visit, the master was ill, and the place empty. The intelligent mis-tress of the girls said that when their teacher was unable to attend, the boys came day after day, and hung abont the door, and looked so miserable, that she could not help taking upon lerself the charge of the little hoys, although the task was almost too much for her. Upstairs in a room were at the least 120 boys and girls, from two to twelve years old. On the walls were maps and various useful pieces of advice, such as "Be kindly affectionate one to the other;" "Speak no evil one of the other;" "Sicaday shalt thou labour and do all that thou hast to do;" and so on. On Thursday last, when we looked in, both schools were in full work. Tew could look at the order which here prevails, and contrast it with the manners in the homes from which, the children come of the little hoys, although the task

which here pictures, in a the homes from which the children come without feelings of satisfaction. A quiet word from the schoolnis-tress seemed sufficient to still any disorder. Very little whipping is required, and the greatest pumsh-ment seems to be the threat of being turned out of the school. The female teacher said that in the evening youths, almost grown to manhoed—of the very roughest and worst description—attend; and that these she has taught in the master's alisence, and found not the least difficulty in managing them, although, elsewhere, they would be very boisterous.

A London Sheep-fold.

How Oxen are persuaded.

[JUNE 20, 1857.

In addition to day-schools for boys and girls, and the evening schools, the rooms are open on Sundays. There is also a weekly meeting for mothers, and a clothing club. Looking around at the contented countenances here together, and thinking of the advantages training was calculated to produce, it was with regret we learnt that the institution is in debt to the extent of about 80*l*; and that those who have assisted in its formation are unwilling to incur more responsibility, and have arrived at the painful conviction, that they must give up one of the day-schools, unless a timely interposition of the friends of the poor in this pitiable neigh-bourhood shall enable them to liquidate the debt, and to prosceute their full work with a hopeful prospect of adequate annual support. of the friends of the poor in this plitable neighbourhood shall enable them to liquidate the debt, and to prosecute their full work with a hopeful prospect of adequate annual support. It is stated that if 300 of the surrounding inhabitants, and the occupiers of offices, were each to give only five shillings a year to this institution in aid of its present income, its various schools would be maintained in their full work of seeking to train children to become honest and useful members of society, instead of the pest and terror of the neighbourhood. The opinions of intelligent persons who are obliged to mix amongst the classes who are so much in need of help and yet are so difficult to deal with, is so valuable, that we were glad to listen to the teacher of this school as to the appreciation which the parents of her flock would have of improved dwellings. Her reply was,—"They want raising up: they are in great part so ignorari, and have been so long neglected, that many of them are altogether careless, and they do not know their danger. It is, bowever, I think, most important, in endeavouring to henefit these people, to respect so them cannot bear the idea of being, as they call it, *under rules*; and many about here think that Tyndale's Buildings and other places which have been improved, they are not allowed to go in and out at their pleasure." This opinion we believe to be perfectly correct. The large majority of those who reside within the Siadows of London must be coased into cleanliness and order, they will not be driven ; and to the ragged and hational schools scattered in these beenghted districts we must look to dispel the illusions and prejudices which at present exist : they should have a statue!

culty. The poor cobbler who established the first ragged-school should have a statue !

THE GOVERNMENT OFFICES COMPETITION.*

THE COLUMNENT OFFICES COMPETITOR."

* See p. 336, ante.

the pavilions of the angles are conspicuous from their dimensions, and varied and contrasted curvature.

The particular of many of the processing the term of the term dimensions, and varied and contrasted curvature. In No. 111, "Honeste Audax," a design for the War-office in a French-Italian style, novelly and richness of detail in the orders and dressings have mainly heen attempted. The wall surface is dispered, the material intended being apparently brick. No. 112, marked "Omieron," has attracted much attention, yet we are inclined to think more for its merits in regard to decorative design, which are apparent in the perspective views, than for those which are to be discerned in the mere *plans*, and which may be greater in degree, whilst more sug-gestive as to expedients for the production of the finest architectural effect. We have felt some ro-gree that there bas been so little opportunity for doing justice to the general street plans and block plans in the collection : those in the cast corridar, we fear, have heen scarcely examined; and in conplans in the collection. those in the cast corridor, we fear, have hearn scarcely examined; and in con-sequence of the sbutting up of the corridor before the time named for the general closing, we shall not be able to make our notice as complete as we desired to do. We would, however, observe, that in all cases the vehicle of expression, or drawing—the plane— itself particularly, claims attention which is not now given to it by the public,—and not merely on the score of its exemplifying convenience in a particular huilding,—hat because in it mainly, what is the hest provision for architectural effect will be found set forth. The drawings now hefore us include a general plan, a block plan, and a design for the Var-office provision for arebitedural effect will be found set forth. The drawings now hefore us include a general plan, a block plan, and a design for the War-office, Foreign-office, and Residence, as buildings grouped together for the external effect, but without internal communication. In the general plan, the author pro-poses three bridges, one of the number being the Hungerford-hridge widened. For Westminster-bridge, he exhibits two surgestions: he one he would Hungerford-hridge widened. For Westminster-hridge, the exhibits two suggestions; by one, he would retain the present site, but as we understand, forming new foundations, — and hy the other he would follow the line of the new Charles-street. We should have preferred his keeping to one sug-gestion. A competitor, in justice to himself and others, should—in the language of the turf—declare with which haves he means to win. As to the Charleswhich horse be means to win. As to the Charles-street line, the present author unconsciously constreet inc, the present author unconsciously con-structs a reason for his new site, instead of choosing a site to suit the traffic and the Offices. Thus, he pro-longs a broad avenue from Charles-street, cutting across the Park to Buckingham-palace, involving alterations in the garden-enclosure which would not he assemted to, even were there arguments of con-venience which are not now offered. The truth is, all the new sites that have been proposed for the Westminster-bridge are less suitable than the present Westminister-priage are less suitaine than the present site for the traffic and the privacy of the Offices; and would serve the public, and the metropolis and West-minister, less than a particular small area about Whitehall and the east end of St. James's-park; and the sconer this simple matter is distinctly seen, the hetter will be the prospect of henefit from the pro-posed improvements. As regards other arrangehetter will he the prospect of henefit from the pro-posed improvements. As regards other arrange-ments suggested in the general plan, propositions such as the removal of St. Margaret's Church, and the formation of a place 600 fest sqaare next the Ahley, are made in the design before us. There are other suggestions of a practical kind which may be worth adverting to. Thus, the author would seeure a vista along the hanks of the river, terminated by the Clock Tower, and would form a public garden between the Offices and Whitchall-stairs, with a communication to it from the emhankment; and would provide a basin for the barges at Scotland-yard. At the end of the parke neclosure overlooking the Parade, be would construct a raised terrace promenade, to form a convenient station for viewing military ceremoials. The War-office, Foreign-office, and Residence, exblibit one grand frontage facing northward to the parade. It is only to be regretted that a production which has the remarkable merit that this exblibits in the plan of its front, as well as in many parts of its intermat the remarkable morit that this exhibits in the plan of ifs front, as well as in many parts of its internal distribution, and in its decorative design generally, should be in any danger of rejection from the list of "instructions" that might offer positive advantages for the object. Enough, however, on the head re-"instructions when they occur. The author created to leagth of the ground interd yellow in the Government plan, as it would appear, by about 30 feet. What we face may be a real defect is, that he considered less than is desirable for lighting the lower rooms aud for ventilation. But, as he does not pro-pose to retain the State Paper-office, increased space inget perhaps he got without groups haves for the real of the cost of the question of the bridges on a cylical paper. Joy about a for the loss of the more state of the source of the for the state or and if the loss of the more state. The more array and y, ivered the down and in the state Paper-office, increased space inget perhaps he got without groups haves dread the loss of the more state. The more array and y, were struct that be loss of the more state. The more array and the state process of the state are allowed in the present to cost of the more state. The more array of the state process of a centre and advauting wings; and the groups of the sameses, as well as of the sub-tor the present more state. The main front in the design consists of a centre and advauting wings; and the groups of the sameses, as well as of the sub-street and the Haymarket, which might pass by the to the set the plan, and of the domes, lan-

terns, and terminations of the roof, is bigbly suc-cessful. We should advect to the plan of the War-office, in which the leading principle is in the provision of a "Great Central Hall," with corridors to the several departments leading out of it. The hall is reached to can end be the entrance from Padiaprovision of a "Creat Central Indi," with correction to the several departments leading out of it. The hall is reached at one end, by the entrance from Parlia-ment-street, and has the principal starcase opposite. The corridors referred to are three on each side the ball, transversely toit, as also are the principal courts. The corridors are lighted chiefly from the sides. Columns and galleries surround the ball, which is well planned for effect. There is a second entrance to the War-office in the northern front, and ose in Charles-street. The Foreign-office occupies the centra of the group. It has a portico m steps at the north, whence the entrance leads across a hall to a rotunda and stairease, crowned on the exterior by the prin-cipal dome. There is also an entrance from Charles-street by a quadrangle and cortile for carriages, and a vestibule leading to the rotunda hefore named. The plan of the Residence we think highly successful in its capabilities for architectural effect. It joins on to that of the Office, at the re-queries angle, by a slight connection taking the highly successful in its capabilities for architectural effect. It joins on to that of the Office, at the re-entering angle, by a slight connection taking the form of a tower and lantern extremally. It sets back considerably on the Charles-street ront, allow-ing space for a conservatory and terrace. An entrance at the west, from a carriage-porch, admits to a hall, square on plan,—heyond which is the staircase ball ranged transversely, with ascents each way, and vesti-bules at the ends. Beyond this, or in the *quad*-rangle, is the "state duing-room," planaed with recesses at the sides, so as to get a space, which is square, and domed over. The staircase and the reception-rooms are, as we have said, excel-lent: the symmetry of parts is complete; yet the skiftal introduction of picturesque and pictoril acces-sories, and the *variety* of effect which is provided for, are remarkable. In regard to architectural details, the design is peculiar, from its profuse application inside and ont, of small columns, generally disengaged from the wall, and often clustered or coupled. The inside and oft, of small columns, generally disengaged from the wall, and often clustered or coupled. The dormers and groups of sculpture, the ornamental evering of the lofty Mansard roof, and its finials or hip-knobs, some of which are 10 feet in height, with the domes and lanterns, certainly exhibit novelty and taste. In choosing or forming the style for his buildings, the author has been governed by the view that neither public opinion nor artistic taste would now or hereafter approve of the adoption of Medieval architecture for the entire district; yet he maintains that in our climate, the picturesque is to be sought rather than charte district; yet he maintains that in our elimate, the picturesque is to be sought rather than the severely classical. Consequently, he has aimed at the effect which belongs to Gothic architecture, hut the effect which belongs to Gothic architecture, but has rejected Gothic detail; in other words, he has adopted what he calls a picturesque elassical, or Remaissance style, as likely to, graduate, and harmonize with, the two characters of architecture prevailing porth and south. The author also conitends well for his use of sculpturesque decoration chiefly composed of the forms of animal life, considering that such forms are necessarily more heautiful them. that such forms are necessarily more heantiful than merely geometrical ornament.

No. 113, with the motto "Mens agitat Molem," No. 115, with the moto " Arens agriar Motem," is given to Mr. John Billing. The drawings include a general plan, a hlock plan, and a design for the War-office and Foreign office as one huilding. Amongst the propositions through the medium of the general plan we desay the area in the site of West plan, we observe the retention of the site of West-minster-bridge as included, and also the construction pinn, we observe the releasest the two evolutions of a bridge from Trafalgar-square, approached from the present site of Northumberland House. For the latter proposed bridge, the author has endeavoared to show that the levels would be peculiarly favourable; hut with what success we are unable to asy, his plans heing hang where we were unable to asy, his plans heing hang where we were unable to asy listice to them. He proposes a four-bridge at the Horseferty, and, having removed Hungerford-bridge, would use the materials on the new site. As to the question of the sites for bridges, with no reason to alter our opinion as to three bridge for the Cockspurstreet traffic should be placed at the best point, without reference to an existing bridge at Hungerford. Brid, with a new bridge, there is, as we

Pall-mall East, and Duncannon-street, and avoid the bollow at Charing-eross. But even this would he negatived by the steepness or length of the incline on the Lambeth sde, as to which a ready opinion may be formed from what now exists at that end of the bridge; and the doubtful argument for the Hungerford site cannot be offered by those competitors who provide their approach to the bridge anywhere out of the line of Hungerford street and the market, now in use. The author of No. 113 the market, now in use. The author of No. 113 has given more attention to the embaukuuent than many have done. Between Westminster and Londonhas given more methods a method in the proposal for a low stone hridges he would adopt the proposal for a low stone quay, enclosing a canal or pool of still water next the the wharfs—retained as at present. The water might be kept at a uniform level, except about the time of higb water, when the tide would be allowed to flow through, to recover ouvious accumulations. The prin-ciple of this arrangement, as contrasted with that of small docks, is, we apprehend, correct for, we need only refer to the state of the existing docks, as Puddle Dock—from time to time brought under the notice of the City Commission of Severs, by their officer of Hcatth—to show that there must be accumulation where the efficient scour is not carefully maintained. The proposition referred to includes a railway, passing Commission of Sewers, by their officer of Health—to show that there must be accumulation where the efficient score is not carefully maintained. The proposition referred to includes a railway, passing brought into use in towing craft by steam power. Distinct towing-paths for horse-traction are, bowere, provided. Imigo Jones's York Gate would be placed at a public landing-place, near the Offices and railroad terminus. The author is one of those who would present site, as aiding the effect of the Abbey. In the arrangement of the Offices, the symmetry of masses has been studied. The fronts of the War-office and the building southward on the same side of Parliament-street, correspond; but are deduces from his plans of the two principal offices, that in all such cases an area one-sixth larger than is needed for convenience should be taken as re-quired by a recessed centre and gates. The author deduces from his plans of the two principal offices, hat in all such cases an area one-sixth larger than is needed for convenience should be taken as re-quired, having regard to lighting and ventilation. At the entrance to the principal Offices, he suggests a writing-hall for deputations; and at the entrance from the Park, another huilding as a place of sholler for carriages. The considers that the business character of the intended edifice is a variance with that of Gothie architecture. He therefore adopts the bolven eutoblatures, roofs of somewhat bigher pitch have and loggias in two stages. Much care have hen given to the design in streatural points. Each corridor has an arched ceiling helow the stone foor of the corridor above, for the gas, water, having, and speaking pipes, and the space is sufficient for a nanto traverse i. The coroles would he covered with stone, laid on tile-arches.——No. 115, '' Vivat Regina,' a block plan, and as corroborating the opinion which we ventured to offer as to the chardence off in modern Haly. The corridors are phaced round the courks, but many of the rooms have to be reached through other

CORRESPONDENCE ON THE WEST. MINSTER DESIGNS.

THERE is one point in all the criticisms I have read (with the exception of some of those contained in your truly valuable journal) of the designs for the new Public Offices that appears to have heen completely ignored by the critics, and that is, the important one of the merits and demerits of the several plans for the Egycsic and Way Office.

hadred other well-known inconsistencies, and in "firmess" had ever been considered, we should not hear--as we now too often do-of churches and church towers, town-halls, houses, &c. falling even before they are completed.

before they are completed. In considering the designs, then, for the offices in question, let all three of these qualities, as displayed by the pluns, sections, and elevations, have each their due share of attention, for all—hoth critics and judges—should he aware, that however much they may now he struck by the beautiful drawings and fine exteriors, yet, when the buildings are creeted, hoth the Government and the public will expect some-thing more than a fine outside. R.

As your pages seem to he opened to the discussion (which has in some quirt'rs rather transgressed the hounds of common contesy) between the rival factions of Classic and Gothie, in the competition for the new buildings at Westminster, I venture to ask for admission for hut a few words. Your correspondent, "A Competitor for the Block Plan," assumes that Mr. Wightwick has rendered superfluous any attempt to prove the fitness of *Hatian* architecture for *English* uses, and he con-siders that Gothie architecture has passed away as completely as has chivalry, and that, though its advocates "hare much, doubless, of the true heart and gellant spirit" " of Don Quirole," they are, unfortunately, insanc riders mon ho'hy-horses! Surely, it would be possible to describe us rather

Surely, it would be possible to describe us rather less facetiously, and at the same time rather more truthfully. The truth is, that we Mediævalists (if we are to be stigmatized with a nick-name) are fighting against the traditions of three centuries, which, to our against ine traditions of three certurnes, which, to our minds, have been ages of intense darkness as far as regards architecture in Eugland. We have so far succeeded, that, happily, uo one now thinks of using anything hut Gothic architecture for all Ecclesias-tical purposes; and we are fully determined to spare tical purposes; and we are fully determined to spare no effort to accoundish the same result in all civil and domestic buildings. The same determination that has succeeded in the one, will, we have not the slightest doubt, secure success in the other; and whilst our numbers daily increase, and whilst the general sympathy of the world is with us, we are not surprised to find the advocates of foreign and all but surprised to had the avocates or loreign and all out extinct styles bitter in their demunications of our work, and hold in their attempts by any means to regain it in proportion to their rapid loss of infla-ence. The world will judge for itself which party has shown most desire to throw off the transmets of the transmet and to desire the properties of the transmets of old evil ways, and to design something for these new huildings really original in its character and in its animology reary original in its character and in its detail, and at the same time in all respects up to the requirements of the day in the matter of light, warmth, and scientific construction. Of one thing I am sure, that it will be recognised that the more notable Gothic designs are most completely free from the taunts so often levelled against the reviews of Gothic, of a desire in any one of these respects to sin against modern necessities. But there is one point against modern necessities. But there is one point upon which all the advocates of a Classic huilding upon which an the advected of a Cresci during at Westminister are most carefully silent, and which, nevertheless, lies at the root of the right solution of the problem which is now to be solved; and this is

stiontion and reward. That it will be so architees ean ord doubt, unless they at once make an carnest protest againsts to false a stindard of tree merit; for the question will, at once, resolve itself into one of dranghtsmanship; and if the judges do not exhibit played, it will be elver drawings rather than good designs that will carry of the prizes. The soems almost purifie to recel to the minds of your readars, what never ought to be-authongh, it to be parfect, include, as I think that quain to do writer, Sr N. Wotton, say, " Commodity, firances, and delight." The "delight," now arkys, seems to be the odd not have not should by with the limited motive of obtaining external effect; for modify' and "firances," one or both, as, indeed, the athry seems to imply by his placing "delight," the starth nis trid. If "commodity, "were ever thought of, we should not have houses and palese, will rooms nueped to their intended purposes, and incon-vemently bottel; dark, narrow, and irregalar cor-rifors, caufied and iuconvenient staircases, and headdred other well-known iucousistencies; and it "frances" had ever eco considered, we should not prode the cast of the starte econsistices of which he has the least reason to be prode. Trepart, thit is is a question which must be and headdred other well-known iucousistencies; and it "firances" had ever bear consistencies; and it "firances" had ever bear consistencies; and it "firances is had ever age consistencies; and it "firances" had ever bear consistencies; and it "firances is had ever age consistencies; and it "firances is had ever bace consistencies; and it "firances is had ever bace consistencies; and it "firances is had ever bear consis view to the necessities of the situation; and I ascet -fearless of any contradiction, supported by one single argument on the facts of the case-that the situation is so singular in its associations, and so com-pletely governed by circumstances which could have no force elsewhere in London, that it would be snieidal to the whole scheme, and an act of real Quixotic machess, to venure upon the adoption of any hut a Medizval design, A MEDLEVALIST,

Str.-Now that we are awaiting the report of the judges, it is, i think, only due to you, to express the thanks you have so justy earned for your able and impartial criticisms upon the various designs, which criticisms must have been the result of much arrive study and discriminating thought. The language of the press generally (with some few notable exceptions) has been wesk and slift to the last degree, and I cannot but contrast them with the careful adjusty on have presented to us, concrited in a very has also appeared in your pages, and which, in my ophion, and I think in that of many others, reflects but. Hitle credit upon its author.

INSTITUTE OF BRITISH ARCHITECTS

THE meeting on Monday last, June 15, was the closing meeting of the session, and was somewhat numerously attended. The chair was taken by Mr. Scoles. Amongst the donations announced was a copy of the specification of the patent of Captain Scott, for improvements in rendering lime cementitions, instead of allowing it to set in the ordinary manner.

Professor Donaldson then introduced to the notice of the meeting another donation, which he described as one of the most magnificent ever given to their library. This work was an illustration of the ancient Roman mouments at Orange, and was published under the auspices of the French Minister of State for Public Instruction. Mr. Donaldson referred to the great interest possessed by the Roman remains in France, comprising theatres, imphilheatres, baths, and private houses. Even in London, the remains of some of these remarkable works still existed, as for example, under the Coal Exchange, in Lower Thames-street. The Roman remains in France were better preserved than those in England; and the Govern-ment of France had voted a sum of 2,000% to clear out a single monument, in order to show what the ar and science of Rome was when it governed Gaul. The French Government, in the like manner, had devoted their attention to the remains of Mediaval art. He proposed a vote of thanks to the French Minister

The proposal a voice of thanks to the French Amnster of Public Instruction, which was unanimously adopted. Mr. M. D. Wyatt announced the donation of an essay on "The Tomple of Diana at Ephesus," by Mr. Falkener, reprinted from the Gentleman's Magazine, which he considered would cast a new light on that interesting subject, and reflect additional cordiu on M. Falkener credit on Mr. Falkener.

crédit on Mr. Faikener. A communication from Mr. B. Ferrey was read, entitled, "A Short Notice on Stamped or Incised Stucco." In this paper Mr. Ferry dwelt upon the importance of a cheap and simple mode of internal decoration, especially in churches. He referred to upon which all the advocates of a Classic huliding at Westningster are most carefully silent, and which, are wertheless, lies at the root of the right solution of the problem which is now to be solved; and this is the question of association with existing hulidings. If wish some of your correspondents who induge in visions of the circuit correspondents who induge in lines of windows and doors, columns and corrites, of condescend for a few minutes to look upon the site with which we shall all see from the quay or terrace which what we shall all see from the quay or terrace which harges below Scotland-yard. They will see the

[JUNE 20, 1857.

ingenious application of a simple principle. He might add, that he thought the cemeral invented hy Captain Scott would apply exceedingly well to the process of Mr. Ferrey: and that the general application of Mr. Perrey's process would give considerable interest at a very simple cost to large wall surfaces, which were generally left plain, and without any decoration whatever. Mr. Wyalt made some further remarks on the manner in which Captain Scott had made his discovery, and on the great advantages which his plaster possessed over the ordinary kind. The new material neither blistered nor crasked, and it might he laid on without the expense of removing the scaffolding, as in the ordinary mode. It was, moreactual on whole the expense of removing the scaffolding, as in the ordinary mode. It was, more-over, of a much more even that than could he obtained by the use of ordinary plaster, and in the course of a week after its application it became as hard as Portland coment

Mr. Baker observed that Scott's ecment had heen used in the houses which had lately fallen down in Tottenham Court-road, and certainly there the cement was very had indeed. If the characteristic of Captain Scott's ccment was cheapness, the huilders of the metropolis would he sure to avail themselves of it the It believed, however, that in the case of Tottenham Court-road, a mistake had been made, and that in fact Roman cement had been used. Captain Scott said that the use of Roman cement in the houses in Tottenham Court-road had heen op-

in jected to, and the new cement had been tried in preference: it had since heen tried at Chatham with great care and success by Capian Shw, and the results of the experiment would be published; and he had no doubt that his event was much stronger than Roman coment. He had taken it to Mr. Faraday, Roman concent. He had taken it to Mr. Faraday, who advised him strongly to take out a patent for it. Captain Scott proceeded to give some further details of the tests to which his cement had heen applied, when

Mr. C. H. Smith said that it appeared to him that Captain Scott's cement was a very excellent material, if put into the hands of a good workman, and it only appeared to have failed in any case hecause the work-man did not understand the use of it. At the suggestion of the Chairman, the discussion

of this subject was postponed to a future day, to enable the meeting to proceed with the ordinary husiness

husiness. Mr. Charles Barry then read "some description of the mechanical scaffolding used at the new palaces at Westminster, particularly in reference to the three main towers of the building," which we shall probably refer to in a future number. It was a very valuable munication.

Mr. M. D. Wyatt observed that, it would be in. Mr. M. D. wyatt observed that, it would be lar teresting to know how fat Sir Charles Barry had made himself responsible for the scaffoldings described had

made himself responsible for the scaffoldings described, and whether they were a gradinitous exercise of ability on the part of the architect to teach the huilder his dary. Mr. Barry said that, the huilders had refused to have the responsibility of the scaffolding, and as a matter of necessity it had fallen npon the architect. In reply to some inquiries from Mr. Wyatt, Mr. Meeson gave some farther explanations of the scaffold-ing. ing

Professor Donaldson then made some Professor Donaldson then made some remarks on the interesting nature of the designs for Government huildings lately exhibited in Westmisster Hall, and particularly upon the striking absence of Gothie designs of English character, which he considered to be a rather extraordinary circumstance. Upon the whole, he considered the exhibition of these designs had produced upon the public mind an impression highly favourable to architects in general, and par-ticularly to those of the English school. After a few remarks by the chairman, enforcing on

After a few remarks by the chairman, enforcing on the members the desirability of contributing to the interest of the meetings next session, the meeting adjourned.

LLANDAFF CATHEDRAL.

WE mentioned, not long ago, the works which have here going ou here, and promised some forther particulars. The approach to the c thedral is sin-gular and striking: it is almost hidden from view

perplexing; and it requires considerable familiarity with the building, both within and without, folly to guess the principle of its arrangement, and to recog-nize its component parts. Looking down from the rising ground to the south, the aspect is confusing; indeed, the appearance of the building resembles a perfect chaos—a deserted ruin at the extreme west; the castern portion (the Lady Chapel) fresh from recent restoration; the eatre town-hall. Perhaps on more incongrame assemblace of discordant no more incongruous assemblage of discordant elements was ever brought together."

Since the above was writtfen, the central portion alluded to has been denuded of its conventicular appearaoce, and restored after the original type, and presents, instead of the former miserable, low-pitched roof aod sash windows, and garniture of urns and other Pagan deformities, a lofty roof, covered with lead, and noble clerestory of early English architecture, and the eross restored to prominence on the gables. "The descried ruin at the extreme tectore, and the cross restored to prominence on the gables. "The descrited ruin at the extreme west" is yet there, though its continnance is, we trust, to be suffered but little longer; and much else remains to be done. The aisles and ehapter-bouse must be restored, and the ruined portion of the build-ing rebuilt; nor is the interior yet sufficiently for-nished, as there are no stalls, bishop's throne, nor even font.

Four sedilia (the original number) bave been inserted in be prespired number) bave been inserted in the prespirery arch. In the design of these, marble shafts, alternately red and green, are employed, and also mosic panels in geometrical forms. In the gables are statues of the Four Evangelists.

The decorated reredos, which was thought to be The decorated reredos, which was thought to be beyond restoration, has been transferred to the north side aisle, for the purpose of preservation, as a memento of past ages, and its phace has been supplied by one in Caen stone, cousisting of three gables with richly-carred mouldings, crockets, and finial crosses. In the centre antroce is represented the lamb and flag, surrounded by the vine, and the lamb treading on the grapes, in allusion to the text, "Treading the wine-press alone." The capitals are filled with rich foliage--all taken from nature. The columns are of rouge royal and emperor red marhle, single to the side White-press alone. The capitals are filled with rieb foliage—all taken from hautre. The columns are of rouge royal and emperor red marhle, single to the side panels, but double to the centre one. It is proposed that Mr. D. G. Rosetti shall paint these panels—the subjects to be, the Nativily for the centre one, and the figures of St. David and St. Panl, as the ancestor and generator a for a Load in the tide orem. The the figures of St. David and St. Panl, as the ancestor and successor of our Lord, in the side ones. The space beneath will be dispered and enriched with colour. A stone pulpit has been created, of the style of the thirteeuth century. It is supported on a green serpentine central shaft, surrounded by six smaller ones of red marble; and the upper part and stairease handrail have also, alternately, red and green marble shafts. The whole is richly carved with foliage. The figure of an angel supports the book-hoard (stone), which is in the form of a Bible. and the four nanels ngue of an angu supports the book hoard (stondy, which is in the form of a Bihle; and the four pacels round the pulpit are to have bas-relie's of Moses and David, as prominent characters in the Old Testament, on the one side, and St. John and St. Panl, as repre-senting the New, on the other side of the angel bearing the Word.

These sculptures are to he modelled hy Mr. Woolner. The whole of the earvings throughout the cathedral are executed by Mr. Clurke.

catheant are executed by Mr. Ostrace. The floor of the nave and a considerable portion of the side aisles have been 1 id with encaustic tiles, by Minton. In the space hefore the altar rich marble mosaics, 18 inches square, are introduced. The cost of the restoration hitherto has been about compared to the set of the restoration hitherto has been about

8,830, which has here done under the direction of the diocesan architects, Messrs. Prichard and Seddon, in conjunction with the hon. diocesan architect, Mr. T. H. Wyatt. Messrs. James and Price, of Cardiff, are the builders.

The cathedral consists of a nave having an arcade The cathedral consists of a nave having an areade of six bays, of very elegant carly English architecture, with a noble western façade, the chief glory of the church. This is divided into three stages, the lower having the somewhat peculiar doorway of pure early English work, yet having a round arch, within which is a tympanum, having two semi-eircular arches, of which the masonry is so arranged, that the central stone dividing them supports itself as a keystone, and is ormamented by a vesion-insis-shaned panel, having is ornamented by a vesica-piscis-shaped panel, having therein the sculptured figure of a bishop. The stage above has a noble triplet window, having internally only three richly-moulded rear arches ; hut, externally between the windows, are two panels, forming, with the windows themselves, a beautiful group of five arches. In the gable above is an arcade, following the rake of the gable, the central archi only being

shire churches, and which it is proposed to restore. side The corresponding tower on the south of early English architecture, is destroyed, and will be rebuilt with a broad spire.

The nave has a lean-to aisle on either side, with doorways of rich late Norman work, and windows of doorways of nch late Norman work, and windows of late Decorated. The alies have been totally spanned hy flyiog arches and buttresses, added externally to support the clerestory which overhang the piers below. The clerestory is very beautiful, but simple, consisting of an arcade of five arches internally—the o widest only pierced as windows. Beyond the six bays of the nave without archited

beyond the six bays of the inter without attinted tural divisions, are two hays forming the choir, and of the same style. A noble lofty arch divides the choir internally from the presbytery, which has two bays of decorated architecture, but there is still no external distinction—at least in the roof; but the clere-story, for which no precedent was found, is restored in character with the decorated work below.

A very fine Norman stilled arch (probably the chancel arch of the original church) divides the presbytery from the Lady Chapel: above the arch are a decorated three-light window and a circular one over, with painted glass, the gift of Mr. Markland, of Bath.

The Lady Chapel is a beautiful structure of early geometrical architecture of five bays, filled with loft two-light windows. This chapel is vaulted with stone, resting on shafts carried to the ground. The east window is of five lights, with geometrical tracery

To the south of the presbytery is the chapter

To the south of the presbytery is the ebapter-house, a square holding with central column and quadripartite vanlting of early English work. The north and south asiles are continued as far as the second hay of the Lady Chapel. It will be judged, from the ahove, that the interior effect from the considerable length is simple and grand: externally the want of the usual central feature and transcept is fold, but to some degree the chapter-house when restored with its high conical roof will remedy this defent this defect.

Altogether the building is one of great interest, not alone in an architectural point of view, but as being the mother church of English cathedrals; and it is hoped that the present effort to complete its restoration may be successful.

THE OUTSKIRTS OF THE METROPOLIS.

PASSING the other day through Panyer's-alley, near the General Post-office, and noticing the curious little monument there placed, and on which is inlittle seribed --

"When ye have soughte ye cittie round You'll still find this ye highest ground,"-

as soon as opportunity offered we took up an old map, in order to measure the extent of the outskirts of the houses by which this stone was in former days sur-rounded, and found that the distance was but little rounded, and touth that the distance was had netter more than five miles, so that it would have been a very easy matter then to take a walk round London. At present, however, to make a pedestrian expedition round the metropolis would, to most persons, he an

round the metropoits would, to most pussion, be an undertaking of some importance, as may be seen by referring to the following particulars, which have been gathered from a recently-published roap. Starting from the Thannes, near Chiswick, and pro-ceeding northword to the New-road, Hammersmith, the neighbourhood, although open, is still built upon, and we may be said to have commerced our journey. and we may be said to have commenced our journey on the streets of the metropolis. From the place From the place Hammersmith-road, the west end of Kensington-road, then northward near the east side of Holland-park to the Uxbridge-road; from there ato Sheberd's bus; then north-cast to the Kensington-park estate; then to Westbourne; still bearing towards the north-cast, to Westbourne: still hearing lowards the north-cast, we come to the very distinctly-marked margin of Portland-town; keeping round that, past the Prim-rose-hill-park, and then along the Queen's-rood to Haverstock-hill, we go ca-tward to Kentish-town, where we will rest and measure the distance, which is the distance while is about twelve miles.

From Kentish-town a little southward, to the skirts rrom Kentish-town a mite solution at the safet of Canden New-tuwn, Lover Holloway, bit south of Highbury, then in the direction of Stoke Newington, by Kingsland to Dalston and Homerton, skirting round by the west of Hackney-common and Vietoria-park, by the vest of Hackney-common and Vidoria-park, to Old Ford and the Bow-road, then west of Bromley-marsh to the East-India Import Dock to the Thomes, and then take a line which will enable us to get round the built part of the Isle of Dogs, and stop at the Thames, near Mr. Scott Russell's ship-yard. The distance from Kentish-town to this point is securities miles and a half. Crossing the river we go along its margin est-cod taking in Greenwich, and then our Dorbtford New

Rotherhithe ; then towards the Brieklayers' Arms Rothermithe; then towards the Brieklayers' Arms station; thence by twisting roads to Peckham New Town and New Cross; thence west again to the High-street Peckham, then round Camber-well, Brixton, Stockwell, South Lambeth, and they along the side of Father Thanes to Battersac-bridge, which we must errors and keep along the shore to Chelses-bridge, and then round by Cremone-gardens, King's-road, Brompton, North-end, Hanmersmith, to the point from which we started, and find that this is a distance from our last stage of *twenty-eight* miles, making the entire circuit,-

From Chiswick to Kentish-town ... 12 do. do

seven miles.

NEW CORN-EXCHANGE AT CHELMSFORD

A NEW corn-exchange, creeted from the designs of Mr. Chaocellor, was opened on the 5th inst. The building is in the Italian style. The openings on the ground floor, which comprise three doorways and two windows, have semi-circular arches, with and two windows, have semi-dreular arches, with imposts supported by columns in the depth of the reveals; the centre doorway being marked, by having two columes in the depth of the opening, and by heing somewhat larger than the others. The capitals of the columns are studies of Euglish trees, and include osk (two specimens), sah, elm, poplar, chesnut, holly, lime, beech, maple, baw-thorn, and walaut; the carvings of these and other similar work throughout the building heing remark-ably well excended. The first floor is lighted by five similar work control in the first floor is lighted by five semi-eircular headed windows, with columns of similar design to those on the ground floor, except that the capitals are studies of plants, including the hop, vice, capitals are studies of pants, including the hop, vice, strawberry, blackberry, rose, lity, nightshade, con-volvulus, ivy, and honeysuckle. A stone balcony with pierced balastrade, and supported on deep hold brackets, is continued along the front of this floor. The whole hullding is surmonuted by a massive The whole huilding is surmounted by a massive cornice, with trusses, the spaces between being panelled, and is crowned by a pierced balastrade. The external wall in front is of Bath stone to the height of the first floor, and above that of white hrick, with stone dressings. The building contains, on the ground floor, an entrance-hall, or vestibule, 28 feet long by 12 feet wide: at either end one large arch encloses two smaller ones, the centre impost being supported by a column, the capital of one being a study of the pea, and the other of the bean. The semi-circular heads of the smaller arches are decorated with panels, each panel having a carved study of corn, with a erceping plant peculiar thereto, and, with appropriate taste, the four varieties of corn ebosen are those more particularly grown in this contry, viz. With a treeping pain plant plant thereas the cost of even chosen are those more particularly grown in this county, viz. wheat, bartey, oats, and vyc, the ground ivy and other wild creeping plants forming a background: helveen the two arches and filing up the centre of the large one, a hold circular panel forms the receptacle for a gas-light. The pavement is formed of squares of Portlaud stone, placed lozengewise, and divided by bands of red tiles. At one end of the vestibule is a room 12 feet by 10 feet, to be need as a cloak-room or parcel office, and which will form the office of the company. At the other end is a stone staircase giving access to the first floor. Three lobbies, each 9 feet by 6 feet, connect the vestibule with the corn ball, which is 100 feet long by 45 feet wide, the extreme height being 40 feet: at a height of 18 feet large stone trusses support a series of seven east-iron girders, each in six pieces, securely holted together, the whole formiug a four centred arch spanning the entire area forming a four centred arch spanning the entire area, the web of the girder being filled in with flowing foliage: wood pullas reaching from girder to girder support stoat wooden sush-bars, which in turn receive the sheets of glass, each sheet heing nearly 6 fact long, by 2 feet 6 inches wile, and 4 of an inob thick. The whole of the roof, with the exception of a portion of about 12 feet in width at the top, is glazed, and there for the area of the class is more than equal to the about 12 feet in which at the top is the top is a second to the area of the floor. Excellent light is thus secured. A ventilation chamber is constructed along the ridge into the rake of the gable, the central arch only being picceed as a window. On the north side of the west front is a fine tower of the Perpendicular period, hut with modern bittle-ments, which have replaced a rich crown of tracer, similar to that of Cardiff and many of the Somerset. a circular panel, with the letters C.C.E. forming a

The hulding has been created by Jr. Simpson, of Jpswich, who took the contract at 4,923. Mesars, Wood and Son, of Chelmsford, supplied the principal portion of the irowork. The gas fittings are being carried out by Mr. Church, engineer at the Chelms-ford exercised and the second s ford gasworks.

The opening of the exchange was celebrated with a public dinner

Mr. Chancellor, in returning thanks for the toast of his health, said,

Public dinner. Mr. Chancellor, in returning thanks for the toast of his health, ead.— "I would be out of place upon such an occasion for me for the porce proportions, or the cepitals correct in the routine, neither will I attempt to justify the depth of the balatrade; but what I have any of the design of the design, whether the columns for the proper proportions, or the cepitals correct in the proper state and what I divergential at I have any of the design of the balatrade; but what I have any of the design of the balatrade; but what I have any of the balatrade; but what I have any of the design of the balatrade; but what I have any of the design of the balatrade; but what I have any of the design of the balatrade; but what I have any of the design of the balatrade; but what I have any of the design of the balatrade; but what I have any of the design of the balatrade; but what I have any of the design of the manner take of the world. The set of the world, is the the merchant primes of the world. Let us look back former times. For what do thousands of one country are stated as a transformer the second the barbatrade as I have barbatrade; but what a charm of the barbatrade as I have barbatrade; but what a charm of the barbatrade as I have barbatrade and the second the barbatrade as I have barbatrade and the second the barbatrade as I have barbatrade and the second the barbatrade as I have barbatrade as the row of the second the barbatrade as I have barbatrade and the second the barbatrade as I have barbatrade and the second the barbatrade as I have barbatrade and the second the barbatrade as I have barbatrade and the second the barbatrade and the second th

TESTIMONIAL TO THE FOUNDER OF THE BUILDERS' BENEVOLENT INSTITUTION.

We mentioned that the testimonia was to be pre-sented to Mr. Cozens, at a dinner on the 9th instant. It coosisted of a service of plate, value 1002, and a lithograph, handsomely framed, bearing upon it the names of the subscribers. The following was the inscription :---

" This testimonial, with a service of plate, was presented to Mr. Thomas Cozens, June, 1857, by the undermentioned subscribers to the Builders' Benevolent Institution, as a token of their esteem, and in recognition of his philanthropic efforts and persevering energy in founding the above-named charity, established in 1847 for giving relief and granting pensions to decayed members of the various hranches of the huilding trade and their widows.'

of the huilding trade and their wisdows." The chair was taken by the president, Mr. Alder-man Lawrence, and amoogst those present were Alderman Cuhit, M.P. Messrs. George Bird (trea-surer), Joseph Bird, H. W. Cooper, W. H. Culling-ford, Cockreil, G. Grayson, G. Head, G. Head, jun. Samuel H. Head, A. G. Ilarris (sceretary), J. Higgs, William Hutchons, J. Morris, G. Myers, J. Nichol-son, jun. J. Peters, Thomas Stirling, John Thorn, J. Herd, T. Longman, William Scaotlehary, John Newson, sen. John Newson, jun. Charles Carr, Charles Formhy, J. Chargmann, Jos. Lamhert, T. Howard, W. D. Nics. Bobert, Yoo, W. Tremere, Formhy, J. Chapman, Jos. Lamher, T. Howard, J. Harvey, W. D. Main, Rohert Yco, W. Tremere, R. Watts, Wm. Stirling, R. Richardson, &c. Mr. Thomas Cozzas in returning thacks said, in the course of his remarks, that he was of humble

origin, but he never had forgotten two golden pre-cepts that were instilled into his mind hy his father, who said "You are now leaving a good home : always cepts that were instilled into his mind by his father, who said "Voa are now leaving a good home: always endeavour to keep better eompauy than your own, and leave the world heiter than you found it." Who-ther he had done so he would leave them to decide. As to the first his presence there that evening would prove it. With regard to the Bailders' Benevolent Institution he trusted that they would, by the help of their frieods, make it one of the nohlest in the world. In the course of the evening reference heing made

In the course of the evening reference heing made to an amended Building Bill.

Mr. Alderman Cubitt stated that it was now hefore the Builders' Society, who would be glad to receive any suggestions which those who felt interested might

TOTTENHAM-COURT-ROAD ACCIDENT.

THE jury in this case find that the accident arose from the entiting of the holes in the walls of 147 and 148; also from the cutting away the party-wall of 147 aod 148.

147 and 148. This, be it remembered, it is in evidence, was not only without the consent, hut against the expressed determination, of the district surveyor. But here they stop short of what seemed an in-evitable inference, and proceed in a somewhat illogical and rambling way to connect this with the district and police surveyors, and to make it appear that the accident arose out of the conflict of jurisdictions. This is so transparent a fallacy as to render further formmer furthers.

The public have a right to know, and I believe have formed a just idea of, the really blamcable parties, and have no difficulty in supplying what is deficient in the finding of the jury.

FIAT JUSTITIA RUAT CÆLUM.

*** The district surveyor has no power or jurisdic-tion in the matter of ruinous huildings beyond that possessed by any ordinary individual—that of report-ing them to the Police Commissioners, who alone are the parties possessing jurisdiction.

RUINOUS BUILDINGS AND ALLEGED RUINOUS BUILDINGS. TOTTENHAM-COURT-BOAD ACCIDENT.

TOTTENIAM-COURT-ROAD ACCIDENT. Is is to be hoped your leader will tend to remove at "least one of the popular delusions of the day,"--that is, the responsibility of district aureyors, when an ald build-ing, sought to be converted end patched up into a new one, is let down from a want of cere in the handling. The primary cause of the untoward event we have here the cutting down a chimner, hereast, no touly without the approval of the district surveyor, hut against his expressed pundation heing removed, and the whole collapsee. Cause wonder at the result, and can there be any difficult y the output of supervision on the part of district aur-veyors, or polce surveyors, can ever afford the public a sufficient guarentee against such recklers conduct. <u>AUDI ALTERAN PARTIN</u>.

BAD CEMENT.

BAD CEMENT. Is appears by Mr. Nelson's report (which has been mude public) on the fail of the two houses in Tottenham court-road, that "Old bricks had been used without being properly bonded," and the cements did not possess the adhesive qualities of common mortar. Mr. Nelson goes on the second way must be cement, and the much to be regretted but respectables houses, as that its much to be regretted that respectables houses in Tottenham.court road the supposed upon. At toos houses in Tottenham.court road the cement was supplied by a dealer in various cements, not a manufacturer. At the adjoining house a new and almost use the most internative the same of almost use the most of the doubles are new and almost use the most of the doubles are manufacturers " moving of the materials. It is hamentable enough that such accidents should happen from want of supersition of the work and the works are in progress, when a hilto-main formate should happen from want of supersition of the work as in this instance, the value of these remarks. A the works are in progress, when a hilto-main formation of the services of supersition of house in the instance, the value of these remarks. A the works are in the sine was a sine as the such accidents should happen from want of supersition of have instance and the value of a supersition of house in the instance, the value of these remarks. A Marutavorvaga.

FALL OF BUILDING, TEMPLE-STREET, WOLVERHAMPTON.

SOME alterations and additions have been going on hampton News says :-

[JUNE 20, 1857.

somer or later, and it is perhaps fortunate that it took place at a moment when comparatively few lives were in its that the second second second second second provide the removes abroad respecting the quality of these griders. A short time ago one of Mr. Powell's men dis-covered a fracture in a girder, but not null it had re-creached her set of the bar; but he unperincumber to resemble the rest of the bar; but he unperincumber to resemble the rest of the bar; but he unperincumber was ordered to be removed to the yard, where it may now he seen. No one for a moment thinks of charging Mr. Brydges with a knowledge of the condition in which this clear that his workmen, or some of thom, have been base enough to conceal their knowledge of the state, and thus ployer, but endanger the lives of their fellow-creatures. This grider was replaced by that which broke yesterday, and at the very spot where it samped, we are sorry to asy, a palpable flaw--Mark is called the 'cold shut'-is distinctly visible."

THE POLICE COMMISSIONERS AND RUINOUS BUILDINGS

A CORRESPONDENT writes, - Your able leader of last week ought to remove much misconception, and lead to improvement in an important particular. You have pointed out the great amount of labour and re-sponsibility thrown upon the police surveyor, whose daty it is to make the surveys agreeably with the daty it is to make the surveys agreeably with the second part of the Building Act, and the miserable remaneration awarded by the Government for carry-ing on this onerous daty. The gentleman who is now acting as surveyor, Mr. Caiger, was appointed, on the dismissal of the deputy, some three months since, to make all surveys within the limits of the heforo-mentioned Act, and up to the present time has made, I have reason to know, more than 612 surveys, re-ported the result to the commissioners, and fulled in the arise notices of works to be done, and inled in ported the result to the commissioners, and filled in the original notices of works to be done, and instead of having twenty or thirty notices in his pocket, as you say, has had as many as seventy at one time in arrear; although he has devoted on the average no less than sixteen hours per diem. He has heen unable to make the greater portion of thess surveys within the ordinary hours of husices, in consequence within the ordinary hours of husicess, in consequence of having to attend one, two, and sometimes three police courts daily, to support summonses against owners for non-compliance with notice: during the three months he has given evidence in support of 688 summonses and adjournments. On his giving notice to the commissioners, some fortnight since, of his not considering himself respon-

sihle should any accident occur through inability to make his survey as soon as the nature of the case make nis survey as soon as the nature of the case might require, a second surveyor was appointed, and the district divided into two parts. Notwithstanding this alteration, it is utterly impossible to keep pase with the informations, which of course have increased wonderfully since the accident in Tottenham-courtroad

With regard to any ill feeling existing hotween the police surveyor and any district surveyor, I am quite sure there is nothing of the kind.

CHURCH OF THE HOLY TRINITY, HASTINGS.

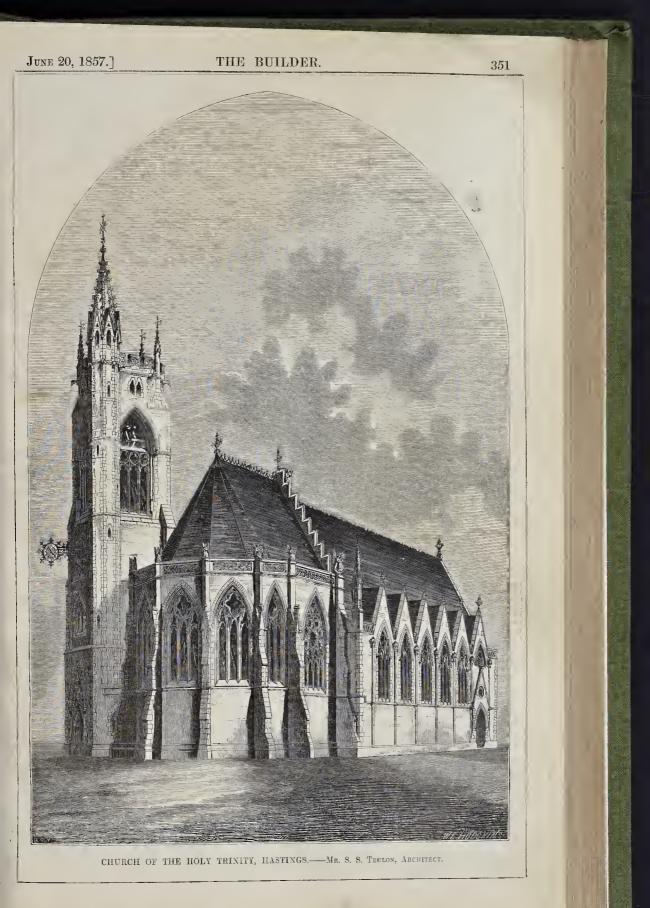

THE Church of the Holy Trinity, Hastings, represented by our engraving, is for a parish that formerly existed under that name. The first site was rather out of the town, and there were difficulties which induced the promoters to abandon it and to anole for the present site. which indicates which induced the promoters to abandon it, and to apply for the present site, which is from the Crown. It is situated in the way leading from Hastings to St. Leonard's, and it will be the only church at Hastings on a flat, all others being accessible only by steps and other means of ascent; consequently it will be of material advanteer to invelve of material advantage to invalids. The church is designed with a nave and south

aisle and chancel, with polygonal apse. The tower will stand diagonally with the side of the apse, this arrangement being the result of the peculiarity of the site. The north side will be peculiarity of the site. The north side will be gableted for the purposes of light. It is being built of local stone of two kinds, the yellow and grey sandstone. The interior is ashlared with local stone. The style is Middle Pointed. The contractor is Mr. Howell, of Hastings. Mr. S. S. Teulon is the architect.

The only portion now crecting is the nave and north aisle, the funds in hand being insufficient to do more than this.

RETENTION OF DRAWINGS BY A BUILDER. Ch you inform me what legal steps can be taken to secure the return of drawings sent to a contractor to he worked from, and afterwards retained hy him ? A. B.

*** Summon him hefore a magistrate.

STAINED GLASS.

STAINED GLASS. St. Paul's Church, Stalybridge.--A stained-glass east window has heen put up in this church. It is the gift of Mr. James Buckley, and the work of Mr. Wailes, of Newcasile-on-Yyne. In the four lower compartments, there are scenes illustrative of our Lord's bumiliation, viz.,-His agony, hearing the cross, crucifixion, and burrial. In the upper four are illustrations of His exoltation, viz.,-the transfigura-tion, resurrection, ascension, and sitting in heaven. In the wheel at the top of the window is a representa-tion of St. Paul preaching on Mars'-hill. *Kidlington Church.*-A stained-glass window has just heen placed in the west end of Kidlington Church, in memory of the late Rev. Dr. Richards, rector of Exeter College, Oxford, and vicar of the parish. It contains a number of sacred subjects, the idea intended to be emhodied in the whole design being the recol-lection of works of piely and charity for which his

lection of works of piety and charity for which his memory is honoured. The crucifixion of our Lord forms the central subject: surrounding it are repre-sentations of fourteen scriptural subjects illustrative of the chief modes in which active charity is wont to he exercised—clothing the naked, feeding the hungry and thirsty, visiting and relieving the sick and suffer-ing, teaching the ignorant, &c. Seven of these are ing, teaching the ignorant, &c. Seven of these are from the Old Testament, and seven from the New. The window was executed by Mr. O'Connor, of

The window was excented by Mr. O'Connor, of London. St. Martin's, Worcester.—The stained-glass me-morial window at the east end of St. Martin's Church, Worcester, has been completed. Messrs. Hardman, of Birmingham, were the artists. The window is divided into five compartments, having a horder run-ning round it, containing heads of prophets and the sacred monogram interspersed. In the lower portion of the centre compartment is represented the Ascen-sion of Christ, the Apostles heing disposed on either side. The upper portion is coloured as representing, with hargels, and surmounted by the ascred emblem of , and surmounted hy the sacred emblem of y. The stonework is hy Mr. Norman, of angels, divinity Worcester.

Glasgow Cathedral.—The report by the committee appointed to consider the subject of filing the windows of Glasgow Cathedral with stained glass, has heen published. The committee state that they have "adopted every means to ascertain the present state of glass-painting in Great Britain," and that it "would naturally have heen agreeable" to them to "name one or more British glass-painters as compe-tent to design and execute windows for the cathedral." Their investigations, however, have failed to lead them to this result, and as they consider the glass-painters of Germany and Belgim pre-eminent, the committee express their opinion that the subacribers would "do well to employ the Ryal Factory of Munich in the execution of the windows of the cathe-picts are forty-three in number; and it appears that by Glasgow Cathedral .- The report by the committee takine grass in the Grant Industrial Exhibition at Paris, in 1855, by Boatemps, who is a first authority in such things, and he said, that although Britain had sent little in the way of painted glass to the Exhibi-tion, yet of what he did see, he affirmed it was equal to anything that was done on the Continent. Now, our specimens of stained glass have been done by the glass-stainers themselves without the co-operation of artists, so that we cannot take the windows that have arbists, so that we cannot take the windows see that as been lately put up in different places in Britain as specimens of what might be done if they employed artists to make the designs. * * * If the comspecimens of what might be done if they employed artists to make the designs. * * * If the com-mittee carry out this report, and give the commission to Manich, what will be the result? They will give the order to a glass-statute there, who of course will try to make as much money out of his estimate as is consistent with the work being thoroughly done, which no doubt it will here but then, if they are access-tomed to do so much in that way at Manich, they will have numberless designs be the German artist. tomen to do so much in that way at runned, iner-will have numberless designs by the German artists for all kinds of subjects, so that they will not have to go to the expense of procuring new designs; they will just out down or stretch out, as the case may require, all the old material they have at hand. So that the Glassow recode above in their arguifficant timedance

therefore, dead, the most of German art (especially sacred art) is, what shall we gain by going to Munich? A very perfectly manipulated stained-glass window (but, remember, not more so than we could do bere), one whose design is tame and characterloss, as if turned out by a picture-moking mechine." Motram (near Manchester), — A stained glass memorial window has been placed in Motram Church, in the hasement story of the tower, by Mr. Joshua Reddish, in memory of his deceased parents. The window is divided into three compariments, represent.

in the hadement story of the tower, by parents. The window is divided into three compartments, represent-ing Charitable Relief of the Hungry, the Thisiy, and the Stranger. Messrs. Edmundson and Son, of Man-chester, designed and executed the work.

OXIDATION OF STEAM-BOILERS.

OXIDATION OF STEAM-BOILERS. In a late number of your journal a correspondent wished to be made acquisited with a means of pre-venting the internal oxidation of steam-boilers. In reply, I would suggest the propriety of having small portions of sinc plate attached at various points inside the boilers, eare being taken to secure perfect metallic contact hetween the zinc and iron. Under such circumstances, the boiler becomes a kind of slowly-acting voltaic battery, the zinc heing the posi-tive metal, which is gradually, although almost inap-preciably dissolved by the various salts, &c. contained in the water, while the iron becomes the "negative plate," conducting away the electricity formed, without being itself at all acted upon. If may perhaps he remembered that some time hack I suggested, through your columos, a like contrivance, with a similar risew, in relation to iron water-pipes.

with a similar view, in relation to iron water-pipes

Years ago the sagacity of Davy first proposed the application of this principle for the protection of the copper sheathing of ships' bottoms, which, indeed, was successfully accomplished ; unfortunately, bowever, after remedying one evil, another presented itself, for the mollusca, and other marine animals, no leser, for the monusca, and other manue animals, no logger deterred by the poisonons copper salts formed by the action of sea water hefore this principle was earried out, energisted all parts of the bidls of vessels, below water-line, to such an extent as scriously to retard their motion.

Now, however, with quick voyages and efficient scraping machines, this latter disadvantage does not apply so seriously .-- WENTWORTH L. SCOTT.

TRIAL OF SEWAGE MANURING AT PARIS.

A SPECIAL meeting was held at the Apricultural Society's, on the 10th inst. when Mr. E. Chaawick, C.B. read the translation of a report made by com-missioners in Paris on some trial works, to determine the applicability of liquified town manure to various species of commercial and other plaust. The results were stated in the report to have been favourable, all determine the adhere the other in the dd. for

were stated in the report to have been favourante, all showing an increase over the culture in the old form by stable manure. Mr. Chadwick addressed the meeting at some length, both hefore and after he had read the report, and was followed by the Earl of Essex, confirmatory of Mr. Chadwick's views in favour of the sanitary results of the system which he has so long advocated

A long conversational discussion then ensued, in

A long conversational discussion then ensued, in the course of which M. de Trehonnás said he thought the outlay of capital required would be an obstacle to the extension of the system in France. The E-rl of Essex said he was confident that the outlay would pay him well if it were for the distribu-tion of plain water alone. Take the outlay of capital at 0.1 per acre, what was that to the power of saving a crop by a watering in dry weather? He estimated that he could hrow in water, or the liquid manure, at the expense of about 1d. a ton, or 100 tons, or an inch deep of water on an acre, at an expense of about Ss. and what was that for the power of saving or advancing a whole crop? advancing a whole crop a

EXCOMMUNICATION OF WORKMEN.

THE following placard has been addressed " to the plasterers of London :"-

"Whereas, on the 22od of May, 1857, the plas-terers in the employ of Mr. Freak struck for 5s. 6d. per day; and while thus on strike, two men, named and any and white this of strike, we here, having and a went to work at the above place for 5s. — having struck for wages, left Mr. Farr on the 25th instant, and on the same day deliherately re-engaged himself at the terms above stated. It is earnestly hoped, that in consideration of the men now on strike, the plasterers will treat ---- and ----with the contempt they deserve.

We can hardly believe that those who prepared and approved of such a placard for publication understood

sion, or what he conceives to be oppression, on the part of his employer; but what is this but the most tyrannical and mercliese oppression of workmen hy workmen? What ought those to expect from masters by initial all microtics of provide so that the second sequence of the second second sequence of the second sequence of the second sequence of the second second sequence of the second sequence of the second second sequence of the second se own price, but they bave uo business to prevent others from doing so.

HEALTH OF ST. GEORGE'S, HANOVER-SQUARE.

SQUARE. DR. DRUTT, as medical officer of health for St. George's parish, Hanover-square, has published, in the form of a letter to a vestryman, a sixpenny tract, giving some idea of the duties of a medical officer of health, and various statistics in reference to the state of his own parish in particular. The interest and feelings of the vestryman himself ure specially appealed to by such remarks as the following :--"One of the places where small-pox appeared was the room of a journeyman, who, in this room, surrounded hy his sick children, was making coats for the enstomers of a fashionable tailor in a fashionable street. Auchter was the room of a laundress, employed in getting up genitemen's of a laundress, employed in getting up gentlemen's white ties. Another was inhabited by the family of an upper servant at a bouse in Berkeley-square. I mention this in order to show that there is no class, mention this in order to show that there is no class, bowever clevated, which may not be concerned some-how in the healthiness of the poor mark-home,"—and to convince "vestrymen," we dare say, as well as others "well to do" in the parish, that even in so distinguished a district as St. George's, Hanover-square, it may be as well, after all, not to grudge the cost of a medical officer of health to look after such matters. An inference which Dr. Druitt draws from some statisties into which he enter is, that "this parish continus two classes of persons; that the mor-faity of one class is very small, and that of the other far too large; and, further, that the places in which cleanliner and drainage are most decident, appear to be precisely those in which most deaths have ocearred." One other inference to which be bas heen led by reitorated experience is worthy of note, namely, led by reiterated experience is worthy of note, namely, that " in dirty houses the rent is always in arrear," an inference which it is to be hoped that many a vestryman and other gentlemen who may happen to Vestyman and other generation who may happen to be the handlords of houses let out ultimately in a part-ments to the poor, will meditate on with the view of calculating bow, in such cases, they can most effectu-ally prevent the rent from getting into arrear.

THE NEW GOVERNMENT BUILDINGS AT WELLINGTON, NEW ZEALAND.

On the 9th of March, in the present year, the foundation-stone of the huildings intended for the use of the general and provincial legislatures, at Welling-ton, New Zealand, was laid by "This Honour the Superintendent," in presence of a large concourse of sweetstore spectators.

"Plans having been publicly called for," says the "Plans having been publicly called for," says the Wellington Independent of 11th March, in its roport of the laying of the stone, "premiums were awarded to three out of ahout ten designs, but neither of them proving exactly suitable, the derk of the works (Mr. George Single, R.E.), to whom the first premium had been awarded, was finally interasted with a com-usion to memore fresh designs in a style of architec. and been awardes, was induity inclusive with a com-nission to prepare fresh designs in a style of architec-ture which has been found well adapted to the natural features and peculiarities of this locality. The tonder of Mr. C. R. Carter, being the lowest, the contract for the building was entered into with him a few works are: eeks ago.

In explanation, at least, of, if not in contradiction In explanation, at least, of, if not in contradiction to, this account of the matter, however, we have been appealed to by Mr. Charles Moore Igglesden, of Wel-lington, architect (Draughtsman to the Survey De-partment at Wellington), on whose part we are given to understand that the design was his; that the com-petition committee declared it "to be the best in every respect," but that from its exceeding the estimate it all the old material they have at hand. So that the Glasgow people, glorying in their magalificest windows from Munich, will, after all, only get the leavings and second-hand properties of the German school; and when we know (as any one who has studied the subject does know) how utterly conventional, and was subjected to alteration at the hands of Mr. Single; and Mr. Igglesden says he does not wish to deprive

as the members of the competition committee, and as the mean of the comparison commutee, and other influential persons interested to the erection of the edifice, being all perfectly well aware that the design for the faqade is copied, line for line, save the substitution of zinc for brick chimneys, and the removal of two side porches, from a drawing presented by Mr. Igglesden himself to the committee shortly after they had awarded the premiums; the smallest and most satisfactory recompense he could have and most suspaced by recompense he could have expected for the aid he had given towards the erection of the edifice would have been an acknowledgment equally public with that which, through the medium of the local press, and by the inscription on the foundation plate, had heen already paid to Mr. Single

The new cdifice will stand on a picturesque and clevated site at Wellington. The huilding will be 40 fect high. The plan may be divided into three particus comprising two wings convected with a comportions, comprising two wings connected with a cen-tral two-storied building. The central part recedes from the front line of the two wings about 6 feet, and contains all the effices of the Provincial Govern-The two wines are invoted to the use of the ment. General Assembly.

General Assembly. The style is Gothic, but not the Gothic of any particular period, the different styles having been headed. The gables of the principal wings are pierced for large lancet-headed windows, in the Per-pendicular style; while the porch with tracericd window in its gable is entered by a doorway in the Tudor style. The internal finishings are red pine and mai, varoished, which will display the hearty of these New Zenland woods. The external timber is totara. The foundation is constructed of brick and piles, and the roof covered in with slate. The estipiles, and the roof covered in with slate. mate was 6,6887, and the contractor wa The estithe contractor was bound to which comprises two acres, cost 7002.—the leveling about 1507, or 2007, and the furniture is estimated at about 500%. making a total of about 8,100%

ARCHITECTS' REMUNERATION AS WITNESSES.

YOUR correspondent in the Builder of the 6th Yous correspondent in the Builder of the 6th inst. is not quite right as to so much of his state-ment as relates to enforcing payment for loss of time as a witness. He overlooked the case of Collins e. Godfrey, I. Barn. and Adolph 950, in which it is decided that a witness can only recover expenses, and not for loss of time. The plaintiff was a solicitor, and sucd for 6.6. for sit days' attendance in court. A verdict was given against him, with leave to move to have it entered for him for the 6t. 6s.; but the Court decided that it is a constitutional duty in every one to give evidence as a witness on a subprena, without being entitled to recover for loss of time. without being entitled to recover for loss of time, although the practice of the Court was to allow for loss of time according to a scale, *if paid*. On taxing costs, if Mr. Edmoston had been paid 31. 3s. that would have been allowed; hut, looking at the above case, it appears that he cannot been to beyond what he has already received. se, it appears that he cannot now recover any ing A. B.

*** If this he so, it hehoves architects to make a special arrangement in each case, hefore undertaking any business likely to involve attendance to give evidence.

COMPETITIONS.

Kilmainham. -- The Freeman's Journal says,--"The Board of Superintendence of Kilmainham Juil awarded the premiums offered for the three best designs for callarging and remodelling the prison to the following architects, viz. Mr. John M'Cnrdy, first; Mr. E. H. Carson, second; and Mr. Gray, third. It is proposed to give greatly iucreased accommodation for prisoners on the separate system."

Chickester Cemetery. - The sub-committee ap-pointed, by the Burial Board, to examine and report pointed, by the Burai Board, to examine and report on the designs sort in for the new contextry, selected three, from which they recommended the committee to make choice. At a recent meeting of the com-mittee, they decided, by a majority of cleven to seven, to select the design of Mr. Rakes, of Portses, as being in all vacance the heat in all respects the best.

Alcester Corn Exchange. - The directors have selected the plans by Mr. Edward Holmes, of Bir-mingbam, for the above huilding. There were tweotyone competitors.

THE BUILDER:

deputation should visit Dereham to inspect the exchange there, and make such inquiries on 'ic the nature of the case might suggest." Mr. ... has since been commissioned to carry out his des

THE HA DEL FESTIVAL

CET . L PALACE.

It is a laudable herang toot it an .. he British It is a faucable accurate to the accurate the between the accurate the second s good reasons for this premature observance; and even had there not heen, so great is the homage paid to Handel in this country, that the trammels of fixed periods are no longer regarded in its offering .- the revolving cycles of time no longer form the limits of its fulfilment, and, since the establishment of the Sacred Harmonic, and, since the estamisment of the Sacred Harmonic Society, the constant performance of his hest works may be regarded, in some respects, as an annual ovation to bis memory. However, the existence of a building of gigantic dimensions within a few miles of the metropolis, whose vast area might accommodate an almost un-limited angliance and to the came time time.

limited audience, and at the same time give the opportunity for the assembling of a crowd of vocal opportunity for instrumental performers, numbered by thousands, whose united efforts might give an effect to the cho-ruses of the great master of sacred music never before equalled in the country, was an opportunity no longer to be neglected. At the same time a full and fair equinized in the county, was an opportunity as longer to be englected. At the same time a full and fair means was afforded of testing the acoustical properties of the Crystal Palace, which may now he considered as fully assortained, and the result of which, if not

as fully ascertained, and the result of which, if not entirely satisfactory, has at least set at rest certain doubts and forms of an oposite tradency. There can be no doubt that an edifice constructed of brick and stone is for hetter adapted for the con-centration of sound than one built of iron and glass; and further, that the unlimited length of the naves of the Crystal Palace allows too great a dispersion of such sounds, and its numerous parts occasion too great an eabo, to give precisely the effect that might be expected from so large a body as 2,500 excentains. Nevertheless, it is our pleasure to record a great success, in the general acceptation of the term; and those who have bad the good fortune to attend either of the performances that constitute the Handel Fesof the performances that constitute the Handel Fes-tival of 1857, have cause to cougratulate themselves at having witnessed the grandest musical congress that the country has yet assembled, and the effect of which upon the futurity of the art may produce results hardly yet contemplated. The Orchestra, which occupies the west end of the

great central transcpt, occupies an area of 14,784 superficial feet, aud contains 10,102 cubical feet of timber. The scats form concentric segments of a vast circle, of which the conductor's scat forms not quite the centre. te the centre. Next to the conductor are the seats the hand, which comprises nearly 400 of the hest professional and amatcur instrumentalists of metropolis, led by Sainton and Blagrove ; and heh the the baud are the seats for the chorus, who, upwards of 2,000 in number, in the divisious of sopranos, tenors, altos, and bases, radiate up to and on cach side of the great organ, built by Messrs. Gray and Davison, which covers an area of 42 by 26 fect, and is supported upou covers an arcs of 42 by 26 fect, and is supported upou a platform of great strength. A popular account of this instrument, now profusely circulated, saves us the necessity of more than alludiog to it; and indeed any attempt at a technical analysis of its parts, or even an abstract appreciation of its effects and merits, would be here out of place. The effect of the vast volume of sound produced by this interview probability areas first leaded on Sturdow

The encet of the visit volume to some producer of this gigantic orchestra was first tested on Saturday last, when the full rehearsal took place, which con-sisted of selections from the three Oratorios chosen rasi, when the full renearsal took place, when con-sisted of selections from the three Oratorios chosen for these performances, and at which the powerful effect of the chorus was made so manifest, as to leave no reasonable doubts of the final result of the underno reasonable doubts of the final result of the under-taking. It was then arranged by Mr. Costa that the sopranos and altos should change places with the tenors and bases in the orchestra, by which advan-tageous change the aspect of the orchestra was materi-ally improved by the presence of the 750 ladies io the centre of the mass, whilst the musical effect was also much improved. One more observation we made at the rehearsal, and which we did not at the perform-ance new much cause to modify a mandy. that the one competitors. Iterford Corn Exchange.—The local Corn Exchange Improvement Committee say in their report, "That the plans furnished by Mr. Evans, of London, approach nearest to the requirements of the case: they would, however, recommend rather more additional height, and some few deviations in micro details. The model upon which these are founded (t is admitted by their, author) is a corn exchange recently creeted at East Derehann; and, as they comprise an entire new feature, viz. a glass celling, it was thought desirable that a

The Messiah, which was chosen for the performance of Modely, is the sixth in order of composition of these sacred writings of the inmortal Handel, heing preceded by Esther, Deborah, Athuliah, Saul, and Israel in Egypt, and, from the dates in his own handwriting in the original manuscript, would appear to have been hegun and ended in the incredibly short period of twenty-two days. It was first performed in Duhlin on the 13th April, 1742. In March, 1789, Mozart added his extra instrumentation to the original score; his intention being to supply in the orchestra such effects as Handel would binself have orchestra such citects as Handel would binself have produced in accomparison between the two scores of the Messiah, is another proof of the inventive genius of Mozart, who thus, thirty years after Han-del's death, could pass from the antiquated style of orchestral writing of Handel's period to the rich and beautiful style that renders the works of Mozart a world fear U time. model for all time.

The performance of Monday was a very great success A bright day, a high expectation, and a genuine love of good music, induced thousands of the élite of London to betake themselves betimes to the Crystal Palace, and when, after the usual popular ovation to Mr. Costa, that conductor raised his haton, ovation to DJF. Costa, that conductor raised his hatcon, very voice was hushed to silence, and the maguificent orchestra proceeded with the point and decision of a single instrument to excent the national anthem, the area of the transcept presented such a scene of rank, fashion, and musical combination, as will not easily be forgotten by those present.

The Messiah is a work so patent to the world its leading features so well known to the public generally, that, when entrusted to good hands, as it It's leading reasons of the critic horizon hands, as it was on Monday, the task of the critic hecomes easy, as it would he an impertunce to go through the various portions of a composition that has been criticized and analyzed already so thoroughly. All that we need do therefore in the matter, is to give a form a more its general execution upon this but we been of interview in the indicer, is to give a brief opin - 'noon its general execution upon this necasion. Ine words of the Messiah, and of Israel in Egypt, consist simply of passages of Scripture, chosen to illustrate a particular scory, but put together without dramatic form or impersonation. logence without dramatic form of empersonation. Judos Maccaberus, on the contrary, is a sacred drama, like the rest of the compositions of the class, written in verse, with a regular plot, and a number of dramatis procession, who sustain certain characters throughout the claer it be the associacharacters throughout when it is the the associa-tions called up to k^{-1} -mean of the strains of Handel with the words at one inspired writers in their purity, or the exact beauty of the melodies and grandeur of the choices, or hardy we will not now consider, but certain it is that the two former Oratorios have the preponderance of admirers. The first chorus of the *Messiah*, "And the glary of the Lord" via one preclement the advantage wind

The first chorus of the message, and the gains of the Lord," at once proclaimed the advantage gained by the new arrangement of the female voices, and gave an earnest of what was to follow. "For unto us by the tew arrangement was to follow. "For unit outs a child is horn," was a noble performance, and was unanimously redemanded, hut the conductor was inexorable. After "His yoke is easy," the orchestra mainthousy reanances in seasy," the orchestra had a balchour's respite, and the audience took ad-vantage of it for refreshment. Of the remainder of the choruses, we need only say that the "Hallelnjah" (during which, according to established custom, the whole assembly remained standing) was grand to the bighest degree, and impressive beyond description. The concluding chorus, "Worthy is the Lamb," was almost equally astounding, and the "Amen" brought this unprecedentedly grand performance to a close in a hecoming nanner. The performances of the solvists, who, it is right to observe, excrted themselves to the utmost noder such trying conditions, were duly appreciated. The instrumentalists played with marappreciated. vellous precision and force, showing at once the sources whence they were derived.

The second of these grand musical fetes took place The second of these grand ministed *fets* took place on Wednesday, in presence of her Majesty and the Royal Family, with a success surpassing even that of Monday. Less dust, a milder wind, and an equally blue sky, made the day more agreeable than its pre-decessor, while a considerable increase in the number of visitors, and the presence of royalty, gave greater

quoring hero comes " was redemanded, and this time

quering hero comes " was redemanded, and this time with success, for the Queen siding with ber subjects, the point was immediately conceded. Whether the presence of royalty occasioned greater ensemble in the hand and chorus we cannot asy, but certainly the soloists were more successful than on Monday, and the chief bonours of the day secured, hy general consent, to be awarded to Mr. Sims Reeves. After Judas Maccaheus (at the Queen's desire) the Old 100th Psalm was sung,—her Majesty and the whole assemble standing. the whole assembly standing.

SCENERY AND THE STAGE.

SCENERY AND THE STACE. Her Majesty's Theatre.—The revival of Mozart's Dom Giovant', perhaps the greatest opera ever written, with more attention to scenery and "getting up"' than has here usually bestowed upon it, has proved a great success, notwithstanding the fact that most of the singers engaged in it are hut winning proved a great snecess, notwithstanding the fact that most of the singers cargaged in it are but winning their spurs from the London public. The new tenor Giuglini is a decided acquisition, and Madame Spezia is improving greatly. Moorish architecture has of Giugimi is a decided acquisition, and shaaning operating is improving greatly. Moorish architecture has of course heen called in to aid the general effect of the scenery: the ball-room, at the end of the first act, is a fine interior in that character. A peculiar effect in this is obtained by keeping the masses on the stage dark, the upper part of the apartment showing a blage of light.

Royal Lyceum Theatre .- No artist should allow Royal Lyceum Theatre.—No artist should allow the opportunity to pass, without witnessing the mag-nificent series of studies presented by Madame Ristori in every one of her parts. She is in truth an actress of aurpassing power, and the public owe something to Mr. Gye for enabling them to witness it. The new trengely, *Camma*, affords opportunities for the display of her highest skill.

The late Douglas Jerrold.--We go out of our way a Polle, in consideration of long knowledge of one to whom the world is much indehted, to assist in announcing to the public that a series of musical and other entertainments has heen organized by a comof the intertainments has been objected by the advantage of the late Mr. Douglas Jerrold's family. Amongst the entertainments are Lectures by Mr. Thackeray and Mr. Russell, a dramatic entertainment under the management of Mr. Charles Diekens, and others in which some of Mr. Jerrold's own dramatic picces will he performed. For particulars of all we may refer to the advertise note into daily opers; and we hope that many of those who have laughed with Jerrold in *Punch*, or shed a tear with him in "Black-eyed Susan," will come forward to aid in raising a fund for those he has left behind him.

METROPOLITAN BOARD OF WORKS.

AT their last weekly meeting on the 12th inst. the oard met to cousider and decide on the reports of Mr. Marrable, the superintending architect, and on a variety of architectural and building applications, the following amongst others heing the most noticeable:----

Proposed new Iron-built Bazaar, near the Regent-circus,—This application was by Messrs. Doyne and Garrett, of 2. Derhy-street, Porliament-street. The drawings showed the design for a hazaar proposed to be built npon vacant ground, hounded by the hack premises of the houses forming portions of Regent-street, Oxford-street, Great Castle-street, and John-street, and adjoining the Regent-circus, Oxford-street. The proposed building is to be mainly constructed of iron and glass, and is to consist of one central pas-sage, and two side aisles, and a square compariment or transept, surmounted hy a donie. The length of the former is to be 146 feet 6 in-thes, by 31 feet 9 inches wide, and the latter about 59 feet square. The height of the central aisle is to be about 21 feet from the floor level to the springing of the semi-Proposed new Iron-built Bazaar, near the Regentfrom the floor level to the springing of the sem circular arched roof, such roof rising about 8 fe 6 inches to the erown. The side aisles are to be covered with lean-to roofs, sloping from the springing of the central roof, so as to give a height of 7 leef, where they pitch upon the outer columns. Galleries will run round the whole of the building, under the will run round the whole of the building, under the side aisles, supported hetween the columns by rolled wrought-iron hearers, 7 inches deep, with top and hottom flanges resting upon and bolted to colhels east on the columns. Under these circumstances, the superintending architect said he had no hesitation in recommending the Board to approve of the con-struction of this building, it heing understood that the foundations shall he put in as the district surveyor shall consider necessary from the nature of the ground, and the weights to be supported, and that the whole will he security put together and holted up under his careful supervision. The application was granted under certain condi-tions. whole of the building, under the

tions

Leicetter-square.—An application was made hy Mr. J. F. Matthews, of Reigate, Surrey, on hehalf of Messrs. Hampton and Russell, of Nos. 10 to 15, year. An oak roof has taken the place of a plaster

Leicester-square, for consent to huild part of front of Leicester-square, for consent to huild part of front of their premises, 10, Leicester-square, bodily forward over the existing shop, so as to range with the face of their adjoining premises, and thus make one uniform elevation. The extent of the new front would he about 12 feet hefore the present front. All the "main" fronts of buildings on this, the north side of the square, ranged in a straight line, with the present recessed portion of Hampton and Russell's nemnises "main" roots of buildings on this, the threat successed the square, ranged in a straight line, with the present recessed portion of Hampton and Russell's premises; but there were three one-story shops in a row towards Coventry-street, projecting from 12 to 13 feet, and ranging with the fronts of thcir shops. Although there was a shop in front of the house which it was desired to bring wholly forward, the superintending architect did not consider it desirable to comply with the application, as the building would present a large block standing before the main fronts over the adjoin-ing shops, and to that extent impede the ventilation of the thoroughfare. It was, moreover, unadvisable to allow it, as it would open the door to numerous amplications for structures over shops of a less sightly applications for structures over shops of a less sightly character, such as photographic rooms, to the dis-figurement of neighbourhoods in general, and he therefore could not recommend the Board to grant the application.

appeared that the Board of Works for the Strand district objected to the intended operation on the ground that at a future time the frontage might he required to be kept hack in connection with the intended new street from Cranbourne-sircet to Covent-garden, and for other reasons.

garden, and for other reasons. After some discussion the subject was adjourned. An application for the construction of a shop on the forecourt of No. 2, Upper Craven-place, Bays-water, was refused, on the ground that two other shops had been built there in spite of refusals of the Board and an angued and in respect of which shows an appeal, and in respect of which shops demolition had been commenced by the Board and an so erected, local authorities.

It was reported that there was a vacancy in the surveyorship of the western division of the City of London, through the decease of Mr. John H. Stevens, elsewhere mentioned.

CHURCH-BUILDING NEWS.

CHURCH-BUILDING NEWS. Colchester.—The state of the fahrie of St. Peter's. Colchester, the metropolitan church of the town, and the most promincut one in il, has for some time de-manded attention, and the tower in particular now requires substantial repair. It has been thought advisable to attempt to raise, by subscription, a fund for the complete restoration of the church, heth in-termells and teterpille. But are represented in the ternally and externally. By a re-arrangement of pews, the objectionable features may be removed, and accom-modation provided for at least 300 additional persons. The tower, in addition to an utter want of arehitec-tural design, has heen officially pronounced unsound. The tower, in andulon to an inter want is a more transferred to a result of the second that of a substantial Gothic tower, with suitable but-trasses and battlements, &c. The windows and roofs tresses and battlements, &c. The windows and roofs would require corresponding restoration. The chancel is susceptible of much improvement, and other minor alterations would be desirable, but no material alterations are contemplated in the galleries beyond the raising of the roofs above them. It is believed that raising of the roofs above them. It is believed that the whole expense of these restonations will be about 3,0007. A committee has heen appointed, and dona-tions and subscriptions are heing collected at the bank of Messra. Mills, Bawree, and Co. and by the vicar and other members of the committee. Three plans have been sent in.

Braintree .- The restoration committee of Brain-Braintree.—The restoration committee of Brain-tree Church have resolved to extend the north aisle, and that Mr. Pearson, the architect, be instructed to proceed with the extended plan. It appears that this alteration will give sufficient space for nearly 100 additional sents, whilst it will cause no extra outlay of about 22:57. a considerable portion of which, how-ever, is already subscribed. The nave roof, tower, and spice portions of the restamption work are nearly and spire portions of the restoration work are nearly completed

Wheatley .- The consecration of the new church at Wheatley, —The consecration of the new church at Wheatley, according to an Oxford paper, took place on the 10th inst. The edifice, which, it says, is a new crection and on a new site, is huilt in the Italianised Decorated style, by Mr. G. E. Strect, of Londoo. It will accountodate 523 persons, and the sittings are all tree. The Rev. E. Elton gave the land for the site, and for the burial-ground attached, in addition to a liberal subscription. The hulding has here crected at a cost of something above 2,0002.

ceiling. Three new windows of Early Decorated design have been put up, in Coomhe-down stone, and all filled with painted glass, executed by Messrs. J. Hardman and Co. of Birmingham. The eastern window is in memory of the late vicar: the subjects are the Crucification, the Virgim Mary, and St. John. One of the side windows is the gift of the family of the late Hr. Ward, as a memorial to him: the subject of it is the Good Samaritae. The third window is the gift of Late. Dave Labouchers and the subject of it is. Our the Good Samaritan. The toria Mindow is the girld Lady Mary Lahouchere, and the subject of it is, Our Saviour hlessing Little Children. The old font bas also been restored by the parishioners, and its carred oak cover has been cleansed from its many coals of paint. The work has heen done under the directions of Mr. C. E. Giles, of Taunton, Architect.

Moseley .- The parsonage-house in connection with Mosetcy.— In the parsonage nouse in connection with St. Mary's, Moselcy, has just been completed under the superintendence of Mr. Edward Holmes, at a cost of ahout 1,300?. The style is Gothic. White brick has heen used in the place of stone for the windowhas heen used in the place of stoke for the window-dressings, strings, &c. with pointed arches to the doors and windows, and relieving arches in alternate black and white brick bave here inserted with good effect. The roof is covered with alternate courses of ornamental blue and red tiling, with projecting gables finished with richly carved oak harge-boards and finials.

Manchester .- We are requested to state that all the stone work, in the screen put up at the cathedral, as well as the carving, was done by Mr. T. R. Williams, sculptor.

Books Receibed.

VARIORUM.

"A STNOPSIS of the Patent Laws of Various Conn-tries," by A. Tolhausen, Ph. D. (Taylor and Francis, Red Lion-court, Fleet-street), has been issued with the view of enabling inventors to acquire at one view a practical knowledge of the patent laws of various States. It is said to have been prepared entirely from anthentic documents, mostly official, and cou-rained in the library of the Great Scal Patent-office. States. It is said to have been prepared entirely from authentic documents, mostly official, and con-tained in the lihrary of the Great Scal Patent-office, in Chancery-lane, the author having transited the laws in forcing languages for the Commissioners of Patents.—...The Roman Catholies, on their own abowing, are making rapid changes "from dark, dungeon-looking chaptels in back streets, to magni-ficent and spacious churches," and they have just had published "The Catholic Hand-hook; a History of the Metropolitan Missions" (Dolman, 61, New Bond-street), in which there is "a description of one hun-dred churches and chapels, of the dioceses of West-minster and Southwark." Amougst these there are not a few edifices of an important character, hut the dioceses in question spread about through numerous suburhan towns and villages; and, amongst the chaptes described, are some which require to bu-pointed out as_-occupying the cast wing of a mansion, ..., a large room serving as a chapel, --a small tenement pointed out as, —accupying the east wing of a massion, —a large room serving as a chapel, — a small tenement in the village, &c. &c. — Lieutenant-general Sir C. W. Pasley, has had published (Dalton, Cockspur-street), a tract developing a "Plan for simplifying and improving the Weights, Measures, and Money of the Coputer without materially attering the present this Country, without materially altering the present Standards,"—an essential consideration in such a question as we have often nrged. Sir Charles's mode of question as we have often nrged. Sir Charles's mode of simplifying the coinage, is to hase all on the farthing, ten of which to form a silver cent, ten cents a thorm, and ten florins a pound; other coins to be gradually withdrawn, and florins substituted for the silver ones, and cents for the copper ones, except the farthing. For measuring works of architecture and engineering. he proposes that the foot and its decimal subdivisions shall be the unit, all workmanship measured by lineal shall be the unit, all workmanship measured by infea-measure to be priced by the foot, the 10 feet, or the 100 feet, not by the yard or rod. The foot referred to, he proposes to subdivide thus --ten tenth parts, I imperial inch; 10 imperial inches, or one bun-dred parts, I foot. As a new measure of soli-divide the proposes 1,000 exbite inches I cubic foot. dity, he proposes 1,000 cubic inches I cubic foct. Of the French revolutionary decimal system in general Sir Charles speaks with contempt. ——From a small tract on "The Public Health Act, its Application to tract on "The Fubic Fleatin Act, is a physical of and Operations at Burley, in Wharfedale, by a Rate-payer," reprinted from the *Leeds Mercury* of 28th May, it appears this little village has had severage works done at a cost of about 1,430. The ratesble value of the district is 6,458. so that one-fourth of what the Public Health Act would have allowed the allowed the several has any bar resource. The what the Public Health Act would have allowed the local Board to expend has only heer required. The repayment of the sum borrowed is being made with interest of 5 per cent. by instalments of less than 1000, a year. A rate of 6d, in the pound on building, and 1gd, on land suffices. The result of saultary efforts in this model village has already "prolonged lives, improved health, and increased comforts." A tract on "The Licensing System, its Origin and Working, as described in Reports of Select Com-mittees of the House of Commons," shows up the

ahuses of this system, and recommends free trade in beer, wines, and spirits, by way of preventing the extension of "this demoralizing system," under which, it is observed, Mr. Hardy now seeks to add which, it is observed, Mr. Hardy now seeks to add 41,547 heer-houses, at present exempt from its infin-ence, to the 89,866 public-bouses already licensed. This is a different sort of remedy for a "demorshizing system" than the Maine Liquor Law! The influence of builders and hrewers nuder the licensing system is denounced, and that influence certainly does generated its own class of evils, as we bave ourselves shown, but whether free trade in drink would not be a remedy the toter receives in a track would not be a termino ten times worse than the disease is another question requiring some consideration.—A shilbing volume, published by Routledge and Co. Farringdon-street, and titled "The Common Objects of the Sea Shore, Wood, with illustrations by G. B. Sowerhy," is one of the best written and liveliest little volumes on form an indispensable guide and companion to the amusements of the aquarium.

Miscellanea.

WORKMEN DISOWNING THE CENTRAL TRADE UNION.—A public meeting, numeronsly attended, of the workmen (chiefly bricklayers) employed in the huiding trades of Notingham, was held there on 5th inst. Mr. W. Simpson was called to the chair. He initial first of the international was called to the chair. He maintained that the whole country had too long been subject to the dictation and control of the Central Trade Union of Manchester, and could see no henefit which that society bad conferred upon the workmen of any town except their own. London, Sbeffield, Hull, and other large and important towns, had lately thrown off the yoke, and formed local and independent associations, which worked well, and were found of great henefit; and he did not see why Nottingham should not follow their example. The Central Union had done orbing from the commencement to the present day but plunder the working men! Mr. John Edwards moved that a local trade society he forth-with established, of which Nottingham shall he the head quarters. They could thus easily settle any difference with the unsters without dictation or conhead quarters. They could thus easily settle any difference with the masters without dictation or con trol from any other hody, doing away with the necessity for further strikes. He had always found necessity for further strikes. He had always found that such misunderstandings between masters and men arose from the want of a little friendly commu-nication hetween them; and the masters had them-selves suggested a code of regulations, leaving all dis-puted questions to be settled by the arbitration of delegates chosen from both sides. A lively discussion took place, the prominent feeling being strongly adverse to the Manchester Union and in favour of the han promozed —The resolution was then put and averse to the mannester command in avoir of the plan proposed.—The resolution was then put and earried *nem. con.* and a committee was chosen to draw up the laws of the new society. STRIERS.—The strike of about 200 labourers in the employ of the Eastern Counties Railway Com-

pany at Blackwall, took place on the 1st instant, in coasequence of the Board of Directors having notified party in Discarding, food place on the ST match, in coasequence of the Board of Directors having notified that in future the wages would he paid every fort-nigbt, in lieu of weekly, as heretofore. The matter having come before the Board, they settled the dis-pute hy resenting the continuance of weekly pay-ments.——At the Brick-hane Goods Station and the Stratfard Station, dissatisfaction also prevails from a like cause, but a petition of nearly 400 labourers and derks for weekly payments has been rejected by the very same directors whom a strike compelled to force their employés into strikes ? Their conduct implies a recognition of strikes as the only proper and sufficient manifestation of the desires of those under their employment. Is this wise ? METROFOLITAN IMPROVEMENTS: PARK-LANE,

Inder their employment. Is this wise r METROFOLITAN IMPROVEMENTS: PARK-LANE TRAFFIC.—In reply to a question in the Commons last week, Sir B. Hall said the committee of 1855 had recommended that one of the first openings for improving the traffic through the metropolis should be from Piccadilly, through Hamilton-place to Stanhope gate, and he had last year takeo steps to carry out the recommendation, but was met by ob-ietions of residents in Immitton-place supported by carry out the recommendation, but was met by ob-jections of residents in Hamilton-place, supported by the law officers of the Crown. He thought there was a very great abjection to throwing open the gate into the Park, for if it was open by day it must be open by night also, otherwise a great deal of inconvenience would result, and that would involve the throwing open of the whole of the Park hy night, which no honourable member would desire. However, be entirely concurred in the recommendations of the ealect committee, as it was obvious that great incon-venience arcse from the narrow state of Park-lane. The Locel Board of Works had power to purchase property in Park-lane for the purpose of widening the thorong bfare.

GAS AT PLYMOUTH AND STONEHOUSE. -The annual GAS AT FL AUDI HAND STOKEHOUSE. -- IN C ADUAL report of the directors of the Plymouth and Stonchouse Gaslight and Coke Company, to the shareholders, on the 12th inst. states that, "at the last annual general meeting, the directors announced their intention to meeting, the directors amounced their intention to reduce the price of gas from 5s. to 4s. 6d. per 1,000 enbic feet; and it is gratifying to them to state that the increase in the consumption, which bas taken place since that period, bas so fully realised their anticipations, that they are now enabled to amounce their intention to make a further reduction of 6d. per 1,000 feet from and after the 29th of September their intention to make a further reduction of 6d, per 1,000 fect, from and after the 29th of September next, when the charge will he 4s. per 1,000 cubic fect,—thereby giving their customers the benefit of reduced clarges on the next winter's consumption." The increase of consumption already obtained, as the directors may rest assured is not *all* their share-holders will yreap from that simple act for even turbles holders will reap from that single act, for even twelve months are not long enough to complete all the intwelve motifies are not long enough to complete all the in-crease to be hence anticipated. That increase will still, doubtless, go on concurrently with the still further increase to arise from the further reduction, and we shall be bappy to hear, in course of another year, that our anticipation has been completely ful-filled. Meantime the sum of 3,000%, out of the pro-file of the range more hear and at the theory fits of the past year bas heen added to the reserve fund; and, after providing for out-standing debts, and hand a start providing to our scaling users, and payment of the half-yearly dividend, authorised at the last annual general meeting, the sum of 2,000/. re-mained as a disposable halance for the payment of another satisfactory dividend.

another satistatory dividend. DESTRUCTION OF PICKFORD'S GOODS WARE-HOUSES AT CAMDEN-TOWN.—This has been a very extensive fire, destroying admittedly 60,0002. worth of property, but much more according to some esti-mations. A good deal of it was insured, but the public will be computed to roble and be seen not call with de neuron mations. A gloud deal of it was insured, but the public will have much trouble and loss connected with destroyed parcels, &c. The official report of Mr. Braidwood descrites the main damage done as follows .--- 'O val-road, Canden-town, Messre. Pickford and Co. of the London and North-Western Goods Station,---The contents, and also the warehouses, &c. 300 feet by 250 fost all but destroyed, core here we do for 250 feet, all a uso the warehouses, &c. 300 feet by 250 feet, all but destroyed; one horse and a number of pigs hurat to deatb; the stahling and vaults under ground severely damaged by fire, water, &c. and two barges in the canal alongside severely hurned. The buildings were insured by the company in the Globe, and Messrs. Pickfard's were insured in the Norwich Union and other fire offices. The eause of the fire is unknown.

FATAL ACCIDENT AT THE LEGHORN THEATER. sad catastrophe occurred at Leghoro on the 7th st. Upwards of 3,000 persons were assembled in e Thcatre degli Aquidotti to witness the repre-Δ. the sentation of the taking of Sebastopol, when suddenly one of the rockets let off to imitate the humbardment one of the rockets let on to initiate the numbardment set free to the side-scenes. A sudden panie scized the public, and it was believed (according to the *Corriere Mercantile* of Genoa) that a hundred persons perished, and that more than double that number were injured. ——The official *Monitore Toscano* of the 5th, however, says that, according to the list accounts, the killed were forty-three, and the wounded 134. "The fire never got heyond the scenes, and did no damage to the other part of the theatre."

FALING IN OF A SWISS TUNNEL.—No less than fifty-four of the workmen engaged in forming the Hauenstein tannel, on the centre railway, uniting Basle with Aarau, Lucerne, Berne, &c. were buried hy Dask with Arau, Lucerae, Berne, Xc. were burned hy the fulling in of a portion of the tunnel, in conse-quence of the wood-work of the shaft having been hurnt; and, by last secounts, thirty-two dead hodies had heen extracted. In the tunnel, which is about three miles in leugth, a fire was constantly kept up to promote the circulation of air, and a forge had been at work at the bottum of the shaft, so that the woodat work at the bottom of the shaft, so that the wood-work heame very dry, and at length eaught are. Great exertions have been made to open a way to those entombed; but there was little or no hope of any of them having survived, although they had sufficient space, and a spring-well for drink, with several horses for food, all probably having heen sufficiented by the formes of the huming timber.

SALARY OF THE SALFORD SURVEYOR. - At a receut meeting of the local council a report from the recent meeting of the local council a report from the Salford District General Purposes Committee recom-mended that the silicity of Mr. Evans, surveyor of the district, he increased from 2004. to 2504, a year, Mr. Evans devoting his whole time to the duties of the office, and the engagement being terminable by three months' notice from either party. It was stated that the total expended by the committee under whom Mr. Evans served was about 7,1754; which, at the usual five per cent. would give him a salary of 3584. 15s. The General Purposes Committee recom-mended that an increase should be granted, rather than that a servant of seven years' experience should be lost, and all the inconvenience of a new man he encountered. A motion to that effect was earried by 11 to 10.

LECTURES ON ART.--With special reference to be Art Erhibition, Mr. Henry Cook, on the 10th inst. delivered, in the lecture-hall of the new Mechanics' Institution at Manchester, the first of a course of six lectures on this subject. The audience was very scleet, including the Bishop and many of the elergy. The moral and social advantage of a right under-standing of the arts formed the chief subject of the lecture. lecture

Jecture. THE UNETT MEMORIAL, BIRMINGHAM. — The monument to the memory of Colonel Unett, who fell at the Redan, is now finished. It stands in St. Philip's churchyard, at an angle of the burial-ground facing Upper Temple-street. It consists of an Fermine Ablick of nolished Peterhead gramita. Philip's churchyard, at an angle of the burnar-ground facing Upper Temple-street. It consists of an Egyptian obelisk, of polished Peterhead granite, raised on a pedestal of same material, the whole sup-raised on a pedestal of same material, the whole sup-Insect of a peterstal of same maternal, the whole sup-ported at the hash by three steps. The height of the monument is very nearly 20 feet, of which the obeliak alone measures 12, the latter being hewn out of one hlock of granite upwards of 3 tons in weight. The design was furnished hy Mr. Peter Hollins, by whom also it has hene recented has been executed.

ARCHÆOLOGICAL DISCOVERY AT ABINGDON ARCHAROLOGICAL DISCOTENT AT ABINGDON-In the course of last week the workmen of Mr. Jas. Thomas, of this town, builder, whilst engaged in lay-ing down a drain from the Abhey to the "Stort-water," which crosses the end of the Market-square, which in the second second second particle water," which crosses the end of the Market-square, broke into a subterrancous vanited passage, leading from the Council-shamber buildings towards the church of St. Nicholas. It possessed characteristics of a peculiar nature, heing some 8 feet in height by 6 feet in width, constructed with small rough stones, with an areh very neatly turned. The workmen followed the passage under the church for some 10 feet (when the length presented was from 8 to 10 yards) and were then stopped hy the walls of a vault which had been built through and entirely across it. The passage was not further followed. CONCREGATIONAL SCHOLS, ROTHERDITING - The

CONGREGATIONAL SCHOOLS, ROTHERHITHE.-The CONGREGATIONAL SCHOOLS, MUTHERITHE, --- THE foundation-stone of these new schools was laid on 11th instant. The building, which will be in the Italian style of architecture, is to be formed of plain bricks, and is being erected by Mr. Hollings, huilder. The cost of the building will exceed 800% of which nearly 400% have still to be raised.

prevence might be effected by the removal of trades prejudicial to health in London, to a distance of at least averal miles, so withdrawing also many of the working classes from their close and crowded dwell-Working classes from their close and crowded dwell-ings to more healthful districts, has met with very favourable consideration by the press. The Glasgow of several objectionable trades which have of late given frequent cause for complaint; and there is no eity in the kingdom, we may add, which more requires a thinning (for their own as well as the general henefit) amongst the crowded working classes in its close courts. the crowded working classes in its closes, courts. aud wynds.

STATUE OF THE LATE MR. G. B. THORNEYCROFT, AT WOLVENHAMPTON.—A statue of Mr. Thorneycroft was placed, on the 11th instant, upon the pedestal created at the head of the vanit in the cemtery where his remains were interred. The statue is 8 fect 6 in, in height, and executed from a block of Carrara marble: the pedestal is also of marble, but of a greyish white. The late Mr. Thoraeycroft having been the first mayor of Wolverhampton, advantage has heen taken of this revresented in the act of addressing his fellow towna-men, and wering the robe and court-dress of his office. At his fect, sustaining the statue and uniting it with the plinth, is an iron roll, indicative of the of the statue are said to form a correct portrait. Mr. Thorneycroft was the sculptor of the statue. STATUE OF THE LATE MR. G. B. THORNEYCROFT Thorneycroft was the sculptor of the statue.

THE COLERAINE ACADEMICAL INSTITUTION .- The first stone of the Coleraine Academical Institution was laid on the 4th inst. This building will be creeted in the neighbourhood of Coleraine. Near the site the National Board have creeted an extensive model-National Board have erected an extensive model-school. The proposed crection is of considerable extent. The building is a plain specimen of the Italian style of architecture. It is of a somewhat oblong shape—the front, which has an eastern aspect, measuring about 150 feet in length. The average breadth may be set down at 50 feet. Mr. Isaae Farrell, of Dublin, C.E. is the architect; and Mr. Kil-patrick, of Coleraine, the huilder. The ORDENANCE MAPS FOR SCOTLAND. — The sublication of these mars on a scale of 1 inch per

THE ORDNANCE MAPS FOR SCOTLAND. — THE publication of these maps, on a scele of 1 inch per mile, is now begun. They are reduced from the 6-inch maps, and published in sheets measuring 24 inches by 18 inches each, delineating ao area 24 miles long by 18 miles broad. Sheet 32, the only one yet ready, embranes the contrary on both sides of Edmfong by 15 miles invoid. Sheet 32, the only one yet ready, embrases the country on both sides of Edm-burgh, from Linbthgow on the west, to Prestonpans on the cast, and in the other direction from Penienik to Dalgetty in Fife. They are sold at one shilling per

to his victims, or to his country. THE LATE MR. J. H. STEVENS, ARCHITECT.—We record with regret the premature death of Mr. John Hargrave Stevens, surveyor, under the Metropolitan Building Act, of the western district of the City of Nor-London, which took place on the Zad instant. Mr. Stevens was intimately associated with the City solicitor, Mr. Pearson, in the plans for metropolitan railways, which he has at different times brought before the public. THE CONSTRUCTION OF FLUES.—As a part to the solution of the solution of the solution of the solution.

Detore the public. THE CONSTRUCTION OF FLUES. — As a note to irticle on p. 325, let me say that at Southfield Grange, Wandsworlh (built five years ago) are flues on the plan shown in fig. 1, hut the foot of the main flue C D was not intended as a receptacle for soot, hut to allow the chimneys of best rooms to be swept from the kitchen. — an arrangement, attended with orgent clear

was not intended as a receptacle for soot, but to allow the chinneys of best rooms to be swept from the kitchen,—an arrangement attended with great clean-liness and comfort.—T.M. ROMAN CATHOLIC SCHOOLS FOR DRURT-LANE.— The Roman Catholics have bought a piece of ground at the end of Charles-street, Drury-lane, on which it is intended to erect schools, to he called "The Schools of Compassion." The cost of erection, it is stated, will be npwards of 10,000. SOUTH KENSINGTON MUSEUM (AT BROMFTON).— The Queen and members of the Legislature are about to pay private visits to this museum, the dates of which have been arranged, and it will be opened to the public, both in the daytime and the evening, on and after Wednesday, the 54th instant. Besides the various collections of architecture, sculptore, patented inventions, &c. the Schepsbanks pictures will be exhibited in the new gallery erected to receive them. The admission of the public to the museum lighted up in the evening, is the first experiment of the kind with a public institution, and it is hoped will he acceptable to those who work in the daytime. Builder.

Vol. XV.-No. 751

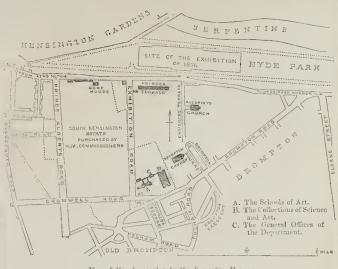

ENERAL expressions of satisfaction have attended the opening of the Government Museum at Brompton. Few amongst the thousands who have already visited it were prepared to see so many departments of science and art illustrated so fully as are there to be found. The accompanying little map shows the approaches to the site and the position of the buildings appropriated to the Schools of Art for masters and mistresses, A ;

the Collections, or mnseum proper, B; and the offices of the department, C. The museum proper includes the Commissioners of Patents' Museum

(models and publications), at the sonth (or Brompton) end of the building; the Educational Collections in the centre; the Museum of Ornamental Art northward ; a collection of architectural easts, Greek, Roman, and Renaissance, on the west side of the courts already mentioned; the Architectural Museum, removed from Canon-row, in the gallery above least possible effort. Group labels communi- rooms. Apertures for the admission of fresh the collection last mentioned, and running nearly the whole length of the building ; a court of modern sculpture at the northern cud of this gallery (a capital idea); the general Trade Museum in the gallery on the other side; and the Gallery of British Art in rooms built for the purpose, and approached from the Sculpture the exemplifications of the application of human Court on this floor.

whereon we have a quarrel with the authoritics, such as the frightful ugliness of the irou building, and its dangerous condition in respect of fire ; the avoidance of architectural supervision and its results in the external appearance of the ducts, is instructive. Nothing is wasted: from other structures,—we must accord to them warm what would seem a worthless abomination, commendation for the energy which has been displayed, the goodness of the arrangements, delicate ladics. And touching dyes, hard by and the admirable intention everywhere shown. will be seen specimcus of lac-dye, the product Great advantages will result from this Iustitu. of the small insect known as the coccus ficus. tion. study, and will instruct those who come simply to be amused.

least, will be found to contain most interesting matter. Take, for example, the Museum of Animal Products, part of the Trade Museum, arranged in the east gallery, under the special supervision of Dr. Lyon Playfair, which bids fair to supply a want. Two of the great divisions into which raw materials are divided are already represented in the metropolis: the Museum of Practical Goology in Jermyn-street, represents the economic application of geology to the useful purposes of life : the Botanical Gardens, at Kew, represent the cultivation of vegetable products, and the illustration of their application to our wants : and now the collection of animal products will be made a centre for the dissemination of technical knowledge on the subject, the importance of which can hardly be too highly rated.

Mup of the Approaches to the Brompton Museum

cate the general facts belonging to cach series, air, 45 square fect; and for escape of foul air, and specific labels describe each item. The collection of furs is very considerable, including a skin of the sca otter, worth, though small, 40%. and to the use of which, in China, the Emperor claims the exclusive right. Looking amongst Putting aside for the moment those points visitor will learn with some surprise that the hereon we have a quarrel with the authorities, average annual yield of the "hair harvest" in France, amounts to 200,000 lbs. weight. The stand of bottles and specimeus showing the final destination of the refuse of animal procomes Prussian blue, to dye elegant dresses for If the Muscum afforded uothing but free Lac itself, used mainly for scaling-wax and healthful recreation and delight to the inhabi- varnishes, is produced on different kinds of tants of the metropolis, the outlay would be trees, by the puncture of this insect, a member well applied; hut it will do much more than of the family to which the cochineal insect this: it affords the means for most profitable belongs. The parent insect, after laying her eggs, hecomes a mere bag, containing a small quantity of red liquid, and the young, feeding on Even those departments which promise at this, assume the same colour. The male insect, first sight to amuse the mere sightseers the by the way, is the greatest polygamist in creation, for the proportion of females to males is as 5,000 to 1.

It is not our intention, at this moment, to describe the collectious in detail : we shall have to return to them. Travelling back, however, by the road we came, we may briefly mention that the Gallery of British Art mainly consists at present of the 234 oil-paintings, and a considerable number of sketches, drawings, and etchiugs, almost all the works of British artists, munificently given to the nation by Mr. Sheepshanks, and including some of the best works of Mulready, Leslie, and Sir Edwin Landsoer, with others hy Turner, Webster, Redgrave, Collins, and Constable

The collection is contained in four rooms ;the two larger, 40 feet by 20 feet; the two smaller, 34 feet by 20 feet; 22 feet high. Light Here are found wools, hair, furs, bristles, halebone (developed bristles), horn, foathers, leather, and other animal products, in their various applications, and all so labelled as to black being placed below. Gas is supplied by enable the visitor to get information with the 112 burners in the larger, 84 in the smaller the latter more perfect. Viewed in conjunction

40 square feet, are provided in each room. The building was creeted from the designs of Captain Fowke, R.E.

The Modern Scalpture Gallery cousists at present of fifty works, contributed by twenty-five sculptors, including Bailey, Bell, Foley, Munro, Calder Marshall, and Earle : it will be constantly enriched by fresh contributions.

The Architectural Museum, over which the original committee have absolute control, looks well in its new locality, and will, it is to be hoped, be widely studied. Quoting the synopsis printed in the cheap introductory guide to the Collections already published,-

Collections already published,— " Its direct object is to improve and perfect the *ard norkenasskip* of the present time. To effect this, a large and increasing collection of casts and specimens has been already formed from the finest ancient examples. English and foreign, of complete architectural works, arranged as far as pes-sible in the order of their date; and of details, com-prehending figures, unimals, and follage; mouldings, consults it illes, mural publicity, roof ornamints, rub-bings of sepulchral brasses, stained gliss, impressions from seals, and of all other objects of fine art con-nected with architecture. The whole range of Gothic art from those countries where it has been practised is more or less represented by casts and speci-mens. Arrangements are also now being made for the complete classification in the new Museum, in the order of their countries and dates, of the casts and The complete classification in the new Museum, in the order of their countries and dates, of the casts and specimens of the architectures of the Oriental, Classical, and other styles, of which there are now a number of fine examples in the Museum. A collec-tion of casts i commutual folinge, &c. is in course of formation, to afford opportunities for the study of the onumental art of past ages side by side with nature. To casts and specimens are alded, as opportunities offer, photographs, drawings, and engravings of archi-tectural works; the photograph or engraving giving a view of the whole structure, the casts giving the detail. To these have been added models of buildings. The various collections now number upwards of 7,000 The various collections now number upwards of 7,000 specimens."

Lectures will be delivered here during the session, some with especial reference to artworkmen.

The classification of the various easts, although broadly correct, has yet to be made perfect. This is also the case in respect of the Greek, Roman, and Renaissance casts in the gallery below; but steps have heen taken by the Department to make the arrangement of

357

with the casts helonging to the Architectural Museum (mostly Mediæval), the architectural student will here find illustrations of the whole progress of his art iu respect of details and decorations.

The Museum of Ornamental Art bas seventeen divisions, viz. :--1. Sculpture, including carvings in marble, alabaster, stone, wood, ivory, and other materials; art-brouzes, terra-cottas, and models in wax, plaster, &c. 2. Painting-Wall decoration, paper-hangings, illuminations, printing, designs. 3. Glyptic and Numismatic art. 4. Mosaics. 5. Furniture and general upholstery. 6. Basket-work. 7. Leather-work. S. Japanned or lacquered work. 9. Glass paint- Ing. 10. Glass manufactures of this pathe-ing. 10. Glass manufactures. 11. Enamels.
 Pottery. 13. Works in metal. 14. Arms, armour, and accourtements. 15. Watch and backs. clock-work. 16. Jewellery. 17. Textile fabrics. At the present, time only a small proportion

of the collection which now numbers upwards of 4,000 objects, can be exhibited. The reasons for this deficiency are, that a selection consisting of 1,000 specimens, including the entire acquisitions from the Bernal collection, has been sent to the Manchester Art-Treasures Exhibition; that a further instalment of several hundred objects in every class has, for the last three years, been circulated for exhibition in the various provincial towns in which schools of art are established; and that, lastly, it has been decided to await the completiou of the new fire-proof rooms behind the present build-ing, and under the Sheepshanks' Gallery, in order to avoid the risk of exposing many rare and valuable objects in the iron building. The collection of original specimens now exhibited, consists, therefore, mainly of the bulkier objects of furniture, and of works of modern origin, purchased from the Paris Exhibition of 1855, which, from want of space at Marlborough have not yet been seen by the public House.

Even from this brief outline it will be evident to our readers that the museum at Brompton may be made to play an important part in the education of the rising generation.

SOME REMARKS ON DOMES.*

Or all the forms created by the architect, the dome is perhaps the noblest. There are few of us who have not seen with admiration the immeose domes of Rome and of Florence towering high above all around ; and here at home, the dome of our eath dral, hursting through the smoky cloud sent forth from the myvind of honest, majestically rears its gulden cross, and constitutes the well-known crowning feature of our city. In the following general sketch of the origin and the progressive development of couline of dames, I propose to enter but very slightly it to the question of construction, though I think that this part of the subject has not yet been treated as it shuld be, and that a mongraph of it, working out the theory from actual examples, is still wanted. Late discoveries in Exput and Assyrin have haid open many a work of ancient or before maknown; but we must still seek in Greer for the carliest exam-les of one subject, viz. at Mycence and Orchomenes; Or all the forms created by the architect, the dome perhaps the poblest. There are few of us who

but we must still seek in Greece for the carliest exam-ples of one subject, viz. at Mycene and Orchomenos; to which two instances we seem limited in that country. The Abbé Winekelmun indeed, no mean authority, maiotains that the Greeks through all ages used this form of covering; but I have carefully searched the passages to which he refers, and find that his only grounds of helief are the use of the word that the covering is described by the the Polog by Pansanias in bis description of several huild-ings, and some exceedingly doubtful possages in other authors. Pausanias makes no mention whatever of any peculiar form of covering, and I h lieve the meanition whatever of any perman role overlig, and in here the mean-ing of the word bolog as applied to a dome is a later reading. Oue instance, however, of a has-relief in the Ciementine Museum, to which the Abbé alludes, gives at first sight some colour to bis theory. I find, however, that it represents a tower, apparently of wood, on the provo of a ship, and that the date of the bis-relief and of the invention of the towers them. Seven is uncertain. It seems to me that the most invectorate esseviat could scarcely found a throny upon this. I have also been reminded of a doubting pas-sage of Cratinus referring to the Odenm of Perioles;

* By Mr. T. H. Lewis, Fellow. Read at the Ordinary eneral Meeting of the Royal Institute of British Archi-cts, June 1, as already mentioned.

hut Vitruvius, who gives a long description of that huilding, makes no mention of a dome. In Sardinia we have those curious buildings described by M. Petit Radel. In Etrania we have some few instances such have. The entrum we have some new institutes and as I have given from Riello; and in the Crimera the tomb of Mithridates at Kerteb : hat the dates and the builders are doubtful, and we must return to Greece hefore we are on sure ground.

At Mycenne we see the form, if not the construction of the dome, worked out by a master hand with no little skill; and most singular is it that for nearly 1,000 years (so long is it to the next example) that form remained, so far as our knowledge goes, un-copied, though in the heart of the contry. For it is not a ruin whose form can be developed only by the patient labour of the antiquary. The hand of time, which has weighed heavily on works of a later date, has passed geutly over this, and whilst it has only spared a few columns at Corinth and at Thebas, and little at Argos and Epidamus but the rock-cut steps of their theatres, it has left this earlier work almost meantical, as though to teach us how great was the At Mycenæ we see the form, if not the construction unscathed, as though to teach us how great was the nation whom we once called barbarian, though their nation whom we once called barbarian, though thew history, their name, and race can now only be conjec-tured. Between the Trensury of Atreus and the Chorogie monument (an example so small as hardly to be quoted except as a connecting link) there is a gap of 1,000 years—a space which contains the life-time of a nation—sees its rise and its decay; and yet availed the baildings, the sculptures, and the vases whercom so much of the nation's character has been written, 1 cannot recall one instance beyond those to have a variance deposite the down was aver a theory are aver If have mentioned to show that the done was ever used by the Greeks; that nation whose fertile mind teemed with investions in art, in poetry,--in every-thing, I am heretic enough to say, but in architecture, For heantiful as their one form once was, and refined in detail to an extent that we can scarcely yet appre-ciste, the form was still one which, varying only in detail, might have served as the model of urarly every temple from Pæstum to Ionia.

The inv monument of Lysicrates is interesting, so far as, were we disposed to trace art forms up to thrir carliest source, it would offer the first justance of a dome raised on columns, and showing the domical form both inside and ont. This monument of a concern base of relations, and anothing one domical form both inside and out. This monument is of singular benuty, but it can now, perhaps, be-better judged of by casts and drwings than from the reality. For it is (or was a few years back, when I saw it) huff huried in rubbish and filth, and to be ap-proseded only through a nest of squalid hovels. Another jump of some 500 years brings us to a number of examples, showing the oulline of the dome almost perfected—at Rome the Pantheon, the temples of Yeans, of Minerva Medica, and the B tilts of Caracalla; at Baire the Temple of Yeans; at Pompeii, the B.ths show us the form developed, while the grandeur of many of these (xamples still left teach ns how very many we must have lost. Iu some small remains at Mylass, in Ionis, of perhaps carlier date than the above, the Greeks made a great advance by covering a square space with a domical structure, and covering a square space with a domical which has been This monument covering a square space with a domical structure, and raising it on columns by a method which has been well destribed by Mr. Pergusson, in bis Handbook, more especially in reference to Indian domes. This method is the one that we might expect would be first adopted, and consists simply in covering the angles of the square with a flat stone or girder then repeating the process, and thus gradually obtaining a near approach to a circle. At Mylassa, the arrangement eccens to have been well managed, and to have pro-duced a very pleasing effect. In the Indian domes the arrangement was still more picturesque, but the whole must, I think, be considered as a rude way of getting over a difficulty. We have an example of 1,000 years later date than that at Mylassa, in the Temple of Pandrethan, in Kashmir, but formed on Food years later date that inst at Mylass, in the Temple of Pandrethan, in Kashimit, but formed on precisely the same principles. I remember but one instance of its use in an interior in modern times, viz. at Sta. Balhina, at Milan, where the angles are cut off in the most abrupt manner, and the effect is disagreeable in the extreme. But a remarkable instance of its use extended. But a remarkable in-stance of its use extended and the second remarkable and eclobrated villa Capri, near Vicenza, where the dome, with a low styloabte under, is placed directly on the square hipped roof, not raised above it as shown in the accurate proof, not raised above it as shown in square hipped roof, not raised above it as shown in the engravings, but sunk into the sides in the most awkward manner. At Mereworth Castle, Kent, this example has been copied, without the cutting into the roof, which is better, but with a higher dome, which is decidedly worse. The external effect of this ahrupt change from the square to the circle could searcely be pleasing anywhere, and it is surprising to find that we must look for the most numerons examples of its nee amongst the nictures one churches of elegant we most look for the most nongrons examples of us use amongst the picturesque churches of elegant Palerno. No effort is there made to conceal the tran-sition, and the effect is certainly upplrasant. There are some examples also at Cairo and Ancona, hut the change is there softened by an octagon heing ister-mond pos

The next attempt to get rid of the harsh effect of

the horizontal angular pieces internally would be, we may imagine, to fill them up by a slanting projection starting from a point at the base, each filling in piece starting from a point at the base, each filling-in piece heing triangular. Yet this is by no means the culiest in point of dats, and very few examples of it in its simple form, as applied to interiors, exist. The best specimens are, perbaps, to he found in the French churches of Loches, Uzerche, &c. so well described by Mr. Petit. Bott the boneycounh pendentives of the Saracens, seen in the Mosque of Hassan at Cairo, the Cuba at Palermo, and the Pathan Mosque at Delhi, may be ranked in the same class a a beautiful variety. The transition externally from the square to the round may he made in the most ready way, by merely slauling off the angles; by which by merely slauting off the angles; by which simple expedient a very beautiful outline has been produced by the Arab architeets, as will be at once seen in the well-known tombs of Cairo. The some seen in the wear-shown tomos of Caro. The some expedicat has been sometimes used in later times, as in the well-known villa at Chiswick; but con-sidering the picturesque effect which the Arabs bave proved ean be produced by this easy plan, I must say I wonder that it has not been more often adopted

more especially as the Gothic architects have shown in many a beautiful example, in their spires, how picturesque the connection between two dissimilar pretressue the connection netween two assuming forms may be mide. Somewhat of this treatment may be seen in the dome of Ani in Armenia, but I cannot help regretting that the Gothie architets did not adapt to their own forms that of the dome, and complete the beautiful beginning made towards it at Ely. The nucl change would be probably to support the angular filling in by an arch; and at support the angular filling in by an arch, and at Serbistan we see this arrangement complete. It is, indeed, so strikingly like the Arah forms of 800 years hater, seen in Polermo, that we besitate at first to assign it to the fourth ecutury. But we have good anthority for so doing, and indeed the remains now disintered in the fast show us how little is our present knowledge of its art. Who, for instance, having at the betthermost durate and cound arched our present knowledge of its art. Who, Jor instance, looking at the battlemented turrets and round arched dome of the Asyriau sculptures, would, not knowlog its date, venture to assign its real one? Or who would consider the Temple of Payach, in Kashmir, to be of the age of Theodoric, or the pointed arch at Bisotourn, to be of the fifth century? and yet we have execllent authority for these conclusions. And, indged, changing in all else, the East retains its art traditions almost unchanging; and the art workman there produces his tapestry and mossies after the same likeness as his ancestors have done for

centuries before him. The models at Serbistan and Ferouzabad, however. The models at Serbistan and Ferouzabad, however, if followed, seem to have left few immediate copies, and for many a year after we see no trace of their influence. In Italy we now find the great circular huildings of Nocera, Sta. Costanza, &c. All these seem to have heen formed oo one plan: the builders got some old columns on which they put as many old capitals as they could find, without much regard to size or form. A tall base made amends for a short capital, and where capitals and hases enough were not found ready made, others were worked out in rude similitude. The columns being ranged in circles a dram was carried un over them, and in circles, a drum was carried up over them, and a large dome covered all; yet, rude as is the whole

a large come covered all; yet, russ as is the whole arrangement, there is a picture-sque and quiet effect in the mass that is very pleasing. Of a somewhat later date is the well-known tomb of Discodoric at Ravenna, as picture-sque in effect as bold in construction. A done of 35 feet diameter in one solid block of stone, hoisted some 50 feet in the ir, russid attendo a whore were to the the trione solid block of stone, holsted some bu reet in the air, would startle a modern mason; but though its foundations were, when I saw it, under water, searcely a fracture could be seen throughout the huilding. Were not the date of this also well authenticated, we should hesitate to place it where we now do.

Another method, more scientific, and, perhaps, more artistic, took the place of that of Serhistan. If we round off the top edges of these exterior angular gussets to the form of the circle in clevation, we shall have externally the Byzantine form of pendentive. But the Eastern architects seem to bave worked out the form in a different way, hest described hy Mr. Petit *

Externally the western dome corresponds in diameter to one side of the square on which it is described, but in the castero the diameter is often equal to the diagonal. Try this on the model and see if anything eur be more unpromising in outline than the huge overhanging on each side of the square. But eut off this projection and see how picturesque is the result. On a square, on an unequal side figure, on a polygon, the result is the same, and I helieve that no more picturesque outline was ever invented. From its earliest use down to the present time-as exemplified in the beautiful Indian eanopy exbibited at the Crystal Palace of 1851, this outline has supplied forms of beauty throughout the East. To individualise the specimens of this form, for the diagonal Try this on the model and see if anything

* Architectural Studies in France

first idea of which we are, however, indebted to the Romans, we must begin with Constantinople. The earliest church there (Ajos Scrgios) has much in plan resembling the Temple of Minerva Medica at Rome, and its picturesque arrangement of columns might once have existed in its prototype. But in the next example, the celebrated Sta. Sophin, we have the Byzantine pendentive celearly worked ont between two loity arches and supporting the dome above, with an outside ring of arches added, shadowing forth, perhaps, the later mode of the circular peristyle. On S. Vitale, a work of the same emperor, I need not dwell, as its picturesque form is known to all. But at Agia Theotokos, at Constantinople, a very important novelly was introduced in the external treat-

On S. Vitale, a work of the same emperor, I need not dwell, as its pieturesque form is known to all. But at Agia Theotokos, at Constantinople, a very important novelty was introduced in the external treatment, and very worthy is it of notice. It consists in carrying on the outline of the internal arches where they ext the dome, ornamenting them with massive archivolts carried on marble columns, and thus breaking up the hase of the dome by a wave line in place of the level cornice.

of the level cornice. There are a few examples in the West of Europe. The exterior of the S. Aposteln, at Cologne, is a very good specimen, though the internal arrangement is like that described for Scribstan. But in Greece, the form is everywhere met with as a native style; and the churches, springing as they do from the square to the cross form, raised in the earther by these domes, and coloured in the boldest way by the use of marble, brick, and terra cotta, have an effect scarcely to be imagined.*

WHAT A FOREIGNER THINKS OF THE GOVERNMENT COMPETITION,

The competition for the designs of the new Government Offices has, no doubt, created much interest in the minds, not only of professional men, but of all who are anxious for the progress of art and science. The doors of Westminster-hall, which have been open to the public inspection of its contents for several weeks, are now closed; and the day draws near, when those appointed to decide on the merits of the competitors will give their judgment.

There is, perhaps, no art or science which contributes more directly to the education of the popular mind than good architectural edifices, or that vulgarizes it more, than had ones; still there is no art which has been more neglected, not to say abused, than architecture, during the greatest part of the eighteenth and the beginning of the present century. It is not very long since the public looked upon an architect as a kind of cross between a carpenter and a builder: those times, let ns hope, are gone hy, and though the present exhibition does not show all the progress in the art that might be desired, it is evident that in architectural skill great advances have been made.

very long since the public looked upon an architect as a kind of cross between a carpenter and a builder : those times, let us hope, are gone hy, and though the present exhibition does not show all the progress in the art that might be desired, it is evident that in architectural skill great advances have been made. Sir Benjamin Hall has been very judicions in laying these designs hefore the public. 1st. It shows what this contry is able to produce in architectural design: the continental ones are very indifferent, indeed; as far as 1 can guess, no man of any repute has compred. 2nd. It is a contribution to popular education. 3rd. It is throwing off at once all suspicion of sceresy, intrigue, or partiality.

ementoa. 5rd. It is throwing of it i once an usepicion of secresy, intrigue, or partiality. The profession, I think, cannot be entirely satisfied with the members of the committee. Most of them I helieve to be men of superior education, and some of the profession; and, if I am rightly informed, they are of the old school, not familiar with restletiend progress in practical forms. It has low here a mistake to suppose that an architect can do very well without estbetical principles; and that a practical acquaintance with stone, hrieks, mortar, and wood, assisted by the knowledge of the construction of a staircase, with some rices of the five orders, would be sufficient to give a hricklayer the diploma of an architect. Hence the great number of horrid architectural features with which the public buildings of this metropolis have been deformed during more than half a century, with some few exceptions in the so-called classic, and some creditable buildings and churches in the Pointed styles.

this metropolis have been deformed during more than half a century, with some few exceptions in the so-called classic, and some ereditable buildings and churches in the Pointed styles. Before entering the competition-hall, it may be useful to remember that in arts, as in science, we are all, to a certain extent, copyists, stepping forwards in the path of our predecessors, now rising upon their shoulders, then turnhling down under their fect when we heceme giddy, or falling back if we feel exhausted. It would be quite as useless to look for a new style as a matter of fact, as it would be useless to look out for a new star, only by wishing for it. New styles and new stars are scarce, but the solar system moves on quietly and surely, and so does architecture. It is infinenced by the greater or less development of the infelect of a prople in accordance with its religious feelings and domestic wants; and we may capter, accordingly, a more or less refined taste in its productions. It would be very easy to prove this truth in

* To be continued,

laying before you the history of architecture, in conjunction with the history of the rise, development, and decline of a nation. But I must not impose either upon your valuable space, or the valuable time of the public let it be sufficient to say, that we should not enter Westminster-hall with the sanguine expectation of fluiding a style hitherto unknown, but with the sober interation of finding out the hest plan regardless that the style has no novelty to recommend it.

nuchit. In walking for the first time through such an immruse alley of drawings, the non-professional public and amateur must feel at a loss. There are plans paited with a profinsion of Chiuese red, iodigo, and ehrome yellow, as if the artist was a colour man, and waated to alvertise his trade: there are drawings so delicately tinted couleur de rose, that you are afraid they will vanish in looking at them : there are elevations and plans so carefully finisbed in detail, that you may tell the stones and hricks with their joints, if you had the time and a mind to do so: there are sketches in pen and ink for amateurs, of outlices, it a prima, which certainly would puzzle the expenter and builder how to find out the working drawings: there are some so impudently large, that you want an assistant with a six-foot rule to measure them; and again, there are sections so minute, that you want an ansistant with a six-foot rule to measure them; and again, there are settons so minute, that you want an ansist of strong spectacles to discover the beauty of them: there are block plans, knocking down to the right and to the left all that lies in their way, as if all the dwelling ground from Parliamentstreet to Charing-cross was on sale for 3d. a yard, making flower-gardens and areanes as for a country massion. There are some which go as far as to blow µ Rickmond-terrace by gunpowder, like a piece of rock (in imagination, I mean), crossing the Thanes hy a single arch, I suppose as an improvement to the vectilation and drainage of the metropolis, or filling up the central part of the hlessed stream, leaving only wo marken waterways at the sides, regardless of the increased velocity which would render these passages quite unft for navigation. There are again drawings, showing small arches upon long columns, and others remendous arches upon short ones; the first remindion to the Byzantine type in Marcuitus busiliea, 300 A.D. I will not allade to the number of drawings which are as declicert in any type or style as they are in

One, an Italian (Greek) design, distinguishes itself by simplicity and harmony of eorception. It is planned to preserve the facade of the present Treasury, but as that facade is only the mantle of a defective construction, without proper entrances to meet architectural beauty or practical use, and the whole surmounted by a dome, which not being in harmony with Greek, or Italian Greek architecture, an elevation showing no progress in art above what has been before excented in England, I should deeline the project, notwithstanding its practical ability and harmonious dimensions.

In the Elizabethan style there is one very elever project indeed; hut I object to the style itself, notwithstanding nuy great regard for some beautiful ancient specimens of it; for instance, Crewe Hell, so tastefully restored by its present possessor, as having only a few features for the development of architectural progress, in comparison with other styles. I should decline that design for the present object, notwithstanding its merits.

We notain any its interest. As to the Roman plan, it is a pity that the architect has not directed the power of his genins another way, as S P Q R will never do for S P Q L.

The four hest designs I allude to in the Renaissance style are all bold, spirited, and tastefully handled. They surpass, in that line, every elevation around them; and, skilldly drawn, they give a favourable impression of their intrinsic value. In fact, for the impression of grace and elegance in lines, this style is admirably ad pied; but it wants also a good deal of professional experience and eool judgment for its application in elevations of large dimensions: accordingly we have not only in these designs to look up for spirit and elegance in the elevation, but also to look due to effect the bulking will have when creeted, as many of the spirited tonches of pen or brush will never appear is the execution when scen at a proper distance.

The general rule by which the other appendix The general rule by which the effect of architectural structures may be calculated is the more or less projection of certain parts of the elevation, and the greater or less deep and bold sections in accordance with the distance at which the whole may be seen at once. I make these observations purposely, because in one

of the most gorgeous and showy designs in the Remaisance style the sections are too flat, and the projections too many and too deep. One other fault in the same design is, that the second-floor is standing hack several fact behind the general line of the front elevation rather terrace-like, and cuts in reality the elevation horizontally in two pieces above the firstfloor, so that only a lew feet of the nipper story wall will be seen from the ground, if seen at all.

will be seen from the ground, if seen at all. Space and time oblige me to forego a particular description of the other two designs in the same style, hot there is one under them, in my humble opinion, decidedly superior to the others for boldness of conception, light and shade of projection, judicions sections, and grandeur of lines, being stamped, notwithstanding the riebness of its statuary orcaments, withs an unpretending simplicity. If the able designer would allow me one remark, I should wish the secondfloor windows 2 feet higher, the columns of the chief entrance coupled, and some more skylights in the roof to pierce the large masses. But, after all, these few remarks may he wrong, and if they are right they do not much injure the design. Let us not forget, "La critique est aide et Vart est difficile."

Noget, the onwith 60thic designs only left for our consideration. I mean the few good ones, as there is a great number. I was glad to see it: glad because it shows an entire faith in the justice of the committee, notwithstanding that it has been whispered in many quarters that they—the leading men—"bad got plenty of Gothic already." "They did not wish for it," "They would never adopt it." "They would not appoint a man in the committee to protect it," &e. &e. I do not believe the Government had a preference for any style. If the Government had had a preference for any style. If the Government had had a preference for any style. If the Government had had a preference for any style. If the Government had had a preference for any style in particular, they would have asked for it exclusively, and have spared a sure disappointment to a number of able and distinguished architets, not to mention the loss of time and capital. I think the Government has alced very firly. It has given to all professional men the same opportuality, namely, to make a design superior in architectur-al merit and domestic fitness to all others; and the simple question for the committee to decide is, which is that design.

Perhaps some anti-Gothie reader may say, "Yes, an architect of genuss may make a very superior design in any style, but what style is fit for the elimate, the babits of the country, and the wants of the present day, is another question, and the Pointed style is not." Now let us see if this bold assertion is true or not.

is true or not. The Gothic style, notwithstanding it is an English child, has bad a hard struggle to become adopted by its parents. Some twenty years ago they would hardly allow it to enter places of worship, and now they would say, "You are not fit to enter places of husiness like Government offices. You are a too serions and holy unan. We do not want your poetry and chivalry. We want some design à la Japiter, or à la Diana, or 1ather à la Fenus, — anything will do hut your serious fac⁻¹. As far as 1 know architecture, the Gothic style is cuite as fit for domestic arrangements as any other as

As far as 1 know architecture, the Gothic style is quite as fit for domestic arrangements as any other as regards its construction. The walls are strong, hecanse their strength is always near the pressure of the arches or girdes, it being a mistake to consider that the strength of a wall consists in its greater or less thickness over the whole length. There is no style better fitted for the construction of valles in the basement floor, and for lofty roots; the present low unventilated roots being the chief reason of so much vermin in the metroposit. There is another prejudice, namely, that Gothie windows admit less light in an apartment then others; but the truth is, that a window of 5 feet square, pieced through a wall of 2 feet thickness, would give in the Greek, or Roman style, 0.64, but, in the Gothie sight, 1.00, consequently there is 0.36 more surface of light in the latter. For further examples for information look at the town-halls of Lonvain, Brussels, Biuges, and other similar etdifices in the Mediaetal style of former towns, and judge tor yourself.

towns, and judge for yourself. I must apologise for having entered more at large in regard to Pointed architecture, but I wish to meet errors or prejudices, it there should be any, and to set the public on a fair footing : and now I can be brief.

Among the five Mcdiaval designs I allude to, the Southern Gothic is Venctian; but notwithstanding the drawings are both stiffind and tasteful, I consider the principles of a southern arrangement, --a large surface of wall and small windows,-less fitted for a northern and foggy stnosphere, where rather a large surface of light is wanted. There is, among the four of Northern Gothic, one with several perspective views. It has a s, ire in the centre of one of the clevations, and I should call it a very clever dasign but for its great similarity with existing specimens of that style on the continent. But there is another Mediaval design which supposes every other project in that line; the sin which shows the deepest knowledge of harmony in forms, ability in construction, and arquinitane-wild in devials, in set, a superior postical impir door transplanted in a lifeless may of stone, brick, and

morit. When I survey the results of my investigation as impartially as I am able, the result is: there are two designs, one in the Renaissance, and one in the G thir style, superior to the other 216. But I must have to abl r must asy whether I an a right or wrong. There are many, mmy homs of rhay and night loban and -tany exhibited in W. Schnister Hull, and I should be mest sorry to hurt the feelin, so f any competitor. When I look up the pen, it was not to do hinyry, but to support justice in an art to which my whole life has been deviced. But Jone

THE WESTMINSTER DESIGNS.

You'n correspondent, "A Mediavalist," says, "There is one point upon which all the advocates of a Classic building at Westminster are most carefully sileat, and which, nevertheless, lies at the root of the siteal, and which, nevertheless, hes at the root of the right solution of the problem which is now to be solved; and this is the question of association with existing buildings." He then takes the mere *river* view of the subject, and, standing on the Hungerfard Suspension-bridge, burls, as it were, his note of approving principle at the Houses of Parliament, thinking the rebound northward is to sweep away for appriving principle at the Houses of Parliament, thinking the rebound northward is to sweep away erwything of Classic eburater, leaving no ground for any reasons but hose in favour of Gothie adoption. But I ask (respectfully, and in the very spirit of his own proper regard for "association with existing buildings") whether this would be right, in the enlarged view of the subject, having—which I think it should—a due regard for the architectural com-pendium that includes the Gothie structures on the south, and the numerous Italian edifices which extend to St. James's Palace, and thence again to Buckieg, ham Palace, and so oward? Surely" A Mediavalisit does not mean wholly to ignure the new Treasmy-huldings, the Horse-curards, Iraigo Jones's Banuet-ig-hall, St. Martin's Church, the Pall-mall Chu-hourse, and the palatic edifices of St. James's-park t At all events, if he denounce them critically, he can-not do away with them substantially. There they are, and hey will remain, most proholy, as long as the grand additions which are shortly to he made in their immediate neighbourhood; and therefore, to say the least of it, some accommoding spirit of compromise should be allowed to operate.

"The buildings to be creeted are to connect the absolute Gothic of the Abbey with the modified Classic of the Buqueling-room and the Halian architecture of St. Martin's Church, Pall-mall, &c. The New Houses of Parliament are a modified Gothic, forming a link between these and the Abby. We therefore desire to see a range of buildings which may harmo-ninesly muito the Honeses of Parliament with the Palladian and the Palatial Halian of the quarters' alluded to. To effect this required harmonization, we would be ourselves favourable to the rich Ransissance architecture of which we have so many native exam-ples that we need scarcely refer to those parts of the Tuilferies and Lowre at Paris, which, however, serve us for illnstration. Though their features are of Classic origin, they are capable of such treatment as to render them productive of a general effect, continuing to a meeting point, or raher to an agreeably comminging The huildings to be crected are to con nect the them productive of a general effect, continuing to a meeting point, or rahler to an agreeably commingling comperiment, the respective characteristics of the Gobie and Classic extremes. All this would be made available to the grand entirety that is to $b_{r_{1}}$ and the walk from Pall-mall to the Abbey would exhibit a chain of sequent passages of art, cherming to observers in general, and reasonably satisfying to the eyes even of those who have their strong architectural predi-lections either way. * * At all evcols, every architectural monomanies chould be ableed header in lections either way. * * * At all eveots, every architectural monomaniae sbou'd be placed hopelessly are necessary and a second sec or observation

"A Mediceralist" speaks of "some of your corre-spondents indulging in visions of the eternal repro-duction of some dead level lines of windows and doors, eternal reproduction of some dead level lines of windows and doors, colmans and cornices of wearving similarity and pain-ful horizontality," and speaks of a "pictursayee sky line" as if it were only attainable in Gothie design. Now, in the first place, rejoicing, and fully concurring in the culogy he beslows on the Houses of Parliament as a huilding of its kind, and yielding to no man in my admiration of Sir Charles Barry, of whom it may truly he said in plain English, " ile touches nothing

THE BUILDER.

ie dues not genee," I yet mist question the safety of taking the Houses of Parliament to illustrate the uppesite of "similarity" and "horizontally." The making some parts of the building lighter than others, tee placing a bulky tower here, and a slenderr tower here, the advance of masses to throw their shadows on the surfaces in the car, are all quite as compatible with mod fiel Classic as with the Todor modification of the Guttie. Is there a fluer skyline in the world than that of St. Paul's Cathedral (theath I quite give up the Classic as applied to the church)? Does not the dome with its crowning lantern, in itself, and in connection with the staneture generally, compete not the dome with its crowning lantern, in itself, and in connection with the structure generally, complete successfully with the Victoria Tower? And are the ermpanile lowers of the west front of the eathed-al neworthy of a comparison with Sir C. Berry's Clock Thwer? The "lines of wimlows, dows, and cornices," need no more be "level" in a Classic than in a Guthic structure, nor need "similarity" he more "wearying," nor "horizontality" more "painful" in one case than in the other. But, when your corre-spondent talks of "columns" as aiding in that "horizontality," I am reminded of a former Irish senator's hold, when he spokes of "standing prostrate;" spontent talks of "columns" as adding in that 'horizundaity," I am reminded of a former Irish senator's hull, when he spoke of "standing prostrate;" for assuredly, if columns be aiders and aluchors in the critical erime of horizontality, they are so in spite of the portice, apart from its practical purpose, is the very correction of the evil which your correspondent so justly condemns. so justly condemns.

so justly condemns. I have only at present to add that the opinions quoted from the *Critic* are my own. Of the designs' now under judgment, I am wholly ignorant. It may he there is no one of them illustrating the principle of "association with cristing bulkings," but I quite concur with "A Mrdizerelist," in thinking (for I had concur with "A Mirdinvilist" in thinking (for I had thought so he'ore he wrole) that this consideration "lies at the root of the right solution of the problem which is now to be solved;" and it is in this concep-tion that a compromising farmonisation, conciliatory to the feelings of the leaders engaged in this great battle of the styles, is deformedially submitted. GEORGE WIGHTWICK.

dette of the styles, is deferentially submitted Genome Viourrwick. A consessory or the styles, and the start of the start and the some comment on the opinion cyressed in our pages on the meaning which onch to be put upon the vories "in line only," in the instructions for the Elev-vions for the Government Offices. MR. WIGHTWICK AND THE CLASSICISTS.

Sin,-On reading even a second time the very elever and complete statement of the Classicists' case. which your anouymous correspondent so henevalently commends to my study (which he may be assured. every sophism and argument in it not supplied by myself had received years before this their appearance. mysel and received years before this their appearance; and probably before any one thought of writing them down). I confess it puzzled me to discover which side Mr. Wightwick means to serve ,--whether he were in sober entrest, as the "Competitor for the Block-plan" takes him, or were a real artist who had taken this ingenions way of exposing, by slightly caricaturing, the theory of our optoneots, as the lalented author of the theory of our ophoneoits, as the latented author of No. 146, did their practice; the satire heing, how-ever, in hoth cases, it scenas, too delicate to reach the "Competitors" appreheasion; as that conveyed in the temple-topped composition failed; I observed, it synaving word, — he knows nohody wants penetrate the dense cloud of mystified reverence eu-veloping many an hoaest visitor to the Hall dais. Our

[JUNE 27, 1857.

me hand, it seemed incredible that any one really ble hand, it restrict the state of the state Angeneration of the second sec pen (even supposing him ignorant of its contents), into that form of defiant questioning, as "What can when, for angue he gives, his realises, with the denance fresh in their memories, might the next day or hour walk into the Hall and find every question exactly and perturnally asswered to the very letter." For this, Mr. Wightwick knew, must be the ease, if there were but a single true artist, a single ready invential man among the whole body of English connections. because no Englishman could be junorant that his countrymen (architects alone excepted) uttedy despise and device "pseudo-features," and will only turerate or pay for them faule de mienz, as a means of keeping up appearances, --- a desperate and humiliating substi-tute for decency or artistic grace. There is not one Anglo-Saxon, or hady of them, out of the archi-tectural profession, from the Queen or Parliament to the creetors of a gipsy camp, or even, to go lower, to the creetors of mimic churches for the Puscyites,to the erectors of mimic churches for the Phasyltes,-not one Anglo-Saxon who, in this year of grace 1857, knowingly and willingly admits pseudo-archi-tecture of any style or scale, from pseudo-Xieloria Towers, or Sr. George's Hall colonnades, to the most "inohtmisve" fictions shout the absurdly flattered Travellers' Club (of which more hereaf'er), not one who would not pay for their room instead of their eompany, if without them he could get a huilding to look decemlly respectable. The demand is well under-stod to he simply for respectable of approximation of the store of the store of the simply for respectable. stood to he simply for *respectability* of appearance, and not for any style of architecture (still less of near the formal style of architecture (still less of pseudo-architecture), except as a means to this end. Therefore, as demand regulates supply, no designer knowing this (that is, no English designer), able to attain the end without those means, would use them. And thus Mr. Wightvick might be sure that if there And this driver a single weak angut be such that a three were a single real artist's design, but by a foreigner, in the Hall, his defaut questions would all be answered pat (as they were in one at least, if not in others). And to count on there heing not one wise name among not one wise man among No, I said; Mr. Wightus, seemed rather too rash. wick is evidently the anthor of one of those real designs that distinguish this competitiou; and seeing the very poor chance they stand of notice by the goping crowd, he is trying by these questious to put graph cover, he is tring by inter-quasitor by methods to put people on the scart that may lead them to the right gaute. Feigning the character—the very common one, unhapily—of one of those inventionless, fanciless, and at the same time untravelled Coekneys (for even the dullest could hardly step beyond the Channel without having the mind more opened), whose entire conception of the possible in building is derived from eonception of the possible in building is derived from modern mimiery and shams, among which he is horn, lives, and dies,--who never looks on a bit of real work hut as a enrions old relie (for I pray you to observe that Mr. Wightwick never in his whole paper once refers to a single orchitectural *reality*, from the Par-theono to a railway-bridge, build raws his whole range of illustration upon what are truly called "the Monkey styles"), he affects to ask, with their stolid methods are and the real truly called the stole and methods. naïvele, what can an architect do without pseudo-construction? Would you leave the poor wretch without straw, and not minish the tale of hrick? Do wretch you Mcd mvalists, after deriding our classic fictions, depend the less on fictions yourselves ? Have we not depeud the less on fictions yourselves? Have we not as much right to our minic columns, entallabures, pedionents, as you to your "huttresses, pinnales, hlind-archvs, and other pseudo-features, without which your wells might be as bare as a bare?" Ay, and as much right to our "grand" fictions, our "whole eud or whole side of a Greek temple," as you to your whole "Victoria Tower," or central tower, or Lady-chapel, miscalled a "chancel," or whole "clear story," without a window (don't haugh, you may see it at Christ Church, Streahlam), or whole nave-areade, without gallery or story to support? (off eourse, my brave Classic, yon have quite as much right; and if you ask any of thosewho don't design, but pay, he course, my brave Classic, yon have quite as much right; and if you ask any of those who don't design, but pay, he will tell you exactly how much right that is). "Waat right have you to more than——" Mr. Wightwisk says he "need not continue the repliant echo. But this is mere reorimination; and in defence of one party" he will answer for both. And the answer he gives agrees with this my first hypothesis, that he meant to expose both, and meant his renders to see all his questions answered in the only way possible; that in which they were answered, on the screens of

⁶ pieces of architecture,' but honses, churches, factories, and offices), the surface decoration of an piece of architecture, Gothie or Classic, should have typical reference to some constructive feature inditypical reference to some constructive feature indi-genous to its practical development, or to some extrinsic appliance which may have been customary." Admirable 1--worthy of Vitruvins! There is only one possible cavil to such noble doctrine; and that is,-that not one man, woman, or obild in the British empire, who is not a professional architect, believes it believes it

And if proof is asked of this, I will just copy here a direct counter-doctrine ou this point, which I think it will be found they do or will believe. "That all decoration or ornament which takes for its subject, human work, is base," and at length disgusting to every mind,--that "to caree our own work, and set it up for admiration, is a miserable self-complacency And all noble ornament is the exact reverse of this And all noble ornament is the exact reverse' of this ; it is the expression of mai's delight in God's work." And having now pleed side by side, these two short, but elahorately studied doctrines, Mr. Wightwick's and Mr. Ruskin's, on the same point, I am content, without a word of eomate, to leave them to fight their respective ways. But, as I said, Mr. Wightwick seems too rigorously consistent to be in earnest. His whole argument coheres, and rests on the premiss that our business is simply to dress up everything into respectability, by giving it the semblance of some work of certain extinct species called *artists* and *inventors*, who, like the megalnering, once whice, and left their traces on this

the megalheria, once walked, and left their traces on this the megal hera, once walked, and leit their traces on tops planet;--to produce a mesquerade city, the buildings all got up "in character," this Roman, that Gothic, and the prison (oh, prodigions dica), the prison of all things, in the nohlest style accessible to us,--the prison Norman! Grant the premise, that no art is wanted, and we are only milliners preparing a masquerade, and the argument is unanswerable agree with every word. Т

agree with every word. There is much humour in the paper, and I am specially struck with that dry boast about St. George's Hall, that "no tower is wanted here," which is meant to raise of course the exclamation, "No tower !" We should hope not, indeed, when two "whole ends," and two "whole sides "of temples are wanted only to make it "simple." Equally dry is the question, what do the modern Goths (*i.e.* the Progin school), when denied their pseudo-construction "fall back what do the modern Goths (*i.e.*, the Pngin school), when devied their pseudo-construction, "fall back upon?" Only observe the expression, "fall back upon?." Not allowed shams, we "fall back upon? a "panyer bospital?" Exactly so, Mr. Wightwick; that is the very thing we anti-classics are fighting for; or rather we anti-Renaissants (for we attack just as much Gothie Renaissance as Classie Renaissance; just as much the Pugin-Barry-Scott school, as the Bramarke Palladio-Jones school) — thet is the very much Gothie Remaissance as Classie Remaissance; just as much the Pugin-Barry-Scott school, as the Bramante-Palladio-Jones school), — that is the very thing we desire, that every man be left with no refuge offices to "cover his head in the day of battle;" but all be forced to "fail back upon" their own resources, that we may see what is in them, and the mind that produces " pauper hospitals" he discerned from that which produces architecture.

which produces architecture. And now a word of what our present most judicions selector of models, "fell back upon" (the offensive words are not mine, observe), in lis "Travellers" (Tub-house." No doubt that importation was, till lately, at least till the erection of St. Martin's schools, the genn of Loudon, and is still so in its style. But I cannot agree that here, or in the Florentine origi-ual, "is no pseudo-architecture of ostentations kind." I can neither see why windows require "brows and hakes" in the form of pseudo-contabilatures pseudo-pedestals, to hear pseudo-entablatures er the pseudo-pediments, nor against what these on mater the pseudo-periments, nor against what these orientions arrangements are supposed to be "greatly protective," at least by the convenience-loving Lon-doners, who so often "berburously" ent of all that their landlords will let them. Nor ean I allow that their landlords will let them. Nor can I allow that what is spent in making these windows appear everced by lintcls, in a brick building whose brek windows are arched, is either well and effectively spent, or spent in anything else than *pseudo*-archi-teeture. But of this the building and its class offer one special instance, on which the Florentines must speak for themselves. Pray, what are all those courses of wronght stone, often rising many feet, in your "well-proportioned" palazzi, between the bighest window-heads and the roof, and not unfrequently, too, between other windows and the ceilings over them, amounting altogether sometimes to a third of them, amounting altogether sometimes to a third of the material and workmanship in the whole visible walls? I can understand three motives for beight in all apartments,—obtaining of light, store of air, and dignity of appearance; but I cannot see which of these gains one particle by an increase in height of wall only, gains one particle by an increase in negative method, not shared by the windows. The effective beight of a room, whether as to lighting or picturesque propor-tion, is simply the height from the Aloor to the highest window-top-meither more nor less—whether the eeiling spring helow that level, as in cathedrals, or

THE BUILDER.

above it, as in Florentine palazzi. All space above transmit light, not sir. They were only wanted for that would be sheer wastr, even were the ceiling self-light in the Roman baths-perhaps in many Me-ventilative, as in the scientific Alhambur or Roman davad churches, constantly crowdd, certaidly in baths (twenty centuries in advance of the age of the Alhambua, in a climate where ventilation is not Faraday and Arnoit!); but with the derth-dealing arrangements of our "architects," who cannot yet learn whether hot or cold air is heaviest, it is far worse than a waste, -- being simily an inverted eistern of foul air, -- a consumption and fever tank, exactly similar to the "clear story" above referred to at similar to the "deer slory" above referra to at Streatham Church, except in needing no columns and arcades for its special support. Of course, registration analyses, if made with this view, would show the mortabily and disease to be a function of the number of inches depth in these overhead fever-tanks, whether from the top of window open valve-opening to the ceilings. opening or of Dr. Aruott's

this brings me to another connected fallacy in An Mr. Wightwick's argument, hefore returning to which I would wish to observe, that though the club-house referred to is, as times go here, an uncommonly decent work, and, with a little more thought, might have here, almost respectable, such things, are not, as Ruskin says, "anything to be proud of, especially when you did not invest them." This has to be said, not as implying for a moment that a man of when you all not invest them. This has to be sold, not as implying for a minerat that a man of Sir Charles Barry's sense would be proud of their selection, or even Raffledle of their invention; but be-cause it is an absurdity that the latter should never prohably, either in life or since, have received a tenth of the fulsome landstion for his Palazzo Pandolfini, that Sir Charles has already had, for happening to he the first Englishman at onee a bred architect and having the common sense to see, like other Eaglish-mcu, its superiority. I must observe, too, that remarks like these have never appeared to me, even if they came from unsuccessful or disappointed architects ch the severest never have), to show any such indiced eve " as your correspondent, the "Com-"janndiced eye" as your correspondent, the "Com-petitor for the Block-plan," talks of. I know not the names even of the authors of more than two (and there the target the second secon these the two I place lowest), among the designs I have indicated as really artistic; so that the "Quixote" to whom he thinks me such an un-The follocities is fearly difference, so that the "Quixote" to whom the thinks me such an un-worthy Sancho, is a perfect stranger. My fears and grumbling, therefore, are hy no means for these "less fortunate but more descriping mean than Sir C. Barry," &c. They can take far better care of themselves then those for whom I am fearing and grumbling — the juggled, mystified, and robbed public—can. England has far more need of such mean than they have of England. I said they would bido their time; and the grievance I complain of is not their having to go without commissions, but the netion to go without chem. And a most essential point to be learnt by the public (would that some ahler pens would undertake to teach it) is the relative position of such and the former cless;—that the latter, however useful in their right sphere, are alto grether a lower order of beings—another species of the er a lower order of beings-another species of the s homo-than those who ought to design public geth genus home-then those who ought to design publi-buildings, if they are present (which we now know they are), and a species inferior as is the "Sancho" cnow style in which I am trying to express these things, to that in which I wish it could be expressed, that of that in which Milton or Addison.

But I said the monstrous, the inhuman, total But I said the monstrous, the inbuman, total neglect by our architects of a most important part of their duty,—*immaziaus* structure—physical *harmless-arss*,—was connected with auchter point in Mr. Wightwick's letter. He thinks he finds some reason for the Gothie fenestral system, with stone mullions, wherever the glazing "is not to open, but remain fixed with lead and iron." (Why he wants *lead*, by-the-by, with glass-plates of the sizes now most useful and rational. I cannot tell.) Now in this matter of complime he is see for more Gothie than I who of mullions, he is, so far, more Gothic than I who call myself a Goth; for the one sole, but (in monumental works) all-outweighing motive for stone mul-lions, rather than wood or iron, being imperishability. fess my inability to discover the sense or motive for imperishable supports to the glass, where there are none to those other trifles, flores and roofs. If we dreamt of building anything, like our mediaval neestors, for posterity, I could nuderstand in us as in them, after the bestowal of thought and expense in making floors, roofs, or at least coverings, permanent, the bestowal of more on making the window-fillings so, but what advantage is anticipated from the glass lasting longer than the huilding's shelter overhead, surpasses my power to perceive. However, "in all other huildings" then eburches (why not in them be does not say) "there will be many windows requiring to opeo, and then stone mulions become farful conductors of the tempest." On what mechanical principle they thus at Piptwick will explain, and the stone. are none to those other trifles, floors and roofs. If we ductors of the tempest." On what mechanical prin-eiple they thus act I bope Mr. Wightwick will explain, for it must be a very novel one. But the m tion I here want to put to him is this? But the main ques Who or what makes this opening of windows necessary? them, for pity's sake, admit me to their n You say it was not necessary in all buildings. I shall never be above receiving thankful Certaioly it was not. Windows were invented to suggestions which the common consent of

the Albancha, in a climate where venifation is not half so cany a here. Now who created the necessity for making them also ventilators? Is it so by a law of nature, nextly come into operation since the Middle Ages? No. The Creator has not in de it necessary. It is gow have done so; yes, you. Messrs. Wightwisk and Co, in every one of your buildings, by your total neglect of this great branch of your duty, innocuous constantion, your entitie refused to a saider and negleat of this great brunch of your duty, numerous construction; your entire relusal to causider and reason out *ab initio* (as the real architects roun-idered everything) the breathing of those your built for, and the disposal of their breath; which you would then have fined to depend entirely on the structure of your ceilings, not your windows; but hiving left all this to chance, and to better men than you, to the various tribes of remedial inventors, — building-doctors,—architecture-carers; whose business is to step in, as the architect steps out, and begin such dectors,—architecture-currers; whose business is for step in, as the architect steps out, and begin such mitigations of his blanders as may be practicable, without pulling all down; these useful non-have con-trived various highly increased bungl at best, of course, miscrably increased bungl at best, of course, miscrably increased bungl at best, of such as the second second bungl at best, of course, miscrably increased bungl at best, of such as the second bungl at both and the second bungle provide bungle bung genious English window-sash. Do not think any architects contributed to its invention. a rathitects in-vent nothing; though Mr. Wightwick has the a-bound-ing self-complacency to think that "we take a shed, and we (prob l pador). WE artistify it into a partico;" with which quotation I heg to leave his interesting paper for the present. E. L. GAMET.

FRATERNITIES FOR THE DEVELOPMENT OF ARCHITECTURE.

You kindly allowed me to "have my say" in the great architectural controversy which has been going on about "styles." I trust you will now permit me on about "styles." I trust yon will now permit me to add a few lines to direct the stleniton of your readers to a great practical drug devolving upon all who love their art, on whatever side they may range themselves, viz. that of combining together to carry out their principles by conventional agreement. It may be, and perhaps must be, a long time hefore much lasting good can be effected; but, if art is ever again to rise to what she once was, it will be found that her chief hope must consist in eleser compact, and in a more general bond of union, than at present exists amongst those who are now stiving against the tide to place her where she ought to be. tide to place her where she ought to be.

the to place her where she ought to be. Now, for the production of good and pure architecture, there are three requisites; -1. Imagination, for the conception of beauty; 2. Feeling or Taste; 3. A sound sense, able to argue out and form a correct judgment on subjects of scientific research. All these are generally acknowledged to be essential, but the pressity of a dusa plutation of the later. the research of a dusa plutation of the later. are generally acknowledged to be essential, but the necessity of a dne cultivation of the latter—the reason-ing faculty—is far too generally forgotten: we are too apt to trast too urfancies and feelings, too ur per-ceptions of what we deem to he truth, instead of analysing our reasons, or submitting our works to any fixed test or standard of right and wrong. Tests of beauty or standards of taste I have nothing now to do with, but with matters true or false in a scientific point of view,—for unless architecture is true to science, as well as to imagination and feeling, it is no real art,—and hence it is that I desire to sce a re-union to some mercical purpose for the permanent estabreat arg_many mence u is that 1 desire to see a re-union to some prediction purposes for the permanent estab-lishment of such facts, and earrying out of such prin-ciples as are capable of demonstration or proof. Perhaps there is amongst us too preast a jealousy of imparing to others the benefits of our own experience or presempt mechans, also too much of the above impairing to others the ochards of on over the states or research; perhaps, also, too much of false shame against condescending to make use of the investiga-tions of others: we shrink from the acknowledgment of others having discovered more than we could have found out for ourselves: perbaps, too, inability to store np in our minds for reproduction at the proper moment all that we are continually gathering from various sources deprives us of much of the benefit of various sources deprives us of much of the benefit of our one acquired knowledge, and we fear to confess our ignorance to others. Mlatever may be the cause, nearly all our professional practice is one of individual isolation and seclusion. True, we have our societies, associations, and institutions, we discuss "generals," we sometimes pass sweeping condemuations on those who do not agree with us,—or rather on those with whom we do not happen to agree ;—but as for quiet, ddilerate consultation and co-operation amongst our selves, far away from the public eye, where is it to be found? If any of your readers cau tell use of the quiet nook to which they resort, in order to aid each other by friedly intercourse in searching for, and pointing out, practical defects and inconsistencies, or unitentional disobedience to principles to which they have npon caim deliberation subscribed; let unintentional disonationed to principles to whose they have upon calm deliheration subscribed; let them, for pity's sake, admit me to their number. I shall never be above receiving thankfully any of others

shall show to he capable of reasonable demonstration, though I might not pledge myself to follow them in each particular instance. I shall never grudge my mite of information, or hold myself alcof from anything wherein the true interests of art can be the best screed. I shall never make a boat of having been instrumental in enabling an erring brother to avoid a false step, or to escape a pitfall ; for I should be link the error or inefficiency of one would be in a great measure a reflection inpon all; and that by the success or advancement of one, all would be really and permanently heuchited, for the and that by the success or advancement of one, all would be really and permanently heucfited, for the standard of art would thereby be raised, and the field for lawful emulation enlarged, — the strong would be supported by the weak, and the weak would be helped by the strong. We should be helping ourselves for-we d in the race, not by retarding others, but by advancing our own position. Nor is this all. When any one occasionally pre-fer samifation a commission to big art — when he

Nor is this all. When any one occasionally pre-fers sacrificing a commission to bis art,—when be gives up mere money rather than a true and living principle,—what comfort and support would be not have in being assured that others also were ready to do the same, — what weight with those extraneous to his own fraternity, — what inflame amongst those who are looking for some more authoritative and more provinsive power than any which yet exists? Once more. It is generally acknowledged that art can never attain to any degree of eminence but by the origination and successive developement of some style or school. And how shall any style or school of art arise but by some such process as this? We despise the dark ages of confraternity and freemasonry and now that freemasonry exists only as a hollow and now that freemasonry exists only as a hollow shell, whose kernel bas been caten ont by age, and is shell, whose kernel bas been caten out by age, and is employed only as a means of social fellowship and brotherly assistance, without the slightest reference to its original purpose, — it is no wonder thin the whole principle of it should he looked upon with an evil eye. But when we call to mind what glorious results such a community of hearts and interests did once produce, we may well pause and ask if the ker-nel is really lost to us for ever. The overpowering argument against it all is bis, — "How can men be brongbt to work together in such days as these, when brought to work together in such days as these, when everyhoody feels bound to push his own interests to the uttermost?" But has it been tried? And has it failed? or is it still smouldering in some secret corner to burst forth into life and energy, so soon as it shall have gathered sufficient strength to kindle? May L be not the last to get light and heat from its glowing flame!

It is your own columns which have stirred me up to ask this. I am aware that it is only "kindred spirits," that can effectually work together for a com-mon good; but if any number of such kindred spirits would collect themselves into their several spines would contect themselves into their several groups in support of their common cause, they would fight more manfully, and try their respective strengths more effectually than by each individual standing alone to fight his own battle in his own way.

There would then be far fewer gross blunders and scrious mistakes, even amongst the less proficient, than there now are. But when such severe censures are constantly heard as those which have been passiog from mouth to mouth during the last six weeks, and in the most emiuent exhibition of architectural de in the most elimitet exhibition of architectural de-sign which there has been for years; when it is said that such and such a design is all arch and corolice; another only blank wall, piereed with square oblong openings; another a mere mass of fretwork; another displaying successions of arches under openings, with little or nothing to earry, as though arches were displaying successions of arches under openings, with little or nothing to carry, as though arches were meant for ornament rather than nes: whilst another is said to be nearly all window, without wall space or point or repose; another, deal wall, without relief; another, all roof; and another, without any visible roof at all ;--when such are the enitieisms on all sides in an exhibition of that sort,--whether the criticiams are deservedly or undeservedly bestowed,--it is not to be woodcred at, however much it is to be lamented, that the voice of the people should aim at directing and reforming art, instead of art herself directing and reforming the taste of the people. Is say it is indeed no wonder; for when amongst professed allies there is nothing like unanimity, or subjection to any kind of reasonable restruint, there is but little chance of their having weight with others, or even of their gaining an antimitive art to their own side of the ques. their having weight with others, or even of their gaining an attentive car to their own side of the ques-tion at all. Whilst on the other hand, if all teach the same truths, and all earry out into practice the same principles, then, and not till then, others will be found to pay deference to those who profess them; then, too, and not till then, will noviliates in any such school of art, or even converts to it, find a resting-place for their confidence, nod a secure home for their sympathies. And if there is such a thing as *trutfollows* if

And if there is such a thing as truthfulness either

THE BUILDER.

regulate them. For the sake of concentrating the gramment moon this single point, I am purposely setting aside all that might be advanced of a similar andure in favour of the like process being qually applicable to the improvement and cultivation of the imaginative and perceptive faculties also. But the value of the deductions of science, and of the applica-tions of common sense, by means of mutual co-operation, to practical and definite purposes, forms quite a sufficient plen for such fraternising, inde-rendently of the other and higher results to be attained by such mutual aid and intercourse. I know that many despise and deprecate the bare notion of such a thing, but this is no valid reason against others taking hold of it, and asing it with advantage. And is being so prominently called to our present deceiving reations? practice ?

practice? Let me not be supposed, however, to be laying down a "royal road" for the attaioment of know-ledge, imagination, or taste. Nor let any be led to thisk that a mere gregarious system will ever he the parent of one great mind. All I maintain and con-tend for is, that in order to a proper culturation of artistic talent and a healthy development of art, there is need of closer contact of mind with mind; and that is an ordinear war an immanse, ded and and which in an ordinary way an immense deal of good might be gained and an immense deal of evilescaped by uca be gamed and all immerse due to evidence by inchesion of the helping each other in such ways as this, and that art herself would immediately be placed upon a firmer footing, and take a higher stand, by a combination of individual efforts, than by the present blind subjection of each one to his own individual exprise and will, and unaided judgment. I have of course my own notions as to the number due would which such from the and unaided judgment. I have of course my own notions as to the principles upon which such frater-nities should be conducted, and on which alone I con-ceive such schemes could be carried out with any reasonable prospect of ultimate success; but 1 do not think this the time or place to enter into defails. WILLIAM WHITE.

PROFOSED NEW YORK EXHIBITION OF BRITISH ART. We hear that it is in contemplation to organise in New York au annual exhibition of the works of living British artists—paniers and scalptors. There is good reason for believing that such an exhibition vould be welcomed by the Americaos. The wealthy classes in New York are well known to be lavisly sumptaous in the arrangement and decoration of their dwellings, and they would be gdal not only to eall in the aid of fine art for this purpose, but to have its productions brought home to them, for that con-stant contemplation and study which exhibitions and museums of a similar order receive throughout burope. If well managed, we should have no doubt whatever of the success of the scheme, and the good that will remain from it.

Intervent of the success of the schemer, and the good that will result from it. Active measures are already in progress for making the projected exhibition a fact. Mr. Augustus Ruxton, the original projector, left London for New York at the beginning of Mary, with the view of com-numicating with some of the leading men in the States, and of obtaining a gallery. Mr. Ford Madox Brown, the historical painter, has consented to scompany to America the works that may be offered, and to superinterad the hanging and all other such pre-liminaries. Mr. W. M. Rossetti is acting as sceretary. With the best possible feeling,—indeed, an unxius desire that the project should be carried ont success-fully, and to the honour of the gentlemen who have originated it, we would suggest the desirability of not confining it, even in appearance, to any one school or patty. Tary must, moreover, take care into what hands they place themesteves in America, taking warm-ing by some of the circumstances connected with the "Universal Exhibition " there.

MAGISTRATES' DECISION UNDER THE

MAGISTRATES' DECISION UNDER THE BUILDING ACT. PEBMIT me, Sir, to direct your attention to a re-cent decision of n police magistrate, in which a theatre, a room of public cutertainment and resort, in a tea-garden, because not affixed to the freehold, is decided *not* to be a building. Also to in-goire, if it be not a building, what less is it to be con-sidered? And further to remark that, supposing the derision to be asound one, it is frangbt with extreme danger, particularly in the supurban districts. to decision to be a sound one, it is franch with extreme danger, particularly in the suburban districts, to allow such buildings to be erected without proper supervision; in fast, without soy supervision at all, either as to materials or construction. On the plea of temporary buildings, many irregular buildings are built, and alterwards mache permanent by the addition of brick chimney-breasts and flues.

AN OBSERVER. in materials, construction, or io any other principles ** We fully agree with our correspondent that of art, the way to arrive at any true results must be by analysis and scientific research into the laws which dangerous. AN OBSERVE

[JUNE 27, 1857.

A FOREIGN COMPETITION.

A FORGER COMPETITION. The municipal authorities of Bordeaux, to aid the impulse which has been given to the fine arts in Paris, have determined on the erec-tion of a fountain, of monumental character, in the *Hemicyla des Quinconces*, and they have in-vited artists of all countries to submit designs for it. The choice of material is left open, and may be of several kinds: the cost is not to ex-ceed S.0000, and the designs are to be sent in by for it. The choice of matcher is reference, and may be of several kluds: the cost is not to ex-ceed 8,000% and the designs are to he sent in hy the 20th of November, 1857. A premium of 2410% will be awarded hy the jury, if a design of sufficient merit to justify it be presented. In addition, the sum of 160% will be placed at the disposal of the jury, and he appropriated as they may decide. In the event of the execution of the selected design heing confided to the author of it, he is to receive *independently* of the prize, an *homoarium* equal to the twentieth of the whole outlay. The jury will consist of twelve members, under the presidency of the Mayor of Bordeaux, and will include two mem-bers of the Institute, two artists, who have obtained a great medal of honour, or a first medal at the *Exposition Universelle des Benaux Arts*, and two members of the Society for the encouragement of National Industry. encouragement of National Industry.

The terms, it will be seen, are most liberal, and entitle the municipality of Bordeaux to the warmest praise. A copy of the exact con-ditions may he seen at our office.

ST. JAMES'S PARK BRIDGE, LONDON

THE bridge across the ornamental water in St. James's park, determined on to improve the means of communication between the districts on each side of the park, is making progress; and we now place before our readers a view of the aspect it will present when fluished.

The engraving will explain the general con-struction of the bridge.

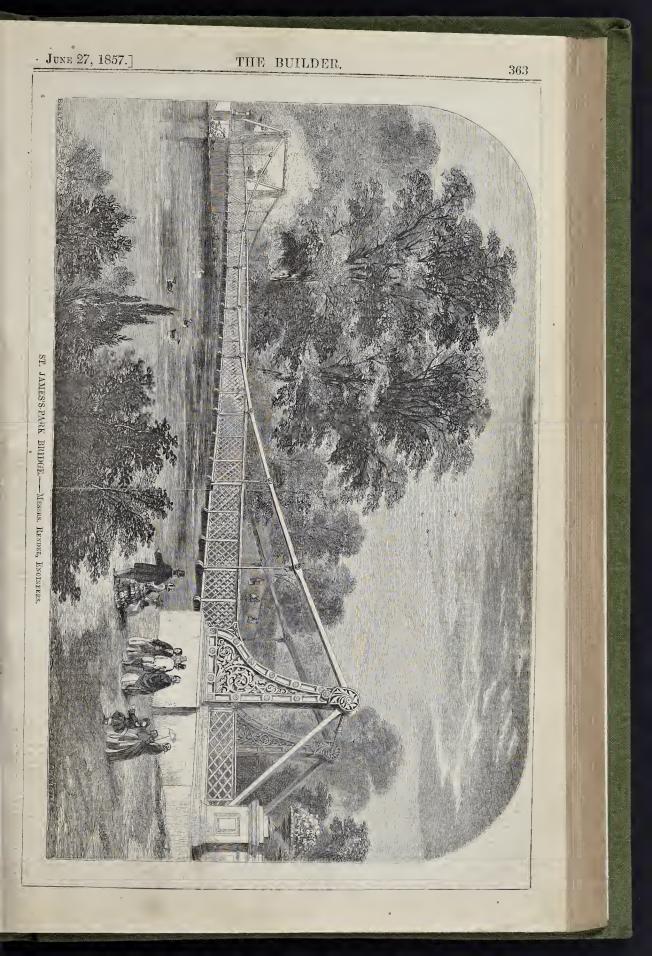

The anchor tunne's are founded on the London clay, which is met with 20 feet helow the surface of ground. Above the clay lie beds of gravel of ground. Above the clay he beds of and sand, about 10 feet thick in all, on the columns of the bridge stand. The 140 feet hetween abutnents, or 157 on which The span is 157 feet 6

The contains of the bridge stand. The sparm is 140 feet hetween abuthaents, or 157 feet 6 inches hetween the highest points of the sas-pension chains. The bridge is designed for foot passengers only : the footway is 12 feet in clear width, and is to be covered with asphalte laid on two thicknesses of diagonal clan planking. The weight of the suspended roadway will be 523 lbs. per foot run, or about 33 tons in all. The maximum load is taken at 1 evt. per square foot, which is something over that due to a dense crowd of people. The total maximum load, therefore, upon the chains, exclusive of their own weight, will he 119 tons, uniformly distributed. This gives a strain of 12 tons on each pair of suspension rods. The maximum strain upon the chains over each pair of six links, and have a section together of 56 inches. The maximum strain on the iron will thus he about 5½ tons per square inch of section. The strain on the mole heare of the other to read the strain. The maximum strain on the from will thus be about 5½ tons per square inch of section. The strain on the anchor heams (tending to tear them up from the ground), on each side of the hridge, is equal to 350 tons in a vertical direcstrain is resisted by a large mass of material, principally concrete, placed in and about the anchor tunnels.

It was intended originally to cross the lake hy a viaduet, but this was objected to on the score of its obstracting too much the view along the lake, and a snspension-hridge was finally agreed upon as the form of bridge least open to that objection.

The cost of the bridge will not exceed 4,5007. Messrs. Rendel are the engineers: the decora-tive portion was designed by Mr. Digby Wyatt.

THE WATT SEATLE AT MANCHESTER, -- The statue of Watt was to be fixed on its pedestal, in front of the Manchester Royal Inframary, on the 25th inst. If was to be inaugurated by Mr. William Fairbairu, F.R.S. the president of the Literary and Pailosophical Society of Manchester, and chairparn of the Wat committee. The statuc is in hrozze, direr Chantrey's, and will occupy the corresponding pedestal to Dr. Daton's. Dalton's

CHURCH-BUILDING NEWS.

CHURCH.BUILDING NEWS. Chillon Caulelo.—The following are the tenders for the erection of a rectory house in this parish :— Greig 3,605.; Lueas, Brothers, 3,570.; Mausfield and Sou, 3,489. Mr. Homas Bellamy, architect The quantities were supplied by Mr. W. W. (Gwyther, *Telshopol.*—Improvements at the parish church have been commenced with the renovation of the charged. Chissi

chancel. This portion of the church belongs to Christ College, Oxfori, by whom the improvements are being carried out. The east end of the chancel will be taken due. carried out. The east end of the chaucel will he taken down, and the present one replaced by one more highly decorated. The old picturesque ceiling will be retained, and a new roof added, with a pointed gable. A new stone arch, with earved eorbeds, will be placed between the chancel and the hody of the church. Mr. J. Billing is the architect; and the earrying out of the work is entrusted to Messrs. J. and W. Fisher, of Oxford.

and W. Fisher, of Oxford. Chester, -At a meeting on the 11th inst. of the subscribers to the fund for erecting Chancellor Ruikes subscribers to the fund for creating Ghancellor Raikes momment, to examine several designs and select the one most approved, the Rev. Chancellor Thurlow annonneed that the subscriptions amounted to 2854. Several designs, by Mr. Penson and Mr. Harrison, were handler found, and the choice fell upon two crhi-bited by Mr. Penson. "At this moment," says the *Chester Charmisle*, "A design by Mr. Henry Sum-ners, architect, Liverpool, was handed in, and excited the admiration of all present." It represented an orsamental canopy surmonnling a coped grave, with a railing surrounding the structure. Eventually, how-ever, the choice fell upon cue of Mr. Penson's draw-ings. The design is a monumental tomb, of massive character, in the Early English style; the roof sup-ported by a two-centered arch, enriched with the bill flower and doptool tornament : the sofit of the arch is relieved with moulded riks and caveed terminations; is relieved with moulded riks and carved terminations; tbe ends of the tomb are designed with buttresses and niehes above, surmonated by crocketted canopies Underacath the arch is a sculptured recumbent effigy reposiog upon a monumental base, ornamented with the emblems of the evangelists in the quatrefoils The total beight of the tomh is about 20 feet. Mr

Inc total begint of the form is about 20 Jecf. Arr. Penson also submitted other designs of a more deco-rated character, and several of the subsoribers were in favour of one of the latter. Liverpool.--The opcoing of the Prince's Park Presbyterian Church took place on the 10th inst. The charch is seated for 500 on the ground floor, and movision is unde for approxime it is caller to bold provision is made for enharging it by a gallery to hold 180. The length inside is 80 feet, and width 34 feet the height of the walls 19 feet, and to the top of the The height of the walls 19 feet, and to the top of the roof 33 feet. The timbers of the roof are supported on arched trusses, staioed and vanished. The style of the edifice is hite "Early English," with a rose wiodow at the south end. The entrance is by a porch on the east side, with a spirelet growing out of the angle of the porch and church, in which is formed the stains for the future gallery. The spirelet rises from a hase 11 feet square to a height of 83 feet, sur-monnted with a gibled cross. The dressed stone is from the Welsh quarries of Mr. Robert Wells, and the facing stones from the Yorkshire quarries. The mason work has hene executed by Mr. Thornton, the earpenter and joiner work by Mr. Thomas Jones, and the painting, plumbing, and glazing by Mr. Hot. The entire cost is 1,7107. The architects are Messres. J. W. and J. Hay.

entire cost is an and J. Hay. Rock Ferry.—The chief stone of a Presbyterian church was hid at Bock Ferry on 23rd inst. The church was hid at Bock Terry on 23rd inst. The edifice is in course of erection. The design Early Decorated style of architecture, and Early Decorated style of architecture, and was fur-nished by Messrs. Hay, architects. The building will consist of a simple nave, 71 feet long by 41 feet wide. The groon difference of the accommoda-tion of 500 persons, and, in addition, provision is made for the subsequent creation of a gallery to scat 150. At the west end a steeple will be erceted, which will rise to the height of 140 feet. The edifice will be constructed with while Stourton stone; and all the timher will be variashed. Mr. Fisher, of Birkenhead, has taken the contract for the work, the estimated coat of which is 1.700. Early cost of which is 1,7007.

cost of which is 1,700. Smettherick.-The foundation.stone of the new church of St. Paul, Smethwick, was laid by Mr. J. J. Chance, on 15th iost. The architect is Mr. George B. Nichols, of Wasthromwich. The eburch is in the Early Euglish style of architecture, with nave, north and sonth traosepts, and chancel, forming an octagonal and sonth traosents, and chancel, forming an celagon-1 modation is provided for 800 persons, exclusive of children, there being galleries at the vest end and in the north and sonth transperts. The roof is open tim-bered, stained, and varaished, as also the whole of the interior woodwork. The church is to be hullt with which are child but house to be not with the roofs, which are children with the sonth reason. A teacher's of various coloured slates. The contract is taken by

the laboration of the international and the laboration of the labo sight of the Jews, and terminating with the Entomb-

ment. Sheffield.---Varions improvements have been car-ried out in the parish church. Besides repewing, painting, and other works, thut partion of the weat window which can be sen in the interior of the church has been filled with st inted glass, at the ex-count of the Sale, the winer. The excention of the church has been filled with st ined glass, at the ex-pense of Dr. Sale, the vicar. The exceedion of the work is by Mesra. Drury and Smith. The cast win-dow is also to be filled with st ined glass. The ex-pense attending the attentions in the church has been defrayed by the Church Burgesses and the congrega-tion. The chancel improvements have been mainly at the expense of the Duke of Norfolk, hard of the manor. Mesra, Flockton and Son were the archi-urate semiconder. tects employed.

Leek .- A new four-light stained-glass window the early perpendicular period, has just heen placed in the chancel of St. Lube's Church, Leek. The work the chuncel of St. Luffer Chinreh, Leek. The work was done by Mr. Wailes, of Newcastle-upon-Tyne. The first light comprises "The Agony in the Garden :" it consecond contains a copy of Ruhen's "Descent from the Cross" the third and fourth compartments re-present "The Resurrectioo," and "The second coming of Opeia" of Christ."

Carlisle .- Three side wiodows in the chancel of St. Paul's Church, Holme Cultram, says the Carlisle Journal, have been filled with stained glass, by Messra. Scott and Drape, of this sity. The geogra design is a cross with croslets, in a style which accords well with the prelitecture of the church, and pre-vailed in the thirtcenth contary. The cast window also was insorted by the same artists some time ago.

PROVINCIAL NEWS.

PROVINCIAL NEWS. Woolwick.-New Roman Catholic schools are to be commenced here immediately, from the designs of Mr. E. Welby Pugin. West Ham.-The Loral Bond of Health, accord-ing to the Chemsford Chronicle, have decided as to the plan for the drainage of the parish, which it is computed will cost, helore completed, a sum con-siderably over 100,000?. One potion of the works is estimated at 80,000?, but there are other contin-genesies to pravide for, which it is supposed will amount in the aggregate to from 20,000?. Windsor.-Thue foundation-stone of a building for the ragged schools in connection with St. Clement's Church, Windsor, was haid oo 9th inst. The archi-tect is Mr. George Williauns; and Mr. J. Nelson is the contractor.

teet is Mr. George Williams; and Mr. J. Nelson is the contractor. Gosport. — The new harracks, North-street, for 1,000 men have been commenced by Messres, Luces, Brothers, the contractors. The block just begun is the officers' quarters, opposite the Bryal Clarence Vietualing Yard. The commanding officer's quarters will be creted on the pice of I and at the south side of the Royal Clarence Vietualing Yard, and adjoining St. Matthew's Church, while the main block for the men's quarters will be opposite on the west side of the ground according to the Portsmouth Times, there are 2,000,000 of bricks, sixteen cargoes of east-irou girders, and a crushing-machine for making stone into sand, worked by a steam-engine of 6-horse power, griders, and a crushing machine for making stoke like sand, worked by a steam-engine of 6-horse power, and a patent mill for grinding mortar, worked by an engine of 4-horse power. In the brickyard the con-tractors have sunk an artesian well of the depth of 150 feet, from which they obtain an excellent supply of water. It is calculated that during the season S,000,000 of bricks will be made at Frater for these works: 400 men will shortly be employed on theor at the site itself.

Farmouth.—A committee has been formed to for-ward a scheme for the creation of a hridge across the river Yar, at the harbour of Yarmouth, on plans and specifications prepared by Mr. Birkenshaw, the engi-

Mr. Paraell, of Rugby, at under 2,4007, and the estimated cost complete, including walling, &r. will be under 20007, towards which the sam of 1,0007, is contributed by the Mrssrs. Chauce, of the glass works, and 5007, by their workmen, 500 m number; the re-maining sum being made up by subscriptions annous the industions of the mich number of the re-reseated by Mr. John Sylvestry.

enversel with due and redecounted integrated takes and meanenential creating, the whole summonited by a spiralet. The east of the huildings and hand will be about 1,2004, of which 5004, have been raised by private subscriptions, and the remainder from grants of the Privy Cauceil and Diocesan Societies.

of the Privy Couveil and Diocesan Societies. *Curdiff*.—The excevation of the 1.st 1.300 fet of the upper part of the East Bute Dork is in progress. This ionk, when completed, will be 1,433 yards loog, 3,000 feet of which will be 500 leet wide, and the dorph of water form one and to Contar and the features. 3,000 feet of which will be 500 lect wide, and the depth of water from one end to the other will be 25 treet. Some of the statiks for tipping coal oo the east side, where the Rhymney Railway comes in, are finished. The oumber of statiks on each side of this duck will be sufficient to ship 2,330,640 tons per smann. The present West Duck affards accommoda-tion to tip npwards of 1,059,788 tons a year. The Bolle-wards will shortly be proceeded with. Buildings are ex-tending on the cast towards Roth, and ou the north towards the Grange and Blackweir, forming a suburb to the cast of Cathay's-park.

towards the Grange and Blackwer, forming a suburb to the cast of Cathay's-park. Stoke-upon-Trent.---Messrs. Minton and Co's new show rooms here have been completed, and are de-scribed in the Staffordshire Advertiser. The exterior is merely of brickwork, and connected with the older part of the manufactory. At the eutrance there is a stone balastrade, inside of which is a plain tile paving. Proven this more three is an east salineas. On each since bulkstrade, inside of which is a plan tile paving. From this porch there is an oals staircase. On each side are passiges to a lavatory, &c. -the walls being enca-ed with tiles. The staircase leads to the corrilor, which is 68 fect long by 12 fect wide, and lighted from the roof. The ceiling is segmental in section, and rises from a hold cornice, underneath which is introduced a Della Robbia frieze in blue and white with several platterns of encaustic tiles. There is a holdstrade coating, and which was designed for the place by the architect (Mr. Edgar). Ou cach side, the walls are covered with varied specimens of coloured files, arrouged in panels, and aurounded by borders tiles, arranged in panels, and surrounded hy borders of the same material. Several of the panels are tiles, arranged in panels, and surrounded hy borders of the some material. Several of the panels are *fac-similes* of originals at the ducal palace of Modena, in Italy, others being after the designs of the late Mr. Welby Pogin and others. This apartment is devoted principally to the exhibition of Mijolica and Palisay ware. The showroom is 42 fect square, and is lighted by a square landern, filled with polished plate.ginas. The coiling of the lanteru is panelled the device of the distribution of Mijolica and palisation of Mijolica and the second second second second plate.ginas. The coiling of the lanteru is panelled plate-guass. The defining of historic definition of printed earthen-ware tiles, while ornament on a blue ground, eneireles the lantern, each side of which resis on an elliptical arch, nod the whole is carried by four Ionic columns.

Birmingham .- Iu an article on street architecture, the Birmingham Gazette gives some details of a new shop ercoled for Messrs. Eld and Chamberlain, from a design by Mr. J. II. Chamberlain, architect. The a design by MF. 6. If. Chambership, achieved. The design is haved on Italian Gothic: its details partake of the freer and broader character of English archi-tecture when England had a style it might properly call its own. The front towards Union-street is cell its own. The front towards Union-street is 50 feet broad, and the Uoion-passage front 36 feet broad: the total depth (mainly concealed by other buildings) is 100 feet, and the height 60 feet. The principal front is pierced on the ground-floor by two call large arched windows, one on either side of the cantrance: over these are two triple lancet windows, single lancet. Over the columns, and between them a single lancet. Above these windows is a moulding of blue and red brick. The triple lancets are repeated to be seen detors: and are surrounded by a richly of blue and red brick. The triple lancets are repeated in the second story, and are surmounted hy a richly carved and moulded stone cornice, decorated in the flat with specimens of Minton's tiles. Above the cornice rise three dormer windows. The materials used in the building are white Discoverth bricks, with hands of coloured brick, Hollington stone for the lower story windows, and Both stone for the windows and ornaments of the upper stories. The whole of the convict of the window are carved in the capitals of the window columos are carved in foliage. The principal feature in the interior is the naiu staircase. The walls are composed of coloured hrick and Miaton's tiles, and the decoration is carried hrick and Alinton's tiles, and the decoration is carried ou by a carved cornice to the stained glass in the lantern from which light is transmitted. On either side of the staircase-hall are open arcades worked in stone. The rooms throughout are panelled in stained fir, and the ceiling of the principal showroom is also panelled. The Gazzette directs attention to the effect of simple materials in the wooden cornice of one of the showrows where the billot puncillar is adouted. the showrooms, where the billet moulding is adapted ; and to the design of the iron columns by which the erilings of the using of the non-continue by which are erilings of several rooms are supported. The contract for the building was taken by Mr. Barnsley. *Tork*.—The Conneil of the Philosophical Society of York have decided upon enlarging the museum,

provided the finds to accomplish it can be raised by anthorities, as would have been sufficient to have pro-ambscription. From plans and estimates prepared and hid before the council by Mr. Pritchett, it seems that a room, 90 feet long, with entrances from the geo-bagical and skeleton rooms, may be built at the back of the muscam for about 450%, exclusive of fittings petitor for the premiums offered by the commissioners, pro- The present ide is to attempt to raise 500%, by log subscriptions of 5% each.

of the muscum for about 450% exclusive of fittings up. The present idea is to attempt to raise 500% by 100 subscriptions of 5% caeb. Levels.— The town-hall committee have made ar-rangements for proceeding at once with the works at the town-hall, nader the direction of the ar-hitects. Mr. Brodrick. This step, however, says the Intelli-gencer, will not interfere with any proceedings in Chancery which the assignces of Mr. Atack, the con-tractor, may take, though too long a delay has occurred to enable the assignces to obtain an injunc-tion prohibiting the committee from coing on with tion prohibiting the committee from going on with works.

the works, the control to the gamp definition of the works. Scarborough.—The report of the committee of the Cliff Bridge Company, on the proposed alterations and extensions at the Spa, was read at a recent meet-ing of the shareholders, and the plans of Sir Joseph Paxton, showing the projected improvements, were received. A rough estimate of the cost of rarying out Sir Joseph's design consisted of the following items.—For the proposed new musical hall or primipal building, 4,900/; colonade, 1,250/; vestibule,472/; alterations to the present buildings, 350/; addition to the wall north of the Spa, 1,250/; improvements and extensions in the pleasure-grounds, including a proposed new road north of the Spa, 650/; total, S,8977. To this the committee and promenade south cost of lengthening the sea-wall and promenade southward, 3,500.; and for contingent expenses, 1,103.; making a totat of 13,500. In order to raise the required capital, new shares at the rate of 3. each are to be icourd. are to be issued.

THE COMPETITION DESIGNS FOR LONDONDERRY-BRIDGE

THE COMPETITION DESIGNS FOR LONDONDERRY-BRIDGE.
SR,—I have been glad to see that the competition for Londonderry-bridge designs bas obtained a place in your paper. The manner in which such competitions are conducted, and the results which are obtained by them, cannot receive too much attention. As to the queries of your correspondent, "C. E." it is well known that Sir W. Cubitt was in a very midifferent state of health, and it is understood that, at the outset, be declared that he would give himself very little trouble about the ma'ter of the competition. How much attention be subsequently gave to the called in to assist him Mr. Charles May, whose practice has been, as a partner in the firm of Ranomes and May, almost exclusively that of a manufacturer of agricultural implements and of railway chairs, &c.; and the design of the bridge, which was exhibited at a recent meeting of the Institution of Givil Engineers, and for which Sir W. Cubitt's same stabilited at a apoptation states is being generally made, is at least, a very natural one.
It is now that any olivative design much for London-dery-bridge, some years since, by Mr. Charles May, yet hat the resemblance, in some leading features of both, is solvented and the substance design much for London-dery-bridge, some years since, by Mr. Charles May, yet hat the resemblance, in some leading features of both, is solven baro seen the design much for London-dery-bridge, some years since, by Mr. May, yet that the resemblance, in some leading features of both, is solven baro seen leading features of both, is solven being the the resemblance, in some leading features of both, is solven baro seen leading features of both, is solven baro

The Description of the second provided the second process of the second provided provided the second provided p

themselves to the latter only. They now also complain that 80,000/. was originally

I ney now also compliant that sources, whereas the com-fixed as the sum to be expended, whereas the com-missioners now state that they cannot afford to spend that sum, but must have a design for a structure which will cost less money.

The whole affair is indeed an instructive lesson on competitions generally. Five times as much money will probably have been spent, in ultimately obtaining a design, on a principle condemned by the highest

* It is right to say that this is denied by Mr. May,

ANOTHER C E

Sir,-I observe that you repeat the statement that Sir, --I observe that you repeat the statement that the principle of my design was objected to by more than one member, at a late meeting of the institution of Civil Engineers.^{*} Will you allow me to state, that the only member who ventured to question Sir W. Cubit's optimul in favour of my plan, was Mr. Edwin Clarke, who repeated the theory advanced in his otherwise able work on the Britannia tube, a theory numerical by a sincle manifold fact, and which has, Clarke, who repeated the theory advanced in his otherwise able work on the Bitianuia tube, at theory unsupported by a single practical lack, and which has, in my judgment, led to the waste of large sums of money. If any other member expressed an opinion, it must have been given in private. Your informant has, therefore, adopted the emprofessional proceeding of conveying to yon for publication, the private opinion of a member given after the discussion, and to which I had no opportunity of reply. As the sub-ject is one of great importance to initways, inasmicen as very large spans are impracticable with a girder, and large girder spans may be enseed by the suspen-sion girder, without greater deflection, or strain on the metal, with one-third, or one-jourd of the weight of material bitherto employed, I propose to read a paper on this subject before the British Association, when I bope the member (if such member there be), who objected privately to my design, will in a matter of so much public interest, also lay before the Asso-ciation his objections, to cauble the subject to be firity discussed. PEREN W. BARLOW. June 24th.

TOTTENHAM-COURT ROAD ACCIDENT.

TOTTEMHAM-OUCRT ROAD ACCIDENT. Sum,—I berg to inform you that the average number of houses building in St. Pancras, viz. 300, as stated in the leading article in the *Times*, was correct : the "500" in the *report*, which appeared in the same paper, was a mistake of the printers. You will find, by referring to the superintending arebisect's report, from which you quote, that the 162 new buildings applies only to *fees received*, and it appears that there of 300, based mon the census return of 1851, will therefore anoly to 1856.

therefore apply to 1856. As the remain router of 1891, with therefore apply to 1856. As the leading article in the *Times* stated my figures correctly, I did not think it worth while to write to the paper about the *misprint* in the report.

T. MARSH NELSON

DEAR SIR,-In consequence of the discrepancy between the statement in Mr. Marsh Nelson's report and the actual fact, I have looked into the matter, and I find that the whole number of new honses now, and i had that the whole among of new houses how, more or less, coming under my supervision is under 100. Probably fifty or sixty are under survey at one time t these are in rows of four to twelve, and the majority of them clustered together within a quarter majority to them clustered togener within a quarter of a mile. Many are now standing still for want of funds; others are covered in, and require but occa-sional inspection; whilst in no case is it necessary to waste half an hour on "cach honse," nales, indeed, it be built by a Johnson. It is clear that one row of twelve four-roomed cottages can just as little stand in need of a six hous' inspection each visit as the row of seven excellent Cubit mausions huilding in Gordon-square can require three and a half hours.

square can require three and a half hours. I apprehead that the Returns in 1851, from which Mr. Nelson has taken bis data, furnish no clue to the number of houses actually building, hut refer to un-iohabited houses—those which did not come into rating. It is manifest that the returning officers, who were called upon to report as to the population, would supply a list of empty houses; and it is the aggregate of these which dir. Nelson incorrectly refers to, hut which have more bearing on the consting than his which have no more bearing on the question than his other deduction, that the flourishing period of 1851 is to furnish statistics for the present times of depres-

As you have made editorial remarks, I shall abstain As you have made cultorial remarks, I shall abstain from offering futher observatiou on this very disin-genous report,—its omissions being still more unfair than its wandering assertions and uncelled for dicta-tion. Nor shall I enter the lists against another writer who throws about his ink-bottle in a most reekless manner, determined to make a sensation somehow. He may well dread, in his coucluding paragraph, the influence of the Institute, for, assuredly, if he presented binself before that body for examina-tion for a district surveyorship, with no better know-ledge of the Act than be exhibits at present, it requires no conjurce to foretell the result. Independently of

* Mr. Barlow is surely in error. We have not done any such thing.-En.

merit, or, at all events, of decent qualification, the Institute will not admit as a member any person whose conduct is not founded on truth and bonour.

Include Wir not annit as a member any person whose conduct is not founded on tuth and homon. With regard to my part in the subappy subject Tuttenhum-controrad, sufficient is it for me to say that I took every possible step in my power to pre-vent the catactrophe, and to conforce the regulations of the Act. The coroner's jury satisfy a secondary, inquiring most minutely into every circumstance, and, think you, a district surveyor, of all people, would have escaped censure, could they have fistened one error none him. So conscions did fael of having performed my duty, fally and actively,—t impos-sible" as it seems to Mr. Nelson,—that, nunngst all the drend array of barristers and attorneys, not one was there "instructed to appear" on my behalf; and when a brother surveyor, who had been summoned on the jury, generoasly proposed to give bis valuable time to the inquiry, if I but expressed a wish to that effect, I perseveringly declined his kindness, though I shall not soon forget it. Thank Heaven! if calanny is allowed to "strut and fret its hour upon the slage," the unfavourable impression, if any, is transient, is allowed to "strut and fret its hour upon the slage," the unfavourable impression, if auxy, is transient, whilst ample compensation is afforded by extended and valued hiendships, and by the pleasing opportu-nity it gives one of receiving the good offlees of those whose opinion is worth having.

HENRY BAKER, M 1.B.A. District Surveyor of St. Paneras June 23rd.

P.S .-- Since writing the above, I have received communication, inclosed in reply to two letters dated respectively 10th and 18th inst, written by mc to the Metropolitan Board, to court their inquiry into the matter. I much regret that they do not grant my request, but I confess I am not surprised at it, as it must be clear to any gentleman that the silcnee of the jury is entitled to greater consideration than the noise of an intemperate opponent.

PP.S. -Scoll's Cement .- I regret that some 12.5.—ScoU's Cement.—I regret that some remarks of mine at the Iustitute, with regard to Captain ScoU's Patent Cement being used at Tottenham-court-road, have tended unjustly to lower the merits of what I now believe to be an excellent article. I have since had the patentee's "instructions for use" placed uny bands, with scarcely one of which did the builder or his men comply. Sing the ioner boucht it because it was an entert a second s comply. Snug the joiner bught it because it was eheap; and small blame to him for that, although "it was not in the bond;" but his helpmates, Owl cheap; and small blame to him for that, attnogm 'nt was not in the bond; '' but his helpm-tes, Owl Moore and Sparrow Harrison, thought proper to mix seven parts of sand to one of the cement (iustead of three or four parts only), and then applied it to make good a rotten party-wall with old brick-bats used dry, acain contravening the instructions. No wonder the cement crumbled; and hence the false impression of the nublic in official remarks that the '' manuthe cement crumbled; and hence the take impression given to the public in odicial reports that the "manu-facturers" are to bland, when the mischief solely arises from the ignoble practices of a cetting builder. You omitted to give Mr. II. Williams's remarks in your report, that he was using Scott's cement in con-siderable quantity, and that, taking care to see it mixed fairly and applied properly, no material could possibly be hetter. H. B. be better. H. B

THE HOUSES OF PARLIAMENT

On the 22nd inst. on taking a vote of 102,861/. for works at the Houses of Parliament, the architect was,

works at the Houses of Parliament, the architect was, as usual, soundly abused by various members, without any opportunity of reply. Without going into the question whether or not Sir Charles Barry is calvable in the matter of expenditure, we may give an instance of the hap-hozard statements made on the occasion. Mr. Drummond is reported to bare asked how it bappened that Sir Charles Barry had been paid 1.300/, for designing and drawing the plate, linen, glass, &c. which had been supplied to the refresh-ment rooms, and which had been specially designed by the architect, in accordance with the sile of the palarce. - Mr. Wilson explained that the sum of 1.300/, was for the articles themselves, and not for the designs, but he probably forgot to add that designs; but he probably forgot to add that igh the tradesmen's accounts have been disthough

the designs; but he probably lorger to all the though the tradesment's accounts have been dis-charged. Sir Charles Barry's claim for commission apon them has been disallowed, and that he has con-sequently received no remuneration whatever for his services in this matter—rather a different story! In reply to observations by Mr. Kink and Mr. Henley that the siron of the roof was russing, Sir B. Hall was sorry to say that the right hon-gentleman was not mistaken in this view of the case; for he had made inquiries some months ago as to the state of the roof, and he found on examination that the galvanized process had caused to act, and that worniably the case where galvanized iron had been used for structures which were not of a temporary bebaracter. All that they could do now would be to cover it over with some chymical preparation, with the view of preventing further mischief; but he was

sorry to say that the rust certainly was showing itself in different parts of the roof. His attention had also been drawn to some of the stone, which was decaying in certain places, and a good many chymical processes had been tried for the purpose of preserving it; but it would he years before the full success of the experiments could be tested.

the experiments could be tested. As respects the stone it seems very desirable that a survey should be made by competent persons, to ascer-tain if the decay be general and progressing, or merely what might be expected in a building of such an immense extend as the Houses of Prediament, send middle for the what might be expected in a building of such an immense extent as the Houses of Parliament, constructed of stone taken from one locality in the course of a few years, some of which was probably sent when the demand was great without much examination. The owner of the quarry from which the stone was sent for the Peers' entrance and apartments recently finished, and from which it is supplied for the works still in progress, is of course greatly interested in preventing a stigma improperly attaching itself to the stone, and has solicited us in justice to state, that the greatest care has heen exercised in not forwarding stone from any heds considered doubtful. heds considered doubtful.

PENNETHORNE TESTIMONIAL.

The medal having been presented to Mr. Penne-thorne, and the account wound up, a narrative of the proceedings has been printed and forwarded to the subscribers. The following statement of some of the events in Mr. Pennethorne's professional career may interest our readers:--

Mr. Pennethorne holds two appointments, being Architect to the Commissioners of her Majesty's Works, and also to the Commissioners of her Majesty's Woods.

the commissioners of ner Alaysay's Woods. 1520. Mr. Pennethorne, who is a native of the city of Worcester, and came to Lonion in February, 1820, was aducated for his profession by the late Mr. Nash, and, as is clerk, he then began to be known at the Office of Woods.

Worcester, and came to London in February, 1820, was educated for his profession by the late Mr. Na. Mol. Sci. 1828.
 Woods.
 Hens began to be known at the Office of Woods.
 1828.
 Mr. Pennethorne, having returned from abroad, hecame Mr. Nash sprincipal assistant, and in that espacity was employed and entrasted to a great extent with the Strand inprovements, the building of Carlos-house-terrace, the laying out of St. James's Fark, and other public works, which required constitution on missioners of Woods as an independent professional man, and has ever since (now twenty-four years) been more or less employed by them.
 1838. Mr. Pennethorne this year submitted to a select committee of the House of Commons plans for the recommended by them for adoption, where upon he was appointed, no chineses for carlos plans for the recommended by them for adoption, where upon he was appointed, no column to with Mr. Chawner, then one of the giona and and states for carrying them out, Mr. Pennethorne being considered fully qualified by the X. Sh.

PHOTOGRAPHY AND THE STEREOSCOPE.

A CORRESPONDENT in a late number of your paper suggests a plan for constructing a stereoscope, so as to give different views of one hnilding in continuous succession.

succession. The photographic illustrations of architecture as seen through this instrument are very beautiful, and the improvement there suggested would doubtless tend to enhance the effect of any view exhibited therein; hut I am of opinion that the time is not far distant when something more than this will be accoun-plished through the medium of photography and the starso-some combined stereoscope combined. Assuming that means will be obtained of rendering

paper or collodion so sensitive that a distinct impres-sion can be taken in a second of time, some simple and that he take in a second of the source super-machinery is all that is required to take a momentary hat continuous series of views, and to present theu afterwards to the eye in the stereoscope with corre-sponding rapidity. As the impression on the return sponding rapidity. As the impression on the retina would be sufficiently lasting to connect the several representations together, the result must be that moving objects thus taken would be represented in motion, and a marvellous effect would be produced.

Imagine, for instance, one of the stirring scenes in the fourth act of "Richard II." as now represented in the fourth act of the formation is now represented at the Friccess's, a secret in domestic life, or a three minufes' portrait of Mr. Spurgeon in the pulpit thus depicted,—what a galatify of illustrations we should have! what a faithful register of "deeds done in the

have i what a taking tegree of the decay taking in the ficsh" would lee here given ! Magical as the effect would lee, the novelty would simply consist in applying to the discoveries ahove-named the principle of a shilling toy which was in constant use some twenty years ago. T. C. H.

WASTE HEAT USED UP AND SMOKE CON-SUMED ON ECONOMICAL PRINCIPLES.

Some years since we occasionally drew attention Some years since we occasionally drew attention to the great waste of heat in many maufacturing processes, and suggested the possibility and advan-tage of using it up to some profitable purpose. This, it appears, is now heing done by aid of inventions patented by Mr. Hands, of Epsow, who has in several instances applied his apparatus to manuf. etures on a considerable scale, as at Epsom itself, in connection with Cleyton's patents for the manufacture of brick. And not only is the waste heat of the kilns used up in drying the articles proparatory to hurring, thus facilitating the process of brick manufacture, so as to be available in winter and summer alike, limt the furnace-smoke is at same time consumed, without any additioual expense articles proparatory to hurning, thus facilitating the process of brick manufacture, so as to be available in winter and summer alike, luit the furnace-smoke is at same time consumed, without any additioual expense beyond that necessary to the saving of the waste nets. The heated smoke and vapours from the fur-naces are conducted first through the drying cham-bers (which, it sceme, can be more cheaply constructed in this way), and then back to the furnaces, herween which, hat not in them, the smoke is then consumed by the furnace heat, which at same time yields the section power wherely the smoke was foreibly drawn through the drying flues, whether horizoutal or in per-pendicular descent, luit al above ground. Moreover, the heated and consumed smoke, on its way up the chimney (a 30 or 40 feet chimney is aid to he suffi-cient on this plan, in place of one far higher and more costly), with the heat radiating from the fur-naces and heating the surrounding air, are made still farther available by the conduction of that heated and more costly) with the power of the furnace vaporated from the drying goods, and which is withdrawn through openings in the drying the, into which it is sucked by the power of the furnace vacuus; thus completely vosultisting the drying chamber, and greatly promoting the drying processes, while also cousting the smoke. These inventions, it appears, ean he either partially or wholly applied to all sorts of furnaces already in action, whether for the con-sumption of their smoke or for drying processes; and we set that, especially that of klins, which we in-stanced, at the time, as one of the most wasteful of heat amongst modern manufacturing processe; and we feel it a duty to call attention to any efforts having is on such an end in view as the twofold one of using is maching the advanting moke at one and the same time, and hy one and the same economical up waste heat and consuming smoke at one and the same time, and hy one and the same economical cans

OXFORD ARCHITECTURAL SOCIETY.

OXFORD ARCHITECTURAL SOCIETY. On Wednesday, June 10, on the third meeting of the Oxford Architecturel Society, a Paper was read by Mr. J. T. Jeffoodk, of Oricl College, entitled "Gothic Architecture, a National Siyle." He ex-plained his conception of the term "uational style." It was a style adapted to the physical nature of a country, to its climate, to the terrestrial and metcoro-logical phenomena to which it was subject. It was one for which suitable materials to carry it out could be found on the spot, or he imported without too great expense. It was one which could be eaployed for huidings eivil and religious, public and private, large and small. Lastly, it was of no use that it should be proved theoretically suited to a nation, if at the proved theoretically suited to a nation, if at the proof by commonly adopting the style. He rocceeded that the climate of England, as contrasted with that of Greece and Italy, demanded an essentially different style of a relifecture. Our climate is essentially one which requires damp-excluding buildings; and in each if light is to be admitted but not the chill style of architecture. "Our climate is essentially one which requires damp-excluding shuldings; and in such, if light is to be admitted, but not the chill damp air, windows must ever form a most prominent characteristic. An English national style, therefore, must be one in which the windows form a grand feature. And which style, the Gothie or the Classic, is best calculated to employ in windows with heautiful effect? Greece and Rome saredby had windows at all in our sense of the word: hence they made no provision for them in their architecture; and, pace Sir Christopher Wren be it spoken, none of the Classic architects, in my opinion, have ever introduced windows in their buildings with grace and elegance. Their windows look, as indeed they are, interlopers." In point of materials to be employed, be instanced All Saiuts' Church, Margaret-street, as making use of brick, tile, marble, and stone, all in one edifice, a proof of the universality of materials allowed in Gothie architecture. He thought that large towns like Liverpool or Bradford might huild their public halls of stone, but the poor parish in which elay only halls of stone, but the poor parish in which clay only is found ought not to he required to expend its funds on the carriage of stone, but should be enabled, so far as architectural style is concerned, to huild its church from hricks furnished by the soil itself.

Mr. Freeman (according to the Oxford Herald), ile expressing bis approval of Mr. Jeffcock's rewhile expressing marks, called attention to the difficulties which modern marks, called attention to the difficulties where modern architects had to contend with, in adapting Gothic windows to modern requirements. He alladed at some length to the designs which were now being exhibited in London for the Government offices, and while asserting the superiority of the Gothe designs over the Palladian, be could not but regret that in all of them a sort of wild attempt at combining incongraous forms in one design scenard to mar their general effect, destroying that purity which is so remarkable a feature in English Gothie, and especially so at the period when the Perpendicular style was introduced by that great architect — William of

Introduced by that great architect — William of Wykeham — into this country. Mr. J. H. Parker, refering to that part of Mr. Freeman's remarks which related to windows, begged to observe that Goltine windows, by being *splaged*, in reality gave as much light as Palladian windows with nucle have a mortions. Use also accessed that the reality gave as much light as Palladian windows with much larger apertures. Ile olso suggested that the difficulty of the mullions intervening was easily surmonated, by having the framework and sashes placed within, and entirely independent of, the mul-lions, which plan, while no desight, alforded all the convenience required. These remarks were corroborated by Mr. Beunet, their Callean who cited the new buildings of

These remarks were corroported by Mr. beauto, of University College, who cited the new buildings of the Union Society as a case in point. He also, while speaking on the subject of windows, suggested a plon of constructing the building so that the stables might be made to slide into apertures in the thickness of $M_{\rm eff}$ and $M_{\rm eff}$. the wall.

The annual Excursion of the society took place on the 15th.

HINTS TO WORKMEN.

CAUTIONS TO PAINTERS, GLAZIERS, AND PLUMBERS. 1. To maintain the strictest temperance, par-ticularly regarding spirits, which had better altoer be avoided. To pay the strictest attention to eleanliness, and gether

2. 2. To pay the structure about their hands; and particularly never to eat their meals, or go to rest, without washing their hands and face, with soap, perfectly clean.

3. A charcoal respirator should be worn when at

3. A charcoal respirator should be worn when at work. The cost is but very trilling. This would prevent the dry colours reaching their lnngs.* 4. Not to eat or drink in the place in which they work; and much less to suffer any food or drink to remain, unnsed, even for the shortest space of time, in our nort of the room while native a cubme schoor. any part of the room, while painting, or where colour

any part of the room, while painting, or where colour stands; and not to work on an empty stomach. 5. As the clothes of persons in this line (painters particularly) are generally much solied with colour; it is recommended for them to perform their work in frocks of ticking (*how seldom adopted*) which may be frequently washed, and conveniently hid aside, when the workmen go to their meals, and again put on when they return. 6. Beiters in performing along light work a phone

6. Painters, in performing elean light work, where would be inconvenient to wear gloves, should scrape the handles of their brushes often

7. All artificers should avoid tonching lead when 1. An article's should avoid to heating read wheat hot; and this caution is especially necessary for printers or compositors, who have often lost the use of their links hy handling the types, when drying by the fire, after heing washed. S. If any person in the above employment expe-riences psin in the bowels, with costiveness, he handling is a set of the sources.

8. If any person in the above employment experiences pain in the bowels, with costiveness, he should immediately take tweety drops of landmum, and when the pain is abatel, two tablespoonfals of rhubarb in warm camomile tea. If this does not succeed, a piut, or two pints, of warm scap-suds should be thrown up as a clyster.

 As a preventive, two or three spoonfuls of salad-oil, taken in a small exp of grued, is likely to be of service, if taken daily, and steadily pursued. Gilders should above the service, and wear the one loves and wear

Gilders should always put on gloves, and wear

• Fresh-burnt charcoal, powdered and stitched up in a piece of silk, and worn with a piece of elastic to fasten it over the mouth, will answer the purpose.

either the charcoal respirator or masks furnished with either the charcoal respirator or masks turnisden with glass cyc-holes. They can have no objection to follow the first, and a little reliection will serve to convince them of the propriety of overcoming every prejudice against the last of these precautions. J. B. N.

The second part of "The Illustrated Historieal and frie second part of "The Illustrated Historieal and frie surcounding Coantry," by Mr. Philip Branano, arcount of Poole particularly, and of Branksen and the surcounding Coantry," by Mr. Philip Branano, arcount of Poole particularly, and of Branksen and other islands, as well as of the adjocant energy of the source of the Poole district. The caps-bilities of the Poole district, to which we have use the surcound of the Poole district. The caps-part of the Poole district, to main the these or political attention, are treated of at some to some cue the vectoped by a rapidly-extend-ingoing, and we are glad to observe, from an allusion to some cue the Vectoped by a rapidly-extend-ingoing, and we are glad to observe, from and lusion to some cue the Vectoped by a rapidly-extend-ingoing, and the Poole clays for potery par-parts, as well as in the working of the in-pose, as well as in the working of the in-strated, will soome be in a more satisfactory bitle volume is illustrated, and there are various bitle volume, is a beird and condenses and schools, bitle volume, settime is flustrated, and there is posed and its vicinity.——" What to be and Where to be bing and its vicinity.——" What to be and Where to be bing bitle volume, is a beird and condenses trace, by the bitle bitle volume is a bitle and condenses there. In the bitle volume is a bitle volume is a bitle volume in the bitle volume is a bitle volume in the congete Mr. A. Bernause, ealing the attention of operative visitors to the principal works of art in the Manchester Exhibition,—a much more effectual way of helping such a visitor to make an intelligent as of the little time he may have to spare than giving him balky and distrating cathologues or guides, more suitable to other classes of visitors, with more time on their lands are used as of visitors, with more more suitable to other classes of visitors, with more time on their hands, as well as a little more general acquaintance with what ought to attract their atten-tion. —— "Hints to Practical Agriculturists. By F. B. FOWLER," of the Royal College of Chemistry and Museum of Practical Geology, is just the sort of brief address which ought to find its way into the rough hands of the bard-working farmer as a friendly uside and index noilitiog the way to improvement. W. Acland, F.R.S. gives mainly an extract from a larger work of bis, now reprinted for the sake of in-increased erelabion in a cheaper form. The subject is chiefly of local interest, but the extract contains some and of the second secon too sauguine auticipations entertained by some 100 sanguine auticipations entertained by some as to the profitable disposal of town manare.—A useful little pocket companion for tourists has heen pub-lished by Lambert and Co. King William-street, Strand, titled the "Vade Meeum for Tourists in France and Belgium." It contains a phrase-hook and vocabulary useful on a generative with pose of motion and useful on an emergency, with maps of routes and information as to money, passports, hotels, &c. The phrase book, bowever, though fertile in the conversion of English questions into French, is rather harren in respect to the conversion of French responses into English.

Miscellanca.

FLUES .- With due deference to your correspondent, Mr. Wyatt Papworth, page 325 ante, allow me to propose the introduction of a damper, just under the lower part of the flues in the chimneys represented. Sparks will fall, and ignite the soot contained in the bottom receptacle, and, if it should fire in the night, bottom receptaces, and, it it should free in the highly cause alarm, though no damage might ensure; and if closed every night, or even in the dystime if the soot should ignite, would include the dystime if the axing with it, and prevent acy alarm or damage either in the day or night.—T. G. Nuw Were AND HORT —Sir — As I preview the

either in the day or night,—T. G. NEW WEST_END HOTEL.—Sir,—As I perceive the West-end Ridway and Loadon Hotel Company are about to erect an enormous hotel in Victoria-street, Westminster, on the principle of the Hotel Loanvois, at Paris, I beg to suggest that great care should be taken about the architecture, and not to have any-thing in the share plaster style of building as now used in that street, nor to have a building in the magningless tyle of the Loanve. used in that street, nor to have a building in the meaningless style of the Louvre. Let us have done with shams, plaster, and other abominations. CH DE V

THE LATE MR. CROSSE ON DIVINE INTELLI-ence.-We bave received the following, with suffi-THE LATE MR. CROSSE ON DIVINE INTELL GENCE.—We have received the following, with suffi-eient verification, from a known correspondent (who seems to fear that a wrong deduction may be made from our late notice of MR. Crosse, as portion of a private letter from the late MR. Crosse to him. The writer adds.—"MR. C. a gentleman of eonsiderable property, who, I believe had a son in the Church, seems ruther to have assimilated bis resuscitations to a cbild entering a cabinet, and work-ing an accidental fest, or a naturalist sowing a seed, which, with its reproductive qualities, he could not bave contrived. Whilst the annazing could and bave contrived. Whilst the manzing could and bave contrived. and Locke—to whom might be added,—as known believes in the present day—a franday and Brougham—have maintained respectful adoration—it is satisfactory to aid to them that of the greatest experimentalist events.—MR. Crosse." "I think it would he most appreding, as well as GENCE.-"I think it would be most *ungrateful*, as well as presumptuous, in us, when the Almighty has per-mitted as to see a very small portion of bis Great Works, to arrogate to ourselves his Power and Attributes."

ARCHITECTURAL SOCIETY OF NORTHAMPTON .- At a committee meeting held on Monday, June 8th, the secretary stated that the church of Oakham, one of the finest in the archdeaconry, and which has long heen in a state loudly calling for repair, was about to be restored under the superintendence of Mr. Scott. be restored under the superintendence of Mr. Scott. The munificent sum of 800/, was offered, through the secretary of the society, to the view, on condition of the work being at once commenced, and of the plaus being approved by the committee of the Architectaral Society. The offer has been accepted, and a report has been made estimating its restoration, in oak, at 4,640/. Plaus for the reseating of Market Har-borough Church, by Mr. E. P. Law, were exhibited. Plaus for the chancel roof of Theddingworth were exhibited and approved. The Rev. G. Matin, view of Higham Ferrers, and T. J. Starling, esq. church-warden, attended with Mr. Slater, archited, to explain the plaus for the restoration of Higham Ferrers warden, attended with SAT. Stater, architect, to explain the plans for the restoration of lightan Ferrers Church. They include the re-building of the north aisle of the nave, the re-roofing and re-scating of the entire church, and general restoration of decayed parts; but it is proposed to adhree to existing forms, and to preserve intact the rich stalls and ancient pavement of the chancel. The architect's estimate is 5,000%.

INSTITUTION OF MECHANICAL ENGINEERS.--This hody was to hold a series of meetings in Manchester this week. On Wednesday a number of papers were to be read at the new Meebanies' Institution, David passenger traus, by arr. chas. rey, or boliers," by " On an improved safety valve for steam-boilers," by Mr. Chas. Beyer, of Manchester; " On recent im-provements in water-meters," by Mr. Benjamin provements in water-meters," by Mr. Benjamin Fothergill, of Manchester; "Description of a new apparatus for the application of water power," by Mr. David Joy, of Leeds; "Description of a safety escape pipe for steam-boilers," by Mr. John Roms-bottom, of Manchester; and "Description of an apparatus for economising fuel," by Mr. W. C. Craig, of Manchester Manchester.

IMPROVEMENT IN PAPER-HANGINGS. - By a recently invented process, paper-hangings are printed in oil instead of water colours.

TRADE STRIKES .- The cabinetmakers and stone-masons of Liverpool have been four weeks on strike masons of Laverpool have been tour weeks on strike for an advance of wages. The showeverk at several large piles of extensive offices in the neighbourhood of the Exchange has come to a standstill.——The masons employed at the viaduct and the various bridges in course of erection on the Damfries contract of the Castle-Douglas and Dunfries Railway, bare of the Castle-Douglas and Dumfries Railway, barc struck work for an advance of wages. Their present wages are 22s. 6d, per week, and they demand an increase of 3s, 6d, making the weekly wage 2ds. The men employed by on tocal masons and builders, says the *Dumfries Convier*, also demanded an increase of wages: the masters have agreed to give 24s, when employed in town, or 26s, when engaged in the country. These terms having been agreed to on Saturday, no interruption of work took place among the local huilders. CARVED WOODEN LETTERS.—We have some spe-eimens of small projecting letters carved in chestnut, and intended for ecclesiastical inscriptions, altar-pieces, inscriptions for statues, pictures, or ceilings. The producer, Mr. William Nash, says.—" These letters can be carved in any style or hand (plain or ornamental), and that he has been some time pro-jecting the art, and believes that it bas not before been successfully attempted to cut separate letters can be carved." The letters seot tons are exceedingly well formed, and if they can be produced eheaply onght to come into extensive use. Sr. LUKE'S, NEW-ROAD.—The foundations of the new church, dediletted to St. Luke, in the New-read, St. Paners, were laid some months since, and nothing more seems to have been done towards its ceretion. All over the town there are iron churches, and services in rooms, and other make-shifts to provide accommoda-

All over the town there are iron churches, and services in rooms, and other make-shifts to provide accommoda-tion for relicious instruction. According to a late re-port, only 220 churches have been built in the diocese of London in thirty years, and the funds for many of them have been russel with considerable difficulty. In no period of our history have larger fortnoes been accumulated than in this centry. Those who have wealth and inflaence should give liberally, that the reproach of baving too few phaces of worship may no longer exist.—II.

accimulated that is the should give likerally, that the reproach of baving too few places of worship may no longer exist.—H. BURLINGTON HOUSE AND ST. JAMES'S PAIN.— On the votes of 00.3826. for repairs, &c. of public buildings, and 75,7814. for maintenance, &c. of public parks, being proposed in the Honse of Commons on the 19th instant, some rather fractions discussion cosmed, in course of which it was stated, by Mr. Wilson, as regards Barlington Honse, that the societies now there in possession had only temporary accommodutioo. Some members objected to wealthy isocieties heing provided with offices at the public expense, but Mr. Tite donied that they were wealthy. In naming the Society of Antiquaries as one of those so located, Mr. Tite, however, was mistaken. The others to whom be althold were the Royal Society, the Linnean, and the Geological. The chief objec-tion was to the fact of money speet, as Mr. Tite called it, being now asked for as an estimate. The subject on which some members still harped in respect of St. James's-park, was the cost of the very desided asmitary and erunamental improvement of the water, respecting which Sir Beojamir Hall had anew to run the ganulet. In hoth cases, however, the insenderion. THE GOVERNMENT SCHOOL OF SCHENCE AT DURIN.—The Lord Licutenand, on the 15th inst. distributed the prizes awarded to the successful candi-

money being voted in the fact of anticolations for its reduction. The GOVERNMENT SCHOOL OF SOTENCE AT DUBLIN-The Lord Licutenant, on the 18th inst. distributed the prizes awarded to the snecessful candi-dates at the late exhibition in the GOV. Industry, in Stephen's green. Site Robert Kane addressed the assembly on the general character and objects of the institution, and briefly detailed its pro-ceedings for the past year. The several professors gave in reports, and the Lord Licutenant and Sir R. Kane addressed the meeting. The PLYNOUTH AND STONEMOUSE GAS-LIGHT AND COMPANY. The price of gas originally handberged by this company was 6s. : it bas of late been of the company has been nearly doubled, having in-reased from 11,0007, to 20,0007. Hence it is that another signeme is to be taken off the price, which, for the future of MARVLEDONE. The new dis-triet of Christ Church, Marylebone, is to be created upon a site granted by Lord Portman, at Calmel-buildings, on the east side of Orebard-street, formerly one of the most degraded parts of the netropolis. The estimated cost, with site, is 11,0007, or which there has already be. construction 20,007. The foundation-stone was to he laid on 23rd inst. New RAIRWAY STATION AT LEWER. — The new which is being erected at the foot of

The rolling oblights was not not not the oblight New RALLWAY STATIONE AT LEWES. — The new building which is heing erected at the foot of St. Mary's-lane, comprises a violuted and passenger station, the length of violate heing nearly 300 fect. There are altogether twelve arches, eight of which are 12 fest each; two, 15 fect each; and the remaining two, 15 fest each; making a total of 162 fest : to which must be added the width of the different hut-tresses; the opening for the Keymer branel, 32 fect 9 inches, with two additional openings (one upon each side of the line) of 24 fect each. The arches will be brick, with stone coping, and the girders over the Keymer branch and its sides of cast-iron. The goods traffic will be carried on, as hitherto, at the old station, the new one being intended for passenger traffic only. Mr. Hood, the resident engineer of the company, is the architect of the works; Mr. Davey, efforts and the side of the works; Mr. Davey, NEW RAILWAY STATION AT LEWES, - The new

RUNNOUS BULLDINGS-Nothing can be more un-true than the insignation that any antagonistic feeling exists between the district and police surveyors. The reverse is the case. The police surveyors have re-lieved the former of a difficult duty, nod one they were unable successfully to grapple with nuder the Act of 1544. The transference of this duty to a body "alone able to act on carreparies," was, I believe, halded with general satisfaction by the surveyors under the Building Act, although pecuniary losers in respect of fees. It is generally coreceded that Sir R. Mayne and bis colleague are fearfully averworked, and that two or three assistant commissioners and surveyors must be appointed, as the talk is of the Board of Health heing also brought under the Police,— in fact, the "ruinous building department" must be put on an altogether altered footing. Surveyors of expe-rimes and knowledge, and an adequate working staff, must be provided by Government. Will yon state that in all cases of ruinous buildings, or parts of huddings, in the information should be given by the surveyor exclusively. Here is a case of a wall in imminent danger from a fre: the surveyor may he absent in his district, or elsewhere, on business, and a delay might possibly occur: all that the surveyor can in any event do, and is required to do, is to traosmit any information he may receive. This can be done by any one without incarring amoment'sdelay.—A SURVEYOR. The CHURCHAT MINNERE (TRANED).—The ancient church of Vinster, its some believed to be the oldest RUINOUS BUILDINGS .- Nothing can be more un-ne than the insinuation that any antagonistic feeling

THE COUPENANT MINSTER (THANET) .- The ancient church of Minster, hy some believed to be the oldest in England, and containing many Saxon remains, &c. in England, and containing many Sakon remaining, acti-is going to wreek, aud much needs restoration. Beams and rafters are reported, by the South-Eastern Gazette, as fast decaying; maightly pews, or rather baxes of various heights and sizes, "grace" the interior; several conts of whitewash "adoru" many of its fine willow could blick their beauty, and a considerable sum Several coats of whitewash "adoru" many of its fine pillars and hide their beauty, and a considerable sum would be required to put the ancient fubrie in proper order. The living is said to be over S007, per aonum, and it is proposed that the archibishop should limit the view's salary to 5007, per year on the next pre-sentation, leaving 3007, a year to prop up the vece-ruble "Mioster" Church. The ancient abbey, once associated with this edifice, is also still not only in existence, but inhabited as a munsion. ANTIQUARIAN DISCOVERY AT THE RVE HOUSE. -An interestiog exploration has hece made by Mr.

ANTIQUARIAN DISCOVERY AT THE RYE HOUSE. —An interesting exploration has heco made by Mr. Teale, under the anciect gateway of the Rye House Castle. A tradition has beeco banded down, that a subternucan passage extended from the Rye House Castle to Nether Hall, in Easex. Mr. Teale a few weeks since commenced excaving under the hick-staircase of the tower. After elevaring out several cartloads of earth, a passage was discovered, descend-ing round the central foundation of the staircase. At a considerable depth there was found a buge stone. A passage was next found, leading off westerly from the tower, and after proceeding some yards, a cell was discovered, with massive iron door and grating inside this cell is a seat of hrickwork running the curath of the ioterior, So ro 10 feet. A faint ray of light glimmers in from above. A passage branching Inside this test of the set of the set of the set of the interior, S or 10 feet. A faint ray of light gliminars in from above. A passage branching off north, under an arched doeway, near the cell grating, has been blocked up for the present; another leading south was cleared out and explored, and an entrance has been made from it into the garden south of the tower. Some enrinois implements were found, a very remarkable speer, but no human remains. The roof of the passage, near the cell, has large stalastites of a dingy grey cast hanging from the top. SALT AND DAMF IN WALLS.—A correspondent asks for a remedy against salt in a streeoed and phastered brick wall, the salt continually exuding thrick made near the lumber. This is a subject which has been frequently treated of in our columns, the result, if we wrey difficult to prevent such exudation. Had

the result; it we manage to provent such early all optimizes that it was very difficult to provent such extedation. Had we time to refer, however, we think it would appear that a remedy near found and recorded in our columns; but there are different kinds of i filorescence requiring different treatment. Would not Ransome's patent preservative of stone walls be of some use in such a preservative of stone walls be of some nae in such a case as that of self exuling from a stuceoed wall ? This preservative consists in washing the face of the wall with a solved silicate of potash or soda, and afterwards going over it with a solution of some such self as chloride of calcium (or muriate of line), which converts the soluble silicate into an insoluble silicate of line, which may perhaps be able to prevent the exudation of salts from a wall. Another corre-spondent is desirous of knowing how to make a wall of random stoce wacherbarbod, or causable of turning of random stooe weatherproof, or capable of turning water; and hints that a "solt or solution of solicate" station, the new one being intended for paragraphic water; and hints that a "solt or solution of suprate company, is the architect of the works; Mr. Davey, was some years since suggested in our columns as a of Lewes, huilder of the station; Mr. Pahina, of remedy. Doubless it was just such an application Brighton, builder of the viaduct; and Mr. Oliver, the as that now suggested as a remedy against the exuda-inspector of the line, is also inspector of the works.

OPENING OF THE NEW PHILOLOGICAL SCHOOL, OPENING OF THE NEW PHILDLOGICAL SCHOOL, NEW-ROAD.—The new school-honse of this institu-tion, in the New-road, was opened on the 15th instant by the Archbishop of Caoterbury. The style of architecture is a modification of the Gothic. Separate seluol-rooms are provided for each of the four classes, each room being fitted for the accommodation of about fifty boys. There are a lectric-theatre and two play-grounds—one open, and the other protected from the weather. Although a considerable sum has heen subscribed towards defray-ing the expenses of the new huilding, the institution is still nearly 1.000/. in debt on that account. is still nearly 1,000% in debt on that account.

JULY 4, 1857.

The Builder. Vol. XV.-No. 752.

HAT with pulling down, burning down, and tumbling down, the domestic vestiges of Old London are, with surprising rapidity, disappearing from the view of even the present generation. Roman London rose upon the ashes of the British eity : the Danes destroyed and Saxons built, and out of the wreck of Saxon and Roman cities in the Norman times, London still grew in extent and prosperity. Fires and plagues were but the means of effecting improvement. Gain came from loss, as it often does. In Elizabeth's days, the growth of London alarmed hoth the Queen

Government, and in the present and the reign its increase is like the rolling snowball. The row of houses in front of Staples Inu, the old houses near the hottom of Gray's-innlane, and other remnants of an earlier inctropolis will gradually yield to the course of improvement. We have preserved some of these as curiosities for succeeding generations; and on the next leaf we add another characteristic example of London street architecture before the Fire, which is, we are told, to be shortly removed. The houses there shown form the west side of the well-known and once notorious Field laue, which for some distance skirted the Fleet. The east side of the laue, with all the adjoining neighbourhood, has been swept away by the Victoria street improvements.

We described a night peep into some of these houses in earlier papers. Field-lane, before the alteration, was a dark, narrow, but picturesque alley, made as gay in colour as a Turkish hazaar, by strings of pocket-handkerchiefs and other matters. It was difficult to effect a passage through this strait, and resist the blandishments of the fair dealers, who, with many words, and sometimes actual force, persuaded the "gentlemens to huy half-a-dozen real Indian pocket-handkerchiefs, better as new." Mauy a purchase has heen made here hy those who must have felt at the time that they were in a way dealers in stolen goods : however, it frequently happened that the pangs of their conscience were removed before they got out of the lane, sharp fingers relieving them not only of their purchases, but perhaps of other valuables, hefore they had completed the exploration of this region.

In the dark days of Field-lane, persons who went for the purpose of inquiry were looked upon with anything but friendly feelings; and some years since our artist, in the pursuit of his vocation, was saluted hy small boys, instigated by those of more mature years, with turnip-tops and other missiles, and made his progress through the place something in the manner of John Bunyan's pilgrim through "vanity fair." A surprising change was effected when the daylight was thrown into the lane : the adventurous artist may now pursue his labours without interruption; and although the little hit of Field-lane which is left is not so gay in appearance, it is certainly much better in both a moral and sanitary point of view.

Changes of the most complete character are going on throughout the metropolis. A volume of much interest, for example, might be written on the inns and hostelries of Old London, -- those quaint places of resort, which, from the most remote times, have formed a feature of this wick-source has been liderated in the Builder.

great city, for in few departments of trade have about 40 or 50 yards to the south-east of the the changes been more marked than in the ap- statue of William IV. pearance and management of the victualling houses of London.

Some examples, which are left in the metropolis of old inn architecture, still hring to recollection the burly plain-spoken hosts figured in the plays of Shakspeare, and other of the old dramatists.

In Bishopsgate-street portions of two or three of the galleried inns still remain; the most perfect is the Five Swans, the court-yard of which has much the same appearance as it presented when the players were wont to erect their stage, and give performances in the centre of it. The cluster of ancient inns in the neighbourhood of Snow-hill, the back streets leading to Cheapside, Warwick-laue,* St. Martin's-le-Grand, and other famed places for the reception of travellers, have now but few marks of their original appearance. In Holhorn, the quadrangles of some of the large hostelrics which were formerly places of great resort to pack-horse travellers and carriers, may, with difficulty, be traced. In Gray's-inn-lane all signs of ornamented court-yards have vanished; but behind the now modern front of the "Pindar of Wakefield," are large barn-like buildings, which have, no doubt, afforded accommodation for horses. In Smithfield few of the characteristic features of the old inus remain.

In the suburhs, in various directions, are places formerly much frequented, hut which are now, in some instances, neglected, and " mine host " of these days is obliged to resort to the attractions of cheap concerts and other amusements, in order to make up for the change in the current of business. There is a curious old iun nearly opposite to the south entrance of the Knightsbridge barracks, which is worthy of a passing glance. In the High-street of the Borough, where a

long line of well-frequented hostelries formerly stood, there is little except the yard of the Tahard to attract much notice. Besides the great inns to which we have referred, and which were chiefly supported by travellers, there were smaller, and perhaps more comfortable places of public accommodation, some of them over against churches, having the signs of the Cross Keys, the Cock, the Mitre, which attracted the permanent residents to most together, to enjoy that amount of gossip and information which would he sought for before the days of newspapers and useful hooks.

Inus, both great and small, were swept away over a large space by the fire of 1666, and at present even fewer vestiges of the lesser hostelries remain than of those of greater importance.

It is worthy of remark, that in the days of Queen Elizabeth little mention is made of the sale of either ale or ardent spirits in the hostelries of England. In the monastie institutions ale was brewed for the use of the inmates and for the refreshment of the poorer sort of travel-lers; hut various wincs, "sack" and others, seem to have heen in use; and the ale in those old days was no doubt chiefly manufactured by the managing dames at home for the various households, in the same way as at the present day in out of the way places. The "Blue Boar" of Easteheap (Dame

Qnickly's inn) had all those aucient features which would have been in character with Prince Hal, Fat John, and those other boon companions whom Shakspeare has so wonderfully placed hefore us. The stone sign of the house, holdly carved, is still fortunately to he found in the Guildhall Lihrary. The house built on the site of the old "Blue Boar" was destroyed in making the approaches to new London-bridge. It stood

At the commencement of the present cen-tury, many of the London hostlerics were regularly frequented in the evenings by the respectable tradesmen of the various districts, for the purpose, in most instances, of enjoying a moderate potation, and discussing the affairs of the parish or nation. In many cases, the regular frequenters of the tavern parlours read in turn the principal parts of the daily paper. The writer of this knew of a company of old geutlemen who had assembled in this manner for many years: at one time they generally mus-tered hetween twenty and thirty strong. One by one they dropped off, until there were but two, who came so crippled that they could scarcely walk, and so dim-sighted that the newspaper was hut of little use to them.

The "clubable" spirit to which we have alluded was at the time somewhat a matter of necessity, for the homes of even the more opulent tradesmen were not so well supplied then as now with means of intellectual recreation : literature of all kinds was scarce and expensive, and music in the families of the middle classes hut little practised.

A century or so ago a large number of the publicans of the metropolis manufactured their own ale and porter; and in course of time some, having more skill and enterprise than others, enlarged their premises to enable them to supply other houses, and so the growth of the brewerics year hy year increased with that of the metropolis, until now private hrewing has almost goue ont of custom. A member of the great firm of Truman, Haubnry, and Co. stated a short time since, that so many years had not passed over since the principal of the then iufant establishment used to drag his hrewing on a truck to his customers.

It is curious to contrast this with the present extent of the Brick-lane and other breweries. Huge piles of buildings have risen up, mouster vats of such capacity that the bursting of oue iu the Borough swept away dwellings, and caused loss of life; several hundreds of horses are required for the couveyance of the beer; in some iustances artesian wells have been sunk at enormous cost; and steam machinery, which to a stranger seems magical in its operations, moves and ernshes the malt, carries or pushes it to its appointed place, and performs work which hy other means could scarcely be done.

In Dr. Johnson's days, when his friend Mr. Thrale, the brewer, died, the famous doctor might he seen with ink-bottle in his waistcoatpocket and pen hehiud his ear, aud with solemn business-like countenance, moving amongst the casks, and wondering at the extent and value of the interests which he was in the course of examining : surprising increase has taken place since then.

The change which has been made in the appearance of the hostelries,-we mean those provided for the use of the resident inhabitants, -is as great as that in the brewerics. In old engravings, we find "Hornsey-wood House Tavern," and many other well-known suburban places of resort, very homely indeed in appearance. The "White conduit House," which is shown in one of the cuts, was a small unpicturesque-looking house, two stories high, with four windows in front, near the ancient couduit. In the old print from which the engraving is copied, only one house appears in the background. Even at the time when this view was made, the necessity of enlargement is shown hy the addition of the pent which is built against one side.

Formerly the suburhan taverns were not so much resorted to for strong drinks as at the pre-sent time. The White Conduit-house, was long famous for hot hreakfast rolls and tea; aud early in the summer mornings, numerous Lon-

A London Tavern of the Last Century

An Interior.

[JULY 4, 1857.

doners might he seen there enjoying the fresh hreeze and early breakfast. Oliver Goldsmith frequently dined at the Highbury-barn Tavern, and called at the White Conduit to take a cup of tea on the way home.

The third engraving may he regarded as a fair specimen of one of the ordinary London public-houses of about a century ago. The massive window frames painted green, the red curtains, yellow letters, and the chequers on the door-posts give them a quaint appearance, which contrasts curiously with the ornament and glitter of the modern buildings creeted for a similar purpose. Before the alteration, a few years ago, that very ancient hostelry, the Cock, in Tothill-street, Westminster, a place mentioned hy John Stowe, and which is said to he the house from which the first stage-coach started, had a front very like that shown in the engraving.* Both of these had a flight of steps leading down from the street, the pavement having heen raised from time to time. It is worth while to make a survey of the interiors of one or two of these specimens of old London street architecture. The fittings are of the most plain and primitive description: an array of punch-hows is shown upon the shelves, and two or three "black jacks,"—the leathern vessel of early days,—and some other relics, are carefully preserved in the some outer reacs, are carefully preserved in the sitting room for customers: there is a spacious fire-place, with a large hood, supported by hrackets. In one part is a clock, with black frame, and a very large dial; and round the panelled walls are a few dingy prints of cele-parted acek fichter grain fielders and pair bill. hrated cock-fights, prize-fighters, aud such like subjects. The tenauts occupying the unaltered houses are, in some instances, so old-fashioned, aud so conservative, that it seems wonderful they have been prevailed upon to allow the intro-duction of gas-light. They have, usually, in former days, when their premises were more in accordance with the general taste, accumulated money; and they remain, year after year, com-plaining of the degeneracy of the times, and looking with as much contempt at gaudy opposition on all sides as did Meg Dods at the Hotel at St. Ronau's Well.

In passing along the streets you may notice the shutters of one of these old public-houses closed, announcing the death of the ancient tenaut: theu hoardings are put up, and in a short time, with the aid of plate-glass, Grecian pillars, and hrass work, such a change is made that the hostelry can he no longer recognised hy its oldest frequenter.

THE DESIGNS FOR THE GOVERNMENT OFFICES.⁺

THE DESIGNS FOR THE GOVERNMENT OFFICES.⁺ Nor comparing the principal Gothic designs with others, for such merits as they may appear to possess, and without reference to the numerous and excellent drawings through which they are illustrated,—or without hoping to settle the question of the style or character appropriate to the Olices,—we may say there are few works in the collection lately open to the public in Westmisster-hall, that would fairly de-serve more attention than the designs numbered 116, 129, and 140-by Mr. Sooth, Mr. Street, and Mesars. Prinhard and Seddon. With No, 35, already noticed, these works best support the claim which is advanced to Gothie architecture as alone adapted to the chosen locality and its associations, if not for general use. Their authors start from this position of superiority ; they have before them a defined purpose—an object which they consistently follow. They hold certain opinions—dogmas these may be styled—and on their belief they act. Others scatter rather than concen-trate the aims of their art-life,—are not content to lears and gather from numerons sources—but realize least where they would be the most diffuse. We have always endeavoured to maintain that a return to unity of style was an object without which our arebitecture would not ever gain the high position that may be destined for it. We have believed that the greatst development of art was consistent with the prevalue

* In this house are (or at any rate a whort time since were) preserved some very good carvings, said to have been secuted by the Italian workmen employed in the secetion of Heary VII.'s Chapel, who formerly lodged here. † See p. 346, arder. This article was in typo last week.

370

of some one slyle,—that art is even served by such a condition of circumstances; whilst we have felt con-fident—from study of the recent history, as of the current progress of architecture—that the public per-ception and appreciation of the art, ou which every-tive down of the art, ou which everyception and appreciation of the art, ou which every-timg depends, was retarded hy changes of style, or by the harsh centrasts, as they appear, hetween huild-ings, whether of the same epoch, or the same locality. The choice of a style (of course, for the subservience of art) looking at the question a moment apart from existing circumstances, is, we feel, surrounded with difficulties. These form the cause of the existence of any opposite factions in our profession. The circum-stances, however, it is necessary to look at; and the guestion we put is, whether those should not he allowed to decide the fature course-as probably they will at length do, in the face of all efforts. Therefore, if it is a fair argument with the advo-cates of the Medieval for the Offices, that no other style would he suivel to the character of Westminster

style would be suited to the character of Westminster Abbey and the Houses of Parliament,---the difficulty being one that has been seen in many non-Mediaval designs which we have noticed,—it is equally im-portant to consider whether the architecture of all London could be made Gothie; because, if not, there must he harsh contrast somewhere—fatal to the London could be made Gothic; because, if not, there must be harsh contrast somewhere—fatel to the objects of all parties; and nothing would be goined, but rather the contrast effected would be greater, by the staving off the time of it. The study of Gothic architecture was, doubtless, the very thing necded—to correct the vicious copyism for one purpose, of forms adapted to other purposes, and to lead to due con-sideration of the properties of the materials used, as part of the question of art. The desired qualities of at, hare in view, however are not such as would specially belong to any new development of a style. Much of the able crassoning of those professionally concerned in the Gothic movement, who treat the question with due regard for art, and generally on higher grounds than were once maintained, seizes on our sympathies because it is true of good architectural at in general. By every speciality of application to our symptomes occases it is the of good interference at at in general. By every speciality of application to a style which is not that of our day, the value of these arguments is only lessened. We can conceive no higher development of art than that which would prohably result, were some of those who are now cul-tivating the Gothie style, and who are acquinted with the characteristic details of other styles, to devote their efforts to the very field which they now eachew. This, it is said, is what some of the architects referred to, have in fact done in this competition ; and it would be eurious to discover, as we think is not unlikely, that these men are the authors of the hest Ituian designs. Possibly, we might even think also, that modern Gothie architecture had heen wauting a little interest of the second seco

The point architecturate had hene wanting a little invigoration from without. The point to which we wished to draw attention, was the position of vantage in which all stand who pursue one course, as well as that it is a matter really of less importance as affecting *intrinsic merit* than is supposed, what style may be chosen. But we pro-ceed to observe that the tendency of the extremes to touch, is one of the most hopeful signs in the archi-tecture of our day. It is effecting a slow, but obvious subversion in the application of Gothic architecture ; pending which, something of the distinctive character— and perhaps, for a time, heaty—of the style, is lost; but much is goined in the way of new forms, in com-hinations suggested by other styles, and in the recog-nition of modern circumstances and wants,—things hantions suggested by other styles, and in the recog-nition of modern circumstances and wants,—things all, which are essential to good architecture, as to the heautiful in it also. Our architects of the Mediaval school, or the best of them—no longer opealy follow, hut desire to lead the taste of anna-teurs; and we can only wish them to do so—being assured that the issue of that path, with their present aims, would be right.

There is a view as to the choice for modern use, of There is a view us to the endoce for mostering of the formational style, which we shall be well disposed to examine. The impression of the peculiar value of the English The impression of the peculiar value of the English Gothic has our full sympathy : yet we see no reason to question the statement, that this distinctive English character is precisely what could not he food in the collection of designs at Westminster-hall. But, what more than a more version of any style, can England lay claim to have produced? She has not the title to the invention of the Gothic that is claimed by France. What style at first would seem to be more distinctively English, than the Elizabethan? yet, that was a style, in the main ia-debted to other countries. Italy, from the number Encanethan? yet, that was a style, in the main in-debted to other countries. Italy, from the number of its developments, and the constant flow of art from it during centuries, is, perhaps, the only conutry in modern times which can be safely named as the originator of art. But, whatever their names, general styles no more pertain to particular countries solely, than do works of iterature. Like the dramatic poetry of Shakespeare, the same architecture can be appre-cided and berome naturelized in many countries. ciated and become naturalized in many countries,-so that it would denationalize or revolutionize more,

to remove what may exist, and to return to what was, than to pursue the existing path, although we may have heen diverted into it hy *foreign* influence. It matters little what was the original nationality;

but it matters greatly that the constant invigoration of new life should be maintained. The architecture called Halina is capable of this-as was shown in the production of the French-Italian style; as is shown in the arcbitecture of Paris during our own time; and by designs themselves, exhibited in Westminsterall. The French-Italian style is one that was prined, we apprehend, on somewhat the same prinhall. ciple of effect as that on which the author of the design No. 112 set to work, as noticed lately. It was indebted somewhat to the Gothic. It is a pre-cedent which we adduce, as lending evidence to our view that a style might be founded upon the general architecture of our day—so as to he appreciated by the public—and which might use everything whatever in the Gothie that is capable of, and valuable for, moderu application

The Gothie designs in the collection at Westminsterhall must, however, he judged on other grounds than those which some of their advocates claim for them, or which others feared might lead to their rejection. The which objects rearry linght leads to their repetition. The very character in design No.129 to which our attention is directed by more than one valued correspondent— the "beautifully broken up" appearance, the "traly Gothie" effect, "this exquisite breaking up of straight likes, these glorious being, nooks, & c."—the picta-resque according to the common rendering of that iff-ungerstand between the userue for more Gothie, then understood phrase-to us seems far more *Gothic*, than consistent with modern associations, or with the idea of the effect consonant with such a huilding, the of the error constant with such a multing, the purpose of which would suggest to solie extent a monumental character. The "picturesque" officet which there is in drawings cleverly shaled in pen and ink, is not that of which an implession would he de-rived from the work is "left, or, at least, not after the reason and the judgment had come in to aid. We berght with the subject of officient is a subject to a subject to a subject to a subject of the subj reason and the judgment had come in to add. We doubt whether even it is good *Gobia* architecture, to design so determinedly, irregularity: at least, there was no such character in the chief municipal build-ings, such as those which are remaining ou the con-tinent. The merit in No. 129 we might find great, nevertheless.

The design, No. 116, illustrated in thirty-two drawings-many of them elaborate, and to a large scale, and which include several well-executed perspecsone, and which needed seven which exceeded perspec-tive views—may, on the whole, be considered the chief of the works which were assumed to protest against a supposed foregone conclusion of the Government, or the Office of Works, against Mediaeval architecture for the intended buildings. It hears the motto from Horace (De Arte Poetica) :—

· N Nec minimum meruere decus, vestigia Grad Ausi deserere, et celebrare domestica facta

and the drawings include a large plan of the streets extending to a considerable distance, a block plan also showing in some of the proposed improvements sonth-ward, and designs for the War-office and Foreign-office in huildings of similar character, joined by archways. To the War-office there are two sets of drawings, illustrating alternative arrangements marked A and B Intertaining alternative atradiguenties for each A and D. In many respects, we believe the design No. 140 would be quite as worthy of examination as any of the designa-which we are more especially attending to; but, unfor-tunately, the exhibition closed too early to allow our tunately, the exhibition closed too early to allow our giving the careful examination which was necessary to do this work justice. The design No. 110 is interest-ing on many grounds in addition to its norits. Its well-known authorship by one who has offered the best of the arguments put forth in favour of the views which have been adverted to; its careful treatuent; and the grasp of the subject which it evinces, would alone demand for it particular attention. Still, in the lengthy "explanatory remarks" accoupanying the drawings, well written though they are,—as also by the author of No. 120,—some assertions are ven-tured on, which we cannot wholly accele to. We do not assent to the statement of facts, and the precise inference drawn, as to the cumparative value do not assent to the statement of heats, and the precise inference drawn, as to the cumparative value of the "Classic" and the "Gothe" styles. We do not think that "our public buildings, with the excep-tion of the Houses of Parliament and a few others, have become proverhial as failures." Such an asser-tion—to be supposed of any value—must be taken buttise our the periadrem of a St Graywis III and tiou of the Houses of Parliament and a few others, have become proverhial as failures." Such an asser-tion—to be supposed of any value—must be taken shutting out the existence of a St. George's II.Jl, and of the best works of Sir Charles Barry—as the Reform Clah and Bridgewater House (which have essentially the character of public buildings—Ler the present argument), and shutting out the facts as to the growth of architecture of a high class in our pro-vincial towns. This unquestionable progress has been contemporaneous with the increasing study of the Gothic style,—which style, we may say, as the ques-tion is of facts has not, during the same time, pro-duced any considerable works except the Houses of Parliament. These latter buildings—recollecting the circumstances nucler which they were disigned, and

as they ever must follow certain hranches of their study, and just as those who would study Gothic architecture, must learn from the relies of manners and times equally foreign to our own. The choice of a style by "a noble duke," our argument by no means requires that we should excuse or defend. We did hefore quite the reverse. It has been "urged that the best model to be followed in the present instance, would be Inigo Jones's design for the Palace of King Charles I."—but, we think, ouly by one not an architect, in a proposition respect-ing which in October has, we doubted "whether es-isting architectural talent could not produce some-thing equally good in art, original, and more appro-priate." Yet the style of even that building we can-not hold is one incapable of artistic treatment; and not hold is one incapable of artistic treatment; and which could be as fairly addueed on the one side, as the Gothic designs could on the other.

the Gothic designs could on the other. We depresent, however, the adoption of style pre-ceding, by whatever date, and different to, what is actually prevalent. There is a strong argument for Gothic architecture for exclesisatical purposes; and the style may be considered as having been never wholly abandoned in traditional acceptance, and in many points of observance, such as are found even in churches which have no Gothi detnils. But it is very for fact the theorem of other detnils. far from being the prevalent style in the general huild-ings of towns; and even used in town churches, it does not stand in the most favourable position for its

does not stand in the most favourable position for its own effect, or the general hormony. This bugben of the Whitchill Palace, seen by the authors of Nos. 116 and 129, is one of their own raising: no one whose opinion is worth a great, desires more than the symmetrical duplication of the "fragment," on the Whitchill site; and when the author of No. 120 refers to the "one reason, and one only, in favour of any other style." than the Gohine, for the Offices, he entirely missitates the case against him. The reason, whatever its value, is, not the existence of a fragment at a distant spot, but that all the architecture on the sume side, as everywhere else—the Vestimister buildings heing excepted—is in one or other version of a family of styles which are not one or other version of a family of styles which are not Gothie

The author of No. 116 would disclaim the desig-The author of No. 110 would cuscam he usage nation -11dian.Gothie-for the style of his design; he has sought not the style of any particular country, but Gothie in the abstract, and gathered from the works of all countries. It so happens, country, but Gothie in the abstract, and gathered from the works of all countries. It is o happens however, whicher from the circumstance that Italy contains many Medieval buildings not ceclesiastical, or from some proper endeavour to avoid incongruity with our existing Italian buildings, or other cause, that the ch-racter of his design, as of others, is more It diam, or at less t Coulinental, than it is English. What recease on the case has whethere our stude

What reason can there he, whatever our style that we should not ad qut it to every want? Nee we even conceal structural features, as the author of No. 129 allows it to be implied that we must of No. 129 allows it to be implied that we must perforce do? Why should we not expose to view the metal beams of an interier,—thus shaping a "design to suit the c-ustmetion," and add enrichturents and foliated brackets in brass-work; and, as it is admitted by the asthor of No. 116, "has been beautifully done in another siyle, in the New Mus.um at Berlin." The special value supposed to exist in the Gothic style has become at inhuted to it, in great degree, from the mistakes that had here mode during the "dark age" of English taste in architecture gene-

for the mistakes that had been made ourng one "dark age" of English taste in architecture gene-nally, and to knick use have recognised that the nealizeral principles were the fitting corrective. The only qrestion as to the Classic or the Gothie, is what atyle should be taken as the point of departure. Now, supposing professional and architectural skill-equal, for example, to that of the authors of the best Gothie design-together with concentrated effort, given to the Italian style, can any one believe, from the evidesee on both sides at Westminster-ball, that any special kriftly or art, arising from style, would be apparent. The real question to be decided is simply,— what is the siyle of the day? On that we must advance. of English taste in architecture gene-

AWARD OF THE JUDGES.

The following is a list of the artists entitled to premiums under the award of the judges of the designs lately exhibited in Westmiaster-hall. The names are

arranged in the order. of merit as decided by the judges, with the motio and amount of premium.

SOME REMARKS ON DOMES.*

I WOULD give a few minutes' investigation to a church which deserves, I think, most careful examinations, S. Cirico, at Anconay, an architeet unal work fine in itself, and occupying a stenet to be exceeded for beauty. It is evidently the work of uny ages, and bears the mark of m my changes : it has met with unserupulous streators, how yet have left enough to tell the tale. In a case like this we feel the want of such a guide as Willis bas here to several of our own cathedrals. In Italy mony a patient antiquary has written a history of these old places carefully and well. Tahri has worked hard for Ravena, Severano for Rume, and Maffei for Verona; but they all worked from hocks and not from the stones themselves. They have not traced, from the change of style, of moulding, or of massner, the various works of the various huilders, and there are few of us, I an afraid, who can afford the time to do so on the apot for ourselves. Numer is an issue: D'Agincourt and Serra di Faleo gave 050 as the date, while Milizia names shout 1300, and asgins it to Marghettone of Arezzo. I have no doubt whatever that the local tradition is correct, and that, next to S. Vitale, it is the most ancient done in Italy, whilst it ranks first for heing on detached pirse. Batt it was largely altered in later times, and Milizia's date applies to them. This is borne out by an inscription in the church of the Milerio and larghettone the date is recorded as shortly after 1349, and the dome is a elunny copy of S. Ciraco. The latter is built on the plan of a Greek cross, each of the transepts being raised secra, and the lines of manuty, and down class diverting. All the int-resends of the cross is a dome resting on a enricous pendentive, half Byzanting, half arched, and worked as though by a novice at the card, or the lines of missery is stored the secale of art than it most much more carging the contous both being twolve-sided inside around, but carried up on a series of ribs converging quite in the Gothic system of construction and of there, a

* Continued from page 359, ante.

THE BUILDER.

struction: and arrangement. In the ordinary form, where no weight had to he supported but that of tho dome itself, the construction adopted was of a boldmess scarcely to be inagined, and the tenuity of the section, and the lightness of the material (the dome of S. Vitale, for instance, being of pipes only) show how much more easily this beautiful form of covering can be used than is generally thought. When, however, the lantern was added, a change became at once necessary to support the extra weight. At S. Cirinco there is a series of rike in addition to the thick covering itself. At Bergamo the thickness of the dome is increased. Bat in later times and with larger domes, a double covering (as seen very clearly at Florence and at St. Peter's) was used, and by this means, the external form of the dome often became quite different from the interior and much more nearly approaching the cone. Up to this time, also, the dome, in Western Europe at least, seens to have been tracted almost entirely with regard to the internal effect, its exterior, with few exceptions, being left unorunneuted and hare. Bat fature was not as carefully finished externally as the rest of the edifice.

rest of the editice. The acts example worthy of note is Sia. Fosca, at Venice, where the dome is unfinished; but the plan is one of much heaty, and the pendentives are arranged with great elegance. Were this church compluted, I know no building that would exceed it in beauty of outline, or be more worthy of imit tion, if imitrition there must be, for our present form of worship. Or SI. Mark's every detail is so well known that need not dwell upon it. Altered as the church is, and added to in later times in a way that must overturu all our ideas of correct restoration, there is a spell in the old building that more chaste forms cannot excite; and were the windows that now admit an unsubdued glare toned down by colour, the interior, i effect, would almost execced the iungiantion. Outside, it seemed to me that, whether by the gorgeous light of day, or the softer glean of night, the Finzan of stature, is unsurpassed in beauly. The church of S. Tom so at B.rgamo now suc-

The church of S. Tom so at B. rgamo now suceeeds, in which the laatern has become an important and massive feature, and the old plan of hiding the external form of the cupola by a sloping roof is revived after a sleep of some 600 years. Since the time of the Ruman Baptisteries the dome had shown its own honest form inside and out in nearly every instance, hut now we have it need merely as a vault covering inside, whilst the exterior shows no more traces of it than our Guthic high-pitched roots do of the groined vaniting they cover. The reason of the change is sake of altring. They had the same climate, the same underials, I think the same skill, as their fathers, and when the interior vault was turned, the same underials, I think the same skill, as their fathers, and when the interior vault was turned, the same underials, I think the same skill, as their fathers, and when the interior vault was turned, the same underials of the roof gave space for the picturesque areade so berutifully worked out in the lithenist churches? Whatever the motive, these who have studied in the eities of the Rhine can scarcely regret the change. This roof cover seems to have been very general about this time. We find its form most picturesque developed in Germany, in Italy, and even in Armeuia, where the tomh and cathelral of Ani, and the church of Dighour, excite our admiration.

But anonget the Arab workmen in Egypt and Sicily, the old form continued in use, and it is to this date that we owe the beautiful interiors of the Mosque Barkank at Cairo, and of S. Giovanni, S. Simone, and the Capella Reale at Palermo. The church of Agia Theotokos at Constantinople, those of Aui and Dighour, and that of the S. Aposteln at Cologne, may hoast of having heen almost the only ones to this time where the tambour was made ornaranctil, and the dome and superstructure were thus hrought into one harmonious whole.

time where the tambour was mide ornamental, and the dome and superstructure were thus hrought into one harmonious whole. Our next great example is the Baptistery at Fisa, where the dome is so utterly false, inside and out, that the whole mist he looked upon as an exceptional ease, not to he classed or reckoned, while the great Baptistery at Florence, beautiful as it is, has heen so altered, and the times of the alterations are so doubtful, that its date can scarcely he fixed. The Bapfuly that its date can scarcely he fixed. The Baptistery at Parma is of clearer date, but I donbt if the upper range of arches which screens so falsely hoth dome and roof, is coeral with the building or part of the design. I thought not when on the spot.

The next is Brunelleschi's great work at Florence. But before beginning the sketch of these later works, I would devote a short time to consider some other detached specimens of the Mediæval age in Germany

[JULY 4, 1857.

and France. In fact, in thinking over these memorials of a by-gone time, we feel the same regret as in roaming through their aisles and cloisters. There is a fascination about them which time will not, I fear, ever give to those of later date. St. Peter's and St. Paul's, and Sta. Maria at Florence, may astonish us by their greatness and their grandeur, but I doubt if our descendants will ever pass with such soleum feelings through them as we do now through the aisles of S. Ambrogio, at Milan, or the eathedrals of Mayence, or Lincolo, to which I think those magnificent lines of Byron could be hetter applied than to St. Peter's-

"Enter. Its grandeur overpowers thee not, And why? It is not lessened, but thy mind Expanded by the grains of the spot Halh grown colossal,"

That this difference in the feelings caused by the earlier and by the later works exists is certain. It were too long now to analyze it. In the churches of France, at Blois, Loches, Uzerche, Perigneux, Angonleme, and other towns, we find a series of domes of the most picturesque forms, of all classes and of the holdest construction. The details have been well illustrated by Mr. Peiti, and each of these churches is worth a careful study. At Ratisbon, the Baptistery, a small building of uncertain date and of a picturesque plan, has an arrangement of pendentives which combines the Byznatine and the arched system, and has a very good effect. In all these works I have not, I believe, found any

In all these works I have not, I believe, found any construction but that of briek and stone: timber does not seem to have been used. Yet the hold roofs at Padua and Viceaz i show what the men of old could do, when they willed. We must now bid adien to them and come to those whom we must rank as moderns. And, truly, there have been giants even in these days; for the changes made in the form and treatment of the dome by modern architects have made it a new feature. Of all these great men, I reekon Brunelleschi as the first, in rack as well as in time. The eathchraf of Florence would be, pertaps, enough for bis fame, but the heavity of proportion and details in S. Spirito, S. Lorenzo, and Degil Angeli, bear witness to it, perhaps, still more.

reckon Bruncleschi as the first, in rack as well as in time. The eathedral of Florence would he, perhaps, econgh for his fame, but the heauty of proportion and details in S. Spirito, S. Lorenzo, and Degli Angeli, bear witness to it, perhaps, still more. Yet even with him the dome is in one case concealed by an external roof, and, in the other, only timidly shown. The eathedral has its dome still unfuilshed, and not until all is done as he designed it, ean its heaving be appreciated. The large coulse at the base has but one side fuished? the small areade at top is in the same state: the naked bricks show where the marble stood, and tiles, as a covering to the wholo, impoverish the look. The Roman who covered has Pantheon with hronzowould have laughed at the change, and those who complain of want of zeal in the intecent ensury, may think of what was left undone in the fairest city of the fourteenth.

For St. Augustin's, at Rome, D'Agincourt claims the credit of having the first dome elevated upon an orannental high tambour; hut the Armenian churches certainly forestalled it, and the polygonal fluibt to S. M. delle Grazie, at Millam, may rank with the works of any time, for beauty of conception, hoth in outline and colour. Between this and St. Peter's comes the heattine dure of S. Andrea, at Mantua. But I am afraid that the dome, which forms so fine a feature, must not rank as Albertl's, but that it is of a much later date. St. Peter's succeeds, and with it comes the uss of the markel feature of nearly all the later domes,—the peristyle of the tambour. So far, J believe, as our knowledge extends, this was the creation of Bramante, an architect as bold in conception as deliated in his details. This peristyle forms the most prominent object, both iu his design and in that of Saugallo, where it is at once carried aimost to exitavagance. Michelangelo's design is, perhaps, more simply grand than that of either of his predeessors, but I must say boldy that the outline of our own St. Paul's excels them all, and that I know nothing to exceed the exquisite proportions of its form. St. Peter's has its noble colonnade, and, in the Vatiean and its Loggic, accessories, of which we cannot boast. But its dome starts from an inasgiaary point, and is now stards from an inasgiaary point, and inmere- piazza, is taken from an inasgiaary point, and inmered, are much more likely to be carefolly preserved. Now, St. Paul's, seen closely as it is, shows itself clearly as a mass, with the downe springing from it and rising out of it without effort, and as part of the whole: and, if ever it shall be scen clearly from a wide opening in any quarter, our follow withens, who know not architecture, and who have all their lives seen, perhaps mmoved, thall be scen clearly from a wide opening in any quarter, our follow withis, A Palakio, irvals the greatest of other capit.s. Palhadio, in bis St. M. della Salate, at Venice, has holdly used another method, and nothing, perbaps, on that site could be happier in effect. He resists the apparent threat of the dome by huge consoles, which he readers ornamental by making them pedestals for statues. In another great work of his, the Redentore, there is a enrious perspective effect. The dome is stilted up for about a quarter of its height, without any moulding or set-off, and the result is that, both in reality and in drawings, it appears to hulze very much at the sprinzing.

is that, both in reality and in drawings, it appears to hulge very much at the springing. Wren, in his St. Stephen's, Walbrock, has produced a church of striking originality and benuty, and no form, perhaps, of the style, could be hetter used for our churches. We may too, in London, boast of two modern domes,—at the Coal-Exchange and at the Minseum,—whose novel construction in respect to material has heren very successful, and whose outline, mode of lighting, and decoration give them a high rank. At Rome, the churches of SS. Trinità dei Pellegrini, S. Andrea al Quirinale, by Bernini, and S. M. Lauretana, by Sancallo, deserve attention. In more modern times, the Basilita of Sta Frauceesa, at Naples, by Bianchi, has been erowned with a dome of 12 feet greater diameter than St. Paul's. At Paris, the French may boast of the iron roof of the Halleau-Blć, of the domes of the Fantheon, the Valde-Grace, the Invalides, and the Sorhonne. But, except that of the Pantheon, they are not remarkable for elegance. Russia lays claim to more attention, and the recently crected church of St. Isaae, at St. Petershurg, has a doue trented in a movel, and seemingly successful, manuer.

herg, has a douit treate in a susceptibility of the specimens of eccentricities, merely to put them on record. In Schastinn Scrilo's work there are several designs for dome, oval on plan, and, in several places, the idea has, unfortunately, been worked out. The most notable examples are the Cathedral at Pisa, and the two churches at the end of the Corso, in Rome. At Pisa, from the sitantion and accessories, the defect is not so much noticed; but, in the twin churches at Rome, each presents, except when seen directly in front or at the side, a different outline from the other, and the result is as unsatisfactory as can be imagined. Internally, the effect is not so bad, and, in several instances, quite the reverse. At the churche of Ara Cabi, at Vienza, for instance, the plan works out well; and there is one at Rome, I think, by Borromini, equally satisfactry. As ouriosities, or mostrosities, as you like, I may instance the Eastern domes of the mosque at Varieties of form works out well. Joink of hearty, is surfload to a wish for novely. To go into all the varieties of form work he and wells the surflow and for any houring of construction, and, I think, of hearty, is surfload to a wish for novelly. To go into all the varieties of form would be a useless task. They range from the steeple-like domo of S. Leonard, at Dublin, a building which, by this false outline, has just missed being one of the most pleasing and picturesque in the kingdom. A few words as to lighting and decoration. I A few words as to lighting the devel is duck and gloomy effect may harmonise with the object of the down should be so too. To arrange this, I know no way more simple, the care the well lighted, the dome should be so too. To arrange this, I know no

A few words as to lighting and decoration. I cannot but think that, however well a dark and gloomy effect may harmonise with the object of the dome should be so too. To arrange this, I know no way more simple than the central light of the Pantheon. But other methods have heen successfully used, and, as at the Minerva Medica, or better at Nocera, and best at Scribistan, the light has been admitted through many small openiogs in the dome. To leave the dame in darkness is to lose its whole fact, and to make it of no more value than the root that I remember in a country town in Hely, where, at the springing of an unfinished dome, the fat roof was so hidden by being painted black, that it had all the appearance of a dark vacuity. A very picturesque way of lighting may be seen in the small semi-dome behind the attar of St. Sulper, at Paris, where the light enters from behind large cornice, whose projection conceals the source. A large cornice of the sort is introduced, with excellent effect, in the church of Moute Berico. This church offers, too, owo of the most notable instances of slight piers that I remember.

For decoration, I know nothing to equal in effect the old mosaics. Their richness of colour, and the splendour of the gilt grounds which give grandeur without gaudiness, make them nuequalled, and the treatment of the figures and secoll-work is never such as to break up the general outline. The whole seems to form part of the general design, and not to break the sweep.of the done in any way. This art is certainly not progressive. At St. Peter's, indeed, the modern mosines tell extremely well, but they are of the most simple kind, and where elaborate effect is tried, as at St. Mark's, the result is painfully inferior to that of the old. These latter artists put in pictures, when what was asked for was decoration. In later times still, some perhaps of the most successful attempts have heen made in the heautiful Genoceschnrehes, where the artists have, as it were, identified themselves with the architect, and produced work which harmonises with this. But whatever the style of decoration be (and I say it with all the diffidence becoming a junior member of the profession). I am sure that any style must fail which, earried out like Thornbill's at St. Paul's, breaks up the heantiful contour of the dome with columns and arches, and other forus utterly foreign to its outline.

contour of the dome with columns and arches, and other forms uttarly foreign to its outline. In reviewing the whole subject, the most inveterate admirer of the Middle Ages (and I confess to being one myself), must, I think, admit, that the dome owes much of its grandeur to the moderns; and, admiring as I do the picturesque effect of the Greek churches, I cannot belp thinking that I would scarcely exchange the majestic dome of St. Paul's for theirs. I know its waste of space—I know that one-half of it is, inside, a dark mass, encumbered with timker and with brickwork, and I kow that the others are small because they tell their story truly, and show without what they are within. But the peristyle, tho lofty dome, and its grand lancern, have a look of majesty that diffes its rivals, and almost reconcile us to all its faults. And in the days of old the architects found at St, Mark's the same want that Wren did, and supplied it in the same way.

found at St. Mark's the same want that Wren did, and supplied it in the same way. One word uore—Of all these glorious works that we have reviewed, who were the authors ? Wren we know and glory in, and Angelo, Brunelleschi, and the architects of Sta. Sophia arc household words to us. But of the multitude of other works which are spread over the land, who were the workmen? whence can.e they, and where did they learn their eraft ? It was no common skill that poisod the stones at Mycene to last 3,000 years ; that raised the fragile coil of pipes that has erowned S. Vitale for thirteen centuries; and that spaunod the Pantheon with a dome not yet surpassed! But of all the thousand pilgrims who gaze delight d on these works, how few give a thought to

But of all the thousand pilgrims who goze delighted ou these works, how lew give a thought to their authors! They were of us—prond may we he to say it—and well could J wish that the glance of modern scrutiny, that has searched so deeply into the cloudy past, could open out to us the names and history of its guiding spirits, and let us know somewhat of the workings of our brethren of old, who bave left behind them ouly their great works.

" Footprints on the shores of time.

MR. WIGHTWICK AND THE CLASSICISTS.*

Six,—The notable argament from the "requirements" of the sash-window is a fair simple and highly characteristic of the working of our system of supposed "competition," both artistic and commercial. Still more and more onvisions, to save either the elbow-grease of competing contractors, or the main-grease of competing artists, ereate more and more "artificial wants," —afterthought necessities, that need not have been necessities at all, to be miserably patched up with palliatives whose "barbarism" the architects that cause them, but cannot supply them, are the first to complain of. Designers may of course omit from their baits and show-drawings whatever is so essential to the finished work as to be *aree* to be added somebow, whether designed or not. Such things you may leave to the consideration of mantics, foundations, gutters, wet awnings, and in general 10 thing necessary to make his huilding stand, or keep out wet, or san, or let in eit, or be made, or put together, or insured, or taken down. On this principle it is well understood that in Remaissance designs, as the sunke, for instance, after they are built, *mast* line," or be unitted entirely, as net, "required by the genius of the style." Hence, in the dark ages before photography, foreigners doubtless supposel, and may still suppose, till some secrative of befuits art rejote in the skylence supravel of British art rejotes in the skylence supravel of a Wightwiek, that a style like the Northern Gothicad, and spreading-conped shafts over every subk-edle, ad any scrawagant, and not to be named by "commonsene," beside the convenient Italian that *requires* nothing of the kind like *admiting* any range of fancy in the name of chinneys, from urus to lions, chaste eubicalities of the "hostmodel," or dragons and hydras and ehimers dire.

enastic ennovatities on the morandose, of dragons and hydras and chimeras dire. Greek porticoes must be, according to Mr. Wightwick, so supremely useful, that I wonder they are ever removed from buildings that have once enjoyed the luxiny. A shelter projecting some fifth or fourth part of its height from the ground, must be so greatly

* Continued from page 361.

protective to "coming and departing visitors" (especially when on the level of the first floor, and having itself, as at the Custon House, or the Gower-street College, no floor), and with its columns set at the "Eusiyle" distance of 23 diameters, it cannot, of course, darken "the vestibule and the room adore" (though why the latter should he included under it at all L cannot see) in any degree worth no 'cing, compared with an "areaded structure" that may have its pillars 10 diameters apart, and its whole arcanion taken out of the space that would be filed up by the Greek entablatures and pediment; of which the former adore must, as Mr. Wightwick is well aware, occupy from a fourth to a fifth of the whole height from the expression of all Classic architecture, whether columnar or fenestral, is so inseparably dependent on the height of mass abave the apertures, that it is easy to see the rolative praise awarded to the " proportious" of our simply for want of this; and the conservative and san arched copetivy of their stagmant-air reservoirs. The Reform Club-house yields to its minor neighbour simply for want of this; and the Conservative and an arched one would under its key; the litedled aperium (whether window or infercolumy) can havely, in a given total height of masonry, be-continued up, without losing all classicality and dignity, san higher than the spingings of an arch might be. And as for that a dothe is if you build for posterity; and a little wanted in Gothie as forcek, if you the winted in Romana as in all the Lulian Gothie, and all our Remainsance, Glassie or Gothie, from St. Paul's to the Houses of Paulianent.

But how can these questions be argued till we are sure in what sense we use terms? Mr. Wightwick and I may, all the time, be meaning by "Gothic," totally different things. He appears to make Gothicism consist io (1), silly imitations of archwork, as at Fiao, and the new tay for Constantinople; (2), buttresses or pseudo-buttresses; (3), nuiversally arched openings, even in a granite cow-shed; (4), stone mullions; (5), roofs steeper than a certain auglo of pitcl, which he does not define. None of these, and still less the parapet (which he tells us is "invariable in all first-rate Gothic structures I') can I regard as at all essential to Gothicism, in the sense the term is now taken by the clausated, and which, I believe, has altered considerably in a few years. Eight years ago, I observed that almost every characteristic feature of Eoglish Gothic, the ouly Gothie I know, —in fact, every one that was more than minute detail, and quite everything that our restorers had then copied, grew up (or down), simply from the working out of the problem to vault a church, and ware without sense or connection is an unvalled hulding; so that all our modernu Gothierism, as well as the Tudor realities, things (as Mr. Wightwick says), "of walls and flat floors," were as mere pseudo-architecture and langhed at. This (which I helleve no one cles had langined of au-ther style, all that he (ad all non-profusional vriters on it *before* him), had satirized and languide at. This (which I helleve no one cles had announced the same of the *Hedicared* woodwork, and and bay before the Gothie revival was dreamt of, had sumounced the same of the *Hedicared* woodwork, and and by of the rimelle haid down plainly by Dr. Robison, and tacily, hut implicity I admit, to my reasoning of that time, that Gothie was exclusively a slowe style, or one for vaulted hulding. In the widen, and yet incore strictly artitist, and a the same time ethoographically correct use of the term now becoming general, chiefly through Mr. Ruskin's most careful and

Mr. Wightwick goes a great way into very poculiar circumstances, those of the granite districts that do not caver a one-hundredth part of Eogland, to find in a granite cow-house, something that he thicks will he most effective and serviceable in a non-Gothie form. I utterly deuy that the cow-house he describes, either is of any other style than Gothie, or could fail to be Gothic except hy being carelessly and wrongly finished. An unaffected mason, who aimed only at making a good cow-house, and not at minicking things seen in modern towus, would, if he had any mind and applied it to the work, not square the pillars, but chanfer their edges, stopping the chanfer in some near way, mpward and downward : the linetl-course be would not lay at once on their tops, but on bræcket-capitals, to diminish the wildt of hearing ; and these would have their offensive corners removed, as would the rafters if they overhung; ; and if there were coping, it would be bevelled to a ridge, and the whole would be recognized by every one to be what we now call "Gothic," but what i, to the Middle Ages was called nothing, because nothing else was built. If engineer-ing works, intended to be in no style, are not now Gothic, it is hecause they are not true cogineering — not really considered and thought out. Of course, factions and affectations (as bigh roofs

not really considered and thought out. Of course, fictions and affectations (as bigh roofs with parapets, that retain the snow on them, or pointed arches where round would be better) are not Gothic. They are mere blots and hlemisles in any style. I define Gothie as the unaffected style of the Gothie nations, when unnixed with imitations of human work for ornament. Now the quality of being unaffected excludes all substitutions of any form for a better (i.e. more utilitarian) form of the sume thing.

better (i. e. more tilliarian) form of the sume thing. It is more thic, therefore, to make your roch-pitch either so high or so loss that it would have been better (in a utilliarian sense) 1 inch lower or higher. It is angothic t give a window a round bead, because that can have no structural advantage over a pointed one, and, as a Goth, you love pointedness, and that quality of form which Rushin calls rigidily, which is present in a pointed, and absent in a round arch. But it is not nugothic to give it a lintel and no arch, if that be, in the locality, the cheapest way of cover-ing it. Again it is suppathe, because affected, to if that be, in the locality, the cheapest way of cover-ing it. Again it is mugathic, because affected, to make the middle arch of a carriage bridge pointed, hecause there a single segment is structurally hetter, as the Middle-age men themselves knew and prac-tised. For the same reason, a real Mediaval would have made the arches of the St. Martin's Schools round, it obliged to arrange them as at present, centre over center, but if not so obliged he would, for the over centre; but if not so obliged, he would, for the sake of using pointed ones, have arranged them two

sake of using pointed ones, have arranged them two arches above one, and the picr over its point. Thus, either the present arrangement of them (throwing a mass over every weakest part, and a void over every strongest), or else their being pointed is an affectation. A cause must be reduced to a desperate strait for arguments, ere it can concect such a one as Mr. Wightwick supposes drawn from Ox'ord. The Rad-cliffe Library is the "coronal pride" (*Anglice*, the Biggest round building) of that town. So is, hy-the-bye, at Jerusalem, the Mosque of Omry, which Stanley says is the sole, yet all-sufficient dignifying feature in every view. It is a enclous property of a domed building amoag rectilinear ones, it matters not to be investigatel. But, of course, it matters not domed building among rectilinear ones, and descrees to be investigate). But, of course, it matters not whether the "coronal" building be as Gothic as the Pias Reptistery, and the other Greek temples, or vice versal. However, the triumpl, thus secured for *vice versa.* However, the criminal this secure of whatever may happen to be the style of the Raddlife over that of Merton Chapel, is evident. I wonder Mr. Wightwick did not take a wider area for this compondions mode of comparison. Dures any one deny that St. Peter's is the "coronal pride" of deny that St. reter's is the coronal price of Europe? Is it lekely, then...-is it "common sense"... to suppose that such an unrivalled work could "happen" to be in any but the very best style of Europe? Of course not: the Golbs are annihilated.

Europer Of conrection to the coulds are annumated. I borrow a happy expression of one of yoor cor-respondents, who complains that I fall foul of build-ings only for "happening to have" Classic decora-tion. "Happening 1"—only think, What a curious phenomenon this decoration must be, to happen upon buildings; and to happen to take so very much labour, and bappen to dave so very much labour, and bappen to dave be never end.

this the base of his printed " Apology." To say nothing it is being a two-edged sword, this will serve our adversaries far offener than our friends, the principle is plainy one utterly inconsistent with any pretence even that "there is such a thing as traditions of the source of

found full of water, and was obliged to extemporize a drain before he could begin his work. At Spello are the masterpices of Pinturicchio, the contemporary of Perugico, and friend of Raffaelle.

Mr. Ruskin afterwards addressed the meeting in aid of efforts for the preservation of records of a time when art and literature were the only exponents of men's best thoughts and noblest energies.

ST. JAMES'S PARK AND PALACE.

ST. JAMES'S PARK AND PALACE. No one can have forgotten the Darliamentary dis-cussions about the entrances to St. James's-park, and particularly the new one from Pall-Mall. Not a little was said as to the desirableness of removing the German chapel, which not only interferes with the line and width of the carriage way, but also with suitable approaches to Maribarough House, very shorth to become the residence of the bein-numeration suitable approaches to Marionrough House, very shortly to become the residence of the heir-apparent to the throne. If the building is to remain, I would suggest the great improvements that would result from putting it hack in line with the other walls. To those who might be inclined to demar to the idea To cose who might be include to denot to the idea of reducing the area of the chapel, it may be well to say that the congregation assumbling there for public worship averages about fifteen persons, as I have re-peatedly witnessed: I think I once counted as many peateoly withdessed: I time I code counted as many astwenty. Between the outer door and the chapel proper, there infervences a considerable space, or vestibule, affording ample facilities for the object I am proposing, without any interference beyond, so that a bundsome portice, or coramental front, might be raised in liem of the present nosightly one.

It would seem that a plan is in prosecution for throwing away money in patching up the drawing-room eutrance to St. James's Palace, by some outer excressence, as an attempted remedy for the existing inconveniences, which no other Court in Europe would have ever tolerated at all. But the set of the exercise case, as an attempted remedy for the existing inconveniences, which no other Court in Europe would have ever tolerated at all. But why not follow the suggestion I have seen in your columns for com-pleting Buckingham Paleace, by the creation of a new wing on the north side, in correspondence, as to the garden front, with that recently completed next Finilico? I at this way all the requisites for State occasions are obtainable on any desired plan or seale, contignous to the residence of the Sovereign; whilst the parks and royal garden would afford the means of ready access, and departure for carriages, entirely independent of the stretcet. St. James's Palace might then become available for national and scientific, objects,—the depository of pictures, &e. of which we stand in such need. H. T. H. T. stand in such need.

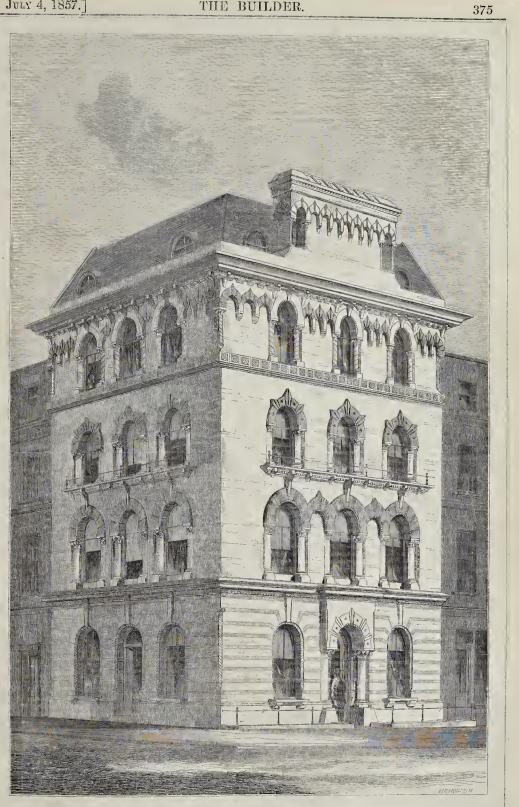

STREET ARCHITECTURE: COLOURED BRICKS.

TAVISTOCK · CHAMBERS, SOUTHAMPTON · STREET, STRAND.

This house has been recently rebuilt from the designs of Mr. Charles Gray, architect, of whose special adaptation of brickwork in street architecture we have before now spoken.

The fronts are faced with yellow malm bricks, and the gauged arches to the windows, cornice, and other parts are excented in red and black bricks. The ground-story throughout is built of red and yellow hricks, constructed in alteror real and yenow arters, constructed in alter-nate courses. The string-course to the third story is ornamented with Miuton's porcelain tiles, and the whole of the dressings to the windows, the porch, entrance, shafts, and caps of columns are excented in Bath stone.

THE BUILDER.

TAVISTOCK-CHAMBERS, SOUTHAMPTON-STREET, STRAND.-MR. CHARLES GRAY, ARCHITECT.

THE STONE AND IRON ROOFS OF THE HOUSES OF PARLIAMENT.

PUBLIC attention baving, by a recent discussion in Parliament, been directed to the condition of the iron roofs and the stone of the New Palace at Westminster, the following information respecting them may not be unacceptable to your readers, and may serve to remove any misapprehension that may exist on the subject

Metal roofs were not contemplated in the original Metai roofs were not contemplated in the original design; they were resorted to upon the adoption by the Government of Dr. Reid's plans for warming, ventilating, & by which they were required to con-tain, as they now do, the main smoke-flues of the building; and therefore it heame necessary that they should be constructed entirely of fire-proof materials. should be constructed entirely of fire-proof materials. A coating of zine, in preference to paint, for the external plates was adopted, upon the strongest testimonials from the French Government, and other sources, as to its long and successful use in France, where it still continues to be employed extensively, particularly in the dockyards of that country. Since its adoption at the New Palaca at Westminster, it has also been extensively used, both in public and private works in this country, and is still being used by the Government in our naw dock-yards. Experience, however, has proved that it is not capable of offering a long resistance to the dele-terious effects of a smoky and impure atmosphere, and the roofs of the New Palace at Westminster have consequently become partially covered with an oxide consequently become partially covered with an oxide of iron or rust. As regards their stability and weatherof iron or rust. As regards their slability and weather-proof qualities, however, they are unon the worse on that account. No difficulty, moreover, exists in re-sisting all further axidation, by covering thean with one of the anti-oxide compositions now in use, which may be done at a very moderate cost. Several of these compositions have been in course of trial, in varions parts of the roofs, for some time past; and I bave reason to believe that I have discovered one that ware hear of the a long imposentiation. be said to be almost imperishable.

may be said to be almost imperistable. The choice of the stone adopted was the result of the labours of a commission, consisting of two of the most eminent geologists of the day, an intelligent mason, and the architect, who, in, the year 1838, visited every, quarry and locality in the kingdom likely to immish building stone. The stone at Anston, in Yorkshire, was selected and adopted by the Government, and every precaution has been taken to obtain asupply from the best beds of it. Upon the whole, it has turned out to be at least as good as any stone bitherts employed in Randon. Pacifors whole, it has turned out to be at least as good as any stone hitherto employed in Hondon. Portions of it, in particular situations and mader peculiar conditions, have doublices yielded to the deletrions. affects of a London atmosphere; but the perportion of the parts affected to those which are perfectly sound is influitesimally small; and it is remarkable that the decomposition is almost exclusively confined to the decomposition is aimost exclusively conniced to the plain faces, the monided and carved portions of the work being generally as sharp and perfect as when first excented. To say, therefore, as has been reek-lessly asserted, that the stone is perishing in all directions, conveys a most unfair and exagerated impression relative to its actual condition. Various emperiod means however are mediable for accessing economical means, however, are available for arresting all further decomposition of the parts affected, and experiments bave hern in course of trial for years, with a view to determine upon the most effectual and unobjectionable process to be employed; and it is to be hoped, therefore, that ere long-all further decom-position will be successfully arrested.

CHARLES BARRY.

UNIVERSITY OF METROPOLITAN SCHOOLS AND COLLEGES.

Or the phases of our time and generation, the Within a short period two nniversities have been founded, and most successfully carried out, in London, and three in Ireland, besides unany provincial colleges. In addition to this advance, all the creat towns have instituted a built all the great towns have instituted schools of art, of design, and of general instruction, for the-masses inhabiting these emporia of trade; but the most palpable sign of advance is discernible in the more liberal admission to the old univer-The "Atma hole note and atmission to the out mives-sities of extern probationists for literate degrees. The "Atma Matres" have at length opened their bosoms for the tutelage of the population at large, and learning is no longer confined to the ter.

In such a position of affairs, an allusion to the chartered schools and colleges of the great metropolis may not be out of place. There are many nohiy endowed foundations, with eapa-cious buildings and distinguished teachers, within the busy and fuliginous precincts, which originally ware placed educations has the school of t originally were placed advantageously for the

education of youtb, where they stood apart from the bannts of commerce and the turmoil of husy millions. The site of these colleges was in those days comparatively valueless, but now snrrounded by honses, heaped together in unhappy proximity, the ground they occupy is of inestimable worth, being as indispensable is or mesumatic worth, being as multipensanic to the requirements of an improving eity, as it is insuited and improper for the residence and education of congregated infants. Educational conferences show the tone of public optimion; and the zealous perseverance of Royalty in the promotion and culture of sciences and aste mediate the schools of instruction

THE BUILDER.

and arts predicts that schools of instruction shall be hereafter more effective in spreading widely that intelligence which cnnohles a nation, and that knowledge which is the essence of power at home, and the foundation of wealth in

To clear away the enrices masses of deforming in which the busy trade of London heaps its wealth is not possible for any Government less absolute than that of imperial Angustus. The assume than that of impetial Angustus. The whole estate of the corporation could not suitably lay open St. Paul's; nevertheless, by degrees amendments may be effectuated in the surrounding fabrics of that and of many other structural objects, which enrich, but do not grace nor dienify the City, as there another Part grace nor dignify the City, as they ought. But grace nor dignify the City, as they ought. But there are foundations, possessing also inherent architectural merit, which are unnecessarily built about and blocked in, notwithstanding that there was ample space of ground for their proper allocation. Cbrist's Hospital is the most remarkable instance of this kind: the church, the hall, are searcely visible from Newgate-street. The former, like many others of the civic sanctuaries, is shrouded about with lofty. domiciles, which conceal all except the steeple the hall is certainly (temporarily) discernible through an opening left by the demolition of the Compter. But bad though the location is for architectural exposition, it is incouceivably worse as regards the objects to which so much wealth has been dedicated.

Founded (as the colleges at Oxford or Cam, hridge were) at a time when the population was under a title of the present amount ; when open fields bounded it without; when the atmosphere was comparatively pure, with a space of $4\frac{1}{2}$ acres, this college, in the days of Edward VI. might have been a proper alumnar establishment for the children of needy citizeus (for whom it was intended); but now that a swollen metropolis has grown to an extent of 7 miles in a radius drawn from any side of it, such a position is equally unsuited to the morality, the health, or the education of the pupils.

Increasing with the endowment, this school now nurtures, educates, and lodges, 1,000 boys: they are wholly domesticated within the preoucts, save during the periodical vacations: there is no playground but that paved yard in which their gambols afford amusement to observers through the irou railings, extending 100 feet along the pavement; therefore, when on furlough, their migrations, if not in the deserted pens of Smithfield, must be altogether within the bills of mortality; and yet the estates belonging to the founders' trust have many farms and hroad lands, convenient to the metroolis, whereon colleges might he founded cap of accommodating the whole number; while the hnildings now in their occupation, if sold, would midda revenue not only sufficient to erect snit-able colleges for 1,200 hoys, but to add im-mensely to the original endowment. In the present constipated state of the public thoroughtares, in the paneity of situations for

labouring population is driven farther from the centre,-under the absolute impracticability of obtaining any *locus standi* for institutions of inestimable social value,—is it not worse than stolidity to retain, in the heart's core of the metropolis, noble buildings with ample space, which are perverted to purpose destructive of the very objects for which they were destined? But there are other chartered schools, other

buildings, and other sites, which are equally ill-

[JULY 4, 1857.

central to the busiest mercantile traffic and storage,—bad in its vicinage,—in its air,—in its deficiency of lodging and dormitories; but great in its scholastic repute, as in its inflated rental, in its scholastic repute, as in its inflated rental, the Mercers' endowed academy of 150, and the City of London school, with its rapidly-advane-ing fame; there is St. Panl's school, close under the slade of the cathedral, hacking Old Change, witbont any playground but the "fornices," as railed in from the pavement of Paul's-chain; and, lastly, there is the Charter-honse, with its 44 boys on the foundation, its 130 boys externs (but hoarders with the salaried masters 1) - this (but boarders with the salaried masters !) : same charity also lodges and pensious 80 poor brothers, retired tradesmen, gentlemen, ar officers, and possesses, or onglit to realise, revenue of 60,000% per annum! And yet a And yet all these noble institutions, possessing profuse in-comes, established for the comfortable and healthful abodes of the young and the old, suffered to remain in the centre of the City's tumult, solely because the governors and the masters retain the antiquated notions of their order; and hecause they are the recipients, and the auditors, and the dishnrsers of incomes which anywhere else might attract observation, but which the world's capital and its commerce bury iu silence.

That the right institutions are here in the wrong place is as clear as that the right buildings and situations of London are grossly misapplied.

Communism of feeling and principle, in m of public utility, is fast over-reaching old habi-tudes of educational prejudice. Oxford and Cambridge are admitting the necessity of em-bracing a more extensive admission to the tests and examinations of university diplomas: the extension, if uot the generalization of their alumnar influences is recognised. May we not, then, hope for the advent of some congenia spirit amongst civic scholastic preceptors, which might adopt aud universalize the same system, so that the princely revenues so pionaly dedi-cated might effectuate the most good; in the best possible manner i

A university, for example, founded on some of the Christ Hospitalor Charter-house estates, a university of several colleges and schools, for infants, adults, and inveusceuce, founded in a rural district, uot very remote from town, the land and buildings occupied to be paid for and raised ont of the separato estates of the various great schools, for their separate use, the various foundations in London to be sold, and remitted to ready and willing purchasers of the overcrowded city, but strictly under limitation for scholastic purposes,-that is, as to the reinvest-ment of the purchase moneys, by which might be realized vast sums. Such withdrawal from London would,

like bloodletting from a plethoric patient, relieve the pressure that impedes a redundant circula-tion : it would be more in conformity with the objects which the founders had in view, as it must be more conducive to the health, comfort, and progress of those children and pensioners who are now incarcerated in urhan slums, not

as beneficiaires, but prisoners! Fancy the central area of the Charter-house, with its nohle and convertible hnildings, as available for one or more public institutions; or St. Panl's site cleared wholly off, together with the western range of the Old Change (of which it forms one-hall); or the commercial value of Merchant Tailors' rightly applied. But Christ's Hospital, as a central position, would realize over 200,000%; and so on of the other endowed schools. This clearance would leave room for emendations eagerly sought after, but imprac ticable, so long as the central seats of trade are thus occupied or retained : such ancient ascrip-tions of right to private boxes in the grand theatre of commerce are inconsistent with the requirements of the day, whilst the benefits these city locations confer can be of no value to those whose habitudes and discipline relate to the performances before and around them. The academic groves are always best removed

from citics. There ample scope can be secured placed as regards the nurture and education of for study or for recreation;—there more economically boys, situate in a retired lane (Cross-street, off erceted;—and there the genius of architecture Canon-street), an old, tottering, clumsy pile; may find a new field for the exercise of those

Kett, Essex, and even in Middlesex, upon which a university of schools might advantageously be founded. Perhaps it would be necessary that an Act of Parliament should sanction the removal of statutory trusts: if so, there is no deficiency of philanthropic and literary M.P.s. to allot such a measure through the House. The to pilot such a measure through the House. The removal of individual schools has been nrged by the writer before now, but the withdrawal en masse as an aggregate university is broached for the first time

Ont of 3,000 resident pupils enrolled in the metropolitan first class schools, there are not 300 whose parents or gnardiaus reside within the limits of population. How much better, and happier, and bealthier would they be in a college ? Day-schools on a limited scale rural should certainly remain for the benefit of the small minority; but such establishments need neither the extent of ground nor scope of house room that is indispensable for large num-bers congregated in a fixed domicile; neither would they require the staff of visitors, governors, masters, bursars, chaplains, servitors, anditors, and the hosts of other high sataried and feed employee with hard and obseter names.

It is a known fact that one-third part of the endowed revenues of great schools is expended on salaries and other modes of dishursement not educational; and the formularies of antiquity with regard to these are not essential nor applicable to the usages of our time. London University retains none of them: this noble foundation completely educates and accom-plishes 600 non-resident students : conceived in plishes 600 non-resident students: concerved in the great spirit of reform, it has germinated in our time, and the patron, Lord Brougham, took care that a snitable position and ample space should be reserved for ulterior enlargement. The Queen's College is also illustrions for an improved. curriculum, but it is too much cramped, and most unhappily situated: that university migb occupy more appropriately one of the vacated foundations, in which there is abundant room; and the halls of Christ's Hospital, if vacated, would be certainly more àpropos to its objects. Universities there must be in London : they

have taken root, and are germinating with huxuriance: educational schools are also indis-pensable; but residential asylums, whether for pensable; but residential asylums, whether the aged or for the rising generation, ought be transferred to situations where study should be free from the seduction of vice, and where the breath of Nature might inspire the hearts of those who study Nature's laws.

GIGANTIC DRAINAGE OPERATION.

QUONDAM.

If is a rare thing to find private outperformance of the second intelligence operating upon so extensive a scale as in an instance which we are about to cite; and we cannot allow the opportunity to pass of commending the calightened policy which prompts the outlay of capital in a direction which promises no carly return, but of which the future results will be incalculably beneficial, not only to be mich andware to to the neighbor of the second s not only to the spirited landowner, but to the neigh-bourhood generally. The work we allode to is a drain of four miles in length, which is being coo-The work we allude to is a structed by Sanuel Brooks, Esq. the banker, on his fine estate at S.le, in Cheshire, within six miles of Manchester. The cost of the catific length, we are told, will be about 30,0007, and one-half of the drain has here completed during the last twelve months. The drain is built of brick, and is 5 feet 6 inches in internal duck and 3 feat wide acide. The better The drain is built of brick, and is 5 fest 6 menes an internal depth, and 8 fest wide inside. The bottom of the drain is 10 yards below the surface of the ground, where it discharges into the river Mersey (near Carrington Moss). During the progress of the work considerable difficulty was experienced owing to the water from quicksmads, through which the opera-tions had to be carried on; but this difficulty is decreasing, as the drain is now being put in further from the river, and consequently at a higher level. the river, and consequently at a higher level. Already do the inh-bitants find an improvement in course, additions must be set aside. Of symmetrical fields in the salubrity of the climate, owing to the removal of fronts, the number is so great as to require no exam-the dampuess of the atmosphere in this level locality. In more complex forms, as dwellings, I place the

ONE very great argument for the adoption of the ONP very great argument for the acoption of the Gothic style for modern buildings is, that it will admit of buttress, of any kind of arcb, and occasion-ally of short lintels; of vanits and domes of all kinds; of roofs, high, low, of rid, bipped or gabled; that it will admit of any mode of construction whatever, the mode in any particular case depending on the parti-aller discussions. cular circumstances. As well, every kind of material is satied to it, properly used. Now these are things that can be said of no other style, modern or ancient. The reason of this I ascribe to the fact, that from the conductors of the structure to the fact, that from

The reason of this I ascribe to the fact, that from the carly ages of the art, architecture has made a progress, interrupted at intervals,—as after the falls of Roman and Medieval art,—but still a progress. First, from the massive hut unscientific art of Expypt and Greece, which, though unscientific, contained, without a doubt, the best science of the time, to the use of the circular areb in the mighty piles of Rome, ad with use to a remeal lightness of the proporuse of the ercular arco in the migbly piles of Rome, and with its use, to a general lightness of the propor-tions of the members. The art of this time, in some examples, as mentioned by Mr. Petit, had some tendency to the flual progress, which, however retarled by ages of darkness, resulted in the rise of Pointed Architecture, and the use of the pointed arch, and still further reduction of the mass of mate-wide acculation of the mass of materinks, —a progression which, if it did not continue to the fall of the art, at least must have continued until the general use of the low arch, in situations in which a loftier one would have been better.

The works of the revival of classic art are frequently aly beautiful, but those which are the hest and truly beautiful, The product of the second seco finest in construction are found to be after the Gothic dered necessary to endow with the appearance of being covered by a lintel.

being covered by a unit. If classic architecture (which, as used, is usually that of a time less scientific than the Gothie period) is to be $t\hbar e$ style of the nineteenth century, it should be worked out to accord with our advanced state of Is to be the style of the interteenth century, it should be worked out to accord with our advanced state of science, when I believe it will be found to have become Gothic, except in mere detail. For iostance, in many cases the superior science of the pointed arch, of accessity prevailing over others, will implant in it are of the most correstioned of the in it one of the most conspicuous features of the Pointed style, and so, doubtless, with others. In modern Gothic I am afraid the frequent error is

to slight construction for mere form,-fashion. For instance, in an arch of considerable span,-as to a bridge,—unless the versed size of the arch be greater than half the spin, why should a pointed arch be used? for in a low arch it appears evideut that the thrust of a pointed arch would be more horizontal than that of a segmental one, consequently worse coustruction.

coustraction. And now for an argument which the opponents and the advocates of the Gothic style, as well as those who favour both it and the Classic, have used in their several ways.

The first absolutely decry the slyle for modern The first absolutely decry the slyle for modern buildings anywhere: the second absolutely would have it used everywhere; while the third, denying its propriety for towns, admit its accordance with the contry, on the ground of its irregularity. If it were granted the style is irregular, which it is not, should we slight all its science and east it saide? By uo means: our problem would be to mould it to our use, and, where regularity was required, to make

But I think it will be found that simple buildings, so a church or a hall, will be found to have a regular symmetrical plan, or at least a symmetrical front: of course, additions must be set aside. Of symmetrical fronts, the number is so great as to require no exam-

talents which are now in evidence before the public. The Gothic may appropriately, read, a case an encouragement to improve the value of their property by grappling at once with the drainage perfection of the symmetry, not to perfection or improve the value of their property by grappling at once with the drainage perfection of the symmetry, not to perfection or improve the value of their property by grappling at once with the drainage perfection of the symmetry, not to perfection or improve the value of their symmetry, not to perfection or improve the value of their property by grappling at once with the drainage perfection of the symmetry, not to perfection or improve the value of their property by grappling at once with the articles while awarding this proses. Nevertheless, while awarding this proses, we cannot must be academy of 1855. There are estates, in school-trusts, of many functions of acres, in Hertfordishire, Surrey features, whether, in other words, the object might advantageously be founded. Perhaps it would be necessary the full appropriate the fullings, as anteneour against the considered external symmetry to be sub-fection of the signed it; but most frequently, food billings, as intervient, such as of symmetry, hold the graphing at research with a university of schools might advantageously the founded. Perhaps it would be necessary while the fullings as and rooms, &c. to which the Gothie architect and the second external symmetry to be sub-fection. servient

serviced. The Golbic architects copied nature by imitating her principles. Of all their utilitarian constructions, as buttress and pinnale, window and chinney, they made most exquisite heatiles, and, where possible, arranged them with symmetry. It is searcely neces-sary to point to the human figure, and mark the beauty of the parts, the eyes, the month, &c. or to point out the symmetry and regularity in the arrange-ment of the whole ment of the whole.

In fine, it is the identical principle of utility made beautiful, and arranged hy symmetry, that gives rise to the feelings with which we view a Grecian temple, a Gothic cathedral (the Parthenon and Freiburg Minster), or a finely proportioned human figure. It is the science of the second building, and its aspiring beauty, that give it the pre-emiuence.

It is for us now to work out a progress in the Pointed style—to make it the true "style" of "57."

CHURCH-BUILDING NEWS.

Oxford .--- We are informed that the church built Wheatley, near Oxford, is not Italianised Decorated, as stited in an Oxford paper, quoted by us, but is pure Early English in style.

*Aljeabury.--*The comtery buildings and works at Ayleabury.--The comtery buildings and works at Ayleshury are progressing. The designs were obtained by public competition, and, out of about thirty sent in, those of Messrs. Poulton and Woodman, of Read-In, Guose of Messes, Foulton and Woodman, of Read-ing, were selected, and these gentlemen are carrying out the designs. Mr. Strong, of Windsor, is the con-tractor for the chapels, and Mr. Sharp, of Aylesbury, for the boundaries. The two chapels are in the Decorated style of Gothic architecture, and each is to have a bell-turret of similar altitude and character.

Core's End.—The ebapel at Core's End is about to he repewed and otherwise improved, and schools erceted over the vestry, on plans provided by the archi-

erested over the vestry, on plans provides of interactive texts of the Aylesbury cometery. *Nottingham.*—The following (enders for building a new chancel and other works at St. Mary's Church, Ratcliffe, near Nottiogham, were given iu :---

Mr. James E. Hall, Nottingham ... £970 0 0 0

Mr. William Lee, Retford Mr. C. C. and A. Dennit, Notting-605 0 0 ham

Quantities not supplied. Mr. Charles Baily, Newark, is the architect employed. *Kirby Muxloe.*—The church bere has been restored

Kirog JUX702.— The church here has been restored to some extent, at an outlay of 5000. to 6000. and a sebool in connection with it is being creeted on plans in the Gotlio style, provided by Mr. Burtefridd, of London, architect, and entrusted to Mr. Herbert and Messrs. Lindley and Firn as the huilders and stonemasons

masons. Blackburn.—The cemetery approaches completion. The chapels are on an emiacnee fronting the Whalley new road. In the centre is the Church of England Chapel. The plastering of the interior of this edifice is suble interior of the acousticate the masonry not being Chapel. The plastering of the interior of this edince is only just commencing, the massonry not being quite finished. On the left is the Dissenters' Chapel, which is almost finished. On the right is the Catholic Chapel, rather larger than that of the Dissenters, but not completed. Each huilding bas a spire, the apex of which is recovered with a porces. A hell will be Competential and the second se The upper are fitted with tracery aracter. The designers bave also of a geometrical character. The designers bave also furnished a list of corresponding designs for the re-maining five windows on the south side.

Garstang — The first stone of a new Roman Catholic church was laid at Garstang on 15th inst. The church, when erected, will accommodate should follow the second second second second second second second and St. Michael. The architect is Mr. E. G. Paley, of Lancaster, who is also cagagel in creeting the new Roman Catholic church at Lancastr. The building consists of nave, 77 feet by 26 feet 6 inches, divided by an arcade of five arches from a north aisle the same leagth, and 18 feet 6 inches; under the same leagth, and the start of the same leagth, 23 feet by 26 feet 6 inches; Lady Chapel (separated from aisle and chancel by an arch), and western tower, 22 feet 6 inches square, and 61 feet high to the top of the building on plan and without the tower is a parallelogram, 100 feet long by 46 feet broad, and is divided by columns and arches. A window of five lights, filed with tracery, occupies the east wall. The contrasts have been taken for about 30,000. by Messrs. Harrison, Wilson, and Walker, of Lancaster, and Mr. Harrison, Wilson, and Walker, of Lancaster, and Mr. Waterbouse, of Garstang. Schools and master's house will be hall at a little distance from the church, and will consist of two principal rooms, each 40 feet by 18 feet, with entrance porches, open roof, &c. They are to be chiefly of hrick, with stone dressings.

Edinburgh.—The restored parish church of Old Greyfriars, Edinburgh, has heen opened for public worship, after an interval of twelve-and-a-hal'years. The church was accidentally hurnt down in January, 1845, the walls alone maniners and theoreh The church was accidentally hurnt down in Jauway, 1845, the walls alone remaining; and, though re-stored outwardly on the same model, it still exhibits some improvement. In the interior a complete change has been effected. The galleries and pillars have been removed, and the entire area opened up like a large hall, spanned by an oaken roof. The windows (intue in numb-r), have been filled in with stained glass, being alues the first appearance of this oroannent in the prish churches of Scotland, although Glaegoon Cathedral (which is one of the parish churches of that eity) will shortly exhibit this novel feature in a still more magnifect manner. The central window is erected by the congregation, and illustrates several of the parables. The other windows have been privately gifted to the church, and are intended as memorials

the parables. The other windows have been privately gifted to the church, and are intended as memorials of Scotch workhies and former pastors. *Elgin.*—The Parochial Boardof Elgin having offered hy advertisement a premium of 10% for the hest design for laying out the new parochial cemetry ground, six plans were offered in competition—some from Edinburgh. The premium has been awarded to Mr. Thomes S. Hutcheon, C.E. The ground is to be enclosed with a high wall, and all around the spaces next the wall will be laid out as tombs. The main avenue, or runinging entry, is by a large galeway on next the walk will be find out as tombs. The hain avenue, or principal entry, is by a large gateway on the north side, fronting Eigin: on each side of the roadway withiu that is to be a line of lime-trees, and the intersecting walks will be so arranged as to admit of a hearse to each grave stance. The walks are all The increase of the second state of a large a so and the of a harse to each grave-stance. The walks are all to be bordered with adorificrous shrubs and flowers, and at intervals the express and yer, with patches of other appropriate evergreens, will diversify and heatify the ground. In the centre of the site, a space is reserved for a chapel, with valls under-meth &e

MINTON TESTIMONIAL COMPETITION.

IN RODY TESTIMOVIAL COMPETITION. IN reply to advertisement twenty-nice designs were sent in, and these were exhibited five days before the decision was arrived at. A sub-committee selected five, especially pointing out those having the motioes of "To be or not to be," and "Sub Cruce," although they decidedly gave the preference to the former. The others selected were under the motioes "Hope;" a Geometric motto No. 11; and Stoneheuge A: the three first were from architects residing out of the merichbautheod; the two last were from architects in three first were from architects resulting out of the neighbourhood; the two lask were from architects in the neighbourhood. The decision of the committee was all hut unanimous in favour of "To be or not to he;" which was found, on opening the letter, to be from Messrs. Pugin and Murray, of London and Coventry. The architects guarantee to carry out the decime for the sum architects guarantee to carry out the Four accession and the architects guarantice to carry out the design for the sum specified in the advertisement, namely 2,500. The style of the selected design is described to us as "Venctian Gothie."

THE SOCIETY OF ARTS EXAMINATIONS.

THE SOCIETY OF ARTS EXAMINATIONS. The one hundred and third anniversary of the Society of Arts, held last week, was full of interest and encouragement. Last year was the first in which the Society's examinations were thrown open to pupils of the evening classes of Mechanics' Institutions throughout the ecountry. The results of these exami-nations have been very satisfactory: the number of competitors has increased four-fold in the second year of its trial, having monatod this year to upwards of 200. On the 24th ult, the conference of the dele-gates from the Mechanics' Institutions was held in the Adelphi. There are nearly 800 of these Institu-tions in the kingdom, 300 of which are in connection with the Society. Several important sobjects were tions in the kinguon, so of which are in contents were with the Society. Several important subjects were discussed at the conference. Mr. George Dawson addressed the meeting on a scheme of providing good

tectures at a penny per head for the andience. Pro-posals to request the trustees of the British Museum to permit portions of their duplicates to be taken by a profession if teacher into the provinces, and to recom-mend the purchase of the Sonlages collection by the Government, were rejected. The meeting was unani-mons in favour of conferential visits of the Society to Institutions in union with it.

Institutions in union with it. The following are the names of the candidates to whom prizes were awarded at the recent examinations in Londou :-

140, the cho' one recommended to notice, is uppear-iced to a corpenter in Lincoloshire, and has con-tinued constantly to work at his trade, baving devoted all his loisure, part of his meals' time, and allowed holidays, to the study of drawing; and that although he could give but one hour to the mechanical draw-ing he had employed it most satisfactorily by draw-toria and the satisfactorily by draw-ing he had employed it most satisfactorily by draw-ing he had employed it mos ing each object as it most satisfied on by drifts, ing each object as dictated. If he had acquired the theory of perspective from books, testing and apply-ing its rules to natural objects. An addition of useful books to the mon-y prize was therefore suggested.

UNIVERSITY COLLEGE, LONDON.

DISTRIBUTION OF PRIZES TO THE STUDENTS IN ARCHITECTURE AND CONSTRUCTION FOR THE SESSION 1856-57.

ARCHITECTURE AND CONSTRUCTION FOR THE BESISTON 1856-57. ON Wednesday, the lst of July, the annual distri-bution of Prizes in arts took place, the Right Dioa. Si Joba Shaw Lafever, Vie. Chancellor of the Univer-sity of Londoa, in the chair. We would call atten-tion to the importance of these examinations to the young shilents in arebitecture. They are not mere matters of course; they are the result of a year's earnest, perserving study on the part of the student; who, during that period, must have passed through a methodical series of instruction from his professor (Donaldson), and accumulated a considerable mass of most useful information, available in his after profes-sicaal pacifie. It is the best preparation for the competitive system, now often acted upon, as it pre-pares a young man for the scarehing trial through which he will have to go, and the several tupies em-hereebranchesrequired fortheofficerof distriet surveyor. The production of a prize or certificate, carried off in these intellectual excreises, produces a most favour-able impression, as a guarautec that the individual has already done something meritorious to deserve such a distinction, and that he his gone through a certain degree of instruction and mental training. *Architecture —Fine Art. First Year*.—Prize and first errificate, *Proderick Judge*: second certificate, John S

degree of instruction and mental training. Architecture — Fine Atr. First Year.—Prize and first certificate, Frederick Judge; second certificate, John S. Construction.—Errd Your.—Prize and first certificate, John S. B. George Molecey. Second Year.—Prize and first certificate, John T. Second Year.—Prize and first certificate, John T. Dintroc; second certificate, George Mills.

EXCURSION OF THE LIVERPOOL ARCHIFECTURAL SOCIETY

On the 27th inst, the members of the Liverpool Architectural and Archaeological Society visited lice Blundell and Serton Church. Iuce Blundell is heing restored, under the direction of Mr. Scoles, and the local Daily Post comments on the confusion which reigned there :---

The prevalence of brick and mortar in the house certainly accounts in a great degree for the confusiou cartainy accounts in a great argree for the contaitout and apparent neglect of these genes for art; but we could not but feel psined at seeing tapestries covering the stairs, and covered in turu with lime and briek dust, and the other annoying attendants on the huilders' handieraft." Mr. Weld Blundell, the present possessor of Ince Blundell, explained every object of

interest within the building, and exhibited a knowledge interest within the building, and exhibited a knowledge of art, betokening an appreciation, which would go to prove that the fault is none of his that the treasures have not been better eared for. "From the mansion we were conducted to the Pantheon, a circular huild-ing, terminating in a dome of fine proportions, and well lighted from the top. Here, too, neglect and dust and dirt were painfully apprent. Scattered about—some on pedestals—others lying on the floor shattered and defaced, and others exhibiting testeless attempts at restoration, were to he seen specimens of

attempts at restoration, were to be seen specimens of sculpture which at once attest the master hand. An incursion of a furious bull to the Pantheon is made accountable for much of the damage; and if we did not feel that high art would be descerated by even a not test that high art would be descerated by even a smile at such profanity, we could scarcely forbar lughter at beholding Jupiter bandaged as if for a compound fracture of the thigh; Minerva decorated with the order of the Garter for the same reason; and Apollo exhibiting a hand that certainly formed no part of the original sculptor's canning." The party effectuated sized tracther Mar L M

The party afterwards dined together, Mr. J. M. Hay, vice-president, in the chair, when there was some ple isant and pertinent speaking.

ARCHITECTURAL ASSOCIATION.

THE following gentlemen have been elected to serve as officers for the ensuing session :-

as officers for the ensuing session :-President, Mr. G. J. Wiley, A. I.B.A.: Vice-President, Mr. J. Norton, A. J.B.A.: Honorary Tressurer, Mr. J. A. Sorteriaries, R. S. C. Capes, A. STAINED GLASS.

STAINED GLASS. Halifar Parish Charch.—A memorial window has heen erected in the Holdworth Chapel of this church. The subject which fills the window is the "Raising of Lazarus," designed by Mr. Alfred Bell, and painted on glass by Mr. Laver, of London, from full-sized eartoons, under the superintendence of the artist. The moment chosen by Mr. Bell is when our Saviour beholds, stretched in the sopulchre, the emaciated form of Lazarus. On the right of the Saviour stands St. Peter. On the left, in the third light, are two figures of Martha and Mary. The subject is placed under canopies, and cach light, hencath, is areaded. Two other windows are in course of creetion, in the lateral chapels of the choir, from the same artist, but carried on thy different estabilishments. carried out by different establishments.

Bolton Parish Church.-The committee appointed erect a testimonial window in the parish church, Bolton, to commemorate the long services of the Rev. James Slade, as vicar of the parish, have commissioned Mr. John Hardman, of Birmingham, to execute the work, from a design selected by the committee.

St. Mary's, Chester.—An obitrary window, the cost of which has here defrayed by voluntary subscrip-tions, has just heren placed at the cast end of St. Mary's Church, Chester, to the memory of the late rector, the Rev. W. II. Massic. The principal subject is Our Saviour delivering IIIs commission to the Apostles, just before IIIs ascension. The figure of Christ occupies the centre, and the other compariments are filled with the eleven Apostles. Above the figures are angels bolding a label. In the higher compartments are angels bearing legends inscribed with extracts from the "Te Deum," and along the foot of the window is the inscription. Mr. Wailes, of Newszalle-on-Tyne, was the artist employed.

RECENT BUILDING PATENTS.*

2688. JOHN ROCK DAY, and THOMAS RUTTER, Birmingham.—*Metallic Tile for Roofing or Covering Baildings*. Dated 14th November, 1856.—This in-vention consists of a rectangular sheet of metal, one of the edges on the longer side heing turned up a right angles to the plane of the sheet. The opposit

of the edges on the longer side heing turned up at right angles to the plane of the sheet. The opposite edge is turned up at right angles, and the extreme edge turned down again so as to form an inverted trough-like figure running along the side of the sheet. A series of inverted V formed or carved elevations are raised aeross the sheet of metal by stamping, pressing, or otherwise.—Not proceeded with. 2706. Jours BLLING, Abingdon-street, West-minuster.—Chinneys. Dated 15th November, 1856. —In constructing a stack of chinneys, the top of each chinney is made of a conical or pyramidal form, of straight or curved contour, with or without a level or inclined base or surface on each side of the top of the stack. A vortical purition is placed between each chinney-top to prevent the smoke from one elimany descending into an aljoining one. 2718. ALEXANDRE MANE JOSETH ERCMAN

LILE, France. *Microanical Bakue* Joseff EferMAN LILE, France. *Microanical Bakery and Cookery*. Dated 17th November, 1856. What is chimed as new in this invention is, in so far as it relates to ovens, the application of several moveable baking fores placed one above the other, revolving by the action of a common central vertical shaft, for the pur-pose of baking bread and other articles of food with the same fire; which oven may also heat anartments.

pose of basing Dread and other bridge of locd with the same free; which over may also hast apartments. 2727. WILLIAM BRINDLEY, Moorgate-street. Treatment and Application of Papier Miché for Covering Ploors, Roofs, and other like useful pur-poses. Dated 19th November, 1856.—The patentee irst prepares the papier makehé by putting it into a wire or perforated metal sieve or frame to obtain sheets of any required thickness, according to the usual process of manufacture, and ormunct such sheets while in a soft state by embossing or figuring the surface by roising figures thereon, which is ifferted hy means of metal, papier mäché, or other steneil plates or like means. Another preparation of sheets of pupier mäché, rondering such manufactured articles noiseless whon trod on. Sheets of papier makehé may be corragated hy pressing thus between corrugated metal on Mexima D BROMAN, Pleet-abeted D and Corres and the presence of the state 2638. RICHARD ARCHIBATD BROMAN, Pleet-

corrugated metal or other moulds. 2638. RIGHARD ANGHBAID BROOMAN, Fleet-street. London.—Cutting and Dressing Stone, Marble, and similar Materials. A communication. Dated Sih November, 1556.—This invention relates to stone entting and dressing machinety, the object being to imitate band cutting as near as pussible. 2662. JOSEPH ECCLES, Blackburn, Lancaster.— Machinery for Making Bricks, Tites, Pipes, and Other Articles made of Plastic Materials. Dated 12th November, 1556.—Firstly, this invention relates

* Selected from lists in the Engineer journal.

THE BUILDER.

to machines for making bricks seting on the principle of that for which a patent was granted to James MacHenry on or about the 20th day of July, 1852; and the present invention may be considered as supplemental to that for which a patent was granted to the patentee, No. 2253, and dated the 20th day of October, 1854, which was for making hollow bricks, in machines acting on the principle, of the one descenin machines acting on the principle of the one above referred to.

PASSAGE OF DAMP THROUGH STONE WALLS.

In a paragraph of your last number relating to damp in walls, a question is put, how to make a wall of random stone waterproof. If the stone be so porons as to admit wet to go through it, perhaps the remedy you suggest may be the hest, as it does not alter the aspect of the facing-work. But I rather think there is no other efficient remedy than reudering the outside surface with cenent.^{*} Generally the wet enertrates through the motor injuits, and not et all performance survey with concern. Concerning the weit performance through the meritar joints, and not at all through the stone. Ofter this arises from the most being had or poor, or the joints not being well flushed up, and the great quantity of morter incident to such walling. But I am of opinion that if the front of the heds and joints were set in good Portland cement, to the depth of a couple of inches or so, it would effec-tually prevent the entrance of wet. The too frequent absence of projecting strings is another cause of the penetration of wet; for the water, instead of being thrown by the throating or mouldings off the walks, runs down the whole face, and is sure to get into the joints, and thus be absorbed into the hody of the work through to the inside face.

T. L. D.

Books Receibed.

Christian Memorials: being Working Drawings of Headstones and Tombstones, designed by Pro-fessional Members of the Worcester Diocesan Architectural Society. London and Oxford : J. H. and J. Parker.

To aid in meeting the wnnt expressed for charac-To and in meeting the wint expressed for charac-teristic designs for simple graveyard memorials, Messrs. Male, Truefitt, W. J. Hopkins, C. R. Clarke, and W. White have contributed examples which will be found available. The junction of metal and stone, as proposed by Mr. Clarke, is not ndvisable.

VARIORUM.

"The Carpenter and Joiner's Assistant," of which Part 1. is before us, published by Blackie and Son, of Edioburgh and Loadon, is intended, according to the address, to supply to the workmen, in a compendions form, "A complete and practical course of instruc-tion in the principles of carpentry and joinery, with a scheetion of examples of work actually excented to a selection of examples of work actually executed to serve as illustrations of the state of these arts at the serve as illustrations of the state of these arts at the present time, and gnides in preparing new designs." The plate showing the bent-timber roof of a shed at Maroc, near Bayonne, by Col. Enzy, is a valuable illustration. — The 284 Pat of "The Royal Gallery of Art" (Colnegbi, London; and Agnew, Man-chester), contains "The Prison Group," by Bouvy, very well engraved by Devachez; a sparkling portrait, "The Beauty of Albano," by Riedel, exgraved by Stocks; and Leitch's Londscape, "The Birth of Bcl-phenhe and Amorett," from Speuser, engraved by C. Consen. The work fully maintains its excellent character. character.

Miscellanca.

CONSECRATION OF A NEW IRON CHURCH IN LAMBETH.—Another iron church was last week con-secrated by the Bishop of Winchester. This church, which is of very considerable area, was manufactured and erected by Mr. S. Hemmings, the temporary and portable building manufacturer, of Old Ford, Bow. It is placed in William-street, Regent-street, Lam-beth-walk. beth-walk.

beth-walk. DRAWING IMPLEMENTS. — Messrs. Stanly and Robinson, of Great Throstile, have arranged a T-square, so as to be applicable for protracting angles and reversing angles, enabling the draughtsman to com-plete both sides of a roof, pediment, spire, or the hori-zontal lines of isometrical perspective, with once satting the instrument. It takes the reverse of the angle it is set to, by merely turning the square over. When the place is put close down on the cushion formed by the tongue, it may be used as an ordinary T-square. The construction being simple, it is sold at about the price of a common T-square, and will he found a nseful addition to the draughtsman's "tool-box." hox.

* By adopting, during the construction, a brick lining, and covering the back of each stone with pitch, the neces-sity for so objectionable a remedy may be avoided.-ED.

TEACH THEM A TRADE .- Dear Mr. Editor .- It TRACH THEM A TRADE.—Dear Mr. Editor,—It is my province to read alond many parts of your valuable paper. We were all much interested in your leading article on Reformatory Institutions (p. 313), which had reference to the employment of youth, par-ticularly applying it to ragged boys who are destinute of regular employment. My father often refers with evident satisfaction to the time when he was hound as an apprentice to a mechanical trade, and laments that there are not now the same means of apprenticing youth to distinct franches of business that there were in his carly days. It is, no doubt, well known to yourself, that owing to the system somewhat recent, of merging all the minor trades into the bands of a class now termed contractors, that there are not the class now termed contractors, that there are not the Class now terms, and contractors, that index are not the same means, as herefore, of training that there were when distinct branches of trade were recognised. If you would offer some suggestions on this subject, by which the leviathans could be induced to require their which the levisithms could be induced to require their forement to instruct a few apprentices to learn the different branches in their several departments, hy which means respectable as well as ragged youths could obtain situations, it would he the means of effecting a very desirable object, and would, no doubt, excite attention amongst those who never appear back-ured in authorithm their funds of the mean set. excite attention is motivate who never appear back-ward in subscribing their finds to the support of many benerolent objects which are ndvocated in your paper; and this, in my opinion, would contribute unare to the good of society, and to the promotion of their own real interests, than any contributions from their own lead university. their funds.—JULIA. ARCHITECTURAL PHOTOGRAPHIC ASSOCIATION.-

ARCHITECTURAL FIGTOGRAPHIC ASSOCIATION.— This association is now in shape, and the committee have issued a report setting forth their objects, show-ing what they hape to do, and inviting subscriptions. The report says.—" Basing their estimates apon the statements or individual photographers, your com-mittee consider that at least three copies of the mittee consider that at least three copies of the largest ordinary size—viz. 21 inches by 17 inches— unight he issued for a guines subscription, whereas one of them is now ordinarily sold for ahout 25s. Smaller sizes might be issued in considerably in-creased numbers, and they are informed that probably from thirty to forty steroscopic views might be given association, having a large and definite number of copies to provide, almost all of which will be issued; baving no vendor's profits to pay; and possessing many other advantages not accessible to individuals, may greatly enlarge the issue heyond the number which estimates upon present data would afford. An additional object to architects may probably be which estimates input present data would mitord. An additional object to architects may probably be ntained by enabling them to ascertain, not only the relative proportions, but also the actual sizes of huild-ings, and their details; as would be effected by simply measuring and noting the distance from the station of the instrument to n fixed point on the object." The proposition has been received in a very contail ran proportion has been no doubt as to its successful realization. Mr. Hesketh, of 95, Wimpole-street, is acting ns honorary secretary.

BRITISH ARCH#OLOGICAL ASSOCIATION . corgress of the British Archeological Association will be opened at the Guildhall, Norwich, under the presi-dency of the Earl of Albemarke, F.S.A. Angust 24th, and be continued until the 29th inclusive. The entire week will be devoted to the examination of the an week will be devoted to the examination of the an-tiquities of various portions of the city of Norwich and the county of Norfolk, emhracing also n part of Suffolk. Excursions will be made to Caistor Castle, Burgh Castle, Great Yarmouth, Thetford Priory, Ely Cathedral, Lynn, Castle Rising Castle, Binham Priory, Walsingham Priory, Barsham Hall, &c. The eather drals of Norwich and Ely will be examined under the guidance of Mr. H. H. Burnell and Nr. C. E. Davis : the and the converted of fine and an end. guinance of Mr. H. H. Burnell and Mr. C. E. Davas; the seulptures and monumental efficies, nucler the direction of Mr. J. R. Planché. The charters, decks, and muneipal documents, inspected and com-mented npon by Mr. W. H. Black. Papers relating to the various objects willed will as far as circum-stances permit, be read on the spot, and subjects will stances permit, be read on the spot, and subjects will be discussed at the creating sitting and conversations. The members and visitors will be conducted over the Castle of Norwich by Mr. Robert Fitch; and parts of the city will be inspected nuder the direction of Mr. W. C. Ewing and Mr. Fitch. The remains of the Benedictine Priory and Convents, inspection of ancient houses, &c. at Great Yarmouth, will be subjected to the subjection of Mr. Charles Palmer.

busses, ec. at other terms pairs, busses, ec. at other terms pairs, -A solution of yellow soap (with a certain portion of glycerine), is a preser-vative to red, yellow, and black pairits, when ground in oil, and put into casks, as they sequire no impro-per hardness, and dry in a remarkable manner when haid on with the hrush, without the use of the neual drying articles. This surprises me, that soap, which is so well known to be migable with oily substances, or at least the alkali of which it is composed, has not ulready been brength into me in the composition of oil colours with glycerine. J. B. N.

THE SOANE MUSEUM, LINCOLN'S-INN-FIFLDS.-We are glad to hear that Mr. Wentworth Dilke has been elected the Society of Arts Trustee of the Soane Museum, and we commend to his attention an early consideration of the inquiry whether or not this important collection may be made of real value to the community in general, and architects in particular, as an educational institution. Under present arrangements the fact of its existence is gradually dropping out of men's meroires. The time during which it can be examined should be extended, and ready means of access and study given.

METROPOLITAS ÁSSOCIATION FOR IMPROVEMENT or DWELLINGS.-The thirteenth report of this society states that the average rate of mortality in their buildings, Aleison-square, Panoras-square, Pelhamstreet, Pleasani.row, Queen's-place, Metropolitanter and the state of the state of the metropolity of Compton-street, has this year heen about one-eighth less than that of the rest of the metropolity is, hat, taking an average of the last three years, it has been little more than one-haff. While the receipts from the huildings since December, 1847, have been 368,393. 14s. 83. the had dehts have not amounted to 1607. The net profits for the year ex stated to be 38367, 0s. 10d. more than last year, Nulson-square being hetter occupied; but the chambers for single men have been unprofitable. The society have erected sixteen cottages in Pelham-street, Mile-end Newtown, and have resolved uct to proceed with the dwellings for 100 families at Westminster. The Brighton branch grappens to pay a dividend of four per cent.again this year, and reorganize themselves made the Liability Act. The Bristol branch has nearly completed accommodation for sixty-one families in all.

INSTRUTION OF MECHANICAL ENGINEERS.— The annual ession of the members of this society, for the reading and discussion of papers upon engineering topics, commenced in the lecture theater of the Mechanics' Institution, Manchester, on the 24th ult. ander the presidency of Mr. Joseph Whitworth. A number of papers were read by the secretary. Of those that were to be read we have already given a list. The first paper, by Mr. William Fairbairn, was a description of a large tubular wrongblirion crane, which has recently been crected at Keyham Dockyard, Devonport. The crane is built on the principle of a tubular bridge, and the peculiar advantages of this mode of construction, according to Mr. Fairbairn, are the security and facility with which the greatest weight can be raised to the top of the jib without the slightest risk of failure. It would require a weight of 63 tons to break it, and with a weight of 20 tons the deflaxion of the jib is only 3-73 in. : its actual strength is thus, it is said, much greater thau is ever initiative in adopting these eranes by baving six erected in the New Keyham Docks at Devonport, two more have been ordered for Devonport, and one of clossal dimensions for Keyham. — The dis-

THE BOTHY SYSTEM IN SCOTLAND, — The disgraceful accommodation still provided for farm servants on many farms in Scotlard came under notice at a Jastice of Peace Court at Montrose lately, in a charge of descrito of service brought against George Mason, farm servant, by Mr. John Smith, of Haughs of Kinnaird, the defeuce turning on the unfitness of the bothy and loft for human accommodation. The loft or sleeping-place for six men consisted of a corner of the stable-loft, 5 fect 6 inches in breadth, and 14 or 15 fect in length. The hothy proper, or day apartment, was circular, and about 12 or 13 fect in diameter, and 6 fect in height, and had no window or other opening for ventilation, except the door and the chimney. A conviction was not pressed for under the a incumstances, and the justice adjourned the court till an inspection was made by impartial medical men.

HOT.WATER APPARATUS.—The Birmingham Patent Tube Company have introduced an improved description of store and hot-water apparatus, by which one ordinary fire is made to heat several chambers. The heat is generated in a coil of tubing placed hehind the grate; the water in the coil becoming warm, begins to asceud and follow the travel of the piping, transmitting the heat obtained in the coil through to any length of piping. The peculiarity in the grate consists in its having a double hack, so that if it he required to increase the heat, the register is shut, and the heated air passes through the coil and up hetween the hacks, while to decrease the heat, it is simply necessary to throw back the register, when the chamber between the backs is closed, and the heat asceuds the chimmey in the regular way. The improvement in the arrangement of the piping consists in having the ends open, whereby accidents become impossibile, and the inconveniences generally attending the use of hot water for heating are removed. The apparatus may he usefully applied.

NEW COUNTY-COURT, DUDLEY. — A paragraph appeared in your pages some time since, stating that the contract was for 3,7757. instead of 3,4007, as you had heen informed. Allow me to state that the contract had nothing to do with the tenders as they were delivered. Your informant was perfectly correct when he stated the tenders as follows: — Nelson and Co. 3,4007. Millward, 4,1507, and Pecacok, 4,2607. "Your informant" has heen "informed" that a mistake was discovered in the lowest tender, notice of which was sent a week or two alterwards to the head quarters, and that being allowed, the contract was therefore for the larger amount. The respective amounds were well known two or three days after they were delivered, and the difference between the three well canvassed. It is not for your informant to impute motives, but the mistake, eurously enough, was some time in being found out. Here are the *facts*, as collected by—YOUE INFORMANT.

STATUS.—The inanguration of the bronze statue of James Wati, in front of the Koyal Infirmary, Manchester, took place on the 26th ult. In presence of a great concourse of spectators, including most of the memhers of the Institution of Mechanical Engineers, who have been holding their annual conference at Manchester, and very appropriately went in a body to the inanguration of the statue of their late "Grand Master." Mr. Fairbairn, as chairman of the Statue Cummittee, handed over the property to the care of the mayor and corporation.—Mr. John Steell, the Edinburgh sculptor, is employed in the formation of a statue of Allan Rams y, in freestone, to be creted on the new terrace at Ramsay-gardens, Edinburgh. The block is 11 feet long by 4 feet square, and weighs between 15 and 16 tons. The figure will be 10 feet high, and the pedestal 18 feet. Ramsay will not appear either as a Greek or a Roman, but as a Briton of the last century.—The O'Connell statue, by Hogan, for Limerick, has tow reached that city, and bas been placed on its pedestal at the Cresceut, where it will be hoarded up and enclosed till the day of inauguration.

COMPENSATORY SANITARY AFRANGEMENT. -- Near the Observatory of Washington, says the Mechanics' Magazine, there has cristed, on the banks of the Potomae, a malarious swamp covered with parasitic herks, the exhalations of which have, on many occasions, produced fever in the neighbourhood. It occurred to Licutenant Maury (whose name is honourbly known in connection with numerous public services of great meril) to oppose to these norisons exhalations plants possessing a considerable power of absorption. He accordingly had planted a quantify of the heliantus grandiforms, and these have here completely successful in absorbing the dangerous gases, and altogether avorting the fever visitation from the spot where it had periodically occurred for years.

THE LATE MYSTERIOUS DEATHS NEAR WHITE HATEN.—On the 24th ult. the coroner's inquest into the circumstances attending the mysterious cases of poisoning at Cleator Moor, was brought to a close, after several adjournments. Professor Taylor, who had been sout down by the Home Secretary, presented an elaborate report. Our readers are aware that the cottages in which the mortality occurred are built upon a heap of slag, or *débris*, from the blast furnaces of the Whitehaven Hennalite Iron Company. Dr. Taylor was of opinion, based on a series of experimente, that the deaths resulted from the generation of subpuretted hydrogen in this slag. The jury found that "the cause of death in all these cases bad arisen from the inhalation of subpluretted hydrogen gas, generated from the slag underneath the houses in y which they dwelt, and from the adjoining heap of the same material. In returning this verdiet, the jury recommend that the houses as Bowtborn-row, built upon the slag from the Hematite Company's works, should be sufficiently drained, and that all communidations be effectively cut off; and the jury are further of opinion that the houses so circumstanced caund be safely occupied until this be done." It ought to be remembered, that although every dwelling is not created on such apestferous basis, wherever there are stagmant drains or esspools, there subpluretted hydrogen is just as snrely generated as if it arose from slag: indued, much more surely, for the subplur may remain in its slaggy privon, but in stagmant cesspools or insufficient drains there are no such fixatives as those which keep it down in slag; at least till moisture heat and rot the subpluret, and liberate the noisoners where?

remain in its slaggy prison, but in stagnant cesspools : or insufficient drains there are no such fixatives as those which keep it down in slag; at least till moisture heat and rot the sulphuret, and liberate the poisonous "Mydra." OPENING OF ST. THOMAS'S CHURCH, WEST-OPENING OF ST. THOMAS'S CHURCH, WEST-MINSTER-ROAD, LAMPERTH. -- This newly-erected church was consecrated on the 24th ult. by the Bishop of Winchester. It was built from designs by Mr. Teulon, and contains three galleries, with acc.numodation for 1,033 persons, and 809 free seats. The estimated cost is 4,3754.; and that of the parsonage, 1,0464.; there remains a deficiency of 6304. JULY 4, 1857.

EMENY PAPER.—The Moniteur Industriel mentions an incenions method of obtaining fine emery paper for polishing metals. Slips of paper coated with fuesh starch-size are hung on ropes at different altitudes in a swall room which is afterwards carefully closed. A quantity of fine emery is then hlown in by means of a ventilator tbrough an aperture left for the purpose, by which means a dense cloud of emery-dast fills the room, but only the finest particles rise in the sir to a sufficient beight for them to be deposited on the upper slips: those of the second row receive a somewhat coarser sort, and so on, while such particles as are too beavy, and therefore too coarse for delicate polish, fall to the ground at once. Thus emery-paper of different degrees of fineness may be obtained by a single operation, and sorted with mathematical certainty.

EXPEDITIOUS POSTAL CONMUNICATION.—STR.— We get gas and water through pipes: why not our letters? I think it might thus be effected. Supposing there are twenty great thoroughfares, more or less, switch forming radii, baving for their centre the General Post-office: let iron tabes, in sections, quadrangular, be haid in the ordinary way under these lines of route, and as nearly as possible in a right line, and all meeting at the great postal centre. Each line of tube must be supplied with an "endless band," but of rather curious configuration, the sides being raised to reach the top of the tube, and the under surface supplied with an "endless band," but of rather curious configuration, the sides being form a coatinoous carriage stretching under our principal streets, and receiving letters, while in motion, the noment after leaving the hand of the poster, at the letter-box placed above the "band." The motion would be communicated by carrying the band over drums, connected with steam-machinery. The apparatus already briefly described provides for the collection of letters dropped over the haud through pillar letter-hoxes. I distribution of the letters might be performed (to stations) simultaneously, and by the same band. At convenient points on each line of the let subterranean chambers be formed, through which the tube might pass, which, being partly open, would admit of parcels of letters heing taken off the moving hand for distribution in the vicinity. Parcels of letters would be placed upon, and carried by, the hand in the following mancer: the band passing over a drum of large diameter at the General Post-office, would give smple convenience for the clerks to placepareels of letters upon the reliving portion of the band, which would carry them upon its back until taken off at the desired stations.—O. H. H.

SLAUGHTER-HOUSES.—I was glid to see your remarks on the crucity shown to animals; but you have only given a very faint outline of the harharity that is precised in slanghter-houses. I an in the habit of working at a shughter-house and the adjoining building.-and I can assure you the crucity I have witnessed has made me shudder. I am sure many woul' not allow veal to come to their tables if they knew half the torture the poor animal had suffered. I will now give you the particulars how the calves are murdered, for that is the correct name. * * There is a great deal of eradly practised in the shughtering of sheep, &c. I do hope you will do all in your power to expose the horrid work. I am fearful of giving my name, as my work would be at stake, so I will subscribe myself A JOBBING CARPENTER.

ROAD WATERING CAURIAGES ON RALLWATS.--I have heard lately many complaints from travellers of the dusty state of several of the railways, and that on many roads dust forces its way into the elowed earriages of the first class kind. I conceive that this musance might he easily remedied by attaching a *voatering* carriage, or earriages, to each train,--ory, perhaps, a special train of water carriages might pass from one end of a line to the other at an early hour in the morning, before the ordinary trains of the day begin their journeys. At any rate, some remedy should be found for the annoyance: the expense could not be very great, and if it were, is of much less moment than public comfort and convenience.

SUBSIDIARY.

JULY 11, 1857.

THE BUILDER.

The Builder.

HE germ of the modern railway system struck root and sprang up in our northern colliery districts upwards of 200 years since. Wooden rails were first laid down hy a Mr. Beaumout, near Newcastle, in 1602. They were found so useful that they rapidly spread throughout the colliery districts; and in 1745 General Cope made use of a live near Prestonpans, in Scotland. An intelligent French traveller, named St. Fond, who visited Newcastle in 1791, speaks in terms of great admiration of the collicry waggon-ways of that place and time, and urges them

on the attention of his countrymen. Improve-ments had been gradually made in them; and in 1776 a cast-iron railway, nailed to wooden sleepers, was laid down at the Dnke of Norfolk's collicry, near Sheffield, hy Mr. John Curr, whose son claims for him the invention of the cast-iron railway; but the first iron lines are helieved to have heen laid down at Whitchaven as carly as 1738. Mr. Curr must have had few predecessors, however; for sonew and unprecedented did his iron way appear to the labonring people connected with the colliery, that, helieving it in their ignorauce to he somehow injurious to their interests, they kicked up a riot, tore up the rails, and poor Mr. Curr had to fly into a wood, where he hid himself for three days to escape their fury. In 1800 Mr. Benjamin Outram, of Little Eton, in Derhyshire, used stone props in place of timber for supporting the ends and joinings of the rails, and such roads, according to Mr. Smiles, in his very intcresting volume on "The Life of George Stephenson,"* hecame at length known as "tram-roads," from a contraction of the word " Outram." There seems to he some little difficulty in this statement, however, through which we cannot clearly see our way. The word tram is one connected with the carriage of goods in more ways than oue : we have the trams or shafts of a eart in Scotlaud ; coal-waggons themselves have long heen known as trams in some parts : and thus the track-plates or rails of wood laid to receive these were called tram-ways. From the time of Outram, at all events, tramroads or railways rapidly extended, till at length they were generally adopted in the mining districts, and canal proprietors looked askance on them with a sinister interest, as " snakes in the grass," the Duke of Bridgewater remarking, when congratulated by Lord Kenyon on the successful issue of his inland "navigatiou" scheme, "Yes, we may do well enough if we can steer clear of these deuced tram-roads ; there's mischief in them."

Improvement, thus far, was confined almost entirely to the road. Railway waggons still continued to he drawn hy horses, the power of which, however, had been thus greatly econo-mized. Kailway improvement had almost reached its limits unless mechanical agency could he made applicable to the purpose of rail way traction, and inventors and projectors were not long wanting. One suggested sails to drive the waggous along the line before the wiud, much as it now does a train occasionally at no little speed without any sails at all. But the

* " The Life of George Stephenson, Railway Engineer," By Samuel Smiles; with Portrait, John Murray, Albe-marle-street. 1857.

most favourite project was the application of this was one of the main reasons of his want of steam power on the high pressure principle to railway traction, and not only to railway traction, hut to traction on the common road with out rails,-a still more favourite and carly project. Savery proposed a method of propelling carriages along ordinary roads, and the subject was shortly after (in 1759) suggested to James Watt hy Dr. Rohinson, at Glasgow College, and Watt even included it in the specification of his patent of 1769. About the same time, one Moore, a London linendraper, took out a patent for moving wheel-carriages hy steam, but it was not till 1763 that the first actual model of a steam-carriage is recorded, and that was constructed by a Frenchman named Cugnot, who afterwards built an engine on the same model for the French king,---hut its very power led to its suppression, for when set in motion it projected itself onward with such force that it threw over a wall and was at onec set down as too dangerous an apparatus for further use. This identical engine is now in the Conservatoire des Arts et Métiers. Tn 1772, an American, named Oliver Evans, invented a steam carriage for common roads, hut with no practical result. In 1786, William Symington, the steam-boat inventor, had a working model of a steam carriage coustructed, and he exhibited it at Edinburgh ; hut the roads there were far too had at that time to enable him to do anything with it. The first English model of a steam carriage was made in 1784, by William Murdoch, the assistant of James Watt. It was on the high-pressure principle, and went on three wheels, hy help of a spiritlamp, and thongh only a foot high it ran away from its inventor one night, and almost terrified the pastor of the parish out of his senses, the rev. gentleman imagining it to he a fiery "imp of Satan." Trevethick, an ecceutric genius, a pupil of Murdoch's, followed, with his steam carriage for common roads. Coleridge uarrates how Trevethick's cugine, too, while tearing away like mad along the road to Plymonth, hreaking into gentlemen's gardens, and with other playful tricks hy the way, so astonished and horrified a tollmau that he threw open his toll-bar like magic, feeling assured that he had the Devil to deal with, and refused to touch any of the red-hot coins which he douhtless imagined his strange customer was about to offer him. The management of these common road steamers appears to have long been a difficult point; and it was not unusual for such a machine to land its passengers safely in the middle of a hedge by the wayside, half-way house to its own proper terminus. Trevethick's engine was exhibited in London; but he wanted perseverance, and, indeed, was very probably theu on a wrong sceut, since not even yet have such carriages for common roads proved successful; but Trevethick did endeavour to apply the steam carriage to the railway, and constructed a special engine, in 1804, for the purpose, which actually dragged ten tons of har iron in waggons at the rate of five miles an hour; and, had he persevered, the locomotive might have had another history than it was destined to have; for he was on the verge of a great discovery. As it was, all this projector's endeavonrs turned out to he practically a failure, and he ahandoued the locomotive for more promising schemes. The final success of the locomotive was much

retarded hy an imaginary difficulty, ---namely, the erroneous supposition that if any heavy weight were placed behind the engine, the "grip" or "hite" of the smooth wheels of the locomotive upon the equally smooth iron rail must necessarily he so slight that the wheels would slip round upon the rail itself, and consequently that the machine would not make any progress. The wheels of Trevethick's engine were provided with rough projections, in order work, hut also of those at Leeds, which were of a to ohviate this supposed difficulty, and probably much superior description. Stephenson had

The first locomotive line of railway was one hetween Leeds and the Middleton collieries On this line, a length of three miles and a half, locomotives, invented by Mr. Blenkinsop, of Leeds, hegan to run in 1812, and continued to do so for many years. But still the erroncous idea prevailed; for Bleukinsop's engiues had toothed wheels which ran in a racked or toothed rail. To obviate the same imaginary difficulty, other patents were taken out; one for a chain to extend along the line, with a twist of it round a barrel-wheel on the engine ; another for a locomotive to go upon legs !

Mr. Blackett, of Wylam, made persevering efforts to employ the locomotive of Trevethick, and others, on the Wylam waggon-way, one of the oldest in the north of England. Now, it so happened that an old colliery eugine-tender, of the name of Stephenson, lived in a small cottage hy the side of this tramway, and that the man, his son, who was destined to mature the locomotive and the rail, and to become the true " railway king," was horn in this same cottage at the fitting time, so as to have the work of his life set, as it were, hefore his very cycs, so soou as he had become capable of beuchting by the experiments of Mr. Blackett. Had this latter gentleman experimented only a few years sooner. or had he not begun till a few years later, in all prohability the railway system would have still remained to he elaborated. It is a singular fact, too, as we may here observe, that at one period of the life of the chosen man on whom so much of the future progress of his country depended, he was on the eve of starting for the United States as an emigrant, so small did his prospect of good fortune in his native country appear. his was a crisis in the fate not only of an individual, hut of a country, which stands out in curious coincidence with a similar crisis in the life of another individual with whom Stephenson may he happily compared, namely, in the fate of James Watt, as well as of his native country too, at that period; for Watt, as we uot long since noted, was at one time on the eve of emigrating to Russia, whither the long-headed Russians were very anxious to attract such a prize.

The first engine placed on the Wylam waggonway was one of Trevethick's, in 1812. When the cumbrous machine was set in motion, it would not move an inch,-at least till it flew all to pieces. The next was built by Mr. Blackett himself, and it proved more successful than its predecessor. Still it was on the cog-wheeled principle, and the way laid down for it was racked. It crept along at a snail's pace, and was constantly breaking the cast-iron plates of the railway. At length it became so erauky that horses were regularly sent along with it to pull it out of the scrapes into which it was constantly getting, and at last it was voted "a perfect plague," and was dismissed the service. Before he placed another locomotive on his tramway, Mr. Blackett, hy means of a frame and windlass, proved that the adhesion of wheels on smooth rails was quite sufficient to enable him to work a locomotive without slipping. Thus was the fallacy which had heretofore prevailed on this subject completely dissipated, and rack rails, toothed wheels, cudless chains, and legs, were all alike proved to be unnecessary for the efficient traction of loaded waggons upon a moderately level road.

George Stephenson now comes on the railway stage with his improvements. He had frequently witnessed Mr. Blackett's experi-ments whilst tending his colliery engine at Killingworth, ucar Wylam, and he made himself intimately acquainted, not only with the merits and the delects of the locomotives there at

VOL. XV .--- No. 753.

already made bimself respected by his employer, Lord Ravensworth, and, though a humble engine-man, he had frequent conversations with his lordship, and at length persnaded him to supply the means of forming a locomotive, which, with great difficulty, from the want of fitting mechanics at that time, he at length effected, following to some extent the plan of Blenkinsop. It proved to be the most snecessful engine yet constructed, and was capable of drawing eight loaded carriages of thirty tons weight at the rate of about four miles an hour. "Blutcher" was, nevertbeless, miles an hour. a cumbrous and clumsy machine, and the result was anything but decisive, when Stepbenson at this juncture applied the steam-blast, and thus at once doubled the power of the engine. Without the steam blast, by which the intensity of combustion was kept up to the highest point, and the evolution of steam thus rapidly effected, high rates of speed by means of the combustion of coke could not have been attained, and locomotives might still have been dragging themselves unwieldily along at the rate of not more than five or six miles an honr. It was by means of the steam blast, in conjunction with the multitubular boiler, that be after. wards secured the triumph of the locomotive on the opening of the Manchester and Liverpool railway. Numerons other defects were remedied in subsequent constructions, and, in 1815, Mr. Stephenson, by dint of patient and persevering labour,-by careful observation of the works of others, and never neglecting to avail bimself of their suggestions,-had succeeded in manufacturing an eugine which included the following important improvements on all previous attempts, namely, - simple and direct communication between the cylinder and the wheels rolling upon the rails; joint adhesion of all the wheels attained by the use of horizontal connecting rods; and finally a heautiful method of exciting the combustion of the fuch by employing the waste steam which had formerly been allowed nselessly to escape into the air. "Although many improvements in detail," says Mr. Smiles, "were afterwards introduced in the locomotive by Mr. Stephenson himself, as well as by his equally distinguished son, it is perhaps not too much to say that this engine, as a mechanical contrivance, contained the germ of all that has since been effected. It may in fact be regarded as the type of the present locomotive cugine."

Our immediate purpose having been simply to show, in a brief sketch, based on Mr. Smiles's very interesting volume, how the locomotive and the rail came together, and from what begiunings the more matured system was de veloped, we shall not lengthen our sketch by any further recital of what followed; all the more prominent subsequent procedure heing more familiar to our readers and the public in general than what preceded the first manifestation of the public astonishment when incredulity was no longer possible, and men of science and mark became ashamed of their false predictions.

To all who desire to know what followed, as well as, far more fully, what preceded the grand opening of the Liverpool and Manchester, we can ouly say,-read Mr. Smiles's excellent book and they will not only be satisfied in that respect but amnsed and instructed in many others.

THE DESIGNS FOR THE GOVERNMENT OFFICES

In our last article, we referred to the principal Gothic designs-to the authors of which, premiuns have been awarded-and adverted to some interesting ave even awarded—and adverted to some into esting greations which were connected with them. We also numtioned what was the general scope of the design No. 116. The author of this work, as it will have been seen, likeal those who have received premiums— ualess Mr. Hastings, the author of one of the block

* See p. 370, ante.

plans, should prove an exception-viewed the three plans, should prove an exemption - new that the term subjects announced for competition, as not admitting of the separation pre-supposed, and which, by the awards, has been assumed as though really keep up. Mr. Scott, indeed, considers that the general street awards, has been assumed as though really kept up. Mr. Scott, indeed, considers that the general street plan and the block plan of the Offices, have not necessarily any connection with one another; but he says the block plan and the detailed designs for the Foreiga-office and the War-office, manifesily ought to he the creation of one mind. The street plan, he thinks, might readly be prepared without reference to any particular plan of the Offices. This is going on the assumption that the site of Westminster-bridge is, as he contemplates it, retained; hut the question of the bridges really opened the whole exten-sive problem. The level of the embankment, also, needed to he considered. Mr. Scott, however, pre-pared all the drawings required, and has been awarded a premium (of 3004.) ostensibly only for the Foreign-office. His two Offices are in separate huildings, or office. His two Offices are in separate huildings, joined only by archways; but one of the two wor hardly h-rmonise with the work of another architect better than would the design hy Mr. Dwyer (126), better than would the design by all Dwal (Doy) for the War-office, which is merely one portion of a general building. Leaving the question of the awards for any separate notice that may be called for-recol-lecting, however, that we have already spoken at some length of the mistakes which have led to the difficulties of the adjudication-we proceed with our notes.

In the general plan in design No. 116, the three bridges are provided ; and as to Westminster-bridge, after giving the arguments for the present site, the author "cannot conceive of a bridge hetter placed." Besides the Charing-cross-bridge, he retains Hunger-feed bridge as a foot hetdree normerly holding that if ford-bridge as a foot-bridge, properly holding that if the two hridges would he near together, that would be much hetter than placing the new bridge wrongly. The principal new line of street which he provide extends from Buckingham Palace to the hend of Vic toria-street, and then takes in Great College-street, in preference to following the direct line to the Vicin preference to following the direct line to the Vic-toria Tower, which, as in some of the plans, would intersect the Abbey precincts. His line he thinks, in fact just as good as the other. He would then open out and restore the Chapter Honse, and having removed the honses in Abingdon-street, would form a wide double cloister—to receive the incongruous monuments of Westminster Abbey, and new monu-ments of statesmen—extending to the corner of Col-lege-street, and returning round the College-gardens to the Dormitory of the Westminster-school. He lege-street, and returning round the College-gardens to the Dormitory of the Westminster-school. He advocates in terms which should receive attentive consideration, the retention of the site of St. Mar-gard's Church. He anticipates the removal of the Law Courts;--hut, at least, next Bridge-street, thinks Sir Charles Barry's work should not be completed quite as proposed. In the general arrangement of the Offices he would leave the Board of Trade, and would add to it at the back, but has laid out the whole remaining ground, providing for one grand arrangement of Gothie buildings. With us, he remarks on the obvious locompleteness of the site without the ground now occupied by Richmond. remarks on the overlap to completeness of the site without the ground now occupied by Richmond-terrace. On the river side he has a grand public terrace entered under lofty towers, and having a covered cloister from eod to end. To Parliament-street he would give a width of 150 feet, placing along the control a need sneed sneed somewhat like sizes he would give a which of 100 rest, parents along the coultr a pavel space, somewhat like that in the Union den Linden at Berlin, on which might be raised statues; and at the southern ex-tremity, at a centre from which the lines of different trenify at a centre from which the innes of discress, roads would diverge, he would erect a monument to coninent statesmen. The principal design A, has the buildings of the Offices together surrounding an oblong court. The design B exhibits a modified arrangement, with the War-office plan turned rond, so as to have a court and serven of arches next arrangement, with the War-office plan tarned rond, so as to have a court and serven of arches next Parliment-street. The design A is that which the author prefers; but the screen is one of the hest features in the designs. The general arrangement in cach of the plans—whether for the War-office or the Foreign-office, is similar. An entrance in the centre leads to a staircase-hall, square at the ground-level. In the glaced covering, a clever attempt is made to adapt the dome to Gothie architecture. The centri-dum which head ext In the gatace to contain a contract of the corri-dors which lead out, are in some cases lighted from internal courts, and in a few others by borrowed lights. These lights, in the form of ornamental window-tracery, fill in the arches along the upper part of the corridors—which are grouned. In some cases, mezzanine stories are provided, both stories approached from the same corridor,—the upper story, hy means of a small gallery. In the design B, besides the screen of arches, there is an arcade on the remaining sides of the quadrangle. In the decorative design, all mezzammestories are provided, both stories approached quadrangle of the War-office, are also provided. The from the same corridor, -the upper story, hy mean; rooms are arranged in all cases, on both sides of cor-of a small gallery. In the design B, besides the screen of arches, there is an arrade on the romaining rooms for the Scoretaries of State are placed, in each sides of the quadrangle. In the decorative design, all Office, as near the centre as possible: that for the the external and internal features are studied with the storenal and internal features are studied with mean; but the general effect in the War-office, is, we think, impaired by the form and proportion of the romain or cloister (as well as hy the other cerridors) remains the centre of the earth official recep-trancated roof to the eentre tower; and it is open to consideration whether the wings in design B, which is a large hall communicating with both the private

are symmetrical with each other, should not also he are symmetrical with each other, should not also he symmetrical as to the parts of themselves; as at pre-sent they have the appearance which is suited to small buildings of a different class. The arches gene-rally have the pointed form, as most suitable to a build-ing of the first class: the heads, however, are filled in generally, and are enriched or pierced. Crockoted gables; parapets corbicled out, and made to extend across the gables; square and octagonal angle-turrets and binnedse, with which comparison with beft, and and pinnacles ; wide window openings, with shafts, and halconies; statues in the front, under canopics, and hardon's, forses in the brief and the analysis, and horachy shafts; hroad piers, with ornamental impost mouldings; occasional square-headed windows, with a central shaft, and ornamented chauftering to the jambs; surface enrichment in disper, and secoll-work; coloured voussoirs to arches; pateras, and foliated spandrils; and the coloured materials, in general use, as marble in shafts; with a considerable amount of carved work, are amongst the details deserving of examination. Buttresses are systematically avoided parts of the design.

Within the courts there are entrances with semi-Within the contra there are entrances with semi-circular arches; and some of the porches have marked Italian Gothic features. The principal door-way to the Foreign-office is almost the only part of the design which has any ecclesized character. Staircases are placed in octagonal spire-capped por-tions of the huilding, with the stepped or raking lines showing as external decoration. One detail draw-ing, with the internal finishings, would claim careful interaction account of the unreacted metherizing of ing, with the internal finishings, would claim careful inspection, on account of the successful application of novel and rich decorations on good structural prin-ciples. As to the use of coloured materials, with the exception of the granite and serpeutine shafts, or similar small features, the author of the design, with proper judgment, cootemplates only slight shades of difference. The best brown Porthand-stone, the Anston-stone, or what he would much prefer, the Mansfield Woodhouse, first used at the Houses of Parliament, where it has stood the hest; and the Mansfield red stone—an excellent material, as shown hy the manner in which it has endured in the pavement in Trafagar-square—are what he has named. Trafalgar-square-are what he has named.

Of the drawings, under the number 129-hung opposite to those last noticed, and already referred to --some further particulars may be given in this place. They hear the motto, "A vaillants cœurs opposite to intern particulars may be given in this place. They hear the motto, "A vaillants cours rice impossible," and include a general plan and block-plan, and a design for the War-office and the Foreign-office in one huilding. There are twenty-two drawings elaborately shaded as mentioned, and amongst them are several perspective views and details at harge. To the author, Mr. Street, has been awarded one of the premiums of 1007; this, as it is set forth, is given for the Foreign Department. It may be noticed that the Gothic designs generally have been put under the same division; the only exception being the design, No. 140, hy Messrs. Prichard and Seddon, one equally comprehensive-as to the two offices--and which stands in the list of Them the decises, one event, boxpan, boxpan, the start to the two offices and which stards in the list of designs for the War-office. In his general plau, the nuthor of No. 129 has preserved the site of West-mister-bridge, adding a hridge at Charing Cross, with an approach obtained by the removal of Northum-berland House; and he also shows that he would remove Dover House, to get a new cotrance to the park, and houses opposite in Whitehall to form a garden. But the design having heen prepared in the manner of protest against the choice of any other style than the Gothic, its anthor has given his chief attention to the two principal offices. Like others, the authors of Gothic designs which have been chosen, and like some who are not in the list, he has, how-ever, felt the necessity of considerable modification in the style, to render it consistent with modern wants. Indeed, the identity of the opinions which are put forth in reports is sometimes very remarkable. forth in reports is sometimes very remarkable. The distinctive character of No. 129 arises from

its apparent greater admission of irregularity as consistent with, if not serving the general effect. The War-office, in the forth next Parliament-street, has a recessed centre and a fore-court enclosed by a wall, and has the entrance at one side. The west front of the Foreign-office, where is the residence, oy a wan, and may she entrance at one side. In evest, front of the Foreign-office, where is the residence, has a similar plan with an inclosing railing, and the addition of a loggia of arches to the entrance. A groined passage traverses the two Offices from east to west, whence access would be had to all the staircases and corridors throughout the huildings. Gateways, and a carriage-way from north to south across the quadrangle of the War-office, are also provided. The

portion of the residence and with the state dining-room, Two staircases lead to the *suile* of reception-rooms, which run from north to south the full length, and retorn along the other fronts---where they are less in height than on the west, to allow of bed-rooms over them. A contryard for stahles is obtained, hetween the residence and the eastern wing of the Office--cutered from Charles-street. A central lower, square on plan, with pyramidal and lantern capping; is shown attached to the War-office. It would be used as a ventilating and smoke-conducting shott. The ground-story is raised cight feet, so that the basement is lighted without arcas; and generally, height has been sought for, as conducive to effect,--the author supposing that the limitation to three stories must have been felt by most architets as a serions impediment in the way of a really grand pile of hulddings. He avails hinself, however, of what he asya, a Gothie building, as well as on climate, requires--namely, a steep roof. In this he has gene-rally avoided glish principle,--on the ground that, with many gables, it is difficult to secure the "repose" required in such a building as that projected,--whilst in old English works, the sael-being generally less, he says "it is more possible to think of the picturesque than of the grand in effect, which it need hardly he said would he wrong in this case." The "picturesque," however, we have said, it was not our opinion that he had escaped. Much of the effect which we referred to, ve said, it was not our opinion that he had d. Much of the effect which we referred to, we h escaped. results verily from the extent of the variation in the Tesuits verily from the extent of the variation in the features, such as windows; and which variation the author helieves his design shows [with not the less, an appearance of general miformity. The windows are not placed over one another, and are, he says, "varied according to the use and size of the several rooms;" whilst, "the entrance is placed where most convenient; and, in short, there is with a general result of effect and Is praced where most content, i and it is a sort, if a sort, there is, with a general regularity of effect and outline, a high degree of natural and justifiable irre-gularity in almost all the parts." "This," he observes, " it should he remembered, is the invariable practice "it should be remembered, is the invariable practice of the best Gothie architects;" whilst the "neglect of it," he considers "is the one great hlot on the New Honses of Parliament, as on all revivals of Classie and Rennissance architecture." Many of the windows have a Venction character, and the mojority are of continental origin. Especially, like the author of No. 116, he adopts the shaft-often of coloured marbles—in place of the multion; he owns that mis-takes have been made in modern Gothie honses, as in the promision of owning the source of the the advision the provision of openings too small for the admission of light, and he provides wide openings with sashes and plate glass. The contrivances to reconcile the character of decoration with modern requirements display considerable skill. The uses of the apartments heiug kept in view in the design of the windows, a number of In view in the design of the windows, a minuter of them of similar character in several cases range together; and the upper story hecomes an arcade. Some of the turrets and pinnacles corbelled out at angles, are the least picasing portions of the design. One of the lateral fronts has a recessed centre with a screene of arches somewhat similar to that mentioned in the notice of No. 116.

THE AWARD OF THE JUDGES ON THE DESIGNS FOR GOVERNMENT OFFICES.

THE Report of the Judges appointed to make the selection is not yet in the hands of members of the Houses of Parliament. It will be accompanied with two large plans, and these have caused the delay. The judges are under-stood to say in their report :---

" In examining the designs, which are 218 in number, and which embraced nearly 2,000 drawings, our first object was to ascertain how far those combut into operations to assess the second most worth of notice had or had not sufficiently complied with the instructions issued by her Majesty's Government. In their detailed examination we obtained the assistance of detailed examination we obtained the assistance of two gentlemen of great experience and of high pro-fessional character, namely, Mr. Angell and Mr. Pownall; and we are anxious to bear our testimony to the valuable services of these gentlemen. Of the block plans, we desire to remark that we would not he supposed to approve of all the extensive altera-tions and demolitions recommended in the selected designs, which we, nevertheless, helieve to contain many voltable suggestions. "With regard to the design for the Foreign and War Departments, a difficulty presented itself, in

"With regard to the design for the Foreign ane War Departments, a difficulty presented itself, in consequence of several of the competitors having sent in one building more or less unfitted for sub-division for both the public offices, for which distinct prizes have to be awarded, whilst others have either con-fined their efforts to one of the huildings, or have given separate designs for each. It will be evident that those united designs compete under considerable

disadvantage with the single designs, and that unless a united design should be superior in hoth departments to all its single competitors, it could not receive a prize because one portion of it could hardly he creented without the other. We have been obliged to meet this difficulty by treating the lower prizes marks of distinction for merit rather than as indi-eating special selection of the designs as fitted for separate construction. We desire to express our great admiration of the unprecedented collection of designs submitted to us, of the artistic genius, manual skill, and patient lahour which have combined to produce it, as well as of the criment ability which so many of the competitors have displayed in dealing with interul arraogement, and in adapting the re-quired accommodation to a definite area of ground, and to record oor opinion that the collection reflects the bighest eredit upoo the architeets, foreign and English, who have so therally responded to your appeal (the Chief Commissioner of Works). We can-not conclude this report without expressing our regret at the loss of the assistance of our colleague and chairdesigns submitted to us, of the artistic genius, manual not conclude this report without expressing our regret at the loss of the assistance of our celleague and chair-man, the Duke of Buceleach, who, being unexpectedly called away from London by business of pressiog im-portance, was compelled to resign his seat amongst us at our second meeting, and elmost at the close, when, as we believed, only one more day would he required to complete our task, a don-seite calamity of the most grievons kind hefd our celleague. Lord Brearbur of densined the of the most valuable on the most given is the best our consistent point eversity, and denviced us of his most valuable co-operation in our final awards." The report is signed by Lord Stanhope, Mr. Stirling, Mr. Roberts, Mr. Brunel, and Mr. William Burn.

Stn,—The following information received from a friend at head-quarters is at your service :— The judges weat carefully through *every* design, and gave the matter great care and consideration Messra. Burn and Bruuel heing at the Hall as early as six o'clock in the morning. They measured every plan, aud after several prunings reduced the number to and after several prunings reduced the number to twenty, as deserving of more consideration. All the other designs were then packed up and put on one side, and the twenty selected re-bung, and ultimately, the seventeen premiums given, as already published, leaving the following ;— No. 6.5, by Mr. John Philpot Jones; No. 112, by Mr. Robert Kerr; No. 144, by Jones; No. 11 Mr. Cockerell.

All the authors of the above tweaty sent in for more than one design, but the judges decided to give no competitor more than one premium, so their second

no competitor more ways and the selected is the three design was put by. There were only six block plans selected ; the three that have got prizes, and one by Mr. G. G. Scott, one by Mr. J. P. Jones, and a third whose antbor's name is Mr. J. P. Jones, and a third whose antbor's name is the selected of the selected s

THE GROTTO OF ST. BENEDICT AT SUBIACO, AND ITS MONASTIC INSTITUTIONS

IN our report of the proceedings at the Ordinary General Meeting of the Institute of Architects, on the 18th of May, it was stated that Mr. Dighy Wyatt made some observations on the Grotto of St. Benedici, at St. Subjaco, and its Monastie Institutions, to which we promised to refer on another occasion. He comwe promised to reter on another oreasion. The com-meneed by reminding his hearers that St. Bonedict was as completely the patriarch of the Western Monks, and the founder of all the properly organized monastic systems of Europe, as St. Paul, the proto-hearmit, St. Anthony, St. Basil, and St. Jeronne, had been the precursors of those of Africa and Asia pre-tions to his advent. During the first three secturize vious to his advent. During the first three centuries of the Christian era, numbers of the perscented occu-pants of the Catacombs field to the toeky fastnesses parts of the Catacombs her to the locky instituses skining the Campagna of Rome, and there led lives of seclusion analogues to those of the Fathers of the Desert, and many such still dwelt in similar shelter, and in more or less complete isolation, in the days of and in more or less conjuct isolation, in the days of St. Benedict, nearly two budded years after the adoption of Christianity by Constantine. Utremsived, however, for that worthy saint to introduce the bond of union and of common charity among such recluses, thereby instituting the system of nintual protection and good offices which lent that power to the regular elergy which cuabled them to make head against the turbulence of a wild and rule age, and ultimately to through the statistical influence over near and man-ners, history, literature, and faith, throughout the whole of the Middle Ages. The monasteries of Subiaco, Monte Cassino, Sar

The monasteries of Subiaco, Monte Cassino, San Calisto at Rome, and numerous others in Italy, and other countries of Western Enrope attest, at the present day, the extensive influence exercised by the Benedletime order,—the proverbial protectors of such learning and science as were compatible with the rude energies of Medioval life. From the great foundain head numerons hranches germinated in later times. St. Bruno (1030-1101) became the founder of the Carthusians, and St. Bernard (born 1091) of the Cis-

tercians, which latter hody possessed Fountains Abbey (so worthily preserved through the zeal of the noble President of the Institute), and many of the fairest

President of the Instatute, and many or the inter-domains in this our native country. The Grandmootines, Clugniaes, and Premonstra-tensians, lived also under the rule of St. Benedict, though nuder a somewhat different discipline. In this country the possessions of the Benedictines were immense. With the exception of Carlisle they owned this could yiel possessions in the Denoutlines were immense. With the exceeption of Carlisle they owned all the eathedral priories, and most of the richest abbacies. Even at the period of the dissolution of monasteries, Bishop Tanner, in his "Notitine," en-merates no less than 186 important religions estab-lishments still in their bands, despite the active competition which existed between them and the Dominican and Franciscan Orders. Until the end of the twelfth and the heginning of the thirteenth een-turies, when the founders of these two last-named orders flourished, the Benedictines were the presiding rulers over architectural and all other art, and it can surely, therefore, he no uninteresting duly for us to trace out the vestiges they have left of their skill and taste, prolously scattered around the spot hallowed beyond measure in their hearts by the unquestionable presence and love of their admirable founder. With the age of St. Fraceis, great changes of every

With the age of St. Fraoeis, great changes of every With the age of St. Fraceis, great changes of every kind in faith, manners, and art, were introduced, and one of the most interesting studies of the comparative anatomy of architecture which can he made is between the great monastic establishments founded hy him at Assisi, and that established at Subiaco by St. Bene-dict. St. Francis was horn in 1182, at the former data was a subscription of the former of the former data was a subscription of the former of the former of the subscription of the former place, and in its church Giotto has represented the most remarkable events in his life, in a well-known

most remarkable events in his life, in a well-known scries of freesco paintings. An analogous series of freescoes, representing the leading incidents of St. Benedict's life, and to which we shall hereafter refer, is to be met with at Suhiaco. This romantic spot, venerated by the Catholie as a strine, and by the artist as one of the loveliest spots upon the face of the earth, is grandly situated in a gorge of the mountains, about forty miles castward of Rome. Its name is a corruption of Suhlacom, which face its residue before the artificial labor derived from its position below the artificial lakes formed by Nero in the grounds attached to his villa, by damming up the course of the Anio, a stream which ultimately falls into the Tiber above Rome. which ultimately rails into the Tiber above Rome. It was in this splendid villa that the scene so tersely and yet vividly depicted by Tacitus took place, when the lightning from Heaven dashed the golden enp from the tyrant's hand as he was carousing, and yet spared his excernhic life. These artificial lakes existed for centuries, till on the 20th of February, 1305, a sudden flood burst the barriers, the traces of which catastrophe may still be seen on the sides of the monnain gorge. Fragments of the remains from the auromovie willo may be detected auromnized to mountain gorge. Fragments of the remains from the emperor's villa may be detected appropriated to strange and modern uses in the adjoioing conventual and secular buildings.

The whole of the scenery about Subiaco is most wild The whole of the scenery about Sinhaeo is most wind and picturesque. The road to it from Tivoli, after following awhile the ancient Via Valerin, is carried along the very verge of the gorge : the town perched on a height, the monastery embowered in foliage, and on a neight, the monastery ethnological monaces and the magnificent ravine, by following the windings of which, on a strangely artificial path, it can alone be reached from the town, are subjects familiar to, and endeared to the memories of most tourists and artists. At the distance of about two miles from the town of Subiaco the gorge contracts, and the mountains on either side rise almost vertically to a height of little less than 2,000 feet from the valley, along which the rushing Anio cleaves its noisy way. On the left hand reast in 2000 releaves its noisy way. On the left hand side, at about 1,000 feet from the stream, there are several small caves, and a little table of land, dark with lices of immemorial growth, accessible only, hefore the formation of an artificial footway, at imminext danger. Far above these grottoes the cliff rists precipitously to another table of land at its summit. It was to one of these areas the cliff rists It was to one of these eaves that St. Benchick flow at the early age of fourteen or fitteen years, from the world and such allurements as the semi-harbarie age world and such allurements a in which he lived could offer.

In which he lived could over. Born of noble parents, respectively of the Anician and Claudian families, at Nortia, in the Dakedom of Spoleto, in Italy, A.D. 480, he was taken to Rome for education, where he become disgusted at the victous courses of the inhabitants, in whom the graces of Chesistanity had at that nericed but immericelly. of Christianity had at that period but imperfectly expelled the sensual traditions of Poganism, and fled expelled the sensual traditions of Paganism, and fled, first with his norse, and ultimately alone, to the descreted spot above described. Here it was that he was supplied with food by the generosity of Romanus, a monk of a neighbouring monastery, whose only communication with the youthful reduse was effected by letting down a string along the face of the elifi from the upper table land to the grotto in which he had taken up his abode. The life of St. Benedict, by Pope Gregory the Great, the especial patron of the order, who was removed from its fonader by but one generation, does not full to depict the temptations

faithful, he was enabled to crect twelve monasteri faithing, he was chapted to creat work infomaticity on the rocks surrounding bis retreat. Having, with the assistance of his affectionate dissiples, St. Maur and St. Placid, established and confined, in regular order, thus religious establishments, the saint weat on to Monte Cassino. There he met with a set of inhabitants still profoundly embued with Paganism, inh-bitnets still profoundly enbacd with Paganism, aud worshipping Apollo in a sacred prove. These misgnilel people be converted, and having induced them to cut down their sacred grove, and to descerate their temple, in the year 529 he liad the foundations of that momentery which, vastly increased in after ages, grew to be the great had quarters of the order, and became for many centuries the depository of all that was most advanced in the art and learning of the Dark and Middle Ages. Here it was that the saint expired in the sixty-third year of his age. Of all the twelve monasteries established by St. Benedict at Subiaco, little trace is to he met with in the present day. Lombards, Saraceas, turbulent fendal chickniss, and dishonest administrators gradu-ally swept away almost all that there was of the

fenan chicthans, and discodest administrators gradu-ally sweet away almost all that there was of the primitive institution, and searcely anything but a few fragments in the neighbourhond, and the foundations of portions of the monastery of St. Scholastien attest the importance of the original institutions.

is last-mentioned nuble structure consists of an entrance courtvard, surrounded on three sides hy a important of miscripois of micros of a striking arch of "famboyant" character. The refectory is situated between this coloister and one built by Abhot Lando in the year 1235. The ambulatory of this last is formed by bays of stilted semi-circular arches, supported on slender marble shafts, with capitals and bases, in the Byzanof stilled semi-circular arches, supported on slender marble slatts, with capitals and bases, in the Byzan-tine style, the whole bearing a strong resemblance to those to he scen in the cluisters of S. Saba and of Sta. Subina at Rome. Large pointed arches of con-struction are seen in the re'ectory and in the clurch. The latter was huilt by Beucdict VII. in 981, with a campanile of the usual Early Christian character, but evered with a low pyramidd root. At a much later period, in 1769, a new interior, in modern Italian that was wallen bedied ceiling, was built within the outer walls, they being left almost undisturbed, so that the whole of the interior now wishle is modern, with the exception of the apsidal choir end, which was not much altered. The etterior has heen recently decorted in doubtful tate. The finely-pauted chapel of St. Michael and All Angels, in the erypt, is said to costain the hody of St. Bede, but Bishop Ullathorne (R.C.) has recently proved, at once eloquently and learnedly, that this is not the Vene-rable Bede, our countryman, originally interred at Jarrow, and stolen from thence to enrich the same. Unary of St. Bede the younger, a saint of Italian origin, and rather later date. The mosnic work in the arcede of Bishop Lando's Cloisker is attributed to the Convertic facile arch

officio, and ratore inter arte. The mosaic work in the arcede of Bishop Lando's Cloister is attributed to the Cosmati family, who were much employed as architects, sculptors, and mossicists at Rome, Orvitedo, and elsewhere in the Roman territory. Scroux d'Agincourt, who gives correctly ultates of this cloister and of the other heid mosnetists at round, of trendy the normalized provides the second dependence of the closter, and of the other huildings at Subiaco ("Arcbitetura," tavole xxix and taxis, supplies a copy of the original inseription testifying to the dependence the following words of the original testifying to the start studied) - "Cosmas et filli testiving to the abve fact in the following words (the abbreviations being stypplied);—" Cosmas et filli Lucas Jacobus alti Romani eixes in marmoris arte periti hoe opus expleverant Abbatis tempore Landi." [The architectur.] and round arch peculiarities of this cloister, which are of remarkable interest as compared with later works of the Cosmati in the Compared with fitter works of the Cosmeti in the Pointed style at Rome and elsewhere, were very fully illustrated by Mr. Wyatt's drawings] Santi Scho-natice, whese name is a tached to this monastery, was the beloved sister of St. Benedict, and a virgin dedicated to a holy lie. She was the foundress of the important order of Benedictine Muns, the annual Vivenues for when a view revenues from whose temporalities in this the annual the date of the dissolution of converty, &c amounted to very nearly 8,000% a great sum at that period.

About a mile and a quarter distant from Sta. cholastica, by a lovely path winding along the Scholastica, hy a lovely precipice, and supported for the most part on buttresses clinging to its face, are the monastic huildings con-nected with the "Sigro Speco," the evern in which

which the saint encountered from the Evil One in strainus shapes in this retreat, and the manful way in picturesque situation of which has been already fully which they were overcome. Subsequently he was induced to be some the abbot of the curious rock-curi momastery of St. Co-inato in the vicinity; but the strictness of tis rule oversioned so many plus against his life, that he returned to his former solitade. His fame having now extended f-r and wite, num-bers flocked to him, and through the liberality of the faithful, he was enabled to creet tweive monasteries buildings and chapter grouped about them. A have buildings and chaples grouped about them. A hage portion of the rock, that over which St. Romanus is related to have inwired the cord with food for St. Benedict, overhaugs the non-text with four for the obviously and infinite the context in a manner so obviously and infinitenently dangerous as to afford occasion to the monks to adduce its position as a proof of direct divine interposition in their favour The scene on entering the upper church is most striking. The rays of light from its single west window fail everywhere upon surfaces glowing with colour. With the exception of the time-stained mathle pulpit and its envious coffered ornaments, evidently initiated from the fragments of the lacunarize of the Villa of Norn, all is fretted with an endless variety of hues. Even the fine old pavement of Opus Alex-andrinun ministers to the brilliancy of the general effect. The largeness and simplicity of the carly effect. The largeness and simplicity of the carly pointed forms, the size and severity of the pointed figures and groups, and the grand unity of aspect in shade produced by the admission of a flowd of light at approximation to frittered or merctricious grace. Behind the high alter of the Upper Caurch, a descent of a few steps, on either side, lesds to the chapel of Sta. Scholastice, from which a long descent of steps using under the high alter of the Upper Church pissing under the bigh altar of the Upper Church communicates with the Lower Clunch or crypt. On the lowest level of this church, and hetween the side and the living rock is the grotto of St. Bened Following the sinuosities of the precipice outwards, steps still descending lead to the chapel of St. Lowrence, and over it is the chapel of St. Gregory, to Downer, and over it is the enaped of St. Gregory, to which access is given from the lower church by a species of mezznine gallery. At the lowest level of all is the so called Rose Gorden (one filled with brans till the advent of St. Francis), with various other

till the advent of St. Francis, with various other grottees cut it her rock. The Gothic of the churches in the Sagro Speco may be described as good It dian Gothic-decidedly distinct from our western styles-mail more similar to that found in Sicilian buildings of like data, than to that found in Sicilian buildings of 1ke date, than to any other examples of early pointed work to be found in the north of Iraly. It is, however, to the vast amount of coloured decoration on the walls, especially of the upper church, that the peculiar in-terest and charm attached to the building are to be ascribed. [Mr. Wyatt had seen before he left Eugland the effect which a parial use of colour would produce, in the church which the late Welhy Pugin had constructed at Notingham in this kinerdum. and in other buildings by that this kingdom, and constructed at Northgham in this kingdom, and in other buildings by that accomplished architect, executed prior to the year 1846; but it was not till he visited Suhiaco, he said, that he realized the satisfactory result of an ecclesias-tical interior entirely covered with coloured freeco paintings and oroameutation. It was more especially on this account that he was induced to make elaborate studies of the interior in most of its parts -accurate reasonable and the dense with the second representations of which, done upon the spot, he exhibited to the meeting.] With their richness of tint, strange diversity of plane and level, singular contrasts of brilliancy and sobriety of lighting, every step produced some new picture-some fresh and happy combination; and he felt that there was in them sufficient work for months of an artist's time, rather than for the happy week or ten days only he had been enabled to devote to them

The chapel of St. Gregory contains a fresco por-In the lower enspir, the establishment of the com-munity of the Sagro Spice, by Pope Innocent III, and the donation of the Bull to the first prior, John Tagliacozzo, in 1213, are represented in large fres-ces, in which the probability of portraiture is again apparent. Such a faithful mode of handing down apparent. Such a faithful mode of handing down historical events pictorially to posterily might, Mr Wyatt observed, be worthy of attention in the pre-What Observed, be working of attention in the pre-sent day, as decidedly more instructive and rational than portraying imaginary Cœur de Lions and Joans of Arc in our houses of legislature. Another trees of great heauty and a later date (1489) in the charde of the Beato Lorenzo Loricato, signed hy Stamatico, is a highly-interesting example of the state of the art of that time. The fresco decorations of Subiaco possess much

* An engraving from a careful tracing of the head of he suint will be found in D'Agincourt's great work Pittura, tav. c.).

greater interest in the history of painting than has been generally ascribed to them. They are unques-tionably of at least four distinct and bighly characteristic periods. The first or cadlest specimen in the rude manner

of the artists of the catacombs, which is roughly painted against the side of the lower grotto, less printed against the study of the lower group, less difficult of access than the npper one, and in which it is said St. Benediet first received those who came to receive his admonitions and attend his ministra-tions, may very possibly date from the age of that saiut, *i.e.* from the commencement of the sixth century.

The second set of examples is in the stiff and severe Greek style which preceded the manner of the great Florentine innovator, Cimabue. To this belong many of the pointing in the lower chapter, first boild that protect the Sacred Grotto; and among them may be noticed especially the Representations of the Estab-lishments of the Community, by Pope Innocent III. (1198-1216) the Consecration of the Church by Pope Gregory IX. and the Virgin and Child supported by Augcles. This last is to be especially noted as to be identified by the inscription "Magister Convolus pinxit boc opus." This Magister Convolus was a Greek, and authorities (Lanzi and Bishop Ullathorne) are agreed in considering that he worked at Subiaco as early as the year 1209, thirly-one years before the birth even of Cimabue. It may not be unimportant, in connection with this date, to observe, that many Greek monks, who had been driven away from their monastery at Grotto Ferrota in 1165, by the wars which at that time took place between the Albanians and Tasenlous, wore residing at the Sarto Sneee. to Augels This last is to be especially noted as to he by the inscription "Magister Conxolus which at that time took place between the Albanians and Tuseulans, were residing at the Sagro Spece, to which they had fled for refuge. Through them it was that the establishment at Subiace became pos-sessed of that most interesting refle, evidently of great antiquity, the black camel's hair cowl, soid to have here the capouche or hood of St. Basil, and to have been brought to Italy by his friend St. Gregory Nazianzan, by whom it was presented in the even 2015, the then of the to the year monustery of Gregory Nazianzen, by whom it was presented in the year 378, to the then abbot of that very monastery of Grotta Ferrata. Under the anspices of such a hody as these Greek monks, it seems anything but unrea-sonable to suppose that the skill of Conxolus must have been fully developed. Iu 1066, we know from Leo Ostiensis, that Desiderius, abbot of Monte Cas-sino, desiring to rear a noble church in honour of St. Benedict, had sent to Greece for skillou workmen in monie, and their works maily contributed to in mosaic; and their works mainly contributed to give that great stimulus to pictorial art which led to the ultimate formation of the South Italian School,

The third set of paintings, those for the most part the upper and middle chapel, giving touching and spiritual representations of sacred subjects and legends from the lives of St. Benedict and his sister Scholas-tica, havo evidently heen wrought hy one carefully tica, havo evidently heon wrought hy one carefully tutored in all those changes in religions art which were introduced under the auspices of the Franciscan and Dominican monks. They apparently date from about the year 1400, and as we know that Subiaco had an artist ahout that period, who wrote the follow-ing inscription (copied by Dr. Ullathorne) on a picture still preserved in the old church of St. Eastace, not many miles distant: "M. Bartholomew, of Subiaco, painted this work with good faith in 1424—'Oh Lady, help me; I ask no reward hut this,''—we may be not very far wrong in supposing that some of these

Lary, help help it as horevariate this, - we have be not very far wrong in supposing that some of these works may have been from his hand. The last set are those in the exquisite little chapel of St. Lorenzo Loricato, in which a considerable degree of heauty, both of form and tender colour, are blocked with a singularly archaic treatment of form, shown more particularly in the draperics. This severity of treatment is extremely unusual at so late a period as the better half of the fifteenth century, a period is the octer half of the intention enuity, when naturalism had already acquired a great ageen-dancy over the artist mind; and if the painter of the principal subject over the high altar—the Virgin and Child surrounded by Saints—was not attested by his nearly adjoining signature of "Stamatice Greeo pictor particular D. 1450" or as would neutralls suitedate A.D. 1489," one would naturally ant perfort, A.D. 1459," one would naturally antenace the picture by nearly one handred years. As it stands, this series of treseors curionsly illustrates the clinging of the Greek artists at even so late a date, and despite great improvements in feeling, form, and composition, to their old rigidity of action and arrange-

" E. L. G." AND THE GOTHICISTS.

"E. L. G." AND THE GOTHICISTS. ALLOW me to say a few words, Mr. Editor, in connection with this "proposition," given by "E. L. G." in the postscript of his communication to you of host week y.—" The real karmony of a build-ing with its neighbours depends solely on general form and distribution of masses, and not at all on decorative style." "E. L. G." affects to call this "heresy," but it is evident he is aware it is really such truth as no "monomanic" could originate. I would add to "E. L. G." affects of call originate. I would add to "E. L. G." "proposition," that the real harmony of a building, with its adjacent

objects, in any and every situation, depends on the same principle, viz. the general form and the dis-tribution of its masses. But what is the result on applying this "proposition" to the question of styles Gothic e. Classic?

Gothic v. Classic? The Classic—any phase of it,—is pre-eminently a distribution and arrangement of masses, and a com-bination of gaveral forms; whereas the Gothic is a combination of parts, of which every one has a ten-dency to become a distinct and culminating deco-rative feature, and consequently a detraction from the distribution of masses by the exhibition of its intri-ate littleness. cate littleness.

eate littleness. It is this very "proposition" of "E.L.G." in effect, that gives the supremacy to the Radelific Library at Oxford. When seen, either near or at a distance, the general form, and the distribution of masses, in that building, are equally apparent; but its Gothie neighborn, St. Mary's Church, is, either near or far off, a pilling together of effective deta 1s, each striving to confine the eye to its sole and special value, and quite secondarily its value in relation to the whole composition. A like result may always be observed where two buildings, such as this library and church, are in justgosition; and the deduction, whether produced by the exercise of common scase, or by the application of astbetic culture and prin-eples, must ineviabily, on the ground in question, be

or by the application of testbetic culture and prin-ciples, must inevitally, on the ground in question, he in favour of the Classic building. "E. L. G." says that this "proposition" was the "motion" of "the fatters of your Mediaval ortho-doxy;" but surely it cannot be the "notion" of their followers of the present day, who have com-piled a glossary of "birs," who have become profound in technicalities, who have been capityated and go-verned by abstract theories of the several parts of a huilding, who have songlet to catch beauty in a noral philosophical trap, and who, having exhausted the novely of English precedent, have swerved away to Italian adaptation of mere details:--surely these cannot be commencing at the right point of de-parture; nor ean they the progressing, nor can they. cannot be commencing at the right point of de-parture; nor can they he progressing, nor can they, according to "E. L. G.'s" own showing, he working in any other than a wrong spirit and an unproductive direction. They have become globly adept at the parsing and derivations of a dead language, but have overlooked the right meaning of its words, and they will doubtless, ere long, discover that any "transla-tion" they can make therefrom will be not only some-what ersmped, hut will be inadequate to fulfit the nurnose now required of it. And whatever real purpose now required of it. And whatever real knowledge has been acquired and disseminated, whatever principles have been formed, and however great may be the desire to respectate au outspent artistic may be the desite to resist and at outspin measure power, there cannot possibly result from such sources any architectural progress while they are employed less on eonceiving general forms and distribution of masses, than they are on the compilation of old forms and the attachment thereto of varied ornament and distinct decorative details. Oue word more with "E. L. G." The idea of

Gothic art in his mind appears as widely confused as Gothic art in his mind appears as widely confused as is the expression of his opinions in his multifarious sentences. Gothic is not synonymous with utilitarina, nor is the universal application of one or two solitary rade principles enough to constitute all works in which they may appear Gothic works. Until all other styles than Gothic are annihilated, let us allow them their distinctive titles, and it would he the better course, until the Euglish language has become more prolific, to call things by their right names. James C.

JAMES C.

WHILE, on the oue hand, it is due to you and your while, on the one made, it is due to you and your general readers, not to occupy the columns of the Builder with relords "courtcous" or un-courtcous, having more to do with personal feelings and par-ticular expressions than with critical principles and pervading argument,-will, on the other hand, I would not have my silence imputed to any want of respect for your correspondents, or to any affectation of supercilious disregard for their opponent-or even

for their oppugnant reasonings. At the same time it is difficult, with the preserva-

urged : neither do I expect more temperance than is of the surface may, in many cases, be adjusted in the consistent with energetic purpose. I am only ourscins hying on of ballast ; and even in rough country great all who read the animadversions of my correctors works need not always be re-orded to, for it is now should also study the entire of the articles which may found that much steeper inclines can be advanta-oceasion them ; and then it will be for me, either to geously worked than were formerly considered pracurged: neither do I expect more (emperance than is consistent with ouergetic purpose. I am only anxions all who read the animadversions of my correctors should also study the entire of the articles which may occasion them; and then it will be for me either to leave the public to judge between us, or to say what more may be required of me. Let it be, moreover, remembered, that I am no anti-Goth; but, on the constrary and lease article by a revenence for Gothic contrary, not less actuated by a reverence for Gothic art, in its proper and most exalted place, than by my love for Classic modification in all places else.

love for Classic modification in all places else. Allow me to take this opportunity of respectfully asking of M. De Jong for an explanation of the follow-ing :---''A window of 8 feet square pierred through a wall of 2 feet thickness, would give, in the Greek or Roman style, 0.64; but in the Gothic style 1:00--i.e. 0.36 more surface of light in the latter.'' Unless he means to say, that 8 square feet of glass in a Gothic window would give more light than the same quantity in a Greek one, because dividedly spr ad by the mallions and tracery over a larger circumseribing domain's in a Greek one, because dividenty spr di by the maillons and tracery over a larger circumscribing outline, I am perfectly at a loss to understand him. But the advantage of the Greek window, where such an advantage is desirable, consists in its much larger proportion of light within the same circumscribing outline. Grone Wightwick.

MANAGEMENT OF RAILWAY PROPERTY, SO AS TO RESTORE IT TO ITS PROPER VALUE.

THE attention of the public having now been called The attention of the public having now been called to the great mismanagement of railway property, both by the meeting in London, convened to address Government on the subject, and attended on the 3rd of June by a large body of persons intimately interested in such investments, as well as by a power-ful leading article in the *Times* of the 5th of the same month; as I have long studied the subject, and have written much upon it, I send you a few observations, which I consider of paramout importance. In order to the as concise as possible, and at the same time to take a commerkensive view of the ques-

In order to be as concise as possible, and at the some time to take a comprehensive view of the ques-tion, I will divide my observations under three heads. 1st. With respect to the bying down of the lines. 2nd. As to their construction, &c. 3rd. As to their construction, &c. 3rd. As to the manner of working them. Firstly, then. A great trank line should always be considered as a *through* line, assumed to connect two investors transitions at the latter to be the basic

important termini, one, or other, or both being prin cipal contres of commerce, or places of frequent resort,

cipal contres of commerve, or places of frequent resort, and likely in case of facilitated communication to have much intercourse one with another. The streightest and shortest practicable route be-tween two such places should be selected, not, how-ever, disregarding the lie of the country, or the wants of the intermediate populations. The possi-bility of avoiding engineering difficulties should always be taken into considerable extent, rather than have a bauw lumpel or a heavy houk or lose the have a hing lunnel, or a heavy bank, or lose the traffic, both of passengers and goods, by keeping at too great a distance from coal mines, or wood-supply-ing forests, market towns, harbours, or industrial localities

These main truck lines, with such advantageons defoars, should alone he made by the company under-taking them. It is a fallacions system for the prio-cipal company to make branch lines, and this system is one of the great causes of the depreciation com-ultimed of: plained of

It is plain that if one company were to undertake It is plain that if one company were to undertake to make all the railways in the world, the share-bolders' hopes of a dividend would be deferred to the Greek kalends, because, so long as works of con-struction are going on, the capital employed must necessarily remain unproductive, and the want of a clear appreciation of this fact is the main cause of the depreciation of railway property. On the other band, ii' all the railways, ever likely to be required, could be made at once, economically, and got into good working order, railway property would hence-forward yield immense polits, and be the very best description of investment. Secondly. The manner of constructing railways has

The source time it is difficult, with the preserva-tion of argumentatice solviety, to mean the verse the service of investment. Secondly. The manner of constructing railways has the inhuman total neglect of their duty, *-innovator* the inhuman total neglect of their duty, *-innovator* that the use of a common mode of expression, "we," that the use of a common mode of expression, "we," that the use of a common mode of expression, "we," that the use of a common mode of expression, "we," that a shed, and artistify it into a portice, "earthwork from the cuttings an immense self-complacency!" All I meant was to state a supposed case. *I*, you, or he-we, ye, or they, "take a shed, and artistify it into a portice," is many eases, where the lead is long, to thow "take a shed, and artistify it into a portice," is many eases, where the lead is long, to thow "take a shed, and artistify it into a portice," is many eases, where the lead is long, to thow "take a shed, and artistify it into a portice," is into a thing of heeavy. The use of an inde-pendent pronoun is surely no great violation ondesty, to say nothing of the conventionally admitted adiorial "we." Of cornes, Mr. Editor, I expect to be advantaged by correction, if not confirmed by approval, and shall respectfully receive all comments that are fairly

geonsity worken to an were formerly considered prac-ticable. Again, Bridges, culterts, and viaducts, have been con-structed in far too expensive a manner: all that is requisite in such structures is solidity and suitabilityrequisite in such structures is solidity and suitability-that is, sufficient strength, both in form and material, to resist the forces they may have to contend against; so that they should be made of a maximum strength, calculated according to their position and require-meuls, with a minimum of materials, within safe limits; but the cheaper and plainer the better, con-sistent with efficiency and dmability. Stations, in like manner, should not be built at too great an outlay of money. It is canital locked on

great an outlay of money. It is capital locked up which will never yield a commensurate return.

It is bad enough to have to make all our roads ew, without having to build also the hotels and inns. All that a railway company should construct is the booking-office, and engine and carring-shed. Perhaps in addition, they might provide *roof protection* against soow and rain for passengers; but in as simple a snow and rain for manner as possible.

manner as possible. The barries of the two parts of the company could buy land on which to build an hotel at the different stations of the railway, and then invite tenders from persons willing to build it and take the risk and responsibility of such speculation. They would be sure to receive plenty of offers, and might select the oue they thought most eligible; but on no account should the company lay out its own noney in finding such accommodation. A railway company, to do a good business, should confine itself to its legitimate functions, viz. that of carrying goods and pass ugers. and passengers

and pass-ugers. Indeed, it would be well to put up merely the most requisite portions of the station buildings at first, until the line is opened. Temporary booths would serve for a time, until the profits of the line made it advisable to spend more money, and the capital em-ployed in making the indispensable parts of the rail-way begins to return in the shape of a divideud, and then it might be considered what amount can be ad-tent resource bid out one certain stations and these wantageously laid out upon certain stations, and then only properly, as this depends greatly upon the work-ing of the line. ing

only properly, as this depends greatly upon the work-ing of the line. In the rolling stock also improvements may be advantageously introdue d; cerringes may be made with saloons, and hed-rooms and kitchens. In fact, they may be made small locomotive houses, the saloons with moreable chairs and tables, and stores, and with head room sufficient to enable people to walk about; the bed-rooms, with herths, from the floor to the ceiling one over the other, as on board while. The guand might be allowed to supply tra-vellers with refreshments in the same way that the steward of a steam-pack t does. In such carriages passengers could breakforst, dine, sup., and sleep nearly as conforta-dy as in their own homes; and this would dimins the amount of accommodation re-quired in the stations, and, thereby remove a very heavy item of railway expense; and at the same time make the railway pay hetter, in consequence of allord-ing greater real confort to travellers. Brd. For the efficient working of the line a proper managing director should be appointed as the com-mon for active pay between the same time barbard.

managing director should be appointed as the company is executive agent, having great discretiou allowed, and considerable powers vested in him for a short time : pany's ex and considerable powers vested in finit for a short line: he should, however, he made stricitly responsible to the Board for his acts, and there should be no divided responsibility. He should deposit a certain amount of cantion-money, submit his accounts regularly to andit, and be in all things responsible as the steward of the company; and only be allowed to represent it so long as he performs his duty honourably, honestly, and wolf.

of the company; and only be allowed to represent it so long as the performs his duty honourably, honestly, and well. There is also another important matter with respect to the working of radways, which has not been sufficiently taken into account, viz.—that while it is necessary to have a sufficient number of *express trains* for the through traffic, it is also important to have plenty of *slow trains* starting from even the smallest intermediate places : much traffic is lost to railways from want of proper attention to this. The country produces the nuw material for almost everything, and would scad more goods by rall if slow trains stopped occess onally in the intermediate country places. Timber and stone, hides and vecteables, ithes and bricks, metallic ores, grain, eattle, &c. are alone to be obtained from the country; and when railways have their stations only in toway, they cannot expect to increase their traffic by the transport of such mer-chandze. But, above all things, they should reduce their fares on their rates of tarif. In the long run it is better to accournedate 1,000 persons at a penny than four persons at *U*, simply because the proportion of the annuber of people who can afford to give a peony often is considerably, inc.Ledably, greater than of those who can or who care to spend the latter sum

Therefore excursion-trains on frequent occasions. always pay well. This system has been tried to a certain extent, and has succeeded; but it has never ertain extent, and has spaced uses occur there to a certain extent, and has succeeded; but it has never yet heen earried out on railways throughout the United Kingdom iu a sufficiently extensive manner. It is not at all surprising to me that railways do not pay hetter. My only wonder is that, after so much wraste and extravagance, they yield on an average upwards of 3½ per cent. This only shows what good property they would be if properly manged: "You cannot have your lost and eat it." If an persuaded that good lines, managed well, in who are desirous of gaining by the dear-bought expe-rience of the past, and taking into consideration the future, may, according to eircumstances, be made to yield an anuoal divided of from 10 to 15 per cent. Even existing railway companies might improve

Even existing railway companies might improve their property by selling their great station-buildings to hotel-kcepers, by redu-ing their fares and tariffs, by improving their carriages, and by at once appointing a commetent managing director to administer their competent managing director to administer th flairs. WM. H. VILLIERS SANKEY affairs

INSTRUCTION IN DRAWING. IMPROVEMENT OF MANUFACTURES.

In teaching drawing from the black-board, almost every man has his own particular system, each per-haps grounded on the same principle, but all differing in their application. These systems are good or bid, as they are simple or complex. It is evident that to keep children interested in the lesson is of the greatest importance and this is only at a he down by right keep cultiferauticrested in the lesson is of the greatest importance, and this is only to be done by giving them something to think about, and by carreld do-monstration and explauation to teach them to think correctly. Let them see plainly that everything done has a meaning, and every stroke made, is an addition to the form of the object, and productive of immediate results. This will keep up the interest of the lesson, for a strong the object of the lesson. for when ebildren see beautiful forms made with so much case, their imitative faculties are at onee roused into action, and they will reproduce the object the best of their ability, and according to th to their DOWERS.

Some people bave a theory that it is an excellent ractice to make children draw a certain number of practice constructional lines, and place curves on this line and on that, commencing and almost finishing the lesson without knowing in the least degree what is to be the result, until the lines they have unconsciously juxtaposed assume a distinctoess of form, and the meaning of the object bursts upon them. This method of posed assume a distinctoess of form, and the meaning of the object bursts upon them. This method of giving the lesson was, I well remember, very much in favour at Marlborough House, and is still regarded as admirable by many, though common scues has ex-ploded the notion in the minds of those who think on the subject. To lead any human beings blindfold, who are avoided with a work blue in the set of the set. the subject. To lead any human beings blindfold, who are gifted with a reasonable mind, and especially who are gifted with a reasonable muid, and especially children, at that inquisitive age when they are most impatient of results, is surely hid philosophy. It is not possible that, by drawing the lines of an object without knowing their meaning, so much can be learnt as by drawing them with a consciousness of the value of each line as it is drawn. For how is it pos-value of each line as it is drawn. For how is it possible that the peculiar character and balance of each curve can be given, nnless it be kuown what purpose the curve is to fulfil? Greek vases of the simple ւշհ the curve is to full ? Greek vases of the simpler bind are favorite examples for black-board lessons, hat it is very unlikely that the elliptic entre, so characteristic of their onthnes, will be traly drawn, unless it he explained and illustrated at the time hy other sketches, and this is incompatible with the system of keeping pupils in the dark concerning the intended result of their drawing, masking them, as it were, for the time heire. were, for the time heing.

Another equally false practice is that of using a ultitude of constructional lines and minute propormultitude of tions. By this, drawing becomes mechanical, and the object drawn of little consequence; for after numerous straight lines have been drawn in all directions, as a means, the simplicity of a few pure outlines appears a weak result. When such lines hav: been used continually they become a necessity with the pr and a crutch he finds it difficult to dispense w with Now to earry this practice into the drawing of natural objects would be impossible; and it is, therefore, a had habit to make constructional lines so numerous and important, or to be too minute as to the propor-tions of every detail in the object given as a lesson. Beyond the central line, vertical or otherwise, on which to obtain the proportional altitude or parts of the figure, and one line ut right angles to it showing the greatest width of the figure, beyond these I would have as few constructional lines as possible. The propertions should be pointed out as near as need be, and the drawing of the object in such and such points be left as an exercise of the pupil's eye and ingenity. From use research and important, or to be too minute as to the propor-

I am convinced that the great thing to he accom-plished is to teach the children to think, and to think correctly. The crocked line and ill-balanced curve physical is to receive the erooked line and ill-balanced entry do not so frequently result from the absence of manipu-lative power, as the ignorance of whg such lines should be straight, and why others should entry in such and such directions; and it is the duty of the teacher first to erote this question in the child's mind, and then to answer it. If a child realizes that a line must curve in a certain direction, its hand will

a line must curve in a certain direction, its hand will soon be obedient to its mind, and the curve will be drawn; but if it is ignorant of the cause for such a curve, then there is no influence except that of the eye to take the direction of the hand. I have myself made a practice of drawing the ob-ject about to be given as a lesson, on one side of the board, and questioning the class us to the proportions of it, and what constructionallines will be required to make a correct drawing. This excreises the mind in a precisely similar manner as it would he exercised make a correct drawing. This tartises the number a precisely similar manner as it would be exercised if a porson were required to draw an object from nature. It first makes him see it, and then think about it, and then resolve the best means for drawing Such a method educates the eye to see ad teaches the mechanism of drawing, it truthfully proportion, and besides necessititing the habit of thought, and that is besides necessit ting the hant of hought, and that is no mean attainment. If a pupil can acquire the power of discovering the proportion which the height bears to the width, and the smaller to the greater part of an object, half the battle is over, and care in manipulation joined to this halit of seeing things cor-sends will be producing of a power in drawing. reetly, will be productive of a power in drawing, grasped so tightly, that nothing will shake it. gi

In a large number of pupils, at facher will make the discovery that he may divide them into two classes. First, those who set, but ennuet express; classes. First, toose will see but carposing, but cannot hose who find an of difficulty in expressing, but cannot see. Time and experience will do much for the former class, but it is a task perfectly licreulean to improve the latter. In a dozen boys, perhaps, there may be three among them who will draw a set of the s there may be three among them who will draw a vertical line obliquely, and are incapable of dividing a line into two equal parts. This does not proceed from want of manipulation, but want of sight, and this distortion of vision is by no means uncommon. To remedy this, the simplest possible examples Id be given, those which can be divisible into be divisible should be given, those which can be divisible into masses of two equal parts, and no minor divisions he resorted to. The most familiar objects are the best, so that the memory may go hand in laud with the pencil. Common toys, which often have becautiful outlices, may he given, and if a boy draws a kite, for instance, that is broken-backed, and out of balance, appeal to him whether he thinks he could fly such a thing. This will bring its defects houce, and I have often seen such an appeal answered by an immediate should be often seen such an appeal answered by an immediate erasure of the abortive attempt, and a downright flyahle kite produced in its stead.

My ahle kite produced in its stead. As a rule, no perspective representations should be attempted, for very few children are capable of under-standing them. Children are much fonder of facts than appearances, so that simple geometrical exercises are at all times the best. If a child is required to are at all times the best. It a chuid is required to draw a cube from the solid model, he will almost invariably draw the sides equally, though one side be very much in perspective; and it is a task of some difficulty to explain why one side should be drawn smaller than the other. Perspective may be taught smaller than the other. Perspective may be taught by the solid model more easily than in any other way; so that it is better to let perspective drawings alone at first, and trust only to geometrical outlines. This will avoid confusion, and involve no sacrifice of prin

It is, on the whole, the safest method to divide a It is, on the whole, the sates memory to arrive a class into two divisions. In the first, the most ele-mentary pupils should be taught to draw a straight line, and to divide it into any number of equal parts, and acquire the power of drawing curves through any and acquire the power of drawing curves through any points on the straight line. When they can do this tolerably well, a curve should be given on one side of a straight line, and the drawing of it, and a similar eurre on the opposite side, he given as the exurcise. flaving, in the first division, acquired a facility ia making ourves and straight lines in the abstract, in the second they see and learn to apply such lines to the drawing of actual objects, in the selection of which I have before remarked that the teacher onght to be earoful to choose familier objects rather than such as careful to choose familiar objects, rather than such as his papils have probably never seen.

Having encroached so much on your valuable space, I will ask permission to say a few words more. It is a question whether drawing will ever become naturalized among us, and productive of real good, by the single lesson of an hour or two per week. To become a practical medium for the expression of the schede the sector and the schere arbitrate become a thought, it ght, it needs as much culture as other subjects like advantages attached to them; and to teach arithmetic by one hour per week would he con-sidered impracticable.

hitherto neglected branch of education has such immediate advantages attached to it, that to give it a place among the most important will be any-thing hut bad pohey. Between the mechanie and his master, and between individuals of every class it will facilitate expression, and save much time in verhal description. But to become a positively useful at we must adout a more compactenesive and its inster, and between horizons to Crip class it will faelitate expression, and save much time in verhal description. But to hecome a positively useful art, we must adopt a more comprehensive week,—for practical usefulness cannot result from it. In some instances natural talent will be elicited, as in cases which were mentioned in my last communi-cation, and power will be acquired; hut a system which gives power to all, and develops the peculiar valent of individuals, this is what we require. Ready means are at hand. The pupil teachers of parochial schools all lears to draw, and when they can draw fairly on the black-hoard, they will be able to teach as well, or better, than art sidnets training to be-come art-masters; and this, not because they are better artists, hut because from practice they are better artist, hut because from practice they are better artists, but because from practice they are better acquisited with tuition. Why not make use of such means ?-and why should not drawing be tanght by them as regularly and as often as writing, which experience has tanght us is learnt soonest when drawing is taught simultaneously with it? If, as a nation, we decide that every one is a more useful person when he can draw, let us adopt the broadest possible system to accomplish this, and put such a knowledge of drawing in the bands of each as will be a weapon and not a toy. The work hitherto done has heen an experiment on the raw material, in order to discover whether it was eapable of development; our esperience has proved its possibility, and now we have to invent machinery which will enable us to supply the demand. The Department of Science and Art does much, and what it does is *well* done; but this is does nucc, and what it does is *bett* done, but this is a drop in the ocean in comparison with what might, and must be done, hy some means. The Museum at Brompton contains such an arrangement of materials and illustrations for education as have never yet been seen in one place, and this will do much : the district schools of art are also hoons to the working classes; but all these will not bave one tithe of the influence upon British art as the seeds of art sown in the minds of young children by the teaching of drawing.

of young children by the teaching of drawing. And hefore long we must do something, for England bas surely here in the rear long enough. We established schools of design as a means of im-proving ornamental art, and after twenty years' ex-periment, they have taught as that we began at the wrong end of the task. It was of little avail to produces well-educated designers for manufactures, and leave the mass of the people ineapable of appreciating their works. This was to furnish the supply hefore the demand existed, and common sense would have told that bankruptey must result. It mattered little to a man who was about to furnish a house that such-and-such a wall paper was from the Government to a man who was about to furnish a house that such-and-such a wall paper was from the Government School of Design. He could not see the value of its superior drawing, or appreciate the delicacy of its claste barmony of colour. What he selected was a paper which showed such an amount of knowledge and expression as was the result of thoughts equal in refinement to his own. Thus the country peasant who aspires to a papered parlour, selects a paper on which the adventures of "Unde Tom" are expressed in corne and values colours: and the farmer, one in who asplies to a paper of "unlot", access paper so-which the adventures of "unlot Tom" are expressed in coarse and vulgar colours; and the farmer, one in which the various incidents of the chase are de-lineated. The tradesman chooses a showy pattern that be supposes will set off his room to most ad-vantage, and impress upon the world that he is a thriving man. The rich man papers his drawing-room with a pattern that has positively every colour in it, and for the multitude of hlocks which produce this paper, he readily pays a handsome price; while the aristocracy, when they stoop to paper, will be content only with the last French triumph, bouquets of flowers in profusion standing roundly from the satisfy their more highly-refined tastes, subjects which nost nearly approach their own pet study of mater-colour flowers. water-colour flowe

Thus the mass of people select, each person choosing the pattern which best expresses his own power or thought. That this is the case can hardly be doubted by any one who takes the trouble to observe for him-self. Let him mark the kind of subjects, and their position in the scale of art, which different classes of position in the scale of art, which different classes of people possess. He will detect in the peasant's cottage images glaring with bright hlues, reds, and gold, on bis mantchpicce; and on bis walls figures of precisely similar colours : his jugs and crups, with oullines, having as much beanty in the same scale of art, and, save where sacred necessity compels, the work of his own hands will have the same kind of expression, and show the same habits of thought as the works that one mode for him by others. are made for him by other

The reason of this is, that such things fit him. gennity. From my experience in teaching at the black-hoard, and commercially, it will be evident that this in his uneducated state he imbibes from Nature. He

THE BUILDER.

ST. GEORGE'S SCHOOLS, BATTERSEA .---- MR. JOSEPH PEACOCK, ARCHITECT.

sees that the sun is golden, the sky blue, and evening clouds are red; that leaves are green, sunsets and heather are purple, and fruits and flowers orange-coloured. In all these he sees *facts* alone; he detects heather are purple, and fruits and flowers orange-coloured. In all tosse bases *facts* alone; he detects no proportion, and is not sensible of that grand law of nature hy which some objects retreat that others may advance, and that it is the subtle *proportion* of things which he sees in nature which produces in him emotions of pleasure. He has not learnt to realise this. He sees facts in the abstract, and ignoranity supposes they will be ever fresh to him if he repro-duces facts, and scatters his own version of them hroadcest around him. He does this. He selects what exactly comes up to his own measure of think-ing, and if hy persuasion he is cajoled into taking another choice, he feels afterwards that it does not fit him, he will be his own master another time. Every class of people have their own version of nature, and will proceed unconscionsly to express those versions around them. All classes of people in Evaglad are ignorant, more or less, in matters of art, and therefore all classes will scleet wrongly, and only have anch had things as will run parallel with their own degree of had taste. Good works they reject hecause used things are tabove them, and they act hecause used things are for form this was around been.

Interms such things are above them, and toby act honestly,—to do otherwise were vib hypority. It is on this honesty we rely, for from this we argue that it is ignorance alone which causes the evil,—one which knowledge and calucation will therefore remove.

This brings me to the matter in hand. This brings me to the matter in hand. The School of Design system, then, was to produce a supply of a superior class of ornamental art, and neglected entirely the demand for it, which did not neglected entirely the demand for it, which did not exist, and which was not created by the school's opera-tion. This was untradesmanlike, and has consequently been a failure. The system pursued by the Depart-ment of Science and Art is of the opposite character : it is essentially tradesmanlike, and will as certainly be successful. The prime feature in it is to create a demand for superior manufactures, and in Eagland the demand invariably creates the supply. English people will not have things threat down their threats, and they will have what they want. To create a want, therefore, is the surest manner of producing a supply.

supply. Instead of instructing the solitary designer, the mass of the people will be educated, individual supe-riority be supplanted by general excellence. Now the schoolmaster is abroad : incompetency is outsed from high quarters; and when art-knowledge and art-feeling are common, artists must be comparatively elevated.

That this must follow is written in the world's experience, for never has maukind felt a want which great spirits have not risen and ministered to.

WALTER SMITH.

ST. GEORGE'S SCHOOLS, BATTERSEA.

ST. GEORGE'S Schools, Battersea-park, have sen completed, and were opened in May. ben completed, and were opened in May. They form a pretty group of buildings, close to the South-Western Railway, on a line open site, which was given by the freebolder. Accommodation is provided for 200 boys, 150 Accommodation is provided for 200 boys, 150 girls, and 150 infants, and large class-rooms for each school, with three separate residences for the teachers. They are built of white brick, with Bath stone windows, dressings, and copings, and the roofs are covered with tiles. The girls' school is over the infants' school, and is reached by an open stone staircase, which communicates also with the residence and play-ground. The architect for the schools was Mr. Joseph Peacock: the amount of the con-tract was 3,2007.

THE DECORATIONS IN MANCHESTER FOR THE QUEEN'S VISIT.

THE newspapers have given full particulars of every incident connected with the visit of Her Majesty and the Prince Consort to the treasures of art collected at Manchester, and we shall therefore merely refer to a few of the preparations in which the arts of construcfew of the preparations in which the arts of construc-tion and design were employed to give substantial form to the loyalty which every heart in Manchester falt towards the exemplary Queen and her illustrious companions. It is well known that Her Majesty was the guest of Lord and Lady Ellesmere, at Worsley Hall, about six miles from Manchester (designed by Mr. Edward Blore, and illustrated in an earlier volume of our journal). The villages of Worsley and Swin-ton, and the township of Pendleton, were guily de-corated with earbort fizes happers gradnals and ormaton, and the township of Pendleton, were guily de-corated with arches, flags, hanners, garlands, and oran-mental devices. The first triumphal arch of magni-tude on the route to Manchester was at the Pendleton tolbar, erected for ahout 100. raised by subscription, consisting of three arches upon eight double columos, ornamented with crimoson, white, and hlue drapery, flags, and flowers. The design was by Mr. Dallow, and was selected from siz. Ou Taesday and Wednes-day nights this arch was lighted up by 1,500 varie-gated lamps. The corporation of Salford erected triumphal arches at Windosr-bridge, and at the en-trance to the Peel-park: both were creditable, and the latter is suggestive of a more permanent structure in the same position as a fitting eutrance. to the the latter is suggestive of a more permanent structure in easily. Difference and Sons, it was not be the same set of the same

ration voted the limited sum of 1,0007. (!) from the corporate fund to display the loyalty of the city; and had it not heen for a large amount of private liberality in this direction, Manchester would have cut a sorry figure with its two triumphal arches. The first of these arches was at the Albert-hridge, which divides Manchester and Salford. It was in the Roman style of architecture, and was composed of three divisions, the central one over the carriage-way measuring 24 feet wide and 36 feet in height to the soffit; and the two side ones over the footpaths mea-suring each 7 feet in width and 17 feet in height. Above the side arches were massive cornices and balus-trades, from which the central arch sprang, the erown trades, from which the central arch sprang, the crown of which, decorated with a heautiful cantilèvre cornice, of which, decorated with a heattiful cintilèrre cornice, was upwards of 50 feet from the ground. Surmount-ing the central arch were the royal arms, ornamented with a trophy of flags, and immediately underneath, the arms of Manchester. Over the side arches were the letters "V. A.", surrounded by floral wreaths; and festoons of roses and evergreens ornamented the piers of the arches. Rising from the top of the side arches were colosal figures; those facing Salford representing "The Arts" and "Industry," and those on the Manchester side representing "Paint, ing" and "Victory." Mr. Harrap was the huilder-and Mr. Whate the decorator. and Mr. Whaite the decorator.

Ing " and "Victory." Mr. Harrap was the hulder-and Mr. Wictory." Mr. Harrap was the hulder-and Mr. White the decorator. The triamphal arch erected by the Corporation at the houndary of the horough, in the new Shelford-road, a little heyond the Chorlton-road, was a sub-stantial-looking structure, in imitation of grey granite. It consisted of a lofty arch over the carriage-way flanked by two smaller ones over the footpaths. Round the side arches were evergreenes gracefully fes-tooned, and their entablatures supported halastrades, from which the central arch sprang. The spandrils were decorated with allegorical figures,—on the south side, "Fame" hlowing a trumpet, and holding a laurel crown in her hand, and on the north "Victory" extending the coronal as though to lay it on the hrow of Queen Victoria. The entablature of the large arch rested upon mouldings, hetween which small garlands of evergreens and flower hung in fischons. The face of the kcy-stone was hidden by a shield, bearing the arms and most to of the eity of Manchester, and ahore all was a trophy of flags, enclosing the royal arms. The east and west fugades of the arch were similarly decorated. The cost of this structure was 3002, and its substantial character was highly creditable to dessrs. D. Beilhouse and Sons, hy whom it was exe-ented. At Old Trufford, mar the approach to the Exhibi-

387

33 feet, and each of the smaller arches or bowers was 38 lett, and each of the similer arises of lower's week of feet wide. The arch was of light stone colour. Round the centre, in gold letters, was displayed a "Welcome to Old Trafford," and within the large arch marcon doth was draped in festoons, with gold arch marcon cloth was draped in festoons, with gold cord and tassels. A plune of priace's feathers covered the face of the keystone, and from it drooped gracefol festoous of flowers, which were attached to the entablistures of the side arches. Above the plune, and surmounting the whole, was a trophy of flags, with the Royal arms in the centre. There were plunes of feathers over the keystones of the smaller arches. The entablistures were inscribed with the names "Victoria" and "Albert," in gold letters : over the side arches, iu elliptical tablets, were "Victoria Adelide, Albion," and "Frederick Wil-liam, Prussin," and on the pedestals, in similar tablets, were the manues of all the Royal children, "Albert," "Alce," "Alfred," "Helena," "Louisa," "Arthur," "Leopold," and "Batrice." Thepilars were orusented in the arabecque exite, and at the top they were turcted, and supported a number of were oruann ated in the arabesque style, and it the top they were turreted, and supported a number of plants in pots. Luside the centre areh at the base, the ellipses were inscribed "The tribute of Old Trafford." On different parts of the arch were dis-played English and Prussian hanners, and the arms of Mauchester, Salford, Lancashire, and Chesbire. Both façades were alike. This triumphal arch was created of which underwent the s rutinising examination o competent surveyors, who were engaged by the city authorities for the purpose. Generally speaking, the character of the decorations was in advance, as re-gards taste and design, of that on any former occasion of a similar kiud in Lancashire.

sion of a similar find in Lancesnie. On Wednessday, the 1st thist, the Prince Cousort, the Prince of Prussio, Prince of Wales, and Prince Alfred, after a visit of three hours' duration to the Exbihition, were conducted over the works of Messes. Macintosh and Co, where the vulcanised Indian rubber fahries are manufactured; also over the Print Works of Messes. T. Hoyle and Sous, at Mayfield, On the new to Workson, a cause are made to rive Works of Messes. T. Hoyle and Soss, at Msyfield. On the way to Worsley, a pause was made to view the manufacturing establishment of Messrs. E. Armitage and Sons, at Pendleton. The Royal party seemed determined to make the most of their time. and showed how much may he accomplished where there is "a will " as well as "a way."

STAMPED OR INCISED SUUCCO.

We have already mentioned the mode of decorating stucco introduced by Mr. Ferrey. We now add that gentlenan's own noise of the subject, communicated to the Institute of Architecis at a mucting, as already mentioned, ou the 15th of June :-

I wish to call attention to some specimens of stamped stucco, from which I think it may be seen that it is possible to obtain large surface decorations at a small expense, nucl that a common material, which has hitherto in modern practice been only used for perfectly plain purposes, may be made the means of much successful curichment. My mind was first My mind was first directed to this matter by a desire to obtain som sort of suitable ornamentation for the interior of churches built at small outlay; for it appeared t me that when every effort was making to render churches both solid in construction and heautiful in polychrom tie devices for internal wall surfaces, there should be some attempt (where economy in cost was obligatory), to employ commoo products in such manuer that in their natural use they should enduce to church-like effect, without adopting those surface embellisbments which, in their application, hecome necessarily expensive.

Much structure have supported been given to a better use of bricks for eeclesiastical holidings, and good effect has been produced by them with stone and finit : naked brickwork, however, for the internal facing of walls is less successful, and the usual way of obtaining durable surfaces deconsitions is by main of obtaining durable surface decorations is by paint or obtaining durations surface decondous is by paint-ing upon metal plates and affixing them to the walls With many people, however, there is a strong dislike to polychromy. They will senction any extent o mentral tint or bi-colour, but object to hving coloured decorations, however well executed. This may he and probably is, a mistaken view; but the preva lence of the opinion is a "great fact," and must he dealt with accordingly. Any kind of enrichment therefore, which can be produced in the plaster, and is consistent with "time principles of Medieval art," is worthy of nucleo. Anything affecting to be what in reality it is not should be excluded from us in abuncher there are should be excluded from us in

substance

In former times the plastered walls of our churches were covered with coloured devices and texts, or illustrations of scriptural subjects : entirely plain suraces were seldon to be found; but in later periods a Portianical spirit prevailed, which led to the conceal-Portianical spirit prevailed, which led to the concat-uctual of all these decorations by repeated coatings of whitewash. Itappily a more ealightened feeling now exists, and there is a general desure that our churches should be suitably ornamented; indeed, nothing hinders decoration but the want of funds, and in all modern churches there is a seeking for some economical mode of enriching the internal wall sursome faces. A very cheap and simple mode of ornamenta-tion seems hitherto to have remained unattempted. It is well known that the external rough casting ou old wooden buildings was stamped or wrought in small devices, known by the term "pargeting," but it never assumed the importance of extensive wall decorations, ss, when stone and brick entirely super the use of quartered oak framiog, the system of search the use of quartered out frames, the spectra of pargetting also ceased. There seems no reason, how-ever, why this principle of design should not be largely used in another way. The plan now proposed angely used in above way. The pain here pro-is to impress the common stuced with geometrical and other forms: they may be applied according to the taste of the architect, either under string corners, around arches in spindrils, soffices, or in large masses of diapering, and texts may be imprinted on the plaster instead of heing simply painted on the walls. If colour is desired, it can be effected by mixing the desired colour with the coat forming the groundwork then by laying the stencilled pattern against it, and filling in the solid portious of the device with the ordinary stucco or plaster. It will be observed that I have used the word

stucco in this description and not plaster: it is not, stucco in this description and not plaster it is not, however, to be supposed that this process cannot be used with fine plaster or any cemeut which does not set too rapidly. My object is to show that the commonest material is capable of being employed, and that it may be impressed in site. If common stucco, therefore, may be thus trated, it shows what superconducting any arms to use for which interest to succes, therefore, may be this fract, to show white opportunities are open to us for giving interest to harge wall surfaces which are generally let plain. My bioging this mariner before the members of the Institute is simply with a suggestive view: each

the Institute is simply with a suggestive view : each person will judge for himself as to the particular way in which it may he applied. The cost of making the brass patterns is not expensive, and there is no reason why fresh designs should uot he made to suit any building : thus the frequent repetition of the same ornaments would be avoided. This should not aim at superseding any higher mode of decoration; but that This should not aim at it may be made conducive to good effect in the interior of buildings, I can entertaiu no doubt

OPPOSITION TO SANITARY PROGRESS .-THE PROPOSED NEW PARKS.

At no period of the history of this metropolis has the necessity of all classes and districts working earnestly together for the general good been more carries by together for the general good been more clearly evident than at the present woment, and yet, un-fortunately, there are large numbers in this metropolis who think that they can asfely live for themselves alone. Westminster, so well provided with spacious parks, made and kept up at a large public expense grumhles to afford a similar means of health to the grammes to another a similar means of nearth to the rapidly-increasing populations of Finshury and Ber-mondsey. Other neighbourhoods are similarly opposed, and what is more curious still, it is said that the Corporation of London will strongly oppose the levy-ing of even a small rate for the establishment of new parks.

We ask those who, living year after year in particular localities, are apt to forget how intimately con-uected even those parts of London far distant from them are with themselves, to take up a map of the metropolis and carefully consider its peculiarities.

First, let London eitizenswhoareopposed to providing neans for the health of districts which are now parts of this hnge capital, mark carefully the limits of their own territory, and see how small a speck it is in proportion to the surrounding mass

Then let others lock how unbroken is the almost hewildering moltitude of human dwellings: draw a line round the outskirts, and then see how completely London is a single city, each part depending more or less upon the other for the good sanitary condition of the whole

From the Regent's park castward to the Victoriapark, the whole space is thoroughly hlocked up with houses. From Camberwell to Holloway, there are nothing but close and continuous streets, only worky of nutice. Anything affecting to be what is really it is not should be excluded from use in churches, where trutbfulaess ought to prevail. Plaster is therefore very properly forbidden to be used sent, quie in the suburbs, are widely belted in for columns and arches, or any constructive members with buildings, and persons who now view them

which ought to be of stone or some other rigid admire the forethought of those who caused their formation at a time when it was possible to obtain the ground on easy terms.

the ground on easy terons. A reference to the map will show how admirably the proposed park for Finsbury is situated at an nugle towards the north, between the Regent's and Victoria Parks. It is evident, by the extent of building during the last twenty years, that if advantage he not at once taken of this site, in less than helf-adozen years it will be covered with bricks and mortar, and those who come after us will not conceive a very favourable

opinion of our present enlighteument. Let us again cast a careful look at the map, aud view with consideration the mass, which is girt by a view with consideration the mass, which is gift by a skirting line of about thirty-seven miles, and reflect that great as is this surface covered by two millions and a balf of living creatures, in less than fifty years the mass must, according to the present rate of progress, be doubled; and then, if such spaces as the Finshury and Bernondsey Parks and Hampstead-heath are spared, they will indeed he like water in the descridesert.

One would think that it was scarcely needed now to argue in ther the necessity, with this extraordinary population, of measures of sanitary improvement suf-faciently applicable and extensive for the emergency; hut when the representatives of certain districts ris hut when the representatives of certain districts rise up in Parliment and oppose the formation of metro-politan parks, it is our duty to remind some of our renders that to a considerable extent the health of every individual in London depends upon the proper condition of the whole. The missma which rises from the ill-drained districts of Bethnal-green and other parts cannot fail to reach in an adalterated but still dangerous form places far distant. By purifying the large neighbourhoods of the poor,

by purying the targe negative to be and palaces of the wealthy. With the exception of drainage, no sanitary means are more effective than the plentiful mixture in the midst of our buildings of large open green spaces well planted with trees. Independent of mixture in the midst of our buildings of large open green spaces well planted with trees. Independent of this and various other alvantages, the metropolitan parks are places of pleasant resort to thousands of lard-working and pertup inhalitants. Jones the carpenter, who has half-a-dozen children, cannot afford often to the a time by the aviliance in the fifthere he carpenter, who has halt-a-dozed endured, cannot and e often to take a trip by the railway; hut if there be a park at anything like a reasonable distance, Mrs. Jones and he will walk off with the children and spend

Jones and he will walk of Wint the children inde spice a few hours in the open air, instead of sitting confined in a close dwelling-house, or, perhops, resorting selfishly to the public-house. We hope that the report of City opposition is with-out foundation, for we cannot forget that the Moor-fields, Smithfield, and some other lands, were intrusted to the corporation of London as green places for the recreation of the people for ever 1 Another peop at the map will show how valuable a little park-ap hace of recreation-at Moorfields would now be. Let us howe of the the arms of United in the little parkhope that the error of allowing the misoplication of the places just mentioned may be taken into considera-tion, and that in return the City authorities will give a vigorous support to the proposed new parks.

TOREIGN INTELLIGENCE.

Ulm .- The Great Organ .- The huilding of this buge instrument has caused quite a sensation in Germany. M. Walker, the organ-huilder, has now given it over to the Committee of the Minster, and it has been consecrated by the *Pfarrer*. The German papers say that this organ had already a history of its own, before it was completed. It is so far back as the year 1838 that M. Walker made a plan for this huge instrument. Several plans were made subse-quently, one improving on the other, and increasing the expense from 15,000 to 28,000 florins. Its building lasted upwards of two years, and the tran-sactions about it nearly eight. It has two manuals, nd 4,000 pipes, aud is considered now the largest in Germany.

Germany. Weimar.—Architecture and Poetry.—The restora-tions of this splendid Medieval eastle are putching on with such activity, that the architect, M. Von Ritger, will remain for the next two months on the spot. On the coreasion of the great Singerfest, in September; the company will be conveyed by a special train to this fine restoration of a historically important hereity. locality.

The Tunnel of Mount Cenis .- This grand mani-The Tennet of Mount Cents.—In's grand mani-festation of the mechanical enterprise of our age, hus been decided upon by a vote of the Sardinian Parlia-ment. It is Professor Collaion, of Geneva, who is the origicator of the plan, and it is said that some preparatory experiments are to be made on the Mount Salève, near that city, at which the Premier, Count Cavour, will he present. The Mount Cenis tunnel will have a length of 12 kilomètres, aud it is asserted that the stupendons engine can operate at a distance of 6 to 7 kilomètres (!). Some improvements have been lately added by the engineers, Messrs. Grandis, Grattoni, and Sommeiller.

ESTIMATES AND COST OF METROPOLITAN IMPROVEMENTS

THE First Commissioner of Works has presented to the House of Commons a report with reference to the present condition of the metropolitan improvements, under the direction of his department, now in progress, and the sums of money required to complete them. We have received some trenelant observations on the probable great excess of cost of the works over the asserted, estimates by the Government architect; but the charges are made to look so grave, that we must seek for some information on the subject before deciding as to the publica-tion of them. tion of them.

OXFORD ARCHITECTURAL SOCIETY.

THE nineteenth annual meeting was beld in the Society's Rooms, Holywell, on Monday, the 22nd of June. In the report laid before the meeting on that occasion, the committee said,-

"The important architectural works which were "The important architectural works which were enumerated in the last report are now either com-pleted or are rapidly approaching completion. The Chapel of Balliol College, which is nearly ready to he opened, is remarkable for considerable vigour and originality of design. At Exter College, the library is completed, the rector's new house nearly so, and the walls of the magnificent chapel are rising rapidly. All of these works are most satisfactory and worthy. the wais of the magnificent chapel are rising rapidly. All of these works are most satisfactory, and worthy of the emiuent architects who are employed on them. In the rector's honse especially, Mr. Scott has prac-tically vindicated the suitability of our national style to domestic purposes. The windows, though stirily Gothie, admit abundant light, and are in every respect as convenient as the common sash windows in ordi-nary dredling, honses nary dwelling-bouses.

The decoration of the president's room at Magda-len College has been completed by Mr. Crace.

The committee congratulate the society on the fact that the restoration of coloured glass to the windows of the chapel of this College has been intrusted to Mr. Hardman, of Birmingbam, whose works are now generally admitted to be more successful than those of any other glass-stainer.

The works at the New Museum proceed steadily Ine works at the New Aluscium proceed steadily and satisfactorily, and there can be no doubt that the high anticipations which have been formed of this huilding will be fully realised. The committee feel that they eannot enter into a detailed criticism of so great a work until it shall be completed. The architects of the Muerrer here are the

The architects of the Museum bave recently com-pleted a new d-buting-room for the use of the mem-bers of the Union Society, in which they have suc-cessfully adapted Gothie architecture to the peculiar requirements of the case.

requirements of the ease. The chancel of the partial hurch of St. Peter-in-the-East has been partially restored, and in that of Holywell very important and extensive alterations have been earried out. In the latter church, deco-rative colour has been largely employed, especially in the roof, and on the eastern and western walls, where groups of 'aaggels have heen painted with admirable effect by Mr. Bell, a London artist."

THE SURREY ARCHÆOLOGICAL SOCIETY

THE SURREY ARCHEDIOGRAL SOCIETL. The fourth annual general meeting of this society was held on Monday, the 29th ult. at Dorking, when a pleasant day was spent, though arcbæology did not occopy a very promineout position. A large number of the members of the society assembled at the Deep-dene, shortly after noon, where the husiness proceed-ings of the association had heen announced to take uheen at hult next involve calculate her the hird arcmin ings of the association had heen announced to take place at half-past twelve o'clock, by the kind permis-sion of the owner of the mansion (Henry Thomas Hope, Esq. one of the vice-presidents). The business was confined to mere routine, and on the election of members and no papers were read. A proposition was made by Mr. J. W. Flower, that the society should publisht an archeelogical map of the county, which clicited some discussion, and was agreed to by the council. the council.

The meeting then broke up, and the company proceeded to view the numerous treasures of art con-tained in the Deepdene, and afterwards rambled through the delightfully pieturesque grounds surrounding the mansion

Arrangements baving heen made by the Committee for a visit to Wotton-park, by the kind invitation of W. J. Evelyn, Esq. (one of the vice-presidents of the society), the company left the Red Lion Hotel, in carriages and vehicles, shortly hefore three o'clock. They were bospitalaly received by Mr. Evelyn, who conducted the neutron with heme and the head of the he conducted the party over the house and ground, re-dered classical by the residence there of the celebrated John Evelyn, popularly known as "Sylva Evelyn," and the author of the often quoted "Diary," and Amiable recorder !

other well-known works. Many of his books are still preserved in the library at Wotton. At half-past six o'clock, a large party, including many ladies, sat down to dinner in the Assembly-room, Red Lion Hutel, under the presidency of Mr. Henry T. Hope. The "feature" of the meeting was a speech by Lady Elizabeth Wathen, in reply to the toast of "The Queen, the Prince Consort, and the Royal Family." Professor Donaldson returned thanks for the visitors. for the visitors.

THE SUSSEX ARCHEOLOGICAL SOCIETY IN NORMANDY.

A CHOSEN band of the Sussex Archeologicals have made a descent on the const of Norunady, and a writer under the recognizable signature "M.A.L." has communicated an account of the iavasion to the Brighton Herald.

Referring to the joking terms in which the visit had been spoken of, circulated by us at the time, when it was remarked, —" Master Lower would be the when it was remarked, —" Master Lower would be the Master Wace of the enterprise, and indite a poem thereupon; and the facts of the invasion would be pictorially handed down to pasterity by the facile fugers of certain Lewes Matildas;"—the writer says the Freueh papers also took up the theme; and, io erown all, *Le Charioari* devoted a whole column of its humour to the subject under the title of "L'Archeo-logic Nomade," commencing "Archeology again raises its head in England, where it had not dared how any sim of life sime Walter Secti turned it into Thises its field in England, where it had not dared show any sign of fife since Walter Scott turned it into ridicule in his novel of 'The Antiquary.' The arebmologists of that country have evidently been afraid of taking old dykes for Roman remains,—a blunder which the *Times* would not fail to communi-sate to all *Forme*. cate to all Europe.

Of late the archeeologists, who had remained since Of late the arcueologists, who had remained since the publication of 'The Antiquary' in the state of a secret society (I), have held a public meeting at Newcastle, under the presidency of Dr. Bruce, and they have decided on undertaking a long scientific excursion on the continent. A steamhoat freighted at the expense of the society will convey them first into Perma. The Foulie have a bare so partiat the expense of the society will convey them first into France. The English, whom we have so perti-nacionaly regarded as a people entirely devoted to the trade of Windsor snap and Birmingham razors, have always money at command for the most eccentric of their whims. In France, the country of arts, of letters, and of science, no scientific expedition what-ever could gain the adhesion of a hundred people.

The Eaglish are to bring with them an historian A Leves Maticas (7) commissioned to write daily a report of the expedition, and a poet, Monsieur Lower, whose mission will he to sing all the dis-coveries of importance.

For instance, if they lay hands upon a Gallo-Roman sepulchre, M. Lower will immediately seize his lute and compose a hallad. If they find a pot of coins, M. Lower will begin,

off-hand, to chant a dithyrambic measure

Should they discover an ancient Gothic arch, church or in castle, M. Lower will tune his lyze and chant an ode.

All this time Monsieur Lewes (!), whom Heaven has not endowed with the secret influence, confines himself to the duty of entering upon his register a dull record of all the discoveries."

Dieppe and Rouen were visited. Speaking of the latter the writer says: -- "We went, of course, to St. Gervais, the death-place of the Conqueror. H. re, ervpt, and saw the tomhs of St. Mellon and St. Avietenue, the first and second arehibishops of Ronen Crypt, and saw too tooms of the Article and the Avicence, the first and second architishops of Ronen in the fourth century. This wall is considered by French antiquaries as a genuine relie of the Roman ages; hut Dr. Brace shock his head dubiously, for ages; int Dr. Bruce show his head choices; for which I was sorry. At all events, there are Roman tiles and other marks of great antiquity to he noted in the construction; and it must not be forgoiten that Romen, under the name of Rotho nagus, was a well-known Roman station."

Caen followed, and then Bayenx, where Dr. Brace lectured on the celehrated Tapestry no longer pre-served as a roll as it was when we saw it a few years ago, hut stretched upon hoth sides of a staad running his kuights is represented ridiug to Bosham, in order his kulputs is represented rading to Boshani, in order to eross over to Normandy, where he subsequently made a solemn oath not to disturb the pretensions of William to the English throne: in the last, we hended the death of Harold, and the flight of the English at the battle of Hastings."

THE MANCHESTER EXHIBITION BUILDING

S18,---If we are to have buildings of iron and glass for public purposes, and it is most desirable that we should be able to avail ourselves of such constructions, should be able to avail ourselves of such constructions, we must not gloss over or shut our cyses to weaknesses and failures which become apparent, but boldly seek for the couse of them, and prevent, if possible, their recur-rence in other similar bouidings. I think it very de-sirable, therefore, that you should be informed of the weak state of the user interact of the real state of the ease in respect of the storm at the Art Treasures Exhibition building on Saturday after-Art Treasures Exhibition building on Saturday after-noon, the 4db inst. Of course the matter will be smoothed over with "immense amount and suddenness of the raifold,"---"acadental stoppage of the gutters and down-spouts,"---&c. &c.; but this will not alter facts, which are as follows:---About six o'elock in the afternoon a tremendous thunderstorm commenced, with beavy fall of rain, which lasted with great fury for above a quarter of an hour. The rain-water de-scended in torrents in the inside of the building, all along the line of the gutters on each side of the main Tor above a quarter of an hour. The rank wher de-secuded in torrents in the inside of the building, all along the line of the gutters on cach side of the main arched centre, falling upon the glass cases and other articles beneath. Most fortunate it is, that these articles, so valuable, were in glass cases, else the dwmage would have heen irreparable. The water also found its way into the ancient and modern galleries, and particuledy into the Hertford and Water-colour galleries, and energetic steps had to be taken in the instant removal of pictures. From what I could see, I should think that no damage was received by any of the articles; but this was owing to the promptoses of the uneasures taken by Mr. Denne. The building itself was proved to be quite nucalculated for an ex-traordinaly amount of rainfall, as it is hardly likely that all the gutters should have been simultaneously stopped by accident. The gutters and sponts were falling on so large a surface. I wonder which of the three gutteren the ohose fought so bard in their turn for the honour connected with the building. their turn for the honour connected with the building, will accept the responsibility of this part of the arrangement. A. LEAK. arrangement.

NEW BATHS AND LAUNDRIES AT MANCHESTER.

MANCHESTER. THE second establishment of baths and laundries, creted by the Mauthester and Sulfard Baths and Laundries Company, was opened on Wednesday, lst inst, in Mayfield, Loadou-road, Manchester. The first establishment by this company, which has been in suc-essful operation for a year or more, is in Greengate, Salford. The company intend erecting other similar establishments in different populous parts of Man-chester. The Mayfield tabls are in the midsi of a densely populated district, occupied almost wholly by the working classes. The building has a neat and ornamental appearance, and stands on a piece of ground bounded by Boardman-street and Store-street. According to the Manchester Courier, from which we get these particulars, the style of architecture partaless somewhat of the Italian. With the exception of the end used as the residence of the superintendeut, the huilding is only two stories high. In the former part auother story is added; and immediately over it rises the ebitnney which carries off the snoke and steam. This chinney is less ugh than many of its neigh-bours, of which there is a profosion in that locality. The front of the building is composed of brick, with stone dressings. The length of the froatage is about 120 feet. Of this space, 80 feet are devoted to the torst and second class male swimning-biths, the reminder being occupied by the laundres. The doors leading to the men's baths (of which there are two classes, first and second) are on the Store-street side. There is a approached through a waiting. THE second establishment of baths and laundries, two classes, inst and second) are on the Store-street side. There is a separate entrance for each class. The first-cless baths are approached through a waiting-room 25 fect long by 15 fect wide. The plunge or swimming hith is of large proportions, being 70 feet long by 25 fect wide, and averaging 4½ fect io depth. The bottom is formed of concrete, upon which is a layer of ement, the whole being covered with polished with up. The average with polished Like gottom in the whole heing covered with polished Vorkshire flags. The side walls are first covered with cornent, and afterwards lined with porcelain files, bearing a neat coloured border. Surrounding the bith are thirty-two enclosed drossing stalls; while over these, supported on ornaneental iron pillars, is a gallery, in which are the men's private warm baths, of which there are seventeeu. These are 8 feet by 7 feet, the beight being ahout 12 feet. Separated from the gallery by an open corridor, and facing the front of the building, are five extra first-class private baths. In addition to being a little larger than the others, these are supplied with a shower-bath. The second-class swinning-bath is in most respects similar second-class swimming-odd is in most respects similar to the first. It is entered through a waiting-room adjoining that of the first-class, and is fitted up with every regard to confort. It is of the same dimen-sions as the other, but only a portion of the dressing-stalls are enclosed. In the gallery are the private

warm-baths, and in the front, facing the street, those warm-baths, and in the front, lacing the street, those which are colled extra, and for which an additional amount will be charged. The roof of both haths is in open rafters; the light, of which there is no lack, heing admitted by side windows, instead of by sky-lights, as is the case in the hulding in Solford. The warmon's buth, although in the rame building, are lights, as is the case in the huilding in Sufford. The women's haths, although in the same building, are entirely distinct from the other part. There are two separate doors from the streets, and two waiting-rooms, first and second class. From these a staircase leads to the respective class of haths, of which there are four of the first, S feet by 6 feet; and seven of the second, which are a little smaller. The laundry department occupies the end of the building near Boardman-street. The waiting-room, which is 21 feet by 16 feet; leads directly into the laundry, which is Boardman-street. The waiting-room, which is street by 16 feet, leads directly into the hundry, which is on a level with the street. The room is 64 feet by 38 feet, and is filled with all the necessary apparatus for the various operations in washing. There are six 38 feet, and is filed with all the necessary apparatus for the various operations in washing. There are six first, and thirty second, class departments. The former are provided with three tubs for washing, those for washing and hoiling. Each compartment is provided with an iron 'maiden,' which is placed over the hot-air store, and npon which clothes can be dried in about tweaty minutes. Access can also he had to two patent writinging-machines, which, by a very simple process, remove all the water from the wet clothes, and save agreat amount of labour. The ironing-room adjoins, and will be fitted up with stores. ironing-room adjoins, and will be litted up with stores. For the purpose of supplying the hot water and steam there are three builers, of twenty horses' power each. The water, which is obtained from the corporation, is stored with a tank, placed over the holier-house, which holds about 3,000 gallons. The quantity which is contained in the haths is between 40,000 and 50 000 gallons, and the time required to fill each is about two hours. Arrangements have been made for carrying bors. Arrangements have been made for carrying of the waste water. The building has been created after the designs of Mr. Thomas Worthington, archiafter the designs of Mr. Thomas Worthington, archi-tect, King-street, who was also the architect of the other establishment, in Salford. The cost of the establishment, exclusive of land and furniture, will probably amount to 9,000. The contract for the huilding has heen executed by Mr. Robert Neill; and for the works connected with water and steam supply hy Messrs. Melling and Sou, of Rainhill.

FRATERNITIES OF ART.

BEFORE Mr. White (who addressed so well-inten-tioned a letter to you, published in your Journal, p. 361) gathers together his fraternities, let him remember that the arts are hest developed under reflected light; and no fraternity will be useful that does not embrace men of various pursuits and abilities The arts are mutually serviceable : they borrow phrases from each other : painters respect tone, and musicians talk of light and shade, and thus the first of all considerations in such fraternities is to make the hasis wide ake the hasis wide enough. A society of architects would but prove the low

A society of architects would hut prove the low state of architecture in England. Ask them what it is? they would each give a different definition. How would it have heen of old? Ask Phidias; he would say, "It is an art which, working with its own materials, under its own sun, and its own blue sky, raises, to unknown but venerated idealities, temples, for incomplicable have the size the start arc for the raises to unknown but venerated idealities, temples, of size sufficiently large to give them grandeur, of form so closely allied to the proportions of the humau frame as to give them beauly, of hues so delicate as to please the eye; emanations of minds of the highest genus, appreciated by minds of the lowest cultiva-tion,—the glory of their own age when in perfection, the regret and study of future ages even in their dealine." decl

decline." Ask Bramante, when he first leaned over his design for St. Peter's: "It shall be," he would have said, "an altar which shall attract the religionists of the world to the shrine of their faith; glorions in inten-tion, splendid in decorations, vast in extent; its crowning dome shall be a wonder of construction; its very pavement a marvel of splendour; the throngs that fill it shall find their faith exalted by the very alories which surround them?"

that fill it shall not open later context of glories which surround them." Ask Wren : with more simplicity, he would have

Greeian art in England, hut the nation grew tired of it, and asked again for the picturesque projections of Whitehall,—the mixed Italian of Palladio,—anything for effort, for contrast, and novelty. Gothic architecture, that beautiful emanation of the circular arch, the pointed roof, and the pliant hand of the old masons,—which has sprung up in cathedrals, and passed through its four marked eras—now lives like a magnificent shruh whose every heaf has eased to gather cuttings from the used-up stem. Such was, and such is, architecture.

Such was, and such is, architecture. Now, let Mr. White thick of this: bud then talk of fraternities of architects. We want not these, but we may want fraternities of art: but, even these buter to be useful must be wide, explicitly a solution. latter, to he useful must he wide : architects, painters, latter, to he useful must he wide: areniteets, painters, men in fact of all liberal pursuits, must associate freely together less to serve one particular study than to assist all studies, before art can again hecome the light-giving and spirit-stirring element it once was: and then, too, it would be a solitary affair if the nation that are used avader its influence.

and then, too, it board to be a function of the second sec humanity, or it is nothing.

Take Ruskin : admit his theories ; or, if not, confute tem. The broad truths they contain draw with them them. The broad truins they contain turns when truins when they are so broad, so human, so unprofessional. When we have more Ruskins we may hope for fraternity in architecturc— but not hefore. An Architecture. hut not hefore.

CHEAPENING GAS AND ITS RESULTS. THE directors of the Worksop Gas Company have

The directors of the Workson Gas Company have just declared a dividend at the rate of 7½ per cent. for the past year. In 1853 the company was charg-ing seven shillings per 1,000 feet for the gas, and only able to afford a very insufficient supply. They determined on remodelling the works, which was effected under the superintendence of Mr. Gore, the engineer to the company. The result has been that they have been enabled to reduce the price of gas to 5s. 10d, per 1,000 feet, and yet pay an increased dividend. A further reduction to 5s. per 1,000 is about to he made. Since the reduction from 7s. to 5s. 10d the consumption of gas has increased mearly 10d, the consumption of gas has increased nearly 80 per cent.

THE ARCHITECTURAL MUSEUM,

IN THE GOVERNMENT MUSEUM AT BROMPTON. As our readers already know, the Architee thrad Museum has been removed from the quaint dirty hole in Canon-row, Westminster, where it was first planted and grew. The old place had a charm of its own, and the new place is less convenient to some who used to frequent it. We are quite satisfied, however, that the com-mittee did right to accept the offer when the Government proposed to provide the Institution with premises rent free, as it does the Royal, the Antiquarian, and other Societies. The diffi-outer formation in the societies of the societies. culty found in raising sufficient woney to meet the annual expenses and pay off the debt incurred on its first establishment; the failure of room; the coldness of the place in winter, which made study impossible; and the want of a good access to the collection, all weighed with the com-mittee, and could lead to no other decision than that they came to. In its new home, the collection is better seen, can be studied during the whole year, and, through its connection with other collections, will be visited by a much larger number of persons than heretofore. The Institution retains its independent position as a private society, with all the original powers of direction and management, and with entire dependence, as hefore, npon the exertions of the committee, and the contributions of sub-scribers.*

The original intention of the founders was to

Ask Wren : with more simplicity, he would have said_---We too, will have our central cathedral_-n church worthy of our country ; simple in intention of native workmanship, of native material; ' and has he not succeeded? Of all English buildings, St. Paul's, with its dim domed outline against its Builtish sky, and its softened tiart of hazy columns bacatath to produce an effect from new combinations of very dol materials. He was tengune to the tors work and when we did get Stewart's "Abens," and the forms of Adams was laughed d, and Wren and Vanheng, was the cloqueue of the language of Rome. Adams was laughed d, and Wren and Vanheng, was the cloqueue of the language of Rome. Adams was laughed to and Wren and Vanheng were we? Smirke, it is true, tried strongly to bring out the capacities of Allen.

JULY 11, 1857.

Greeian art in Eagland, hut the nation grew tired of form a nucleus of a National Museum of Archa tectural Art, "to supply that great and increas-ing wait, now felt by the public, architects, artists, and art-workmen, of the means of referring to and studying the architectural art of past ages, and of those arts which have had their origin in architectural art." A large and inercasing collection of casts and specimens has been already formed from the finest ancient examples, English and Foreign, of complete architectural works, arranged, as far as possible, in the order of their date; and of details, com-prehending figures, animals, and foliage; mould istic tiles, mural paintings, roof ornaings, enca ments, mbbings of sepulchral brasses, stained glass, impressions from seals, and of all other objects of fine art connected with architecture ; and it scems to ns that Government should now take charge of the Institution, obtaining annually a grant for its increase and maintenance, and appointing the committee as a board of trustees for its management, with power to fill up vacancies. The Greek, Roman, and Renaissance casts belonging to the Department should be added to the collection and arranged in

sequence. The Museum is an admirable school for study. Every architect, and every architectural carver, should send his pupils there regularly to draw. We are glad to observe that the general

We are glad to observe that the general public, in passing through the Government buildings, manifest as much interest in the col-lection forming the Architectural Muscum, as in any other, and stop in the gallery as long as they do elsewhere. During the week ending June 27, 6,041 persons in the day time, and 8,017 in the evening, being a total of 14,058, visited the Brompton buildings. Our engraving represents the gallery viewed from the north end. On the right hand side, in

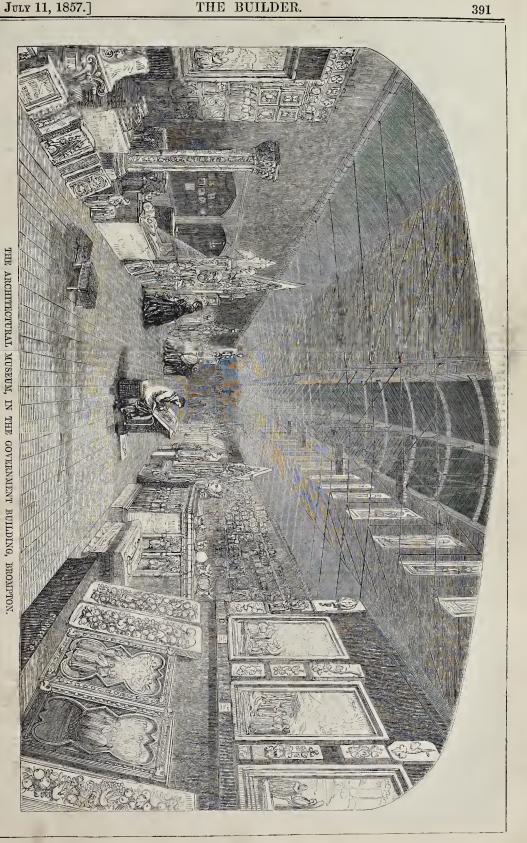

Our engraving represents the gallery viewed from the north end. On the right hand side, in the foreground, are bas reliefs from the south door of the Baptistery of Florence, cast in bronzo (according to the inscription on the door), by Andrea Pisano, from a design by Giotto, in 1330, together with the competition panels, by Lorenzo Ghiberti, and Jacopo della Quercia, of Siena, for the New Testament gates of the Banisterz. The scroosis reminds visitora. Baptistery. The synopsis reminds visitors, that "the number of competitors for this work was seven, three Florentines and four Tuscans. Each artist received a sum of money, and it was commanded that within a year each should produce a story in bronzc, as a specimen of his powers, all to be of the same size. The candidates for this work were Filippo di Ser Brunck esco, Donato, and Lorenzo di Bartoluccio, who were Florentines, with Jacopo della Quercia of Sicua; Niceolo d'Azezzo, his disciple; Fran-cesco di Valdambrina, and Simone da Colle. Lorenzo Ghiberti, whose work was unanimously pronounced the best, at that time was scarcely twenty years old. He was born in the year 1381, and died in 1455." Amongst the panels Amongst the panels are hung some casts from natural leaves, with a view, on the curator's part, of showing how accurately nature had been followed in the foliage of the Ghiberti gates. Beyond are seen the effigies, on an altar-tomb.

Talbot, Earl of Shrewsbury, his son, and of wit

On the left hand side of the gallery arc other panels from the same gates, a clustered column from St. Alban's Abbey Church, seen in the engraving; the font from Patrickton Church, Yorkshire; and part of the effigy of King Edward II. from Gloncester Cathedral. Canopics from the monument of Bishop Acquabiance, Hereford Cathedral, aud from the high altar-screen, St. Alban's Abbey Church, may be seen beyond.

The arrangement of the casts on the walls is now undergoing change, so that it would be nscless to point ont the present position of specimens. When completed, a plan, with num-bered references to the časts, will be issued by the committee. All can draw there on the the committee. All can draw there on the students' days without let or hindrance. Let ns add, in conclusion, that the committee of the Architectural Muscum are issuing cards of invi-tation for a *conversacione*, to be held in the Gal-lery, on Saturday next, the 18th inst. when the subscribers and friends of the Museum will be able to see the present aspect of the collection, to which we are seeking to draw increased attention.

THE BUILDER.

CHURCH-BUILDING NEWS.

Mancroft.—About four or five years since, St. Peter's Chorch, Mancroft, was partially re-pewed, with open benches. It was hoped at the time that a sufficient amount would have heen raised to get rid of the old high-backed pews throughout the church, but it was found that only the chancel could then be com-At the parish feast in 1856, an additional pleted. At the parish teast in 1850, an additional subscription list was begin, and now the church has heen finally rc-opened. The new seats cost about 600%. The architect employed was Mr. Phipson, of London, and the carver, Mr. Ringhan, of Ipswich. *Cheshant* (Herts).—A new Congregational Church was commenced here on the 12th of May, and the

was confinenced here on the Table Table 1. The site is in Crosbrook-street. The main building is so placed as to leave a forecourt and is 60 feet 9 in. by 40 feet, to leave a forecourt and is 60 het 9 in. by 40 feet, accommodating about 400 persons on the ground-floor, and 120 Sundry-school children in a gallery at the western end. The roof is of deal, stained and varnished, open to the ridge, ceiled on the back of the rafters; the ornamental arched trusses forming five here is the locat of the holding. It the contex of bays in the length of the hailding. In the centre of each bay is a stone, single-light, pointed window, except in one on the south side, where a stone arch recess is provided for the organ. The scats are of deal, stained and varnished. The school-room forms the boundary in the rear, and is 38 feet 3 in. by feet 6 in. with entrance lobby. Between the school room and chapel there is also an infants' room, augurintendent's room, and lavatory, and heating-room under the lobby. The style is Geometrical, and room under the lobby. the front bas a tower and apire 85 feet in height. The materials are stock bricks and Bath stone. The contract is taken at about 1,800, which includes the value of the old materials. The architects are Messrs. Lander and Bedells, of London, and the builders are Messrs. Dove, Brothers.

Abingdon.-A vestry meeting for the parish of . Helen was held on the 2nd inst. as to the resto-St. ration of the parish church, and more especially to consider the report of Mr. Street, the diocesau architect, who was employed in the repairs of the tower, which, according to his report, led to the disclosure of further defects which rendered it necessary for him of further defects which rendered it necessary for him to stop the work, and to recommend the taking down of the tower and steeple. Mr. Street and Mr. Wil-kinson had both of them reported what, in their opinion, was necessary to be done to restore the tower and allay all alarms for the safety of the spire, but neither of them had then seen the necessity of laking it down. The views of the former gentleman were addeted by the computies and according to his speciadopted by the committee, and, according to his speci-fication, the repairs have recently been in progress by Mr. Walters, when, as reported by the architect, the removal of certain internal plustering disclosed certain cracks, and also that the walls were so insufficiently constructed that the repairs would be of little constructed avail. The vestry was numerously attended, and avair. The vestry was numerously attended, and some feeling was manifested against Mr. Street in consequence of his discovery, which led the vestry ultimately to resolve to refer the matter to Mr. Scott and Mr. Wilkinson, and a committee was appointed to communicate with these gentlemen on the subject. *Hulme.*—The foundation-stone of the church of

St John the Baptist, Renshaw-street, Hulme, was I on the 24th ult. The site is an oblong piece of laid on the 24th nlt. ground, near the new schools built last year by subscription. The new structure will also he of an oblong form, with a tower and spire at the west end, fronting Reashaw-street, which, when completed, will be 192 fect in beight. The style of architecture will be Gothic, of the time of Edward III. The upper part of the tower will have pinnacles, and ornamental windows and panels. The east end will be decorated with a large chancel window, the upper part of which will be filled in with ornamental pierced stonework. Internally, the church will present a range of six arches on either side terminating in a slichtly.resized form with a tower and spire at the west end, fronting arches on either side, terminating in a slightly-raised at the cast end. These arch es will divide the body of the church into a nave and two side aisles. The roof of the nave will rise higher than that of the side aisles; with a range of small ornamental cleres Sue asies; with a range of small ornamental derres tory windows, giving additional light to the interior. The roof will consist of stained arched ribs; and the seats will be open benches. On the south side of the nave will be sittings for 327 persons. On the north side the pers will accommodate 328, free. The stone to be need in the huilding is the pierminit rall stone. side the pews will accommodate 328, tree. The stone to be used in the building is the pierpoint wall stone, from Dunford-bridge, Yorkshire; together with ashlar dressings, from Peel Delph, in Lanceshire. The cost of the building will be about 6,0004. The amount already raised is 4,0004, the greater portion of which, according to the Manacetase Coursing has been conaccording to the Manchester Courier, has been con-tributed by Messra, T. H. and H. Birley (of the firm of Charles Mackinosh and Co.). The site, which has heen purchased of Mr. J. Renshaw, of Didsbury, will cost an additional J.1007. The architect is Mr. E H. Shellard, of Mauchester: and the accentent of the second ellard, of Manchester; and the contractor, Mr. Mark Foggett

Rawtenstall .- A new chapel, called the " Metho-

ons Free Contron, was opened on the 25th unit. The building is exected on an clevation above the railway, on the Haslingden road. The style is Corinibiao. There is a portico similar to that of the Pantheon at Rome. The designs are by Mr. Robinson, of Raw-tensall, and the material used is ashlar stone. The tor is Mr. Walter Sigley, of Ashton-under-The woodwork of the interior is stained and ontractor varuished, and there is a gallery, supported by columns with Corinthian capitals. The pews are cal

columns with Corinthian capitals. The pews are cal-eulated to seat 1,000 persons. *Carlcoates (Yorkshire)*.—The new Church of St. Anne, at Carlcoates, Penistone, has been opened for Divine service. The ceiffice has been erected at the expense of Mr. John Chapman, late high sheriff of Cheshire, together with a parsonage-house and paro-ebial schools, upon his estate at Carlcoates, in the West Riding. The "architect and builder" was Mr. George Shaw, of Saddleworth, to whom the resto-rations of the parish church of Ashton-under-Lyne have been intrusted, and which have cost mywards of have been intrusted, and which have cost upwards 14,000%. The church at Callcoates is a small Gothic stone structure, capable of accommodating about 300 sitters. All the windows are of stained glass. east window is decorated, the subjects being St. The St. Anno (the mother of the Virgin Mary), teaching the Virgin to read in her infancy; and the Virgin nursing the Saviour. The west window contains three subjects: Savior. The west winnow commus time sages the middle is the Crucifixion : one side computment represents Jesus Blessing Little Children, and the other Blessing his Disciples, and bidding them preach the Gospel to all nations. There is a small Decorated the Gospel to all nations. There is a small Decorated window on each side of the communiou-table, in which are the full-length effigies of the Evangelists. The chancel is occupied hy eight st the use of the family of the founder. eight stalls, intended for

Northleach .- The chuncel of the parish church has Northleach.-The chncel of the parish church has recently heen new roafed, under the direction of Mr. Knight, of Cheltenham, architect. The roof and upper portion of the walls bad heeome much dila-pidated by "time and the weather." The works were intrusted to Messrs. Mitchell, of Fairford, and Mr. Acock, of Cheltenham. It is in contemplation to replace the present heavy-looking sercea, which does duty for a window at the cast end, by a painted or stained-glass window, the framework, which is now filled up with hricks, being adapted for such a pur-pose. Want of funds alone, it is said, prevents this being at once carried jub effect.

pose. Want of unda anone, it is such prevents the being at once carried luto effect. *Escrick (near York)*.—The church of St. Helen's, the parish church of Escrick, bas been rebuilt, and was consecrated on the 1st instant. The church is described in the *York Herald* to be of the curvilinear Gothic architecture, which prevailed in Eugland about the near 1200. It convents of a hera gentral side year 1300. It consists of a large central aisle nave, and one side aisle to the north. The the year 1300. chancel, which presents its front directly to the north-road, is apsidal in its termination, and, in design, something like the east end of Lichfield Cathedral, or something like the east end of Lichfield Cathodral, or of Tewkeshury Abbey Church. On the uorth-eastern side, at the extremity of the north aisle, rises the tower, which is to he carried to the height of 100 feet. At the western extremity of the church is a mult-angular chapel, formed by a heragonal centre, with a radiating aisle. It is huilt over the family valu of the late owners of Escrick-park, and has been erected at the sole expense of the Dowager Lady Wendock. In the centre stunds the tot at that this Wcnlock. In the centre stands the font, so that this building is both a haptistery and mansoleum. The roof here is vanited with stone, and upheld by pillars of red Devoashire marble, from Ipplepen, near Torquay. Marble is also used in the pillars of the nave, from the quarries near Plymouth, which have supplied the hreakwater. The roof of the nave is ned with arched trussed ribs of fir, carried by el corbels. The roof of the church is vaulted with angel co oak. The general dimensions are, in the entire in ternal length, 121 feet; width of the nave, with it aisle, 38 feet, and the same for the height. The whole building is of stone, both inside and out, with a course of hrickwork in the middle of the walls. The stone used for the rough walling is from Huddlestone, near Sherburn, in this neighbourhood, and Whitby stone is used at the ground line. But all the dressed stone is used at the ground line. But all the dressed stone has here brought from the Ancaster quarries, in Lincolnshire, conveyed in block from Grautham, and worked on the spot. There is an entrance into the There is an entrance into the church from under the tower, and on the south there is a porch which, in many old examples, has a chamber is a porch which, to many one samples, has a chamber above it, here used as a vestry. The turret, which contains the spiral staircase leading up to the vestry, projects a little into the church, and forms a feature in the interior. A rose window at the west end of the nave, above the arch leading into the baptistery, and some small clerestory windows on the north side, are filled with stained glass by Messrs. Hardman, of are niced with stance grass by Messrs Hardman, of to xn-hall, which has been carried out, and a com-Birmingham. This window was presented to the modious and well-lighted room formed, 50 feet long, parish by the choir. There is also a window hy Mr. Ward, of Landon, at the west end of the north aisle, directions of Mr. George Low, of London, architect, given by the children of the national school. The who erected the present town-hall, in 1851. Mr. chancel windows, which are at present plain, are to Scar, of Hemel Hempsteid, was the contractor. The

dist Free Chnrch," was opened on the 25th ult. The be filled with Bavarian glass. The floor of the church be interview of the second sec bricks and a large portion of the oak timber need in the fabric were presented by Lord Wenlock. The organ is the work of Mr. G. M. Holdich, of London. is placed under the tower, and opens into the ancel through an arch. The architect is Mr. Pen-It is placed under the other than the architect is Mr. ren-chancel through an arch. The architect is Mr. ren-rose, and the work (which has been done by measure-ment and valuation) has been executed by Messrs. Mirk and Varianton) has been executed external of Mossio-kirk and Parry, of Sleaford. The carving bas heen excerded hy Mr. II. A. Smith, of London. Some of tho wood carving bas been excented by Mr. Wolsten-holme, of York. The clerk of the works was Mr. Frankham.

Bromfield.—The Carlisle Journal states that a church just erected at West Newton, in the parish of Bromfield, was consecrated on the 1st instant. Mr. John Todd, of Manchester, a native of West Newton, who had already put down his name as a large con-tributor to the endowment fund, took the entire expense of this huilding upon himself, as well as of a parsonage, schools, and master's house. The site was given by Mr. Jolliffe, lord of the manor; and the foundation-stone of the church was loid on the 11th of June last year. The church has been creeted by of June last year. The church bas been creeted by the late Mr. John Walker, of Wigton. It is in the Early English style, and consists of chancel, and nvæe, with tower and spire. It will accommo-date ahout 200 persous. At the west cod is a memo-rial window, by Mr. Wailes, placed there by Mrs. Barwis, in memory of her daughter, and also of a friend. And in the south side of the chancel is another window by the same artist, placed by Mr. Todd the founder to the memory of his late wife. Todd, the founder, to the memory of his late wife. The east window is to be filled with stained glass as a memorial to Mr. Todd himself. The parsonage, which is in course of erection, will stand at a short which is in course of effection, will static at a Shoft distance on a site given hy Mrs. Wosley, and will be built somewhat in the same style as the church, from designs hy Mr. Hugall, of Cheltenham. The school and master's house are not yet commenced : they will he placed on the town green, hy the side of the church, with which structure they are intended to harmonize harmonise.

PROVINCIAL NEWS.

Cambridge .- A public meeting was held in the Council Chamber of the Guildhall, last week, to con-Council Chamber of the Guildhal, last week, to con-sider the expediency of calarging the town-ball, the necessity for increased accommodation for concerts, &c. having long been felt. Provided the object desired by the Public Rooms Company could not he attained, the prevailing opinion of the macting was that thu site of the town-hall was the most, if not the that the site of the town-hall was the most, if not the only, eligible one for the erection of public rooms of the description and size requisite. Several rough plans for a new building, presented by Mr. Wetenhall, were laid upon the table. A general committee, com-prising the gentlemen present, was constituted; and a sub-committee was appointed to draw up a memorial to the council, and take such other steps as were deemed necessary. deemed necessary

Banbury.—Many parts of this town having long felt the great want of a water supply, about three years ago it was proposed to establish waterworks, years ago it was proposed to estamism wateroits, and a prospectus of the formation of a company for that purpose was issued. Much beyond that step, and octaining plans, the promoters did not at that time proceed, hut, as the necessity for its operations increased rather than lessened, it has not been forgotten, and it is now proposed to raise capital in shares, and already considerable sums have been thus invested. The water will be drawn from the Cherwell, nvested. The water will be drawn from the Cherwell, near to Grimsbury Mill, where laud for the purpose bas heen secured, and where the requisite buildings, with steam pumps and filtring beds, will be erected. Theuce the water will he pumped to the highest place within a mile of Banhury, from which the town can readily he supplied by gravitation.

Hemel Hempstead (Herts) .- This town, in common with many others, has for some time past felt the want of a corn-exchange commensurate with the requirements of an increasing and important trade in grain and farming produce. The market is en The market is entirely Henry VIII. and has, until recently, been held in the open space under the new town-hall, which was constructed specially with that view. The attendants of the market have suffered so severely from constant exposure to the weather, that the present high bailing determined upon enclosing the under part of the town-hall, which has been carried out, and a comexchange was formally opened and inaugurated on the 19th ult. estimated to be worth 8,5007. Io the same year they commenced the construction of a new observatory

19th ult. Hertford.—The town council have resolved to memorialize the Lords of the Trensury for powers to borrow the sum of 6004, for the improvement of the correcxchange at Hertford. Mr. Evans is the archi-teet whose plaus have been accepted. The alterations now to be carried out in the corre-exchange will, at same time, adapt it to the uses of the public library.

same tune, sdupt it to the uses of the public inheary. Croydom.—It has been resolved to creat a public lecture-hall here, and for that purpose a company, on limited limbility principles, has been formed. The Croydon Literary and Scientific Lostitution alone has an income of 2704, and upwards, and would make use of the hall, paying a rental. There is also a Temper-ance Society. It is considered that 3,0004, will be sufficient and that a reture of 1504, a year in vertal ance Society. It is considered that 3,000/. will be sufficient, and that a return of 150/. a year in rental should suffice to remanerate the company for their

should suffice to remonerate the company for their outlay. *Tentury (Worcestershire)*.—It has been determined by the inhabitants of Tenbury to pull down the pre-sent dilapidated and bally arranged poulty and butter market, and to erect a new building on the present site, increasing it in size as much as ancessary. Air. Cranston, of Birmingham, is engaged by the committee to design and earry out the work.—A joint-stock company has been formed here, for the purposes of purchasing a large lot of badly occupied properly, in Tence-street, called Robinson's-court, and erecting a town-hall and corn-exchange, with rooms for consty-court purposes, and for magistrates' meet, ings, &c. The necessary plans have been prepared by the architect just named.

Rug by.—The foundation-stone of a new town-hall was laid here on the 22nd ult.

Bawtry .- The first stone of an infant-school has Buowry.— He first stone of an intant-school has been haid at Bawtry. It will he in the Elizabethan style, and 30 feet by 16 feet, on a plan provided by Mr. J. G. Weightman, of Sheffield, architect. Mr. Howard, of Bawtry, is the contractor, and the cost of erection will be 3452.

Dunbar.-Long projected improvements upon this harbour are now about to be carried into effect. The The Treasury are said to be prepared to sanction an outlay of 30,0007, towards carrying ont the improvements and alterations on the Victoria Harborr, acreeably to plans which the local magistrates have had before them. The harbour will then he capable of admitting vessels and boats at low water, by which shelter will be obtained by them at all times incide of primit be obtained by them at all times, instead of running for the Firth of Forth in a storm.

Montrose .- At a recent meeting of the local council, reported in the Montross levice, the local stated that he bad received several tenders for the building of the new markets, according to the plans by Mr. Matbews, of Aherdeen, and Mr. Moffat, of Edshawed, best, bet and hulding of the new markers, attended with the by Mr. Mattews, of Aherdeen, and Mr. Moffat, of Ediuburgh; but the Lowest was considerably above the highest sum fixed by the conneil,—the lowest, according to Mr. Moffat's plan, 1,5237. 7s. 6d.; whilst the highest, according to the former, was 1,9874. 3s. 4d. and to the latter, 2,0897. 5s.

CORPORATION WORKS IN LIVERPOOL.

WE glean the following items from the evidence of Mr. Shuttleworth, hefore the committee on the Mersey Conservancy and Docks Bill :---

of AR. Subtleworth, neutre the commute on the Mersey Conservancy and Docks Bill:— In 1829 the corporation built a lighthcuse near New Brightom, at a cost of 30,0004. The corpora-tion, about fitteen years since, creeted a machine on their own land for testing chain cables, at a cost of 11,1444. A small charge was made, bot not equiva-lent to the cost of maintaining it, and the average deficit was 1002, a year. Mr. Shuttleworth stated some of the causes which led to the cretion of St. George's Hall. On Lancashire being divided into two portions, for assize purposes, the corporation undertook to provide courts in their session-house for a considerable period was icadequate, but the cor-poration refused to erect a new court whilst their right to the towo-dues was in dispute. Other parties were desirons of creating a music-hall, and the result architect was Mr. Elmes, now decreased. The corpo-ration also constructed a linding-stage merged and 200,000, had now been expended. The corporation also constructed a londing-stage used by sca-going stamers, at a cost of 5,1577. it was several years constructing, and was opened about fifteen or sixteen years since: its annual charge was 927. A Sixteen years since : its annual charge was 927. A representation had since beco made that it wis insuf-ficient, and a new stage, 1,000 fert long, was now constructing, and nearly finished, at a cost of 130,000. The money had been borrowed, and would be repaid by a sioking fixed of 2,600. a year, whilst its annual cost would be 6,000. In 1540 the corporation gave and for a Sailors' Home, and Sailors' Savings' Bank,

The cost of the huilding and instruments was 10,342/. It was maintained at considerable cost, and though a small sum was received for rating chronometers, the expense exceeded the income by 600% a year.

TEWKESBURY

TEWKESBUEY, situate, as most of your readers know, about 15 miles south of Worcester, is a very pretty town, possessing long and spacious streets, the modern dwellings picturesquely diversified hy those timber-fronted houses which are fast disappearing. Most of these retain unaltered the original windows, to save here more present the continened windows. Most of these retain unaltered the original windows, or, to speak more properly, the contioned window, extending along the whole front. The great attrac-tion, however, of Tewkesbury, is the fine old Abbey Church, a mitred abbey, prononneed by sume archa-ologists to be now the finest parish church in the kingdom. The pier arches of the nave arc horae on those enormous explinders (here 20 feet in circum-ference), which are usually supposed to indicate an early stage of Norman combinations in Evaluation early stage of Norma architecture in England, and yet the mouldings of the comparatively diminutive round arches they carry do not seem consistent with a very remote origin. The extreme disproportion of a very remote origin. The extreme asproportion or these arches to the heights of their supports struck me as radically inclegant. There are no sculptured capitals, but an abaces with plain mouldings beneath; and it is somewhat difficult to separate with precision the two members. Above are a curious little ambula-tory, which from its position we must call triforium ; tory, which from its position we must call triforium; little round arched openings in couples; and at top the clerestory windows, round-headed, but now di-vided by mullions of perhaps the fourtcenth centary. These upper stories are insignificant, the relative pro-portions between the different stages of the elevation essential to pleasing effect being quite destroyed by the undue importance given to the ground story. The valid stone roof (with pointed pier ribs) appears at first sight: somewhat complicated in construction. This sight somewhat complicated in construction, from the number of rihs which intersect and cover it, but I suspect many of these to be mcrely applied, that is, surface ribs, for I could not satisfy myself that Into its, surface ribs for I could not satisfy myself that there existed a groin behind every rib. It is con-siderably lower than the original roof, the tops of the clerestory windows now rising above it some feet. Its former elevation is distinctly marked outside on the central tower. The piers of this choir (this ends in a polygonal apac), though lower, are proportionately as holky as those of the nave, and denote at least as early a date; but the pointed arches they carry are of Decorated design, through meagre and ineffective. The windows of this portion of the elifice are of the style last metitoned, but the tracery is poor. The stained glass is very pleasing. The vaulted stone roof is ich and complicated, and the hosses at every intersection last interview of the tracery is poor. In estantic glass is very pleasing. The valide stone roof is tich and complicated, and the hosses at every intersection of the ribs are most of them of merit. The choir-aisle, with the chaples opening upon it, recalls the arrangement of the Freuen churches. The ball-flower aring the source of the second controls. The charge were comment is extensively used in this part of the clurch, and very well worked. There is an in-exhaustihle fund of interest in the tombs contained in this edifice, most of them of great merit, and some exthis characterize to the theory of the start in the start source to hibiting singular grace and elegance to general design and detail. I will, however, only hriefly refer to those which most struck myself. The most beautiful, I should say, is the one creeted to the memory of a member of which most struck myself. The most beautiful, I should say, is the one crected to the memory of a member of the De Spenser family, said to have been the next lineal descendant of that De Spenser, the favourite of Edward II. beheaded (I think) in the contyard of Warwick Casile. This rises pyramidally in most ex-quisite proportions, in three graduated stages of open work arches, pinoncles, canopies, &c. Though totally different in detail, it called to my mind the tomb of the Scaligeri, at Verona. There is a second one much resembling this, and perbaps equally worthy of praise; and a third raised to the memory of a warrior who fell at Tewkesbury fight, in 1461. The recumbent offigy of the gallent kuight is, however, clubel in armour, of a century earlier. The Sedilia must not he overlooked, an admirable cample of this appendage of a church of the Decorated era. The triangular canopies over each seat have been wilfully mutilated. The origical colouring, within and without, is very well preserved, in which predominate vermillion and green. Behind the apsidel termination, there exits (though now shut out from the church), the Lady Chapel of the Early Pointed era. It is now used as a grammar school: the floor has been raised some yardy; the hases and a great part of the vaulting piers hidden, and the pro-outing witted to notice a laws whiled to notice a laws of the pro-test have been wallted in any cancel and a first the hases and a great part of the vaulting piers hidden, and the pro-varions witted to notice a laws on the down has been raised to the vaulting piers hidden, and the pro-test on the value pro-test have been wallted to notice a laws on the down has been raised to the pro-test on witted to notice a laws on the down has been raised to the pro-test hidden, and the pro-

addition have been rendered necessary by some change introduced in the roof of the choir aisle? I know some examples of this practice in continental churches.

The central tower is Norman, too low and broad to possess any claim to elegance; and it is not until a near approach that you become aware that the 'datal' is very good, and in some parts almost delicate. The panelling of the stages exbibits some rather singular fatures, and the chevron, io all its forms and varieties, is abundantly employed. The west front is, so far as I know, uoique in its arrangement, striking from its singularity rather then its heauty. The whole height and breadth are filled up with one large circular arch, formed of six recessed rolls, resting on s many abadis, in square recesses. At top is opened the window, the present one an insertion of a date somewhat later than the heginning of the seventeenth eventury, and below, the doorway also comparatively The central tower is Norman, too low and broad to century, and below, the doorway also comparatively modern. I never saw an arrangement which appeared to me so destitute of grace. There part of this front of great interest. There is, however, one terest. At the corners part of this front of great interest. At the corners stand little solid square turrets, having each angle connecaled by a cylinder, currets, having each angle connecaled by a cylinder, currets, having each angle the midst of the four rises a taller cone—a nazerat grire. All about these is undoubtedly original (with the exception of added finials), and the arrangement strengthened an impression which I have long enter-tained, that the nohlest external feature of a sacred edifice, the spire, had entered into the conceptions of the men who flourished hefore the adoption of the Pointed style, though the glory of fully developing the idea was reserved for their successors; and that the Ronancesue huilders have full claim to the merit the Romancsque huilders have full claim to the merit of which some would deprive them by maintaining that the spires surmounting certain Romanesque towers in France (I. would instance those of Basse Allemane, Mostivillers, near Harve, and Cunaule, on the Loire), were additions and improvements not contemplated by those who raised the substructure. No one can deny that we have here in charming simplicity the elements of the most beautiful features of our Early Pointed churches; their light and elegant open turrets, their tapering pinnacles, and their crowning glory, the heaven-directed spire.

VIATOR.

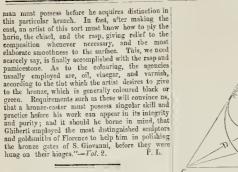

DICK'S LIFE-PRESERVING AND VENTILATING SASHES.

AN arrangement to ohviate the risk of life in painting, glazing, or eleaning windows from the outside, as is now the case, has long been desired, and has led to 103, gizzing, or cleaning windows from the outside, as is now the case, has long been desired, and has led to many inventions more or less applicable. By the mode patented by Mr. Dick, all this may be done by the person inside, without moving from the fioor: the sash may be turned upside down, or allowed to lie dat, as found most convenient. The sashes can like-wise be removed from the frame with the greatest case, without the inconvenience of removing the heads, to have new cords attached, or taken out altogether, to admit any large piece of furniture without removing the cords from their face. It likewise affords a safe means of ventilation, by bringing the top sash down ittle, and allowing the top of the bottom sash to indine a little into the room ; by these means forming a ventilator, admitting the cold air at the middle of the window, and allowing the tob air to escape at the top. Individuals sitting in the room are not exposed to the draught. It is applicable to old sushes equally as to new. The arrangement consists in cutting down the sash on each side, io a line with the face of the paring bead: the joint is made watertight, and the sash is hong by a strong stachment to the bottom of the all the there at the stachment to the bottom of the solit these at off as that phen released at the the parting near to be joint is made waterlight, and the sakis hours by a strong strachment to the bottom of the slip, thus cut off, so that when released at the top, where a catch secures it, it can be turned over into the room. The increase in the cost is had triffing.

BRONZE CASTING AND POLISHING

BRONZE CASTING AND POLISHING. I DELIEVE an inquiry has heen made in your Journal more than once, as to the material and mode of polishing and working the surface of works in bronze. The following extract from Father Marchese's "Lives of the most eminent Painters, Sculptors, &c. of the Order of St. Dominic," translated by Meehan, may supply some information on this subject :=-"Portigioni, temp. IS50, the man who in his time was second to none in the difficult art of casting in bronze, --the man who assisted the celebrated sculptor, Gian. Bologoa,--whilst in the convert S. Marco, Florence, resumed from time to time his early habit Pointed era. It is now used as a grammar school; the floor has been raised some yardy; the hases and a great part of the vaulting piers hilden, and the pro-portions utterly marred. I have omitted to notice a singularity of construction to he found in the choir or what purpose I could not satisfy mysid, which he first sight I telt confident must have been an after-this opinion was somewhat shaken by the identity in the isoder extra or for the would raise the mouldings of the two arches. Can the section of the mouldings of the two arches. Can the

PRACTICAL PROBLEMS.

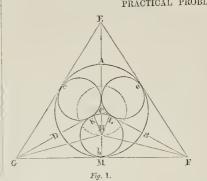

CAMBRIDGE BARRACKS, PORTSMOUTH.

Some of the additional ranges of building are Some of the additional ranges of bullning are now in progress here to form quarters for forty-four officers. In length the additional range is somewhat more than 361 feet. The brickwork is of white bricks, from Beaulieu: the dressings, centres, gateway, and cor-nices are of Portland stone. The carving, in the Royal arms surmounting the cornice, is a work of considerable cost. The new wing to the soldiers' harmecks, in the rear of the parade ground, will afford accommodation for above 1,020 mea, and is of red hrickwork, with Beaulich hick dressings: the out-offices over a large extent of ground, and will conduce much to the health and comfort of the mon. The scholcrooms and library in connection with the additions will shortly be commenced. The drainage is heing carried into the sea below low-water mark, and passes under the fortifications, lunette, reservoirs, and parades. The whole substrata heing under tidal influence makes this a difficult work : one of the land springs makes this a difficult work : one of the land springs crossed in excavating for this work yielded about 700 gallons of water per muinte, which was raised by a centrifugal pump. The time stipulated for completing the original contract, which was taken by Messrs. Lee and Lavers, of Belvider-road, Lamheth, at 32,7001. was the 30th November next. The founda-tion-stone was laid on the 20th June last, and the huildings will be completed about the end of July. The work is being executed under the superintendence of Mr. Hawken, of the Royal Engineer Office. The mess-room is 61 feet by 26 feet; fencing-room, 34 feet 4 inches, by 37 feet. The design is so arranged that the commanding and field officers will have a suite of rooms with separate entrances. Toe have a suite of rooms with separate entrances. architect is Mr. R. O. Mennie, The

THE ORGAN IN ST. PAUL'S CATHEDRAL.

I READ in the Builder some time since a not very dignified complaint on the part of "An Amateur," gainst the fine old organ in St. Paul's Cathedral. Feeling interested in the dissemination of truth as been found, in the opinion of those who know best, amply sufficient for the eloral service of the Church of Eugland, which does *not* require an organ uniting the size of six, and the noise of half a dozen brass hands. I saw nothing "outrageous" when last 1 played upon it, a pleasure (*ano obstante amateur*) of which I have yet a virid recollection. At the same time a venerable instrument, over which nearly 200 Years have nussed canoud however inversed he ex. years have possed, cannot, however improved, be ex-pected to display all the mechanical appliances and comforts of a new one. A CHURCHMAN.

To describe the figure of a Model, for a cast-iron Casement, of the form of a Circle, circumscribing three equal Circles touching each other and the circumscribing Circle. (Fig. 1.)

TARE any point C, and from the centre C, at the distance CA, equal to the radius of the given circle, describe the circle ABD; divide the circle ABD into three equal sectors, CAB, CBD, CDA, and hiscet their esterue the errete AED; divide the circle ABD into three equal sectors, CAB, CBD, CDA, and hisce their ares in the points, a, b, c; draw the straight lines EF, FG, GE, touching the circle ABD at the points a, b, c; produce the straight lines CA, CB, CD, to meet these targents in the points E, F, G, uaking the three equal triangles CEF, CFG, CGE; hiscot the angles, CGF, CFG, at the hase of any of these equal triangles, CFG, by the straight lines GH, FH, meeting one another in H; and from the point H draw the straight lines HK, ILL, HM, perpendicular to the sides CG, CF, FG, of the triangle CFG. Then (Euc. bk. 4, prop. 4), the straight lines HK, HL, HM are equal to one auther, and the circle desoribed from the centre H, at the distance of any one of them, will pass through the extremities of the other two: and hecause the angles at K, L, M, are right angles, each side of the triangle CFG will toneth the eirele; the circle KLM is, therefore, inscribed in the eirele, and the first inscribed in the other two equal triangles tonching each other, the circumscribing eirele, and the first inscribed circle, KLM. *Note*,—The radius of any of the equal inscribed

Note .- The radius of any of the equal inscribed circles may be expressed by the term $mr \tan \frac{\pi}{3}$

For let *m* represent tan. $\angle 11GM$; HM = *m*GM; GM = CM. tan. $\angle GCM = r \tan, \frac{\pi}{2};$

... HM (the radius of the eircle KLM) = mr tan. $\frac{\pi}{3}$;

i.e., $r' = mr \tan \frac{\pi}{3}$, if r' and r be taken to denote the radii of the inscribed and eircumscribed circles respectively. Also mr tan, $\frac{\pi}{n}$ will be the general ex-

pression for the common rulius of any of n equal eircles, inseribed in a eircle, touching each other, and the eircle iu which they are inscribed.

For the same purpose, it is required to describe an equilateral Triangle about a given Circle. (Fig. 2.)

Find C the centre of the circle ABD, and draw the Find C the centre of the circle ABD, and draw the diameter AD; trisect the semicircumfereace ABD in the points B, E, and join CB, CE; draw the straight line FG tonching the circle at the point D; produce BC, EC through C, to meet the tangent FG, in the points F, G; and through the points B, H, draw tangents LF, LG, meeting each other in the point L, and the straight FG in F and G. The triangle Ll'G is equilateral, and it is described about the eircle ABD. ABD

Cor.—Since the straight lines CB, CD, CH, are radii of the eircle ABD, and perpendicular to the sides LF, FG, GL, of the triangle LFG, it is obvious that the area of the triangle LFG is equal to the rectangle under the radius of the insertled eircle, and the sumiperimeter of the triangle LFG ; and, by reference to the construction of the general case (Euc. hk. 4, prop. 3), the same may be prelicated of any triangle described about a circle.

Note .- The equilateral triangle can be shown to have the least area of any triangle described about a given circle, and the greatest area of any triangle insoribed in a given circle.

A. J. TOMPEINS. Cambridge

Fig. 2. DECISIONS UNDER METROPOLITAN

BUILDING ACT. Projecting Closels on Brackels.—At Marlborough-street Police-court, on the 30th of June, Messrs. Dun-canson and Monitrie were summored hefore Mr. Beadon, by the district surveyor for South Marylehone,

Beadon, by the district surveyor for South Marylehone, for an alleged infringement of the Building Act in a hoose, No. 74, Great Titchfield-street. Plans were produced, from which it appeared that the defendants had removed a staircase window, and had thrown out a water-closet at the back of their premises, which addition rested on brankets. It was contended, under the 9th section of the Act, that the projection should he deemed an alteration or addition, and that such addition, according to the first schedule, should have the walls constructed of hrick or stone resting on concrete. resting on concrete. It was admitted that the projection in question did

It was admitted that the projection of the sup-not rest on solid ground of concrete, but was sup-ported by hrackets attached to the wall. The water-eloset was of 1-inch slate, supported on a slate land-ing. One side of the eloset extended over the line of the party-wall.

Mr. Roberts, architect, for the defendants, contended Mr. Roberts, architect, for the defondants, contended that such projections were never intended to heinchulded in the Act, which had specially excepted balconies and verandahs, and therefore intended to except all pro-jections of a similar nature : that a balcony was the foundation of the closet : that as an architectural pro-isition. it was not concleary to the Act : but that, at touncation of the closet: that as an architectural pro-jection, it was not contrary to the Act; hut that, at all events, it was an enclosed virandah, in which, at the time this summons was taken out; there was no seat or woodwork of any kind. Under the 26th section, he contended that the defendants were entitled to have the contrary displayed. mmons dismissed. the s

the summons dismissed. A long legal argument casued hetween the parties, at the conclusion of which— The magistrate said he did not think himself hound to make any order to take it down, hut did not express any opinion on the various questions raised.

Sing.—I have just read in the papers the judicial decision of Mr. Beadon, in the case of a close thrown out on brackets, by Messrs. Duncanson and Co. Titchfield-street, under the Building Act, and I confess myself much sur-prised at the decision. I do not observe it stated bow the brackets which support it are wood or iron; but in either case it seems to me to set at nought one of the must im-portant provisions of the Act. Balconies and versal, but by well:anderstood terms, and assumed 'easet, which is of the bearshet is an apparent as - if so, what is it, if it is a store closet of the same size, and of course without this appendage? I alt because it is presumed to be only some 3 feet by 5 feet ?--if so, what is it if it be double or trable to wells, but with quartered sides, bas as Of what use it, because it within them, it seems hardly possible they could have been forgotten and overcoid, due that Act because it within them, it seems hardly possible they could have been forgotten and over or what use it, state and then are inducted sides, bas as Of what we have to this, but with quartered sides, bas as Of what we have a store of the set on the the of motion are of the first to this, but with quartered sides, bas as Of what we have the first of the set on the of the first of the first of the set on struction projecting to invite the first of the set of the theory of the first of the first of the first of the set of the first of the first of the first of the first of the set of the first of the first of the first of the first of the set of the first of the first of the first of the first of the set of the first of the first of the first of the first of the set of the first of the first of the first of the first of the set of the first of the first of the first of the first of the set of the first of the first of the first of the first of the set of the set of the first of the set of the first of the first of the first of the first

Rainous Baildings.—At the Westminster Police-court, on the 2nd instant, Mr. Reere attended to apply for a summons in order to have the premises, kaown as the Gan Tavera, Pimlico, which are in a

Marking as the only lawer, indice, the order of the order

general rule in law, is not hound by any order I niov issue.

Mr. Reeve referred to the Act, and said that he thought there were clauses in it hy which the Crown would be linkle to the process of a summons. Mr. Arnold.—Suppose the Crown refuse. Did you

Crown being granted? Mr. Reeve explained, that if a summons were granted, and were not acted on, the Commissioners of Police would proceed to protect the premises, and recover the expenses from the owner. Mr. Arnold observed, that the better course would be to give notice to the Office of Works that applica-tion user works for the average and the adjunct

tion was made for the summons, and to adjourn the application to a future day, so that they might have an opportunity of attending.

Reinous Buildings.-Having on one or two occasions lately been professionally engaged in estimating damages to bouses that have been seriously injured by adjoining house having been pulled down in default of proper and sufficient shoring having been first afficient. See a remedy at public attachion to the fact that, where property is injured by ignorant or careless builders, in such cases a remedy at common law exists. In pine cases ont of ten, houses at ing ones being publied down in the absention of proper about the such as the second public down in the absention of proper shoring.

METROPOLITAN BOARD OF WORKS.

AT the usual weekly meeting of the Board, on At the usual weeky meeting of the board, on Friday last, a number of applications were received and considered relative to buildings under the Act. Although possessing little interest for any but the partice concerned, we may for once give a list of them, with the decisions of the Board, to show the class of applications which comes before them :---

Regular Line of Buildings under Local Management Act. sec. 143.

Newington, S.c .- Shops at Nos. 1 and 2, Glonces-

Actionation, Sr. --Shops at Nos. 1 and Z. Glonces-ter-place, East-lane, Walworth. From Mr. George Hammond, for consent. Approved. *Islington.*-Brewery in Seven Sisters'-road, Hol-loway. From Mr. Charles Barlow, architect, on bebalf of Mr. Thomas Whitaker, for consent. Ap-menad proved.

Lambeth.—Four Houses and Shops, Nos. 8 to 11, Longhborough-place, Brixton, From Mr. Johu Johu-son, architect, for consent. Approved.

St. Panoras.—Addition to House, No. 33, Fitzroy-terrace, New-road. From Mr. Richard Richardson, on behalf of Mr. William Squire, for consent. Approved.

St. George, Hanover-square. — Shop at No. 50, Park-street, Grosvenor-square. From Mr. Edward Darby, for consent. Approved.

Projections under Building Act, sec. 26, and Build-ings under Local Management Act, sec. 143.

Lee .- Coachhonse and Portico at No. 2, Cornwallterrace. From Mr. George Legg, architect, on behalf of W. Brown, esq. for consent. Portico only granted.

granten, St. Marylebone.—Balconies to No. 62, Harley-street, Cavendisb-square. From Messrs. Hind and Alldred, for consent. Approved. Woolwick. — Bow window to house, No. 29,

Francis-street. From Mr. Henry Bland, for consent.

Approved. Stoke Newington.—Eaves to Mr. Porter's House, Park-road. From Mr. J. Pope, for approval. Approved.

Buildings under Building Act, sec. 56.

Bermondsey.—Stables and shed ut Cole's wharf, Shad Thames, St. Joha, Horselydowa. From Mr. W. A. Boulnois, architect, on behalf of Messrs. Bovill

W. A. Bollinois architet, on beam of arcsis, brim and Sons, for consent. Approved. *Kensington*.—Purnace chinney-shaft for flour-mill, at rear of Nos. 1 and 2, Higbstretet, Notting-hill, From Mr. William Mamford, architeet, on behalf of

From arr. Within Stufford, architect, on behavior Mr. Brewer, for approval. Approved. Paddington.—Fornace chiuney-shaft, at No. 4, Irongate wharf. From Mr. Robert Greig, on behalf of the London General Omnibus Company, for approval. Approved.

approval. Approved. Bethnal-green.—Furnace chimney-shaft, at Victoria Works, Green-street. From Messirs. Palmer and Co. for approval. Approved.

for approval. Approved. Linehouse.—Furnace chimncy-shaft, at Messrs. Walker, Taylor, and Co.'s brewery. From Messrs. Moreland, for approval. Approved. Lambeth.—Furnace chimney, at Mr. Stiff's pro-mises, Broad-street. From Mr. Stiff, for approval. Auronaul. Approved

Approved. Lambeth.—Furnace chimney, at Mesers. Sowerby's premises. Broad-street. From Mr. William Wills, for approval. Granted with conditions. *Kensington.*—King's Arms Tavern, temporary wooden building. From Mr. George Hunt, on behalf of Mr. Martin, for approval. Approved.

Proposed Offices for the Strand District.

On an application from the Board of Works of the a fair p Strand District, relative to borrowing the sum of school, for the purpose of erecting an office for the district, Mr. Marrable, the superintending architect, school.

THE BUILDER.

ever know of an instance of an application against be Crown being granted? Mr. Rever explained, that if a summons were granted, and were not acted on, the Commissioners on the property exceuted at a less cost than 3,900/. The fourth report of the Department of Science and Art, for the year ending December 31st, 1556, has been published. It commoneces by alluding to the

CANADA

THE following tenders were delivered for additional buildings to the Osgoode Hall, in Toronto, for the Law Society of Upper Canada, according to the de-signs of Messrs. Cumberland and Storm, architects (o the society.

The plastering of the library (estimated to cost about 1,800%) is not included in the above. The sum of 2,250% has to be added to the stonecutter's tender for the execution in Caen stone of the arcade in the centre-ball.

ARTIFICIAL MARBLES.

An Italian correspondent has sent to the Athenæum some notes on a new process for the manufacture of atificial matches, invented by the Marchesi Campana. He says, "The Fabri is at San Giovani, en route to Portici. In a large chamber, I found specimens of various species of the marble worked into tables, vases, pedestals, and cornices. Porphyr, rosso autico, giallo antico, brecatello, and other marhles, were there: so the eye declared, and nother myself nor nor my friends could have distinguished between norm principal could have distinguished between them and the real marbles. They were marked by the same 'ring' on striking them, by the same ap-pearance in the internal formation, and by the same parametric the internation ration, and by the same high polish on the surface. In fact, we were wit-nesses of the mode of polisbing adopted, which re-sembled eractly that used for marbles, that is to say, punice-stone and water in the first instance, and a hard, cross-grained stone, here called 'lavagna' after. Adjoining the fabric, we were shown the roof of a horear arbie herd here oversel with this material and Adjoining the fabric, we were shown the roof of a house which had been covered with this material, and house which not been covered with this insection, and had resisted the beat of two summers and the cold and frost of two winters; yet not the slightest im-pression had here made by either. * * A syst only two fabrics [of these marbles] exist—one in Rome and the other in Naples. In London, an imita-tion has been attempted; but it is limited in its range, tion has been attempted; but it is infitted in its range, not embracing any other varieties than perphyry, giallo autico, and rosso antico, and it is nothing more than a plaster laid over a bard stone, such as lavagna, whereas the Marmoridea is one solid sub-stance."

stance." A patent has just been taken out by Mr. John Baker, of Thirsk, on behalf of a Cauadian relative of his (Mr. J. H. Headley, of Walpole), for plating or vencering a mass of coarse sloue so as to pre-sent an exterior coat of marble. For the sub-stratum, sand, gravel, or almost any kind of pal-verable, mainly silicious, rock may be employed. After the particles of this have been reduced to the requisit degree of tenacity, the mass is mixtd with protoxide of calcium. When amalgamated, the mass a maistened then placed in a mould to be conted with is moistened, then placed in a mould to be coated with carbonate of lime, and afterwards subjected to powerful carbonate of lime, and afterwards subjected to powerful hydraulic pressure. Mr. Headley thus imitates the qualities and varieties of different kinds of marble. He has employed oxide of iron largely as a colouring material, and fauls that by silicate of potable extra hardness is given to the block, which renders it au-ceptible of a bigh degree of polish. The patent right has been sold in eight counties for 12,0007. Messrs. Peto and Brassey have paid 4,0007. It is said, for a license to use it in the construction of the bridges of t = 0 and t = 0. the Grand Trunk Railway.

SCHOOL OF ART FOR LESWICH. - Measures are School of ART FOR PERMICH. — Measures are being taken towards the formation of a school of art in Jawich, and, according to the Rev. W. Campbell, one of Her Majesty's Inspectors of Schools, there is a fair prospect of support from the public and private schools of the town. A public meeting will probably be called shortly for the purpose of founding the

THE fourth report of the Department of Science and Art, for the year ending December 31st, 1856, has been published. It commences by alluding to the transfer of the Department from the Board of Trade to the Board of Education, by order in council; and proceeds to consider the various services over which it has control, including metropolity has control, including metropolitan institutions,

It has control, uscluding metropolitan institutions, secondary instruction, primary instruction, formation of examples, and public services. The institution and service in London are the Geological Survey, Mining Record Office, School of Mines, Minscum of Practical Geology, Training School of Art, Fenale School of Art, Museum of Orna-mental Art, circulating museum and circulating art-herary. Of the conducted survey of Geret Beitain media Art, circulating intervey of Great Britain, maps embracing an area of 2,357 square miles have been published, while others, comprising 996 square miles, are about to he issued. In Ireland, 1,604 square miles have been surveyed; but an unavoidable delay has prevented the issue of a corresponding portion of the maps. That the public begins to appre-ciate the value of these maps is proved by the fact that the sale of maps during the past nice months bas doubled that of any preceding year. The Mining Record Office continues to gather much useful infor-mation, and during the past year 146 plans and sec-tions, of mines how been denosited in the office be. tions of mines have been deposited in the office, he-sides a mass of valuable statistical documents. A sides a mass of valuable statistical documents. A sight falling off in the attendance of the students of the School of Mines is shown, while the lectures to working men have been eminently successful. The laboratorics of the school are fully taken advantage of by the public, and papers of original researches in the laboratory continue to be published. The number of visitors to the Geological Minseum is 20, 415 for 1856, being as burgeness of 700 ener the variance met.

visitors to the Geological Museum is 20,415 for 1856, being an increase of 7,360 over the previous year. The total number of teachers in training in the Normal Training School of Art has been 106, of whom screntcen were females. Tbirty-seven took certifi-cates during the year, and twenty-one bave been appointed to masterships in schools of art. A large increase of the number of parochial school children, tanght in connection with the central school, has taken abave. The number of students attending the

taught in connection with the central school, has taken place. The number of students attending the Female School of Art has fallen from 144 to 126, and the fees from 259/, to 240/. Considerable additions have been made by pur-chase to the Muscum of Orunnental Art, regulated by a desire to complete specific collections. The number of visitors during the year was 111,768. number of visitors during the year was 111,768, against 78,427 in the preceding year, though the museum was open tweaty-one days less in the past year. A peripateite selection from this museum bas been exhibited in Sbeffield, York, Newcastle-on-Tyne, Caernarvon, and Hanley. The collective num-ber of visitors was 32,852, of whom 27,436 pail for admission. The Art Library of the Department was closed three months for removal to Brompton: during the remainder of the year, the number of visitors was 5,346. Arrangements have been made to circulate important works of art among the local schools of art. schools of art.

The Museum of Irish Industry has received considerable addition during the year, and has been visited during the day by 15,329 persons, and in the visited during the day by 15,329 persons, and in the evening, when lectures are delivered, by 16,282; showing a total increase of 6,603 mpon the previous year. The number of persons who submit to the examinations mpon the subjects of the lectures deli-vered in the School of Science, connected with the Museum here also ingraved. Muscum, has also increased. The varied objects of the Royal Dublin Society

bave been prosecuted with vigour, and a marked im-provement has occurred in the returns for the provement has occurred in the returns for the present year is most of is departments; the ex-ceptions being the School of Art, and the lectures on chemistry, physics, and natural history. The gardens of the Royal Zoological Society of Ireland have been considerably improved. 124,976 persons visited them during the year.

The experiment of instituting examinations in con-nection with the provincial lectures in Ireland has been more successful than could have been expected. been more successful that could have been expected. The character of the answers received bas naturally been unequal in the different towns, but, as a whole, have elicited the admiration of the Examiners, generally professors of Triuity or the Queen's Colleges. The Normal Lace School, established in Dublin, The Normal is a check of compared instrum-

although successful as a school of general instruc-tion, has proved a failure as regards its especiality. The Department recommends the gradnal withdrawal of the Parliamentary grant of 500%, voted hitherto

The interest manifested in the National Museum of Scotlaud has produced such lorge accessions to the collections that it now becomes accessions to the endections that it now becomes accessary to carry out the intentions of Parliament in providing a suitable building to contain them, and preparations are in progress to that effect.

There has been an increase of three in the number of local schools of art during the past year, and the instruction has been made more efficient by the introduction of a constant system of inspection. The total ournher of pupils under instruction is 35,083 : of whom 12,337 attend the schools of art, and 22,746 are taught in public and national schools

zeryao are taugut in pione and narioni senools, "Racilites have here given to teachers and pupil teachers of public schools, to qualify themselves to teach drawing: 1,231 teachers and pupil teachers, have availed themselves of these facilities during the year.

DAMP AND SALT IN WALLS.

In the last number but one of your journal (p. 368)

Is the last number bat one of your journal (p. 366), I observe an allusion is made to my newly patented process, in reply to inquiries made by your corre-spondents for remedies against salt io walls, &c. The application suggested by you will unquestion-ably preserve the stones and walls of a boliding, and render them "water-proof;" but in instances where all is continually exading, as is frequently the case in stuceoed walls, I should advise a prebininary concertion operation

The efforces and the solution of the briefs or eement, com-bining with the oxygen of the atmosphere, forms sulphuric acid, which in turn acts upon the soda compounds with which the materials are impreg-

compounds with which the materials are infigure-nated, thus forming the effloresciog sulphate of soda. The process I should adopt would be first to get rid of all effloresciug salt which may be present, by rd of all efforcesculg sait which may be presed, by washing the wall with a solution of chloride of edium (or muriate of lime), which will convert the sulphate of soda into sulphate of lime (an almost in-soluble substance, which will remain in the wall), and into chloride of sodium, or comuon sail, which latter should be removed from the surface by subsequent washi

Washing. In order to prevent further production of cfflores-cence, or susceptibility to absorb moisture, I should theo adopt the course alluded to by you. The mode of operation is simply this :--The stone, or other material, of which a building may be com-posed, should he first cleaned by the removal of any extraceous matter on the surface, and then brushed over with a solution of silicate of soda or potash (the specific gravity of which may be varied to suit the natore of the stone or other material): this should be natore of the stone or other material): it is slouid be followed by a solution of chloride of calciom, applied also with a hrush: the line immediately combines with the silica, forming silicate of lime io the porces of the stone; whils the chlorine combines with the soda, forming chloride of sodium, or common salt, which is removed at once by ao excess of water. I shall feel obliged if you will insert these remarks

in your next number; and I would desire to inform your readers that both the processes above alluded to four tendors that the process for the process and the standard of the second se

SCENERY AND THE STAGE.

SCENERY AND THE STAGE. The Princes's Theatre.—Mr. Charles Kean has revived "The Tempest" in a very remarkable manner. It does not commeud itself to quite such special atto-tion on our parts as alid those previous revivals by Mr. Kean which hrought faithfully before the public the architecture and social hife of past periods,—pre-Norman art in "Macbelh," Englaed under the Tudors, in "Heury VIII." Greek life and buildings, in the "Winter's Tale." or the architecture and de-Tudors, in "Henry VIII." Greek lite and outoings, in the "Winter's Tale," or the architecture and de-coratioos of the end of the fourteenth century, in "Richard II.;" but it displays an amount of me-chanical contrivances, over a rangement, and pictur-sance landscame paioting which has scarcely hetere esque landscape paiotiog which has scarcely hetore been witnessed. The ship io a storm, with which the been wratessed. The ship to a storm, with which the piece commences, is capitally contrived—the stormy sky equally well painted. In the first view of the island, overlooking the sea, a new effect is goined by the tude recading and leaving the 'yellow sands.'' In the opening of the third act a barren and leafless scene is gradually transformed, with great clabo tion, to one of luxuriant vegetatiou; and here the tion, to one of luxurant vegetation; and here the "strange shapes," with many picturesque groupings, form of themselves a flower-clothed table, supporting a hanquet. The "masque" raised by *Prospero* admits of the joiroduction of that suspending machinery of which such good use was made for *Queen Kutherine's* dream, and we have Iris and Venus, and Ceres and Junier floating in the size. For the appropring arcan, and we have ris and vends, and ceres and applier floating in the air. For the appearance of *Ariel* the devices are as numerous as the entrances. Now, the tricks *Sprite* is horne slong, without appa-rent means, midway hetween the stage and the roof:

suspended io the sir, sole tenant of the scene, when suspended to the sir, sole tenant of the state, each of the ship bearing his Lite master has salled away, and the island has disappeared. Mr. Kean invests the character of *Prospero* with great dignity and pathos. Miss Kate Terry is a pleasaot and ready *Ariel*; and Miss Carlotta Leclercq a graceful *Mirouda*. Mr. Hadry's *Trineulo* has been knowo for a century; and Harley's Trineulo has been known for a century; and Mr. Catheart, in the comparatively small part of Antonio, has made an advance in his profession. Quite right is Warharton wheo he points to "The Tempest" as one of the greatest efforts of that amazing imaxinstion, peculiar to Shakspeare, "which soars above the hounds of nature without forsaking sense; or, more properly, carries Nature along with him beyond her established limits."

beyond her established limits." The Lgceum.—The translation of "Macbeth" into Italian, looked forward to with much interest by many playgoers, has afforded Madame Ristori another opportning to show here great powers as an actress, while it has enabled her admirrers to test them hy comparison. Without terming Lady Macbeth one of her greatest parts (it does not afford the same opportunities for those violect bursts of passion, as in the Madae and Rosmunda, io wibin Ristori excels), it is a nuble assumption, not easily to be forgotten by those who witcess it. The sleep-walking scene is the those who witcess it. The sloep-walking scene is the great feature of her version, and displays acting which, for intensity and grace, could scarcely be surnas

NETLEY HOSPITAL AND ALDERSHOT.

WHEN everybody is searching for informatioo respecting the site, arrangement, construction, and ven-tilation of this uo'ortunate Netley Hospital, it behoves those who are at the bead of these matters, not only to look in every quarter for remelies, but to see that similar errors (if proved to be such), are not com-mitted in the errection of other hospitals. A military hospital, for a large number of patients,

A minitary magnin, on a runge cannot on pacentes, has recently been designed by a professional man, for the Camp at Aldershott, and as it is on such a decidedly different plan from the one at Netley, I think it only far that its general features should rerelive some coosideration. The plan is somewhat after this fashiou:--the main front contains all the after the isshou:—the main front contains all the offices for the executive, together with the church, and certain quarters for sick officers, by which arrange-ment they are kept conveniently distinct, but still with anyle means of communication with all the other parts of the boilding, by an open corridor, from which the blocks for the patients branch out, and are isolated, with windows on each side, thus a side the theorem of motiliary of the end of insuring a most thorough ventilatioo. At the end of euch of these hlocks is a tower coonected with the each of these blocks is a tower coonected with file words, by a short carrow passinge, which has also windows on each side. This tower contaios the baths, water-clocets, sculleries, &c. The ward blocks are three stories in height, but communicate with each other, by *external staircases*, which prevents the cir-culation of impure air from one floor to acother. The general plan of this bospital has heen approved by the Army Medical Board, as well as hy many not officially connected with the Government. If these things are found to be *correct*, it is robably oot too

things are found to be *correct*, it is prohably oot too late to see if they cannot be advantageously introduced into other hospitals : if wrong, the sooner they are rejected the better : at any rate they are worthy sideratioo JUSTE JUDICATO

* The design io question is evideotly founded on the plan, suggestions, and reasonings given in our pages. The principle adopted is noquestionably the right oue

THE METROPOLIS.

London and North-Western Railway.-Au exten-sive structure is now in course of creation in front of the Eustoo Station of the London and North-Western Railway, for the purpose of protecting passeogers an vehicles from the weather. The columos and root are of iron, and the cootractors are Messrs. Lawreoce The columos and roof of the City Ironworks. It is to be roofed in with glass. The company have taken teoders for their new general goods station.

new general goods statuo. The Sciers in the Neighbourhood of the Houses of Parliament. — A report upon this subject has just been presented to Sir Borjamin Hall, First Commissioner of Works, on the state of the sewers in the neighbourhood of the Houses of Parlia-ment, by Mr. G. Gurney. The report states that the efflucium escaping from the open mouths of these sew rs taints the atmosphere in and about the Houses of Lords and Commons, and that it is within the doily experience of the members of hoth Houses, and there eannot he the least doubt that the effect upoo the bedth of all subject to its influence is injurions Japiter floating in the air. For the appearance of *Ariel* the devices are as numerous as the entrances. Now, the tricksy *Sprile* is horne along, without appa-reat means, midway hetween the state and the root is device and the root is influence is injurious. The heat of rock, made visible for the instant; there he is seen in floating on a hat; he is here, there, and everywhere, during the progress of the play, and is ultimately left

tignons to Lambeth Palace, where there are two; two plan at Millbank, one at the Peniteutiny, two at Vauxuall-bridge, and one on either side of the river. Of these the most offensive to the Houses of Parliament are the sewers at Lambeth and Millbaok. are the severs at Lambeth and Millback. The others affect the atmosphere only is south-westerly winds and on the fall of the harometer, and do out require such in-mediate attention; but it is desirable that the Lambeth and Millbank sewers should be trapped as soon as possible. There are outsances affecting the atmosphere of the Honese of Parliament on the other side of the river from offensive manu-factories: the worst are the hone manufactories, from which the effluxium constantly finds its way. The exhemistions from the river itself are also a source of exhalations from the river itself are also a so uree of impurity to the atmosphere. The report, together with the consideration of the entire subject, has been referred by Sir Beujamin Hall to the Metropolitan Board of Works.

CATTLE AND DRAUGHTS

SINCE you have opened the Bailder to the cause of maltrated cattle, as regards their homes, may I express a hope that another ernel aluse, incurred in the present dranghty mode of their travelling, may receive your regard, as it seems even probable, from the fact, of the lum discess having negatively a much receive your regard, as it seems even provided so much the fact of the lung disease having prevailed so much during the last fitteen or sixteen years, that most of their sufferiog arises from that source. My attention was drawn to it by a dealer in cows remarking, of this was drawn to it by a dealer in cows remarking, of this wide-spread distemper, that he now nakes cattle walk iostead of exposing them to the daoger. Surely it seems a oatural result from exposing the poor crea-tures to the entiting cold draught of such relocity through the open railing of the cattle-trucks. With such a vi-w, I heartly wish that the directors of rail-ways had it laid oa them, by conscience or legislature, to protect with a worthy providence the health and fountains of milk, io comfortable hoxes, and so do their part for the short-lived enjoyment of the crea-tures whose sufferings will retribute their unfortunate turcs whose sufferings will retribute their unfortunate tures whose sufferings will retribute their unfortunate eaters with a long life of aliments in their own shortened lives; and that they would also view with me the horrid picture reflected from this, where the direct sufferers are their *fellow* creatures, whom they catch by cheap fares in *painted* and *varnished cattle-trucks* that run on pleasure excursions, when the sensitive town-folks' chests are swept under consump-tion's invisible storm-medded southe

tion's invisible steam-speeded scythe. But the people themselves need be wiser, and take But the people themselves need be wiser, and take another lesson from a physician who took a house by the sca-side where he found the sashes made to open at the hottom only, and immediately had them altered so as to open at the top, observing that it was one of the most dangerous positions to sit in a room at any time of the year with the bottom sash open, as the dranght came directly across the obest. How predranght came directly across the chest. How pre-valent is it now, where the popular nuisaoce flushes out with its sooty millions ioto the room where one is intently occupied in stilloess, to throw up the bottom sash, and resume the seat? if this is a danger, as the physician said, surely it should be holdly averted. The top sash might he opened, but perhaps it is a stretch to reach it, and so the first at hand is chosen. Here arises the question, whether the case-ment opening from top to bottom is not preferable

near opening from top to octain is not pretrain to the sharp rush through the few inches of the sash-opening—the common restriction. If we can get *this* question of construction *settled* on sanitary grounds, we may hope to find demanded for it as observance by the numeteenth-century archi-tects, along with the improvement to construction of eithe trade and prelimentary carringes by vallway. eattle-trucks and parliamentary carriages hy railway directors, as ordinances for the good health of man OLIVER. and beast.

FAILURE OF A BRIDGE ACROSS THE SEVERN.

SEVERN. By the failure of a temporary bridge formed across the Severo, at Shrewshury, ten unfortunate persons have lost their lives. At the inquest, held on Monday last, Mr. W. Harley Bayley, mayor of the borough, gave evidence to the effect that in consequence of the com-plaiots made of the injury to the quarry from Jullier's *file* of last year, he gave permission to Mr. Hay to use the Island of Poplars for the late *file*, on the condition that Mr. Hay enulged a commetent merson use the Island of Iophis of the accorption person condition that Mr. Hay employed a competent person to construct a bridge of boats by which to approach the island. Mr. Hay mentioned the name of Mr. Raodal, architect, and stated that he intended to have

Mr. Tisdale, borongh surveyor, said, he examined the bridge of boats on Saturday by order of the coroner, Mr. Henry Kerke. In his opinion it was not sufficiently strong for the purpose for which it was erected

greeted. Mr. Pountney Smith, architect, and Mr. Townsend, engineer, enroborated Mr. Tisdale's evidence as to the unitoress of the hridge for the purpose. Police-constable Broughall, and other witnesses, deposed to persons rocking the bridge, two of whom were a short time in custody, but escaped at the time of the acticant, and had not since been identified. A verdict of "Accidental death" was returned in tratement

ease.

Each case. The jury condemned the construction of the bridge as unsafe, and, at the same time, expressed regret that sufficient police precentions had not been observed, and that the sofety of the bridge had not been pre-viously tested by the borongh surveyor.

OIL-PAINTED PHOTOGRAPHS. MR. E. T. PARRIS.

MR. E. T. PARIES. WE have recently seen some photographs, by Mr. Herbert Watkins, nainted on *in oil* by Mr. E. T. Parris, the artist, so as to have all the effect of the most finished miniatures. In doing this, Mr. Parris claims nothing more than thus making a good photo-graph, when obtained, permanent; but he is able to do much more, for his medium ccables him to remove those overstrong markings, and to lessen those ocen-sional exagerations which photography, at its best, produces, and thus to make portraits pleasing as well as trathful. He is able forther to put into them something of the general character of the individuals represented, in addition to their actual appearance at a special moment, under, what must always be the case a special moment, under, what must always be the case in a photographer's glass room, peculiar and excep-tional circumstances. Mr. Parris is so strongly asso-ciated in one's mind with a certain wonderful view of London on acres of canvass, and with the recent ex-cellent restoration of the huge paintings in the dome consist resoration of the huge paintings in the some of St. Paul's, where for months, not to say years, he must have dealt with the "pound brush" rather than the peneil, that it is surprising to find him retaining such a delicacy of handling as is exhibited in these portraits and some other recent small works.

Considering the great ingenuity of the seaffolding by means of which he painted in the dome of St. Faul's, the laborious nature of the work, the actual risk of life, and the ultimate successful achievement risk of life, and the ultimate successful achievement of the restoration, the completion of this work, let as say, by the way, should have brought this artist a more public demonstration of approval than has yet been made. He may safely comfort himself, however, with the certainty that when he is dead and gone, some half-century hence, the vergers and the guide-books will tell wonderful stories about him, and people uilt ear be really use an extraordinare follow, and books will cer winderin solres and e runs, and pope will say he really was an extraordinary fellow, and will wish they had known him and could have given him some evidence of their admiration for his pluck as well as skill.

NOVELTY IN ART.

THE artist is always making novelties. The faculty which marks him is invention ; the exercise of it pro-duces his works : the lack of it makes him unworlhy of his name : the disuse of it is unwise.

of his name : the disuse of it is unwise. A more combination is not a novelty : it is so when inbucd with the spirit of originality. A combination is not evil, but mean and ordinary. A copyism is offensive : it is a work ouly fit for machinery or igno-rance. It shows admiration of the original, and a desire to perpetuate it; or blind alberence to for-mality and precedence; or simple lack of ability. A copy would not be commendable, even if it could have the energy of the original. That energy can only be strained for: at any time the whole must show a defect of controlling power. The crandware of an old building is incommunicable :

The grandeur of an old building is incommunicable : it has associations with it: it has the cold and heat of many years—the mellowed tints and diversified surfaces: it is old. No modern building or painting can be old at once. No new thing can have the asso-ciations of age,—the years, the scenes, the experiences, of the time hearend. Vid failure in parce and it it is of the time-hosoured. Yet feeling is never old: it is always young and fresh: after enturies it is as full of life as when it first issued from the heart of the originator. It required no lapse of ages, nor long interval, to give the impress of majesty and of intense hivingness to the works of many olden artists. This is the incommunicable part of the work--the source of its character--its great peculiarity and distinction. No amendment work with the triat work is the income of the time-honoured. Yet feeling is never old : it is

No one makes a copy with the ardour with which he made the thing to be copied. It is impossible to do so: it becomes a work of compulsion-unpleasant and tasteless. Copyism is thus subversive of art.

A combination of copied parts is equally evil : the time for imitation should precede that for execution :

learning should be obtained-then given out with freshaes

A tasteful joining together of beautiful atoms must make a beautiful whole : yet it is impossible to take beauties out of old works as features to be combined in a new one

in a new one. The simplicity of what is without character is paioful and injurions: every production should have a character—individual and distinct from all clsc—its own. This is the source of its right to be considered a work of art. If there be men with us with the spirit of the workers of the past, who can shape the stone, can carve the wood, can produce forms with all the variety and originality of their predecessors, they must work. Art wants them: beauty may be made by them: let them leave behind them marks of the full and proper use of their faculty, scattered much and well. and well.

The matter project as of their identity, statistical minina and well. Composition, or combining of features, is allow-able, if it be done to manifest a new life-a fresh power. Copyism is the degrading work: it is the work of lines and letters,--the work of the drudge. It is not so when imbued with mark of its own. The originality of compulsion is now rare. Most men want not to be original: they had rather be other than that. Very few give vent to all their power: the most important ventures, that should have all their attention-all their spirit,--are without the first requisite of success-carnesiness. Vigour is the soul of impressibleness: that which is without it is never fully useful to any.

is never fully useful to any. Love of art is in the nature of man : the artist gives expression to the aspirings of the crowd. He is the burning mountain where the fire that hurns universally is discharged in mass; the vent of th ardent enthusiasm of thousands of other souls. If He is the one who has to create for the many : he is part of the nature of things : he is necessary : be is provided

vided. An artist is possessed of poets' feelings: he is born with it: yon can never make him. When he is possessed he must be used and cared for like a rare and choice tree. His mind is the root: from it trunk, branches, leaves and fruit shall spring up. He must be trained upward that he may schoot heaven-wards; and must grow that he may each the breezes purer than at earth's level,—that he may receive the moisture at once in a stream from ahove. He must be carefully cultured, watched with interest, provided with all aids. Nothing must rise round him to make bis chances less, to narrow his standing-place, to hem ore carefully cultured, walched with interest, provided with all aids. Nothing must rise round him to make his chances less, to narrow his standing-place, to hem in his freedom. Soon will be seen thoughts, bold and anxious, filled with spirit, struggling forth to view. They will increase in size and in number. After other seasons there will be the bud, the blossom, the

acted in enchrotment so long was robbed of its might: the work of a evoluty, the work for the world and for ever, was worked. Once again, with the power of acting unrestrained, each one could do what he would.

acting unrestrained, cach one could do what he yould. The mist cleared of : every one looked at his fellow in a clearer light: cach lived in a lighter region— freer, nobler. Now is the time to go in the course that has been left for ceaturies, to work on from what is past to something better in the future. The great men of old call to work. The sympathy of every heart of them is with it. The cad may he neared soon. Why, in this young world, are younger men than those of to-day to be in the foreground ? It must not be so. The times are older : the artists who will come will be of the age. These times are of mighty import : this age labours with huge discore-ries : it is an age of progress—of energy. Every day, from the mass of restless force that is straining for expression, comes some new thing. The way is to be expression, comes some new thing. The way is to be pursued. Truth in everything is the high achieve-ment. All is forward—art should be in the van. The artist is to lead many onward. He can only advan by his originality. S. F. C. ance by his originality.

Books Receibed.

Rain and Rivers; or, Hutton and Playfair against Lyell and all Comers. By Colonel GEOBGE GREENWOOD. London: Longman and Co. 1857.

COLONEL GREENWOOD is not far wrong, we COLONEL GREENWOOD is not far wrong, we opine, when he says that the subject of his speculations in the present volume "is of vital importance—the very foundation-stone—in theories of geology and physical geography; also in engineering questions touching harbours and docks, the embanking of alluvial rivers, the reclaining of land from the sea or marshes— works which place in jeopardy millions of lives,—and the drainage, sewage, and supply of water to "the cities of the plain." And last, and oh 1 ye goldfinders and utilitarians, not least,— The homollees store

The boundless store Of charms which nature to her votary yields,---

the subject explains even the origin of these. the surface explains even the origin of these. The alternation of the ravine and ridge, the hill and dale, the exquisite beauty of the earth's surface, of all that we see of the earth,—the 'dread magnificence' of the alpine chasm, and the rich loveliness of the allovial vale, are the ever-changing products result-ing --start not at the bathos--from the daily wash of rain."

be carefully cultured, watched with interest, provided with all ada. Nothing must rise round him to main the interest, provided is served to be serv

festations of its geological history still traceable on the face of its now temperate regions. This, how-ever, is not the place to enlarge on such arguments as

" I may here remark, of our own Ordnance map, That if the deincation of the streams throughout Regland is as faulty as it is in the small part of Hampshire which I bappen to know as a sportsman, that map does not deserve the reputation which it has.'

Gleanings among the Castles and Convents of Norfolk. By HENRY HARROD, F.S.A. Norwich : Norfolk. By HENRY HABROD, F. Published by Subscription. 1857.

Published by Sunscription. 1557. Mr. HERROD is the local secretary, for Norfolk, of the Society of Antigaaries and of the Archeological In-stitute. He was also till lately the honorary secre-tary to the Norfolk and Norwich Archeological Society. The volume hefore us, therefore, may well be regarded as one written by a competent author. It be regarded as one written by a competent author. It is pretty fully illustrated by engravings, some of them rough enough certaioly, but others of a better de-scription. The volume contains full accounts of Thetford Priory, Rising Castle, the convent of Black Friars at Norwich, Castle Acre Priory, Norwich Castle, Walsingham Priory, Binkam Priory, Buck-enhaw Priory and Castle, Bromholm Priory, and Norwicb Cathedral Priory; and to the whole is added a useful index.

Report on the Establishment and present Condition of the Public Baths and Washhouses in Liver-pool. By JAMES NEWLANDS, C.E. Borough Engineer.

THIS report may he said to be a strictly professional one, accompanied as it is by numerous plans, sections, and elevations, with details as to costs and arrange-ments. One of the chief conclusions to which the reporter arrives, as to the working of the several estab-lishments at Liverpool, is, that washhouses are a mis take, --that, at all events, they are not used by the class whom they were designed to aid and hencit, hut hy tradespeople, hotel and boarding-house keepers, professional washerwomen, &c. and that they tend to supply that in charity which it is the duty of the houseowner to provide as a right. As to the baths themselves, it appears that there are too many of the better class of baths now provided at Liverpool, and that the price charged for the lowest is too low. Hitherto the charged for the lowest is too low. Hilherto the baths have not heen paying their own expenses; but the reporter expresses his belief that these establish-ments will eventually he self-supporting; and hesides, the habit of bathing is a process of education which is every day being more and more developed. The toticities of the cast for waves the becaute is perstatistics of the next few years, the reporter is per-suaded, will show a result widely different from that now obtained, and more satisfactory to those who desire to see the condition of the poor improved in regard to cleanliness as a means of health.

Brief Account of the Provisional Arrangement and

proposed Development of the Society of Arts Collection of Illustrations of Every-day Life for the Working Classes, 1857. Part first.

THE illustrations of every day life for the working The illustrations of every-day life for the working classes, origin.ted by Nr. Twining, now form one of the most interesting departments of the Educational Collection at the Brompton or South Kensington Museum, and must ultimately constitute a treasury of materials and manufactures, instructive not only to the working classes, but to those who earn their livelihood by supplying the wants of these classes. When a baker, for example, here see, as he will do, in looking over the collection, the beautiful hiscuits pre-pared in other conorries from Indian corn-flour mixed with whest-flour, be will be induced himself to pre-pare such cheap and wholesome food for the working classes of his own connervy: and these will be stimp. elasses of his own country; and these will be stimm. lated, on the other hand, to ask for them at the bakers shops, and so to create a demand that will lead to the desired supply, and also to the introduction of Indian flour, in other forms of food. Even the political and bearings of such a collection, on the state of the working elasses, are not to he despised. What so to make the workman contented with his lot, as What so ant see here, for example, which he will do, the notable contrast between the black dirty and horrid-looking stuff called hread, and eaten by his class in Sweden, Denmark, and Russia, on the one band, and the good wheaten bread, with whose wholesome and entit aspect he is himself so well acquainted, on the other

In the "Brief Account " under notice is the follow-g statement as to catmeal, which is rightly regarded ing one of the most nutritious and valuable articles of food ·-

"It is sometimes stated to produce skin disease when used in large quantities, but the statement has not the slightest foundation."

Now whilst it would he a pity to disparage unjustly so excellent and cheap an article of food for the work-ing classes, it is most desirable that any mal-influence ing classes, it is most destruct that all marking the second it may possess should not be concealed or overlooked It is at least a fact, known to the writer of this notice, that Scotebmen themselves, who have partaken notice, that Scotebmen themselves, who have partaken of oatmeal in the form of eakes, porridge, haggis, &ce. in Scotland, not only with impunity, hut with unques-tionable benefit, bave found it to be rather heating to the blood in Eugland, and productive of a slight out-break on the skin, not from any undee quantity taken, but even sometimes from the least possible quantity. Similar effects have even been known to follow in this coupter from matching of Luder comquantity. Similar effects have even been known to follow in this country from partaking of Indian corn cakes. Facts such as these ought to be known and recognised, especially amongst organic chemists, who may very easily, perhaps, remedy the partial evil by the recommendation of some qualifying agency or ingredient. It is very probable, for instance, that a little barley-meal mixed with oat-meal or with Indiau flour, may completely obviate the tendency d to. It is even probable that a very brief peralluded to. sistence in the use of such foods may be all that is requisite. Valuable and cheap food, such as Indian corn flour and catmeal, ought not to he allowed to be prejudiced and obstructed in their extension by any mere partial evil such as this if a remedy can be at all supplied.

Mr. Twining merits the thanks of the community for his exertions in the good cause of illustrating and improving the every day life of the working classes.

Higgellanea.

ELECTRO-TELEGRAPHIC PROGRESS .- The Atlantic eable has now been completed. The total length is 2,500 miles, and it has been manufactured in two portions. The weight of the cable is 19 to 20 evt. portions. The weight of the came is to be then per mile. There have here used in its construction 27,500 miles of copper wire, 370 to 400 tons of gatta percha, and 135,000 miles of iron wire. —A curious economization of the cost of working t-legraphs by economization of the cost of working friedraphs by belp of what may be called human electricity or electro magnetism is talked of as a highly impor-tant discovery made by Mr. Reid, of Gresham-house, City, by which the cost of telegraphic communication with distant stations will be diminished to an extent almost beyond helief. While the monster battery for sending messages between England and America con-sists of forty pairs of platinised silver and zine plates, and has cost ahout 2,5007.; it is said that, from a series of experiments made by Mr. Reid, with bis "month batter," he monther that the silver of the second secon almost beyond helicf. While the monster battery for series of experiments made up our Acid, with oils "month battery," by a *single pair* of plates the same amount of work may he performed, the cost of the battery being 3d. Mr. Reid's assistant "placed a plate of platina and one of zincin his mouth, each price of partial and one of an inch square, and upon the energy three-sixteenths of an inch square, and upon the energy produced thereby being allowed to pass through 1,250 miles of the Atlantic cable, the galvanometer was deflected 8 degrees; and although the experiment was made many times, the same result was invariably obtained." If this he not a canard, or a " delusion " of "animal magnetism," it shows that there are really magical powers in the human organism, of the results of which we have as yet no conception exercise of a somewhat analagous po we have as yet no conception. May not the wer, for stance, exercise of a somewhat analysis power, for instance, in long past ages, have assisted the Cyclopean huilders in modifying temporarily the pressure of the gravi-tating force in huge musses, thus enabling them to tating force in huge musses, thus enabling them to handle such masses with something like ease, so as to account for the tremendous lahours of which we still have evidence in the Cyclopeau works of past ages ? We must look to Professor Faraday and diamagnetism, perbaps, for a solution of such mysteries. Meantime, it would seem that if electro-magnetism, or magneto-It would seen to be made a practicable and economical working power, it will be by Mr. Reid's "month battery,"--rather an old mode of applying such power,--to steamers, for instance, or to locomotives! power,-to steamers, for instance, or to recent the How could any substitute he obtained for such a

IMPROVEMENTS AT HOLYROOD .- The works at Holyrood and in the Queen's-park, authorised hy a vote of Parliament last week, have been commenced. They consist of a new garden surrounding the palace, including of course the removal of all the old houses hereining of course the reinovaria of all costs out houses hereining a lock below St. Authony's Chapel, huilding new entrance lodges, and extensive improvements within the palace. NEW TOWN-HALL FOR BERLIN--It has been determined to huild a new Town-hall in Berlin, on a

6cent scale. The huilding is to be a monumer of the hest architecture of the day, and artists of all or the nest architecture of the day, and artists of all nations are to prepare plans, and enter into compe-tition for the work. There are to be three prizes awarded for plans, of three hundred, two hundred, and one hundred and fifty ducats.

THE EDINBURGH SCHOOL OF ART .- The prizes for competition drawings, paintings, and models of the students attending this school, were delivered at the the students attending this school, were douvered at the National Gallery in Edinburgh, on the 29th ult. In the ornamental and arebitectural department, Mr. Christic reported that the number of students who attended the classes in this department last year was 411: the number this year is 225; showing a de-crease of 186. But as there were no day-classes last year, the number attending these must be deduct as follows, viz.:-Male class, I1; female ditto, 50 total, 61; making the actual decrease 247. T be deducted This decrease appears to be entirely owing to the adoption of the system of charging fees, but is not more than was anticipated. Twelve students have been transed during the session from this department to the Antique, being three more than the anount of last year. The class of Practical Architecture has in-creased from cleven to sixteen, while the class of year. Composition bas maintained its numbers, so that the Composition bas maintained its numbers, so that the falling off has not taken place in the advanced classes. The result of the trial of the Geometry shows the necessity of extending the education of the students in this direction. In the Antique Life and Colour Department, Mr. R. S. Lauder reports that, in consequence of the system of students paying fees heing adopted, the classes have fallen from ninety-one of year to forty-three for this.

last year to forty-three for this. RALWAY MATTERS,—The traffic returns of the railways in the United Kingdom for the week ending June 27, amonned to 500,9304, and for the corre-sponding week of 1856 to 464,9104, showing an in-crease of 36,0207. The gross receipts at the eight railways having their termini in the metropolis amounted to 210,7837, and last year to 200,5917, showing an increase of 10,1917. The increase on the Eastern Counties amounded to 1,7237,; on the Great Northern to 5477, on the Great Western to 3,6937,; on the London and North-Western to 5,76447, and the South-Eastern to 8407.: total, 12,5677. But from this nust be deducted 777. de-crease on the London and Blackwall; \$7940 on the 12,567. But from this hast be deduced 17. de-erase on the London and Blackwall; 8797. on the London, Brighton, and South Coast; and 1,4207. on the London aud South Western. The receipts on the other lines in the United Kingdom amounted to the other lines in the United Kingdom amounted to 290,1477, and last year to 264,3185, s howing an increase of 25,8201,——Meetings, of a private cha-ractor have heen held during the past few weeks, with a view of hunching a scheme for affording to Cheltenham a shorter route to the metropolis. The line proposed will join the Oxford, Worcester, and Wolverhampton, at Chipping Norton, thus reducing the distance between Cheltenham and London to within 100 miles, and shortening he duration of the journey (without chance of carringe) nearly two have agreed to purchase the Grosvenor Canal, with

view to forming a railway along its hanks and using its Grosvenor basin, within half a mile of Buckingham Palaec, as a grand West-end terminal railway station.

CITY WORKING-CLASS DWELLINGS .- ID a tract under the title of "City Dwellings for the Working Classes," Mr. G. Ross, M.R.C.S. aod a member of the Court of Common Council of the City of London, reurges the heads of addresses and notes of evidence delivered hy him before the Common Council and their Mr. Ross objects, to committee for improvements. Mr. Ross objects, to the formation of suburban dwellings for the industrial descriming of summan avenings for the budgstrill classes employed in the city, that even at a farthing per mile by railway, the passage to and fro, weekly, would average, at least, two shillings a head, an addi-tion to rent far heyoad the means of the elass to be benefited. He therefore proposes that the City comportion shall take mark in the formation of improvation shall take part in the formation of im-oved City dwellings, for which he endeavours to proved City dwellings, for which he endeavours to show that there is abundance of room; the huildings to be five stories in beight, and laid out with wings divided into wards, and with other arrangements and restrictions.

DUBLIN SCHOOL OF ART .- LECTURE ON PAINT-DUBLIN SCHOOL OF ART.—LECTURE ON PAIRT-ING.—MY. Macmanus, head master of the School of Art in Kildare.street, Duhlin, hast week delivered a lecture on painting in the theatre of the Royal Dublin Society House, being the 6rst of a series of three lec-tures, comprising painting, sculpture as connected with painting, and architecture as connected with sculpture. The address opened with some preliminary remarks in reference to a rmort having rained corsculpture. The address opened with some preliminary remarks in reference to a report having gained cor-rency that the School of Art had tormed a life school in opposition to that existing in the academy in Ahkey-street. There was no foundation for the rumour, Mr. Macmanus divided the fine arts into seven, viz.— The time was not come for it : it was not required at present. The seed had been sown, and the future at present. The seed had licen sound, and had would reveal in this, as in other things, what Ireland was capable of.

THE ART MANUFACTURE ASSOCIATION AT EDIN-THE ART MANUFACTURE ASSOCIATION AT EDIS-purchit.—The first annual meeting of this Association for the distribution of prizes, was held on the 27th ult in Queen-street Hall. Sir J. M'Neill was called to the chair, and opened the proceedings by referring to the doubts and misgivings with which the most sanguine engaged in the origination of the Associa-tion. Sir John added that one most pleasing feature of the recent display of the works of art was the ex-tent to which the working classes had availed them. tent to which the working classes had availed them-selves of the evening exhibitions. He had not the smallest doubt that perseverance in this course would tend to produce an important elevation in the taste, and also in the character, of our working classes. The report was then read. It stated that the receipts At the exhibition in the National Galleries, the num-her of ordinary admissions in the day-time, during the six weeks it was open, was 17,457; and in the evening, 17,806. The number of season tiekets sold was 1,767. The receipts derived from the exhibi-tion, and lectures delivered in the galleries, amounted to 1,4457. 19s. 9d. The report was unanimously agreed to, and the distribution of prizes was then proceeded with.

THE LUNATE ASTLUM FOR DORSET. — At the Midsummer Sessions for the county of Dorset, Mr., Moffat's plans for the new huildings were ngain con-sidered, and the committee reported that they were unanimously of opinion that Mr. Moffat should he em-ployed as architect to carry out his plans at the usual per centage, subject to certain minor alterations suggested and agreed to hy Mr. Moffat, the principal one heing the formation of a separate chapel nt an additional cost of L0002. The Rev. J. A. Templer, accord-ing to the report of the proceedings in the *Dorset Chronicle*, explained that at the last sessions it was arreed that Mr. Wyatt should decide which was the THE LUNATIC ASYLUM FOR DORSET. agreed that Mr. Wyatt should decide which was the hest of the six plans for the enlargement of the asy on the court having offered a premium of 80%. for the hest and 20% for the second best. Mr. Wyatt had recommended that of Mr. Moffat, which was now placed before the court, and the ulterations, as referred to in the report, were explained by Mr. Templer. He stated that a great point in Mr. Moffat's plan was, that it was more concentrated than the others, and avoided excavating in the chalk adjointhe others, and avoided excavating in the chalk adjoin-ing the asylum, while it would not interfere so much with the present buildings. He then proposed that the plan should be accepted, and forwarded to the Commissioners in Luavey for their approval. The motion for necepting the plan was carried by a large majority, and after a lengthened discussion ou the sub-ject of the 1,000/, to which the architect's per-centage on 25,000/, would amount it was plituately resolved in on 25,0002, would amount, it was ultimately resolved to appoint Mr. Moffat as the architect, if the Lunacy Commissioners approved of his plans.

Commissioners approved of his plans. MANONS' STRIKE AT MANCHESTER.—The stone-masons of this city have been on strike for nearly three weeks. They demand to leave off work at twelve o'clock at noon on Saturdays, instead of at four o'clock, as heretofore, and refuse to work up any portion of the time, and still require the same wages, 30s. per week. The time lately worked was 572 hours per week in summer, which they demaud to be reduced to 54 \pm hours. They also demand to leave off work at velve o'clock in winter as well as summer, and, as they cannot see to commence work much hefore eight o'clock in the morning, the caployers will have to pay one day's wages for four hours work: altore equal to encode in the morning, the employers will have to pay one day's wages for four hours' work. Any mason working ont of town is to be at the pay-table at twelve o'clock: in such eases, Satur-day's wages will be equivalent to 4s. 6d. for two or three hours' work. The operatives urge that this alteration is necessary for their social improvement, and is convinced by the Bicheset Monchester Size and is sanctioned by the Bishop of Manchester, Sir John Potter, Sir James Wutts, Thos. Bazley, Esq. and many others who have signed their names in favour of it. On the other band, the employers allege that although the alteration in time would he inconworked up, as they cannot get prices to compensate for the loss of the time.—Manchester Courier.

ISLINGTON GREEN.—We regret to find that it is i in contemplation to erect the Vestry Hall on this only open space in the parish. Is it too late to prevent what would certainly be an unwise act?

ACTIVITY OF THE BUILDING TRADE IN GLASGOW -In every direction, says the *Glasgow Gazette*, the utmost activity prevails in the building trade. Some of the streets - Eglinton street md Apsley-place, for instance,—are well-nigh barricaded from end to end with wooden enclosures to facilitate the erection of with wooden enclosures to facilitate the ercetion of new, and the reconstruction of old, buildings. At the south end of Eglinton-street, there are several dwelling-houses, enriched with Greeian ornaments from designs by Messrs. A and G. Thomson. In the Trongate, West St. Vincent-street, Muxwell-street, Howard-street, the vicinity of the Paisley-road, Hutchesontown, Anderston, in short, in every direc-tion extensive building operations are being earried on. Our contemporary the *Guardian* further tells us of buildings in prospect. Besides the U.P. Church to be creeted for Mr. Ker between Sydney-street and Hill-street, with an entrance frontace to Duke-street The exceed of an Ar Act activen Syntry surce and Hill-street, with an entrance frontage to Dak-street, there are other three churches on the eve of creetion. One of these is a U.P. eburch, in the New City-road: another is a territorial mission church, to be creeted in Govan-street, Gorbals; mnd the third is a eburch of the same class, to be erected at Blackquarry.

REPORT ON EXPERIMENTAL PAVEMENTS IN THE REPORT ON EXPERIMENTAL TAYLEDING IN THE CITY.-A Fepothas here made to the City Sewers Commission, by their engineer and surveyor, Mr. Hawwood, on the experimental payements haid down in Moorgate-street, at his suggestion, in 1845. As in Moorgate-street, at his suggestion, in 1845. As regards quality of stone, the result is, —Firstly, that irrespective of size of stone, the Aberdeen granite generally required reparation earlier than the Mount-sorrel. Secondly, that the Aberdeen stone requires a larger area of repair than the Mountsorrel. that it has had more stones worn so as to be unft for nse, nd, consequently, has required the insertion of more new stone, and has cost more per square, per yard, per annum, for repairs than the Mountsorrel. As regards size of stone; —that, irrespective of the nature of the granite used, the pavings composed of the smaller stones have needed more reparation, and the insertion of a larger quantity of new stone, and have eost more for reparation than those composed of the larger stones. These results accord with the reporter's observations made upon other prevenients. The only safe conclusion deduced from these results is stated to be that the cost of repairs non similar pavings will be inversely as the size of the stones. On the whole it is concluded, meanwhile, that the provement usually employed is the most suitable.

puvement usually employed is the most soitable. VISCOUNT CARLINGFORD'S AERIAL MACHINE.— VISCOUNT Carlingford, of Swift's-heath, Kilkenny, has patented an aérial chariot, with which he anticipates obtaining great results. The improved machine is likely, it is said, to be experimented with shortly at the Crystal Palaco, Sydenham. The patente states that "The aérial chariot in form is something of the shape of a boat, extremely light, with one wheel iu front and two behied, having two wings slightly con-cave, fizzed to its side, and sustained by laths of half-hallow from passing against them, and communicating their pressure through the body of the chariot from their pressure through the body of the chariot from one wing to the other, and supported by cords whose one wing to the other, and supported by cords whose force, noting on two hoops nearly of an oval shape, holds the wings firmly in their position, using a force that cannot be less than ten tons, on the principle of corded musical instruments. The aërial chariot is provided with a tail that can be raised or lowered at pleasure. The machine is drawn forward by an serial pleasure. The macbiae is drawn forward by an ac screw of the perfect form of the screw propeller."

SOCIETY OF ANTIQUARIES, NEWCASTLE-UPON-TYNE.-The country meeting of this society, for 1857, was held on 29th ult. at Lindisfarne, or Holy for Island. The inn was first visited, and then the parish ehureh, a structure dating farther back than 1145, enurgh, a structure dating hartner back than 1145, with round and pointed arches, and alterations and ndditions of various periods down to the eighteenth entury. Near the church stand the remains of the ancient priory, which has heen as far as possible arrested from final destruction, under the authority arrested from him destruction, under the autority of the Commissioners of Woods and Forests. The eastle was then visited, and there the party, about twenty in numher, refreshed themselves, and then returned to the mainland, and hy train to Newcastle. The Gateshead Observer, from which we gather these few particulars, gives a full report of the meeting, with a historical sketch of the islaud and its ancient bishops.

COMPETITION, BALSALL HILL, BIRMINGHAM. COMPETITION, DAISALE HILL, DIRHINGHAM.— The Building Committee for the erectiou of Par-songe-House for St. Paul's Church, Balsall Heath, Birmingham, bave selected the designs of Messrs. Briggs and Everal, of Birmingham, submitted in competition.

ART AT DUNFERMLINE .- We regret to observe ART AT DURYERMILINE.—We regret to observe that a resolution has heen come to, to close the School of Art at Dunfermline. The master (Mr. Baker) had previously resigned, transferring his ser-vices to the High School of Stirling, where there seems to he some taste for art, and where he appears to have obtained accuration. to have obtained commendation.

ST. HELEN'S CYMPTERY.—The Barial Board has accepted the tender of Mr. John Middlehurst, of St. Helen's, for the erection of the three chuples and two lodges, at the sum of 3,286/. 14s. 3d.; and that of Mr. Edwin Knight, of Manchester, for the earth-work, road-making, drainage, &c. at the sum of 2,286/. Mr. Barry, of Liverpool, is the architect.

JULY 18, 1857.

The Builder.

CIDENTALLY there bave fallen into our hands, two lithographed views and a prospectus, of a proposed church or chapel, in Oatlands-park, Walton-on-Thames, Surrey, from which we discover certain features in the project that seem to call for notice,-for, just claims of our profession, not merely, are concerned with them, but the real development of art, and perbaps also a point or two of morals. Let us first dismiss the question of art. For the " Plan of the Chapel to be erected," subject to the decision of the subscribers,-one, says the prospec-

tus (with the confusion of terms and things, which even the best writers of the public press scem still addicted to), "of which a sketch is hereto appended, has been suggested, as being pleasing in appearance and economical in construction." The plan proper of this suggested building baving been described, and some particulars of the probable cost and accommodation required having been given, with re-ferences to buildings lately created,---"the Cburch of 'All Saints,' Skeltou, near York," is next named from having been "suggested"-"as being of a still more simple exterior," and " affording as it does a beautiful example of the Early English style; combining, indeed, almost overy feature peculiarly characteristic of that style. But," as it is added, "it is a question whether the carrying out of the interior details of such a church-though the dimensions be but 44 feet by 33 feet,-may not be attended with an expense not warranted in the present case." And in a prospectus or circular hy the Directors of the South Western Hotel Company, who seem to he in some way interested in the pre-sent matter, Skelton Church and Boxwell sent maticr, Church, in Gloucestershire, are named as baving "both heen mentioned as suitable ex-Gloucestershire, are named as baving "both heen mentioned as suitable examples." The lithographs show,—one a southwest view of Skelton Church, - and the other, "Proposed Chapel in Oatlands park," the sketch first mentioned, and which we must again refer to.

Now, the point to which first we would call attention, is that it appears, at this advanced time in the study of Gothic architecture, that churches still can be "designed," and haply built, in which there is not one particle of an element which is essential to the constitution of art. Not one of the examples or models named, is proposed to be used in the way in which only, existing works should be used,-not one of them, we might say, is used really as an example or model. Not one of the designs bas been made for the occasion, or the site,-or more possesses any of the chief elements of that art which should have been contemplated who so largely contribute to the strength and as essential in a new building. Of course, the happiness of the country, need the sympathies architect of the Hotel Company has had nothing and efforts of those who have received a higher to do with these designs ; and when our readers have seen what we have next to say, they may hope there has been no other member of our profession concerned in the husiness.

The design shown in the view of the "Proposed Chapel," simply is an exact fac simile of. one of those in a book of "Desigus for Country Churches," by Mr. Truefitt. Even the litho. graphy is imitated, so that the impressions, till placed side by side, would seem as if inted from the same stone. This use of the

of its publication, and to the interests of art, him we may ask,-are we ever to continue to might have been defended by the committee, hear of the degraded moral condition of the on the ground of temporary convenience, pro- lower orders ? He says : vided the slightest credit had been given for the origiual property and authorship. Not a word, however, is there on that head, and the initials of the original designer have been suppressed, and others substituted. To a note of inquiry which we addressed to the real author of the design, he replies under some surprise, that he knows "nothing whatever" of the church proposed, neither has he made any drawing from his published designs. The committee had better now make such amende as they can, by employing him to furnish a new design,-one which would hoth provide for a suitable church, and not be a negation-as the best design made without reference to actual conditions, is likely to be in point of art.

We caunot, however, let this subject pass without other observations not unconnected with the wording of the prospectus. It is one praisewortby course, to duly regard any want of church accommodation; and the prevalence of vice and crime claims the active exertions of the elergy and all well-minded persons,-though, if we do not question the facts, we may ask to see a comparison drawn with a proper estimate of vastly increased population. But it is a course of a very different character to speak of "the increase of vice and crime amongst the services of the Chnrch-"hut too well known in the neighbourhood." Let a "certaiu number of free sittings" be provided in the building,not designed specially "for domestics and the poor," but for such as like to occupy the poor," but for such as like to occupy them; and let efforts be made to induce *all* "classes" to attend the services. This is not the time when any one class can point to the "vice and crime" charactensing any other. How much of the contrast which is drawu between the religions and moral condition of the classes, is due to circumstances which indeed it is the duty of those who are fortunately circumstanced iu wealth and education to remove, rather than to lack any where of inuate leaning towards what is noble and good ? How much of the crowded state of the present churches ucar Oatlands-park may be attributed to fashion, or "society," or a reason other than a radical difference between the classes which the words that have been hastily used would imply? Much better was the expressiou in the words of the Bishop of London, which are quoted, -as to the fear that the poor feel of intruding, and the difficulties which thus have force in preventing their appearing "where we wish to see them "---and as to the way of overcoming these difficulties "by evincing our readiness to open up to them places of worship where all such hindrances will disappear, and by encouraging them to consider themselves more as one with ourselves than they now do;" or in the words of the Rev. Mr. Rowse'l, upon the opening of a church at Stepney, as to the exhibition of au active "brotherhood," and the recollection that the "lahouring classes" education than themselves." Such is the tone that should be adopted by the promoters of new churches,-not the patronising one which regards superior sanctity as the ally of wealth, or "vice and crime" as especially to he found "amongst the poor."

ing to say on this latter head, and applicable on a wider ground than the case of the projectors of builders, and many private individuals,-which the church in Oatlands-park,-hut our purpose defrauds our professional hrethren of their only has been forestabled by the indignant protest of the book referred to, though opposed to the object Rev. S. G. Osborne on the same subject. With against which course-as we have shown-one

observe—that class raised a few degrees above the labourer, but still a few degrees below what is called the middle class—marks, in a spirit which broods mischief, the hypornitical inconsistency which is for ever on the stoop to. pity, patronize, and smeud, but which shans that view on its own level which would afford a wider and more urgent field for amendment. Let this system of attack on the depravity of those who have been renred to know no better—who, it they had known better, could have scarce survived their rearing—go on at the hands of those who have never known want, except through extrawagence. never known wait, except through extravagance; who have had all traching, whose you'b was protected from contamination, but who -a'hilt-seek it, aay, openly seem to glory in the pursuit, and a day of reekoning will come which will shake our social never known system to its foundation.

How many a man has been transported for life for offeness against properly, which are more 'orchard robbery' compared with the deliberate dishonest appropriation of the money of others which so distinepropusation of the money of others which so distin-guishes, the titled, educated, so netimes religious swindler of our present day 1 I serves know a crime now that does shock 'society,' although 'society' sadly laments, per plutform, the growth of crime among the lower orders."

Again he speaks of-

"the hypocrisy which mourns over the 'motes' of the lower and ignorant, but dure not attack the 'beams' in the upper classes."

And as to education, even, and the waut of it, he says,-

In the bary, "Let $4 \sec^2 t_1$, "good so," t_1 ," hok to it, —the baser orders can endure the trach being told of their condition, but they will not eachine to be fore ever subject to a comparison with the idwards 1, and treated as if to be ignormat was meresarily to be wieled, —ta be educated to be noncessurily gool." Tractary, with difficulty pick their way through a back, but they have eyes to see and ears to hear."

Truly, the moral seuse as to the nature of property and the rights, may be, as it has been found, wanting in the higher, or the middle, as in the "lower classes." One man will rob a hen-roost; another will adulterate his goods, and train up his children in the virtue of getting only rich, by any means; a third makes a way with securities entrusted to him, or swindles under the cloak of a company; a fourth steals openly the cloak of a company; a fourth stears openly the property of your brain. Where is the distinc-tion,—except that made by the obliquity of vision which serves each of the appropriators when he chooses. There can be no real nicety of difference between that which is punishable as felony, and the appropriation of iutcllectual property,-none in the conscience, except where that by custom bas been hlunted. If it must be left to the conscience of an individual to settle in many cases, where appropriation cannot rightly be made,-the moral obligation to right is surely as strong on him, as if all society were witnesses. Clearly, however, if there be cases of doubt, there is no such case where the result of intellectual work is copied off line for line, and form for form, and where a distinct act of payment would have been required to prome that which is got from its real author surreptitiously,—without fee, acknowledgmont, or thanks. The "vice and orime amongst the poor" are punished with a relentless hand; aud ignorance of legal or moral obligations gains the criminal no respite : are we, then, to bold back one word of ours that should place in the We had much more—that we have been wait-g to say on this latter head, and applicable on a which is hecoming habitual with committees, capital and property, and all just rights; and

Vol. XV.-No. 754.

402

of the least of the objections is, that it is utterly inconsistent with the maintenance of a healthy and vigorous condition of architectural art ?

"STYLE."

In the part which Mr. Garbett has been taking in Is the pair which Mr. Gertett has been using in our great controversy-the battle of the siyles—be is evidently fighting for truth rather than for victory; and therefore I teel sure that he will not take it amiss if I question part of his letter, for the sake of eliciting a more correct statement of the case.

if I question part of his letter, for the sake of eliciting a more correct statement of the case. Now, it may after all prove a mere question of "Gothie," which he seems to employ as applicable to almost everything good and true in the shape of art. He seems to confuse "Gothieness" with "untiful-mess,"-style or expression, with an elementary hase: but unless we keep this distiction prominently in view, we cannot maintain our position; for this is the very point which our opponents constantly assall. On such a point as this, even ayaurent confusion leads our antagonists to reject the whole of our expument as based upon false premises. It is true that we have more good work which lacks truthfulness either in Guthie or in any other style; and so, although this truthfulness is one element, it is not the element which makes it Gothie. Truthfulness has nothing to do with "style," as such, and there may be perfect truthfulness to be necessary to all true art; and who find its oak one story to do sover, must acknowledge, and do, theoretically at least, profess truthfulness to be necessary to all true art; and who find its acknowledge their just claims, even if the classics are such as to be hardly justified by the result. result.

There cannot are such as to be harmy justified by the result. Hence it is evident that if truthfolness is the main or only argument that we can find in favoure of Gubie, we shall be only defending a post which no one has ever attacked; and we shall be in danger of falling into the enemy's hands by laying ourselves open on other points; like one of your correspondents, who, in his attack upon Gubie, sets up the Florid style of the Tudor period as the Gothie which he himself most admires,—which he then proceeds to demolish (and even at the expense of dealing a home-thrust at his Palhadien ::', '). And itus, without a straggle, he gains a most inglorious victory,—for who would go out of their way to defend a style which is just arriving at its last stage of degenerary, and possesses but a few fragments of either the spirit or character which rendered Gothie art so glorious during the thriteenth and part of the fourteent centuries' No one, indeed. If we must fight, it us fight against those who have enough of truth on their side to make it worth our while to test our strength; and if we are hut true to ourselves, we need not lear the four ern then. even then

Our only safe and true ground is this,---to analyse the remains, to fathom the priociples, to explore the very foundations of the style of that period wherein we maintain that the highest development of art is to be found, and to base our defence of "style" (until we We manner the second se a sole claim to universal truthfulness. Indeed, could refer to instances of sham in original Media val work of the best period,-iu work which all would agree in calling Gothic.

Many of our misunderstandings arise from the im-Many of our misinalestandings are room the mi-proper use and applications of defaitions and terms; hat much also from failing to refer results to their own proper cause. Thus, for instance, Mr. Garbett appears to me not sufficiently to distinguish between the effice of "sense or judgment," and that of "imagination" as bearing upon "truthfulness" and upon 'design." Not that this nullifies his practical conclusions as to the general superiority of our upon " desig upon 'design.' Not that this multifies his practical conclusions as to the general superiority of our favourite style, hut only that I fear it prevents his arguments coming home to his opponents, with the force and clearness that they would have if a little more guarded and methodised.

I feel sure, that for the sake of your readers as well as myself. Mr. Garbett will not scruple candidly to correct me if unhappily I have mistaken him, or have, myself, advanced views which may appear to him ontenable.

WILLIAM WHITE.

THE BUILDER.

ART IN DRESS

The Wheel of Fashion.

"Those who D cell in Glass Houses should not Throw Stones."

ART IN DRESS-FASHION'S FOLLY.

ART IN DRESS-FASHION'S FOLDI. THERE are few things more curious to contemplate than the "whirligig" of fashion—which never stands still, hut is increasantly preseuting to the view a few original devices, mixed with more which have seemingly become fixtures in the wheel, and are copied, as it turns round, to a greater or less extent from time to time. An old sea-faring character in one of Captain Marryat's novels, had an idea that in seventeen han-dred and are meany rease resears, rutand, and that in Marryat's novels, had an idea that in seventeen hnn-dred and so mony years events rotated, and that in seventeen hundred and so on, he would he engaced upon the ideatieal employment on which he was then husy a similar belicf night, with more means of proof, he attached to the revolutions of fashion. No doubt the ingenions attist who devised the flowing and fall-hottomed wig for the fair and youtbful French monarch, the use of which was presently adapted to the grim-visaged Charls II, thought that he had hit upon an original device. A visit, however, to the British Museum will show that "there are few things new under the sun," for there will be found a flowing wig just similar to that named, which was worn by some emment Egyptian, probably two worn by some emment Egyptian, probably two or three thousand years ago.

Amongst the male agriculturists in some of our English counties, fashion has not changed for 2,000 Engitish counties, fashion has not changed 107 2,000 years. A short time ago we had occasion to pass through a remote part of SufOlk, and there the shep herds, dressed in close-fitting leggings, smock-frock, and wide-brimmed felt hat, might be seen physing on the pipe and looking, with the exception of the heard, as if they had only recently given a sitting to one of our old Saxon illuminators. Many will have officed this adherence to old cosume in other parts of England, particularly in the southern districts.

While, however, amongst the persant class, the wheel has in a measure stood still, changes have when has in a measure source shows on the second source and the second source we note the harly Saxon in his flowing and graceful roles, the taste of which was partly horrowed from the Romans, and the elegant costume of their wives and daughters derived from the same source: then cauch the same source is then cauch the same source is warlike covering, which so well displayed the stalwart had been long in use. forms of the Norman warriors, the female dress of this period is singularly refined and elegant. It would taste in dress, in a great measure, corresponds with

require a volume to notice the numerons chauges which were constantly heing made. The armour, from heing made to fit to the shape of the human hody, grew to monstrous cases unlike anything in the natural creation, which enveloped hoth men and horses. Many strange devices were turned out by fashion: at one time the toes of the gentlemen's shoes grew longer and longer, until it was found necessary to fasten the end of the point to the knee. This would seem to us ridiculous enough, hut many fashions in modern times might he mentioned to show equal absurdities; for instance, when that extra-ordinary ent, the swallow-tailed coat, was introduced, the length of the tails was moderate; it, however, grew in longitude mult the ends were nearly even require a volume to notice the numerons changes the length of the tails was moderate; it, however, grew in longitude until the ends were nearly even with the hecks, and it was only some merciful turn of the wheel which caused the majority of the long tails to be turned into "spencers." That prevented the necessity of tying the "swallow-tails" to the "pig-tails," in the same way that the shoe-toes were formerly fastened to the knees. "Do refure, however, is old the sume the theorem

To return, however, to old times. In the records of various English costumes there is much to admire, and it will be noticed that all those dresses which are and it will be noticed that all those dresses which are admired now, and will he, if representations should crist, for ten thousand years to come, are those which modesly cover the human form, hut which do not disfigure it by harkarous additions. We have not space at present to notice the extraordinary head-dresses, and other inventions of Medizeval times, hut must be content with wondering that such things should have been permitted to disfigure the fair forms of our Envilès wives and maidens. of our English wives and maidens.

Many of the female head-dresses, as well a other portions of costume in use during the Middle Ages, were exceedingly heautiful and appropriate, and the small hounets richly decked with rihbons and the small bouncts richly decked with rinous and flowers, now in use, may, in some measure, he con-sidered as a revival of the head-covering of ancient times, and, although scarcely sufficient as a means of protection in this changeable clinate, are preferable to the variety of honnets with projecting fronts which halthough the in means

that in architecture, and this is strikingly evidenced hy an examination of the female costume of Queen Elizabeth's days, and the singular appendage which, as a whole, had a somewhat picturesque effect, hut was composed of materials so complicated that it seems strange that so much ingeouity should have heen used to render the human hody mecon lortable and nngraceful. The padded rohes of this reign, in a certain measure, resemble the hoops and crinoline dresses which at present encumber our rooms and dis-figure our ladies. figure our ladies.

dresses which at present cneumher our rooms and dis-figure our ladies. In looking over a numher of fashions which have run their course, one cannot help exclaiming, "How rould such things have heen tolerated?" For in-stance, why should mea who were provided hy nature with a plentiful growth of hair suitable to their features and complexions, erop it short and assame the punderous wig already mentioned? Sir Christopher Wren used to wear one of this descrip-tion, for fashion is a mania which, like South-Sea schemes and pestilential disorders, affects all. Hair powder comes into use in courtly quarters, and pre-scutly thousands of dredging-hores are at work, and he heads of the multitude of hoth sexts assume an even covering like snow. In addition to the hair powder, the ladies of that time hi upon several strange devices. They plastered their fine countenances (without necessity) with hake platches, which, in course of time were eut to represent familiar forms, and it was not antor for freaks of fashion with a carringe and horses on one check, a fox-hunt on the other, and perhaps a flight of expids just shove the eyes. This was one of the freaks of fashion, in favoar of which nothing can truly be said, and yet, no doubt, many a compliment has heen passed upon the aste and arrangement of those patches.* It is worthy of remark, that fashions generally sne-ceed in extremes. One were the roles of the hadjes

taste and arrangement of those patches.* It is worthy of remark, that fashions generally sue-ceed in extremes. One year the robes of the ladies are so long that they have either to be tucked under the arn, or cles horne in a most troublesome manner helind: in the next year the dresses are ridiculously short. The bonnets assume dimensions which are an inconvenience hoth to the wearers and others, and then on a sudden they become so small that the heads are scarcely covered. The high head-dress shown in the engraving enabled the waters to dispense with bonnets shaped covering would have been needed for such a superstructure ? Let those who smile at the peedinative for the Chiness and other foreign at the peculiarities of the Chinese and other foreign people, contemplate carefully this fashion of our great people, contemplate carefully this fashion of our great grandmothers, -- this commanding head-dress, which rose to the height of from 2 to 3 feet, and was, we are told, most skilfully built up and stuffed with new hay when that material was to be had. Surely there must have been something wrong with the heads of that date? How else can we account for their style of dress, and also for the accompaniment of the huge balloon-hoop which still further served as meaus of disfigure-ment ment

At the time this fashion prevailed, taste in England was in a poor state. Education amongst even the higher elasses of fenales was very limited, and pug-degs, monkeys, porcelain monsters, negro and dwarf attendants, and other matters which could not tend towards a feeling for the heautiful, were the rage and fashion. After this time came various styles of head-dress—somesimple and hecoming at their introduction, hut which grew (as did the gipsy-bounet), until their extent and absurdity caused them on a sudden to dis-appear. Amongst the head-coverings of the last cen-tury was one prety enough when first hrought in, hut which so expanded in proportion, and was so gaily decked with flowers, that the pictures of it remind one of country girls on May-day morning with the large ornamented grottoes on their heads. We had hoped that it would have been seventeen

We had hoped that it would have been seventeen hundred, and many more years, before the high head-dresses, the hair-powder, plaster-patches, coal-seutile honnets, and uonatural hoops, should again make any prominent feature ou the wheel. Our hopes as regards the latter of these, however, are doomed to disappoint-ment, for the hoops of old, under another name, have hean howled round again, and the rohe eopied from a recently published fashion-book measures inpwards of 5 feet in diameter, or over 15 feet in circumference; nor ean it be said that matters are yet at the worst, for eich month's engraved fashion seems to show a larger and more expensive arrangement. Truly, if the rage We had hoped that it would have been seventeen

⁴ It is enrices arrangement. Triny, if the rage ⁵ It is enrices to remark that the liverid servants of the rich are a means of preserving the costumes of various puriods for many years: the silk bags on the backs of the state footnee, the long midel laced costs, the eacked bate, knee breeches, and silk stockings, were the ordinary appared of the gendlemen themselves. The hair powder, appared of the gendlemen themselves. The hair powder, severants' hall, and the next wing of other days may be still seen surmounting the craniums of fushional be costhour by the will have loss their opsition, and taken the place of the inced coats and corresponding paraphernalis.

THE BUILDER.

continue, changes will be necessary in all directions : earriages must be enlarged; the charge for admission for ladies to all places of anusement must be greatly advanced, owing to the extra space required for their reception; our foot-pavements will be quite inade-quate for their purpose; garden-walks and ehurch-pews must be enlarged; and, then, as the middle classes become more infected, the confusion in omni-bures will be terrible. huses will he terrible.

bases will be terrible. We learn from a morning contemporary that one house in Sheffield has taken an order for forty tons of rolled steel for arinoline, and that a foreign order has heen taken for the supply of one ton a week for some time to eome. This and other matters which have eome under notice, show that husy preparation is going on. We trust, however, that our fair friends will, by timely reflection, prevent the inconveniences to which we have alluded, and at the same time restore the pockets of their bread-getters. It is with much diffi-dence that we venture these observations, for we well know that to run a tilt against the raging fashion is almost as hopeless a task as the course of Don Quixote against the windmill; aud, moreover, we are not amost as hopeness a task as the course of Don Quracter against the windmill; and, moreover, we are not blind to our own short-comings, and when we think of our own head-coverings in particular, we cannot fail to remember the old proverb, "that those who dwell in glass houses should not throw stones."

THE BATTLE OF THE STYLES. A HUDIBRASTIC EPIC.

"A style for Challengers."-Shakspeare.

TO THE JUDGES, APPOINTED TO AWARD THE PREMIUMS TO THE COMPETITORS FOR THE PREPOSED GOVERNMENT OFFICES AT WESTMINSTER, THIS FORM IS MOST ARCHITECTURALLY DEDICATED.

A BLOODLESS Fight,—that is, of blood Not shed,—but whirling like the flood In rocky basiu round and round, And savage, at the least in sound,— I sing : and now invoke the Muse To aid me, though she do abuse The terms of gentle manners all, So they be architectural : For, if the *Orders* be sustained, No order, else, need he maintair'd : Keep but the *Pedestal* intact, No matter then you stand on fet ; Preserve the *Column*, straight and tell, Then let the grace of court'sy fall. *Entabletare* and *Fediment* Will stand for weighty argument; Will stand for weighty argument; Nor need you "mind your stops," my Muse, If Pointed Periods you use: Be still elaborately vexing, Be still elaborately vexing, If but with Tracery perplexing. No need for strength in what you say, If Buttress hold it up to-day ; Since, if a while anstinid why will, Habit may keep it standing still. If slender wit prove eyrical, Speak of th' aspiring Pinnacle; If Folly angel-ward mount high'r, You've but to cap him with a spire; If Impadence good manners shock, Top all with buzen weather-cock ! Only, in Christian puttence' loss, Presume not to insult the cross !

Long had the Classicals repos'd Within their Attice enambers closi'd ; Whence they beheld the run'd walls Of "olden "homes, or Tudor holls, As moulder'd things which seem id to say,-"The Gorns have heen,----and pass'd away On sumy baleony, or shade Of pedimeted colonnade, A Burlington might deem him sure Bestor'd refument would endure : -and pass'd away." Or penalected processing, and the set of the

He fills up half the rest with lead : We've won the plate in glass of size, And the full landscape glads our cyes,-Each pane a picture, all the same As we would hang in gilded frame. Midlaval times and fashions gone, Be modern times and fashions ence. Midlæval tenes and fashions gonc, Be modern times and fashions one; Or, for the comforts of onr day, If no new forms a 'fit' display, Let's seek, no matter in what age For such a 'fit' as we'd engage. Where, likelier, truth and grace to find, Where, likelier, truth and grace to find. Than in those ages when the mind Of Greece or Rome its height attain'd, And Pericles or Cæsar reign'd ? When Buomarotti raised bis dome, Palladio gave to Taste a home, Palladio gave to Taste a home, Taught Inigo to teach agen The laws which ruled our matchless Wren?"

So reason'd he; and in our land, Lo, where Corinthian portals stand, At Blenheim, Castle Howard, Stow ! Not more Vicenza's self could show. Yet view'd he not the ruins round Yet view'd he not the ruins round As worthless loads on valued ground. "No, let them stand," he needs would say, "The Goths were glorinos,—in their way; The vield church my feeding rosses,— I like it well, but d—n their houses!" Yet even these had still his care, E'en as his grandunchler's grey hair,— As things made picturesque by time, Which ne'er had beauty in their prime.

But men, cre now, supposed dead, And all hut safely buri-ed, Have sudden made a gentle cry, And, shortly, roar'd most lastily; Till coffin open'd, and the baker Fetch'd in lieu of undertaker, Grim Death has soon giv'n up the strife, And bread once more has nourish'd life!

And bread once more has nourish'd life! So slept the Goru in death-like scenning, Although with future life yet teeming, Till some "dark age" apologists, And delving archeologists, And the full'a ceclesial stones, And huried "oldeu geutry's" bones, Awaked a voice, which, low—hut clear— Said,—" I'm not dead, but sleeping here I'" "Drag forth the ivy from my face! Thongh worn, my features you may trace; See, proof of life is on my shroud, All *rubrical* I speak aloud! Infuse goar blood into my own, And I shall live again in stone; Throw off my passing Gothic torpor, And erush the *Classical* nsnrper." He rose,—he stood,—he walk'd at length; And so went forth,—f a man again!" And now the priest began to see

And now the priest began to see The bateful impropriety, Of worshipping in churches builded, With what heathen temples yielded. "Arise, ye Goths!" he frantie calls : He'd lay a train beneath St. Paul's: He a hay a train beneard St. radi s: No matter now, how dol or shabby, He sees but beauty in the Abby: Of Christendan he hnik the peoples, "Down, ye Domes; and up, ye Skeples!" The "olden genty," too, he rouses. "Ye shall not live in Classic houses! The " olden gentry," too, he rouses, " Ye akall not live in *Classic* houses 1 Down *peelinent*, and up with *gable*! Be still your *stalls* of Gothie eut, What'er the debt, we'll have the debtor, Pay alone in *Old Black Letter.*" (Thus hipeds, rich in Classic le vraing, Or quadrupeds of Greek discerning, Gr quadrupeds of Greek discerning, Still save the grace the Gothist garbles All uatural as Elgin unables. And thus, though rev'rend critics sue one To Gothie area is but the true one, They still in Pegan Latin speak, And Gaspel read in heathen Greek). E'en Lady-don 'gan turn away From all but *Gothie Closary*: Apse; Buttress (Crocket; " Decorated ;" Early English; Folioted; Gargoyle; Hood-moult; Jesse-tree; Kernel; Lettru; Myuchery; Narc; Oric; Parvise; Ourie and Rood-loft; Sedilia; Taffel; Vinette; Wood-loft; X is wanting; Yard (*see* Yerdis); Eig-zag our lets Gubiev ord is. But, while the Classicists and Goths But, while the Classicists and Goths

404

Espage like bu teiflies and moths, Another party woke from trance,— The rich remscent Remaissance. Like Stanley 'twirt the twoin at Bosworth, Silt thinking which his favour zons worth, Or Dick, ar Harry,—til no longer He might don't which should be stronger,— So stoud the bastad, till be rather Cho-e the Classic for bis father. ~ Fighting sby'' of the Grotesque, He'd yet preserve the Pictureque; And thus declared for Classic, which found, The favour Stanley show'd for Richmond.

And now, while must ring in their wroth, it seem'd "all Dicky" with the Goth, Until, s.id he, "Though 'is beneath an Architect,—*Elizabethan* Aid shall help the true apirant To o'erthrow this Classic tyrant. If, with forcing hirdings, *kn*, Seeks to vanquich, so will *we*. To Classic pelf we'll ope our doors, As *ke* involves-Lonis Quatorze : If bergary may make its call, Why then let us be 'bergars all,' And finery in rags ne'er fall.''

Then Renaissance, with pride clate, In its herabilic robes ornate, Rich in swelling andhaltaion, Flound'ring curves of vegetation, Mix'd with shells and waton scrollery, Much resembling atems of celery, Winding into rare humanity, All profuse as "Fair of Vanity," Mingling Fancy's varied creatures With the stermer Classic features,— Then Renaissance, like King Murat, Prince of personal éclet, Rose as Fortune's low-bors son, Splendour's chosen champion. Solutive, he the eye entices From Tuilor's mongrel hst devices; French-like, starts into the van, To brave th' "Old English Gentleman." 'I join with you, ye Classie pare ones; All, that Gobie splendours yield, I'll surpass with this ng shield Emblazon'd with florescent taste,— The gorgeous added to the chastel "

Stirr'd with bursting indignation Came the Briton into station, Ruffled like the up-stareb'd gear Old Queen Bess was woot to wear O'er her shoulders, like the tail Of turk y-cock when foce assail. "You, you Gallic cock," said be, "Let down goar feathers, for they'll be But borrow'd plonnes; while I adorn My friends with 'manners to them born And native here; ' "Bon jour," vain fop y---A French adren to your French slop,"

"To the mauner boru !" said he of France, "Why, we see both but *Renaissance*; But yon yoar furtire purpose foil, And what you're stolen do but spoil. *I* take the good the gods provide, And by my use ou't please their pride; *You* take your 'pearls' from hands divine, And treat them, proverb-trae, like 'swine,' We hoth give old things a new birth, But I alone afford new worth."

With this the neutrals turn'd awny, And, neutral now no more, array Themselves among th'opposing Jines, Beneath the Greek and Gothie signs. *Remaissance joins the (Zustic heathen*, And *Gothic* owns th' *Elizabethe* n. The forces theu foll back (prepare); And war is formally declared.

But not alone the fight remains To the great parties on the plains; From forth each architect'ral quarter Come stray herces to the shaughter, To shoot at random, swell the pother, All careliss or for one or t'other. *Egyptican* from the tombs of Deader', Risce like the witch of Eanlor; Prestan Dorie, heavy, solenan, Sends its mighty futed columa; Wand'rers come of *Mosquish* mees, And *Athend'ran* with its graces; Comes Lombardie in strined jucket; *Guantime* in parts-hwark placket; *Guantime* in parts-hwark placket; Continental moogrels many Think them-clares is good as any: These arrive to see the fir y,

THE BUILDER.

And fight, or not, as choose they may; Guining lovers as they stand, If not some root in this our land,

And now each front to front opposes, Like the white and blood-red Roses: One, or both, shall now be zu-done, Peter, York,--or Paul of London. Peter, York,--or Paul of London. Peter, York,--or Paul of London. Peters, York,--or Paul of London. Peters, York,--or Paul of London. Peters, York,--or Paul of London. Swelling, helled Balastrade; Gothie pillar furious wafts Its clossify ords' gioines (Gassie shafts; Buttrees seeks to overmaster Flat Coristion Pilaster; Pointed arek of segments, sticking Up, like "merry-thought" of chicken, Seeks t' o'erstride the circle-demi, Like Isosceles o'er Seni; Spurning, as heometh free-stone, Archival-fast-locking key-stone: Dark Triforiam shows its teth all 'Grinat the like in Greek Hypeethral; (Chere-story its plentoous airness 'Gainst the Attle's alylight chariness: Windows,--these with inner tracings (Challenge those with outer gracings; Porch o'er-gabled, close and gloomy, Frowns on Porito: the roomy: Tow'r and Steeple, ostentations, Envious, look upon the specious Dome, and think they will he view'd The loftier for less amplitude. Next, the foud allies, all holly Fierce in their respective molley, Both, alife for others' glory, Fight like Jacobin and Tury; Fight like Jacobin and Tury; Folyting the parts they'y ve taken. Though by principle forsaken. Though by the random rangers,-----"Gothie sharps, and Greeian dats, On, Jike the Kirkenny ental Mutual murder sure prevails, Over the trimph and over tails 1 Matual murder sure prevails, Over the trimph and over tails 1 Keep it up as you begin, Fools fall out that rogues may win !" Long the battle reget, till the

Dost and thick'sing vapour fill the Air, and make them in the smather Air at foe, but hit the other. Argumentative four-pounders Wound their shorters as rebounders; Fury bliods discrimination; Error tries recrimination; Truth lays lustify abont him, Greek, or Goth, alike he'd clout him, Till a mist, above, around 'em, Densely rises to confound 'em, Smother'd balf, and all perplext, Nothing done, exch cries "What next?" When, from forth the marky cloud, Gomes a voice most full and loud, Booming o'er th'astonish'd ear, "Har monious charmingly" and clear ! All amazed, the warriors listen'd, When, amid the fog, there glisten'd Something like a sump beaming, Still increasing in its gleaming, Still increasing in its gleaming, Still increasing the haze weat, Stona previd, as off the haze weat, Standing clear, to their amazement !

A lady fair, of matron greee, With honest purpose in her face,— Of stately build, and well knit frame, As e'er from womb of markle came,— All perfect in proportion's law, And heautiful as at could draw; Just habited, as bast might he, To serve the time's necessity,— E'en such a lady hit them throw Their weapons down, and bend them low. Where'er, or whensoe'er her birth, She seem'd to elain this spot of carth, As a native to'; and e'en the time, As though it were her breathing prime.

As though it were her oreating prime. The squabblers wonder'd, in their plight, Who she could he,—as well they might, For speaking beauty like ber own Had not of late sppear'd in stone. They had, but fought for Fashion's dress,— Not for the Truth in nakedness; And thought alone, as puppers can, How that "the tailor makes the man." The srebitectur-ad alone Had been as yet Contention's bone; And much blank wonderment cause o'er them, With AlcHITECTURE's self before them 1 "How.now, ye ill begot and hred," With sternest scorn, the lady said, "What is't ye do, ye imps of fame? A deed for nothing that an anne ! Back to your tents, ye rabhle rout, And learo what 'tis ye fight about : Back ! and beiter learn your duty. Learn to huld a carcase fealty. Learn to build a carcase featly, All conveniently and neatly : All conveniently and nearly: Think upon its *purpose* duly; Strive to meet that purpose truly: You'll do much in this alone, To make fair Beauty claim her own: Think not what the fashion should be, Till the form is what it would be: Give the head the cap that fits well; Give the body that which sits well; Let th' Expressive give direction, Suit with colour the complexion : Whether Gothic, Greek, or Roman, Be a fashiou-slave to no man: Take old forms, if any rest Ahove your own invention's hest ; Anove your own inventions next, Take, or modify, or alter; To riject may be to palter With the wisdom of the kings Ye revere in other things. You, ye *Coths*, who go to college, Scorning even Christian knowledge, Hit he next from the next. Scorning even Christian knowledge, If it be not from the page Of your Greek Testament,—assnage Your sonseless ire against the people Who aspired not to your steeple." (Here the Class' cists took their eredit, and for why? Themselves had said it.) " You, ye Greeks, are only fools, In blind submission to tho rules Herms for the Roman, when he grafted On his own the forms he drafted From fir Athens. Learn, that use Of present modes is not *ab*-nse Of manuers past, although you mix 'cm,— If harmonoledly you fix 'em." (Here the Golfhief's joy 'gan riot, The he onlyng the 'd best be quiet; For the hady raised her flager,— " Renaissance, at least, has blended Old and new in junction splendid; Golf and Tador have but coblied, In a uoion ne'er cumbiled; While the most round you Only do the more confound you; Since they multiply xour choises. If it be not from the page While the rest that have found you Only do the more confound you; Since they multiply your choices, Crying all, 'Give us your voices!' Back, then, to your homes corrected, From prejudice be disinfected. In lieu of *this* or *that* persisting. In lieu of this or that persisting, Think there is no style existing i Unto use your facey yielding, Give sole care unto your building As a thing of walls and dicors, Roofs and elimneys, windows, doors, Sheds as shelter from the show'rs, Balconies for sum and flow 'rs. Perfect all in honest way, And then will come' the time o' day ' For seeing how you may impart To Use's form the grace of art. No more be special modes contosted, Till you see what are suggested ; Then, should difference perrade, Thi you see what are suggested ; Then, should difference pervade, I may come once more to aid ; And enther make you all sgree, Or give you right of liberty. A true, then, to this fight for fashion, Which savours less of sense theu passion !"

She said, and vanish'd; and again The cloud came o'er the hattle-plain. Ashanned, confused, and stiff with bruisings, Tbe foces retired with wholesome masings. Silenced-most convinced—they wended, Only mow to be befriended By the thought so sweet to sinners, Where all lose, there uone are winners.

But,—the battle-field next day ! What a scene of droll disanay ! There, entablature was hid Prostr.te o'er the Goth's orcade : Through a dome a spire protended : O'er a rase an old font brooted : O'er a rase an old font brooted : O'er a has a of the spire spire spire d'entable spire spire spire spire o'er a has no fegg and tongue; Yet, anidst the havock round, Rose the Dorie column, sound,

Erect and firm, as who should say, Erect and hrm, as who should say, "Ill stand my ground, cone what come may." Prostrate lay the *attice frieze*, With an *Eligin* there, to seize Upon its sculptured *marbles* rate, Them to save with ballow'd care; Jewels they-*Ihemselses atome* Worth all the remnant rain'd stone ! Thus, conq'ring in his fall, the Greek Rem ins; and shall for ever speak To future ages his election For the sculptor's last perfection !

GEO. WIGHTWICK

APPROPRIATION OF SMITHFIELD.

THE report of the committee appointed by the Corporation of London, respecting the appropriation of the site of old Smithfield-market, is now before the public, and the matter is of so much importance, that we will endeavour briefly to put the present state of affairs before our readers. It appears that the committee above mentioned was nominated on the committee above inentotical was nominated on the 10th October, 1849, so that their deliberations ex-tend over a period of ahont eight years. During this loug space, the Town Clerk and Remembrancer were instructed to make inquiry into the origin and rights of the corporation to the site of Smithfield. As soon as it was known to be the intention of the concention is the other states of the intention of the

corporation to endeavour to obtain powers to enable them to eover the site of Smithfield with a market for the sale of dcan neat, poultry, &e. the governors of St. Bartholomew'a Hospital communicated with of St. Bartholomew's Hospital communicated with the Government, for the purpose of inducing them to oppose the use, for any building purposes, of a large part of the vacant space. Meanwhile the architect prepared plans, showing, as far as could be accertained, the ancient site of the market, and also those portions ancient site of the market, and also those portions ieb bad heen purchased by the money of the corwhich had heen purchased by the money of the cor-poration for its enlargement. Other plans were pre-pared, and in 1855, a deputation waited on the Chanporation for its enlargement. Other plans were pre-pared, and in 1855, a deputation waited on the Chan-ellor of the Exchequer, when the matter was thorougbly gone into. Respecting this interview, Mr. H. L. Taylor, the chairman of the committee, says.—"From their first visit to the Chancellor of the Exchequer, they had decided not to raise the question as to the rights of the soil in ancient Smith-field, hut they had nevertheless agreed amougst themselves to oppose any attempt at its seizure on the part of the Government." The first plan submitted enclosed the whole of the

The first plan submitted enclosed the whole of the The first pian submitted enclosed the whole of the site with the exception of a thoroughlare, 60 feet wide at one end, and 80 feet at the other. At first the Chancellor of the Exchequer seemed to make little objection; hut, as Mr. Taylor says, "The hos-pital authorities interfered, and at their next inter-view with the minister, he did not appear to be so well disposed towards the plan, intimining his desire to retain the whole of the portion of the ground from Giltspur-street to Long-lane, fronting the hospital, in an open space.

an open space." Soon after this a committee, consisting of the Right Hon. W. Cowper, M.P. the Hon. H. B. W. Brand, M.P. aod Mr. W. N. Massey, M.P. were appointed by the Crown to consider the question of the open space of Smithfield as a sauitary necessity, who were appointed to discharge that duty by re-pairing avidance and remediate theremone to the eciving evidence and reporting thereupon the Govern ent.

In February, 1856, a deputation of the Markets Improvement Committee waited upon these gentle-men, when the City architest laid before them plans; widence the construction before them planes; evidence respecting a dead-meat market on this sito was also given. After this the Government committee reported that "On the whole, they were of opinion that the site of Smithfield should be kept free from huildings ; that a new metropolitan meat market should he established ; and that such market should be should he established; and that such market should be placed in a central position." The City committee were asked whether they could not appropriate some portion of Victoria-streat to the purposes of a new market; but on the anthority of Deputy Hicks, it was declared to he impossible to place a thriving meat market there. Evidently the Government were strongly opposed to huilding on any part of Smith-field, if it could he avoided. "Other plans," says Mr. Taylor, " were prepared in April hast, and at the request of the Chaocellor of the Exchequer they were left with him, and an early answer promised; hut np to that time (July 10, 1857) no letter had been received. Still, however, there was a further fact which he had to communicate to the Count of Council, and which was this,

to the Court of Common Council, and which was this, that although no letter had been received, the Rememhrancer had received back the plans from the Treasury, and the Chancellor had marked a line upon one of them in peucil, intimating to the officer verbally ibat if the corporation would consent to take that line, he (the Minister) and the Government would have no objection to the plan:" and thus it appears the matter of the appropriation of Smithfield rests at

THE BUILDER.

prescut.* It is with pain that we mention facts present. To is with pain that we mention needs which threaten the covering up of this ancient his-torical site, which has, until a comparaitydry recent date, been an open space for the new of the citizens of London for more than 1,000 years. We have on more than one occasion referred to the circumstance that this valuable site was granted to the corporation in start it is habitation with the the comportion in trust, to be kept an open space for the use of the citizens for ever. We therefore hope that the quescitizers for ever. We therefore hope that the ques-tion may have forther consideration, which will result in the appropriation of some other site which may be equally useful, and leave us this open spot. A single welk through the dead-mest markets of

A single wark through the dear-mean markets or the metr polis will show the necessity for change. Newgate-market, for instance, what can be worse than its arrangement? A chief portion of it is, in fact, a passage of no great width, which leads at right angles for some distance from the south side of Newgatect, and then at right angles again leading to wick-lane to the eutrance below the picturesque tower of the ball of the old College of Physicians. From this point the market stretches a short distance towards Warwick-square, and then again appears on the cust of Warwick-lane. The appearance of this place on any hot summer's market-day is most extrapart of any in summary a matter say a more center ordinary and nupleasant. Piles of heef, pork, sheep, &c. may be seen in stacks, both in the carease and divided. The proper ventilation of the place (parti-cularly the western part) is impossible : on one side is the Newgate prison, on another the high bouses of Newgate-street; then there is the narrow Warwick-lane and square on the other sides. It is, we think, not saying too much to state that the improper arrangement of this portion of Newgate-market has been the cause of rendering nuwholessome and useless, to the value of many thousands of pounds steriling, one of the important necessaries of life. The more easteru portion is more open, but not at all what it ought to be; and yet, notwithstanding these imper-fections, we believe that the removal of these markets will meet with great opposition from the present tenauts. ordinary and nupleasant. Piles of heef, pork, sheep tenauts.

One of the reasons which is given for the establish-ment of a dead-meat market in old Smithfield is, that it will be the means of restoring the value of the property which has been deteriorated by the removal of the meat for living animals. It is unfortunate that no great good can be done without some amount of damage; but in connection with the neighbourbood of Old Smithfield, it would seem that the chief portion of the mischief has already been done. Many of the old hostelries, have removed to or near the new old

of the mischief has already been done. Many of the old hostofries, have removed to or near the new market; and it must he borne in mind that the loss of custom to the shops in the adjoining streets has, in a great measure, been caused by the removal of many' thousands of persons from the large area along the Fleet valley which is oow vacant. If we walk round the present area of old Smithfield, it will be found that the number of shops and other places of business is not solsrge as might he generally supposed: the hospital occupies one side of the space, and another large portion is euclosed hy bare walls towards the Charterhouse. A part of the property is diapided, and must, as a matter of necessity, be abortly removed. Surrounding Smithfield, notwithstanding the removal of the houses already menioned, there is a dense and pent-up popu-lation: look, for instance, into Cloth-fair, and the narrow, high-huiti alleys which surround the aneient church of St. Bartholomew, and the other places leading from Long-lane; and, on the side towards Sow-hill, at the maze of thickly-peopled alleys which are there placed. In looking along the streets which are there placed. In looking along the streets which are there placed. In looking along the streets which are there placed. In looking along the streets which are there placed. In looking along the streets which are there in the the husing streets which is curious to notice now little the disiness estimati-ments would he affected by the opening of a dead-ment market in this locality; and, after careful con-adteration, we cannot help thinking that, if the portion of site which has been purchased by the corporation were occupied by them with suitable dwellings for the families of numerous working meat employed in the tamines of tamines of the space let open and made sightly, in a short time, when the new streets are built adjoining old Smithfield, it will find a legitimate use and soon be greatly improved in appearance.

In considering the position of a new metropolitan dead-meat market, it ought to be remembered that our advanced sauitary knowledge, the facilities of railour advanced sanitary showledge, the hadmins of ham-ways, &c. will not much longer permit the slaughter-ing of the animals required for human food in the midst of a vast population: it therefore hecomes ordent that this necessary purpose must be performed either on the vacant space of the new esttle-market, either on the vacant space of the level entermarket, or elsewhere. The quantity of dead mest brought by the different railways is rapidly increasing, and no doubt in time a large portion of our supply will be brought to us in this way: it therefore becomes a

* It appears that the approximate cost, as already esti-mated by the City architect upon the plan alluded to, amounts to 250,000%.

matter of importance that a dead meat, poultry, and vegetable market of sufficient extent should form an important part of any central metropolinan railway terminus. It is nacertain yet where this terminus important part of any central metropointar raiway formious. It is necetian yet where this terminas may be fixed; however, if it is determined to erect at once a market for the purposes above mentioned, there surely cannot be any difficulty at the present time of finding a site without the sacrifice of old time of finding a site without the sacrifice of old Smithfield. There is the neglected and almost un-used Farringdon-market, and the space of the Fleet Prison, forming a large area, which might he ex-tended at a comparatively small expense in various directions; and in spite of the authority of Mr. Hicks, we eannot see how this site would fail to be as useful to the dealers as either Smithfield, Newgate, or Leadeuhall : it would be very convenient to the rhannes, by which heef and other provisions might he conveyed to the shipping in the river and docks; and it it should be determined to make a central railway terminus on the vacant space of the Fleet-valley, nothing could be more ready than the site just mea-tioned for a market such as is required, to which the tioned for a market such as is required, to which the meat so ready for consumption could he hrought from the ahattoirs of new Smithfield and various neighhouring and remote parts of the country hy railway

WE MOVE ON!

WE MOVE ON! It is often difficult, even and the roar and bustle of the London streets, to avoid falling into dreamy thoughts of bygone days, which, while they do not prevent one from elhowing his way through the erowded thoroughfare, cause the rattling of wheels, the hum of voices, and the never-ending tide of human forms and faces to be as little heeded as the sounding of the sea is by those constantly living on its shore; and a slip into the mud, or the sqlashing of a cah-wheel, has been the means of taking the thomehy hacks to the days of projecting penis, highlythoughts hack to the days of projecting pents, highly-pitched roofs, and long spouts of lion's heat and other devices, from which, at times, the rain poured on the unpaved steet.

Miscrable must have been the case of the shop-keepers of London in such weather, for they must undoubtedly have been obliged to draw up the shutters of their unglazed shops to keep out the rain, and hetake themselves to what ?-- tohaceo in those ancient days had not come into use, so that they could not smoke their pipes : in reading they were not much

days had not come into use, so that not sender their pipes : in reading they were not much skilled, acither had they magazines or journals. As to the ladies, they must, as a matter of necessity, have remained within doors, for surely the call must have heen urgent which could cause a fair dame to venture outside anild the splashing waters from above, and the quagmire and puddles helow. To add to the difficulties of the roads, there

helow. To add to the dimensions of the roads, there were then no sedan chairs, hackney coaches, eaks, nor even umbrellas. Our thoughts do not, however, at present go back to that old date when, in addition to other curious matters, long rows of pack-horses and tilt-waggons might be commonly seen in Loadon streets conveying the various kinds of merchaodize, but rather to thizes bid acrease and merchaodize, but rather to thizes which many will remember not long since, but which are nevertheless now matters of the past.

are nevertheless now matters of the past. The deep bass voice calling "sweep—aoot, oh !" closely followed by the tiny voice of the little sufferer behind, has ccased as regards the latter. The dustmau's bell is still. The dogs once em-ployed in drawing eat's-meat harrows have heen thrown ont of work: the huge advertising yaus, sur-mounted by moestrous hats, dust-pana, carpet-hags, aud other devices; the loug regiments of men hearing placards, announcing woudrous bargaius, have all vanished; vanished :

"And like the baseless fabric of a vision Leave not a rack behind."

They seem to go, and nobody misses them ; and it is only when in some reveries, such as those above mentioned, that oue is liable to turn round and wonder what has become of these once familiar features of the London thoroughfares.

The sedau-chair, that far-famed conveyance of our great graodfathers and grandmothers, has not been great greadfathers and greadmothers, has not been met with in the city for many a day: there may, how-ever, be found in the London workhouse two or three worm-eaten examples, the gilding and enhossing faded, and the once showy leather hangings in tatters : we imagine that one of these in Fleet-street, at the present time, would excite as much euriosity as a cocked-hat and pig-tail. We have in old times "heard the chimes at mid-night." things are now changed: the ancient Charlies, their boardy erv, watch-boxes, born lauterus, and

night'' things are now changed: the ancient Charlies, their boarly cry, watch-boxes, born landerus, and other accountements, are gone from the sight and eye. It is the same with the mail and stage coaches and the guard's lively born, and it will not be long ere we have a last glimpse of the lumbering hackney coaches, decked. Ike an undertaker's shop, with fided heraldie representations: the coachman, old and feeble, dressed

406

[JULY 18, 1857.

in that coat of many capes, will soon be off "the

in that coat of many capes, will soon be off "the stand." The link-hoys, the street oil-lamps, the dim oil and candle-lichts in the tradesmen's shops, have all heen put out by that modern improvement, gas. Not more than 35 years ago, halls were commonly haited at spitafields and elsewhere; then we had our cock-pits and other "anuscements." The dancing hears, and other matters, which were once so common in our streets, are now no longer seen: even the parish headle, that once great authority, is now much-less thonght of than an ordinary policeman. The dessensord, very commonly worn in John-son and Goldsmith's time," has been superseded by walking-sticks and unherdlas. This a sight to see the "charity children" going in various processions to St. Paul's, on their anniversary is then may be observed hoys in leather breeches, green and ther coloured antique coats, and little girls in dresses which, however much they may remind us of old times, are anything hat hecoming; and although woring to a considerable extent of antiquarian predi-lection, we should not be sorry to see these distinctive and improper badges of charity disappear, like the things above mentioned. The musical chincs have heen stopped in several of the city elurches: some of the neighbours consider-ing them an anoyance; although we think the "Old Huddred," and other quain tunes, soming from the bells, are longered for half an hour, near the grey tower of cripplegate. Charch, to hear the chines there which, no doubt, were familiar to Milton's sens. The hellmen of the different parishes and words, were not long since the great advertising medium, and bouch years admiting to accurcing medium, the doubt, were and untown in the metropolis. The hellmen of the different parishes and wards, were mote long since the great advertising medium, the douer years ago, ahout one o'clock on a Christmas morning, ring the

a dozen years ago, ahout one o'clock on a Christmas morning, ringing the

"Wives and maids to rise, And bake their puddings and pies, For 'twas Christmas-day in the morning."

Inside the houses we also miss many well-known objects. Few have seen for many a day past the patience-trying apparatus consisting of the tinder hox, fliot, and steel, which so often troubled both dances and fait, and steel, which so often troubled hoth dances and maidens, at early morning in particular: that has, is the inventor of heider matches. The spinning, wheel is gone, so are the needles and sheath for stocking-knitting. The spinnet and other old-fashioned musical iustraments have succumbed to the pianoforte. Indeed, "such changes in our time we have seen," that they are too numerons to mention in a hird paper. We must not, however, omit an important feature. In the printing-office of this paper there are still at work several hand-printing presses, some of old date. With a much more primitive machine the woodent illustrations of Thomas Bewick's hooks were slowly printed. How wonderful the same office, which throws off, as if by magic, thousands of impressions in a morning! In the towis we have railway stations of a new kind of

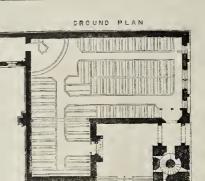

Nor is the change in the river less surprising. In the towis we have railway stations of a new kind of construction, and of such an extent, that it would have seemed madness a few years ago to have shadowed an idea of them. London is surrounded hy railways, which will soon more into the heart of the City. The electric telegraph fashes its news helow our feet, in the most husting thoroughfares. A great portion of the London dead is heing takeo for interment to a distance from the crowded population. The steam-engine is doing its miraculous work. Old Smithfield market has moved, though not, we fear, to a sufficient distance. Baths and washhouses, improved dwellings, improved severage,

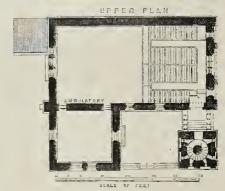

though not, we fear, to a sufficient distance. Baths and washbouses, improved dwellings, improved severage, improved schools, and other matters, which even in their infancy give great promise, are rapidly driving away old fashiomed prejudices, and induce the hope that if every man will but do his work, the advance in the next twenty-five years will not he less remarkahle than it has been in those which have preceded them.

THE BROTHERTON MEMORIAL COM-PETITION.

SIXTY-NINE competitors have submitted designs (several of them more than one), in reply to the com-mittee's advertisement, and these are now open to mittee's advertisement, and these are now open to the public (iil Jady 18), in the Peel-park Museum, at Salford. The monument is to eost 500 guineas. The committee have printed as a pamphlet the descriptions accompanying the designs, which serve as a catalogue, and make the exhibition one of greater interest. Up to this time the course pursued by the committee appears to have hear pariseworthy in the extreme. The majority of the designs are Gothic in style, and many of them very indifferent.

Milton, the famous etcher of foliage, and other artists, might be seen wearing dress-swords not more than thirty years since.

THE SINCLAIR SEAMENS' CHURCH, BELFAST.

THE SINCLAIR SEAMEN'S CHURCH, BELFAST.

THIS church is now in progress, and will cost This church is now in progress, and will cost about 3,0002. It is being erected by public subscription, as a memorial to the memory of the late John Sinclair, esq. of Belfast, and is designed to accommodate the seamen of the Presbyterian Church frequenting this port. The first stone of the building was laid by the Lord Advocate of Scotland, in October last. The material used is the County Down Sandstone. Messrs Lawron and Lynn are the architects.

STREET LINES. IMPROVEMENTS projected in the Government offices, and the elearacoc which must he effected in the nohlest quarter of London, hefore the foundations are laid, cause no little distrust, lest in the realisation of plans, however faultless, however perfect, the graod desideratum he forgoften—an effective ap-proach and exit, together with openings calculated to afford a happy exposition of the buildings. It would appear that hitherto little attention was paid to anything beyond the crection and completion of a grand structure: whatever its dimensions, the old curvilinear and narrow streets were allowed to

of a grain structure: Matter its aimensions, the old curvilinear and narrow streets were allowed to remain, and in after ages, the mean domiciles and paltry huiscess stores, along the lines, having acquired an enormously increased value, were replaced hy solid, expensive, and even magnificent houses of trade. So far the old stinted causeways are irremedi-able that for it helpcome to convert emission the line Song expension, expension, and the song expension of the song expe

error in the new and magnificed quarters which the eurrent half century is to inaugurate. Amongst the plaos put forward in competition, not a few have struck out geoeral features of opeo approach and exposition; but very few have regarded the importance of preserving a clear opening from St. James's park to the river, and fewer still the necessity of keeping a clear causeway and open view, aorth-ward, from the Palace of St. Stephen's to Northum-berland-gardens, along the river hank. By an unhany accident, the palace has been

ohtruded 50 feet upon the hed of the Thames.: the mistake is deplorable; hat as it cannot he remedied, and as, despite the cavils, that perform-ance stands a monument of as yet unrivalled excels lence; the only alternative left us (and that amount-to a duty where so much skill, labour, and exponse have here lavished), is to remove every ohstacle to the contemplation of its varied beauties, and fair proportions,—to open out the aspect on every side; and to adapt every vicinal structure in perfect con-sonance and keeping with the lustrons creations we already possese.

Material used is the County Down Sandstone. Messrs. Lanyon and Lynn are the architects. A sailors' home is also about being built in the same locality. STREET LINES. Lungorupus resided in the Gaugement of the grand causeways, how it is unaccountable, when we consider the facilities this happily and beantifully placed City affords for *trainal effect* in most of the grand causeways, how little attention has heen paid to these points which are sometrial to the seenic exhibition of architec-terture, as well as to the health of the metropolis. tecture, as well as to the health of the metropolis. All the streets, narrow though they he, terminating in Hyde or Regent's parks, derive a health, a health-fulness, and in consequence, an increased value from the aperture which reveals, in ever so sparing a mea-sure, a green tree, an open glade, or a hill: how much is such a termination enhanced by internal squares on the line of street? But an opening, direct from the park to the river, adorned by *chef d'acurves* of artistic taste, and conducting (as it must he) indi-reetly to the majestic flood, how noble would the aspect bel Would that we could, hy a slight incision npon

Would that we could, hy a slight incision npon Government estate in Spring-gardens, clear out another aperture (across the *mikky* word) to the statue in Charing.cross,—that, as a spell of enchantment,

in Charing-cross,—that, as a spell of enchantment, bid, expensive, and even magnificent houses of ade. So far the old stinked causeways are irremedi-le, therefore it hehoves us to guard against the like wrate thal century is to inaugurate. Amongst the place of sprearing from the use struck out geocarl features of operative proach and exposition; but very few have regarded i emportance of preserving a clear opening from St. Ward, from the Palace of St. Stephen's to Northum-ralad-gardens, along the river hank. By an unhappy accident, the palace has been

THE BUILDER.

THE SINCLAIR SEAMENS' CHURCH, BELFAST .--- MESSES. LANYON AND LYNN, ARCHITECTS.

There is another continuous straight route leading northward, from Holborn to Hangstead-road, by Southampton-stroet, Wohrn-place, and Seymon's treet, which, by the sacrifice of some comparatively reluces property, might pass along the west side of Danes; thus exhibiting in its course of three niles more important squares, churches, and public ediffice. The Commercialists and wise men of the east; these are most leader and public ediffice. The ways, poseetable and commerce are to the fixely would enhance the value of the fixel terie of the fixel ength. The first way, respectable and commerce are to continue to be the main due to of traffic, would be to solution of the City, would enhance the value of the fixel end of the insignificant straits of Turnsitie and Kingstet, the most elevated and heautiful of the insignificant straits of Turnsitie and Kingstet, are also the nearest. The sinucsities of the the subjects of this readment straits of Turnsitie and Kingstet and mysity the vacant rambler, whore the subjects of the insignificant straits of Turnsitie and Kingstet, the most elevated and heautiful of the insignificant straits of Turnsitie and Kingstet, perplex and mysity the vacant rambler, whore the the subjects of this readment of the river from Cheles is for strategy of New Oxford-street, nearly a mile

407

tide of population would straight set in that way

tue of population would straight set in that way: the one example may be applied to the numerous strails and obstructions of the trailing metropolis. Any well-built, but isolated quarter, exposed to the objection of a bad approach, is in like manner re-stricted and kept down in value. The same may be said of the low ranges of river-side stores and wharfs: these are at present accessible only by long circuits; or if by straight lines, then hy steep acclivities, at a gradient of I in I8! A palace or castle, with one gradieut of I in I3! A palace or castle, with one sole conduit, and that by a drawbridge, as used in fendal times, would be now valueless, except as a curiosity: every nbode, or village, or town, is esti-mated just in the ratio of its accessibility; but in tites nore especially open, level, and direct streets are indispensable for ease of tration, freedom of in-tercommunication, clear ventilation, and for the obvious disinction of the several stores, shops, and houses. So, but the most valuable sites of all com-mercial kundon, the river banks (on but sides), be opened out, these vital organs of the great system must continue in their present stagnaut and diseased QUONDAM. condition.

NECESSITY FOR LARGE ROOMS.

THE NEW READING-ROOM, BRITISH MUSEUM. THE NEW READING-ROOM, BRITISH MUSEUM. TIME was when men eminent in literature would have thought it derogatory to their dignity to have allowed their works to appear hefore the public in any other shape than large and costly tomes, which completely put them out of the reach of the multitude; and one of the most remarkable signs of the present wonderful days is the comparatively cheap production of high-class works. In addition to this means of instructing the people; it is well worth while to notice the various attempts which are being made in London and other large towns by men of eminance to convey. and other large towns by men of eminence to convey, by means of lectures and illustrations, information to large mas

large masses. To meet the demand which is evidently growing, buildings have been put up capable of holding large numbers. Thirty or forty years ago, a room which would contain an andience of 1,000 was looked upou with cariosity. Since, Exeter Hall, the Surkey Music Hall, and other places in the metropolis, lawe been erected on a much larger scale; and in the pro-vinces, the Free Trade Hail at Manchester, the halls t Birmindum Nawgale.non. The end other and a Birmingham, New reads and an and an and a start to time, and at present from 3.000 to 4.000 persons can both hear the lectures and clearly see the explana-Can not a near the rectures and (searly see the explana-tory illustrations; and we hope the day is not far distant when men like Faraday, Owen, and others famous in art, literature, and science will have the means of addressing themselves to classes of many thousands strong. In the Surrey Music Hall from 8,000 to 10,000 persons flock week after week to hear the popular preacher of the day, and, what is more, do hear him. One of the chief difficulties in bringing about such a desirable result seems to be the difficulty in modern

a desirable result seems to be the difficulty in modern buildings of getting the voice of a speaker to reach a sufficient number, and there are instances in halls of even moderate size where an orator is not so well heard by a considerable portion of the audience as he

would be from a platform in the open sir. Some years since it was found necessary to pull down the old church of All Saints at Newcastle-upon-Tyne, and rebuild another on its sitc. The choir, which, with the exception of a sort of small vestibule which, which the exception of a solid share restore at the entrance, was a perfect circle, was lighted by various round-bcaded windows, and fitted with gal-leries and pews of polished mabogany : the roôf was nearly flat. On the church being completed, and the pulpit placed in its intended position, it was found that those in the centre of the church could scarcely hear a word of the service : the sound seemed to hear a word of the service: the sound seemed to travel round and round the circular walls, and then mingle into an indistinct hum. Mr. T. Sopwibt at the time published a little book, giving particulars of the failure, and the means which were used to remedy the cvil

The acoustic qualities of most of the large ancient churches in this country contrast euriously with such a failure as that above montioned.

In St Albau's Abbey sounds are conveyed clearly d distinctly to a marvellous distance. In Durham Cathedral we have often in remote nooks and galleries heard distinctly the reading of the lessons. West-Westminster Abbcy and other places might also be mentioned

St. Paul's Cathedral a single voice is not In St. Pail's Cathedral a single voice is not canal or audible at a great distance. In most of the Lon-don churches which have been erected sunce the date of the Fire of 1666, the sounding-bourds and other inventions fixed upon the pulpits show the diffi-culty which was felt by the architects in the proper distribution of sound, and it seems that, even at the for severs.

THE BUILDER.

and other intering parts, any it is given by the reading-result of chance. In looking at the vast space of the new reading-room at the British Museum, the notion arises that a magnificent ball for the purpose of illustrated lectures magnificent ball for the purpose of illustrated lectures might be erected on this plan, capable of holding an immense concourse of people, who would see better than those in the back-ground of a building of an oblong form; and it might be useful to make some acoustic experiments, in order to show if, for the purposes of lectures and mosic, similar buildings could be made available. Should such experiments be made, and found to be successful, it might lead to our having in the metropolis a structure devoted to the most useful purposes, wherein thousands at the same most useful purposes, wherein thousands at the stime might find, cheaply, instruction and delight.

CORRESPONDENCE ON THE GOVERNMENT OFFICES DESIGNS.

SIR,-I could scarcely believe my eyes when I read the following in your paper for last week, as part of the judges' report :--

With regard to the design for the Foreign War Departments, a difficulty presorted itself, in consequence of several of the competitors having sent in one hulding more or less unfitted for sub-division for both the public offices, for which distinct prizes bave to be awarded, whilst others have either onfined their efforts to one of the buildings, or have given separate designs for each. It will be evid that these united designs compete mder considerable disadvantage with the single designs, and that unless australingly with the single besides, and to the barres a united design should be superior, in both depart-ments, to all its single comprilions, it could not re-ceive a prize, because one portion of it could hardly be executed without the other." (111) Wall informed as the Builder usually is, I really struct that for once you have been misled. Surely it is immusible thet the induces could come to such a de-

is impossible that the judges could come to such a de cision as that stated above, and for such a reason. I then have stated Ĩf y have acted upou such a principle, those who e done the least work have had the best chance, they while those who have gone most comprehensively into the subject, and bestoved the most labour, thought, and money upon it, have heen treated in the most seury manuer. But I cannot believe that the most scurvy manner. But I cannot believe that t judges have so acted in defiance of the "conditions judges have so acted in defiance of the "conditions," in which not a word is said requiring the designs to he distinct. As to the asserted dilemma which I have italicised above, "that one portion of it could hardly be executed without the other," surget this is no affair of the judges. The duty of the judges was to award of the judges. The duty of the judges was to award the prizes to the best designs, irrespective of the con-sequences. If they have been frightened by this dilemma, what do they say to the far greater dilemmas arising from the facts that the prize block plans will

arising from the facts that the prize block plans will not harmonize with the prize designs for the Foreign and War Offices, nor the latter with each other? A correspondent informs yon that "the judges decided to give no competitor more than one premium." Here, again, I hope you are mistuken. I maintain that if one competitor produced the best designs for the Foreign and War Offices, he would he entitled to two prizes; and if the heat for the block plan as well, to three prize; and I challenge the judges to point out anything in the "conditions" to the contrary. If your statements as quoted above be true, pray insert this from be true, pray insert this from

A DISGUSTED COMPETITOR.

SEWERAGE AND DRAINAGE NOMEN-CLATURE FOR TOWN PURPOSES

THE rapid extension of town sewers, as als This rapid extension of town severs, as also of honse and yord drains, involves frequent use of the words *sever*, *drain*, *sevage*, &c. There is often con-fusion, and consequent inconsistency, in the use of these words, and no divionary contains full and clear difficient. The word *sevage* is not given in some of our standard dictionaries. It is frequently con-founded with *severage*, nod there is no authority to set an inquirer right. We propose to attempt a few definitions. definitious.

dennitous. SEWER, s. singular. A covered or open conduit for the removal or passage of water or liquid refuse, from a city, town, village, or hospital, or from dwell-ing houses or other huildings. There are main sewers, secondary sewers, and branch sewers. Sewers may be of any section, d from and my ba constructed severs, secondary severs, and branch severs. Severs may be of any sectional form, and may be constructed of any suitable material. It is the use, and not the dimensions, form, or material, which constitutes a sever. A sever may be open, like a conduit or canal; or elevated like an aqueduct; or beneath an adit or a numel. That which is puble, —in a street, lane, yard, or court, or along any highway, or an outlet form any of the ahvor, wilh be a sever. Circular slope on the south sile of the to south streen or egg-shaped, ou cross section, is the best form for severs.

SEWERAGE, 5. The aggregate of sewers, if used as descriptive of the sewers of a city, tevn, or dis-trict. "The sewerage has heen completed," that is, a system of sewers has been completed, a number of wers bas been completed, which form a system. The sewcrage and drainage of Alnwick have been completed.

SEWAGE, s. The refuse flowing through drains and sewers. Sewage must not be confounded with sewergage. They are not synonymous, nor ever can A tank may contain sewage, but not sewerage. mistake is frequently made. RAIN, s. A conduit from a house or public This

DRAIN, S. DIARN, s. A countr rom a house of plance bilding, firbutary to a sewer. A drain is a duct, pipe, or passage of stone, brick, earthenware, iron, or other, material, of any dimensions or sectional form, hy means of which foul waters, refuse, and indeed any ny means or which rout waters, reture, and indeen any fluids or semi-fluids, are drained from buildings, houses, yards, or land, into a sewer. Drains may be in all respects like sewers. A sewer is in a public road or other place, for a public purpose: a drain commences on private property, and is a tributary to a sewer.

A system of drains. "The drain-DRAINAGE, S. age of a city has been completed,"-that is, the houses in such ,city have been drained. "The town of Ala-wick is sewered and drained." The town is sewered, in such city have been userver. wick is sewered and drained." The town is severea, the houses are drained, and therefore the sewerege the houses are complete. "The sewage is either

the honses are dramed, and therefore the sewerage and draiuage are complete. "The semenge is either pased (waste) into the river Alm, or applied to the land for agricultural use." *Remarks.*-Sewer, scugh, sew, sboer, scoor, scugh, suff, suf, are merely variations of one word. In the metropolis there were "Commissioners of Sewers:" in Manchester there is a "Paving and Songhing Committee." Town sewers are mecan in both cases. ROBERT RAWLINSON.

PROVINCIAL AND CHURCH-BUILDING

NEWS.

Yarmouth. — The first stone of the new church of St. John the Evangelist, now heing erected-on the Denes, st Yarmouth, for the use of beachmen and sailorz, was laid on the 7th instant. The site is on the open part of the Denes at the junction of York and St. George's roads. The church will be a small plain edifice of flint-work, with Bath stone quoins and dressings, in the Early English style of archi-tecture. It will consist of a nave, ebancel, and apse; with a seatry and turret on the south, and a porch on the north side. The nave will he 55 feet long by 26 feet wide, and the entire length of the church, including the nave, chancel, and apse, will be 87 feet. The height of the hulding, from the floor-line of the roave to the ridge of the roof, will be 38 feet. The roofs will be of open timher stained, but that of the church will be founded internally. The interior of the therch will be founded interk, and the jambs cread with stamped hrieks of ornancetal pattern. Yarmauth .- The first stone of the new church of chances area will be of moduled block, and the Janes cased with stamped hirds of ornamental pattern. The sittings will consist of open hencebes of deal statued, and accommodation will be provided for about 300 persons. Mr. J. H. Hakewell, of London, the architect : Mr. R. Steward, of Yarmouth, is e contractor. The contract is for 1,246/.

18 the architect : bit it. Contrast, by Anny and the contractor. The contract is for 1,2461. Thatcham.—At a meeting of the committee for reserving tenders from the selected parties for restoring and modernizing this church, the tender of Mr. Job Hanson, builder, Speenhamland, for 1,6600. being the lowest, was accepted: between this and the amount of the highest tender the sum exceeded between the theory of the selected between the selected bet 400/.; hut there was only 33/. difference in that of Mr. Hauson and Mr. Thomas, builder, Abingdon.

Cores End .- Tenders have been given in for repairs of Cores End Chapel and the erection of repairs of Cores and Chapter and the election of schools, Mesers. Poulton and Woodman, of Reading, architects; ranging, from Williams, 5604. to Holland and Stevens (Wycombe), 3724.; the latter accepted. The old materials were allowed for.

The old materials were allowed role. Drayton.—The lately renovated oburch in this parish has been reopened for Divine service. The expense connected with the renovations amounted to about 600%, of which 100% is still owing. Mr. Davis, if the service is the acceleration of the service of the

about 600% of which 100% is still owing. Mr. Davis, of Longport, was the architect comployed. *Hereford*.—The Benedictine order of Roman Catholics are about to erect a monastery at Belmont, near Hereford, on a scale unknown in England share the Reformation. Mr. Pugin has advertised for tenders for the work. A Roman Catholic church has also been huilt at Belmont, at the sole expense of Mr. F. R. Wegg Prosser, formerly a member for therefordshire, and who few years since seceded from the Church of England. *Walsall.*—The portion of the Walsell Compton

npproached by a newly-constructed road, 48 feet in

width, leading out of Bridgeman-street, and comprises over 13 acres, Livided as follows, namely, eight to the Church 179 to the Roman Catholics, and the remainder to the Protestant Discenters. It is surrounded by a brick wall, with piers every 15 feet, but her Mar Banker of Wakall at a cost of 8004. huilt by Mr. Rowley, of Welsall, at a cost of 8002. The laving out, forming, and planting of the ground, have been effected by Messrs. Cole and Sharp, burserymen, Perry Barr, under the superintendence of Mr. Clark, the horough surveyor. The lodge and of an class, the body streyor. The longe and entrance pates are not yet completel. They will cost about 4007. The chapter, which were designed by Mr. Clark, measure 37 feet by 17 feet, clear of the walls. Between them rises a tower and spire, by Mr. Clark, measure 37 feet by 17 feet, clear of the walls. Between them rises a tower and spire, 80 feet high including the vane; and between the tower and echapels, on each side, are rohing-rooms and tool and bier houses. The Episcopal chapel is seated for between fifty and sixly persons, the seats being of deal, stained and varnished. The roof is open, and the timber stained and varnished. The end windows are traceried. The side windows are single lancet, similar to the end one, and bordered with stained glass. With the exception of the end window, the Dissenters' chapel is the same as the other in its internal arrangements : as to external dewith stained glass. With the exception of the end window, the Dissenters' chapel is the same as the other in its internal arrangements: as to external de-sign, its principal window is a triple lancet. The chapels and spire are of hrick, with Bath stone dress-ings; and the roofs are covered with ornamental tiles. The chapels were exceted by Megas. Taylor, Brothers, of Walsell, uniter Mr. Clark's superintendence, and cost ahout 1,3004. The contractors were Messrs. Taylor, Brothers, and Messrs. Cole and Sharp. *Prestor.*—The foundation-stope of a B-prist chapel was laid in Fishergate, Presson, on the 2nd instant. Messre. Hibbert and Rainford are the architects. T c chapel will be entered from Fishergate by a flight of

Messre, Hibbert and Rainford are the architects. T e chapel will be entered from Fishergate by a flight of slone steps, with palisading in front. The ground-floor will seet 460 persons. At present it is proposed to have a gollery for the choir only, but the chapel is so planned as to admit of being galleriad round at any time. In the rear of the chapel will be vestries and a stgircase to the organ gallery. The seats will be open, and the roof will have open framing, consist-ng of rafters with enved ribs and scanding. Billed in be open, and the root will nave open training, consist-ing of rafters with curved rish and spandrils, filled in with decorated iron castings. Beneath the chapel will be hoys' and girls' schools, with separate entrances from Charuley-street, and divided from each other by a moreable screee. These schools are to be 12 feet from Charaley-street, and divided from each other of a moveable screen. These schools are to be 12 feet high, and to have all the requisite conveniences attached. The interior dimensions of the chapel will be 40 feet hy 72 feet. The style of architerture is mixed, but with Romanesque and Italian features. There will be a square tower at the corner of Fisher-gate and Charaley-street, 110 feet in height to the top of the tiled roof which will cover it. The contracts for the masons', joiners', cargenters', plasterers', and ironfounders' work have been taken by Messra. Cooper and Tulifs, and Mr. Richard Anghton. The total cost of the chapel, when completed, will be up-wards of 2,500.

FOREIGN INTELLIGENCE.

Novel Use of Electric Telegraphs.—Our German contemporaries do not think that the use of telegraphs for pol.tical purposes is their final destination. As the laws of storms have been now so thoroughly in-vestigated, and the rain-clouds fravel very slowly, the collecting and publishing of meteorological intelligence with become front interactions the activities. may become of great importance to the agriculturist ; aud means have been taken in Germany to effect that object during the sowing and harvest s sous.

Architecture and Poetry.—The Schiller committee of Marbach have purchased the house (now a hake-house) where Schiller was hora, and it will be inaugurated on the poet's hundredth birthday.

Kant's Statue .- The model of this large statuary work, 10 fect high, made hy Professor Rauch, has been east in hronze hy M. Gladenbach, in the foundry Rauch, has of Berlia : for the cast 32 ewt. of metal were required, which does not include Kant's *kead*, which will be will be doue by M. Grünberg, and the work be set in six months to Königsberg, the place where it is to he put up.

Novel Art-Exhibition .- The little town Miningen will witness an exhibition of a novel and interesting kind, viz. that of historical carloons of modern maters. It is owing to Prince George Sax-Meningen, that such high art-works have becu collected and made available to the public sight. Of Cornelias three is a large specimen, "The Four Horsemen of the Apocalypae," from the Campo Sauto of Berliu; "The Greation" and "The Crucifixion" from the Ludwigskirche, in Munich. Of Kauthach, the following cartoons have been procured for the exhi-hition:--"The Flowering Period of Greece," and "The Reconclinition between Charlomagne and Wittekind;" a part of a trieze from Berliu; and the colosal figures of Moses, Salon, Egypt, and Hielas. Of Schwarr of Carolisfeld, some minor cartoons, and the large one collected and made available to the public sight. Of

of the Nichelungen. Of Professor Schwind, all the 61 the infinite of the historical freecose in the Landgrave's fail of the Wantburg, &c. The financial difficulty of this exhibition may be gathered from the fact, that for the zatioous from Berlin abuse a guarantee of 21,060 thalers was required to be given.

BERN: FIRST INDUSTRIAL EXHIBITION OF SWITZERLAND.

Amongst the real conquests of our times, ADONOST the real couplests of our times, the national exhibitions rank surely first, and that of Switzerland has attracted great uotice. The huilding-stands near the Anthor, close to the hill whence the astronomical observatory is looking down on the beholder. It cousists of a main mural building and an annes of wood. Besides the ground floor, two stories have heen creteded, which form halls supported by two rows of columns. The portal is of a grand proportion, the windows high, and the pediment adorned with referoes. The most interesting items of this Alpine exhibition are those nearest to stardy, ruddy Nature : the produce of the iron manufactories : this Alphe exhibition are those vertex to solury, rudy Nature; the produce of the iron manufactories; building stones, exhibiting some huge specimens of marble and slate slabs; blocks of centent, fossil fuel, peat, and a group of huge oak casks; nicely ornapeat, and a group of huge onk easks; nicely orna-neated irou garden furnitare; various products of asphaltum, and other chemical produce, are also to be net with. Very interesting is the collection of Swiss watch and clock works, a series of physical, mathe-matical, and duswing materials: specimens of Swiss printing, l'thography, and photography,—to which the homely straw platitings from the Aargan, and the shiring kitchen utensits of cooper and *plaqué*, form a reliveing peddent. The number of eshibitors is 2,050, with 20,000 asticles. Authors and publishers are separately taken account of, and 8,000 works of different kinds have been sent in by 100 of the above fraternity. fraternity.

STONE FOR THE HOUSES OF PARLIAMENT AND PROPOSED GOVERNMENT BUILDINGS.

A CORRESPONDENT of the Times, writing on the A CORRESPONDENT of the Times, writing on the subject of stone for the proposed Government build-ings, says,---"I think all will admit that the stone chosen for the New Palace is a great mistake, for long since--in fact, before a portion of that material had been exposed to the atmosphere more than seven years--any practised eye could see what would be the result. In proof of this, I took occasion, in the early part of 1849, to write on the subject to your contem-party the *Builder*, but the altitor inthe discovering the subject to be subject to your contemporary the Builder, but the editor, either disregarding the observations of so hunuble an individual as myself,

the observations of so hundle an individual as myself, or perhaps not seeing the truth of the remarks, de-cliced publishing my communication; but now it is found necessary to cost the huilding with a compound to prevent its destruction, and this before the builder has completed his work." The truth is, with the greatest consideration for correspondents, if we were to give insertion to every letter sent to us throwing doubts on the goodness of the various stores used in hubliding, we should damage every quarry-owner in Englaud, and yet do little to advance the cause of truth. The evidence on which Anston stone was selected overode any mere belief expressed in 1849, and though it is unfortunately the ease that the store used in particular situations at the case that the stone used in particular situations at the Houses of Parliament is decaying very fast, it can Houses of Parliament is uccessing very lass, it can scarcely be doubted that much of the Auston stone is a very excellent material. There is a had hed as wells as good bed, and the stone needs selection. We have several letters hefore us recommending various stones, espeletters never us recommending various source, tape-cially Portland, and we give insertion to one of them. It must be remembered, however, that of this also we have some bad specimens in the metropolia, and it is difficult to know what will stand and what will no'. The fact is, no one knows much about stone : we are blundering on in the dark.

In Sir Charles Barry's remarks respecting the stone of the new Palace, at Westminster, I notice one point which, in my humble option, is likely to mise as any stone litherto employed in London." Nine is sony stone litherto employed in London." Nine is Charles Barry will walk down Fleet street, and enrefully examine the Ketton stone, which is used in St. Dunstan's Charch, he will be inclined, I should inagine, to alter his option. If not, let him pro-ceed on to St. Paul's, and examine the Portland stone of which that mesterpice of architecture is will store of which that mesterpice of architecture is a sing stone of which that mesterpice of architecture is a stretcally examine the Ketton stone, which is used in St. Dunstan's Charch, he will be inclined, I should inagine, to alter his optione. If not, let him pro-ceed on to St. Paul's, and examine the Portland stone of which that mesterpice of architecture is a shorted, ther by showing that the atom-sphere, instend of decomposing the Portland stone, in fact, ease hardened, ther by showing that the atom-sphere, instend of decomposing the Portland stone, is some of the most exposed parts, the tooled marks as as visible as on the day they left the meson's banker. The Royal Dublin Society have referived plans in

The carving also, which has heen fuished so many years, is now as sharp as the last fuish at the New Palace. Nor do I think it at all prohable that Sir Christopher Wien would have bestowed his time and talevils on a material that he was not sure from experience would stand the test of the London atmosphere, and remain perfect in its most minute details fur an indefinite period, without heing obligad (as Sir Charles Charles Barry informs us, *ke* intenda doing), to have recourse to various economical meanse doing), to have recourse to various *conomical means* to arrest further decomposition of a work on which so **m**any thousands of the public money have been A Massner Masson.

SMEATONIAN SOCIETY OF CIVIL ENGINEERS.

THIS society, founded in 1771 hy Mr. Smeaton for the purpose of encouraging eivil engineers, and intro-ducing, through social meetings, a friendly intercourse among the profession and men of science, had an

among the profession and men of science, had an cutertainment on Saturdy last at Greenwich. The party during the afternoon visited, under special arrangements, the *Great Eastern* ship, the Athanic rable ou board H.M.S. Agamennon, and the Nautilus diving-bell at the Victoria docks. The inspection, and explanations given at the several works, were of the highest interest, and much pleasure and information were derived from the visit. At the disure the chair was taken by Mr. Hawk-

shaw, the president for the year : about forty gentleshaw, the president for the year: anout forty gentic-men were present: among them, Mr. Stephenson, M.P., Mr. Locke, M.P., Sir J. Rennie, Sir J. Macnell, Mr. Mylne, the treasurer, and Messrs. Walker, Lind-ley, J. Smyson, && &c., while some few memhers were tnavoidably absert in consequence of their pro-fessional energyments in the country. fessional engagements in the country.

Among the visitors were Col. Dawson, R.E., Capt., Claxton, Capt. Moorson, Capt. Galton, R.E., Ker: the usual loyal and ancient toasts of the society were given, and much intercourse and friendly discussion on the engineering and scientific topics of the day took place, and the festive proceedings terminated at a late here: a late hour.

A FEW SCRAPS FROM IRELAND.

The Dundalk core exchange and markets competi-tion has been decided, apparently as much to the dis-satisfaction of the competing architects (except the successful parties) as in the case of the Londonderry bridge, which has been the subject of comment in receut numbers of our Journal. Shortly after the recent numbers of our Journal. Shortly after the decision, which was protracted somewhat heyond the usual time in these matters, the committee sent a printed circular to the unsuccessful competitors, heing a potion of the directors' report to shareholders, stating that after "much trouble and anxiety" they awarded the first premium (30/L) to Mr. Morray (a local builder), and the second to Mr. Neville (the county surveyor). Since then advertisements have county surveyor). Since then advortisements have heen issued calling for tenders.

Drawings in competition were also songht for the erection of a new mechanics' institute at Lurgan, Lurgan, where Union-street intersects with Market-street, and the ultimate decision was in favour of those furnish by Mr. Raffles Brown, which, it is said, cannot be executed for the stipulated sum, 1,2007.

executed for the stipulated sum, 1,2007. The site of St. Killian's new church, Clondalkin, Duhlin, is near the recently-crected conventual build-ings and children's schools, which are both of Gothic character, and with them the new church will form a large quadrangle. The dimensions are (to, extrema end of clanace) 123 feet by 53 feet, including a nave of 27 feet width. Interior height, from floor to ridge piece, 52 feet. Style Gothie. Mr. Calabeck, architett Killian's new church, Cloudalkiu, architect.

The Naas gool competition, as also that of Kilmain-ham gool, Dublio, was decided in favour of Mr John McCordy, architect. In the former case it is pro-posed to build a new wing to accommodate 100 male

competition for re-arranging, with sheds, offices, &c. and roofing, the present cattle-yard in which periodical agricultoral exhibitions are held. We hear that the idea of using the new structure for the triennial exhi-bitions of arts and mamfactures is being entertained. A new town-hall is to he built at Naas, according to Mr. McCurdy's designs, which provide market and weigh houses, commissioners' and clocks' offices, with an assembly-room to hold 400 persons. The style is Gothie of thirteenth century ; the material, green stone, with gravite dressings. The priozelal front displays a Gothie arcade on ground-floor, cusped windows on first-floor, and sormounted in the centre by a gable with clock.

by a gable with clock. The Moore testimonial (pedestal) competition has been decided in favour of Mr. Molvaoy's plans, which, we are informed, anticipate the future site for the states of "Ireland's bard" to be at the intersection of College-street with Westmoreland-street, and oppo-site the vestern portion of the Bauk of Ireland. In case the corporation acquiesee in the wishes of the committee, the testimonial will be in a very central and conspicances situation, and no doubt will be an attractive feature in the city.

KENSINGTON.

The first annual report of Mr. Godrich, the medical officer of health for the parish of Kensington, has just been published. From this report it appears that in the two sub-districts—Kensington-towa and just been published. From this report it appears that in the two sub-districts—Kensington-town and Brompton—into which the parish has been divided by the registrar-general, with an area of 1,244 aud 698 statute arers respectively, there was a population, in 1851, of 29,183 and 14,870, which gives about 23-5 persons to each arer in the town division, and 21-3 in the Brompton. In Kensington, there were of females, 17,275; males, 11,908; excess of females, 5,867; in Brompton, of females, 5,8549; males, 6,021; excess of females, 2,825. All Loodon con-tains 30 mersons to the arer:—St. George's, Hanover-square, 60; St. George the Martyr, 184. The number of inhabited houses in the parish, in 1851, was 6,130; this will give, upon an average, seven inhabitants for this will give, upon an average, seven inhahitants for each house. The rateable value of property is nearly ach house. The rateable value of property is nearly 226,000, and the average annual value of each house is about 457. The entire parish is said to he about eight miles in circumfereoce, to contain sixty miles of read, and 130 miles of paths. From tables prepared by Mr. D. O. Edwards, of West Brompton, contain-ing the results of 100,000 observations extending ing the results of 100,000 observations extending over a space of twenty years, it appears that the mean annual temperature of the parish is 40.68 deg.; while the mean extreme range out of doors reaches to 61 deg. The mean extreme range for each month for the mean extreme range for each month varies from 30 deg, in January, to 37 deg, in Jane, In-doors, the mean annual extreme range is reduced from 61 deg, to 36 deg, and the extreme mouthly range varies from 16 deg, to 19 deg.

The estimated population of the parish for the present year is about 54,000. The total number of aths registered during the present year has been 199. If from this we subtract the large number Jackins registered during the present year has deed [199. If from this we subfract the large number of 190 occurring in the hospitals, but un-parishioners, the mortality of the whole parish will be at the rate of 18.6 per 1,000. In Chelsea, it is 26 per 1,000; in St. Margaret's, Westminster, and St. Janues's, 27 per 1,000. There are ouly three parishes in London in which the rate is more favourable than at Ken-sington, moorely, Lawishan, 17 per 1,000; and St. George's, Hanover-square, and Hampstead, 18 per 1,000; while Whiteshapel and St. George's-in-the-East average 22 per 1,000; St. Saviour's, Southwark, 33 per 1,000; and Liverpool, 36 per 1,000. There is, however, room in the parish for much improve-ment. The visitation of cholera in 1854 cost the parish about 2,000. for extra motical relief and other necessaries, besides charges for behoof of widows and children on the parish rates.

PROPOSED OCCUPATION OF ISLINGTON-GREEN

As yon are, of coorse, aware, the parish of Islington contains nearly 120,000 inhabitants, and it contains only, for such a large parish, but one small open space, common to all, situated about the centre of the parish, called Isiington-green. This is a triangular piece of ground already dis6gured and encroached upoo by a police-station. The parochial aothorities and iohabitants of Islivg-

Into parochial actiontues and tonabilants of 1810g-ton have lately heen exerting themselves to obtain a park, feeling the want of an open space for walking and recreation; and yet, will it he believed, in contra-diction to this, these authorities contemplate—even have, I helieve, decided on—further disfiguring this little space we perceive a vester-hall on it

that which is already small, how very little and cor. temptible will it make the remaining three quarters, letting alone the disfigurement that will be occasioned by contention of the state of the sta letting alone the distiguiential into the whether must be contracting so snall a space. Surely there must be some spot to obtain in Islington much more appro-priate for a vestry-hall than the place proposed, which would destroy an open space so necessary to he re-tained amidst so vast a population. Surely there must

tained amidst so vast a population. There is already a piece of ground by the turupike, covered by some dilapidated buildings, the remains of a fire, which have never been restored : this spot, I apprehend, might be reasonably obtained, or if not, some other site equally convenient.

CHAS, JAS, FACHE.

THE WELLINGTON MONUMENT COMPETITION.

THERE are nearly a hundred designs in West-minstor-hall. Half the number contributed from England, Ireland, and Scotland; --Italy, Germany, Spain, and America furnisb nearly filty.

The designs by British subjects have black num-Inc acsigns by Jordian subjects have black num-bers, those by foreign artists red; so that they are easily distinguished. Many of those with red numbers are unquestionably very fine in modelling, but the general characteristic is either violent action, or built ombs, or temples; one building within another is certainly an error.

certainly an error. It is a great pleasure to find our owo artists have come out so well, even though some of our best men have refrained from sending, through reports of a pre-arrangement with regard to the commission which have been circulated. Of course, amongst so many, and any one sending who pleased, there are some most extraordinary notions, English as well as foreign; reminding one of clock-cases, confectioners temples, resimuling one of characteristic many-temples, resing plates, &c. Many-and very miny-look as if they could not be increased in size without losing whatever merit they now posses. This is an element that should be well considered.

element that should be well considered. Without at present going into relative or particular merit of works, and some åre fine and appropriate, it may he worth while to notice, that the geocarl im-pressioo amongst artists and the public, is, that no one work will be selected; that the premiums will be awarded, and the Government entrust the commission to whom they please. Before doing which—if such has ever been the intention—it would he wise to select four if not five of the best in the present com-petition, to pay them for their models, and direct them to produce works twice the size of those now submitted. We should then, without the slightest doubt, have a monument worthy of the Duke—and one that would show that *British art* is even equal to British heroism. to British heroism.

The following notice has been given : -

The tollowing notice has been given :-¹⁰ The models will be exhibited to the public on Monday, the 20th, Treeday, the 21st, and Saturday, the 25th of July, from 9 a.m. till 7 p.m. On Wedneaday sund Thursday, the 22nd and 23rd, West-minster-hall will be open to Peers and memhers of the Hones of Commons, from 10 a.m. fill 7 p.m. After Saturday, the 25th, the Exhibition will be open every Mouday, Tuesday, Friday, and Ssturday, from 9 till 7, until further notice."

NOTES UPON IRON

(By our Special Correspondent in Staffordshire.)

THE iron trade of Staffordshire is quiet, but the from trace of Schooreshife is quiet, bui-bealthy. The quarterly meetings, which terminated at Dudley on Sturday last, passed off witbout any excitement; and since that time there has been no marked demand, from either the American, continental, or the home markets. The weekly meeting of the trade at Wolverhamptor

on Wednesday last, was not numerously attended; and the proceedings were no exception to the general and the proceedings were no exception to the general rule, the week after the quarterly gatherings, no large transactions having taken place. Pigs are a shade easier than they were a fortnight ago; and if the weather cootinues at the present high temperature, must, at most houses, be ball-a-crown cheaper in another fortnight than they are now. Indeed, we shall not be surprised if they are obtained at that tre-tanties were trache of them comes to us to be shall not be surprised if they are obtained at that re-duction next week, for there seems to us to be a stadied holding hack of orders for pigs on the part of the makers of malleable iron. This, added to the prevailing weather checking the makers of malleable iron, whils it permits the blast furnace to continue its operations, must inevitably throw a larger quantity pigs iuto the market, to the benefit of the makers of of mannfactured iron.

and recreation; and yet, will it he bedieved, in contra-diction to this, these anthorities contra-have, I helieve, decided on—firther disfiguring this little space hy erceing a vestry-ball on it. One of the vestrymen menetioned to me that they should only want a small space of the green—about one quarter; bat if you take away one quarter from

that good iron can only he obtained at "trade" houses and "trade" rates. Very good bars may he obtained at the prices at which they have been for some time selling, namely, Sk.; good hars, 7t. 15s.; and by some makers bars are sold at 7t. 10s. Phates, and speak are sold as how any low sold at 7t. 10s. and by some makers bars are sold at (*i*. 108.) findes and sheets are sold as show as 9.2, and good plates and sheets at 99. 10s.—all at the works. Pigs of a serviceable character range from 3.1 75. 6.4. to 41. 5s. Good mine warm-sir pigs are

34. 178. od. to 44. 55. Good mine warm-air pigs are quoted at 44. 23. 6d., hat 44. Is. 3d. in most instances ; and 44. in others would not be refused. No large transactions are reported at 44. 5s.; and pigs at 37. 17s. 6d. arc serviceable as a mixture; for it is a fact that a good tough bar cannot be made of the best class of pige. class of pigs.

PROPOSED MEMORIAL OF THE '51 EXHIBITION.

WE would draw attention to the invitation in our advertising columns, addressed hy the committee for erecting a memorial of the Great Exhihition, as well to architects as to sculptors. Much is advisedly left to the discretion of the competitors. The sum in the hands of the committee is about 6,000/, and we sim-much have believe to the correspondences of the object names or the committee is about 0,0006, and we sin-cerely hope, looking to the greatness of the object and the desire of the committee, if a good design be submitted, and no difficulty arise to allow the anthor of it to carry it into execution, that aritist of ability will compete. The Rev. Dr. Booth and Mr. Godwin act as homeprer scenarized. act as houorary secretaries.

LONDONDERRY BRIDGE. - COMPETITION DESIGNS.

I HAVE looked antiously in the columns of your Jouroal for an anthoritative contradiction of the charges involved io the questions of your correspon-dent "C.E.," and which, "Another C.E." has not hesitated—with some slight modifications—to answer in the affrentiate. Tract. for the honour of my dent C.E., and which, Abouter C.E. has not hesitated—with some slight modifications—to answer in the affirmative. 1 regret, for the honour of my profession, to say that I bave looked in vain. : for it is impossible to attach any value to statements which you mention having received, but which are marked "not for publicatiou." But, I renture to think, sir, that this matter cao scarcely he allowed to remain as it now is. The Londonderry Bridge Commissioners must have some responsibility towards the public, and while the charges that have been made by your cor-respondents remain unauswered, the Bridge Commis-sioners not only appear identified with a course of proceeding which I should hope is unprecedented in the history of competitions; hut, after having spect a large sum of the puble money, they adopt a design for their bridge which was publicly condemned by a gentleman who is, a dmittedly, the very highest design for their bridge windt was partiely, the very highest authority on the subject. Mr. Barlow, indeed, chal-lenges discussion on his design at the coming meet-ing of the British Association; but the trihunal that he has chosen is not one that, ou such a cubject as this, will command respect. The amateurs and pleasure-hunters who will assemble in Duhlin a few picasure-numers who will assemble in Jamma a teo weeks hence, will find little interest in a discussion, on the advantages of a combination of girdlers and suspension chains. I would suggest to Mr. Barlow, that the Institution of Civil Eagueers is the proper ibunal before which to debate this subject : a g tribunal before which to debate this subject : a good deal of attention has now been drawn to it, and I think I can promise Mr. Barlow, that if be will hring the matter forward in the next session of the Iasti-tution, he will have the opportunity of hearing the opioion of more than one eminent member of our profession upon it. professioo upon it.

THE RECENT DECISION UNDER THE METROPOLITAN BUILDING ACT, ON THE PROJECTION AT 74, GREAT TITCHFIELD-STREET.

STREET. HAD only your report appeared, I should not have con-sidered it nocessary to have addressed you, notwithstand-ing some errors; but "Investigators" "letter, apponded to that report, in your last number, betrays so much igno-rance of the case, and it may possibly be shared by the profession, that I fed called on to offer some explanations; as well as to state that Mr. Beadon most emphatically expressed his option on most of the questions raised, and decided that he "could not be called on to make the order demanded."

expressed his opinion on most of the question maker, hal-decided that he "could not be called on to make the order "amanded." That he build 5-not ware, to take down the slate enclosures and to build 5-not wards from the foundations, and to carry up one portion as a party-wall, 15 inches above the roof. I did not deny that it was an alteration and addition within the meaning of the 9th section, but I contended that the projection came within the 26th section, and was constructed of the stipulated fire-preof materials, and denied that the "projection" was a "huilding." The 26th section distinctly marks the difference herein. It paragraphs of the nection of the section of materials paragraphs of the section of these projections must be of fire-proof makerial. The fifth paragraph states that no pro-jection shall extend beyond the general line of fronts: the words "architectural projection" are here carefully carries and exident there was no case, and be merely gave as an argument that if he could enclose his

THE BUILDER.

balony and rerandah, he could see no reason for object-ing to this kind of projection, and that the second part of the Act (see, 60 and onwards), to which I had referred, gave quite sufficient powers for protecting the inhabitants gainst want of safety. This judgment I consider to be use and legal. The several parts of the Act to which I fait if my day forming rescuences of the Act to which I fait if my day opening rescuences of the Act to which I fait if my day to be a several parts of the Act to which I fait if my day opening rescuences of the Act to which I fait if my day had be a several parts of the Act to which I fait if and many hypothetical cases were suggested by the Bacdon to show how fait the "construction" of a wall was affected by the cutting of a window opening lower, higher, or wide, hut it really had nothing to do with the decision. The whole question turned upon the constru-tion of the words "building" and "architectural projec-tion of the several "building" and "architectural projec-"Threatigator " will be effectually answered building".

"In the property of the constraints of the second s

tories may be "projected." The reference in my defence to the woodwork not then fixed was a technical point of defence only. The aize is only limited by the security of the construc-tion

t5 tion. The projection with "quarter sides" alluded to is con-trary to the Act. EDWARD ROBERTS.

VALUE OF LAND AT NORWOOD.

THOMAS SHELDRICK, AND WEST-END AND CRYSTAL PALACE RAILWAY COMPANY.

PALACE RALLWAY COMPANY. AN inquiry took place before a jury at the Sessions-house at Newington, on the 35th June, to assess the value of 3r, its Newington, on the 35th June, to assess the value of 3r, its Newington, required by the set Planta is built. Lower Norwood, required by the set Planta is newino for the aum of 60. 18s, and ho had since planted and converted it into garden-ground. On the part of the claimant, Mr. Willshire pave eridence that he valued the same at 671. C and her Anter of the company, Mr. R. A. Withdr valued it at 270, and Mr. C Lee at 282. When, after a long inquiry, the jury gave a verdiet for 500.

Books Receibed.

A Dictionary of Greek and Roman Geography, by various Writers. Edited by WILLIAM SMITH, LL.D. Walton and Maberly, Upper Gower-street. 1857. Part XVII, completing the work.

To any one who knows, as many now do, the excel-lence of Smith's "Classical Dictiooary" a new work of a like order, by the same writers, needs not much re-commendation. Such is the case in the present instance. The work just completed forms one of a scries which constitutes a comprehensive encyclopædia of classic lore. This series of classical dictionaries comprises "Greek and Roman Antiquities," "Greek and Roman Biography," and "Greek and Roman Geography ;" and the present work concludes the series. Although writers, the "Dictionary of Geography" includes the geographical names which occur in the sacred Scrip-tures; * and thus this new work form- a "tot designed mainly to illustrate the Greek and Roman writers, the "Dictionary of Geography" includes the geographical names which occur in the sacred Senj-thres, " and thus this new work forms a dictionary of ancient geography, in the widest acceptation of the term, although the name "Greek and Ronau" has heen retained partly for the sake of uniformity, but chiefly to indicate the principal object of the work. Such a dictionary was much needed, even were it but to embedie and accence for new reference the labour. buch a obtionary was made needed, even where to but to embody and arrange for easy reference the labours of various authors of modern times, and the results of various more or less recent discoveries. And well has the task here accomplished. The work is With must be task in the account partial in book as illustrated by plans of cities, districts, and battles; representations of public buildings and other aucieut works, and coins of the more important places; and to the whole is added a useful index of names which occur in the body of articles, but not under special headings of their own, in the alphabetical order of deadings of their own, in the approximation of the produc-dictionary. It is a learned and admitsible produc-tion, essential to every library. Frequent reference was made to this work in the articles on "Greece" and "Rome," which recently appeared in our pages.

and "Rome," which recently appeared in our pages. There is a scriptural name of some importance, refing an at primerse, to which is and Challes are ex-bers to direct Dr. Smith's attention, with the view of mondment, or addition, at some future time. The name in question & 'Hiddekel', "-the 'Great River Hiddekel," as it is called in the scriptural book of Daniel, the prophet and maker of the Magicians and Challesans, who strolled along its banks while a capitre in Babylonia. In the second charger of Genesis, four rivers are named as mitting as the Garden of Eden, -the Suprates, the being one, end the Hiddekel the Bible, "the Diptrates, the bible of Daniel that this latter is called a great, river. Under the head of '' Tigris,'' in the Dictionary mader notice, we are told in a somewhat lengthened and important article, that according to Piny, the Tigris, "Bowd gentle, and the Jigdite, in the upper part of it where Arabea and others in its shift," its called Digit by the Arabea ad others, the init, its called wester arabea ad others, in its init," its called Digit by the arabea ad others, in its init," its called Digit by the Arabea ad others in its init," its called Digit by the arabea ad others, in its init," its called Digit by the arabea ad others in its init," its called Digit by the arabea ad others in its init," its called Digit by the arabea ad others in its init," its called Digit by the arabea ad others in its init," its called Digit by the arabea ad others in its init," its called Digit by the arabea ad others in its init," its called Digit by the arabea ad others in its init," its init, it is in the disk was be arabea ad others in its init," its called Digit by the arabea ad others in its init," its init, it is in the as its init, arabea ad others in its init, its init, it is in the addea with the arabea ad others in its init, its init, it is in the init in the addea of the section is and to this field other is the init is in the init is in the addea. We deem it right, nevertheless, now to mention, with strong commendation, its completion.

Burning the Dead; or, Urn Sepulture: with Sugges-tions. Philip and Son, 32, Fleet-street. 1857.

Α "MEMBER of the Royal College of Surgeons" A shallbe of the layar conege or surgeous revives this subject, treating of it "religiously, soci-ally, and generally, with suggestions for a revival of the practice as a sanitary mensure." The pamphlet will be found to be a readable and interesting one, even by those who, like ourselves, canoot see much likelihood of the adoption of its suggestions by Eng-The mood of the subprise of its suggestions by Eng-lish people. An association, as our readers may recol-lect, was some years since formed for the purpose of carrying out a similar idea, and we easisted in giving publicity to that idea at the time, desirous as we were to have some substitute or other for the disgusting practice of intromural burial. Now that the object of expelling dead and putrefying correases from towns is pretty well effected, we fear there is less chance than ever for "un sepulture," although we do thick it would be preferable even to extramural burial. The present writer's idea seems to be based on, or at least suggested by, that of M. Booneau, proposed as a remedy, at Paris, for cvils such as maliguant sore throats, which are helieved to arise from the contamthroats, which are helieved to arise from the contam-ination of the city air while passing over the extra-mural cemetries in the neighbourhood, and also of the water in wells there. The Parisians, who delight in such memestoes as mourinog rings made of the iron in the blood of their deceased friends, are much more likely to adopt such a novelty as "ran sepultare" than we are, but an association who would show the example might do much to obliterate prejudice against it, even with us, and certainly on sanitary grounds, such a mode of disposing of our dead as against is that a mode of disposing of our dead as that of burning to ashes and preserving these in urns deposited in consecrated galleries, or in open cemeteries, would be infinitely preferable to the present practice of burial.

Miscellanea.

THE FORTHCOMING MEETING OF THE ARCH.EO-LOOICAL INSTITUTE.—The members and friends of the Archeological Institute will bold their meeting this year at Chester. Lord Talbot de Malabide will preside; Sir Stephen Glyane will preside over the architectural section. Wednesday, July 29, annual meeting of members of the Institute, at the Town-hall, for election of members, &c.; general concludiog meeting at twelve.

FATAL ACCIDENT TO BRICKLAVERS --- On the 13th several men in the employ of Mr. Thos. Wilde, uit, several men in the employ of Mr. Thos. Wilde, contractor, Stalybridge, were engaged upon the crec-tion of a chimacy at a mill in Saddleworth. Two of them were at the top of the chimacy, where they had placed some stones upon the brickwork, and they were about to pour molten lead between the slones. As the pau cootaining the boiling metal was being drawn tbrough the manhole in the chimacy, it fell on one side, and the lead ran upon some cotton bags that had heren placed more the top of the old chimacy to one side, and the leaf ran upon some cotton bags that had been placed upon the top of the old chinney to keep the sulpbur from the new part. The cotton blazed, and in trying to put out the fire the two men were so very much hurned that both have since dicd, and a verdict of accidental death has just been returned on an inquest as to the death of one of then

NUTSANCES REMOVAL ACT.—Section 8 provides that no animal shall be kept so as to be a nuissuce or injorious to health. The rest of a large portion of the metropolis is now hroken and disturbed by the erowing, and that of a very powerful kind, of Cuchin China cocks. It is suggested that, if the present Act do not meet the annoyance, it would be very desirable to introduce a clause to meet what threateus to be a very serious nuisance .--- A RATEPAYER.

THE ROYAL VICTORIA PATRIOTIC ASYLUM. THE ROYAL VICTORIA FATRIOTIC ASTLOY,—Onti of the Patriotic Fond, amounting to 1,446,9857, a surplus som of 38,0007, has been reserved for the erection of an asylum for 300 orphan daughters of soldiers, sailors, and marines, and 140,0007, for its endowment. On the 11th instant her Majesty leid the foundation stone of the new aselym, which is to be built Ont foundation stone of the new asylum, which is to be built, with something of the character of Heriot's Hospital Information and the character of Heriot's Hospital at Edinburgh, omitting, however, much of that ornate style of decoration, which would unceressarily absorb an undue portion of the funds at present available. The site which the building is to occupy is on Wands-worth-common, a short distance from the Clapham station of the South-Western Railway, overlooking on one side the Wandsworth House of Correction, and the Freemasons' Asyluot for Female Orphans. Mr.

One side the Wandsworth House of Correction, and the Freemasson's Asylou for Fermale Orphans. Mr. Rhode Hawkins is the architect of the new Asylom. THE NEW WORKHOUSE FOR NORWICH.—The first sod was turned on the site of the new workhonse for Norwich on the 7th instant. The new huildings which are about to be erected by Messrs. Curlis and Ba'ls from the designs of Messrs. Medland and Maberley. of Gloucester consist of fire divisions Bails from the designs of mession first divisions, Maberley, of Gloucester, consist of five divisions, 1st. The front buildings next the Cemetery-road from the Derehan turning, next the Contectivities from the Derehan turnific, consisting of offices for the clerk, board room, porters' room, relieving officers' and waiting rooms, and receiving and vagrants' wards for hold sexes, with their yards, &c. forming a frontage of abudy 250 feet in length. 2nd. The main buildings, distant from the front line about 115 feet. These consist of wards for the old men and women (all having hoarded floors), the able bodied of both scres, the master's matron's, and other officers' rooms. The total frontage of the main huilding is upwards of 400 fect. Connected with the diming-room, by a corridor of 172 feet in length, are the in'ants' wards (division No. 3): these consist of dayrooms, dormitories (all having boarded floors), lav tories, baths, &c. and an infants' school-room. A Ad. torus, baths, &c. and an infunt's school-room. Ad-joining these, but separated so as to prevent any possible annoyance, are the wards for the harmless insane (division No. 4). The infirmary (division No. 5), is situated in a corner of the ground apart from the other buildings. In the rear of the infirmary are the wards for extineous patients, and in a remote corner of the ground is the dead-house. The chapel is situated over the dinpic shell in the main buildings. In the centre of the roof is the hell-turret, with spire and vane and vanc

and vane. CATHEDRAL GRAMMAR.—The following notice is placed in the clisters of Worcester enhadral:— "This public notice is hereby given. That if any damaga is dong to the walks, clitter by writing, or otherwise defacing them, or any other musance, com-mitted in the cloisters, they will immediately be locked up, by order of the Dean and Chapter."

THE SCOTCH IRON TRADE .- Though the pro-The SCOTCH IRON TRADE.--- HOUGH the pro-duction of pig iron in the last quarter, says the quarterly circular of Mr. T. Thorburn, reached nearly 220,000 tans, yet it was fully 8,000 tans less than when compared with the preceding three mouths; and it is important to note, that during the same and it is important to note, that during the since period, the local consumption and exports, foreign and coastwise, exceeded to make 20,000 tons-having in the aggregate amounted to the corrows quantity of 240,000 tons. The stocks are thus reduced since March 20,000 tons, and are now only 103,000 tons lying in warehousekeepers' and makers' hands. The March 20,000 tons, and and makers' hands. The lact of a much greater quantity of iron being sold in May than there was in warehousekcepers' stores, in-duced the principal buyers to demand delivery of the warrants, and the price in consequence quickly rose to \$2s. 60. An interditor injunction having heen multiple for the revent the storekeepers from issuing applied for, to prevent the storckeepers from issuing warrants until the irou was actually in store, this was readily obtained, and the system of issuing warrants witbout actual possession of the iron has been for ever quashed. Since the pressure for warrants t has remained inactive, and prices ceased, the market have gradually declined to 75s. per ton, without much iron chauging hands. Towards the close of the month a better feeling existed.

VISIT OF DUNDEE HOUSE BUILDING TRADES TO Norrose. -On the 27th ult. says the Montrose Review, " a numerous party of the operatives and their friends belonging to the different trades connected with Trends belonging to the different transcondector wito the building and furtishing of houses visited our good town from 'Bonny Dundee.' They were accom-panied with five bands of music, and the various trades displaying flags and bankers and a great variety of beautiful and ingenious models of their respective beautiful and ingentous models of Luer respective handierafts. The large procession, numbering upwards of 1,000 persons, proceeded in great pomp and nag-nificence to visit the various places of public interest in our town. The spectacle, upon the whole, was very imposing, and was much admired by our citizens, who turned out in vast numbers to witness it. The who three out is vaso induces to whites it. The men were well attired, and the apprendices were decked in their best. In particular, the upholsterers had a very fine appearance, heing all respectable-looking jmen and all attired in black suits with white kids."

RAILWAY TRAFFIO.-The traffic returns of the MAILWAY TRAFFIO.—The traffic returns of the railways in the United Kingdom for the week cading July 4, amonted to 495,5717. and for the corre-sponding week of 1856 to 472,3367, showing an increase of 23,2357. The gross receipts of the eight sponding week of 1856 to 472,3366, showing an increase of 23,2557. The gross receipts of the eight railways having their termini in the metropolis amounted for the week ending, as above to 204,5674. and last year to 203,3461, showing an increase of 1,2217. The increase on the Eastern Counties amounted to 9594, on the Great Northern to 2944. Jo on the Great Western to 1,5597, on the London and North-Western to 2,3542, itotal, 5,1964. But from this must he deducted 2617, the decrease on the London and Blackwall; 1307, on the London, Brighton, and South Cossi; 3,1144, on the London, Brighton, and South Cossi; 3,1144, on the London, and South-Western ; not 4700, on the South-Pastern. The receipts on the other lines in the United King-dom amounted to 291,0942, and for the correspond-ing period of 1356, to 268,9904, showing an increase ing period of 1856, to 268,990?. showing an increase of 22,014?.

-Rer REPORTS ON COMMON LODGING-HOUSES .from the provinces as well as from the metropolitan districts, to the General Board of Health, on this subastricts, to the General Doard of Health, of the Salu-jeet, have been printed by order of the Commons. These reports uniformly testify to the sanitary and moral improvements effected by the supervision of logging-houses nader the Common Lodging Houses. ladging-houses nucler the Common Lodging Houses Acts; so much so, indeed, btat these houses, which were not long since a reproach to every town, are now hecoming an example to other houses inhabited by the lower classes; and which many of the re-porters arge should be inrought under similar regula-tions. The diminution of fevers in many of the lodging-houses is alluded to as quite remarkwide, and one feels in rading these reports as if it were the lodging-houses is alluded to as quite remarksble, and one feels in reading these reports, as if it were the "model lodging-house" statistics the reporters were contrasting with the notorious overcrowded, filty, and deadly brodes about which, in former years, com-plaints were so frequent and so urgent. The Crowded Dwellings Prevention Bill, we observe, has just passed through committee in the House of Lords.

passed through committee in the Honse of Lords. THE LECTURE-HALL, TRINITY COLLEGE, DUBLIN. —This building, illustrated by us some time ago, is making rapid progress. The Westmeath Guardian gives the following particulars of its internal fittings. The entrance door is of solid oak, in small panels, with copper holts at the interstices of each rail, and is surmounted by the College Arms, also handsomely earrod in Portland. This door opens into the lower hall of the huilding, the walls of which—as well as those of the inner hell—are lined with Caer stone. "the coing is of wead-wear, with moulded justs sup-parted on heams, moulded and roped on the edges. The lower hall is divided from the inner, or principal hall, by three handsome arches, all of which are carved, notched and roped, and are supported by four pair of Irish marble columns of considerable beanty, highly polshed, and a ring of polshed marble of trinsquir shape surrounding them on a the inner arches. A flight of six steps through the centre arch leads into the inner hall individe the one cades, supported by marble pillars. The hall is en encedening handsome supported by the bines, and arong of one centre and have sing flights feading to arcbed arcades, supported by marble pillars. The hall is en encedening hand-some spartment, lighted from above by two circular dome lights. The domes are constructed of red, while, hue, hrown, and green chamble boated pixes, form-ing a near sig-scap pattern to imitted. Mosaic work, and giving a very handsome and novel appearance to be hall. The arches supporting the dome are com-posed of alternatered and white stone, springing an each side from two green marble polshed pinatsers. The stones forming the stairs are also alternate white and red : the stairs are of Portlend, and the side walls of Caces stones, and capped with Galvay marbie. THE LECTURE-HALL, TRINITY COLLEGE, DUBLIN. G and even to the stars are size alternate white and red : the stars are of Portland, and the side walls of Caen stone, and capped with Galway marble, monided, carved, and polished. The wings at the commencement of the stars are ornamented with two elaborately carved Gaen stone brackets. The floors of the hull average far are of far advected average. elanorately-carved usen stone brackets. The floors of the hall, arcades, &c. are of tesselated paving, red, white, and bluck, with a hlue border; and on the lower floor there are four large, handsome, lofty lecture-rooms, two laboratories, and four private rooms for the professors. The upper floor is divided into two spacions rooms, intended for the College Museum Musenm.

OCCUPATION FOR LADIES.—An association has heen formed for "Promoting the Employment of Ladies as Teachers of the Fine Arts." The Dochess of Argyll, the Countess of Granville, and many others of the female aristocracy, are leading members. The object in view is "to find an occupation especially The suitable for educated and intelligent women. The plan is, we believe, already in working order.

Builder. The

Vol. XV.-No. 755.

AST Saturday evening, the 18th, the annual conversazione of the Architectnral Mnseum was held in the new building at Brompton. The Right Hon. Earl de Grey, the president, took the chair, and was supported by many distinguished men, and a very crowded general assembly, including a large number of ladies. The fact of its being the first meeting held since the change in locality gave particular interest to the evening, and induces ns to give more than usual space to an account

of the proceedings.

63.30

Det

The noble Earl, on taking the chair, said he had attended some

three or four previous *conversazioni*, but the present was the first occasion on which he had been able to "see" all who were present. been able to "see" all who were present. Those who recollected the former place of meet ing would remember the extreme pressure that prevailed on these occasions, the difficulty that there was of either seeing or being seen, or in properly exhibiting the examples of architectural taste which it was the object of the Museum to taste which it was the object of the integration bring before the public eye. In its present situation, however, he thought they had no reason to find fault on that score. The change of situation from the confined position in which they formerly were was undoubtedly a great step in the advances to he made in the future progress and improvement of the Architectural Museum. He did not mean to say hnt that Museum. He did not mean to say hnt that there might he difficulties in the selection of any place for such a purpose. The first spot that was selected was the best that could he that was selected was the best that could be obtained. In the earlier stage of its existence its position was adequate for its purpose, but it was found, long hefore they actually did remove, that it would be impossible the collection could progress, or that the Institution could couler that institution with the institution could couler that reputation ou itself, or that amount of profit on the public which it was intended to confer, by remaining in its confined locality. There were many other circumstances, moreover, that made many other circumstances, moreover, that make it of importance to change, if they possibly could, for the better. It had heen urged that the former "situation was preferable quasi situation, and he did not deny that there might the tornet situation was pretentione quarks situation, and he did not deny that there might be advantages. There might he people living in the neighbourhood of the late locality, who might be more or less inconvenienced by coming further afield, hut then it was to he recollected that a great number of people might be on the west side of the metropolis, to whom the new locality would be as convenient as the old locality was to those living on the east. It had heen observed, though he thought the observation was without foundation in fact, that, because they had selected a spot more or less connected with Government, and the locality of other public institutions, they were therefore likely to he what they might call absorbed by the public institutions around them. Well, he candidly confessed, although them. Well, he candidly contessed, and the public institutions around them might large and very powerful, and though they might have a great swallow, he did not think they would swallow the Mnseum. He though the Mnseum would hold its own, and that it would be a tongh morsel to masticate. The great object of the Museum was not mercly to great object of the Museum was not merely to collect together isolated models or casts, but to collect them in the mass. Taken in an isolated way, or individually, they were of little value; hut taken collectively, in connection with specimens of the same date, and of the same style of architecture, they became for the purpose of study and comparison invaluable. It then became of value, and available hy all connected with the noble profession of architec-

THE BUILDER.

Everything, under these circumstances. that favonred the important object of classificainto and separation, and avoided that of confused intermixture, hy appropriating proper things to proper periods, and placing all in chronological order, in connection with all classes and styles of architecture, must be of immense value. He believed that the Tarking in the second believed that the Institution only required to be known to he appreciated; that numbers would come to it, and that it would recommend itself to the increased support of the members and the public. It did not require a large amount of contribution. A great number of small con-tributions would go much further than many a swaggering donation, that sounded hig, and perhaps only deterred other people from sub-

scribing. Mr. G. G. Scott then read the following

distance from the centre of London causing inconvenience to students. The first of these objections we have guarded against, by the most stringent stipulations for the fullest possible amount of independence and self-government, and by the fact that, whereas in our or old location we had received Government std, in our new one we receive *none subateers*, placed with half a dozen scientific societies, which, though bound by the Governmeut, retain undisturbed independ-ence.

placed with half a dorin scientific accents, which summing housed by the Govirnmeut, retain undisturbed independ-ence. We are, then, reduced to the one objection of sir, and it would be absurd to deny that it has its weight. We all most bearity with that the nusemms in which we are assembled were at Charing-cross, but how is it possible that a building requiring such as a corrocomsonic of space, and the object of the size of a size of the size of a site of the size of the size of the size of the size of the art library, to which, when they come here, they may have access; and that this advantage does very much to compensate them for the additional trouble of getting have only to refer for proof to the returns of the numbers who attend, both on the public and on the student's days. The fact is, that the number who visit our museum is increased size our removal by at least *theory fold*; and judging from appearances, I am of opinion that a large proportion are of the classes which it is our object to been it. I have gone more at length into this subject because it

benefit. I have gone more at length into this subject because it has been minde the ground of repeated, and, I cannot but think, considering the exertions and sacrifices we have made, somewhat ingenerous stateks upon us. Whether we

41.0
were right or wrong in craing here, we fight that our supported been good, and that we are undescripted or such attacks. My object, however, is not to defend a seven be object of the sum of the same supporters for the continuance of their sid. We are determined to press on the objects of our Institution with the same signer which has hrought it to what it is. If there are so many our supporters for the continuance of their sid. We are determined to press on the objects of our Institution with the same signer which has hrought it to what it is. If there are so many our support of the object, there are so many our support of the same section. We also at making our support of the same sections. We also that the same signer when the notion sections of Government to the same sections of Government to the toolbe of getting to it; or all the more worth the toolbe of getting to it; or all the more worth the toolbe of getting to it; or all the more worth the toolbe of getting to it; or all the more worth the toolbe of getting to it; or all the more worth the toolbe of getting to it; or all the more worth the toolbe of getting to it; or all the more worth the toolbe of getting to it; or all the more worth the toolbe of getting the same base in the great work for which has all along here the great det to your abscriptions. We are supporter; on the great work for which we are handed together; and we upper upporters, that we may be the better able to press and the same solution of our collection. If you hare been prejudied to be which and a four confidence in the here been be all the pression of the best previous for the adverted of our collection. If you hare been prejudied to be which and a four confidence on the here the which here the shear best and here the shear been are sheard to now is, our which de your all form a morement when here there and of your confidence in more mark when here there and are objection to all the now is now which de your all form a morement whenhere here and are the pression to

has already here of the utmost benefit to those engaged in srchitectural art. Profersor Donaldson, in moving the adoption of the report, observed, in allusion to the change in the Museum's locality, that they must all admit they had moved from a bern into a palace. There were to be none of the distinctions, however, that some times appertained to palaces, since the numbers of the Museum were to enjoy all the facilities of the new and enlarged site; and the importance of this could not be overrated, when they considered the great number that came to the Museum who would not only have the benefit of studying the casts, but the beautiful collection of pictures; and when they remembered that on Monday last, the vast number of 4,600 persons visited the Museum, they would be able to form a tolerable conception of the enlarged capacities of the Museum, and of the facilities io afforded for observing advantages not only on their own and so conferring advantages not only on their own Museum, but on the whole range of science and art throughout the United Kingdom. While at Westthroughout the United Knogdom. While at West-minister they were a solitary Institute, but now they were an associate with other societies of enlarged conception, and for other pursuits and studies. They were not confined to one geographical position as it were, but their conceptions became charged, and they regarded architecture in its fullest development. Some donations had been amounced in the report, and he had great pleasure in placing ou the table the first that had been presented to the Museum since it first that had been presented to the Museum sicce it had assumed its present site. It eame from a gen-tleman who had done more to extend a knowledge of literature in general, smit the arts and sciences, than any publisher that could be named,—--Wr. Bohn, who had presented to the Museum a volume he had pub-lished, on the subject of "Potery and Porce'ain." He had great pleasure in placing on the table this commetee most of contributions that he hoped would follow in its wake. follow in its wake.

Mr. Baden Powell, in seconding the motion, s The building in Canuon-row was only to be looked on as a temporary one; and had the museum remained there, there was not the same likelihood of its receivthere, there was not the same likelihood of its receiv-ing the specimens and contributions they were now likely to obtain in its present more permanent loca-tion. They had also the greater advantages to arise from better elassification; and they all knew that to the student of architecture, the architectural details of different datas and meriods were very second the student of architechney the architectural details of different dates and periods were very essential. Another advantage gained was the power possessed of keeping up a satisfactory and comfortable timpenture in the present building. In the other building this in winter time was not attainable, and in that respect there was a gain as averable uncair. there was a gain as regarded noving. The resolution was put and carried with applause. Mr. Scott then said, that as they had received the

greatest kindness and assistance from all the geulle-men connected with the Department of Science and

men connected with the Department of Science and the Fine Arts, at the Musseum, he begged to move :---"That the hest thanks of the committee and members of the Architectural Museum beoffered to the Department of Science and Fine Art, and to the Committee of Council on Education, for their general co operations are much personal attention from Mr. Cole, C.B., Mr. Red-grave, R.A.; Dr. Lyon Playfair, C.B.; Captain Fowke, R. E. and to Mr. Oven."

The Architectural Museum was much indebted to all

The Architectaral Museum was much indebted to all these gentlemen for their ec-optration and assistance in a work of great difficulty and disturbance,—the removal of the Museum. They had lent every possible aid, and show every conceitable kindards. Mr. G. Godwin had great pleasure in seconding the motion. He had watched what these gen-tlemen had been doing, and could tratify to the truthfolness of the terms in which the motion was eouched, and to their general efforts in the promotion of exhibitions excludated to be of so much utility in the cause of art and manufacture in this country.

applicable to the design of monuments for Christian churches, bas been frequently discussed. We cannot call to mind any memorial work of such importance as the Wellington manment, exceuted since the works of Banks, Bacon, Westmeott, sen. Flaxman, and others, in Westminster Atbey and St. Pauls Cathedral. A considerable number of the receved monuments, as that to Sir Rohert Peel, in the Abbey Cathedral. have been single figures; or, under the newly recog nised conditions of accordance with the character of a edifice, they have been strictly Mediæval, and in a pro-minent degree architectural. The problem has therefore nument degree architectural. The product and interestore remained, so far at least as our principal national mansolea are concerned, namely, how to design a monument with many sculptural arcessonies, or not the reproduction of an effect, or canopied tomb,— neither obscurely allegorical, nor with emblems borrowed from people of a different creed, --not necessarily Gothic, and yet suited to a church and building. Had it heen d-chiled to erect the moment ment to the Dake of Wellington in Westminster exhibited the designs might have more less of the reproduction of the Medizval character, at least is architectural details : but in St. Paul's Cathe-dral, different details, but combined with what was valuable in the sentiment of the Gothie sculpture, might be expected, as well as perhaps from the very novely of the field, a higher degree of merit thau other case, in the art.

The principal monuments in the Cathedral do not. indeed, err so greatly as the more prominent works in the Abbey, against the conditions of the location : they are representations of events rather than scalp-tured doities. Deep'y as the classical symbolism has woven itself into the thoughts of the civilized world, Woven itself into the tangents of the events works, these forms could be understood where even Christian allegory could only have confused the observer; but if fitted for any other situation, they are often strangely out of place in a church. Of the representative sculpture, under the same conditions, all that could be said was, that it did not attempt the distincall that tive character required noder the associations. The problem, therefore, as we think, was left for solution, The preculiarly in the present case. Lat it not be for-gotten that the distinctions of purpose or locality to which we have referred, are the source and not the hindrauee of a t

The exhibition contains not more than one monu-The existence contains not more than one monte-ment in which we discover an effort to introduce Gothic architectural details. There are several works which include a recumbent effigy, sometimes noder a canopy or covering, sometimes within a portal and canopy or covering, sometimes within a portal and enclosing structure. These are derivations from the enclosing structure. These are derivations from the Goldie chantry chaptes and conopied tombe, or Eliza-hethan monuments, without their details. In general, however, the particular seatiment which we have been supposing as required by the conditions, is not however, the particular sentiment which we have been supposing as required by the conditions, is not reached; but the designs exhibit prominently, allusions to the life and worldly renown of the decensed; and as if to show the difficulty of applying the principles as nrged by some, the classical Victory is very gen-rally adopted. Evastly how far such allusions should be confined to monuments not in churches, we are un-able to settle. It is clear, the monument requires able to settle them in some form.

But, omitting designs which are too absurd for But, oniting designs which are too assure for selection—and somewhich, in a combination of figures and rockwork, repeat the faults of the worst attempts in soulpture—we are glad to see many works which exhibit an advance in the direction we have been speaking of; whilst there are some productions, both to a the are the target morif. The speaking of; whilst there are some production. Eaglish and foreign, that have great merit. military trophies,-

"With guns, drums, trumpets, blunderbuss, and thunder, have nearly all goue, and the art in the sculpture is

all the more expressive for the onission of them. Apart from what arises from the b-otherhood of art, the exhibition is one in which architecturally, there is much interest. In a recent article on public there is much interest. In a resent article or statues,* we referred to the amission on the sculptors, to recognise in the whole group, principles which were those of architecture, and to attend to architectural details in the accessories and the site. Although the requirements in the case of groups within buildings have not been so promineutly before us as in that of sculpture out of doors, similar points re-quire to be considered in all monuments. It does not follow that the sculptor is to adopt the form of a pedestal which may have been used, or would be suitable as part of a building, or choose the alternative of a plain block : these are common errors, from which the works in West ninster Hall are not free. But every ac essory should be designed specially for the purpose, and for the particular monument; and architectural accessories and sculptured figures should all group as parts of one whole, -- the product of, in fact, one art. Sometimes the architectural, and some fact, oue times the sculptural element will predominate. The

* See p. 213, ante.

THE BUILDER.

former occurred in the Gothic canopied tombs, and former occurred in the Gothic eanopied tombs, and strikingly in the enclosed chantries, and also in a very marked memor in the Elizabethan works, which are essentially monuments produced by architecture: the latter predominant element would best effect the aim of recent works, where a story has to be told, and where, therefore, the por-traiture and "phonef.co" character of figure sculpture gives it peculiar advantages. In the present collection there are, however, several works worthy of notice, which merely use architectural deals, and a general which merely use architectural details, and a genera architectural principle of grouping. One of the which interfy use architectural details, and a genes architectural principle of grouping. One of the works, --- nevertheless, one of the best in the collection, --- has a defect, as we must consider it--- though following the example of the Choragis moust th though following the example of the Cooragie moni-ment of Lysicrates—of being in appearance au archi-tectural structure, with roof or domed covering, yet-heing really a solid mass decorated externally, though with scale/tarad accessories. It was suggested in our last, in allusion to the architectonic works of modher class, that oue building within another might be an error. In the Gothic cathedrals, there was a reason arising from the services in the monumental chapel for the distinct structure of the chantry. For modern for the distinct structure of the charity. For mosen monuments, naless where the structure would enclose the actual entrance to the grave—as in the Charlen of the Holy Sepulchre—we should be disposed to prefer a monument mainly sculptural; and of this class there are some at Westminster Hall, making a'l the use o' architectural clements for which we have at any time contended.

A considerable number of the works appear ques-tionable in principle, in smuch as unity of expression Conable in principle, instantial as unity of expression is not kept up in the same monument. They are like the pictures such as those by Holbein at Hamp-ton-court, which represent in the same secone several different incidents. Thus, as parts of one monu-ment, we have above, a figure of the hero in action, and a *representation* of a monument to him, with a distinct figure recombont, below. If it were the fact that the body of the decreased were actually hemeath, a simple scroopharms in the lower act of the monuthat the body of the decased were actually hementh, a simple sarcophagus in the lower part of the monn-ment of which the portrait statue is in the upper part, would have peculiar significance : otherwise the *tomb*, whether with or without the resumbent effigy, seems not strictly correct. The design is less ob-jectionable when the sarcophagus occurs in the upper part of the work,—it is there obviously only em-blematic, a part of the *monument*, and not pre-sented in the way of miniery of the neural tomb. The models themeselves are eighty-three in number, ranged in three rows along the Hall, and on the dais, on temporary pedestals or sup-perts (two models on each), which are covered with crimson eloth.* The foreign competitors master in considerable force, as may easily be discovered :

in considerable force, as may easily be discovered in but the numbers have now been altered, so that the distinction does not appear as when our form was written. The general effect, viewed from the dois, is very good. dais

Many valuable thoughts will be found expressed in works by foreigners, and an equal amonut of merit in those by our own artisls. Owing to the requisite attendance of the competitors to put up their models, authors' names can be no secret at the Office of Owing to the requisite authors names can be no secret at the Omes of Works—more than they were generally in the Public Offices competition. It is very question-able whether any advantage results from the system of concealment. It would be quite sufficient to other it would be quite sufficient to of conceations. It would be quite summerer to make it optional. One whose name has any prestige is sure to make himself known; and it would be rather batter that this should he done of course, than done secretly. Where much depends wonto be ranked becomely. Where much depends upon the execution of a work, a reputation even might be taken into account. The authors of really meritorious designs had better, in any case, have the positive advantage which accrues from publicity, than the uncertain one dependent upon the best-informed and most becaused for the second aud most hononrable of judges. Amongst the designs which earry out the sculp

thresque as well as architectonic principles that should be always observed, and which also conver the idea of a certain lavish devotion of art require the near of a certain invisit devotion of any required by the importance of the subject, we have marked No. 41, which appears to be the work of a foreigner. The grouping of the whole is excellent, and the archi-lectural details of the base are subordinate to the sculptoresque element; and are novel and good—

* The designs were advertised for at the beginning o The designs were advertised for at the beginning of Subscripter in last year; likey were to be one-fourth the Subscripter in last year; likey were to be one-fourth the subscripter in last year; like year to the north side of 13 fort by 3 feet, and, which was to stand upon a space of the nave of the cathedral, soft, and the north side of dome; the cost was not to exceed 20,000, area below the might be suggested; if properly shown on the model; nine premiums, smourting to 3,200, were officed, or in anns of 7000, 500, 300, 201, and free of 100, each; the artist to whom was awarded the highest premium, how, with, rememped to exceed this design, was not to receive the property i had the successful models were to remain the property of the Government,

JULY 25, 1857.

whilst not those of an ordinary pedestal. Many of the works which are amongst the earlier numbers of the series,-even where otherwise unexceptionable,-The series "two wave of the values of the theme. Such is do not grow to the fulness of the theme. Such is the case, both with works which are mainly sculp-tural, and those which are mainly architectural. In the sculptural class under this general category, are No, 2, where a figure of Britanua is crowning Web-low the main the value in instant of covening Weblington, and the principal interest of the composition would have to be looked for in the equestrian figures his companions in arms, surrounding the dado of e oval pedestal. Alto-relievo on the corred plan the would be very objectionable, as the model shows. Likewise (as in No. 7), a mere statue of the Duke as the State-sword bcarer, with whatever accessories of figures around the base, would not satisfy the national hject, or the other conditions. No. II is a work from Rune, of so much beauty and merit that we may be induced to give illustrations of it; hat it is a work about let work and the state of the sta is a distinction between a memorial or monument and a nonumental tonh, which, we say, should be observed. The details of this work are beantifully designed in the style of the Renaissance, and deserve examination as illustrating the real character of that style,—as to which, from the indefinite use of the term, there has been much confusion of ideas of We are more pleased with the admirable work is placed next. In this (12), the architectonic late late. We are more performed as the second performance which is placed next. In this (12), the architectonic element is indeed prominent; but figure sculpture is also freely introduced, and hy its treatment at once the sculpture interval of the second or the second sec claims attention. The architectural details and orua claims attention. The architectural details and oran-ments also are novel and suggestive. The principal mass consists of a superstructure of sculpture, well combined with the architectural details, and supported by an arch highly enriched with carved oroament on the face, and colour on the sofill, and spanning a broaze lid of a sarcophargus, on the ends of which are seated figures. One of these is a mourner and the other supears to be recording the mourner, and the other appears to be recording the great deeds of the deceased. In the *podium*, coloured marbles are introduced in panels. A statue surmounts the whole.

Polychromy is not generally adopted, unless by ne use of coloured marbles in pedestals. Bronze th and granite, and also the same materials. Brozze and granite, and also the same materials and Carrara marble, are sometimes combined with tolerable effect, as in one work at the end of the Hall, but house at the local states of the same state of the same states of the same state Hall ; but hronze as the sole material of the figures Hall; but hronze as the sole material of the figures is adopted in only one or two works; and these are more remarkable for their good modelling, than for the hearty, or at least originality, of their design. The modelling in general, through praised by the newspapers, has not appeared to us equal to the requirements of the case; and nuquestionably it is such as to detract in many works from the expres-sion which the artist intended to convey. It descreas any interim which is in and more for the terms consideration whether it is well, even for the tempo-rary purpose, to neglect the expression of the faces so much, as has been doue in many instances. The Duke of Wellington himself is not always identified Factor of relative and the motion of the moment requires : and in one instance, the face bears more rescublance to that of Sir David Wilkie, than to that of the other great man intended to be commemorated.

Polychrony, however, enters largely into the effect of the domed shrinc, with sedent figures at the angles, and a recombach figure honeath, which is numbered [3] in the collection. The scale of a model is pecuand a recombent neural metal, which is fraction to the secu-liarly indecollection. The scale of a model is pecu-liarly infavourable to it, from the rescultance to pastry-cooks' work liable to be suggested to those who do not make allowance for dimensions, or who are touched with that besetting sin of amateur criti-cism—the making out in every work resemblances to so nothing common or vulgar, however far-fetched, an objection, this referred to, which is not lightly to he encountered, but which is often preferred as though it were the sole object of criticism, and as though the beauty and enjoyment of the present and actual were of no importance. Portions of No. 13 show a practised notimportance. Portions of No. 13 show a practised hand in monumental sculpture. No. 14 has also a recambent figure under a structure of Byzantine character, which would be chiefly dependent upon its coloured details. These are only sketched on the barrent details. coloured details. These are only sketched on model, not shown as the instructions require. model, not shown as the instructions require. The letter of the "instructions," — assuming the exact site on the lithographed plan to he hinding—would be departed from in No. 15. It has a good sedent figure on a pedestal, which, of course, would have to be placed transversely to the line of the nave. The same this assume in at have to and the group, and it thing occurs in at least one other group; and it would curiously exemplify the error in the more important case, of which we have said so much, Would carlously exempting the drive we said so much, were it found here that works of merit seut in could not be allowed to compete, or that the strict-ness of definition had prevented the appearance of some suggestions. Perhaps, however, the advisors of the Office of Works or of the eathedral authorities, have given consideration to what would best conduce to the effect of the cathedral itself. No. 36 has the motto "Past Away," and one of

No. 36 has the motto "Past Away," and one of its prioripal figures is an angel, with finger on lip, and closing the bronze gate of a tomb, near which lies the British lion. The upper part of the monu-ment consists of a group of figures, including one of the Duke. This design will probably be that which will tell with the public. The prominent feature in it is unquestionably a flue conception : probably in those qualities of art which it has, it is not surpased by any other work in the collection; and simplicity of treatment and indilicibility he na means meaning ay any other work in the contection; and simplicity or treatment, and intelligibility, by no means necessitate poverty of thought. But we question whether as a whole, the monument does not offend against the unity of aim for which we have coutended. Like the table: hyblicy chiling a mersentation of a monument in hy Marochetti, lat-dy placed in St. Paul's Cathedral, and which exhibits a representation of a monument in the actual monument, the work here hefore us, mixes ap different motives in its expression,—or confuses the objects of actual *facto-smitle*, and imitation in art. The confusion referred to, however, is greater in No. 38, where the recombeut figure, on a tomh, is placed within a structure, which supports a distinct figure. figure.

No. 49 is noticeable for its combination of figure seulpture around a central stem, or support; hut here the design, though it has considerable heauty has not the same merit as those works where curved lines are less used in the structural part ; and seems hetter fitted for objects of small dimensions.

In No. 55, there is an equestrian statue in advanc of a group of allegorical figures and a pedestal, with a victory at the summit. No. 65 has some good details of ornument, and generally an architectonic arrangement. No. 68, which we have already referred to as involving what is somewhat de cetive in principle, is, never-theless, a work of extraordiury ability. Its author says: -- "In this design, the aim has been to make an architectural muss, in harmony with the structure and position in which the monument is to be placed, and to embody the chief features in the character and principal incidents in the life of the warrior and the statesman." No. 76, a work not without merit, fails in grouping

Taking of the principle of design sometimes adopted in Birmingham manufactures, where a portion of one antique work is thought good anywise conjoined to any other.—No. 80, for honzy, chiefly remarkable for its modelling, we have alluded to; and in No. 83 is the granite sarcophagus of archaic form, in the is the granite sarcophagus of archaic form, in the superstructure, with figures reclining on it, or grouped around, which we have mentioned; and we have omitted to give due attention to No. 27, in which the gratest variety of materials is employed with best effect, especially in the horaze figures, seated around the pedestal of the central statue. But we were not prepared by the short inspection that we could have this week, to do justice to all the merits of the works, and much less to enter into description: we have, however, ventured to offer some remarks on general principles-which we believe have acception, we have not even, tendine to inter some remarks on general principles—which we believe have lately hern more considered in our special hranch of art, than by sculptors—though ever required; and we are quite sure that with consideration of these, the technical skill which is now put forth could proworks monumental and memorial, second none, modern or antique.

THE SCULPTURE OF THE ROYAL ACADEMY EXHIBITION

FROM wandering through the five rooms in which Proof wandering inforge the new rooms in which paintings are exhibited, the ordin nry visitor to the Royal Academy descends, tired and wearly, to the Sculpture-room, or Sepulehre, as it is variously called, by the Academicians and the public respectively. Occasionally some one visits this small receptacle to see the work of a friend, or the portrait of some well-known individual; hut after the hrilliantly lighted above inductional, for arter the fright colour of the paint-rooms upstains, and the hright colour of the paint-ings there, the darkuess and muddle of the sculpture-gallery do not tempt him to prolong his search after the expected work is found. Of course the newspaper eritic visits it, and sees the sixty busts looking like sixty clean casts from moulds of last year's busts busts looking and the arrangements of the figures enable him to see a distinct view of the backs of a dozen when look ing at the front of one. No doubt he is greatly edified by the *spectacle*, and sculptors and their Subdute go there to mourn over the position of their works, and breathe something which is not a pracer, for the academic administration which consigns all their thoughts, and toil, and trouble, to the darkness of such a tomh.

of such a tomh. You see the sculptor there pointing out his work to a friend, half unwillingly, for he says that the light strikes it in exactly the opposite direction to what he intended; that all the strong points are in shadow, and those parts which he paid least attention to are

THE BUILDER.

thrust forward by the misplacement. His friend naturally asks why the academic sculptors do not propose a more suitable place for the exhibition of sculpture; hut is answered by the information that it Simplure; but is attastered by the information that in has been done over and over again. "There is no reason," he says, "why the room should not be enlarged and properly lighted, or that other means of exhibition should not be made use of. It has been proposed, for instance, to place two figures in each of the three hears meintime.more --one on each side al the three large painting-rooms, —one on each side of the central passage, with pedestals to bring them on a level with the cyc, and so arranged that the contras of sculpture and painting, form and colour, might enbance the appreciation of both. This," he adds, "might easily be done, without any great expeci-ture, and with considerable advantage to the sculptor; but how are the five academic sculptors to obtain combine from the sculptor is a sculptor in the sculptor is a sculptor. anything from the thirty-five painters? Painting refigns triumphant, and sculpture and architecture, on which it depends for its very existence, are both thrust aside as things of no importance. And so, I causes a viore equable distribution of space." Let us hope that this influence is already in opera-

Let us hole that tops influence is already in opera-tion. The sculpture this year is said to be very far below the average of late exhibitions, and the public verdict is never very wide of the mark. Nevertheless, there are some works in it which decreve to be remarked, and a few of the highest art. There are a greater number of marks holding a secondar motion remarked, and a lew of the highest art. There are a greater number of works holding a secondary position in the scale of art than in any exhibition of several past years; and perhaps the reason why, as a whole, the exhibition is said to he had, is that no one work standing out from the rest has been a source of attract Standing out from the rest has been a source of attrac-tion. A single fine work, however, does not coasti-tute a good exhibition, and there is more hope, and more vitality, in this year's exhibition, than if an "Eve at the Fountain," or "Youth at the Stream," attracted daily crowds to their solemn place of estomhment; for in the latter case we should see the advance of mean only, whereas we uow see the advance of mean. the advance of many. In 1209, and 1215, we have the marble repetition:

In 1209, and 1215, we have the marble repetitions of works previously exhibited,—" Adam consoling Eve," by Bailey, R.A. and the "Young Naturalist," by Weekes, A.R.A. who contributes also, 1218, "The Nother's Kiss." Both of these last works are indicative of high promise. The design of the "Young Naturalist" is simply the study of a girl, who in all the simpli-city of a child is wandering on the senshore, gathering shells and anastic speemens. Mean while the "breezes shells and aquatic specimens. Meanwhile the "breezes dance in her golden hair," and hlow her drapery elose upon her delicate limhs, causing her to stoop elose upon her delicate links, causing her to stoop-forward and place one hand upon her knee, whilst with the other she holds a starfish. All the artist has simed at is natural beauty without much design, but with fine workamaship to produce a plensing study: he has succeeded perfectly in it. "The Mother's Kiss," hy the same artist, is of a higher order: it is maternity embodied. The figure is well felt, and admirably modelled. It is worthy of remark that Mr. Weekes is his own neet, and whether his sendant is in illustration of

poet, and whether his sculpture is in illustration of his poetry, or vice versa, it is uot a little to say that they are both true to nature, full of grace, and fit each admirably.

1211. "Beatrice Cenci." This reclining figure which is the production of a young lady, a pupil of Gihson, Miss H. Hosmer, although forcibly remind-ing one of modern monumental sculpture, is vastly Gihson, Miss superior to it in design and execution. It is well that so poetical a character should find so able an onent, and well also that the sculptress should eet subjects to grapple with which are evidently exponent within her powers. 1237. "Portrait Statue of the Hon. E. Cornwallis

1237. "Portrait Statue of the Hon. E. Cornwollis Anderson Pelbam," hy W. Th-ed. This is undoubt-edly the finest work in the exhibition. It is seldom that one can speak well of portrait-sculptare, for few men have the power to make a portrait-statue convey more than the likeness and character of their subjects. Here, however, it has been regarded as the vehicle,— the means, and not the end. The portrait no doubt is excellent, for the face shows a close resemblance to the individuality of nature; but if it were not a por-trait, the statue might stand on its own merits as an ideal work of the highest order. It is a child bolding a hird in its hand, skipping along regardless of the little pet, who is pecking the child's hand rather in love tham illnature. The drapery, which fulls to the weaks blow back close mon the figure and thighs of the boy, and its disposition, displaying what it is meant to conceal, viz. the beautiful form of the child, is so true to nature, and yet so grand in its treat-

cially the one holding the bird. This is Pre-Raffa-lle ism in sculpture, and of that kind which does not indulge in eccentricities in order to make itself con-spicuous, but adheres closely to nature as the greatest element in beauty.

It is to he regretted that English architectural It is to be regretted that tagging arcmeterural sculpture should be non-existent. Sculpture, as the earichment and perfection of architecture, is a field that might well tempt many, yet how few, with the feeling and education of artists, are content to enter apon it ! And here it would be well to notice how lementable is the result of our painters and sculptors are apprendent and a set as a white independent regarding their several arts as subjects independent of architecture, for much of God's time is wasted, and his talents abused, by this selfsame conce both painters and sculptors remember that they are both painters and sculptors remember that they are the ministers of the architect, and that their arts are morely the result of the development of architecture, and then we shall have works true in their adaptation to purpose, and heautiful in their truth. There are, however, several works here which profess to he architectural. Amongst them may he noticed Nos. 1225 and 1232,—the first a statue of the Bard by W. Theed for the Ergentian, hall in the

the Bard, hy W. Theed, for the Egyptian-hall, i the Bard, by W. Thread, for the Egyptian-tail, in the Mansion-house; and the second, a statue of Hippo-crates, by Munro, for the New Museum at Oxford. Both these figures are proofs that arcbitectural sculp-ture is non-existent. Together with the statues of Fox and Chatham, they show what little attention has heen given to architectural effect; and their spe-ical chief the states this.

This been given to architectural enect; and their spe-cial object was to produce this. It is some confort to find that part of the third and lowermost circular ledge which rons round the room, and has previously been devoted to busis, bas room, and has previously been devoted to husls, bas been set apprit for statuettes. 1350, " Dr. Latham," by Papworth, sen, is an example of portrait-sculpture possessing some fine feeling, and much good modelling. Amongst the statuettes worthy of notice are 1243, by S. Ruddock, and 1245, by H. H. Armstead. The former, illustrating the passage, " He bath regarded the lowliness of His Handmaiden," is well designed. the lowliness of His Handmaticn," is well designed, and shows considerable power in the treatment of masses of drapery, and delicacy in the modelling of the face. One of the best features of this year's exhi-bition is the comparative absence of bad imitations of Greek models. It is impossible to he too severe on such pieces of hypocrisv, and their failure will hear out the severity. English sculptors seem nnaware that the respect paid to classic works results chiefly from their historic value, and because they were the exponents of a creed in which the artists believed, and which possessed much pactry. Neither of these exponents of a creed in which the artists believed, and which possessed mucb pactry. Neither of these qualifications can be attributed to the works or mo-tives of our modern initiators, and therefore they will never ohtain the same consideration. It is impossible to produce hetter Apollos, or more graceful Venuses, or more auatomical Laocoons, than we already have; or moither do we ver see such things at the present day, or think of such things; nor are one most beautiful thoughts a most allocate provide means in more thoughts or most allocate provide means in more thoughts, or most pleasing reminiscences, in any way connected with such things; --so that we need them not, either for the satisfaction of our intellect, or the cultivation of our imagination. The creation of works of art with inspiration drawn from heathen who is the second matrix of the second matrix in the second mythology, is like speaking bad grammar in an un-known tongue, and deserves a similar reception. To be appreciated, a work mat he maderstood,—and who understands Greco-English sculpture? Walter Smith.

PRIZES TO THE DISTRICT SCHOOLS OF ART.

THE award of medals to the successful students, in

THE award of medals to the successful students, in local competitions, of the London district schools of art, took place on Thursday, the 16th day of July, in the new Lecture Theatre at South Kensington. The Hon. Mr. Cowper, in addressing the students, said that it gave him great pleasure to be the means of the distributing of medals so fairly carned. Ho had examined many of the works which were to be rewarded, and thought them very highly creditable to the producers of them. He had also been told, by those who were better judges of such things than himself, that there were some becautiful works amongst them. and that they showed a very considerable advance on previous years' works. He would call upon Mr. Redgrave to address the students.

Mr. Redgrave said that, in addressing the students upon the subject which had brought them together, be must tell them how he had been struck by the works which had been hrought before him. They They slowed nucle care and delicate nanipultion. He would more especially notice the progress make in applied design in the Central School. The designs showed a more correct appreciation of nature than he meant to conceal, viz. the beautiful form of the child, showed much care and defined indipartion. The is so true to nature, and yets og ground in its treat-would more especially notice the progress made in applied design in the Central School. The designs we might cite this as a perfect instance of the union of natural with ideal heauty. Examine well the had yet seen, and the designs themselves were little feet, and let painters take a hint from them, how feet bearing the weight of the figure should press they feet bearing the weight of the figure should press upout the ground, and not be merely tangential to it: He took the first opportunity of their assembling in and then look no less carefully at the hands, espe-

the position and advantages which were to he derived the position and accuracy when were to be derived from their making use of the means in their hands. They had the Museum of Science and Art, and they had the library with most valuable books in it, which they ought to consult and study. He did uot hesi-tate in saying that, as a school of art, the Central School were the set of tate m saying that, as a school of art, the central School was the best to he found, much better than the Royal Academy for carnest students. The number of works in the Minseum, and also the number of casts, should be of incalculable benefit to the students. He would especially mention the extent of and beauty of the ornamental easts there. A friend of his had applied for admission to the Royal The students. It would specify horizon that friend and beauty of the ornamental easts there. A friend of his had applied for admission to the Royal Academy, as an architectural student, thirty years ago. Most of those present were aware that the architec-tural drawing had to he necompanied by a drawing of ornament, and, after searching in all the plaster-shops in London, he could not find a piece either good or bad, and was obliged to have a piece squared on pur-pose. That was at a time when Italian boys were in he habit of taking casts of Tohy Pbilpot round the country, brightly coloured, with blue coat and yellow breeches. Instead of these, the Italians now sold casts of the best works of antiquity at a low price. Amongst other contents of the Museum would be found some heautiful photographs, coloured, of jewels helonging to the old French kings, and furniture, and such like things, which in themselves were works of art, were there preserved from deeay. Then there Such that things, whice in themselves were were were were a art, were there preserved from decay. Then there were galleries of modern sculpture and painting. Pictures had heen given for the sake of public educa-tion, in the most noble manner. Art was always unselfsh; and a good illustration of that was Sheepbanks's and a good instation of that was Sucep-banks's stripping bis own walls and generously giving his pictures to the public. Vernon and Turner had doue the same, and Sir Francis Chantrey and Scaue. He would recommend all students of archi-tecture to see the Soaman collection, and whoever wished to do so might obtain tickets from him. He would remind the students that, in a similar spirit

be followed merely from that motive. Mr. Cole then proceeded to call the names of the successful students, and Mr. Cowper distributed the medals.

medals. The medal bears the Queen's head, with "Victoria by the Grace of God, Queen;" and on the reverse,— "National prize for success in art, awarded by the Department of Science and Art." The medal itself is of copper, very thin, and not so artistic a work as we should naturally expect as a reward for success in art by a Department of Science and Art.

FRATERNITIES.

In answer to "An Architect's" letter (p. 390), I Is answer to "An Architetts" fetter (p. 390), 1 would only say that he appears to have misappre-hended my aim, which was only to urge the benefit of more mutual co-operation amongst architects in carrying out into practice *any* principles of art what-ever. Take the most extended view of art which he ever. Take the most extended view of art which he himself advocates,—this practical personal re-union is still wanted, quite independently of the falscoess or trath of principles which have been admirably worked out and systematized. Allow, too, to the fullest ex-tent the fan exercise and its of the false factors. tent the fine sentiment which your correspondent puts in the mouths of Phidias, Bramante, and Wren, and the full meed of praise due to their respective works. I only maintain that the magnificent archi-tecture of the Gothic period, to which he so forcibly alludes as having passed through its four distinct eras, emanated not so much from single individuals eras, ennanced not so much from single individuals as from the conventional agreement of those who worked it out in accordance with certain laws and principles; and it is upon this that I hase my plea for that close personal intercommunion which I hold to be essential to any successful development of art. W

THE METROPOLIS. New Works on the London and North-Western Railway.—The operations for rebuilding the general goods station and warehouse of the London and North-Western Railway have been commenced hy Mr. Jay, the contractor for the building, under the super-intendence of Mr. Baker, the engineer, and Mr. Stanshy the architect of the company. The new Stanshy the architect of the company. Intendence of Mr. Baker, the engineer, and Mr. Stansby, the architect of the company. The new huilding will occupy precisely the same site as hefore, but will extend over a considerably eularged area, and will cover, altogether, a superficies of 59,000 square feet. The part of the original Basement that wasvaulted, and which has not suffered from the late catastrophe, will be retained; and the basement of every part of the enlarged huilding will, in accordance with the new design, he vaulted. The ground-floor of the building, together with the platforms, will be clear of new design, he valled. The ground-noor of the livery han the snares, we are too, have been sam-building, together with the platforms, will be clear of all obstruction throughout, for the hetter accommo-dation and management of the extensive goods traffic. The clerks' and managers' offices will be on the upper

floor, and will be vaulted, and rendered fire-proof. On all sides of the building, which will be very nearly a square, the warehouses for storing of goods will be constructed, and the interior will be lighted from above by a glass roof. The walls will be of briek-work, and the girders of the floors of wrought rade aget in a guarder by income advance. The and cast iron, supported by iron columus. The stabling and smiths' shops that hitherto formed part of the building, will, to prevent as far as can be all pos-sibility of future fire, be removed from the building altogether to the other side of the Gloucester road, attogener to the other size of the object of new stabling with all the requisite smiths' shops, harness-rooms, and machinery: water-pipes will be laid rooms, and machinery: water-pipes will be hald on throughont the new structure, and there will he rails all round, to bring up the goods trucks to the goods platform. It is expected that the building will be completed in about four months from this date. New stations are being constructed at Watford (Mr. Palmer, contractor), and at Harrow and Finner (GR. Parnell, contractor), in consequence of the widening of the line out of London, which will ulti-mately extend, in quadruple rails, dwar, to Michael matching of the line out of London, which will ulti-matchy extend, in quadruple rails, down to Bletch-ley, some forty-six miles from London. In noticing the new structure naw emdiance in the structure for the structure naw In noticing they some bory-sis miles round London . The noteing the new structure now erecting in front of the Euston Station, p. 396, for the shelter of vehicles and the public, it was stated that Messrs, Lawrence were the contractors. It should le said, however, that they of Thrapston, is the courted of a completed in about a The Works at the Ornamental Water in St

Inc works at the Ornamian a deter in St. James's park.—The operations in connection with these improvements appear now to be completed. The contractor's men have been engaged during the week in carting away the plant, and in general elearing up. Street Nomenclature .- The Metropolitan Board of Works have just taken the first step in the prop reform of "street nomenclature," about which a s ed a sbort time since there was much discussion. They are eausing to be issued notices to the owners and occupiers of all houses in the New-road, between the Angel Inn, Islington, and the Edgware-road, Pad-dington, ordering them to affix or paint upon their houses or buildings only new a prior theory of the houses or huldings such nones or numbers as the Board shall approve or direct. The Board have de-termined that that portion of the New-road between the Angol Inn, Islington, and King's-cross, shall be called "Pentonville-road," that portion between King's-cross and Osuabarg-street, "Easton-road," King's-cross and Osuaburg-street, "Easton-road;" and the portion between Osnahurg-street and and the Edgware-ro and the portion between Osnahurg-street and Edgware-road, "Maryleboue-road," The names of existing roads to be abolished. The Board state that the proposed alterations have heen approved by the First Commissioner of Works, and that they are to take effect from and after the 31st of this month.

take effect from and after the 31st of this mouth. Westminister Improvements.—On Wednesday in last week, the committee of the House of Commons threw out this Bill. Its object was to "wind up" the affairs of the Westminster Improvement Com-mission, and to appoint three official Managers for that purpose, to he called "The Westminster Eneum-hered Estates Managers." The promoters of the Bill alleged that the commissioners had not been able to hered Estates Managers. The promoters of the bin alleged that the commissioners had not been able to complete the contracts entered into for the purchase tstanding interests in laods lying on both sides of outstanding interests in lacks lying on both sides of Victoria-street, and that in consequence thereof the lands could not be sold or leased for building, nor could the existing dilapidated and unsightly huildings he removed, to the injury of owners of outstanding interests, and of the mortgagees and bondholders, and of persons interested in the improvement of pro-perly in the parishes of St. Margaret and St. John, Westminster. The promoters, therefore, sought power to have the lands and promety of the commu-Westimister. The promoters, therefore, sought power to have the lands and property of the commis-sion sold, collected, and divided among the creditors, whether hy mortgage, bond, or otherwise. The Bill vas thrown out, consequent on the opposition of certain of the bondholders.

Finsbury Park .- The Committee of the House of Firshury Park.—The Committee of the House of Commons have passed the Bill promoted by the Metropolitan Board of Works, for establishing a people's park for Finshury. The City withdrew their opposition and that on the part of St. George's, Hanover-square, was declared by the committee to have to locus standi. Westminster Palace Hotel.—This is the fille of a we underthing interviewed mode the limited

Bestimmister Falace Hotel.—Ims is the tille of a new undertaking, just registered under the Limited Liability Joint-Stock Act, for creeting an hotel in some central part of Westmioster, and to purchase lease-bold lands for that purpose. THE TREASURY, WHITEHALL.

THE TREASURY, WHITEHALL. If the intentions of the present energetic-Chief Commissioner of Works be carried out, we shall soon see great changes in Whitehall, and we have heen led, therefore, to precede the illustrations we intend to give of the selected designs for the Government Offices, with a view of the St. James's-park front of the Treasury; as designed by William Kent. As carried out, it will be found, a little to the south of the Horse Guards, to have the projecting ceutral portion with two windows only on each side of it instead of the extension shown in the energying instead of the extension shown in the engraving. It consists, as will be seen, of a ground-story of Doric character on a rusticated basement, and an upper story, which has, attached to the projection in the centre, four three-quarter c columns, carrying an entablature and Ior pediment ; the entablature running through, and forming the termination of the front wall of the wings. Several offices, of which we will pre-sently speak, were destroyed in 1733, in order to erect the present building facing the Parade, the expense of which, according to Malcolm (Londinium Redivirum, vol. iv. p. 312), was estimated at 9,0001.*

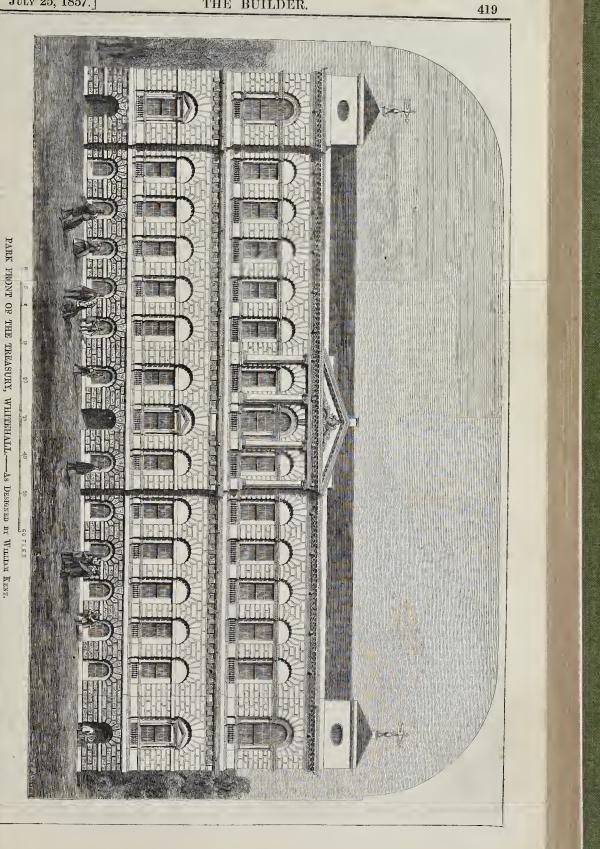

Whitehall, it may he well to remind our readers, extends from Scotland-yard down to Canon-row, and from the Thames to St. James'spark. It was originally known as York Honse, and belonged to Cardinal Wolsey, and was first called Whitehall when King Heury VIII. took possession of it :---

"You Must no more call it You For, since the Cardinal foll, that title's lost: "Tis now the King's, and called White Hall." *King Henry VIII*. Act iv. a. 1.

The King's Palace was seven years in build The King's Palace was seven years in build-ing. There was a public way through it, with two gates, one of which was built under the direction of Holbein, at the north end of King's-street. This gate was taken down in 1759. Amongst his other works, Henry con-structed a cock-pit, close by this gate: the gate, indeed, came to be called "Cock-pit-gate." This cock-pit after various changes sattled This cock-pit, after various changes, settled down into "The Treasury." Godolphin, Lord Treasurer in the reign of Queen Anne High stathree or, four times a week "at the Cock-pit." Mr. Timbs, in his "Curiosities," says the phrase---"Given at the Cock-pit, at Westminthe pirase of the action of the collection. It occupied nearly the site of the Whitehall front of the Treasury,—the Board of Trade Office, first put into architectural shape by Soane, and then, as our readers know, made to take its present appearance by Sir Charles Barry.

Whitehall Palace, after previous mishaps, was Whitehall Palace, after previous mishaps, was finally destroyed by fire Jauuary 4th, 1697-8. The old Banqueting-house had been hurnt down iu 1619: the present Banqueting-house was commenced, by Inigo Jones, in that same year, and was finished in 1622, at the cost, according to Mr. Cunningham, of 14,9407. 4s. 1d. The Admiralty was commenced in 1733. Thomas Biolog was the predicted and Theorem Churchill Ripley was the architect, and Thomas Churchill the huilder. In 1724, 600 planks of mahogany were brought from Janaica for the inner doors and tables of this building; and, judging by the way in which the wood is mentioned in the public. way in which the wood is mentioned in the public. papers, it was evidently far from well known. Looking south of the building we have illus-trated, in King-street the poet Spenser died from want, and here Cromwell lived when Member of Parliament. In a house facing Charles-street lived the poet Prior; and in Gardener's-lane, extending from Duke-street to King-street, died (1677) Hollar, the celebrated engraver, at the moment when he had an execution in bis house. He desired of the sheriff's officers, says Oldys, "ouly the liberty of dying in his bed, and that he might not he removed to any other prison but his grave."

* The same writer asys-""The same of the freshed and inheritance of the and and buildings from Syndar-gardens-passage to the Admiralry was estimated, in 1757, at 05,344. exclusive of a brick house adjoining the old gateway near the Horse Guards, said to be worth 1,137."

JULY 25, 1857.]

THE BUILDER.

THE WORKS AT DOVER HARBOUR

THE works now going on for the formation of what is called a harbour of refuge, at Dover, are of such as called a harbour of relige, at Dover, are of solar an extraordinary character, and involve such an enormous expenditure, that the particulars should be better known than they are. During a recent debate on Supply, Mr. Healey made some statements which deserve consideration. Gulphed, as these are, in the on Supply, strategies, Gulphed, as these area described as the second se some of the principal points. Mr. Henley first wished to know whether the Government intended to carry out the works which had been recommended, or whether they had other intentions. The operations at Dover commenced about seventcen or eighteen years ago, when a commission was issued—knows as the James Gordon's Commission—to inquire into the state of the south-castern ports. Nothing, however, state of the south-eastern ports. Nothing appeared to have come from that comm appeared to have come from that commission, and about 1842 a committee—known as the Shipwreck Committee—sat, and recommended many things, but only torached lightly on harbours of refuge. In 1844 and 1845 another commission was appointed, in which also the fighting element largely predominated, and they recommended, on the 7th of Angust, 1844, that a harbour be constructed at Dover, and that the works should be immediately commenced by carrying out ission, and should be immediately commenced by corrying out that portion which communicated with Cheesman's Head. Mr. Walker, and several other engineers, were These, Mr. Walker, and several other engineers, were next employed to prepare plans for the harhour, and also to state their opinions as to whether the shingle and silt would destroy the works when completed. They reported in favour of beginning at Cheesmans' Head, but said that no safe conclusion could be arrived at with respect to the shingle and silt, and, ia 1845, they recommended that the south front should be proceeded with. He now came to the resolution of the commissioners, which was communicated to the Government in 1846. The commissioners stated, in Government in 1840. The commissioners stated, in the first instance, that they were decidely in farour of a harbour in Dover-hay, adding that the chief points for consideration were the arca, the oullines, the position, the entrances, and the mode of construction. In the second and final report they recommended that the works should be commenced at a many points as practicable, and expressed their earnes have points up permission of the second seco Some length, into the question of construction, and the consequence was that two of the commissioners— Sir William Symouds and Sir Howard Douglas—dis-Sir sented from the report, the former stating that a large area was unnecessary, as the harbour would be visited only hy war-steamers, post-office packets, and a fev disabled or straggling merchant vessels, and that the evidence in favour of the mode of construction adopted hy a majority of the commissioners was conflicting and nusubstantial. At last, however, conflicting and musubstantial. At last, however in the autumn of 1847, after a deliberation seven or eight years, the works were commence seven or eight years, the works where commensed, the commissioners having decided — Sir Howard Douglas and Sir William Symonds dissenting—to build the walls nearly upright, and to enclose an area of about 520 acres. The estimated expense was stated to be about 2,500,000!. He now came to the progress of the works, and here he must express the strong opinion, which he thought would he shared by strong opinion, which he thought would be shared by the committee, that it was very desirable the country should be informed what the Government really meant to do with these works—whether they intended to earry them out ngon the original plans or not. They began with taking some 30,000*l*. or 40,000*l*. year; and the first contract, which was for a length 800 feet, was concluded in 1854. A second contract was then entered into for 1,000 feet, still pro-ceeding upon the plans which accompanied the final report of the commissioners, and in which no material alteration was made, except as to size and the position alteration was made except as to size and the position of the entrances. Up to the present time, therefore, the progress of the works had been extremely slow. Only 800 fect out of one mile and three-quarters, which was the length of the whole plan, were com-pleted in 1854, with some little extension of the foundations, and the contract which had been entered into since then for 1,000 fext was to extend over ten wears enalying in 1864, being at the rate of 100 feet years, ending in 1864, being at the rate of 100 feet per annum. It did not seem to him that the works years, chaing in 1904, being at the rate of 100 lect per annum. It did not seem to him that the works had progressed even at that rate, and he would pre-sently make some observations to show the reason why they had not done so. This work had to be excented by means of the diving-hell in deep water; and here he could not referin in messing from nor and here he could not refrain, in passing, from pay-ing a tribute to the skill, ingeouity, and perseverance displayed by the engineers and all employed under them in carrying out such an arduous and difficult undertaking. The work, however, was proceeding

has auvised that the works at Jover should be begun simultaneously at more places than one, and completed as rapidly as possible; and they also attached greater importance to this harbour than to any of the other works which they recommended. These suggestions had not, however, heen practically attended to. Only SOU for to the measure had been attended to. Only 800 feet of the masonry had been fuished in seven years up to 1854. Another, 1,000 attended to. Only SUD rect of the massing has have fusished in seven years up to 1854. Another, 1,000 feet were contracted to be finished in ten years more which would bring them to the year 1864. The format part of the work had here excented to comparatively part of the work had been excented to comparatively shallow water, but now the operations had to be carried on at about 46 feet below low-water mark. There still remained to he completed, according to the plans, 8,500 feet, which, at the present rate of progress — viz. 100 feet per annum — would take eighty-five years. If they added to this the seven years required to finish the 1,000 feet contracted to a finite the seven derived with the model of the seven years required to finish the 1,000 feet contracted to the seven years required to finish the 1,000 feet contracted to years required to missi the 1,000 feet contracted to be finished up to 1864, this would give them a period of nincty-two years over which the work would extend. Surely this slow rate of progress in-volved a great waste of capital. But taking the work done in deep water and averaging it with that done in shallow water, they would find that between 1847 and 1855 the actual rate of progress between 18% and 1855 the actual rate of progress was not 100 feet, but only 86 feet per annum. In-deed, in 1855 only 46 feet of the foundations had been laid, and in 1856 50 feet more; and as it was clear the work could not proceed faster than the foundations, instead of the undertaking being completed in 100 years, if it went on at the present ra it would probably require 200 years. Surely this was a very nusatisfactory prospect; and he was therefore anvious to learn whether the Government intended to carry out this work according to the recommendation of various commissions. Sir W. Symonds apprehended some difficulty as to the foundations. Let the committee mark the facts disfoundations. Let the committee mark the facts dis-closed ou this point in successive reports from Messrs. Burgess and Walker. In April, 1855, Mr. Walker said, "The progress of the works has been much delayed hy the weather, and also from the chalk foundation not proving so good as in the portion neaver the as stited in our special report of the 29th of July, 1854." The special report here referred to had not been laid before the House. In July, 1855, Mr. Walker followed up his former statements in these July, 1854. words :-- " The surface of the chalk heing still of an inferior quality, it has been necessary to such that massoary a considerable depth into it, to obtain a good foundation. The foundations are 41 feet below low-water spring tides." The remort of the 10th of water spring-tides." The report of the 10th of October, in the same year, said the foundation was still retarded from the necessity of removing a large quantity of soft material before it could be laid. It added, "The foundations are being laid 45 feet below low-water spring-tides." In July, 1856, Mr. Walker reported that "the soft nature of the hottom still retards the progress of the works;" and on the 68th of October of the same year, he said. "The of Octoher of the same year, he said, "The founda-tions are being laid upon the same description of bottom as described in our former reports, 45 feet below low water spring tides." Another matter which below low water spring tides." Another matter which below low water spring tides." Another matter which bore very much upon the time at which the harbour would he completed, was the interruption that the work had experienced from time to time from gales of Walker's reports, curiously enough, wind. Mr. of what she values reputs, curves, the same source light upon those discussions which took place some time ago as to the form in which the barbour should he constructed. One point discussed by learned men at that time was, whether, in point of fact, there was any percussion in the sea, some maintaining there was, and others that there was not. Mr. Wa that Mr. Walker's report, data January, 1851, referred to the storm which took place on the 23rd of October, 1850. Mr. Walker stated that portions of the new works were thrown down during the storm, as they were unable to withstand the continued shocks. Now, he (Mr. Henley) apprchended that shocks meant something like percussions. The successive gales and continued have percessions . The successive gaues and continued shocks washed upwards of 200 tons of stones out of their beds. He had been toll by persons coversant with the subject that these stones were of very large size, and that they had been fastened to each other in the strongest manner possible. On another occa sion the same thing took place. In 1853 many stones were replaced, and it hecame necessary to take np many other stones in order to replace them. Again, in 1854, a portion of the stones was displaced. and 240 feet of the staging was carried away. These accidents had, no doubt, occasioned great delay, but it was a matter of great importance to the House to be informed whether the Government really intended to complete the work as recommended by the commissioners, and whether they intended to proceed at a more rapid rate with it than at the rate of 40 or 50

mind to construct the whole harbour as recommended mind to construct the whole harbour as recommended by the commission, he was afraid he could not give the right hon, gentleman any satisfactory explanation, because, as far as he heave, that subject had never seriously been considered by any Government. The two commissions which had reported differed as to the area which should he included in that horbour, as well as one of the construction of the top of the second sec well as upon other points, the estimate in the one case being 2,000,000/. and in the other 2,500,000/. If the ultimate decision of the Government should be not to construct the larger harbour, a most valuable work would still have been completed; capable of work would still have been completed; capable of sheltering vessels and of holding a steamer at any state of the tides.

THE FAILURE OF GIRDER, WOLVER-HAMPTON

MENTION was made in our pages of the hreaking in June last of an iron girder, and the consequent fall of the arches of a new building, on the premises of Messrs. R. Perry and Sons, Temple-street, in Wolver-hampton. A young man named Thomas Lewis was seriously burt, and has same died. At the inquest held on the 7th and 158th inst., evidence was given that the girder which horoks had been substituted for one in which there was a crack about 4 inches long and one-sity of an inch wide stonet 4 inches long one in which there was a crack about 4 inches long and one-sith of an inch wide, stopped up with putty. Amongst other witnesses, Mr. H. C. Hurry, eivil engineer, who had been employed by Mr. Bridges to make an examination of the girder, having been called by Mr. Hayes, handed in a report upon the eause of the breakage, which was received as evidence. It stated that the breakage which was received as evidence. eause of the breakage, which was received as cvidence. It stated that the broken grider was one of a number used in the construction of a fire-proof floor, and was carried at each end by a brick wall, the space be-tween the walls being 13 feet 6 inches. The section of the grider was one of an inverted V, with three cross webs in its length. The griders were placed about 7 feet 9 inches apart: they were ted shout 7 feet 9 inches apart they were ted together by wrought-iron rods, and from girder to girder were thrown brick arches, with brick paring abve forming the floor. The weight of the portion of the flooring carried by such girder was about 7 tons 5 evt., including the girder. For the situation and circumstances, and allowing five a weight of oue ton per square yard to be put npon the floor, a girder wear required of a theoretic strength of about 27 tons. was required of a theoretic strength of about 27 tons. The maximum theoretic breaking weight for the girders used he found to be about 8°S tons. He girders used he found to be about 8:8 tons. He therefore considered that the girder used was much below the strength required. However, the ouly load upon the girder at the time of the breakage was the. fooring, a few workmen, and its own weight, which united might be taken as equal to about eight tons, or to a central weight of about four tons. Making the usual allowance for imperfections, a girder of a theo-retic strength equal to about twelve tons was re-quired to carry the weight that twee upon the cirder guired to carry the weight that was upon the girder that hroke. He therefore concluded that the girder was about thirty per cent. less in strength than it was prudent to trust the weight npon. He did not consider the iron of which the girder was made Was prodent to trust to evaluate normal consider the iron of which the girder was made to be of first-rate quality, but it was such as he should without hesitation have accepted as fair con-tra-et material for the purpose. Where the fracture should without nestantia have accepted as har con-tract material for the purpose. Where the fracture had taken place there was a small imperfection in the casting, but not, in his opinion, at all sufficient to account for the accident. The distribution of the notal in the girder was considerably at variance with Incluin the great was considerably at Variance with, the theory of cast-iron gridders as established by the best authorities. He was of opinion that had the rules given here more closely observed, a stronger girder might have been obtained with the same weight of metal. He was consequently forced to, the conviction that the accident resulted from the evident burging here mode by come with the resu girders having been made by some mistake con-structively imperfect, and therefore inadequate in strengtl

Mr. John Coley, manager to Mr. Bridges, whogave his evidence iu a nowise satiafactory manner to the coroner and jury, said there was no written contract for the supply of the girders. The section of the girders, the specification, and the qualities were sup-plied to him by Mr. Veall. The witness admitted, after much questioning, that it was his duty to examine the girders hefore they were sent cut from the foundry, but he could not say he had examined all the girders supplied to Messrs. Perry. Ile par-ticularly examined the girder which broke. He did not detect any flaw in it. Mr. Bridges' men creeted it. He and their moulder expressed an opinion that the girders were too weak, but the girders. He end Mr. Veall. He was not satisfied with the principle of the girder: he never saw one like it before. The other part of the building had hean prevented from fulling by columns being placed under the girders. Mr. John Coley, manager to Mr. Bridges, who gave Them in carrying out such an ardiums and difficult with it than at the rate of $40 \text{ or } 50^\circ$ the part of the building had been prevented from more rapid rate with it than at the rate of $40 \text{ or } 50^\circ$. He had examined the girder which broke, and there are such a search of the part of the building had been prevented from the rate of $40 \text{ or } 50^\circ$. He had examined the girder which broke, and there are such a search of the part of the building had been prevented from the rate of $40 \text{ or } 50^\circ$. He had examined the girder which broke, and there are such are such as such are such as such are such as such as such as the rate of the part of the building had been prevented from the rate of $40 \text{ or } 50^\circ$. He had examined the girder which broke, and there are such as such as such as such as such as such as the rate of the part of the building had been prevented from the other, coming in contact and not uniting. His

opinion was that the flaw arose from a small portion optimin was that the haw arose from a stand portion of scoria being mixed with the molten iron. The cause of the breakage was the defect in the caving, but such defect could not be seen hefore the girder broke, there being a shell over it. Mr. Veal tied some of the girders with a chisel and hammer. The was not paid at le per ewt. for good eastings : was not paid at all for defective oucs. Mr. F. R. Whgeldon, engineer, aud manager

Moment was pain at per device in good easings: he was not paid at all for defective ones. Mr. F. R. Whgeldon, engineer, and manager for Messrs. Homas Perry and Sons, of Highfields, said that by request of Mr. Veal' be examined the girler which broke. It observed a defect at the part which broke. It observed a defect at the part which broke. The birrer was generally very defective in consequence of "cold shuts," which were not apparent to the eye, hat he detected them by striking the girder which wave a scertained that it was defective. The witness then produced two pieces of iroo broken from the girder, in hoth of which he pointed out very extensive illustrations of his state. ment that the defects were produced by "cold shuts", "ceach piece not heing a solid mass, but composed of two layers, which had not united. The jury returned a verdiet of "Accidental death," accompanying it with an expression of opinion that

The puty returned a verdict of "Accidental death," accompanying it with an expression of opinion that great blame attached to Mr. Coley, Mr. Bridges manager, for not testing the girder in question with a hammer, in the absence of a hydraulic press, his attention having heen particularly drawn to the subject by the girder-which the casting that broke replaced—having been found defective.

THE DISTRICT SURVEYORS AND DANGEROUS STRUCTURES. METROPOLITAN BOARD OF WORKS.

A BERGOPOLITAN BOARD OF WORKS. AT the usu I weekly meeting of the Metropolitan Board of Works on Friday, the 17th inst., a deputa-tion from the Association of District Surveyors under the Metropolitan Building Act, presented a memorial praying the Board to institute an inquiry into the mode in which the provisions of part 2 of the Building Act relating to dangerous structures had been carried out, more especially by the memorialists. Mr. John Thwaites, President, in the chair. Mr. Woolwrych having read the memorial, Professor D maldson then explained that the object of the District Surveyors' Association was for the purpose of "establishing uniformity and respectability of practice amongst the district surveyors; for their protestor and matters relative to the Metropolitan Board Act, or any Act under which they may hold affles; and for co-operation in carrying ant any such Act efficiently, and with advantage to the public."

Act efficiently, and with advantage to the public." These were the broad, liberal, and public grounds on which the Association was founded, and the deputa-Which the Association was founded, and the deputa-tion came before the Board which had the appoint-ment of district surveyors, and the superintendence of the way in which they discharged their duties, in order that they might not rest under any unjust accusation as to the way in which those duties were discharged, or lose the confidence of the Board, activity of the board of the Board, which they were most anxious to possess. Part 2 was a very important portion of the Building Act, and was a very imp perhaps there was a very important portion of the Domining Act, and perhaps there was no other portion of the Act in which the public were so materially interested as that which related to "dangerous structures," and there was one part of it, the following, he would read, which was all that related to district surveyors — "Whenever it is used to be a Active Construction of the "Whenever it is made known to the Commissioners hereinafter named, that any structure (including in "Whenever it is made known to the Commissioners, and anything affixed to or projecting from any build-ing, wall, or other structure), is in a dangerous state, such Commissioners aball require a survey of such structure to be made by the district or some other competent surveyor, and it shall also be the duty of the district surveyor to make known to the said Commissioners any information he may receive with respect to any structure being in such state." By this provision the duty of the district surveyor was simply limited to this—that if any party gave him notice of any structure being in a dangerous condition, it was his duty immediately to send a notice to the Commissioners of Police. Now as directly bearing upon the provision of the Act, and with respect to the read the notice that hab ben given in that matter to the Commissioners of Police.

The commissioners of Police. Having read the notice, the speaker went on to say.—It would he found that the district surveyor ought notin fact to make a survey, because the survey is to be made by the surveyor to the Commissioners of Police, but as soon as the district surveyor found the premission a domesmue condition he for the view. the premises in a dangerous condition he forthwith sent notice. Then the Commissioners of Police sent their surveyor, presumed to be competent, and he made his survey, and he served notice of condemnation,

sent by one of the Commissioners of Police on the premises or the parties. The terms of this notice were very general. The President.—What was the date of the accident

in Tottenham-court Road ?

Professor Donaldson.—May 9. The President.—And what is the date of the notice given by the district surveyor to the Commissioners of Poli

Professor Donaldson, - April 18. No copy of Professor Donaldson — April 18. No copy or the condemnation was served on the district sur-veyor, and after this the district surveyor heard nothing about the matter of dangerous structures; in fact, he had nothing more to do, because the Commissioners of Police take the care of it. But the district surveyors have been very anxious to know the district surveyors have been very anxious to know to what estant attention is given to their notice, as regarded any required supervision; and applica-tion had been made to the Commissioners of Polee, in that special case requesting them to furnish a copy of the notice.

The application was ready in reply Sir R. Mayne said,—"The sending as suggested to the district surveyor a copy of the Commissioner's notice to the owner of a dangerous structure in each case, would owner of a dangerous structure in each ease, world add so much to the correspondence, already very heavy, in earrying out the Act, that I am unable to comply with the suggestion. I understand that the builder is required by the law to communicate with the district surveyor before the work is com-menced, and in this way the information will be given to the surveyor instead of by the communication from this office."

Now, what was the result of this? The notice of condemation of a dangerous structure might be forwarded to an owner in the country, and might never reach the huilder. In fact, it was found that the owners kept it as mach to themselves as possible, so as not to let the district surveyors be cognizant of the extent of the work to be done; but the builder is extent of the work to be done; but the builder is desired to go on with operations. Consequently, the district surveyors never saw the notice, and they were left quite in the dark as to the result of the informa-tion they had given. It appeared from the report of a gentleman who was called in as assessor; in the Tottenham-court-road case, as to the way in which the district survey was carried out, Mr. Marsh Nelson,

"That the primary cause is to be associated from the evidence of the district surveyor. He stated that no detailed auresy was rands before permission was given for the alterations, the walls were not examined either in the basement story or in the root. Now, had the district survey or considered it part of his duty to make a proper that the first instance, the result would have been that the party and front wall would have been con-domned."

This was a contradiction to the very notice given γ Mr. Baker himself, calling attention to these remises. Then again, in the same report, it was by premises stated :-

premises. The angain, in the same report to vise stated :--"The effect has been to create a difference of practice and division of authority, and the Act in this respect is more complicated and coulised than hefore. The Metro-politan Board of Works, who appoint the district sur-report, have and the Police Commissioners adopt one course of pracetime the Difference of the Commissioners of the distribution of the distribution of the district course of pracetime the duties imposed upon them by the Act, not being in any way connected with the ordinary duties of their departments. The Commissioners of Sewers have not appointed surreyors to administer the date must be carried out, being the arrively direct-ing them to be carried out, being the arrively direct-ing them to be carried out, being the arrively direct-arreyors, who are called upon to superintend the works ordered by the Act to supervise how ways and each that in this case they may consider improper, but still they are carried out."

Now the deputation on hehalf of the Distric Now the deputation on hehalt of the District Surveyors' Association herged to repudiate any such imputation as the above, in reference to the discharge of their duties. There was no jealonsy on their part, and they were willing to give every authority and power they had under the Act, and see that all works were earried out in a sound and efficient manner. He would rather say that there was no division of authority among the body represented by the deputation, but rather a cancurrence or combina-tion of authority and a desire for discharge their duty. the deputation, but rather a concurrence or combina-tion of anthority, and a desire to discharge their duty not only faithfully and to the satisfaction of the Metro-patian Board of Works, but to the public generally. It was under these impressions and circumstances that the deputation brought the matter before the Board, hoping that in its eyes they would be found to have discharged their duties properly and efficiently, and requesting the Board in the terms of the memorial to institute an inquiry into the question.

Mr. Bristow then moved that the memorial be received and referred to the General Purposes Committee. He thought that the gentlemen representing the deputation had established a case of considerable moral grievance. There were many matters in the memorial that called for inquiry, including the question of application to the Police Commissioners for fees for special service. The facts, he thought, went to show that Mr. Baker did his

duty efficiently and well, and he would take that oppor-tunity of saying that, in his humble judg nent, and as far as his experience went, he knew of no body of men who did their duty hetter, taking them as a hody, than did the district surveyors. Mr. Brown, in fact, in his (Mr. B.'s) district, was what he might term a model sur-veyor.

(Mr. B.*s) district, was what he might term a model surveyor. Mr. Burslem, representative of Paddington, seconded the reference. Its believed that the district surveyors might be made the most institut hody of men in the whole metropolita district. He believed that their duits were much checked and complicated by the Act of Pariment, such of abaged the magnetic references would be the re-sult of abaged the magnetic reference would be the re-sult of abaged the magnetic reference to the com-mittee, for the thought latt by the Act injustice was done to the district surveyors. He thought Part 2 of the Act, correctly requered the district surveyor should be the party employed, though it did say "some other com-petent" surveyor to be employed by the commissioners. The further consideration of the matter was then te-tation withdree.

CONDITION OF COLNEY-HATCH LUNATIC ASYLUM.

Sin,---A good deal of discussion having arisen as to the state and condition of the Pauper Lunatic Asylum, Colney-Intch, it occurs to me that the fol-lowing report which I have obtained on the subject will not be without interest to your readers

S. W. DAUKES

CORRESPONDENCE ON THE GOVERNMENT OFFICES COMPETITION.

OFFICES COMPETITION. IAVING been requested by several professional friends, now that the decision of the committee is made public, to mention in your periodical the names or numhers of the superior designs I alladed to in my article ecilide "What a Foreigner thinks of the Government Competition," you will oblige me by publishing in your next number that in the Renais-sance style 1 fixed upon No. 77, by Mr. H. B. Garling; and for the second, No. 94; both the designs approaching one another very mach in harmonious arrangement; hut as, in my opinion, the tower at the right-hand corner of the elevation in No. 94 might as well not he there, I alluded to No. 77 as the first, and was glad to hear, since I wrote the article, from the able designer, what I did not know hefore, that he discussed pointed out in his memoir that he did not consider the tower an improvement to the elevation; but that there was no time for alteration. The other

Intrasert pointed out in his memory that he due not consider the tower an improvement to the elevation; but that there was no time for alteration. The other two I selected as next in merit were Nos. 54 and 112. In the Gothic style, No. 116, by Mr. G. G. Sott, is the design which distinguishes tiself above all others, and I intended it to occupy the first place in my provious writing. Perhaps the non-professional visitor may not have been so much struck as myself; becanse, as there was not a general view, it required the mind of a professional man to group the several heautiful elevations into one picture. But I remain by my former expressed opinion, that it is unques-tionably the best of the Mediaval designs. Next to these, No. 140, by Messrs. Prichard and Seddon, and No. 129, by Mr. Street, are the ones I alluded to; while No. 61, in the Elizabethan style, and Nos. 76 and 99, give eminent proof of great architectural ability and refined taste; but, as I have said hefore, the styles adopted in these designs, however meri-torious they may be in themselves, I did not consider suitable for the object in view, and it seems that the commutation of the same opinion.

sortable for the opject in view, and it because that the committee has here of the same opinion. If aving accomplished the wishes of my friends in the above remarks, I cannot forcego expressing at the same time my fervent hope that Sir Benjamin Hall may continue in the same judicious and liberal path he h is entered upon, by entrusting the successful

competitors with the execution of their own plaus, competitors with the extention to that objects pro-for it would seem to me hardly fair to place the pro-ductions of the labour and thought of those gentlemen in other hands; besides the danger that the designs themselves should not be carried out according to the intentions of their projectors. Dr. JONG, intentions of their projectors.

THE PROPOSED TRUSSED SUSPENSION-BRIDGE FOR LONDONDERRY.

BRIDGE FOR LONDONDERRY. Mr. P. W. BARLOW, in the Builder of the 27th June last, publishes a sort of challenge to all comers who disapprove of bis designs for a trussed suspension-bridge for Londonderry, to carry both railway and common road traffic, stating that he purposes to bring the subject before the mechanical section of the British Association at its meeting in Dublin, in August next, and there have the subject, which he affirms is of great importance to railway interests generally, thoroughly ventilated and discussed. Per-taps you will permit one of the competitors for this haps you will permit one of the competitors for this haps you will permit one of the competitors for this said Londondery bridge, who knows something of British Association sectional discussions, and especially of those of the mechanical section, to say that the challenge is a very safe one,—that as few engineers of any practice, mark, or station have ever attended this section of the British Association, in a profes-sional aspect,—as probably not one competent or re-cognised engineering authority may be present in that section at Dubin,—and as the audience at such sec-tional mechanism in a section of such outsitions. section at Dublin,—and as the audience at such sec-tional meetings is no practical judge of such questions, ,—so Mr. Barlow, if permitted to bring forward bis sub-ject at all, will probably have "a walk over," or no discussion at all. It may be hoped, however, that the officers of the Association will guard its legitimate object.—"the promotion of sciences" — from this very equaing device to prostitute the name and the authority of the British Association to the promotion of a private object. If we were to have Mr. Barlow's pet project there, it certainly would he both fair and satisfactory to the ill-tread competitors of the Lonsatisfactory to the ill-track decompetent for the Lon-donderry bridge designs, that Mr. Charles May would also appear, and let us feast our eyes upon the design of Sir William Cuhit's clerk, to which he gave the first prize, and which has been as invisible to all men so far as Fortunatus, with his cap on ;--and that the commissioners also would come into court, and explain why it is that, passing over alt the designs to which their prizes were given, and those designs to which their prizes were given, and those others purchased by them, with estimates far within their prescribed limits of money, they employ Mr. Barlow, who won no prize, as their permauent way, and to whose imperfect estimate for his injudicions structure, Sir William Cubit tacks on one-sizth at the first blow, and is then cautious of his approval. The arena which Mr. Barlow offers is quite as fit for the letter of for this conversely more that for The areas which Mr. Barlow offers is quite as fit for the latter as for this proposed purpose. But, no: away with such humbug: if Mr. Barlow is really in earnest in faneying that he can persuade the engineer-ing profession that there is any merit in his damaged version of an imported Yankee design, to say nothing of its special ansultabilities for the place and purposes he proposes it, let him bring it forward next autuma at the Institution of Gvil Engineers, Westminster, where I promise him justice will be done him by men really competent to judge of the subject. I send you my name, and am A THIRD C. E.

THE LATE MR. C. H. WILD.

WE have this week to record the death of a y engineer of great promise, Charles Heard Wild, who, as is well known to his professional brethren, has for some time past heen the victim of a painful and hin-gering brain disease,-the result of over-work at an gering brain disease, --the result of over-work at an early period of his carcer. Mr. Wild was a pupil of John Brathwaite, and afterwards studied practically in the factory of Messrs. Brathwaite and Co. At a very early age he was entrusted with an important mission in France, to superintend the construction of Ericsson's propeller boats. On his return to England he was placed at the head of Messrs. Fox, Henderson, ne was placed at the nead of Messrs. Fox, Henderson, and Co's drawing-office at Birningham, where the designing of many very important works was con-fided to him; and he here displayed such a remark-able aptitude for engineering science, that he was, on heing introduced to Mr. Robert Stephenson, engaged by him as one of his principal assistants, on several Works of magnitude :- appropriet the Britannia

superintendence. It was at this period that the painsuperintendence. If was at this period uside the pain-ful disease, which has just terminated fatally, first declared itself; and he was recommended by his medical adviser to resign his post, and to travel abroad for two years, which he did, with, bowever, but little benefit. Since his return bis balth bas gra-dually declined, until he was relieved from all suffer-

THE BUILDER.

dually declined, until he was reneved from an same ing on the 19th instant. Mr. Wild was the author of several valuable im-provements in railways: his railway switch is now universally adopted, and it is considered by engineers that he completely solved the problem of a change of

rails ralis. "Warreu's girder," which is now so much em-ployed for railway bridges, owes its success to Mr. Wild's assistance, notahly at the Newark-bridge and the Crunbin viaduct. His "Hexagon turn-table," and "dock-gates," are also amongst the valuable improvements which Mr. Wild has left behind him, in some way to compensate for a life of such great promise being thus early terminated.

PARK-WICKET, KNIGHTSBRIDGE.

Trus access to Hyde-park, lately so nuch improved by the clearance of the Old Life Guards public-bouse, with its external tippling-seats and tahles, and also of a row of costermongers' stalls, now replaced by the Duke of Wellington's riding-house and stables, is one Due of Weinlegow's hang more and study, is our of the most important casements to the districts of Brompton and Chelsea. Its length is about 160 feet, and the mean width throughout about 14 feet, the whole being pared level from house to house. None of the approach set in the nork by wicket is more thronged than this, and yet, narrow though it is, we find the greater portion (about 100 feet next the park) obstructed by tables, benches, and settles, the park) obstructed by tables, benches, and settles, thrust out upon the pavement. There are, beyond the riding-boose on one side, three small houses, and on the other side four, all of which, with only one exception, are turned into shops, with open doors and windows, exhibiting all sorts of fluid and solid re-freshments, together with nondescript confectionery for children, nursemaids, and idlers in dalliance; but the second the source of bushing exciting the worst feature is the array of benches on either side, which narrow the too stinted way to the width of an ordinary hall entrance. On emerging from the park, these free stalls, for

On emerging from the park, these free stalls, for eating and drinking al fresco, are certainly not re-quired here, for in this very passage there are two public-houses, and at the end of it, in Knightshridge, within 100 yards at either hand, there are no less than seven gio and dram-atic exhibition palaces, with as many coffee-shops and other places of turbulent recreation.

If the aristocratic squares and genteel streets are If the aristocratic squares and geneta swares are conserved by the police, and kept free from the un-bidden enactment of acrobats, and of Polchineldo's theatre on four legs, surely it is infinitely more im-portant that the narrow strait to the Park-wicket, through which over 20,000 persons pass daily, should he kept free and unobstructed.

This privileged entrance to the park is really much valued by the populous neighbourhoods to which it This privileged entrance to the park is really much valued by the populous neighbourhoods to which it subserves, and as the stall-holders now threaten violence to any wayfarer who passes on the public pavement between the outstanding tables and the houses, it is time that the local authorities or the police should interfere to put down the nuisance. 'n

CHURCH-BUILDING NEWS.

Norwich.-The restoration of the last side of the tower of Norwich cathedral is now nearly completed. The works have been executed under the superintendeuce of Mr. J. Brown, architect to the Dean and Chapter.

Dorking .- The new church of St. Paul, Dorkin Dorking.—The new church of St. Paul, Dorking, was consecrated on the 22ud inst, It has heen created at the sole cost of Mr. John Labouchere, on a site presented by Mr. H. T. Hope. The chifes will accommodate hetween 500 aud 600 persons. It is in the Early Decorated style, and consists of a nave and chancel, with open south porch. In the west gable is a rose window of painted glass, poposite to which is the large east window, of stained glass by Mr. Hudson, of London, representing the four Evan-relists. The root the ridge of which in the nave is by him as one of his principal assistants, on several works of magnitude:—amongst others, the Britannia, hridge, where Mr. Wild largely assistant (and the function and conway Tuhular Bridges," there is a very valanble paper on "The Deflection and relative strains in single and continuous Beams," from the averaneut of the passages. Above the windows and doorways are devices, stamped on the strains in single and continuous Beams," from the averaneut of the passages. Above the windows and doorways are devices, stamped on the strains in single and continuous Beams," from the averaneut of the passages. Above the windows and doorways are devices, stamped on the strains in single and continuous Beams," from the averaneut of the passages. The son, Mr. Wild was appointed assistant engineer and Sir William Cubitt, to the huilding in Hyde-park; Mr. Wild was appointed engineer to the building at Sydenham, which was eretted under his engineering

dilapidations of St. Helen's church, with the view of reporting upon them. It is hinted that the com-mittee will be advised of the practicability of restoring the building. Elkstone.-Tbe west window of the old church at

"Ethetone.—The west window of the old church at Elkstone, near Cirencester, bas been fitted up with colonred glass, designed and executed by Mr. G. Rogers, of Worcester. It is a four-light window. The effigies of the Evangelists form the main design, and the tracery of the lead presents a foliage pattern. *Maceleffeld*.—An ohitary window, designed by Mr. Janics Stevens, of Manchester, architect, and creeuted by Messrs. Edmudson and Son, of that city, has just been set up in Christ Cburch, Macelesfield. The ground is an interlacing pattern with florid border: at the top is the Alpha and Omega; at the boitnuar uptice. There are two medallions, the upper bottom a family shield, and on a ribbon behiud it the obitnary notice. There are two medalions, the upper subject being the little obild in the midst of the disciples; the lower, the return of the prodigal. There are also three family the over the two west and north doors; subjects, "The Sower," "The lost Sbeep," and "The good Shepherd." Bacup. — The foundation stone of a new Catholic Church, at Bacup, was laid on the 2ud inst. The style of the building is Gothie. The architect is Mr., Wm. Niebolson, of Manchester. South Shields.—A new church is now in course of

South Shields .- A new church is now in course of South Shields.—A new church is now in course of erection at Mile-cod-road, South Shields, by the United Presbyteriau congregation of Heugh-street chapel, under the superintendence of Mr. Thomas Oliver, of Sunderland, architete, The buildings, *i.e.* church, school-room, and vestry, are designed, says the *Gateshead Observer*, in the Gothie style of archi-tecture, with the characteristics of the Geometrical period. The church is crueiform in plan, with nave, either and the memory and a torar with spike at the period. The entern is tracing in the spice at the south-east angle, with dcacons' vestry and boiler-house below. There will be no galleries, but provi-sion will he made in case they are required afterwards. The ground floor will afford accommodation for about 500 persons. The entrance is in Ingham-street, by a deeply-recessed porch, with carved capital and arch-mould. The end windows are each four lights, and are to be filled with stained glass. The pave columns are to be filled with standed glass. The nave could make are of iron, and the arches above, which support the roof, are of wood, filled with ornamental iron tracery. The whole of the woodwork will be stained, as well as the roof, which is to be of open timber work, some portions carved. The iron will be represented as the protocol of the state of the state of the state of the portions of the state of the portions carved.

the roof, which is to he of open timber work, some portions carved. The iron will he represented as such, hnt painted in appropriate colours, and other-wise ornaruented and moulded. *Edinburgh.*—At a recent meeting of the City Council, a letter from the minister of Greyfriars Church was read, in which complaint was made of the want of ventilation in the church. This was attributed by Mr. Cousin, the eity architect, to a re-fusal of Messrs. Ballantine and Allan to allow arrangements to he made in the stained windows for ventilation - but he successfed that if authorised, the arrangements to he made in the stained windows for ventilation; but he suggested that if authorised, the edifice could easily be otherwise ventilated. The subject was referred to the Plans and Works Com-mittee.—Notice of a motion was given at the same meeting of council, by Professor Dick, the veterinary surgeon to the effect "that as it is now determined meening of conneul, by Professor Dick, the veterinary surgeon, to the effect "that as it is now determined that the old stones of Trinity College Church shall not be re-erected, and as they have been kept at a considerable expense, they ought now to be sold, and the movey placed in the hank, and the rent of the ground ou which they are haid got rid of."

THE BRIDGE IN ST. JAMES'S PARK.

A contresponter writes to the Mechanics' Magazine respecting this bridge as follows:—In the Builder for 27th June, I noticed an admirable illus-tration of the new bridge of Messrs. Rendel across the orugential water in St. James's Park, and in an article accompanying it, a description of the new bridge is followed by this remark: "It was intended originally" any your corellent conterpresenter "to orage is toilowed by this remark: "It was intended originally," says your cocellent contemporary, "to cross the lake by a viaduet, hut this was objected to on the score of its obstructing too much the view along the lake, and a suspension-bridge was finally agreed upon as the form of hridge least open to that objection." objection

objection." On Sunday evening last, I stolled, through the showers, along the lake, and passed the bridge in ques-tion. On approaching it, and on looking hack towards it after passing it, I was astonished to observe how seriously it interfered with the view of the lake. In fact, the entire hody of the water heyond it was conceded from me during my walk along the greater portion of the distance between the bridge and the palace end of the water. As I am a man of moderate height, with my eyes about 5 feet 5 inches from the ground. I fear the great holk of the foot passengers who seek refreshment at he lake side will experience the same disappointment as I. If so, I would recommend them to reflect, as I reflected, s. so, I would recommend them to reflect, as I reflected, ir. Wilkinson, the examined into the their Sovereign and her estimable family, looking

down from the southern apartments of the palace, will be hlessed with the complete view, and will find in the bridge nothing but another and a novel orna-How fortunate are monarchs and courtiers and how luckless we ! The obstructiveness of the bridge arises from the

close lattice-work of which its sides are formed. Had these sides been composed ehiefly of rods, formed and arranged with regard to the taste and plensure of us plebeau pedestrians, Ishould have seen almost as much of the cool crystal heaving as the Gueen. I suppose it is now too late to hope for such gratification. Since Sunday I have again looked at the *Builder*, and I find that if the artist had heen far enough from

the bridge to throw the water and not the opposite shore into the background of the pieture, he would have perfectly illustrated my letter. But then the only thing visible beyond the bridge would (from the cause which I have explained) have been the Horse guards and the beavens.

As I write with perfect resignation, you will, I hope, give place to my reflections.

A LOVER OF LAKES.

STABLE FLOORINGS.

PERHAPS some of your intelligent readers would advise me as to which is the best flooring for cart A primary source of your intelligent resurces wound advise ne as to which is the best flooring for cart horse stables, heing at the same time good and durable. There is a species of fir wood, driven in as piles, and ecmented with lime: there is also asphalte, especially that of a foreign company, and used, they say, in the imperial eavalry stables of France; and there are the old bricks and dressed flags, besides, I dare say, many other sorts. Which of all, however,

do your readers and writers recommend? At the same time, perhaps they would advise me upon the best sorts of paiat for the same stables, occupied by cart-horses. EBOR.

VARIORUM.

The new number of the *Quarterly* contains a dis-criminating article on the "Manchester Exhibition," of which the writer, with full reference to its shortor when the writer, with full reference to its short-comings, asys ----''It would yet he difficult to form a more instructive and interesting collection,---one which, a a moment like the present, when art is beginning to be better understood and more widely studied, could afford more useful hints, and could teach more to the Boglish public." An article in the same namto the English publie." An article in the same num-ber, "The Internal Decoration and Arrangement of Churches," is a strong protest against the result, in a theological point of view, of the architectural teach-ing of the Ecclesiological (late Cambridge Canden) Society, and which the writer, by the way, erroneously designates as simply the Camden Society, m entirely different body.—The National Review (Chapmun and Hall, publishers) has also an sente article on the "Manchester Exhibition," pointing out some of its weaknesses, the presence of many second-rate copies, want of sequence in the ancient pictures as arranged, but arriving at the conclusion that it is, merertheless. had our sequence in the alternit profiles as arranged, but arriving at the conclusion that it is, nevertheless, an honour to the great industrial community which has carried it into execution. The writer of the article "Loudon Street Architecture," in the same Review, points out that the metropolis now sees the necessity of henceforward afferting the perpendicular Review, points out that the metropolis now sees the necessity of henceforward affecting the perpendicular instead of the horizontal direction of expansion; and says,—"In this necessity lies the great hope for the domestic architecture of London, which has hitherto been wholly below contempt." This is quite true, as been wholly below contempt." This is quite true, as far as architecture is concerned, although there may he ar as architecture is concerned, atthough there may he great question as to the advantage in a social and sanitary point of view. A feeling adverse to the use of lofty structures containing pumerous dwellings one above the other is growing in Paris, where en-deavours are being made, beyond the walls, to intro-duce the English mode of building small houses for a simple fumily seek. This is a point to much

reports and proceedings as to infriogements of patents, reports and proceedings as to infriogements of patents, s.e. &c. Attached to the part under notice is an index of names of inventors, patentces, and others who have had anything to do with marine propulsion j and also an index of the subject matter itself, afford-ing great facility of reference to the contexts. These markholes are an even of the subject matter itself. amphlets are a most valuable and important boon to investors, especially those of restricted means, and, Inventors, especially those of restricted means, and, besides, contaio much unter of interest to the general reader.——A nseful school scries of "quby," by the Rev. T. Bowman, A.B. Vice-Principal of Bishop's Collece, Bristol, has been issued by Messrs. Longman, and Co. Physical geography is a most important subject-or series of subjects rather,—yet it has never obtained that attention from instructors which its subject—or series of subjects rather, —yet it has never obtained that attention from instructors which its varied information demands. The publication of a text book such as this must greatly tend to do away with this defect in school teaching.

Miscellanea.

THE ATLANTIC TELEGRAPH .- By this time doubtless the whole of the 2,500 miles of Atlantic telegraph cahle has been shipped on hoard the British ship Agamemnon, at Greenwich, and the American ship Niagara, at Birkenhead; and in less than a month's further time it may be at work across the whole breadth of the "big pond." The most notable feature in the cable, as it lies twined round and round in its many folds on board the Agamemon, is the fact that at every beat of a seconds' pendulum an electric life-spark flashes through and through its innumerable coils from head to tail, so that this veritable sen-serpert may be shined alize and well equilibrium. The Niagara, at Birkenhead; and in less than a month's may be shipped alive and well conditioned. The purpose of course is to ascertain at a moment's notice The whenever and wherever any vital injury may affect it, so as to call for immediate examination and repair. The same thing will take place while it is heing haid down in the ocean, and should the electrometer fail to indicate indicate a free circuit, the working engine, by help of which it is payed ont, nust reverse the process and coil it up on hoard again till the flaw be discovered. It had he en decided to sail right off into mid ocean and there to initiate the marriage ceremonial hetwees the American and the European moiety, but an idea seems now to prevail that it will be better to lay the Such a low to prevail that it will be better to by the line down from the western Irish cosst at once, the *Ningara's* half heing joined to the half laid down in mid-ocean. The "tight little island" in which an Atlantic telegraph cahle has heen made, and in which a "Great Eastern" steam-ship is getting into " ship shape," is still resolved, it appears, to continue Wistress of the Ocean. shape," is still resolution. Mistress of the Ocean,

PROPOSED PUBLIC PARK AND OTHER IMPROVE PROFOSED PUBLIC FARE AND OTHER IMPROVE-MENTS AT DEVONPORT. —The military parade-ground, or brickfield, will probably be converted into a re-creative ground for the public at a cost of nhout 500%, of which Mr. St. Aubyn has offered 100%, besides of which Mr St. Annyh has olfered 1007, besides shruhs and trees. The authorities of the War Depart-ment are said to have approved of the plan, on con-dition of having still the use of the ground for parade purposes. New roads are also in contemplation, one 40 or 50 fect wide from the Stoke-road along the To in or let wide from the stoke-road along the bondary-wall of the pleasure-ground in front of St. Michael's-terrace, and parallel with Tamor-terrace, to the proposed railway station at Stoke, which is to he arceted on the south side of St. Michael's Church. The railway company will contribute 500% tow-its formation, which will nearly cover the cost. It is also proposed to form a direct road from Stonehouse-hill to the head of Fore-street, for the convenience of the military from Plymouth and Stonchouse going on guard at Keyham and Bull Point, and also for a ready means of access to the general military parade-ground, —the brickfield. The plan for constructing a new road at Stoke Church, leading to Fellowes-place, is prepared, and the work will prohably he com-menced shortly. It is to he a carriage road, ahout 10 fest-site. 40 fect wide.

OPENING OF THE ROYAL WELSH SCHOOL, OFENING OF THE ROYAL WELSH SCHOOL, AT ASHTORD.—The new school, at Ashford, Middleser, belonging to the Society of Ancient Britons, of which we gave illustrations some little time since, was opened last week with the usual ceremonies by the Prince Consort. The hulding is front designs by Mr. H. Clutton. It will contain 130 hoys and 70 girls. The total cost of creecing the building yeas 15,0002, 4.0002.6 which it is said will be covered by the The total cost of creeding the building was 15,000*t*, 14,000*t*, or which, it is said, will be covered by the sale of the old building in Gray's lou-lane, which was purchased by a cartridge manufacturer. There are 13 acres of ground attached to the new school, two acres of which will he had out for the instruction of the boys in cultivation. There will also he a small plot of land set aside for the girls to cultivate as an amuscment. The foundation-stone was laid in August last.

meeting of this society was held in its hall, George-street, Edinhurgh, on the 20th inst. Mr. Cosmo Innes in the chair. Mr. Stuart reported that he had received in the chair. Mr. Sthart reported that he had received a communication from the sceretary of the Board of Manufactures, annonneing that the Board had allo eated the gallery and two octagon rooms in the Royal Iostitution, presently occupied by the Royal Academy, as suitable apartments for the society's muscum, in terms of the Treasury minute of 1851. Mr. Stnart terms of the Treasury minute of 1851. Mr. Stua also reported that he had received a communication also reported that he had received a communication from Mr. Farter, announcing the resumption of his diggings in Orkney. Dr. Smith presented some remains found near a standing stone in Yarrow, sent to the muscum hy Mr. Currie, Darniek. Amongst the papers real was a "Notice of an Ancient Oratory on the Island of Inch Colm, with drawings. By J. Y. Simuson, M.D. F.S.A. Scott." in which Professor Simpson maintaiced that this orntory was of the same character with that of St. Colomha at Kells, and others in Ireland. others in Irela

PROPOSED HOSPITAL FOR DISABLED MARINERS. --It is proposed to crect an hospital for master mariners, mates, and scamen of the merennile -It is proposed to crect an hospital for master mariners, mates, and seamen of the meremtile marine; a proportionate number of each class, heing marine; a proportionate number of each class, heing marinel, without children living with them; to be under the government of the committee of the Ship-wrecked Mariners' Society, incorporated by Act of Parliament, 13th Viet, with power to huild asylums for seameo, and hold land for the purpose; the society haviog, at a general meeting held on the 29th alt, voted 5,000*l*. in furtherance of the proposition. A very large and influential meeting was held on 17th instant, in the Egyptian-hall, Mansion-house, London, for the promotion of the same object (the lord mayor in the chair); and resolutions were passed, one of them to the effect that a building he raised on the banks of the Thames, within the port of London, to Licen to the effect that a building he raised on the banks of the Thames, within the port of London, to be called (with her Majesty's permission) "The Royal Hospital for Worn-out and Disabled Merehaut Scamen;" that the said building he prepared for the reception of 500 persons, selected from the different grades of the mereantile marine; and that it be com-menced as soon as there is a fair prospect of 50,0007. being subscribed

being subscribed. THE SCOTCH INDUSTRIAL MUSEUM AT EDIX-BUGH.—Dr. Wilson, director of this Museum, has presented his annual report to the Department of Science and Art. In the outset the reporter states that the progress made during last year will hest appear hy considering separately the Museum, the Laboratory, the Chair of Technology associated with them, and the incidental relation of all three to the interests of the public. This he does, showing that considerable advances have been made in the various advances have been made in the various The Museum bas been largely enriched, considerable adv: departments. The Museum bas been largely enrices, since the date of last report, hy donations and pur-chases. The Duke of Argyle has presented examples of the granites and building stones occurring on his estates. The Duke of Buceleuch has authorised the imperate partments. estates. The Duke of Duceteuen mis automate the receipt by the director of specimens of the minerals wrought in his lands, and of the tools with which they are worked; and a series of the lead ores and products of the Wanlockhead mines and works is usarly completed. The collection of building-stones, commenced last ver. has been increased by a gift commenced last year, has been increased by a gift from the Museum of Practical Geology, Jernya-street, Londoa, of their duplicate specimens, and hy douations of interesting examples from various individuals.

THE ORDNANCE SURVEY .- On a motion by the Dake of Bacelevel, the Lords have agreed to pray Her Majesty to appoint a Royal Commission to in-quire into the whole subject of the National Survey, and as to the scale or scales on which it should be and as to the scale a made and published.

made and published. DESTRUCTION OF A BUILDER'S PREMISES IN SOUTHWARK BY FIRE.--On the 15th instant, the premises belonging to Messra. Wilson and Co. of Great Saffölk-street, Southwark, were destroyed hy fire. The whole of the saw-mills, carpenters', and joiners' shops, stabiling, and several piles of timher, were destroyed, and nearly a dozen houses adjoining were more or less damaged hy fire and water.

The transepts are designed to he lighted by triple lancets; but it is intended, if the funds permit, to substitute wheel windows filled with stained glass. The west gable will be decorated with an entrance doorway, and a window in five compartments, only three of which will he filled with glass, the blank recesses being intended for states. The roof timhers will he exposed. The windows of aisles and eler-torizes will be double largets. being intended for statues. The roof timhers will be exposed. The windows of aisles and clere-stories will be double lancets. The extreme length of the church will be 140 feet; the interior breadth across nave and aisles 56 feet, and the height to top of gable crosses 70 feet. The material will be lime-store of the district. stone of the district.

PUBLIC DRINKING FOUNTAINS.—Notwithslanding the reiterated endeavours of the press, and particularly of the Builder, to obtain for the metropolitan public an increase of public drinking-places, hoth for main and heast, we regret to say that there is still a sad waat of such conveniences. Pumps there are, in ahundance, hut they are carefully kept locked, or deprived of their handles, for fear the public should obtain a mouthful of water without payment. In every Parliamentary grant of privileges to water com-panies there ought to he a clause compelling them to provide such public accommodation. The uccessity for it is somewhat notabily manifested at St. Paul's Church-yard, where a poor woman appears to find it worth her while to devote her time to the supply of clean glasses to the public at a public pump well. PUBLIC DRINKING FOUNTAINS .-- Notwithstanding clean glasses to the public at a public pump well. Would it not he worth the while of water companies who grudge the poor so cheap a refreshment to crect a number of fountains in thoroughfares, and let them a number of fountains in incrougeners, our even at a smell rent to just such persons as this woman, with a limitation of charge to a halfpenny, or a far-thing for each separate supply? Mr. Melly, of with a limitation of charge to a halfpenny, or a lar-thing, for each separate supply? Mr. Melly, of Idverpool, has added fourteen drinking fountains to those he had previously supplied at Liverpool. On the 7th inst, at one of these, no less than 2,500 persons availed themselves of Mr. Melly's excellent provision. The British Workman states that Bir-kenhead and Runcorn are following the good example of Liverpool, and adds, "we trust that in London and many other places gentlemen will be found with hearts as larger and purses as heavy as Mr. Melly's. hearts as large and purses as heavy as Mr. Melly's, by whom water for the people will be provided by means of these public drinking fountains."

THE KILKENNY ARCHÆOLOGICAL SOCIETY .--The The KILBENNY ARCHEDGLOGICAL SOCIETY.—The July meeting of this society was held in the Tholsel, at Kilkenny, on the 1st iost., the Dean of Ossery in the ebair, when fourteen new members were elected. Various donations were announced, and articles of interest exhibited, including some rubbings of in-scriptions found at St. Mary's Church, Clonnel; and after some other procedure, a paper, by Mr. T. L. Cooke, was read, describing an ancient wayside cross slab at Drisoge, in King's County.

M. LASSUS, ARCHITECT.—We hear with great regret of the death of M. Lassus, who was the archi-tect of the restoration of the Sainte Chapelle, at Paris. This sad event took place at Vieby, after a very short illness. It was M. Lassus who, with M. Viollet le Due, undertook the restoration of the old cathedral of Paris, Notre Dame. pli

the strike, which has lasted six weeks. ART TREASURES EXHIBITION MEMORIAL. — The members of the Manchester Academy of Painters, headed by Mr. J. A. Hammersley, as chairmup, have addressed a letter to the citizens of Manchester, calling upon them to contribute to a public subscription for the purpose of procuring portraits of the exceedive committee of the Art-Treasarce Exhibition, to be placed as a memorial of the Exhibition, in the per-manent gallery of the Royal Manchester. Institution. ST, GERMAN'S CHURCH. CONWALL. — I send you

ST. GERMAN'S CHURCH, CORNWALL .- I send you a rough sketch of a capital from St. German's Church, a rough sketch of a capital from St. German's Church, Corowall, which appears to me interesting from its strongly marked classical character [the angle termi-nates in a well-developed volute]. The church itself was originally a large edifice of the semi-Norman period, hat the .whole of one aisle and the chancel have fallen down, and a great portion of what remains are additions, in the Decorated and Perpendicular styles. The more in serve func, consisting of a door. sh period, full toe winde of anime table table table and period and period and the period is a state of the seven semicircular arches, richly oranametted with chevrons and other characteristic ornaments; the arches supported by pillars and pillaters, enriched with chevrons and other characteristic ornaments; the arches supported by pillars and pillaters, enriched with chevrons aller outely. The width of the seven arches is 7 feet 3 inches, giving for the total span 20 feet 6 inches; the depth or recess of the arch is 5 feet; and as the face of the porch projects heyond the front of the building about 4 feet 3 inches, the arches have bardly that appearance of richness in depth which their recess should give. The contro downay, of 6 feet span, has arise only of about 2 feet 7 inches. This produces a great flatness in the outside rings. It was caused no doubt by a sinking of the arch in the first place, owing to want of proper weight on the haunches. The porch itself is a good deal weathered, hut some massive horman piers (semicircular), inside, surmounted by red marks, but unfortunately it is precisely such portions which most rapidly decar, the red marks proceeding from the presence of iron. The porch is at the west end, hetween two lowers, inside the norther of which is the capital referred to. Externally this tower is carried above the roof in an octagoo, the sontherm being finished in a square, like the original Norman part of the church appears to be the twelfbe century, it must have been arcted a later the Cornish bishopric—A. The Builder.

Vol. XV.-No. 756.

tically, so far as to lead men to

URTHER examination of the models for the Wellington Monument,* now being exbibited at Westminster-hall, has afforded us additional evidence of the ground of the opinions put forth in our last article, especially as to the fact of sufficient technical or manipulative mental to the power of expression through the higher fields of their art. The doctrine of division of labour as necessary to productiveness, has been followed prac-

trammel their own thoughts, and to assume the existence of demarcations having no foundation in nature. No mau has been able to map out the domain of any assorted branch of science or literature, as a distinct subject of study; and the pursuit through separate professional callings, of what still are called the sister arts, should be in some degree supposititions,-though the arrangement is essential for convenience and expediency. All this, it is true, we may have ventured to urge before the present occasion : at least, we have done so as to arcbitecture,-though not forgetting that there are qualities peculiar to each of the arts-media of expression, which they never happily imitate from one another. What it is now important to bear in mind as to the present case is that, if one of the arts can in works of humble pretensious, trust to itself, co-operation is absolutely necessary to produce works of the highest class,—and whichever special art be the first intention. In short, we have apprehended that lately, architecture has been neglected as a branch of study by scnlptors; and that the philosophy and universal principles of art-which have been so much under discussion in writings on architecture-have not received attentiou generally. The want both of the special and the general aid to the senlptor, manifests itself now when a work of the first class is really required. To produce the highest art, the mere craftsmanship of the statuary is not enough; and the want is not supplied by getting from an architect a design for a pedestal to the statue or group of figures. This, however, or something like it, has been done iu several works by sculptors of eminence in the case of the present competition, as it had been previously, in cases within the knowledge of our readers. A work intended to be mainly sculptural, ought, in our opinion, to be designed tbroughout by a scnlptor artist - one having so much knowledge of construction and archi tectural principles as to be independent of assistance. The result could then be truly a monumental work; and originality of conception would accrue hy which the field of architecture itself would be expanded.

Under the disadvantages as apparent in many of the works exhibited, we are not surprised to find that the merit which we have discovered has not been the subject of general remark. Indeed, as to grouping, and architectural de-tails, the great majority of works in the collection exhibit no advance on those of the last generation of artists. We have cudeavoured to suggest what is mainly wanting to complete the excellence of the school of British sculp-

* See p. 415, ante.

than others to the question of allegory

We differ from some who would exclude this element from the resources of sculp-Unless we were prepared to admit the ture. propriety of statues painted in semblance of figures-which supposing them to be natural justified hy aneient precedent, we should consider rather as belouging to a distinct branch of artwe should hold that the modern art of sculpture, like, indeed, all true arts-is one that is addressed to those having some educational faculties for judgment. Representation, there-fore, which would seem to be the alternative, is not the object of the highest department of the art. Such highest art requires capacity, and we may say time and attention, in the observer, skill amongst our scnlptors, yet commensurate with the thought given in the conjoined with deficiencies-detri- production of the work itself. The work must, indeed, have its intention expressed by no means obsenrely, or under the guise of types and symbols-conventional with sculptors, but not readily apprehended or borne in mind hy people of ordinary intelligence. We would exclude utterly many of the personified attributes and sensations-as in many of the works at Westminster Hall-which no person whatever would recognise without the written description. We are not prepared, however, reject all conventional representations of the virtues, or of Peace and War, or of Britannia, or other actual or ideal things—where the inten-tion cau be made apparent by familiar emblems and accessories. So that the personification is not to be mistaken for a represented natural figure, can be itself understood, and has given to it some new beauty of form or position, there can he no reason why sculpture should reject what is the real material of it as an art, and is the vehicle of its poetry in expression. Allegory has got into contempt-first, from the use of the Pagan mythological forms of it in Christian monumeuts; secondly, because the anthor of a work has forgotten that art should speak to the people, and that the expression should be at least perspicnous; and, thirdly, because the conventioualities and mere statuary work have been put forth without mind—without the real art. If the observer can only follow out the chain of ideas, he will then realize that emotion which is the object of art, and which cannot be anticipated from simple representative sculpture; and he will experience all the higher gratification, from the feeling of having passed through the intellectual process.

Again we say that we would not recognise the slightest obscurity in the expression and sense. It may be difficult to avoid this: but the grand aims of art must ever be difficult of attainment. What is clear and simple in expression to others, must often be the result of the ntmost intellectual labour. But we see no reason why inscriptions should not be used, as names or mottoes, not in substitution for the sculptor's art, or so as to be in anywise obtrusive in themselves, but to facilitate observation. In a work making some use of the architectural element-as we have tried to show, monuments of the first class must do-iuscriptions could be introduced with advantage-to the general effect, as to the whole result. This is shown, indeed, in the case of some of the hest works in the collectiou-those few in which are recognised all the points of importance that we have been advancing.

It was not to be expected that any very large proportiou of the models sent in, should realize the unusual couditions of a Wellington monument. In several works, as it will have been understood, the figures are in themselves good, whilst the general conception is tame or else obscure. Others mercly recognise onr several conditions, whilst not giving the dnc importance to some of them. There are, however, three or fact, conditions, whilst not giving the due importance * The Chorsgio Monument of Lysierstes, was not in to some of them. There are, however, three or fact, as we called it, "a solid mass;" but the inter-four works — mentioned last week — which, window.

ture. We have naturally given less attention we think, deserve particular notice, as truly coming under the head of monumental seulpture. No. 11, which bears the motto (quoting literally), "The man whose exploits and labours have been recovering for many peoples peace and liberty, descrives to be rewarded with an immortal honour," is one of the best, as we have said, in the collection, so far as it exemplifies the due relative proportions of the sculpturesque and architectonic elements. The principal figures, bowever, are inferior in design and modelling to those of some other works ; the mailed knights, placed as accessories of the pedestal, are diminutive as compared with the figures of Wellington and Peace above; and the structural part itself of the design fails-inasmuch as it is not apparent in the front view, that the truncated ohelisk, which hears a figure of Britannia, represented holding a wreath over the head of the duke, has a sufficient support on the pedestal. The architectural details, and the general gronping, are, however, especial merits of the work, besides that of due prominence of the sculpturesque, which we have already uoticed.

In No. 12, which has the motto, from Shakspeare :---

" 'Tis not my profit that doth lead mine honour ; Mine honour it,"--

we regard the architecture as tending to undue prominence. There is, however, so much that is elever and good in the details, conjoined with much that is beantiful in the groups of three figures, and in the single figures, that we should regret to lose sight of the design with the closing of the exhibition. With all the demerits, the Wellington monnment, if erected from this design, would, we think be a fine work of art, and an advance in memorial sculpture in our country. The ornament in the tympanum over the arch, ou each face, formed of tropbies and a coat-of-arms, is unequal to the rest of the work

The eminently valuable characteristics of No. 68, which has the motto, "Integrita," are to be found in the conception of the sculpture, which is poetical and allegorical. When this part of the design is looked into for a few minutes, and the expression of thought is gathered, the architectural element is no longer scen unduly prominent, whilst the idea of the building with no interior, like that once called by the strange name of the Lanthorn of Demosthenes, vanishes.* Perhaps the comparison was not likely to have occurred to any one but an architect; and there is no resemblance between the model and the monument at Atbeus, excepting in their being both circular as to the general plan, and being without apertures, for entrance or light. The model, the author says, " is left to tell its own tale :" no written " argument," or description, is offered. In the allegorical intention of the scalpture, the leading thought is clear and beautiful. This is expressed by the fignre of Peace (represented with a rayant crown, and wings tinged with gold) on the domed covering, as we called it, of the monnment, but on what is rather designed to represent the globe, over which the light of Peace is diffused in golden rays from the spot whereon she descends. The domical or globalar feature is encircled hy the coruice which terminates the structure of the monument, and which is of novel character, enriched with lions' heads, and inscribed with the names of Wellington's chief The main portion of the monument victorics. is divided into four fronts or compartments by winged figures on pedestals, and by sedent figures below; and the whole is elevated on an appropriate pedestal, euriched, like other parts the work, with rilievos and iuscriptions, carrying ont the general illustration of peace

and war, and the commemoration of Wellington in his two great spheres of action. The prin-cipal front bas a statue of the Duke. To-wards the bead, two of the winged figures extend their arms, holding gilt wreaths, whilst in the other hand, each sustains a sword. The pedestals are inscribed with the words in the other hand, each sustains a sword. The pedestals are inscribed with the words " Honour," and " Duty." The corresponding figures in the opposite iront have the attributes of Peace, and under them are inscribed " Firm-ness," and "Truth." On this side of the monument, in place of the statue of the Duke, there is a scated figure of Justice. Below it is an alto-rilievo of Wellington addressing the House of Lords, whilst in the corresponding position on the front is a fuely-executed reprenonse of Long, whils in the corresponding position on the front is a finely-exceuted repre-scutation, in a similar character of relief, of the battle of Waterloo. Below this is a simple panel, with a work in low relief, expressive of the simultaneous announcement of Victory and Peage. In the corresponding parel at the here Peace. In the corresponding panel at the back, Commerce and Industry, with Mechanical Science, are represented in active operation. This sort of contrast and variety as to the sides of the monument, and as to the sort of rilievo, is observed throughout. Thus, at the ends, one of the rilievos represents the field after one of the rinkows represents the held atter the battle, and the opposite one reapers at work. Of the sedent figures at the angles, that of War is finely conceived, and the allusion to let-ting "loose the dogs of war" is well expressed. The thinking figure under which is written, "The prudent are crowned with knowledge," is used by it design and treatment. An insertion excellent in design and treatment. Au iuscrip-tion in a promiuent position gives the words in Duke's despatch of the 19th June, 1815,-The Dake s despatch of the Join Jule, 1815, — "Believe me, nothing except a battle lost, can be half so melancholy as a battle won." On the whole, we consider this work has more of the postical requisites of monumental sculpture than any other in the collection. It might, perhaps, have heen better had the architectural perhaps, have here better had the architectural or rather structural element been subsidiary in-stead of prominent. The winged and seated figures, however, are not quite so plain in their personification as we should have desired them; though now they excite thought—like those on the Portland Vase, to which have been given one or two different renderings. The meaning of some of the figures is obscured rather than popularized by the inscriptions under them; and these might well he reunder them; and these might well ne re-considered. To be understood, a work of art into which allegory enters, must have its permovement alregory checks, hust layed the pet-sonified virtues or qualities, such as may stand marked in a character: it should not attempt minute psychical definitions. Also, to be under-stood, the language of the allegory must be strictly logical. We are not certain that the author of No. 68 does not intend distinct per-value of the strict part. The desonifications of Integrity and Truth. The de-sign, however, as we have shown, has great merit

It should not be forgotten in judging of the collection, that whilst competitions do not by any means necessarily, call forth the efforts of any means uccessarily, call forth the efforts of the leading artists, they are very likely to excite delusive hopes amongst the incompetent. This is the only explanation that occurs to us for the contribution of many works, which have the worst faults attributed to the monuments of Westminster Abbey, and are altogether behind the standard of ability of our chief sculptors. We would show in what we consider these last are would show in what we consider these last are still waiting. But, how is the presence of the works just referred to, to he explained?

There is a very large class of persons eugaged in the production of cemetery monuments-ir which art of the lowest grade has long prevailed and there are a considerable number of others who are able to carve or model in some manner for articles of furniture or decoration, but who are scarcely to be called *sculptors*. This would account for the exhibition of several models which, without mention of excention, are in design what we never expected to see again. They resemble the works in the Abbey more nearly than we might have deemed possible, after the little that we have had lately of Roman costume, and of that sort of conventional per-sonification which is supplied without artistic grouping, and new conception or thought. The grouping, and new conception or thought. The circumstance shows that had works are permanently injurious: they are referred to as models, simply hecause of their number or prominence.

the lifeless manuerism of works that had hrought the true art of sculpture into contempt, hrought the true art of sculpture into contempt, and through which all allegory has heen forbidden, unmindfully of the conclusion that would cast aside the "Fairy Queen," and some of the most beautiful conceptions in art and literature. Influenced by the general demand for portrait sculpture, and seldom cugaged on buildings or grand public memorials, our sculptors have not through their own works corrected the vicious example of these who nercoded them ' example of those who preceded them.

We have learned particulars of exertions that have been made by working meu, in which we know not whether to express our admiration of the perseverance by which their models were produced without the common tools and ordinary modelling and casting processes, or the regret that so much should have beeu wasted merely to gain a lesson of fortitude. It is well to feel that any man may attain to eminence in any calling but the odds are in favour of those who have had the start, and have never dispensed with known appliances, or consecutive and gradual steps, or with the best available means of instruction and example.

But on no supposition can we account for the exhibition of the work which first meets the eye (No. 1) in the collection, "The Wel-lington Star Monument." A production so com-pletely destitute of art, it has never been our hecey destricte of art, it has never been out lot to encounter. This one work surely will not he ascribed to an *artist*, British or Foreign. Proceeding with our notice,—No. 6, with the motto, "Wellington fortis viri sapiensque," exhibits a group of Wellington delivering his sword to Britannia. There are four figures sword to Britannia. There are four figures seated on the pedestal. There is little art of sculpture or architecture in the composition, sculpture or arcbitecture in the composition, though it is one which has some pretension by its dimensions and mass.—No. 7, "Beatus life qui mercute palmam onusque tulerit," before noticed, is like many of the models, hetter in its accessory figures than as to its principal figure and centre in the composition. matte. motto-

"Uno de' due "Uno de due D'un' illustre vittoria andră superbo; Il cimento è comune, ed avvien spesso Che morte incontra chi di durla ha speme;"

Che morte neoetra chi ai daria ha speme; and displays less merit than is to be found in several English works. There arc, as in other cases, tolerahly good sedent figures on the lower pedestal, but the principal figures are almost absnrd. — The author of No. 10, "Arno," also a foreigner, believes that the momment should be simple in its main lines; and be therefore gives architectural details in momment should be simple in us had hads, is and he, therefore, gives architectural details in which we see only poverty of thought. Wel-lington is habited in the toga, and is led by the hand by Victory—Peace kneeling.— No. 11, the Renaissance tomh, has the motto,— "No. 12, the caso e virtă angi è bel l'arte."——No. 13, the coloured aud gilded shrine over a recum-hent figure and tomb, has the motto from Richard III. :-

" Death makes no conquest of this conqueror ; For now he lives in Fame, though not in life."

There are some good details in this work, but much injured in effect hy the want of sufficient care in putting on the colouring and gold.—No. 16, with the device of three crosses, is a curious design, which is all pedestal, except that there is a figure of Fame on a pedestal of a much smaller size, on the lower pedestal. This lower one is decorated with arcbes and columns, and rilievos of lumpy figures, in marble and bronze. —No.17, "Spero Meliora," presents the Duke as "a central figure in English history," &c. as "a central ngure in English instory, ecc. This the artist accomplishes by having a recum-bent figure in hrouze ou a pedestal, around which stand figures of some of the principle "celebrics."——No. 18, "I know of but oue art," is a model for an Elizabethau kind of monument, for brouze, with a reenabent figure draped car drawn by lions, and attended by and an equestrian statue at the summit. It Britannia, attract attentiou, —as though the ob-would reach, we think, to not less than 40 feet ject of a visit to Westminster Hall, were to be in height. There is some vigonr in the groups tickled with such puerilities, and not to have which are introduced at the ends, of Truth over-the more intellectual and dignified seuse im-coming Fraud or Falschood, and of "Valour with Cowardice at her feet."—No. 20, "Finis Coronat Opus," is probably the hest of the still sometimes showing that British seulp-simple statuesque monuments. Wellington stands on a plain pedestal, round which ar monument, for brouze, with a reenabent figure

[Aug. 1, 1857.

The real artists of the day have abandoned be lifeless mannerism of works that had rought the true art of sculpture into contempt, and Ireland.—...No. 21 bears the inscription, "A design in elay resembles life is a stacco copy resembles death: the execution in marble, how-ver, is the resurrection of the work of art." is do the "Faëry Queen," and some of the most slide the "Faëry Queen," and some of the most fuluenced by the general demand for portrait eautiful conceptions in art and literature. fuluenced by the general demand for portrait outpure, and seldom engaged on buildings or rand public memorials, our sculptors have not xample of those who preceded them.? We have a statistic presentions that the foot, have considerable merit. No. 22, which is inserviced with a motto from

No. 22, which is inseribed with a motto from "Dante-Di quell' umile Italia," has a figure of the Duke, on a pedestal, round which are sedent figures of Britannia and India, and two others. This part of the monument has some merit of treatment; though no greater invention than just the moderate quantity, which as it will have been apparent from our notices, is to be observed in a considerable proportion of the models. The sculpture in No. 22, however, is placed on a high pedestal of most tasteless Is placed on a high pederation of most extensions character. It has a Doric entablature, with cannon in place of columns; and ennuon balls are beaped around. All these "decorative" features have a profinse application of gilding. We have no evidence certainly in this compe-tion that each ext is to be produced pages. tition that good art is to be procured neces-sarily from the continent; and as in the case of the competition for the Government Offices, we the competition for the Government onders, we can look to Italy ouly to feel how low she has failen. The voice of Dante speaks, but cannot restore. It is it liberty alone that she useds to revivify the dead — the body which is all that she offers in place of the living art? No. 26, "I have done my duty," — a tomby

No. 26, "I have done my duty,"-- a tomb aud figures, open to several objections which we offered to works of the class, and to those in which unity of thought was not observed, is clearly double the scale intended for the models; and ought to have been excluded, considering that in other eases models with accessories which would have overstepped the limits of the which would have overscopped the mass of the space shown on the lithographed plan, were do-nucled of their additions before the opening of the exhibition.—In No. 27, "Immer Strebe zum Ganzen," mentioned in our last, the zum Ganzen," mentioned in our last, tobe commonplace treatment of the statue with four sedent figures on a lower pedestal, is much re-deemed by the good proportions of the monu-ment and its parts, and by the attitudes and effect of the figures individually. The coloured materials we have spoken of. The lower pedestal of Peterhead granite has monldings and rillevos in bronze. This monument would reach to a height of about 34 feet. There seems to be height of about 34 fect. There seems to be considerable difference of opinion, amongst the anthors of the works of the hetter class-whether a low monument or one coming to above the springing of the arch, would be best suited to the building. Experiments might be tried at very slight outlay, in the catbedral. We hear that one or more of the models were accompanied by an enclosing arch. This it was not thenefit parmer to have exhibited.

No. 29, apparently by the author of No. 16, already noticed, has an equestrian statue of Wellington in bronze, planted on a rock. In the lower portion of the monument are a number of lower portion of the monument are a number of figures—to be in part marble, and in part hronze.——In No.30, her Majesty is represented "mourning the memory of the counsellor, the hero, and the friend." A draped urn, and the British lion are amongst the accessories. We should scarcely do our duty were we to pass by these miscrable pretences for *sculpture*. Let the real artist look to it: he must do more than be here at attempted beyond skilled modelling he has yet attempted beyond skilful modelling in portraiture, or the commonplace and mindless presentation of mere allegory; he must set free new currents of ideality, and infuse new thoughts into the marble and brouze. The misfortune is that attempts—such, for example, as No. 31, where Wellington is laid out on a draped car drawn by lions, and attended by

he future.—No. 32, "Alpha," is one of two rorks by the same author, which surely cannot leserve what has been said in favour of them. In this one, Wellington is shown attended by eace and War,—Peace proclaiming to Europe hat throughout the victories of her hero, Britannia is still triumphant. Britannia is frawn through the sea, in a car, around the ase of the group. In the other work by he same band (No. 35) the Queen, Lords, and Commons—the two latter represented by gures robed and wigged—are paying a tribute of respect to their hero, whilst Peace and War re raising a trophy to his memory. The Queen s seated in front, and is pointing up to Wel-If respect to their hero, whilst Peace and War re raising a trophy to his memory. The Qacen s seated in front, and is pointing up to Wel-ington, who stands on a pedestal above. There s, doubtless, something to admire in the sepa-ate figures in this latter work. But the idea gain, like others, is not removed from common-lace; and further, the endeavour to express be raising a monument, as part of the real nounment, were better, we believe, not made. In he other model (32), there is attempted a com-licated kind of action, which belones essentially slicated kind of action, which belongs essentially o dramatic art, or which, in sculpture, must generally fail where there are allegorical figures. be aim should be, we think to take of the aim should be away the channel may seem—between, on the one hand, portraiture and representative sculpone man, portrature and representative soup-parts or common-place allegorical figures with-part action; and, on the other, that combination of allegory with dramatic action, which essays to express what is beyond the limits of the souppor's art. Whereas, by a mere connected sequence of thought suggested by the allegorical source concentrat corrected from one arctime igures-somewhat separated from one another igures—somewhat separated from one another, and grouping into one whole by the aid of reclitectural mass or details; and with the episodes, which may be expressed through rlievo and ornament, we believe a more com-leter result can be actually attained. The real difficulty, as we have said, is to make the use of architecture, and yet present seulpturesque character predominant. Of the two works last named, one makes no use of architectural features, and the other attempts them only without invention : whereas the work Membershift at the other attempts at the other attempts which above, we have felt deserving of much attention, would probably be deemed too like a structure in its general outline. The aim of the artist should be to present something which can be understood at once—though to aid and have access for the observant to become imprassed leave scope for the observer to hecome impressed with further sensations of poetry, received brough the medium of his own consecutive

chapel has a nave and aisles, separated from each other by an arcade of semicircular arches, without mouldings, which are supported by twelve columns, and two half columns. The form of the castern extremity is apsilal; and it would appear that the otherwise rectangular outline of the huilding was purposely interfered with in order to give the chapel this favourite peculiarity. Over the lower is an upper arcade, divided by a phily-chamfered string-course, which arcade opens into a gallery that occupies the space abox the sides. Among the smaller towers of the fortress, which the paper proceeded to notice, and which are with one or two exceptions of the period of King Henry III. Mr. Hugo drew particular attention to the Bell Tower, the remains existing in which have never been figured, and bat very briefly allnded to. Of this tower he promised a memoir, with accurate drawings, for the next evening meeting of the society. He concluded with an expression of thacks to the antho-rities for the maner in which they are responded to the solicitations which the concel had commissioned him to offer in the society's behalf. The visitors were then divided into a certain number of parties, each attended by a warder, and each took a different irote to visit various parts of the fortress. Mr. Charles Baily received the company in the Beanchamp or Cohham Tower, and pointed out the intresting memorials with which its wills abound. These, as our readers well know, consist of inacrip-tions, devices, and cast-of-arms, the work of many unhappy prisoners, who thus beguided the tedium of raptivity, terminated, in the case of many of then, by a violent death. Among others, those of Tyrrel, howas there of Arrundel, John Dudley Earl of Warwick, John Story, Jane (the wife, per-haps, of Lord Guildford Dudley). Egremoud Rid-elf, fix, ewere day noticed, and the history of their inseribers briefly detailed. Amongs the inseriptious, a nameske of the grathema who thus kindly officiated, "C. Bailly," has let upon the walls this apothegm : "T cbapel has a nave and aisles, separated from each other by an arcade of semicircular arches, without

he that is not pacient in adversities; for men are not he that is not packent in aversatiles; for mice are not as not will be written by a second state of the latter who were in a hurry to get round, and found them-solves compelled to adhere to the arrangement, and wait until the party in possession had left the narrow staircase free, had almost given practical illustrations of the truth of the remark.

Mr. Alfred White was stationed appropriately in the tower of that name, and pointed out its features to each successive hatch of visitors. What he said was to this effect :-

The charge of St. John, from the position in which it is placed in the White Tower, elserly belongs to a period shortly after the crection of this tower in 1078. Some of the details of the capitals of the columns would induce us to believe this date is some-bet to engle and this coming is streamthered by

act was the foundation of a curious legend, in which act was the foundation of a curious legend, in which the sainted king is said to have given bis ring to St. John when appearing to him under the form of a poor beggar. Henry III, ordered much decorating at the same time for the eburch of St. Peter: but in addition to what was ordered for St. John's, be directed that stalls should be made for himself and directed that stalls should be made for himself and queen; and from this we may suppose that SL. Peter's was the church frequented by the royal family, and that this chapel of SL. John was, perhaps, used by the garrison, or by the noble prisoners frequently de-tained in the fortress. We find little notice of this chaped till 1512, when Stowe tells us the chapel in the high shifts force are bound. Unving autofully the high white tower was burned. Having carefully examined the stonework, he had not been able to find examined the stonework, he had not been abie to had the effects of fire; nor does there appear to have been any lead melted out of the joints, and from the absence of these nijnuies so generally found in churches which have here subjected to fire (as the choir of Caoterbury Cathedral), it would seem as if this fire was confined to the hurning of some inconsiderable woodwork within the huilding, or the wooden roof might have been hurned off; the effects of which would be seen hursd off, the effects of which would not have been furned off, the effects of which would not have been felt in the chapel, as both the heady and aisles are covered with a thick stone areb. The party were afterwards conducted round the trifo-The party were envired to that we are a south the relation of the set and south, which formerly formed a means of communication between this chapel, the conneil-chamber, and ante-room. These openings have been hricked up within a few years. So far Mr. White.

room. These openines have been harded up within a few years. So far Mr. White. In the chapel on the Green,—St. Peter's ad Vin-cula,—the Rev. Mr. Bontell, on whom the general arrangement bad devolcel, and who did his duty well, received party after party, and pointed out briefly the principal objects of interest. He was not able, he said, in entering upon the sketch, like bis friend, Mr. White, in his d-scription of the chapel in the White Tower, dedicated to St. John, to engage their attention with a venerable example of early architecture; nor could he hope, from this building itself, as an architectural stucture, to elicit anything which would excite their interest. The present church was the result of even an unusual anount of bar-barons maltreatment, under the pretext of restoration and improvement. Probably, nothing visible was earlier than the time of Henry VIII, and hut little indeed so early as that. When the Tower was first erected, as a Norman royal fortners, the chapel of St. John was probably the only church within the eircuit of its walls; and when the outer works of this re-nowned easile were extended and consolidated by Henry III, it would scenn that adistince thereA was erected by that prince, which church was, in all pro-ability. presented hey the church of St. Peter of Henry III, it would seem but a distinct entrem was erected by that prince, which church was, in all pro-bability, represented by the church of SL Feter of the present time. But if the existing church could advance no strong appeal as work either of aucient or of noble art, through its associations it was able to appeal to our deepest feelings and our most che-rished sympathies. Inseparably is it connected with through the medium of his own consecutions through the security of the secure secure of place which are as and security be sec

in the armouries, suggested. Hence followed a few remarks upon the historical as well as artistic of monumental effigies in general. The Screope monuments were next described, and their interesting The Screope motionents were next described, and their indersting heraldry particularly noticed y — also some recent interments, and more particularly of two of the founders of the Suciety of Antiquaries. He concluded with reminding his havers that now a sketch only was attempted, but more minute, as well as more caste, hescriptions were reserved for papers hereafter to be read and then published in the transactions of

the source of the second secon afforded of the fashions adopted in plate armour Of the earlier chain-mail no satisfa tory example wa found ; but the Asiatic chain-mail might be safe! taken as a true exponent of its manu'acture, inasmi as the nuchanging characteristics of the Eastern mind kept their artisans employed to the manufacture of Rept their arrisans employed to the manufacture of chain-mil precisely similar to errly fragments which we have reason to believe were made and need in the crossoding era. The compension of such frag-ments in the Tower with the Asianic suits also pre-served there establishes the fact. After the adoption of chain-mail, additions of plotten if the kness and elbows, shout the time of Edward 1. led to the far-ther adoption of defines for the leg and arm; and in the reign of Edward 111, the knight became cornsal in Materia. the reign of Eisard 111, the knight become consists in plate-armony. It then begon to assume fanciful forms, and in some degree accord with the prevailing fashions of dress; the tight-fitting baubark and knightly gridely, resemblug the jupon, and haldrick worn by gentlemen generally. The long-toed solleret of the time of Rienard 11, was a cupy of the shrees whose toes wrie fistened to the knee by a chain. The puffed and slacked dresses of the days of Henry VIII were also imitated in metal and the The pioloci and six-hed dresses of the days of Henry VIII were also invitated in metal, and the broat shoes indicative of his period are seen in the steel suits of the sollier. After the knight had been thus encased in armour, a variety of curta defences were invented to add this suit; thus the mentionnize protected the neck, where the junctions might have given dangernus entry to a sword or lonce-point and the grande-garde was screwel over all, protecting the entire breast and left side of the knight ing the entire breast and left side of the single-the ann on that side being includes of doing more than guide the rein, for which reason the gammled was seldom separated into fingers. The heavy hance was secored in a ret, give afficient of the heavy place was secored in a ret, give afficient of the heavy place and the man fixed in a high saddle, so that he became a mere in white in the tourney; and if he w thrown, was completely much to move, and at the mercy of an opponent. When the utnost had thus been done to make armour strong, it was then much ornamental; and suits were covered with engravings of the most elab orate kind, and sometimes d-conrated with gold and silver patterns, inlaid with great art and micety. Occasion d'y the surface was emboased in high relief, and finished by chasing. Examples of all this work were pointed out, and attention directed to a splendid suit for mu and horse, which occupied the centre of the salooo, and is one of the fluxet in existence; it was unde for K ng Henry VIII, and his initials and those of his first wife Katherine of A ragon, as well as their badges, any can upon it. It is be-lieved to have been presented to him by Maximilian of Germeny; at all events it is of German workman-ship, the armoning so of that country being then edethrown, was completely unable to move, and at the of Germany : at all events it is of German workmany ship, the armourters of that country bring the celu-brated all over Europe. Various scenes in the history of St. George are also cugraved upon its surfree, as well as various sainly legend. Mr. Faitholt accom-panied each party of visitors to the small armoury above stars, and pointed the most striking objects. able scries of helmits which line the lower part of the great armoniy and were seen as the visitors denaried

departed. Mr. Faitholt, like the other gentlemen who had undertaken the office, had to tell his story many times over, and must have been quite tired when the *eighthe* over, and must have been quite tired when the *eighthe* We have never obtained a satisfa tory party retreation of a new first order of any com-answer to our inquiry as to the retention of any com-petent person by the Tower anthorities for advice and assistance as to the armonries. We have reason to assistance as to the armor antorities to navice and assistance as to the armorrise. We have reason to helive that there is no person responsible for their safe keeping and judicious increase. If it be true, as we have heard winspereil, that the celebrated "winged We have nearly winsperied, by the the celebrated "winged burgoned," of Iheatrial memory, was sent down by the Tower authorities for exhibition at Manchester will other things, and that it was quickly put linto a box there and maled down by Mr Planché, to prevent seandal, the wast of some directing mind with know-ledge of the subject must be sufficiently evident.

We have no desire to flud full, especially as the request on the part of the society was so kindly met at the Tower, but one or two observations we must

niake. other parts of the Tower, is misecable in treme: Gray's epithet,---

"Ye towers of Julius, London's lasling shame,

might be applied in a fresh sense. Inside the chapel, mean de applied in a riest sense. Insue the chapts, party filled with records, the plastering is broken, the stonework damagel, and the whole dirty and nearcolled. Once of the plastantest parts of the examination was a walk found the onler walls of the fortress; but it exposed to view some of the the fortress; one is exposed of view some of the miserable sham work done a few years ago. The works now going on, it is right to say, are of a different and more satisfactory character. An concretic R.A. whole sea views annually gratify London, was delighted to find a bit of his favourite Veuice, in the shape of a lion, built into the er-Venice, in the shape of a line, built into the ex-ternal wall of part of the new barraeks, and not less so to discover a fern for his collection. Several found some nice bits to sketch, and all, we believe, were well satisfied with the ramble, looking to coming evening meetings and the Soviety's jurval for more previse information, particularly of the smaller and less known towers into which it was not found practhable to introduce so large a number of persons as were then assembled there.*

VISITS TO THE MUSEUM AT BROMPTON. LARGE non bers of persons continue weekly to visit the so-called South Krosington Museum, and there seems to be no differences of opinion as to the value of the collection as a means of promoting artistic and scientific education. Continuing our examination of the various departments, with a view to give such particulars as may be useful and intere-ting to our readers at a distance, we will now look into the Gallery of Pateuled Inventions

This operational inventions. This operational although of considerable extent, courtains, evidently, but the beginning of a great and valo ble callection. Here are already stored upwards of a hundr d models of various descriptions of machinery, and the number is constantly increasing. Many of these may be considered historical, and serve, in a of these may be considered historical, and serve, in a curicon smanner, to show the projectess of important invertions, without the use of which, at the present day, we should wonder how the affairs of the world would in we along. Some of the models here are public property, others are forwarded for exhibi-tion by their owners; and it is worth while in mention that objects of this description will be received here, and well carefore. and well cared for. From the models, which are all carefully numbered

and disjunctly described, we are templed first, as many no doubt will be, to glinee at the numerous drawings no upper which are to get need at the numerous nrawings and engovings which party cover the wells. These con-sist of portraits and other particulars connected with emined inventors of the last two centuries, and great credit is due to the heads of this department for so judicionally collecting mate ials which must interest Janichasiy conecting instenars when must interest the majority of visitors, and conse many to make an examination of models which would otherwise be passed over without notice. Each portrait has a printed label affixed to it, descriptive of the claims which every worthy his to a place here; and first we must notice a chalk drawing of the Rev. John Har-mar, which heres the following ingestition. This must notice a chalk drawing of the Rev. John Har-mar, which benrs the following inseription: $-^{-1}$ This, the original likeness of the late Rev. John Hormar, has, by his family, been presented to Bennet Wood-croft, towards the formation of a National Gallery of the Portraits of Inventors, and is the first gift for that interesting and valuable object. 6 Dec., 1533.-Im.wentor of improcements in machinery for raising and shearing woollen cloth. Patents, Nos. 1595 (1787), here 0.721982 (ľ794).

Aud from this small beginning, the collection has And from this small beginning, the collection has increased to its present important size in less than four years. The men, whase figures are now put before the view, and their works, are strangely varions. Here, or instance, is Edward, Marqu's of Workester, author of the "Century of Inventions," and inventor of an engine for applying steam as a motive pawar,—of a method of princelling vessels,—of appatants for in-stantly disengating restive horses from vehicles, and of improvements in clocks, an colour and for the standard of improvements in clocks, and of the standard s of improvements in clocks, wa ches, and fire-arms, (Patent, No. 131: date 1661.) There is also Prince Rupert, from a picture by Vaulyke. The investor of processes of converting forged iron into steel, and for enating iron with copper. The Prince's 1 Nos. 161 (date 1670) and 162 (date 1671). pater It is said that Prince Rupert was that Prince Rupert was the inventor of mizzotiut engraving. Sir Hugh Middleton figures as the pro-jee or of the New River Works, and inventor of pee or of the New Yover Works, and Inventor or machinery for draining lands. The chemical philo-sopher, Liebig, is in connection with a ratent in the name of Masprati, (No.10.616; dute 1845.). Thomss P-ine, the political writer, appears as the inventor of a method of constructing iron bridges,

* A sketch in the Bloody Tower, showing the machinery or lowering and raising the portcullis, and one of a vaulted hamber near, will be found p. 203, aste.

The condition of the Norman chapel, and and other vaulted or arched structures requiring ex-parts of the Tower, is mise able in the extended span. James Puckle, author of humorous and satirical essays, and inventor of the first revolving gnu

gue. Amongst the most striking portraits is one en-graved by Seriven, of John Rennio, the engineer. The works excented by the litter are so numerous, that we are percented from mentioning them in our present space. The purtrait of the first Sir Robert Peel, after Northeole, is very characteristic. We passe with interest before the picture of Prederick Albert Wusser, the projector of public gas-lighting, and founder of the first gas-light comprises in Encland and France: he was also the inventor of an and founder of the first gas-light componies in England and France: he was also the inventor of an apparatus for the production of gas for illuminating purposes of a telegraph light-honse, and of the appli-cation of sugar to certain purposes. This fanous man, who was so eminent a public benefactor, ended his days in great distress.

We learn that the inventor of the fire-escapes, now in use, was the artist who painted several of the por-traits in this collection: his name was Abraham in this collection: Wivell. And here he may be seen in the costume a fireman attending upon his machine.

Amongst other remarkable portraits are those of the Earl of Stanhope, the improver of the printing press; John Smeaton; Gerge and Robrt Stephen-son; James Walt; Richard Roberts; Henry Great-head, inveator of the life-boat; Rev. E Cartwright; William Raibaira; the late Sir M. I. Brunel; the Errl of Dundonald; James Bindhy; Sir Richard Arburicht: Bulag on James Bindhy; Arkwright ; Bolton, and many others.

We must not pass over without notice a very effective oil painting of a family group representing John Arnold and his wife, seated, with their son standing between them and listening to his father, who is explaining the construction of a chronometer which be holds in his hand. It is said that Mrs. Arould was a very talented woman, and gave great assistance to her bashand in his citultions. Nor can we pass over the effiy of Roger Bacon, the re-puted invector of gungowder, the air-pung, the cumera obscura, the diving bell, and of the applica-tion as in moders times of waldhe backs to how to tion, as in modern times, of paddle whrels to boats. No wonder if, in a comparatively dark age, the philosopher was able to do such thiugs, that he gained the sopher was able to do such thiugs, that he gained the character of a wizard, and was supposed to have been an able pupil in the "black art." It is pleasant to see the face of William Cathon, the printer, amongst this company, and George Bickheck, the founder of nechanos' institutions. Here, also, is Rowland Hill, of the Pusi-office, the well-knawa projector of the penny postage, and isventor of improvements in printing machines. We had almost overlooked the partrait of Joseph Marie Jacquard, produced by weay-ing in silk with the sid of the Jacquard machine; and ig in silk with the aid of the Jacquard machine; and ir Francis Crane, last Lay Chancellor of the order of the Garter, and Master of Tapesny to King James I reign he began the tapestry manufacture at Murclake, in Surrey, where copies were woven of the cartoous of Raffalle, now at Hamptoa-cont. We cannot leave this national gallery of inventions without mention of a print of William Lee, A.M. inventur of the stocking-trame. This is copied from a picture formerly in the possession of the stocking weavers, who formerly had a hall in Redcross-street, weavers, who tensure is clad in collegiate costume, London. The investor is clad in collegiate costume, and is in the act of pointing to an irwn stocking-frame, and addressing a woman who is kuiting with usedles by hand. On the pitture was the following inscription: ---- 'In the year 1589 the ingenious William Lee, A.M. of St. John's College, Cambridge, the profitable art for stockings (int being devised this profitable at for storiege, cambridge, devised this profitable at for storikings (hut being despised, went to France), yet of iron to himself, but to us and others of gold--m memory of whom this is here painted." The original painting is now missing, howing because add, it is supposed, at a perind when the company fell into pecuaiary embarrasament, and it would be a fortunete conversion of the device. be a fortunate circumstance if the notice of

whild be a fortunate creunstance if the notice of this now lost portrait should be the means of direct-ing the attention of its present possessor to its value. We must, however, leave this part of the collection to glaare at the models which occurs the contrespace, and in such bright and clean condition are they, that many will be supprised that a number of them are of cansiderable antiquity. They have, however, been polished up and put in order number the careful inspec-tion of Mr. George Nasmyth, who, under Mr. Bennet Wooderoft, has charge of this department. It is evident that Mr. Nasmyth has made this restoration of the models a labour of lowe ard that ye have here of the models a labour of love, and that we have here the right man in the right place."

Amongst the most interesting of the machines Amongst the most there are a first or stream Navi-exhibited is No. 1, "Parent Engine of Steam Navi-gation," William Symingt m-Letters Patent, A.D. 1787, June 5, No. 1,610. The history of this engine (or it is the identical one used, and not a model) we (or it is the identical one used, and not a model) we (or is the reduced one used, and not a model, we quote from the descriptive caralogue ---- Por some years prior to 1787, Parick Miller, eq. of Dalswin-ton, Scotland, had heen engaged in a series of experi-ments with double and tripic vessels, propelled by

paddle-wheels worked by manual labour. In the experimental trips of 1786 and 1787, he was assisted by Mr, Janes Tsylor (the totor to his two younger-sons), and at the suggestion of the latter it was dr-termined to substitute steam-power for manual labour. For this purpose, in the early part of 1788. Taylor introluced William Symington, an engine er at Wanlockhead Lad-mines, who had previonsly ob-tained letters patent (June 5, 1787) for 'his new invented steam-engine, on principles entirely new? An arrangement was made with Symington to apply an engine constructed ac-ording to his invention to one of Mr. Miller's versels; and, cousequently, the engine which forms the subject of this notice was made, the eastings being extend in brass by George Watt, founder, of Low Caltor, Edinburgh, in 1788. At the beginning of October in that year, the engine, mounted on a frame, was placed upon the deck of a donble pleasure-bant, 25 feet long and 7 feet broad, and connected with two paddle-wheels, one forward, and the other abaft the engine, in the space between the two hule, of the double hot: On the stears paddle-wheels worked by manual labour. In the and the other about the engine, in the space between the two hulls of the double beat. On the steamengine heing put into action, it propelled the vessel along Dalswinton Lake at the rate of five miles au hour. After Mr. Miller and his friends had made n series of experimental trips in the hoat, the engine series of experimental trips in the boat, the engine was taken into M. Niller's honse, where it remained in the hbrary until his decease in 1815. It sub-equently passed through varions hands, and ultimately came into Mr. Weoderoft's possession in A pril, 1853." This interesting relie, which we are told had a vry narrow exceeps from being broken up and sold for old metal, is of the class known in the early history of steam machinery as the 'atmospheric engine,'' and great credit is due to Symington for combining varions immergyments in the same engine. In 1801 warions improvements in the same engine. In 1801, Symington w.s employed by Lord Dandas to con-struct a steam-hoat; and having by former foilness learned what was required, he availed himself of the learned what was required, he avail d himself of the great improvements recently made in the steam-engine by Watt and others, and constructed a steam-engine, in combination with a boat and paddle-wheel, on the plan which is now generally adupted. This boat, called the *Charlotte Dundas*, was the first practical steam-boat; and for the novel ecubination of all the parts, Symington obtained letters of patent on the 14th of October, 1801. The number of the metern is 2544. patent is 2,544

on the 14th of October, 1801. The number of the patent is 2,544. It is not only enrious, but highly instructive to examine this capine, prepared for Mr. Miller, which was probably the first attempt to apply stem power to natified purposes; and we have only to look upon the walls to see correct portraits of the different unenconcerned in this important work. Here, close to Vedgewood and Coit, is a very fine medallion of Patrick Miller, presented by the Misses Nasmyth; and not far off are those of Symington and others; and immediately above the portrait of Miller is a beantiful water colour drawing, excented by the late Mr. Nosmyth secondy years areo. In this scene is the front of the hones the identical attificial lake, ou which the experiments were made; and ly mere these hore is the double beat, with the engine to which we have alluded. Close by is the town of Dumfires, far in the distonce wandres the stern, similar to the serves which have lately come into use.

calicos, spreimens of the blocks used for printing calico by the hand, bridges, inventions connected with weaving and spinning, bleaching apparatus; the paddle, screw, &r. of the Great Eastern ; models of signals; an interesting collection, showing the pro-gress of the screw propeller; and other things too numerous to mention.

numerous to mention. A considerable space is occupied by an implosing library of folio and quarto volumes, which, however, prove on examination to be "dummies," but which, in course of time, will give place to real and sub-stantial books, containing printed and engraved parti-culars of all pictars gemented since the introduction of the new Act of Parliament, which enne into effect on the 1st of Octoher, 1852. The number of patents granted since the are as follow :=-list October, 1852, to the end of December, 1211, and in the following years, 2 644 and 3,045; and it is for the regular reception of the description of the patents granted since the space to which we have alluded is reserved. The volume silveady conthe new Act of Parliament, which same into effect on the 1st of October, 1852, the number of patents granted since then are as follow := ist October, 1852, to the end of December, 1211, and in the following yeers, 2.644 and 3.045; and it is for the regular reception of the description of the patents granted earh year, that the space to which we have alluded is reserved. The volumes already com-pleted occupy—the specifications 16 feet, and the about 40 feet will be required for these how and it is calculated that about 40 feet will be required for these hows and which are prepared by Mr. B. Wooleroff, of the which are prepared by Mr. B. Wooleroff, of the and some other libraries in London, and to several of the devent of the last period, and how were disting status entry that have and the about 40 feet manafacturing towns of England, and also) of roofs. Kigid nee ssity produced economical work

to parts alread. It is intruded to print and bind the partirulars of all the materials since No. I was granted in 1617. From this date to the passing of the new that in 1852, the number of patents granted amount to 14 350, being on an average 235 jatents for each year, and the increase in the number with the 3,045 patents granted in an event year. It is eviders that it must be a halow of considerable time for its with a material in ventors to search through all this mass of material in that is must one has preceded him. Its that it must he a labour of considerable time for in-ventors to search through all this mass of material in order to discover if any one has preceded him. In order to ave this toroble and expense, a series of small hooks, which sell at 6d, each, are in course of priparation: each of these contains a complete list, and brief description of the patents of each class. There have already bren published abridgements of the specifications connected with sewing and em-broidery, drain-tiles and pipes, manufacture of iron, used architecture and propelling, preservation of find. It needs hut a glacee at this department of the Brompton Misseum, to feel sure that what is row here is but the germ of a large and useful collection, which will show the progress of our mechanical skill, and where in course of time we shall beable, by an ex-amination of the models, &c. here placed, to trace the progress of spinning from the time of the sortent dis-should be lost in getting specimens of the spinning-wheel, and the other mechines connected with it, one such familiar features in our humses, but which events and the other mechines of the spinning wheel, and the other mechines connected with it, one such familiar features in our humses, but which events the progress of prioting sources in our humses, but which events the progress of prioting the other mechines of the spinning wheel, and the other mechines connected with it, one such familiar features in our humses, but which are fast vanishing. There are a few of the old-fashioned hand-printing presses still remaining; but we apprehend, that if spu cim ns are not soon secured, the existing examples will run a similar risk from the rebaufs, as did Mr. Miller's first steamold iron m boat cugine.

RANDOM DESIGN

THE five centuris that clapsed between the time Authemins built Sr. Suplia's, at Constantinuple, and the creetion of Pisa Cathed al, by Buscheito, are called the Dark Ages of Architecture. Few records or remains of that period exist, and those positively referred to are not considered accurate. Very Itile labour has been bectowed upon the restarch, partly from the want of means inhividually, may hardly because the edifices of that time have been notil lately nop-ular -most review d professionally. in deference to the edifiees of that time have been notif lately nop-pular,--not revived professionally, in deference to the spirit of reviving ancient Greece and Rome. As some large eitirs were funded during these carturies, and the inhabitants were enigrants from contries where architecture had flourished and fallen off, it is naturally conclusive thet their public buildings, parti-eularly places of worship, wire creeted with some degree of order; and, as they decayed, were burned, or became otherwise unsafe, were rbuilt in an im-proved and calarged manner. Change of climate would inhee many departures from ald form, and the law of necessity is as absolute in design as in any other branch of lumanialitative and taste. Morewere, men of talent have been known to dochue styles of other oraner or numbring transfer and tasks. Morework, men of talent have been known to deduce styles of architecture from the customs, hahits, and dwellings of aboriginal people, for more suitable to their alopted countries than any, the nost complete, combination of material elements left apon their native shores.

of material elements left upon their native shores. It is difficult to understand why those ages cannot be ralled by a more enlightened name, when out of them appeared a style that adorned the greater part of Europe for several hundred years. This peculiar mode of construction was suited mobly to the wants of the age,—inproving, extending, expanding with human advancement, and be conting more cossily and elaborate as the emmunities grew wealhicr. It cannot to reflect the age contrainestrue elaborate as the emmandities grew wealthier. It came to perfection, aerording to some connoissents, at accriain stage, and then hegan to decline, although it is doubtful whither the last arrangement of con-structive comparitien awas not as gludicious as that of the so-called perfect sertion. If it were not so, it may be more in accordance with the spirit of that time; and it is evident that architects, following successively in a beaten track, only untraduced and improvements as were warranted by their knowledge of these rireumstances. They distinguished between the days when beads were thimbed, and these wherein the intraduction of hooks into chardness colled algord

Hors from the schooled elegance of the original out-line, both in design and wurkmanship. Notwithstanding that all the up of tamit's of study and improvement were before the types of the archi-tect, and within easy reach of his mind, the progress of reviving the Pointed Style was very slow and incongruous. He began to huild again in the medi-real eleganctar without understrading one authors are shown. incongruous. He began to huild ngain in the medi-revel character, without understanding one outline or relature, or stadying to know the reason why it should be so delineated. This is evidenced by the misappli-cation of many datalis in the new G thic. The mystery which wants solution is, how a man requiring such a general fund of knowledge and schulastu disci-pline to learn the sp lication of Greek and Roman proportions to his designs, shuld dream of launching at once into, and earrying out, the most relationste and intri ate of all architectural studies, without any previous preparation, more than prinsps mere o udar inspection of such portions, in a coulensed style, as he thought suitable fit reviral? When the style began to be sought out and under-

previous preparation, more than parages more outlier inspection of such portions, in a coulenced style, as he thought suitable for reviral? When the style began to be sought out and under-stord, leaving less excuse for ignorance in the general outline, and when the architect commenced giving permanent specimens of his skill, it is surprising that he did not begin where his progenitors left off. In-stend thereof he wrath bark some handred years, and nickul up these dark and ensure designs of the first stage, thrown assile by the Medirevit and Tuder archi-terts, and inconsistent with every sense of eivilization. The Norman followed next, in point of succession, nutil it was exhausted and dispisal, and even the Saxon rhararter hes here attruncted, where zeal mastered reason. Every rond-about vary was taken, to a arrive at that perfection manifest in the l test specimens. And it was not nutil each in spirits, at great presonal losses, produed several visiting moun-ments on paper, with the measurements and mole of delineation, and gave sections to show the original method of cerrying out the whole construction, that any approach type sections to how the original method of cerrying out the whole construction, that any approach type relation that, is vigcionally obtined upon the public by many. It is laured as beautiful and appropriate, sull recommended as the most suitable for crelesinstical jurposes, by thore whose imagin tion cannot ilistignish between an ago when few Englishmen end and backs, and that wherein reading is become almost miversal. Passing over the frippery of what is called the Debased and the intervalisture of various sections of

Passing types the frippers of what is called the Debased and the internixtnre of various sections of the Point d style by modern artists, without any notice of what might have been done, there is more than softwirent now before the world, of random design, t call for become the section of the base of the section. notice of what micht have been done, there is more than soffirient now before the world, of random design, to call for observation. Though it may be lastful to improve and extend the details applied by former errhiterts, and to vary legitimately every break, base, extrance, and roof, nothing can worrait a direct violation of these rule, which, from the improved state of art, are considered to belong ex-clusively to retrin orders, and do not admit uf inter-mixture, without exciting discussed for the vary contines interwoven with each other, as may be seen by many warehouses and new mansions of the precent day. Indeed, the matter is nondescript where semi-Gubing Greetan, Roman, Italian, and Elizabethan, which the scriptural one only differed in magnitude. Architrase are returned at he very door-stop without a plinth, and similarly on window-sills and strings, and they abut a genetial arches without any spring-gen to the are unalso introduced into Italiae doors, which are such and monlide in Gothic solay at a vast exprise, 1 oking for more use thefore solay at a vast exprise, 1 oking for more use theore. doors, which are such and moment in one case the error at a vast exprase, I oblig far more unstafferry when the purcite nuvely becames more familar to the ere, than the easy recesses of heritimate architec-ture, which admits of ornament sufficient to relieve

Still there are admirers who dogmatize these errors as excelled in design; and it is not util some well-excelled *façada* arises alongside the merctricions con-position, and popularly shames it out of expression, that ametents acknowledge their oversight, by the isual method practised in sophisticated pedantrysilence.

Amongst modern buildings may be noticed several Amongst modern buildings may be noticed several brinks, which have every appearance of club-bonses and excellent club-honse fronts they seem, whether eopied or worked out laboriously. It must he ad-mitted, however, that there is a first-class specimen of mitted, however, that there is a first-class spectrum of a bank in King-street, Mauchester, its appearance at once indicating the purport of its business. Few designers seem to keep this object in view; and honce, being wholly occupied by producing a handsome focade, the work is brought to a close without any specific expression. The purport of the edifice should engross the mind, and if that be so satisfactorily impressed on the imagination that it is never forg when producing the ontline and its details, th otten chance of arriving at what cannot be mistaken its appropriation. However, the style adopted every its appropriation. at the first must be carried forward faithfully, even to its minutest details, without borrowing from others of a different class. In order to be able easily to acof a different class. In order to be able easily to ac-complish this, it is necessary that the designer should be intimately acquaicted with all the orders, styles, changes, and improvements in existence, both from hooks and by copying every example within his reach. Without these two conditions the design will be random, and the production displeasing to every person of taste and judgoient.

Many instances may be cited where new elevations do not represent what they really are, hut rather im-press a beholder with opinions quite the contrary. It is true that, those temporary constructions lately set Is true that those temporary constructions lately set up for exbibitions required a great latitude of idea, and, on account of the materials used, do not come within the range of ordinary practice. Indeed, it is scarcely architecture, any further than that required in the erection of hot-houses on a gigantic scale, but rather helongs to some department of engineering. As for design, that is out of the question, uoless arches incepable of self-maintenance, if not iron-bound, and wings like the stables of an aristocraft shall, have any pretensions therefor. The circular transact of and wings first the stables of an anistoeral's hall, have any preclassions thereto. The circular transact of Hyde-park, raised intentionally to preserve some trees from being lopped, has rendered it necessary that in future all such buildings should have circular roofs. They are suitable enough for their temporary purposes, and a such should be elassed by themselves; but they are as far removed from true arebitecture, as a buellon. a pavilion, a monster circus, or any other moveable place of shelter.

Two questions are asked, which, though very simple and well known, are sufficiently important to be repeated here. Why do the Classical, Grecian, and Roman remains look, on revival, so subline, solid, and awe-inspiring; and how is it that the eye is not and nwe-inspiring; and how is it that the eye is not dissatisfied with their introduction into many build-ings for modern usages? How is it that the Pointed style, in its complete condition, strikes the mind with astonishmeot and admiration? Because they possess concord, unity, and singleness of desigo. Many monn-ments exist to prove this on a large scale; but the lanthorn of Demostheces, and secretal Mediuval fonts and their canonics eccentifier the association is zero. lattorn of Demostheoes, and several atenavar are and their eanopies, exemplify the assertion in very reduced proportions. Similar to any ordinary inces-tigation, the irregularities which cause displacence in modern buildings will be found, if properly traced out, to originate in a want of discrimination, caused out, to originate in a want of discrimination, caused by neglecting to consult the principles of art,—pro-bably the lucdamental ones. Utder such circam-stances, a great many varieties will be produced, and none of a permacent description, which will ever assist in making progress; noless, as an absurd argu-ment, they convince men of errors to be avoided. The most elaborate datable housed by most elaborate details, beautifully wrought out and decorated, canoot save a composition from heiug a failure, under such negligence. But if committees But if committees, who have some responsibility in the malter, were to act with strict impariality, and call in qualified professional assistance to guide their decisions, very few specimens of random design would disgrace the who have some counties FRANCIS SULLIVAN.

THE CHESTER CONGRESS OF THE ARCHLEOLOGICAL INSTITUTE.

ARCHLEODOGICAL INSTITUTE. The first meeting was held in the Town-hall, on Tuesday, the 21st, Lord Talbot de Malahide, presiding. The Bishop of Chester welcomed the Institute to the City, also the Rev. Canon Sinde, and Mr. Hicklin. The Bishop of Oxford, on the part of the Institute, replied, and in the course of his address, said, I helive that my reverend friend and brother; the Lord Bishop of Chester feels that he has done and is and Bishop of Clester feels that be has done well in wel-coming such a society as this, because, after all, there is far more than the mere gratification of a somewhat idle curiosity in groping in the dust of antiquity in

such pursuits, and carrying our inquiries to the dim post. The great Creator and Ruler of the world has so ordered the affairs of man that things every day return again as in a perpetual cycle, the past repro-ducing itself in the present with only slight external alteration; but in reality and thoroughly the kernel remains the same it was before. Therefore, when people do set themselves to study the past, not for a mere superfield acquaintance with it, but to know it as it was—to see how it livel, moved, breathed, and had its being—to nuclerstand it in its temper, and had its being—to nuclerstand it in its temper, and had its being—to nuclerstand live, those persons do get, if they pursue the task with application, a certain sort of prescience for the future, from that acquaintance with the pst. such pursuits, and carrying our inquiries to the dim

of prescience for the future, from that acquaintance with the pist. Mr. Markland and Sir Charles Anderson also addressed the meeting. Papers were read in the evening. On Wednesday morning, in the Section of Antigotics, Professor Earle read a paper on audent names of places and things in Cheshire. In the Architestural Section, Mr. J. II. Porker read a paper St. Isho's Church Chesler, an ancient Norman on St. John's Church, Chester, an ancient Norman structure, huilt about the middle of the cleventh censcrietize, nine about the induce of the erection extra tury. The paper had reference to the architectural features of the building, its history being reserved for another paper. An adjournment took plree, and the members proceeded to inspect the building, and Mr. Parker pointed out the distinguishing features of this

At half past six the annual dinner of the Institute, presided over hy Lord Talbot de Malahide, was held in the Musie-hall.

in the Musie-hall. On Thursday, the meeting visited the Art-Treasures Exhibition at Manchester, Mr. Geo. Scharf, having on the previous evening given some particulars as to its formation, and a review of some of the works it comprises. In the course of his address, he gave some facts communicated by Mr. J. B. Waring, in reference to the Museum of Ornamental Art. "The Museum of Ornamental Art, which forms so import-ant a feature in the Art Treasures Exhibition, at Manchester, originated in the idea of collecting together the most remarkable relies of the Middle Ages and the Renaissance, somewhat on the plan (as it was expressed in the idea) of collecting Ages and the iteranssisee, somewhat on the plan (as it was expressed in the prospective) of the Hôtel Chuny, at Paris. How far anything resembling the Hôtel Cluny could be obtained in an open space about 600 leet long and 104 feet wide, may at once he conceived by those who are acquainted with the picturesque arrangement of that fine old mansion and its contents. Thus the original idea of forming young illustrations of aview any the fact. and his contents. This the original idea of forming rooms, illustrative of various epochs of art, appeared out of the question, and the only object which the directors had in view was, to form a museum as simile as possible in its plan, nod calculated not only to interest the general public, but to be of some ser-vice in placing before the eye a chronological series of the several arts therein illustrated. Before prowith ceeding farther, it may be well to state, that with the exception of the promise of the Meyrick col-Lection, notify the promise of the Meyrick col-lection, notify that here a done towards forming the maseum by the 1st of November, 1856, on which day Mr. Waring commenced his duties at Man-chester; even then, many precious days were lost for wart of any office for the department, and the Decessary requirements for work having to be set The ward of any once for the department, and the necessary requirements for work having to be set on foot. Indeed, the difficulties to be overcome at the commencement were great, and were increased by the evident lukewarmness of several of the committee the evident lukewarmness of several of the committee —in regard to this section of the museum — and the secret as well as open discouragement thrown in our way by the illiberal spirit of several influential men-in London and elsewhere—who ongth to have been its most active supporters? The aid of Mr. Robert Dud-ley, who had rendered good service at the Mediaval and Renaissance Courts at Sydrehum, was scenred, and shortly afterwards that of Mr. Chaffers. The speaker afterwards wave some account of the reneed processor afterwards gave some account of the general arrange ment of the museum. "In ten large glass cases, I4 feet nient of the museum. "In ten marke glass tears, if the by 7 feet, on the right hand side as we enter, are placed the government contribution, Lord Hastings' Majolica, the Soulages collection, and the Mayrick ivories, &c., i The coases covernment contribution, one Lord Hastings, three Sonlages, and one Meyrick. There is but little system observable in this series, owing to the neces-sity of keeping the several contributions separate. The other large cases, to the left on entering, contain those private contributions which were alread an

C. Price, Messrs. Slade and Nicholson, and Mr. Mayer's collection. On the opposite side, one cass of Mr. Mayer's containing a variety of mediaeval works, and three cases of gold and silver work, ob-

works, and three cases of gold and silver work, ob-tained chicky through the energy and liberal assist-ance of Messrs. Hunt and Roskell." On Friday, the historical section met in the Town Hall, under the presidency of the Bishop of Chester. The first paper read was by the Rev. F. Grosvenor, on the "History of St. John's Church." Mr. Grosvenor supposed that the first religions house was erceted on the spot now occupied by the present church about the year 906. The Rev. W. H. Gunnar, M.A., secretary of the section, then read extracts from a paper on the "Illustrations of Magic io the Middle Ages," by the Rev. Jas. Raine, juo., and a paper on the "Catalogue of Books in Winchester College Library, from Richard II. to Henry VI.," eontributed by binsel.

contributed by hunsel; In the section of antiquities, E. Guest, Esq., D.C.L., presided, and the first paper was read by Mr. J. A. Picton, on the "Primitive Condition and Early Settlement of South Lancashire and North Cheshire, with the Physical Changes which have taken place." Mr. Picton concluded an interestiog paper, by a reference to the spread of eivilisation and commerce, as exhibited in Liverpool, which would, he trusted, continue to extend for the good of the present and future generations.

In the architestural section, a paper was read by Mr. J. H. Parker, on the "Architesture of the Cathedral," and/one by the Rev. Charles Hartshorne, on "Carnaryon Castle," with ro'erence to Flint and other eastles in Wales.

Liverpool was visited on Saturday, and some of the Welsb eastles on Mooday. Reference to what took place there will be found in the next article.

AN INDIVIDUAL VIEW OF THE CHESTER CONGRESS.

CONGRESS. BEFORE going to Chester, I recreated myself with a short tour in North Wales, and enjoyed the con-templation of those heauties that existed long before the monuments—the work of man's hands—which are the especial study of the arebenologist. The journey hrought me in coolact with many works of the present time, and I must be candid enough to acknowledge, even at the risk of being accused of heresy, that whatever may be the amount of benity cristing in the memorials of the past, the works of the present day are productive of more good to man-kind, and, as evidence of the might of man's mind, elorify " Him who gave it."

kind, and, as evidence of the might of man's mind, glorify "Him who gave it." I was led into these reflections by a contemplation of Valle Crucis Abhey and a visit to the Dinorwic Slate Quarry, belonging to Mr. Assiton Smith, at Llanberiz. The heads of the former, when at the height of their power, raised a structure from the contributions of the faithful, to retain within its walls these subscript. controlutions of the latthful, to retain within its walls those subservient to its authority, and to bestow its dole to the wretched without. The proprietor of the latter employs 2,300 men, retained at a cost of 10,000/, per mouth. A German gentleman whom I met at Llauberris told me that he bad come to pur-chase shires and that a correa which he was a how to chase slates, and that a cargo which he was about to purchase would consist of about 120,000 or 130,000 slates, and the value would be 2307.; and when we consider that the quarry is said to return its proprietor a net annual income of 70,0007, how vast must be the a net annual income of 70,000% how vast must be the ramifections of commerce, and how great must he the employment erested to produce this result. I think if the other members of the Arebeological Institute are equally candid, they will acknowledge the same feelings, more especially after the visit to the modern Liverpool and the Niagara, with the eable that is to unite us with our Anglo-Saxon brethren. Well might the Bishop of Oxford, in his element address at the first meeting on Tweeder cable that is to unite us with our Anglo-Saxon brethren. Well might the Bishop of Oxford, in his eloquent address at the first meeting on Tuesday, have rejoiced that "while we conserved the monn-ments of the past, we were ahead of all other nations in adopting the newst of the new." In a paper like the Buildler, devoted to the improvement of the prescot, I need not hesitate to express a gratification at that advancement of science connected with the increase of the material interests and physical condi-tion of mankind. of mankind.

My first day in Chester was tinetured with regret that there should be two institutioos of the same that there should be two institutions of the same character in existence. Ten years ago our Institute visited Norwich, and this year the Archeological Association follows in our footsteps. Nice years ago that society investigated Chester, and now we trad the same path. But judging from the papers and discussions that we had, they had left us plenty of room for summing and conjecture. Whether the us plenty of Whether the discussions that we may toey muture as posty-room for surmise and conjecture. Whether the places possessing antiquarian interest are so few, or whether interest a disinclination in many places to receive us, I cannot help now feeling that the interests of archaeology would be best served hy the two societies multing; and surely this might be accom-

those private cootributions which were placed un-reservedly at Mr. Waring's disposal. The several reserveily at Mr. Waring's disposal. The several sets are, in these eases, mapped according to their material, and were arranged, as far as time and the balance of the cases would allow, in chronological order, the main divisions being glass, ensuel, Euro-pena porcelsio, Oriental porcelain, European pottery (principally Majolica), metal work generally, the precious metals, sculpture (small), in bronze, wood, terra cotta, &e., and hasly works in ivory. Beyond this point, on each side, is the armour and arms. The Meyrick collection on the south, and other con-tributors on the uortb side. In the next three bays, up to the transept, are placed the bookbindings of Sir plished by one of those compromises of which life is continued series

We were certainly well received by the authorities We were certaily well received by the authorities of the place, but the beginning of the meeting was the dulket of the dull. In the evening of the first day we assembled to hear a paper hy Mr. Salt, on the "Progress of Henry III." It is to he re-gretted that gentlemen who display such wonderful powers of research, should not understand the ne-cessity of popularising their productions. Here was a memoir in three volumes listened to with the most soundoent wearings, until the Bishon of Oxford a memory in three volumes instened to wind the most sommolent wearness, until the Bishop of Orford came to the rescue, and in a few remarks pointed out the salient features of the essay, and with consum-mate tast extracted from it certain points with which the salient set of the same set of the salient set of the same set of the sa he played with considerable humonr, which broke up the audience, and sent them home eheerful and con-tented. On Wedcesday, the 22nd, we had a paper from Mr. Earl, of Oxford, which led to a very interesting discussion on the origin of names and words.

words. In the afternoon we visited the church of St. John, under the guidance of Mr. Parker, who had previously read a paper on that structure. I think he had not given so much attention to this subject as he generally does, for the corrections from the local antiquaries were very fragment were very frequent.

were very frequent. The same day Mr. Scharf, a model for all lecturers, gave us a flueut and eloquent address, which might be termed "a guide for archeelogists to view the Att Tressures at Manchester," and on our visit there the following day it was found of great advantage to the members of the Institute. The annual dinner took place in the evening, and nothing could have been more dull and dreary. Mr. Hicklin was the only speaker whose remarks could boast of an idea, the oratory of the other speakers being of that class of which "funceustomed as I am" and "I regret that it has not fallen into abler hands" may be considered the type.

and "I regret that it has not fallen into abler hands" may be considered the type. On Thursday we visited Manchester, and on Satur-day we were received at Liverpool—a great distinction. At the former place, had it not been for our memher, Mr. Scharf, we should have been quite unconscious that there was such a body as an executive committee, general commissioner, or any other officer. This was felt hy many members of the lastitute, as the committee and sceretaries of that body took a lively interest in. and did materially aid the promoters of the committee and secretaries of that body took a lively interest in, and did materially aid the promoters of the Art Treasures Exhibition in furthering the object they had in view. Gralitude is said to he a lively sense of favours to be received, and as it is expected there is nothing more to be obtained from the future, our hody did uot receive the courtesy of an acknow-ledgment.

ledgment. From Liverpool, where the Cunards Company placed the "Satellite" at our disposal, we proceeded to Speke Hall, a brautiful specimen of domestic architecture of the latter part of the sixteenth century. Mr. Wati was a most liberal host, and we were all delighted with "ye faire ladye," who did receive as with much grace. On our groups to Liperpool we visited that face

with much grace. On our return to Liverpool, we visited that fine modern huilding, St. George's Hall, and in the evening we attended, at the Town Hall, a conversa-zione of the Historic Society of Lancashire and Cheshire, who had invited a hrilliant assembly to meet us, and to contribute to whose enjoyment no pains scemed to be spared. A hand of music was provided for those who could find more pleasure in daming than in dry bistorie lone dancing than in dry historic lore.

dansing than in dry historie lore. This day abounded in enjoyment, and caused us to forget the dulness of the previous days of our eongress. On Monday we visited Cornarvon, where Mr. Hartshorne gave us a very interessing account of the huilding of the Castle. His remarks were valuable because anthentic, he having by diut of great research obtained the records and accounts, even down to the name of the hlacksmith, and the amount of bis hill. But Mr. Hartshorne has caused considerable annoyance to many natives of those parts, because his statement has destroyed one of the pet tra-ditions that Edward the Second was born in the E gle Tower; his documents clearly proving that the king inself huilt it, having for the architert one John de Briton, a name calling up pleasant associations in connection with archaeology and the Institute. We left Carnarvon to view the Tuhular and Sus-

connection with archaeology and the Institute. We left Carnarron to view the Tuhular and Sus-pension Bridges, and here the feelings that I have described at the commancement of this communica-tion were renewed and strengthened. If the former gigantic monument of Stephenson's genius should be in ruins when that mysterious but inquiring New Zealander makes his appearance, and if the fragments do not excite his admiration for its beauty, like the remaius of some Gothie building, he will be com-pelled to acknowledge that we were not a degenerate race, but that we have left memorials showing that the mighty minds of this tione achieved aluoot miracellous triumphs over matter, not for their own glory, but the advantage of their fellow creatures.

We then went to the George at Bangor, where the kind and attentive hostess bad provided a repast for us that would have shamed many establishments in London. O that the innkeepers of Eagland would learn a little civilization from their brethren iu Wales! learn a little eivilization from their brethren in Wales! We afterwards visited Conway, where we were again instrueted hy Mr. Hartshorne. On Tuesday Mr. Petti read a paper on Nantwich, and an excursion was afterwards formed to visit that spot, but by this time many memhers had departed. Saturday at Liverpool and Monday at Carnarvon were two bright and enjoyable days of the week's meeting, but heyood this, duloess was the general characteristic; and with-out some effort is made, either by fusion with the other society, or by making our visits to ground that has not alroady been 'explored, we shall lose our position, and the proceedings of the Iustitute will not be regarded with that interest which has hitherto marked them. F. S. A. marked them. F. S. A.

ASSUMED COST OF THE PROPOSED GOVERNMENT OFFICES

In a pamphlet recently published, entitled "Re-marks on the Designs Proposed for the New Govern-ment Offices," by a Practical Man (Ridgway, Picea-dilly), the writer gives some broad calculations as to the probable cost of the land and proposed buildings, which may interest onr renders. He soys:--

which may interest onr renders. He says :---"Of the whole area pointed ont by the chief com-missioner, the existing hulldings and the ground un-built upon helonging to the Government, comprise about 18,000 square yards, including the small angle taken from the south parade, opposite the present Poreign Office: about 16,000 square yards will be obtained from the Thames, within the proposed river wall, and some 20,000 square yards consist of strets and public thorough fares, leaving 60,000 square yards, or 540,000 saperficial feet of ground, covered with buildings and their appurtenances, which must be purchased under the compulsory powers of an Act of Parliaunet. The preceding areas, always given in Parliament. The preceding areas, always given in round numbers, make up the total of $23\frac{1}{2}$ acres, or 114,000 square yards of ground to work upon

"The proof square of ground to be purchased will probably average about 25%, per square yard. This valuation is obtained by data, to be found in blue books of the last two or three years; consequently the first item of an estimate will be 60,000 square yards at 25%, heirol 3,200,000%; a sum which would eover the contingencies of clearing the ground, and reclaiming the land from the river hy the proposed embankment.

embankment. It is helieved that this item of 1,500,0007, for purchase of property and elearing the ground, is put at a higb figure; hut it is far better to look a diffi-ently in the face at the very outset. We ought to know the worst, as we have them no drend of unfore-scen expenses occurring afterwards. But let every one judge for himself.

The estimated cost of the block of buildings on the south side of Bridge-street, Westminster, covering ering

The estimated cost of the mock of buildings on the south side of Bridge-street, Westminister, covering about 2,100 square yards of ground, is 170,000/, or upwards of 80/, per yard. The valuation of the houses on the north side of this same Bridge-street is 70,000/, for 1,735 square yards, or more than 40/, per yard. A site lately proposed for St. Margaret's church, at the corner of Tothill-street, and fronting on the Broad Sanetnary, containing 1,500 square yards, was valued at 45,000/, or 30/, per yard. It would require 180,000/. to pay for the houses and properties on both sides of Bridge-street, Lam-beth, at the east end of the present Westminster Bridge: the buildings and their appendages cover 8,754 square yards of ground; the cost being, three-fore, more than 20/, per yard. The sum of 110,000/. is the price of a block in Old Palaee-yard, between Poet's Corner and Abingdon-street, covering 6,400 square yards; being 17/. per

street, covering 6,400 square yards; being 177. per yard

yard. The estimated expense of the property for the approaches on the Middlesex side of the proposed bridge across the Thomes, from the Horseferry-road to Lambeth Palace, is 200,0002, for 24,000 square yards of houses and huildings, being about eight

yarus oi noises and nunuings, being infont organ gpinoas per yard. Considering the valushle nature of the buildings in Bridge-street, Great George-street, Parliament-street, Duke-street, Charles-street, &a., and comparing them with the above, it can hardly be said that the average of 25/, per square yard is too high. When these remarks were commenced, not the least ide: of making estimates was eutertained; but

least det of making estimates was enternamed; out is scens almost impossible to engage in a practical investigation of such a subject as this, without in-variably asking ourselves, ' What will it cost?—and following up this vein of inquiry, and having elenred the ground and prepared for laying the foundations of our New Government Offices, an attempt must be made to find out the expense of creeting them.

There is no doubt that an experienced architect There is no doubt that an experienced architect would he able to give a very near estimate for build-ings, in the style required, to cover 50,000 square yards of ground. The blue books, however, give us some clue for ourselves; and it appears that it has cost about 600, per square yard of the ground on which they actually stand, to erect the buildings of the new palace at Westminster as we now see them finished, exclusive of the purchase of ground and other jucidentias, not being actual constructions: but this incidentials not being actual constructions; but this price includes the furnishing, and a considerable extent of splendid interior decoration. The estimates made a year or two since for the new public offices and official residences to be creeted

new public offices and official residences to be creeted around Downing-street were, however, at the rate of only 124, per square yard of huilding. Allowing for the character of the architecture now contemplated, we shall not be very far wrong, under all circum-stances, prohably, in assuming that 304, per square yard of the ground which the buildings are actually to occupy will be the cost of erecting the new Govern-ment Offices on the chosen site. The second item of the actimate will thus he

The second item of the estimate will thus he 50,000 square yards of huildings at 30%, amounting to 1,500,000%

If then, to the million and a half for purchase of property and elearing the ground, and to an equal amount for the buildings, we add half a million for fittings, and furniture, and pavior, sewerage, gas and water supplies, contiguencies, &e., we shall get a total of three and a half million sterling as the ultimate. and, it is helieved, the maximum, expenditure for the new offices

This is irrespective of the cost of approaches, and improvement of the neighbourhood.

CORRESPONDENCE ON THE DESIGNS FOR PROPOSED GOVERNMENT OFFICES.

Sin,--I beg to be allowed to offer a few plain re-marks on the competition for the Goverament Offices, I am not mysclf a competitor, but I bave watched the conpetition with interest. In common with the profession generally, I have been for the last few weeks looking anxiously for the report of the judges. I have also been waiting for some expression of the judgment which the profession at large is to pass upon the award. Critics will be unwilling to say much until the report appears, but it seems to me that we may wait too lung even for the report. Our silence may be taken as if it were our consent. The publication of the report may, perhaps, he staved off SIR,-I beg to be allowed to offer a few plain reshearer may be taked as if it were out consistent. The publication of the report may, perhaps, he staved off till the very end of the parliamentary session, so as to let the matter be what is called "smaggled" through the House of Commons, and put out of sight through the House of Commons, and part out of sight before any one has time to object. Notwithstanding the want of the report then, let me point out oue thing, at least, which puzzles me very much. I re-member the competition for the Houses of Parlia-ment, and the pre-eminence of one design over all the set. There is almost always non pre-eminent design rest. There is almost always one pre-eminent design in every competition. I certainly think the compe-tition for the Government Offices was no exception to tition for the Government Offices was no exception to the rule. At any rate I know, that a very great many of the profession, and the public of every degree, will join me in saying, that for excellence of plan, grandeur of exterior, refined and Classical finish of detail, esthetical good taste, and suitability of style for the purpose and site No. 112, "Omieron," stood oat alone. For confirmation of what I say, II need only refer to the intelligent and impartial deritique of the Builder itself. But where is this design now? If the deliberations of the judges wet so far as to reverse the indement of the public (if von so far as to reverse the judgment of the public (if yon will allow me to use the expression) which placed this design first surely it is singular that it should receive no acknowledgment at all, not even a seventh prize. We cannot imagine that on grounds of merit, No. 112, should be seriously put below Nos. 17, 126, and the Gothie 54.

No. 99, " Delta," is another design left in an in-No. 99, "Detta," is another design left in an in-comprehensible position. If may have set out on an injudicious idea, but that was at least a grand idea, and the public and the profession schowledged it as such, and paid a great deal of attention to it. And this design is nowhere.

such, and paid is great deal of alterniou to R. And this design is nowhere. One test which we may safely apply to the award is this. The present exhibition of the selected designs ought to show hetter and not worse than the former exhibition of the whole. It ought to show a very great deal better too, as if the jewels were separated from the dross. But I regret to express the fact, that to my eye the selected designs make but a very inforior show indeed. The *spirit* of the competition, instead of buing concentrated, its somehow absent. Nos. I12, 99, 69, 41, 100, if no others, are sadly missed, while to consider the treatment of the two Offices as one editice (adopted hy the great mass of competitors) as a "difficulty." On the contrary, in the opinion of

almost the who'c profession and public, that combi-nation was the very thing to be considered an advan-tage. And some such combination, I am sure, must be the first step towards carrying cut the two first premium designs, if they are ever to be carried out at all. I look upon the "didiculty" as the most unfortunete confession the judges could have possibly

made. If the report clears up all this, I think it will get over a very serious "difficulty " indeed. But, whatever may be done, I hope the profession will lese no time in letting its opinion he heard (whatever it may be) through your columns and other channe's. Members of Parliament are no doubt looking for this all this lies to a bla throw to five their internet and if up time to enable them to form their opinion ; and, if we complain after their approval of the transaction has been passed, they will simply tell us we are too late. AN EARLY MEMBER OF THE INSTITUTE.

ON THE POLITICAL ECONOMY OF ART.

On this subject Mr. Ruskin has recently delivered two lectures at the Manchester Atheneeum. In the course of the first, as reported in the Courier, the lecturer said: — All economy, whether of states, households, or individuals, is the art of manazing labour. The want and suffering that are so prevalent one the world of immediates on the indelore. Our are the result of improvidence and indolence. Our restricted use of the word "economy," as if it means spending or saving, was a mistake. This use of the restricted use of the word "concomy," as it it must is spending or saving, was a mistaky. This use of the word was not English, it was had Greek, and w res-sense. Economy means the wise management of labour, the applying of it rationally, preserving its produce earch 19, and distributing its produce season-ably. In true concomy there is a balanced division between the objects of utility and splandour. He should address them elicity on the laws by which best to grow in our national garden trees and fruits plea-sant to the sight, and, in no forbidden sense, desira Such to the signi, and, in no forbatten sense, destin-hle to make men wise. A tation's labour well applied is amply sufficient to provide its whole population with food and confortable clothing; but the good application is everything. We complain of the diffi-culty of inding work for our men: the real difficulty is in finding unit for our work. It is our ioactivity and not our humare that ruins an *Reviseder theorem*. is in huding mentor our work. It is our roberney, and not our hunger that ruins us. Precisely the same laws of economy which apply to the cultivation of a farm will apply to the cultivation of a province. The same principles which are right in the administration of a few fields are right in the administration of a surface. country. Idleness does not cease to be ruinons because it is extensive, nor labour to be productive because it is extensive, nor labour to be productive because it is universal. The 'let alone " r principle was ruin: all discipline was interference. Mr. Ruskin applied this maxim to the government of the contry, and passed on to consider the question, " How are we to produce emouget us at any time the greatest quantity of art intellect". "Artists have to be found, of made. A certain quantity of art intellect is pro-duced annually in every nation. The first thing to be done was the establishment of " trial rebools" in large towns for the development and cultivation." large towns for the development and cultivation of this intellect. The most useful school was the worklarge total the most useful school was the example of the shop of a great painter — see the example of the shop of a great stress upon feature musters. Mr. Ruskin I id great stress upon shop of a green parent. Italian masters. Mr. Ruskiu laid great stress hum-the importance to yong at ists of judicious criticism. The next thing was to train them to be in the unblest sense gentlemen, that their minds might see and feel the noblest and lovelist things. He was sory to eave this was of all parts of an artist's education the other was of all parts of an artist's education the the moldest and lovelist things. He was party to say this was of all parts of an artist's education the most neglected amongst us. The want of this was visible in the pictures of even any greatest painter. The picture which most truly described the pain ted by a good and wise man. No money could be better agent than in providing good education for artists. The next question was, "How best to employ the genius we discover." First, they should be set to various work; second, to rasy work; and third, to produce lasting work. In the architects' yards throughbout Bajing work. In the architects' yards throughbout Bajing work. In the architects yards throughbout Bajing work so fast as the stone carvers who were st

things. Their ideas were thus erramped, and they did not work so fast as the stone earvers who were st work on the museum at Oxford, who each copied the flowers of the district for their capitals, and worked so fast that a saving of 30 per each was effected. In the course of his second lecture Mr. Rusk'n arged that there was oothing in England in which money was so wated as in building fine tounks; but true respect would be shown by rather preserving the monnemus which those despetd has accound with monuments which those departed had erected with their own hands. The living, in their work, should monuments when a the living, in their work, summa their own hands. The living, in their work, summa think constantly of its being serviceable to those who were to come after; and it would he the duty of these the living and the service what was so left, and not to that fully to receive what was so left, and not to thankfully to receive what was so left, and not to thrust it aside as soon as they thought there was no use for it. The world had chosen, and still seemed to choose, those spots where the treasures of art were

One consideration for the judges, namely, accordance or otherwise on the part of the designs with the *instruc-*tions, may have been overlooked by our correspondent.

most rich, that they might turn them into bettlefields. This was pre-eminently the case with Italy He had seen the most direful neglect and destruction of works of art in Verona: in Venice be had seen pictures by Tintoret banging in rags from heles made by homb shells. It might be said, "We cannot help by hom:-shells. It might be said, "We control neighbors all this. We cannot dive the Austrians out of Huly; and we cannot keep the Italians quiet without gams." But at least something might be done-more than we are all doing. He would recommend those who travelled, and who loved art, never to have copies used a of headed covied with time. These were automated le of already-copied mitures : there were number of the fine-t pictures scarceny ': own that had never heen copied, and that might be shot-riddled next month. The reputation of many oft-copied pictures arose mainly from the fact that they were easy to be month. seen, not because they were the best: these to which he had referred would have to be sought. He now came to the last point—the distribution of art. It come to the last point—the distribution of art. In must be evident that the way in which works of art were, on the wh-le, most useful to the nation to which they helonged, must be by their collection in public galleries, when these galleries were properly manged. He hoped we should see the time when there would be a large and savierable gallery in every managed. He hoped we should see the time when there would be a large and serviceable gallery in every principal town in the kingdom. Much also must be done by private possession. The object of the Government should be to collect the works of dead should be given hy private individuals to living masters, and the way to do this was to keep down the prices as much as we could. In doing this we should produce two effects: we should make painters supply more pictures, if they wished to make money; and we should bring good painters more within the reach of persons of moderate income. Another and a most investant Another and a most important measus of distributing at was by the permanent decoration of public build-ings. The best way of bringing forward young men who wanted practice was to employ them, uoder great measures, in this kield of work. Of the class of structures in which this decoration might be especially carried out were schools, buildings for the meeting of Tures in which this become and the intering of carried cut were schools, buildings for the intering of trade guilds, and almshouses. In schools, the walls might be covered with paintiogs illustrating the great facts of past ages; in the houses of guilds, with inci-dents showing the services which men belonging to trade had readered to their country; and in alms-houses, with pictures receiling events most interesting to those who were likely to inhahit them. Both these points, the establishment of a public gallery in each provincial town, and the employment of rising artists in decorating the walls of buildings.

of rising a tisk in decorating the walls of buildings belonging to public companies, schools, &c. have been urred for many years by the Council of the Art-Union of London, in their annual Report, and cannot be too often referred to and insisted or

CHURCH BUILDING NEWS

Askern.—Campsal Church has been restored in-teriorly, by repewing, repainting, decorating, &c. The chaocel is the only part of the church where the im-provements have been least and the requirements provements have been least and the requirements most. Several old spuare peex have been taken away, and stalls substituted; but beyond this, and the cleansing of the monuments to the right of the communion table, one of which is a tablic by Flaz-man, nothing has been done. The unsightliness of the channel roof is a great objection. It is apparently a work of modern date. The roof has been brought so low, that, whilst it has partially covered the win. a work of modern date. The roof has been fine of a so low, that, whilst it has partially covered the win-dows, two or three of which have been filled in, it completely mars the effect of the chancel arch, as seen on first entering the edifice.

Liverpool .- The Roman Catholic Church of St Vincent de Paul, at the upper end of Park-lane, approaches towards completion. The masoury of the structure is now all but completed, while the other portions of the fabric are far advanced. The west or principal entrance, coincides with the line of Park-lan Park-lane. The western door is surmounted by a window 18 feet wide and 32 feet high, divided into Window 15 feet while and 32 feet high, divided into comparitments by stone mallions, terminating in Innecolated arches; and the whole combined into a cluster of quarter il tracery. The stone-work is exe-cuted in rock-faced conrese, of Upholland stone, with polished labels, quotins, and dressings. The central window is surmout bed by a bylfy and coop, reaching to the beight of 120 feet from the ground. On each sible of the center window is increased with its increase. side of the great window is one filled in with tracery. These latter admit the principal light into the side aisles, the nave being chiefly lighted by the large window. In length from the western entrance to the eastern extremity of the chancel, the church internally is 150 feet: it is 56 feet high in the nave, and 49 feet high in the chancel. There are side sisles on the leet high in the chancel. Increase so consists on the pares for south and north of the nave, divided of by octspoon. It he Board pillers of Painswick stone, of which there are eight on each side, supporting Increaselate arches, the orbed and R. G. springers of which are ornameuted by earving. The applicants

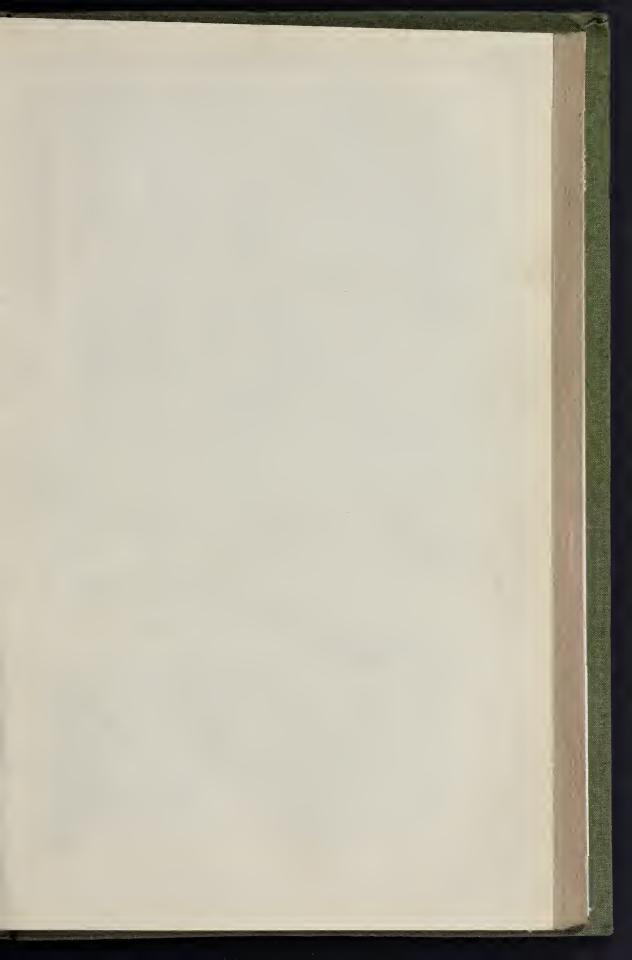

wall above these arches is pierced by lance-pointed, elerestory windows. On the exterior side of the sonthern aisle there is a range of confessionals, each having a separate entrance from the aisle, and also from a corridor which runs along the south wall of the edifice. The width of the nave is 38 feet clear within the pillars. The aisles are each 12 feet wide, making the inside width of the church 62 feet, while it measures 90 feet to the extreme width of the con-fessional corridor. The chancel is of the same width It measures so that the chancel is of the same inde-fessional corresponding in wide-as the nave, with side chapels corresponding in wide-meter the side sisles. It is more fully ornamented the side sisles. It is more fully ornamented as the nave, with successful to increase the nave, with successful to increase the solid ealers. It is more fully ornamented that the body of the church. The eastern or high altar window is 22 feet which: its chief feature is a St. Catherine's wheel. The floor of the chancel and side chapels will be of oak, Spanish chesnut, and other four more areased an accounting degines. This Side couples will be to us, Spanish cheshal, add ther fineey woods, stranged in geometrical designs. This floor was origically made for the late Earl of Shrews-bury, and was designed to occupy a conspicuous place at Alton Towers. On the north side of the church, which extends between Park-lane and South Frederick-street, is a residence for the clergymen connected with the church. This building is in the Anglican style, with projecting bays and pointed roof. I brick, with polished stone labels and dressings. It is of The

brick, with polished store labels and dressings. The whole of these structures have been built from designs made by Mr. E. W. Pugin. The contractors are Messrs. Thomas Haigh and Co. of this town. *Cleckheaton.*—The corner stone of a new Con-regational chapel, at Moor End, was laid by Mr. F. Crossley, on the 17th uit. The new structure will be approached by a flight of steps, leading to a colon-nade of Coriathian columns, with arches-over the supporting pediment. From the colonated, access will be bad to an inner vestibule, from which the ground floor and the galleries will be approached. The chapel is a parallelogram 100 feet by 00, with a gallery on three side, and an organ recess and orchestra. The whole of the ground floor is to be occupied by pews, as also the galleries, with the ar-ception of a portion at the back, to be appropriated eeption of a portion at the back, to be appropriated for Sabhath-school children; accommodation being provided for 1,600 people. Under the chapel will be school-rooms for boys and girls, with class-rooms and school rooms for ony and gris, the lower basement provision will be made for the residence of the chapel-keeper, and the heating of the building. The cost of the edifice, exclusive of the ground, will be about 6,000. The architects are Messre, Lockwood and Mawson, of Bradford.

Mawson, of Bratford. Sear-Jorogayh.--The Roman Catholic Church dedi-cated to St. Peter, now in course of erectiou at Toller-gate, fr-m the design of Messrs. Weightman, Hadfield, and Goldic, of Sheffield, is progressing. The founda-tion-stone was laid during the antunn of last year, but the works wave mounded during the sevene tion-stone was laid during the anturnn of last year, but the works were suspended during the severe weather in winter, and have been resumed by the contractor, Mr. William Falkingbridge, of Whitby, under the immediate direction of Mr. Markell, elerk of the works. It is expected that the roofs will be covered by the end of Octoher. The church is in the Pointed style of the Geometric period. The dimen-sions are as follow :--Internal space, 88 feet by 20 for invitation of the house of the table of by sions are as follow: --Internal space, 88 feet by 53 feet, including aisles; chancel, 27 feet by 22 feet. The arrangement of the plan is designed with refer-ence to the difficulties of the site, which necessitate the chancel being placed due south. It is proposed, therefore, in place of the nsual altar-window, to light the apse by four interal windows, the internal wall surface heing reserved for idea with the former wint. the apse by four interal windows, the internal wall surface being reserved for decoration by fresco paint-ing. This arrangement is very common on the Conti-nent. The nave is separated from the aisles by an arcade, the columns being circular, with moulded capitals and arches of two orders supporting a clerc-story of two-lighted windows; the internal height being 50 fect. There is a sacristy, and adjoining to it a baptistry, opening by an arch to the aisle. The tower terminates the west aisle. It is only in con-temphalion by the present contract to build a portemplation by the present contract to huild a tion of the tower. The aisles are terminated by chapels. The nave will be fitted up with open henches, and the aisles left open. There will be a loft for an organ st the end opposite the chancel. A window filled with tracery will constitute the principal feature in the Castle-road front

CERTIFICATES FOR DISTRICT SURVEYORSHIPS.-At a meeting of the Board of Examiners of candi-dates for district surveyorships, on the 21st ultimo, the Board recommended to the Conneil of the Institute for certificates, Messrs. M. D. Wyatt, Joseph Lavender, and R. G. Aitchison, jun, There were several other

THE GOVERNMENT OFFICES. THE REPORT.

THE REPORT. WE have now the pleasure to lay before our readers, views of the two principal designs for the Government Offices, to which were awarded premiums of SOOL each—one, the design for the War Office, by Mr. H. B. Garling, and the other, the design for the Foreign Office and Residence, by Mr. H. E. Coe and Mr. H. H. Hofland. For information, as to the internal arrangements, we may refer to the notices of the exhibition at Westmuster Hall, which appeared in our nages, where we have eiven a complete exhibition at Westmuster Hall, which appeared in our pages, where we have given a complete account of each of the designs. Mr. Garling's design will be found described as No. 77, with the motto "Fortier et Fideliter," at page 303; and Messrs. Coe and Hofland's, as No. 94, with the motto "Utilitas," at page 314. It will be seen from these notices that the *plans*, in hoth eases, offered many points of interest as regards the purpose of the building. The particular offices of the departments of War and Foreign Affairs, we may remind our non-professional Affairs, we may remind our non-professional readers, were proposed to stand on a site to he ohtained hetween Downing-street and Charles-street,-the War Office to he next Parliament street, and the Foreign office at the other end, from which points our views are supposed to be taken. Mr. Garling's design for the Foreign Office was also described by us. We observed at the time, on the fact of the great resemblance in bid derives to woll become headlings in Design. in his designs to well-known huildings in Paris

Since we last referred to the subject of the competition, the report of the judges has been printed, as a portion of a return to an order of the House of Commons, for a copy of a letter addressed by the First Commissioner of Works to the Lords of the Treasury, on the 30th of June, furnishing his report of proceedings with a copy of the particulars given to the compe-titors. The "Report" of the judges supplies nothing more than we have printed in the list of the designs to which premiums had heen awarded,* and in the matter which we gave (anticipating the Report) at page 353, except reduced copies of the two plans which were supplied with the instructions; the statement that the these last numbers in each bit of the that the three last numbers in each list of the

"In making heater ecommendations we desire to observe, in the first place, that we were not in possession of any knowledge as to the sum which Her Majesty's Government might propose to the House of Commons to expend upon these works. "Up desires before more memory memory and works. The designs before usere inaccom-panied hy estimates, and did not admit of any accurate calculation with regard to their pro-hable cost."

ISLINGTON.

A CLEAR, precise, and well-arranged report, under the Metropolitan Local Management Act, by Mr. John Layton, the able vestry-elerk of St. Mary's, Islington, showing the preceedings of the vestry, the works commenced and completed, with other details, has been issued in a printed form. From this report it appears that there are nearly 50 miles of roads and 100 miles of footgaths under the invisition of the vestor and know i non efficient

50 miles of roads and 100 miles of footpaths under the jurisdiction of the vestry, and kept in an efficient state of repair. The cost of labour has amounted to nearly 3,0004. The outlay for materials has here 3,653. For new paving and relaying pavement by the contrastor, 2,7634, 98.3d. Nearly 400 estimates have been prepared for raving and road-making, 135 of which were to be paid for by private parties. About 2,000 notices for the removal of misances have here avered. The medical officer of health and inspectors of nuisances have visited 1,736 houres: 304 houses have here white mashed and cleanced :

Inspectors of nursances have visited 1,736 hourse; 364 houses have heen whitewashed and chansed; 1,159 cesspools filled up; 63 houses ventilated; drains amended or laid in from 1,250 houses; 1,226 water-closets made or omended, and panned and trapped; water supply laid on to 1,302 panned closets; 758 dust-bius constructed, and 272 old dus-hins covered. In three courts, water-eisterns have heen provided for domestic purposes. Proceedings have heen taken in twent seven access arguing transmission her however the server as a server of some server and the research of the server as a server of some server of some servers, drains, and buildings is now

engaged in making a survey of Belle Isle, with a view to its effectual drainage. In order to prevent the objectionable practice of conveying patients suffer-ing from contagious diseases to the hospital in street-cabs, the vestry have provided three ambulances, and thereby supplied a want which bod head head for a fit and cabs, the vestry have provided three ambutances, and thereby supplied a want which had been long felt and

locity supplied a wait which had been long rit and loudly complained of. On the 1st of January, 1856, the number of assess-ments in the parish was 16,145, and the amount of retuly was 491,1000. The number of assessments now is 17,257, and the amount of rental 523,5977.

ISLINGTON-GREEN.

ISLINGTON-GREEN. In former times the "village greens" and the common laads attached to boronghs and eities were held in great tespect as places of recreation and for other useful purposes. These commons were, in many in-stances, of great extent, and were more or less culti-vated and erred for by the various corporations, and to these spots the inhabitants could send their cows and horses to be fed, clothes to be bleached, &c. As time passed on, several of these corporations became small bodies in comparison with the great increase of and horses to be field, clothes to be bleached, &c. As time passed on, several of these corporations became small bodies in comparison with the great increase of those inhabitants who were not "Freemen"—that is to say, who had not availed themselves, by serving an appreuticeship or otherwise, of the use of the ancient corporate rights; and it has so happened that these bodies dwindled away to a few who have cast covetous eyes on property which was cartrasted to them for other purposes, and divided it into shares, which have been built upon and enclosed. Fortanetely a number of these commons were still existing at the time of the passing of the Test and Corporation Acts, and will he now preserved for the use of future genera-tions. Where the common lands have here divided, and in other ways appropriated to a use for which they never were intended, it is evident that a great act of injustice has been done by the trusters to the community. The other open spaces in parisles such as the village greens, although of less extent, have also an eninent claim to preservation, and their utility becomes grader as these little bits of public property become surrounded by houses. In London the very name of the Green has a pleasant and re-reshing sound, and it is to be regreted that the greens have generally been so little eared for. Clerkenwellhersman south and it is to be regreticed that the greens have generally been so little eared for. Clerkenwell-green, although covered with paving-stones, and eucroached upon by the Sessions-house-a building most unpleasant to the sight—is, notwithstanding, an open area of the very greatest value to the inhabi-tants. Newington-green, P-adington-green, Kensall-tants. Newington-green, P-adington-green, Kensalltants. Newington-preen, P-ddlington-preen, Kensall-green, and twenty other greens of villages now form-ing parts of the metropolis, will, if properly cared for and preserved, be in like manner breathing-places for crowded populations. Amongst the London greens that of Islington is not the least celebrated, and the great increase of building in the neighbourhood ren-ders its preservation of considerable consequence,— indeed, we can scarcely moderstand the feeling which prompted the idea of covering a large portion of it with a new vestry hall. Such an net would, at the present fine, be as bad as the appropriation of the common lands to which we have alluded, and would, we thich be commos due the wishes and general intelcommon laads to which we have siluded, and would, we think, be opposed to the wishes and general intel-ligence of the parish. It will not be loug before the turnpike-gate is moved out of lown, and that singular structure used as a police-station surely cannot much longer exist in this exposed situation, unless it should he kept in countenance by some other building, and, that removed, we should have an open area which, with early, might be made orcamental, and would, undonk-edly, be very useful. Let but the vesty-hall be built, then it is by no means improbable that it will be found necessary to call arge the station-house, and other thrungs may follow, when a beginning is once made, which will be the means of using up by those now in office a public area which should be honestly and faithfully kept open for the use of future genera-tions.

THE BATTLE OF ISLINGTON-GREEN,

ALL those acquainted with the suburban outlets of And, those acquainted with the suburban outlets of London, know that there are very few of the "greens" of our forelathers remniung, as Cambrwell, Pad-dington, Bethani, &e. (all verdure at Clerkenwell has long succanneled to pebbles). Borrowing, therefore, from a popular song, addressed to a "Woodman," to spare a time-honourd "tree," we might, supposing such an appel to any parochial officer of good taste had here anticipated as necessary, have said, "Vestry-ware acress that greens".

some tyrants to unfortunate donkeys,-because they thought it "had got no friends." "Isington-green" was given to the parish, as "a public area for ever," by the Marquis of Notthampton, Lord of the Manor of Canonhary, whilom, holonging to St. Barthelomew's Priory, Smithfield, about eighty years ago. The space, enclosed about ten years ago, and in a hald and elunsy monner, capable now of tasteful improvements, is bardly en aere and a half. Still old Isliggtonians, and more recent ones of taste, were determined (honour to their example), not to "stand" it; and though a small majority of vestrymen, on the 11th of July, determined that the green should be used, being greeted at their next meeting, on the 18th, by a memorial, signed by 450 Islingtonians, magistrates, elergymen, dissenting univisters, medical meng, de. with the full knowledge that a similar protest was going to the Marquis of Northampton, they thought "the better part of valour was discretion," and promptly sneambed, and so the green is, for the present, saved, some other site being directed to he chosen. Thus, those who wished to defend "old paths"--

site being directed to be chosen. Thus, those who wished to defend "old paths"— stare super antiquas vias—have been successful, and a time-honoured patch of commou verdure, however comparatively insignificant or unattractive, as now

PROVINCIAL NEWS.

Norwich .- At the Norfolk Quarter Sessions, held, a letter from the county surveyor, Mr. John Brown, was read, in which the magistrates were called

Brown, was read, in which the magistrates were called upon to review his long services, and defue his posi-tion, giving him a fixed remuneration equal to the work expected of him. Mr. Brown's salary, we believe, has been only 75/. a year! *Chester*.—Some proposed new buildings in East-gate-street, designed by Mr. T. M. Penson, architect, are thus described by the local *Chronicle*:—The crection in question will embrace three shops of large dimensions; the first and second floors over the row heime intended for chambers or offices, access to them officients of the standard of the source of the two being intended for chambers or offices, access to them heing obtained by a stone staircase carried up the front of the building as a campanile tower, with a highly-pitched roof. The whole design is strictly Mediaval of the period of the fourteenth century, the Medice'al of the period of the fourteenth century, the front being supported by a series of Gothic arebes, the windows of the upper part being of the same style, similar to those in some of the buildings in the old cities in Belgium. The whole front will be con-structed of white stone, and the roof covered with Staffordshire tiles in pattern. Messre, Dixons' and Wardell have purchased extensive premises in East-gate-street and St. Werburgh-street, on the site of which they purpose creeting a hank, their present one being very inconvenient. We hope, adds our authority, that Messre, Dixons and Wardell will follow Messrs. Brown's example, and erect a building of a similar style, as its desirable that, in an old eity like this Medicaval or Elizabethan architecture should be this Mcdiæval or Elizabethan architecture should be adopted in preference to Grecian.

Albury.—Almshonses have just been commenced at Albury.—Almshonses have just been commenced at Albury.park, the seat of Henry Drummond, Esq. M.P. They are to be constructed of red hrick and ornamented oak work. The building consists of a chapel, committee-room, and chambers for twelve inmates. Messrs. Pugin and Murray are the archi-teste teets

tects. Manchester.—The designs for a graveyard-monu-ment to the late Mr. Joseph Brotherton have been on view in the Museum, Peel-park. The cost of the monument will be about 5004. In addition to this memorial, a statue of Mr. Brotherton, by Mr., Matthew Nohle, is to he placed in Peel-park. The designs for the cenclery memorial are of a miscel-lancous character, as we have already mentioned.

from a popular song, addressed to a "Woodman," to spare a time-honoured "tree," we might, supposing had heeo anticipated as necessary, have said, "*Vestry-man*, spare that green." Other site, however, thought the newly-instituted parochial parliament of Islington : an abnormal "vestry-hall," was the first stepping-stone to their situated in the castern extremity of the town, con-ambition, and, however thus easily secured, they ground, "Myddleton-hall," the purchase or period end use of which they might have easily secured, they made a "grab" at the "green," - seemingly as actuates

intendent at the Sydenham-gardens. It will be com-pleted in about two months.—A committee has been appointed at a recent public meeting for the purpose of earrying out resolutions in favour of the formation of public haths at Halifax. *Scarborough*.—The Scanborough Cliff Bridge Com-pany, in reply to advertisements soliciting estimates for work connected with the huilding of a sea-wall at the foot of the cliff to the north and south of the Spa, including the formation of a carriage-drive upon the wall at the north end. received the following --Meaning the north ends a caring't end of the following:--Measure, Smith and Sigley, Manchester, 4,9004; Measure, Smith and Cawood, Scarborough, 4,5004; Mr. Shafto, York, 4,4004. The last-named is the successful competitor, his estimate heing considerably below the supposed cost of the work as intimated in the last report of the committee of the shareholders.

below the suppose cost of the work as intrinsect in the last report of the committee of the shareholders. *Silloth Bay*.—Much activity prevails at Silloth Bay in anticipation of the ceremony of laying the foundation stone of the docks, which is to take place, according to the *Carlisle Journal*, on the 4th of August. The jetty is nearly complete, having heen carried out upwards of 1,000 fect, to a depth of 10 feet al low water mark. The lauding stages and lighthouse are progressing. The wharfing is com-pleted, and a line of railway has heen laid along the north frontage. The coffer dam and other works, necessary previous to proceeding with the masonry of the dock, have been constructed. A large pumping-engine has heen creted to carry off the water from the land springs. Another engine has been creted to expedite the excavation of the docks. A diver is now engaged upon the fetty. The nucleus of the town is gradually expending. Plans of the proposed to expedite the excavation of the cocks. A cuvet as-now engaged upon the jetty. The nucleus of the town is gradually expanding. Plans of the proposed town, prepared by Messrs. Hay, of Liverpool, have been lithographed. Among the varions huildings projected is a Temperance-hotel and Boarding-house. Concernent — The Kaleingmen of the Soalitish port is

Glasgow.—The Kelvingrove of the Scolitsh pact is no longer the solitary rural retreat it once was, but is fast becoming a grove of houses, interspersed, howno longer the solitary rural retreat it once was, but is fash hecoming a grove of houses, interspersed, how-ever, still, with turf and tree. The portions of Kel-vingrove-park and huildings in front of Park-quad-rant and Cliff-terrace, have now hece completed. The laying out of the park grounds is now fioished, Sir Joseph Parton's plan having hecen earried out as for as practicable. A number of additional walks and terraces has been formed upon the suggestions of Mr. Charles Wilson architect. During the summer terraces nos been corner upon the suggestions of summer Charles Wilson, architect. During the summer months, according to the *Glasgow Gazette*, from 30,000 to 40,000 persons visit the park each fair Sunday. On the Kelvingrove grounds are now two large guns and a mortar captured at Schastopol in and, 1855. The buildings on the land, result he adding The huildings on the lands reserved by the town council for feuing have made rapid progress. Already the whole of Park-gardens and Park-terrace have been feed and huilt ou. The houses are of a first-class character, and have been eagerly hought up by the principal merchants of the city.

SCHOOLS.

Stone .- The foundation-stone of new schools, Stone.--The foundation-stone of new schools, in connection with the parish church of Stone, was laid by the Bishop of Lichfield, on Thursday, the 16th ult. The schools are being built on a site opposite the vicarage-house, containing about 1,700 yards of ground. They comprise school-rooms for 100 boys, 100 girls, and about 80 infants, with class-rooms, lavatories, and playgrounds for each acx, and a teachers' residence, &c. The schools will be built of dressed red and blue hricks, with stone dressings. The design is in the Decorated style of Gothic archi-tecture, presenting two projecting caples with tracery. tecture, presenting two projecting cables with tracery windows, a receding centre with tracery dormer windows, and an open arcade stretching between the two crobies the cromere being between the windows, and an open arcade stretching beliveen the two gables, the archways being enclosed with orna-mental iron railing and gates. In the centre of the roof there is a bell-turret, ornamented with gurgojle and finials, broached canopy, and weather vane. The roof is to he open timhered, staiued and varaished, and the floors hoarded. The design was furnished by Messrs. Ward and Son, of Hauley, architects, and the huilder is Mr. John Turner, of Stone. The entire cost of the building and fittings will be about 1.5002 cost of the building and fittings will be about 1,500/

Liverpool .- St. Francis Xavier's (R.C.) Schools Liverpool.--St. Francis Aavier's (I.C.) Schools, Hague-street, Liverpool, creted for the accommoda-tion of 1,000 children, of red sandstone, in 1854, from designs, in the Early Decorated style, by Mr. Joseph Spencer, architect, and under his immediate superintendence, at a cost of upwards of 3,000/, are about to be subcread. The present contumplated salperniceacence, at a cost of upwards of 3,000/, are adout to be enlarged. The present contemplated erections embrace an enlargement of the infants' school, doubling its area, and the addition of a girls' class-room. The estimates are as follows; quantities supplied :---

PUBLIC BUILDINGS IN THE PROVINCES.

PUBLIC BUILDINGS IN THE PROVINCES. Reading.—At a recent nucling of the Local Board of Health, a report was received from a committee appointed to inquire into the subject of the crection of abattors in this town, in which they strongly urged the desirability of such a plan, as the ouly adequate means of abating the great evils now acknowledged to exist. The report was adopted by the Board, giving also powers to the committee to carry out the object proposed by them, first laying the plans and estimates for the same before the Board for anyroyal.

for approval. for approval. *Hertford.*—At a special meeting of the Hertford town conneil, held to receive and consider the estimates for the alterations in the corn exchange, Mr. Evans, the by any state that, he was prepared to say that the lowest estimate was a fair and moderate one. The amond seems, however, to have taken the conneil by surprise, l, after some discussion, they determined ouruing the consideration of the tenders. adj adjourning the consideration of the tenders. I use building, if improved on the plans of Mr. Evans, according to the *Hertford Mercary*, would be not only an adequate corn exchange, but well adapted for the purposes of a public library, and also be an orna-mental addition to be town. The

mental addition to the town. Weston-super-Mare.—It is infended to construct a suite of public rooms upon the site known as "Fair-lawn." near the Royal Hotel, at Westou. The undera solie of public rooms upon the site known as "Fair-lawn," near the Royal litcl, at Westou. The mader-taking will include an assembly-room, about 70 feet hy 35 feet, and a smoller room or hall, besides a read-ing-room, with anti-rooms. The projector is Mr. E. Loceck, who is huilding a range of shops and dwellings in the sprame health?

Tewhesbury.—At the Severn New Works, on Saturday, the 12th nlt. a movement of the earth near where the large engine is stationed on the works in the Severn Ham was observed, and by the evening the the engine-house was found to have sunk about 4 inches. On the following Monday morning an earth slip near the lock took place, doing, however, little or damage. Liskeard.-The tenders for the erection of the new

town-hall were delivered on the 22nd uit. The build-ing is to be principally of granite, procured from the Checsewring or Browngellis quarries, and from the basement to the top of the root will he about 50 feet high. The tower for the town clock will be 63 feet high, underneath which is the entrance-door to the reading-room belonging to the Mechanics' Institute. The principal cutrauce to the town-hall will be in The principal curvate to the town has will be in Fore-street, and two other gate curvates to the buchers' market in the same street. The interior dimensions of the town-hall will be, 53 feet in height; the size of the present room being 68 feet by 17 feet 6 inches. The realme-room will be 27 feet 3 inches hy 17 feet 5 inches, adjoining which will be the county count induce means under the the size of the size o court judge's room ; and at the other end, over part of the old Tin Comt, a public office, 14 feet 3 inches b) the out in court a part of the Tiu Court having a glass rooting, with the hatchers' market underneath the whole. The height of the market will be 16 lect.

Notlingham .- The foundation stone of girls' and to the highest, 6,1407. The tender of Messrs. Ferguson and Allen was accepted, subject to the approval of the Poor Law Board. Stockport.—At a public meeting here, it has been

biological a special meeting of the comportion to erect public baths for the town. The mayor has been requested to call a special meeting of the council to consider the

Surject. West Hartlepool.—About two years ago, says the Durham Advertiser, the sum of 1,6001. was laid out in the building of commodious slaughter-houses a short distance from the town, and by a mandate the knights of the cleaver were forhidden thenecforth to singular within the predicts of the town, the commis-sioners naturally reposing in the helief that henceforth all the shughtering would of necessity be done in *their* new shops. Anumber of butchers took the "huff" at the "tyranny" of the commissioners, and in revenge huilt themselves slaughter-houses outside the town. The commissioners' shops, therefore, lost the antici-pated custom, and now the proceeds are less by 70., per annum than the interest of the money and work-ing expenses. To remedy this state of things, the per annum than the interest of the money and work-ing expenses. To remedy this state of things, the commissioners are now setting their wits to work, and one notable project is to convert one-half of the slagghter-houses into dwelling-houses, some of the body finding out that residence in such a locality is not unhealthy!

South Shields.-The opening of a new market, at the high part of South Shields, took place on the 18th nlt. The market stands on a plot of ground situated at the junction of West Holhorn and Commercialroad, and consists of twelve shops surrounding a central area, with two entrances at the north and central area, with two entrances at the north and south angles, and a minor one in Commercial-road. The main entrances are through rusticated archways, flanked by Tuscan columns, and surmonsted by carved pediments. Over the south entrance stands a clock-tower, 34 feet high, surmounted with a gilded vane. The materials of the huilding are brick and stone. The materials of the miniming are orice and score, with wood-framed partitions hetween the shops. In the centre of the enclosed area is an ornamental water-hasin and gas-pillar, and proper conveniences are provided for the market people. The whole of the shops are to be lighted with gas, and have open the benefit water and market weight with presider. timber roofs, boarded over and painted, with project-ing caves. The enclosed area and the shops are ing eaves. usphalted.

Chester-le-Street. — The new union workhouse, erected at the south end of Chester-le-Street, says the erected at the south end of Chester-le-Street, says the Gateshead Observer, was visited by Mr. Hirst, poor-law inspector, on the 16th ult. It was, he said, a model workhouse. Fronting the road is a huilding comprising porter's-10dge, hoard -room, relieving officer's and clerk's offices, prohation and vagrants' wards, &c. &c. all conveniently arranged. The gardeus are hehind; and heyond these is the workhouse, with an elevation the effect of which is marred by uncouth were a product by compared of the Bore has Board in walls, erected by command of the Poor-law Board in London, for the commendable purpose of preventing communication hetween the young persons within and the adults in the grounds without. Mr. Matthew Thompson was the architect of the workhouse. The

The principal contractors were Messrs. Currie and Gibson; the plumber Mr. Bailey. *Alston.*—The foundation stone of a new Town-hall was laid here on the 15th ult. Upwards of 1,300/. have heen subscribed in this small out-of-the-way place for the purpose.

Bruick ropor Tweed. - The foundation stone of a new Corn Exchange was laid here on the 4th ult. The arebitect is Mr. John Johnston, and the huilder Mr. Matthew Reed.

STAINED GLASS

Ripponden .- The church of this seelnded village is about to be adorned by the east window being filled with stained glass. The window is a triplet one, and forms a kind of apse to the church. The expense will to his a knut of aps to the church. The expense win he defrayed by a hady who formerly resided at Rip-ponden. Mr. Bell, the artist (who has recently heen employed upon the parish church windows), will produce the design and the estimate.

Halijaz.—Receuty three stained-glass windows have been added at the parish church of Halifaz. About two years ago the harge centre window at the east end of the church was illed with stained glass, and the result was so satisfactory that many of the unore active of the congregation determined to carry out still further the improvement of the edifice a various points. A subscription was accordingly entered into for the purpose. Now, the windows on each side of the contral east window are hoto completed. The design of that on the south side is the "Preaching of Tawoorth.—At a meeting of the instact will be a beet, design of that on the south sides is the "Freeaung on Tawoorth.—At a meeting of the local board of John the Baptist." The forerunner of the Saviour, guardians on the 18th ult. tenders were received surrounded by a group of Phanisees and Saddnees, for the creation of the new workhouse, according to attired in costly apparel, occupies the centre of the the plans of Messrs, Brizgs and Everall, of Birning-picture. The whole of the figures are placed under nam. The tenders varied in amount from that of encopies. For this window Mr. Bell of London, was Messrs. Ferguson and Allen, of Nottingham, 4,9507, the artist. The north window is also from a design by Mr. Bell ; the subject heing the "Healing of the Cripple at the Beautiful Gate of the Temple." The apostles Peter and John are surrounded by a group of wondering people. The eripple is in the attitude of wondering people. The cripple is in the attitude of rising. Another painted window has heen filled in the south chapel, sometimes termed Dr. Holdsworth's Chapel. The subject is "The Raising of Lozarus from the Dead." Near the Saviour are figures of Martha and Mary. Other alterations are being carried on within the precinets of the church. *Mainten and Mary* and class window has repeated

on within the preemets of the church. Maidstone.—A stained_glass window has recently been placed in the south side of All Saints' Church, Maidstone, by the Rev. T. A. Carr, carate, in memory of his sister. On one side, in the centre of the two principal lights, is a representation of the laying of our Saviour in the tomb, and, on the other side, an illustration of the visit of Mary Magdalene and Mary the mother of Lawne to the semulcher after the near. the mother of James, to the sepalchrc, after the resur-rection. At the head of the window are monograms descriptive of the name and attributes of the Redeemer. The remaining portions are filled in with ornamental devices, &c. The work has been excented by Messrs. devices, &c. The Powell and Sons.

PROPOSED ROOMS FOR THE INSTITUTE OF ARCHITECTS, AND GALLERIES FOR THE ARCHITECFURAL EXHIBITION.

SIR,-Will you permit me to call attention through SIG.—Will you permit me to call attention through your columns to tbe great importance of the under-taking, now in hand, for providing spacious rooms for the Royal Institute of British Architects, and a set of galleries, equal to any in London, for the Archi-tectural Exhibitiou? This, bowever, is not all, for there will be accommodation for other bodies con-mected directly or indirectly with the art. Surely the conviction must force itself upon every one that this is indeed a most important comportunity.

Surely the convertion must hore user upon every one, that this is indeed a most important opportunity, and full of advantages, which on no account must be lost, and which are likely to bear the very best fruit. The Institute will gain greatly by superior accom-modation, and specially by the convenience arising from the proximity of the galleries; and the Exhibi-tion Committee will at last have the satisfication of regime the arbiblistic acces at the right finare sceing the exhibition open at the right time. It is intended to devote the whole of these premises

It is intended to devote the whole of these premises especially for the use of architectaral art, and there are many kindred societies, it is to he hoped, who will lend their aid for the common good, and who will join in realising a common advantage. The now pressing necessity is to subscribe the necessary funds; and it is desirable that the whole should be kept in the hands of the profession. I trust, therefore, that when the formal appeal is made all will be ready to do what they can; and if so, the result will be eatimed easily, and without special effort on the part of individuals. Hoping your support and cmonuragement will he afforded us at this important moment,—I am, &e. JAS, EMENTSON, Hon, See, Arch, Exhibition.

ST. JAMES'S-PALACE.

WHEN this was the sole town residence of George III. WHEN this was the sole town residence of George III. and his family, when it served for the levees, courts, and royal festivities, the attendances were prohably not so great as now: at any rate, there never was such an outery against its want of extent and conve-nience as has lately heen bruited amongst the aris-tocracy, and re-echoed through the whole range of the press. A pille of several abodes and ancient suites, somewhat resembling Chelsea Hospital, and certainly for informs of the arm participation of the mathematical sectors. somewhat resembling Chelsea Hospital, and certainly far inferior to any portion of Hampton-court,—it is ill calculated for any of the objects to which it is dedi-cated, whether residential or otherwise. The domi-ciles of the whole nation have heen vastly improved since the date of its foundation, and so also has the palace of the monarch of Britsin been constructed on the modern scale of style and comfort. St. James's Deletion of the second state of the construction of the second state of the second style and comfort. St. James's The modern scale of style and contort. St. James s Palace is now but an occessional assembly-room, opened, as Ahmack's or the Hanover-rooms, but not one tithe so often, for the reception of visitors : this is as to the State apartments : for the rest of the pile,

is as to the State apartments : for the rest of the pile, it is a lie-by-something of the old workhouse kind--for officials, pensioners, and a captain's guard. All this occupies a site which is most certainly one of the best in London. It ranges square between Pall-mull and the Park, to which it has a frontage of 450 feet (exclusive of the colomade on the north, and of the purjecting calterna call stack it he table work) of the projecting entrance and stack in the stable-yard), with a depth of 460 feet between the Park-wall and With a depin of 400 feet body when the early with an the pavement in Pall-mell. Here is a plot for a magnificant structure as large as Somerset House, and even larger than the eventral muss of Buckingham Palace,—a plot which, as to the character of the pre-sent huildings, is wholly thrown away; and which, as to the objects it subserves, is in a torpid and inert are able to the object of the precondition.

condition. It would occur to passing observers of the works now in progress; of some that have been threatened, hat suspended; and of others which are promised, and perhaps reserved for the next generation; that the building funds of the nation and the energies of the Board of Works, aided by the professional tailent which we have lately seen in competition, could not be hetter expended than for the purpose of raising a fabric here worthy of the age, and suitable to the occusions of the Court, as well as to the splendid position in the West-end, of which it ought to be the main feature. main feature.

any new elevation, there should be an opening In 'my new elevation, there should be an opening 'keeps most of the South Staffordshire irronmasters pretty fully occupied. As a whole, however, the least, the 'pian terreno' should be surmounted with trade is 'quiet;' and this was the general reply an interval, columniated, as in Somerset House, to which met the inquiry made hy one master of the afford a glimpse from the ascent of the street, and their eustamary weekly gatherings at Wolver-homoto of the St. Stephen's towers. At the same time, in order to accomptish Pall-mall (the most admirable in order to accomptish Pall-mall (the most admirable mere's and the Duke of Statherland's noble mastions' the unseemly and dislocated range of Palace-row and Little St. James's-place ought to be withdrawn from In

the splendid opening which they shut out, and from the propinquity which they as irrespectively degrade. As to the erection of State reception-rooms (lately recommended in the *Builder*) adjacent to her Misjesty's palace, in Buckingham-gardens; it is manifest that such an addition would render the north wing of the palace gloomy, if not unhealthy; that it would occupy places of grands not now the extension. occupy that it pleasant grounds, not now too extensive : and that it would not enhance the value of any architectural pre-tensions (if any) to which the royal abode may lay elan

It would be vain to say one word as to the style of are interior to be employed, or to excernate the bitter strife now raging between the admirers of the ordinal and the devotees to the Gothic: suffice it, that above all, the huilding should be a *chef-d*'ourcer suitable to the most glorious site in London.

CLERKENWELL IMPROVEMENT. VICTORIA STREET

CLEARER.WELL INFROVEMENT. VICTORIA STREET. MUCH discontent and disadisfaction prevails at the dilatory proceedings of the City authorities with regard to the new street, considerable loss and inconveniences having heen experienced by large shopkeepers, from the removal of an entire neigh-bourhood, npon which they had been more or less dependent for support and means of subsistence. In this view of the matter they would have an equitable claim for dompensation and relief. The City authorities are following, and have for some time past been firting with the North Metro-politan Railway Company. How far they are ful-lilling the requirements of the Aet under which they were constituted for the formation of a new street, and whether this is strictly compatible with their powers and jurisdiction, is yet to be seen. These long delays have inflicted great injury on Clerkenwell, as relates to property circumiseent to the line of *intended* new street, preventing improvements from the prevalent uncertainty; and the number of empty honses is alarming. What L an more particularly decimes of analling

uncertainty; and the number of a alarming. What I am more particularly desirons of calling the attention of your readers to is this,--that the new street and its concomitants are heing sacrificed to the veriest *ignis fatuus* that ever lured any public body from the performance of a plain duty. In the present state and aspect of the money market, the North Metropolitan is simply an absurdity; and that money will be less stringent is very improbable. A RATEPAYER.

OPERATIVE MASONS' BENEFIT SOCIETY.

THE forty-seventh anniversary of the Operative Masons' Benefit Society was celebrated at the High-Massing Defend to Softety was celectriced at the Figure bury-barn Tavern, Islington, on Tuesday last, the 28th ult. The numbers and their friends, including some of the principal builders, or their representatives, to the number of about 100, sat down to an excellent

to the number of about 100, sat down to an excellent dinuer at half-past four o'clock. In the absence of their president, Mr. C. H. Smith was called to the obair. After the usual toasts, the scerctary read a statement of the society's affnirs, receipts, and expenditure, by which it appears to be progressing, slowly and surely, in the right direction : the numbers increase, the funds improve. Still, it is rather surprising that a society so firmly established, during nearly half a century, should not he more generally known and appreciated by the working stone-masons. At about eight o'clock there was a general disturbance in the room, though by no means a disagreeable one: a few of the other sex, gaily attired, were observed peeping in at the door, and were a disagreenble one: a few of the other sex, gaily attired, were observed peeping in at the door, and were gradually pressed forward by others from behind. Almost like magic, the chairs and tables were heard rambling from the centre to the sides of the room; the masic struck up a quadrille; all faces were lively and ebeerful. Off they went on the "light fautastic toe," and continued in action until midnight, appa-rently highly gratified with each other's company. If the "carvers" had it all their own way at diamer, the "setters" were at a premium in the dance.

NOTES UPON IRON.

(From our Correspondent at Wolverhampton.)

(From our Correspondent at Wolerhampton.) True completing of old orders and the supplying of a from-hand-to-mouth demand, now heing made, keeps most of the South Staffordshire ironamsters pretty fully occupied. As a whole, however, the trade is "quiet;" and this was the general reply which met the inquiry made by one master of the other at their eustomary weekly gatherings at Wolver-hampton and at Birmingham. The orders on export account are for the most part forwarded vid Hull: some are sent to Loadon; very few to Liverpool; the Americans, who seem to he able

The activity of the export trade to the northerm ports arises first from this being the "senson" for the Hull trade, and exit, from the Late hostilities having irrerased customers' necessities. The reduc-tions in the Russian tariff appear as yet to be only imperfectly understool in this district, the official list not having hiberto come to hand. There can b-no doub, however, that the pig makers of the Cleveland district in particular will be benefited by the reduction; and the tin and japanned wares of Bilston will in consequence be in improved demand. The Russian weights and coins only have been men-tioned in all the ninted statements that we seen The Russian weights and couss only have been men-tioned in all the pittel statements that we have seen of the alterstion. In English, supposing the exchange to be at 38, which is a fair rate, 15 copces per pood upon pig iron will he Is. 5d, per evt.; 50 copces per pood on bars of half an inch thick and upwards, 4s. 9d, per evt.; and 90 conces per pood upon plets will be 8s, 6d, per evt. Under the old turiff pizs were altogether prohibited, except in a few instances in which permission was granted to engineers to im-port stated quantilies daty free. There is a tolerably good denand from home markets, the descriptions indicating at once an ex-tended application of steam to the requirements of navigation and commerce, and a free use of iron as a constructive malerial in stationary buildings and for sanitary purposes. The cesting firms, with vhom large contracts are generally made, are reported to be active.

active

We have heard of no extensive transactions at

The more neare of no extensive transactions at prices different from those quoted in our last. The "make" of malleahle iron has been chreked by the men at several large works keeping holiday at the Tipton "wakes."

For stuccoed bricks, and sich-like tricks, At present all the rage is: They took no one in, those fac old min!! In the 'pinns' middle ages!!!"

INSANE COMPETITION AMONG ARCHI-TECTS, AND ITS CURE

TECTS, AND ITS CURE. Some months since a bowrd of guardians adver-tised in your Journal for plans for a new workhouse, not to exceed in cost 11,000/. A plan was selected, tenders advertised for, and thirtene builders bestowed their time and skill in estimating the cost of the selected plan: their lowest tender was upwards of 22,000/. The term "bland bulklers" has often figured in the parces of the Builder, but in this in stame surger "bland architeers" might be substituted for builders. What step will the board of guardians take in this matter? It seems to he a very usual custom with the youthful numbers of the profession to design the hand comest buildings possible for com-putition, which any recard to thir cost, while the better the second secon sequence, have but a poor prospect of competing with the flowing ardour of the youthful peacel, uncurbed by figures of arithmetic.

by figures of arithmetic. Surely something should be done to make fair footing for competing architects, save builders the immense annual trouble they have in making useless calculations, and builds the industry of youthful architects with formers of dealing to their more ex-perienced brethren. Cannot committees insert in their carditions to architects are used that them will perienced brethren. Cannot committees insert in their conditions to architects, not only that they will refuse to pay the premium on the selected plan, if beyond the stipulated sum, but that such architect shall pay them all the expanses incurred by adver-tising, & a and pay in addition a fine of ten per cest, to the Builder's Stimutate beyond the sum proposed to be expended? Should a rule of this kind be gene-rally adopted, it would induce young architects to a quire some knowledge of estimating, and give some guaravtee to the fairness of computition among archi-tects. IMPROVED DWELLINGS AT KENSINGTON. An inductial meeting of the inhabitotis of Kensing-tran was held on the 21st off, for the jurpose of making more extensively known the objects of the Kensington Associ-tion, on limited liability principles, for provid-ing inproved dwellings for the labouring classes. The Dake of Argyle presided. In opening the proceed-ings his grace sold that there were a large number of families crowded together in Kensington, and he thought they should do all to remely this state of things that hey in their power: it was their duy to do so. Leaving Parliament to deal with the question as they thought best, they must themselves try to deal with if, and he could see no other mode but that of joining their exertions to those of others in other deal with it, and he could see no other mode but that of joining their exertions to those of others in other parts of the metropolis in providing good and healthy dwellings for the working classes. He thought they should try to make them remunerative, as they would not be of that class and extent unliss they were so. The system of taking houses ou the huidding society principle hed been found to work well. The Society for Improving the Dwellings of the Labouring Classes had taken houses and built others, and the results had averaged 4 to 6 per cent, dividend, while in one in-stance 10 per cent, had been realised. He felt that there were a great many in Kensington would averaged 4 to 6 per cent, dividend, while in one in-sinner 10 per cent, had be in realised. He felt that there were a great many in Kensinston who would hearily regine if they could, by this class of subscrip-tions, aid in extending the accommodation for the a good Christian work, and when the results were scen, they would all feel that they had an ample re-turn for what they had done, if only a portion of the working min were benefited. Appropriate resolu-tions were passed, and Mr. Walter (chairman of the directors) then explsined the modus operandi of the association at some length, and movid a resolution to the effect 'That the association lately formed in Kan-sington, with limited liability, under the Joint-Stock Companies Art, 1856, 'For proving Improved Dwellings for the Labouring Classes,' is deserving encouragement.'' He added that the amount already subscribed was 2,580', and that a site near the police-court had been apprived by several inducatil gentle-mer. The amount of their capital wes limited to 10,000', but if they could get ahout 5,000', they could make a good beginning.

RECENT BUILDING AND OTHER PATENTS.* BOUSPIELD, G. T. — An Improvement in the Manu-facture of Artificial Stone. (A communication.) Dated Sept. 29, 1856. (No. 2 852.) — The patentee takes of creating charts from 80 to 85 parts, and of slaked line from 15 to 20 parts by messure. These ingredients are pulverized and mixed with water to give the consistency for mondilings. The pasts is then moulded, and after coming from the moulds the blocks or tiles are dired in the open are. FONTAINEMONEAU, P. A. L. DE.—Certain Im-provements in Maching Artificial Stone for Status and Oramenting Purposes. (A communication.) Dated Sept. 6, 1856. (No. 2,083.) The investor mixes argin with red ordere or inor ores (ahuat one-fifth argil). This mixture is palverized and silted, and then spinkled with acidulated water. A Walk through the Art-Treasures Exhibition at Manchester, under the Guidance of Dr. Waagen, London: John Murray, and W. H. Smith. 1857.

DE. WAAGEN'S "Tressures of Art in Great Britain" probably led to the Manchester Exhibition; at any greatly farilitated it, and he has a right to be a connection with it. The little book named rate it heard in connection with it. The little book named above will save the time of many by enabling them to go at once is the best pictures by the old misters, and will, at the same time, instruct. Dr. Waagen is ust infullible, or he would not say, for example, of 261, "Titian, the Magdalen,—of the many repet-tions of this subject by the master, this picture is one of the fuest." It is surely only a copy. Nevertheless, he knows mire about ancient pictures thin most people, and is a valuable guide. We may quote some of bis brief headings to the works of different schols: thus; leard in connection with it. thus:-

Italian School, in the Byzantine Style. Thir. teenth and first hulf of the fourteenth century. The pictures of this and the next period are chara In pictures of this and the next period are charac-terised by a deep religious sectiment, seen especially in the heads and gestures. The technical execution is bard, and the drawing generally stiff and uncouth. It is therefore advisable to look very close at them, in order that their beauties may be fully understood." And of-

"The Italian Schools of the fifteenth and sixteenth centuries. - In the fiftcenth century the Italian, Netherlandish, and German schools will be seen aiming in every respect-in drawing, colour, and per-spective-at a true delineation of Nature.

In the sixteenth century--or what is called the Gioque-cento--painting attained the full knowledge and command of all the means essential to true and beautiful delineation."

Chronicles of the Tombs: a Select Collection of Epitaphs, preceded by an Essay. By T. J. PET-TIGBEW, F.R.S. & London: Bohn, York-street, Covent Gardeu, 1857.

Tue compilation of this curious volume must have cost the author no little labour and research. It is not restricted either to our own cumtry or our own times; but, on the contrary, traces the records of the tombs from the earliest times, and amongst various nations, beginning with the Egyptians, the Greeks, and the Romans. The work is almost altogether a and the Romans. The work is almost altogether a novelty in its kind, too; the history of epiraphal in-scriptions having till now been written only in frag-ments. Of late years, indeed, the chief record even of such fragments has been our own columns, in which several articles on this subject have appeared, our main object having been the our main object having been the amendment or eleve of the tone of what may be called the literature of the tomb.

of the tomb. There has been a remarkable diversity of taste and feeling prevalent at different periods in the world's history in respect to oplitaphs. The more ancient are certainly the more diguified, generally speaking. As respects different countries in less ancient times, the accusation that the English have been behind other values in means to this means of means achieved. nations in regard to their records of monumental in-scriptions is one not altogether devoid of truth. Fur the most extensive collections of chitable we are in-debted to the Greeks and Romans. Italy, France, and Germany can also produce their vast collections. In this country, in carly times, inscriptions were prohibited to be engraven on any tombs but those be-longing to persons distinguished either by their high position as governors of the kingdom, as military composition as governous or nawing out, as similary com-maiders, or as remarkable for their wi-down or their virtues. In this respect, as remarked by Mr. Petti-grew, we seem to have followed the example of the Lacedemousians, who allowed the honour of epitapus only to those men who died bravely in battle, and to those women who were distinguished by their virtue. Hence such records were viewed with veneration, and protected with solicitude. Roman epitaphs were always addressed to the manes of the deceased, and MARTERS, J. G. - *Laprovements in the Manifest* is something peculiarly appropriate and *tare of Iron*. Dated Sept. 16, 1856. (No. 2, 171.) touching in them. Roman British epitephs par-This consists in applying to, and disseminating take of the Roman simplicity. It has been ques-amongst fluid metal possessing the characteristics of tioned whether we possess any genuine Saxon

corded of them are few in number, though hi worthy of attention. In England, epitaphs are sourcely to be found prior to the eleventh contary, and these are in Latin, and chiefly royal or eccle-sisatical. In France there were tew epitaphs in the French language itself before the thirteenth century. Epitaphs in the French language were common in this country from the thirteenth till the middle of the forteenth sentury, and continued more or less to be used even in the fiftcenth century. It is generally admitted that of all languages there is none equal to the Litin for spiness in inscriptions. The Spanish the Litin for aptness in inscriptions. The Spanish has been commended for its terseness of expression. and the English, as many of our inscriptions she admits of considerable force and elegance. The di The diff. authy however, of composing an appropriate or satisfactory inswiption in English has been so generally felt, that many of our staturs of recent erection record only the name, or at the most are culty. accompanied only by the date of bith and decease, of those in whose honour they have been creeled. Yet many arguments might be adduced in favour of epiin the English language. Much must depend upon the situation in which they are placed. Taste in the style of the language of an epitaph is

a matter of the very first consideration. Portno or quaintness, either in the style or the sentiment, Pertness or quainfluess, either in the style or the sentimet, is repugnant to good tasic : still, one will readily be disposed, with Mr. Pettigrew, to admit of something of an epigrammatic turu in the composition. Str Joshna R-ynelds tells us, on this head, that he remembered once having made an observation to Burke that "it would be no bid definition of one sort of epignphs to cill them 'grave epigrams.' Burke, adda Sir Joshna, grave'y re-echeed the words 'grave epigrams,' giving me the credit of a pan which I never intended to perpetrate. A very large proportion of epitaphs exhibit instances of glaring definiency of tasic, turgidity of language, and exaggeration of sentiment. What Armstrong said of the *best* language is peculingly applicible to that which ought to characterise epitaphs. In these, the thoughts assist way, and by the most harmonions clearest, and easiest way, and by the most harmonious arrangement of the most choice words, both in meau-

ing and in utterance. Without any special intention to illustrate what Winnot any special inclusion of model bas been said, either by adducing instances of model epitaphs or "frightful examples," we shall conclude these few remarks on the subject by gleaning from Mr. Pettigrew's eurious and interesting collection two or three of the more salient specimens of various kinds of epituphs, selected, in truth, more on account of their brevity, in consideration for our own limited

space, than for any other special reason. First of all, we may give a specimen of Egyptian epitaphs or mummy inscriptions :

"Let us pray for Osiris, Lady of the House, Ohranis;"remarking that though Osiris was an Egyptian god, there was this peculiarity about Egyptian ideas, that every one who died became Osiris or the godan idea originating, doubtless, in the aucient doctrine of divine possession, according to which, in religious or devotive contemplation, the "servant of the god or devotive contemplation, the "servant of the god gave up possession of his body, as a "dead" carcasa, to be inhalited, as a shrine, by the got himself; so that, loosely speaking, he became the god, and was no longer merely a human being, at least, till dispos-essed of the divine afflutus, and " come to him-edd" arise. self again.

Of Greek epitaphs we may select the following, on Æ-igenes ;-

" Hail | universal mother | lightly rest On that dead form Which, when with life invested, ne'er oppress'd Its fellow worm."

The fellow worm." One of the most frequent expressions on the Roman tombs, both of Pagan and of Caristian times, is to be found in the well-known passage of Taeitas...." Sit tibi terra levis,"...." Light be the earth upon the.." This expression, as we have just seen, was also Greek; and it has been handed down even to our own any, and is still olten employed. . There is in it unquestionably, as Mr. Pettigrew remarks, an elegance and a feeling of the most deli-eate character, bearing the most aff ct onste applica-tion. The Romans dd not confine themselves to the employment of this passage on the tombs: they were in the halit of offering lighted at their tombs of the dead. One of the most intersting of these the dead. One of the most interesting of these (preserved by Gruter) is the following :---

"Adien, Septimia! May the earth be light upon thee! hoever places a burning lamp before this tomb, may a lden soil cover his ashes." WE

Gough hints that it is not improbable that the idea

442

of the earth lying light on the hody interred-this favourite desire of antiquity--suggested the raising of cells of stones or sods within the vast harrows after-wards heaped over them; but we have elsewhere pointed out another reason altogether for the forma-tion of some at least of these cells, which indeed were most intimately connected with the most mysterions and ascred doctrines of the Druids and other orders of the Pagan priesthood. Of Saxon epitaphs, the well-known "Requisecnt in pace," inseribed in Runic and Saxon characters on a circular stone with a cross in a circle (the cross, by the way, often not multike the plan of the Druidical of the earth lying light on the hody interred-this

a circular stone with a cross in a circle (the cross, by the way, often not unlike the plan of the Druiding cells just spoken of), may serve us an example. In old English epitaphs, "pray for the sawl" of so and so who "here lyetch," was a very general and characteristic introduction to what followed. Many, however, made little pretension to religions sentiment. On the tornh of the third Earl of Devon, "the blind and good earl," and of Maud, his wife, the evitaph is —

epitaph is,-

Ou more than one old English toub is the following :-

"The bitter cup that death gave me, Is passing round to come to thee."

Of punning epitaphs a sprinkling may be adduced

On the Rev. Mr. Chest,-

"Here lies at rest, I do protest, One chest within another. The chest of wood was very good : Who suys so of the other?"

On Merideth, an organist at St. Mary Winton

College, Oxford : " Here lies one blown out of breath, Who lived a merry life and died a Merideth."

On John White :---

" Here lies John, a burning, shining light, Whose name, life, actions, all-were White."

On Juhn Potter, Archbishop of Canterbury (1736) :---

" Alack, and well-a-day ! Potter bimself is turned to clay."

In Notes and Queries is given an English version a singular arrangement of Latin verses in an epitaph at St. Anne-in-the-Willows, on John Herenden Mercer, E.q.:

cur f w d dis and p A sed riend rought each ease ain bles f b br and ag "A cursed friend wrought death, disease, and pain;" A blessed friend brought breath and easo again."

Amongst ludierous and eccentric epitaphs, perhaps one of the worst is that at Gateshead, on Rubert Trollop, architect of the Exchange and Town Court of Newcastle :-

"Here lies Robert Trollop, Who made you stones roll up; When death took his soul up. His body filled this hole up."

As we are amongst the old bones of a fellow architect, we may present the remains of another, -Mr. John Abel, of Sarnesfield, ob. 1694, set. 97:--

"This craggystone a covering is for an architector's hed That lofly buildings raised high, yet uow lyes low his head His line and rule, so death concludes, are locked up in

store, Build they that list or they that wist, for he can build

His house of clay could hold no longer, His house of clay could him a stronger. May Heaven's joy huild him a stronger. At Monknewton, near Drogheda, there was, or is a tombstone-

"Erected by Patrick Kelly, Of the town of Drogheda, mariner, In memory of his posterity."

Whether the following, on a glutton, he a real or a fictitious cpitaph, does not appear :---

"At length, my friends, the feast of life is o'er, 1've ate aufficient, and I'll drink no more. My night is come : 1've spent a jorial day : "Tis time to part, but ob !- What is to pay?"

If any be curious to know how "Ann Collins died, th September, 1804, æt. 49," he is assured that— 1Ith S.

'Twas as she tript from cask to cask, In at a bunghole quick she fell. Suffocation was her task : She had no time to say farewell.''

Poor sister Ann ! Had great Cesar's elay formed the bung of the fatal cesk, he might have been of some little service to her at least in articults mortis. But half service to her at test in articulus moris. Due here we must panes, apologizing to Mr. Petitigree for the lherties we have taken with bis labours, and toanking him, in the public's name, for his excellent contribution towards the history of the posthamous literature (shall we call it), of this weary world. THE BUILDER.

Miscellanea.

LIZARD SERFERTINE. — The interests of the southern part of Cornwall are likely to be advanced by the success which, we are told, is attending the progress of the works at the Cadgwith Signal Staff, where a lower depth in the excavation of this material has now been reached than has ever been attained. The primitive formation near Cadgwith has been shot upwards, from depths impossible to estimate, through liquid granite, porphyry, and asheetos; and at the junction of the serpentiae with the minericons forma-tion there is developed, in huge masses of fifty and one hundred tons weight, stone of great beauty, with tion there is developed, in linge masses of the weight one hundred tons weight, stone of great beauty, with ever-varying shade and colour. The Signal Staff quarry, as now hid open, on a hold perpendicular cliff between 200 and 300 feet high, with the ocean lashing its base, excites in the vis.tor at first sight an idea, that all is chaotic confusion; but the observaides, that all is chaotic confusion ; but the observa-tions of Mr. Cox, the superintendent of the Lizard Company, has led to the discovery, that, throughout the extensive field of scrpentine, there have reigned certain general laws which have produced a systematic order of colours. The surface stone for several feet is mety red, and brittle ; much disintegrated, and or so overburnt an appearance as to have occessioned an opinion of general faultiness : below this upper enst, the peculiar light green has been developed - proceed-ing downwards, the green becomes darker, and is incorporated witb bright red ; and below this again is a mixture of rich red, with fine-greined black stone, compact as marble, not less ensity worked, and not influenced by the district of the Lizard consists of serpent compact as marble, not less ensity worked, and not influenced by the action of caids. By far the greater portion of the district of the Lizard consists of serpen-tine, and it was erroneously supposed that the bulk was applicable to ornamentul and useful purposes; but this is not the case, the stone of superior working quality and of rich colour being found where the heds are intersected with porphyritic rocks. The protinnate causes of the great varieties of colours, their striking constructs, and numberless changes of shade and tint, constitute a problem which geologists and chemisfs constitute a problem which geologists and chemists have yet to solve.

have yet to solve. PURCHASE OF LAND FOR DEFENCE-WORKS AT GOSPORT. — Sume of the circumstances connected with the purchase transaction of the land in this neighbourhood, says the *Mechanic's Magazine*, are painfally ridiculous. About fity years ago, the necessity of strengthening the outlying fortifications at Gosport became apparent to the military curineers, a map purchases of land were made about Browndown and in the locality of Gower Fort for this purpose, on which occasion about 100. per acre was paid for the property. The land, however, was not turned to account for fortifications. With the exception of a few small carthworks, nothing was done; and in the of the Government land was sold, and in many in-stances did not realize more than 10*l*, per acre. On the occasion of the last purchase of the some land, which had been thus hought and sold on such un-favorable terms, Government pid 24*0l*, per acre for it, thus making the public a loser by about 300*l*, per acre on their transactions. It has not yet transpired what will be the extent and character of the fortifica-tions which are to be created on this land. Approximation of the last and character of the fortifica-tions which are to be created on this land. PURCHASE OF LAND FOR DEFENCE-WORKS AT

tions which are the cattent and manages of the formal Angel, INN, HIGH-STREET, CLERERWELL-Application has heen unade, under see. 143, Metro-polis L-cal Management Act, by Mr. Smith, to allow polis L-cal Management Act, by Mr. Smith, to allow him to fill up a gap hetween shops in Angel-place and his premises, by building over space in front, and so to do away with the paved portion, on private and public grounds, decmed by him a great noissance. The question was referred by the Board to the Clerk-enwell Vestry, who reported in favour of Mr. Smith. The Metropolitan Board have not, however, adopted the recommendation of the vestry, but have refused consent.--A Pausitiovers. consent .-- A PARISHIONER.

consent.--A PARSHONEA. HASTINGS... NEW HOTEL. -- At this benutiful watering-place a colossal hotel has heen commenced, on a scale of magnificence scarcely paralleled by any other in the south of the kingdom. The site is on the scan head, in continuation of Carlisle-parade, pre-senting fontages to the Parade and to Harold-struct 2002 senting frontages to the Parade and to Harold-street of 200 feet respectively. The foundations are hid, and the plan contemplates the completion of I30 rooms; comprising first and second elass coffice rooms, saleons, and suites for families; besides assembly, billiard, and smoking rooms, and a library. There is also an arrangement for baths. The plan is being carried out by a company on the principle of limited liability, and the excention of the design is under the emerging descent of the design is under the emerging descent of the design is under the superintendence of Mr. Francis II. Fowler, architect.

IMPROVEMENT IN THE PREPARATION OF CRUDE IMPROVEMENT IN THE PREPARATION OF CRUDE ORDS.—W.T. Join Harding, of the Beeston Manor Ironworks, Leeds, has patented a new method of free-ing ironstone and other metallic ores from shale and other extraneous matter. Mr. Harding's discovery dispenses with the action of the air, and, by the appli-cation of steam, accomplishes in two or three hours that which has previously occupied one or two years.

ROYAL SURREY GARDENS.—Experience confirms the opinion we early expressed, that the fine music-hall in the Surrey Gardens is admirably adapted for sound, and so does great credit to its architect, Mr. Horace Jones. Eleven military bandah, besides M. Jullien's own, tsted its excellence in one respect on Taesday and Wednesday Inst, in aid of a fund for Mrs. Sacole, of the Crimea, and if all the slatements of her goodness of beart and liberality to our brave soldiers be true they will never he guibered loxether soldiery be true, they will never he gathered together in a nobler cause. She has reason to be thankful for soldery be true, they will never be galacted togenher in a nobler cause. She has reason to be thankful for her losses, since they have served to show her the sense the public entertain of her services. According to one who ought to know, "she nursed the sick, succeured the wounded, and performed the last offices to many of the most illustrious dead."

to many of the most illustrions deal." ROYAL POLYTECHNIC INSTITUTION.—On Saturday evening, the 25th ult. a ceremony highly creditable to this excellent institution took place in the large lecture-room—namely, the distribution of the certifi-cates of merit from the Society of Arts to the 44 suc-cessful candidates who had attended the classes at the burdenic location of the certification of the cer cessin enhances who had needed in the classes of two Polytechnic Institution during the part year. The chair was supported, among others, by Professor Buck-master, Dr. White, Dr. Sayer, Mr. Leslie, Mr. Ure, and others. The number of students in the Poly-technic who have obtained certificates must be very with the two bare obtained certificates must be very with the two bare obtained certificates must be very satisfactory to Mr. Pepper, and affords a proof of the excellence of the classes he has established.

ADDERENCE TO CONTACTS — Some few months since there were tenders sent in for a new Pauper Lumatic Asylum for the counties of Beds, Hunts, and Herts. The specification tenders were based upon contained distinctly that the line for the works was to be of Hickin andbusing on executing Largerme. teries. The specimention tensers were based upon contained distinctly that the line for the works was to be of Hitebin production (on account, I presume, of its excellent quality). Now, the distance from litebin to the saytum is five miles, which, of course, was duly calculated upon, as well as the price of the article; but to show the unfairweas of present pro-ceedings, the line nsed is made on the spot, and from such a quality of material that it has been arserted the former line arches were abandoned more than once, it being so inferior. Putting aside the hadness of the chalk for such ponderous works to he carried up with. I must reiterate the sentiment of its being unfair towards other competitors, who were at the expense and trouble of senting in tenders, unless it has been considered by the committee, and a fair allowance made on behalf of the ratepayers. I shall be glad to know if this is be case?-A COMPETITOR.

be glad to know it this is the case r-A COMPATION. THE ATWOOD MEMORIAL, BRANNOHAL—The models of a monument to the memory of the late Mr. Thomas Attwood have been set in competition by Mr. Peter Hollins, and Mr. Thomas, of London. Both are statues. That by Mr. Hollins represents Mr. Atwood in the act of addressing an assembly. figure rests on a plain square plinth and pillar. Ir. Thom is's, the figure is represented also in the of addressing the people. The figure stands on a The In Mr act of addressing the people. The figure stands on a colorm, supported by a flight of steps. The cost in both cases, involving the erection, is SOOZ, it be figure to be Sicilian marble. The committee reserve their decision.

decision. SEDDON SUBSERIFION FUND.—We are glad to bear that one main object of this subscription is attained; the trustees of the National Gallery having accepted Mr. Schdon's pieture of Jerusaken with the Valley of Jeheshaphat, which will be exhibited along with the ather works of the British school forming part of the Gallery. The other object of the fund is also fairly attained, the subscription having realized not only the facthers money of the pieture, 420%, but a net surplus of about 144%, which will be pre-sented to Mrs. Thomas Seddon along with the pur-chase-morey. The subscription will remain open until the 15th of Angust.

CHERST'S HOSPITAL. - General repairs are to be done, and tenders have been received, ranging from Hayward, 5487, 9s. 6d. to Clarke and Barnes, 4807.

GAS.—At the annual meeting of the Montros⁶ Gas Company just held, it was resolved to pay to the shareholders a dividend of 10 per cent. The com-pany are extending their pipes.

pany are extending their pipes. INPUSIBLE CLAYS FOR REFORTS, EARTHENWARE, &c.--Mr. L. J. F. Marguerite, of Patis, has invented some improvements in the preparation and mixture of infusible clays for manufacturing carthenware. The object is to increase in all kinds of clays for the manufacture of earthenware the proportions of silica and alumina. The process is as follows :---Make the and anomalia. The process is so formore the ordinary manner, and after they have been submitted to the first operation of drying in a store, immerse them in a solution of chloride of aluminium or chloride of silicium. After this operation the soaked earthenware products are hurnt till the hydrochloric acid is entirely evolved. There remain in the interior of the carff evolved. There remain in the interior of the called envare alumiua and silica in proportion to the con-centrated state of the solution, and to the repeated immersions to which the articles have been subjected.

Aug. 1, 1857.

CONSECRATION OF OLD FORD CHURCH, BOW The Bisbnp of London has consecrated the new church erected at Old Ford, Bow, near the railway The church is of the Early Perpendicular recently er station. period of Gothic architecture, and built of brick, with stone dressings, upon a site given by Sir Charles Morgan, Bart. on the Tredegar-road. The strictest of Gothic architecture, and built Morgan Bart. on the Tredegar-road. The strictest economy has been observed in its construction. There are 1,500 sittings; nearly one-third free. The architect was Mr. John Nicholls. The cost of creetion has been nearly 6,000% mostly advanced by friends.

ORDNANCE SURVEY.—The report of Licut.col. James to the Inspector-general of Fortifications, of the progress of the Ordnance survey of the United Kingdom up to December last, has been issued, together with remarks npon the different brauches of the work, and the methods of conducting the operathe work, and the methods of conducting the opera-tions of the survey. This is the first detailed report on the survey which has been presented to Parlia-ment. It is in contemplation to remove the head-quarters of the survey from Southampton to London, still keeping at Southampton the engraving and pub-lication, as in Dublin. The number of persons em-ployed on the survey on the 31st of March last was: 1 lieutenant-colonel superintending, 16 captains, 2 lieutenants, 1 quartermaster, and 480 non-com-missioned officers and sappers of the corps of Royal Engineers, 960 civil assistants, and 609 labourcers ; making a total of 2,069 persons; but, in consequence of the reduction in the amount of the grants for the survey, this number is now reduced to 1,282.

of the reduction in the amount of the priors of the survey, this number is now reduced to 1,282. . . "The great drawback to the survey," says the re-porter, "has been the frequent change of orders relative to it. I helieve those under which we are relative to it. I helieve those under which we her now acting are most judicions; and after the ful dis-cussions upon this subject which have taken place by correspondence, in committees, and in Parliament, I trust that this great work (which will, certainly, be the most perfect of its kind ever executed) will now be pashed an steadily and rapidly, and without any further material ebanges."

A NEW CEMENT OF VARIED USE .- New uses A NEW CEMENT OF VARIED USE.—New uses have been suggested for a combination of pitch and gutta percha, as to which we some years since gave instructions for the prevention of daup in walls. Protessor Edmund Davy has read a paper to the Royal Dublin Society on the subject. He obtains the several moved as we accessized by moliticit digether in Royal Dublin Society on the subject. He obtains the cement much as we suggested, by meltiog together in an iron vessel two parts by weight of common pitch with one part of gutta percha. It forms a homo-geneous fluid, white is much more managcable for nany useful purposes than gutta percha alone, and which, after being poured into cold water, may be easily wiped dry and kept for nsc. The cement adheres with the greatest tenacity to wood, stomas, glass, porcelin, ivorr, leather, purchment. maper glass, porcelain, ivory, leather, parchment, paper, heir, feathers, silk, woollen, cotton, linen fabries, &c. It is well adapted for glazing windows, and as a coment for aquariums

THE COLERAINE NEW TOWN-HALL .- The founds tion-stone of a new town-hall in Coleraioc was laid on 21st ult. nuder circumstances of great rejoicing.

ELECTRO-TELEGRAPHIC PROGRESS. - It appears ELECTRO-TELEGRAPHIC FROORESS.—It appears that the Enphrates Telegraph is about to be com-menced. A large quantity of telegraph stores has been despatched for Bagdad, and Lieut. Arthur Hawes, of the East-India Company's Service, and other excentive officers of the European and ludinn Junction Telegraph Company, will start forthwith for the tensor to heavin the construction of the promosed that town to begin the construction of the proposed line

SWISS RAILWAYS .- In Switzerland, railways are Swiss Raitways.—In Switzerland, railways are rapidly extending. The following sections bave been opened within the last three months:.—On April 15, that from Winterchur to Schaffhansen, 29 kilom. (183 miles) in length; in the course of the same month, that from Sissach to Laufelfingen, 9 kilom. (54 miles); on May 16, that from Herzogenbuehsée to Biel, 37 kilom. (235 miles); on June 10, from Villeneuve to Bex, 17 kilom. (105 miles); and on June 15, the section from Herzogenbuchsée to the plain of Wyller, near Berne, 39 kilom. (25 miles). Oxy or with same Thomas in Agenumezuwith.

ONE OF THE LATEST DODGES IN ARCHITECTURAL COMPETITION.-In a competition for a public build-ing proposed to be erected not 100 miles from Bilston, Constantion, and constant of the problem of the second ing proposed to be erected and 100 miles from Bliston, a limited number of architets were invited to send if designs, and anongst the instructions issued for their guidance, was the announcement, that if a competitor made knawn his plans or motto to any member of the committee, such plans would be disqualified. To overcome this difficulty a spritted fram, before sending in their drawings, forwarded to each committee-man a photographic copy of their designs, and also a copy of their report, with Pecksuif and Co's compli-ments. If architects wish committees to act fairly and porjehyly, they must themselves "do as they would be done by," instead of adopting the motto, "Do your neighbours as they would do you," which seems anfortanately to he the leading principle of competitions in general.

lately an application was made by Mr. Alexander, builder, to the Police Commissioners and the City Corporation, for payment of an account of 50% odds, incurred in removing the *debris* of a building which fell in Leith Wynd, upwords of a year since, and fell in Leith Wind, upwards of a building which fell in Leith Wind, upwards of a year size, and thereby rescuing a child from suffocation, and also for taking down a dangerous gable in the same wynd. It appears that, on the accident taking place, Mr. Alexander was ordered, or requested, by the sheriff to elear the wynd of the rubbish of the fallen huilding, and to take down the weards as he was done the state. and to take down the unsafe gable, and that the oper-tion was superintended by the inspector of police. He did so, and sent in his necount to the Commis-Hole was superior to his necount to the Commis-sioners of Police. The matter was remitted to the committee presided over by Mr. Fyfe, and, "as might bave been expected," says an Edinburgh paper, there bave been expected," says an Eduburgb paper, there was immediately a difficulty found to prevent the payment of the account. No regular order, it seems, had issued from the police anthorities for the employ-ment of Mr. Alexander, and he was told that this flaw was fatal to his demand. The Lord Provost and other members of council strongly recommended pay-ment. Mr. Even. nt. Mr. Fyfc, however, persisted in holding by technical objection, and persuaded the council to ment. his adopt the view of his committee, and refuse payment. It is to be boped, should Mr. Fyfe happen to lie under the rubbish of some future fallen building, that no Edinburgh contractor will hesitate for a moment dig him ont, in such an emergency, merely because there is no time for the issue of a "regular order."

ROYAL ASSOCIATION FOR THE PROMOTION OF THE FINE ARTS, EDINBURGH.—The annual general meet ing for the distribution of works of art by this by this ing for the distribution of works of art by this association mmong the subscribers, was held on the 18th ult., in Queen-street Hall. The pictures bought by the committee were ranged behind and in front of the platform. Mr. J. A. Bell, secretary, read the annual report of the committee of management. It setted that the amount of subscriptions for 1856 was annual report of the committee of management. It stated that the amount of subscriptions for 1856 was 4,974l: this year it was 5,400*l*, being an increase of 426*l*, and of 1,183*l*, over the year 1855. The committee (continued the report) have purebased, at a cost of 2,409*l*, seventy-eight works of art, recently build a state the state of the state a dost of 2, 2007, Seventy-legiti works of art, recently exbibited by the Royal Scottish Academy. These consist of forty-five paintings, thirty-two water-colour drawings, and one piece of sculpture. The sum so expended is larger by upwards of 3007, than was spent by the association last year in the Academy Exhibition.

THE PAVILION AT BUIGHTON.—The Brighton town conucil having advertised two premiuns, one of 2002, and the other of 50/. for the best designs for the appropriation of the northern portion of the Pavilion property, the competition has closed, only nine designs having been sent in. Each plan is seen in under a motto. The council, according to the local *Herald*, have ordered three of the apper rooms of the Pavilion, over the King's apartments, to be set apart for the reception of these designs. A correspondent of the paper referred to suggests that the reason why there have been THE PAVILION AT BRIGHTON .- The Brighton designs. A correspondent of the paper referred to suggests that the reason why there have been so few competitors for premiums so liberal is, that the committee have made no mention of a professional referee, and states, indeed, that several local architects committee have have no minute of a processorial referce, and states, indeed, that several local architects have informed him that this was the reason why they declined to risk the waste of their time on the com-petition. All the designs sent in purport to deal with the whole of the property forming the subject of the advertisement calling attention to the competition ; so that it may subserve certain specified purposes. These purposes are, to provide the town with,— 1. A Mosie Hall, capable of necesimodating a large body of persons. 2. An Antheum, that is, a wioter garden or conservatory, something after the fashion of the Crystal Palane. 3. A Free Public Library and Reading Room. 4. A Picture Galleyr, 5. A Maseum. Upon the town council will devolve the responsibility of choosing from among the competitors, but, as sug-gested by the writer alluded to, even still a pro-fessional referee ought to be called in. Sr. CLERENT'S DARNES.—Tenders for works at St.

ST. CLEMENT'S DANES.—Tenders for works at St. Clement's Dancs Church, Strand, Messrs. II. and F. Cudogan, architects, have been lodged, ranging from Cull. 499/. to Sykes, 470/.

ORKNEY ANTIQUITIES. -- A "Pict's House" at hay, one of the Orkney Isles, was lately exca-ted by Mr. Farrer and others. It consists of Eday. Eday, one of the Orkney Isies, was nately exe-vated by Mr. Farrer and others. It consists of a circular mound or tunnulus, with a central cell, and a narrow passage to the outer surface of the barrow. The central cell opens right and left at each corner of the "quadrangenar enclosure," through other passages into smaller cells. The roof of the central cell had fallen in. Exteriorly there of the central cell had fellen in. Exteriorly there was nothing to distinguish the tumulus from other barrows ar graves, but interiorly it was faced round with a wall, to give greater stability to the cellular structure. In nooe of these "Piets' Houses" have any relies been found, and in the north there seems to be great doubt as to the uses to which such structures

A REPUBLIATING CORPORATION. — At Edinburgb could have been put. We are much mistaken, how-ely an application was made by Mr. Alexander, ever, if they be not Drudidenl, or arkite cells, such as ilder, to the Police Commissioners and the City that of New Grange, near Drogheda, in Ireland, and groration, for payment of an account of 50% edds, various others throughout the British 14:s. New Grange contained only one cell, with its long narrow passage; but right and left, like the branches narrow passage; but right and left, like the branches of a cross, were niches, correspondent to the side-cells of the Eday barrow. Each niche contained n rock hasin, and one of them was inscribed in Ogham cha-racters denoting "the sepulchre of the bero," and the other, "the house of the God," with a dedication to "the Great Mother Ops." In these cells, thus iden-tified as at one and the same time the grave of a dead hero and the house of a living God, the Druidical neophyte was buried for a brief interval, denotive of death to the dash, but cuickening the the Smitt - and adoption the fields, but quickening by the Spirit; and theoree, as from a mother's womb, the Tallesin, or initiated Druid, was "born again," or resurrected from the tomb or "kist yaea,"—now one of "the deatbless brotherhood." Let such a mound and cuclesure as this be compared with the Egyptian Pyramid and its closed and narrow entrance and passage, leading to its small central chamber and passage, leading to its small central chamber and sarcophagus: the analogy is very strong, and leaves little doubt, we should think, as to the actual purpose of the mysterious pyramid. Indeed, the crowleeh or barrow at New Grunge was even in itself of a some-what pyromidal shape, though composed of eartb and truncated at top. The singular association of the tomb and the temple, in so many forms as they assume throughout the world, has thus, too, somo light shed on it by the connection between such a curious structure as that of New Grange and the Draidical rites for which the British Isles were once so distinguished.

> THE UNITED STATES PATENT OFFICE. the west wing of this cdifice was only intely in course of erection, and has jost been completed. The building known as the Patch Office contains also, at present, various Government offices. The huilding is 405 feet front, including the wings, which are 275 feet long, both the front and wings having a depth of, the former 70, and the latter 69 feet. The centre building faces 70, mal the latter 69 fest. The centre building faces Eighth-street, and is 270 feet wide: it connects on either side directly with the wings, and but for the difference of material the whole looks, as it is in fact. Ik cone building. The material of the first structure is sandstone, painted white, with granite hasement in the rear: it has a rusticated basement, and rises two stories in height above. The wings are of marble, the cast similar in its construction to the ground, the west wing has a sub-basement of granite, to bring it on a line with the rest i the rear of each wing is of granite. The portioo, which is very elevated, being reached hy nunceroos granite stops, supported by checkblocks, is of the same proportion supported by checkblocks, is of the same proportion as the Parthenon. The entablature and pediment are supported by a double row of massive Doric columns, supported by a double row of massive Doric columns, resting on a stone payement : pillsters ornament the cotire front of the building. The porticoes of the wings differ from the one in front : they have one row of six massive fluted marble columns, parely Doric, resting on the payement : they are 34 feet 6 iuches high, and 5 feet 10 inches in dämeter. The archi-tect and superintendent is Mr. Edward Clark. An appropriation hos just been mnde of 200,000 dollars to commence the building on the fourth side of the quadrangle. This will be creeted by Mr. Clark.

so distinguished.

THE BUILDER.

The Builder.

VOL. XV.-No. 757.

N a recent number we made some observations (with re-ference to general improvement) on Reformatories, ragged schools, homes, and other "social bridges," which observations obtained very general circulation, and have aided in awakening public attention to the importance of such establishments. The Sheffield Independent, amongst other journals, commenting on them, in an article headed "Prevention better than cure," says,

" The truth of this old adage is borne witness to everywhere, and in a way which leaves no room for doubt or cavil-

which leaves no room for doubt or cavil-ing. Yet, self-evident as it is, the appli-cation of the principle so as to secure practical re-sults is, in many instances, very slowly discerned hy the public, and very despondingly acted upon. The case of juvenile reformatories is one in point. Possibly some excuse for this may be drawn from the fact that what is a gravid data. some excess of this may be dury of all, and not that of any particular individual—is, in some sense, held to be no one's duty, at least very few feel themselves called upon to take the initiative and to agitate for the thing. There would be less wonder were the the thing. There would be less wonder were the moral certainty of the success of reformatory schools less decided; but after the many satisfactory experi-ments that have heen made, and are now being pub-lished to the world, the apathy of the people as a whole, and particularly of our county magistrates, who have shown their want of confidence in such agency, and their lack of faith in the accessibility of the public mind to evidence, is astonnding."

After quoting some of our statements, the writer continues :-

"Let no one, then, he content to let the movement take its own course, receiving the sid of those who choose to give it. Each must fed that he is per-sonally bound, to the extent of his means, to aid it himself; that in declining, be is nujant to his country, to his species, and to his God. To allow, by passivity, thonsands of ignorant and destitute children, at our doors, horn and eradled in erime, to go to almost certain ruin, without making an effort, is both crud-to them and a wrong to ourselves. The Bailder places the matter, for the sake of those unsusceptible of higher motives, in the following practical point of view :-- We want good artisans,-our colonies want them even more-offer ary money for them. Would it not he hetter, wisser, cheaper, for the country to turn the neglected infant population of our cellars and streets into men of this class, instead of allowing them "Let no one, then, he content to let the movement stretes into men of this class, instead of anowing them to become, as they unquestionably must become if ancared for, rogues and thieves, if nothing worse, to plunder honester men, and to be ultimately caught, tried, convicted, and maintoincd in prison, or a penal settlement, all at the cost of the state ?''

Notwithstanding the recent war with Russia, the exports of 1856 show an enormous increase over those of the previous year. Shipping, railways, docks, household property, have all increased in value to an immense extent, and yet, amidst all this prosperity, we have accounts of widely-spread distress, and find thousands of fellow creatures living in miserable deus, and under circumstances which render health and virtue scarcely possible.

The Government at the present time are assisting female servants to a free passage to various of the colonies. Although, perhaps, none amougst the working-classes of Lon-don are generally better off than well-conducted and efficient female domestic servants -they have a fair amount of wages, comfortable lodgings, and sufficient food,-the emigration of this useful class of persons will, to a certain extent, make room for others. It seems a pity that the small tradesmen and the best paid mechanics of the metropolis and other paid mechanics of the metropolis and other of the town and in the City : in some instances arge towns should consider respectable service lodging is provided for the assistants and

for their daughters as a sort of disgrace, and bring them up not in a way to make them useful wives to those of moderate means, or, when left to their own resources, to enable them to carn a sufficient livelihood. We want more occupation for females.

The managers of the Electric Telegraph have very wisely adopted the employment of female clerks, who have been found to answer the purpose admirably; and this, when the resources of the great invention have been developed, will in Great Britain be the means of affording occupation to some thousands of young women. The difficulty of obtaining profitable employment for a very intellectual portion of the women in large towns, is shown in varions ways: for instance, in reply to an advertisement in a London paper, seeking a young person, as useful companion to a lady, at a very moderate salary, there were 270 applications in a few days.

The condition of thousands of needle-women in London is generally known to be deplorable ; but only those who have seen with their own eyes can fully appreciate the misery which at present exists. It is a melaneholy fact that, as matters are working at the present time, large bodics who would willingly earn their food by honest industry are yearly falling into greater poverty; and it is unfortunately the case in other trades hesides that of the needlewomen that the rich capitalist is getting richer, and the poor workman and workwoman poorer. It would require a large amount of space to discuss the causes of this unfortunate state of affairs and the different views of this important subject which are held by various persons whose opinions are well worthy of considera-It is not our present purpose, however, tion. to discuss this further. We have a different object in view with reference to the well-heing of a superior class.

Those who have examined with care the various conditions of London life, will appreeiate properly well-intentioned plans having for their object the provision of arrangement to enable members of different classes to escape from inconvenient and too often dangerous conditions, and it is with pleasure that from time to time we notice various experiments for improving the means of living, with comparatively limited means, in comfort, and respect in this metropolis. These are to be placed amongst social bridges : all honour to the builders.

The lately opened institution to which we just now desire to direct attention, is situated at No. 44, Great Ormond-street, that somewhat stately neighbourhood of Queen Anne's days. The house was formerly the residence of Lord Thurloe, and is a characteristic specimen of the London domestic architec ure of the time. So far as the interior arrangement is concerned, has considerable elegance : the entrancehall, with marble floor, wide carved staircase, ornamented panels, and ceiling of rich design, are noticeable: the lighting of it is excellent: the rooms are lofty: the dining room, on the ground-floor, is adorned with columns, and is handsome apartment, in which have as sembled many an eminent company in former days. Other rooms lead to a terrace, communicating with a large garden, which, by the way, might he made a little more trim than it is.

While looking over this large, comfort-able, though old-fashioned mansion, one cannot help contrasting its well ventilated, light, elegant condition with many of those places of a totally opposite description in which some thousands of the young women of London are by force of eircumstances obliged to lodge. Amongst the female part of our population, a large number obtain employment in the establishments of milliners and dressmakers both at the west end

learners: in others they are obliged to find sleeping-rooms theuselves. No doubt many young women so employed have the shelter of the homes of parents and other relatives : there are, nevertheless, a considerable number who, with slender means, are obliged to provide for themselves.

It must be evident to every one, as matters are at present, that a respectable establishment, managed, in a right manner, by those who can command general confidence, for the use of young women who have not a proper and comfortable home, must he of great service. Besides the workwomen who have been reared in London, there also come, year after year, hundreds of dressmakers, and others, from the provinces, to seek improvement here, for the purpose of enabling them to commence business in their native places with a chance of success ; and the necessity for some provision for these classes diffe rent from that generally obtained is so evident, that we need not say more on this point. This necessity seemed so great to Lady Gooderich and Lady Hobart, that they determined to risk the expense of opening a house in Manchesterstreet, to supply the want; and after trying the experiment there for some time, they have taken the house we are now speaking of, where young women can find a home, after their labours, at a cost of from 2s. to 2s. 6d. a-week each. Lord Thurloe's dining-room is used as sitting-room by the inmates, and here there is a pianoforte, a good library, and other means of amusement A Lady-resident, who is heartily carnest in her task, manages the house, and arrangements are made, something on the club principle, to pro-vide meals at a cheap rate. The honse would accommodate npwards of sixty, and it scens to us that the advantages of this home only require to be understood by those for whose use it is intended, for the establishment to be fully appreciated. In the meanwhile the expense is great to the ladies who have so kindly made this experiment, and it is desirable that the place should be made known to those for whom it is intended

THE WELLINGTON MONUMENT COMPE-TITION.

THE WELLINGTON MONUMENT COMPE-TITION.* TAKING up our notices of the models now heing exhibitied at Westminster-hall, we come to No. 33, which is marked "Nameless," a curious production wanting alike structural character and good architec-tural detail. What surves for 'platform to the prin-cipal group, is composed of a number of flags lorne by seated figures at the angles of the pedostal. On this somewhat unstructural base stands Wellington, to whom a figure habited as a king is doing your the duke. The author seems to be a Franchman. Carionsly enough, he has written the nume "Bri-tannia" upside down. — No. 34, "Rem Magni Auini Agressus," is an initiation of a Gothic monument with a recumbent figure. There are sould groups of figures at the angles of the piers, and a figure of Wellington at the top, in what we can best describe as "a fighting attitude." — Of No. 36, " Past Away," we have spoken. We still look upon works of this sort, as being the best of them erroneous in prin-ciple. The spectator is asked to take it upon trast, that the body of the deceased is within the sarco-phaguas and tomb. He knows this to be false; that the whole thing is a pretence and make-believe: and the whole thing is a pretence and make-believe: and the chance is that he goes away less impressed than it was the avit's chiest that he hood that he. There are phagus and tomb. He knows this to be hale; tult the whole thing is a pretence and make-believe: and the chance is that he goes away less impressed than it was the artist's object that he should be. There are two sorts of initiation, — that which alone the true artist would attempt—and that where the object is artist would attempt—and that where the object is less art than minicry or deception. The two kinds of so-called art are here mixed up. In No. 36, there is certainly much to admire in the action of the figure closing the gate, and in the group at the summit; and the simplicity of the soulpuresque features is commendable. The rilezos on the bronze gates, it is proposed should illustrate "the romerkable cycles military and political from 1790." In the group of objects at the back of the tomb, the coronet and shield are strangely represented, as about equal in diameter. — In No. 37, TO KAOHKON, a figure of Wellington, holding the sword of state, is placed on a circular pedestal. Round this are grouped some expital allegorical figures; and on the lower pedestal

* See pp. 415 and 425, ante.

two alto-rilievos are shown, which though very roughly modelled, are remarkable—the one, the battle of Waterloo, for the fire and spirit which is expressed in the other and the short in the charge; and the other, apparently the entry into Madrid, for the grace and heauty of the compoin the chara sition

In No. 38, "Cincinnatos," most of the errors which In No. 88, "Cincinnatos," most of the errors which we have heen remarking upon, as inconsistent with the intention in sculpture, are accumulated. We have first a representation of a tomb (oo which is a recum-bent effigy of the duke), next a building enclosing the tomh; aod on this, a group including the statue of the duke—who is supposed to be surveying the field of Waterloo. The sides of the pelestal or building have bronze gates, which are the hest part of the design, and internally around the walls are statues of the duke's companious in arms, and a number of design, and internally around the waits are status of the dake's companions in arms, and a number of flags. The angles of the pedestal are out away for the insertion of figures (we can hardly call them Carintides), just in the manner which is condemned in buildings-where the same artifice is resorted to, merely for the insertion of columns not required for the structure; and the cornice overhauss not required to angles in a very unsightly manner. We could not quote a better instance to show the desirableness of architectural criticism on the exhibition, and the necessity for architecture itself-that is, good archithe necessary for architecture resert—that is good architecture—as an element in the design of works in monumental sculpture.—No. 39, which is the work of a foreigner, is defective in the structural and architectural elements; and it also exhibits the error of the representative sculpture in making beauty of of the representative sculpture in making beauty of form, of secondary importance — except as regards outline and general grouping. Wellington, at the summit of the monument, is shown as though in action; near him are guns and artillerymen; and round a pedestal of poor desigo, are statuses of generals; whils a lower pedestal exhibits an antique sarcopha-gus, and figures in the attitude of mouraers. No 40. "Name Encload" is nearly that the

"New England," is not ereditable to the No. 40, No. 40, "New England," is not ereditable to the country from which it would appear to have come. Wellington stands with his generals about him; and over his head, on a large ball marked "Waterloo," and to which the dake scenar in dangerous proximity, stands the figure of Victory. At the heak of the stands the figure of Victory. At the nack of the monument, Napoleon is represented.——No. 41 has been sufficiently mentioned.——In No. 42, "Aut monquan tentes, aut persice," there is a figure of the dake on a pedestal ; and the latter is inscribed with the name "Wellington," to which Fame is pointing. Why should the artist no have seen the necessity which art is ever under, of doing something fresh? which art is ever under, of doing something fresh.⁹ It does not follow that we are to have eccentricity and bizarcric. There are some good figures in No. 42, but others are placed on the pedestal as though ready to fall off.—No. 44 includes some allegorical figures, half-scated and flying, and exhibits the tendency to common-place, and the imitation of dramatic action.—In No. 45, the scalptor has sought to produce effect by the contrast of white marble with the grey grants of his pedestals — a method of treatment which, though it may have been practically exemplified in a large number of the mmral practically exemplified in a large number of the mnral tablets in our cathedrals, and though it may once have had the sanction of Chautrey, judging from his recommendation of a leaden wash on the stonework of Westminster Abbey, as a background --- is open to many doubts. Wellington here stands on rockof Westminster Albey, as a background—is open to many doubts. Wellington here stands on rock-work, placed on a eircular pedestal; which itself stands on oue of oblong for.a, bearing seated figures and enriched with *riliceos.*—No. 46, with a statue of the duke, and figures representing Britannia and her colonies, becomes ridiculous from the pedestal formed of the state and is more representing the the divergencement of the state.

No. 48, "Du Conrage," exhibits architectural features prominently, under the idea of unison with the huildprominentity, inter each case of unsole win the fund-ing; hut at the same time inisconceives architectonic as well as sculptureque principles. An arch, with pilasters and entablature, as though a reduced copy from one of the bays of the nave, supports a statue from one of the days of the asy supports a statue of the dake. Beneath is asarcophagus, covered by a pall, the ends of which are raised by figures of Duty, Truth, Peace, and Religion. The podestal displays a number of *riliceos*, which, heing in low relief, seem in their treatment to trench too much on There is seen in the detailed to there to there is on men on the province of pictorial and landsepe art. One of them is a view of Walmer Castle, showing the sun setting.—No. 49, "Victory and Peace," would have appeared more to deserve what we said of its general

same author, each having the motto from Shakespeare-

"Most greatly liv'd This star of England ; fortune made his sword,"-

This star of England; fortune made his sword,"--have hronze sculptare and pedestals of gray granite. Bronze was, we believe, preferred, hy the artist, on the ground that marble cannot he preserved in a sightly state in St. Paul's, where the monuments are generally covered with dust, and are frequently broken. We should be scarcely realy to admit that advantages in point of artistic effect, would attend either the general, or the partial use, in promiuent positions, of bronze. In the one case, a decadly sombre effect would pervade the edifice-far different to what the 'dian religious light,'' which may be really wanting to the building, could impart to it; in the other case, in place of the architectural uniformity in the areades, and the headuit of perspective gradation areades, and the heauty of perspective gradation which results, spaces would he dotted out, at irrewhich results, spaces would be derived wholly mar the architectonic effect, as designed. But Nos. 50 and 80, as referred to in a former notice, are very remarkable for the heauty and technical skill which are exhibited in the separate figures and in the modelling; though they nevertheless exemplify the observations which we have made, as to the absence observations which we have made, as to the ansate of other requisites in the works of some of our hest sculptors. In No. 50, passing over the question sculptors. In No. 50, passing over the question raised by some, whether an equestrian statue would be desirable in the Cathedral, there is little that is really monumental, or that touches the feelings through the presence of a postic ingredient. The work is a simple representation of Wellington, with figures of his generals in front of the pedestal ; excepting that at each end of the monument is a figure holding an olive branch; and these features are before the best marks of the composition. The figure holding an olive branch; and these features are perhaps the hest parts of the composition. The peekstal is black and tastless. This model it is right to say, as No. 80 also, was accompanied with four figures besides those spoken of --intended to stand in re-entering angles of the architecture of the building, and which would probably have had much value in the grouping. These figures, however, were not allowed to be exhibited, as we may have men-tioned. The other model, No. 80, mingles the repre-sentative and the allegoried forms of expression-or places them in what we consider too close or places them in what we consider too close vicinity; hut has we thick much greater merit than the other work, and has some beautiful episodes --such as the group of the mother bending over the dead. No. 51, "Waterloo," includes a figure of Wellington

No. 51, "Waterloo," includes a figure of Wellington with allegorical figures, and an Tonic column sup-porting a gilded Victory. This composition is placed on a black pedestal, decorated with a profusion of gilding to festoons and relievoz.— No. 53 exhibits anything but the characteristic of "Power," which is its motto. It is the proseenium of a show, in which is a rilievo copiel from a well-known engraving of the duke in his study. No. 54, "Multum in parvo," is in some respects better designated by its motto; but the multum is the abundance of details rather than the higher much which may be expressed in small cubical or superficial compass. Welliozton Table that the might made when may be threshold in small childeal or superficial compass. Welliogton is here a sedent figure; and, the irreverent would say, looks as if he were being patted on the head by Victory. The pedestal is covered with *ritievos*; and Victory. The pedestal is covered with *transcore*, the it has at the angles crouching figures, which are the hest features. The busts above them are as much hest features. The new rediment over another that out of place, as the one pediment over another that is condemned in architecture.—No. 55, "TOY Δ II TOI KAEOS ESTAI OSON T EPIKI Δ NATAI $H\Omega\Sigma_{i}$ is a work which we have mentioned. It includes an equestrian statue on a double pedestal, and cludes an equestrian statue on a double pedestal, and a still more lofty arrangement of pedestals with allegorical figures, and a Victory at the summit. The dados of the pedestals generally are enriched with *rileross* of processions. The artist deserves praise for his recognition of many of the desiderata of monu-

for his recognition of many of the acsiderate of monit-mental sculpture, inclusive of good architectural detail. In No. 56, "Aron "-where there is an excellent scatch fluere of Wellington, and figures, also sedent, of Devotion, Euergy, Order, and Decision-the archi-tectural detail of the chief pedestal is not equal to the demand; and the monument would, we think, be are before with at the monument would, we think, be even better without the modillion cornice. We may be accustomed to it in buildings; hut, whilst re We may quiting architecture in monuments, we require alsonew design in ornament, from the artist—the senlptor— Guiling architecture in monaments, we require alsonew design in ornament, from the artist-t-the scalptor-whose province it should be specially to supply it. The titles "Devotion," "Energy," Sc. are written helow the figures, otherwise the allezory in the case of some of them, might he what is called "far-fetched."

Nos. 57 and 60, marked " Studens," are hy the a supeared nore to deserve what we said of its general nose. of and 00, marked "Studens," are hy the appeared nose nother. character—which, however, we thought suitable to ob-gets of smull dimeosions—had the lion, which is infru-duced in the base, appeared less uncomfortable. A figure of Wellington is of coorse the main feature. The figures with outstretched arms, holding wreatls, form the hest part of the design.——Nos. 50 and 80, by the

[Aug. 8, 1857.

It will be observed that No. 60, assuming that there is not an obvious and "practicable" entrance, or descent, would not observe principles which we have endeavoured to mark out-manely, that where there is no actual tomh, none should be indicated, but that the work should be strictly monumental. The end of the sarcophagus may be approved of as simply emblematic—not placed there in the manner of miniery or deceptiou: the *indication* of the form by unised lices, however, would, according to our view, he preferable. In other respects, the design treating it as the same, in each—for, so it is, with slight interchange of figures—deserves par-ticular commendation. Whilst it is admirable in the technical sculpturesque requisites—especially in the with slight interchange of ngures—useries pa-ticular commendation. Whilst it is admirable in the technical sculpturesque requisites—especially in the modeling of the figures, and the arrangement of the whole group of the Duke, with Peace and War, which surmounts the monment—structoral disposi-tion is attended to, and the allegorical figures or personifications of countries in the lower part of the example. personneations of countries in the lower part of the monument, are introduced with recognition of the priociples for which we have contended. Inserip-tions also play their part. The only detraction from the merit of the work in certain particulars, arises from the detail—as of the mondlings. This is somewhat is inseribed: "Flere et meminisse relietum est."

No 58, with a motto from the Faëry Qucen :--"Right, faithful, true he was in deed and word, But of his cheere did seem too solemn sad, Yet nothing did he dread, but ever was y-drad,"-

has a hlack marble sarcophagus or slah, supported hy uss a mack marble sarcophagis or sich, supported by pillars, and hearing a resumbent figure. At each angle is a kneeling soldier.—...No. 61, "The Path of Duty is the Way to Glory," is an endeavour to repro-sent hy different figures, the duke at various periods in his carcer.....No. 62, "In God and the Britons I hone," appears to he a foreign production. There in his earcer.—No. 62, " In God and the Britons I hope," appears to he a foreign production. There is some design about the pedestal, which is composed of coloured materials; hut the proportions of the sculpture appear defective.—No. 63, "Let us guard our Honour in Art as in Arms," on the other hand, is quite wanting in the architectural element just referred to. Wellington and his generals are represented—in hronzer.—No. 64, " Virtute et viris virtutis," is a building of hlack and coloured marbles; und it goating the dayle's bat and a girgantic envord. and it contains the duke's bat and a gigantic coronet Need we say more?----No. 65, "Roma," has a and it contains the dike's bat and a grganic coronet. Need we say more?----No.65, "Roma," has a poorly-modelled figure of the duke; but we were induced to notice it for the general attention to architectonic principles, and the novelty which is attempted in the details of the circular pedestal, and the lower one of oblong form. Resting on the latter, are sedent figures on each side, holding a circular tablet, and in the lower pedestal moning a circular table, and in the lower peacestan arc hoys with festoons, and medallions with the names of great hattles.——No. 66, "Virtute Prudoatian Victor," is a work which would have deserved a more prominent place than it now occupies in these notices : has, indeed, such excellence as is seldom found in it has, indeed, such excellence as is soldum found in monumental sculpture. It is true that architectural *detait* is not elaborated ; hut architectonie principle is attended to, as in the general grouping and mass: the group stands upon a proper moulded hase; and the sculpture, which is heautifully modelled, tells its story—and that a thrilling and a full one—yet has a pervading character of simplicity. A plain marble slab, slightly diminishing, with a shallow niche on each side, forms the hackground to the principal allegorical sculpture; and it supnorts a group of Weleach side, forms the hackground to the principal allegorical sculpture; and it supports a group of Wel-lington in civil costame, returning his sword to Justice —Britannia on the other side. The group in front of the slah represents Victory the result of Valour and Wisdom, and the group at the hack, Religion, Liberty, Wisdom, and the group at the hack, Religion, Liberty, and Peace. At the ends are angels with the ter-restrial and eelestial coronets. There is no extrava-gance of action here, nothing but what is within the limits of the sculptor's art; and nothing hut what tells the more, for not attempting to go beyond that art. Neither is there Pagan association of ideas, nor use of allegory in any manner but that which ean he readily understood.

There are a few other models which may require otice. These we shall mention in a future number, notice. when we shall offer a few concluding remarks.

DOINGS IN NEWGATE.

IN PROBABLE IN NEWGARE. In preparing for the new block of cells about to be built in Newgate, the wall of old Loudon has been cut through, where it runs from north to south across the prison, about a hundred feet to the cast of the Old Bailey. The upper part, about 8 feet thick, consisted mainly of masses of ragstone concreted together; but in the lower nort layers of Roman bricks, at interthe lower part layers of Roman bricks, at inter-vals of about 3 feet in height, were found, as in other portions of the wall, of which descriptions have been published at different times. In the illustrated account of the wall and gates of old London, given in our volume for 1855 (vol. XIII. pp. 221-269), the position of New-gate, and the course London wall took, will be seen. In digging out at the side of the wall, near that part of the prison formerly known as the condemned cells, it was found that the foundations had been laid on what were evidently the débris of the fire of 1666. The prison was restored by Wren after that event (1672). Lower still were what might bave been the cri-dences of auother fire, which would take us back a long way in the history of the metro-polis: these, however, were not clear. It might have been expected that some interesting things would have been discovered while ex-cavating, but this was not the case. There were some glass bottles containing liquid, and we have seen a fragment of a Roman earthen-ware vessel which was taken out, possibly a mortarium, with the words---

MARINVS	
FECIT	

impressed on the rim, and placed as we have set them. The impression is sharp and clear. Adjoining the east side of the old wall, to-

Adjoining the east side of the old wall, to-wards its northernmost extremity within the prison, is a concreted mass, which may have been the foundation of a part of the gate or some adjoining huilding. New, though the gate there was called, it was in use as a prison from the time of King John, and there is record that in 1218 Henry ILI commanded the sheriff to repair the jail of Newgate for the safe keep-ing of the prisoners. Omitting mention of intermediate events, the gate and the prison were partially destroyed by the fire of London in 1666, and were reinstated. In Lord George Gordon's riots of 1780, hoth were burnt, and the gate was not reinstated. A new prison had been commenced, such as we now see it, in May the gate was not reinstated. A new prison had been commenced, such as we now see it, in May 1770, from the designs of George Dance, the architect of the Mansion-house; and if the visitor look up at the wall of Dance's building, on the south side of the area which has been been found to found the south side of the area which has been cleared for fresh constructions, he will see where the fire of the rioters has blackened and calcined the stonework. Lord George Gordon died in the prison some years afterwards, 1793. Newgate consists, as many of our readers will recollect, of a centre and two wings, north and south. It is in the northern portion, bounded by the Old Bailey and Newgate-street, that the new works, under the direction of Mr. Bunning, are being carried on. Dance's external walls will be left up, but within these a block of cells, abrogating the present day-room system, will be built 44 feet wide and five stories high! Means will be provided to enable the van to enter within the walls, and so to avoid setting down the prisoners in the road. A large amount of underpinning to the adjoining buildings has heen required, which was not calculated on. Messrs. Brown and Robinson are the contractors.

THE MAIN DRAINAGE OF LONDON.

THE MARNAGE OF LONDON. THE plans for the drainage of London prepared hy the Metropolitan Board of Works were referred by Sir Beujamin Hall, it will be remembered, to Captain Galton, Mr. James Simpson, and Mr. T. E. Blackwell, engineers. These gentlemen have made their report, and it has been laid before Parliament, and forwarded to the Board of Works. The conclusions to which there here a survey here a given in the drill nanote. they have arrived have been given in the daily papers. The evidence and phan, however, are not yet published, so that the report cannot yet he fairly discussed. Briefly, the main conclusions to which they come

are these

That the influence of the sewage on the river is per-

That the influence of the sewage on the first is pus-nicions. That in order to purify the Thames from ewage, it will be necessary to exclude from it not only the sewage of the metropolitan district, but of the adjacent districts. That the plan of the Metropolitan Board of Works does not provide for the removal of a sufficient quantity of sewage from the metropolitan districts; that the amount of rainfall which it is contemplated by this plan to inter-cept from the river should be increased; and, that the plan does not make adequate provision for remving does not necessith the limits of the metropolitan district.

uow noto use recervition the limits of the metropolitan That the prospective population of the metropolitan district, for which provision should be made, is 3,575,060 as compared with 5,262,236 in 1851; the population of the subdiary districts being 401,000, as compared with 154,068 in 1851; the total prospective population heing 3,579,069. That the colly mode of estimating approximation approximately the probable amount of sovrage from the district is of Crown-street, Finshury.—W. W. WARDELL.

THEE BUILDERK. The sesume a certain quantity per head of the population. That 7 eulis feet per head is the amount for which pro-vision should be made; it hat it appears from our experi-ments that half this quantity passes off in eight hours; that half this quantity passes off in eight hours; that half this quantity passes off in eight hours; that half this quantity passes off in eight hours; that half the additional volumes of rain-water in the maintime flow of the sewage, provision should be made of removing two-fiths incluses of rain-fitties from Abda, and that the system which is adopted met metropolis which does not relieve the hous level districts from Abda, and that the system which is adopted metror of the more the highly putrescible could be constituents from the liquid which passes off; and that, consequently, theliquid, here does not relieve the could be constituents from the liquid which passes off; and that, consequently, theliquid, here doe ordinave, must be disposed of in the same more the highly putrescible could be constituents from the liquid which passes off; and that, consequently, theliquid, here doe ordinave, must be disposed of in the same the deedorization of London sewage could be carlied to without creating a network it is dualed precludes the off the fortuliang matter by any known economical pro-tests; that a corpus dilution of the sawage is necessary to therefore the sacrifice entished by the duales the herefore the sacrifice entished by the duales the herefore the sacrifice entished by the duales the herefore the sacrifice entished by the dual for enti-therefore the sacrifice entished by the duales the provide for the restropoils dependent on commercial con-side the fortuliang matter by any known economical pro-test, that a corpus distribution of the sawage is necessary to therefore the sacrifice entished by the duales must be and the deedorization of the sawage is necessary to therefore the metropolis dependent on commercist con-side the m

control, may be at liberty to utilize it; but thet, when not required for purposes of utilization, these channels should provide for its flow in the most expeditions manner ito the sex. "where abuild he taken to one on full. "That the proposed outful at B' in Erith Reach is objec-tionable, because it would not effectually prevent the swage from returning within the limits of the metropolitan boundary, because it would not effectually prevent the the health of the district; and because it would probably be projudicial to the navigation. "That in order to intercept the source in same between That in order to intercept the source of a large area, a level should be adopted a lift above that of the highest tides, viz. 5 foot above Trivity high-water mark, as the level from which the source source on the intercept the source of the district; and the above the other of the highest tides, viz. 5 foot above Trivity high-water mark, as the source of the district; and the source flow on the other level from which the source source on the river Less on the north side, and the river Reversbourse on the outful channels, and that in the main outful channels uso about do mado of tidal water near the metropolis to of the sewage. That the area from which the source will be distributed be lifted in nearly thirty-eight square miles. That the outful channels are from which the source will be distributed be lifted in a nearly thirty-eight square miles. That the works should court of the outful channels uso atom the cost of the rain outful lever will be distributed. That the works should course for operase. That the works should ensure distributed. Math at they are opposed to the diminution of the size of the servers. We learn from the report (what, perhaps, is not to sparaent in the "conclusions") that the servage is to

size of the severs. We learn from the report (what, perhaps, is not apparent in the "conclusions") that the sewage is to he taken for a certain long distance in vast open channels, commencing, if we understand it rightly, just beyond Barking on one side, and in the marshes helow Woolwich on the other, although in one part of the report the much nearer approach to London of such channels is hinted at.

such channels is innied at. "A channel capable of conveying the total amount of sewage and rainfall to be removed on the north side, at a valority of 2 feet 6 inches per second, would be 39 feet broad and 16 feet 6 inches deep; and a channel capable of conveying, at a velocity of 2 feet 6 inches per second, the total amount of sewage and rainfall to be removed on the sonth side, would be 37 feet to broad and 16 feet deep. These channels would require a fall of 6 inches per mile; and in their execution the proportions would be, to some extend, adapted to local circumstances." These channels they removes the source only " in

These channels they propose to cover only "in the ueighbourhood of towns, huildings, and erossings of public roads," considering that the sewage will bo diluted so as to be a "comparatively innovious stream." The notion of these rivers of filth is not an agreeable one: if now, when diluted by the whole Thomas the searage creates an encourse and backh

an agree and e one : It now, when unneed by the whole Thames, the sewage creates an enormous and health-destroying misance, what must we expect from it in the condensed stream proposed by the referees? At a meeting of the Metropolitan Board of Works, held on Tuesday last, to receive this report, a very strong objection to the proposed open channels was expressed; but it was ultimately decided to wait for the circulation of the appendices and maps mentioned in the report before coming to any decision.

THE SEWAGE MANURE QUESTION. REPORT OF MR. 11. AUSTIN, C.F.

PENDING the deliheration and decisions of the PENDING the deliberation and decisions of the Scrage Commission, a report has here made by Mr. II. Austin, who had some time since, and previously to the appointment of that commission, investigated the subject with the view of reporting, as he has done, on "the means of deolorizing and utilizing the sewage of towns," to the President of the General Board of Health, as their chief superintending inspector. This report has been printed, and a copy of it is now before us.

Mr. Ansiin here enters pretty fully into the whole subject, treating *scriatim* of the constituents of sewage; its dcodorization and manufacture into solid sewage; its deciderization and manufacture into solid manune by chemical and mechanical process; the utilization of sewage in the liquid form, as by open irrigation and nunderground pipts, &c.; and the agricultural results from the use of sewage manure. In dealing with the subject of chemical processes for separating the solid mitter of sewage, he describes Mr. Higgs's process and the Tottenham works, Mr. Wicksteed's patents and the Licecster works, the Manchester experiments, Mr. Stothert's and Mr. Herapath's processes, Mr. Dover's patent or Mac-Dougal's powder, Mr. Manning's process and the Croydou seware works, the Clifton Union sewage works, &c. Under the head of "Mechanical Pro-cesses for separating the Solid Matter of Sewage," he describes the Cheltenham, Uskridge, Ely, and Hitchiu describes the Cheltenham, Uxbridge, Ely, and Hitchiu and Dartmoor works, and the use of peat charcoal and Boghead coke. With reference to the utilization of Boghead coke. With reference to the utilization of sewage in the liquid form, the reporter speaks of the Craigentinny and Tavistock meadows, the sewage irrigation at Harrow and Crediton, and at Milan, the Puscy and Clipstone meadows, and Mr. Bickford's system of irrigation. A list of cases is given where liquid farm manures are distributed, as at Tiptree Farm (Mr. Mechi's); Myer Mill Farm, Ayrshire; Mr. Harvey's farm, near Glasgow; Mr. Walker's farm, at Rughy; Mr. Vorsley's, at Rusholme; the Earl of E-sext's, at Watford; the works of the Metro-politan Sowage Manure Company, and tiose at Dart-moor Prison, &c. Various plans accompany the report, including some of works recommended by Mr. Austin. Mr. Austin.

Amongst the conclusions to which the investigation of the whole subject has led the reporter, are the following :---

following :---That although from the earliest agitation of the question of samitary reform and of the complete drainage of towns, the mischief from pollution of rivers on the one hand, and the waste of valuable manaters on the other, by the option was at any time formed of the extent of the evel which now so imperatively calls for reneedy. That although tho means of remedy by deciderization appear to be as yet but imperfectly understood, and demand further investigation, various processes have for the determine of the fertilizing power of sewage, would impart the investigation, various processes have for the destineties of the fertilizing power of sewage, would impart of the second second the second second second second to avoid any permanent darger to the pupulation, it ap-pears that other deodorizing materials are not destructive for the territizing power. That it is most important, there-fore, to determine whether the fertilizing elements in this refuse are preceded in each form as to be practically available for agriculture, either in the solid state or in the liquid form, out of throwing any the sewage. That chemical research has not yet arrived at any satis-ments.

enormous waste of throwing way the sewage. That chemical research has not yet arrived at any satis-factory method of economically arresting from solution the fortilizing ingredients in sewarg, while the analyses of solid sewage manures, manufactured under various patents, show, that although for the most part possessing a certain low value, they do not it to the public; nor does there appear to be evidence of any agricultural results, derived from their use, which will support such a view of their value.

vance. That the mant facture from excrement of a dry portable manure, as practised at Paris, although realizing results of greater value, is applicable only where the cesspoor system presails, and leads to an aggravatiou of tha nail sance of that system, which due regard for the public health would not telerato.

heath would not tolerate. That the exparate system of drainage, frequently pro-posed as a solution of the sonitary and sprincipared tile oct of the average quescion, would increase immensely the oct of drainage works; would add to the sources of danger to the public health; and would tend to a waste of fertilising power.

fertilizing power. That the practical experience obtained during many grars at Eliborgh and Allen, has shown the great value of sever water on grant subscription of the seven of of great allowing the subscription of the seven of great allowing the subscription of the seven of great allowing the seven error solution, and retain for regetation, the fertilizing elements. That allowing himmesse agricultural results have been obtained from irrigation with savage water at Edinburgh, the method employed has given a rise to much complaint of nuisance. That this arises for the mest part from foul de-parist in wide ditches, and from the large exaporating surfaces of the sewage constantly exposed in the channels of irrigation. irrigation.

of irrigation. That all such sonross of nuisance and danger are preventible, and should not be tolerated. That no difense should be used, and that the source schoold be exposed outy during the act of irrigation of each portion of the land, when it would be immediately absorbed and deodor-ised by the soll.

That in order to avoid all further risk of injury to bealth whether from discharge of the sewage into the rivers and streams, or from its application to the lead, it appears de-grable that the solid matter should in every case to saps rated from the Equid sewage at the outfall, and that, cheap portable manue should be mynormal to a se-tisted at the solid matter should no every case to saps rated from the Equid sewage at the outfall, and that, shape of the town, or such other dedoring material as particular to an or solid be mixed with the same of the solid sewage at the outfall, and that, and repeared, if desirable, with other manufall for gradients for particular crops. That it appears probable that such operation will in manufall solid the severation of the surrounding town and the same repeared, the solid be that such so that a mode as arrangements devolving upon them for yound of dust or other refuse from the tawn. It should to the same contract. That the inquid portion of the sewage, thus cleared of its

form, in fact, part of anch service, and might be combined in the same contract. That the liquid portion of the sewage, thus cleared of its solid matter, but still retaining its chief value as manner, might then be applied with benefit to the prejabouring. Inds in any quantity, but that all land upon which this method of application of the sewine is practised should, if allowed to proceen service is practised should, if allowed to proceen service is practised should. If allowed to proceen service is the antice of the sevine thabitants, or in cattle exposed to its influence. That the distribution of manares in the heighbouring the horse and jet, from a system of underground pipes on the land, has been found, by the experience of several tageons, and that the outlay for vuch works is contained their hendits, as a very profitable outlay, irrespective altogether of the question of *escage* distribution. That although the adoption of the same system at Ragby, and other places, for the distribution of liquid sevarge, has been found decidedly successful, the great Ediburgh results are not statiable by this method, un-less conjoined with more ample and ready means for to be the distribution of the great filter benefit of who have a main for the sevand with been almout and expense than can be done with the hose.

uses with the bose. That upon graus lands, for which the application is best adapted, these larger quantities of the liquid scenage, do-prived of its grosser particles, may be economically dis-tributed, especially upon the lower levels, by a combina-tion of the underground pipe system with the subsidiary open irrigation by small contour gutters, practised by Mr. Bieldord.

That this work, helps of a commercial or speculative nature, and not so much required for the safety of the public health, would fall rether within the province of local companies or proprietors than of the local authorities, and to these parties all facilities should be granted for carrying it out.

HTYDE 10 out. That the solid sewage mannee, prepared and deodorized a slove proposed, may be anywhere used, and any quan-ity of the liquid applied on absorbent or properly drained and, without any raks of injary to health, and without any f the offessiveness constantly experienced from farmyard and other solid mannees applied as top-dressings.

That in any neighbornhoush, however, where no oppor-tunity exists for this beneficial irrigation, the liquid aswage, below being discharged into rivers or streams, should, after separation of the solid matter, he treated with lime or other decodving and precipitating generics a duty which should devolve upon the local board or other governing body, as a precaution in which the public health is materially concerned.

.s materially concerned. Lastly, that it is an object of immense public concern that the poincous secondulations of our towns, now fast streams, should without duey how of our rivers and streams, should without duey how of our rivers and for reproductive uses. That by this means the greatest sanitary problem will be solved, and the greatest advance-ment of agricultural prosperity secured."

The hearings of the whole question upon the case of the metropolis have not come under the reporter's consideration; but these, he hopes, will now he thoroughly investigated.

A discussion, we may here note, has arisen in the Society of Arts Journal, hetween Mr. Chadwick and Mr. Mechi on the one haad, and Mr. S. Sidney on the other, in consequence of the latter gentleman taking a less favour-hile view of the Raghy and Tiptree results than Mr. Chadwick had doue in the late discussion at the Adelphi.

Within the last few years, and by dint of down-right hectoring and hard work on the part of the press (ourselves included), the public apathy on the subject of severage and drainage, and their sanitary importance to all, was greatly dispelled, and the public mind arcused into a highly favourable state of public must aroused into a highly favourable state of preparation for the final settlement of this important question; and it is a pity that this favourable state of mind could not be taken advantage of while it hasts. The hitch at present lies, not with the public, but with those on whom depends the solution of the problem of the best mode of disposing of the sewage of lowns, so as to leave rivers and the atmosphere near them unpolluted, and the public health uninjured. Men of science, agriculturists, chemists, and others interested, therefore, ought to agritate this problem Men of science, agriculturists, chemists, and others interested, therefore, ought to sgithte this problem among themselves without ceasing, till something like unanimity in regard to first principles he attained and clear and definite practical conclusions he arrived at, on which effectual means of carrying out the grand objects in view might be based and actuation objects in view might be based and systematically carried into operation. The metropolitan sewage carried into operation. The metropolitan sewage question is a most nrgent oue, rising, moreover, as it does, with vast strides and in a rapidly accelerating ratio, into greater and still greater importance.

THE BUILDER.

THE HALICARNASSIAN MARBLES.

THE steam sloop, the Gorgon, has discharged Line steam stoop, the corgon, has discharged her cargo of antiquities from Asia Minor, at Woolwich. It is said that many of the pieces are much injured, which is greatly to be re-gretted. We are glad to be able to lay before our readers a letter from Mr. Chas. Newton, by whom they have been sent to England. It is interesting as convenient Mr. Newton, the interesting, as conveying Mr. Newton's own impressions; and, moreover, it gives eredit where credit is due. The letter is addressed to Professor Donaldson, and is dated Budrum, Lub 2.257 July 2. 1857 :--

My dear Sir,—You have doubtless heard long ere this of the discovery of the Mausoleum made hy me here, and I take an early opportunity of making the here, and I take an early opportunity of making the acknowledgement that you are, as far as I know, the only traveller except myself who took any particular notice of the very suggestive fact, that immediately north of the Aga's konah, on the shore, on rising ground overlooking the centre of the herbour, were the "rains of a superb lonic edifice." I quote these mach form the myna which you were so groud as to words from the notes which you were so good as to load no when I wrote my memoir on the mausoleum ten years ago. Long hefore I ever saw Budrum I recorded my opinion in print that the spot where you noticed these ruins was the site of the mausoleum. I particularly drew Spratt's attention to this spot when he made his second survey of Budrum; but neither he nor the German traveller, Ross, would even pay hc .nor the smallest attention to my suggestion. Ross wrote an ill-natured critique on my theory in the fourth volume of his travels

One object I have in addressing you now is to tell you that the eargo of the Gorgon, consisting chiefly of machles from the mausoleum, is now on its way to England. I have most carefully looked over all the specimens of architectural ornament, and have sent home the hest. You will find much to study and to specimens of architectural obtainers, as the study and to speculate on. I have not as yet sent home the larger marbles, which may throw light on the *structure* of the huilding; hut, as I have now got a steem store-ship here of almost unlimited capacity, I shall send how the full set of the full of the super black that the a good sample of these, feeling quite sure that the architects will like to examine every clamp-hole, joint, mitre, &c. in a way that no architectural drawing could suffice for them.

You will find among the architectural marhles scnt home in the Gorgon a piece of column next the hase, also several fragments of the two stones forming the hase. Since the Gorgon sailed, I have found the two pieces of column next the capital, and shall take them both. I have also sent home by the Gorgon a capital.

These data will, I presume, he sufficient to enable architects to calculate the height of the shaft of the column.

I have found altogether about sixty-five frusta of I have fold an degetic about sixty we prists of columns, but most of them broken at one end. All these, except those I send home, I have havined in the soil os I dug on and filled in, so they can he recog-nised at any future period, and will mark the site for ever

You will find among the Gorgan marbles many specimens of coloured sculpture and architecture. It would strongly recommend you to take an carly opportunity of examining these hefore the colours fade, as they will in a London atmosphere. C. T. NEWTON.

UNSANITARY CONDITION OF THE HOUSES OF PARLIAMENT.

In the House of Commons last week, Mr. Adderley asked the First Commissioner of Works whether he had any plan for the prevention of the pestilential had any plan to the prevention of the pesticitian stendy which came every evening into every window in the river front of the Houses of Parliament; and also whether there was any power to enforce hetter trapping of the drains, or a removal of the deposits of house and other refuse on the opposite hank, or whether heighting for the numerical states. honces and other refuse on the opposite hank, or whether legislation for the purpose was necessary ; or, if there was no redress, whether any plan had been suggested by which the stench might be shut out of the honses by closing all the windows on the river side, and admitting air from another direction. To this appeal of the hon, getcleman, Sir Benjamin Hall replied that the drainage of the metropolis rested with the Metropolitan Board of Works; hut since

with the Metropolitan Board of Works; hut since representations had been made to him as to the anoyance complaned of hy the officers of the House, he had that morning seen Mr. Gurney, and he said that the store cause from the open sewers, and that whether the windows were open or not the stored would be the same, owing to the abominable state of the sewers. Independently of that, Mr. Gurney said that the great Victoria sewer had lately *broken* in which is the state of the sewer had lately broken in

[Aug. 8, 1857.

Victoria sewer had augmented the pestilential state of the river. With respect to the offensive trades which had been complained of, he might state that the clauses which had been introduced into the Metropoclauses which has been introduced into the sucropo-litan Act had been so modified as to be of very little nee. It was a most essential clause, and one by which the local authorities were empowered to deal with the nuisances; hat the course which had been with the numsances; but the course which had been pursued by that House had had the effect of taking out of the hands of the local authorities all power in the matter, and the consequence was that they were now at the mercy of hundreds of persons carrying on offensive trades along the hauks of the river, such as bone-hollers and the like, who, under the provisions of the Act as now constituted, might do what they liked arithmet ensures to the help of the arters. of the Act as now consituted, might do what they liked, without reference to the health of the metro-poles; and he must say that his hon, friend who put this question was mainly instrumental to making the alterations in the clause in question. The latter part of this statement was received with laughter, in which, if the matter was not so sorious, we should feel in-clined to join; but while we commiserate the present condition of our legislators, we cannot but remember the thousands in London—some poor and helpless— who are poisoned by had draiuage and the deposits of hones and other refuse. We trust that the evil sanitary condition of the Houses of Parliament will soon meek with a remedy.

Houses of Parliament will soon meet with a remedy, and that upon the principle that "A fellow-feeling makes us wondrous kind," an experience of the dis-agreeable consequences of bad sanitary arrangements any cause the makers of the laws to pass more strin-gent and useful measures. About a century and a half ago the metropolis was overrun with hands of thieves and robbers, who were permitted to pursue their avocations without much interference from the City authoritics. However, the Queen had a narrow escape from the rognes on her return to St. James's secupe notified regulas on her retain to st. sames a from a visit to the City: one of the high City dignitaries was effectually robbed, and then vigorous measures were put in force, and so many of the thieves were taken that the public safety was speedily restored. In like manner, may he, out of evil will come good, and the present suffering of the members of the Legislature may he the means of directing such proper measures against the hone-hoiling, tallowmelting, and cat-gut manufacturing, as will enable the pent-up dwellers in many a household to open their windows in the hot summer-time with com-

parative pleasure. As to the fresh tumhling in of the Victoria sev we must one day go into a calculation of what that wonderful piece of drainage work has already cost the ratepayers, and what it is likely yet to cost !

RESTORATIONS AT BOSTON CHURCH, LINCOLNSHIRE.

BOSTON IN AMERICA TO BOSTON IN ENGLAND. THE Cotton memorial, comprising the restoration of the south-western chapel of Boston church, Linof the softh-western enapel of Boston entref, Lin-colushire, has here completed, and the chapel re-opened. This work has been done hy subscription, as we have heretofore noted, emanating from natives and residents in Boston, Massehusetts, and in honour of the Rev. John Cotton, an English Boston worthy, of the Rev. Joint Cotton, an Lagran Boston wormly, who, from 1612 to 1633, when he emigrated, was view of our own Boston, and thereafter hecame the first pastor of the new Boston, which was named in honour of this spiritual teacher, alheit a hit of a per-scentor himself in his day, as too many of those who were among the perscented on this side the Atlantic VET score heaving a factor as the head the reasons very soon hecame so soou as they had the power on the other side of the same wide way to "liberty" of conscience. Cotton, however, who was very instru-mental in establishing the new Boston in the new England, died, it is said, universally respected, in the year 1652. Many of the earliest settlers in New England emigrated from Lincolnshire, and especially from the vicinity of Boston, so that the present memorial may be said to manifest the existence of even closer sympathies and relationships with Boston than those excited through their Cotton hand of union. Several of the subscribers, nevertheless, are descend-ants of Mr. Cotton himself.

The work of reparation was commenced in Angust, 1856. The chapel restored is about 40 feet long hy 18 feet broad. It was in a state of dilapidation; the tracery of its windows saldy mutilated; the floor broken up and irregular; and the roof in a dangerous condition; the outer walls perished and decayed in great measure, and the inner ones disfigured with ages of whitewash, &c. So great, indeed, was the work reparation, that, prohably, the old chapel might heen built at a less cost than has heen required for its restoration. Restoration, however, was the object in view; and, under the direction of Mr. Scott, it has said that the great Victoria sever had lately broken in now here completed. The outside walls have here uear Whitehall-yard, and that all the contents had repaired; the fine tracery of the three sonthern wia-been forced down to the bridge-street sever. The dows restored; the southern door reduced to its consequence has here that the blocking up of the original dimensions; the ornaments of the buttresses and pinnacles, in great measure, replaced by new ones in unison with the originals. The window at the west end, which was almost entirely destroyed, and its space filled up with bricks, bas been restored, and its Perpendicular tracery made perfect. The roof is new, and of the same pitch as the former, and the whole of the eastern end of the chapel has an appear-neme of complete supersider.

ance of complete reparation. In the interior, the ceiling has been replaced by a new one of Perpendicular paudled work, in imitation of such portions of the old one as remained. The floor has been levelled, and repayed with Minton's floor has been levelled, and repayed with Minton's patent tiles; the walls relieved from whitewash, and repaired; the arch, and all the remainder of the cast end, rid of encumbrances. In doing this, an ancient piseina near the south-eastern corner of the building. The eastern arch contains a brass tablet of large size, hearing the inscription, from the pen of the Hou. E. Everett, of Boston, Massachusetts. The tablet, and its carved surroundings, are of Caen stone, and measure 5 feet 9 inches in length, and 2 feet 9 inches in width. The brass plate, and its inscriptions and oranments, are the work of

and 2 teet 9 heenes in which. The brass prace and its inscriptions and orvanneots, are the work of Messrs. Hardman, of Birmingham. The ten stone corhels which sustain the priucipal timbers of the roof, have been faced with the armoral bearings of ten families of New England, descendants of John ten families of New England, descendants of John Cotton, subscribers to the Cotton memorial, or de-scendants of early settlers in or near Buston, in Massachnsetts, who emigrated from old Boston and its immediate neighbourhood. The windows have heen entirely re-glazed with semi-pellesid glass, in the ancient lozenge style. The interior mouldings of the windows and doors, the eorbel heads, &e. have here entirely methods. been restored.

The entire amount received from the citizens of Massachusetts is, in English eurrency, 673/. 2s. 4d. of which nearly 120/. was expended in the brass tablet and its earved-stone frame-work.

WORKS IN IRELAND.

WORKS IN IRELAND. Is this *ultima Thule* (Derry, July 24] I have only to-day seen your paper of the 18th, and an, therefore, somewhat late in noticing your "Scraps from Ire-land." In your notice of the Dundalk competition, prohably shore the opinion of the thirty or forty disappointed competitors, that the design chosen was not the hest though we should probably not equally agree as to which was; hat having seen the selected de-sign, I can bear testimony to its being a very creditable one, although sailly disfigured by two disproportion-etable arched gateways to the markets and corn-exchange; yet still it bears no evidence on the face of it of an intentionally unfair decision on the part of the committee, and I think competing architests not unfrequently charge committees unfairly with par-tiality in deciding in favour of local architects. It often happens that those resident at the place know better than others what are exactly the desiderata better than they can be set forth in any set of in-transitions und recorrect provided with part better than they can be set forth in any set of in-structions, and moreover, are acquainted with the peculiar views and crotchets of influential members peculiar views and crotchets of influential members of the committee, and accordingly embody them in their plans. In this case, too, the usual problem for competitors, giving a very little money to do a great deal of work, was set before them in a most agra-vated form, and I believe the tender from Mr. Murray, *builder*, accompanying the plans of Mr. Murray, *architect*, helped not a little to determine the selection. The committee seem wisely to have determined not to recognise the identity of the two individuals, and it is quite possible that in these days there may be builders found who do not comprehend the difference, and who may choose to tender for the difference, and who may choose to tender for works under the superintendence of Mr. Murray, works under the superimentatione of that bipartite gouldeman architest. Fifty the fate of that bipartite gouldeman when the bill of extras comes in. Garrick between tragedy and comedy does but faintly foreshadow it. The award of premium No. 2 to Mr. Neville is cer-tainly "a coincidence."

With regard to the Largen Mechanics' Institute, the committee cannot he charged with partiality, inasmuch as they "knew not Joseph;" hut in this case also twenty-eight gentlemen feel themselves aggrieved. It is said it cannot be creeted for the money, namely, J,2007. In answer to this I can simply state the facts: the committee resolved before I made may working drawings, to make some altera-tions and additions, including an observatory, a rain-water tank, and a large room in the hasement; and as they wished fairly to test my estimate, these were separated from the original work in the hills of quan-tities and tenders. A tender was received from a respect-With regard to the Lurgan Mechanics' Institute, tities and tenders. A tender was received from a respect-The Superintending Architect's Annual Report. able Dublin contractor for the whole for 1,3007. But the committee, preferring a local contractor, accepted the tender of Mr. M'Connel, of Largan, for 1,3167. Sented a report of the transactions in his department inclusive of S77. for work added subsequent to the fair margin, viz. 287. in 1,2007. The committee had, fair margin, viz. 287. in 1,2007.

I believe, fixed a higher one as the maximum that A believe, it is a light of the same the terminer that they could in justice to ther architects allow, and this is really a point descring the consideration of competing architects: to require an exact adherence to the sum specified, all who understand the matter know the source of specification and the second settle among ourselves what was really fair, it would help us and help com-mitters. In the case of the Tulschill Church, recently crected, my design, first selected, was, I berecently crected, my design, first selected, was, I be-liere, reluctantly thrown over by the committee for an excess of 4007 in an estimate of 7,5007. This appeared to me uncreasonable. The committee had, I believe, received notifications from other architects, that if the estimate was exceeded they would he had responsible. Let us first set our own house in order, and then proceed to find fault with committees. In case any of your English readers should he in-eliced to compete, I heg to inform them that a com-petition is advertised for a church (R. C.) at Ballybay, to he 80 feet long, exclusive of chancel : premiuus,

to he 80 feet long, exclusive of chancel: premiuu 57. and 21.! Sic itur ad astra.

RAFFLES BROWN.

MEMS. FROM IRELAND.

MEMS. FROM IRELAND. The foundation stone of a new chapel of ease to be creeted at Bray, Co. Dublin, was recently faid by the Archbishop of Dublin. The site is at Kilerory-bill, near the point where the parish of Bray meets those of Powerscourt and Delgany, and is replete with scenic beauties, it being on the borders of the world-famed Co. Wicklow. Mr. W. J. Barre, of Newry, is the architect, and Mr. Thomas H. Lee, of Drogheda, the contractor. The general dimensions of the cburch are 87 fact 6 inches in length, including chancel, by 27 fact 6 inches in length, including chancel, by 27 fact 6 inches in length, including chancel, by 27 fact 6 inches in length, including chancel, by 27 fact 6 inches in length, including chancel, by 27 fact 8 inches in length, including chancel, by 27 fact 8 inches in length. Lander were used as four-light window, with elaborate tracery, and *cingue faultle* gable light, with headorate tracery, and *cingue faultle* gable light, with bod moulding, and corbels over same. The nave windows are couplets with *quarter_faultle* pierces in the bends. Buttresses are introduced between the windows. The entrance-door is deeply recessed. At south-west angle is the turret, which will be 80 foet high, square a base, octagonal introduced between the windows. The curance-approximate approximate approximat plain maris. The walls to be of random coursed granite rubble, and the dressings in chiselled lime-store. Expenditure about 1,400%, exclusive of fur-niture, which will cost 400%.

solit: Inprinting about 2007. A new town-hall is in progress in the centre of the Diamond Coleraine; Mr. Thomas Turner, archiltect. It will present externally a façade of 103 feet, with depth of 34 feet, the end facing Bridge-street, which will contain the principal entrance, and be surmounted by a clock-tower and cupola 88 feet in height, being semi-cliptic. A parapet will surround the huilding, and the ridge will be ornamented. Two stories in height, it will contain on the ground floor a heard-room, news-room, library, telegraph office, mechanics' institute, offices, &e., as also a small bridewell, and on the upper floor the assembly-room, 86 feet by 34, by 20 feet in height. The local hlack whinstone is the material used for walling, and white freestone for

on the upper floor the assembly-room, 86 feet by 34, by 20 feet in height. The local hlack whinstone is the material used for walling, and white freestone for dressings; but some are in favour of having it ex-clusively of the latter material, which would involve an extra outlay of 7007. The Royal Dablin Society have again set up for competition the roofing in of the earth yard. The plans, distinguished by the motto "Never venture, never vin," were publicly acknowledged to be the best smitch to the requirements of the committee; hut it is said that the estimates having exceeded the stipulated amount, they were not adopted. We with-hold the authors' names and statement of facts relative to this competition, until the final decision shall be made known, which will he about the 20th of this month. month.

METROPOLITAN BOARD OF WORKS.

At the usual weekly meeting of the Board, ou Friday last, an application from Mr. T. Little, archi-tect, on behalf of the Westminster and General Life Association, for a columnar façade to 28, King-street,

Association for a continual mass of 25 Allesteer, Covent-garden, was granted. The Board has consented to the appointment of an additioual assistant in the architect's department, owing to the accumulation of business, at a salary of per annum. 1002

The Superintending Architect's Annual Report.

Mr. Marrable, the superintending architect, pre-sented a report of the transactions in his department from June, 1856, to June, 1857.

<text><text><text>

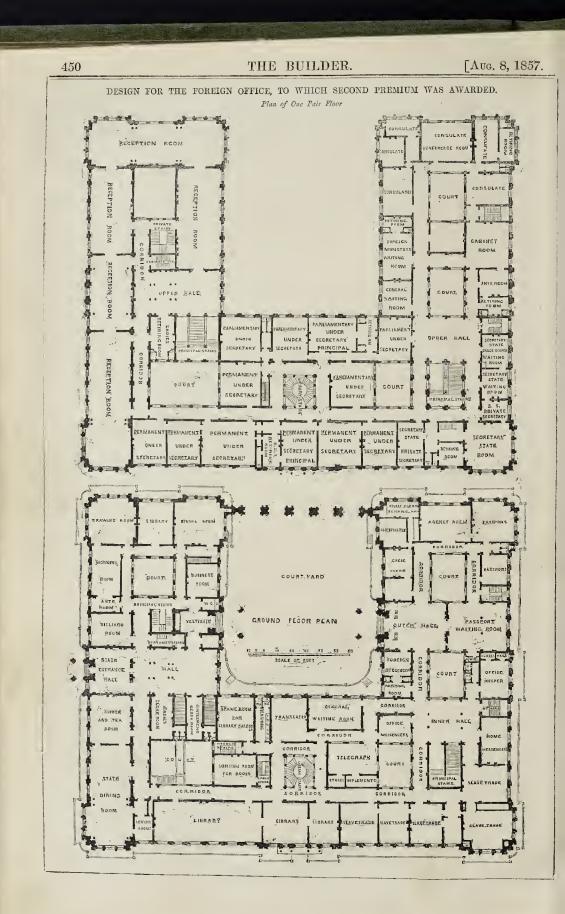

intraced, that he had attended 139 board and committee meetinge, had protented \$12 reports, and insued 1,367 official latters. The annual report of the Board has also been published. It is an numerss tome of their transactions, the index alone being eighty-four double-column folio pages, and the report 747 loito pages. As a voluminous record of *Medicality matters* connected with Metropolitan Local Management, it forms a vasi but valuable handbook. On the memorial of the geutlement in the various the partments of the Metropolitan I of the introduction of the Saturday half-holday system into the establishment at Greek-atreet.

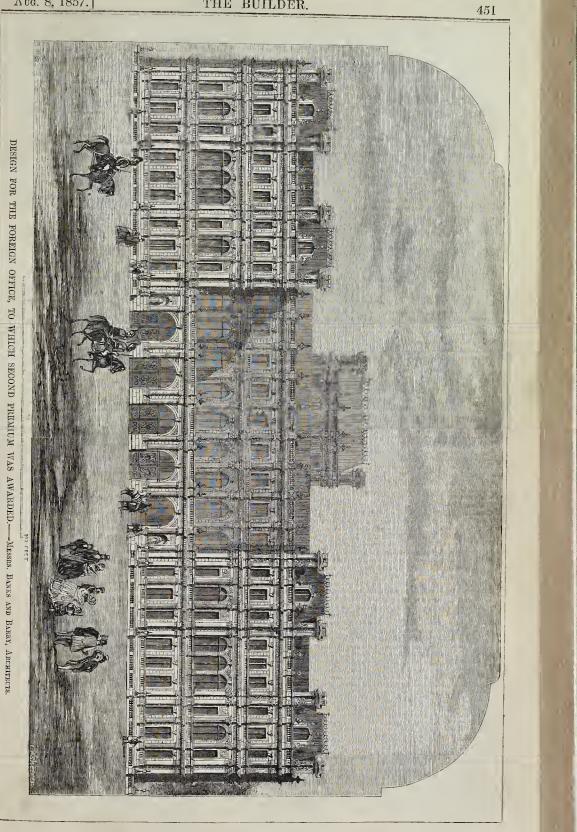

The 200th section of the Mctropolitan Local Manage-The 200th section of the Mctropolitan Local Manage-ment Act requires that each year the Board shall re-port as to what it has effected. This the Board has now done, and the report may be divided into two parts; the first, pointing out couciesly what the Act requires or empowers the Board to do; and the second, show-ing what the Board really has effected. The period embraced in the report is from the lst of January, 1856, to the 30th of January, 1857.

METROPOLITAN LOCAL MANAGEMENT

ACF. Ar Greenwich Police-court a few days ago, Mr. E. T. Phillips appeared upon a summons, at the instance of the Lewisham District Board of Works, instance of the Lewisham District Board of Works, eltarging him with unlawfully making a certain drain from premises No. 1, Shepherd's-place, so as to com-municate with a sever vested in the Metropolitan Board of Works, the said drain being of a different condition, and the communication heing made with the sever in a different manuer and form than was directed by the Board, whereby he had incurred a penalty not exceeding 50. Mr. Trail, having beard parties, said there could he co dowit that the Act of Parliament cave the District

penalty not exceeding 507. Mr. Traill, having beard parties, said there could he no doubt that the Act of Parliament gave the District Board of Works power to enter upon defeudant's property and to make a drain through it. He could not see that defendant's interests were at all affected therehy, because having, by his own showing, made a connection in a line with the drain as for as it was hid, he could not alter such connection at any future time without the sametion of the district board, in whom sewage works became for ever vested. The defendant, rather warnly, remarked that his worship was affording him no protection, and threat-cend to appeal against bis decision. Mr. Trail — If it is your intention to raise a question upon the point, I will make the penalty sufficiently high. The Defendant.—I shall certainly appeal to the sessions. The Board bas no right to coter upon my private freehold. Mr. Trail.—Then you are fined 507, and I shall require you to enter into survices to proscente an appeal within ten days, as required by the Act.

Aug. 8, 1857.]

THE BUILDER.

THE PREMIATED DESIGNS FOR THE GOVERNMENT OFFICES.

In our present impression we give a geome-trical view, and the plans of the principal floors, of the design for the Foreign-office, by Messrs. Banks and Barry, to which the second premium was awarded. Some account of the design, and of other parts of the general project submitted by Messrs. Banks and Barry (No. 55 and No. 60), will be found in our previous notice of the competition,—p. 252, aute. The building, it will be seen, is disposed round three sides of a quadrangle, a sercen of arches and counled In our present impression we give a geome a quadrangle, a screen of arches and coupled columns enclosing the area on the fourth or east side, shown by our view. The style east side, shown by our view. The style adopted is Italian, of a somewhat late character. The official portion would form the south part of the edifice, the Residence the northern. The plan is exceedingly good.

CHURCH-BUILDING NEWS.

East Grinstead.—A chapel at East Grinstead, erected by the Rev. F. Glossop, the rector of the parish, was consecrated by the Bishop of Salisbury on the 23rd ult. It was dedicated under the name of the Holy Trinity. The cast window and the two windows in the south wall of the chancel are of stained class, being ancientable concentration entitions the stained glass, being principally geometric patterns to suit the tracery, but the centre of the cast wiudow is a small medallion, representing the erucifixion, after a small medallion, representing the erucitivion, after a design by Mr. Alfred Bell, who has been employed in the same way in Westminster Abbey. In the chancel there are seven stalls, which are reserved by the rector for those of the parishioners whom it pleases bin to honour. In the nave there are seven-teen cas benches, capable of accommodating four each, free sittings for the inbabilants of East Grinstead. In the organ chamber are small marble columns, which, with the marbles used in other parts of the building, are, with one exception, from Torquay. The building, are, with one exception, from fording. The font stands at the entrance into the chapel, and is supported on four columns of Madrepore. The in-terior of the walls are of common red and hlack brick, relieved by horizontal courses of white stone.

Warestey, reneved by norzonital courses of while stone. Warestey.—The consecration of the new cburch of St. James, at Waresley, took place on the 25th ult. St. James's day. The old cburch was pulled down about two years sago, and a stone cross marks its site. The new edifice has been creeted in the centre of the village, after the designs of Mr. Butter-field in the Middle Densetted the. centre of the village, after the designs of Mr. Butter-field, in the Middle Decorated style. The cost, though aided by the subscriptions of the master and fellows of Penbroke College, Cambridge, who are the patrons of the living, and a few other friends to the parish, was mainly defrayed by Colonel Dun-combe, M.P. of Waresley-park. The first stone was laid on Ascension-day last year by Lady Caroline Duncombe, who has presented to the church a painted window. window.

Worcester .- On the 27th nlt. the General Health Committee of the Town Council opened the tenders Committee of the 10wn Connect opened the tenders for the erection of the cennetery chapels, and other advertised works. The offers were as follows:— No. I, 5,101.2; No. 2, 4,965; No. 3, 7,385; No. 4, 4,830.1 is. 6d. The lowest tender being much higher than what was expected, a discussion ensued, and it was ultimately resolved to ask the architect to meet the committee and advise with them upon the eet the committee and advise with them upon the subject

subject. Wrighten, (Chorley).—On the 27^{tb} nlt. the Bisbop of Mancbester consecrated a cburch dedicated to St. James, which has recently heen crected by private subscription at Wrightington, near Chorley. The church is built in the Norman style of architecture, with open roof, and dark supporting timbers. It is calculated to accommodate about 500 persons. Levds.—The "Cburch of the Immaculate Concep-

Leeds.—The "Church of the Immaculate Concep-tion," Monut St. Marie, Leeds, which has been in the course of crection for about four years, was opened on the 29th ult. The edifice is not yet completed, as on the 29tb uit. The edifice is not yet completed, as it consists at present of only nave and aisles. When finished, it will also comprise north and south tran-scepts, two scarristics, a choir, with double choir nisles on each side, a lodge chapel eastward of the choir, and eight chapels and other dedications. The extreme length of the building will be about 210 feet, and the extreme width across the transpis about 110 feet. The height of nave inside is 82 feet from the tile floors. The edifice is erected on Richmond-hill, at the east end of the four. The huiding ha already

ton, of Sherhurn. The chapel has been designed by Mr. Greener, architect, Sunderland; and Mr. Clarke, of the same place, is the contractor. Il will be a plain Italian structure, and is calculated to sent 550 persons. There will be 300 appropriated sittings, and the remainder will be free. In the schoolroom provision will be made for the accommodation of 600 sebolars. The entire cost will amount to about 750*l*, reised by voluntary contributions.

provision will be made for the accommodation of shows scholars. The entire cost will amount to about 750C, raised by voluntary contributions. Shottey Hill. --The ceremony of inaugurating the new Roman Caholic Church at Shotley Hill was performed on the 24th ult. by Dr. Wisemau and Dr. Hogarth, of Hexham. The first church, with the exception of the sacristy, was destroyed by a hurricease on the 7th of February of last year; and the church which has just now here opened was com-menced almost immediately afterwards, upon an entirely new plan, by Mr. A. M. Dunn, of Newcaslle, architect. It econsists of a nave, 75 feet long hy 25 feet wide, and 47 feet to the ridge of the roof; north aisle, 75 feet long, and 11 feet 6 inches wide ; and south aisle, with a porch on the south-west, and a tower on the south-east, hut which, at present, is only carried up two stages, with the ladve chaped underneath, and the organ -gallery above. The long and 19 feet wide. The ceiling is of wood, di-rided into panels by moulded rink, arranged for deco-ration at some uture day. It is lighted by five hancet vided noto panels by moduled runs, arranged to beco-ration at some tuture day. It is lighted by five lancet windows, each 15 feet high: the three in the apse are filled with stained glass, by Mr. Walles, of Neweastle, from sketches by the architect in the centre is a figure of "The Humaculate Conception," under a figure of "The Immaculate Conception," under a canopy and on either side are St. Patrick, the patron of the eburch, and St. Henry. The nave and aisles are covered with open timber roofs. Three hancets fill the west end of the nave, the evolve one heing 26 feet in height, surmounted hy a small traceried window in the gable. The stone piers supporting the nave arches are bezagonal in plan, with moulded caps. arches are bexagonal in plan, with moulded caps, which run up into the under side of the arches. From the exposed nature of the situation, unusual precautions have heen taken hy the architect to secure the huildbave heren taken hy the architect to secure the milit-ing against the recurrence of a calamity that has already proved so serious. Hollow arches, built of brick and evenent, are thrown at intervals across the aisles, springing from massive bottresses, and butting against the eleversory walls; in addition to which iron griders are haid on to the back of each of the principal brokens of the solid energy accorded into iron plottes in graders are faid out to the back of each of the principal timbers of the siste root, served in the ion plates in the elerestory wall, and let into the canopied buttress heads, which are also eramped with iron into the walls. The contract was taken by Messrs. Gibson and Stewart, and Messrs. Wait and Howard, of New-castle. The church will afford accommodation for about 800 persons. _

REDCAR.

THE foundation-stone of a new congregational church was laid on Wednesday, the 29th ult, at Redear, Yorkshire, by Mr. John Crossley, of Ilalifax, Redear is a sea-bathing town, and is yearly improving in its sanitary condition and number of visitors. Within the last three years the town has been drained, a water company has been formed, and now supplies a wate company ossition muce, and not supplies the inhabitants plentifully; gas-works are nearly completed, and the crection of dwelling-houses is going on more rapidly than is most towns with a population of four or five thousand. Doubless this population of four or the toousand. Donotices to is is to be attrihined to the rapid increase of the popu-lation in the neighbourbood, developed by the dis-covery of the iron stone in the Cleveland Hills. The charch in question will be a Gothe structure, huilt of stone from the surrounding district. The walling stone from the surrounding district. The walling, will be a deep brown colour, and the dressings white, huilt in contrast. The stone has been given by the Earl of Zetland. There will be no gallery in the church, and sittings will he provided for 350 persons. A vestry and offices acjoin the huilding, and sufi-cient land bas been purchased to erect schools and a clergyman's house upon. There will he a tower and spine at the north west angle. The roof will he solid event land bas been purchased to erect scools and a clergyman's house npon. There will be a tower and spire at the north-west angle. The roof will be celled in the form of a semi-octagon, at the request of the committee, although the experience of the architect is against this form for acoustic purposes. Mr. James Jones, of Barnard Castle, is the huilder; and Mr. Thomas Oliver, jun. the architect.

STAINED GLASS.

Sermon on the Mount, and in the upper the Resurce-tion of Lazarus. The subjects chosen are a sequence of those in the adjoining window, and form part of a design for a chronological series for the remaining windows. The general pattern of the glass (the work of Mr. Oliphant) is of the Early English type at Chetwode, and is similar to that of the windows already excented, excepting that the central circle is The whole has been provided at the cost of Mr. and Mrs. Richard Rose, as a memorial of their brother. brass plate at the base of the window is the in-On a

THE ROMAN BATHS.

THE BORAN BAIRS. THE great popularity sequired by this watering-place has led to the establishment of an Improvement Company, whose capital is upwards of one million france. On making lately some excavations, the remnants of Roman huildings have been found, which are of great interset. They are covered he a thick are of great interest. They are covered by a thick layer of rubbish, which, bowever, is to he removed; also for the sake of the concentration of the mineral also for the sake of the concentration of the minoral sources, whose channels are yet uoknown. As a small rivulet is rnaming near the springs, the Romans dug an artificial hed on the left bank of the river, and covered it with *bdcm* and enormous tiles, and thereto conducted the river, on the banks of which stands a part of the present town. The filled up space was then built over by the *caldaria* of the bah. The Huns (from AD, 451 to 937) devastated the neighbourhood of Plombières. It was only about 1292 that the banks ware again made use of. But nothing more was done then, than to collect the waters in one of the old *pixcinat*, which was repaired for that purpose. One of these, and a hath (*duce*) has been discovered of late. At its base bave been found the leaden tubes, and farther on an enormous cock, the leaden tubes, and farther on an enormous cock, the preservation of which, during so many centuries, is preservation of which during so many centuries, is very remarkable, as the water passes through it now as it did 1,500 years ago. There have been formed by the long contact of the mineral waters small copper crystals, similar to those which Nature forms in the mines in ber own way. The walls of the bath, instead crystals, similar to those which Nature forms in the mines in ber own way. The walls of the bath, instead of being made only of bewn stones, as in other Roman baths, are arronged as follows: on the hewn stone, which forms the outer stratum of the wall, is faid a bit is not never stratum of the wall, is bid a cement of pounded tiles (tailes pildes) O'10 mètres in tbickness : on this is put a sort of yellow mastic, having the appearance of stucco, 0'02 mètres thick. The pikeina was built entirely of Ronan bricks, and the walls were made of square hollow bricks, in which way the vapours circulated and beated the walls. Bronze medals of Constantine I. and Con-stantine II. in a perfect state of preservation, were also found. The mortar (béton) of the building is as our neichbours say. "d'une solidité prodigience." our neighbonrs say, " d'une solidité prodigieuse.

NOTES UPON IRON

(From our Correspondent at Wolverhampton.) THE "quietness" in the iron trade of South Staffordshire, noticed in our last, is not now so per-ceptible as it was then; in other words, there is more doing, without the trade having received any great

doing, when the set of the set of

time prescribed by cuatomers. Upon 'Change, at Birmingham, yesterday (Thurs-day), and at Wolverhampton on the previous day, there was a shade more cheerfulness apparent, not, however, numixed with apprehension as to the effect that the Indian matiny would have upon the trade. It is said totat these disturbances will seriously check the export of rails to India. They no doubt will ; but South Staffordshire will not suffer in this rescard The height of nave inside is 82 feet from the tile floors. The edifice is erected on Richmond-hill, at the cast end of the town. The huilding bas already cost about 12,000/, a considerable portion of which has been subscribed by the Roman Catholies in the south of France. South Helton.—The foundation stone of a new Primitive Methodist Chapel was laid at South Hetton, by Mr. N. Wood, of the Hetton Colliery, on the 25th uit. The site of the intended edifice, twisher scholar rooms will be attached, is at the end of Uuion-street, and the ground has been purchased of Mrs. Pemher-

west seem to have reached their limit, and the gene-

ral appearances indicate the near approach of a time of much prosperity, with a good "fall" trade. The late fatal accident in this town, from the breaking of a new cost-iron grider that was being placed in a huilding in course of ercetioc, previously placed in a hulding in course of erection, previously reported in the Builder, has occasioned a very gene-ral inquiry among persons engaged in the mollcable iron trade, why wrought-iron girders are not used more frequently than they are. The increased cost of the wrought-iron girder would be almost met by the saving effected in weight of metal net; and hefore a good wrought-iron girder broke it would give timely varning budder. warning by bending.

PROPOSED PURCHASE OF A HOUSE FOR SOCIETIES CONNECTED WITH ARCHI-TECTURE.

MEETING was held at the Rooms of the Royal Institute of British of Architects, on the 4th inst. to consider the best mode of purchasing No. 9, Conduit-street, for the purposes of societies connected with the itectural profession

Mr. Arthur Ashpitel, F.S.A. having been called to Art artistic schemeter, the schemeter of the chain of the schemeter was now likely to pass into a new phase, and as the names of those who had into a new phase, and as the names of those who bad initiated it would shortly appear, included generally with many others, he begged leave particularly to mention, that the premises in question had here first brought under notice by Mr. Charles Gray, and there-fore the great benefits to be realized when the whole idea was worked out, might fairly be traced to that as the first step. The matter had then here carried mered by Meyer Achield Weatt Panyorth Gray act was not step. The matter had then near carries as the first step. The matter had then near carries forward by Messrs. Ashpitel, Wyatt Papworth, Gray, forward by Messrs. Ashpitel, Wyatt Papworth, Gray, forward by Messrs. Ashpitel, Wyatt Papworth, Gray, Heaketh, and Wylson, as a sub-committee appointed by the committee of the Architectural Exhibition, who had been most cordially received by the premises committee of the Royal Institute of British Archi-teets, and no one had bestowed more personal pains and trankle and sociated is a more mericical manuar and trouble, and assisted in a more practical manner in the later stages than Mr. Dighy Wyatt, honorary

On the motion of Mr. Digby Wyatt, seconded by Mr. J. T. Knowles, it was resolved nanimously: --

" That the want of some huilding available for the ac-commodation of the principal societies connected with the architectural profession, and affording facilities for the meetings of large numbers of persons, has been much fell of late years, and that it is desirable that that want should be at once supplied, by taking advantage of the accom-modalion offered by the premises, No. 8, Conduit-street, the residence of the Earl of Macclesfield."

Mr. Wyatt, in the course of his observations support of the resolution, read a letter from Earl de Grey, P.R.I.B.A. expressing the warmest sympathy with the uudertaking, and his lordship's munificent iutention, in the event of the measure proposed heing Intention, in the event of the measure proposed near carried out, of purchasing twenty-five shares in the contemplated company, twenty of which he would present gratuitonsly to the Institute, and five to the Architectural Exhibition. It was proposed by Mr, Whichcord, seconded hy Mr, Gray, and carried unauimonsly :--

"That the hest mode of carrying out the desirable objects contemplated in the preceding resolution, will be by the formation of a company under the Act for ensuring a limited liability, and this meeting hereby piedges itself to support such a company by every means in their power."

Mr. Whichcord said that it appeared to him there was no other mode possible of realising the object in view than the one named in the resolution, since neither a Government grant was to be expected nor since yet that any private individual would come forward with the money required. In the manner suggested, all might render some assistance, however small, and no one would rnn any risk whatever beyond which they had the full knowledge at starting. beyond that Under which they had the full knowledge as subrough, conten-tifs Act, a creditor was hound to look to the credit of the company not to any individual shareholder, nor could any contribution he required from a share-holder exceeding any amount that might be unpaid on the shares held by him. On the motion of Mr. C. Mayhew, seconded hy

On the motion of sir, or having, second and the form of the motion of sir, or having the become honorary directors, and to qualify for such an office by taking not less than ten 10. shares each, were authorised to act in that capacity, with power to increase their number

Mr. Education then read to the meeting a list of the names of gentlemen, more than twenty in number, who had communicated to him their desire to act in this capacity; of these Mr. Tite was one of the first who had most cordially taken up the scheme, and Mr. Cockorell, Mr. Beresford Hope, Mr. Down and Mr. Cockorell, Mr. Beresford Hope, Mr. scheme, and Mr. Cockereil, Mr. Berestord Hope, Mr. geois binage of these and needs in Hose and the scheme of the s

the precise mode and extent of their assistance. lt i was gratifying, however, to find that, even at this very carly date, and with a few persons only at all aware that anything of the kind was in agitation, promises to take shares to the extent of more than 2,000k had siready been made. It was proposed by Mr. Edmeston, seconded by Mr. Ferguson, and carried by acclamation—

" That the best thanks of this meeting be tendered to the Right Honourable the Earl de Grey, president of the R.L.B.A. for the kindness of his expressions towards the proposed Company, for the interest he has taken in the details of the scheme, and for his munificent offer of assistance."

Thanks, moved by Mr. Chas. Grey, and seconded Mr. Joseph Clarke, were voted to the Institute : and the houorary secretary was requested to have printed, Le nouorary secretary was requested to have printed, and to circulate by post, a report of this meeting, among members of the architectural profession, with a note requesting some expressions of opinion, as a guide to the booorary directors, at their meeting early next week, when a prospectus was to be pre-pared, and final steps would be resolved upon.

THE NEW ROAD.

THE New-road was formed by Act of Parliament of the 29th of Geo. IL, in the year 1756, but not without much petty oppositiou thereto from the land-holders whose property lay in the line of the proposed new route to the west end. Horace Walpole notices, in one of his letters, the objection of the Duke of Bedford to it on account of the " dnst it would make in the rear of Bedford house," and at the same time slyl tells his friend that the duke is too short-sighted to see the weaved. to see the prospect. A complaint was made by one of the duke's tenants.

who held from him a large cow-farm in the intended route, at a rental of 37. an acre, " that the dust and the number of people must entirely spoil her fields, and make them no better than common-land : she intreats his Grace to prevent such an evil, as it would be impossible for her to hold his estate without a large abatement of rent.

abatement of rcot." On suchlike frivolous opposition the *Public Adver-tizer*, of Feb. 20, 1756, remarks that "All objections to new roads, which arise merely from partial and separate interests, that happen in this respect to be opposite to the interests of the public, should have no weight." The journalist then proceeds to notice the advantages to the public in general of the proposed thoroughine. " How much the communication with almost every part of the metropolis will be facilitated. Drovers from the west will pass from the extremity almost every part of the metropolis will be facilitated. Drovers from the west will pass from the extremity of the eity to the centre in one continued straight line. Persons that have husiness in other parts may reach them by ercoss roads communicating with the main line; and persons of fashion, who live in the great squares and huidings about Oxford-read, may ecome into the eity without being jolted three miles over the stones, or perhaps detailed three hours hy a stop in a narrow street. It must also be remembered that those who shall find it necessary to pass through the stores will pass much more commodiously, as the streets will pass much more commodiously, as the number of carriages will be lessened and the pavement preserved."

In the preamble of the Act of 29th Geo. II., it is stated, "that in times of threatened invasion, the new road will form a complete line of circumvallation, and his Majesty's forces may easily and expeditiously march their way into Essex to defend our coasts, without passing through the cities of London and Westminster."

passing through the cities of London and Westimbster. When this great trunk-line of road was in course of construction, the progress made upou it was from time to time noticed in the public journals. Thus, under date May 8, 1756, we are upprised of its early commencement hy heing informed that on the Wed-nesday following, the trastees would meet, and that on the next due the mesone work upon it. At on the next day the men were to work upon it. At this period the expense of making the road was computed at 8,0007. After the lapse of a few months, during the interval of which the road makers must have worked industriously, the following appeared print on the 13th of September, 1756 :--" It is w pleasure we assure the public that great numbers coaches, earriages, and harsemen daily pass over the New-road, from Islington to Battle-bridge." F It is with the days later, September 17th, we are informed that the banks and fences of the land between Paddington and banks and leaves of the land between values of the fields opened to the public. In the b comber of 1756, the expensiveness of the road was adverted to, and 100,000 cart-loads of gravel estimated to be

and 100,000 curve loads of graver estimated to be required for its completion. The pleasant aspect of this grand thoroughfare during several months of the year, which the unbra-geous foliage of trees and the gardens in front of most of the houses contribute chiefly to impart, is owing to

pall down any such crection, and levy the expenses on the offender's goods and chattels. The lapse of a century, however, seems to have materially modified this penal enactmont, for numerous are the instances in which the 50-feet plot is built upon. Travelling on this highway after nightfall seems formerly to have been attended with some risk, as will appear from such notices as the following ap-pended to the Sadler's Wells advertisements and bills of the performances :---'' A horse-patrole will be sent in the New-road at night, for the protection of the nobility and gentry who go from the souares and that nobility and gentry who go from the squares and that end of the town: the road also towards the City will be properly garded." " June, 1783.-Patrols, horse and foot, are stationed from Sadler's Wells-gate along the New-road to Tottenham-court-turnpike, &c. hetween the hours of eight and eleven." The Metropolitan Board of Works have given notice

that on and after the 31st proximo, the New road, and the separate names of places thereon, will be changed. The separatic names of piace's thereon, will be changed. Thus, the road between the Angel and King's-cross, will be the Pentonville-road; from King's-cross to Osnahurgh-street, the Euston-road; from Osnahurgh-street to Edgware-road, the Marylebone-road; and, further, the inhabitants are required to paint such numbers and names on their houses as the Board shall direct. W. J. PINKS.

AWARDS OF THE BATH AND WEST OF ENGLAND AGRICULTURAL SOCIETY.

THE council of this society met at Tauhon on Saturday, the 25th ult., when the Journal Committee reported their awards for essays as follows:— 1. On the Condition of the Labourer, and the hest means of improving bis condition. Premium 217. To Mr. Edward Spender and Mr. T. W. P. Isaac, of Bath Bath. 2. On the Cattle of the West of England.

Preminm 15/. To Mr. Henry Tanner, of South Molton, Devon.

3. Ou Beans and Peas. Premium 10/. Two essays of equal mcrit were submitted for this prize, and the same was therefore divided between Dr. Donaldson, of London, and Mr. Colthurst, of Belfast. On the Thrashing Machine. There was no com-

4. On the Thrashing Machine. There was no competitors for this essay.
5. On the Mnnagement of Dung, considered Chemically and Practically. Premium 204. This premium was divided between two essays of equal merit, one hy Mr. Edward Spender and Mr. T. W. P. Isaac, the other by Mr. Henry Tanner.
6. On Roofing for Farm Buildings. Premium 10/, To Mr. T. W. P. Isaac.

DESTRUCTION OF BUILDER'S WORKSHOPS IN MANCHESTER.

ON Saturday morning inst the workshops of Mr. William Harrap were completely destroyed hy fire. In addition to the sawing, planing, and moolding unchivery, stock of timber, and general work in hand, Mr. Harrap had ready for sending out a large stock of counters and other fittings for the warchouse of Messrs. Watts, in Portland street, to the amount of 2000/ which was entirely upposed by insurance of Messrs. Watts, in Forbiand street, to the amount of 2,0007, which was entirely uncovered by insurance of any kind. The loss of workmen's tools alone was about 1,0007, and the entire loss, inclusive of the two foregoing items, is said to have here 10,0007. It is stated that the total amount of insurance does not exceed 1,600. It belowes all persons having work in hand to consider the propriety of increasing their insurances where circumstances shall cause them to have heavy stocks in hand.

NATIONAL GALLERY.

A VERDICT has been given at last by the Royal Commissioners, who have decided ou numerous counts, proven and disproven, that the pictorial possessions of the nation shall be continued in their present locality. Like other verifies of other juries (appointed to try the same question), this last award wats the approval of the high justiciaries, whose "crequatur" will be decreed only in case that the issue be in exact conformity with their own predilections.

mity with their own predilections. For the satisfaction of the public, a record is pre-sented of the views and reasonings which induced the delegated inquirers to subside in the one *pis* alter couclusion, and the published details indicate suf-ficiently that great minds, when applied to common-plare subjects, are swayed and directed pretty much in the same way as are the intellects of ordinary observers among little men. The nebulous vapours of London were first brought ind debate and to essence from their influence three

into debute, and to escape from their influence three alternatives were suggested, --a removal to Kensing-ton-gore, to one of the Parks, or to the British Mus num

The utter insufficiency of the National Gallery any national purpose, coupled with the impossibility of enlarging it, without displacing a harrack and a

wo khonse, might bave led away the commissioners to the contemplation of Great Russell-street. Flo-rence, Naples, Milan, not to mention Rome or Paris, would, so far as their directing neadenicians are concerned, acovel contemptously at a proposal to lodge their art-treasures in such a shrine as that which we dignify by the name of National Gallery. We have unquestionably a site not excelled by any in Europe. The front to Tradilgar-square metaures nearly 500 feet. It is filled in from St. Martin's-lane to Paul Mall-east with an elevation in respect-ably chiselled stone, but of such a character as uceds no further commentary than that its only merit is in the adoption of the elassic columns of Carlton-bouze, and that the dome and turrels ought to be transferred to the stables of her Majesty's new mevs.

and that the dome and turrets ought to be transferred to the stables of her Majesty's new mews. Supposing that the whole 500 fect range were dedicated to the objects of a gallery, if we are to messure the collections which the wealth and taste of this great country will inevitably concentrate in the building within another half centory,—even that, at its present depth, of outly 55 feet/11 would he sim-ply ridicalcus. The range is all front, a single peat roof from end to cad, fronting the square, and backed by an insignificant paved court about 20 feet wide: behind it, for two-thirds of the length, ranges the deformed and comparatively valueless pile of St. Martin's Workhouse; and for the other third, a barrack-yard and a poor thoroughfare, leading to theicester-square. Leicester-sonare.

In the laying ont of modern structures or building speculations, it is usual, when the investment is large, epcuantions, it is usual, when the investment is large, to purchase the back shrins, to abate them, and, hy combining the ground with the grand front plan, to confer an increased (and perhaps indemnifying) value upon the total outlay on a great design. New Oxford street, Moorgate-street, Cannon-street, were oil's treeted. Where the concern is for a national war upon the total oftany on a general so street, Moorgate-street, Cannon-street, were all so treated. Where the concern is for a national purpose, and above all for the promotion of art, by how much the more is it not important to secure every facility for the performance of works that may promote the objects in a view, or at least that Britons may be saved from foreign ridicule, to which they are now too obnotious, of having lavished their money, and expended their labour, upon a monument of bad new too obnoxious, of having havished their money, and expended their labour, upon a monuneut of bad taste! Here, then, we have a frontage of 500 feet, and behind it an extent of depth to Hemming's-row, nearly equal. The workboute and adjacent schools are not only of small value, but they would be better in other parts of St. Martin's parish (much of which is tenantles! and still more squalid and wretched), or removed to some other more central or extra-mention busing. parochial locality.

Itere is an opportunity for opening a respectable thoroughtare by Castle-street to Leicester-square, in a direct line from Spring-gardens; of making another leading duct, of suitable lakitude, in continuation of King William-street; thus infusing life in a torrent from the Strend into the lawnberg concernent that from the Strand into the lumbered square,-that from the Strand into the fumbered square,—that scaled and yet most central spot of town. It occupies a fine clevated site, and wants only clear ventilation and access: it is the hannt of refugees and exhibi-tioners. Let us hope that Shakspeare's prophecy may be fulfilled, and "that the great Globe itself, and all who it inherit may dissolve:" at present the wreek is henceth and around it.

But the most singular part of the manifesto, or report, of the Royal Commissioners is (in their own words), "the aids to economy which would be fur-nished by the *rare circumstance* of only one orgamental front being rendered necessary, from the dis-position of the ground," &e. Now in point of fact there are three fronts or external walls ;—the grand -the grand mistake facing Trading request, the brick putes next the court and barrack-yard; and the cast end, *affronting* St. Martin's. But the rarity and the dif-fieldly in the metropolis is to find any site that will admit of more than one front, and that in the street aunit of more than one front, and that in the street line. We should hold it as an immense advantage if not one front only, but four fronts, could be secured for every great public structure. Then, indeed, arts might have fair play, and something like *integrity* in architecture might reclaim from ancient models a chance of perfection.

The grand mistake committed, even in this wretched mask of a gallery (more fitted in form for an American bowling saloon than for an exhibition of pictures), is the continuation of the line to the honses of Pall Mall-east, where there ought to have been a street, or an opening of at least 50 feet wide, to detach the building, so as to make it *integral*.

Granting that the whole plot of nearly 500 feet square, or an area of 250,000 square feet, were obtained, it would be by no means necessary to inclose obtained, it would be by no means necessary to inclose the guide book also contrins the railway time tables, or ever all that space: part would suffice to found a the refrashment torif, and other useful matters, and structure suitable to the exhibition of the arts (*cculp*-1 a new selection has been added, giving some account *lare* and *painting*), while the remainder would admit of fine thoronghiares, where they are most wanted, and assure free access of air, with good points of view and assure free access of air, with good points of view desirable that the five houses in St. Martin's-lane,

which, standing on a depth of 25 fort only, are built up against the workhonse, should enme down : this would expose the east front in contrasting effect as opposed to the noble portico of St. Martin's ; and, as

THE BUILDER.

opposed to the mobile portice of St. Martin S; mot, as the artists of the day (perhaps somewhat romantically) auticipate great improvements about Charing-ross, and grand demonstrations in architectural skill, the extension of the National Gallery scheme as herein noticed may not be considered inopportune. QUONDAM

APPLICATIONS RELATIVE TO BUILDINGS UNDER THE BUILDING ACT AND METRO-POLIS LOCAL MANAGEMENT ACT.

A CODE of rules and regulations has just been confirmed and issued by the Metropolitan Board of Works, relative to applications with reference to buildings to which the rules of the Metropolitan Building Act are inapplicable, which should be obtained by those who are interested. It includes the following :

Erection of Furnace Chimney Shafts.

Erection of Farnace Chimney Shafts. All builders or other persons who may be desirons of recting any chimney-shaft of a steam-cupica, brewery, distilery, or manufactory, the sham cubing the star-which the schedul before commercing any such build-ing, make an application to this Board requesting their exproval thereed, setting out a plan of the proposed building, and such other necessary particulars us may be required by the Board. (Sec. 66, Metropolitan Building Act, 1855.)

THE CRYSTAL PALACE

At an extraordiuary general meeting of the share-holders of the Crystal Palace Company, held on the 30th ult a report by a committee of investigation on the management was read, in which various statistics the management was read, in when various statistics of profit and loss were given, and recommendations for the future management suggested. A reduction under the head of elerks, office expenses and disbursements, gardeners, &c., was recommended. At present 146 gardeners were employed, and a large reduction in the number of the multi-constitution of the discusthe number it was thought might sately be effected. The cost of each display of the great fountains could not be stated; but the committee advised that they should play occasionally in the autumn on shilling days. Indeed, various suggestions for the populariza-tion of the palace, of a similar kind, were made, such as the conversion of the Saturdays into shilling days, and Wednesdays into higher priced fites, the providing of hetter arrangements in the refreshment department for behood of the middle and poorer classes, the dis-tribution of small fountains of filtered water for drinking throughout the building and the grounds, &c. Advertisement in the cheaper order of news-papers was also urged, so that the million should be induced to patronize the palace more than they had done. The result of shutting out the shilling public on so many occasions, while expending large sums to not be stated : but the committee advised that they done. The result of shutting out the shilling public on so many occasions, while expending large sums to attract the higher classes, was regarded as anything but satisfactory. The Halian opera concerts had been a loss to the Company of at least 5,000?, instead of a gain. So with the peace festival : the working drawings designed by Boron Marcehetti for the peace trophy and Scutari monument were submitted to the directors at an expense of 6502, and to that amount must be added 1,2587, including 1007. to Baron Marochetti, making the total cost of the Peace Festival 1,9087, against which sum the receipts in cash only amounted to G282, making aloss of 1,2807. restival 1,3054, against which sum the receipts in cash only amounted to G284, making a loss of 1,2807, to the company. A large immediate outlay for maintenance and repairs was necessary. The com-mittee recommended au increase in the number of directors, and various other alterations and improve-ments in the management. The whole subject is to be taken into consideration on the 18th inst. A nore dividual of the disc of General Cord 21 to the

A new edition of the official "General Guide" to the Crystal Palace and Park, revised, with new plans and ullustrations, and an index of principal objects, by Mr. F. K. J. Sherton, has just been issued. This division of the guide book also contains the railway time tables

advantage, every portion of the palaee. In noticing the issue of a new edition of the guide hook to the Crystal Palace, its educational value must not he over-looked; to teach a great practical lesson in art is one of its most important objects, and it is to he regretted that it is not made more use of in this respect. In the own arrangements which appear to be on the eve of being carried into practice, could not something be done towards so useful an end, as by brief and colloquial remarks or lectures (often before urged by us) on the various objects of interest where they stand? stand P

BUILDERS' BENEVOLENT INSTITUTION.

BUILDERS' BENEAULERY INSTITUTION. THE tenth annual meeting of this excellent society was held at the London Tavern on the 30th ult. Sheriff Lawrence in the chair, supported by Mr. George Bird, Mr. Thomas Cozens, Mr. J. Newson, jun. Mr. J. Thorn, Mr. J. Williams, and other gen-tlemen. After a few introductory observatious by the chairman, the sceretary read the report, which stated that for the first time since the foundation of the in-ticities in them held here a decrease in the smouth of stitution there had been a decrease in the amount of subsciptions and donations received at their annual festival, and during the past year.

The total number of recipients, continued the report, is now thirty-six, viz.-twenty males and sixteen females. During the past year 801/13s. 44. was distributed in pensionary relief, and since the formation of the institu-tion, 3(58), 13s. 44. have been thus expended. The following deaths have taken place since the fast report:-

1001, 35:39, 135, 34, note over the state space since the fast report :-John Wilkins, of Brighton, Oct, 1950, aged 66 years. Joseph C. May, March, 1857, aged 75 years. Joseph Zumell, April, 1857, aged 75 years. Ann Storenz, October, 1856, aged 75 years. Ann Storenz, October, 1856, aged 75 years. The state state state state state state state amount to 1, 1252, 0, ed. and the stock purchased in the 3 per Cent. Consols, is 3307, to the Relief Fand, making the Iotal amount of stock 5, 3004.-wiz, 35500, (stock), to the Belief Fand, and 1, 9504, (stock), to the Building Yund. Since the auditing of the above accounts the directors have the satisfaction of amouncing that they have re-ceived, through Charles Lones, esq. the munificent dona-tion of 506. from, Thomas Brassey, esq. On the motion of Mr. J. Thorn, seconded by Mr. Cozens, the report was adopted, and the treasurer.

On the motion of Mr. J. Thorn, seconded by Mr. Cozens, the report was adopted, and the treasurer, Mr. G. Bird, then moved a vote of thanks to Mr. Alderman Lawrence, who, as he said, had unde a first-rate president for the past year. This motion was also seconded by Mr. Cozens, and unanimously agreed to. After the chairman had returned thanks, Mr. John Newson moved a similar vote of thanks to the patrons, to whose number he begged to propose that the name of Alderman and Sheriff Lawrence should be added. Mr. Simkin seconded the motion, which was agreed to, as also were votes of thanks to the vice-nresidents, the treastees, Mr. G. S. Smith, Mr. which was agreed to, as also well vides of that is to the vice-presidents, the trastees, Mr. G. S. Smith, Mr. G. Bird, the retiring directors, the office bearers of the Baighton Branch Society, Mr. Joseph Bird, and the solicitors of the institution. Mr. Alderman Rose was then elected president for the evening year, and we have no doubt will do well for the iostitution.

PROPOSED MEMORIAL OF THE GREAT EXHIBITION.

ON Tuesday, in the House of Commons, Mr. Laurie asked the First Commissioner of Works whether it was intended to creet any edifice in Hyde Park, in commemoration of the Great Exhibition ; and, if no site had yet been adopted for Richard Cœur de Lion, whether there was any objection to allow it to surmount the Marble Areb?

allow it to surmout the Marble Arch? Sir B. Hall said no public moneys had been spent on a memoral of the Great Exhibition of 1851, hut when Mr. Alderman Challis was Lord Mayor of London, a subscription was entered into with that view. He saw Mr. Alderman Challis not long ago on the subject, and that gentleman asked him whether a site would be given in Uvde Park for the exection a site would be given in Hyde Park for the erection of such a memorial. He (Sir B. Hall) told him that of site a memorial. He (Sr B. Hal) told film that he could give no positive answer until he saw the design that might be proposed. With respect to the question as to allowing the statue of Richard Cœur de Lion to surmount the Marble Arch, he did not think the public would thank the hon. member for

. What spitcful imp could have put such a notion into Mr. Laurie's head?

DISTRICT SURVEYORS' MEMORIAL.

and. Each surveyor to be a man of practical knowledge, and of ascerisical componency in the terms of the Act. Art. That a copy of each condemnation should be sent to the surveyor of the district and the sent of the act of the surveyor should watch the progress forceeding to antisfaction, and certify, leadly, when com-blete a property. It is true that by such an arrangement a divided respon-net of the surveyor should be made immediately on both the surveyor should be made immediately on the surveyors being interested in condemnation, would not surveyors being interested in condemnation, would not survey and an efficient supplementer Surveyor. A berner Survey and the made immediately on place and the survey of the surveyors being interested surveyors being interested in condemnation, would not be an another the survey of the surveyors being interested in the surveyors being interested in condemnation of the district surveyors being interested in condemnation, would not be an another the surveyor and the surveyors being interested in the surveyors being interest and the survey or the proper person to be the surveyors but we strongly incline to the belief that the district surveyor is the proper person to be employed to survey ruinous structures, and that the surveyors being many of whom have an illust to district surveyors existing, many of whom have an illust to be an another the should be and bering the surveyors district surveyors existing, may of whom have an illust to be intered and the bear out be an induced. But the district surveyors are survey to be an another the surveyors are been and district surveyors surveyors and the should be an out be surveyors and the should be an out be surveyors are surveyors and the should be an out be surveyors are surveyors and the should be an out be surveyors are surveyors and the should be an out be surveyors are surveyors and the should be an out be surveyors are surveyors are surveyors are surveyors are surveyors are surveyors are surveyors areading the should be a

Norman here straight out a the string the straight of the straight on the straight of the straight of the straight on the straight of the

THE GREAT EASTERN AND THE ARK. THE GREAT EASTERN AND THE ARK. WILL you permit me, through the medium of your Journal, to refute a statement which appeared in a widely-circulated pamphlet, and also in the *Times?* The writers state that the Great Eastern etsam-ship, now being built at Millwall, is larger than Nosh's Ark. With your permission I shall prove, hey ond dispute, that so far from being farger, this monster ship is not so large by several hundred thousand enbic fact. The Great Satem thou is in the lowest next 600 for each late to lar from being larger, this monster ship is not so large by several hundred thousand eubic feet. The Great Eastern, then, is, in its longest part, 692 feet; in the broadest, 53 feet, and 60 feet deep. In order to be certain of measuring this ship correctly, I planed up a rectangular prism of dry mahogany, corresponding to the above dimensions, to a scale of the 64th part of an inch to a foot. This piece of wood contained 13/1295 cubic ioches, and it weighed sity-four pennyweights. I then formed it to the model of the hull of the ship, and weighed it again, and it weighed forty four pennyweights; it now became an easy arithmetical process to find this model contained only 9/0205 cubic inches, this number multiplied into the cube of 64, gives 2366242 816 cubic feet for the content of the whole alip. According to the best commentators a cubit equals 21/855 inches, or 1.824 foot: and we read in Goessis, "Thou shalt make the ark 300 cubits long [or 547/2 feet], 50 cubits hroad [or 912 feet], 30 cubits deep [or 547/2 feet]." These numbers multiplied into each other give nearly 2,730/782 cubic feet for the content of the whole ark, which it will be scen is 364539 184 cubic feet for the out for the Grout of the availar of the cubic feet for the out of the scheme. The availar of the

suspended in the middle of their progress. The por-tions of the new works already on the point of com-pletion are—a new and extended boundary wall, a debtors' ward, and an east wing. The houndary wall is 17 feet high, and encloses all the fresh had avail-is 17 feet high, and encloses all the fresh had avail-out y police station. Thus the whole area now cumbraced by the gaol is three ares, being one-third more than hefore. At the north-cast corner is the new debtors' ward, which is divided into three de-partments. This ward contains two tiers of cells, the uppermost being reacbed by an iron staircase and gallery. Each cell is 13 feet by 7 feet, and 9 feet high, provided with gas, and well warmed and veni-tated, each prisoner being enabled by a simple con-trivance to regulate the temperature at bis pleasure, hot air being admitted from the hotom, and fresh cold air at the top. The hot-water apparatus by which the establishment is to be warmed will be fixed at the basement of this ward. It was furnished by More Linke, of Tewahidro. The second by the second transe to regulate the temperature and the fixed cold air at the top. The hot-water apparatus by which the cash similar to the warmed will be fixed at the basement of this ward. It was furnished by suspended in the middle of their progress. The porwhich the establishment is to be warned will be fixed at the basement of this ward. It was furnished hy Messrs. Haden, of Trowhridge. The arrangements for ventilation will occasion 30 enhic feet of fresh air to be supplied to each cell per minute. There are twenty-six debtors' cells, with lavatory, closets, pan-tries, cooking kitchen, and a large corridor and yard for each department, wherein the debtors may take exercise: in each yard is also a visitors' room. The cast wing consists of two paralled ranges of cells, three there have in the whole. This huilding is 90 feet high from the hotom of the sub-hasemut to the ton of the youtha whole. This mutating is 90 ret high from the holtom of the sub-hasement to the top of the ventila-tion shaft, and there are eighty-four cells for criminal prisoners, each tire heing approached by iron stair-cases and galleries of the same material. The hase-ment contains a reception ward of twelve cells, fitted up with washing apparatus, water-closets, and gas; and, instead of the old iron hedstead, the hammock will be introduced, so as to allow the prisoner room to work in bis cell. The whole of this wing is lit hy to work in bis cell. The whole of this wing is lit hy skylights and a window, at the cast end, nearly as high as the huilding itself. To supply this enlarged establishment with water, a well is to be suck more than 200 feet deep : a tank, which holds 120 begshends, has heen creeted at the top of the mull-house, at a suff-cient height to force the water to the highest floors of the establishment. All the new foundations are lid on concrete, and so are the whole of the floors. The average thickness of the exterior walls is 2 feet, and every alternate course of briedwork is bonded <text><section-header><text><text><text><text><text><text><text><text><text><text><text><text>

of the same architectoral character. The walls will be constructed of stone of the locality, with freestone dressings, lined internally with hriekwork. The roofs will be of open timber-work upon the trussed ratter

will be of open unmer-work alon the trussed ratter principle. The contract for the work bas been taken by Mr. Noden, of Leominster, builder. Blyth.—The contracts for the masonry and joiner-work of the proposed public-hall at Biyth bave been let at 9607.

DECIMAL COINAGE.

THE report of the Commissioners on the Decimal Coinage having made its appearance, much com-plerity of opinion as to the hest method seems yet to with. Some difficult pierty of opinion as to the nest method seems yet of exist. Some difficulty must appertain to any change, whatever it may be. Yet in practice I am sore there would be no difficulty whatever; and as in other States, which made great objections to a similar change, so we also shall only wonder we could have change, so we also shall only wonder we could have done without its o long. Permit ue to ask, Mr. Editor, what may be the objections to the following plan (a simplication of the *pound* and *mil system*), viz, ; to keep our accounts in *forins* and *furthings* (or cents), which can be readily converted into k. a. d.; or *vice versit*. Our coinsge to be, sovereign; half ditto; dollar; or 4s.; florin, or 2s.; shilling, or half forin ; sixpence, or quarter forin; i threepence, or one-eighth florin ; a copper, 2d.; one-half copper, or penye one-onadre copper, or half-peny; and change, or one-eighth floring is copper, 2d.; one-hall copper, or penny; one-quarker copper, or half-penny; and farthing, or cent. To do away with the 5s. or crown, the 2s. 6d. or half-crown, and 4d. puece; and to coin a dollar, or double florin, or 4s. piece, and a copper, or 2d. piece: our table to run thus:--

10 Fartbings (or cents) One copper. 10 Coppers 10 Florins One flor

One pound.

A crown-piece is a heavy and almost useless piece of coin: the half-crown is often mistakeu for the two-shilling piece, and the fourpenny piece confounded with the threepenny piece. An English dollar would pass current all over the world, and be very useful to Englishmen; and the twopenny piece (or English corper) would also by its name (a copper) soon obtain a world-wide notoriety. Thus, 500 florins, by cutting off one figure, gives you the number of pounds; and *vice versid*, adding one figure to the pound, always gives you the number of florins, thus : 77.14s, 6d. would be 77 florins 25 farthings. That minor division at the end of stated sums is of no moment compared with the facility for commercial purposes. As to alterof coin : the half-crown is often mistakeu for the twoat the call of state sums so in the moments compared with the factility for commercial purposes. As to alter-ing the number of fartbings in a penuy, the public will find that some pennics weigh six fartbings (allow-ing for wear); so that eight are equal to twelve of ing for wear); so that eight are equal to twelve of Victoria, others weigh four farthings, and some less, Metora, others weight our larinings and so on. Yet no one considers the difference of moment in the ordinary pursuits of business: every old apple-woman would in a day understand the new plan, which need not at all prevent us keeping our accounts as at present in £. s. d. or Florins and Farthings, hecause each is at once convertible into the other. A BELGRAVIAN.

Miscellanea.

GLAZING BRICKS.--Will some of your correspon-dents inform me how I can stain and glaze the red rubber arch brick, so as to correspond with the Staffordshire hake brick, thus belping me out of a difficulty which at the present appears to me rather formidable. I am superintending the erection of a red brick huiding, in which the Staffordshire blue brick is introduced very freely, and with considerable effect in the blinth string-contres & and forming trick is introduced very freety, and with considerable effect in the plinth, string-courses, &c. and forming dressings of *colour* to all the jambs and arches of the windows and doorways,—in blocks of hine and red alternately. The arches being rubbed, and ganged I find it impossible to use the hine hirds for them, I find it impossible to use the blue bricks for them, as the material is much too hard to cut with any degree of accurrecy.—let alone the rubbing. To he compaled to put in the arches entirely of red hricks would, to a great extent, destroy the *effect* simed at by the architect, therefore, I have no alternative but to stain the red hricks blue: this the architect will not consent to unless I can put a glaze upon them, so as to correspond as nearly as possible with the blue bricks in the jamba. The staining I can manage, but I am entirely ignorant of the glazing process, and an likely to continue so unless some of your more intelligent correspondents will he good enough to collighten me in the matter.—A CLERK OF WORKS. CORE SCHOL OF DESTOR.—From argorit recently

enighten me in the matter.—A CLERK OF WORKS. CORK SCHOOL OF DESIGN.—From a report recently issued by the committee of management, it appears that this school, which was closed during the whole of the year 1855, has been successfully reorganised, and the committee attach a great portion of this success to the exertions of Mr. Raimhach, under whose direction the school has since heen in operation. Strings differences however ansate to have meantful Serious differences, however, appear to have recently arisen hetween him and the committee, which have resulted in his resignation of the bead mastership.

ELECTRO-TELEGRAPHIC. - The balauce-sbeet ELECTRO-TELEGRAPHIC. — The balauce-sbeet of the Electric and International Telegraph Company for the balf-year ending June 30, 1857, shows that 89,4512 (less porterage paid out, 2,5732), have been received for messages, intelligence, subscriptions, &c. The working expenses, charges for maintenance and repairs, &c. amount to 56,1292, balance, 30,7482. The receipts of the company steadily increase. For the first half of 1855 they were 67,6592.; for 1856, 78,5162, and for the present half year, 89,4517. The directors are enabled to recommend a dividend at the paire of 82, per cent, per annum.—A submarine rate of δl , per cent. per annum—A submarine cable is heing made for the Norwegian government. This is probably the first electric telegraph which has ever been used for fishing purposes. A NEW MONUMENT.—Last week a monument was

A New MONUMENT_Last week a monument was crected in the chancel of Newport Church, Salor, for J. H. Adams, esq. to the memory of the late Mrs. Adams, his wife. The architecture is Gothie, of the later Perpendicular period, peculiar to the reign of Heary VII. Columns, buttresses, and enriched cornice, are arranged to form a niche to receive a life-sized figure in statuary marble, expressive of Resignation. The figure is enclosed under plate glass in a metal gilt frame, which in statuary is a new arrangement, having in view the preservation of the scutpture. The coloured letters of the inscription, and the legand, "Thy will be done," are in the Old English character, and easily deciphered. The sculp-ture is by Mr. Calder Marshall, R.A. of London, assisted in the architectural portions by Mr. John Cohb, Chetwynd End, Stropshire. THE DWLLINGS or THE POOR.—The Earl of Shaftesbury's Bill for the prevention of over-crewding in the dwellings of the poor, has heen brought down from the House of Lords for the assent of the Lower House of Parliament. The Bill encats that no house or part of a house shall be exempted from the pre-visions of the Common Lodging House Acts by reason only that the lodgers in such house are members of the same family, unless such family consists solely of persons in the relationship of grandfather, grand-mother, father, mother, child or children, grandchild or grandehildren ; and the onus proband is regards relatiouship will lie on the persons prosecuted at the inset mey provered to enforce the 20th section of the A New MONUMENT. —Last week a monument was ected in the chancel of Newport Church, Salop, for

reinforcemption in the out the persons processing for the out-instance of the police. The Commissioners of Police are empowered to enforce the 29th section of the Nuisances Removal Art. The Act will only apply to such parts of the metropolis as are situates within the The Commissioners of Police

and parts of the methodolis is a constraint of the methodolism police district. MEDWAY UNION CONFERTION.—Allow me to call the attention of your readers to the decision in the above competition, as I think it will be of service to judges, and a warning to all persons engaged in com-petitions, inasmuch as it shows that if drawings sub-dentications and the set of the structure of the second seco mitted exceed the amount of the stipulated sum, even if all workings, drawings, and quantities are furnished, 11 all workings, drawings, and quantities are intrusined, architects are not to consider themselves the accepted, even if tenders are sent in for the works, and every-thing is ready to commence them. The guardians of the Medway Uuion have, upon receipt of the tenders, declined to accept the drawings for the workhouse; and why 2 because Measure Process for and Stephens en-and Stephense theory. y?-because Messrs. Peek and Stephens en-that the works should be completed for and why gaged 11,0007.: the lowest tender exceeds double that amount. They are very properly punished, although it is an injustice to others who forwarded dra as theirs might have been executed for the an and it is also a great delay of time.—R. A. U. rwarded drawings.

FROM OXPORD-STREET TO PALL-MAIL. — Has the rumour reached you of a company in private forma-tion to construct a street from Coventry-street or cester-square through Whitcomb-street to Pallmall, more befitting so important a thoroughfare P I ask the question, hecause, if such be the case, the public will look to yoo, as censor and conservator, to protect it from an ill-constructed line of road or muldings baseborn not becoming the locality, verging as it does on manusions and palaces. There appears to be no other selection to make, if such a street is at all in projection, the mews and barracks offering an in-superable barrier clsewhere; and the way will by this means he direct from Oxford-street to its almost means he direct from Oxford-street to its almost imperial parallel, through Wardour-street, Princes-street, &c. till you come to the little disgraceful obtruder Whitcomh-street, with its little trumpery tenements of small rag-shops, chinney-sweeps, and low ginger-beer stalls. Of course, such an enterprise, however private, must be by parmission. I do not voneh for the correctness of the report, but I have heard it; and as such an improvement is desirable, and the presents of comparatively small value that and the property of comparatively small value that forms the present obstruction, I think it not unforms the present obtainties, in this is not un-likely. At present the tide percolates through ill courts and alkeys and missrable streets to the cast side towards St. Martin's-lane round the side of the hurtowards of, and state from the state for the alternative states and state states and other values and other values and other values and other values and state values and state values and state values and states are states and states and states are states at the states are st I remain-G.

THE CLOCK TOWER OF THE NEW PALACE AT WESTMINSTER.--U appears from a return to the House of Commons, moved for by Mr. Ridley, M.P. that the amount in weight of gold leaf used in deco-rating the outside of the Clock Tower of the new Houses of Parliament, up to the 30th of June last, is about 95¹/₂ ounces; that the cost of the same is 1,199. of which 8900, applies to the gold leaf used, and 2299. to the wages of the artificers employed; and that the amount of Sir C. Barry's estimate of the cutire further sum which will be required for the completion of the work is 4144. Fine or pure gold of treble the thickness of ordinary gold leaf has been used by Sir C. Barry, and difficulties baving arisen used by Sir C. Barry, and thus the expense in-creased. A composite, bowever, has been applied, THE CLOCK TOWER OF THE NEW PALACE AT A composite, bowever, has been applied, in addition to having advantages as to durabicreased. lity and colour, constitutes a perfect insulation be-tween the gold and the metal which it covers, and Sir C. Barry has every confidence that "the gilding, as uow executed, will remain unimpaired and un-affected in appearance for a very considerable number

of years to come." ADMISSION TO THE ARCHITECTURAL MUSZUM, BROMPTON.—In reply to some inquirers, members subscribing one guines and upwords per annum, in the new annum, and art-workstudents subscribing IOs. per annum, and art-work-men 5s. per annum, are admitted to the Architectural men 5s, per annum, are admitted to the Architechural Museum, and, by permission of the Committee of Council on Education, to all the other collections in the South Kensington Museum, on every day of the weel, excepting Studday from ten o'clock a.m. till four o'clock p.m. and on the evenings of Mondays and The strengtheners for the even ill the pro-ting the strengtheners. and Thorsdays from seven till ten pm. They are farther entitled to a copy of the catalogue of the Arebitetural Museum, with free admission to all the lectures and conversazioui, and can study at all times in the museum. Subscribers of one guinea and upin the muscum. Subscripers of one genues and the words have the privilege of introducing, daily, by order, one visitor, or workman employed by them, for purposes of study, &c. free. LIVERFOOL LABOURERS' "DWELLINGS" COM-

PANY.—A meeting of this company was held on the 30th ult. in the Common-hall, Hackin's-hey, at which it was stated the block of buildings which the which it was stated the block of obtainings which like company had determined on erecting had been com-pleted at a cost of 6,300ℓ. Nearly the whole of the houses were occupied, and it seemed a matter of errtainty that they would pay a dividend of 5 per eent. per annum.

ent. per annum. The Borth SYSTEM.—In the case before the Justice of Peace Court, Montrose, Smith v. Mason, the fol-lowing report was put into process:—" Montrose, June 3, 1857.—We this day inspected the hothy and sleeping apartments at Haughs of Kinnaird, occupied by the men employed on the farm. The hothy is a circular house apart from the other farm buildings, surrounded by a large quantity of hay. Immediately outside the door to the right is a puddle of stagnant outside the door to the right is a public of stagnant water, and a good many shates on the back part of the roof are broken. The interior is 13 feet in diameter, with walls 6 feet in height, without plaster on the walls, or ceiling to the roof. The floor is of mud and damp. Iuside the door, and below its level, is a pool of dirty water, part of which is encouched by these or four grave states also below its level, is a pool of dirty water, part of which is concealed by three or four grey slates placed on it. Opposite the door is a large fire-place. It contains no article of furniture except a form 3 or 4 feet in length, and lying on its side in consequence of having only one leg, and two small harrels for holding meal. When the door is shut no light is admitted, except through a hole in a broken shut, and another in the lattem of a door sufficient to admit a set. The always through a hole in a broken state, and another the hottom of a door sufficient to admit a cat. The sleep-situated immediately above the rtment is situated immediately above the The entrance to it is by a door 5 feet in ing apartment stable stable. The entrance to it is by a door 5 feet in height, and is 5 feet 9 incbes above the ground out-side. It is reached hy a ladder fixed perpendicularly against the wall, consisting of five steps, the lower one being wanting. A rope haogs from the top of the gangway, to he grasped when at the top of the ladder to assist in the ascent. Except the door three is no opening of any kind. The dimensions of the apartment are 16 feet in length and 6 feet 6 inches in hwadth wardneize of the passe accurated by the in breadth, exclusive of the space occupied by the bedsteads. The height is 5 feet 9 inches. It con-tains five bedsteads, three of which are filled with clean bedding, and in use, and said to be occupied by six men. In the room a pane of glass is fixed about a foot square. From the dampness, want of light, and absence of any kind of comfort in the bothy, and from the situation, scanty space for the number of inmates, and thoroughly defective ventilation of the sleeping apartments, we are of opinion that a resi-dence in these places must tend to deteriorate the health of the occupants.-Signed, John A. Ross, surgeon; David Johnston, M.D.-Law Chronieles, Dundee.-The above is a specimen of the brutal con-dution of farm servants in Scotland, in their sleeping and eating apartments.

Aug. 15, 1857.]

The Builder. Vol. XV .-- No. 758.

ROMPTED by considerations adverted to in recent notices of the competition for the Wellington Monument, * we have been induced to pay much attention to the exhibition at Westminster Hall, and have tried to clucidate the principles to be observed in sculpture of the high class which is in question. We also have particularised under their mottoes, many of the models. Since our last number was published, the report of the judges has appeared, and will he found, with the names of the anthors of the rewarded designs, at the end of

had heen privately mentioned some time p this article. The names of the judges vious to the date of the report. It will be observed that amongst the gentlemen at first selected as judges, was Mr. Cockerell, whose reasons for dechning to take part in the final decision might, perhaps, he such as would deserve more notice than they have received in the not very perspicuous English of the report. We believe they arose in the feeling of doubt, which he-the only one of the tribunal who can be considered qualified by the required extcuded study of art, the architect long attached to the structure of St. Paul's Cathedral and who suggested the particular site for the monument, the discoverer of ancient marbles, and the author of published and other investigations into the design and character of sculpture, hoth mediaeval and antique,-which even he, Professor Cockerell, felt of his own individual qualifications for the judicial office. Such office, probably, he would not have shrunk from, had the tribunal heen constituted, or mainly so, of artists-representatives of the different branches of architecture, sculpture, and painting. Such a constitution, however, does not always obtain the sanction of those who dispense the patronage of art in England. We can only say, that taking these as Mr Cockerell's reasons, they quite correspond with the views we have continually put forward in speaking of competitions. It does not follow that the valuable combination of judicial aptitude with artistic knowledge and skill is to be found necessarily amongst artists; but we cannot admit-as we seem to be asked to do. when there is a selection of judges merely to represent particular functions or departments of the legislature-or even when these are distinguished collectors or amateurs-that we necessarily get a tribuual to which deference can be paid. The practice of such appointments touds to keep up the fallacy that any one is able to judge of a work of Such a one may say he knows what art. pleases him,-the common remark ; but he does not know what will permanently hold or deserve his admiration. Our remarks are general in their application, rather than applicable to the particular selection which has been made in the case of the Wellington monuncut. On that head we withhold any observations for or against particular models, hut will rather lay before our readers the continuation of our views on mouumental sculpture,-not denying, bowever, that we should be at issue in several points with the judges, as may be seen from a comparison of the selections with the matter of our notices.

* See pp. 415, 425, and 445 ante; also p. 213, on " Monu-ments and Statues."

THE BUILDER.

Perhaps we should have hesitated to enter nised in each of the works at Westminster Hall, so deeply into the merits of works in a that we had ventured to single out and make sister art, had we not felt that the deficiencies in the art as practised, were such as it lay within the scope of architectural criticism, or of our own habits of thought, to suggest the way to remove ; whilst the period and the occasion appeared singular, as well as favourable to the efficiency of our interference. We trust that in drawing attention to the architectonic element as important in monumental sculpture-yet to the required predominance of the sculpturesque in works intended merely as memorials, though beantiful and didactic in their expression-and to the need of a poetic and imaginative element, combined with perspicuity of the language, we have been so fortunate as to enumerate the real causes of the contrast between, on the one hand, the executive skill of our sculptors and their indisputable success in the majority of the works in which they happen to be engaged, and, on the other, their too general ill-success in works of the class now more prominently under notice

We ought to observe, if it have not already appeared plain, that a defence of allegory as an agent iu imaginative art, does not imply the defence of its treatment, as commonly met with. Morcover, as to what we have called representatice sculpture,-and as to its falling short of the highest art,-we would say merely that the representation of a single episode, or event, is that which we considered could not fulfil the conditions - in the case of most individuals worthy to be commemorated, or of those pertaining to the varied life and character of the Duke of Wellington. But, separate representations of figures drawn from different conditions of time and place, perhaps could be idealised into one group; and the monument might claim to belong to art of a higher class than that of the representation of incident or fact, or that of the simple statuesque or portrait branch. It is possible that this sort of sculpture would include the poetic and imaginative element sought for through the allegorical : but, judging from what has been put forth at Westminster Hall, or from the monuments in St. Paul's Cathedral. there is both difficulty in forming a connected group without vulgarity, and in conveying the used in some of the best monuments. intended idea without the assistance of alle- name the monument to Lord Mansfield in West-The mixed combination-representative gory. sculpture with the allegorical in the same group-has been attempted in numerous instances, with a view to the proper recognition of facts, and the illustration of a large theme under restrictions inevitable in sculpture. In one of the monuments in St. Paul's-that of Major-General Hay-the dying man, in his habit as he lived, is supported by the allegorical figure of Valour. But the mixture of the vehicles-the representative and the allegorical - even where the latter is understood hy the multitude better than it is here, cannot, we believe, be satisfactory. It is erroneous iu principle, and has, more than any other cause, brought all allegory into contempt. It was a concession to the popular demand-a half-measure hetween the senlptor's prejudice for a certain conventional allegory, and the people's want of something which they could understand—and, like many other compromises, was worse than either of the courses for which it was substituted.

By the sculptor, the incongruity, as well as the unsuitableness of modern costume was, on the other hand, attempted to be warded off, hy idealising the whole group-so far as to represent the figure of the hero-a necessary featureuot in the dress which he wore, hut naked, or draped, or in Roman costume. Thus, the whole became a consistent, whilst poetic and failed in oue of the objects of the monument,one which, we may observe, is distinctly recog- the author of monuments which are liable to

prominent in our notices. In these works, a figure of the Duke, and in true costume, has heen treated as an essential feature. But, the fact of the intractableness of the costume is deducible from many recent statues. Dalton, at Manchester, must be represented in a dress which he wore-perhaps on three occasions in his life; and Sir Rohert Peel, hy our first sculptors, must be a naked fignre with garments pasted on,-not disposed like the Greek draperics-which, if they sat close in some places, to exhibit the heauty of the human form, in others hung in folds which, by contrast and concealment, added to the expression of the art.

It were much to be desired that the dilemma in which sculptors feel themselves, could itself produce some change in costume. The artist has little control over dress, though that may be such as both he and his patrons would least desire for perpetuation in stone; whilst the sculptor scems to be surrounded by difficulties which never occur to the painter. What lady would wish to he modelled in crinoline, or what gentleman in the hat ? These difficulties seem never to weigh upou the portrait-painter, else why the enduring heauty of the works of Reynolds ? But, taking things as they are, the objections are less to the use unconcealedly, of the modern costume-at least to so much of it as is not the fashion of a single year-than to the adoption of a dress which does not allow of true representation. For, it is obvious that the mouument should include a portrait of the. deceased It is this very necessity, indeed,-the combination to a certain extcut of represented fact, with art-vehicle of auother kiud,-which makes the peculiar difficulty in our present ease. In the same monument you have to show the appearance of the man, and also to tell what were the features of his character, and circumstances of his life. To effect these objects, considerable space will be required for detail in representation, or some use of types and emblems. To interdict ellegory, therefore, is to limit the resources of the art-to entail a partial exhibition of the attributes of the man.

Allegory, to the extent contended for, has been We may minster Abbey, not because it reaches all that we now require, but because the mention of it shows how much of really superior art is condemned by sweeping denunciations. This tendency referred to may be no proof of merit : hut we see uothing inconsistent with either perspicuity or Christiau art, in Flaxman's representation of Justice-more than in the heautiful forms of allegorical representation used by the author of No. 13 in the exhibition, where Justice, instead of the scales, holds a weight in each hand, and Truth is placed beside a sundial. Nor could there be any objectiou to the typical signification of locality in the monument to Sir Ralph Ahereromby in St. Paul's, mainly a work of the representative class, where Egypt is indicated hy sphinxes. On the other hand, reverting particularly to this latter class; iu the beautiful work of sculpture, the monument to Mrs. Warren and her child, in West minster Abbey-by the same artist as that just mentioned,-the elder Westmacott,-the seated figure of a poor woman with an iufant, is exquisite in its pathos, and admirable in its manifestation of technical skill : hut-taking it as a perfect work of its class-we may ask,-Does it realise what is intended in monumental sculpture,-to wit, the perspicuous commemo-ration of a particular individual-along with the lesson to the living ?

the same generalization. But all the resources for portraiture; and commemorative, didactio, and "phonetic" expression, will be needed in a monument to the Duke of Wellington; and the aim must be to nuite them in position and in grouping of the monument, without the inter-ference of different modes of expression with ference of different modes of expression with one another. Architecture offers the means of this, and the structural framework for each separate representation or composition : but, molices which should be kept distinct should not he attempted as parts of the same particular combination : that is to say, otherwise connected than somewhat as the hocks of a library, or the objects of a museum or the decorative name objects of a museum, or the decorative paint-ings of a room, are united in selection and dis-position, and in general grouping and design to noise a connected train general general general design, or aid a connected train of images and thought. It is worthy of notice that a minor feature in one of Westmacott's works in St. Paul's Cathedral—the monument to Lord Collingwood catnedral—the monument to Lord Collingwood —displays the principle of composition which up to the present time had seldon been exhi-bited for a whole design. In a seroll on the prow or side of the ship, in separate, hut con-nected, *rilievos*, is represented, under the guise of allegory, a complete picture of the progress of navigation. Here there is so far perspiculty, that the series requires only to be looked at to be understood as well as the most natural work. be understood as well as the most natural work be understood as were as the most minor to the in representative sculpture. The monument, generally, is of the latter class, modified or idealised to suit the limitations of the space. Observe, also, the value of the seroll, or archi-tectural framework—subordinate though it pro-tice the seroll as the seroll as the seroll of feel perly is,—its value as well to the general effect as to the sculpturesque element, besides the

as to the sempinresque element, besides the telling of the story. We may be told—as those are who would inculcate the "principle of selection" which be longs to art, and to the use which it makes of Nature—that we should narrow the field by the general course which we have contended for and that mounements sculdure would no by the general course which we have contented for, and that monumer'al sculpture would no longer claim the highest rank as a branch of the art. We would rather three should be even that result, and success proportionate to the effort, than that from the face of the work there should be read only those greatest of deficien-cies, as to art sculptural or architectural, the confession of a failure, or of the inability to reach the perceptions of the public. But, we should dispute the conclusion that we should lessen the dispute the conclusion that we should essent the scope and out of art, by guiding its efforts. The different hranches of art have heen repeatedly trying to achieve what was beyond their powers, or that which could not be expressed by one art separately; and more would have heen in many cases done, by attempting less. The best sculpture, medieval or antique, is best scalpture, mediæval or antique, is that which is strikingly characterized by simthat which is strikingly characterized by sim-plicity—where the conception was such as could be expressed by one, two, or three figures, or otherwise where the separate parts of the series were, as we may say, im-bedded in a building, and so the links of the story or moral could be taken up and read. We do not, indeed, now want a building—a Parthe-non, a Wells Cathedral, or any miniature of a structure — we recours a monument mainly structure, — we require a monument mainly seulptural: but use must be made of architecture nevertheless, and considerable use, if a complex and a dillicuit theme is to be uttered; and if it is to ach the according or one and "moint a is to reach the perceptive sense, and "point a moral," and fulfil the ends for which alone 20,000%.—or whatever smaller sum—could be

justifiably expended. Although we have mentioned all the designs Antionign we note included all the designs which happen to have been selected, and some of the number more than once, we may further state that No. ⁸⁰, by Mr. W. Calder Marshall, R.A. which has received the first premium, consists of a statue of Wellington on a pedestal of red granite, at the angles of which are released allegerical futures as of Yalour are placed allegorical figures, as of Valour, Peace, Duty, &c.; whilst at one cud are groups-Peace, Daiy, &c.; whilst at one end are groups— —in one case, a mother with a child in her arms bending over the dead body of her husband; mental sculptare; hat and in the other case, a group intended to ing much that has bee represent Commerce and Agriculture rejoicing tending to a different co at the restoration of Peace. These several figures, with the statue and pedestal, stand on a lower pedestal of grey murble, occupying the oblong space intended for the site. The figures are shown as bronze; but the author says

marble might be adopted, with slight change in the drapery. We have already spoken of the merit of the modelling, and of the beauty of the design is a specific design of the design is a specific design of the design in many respects ; and have offered some other remarks.

In the design by Mr. W. F. Woodington, marked "Avon" (No. 56), there is barely an allusion to the military incidents of the Duke's life. Some of the models, from their height, were, we believe, deemed unsuitable to the enthedral and wave on that account minimal cathedral, and were on that account rejected but we observe that one of the number which occupies the greatest height in the Hall, is in the selected list.

We have described or referred to nearly all e other works which would seem to deserve the other works which would seem to deserve notice, but may mention No. 67—"Arma Virumque Cano," — which has a figure of Wellington scated, on a pedestal that takes the form of a tomb, with a door on each side. Over the door is a sarcophagns. At the angles of the pedestal are figures of War, Fortitude, Temperance, and Peace. Also, No. 71— "Pro Patria,"—which is a simple figure of the Duke, with the usual accessories of fources. all statusesone. on a general the figures, allegorical and statuesque, on a general inguises, angointa and several stages. A portion of the actual pedestal, however, takes the form of a circular building with a Dorie order—the intercolumon filled up. No. 72—"Justice"—is noticeable as having some attention given to the monimental requirements in grouping—in which the pedestal of coloured materials takes part,—but the sculpture is defective. No.75 part "Hope"—has a statue of Wellington, and alle-gorical figures of Britannia, Mars seated in front, History reciting the deeds of Wellington to a youth, and a figure representing Ireland. The figures of soldiers are at the augles of the The argures of soluters are at the angles of the pedestal. $1.0n_0.76--.82$ —which we have already referred to, there is merit in the ornaments and *rilievos*; though the excessively architectural character, the representation of a tomb, the grouping of the tiers of pedestals, and the Pagan idea of the recombance there are the result. grouping of the tiers of pedestals, and the Pagan idea of the recumbent figure on a surcephagus at the summit of the inonument, may all be objected to. No. 78—" Deeds, not words"— has a recumbent figure under a low arch, desti-tute of architectural detail. The arch supports a kneeling figure of Victory, laying a laurel wreath. The author of No. 79 has tried to solve one difficulty in the portraiture of Wel-lington, by showing him twice, at different periods of his career. In No. 82—" Virtutis fortuna comes"—

In No. 82—" Virtutis fortuna comes"— a statuc of Wellington is designed to he placed on a tall pedestal of clahorate character; hut 82-" Virtutis fortuna comes which forms a marked hackground to the figures, without contributing to the moun-mental effect. In No. 83—" Studies et rehus honcetis"—before mentioned, as having the form of a sarcophagns as a leading feature of the structural part—the sculptor scens to have had Michelangelo's Medici monuments in his nad Altenetangelo's Medici monuments in his mind. The reenubent figures here, are on one side a soldier of Assaye, and on the other a Highlander of Waterloo; the principal group is a figure of Wellington crowned hy Victory, and altended by Peace; and below are Britamia seated, and figures of Military and Civil Science. The architectural and senlptural elements are here well combined, and the general grouping is good. The pedestal, sarcophagus, and similar portions are of red granite; and gilt inscriptions are introduced.

The model just mentioned is the last in the collection; and we have now bronght our notices to a conclusion. Should it be inferred from the character of all the works in the exhibition is not creditable to British art, or that the dra-netice of the art being and the character of the should be the state of the second secon matic effects on which we have made observations, are generally sought in the models, we would observe that such is not the case. We have spoken freely of what we believe is wanting in many otherwise excellent produc-tions, to constitute them true works of monumental sculpture; hut we think, notwithstand-ing much that has been said of the collection tending to a different construction, that, as con-trasted with sculpture of the date of the monu-ments in St. P.ul's Cathedral and Westminster Abbey,-so often referred to as exhibiting the worst treatment of allegory-the models show [Aug. 15, 1857.

THE WELLINGTON MONUMENT

AWARD OF THE JUDGES

THE following is the report of the judges appointed to examine the models, submitted in competition, for a monument to the late Dake of Wellington :--

THE NEW WESTMINSTER-BRIDGE.

The question as to the site of Westminster-bridge has been at length decided in the manner for which we have contended, and this week the works have been recommenced. The committee of the House of We have conclusing and this matter of the House of Commons had previously met, and, after hearing the evidence of Mr. Stephenson, MP, and of Mr. Page, the Government engineer, agreed to report as follows :

* What was the use then of the lithographic plans, sections, and view of the proposed site, very properly furnished by Sir Benjamia Hall to competitors?-En.

gradient of the rondway as now proposed, and the gra-disat which would be consequent upon raising the bridge. The committee find that, according to the plan now yre, "Music," "Household Ecooomy," "Drawing posed, the roadway on the Surrey side, would be 1 in 45, and if the bridge was raised from 20 to 22 feet, the gradient, would be 1 in 27; that on the Middleser side the gradient, in 45. The committee are, therefore, of opinion that it bridge."

We might now take some credit for having held to We might now take some credit for having held to our views on this matter, in opposition nearly to all others. But in truth we could never comprehend how there could be any doubt on the subject of the site. The questions of headway, gradients, and effect in conjunction with the Houses of Parliament, had hear all corrections where the heart is the set. heen all carefully considered before Mr. Page's design heen all carefully considered before Mr. Fage's design was adopted; and the report above presents no new feature as to these particulars. Mr. Page's letter, which is alluded to, probably refers to the slight structural amendments recommodical last year, and which could hardly be deemed important enough to affect the principle of the constructural. The to affect the prioripie of the construction. The heads of the piles, we suppose, will be all cut down a few inches—so that there will be no risk of their remaining, during some minutes, shove the estitentating, turing some infinites, induce the esti-mated level of low water at certain tides; and some other improvements in details may be effected. It is considered by the eminent authorities who were consulted, that the hridge will be the better for the slight sulfed, that the bridge will be the better for the slight modifications: the engineer, we presume, willingly accords, and we will not question the propriety of the additional outlay. We do, however—whilst gladly giving credit for the motives to the stoppage of the works, and for the determination which is now made—repeat that no advantage could be derived from a course such as that which has been followed in the case of Westminster-bridge. If, on the one hand, failure in our puble works results from precipitancy, or ill-management of those melinionies which eaund he dispensed with oo the other, there can be no pro-gress, if changes, probably not much considered, are gress, if changes, probably not much considered, are to be introduced suddenly into a design that had ooce heen matured.

heen matured. We are not alluding to the case of Westminster-bridge, so much as to the practice,—for which the British Honse of Commons, perhaps, might be takean to account, as much as the Government. But here was a case in which there had been us precipitancy; where every interest and opinico had here herd, and a judgment had heen formed with the greatest care; in which works had heen actually commeoed, and a bare smouth of mover had been speet, and in and a large amount of money had been speet; and in which, positive outlay in the removal of what had been done, and inceletable sums in compensation, would have resulted from ebauge. We believe also that which may be added from the to time on the autho-rity, as to the condition of the old bridge, by no means warranted the inferences drawn that there was no actual danger from delay, and which inferences were ioconsistent with the assertions of several com-peteot authoritics whose evidence is on record. Also, percet authorities whose evidence is on record. Also, we may observe that a constant weekly expenditure, which would strike our readers as deserving of con-sideratioo, has been going on, merely io the mainten-ance of the works and plant. We will add motive

We will add uothing as to the advantages of the existing line of *route*, either with or without the other hridges which are required, having already said other hridges which are required, having already said enough on previous occasions, as in the course of our remarks on the several designs for the Gavernment Offices—which all, whether suggesting a new site or retaining the old, so clearly pointed to the decision that has heen made. It is ooly worthy of remark, that each one of the three designs for the general arrangement of the Offices and street commonion-tions to which premiums here here exceed, cheese tons, to which premiums have been awarded, shows the bridge on a site different from that which has now been addimed and adopted. The decision here only corroborates the view which we took as to the only corrohorates the view small value of thuse plans.

Therefore, repeating the expression of our thanks for the decision which we have recorded, we trust that neither tergiversation in the executive part of public works, nor precipitancy in the recentry part of selection and decision, will be allowed in future to militate against the desired progress, so much as they have sometimes done.

THE EDUCATIONAL DEPARTMENT OF THE BROMPTON MUSEUM.

THIS very important department is placed between the galleries of mechanical models already described and that portion of the five arts department which contains specimens of fact work furniture, ornamental brass and iron work, porcelain, and copies of the frescores of the Rafiadle school. It consists of a central passage, in which are arranged numerous objects, with a series of compartments on each side labelled, and io which are arranged the matters corre-sponding with the labels,

First, we have the space for " School Buildings and

Source cutching into an examination of these varies compartiments, it is ioteresting to glance round at the aids to education and general knowledge which are here gathered together, and contrast them with those in use less than half a century ago; and it might be worth while (particularly as the space required would not be large) to collect the helps which the school-masters and schoolmistresses who had to labour insters and sensolimistresses who had to labour amongst the large and industrious class of the Euglish people at the end of the last century possessed. Amongst those we shruld flud the "Horn-book," for very small boys and girls, the "Reading made Ensy," the Spelling-Book," disfigured by a few borrible engrav-Sham ooys also gives, the Accaning mate pray; the Spelling-Box," disfigured by a few borrible engrav-ings; a clearly printed edition of the Old and New Testament; and an "Arithmetic," complicated and difficult. We must not forget the "Copy-hooks," which the scholars or the teachers used to rule with which the scholars or the teachers used to rule with the help of round rulers : a that time no machines bad been invested for that purpose. The plan of consing ehildren into knowledge had not been thought of, and explanatory pictures, and others which would teach, as well as among, were discountenanced by most of the intermeters of worth in concentration of bings as expansionly pictures, and observations what of the instructors of youth, in consequence of being, as they supposed, "a means of drawing off the atten-tion." As a natural consequence of such a state of things, the lives of the little things during school-hours was one of such dry fag, that it was a matter of necessity to provide other persuaders than those by which we are here surrounded: amongst these were the birch, the instrument of earliest application,—the fool's-cap, and long red inscribed torgue of horrible appearace,—the hlack-hole, the cause, and in addition to those, a heavy clog for transts, with a chain to fasten it round the leg. Many not yet past the prime of life, will remember receiving puolsbment in old schools which, if practiced at the pressed ay, would eause the teacher to meet with the fate of a criminal, and make him to he generally thought of with indigcause the teacher to meet with the face of a straining, and make him to he generally thought of with indig-nation. A group of those persuaders placed here would cause many a pleasaot thought, by a comparison between them and the instruments by which they would be surrounded. The department of school huildings and fittings

The department of school hulldings and fittings contains large models of some of the most approved designs for schools of different descriptions, from which may be gathered many hints as to the most economical arrangement, lighting, heating, and veo-tilation. There are also various scats, tables, desks, and other matters, which may be most usefully ex-amined by all who are engaged in fitting up schools. There are, besides, various drawings and estimates of expenses. expenses

In the department of general education there exhibited a very large variety of alphabets (English aod foreign), of various sizes and plans, which now take the place of the "Horn-bock" of old. Many of and foreign), of various sizes and plans, which now ' take the place of the "Hora-book" of old. Many of these are most ingenious in their construction and arrangement. Here are also on the shelves numerons editious of primers, spelling-books, grammars, with-medics, histories of Eugland, &c. &c. &c. and many will be surprised at the extent and variety of this educational library : of "arithmetics" alooe there are about 150 different descriptions. The means for taching writing, from the simplest radiments to the most fluished lessons, are also exhibited. In this department are collected all the printed methods of diffusing general education, as in those of chemistry, mechanics, &c. are the books which teach each science; so that in fact, hesides the models, we science; so that in fact, hesides the models, here a large and valuable library of works on have have here a large and valuable library of works on education, which may he freely consulted by any visitor during the Wednesdays, Thursdays, and Fridays, which are set apart for study; and it may be worth while also to moniton that books oo those subjects will be received here and descriptious printed in fresh editions of the catalogue, recently published. The books may go either as gifts to the museum, or they may be left in charge for twelve months. These are provided for much contents in the formation of the set of the

they may be left in charge for twelve months. The space provided for music entains simple and advanced lessons, and the various methods of traching this delightfol art in schools and other-wise; and next to this is the department of household economy. In this space are arranged araw-ings of model haldluges, and other suggestions for improving both the interior and exterior arrangement of our deallines: there are variant models for the state of our deallines. of our dwellings; there are various models of fire-places, &e intended for the purpose of economising fuel. By means of one of the cooking ranges, it is said that, with a singularly small quantity of coals, a dinner for 100 persons could be got ready. Those matters are well worthy of notice, Amongst other objects is one which we must more particularly describe, hecause it is so simple, and would be usefu be useful iu conveyiog warm food, such as stews, soup, coffee, &c. to workmen at a distance from houses and fireplaces. This invention is from Belgium, and consists of a square box of such a size as to admit of the tight surrounding at sides, bottom, and top, with dry hay or straw, of any ordinary tin cooking vessel with a tight-fitting Id. When the pan is boiling, and the food ready, it should be lifted from the fre, the sparks cervfolly removed, and then placed in the casing of bay; and so completely does this prevent the escape of heat, that we are told the process of cooking will go on for some time after the pan has been thus packed. On even a small scale, this plan might be used for the coovergance of the food of workbeen thus packed. On even a small scale, this plan might be used for the cooveyance of the food of workmany or used for the coveyance of the food of work-men when at a distance from their homes. No doubt this portion of the unusenm will rapidly extend, for no department of education is of grenter importance to the middle and industrians classes than that of

no départment of education is of griener inoportance to the middle and industrians clisses than that of *Household Economy*. Drawing and the fine arts occupy a very large space, and as in the depart.ent of general education we find the first letters of the alphabet and tho first strokes of writing, in that of drawing we have lessons which enable the stutent to proceed from the first strokes of writing in that of drawing we have lessons which enable the stutent to proceed from the first strokes of writing in that of drawing we have lessons which enable the stutent to proceed from the first persverare will caable him to master the difficult yet beautiful forms of the human body, and the intrinst outlines of folging, Indicappe, and archi-tecture. We see here specimeus of drawing unaterials by several makers ; geometrical models, oingranos, &c.; an extensive collection of husis from full ex-amples of Greek and other art, and from nature; and those are to be purchased from a department of this museum at a moderate retail price. For instance, we uoticed full-sized casts of horses' legs, marked 4s. 6d.; architectural details, small casts of animals, at from 3s. to 5s.; and these prices will be very consi-derably reduced when the casts are bought in numbers, or when meeded tor the use of such schools as require assistance. It would want a great deal more space than we are able to devote, to mention the various drawing lessons, plain and coloured, which history deportment less worthy of uoties; and here here most strikkug feature is the arrangement of a history department less worthy of uotice; and here the most striking feature is the arrangement of a the most striking feature is the arrangement of a series of animals prioted in colours on Large sheets of stout calico, which is published by the Working Men's Educational Unico, and can be purchased at about 1s. 6d, each sheet. These prints are bold and effective, and well adapted to the purpose for which they are iotended. Our experience, however, shows that a set of these, cheaper in price, is required for the ragged and poorer schools both in the large towns and courty districts, Mr. Waterhouse Hawkins's large and clever litho-graphs of the restoration of extinct animals will here attract attection, and we must notice that one of the graphs of the restoration of extinct animals will here attract attection, and we must notice that one of the great uses of this Museum is, that here can be dis-played many large works required for ducational purposes which could not be exhibited in the shops of the booksellers; and many a schoolmaster of both Loodon and the provinces might, in search of mate-rials, travel the town round, and even then miss many matters of consequence which he would here see withmatters of consequence which he would here see with-out trouble. In the days of the Horn-book and birch nee or worker in the any of the horn book and mire men or worker could gain int little knowledge of the structure of their bodies, and great loss of life has been the consequence of that ignorance. Now, how-ever, we have large sketches for the use of schools of two, nave large sketches for the use of schools of the anatomical formation of the chest, and other parts, which may be familiarly explained. Many will thus acquire such a koowledge of "the house they live in," that they will be enabled to ever evils.

In the geographical department the collection of school-books on this subject is extensive. There is school-books on this subject is extensive. There is also an immense collection of maps, the production of England, America, Germany, &c. the larger of which are arranged on rollers, and ean be een-veniently consulted. Considering the importance-of a good geographical knowledge to the rising generation, we made an examination of many of the maps here arranged, and found, that although those produced in this country for the use of schools are neatly excented, they want that boldcess of both outline and colouring which is so necessary in schools are nearly executed, they want that boundees or both outline and colouring which is so necessary in the lecture and school room. A large coloured map which forms part of the series of American works oo education which has been presented by the New York Educational Board to this Governmeot, is well worthy of attention : certain parts are coarser than necessary, but the colouring is most effective.

The astronomical instruments, drawings, &c. pre The astronomical instruments, unaways, etc. Jus-sent a goodly array; a mongst them is a large mudel of a monster telescope, which is, however, mistaken by some visitors (not ill-dressed) for a curon, and some of the black, uncovered, and colettered globes are taken for cannon-halls. These mistakes show the necestaken for cannon-anis. These initiates so the used of sity of such institutions as this, and also the used of activity on the part of the schoolmaster. Many of the diagrams of celestial phenomena are well done, and of moderate pice.

In connection with chemistry, we have sets of apparatus and materials exhibited which can be pro-

cured at a cost of from less than 21. to 201. or 307. and current a cost or room ress than 2. to 200. or 307, and npwards. Here the hooks on the subject are also carefully collected, and in the various departments, in their proper phrces, are busts of Benjamin Franklin and others. In like manuer, the spaces for physics and machinery are illustrated by useful examples. In these the calico priots of the society above referred to are conscious. are conspicnous.

The catalogue of this part of the museum will be

The catalogue of this part of the museum will be found a useful guide, as well to those who come here as to directors and teachers of schools at a distance, for it contains a priced list of all the objects that are gathered together, classified; and it is very cheap. Crowds continue to flock to Broupton, and it is pleasant to notice that ou the public days a large number of those for, whose expecial ause this collection is arranged are in attendance; in the flue arts department intelligent workunen may be seen ex-amining and comparing the aucient wood carving and other works, with the French and English modern productions. productions.

ON RESTORATION .- CANTERBURY CATHEDRAL

THE restoration of ancient and dilapidated edifices I he restoration to assess importance, requiring serious, patient, and persevering research. To hecome proficient therein, a practised kowledge of the varieties into which all styles have been, or possibly varieties into which all styles have been, or possibly can be, exteeded, must be familiarly obtained; and the student must also examine the restorations made from time to time, in order to judge of their accuracy or errors. When his imagination can fill up all the vacancies of a muinel temple, church, easile, or man-sion; complete hroken and defaced shafts, empitals, which examples have a start of a whole the defaced shafts. windows, buttresses, finials, and all other details faith-fully; and obtain a visionary prospect of it, as it stood perfect from the tools of the free-mason, he may commence to lay down his measurement proceed with every chance of success. In Pointed architecture, on account of much difference in some details of the same class, the designer thinks he is at liberty to use any of these, when making good the old work, witbout any breach of order.

Where an edifice is a church or maosion, huilt within a certain period, by one architect, or from the same design, there exists searcely any difficulty; but works doue in different centuries, without any order of progress, the extension and repairs having beeu left to the caprice of some great improvers, anxious to display their skill, are quite different subjects altogether. Such ambition was in a great measure praisewortby, causing a competition which did, as it always will, when practised hononrahly for the exaltation of a chitecture, result in a high degree of excellence. Still these clashings of set styles would excellence. Still these clashings of set styles would he disagreeable to the eye, if practised in the present age, because they now seem so historically distinct; although, perhaps, the architects of those ages only considered them expansions and improvements of the same order. Nor would it be judicious to enter upon a restoration, with the latter conceptions, as the builders of those days, when introducing a newly acquired advancement amongst earlier and distinct phases, faucied, perhaps, that are for anone future time, when the older portious would require recon-struction, it sbould be done according to their modern taste. modern taste.

modern taste. The prejudice inhibed in favour of a particular section, when pursuing the study of Gothic, is ad-uissible; but it should never influence a person cagaged on a restoration. Nor is any danger to be approhended if the entire subject be perfectly under-stool, noless the mind is clonded by an illiberal youthful education. Even then a trabful impalse may be given to the imagination, by certain calm considerings, and by silent reflection on the result of all immature utions. if carried out I twould not all immature uotions, if carried out. It would not be wise of any person, however experienced may he his judgment, to pronounce dogmatically upon his judgment, to pronounce dogmatically upon a serious reconstruction, as long as he can qualify his ideas, by attending to the united optimion of a pro-fessional conneil. He will not lose any fame as an arebitect, if he throw aside conceited selfishness, and ask the optimion of another equally skilled with him-self. Let any reader look hack to those cras when architecture downided to be for the second se sell. Let any reader look hack to those class when architecture flourished, under the auspices of great and zealous men, and he will find that each galaxy of illustrious artists maintained a cordial communion of brilliant sentiments.

To restore Salisbury Cathedral, or the church of To Pretore Sumsoury Cambra, or Sologne Batalla, and to finish the construction of Cologne Cathedral, are simple practice (as before observed), in comparison with entering upon an edifice mixed with comparison with entering upon an edifice mixed with pairs were made under Queed Anne, and the disc two controllers, and defaced by anomalous repairs, Georges. center, and wilfal demolition. With reference to a The partial restoration resolved on through neces-small church or mansion, it may be lawful to notice sity, a low years since, gave Mr. Austin an oppor-the lates predominating type, and if that be stable touting of displaying hat ingrequity and talent. A and require little trouble, to make the portions that very great difficulty existed to pulling down Arundel are to come down of similar design. But it would be steeple, on account of its connection with the mave; necessary to examine carfully whether that style but this he cleverly overcome, and rebuilt a tower

were sufficiently free from debasement to warrant such a conversion of the older portions. Above all things, every erroneons feature introduced hy negli-gence or ignorance must be removed. Gothie from Classic, and reverselly, and this though modern work. Good old parts of a Mediæval huldling are also found successively in deay, according to age, leaving to the last style of that art every chance of heing spared, and waving the judgment of coutinning an older system, when its fragments are as shapeless as its system, when its fragments are as shapeless as its ntility is inappreciable

That a mixed restoration is beset with many difficulties, cannot be better exemplified than in the various specimens of Canterhury Cathedral, the construction of which extended over all the transitions of Gothieism in England. Religious edifices were framed of wood, previous to the Conquest; for Stowe, in his "Survey previous to the conduct; for scowe, in its Survey of Loadon," records the observation of King Edgar, in the Mahuesbury charter, A.D. 974;—" All the monasteries in my realm, to the outward sight are nothing but worm-caica and rottee timber and boards." The wooden structure having been burned down, Edmerus ays, "Langfranc built the new bards down that wrephale (or Lacouvie) after this down, Edmerus savs, "Langfranc built the new church, and that probably (as I conceive) after this chitch, and that probably us 1 concerve) after this new French form; and, within the space of seven years, he almost entirely completed the work, from the foundation thereof." This is the church begun in 1080, the new form leing the Norman, introduced by his "French architects and masons;" but Gostling seems to think, in reference to the foundation, that the great crypt is of the ninth century. In 1114 were commenced the towers of St. Andrew, on the north side, and St. Anslem, on the south; and, accord-ing to Ediments, " the oratory or choir, as far as from Ing to Landrus, the basis of the case of the structure of the great tawer to the east end, was, by the earc of Archbishop Anselm, cularged," which, from the chronicle of a nunk, Gervase, was destroyed by fire in 1174, four years after Beckett's murder.

In 1175 a reconstruction of the church was resolved on, and the design subjected to competition, in which it seems that William of Seus obtained superiority; hut having fallen from the scaffold, and received injuries that compelled bim to return home, the finishing of the "glorious" choir fell into the hands of William the Englishman, who also huilt the names of within the Englishman, who also finite the eastern transcript, Trinity Chapel, and Beckett's Crown, the last at the extreme cast of the fabric. In 1804, Henry d'Estria built the organ-series, and in 1879 were commenced a series of extensions, progressing slowly up to their conclusion in the reign o Henry VIII. The great transept and chapel of St Michael (oblique on the plan), arose noder Archbishop Sudbury ; the nave, cloisters, Arundel (north) steeple, and chapter-house, under Archhishop Arundel ; and the south, or Dunstan's steeple, was began in 1410, hot not completed till 1468. The northern tower appeared of the same age as the normern tower ap-goard of the same age as the nave, and Bishop Godwin snysthat it was "covered with lead pyramid-wise." The length of time occupied in building the south tower extending over halt a centary, it repre-sented the anomaly of tensities seuted the anomaly of transition, bearing no resem-blace to the other. In 1417, Herry IV, and Dean Novil's chapel were huilt; and ahout 1470 the Iady-chapel was erected, and the central (Bell Harry) tower was countenced; for, according to Somner, "the great tower in the centre, called Angel Steeple, remained such as Lanfranc left it, until Prior Saelling, who died in 1405, hegan to rebuild it; and his successor, Prior Thomas Goldstone the second, finished it before his death, which happened A.D. 1517.

Here are a series of designs, from Saxou to Per-If cre are a series of designs, from Saxon to Per-pendicular Gothic, connected together in one im-mease tabric, including every variety introduced during the lapse of five centuries. The view would have been a very indifferent one indeed, could it be seen as Salisbury; but as it stood externally, so many obstructions advantageously arbitrided the whole, an ordinary scretcher forcut its discorder in its part ordinary spectator forgot its disorder in its vast dimensions. Still, in the western elevation, the dis-similarity of the two towers before referred to, the nondescript porch, and the unmeaning window in the pediment, square with rounded angles, could not scenario, square with founded angles, could not seerge notice. Semi-circular and pointed window heads were to be seen in the same compartment, Internally, the entrance of the fine organ-sereen was filled in. The columos with screens between, at each difference of the series of the Internaty, the columns with screens between, at taken side of the eboir, were alternately circular and octa-gonal; apparently due to the talent of William of Sens, whose "new" form was so close to of Sens, whose "new" form was so close to Corinthian, in its capitals and mouldings, as to be almost mistaken for a classic order. To complete the debasement, a Corinthian altar-screen was introduced in the reign of Charles 11. and several barbarous repairs were made under Queen Anne, and the first two

similar to Dunstan's, which was a step in the right direction. Where he had to renew a lotter is pri-tion of the Norman, in the south-eastern transept, he did that in its pristine form; wherein he also acted did that in its pristine form; where to balancing the perhaps judiciously, with a view to balancing the features of the general plau. His internal improve-ments, including the throne, which exhibit a blending of two styles, taking into consideration the irregular character of the entire pile, are unquestionably ex-cellent, and, from his limited position, exempt from all callous criticism.

However, attention must be drawn to the fact that. during the transition of styles, every change was pro-gressive; and the moment an old form was neglected or set aside, never again was a church or moostery built in that fashion. Both in the Classic and Gothi orders, there is no iustance of retrogression either to he seen or on record ; and thus it may be easy to ne seen or on record; and thus it may be easy to conjecture what the ancient and Tudor architects would have done, had they to restore the dilapidations of an older date in a mixed building. And, as an opisodal remark, if the spirit of retorgression infla-enced their movement, as it has done modern enter-nets in arc there never would have more black that prise in art, they never would have accomplished the beautiful results left for men's admiratioo. Therefore it may be well to form a theory of this system, so Therefore successful in former times, and to avoid all retrogressuccessful in former times, and to avoid all retrogree-sion in designing to restore. If the aim of the mythologists and medievals were progress, and meu consider that they made their styles perfect, the view of a modern architect should be to stand stationary on that perfection, or to render his alterations as ap proximate as possible thereto.

Perhaps, it may be maintained, where a building is extensive, and every compartment requires a change extensive, and every comparimeter requires a change of position to view it, either within or on the out-side, it is not expedient to reduce all to the same style, in a renewal of the older parts. Others may urge a similar reconstruction of every peculiarity, for the purpose of identifying its age, and for the edifica-tion of modern professional aspirants. The zeal of a few alone would induce them to prefer a restoration rew along would induce them to proce a resolution of old errors and anomalies to the most perfect har-mony of a symmetrical style. With such opinions the caudid actist has nothing to do, when study-ing to arrive at perfect order in his design. Though it is necessary to restore faithfully the gurgoyles and other grotesque carvings in an old huilding, it does not follow that new buildings should be disfigured not follow that new buildings should be distigured by the illustrations of an age, the extinct customs of which need no looger he ridiculed. Neither is it fitting to revive the old "willow-pattern" figures, lozenge-work, or other *pseudo* decurations, in the glaring and offensive colours often resorted to still by the hearded professors of ceclesiastical frippery; since there are chaster modes of colouring, cultivated with the march of civilized art, exquisitely suitable to with the march of civilized art, erquisitely suitable (o walls and ceilings, and in unison with the solemnity of a saucitury. And, even in reuewing windows, it would be folly to introduce into stained glass lights subjects which, from simple truthful origins, have been pretermaturally blazoned by the legendary writings and perorations of conveutional enthusiasts. Restoration must therefore be divided into two sections, the unique and the identical,—the former when an edifice is restored to one particular style, and ever d detail fauished in accordance therewith: the

every detail finished in accordance therewith; the latter when everything has been renewed, without any change or improvement, and all errors even re-in-stated, with the fidelity shown by the Chinese tailor stated, with the fidelity shown by the Chinese failor, when working according to pattern. It would be unwise to argue in favour of either, as circumstances and necessity may decide the choice, even when the best inteution exists, to carry out a scheme magnif-cently. But as to the effect of studying the princi-ples of restoration, upon the minds of professional stu-deots, the benefits therefrom are too great to be detailed within the compass of a few works. Softlers it to saw within the compass of a few words. Suffice it to say that as, during those centuries called the dark ages, the hread of Mediæval grandeur was cast upon the with actual fidelity, the spirit of architectaral improve-neut will reappear in its former grandeur.

FRANCIS SULLIVAN.

NOTES UPON 1RON.

(From our Correspondent at Wolverhampton.)

COMPARATIVELY little iron has been manufactured in South Staffordshire, in consequence of the Wolver in South Stationships, in consequence of the Wolver-hampton races, which eams off on Monday and Tues-day, affording the men an opportunity of recreation, and their employers a favourable period for making those reprarations and improvements in the machinery of their works which are called for at tolerably fre-quent intervals when there is a good demand for nanacastared iron. Ou the Wolverhampton side of the theory theory of the state of the the district, the works remained elosed up to Thurs-day morning; and in the district hemming Birmingbarn and Dulley, the first two days were blanks at the malleable iron establishments. The exteot to which

these recreations are attended, may be gathered from the fact that last week the North Staffordshire races

the fact that last week the North Stanordsmure races were attended on one day by 27,000 to 28,000 per-sons, and on another by as many as 30,000 persons. These interruptions to business are acceptable only when there is no great demand; and in the existing state of the order-books those of the past week will not be asrively foil not be seriously felt.

Whilst from these statements it will be guthered that there has not been any alteration upon last week in the direction of improvement, it will at the same time be seen, from there having been a no greater delay than two days in most instances, that masters generally are not over-really to take advantage of a favourable opportunity for closing their works for a week, showing that orders are fortheoming of a number sufficient to require the full operation of the works. This, in the place of a numked decrease in the demand from the United States, with a falling off it the ernor trade to take which a falling off in the export trade to ludia, which was rapidly grow-ing, is a most encouraging circumstance, demonstrat. ing the healthings of the home trade in those great

The past week's nail from America has brought exceedingly fair promises, but exceedingly seanty order-sheets.

On 'Change at Birmingham yesterday (Thursday), and at Wolverhampton on the day before, there was a marked readiness to sell pig irou, but no disposition on the part of the long-established firms to giving way on the part of the long-established firms to gyving way in price, 44, 28, 6d, being asked for warm-air mine pigs. At the same time there are large quantities of another brand on offer, at 37, 10s. We have little doubt, however, that at least 28, 6d, would be split in the majority of instances in each of the brands which we have quoted, if there should be serious disposition to transact husiness. At the same time strike action of We have quoted, it there should be serious composition to transact business. At the same time stocks of pigs in the pards both of makers and consumers are low, and the weekly product of pigs is not a large weight in excess of the demund. A good order from a leading malleable-iron establishment would drive up whites et access, while cautions whitehalding on the rices at once; whilst cautious withholding on the art of these keeps prices easy, and the pig-makers as prices at a whole open to receive offers

METROPOLITAN BOARD OF WORKS.

AT the meeting of the B and on Fridsy, a delicate question, for the first time since its reliabilishment, was discussed with closed doors, relative to a report from the committee of the whole Board, stating the result was the committee of the whole board, storing in the re-of their investigation of certain particulars in the re-turn of fees mude to the Bnard by one of the district surveyors of the metropolis. It was stated that the return of fees in question had been falsified, and charges male that were not in accordance with the regulated scale of fees. For the present the considera-

regulated scale of rees. For the present the considera-tion of the subject is adjourned. The conclusions arrived at by the Building and General Purposes Committee were reported, and a copy of the report was ordered to the sent to the Commissioners of Police and the District Surveyors' Association. Association

Association. An application from Mr. C. Furber, surveyor, on hehalf of the Postmaster General, for the establish-ment and erection of a district post-office, at No. 1, ment and erection of a district post-ones, of Moor-place, Kenniogton-road, was approved of, o the recommendation of the superintending architect. on

PROPOSED PURCHASE OF PREMISES FOR ARCHITECTURAL SOCIETIES.

Our report last week of the proceedings at a in Conduit-street, to be occupied hy societies con-nected with architecture, has shown our readers that the lastitute has entered warmly into the project, and are willing to hecome the tenants of part of the pre-mises. The resolution come to by the Institute was mises. this :---

this :— "That this meeting, having received the resolution of the Premises Committee, communicated through the council, hereby anthorizes the council to prosente such further negotialions as they may think fit with the pro-puter, and they premises, No. 9, Conduit-street, Regent, etc., and they premises, No. 9, Conduit-street, Regent, the Boyal Iostifute of British Architects may obtain for a term of years, on lease, the amount of accommodation how upon the plane now exhibited, at a rent not exceeding the term of the part of the council the termination of any such negotiations will be fore that the termination of maximuc they are hereby authorized to hring them to a close, reporting authorizes the council, in the event statem, the meeting authorizes the salower referred to, to expend at not any such contrast as alows referred to, to expend and not such committee." The this meeting authorizes the council, in the event to, to expend a two any such contrast as alows referred to, to expend a two any such contrast as alows referred to, to expend a two any such contrast the subarties of the meeting for the purposes of the Institute." The Architectural Exhibition Committee will take

The Architectural Exhibition Committee will take a another large partion of the premises; and indeed t there seems little doubt of tenants encugh at starting to pay a fair per-centage on any fair expenditure for the house, if the matter he properly managed, as we have no doubt it will be. Under the Limited Liahi-lity Act, individual sharebolders will run no risk beyond the amount they may subscribe for, and it is to be expected that all the shares will be taken by architects, who will thus become their own landlords. It is a good roomy sound house, well placed ; any circumstances, there seems to be so little risk of loss, that we may pretty confidently avise our readers to take shares, urging upon them that they may thus alvance the professional status with every reasonable prospect of obtaining a far return for their money.

PROVINCIAL NEWS.

Reading.—Varions improvements are here under consideration, to which the sanction of the ratepayers is looked to: The scheme combines the creation of n new police-office, with court, magistrates' room, de-tention cells, &e. an extrance to the public markets in Friar-street, corresponding with that in Broad-street, and divingences aud giving a more extensive area.

Herford.—The improvements which have been carried on in this town during the last few years, says the local Mercury, must be regarded as indications of local prosperity. There has been no building mania. local prosperity. Incre has been no building manua. On the contrary, there has been a want of enterprise and courage on the part of the builders, which is rather surprising, seeing that, wherever a house has has been built, it has been immediately occupied. Nevertheless, considerable additions have been made to the town during a short period. Almost the Neverthetess, considerable additions nave occus makes to the town during a short period. Almost the youngest man amongst us can recollect the erection of the Port-vale suburb; and the Ware-road suburb is the creation of the last five years. It is worthy of mention that these extensions have become necessary for the accommodation of persons whose business lies in the town. Could land for villa residences be procured on the north side of the Warc-road, we procured on the north side of the ware-road, we might hope for a new population from London, from amongst a class who would certainly prefer dwellings amidst the scenery of Hertford to the tenancy of "a house in a row" in the overcrowded streets of Tot-tcubam or Edmonton. But it is not alone in the extension of the town that we find the proofs of prosextension of the town that we find the proofs of pros-perity. There are various improvements which tell their own story.

Decomport.—The plans of the proposed public park at the Brickfield have been propared, giving in detail the proposed alterations, and have been approved of at head-quarters. The War Department have offered the ground at 1007, a year. That offer is now before the committee of the Council.

hereometrice or the content. Derby.—A project for a Crystal Palace at the Arboretum has here started, and at a recent meeting of the Arboretum committee, resolutions were adopted to the effect, that drawings, together with plans and estimates of the proposed huilding, be made and had before the public, and a subscription raised for erecting it; that a huilding fund account be opened, and 600% be paid over from the Arboretum funds to that account, and that the secretary solicit subscriptions to this fund. The cost of a huilding of the desired size will be over 2,000/, and promises of assistance have here given, among which Mr. H. Bodes, of the Grange, has promised 100/.

St. Helens .- This town is undergoing some sand b. neteros. This town is undergoing some sami-tary and other improvements. The Sankey brook running through it for many years, and a great nuisance, is being pared with flag, haid in Cy-dopean order; and an engine-house, cottage, stables, &c. are also to be creeted by the local commissioners, accord-ing to drawings furnished by Mr. McManus, the ing to drawings furnished by Mr. McManus, town surveyor. Mr. Charles Bishop, one of the c missioners, is to erect a fountain in the centre of town, the commissioners supplying the water. The erection of haths, it is expected, will soon follow. The relevant of himsy is a capacity, with software with a software company. Castleford .- The foundation-stone of a building

for the Local Mechanics' Institute was laid o 3rd instant. The building has been designed by 3rd instant. The building has been designed by Mr. D. Dixon, of Lock, and the contractor is Mr. D. Sykes, of Castleford. The building will comprise a lecture-room, 50 feet long by 34 feet broad; a read-ing-room, library, class-rooms, &c. The estimated eost is 800!. a large portion of which has been subseribed

Gulashiels. -A public meeting was held here last Guidances.—A phone meeting was made a town-week, to consider the propriety of creeting a town-hall, when it was proposed, and unnuimously agreed to, that a committee be appointed to look out for a site, and ascertain the probable expense, and that the capital required should be raised by the creation of stock in shares of 1/. each.

THE WORKING CLASSES.

I Ar sure that all those who have had the oppor-tunity of becoming acquainted with the artisans of London and other large towns will agree with you as to the facts stated in the leading article of your number for the 18th ult. (p. 401), and that the great balk of intelligent working men will be girld to read the plain and earnest manner in which your opinion has been given. It is quite true that but few of these who enjoy rank and wealth, are aware of the those who enjoy rank and wealth, are aware of the has been given. It is quite true that but few of the makers of our laws, and the chief portion of those who enjoy rank and wealth, are aware of the intellectual superiority of a large majority of the working classes who are anxiously watching the progress of events, and it is unfortunate that for years this class which, as you observe, "so largely con-tribute to the strength and happiness of the country," have been so left without consideration from those above them in working residence to whith formers above them in worldly position that a spirit of some-thing like contempt and animosity has risen up on the part of the artisans against the upper classes.

In small towns and country will leges a friendly communication is kept up between "the hall " and "the cotting," and those of various grades are knit together hy various acts of kindness and interes". Logebber hy various acts of kindness and interest. The elergymmn in most instances is acquinited with his flock, both rich and poor, and on Suudays the poorest pessents in their plain yet picturesque sunck-froeks, and their homely-dressed yet neat and cleanly elad children, form a sight which few can witness without plassure. In such basy hives of people as this metropolis, this community of feeling has been too much ent off, and

community of feeling has been too much ent off comminuity of leeling has been too much ent ou, aus so isolated are the people from each other, that it often happens that a person is not acquaiuted with bis next door neighbour; and io many instances so large is the population entrusted to the care of one elergyman, that it is almost impossible that he can much premare and acculate with a to be houses in bis The provide the processing the provided the processing the process

act the prejudice and danger which have arisen. It must be granted that the difficulties in the It must be granted that the difficulties in the metropolis are great of keeping pace with the won-derful increase of the population. Not many years ago the population of St. Paneras was of trifling amount: now it is nearly 200,000. The growth of Islington has been nearly as great; and the same words will work to the phene. It is heremore remark will apply to other places. It is, however, nust important that a system of house to house calls should be made by each of the parochial elergymen of all thickly-peopled neighborrhoods. I know that this practice has been carried out with the best effect in several of the poorer parishes of London. In almost every instance the visits of those continue who have they are meaned followed their London. In amost every instance the visits of mose genilemen who have thus so properly fulfilled their daty, were received with the best f-cling by those who even differed from them in opinion; and it is a satisfactory fact that those calls have led to many who had not done so for years becoming regular in their attendance at church; children were taken to be the source of the actioned by the actional contheir attendance at church: children were taken to be baptised, and many were sent to the national and other schools, who but for those friendly visits would have been growing up in neglect. I have not the least doubt, from the experience I have had of the disposi-tion of the working classes of several large towas, that this system of kindly visitation would form one of these "to easil bridges" to which you have inof those " social bridges " to which you have already referred, and which in a measure would be the meaus referred, and which in a measure would be the means of joining together our at present disjointed con-ditions of society. By those visits the elergyman would become acquainted with the feelings and re-quiremeets of those inhabiting his district: bis friendly advice would he the means of adding largely to the numbers in the schools, and he would be enabled by personal communication with the youth who are in course of training in various trades to index who are in course of training in various trades to judge how far they might be benefited by classes, lectures, libraries, &c. in connection with the national schools, which might be made available after working hours. which might be made available atter working hours. Moreover, the Established chergymen would, by this koowledge of the ability, honesity, and good feeling of the majority of our skilled mechanics, be able to dispel by their evidence the often hastily-formed and wrong opinions of these who move in a higher position. In all attempts to move amongs the working elasses, it should he borne in mind that the working elasses, it on the require the intraviout of ill-indepal

classes do not require the intrusion of ill-judged charitable offers; but I am sure, if they are met in a charitable offers; but I am suce in they are include frank and kindly spirit by those whose duty it is to eulivate their acquaintance, it will be found that great good will be the result; and, appreciating the excellent services of the missionaries and others, I must still urge the necessity of the dergymen them must sim urge the accessive of the Gergement atom-selves taking this matter up; and if at the time of those friendly visits they could glance at sanilary conditions, nucl, when needful, give a word of advice, the benefit would be much increased.

A WORKER.

THE BUILDER.

Aug. 15, 1857.

MIDDLE TEMPLE HALL, LONDON.

462

THE Knights of the Red Cross, first living humbly in Holborn, removed to the new Temple in 1184, where buildings of cost were erected for them, including the church (which for-tunately remains as a choice example of the unitiestic of the section of the section of the tunately remains as a choice example of the architecture of that period), a hall, and varions other offices appertaining to a monastic establishment: here, during a time of prosperity, the knight dispensed a spleudid bospitality, and kings and other magnates were not unfrequently their mosts. their guests.

their guests. In course of time a change came over the scene; the knights had become too powerful and dangerous to the established government; their mission to the East was no longer looked upon as of importance, and, as a matter of policy, the vast property of the Templars was confuscated, and the order suppressed. After the men of the sword, there came to this site those skilled in battling with the pen and tongue, who have, since the beginning of the fourteenth century, held their own in this place, increasing much in numbers, influence, and ridbes. Spenser speaks of—

and riebes. Spenser speaks of-

"Those bricky towers The which on Thames' bank doe ride, Where now the studious lawyers have their bowers, There which wond the Templar Knights to bide, Till they decay'd through pride."

The church escaped, almost by miracle, the great fire of 1666. Antiquaries would be glad if the ancient hall remained too, but this was removed, and the hall we now see there was built in its stead, in 1572. As a specimen of the work of that time it is creatingly intermediate.

The wainscoting has a large number of shields amon st the trees has attracted much admira-of arms, some of which are curious. Along the length of the hall stand rows of massive tables and scats, some of them probably as old is the building. At the end of the hall is a slightly mised dats, with a recess towards the concession of the concesion of the concession of the co

slightly taked data, with a recess towards the river, lighted by a window, also filled with painted glass. The green trees, and well kept grass-plot, bordering Father Thanes, form here, when the windows are open, a pleasant picture. At the end of the hall, where the best light following the memory is if the following the best light

falls, is a large portrait of Charles I on horse-back, and some others. In an honomrable posi-tion here are also fine busts of Lords Eldon and tion here are also inc busts of Lords Fidon and Stowell, both members of this 1nn, and other matters of interest. In this hall one, at any rate, of Shakspeare's plays was acted, very shortly after its composition in 1601. But for the large chandeliers, not very good in form, of burnished gold, and ill-formed shades for the gas-ligbts which are now need (onitted in our view), it would be easy to fancy the Feasts of Peacocks and other for the when kings and Peacocks, and other fee tivels, when kings and their courts were entertained by the legal Templars, and grave judges in the hall were wont in the senson to nubend. At Easter time the fire-place in the centre of the hall was decked with shrubs and flowers.

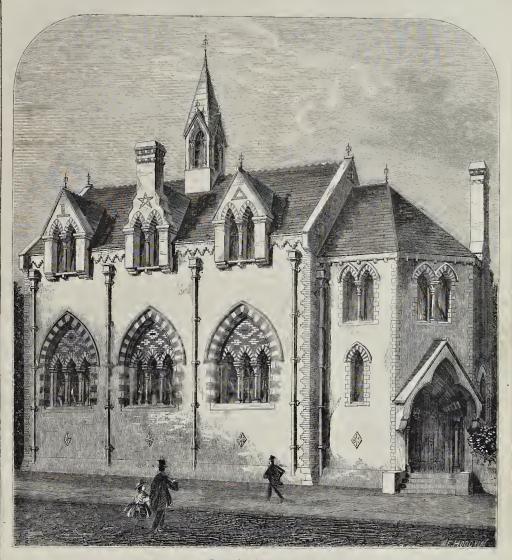

In a portion of this building which now belongs to the Middle Temple, the library is arranged, evidently, both as to readers and to great fire of 1666. Antiquaries would be glad if the ancient hall remained too, but this was removed, and the hall we now see there was built in its stead, in 1572. As a specimen of the work of that time it is exceedingly interest ing,—as much so as anything in Loudon. On entering the hall, few visitors can fail to be struck by the fine effect of the light and shadow. The roof is of dark oak. The windows on each side are filled with the armorial bearings of benchers, and other diguitaries of the Inns.

CORRESPONDENCE ON THE COMPETITION DESIGNS FOR THE PUBLIC OFFICES.

for the following reasons:— The instructions given to competitors were admi-rably and elearly drawn up. An outline of the ground-upon which the buildings are proposed to be erected accompanied these instructions, and it was understood that this outline was not in any case to be creeeded. What shall we say them to those architects who have not attended to these instructions, who have, in fact, thrown them aside, and who have disregarded the. value of the properties in connection with the spot in question ?

value of the properties in connector when we pro-question? The plan now under consideration, composed by M. Crepinel, of Paris, is, I repeat, very beautiful in its outline, but is it calculated for the spot where it is intruded to be creeted? Does it adhere to the in-structions, or will it be injurious or otherwise to the buildings in its immediate neighbourhood? In the structions, or will it be injurious or otherwise to the haidlings in its immediate neighbourhood? In the irst place, it exceeds very considerably the outline upon which the buildings are proposed to be creeted; it sweeps away the whole of Great Georgo-street, north and south; it extends into St. James's-park far beyond the reserved line, and it removes Rielmond-terrace. By the block of buildings hetween Parlia-ment-street and the Thames, it obscures Sir Charles-Barry's building; and in approaching from Whitehall' the whole of that building would be concealed, as well as the greater part of the Abb y. How is it, then, that this design has been accepted, and that the first-prize has been awarded to it? Surely some con-sideration ought to be paid to those who have abided by the instructions. by the instructions. The remainder of the plan, as regards the streets,

THE BUILDER.

BUILDING FOR THE FREEMASONS' LODGE OF ST. JOHN'S, TORQUAY .--- MR. EDWARD APPLETON, ARCHITECT.

may soon be dismissed. It is a *bean idéal*, made of the internal doorways. The roof will be open without any regard to the value of property. I might so well take Sir Christopher Wren's plan in my band, room is to be laid with parquetric. Our *Ma*-and propose straight lines of streets as far as St. Paul's without any consideration for vested interest. The great merit of an architect, I conceive, is to adapt *porch*, dormer, and tessellated *paring*. The east The great ment of an architect, 1 conceve, is to another his conceptions to existing circumstances, and to meet the difficulties which may present themselves, with the least possible injury to individuals. No doubt the plan which M. Crepinet has proposed would be very beautiful, but is it likely such a plan can ever be carried into effect? VIGNOLA.

MASONIC LODGE, TORQUAY.

Ar the end of May last, the first stone was laid of a huilding about to be crected in Tor-quay, for the Freemasons' Lodge of St. John, No. 411. The annexed engraving is a view of it. Mr. John Harvey, of Torquay, is the con-tractor for the works. Mr. Edward Appleton is the architect.

OPENING OF THE MANCHESTER AND SALFORD REFORMATORY.

SALFORD REFORMATORY. THE building recently erected at Blackley for the Mayes.strect Reformatory School was formally opened on the 7th inst. by the Bisbop of Manebester, under the auspices of the Earl of Shaftesbury, Lord Radstock, and others. The building stands about half a mile to the northward of Blackley Church. It has been con-strated by Mr. Rohert Neil, builder, Strangeways, from plans furnished by Messrs, Cawley and Radford. It is a plain brick building, with stone facings, and convenience of internal arrangement has very properly been more attended to than beauty of external appear-ance. The ground to be enclosed, and which bas cost the committee 1,550', amounts to nine statute acres. The building faces the south-west. The entrance is

by a large gateway, which runs through the hailding to a yard behind. To the left of this arcbed passage is an entrance-hall, from which the stairs ascends to the dormitories, and from which a corridor leads up the centre of the building, dividing the rooms in the front from those at the hack. At the foot of the stairs a door leads into the committee-room, if fort by 14 feet, from which there is also a door leading into the dining-hall and selool-room, an apartment 40 feet long hy 20 feet broad, and 16 feet high. At the back of the ground-floor of the building are a hath and laratory, laundry 14 feet by 13 feet, store-room, kitchen 17 feet hy 14 feet, for 28 feet, the largest part of which is a workalop, and the lesser and furthest removed, the foul washhonse. The master's house is in a line of buildings to the right of the entrance-ball. On the ground floor are sitting room, by a large gateway, which runs through the hailding entrance-ball. On the ground floor are sitting room, kitchen, scullery, and pantry, and at the extreme right an enclosed yard, from hebind which a huilding extends which forms a workshop, 35 feet by 15 feet. There are various other accommodations, in the shape There are various other accommodations, in the snape of dormitries, probationary and refractory wards, &c. The extreme length of the huilding is about 150 fect, and it covers an area of 482 square yards. The cost of the land and the building contract The cost of the hard and to be building contrador amounted to 3,224.4; furnishings and extras swelled it to 3,724.1; und about 4001, will yet he required to complete the work, making a total of 4,1001. Of that amount, 3,700.1 has been subscribed, leaving only 4001, to he supplied. The huilding was designed for forty boys, between the ages of twelve and fireen, though accommodation might he found for fifty to sixty: and the cost of forty hoys would be 8000, per annum. At present an allowance is received from the committee of council; hut mnre would he obtained if the school was registered nuder Lord Palmerston's Act.

CHURCH-BUILDING NEWS.

Great Baddow. — The parish church of Great Baddow has heen re-opened for divine service, after having had extensive alterations earried out. The old and maightly pews have been swept away and replaced hy others of a uniform width and height The floor, which sloped considerably, has heen levelled and paved with terro-metalic tiles. A new do painted Gothic, with Bath stone dressings, has A new door, in erected in the chancel, a realing desk, in old oak, constructed upon the north side of the middle aisle, and the pulpit, which was carved, and dates from the constructed upon the north side of the mouth asset, and the pulpit, which was carved, and dates from the year 1639, is thoroughly restored. By these altera-tions, about one hundred free sittings have been obtained, a considerable portion being allotted to the aged poor. The works have been executed by Messrs. J. and R. Sorrell, of Great Baddow, according to the plans of Mr. C. Ainslie, of Londom, architect. *Holt.*—Through the liberality of a professional was then are then are the arrise heurch, as a the

gentleman of this town, the parish church, says the Norfolk Chronicle, has been embellished with the following ornameutal windows, and it is hoped that the example will be followed out by others with a rearrangement of the pews. A short time since, the south chancel window, within the altar rails, was filled with stained glass by Mr. Jas. King, of Norwich. Inlied with standed giass by Air. Jak. King, of Norwich. The window consists of a quarter-foil and two lights in the quarter-foil is "the Lamb standing upon the Bible." the two lights are divided into three sub-jects, the first on each side, "weeping angels." undermeath these, and in the second division as it were, "Moses representing the Old Law," and on the as it aud on the were, alloss representing the Old Law, and all the opposite side, "St. Join the Baptist as the type of the New Law?" under these is the "death of the first-born in Egypt," and opposite, "the resurrection of the first-born is beneath this window, on the chancel wall, is a brass plate, in searce and black letter. Within the last two weeks, the five south clerestory windows have been filled with stained glass, elerestory windows have been filled with stained glass, each containing three lights and two crecket lights, by Mr. Wales, of Neweastle; the subject in four of the windows heing the "passion of our Lord?" with alternate borders of blue and scalet. In factirst light of the east end is the cross with the spear on one side, and the stick with the sponge on the other side: the middle light is morely filled with stained side : the middle light is merely filled with stain glass and a ventilator, whilst the third light represen the coal and dice. The second window of the outside lights has "the erown of thorns, with the lantern and sword and staves." The middle window consists of the emblematical devices of "the four apostles spoken of in the Revelations," whilst the centre light has

mullion in the whole five windows, the rest being wood: these have all been replaced with stone by Mr. Freeman, of Aylsham, and as a safety guard, the

outsides are all protected with copper guards. Lawshall.—The ceremony of re-opening the church Lawsnatt.—Inc ceremony of re-openeding the children of this parish (which has undergone extensive repairs, at the sole expense of the rector, the Rev. E. Ballie), took place on the 6th nlt. The new floor is of oak, the passages composed of red and black tiles, mixed with Porliand stone. The straggling old pews, en-combering the hody of the church, have been removed, and ext benches and chairs substituted. The amount The ancie and oak benches and chairs substituted. font remains, and the new oaken canopy is earved The pulpit, lectern, and reading-desks, are of carved of carved oak. The porch is rebuilt and paved. The chancel (also re-hnilt), vestry, and organ-room, are in the early English style. The latter is divided from the carly English style. The latter is divided from the chancel hy a pierced and monifed oak sereen. The edifice is lighted by numerous lancet windows, several of which are of stained glass. The celling is decorated. The pavement of the chancel is laid with encaustic tiles, figured. The architect employed was Mr. Butterfield. Mr. Ellistou executed the woodwork, Mr. Grimwood the hricklaying, Messrs. Keogh (Brothers) the stone-masonry : all are of Sudbury, Suffolk

Buckingham. -A congregational church has been Buckingham.—A congregational church has been erected here, and was opened on the 5th instant. The building, which is in the style of the latter part of the thirteenth eentury, and is similar to Christchurch Chapel, Banbury, consists of a nave (with end gal-lery for the school children), and one nisle, together with minister's and deacons' vestries, entrance lobby, and porch, and will seat about 500. The internal length is 70 feet, and the width 38 feet. The roof is onen to the timbers, and eensists of is y arched hamopen to the timbers, and consists of six arche open to the timbers, and consists of six arened nam-ner-beam transses, enriched with light shafts and carved tracery panels. The nucled ribs support an innor celling which forms a ventilating chamber he-tween the chapel and the external air. The nave and aisle are divided by an areade of four compartments (the columns, explicitly, and springing of the arches being of energy corresponding with which on the being of stone), being of stone), corresponding with which, on the opposite side, are two arches opening into the vestries. which are separated from the chapel by traceried par-closes with curtains. The seats are open, with eut clhows, and, together with the other internal fittings, are stained and varuished. The porch, lobhy, and passages, are floored with red and black Staffordshire provides, the fourth with the state of the interfor will be of a uniform have colour. The huilding will have lighted by metal gas standards, of mediaval character. The windows are glazed with cathedral glass in lead quarries. Owing to the limited extent and confined ture of the site, the architectural features of the ature of the site, the architectural relations of the exterior are principally restricted to the front eleva-tion. This consists of a lofty gable, the principal feature of which is a triple window. The heads of the lights me fitted with geometrical tracery. The principal gable is financed by a turret containing the ellow subscience and activities. gallery entrance and staircase. The walls are huilt with Cosgrove stone, with Bath stone dressings. The building has heen executed by the contractor, Mr. E. Chesterman, of Baubary, under the direction of the architects, Messrs. Fosters and Wood, of Bristol. The arming apparatus was supplied by Messrs. Haden, of Trowhridge.

Bridport .- The parish church of Bridport is to be restored at a cost of 1.2007.

Bromsgrove. - A meeting of the Bromsgrove Dromagrove. — A meeting of the bromagrove Chareh Restoration Committee was held on the 7th inst. for the purpose of receiving teaders for the work. Tenders had been obtained by writing to different individuals, and some of the subscribers to the fund field dissatisfied with this mode of proceed-ing. The tender of Mr. Cooper, of Derby, heing the lowest (2,800t) was accepted. The work he contracts to do for that sum includes the restoration of the edifice, new pewing, and removing the galleries. Several things necessary to the complete restoration of the parish church will have to be carried out by others

Bebington .- Christ Church, Higher Bebington, designed in the first Pointed style, and will consist of nave, north and south aisles, chancel, organ, chapel, north porch, and sacristy. The principal cutrance will be through the north porch, and there cutrate will are through the most porch, not have will also be two catranees one on the west and one on the south. The total inside length of nave is \$4 feet 7 inches, and of chancel 28 feet, in all 112 feet 7 inches; width of nave, including aisles, 51 feet. There will be a loty elevestory to the nave, will be seven three-light windows each side. The roof of in the Revelations," whilst the centre light has three devices, a figure of the Lamb holding a banner with "Ecce Agnus Dei," above this Alpha and Omega, and underneath, I.H. S. The fourth window represents "the bead of Judas Iscariot, with the thirty pieces of silver, and under, the tope with which nor Saviour was bound." The fifth represents "the nails, bammer, and nippers, with the solar works were removed, it was found that there was only one store

plaster heing used in the church. The passages porch, and chancel will be paved with tiles. The west window, of six lights, will be of considerable size, and the cast or chancel window, of four lights, will be and the cast of changed whow, of four lights, while we filed with tracery. The beight of nave, from floor to top of roof, will be 47 feet, that of the changed 36 feet. The pulpit will be of carved stone. All the stone, both externally and internally, will be from the Storeton quarries. A tower and fofty spire are intended to be built at a future period. Part of the aisles will not be built at present. All the be asises with not be built at present. All the benches are to be open, without doors with carved ends, ---and a considerable portion free. The church will have accommodation, at first, for 500 persons, and when completed for 690. Mr. Walter Scott, of Birkenhead, is the architect, and Mr. James Rout-

Birkenhead, is the architect, and Mr. James Rout-ledge, the contractor. *Linerpool.*—Stanley Church, Old Swan, has been re-opened. Two stained-glass windows, the gift of Mr. W. Preston, have been added to the chancel, representing the Conversion of St. Paul and the Deliverance of St. Peter. Other two windows have heen fixed as memorials, one representing our Saviour reproving Martha, with Mary sitting at his feet; the other, the two Marys at the Sepuldene. The windows have a'l heen designed and executed by Messrs. Forrest and Bromley, of this town. *Coventry*.—Holy Trinity Church, Coventry, has heen eleared of old pews, galleries, white and drab wash, and reseated with eak open seats, with poppy heads. The whole of the seats in the south transcept and the south side of the nave are free, and are now always filled by the working classes.

always filled by the working classes

always filled by the working classes. *Wantage*.—The old parish church of Wantage, which has been under repair since May, 1856, has now been re-opened. The edifice, which still retains's portions of "twelfth century work," had been en-larged, and encased by architecture of the sixteenth century, when the third Pointed style was hecoming debased. The work of this date, though of a very carse description, and in its details far from pleasing, gave hetter proportions in length and height; hut heing of a very indifferent character, it was every where falling into decay. The multions, erumbling to pieces, were nathend here with plaster, and there with wood, patched here with plaster, and there with wood, washed to imitate stone: the roofs, hardly keeping out the water, were in places threatening those who might gather together under them : the area of the building was choked with high pews, and its arches were enubered with heavy galleries. These have been removed. A new your of considerable higher pitch than the old one has been raised over the ebaucel, the interior woodwork of which is left open and varnished. A new east window has taken the place of the old one. In character it is in keeping and varmisbed. A new east window has taken the place of the old one. In character it is in keeping with the original middle Pointed window, the re-mains of which were found a few years ago imhedded in the chaucel walls. It is of five lights, with a large eircle, cusped with open work in the upper part, and is filled with stained glass. The two northern and is filed with standed glass. The two normer and southern lights control figures of St. Peter and St. Paul (to whom the church is dedicated), and of St. John and St. Andrew: the middle light represents the Incurration of our Lord, and the circle above the incurtation of our Lord, and the encode cover contains the Crucificion. New eleventor windows, of simple design, have also heren inserted; and a reredos in stone, markle, and alhabster, has been raised behind the altar. The floor has heen laid with encantic tills. The window is the work of Messers. Hardman, and the floor was laid by Messrs. Minton : in this prevent there is a considerable admixture of bright green tiles. The remainder of the ehurch is floored with Minton's tiles, in a simpler pattern. The south transept has received a new win-dow, of similar style to that in the chancel, but of simpler design. Iron stalls have been placed under the central tower, the roof of which is ground in stone. A pulpi of stone and alabaster, of the same character with the reredos, has been placed in the nave, the roof of which has been thrown open, felt and boarding heing placed between the lead and the rafters. The whide of the stonework has been made good, within and without. Messrs. Keut, of Wantage, builders, were the contractors. Shields.-The Roman Catholics of North Shields

have resolved to creet a memorial to their late pastor, the Rev. Thomas Gillow. The memorial is to consist of a new tracery window, filled with stained glass, to he placed in the south side of the ebapel, and also a carved monoment, to be placed near the entrance outside. The committee have selected the designs of

open timber ouc, high pitched: the pillars which support it are of iron, with ornamental capitals. In allusion to this edifice, the *Gateshead Observer* says, "The commonalty *will* give nicknames, and the new church in Blackett-street has been dubbed 'The *Given U*, and the mean-black is carticily as a triling church in Giraffe!' a Giraffe !' and the resemblance is certainly as striking as that of certain stars to Bears and Chairs,-which is not saying much for the likeness.'

BLUE BRICKS.

BLUE BRICKS. ANOTHER "Clerk of Works," in reference to our correspondent's question on this subject last week, says he very much doubts the possibility of staining bricks so as to correspond with the hlue jamb bricks, and the difference not be perceptible to a practical eye; "and to produce am imperishable qlaze, or one equal to and corresponding with the jamb brick, on the face of the common red brick," he continues, "I think would be equally difficult. But why not make moulds of those of the arch bricks in-tended to be blue, and hand them over to the Stafford-shire manufacturer, to be made and treated in precisely shire manufacturer, to be made and treated in precisely the same manner as the jamb brick ? By this method of treatment he would be able to produce a uniform tone and quality throughout the building, and, in the tone and quality throughout the building, and, in the end, as economical as the artificial means of staining. He does not describe the length of the arch hrick, but should it he so long as to cause a doubt as to its retaining its proper form when exposed to the fire, cut it in two at the cross joint immediately on taking it from the mould, previously to being dried."

"One of the Craft," says on this subject,—" As the glazing should be indelible and a component part of the brick, I much doubt if it can he done; hut if it is to he obtained at all, it must be before the bricks are laid. The following, I think, may be the only means: —After the hricks are cut and rubbed, wash them with water, sufficient to remove all dust from them, and when dry, apply the staining and pigment for fixing and glazing the same, as used hy potters ; and then subject them to a hurning in an over, the same as used for hurning painting, &c. on ebina; or in a pottery thin may answer the same purpose. " One of the Craft," says on this subject, -" As the

same as used for norming particing, see ou contar, or in a poitery tilk may answer the same purpose. Ualess the glazing is procured by burning, the application of any substance will, in my opinion, be a failure, by the effect of the sun and weather."

In reply to an inquiry in your last number hy a clerk of works, we beg to inform him (bat no mere staining of the arch bricks will answer, and both that statung of the arch bricks will answer, and both that and glazing would be an invasion of our patent; but if he will apply to us, we shall be happy to aid him. In common with others, he mistakes in calling the Staffordshire blue "a glazed surface." It is not glazed at all, as potters use the term; but the pecu-lar colour, neither black, blue, nor gray, is the result of a chemical change produced on the iron of the clay and silica at a high beat. Another error, much in fashion now, is using the term of "coloured bricks" in the common zed and buff or collow (miscalled fashion now, is using the term of "coloured bricks" to the common red, and buff or yellow (miscalled white). Strietly speaking, they are not colours at all, hat simply the usual well-known native clays, ofteu combined in a huilding with effect. The only build-ing materials really glazed and coloured, as Marcon, Celeste, and Mazarine blues, pink, orange buffs, drabs, &c. and the only ones proved to be perfectly impervious to wet, dirt, gasces, smoke, &c. are those manufactured by as (Bale's pateut). These goods have heen largely used at the Lecture hall, Trinity-college, Dublic, and many other public and private huildings in the kingdom, banks, statious, batis, &c. Hoping this information may surve your correspondent and others, We are, &c. and others, We are, &c. THE PATENT ARCHITECTURAL POTTERY

COMPANY

ON THE POINTED PENDENTIVE DOME.

THE pointed peudentive dome,--i.e. a dome in section a pointed such, and having wall arches of similar figure,--is a vault which I have never seen similar figure,—is a valut which Ĭ have never seen employed, and yet, possessing all the excellence of the pointed arch, it is the lightest, the most easily equili-brated, the most perpendicular in its thrust, and so, the best and cheapest of pendentive domes. And it would be deemed the best in taste by those who hold Bartholomew's maxim, that taste in architecture is purely structural. Best in taste, and hest inconstruction, I should conceive that this dome would not be an in-oppropriate feature in modern "utilitarian" architec-ture. However, it has in its height a disadvantage which would frequently cause it to be superseded by seemental or circular domes.

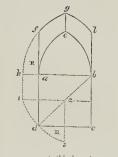

• which would frequently cause it to be superseded by segmental or circular domes. Pointed pendentive domes are as susceptible of variety as the ordinary circular domes: they are applicable to any plan, the angles of which touch the circumference of a circle. They may be stopped at any horizontal course, and be surmounted with any k kind of dome, circular in plan, or polygonal, and of a

section either pointed or semi-circular, or by any

section either pointed of semi-circular, or by any form of cover pyramid. The most obvious pointed pendentive dome is that derived from the sphere, and is, in the upper portion, in plan a polygon of curved lines. It consists of as many segments as the plan has sides, of a sphere, whose

radius $= \frac{s. d}{s}$ where s. = a side, r = the radius of

its arch, and d = the diameter of the circumscrib-ing circle. This holds for all plans, square, oblong, hexagon, &c.

The diagram represents this dome to a square plan, $a \ b \ c \ d : a \ c \ b \ i$ the elevation of arch; 1, 2, 3, is one of the four segments of the sphere of which b is centre, and b d radius; kfg is the elevation of 1, 2; and the portions It being retremend, the figure afg b b erpresents the section through the centre of the dome on the line 4, 2; a and b being the centres, and b k the radius of the arcs fg and g l; the section on the line b d would be an equilateral arch as is a c b arch, as is a eb.

Another pointed pendentive dome might he formed Another pointed pencentry done might be formed by making the eircumseriling eircle the plan of an ordinary pointed dome, into which the pointed arches would cut; but the line of these arches would be-come curved hoth in plan and section. S. C. R.

DEBATE ON THE PROPOSED PUBLIC OFFICES.

In the House of Commons, last Monday, on the question of going into committe of supply, Mr. Beresford Hope noved that a humble address be presented to her Majesty, praying her Majesty to appoint a royal commission to consider the site and plans of the proposed new public offices, and particu-larly the Foreign and War offices, and to report on the same. He said the judges discharged their daty ably and conscientiously, but being bound by their instructions, they were obliged to give prizes to three plans totally different from each other, and incapable of being fuscal together. A French geutlennan got the first prize for the block plan, an Euglishman got the prize for the Foreign-office, which was incapable of beiog worked into the block plan ; and another Eng-lishman got a prize for a War-office, which was equally at variance with the block plan and whit the Foreign-office. He understood that the block plan was to be thrown aside, and that the discordant War and Foreign offices were to be run up check by jowl. An accuse had been made, that to carry out the block plan of M. Grepinet would involve an extraordinary In the House of Commons, last Monday, on the plan of M. Crepinet would involve an extraordinary amount of expenditure. He could not deny that, in amount of expenditure. He could not deny that, if this plan were carried out in its integrity, it would cost a sum which would stagger the legislature, but, besides the scheme for the re-adjustment of the public offices, this plan contained a scheme for the re-ar-rangement of the approaches, considered particularly with a reference to the rebuilding of Westminsterwith a feature to the resenting or estimated bridge, which was not an essential part of the block plan, but which the competitors bad been invited to contribute over and above the main design. It was not certain, however, that the scheme of the Governnot certain, however, that the scheme of the Govern-nent would be much less costly. It certainly would be much chesper, in the long run, to lay down some great scheme, which might be carried out gradually as the national resources would allow, than to run up two independent and distinct offices, which would be finished in 1860, and which, before 1861 had gone round, we should devontly pray that some earthquake would decirer.

ture they propose. The plans which they had at present were, without doubt, exceedingly handsome, but they seemed to him infinitely more adapted for palaces than public offices.

palaces than public offices. Sir Benjamin Hall explained the course he had adopted, and showed that the buildings proposed were no larger than the requirements of the offices do-manded. Then, with regard to the architectural clevation, he said surely it was desirable, if they were to rehuild the public offices, that they should have some design for an elevation which should really be wortby the country, seeing that the constant com-plaint was that the public buildings in the metropolis were such wretched abortions. The had had these designs exhibited, and he believed they had met with considerable favour, but it was for the House of Com-mons to say whether they would earry them out. If considerable favour, but it was for the House of Com-mons to say whether they would carry them out. If the House thought them too grand or expensive they would not be proceeded with. What the Govern-ment proposed to do at present was simply this, to bave some ground set apart in the neighbourhood of Downing-street on which two or three public offices might hereafter be evected; but no steps would he taken in regard to the expenditure until the House of Commons had sanctioned the pronosed. He promosed Commons had sanctioned the proposal. He proposed during the recess to look at the designs which had been approved by the judges, and endeavour to seer-tain the expresse of carrying them out; hut nothing further would he done until the House was informed on that point. Mr. Tite thought the block plan was so extravagant,

Mr. The thought the block plan was so extravagant, involving an expenditure of from fire to ten millions at the least, that no country could be expected to embark in it. It was quite true that in the two plans for the two blocks of buildings one was modelled on the *remaissance*, and followed closely the style of the Hotel de Ville, and the other was in a very ornate style of talian architecture. To have a twery ornate position with a building very much like the Hotel de Ville, would be an incongruity which no man of taste would put np with for a moment. He wished to impress upon the House that they ought not to em-bark in anything without a distinct and well-on-sidered plan. He believed that the competition had not produced much of a practical ebaracter, but the suggestions of the emisent and talented men who had competed were worthy of consideration, and he hoped that the Government, baving the results of the public competition before them, would take time to too solar that the Government, baving the results of the public compatition before them, would take time to consider these suggestions, and would be prepared next session to submit a well-digested plan to the House. After other speeches, the motion for going into committee, negativing Mr. Hope's proposition, was carried by 138 to 8 dissentients. A grant has since heen obtained for the purchase of the site

of the site.

LEICESTERSHIRE ARCHITECTURAL AND ARCHÆOLOGICAL SOCIETY. THE

AND ARCHIECTIONICAL SOCIETY I. This society held its meetings in the week hefore last, at Ashby-de-la-Zouch. On Tuesday morning the members and friends assembled at the eastle, the Rev. J. M. Greeley acting as *cicerone*. The attention of the visitors was directed cicerone. The attention of the visitors was directed to the various points of interest, particularly the chimney-piece in the upper part of the building, and the remains of the chapel. From the castle the party proceeded to the church, where the carved screen was one of the first abients that attracted was one of the first objects that attracted on. Nothing excited more interest, however, attention. although not of a very ceclesiological character, than the celebrated finger-stocks at the west cud, which are believed to be almost unique. This singular iuare believed to be almost unique. This singular in strument for the punishment of disorderly hehaviour structure torthe pulsioner or disorderly intervolu-we may state, answers the same purpose with regard to the fingers as the stocks, which formerly stood on every village green, for the fet: the apertures are graduated, so as to scenre effectually the digital ap-pendages of the stontest adult and the youngest boy who might chance to require the exercise of their correction efficient.

pendages of the stoutest adult and the younget oby who might chauce to require the exercise of their corrective efficacy. The husiness meeting was held in the Bath-rooms at four p.m. and the public meeting in the same rooms at cight p.m. The latter was numerously attended. Sir A. G. Hadring, bard, took the chair. A latter from Lard John Manners, apologising for his absence, having been read, the Rev. J. M. Gresley read a paper on Croxden Abbey. The rev. gentleman traced the origin of the religious establishments of the twelfth century to the remore of the Norman nobles for the earines of which their ancestors had been guilty to the serfs and vilains over whom they ruled, their idea being that by the foundation of these houses they would promote the benefit of the souls of the departed, while they were of great benefit to the poor of the current age. It was impossible to rightly appreciate foundations of this kind without divesting ourselves of many of the prejudices in which we had round, we should devortly pray that some earthquak would destroy. The Chancellor of the Exchequer deprecated putting the matter into the bands of a Commission, and said, all they wanted this essention was power to acquir sofficient space for the erection of a new Foreign-office, and one or two other public offices. Lord John Russell said be boged that the Gorera-ment would throw aside the whole of these plans, and consider what it was they wanted, and what sum and then let the out of the projecte to Parliament, and then let the out of the projecte to Parliament, and then let the out of the projecte to Parliament, and then let the out of the projecte to Parliament, and then let the out of the projecte to Parliament, and then let the out of the projecte to Parliament, and then let the out of the projecte to Parliament, and then let the out of the projecte to Parliament, and then let the out of the projecte to Parliament, and then let the out of the projecte to Parliament, and then let the out of the projecte to Parliament, and then let the out of the projecte to Parliament, and then let the out of the projecte to Parliament of the the projecte to Parliament of the the projecte to Parliament of the projecte to Parliam

of Cistercian monks. It was one of the few religions of Cistercian monks. It was one of the few religious houses which were permitted to survive for a short period the general destruction decreed by Henry VIII. In 1538, however, it was surrendered by the abbody, and the king's agents forthwith destroyed it. A paper by Mr. P. North on the principles and aims of Archaeological Societies, was then read, and the Rev. Mr. Gresley followed with some remarks as to the

An orestey followed with some remains as of the Licestershifter Society. An exhibition was held in the large room at the Bath-rooms, superior, it is sid, to any the society has ever been able to collect together till now. The

sitors to it were numerous. An excursion took place on Wednesday, Repton and Melhourne were visited, also Breedon-ou-the-Hill, and Stauton Harold, at all which places the eburches formed prominent objects of interest.

PROGRESS AT MONTREAL.

THERE are many buildings of recent erection, in course of creetion, or about to he erected, at present in this city. We can notice a few only of the more important

foundation-stone of Christ Church Cathedral The The foundation-stone of christ church called an was laid some time ago. It will be a cruciform structure in the Early Decorated style, with tower and spire at the intersection of the cross branches. The material will be Montreal linestone, with dress-The plan consists of nave, with belobes, transpire, 224 feet. The nave and chancel will be lit hy windows in the elerestory of two lights of varied tracery, in addition to which, at the chancel end, there will be a large ornamental window with five lights, of a highly decorative chawindow with nve lights, of a lightly decount character, and, at the nave end, a wheel window, of 12 feet diameter. The aisless are lit by windows with three lights, having tracery of varied design. The main entrance to the edifice will face St. Cath-The designs were furnished by two large ortagonal turrets. The designs were furnished by the late Mr. F. Wills, the architect of the eathedral church at Fredericton, in Nova Scotti and of various other important collifices both in the Britsh provinces and in the States. The plans for Christ Church were unfaished, hut have been adopted by the present architect, Mr. T. S. Scott, of Moutreal. The contractors are Messrs, Brown Watson, builders,

and Watson, builders. A Roman Catholic cathedral is about to be crected in St. Antoine's ward, ou the site of the old cemetery. It will be in that style of architecture which has grown out of the Greein basilica, by the addition of dome and towers. The pillars are to be of the Corin-than order, and the whole building will be creciform, and a copy of St. Peter's, at Rome, so far as can be observed in an edifiee only one half the size. The outside walls will be of incly-cut stone, but the in-terior chiefly of brick. The design will be intensted to Mr. Vietor Bourgean, who has visited St. Peter's for the purpose of studying all its dimensions. The Qualitation Charch in Beaver-shall will shortly be rebuilt on an enlarged seele, and on the present

The contraint control in Detection of the present be robuilt on an enlarged scale, and on the present site. The style adopted is the Bjzantine. There will be a tower about 17 feet square, and rising to a height of 120 feet at the east end. Some of the win-

height of 120 feet at the east end. Some of the Win-dows will be of stained glass. The barchitets em-ployed are Messrs. Hopkins, Lawford, and Nelson. St. James's (R.C.) Church has been erected on the ruins of the one destroyed by the great fire, and known as the Bishof's Church. It is in the Pointed style of chirteenth century. The windows will be of viewed clusters. ined glass. sta

There are other churches in course of improvement one of these being St. George's, which is being enlarged, and St. Andrew's, which is being enclosed with eut stone plinth, and cast and wrongbt iron one raili

The Theological College in course of crection on the ground of the seminary of St. Sulpice —commonly ealled the Priests' Farm, abutting on the line of Sherbrooke-street, is an extensive and imposing structure, in the Italian style of architecture. The Structure, in the Italian siyle of architecture. The plan forms three sides of a quadrangle, with the wings advancing. The western wing will contain a chapel 100 feet by 40 feet, in the Corinthian order. It is probable, says the *Herald*, in describing the building, that this is the most substantial-building ever erected in Canada, built from a quarry of compact building stone of basilite character. The materials employed were of large size, and very generally of the whole thickness of the wall. When used in facing as ashlar, the introduction of grey stone dressings produces an agreeable effect. There is no quarry in the district of the same class of building stone. Mr. Footner is the architect

Amongst the business premises, stores, &c. newly

West, of fine cut stone, at a cost of 7,500%.—archi-tect, Mr. J. II. Springle. Adjoining is a site destined for a similar mansion, and a residence in St. Catherine street is about to be extensively altered and enlarged be eastcllated Gothic style, from accepted. Four Messrs. Hopkins, Lawford, and Nelson. Four by Messrs. Hopkins, Lawiord, and Action. Four cut-stone first-class residences, near the English Hospital, in Dorchester-street, have been designed by the proprietor, and are in course of creection. A villa residence has been creected of cut-stone, in its own grounds, in Drummond-street : it has a stone portice of the Loris course with forth achieves.

of the Ionic order, with floted columns. These few particulars, selected from a nume list, may give some idea of progress at Moutreal.

PLACES FOR STATUES

WHILE passing through the principal thorough-fares of this "Our mighty London," I have often been struck by the number of nnocenpied niches in nost of the public buildings of which we boast. It meads he use the state of the s would be uccelless for me, sir, to point out to your readers what a serious deterioration these omissious are to the general beauty of an edifice : the appear-ance of St. Paul's and other buildings answers that. ance of St

What I would suggest is this -- that these niches should be made the receptacles of statues of our illus trious men-statues that we (admiring Londoners I) too often bury within eathedral walls : let them be exposed around our public buildings, where places have so long been provided for that purpose, so that as passers-by we may look upon them and remember that

"We can make our lives sublime, And departing leave behind us Footprints on the sands of time."

ETA.

THE MAIN DRAINAGE SCHEME.

The great objection we have already niged to that part of the plau of the referees who have reported on the scheme for the drainage of London, which proposes to carry the sewage to the ontfall in huge poses to carry the sewage to the ontial in huge open channels, appears to be very generally felt. In the face of the present nuisance arising from the Thannes, of which the sewage forms but a compara-tively small portion, it is impossible to contemplate with equanimity the establishment of two streams of pure sewage, 35 feet wide, with a very sluggish fall. A member of the Board of Works, Mr. F. Donlton,

writing on the subject, says :- "From your reports of the dehates of the present board, when discussing their own project, it appeared that a considerable diver-sity of opinion existed as to the fall which ongbt to sity of opinion existed as for the fait where ongot to be given to the main severs. Their most eminent predicessors had, it appeared, settled that 4 feet per mile was the least they ought to have, whereas the present board were advised by their engineer that they present board were advised by their engineer that they could do with 2 feet per mile, but he seemed to think it ought not to be less. The referees, however, im-proving upon him as he improved upon his prede-cessors, when they nearly doubled his estimate, re-duced the inclination of their sewers to 6 inches per mile. Now, sir, I have lived all my life by the river-side, and I know the bed of the Thames above Blackwall falls about 2 feet per mile; and I do not require a galaxy of eminent talent to tell me that, with all the scour of the tide, added by the steamers, shoals are continually forming, and require a vast deal of dredging to keep them down--a great deal more indeed, than they get; and if this takes place in the Thames, what will happen in the big ditches?"

PROPOSED NEW PUBLIC BUILDINGS IN MANCHESTER

CONSIDERABLE discussion is taking place in Man-chester, through the press, and in public and private eircles, respecting the entire remodelling of all the public offices econocted with the corporation, the law courts, the post-office, and other public buildings. The post-office authorities have requested the city al to point out a situation for a new post-office eound as the present one is most contracted and incon-venient. As the town-hall, the gas and water offices, the borough court, are also too contracted for the increasing requirements of Manchester, it is thought that the present time is a fitting one for a complete remodelling of the arrangements connected with the buildings for public purposes, and the subject com-mands attention.

[Aug. 15, 1857.

erected, or in progress, are a large wholesale store, in Wellington-street, Mr. A. Laberge, builder; a large four varehouse, at the corner of Grey Nun and niggard spirit to prevail in the arrangements to supply William streets, Mr. Noab Shaw, builder, cost 4,5007. The corner of the Lebino Canal, Commou-street, Messrs. Hopkins, Lawford, and Nelson, architects. There are also numerous town residences and street dwellings recently crected, and in course of creetion. A town mansion is heing huilt in Dorchestor-stree.

lightened spirit, the interval street communications may be considerably improved; a central open square be provided (of vast importance to the health of the city); and an alvantageous concentration of cor-portion offices, and provision for the requirements of post-office, law and hankruptey courts, &c. may at once be attained.

FOREIGN INTELLIGENCE.
