"THE PEACE CONFERENCE."—M. Dubufe's picture commenu-rative of this event, painted for the Emporer of the French, is now on view at Messrs. Leggatt's, Cornhill. It is 17 feet loog and 10 feet 6 in. high, and contains fifteen portaits,—Orloff, Clarendon, Cowley, Walewski, Buol, Cavour, Brunow, and the rest, of the size of life. The figures are skilfully grouped, and the result of the whole is very excellent. It takes rank amongst the finets works of its class.

IIS CASS. PORTLAND CEMENT FRONTS.—Will you allow me the use of your columns to ask a question? My house, situated in the country, has been altered, enlarged, and stuccoed. The Portland cement, it was said, would "set" of one uniform stone colour; but instead of that, I find it sadly mottled, although it is the premedy? The parker recommends oil paint : good taste forbids; it would be too shiny; and as the surface is extensive, the expense would be an objection. The plasterer recommends a wash, which I myzelf would be glad to be informed how such a difficulty is to be met with good effect as regards appearance, and with moderation in the demand upon the pocket.—RUSTIC.

⁷ THE LITERARY FUND SOCIETY.—At the annual general meeting of this admirable and important Society, held on the 11th instant (Earl Stauhope in the chair), another attempt was made to pass a vote of censure on the committee, hut which, being allogetber groundless, utterly failed, notwithstanding the position and abilities of the objectors, Mr. Dilke, Mr. Dickens, and Mr. John Foster. Mr. Robert Bell, Mr. Monekton Miloes, and the Bishop of Oxford Spoke on the other side. In answer to some charges against the committee in respect of the late Mr. Hayda, which have been industrionally circulated, a triumphant reply was given, and the meeting showed their foll appreciation of it by voting sity-nine against the motion, eleven for. Unanimous testimony was borne to the value of Mr. Blewitt's services as sceretary.

Secretary. BRANCOTE CHURCH COMPETITION. — Correspondents complain, and with good reason, of the terms put forth in this matter, which end with the initiation that "The committee do not intend to give any premium or other remuneration for designs, and will not bind themselves to accept any of the designs which may be sent in." But what can we say more than we have already solid a thousand times? While architets are to be found who will send designs, no matter what the conditions muy be, it is hopeless to expect improvement.

matter what the conditions are, and expect improvement. SALE OF GENUINE PICTURES.—On the 18th inst. Messrs. Foster will sell a number of first-rate drawings and paintings, the property of Mr. Lewis Pocock, F.S.A. who has purchased so many pictures during the last few years, that he now finds some of them in the way. The sale will include Millais's "Proscribed Royalist," Linnell's "Wold of Kent," Dobson's "Children in the Market-place," and many charming specimens, by E. M. Ward, F. R. Pickersgill, Goodail, Frith, Holman, Hunt, Leslie, John Lewis, Webster, and others.

MILBORNE REFORMATORY. — This Re'ormatory School is now rendy for the reception of boys conricted under the 17th and 18th Vict. c. 86, and similar Acts. It is built upon the most economical principle consistent with bealth and confort, and consists of a large school-room, two sitting-rooms, a litchen, and small store-room on the ground floor; a dormitory for twenty hoys, two bed-rooms, and an hospital on the first floor. A master, matron, and bailing will have the supervision of the hoys. Convert Supervision ID Sector — The following

bailiff will have the supervision of the hoys. COUNTY SURVEYORSHIP, ESSEX.—The following gentlemen were selected from fity-eight candidates ;— Mr. Whichcord, London ; Mr. Smith, Hertfordshire ; Mr. Webb, Chelmsford ; Mr. Chas.Forster Hayward, Colchester and London ; Mr. Chancellor, Chelmsford ; Mr. Pritchett, Bishop's Stortford ; Mr. Phipson, Jpswich and London ; Mr. Henry Stock, London ; and Mr. Crewe, Aldershoit Camp. The latter five gentlemen have heen chosen for further selection in April next, when the election is expected to take place. The salary is 3007. per annum.

LETTTEED GLASS SCREENS: GLASS TRADE AL-MANAC.-The globe and other gas-lights in shop windows are now being improved in effect by lettered screens of ornamental glass, made to scree the parposes of advertising shop goods, &c. and which might also be made very serviceable in pointing out the thoroughfares after dark, if applied to the public hamps. The effect of these screens is attractive, and decidedly good. They form the subject of a patent evented by the Cosmopolitan Gas Company, in Orford-street, one of the managers of which firm, we observe, has just published a bandy office sheet, in form of an almanae, with borders usefully occupied with a good deal of interesting information on the subject of the glass trade and manufacture in its various branches.

various branches. "ARCHTFETURAL SKETCHES FROM THE CONTI-FERT,"---MESSER. Day annonnee a work under this title, consisting of a series of views and details from France, Italy, and Germany, by Mr. Richard Norman Sbaw, architect. The author says,-- "While every corner of the United Kingdom has been ransacked for fresh examples, and nearly every building of note has beeo more or less illustrated, nany of the most beautitul works in France, Italy, and Germany remain cutirely untonched, and very Hitle known. This is, perhaps, chiefly romarkable in the case of France, the country of all others the most accessible, and imdoubtedly the most richly stored with the triumphs of medieval genus."

THE METROPOLITAN BOARD AND THE NEW PARK FOR FIXSBUTY.—At the ordinary weekly meeting of the Metropolitan Board of Works on the 6th inst. a report from the Committee of Ways and Improvements was presented, recommending the Board to replace the Bill of the Finsbury-park promoters by a new Bill of their own; to coosider whether the expenses incurred by the promoters should be paid by the Board; and, io the event of adopting the Bill, to retain the services of Mr. Barnet, surveyor, in its prosecution. The recommendations of the committee, after some discussion on proposed amendments, were agreed to by a majority of inicteen to twelve.

agreed to by a majority of ninetcen to twelve. Sr. JOHN'S CATHEDRAL, LIMERICE.—According to the design of the architect, Mr. P. C. Hardwick, this church will comprise a nave, two aisles, north and south transcopt, chancel, four side chapels, and a tower. The tower will be reared in the angle formed by the projection of the north transcept beyond the aisle. Two sacristics will be created to the eastward of the chapels. The total longth of the church, chancel inclusive, will be 168 feet; width across transcopts, 116 feet,—across chanced and chapels, 118 feet,—across nave and aisles, 74 feet; depth of chancel, 43 feet, height of axve to underside of ridge, 77 feet 6 inches; external height of west front, 88 feet 6 inches; nor ground line to top of cross. The tower will be upwards of 200 feet in height, and at base 37 feet 6 inches in breadth.

LIVERFOOL ARCHITECTURAL SOCIETY. — At the eleventh meeting of the present session of this society, held on Wednesday, the 4th, Mr. James Hay, Vice-President, in the chair, a paper by Mr. W. Imray, "On Imptoved Machinery for the Manufacture of Bricks," was read.

RISE IN VALUE OF SANDSTONE AT BANFR.— Owiog to the large demand for sandstone, says the Banffshire Journal, occasioned, it is sold, chicfly by the large quantity required for the railway hridge across the Spey, the price of the stone has risen, in this district, within a short period, by 3d. a cubic foot. The stone for the bridge is said to be chicfly from the Covesea quarries, in Morayshire, known for bard close grain.

ARCHITECTURE IN NEW ZEALAND.—Under the heading of "Our Want of Practical Architecture," the New Zealander says, "This is a want we have more than once had to speak of in reference to our public buildings in this city; and botb from editorial articles and newspaper correspondence we learn that the decision of the Architectural Commissioners of Wellington, with reference to the plans for the proposed new Government Offices and Assenbly Houses in that city, has met with anything but general approval. One writer, 'Public,' deals with the several designs very sensibly (his remarks, indeed, have more than a merely loc-l application), and shows that not one is suited to the provinces or the locality where the elifices are proposed to be raised: all are too costly and ambitions: none are characterized by that unity and simplicity, and regard to judicious economy, which are all so r.quisite in young countries—even in the Empire City. The critic thus concludes his review of the first prize design:—

The stew of the Brite design: --'In this design there is nothing for Wellington to feel proud of, -- no display of good workmaship, practical knowledge, productation with the province. The committee think that a design may be made up ont of three accepted dosigns, -- but how a row of cottages with two Vandalised portions, a Gothic building, and an Italian villa, can be amalgamated, is a puzzle.'

[MARCH 14, 1857.

ARCHES.—Allow me to enter into a few particulars on this subject, and at the same time to point out what I consider a great defect in the common arch. In the ordinary radiating arch, resistance to upward pressure is effected by loading, which, however, is only efficient to a certain extent, and that in some instances very limited. Now, I propose to construct arches in such a manner that resistance to upward pressure should be obtained in the arch itself. For this purpose, the arch stones should be so made as to fit into one another in such a manner, that no arch stone can move ou account of the ones on either side of it. According to the form of the arch, whether semicircular, elliptical, or otherwise, so will be the form of the vonsoirs. It is difficult without diagram to show how the form of the key-stones could be got, but if from the upper end of an ordinary radiating key-stone a vertical line he let fall (which of course will be parallel with the line representing the rise of the arch, where this bisecting line intersects the line whose top represents the upper end of the key-stone, a line should be drawn from the centre of the arch, where this bisecting line intersects the line whose top represents the upper end of the key-stone, a line should be drawn to meet the vertical line first spoken of, where it ents, or would seem to cut, the under line of vonsoirs. The same process should be gone through on the opposite side of the keystone, and thus the key-stone would become of bits has been done, the same process should he gone through with all the stones in such a way that the, so to speak, projecting parts of every stone should the in and hold together the inducted parts of the acids it. An whole is incapable of induct if rand this is the case with all_-it in same and not of upper this is the case with all_-it in stones follow that the arch itself as a whole is incapable of motion if rightly constructed. An erch of this sort would, of course, be in stable equilithrim, and would at any with all the

With idem.-J. A. D. TUNNELING IN THE BHORE GHAUT.—The Bombay Times says the slope or incline intended for the scending between the two points at an elevation of 19,000 feet. Stretching along the face of the precipice, the line is every row and then seen to plange by tunnel into the bosom of the rock; to shoot by some light airy vialuct across the chasm, or extend itself over the more substantial-looking support of an earthwork. About three-formths of it crosses one of these, containing no less than 200,000 cubic pards of material. There are in all tweire tunnels, mesaring between them 2,300 yards, or about a mile and a half. Theres works were commenced under the auspices of 663,000. There are at present ten thousand workpoople employed on this part of the line, the average pay being about 1,500 rupees alay. The cost of the whole work amounts to from 10,000/to 12,000/, a month. There are 3,000 men employed in boring or jumping the rock. The charge of each mine amounts on an average to about 12bs, and about a ion of ganpowder (made on the spot) is consumed daily. Near Poona, Mr. Farviell employs 7,000 people, and the line from the top of the incline to Poona will be opened before the rains in 1858.

HOUSE-BUILDING AND RENTS IN PARIS.—The Prefect of the Scine reports that the number of houses pulled down in the last five years amounts to 2,524, whilst the number of new huildings is 5,238, or more than double of the former, and that inquiries made in the arrondissements of St. Denis and of Sceaux show that in the suburbs the houses newly constructed surpass sixfold the number pulled down. Thus, in Paris and the suburbs, 16,594 houses have been constructed, against 4,667 houses pulled down. The prefect also states that the old houses were not more subdivided, nor contained a greater proportion of lodgings, than those recently constructed in their phese. It is thus maintiniced that the increase of reuts does not proceeds out that it proceeds from the projut increase of the population of the capital, and from the profile profile out that it proceeds from the projut increase of the population of the capital, and from the unuber of horeigners and persons from the provinces, attracted by the facility of communications, the population of the capital having increased, in the last fave years, 305,000. "Houses," arys the *Constitutionnel*, commenting on the prefect's report, "cannot be built by conchantmet. There is a limit to the capital applied to huilding. But as the money invested in houses gives so excellent an interest, the building movement, far from diminishing, cannot fail to spread. The increased the facility of combined and the subdelayed, thanks to the measures of the administration. March 21, 1857.

The Builder.

Vol. XV .--- No. 737.

IE exhibition of the designs sent in competition for the Memorial Church at Constantinople projected huilding, was opened to the public on Monday last, and comprises a collection of great interest and value to the professiou. The drawings are arranged at King's College, in one of the corridors, 69 feet long, and fill the walls to more than the usual height for exhibition, as well as both sides of a screen down the centre of the corridor. There are about 370 drawings in the forty-six sets. Mr. Edmeston, to whom the superintendence of the arrangements was entrusted

by the committee, has made the most of the space, and descrives the thanks of the competitors.

At the same time, we should not discharge our duty did we omit again to say that the space allowed in such cases, hears little relation to the thought and labour expended on designs, or to the requirements for simple inspection. We may he told that no ordinary exhibition room would contain drawings displayed on the principle of ample area for their observation and study, that we venture to contend for. The point, however, with which we have to deal, is not as to what rooms are available in London, but is as to the reasonable expectations of com petitors in answering au appeal to their exertions.

Every drawing should be placed so that its minute details could be examined, and that the real character of the several designs could be gathered, in order to their comparison with each other. The ample space is necessary for proper adjudication; and it is equally required if the profession and the art are to gain by mutual improvement,-in the manuer we have spoken of, as possibly the chief gain that should he looked for in entering into a competition. It would assist the object if the space would allow drawings to he in the same relative positions,say, as to the plans, by having them bung always on the lower line. And it would assist arrangements if an uniform system could he devised for mounting-avoiding wide margins to drawings, and to admit of their suspension without injury.

In regard to the freshuess of conception which is displayed in many of the designs for the Memorial Church, we regard the present occasion as one of much importance. A wider field of study has been entered upon ; the right value, as with reference to new art, of English and continental models both, is being perceived and that there is value in what may be old, and a necessity for the new, is heing equally admitted. Designs which there happen to be in this exhibition, such as were the works of our best architects scarce ten years ago, already fail to satisfy, even where scrupulously correct,-for the simple reason that they beloug to a school which was ever wanting in the art Of some of the dangers however, incidental to the present position, we have very lately spoken.* have also given particulars of the designs to which premiums were awarded.+

Italian Gothic character is exhibited in many

See ante, p. 126; "The Church of St. Andrea, at celli, and the Gothic Architecture of Italy,"

f In our present number (pp. 162 and 163) will be found a view and plan of the second prize design, with a state-ment of the considerations which guided the architect.

of the works; indeed, in several cases, one to place for the destruction of what there is or other version of the general style has been of real merit. taken as a hasis. One of the principal designs Mr. C. C of this class is that of Messrs. Weightman, Hadfield, and Goldie (one of the five "cspecially mentioned "), which, iu plan aud exterior at least, much resembles the Gothic huildings of Lombardy, though its details are modified rather from those of the Campanile at Florence. The plan has long nave and aisles, short chancel aud transepts, each with octagonal ends, a tower at the intersection, western turrets, and an atrium or cloistered court at the west. This feature in the plan, we may observe, is perhaps more characteristic of the Romanesque and Byzantine churches, than those of the Gothie period. We mentioned it as existing at Vercelli, on the trustworthy authority of the writer in the Quarterly Review,* who shows it in a plan; but no such feature is shown in the work of paved space is, however, remaining, according to informatiou derived from Mr. Burges. We should also state that in designating the different sides of a huilding, we use the points of the compass as they would apply iu England, though in Italy, iu Romanesque churches, the altar may he at the west end.

In the design we were speaking of, the atrium has semi-circular arches, in the spandrils of which are pateras representing the colours of England, France, Sardinia, and Turkey. Generally ou the exterior of the building, except as to the use of hands of dark marhle coloured decoration is confined to the windowsas by ornamental tiles in splayed reveals-and to the cornice, and the use of red tiles to the The roofs are of no great elevation : the roofs main gable, helow the coping, is stepped with arches, and au arcade extends along the front below from tower to tower.

The huttresses of slight projection of most of the competitors, appear to he adopted under the idea that they are host suited to the climate, and that they were on that account used by the Italian architects. Certainly, whether by hold projections as those of ordinary buttresses, the general breadth would be interfered with, may deserve consideration : the treatment of the drawing before us, seems to show that such was the idea in the design. On the other hand, the evidence would lead us to think that the shallow buttress, like the low gable, was simply a re-production of a classical feature, --- in that case. the pilaster. A question analogous to that just referred to, suggests itself as to the substitution of hroad reveals for mouldings. In short, were such deviations from the general Gothic system made from considerations of art, as supposed, or are they simply the results from attempting a style different to that to which the architects were accustomed ? These observatious are iutroduced now as hearing upon questions of general importance, rather than as applying to the one design which happened to lead to them. Our notice of it should, however, add that the central tower introduced, does not solve the problem of the appropriate termination of that of Giotto, which otherwise it resembles : indeed, the pyramidal cappings to all the towers are the least successful portion of this design. The iuterior of the huilding here has principal arches of stone, as the support to a ceiling panelled at the slope of the roof. It is questionable whether the enrye and the raking lines harmonise in such cases. A quasi-triforium is introduced : rectaugular openings, having columns with red marble shafts, being coupled in the thickness of the wall. This design is illustrated by very good perspective views, the hest of which, how ever, is "killed " by ornaments in the corucrs, such as it is the fashion of architects just now

* Vol. LXXV. 1845. "Gally Knight and Bunsen, on Ecclesiastical Architecture," p. 399.

Mr. C. Gray's design ("especially men-tioned") is a combination of Romanesque general character and forms, with Gothie details. The plan consists of nave and aisles; transents, formed by semi-circular projections from the aisles, and by broad piers at the point of intersection with the nave; of a chaucel, also with semi-circular apse ; a north porch ; a square tower, joined to the sonth aisle hy a long passageway, or entrance-porch; and an octagonal vestry. The roof of the electory, which is of low pitch, has a range of trefoiled arches, with shafts, and mouldings with stones set anglewise, as cornice to the eaves-also continued up the raking lines of the gable. There is a rose window at the end, the proportion of the gable heing given by mouldings below,--in continuation of the decoration to the eaves of the aisles,-and this Osten on the churches of Lombardy. A square arrangement gets over appearance of imitation of the classical pediment. The windows generally, which in the apses are closely set, have trefoiled arches and shafts. The interior has more of the Early English character. It has round piers and arches, with the dog-tooth ornament. The tower has a weathered lower stage, lofty plain walling, belfry windows, and a pyramidal roof of great apparent height.

In the selection of designs for approval, the general principles appear to have heen acted upon hy the judges which are put forth in the report. The English Gothic designs, or those having rich tracery and elaborate monldings, are generally passed over, and all designs with domes are "nowhere." There are, however, There are, however, works of considerable merit in which a dome is introduced. Mr. S. J. Nicholl has such a design, descrving attention. It exhibits, perhaps, the best attempt at a Gothic dome that has vet heen made. The main portion of the huilding derives some of its features from the cathedral at Florence, aided, however, hy considerable freshness of thought. The west front might, with some modification, serve for a front for the cathedral. The dome, however, is very different. The plan may he described as a monification of the Greek cross, the re-entering angles thereof being in part filled up, the nave slightly extended, and towers added laterally to the west front. The dome is carried by pointed arches, which spring from columns arranged on the plan of an octagon, or more properly a square with the angles cut off so as to leave the four principal sides double the width of those at the angles. Above, hy pendentives or corhelling, the plan becomes a figure of twelve sides, above which is the dome. This is decorated externally hy pauelling and mouldings ; and at the hase are Gothic windows, nearly in the form of spherical triangles, and filled with cusping, and around the exterior clustered shafts and pinnacles terminating the actual huttresses; whilst the whole is surmounted with what may he called a smaller Gothic dome, with polygonal hase and perforations, and an curiched finial and cross. According to the plan, the gathering over from the arches would require unusual skill; but there is great merit in the work-elever adaptation of ouc example and an equal amount of invention. The western towers are square, with pyramidal cappings, the latter having, independently, details which are suggestive. Coloured marhles are introduced sparingly iu compartments. The grouping of the mould ings and panelling throughout is excellent.

Somewhat on like good principles-as regards new forms in church architecture, with the provision of space on a plan more concentrated, and therefore in some respects more suitable than the traditional oblong, and with an application of the dome,-is the design of Mr. G. Aitchison, jun. It should not, however, be classed with designs of the character of either Northeru or Italian Gothic. Its merits are not enhanced by the

profuse striping of coloured materials,--even allowing for exaggerated colouring in the draw-ings; and the west front, which comprises a great arcb under a low-pitched roof, and two square towers with corbelled parapets, and low lead covered spires, is weak in design. The main portion of the plan, however, deserves to be examined. There is a central octagon of coupled columns and arches, and an aisle or ambulatory around, in the form of a polygon of sixteen sides. The tambour of the dome is converted into a polygon of the same character by supporting shafts and corbelling : it contains a triforium gallery, and a clerestory with windows, and vaniting shafts supporting the ribs of the pointed vanit or dome. The sixteen ribs of the pointed vault or dome. windows of the tambour, or elerestory, exter-nally, have gables, and their roof covering meets that of the dome ; which last eovering forms a polygon of thirty-two sides on plan,-in other words, is arranged in ridge and valley form. The dome itself carries a small open lantern The windows are plain and spire capping. pointed openings, with central shafts and sub-arches, and the effect is got chiefly by the study of plan and the colour - which inter-nally is of some merit. Porches, each in the

plan of a half-hexagon, are placed north and

south. The chancel, earrying out the general principle, is chiefly internal—being advanced to the octagon of piers and arches. Mr. G. J. Wigley has also essayed the dome, and has, we presume, been passed over for similar reasons. His design is a modification from the church of Sta. Sophia, with a great in-crease of altitude in the dome. There are apsidal ends to the wide chancel and transepts. In the internal arrangements, the study of the same model -with, however, many important innovationsmay be observed throughout. The main bays of piers aud arches rise to the full height of the church, and are filled in with secondary divisions of three bays on the plan, and in two stories,--providing the lofty triforium. The west front is extended by towers-which have pyramidal cappings,-and large arehes for a carriage-way under each, are provided. The dome rises from a low tambour, arcaded, and is surmonuted with a very large ball and cross. All the arches are pointed, and are chiefly without moulding. The eapitals and bases are foliated .- Mr. H. B. Garling, also, has a dome in bis design, which generally is Gothie on a Romanesque basis. It is conceived on the same leading principle as the design of Mr. Gray, both as to position of the tower, and general decorative detail, but appears to be inferior in general proportions. different kind of termination, however, is adopted for the tower, instead of the blank pyramidal eapping, which spoils many designs. The dome, with a cluster of erocketted gables, recalls that of Pisa. In the interior, which is hardly ecclesiastical in character, the principal effect is given by a pauclied ceiling. The coloured decoration has a pervading blue tiut, which conductance of the satisfactory in any climate. Messrs. Guillaume and Campbell have adopted a plan similar in principle to that of Mr. Burges, so far as regards the apse occupying large space, and the aisle earried round it, are concerned; and their design also exhibits a feature perhaps derived from some of Wren's ehurches, as that of St. Magnus, London-bridge, namely, the combination of the domed eapping to a tower, with a spire as the termination. Internally, they provide a gallery in the lantern, octagonal in plan, carried on pendeutive vaulting. One or all of such latter features are, we think, introduced in oue or other of Mr. T. C. Sorby's "alternative" designs at the opposite end of the room; but the drawings are placed too high for us to diseover more than that the author has gone to an extraordinary amount of labour, though not without falling into mistakes, as in the bulkiness of his tracery. Some of his views and sections,

however, exhibit novelty, both in plan and our own practice and the arcbitecture of the decorative treatment.-We must break off till future. next week.

R. G. G. SCOTT'S LECTURE AT THE ROYAL ACADEMY ON MEDLÆVAL ARCHITECTURE.* MR

ARCHITECTORE." It is with feelings somewhat closely border-ing upon trepidation that, availing myself of the liberty given by the regulations recently passed by the conneil of the Royal Academy, I venture to address you on a subject which has never, till now, been more than incidentally touched upon within these walls; a subject, indeed, dear to my heart, and entwined among my innest to my heart, and entwined among my inmost thoughts and affections, but one which, perhaps thoughts and affections, but one which, gethaps for that very reason. I feel is the more difficult to bring before you, through the medium of a lecture. It may be at first sight imagined that love, of all the human feelings, is that hest cal-culated to aid in describing the beauties of its constant to and in advocting the leadings of his object, and in advocating its claims upon the admiration; but it is not so. We can hardly state the reasons why we love our parents, or our brothers. We know that it is a feeling which has grown with our growth, and is a part of our yords excitance. Yet it is exclude that of our very existence. Yet it is probable that an acquaintance who has never shared in these warmer sentiments might describe their chawarmer schultents might describe their cha-racter and even their virtues more successfully than ourselves. If we seek to investigate them, we find the research all too cold and too metho-dical, to accord with the tone of our feelings; and, like the poet who wished to sing of the Atrides and of Cadmus, the chords of our hearts research out of large

Atrides and of Cadmus, the chords of our hearts respond only of love. So it is with those who have harboured au carly affection for the architecture of their native land. Strongly as I appreciate the in-trinsic beauty of the monuments of classic antiquity, and the merits of very many works of the Revival, I should doubt whether it were possible for any nusophisticated youth, before studying their architecture as a science, to entertain towards its productions in this country, not feedines bordering apon real affection. He studying then are included as a science, to cutertain towards its productions in this country, any feetings bordering upon real affection. He may see in them much to admire,—much to lead him to study the art which has produced them; and this study will, no doubt, often kindle those warmer feelings which ripen into love; but this is a very different feeling from that deep and filial affection which many a youth, nutanght in art, but gifted by nature with a perception of its heantics, has enter-tained from his tenderest years towards the old ehurches 'of his neighbourhood, and which bas impelled him to walk from village to village, not only under the halmy influences of summer, but along muddy roads or snowy paths; and with glowing heart hut shivering hand, to sketch the humble porch, the unaspiring steeple, and the mutilated though venerable monament, with feelings of indescribable delight.

It is this instinctive affection which it is so difficult to reason upon, and to which cold indifficult to reason upon, and to which eold in-vestigation seems so uncongenial; yet most pleasaut it is, in after life, to find ever new proof that our early feelings have not been misplaced; that those once callous warm np when they are led to examine; that those who, strange to say, disliked the architecture of their forefathers, are now forced to admit some of its beautics; that the stile once despised has because that the style, once despised, has become gradually appreciated, and its study become the favourite pursuit of thousauds, every county lavonite pursuit of thousands, every connity having its society organised to promote it; that in every country in which it once flourished (Italy herself not excepted), the same revived feeling towards it has arisen; and, finally, that this distinguished academy bas stamped it as equally classic with the architecture of the an-eient world, and admitted it to an equal place in the instructions offered to her students

in the instructions offered to be r students. Having found it impracticable, from previous engagements, to give, as had been kindly suggested to use a short course of lectures during this season, I propose, on the present occasion, to limit myself to some introductory remarks on the study of Medieval architecture, which I with the kind permission of the eoun trust to follow up next year hy one or two further lectures, both upon its original productions, and upou the bearing of the study of them upon

* Read on Monday, March 16th.

I will commence by considering the different claims which Pointed architecture has upon our study.

The more carefully we examine into the sub-ject, the stronger and the more numerous do we find these claims to be. To a casual observer, the interest we feel in the subject observer, the interest we teel in the subject may appear to be the result of local prejudice, or of arbitrary choice, and our Mediaval styles may seem to have no greater claim upon us than those of a hundred other periods or countries. The fact, however, is the very reverse, and that Pointed architecture is marked out from among others in the most signal and remarkable manner, I will briefly point ont some of the circumstances which thus especially single it

In tracing the history of civilization, we cannot fail to perceive that, from the earliest ages to the present, it has followed one, not unbroken, yet connected stream, and, though branches have struck off in different directions, it has ever had one main channel which at each period repreone main channel which at each period repre-sents the central mass of civilization; this stream, passing now through this country and now through that, but its place being nearly always so marked as to leave no donbt as to where, in each succeeding age, the main seat of civilization is to be found. Art has in regular successiou followed in the same course,—the main channel of civilization and art having been the same though each possessing its minor the same, though each possessing its minor branches.

The earliest seats of mental culture were the great valleys of Egypt and Mesopotamia. There, too, were the cradles of primitive art. The less enduring materials of the eastern valley have deprived us of the remains of its earlier architecture, but the imperishable ruins of Egypt will tell till earth's closing day how mighty was her primæval civilization.

Persia scems to have succeeded to Egypt and Assyria as well in art as in dominion; but long before her political power bad been overthrown the stream of mental power had been trans-ferred to Greece, whose arts and knowledge, party indigenous and party derived from Egypt and Assyria, so infinitely excelled all which had preceded them, that we are apl, and with reason, to view both as the only genuine art and eivili-zation of the ancient world.

Rome, succeeding Greece in external power, borrowed both her arts and literature, but, borrowcu ootn ner arts and interature, out, throughout her whole carcer, was as subordinate to her in these as she was predominant in power; and when that great catastrophe occurred which crushed to dust the mighty fabric of Roman domination, it was again in Greece that civiliza-tion and art flowed on and it was thouse that domination, it was again in Greece that etviliza-tion and art flowed on, and it was thence that those friendly streams proceeded which enabled the Gothie conquerors of Rome to reconstruct what they had destroyed, and, among the *débris* of ancient art and knowledge, to sow the seeds and to foster the growth of that rieber and mightier eivilization which distinguishes the modern from the ancient world. In all is earlier stores the growth of eiviliza-

modern from the ancient world. In all its earlier stages, the growth of eiviliza-tion in the modern, as in the ancient, world was marked by corresponding changes in its architecture. Every age had its architectural style distinctly and strongly marked, a style which, though connecting itself unmistakeably with the long chain of ancient art, that, though rudely broken in the West, had been continuous in the Eastern empire, was uever-theless so distinct from any former link in that chain as clearly to mark a new dynasty in human affairs, and to show that the stream which had passed successively through Egypt, Assyria, Persia, Greece, and Rome, was now making wide and deep its channel among those Gothic nations whose progenitors had been Gothie nations whose progenitors had been viewed as the enemies of art and knowledge; and that the seat of art was henceforth to be established among those vigorons races which had destroyed that of the ancient world.

had destroyed that of the ancient world. My object in going over this well-beaten path is to draw your attention to three very marked *prime facic* claims which Gothie archi-tecture bas upon our study. 1. That, though we are in the labit of considering it antiquated, it is in fact the architecture of the modern as distinguished from the ancient world, — that

just as the architecture of the earlier half of the world's history culminated in that of Greece, which must ever be viewed as its most perfect and most glorious representative, so did the indigenous architecture of the newer world reach its c lminating point in the thirtcenth and fourteenth centuries among the nations of Western Europe-the depositories of a new civilization. Secondly, that it is the architec new and the main stream of civilization now runs, as of old it did through Egypt, Greece, and Rome; and, thirdly, that it is the latest original style of architecture which the civilized world has produced; that the chain of architectural has produced; that the Egypt, and passing on in styles, commencing in Egypt, and passing on in continuous course through Assyria, Persia, Greece, Rome, and Byzantium, and thence taken up by the infant nations of modern Europe, and hy them prolonged through suc-cessive ages of continuous progress, terminated is the style which we are involved of and has in the style which we are treating of, and has never since produced another link of its own.

As, then, the architecture of Egypt claims our respect as the carliest link in the history of architecture, so are our own Mcdiæval styles especially marked out from all others as being its latest ercation. That continuous stream of indigenous art which from the earliest ages of the world had unceasingly flowed onwards, now through this country, now an ow through that; now smoothly flowing on through a deep and copious channel, now choked up with rocks, or spreading itself sluggishly, unhealthily through marshes and morasses, but ever pro unhealthily. gressing, seemed at the cud of the period we are gressing, seemed at the cud of the period we are speaking of to turn hack upon its course, and, instead of creating as heretofore ever new beauties of its own, to content itself with re-producing those of bygone periods; instead of illustrating, as it were, the collateral stream of civilization which flowed on so might by its side—it accompanied it hy images of that of an older world—of another family of nations—of another religion; and since then, though civili-zation has rolled on in a continuous course, it hese foiled to produce any style of architecture has failed to produce any style of architecture of its own

Mediæval architecture, theu, is distinguished from all other styles as being the last link of the mighty chain which had stretched, unbroken through nearly 4,000 years,—the glorious termination of the history of original and genuine architecture.

The next claim to which I will direct your attention, is, that our style is par excellence Christian architecture.

This is a claim which it is so much the fashion of the day to dispute, and even to deride, that it demands somewhat careful investigation. Many who have no hesitation in using the terms Mahomedan, Hiudoo, or Buddhist architecture, and who do not, in the least, deny the influence of the various religions of the ancients upon their modes of building, see nothing but fanaticism in attributing any sueff influence to Christiauity; or if they do not deny this influence they view Pointed architecture as the special property of the Roman church (though Rome herself boasts of having scarcely admitted it within her walls), and find no style to symbolize their Protestantism hut that derived from the heathenism of the ancient world, and whose more recent type is to he found in the great metropolitau church of modern Rome.

Other more reasoning persons object that, as Christianity, in its purest ages, adopted a modi-fied form of the aucient Roman style, and bent it to their uses, the Roman style became hy that process a bond-fide Christian architecture further, argue that Pointed architecture, having derived some of its forms from the Saraeenic has thereby lost its title to being considered a

purely Christian style. To meet these objections, it is necessary to explain what we mean hy Christian architecture.

There can be no doubt that nearly all forms of architecture have taken their rise in the ture of the heathen Romans, in its deteriora-temple, whose form and character have been regulated by the religion for which it was most nearly preceded the conversion of its rulers created. From the temple it has diffused itself thronghout all classes of buildings, carrying with it, in a certain degree, the feeling it had

already acquired. No one will deny this of the Egyptian, the Greek, or the Saracenic; and, so inconsistent are people on such questions, that the very persons who would laugh at the term "Christian architecture," will almost, in the same breath, object to the use of our style for secular huildings, on the ground that it will make them look like churches! Now, what we claim for Pointed architecture is, not that it is the only Christian style which

has arisen, or is likely to arise, but that it has been more entirely developed under the influence of the Christiau religiou, and more thoroughly carries out its tone and sentiment than any other It is not exclusively, but, par eminence, an. The early Christians naturally style. uistian. adopted the style which was ready-made to their hands. That this style, as they found it, was essentially Pagan, it would be absurd to deny, hut it was the only one they knew; and, care-fully avoiding the types of Pagan temples, they adopted one of its secular forms, and wholly adapted if to their uses. The buildings thus produced were unmistakably Christian, hut it would be absord to say so of their style. This heirg nearly identical with that of their headben predecessors, it needed a long conrse of re-moulding hefore it could justly be predicated of it that it was a Christian style, —a style gene rated under the influence of Christian customs, to fulfil Christian requirements, and to harmo-nise fully with the sentiments of the religion of

these who made use of it. The earliest style which may fairly he called Christian was the Byzantine. In the East no sudden revolution had affected art or civilization, but the Greek empire, founded at the moment when Christianity becaund at a characteristic and the order of the stabilished re-ligion, went on quietly adapting its arts and institutions to its new religion. Art having already degenerated under the later Pagan comperors, and difficulties hoth from without and from within gradually weakening and under-isize the around of the state it was natural mining the power of the state, it was natural that the changing style should uot have that full scope which would have heen afforded it had the purifying influences of Christianity acquired full sway during the Augustan age. Painting, soulpture, and architectural curving had lamentably fallen off hefore they were trans-ferred from the heathen temple to the Christian church, and even the more mechanical features of Roman architecture had departed widely from their original parity of form. The task pro-scrihed to the new religion was not to take the highest form of Pagan art as it had existed under Pericles or Augustus, and to mould it to its own uses and its own purer and holier senti-ments: what she had to deal with was a mere wreck of its former self : all its early simplicity destroyed, its vigour enervated, its magic in-stinct for beauty gone, its artists fast falling hack into barbarism ; and that not the savage ness of carly hut untratored art, but the effete and nerveless heartlessness of a race whose glory had departed. It was this lifeless body which Christianity had to awaken to new energy, —this dull and spiritless lnmp out of which she when the western half of the empire was about to be crusbed to powder by the nighty storm of northern harbarism, and the castern portiou itself weakened by gradual decay and by the iu cursions of the Goths, Huns, Persians, &c. and eventually by the tremendous inuudation of the followers of Mahomet. That such a glorious result as Byzantine architecture should have been produced out of materials so lifeless, and

been produced out of indexing actions, and through the agency of a decaying nation, speaks volumes for the power of religion over art. Let us turn, however, to the Western Em-pire. There the case is still stronger. With the same decayed and lifeless art as their the same decayed and lifeless art as their nucleus, the people of Christian Rome had the additional disadvantage caused by the removal of the seat of government, and with it of the seat of art, to Constantinople; nevertheless their first efforts were so successful, that though, iu the words of Thomas Hope, "The architec ture of the heathen Romans, in its deteriora

the magnificence, the harmony of their com ponent parts, had a grandeur which we seck in vain in the complicated architecture of modern churches."

What course art would have taken had the Roman empire continued, it is impossible to It was destined to share the fate of the judge. empire itself, and to be utterly overwhelmed by that mighty deluge which severs the ancient from the modern world; so that its Christianizafrom the modern world is of that its offischild and tion, instead of heing gradual and progressive, as in the East, became a complete reconstruction by the successors of those who had destroyed it, though aided in their work by the friendly hands of those who, in the Eastern empire, had kept those who, in the Eastern empire, had kept alight the lamp of civilization. The architecture of the West, therefore, instead of being a mere translation of the old style from Pagan to Christian uses and expression, was a new crea-tion, formed, it is true, out of the ancient débris, hut, nevertheless, originated, carried and perfected by Christian nations, and for Christian uses, and may, consequently, he said, even in a stronger seuse than that of Byzantium, For the a distinct Christian style; and f suppose none would doubt that its culminating point, and that to which all its progress tended, was the Pointed architecture of the thirteenth and fourtcenth ceuturics.

An argument against its claim to the title has heen founded on the theory that the Pointed arch, which is in some respects the culminating arch, which is in some respects the containmant of feature of the style, was not developed sponta-neously hy our Christian forefathers, hut learned by them from the Saraceus. As well may it be attempted to sever Greeian architecture from the mythology and traditions of the Greeks, merely because some of its details may find their prototypes in Egypt or Assyria; or to disconnect the native architecture of India from their reli-gion hecause its first inspiration scens traceable gion hecause its first inspiration sceme traceable to the Firveworshippers of Aucient Persia! Even Saracenic architecture itself was an emanation from that of Christian Greece, so that if we are indebted to it for the Pointed arch (a question which I will not now attempt to investigate), she only paid hack to the religion from which she had horrowed. No one, however, can study the tendencies of the late Romanesque without the Romanesque without seeing that the Pointed arch was becoming every day more necessary to the development of the germ which it coutained. The gradually increas-ing predomiuance of the vertical over the horizontal; the increase in the height of pillars and jambs demanding a proportionate addition to the arch; the necessities of ground valling over ollog spaces; and a hin-dred other evidences, proved the Pointed arch to he the inevitable result of the already attained developments, and often had it, almost unconsciously, appeared in intersecting almost unconsciously, appeared in intersecting areades. If its systematic adoption can with certainty he traced to the suggestive architec-ture of the East, surely this does not un-christianize the already Christian architecture of the soldiers of the Cross, who brought the idea home, among the spoils won from their unbelieving focs! Is it not rather in the spirit of our religion to receive tribute and homage from all the nations of the earth? And if it may be said of the Christian Church, that-

"Eastern Java there Kneels with the native of the farthest west ; And Ethiopia spreads abroad the hand, And worships."

It is equally reasonable to expect of her material temples, that-

"The looms of Ormus, and the mines of Ind, And Java's spicy groves, pay tribute there."

And data space gover, pay induct data. The character of a style of art does not de-pend upon the mere material from which it has been fabricated, but upon the sentiments with which it has been developed. Were not this the case, all styles, excepting, perhaps, those in China and Central America, with a few others still more obseure, would be more or less connected with the religion of Egypt, or of Nimeveh; whereas, in fact, every race up to the sixteenth whereas, in fact, every race up to the siteenth ecentury, had so moulded the original materials upon which its arts have heen founded, as to render them expressive, in a great degree, of their own settiments, and especially of their own religion; and more strongly than in any other was it so with our own forefathers, when developing the latest of all styles of genuine

architecture, and forming it to harmonise with the sentiment of our holy religion.

The last of the historical claims of Pointed architecture to which I will call your attention are interview to which I will call your action of is, that it is the native architecture of our own country, and that of our own forefathers. Here, again, I must deflue uy meaning for the sake of meeting a class of objectors who delight to attach a false and exaggerated meanto an expression.

I do not, then, mean that Pointed architec ture helongs to us in any different sense from in any different sense from that in which it helongs to Frauce or Ger-many: I do not mean to revive the claims of our contry to its origination, nor to assert in its behalf any pre-envoent share in its development. All I mean to urge is the simple fact that, by whatever members of our family fact that, by whatever members of our family of nations it was shared, it was, nevertheless, the architecture of our own country, just as much English as we are ourselves, as indigenous to our country as are our wild-flowers, our family names, our customs, or our political country output of the state of the state of the state of the state output of the state state of the state of constitution

In England, as in France and Germany, the Romanesque architecture had (with local varieties) grown np with the new civilization : as it perfected itself it showed in each the same tendencies and the same yearnings, which Pointed architecture could alone satisfy. If it Pointed architecture could alone satisfy. If it were so, that these were at length met by sug-gestions from the East, it was our forclathers who fought there side by side with those of our neighbours; and the lessons learned and the trophies won were common property. It is pos-sible that France was more rapid in making use of them, and it is certain that Germany was the most tardy in doing so, but is each the mercil most tardy in doing so; hut in each the result had long been aimed at; in each it was the natural consequence of what had already been attained, and was therefore not the property of one, but the common inheritance of all; and each having attained it, carried it on and developed it in her own way; thus making it in every sense her own.

sense her own. I an, however, only urging this as a claim which our old architecture has upon our own study. If we investigate the architecture of Egypt, of Persia, or of the East, we find that it tells of races with whom we have no national or personal sympathy. If we go to the classic shores of Creece, though there we should bu viewing the work of a race whose arts and literature are more than these of east scheme literature are, more than those of any other people, the property of the world, we neverthe-less fail to find anything to connect them in any special sense with ourselves. If we transfer our researches from Greece to Rome, though we now view the vestiges of that mighty nature whose world-wide sway stretched its iron whose world whice sway stretched its iron secptre over our own land, and though we find among them the germ of the arcuated architec-ture which forms the nucleus of our own styles, they are still severed from us by so while a guil that, were it not for the modern revival of their cere the new low is severed for the severe of the severe that, were it not not the modern revival of their skyle, they would appear perfectly adien to our race and climate. All these studies must be followed up in distant lands, excepting only those few fragments of Roman work scattered here and there in our own and neighbouring have the ordeness of universe! lands, the evidences of universal empire, the footsteps and symbols of aucient servitude. How different is the study of Gothic architecture! Its original exemplars are at our own doors; the very churches perhaps in which from our the very characters perhaps in which from our infancy we have worshipped; the monuments of our own forefathers; the works of men bear-ing our own names, whose armorial hadges we are still proud to use; who spoke, in its pristine form, our own lauguage; who sat in our own parliaments, were lords of still existing manors, founders of still surviving charities, men who fought the battles of which we are still proud, and laid the foundations of our liberties and of all those institutions which reader the armore of all those institutions which render the name of all those institutions which render the name of England illustrious among the nations of the earth. Surely the architecture which grew up among men so uearly allied to us has a pre-eminent claim upon our attention.*

PARIS.—A fine collection of drawings by Leonardo da Vinci has been obtained for the Louvre, at the cost of 1,400/.

MICHELANGELO'S "DAVID," AT BROMPTON.

THE great attraction for artists and art critics in the coming Exhibition at Brompton will be a cast of Michelangelo's celebrated statue of David, the original marble of which stands in the Piazza in front of the Palazzo Vecchio, at Florence.

For this grand acquisition to our national collec-tions, we are indebted to the Kiug of Sardinia, who, in a spirit worthy of a kingly patron of the arts, pre-sented the cast to the English Government, as a

memento of our alliance and bis visit to London. The history of this statue is as remarkable as its excellence is wonderful, and shows how genius and

excellence is wonderful, and shows how genius and perseverance, when compined, can overcome even the greatest difficulties. When Soderini was made Gonfaloniere of the Republic of Florence, hickbelangelo, then in Rome, returned to Florence, in order that he, in common with other Florentiue sculptors, might enjoy the likerally histowed paironage of Soderini. On his arrival, Michelangelo made an estraest aspeal for a certain huge block of marble, which had been em-hossed, or rough hewo, for a gigantic statue by Flesole, hut which had lain in its incomplete state for many years, regarded as spoilt for a large figure, and too fine a piece of stone to be cut into small pieces. The Gonfalouiere had intended to present the stone to Leonardo da Vinci, but, at the time of Nichelangelo's application, was preparing it as a present to a cele-brated Florentine sculptor, Sansovino. The hlock brated Florentine sculptor, Sansovino. The block was, however, given to Michelangelo, who determined was nowcet, given to interentingeto, who determined to make a single statue out of it,—an undertaking which, from the hacked condition of the marble, no one else would attempt. The difficulties to be aurmounted were of the most perplexing character, for the previous *embossing* had to deturned the activity of the prime

perplexing character, for the previous embossing had so destroyed the original capabilities of the piece, that no figure in violent action, or with extended limbs, could be wrought from it, and it was much feared that other pieces of marhle would have to be joined to it before any work of character could be produced. Instead of resorting to this expedient, Minheingelo adapted his design to the dimensions of the block, which he obtained by careful measurement, and having in his usual manner received the succament, hefore commencing the design. he modelled a small and naving in his usual manher received the sacrament hefore commencing the design, he modelled a small statuctte in wax,* of David as the youthful shepherd boy, preparing to sling the stone at his giant opponent. This design was so exactly calculated to the dimenboy, preparing to sling the stone at his giant opponent. This dosign was as exactly calculated to the dimen-sions of the marble block, that on the shorlders and toes of the large statue may yet be diserned the rough marks of his predecessor's chisel, and which Michelangelo was too scruppilous to cr.ss, for far, of risking the minute proportions of his own gigantic work. His devotion to the task of transforming this disshapen mass to bis own exquisite design was entire, permitting no one to see the work during pro-gression; and it is of the head of this statue the table is told, that upon having completed it, even to his own ideal, he struck the marble with his mallet, and ectaimed, "Now speak I for 1 know you ean." To say little of the excellencies of this mighty per-formance would be to do it an injustice, and to say

To say little of the excellencies of this mighty per-formance would be to do it an injustice, and to say much would be folly. The perfect expression of youth in every feature and limb, in so gigantic a figure, is a triumph of art, whilst the deep cuttings and apparent exaggerations of a work intended to be seen at a distance, eanot in a single feature be de-tected on the closest and most minute inspection. Vasari's own emarks unon it are. nethaps, slightly

tected on the closest and most minute inspection. Vasari's own remarks upon it are, perhaps, slightly influenced by his initiate friendship with Michel-angelo and admiration of his genins, but may, never-thcless, be here appropriet-ly given :--" The work fully completed, Michelangelo gave it to view; and truly may we affirm that this statue sur-passes all others, whether ancient or modern, Greek or Lutio: neither the Marforio at Rome, the Tiber and the Nile in the Belvidee, nor the giants of Monte Cavallo, ean he compared with it, to such per-fection of beauty and excellence did our artist hring this work. The outline of the lower limbs is most heautiful. The connection of each limb with the this work. The outline of the lower hmos is mos-beauifol. The connection of each linb with the runk is faultless, and the spirit of the whole form is there here produced so finc diviue: never since has there been produced so fine an attitude, so perfect a grace, such beauty of head, feet, and hands: every part is replete with excellence; nor is so much harmony and admirable at to be found in any other work. He that has seen this, therefore, need not care to see any production hesides, whether of our own times or those preceding it." The eyes, mouth, and toes are so minutely clabo-rated that, though a mide figure, it may be called

* The original anatomical studies for this figure were exhibited some time ago at Mariborough House, and are now added to the Masseum of Science and Art. The careful rendering of each massle and tendon, in these wara models, shows how minutely Michelangelo studied every detail before he attempted to commit his design to the marble, a lesson not to be thrown away.

[MARCH 21, 1857.

the foundation and masterpiece of the "natural" school of sculpture; these, as well as other details, but these especially being direct transcripts from nati

nature. The height of the figure is 16 feet 6 inches. It came to England in five pieces,—the trunk, legs, head, and two arms. The legs were slightly shakes, either in the journey or during the unpacking, so that it was feared they would not support the enormous weight of the trunk and head. It became necessary, therefore, to add a large iron support to the inside of each legs; and this necessitated the moulding of the legs, in order that the outline of the figure might not in any decree suffer from the mending and filme in heres in order that the outline of the figure might not in any degree suffer from the mending and fing in of the grooves cut for the insertion of the supports. So large a portion of the figure having here moulded, Mr. Bruciai completed a mould of the whole, and thus an accident has proved a boon, for we shall now this is account in a prover a boon, for we such some hope to see casts of this grand work in the Crystal Palace, and other such institutions. Portions of the fogure, such as the mask, hands, and feet, will also be of valuable assistance in schools of art, as well as private studios.

private studios. So great is the enthusiasm aroused by this cast (the first ever made in plaster, only one having been ess in bronze), that applications have been made for permission to make copies of it in Parina and terta cotta,—an enterprising terra-cotta manufacturer having offered to try the experiment of burning it in one piece, which, if accomplished, would be almost as wonderful as the circumstance of its original pro-duction duction.

THE SCENERY IN "RICHARD II." AT THE PRINCESS'S THEATRE.

PRINCESS'S THEATRE. SCARCELY has the curtain falleu upon the crossed and wayward loves of Hermia and Lysander, Deme-trius and Helema,—scarcely has the last burst of laughter died away, as Bottom, the waver, prepetrates his crowning drollery by his hard and drificuld de-tb ; the city of Theseus, restored, yet rears its temples and its palaces in our fresh remembrance;—Pruck still seems to plague us with his mischief, the fury-train of Oberon and Titania, to weave their maxy dances upon the moonlit greensward, or make the woods re-echo to their wild and superhuman chorus;—and the last notes of the creations of the gifted Mendelssohn yet linger upon our charmed sense, when again the eurtain rises, and yet another revival from the works of our great dramatist, in all respects equalling, in some, perbaps, outrivalling its respects equalling, in some, perbaps, outrivialing its predecessors, is presented before us by the enter-prising and indefatigable manager of the Princess's Theatre.

We have followed Mr. Kean to the capital of We have howen sur, Kean to the capter of Assyrian Nious; have trod with Madbeth the wids of Scolland and visited its pre-Norman fortresses; have seen the cighth Henry in his voluptions court, and studied in his palaces the magnificence of the last period studied in his palaces the magnificence of the last period of the Gothic style; have thence transferred ourselves to Sirily, and, in the picture of Doric Symense, second to Athens only in arts and laxary, contem-plated a portraiture of the architecture, costume, and domestic manuers of the Greeks never before attempted upon any stage; and lastly, in the revival immediately preceding the present, obtained a glance, though but transient, of the Athenian capital list.

Subject, there has performed as both and dissirous reign of King Richard II.; —the doke from 1396 to 1399, when the Decorated style was marging into the Perpendicular, and when a semi-babarous, semi-civilised taste in dress and equipment, symbolical of the state of society at the time, gave the oppor-tunity for a display of military and hereldie gorgeous-ness never hefore excelled, if equalled. This opportunity has not here neglected. The performance of "Riebard II." has not hitherto been marked by any very great success. The absence of what is called "plot," has proved in general a want of that popular element without which mere dislogne, however pocifical and beautiful, bas failed to secure public patronage; but the happy idea in Mr. Kean's various revicals, of investing narrative with all the ilfu-sion which seenery, costume, and circumstance, in the strietest accordance with historical tradition and anti-quorian sanction, could confer, has, in addition to the surfices according with insorted transformed transformed and anti-quorian season of the plays themselves, called forth an amount of appreciation from the public, which seems to indicate that the one thing wanting has been supplied. In the present instance, every available antho-rity has been consulted, to identify scenes, actors, and Pty has been consolled, to identify scenes, actors, and circumstances with whom and what they represent, and it is only where actual warranty fails, that invention has been called in to supply the deficiency, and in such case every precaution taken not to exceed or diminish aught that might he deemed essential to the semblance of truth. From the heardless and juvenide-looking monarch, as described by the Monk of Evesham, and whose exact resemblance to his con-

^{*} To be continued.

ventional portraits may be recognised at a glance, down to the lowest menial in his train, every detail has been scrupplously observed, to stamp the period with reality.

In the opening scene of the Council Chamber in Westminster Palace, and the following one in the palace of the Duke of Lancaster, two styles of internal decoration are presented; the latter being of the thir-teenth century, the former of Richard's own period. A ceiling, whose hearns and pauels are highly ornamented and polychromatised, --walls hung with tapestry, em-belished with the kuceling and chained hart, the pool of the *plantagenista*, the rosemary-branch, and the letter R_{s-ra} throne, the safin ecoopy of which is embroidered with the same devices, and an inclosure of stalls for the Prive Conneil, constitute the leading features of

R.-a throne, the satin eacopy of which is embroidered with the same devices, and an inclosure of stalls for the Privy Council, constitute the leading features of the first. An air of agreeable simplicity characterizes the latter in its equilateral arched stone ceiling, of low spring; the ribs of which are ornamented with the dog-tooth and other mouldings picked out in colours; its small stained glass window at the further end; the nicely drawn door and ornament that eneireles it, and the sideboard with its accessories. A very remarkable scene is that of the death of John of Gaunt, in Ely House. It occurs in an old harooial gartment of uncexceptionable form, into which a subdued light is thrown from a bay window. The walls are covered with paintings, elaborately and minutely executed, of passages in the lives of St. Edmund (Richard's patroussind) and St. Fremund, from an illuminated manuscript in the British Museum. The fiftal light from the expiring embers of the and occerlid of the conch upon which time-honoured laneaster reclices; and the warning words that fall from his lips assume a doubly prophetic significance from the solerm air that pervades the whole apart-ient. The painting of this scene is higbly creditable to Mr. Lloyd. Of the architectural restorations, perhaps St.

to Mr. Lloyd. Of the architectaral restorations, perhaps St. Stepben's Chapel, painted hy Mr. Dayes, presents the greatest amount of elaborate pauelling and tracery, alheit, the chapel itself, seen through the arched-entrauce, is but faituly delineated. Founded by Stephen, the chapel was rebuilt in the reign of Edward II. between 1320 and 1352, and until its destruction by fire, in 1834, to which time, from the reign of Heory III it served for the House of Commons, was considered, as all our readers know, a fine specifier, and seen through the arches in the lorerground, it makes a very heautiful and effective scene. Westminster Hall forms another elaborate interior, the fine roof of which would be seen to still greater

Westminster Hall forms another elaborate interior, the fine roof of which would be seen to still greater advantage were the gallery erected for the spectators of Richard's abdication a little lower, and of less size. The hall was materially changed in the latter years of the reign of that unfortunate king, when the walls were heightened and the present fice roof constructed. It is not a little singular that the first use made of the building should have heen for the deposition of the monarch who restored it. Acting on the evidence, documentary and otherwise, that remains of the use of colours on roofs and walls during Richard's reigo, polychromy is introduced, though hut sparingly. The sceue, however, that will be last forgoiten in

or course on roots and wais auring themats Feigo, polychromy is introduced, though hut sparingly. The scene, however, that will be last forgotten in this list of revivals, is a street scene in old Loudon, where the crowd have assembled to welcome Boling-hovke and insuit their fallen monarch. A block of picturesque, ball-tinhered houses, stands obliquely in the centre of the stage, from which streets run to two separate vanishing points. The varied designs of these houses, all odoroed with tapestry and bang-ings, from which festions haug from side to side of the streets, and whose windows are crowded with gaily-attired spectators,—the motley crowd in the street helow, dressed in every variety of costune of the period,—the fests of jagglers, jesters, and "itierant tools," the shorts of merriment from the mob, and the enlivening sonuls of a real peal of hells, form the most exciting *tableau* of the piece. One more interior, and of a different character to the others, should not be overlooked: the dangeon at Pomfred Casele, a Norman erypt with the validing carefully made out.

carefully made out.

carefully made out. Two other restorations of great merit deserve consideration : the exterior of Plint Castle, and the Traitor's Gate at the Tower of London. The first of these, in exact accordance with the type of the Welsh these, in exact accordance with the type of the Welsh eastles, is excellently painted, and has an extra air of substantiality given to it by the raising of an actual porteulis and lowering of the drawbridge by which the unfortunate Rielard throws himself upon the merey of his rival. The second shows the internaf elevation of the tower formerly called "St. Thounas's," but, from the water entrance beneath it, bbrough which State, missures were houter be its.

Index of the descent of the determinated and the second se

of Struit, Meyrick, Finisholt, and Shaw. As regards Mr. Kean's conception of the part of the king, there seems to he but oue opinion,—that of uqualified praise. The various phases in his event-ful career of absolute and imperious authority, sur-prise, rage, hope, despair, all receive their full value at his hands; all have their exact weight assigned them in his balauce of the whole.

Not less meritorious in her degree, is Mrs. Keau, who in the little she bas to do as his queen, throws a depth of feeling, an intensity of grief, into the part, that raises the character into an importance it has not hitherto enjoyed. And if our province it has speak of acting, Mr. Ryder and Mr. Walter Lacy would certainly come in for a full share of praise. A, F. A.

NATIONAL INSTITUTION OF FINE ARTS, AT THE PORTLAND GALLERY

TEN years have elapsed since ertain adventurous and self-dependent artists resolved to afford them-selves and others more extended opportunity of be-coming known und appreciated according to their particular merits, by the somewhat hazirdous expe-riment of allowing all who chose to contribute to the expression and formation of a kine At achilities finent of anowing an who chose to contribute to the expenses and formation of a Fine Art exhibition, a fair proportion of the most favourable positions, fair proportion of the most favourable positiona, irrespective of professional precedence. For a scason or two the result was necessarily a heterogeneous combination of the good, had, and indifferent; but sufficiently encouraging for its originators to perse-vere, and by a little judicious restriction and modi-fication of first intentions, gradually ntain success. Although this advantages offered by this institution are papable enough to invite new-conners, it still de-volves on the nucleus of its members to sumont its

volves on the nucleus of its members to support its character

character. Mr. R. S. Lander, R.S.A., is almost singular in historic and dramatic compositions. Mr. Lander has gene to his old source for inspiration, and scems to cling tenacionsly and gratefully to the works of Sir Walter Scott, perhaps because they are associated with early triumplis. (132) "Meg Merrilies and the Dying Smuggler," proces how sympathetically he can embody the author's meaning. In the (286) "Death of Arthur, duke of Bretagne," these qualities for which he is renowned are still more conspienous: whatmuch Falconbridge lacks in character is made up for by pathos in demeanour, and one forgets to look for finish where the desired impression is conveyed so powerfully.

powerfully The chief chief component of the present collection is The chief component of the present collection is essentially landscape, and the most attractive reali-zations emanate from the Williams' family, whose industry is only equalled by their ability of turning it to the hest account. (44) "On the Webs Hills" has furnished Mr. A. W. Williams a theme to dlate upon most glowingly—" The shower passed, a glean of sun makes nature doubly joyous." It would be difficult to exceed this in rich local colour, and truthful effect: every massace surgests

It would be difficult to exceed this in rich local colour, and truthful effect; every passage suggests conscientions study of Nature and an intuitive per-emption of its most beautiful phases. The same re-nurks would apply to (343) "A Tranqui Eve," and (466) "Haymaking." Mr. S. R. Perey also delights in the grandeur of Welsh hills (52), "In the Vale of Ffestinicg." but, investing them with a distinct effect, leaves them cold, massive, and uninfluenced by atmos-tance scalar. elevation of the tower formerly called "St. Thomas's," but, from the water entrance beneath it, through which State prisoners were brought, known hetter by its present name. It is nicely painted hy Mr. Gordon. In the Dake of York's garden at Langley, alapted from the MS. of the *Roman d'Alexandre*, in the Bodleian library, we have a specimeu of the style of

 is foreible and real-looking. (31) "Bolingbroke's Entry into London," F. Cowie, has many great beauty, and a representation of Wilford Haver (54)

 with Pembroke Castle restored, and the first lying a mehor that conveyed Rishard back to England, as copied from the Metrical History in the British Museum, form an agreesble relief to the architectural restoreming landscape, with practical bridge, showing the hand of Mr. Grieve Hills, " F. W. Hulme, is delightfully freesh and true. (99) "River Lingwy, North Wels," by the same, appeals at once to the attention. (66) "Haynaking receiving indefinite length by againgther position of the spot, and is a very clever performance, in which and suthority of Mr. Salvin and M. Gorge Scharf, Mr. Kean tenders hachovledgements in the play-hill.

 The subject of costume we dare not here tout and restored to varioos other manuscripts, and the work is colored the spot, addition to varioos other manuscripts, and the work of some lines are appended, is real petition of a successful formische with and successful for the spot, addition to varios other manuscripts, and the work of some lines are appended, is really at transfield of the deciming successful for out of the spot in its Elluminated page, is addition to varios other manuscripts, and the work is complete the laster of the deciming successful for out of these filte one on those little islauds met with in a row of Strutt, Meyrek, Fribrik, and She.

 As regards Mr. Kean's conception of the part of struct and back one provide the deciming successful for out the spot in to which some lines are appended, is really a tran-script of one of those little islands met with in a row up the Thames (well known to aquarian pic-nie light of a summer's ceruing, by G. A. Williams, and pleasantly contrasts with (404) "Winter-Sanset," by the same. (315) "Interior, Accurington, Lanca-shire." There is always something admirably quait and pleasing in Mr. D. Pasmore's works, but in this case he has produced a perfost little gem. (395) "Morning Light on the Hills," is by A. Gilbert, another Williams--mat as this asserts-most the least elever of the number. (50) "A Family Group," H. B. Willis, consisting of two goats and a kid, is carefully, hut somewhat timility excented. Amongst other taking pictures, will be found (25) "The Scarcerow," P. Morris; (60) "Returning from the Conven-ticle," H. Stacy Marks (a capital intersonation of character); (79) "A Regred Pah," C. Dakes; (276) "Crossing the Stones," J. Dearle; (307) "The Taming of the Strew," W. M. Egley; (321) "Modern Min-strely," Rossiter; (373) "Morning in a Gleu," R. S. Bood; (439) "In the New Forest," H. Moore; (440) "Some and Trout," H. L. Rolfe; (445), "Cot-tage Interior," J. B. Burgess; and lastly, we would mution, having nearly overlooked it, (231) "Ashford Mill, Derhyshire," A. Fraser.

THE MODEL OF WREN'S FIRST DESIGN FOR ST. PAUL'S.

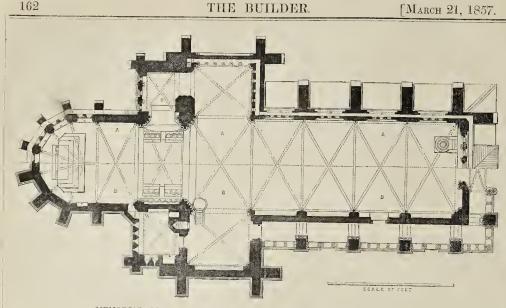

THE Architectural Association have addressed a nemorial to the Dean and Chapter of St. Peul's Cathedral, on the present condition of the model of Wrea's first design for St. Paul's Cathedral. The writers say :-

writers say :---"The fact of its being the work of that great man rould alone entitle it to the reverent consideration of all architects; but when, in addition to the, the model is similted to be a work of extraordinary beauty, and that tremnied to the last the favourite design of Sir Christo-her Wren humself (he hinself desiring the model to be terfectly preserved), notwithstanding the numerous works of beauty afterwards produced by his hand; uo archi-et can see it gradually dropping to decay without feelings if extreme regret, or without protesturg, in the nume of he art which gave it existence, against the neglect which total ruin."

They further suggest that the position of the model in the room in which it is exhibited is not favourable for inspection.

THE MIDDLE TEMPLE LIBRARY.

THE MIDDLE TEMPLE LIBRARY. THE new library which is to he erceted for the Society of the Middle Temple, from the design of Mr. Il. R. Abraham, will be 55 fect long, 42 fect wide, and 62 fect high to the underside of the ridge. Beneath, will be class-rooms and rooms for the benchers. The huilding is Gothie of the Perpendicular period in style. There will he an oricl window at the end next Garden-court, and a large tracericel Pointed window in the end, which will be secue from New-court. There will be a lowre and spiret on the roof. The new Ebrary will be connected with the old hull by means of a new turret to be added to the latter, with a flight of stairs which externally will take the shape of a flying buttress. The library will have an open timber roof. open timber roof.

MEMORIAL CHURCH, CONSTANTINOPLE. PLAN OF SECOND PRIZE DESIGN.

HE SECOND PRIZE DESIGN FOR THE MEMORIAL CHURCH AT CON-STANTINOPLE.

STANTINOPLE. THE author of this design claims to have attempted to secure the object which the com-mittee had in view by making his design avow-edly monumental. He considered, therefore, that a fine simple chaple without ailes was the most suitable form to adopt; and though the width of his church is considerable when judged by our English ideas, it is below that of a large number of continential examples. In his memoir Mr. Street strongly argued against the impro-priety and absurdity of taking a cathedral as the church of a future histop. He considered, also, that the church should distinctly proclaim its English origin, and not be an imitation of foreign buildings to such an extent as to render it diffi-English origin, and not be an imitation of foreign buildings to such an extent as to render it diffi-calt to distinguish it from a building devoted to the use of Italians or others. He looked, there-fore, to Italian buildings only for the best modes of securing his church against the heat of the elimate. These he found to be, generally, very few and small windows placed at great height from the floor, groined roofs, and external clois-ters or porches. Besides this, in Constanti-nople it is the custom to have large blinds in front of the windows. The windows in the design are therefore arranged with outer and immer traceries, and so narrow is the light and inner traceries, and so narrow is the light and so high from the floor that the suu would never have fallen upon the people occupying the scats on the floor of the church. There was a passage round the walls also at the base of the windows, to allow of blinds of lattice-work being put up and taken down if it means found it. to allow of blinds of lattice-work being put ap and take down if it were found necessary. The spaces between the buttresses were converted into a small cloister, which would protect the doors from the sun and keep the walls cool. No one who has not been in a hot climate knows how intolerable a large amount of window is in such a city a Constrained and it of now information a large amount of window is in such a city as Constantinople, and in this case, as figures and subjects were expressly forbidden, it was useless to think of filling the windows with stained glass sufficiently rich in colour to subdue the light.

subdue the light. It was proposed to build the walls of rubble stone of the neighbourhood, covered occasionally with stone of other colours. The use of marble was intended to be mainly reserved for the interior. As the native workmen are incompe-tent to execute any but the simplest work, it

ART TREASURES' EXHIBITION BUILDING MANCHESTER.

The decoration of the Manchester Exhibition huilding is now being proceeded with. The centre nave is being executed by Mr. Crace, and the side galleries are being done under his direction, but by a galleries are bein Manchester firm.

Manchester firm. Manchester firm. All the principal constructive features in the centre mave, such as the columns and main griders, are of a pale bronze, relieved slightly with gold. The walls are a deep but subdued tone of red, finished at top by an ornamental frieze. The main arches of the roof are of pale bronze, the rivets heing gilt, and the thickness relieved with gilt patera; the fillog-in between the flunges of the arched ribs being painted in ned serol for fet work alternately, on avelum ground. The ground of the ceiling is a warm grey, the parlines being vellum colour, relieved with a firize on a red ground. The ceilings here correspond in general tone of colour with that of the grand nave.

ILLUMINA "ED CLOCKS.

ILLUMINATED CLOCKS. I BEG to remind you that it is now more than two years since I suggested that the face of illuminated clocks should consist of concentric discs. In my plan I did away with the necessity of hands altogether. My proposition was, that the centre disc should be fixed, that a concentric disc, with a circular opening, should encircle it over an illuminated *red* set of

was felt to he a great point that there should not only be as much simplicity but as much similarity as possible. The groining, therefore, though of large dimensions, was of the simplest the mouldings were all to be very simple. The designs for alphi, font, stalls, altar, and reredos, sent with the design, were not included in the estimate of 20,0001, but were proposed by the committee as the objects of future doma-tions, by way of memorials. The committee place was specially provided for what in England are rapidly being expelled from our churches; but it was thought that the external cloister would afford all the space which would be required for this purpose. N. Half plan at level of windows. long before yon can ascertain the time.

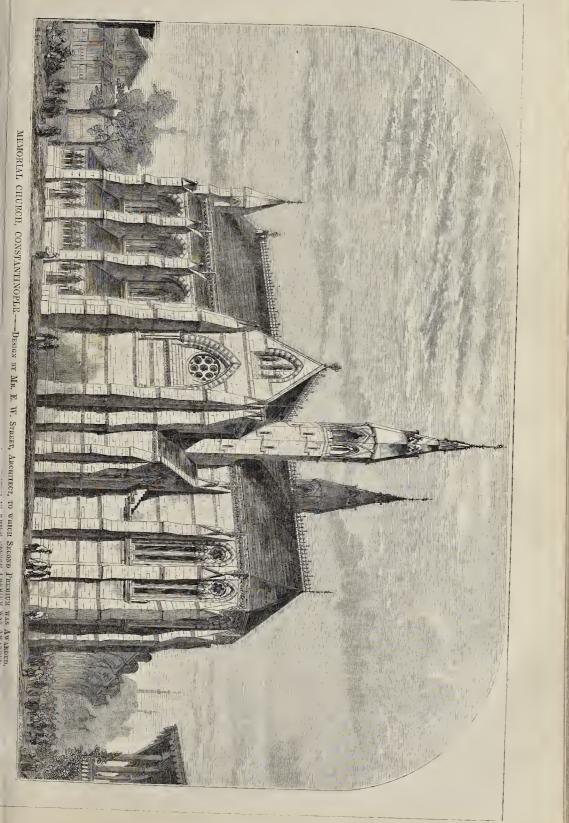

W. H. BUTTERFIELD.

P.S. The white spot might be the minute, the red the hour.

CONGRESS TO SETTLE THE PRINCIPLES OF GOTHIC,

ALL architects, I think, agree that one of the causes of the beauty of the Gothic architecture of the thir-teenth century was the unanimity of the Freemasons as regards the principles of Gothic, and one of the great defects of the present day is, that every archi-teet has his own principles. Now the only way to arrive at unanimity is for architects to form themselves into a society after the following plan. Let us request them to ecure a meeting in some spacione hell in a arrive at unauinity is for architects to form themselves into a society after the following plan. Let us request them to convene a meeting in some spacious hall in London, and request the cloadnace of all architects of England, elect a president, and proceed to work by holding daily meetings and discussion the various principles, and thereby come to some general under-standing, and frame rules and principles for the system of Gothic architecture to be pursued. I doubt not that the Freemasons settled their principles by a similar system in the thirtecuth century. They must back done something of the sort. I do trust we shall see again a regular system of principles had down, and then we shall have some chance of secing as fine buildings as those of the Middle Ages. Architects of original teleat would then have some fuely system, and not lose time by giving themselves up to vild speculations shout the so-called principles of Gothic art, but would be employing their talect to raise a new style suited to the micatecath centary, upon a true basis, and the thorongb stady of previous styles; for, as Mr. Sydney Smitke remarked, a new system will not spring up in a night. Hongi that some sueh meeting may be conveued, I remain, CHARLES DE VERE.

INFLUENCE OF FASHION ON TASTE

INFLUENCE OF FASHION ON TASTE. Is the infinence of fashion on taste henchicial, or prejudicial? Does fashion really affect taste at all, or does taste affect fashion? Taste and fashion are more frequently autagonistic than frieudly. They do not often row in the same boal, or march in the same path. They frequently diverge widely apart, yet sometimes, for brief intervals, they coaverge, and while the convergence lasts they benchicially affect each other; for, if any particular species of taste becomes fashionable, it is patrionised by the *heast* for, by parties of influence, by men amhitions of being dis-tinguished in peculiar matters of taste, whether architectural or artistic. Fashion is variable, ever-changing, and motable: it moves in cycles more or less short, dies, and recurs at intervals. What is old-fashioned to-day may he quite new twenty years fashiond to-day may be quite new tweaty years hence, and what is quite the rage to-day is only some modification of the *eraie mode* in the time of our grandfathers.

our grandathers. These observations apply to architecture, sculpture, painting, decorations, furniture, and the kindred arts, with quite as much force as to more samplurar mat-ters, modes, ruld manners, but they do not apply to high art, for that is of all time, iadependent of the pertulant changes of mere fashion in taste. Here lies the distinction between art and taste. One is real and negment, the other tamporary and artificial. and permanent, the other temporary and artificial.

A "thing of beauty is a joy for ever," but a thing of fashion is only considered heautiful while in fashion. If based on the principles of real art, it will remain beautiful to all ages; hut if based on mere fashion-It based on the principles of real art, it will remain beautiful to all ages; hut if based on mere fashion-able taste; its beauty fades with the fashion that gave it birth. From heiog admired as a thing of heauty, it becomes odd, quaint, or enrious, a mere type of past tastes, a prized article in the "old curiosity-sitop"--- gren with the antiquary, but not an object of art,---the work of genius challenging admiration through all times, simple, pure, and trae, perfect of its kind. If conceived in the trae spirit of art, the stamp of genius is incfl ceable; it endures through a hundred eycles of mere fashionable at and tastes too fickle to fix a thought which the "world will not willingly let die." Architecture moves in cycles: we live in the midst of revivals, of styles resuscitated, and of bleading styles. New combinations of old parts create a ovely, with nothing new in principle, but new only in arrangement, with no great range of variety in detail; cach style being more or less rigorously confined to its peculiar type of ornamenta-tion. No one would insert Gothe details in a Gorin-thian huilding, or introduce Corinthian details into a Gothe structure. Linica, Long and S. Schenger tion. No one would insert Gount attain details into a thian huilding, or introduce Corinthian details into a Gothic structure. Injog Jones put a "magnificent rutting" to old St. Panl's : the portice might tion. No one would misely occure driving details into a Gothia huiding, or introduce Corinditian details into a Gothie structure. Inigo Jones pnt a "magnificent portico" to old St. Paul's : the portico might have been good in itself, perfect in detail and proportion, but yet an excressence on the building to which applied. Yet these freaks of fancy are not unusual, especially during the last century. This curious species of barharianism is not un-common on the continent any more than in Eug-land. Many beautiful cathedrals in the south of France are disfigured internally by the injudicious application of classic organ-lofts do not accord with elaborate tracery in Gothie churches. They may be good in themselves, but are incongraous when placed in foreible and direct contact with groined vaults and definance of every rule of art and real taste are com-mon in France. Narbonne, Capestang, and Beziers eathedrals have all been beautified in the is fabion, definece of every rule of art and real taste are com-mon in France. Narbonne, Capestang, and Beziers eathedrals have all been *beaufiged* in this fashion, for it was once the fashion of the day to improve Gotlie choirs with classic decorations. The fashion was to introduce mary-coloured marbles, as a direct contrast to the rich greg of the original time-honoured stoue. Clustered pillars, beautifully mooled arches, and panels rich in cluborate tracery and diaper, were ruthlessly ent away, or lined with slabs of variegated marbles, doubtless beautifully polished, and "adorned" with columns of a "severe and classic taste," which markles, doubless beating and states of variential markles, doubless beating points, and "dormed" with columns of a "severe and classic taste," which may be good enough, per se, but are sadly out of place. Many beautiful side chapels, rich in elaborate tracery, are spoiled aud disfigured by the erection of enmbrous classic shrines for the Virgin's throne. Farey a Corinthian or Ionic throne in the House of Lords, with the whole of that end of the building encrusted with stabs of veined marble, " heautifully polished, and highly wrought," and the effect of the once fashionable classic improvements in many of the old French cathedrais will be fully realised. This style is now happily out of date ; yet it seems to linger; for a recent French writer, in criticising the Queen's throue, in the House of Lords, states, — "I aymbolize a merveille la royanté constitutionnelle: il resemble à ane cage dorce;" and trac the whole chamber is "gen monumentate," and recombles, in fact, " nos

where locomotives never whistle nor penny papers

Provi introducing classic work into cathedrals, the framinite taste of the day turned to improving ancient châteaux in the same style: here, however, it was of less consequence, though a really fine old weather-beatm château is worth preserving intact in the taste of its time. Externally many are marked by well defined lines of hoar antiquity: internally they are almost fresh from the "improver's" hands, in a style totally different. You pass under grin cover's and turrets, through groined arches, and fashionshe upholsterers, in the taste of the present day. Old panelling gooe to the brokers; old tapestry to the curiosity-shop; canopied chinneys replaced by day. Old panelling gooe to the brokers; old tapestry to the curiosity-shop; canopied chimneys replaced by modern sloves; mullioned windows "ricbly dight," by slavs of plate-glass, and carved ceilings by plain

by slass of plate-gauss, and curver county in plate stuceol The walls covered by flock or satin paper, "beau-tifully panelled" with caborate borders, block printed, and heightened up with genuine Dutch gold. Reality abolished to make room for sham. At Windsor-royal Windsor-we have the St. George's Hall, Waterloo Gallery, and ball-room, all different in fashion, style, and taste. Our French friend, before quoted, is erraptured at this ball-room. He says: "La salle de bal, tendbue de tapisseries des Gobelins, décoré dans le style de Versailles, soit la plus riche, la plus déliciense gwill soit possible d'imaginer." In the style of Versailles 1 and this of Windsor, with St. George's Chapel; its eastellated walk, towers, turrets, and donjon keep! The old feudia fortness of Alwick is being restored, and transformed at the same time, and here comes

and transformed at the same time; and here comes the question in all its force,---What is the influence of fashion on taste?

This kind of restoration will become fashionable This kind of restoration will become simulation in the more than one fendal stronghold will follow in the wake of Alnwick: the fitness of things will be over-looked, this hybrid fashion of questionable taste pre-dominate, and restoration become synonymous with transformation : they will become nothing more than "un decor, ajusté dans un théatre Gothique."

Will modern decorators and upholsterers assimi-Will movern accorators and uphotscrerrs assumi-late with the stardy master masons of olden time ? Can ancient Alnwick and New Belgravin accord ? Woold the Alhambra and Vatican he harmonious if united ? Can modern "house decorators" be in united with ancient masters in the cunning craft of cost he building ? building?

castle building? Fashion has given rise to deadly feuds between arcbitects and upholterers. It rages even now, as fiercely as the wars of the Roses, or the wars of the Montagua and Capulets. Au architect designs a building: no sooner is he ready to lavish his skill and taste in the judicions decoration of his rooms and halls, in mison with his general design, than in walks the upholsterr, takes foreible possession, and expels the architect. The architect makes the hulding, and designs its proportion; but the upholsterer stalks in with his high pricet,—the "house decorator,"—to finish it of, without the slightest reference to the injured feelings of the agonised architect,—whose injured feelings of the agonised architect,-whose work they are conspiring to spoil, --whose skill they forestal,--the proportion of whose work they destroy,--and leave to bear the hlame of their they.--

blanders. Small rooms are "decorated" with papers of pro-dicions pattern; large ones "beantfully panelled in the French style," and licked into shape with the paperr's past-brmsh and shears. The cornice,—a grand subject with the "decorator,"—must be picked out with gold, and filled in with greeo; or touched with silver, and tinted with blne,—deheate cream, or sickly salmon, to say nothing of clear-colling and fatting. The walls are now ready, and completely decorated in the highest style of the latest fashion,—glowing in all the colours of the rain-low, for such discriminating patrons as are fond of "eolour,"—or donce and subdued to very haldness, for such as prefer to gaze in the placid heauty of "neutral" such as prefer to gaze in the placid beauty of " neutral" tints.

As soon as the decorator has exhausted the mighty eunning of his craft, in comes the great man of the day — the unholsterer, to " cry havoc, and let slip the classic similar of the transformation of the constitution of the transformation of the constitution of the constit the constitution of the constitution of the consti

the picking out with gold and filling in with silver are eclipsed by the glowing brilliance of the strongly-favoured carpet, and its hrace small family of table, chair, and sofa covers, equally dazzling with the great Mognil of a carpet,—which converts a fashionably embellished room into a "chamber of horrors," where art and taste are often done to death by those who try to give them hirth. Fashion in furniture varies much,—at one time brilliantly polished mahogany, at nother dark and sombre rosewood, then sometimes light tored maple. They are often selected for the fashion of the furniture, irrespective of their being in harmony with the general character or colour of the "highly-decorated" walls. Too often a huge music-hos, shaped like a coffin, and called, par excellence, a grand plano, is foisted into a room, utbrily regardless of cft et. And, generally speaking, a grand plano, is best, is no beauty, either in colour, form, or execution. Whatever progress may have here made in the internal parts of planos, externally they remain much the same as when first rising, high fashunable remate

in intever progress may have neer made in the internal parts of pianos, externally they remain much the same as when first rising into fashionable repute. They are rarely so constructed as to be ornameotal in They are rarely so constructed as to be ornamectal in a room decorated according to the present taste. There is much scope for improvement in the external orna-mentation of pianos. They retain their old features too strongly, and are evidently designed in general by "cabinetmakers," and not by artists. Why should they not become ornaments to a room, instead of mere pieces of "furniture." They are nearly all of one prevailing them, and stick to the same form and natthey not become creatments to a room, instead of mere picess of "furniture." They are nearly all of one prevailing type, and stick to the same form and pat-tern as pertinaciously as if designed by Chiuses artists, --who conserve old patterns in everything. But who would pay for an artistically-dasigned piano? Who cares for a combination of art and heavy in the external enso of a piano? Very few, it is to be feared. They are treated as mere music-heaves on a layer scale, as user cases to cover an

is to be feared. They are treated as mere musi-boxes on a large scale; as mere cases to cover an ingeniously-contrived combinatiou of hammers and wires. But why should they not be so formed as to please the eye as well as the ear? Let us hope the time is not far distant when the case of a piano will be looked upon as a work of art, and so designed as to be an degrant and appropriate ornament to a taste-fully-decorated apartment. Its conspicuous size in a modern room imperatively demands ornamentation, in harmony with the general features of the prevailing decorations; to which at present they violently con-trast in every particular.

decordions; to which at present they violently con-trast in every particular. Ladies are generally allowed the privilege of select-ing earpets, chintz, and forniture, and exercise a powertul influence in the choice of paper for decorating or disguising their rooms. Perhaps *milatis* has been to Marlborough House, visited the "chamber of horrors," wandered through the deserted halls of Soyer's Symposium at Gore House, or even had a peep at the growing glories of the "Brompton boilers," whereby *miladi's* taste has been bounteously refreshed. refreshed

But being dazzled by the brilliance of carpets, the glories of glazed chintz, the beauties of elegant-patterned papers, and dumbioundered by the "horrors," mildat is confused in her ideas, mistakes brilliancy of colour for heatty of design, and confounds simplicity with baldness. Mildat "tusses" about from shop to shop, makes inappropriate purchases, sends them home in triumph,--to meet with dis-appointment and varciance of finitum what a consist But being dazzled by the brilliance of carpets, the simpletity with automess. *Diracti* Taskes about from shop to shop, makes inappropriate purchases, sends them home in triumph,—to meet with dis-appointment and vesation on finding what a comical combination of colours she bas jumbled together, what hop or effect is produced, how, after all her trouble her rooms do not hook what she expected, or what they ought to he. Something is still wanted, although there is excess of everything—but taste. In vanue bacuftul table-covers are purchased, elegantly-bound books, shining in gold and moroceo, scattered on the table; the chinneypicce crowded with ornaments, reflected in splendid glasses: all these efforts fail: *miladi* feels that something is wanting; but, not cractly koowing what that something is, she cousels herself by saying, "the rooms at least are comfortable," and so dexteronsly evades the difficulty. Tashion has much to do with these matters. Some twenty years ago it was fashionable to bave rooms as caramed and charged with forniture of all kinds as scarcely to permit moving in them,—species of furniture.

as scarcely to permit moving in them,-species of furniture pantechnicons! The fashion changed : rooms were stripped bare,--the less the furniture the rooms were stripped bare, — the less the furnitore the greater the fashion : even pictures were tabooed, and received the route for other rooms less used for grand occasions and state displays. Fashiou ran from one extreme to auother, but let tate stand stock still, or ignored it altogether, as is too often the case with fashionable patrons of " painters or decorators." When the late of the state stand stock is different to be a stock of the s

fashionable patrons of " painters or decorators." When the Duke of Brentford or Marquis of Cara-has shall employ real arists to design their furniture and fittings; when the Duchess of Putney and Countess of Crippegate shall employ able artists, cunning in the craft of designing chintz, earpets, and table-covers, really pure in taste, and veritable works of art, then will fashion operate hencicially in the spread of general taste in house decorntion. The bas monde will ever follow the beau monde

the lower ten thousand tread in the steps of the "upper ten thousand." Honce our patricinas set the example of following sound rules of taste, instead of the whims and foncies of mere fashion, the parvenus will extend the practice, and spread a koowledge of it to the outside eircles: and surely if taken in a proper spirit, it is just as easy to make true taste fashionable as false taste. Example is the hest prefashionable as false tasks. Example is the fast pre-cept. It ought not to be beneath the notice of a man of fashion to study the designs of his furniture and employ artists for the purpose, instead of leaving such matters to the crude skill and nututored taste of mare "cabinet-makers." In the olden time half-a-dozen artists or more, each of eminence, did not dis-tic to invite their ability in the task half as the dain to unite their abilities in the production of a piece of furniture,—and why should they now ? The cheep and masty system at present in vogue canoot be expected to clevate taste or produce works of art. The best that eao be said of the productions of such a system is that their works are "good enough for The best line can be said of the productions of such a system is that their works are "good enough for the money." Many of the upper class, who are won-derfully particular io the pattern of their eravats, are utterly careless as to the dosigns of their furcilure. ey spend thousands in the erection of a house, and thousands more to spoil it, hy reason of following fashion instead of taste in their attempts to decorate and furnish—a matter quite as difficult as to build the house itself. JOSEPH LOCKWOOD.

THE BUILDING CLASSES.

As I am convinced it is your desire to hold the scales canally between the employer and the employed, I am induced to trouble you with a few remarks respecting the present scarcity of employment, par-ticularly among the building classes, which has now continued for a long time, and without any immediate signs of improvement. For a long time the average yearly earnings of thousands of skilled work mee have pnothing like equalled the pay of a policeman, and that not through any fault of their own, but entirely occanot through any fault of their own, but entirely occa-osioned by the searcity of employment: but I contend, sir, the pay of a policeman is no eriterion to go by, as a good character and the blessing of a sound con-istitution are sufficient to procure him employment. How different is the case of the building classes, who im many cases have served an approacheship, have to purchase tools, and cannot ensure aoything like monstant employment, leaving illness of themselves and family out of the question. Once cause that has operated much to the injury of the building classes is the vile system of contracting, and letting, and again sub-letting, until sufficient time s not allowed to excente work as it cought to be done,

and letting, and again sub-letting, ontil sufficient time is not allowed to excente work as it orchit to be done, and scarcely with safety to the public. Before the uresent mooopolizing system came into operation, iu the erection of a mansion, a master of each trade was camployed, and the work was generally done in a good and workmanlike manner, and of course occupied amch longer time than in the present day : there was also the inducement that, hy good conduct, the man shood a fair chause of becoming master with bacofit who the inducement that, by good conduct, the man stood a fair chauce of becoming master, with heoefit o himself and family; but as monopoly increased that hance gradually disappeared, and for the loss of ubis the building classes up to this day have not received an equivalent. Well might the purchases of the late Mr. Holford's manison, in the Regent's-park, stongratulate themselves with having met with such a nargaio, as it would not require helf the expenditure o keep it in repair as one of the same size built by sontract in the purcent day would. For your part o more in the present so we the same size built by pontract in the present day would. For years past, every means has been adopted hoth by machinery and wherwise to reduce the amount of labour in every aranch of the building line. I could name a branch of

search of the hailding line. I could name a branch of ray own business where work which as fornorly done would have had a day's labour given to it, I have seen time. Of course, it was not worthy to be placed by the side of the former, but still it is allowed to pass even io a Government hulding. Yet we have schools if design, in order to produce superior workmanship a that very brach that I have alloded to, and the complation has been for a length of time..." We are excelled by foreigners." Iodeci, that is not much to e surprised at, as has been most instly observed.... scelled by foreigners." I odced, that is not much to e surprised at, as has been most justly observed— anantity is everything, and quality but little thought f. Let the English workman but meet with encou-agement and fair play, and the complaint I have illided to will sooo pass away. It is a fact, that the english workman performs more than double the drock the foreigner does in an equal space of time. If I peaceable conduct under privation is any recom-mendatioo, surely the Government will adopt every aceass in their power to counteract the presect want of employment. Prompt measures are required : the ease is urgent. Emigration, and a reture to the better acceution of the different hranches of work, appear to be the only remedy. R. S.

few observations to make on this serious subject. The system of apprenticeship is very detective : most mesters keep their apprentices employed in the most ordioary work : this may answer their profit very well, but they seem to forget the conditions required of them, to teach their apprentices the "art and mystery" of their various professions. I respectfully submit a remedy for this willou neglect on their part. submit a remeay for this within neglect on their part. If magistrates were empowered to insist on the masters performing their part of the contract, or agreement, or, in adfault, to impose a pecuniary fine, as a compensation to their njured apprentices, the result would be productive of much good. But this is not all: I have to regret how much voluable time is not all: I nave to regret how much vaname unne and money are thoughtlessly wasted by the apprentice and young mechanic. Let them resist temptations, and devote their time and means to the acquirement of what will prove of nltimate henefit to them, "useful koowledge" required in their several pro-fessions and trades. T. G.

The Duke of Wellington having headed a subscrip-tion list for the promotion of emigration for the unemployed with LOODC and various other consider-able sums having been forthwith added, the fund thus in progress of accumulation has been called the Wel-liugton Emigration Fund, and a committee has been lugiou Emigration Fund, and a committee has been formed, including various influential names, such as these of Lord Stately. Mr. Laboncherer, M.P. Mr. S. Herbert, M.P. the Lord Mayor of London, Mr. T. Baring (who has coutribute 500%), and others, with the Duke of Weilington as chairman. The emigra-tion, as a meaus of relieving the distress among the unemployed, will eliefly be directed to those colonies which may contribute most to the fund, and sub-seribers are allowed to specify the colony to which their sub-scription is to he applied. Lord Goderieb, the Rev. F. D. Maurice, and others, are acting on behalf of the working classes for the selection of emi-grants, who will repay the sums advanced on their behalf by instalments, after they have been fairly set a-going in the colonies.

BRISTOL LUNATIC ASYLUM COMPETITION

The committee, actiog according to their state-ent, "with the advice of Mr. Salvin," have awarded ment, "with the advice of Mr. Salvia," have awarded the first premium of 100Å; to Mr. T. R. Lysaght, of Bristol; the second premium of 50% to Messra. Medlaod and Maberly, of Gloucester; and the third premium of 25% to Mr. J. H. Ilirst, of Bristol. The letters accompanying the designs of the other com-petitors were opened, and the plaus were returned without even the cold and costless courtesy of thanks. We understand that there were twenty seven compeve nucleising that three were twenty-seven compe-tions. According to the Bristol papers, "The cost of the exection of the approved plao is guaranteed at nucler 20,0007. We believe that the estimate is 18,0007. The cost of the laod will be about 3,0007. and when the furnishing has heen completed, the eatire cost will probably be about 25,000/. The payment will be spread over twenty years." We have re-ceived two very indigoant letters. One writer says,-"The Bristol committee have sent off all the draw-ings, and have not permitted eveo the selected designs ings, and have not permitted eveo the selected designs to be seen, having even returned the 2nd and 3rd prize drawiogs to the authors of them. Coupling this with the fact that the selected men are all of Bristol and Gloucester, it looks very like a job. As a ratepayer, I protest against the whole proceeding, and hope the rejected competitors will at any rate take means to exhibit their designs. Can you not get a little light' thrown upon the affair? A Burgrow Max ".

A BRISTOL MAN."

COMPETITIONS.

Moulton, near Spulding, Lincolushire.--Most of your readers have, doubtless, seeo an advertisement in the Bailder of the 7th inst, from the "Governors" of a certain school near Spaldiog, for plans, &c. for (No. I) a new "school and class-room for 150 hoys; (No. 1) a new "school and class-room for 100 noys; (No. 2), school and class-room for 60 boys; (No. 3), alteration of present school-bouse for head-master and 12 boarders; and (No. 4) a bouse of six or seven rooms for the under-master." The whole cost not to exceed £1,200. So far, so good,--but few of your readers will find fault with the terms up to the present main. The the next content is platflar. The period. But the next sentcore is a startler. Two POUNDS! for the best plan!! and one ponod!!! for the next best!!!! Such is the hurden of the next soutence, and a hurden that ought to break the camel's back. The profession have long had indignities showered down upon them by Competition Com-mittees—bave groaned under the burdeo; but this rare iosuit, one would face, would be the one either But the next sentcore is a startler Two a composition of the different hranches of work, appear to the the only remedy. Readiog, with regret, the statement, in p. 133, Non the Decline of Skill in Operatives," I have a bave strengthened the hands of the oppressors—acts

emanating from professional men themselves-hut never before have we wilnessed such a humiliating instance of the low standard awarded to the profession by educated laymen (laymen as far as the pro-fession is concerned) and GENTLEMEN. It is matter Tession is concerned, and GENTLEMEN. It is matter for serious reflection—it is food for deep thought, and a warning evy to us to unite, as we should do, to stop the raging of this giant disease. I need not occupy your space further. As a member of the Institute, I look to that hody this time to take the initiative: the provincial architectural societies will render it all the provide a Bolice total address will refine to all the support possible, and the London Architectural Asso-cistion will be cordial co-operators in the work. The time has arrived for something to be done. I, as an individual member, feel *lowered* io the eyes of the public from such occurrences, and soon shall find but little pleasure eyes on the name of architecture. It is for provide a series of the superscription of the series of is of no use saying this is a solitary instance, or one only of a few : from my intinute knowledge of scores of committees in the Midland Counties, I know to the contrary, and architects themselves seem to foster the impression scattered abroad. I write, perhaps, despondingly, but no one will be more ready to be up despor and stirring, or work more cheerfully in counter acting the doings of these committees thao your art loving, bard-working A. R. I. B. A.

ROYAL INSTITUTE OF BRITISH

ARCHITEOF BRITSH ARCHITECTS. At the ordinary meeting, held on the 23rd ult, Mr. ashpitel in the chair, a paper by Mr. J. W. Pap-worth was read, entitled, "On Beanty in Architecture and its Alliance with the Past." A discussion followed, in which Mr. M. D. Wyatt, Mr. Jennings, Mr. C. C. Nelson, and the chairman took nort

part

took part. Mr. Fraser, contributing visitor, called the attention of the meeting to an article io the newspapers, from which it appeared that a suspension-bridge was to be creeded across the ornamental water in St. James's-park. This he considered would be a very great eye-sore. Where there were high tides or violent currents suspeosion-bridges were most useful (as in the cases of the Britannia and Cooway bridges); and in France such bridges were properly employed from motives of economy; but over a quiet lake, as that in St. James's-park, always at the same level, a suspension-bridge was totally out of pace. and would by no bridge was totally out of place, and would by no means add to the heauty of the scene.

Mr. M. D. Wyatt said, that as his name would probably be hereafter associated, to some slight extent, with the bridge referred to, be begad to say publicly that he agreed with the general principle laid down by Mr. Fraser, and cousidered that a low bridge on arches, recalling the Palladian bridge at Wilton, would have been a more classic and picturesque object in St. James's park than any suspension-bridge could nearbly the pade when he was could be by the possibly be made. When he was applied to by the late Mr. Rendel the matter was a *fait accompli*. Mr. Rendel's engineering arraogements were nearly com-pleted, aod it was in respect to the precise forms of all the iroowork that could be made io anywise sub-servient to the laws of beauty, that his assistance had been invited.

Previously to the reading of Mr. Papworth's paper, Mr. C. F. Hayward, associate, called atteotion to the dilapidated state of Sir C. Wreu's model of St. Panl's displanted state of sit C. Wieu's model of Scham's Cathedral, with a view to memorialising the authorities to effect a restoration, and to place it is a more ad-vantageous position. Mr. M. D. Wyatt, and Mr. Parria, visitor, explaiced that the subject had not escaped the attention and care of the surveyor to the

fabrie. Mr. Trivining, contributing visitor, then exhibited some sketches of ehurehes in Bavaria. The towers, he stated, were generally surmounted by small cupolas, modelled after that of the cathedral of Muoich, but mobified io varions ways; and it ap-peared to him biat these cupolas, though by no means beautiful in themselves, harmonised with the rocky outliese of the Bavarian Alps much better than the spires of the Tyrolese churches assimilated with that monutivines were. monutainous region.

At the meeting held on the 9th inst. Profes At the meeting held on the 9th inst. Professor Donaldson io the chair, M. Labarto scot his "Recherches sur la Peinturc en Email dans l'Antiquité et au Moyce Age;" M. Didron, aioé, his "Maouel d'Iconographic Chrétieuce, Grecque, et Latin;" and Mon. M. H. Duraod, "Le Moniteur des Arebitectes, Jouroal Indicateur Géoéral et Spécial, a l'usage des Architectes, Entrepreneurs, et Coustructeur

teurs: Mr. Ashpitel read a paper "On the different Theories respecting the Forum at Rome, particularly those of the Commeodatore Canina." One of tweety pendunts, carved by Mr. W. G. Rogers, for the new Palaee of the Sultao, Constanti-nople, was hung on the wall.*

CHURCH-BUILDING NEWS.

Frampton Cotterell.-The ancient parish church of Frampton Cotterell is about to he taken down, rehnilt, and enlarged, at the cost of one of the joint patrons of

and changes, and the rectory, *Macclesfield*.—A rich stained glass window has re-cently been put up in Christ Church, from the designs of Mr. A. Bell, and executed hy Messrs. Filkington,

of St. Helen's. Little Finborough.-The church here has been Little Finborough. the church here restored. The Little Finborauph.—The church here has been lately re-openet, after having here restored. The west end, which previous to the restoration was of lath and plaster, has been pulled down and rebuilt, with a bell-turet and angle buttresses of rubble flut-work, and Bath stone dressings. The interior has with a belf-turret and angle buttresses of rubble lind-work, and Bath stone dressings. The interior has heen entirely reseated, with open benches, and a new screen, pulpit, and reading-desk have heen erected, all of English oak. The floor has heen relaid, with Minton's red, black, and buff tiles. The roof bas been covered with old phini tiles, in lieu of the thatch previously existing, and a harge-board and cross of oak have been added at the cast end. The whole cost of the various works, including architect's commis-sion, has heen 2800. About 400, are still wanted: this, however, it is expected will be given by the authorhowever, it is expected will be given by the authorn ties of King's College, Cambridge, the patrons of th however, it is expected with be given by the author-ties of King's College, Cambridge, the patrons of the living, who it is also expected will put the chancel in a state to accord with the rest of the church. The works have been excented by Mr. Betts, of Stow-market, huilder. The architect was Mr. Edwin G. Pennineton of London. market, huilder. The Pennington, of London.

Pennington, of London. Moseley (Brmingham). — On Moseley-common, and occuping a situation on the south side of Bir-mingham, very similar to that which Oscott College occupies on the north, stands Spring Hill College, an institution for training ministers in connection with the Independent budy. The old huilding being very inconvenient for collegiate purposes, a fund for the the Independent body. The old huilding being w inconvenient for collegiate purposes, a fund for erection of a new one was started in 1840, and at close of 1856 this find amounted to 12,9857. Twenty-two acres of land on Moseley-common form the set of 1000 the set of land on Mosely-common form the site for the new college. The building was begun early in 1854, and a formal opening will take place in June next; but the professors and students have already taken possession. The style of the building is of the Decorated period: three sides of a quad-rangle are occupied by it, and in the centre of the south front is a butlemented tower, 78 feet in height, flanked by a bell turret, earried 14 feet higher. In this tower is the principal entrance to the building. Above the main entrance rise in succession three large bay windows, for the lighting respectively of council-room, museum, and laboratory. To the west of the tower is the library. It is lighted by four larger moulded windows of stained glass. Over the library and forming the west angle is the warden's house, flanked by an octangu turret, on the summit of library, and forming the west angle, is the waraca -house, flanked by an octagou turret, on the summit of which is a water tank for the use of the establishment. To the east of the tower is the dising-hall, with lecture-rooms over it, and beyond these the matron's residence. The wings are two-storied, and have tranlecture-rooms over it, and beyond these the matron s residence. The wings are two-solvicel, and have tran-somed windows. At the end of each wing is a turret, intended to earry a bell. The entrance-hall is paved with enceastic tiles. A corrilor window immediately fronting the entrance-hall is to be filled with statued glass. Along the north side of the principal building runs a corridor, with pointed arches. The wings are appropriated to the students, the studies heing on the first days and the deronizes corrected. There is of appropriate to the students, the students heng out can first-floor, and the dormitories overhead. There is at present accommodation for thirty-six students, hut this can he doubled. Mr. Josepb James, of Loudon, is the architect; Mr. G. Myers, of Loudon, the con-tractor; and Mr. II. Beeson clerk of the works.

Bangor, —A Wesleyan church is being constructed in Bangor upon a large scale, in the Elizabethan style. It is to be ornamented with what a contemporary calls "a spiral steeple" placed at its centre. The altar is

It is to be ornamented with what a contemporary calls "a spiral stepple" placed at its centre. The altaria is to be elevated with three steps to approach it, and to have in it, or attached to it, a haptismal fout. *Literpool*.—The Wesleyrans here propose to creet three or four new chapels, on a large scale, with schools attached, in neighbourhoods at present wanting such accommodation. About 15,0007, bare already here minerial, the 2000 just as more more than the schoos accured, in legisloan to a present wanting such accommodation. About 15,000, have already been subscribed; hut 20,000, is the sam wanted. It is proposed to erect one chapel in Grove-street, another in Prince's-park; to calarge the one in Sim-hope-street; and to refit and decorate the one in Pitt chart invariant. Grove-street; street, increasing its capacity, and improving its appearance. The building committee are commencing appearance. The building comm forthwith to realise their objects.

in the church, which will contain benches for 700 people. The schools will afford accommodation to 1,000 children. The entire cost is estimated at 6.000/.

Elgin .--- Contracts have heen entered into for the Elgin.—Contracts have heen entered into for the Moss-street United Presbyterian Church. The suc-cessful candidates, according to the local Courant, were.—Builder, Messrs. John Lamb, 1,1247; car-penter, Alex. Forsyth, 7317.; slatter, J. Findley, 817.; plasterer, Joseph Stuart, 744. 19s.; plumher, John Gordon, 457.—in all, 2,0557. 19s. exclusive of the cost of clock and hell. The church, which is in the florid Gouhie style, from a design by the Messrs. Reid, of Elgin, arclittets, is about 60 teet long by 42 feet wide, within walls, and the side walls are to be 26 feet high. The tower, which is on the cast end fronting Moss-street, is to he 90 feet high, with corner turrets and erocletes. &c. and crockets, &c.

STRAW-THATCHING UNDER THE BUILD-

STRAW-THATCHING UNDER THE BUILD-ING ACT. The Grestal Palaee Company created a building within 5 feet of the public way, without giving notice to the dis-trict surveyor of Penge (Mr, Nash), in a trace, 61 feet by 32 feet, and intended to be used as a store-house for rough the walls. Upon discovery by the district surveyor, he gave legal notice to the Clerk of the Works of Irregularity in the sadi tenss of root and door frawers, required, and warehouse building. Upon non-compliance with the motion, information of such non-compliance was had before hered of works being in attendance, the ease was then best overang for an ice house, and as double doors were required in the walls, the building was the best overang for an ice house, and as double doors were lateration! The decision was, that as straw thatching was the best overang for an ice house, and as double doors were alteration!

alteration! The decision is manifestly an illegal one; inasmuch as the Building Act does not place any power in the justices to dispense with the rules of construction con-tained in the Act, their duties being merely administra-tive. Moreover, the building, though an ice-bouse uow, may be something cleo another day.

TUNSTALL NEW COVERED MARKET.

[With this, the correspondence must terminate, so far we are concerned].

TESTIMONIALS TO CLERKS OF WORKS.

TESTIMONIALS TO CLERKS OF WORKS. I should be sorry for the remarks that appeared in your number for March 7th (p. 184), from "One who speaks from experience," to pass without notice, and shall be glud if I have been anticipated by some one more able than myself in protesting against his sweeping assertion, that the majority of elerks of works are such wortbless individuals as he describes. I am not ashamed to say that I have worked manually, and did not leave it from being too lazy so to do, but heing desirons to hetter my position (and who is there, I would ask, who ought not to aspire to go forward by all honourable means?), by dint of study and perseverance I have sacceeded to some extent.

extent. "One who speaks from experience" reasons illogically in speaking of testimonials. Surely every practical architect would form a tolerably correct estimate of any man's character and abilities before he would give him a written certificate. The writer

[MARCH 21, 1857.

It should he some consolation to us poor elerks of works to find that the writer filings his innendos at discrimination, &c.; although I think he fails to make out his case, as very few architects would fail to discover the shortcomings, or roguery, or whatever elso he may term it, of a elerk of works, until his eliconverte yras mede suprent in a court of law

elso he may term il, of a elerk of works, until Bis delinquency was made apparent in a court of law. I will pass over his "regret that a superior elass of men do not qualify themselves," and, in conclusion, will boldy assert that the position of a clerk of works in carrying out his duties is attended with difficulties enough, without being publicly assiled as "One who speaks from experience" has thought fit to do.

A LOVER OF FAIR PLAY.

Another correspondent writes :---

Another correspondent writes:---""One who epeaks from experience,' says that two-thirds of the clerks of works consist of max who are too larg to work manually at their trade: they profer (nutu-and builders' grautites. Asy, positop, free concore too kay and builders' grautites. Asy, to preserve too kay inow,--they must not bo hay to please on architect; and as regards superior pay, they surely will never leave their trade, expecting better pay from an architect; if they do, they will be wofailly mistaken. Talk about three guinees per week, indeed 1 should hink that jobs where derks of works get three guiness per week are like. "angel-tists. How my they the there is the position, which of architect and the poprietor, so that is anything is wrong, he may get all the blame, and, as before stated, screen the karchitect and, and here themelver respectible, and above suppleion. "Osa wine states cabundary."

BUILDERS' BILLS.

WOOD 7. KING.

THIS case, tried in the Greenwich County Court on the 11th inst. before Mr. J. Pitt Taylor, appeared to cause some excitement. It had been previously heard and twice adjourned.

<text><text><text><text><text>

PORTLAND CEMENT FRONTS.

Your correspondent "Rustic," has opened up a subject of great importance to architects, builders, and the public. That many of the Portlaud eements and the public. That many of the Forhaut conducts now in use dry off in colours as numerous as the tints of the rainhow, experience is continually proving, and it has became an evil of such magni-tude that, unless some method be adopted to check it, a highly valuable material will be disused for the purpose of facing huldidgs. The course I would suggest to prevent future failures (I fear "Rustic") bas no satisfactory remedy) is to ask the favour of your publishing in the *Builder* the names of those manufacturers whose Porland cement can be relied ou for facing purposes, and I have no doubt there are many carting the satisfactory of the sa own experience goes, I deny all this, and believe that the fault is in the manufacture of the cement. If you would lead your powerful aid in this cause, you would, I think, have the thanks of many others besides your subscriber.—W. *_* We cannot undertake to carry out the request: but we inset the letter as a superimeter to manufacture.

but we insert the letter, as a suggestion to manufac-turers who prepare a really good eement, that they may use their own means to make the fact known.

In answer to the article in the *Builder*, p. 156, respecting the defective colour of the Portland cement front referred to, I would recommend colouring the front twice with Portland cement colouring. Calculate the quantity, and mix the cement well: dry first, as I have found, when opening casks of Portland, the cement of different shades. I am sure, if the above be attended to, it will answer the nurrose and and dry in different shades. shades. I am sure, if the above be attended to, it will answer the purpose, and not dry in different shades : it will also form an additional hard easing. I also beg to recommend to any that may stuece the front of a building with Portland ecement ;-First ealendate the quantity of cement required, and then mix the whole of the cement dry, in a large trough formed of boards temporarily for that purpose, and noder cover ; then mix the quantity of washed soud required, and lof one colour : mix the whole up, sand and cement, will together : the plastere can then take any quan-tity to mix with water as he may require. - A Cire so tity to mix with water as he may require.-A CLERK oF WORKS.

Books Receibed.

Examples of Ancient Domestic Architecture. FRANCIS T. DOLLMAN, Architect. Part II, Londo 6, Albert-street, Regent's-park : Bell and Daldy. By . mdon: b) Hole Street, Regents-part: Defi and Dany. First present number of Mr. Dollman's work is de-roted to the llospital of St. Cross, near Winchester, and contains ten plates, carefully drawn and engraved, including, with plans, the gatebouse, the refectory, she dwellings, the ambulatory, &e. The examples are of a practically useful character.

Landed Property : its Sale, Parchase, Improvement, and general Management. By FRANCIS CROSS, Architeet. London : Simpkin and Marshall. 1857. MR. CROSS'S book, to which we bave already briefly illuded, is addressed rather to those who own, or de-Iluded, is addressed rather to those who own, or de-ire to own, land than to the profession. His main biject is to aid the former in arriving at a notion of he value of land, and the points to be attended to in naking purchases. The management and improv-aent of a landed estate are treated of, and incidentally wints on which legislation is required are discussed. a the endeavour to make the treatise "light" for he general reader, Mr. Cross adopts a style which, 1 some minds, serves to throw a doubt on the condness of the information so conveyed. We must had a little fault with bim, too, for going out of his ay to discourage the preservation of our national atiquities,—those footmarks of past times which iford food for thought, calarge the mind, and nourish ne heart. ie heart.

e heart. "Antiquaries," he says, "are alarmed at the manner in high agriculturists of the present day disregard all his-tick spreudurists of the present day disregard all his-tick are interesting and the same and the same and the order of the same and the same and the same and existent means and the same and the same and and the same and the same and the same and all same and the same and the same and the same and all same and the same and the same and the same and all same and the same and the same and the same and all same and the same and the same and the same and all same and the same and the same and the same and all same and the same an

The removal of a Druidical temple, and the growth its place of a crop of wheat, may be "characteristic btbe genins and progress of the nincteenth century," it it is well to remember that man shall not live by ead alone

The book will, nevertheless, be found very useful those for whom it is intended. The measures he agests for the advantage of agriculture are thus muned up :

1. The freely granting of leases with liberal cove-

1.4. The recey granting on the moral and physical condition risks in improvement of the moral and physical condition with a lobors. The second sec

THE BUILDER.

much to be desired, and the author rightly urges such much to be desired, and the author rightly urges such legislation as might effect this. Lead is increasing in worth. Estates now ranging in value from twenty-five to thirty years' purchase, will eventually realize, our author suggests, from thirty-free to forty years' purchase, and seeing that, do what we will, we cannot add an area to Euclided with the twenty of the second add an acre to England while the supply of gold is daily becoming greater, we should not hesitate to daily endorse his opinion.

Miscellanea.

FURTHER IMPROVEMENTS BY MR. BESSEMER THE IRON MANUFACTURE. -- Mr. H. Bessemer IN IN THE HON MANUFACTURE, --- Mr. II. Dessence has just filed specifications of two patents for further improvements, which are thus described in the *Mechanics' Magazine*. "By the process of pudding," says Mr. Bessencer, "the iron is found to be more or less injured by the gaseous matters thus brought in contact with it, while the consumption of coal adds grathy to the cost of the process. The object of the first of his new inventions is to reader malleable either the crude molten iron obtained from the smelt. either the crude molten iron obtained from the smelt-ing furnace, or remedited pig or refined iron, in part by the process of puddling (or by a process pro-ducing a similar effect), and in part by foreing into and among the particles of such fluid iron, jets of air, or of some other gaseous matter containing sufficient oxygen to raise the temperature of the metal, so far as to admit of the puddling or other analogous pro-cess heing carried on without the use of ears for cess heing carried ou without the use of any fuel, or cess heing carried ou without the use of any fuel, or any other heat than is obtained by the introduction of oxygen or hydrogen into the mutal. The second of his new investions consists in obtaining crude or grey pay iron, hard white iron, or steel, and maileable iron, direct from earbonaceous iron ores, or from any mixtures of earbonaceous orns with oxides or other ores of iron, by the spplication thereto of a blast of bot or eold air, or steam, or of any other gaseous matter containing oxygen or hydrogen, and without requiring any fuel except such as is evolved from the said ores of iron, and from the gaseous matters forced said ores of iron, and from the gaseous matters forced

THE HORTICULTURAL SOCIETY, CHISWICK AND REGENT STREET.-Some important changes have been introduced amongst the Society's regulations, and it is confidently believed that these will be of have great public benefit. Amongst them are a plun of admitting all kinds of manufactured atticles connected with Horticulture, and arrangements for an autumnal Fruit Exhibition. The new council have resolved, Fruit Exhibition. with a view to promoting good gardening, and ren-dering the Society more stable, to establish a new elass of two-guinea members, and abolish admission fees, classof two-gunca members, and abolish admission fees, all nuw subscriptions being in future payable in ad-vance; aud to place the Chiswick Garden under one general superintendent, whose standing in the horti-cultural world will secure general conidence. Such a person has at length been found in Mr. George Malium, formedic generation to the late. Date of McEwen, formerly gardener to the late Duke of Norfolk, at Arundel. With this accession, and the Noriots, at Aradici. With this accession, and the aid of foulds voluntarily provided hy a large number of Fellows, the council believe that the Garden at Chiswick will become a great seat of instruction and education, as well as of experimental Horticulture.

IMPROVEMENT OF OPERATIVES. — I hope your remarks of last week respecting the closing of Gore House will have the desired effect, and that another House with have the uestrue enect, and thus automet school at the same rate of charges may be established at or near Kensington, to enable mechanics, their sons, and others, to learn something of drawing, but who are shat out from Cromwell-lane School by who are shut out from Cromwell-lane School by higher charges and a greater distance. But why educate and iceah to draw, seeing that at the present day men are not paid according to merit, but equal wages are paid to the had as well as the good, and in wages are paid to the had as well as the good, and in wages are paid to the bad as well as the good, and in many instances the indifferent workmau is employed in preference to the good ? I readly adult the utility of drawing; and if we call back the remarks lately made on the decline in skill of building operatives, we shall there see the use of it in a greater degree if we could follow it; but until men are invited to a more recrea-tive and instructive enjoyment than a public-house, so long must we expect to follow in the same path we now trade, we shall never arrive at that proficiency that our "Well Wisher" complains of; hut if architets were to exercise their rights, and take each trade separately, we might still hope to add something to on: separately, we might still hope to add something to our reputation.—One GOOD IN TRADE.

a. The improvement of the moral and physical condition
b. The abolition of the moral and physical condition
b. The abolition of burdens that press heavily on the far emaining sources to which we look for success, and hands will be at a premium. In Wick and roll and success the which we look for success, and makes and success to which we look for success, and method of success and encouragement for land drainage.
b. The calculation of statistics, and the diffusion of sources to which we look for success, it is all the diffusion of sources to which we look for success, it is all the diffusion of sources to the diffusion of sources to which we look for success, our correspondent says, a similar state of matters prevails, owing to the large number of interest to agriculture."
The collection of statistics and the diffusion of sources to advect the sources and Aberdeen Janeton Railway, where they are in receipt of high wages. The means of a cheap and casy transfer of land are they are in receipt of high wages.

MANCHESTER SCHOOL OF AET. - The annual meeting of this school was held on Monday in last week, at the Manchester Royal Institution. Mr. Pottor, The annual week, at the Manchester Royal Institution. Mr. Potter, the president, occupied the chair. He regretted the small attendance. At the last meeting, he said, he made some remarks of a rather dolcful character: then they were 400% in deht; but the debt had now been reduced one half, and things looked, on many accounts, more cheering. The improvement had hece upon the best possible hasis; for their fees were increased, in quence of the much larger attendance of students. COUSE Ho believed that there was no similar institution that stood firmer; but there was one clog—the school was desperately heavily rented. Sheffield had built what desperately heavily rented. Sheffield had built what be understood to be a very handsome building for fiself; and most of the other schools were rent free, or nearly so. Considering the Art Treasures Exhi-bition, if something was not done this year to put the school upon a higher footing, the chance might almost be considered as goue for ever. During the twenty years' existence of the school, they had eer-tainly improved as to the system of teaching; hut, generally, they had not taken the rise they ought to have done. This year he thought that a move should really be made to atlach the school to the Royal Institution. Institution.

Institution. INSTITUTION OF CIVIL ENGINEERS.—At a meeting on the 10th inst. Mr. R. Stephenson, M.P., Presi-dent, in the chair, with reference to the discussion at the previous meeting "00 the Results of the Use of Clay Retorts for Gas-making," it was remarked, that the merits of iron reiorts had searcely been fairly when a meeting "one a much gas has stated, as in some instances, quite as much gas has been made by the latter as by the former, unless in cases of peculiar qualities of coal heing used, and that the iron retorts had been in constant work for two years and a half. It was stated, that the course the discussion had taken might lead to fallacious conclusions, for although elay retorts, when well set and earefully managed, might endure twice or thrice as long as iron retorts, and the materials of these retorts and also of their settings were cheaper than those of iron retorts, yet on the other side of the account must For reforts, yet on the other side of the account must be placed several important items of charge, which under certain circumstances would thun the balance in favour of iron retorts; in certain other circumstances render it matter of indifference which description of retort was used; and in a third state of eircumstances prove that clay reforts ought to be preferred. The Paper read was "On High Speed Steam Navigation; j and on the Relative Efficiency of the Screw Propeller and Paddle Wheels," by Mr. Robert Armstrong, The first patt of the Paper was devoted to the con-sideration of the circumstances which appeared to limit the maintenance of higher speeds than were now attained by steam ships, in deep sea navigation, and the causes which had hitherto prevented the asserted high speeds of steam anvigation on the American rivers from being attained in England. In the second part of the Paper the relative efficiency of the Screw Propeller and Paddle Wheels, when applied to vessels of identical form, tourage, and steam power, independent of the use of sails, was considered. The BROMETON SCHOOL OF AET AND ITS Peo. retort was used; and in a third state of eircumstances

THE BROMPTON SCHOOL OF ART AND ITS PRO-FESSORS.—On looking over the article on the Letter Box, in your paper of the 21st ult., I felt enrious to Box, in your paper of the 21st ult., I felt enrious to know the amount of salary of the Department's staff of professors. On consulting the blue-hooks of the Department, I find that two of these professors, whose works have often been before the public, and who are rightly appreciated for their practical, as well as their artistic knowledge, receive a salary about equal to that of a common mechanic. How can we expect art to progress when the professors are so ill-paid? Surely, out of the grant which is received from parliament, enough might he spared to bring them under the law enough might he spared to bring them under the law enough might ne sparen to bring them under the law of the income tax, and put them to a lovel with their office-clerks; for surely, the position of an Art Pro-fessor is equal to that of a clerk. If Eugland wish to approximate to the standard of excellence of the con-tinental nations, she should see that all classes of here professors receive a purposer torumner in a state to the professors receive a proper remuneration .- AN ART STUDENT.

NATIONAL GALLERY OF IRELAND .- There seems NATIONAL GALLERY OF IMPLAND.—"There seems to be a fair prospect of the establishment of this insti-tution. The hoard has directed its attention to two objects—the erection of a suitable huilding on Lein-ster Lawa, for which a fund of 11,000. As aiready been provided, and the creation of a fund to purchase works of art to exhibit permanently in the building when finished. The plans and estimates are in the hands of the building committee, with a view of enter-ing into the necessary contracts, so that the corrent hands of the building committee, with a view of enter-ing into the necessary contracts, so that the eeremo-nial of laying the first stone will shortly take place. The building will correspond externally with the Mu-semms of the Royal Dublin Society, now in course of erection on the south side of the Lawn, and form a corresponding wing to the main building on the op-posite side. The "Dictare Fund" is also progressing.

STATUE OF MOORE THE POET .- The bronze statue, by Moore, the sculptor, of Thomas Moore, the poet, has arrived safely in Dublin. Early steps will he taken to have it placed in its designed locality, opposite the entrance of the House of Lords in College-street.

CAMBRIDGE ARCHITECTURAL SOCIETY. - At the CAMBRIDGE ARCHITECTURAL SOCIETT. — At the second meeting of this society for the present term, held on Thursday, March 5th (the Rev. H. M. Iogram in the chair), Mr. W. T. J. Drake, Trinity, read a paper on the Churches of Coventry, especially noticing the Cathedral, which could once hoast of three spires, hut was destroyed in 1440 A.D. : the bases of some of its pillars, have hidely hear discoursed in during the hat was destroyou in 1+40 k.D. the bases of solide of its pillars have lately hen discovered in digging the foundations of a school. Mr. Drake also gave an account of the Churches of the Holy Triuity and St. Michael, the latter of which has been lately re-

DESTRUCTION OF THE PORCELAIN TOWER OF DESTRUCTION OF THE PORCELAIN TOWER OF NANKIN.—The China Harald relates that the far-faned porcelain tower at Nankin was destroyed in November, during a bloody massacre of some 5,000 to 6,000 imperial troops by the insurgents, who had gained possession of the city by treason.

gained pessession of the eity by treason. THE CHOELEX SEWERAGE. -A report on the completion of the sewerage of Chorley has been printed, in which the engineer, Mr. Rawlinson, states the amont of work done, together with the cost. Of brick sewers there were 5,3604 yards, costing 5,0607, odds; of earthenware pipe sewers, 7,8444 yards, costing 2,454/. odds; of guilles, 282, costing 6967, odds; and of matholes, 79, costing 778/. odds. The total cost, including 151/. to consulting engineer for plan and report, and 4537. for com-mission; 372/. odds to resident engineer, inspector, and store-keeper, and other items, was 10,759/. ATTREATONS AND ENLARCEMENT OF CROTDON

ALTERATIONS AND ENLARGEMENT OF CROYDON ALTERATIONS AND ENLARGEMENT OF CROYDON PARISH CHURCH...-At a meeting of rate-payers held last week, at Croydon, it was resolved to consent to the projected interior improvement of the parish church by voluntary subscription, on plans prepared by Mr. Scott at the request of the promoters of the parameter.

by Mr. Scott at the request of the promoters of the movement. THE STOPFACES IN FLEET-STREET. — A corre-spondent suggests, in reference to the frequent stoppage of traffic in Flet-street and Ludgate-bill on account of the crossing from Farringdon-street to Bridge-street, that this difficulty" might be entirely done away with, by forming a new and level line of street (by a light bridge over Farringdon-street) to com-mence at St. Paul's and fusish at the east end of Long.arce, forming a direct line from Piecadily through Leicester Square, doing away with a very dirty locality, and heng of the greatest service to the public, and a great organent to the metropolis." AccoundatION FOR THE VAGEANT OR HOUSELESS

ACCOMODATION FOR THE VAGRANT OR HOUSELESS Accomparison for the VaceAst on HOUSELESS POOR.—M., J. W. Butterworth, of Fleet-street, a West Loudon Union Guardian, proposes, that each metropolitan Union or Puor Board should contribute to a common fund, to be applied to the crection and maintenance of "a proper number of conveniently sit-uated and uniformly conducted easual wards through-out the metropolis." This, he thinks, if carried out, unted and uniformly conducted essuit waves infouga-out the metropolis." This, he thinks, if carried out, "would at once remove the motive, and therefore put an end to the system at present pursued by different hoards, of rendering their casual wards unattractive and inaccessible to the wandering and peculiar class of paupers for whom they are minitained, in order to shift on other shoulders the burden of the rate for their convert." their support.

their support." SROEF NUTSANCE AND THE HOUSES OF PARLIA-MENT.—We owe you thanks for calling attention to the frightful quantity of smoke emitted coutrary to law, by the very palace of the law itself. No factory in London, no ball-dazen factories to ather, create so much miseibie in this respect as the Houses of Par-liament. The hulding itself is hecoming dingy, and all its more chicate factures hidden, by the effect of its own smoke, and the atmosphere of the whole neighbourhood is defied by it. Pray do not let the matter rest until an effectual remedy is provided. Pleasedraw attention also to the smoke nuisance of the Reform and Carlton Clubs; and that of Sk. Martin's Reform and Carlton Clubs; and that of St. Martin's Baths, immediately behind the National Gallery. W. B.

THE BUILDER.

PANELS.—We have received from Mr. Mappin, of sir, it appears to me that the time for appealing has Birmingham, a sample of a new panel, patented by long since gone by, and that means should now he him, for resisting burglarious attempts. It consists taken to compet the directors to afford the necessary of a composition, enclosing a thin plate of steel. In accommodation. I would therefore suggest, that an making a full size panel, he says the steel would not application should be made to the magistrates at the be in one piece the size of the panel, but as a series next licensing day, to withhold the music license of strips, 14 inch broad, inserted at intervals, leaving mutil the necessary alterations were made. This space of three quarters of an inch between each. The aim, for ressing onrganous attempts. It consists of a composition, enclosing a thin plate of steel. In making a full size panel, he says the steel would not be in one piece the size of the panel, but as a series of strips, 12 inch broad, inserted at intervals, leaving space of three-quarters of an inch between each. The patentee considers that it affords a perfect resistance to sharp instruments need by burghers; that panels made of this material will never shrink or twist; and that it is well adapted for curved panels. OXFORD ABCHTECTURAL SOCIETY.—On the 4th inst. a paper was read by Mr. Forbes, the subject being, "English Architecture viewed in connection with English History." It is next to impossible," said the reader, "to visit the cathedrals and ancient charches in this country and not suffer our mind to recent to persons and events connected with them; and year many of our towns and villages are exceedingly interesting.

recur to persons and events connected with them; and even many of our towns and villages are exceedingly interesting from their associations. All history is important, as it is the narration of God's dealings with munkind; and to Englishmen the history of their own country and of their own ancestors must of necessity be most interesting as most nearly concern-ing themselves. The old English towns, cathedrads, costles, ablews, and churches are full of reminisences. castles, abbeys, and churches are full of reminiscences of the past—most deeply interesting; and it is imros-sible to visit them and to shad out from our minds the image of their past associations: kings, lishops, clergy, princes, nobles, statesmen, and warriors, will rise up before us in quick succession; indeed, there are few spots on English ground thet have not some connection with past history, for which they deserve to be remembered. But all such recollections will be worse than useless to us of the present day, if we do not learu from them the lessons they are intended to teach us." castles, abbeys, and churches are full of reminiscences

REMOVAL OF AN IRON BUILDING.—The Man-cleater Guardian mentions the removal, bodily, of an Irou Carriage Repository, erected in that eity by Messrs. E. T. Bellhouse and Co. for Messrs. W. Brown Messrs, E. T. Beilnouse and Co. for Messrs, W. Brown and Co. The building is 82 feet long, 22 feet wile, and 16 feet in beight: the foundation is of wood, having heen laid on a brick base, and connected trans-versely by the joisting of the floor. The pillors are of east iron, holted to the foundation : the sides, eads, and are fare for converted in the sides, eads, of east iron, holied to the foundation: the sides, ends, and roof, are of corrugated iron. The main entrance is in the centre, by spacions double folding doors. There are ten plate glass windows in front. Messrs. Hay, M'Nish, and M'Kean, have not only transferred it holdly from its former site to another on the opposite side of the street, hut completely sleved it ''face about.'' In the first place the building was raised from its foundation hy powerful serve-jacks, then placed on beaus and rollers, and moved by powerful eranes.

placed on beams and rollers, and moved by powerful eranes. STAINED GLASS.—Another painted window has just been placed in the old church of Alderley. It is a haptismal window of three lights, with tracery open-ings in the head. The subject in the centre light is St. John baptising Christ in the Jordan. In the side light to the left is represented the birth of our Saviour. In the one to the right, Christ blessing little children.—In St. Thomas's Church, Bedford, the old chancel window of plain glass has been re-placed by one of kubidiscopic aspect, representing, in colours of every shade and tone, events in the life of Christ.—There has just been placed in the German Protestant Church, Wright-street, Hulme, a rose window of eight compartments, each filled up with geometrical scrollwork, on grounds of ruby and blue idternately, each surrounded with borders. All these windows were designed and executed hy. Messre, R. B. Edmundon and Son, of Mancbester, BMANTEEE WATER WORSS.—These works are sup-

Messra, K. B. Edmundson and Son, of Manchester. BRAINTREE WATER WORKs.—These works are sup-plied by an artesian bore, 240 feet doep, and 10 inches in diameter. The well, from the hottom of which this hore is pierced, is 54 feet deep and 9 feet in diameter, and the water rises to within 15 feet of the surfage. The purpus are fong in number, these surfage The pumps are four in number, three ouly surface. The pumps are four in number, three ouly being need, the fourth being a reserve. There are two high pressure condensing steam eugines, which will be worked alternately. The two Cornish boilers are double the power of the engines. At a distance of one-third of a mile from, and 70 feet above, the engine-house, stands the water tower, 50 feet high, supporting a wrought-iron tank, 21 feet dianuctr and 21 fact deep, expable of containing 45,000 gallons of water, that quantity weighing npwards of 200 tons, and it is suid that in case of fire, the water will rise, without the aid of a fire-engine, over any building iu surface. and it is suit that in case or use, are water and the without the aid of a fire-engine, over any building in the tawn. The engine, hollers, and pumps, and also the water-tank, bare been constructed by Messra. Headly and Manning, of Cambridge.

Headly and Manning, of Cambridge. MEANS OF BORRES, EXETER HALL.—Iu your paper of the 7th inst. I observe a short report of a meeting of the Sacred Harmonie Society, held on Tuesday even ag, February 24th, at which an appeart to the directors of Exeter Hall, to provide additional means of egress, was unanimously agreed to. Now,

THE BUILDER.

The Builder.

Vol. XV.-No. 738.

AMBETH has long been famous for its pottery, hut it was never so much so as now,--thanks, above all things, to the extended use of pipes in drainage. A visit to Messrs. Doultou's, Mr. Stephen Green's, or one of the other Potteries in Lambeth, would astonish most of our readers. Such as may wend their way thither with instructed eyes, will find the neighbourhood full of interest. Of the Palace we spoke not long ago, with the

restored church, the tomh of the collector Tradescant, the slab to Elias Hag Ashmole, founder of the Ashmolean At Museum, the Pedlar and his dog, in

stained glass,-connected traditionally with "Pedlar's-acre," a portion of the Marsh,-and other memorials. The ferry here is of great antiquity. The pedestrian will stop near the Palace-gateway to notice the view obtained there of the Victoria Tower, and the Houses of Parliament. When the sun is shining, and the river full, the structure there looks its best. Some of the houses ucar the church are older than the time of Queen Elizabeth. In the little coffee-shop opposite the churchyard, there is a richly ornamented ceiling of that date, a remnant of one of the noble houses which formerly occupied this site. In times past, this house was much frequented by the Welsh, and some who are living, it is said, remember a Welsh fair being held there. The panel-ling is old, and part of the walls very massive : in the kitchen is a firc-place of large size. In the upper part of these premises the leading of the windows still remains: in one room the mantel-picce is ornamented with carved clay, with a sufficient quantity of water, is flowers. Returning over more towards the Thames, the visitor will find a narrow, ill-paved, and worse swept street, running westward towards Vauxhall-bridge, connected with which, ou the side farthest from the river, are some miserably-neglected spots: worse will not he met with in London. The drainage is either edeficient or altogether wanting. Some of the honses are of large size, and have formerly been places of importance, hut the majority are small, ill-hnilt, and dilapidated. In one narrow pasasage, not more than 4 feet wide, the houses are tbickly occupied, the closet, with an open cesspool, is placed between the two windows; the people have some distance to go for water, and, sas we need searcely say, sickness is often to be ofound. The smell when we visited it was frightful.

The inhabitants about here are, for the most rpart, very poor. Some appear to earn a trifle by gathering up the refuse along the river banks. It is the dinner-hour, and hundreds of choys, white as millers, are amusing themselves an various ways. Some are chasing stray pigs, nanimals ominous of ill-condition. The whiteocoated boys are employed in the potteries, which mare situated amongst the houses, and extend years from Lambeth-ferry to near Vauxhall-bridge. The manufacture, which is produced here in were mostly of small extent; horses, and even immense quantities, cousists chiefly of what is hand power, were in use for crushing the clay; ofor chemical purposes.

scale, and its application was very limited : it which enabled the workmen to produce better was almost confined, indeed, to spirit and oil bottles. Within that time, however, many improvements have been made; and hy the employment of machinery the material has become available for numerous purposes, and the trade has enormously increased. The quantity of drain-pipes made in England is said to average forty miles a week ! And of these, prohably one-third is made in Lamheth. This part of the trade has grown up wholly within the last ten years. Beginning at the beginning in one of the establishments we have named, you will find several huge stacks of white clay, in square blocks, each weighing about a quarter of a hundred weight. Examina-tion shows that the clay is of different qualities and colour: it is hrought chiefly from Devonshiro, Cornwall, aud Dorsetshire, to be mixed or used separately, according to circumstances. For the best descriptions of ware some of the very fine earth used in making chiua is added. The clay from Dorset and Devon contains a large proportion of silica, fully two-thirds of the whole bulk,-less than a third being alumina, with a small quantity of iron and lime in combination. Other clays are brought from various parts of the country, and the whole may be divided into three classes: 1st. That used for small ware, or vessels not exceeding in capacity two or three quarts. 2nd. That used for vessels of a larger capacity, say up to six or eight gallons; aud, lastly, that used for the manufacture of large chemical vessels, some of which have been made by Mr. Green to hold upwards of 400 gallons.

The clay having been landed, it is allowed to remain for some time in drying - rooms, until the moisture is evaporated; and when the lumps have a dry and white appearance, and are what is technically called " white hard," the blocks are taken to a mill (worked by steam power, exactly like those used for crushing tanners' bark), by means of which the clay is reduced to a rough powder: it is then brought to the "pug-mill," containing a number of knives or flat pieces of iron, set at angl-s so as to form an imperfect serew. The powdered passed through this mill, and is delivered at the bottom in fine plastic form, fit for use by the potters. For small ware, the Devonshire clay needs no admixture.

The second description is a mixture of various clays with saud, the quantity of sand varying according to the size of the vessels intcuded to be made

The third, or chemical ware elay, requires the greatest care, for the least fragment of guit will often render a large vessel useless. The clays used for this purpose are mixed to the exteut of nearly one-fourth of the whole bulk with strong fire clays, such as those in use at Stourbridge and Newcastle, together with burut cartheuware of the most vitreous description. This mixture is carefully sifted through fine sieves; and, when the whole has been properly ground, it is raised to the different floors by machinery for the use of the potters.

The potter's wheel, a kind of lathe, having its mandril in a vertical position, is so well known, that it does not require any particular description. We must, however, notice the improvements which have heen made in working it in this district during the last thirty or forty

Within recollection, the Lamheth potteries were mostly of small extent; horses, and even alcalled Stoneware, of various degrees of firmuess, and the potters all used wheels which they from the common drain-pipes to the finest jars turned with the foot, as in the machine of the street seissor grinders : these were called afterwards huilt up, and closely plastered : six Until within the last thirty years the descrip. "*kickers*." In the Staffordshire and some other tion of pottery known as salt-glazed stoneware twas manufactured on a comparatively small seded by wheels and bands, turued by boys,

work and with greater rapidity. When Mr. Green determined to introduce the new wheel into his manufactory, the whole of the workpeople struck; the master endcavoured to explain the advantages of the uew plan both to them and himself, and said that although he would not discharge any man who was willing to work for him, it would be a benefit to him if they left, as it would enable him to carry out the improvements he proposed. The men, of their own will, all left except one, who was kept at work at his "kicker" until bis death, a period of fifteen years, he earning 30s. a-week, while the man with the improved lathe, who sat next to him, earned 31.; and so much greater was the rapidity of the potter at the new machine than the man at the "kieker," that he could produce as many stoneware ink-bottles for 6d, at the advanced wages as the other could throw off by his machine for 1s. 3d. Since the days of the "kicker," the uumber of men and boys employed at this establishment alone has been increased fivefold. What is thought evil turns out good :---

" In the unreasoning progress of the world A wiser spirit is at work for us, A better eye than ours."

Out of the threes and spasms of individuals come increased comforts for the many, and general progress.

In its turn the Staffordshire wheel has given lace to steam. Iu Messrs. Doulton's establishment steam is made to turn the disk of each potter, the speed being varied (the great point to be achieved) by means of a conical drum, over which the band passes: accord-ing to the position given to the band on the drum by the potter, so, of course, is the speed.

The rapidity and certainty with which the potter works make the operation appear an easy one: under his thumb the vessel expands, the neck contracts, the lip is rounded without an apparent effort-but, in truth, as we need hardly say, it requires long practice to acquire this skill. A good potter can make upwards of 1,000 pintand-a-half ink-bottles in a day, and other things in proportion. A small boy at Doulton's makes 1,250 jam-pots in that time.*

Looking at the potter at work, one is struck with the force of the simile in Jeremiah,-

"Behold, as the clay is in the patter's hand, so are ye in mine hand, O house of Israel."-xviii, 6.

The allusions to the productions of the potter's wheel throughout the Holy writings are numerous. As in Isaiah,-

"But now, O Lord, thou art- our father ; we are the clay, and then our potter, and we are all the work of thy hand."-lxiv. 8.

Or in the New Testameut,-

"Hath not the patter power over the clay, of the same lump to make one vessel unto humour, and another unto dishosour?"-Romans ix. 21.

After the turning of such objects as are round, and the casting in moulds of others of different shape, the ware is allowed partially to dry, when it is again placed in the lathe and smoothed by shaving, and ornamented by means of various instru-ments: it is then left in the drying room, until as was the case with the blocks, all the moisture has evaporated, and the vessels have become "white dry." Great care is needed in this particular, for a single damp vessel is liable particular, for a single using tools by crack-to produce mischief in the kiln, by cracklarge chamber called the kiln, the dried goods are then packed in earthenware cases, called one above the other, until the whole "saggers, iuterior is filled. The entrance by which the men have been enabled to pack the kiln is

or seven fire-places in the sides are slowly lighted, and the heat is gradually increased until the whole of the interior of the kiln has heen hrought to a white heat, by which time the pottery has become a hard substance, but is without glaze. Salt thrown into the furnace produces what is called the salt-glazed ware. The brown ware and most of the common articles are made in this way.

Another method of glazing, however, has heen introduced lately into some of the Lambeth Potteries. This is hy a preparation chiefly composed of feldt-spar, ground and reduced to such a consistency that it can be painted over the surface of the articles; and this the white heat of the furnace turns into a vitrcons glaze without the use of salt. The ware glazed in this way has a very clean and light appearauce. The baking being finished, the kiln is allowed very gradually to cool, and then the entrance is again opeued, and the various objects taken out ready for the market. In the whole three or four days are occupied. So great is the heat required for this purpose, that it becomes necessary to Tt is renew kilns every two or three years. It is from the numerons chimneys of the kilns that the hlack volumes of smoke proceed which roll over Lambeth Palace and other quarters.

It will be remembered that, at the passing of the Smoke Act, the potters made so strong an opposition, declaring that they could not pos-sibly carry on their husiness without smoke, that they were partially relieved from the opera-tion of the Act. We are glad, however, to learn that they have changed their opinion, and are striving to comply with the regulations. At Messrs. Doultou's we saw three kidns which, by a very simple arrangement, produce little if any If gas could he employed for heating smoke the kilns, as was once suggested, it would seem that many advantages would result, the avoidance of smoke amongst them.

It is curious to notice the variety of stoneware which is produced at these Lamheth Potteries ;- ink-bottles of various sizes, large bottles for spirits, ornamented glazed casks (if we may so call them) for the publicans, various kinds of mugs, &c. for shipboard, immense quantitics of strong articles for exportation to Australia; chemical vessels, retorts, glazed pans, and the worms of stills for making acids ; filters, and the varions goods required for sanitary uses. The large glazed ware jars of 400 gallous bring to mind the story of "Ali Baha aud the Forty Tbicves," and we should not be surprised to hear a voice exclaim, " Is it time ?" Large jars arc in use in various parts of the East, hnt these are unglazed, and, consequently, much more easy of mauufacture.

The process of grinding the neck and lids of jars, and fixing them hy simple means, so as to render them air-tight, is uoteworthy. Thousands of such jars are sent abroad, filled with jams and There are many other matters which jellics. There are many other matters which might he looked to ; but having seen this much, we shake the dust from our clothes and depart, suggesting, as we do so, that a little more art might advantageously he brought to bear on this manufacture, so admirable iu a commercial, social, and scientific point of regard. The arrange-ments for saving labour, lessening cost, and multiplying productions, are perfect, and most advantageous for society: it is to be regretted, however, when these prove adverse development of taste,-the production of beauty.

Of Lambeth, in a sauitary point of view, we must find an opportunity to speak further hefore long.

SOCIETY OF BRITISH ARTISTS .- The thirty-fourth SOCIETY OF BAITSII ARTISTS.—The thirty-fourth Exhibition of the Society of British Artists is now open in Suffielk-street. It consists of 852 works of art, and is similar in character to those which have preceded it. We will give some account of it in another number.

TINOPLE.

TINOPLE. Is the first portion of our notice,* we were led by the heat of our ideas as to novely and the nse of continental models, away from the desigus "especially mentioned," of which we have remarked only on those of Messrs. Weight-man, Hadfield, and Goldie, and Mr. C. Gray. Mr. W. White's desigu is certainly one that would not be passed by so long as we have left it. It is glowing in party-colour thronghost, unstituted in the drawings, and profuse in con-tivance of plan and in novelty of device. The plan, described generally, comprises nave, and ealses, and transcepts, with central tower, chan-cel; north and south corridors, forming with a aisles, and transcepts, with central control, card cel; north and south corridors, forming with a western porch, a covered way round the main portion of the huilding; and a tower at the north-west ioined hya covered way. The length portion of the number and a tower at the north-west, joined by a covered way. The length of the nave is ebiefly made np of three wide divisions of piers and arches; but each hay has three subordinate divisions marked in the groin-ing of the nave and by the bearing shafts and ceil-ior rike of the aiches; and in these divisions divisions are divisions. ing ribs of the aisles ; and in these divisions, very rrow windows are set, four together. The narrow windows are set, four together. The huttresses are carried up to form what we must call pinneles, though they are square in plan, and are terminated by party-coloured tile spire coverings, with finials of metal work, and there are very bold flying huttresses across the aisles and corridors. There is a general blankness of character about the decorative treatment exter-ally greening as to the affect we dreat by the analy, excepting as to the effect produced by the features mentioned, and the several gables to the entrances of the western porch; but positive colour is prominent on the gables, and in vandyke patterns in the roof covering; and in the interior it prevails largely. The central tower is octagonal above the roof, and is finished with a tiled capping; and internally the lofty ceiling of the lantern is vanited. The other tower is lofty, and barely decorated in the lower part, and is finished with gabled sides and an octagonal tiled spire capping. It may be doubted whether the design would not be too gaudy in effect, and whether the result would be at all proportionate to the real study involved, or even the *cleverness* which the work exhibits. nally, excepting as to the effect produced by the

exhibits. From the manner in which novelty in details is studied, it may result that art is reduced in effect; and the very ingredients which should go to form the art may be the means of destroy-

go to form the ate may be the start of the s lotty inside without nutricesce. The shows no clerestory, but has a triforium, lighted by a second range of windows. The ceilings of nave and aisles are vanited; and as in most of the designs, the roofs are of timher, and of a high pitch. A woodeu *fleche*, with lead covered crocketted spirelet, is placed at the intersection of the area. The area architect aphibits a of the cross. The same architect exhibits a second design, but of less merit.

Mr. G. Trucfitt—in the same class—shows no decoration in colour, and little otherwise in ornament; hut, whilst his plan is novel, the combi-nation in the design is effective. The plan in general arrangement is eruciform; but the e and transepts are narrow, witbout aisles, and branch out from a central irregular octagon (a square with augles ent off); the transepts are terminated by towers rising of the ceutre, surmounted with gables, pinnacles, and spires, and the chancel is ter-minated by an octagonal apse, whilst a vestry and organ-chamber to the chancel form with it and organization of the ground, though they our general octagon on the ground, though they are carried up to somewhat less height. The centre octagon is carried to a greater height than the nave and chaucel, and has its separate roof, with a fiche or spirelet. There are no buttresses, except as piers internally; mouldings are sparingly used—there being none to the gables: the parapets have only a crowning

* See p. 157, ante.

REVIEW OF THE DESIGNS FOR THE moulding; and the chief decoration is got by the MEMORIAL CHURCH AT CONSTAN. windows-with plain perforations to their heads;

moulding; and the chief decoration is got by the windows — with plain perforations to their heads; and by a number of star-shaped perforations along the battlements and other parts. The general group, however, is happily composed. The windows are in the upper part of the walls; the ceiling is plain waggon-headed—arches over the windows groining in; and the centre space heing domed over. A good rood-screen in iron-work is shown. work is shown.

Of the four designs which are "hononrably mentioued," Mr. A. Bell's is of northern Gothic mentioned," Mr. A. Bell's is of northern Golme character, creations on the plan,—having nave and nisles, and lofty chancel, with apse dode-cagonal in plan,—and two square towers in the position of transcepts, with pinnacles, gabled sides, and low pyramidal spire-cappings of stone; and it has also a vestry and an organ-chamber with apses, in the position of chapels to the transcepts. The north transcept or floor level of the tower forms a hautistery, and the cortransepts. The north transept or floor level of the tower forms a baptistery, and the cor-responding part of the plan forms the depo-sitory for the hier, and would he approached at fourerals by a covered way, which is external to the south aisle. The arches of the towers next to the south aisle. The arches of the towers next the nave, are filled in, each with subordinate open-ings and a central column. The style is a modified ings aud a central column. The style is a modified Early English, with continental features. There are kold buttresses and flying buttresses, and bigh-pitched roofs; a waggon-headed vanit to the nave, and a groined ceiling to the chancel. Coloured materials are sparingly introduced. The nave piers are shown as of red marble or granite, and there is a smaller shaft attached, for the symoort of the principal arches to the for the support of the principal arches to the aish

The design hy Francke, of Meiningen, is the only one of those hy a foreign hand that would lay much claim to notice. The plan has would lay much claim to notice. The plan has heen carefully studied; but the decorative de-tails, though they may he moulded after some examples of German Gothic, are so spiritless, and positively so un-Gothic to English eyes, that we are afraid we may not give that place to the design which others have decrued it de-scring of. Its hest feature is exhibited on plan with the acet and no doubt in serving of. Its hest feature is exhibited on plan in the treatment of the east end, no doubt in-tended as the place for monumeuts. As in cases before referred to, this has a polygonal apse, formed by piers and arches, with the aisle carried word. the inver form hence inversion that octavoual. round-the inuer form being irregular octagonal, the divisions of nave and aisles of equal height internally; and there are two western towers with perforated spires, and a central spirelet. The aisle windows are lofty, with nubroken nullions, and traceried heads. The disconnected horizontal stages of the towers; and the pin-nacles springing from labels or canopies, or inserted in the raking lines of gables, are surely things such as should be avoided. Messrs. Howell and Budd's design has heen studied with extraordinary pains, and is shown in a very elaborate set of drawings. Every-thing appears to he drawn,—to the hanging of the bells, and the colours and patterns of decora-tion. The plan—an extensive one—consists of

the ones, and the colours and pattern on decond tion. The plan-an extensive one-consists of nave and aisles, transe pts, chancel with apse on the dodecagonal plan and ambulatory, aisles of communic tion (alongside the chancel) and vestries without, a sonth porch having a room over its a west tower and spire, and a haptistery and a morning chapel to the west. Also, there are a triforium and a clerestory. The general design is of Early English character. Coloured mate-rials are used in patterns with considerable skill. The payer users are restangular on the above and The nave piers are rectangular on the plan, and The may plets are feetably in our or plans, while carry segmential arches, but with a second arch under the sofiit, of equilateral shape : whilst the chancel arches are of the more general form. The may is covered by a waggou-headed walk with arches over the clerestory windows, groining in : whilst the chancel ceiling is groined throughm: whist the chancel cellug is ground throngh-out. There is a wooden louvre, opening to the in-terior, at the intersection of the cross. The perspective effect of the interior would be fine; and details of decoration, hoth pictorial and ornamental, exhibit taste,—but could such a building he raised for 20,0001.? Messrs. Prichard and Seddon exbibit in their design a very elever application of coloured

design, design, a very clever application of coloured materials disposed in voussoirs of arches and circles and sub-arches surrounding the light-of the framing to the roofs and spire appears to be coloured stone tracery which fills in the window openings. The plan also has a distinctive cha-case of the spire ornamented with pateras in racter. It comprises nave and aisles, chancel alternate spaces. We suppose the climate was with dodecagonal apse, trausepts extending to the aistes, a western tower, and in advance of the latter a porch running up to the height of two stages, with open arches in the lower part, and exposing internally the full height with-out floor. This communicates with the middle out floor. of an open loggia at the end of the main huilding, — proposed for the sculpture, — through which access is gained to the congregational portion of the church. The style may be called Early Decorated in character, with a few Italian features. The aisles are low, with Itahan features. The austes are been shallow huttresses, but without windows, and are faced internally with coloured materials in patterns, and have stone roofs. The elerestory are need internary with coloured maternas in patterns, and have stone roofs. The elerestory is of great height, with gables and hold fying buttresses, the ceiling of the main division heing stone groined, under a high-pitched roof. The tower is square helow, and octagonal at the helf y stage, and is crowned by a lofty spire; and at the intersection of the cross is a $fleck_{e}$, or spirelet. The merit of the design is in the treatment of the coloured materials,—each being applied in its proper place, and without the too commou excess.

Amongst the other designs, is one by Mr. T. Amongst the other designs, is one by Mr. T. Meyer, which has a cruciform plan without aisles, and acentral octagon with large lautern, pinnacles, and lying huttresses, hut is more clahorate than successful in its details.—Mr. C. H. Gahriel, whose design is of Early Decorated character, and cruciform plan, exhibits two well-drawn yiews of it.—Mr. Railton's design is cruciform in plan, with western and central towers and suites, and fying huttresses. and is of general spires, and flying huttresses, and is of general Early English character, with the masses well proportioued for effect, though the details have less novelty than those of other designs. The piers supporting the central tower seem of slight proportions,-heing no larger than the others

Mr. T. E. Thrupp, who has a good perspec-tive view of his design (Early English, with two western towers), shows a contrivance which it may he supposed is introduced to resist the effects of earthquakes. He would turn the main arches as semicircles, from pier to next pier hut one, placing the intermediate pier with its halves of the pointed arches (in which the vonssoirs are shown dowelled together), under the other. An iron rod would he then fixed upthe other. An iron rod would he then fixed up-right in the intermediate pier, and holted top and hottom to a continuous chain, --one chain and notion as continuous chain, -one chain labove and another heliow the arcade. — Mr. Raffles Brown's plan is cruciform, with nearly cequal nave and aisles, and the apsidal termina-tion to the chancel which in some form has been adopted hy so many of the competitors. Otherwise the design is of English Gothic character, except as to the introduction of red hands. has a tower and spire of excessive height.

Mr. J. W. Mould is an exhibitor from New York. The transcept in his design is of greater height than the nave, and has the tower at one York. cond of it. The general grouping has merit than have the details. Like many amerit than have the details. Like many of the American attempts in Gothic,—shall we say, faffording that reflex of character which archi-and its chains, but wholly tails when tested hy sexamination, — the horizontal lines in the otower and spire are sufficient to quote as in-tstances. —— Mr. Henszlemann's Gothic, of a different sort, is equally curious in its way; rand yet, some of the details of the polychromatic adecoration show knowledge of that portion of the subject.——Mr. James Castle's design has merrit in many of the parts — wite of their The sunject.—Mr. James Castle's design has ment in many of the parts, — spite of their reostiness. But, the coloured materials are papplied in a questionable way, considering hoth colour and cost of carving,—Mr. M. Rohde IHawkins's design is one of a higher class than some that we have been excitations and the some that we have been noticing,-yet the reand the western towers, and the difference in scale and treatment otherwise, involves, we think, some error of principle. They should either he and treatment otherwise, invokes, we tanky, some error of principle. They should either he iof one family—with spires, or designedly more different as to the towers.—Messrs. F. and H. Francis's design is also of English Gothie cha-tracter, and is shown in a good perspective view.

of wrought-iron, and covered with lead,—in the case of the spire ornamented with pateras in alternate spaces. We suppose the elimate was considered with reference to this metal-work. In some parts of the East, we apprehend, such a mode of construction would be wholly unsuit-ble. The stone roof is as we observed in a blc. The stone roof is, as we observed in a able. The stone root is, as we observed in a former article, the proper covering. — Mr. L. de Ville's design has a peculiar character of loftiness of proportion, hut fails in details; whilst Mr. Derick's design is one of those which are correct and careful, —good according to the standard of English models, —hut which contain the next the standard of the properties. little that is new, or of the real nature of the indispensable art.

But, on the whole, we retain the opinion that the exhibition illustrates a decided step of pro-gress : and it deserves even more attention than gre we have heen able to give to it.

MR. SYDNEY SMIRKE'S SECOND LECTURE ON ARCHITECTURE AT THE ROYAL ACADEMY."

It is amusing to trace the various changes and It is amusing to trace the various changes and chances of onr helpless art, stronguling amidst the diff-eulties that baset her during the four or five centuries succeeding the date of the Tomb of Theodoric. To horrow a not inexpressive bomely figure of speech, the builders of these times were as breaders who wholly neglected parity of blood, and every species of cross was the eonsequence. Iu Lombardy the old Roman stock got tinzed by the strange fantasies of the northern mind ; and in Venice may he recognised strong indications of an eastern infusion. In Puglia and Sielly the graceful band of the Saracen plainly discovers itself ; and in parts of France, also, these eastern influences have left behind them the traces of a genial taste. Strange aud often inhurmonious combinations led necessarily to often inharmonious comhinations led necessarily to the confusion of style; for there were no master minds may tus criticism ne-appied to their pointangs. Unable themselves to carve, they misunderstood and misupplied the sculpture of their predecessors. Reck-less spoilers, they carried off the columns that others, in happier times, had wrought; and piled them up again often with misupplied capitals and inappropriate base. I have muscif scene in the grout of one of the again other with imaginate capitals and mappropriate hises. I have mixed scen, in the crypt of one of the earliest Christian churches in Sicily, an Ionic capital, of classic workmanship, reversed and converted into one of the priest's sedilia, the volutes forming the elbows.

elbows. The strange expectation that pervaded Europe in the teath century, that at its close the world was to pass away, seems typical of the prostrate state of society at this period. But the night has its morning, and with the eleventh century came clear evidences that the crisis was past. Political improvement soon hegot improvement in the arts. The vigorous re-publics of Italy led the way to the cultivation of the neglected arts of peace, only the domant fallows soon hegat to show signs of the rinkes they conceled. In Fisa, and Lomhardy, and Venice, huidings arose hegain to show signs of the riches they concerded. In Pisa, and Lomhardy, and Venice, huildings arose which, to this day, court and deserve our admiration. The period of the highest political prosperity of Lom-bardy was marked by the execution of great engineer-ing and architectural works, which remain to this day as honourable monuments of the freedom and energy of the Lowbardie States. On the Bhing and any as inductive interactions of the freedom and energy of the Lombardie States. On the Rhine, and in France, our tecraing art hrought forth a numerons and noble progery of huildings. On our own soil, too, sprang up edifices which command our veneration, not only for their age, nor only hecanse they are the works of our own forefathers, hut because they are, in some respects, and in some instances toby are, in some respects, and in some instances, narivalled, in digatified and simple grandeur, by the works of any succeeding time. Disregarding the attraction of mere ornament—devoid of all architectural artifice,—the old builders of our Norman period knew well how to roise structures in harmony with their own exmest and devout feelings.

and devont feelings. It may he an agreeable task, hereafter, for me—or some other who may follow me—to study with you the details of these truly noble monuments, to trace the Classic purcetage of many of the most character-istic details of Norman architecture; to point out the direct lineal descent of uot only many ornamental, hut many constructive devices, from the age of the emperors to that of the pontifis; for example, how the solid ashined ribs, with light ruthile spandrils, as practised by Norman masons, were derived from a like

* See page 148, ante.

economy of lahour and material observable in the economy of lahour and material observable in the ground vanils of the Coliseum. But, for the pre-scut, I forbear to dwell on such matters. Nor shall I attempt to expound to you how, when, and where already had theories enough. Our old master, Wrea, tells us that the Crusaders hrought the pointed arch from the East, and I, for one, an quice willing to believe that, if they did not, they had used arch such archeg in use hefore they.

One, an quite wrining to behave that, if they due tog, they had at least seen such arches in use before they had here augrafted on westeru architecture. It may, I su pose, be saiely asserted that, since the dispersion of B-bcl, no movement of popular masses has here attended with more important or more permanent re-with than the Caracdas and it seems no unreasonable sults than the Crusades, and it seems no unreasonable substituting the Orisanes, and it seems no intreasonable conjecture that the pointed areh was one of these re-sults. But a larger and more interesting question remains behind. In what region and at what period were buildings in the Pointed syle (of which the arch is only a component member) first created ? England To only a component member) pirst creates r Lagiana once laid claim to the parentage of it, —Gernany still appropriates it,—Italy has had its advocates. I believe that the weight of evidence prepoulerates in favour of France; and the period of its earliest ap-pearance is to be referred to the first half of the tweffth century.

Such was the extraordinary vigour of our art, now thoroughly awakened from its long slumhers, that, in the short period of half a century, the style arose, and reached, if not its maturity, at least to a perfect, complete, and consistent existence. Som id a may be obtained of the fevrid activity of this period, from a consideration of which exclute an affected in he obtained of the fervio activity of this period, itom a consideration of what architecture effected in Europe during half of the twelfth eeutnry, as eom-pared with the progress (if progress it may be called), during half of the eighteenth century. In the one case it would he easy to adduce a long series of spleadid elifices, evineing a constant advance in the know-ledge and power of art. In the *latter* case, how faint and feeble the steps I The prerilities of Louis XVI, varied but little from those of the preceding Louises. In England, from the first George to the third, what advance was made but from one deformity to auother?

advance was made but from one deformity to another ? During the first period under consideration, not only did religious bodies vie with each other in the erection of numerons stately structures, on a more extended plau, and upon a more sumptuous scale than hefore, but their artists devised new modes of con-struction,—hrought out new effects—created new heatings—and overcame new difficulties. Disdaining to follow their predecessors even in the mere outline of their modifiers, they func acid their edd models. to follow their predecessors even in the mere outline of their moddings, they fung aside their old moulds; excavating deep hollows, and bringing out sharp arisess, with a viscour and force of hand quite un-known to their fathers. But it must, in candour, he admitted that to France is nainly due this wonderful development. England followed with a more faulter-ing step, and patted slowly with the forms of her Norman conquerors. It was in France that a monal actergy, religious zeal, and political preponderance, combined to favour the exertions and genius of its accomplished architects. accomplished architects.

accomplished architects. I may remark, however, that our comparatively slower pace was attended by one advantage: it gave us time to perfect an Exrly Pointed style (which, with a degree of pride not alcogether unwarranted by fact, we are fain to call the Early English style), more homogeneous and complete than any corresponding transition style in France. So rapid and brilliant was the advance there, that the interval was short that interved between the first estilishment of the was the advance there, that the interval was short that intervened between the first establishment of the Pointed style and its full maturity. As to Germany, the grand, old, sombre style of Romanesque archi-tecture lingered on the hanks of the Rhine long after the more mercurial genius of the neighbouring country had advanced far in the new manner of building ; whilst in Italy this novelty, being an in ported article, was marked by searcely any preliminary efforts

was morked hy searcely any preliminary efforts. The upper church at Assissi affords, prehrsp, as complete a specimen of Eurly Pointed art as any in Italy, and yet it was nearly the first, bearing date in the earlier part of the thirteenth century. For a time, it is true, this style became prevalent in Italy, but its reign was short. From the date of Arnolpho di Lapo's work at Assissi to Andreo Orcagna's Loggia at Florence, there was an interval of about 100 years; and at this Loggia we see strong indications of a return to the classic school, which Italy had quitted so late and so reluctantly. Reverting however to the more general Euronean

Reverting, however, to the more general European view we are taking, I would say that, with certain exceptions, Pointed architecture perfected itself throughout Europe at the close of the thirteenth cen-tury, and obtained that preponderance which was due to its own superiority in all the highest qualities of our art.

An insatiate spirit led on the enthusiasts of the fourtcenth century to seek out fresh triumphs, hut this very amhition was the stepping-stone to their subse-quent degradation. The first signs of this are per-civable in an exultrance of ornament, and a certain

rtificial character of construction, which afterwards became the seeds and sources of ultimate decay. Every rimenal chera fer of constru town, which afferwards became the seeks and sources of ultimate decay. Every gable and piu acle, and almost every cornice, became fringed or studded with a cockets, huds, or bosses, Workmen began to fict over and ent up every plain, surface, and to seek out means or excuss for performi-ing access and encode serves. surface, and to seek out means or excites for pertorn-ing every sold space. That last remunit of Early art,—the capital,—representing the impost of classic times, ceased at length to be an essential feature of an areade ; and all lness became blanded into each other; the straight into the curved; the convex into the coucave; until masons seem to have repudiated their natural material, and treated stone like wood or their natural miterial, and treated stone like wood or iron. Many superior huldings, no doubt, arose during this period. The accumulating wealth, and, I must and, the aspiring tendencies of the ecclesisatical and municipal bolies, urged the huldiders of the four-teenth and fifteenth centuries to make great efforts, and many noble huldings were the result. St. Stephen's, at Vieona, Erhourg, Antwerp, Milan, and many other fine structures, attest the unabated ardour for church budding, and the increasing constructive powers of masonry : yet still the course of true art was then a downward course. In short, a great change had come over the Gothie manner, we have alrealy seen how it fared with Greek and Roman art, and so it fared also with Mediaval art. What kegan already seen now it area with Greek and Rollman at, and so it fired also with Mediaval art. What hegan is simplicity, ended in complexity and confusion: what was pure at first, heckme perment at last. Indeed, excessive ornament, however admirable or striking the effect of it in particular iostances, may be taken as the surest indication we can have of

ne taken as the survey indication we can have of approaching decay. It is needless, however, to dwell on a tale which has been often tabl. The errors of the later Medgaval architects have often heen the subject of unfavourable comment, and are too often unjustly osed as instruments of attack on the style itself. We are accustomed, with justice, to accuse the exuberance are accessioned, with justice, to access the con-and excess of the later styles as the course or the con-sequences of degeneracy; yet such a result seems to he in the natural and inevitable order of events. Builders were at first timid and eautions, like men Builders were at first tund and cautons, like uen cryptoring a new country: they were subside with small alrauces, and sought rather to secure their footing than to expatiate freely. To course of time they gained coorage through experience, the masons struck their stone with a biolder ruld a freer hand, and at length, hiving acquired a complete mastery over at length, invitig acquired a complete mastery over their materials, and confidence in themselves; they would seek by *tours de force* to proûnce new eff. ets and more surprising displiys, and ench became enulous to exceed his follows in the exhibition of manual desterity. Thus our art would necessarily he distio-To execute in the output of the ensurement of th

in actual incapacity. As we pass on in our history, we find our ch As we pass on n on mistory, we not our corono-logical view somewhat embarrassing. It might almost be said that eivilized Europe had hitherto been calit-vating one school: architecture spoke, as it were, but one language, varied only by dialectic peculiarities; a general concidence which is very remarkable, con-ticuted the said linear of complement this patient. sidering the social dismion of countries at this period, and of which, if the subject were worth pursuing, many curious instances might be adduced. We can many curious instances might be adduced. We can secretly account for this coincidence, except as perhaps one of the effects of the widely extended and closely builded fraternity of Freemasoury. But in the course of time this unity of feeling and practice hecame weakened or dissolved, and the artists of various countries diverged into various paths. Distinct schools were formed, and styles became localised. France, Germany, and Eugland assumed widely different aspects, and it is curious to note to what extent this separation was altimately carried. The several provinces of France differed materially from each other: mutual differences are also apparent iu the several schools of German art. Even in a country several provinces of France ontereat materiary neuro-each other: mutual differences are also apparent in the several schools of German art. Even in a country so geographically small as England, striking charac-toristics distinguish the north from the south; the cast from the west.

cast from the west. Such differences were no doubt partly due to the differences of available miterials, a circumstance often greatly inducening the local character of buildings; and of this I may hereafter have occasion to present to you some notable instances. But these differences were, in this country, also due to its growing inde-pendence of foreign connection and of foreign art. England hall formed her own special diversities of style. I shall not have see oursum the new remembriding the scame possessed of her own special diversities of style.

I shall not, however, contend for our superiority at I shall not, however, contend for our superiority at this period. I am ready to confers, that whilst on the continent a licentious freedom prevailed in late Mediaval architecture, characterised by great force aud boldness; England, on the contrary, sank far he-neath her lormer level, and betrayed undeniable signs of imbecility. Whether, and to what extent, this decay may he attributed to social and pohtical causes we will not stop to inquire. It is, however, certain,

from whatever cause arising, that not only in England but throughont Europe, Pointed architecture lapsed into such a condition as to render its final abandon-ment a subject of little regret. The style had in truth worn itself out. The strangest vagaries prevailed. Stonework was dis-torted into apparently impossible form, assuming the mode to initiate the branches and small twigs of arrees. All merit was considered to consist in extreme stranges and immicitive seemed to be fuses itself, and entry fuel and interval to a subject of little regret. ment a subject of little regret. The style had in truth worn itself out. The strangest vagarics prevailed. Stonework was dis-torted into apparently impossible forms, assuming the proportions of metal; twisted into a resemblance of woad; and, as at Ulm and elsewhere, tracery was mete to initiate the branches and small twigs of trees. All merit was considered to consist in extreme dexterity of execution; and simplicity seemed to be the principal defect to be avoided. Bit the ahandonment of medieval art was very for from being contemportuous throughout Europe, as I

But the anomaloumout of mean art was very at from being contemportances throughout Europe, as I will proceed in a few words to shrw. I have already named Ore:gna's celebrated Loggia, whose date is the middle of the fourteeath century. This work is of no great dimensions, but of most pleasing proportions, and, except its cornice and a few minor details, seems conceived in a perfectly classical spirit, and was, iu furt, among the first fruits of the growing distaste for There around the array in this of the growing distance on the then prevalent Pointed style. The passion for class calliterature in the free states of Italy soon com-pleted the disconfiture of mediavalart. Fortunately for Italy, a most beautiful modification of the classic style arose in the fifteenth century; and as the change happened to coincide with the appearance of a glorious company of the most accomplished antists, a beauty was imparted to the respectated features of accient art which was truly admirable. I would name the church of Sta. Maria dei Miracoli, at Venice, and the church of S. Fraucesco at Rimini, with some other well known buildings, as singularly elegant and well worthy of careful study, not only for their exquisite details, but for the pure and simple dignity apparent in their design.

in their design. The examples, however, of the best renaissance work are not numerous io Italy. The extreme activity of art at this period led to the natural result - excess, as at the Certos, at Pavia, and the inordinate study of classical remains led to the abandonment of much of that which was oligin-lin the manner. A school, however, arose, of which the masters were such men as Alberti, Peruzzi, Raffaelle, and Michelangelo, wherein was perfected such an admirable adaptation of ancient forms to modern uses, that now, after the lanse of 300 years, human ingenuity has since conlapse of 300 years, human ingenuity has since con-trived no style (as it appears to me) so exactly meeting the wants of civic architecture : plastic and versa-tile; capable of adaptation to every purpose; susceptible of every expression-

"From grave to gay, from lively to severe.

So active, however, was the movement of our art, and so rapid her course at this period, that the same great master who witnessed the earlier steps of the Remaissance, witnessed also its decline. Michelangelo, Whose supports provide the section of the section o hieh io weaker haods hecame serious defects.

It affords a curious evidence of the æsthetic isolation It alores a currous evidence of the estimate isona-tion of England at this time, that during the greater part of the period to which we have just here advert-ing, scarcely a glimpse hud been yet caught of the great changes which continental art was then nudergreat changes which continental art was then mndr-going. England appears to have been tanght her first lesson in the new style by Holbein; hat is it not romarkable that at the very time when this German artist was startling the semi-Gothie court of Heory by his novel and fautastic arabesques on the ceiling of the chapel in St. James's Palace, Michelangelo was painting the noblest imagery which the human hand had yet depicted on the ceiling and walls of the Sistiue Chanel in Rome. stine Chapel in Rome. With us the new Italian mode of architectural Sisti

design make to very tapid progress. For full 100 years our buildings generally, retained a strong savour of Mediaval art. Uubrinnardy, too, the active mercantile intercourse existing at this time hetween uncreatills intercourse existing at this time hetween Eugland and the German states, and onr tics of con-sanguiuty and of political interest with the German races, gave to our Rennissance rather a German than a French or Italian hiss. We are not wanting in specimeus of this transitional style, equal perhaps in beauty and grace to any,—hut the examples are neither numerous nor considerable. Certainly, the beauty and grace to any,—hut the examples are neither numerous nor considerable. Certainly, the general character of our Euglish huildings at this general distance of the condemnation which has heen bestowed on it with no sparing hand; for, how-ever widely asunder the partisans of the two extremes these bestuwer on it with no sparing hand; for, how-ever wildly sander the partisans of the two extremes of Classical and Medieval art may be, hoth extremes concur pretty cordially in contemning that mixed breed of architectural forms which prevailed during the reigns of Elizabeth and Jonnes. This hybrid style has, indeel, its merits as well as its admirers: there is a hroad, masculue holdness in its eccentricities; much inservitte and evidence in the secentricities; is a hroad, maculue bolicas in its conceptions; there canging drags of the people of a great policial fabric much ingenity and originality in its conceptions; that the energies of England were exclusively directed, and, above all, its peculiar telaim to the quality of the and she postponed all minor considerations to a more picturesque is undeniable. It, further, enlists our peaceful time and a more convenient season. It is

fuses itself, and, entering into new combinations, emerges anew with an altered aspect.

emerges snew with an alcred aspect. Recurring again now to Italy, as unquestionably taking the lead, at this period, swong the artistic powers of Europe, we find art making a rapid descent after the days of the elegant Fallado and his polished contemporaries, and a style of architectural design became prevalent, the inferiority of which is, like that of Eizabeth, only redeemed by its hreadth and holdness. holdness.

I am much inclined to attribute some of the leading a minute include to attracte some of the reading errors of architecture at this period to the habit, thou very generally prevalent, of uniting the practice of our art with that of one, or hoth, of the sister arts, our art with that of one, or hold, of the sister arts, Those sisters are guided by principles, in many respects so different from ours, that the architect must be indeed rarely endowed who is expable of successfully practising (however carefully he may, and should, calivate) those other arts. The painter and the sculptor may well share with the architect in the study of the purely arsthetic principles of design; but there ever them purely methatics. I need because here immestudy of the purely asthetic principles of design; nur there are other studies. In each scarcely say, inome-diately connected with the art of building, which are at least of equal importance to us. That whatever we design shall be consistent with the principles of sound construction is an obviously essential cou-sideratioo, and, io designing, should ever be present in our minds. Yet these principles are precisely those which are necessarily foreign to the sculptor's read the neither's corres of study and halort of and the painter's course of stody and haut of thought.

From this combination of porsuits has, probably From this combination of persuits has provady arisen much of the extravagance of the Borcomiul school: such practical absurdities as broken pedi-ments, and twisted columns, and that strange inter-mixture of floating clouds and flying drapery with the rigid aud substantial forms of architecture, which defies common sense, though it certainly, sometimes, Hence, ton, thuse brings ont some fine scenic effects.

brings out some fine scenic effects. Hence, to, those strauge curvilinear plans, such as the Royal Library at Bertho, and many conducatal churches, built in the palmy days of the Jeanit missions, which were quite toknown in the hetter periods of art. It is to he lamented that the great religions move-ment which origituded with Ignatius Loyola, ebauced to coern at this period, when our att was in so debased a state. As extreme zeal in the ercetion of eluarches and colleges distinguished that society, and to this day we witness the result, throughout the Coutinent, in a great variety of huildings, often very picturesque, profuse in descration, and sometimes ingenious in profose in decoration, and sometimes ingenious in construction, but in a style that has nothing whatever to recommend it to your favourable coosideration.

Whilst art, in Italy and Germany, having lost its true path, was thus wasting itself in wain efforts to produce great effects, by lalse and artificial means, French art was diverging into another path, with results if not more natural, at all events, far less open to condemnation.

The grandeur of the architectural works towards the close of the sevence entry in France, is so nearly allied to real greatness, and has so much of actual heauty of detail to recommend it, that we cannot be surprised at the estimation in which it is still held by many.

But, as we have already seen, our art never pursues a level course; and the breadth of design which dis-tinguishes the age of Louis XIV. became brittered way and diffigured by affectation under his suc-cessors, when at length the storm of the great revo-lution arcse, acd our art, in common with the pul-tical institutions of Europe, had to submit to other great changes.

great changes. To revert to the period of the Renaissance iu our own country, I have already soid that the free, though grotesqoe mailmess of the Elizabethan period sous lost its character. The public mind of England was exprosed by her internal contentions, and influenced by the more frequent and direct communication with the Configuration of the formation of the sound hy the more frequent and direct communication with the Continent, we were context to horrow the peaceful arts of design from our neighbours, on whom we bave been so otten dependant in matters of social babit and taste. Close observers of costume will trace, in pie-tures of this date, the prevalent fashious of France, Germany, Spnio, and Italy, contemporaneously utilu-encing the dress of the people of England. It was to the building up of a great publical fashrie

recorded of Themistocles that whilst he would frankly inability to play on any instrument, he yet he prouder distinction of knowing how to claimed the prouder to render a great nation prosperous and happy. So Euglishmen, at the end of the seventeenth century, may well afford to admit that they followed the taste and fashiers of the and fashions of other countries, whilst, in their own, they were engaged in laying deeply and broadly the foundations of a political system which other coun-tries have ineffectually attempted to horrow or imitate

Let me not, however, do injustice to the memory act me not, now ver, so injusted to intermediate the method of our great master, Wren, who centrainly holds such rank among the artists of Europe as may go far to redeem the character of our country at his period. I think there is little doubt that, had he lived under more favourable influences, in better times, and

with the means of acquiring a more intimate know-ledge of art at its best periods, the mental powers and professional skill of Wren would have placed him on a level with the highest of his predecessors, as they a fevel with the highest of his proceedssors, as high certainly did win for him an unapproached par-eminence among his contemporaries. In tracing these outlines of the history of our art, you will perceive that I have exclusively followed her fortunes as *dise* art. Were it possible within these walls, and on such an occasion as this, to trace the mechanical and con-tunction as the history of the mechanical and con-tunction are and the history of the mechanical and con-tunction are and the history of the mechanical and conan occasion is this, to the measure and to structive progress of architecture, our course would not be without interest and utility: we should find that sound principles of construction have always dis-tinguished the hest periods of art. The Greeks, like the Egyptians, worked, not perhaps with much con-structive finesse, but with a most elaborate, revern-tial attention to good execution. The bedding and jointing of their masonry surpasses even the compre-hension of a modern mason. Roman buildings, also, of the Augustan age, show the highest degree of con-structive excellence; and, except in the use of iron, I am at a loss to say what material progress has been made in this department of practical art, during the seventeenth or eighteenth centuries that have since ed away pass

The darker ages that followed were as strongly The darker ages that followed were as all and marked by constructive incapacity as by the fallen condition of architecture as a fine art. Great neglicondition of architecture as a hac art. Great negli-gence of excention, and a resort to rude, uscientific, expedients mark that age, and it was a sagadous policy of the charch to re-animate the subsidiary arts of huidding, by canabiling and investing them with the character of a religious confraternity of which the vestiges still survive to us in the social institution of

Freemaonry. In the best period of the middle ages, the study of the arts of construction were not held to be beneath the dignity of the highest intellects, and the result was a wonderful mastery over the practical arts of

building. These few remarks I throw out as suggesting to

These few remarks I throw out as suggesting to you a useful line of study; not one, however, that can be pursued within these walls. I now bring my brief historical notes to a close; it is useless, perhaps, to pursue them farther. To speak of the present would be an iduly presumption. To undergo a perpetual change seems to be the destiny of our art. Between the works of the Creator and of the created there is no version of the there is no the the created, there is no greater distinction than their relative mutability. Of the latter, all is fluctuation, change, and deevy — of the farter, an is internation, change, and deevy — of the former, as it is to-day, so it has been since the heginning. There are no fashions in the plumage of birds; and the flowers, whose grace delights us now, have, with the same grace, delighted mankind since they first scattered their fragrance over the garden of our earliest parents.

Let each man, therefore, in his sphere, strive to restrain these fluctuations of fashion within the limits of good sense. It is, at least, the artist's duty to do so. But we cannot alter our inherent infirmities, and all that the most ambitious teacher can hope to do, is to offer the assistance of rudder and compass to those who are about to launch their frail vessels on the troubled waves of professional life.

IMPROVEMENTS IN THE PARKS.

THE PROVEMENTS IN THE FARMS. The projected improvements and alterations in the metropolitan parks are beginning to develop them-selves, so that an opinion may be formed as to what their effect will be when complete. The long draining and cleausing operation in St. James's-park seems to be progressing satisfactorily. The bottom is nearly formed, and in a few weeks this part of the business may be easily terminated, and by the end of May the water he tranged in . Let us honce that the little lawn. water he turned in. Let us hope that the little loun-tain at the head of the lake opposite Buckingham tan at the head of the lake opposite Buckingham annexment. Palace will be really improved, and the quauity of In many places the old weather-beaten wooden as contributing mainly to the necessary accuracy with whether many the powers and the necessary accuracy with whether many the powers that be ean call to fause that old fashioned posts and rails are more a differences. And stated that in the hands of the heaters of rosts i and park-like than new wire feacing. The added some existing a series of roses, jets, change, however, is for the hetter, as from a little entry othin accuracy and beauty.

and pipes something different from the old model of distance il e wires are searcely perceptible, which gives and pipes sometoing unleter row to out model of the street fire-plug, which really seems to bave here the original of all our attempts at fountains. The foundations of the suspension-bridge are pro-

gressing apace. A light structure of this kind, when once well commenced, ought not to be long in haud, and might be finished in a few months. This bridge will lead direct to the new passage opened to the public hetween St. James's Palace and Marlborough House.

This passage is supposed to be a thoroughfare, but aring the levee the other day it was closed to the public, and considerable confusion was the result, for numberless eabs were turned back to make a detour either by the Stable-yard, or, in some cases, by the Horse Guards. This is an inconvenience which, when the new bridge is opened, will amount to a nuisance but which, from the peculiar nature of the case, seems to be difficult to obviate on the occasion of drawingoms and levees.

By opening the passage to Pall-mall, a considerable alp of garden-ground is added to Marlborough House, which was much required at this part, as it was too closely hemmed in by the wall forming the western

In Ilyde-park extensive alterations are in progress, which may be decidedly pronounced great improve ments. Rotten-row has been considerably widened ments. Kotten-row has been considerably widered, re-railed, and partially drained, so that it now forms an excellent promenade for the equestrian part of the *beau-monde*. The Ladies' mile on the side of the Ser-pentize scenes to have been left untouched and for-gotten, except near the magazine by the bridge, where

gotton, except near the magazine by the broads, where the approach to Kensington-gardens has heen opened up and considerably improved. The Ladies'-mile requires widening,—not only the carriage-drive, but the paths on each side, for ou fine attractive Sundays they are overcrowded, while on the north side, now apparently the fashionable lounge in the senson, there are exceedy any walks at all, except ragged and irregular paths paddled out by the people themselves. The immediate vicinity of the Humane Society's Receiving house requires in-proving, as a present it forms anythoing but a pleasing proving, as at present it forms anything but a pleasing feature in the scene.

However, the grand improvement in Hyde-park is the new walk loading from the Machie Arch to Ken-sington-gardens. This is a decided improvement, and sington-gardens. This is a decided improvement, and will be much appreciated by the denizens of the neigh-bourhood. It forms a pleasant walk from town to the gardens; and when the young trees and shrubs are full grown, will screen the park side from the dust and desagrements of the public road running parallel with it. Any one remembering what this walk used to ha,—little better thans awanny publike, replete with every kind of naisance, offensive to more scuess than non-mwill be highly credified at the algesant chause will he highly gratified at the pleasant change

Near the Marble Arch a kind of artificial mound bas been formed, with a sunk road, which is for the bas been formed, with a suck road, which is for the purpose of concesing: a series of conveniences, much required in the parks. These will be entirely concelled from view by the little-shrubbery planted on the newly-created mound. There will be a small orna-mental cottage for the residence of the Jaulior of the place, which will be snugly enconced in a howery plantation of skrubs and trees. While on the moster of new mode and shrubbaries

While on the matter of new roads and sbrubberics, attention may be called to the neglected state of the path from the Bayswater-gate to Brick-Inll-gate. This route connects Belgravia with the new neighbourhood of Bayswards, and is much used. The path, how-ever, in winter, is little better than an impassable puddle, full of boles and muddy water. It requires immediate attention, and as it is really an important path through the gardens, it ought not to be left in its present neglected and forlorn condition, for in wet weather it is really impassable. The trees in the neighbourhood of this path have been rather smartly lopped, for the purpose of admitting a free eirculation of air, and letting the same more readily penetrate, so as to promote the growth of an agreeable covering of grass, instead of the present black and swampy-looking surface.

The improvements in the parks are not m In a good long stride in the right direction,—a pretty clear indication that at last, by some means or other, "the right man is in the right place:" and as he has begun so let him continue till the parks are transformed into what they ought to be—pleasant and originmental places of recreation, where our pentup eitizeus may freely breathe the fresh air, and son themselves in parks and gardens as beautiful in appearance as they are useful for healthy exercise and usement.

the inclosure the appearance of being of state of nature, which is certainly more of being open and in a inly more effective and

state of nature, which is certainly more effective and pleasing to the eye than a long array of wooden rails, howso-ver old and rustic they may seem to the eyes of a few old-holes and gentlemen of a certain age. In a few months, when all these alterations are effected, the young trees and shrubs in full leaf, glow-ing in all the heanties of the pleasant spring time, these changes and improvements will be duly appre-ciated: let us hope that they will be thankfully acknowledged, and due praise given where the praise dame-to the tasks and exertions of the worthy Com. is due-to the taste and exertions of the worthy Com-missioner, Sir Beujamin Hall. J. L.

INSTITUTE OF BRITISH ARCHITECTS.

AT the ordinary meeting of the Institute, on Mon-day Inst, Professor Donaldson took the chair. Mr. H. Shaw, F.S.A. was admitted as an Honorary Member and Mr. Francis was admitted as a Pellow. A letter was read from Colonel Phipps to Earl De Grey, president, converging her Majesty's entire approval of the award of the Royal Gold Medal to the Onese Lucas ackes deltato free Mr. Owno Long

approval Mr. Owa

approval of the award of the Royal Gold Medal to Mr. Owen Jones; also a letter from Mr. Owen Jones, expressing bia appreciation of the flattering manner in which the resolution of the Council bad heen sup-ported by the members generally. Mr. J. G. Crace read a paper "On Furnitare; its History and Manufacture." Mr. Crace's paper was illustrated by some interest-ing drawings of Egyptian, Greek, and Roman furni-ture, copied from existing specimens, and from vases and other representations; together with a large and beautiful series of photographs of the cabinets and other specimens of furniture exhibited at Gore House, and in the Great Exhibitions of 1851 and 1855. and in the Great Exhibitions of 1851 and 1855.

The chairman said that he was sure the meeting ould feel much indebted to Mr. Crace for his illustrations of the history and development of art in con-nection with the manufacture of furniture, which was nection with the manufacture of infinite, when was one of the most important branches of decorative art. Mr. Crace had given some interesting illustrations of E_2 yptian, Greek, and Roman furviture; and in addition to his remarks, it might he noticed that earpets tion to his remarks, it might he noticed that carpets were entirely unknown in classical times, having been introduced from the East at a later period. The tesselated pavements, however, of the Greeks and Romans, were exceedingly interesting, from the beauty and variety of their patterns. In Mcdieval times, a profusion of ornament and decoration was hestowed upon farmiture, both in churches and massions; but upon rarrative, both in churches and mansious; but he would only now allowed to the two throaes or chairs used at the coronation of the Sovereign, in West-minster Athey. One of these was originally a very splendid piece of furniture, being beautifully carved, and in part covered with glided stace-work; hut the other was only a rude imitation of it. Mr. Crace had other was only a rule initiation of it. All, cluck had referred to an Explicit set, presenting camples of initial work, somewhat analogous to modern marquety ; but that ar appeared to have here directly derived from inlaying in marble, especially as practised in Florence. French furniture had deteriorated very nuch in artistic merit from the time of Louis XIV, in that of Naradown L, but a superior style of to that of Napoleou I.; but a superior style of ornament had litely been introduced. This was strikingly manifested in the Great Exhibitions of to that of strikingly indifferent in the order transmission of the term of the second striking of the second striking of the second striking of the second striking of a pure tasts were not upheld in the production of matters of luxury, such as decorative furniture, England would fall behind her competitors.

Mr. Digby Wyatt referred to the ivory diptychs of Lower Empire, as furnishing some curious illusthe lower limit, as initial some original fields have trations of the Emperor's seat or throne. This, it would appear, hecame gradnally more and more clabo-rate within the next two or three centuries after the rate within the next two or inree continues inter the time of Constantine, and at length was covered with jewels and similar decorations. The great seals of England, France, &c. afforded similar illustrations of the subject, and wree especially valuable, as being in all cases the work of the best artists of the time.

all cases the work of the best artists of the time. Mr. Crace called the attention of the meeting to some specimens of inlaying for marquery, which had heen cut in the room in the coarse of the proceedings by a workman in the employment of Mr. Blake, of Rathboue-place. These consisted of the petals and other parts of flowers, in four thicknesses of differently coloured woods; and the process of their excention, with the nature of the implements employed, excited a considerable degree of interest. Mr. Crace drew yarticular attention to the extreme fueness of the saw (being a watch-spring almost as fine as a hair), as contributing mainly to the necessary accuracy with which marquery was fitted together.

In reference to a remark by Mr. Digby Wyatt, Mr. Crace stated that in a large establishment at Paris, the patterns for margnetry (on which the accuracy of the workmanship, of course, mainly depended) had lately heen exceuted in lithography. This was a very useful application of the printer's art; but minute accuracy, even to a hair's breadth, was essential in small designs, and however correctly a design might be drawa upon the stone, the paper on which it was printed was liable to shrink in drying. Mr. Nelson, Hon. See. Introduced the subject of parquetry for floors. He understood that the par-quetted floors of Buckingham Palace had cost as much as 2007, per square. Mr. Graes said that floors of that description might be excented at a comparatively trilling cost. He

much as 2007, per square. Mr. Crace said that focors of that description might be excented at a comparatively trifling cost. He hriefly described the process of their excention, stating that the inlay was cut by a machine, in order to ensure greater accuracy in the vertical position of the saw than could be obtained by hand labour. The Chairman alluded to the an logous arts of Florentine mossie, and Ludian inlahd marbles. The latter, he observed, were remarkable for heauty of execution, but the recent specimens of Florentine work did not quite sustain its former reputation. In reply to a question from Mr. A. J. Biker, Mr. Crace stated that only ordinary glue was at pre-sent employed for marquetry, though there could he o objection to maring ell: as a greater protection from dump or heat. He farther referred to the pro-cess of manufacturing the well-known Tonhridge ware, as a cheap and effective species of mosaic work. It was probable of the Queen of Spain, exhibited in 1851, and containing between three and four millions of separate pieces, had been constructed.

THE CONTRACT TO LIFT THE SUNK FLEET AT SEBASTOPOL.

THE CONTRACT TO LIFT THE SUNK FLEET AT SEDASTOPOL. From a Mericae source we learn some par-ficulars as to the contract entered into by the Russian Government with Mr. J. E. Gowen, of Busion U.S. for raising the sixty-four vessels-of-war composing the fleet sunk in the harbour of Sebastopol during the date sunk in the harbour of Sebastopol during the late war. In the course of an examination of the condition of the ships, which occupied him for several acouths, with a Russian steamer at his disposal, Mr. Gowen descended with his sub-narine arrounor to the hottom of the harbour and examined the suck ovessels. He found that the channel of the harbour was in the middle, with hanks upon both sides, that of the north heing of sand, and that upon the south of mud. In the sand there were uo worms : in the mud they were quite plentiful : the vessels crossed to the attacks of the world suffer from their attacks. The machinery of the ships, it appears, was care-tally covered with a preparation of tallow to prevent thirty of the vessels. The value of the whole fleet is said to be 65,000,000 dollars ; and a certain portion of the value of careb ship raised is to he handed to prevente. The American expedition will consist of two vessels,

bit in Value of cace ship raised is to be handed to the K. Gowen at the moment it is restored to the Russian covernment.
The American expellion will consist of two vessels, for April. The number of persons euraged to accompany it is about 150. Some of the hydraulic machinery for raising the vessels is of a colossal description, one eylinder alone weighing 54,000 pounds. The Museum to be used in the raising of the fleet will be about 1,500,000 dollars; and the time occupied in exforming the contract, which are the doubt of the contract, and the important of the second strate will, it is thought, he about experiments of the fleet will be about 1,500,000 dollars; and the time occupied in exforming the contract will, it is thought, he about experiments of two years.
At Kertch, there are also some five or six Russian of the harbour of Schastopol there are some 600,000 dollars worth of chains and anchors. It addition to the barbour of Schastopol there are some 600,000 dollars worth of chains and anchors. It addition to the themselves to farnish from Apolo to 5,000 uons, whose you from Mr. Gowen will be about 25 cents, per day, they "finding" themselves.
The Russian Government are engaged in the works, and the barbour of 0,000 had returned. Several thousand theore was to he largely increased. The old city will be about 60,000 had returned. Several thousand theore was to he largely increased. The old city will be about 50 for its anrow streets: the new city will be about 50 works, and the discours were then engaged upon the works, and the theore was to he largely increased. The old city will be about 50 works work there are then engaged in the individual street in the individual street is a labout 60,000 to 3000 to 5000 to 5000 the street street with a squares. It is also asid that there are there increased is of rits anrow streets: the new city will be about 50 works, and the discussion for the anrow streets is the null ding the discustion of wooden huildings. ST. MICHAEL'S, CORNHILL

ST. MICHAEL'S, CORNHILL. NEW PORCH.

The old church of St. Michael, Cornhill, was destroyed by the fire of 1666, and the rebuilding of the body of it was commenced by Wren in 1672, in the style of other of his churches. The tower itself was weakened, and fifty years after-wards was taken down and rebuilt, it is assorted by the same graphised the last the last division. wards was taken down and rebuilt, it is asserted, by the same architect, the last stone being haid, according to Maleolm, August 29, 1721. Wren must have retired from practice at this time, but may have made the arrangement previously. Strangely enough, the architect, in rebuilding the tower, adhered to the Gothie style, and though the details are poor, the general ontline is noble and effective. is noble aud effective.

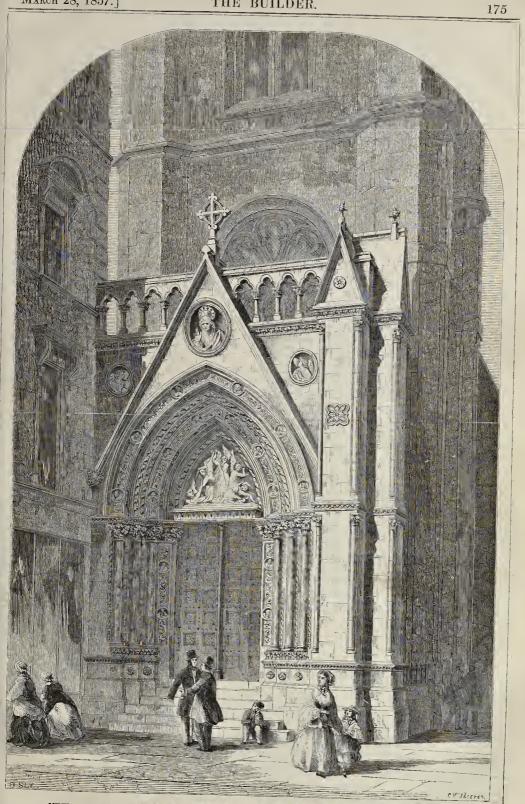

It was long shut in, but a year or so ago some of the houses which intervened between the order side of the tower and Cornhill were cleared away, to obtain an entrance there to the church, and now a Porch has been built, and two stages of the tower itself have been re-paired and altered, windows with tracery, and a diately above the porch, having heen inserted.

Our views show the general appearance and position of the tower, and the porch at large. The only stone employed is Portland, of which the original tower is built. The six shafts in the jambs of the principal doorway are of red polished granite. The sculpture in the gable of doorway repre-sents Our Lord in the act of benediction. In the tympanum below is to be a group repre-senting Michael disputing with Satan about the hody of Moses. The other carring consists of medallions of angels, bosses of foliage, &c. which are liherally introduced throughout the work. work

The porch is a parallelogram on plan, and is grouned in stone. The side window will be filled with a subject in stained glass, by Mr.

THE BUILDER.

NEW PORCH, ST. MICHAEL'S, CORNHILL .- MR. SCOTT, A.R.A. and MR. Mason, Architects.

MOVES IN THE BRITISH MUSEUM.

The visitor to the British Museum will notice that a great alteration has been made in the arrangement of the Greek and Romaa antiquities. The placing and lettering of the Townley and other marbles are not quite completed, but will be so in a few days. Some of our readers will remember a narrow gallery, the first door on the left hand after passing through the main entrance, in which were many sculptures of ex-quisite beauty, and slas of the greatest bistorical interest. These, however, ware jumiked together: busts of Romans were by the side of those of Greeks, and the other antiquities were so arranged that, although even the uneducated visitor of taste might feel and enjoy the things of beauty there, he must have left the place with confused ides. Up to a sertain height the wall has been painted of a kind of crimson " madder bown " colour, which is rich, yet sublatel, and seems to throw out, with good effect, both ank colours and light. Against this back-bines of the Otherize ware. THE visitor to the British Museum will notice that

effect, both dark colours and light. Against this buck-ground are arranged the Roman antiquities, in some-thing of the following unance:... In one group, marked in gilt letters.—Roman por-traits.—B.C. —A.D. 10. On the bust of Julius Cœsar.—B.C. —101.—44. (It is curious to notice how much, in many points, this bead resembles Roubiline's bust of Pope, the poet, formerly in Rogers's cullec-tion.) Augustus.—B.C. 63—imp.—B.C.—A D. 14. Therius.—B.C. 42; and so on. Mear here are busts of Hadrian, the huilder of the wall from Wall's-end, across the borders of Stoc-land,—Antoniuns,—and a Roman female, with simply crisped locks. Then we have Roman tesselated pave-ments from the City of London, aud-olver districts.

mer

spec focas. Then we have a online costance parts and focas and the cost of the solution of the and one of them is described as a surcophague found in Hampshine; and reference is made to the Archa-ological Journal, in. 12. The is the survey of the sur found

This is the sort of detail, added to more minute dc-scription, which we want in this national institution. In this department of Roman antiquities we recognise some old acquaintances; amongst them the curious volute, ornamented with leaves, cograved in the *Builder* (see "Antiquities found near the Tower Posters"), and some fragments from Mr. Roæch Snith's collection. Here is also abe curious Roman sarcophagus found near the Holy Trinity Church, Minories, presented hy the clargyman and church-wardons. This is the sort of detail, added to more minute dewardens.

With this glance at the Roman antiquities, we pass on to the room marked "First Grace. Roman Saloon," in which are Olympic deities — Minerva, Apollo, Diana, Mercury, --verions votive tablets, &c. Another in waten are Oymme dentes — Minerea, Apollo, Diana, Mercury — verious voivier tablets, &c. Another group is lettered "Mythological Personages — Olympic Deitus," How wonderfaily beautiful is the head Diana, and fine the contrast hetween that and the splendial busts of Japiter ! The subject is the

spleudid busts of Jupiter ! The aubjects in the next room are divided, and marke d" Subjects from Common Life." In this divi-sion is the Quoit Thnower, &c. "Historical Per-sonages,"—Domosthenes, &c. Tu the next room of Greek antiquities are "The Hercos," Hercules, &c.,..." Masco, Herces, and Hercines." Hercae Castor and Pollux, &c. Apother group is headed "Assidte and Mystic Subjects." On the other side are mythological personages of the Dionysian Cycle, where are figures of Bacehus and Satyrs. Satv

It will be seen by these hasty notes how very much It will be seen by these masy holes above they have the interest of these magnificent works of sucient art is increased by the new description and classified arrangement; and we hope that the principle will he still further carried out in this and other parts of the Museum.

"GOTHIC AND CLASSIC."

I AM pleased to find that your correspondent "T. G." (p. 81) has favoured us with an *explanation* of his communication in the *Bailder* of the 10th ultimo. It was much to be desired, for I had care. altimo. It was much to be desared, for 1 ind cale fully read and reread his letter in question, to try and discover whether its author had cast even one favour-able glance upon the Gothic style, but not so much as the shadow of a "wink" could I perceive.

It is quite true that a building should be expressive of its purpose; that we should not be liable to mistake a church for a mill, or an "Exter-hall" for a theatre; but, are the principles of Gothic architecture theares out, are use principles of colume arcuitecture so narrow and confined as to be only applicable to a certain class of buildings? Had we not been accus-tomed to see our eivil structures, our homes, and even our furniture, modelled after Classic forms, the veriest loiterer upon the threshold of art would never have ionerer upon the toreshold of art would never have mistaken a manor-hones for a college, or have failed to perceive that although the *principles* of a style may prevail in all classes of huildings (in juil, theatre, mansion, and churb althe), it is the *application* of those principles to characteristic individual features

which enables him to distinguish a palace from a bank, or a museum from a penitentiary. Jam really at a loss to comprehend in what school "T. G.'s" knowledge of Gohio was gleaned, when be describes it as "ignoring the use of materials to which not a little of the advancement of the present age is attributable," and as "a style of stone and wood." Gan it be possible that your correspondent has never seen or heard of the isrowork which sur-rounds the touch of a certain queen in Westminster Abbey? Have the numerous hinges, so exquisitely designed and so beautifully wrought, which cover the otherwise plain doors of the thirteenth and fourteenth entaries with a tracery of *iron*, escaped his observaotherwise plain doors of the thirteenth and fourteenth entaries with a tracery of *iron*, escaped his observa-tion? Does not the *lead* work of many a cathedral, the inhid "brasses" upon the floors, and the nume-rous works in *silver* and gold, prove that the same principles which formed the granufwork of a struc-ture in "stone and wood," would as readily and as easily have formed the basis of a cathedral in *lead* or *silver*, had these materials been more sourceutiet. It easily over other the tasks of a more appropriate. It silver, had these materials here more appropriate. It hy no means necessarily follows that because n column of *iron* 2 inches in diameter can support the same of iron 2 inches in diameter can support the same weight as a stone column ten or twenty times the size, therefore it is more suited to columnar purposes. The Great Architect night have given us the spring of the grasshopper, or made our bone as tough as admand; but yet who will venture to assert that either the one or the other would have been an im-provement. But even granting that stone and wood are the only materials the Gothic architect can work in, it has yet to be proved that there exist other materials in *carery* respect as suitable for building purposes.

purposes. All "T. G.'s " remarks on the introduction of colou All "T.G.S" remarks of nic infordation of context at the expense of heauty of outline I fully agree with, but *beauly of form*, it is to be remembered, is not con-fined to *outline*, and may often be produced by colour when other means are unattainable. I am pleased to fined to outline, and may often be produced by colour when other means are unattainable. I am plessed to find, too, that this gentleman has dissovered that Gothie architecture has something more than what he enumersted as its components in his former letter, and that tracerised windcases and pointed arches are now added to the "stock in trade" which he was pleased to afford to "one-branch hands." But still, with all due deference, I assert that a building may be Gothic and yet possess none of these leatures,-that, in fine, a mighty style like this is independent of the characteristics of a time or a locality, be they "hoodwinked" or "traceried" windows, "but tresses" or "pinnacles," panelled towers, or lofty that, in time, a mighty style into this is independent of the characteristics of a time or a locality, by they "hoodwinked" or "traceried" windows, "bit-tresses" or "pinnales," panelled towers, or loity spires. I beliove, and sincerely hope, in spite of the opposition of the champions of the "Classic," that a style will grave apon the hitherto but little understood principles of the Mediaeval style, ns different as that of the fourtescuth from that of the twellth cattery, and as conformable to the progress of invention. I ask,--would such a style be Mediaeval ? Would not such a style be Gothic? For who amongst us will presume, for instance, to teher down to a time or people or creed, such forms as the trefoil and the quatrefoil. Shall we have off twining our capitals with oak leaves, or stamping our tombstones with the with oak leaves, or stamping our tombstones with the cross? Shall we fail to fix the slope of our roofs eross? Shall we fail to fix the slope of our roots with due regard to the rhements,—the wind, and the rain, and the seaw? or refuse to accept with thank-fulness such lessons as the ivy and the vine, the bawthern and the sharncock, teach us, because others have dome the same? Rather let us, in bumbleness of heart and singleness of purpose, read more dif-gently that volume of Nature which lies open before us, and we shall then more readily understand the constitution of the fine art which we profess, and more easily comprehend the studies of the Medicevel architeto tas he sings to us from the dusky past;—

"The book I read is Nature's: Her simple lutths appear; And, though she change her features, Her diotates still are chear."

And here, sir, I should have laid down my pen but for the closing observations of the first paragraph in the last letter of "T. G." Really, one would imagine from the tenour of his remarks, that Gothie architecture was utterly dependent upon aisles and chaucels, and chapels and transepts, and all the *et-ceteras* of piscina aud sedilia. His argument, therefore, is vir-tually, after all, what I believe most of the arguments to be which are nominally anti-Gothie, not against to be which are nominally anti-totate, not against the skyle, but an utar-Protestant outery against cortain revived existence and church arrangements, yeleped "Tradarian," I-delight as much as "T. G." is the "quirty" of the Protestant church, but this purity I must believe to be comparative, for I equally believe that us of individual church or sect can here be pure. Perfection in religion or art is in this world pure. Leffection in religion or art is in this world replaced by a net warm-coloured Ham-hil stone, and unatvinable. Progression and refrogression form, thus, bit by bit, the whole roof has been taken down, the history of both the one and the other, and reforms and either re-erected or rebuilt. In the aisles the and revolutions but mark the changes from the back- walls have been forced outwards by the decay of the ward to the forward, and from the forward to the beavy timbers of the roofs, the ends of which no backward step. It behoves us, then, to consider well longer rested on the walls, hut pressed against them, the direction in which we are moving,—whether we the inclination is inconsiderable, and they bare

are walking in the straight course of wise and honest are walking in the straight course of wise and honest men, or imitating the crab, hy going backwards; if the former, let us pursue it boldly, and with a pitying eye for all those who would have us turn aside: hut, if the latter is our case, then let us quickly retrace our steps, endeavouring more and more to restore that likeness within us which has become so obscure by the accumulation of sia; and, with more faith, more hope, more love, exercise a deeper sympathy with all the glorious creations of the Great Good, and we shall find our architecture will reflect, as in a glass, the innage of this likeness, and, endowed with the life of the inner man, approach more userly the excellence of those works which God himself pro-nounced to be so "very good." E. W. GODWIX.

PROPOSED MEMORIAL TO THE LATE JOHN BRITTON.

JOHN BRITTON. THE subscription at the Institute of Architects is making gradual progress towards the anount con-templated, 1002, and the committee have determined that their tribute shall take the shape of an incised haves plate in Sulishary Cathedral, the dean and chapter having readily couseated to allow it to be set up there. Some of Mr. Britton's friends are auxious, as we have already mentioned, to give the memorial a more important character, and Mr. Tite, FRS. 5; Mr. Alderman Cahitt, Mr. Charles Hill, FIS.A.; Mr. Alderman Chaitt, Mr. Charles Hill, FIS.A.; Mr. Alderman Protor, of Bristol, and othere, have signified their desire to subscribe for such a pur-pose, for which about 3002, it is said, would be required. The Institution committee have expressed by a resolution their willingness to allow their incised pose, for which about 300*I*, it is said, would be required. The Institution committee have expressed by a resolution tobic willingness to allow their incised brass to be combined with this restoration, if it can be effected, and to contribute towards it whatever might remain from their subscription, after paying for the plate. As a centre is needed, so that the good desires of the friends of Mr. Britton may be realised, we venture to state that communications on the sub-ject may be addressed to Nathaniel Gould, esq. No. 4, Tavistook-suame. Tavistook-square

CHURCH-BUILDING NEWS.

CHURCH-BUILDING NEWS. Broxbourne (Herts). — The fine Perpendicular church of Broxbourne bas beeu restored externally, and is now going to be reseated and thoroughly re-stored internally, at an expense of about 1,5004, under the directions of Mr. Joseph Clarke. It was built about ninety years hefore the Reformation, though low seems to have been given to a Sir William Say to erect a chantrey on the north side; the following inscription running round the parapet. — "Pray for the welfare of Sir William Say, Knight, which founded this chapel in honor of the Trinity, —the year of our Lord Gol, 1577." The church has been much-muti-lated hy the insertion of large and cumbrons gal-leries. These will be removed and the whole of the stonework restored, and the church handsomelyseated. stonework restored, and the church handsomely-seated. Mr. Bosanquet, of Broxbourne, will at the same time restore the channel, and Adaniral O'Brien the Say Chapel, both acting on the architeat's phas and advice. It is a good specimen of Perpendicular work, and will be a very fine eburch when completed. The parish are much interested in the work, and assist beartily in the exertions of the vicar and church-warden. nework restored, and the church handsomely seated

warden. Romsey.—The new cemetery was consecrated on the 18th instant, by the Bishop of Winebester. The architect nuder whose superintendence and designs the cemetery has been carried out is Mr. W. E. Lower, of London of London.

Sherborne .- It has been discovered that the dry Sheroorne.—It has been unsovered mice to any rot has set in in the joists which support the flooring of the north transent of Sherhorne church, and that already an expense of nearly 50% has been occasioned by it. The work of restoring the chancel is proceed. by it. The work of restoring the chancel is proceed-ing. The veinstating of the groined ceiling of the choir has been completed, and the groined ceiling of the south aisle is nearly done. The mode of proceed-ing, says the Sherborn Journal, was, first to raise large balks of timber to the chancel windows, and to pass them through the building from sill to sill; these timbers were bolted together outside by cross views and when these were keyed-up, the huilding These timbers were bolted together outside by cross pieces, and when these were keyed-my, the hulding was firmly and scornely "loaced." On these timbers strong centreings were placed, and a platform erected for the workmen, who, having uow reached the roof, proceeded to underpin cach rih of the grois, and then to take out the paneling piece by piece. All the rihs of the choir ceiling have been taken outsand raised from 8 to 10 inches; the whole of the paneling, which consisted of Tufa stone, has heen removed and rephaced by a rich warm-coloured Ham-hill stone, and thus, bit by bit, the whole roof has heen taken down.

settled firmly, and to adapt the roof to their position, wedges of slate and cement in the joints of the riba are said to suffice. The cause of the outward dispositheribs are stild to suffice. The same of the outward disposi-tion of the wall having been discovered, a recurrence-of it has been guarded against. The buttresses of the south aisle bave heen rebuilt, with 5 inches groater projection. The whole of the flying hattresses either have been, or will he taken down, and reconstructed of large blocks of Ham-bill stone. Bath the north and south doorways, and the south and north aisle windows have been reinstated. It will, therefore, he seen that a.large portion of the works. affecting the security of the tuilding has been accomplished. Still there re-main works considered amply sufficient to occupy the next twenty months. Mr. Digby went over the works lately, and is sail to have been satisfied with their their progress. eir progress. Westleigh --- We recently mentioned the erection of thei

Preserve of the recently includent the error that of a window in Westleigh church, near Bideford, Devon-shire. Another has been put up in the same church, by Mr. Warrington, of London, being a memorial window, consisting of three lights, also Perpendicular window, consisting of three lights, also repredictants in character, to the young and only son of Mrs. Clevalad, of Toply-park; Westleigh, who lost his life while serving with the armyin the late Crimean cam-paign. The window is one of large dimensions, occupies the east end of the north sisle, and contains subjects from the life of David. The entire gable

occupies the east end of the north usic, and contains subjects from the life of David. The entire gable was t-ken down and rebuilt, and the new window of stone inserted from the design and under the direction of Mr. Arthur Billing, architect. Rochdalz,—The third contract for the restoration of Koebdale parish church has just bren completed, including a uew roof on the nave, and the rebuilding of the elerestory walls. The galeries on the south and west sides have been takeo down, but it was thought necessary to build a smaller gallery at the west end. Further works are contemplated, for which the plus have obsen, prepared by Mr. Joseph Clarke, the judicious course having been adopted by the com-mittee of settling the plans for the entire restoration, and theu each year completing a portion as the funds and theu each year completing a portion as the funds permit.

Doncaster .- The design for the memorial windows to the Elston and Saunders family, by Mons. T. B. to the biston and onlinear standing of strong to the Capronniers, Brussels, bas just here completed. It represents remarkable seenes of Scripture history. The unanomials will occupy two sales windows at the west end. Each light contains two medallions, with six subjects for each window. The first represents the creation of man—the Creator meeting man in the garden — his expulsion — and the death of Abel, as showing the herediany nature of sin. The second portrays the first destruction of Jerusalem and the Temple, with the captivity—Daniel and his com-pacious—Nebuchadaezzar's dream—Shadrach, Mcpacious-Nebuchadaezzan's dream-Shadrach, Mic-shach, and Abedaego-the return to the promised land-and the rebuilding of the Temple.

PROVINCIAL, NEWS.

PROVINCIAL, NEWS. Novoich. — The Free Library was opened on Monday in last week to all the citizens. The expen-iditor, cither actual or estimated, has been as fol-lows : — The site, including house, 1,850/; amount of contract, 3,098/; cstimated extras, 957, ; extras for stone pilasters in lien of hrick, 700; cost of temporary stone pilasters in lien of hrick, 700; cost of temporary cellar, 257, estimated cost of upper story, 7000, cost of gras fittings, 1200; jtotal, 5,0588. Iucluding book-shelves, stoves, and furniture, the expenditure will be about 6,500. Sir Sannel Bignold advaued 4,0007, to the council in order to expedite the erection of the transflicet for the new building, and Mr. Worman the contractor. The building is in the Italian style. There has been an erroneous impression among the There is a set of the first outputs and star. Working the constructor. The building is in the Halian style. Tunstall .- At a recent meeting of the local Board, in. of Health, a resolution was entertained, upon recommendation of Mr. Robinson, architect for for the Town hall, to the effect that the clerk give Mr. WIL kinson, contractor, forual voice that the Board would, under the terms of the contract, take the Townhall out, of his hands, and proceed to complete it, in consequence, of bis having failed to carry out the contract

Bristol .- The building in course of erection for the Bristol.—The building in course of erection for use use, of the Academy-of Fine Acts and the School of Art, approaches completion. It is said to differ in character from any structure in the locality. An exhibition of local and nutropolitan art is to be held at the new rooms in September next.—The foundation-stone of parocbial schools for the paish of St. Nicholas with St. Leonards was haid on Thursday in last week. The aschools whop completed, will St. Nicholas with St. Leonards was laid on Thursday in last week. The schools, when completed, will accommodate 120 infants, 64 boys, and 84 grirs. The building will have an oroamental blank front, in the boys' school being lighted from the roof, while the grirs' and infants' schools will have windows facing the playground. The infant school-room will be 42 feet hy 22 feet, and 18 feet high; and the hoys' and grirs' schools 41 feet 6 inches, by 18 feet and 44 feet thich. There will be a residence for the mishigh. There will be a residence for the mis-Messrs. Foster and Wood are the architects, 14 feet high. tress. and Mr. Samuel Bowden the contractor. The site cost about 700/. and the contract for the building

Cost about 7007, the top contract for the building amounts to 1,3007. Pontypool.—Preparations are going forward for the erection of a new huilding for the branch of the West of England and South Wales Bank at Ponty-pool. The foundations are being dug in a field adjoin-ter the second second second second second second second the second sec ing the Townhall.

Termworth .- The building committee of the hoard of guardians of the Tamworth Poor-law Union, on Saturday week, received tenders for the erection of a Saturday week, received tenders for the erection of a new workhouse, according to plana and specifications of Mr. Nicholls, arebitect, of Westbromwieh. The lowest tender was from Mr. Paroel, huilder, Rugby, 4,4737. The other tenders varied from 4,5457. to upwardls of 5,5007. We have received complaints from competitors that they cannot get back their design.

Liverpool .- At a recent meeting of the Town-uncil it was resolved, that the tender of Mr. John connent it was resolved, that the tender of Mr. John H. Mullens, for the creation of the proposed public buildings in Dale-street and Hatton-garden, for 20,2017. 2s. 6d. (according to the plans of the sur-veyor) be accepted. The tender was the lowest of nine sent in.—It was also resolved to apply steam.power to the machinery of the chain-tester, which wire now worked by head. The accet of the which was now worked by band. The cost of the new building will be about 5,000% and of the machinery from 1,400% to 1,600%.

SCOTLAND.

Improvements in Edinbargh. — Masons were lately set to work in hewing stones on the Castle esplanade, for the new garrison place of worship. The new accommodation, according to the local Post, from which we adapt the present note, is to consist of an addition to the sucient chaple of St. Margaret's : the need text of million present is resulting to the second of an addition to the aucient chapel of St. Margaret's; the good taste of which arrangement is considered questionable. An angle in the Parliament House huidings has recently been completed, with a zig-zag piece of coarse wall, however, in proximity...... At Melbourne-place, George the Fourth's Bridge, the street will shortly he completed, adding another architectural feature to the old town : the houses are lofty, and are said to be of fine stone. Melbourne-place is completed by the extension to Victoria-street. An inlet from Victoriz-terrace is completed by an An inlet from Victoria-terrace is completed by an arched gateway. Other buildings (of one story) have here erected westward from the terminal point of icen erected

Perth.—The new Commercial Bank at the north end of Princes-street, Perth, is now ready to be roofed in. The hulding is in the Italian style. The Free Territorial Church, South-street, is nearly completed. Though plain in design exteriorly, the edifice, second-ing to the *Constitutional*, is superior in point of architecture to the other Free Churches in the town. Preparations are being made for erecting a row of villas on the Glovers' lands at St. Leonards, on the north side of Craigie Barn. A macadamised road leading to the villas has already been constructed. Workmen are excavating the foundation for the erection of the new wing and other additional build-ings at the General Prison. The contractor is Mr. David Rac, of Edinburgh, and his estimate for the work appears, from the report just issued by the General Board of Directors of Prisons in Scotland, to bc 27 3977

COMPETITIONS.

Wellingbonough Cemetery: - A meeting of the Burial Board of the Wellingborough New Cemetery was held on Tuesday, the 10th inst. for the purpose of fically considering and deciding upon the designs for chapels, lodge, &c. which had heen sent in by various architects in answer to advertisements which appeared in the public journals. The designs hearing the motio "Nisi Dominus Frustra" were (we are told) unaui-mously.adopted, and the successful competitor was found to be Mr. E. P. Law, of Northampton, who found to be Mr. E. F. Law, or restraining out, that received a commission to prepare the necessary drawings and specifications for carrying out the

Chatham Workhouse .- In this case there erick Peck and E. W. Stephens, of Birmingham, has been selected as the best, and that of Mr. E. Holmes,

also of Birmingham, as the second hest. Worcester Cemetery.-About fifty designs, we are told, have heen sent in

Browsprove Cemetery.—Eight designs for erecting a lodge, &e. and for laying out the new burial-ground, have been received, the estimates varying from near 600. to 1,9002. Five of the more expressive plans 6000. to 1,9007. Five of the more expressive plans were set aside, leaving the other three to be decided on. The Board at length decided upon accepting the plan submitted by Mr. C. H. Cook, of London, whose estimate was 5757. A competitor states that when he sent in his drawings, he received by return of post a printed circular with the view's name at the end, unreinvelous meanwriting a subcapitation tensorie the particularly requesting a subscription towards the funds for restoring the church l

ACCIDENTS CONNECTED WITH BUILDINGS.

Huddersfield.—At the theatre, in Huddersfield, while Mr. Cobden was speaking last week at a political meeting, a portion of one of the side galleries fell, precipitating about twenty persons, along with the beams, &c. on the heads of those becaust the gallery. Great confusion ensued, and there was a fear of greater mischief from panie; but the meeting was dispersed without further accident.

Liverpool.— On Saturday last five men were at work at a house in process of erection in Netherfieldwork at a house in process of erection in Nethernau-road North, when the portion of the building on which they were engaged fell down, briuging along with it the scaffolding and four of the men, who were partially buried amongst the bricks and timber, and were severely injured. The fifth workman per-ceived the danger in time to spring upon two firm joists, and thus succeeded in saving himself. One of the men was so buried amongst the bricks, which wedged him in on every side, that it took half an hour to release him, and in a few minutes afterwards the wall fell down. The house was to have been opened to release him, and in a few minutes afterwards the wall fell down. The house was to have been optued as a public-house. "Great blame," says the *Albing*, "attaches to the owner, the huilder, and, if we are correctly informed, to the building surveyor, inasmodh as the house, though of unusually large dimensions, and of three stories in height, had no foundation, being built immediately on the soft soil, while the outside wall, instead of being a 14-inch, was only a 9-inch wall. We understand that another house, in the some neit-bloomhood also came partially down on

several persons were injured, and considerable damage was ione to property. An addition to this extensive distillery was in course of being made by the creation of a malt hara about 300 feet long by 75 feet in breadth, and four stories in height. An iron roof was nearly finished, part of the supporters of which were pillars trising from the ground. Simultaneously the floors were being laid upon iron girders and briek arches, supported in part by the same pillars. The building was therefore to the fore-proof in every story. About a third part of the work of building the briek arches had heen completed, when, suddenly, something was heard to snan about the roof. Imme-diately the whole covering, and a great part of the internal structure, gave way in a series of crashes, and in a few moments there was little left except the exterior of the building, and a mass of ruins inside. About thirty or forty men were at work within the esteror of the building, and a mass of runs made. Ahout thirty or forly men were at work within the building, but they all escaped with life, escept one man, who was struck on the head by an iron beam, and almost instantly expired. Attaglin (Linerick).—On Thursday week the metal bilding correspond to Line and the state of the state of

Attigits (Linertoc).—On Linesary etect the messar bridge crossing the Linerick and Poyces Rallway at Attylin fell in, completely blocking up the line. The first train was within fifteen minutes of heing due at the moment the accident occurred, but it was fortuthe moment he acchient occurrent, but it was folder nately stopped, and 100 working a were set at once to clear away the rubhish. The loss will fall on Mr. Dargan, the contractor, and the expense of replace-ment, it is said, will he heavy. Fortunately no life was lost.

NEW SCHOOLS OF ST. THOMAS CHARTERHOUSE.

NEW SCHOOLS OF ST. THOMAS CHARTERIOUSE. Ow the 19th, these schools, situated is Golden-late, St. Luke's, and commenced in May hast, were for-mally opened by II.R.H. Prince Albert, who spoke admirally and with great feeling on the oreasion. Some effect is obtained in the building by the alter-nate use of red, black, and huff-col ared bricks. Out the ground story is the infant school, which is 60 feet by 29 feet, and 13 feet in height, to which is at the infant school helow, and hus leading from it a lecture-room 28 feet by 14 feet. The boys' school is on the top story, and is 67 feet by 30 feet, and 13 feet high at the sides, and 17 feet in the ceatre. The lecture-room attached to the boys' school is of the same dimensions as that on the first floor. There is a hase-ment story, containing kitchen, scullery, &c. and a heating apparents. The desks are constructed to accommodate 264 boys and a similar numher of girts, the side as do dask in the galleris for 372 infants, thus giving ample accommodation for 900 ebildren. There are also desks in the gallerics for 372 infants, thus giving ample accommodation for 900 oblidren. All the rooms are lighted with gas, which renders them very suitable for evening classes for adults, or those whose occupations prevent their attendance during the day-time. The total cost of building, fittings, see, with 2,2007, expended in the parchase of the site and the play-ground, was 3,4527. The build-ing was designed and constructed by Mr. Hesketh, the architect, who constructed the other schools of the district, which, with those just completed, are eapable of accommodating 2,500 pupils at one time.

ON RECENT IMPROVEMENTS IN THE MANUFACTURE OF IRON

A REPORT was read lately to the Fellows of the Chemical Society, by Mr. Abel, director of the chemi-cal est hlishment of the War Department, on the above subject

above subject. The first portion of the report was devoted to a consideration of proposals relating to the construction of the blast furnace, the application of the blast, the mixture of ores, &c. with the view to ensure uni-formity in the working of the furnaces; the prepara-tion and state of division of the ore, and its mixture with fuel and furxes; the economisation of fuel and heat. and the description of fuel enal. The eat; and the description of fuel employed. ast was considered to he a subject of much in The nterest last tast was considered to be a subject of much inferest from the circomstance that the very considerable iron resources of Ireland might he expected to rise to great importance, if the application of pest in one form or other, as the means of reducing and refaining the metal, proved as successful as was anticipated by rsons, whose attention had been devoted to the subject.

A review was next taken of the numerous plans proposed for effecting the reduction and purification proposed for effecting the reduction and purification of the metal in one continuous operation, none of which were considered as likely to compete success-fully with the present system of iron smelting. Allu-sion was also made to the system of producing refned iron or steel direct from the ore in the United States, in the so-called bloomery forges. The second portion of the report related to the spplication of other agents than those in general use in the manufacture of iron. After an examination into numerous proposels for

improving the ordinary refuing and pudding pro-cesses, patents were noticed in which water was made an agent in the purification or decarbonization of the metal, hy coaling its surface, when in a divided con-dition, and prior to its final treatment, with a covering of order of its and the surface and the surface and the surface for the surface and the surface and the surface and the surface of a subject in the surface and th

dition, and prior to its hual treatment, with a covering of oxide of iron. Recent patents relating to the production of steel from refined or wrought iron by fusion and by cementation, with the employment of particular cementing mutcrials and fluxes, and of contrivances for readering the cementing operation a continuous one, were uest noticed, and this led to the discussion of the scenario neutral brought out by Mr. Bessemer of the several patents brought out by Mr. Be for the production of steel and malle hle iron. Mr. Bessemer

of the several patents brought out by Mr. Bessemer for the production of steel and malle-hie iron. Other patents, such as those of Mr. Matvin, Mr. Parry, and Messrs. Len and Armitage, bearing upon the same principle, were described, and notice was taken of the effects of this particular mode of treatment upon iron. It was held that the results of experiments with Mr. Bessener's process, and of the chemical examination of his products, had not served to bear out the state-ments male by him in his paper read before the British Association last year. The report concluded by pointing on the great extent to which the padding process depended upon the skill and iadustry of the workmen, and by show-ing that this was sufficient reason to lead all interested in iron manufacture to cherish the hope that the con-tioned excitions of Mr. Bessemer and others who are now actively engaged on the subject, might lead to the successful application of the principle upon which was hased the process which had excited such general attention, so that the prophety of Mr. Nasnyth, that it would lead to a new era in a most important branch of our manufactures, might ultimately he fulfill d.*

SINGULAR PRESERVATION OF THE TOWER OF LONDON IN 1691. We are indebted for the following interesting extract to Mr. Lemon, the editor of "The Calendar of

State Papers :

State Papers :— "9 Jady, 1691.—Her Majesty in Councill having received ao account that hy the fall of part of one of the floores this morning in the White Tower, where the powder was lodged, about two thousand barrelis are fallen through and lye upon the next floore; and that the keeping of so great a quantitie of powder as at present is extreanly duagerous to the Tower and City of London, Her Majesty is pleased to order the Rt. Honble. Sir Henry Goodricke, Knt. and Bart. Licentenant Generall, and the rest of the princ pall officers of the Ordunuee, to consider of a fit place or places where the stores of powder may be conveniently lodged, as well for the security thereof, as of the Tower and City of Loodon."

The fact of a large flooring at occe giving way, and 2,000 barrels of powder being precipitated through to the floor below, without the least spark of fire occur-ring, is a next wonderful instance of preservation.

THE GOVERNMENT OFFICES COMPETITION.

COMPETITION. DEAR MR. EDITOR,—Pray put your head into Westminster-Hall, and see the official doings there for the fortheoming Exhibition of Desigus. The hall is being divided into small compartments, which some liken to sheep-peas, and some to cating-buse horse, but which will, I feat, considering the darkness of the hall, prove very slaughter-houses to the unfor-tunate drawings which may be committed to them. Pray give the officidis a jog, for Sir Benjamin Hall can have no wish to do otherwise than exhibit the designs well and conveniently. NEMO. designs well and conveniently. NEMO

* We understand that 192 British competitors We industrate that the for alread have yet to have sent in designs: these form alread have yet to be received. Some of the packages include drawings for the three competitions, some for two of them, so that the number of designs is of course greater than the number of competitors.

WREN'S MODEL OF ST. PAUL'S.

I PERCEIVE that some attention is at length being called to the model of Sir C. Wren's first design for St. Paul's, now decaying from want of care; little known, from its seeluded position, and no way ser-viceable, except as one of the twopenny sights in our great show eathedral.

great show eathedral. But it is surprising the architectural world does not seek for more than its restoration and improved position. It should be made known to the many who may have no opportunity of thoroughly inspect-ing it in its show-room, nor can I doubt hut the publication of a quarto volume, fully illustrating it, with plan, elevations, sections, and views, would repay

the manufacture of iron. After an examination into numerous proposals for Engineerjournal.

[MARCH 28, 1857.

the time and outlay of any competent person who night undertake it. In Elmes's "Life of Wren" there is a plan of the model—and a great provocative it is to the desire for more. In the hope that this suggestion may some-what assist in promoting a result alke beneficial to the fame of Wren and the cause of original design — I am. Ex-Architect. I am.

TENDERS FOR DRAIN-PIPES.

TENDERS FOR DRAIN-PIPES. Harrso regularly taken the Builder from the commence ment of its publication, thave always couldered it a pro-per channel for promoting the internet on the second of the second of the second of the second of the second expension and submet that were distrimented to its interests. Allow me, therefore, to call your attention to a practice as the of London, and to my surprise, there found at allowing the second of the second of the second as found to be exposed. A faw days since I inserted as pecification for work to be done as drainage, at the east end of London, and to my surprise, there found at allowing the second of the second of the second of the second of London, and to my surprise, there found at allowing the second of the second of the second of the regulations founded upon any peculiar ground, 1 am mobio to say, but if not, it was the most gratitions injury purchase of the part memory taries from 10 to 50 per cent, to reget as the second of the purchaser, as to freedom purchase, and I have seen fusiances where pipes have been used that would bare been rejected if from any other maker. A Construction.

RECENT BUILDING PATENTS.*

1755. CHARLES BUERRON, Regeot-street, London. — Warming Houses and other Buildings. Dated 24th July, 1856 — In carrying out this invention, air is led hy a shaft from the top of the house or other building to a chamber in the hasement, in which is a second by concerne or other reflectors. SO fire surrounded by concave or other reflectors, so arranged as to concentrate the heat of the fire to warm the air, and from this coamber the warmed air warm the air, and from this chamber the warmed air is conducted by turned pipes to the rooms or other places to be warmed. The air is forced down the shaft to the warming-chamber by means of a serce wor other instrument (in the shaft), which is put in motion by the force of the wind. In order to regu-late the amount of heated air discharged into the room or other place, a valve is employed, which is opened more or less by a self-acting apparatus, consisting of an arrange-curit of levers put in motion by the ex-pansion and contraction of a har of metal or other material exposed to the temperature of the room or material exposed to the temperature of the room or

pince. 1060. W. GREGORY.—An Improvement in the Construction of Roofing Tiles. Dated 5th May, 1856.—The patrutce forms in the arched 1-pping piece of each the (except the cave tiles) a recess or eng to receive the each of the arched lip of the ad-ionized the. This recess or cause he makes of a doubt cup to receive the ends of the arched hip of the ad-joining tile. This recease or cup he makes of a depth equal to the width of lap required for two adjoining rows, and the workman or tiler is thus provided with a gauge for fitting the tiles together. He also forms recesses at the opposite edges of the ridge tiles, so that they will completely overlap the upper edge of the top row of tiles at the opposite sides of the ridge, and 'produce a water-tight joint, which may, when desirable, be further secured by a thin line of montar or cement. or cemeut

or cement. 1777. JOSEPH PLATF, Audlem, Cheshire.—Door Knockers. Dated 26th July, 1856.—This invention consists in peculiar mechanical arrangements, by means of which the knocker is operated by a suitable handle on the outside of the door, causing a hammer or knocker to strike on the inside. The handles may or knocker to strike on the inside. The handles may be variously constructed to turn, or to pull out, or push inwards; and the hammer, knocker, or other alarum may be connected with the outside handle by springs, ratchet wheels, or other like contrivances.— Not proceeded with,

Not proceeded with. 1172. J. J. MEYER.—Improvements in Machinery for Mortising, Tenoning, Rounding, Sweep and Straight Moulding, Boring, Growing, and Mitring. Ducd 17th May, 1856.—These relate to certain com-hinations of parts constituting a machine in which the operations of mortising, tenoning, rounding, sweep and straight moulding, boring, growing, and mitreing may all be performed, instead of employing ceparate machines for these purposes, as herefolore. And a feature consists in an improved mode of form-ing the following cutting fools:—the mortising ing the following eutting tools :- the mortising chisel, the tenon cutters, the cross revolving moulding cutter, the mitre wheel or cutter, and the grooving cutter.

enter. J. BABBOUR,-Improvements in Saving Apparatus. Dated 23rd April, 1856.-The saw blade to he used is made in the form of an endless helt, which is passed round two pulleys, and kept properly stretched by serew or other adjustment, by which the bearings of the two pulleys can be separated more or less.

1769. ROBERT STEWART, Glasgow. -- Cutting Stone and other Mineral Substances. Dated 2od July,

* Gleaned from lists in the Mechanics' Magazine, the Engi

1856.—According to one modification of the improved apparatus, a suitable sole or bed is laid down for the traverse upon it of a carriage carrying the cutting tools, the stone to be ent being placed hemeath. The machine may be furnished with any convenient num-her of cutting tools, arranged in a line one behind the other, and following each other in the cut. The cutting action is made to take place by raising and latting fall a bar, which is of considerable weight, and causes the cutting tool to foreibly strike the stone, and so effect an increment of the cut. The cutting action be mored forward by heaven of stone, and so effect an increment of the cut. The earriage may he moved forward by haud, by means of a suitable lever connection with the running wheels, a similar reversion end of the training wheet, or a self-acting feed motion may be employed. In some eases the carriage may be kept stationary during a number of strokes, so that the ent may be made vertically downwards on the side of the stone, or at

Verticing unwarms on the state of the state of the any other part. 1805. GEORGE HOLCROFT, Manchester, and PETER JOINSON, Wigan.—Improvements in the Manufac-ture of Cenent, and in the Application of a known Material to Cementing Purposes. Dated 31st July, 1856.—This invention consists in manufacturing under the induce combined with state of expanse. content of sulplur consists in functionary any other suitable material; also, in the application of sulplur alone for cementing the joints of stones, or as a substitute for cement when used for any other purpose

1870. WILLIAM GORSE, Birmingham.—Improved Door Fastener. A communication. Dated 8th Angust, 1856.—This door fastener consists of a plate of metal inserted between the door-post and the edge of the door, the said plate heing secured to the door-post by the closing of the door. The plate carries at its projecting end a plate, arm, or bolt, which, being hrought against the door, prevents the said door from heing opened.

heng opened. 1885. JOHN CARTLAND, Birmingham.—Improved Door Spring. Dated 11th August, 1856.—This in-vention consists essentially of a beliacal or colled spring of steel, iron, hrass, or other wire, the said spring being acted upon in such a manner, by its connection with the door or door-hinge, that the said spring shall be colled or nacoiled at the opening of the door. The clastic force of the spring is exerted by a winding action, instead of a lengthening or shortening action, as is usual with heliaeal door-springs. springs

Books Receibed.

Practical Suggestions for relieving the Overcrowded Thoroughfares of London, securing improved Means of Locomotion, directing the Seusage from the Thanes, and appropriating it to Agricultural Use, Spc. By JOSEPH MITCHELL, C.E. Stanford, Use, Sec. By Charing-cross

Charing-cross. THESE practical suggestions assume the form of a letter to Sir Benjamin Hall, as chief commissioner of the Board of Works. The principal feature in the vast scheme proposed is the formation of a great street or road, leading in a straight line, or nearly so, from Kensington-gardens to Shoreditel. Station, with a metropolitan railway adjoining it, in a sunk track, and a main sewer under the railway, which latter it is proposed to unite on the north with the metropoli-tan railway already sanctioned by Pariament, and on the south with the South-Western and other lines, by hermede receiver the south-Western and other lines, by abrauch crossing Waterloo-bridge, on an iron way raised above the bridge. The proposed sewer, the projector remarks, would drain all Londou north of the line, and would be continued from Shoreditch along and near the Eastern Counties Railway, beyond the river Lea, where the sewage would meet that of the river La, where the service would meet that of the lower portion of the metropolis and that of the south side, as proposed by Mr. F. Foster and Mr. Bazalgette, and thence the whole be sent through the agricultural districts, and to the sea. Mr. Mitchell agricultural districts, and to the sea. Mr. Mitchell also proposes, in connection with his road scheme, the creation of a new palace in Kensington-gardeus, to be partly devoted to the national collection of art-works, and partly as a residence for her Majesty. The line of street and roadway, he observes, would inter-fere with no public buildings of importance : it would pass chiefly through property of inferior value, except the north side of Grosvenor-street, and would pass by and cross the celosures of several of the London resurces. Phase would be 70 fort of merimeners with and cross the enclosures of several of the London squares. Three would be 70 fect of carriageway, with footpaths 02 4 fect, on each side, or a width con-siderably greater than Regent-street, which is 50 to 514 fect wide, with lootways of 18 and 21 fect. The construction of Regent-street, one-and-a-haff mile in length, cost 1, 533,5827. The cost of the proposed new line of road, with abranch to the post-office, in all ($\lambda 090,552$), or with additional width of street, rail way, 1976,5305. All tional width of street, rail way, 1976,5305. All tional width of street, rail ton, 1,500,0007, or in all (not including three-and-a-haff millions, for the main sewer and whole drain-

THE BUILDER.

age), 9,978,7171 The estimate of revenue is set down as follows: -- Revenue of new street (ruled (ruled down as follows: — Revenue of new street (ruled hy known revenue of Regeni-street, viz. 39,000/), 97,5007. to which add 10 per cent. for additional attraction and thoroughfare, 97,507. ; revenue from railways, 180,0007, in all 257,2507. being nearly 3 per cent. on 9,978,7177. The sewage, if applied in irrigation, as at Edhaburgh, would, it is estimated, yield a clear revenue of 472,5007. or a profit of 262,5007. to which the author adds 287,2507. as estimated revenue from rents of new street and from railways, and remarks, that the 549,7507. of revenue derivable from the whole of these improvements, would be about 54 per cent. on the capital of 9,978,7177. required, forgetting, however, that in this sum the three-and-a-balf millions of first cost of the drainage is not included.

the drainage is not included. We have preferred thus occupying our limits with a condensed and brief abstract of Mr. Mitchell's a conducted and price assirated of MF. Mitteneri s scheme, without displacing anything by the insertion of any observations of our own, and will simply add, that even ten millions, if that sum would do it, might, as it seems to us, be hetter spent with the same end in view.

The Art of Valuing Rents and Tillages. Originally written by Mr. BAYLDON. Seventh edition, en-larged, by ROBERT BAKER, Valuer. London: Longman and Co.

BAYLDON on Rents" bas long heen indispensable with all concerned in the valuation or the management of land, and this last edition contains much that is

of land, and this last edition contains much that is new, especially with reference to the principle of Michaelmass entries and the valuation of property for assessment. It is the hest existing hook of the kind. Mr. Baker, in his preface, urges that it daily he-comess more and more imperative upon landed pro-prietors to give due encouragement to their tenants, by alfording them the utmost scenarity for the invest-ment of their capital, "not alone by removing such absurd restrictions in leases that hitherto have existed, but by giving scenarity the valuation for unachangted hut by giving security, by valuation, for unexhausted improvements."

It proposes the abolition of the yearly tenancy altogether, and the substitution of a lease for a term of one year, with clear clauses as to cropping and the mode of quitting.

Miscellanea.

DONCASTER NEW PARISH CHURCH .- A month or two ago it was found necessary, before proceeding with the tower, to appeal for an additional subscrip-tion of 10,000/. the funds obtained by the first sub-scription, amounting to about 30,0007. heing exhausted, tion of 10,000/, the funds obtained by the first ab-scription, amounting to about 30,000/heing exhausted. The unnout subscribed has now reached the sum of 8,600/. Although this is 1,400/, short of the money required for the completion of the eburch, it has been decaued sufficiently large by the building committee to warrant them in continuing the works of the church, which would otherwise have shortly been sus-pended. Arrangements have heen mode with Messrs. Warner for a new peel of hells, which will be cast under the direction of Mr. Denison. Mr. Dent has promised to supply a clock gratis for the tower. Mr. W. Foreman, of Surrey, has rebuilt the south chapel entirely at his own expense. LONDON ARMOSPHERE.—What a destructive agent is the atmosphere of London! 1 observe that the forman Catholic Church in St. George's-fields, hailt a few years ago by Pugin, is already wearing a most *aulumnal* aspect: its foliage is rapidly decaying, and in a few more years its erockets and finials will be numbered with the things that have been, and we shall then be enabled to judge what will be the effect of a fourteenth-century huilding deprived of those interesting excressences. Should they be equally dis-posed to erumile and fall off from the surface of the colossal structure in the same vicinity,—the Houses of Parliancent,—we shall have a somewhat alarning

poster to cruining and an our four iteration of successful to cruining ecolosis alternatore in the same vicinity,—the Houses of Parliament,—we shall have a somewhat alarming bill to pay per annum for new crockets. A considerashould have some influence in deciding on the sty and character of the future Government buildings. style ANTI-CORROSION

ROTTING OF GUTTA-PERCHA UNDER GROUND. An investigation has been made by Mr. E. Highton, into certain cases of decay in the gutta-

LECUBES ON ART-ÉDUCATION AT LEEDS.—Mr. G. Jackson recently delivered two lectures before the members of the Leeds Mechanies' Institution and Literary Society, "On Art-Education." The lecturer commenced by usserting that no nation had ever excelled Great Britian in the development of the abstract mechanical sciences, and that it might as truly he said that no nation had done less to promote the mational, social, and commercial importance of LECTURES ON ART-EDUCATION AT LEEDS .- Mr. y he said that no nation that done tess to promote national, social, and commercial importance of arts. This could not be attributed to any want that that it much rather he taken as a demonthe the arts. the arts. This could not be attributed to any want of falert, but it might rather be taken as a demon-stration that the old proverb which said that two things could not be done at the same time would apply to nations as well as to individuals. Attention had begun to be directed to the importance of art, and to the national necessity of it being encouraged. It would, therefore, be his object to point out what constituted the elements of art, and how to impart a constituted the elements of art, and now to impart a knowledge of art. Mr. Jackson's second lecture was devoted to the consideration of the necessity of the principles of art forming part of all systems of elementary education. CRESTAL PALACE DISTRICT GAS COMPANY.—At

the third annual general meeting of this company, on 3rd inst. it was announced in the directors' report 3rd inst. it was simonneed in the directors³ report that during the last year the number of private con-samors had largely increased, new rollway stations had been lighted, and public lighting had been commenced throughout the district. In 1854 (helf-year), the gas ronta), it was stated, was 1,736/. 16s. 11d.; for the entire year 1855, 5,078/. 8s. 8d.; and in the year now passed, 1856, 6,535/. 19s. 11d.; and it was estimated that the company are now in possession of a gas rontal of nearly 8,000/. per annum. The profits on the year amounted to 2,207/. 8s. 1d. out of which a dividend was declared on the naid up expiral of the

on the year amounted to 2,297/. Ss. Id. out of which a dividend was declared on the paid-up capital of the company at the rate of $5\frac{1}{3}$ per cent. per annum, leaving a free halance to be carried to the profit of next year. INDECATE TURES—WITE b. Looker, jun. of Nor-hiton Pottery, Kingston-on-Thames, has forwarded to us specimeus of some new "Indicater Tiles," which be has introduced as a suggestion for marking the new Postal Districts ("E C," "W C," & C.). They can be media of any size or them or the new the next new Postal Districts (" E C," " W C," &c.). They can be made of any size or shape, and in any descrip-tion of earthenware. The specimens forwarded are composed of ordinary tile elay, and the letters are coloured with a permanent vitrified black. They are rather rough and imperfect, however, being the first he has made. They are 9 in. by 6 in. (the length of one and the depth of two bricks), for the facility of fixing in a wall, and can be produced and sold at something like 60. each.

of fixing in a wall, and can be produced and sold at something like 6d. each. UVBLIN.—The foundation stone of the now church of St. Patrick, Celbridge, was laid on Sanday in week before last. The architet is Mr. J. J. M'Carthy, and the design is Erly Gothie. Mr. R. Farrell, of Dublin, builder, is the contractor. The site is at the rear of the present parish chapel. The new church will be 130 feet in length, and 60 feet in width. It will comprise nave and side aisles. At the end of the north aisle will he placed the chapel of the Sacrament, and at the termination of the north sisle will be creeted the chapel of the Virgin. The great oriel window of the clurch will be a toplet of stained glass. Another end of the edifice will also have an illuminated window, the designs of each being com-memorative of some great event of Gospel bistory. The building will he of solid limestone, with Gothie front and helfry. The interior will be completed with open woodwork roof, and with the usual Early Gothie desourtions. The church of St. Catherine in Meath-street, now furshed, and the church of St. Saviour in course of completion, were designed by the same architet. same architeet.

THE SOCIETY OF ARTS' EXHIBITION OF INVEN-TIONS.—This exhibition is now open to the public, and will continue to he so till about the end of May. By next week the arrangements will be more matured, and the articles exhibited more numerous than at present, and we shall then take an opportunity of noting some of the more important and interesting features of the new exhibition.

features of the new exhibition. GOVERNMENT ARTISANS AND EMIGRATION. — Upwards of 2,000 workmen in various departments of Woolwich Arsenal, having received notice to leave, in accordance with the reductions in the last army estimates, a memorial has been adopted at a large meeting of the men, and forwarded to Lord Pannure, strongly recommended by the heads of the depart-ments, praying the Government to grant a free pas-sage for themselves and families to the Canadas, Australia, or elsewhere. The memorial, it is said, has received the favourable consideration of the War Office. Off

ENCAUSTIC TILES TURNING DULL .- Having the ERADURIC TIES TURNING DULL — Having the foor of a haleony of considerable length laid with Matton's tiles a few years ago, I find they became very dull at all times except when wet. Perhaps you, or some of your readers, could inform me if anything could be done in the way of glazing or varnishing them, so as to improve their appearance?—F. K. LIVERPOOL ARCHITECTURAL SOCIETY .- The twelfth

LIVERPOOL ARCHITECTURAL SOCIETY.— The twelfth meeting of this holy was held on Wednesday, the 18th, when the chair was taken by Mr. James Hay. Mr. Jense Hay. Mr. Description of Pickering Church, with reference to the Principles of Decoration." Sr. HLEN'S, BISHOTSOATE.— During the last few days a house, sapposed to have been huilt in the reign of James I. adjusting to this interesting specimen of charch architecture, which escapad the Great Fire of London, has been pulled down, by which means many points in the exterior of the south choir, which had been ruthlessly blocked up, have been brought to hight. Amongst other discoveries, a window has been laid open, the greater part of the mullions and glazing light. Amongst other discoveres, a wholew has been laid open, the greater part of the multions and glazing of which remains entire, as they were covered over with plaster when the charch was made the porty-wall of the adjoining hous. Several windows of Norman character have also heen discovered. Expressive Description Works at Norman

Norman character have also here discovered. EXTENSIVE DRAINAGE WORKS IN NORMER.— The drainage of the northern part of Norwich was again discussed in the Local Board of Health, on Tuesday in last week; the reports of the surveyor and of Mr. Donaldson heing placed in the members' bands. From the surveyor's report it appears that with a view to the ultimate diversion of the whole of the sewage of the city from the river, be has so arranged the several lines of severs as to secure but one outfall for the whole drainage of this north-ern district, at a spot most convenient for extending the sever to an outfall beyond the limits of the eity. but one outfall for the whole drainage of this norther district, at a spot most convenient for extending the sever to an outfall beyond the limits of the city. The system of drainage consists of one main sever, two collateral severs, and tweuty-nine tranch severs, two collateral severs are total length of 7,314 fet. In two collateral severs are respectively 1,818 feet and 4,462 feet in length. From the main sever there are mineteen branch severs, in all 8,462 feet in length; from the first collateral severs second collateral severs six branch severs, 2,111 fet in length; from the first collateral sever second collateral sever second collateral sever six branch severs, 2,111 fet in length. How over the second collateral sever six branch severs, 2,111 fet in length. These works must be executed with borrowed money, to be repaid by instelments in thirty years, heing a fraction over one penny in the pound on the assesshell property in the city, or, an additional half-penny rate in the solution of the severe of the unreports approves of the unreports of the triver, should be serviced and board board severage deposit in the river, should be serviced by the severage constituent of sevage deposit of proventing the accumulation of sevage deposit in the first, of own the site. The roommends that the server constructors Eastand. The Barding for the Board works, —the Board at the same time reserving the brower and brow the street. The section of the forms of the discussion of the form of the discussion of the discussion of the discussion the direct of the Board works, —the Board at the same time reserving the Board at the same time reserving the brower and the discussion of the forms of the discussion of the discussion of the form salt on one process the same thread of in our process. The brower the salt in center the disk in our process of the discussion of the discussion of t

on the surface. LLUMINATED CLOCKS.—Having read some letters in your paper about illuminated clock faces, it appears to me that the figures might he formed of gas-pipting, which might be pierced for jets, and so hecome figures of fire at night .- PARTHENON CLUB.

ARCHITECTURE AT SYDNEY .--- The foundation-stone ARCHITECTURE AT SYDNEX.—The foundation-stone of a mansion to be erected at Rose Bay, new Sydney, New South Wales, for Mr. Daniel Cooper, speaker of the House of Assembly there, has been laid by the Governor-General, the Bishop of Sydney having sail a prayer over the stone. The building is to cost 100,000. of which sum, says a Sydney having sail cost architects, Mesrs. Hilly and Mansield, will have a share of 10,000.

MONUMENT FOR EDGCOTT CHURCH .-- A MODUL MONVMENT FOR EDGCOT CHICKEL - A MONIMENT, to the memory of the late MRS. Cartwright, of Ayabae, has just been executed by Mr. Grimsley, of Oxford, scalptor, from a design furnished by him. The monu-ment, which is in Caen stone, is in the Decorated Gothie style of architecture, and consists of three niches: the large one in the centre is filled with the tablet, and in each of the other niches is the figure of tapier, and in each of the other nucles is the higher of an angel, modeld by Mr. Grinsley, sen. The monn-ment, says the Oxford Journal in speaking of it, differs materially from those ordinarily executed, inas-much as it is a brapy combination of architecture and aculture carried ents as as to justify its occupying a high position as a work of art.

THE BUILDER.

GAS.—The directors of the Southampton Gas Com-pany have reduced the price of their gas, to 5s. a thousand cubic lect.—The Margate Gas Company have declined to accede to the dermunds made upon them and determined on at a recent meeting of gas consumers, unmely, to charge 45.6d, per 1,000 fet in-stead of fis. with a better supply and of better quality.

THE LATE MR. PLAYPAIR, ARCHITECT. - The Edinburgh Courant says, - We have to record the death of the greatest of our northern architects-the death of the greatest of our northern architects---the man who, more than any other, has filled the Scottish capital with inconuments of his gcuins. William Henry Playfair died on Thursday, 19th inst. after a long illness, which had for some years paralysed his limbs, and for the last day or two made him insen-sible to everything. Mr. Playfair was horn in Lon-don in July, 1759. He came of no undistinguished stock. His father was an architect of note in his day, although his reprutation has low hean charged by the stock. His father was an architect of note in his day, although his reputation has long heen obscured by the hrighter eminence of his son; and his uncle was the eclebrated mathematician and natural philosopher, Professor John Playfair. He had the advantage of being edicated under the roof of the latter, at a time when Lord John Russell was not the only pupil of mark whom it sheltered. At a subsequent period he accompanied his uncle in that continental tour which occupied the closing years of the geologist's life. STRIKE or MASONS NEAR SOUTHARPOON - The

STRIKE OF MASONS NEAR SOUTHAMPTON .- The STRIKE OF MASONS NEAR SOUTHAMPTON.—The large hody of stonemasons employed at the works of the Victoria Hospital, Hamble, are under strike, and maintained by the General Society of the Trade, each man receiving 14s. a week. The men, according to the Hampshire Advertiser, desired to leave work on Saturdays oue hour and a half earlier than usual, to enable them to get home to Southampton and other distant places; but with this the contractor stated that his contract did not permit him to comply. GUEDSNY HARBOUR WORKS.—The contract for

GUERNSEY HARBOUR WORKS .- The contract for the new works at Guernsey Harhour, according to the new works at Guernsey Harnour, according to the Jersey Times, has been virtually assigned to Mr. Coult-hard, whose touder was much lower than those of Messra. Le Gros and Gallichan and the other com-petitors. "The doubt," says a Guernsey paper, "which has been entertained as to whether Mr. which has been entertained as to whether Mr. Coulthard understood his own husiness was entirely dissipated by an examination of his figures. It was found that, where labour and materials were estimated, these items were set down at higher figures than in the other tenders, and that the saving which enables him to tender so much helow his competitors was to be effected by the modern appliances of mechanical science, which formed up part of the other plans."

SCHOOL OF ART FOE READING .- A public meet-ing was held in the Townhall, Reading, on Wednesday We was held in the rownan, reading, on weaheday evening before last, for the purpose of receiving a re-port from the committee (appointed at a meeting held about three months back) of their proceedings in arranging the preliminaries necessary to the stabilis-ment of a Government School of Art in Reading. It is a superior to the apple actional he nether was resolved nonuinously that such a school be torth-with formed in Reading. The president, vice-presi-dent, treasurer, and committee, were then appointed.

THE IRON TRADE IN SOUTH STAFFORDSHIRE. THE IRON TRADE IN SOUTH STAFFORDSHIRE.— The trade here continues steady, and the idea of changing prices at the preliminary meeting has never been entertained. The reduction of the import daty on iron in America from 30 to 24 per cent. news of which has arrived, will, it is helieved, have an im-portant influence on the American demand, as it will amount in round numbers to 10s. per ton on fluished iron. The reduced daties, however, do not come into operation ill July

iron. The reduced duties, however, do not come info operation till July. THE "TIME O' DAY."—A correspondent, "G," suggests a revolution in time-telling, which, we agree with him in suspecting, is not very likely to be adopted,—namely, to make the bands stationary and the hours and mioutes to pass by them with a regular and continuons movement, the figures heing all up-right and parallel. The immense allvantage of the present method is, that the time can be inferred at a clagone from the uper correctived aspect of the clock. right and parallel. The immense anyahoge of the present method is, that the time can be inferred at a glance from the mere geometrical aspect of the clock-face intersected by its changing hands, and at dis-lances even beyond those at which figures, however hold and distinct, can be readily seen. Our corre-spondent's object appears to be the obviation of the great weight of the hands in such a clock as the Westminster Palace one, and the prevention of any necessity for 7-inch junips, such as the minute-hand will take. It is perhaps doubtful, however, whether the public would thank our correspondent even for the osnitute a never-failing source of curiosity and interest, not only to country cousins, but to the Metropolitans thermselves, and will far outvie the Wonderful fact that every time the stone lion at Nartin's strike one, he invariably wags his tail. The 7-inch jumps will he a real and *bona fide* wonder, that need not long he waited for by any one, when they are once set a-going. they are once set a-going.

[MARCH 28, 1857.

CARPET SWEEPER .- The Scientific American CARPET SWEEPER. - The Determine Subjects to scribes a carpet-sweeping machine, exhibited at the fair of the American Institute in New York. It con-sists of a small hox, in which there is a revolving fan that sucks up all the dust and dirt, and carries it into a small compartment containing water. The woollen fibres and larger particles are deposited in a drawer. The sweeping is done by pushing the hox over the surface of the earpet by handles. The woollen

The Builder.

LTHOUGH the question of architects' remuneration appears to he placed-so far as Government works are concerned-in a more promising state, hy the conditions for the public offices competition, than it was left in by the Treasnry, at the cousummation of their treatment Sir Charles Barry-by which he was made to forego a large pro-portion of the amount of his fair claims,-it cannot be held as at present adjusted satisfactorily,--having regard to professional inte-rests, or to the national interestswhich equally are involved in the question-and the cultivation and advance-

ment of art. The Government has reverted to the principle of payment hy a commission of 5 per cent.; but complaints reach us from the country, showing that-as it was feared would be the effect-rates of remuncration hy other parties are offered, for which it must, before long, prove impossible to command the qualifications expected-much less those which the real duties of an architect require

Where artists deal with the British Government, the case of Sir Charles Barry may show what is the minute precision in agreement which they must take care to have attended to, for their protection. The reader of Dickens's tale, who is puzzled to know what particular office of those about Whitehall and Downingstreet, is the Circumlocution Office, should refresh himself with the papers on the case in question. He may be the snecessful competitor, employed at the rate of 5 per cent. upon the outlay, on the buildings now proposed ; but, no matter what extra services not connected with the structural outlay, he may he called to reuder, he will he denied his rights, and told he has got to the wrong office. This is, we regret to say, the simple and necessary conclusion.

Now, it may save much trouble hereafter, if those architects whose designs are selected will consider what they have to guard against. In treating themselves fairly, they will take one step, at least, to serve the country also.

The case of Sir Charles Barry shows that an amount of miscellaneous service,-extending over twenty years .- to some ten thousand pounds in value, — including services such as the preparation of plans and reports, interviews, superintendence of work, and expenses connected with the arrangement of papers and records; similarly, plans, reports, attendance, and expenses called for hy auy royal commissiou appointed in regard to decoratiou of huildings with works of painting and sculpture; "voluminous and elaborate returns to Par. liament," with attendances on committees and debates, correspondence, and so forth; persoual direction of works of unusnal character, beyond the sphere of a contractor; negociations for purchase of materials, and of easts forming part of a museum of great and *permanent* value to the country; designing and re-designing each portiou of a comprehensive range of huildings, to suit the ever-varying orders of committees, fixed remuneration; preparation of documents,

commission,-may be demanded of the archi- cau e, are placed surrounded with objects of a compensation whatever he given him for them. He may have defrayed heavy costs ont of pocket, whilst instalments to him are far iu arrear, yet will get no allowance of interest on the one Verily one must have a ground or flie other. fortune and large capital to begin and support a calling where so much is made to depend on length of purse. Is that a position in which should remain a profession requiring very different qualifications for its objects and real sphere of influence?

in the case of the Crimean Commissioners,-the country is, by the conduct of its Government, made to appear willing to reap advantage, and yet to offer any quibble in lice of compensation. The public have, ordinarily, no time to master " Parliamentary papers ;" they leave the public honour and ciedit in the hands of those who administrate; but they recognise no distinction in their debt for services whether rendered to the order of one "Department," "Board," or "Commission," and another. On the ground of such distinction, however, the Government appear to bave acted in Sir Charles Barry's case, when they refused the claim for services conneeted with the arrangements for the public records, and with the Fine Art Commission ; or ou the ground that the services were, in the former ease, performed without competent authority, and, in the latter ease, rendered at the instance of the Royal Commission, who ought to pay, and not the Treasury.

Such is the position that architects must, for their own sake, and for the national credit and the desired advancement of art, assume may he theirs. We say the question is pressing, as a national one ; for it is now that has to he decided the issue in our art and science, which will hecome manifest only after an interval of years.

Are we called to show the connection of architecture with progress in every relation,social, moral, or intellectual ? If, now, we need not do this, we ask,-is it desirable that there should he an educated body of men-- oue qualified to further these grand objects ? Everywhere we can discover growing, evidences that architeets are disposed to take an extended view of their calling; and of the necessity which there is, towards a due acquittance of their responsibilities, that there should be a great improvement effected in the resources for professioual education. It will be impossible, however, that the progress can continue as desired, unless by the public there are furnished at once the obvious required returns of industry, aud means which are also in some measure required, to assist in supporting the pursuit of the educa tion. In the nature of an architect's study and "mission," ever constaut growth of knowledge is a normal and requisite condition. The man in such a sphere who ceases to learn and to receive external impressions, ceases to act, or to fill worthily the measure of his high calling. Hc must he not only arduous in the pursuit but judicious in the choice of studies when young ; but also, he must preserve the means of continuing them. Need we say that such an individual should be surrounded with books and all the appliances for study; that his bouse should be adorned with taste-for the iufluence upou him,-no less than the houses which he designs as the means of influence upon others. If the impressious produced hy heautiful objects are worth seeking for in every home, art of some kind deserves to have visible provision in the of constantly extending their sphere of knowcommissioners, and departments, four times ad-lier of an artist. There should, indeed, he ledge. So far as it may be that the range of over, or any number of times, for the one art and heauty everywhere, — in a palace or a architects' education hears no relation to the fixed remuneration; preparation of documents, labourer's cottage; a mausion or a model lodg- area and comprehensiveness of the field, the attendances and expenses in resisting claims ing-house; a suburbau residence or a place of feeling of the profession itself now tends in the and legal proceedings; all these, and any other husiness; a suite of apartments or a single same course of opinion. But the plain reason services,—though leading to no outlay on the office-room. Yet a considerable proportion of of what leads to an imputation, is the difference building, and therefore bringing no return by the number of architects in practice, from some in the circumstances of the professions (if we

tect over and above his ordinary duty, and no character which are incentive to the production of ugliness and want of propriety, rather than of beanty and good taste in their designs.

Such, it should be allowed, is the present influence of mechanism and manufacture, that the very means which should serve the exten sion of art, are not yet understood so as to be made to operate much otherwise than in the dissemination of bad designs and pernicious principles. A very plain article of furniture, or adornment, costs more to execute than a manufactured article, elaborately " ornamented ; "-By a course such as we have referred to,—as the case of the Grimean Commissioners,—the pense," presents itself for the nonce, at a dis-puntry is, by the conduct of its Government, tance unattainable, save with great trouble ade to appear willing to reap advantage, and at to offer any quibble in lieu of compensation. the objects to be provided, for association with the pursnit of the practical husiness of an archi tect, more difficult of acquisition ; but the amendment desired would uot render needless a continued cultivation of taste through similar agencies. We might regret to see our profession imbucd with the mere passion for collect-ing: such a "taste," though it may afford service to others, is in the subject or victim of it, hardly consistent with the practice of art, even though accompanied with a feeling for the heautiful. But, much on the part of the archi tect will be always required, towards fostering his art-spirit, by immediate association of heautiful objects with his daily observation and thoughts. His home should be in its sphere, a constant hook of reference-though, perhaps, intelligible to him ouly; it should be the sphere where whilst securing his own comfort and repose, he should be able,-by practical experiment, if need he-to study contrivances for domestic couvenience, and new effects to be worked ont on another scale, or under different circumstauces. It is no mere fanciful assertion that the public gain would be great,-even through the agency adverted to,-from any improved worldly position of architects. So far from reducing the emoluments of the profession, it were much to he desired that these could be made such as to induce a larger infusion of taste into the class of houses in town and suburbs, where art is most needed, and architectural design is seldom afforded. Some visible demonstration is wanted of the fact, that beauty is quite attainable with moderate elaboration, or rather without what now pass for ornaments, -that the walls of rooms may he plain, fireplaces and furniture, and carpets, composed with few elements of form or surface-pattern,and yet that a hetter effect may be produced than through the aid of the mockery of art, which now holds place solely through dominance of fashion. We believe the improvement would be easily made; and that the body of our own professiou could, and would effect it, either by the example of their homes, or the application of gains in the mode of investment which they would choose-that of erection of honses on private speculation.

But whatever may be thought of one view of the public gain, the condition of art in architecture generally, cannot improve, if what supplies hoth the means and the reward be denied. What can be the reason of the difference of which publishers complain, betweeu the sale of books to architects and engineers? We have heard it said that architects did not buy books, the intended inference being that they did not care to pursue the course-which we have spoken of above-

Vol. XV .--- No. 739.

must for the moment treat them as separate) of must for the moment treat them as separately of engineering and architecture. Engineering is, we believe, generally far less comprehensive than is the profession of architecture. The requirements to be provided for, and the elements for consideration, in designing a headron or areas a window over the superhead harbour, or even a railway, arc, we apprehend, much less in numher or in character of complimuch less in human of an oblighted of the cation, than those in a house. The bulk of the contractor's work is great, but the design and contrivance bear no such relation to it, as in the architect's branch. The greatest skill is called are needs induce. The greatest skill is called into play; ycf, from the restriction of the field, the knowledge is nearer in proportion to the de-mand. It may be conceded that great results have been attained—extending the domain of science, as of its applications to the wants of science, as also it may be cheaved that there society, —as also it may be observed that there have been some errors, such as where architects are concerned are heavily visited upon *them*. But the real reason of the difference imputed is the very simple one, that 5 per cent. on "eugineer-ing works" is worth vastly more than 5 per cent. mg works" is worth vastly more than 5 per cent. upon practical architecture. In the architec-tural profession the 5 per cent, pays so ill, that the majority of building works are necessarily eschewed by the profession; whilst engineers, either in subordinate or chief positions, readily wine a generative and the second sec gain a competence and sometimes secure large fortunes. Thus the engineering profession "patronises" the literature of its pursuit; any "partonises" the interactic of its putshit, any good work can commond a sale; a vigorous and useful society is maintained; and so, an ever-growing stream of knowledge aud progress is kept up. To place the architectural profession in the same vantage-ground, or to extend it downin over the prog which architect extend its domain over the area which architec-ture—the art—includes, may be more than we can at present find the way of doing ; but architeccan at present mat the only of only in the progressive as art, or tend to the public good, if the inducements to the *profession* become less. We do not say that "architects" will not be found, ready to undertake works at almost any rate of remn-neration, for such appears to have been the ease, according to statements in our columnus; but the educational standard, instead of rising will become gradually reduced, and in a few will become granuary entode, and it whose years some intelligent reviewer of our archite-ture will discover that things have by small steps of decadence got greatly worse. The means to avert this unfortunate result.

must be an extensive dissemination amongst the public, of knowledge of the real nature of the architect's pursuit and calling; and the performance at this juncture by the Government, of their great duty, calculated to secure the in-terests of all, and to have the force of example. Corporate bodies, and private individuals-though Corporate bodies, and private individuals—though under particular views derived from some sec-tion of architectural students, rather than dis-cerning the real extent and nature of architec-ture as a study, or a pursuit—arc likely to miss their aim from other reasons than the desire to risk the cousequences we have adverted to.

You can no more improvise the resources of architecture than you can the mutériel of war it takes many years to grow an architect as it does to make a soldier. Let not, therefore, the nation find itself unprepared for any peaceful campaign that the future may require: let it not find, when the need of art is felt, that the means to produce it have passed away, through neglect and the effects of ill-requited labour. It will be for the Government to show the way, and set the example,-by a course of treatment liberal and different to that adopted in the case of the works of the Honses of Parliameut, which extended over so loug a period, and involved questious unusually complex and difficult in their character; and by the conduct of which, art in this country has received great advantage. It will be recollected that after considerable

discussion and delay, Sir Charles Barry was compelled to assent to terms including 3 per cent. on the ontlay, I per cent. for measuring, and an amount for services in connection with the warming and veutilating. The great amount the warming and reutilating. The great amount of extra service cannot be considered as included in the sums allowed, in any adequate manner, though eventually the principle was virtually admitted by the Treasury in the reasons which they gave for sanctioning the full 1 per cent. for measuring,—which, according to their view, allowed a sum for the extra services.

Not only the 5 per cent. should have been allowed, but all the other claims,-since they were just, and consistent with the precedents so often appealed to. In the "Statement of amounts of professional re-muneration paid to architects by the Govern-ment on account of various public huild." And thus it was with Rome. "And thus it was with Rome. "And thus it was with Rome." numeration paid to arcintects by the Govern-ment ou account of varions public build-ings, prepared at the Office of Works for Sir Charles Barry in the year 1848, by which it appears that his claim of 5 per ceut, with refer-ence to the New Palace at Westminster, is fully justified by weeedent in the area of these profi chec to the New Palace at Westminster, is fully justified by precedent in the case of those archi-tects who have undertaken the same duties as have been performed by himself," it is observed that "prior to the year 1815, when the appointments of attached architects to the Board of Works first took place, and subsequently to the abolition of those ap-pointments in 1832, up to the present time, when both the architectural and financial duties of the profession were undertaken by the several of the profession were undertaken by the several architects employed upon public works, the professional allowance has been invariably five per cent, upon the outlay. It was only during the existence of the appointments of attached architects to the Board of Works, when that Board undertook the financial part of an archiboard undertook of emandation part of an archi-tect's duties, that the professional allowance was three per cent." This is clearly shown by the tabular statement and notes, in which the remuncration is never under five per cent. where remaneration is never timer new percent, where the measuring, valuing, and adjusting accounts were effected by the architect. Indeed, Sir Charles Barry's representations were rather within than in excess of the facts. Within the very period-1815 to 1832-above referred the very period—1815 to 1832—above referred to, or from 1825 to 1830, Mr. Nash received five per cent. Similar allowances in excess were made in other cases. The cases quoted by "My Lords" were really not precedents ; for the only point made out was that from 1815 to 1832, it was the practice to relieve architects of Government works, of a portion of what might be their labour, and in such cases to allow them a lower rate. The Trensury hy onotine such cases lower rate. The Treasury, hy quoting such cases at all, as by the conrse which they adhered to in at all, as by the conrise when they antered to in Sir Charles Barry's case—giving him a reduced per centage for the regular duty of an architect, and denying compensation of any kind for the onerous extra duties required from him—bave simply shown that it is not their babit to apportion labour and its remuneration with any relation to one another.

The conditions for the Government Offices competitiou, as we have remarked, leave some of the chief points still open for a course similar to that taken in the case mentioned. Architects may therefore feel interested in the particulars of another case (to which we shall refer next week), showing remuneration which was given to one of the Government architects, even during the time so often mentioned, when there were architects attached to the Office of Works.

BOME.*

"As rivers flow into the sea," says Niebnhr, "so does the history of all the nations known to have existed previously in the regions round the Mediterranean terminate in that of Rome. Many appear in it only to perish forthwith. Others maintain their existence only for a while, mostly in a struggle, but the contact sooner or later proves fatal to them."

The peculiar circumstances that made Rome, The peculiar circumstances that made Kome, surrounded as she was by enemies from the noment of her birth, rely upon her arms for very existence, occasioned that element of valour in her composition, which, born of necessity, ripened in its maturity into that thirst for con-quest which could only be allayed by an un-limited possession. Thus did she hasten on from conquest in connects until in the herity limited possession. Thus did she hasten on from conquest to conquest, until, in the begin-ning of the Christian era, she had gained the ning of the Christian era, she had gaihed the dominion of the known world, when, after a glorious existence of a thousand years, paralysed by the degeneracy of her rulers and her armies, she succumbed to the harbarians she had once despised, and who founded fresh empires upon

And thus it is that the monuments of the most absolute nations, the trophies of the widest spread dominion, seem destined by a moral

Her resurrection; all besides, decay." He who surveys from the similar of the tower of the capitol the undulating and wide-spread plain of the Campagna,—beholds the secnes of the latter portion of the Eneid—now trackless wood and swamp, and contemplates at one glance the lands of Etruria, Latium, and the Sabin_.—where the Sabini .--- where

" Cultor Latii, per opaca silentia Tibris Labitur,"

the former country being divided from the two latter by that river as it follows its conrsc from Soracte to the Auio, from the Anio to the sea; sees the mountains whence the Anio draws its source, thence in its course to the Tiber dividing source, thence in its course to the Arber dividing the territories of the Latins and the Salunes; he who revels in the glowing tints of the Campagna, contrasted by the deep blue shades of the Alban hills on the south-east, on the bighest summit of which, now called Monte Cavo, stood the temple of Jupiter Latinits, to which, by the via numinis, the sacrificial procession yearly ascended to celebrate the *feriæ Latinæ*, and midway hetween its summit and the plain, Albano, or the more distant Algido, with its midway hetween its summit and the plain, Albano, or the more distant Algido, with its caves of snow, as allholed to by Horace; de-scries the sites of Alba Longa, the eity of Ascanius, and Tusculum, sacred to the im-mortal Cicero, and Colonna, built upon the ancient Labienn, and "*frigidum* Præneste," now Pelestrina, favoured retreat of Angusius, and the lake Regillus, famed for the fatal defeat of the Tarquius, and Collatia, hallowed by the memory of Lucretia and Roman liberty, and Lamvium, so often confounded with its neigh-bour Lavinium; or, bearing to the left between the Alban and Sobine hills, the village of Zagorolo, until, quitting the range of hills so barren and monotonous, the eye once more reposes npon beauty and verdure in the olive-grounds and woods of Tivoli, and from which point towards the north, the view of Etruria beyond the Tiber is intercepted by the Jani-culum, Vatican, and Monte Mario; whoever, we say, contemplates this varied scene upon a cloudless day, receives into his soul an amount of inspiration from the *genius loci* thm uust fit him the better for his after-task of critical investigation. Turning to the south, we verify the description of Martial, thouch by him in subless the description

Turning to the south, we verify the description of Martial, though by him in allusion to the view from the Janienhum, as we trace the outline of the seven hills there spread out before us :-

" Hinc septem dominos videre montes Et totam licet æstimare Romam."

In the foreground, on one side, are the ruins In the foreground, of one state, at the tails of her nighty monuments, when Rome swayed the sceptre of the world; on the other, the churches and palaces of the modern city; the capitol standing, as it were, between the living and the dead, separating the City of the Popes from that of the Casars. The follows of the assurance of nernetual

The fallacy of the assurance of perpetual empire, as ascribed to Jupiter in his celebrated address to Venus, by Rome's greatest epic poet.-

Hic ego nec metas rerum nec tempora pono ; Imperium sine fine dedi,"---

comes vividly to the recollectiou, as we behold those masses of ruins, so mighty in their deso-lation, that wide spread Campagna, once thickly studded with flourishing citics, now devoted only to the pasturage of cattle.

More true was the prophecy of Virgil's great lyric contemporary, Horace, where, in reference to the increasing luxury of the Romans, he says,

" Jam pauca aratro jugera regiæ Moles relinquent; undique latius Extenta visentur Lucrino Slagna lacu; platanusque cælebs Evincet ulmos."

In the few brief observatious we propose making upon the subject of Rome, nothing is further from our intention than to attempt to recoucile discordant theories, or to adjust the differences between the German and Italian schools of topographers, -the adherents of Nie-huhr, Bunsen, and Becker,-Nardini, Nibbi, and Canina

endeavour to condense into a few columns the descriptions of fora, palaces, temples, theatres, amphitoactres, baths, aquednets, bridges, walls, gates, arches, columns, tombs, and the numerons other objects of antiquity, the details of many of which have individually occupied volumes to discuss, and employed whole years to investigate.

Our intention is to confine ourselves to the our interaction is to comme ourserves to the most salient points, looking to, amongst other anthorities, the article on this subject from the pen of Mr. T. Dyer in Dr. Smith's Dictionary already referred to, and making such observations and suggestions as may arise in the consideration of the question at issue.

The Tiher, in an irregular course of nearly three miles from uorth to sonth, divides Rome into two nnequal parts, the larger of which— that upon the left bank—comprises the seven is the Mous Pincius, not included in the ancient eity, but a portion of which was enclosed in the walls of Anrelian. Within a short distance of the easternmost point of the Tiber rises the Mons Capitolinus, the smallest of the seven, Mons Capitolinus, the smallest of the seren, though the most renowned. Almost tonching it, and the most northern of the group, is the Collis Quirinais, being in fact, together with the Collis Viminais, which lies to the cast of it, offshoots of the Mons Esquilinus, the most easterly of the group, and the two tongues of which were formerly called Cispius and Oppius, but afterwards considered but as one hill, in order not to exceed the prescriptive number of seven South of the Keauline lies the Mone seven. South of the Esquiline lies the Mons Cælius, the largest of the seven, and to the west of that is the Mous Aventinns, the next in extent; and almost in the centre of the entire group is the Mous Palatinns.

On the right bank of the river are the Montes Vaticanus and Janiculus, of a considerably greater elevation than the hills before men-

The principal portion of the modern city, and the most densely populated, is the area upon the left bauk, enclosed by the Pincian, Quirinal, Viminal, and Capitoline hills, forming the irregular plain of the ancient Campus Martius, and is traversed by the principal street of Rome, the Corso, about a mile in length, and running from the Porta del Popolo on the northern foot of the Capitoline. Why the Quirinal and of the Capitoline. Why the Quirinal and Viminal were styled Colles, in opposition to the term Montes applied to the others, is not exactly known, but probably originated in the ancient traditions of the Septimontium.

The height of these hills varies from 120 to 160 feet above the river, hut in ancient times they must have appeared of greater elevation, owing to the intersecting valleys having been

considerably deeper than at present. The Capitoline, the Aventine, the Palatine, and the Cælian, were quite isolated and separated from each other by narrow valleys, of which those nearest the river appear originally to have formed a marsh. The three latter hills, with the Esquiline, though included within the walls, are comparatively uninhabited, being prin-cipally occupied by gardens and vineyards. The remaining portion of the inhabitants of Rome are located in the Borgo and Trastevere, on the other bank of the Tiber.

Conflicting accounts accompany the history of the city from its ontset; for instance, Varro and Dionysius ascribe the incorporation of the Cælian to Romnlus, — Eutropins and Livy to Tullus Hostilius, — Cicero and Straho to Ancus Martins,—Tacitus and Festus to Tarquinius Prisons; and equal discrepancies exist elsewhere.

The preponderance of testimony establishes the following general order of the gradual annexation of these hills to the spreading city. annexation of these hills to the spreading city. Rome was originally confined to the Palatine; and Tactus, in his "Annales," traces the course taken by Romulus, with his plough, in describ-ing the pomerium, or symbolical boundary, ac-cording to the Latin and Etruscan custom, and from which description and analogous reasonings, the form of "Rome Quadrata" has been inferred. The words of Tacitas translated are,—"Therefore from the Forum Roarium, where we see the brazen figure of a

Equally foreign to our purpose would be the bull, because that kind of animal is yoked to the adds to these the Quirinal ; but these little displough, the furrow for the marking out the city commenced, so as to include the great altar of Hercules. Thence, stones being placed at certain distances, it continued along the base of the Mount Palatine to the Ara Cossi, then to the Curiæ Veteres, then to the Edes Larum," &c. This process of setting out a city is laconically described by Cato in the following pithy sen-tence,—"Qui urbem novam condet, tauro et vacea aret; nbi araverit, murum faciat; uhi portam valt esse, aratrım sustollat et portet, et portam vocet." But from the very starting of the plough of Romulus, the enigmatical and defective descriptions of the Roman writers and defe plunge as into difficulties as respects the actual site of these obliterated landmarks, from which the views of Niebuhr, Bunsen, and Becker by no means extricate us; and for rescue from the no means extricate us; and for rescue from the slough of despond, we refer our readers to the clear exposition of Mr. Dyer. For the progress of the city under its first five kings, we rely more upon probabilities than upon facts. The addition of the Capitoline, formerly called Saturnius, the least in extent, but greatest in importance, and whose oval form may still be traced in a circumformer of 4000 feat teacther traced in a circumference of 4,000 feet, together with those of the Aventine and Calian, are referred to Romulus. But whilst the latter were merely fortified by ditches and palisades as a protection for herdsmen and their flocks, the former must have been surrounded with a wall aud gates to correspond with the account Wall and gates to correspond with the account of the Sabine attack made noon it. Romalus had, without doubt, selected this hill for his future eitadel, and thither he carried his first spolia opina, and dedicated them upon the site of the temple of Jupiter Feretrius, the first temple couscerated at Rome.

The Aventine, for the circuit of which Dionysius allows 18 stadia, or 21 miles, seems to have remained as a mere fortified inclosure for shepherds to the time of Aneus Martius, who allotted it for the residence of a portion of the conquered Latins. After his final victory over them, he located the remuant of that people in the districts between the Aveutine and the Palatine; and, further, incorporated with the city the Janiculum, built the Pous Sublicius across the Tiber, and constructed the Fossa Quiritium. It was to the introduction of Forsia Quiritium. It was to the introduction of the Latins into Rome that the plebeian order owes its origin, and Rome its greatness; and it is to the genius of Niebuhr that we may ascribe our present knowledge of the relations between the patrician and plebeian ranks. The The etymology of the term Aventine has called forth so great a number of ingenious solutions, that it is difficult to say which is the most probable. The Cælian (formerly Querquetnlanus, from its oaks), so named from Cælius Vibennus, an Etruscan general who assisted Romulus against Tatins, and who had his station upon the Mount, had as we before observed, three dates assigned to it. The removal of these Tuscaus to the Plain, where they founded the Viens Tuscus, and the subsequent colonization of the Crelian, may partially reconcile these conflicting accounts. The more modern name of this hill is Laterman form and the state of the state is Lateranus, from a senator of that name who had a splendid house upon it in the reign of Nero.

The Quirinal hill, formerly called Agonian, seems, in the time of Numa, to have been divided into four distinct eminences, each named after some deity, namely, Quirinalis, Salutaris, Mucialis, and Latiaris, all of which, however, were afterwards absorbed in that of Quirinalis, so called from the Quirites, who came with Tatius from Cures.

The circuit of Rome at the accession of Tarquinius Priscus appears to have embraced the Quirinal, Capitoline, Palatiue, Aventine, and Caelian hills, and the Janiculum beyond the Tiber. Tarquinins made no autorus -city, hot plauned, and as some say, excented the walls usually attributed to his successor. In addition to this and many public works, he constructed the Cloace Maxima, improved the Circus Maximus, planned the temple of Jupiter Capitolinns, and crected the first porticos and tabernæ around the fornm. The incorporation of the Viminal aud Esqui-

acus to base the Quirnal; but these little dis-crepancies are easily accounted for, and are but of small moment. Although the anthorsbip of the wall, comprising the whole "Urbs Septi-colls," usually ascribed to Scruins, is disputed by the elder Tarquin, that of the Agger certainly belongs to the former. This agger, which was a great rampart or mound of earth, 50 feet wide and above 60 fect high, faced with flag-stones and finked by towers, constituted the most formidable portion of the fortifications of Servius, and extended across the broad table formidable portion of the formation of the Servius, and extended across the broad table land formed by the junction of the Quirinal, Esquiline, and Viminal, since it was on this Esquiline, and Viminal, since it was on side that the city was most open to attack. Its length was 6 or 7 stadia,—three-quarters of a nille,—and below it was a moat, 100 feet broad aud 80 feet deep. Remains of this monment of mitiquity are still to be seen near the Baths of Diocletian and iu the grounds of the Villa Negroni.

As in the time of Augustus it was difficult to trace this wall, it is now, of course, impossible, no remains of it being left : therefore it is by determining the probable position of the gates alone, and by what remains of the Agger, that alone, and by what remains of the agger, snar by connecting these gates by lines, according to the indications offered by the ground itself, an approximation to the truth may be arrived at. Cheero informs us that Servius, like Romulus, was guided in the construction of his walls by the form or outline of the hills. And here our difficulties begin again, for Becker, after assert-ing that Servius only constructed walls where there were no hills as natural defeuces, afterwards conducts the line of walls over the height of the Quirinal, and even over the summit of the Capitoline itself. There were, however, two exceptions to the continuous line of wall, and those occurred at the Agger and the Arx, or Capitoline, the latter exception being proved, as Niebuhr remarks, by Livy's account of the Gauls scaling the height.

unmher of the gates in the Servian wall The varies in different writers, but as space would not allow us to institute comparisous, we will content ourselves with the able conclusions of Mr. Dyer, who enumerates twenty, including the Porta Triumphalis. "When we consider," says he, "that there were only nine or ten main roads leading out of ancient Rome, and that seven of these issued from the three gates, Capena, Esquilina, and Collina alone, it that five or six gates would have sufficed for the main entrances, and that the remainder must have been unimportant oues," &c. The reing gates of chief importance were the Vini-nalis, Cælimontana, Trigemina, Carmentalis, and Ratumena

Of the fortifications of the Janienlum, on the ght hank of the Tiber, as ascribed to Ancus Martius, modern opinions are not in favour of any having existed; Niebuhr, amougst others, holding the theory as crroneous, though not giving reasons for his conclusions.

The modern walls of Rome, including those the Trastevere and the Vatican, are from 12 to 13 miles in circuit; those on the left hank being the same as those commenced by Aurelian in Λ .D. 271, and completed by Probus. But as in the repairs by Honorius, the gates of Aurelian are supposed to have disappeared, it is difficult to say whether any part of the actual difficult to say whether any part of the action walls of Aurelian remains. Hurried and tem-porary repairs hy Theodorie, Belisarius, Narses, and several of the popes, exhibit so many varieties of masonry, that it is difficult to assign periods to these several constructions.

The last general repairs were by Benedict XIV. The last generate repairs were by Detailed Arts. They are generally of brick, with patches of masoury, oceasionally presenting portions of *opus reliculatum*, as in the *Muro forto*, described by Procopins. These walls average about 50 feet in height on the outside, but from the accumulation of soil, do not exceed 30 feet upon the inner surface. Twenty gates belong to the modern city, of which seven are now Twenty gates belong walled up. Procopius, who wrote upou the Gothic war, and is the chief anthority on this subject, enumerates fourteen principal gates $\pi \delta \lambda \alpha _{\lambda}$, and some smaller ones $(\pi \delta \lambda \alpha _{\lambda})$. The distinction, however, hetween these two appellations is not very clear, as we find the Phuciaua indifferently called $\pi \delta \lambda r_{\alpha}$ and $\pi v \lambda r_{\alpha}$.

disproved by a few inscriptions still remaining over present once. Any how it is assumed that their situation was not altered in the repairs of Honorius; and the question is, not so unch to discover the sites of the ancient gates, as to ascertain the ancient names of the existing ones.

After the destruction of the city by the Gauls 390, its hasty reconstruction proved fatal s beauly and symmetry. Building for im-BI to its beauly and symmetry. Building for im-mediate necessity instead of for posterity, the old lines of road were disregarded; and even in old lines of road were disregarded; and even in the time of Angustus, the narrow crooked streets and mean houses formed a striking con-trast to the public buildings and palaces he had errected. In 312 B.C. the Aqua and Via Appia were commenced nuder Appins Clandins Crecus; and in B.C. 220, the Censor Flaminius com-menced the Flaminian Way and Circus. In-creased acquaintance with the architecture of Greece furned. Their connects in that country Greece through their conquests in that country and its colonies, doubtless gave the Romans th taste for architectural magnificence afterwards so highly displayed in the dwellings of their lead-ing men, albeit, the mass of the houses of Rome still remained poor and wretched. On the other hand, some of their greatest men pre the other hand, some of their greates, and pre-ferred to court popular favour by the creditor of public buildings, rather than by the exhibi-tion of private opulence. The reign of Augustus forms a most im-portant epoch in the history of the city, as his

firm and long-enduring power, and vast re-sources enabled him to carry out, not only his uncle's plans, but his own also; and the extent and magnificence of bis undertakings may be best described by the boast of his old age, that he had found Rome of brick, and left it of marble.

The event which ultimately conduced to the In event which ultimately conduced to he greatest improvement in Rome, was the destruc-tion, by fire, of nearly two-thirds of the eity in the reign of Nero; and to the wilful act of which emperor, owing to fis disgust at the narrow and winding streets, Suctomus unequivocally attri-butes it. Out of the instance of which Out of the fourteen regions of which musisted, three were completely detes it. Rome consisted, three were completely stroyed, and seven nearly so, whilst three only escaped intouched. Many masterpieces of Greek art, besides public buildings, perished upon this occasion; hut, on the other hand, the advan-tages in the eity of regular plan, hroad streets, rages in one city or regular plan, froad streets, better constructed houses, portions of which were of stone, plentiful supply of water, and increased magnificence of every kind, more than compensated for the rulu caused by this calastrophe.

catastropue. The *Anrea domus*, or new palace of Nero himself, was in keeping with all around. Erected on the ruins of the former palace, it included in its precincts large parks and gardens, filed with wild onimals, and a vast lake, afterwards the wild animals, and a vast lake, atterwards the site of the Elavian amplitheatre, comprehending portions of the Cælian, the Æsquiline, and the Palatine hills in its vast extent. Under suc-ceeding emperors, this corornous structure ex-perienced muny alterations, and but a shapeless mass of ruins now remains to mock the anti-quary and confound the architect.

"Temples, baths, or halls? Pronounce who can : for all that learning reap'd From her research bath here, that these are walls. Behold the Imperial Mount! 'tis thus the mighty falls."

It would occupy far too much space to pursue the works of the empire to the time of Aurelian, when that enterprising and active monarch, though engaged in successful wars in Egypt and the East, found it necessary to secure his capital from barbarian foes by the construction of the wall that bears his name.

In that interim the reigns of Vespasian and In that interim the regres of vespasian and Titus produced many public works; amongst which the Coliseum of the former, and the Baths of the latter, take the first rank. Domitian rebuilt the temple of Jupiter Capi-tolinus; Nerva completed the forum whose name it bore; Trajan constructed the last of the imperial fora, with which was con-nected the Basilica Ulpia, and under Hadrian Rame attained its culminating point of soler. Rome attained its culminating point of splen-Of succeeding monarchs it may suffice to say that those who most contributed to reno vate the city were Septimins Severus, Caracalla, and Alexander Severus. The walls of Anrelian, with the exception of that part beyond the

The destruction of all the gales by Totila, seems | Tiber, and some modern additions by the popes, There, and some modern autocons by the paper, are substantially the same as those which now exist, as appears from the inscriptions on the gates, and their circumference, as given by Ammon and Vopiscus, are therefore held as

THE BUILDER.

MR. G. G. SCOTT'S LECTURE ON MEDI-EVAL ARCHITECTURE AT THE ROYAL ACADEMY.

I HAVE thus traced out what appear to me to be the leading historical claims of the style we are treat-ing of, and which I will recapitulate as being ;--

1st. That it is the architecture of the modern, as distinguished from the ancient world. 2nd. That it is the architecture of the Germanic ruces, in whose hands the civilization of the modern

recs, in whose hands the civilization of the moderu world has been vested. Srdly. That it is the latest link in the chain of genuine and original styles of architecture, a chain commencing with the first settlement of the human race, and terminating in Gothie architecture. 4thly. That it is, in a stronger sense than can be predicated of any other style.—Christian architecture. 5thly and hash. That it is in concompanded to architecture.

5thly, and lasly. That it is pre-enineutly the archi-tecture of our own forefathers and of our own land.

1 will now proceed to direct your attention to some the more prominent among its intrinsic claims. Commencing, then, with its abstract beauty, I will

treat this as a comparative, but as a positive lity. Differences of taste and education leid us to quality. Differences of taste and education lead as to form varied estimates of the relative merits of the several styles of a t, but the must devoted follower of classic antiquity could scarcely question the absolute and intrinsic beauty of a Gothie cathedral. Every style of architecture has had its own glories. The mightly hall at Karune, the hall of Xerxes at Perse-polis; that model of symmetry, the Parthenon; the Coliseum at Rome, and that gorgeous concernes of polis; that model of symmetry, the l'arthenon; the Culiseum at Rome, and that gargeous congeries of domes which canopied the shrine of Holy Wisdom at Constantinople, all rank ameng the most availe of the works of man; but who is there so prejudiced as to deny the worthiness of those alorions temples which preside in angust series for your effectives to mortheru Europe, to an equal place in our admiration ? Surely, if abstract hearth and intrinsic grandeur alone are Europe, to an equal place in our admiration ? Surely, if abstract beauty and intrinsic grandeur aloue are considered, the enthedrals of Amiens, of Rheims, of Chattres, of Bourges, of Strasburgh, Cologne, of Luncoln, Salisbury, or York, with a hundred others, with not suffer by comparison with the works of any previous age! Nay, I am convinced that an unpre-judiced ampire would go much further and prououee them, in most respects, far superior to the works of earlier acces; but my argument only requires that they should be admitted as their equals. The next claim I will state is this,—that as

they should be admitted as then set in this,—that as The next clim I will state is this,—that as trahented architecture was bronght to its highest per-trahented architecture was bronght to its highest per-Immented intenteentee was obtaine on as majores per fection in the Greeks, so the other great type of con-struction, arenated architecture, was perfected by the Medicata builders; the round-arch variety in the twelfth, and the pointed-arch in the two surcecoming centuris. No one who gives the subject a moment's consideration, will doubt the enormous advantages of the arcansted over the traheaded system : indeed, with the materials we have at command in this country, the arcmater over the transated system: indeed, with the materials we have at command in this commen-ticable, as is shown by half our modern attempts at it heing in reality arcuation plastered over to look

like trabention. The peculiar advantages of the pointed arch (though The peculiar drivantages of the pointer and iterate 1 do not unge them to the acclusion of other formals are its greater power of carrying weight; its lessened thrast; the facility with which it proportions its height to that of its supporting jomby, and the general feeling of the building in which it is used, whether more the interval is its to the support of the screent advanor less vertical in its tendency; and its great advantages in groined vaulting.

The next quality I will mention is the extraordinary facility of our style in decorating construction, and in converting structural and useful features into elements conversion of beauty. The arch, its normal least the start supplies it an endless store of beauty. The valit supplies another incentansithe fund, and assumes forms un-rivaled in any other style. The window, compar-tively neglected by the ancient architects, and even hated by the Greeks, was, in the hands of the Gothic hated by the Greeks, was, in the hands of the Gothic hated by the Greeks, was, in the hands of the Gothic hated by the Greeks and the start invention. build as a perfect treasury of architectural lovelines, and the introduction of window glass, an invention uknown to the ancients, became the science of an entirely use and most enchuting art, and one which exercised the most surprising influence upon archi-tecture. The buttres, the natural hut unpromising accompaniment of an arcuated style, became, in their hand , a source of stateliness and varied beauty magic nands, a source of statelines and varied beauty. The roof, unwillingly shown by the clussic builders, adds solemn dignity to the works of their northern accessors; while, if need be, its timbers are made to contribute liberally to the effect of the interior. The

* See p. 159, ante.

campanile, a structure resulting wholly from practical necessity, because the greatest ornament of Christian eities, and sapplied an endless variety of majestic forms, which had no parallels in ancient architecture; and generally, whatever feature, whether homely or otherwise, construction or utility domanded, was at once collisted, and that with right good will and heartiness, amout the essential elements of the heartiness, among the essential elements of the design.

Carrying ont the same spirit, no material either too rich or too rustic to find an honomrable place in the works of these truly Catholic huilders. place in the works of these truly Catholic huilders. The varied morthles of the Appenines, the polished amethysts of Bohemia, the glass moraics of the Byzantines, with gold and silver, cnamel, brass, and iron, were all brought under tribute to make their richer works glorious; yet they were equally at home in the use of hick, or flint, or rubble, and did not despise even a homely coating of plaster, if only it were housetly and truthully used. And, what is more remarkable, they excelled in the use of nearly verey one of these materials, and varied their design with instinctive precision to meet every one of their individual conditions.

individual conditions. Carrying on the same spirit a step further, Gothic architecture shapes itself instinctively to varied climate and local tradition, and that without sacrificing its leading principles. It is true that its great normal types are found in northern Europe, and that the north of France may, pethaps, be considered as its central province; yet how admirably does it shape itself to the varied conditions of Italy or Spain, to the values of Suitzedead or the inhomirable hows of vallies of Switzerland or the inhospitable shores of Scandinavia; while, in every country where it pre-valled, it assumes a national type, and in every province a local variety.

In the same way, again, it suits itself to every grade and every class of building to which it is applied. It is equally at home in the humble chapel of the rastic header of the same in the humble chapel of the rastic hamlet as in the metropolitan cathedral. The Iraveller through Lincolnshire is no less charmed by the vilhamlet as lage churches which rise in such profusion from its level surface than with the majestic minster, which, from surface than with the majestic minister, which, from its lotty site, surveys the whole converty; nor are we, after wondering at the stupendous grandeur of York, the less disposed to be delighted with the little village change at Skelton; and even the rudest structures of the most obscure district possess a truthfulness and a seutiment which does more than compensate for their rushicity. To pass again to different classes of build-ing, the Mediaval castles, though belonging to a class which the att red modes of warfare have rendered which the alt red modes of warfare have rendered obsolcte, are in their degree as noble and as thoroughly obsolcte, are in their degree as noble and as thoroughly suited to their purpose as the sacerd structures. Tho nunor-house, the farm, and the cottage show equal appropriateness of treatment. The timber street-fronts of Coventry or Brunswick; the brick houses of Lubeck or of the Lombard cities; or those of stoneat Nuremberg—all eviance the same power of meeting the conditions of purpose or material, —while the vast warehouses of the connercial cities of Germany, the town holls of Einders and the tilg-horns of an town-halls of Flanders, and the tithe-barns of an English village are, in their way, as admirable and as appropriate as the minster at Rheims or the eastle at irnarvon.

Again, Gothic architecture unites all arts in one, more, perhaps, than has been effected by any other style, or, to say the least, fully as much so.

In its normal form a stone architecture, it does not niske all other materials conform to this condition, but treats them each according to its own demands. Duske all other materials contorm to this condition, but treats them each according to its own demands. It is almost equally successful in its timber roofs as in its stone construction, and equally perfect in wood as in stone carving ; it treats iron and brass in a manner perfectly suited to the varying conditions ; it brings un painted decorations of toe richest or the simplest character, as best suits the building ; it has introduced one all-pervading art entirely of its own—I mean painted glass ; and no art perhaps ever contributed in so large a degree to the increase of architectural effect ; its jewellery, enamels, ivory carving, embroidery, tapestry, and all other arts are in perfect harmony ; and though it tell short of the classic styles in the perfection of its figure-scalpture, it possessed even here a solemn and severe dignity, hardly equalled at any period, and its draperies often exceeded in beauty those of the classic semptors. ose of the classic semptors. In describing the semptores at Wells Cathedral, onr the

In describing the support at which control out of the reversed p. locksony, who possisses, in a greater degree than any one whom it is my privilege to know, the happiness of being susceptible of enthosisatic emotion from the beauties of a rival school of art to that to which he has especially devoted himself, makes the cluster encoder. following remarks

Regarded in the right spirit, we shall wonder at "Regarded in the right spirit, we shall would at the invahues the resources of the artist in delineating the various and opposite characters of his multifarious composition, in which no two are to be found alike, and in each of which we find the appropriate idea, and the follows of embodiment which sustains the dramatis prisona throughout, with an untiring energy

impersonation in costume, symbol, and action. which excites our warmest admiration.

"We have the sanctity of the mosk, the meckness and abstraction of the Supreme Pontiff; the arch-bishop; the pious energy of the hisbop in the act of bishop; the pious energy of the histop in the act of benediction; the prudent abbot; the devoted nucho-rite; the haughly and imposing king; the stark con-The international and the start of conception, which the informed artist may

-" The Mediæval artist appealed sometimes Again to the imagination, and sometimes to the conscience and thus gave a degree of sentiment to his works which the moderns can searcely attempt, much less

But it is the moral understanding of the artist which is most affected by the contemplation of so vast an assemblage of Christian art, as contrasted with the classical, contained in our museums, or in ancient monuments. Habitated to the Grecian model in which the pride of life, the sensatily of beauty, a superhuman energy, or an unreal Elysium, are assumed, debuling with a heau-ideal, and disappointing to all human experience, be is brought here to the full admission of the realities and true conof the ratio admission of the relations and the con-ditions of human existence, — probation by the sweat of the brow, and the grand achievement of eternal life. Art is here employed to impress the great lessons of truth, the warfare of the world, the subjagation of the natural to the spiritual man, the houest employment of the intellect in the gret cause of religion. * * * * * No characters enter into religion. * * * * * No characters enter into this pietnre which have not been signalized by some This picture which have not been signalized by some great good to suciety, or some great triumph over all absorbing self. Wisdom in its true sense, and varying energies of personal or intellectual strength, in a great eause, are the only passports to admission in these records "

I need not apologize for quoting at so much length from him who has so often and so eloquently ad-dressed you from this place, and cannot refrain from

In foliated sculpture the Med aval artists exceeded The ionated sempore the rate available screened those of, perhaps, any other period. In their works you find the fuest specimens of conventional or imaginary foliage, founded on natural principles, yet not imitated from nature,—the hest instances of the introduction of natural foliage, either wholly or maited with the mentional screened and the ment ended with the conventional;-and the most admirable examples of conventionalizing nature, or, as Mr. Ruskin defines it, "bringing it into service," so as to suit it to the material and to the forms, conditions and purposes of architectural decoration, whether in relief or in painting; and not the least valuable of the lessons we learn from them is the heat valuable of the lessons we learn from them is the acknowledg-ment of the mind and imagination of the art-work-man, who was not, as in classic architecture, en-ployed to make for his capitals, or other features, an indefinite number of for-similes of a single model, much less as in your worders mergine to constitumachine manor of persinner or a single mach, hundred buildings a model which its author never meant to be used hot in one; but after having acquired a due amount of skill in the arrangement and execution of his folinge, and a due knowledge of the general tone and ferling which the architect de-sired to express, was then left, under only general sired to express, was then left, under only general guidance, to the indulgence of his own inventive and artistic facultics, and thus rendered every canital. actistic faculties, and thus rendered every capital, every hoss, and every cusp a distinct and separate work of art, though all in harmouy with the ideal or the whole design

variety of expression Gothic architecture is In and most majestic severity, and the most explicitly explicitly explicitly explicitly explicitly explicitly and refined elegance, as well as of all the intermediate

In heanty of external nutline, no other style of and nearly of external notine, no once system a architecture approaches it; and in the variety, depth, and refined delicacy of the profiles of its mouldings it stands unrivalled. Time would fail me to tell of the wonderful manner in which our style shapes itself to

every accidental requirement; grapples with every every accidental requirement; grapples with every difficulty, and enverts it into a source of beauty; disdains, on the one hand, all artificially effected symmetry, nor, on the other, fears to submit to the most rigid uniformity, should the conditions of the case require it, being equally noble in the ensile, where no two parts are alike, as in the Hall at Ypres, where no two parts are alike, as different. Here it meets every emergency with the utmost frankness and honesty: then it disduins all denoting the full and the full start disduins all denoting the contrasting itself. emergency with the utmost frankness and house how it disdoins all deception I thus contrasting its I how it disdoins all deception I thus contrasting its I not with other gennine styles, for uone reall systematically admit of shams, hut with the despicabl trickiness which our modern architects have learned from their own plasterers and honse-painters; nor have I time to treat of the boldness, freedom. and originality of its conceptions. But, above all, its great glory is the solemnity of religious character pervades the interior of its temples. To this whiah all is other atributes must bord, as it is this which renders it so pre-minently suited to the highest uses of the Christian church. It was this probably which led Romnoy to exclaim, that if Greeinn architecture was the work of glorious men, Gothic was the inven tion of gods

Having, I fear, at too great length, sketched out the clums of Mediaval architecture upon your study, I will conclude with a few remarks as to the spirit with which that study should be undertaken, the manner in which it should be parsurd, and the prac-tical objects for which it should be followed up.

treat objects for which it should be followed up. In the first place, I will premise that your studies should not be undertaken in a spirit of mere anti-quarianism. We owe very much to antiquaries, and far be it from me to depreciate the value of their rescarches: on the contrary, I think that the enlightened system on which they are followed up is one of the things of which our age has to be plond, and one for which, as lovers of art, we have great cause for gratitude; nor do I wish to discourage the pursuit of such investications by architects. It is in purshit of such investigations by architects. It is, in some degree, a necessary accompaniment to their studies, and will always add interest to them. What I wish to suggest is that one own proper subject is art rather than antiquity. The fact that the types from which we have to study have grown old is accidental: their merits and their value are perfectly irrespective of their age, and would have been as great Interpret to their age, and would have been as great had they been erected in our own day ; nay, more so, for then we should be following np, as in former days, the works of our own immediate predecessors, and should not be suffering, as now, from a great and nn-natural hints in the history of our art. In the second large our studies cheruld not hered here the section place, our studies should not be undertaken in a spirit of mere philosophical investigation : that, too, is ful i its place, and is an important element in the study of art, though somewhat too cold to suit the feelings which belong to the true artist.

I would suggest two classes of sentiments as especially suited to our own studies, -- somewhat opp in their character, and each calculated to temper -somewhat oppo in their character, and each calculated to temper and correct any tendency to unluce excess in the other. On the son hand, I would arge that your studies should be the carnest following up of the genuine impulses of the heart, --that their primary charac-teristics should he warmth, enthusiasm, veneration, and love. "Keep thy heart with all diligence, for out of it are the issues of life." Never repress in yourselves nor ridicule in others the generous im-pulses of enthusiasm. They are the very soul of srt they are the fresh spring.-Busers of the youth'ul mind, the life-spring of every noble thought and action: without them, at would cease to exist, and we should sink under the bondage of an iron age. Abave all, and sink under the bondage of an iron age. Abure all, cultivate these feelings now that you are young.— guard and cherish them as you would the cluicest and tenderest of flowers; for, depend upon it, the chelling blasts of advancing years, and the deadening contact of a hard and unsentimental world, will have sufficient tendency to nip the precious bud almost before it has time to burst into bloom. On the other hand, it is necessary that the exercise of this zeal, heartiness, and yeneration, should be regulated by sound and dis-criminating judgment, a perfect and unfettered free-dem of thought each argument and hearting for the source of the s dom of thought, and an eye to real beauty of form and reasonableness of construction and design; so that our generous enthusiasm may not betray us into forming erroneous judgments. However perfect a style of art may be, its produe

tions are not all perfect, nor all of equal ucrit, while every human art has had its period of rise, culmina-tion, and deeline; and, enthasiastic and heart-stirring lings towards any art in which we as must be our fe hope to excel, and intense as may be our veneration for the skill and noble sentiment of its original masters, these feelings should in no degree he permitted to blunt the sensitiveness of our own instinctive perception of beanty, whether positive or relative, nor to bias the freedom of our judgment as in the comparative truthfulness, propriety, or genuinceness of the works of different periods or of different hands. We must keep a constant balance between our zeal and our judgment,---not repressing the exercise of either but giving each its full play, and exercising each in its highest and mobilest degree. now come to the manner in which Medizeval

architecture should be studied.

architecture should be studied. In the first place, though books and prints are very useful in their degree, let me impress upon you, in the strongest manner, that all real study should be at the fountain head. You may derive information as to the history of art from books, but knowledge of art "itself must be derived from works of art. The know-ledge derived from books and prints comes to you at Second-hand : you are sceing through chlory works." second-hand: you are seeing through other men's eyes: the really useful information is that which you obtain at the first hand, and through your own eyes. If you learn a fact from a book, be never satisfied till you have proved it by your own observation : if you are impressed with the beauty of a huilding from are impressed with the beauty of a hulding from a drawing or a print, make sure of its being really beautiful by examining it for yourselves. Investigate every theory, however rudimental, by actual examina-tion of the data on which it is founded, so that assue of your knowledge shell be merely taken upon trust from others. fro others.

from others. During a genuine and n-tural state of art, every one learned it from, and developed it upon, the works of his immediate predecessors. This initural course of his immediate professors. This mitural course having been broken up, the most reason ide substitute for it is to study the actual works which surround us, and which were produced while art was sill genuine and unbroken. We have not to visit distant shares, and to investigate obscure fragments, -- the works of races which have vanished from the face of the races which have vinished from the face of each are earth : we are surrounded on every side by original examples of the arts which we woold study : they are the productions of our own country and out own race. The temples from which our authorities are derived are not those of an ancient and Lygone nation, but those in which we ourselves worsbin, and within and around whose hallowed walls sleep the remains of our around whose hallowed waits steep the remains or our own forefathers. We study no outlandish or exotic architecture, but that of buildings which from pur infancy we have been taught to venerate. We have then no exants if we neglect to obtain our knowledge from the fountain-head.

The choice and order of the particular buildings which we select for our studies must depend nucle upon accidental circumstances; but, as a general rule, I would alvise each student to begin with those rule, I would advise each student to begin with those which are readiest to his hand. If your home is in the country, visit, study, and sketch from your nwa parish church, and from those immediately surround-ing you, widdoning your circle as you proceed; gene-tally studying the simpler specimens before you yea-ture upon the more magnificent. If you live in London, the case is different. The bumble speciments have mosely perihed, but the carnest student will still fuid out mone of which the public are immediated. still find out many of which the public are ignorant. Ilcre, however, you must for the most part attend to There, however, you must for the most part attend to the more magnificant works, and reserve the humbler for your rural excursions; and, above all, you must diligently study the glorious abbey church of West-minster,—internally, perhaps, the fluer in England, but which, from its proximity, is made nothing like so much use of as it ought to be. Though the village downshot round Lurab have available and an other ling. but which, from its proximity, is made nothing like so much use of as it onjatt to be. Though the village churches round Lundon have suffered more than almost any others, you would still do well to make pedestrian excursions annoug them, and earefully sketch what remains of them; and by extending your excursions to Waltham and St. Abu's, to Etham and Hampton Court, you will find objects of study of the highest merit, and the most profitable mode, of following up the subject, more lengthened excursions; as, for instance, pedestrian tours through particular constites or districts, walking from village to village, and earefully sketching everything worthy of note to be found in it, whether ecclesiation or domestic. This should be repeated over and over your attention to the nobler productions of architec-ture, you must sext yourselves down in some eathedral town, and follow it up patiently from day to day, till yo it time is exhansted. A hasty view, to these noblest of structures, is but of lutte as.

Especially would I entreat your attention to those beauteons but melancholy ruins which still mark the sites of ancient monastic institutions. You may find in them the function be standing examples of your att,—works designed and carried out,—root in the busile and hosy hunn of cites—tut ander the quieting influence of learned retirement: they are the works busile and how hann of cities—har under the queening influence of learned retirement: they are the works of the most thoughtof spirits of their age, and have received their utnost study and consideration. Not only are they intrinsically among the most heantiful specimens you can visit, hut their pursent condition is calculated to intraces them the most deeply noon the imagination and memory.

It is well to visit these remains alone; to stay long at them; to study them thoroughly, and not to repress the emotions to which they are calculated to

I would also plead for them on another give rise. I would also plead for them on another ground: there are many of them fast mouldering away or tottering to their fall. A few years more, and many of them will have perished. Lend, thee, a friendly hand while they still exist, and rescue from oblivion their noble details by making earoful and measured drawings of every part; so that, when the reality is no more, the truthful representation at least will be preserved. give rise. will be preserved.

tens: whi be preserved. I need hardly say that uo works of art can be really profitably studied without drawing from them. The memory will not retain its impressions by more ab-stract study and observation. I would not advise memory will not retain its impressions of world not advise stract study and observation. I would not advise hasty and eareless sketching, unless your time is so short as to render more impossible, but would arge upon you the necessity of earefully and assiduously drawing whatever strikes you as worthy of it, making and moting and moting and moting measured drawings whenever you can, and measured arawngs whenever you can, and holing down your impressions as to the merits or the defects of the work. So study what you see as thoroughly to learn it, as if no one had ever mude drawings of it before. Never huy prints or photographs of it as before. Never hay prints or photographs of it as substitutes for yoar own work; though they are most useful when yon have done all you can for yourself. In this way you will in a few years obtain a good knowledge of the architecture of your own country, and this is the best preparation for studying the con-temporary works of other lands. I would never encourage a student to go too early ahroad. Study well our own examples first; and follow up forcing oues late. When you go ahroad, begin with France. It is the great centre of Mediaeval art. Perhaps the best course is to talke Normandy first, as heing most

When you go anroad, begin with France. It is the great centre of Mediaval art. Perhaps the best course is to take Normandy first, as heing most allied to our own country, but still more inportant is the district round Paris,—the old royal domain, which seems to be the beart from which Gothic archi-tecture diffused itself throughout Europe. The architecture diffused itself throughout Europe. The areal-tecture of this central district, particularly in works of the thirteenth century, demands the closest and the most diffuent study : it is the great standard and type of the style, and, without a good knowledge of it, your of the style, and, without a good knowledge of it, your studies would be not ouly incomplete, hut defective at the most vital part. After France, I would recommend Germany.

After France, I would recommend termany. Pointed architecture in Germany is a direct emanation from Frauce, far more so than is the case with our own country. Yet it has a character of its own, which it is well to study, and the later Romanesque of Ger-many, which is contemporary with the Early Pointed architecture of France and England, is replete with beauty and suggestiveness.

Italy should come after France and Germany, and the study of its Mediæval works is, in my opinion, necessary to the completeness of the course I am sugthe study of its Meduaeval works is, in my opinion, necessary to the completeness of the course I an sug-gesting. It should, however, he undertaken with much caution, without which it is apt to lead astray. I have above recommended you never to repress the generous impulses of enthusiasur: I fear, however, I first must here make an exception to my rule. On first visiting italy the scenes are so new, and so exciting, and the effects of the elimate and the beauty of the atmosphere so intoxicating to the feelings, that we are apt to view everything through an exaggerating medium. Without repressing noble and generous emotions, I would still suggest that a rigorous watch should be kept over the undue effect of mcrely external influences: "Pat a knife to thy throat if thou he a man given to appetite." With proper safeguards, however, on this head, sontherm Gothic is one of the most useful and delightful branches of the studies which would otherwise exist. must here make an exception to my rule. On which would otherwise exist.

I hope, however, on some future occasion, to say more on this subject. For the present, I will close my remarks on the maoner in which Gothic archimy remarks on the manner in which Gothic archi-tecture should be studied, by saying that it is not mere architecture which you will have to attend to: painted decoration, whether in its nobler or humbler hranches, stained glass, illuminated manuscripts, carved ivories, embroidery, and a hundred other sub-sidiary hranches, possess an almost equal claim upon your attention; and many of these must be followed up in museums and public libraries, in collections of archives, and in the sacristies and treasmires of monasarchives, and in the sacristics and treasuries of monas-teries and cathedrals, where, for the most part, they teries and cathedrais, where, for the most part, they lie hidden, and naknown to the busy world arouad. Nor would I leave you to suppose that the objects of your study should be either exclusively, or even, per-haps, mainly, ecclesinstical. You must scarch out with the utmost diligence the remnants of eivil, secular, and domestie buildings of the same ages: without this your studies would be imperfect, indeed ! The caprice of individuals, and the love of living in new houses, have rendered these remains most im-perfect and fragmentary, yot the fragments are perfect and fragmentary; yet the fragments are strewed on all sides of us, and demand to be carefully collected, and not a village you pass will fail to supply ith some contribution.

Finally. What are the special objects for which this cill.

course of study should be undertaken ? They are, I

Introduction ourselves is a constrainting ourselves is the one of the more standard phases io the whole history of art, and that which belonged to our own race, couotry, and religion. It is one of the most striking characteristics of our day that in it, alone, of all periods of the world's bistory, the arts of all periods of the world's bistory, the arts of all preclaing times are studied and their history understood; and strange would it be if, while traversing every land to glean vestiges of its bygone arts, we should usglete to acquaint ourselves with that noble style whose glerious monuments surround us on every side. These noble monuments, the pride and glary of our

The scoola object is one of a mole particle value. These noble monuments, the pride and glory of our land, have, through the lapse of time, and the harba-rous hand of modern vandhism, become in many cases so decayed and nutilated, as to demand at our hands the most careful and judicious reparations. This cannot safely be undertaken by any but those This cannot safely be undertaken by any but those who have as perfect knowledge as is possible of their architecture, and who are able to trace out with precision the history and changes they have undergo on the bisody and change has have many bar and whose feelings are such as to lead them to deal tenderly and lovingly with them. This alone is a sufficient object to induce a careful study of our Mediaval architecture.

There remains, however, a third object to lead us to this study, hut it is one on which so much differit is one on which so much difference of opinion exists, that I must avoid on the pre-seut occasion doing more than maming it. I refer, of course, to the revival of Pointed architecture now going on. The promoters of this great movement do not desire to revive a departed art, however glorious, exactly as they find it in its original remains. Such may naturally be the character of their first essays, but it is not their ultimate wisb. Their view is her this,---that, feeling deeply the fact that we this,rather have long since censed to possess an architecture which can be said to belong to our race or our age, and fully agreeing with those who desire to see a new developement of our art to meet these demands ; they feel that the most probable foundation for such a development is the native architecture of our own race and country, and that the thorough study of its principles may tend in time to promote the formation of an architecture of the future, which will be more thoroughly our own than that, however meritorious, which has been founded upon traditions of the aucient world.

CARISBROOK CASTLE.

THE steep conical mound on which in later times the keep of Carishrook Castle was hull, was probably a fortified position from the earliest days after the Isle of Wight was inhahited; though the more recent structure has obliterated all trace of the first earthworks, if any such ever existed. The sides are so precipitous that they needed hut slight artificial defences to render this hy far the strongest position in the whole island; and we may therefore couclude that it was occupied as a military stronghold by the first settlers, and subsequently by those who successively obtained the command of the island.

The earliest architectural remains that have been found in the course of the recent repairs are towards the end of the twelfth century, when there must have been a *residence* of some extent on the site of the present house, as well as the keep; and from the nature of the ground a wall must have connected the two, and partly enclosed the residence. But few remains of this period have hitherto been found in situ. The most interesting feature is a small two-light window on the east side of the main huilding, which from its position and appearance most probably or he of the windows of the hall of the castle of that time. It is only recently that this window has been discovered, and the removal of a modern shed which concealed it has made it a prominent feature in that part of the huilding, and in conjunction with the chapel and old chimney of the hall, which has also been hrought to light—one of the most picturesque points of the whole group of huildings

A large portion of the existing huilding was erected by the Lady Isabella de Fortibus, who was possessed of the island from the death her hrother in 1262 to her death in 1293. The chapel is the only work of her time, which has retained its architectural features with but little change. The side window remains, and the arcade on hoth sides; but of the east window there is no other trace than the position of the It is now occupied by the great staircase, [April 4, 1857.

put up by Lord Cutts, who was governor of the island and captain of the castle after the Resto-ration. Appended is an interesting extract from ration. Appended is an interesting extract from some accounts of the year 1270, printed by Mr. Hellier in his unpublished work on the "History and Antiquities of the Isle of Wight," in which reference is made to this very chapel. There is also appended, on the authority of a "Memorial of the Castle," by the same author, an extract from an inquisition taken after the death of the Lady Isabella de Fortibus. The chapel of St. Nicholas, therein mentioned, is chapel of St. Nicholas, therein mentioned, is probably that we have been speaking of : the other "great chapel" most likely refers to one which may have stood on the site now occupied hy the walls of the chapel erected in the year by the walls of the chapter receiver in the year [735, which was dismantiled a few years ago. It possesses no feature interesting to the architect. The next alterations of any great extent appear to have heer made in the days of Edward IV, when the residence assumed the shape it still when the residence assumed the shape it still retaius in all its main points. The kitchen is a fine work of this period.

The whole residence may have falleu into had repair during the Commonwealth, or was found unsuited to the wants and taste of the time; for large alterations were made hy Lord Cutts in large anterations were made up born constants in the windows and internal arrangements; pro-hably hefore his day, the huilding opposite the great entrance-gateway was the hall of the castle; and, according to the evidence of old representations, open to the root. It is now divided into two stories. Further investigation may reveal details of the original structure sufficient to determine the design, which, it is

hoped, may ultimately be restored. The object of the repairs that have been recently executed, under Mr. Hardwick's direction, has been principally to preserve the exist-ing features of interest, rather than to restore,to arrest the progress of decay, rather than to recreate, however faithfully, ancient forms from the mutilated fragments, which, after all, are the nutrated tragments, which, after all, are more interesting to the autiquary and architect than the most careful copy. Another object has been to remove such buildings of modern erection, as disfigured and concealed the ancient structure, without adding either to its stability or usefulnes.

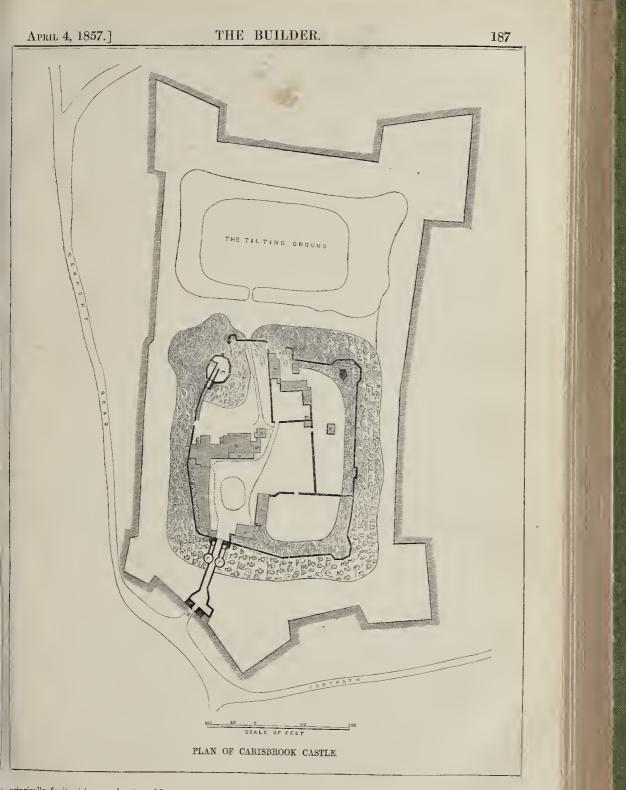

or usefulness. The entrauce-gateway is a magnificent work. and it is satisfactory to be able to state, that it is less ruinous than most similar constructions that have been as much neglected. No other repair has been done to this portion of the eastle, or to the external walls, except the removal of ivy and other vegetation, which was found to be actually injuring the fabric, and the securing in their original positiou such stones especially those of the parapets and upper sur-faces of the walls-as were loose aud likely to

The building which covers the famous well is a structure of the fifteenth century. The walls are sound, but the roof was entirely purpose of restoring every part, except the barge board. The depth of this well has been popularly stated at 600 fect: in fact, it is only 145 feet.

Withiu the walls are two isolated buildings winnu the wais are two isolated buildings, besides the residence and chapel,—one near the gateway,—prohahly the guard-house; the other, a work of the fifteenth century, which was most likely huilt as quarters for the troops: it con-tains some fireplaces of good bold design. The range of ruined buildings on the left side of the autoproper draway are works late in the

The range of runner buildings of the rel sale of the entrance-galeway are works late in the fifteenth century. Here were the apartments where Charles I. was confined after his first attempt to escape; and it was from a window nearly opposite the end of the present residence that he mode his second unsuccessful attempt It. that he made his second unsuccessful attempt. is quite clear that the window which has hitherto been pointed out as that through which the king endeavoured to cscape must have been in an ante-room, or in one of the rooms occupied by

Colonel Hammond. The gateway in the wall of the outworks is of the time of Elizabeth, and hears her initials, the time of Elizabeth. The whole of these outer whole of these outer with the date 1598. The whole of these outer works, which are of considerable extent, and interesting as examples of the military engineering of that time, were constructed by Genebello, an Italian engineer, for Elizabeth. Carisbrook Castle has been visited hitherto

principally for its picturesque beauty and from the sympathy feit for the events of the life of Charles I. which took place within its walls. In addition to these sources of interest, the modern buildings that concealed its ancient form, and have developed much that was scarcely known before, have added much to its interest to all those who are desirous to see our national

THE SANITARY COMMISSION IN

THE EAST. THE Report of Dr. Sutherland and Mr. Robt. The Report of Dr. Sutherland and Ar. ROD. Rawlinson, the commissioners appointed (with poor Gavin) by ber Majesty to proceed on a sanitary mission to Constantinople and the Crimed, during the late war, has been presented to Parliament, and will be found to show, as all such reports must show, the immense import-ance of improved sanitary arrangements,—the sin involved in their neglect. It will be seen that the allied occupation afforded no exception to the reneral law, that, given an enidemic to the general law, that, given an epidemic influence, the effects of that influence will be most marked where there are damp, and fith, and foul air; where there are defective drainage, want of cleansing, muisances, overcrowding, defective ventilation, and impure water.

" Certain positions exhibited these diffects, or some Corran positions exhibited these differs of some of them, in so marked a manner, the the only remerly, in the absence of older means, was change of position. In other instances, from the more intense heat of the elimite, local conditions, which otherwise might have appeared comparatively harmless, heeane of great importance to the public health."

It may be as were we should say, in code quence of a recent discussion, that the commis-sion was precluded from interfering with the treatment of the sick or with the discipline of the wards, and was not to interfere with any-thing connected with the personal hypitane of the should be discussed as the declinity of the size of the declinity of the declinity of the size of the size of the declinity of the size of the declinity of the size of the size of the declinity of the size of the size of the size of the declinity of the size of the size of the declinity of the size this connected with the personal *nyperior* the soldiers. "It had, in a word, to deal with the hospitals, but not with the sick, and with the camp, hut not with the troops."

The report, which has an appendix with maps, describes the condition of the various maps, describes the condition of the various hospitals separately, and the steps taken to improve them in respect of drainage, venti-lation, overcrowding, and other points. We can do little more than report the result. The commissioners state that while the sanitary reforms were being carried out, a marked im-provement took place in the health of all the hospitals. Part of the result they admit was probably due to the less severe character of the case sent from the Crimca to Scutari, but there can be no doubt they say that the favourable can be no doubt, they say, that the favourable change in the health of the hospitals advanced simultaneously with the progress of the sauitary works

"All the sanitary measures adopted,-the external cleansing, the deudorizing, cleansing, finshing, and structural improvements in severs and drains, the linewashing of wards and corridors, the cessation of nnewsaming of warvs and corritors, the desarious of overcrowding, and the improved ventilation,—had for their object the removal of numerous causes of atmos-phetic contamination which existed around, under, and within the lospithlas at the time they were first examined, so as to preserve the parity of the sit in the wards as far as it might be practicable to do so."

The mortality among the sick had fallen very considerably, as will be seen by the following table of the percentages of deaths to the siek remaining and admitted into hospital for six periods of twenty-one days each, from March 17, when the sanitary works were commenced, to June 30 :-

Every one knows by this time that it was not the "enemy" who destroyed our men. Even after the attack on the Redan, the zymotic class of diseases still vindicated its deadly superiority over one of the bloodiest struggles of the whole war. No fewer than 1,913 zymotic eases, or war. No rewer taan 1,912 Wynolle cases, or 61-9 per cent, of the total admissions, went into hospital; and there were 178 deaths from the same class of diseases, equal to 66.4 per cent. of the total mortality, in hospital, during the weat 1? week

It appears to be made tolerably clear, that whenever fevers of the continued type, especially with a typhoid tendency, appear in a regiment, there is some local removable cause.

" Most of the occupants of a certain tent in the French camp had been successively attacked with typhus throughout the whole course of the winter of s throughout the whole course of the winter of 56. The test was struck, and the ground under 1855-56. is used by up to ascertain whether there was any cause for the disease. The corpse of a soldier, in an advanced state of purterfaction, was found bene it the surface over which the tent had heen p'tched."

The commissioners were directed to inspect revery part of the hospitals and infimaries, to ascertain the character and sufficiency of the drainage and ventilation, the quantity and quality of the water-supply, and to determine

[April 4, 1857.

among infinity of the line in the Unit of Kingdon is 16'S µer 1,000 per annun from discase alone, while model dwellings of the metropolis, the mortality for all periods, from infancy to old age, has ranged be-tween 12.6 and 13'9 per 1,000 per annum, a little more than half the mortality of the metropolis for the same years. On comparing the mortality in these dwellings at all ages with the picked lives of the army, we have a most convincing proof of what may be done, and how much requires to be done for the sanitary improvement of the soldier."

Attention to the "practical conclusions" with which the commissioners end their report will tend to remove the cause of the largest amount of loss in armies, and promote immensely the physical efficiency of our forces.

ON FURNIFURE, ITS HISTORY, AND MANUFACTURE.*

WHEN a nation has made a certain progress in the arts, it naturally seeks to adorn the ordinary articles of daily use, and to render them more convenient and elegant; so that ont of a state of role deformily they at has become objects of benuty and luxury; thus from a rule clay cup have been developed the precious vases of Etruria--and thus did refinement mark its growth on the brouze implements of Hereulaneum Pompeii.

furniture of ancient times we possess but Of the Of the furniture of ancient function we possess but first specimens. We are told by Wilkisson that the Egyptians displayed considerable taste in the furni-ture of their houses studionaly avoiding too much regularity, they preferred variety hoth in the arrange-ment of the rooms and in the character of the furni-ture. Their mode of sitting on chairs resembled that ture. Their mode of sitting on chairs resembled that of modern Europeaus rather than of Asatics, nor did they recline at meals like the Romans, though conches and ottomans were to be 'ound in an Egyptian as they are in an English drawing-rocm. Many of the fautenils were made of most elegant forms in ebony and other rare woods inhaid with ivory. The legs were mostly in initiation of those of animals, but s une had folding legs like our eamp stools. The back was light and strong, consisting of a single set of up-right and eross hars, or of a frame receding gradually and terminating in a graceful euror supported from without by nergendicular bars. Over this was thrown and terminating in a graceful eurve supported from without by perpendicular bars. Over this was thrown a handsome pillow of coloured cotton, painted leather, or gold and silver tissue. The couches crimed uso less taste than the fanctuils, and were of wood, with one end raised and receding in a graceful eurve. The British Museum contains examples of chairs in ebony inhid with ivory, of a kind of citron-wood lubidi with dark wood and ivory, and an X chair likewise inhid, all of which show the degree of perfection to which the Egyptians had attained. The e inlays are made by vencering, just as at the present day.

the Egyptians had attained. The e-inlays are made by vencering, just as at the present day. The paintings on the Ernssean vasces stupply us with numerous examples of the farmiture used by the Greeks, and showing with what degance and sim-plicity of form they were designed. Judging from the tasteful folds of their garments, and the pare ornamentation that enriched them, we may suppose that the furnished interior of a Greek house harmo-nised with the cultivated taste which fostered and annuladed the works of Publics and Anelles. The auplanded the works of Phidias and Apelles. The sketches traced from examples on these vases represent chairs which have served as models at the present day. The late Mr. Rogers had a set made from a bronze example in his own possession, but which is now in the British Museum.

now in the British Museum. Of the furniture of the ancient Romans we are enabled to speak with more certainty, as we possess a greater number of specimens, which the discovery of Herealaneum and Pompeii has bronght to light, Less tasteful but more laxurious than the Greeks, their furniture was remarkable for richness rather than for purity of design. They had furniture in bronze and iron avaid in prosing smooth build with irory and and iron, and in precious woods indial with irory and pearl: they had costly and heautiful stuffs richly embroidered with selectant designs, and their houses were decorated with such taste, that the remains taken from these two provincial towns excite the admiration-

from these two provincial towns excise we summarize the most calibrated minds. A passage in the 16th hook of Pliny's Natural History gives the following interesting illustration of our subject. "The best woods for eutting into layers and em-

* Read by Mr. J. G. Crace, Contributing Visitor, at the Ordinary General Meeting of the Royal Institute of British Architects, March 23rd.

ploying as a veneer for covering others, are the citrus, the terebinth, the different varieties of the mople, the hox, the holly, the holm ook, the root of the elder, and the poplar. 'The elder furnishes also, as already stated, a kind of therosity, which is not into layers like those of the citrus and the maple. In all the other trees the thereacting are of meriles whether other trees the tuberosities are of no value whatever It is the central part of trees that is most variegated, At is the central part of recent that is most variety and and the paper we approach to the root the smaller are the spots, and the more way. It was in this appearance that originated that requirement of luxary which displays itself in covering one tree with mother, and bestowing upon the more common woods a bark In order to make a single tree sell of higher price. many times over, laminæ of veneer have been devised; bot that was not thought sufficient,—the horns of animals must next be statued of different colours, and their teeth ent into sections, in order to decorate wood with ivory, and, at a hter period, to veneer it all over. Then, after all this, may must go and seek his materials in the sea as well! For this purpose he has learned to ent tortoise shell into sections; and of late, in the reign of Nero, there was a monstrons in-vention devised of destroying its natural appearance by paint, and making it sell at a still bigher price by a successful imitation of wood."

"It is in this way that the value of our couches is so greatly enhanced; it is in this way, too, that they bid the rich lustre of the terebinth to be outdone, a mock citrus to be made that shall be more valuable than the real one, and the grain of the maple to be feigned. feigned. At one time luxury was not content with wood, at the present day it sets us on huying tortoise-shell in the guise of wood."

shell in the guise of wood." In the 13th book, Pliny speaks of the mania for fine tables. He also says, "There is preserved to the present day a table which belonged to M. Cicero, and for which, notwithstauding his comparatively mode-rate means, he gave no less than one million sesterces (9,0004). Two tables were also sold by auction, which had telonged to King Juha: the price fetched by one was one million two hundred thousand sesterces." A library discovered in a ruined villa near Portici was adarmed with presses indid with different eacts of adorned with presses inlaid with different sorts of woods. The beds were often made of cedrate enriched

woods. The beds were often made of eedrate enriched with inlaid work, See, and a bed made of iron has heen found at Pompeii. In all these specimens of Egyptian, Greeian, and Roman workuauship, it will be noticed that though the peculiarities of the style are distinctly preserved yet they have no architectural character, but simply constructive forms and heanty of outline adapted to the material used. the material used.

We have now to pass through a dark cloud which obscured every phase of art;--we pass over a period of more than a thousand years. According to Greek manuscripts of the tenth century, the decomtion of or more than tousand years. According to three manuscripts of the tent he century, the decountion of furniture in the Eastern Empire must have been of considerable richness, as the thrones, seats, and beds represented, though rule and angeneful in form, are highly decorated with gliding and inlaid work. Theophilus the Monk, in the twelfth century, tells us that, not satisfied with decorating the smooth parts of furniture with colour, they painted on it figures, aniants, and foliage, sometimes on a gold ground. The same writer in his Easay on Various Arts, ebap, xvii, thus describes the manner of preparing panels for painting ou: " You must join the boards with earc, piece by piece, by the help of the instru-ment used by carpenters and joiners : you must fasten them with glue; the panels brought together by this glue when they aro dry adhere so solidly that they cannot be separated either by damp or hest. They must then he made smooth with an iron proper for that purpose: this iron, curved and euting on the inside, is provided with two handles in order that it may be used with two hands. It serves to plane the inside, is provided with two handles in order that it may be used with two hands. It serves to plane the panels and the doors, so that these objects become perfectly smooth. You must then cover them with the hide not yet tanued, either of horse, ass, or ox. After having maccrated it in water and scraped off the hair, the excess of water is pressed out of it. It is applied to the wood in this damp state with the glue of cheese." In another chypter he explains the manuer of covering these panels lined with leather with a hight coal of plaster or chaft, is takes earce to recommend the use of linen cloth or canvass if no skin is to be lad; he a therwards gives the process for with no see panels in red or may other colour with painting these panels in red or any other colour with linseed oil and covering them with varnish. The bactiful after forchig there will be a bactiful after forces described by most interesting example of the process described by Theophilus, and it is of a period not far removed from iue.

We now enter upon a style of art founded upon principles sltogether different from those which pre-ceded it—the Mediæval. In that chivalrous era the principles subjection interval from timble which pre- the expect inc times, the employing, the enables the coded it—the Mediawal. In that chivalrous era the stools, two great choirs, silk and velvel coverings, itournament and the battle-field were the predominating entrins to the windows and dors, a great screen, the objects which engaged the attention of the many, and fire-irous, branches for lights, &c. tho study of literature and the practice of art were. There is no mention of a mirror, but they were zonfined to the Church alone. The Crasades had, used at this time, but very small, and of metal,

however, opened to Europeans a knowledge of the arts that still flourished in the East, and hud probably material influence on the principles of Medicaval design. Our forefathers of the thirteenth, fourteenth, and fifteenth centuries, lived in a rude convival manner which demanded few luxuries of furniture, and these at the earlier parts of that period were sufficiently plain and simple in form depending rather on their painted decoration than on neat workmanship or earving ; this taste, however, towards the end of the fourteenth century gradually charged, and colon gave way to more fushed warkmanship, monided panels, and carved ornaments. The construction of the furand envelopments. The construction of the fur-niture thus became better suited to the material employed. On rejecting the covering of parchment, it was necessary to arrange the wood in smaller com-pariments to prevent it splitting or casting; hence arose the system of pauciling and framing which became the main feature. One of the chief beauties, which however, of the furniture of this later time was the elegent netal-work applied in the form of locks, hinges, handles, &c. Many of these still remaining hinges, handles, &c. Many of these still remaining show wonderful perfection and taste in the workmunshow wonderin per needed and caste it doe workman-ship. I will not attempt to particularize the pecu-librities of style of the various periods, but I will now describe the principal articles of furniture belonging to a house of that time. The great diving-hall had a long table at the end, at which the borl and his prin-cipal guests sat; two other tables for inferior visitors cipal guests sat; two other tables for inferior visitors and retainers were placed along the sides of the holl at right angles with the upper one; tables so placed were said to stand banquet-wise. The lord's seat was dis-trajusised by a canopy of cloth of existe, on which was generally displayed his coat of arms, and a cloth of t quistry was hang against the wall. This end of the holl being raised above the rest was ealed the "high dese" or dais, the step forming a line of ilemarcation beyond which none were to approach except hy invitation. Sometimes the tables were arranged in one length, in which ease the salt-cellar formed the boundary bristeen infortiors and the more arranged in one reight, in which e is the sail central formed the boundary between inferiors and the more honoured guests. The floor was generally sirvered with rushes. The tables were massive boards fixed on trestles mortised into the floor. The scats were on usatis mortised into the noor. The scats were mostly forms, but chairs were sometimes used. A MS, of the fourteenth century has this item :=-"1" up put wainscote above the dais in the king's hall, and is make a fine large and well sculptured chair." At to make a line large and well sculptured chair." At the further end of the holl a cupboard called the "Court cupboard" was generally placed, in which the service of plate, such as salvers and gold drinking emps, were arranged, on shelves or stages, massering in some respects to our sideboards of the present day. These combards through a principle is guide scale. These eupboards, though originally of rude construc-tion, afterwards became claborate and heautiful picers for intervants became canonic and nearling press of furniture, richly earwed in oak; they are often alluded to in old documents. On grand occasions temporary stages as cupboards were also crevted. "At the marriage of Prince Arthur, son of Henry VII. in the hall was a transplar cupbord, five stages high, set with plate valued at 1,2007, entirely orna-mental; and in the "utter clrumber," where the primerss dined, was another cupboard set with gold plate, garnished with stones and pearls, valued at 20,000 20 0007

In the inventory of Skipton Castle, in Yorkshire, In the inventory of Skipton Castle, in Torksmire, the furniture of the great hill is thus given :--"Imprimis, 7 large pieces of hangings, with the Earl's arms at large in every one of them, and pow-dered with the several contes of the hunse. 3 long tables on standard fromes, 6 long forms, 1 short ditty, 1 Court explored, 1 fayre bruss lantern, 1 inva eradle with wheels for charcoal, 1 almes tubb, 20 long pikes

The great chamber was often used as a sleeping-

The great character was onto used as a stepping-room by night and a reception-room by day. Shaw, in his decorations of the Middle Ages, gives the interior of a chamber in which Isabella of Bavaria receives from Christine of Pisa her volume of poems. The queen is seated on a couch covered with a stuff in red and gold, and there is a bed in the room furnished with the same material, to which are attached three shields of arms. The walls of the chamber hished with the same intervals of the chamber three shields of arms. The walls of the chamber were either hung with tapesity or painted with his-torical subjects. Ohaueer, in his Dream, fineles him-

torient sunjects. Cuadety, in well depointed, self iu a chamber— Met al the walles with colors flue, Were painted to the text and glues, And withe Romaunte of the Kose."

The floors, which at an early period were laid with I the Boors, which at an early period were hild with rushes, were at a fater one covered with a carpet, called the hord carpet. The description of the furni-ture in the great chamber at Hengrave, the seat of Sir Robert Kyrsor, terup. Hency VII, enumerates very minutely the various articles, among which are, the carpet, the tables, the emphands, the chairs, the stools, two great chairs, silk and velvet coverings, eurtains to the windows and deers, a great screen, the free innus horder with the tables.

polished. The coffre or chest which contained the The wardrobes, so called , were generally and round a the fadies' trousseaux, was subsequently much oranneuted. The wardrobes, so called, were generally small rooms fitted with copboards called armoires. In 1253, "the sheriff of Southamptan was ordered to make in the king's oper wardobe in Winchester Castle, where the king's cloths were deposited, two emphands or armoiries, one on each side of fireplace, with arches and a certain purtition of board across the same ward. rohe

There were also tables of eyprus and other rare woods, carved eatinets, desks, chess-boards, and above all the bed---the most important piece of furniture in the house and of which Rahd, Lad Randal all the bed---the most important piece of furniturs in the house, and of which Ralph, Lord Basset said, "Whoever shall first bear my surname and arms, ac-cording to my will, shall have my great bed for life." There was the "standing bed," and the "truckle bed," on the former lay the lord and on the latter his attendant. In the daytime the truckle bed, on cas-tors, was rolled under the standing bed. The posts, head-boards, and canopics or spervers of budsteads, were sometimes carved, or painted in colours, but they are generally represented rovered by rich hang-ings. King Edward III, bequeated to his heir an entire bed marked with the arms of France and England, and Richard, Earl of Armole, to his wife Philippa, a blue bed, marked with his arms, and the arms of his late wife; to his son Richard a standing bed called clove, also a bail of silk embroidered with bed called clove, also a bei of silk embroidered with the arms of Arundel and Warren; to his son Thomas, his blue hed of silk embroidered with griffins, &c. &c.

The chair was a single seat without arms. The fauldsteuel (fanteuil in modern French), was originally a folding stool of the curule form, but afterwards the form alone was preserved; examples remain from the time of Dagobert up to a late period. Dagobert's seat is considered by some to be of much greater antiquity than his time, and the back and arms are certainly of a liter period than the rest. The so-called Glaston-hury chair is much to be commended for simplicity of form, perfect strength, and adaptation for comfort.

In the carlier times chairs and benches were not stuffed, but had cushions to sit upon and cloths spread over them: atterwards, as the workmanship improved, they were stuffed and covered with tapestry, hather, or velvet. The forms and workmanship of have, or vere carrely very rule, but the staffs that covered them were of great richness and value, and tastenuly trimmed with fringes and gimps, fas-tened with large brass studs or nails.*

SOCIETY OF BRITISH ARTISTS.

The most striking picture in the Suffilk-street Exhibition is No. 86, "The Sick B y," hy T. Roberts, and this, strange to say, is not on the line. The objection that may be niged to it is that it recalls hy its composition the death of Chatterton, exhibited hast year in the Royal Academy, but in truth it owes withing to that might be it is an admirable mainting persant wou in crossing a ford, carrying her child. It is full of ebarater: as a piece of maij addition the piniting of the dress is additrable. No. 441, "11 Piecedo Tesoro della Madre," by the sume artist, although not quite so gond, is nevertheless a clever picture. Mr. Haristone's principal picture, "The Son of Louis XVI. ander the Tatelage of Simon," although noise and streaky. "There is much cha-racter in 379, "Waiting for Legal Advice," hy Compbell, jun.: the compressed bla addited to the streak of the strea romewhat coarse and streaky. "There is much cha-racter in 379. "Waiting for Legel Advice," hy J. Cumpbell, jun.: the compressed lip and raised toe are doquent. The field of the picture should have been a fittle-larger. Character is the quality for which 565, too, is distinguished, "French Soldian sdeardbing ther Battles;" and, as of the same class, if the visitor want a laugh, he may host at 327, "Auxions Suspense," where a young joskin, stealing apples, having slipped from the bough, is held mp by his "fock," while the owner approaches. 52. "Heatts-ense," is one of Mr. Baxter's gar-off and graeions female portrains, hefore which all stop. Mr. Cobbett's "Beg, Sir," 206, has heen inmortal zed in the Illas-Tatted News, and deserves it. "The Tsherman's Return," by J. J. Hill; 109, "Cressing the Brook," "416, by I. Henzel, "Virginin", '432, by M. P. Patten; "A Nearolitan Pifferaro," 528, by R. B. Paul, have good norks against the min our catalogue: Mr. Syer has sone bright fresh landscape; 205, for example, "Near Caped Curis, North Wales;" and 175, "Salmon Leap on the Couway." No, 13 is a good sound landscape by G. Cole; and "Albury Ponds," by the same, 408, is equally good, 105, "Brening on the "Lingwy," is a good specimen of "Brening on the "Lingwy," is a good specimen of "Brening on the "Lingwy," is a good specimen of "Brening on the "Lingwy," is a good specimen of "Brening on the "Lingwy," is a good specimen of "Brening on the "Lingwy," is a good specimen of "Brening on the "Lingwy," is a good specimen of "Brening on the "Lingwy," is a good specimen of "Brening on the "Lingwy," is a good specimen of "Brening on the "Lingwy," is a good specimen of "Brening on the "Lingwy," is a good specimen of "Brening on the "Lingwy," is a good specimen of "Brening on the "Lingwy," is a good specimen of "Brening on the "Lingwy," is a good specimen of "Brening on the "Lingwy," is a good specimen of "Brening on the "Lingwy," is a good specimen of "Brening on the "Lingwy," is a good specimen of "Brening on the speciment o

CROSBY HALL, BISHOPSGATE. EVENING CLASSES FOR YOUNG MEN.

EVENING CLASSES FOR YOUNG MEN. CROSET HALL was probably erected in the fifteenth century, but the exact date of its foundation is uncer-tain. In the year 1466, when the lease was granted to John Crosby, by Alice Ashfeld, prioress of St. Helen's, it is described as a great tenement, formerly in the possession of Cataneo Pinelli, a merchant of Genoa. it was, however, finished in 1470, by Alder-man Crosby, M.P. who was that year sheriff of the eity of Loudon, and in the following year kuighted by King Edward IV. coming into the eity. Soon after the death of Sir John Croshy, A.D. 1475, it was occupied by Richard III. whose connection with Crosby-place has heen immortalized

of Gloucester, afterwards King Richard III. whose connection with Crosby-place has heen immortalized by Shakspeare, in two well-known passages," while his residence there is affirmed by the best authorities, viz.—Sir Thomas More; the chroniclers, Hall and Hollinshod; and the historians, Rapin, Lingard, and the accurate Mr. Hallam. The next possessor of this princely mansion was Sir Bartholomew Reed, who spent his splendid and celebrated mayoralty therein, A.D 1562. He seems to bare entertained the Princess Catbarine of Arragon, two days before her marriage with the youthful

to have entertained the Princess Catoarne of Arragon, two days before her marriage with the youthful Arthur, the eldest son of King Henry VII.; and he is reported to have received there some ambassadors from Maximilian, Emperor of Germany, when they came to condole with the king upou bis son's early death death

Reed was succeeded by Sir John Rest, who was Lord Mayor in the year 1516. During the reign of Henry VIII. Sir Thomas More, afterwards Lord Chancellor, resided for several

At the dissolution of the Priory, the estate was surrendered to the Crown; and in the reign of Eliza-

sorrendered to the Crown ; and in the reigo of Eliza-beth it hecame the property of German Cioll a dis-tingenshed merchant, and his wife, Cicely, a daughter of Sir John, and cousin of Sir Thomas Gresham. In 1594, Crosby-place was pnichased by Sir John Spencer, on the eve of his moyonity, and it passed, through bis daughter and heiress Elizaheth, to Sir William Compton, Lord Northampton. It was while Spencer was Lord Mayor that Queen Elizaheth honoured the hall with her presence, and witnessed a measure conducted by the youry wits and preceders of

honoured the hall with her presence, and witnessed a masque, conducted by the young wils and revellers of Gray's-ina and the Temple. At the commencement of the Great Rebellion, A.D. 1642, when Sir John Langham was the occo-pant, Crosby-place was made a temporary prison for the Royalists, and several clergymen were sout there by order of the Commons House of Parliament. Thirty years afterwards (a fre having destroyed the greater part of the huilding, A.D. 1672), the hall was used as A Meeting-house for the Presbyteinas.

used as a Meeting-house for the Presbyterians, continued there, with some intermission, for

who continue there, who some intermission, for nearly a hundred years. In the year 1692, the estate was sold to William Freeman, esq, in whose family it still remains. Pro-hably in despair of its restoration, it was let to Messrs. Holmes and Hall, packers, and in utter dis-regard of its heautiful form and original occupation, it was sadly altered to be made available for their commencied utmoses commercial purposes. In 1831, the prem

In 1831, the premises, then in a ruinous condition, were advertised to he let on a building lease; and a public meeting was held, in order to avert, if possible, the destruction of an ancient and heautiful edifice so rich in historical associations, and so valuable in a scientific point of view, as a connecting link between the domestic architecture of the fifteenth and sixteenth

the domestic architecture of the filteenth and sixteenth centuries. A subscription was immediately opened, and extensive repairs, necessary to preserve the great hall from farther injury and dilapidation, were effected, under the gratuitons superintendence of Mr. Edward Blore, architect. The amount of subscriptions was, however, inade-quate to render the hall available to any useful pur-pose, or to provide for the ground-rent, and other maroidable expenses: the northern wall was still it a dilapidated condition, and the front in Bishopsgate-street was unrepaired. street was unrepaired.

street was unrepaired. A number of gentlemen (most of whom were in-terested in a Literary and Scientific Institution then lately opened at Scivalor House) associated themselves with a lady, whose energy and taste hud hitherto directed the work, and, assisted by the expe-rience of Mr. John Davies, architet, expended nearly 3,0002, more upon the property. For seven years the Literary and Scientific Institution found an agreeable home at Crosby-place, hut ceased its tenancy in 1849. tenancy in 1849.

* Act 1, scene 2; act 1, scene 3,-" Richard III."

The committee for Evening Classes for young men then engaged the hall for their weekly lectore; and at Michehemas, 1851, opened also a reading-room and library, at a price so small, as to be within the reach of every mcreantile clerk and industrious mechanic, who desired mental improvement, and a wise occupation for his leisure honrs. In the face of great difficulties, the committee have earried on their Institution with great usefulness to the thousands of young men who have, from time to time, joined the classes, many of whom have improved their position in life by the instruction they have obtained. Three have been recently apointed to clerkships at the Privy Conneil-office, and several distinguished themselves at the examination held in Jute last, by the Society of Arts. The present leascholders have, however, recently determined to part with their interest in the building, and the committee are desirous of purchasing it, in order to preserve the building during the remainder of the lease (seventy-oine years), for educational pur-poses. In the event of their helars mable to accom-

order to preserve the building during the remainder of the lease (seventy-nine years), for educational pur-poses. In the event of their heing musble to accom-plish this object, the lease will be offered to public sele. To what purpose it might then be applied it is impossible to predict. The arcbreologist, the lover of the heautiful in architecture, and the friend of educa-tion, earnestly desire the continuance of its present appropriate occupation; hat as the sun necessary for the purchase of the lease is considerable—5.0007. or the purchase of the lease is considerable—5,000/. or 6,000/.—the aid of the public is asked, and a subscrip-tion list is opened at the hall. To induce the assist-ance of some of our readers is the immediate object of the lease is considerable--5,000/ our notice.

PREMIUMS IN COMPETITIONS.

THE shameful results which are constantly following This shameful results which are constantly following most competitions have often in your pages heen well commented upon, and many modes of procedure suggested to cure the inercasing cvil, some of which are admirable, but none have, so far, been practically carried out. It appears to me that the real sonree of such evils is in the arebitects themselves; and I cannot but think that with a determined unacionity among ourselves, we could soon put a stop to such proceedings. It is self-evident, that if the shameful calls remained unanswerd. the calls would soon core calls remained unanswered, the calls would soon cease to be made.

First as regards the premiums, which are so often totally indequate. I would suggest that archi-tects, one and all, should agree never to respond to any competition unless the successful competitor be any competition unless the successful competition of allowed to earry out the work at the usual commis-sion of 5 per cent. and in addition to that, a premium of 1 per cent. in consideration of the superiority of of 1 per cent. in consideration of the superiority of his design above those of the many other competitors. The first premium would then be 1 per cent. on the cost. For the second premium, I would have it agreed not to accept less than 23 per cent.; and for the third, 1 per cent. The shaurdity of calling the first premium such, when it is to be merged into the com-mission, often a reduced one, must he manifest to all. The premiums for a 1,0002, huilding would then stand thus:--First premium, 107, in addition to the usual 5 per cent.; second premium, 257.; third premium, 107.

usual 5 per cent.; premium, 107.

premium, 107. Now, as regards practically carrying out this scheme. Should it be approved of, nothing is simpler. It is only requisite that such architects as engage themselves to abide by the ahove rules should he in-vited to forward their names and addresses, to be publicly chronicled in the *Builder*; and I feel sure we should soon see the names of all the principal men in the profession put down, thereby testifying their desire to support their character, and raise the style of design throughout the country. A Pagaynetat Appendix of the style of the style

A PROVINCIAL ARCHITECT.

COMPETITIONS.

Etheridge Memorial, Bilston, Staffordshire.—The committee for erecting this memorial have selected the design of Messrs. Bidhke and Lovatt, architects, of Wolverhampton, which is to be executed in Mans-field magnesian limestone, by Mr. Horsman, of the Wolverhampton Stone and Marble Works.

Wolverhampton Stone and Burner Forest London.—The designs submitted by Messrs. F. and H. Francis, for the National Discourt Com-pany's offices, in Cornhill, have been selected. The other competitors were Mr. H. Baker, Messrs. Nelson, W. N. W. Randall, and Mr. C. O. Farnell. The four Mr. N. T. Randall, and Mr. C. O. Parnell. The four unsuccessful competitors received 25/. each for their plans; a fair and honourable arrangement.

pians: a tair and nonintrane arrangement. Iterator Centerey,—The designs of Mr. Benjamin Wilson, of Alfreton, have been selected; and a tender from Mr. Joseph Evrans, builder, to excente the works under Mr. Wilson, has heen accepted. 'The Derby Advertiser says,—"The chapels, which are to be placed some little distance from the entrance, are separated by an archway surmounted hy a helfry and affording shelter for hearses and mourning cosches;

[April 4, 1857.

and a covered entrance common to hold chapels, each of which has a robing-room connected with it. They form a cross on plan, the gable end of the Episcopal chapel looking east : considerable similarity is observed in their style and orrangement. The walls are in-tended to be huilt of stone, backed with bricks ; all the dressings heing of chiselied ashlar. The framing of the root, the doors, desks, sents, and other fittings, are to be of deal, varnished. The floors of black and real tiles. The lodge contains two rooms, with pantry, &c. ; and board-room for meetings on the ground-floor, with hed-rooms above."

ENCAUSTIC TILES TURNING DULL.

ENCAUSTIC TILES TORNING DOLL. With regard to the complaint of your correspondent "F.K." (p. 179) I beg to say that the appearance he describes is probably due to the minute poreson-the surface of the tile having become filled with mortar when first laid down, which, whenever the surface of the tile is thoroughly dry, gives them a diugy grey appearance. Should this he the case, the only remedy 1 know of is to dissolve out the caronly remedy I know of is to dissolve out the car-honate of lime by using subplurie or mariatic acid; or the former after saturating the floor with a strong solution of sal-ammoniae. This remedy will also be effectual should the greyness arise from efflorescence of the salts or other constituents of the cement or mortar, or of the coucrete, if any, which frequently, mortar, or of the couerete, if any, which frequently, if the abstratum is damp, proves an inveterate source of anoyance in this manner. In fact, where the foundation is damp, more care than is usually he-stowed upon tiles, which any one will undertake to " rattle down," is necessary to prevent the appearance of saits on the surface. Where eventual dryness is attainable, the tiles may be much improved in appear-ance, and a gloss obtained, by washing with milk, which is much precised. Another frequent cause of " encaustic tiles turning

Another frequent cause of "encaustie tiles turning dull" is neglect of eleanliness, and I can truly say,

dull" is neglect of eleanlness, and I can truly say; that where the foundation was dry, and the owner eareful to keep them clean. I have never scene neaustic tides which did not look quite as well twelve years atter loying down as during the first week. There is nothing in the tile itself to "torn dull." if kept clean it will never look so. Frequent scouring with a *flannel*, silver sand, and clean water, is all that is necessary under the most unfavourable circum-stances of traffic. The opposite course is also a good-one, to encourage an oleginous crust over the surface by use of milk. by use of milk.

F. HEWS, for MINTON and Co.

THE LONDONDERRY MONUMENT AT SCRABO.

THE first stone of the memorial about to be The first scole of the memorial about to be erected to the late Marquis of Londondery, in County Down, Ireland, and of which we now give a view, was laid on the 28th of February last, as noted at the time.

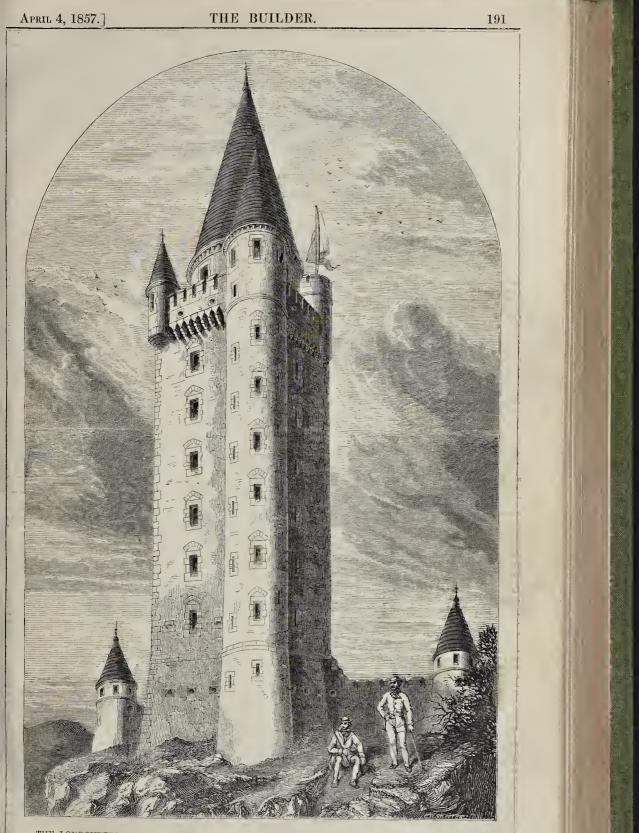

last, as noted at the time. The monument, which is to stand on the highest point of Scrabo Hill, near Newtownards, nignest point of section fini, near Yew wonands, and 500 feet above the level of Lough Strang-ford, will be a tower in the Scottish chateau form. The walls are to be built throughout, and faced, with rubble work of hard basalt. The door and window dressings, quoins, coping, &c. are to be executed in sandstone. The sandstone is procured from quarries at the base of the bill, and the basalt overlying it enables the material the site of the second roofs are to be executed in sandstone, in the same manner as church spires. The architects are Messrs. C. Lanyon and

W. H. Lyun.

The contract has been taken for 2,000%. the exact sum provided by the committee in their instructions to architects: under the present system of competitions, perhaps this fact may he considered rather singular. The tower will be 135 feet in height. A stone

staircase will ascend in the round tower to the starteness will ascend in the round ower to the parapets and guard chamber, which will be fitted up with an armoury, with oak panels, and ground ceiling. The building will afford accommodation to a *custodica*. The form is considered appropriate to this quarter of the bundless incomparise to initial buildings are not kingdom, inasmuch as similar buildings are not unfrequent in Ulster, into which they were introduced by the Scottish countrymen of the Stewart-ancestors of the Londouderry family.

THAMES TUNNEL .- In the week ending 28th of March, 54,611 passengers passed through the tunnel, and paid 2271. IOs. 11d. in tolls.

THE LONDONDERRY MEMORIAL, COUNTY DOWN, IRELAND .----- Messre. Lanyon and Lynx, Architects.

ST. THOMAS'S CHURCH, NEWPORT, AND THE ROYAL MONUMENT.

Some time since, we printed a short paragraph respecting the monument which her Majesty commissioned Baron Marochetti to erect in Church, at Newport, in the Thomas's St. Thomas's Church, at Newport, in the lale of Wight, in commemoration of the virtues and sorrows of the Princess Elizabeth, second daughter of Charles I. We now give a few particulars of the church itself.^{**} In the reign of Edward IV. the town was burnt by the French; and St. Thomas's appears to have shared in the injury, as many of the stones had the marks of fire clearly discernible, when willed down in US14.

when pulled down in I854. Various alterations had the effect of destroy

rations aneratons muferent of energy distribu-ing any rehitectural uniformity that might have originally existed, and rendered the building an anomalous combination of successive periods. Upon an architectural survey, in 1853, the huilding was found to be too far decayed to allow hope ing was round to be too far accayed to allow nope that any repairs would be effectual; the hearings of the beams being so worm-caten as only to cause wonder that they had not fallen hefore. Accordingly, the paroobial authorities and the inhabitants generally resolved to raise funds for the ergetion of a new huiding. Subscriptions the erection of a new building. Subscriptious were obtained, her Majesty and Prince Albert heading the list. Two bazars were also held in Carisbrooke Castle, the proceeds of which (2,000/.) materially aided the funds. Architects (2)000.) initiating and in designs; and one by Mr. Dankes was selected. The huiders were Messrs. Dashwood, of Ryde; and the earvings were entrusted to Mr. Baker, of Kennington. During the process of demolition, many curious of the process of demolition. They have been demonstrated and the selection of the selection.

During the process of demonstraining margine discovered. They have relies of antiquity were discovered. They have beeu described by Mr. Ernest Wilkins, curator of Newport Museum, where many of them are preserved. Many mural paintings were found : their colours were black, red, yellow, and puce. Those of the middle aisles were better preserved dues these in the ride aisles. They had here than those in the side aisles. They had been than those in the state asies. They had been renewed from time to time—the old paintings having been covered with a layer of whitewash, and upon that the new painting was excended. On August 24, 1554, the first stoue of the new building was laid by Prince Albert, with Mucrovic forms.

Masonic forms.

The style of architecture is Early Decorated ; and the building consists of a nave, with clere-story, side aisles, north and south porches, aud chapels; western entrance, arch, and tower.

nterior of the roof is open timbered, with 1 ribs. The large stone corbels carrying The i moulded ribs. The large stone corbels carr the principals have some good specimen carving, representing maple, nut, thorn, ivy, oak,

vine, rose, &c. A richly-carved screen separated the body of the old church from the chancel. In the new

the old church from the chancel. In the new building, this screen has been adapted into a new reading-desk. The pulpit has been preserved, and placed on its old site, near the chancel. The top or sounding-board, is an irregular octagon. The north chapel contaius her Majesty's tribute to Elizabeth Stuart. Near this spot, "about the middle of the cast part of the chancel," the princess was interred. But the memory of this event passed away; till it chanced that, in October, 1793, some workmon who were digging a grave to receive the rewho were digging a grave to receive the re-mains of the Hon. Thomas West, accidentally discovered the initials E. S. engraved on a stone in the floor: Beneath was a vault containing the princess's remains. The coffin was of lead, the princess's remains. The column was of lead, ridged in the middle, and in good preservation. An inseribed plate proved its identity, by this inscription — "Elizabeth, 2st daughter of y" late King Charles, dee'd. Sept. 5, MDCL." A tablet was then creeted to perpetuate the event; but that also at last departed, and no further memento was added. till her Majesty memoria the screeger of the writewas from the

rescued the memory of the princess from the neglect into which it had fallen. For the monument, sunk 2 feet 6 inches in the wall, is a space with the stone back carved to represent hars of a prisons In front, iron spikes depend about a foot from the top. Below is a figure of the princess, in Carrara marble, the dress in accord-One delicate arm ance with the Stuart period. One delicate arm and hand rest on the waist : the other is extended

* This notice, with some others in the present number,

by the side, with the hand partly open. The neck is bare; and the check reclines upon an open Bible. Gothic mouldings are, on either de of the monument, continued square round side of the invaluence, communicating being seg-mental. The height is 5 feet 6 inches; width, 8 feet 3 inches; projection from wall, 3 inches. The figure is well spoken of, but the niche, with its mouldings, if we may judge from an engrav-ing, is wanting in the right character and effect.

ing, is wanting in the right enaracter and effect. Accommodation is provided in the church for 1,460 worshippers; and the total cost of ercetion and fittings is 10,719. We have gleaned these particulars from a tasteful little volume, by Mr. Samuel B. Beal,^{*} which contains a view of the church and one of the monument. The writer deals too freely with superlatives, but the book will nevertheless he found a very useful and pleasant companion to the church.

CATTLE IN LONDON.

ALTHOUGH the new regulation respecting the slaughter-houses of London has effected the slaughter-houses of London has enceded much good in certain districts (particularly in the City), still it is by no means uncounter to see a flock of sheep dropped, and pushed through trap-holes, into deep cellurs, or oxen persuaded by blows, tail-twisting, and other gentle means, into the doorways and narrow passages of ordinary dwelling-houses, and then slaughtered in most unfit and inconvenient places, which are surrounded by thick populalions

Reflecting on the evils of this practice, which is not only injurious to health, but also the cause of considerable waste of valuable material into the sewers, the writer visited, the other day, the recently erected slaughter-houses at new The recently elected shadpherhouses and pro-perly ventilated places, fitted with the proper machinery for hoisting heavy animals: there are receptacles for the various kinds of refuse, almost the whole of which is sold at a profit, and but little is allowed to pass into the great drain, which runs to Essex. + At frequent in taria, which ruis to essect. At trequent in-tervals, everything is cleared away, and by meaus of an clastic hose, and powerful force of water, the roof, walls, and floors, arc so thoroughly purified, that no taint remains. Second of the Lorden tails Several of the Loudon batchers are beginning to avail themselves of these places, finding that it better and cheaper to have their animals slaughtered in properly appointed houses than in ill-arranged dark and poisouous slums.

On market days, it is an extraordinary sight, at Smithfield, to see the crowds of oxen and sheep which are driven through the streets to various parts of the metropolis, in some places almost stopping the other traffic. The process of driving over long distances of the hard and often slippery pavement, does not improve the quality of the beef and mutton; for it is a well-established fact, that hullocks lose 20 lbs. when driven 100 miles, sheep, S lbs. and hogs, S lbs. each; and it has, therefore, been found that it is cheaper to send them hy railway than to incur the loss of weight, tollage, and cost of driving.

Large quantities of small-sized beef and mutton arrive in London by railway and steam-packets, ready prepared, from parts of Wales and other remote districts, and are sold at and other price; and it seems to be worth the consideration of the larger cattle traders and the London meat salesmen, if it would not be to the advantage of all to slaughter the animals on their farms, and send them to London ready for the shop. It is, unfortunately, difficult to get rid of old customs; and we fear that it will be some time yet hefore the slaughtering of animals in this large metropolis has ceased. animals in this rarge. We hope, however, that before the summer-comes, the cellar slaughterhouses and other wrong places will be visited, and made conform-tion regulations. The poor miserable is their dark and able to the regulations. The poor miserable London cows, many of whom, in their dark and unwholesome lairs, look almost as wretched as the horses we have often pitied in the coal-

* Published by Etheridge, Newport; Dalton, Cock-spurstreet, London. † The Parisian butchers, it is told, do not waste a particle of either oren or sheep: all is used for food, or for agricultural or chemical purpose.

[April 4, 1857.

The mines, should be looked after : some of these mines, should be looked after: some of these places, which are to be seen in narrow alleys, are so contrary to the nature of the dumb brutes, that it is impossible that they can be in the condition to supply wholesome milk. The grains from the neighbouring breweries, and other im-proper kinds of food, cause the animals to yield a larger quantity of a liquid called milk than they would do if roaming in the fields, or fed with pure materials. The children who are made to depend on such milk suffer greatly. It will be a good day for the poor beasts, and drink milk, when the cows are driven out of their collars into the green fields.

MANAGEMENT OF PORTLAND CEMENT. :

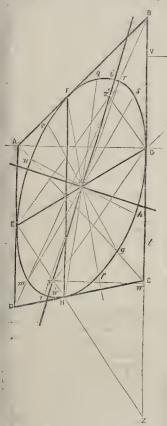

ALLOW no to make a few observations on the "Suggestions" offered by a "Clerk of Works" (page 167), in answer to your correspondent "Rustie," of the preceding number (March 14th), respecting the varied colours which occur in the drying out of Dealed lowerst stores feats.

the varied colours which occur in the drying out of Porlaud cement staceo fronts. His first suggestion is good, viz. that of colouring with Portland cement colour: his second, that of "mixing large quantities of cement with well-washed soud in a huge tough," is an idea that is at once fallacious and impracticable, for reasons that are obvious. Imprimis, it is well known that either Port-land or Roman cements while in their powdered state loss their strength if they are exposed for any length of time to the action of the atmosphere or to damp, thus becoming actually deal, next, the improbability of being able to dry the sand after the washing pro-cess—especially in large quantities—sufficiently to justify its heing mixed with the cement in the manace described; as the almost improceptible moisture which is found in the sand for weeks and mooths after washing—to say nothing of its being atterwards exposed to atmospheric influences,—would in a few days destroy from '50 to '75 of its virtue. The result of oneth an experiment must necessarily be a fulture,—while the authority upon which it is hased is cleanlated only to mislead. If experience can treach, its teachings will be found to be diametrically opposite to those of your correspondent; and, instead of mixing the sand and cement in the quementing. teach, its teachings will be tound to be diametrically opposite to those of your correspondent; and, instead of mixing the sand and cement in large quantities, it advises that they be mixed in small quantities; suffi-cient only for one "gauging," the size or quantity of which should be regulated according to circumstances, such as the number of monthet are supplied from which should he regulated according to circumstances, such as the number of men that are supplied from any one gauge box with it, and whether they are roughing in or fining off. Be that as it may, when mixed it requires using immuniately; and in no case attempt to wet up again and use, after it has been standing for some time, and found to be "gone." Care also should be taken that the same ratio he always observed in the mixing of each separate gauging; if not, it is either too "fat" or too "poor; "this is of the greatest importance, as the neglect of this precaution affects—not so much the colour as—the strength of the stuce generally; and is one of the principal causes that produces the cracks colour as the strength of the stuce generally; and is one of the principal causes that produces the racks on the surface, so frequently complained of hy some of your renders. Lastly, open but one cask or so at a time, and avoid all unnecessary exposure to air, &c; and as the work progresses colour it as fast as it is finished, with Portland cement colour, thinned with here around (or bottome), it is then readily absorbed heer grounds (or hottoms) : it is then readily absor and, as the cement dries and hardens, the colour and, as the cement dries and hardens, the colour he-comes fast: a second cost will be found necessary comes last: a second cont with be total network when completed, but not so thick as the first coat already given: this will, after a time, dry out in one uniform colour, and have the appearance of a Porland stone front. A PRACTICAL MAN.

PRACTICAL PERSPECTIVE.

Some time since mathematici ins were not a little Sour time since mathematic ins were not a little startled at an assertion male by the head-master of the Training-school, at Marlborough House, namdy, "that a circle seen in perspective is not an ellipse." A demonstration of the commonly received notion very properly appeared in the *Builder*, but I did not expect that that demonstration would make proselytes of the supporters of Mr. Burchett's new theorem (2), hecause a tolerable acquaintance with Euclid's ele-ments, as applied to conic sections, would invitably persona are one being led astraw by any assertion in. ments, as appared to the status, were intrinsip prevent any one being led astray by any insertion in-compatible with true geometrical principles. The realers of the *Builder* will not, therefore, be sur-prised when I tell them that there are other teachers of drawing, who still adhere to the new notion.

of drawing, who still annere to the new horizon. Now, I am not about to give any demonstrations myself, hut having been asked by one teacher for some authority of sufficient importance, to induce him to acquiese in the commonly received opticion, without being at the trouble to learn come sections for him-self, I would merely refer him and others of the same

Let ABCD in the accompanying figure represent he perspective of a vertical square, whose plane is not parallel with the vertical plane of the picture; SA and CD being lines converging towards the AA and CD being lines converging towards the annihing point; and suppose it he required to repre-cut the perspective of a circle within the square appresented by ABCD. Draw the diagonals, BD and C, and through the intersection at O draw HF atticulty, and GE to the common vanishing point; nen will GE and HF represent accurately the hori-nutal and vertical diameters of the circle, and the edges of the quadrilateral will be tangents to an ascribed ellipse, touching at the points EFGH. Thus, in the method is very common, but for the sake of courser, more points are needed. Now, because the angents AD, BC are parallel, the line EG will pass arough the intersection of the conjugate and transarough the intersection of the conjugate and trans serse diameters of the ellipse : hence, biseet EG in x **ETRO Gumeters of the ellipse:** hence, bisset EG in x_i from F x_f and H $x q_i$ make xq = x H, and $e^f = Fx_i$; then will q and f be points in the eurve. If the ellipse. Farther, draw GT, making an angle if 45 deg, with, and equal to GB; draw TV per-imilicitar to GB, and draw a line from V to the unisibility point, euting the diagonals at r and x_i cut a diagonals at m and q_i by vertical lines from n and be thus four units more are found in the entrop. as diagonals at m and g, by vertical lines from n and b thus four points more are found in the curve : as again, draw lines from these last found points arough the centre x, and four other points will be and in the same manuer as g and f were found : us then are there fourteen of the most essential wints in the elliptic enrycfound. Now, all this may b done in much less time than it has taken me to rearibe it, and I am sure the curve will be much type accurately represented than by the usual bathods. It is frequently very desirable to know the

school to Dr. Hutton's, Francœur's, and Hamilton's in the columns of the Builder, if it had not been for school to Dr. Hutton's, Franceur's, and Hauilton's conie sections. The first mathematician demonstrates the nature of nerspective representations of circles, simply from Euclid's elements; the other two do the same thing by analytical geometry. Dr. Hutton's demonstrations being the simplest, I would recom-mead his book to beginners in preference to those of the other mathematicians, although the latter are Cambridge buoks, and may, therefore, have sufficient of the so easily understood. I would not have taken any notice of this subject

> true position of the elliptical axes : this may be done true position of the elliptical arcs: this may be done very expeditionsly as follows: make the line Ex =w'i, the transverse axis bisect Gx in w; draw wyperpendicular to Gx, enting Ex in y; then will y be one of the foci to the ellipse; the transverse axis may then be drawn through y x i, and the conjugate at right angles. When this is done the curve will at once assume the appearance, as it really is of a true ellipse, and any one may upper pricieally that this Once assume the appearance, as it really is of a true ellipse; and any one may prove practically that this is really the case by drawing the curve in the usual manner, and comparing it with the known properties of the ellipse. The problem for finding the transverse axis is founded on the known property of the ellipse, that z' = t = y = wc', y and z' being the foci, and y.G = E z'.

I believe the mistake about the nature of the curve has arisen from confounding the perspective, hori-zontal, and vertical diameters of the circle with the Zontal, and vertical diameters or the error with the acces of the curve which the represent the eircle; this is, indeed, the ground of Mr. Barchett's assertion (see page 78 of his "Practical Perspective"). All that thave written in confirmation of the curve being au ellipse is founded on the supposition that the plane of the picture ents vertically through an oblique reas writent, eating, the circle to be represented.

phase of the preview entry through an oblique cone, without cutting the circle to the represented, which is the base of the cone,—the point of sight being the apex. If, however, it he required to repre-sent the perspective of a circle on plau, and the point of sight be in a vertical base either above or helow the circumference of the eircle, then the perspective of the circle up a variable plaue will be correly key. the circumference of the eircle, then the perspective of the circle on a vertical plane will be parabolical; and if the point of sight be within the circle the curve will be hyperbolical. For instance, if it be required to make a perspective view of the interior of a circular building, and the station point be at the entrance, ngoo the circumference of the horizontal circles to be represented, then all the representations of such circles will be parabolical, and may be accu-rated drawn on the perspective circle with some rately drawn on the perspective itself, with even greater rapidity than the elliptic eurve. In conclusion, I may state that I have not thought

it necessary to prove everything relative to my method; I have merely applied the well-known pro-perties of conie sections in a way which I think is somewhat more expeditious and accurate than what is usually adopted. JOHN BURLISON.

CHURCH-BUILDING AND PROVINCIAL NEWS

Yarmouth. — A new church for beachmen and seamen, to be called St. Andrew's, is to be erceted here, on the open ground to the westward of the 'look-out.' The nave will be 55 fort 6 inches in length, and in width 26 feet, having a contro aisle fort in width. The observation of consentil be length, and in width 26 feet, having a courter aisle 4 feet in width. The chancel and apse will be 24 feet in depth, and the vestry on the south side, with a porch adjoining. Three will be another entrance and porch out the north side of the nave. The church will seat about 600. The architecture will be Early English, with lancet arches and high pitched root. The wails will be of cut finits, with hrick on the inner surface. The foundations will be in courter, and the walk will be supported by commented but While the set about 000. The arenitectific will be Early English, with lancet arches and high pitched root. The walls will be of earl finits, with hrick on the inner surface. The foundations will be in coarcete, and the walls will be supported by ornamental but tresses. The jambs, sills, and nullions of the windows will be of Caus stoue, and the plinths, eaves, quoins, slopes of buttresses, copings, labels, and belt-tarret, of hard Bath stoue from the Box quarries. The root

will be covered with Delabole slating, and the windows

will be covered with Delabole slating, and the windows will be in lead quarries. The designs have been pre-pared by Mr. J. H. Hakewill. *East Peekham (Keut)*.—The church of East Peek-ham is being restored nuder the direction of Mr. Joseph Clarke. The interior of the chancel and south chapel are completed with the exception of the proposed new roofs. The work has been carried out by Mr. Carruthers, of Reigner, who has had considerable South chapel are completed with the exception of the proposed new roots. The work has been carried out by Mr. Carrethers, of Reigate, who has had considerable difficulties to overcome in taking down and rebuilding the accude and chancel arches. The chancel fittings are of oak. The floors are hild with Minton's tiles, and the steps are of Bethersden stone, which so nearly resembles Purbeck, as often to be mistaken for it. Several works of interest were discovered during the restoration. A memorial window by O'Conner has been placed in the . . . apel. There are two curious objects of interest worth noting; one, an iron instead of a hrase cross, inlaid in a ledger of the date 1487, the iron prohably coming from the neighbourhood ; and in one of the north windows of the nave. is a curious inscription, painted in the place of, evidently, a distasteful representation which existed at the time, a distasteful representation which existed at the time, as follows

"Here stood the wisked Fable of St. Michael wayinge of soules, 'By the lawe of Queen Elizabeth according to God's word is taken awaye.''

Eastbourne (Sassez).—The new eemetery for this parish is just completed. Two chapels in the Early English style have been erected, built in fint and brick, with Bath stone dressings. The Episcopal chapel is surmonned with a bell tarret, with a vestry adjusting extend has merch, and merces interacting the chapel is surmounted with a bell tarret, with a vestry adjoining, entered by a porch; and measures internally 36 feet by 18 feet, with sents for fifty persons. The Dissonters' chapel is 25 feet by 18 feet, with a vestry, and seats for thirty persons. The ground is laid out in paths and shruhhery borders, planted; and con-tains four acres: it is surrounded by a brick and fluit well, with a gataway, and stone piers from the old London-road. The chapels were desigued and carried out under the superintendence of Mr. Ferrey. Mr. Haines, of Easthourne, was the builder, and Mr. Haines, of Eastbourne, was the builder, Mr. S. Stapelton clerk of works. The total cost, inchading the conveyance of the land, is about 2,000/. The Episeopal chapel and ground will he consecrated

The school-house is believed to be the original our

The school-house is believed to be the original one, built about 350 years ago. The doorway is of ancient brickwork, the sides being formed with moulded bricks, and a Gothic elliptic arch over, corresponding with the sides. The bricks, it is said, are to be care-fully preserved. *Clifton (Bristol)*.—Christ Church, Clifton, which has hitherto remained uofinished owing to the want of funds, is about to be completed. The tower will at once he earried up to its full height. The cost will be defrayed by subscription, and 800?. have already been raised; but between 500? and 700?. more will be required to complete the tower in the ornate style been raised; jout between 5007, and 7007, more will been raised; jout between 5007, and 7007, more will be required to complete the tower in the ornate style of the building. The opportunity will be taken to build an additional aisle, the cost of which, estimated at 1,300. will be defraved by the Rev. Mr. Bevan, one of the entrates of the church. The completion of the church has heen confided to Mr. Even Christian.

Middlewich .- The church of St. Michael, in this Middlewick.—The church of St. Michael, m thus town, which has become mutulated partly from causes during the civil wars, but more from ruthless church-wardens since, is now about to be restored by Mr. Clarke. The whole of the interior will be swept away, leaving, bowvere, the interesting memorials of the Vernon family in the Barou's Aisle and Ladye Chapel; and, instead of the galleries round the church wald the mesone liftle bores or news, the church will and the present little boxes or pews, the church will be seated with handsome stats raised to the original levels of the floors. The chancel will also be restored ; levels of the iteors. The chancel will also be restored; and the tower, which scens constructed for the pur-pose, made the baptistry and the present font moved into it. Mr. France, of Bostock Hall, carries out the restoration of that part of the plans which comprises the chaptes attached to the Kinderton lands, and held from the Conquest down to a recent date by the same family, the original Barrons of Kinderton. The Jacobin screens will be preserved, and all that is interesting. Besides these works, it is intended to restore, if funds can be found, the decorated from as a memorial to can be found, the decorated front as a memorial to the late Rev. Thomas Hulse, the founder of the Hulsen Lectures, who was buried in this church.

Bakewell.-Mr. Alleard is about to commence one very extensive additious to his mansion at Burton

stage. the stage. *Chorley.*—On the 19th ult. the first stone of a Roman Catholic Church was laid at Aspull: it is to he dedicated to "Our Lady of the Immaculate Con-ception." Size of church:—Nave, 64 feet long: Be deniated to state of church :--Nave, 64 feet long; width (including aisles), 39 feet 5 inches. Chancels and small chapels will be added at a future period. Style - Early Decorated Gothic. Architect -- Mr. Goodman, London. Builder -- Mr. James Fairclougb, Wigan.

Wigan. Bradford.—The church of St. Mark, Low Moor, has heen consecrated. It consists of a nave, transepts, and chancel, with a turct and spire, vestry, &c. The style is Early D. cont.d. The nave consists of four boys, in each of which is a two-light window, three foiled, with alternate tre-fork and four-foils in the head, as are the two windows at the west end. Above the two last is one of a spherical triangular form, the two last is one of a spherical triangular form, composed of six tre-foils. The transpers on their east and west sides are lighted by three tre-foiled windows under arehes of construction, having their leads filled in with a four-foil. On either side of thesouth transper doorway is a slight tre-foiled light, and above a wheel window, 12 feet diameter, formed of a centre four-foil and eight radiating tre-foiled lights, filled in with small four-foils. The north transpet differs from this copy in paying an doarway and having a small treand open reduced receiver angets, litter in with small four-folis. The north transpet differs from this only in having no doorway, and having a small tra-foil in the gable for ventilation. The south side of the chancel contains a three-light window of inter-secting tracery, the light and the tracery tra-folied. The east window is of ifve lights, and is composed of two fenestalle, and a complemental light. The gable contains a spherical, trac-folied triangular opening. The turret is of three stories, surmounted by an octa-gonal spire, rising to the height of 80 feet. Eatering by the south doorway, the font stands on the west. It is deal, stained; the remainder of oak. The chancel arch is of three orders, the moulding resting upon deeply carred capitals and shafts. The chancel is entered from the nave by a flight of three steps. The deeply carred rapitals and shafts. The chancel is entered from the nave by a flight of three steps. The floors of the aisles and the landing of the chancel are laid with plain Staffordshire tiles; the space within the rails with Miuton's pattern tiles, black, red, and bird. The roof of the nave is composed of arched r hs, which run down the walls, and rest upon carred arbs, which run down the solar staff rest upon carred stone brackets. The roofs of the transepts and chancel vary in construction, whilst the four meeting at the intersection are formed of arched braces, resting upon intersection are formed of arched braces, resting upon earved stone corbels. The windows are filled in with Hartley's patent rolled rough plate glass, furnished by Mesara. Watson, of Dunfermline. The stained glass at the vest end, which is of decorated character, but, according to the *Bradford Observer*, from which we quote, not very effective, is from the same firm. The dimensions of the cburch are as follow --Nave, was to west 68 feet - moth to santh 24 feet. Chanced The dimensions of the church are as follow :-- Nave, east to west, 68 feet; north to south, 24 feet. Channel, east to west, 22 feet 6 inches; north to south, 19 feet 6 inches. Transepts, east to west, 20 feet; north to south, 13 feet. Vestry, east to west, 9 feet; north to south, 10 feet. Turret, 10 feet 6 inches span. The accommodation is on the ground-floor for 350 sittings; in the transept galteries, 120 sittings. The architects were Messre. Mallinson and Healey.

Bathgate.-Plans for the proposed Corn Exchange Jarvey street are thus described in the Falkirk Herald. The elevation is simple, and when the huilding is finished it will have a good effect, and be an ornament to the town as well as a great public convenience. The front portion of the building is to consist of large shops on the ground floor, with a commodious hall on the second story for public meet commotions hall on the second story for public meet-ings. This hall is to be lighted by large arched windows, and the shops are to have windows of plate-glass. A large gateway in the centre will admit the public to the market behind; and at one end of the building there is to be a steeple and clock. The frontage of the holiding is 40 feet, and the depth of space occupied is nearly 90 feet. The market area is to be roofed with glass. Upwards of 1,500? have here asheerided.

to be routed with glass. Upwards of 1,500% have to be routed with glass. Upwards of 1,500% have the subscribed. Portsoy-The new building for the Ladles' Seminary, at Portsoy, has heen contracted for, the contracted being, for the masonwork, James Wilson, Portsoy; joiner-work, W. and P. Thomson, Portsoy; julaster-work, James and Ross, Banff; slater-work, James Watson, Portsoy. Netherdale. — The Banffshire Journal states that additions and repairs are ahout to be made on the House of Netherdale, in that county, the residence of Mr. T. G. Rose Innee, of Netherdale. The house is situated in the parish of Marnoch, overlooking the Deveron. Besides considerably heightening the pre-

sent huilding, two large wings are to be erected. For the mason-work, Fraser and Son, Aberdeen; ear-penter-work, Runnic, Aberdeen; slater-work, Walker, Banff; plaster-work, Simpson, Elgin.

A RECOLLECTION OF THE LATE GEORGE STEPHENSON.

THE writer of this notice remembers well, thirty years or so ago, in the north of England, the old colliery tramways; the "loggerheads," or pnmping engiues, for taking the water from the coal-mines; the inclined planes on which the loaded coal-waggous were made to draw np those loaded coal-waggons were made to draw up those empty; and one of the first of the locomotives, an unwieldy apparatus, with ontsetting ironwork, which moved something like the wings of a bat, and in its progress made a most horrible aud snorting noise. This engine, called the "Iron Horse," was able to travel at the rate of fonr or five miles au hour, dragging after it nume-rous waggon-loads of "hlack diamonds." This was a great inprogrammation the old tramways at improvement on the old tramways, was a great improvement on the old transmission which seldom, on an average, exceeded a speed of three miles an hour.

Abont this time George Stephenson, who has About this time George Stephenson, who has himself felt pride in stating that he had worked for twopence a day, and eaten a red-herring for dinner at the pit's-month, chanced to be em-ployed in earing for the "loggerheads" at one of the late Lord Ravensworth's pits, when his genins was discovered, and, from very small beginning, Mr. Stephenson was enabled to open a manufactory for engineering apparatus, which erew randily, and in a short time a long regiment grew rapidly, and in a short time a long regiment of workmen night be seen at the proper honrs moving to and from Stephenson's factory on the Forth hanks at Newcastle on-Tyne. The rail ways were projected, and the writer well remem-bers seeing the prize locomotive engine tried in place this

The labours of this self-tanght man in connection with the commencement of railways are so well known, that it is unnecessary to enter into particulars. Having watched and marvelled at this wondrons introduction, and having from school-boy days been as familiar with the name of George Stephenson as with that of any other well-known fact, it was with no little pleasnre and enriosity that I availed myself of the opporthis of meeting with this celebrated man. This took place in 1845, that year of railway speculation, when civil engineers' and surveyors' minutes and bours were worth fabulons sums of money. The offices of Mr. Robert Stephenson were filled with a crowd of persons of varions conditions seeking an interview, and presented contained seeking an interview, and presented very much the appearance of the levee of a minister of state. Here, amongst others, popped in the "railway king," followed by a sort of staff of persons. Amongst the group appeared a gentleman of middle height, neatly drossed in black: the coat of old-fashioned ent, with memory poplets in the tails with the product square pockets in the tails, and the pocket-bandkerchief hanging some distance ont, a white neckeloth and a large bunch of seals suspended by a watch-ribbon, completed the costume of George Stephenson; for he it was who was present, engaged in an apparently pleasant gossip with those nearest to him, during which there was an opportunity of examining the features of the man who, from the most humble rank, had raised bimself to the position of a public benefactor, and to the company of kings and other magnates. The face in many respects resembled that of Thomas Bewick, the engraver on wood; the forchead large and high, projected to a considerable extent over the eyes — a peculiarity which may he observed in the beads of many who have been eminent in the higher departments of art and constructive skill. The hair was almost white, but his countenance was ruddy and seemingly glowing with health. The month and seemingly glowing with health. and seemingly growing with heads. I the more was firmly marked, but with a larking humour in both that and the eye; and there was some-thing so easy and gentleman-like in his general manner, that most must have forgotten his

early strnggles and disadvantages.

and mannfacturing districts a great railway for the carriage of these valuable materials. We want, sit, you see, if I may so say, a sort of stream of steam directly across the country, from the north to London, and from other similar dis-tricts to London, smad is not so much as tricts to London: speed is not so much an object as ntility and cheapness. We would want, sir, a very broad gauge and great strength in all the materials." With another person he got quite animated on the subject of agriculture got quite animate on the subject of a subjec sir, will you see carry more flesh than if they were so and so."

In these railway times many young limbs of the law and others came into nnnahrral positions and some endeavoured to hide deficient parts by extensive personal decorations. A youth of this description chanced to come in Mr. Stephenson's way on the occasion above mentioned, when, after the usual exchange of civilities, he made something like the following remark :- "You will, I hope, Mr. -----, excuse me; I am a plain-spoken person, and am sorry to see a nice looking and rather elever young man like you disfigured with that fine-patterned waistcoat and all these chains and fang-dangs. If I. sir, had bothered my head when at your age with these things, I should not have been where I am now."

COHESIVE STRENGTH OF STONES.

WILL some of your practical, scientific readers favour mc with some remarks on this important point? The crushing weight per square inch or foot of a stone being known, with what proportion of this may it be safely trusted for a constant load?

it be safely trasted for a constant load? From an account given in Weale's "Engineers" Pocket-Book" (1852-3), it appears that the calculated maximum weight on the piers of Hungerford-bridge is about one-quarter of the crushing weight of red hrick. Would this he safe as a constant load?

From experiments given hy Sir J. Burgoyne ("Treatise on Blasting "), it appears that the weight with which granites are fractured varies from '590 to '883 of the erusbing weight ; sandstones from '636 to '943. I should be obliged for any further information or reference to where it can be obtained. PETEUS.

OXFORD ARCHITECTURAL SOCIETY.

OAFOID ARCHITECTURAL SOCIETY. At the last meeting of the term, held on the 18th ultimo, Mr. Lowder read a paper "On the Proper Construction of Town Churches." According to the Oxford Herald, the great principle which was advo-cated was unity, which was stated to be the great secret of success in ancient buildings, and the only way of returning again to ancient excellence. The difficulties with which architects had to contend in the construction of town churches were discussed in detail. They formed four heads; namely, in matethe construction from the set of of unity and harmony was strongly enforced. The third advocated the partial completion of buildings on a large scale, instead of eramping the design hy finish-ing at once. The fourth referred to Building Acts The paper and other restrictions of a similar nature. was concluded with a suggestion for a school of archi-teets, and some observations upon the evils of the existing state of competition.

THE GLASGOW ARCILEOLOGICAL SOCIETY. THIS society met on the evening of the 23rd March, Sheriff Steele in the chair, when the scoretary submitted a report, showing that the progress already made towards organizing the society was very satis-factory. factory

The Chairman delivered an address on the importance of archeeological pursuits. He claimed for the archeeologist a position with the metaphysician, the moralist, and the historian. He deals with the elements of historical truth, and searches out for the carly stringgles and disadvantages. Mr. Stephenson's Northnabrian gnttural was particularly distinct, but seemed to give cm-ferred to the variety of objects which interest the phasis to his speech, and it was remarkable how intelligent archeologist; and concluded hy pointing readily he varied his discourse with different out the favourable position Glasgow occupied as a people. To one gentleman he said, — "We field for antiquarian investigations—as a sector learn-want from the coal-mining and iron producing ing, of commerce, of enterprise, and as heing in the bistorian his most valuable resources-in the records, neighbourhood of Romao, Celtic, and Scandinavian antiquities, Mr. Laurence Hill brought before the meeting

Mr. Laurence Hill hrought before the meeting three original letters from King James VI, to the hird of Craighall; and also an original letter from Canningham of Craigends, dated 26th November, 1696, demanding from the freeholders of Renfrew-shire payment for his services as M.P. 1 and civilly pointing out to them the course of legal proceedings he must resort to in eases of refrash or dolw. Mr pointing out to them the course of regar proceedings he must resort to in eases of refusal or delay. Mr. Hill presented these MSS, and also a silver penny of

Hill presented these MSS and also a siver penny or the reign of William the Lion, to the Society. Mr. John Buchanan afterwards read a few notes regarding the chair which was ocenpied by the chair-man during the evening: it belonged to the last Renfrewshire witch, who was burned at Paisley so late as 1697. He also exhibited several interesting memorials of old Glasgow.

THE SAXON CHURCH ON DOVER HEIGHTS.

MR. C. ROACH SMITH has been drawing attention to this most interesting relic and memorial, as being threatened with destruction by the Government, who, it was stated, were about to build on the site of it.

The associated with experiments of the second seco

dressed by the Society of Antiquaries, in the following cerms:

" "I am directed by the Secretary of State for War o inform you that the War Department has no intenwion at present of disturbing the ruins of the ancient whurch at Dover Castle."

This will be heard with satisfaction. We would denounce the threatened Vandalism in the strongest and and the construction of a construction of the strongest marguage. It would be a robbery committed on pos-rerity. As a suggestive autograph of the past, an and enable corroborator of written history, the ancient church at Dover should be sedulously preserved.

RECENT BUILDING PATENTS.

1 1445. T. SCHWARTZ .- An Improved Brick. Dated 1 1445. T. SCHWARTZ.—An Improved Brick. Dated anne 19, 1856. — The inventor removes vertically imom the central portion of the brick such a quantity if the material as en he dispensed with, and gives a membiar configuration to the envity. 1 1324. J. BRIGGS.—Improvements in Blocks and Bricks for Building. Dated June 4, 1856.—The tarts of blocks and bricks for building, whether of model atoms, an other substauce, are constructed in

series for Database. Dates June 4, 1856.—The arts of blocks and bricks for building, whether of wood, stone, or other substruce, are constructed in acrous corresponding forms, and so that each has mertures into which may be inserted rods, burs, pins, .es, or bolts, so as to hold them together. I 1270. L. D. Owes.—*Chaprocements in the Manu-tated May* 28, 1856.—Building blocks are formed as killows :—A quantity of coarse silicions sand, as free possible from clay or other earth, is provided, with q quantity of freshly-slacked lime in powder. As anch sand and lime ns can be moulded in an hour te then thoroughly mixed (about one part of lime to the motoroughly mixed (about one part of lime to the software freshly slacked, and the sand having the software it has when dug out of the earth. This supposition is then placed into the mould of a mould-?=Press, and subnitted to great pressure, and the g-press, and submitted to great pressure, and the locks so produced are then taken out of the mould, maced upon a flat surface, and exposed to the air to

arden. 212999. G. GUDLEY and W. CHRISTOPHER. — Re-nacing the Bottle or imported India-rubber to a manaparent liquid state, so that it may be used as a wanaparent Urarish or Solution for mixing with solours. Dated June 2, 1856. — This consists in sub-sisting the India-rubber (preferring the bottle India-schber) to an alkaline actiou; also to holding in water, d then dissolving the India-rubber in suitable wents.

1976. MARC ANTOINE FRANCOIS MENNONS, Rue apoleon, Montmarter (Département de la Seine), sance.— A new Composition applicable to the Coat-or Covering of metallitic or non-metallic Surfaces. © communication.) Dated August 25, 1856.—This

6' Gleaned from lists in the Mechanics' Magazine, the

invention consists in the preparation of a non-con-ducting composition applicable to the coating of sur-faces in general, such as walls, portitions, and other parts of buildings, steam-boilers, locomotives, and in short all structures and apparatus to which a pro-tering enverting may be measure. The notestar parts of bindings, steam-bortes, tocomotives, and in short all structures and apparatus to which a pro-tective covering may be necessary. The patentee takes a quantity of argillaceous clays, as far as practicable, of different kinds, and containing a certain proportion of alumina. These clays are kneaded with water so as to produce a constant mass, and to this mass he adds in succession the proportions hereafter noted of mucilaginous, resi-nous, oleaginous, bitaminous, and other substances imperfect conductors of heat. Clays prepared as above, 100 parts; oily substances, or residues, 6 parts; oil sediment, 5 parts; fat, 2 parts; animal charcoal, 2 parts; vegetable charcoal, 2 parts; nood saw-dust, or ground wood, already employed in the purification of oils, or in drying processes, 10 parts; weste hair, well beaten, 4 parts. To this he adds a decoction of logwood treated with nitrate of iron (to deepen the volour), together with a small proportion of soot. The whole is then thoronglay mixed and brought to the consistence required. The composition is then ready for use.

PRINTS AND DRAWINGS.

for use.

The Opening of the Great Exhibition. — Mr. Bellin's engraving after Mr. Henry Sclons's large picture of this event has been published by Mr. Boys, and will be found an excellent nuemento of that memorable event. "Evil May-Day" has a place in our history: 1851 gave us a "Good May-Day" to inemorable event. "Evil May-Dny" has a place in our hislory: 1851 gave us a "Good May-Day" to balance it. All the leading persons connected with the Exhibition, and those who attended the opening, are shown in the engraving, including that impudent Chinaman who contrived to take in the two greatest nations on the earth, England and France, and whose representations of the ease with which he did it may have misled Commissioner Yeh in his estimate of us. The likenesses, especially those on the left side of the picture, are for the most part exceedingly well pre-served. served.

served. Works exceeded by Mr. Myers, and designed by E.W.Pagin.—-Mr. Myers has had prepared for private circulation a chromolithograph, showing the vorious works which were exceeded by him from designs by the late E.W. Physin, and exhibited at the Crystal Palace in USL includes a second alteration with recumlate E. W. Pugin, and exhibited at the Crystal Palace in 1851, including a canopied altar-tomb with recum-bent figure, fout, tabernacle, chimoeppicee, screen, cross, and cabiuet. It was produced at the establish-ment of Messrs. Day, drawn hy Ordish, chromo-lithographed by F. Bedford, and, apart from the great excellence of the objects represented, is one of the most successful specimens we have seen of the art. The fout and tabernacle are now in Pugin's church at Bauerard M. Warm, buy one win Pugin's church at Ramsgate, Mr. Myers having presended them to him for that purpose

VARIORUM.

VARIORUM. THE Supplementary Report of the Association for Improvement of the Dwellings of Agricultural Laboarers in Scotland contains two designs for cut-tages by Mr. W. Fowler, of the chenpest sort of con-tages by Mr. W. Fowler, of the chenpest sort of con-structic. Mr. Fowler baving become superintendent of buildings on the Duke of Sutherland's estates at Dunrohin, Mr. James Campbell Walker has been appointed architect to the association, and is to art also as sceretary.——In the *Art-Journal*, which well maintains its excellent charmeter, the Rev. Charles Boutell has commenced a series of papers on "The Crystal Polace," as a teacher from ancient and early art. The March number contains the second of them. Crystal Polace," as a teacher from ancient and early art. The March number contains the second of them, founded on the Byzantine Cuart, which, the writer urges, is incorrectly named, and should be called the *Romanesque Court*......" The Crystal Palace Maga-zine," new series (Hall and Virtue) is an interesting and well-conducted miscellany, not confined by any means to the huilding from which it takes its name......" "Adulterations Detected; or Plain Instructions for the Discovery of Frauds in Food and Medicine," is a new work by Dr. Hassall, published by Messrs, Long-man and Co. This more condensed and general ho k of instructions is not intended to supersede the larger work in which so many individual exposures of adulte.

work in which so many individual exposures of adulte-ration were made. A cheap treatise, illustrated with Tation were made. A cheap treatise, illustrated with such woodents as this new volume contains, and in-cluding such plain instructions for microscopie and other detections of adulteration as are given was much required; and, indeed, the public looked to Dr. Hassall in particular for it. It is to be hoped the doctor's inquiries and instructions will extend to other branches of trade besides those connected with God and uncdi-cine, though these he assuredly hy far the most im-portant.————"A Voice from the Goodwin; or, a Plan for the Prevention of Puture Casualties on the GoodJames-street, Covent-garden, proposes the formation of hell-booys to surround these dangerous sande, so as to warn off all vessels which may be approaching them in mist, fog, or darkness, by the continual sound of the bell attached to each how. The idea seems to be a good one, and the construction of the how appears to be effective, but it would be well to test the tear and wear of such an apparatus for a short time hefore trusting the lives of mariners to expected sounds which might not meet the ear in the moment of peril, should a limited experience of the buoys from doing duty.----Mr. Thomas Tate, the author of many educational works, has just published (Messrs. Longman and Co.) "A System of Mental Arithmetic, after the method of Pestalozzi, for the use of teachers." Mental arithmetic is certaioly one of the must important branches of primary instrue. use of teachers." Mentai anthmetic is certainly one of the most important branches of primary instruc-tion,—the faculty of mental calculation being almost as useful to n tradesman or to an artizan as the faculty of speech, and ranking highly as an iostrument of intellectual culture in general school instruction. The rules and arranging more has Mar Teles menerate the Intellectual control in general school instruction. And rules and examples given by Mr. Tate scene to be clear and simple, and well adapted to the end in view, ——The conductors of *The National Magazine* con-tinne to introduce articles bearing on the adornment of Home. Part V. with much pleasant hiterature, contains a suggestion for the ornamentation of win-daw class. The dask is to be pointed with a thin the school of the scho

dow-glass. The glass is to be painted with a thin coating of white; then with a pointed stick, which will coating of white; then with a pointed stick, which will remove the wet paint, patterns may be drawn.— Mons. Léon Contanseau, Professor of the French language at the East-India Company's Military College at Addiscombe, and Examiner for direct appointments of Cadets, &c. has compiled a very superior "Practical Dictionary of the French and English Languages" (Longman and Co. publishers), The authorities to whom the author acknowledges his obligations are the French dictionaries of the Academy, Boiste, Bescherelle, &c. and the English dictionaries of Johnson, Welster, Richardson, &e, besides technological and scientific dictionaries in both besides technological and scientific dictionaries in both languages. The work contains various improvements, such as new words in general use, but not in other dictionaries, compound words not translated literally, prepositions annexed to the French verbs and adjectives, showing what case they govern, familiar idioms and phrases, &c. and there are also abridged vocabularies of geographical and mythological names. This new die-tionary is the fruit of seven years' laborious application and research, and must hence be regarded as an entirely new work, and one that was in many respects much wanted, notwithstanding the previous supply of warted, notwildstanding the previous supply of French and English dictionaries. The ridicalous mistakes made by many students in translating English into French, have been found by M. Contanseau to be in many cases the fault of the diction-aries rather than that of the students. It required an intelligent Frenchman, occupying just such an English position as the present author holds, to trace out and correct such radical errors; and the correction of these, together with the incorportation of new works, and the various other im-provements, render M. Contauseau's work a very valuable acquisition both to English students learning French, and to French students learning learning French, and to French scatters framing English, as well as to translators generally of two languages so cordially associated as are now the French and the English. As an example of watchful attention in the insertion of new words, we may remark that we have already find the congeners of a new and useful word, first suggested in our own columns within the last weake months — namely the columns within the last twelve months, -manely, the word "stereograph," as applied to the stereoscopic pietners or sides, as they used to be called, ----The "Universal House and Land Advertiser," a monthly "Universal House and Land Advertiser," a monthly sixpenny list, published at 1, Brook-street, Hanover-square, contains a classified registry of property on sale or hire throughout the kiugdom, and seems capable of becoming exceedingly useful, not only to agents, who can insert their whole lists gratis, but to huyers and hirers of houses and land, who can obtain the convince particular sets our three means the hear of the Il requisite particulars as to any three properties here dvertised for a second sixpence, after obtaining the 'Advertiser" of fifty pages itself. adv

Hiscellanea.

MONUMENT TO SIR JOHN FRANKLIN IN LINCOLN. NOWMENT TO SIE JOIN FRANKLIN IN LINCOLM. —A numerously attended meeting of the inhahitants of Lincoln, presided over by the mayor, was held last week, when a proposal to commemorate the fame and virue of Sir John Franklin, the intrepid Arctie navi-gator, by the erection of a Franklin lastitute and Scientific Museum, was warraly responded to and enthusiastically adopted. Some genthmen who had subscribed 51, under the idea that a statue only was contemplated, announced their intention of now giving 52. An alderman expressed bis hone that the exp. for the Prevention of Future Casualties on the Good-257. An alderman expressed his hope that the cor-win Sands; by George Chowen," published at 7, poration would, at least, vote 1,000/.

NEW CHURCH FOR ST. JOHN'S DISTRICT, PAD-DINGTON.—A new church is about to be erected in Praed-streed, adjuding the Grand Junctiou Canal. At a meeting of the St. John's Church Association, held ou Tuesday evening, the appointment of an archi-teet was decided in favour of Mr. Hawkins, who made the offer to give his services gratuitually. Two other architects had been nominated, and had expressed their willingness to serve if elected, viz. Mr. G. G. Scott and Messrs, Francis: hut the nature of Mr. Hawkins's proposal determined the votes of the asso-ciation. The church will be built in a poor part of the district, and will cost from five to six thousand pounds. Are not these rejeated offers of graluitous services to be depreseded?—A. B. MESTORATION OF THE CANNING IN ST. JAMES'S CTURGEN, PICCADILX,—With reference to the remark in "F. C.'s" article on St. James's Church (n. 94, ante), that the earvings of the altar-screet by Ghbons were thoroughly "Meinder by two Halium attists, we NEW CHURCH FOR ST. JOHN'S DISTRICT, PAD

ante), that the earrings of the altar-screen by Ghibons were thoroughly repaired by two Italium attists, we are requested by Mr. George Lock, of Leannington, to say that the merit is not due to any foreigners, hut to himself and a young man who was employed by him of the name of Kent. The contractor for the work at St. James's was Mr. E. Wyait, of Oxford-street. "I may also state," Mr. Lock adds, "in further confirmation, that on the top of the pelicau's hest I placed a small tablet, stating I had restored it, with the date. &c.

nest i pactor a simar tomet, staning i mettersteriet with the date, &c. THE IRON TUADE.-At the preliminary meeting of ironnasters, held at Birmingham last week, it was resolved to make no siteration in the nominal prices resolved to make no siteration in the nominal prices recognised by the quarterly meeting meeters, viz., in hers, 92, hoops and sheets, respectively II. and 92, per ton dearce. — A New York correspondent of the *Birmingham Journal*, says that the progress of America in manufactures is perfectly a-bunding, and that the best workmen of England and Germany in the mannfecture of carpenters' tools, edge-tools, cut-lery, &c. are continually arriving at New York. Yankee wares, he asserves, are stocally supersching all others, not only in the States, but in Canaha, and version and the trade here, and the top of English iron," a result which it needed no prophet to foresce even years sime, while the irou trade in to foresee even years since, while the irou trad to foresee even years since, while the trou trade in this country was running mad under the reckless mismanagement of gembling speculators. It is now to he feared that, notwithstanding the more steady course of the trade latterly, it is too late to recall the American trade to its former state of activity.— American because nor investings recombing hardfold in American trada to its former state of activity— Among the many new investions recently patented in the United States, is an expanding augur, invested by L. H. Gihbs, of New York, who is now folfilling a contract for 2000 for the Government. The bit, by means of a single moreable part, fixed in a peculiar manner in a slot in the main bit, bores the lose of any size, from A inch up to 2½ inches.

BRANKSEA, POOLE.-The Preston Guardian says, The reported failure of Colonel Waugh, of Branksea Island, near Poole, in connection with the failure of the Eistern Bank, has caused much anxiety in the south of England. The colonel purchased Brauksca Island a few years ago for 13,000/. The island was Istand a few years ago for 13,0007. The island was fhen a harren heath, but it is about three or four miles in circamference, and its purchase was cou-sidered a bargoin. Soon after it was bought, a valuable pottery clay was discovered beneath the surface. Colonel Waugh dug for this clay, and esta-blished a colony of workmen on the island. He built a church for the use of bis fmully and workmen, which each bio colong is provident. Brunksen which cost 10,000?; and his residence, Branksen Castle, which he also built, is a costly edifice. The reclaiming of the land and digging for the elay turned

out very expensive operations. PAINT ON PORTLAND STONE. "A. B." would . PAINT ON PORTLAND STONE. - A. D. suspective of the many sub-section it a great favour if any one of the many sub-serihers to the *Builder* could inform him how to certains to the *ballar* contained future into the some Coninthian pillars, capitals, &c. that have been painted for a quarter of a century, and he wishes to know how to clean them without injuring the stonr."

to clean them without injuring the stone." WARWICKSHIEL ANTIQUITIES. — Proposals are issned to publish a "Warwickshire Antiquarian. Magazine," to be devoted to the furtherance of the study of local antiquities, and for the publication of matters relative to local or family history; notices and illustrations of the principal eculesiastical, military, and domestic remains in the contary; reprints of searce tracts, hroadsides, &c.; county obituary, and other matters of local antiquarian interest. Mr. G. T. Robinson, architect is to he the editor. The G. T. Robinson, architect, is to be the editor. The work will be commenced so soon as the names of 200 calastic the statement of the source of the source of the statement of the source of the statement of the source of the sou 200 subscribers bave been received.

SIR HANS SLOANE'S MONUMENT. - This hand-some tomb [Chelsea Old Church] is hecoming sadly some toma (Critica Ori Church] is necessing soury out of order. The inscription is scarcely legible, and if taken in time, a small outhy would put it to rights. Pray say a word for this reparation : surely the man it recals to our minds was worthy the memorial devoted to his memory .- B.

KILKENNY ARCHEOLOGICAL SOCIETY. — The Marcb meeting of this society was held in the Assem-bly-rooms, Kilkenny, on the 18th alt, the Dean of Ossory, the president, in the chair, when twenty-five new members, and one honerary member, were The ossory, the pressuem, in the enarty when twenty-five new numbers, and one honorary member, were elected. The accounts for the past year showed an income of 4297, olds, and a balance in hand of 757, edds. Various donations were brought under Mr. E. Fitzgerald, the local secretary of the notice. Mr. E. Fitzzerald, the local scerelary of the society at Youghal, sent an account of the destruction of a monumental statue at Youghal, by the sexton, while hastily digging a grave where it lay under-ground. Mr. Fitzgerald called the attention of the many clerical members of the society to the power that a single word from them in such cases to their sextons would have in the preservation of interesting orderized and other remains. Several other notice. ecclesiastical and other remains. Several other papers were communicated to the meeting, including papers were communicated to the meeting, metuding one by the last-named gentleman on Archevology, and another hy Mr. W. Williams, of Dangarwan, on Ogham Readings, with an account of an Ogham monument recently discovered in the ruins of the charch of Kilrush, near Dangarwan, in the contry of Waterford, lowards the illustration of which Mr. Williams contributed a large number of woolcuts.

TRAMWAY STEAM OMNIBUSES FOR SOPLE.-A correspondent, "Turntable," WORKING PEOPLE.—A correspondent, "Turntable," suggests, amongst other ideas counceted with metropolitan and reneral improvement, the laying down of common rails, rib downwards, between two blocks of the T rails, rib a rais, its downards, of them to he he of the sectors street granite, and the formation of omnibus engines to carry 100 persons each, or more, and to run from five o'clock in the morning, in various directions, at fares of say sixpence for twelve rides, varying fr four or five miles radius from the General Post-office tour or hve must read in round in the deneral reacting to leaser distances, and running at the rate of six niles an hour, without stoppage; the floor of the earriage to he only six inches or so from the groand, with a fool-board or step all round, so that worknen might step in or out from the kerb as the carriage passed close to it. This arrangement, he thinks, could be easily carried out were something like order established in the street traffic.

established in the street trainc. DUBLIX.-A Romen Catholie Institution for the deaf and dumb has been erected, frum designs in the Tuder Gothie style, furnished by Mr. C. Geoghegon, architect, on a site of about five aeres north of the high road from Dublin to Cavan, at Cobra. Mr. Beardwood, was the contractor. The local papers

high road from Dublin to Cavan, at Cobra. Mr. Beardwood, was the contractor. The local papers speak very well of the building. The Turknist Barn, —At the Polytechnic Insti-tution, Regent-street, last week, Mr. David Urquhart lectured to a large audience on the Turkish Bath, the use of which in this country, the lecturer said, he had come 500 miles expressly to urge. He pointed out the difference hetween the ordi-nary hath in use here and the Turkish buth, espe-ciplie as received termoreture and the uncersaire cially as regarded temperature, and the successive processes peculiar to the more claborale Eastern bath, at same time describing a building which he had heen engaged in creating for the purpose in the south of Ireland. He had filled it up with a chamker cor-responding with the frigid rium of the Romans, with au inner chamber, corresponding with the tepidarium, and a third large chamber, vaulted, and lighted with coloured glass from above—deep and sombre, which was heated by furnaces beneath. The chamber first to be entered would be heated to 170 degrees, the next to about 100 degrees, and the third was open to the heavens. This building was capable of bathing about 800 persons in the course of every twelve hours, and the erneme would not exceed 5004. same time describing a building which he had the expense would not exceed 500/.

ALUMINUM — Mr. W. E. Newton (for a foreign correspondent) has pytented a process, by which the production of aluminium is said to be reduced to an essentially practical and commercial form. The in-ventors have, in the first place, substituted for other apparalus vessels made of cust or wrought iron, of maning form in which results the results in selfect trying form, in which vessels the reaction is effected the same manner as in vessels of clay. They have in the same manner as in vessels of elev. They have also, it is said, succeeded in effecting the reduction in chambers made of hirdskowerk or fire-elay, either heated as a reverberatory furnace, or through the sides. The apparatus employed by preference, how-ever, is a reverberatory furnace, the had of which having a potition of it include, is arranged for facili-tating the collection of the metal as it is produced ; but the furnaces ordinarily employed for the manufac-ture of soda may he used. Another improvement consists in dispensing with the marine salt, which is nsually added either to the simple chloride of alumi-nium, the double chloride of aluminium and sodium. or to the fluoride of aluminium and sodium (eryolite) and in simply adding a suitable proportion of fluoride of calcium.

of calcium. DESTRUCTION OF SUNDERLAND EXCHANGE MUSIC-HARL.—On Saturday before last, the Exchange Music-hall here was discovered to be on fire. The roof fellio, and the internal fittings were consumed, nothing heiug left hort the ruined walls. The damage is esti-mated to be upwards of 2,000?, which is insured.

EXTINGUISHING FIRE WITHOUT WATER, ON LAND ENTIREUMBILIES FIRE WITHOUT WITHOUT AND AND SEA.—A suggestion is mode by a correspondent, Mr. F. W. Devey, that by simply having the means of shutting up any house in which a fire is reging, the fire might be much more readily subdued than by the increasing in water and the opening of doors and windows which generally accompanies the use of the water. But firenen are already perfectly well aware of the evil of unaccessarily opening doors and windows in such cases, although in many instances, doubtless, in the flurry and coofusion at fires, much mischief is done by not attending to this as a rule. The suggesdone up not attenuing to the as a rule. The sugges-tion has been repeatedly made before, and it is well known at sea when a cargo is fired that the hatches ought to he kept as close as consistent with other efforts to put out the fire. Carbonic seid gas, the general product of the burning, is inquestionably a potent extinguisher of fire, and the fire annihilator out on this general product of the sense very constituently acts on this principle ; hut it seems very questionable whether a burning house can be easily or cheaply shut up in the way our correspondent secures to imagine, as the fire so frequently opens its own way through windows, doors, or roofs, hefore the interior is sufficiently charged with the earbouic acid arising

mercly from its own progress. CAUSE OF FAILURE IN HEATING CHURCHES, &e.-My attention has been often called to failures Aty attention has been often called to failures in henting churches and other large buildings. I shall best explain the cause hy showing the usual way of fixing. In a small church, say with 160 feet of 6-inch pipe, the boiler holds 100 gallons: the supply cistern, only six gallons, is fixed on a level with the top of the boiler. Now, it must appear to any think-ter wild are mithant and earth the boundary the top of the botter. Now, it must appear to any containing mind, even without any scientific knowledge, that this is wrong; for, when the water in the boiler becomes heated, then both air and water expand, for the pipes are never full of water : the cistern being on a level with boiler exerts no pressure ; consequently, the water is forced over the small cistern, omptying the boiler helow the hot water pipe, — then the chance of a flow is gone, for steam has taken the place the boiler helow the hot-water ppe,—then the chance of a flow is gone, for steam has taken the place of water, and uot a drop of hot-water flows in the pipes. My plan is this. Let the eistern be placed on the top of the boiler, say 4 feet to the top of eistern; the eistern to hold fifty gallons. This will do for a small chanch with 200 feet of pipe: if more, make the eistern still larger. We shall uow have a pressure equal to the height of the eistern, and an earder small of weter —G W T.

make the civitin similarity. In the share where the result of the height of the cistern, and an ample supply of water.—G. W. T. Desraterizions or Ecorptian ANTIQUITIES.—I saw, the other day, at the Great Temple at Karnac, a person whom I afterwards discorered to be a preacher from New York, haumering away with a pole at the heatiful star-spangled ceiling of the sanctim, endeavorning to detach a "whole star," as he said. I remonstrated, but in vaio, for I afterwards saw hira picking out a piece of the stone which hears the effigure and oval of the King of Judah, by which the victory of Shishak over Rehobeam is recorded. Then comes a legion of seribhers. In the grotto at Beni-Hassa, mong them is a procession, believed to Egyptians, among them is a procession, believed to be by some the arrival of Joseph and his brethren. "J. B. Salter, Francis Abrahams, dragoman, Nov. 1856," occupics something like 4 feet square, written 1550, occupits something face a teer square, write with a charred slick over the pointings, while on the ceiling, the delicate colouring and chaste pattern of which any decorator of the present day might advan-tageously copy, there is "W. Stevenson, 1855," in letters nearly a font long each, with the sucke of a candle. Who these gentlemen are I have no idea; hut there are plenly of the same sort .- Letter in The Times.

THE LARGE BLOCK OF GRANITE, weighing 33 tons, from Messrs. Freeman's quarries, at Penryn, and which was at the Great Exhibition, has been recently

Illians, 5357. DOUBLE BARS ON THE TOLL BRIDGES.-Will you DOLDER BARS ON THE TOLE BRIDGES.--Will you eive your aid to abolish the double bars on the Waterloo and Charing-cross bridges? Really there is no uccrssity for them; and after paying tha toll and crossing the hridges, it is really a hindrance and a hore to be obliged to go through the same amory-ance to get off them. Surely a stop might be placed, if necessary, without a scend turnstile messing once clothes, and in some cases involving disarrangement.--A LADY

REGULATIONS AS TO NEW STREETS IN METROPOLIS.—The regulations as to the formation of new streets in the metropolis, shout to be issued by the Metropolitan Board of Works, are not yet settled ; the law will come up for confirmation this Friday, the 3rd.

APRIL 4, 1857.]

TUNSTALL NEW MARKET.

TUNSTALL NEW MARKET. \leq SIR,—Mr. Chapman's statement, that I gave Mr. Batly a tender for the above, subject to a dis-count of $1\frac{1}{2}$ per cent, and that my tender to the doard was less than the one I gave to Mr. Batty, ind to the other builders, as well as to the Board, were all precisely of the same amount, and upon the same conditions. With regard to scatibiling, I told Ar. Chapman in reply to an inquiry from him, that I chould expect to be allowed the use of such scatfield regg as he might have there; but I certainly did not trapet him to find one pennyworth mure than what he would require for his own use. I 1 do not see how he can complain of my tendering

Would require for his own use. 1 I do not see how he can complain of my tendering airect to the Board. Does he suppose that because I wave him a tender (which, by the bye, he applied for), was to be debarred from tendering to the Board? If I had confined myself to the Board, I should, in all orobability, have had the job. Ly HANKOOD Ly

A SPHALTE.-GERVASE FOOTTI INDUK Evaluation of the second s

April 11, 1857.

The Builder. Vol. XV.-No. 740.

> CN of ingenuity, lend us your cars. There is no greater nuisance in modern houses than that of the transmission of sound through party-walls. Any practical, inexpensive, and efficient means of deadening sound will be a great hoon. Solid walls and solid floors transmit sound in the highest degree. The Metropolitan Building Act provides that all party-walls shall be solid, and of a certain thickness in proportion to height and length. How is the evil to be overcome ?

"For eight years," writes a stu-dious friend to us, "I have occupied a house in London; and, during the whole of this time, there have been

治

gigbbours having young families. They are susical, and, I must confess, labour most indusviously at the scales : morning, noon, and night ere or other child howls and strums, apparently ithout making any progress." There is no spection to neighbours' children learning susic and singing : quite the reverse ; hut it is sost objectionable that walls should so readily ansmit sound, and render the young ladies' forts so widely known. Some persons always the a corner house, so as to be free from the nuisauce on one side at least. Is there no medy?

In nature there are certain simple laws to hich men pay little practical attention. Hence e numerous blunders constantly made. Solids mansmit sound : polished surfaces reflect sound . hllular substances, aud cellular surfaces, absorh d deaden sound. A party-wall built of pumice, ould transmit less sound than if huilt of solid ickwork; and a chambered party-wall, the waces filled in with small loose particles, would asorh more of any sound than a wall of pumice, proportion to the extent of chambering, and e character of the material filled in. Pugging c deadening floors is well known : the joists

e filled in, betwixt ceiling and floor, with aterial to absorb or deaden sound. The late 'r. Cubitt had some trouble at Balmoral, with artain floors, and remembered that in taking rown au old palace floor (many years before), tst quantities of cockle shells fell out from atwixt the joists. These had been used in agging. The idea was acted upon. Cockles rere dredged, and brought : the shells were azaned, dried, and used, with beneficial effect. ic cellular spaces thus produced absorbed brund.

P Patent fire-proof floors, formed with iron stists and concrete, arc terrible transmitters of urand. In some new botels, the nuisance is a reat drawhack : sitting-rooms under bed rooms, unnot be used with comfort. But, apart from s, is, iron joists, as often used, ruin the Wilings: the iron shows through the plaster did finishings.

"(Solid party-walls and fire-proof floors are stost desirable, if they can be retained and means can be added to absorb or destroy sound turcly science will accomplish this. Polished furfaces reflect and transmit light: polished eleel reflects : polished glass transmits (if hoth edes are polished) : rough grinding the surfaces testroys the power of reflection and transmis-

rid of the nuisance of transmission of sound. Some highly cellular texture may be applied to walls, ceilings, and floors, which shall resist fire aud ordinary decay, allow of finish, and yet deaden sound. Who is to invent and introduce such materials? They may patcut the invention and make a fortune, if they will only abate the existing nuisance, and enable us to have solid party-walls and fireproof floors without being compelled to hear what is going on up-stairs and in the next house.

THE ELECTIONS .- SOCIAL PROGRESS.

WE have no business—some might say—to meddle with party politics; and we are not about to quarrel with the division of labour which would relieve us from a duty that may he performed better by others. Yet, we represent interests which are decively concerned in the results of legislation and government, — the public interests as affected by our art, and by the advancement of science and diffusion of knowledge, and those pertaining to the moral and physical condition of immense classes, —in and physical condition of immense classes,—in short, social progress in the wide and compre-hensive seuse. It is on such accounts that we cauuot witness unconcernedly, movements in the political world like those which have occu-pied attention during the past three weeks. Indeed, if the objects of *politics* have any rela-tion to the meaning of the term, then the *Builder*, on the score of its usual matter, may claim to be a political journal. a political journal.

a political journal. The object of government has been defined to be "the greatest happiness of the greatest number." Has that object been followed as yet with the same assiduity by Parliament as out of it; and what is the prospect for the future? We lament that appearances are not encon-raging. The course of the elections seems un-fortunate in many respects. Without an opinion that Liberal or Conservative, Muisterialist or Opnositionist, as such, could except to we

that Liberal or 'Conservative, Ministerialist or Oppositionist, as such, could except to, we must say that what has occurred is not credit-able to the intelligence of the country. On the China question the Ministry may he right or wrong,—we believe the former; at least it ought to be considered a correct principle to entrust responsibility to agents; without this, efficient service cannot he expected. The punish-ment inflicted upou an utterly defenceless people may he wrong neverthcless. On that we express no opinion,—though herein, we do, as we con-ceive, hetter than many who have not inquired into the evidence. into the evidence.

into the evidence. A serious question is, whether the machinery of progress at home should stand idle during the best portion of a year, through any such combination of circumstances. Measures affect combination of circumstances. At Casures attect-ing the lives, morals, and condition of thousands of our conntrymen—but which are not of the nature of ordinary "party questions"—have here kept unsettled for years, only because honour-able gentlemen must be verhose and oratorical, and hencue a notion is that accommendation. and hecuse a notion is that government must he effected through "parties." Does Mr. Disraeli mean to argue that it is better that men should not act by the light of reason, or straightway ou their honest convictions?

It is the country, and not Parliament, which is It is the country, and not random when is now suffering what Lord John Russell, quoting a former statesman, called the "*pend* dissolution." It is the country, however, which is itself to blame for what has occurred, and what is going on. Our contemporaries of the general press, for are not holding the nogliou which they too, are not holding the position which they should have as promoters of improvement. So

should have as promoters of improvement. So long as the people give to the questions called "political," the first attention, so long will the real political questions be staved off. Many of these last are difficult enough; but so much the more desrable is it to give every scope to their solution by meu really patriotic, who devote themselves thereto. But what is it that the constituencies have done? Quadifications for the social questions, as well as Parliamentary expe-rience, appear to be valueless. Men unknown are preferred to those who are the hone—and x_{a} is power of reflection and transmis-are preferred to those who are the hope—and path is,—it the wave theory be accepted. We vidual opinions may prove wrong i hut statement vidual opinions may prove wrong i hut statement alls and our new fireproof floors, and yet get The *Times* now sees, if it ever doubted, that

In our own more immediate department, we have to regret the loss of Mr. Bell, at Guildford. Mr. Tite, whose services both in the House and in committees have heeu of the House and in committees have heeu of value, has gained by a slender majority, and has a scrutiny hanging over him. Mr. R. Stephen-son, Mr. Locke, Sir J. Paxton, and Mr. Wm. Cubitt, are amongst those connected with our class of subjects who remain. The list of mom-bers also includes the author of "Eöthen;" Mr. Coningham, who has made so many attacks upon the management of the National Gallery ; Mr. Slaney, we presume the same to whom much is owing in regard to the proceedings of former Parliaments in matters of the health of towns, and the condition of the working classes ; Towns, and the condition of the working classes; Mr. A. B. Hope, and Lord Ingestre. Sir Henry Rawlinson was a candidate at Reigate. In many cases, bribery, under the guise of payments for committee rooms and cauxassers, as committee a committee for the fort of the

has carried everything. Is not the fact of the cost, to a candidate, of an election, itself a thing disgraeeful to both the Parliament and the asgradeful to both the Parliament and the country? In some cases, the *free and en-lightened* electors have made a special grievance of the fact that their "sweet voices" had not been asked for. Or the most abstrase questions of our day have been solved in a moment, for the sake of electors who required "not a man, but a machine."

Generally, the "cry" of the moment has borne all before it, and electors have been oblivious of the interests which, within another month, they may have painfully hefore them.

It is perhaps not for us to suggest measures of parliamentary reform,—hut we cannot hut sometimes think within ourselves, whether education should not be directly represented,— whether, by a modification in the representative system, professions and interests, such as those of our class, might not have their own voice, with advantage to the public good, and without being indebted to a mere chance election hy property or population, — also, whether the ministers of the day should not he *ex officio* members of Parliancut without votes, and not

nembers of Parliancut without votes, and not allowed to seek the suffrages of any constituency. It is now long since a prime minister of the day opened a session of Parliancut with the coulession that social improvement had heen too much neglected; and to Lord Palmerston, though deprived of some of those who would be his alics, we shall not fail to lock to remedy the hung dalay. the long delay.

REMUNERATION OF ARCHITECTS.

Our article, last week, on professional remu-neration, referred to the case of a single archi-tect, and did not allude to many circumstances which are of importance, as presented in the relations between the Government and Sir Charles Barry. Much less did we attempt to notice all the questions about which it is desi-relate architects should around to access rable that architects should come to opinion amougst themselves, --- if not for the purpose of attempting to enforce rights of burjust of a set of the may be propared to make such arrangements as will allow them to devote greater, rather than less attention to their duties. We have shown that an architect their duties. We have shown that an arcenteer employed by the Government, may have thrust upon him any amount of *extra* labour,—never contemplated at the outset,—and is likely to receive no consideration for it. That the course taken in Sir Charles Barry's case—assuning him to have assented to a fixed sum-is opposed to the law of contracts, we apprehend is obvious. Every day's experience with builders shows this, Every day's experience with builders shows tins, —for, general clauses — sometimes framed under the idea that they will include all con-tingencies — hardly ever have the force ex-pected,—and justly so. The law and the justice of the case equaly, decide with reference to the original intention. So much for the treat-ment which the architect of the Houses of Par-liament has received in the mere matter of *extre services* * general clauses - sometimes framed

Amongst the other questions which remain unsettled, that of measuring deserves immediate consideration. Assuming that the 5 per cent. in the case of large works, might he adequate remuneration for the design, working drawings and specifications, and superintendence, it is questionable whether that rate should be inclusive of adjustment of any accounts, even where these refer only to extras and omissions, as in the case where there is a contract. The few statements which may he found in print, as to matters of professional practice, are hardly to be quoted here as authorities: some of them do, however, include the business of the accounts in the 5 per cent.; and such appears to have been the principle intended to be followed by the Government in the majority of cases which have heen referred to. On the other hand, it is the practice of many architects, and especially so with those in the provinces, to charge a certain per centage, on the amount of extras and omissions hold, for the duties in connection with the accounts. sive of adjustment of any accounts, even where on the amount of extras and omissious hold, for the duties in connection with the accounts, and in addition to 5 per ceut. upon the amount of contract and extra works. Where the builder's contract is one for prices, the question requires to be settled on distinct merits. In such case, the architect's lahour in accurate the settled on superintendence may be even increased: deduc-tion from the 5 per cent. therefore, is less jus-tifiable in such case than in the other; but the or architet is should be held fully entitled, ou account of the increased lahour in measuring, to the sum larger than he couldobtain where there was a cou-tract. We are aware that the cases quoted hy Sir Charles Barry do not show that such views have been followed practically by the Government. It is, however, clear to us, that the architect of the Houses of Parliament was placed, even in a worse position than the architects were in any of the precedents quoted, and without reference the precedents quoted, and without reference to the extra services. In some cases, as when Mr. Blore was employed at Buckingham Palace, and Sir Jeffrey Wyatville, at Windsor, the re-muucration was in effect higher than the 5 per numeration was in check inglet can be per cent.—since, with that rate, the architects were both relieved from the trouble of measuring, which it appears was thrown upon the architects in the other cases. But, this allusion hardly does justice to Sir Charles Barry's case, which invalues more point of invartance to the pito. involves many points of importance to the pro-fession even heyoud what have heeu noticed.

In connection with the subject of architects' remuncration, some particulars of the payments to a Government architect for services of a varied character-often required from the pro-fessiou-will be interesting.

fession—will be interesting. We have now hefore us a copy of a conitact, entered into on the 15th Fehrmary, 1815, be-tween the Commissioners of Woods, Forests, and Land Revenues, and Mr. Nash, "in re-gard to his employment as architect," in con-nection with the Regent-street improvements and works connected therewith, "and for regu-lating his compensation," as well as a copy of "An explanatory agreement," dated 25th April, 1818, and which enter into minute particulars, filling nearly eight folio pages in the appendix to the "Report from the Select Committee on Crown Leases," dated 19th June, 1829. Nash had been employed by the commissioners in making the plans and estimates in regard to the ultended street and the sower, preparatory to making the plans and estimates in regard to the intended street and the sower, preparatory to the Δ ct of the 53rd of George III.* and to attend the passing of the Δ ct through Parlia-meut; and by the agreement, he received his formal appointment as architect and surveyor. The remuneration was classed under several heads, according to the duties. Thus he was to receive remuneration at a certain rate for the superiutendence of the works of the sewer; other remuneration for designs, superintendence and adjustment of the accounts in respect of public buildings, lodges, inclosures, and rail-ings, pavements, and similar works (includin-micor sewers), uot of a nature to yield compensation under auother article of the agreement, and in rate according as the works were or were not earried into execution : remuneration for all valuations necessary for the purchase or sale of

"An Act for making a more convenient communication a Mary-la-bone Park, and the northern parts of the ropolis, in the parish of Saint Mary-le-bone, to Charing-s, within the liberty of Westminster, and for muking a convenient sewage for the same."

property, and commission on re-sales; a sum for his original plans for the new street; and, lastly, compensation for letting ground and buildings, and the duties of a surveyor cou-nected therewith. He received also compeusa-tion for valuing old materials. The explanatory tion for valuing old materials. The explanatory agreement is framed to show that the remune-ration for letting, &c. was to be in addition to any amount allowed for the valuing; and it allowed him per centage upon additional valua-tions which were required, in consequence of modifications in the intended line whilst the Bill was in Parliament (joint a desiration in the intended line whilst the Bill was in Parliament (joiut or derivative in-But was in Frankment (joint of derivative in terests, however, entailing but one charge): aud in other points it secured the true intent of the original contract.—The services of the several kinds, and the renuncration for them, may now he particularized, following the order in which they are named. As regards the for-In which only all handled. As regardles the lof-mation of the sever, in case the expense of it amounted to 50,000. or any larger sum, the architect was to receive 5 per cent. on 50,000. that is, 2,500, and no more; and if it amounted to least the 50,000 by the result of the second to less than 50,0001. but more than 45,0001. be was to receive 5 per cent. on the amount expended. But if the expense exceeded 40,000/. without reaching the next larger item named, he was to receive 51 per cent. ou the expendi-ture; if it exceeded in like manner 35,000*l* he the second seco distinctly specified. In figure to be let, in-public works and buildings not to be let, in-cluding the rails, pavements, and other matters before referred to, he was to furnish "the original plans and designs ;" to make estimates, to arrauge the contracts, superintend the works, and arrange the accounts, and for such services he was to receive a commission of 5 per cent. And in cases where he was called on to make designs And in cases where n was ealied to in to match designs and estimates for works of the character referred to, in anticipation of the requirements, he was to be allowed then a commission of $1\frac{1}{2}$ per cent. and the remainder making up 5 per cent. in case the works were eventually proceeded with. Where materials from the existing huildings were used again, in order to remove any doubt was agreed that their value should be added to the actual expenditure, and the commissiou be calculated upon the whole, —the value, how-ever, it seems, being treated as that of old materials. No other compensation, as connected with this head, was to be claimed for valuing, where a house or ground should be afterwards let, thereby yielding compensation under the head of compensation for *letting*.—As to valuations, as of buildings, ground, or materials, to the order of the commissioners, with a view to the purchase or the sale, Mr. Nash was to he allowed a commission of $0\frac{1}{2}$ per cent. on the allowed a commission of $O_{\frac{1}{2}}$ per cent. on the amount paid in event of a purchase, provided the amount did not prove in excess of the amount of valuation; but if the sum paid exceeded the valuation, or in the event of the intended purchase not heing made, or in the case of a valuation for the purpose of a the ease of a valuation for the purpose of a sale, in such eases he was to he allowed $0\frac{1}{2}$ per cent, upon the amount of valuation : but no compensation was to he allowed for valuing for purchase, ground or huildings afterwards let, and so yielding compensation for letting. In the ease of a purchase and re-sale, $1\frac{1}{4}$ per cent. were to be allowed on the amount arising or pro-

THE BUILDER.

duced by such re-sale, in case such money should not exceed by more than 10 per cent the amount of the valuation for sale; but if the proceeds should be beyond that 10 per cent. excess, then Mr. Nash was to be allowed a further commis-

5tb of April, 1814, "save and except such commission as he may be entitled to under any or either of the other articles of this agree-ment," he was to receive "a gross sum of 1,0001."

1,000*L*." For the letting of buildings or ground, Mr. Nash was to be allowed one half-year's full rent as reserved in the leases, to he paid on execution of the lease,—for which he was to take the trouble of negociating any required purchases, to advise as to the letting and the covenants for the leases, "to measure and value the ground." (retaining, however, his compensa-tion where received purchasely ou valuations). the ground received previously ou valuations), "to prepare all designs for the buildings" to be crected, to negociate with lessees, to insert the plans on lesses, and to superintend the buildings and repairs required to be done; and in case of his death before the completion of these meticans his death before the completion of In ease of his death bence the completion of these matters, his administrators were to be able to claim three-fourths of what he would have hecome entitled to. Touching cases where the rent reserved might happen to be reduced by fine, exchange, or other means, so as to render it less than the annual value, or where, render it less than the animal value, of whete, on the other hand, it might be increased through the Commissioners' purchase (whether they paid in money, or by sale of building materials), the compensation was to be estimated not upon the reserved reut, but upon the rent as it would have been under ordinary circumstauces. And again, where the reserved rent might be increased again, where the reserved rein might be indecased by reason of buildings or improvements made at the expense of the Crown, under Mr. Nash's directions as architect, the compensation was to he estimated as on ground-rent, or on the rent which would have been produced if no such improvements had been made, -- Mr. Nash being allowed his five per cent. as architect, notwithstanding.

standing. It may be interesting to state that it appears from the agreement of 1518, that subsequent to the date in 1815 before mentioned, Mr. Nash had delivered accounts of his claims up to Christmas, 1816, and had received a com-mission of 0¹ per cent. on a sum of 619,3871. (or upwards of 3,0002.) for surveying, plauning, and valuing, the estates and property originally in-tended to be purchased, and also upon 156,8602. (or upwards of 7802.) for valuing dd materials, over and above the sum of 1,0002, allowed him-for his plans and designs. It may be also well to refer to the belief that he realized largely through becoming himself the lessee of the Crown. This position, however, whilst he was acting as the Crown agent or surveyor, involved acting as the Crown agent or surveyor, involved bim in many imputations-still sometimes quoted to his prejudice; hut from these he was distinctly exculpated by the result of the parliamentary inquiry, and there is no doubt that to his enterprise in taking ground subject to onerous conditions which accrued by the improvements themselves, was the source of gain to the public.

These particulars may at the present juncture be useful for reference.

THE ARCHITECT OF THE NEW PALACE AT WESTMINSTER AND THE GOVERNMENT.

In connection with our observations on the re-muneration of Sir Charles Barry, and that our readers may be made acquainted with all the steps taken in the matter, we insert the following profest of the architect against the decision formed by the Lords Commissioners of her Majesty's Treasury, in respect of his claims, recently delivered by him to the Treasury. It has not yet produced any rejoinder.

should be beyond that 10 per cent. excess, then Mr. Nash was to be allowed a further commis-sion,—that is to say, if the proceeds exceeded the amount of such re-valuation hy more than to he allowed a further commission of 04 per cent.; and so on, each additional 04 per cent. realized was to give him au additional 04 per cent. calculated upon the original re-valuation for sale. For such remuneration Mr. Nash was to take measurements, negociate, and dispose of the property as might he required. For the original maps or plans of the in-tended street, the calculations and estimates, engravings and copies of the plans, estimates, and expense in regard to the sewer, up to the

have been altogether violated, from no fault on the part of the architect, whereby such hargain would be rendered

Thick TT, TOOTJ
In the number of the second seco

terma: And Lastly,-Because, by the decision in question, which, practically, as is well known in all cases between an individual and the Government, leaves the architect little or no chance of a remedy at law; the Treasury has committed an act of injustice and oppression towards him; whereby the honour and good faith of the country are compromised."

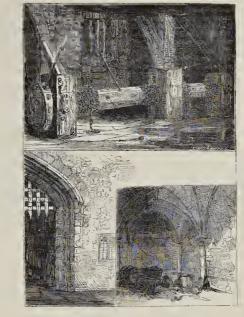

A NOOK IN THE TOWER OF LONDON.

In the north aisle of Henry VII.'s Chapel, in Westminster Abhey, there is a sarcophagus with an inscription put up hy King Charles II. to mark the resting-place of the supposed remains of the princes who were mnrdered in the Tower by order of the Duke of Gloucester, and buried there, hut were afterwards removed to the A Abbey.

The sight of this record the other day induced s to take an opportunity to visit the locality in the Tower whence the remains were removed

Tradition states that the nnfortunate children Tradition states that the nnfortunate children were killed in the gateway called the "Bloody Tower." This is now occupied by modern fur-niture, and has lost its original aspect. The chief room is of considerable size, and is lined with a very thick panelling of wood. There are also some smaller rooms and dark-looking passages. Whether or not tradition he right in connecting this place with the marder, it is certain that events have here happened which invest the spot with an indescribable interest, In one part we came upon the machinery for Tower." invest the spot with an indescribable interest. I In one part we came noon the machinery for raising and lowering the portcullis, such a curious relie of ancient warfare, that we have given a small engraving of it. There is no of other perfect example in England. Tradition says, too, it was in the room in the Bloody Tower that the Duke of Clarence was drowned in a hut of Malmsey. Those who visit this part of the Tower, hy the way, should take a view of Father Thames from the top of the crateway. g gateway.

Leaving the upper part under the fine arch-way which leads to the "Traitor's Gate," we endeavour to move the huge door of wood and r iron at the east side of the Tower, and having

NOOKS IN THE TOWER

with much difficulty succeeded in doing so, find a small entrance which leads to the vaulted chamber here engraved, where, in Charles IL's reign, the bones now in Westminster Abbey were discovered.

ON FURNITURE, ITS HISTORY, AND MANUFACTURE.*

MANURACTORE." We now arrive at a period when the taste for classic literature led to the study of the arts asso-ciated with it, and produced the era of the Renais-sance. Then appeared those great artist minds, Raffaelle and Michelaogelo ; while the demand for articles of luxury called forth the genius of Cellini, Palissy, Jean Gonjon, and Germain Pilon. I think it is generally agreed that the Italians were the first to apple themselves to the manufacture of ornamental to apply themselves to the manufacture of ornamental furniture of the more modern style. They adopted in their cabinets architectural forms, which they enin their cabinets arcbitectural forms, which they en-riched with a superabundance of ornaments, figures, inlaid marhles, Ke.; but so clegantly disposed as to make us forget the want of constructional character. Giuliano, son of Baccio d'Agnolo, and his borbters Filippino and Domenico, are particularly mentioned by Yasari as the most talented sculptors of furniture by Vasari as the most falented sculptors of furniture in the middle of the sixteenth century. Marquetry was revived and applied to the decoration of furniture. Vasari names among the most skilful in this art in the fifteenth century Giuliano da Maiano (1460), Giusto and Minore who assisted him, and Benedetto da Maiano who excelled in the process of conjoining voods tinted of various colours, and thus representing building in perspective, foliage, &c. In the sixteenth eentury he mentions Fra Giovanni di Verona (who had a high reputation), Fra Raffaelle de Breseia, and others. This furniture was highly esteemed through-out Europe, and Vasari relates that Beuedetto da Maiano made two magnificent collers in Marquetry ont Europe, and vasari relates that bediedetto da Maiano made two magnificent collers in Marquetry for Matthias Corvinus, king of Hungary, but on unpacking them, that the damp weather had softened the glue, and that all bis heautiful Marquetry was detached from the work.

The large tronsseaux chests or coffers of this period The high thousedar thesis of the so of the so in the feltime are remarkable for the richness and excellence of their sculpture: they were made principally for marriage gifts, and the talent of the first artists was employed upon them. The style of this work can scarcely be considered appropriate, as it hears the characteristics of design anitable for stone rather than for wood.

See p. 188, ante, Read by Mr. Crace, at the Institute of Architects.

In the latter part of the sixteenth century, the Germans had arrived at considerable renown for excellence in the manufacture of furniture -both in cavred work and marquetry. More especially cele-braded were those at cabinets (kunst schränke), of which many are still preserved in European palaces and collections. Adopting generally the design of an architectural façade, they combined in them all that was rich in materials and excellent in art: chony, ivory, tortoiseshell, amher, lapis lazuli, jasper, and energens were used by the painter, the goldsmith, the sculptor, the enameller, the workers in marquetry and mosaic, to produce conjointly these truly named at cabinets. The manufacture was principally ear-ried on at Nuremherg, Dreskeu, and Augsburg. There, which hears the name of Hans Schuferstein of Dresden: a desk which accompanies it is dated 1668 another eabinet in the same collection bears the name of Kelerthaler, a goldsmith of Nuremberg, and is dated 1555. One of the choicest examples is to be seen in the Royal Palace at Berlin, and it was made at Augsburg in 1616, for the Duke of Pome-rani, having been designed by Philip Hainhoff, and excented by Baungiertner. Hans Schwahard, nowher eminent cabinet-maker, who died 1621, in-vented the undulating chony moddings introduced in adhenes of that time. In the latter part of the sixteenth century, the

In France, through the efforts of Francis I. the arts In France, through the chorts of Frances 1. the arts made great progress in the sixteenth century. He in-duced many celebrated Italian artists, as Primaticeio, Giulio Romano, Beuvenuto Cellini, and many others, to settle in France, and laid the foundation of that taste which has since taken such deep root. Less celebrated than the Italian, French enhanct work yet Inste which has since takin such deep role. Inse celebrated than the Italian, French cahinet work yet arrived during the sixtcenth century at great per-fection. Bachelier, a celebrated architect and sculptor of Tonlouse, said to be a papil of Michelangelo, applied himself to cabinet work, and acquired great reputation. A cabinet in the Soulages collection is said to be hy this artist. The elebrated wood sculp-tor, Jean Goujon, disdained not to apply his talent to this hranch of art. Marquetry also was much em-ployed by the French at this time. I have aluded hitherto to the artistic farmiture of the period which was required for ornament rather than use, and could be purchased only by the very wealthy. The com-moner articles of house furniture were still of a rude and simple character-good tools and dever work-men being scarce. The clairs were generally of the ordinary curde shape, of which there are several specimens in the Soulages collection, some heing of simple wood, others inlaid there were also square chairs, with square stuffed hacks—all rather rude in niake. but sometimes covered with extremely rich

stuffs, handsomely trimmed with fringes, &c. Towards the cud of the sixteenth coutury the Renaissance lost its earlier tastefulness, and, especially Remaissance lost its end/or tratefulness, and, especially in Flanders, assumed a holder but a coverse cha-racter. The furniture was picturesque, but had lost the qualities of parify of design. The chairs now were much altered in form, the legs were turned, either plainly or spirally, the backs sometimes high more generally used the earwing became of a coarsor and componer description.

d commoner description. The reign of Louis XIV. of France introduced con The reign of Louis AIV of France introduced con-siderable alterations in the errs; riebness ond grand.uu now took the place of the purer type of the Ronais-sance. For the places built by Mansart, where Le Notre designed the gardenes, and Le Brun decorated, it was necessary to have furniture which corresponded it was necessary to have furniture which corresponded with the splendor of all around. It was at this time that the celebrated Buhl, or Boule, was employed to make those cabinets that still hear his same. André Charles Boule, borne at Paris in 1642, desired to become a pointer, but he at last settled to the husi-ness of his faher, a cabinet. maker, and the superiority of his works attracted the favour of the king, who granted him opartments at the Louvre, and named him Premier Elechsite de sa Maison. He then com-mened the grand series of cabinets and bis courtiers : what particularly distinguished there, was the kind of marquicity in cortoiseshel and metal which was marqueiy in tortoiseshell and metal which was invented by Boule, and still called after him. Although out of the bounds of strict taste, there is yet abundant out of the bounds of strict facto, there is yet aboundant genios in the works of this master. The patterns of his inlay work were full of fancy and heautiful draw-ing; and his gilt metal monatives, though detached and apparently unconnected, form a magnificent gad harmoni.us whole. His grand inkstands and ind-dental furniture show wonderful talent in their flowing entrees and harmonious ornameuts. The genius of Boule is hest understood in comparing him with his successors: notwithstanding the richness, there is a successors: notwithstanding the richness, there is a sobriety in the ornamentation of his works; while, in Society in the ornandeduction of its works; which in Crescent and others of his initiators, there was too much disposition to profusion of orn-ment. Another man of great taleut in designing furuitare and orna-ments for july work was Berain, who was also attached to the royal factory

During the reign of Louis XIV. the arts were much During the region Louis AIV, the arts were mach encouraged: his minister, Colbert, saw their import-ance; and, though a chancellor of the exchequer, he was bountful in founding schools for the instruction of workmen in drawing and knowledge of art, and in fostering that school of manufacturing art, the tapestry manufactor of the Gobelius: this and the royal manufactory of porcelain at Sèvres, in executing works of the hitpest at utistic merfection rules of the above minimum only of privator at severe, in exceeding works of the higher attristic perfection, raised up a class of skilled designers and art workmen, who deseminated the knowledge they thus acquired in these roy-I fac-tories. Under Louis XV, furniture lost its grandinge character, and became more remarkable for prettiness : the forms enough desemination horizontal horizonta the forms rounded or enrved became more eccentric the ornaments assumed the peculiar style calle the forms rounded or enred became more eccentric: the oroments assumed the peculiar style called Roncoo, which is founded on a system of reversed scroll and shell work producing undukting forms, not ungraceful in the hand of a master, hut of dangerous facility of execution, and the curse of the common ornamental furniture of the present day. A taste for marquetry in woods seems to have revised, and to such an extent was it used, as sometimes to cover the whole of a piece of fundater. The chairs of this time. Were very expectfully formed in the stele called where or a precedit furniture. The chairs of this time were very gracefully formed in the style called the Cabriole, in which there is no fixed form but con-Cabriols, in which there is no fixed form but con-tinonus curved lines. As case and luxarious comfort were essential considerations, the upholsterer's art of staffing became no important aid in carrying out this desideratum. Beauxais tapestry of a very beautiful description, introducing flowers, animals, trophies, or pastoral subjects, was also opplied to furniture. In the time of Lonis XVI, a fresh style of orna-mentation arease which is now known, by the

In the tune of Joins AVI. a fresh style of orna-mentation arcse, which is now known by that monarch's name. It resembles the Renaissance in its ornaments, but had nothing of its artistic genuins, and it mingled deloate (blange, and ribbons, and roses, with the attributes of Corydon and Phillis. The further of this priod is remarkable for the elaborate fursh of the ornaments, the constructive forms being simple and generally without curves. Marquetry work in France appears to have reached Relation of finish at this time. Relater, David Reintientz, a native of Neuwied, and Gonthier, were eminent cabinet-makers, and celebrated for this kind of work. Reisner was remark ble for his peculiar and beantiful inlay of flowers, the leaves of which were shaded by heat. David Reinticutz produced the shaded by heat. shades of his p shaded by heat. Dravid Reinticatiz produced the shales of his marquetry solely by the natural colours of the woods. Nothing can exceed the ex-tremely fine jointing of the parts of the marquetry by these two masters, nor the taste and perfect finish with which the varians woods are combined. Gouthier was celebrated for the exquisite taste and THE BUILDER.

on his marringe. The chairs and sofas of this period had lost the graceful carves of the former reigo, aud a stiff straight style was adopted, which was, however, relieved by the infinite delicacy of the ornamental

earving. The Revolution in France, especially during the Reign of Terror, must have either ruined or caused to wander abroad most of the art-workmen, and for a long period a style of art obtained which was a very period to style of art obtained which was a very any period a super of art optanced which was a very poor copy of the classic: this under Napoleon I. was modified into the so-called style of the Empire, founded on the works of Performed La Fontaine, two celebrated architects; but though any style carried Celebratical architects, but though any style carried out by elever men may have a certain merit, there is lattle in this to interest or instruct. The furniture of this period was made principally of mahogany, with bitle if any carving, the ornamentation being given by bronze work of a very flat and meagre character. During the view of Louis Philings French art

During the reign of Louis Philippe, French art changed very considerably, and sought for models in the Renaissnee period. The periodical exhibitions of untional products, by causing caulation among the manufacturers, produced a higher class of art-work-men, and also, by the beauty of the works executed, caused a great demand for them. May these words of the celebrated Neeker ever be borne in mind by our Obancellors of the Exchequer :---"Le gout est le plus adroit de tous les commerces ;" which may be rendered thus, "That no kind of commerce has such sklifulness in increasing the demand for manufactures as taste." The art of marquetry, which had lain dormant since the Revolution, was revived, and wood-carving as applied to art manufacture has arrived at a very high state of perfection. During the reign of Louis Philippe, French art a very high state of perfection.

In speaking of the furniture of various countries an speaking of the information of various commitses since the Rensissance 1 have not alluded to our own; but as England had not exhibited any peculiar excel-lence in this macufacture, I thought it better to carry on the explanation of the successive styles through those countries which particularly influenced them. While the Renaissance supplanted the Gothic in France, Italy, and Germany, our own country adopted the Tudor style, till that was changed into a coarse kind of Cinque-cento work named the Elizabethan : this continued with various modifications till the works celebrated conutryman, Inigo Jones, induced a taste for Italian art. The carved oak furniture of the taste for Italian art. The carved our running of the time of Elizabeth and James I. is marked by rather exaggerated forms, particularly in the turning, as instanced in the bed of Ware and that from Curmer-ic and the set of the set instanced in the bed of Ware and that from Curmner-place, illustrated in Richardson's work on "Old English Mansions." the tables and buffets, too, where the turned work is introduced, present the same features: the friezes and panellings have either seroll work, or that patieolar kind of ornament called strap work; various specimeus of furniture of this period and the next century remain at Penshurst, Knowle, Hardwicke Hall, and Holland House. Towards the time of King William and Queen Anne, the style greatly changed, assuming more of a bold Florentine character, but the taste seems then to have declined till the time of George III. when I think it reached till the time of George III. when I think it reached its lowest point—a compound of Strawberry.hill Gothie and Chinese being considered the most fushion-able style. Mayhew and lace, cahinetmakers, pub-lished, in 1750, a work of specimeaus in this style ; and Chinpendale, another manufacturer, and an able man, also published a collection of designs. It was a grand step to work away from these false ideas of ornancatis, and resume a quiet, simple style distin-guished by good workmauship and pure taste: this was achieved by our cahinetmakers early in this cen-tury. During the last forty years art has grown up gradually amongst us, until we perceive the full im-potance of encouraging its growth: a bave all, com-petition with foreign countries has tanght us to know our own definetneses.

petition with foreign countries must angle us to another our own deficiencies. I will now say a few works respecting the manu-facture of furniture: it will not be possible to give a foll description of the various drails, but an account of some of the ornamental processes may be of in-

It is essential for good cabinet work that the wood It is assolute for good caunct work that the wood employed be thoroughly assoned,-far more so than for joincrs' work. Except in wainsect furuiture, almost all of it has, in some part or other, to be veneered, the handsomer qualities of wood heing to expensive for use in the solid, and also not so likely to stand as when haid and wood of a busines kind. The excende when laid on a wood of a plainer kind. The ground generally used for this purpose is Houduras mahogany Veneer is wood cut into shorts short or statement. The ground enecr is wood cut into sheets, about one sixtcenth of an inch thick, by saws contrived for that purpose. The wood from which these veneers are cut sometimes

elegance of his metal works, producing groups of loinge and flowers which rivalled nature in the per-root. The woods most frequently used for vencering fection of their design and workmanship: this artist are, the fine kinds of mahogany, rosewood, satinwood, work. David made the "menhle de noce" of Marie Antoinette, and Gouthier one for the Comte d'Artois fuilshed with a toothed plane, on the side to be on his maringe. The chairs and solis of this period vencer of vencer is full is asked with water, then had lost the graceful curves of the former reign, and work the graceful curves of the former reign, and had lost the graceful curves of the former reign, and work the wood is first sonked with water, then the sheet of vencer is well dried and direworks both the sheet of veneer is well dried, and afterwards both it and the ground are spread over rapidly with glue, and the two parts are brought immediately together: when joined, it is at once covered with a heated eaul, either of wood or metal, and afterwards a number of screws are applied, so as to press the parts together in every direction.

in every direction. Marquetry, or the inlay of various woods, is one of the most beautiful processes in cabinet work. The design having heen first drawn on paper, and properly coloured, is pricked with a fine needle, so that the outline of the ornament can be pounced on the various coloured woods proposed to be employed. These out-lines being carefully marked in, are cut with a fine watch-spring saw. I most cases the wood forming the ground is eut with that of the ornament; so that a piece aut of the fine out of while wood corresponds cractity in ece cut out of white wood corresponds exactly in ape and size with the opening left in the black shape and size with the opening left in the black wood, in which it therefore fits, and forms the re-quired pattern. In those ornamonts which are shaded, the effect is given by dipping them in heated sand. The various parts being out out, in the re-quired tints, are now adjusted according to the design, and fixed on paper; afterwards they are applied, exactly as vencer, to the piece of furniture. Buhl, or Boulc inlay is conducted on the same principles as mar-quetry, only that the various ornaments in this kind of inlay are cut out of sheets of metal, tortoiseshell, or

I have shown that it was the policy of the French f nove shown that it was the poncy of the Freine Government, and is still, to encourage and develope a knowledge of art among their manufacturing popula-tion. And I acknowledge that much has been done by our own, in the establishment of schools of design in various towns; but it is essential to bring before the eyes of art-workmen good examples; to form the cyces of art-workmen good examples; to form collections of the fine productions of former times; and thus not only form schools of art for them alone, but hy them educate the popular taste, and hence create a demand for what is heautiful. With this feeling, I can scareely believe that the Government ve decided not to purchase the Soulages collection. Think of the muscanis at the Hôtel de Cluny and have

at the Louvre, at Paris, and compare them with OUF at the Louvre, at Faris, and compare them with our own. Compare, also, with our own, the French ex-ports of fancy goods, dependant upon taste—their furniture, their hronzes, their paper-hangings, their printed musling, their rich silks,—and then acknow-ledge, that as certainly as "knowledge is power," there is compared is commerce.

I will now hazard a few remarks opon the princi-I will now aszard a rew remarks upon the princi-ples that should guide us in our designs for furniture. I will recite, if you will allow me, two sentences out of the report I was suddenly called upon to draw up on Furniture at our Exhibition of 1851.

" It is important, hoth for the strength and good effect of furniture, that the principles of sound con-struction be well carried out; that the construction struction be went earried out; that the construction be evident, s and that, if earving or other ornamed he introduced, it should be by decorating that con-struction itself, not by overloading it and disguising it. It is not necessary that an object he covered with ornament, or he extravagant in form, to obtain the ornament, or he extravagant in torm, to obtain the cloment of beauty: articles of furniture are to often crowded with unnecessary embellishment, which, hesides adding to their cost, interferes with their use, purpose, and convenicee. The perfection of ait manufacture consists in combining, with the greatest possible effect, the useful with the pleasing; and the excention of this can generally be most successfully carried out by adouting the simplest process." carried out by adopting the simplest process.

carried out by adopting the simplest process. Though these words are mine, the principles they enunciate are from a far higher source, and were pub-lished as carly as 1841, by Augustas Welby Pugin-a man now, alsa! lost to us-whose memory I revere, and whom I look up to as one of the greatest artists of his care mana mana share account had career bursur to ha of his age-whose genius had searcely begun to be known to the world, when he was struck down. He in. In. rarely mixed with society, and therefore his high att-ionments and great powers of mind were only fully known to the few who possessed his intimacy or his friendship. For some years previous to his death, I had the advantage of his advice and assistance in the

Gothic furniture I made. I have lately heard it discussed that Gothic furniture and decoration are not suitable to a nohleman's house of the present day-that their forms and appliances are incompatible with modern tastcs and comforts. But, in my opinion, there is no quality of lightness, elegance, richness, or beauty, possessed by any other style, which cannot, with equal propriety, he main-tuned in Medireval furnishing or decoration; and In wood now water that they price. The ornamental thind in Medieval furnishing or decoration; and knotted-looking walnut wood, now so much used, is a with this addition, that I know no style where the

principles of sound construction can be so well carried

out. Returning to the immediate subject of this paper, let us hope that the principles of true taste will guidu us in improving our honsehold furnitare: it is as gesentia in the simple as in the more claharate kinds Let us avoid gross, exaggerated carvings, which, applied without meaning, so vulgarize everything they pretend to decorate. Neither let us imitate the appread without meaning, so vagance orly uning they pretend to decorate. Neither let us imitate the French in their exuberance of ornament. Let us feel that well-considered forms and proportions cost no more in their manufacture than distortions, and that ublity and construction should be the element of design. To conclude, in the words of Pagin, "Let then, 'the BEAUTIFUL and the TRUE' be our watch-words for future exertions."

ARCHITECTURAL NOTES, PRINCIPALLY ECCLESIASTICAL -IN HOLLAND, GER-MANY, AND SWITZERLAND.

ROTTERDAM-AMSTERDAM-THE BHINE.

Two previous papers have already appeared in the Two previous papers have already appeared in the Builder, containing observations by the present writer on architecture in Central France and in Flanders. The following paper contains a few similar notes in the countries more eastward. To begin with Holland. Generally speaking, the kingdom of the Nethenlands

benerally speaking, the kinguan of the Neuterlands is not distinguished for any special heauty or gran-deur in its architecture. There are, however, some peculiarities which are interesting from their quaint-ness, or from their historical associations.

Rotterdam was the first town visited. Its aspect, like that of most of the Dutch towns, is quaint and striking at first, from the interpretation of land and water; the canals and havens, with their broad quays lined with trees, penetrating the town in every direction. This quaintness and old-world look is direction. This quainties and old-world look is increased by the houses in a great majority of instances presenting their gables to the street, many of them with serolls and pinnales in the Flemish style. After the first coup d'ail, when the mind begins to analyse the component parts, and descend into detail, the first impression becomes considerably modified.

There is great sameness in the street architecture, and nothing very striking in each of the honses taken singly : the public buildings are in general poor and meagre

Brick is the prevailing huilding material. The basement story of many of the modern houses is carried up in blue limestone of considerable hardness. The churches of Rotterdam present for the most part nothing remarkable. The national religion is Presbyterianism, which has, until recently, affected the utmost plainness in its ecclesiastical stru-tures.

The church of St. Lawrence, formerly the cathe dral, is a cross church, a large part apparently of fourteenth-century architecture, but the detail miserably mutilated. The east end has a details are miscrably mutated. The east end has a moli-augular apset. The nave has three aisles, besides chapels carried out between the huttresses and groined. The outside walls are briok, with stone facings and tracery. The piers and arebes, internally, are stone. These are bound with iron ties, the centre piers under the cross being much out of plugab. The present read of the news is a out of plamh. The present roof of the nave is a barrel vault formed with wood, having rough logs for the beams, with large brackets under. The window tracery is of flowing lines, but thin and meagre. The south side of the nave is undergoing measure. The south side of the fact is he ing patched up with Roman cement: the choir, internally, is sepa-rated hy a fine brass screen: the floor of the church is paved with monumental slabs of a fine dark ba These have been highly decorated with altic stone. armorial bearings, now much mutilated.

A modern organ, completed in the year 1840, occupies the west end of the nave. It is a large and noble instrument. The pipes are left in the natural colour of the metal, and highly burnished. The

effect is exceedingly good. The tower of the church presents some good features, having hold angle buttresses, with triple recessed arches in two stages above the roof. Above this the tower bas been modernised. The modern national churches are plain, even to meanness, and er no architectural features whatever. There is one church of recent date which possess offer no architectural fo

There is one church of recent date which possesses intermixture of land and water, gives to the two eities much merit as a hold and successful attempt to dissource and conventionalities, and to consider the object of resemblance cuds. The Dutch city is of the earth the structure regardless of traditionary forms. This earthy: there is no etheresi element out of which the is the Reformator Kerke, helongice, 1 believe, to a poetical spark can be kindled. Even the genus of Secession from the Establishment. The body of the Ruskin would find it difficult to desent with his usual structure is cetagonal in form, probably S0 to 100 fervid loqueare on the few specimens of the beautiful feet in dimeter, with shifts at each internal naple, to be found amids the dull mediocrity of its architect. This portion is unbroken by galleries, and is light and Johnson and the catagon a recessis rise up sheer cut of the water, giving the aspect of carried hack under a lofty pointed areb. Four of a city built in the sea. In Amsterdam the canals

THE BUILDER.

these recesses are semi-octogonal, and contain gal-The other four are rectangular, and shall leries. terres. The other rowr are rectangular, and shallower, containing the organ gallery and chronace vestibules. The building is capable of containing a very large congregation, all able to see and hear. The architec-tural effect is simple and grand. Externally, the building is brick, with stone facings. The style is the moderu German Gothie, the detail of which would escendle find facure in the areas of the Ecologiaderial careely find favour in the eyes of the Ecclesiological ociety, but which is, nevertheless, capable of very effects

The other public buildings are searcely worthy of workion. There is an English church in the heavy style of the William III. era. The Stadi-bau is somewhat aublitors, having a hexastyle Ionic portico, surmounted by a pediment filled by allegorical sculpof very grotesque design; the figures in their are thoroughly Dutch.

ture of very grotesque design; the ngures in their build are thoroughly Dutch. The next town visited was the Hague, the seat of the Dutch Government, and the residence of the monarch. It is a clean-looking, brick-huilt town, containing about 60,000 inhabitants. The court end of the town contains some fine streets, bordered with large trees, and lined with heaven of course extense. The rough under wresents

bouss of some pretnee. The royal palace presents nothing remarkable in its external aspect, being a plain Italianised building. Immediately opposite the entrance stands a noble equestrian statue in hronze, of William, the first stadtholder. Fronting the palaee some new buildiogs have been creeted of brick, forming a covered cloister, with unglazed windows, having open flowing tracery and mullions of hrick. The brickwork in these is beautifully exceuted, the curves easy and flowing, and the cuspidations sharp and well

easy and flowing, and the cuspidations sharp and well marked. The style is German Gothie. The King's library, in the Lang Voorhout, is a nohle modern building, in the Modern Belgian style. The ceclesistical architecture is not remarkable. The principal church is a Mediaval building of brick, with brick mullions, and a heavy hrick tower. St. Jacob's Church is a building of the latter end of the seven-teenth eentury, in brick, with stone pilosters and establature. The plan is somewhat singular being a terath century, in brick, with slowe pilosters and eutahlature. The plan is somewhat singular heing a rectangular parallelogram, with semi-octagonal pro-jections on each of the sides. The Kloster Clurreh is Modern Gothie, with very large windows, and slend-brick mullions and tracery.

There are some remains of the original castle of the counts of Holland, from which the town dates its counts of Holman, from which the town dates its origin, principally consisting of a large Gothie hall, with a timber root. The Stadt-bouse, partly hull in 1565, in a semi-Gothie style, is brick, with stone dressings. It has a slender tower, with a projecting gallery, and is eovered with a enpola.

gallety, and is covered with a clupola. From the Hague we departed for Leyden, famous for its siege and its university. This has all the ap-pearance of a decayed town. The hustle and noise of trade are strangers to its quiet streets. The cluck of the trowel, and the streek of the mallet, are seldom heard. Some of the street architecture is by no means huminble. The Decad terest extending in a result despicable. The Broad-street, extending in a geutle euroge through the town, flanked by quaint old buildeurve through the visitor of the High-street of Oxford. This does not arise, as might be supposed, Oxford. This does not arise, as mise uldings. The from the Collegiate or University buildings. The Collegiate system does not exist in the continental collegiate system does not exist buildings are seattered universities, and the University buildings are seattered inversities, and the Curversity bindings are seattice to in various parts of the town, with no arebitectural pretensions to boast of. The Stadt-house, hult in 1574, is a picturesque building, in the quaint irregu-lar semi-Gothic style of the period. One or two of 1574, is a picturesque building, and lar semi-Gothic style of the period. One or two of lar semi-Gothic style of the period. St. Peter's is very har semi-toome style of the period. One of two of the churches are worth mention. St. Peter's is very large, and has been very good. The west end is hriek, with stone dressings: the south transpet is stone. St. Paneras is a large eross church, with very long nsepts. These transepts are very fine, with eight-ht end windows, and octagon angle huttress light dows runs an external gallery, the gables recessed back, with three windows to each, and rich tracery heads. The east end has a multangular apsc. There are remains of a tower at the west end. The church are remains of a tower at the west end. The church is a noble specimen of late thirtecuth-century work in mixed brick and stone, hut the whole is wretchedly dilapidated, and so surrounded with huildings, that in areely possible to get a good sight of it

From Leyden we proceeded to Amsterdam. This renowned eity has been called the Northern Venice, and doubtless the amphibious character, the thorough intermixture of land and water, gives to the two eitics

which intersect the town in all directions are lined with quays, giving the idea of ditebes cut into the land

The houses usually present their gable ends to the street, and the greater part date from the latter end of the sixteenth to the heginning of the eighteeuth en-tury—the palmy days of Holland. The material is almost exclusively brick, with dressings of freestone, or, in some esses, of limestone. The arrangements are almost universally the same, —a cellar for mor-chandize about balf out of the ground; three stories control a dwelling-house with three stories of warevoons over, crowned with a projecting estheal and peut-house,-a very convenient arrangement, doubless, when the ship could lie opposite the merchant's door, menute supproductine opposite the merchant's door, and his spices and coffees could be warchoused over his head. Great changes have taken place in this respect during the last half-century. Large doeks surrounded with warchouses have hear econstructed for the large ships, and the inner canals are principally used for the coasting trade. One building meanlishty in Ameteodom on Det

One building peculiarity in Amsterdam and Rot-terdam strikes an architect as very singular. A large number of the buildings overhang their foundations— A large many as much as a foot or 18 inches; not by projec-tions in stages like the old English timber buildings, by a line sloping forwards from the ground up-ls. I was at first inclined to suppose that this wards arose from the sinking of the soft substratum which the buildings stand, throwing the building abstratum on ward at the top, but subsequent observation convinced me that they were designedly constructed in this manner. The object is probably to keep the walls and foundations dry, but the appearance is unsightly and inscence.

Generally speaking, the buildings in Holland are betteraily speaking, the binnings in Found at the kept in excellent repair. The scrubbing-binsh and paint are in continual demand to efficie the marks of the mellowing band of time. The result is a great want of the picturesque. Weather-stains and moss, want of the picturesque. Weather-stains and moss, the erumbling edge and ragged sky-line in which painters delight, are searcely to be found. Strange balliers utight, are search to be found to be the there is an interest of the search o teetural style

The Royal Palace, formerly the Stadt-house, finest building in Amsterdam, or probably in Holland. It was erected about the middle of the seventeenth century, in the classical style, with two orders of Corinthian and composite pilasters, raised on a hase-ment, with a ceutral pediment and wings to each

The state apartments are exceedingly fine. A noble The state apartments are exceedingly fine. A noble corridor extends round a central court, probably 100 feet square, valited and lined with marble, about 25 feet wide, and 30 feet bigh, rich with senipture.* The great hall is 120 feet long, 100 feet bigh, and 60 feet wide, lined with polished marble for a con-siderable portion of its height, with Corinthian plasters and valued roof. The walls are adorned with mear fine hear-rulefs.

with many fine bos-reliefs. The building is surmounted by a cupola, surrounded by a gallery, from which a fine view is obtained of the

by a gallery, from which a fine view is obtained of the surrounding country. Near the palace stands the Exchange, built in 1845. It is a building in the Greeian style, and possesses some nerit. The centre is formed by a tetrastyle Ionic portico, dipteral in depth, and deeply recessed back into the building. This portice forms a propylea, towering above the rest of the building, which is com-paratively low, with antæ at the corners, and doric entablature. entablature.

A new Post-office is in course of ercction in the same neighbourhood, in the modern Italian style, built of hrick, and plastered with Roman eement.

The ancient churches are mutilated, modernised, and built round in such a manner as to offer no archiand built round in such a manner as to ourse ho areni-tectural features. The modern ehurches are poor, with wooden steeples, erowned with a kind of dome, semi-Flemish, semi-Oriental, in style. On the whole, the feating after viewing the archi-tecture of Holland for the first time, is one of deep foremaniement. Utility and enyweinere there may

disappointment. Utility and convenience there may be, but taste and design are saily deficient. This does not arise solely from want of suitable materials, for their neighbours the Flemings have contrived, with as great a paueity of materials, to stamp the mark of picturesque beauty on the brick huildings of Bruges and Gheut. The genius for architecture, or the ciations of which genius takes hold, appear to bave beeu wanting in the Dutch character.

Passing through Utreeht and Arnhem into Rhenish Prussia and the hauks of the Rhine, we soon arrive at a school of architecture of a very different charact

The little town of Emmerich, where the Dutch-Rhenish Railway terminated until within the last few

* This is now divided into several separate apartments

weeks, presents some features worthy to be mentioned

The town itself presents the aspect of a quiet English country town of about 5,000 inhabitants. Its two churches are ancient and rather dilapidated. Aldegund's has three aisles, and west tower. St. The Aldegund's has three aisles, and west tower. The aisles are apsidal at hoth ends: the chancel is also apsidal, all covered with groined valitiez, with thin ribs, and slightly domical. The principal material is brick, with stone coins and tabling. The windows have flowing tracery heads of meagre character. The tower is brick, with stone coins, without buttresses; in three stages, the upper octagonal, with a stone shaft at each angle, and a large blank panel on each face, in the centre of which a narrow slit is opened for light. The floor nuder the tower is paved with incised sepulchral slabs of very ornamental design. Another, and older church, is situated on the extreme edge of the Rhine. It appears of carly Romanesque work, with additions and insertions of fourteenth-century architecture. It has originally been

fourteenth century architecture. It has originally been a cross church without aisles, to which aisles have been subsequently added. The chancel has an apsidal end and plain semicircular barrel vault. The transcepts are ground. Recesses are formed in each side-wall of are ground. Recesses are formed in each side-wall of the chancel, filled in with stall-work of late date, but well executed. There is some good Renaissance carving in hench-ends and panels. The tower is brick, with slated spire. An open gallery is carried round the tower with semicircular arches. The village eburches from hence np to Düsseldorf

very much resemble each other in style. They usually built of brick in three aisles; the east end chancel upsidal. The tower at the west end, with broach spires of timber covered with slate.

Disselent, in its stretce architecture, presents a very modern look. Many of its buildings are spacious and handsome. The streets and squarers in the quarter near the Hofgarten, interspersed with trees, have a very fine effect.

The architecture of the Rhenish churches, from Cologne up to Spires and Worms, exhibits features of a very marked character, which have attracted nuch attention from architectural antiquaries. The attentive study of these buildings is calculated

to throw much light on the derivation, the early bis-tory, and the tendencies of Mediæval architecture.* That all Mediæval art has been derived from the That all Mediaeval art has been derived from the Roman, nearer, or more remotely, is admitted on all hands, hut the particular sources from which each country derived its typical forms, the channels through which these inducences were brought to been, and the peculiar eircumstances which modified them in their peculiar circumstances which modified them in their development in each instance, require careful exami-nation before any general conclusions can he arrived at

That there existed at different periods various schools or centres of Mediaval art, the influence of which stamped their peculiarities on the buildings within particular countries or districts, is a fact now well ascertained

well ascertained. The history of these schools yet remains to be written. Indeed, it is only within a period compara-tively recent that materials have existed for this purpose. The old idea of former writers on the sub-ject, founded on partial and imperfect data, that any purificial county, necessed, the prefect thread for Jeef, lounded on partan and imperiety and, that any particular country possessed the perfect type of Mediaval art, — any departure from which was debase-ment and degradation, — is no longer tenable. The English, the Flemish, the Norman, the Ile de France, Engass, the Fremss, the Ivornan, the He de France, the Poitevin, the German, the Italian Tedesco, nre all styles complete and consistent in themselves, as growing out of actual circumstances and necessities. This subject is worthy of more attention than it has yet received.

The particular district to which our attention is The particular district to when our attention is now directed is a case in point. Its churches of the eleventh and twelfth centuries bear a striking resem-blance to each other in general character and style, with peculiarities which are found nowhere else, except in a few isolated instances where Rhenish influence has here howight to hear. bas been brought to bear

bas been brought to bear. The church of the Holy Apostles, at Cologne, upproaches prohably as near the typical form as any which could be cited. It consists of n rectangular nave with side aisles. The cast end terminates in a nave with side aisles. The cast end terminates in a Latin cross, each arm of which has a semicircular apsis covered by a semidome. Above the intersection of the cross rises an oetagonal cupols, carried on pen-dentives. On each side of the choir, at the re-entering angle, a slender circular tower is carried up, hreaking into an oetagon ahove. At the west end a square tower rises in a similar style of design. a square tower rises in a similar style of design. There are square transepts at the west end of the nave, There are square transcapts at the west end of the have, hut these are evidently of later construction, and may he fairly ascribed to the tbirteenth century. This church has suffered by fire at different periods, and has undergone some mutilations and insertions; hut

• Dr. Whewell, in his "Notes on German Churches," and the late Thos. Hope, in his "History of Architecture," have bestowed considerable attention on this subject.

there is no difficulty in determining the general scope of its architecture. The details of the original work of its architecture. The details of the original work in the piers, arches, vaulting, strings, tabling, &c. do not differ materially in principle from the Freach Rommesque, or the English Norman of similar date, except that they approach nearer the classical forms, and are much less rude than our early specimens.

THE BUILDER.

and are much less rude than our early specimens. There is also in the Rhenish churches much less dis-play of the varieties of the chevron, billet nail, head---and other grotesque mouldings and enrichments. A very prominent peculiarity in most of these churches is the open arcaded galleries, with columns and semicircula ular arches extending round the buildings exter-y, immediately under the eaves. The termination nal

nany, innectately under the caves. The termination of the towers generally bas a gable on each face, sur-monnted by a low slated spire. This style of building, hy Hope and other authors, has been designated the Lombard, from an idea that the revival of ecclesiastical architecture at the comthe revival of coclesisation architecture at the com-mencement of the eleventh century first took place on the planes of Lombardy, and that the style was carried by the incorporations of Freemanons originated there, into the countries lying to the north. That a great improvement in church architecture took place at the beginning of the cleventh ecutury is unquestionable; that its progress was from south-east to north-west, and that in progress was non sourcess to our owners, and that in passing through Lombardy some influence was exercised over its development is a fair inference from the comparison of existing specimens; but that the style either originated in Lombardy, or that its fluest specimes are to be found there is a conclusion which we cannot think at all warranted by the exist-ing_state of our information on the subject.

Down to the reigo of Charlemagne, in the eighth century, the churches in the west of Europe had been rude copies of the classical remains left amongst the ruins of the Roman Empire. The west front of the shabey of Lorsch, and the huilding called the Bap-tislerv of St. John, at Politers, are good asceimes tistery of St. John, at Poitiers, are good specimens of this style. It is to the Emperor Charlemagne, of this style. und to his intercourse with the East, that we owe the introduction of the first germs of Eastern art, which, modified by the peculiar genius of the West after ages to bear such ahundant fruit.* Th est, was in The cathemoduled by the period abundant fruit." The cance-after ages to bear such abundant fruit." The cance-dral of Aix-la-Chapelle, built by Charlemagne, was an imitation of the eburch of the Holy Sepulcher, at Jerusalem; and there can he no doubt that many other huildings in the Rhenish provinces, since de-stroyed, were constructed under Eastern influences. Charlemagne, however, was before his age, and in the Charlemagne, however, was before his age, and in the long period of confusion which followed his death, architecture, as well as other arts, well-nigh periohed from the earth. In the mean time, similar influences had been at work in other quarters. Venice had been cluster account to the function. silently growing up to he the mistress of the Adriatic. The riches of the East poured into her harhours, found their way across the plains of Lombardy, over the passes of the Alps, and down the course of the Rhine into western Europe and down the course of the the passes of the Alps, and down the course of the Rhine into western Europe, and along with commerce, there is sufficient evidence that science and art walked hand in hand. It is a singular fact, account for it how we may, that the Byzantine influence upon the architecture of western Europe did not develope itself in the same form in the different countries to which it extends to account in the different countries to which it extended. In one it principally affected the general

it extended. In one it principally affected the generat plan and arrangement; in arother the domical forms of the validing; in a third, the polyechronic and rich characler of the ornamentation; in a fourth, the scolpures and eurichments of the mouldings. "There exist," says M. Viollet le Due, in his "Dictionnaire Raisonnée," in the East, three plans, which have been applied as types to churches: the most ancient is the circular, of which the Holy Sepulchre at Jorusalem is one of the best known models. The second type is one derived from the ancient hasilica, hut with the transepts terminated hy semicircular apses, such as the Church of the Convent ancient assumed, but with the transcepts terminated by semicircular spees, such as the Church of the Conrect of the Nativity, at Betälchem. The third, which is the only originally Byzautine plan, is composed of a central cupola, carried on pendentives, with openings to the four cardinal points, and one or three appes to the cast end. lateral valleries over the side order acthe east end, lateral galleries over the side aisles, and

The east cut, lateral galacter over the side aisles, and n narthex or open loggin at the west end." The church of St. Mark, at Venice, is constructed on the type of St. Sophia, having both central and lateral domes on pendentives, as well as the side-galactics and the narthex. The present building was commenced in the year 976, faster the destruction of an older one probably after the same type. As we proceed westward was dead the news of the site. an other one promoty and the types of plan all nded to above mixed and combined. The church of San Michele, in Pavia, built not later than the eighth cen-Minete, in Favia, out that start than the eigent ech-tury, has the form of a Latin cross with apsidal east end, vaulted galeries over the side sistes and central octagonal eupola carried on pendentives. Many of the details of this huilding show the germs of the peculiarities afterwards carried to such an extent on the horders of the Rhine. The slender tower at the angle of the choir and transept, the double tier of * See Viollet le Duc. "Dictionnaire Raisonnée." Vol. I. p. 120.

areades round the drum of the cupola, the open gal-lery ranning up the gable of the west front, are identical in principle with those described in the Church of the Apostles. San Ciriaco at Ancona and the Duomo at Pisa, both built in the cleventh century, exhibit some of the same features. If we now turn to the Rheuish churches, and com

pare them with the specimens just alluded to, we find the plan of the Holy Apostles Church very nearly identical with the church at Bethlehem, except that the latter has four rows of piers, and the former only two

The central cupola with its pendentives re-appears, d the arcades, the slender towera, the gallerics, and other minor features only sketched out, as it were, in the Italian buildings, here receive their full deveop-ment. It is interesting thus to trace out to their ment. It is interesting thus to trace out to terr sources and to ascertain the analogies of huildings separated by mountain ranges, difference of languace, manners, and customs; and antil this is thoroughly explored, the true progress of architecture will nave be satisfactorily understood.* J. A. PICTON.

ARTISTS AND AMATEURS' CONVERSAZIONE.

It is some time since we attended one of these agreeable réunions, and it was a pleasant surprise, os the 2nd instant, to find that they are now held in the upper room at Wilki's, the cheerful aspect of which, the ample space, and the good lighting, add mat-rially to the comfort and satisfaction of the visitor: The committee for that excinct descent reside committee for that evening deserve great praise The committee on this evening desive great prists both for the agreeable company invited, and for the interesting display of works of art collected. Less erowded and better known to each other than in some eases, the visitors chatted in lively groups, rendering the evening a true conversazione. Amongst the works exhibited were some interesting portfolios of drawings and sketches by Richardson, Harttman, and Collingwood Snith; a pleasing picture by a German artist; an Italian mother depositing her shild at the door of a convent, the property of Mr. Walter Faweett; the original sketch of Collins's "Cut Finger;" Mrs. Garrick before her marriage, by Hogarth, -piquant in the extreme; "Roma," by Hartlman, very poetic and suggestive, but, nevertheless, open to criticism; and suggestive, and, hevertheless, open to erthesm; i a nice, breezy, sea-pice, by E. W. Cooke; a scene from "Macheth," by Cattermole, very vigorous and effective; "Milais's cartoron for his picture of "The Rescue;" and many others. Mr. Herhert Watkiw-exhibited some admirable photographs of Balle, the composer, and Robson, the actor, in several of his worth. part

The last of these very pleasant meetings for the season will be held on the 7th of May.

THE DESIGNS FOR THE NEW PUBLIC OFFICES.

THE arrangement of the designs is being procecded with. The exact number of packages received (some of which contain more than one design) is 218,—of which 188 were delivered up to the 20th ult.; and 30 (from abroad) up to the 4th instant.

THE NEW PARTS OF THE LOUVRE, PARIS

In our fourteenth volume, amongst other illustrations of Paris, a general view is given, at p. 275, of the additions to the Palace of the Louvre, made hy direction of the present Emperor, from the designs of the late illustrious Visconti. The accommission generation to the Visconti. The accompanying engraving, taken Visconii. The accompanying engraving, taken from a photograph of wonderful beauty, repre-sents more at large the front of the centre Pavilion, next the Place Louis Napoleon, as the space enclosed by the two new wings is called, together with a small portion of the Called, together with a small portion of the arcade, surmounted by statues, on each side of it.⁺ The statue on the left side, by the way, represents Montesquieu; that on the right, Mathieu Mole. The design of the Pavilion in the Renaissance Court, huilt during the reign of Louis XIV.⁺ and displays an amount of sculp-ture of which we have no corresponding exture of which we have no corresponding ex-ample. The caryatides, and the details of the windows which occur hetween them, are exquisitely modelled.

* To be continued.

A bird's are view of the Louvre and Tuileries united, will book in vol. xii. (p. 131), with a history of the buildings (pp. 129 and 137). A plan is given in vol. x. 5 Sam-1.

\$ See vol. siv. p. 7, for view of that Court.

THE BUILDER.

207

"PAVILLON RICHELIEU," PALACE OF THE LOUVRE, PARIS .---- L. VISCONTI, ARCHITECT.

4...

THE LATE W. H. PLAYFAIR, ARCHITECT.

At the last meeting of the Liverpool Archi-tectural Society, Mr. James M. Hay alluded to the recent death of William Henry Playfair, the able and distinguished architect, of Edinburgh, and after reading a notice of that gen-tleman from the *Daily Scotsman* of the 20th of March, he exhibited and described some of Playfair's designs, and continued with the following remarks :-

Plsyfair completed his studies st a time when Greek and Roman Architecture were considered the only styles worthy of imitation, and it is surprising that styles worthy of imitation, and it is surprising that he should have succeeded at all in Gothie architecture, Great is the advantage of the architectural student in the present day, when every style of art, ancient and modern, is illustrated, examined, sifted, and analyzed, and we have every reason to helieve that a greater advance will be made within the mext fifty years than at any past period. But every architect shows a preference to one style though educated in several, and "Pheyriar's forfer was doorded to be Greek style. There is a freshences and every architect shows a preference to one sive though clucated in several, and Playfari's forte was decidedly the Greck style. There is a fresheess and vigour in these compositions, comhined with so mach clegance and delicacy of finish in every detail that you recognise at once the work of a master who has worked out his subject with love and enthusiasm. St. Stephen's Church, Edimburgh, forming the termi-nation to St. Vincent-street, is a successful work of his, II is hexagon on plan, with a tower to one of the sides or front: the two grapped funks of this ns. At is netrogon on pise, with a tower to one of the sides or front: the two exposed funks of this building exhibit great power and heauty, and indicate as fine a feeling for Greek att as anything 1 have seen; the upper part of the tower partakes, perhaps, unnecessarily of the Gothic, but the whole design is hold and original hold and original.

The Royal Institution is after the Greek Doric, hat is a sufficient departure from the temple form to stamp it us an original work. An octastyle portico terminates each extremity of the hulding, and each flank is broken by projections surmounted by sphinxes. The roof of the colonnade abuts against the cella The roof of the colonnade ahuts against the cells which rises no through the roof, as it were, to receive it, making this part of the design exceedingly heau-tful. This, in my opinion, is the finest of all Play-fair's designs, and is a noble building, notwithstand-ing the lowers of the second ing the lowness of the site, which much impairs its majesty of effect.

The National Gallery is vary inferior to the Royal Institution, and although Playfair's latest work, will

not been the same inspection. Donaldson's Hospital was the result of a competi-Domaidson's Hospital was the result of a competi-tion limited to Gillespic Graham, David Hamilton, of Glasgow, and Playiar, all three able and eminent men, and the latter gentleman was commissioned to carry his design into execution. Although in a style foreign to his predilection, he has acquitted himself with great whitry. The sight is latt Tudor, with n certain infusion of Elizabetham, and his fine classic tasts in infusion in the sign of the sign of the sign of the sign case in the sign of the size in infusion of Elizabetham, and his fine classic tasts in the size of the taste is indicated in every detail and moulding, which are not merely horrowed from precedent, but are drawn out afresh according to his own standard drawn oot afresh according to his own standard of purity and heauty. I may here observe, that there is, perhaps, no style more capable of heing improved in elegance of detail, and in general cha-racter than the Elizabethan, and that there is none equal to the study of the Greek style, for imparting the qualification for doing so. The Free Church College was offered for public competition; the first and second premiums were awarded by the committee, assisted in their selection by Sir Charles Barry, and the work ultimately given to Mr. Playfair, who was not a competitor. As a design, this building is com-pletely marred by the character of the four towers. Gothie has heen defined as the vertical style, and Greek as the horizontal one; that it would he absurd to conclude that every vertical line in the one, and Greak as the normound one; but it would be ansure to conclude that every vertical line in the one, and horizontal in the other, ought to be dispensed with; hat corrected by the dispense of the dispense of the such idea, when he designed the towers in ques-tion, for there is not a single string or horizontal tion, nor turner is not a single string or horizontal moniding of any description, from the base to the parapet. Every Gothic architect is aware of the esthetic value of the string moulds, in binding the edifice together, in indicating and contrasting the heights of the various stories, and, in fact, imparting more of the aspiring or vertical principle, than the design could have without them. The other portions

hate, and this is finished by a handsome galeway at each end.

The monument to Dugald Stewart is crected on the Calton Hill; and though the idea is horrowed from the monument of Lysicrotes, it is quite original in its treatment, not to mention all the minor differences. The columns are nine in number, and stand free, there being no cells or inner chamber, as in the Athenian exemple. The stylobute is circular, while

Attentish example. The styloate is circuit, where that of Athens is square. There are other buildings in and around Edinhurgh from the classic pencil of Playfair, and if they are not so numerous as those of some of his comperes. they are sufficient to stamp his reputation as a great and distinguished architect. One picture is enough to prove a great painter, one poem a poet. What is desired is quality, not quantity, and in the works of Playfair we find genaine and sterling morit.

INFLUENCE OF FASHION ON TASTE.

YOUR correspondent, Mr. Lockwood, under the above Your correspondent, Mr. Lokwood, mucr the address heading (n.164) treats us to a dissertation upon matters of taste as applied to the finishing and furnishing of houses in general, wherein, amidst nuch that is true, there is mingled much that is surcestic, — much that is positively unjust. He has painted a fearfully real picture of the horrors and incongruities that certainly related the means of a curr moders, manistims. and exist in too many of our modern mansions; and doubtless many articles of so-called ornament would be hetter placed, and give more joy to the heholder, presuming him to have a healthy perception of what is ornament, if used to illustrate some of our popular professors' lectures on combustion, in lieu of heing allowed to usurp the place of honour in our honse-holds, and drive taste from out the drawing-room to holds, and drive tasts from out the drawing-room to consort only with the gardener out of doors. That this state of things exists, no one has a better know-ledge than myself, and no one feels more pain in the possession of it; but it heing conceded that a lament-able want of taste exists, the question is, how is that evil to be met; and to whom are we to look for an improvement? Mr. Lockwood considers, by arming architects with full powers, and allowing the sole and entire supervision to them of everything, that the entire supervision to them of everything, that the remedy is at hand. Alas! until the architects show, by a greater preponderance of good works over had than at present exists among their works, that we may do so with safety. I am afraid we should he scarcely henefitted. And with a house so divided against itself as the profession of architecture,—one urging the adoption of the Classic, another Mediawal, the heir the heavieffling of an orthogram string and a third to be desirability of an entirely new style, each to the total exclusion of all others,—the public, or pattern, does not know on whom to throw himself to have his erring footsteps guided rightly in furnishing his house.

It seems to me exceedingly unjust to throw the blame entirely on the decorator and upholaters. They have in too many instances, like the architects, and voice in the matter, but are compelled, *nolems volens*, voice in the matter, hut are compelled, nolens volcas, to hecome passive instruments in the hands of their employers, disgusted oftentimes with the impropri-tics they are compelled to commit; hat rates and taxes must be paid, and large establishments kept np; there-fore, the patron's *peculiar fancies* must be howed to, or the shop elosed. The disrepute that decorators have fallen into, amongst writers upon art generally, arises not from their own deserts, but from that love of meretraious adorament that unfortunately pervades society to such an extent. for ware, a decorator society to such an extent; for were a decorator worthy of the name called in (and there is no lack of them) and allowed to use his skill, unshackled miladi," we should have none of those incongruous ements complained of. None possess a more refined clements complained of. None possess a more refined feeling for colour, or are accustomed to act with greater reforence to the *tout ensemble*, than the decorator-proper: effect is his grand object. Unfor-timately, in far too may instances, the method of procedure is as follows :---When " miladi's" drawing-room requires refurbishing, she sends for the plumber and glazier, who reinstates the square of glass the chil-dren's hall has broken, or plasters up the water-pipe, raptured by last night's first, with alscrity ;--- a very worthy man, no doubl, and quite an oracle of taste anonget those worthies whom he regularly meets at evensous; but one who knows no more of the harmony evensong ; but one who knows no more of the harmony of colours, and has no more idea of the difference of treatment required, in a room at Haddon Hal and one in Compo-place, that an Esquinaux. This "plain good mau" duks himself decorator, and in that character "miladi" sends for him. He design cond have without them. The other portions This " plain good mau" duts himself decorator, this is generally recognised as a principle by run of the college are good, the entrance, and especially and in that chearacter "milhad" sends for this. He duadrangle, is very fac, but the design of the fully character of graining for the work, and that the moldings arises, in my opinion, from the faulty character of graining for the work, and that the moldings should be gill,—tempting, of course, his victim with similar comments. The Surgeons' Hall, in Nicholson-street, is another different in milhadi" goes to an upholsterer. He, having a sion on Mr. Armstrong's Paper "On Higg wife and family to keep, must make a bill; chars, Steam Navigation, and on the Relative Efficit a main building of small extent on eak side; the couches, and other requisites which remind of Louis the Sereen-propeller and Paddle-wheel," has or front columns of the portico rest upon a high stylo-

[April 11, 1857.

slightly noisy" in effect, but still only neutrally "slightly noisy" in effect, but still outly neutrally offensive; hut the curvest and the curtains recom-mended are "thrilling;" and all these things, with pendout fringes from the cornices. — these latter recoco in its last stage—like gilded ropes of outons, are ordered home; and when "miladis" lord returns one evening, he is hid to wipe his shoes, and all the glories of the rowoyated room hurst on his gaze at once. Of course, at first he shudders, as is natural; hut hecoming callous with familiarity, he thinks his wife a woman of grayst taste, and writes a cheque. Now, why should we become the scapegoats of sll this? Because, forsooth | people persist in ignoring this? Because, forsooth | people persist in ignoring the existence of competent professional men, it goes forth to the world that decorators are the enemies of A DECORATOR. good taste.

COMPETITIONS.

North Shields Mechanics' Institution .- From the

North Shields Mechanics' Institution.—From the several designs sent in, the committee have selected one hy Mr. John Johnstone, the architect for the Exchange huildings, St. Nicholas'-square, Newcastle. *Worcester Cemetery*.—When we last heard, the plans and designs for laying out the new hurial ground had not hene examined. The reason assigned for the delay is the rity election, which has put all public huipress out of iont. public husiness out of joint.

Bowden Church .- A correspondent asserts his belief that the appointment of architect in this matter

balled that the appointment of architect in this matter has hene settled some time, and is at a loss to con-ecive what can be the motive in advertising. *Cardiff Concerry*.—The first premium of 20% for the plans of the chapels and laying out of the pro-posed cemetery has heen adjudged to Mr. R. G. Thomas, architect, Newport, Monmouthabire, who Thomas, architect, Newport, Monmouthshire, who will carry ont the design. The Burial Board propose to purchase thirty acres, and the works, it is supposed, will cost abont 7,0007.

THREATENED DESTRUCTION OF DOVER CASTLE CHURCH.

I AM greatly surprised to see an article in your last publication which conveys the impression to anti-quaries not in the locality of Bover that the old church not to he destroyed. If it is not the intention of War Department to disturh the rains, is it not îs not the Somewhat singular that the Secretary of State for War ahould have asked for tenders for pulling down the walls and erecting a garrison chapel school on the site of the present edifice? Indeed, many have hat just finished their calculations of what it would cost to pull down the present walls and use the material so obtained to form a foundation for the proposed erection.

obtained to form a foundation for the proposed effection. A very short time ago the anthorities were visited with some qualms of conscience, hecause they had committed the gross sacrilege of making the interior of the church serve as a coal-store, and orders were given to discontinue the practice; hut they seem now to have so far recovered themselves as to have come to the determination to demolish the accord colince to the determination to demoitan the subra culter altogether, and place the venerable materials—which so recently they were afraid the coals would injure— anderground, to form the foundation of a school for soldiers' children, which might just as well be erected near the site of the present hallding as eractly upon it. VERTO.

DISCOUNTS TO ARCHITECTS.

Incosep herewith is a circular from an iron-monger of extensive business, headed "Circular for Architects only," and offering them 10 per cent. dis-count on the prices of the articles. I think it would have here more appropriately called a "Circular for *Discuss* only," Surely the tradesman who issued it is ignorant of the obligations of architects; or is it Is ignorant of the obligations of architects; of is it that his principal customers are some low close in our profession which systematically defrauds an employer by certifying for the payment of upwards of 11 per cent. extra upon the real value of works, in order to enable the tradesman to pay 10 per cent. to him, the very person on whom reliance is placed for seeing that only fair moments are noted?

at only fair prices are paid f It is right in the face of t of this imposture that the It is right in the face of this imposture that the public should know that very Fellow of the Institute of Architects has subscribed a pledge, "that he will not receive any peenlary consideration or emoluneat from any hulder or other tradesman whose corks he may be engaged to superintend," and I helive that the is ensured as a remaining her remeet. this is generally recognized as a principle by respect-able architects. F. 1. B. A.

*** We have received nine other letters enclosing the same "circular," with similar comments.

INSTITUTION OF CIVIL ENGINEERS .- The discussion on Mr. Armstrong's Paper "On High-speed Steam Navigation, and on the Relative Efficiency of the Screw-propeller and Paddle-wheel," has occupied

THE EXHIBITION OF NEW INVENTIONS AT THE SOCIETY OF ARTS.

THE ninth exhibition of ioventions at the Society A Arts, Adelphi, has now assumed something like its matured form, though some rather prominent articles in the catalogue have not even yet made their appear-sume. Maay of those to which we will refer, as well

as of the others, are recedy patented. 1 The first series, in the catalogued order, are "Ea-signeering and Mechanical Appliances," amongst the 116 separate articles of which we note (No. 7), an 116 separate articles of scouring steam-boilers of 116 separate articles of scouring steam-boilers of automatic scavenger for scouring steam-boilers of tenerustatioo, seale, or mud deposit, and consisting of caterbistatico, scale, or mud deposit, and consisting of catelalic articles in varied geometrical forms like wnodels of crystals, which move about in the water, and scrape and stir the nasceot deposit; (33) a whomble action centrifugal pump; (43) a railway mostman, very like an old invention for slipping of and on unail hags as the mail train passes the post-trations. (40) dush and for fast (40). utations; (48) flush rails for streets; (49) bollow-waced demisemicylindrical rails, also for streets; (71) sized demisemicylindrical rails, also for streets; (71) drawings of Bishford's gas-making apparatus for dioing away with all utisance in gas maufacture, and (72) his Pavilion gas-works for parks and plea-nure-grounds; (81) a hand saw without joint, for dufting eurves and bends heretofore cut by hand; (84) the timher-bendiog machice; (88) a self-acting uraversing drilling machice; (89) the litholemer, or steam stonc-cutting machice; (91) drawings of Clay-tor and observatory; aod (93) Howard's apparatus for making moulds for eastings.

1 The next in order are the "Building Contrivaoces and Hardware." The first of these is-

No. 146. A specimen of wood paving for floors of

school-rooms or workshops, consisting of wooden bricks laid on asphalte; Holmes, Derby, exhibiter. No. 147 is a specimen of wood indying, composed of sixty-seven different woods; Rea, exhibiter.

No. 148. A specimen of the solid Swiss parque-terie; Arrowsmith, exhibiter.

tere ; Arrowsmith, exhibiter.
No. 149. Specimeus of parquet floors and borders, parquetetto panels, and wooden tiles, exhibited by the London Parquetry Company.
No. 150. A specimeu of ornamental vencer floor-ing for sides of rooms, window recesses, hells, &c.; Sikes, exhibiter.

151. Roherts's encaustic tiles for flooring, No No. 151. Roheriss encausite tues for mooring, glazed, to prevent tear and wear and to keep dry and elean, aud iodented to prevent the feet from slipping on them. Glazing must tend to show out and pre-serve the colours of encaustic tiles. In these speci-mens, however, the glazing is unequal, some looking bighly varnished, and the glazing on others heing areason withle. scarcely visible.

No. 152. Corrugated papier maché for living port-le houses, and for partitions, panelling, and ornaable

mental purposes. No. 153. Ransome's silicions stone, and 154, a process of preserving stone : these are interesting specimens

specimens. No. 155. Page's pellucid chromatic embossed glass. No. 156. Imitation of stained glass, consisting of sheets of gelatine, painted and ioserted between two sheets of glass; Myers, exhibiter: a good subject for ladies to amuse themselves with. No. 157. Enamelled wrought and east iron, from the Patient Glass Formal Company. Biomichem

coatiog iron with copper and brass; Tytherleigh exhibiter. Here are brass nails made of iron, and sheets of iron timed with brass. This is another mode of guarding iron articles from corrosioo : the uering seems to be complete, and the articles have

additional the specime of heats. No. 162 is an attractive looking show specimen of Parcell's now patent "universal lock," of which we have already expressed a favourable opinion : as an exhibition article, this is one of the most noticeable in the room.

These are the chief objects of interest to our readers in this exhibition, although there are many others of a miscellaneous order to which we might have referred, did our limits permit. It will be seen that there is not a very numerous list of building trade inventions hot a very numerous has of building trade inventions this year, and that, in fact, most of those noted have already heen described io our columns, as have others connected with sanitary science and ventilation, connected with sanitary science and ventilation, engineering, gas, mechanics, &c. to which therefore we need not here make any further or more special reference.

EXPERIMENTS ON DANTZIC TIMBER.

REFERENCE to the account of experiments on the elasticity of timber, hy Mr. H. R. Abraham, at page 25 of the eurrent volume of the *Builder*, wherein, after giving the particulars of the deflexioos produced after giving the particulars of the defixious produced by different weights on a bean supported at both cods, and loaded uniformly throughout its length, he states, that "4750 is the multiplier for detaticity" probably many of your readers may have been puzzled to know how this result has been arrived at ; perhaps Mr. Abraham would not object to add to the value of the experiments, by stating what formula he adopts to obtain his constant. Terdendify semant formula for a hear supported at

Tredgold's general formula for a heam, supported at hoth ends, and loaded in the middle, is $\frac{B \times D^3 \times d}{L^3 \times W} = a$ $L^3 \times W$

constant number, when B = the breadth, and <math>D = the depth, hoth in inches; L = the length of hearing in fect, W = the weight in ponnds, and <math>A = the deflexion in inches, for the material ascertained by

the experiment. The matching determined by experiment. The computing the constants given in his own tables of experiments, Tradgold takes forty times the result of the above formula, thus $\frac{40 \text{ B.D}^3}{\text{ L}_2 \text{ W}} = a$. But where the weight is uniformly diffused over

But where the weight is uniformly diffused over the length of the heam, as in the experimeous alluded to, he shows that the deflexion produced is, to the deflexion resulting from the same wei, ht collected in the middle, as 5 is to 8, or, as '625 is to 1; there-fore, to obtain the value of a, for a beam uniformly loaded, the formula hecomes $\frac{1}{10^3} \cdot \frac{625}{625}$ w. = a.

Applying this formula to Mr. Abraham's experi-

ments	;												
When	W	-	8	tons	and	d	=:	2.65	then	a	=	·0188	
22	W	-	10	tons	37	d	=	3.20	31	a	=	.0198	
27	W	=	14	tons	22	d		4.25	,,	а	-	.0172	
	W	=	15	tons	27	đ		4.80		а	-	'018L	
									4)-		.0739	

Average value of a =.0185

If the theory from which the formula is deduced were absolutely correct, and the several weights and When ansometry correct, and the several weights and defersions accurately noted, of courses the value of awould be the same in each case; as it is, it appears that with 10 toos the deflexion was greatest io pro-portion to the weight, and that it was least in pro-portion when the heam was loaded with 14 tons. It will be observed that the value of a here given is very different to the multiplier obtained hy Mr. S. Abrabam.

IRON AND STEEL MANUFACTURE.

MR. BESSEMER scems resolved to make the hest MR, BESSEMER seems resolved to make the hest possible use of his process for keeping iroo melted without fuel. He last month filed specifications of other two new patents for further improvements. He states that by the ordinary pudding process of re-verberating fame and gaseous matter from mineral cose on to the molten or semi-molten metal, the iron include the ment each day height of his first No. 156. Imitation of stained glass, consisting of sheets of gelatine, painted and ioserted between two is injured, at great cost; and the object of his first sheets of glass; Myers, exhibiter: a good andject for patent is to sustain, without ordinary fuel, the heat requisite during a process producing the effect of No. 157. Enamelled wrought and east iron, from the Patent Glass Ecamel Company, Birmiugham. Besides various household utcosils, includiog unbreakable crockery, and notaintable saucepans, without end there are there specimens of enamelled iron pipes, which look promising for so great a desideration and sub-stitute for lead. The coamel does not look just bait of the puddling or such are still the iron seems to he effectively covered. seems to be effectively covered. naceous iron ores, or from any mixtures of carbona-No. 158. Specimeos of the patented process for ceous ores with oxides or other ores of iron, by the

application thereto of a hlast of hot or cold air, or

application thereto of a hlast of hot or cold air, or steam, or of any other gueens matter containing except such as is evalved from the said orcs of iron, and from the gaseous matters forced in. It is rather a carious circemstance in reference to the essential principle of all Mr. Bessemer's pro-cesses, namely, the dispensing with ordinary fuel in his melting processes, that an old author, who worde before Mr. Bessemer could have ever dreamt of his new processes, in a work treating of the Japanese and their inventions, is said to have stated that they had one " for melting iron without using any fire, casting it into a tun, dane about on the inside with about a balf foot of earth, where they keep it with continual blowing, and take it out by Jalles full, to give it what form they please, much better and more aritificially than the inhabitants of Liége are able to do. So that it may be said Japan may live able to do. So that it may be said Japan may live without its neighbours, as being well furnished with all things requisite to life."

There is scarcely any *new* invention of mark or moment, of which traces have not existed in the East moment, of which traces have not existed in the East from time immemorial. Such was the case with the serew propeller, with gas, with the compass, and many other inventions and discoveries; and new instances are ever and annu turning pass was hately the case with the screw augur and the Bramab lock. If the Japanese (a sort of insular Chinese) do really practice this new process of Mr. Bessemer's, depend on it "there is something in it," however much it may as yet be involved in difficulties.

ROME

THE POPE INSPECTING M. OVERBECK'S NEW PICTURES.

Ox the 7th of February the Eternal city was plea-sandly surprised by the visit which Pio IX, paid to the *atelier* of the German painter, M. Overbeck, in his villa on Monte Esquilino. His visit chiefly referred to the pieture *Alla Tempora*, which is to be placed in the Palazzo Quirinal, and which Overbeck has completed during his late *villeginture* at Perugia, representing the Saviour disclosing ta the future Evan-gelist the Secret of the Trinity. Christ is repre-sented in a sitting position, a holy vision rests on his brow, whilst the loving disciple reclines at the breast of the Divine master, listening to the disclosures of his inspiration. The scuptor, M. Haffmann, is concerned to expect the fine disclosure as a group in Ox the 7th of February the Eternal city was plca. of the Divine master, listening to the disclusures his inspiration. The sculptor, M. Haffmann, engaged to excent this fine design as a group marble. M. Overbeck is now painting the "Sta-tions," as well as an allegory of the Seven Sacra ments.

ELECTRO-TELEGRAPHIC PROGRESS.

ELECTRO-TELEGRAPHIC PROGRESS. THAT there will shortly be a telegraphic line laid down to Iudia, we think, cannot well be douhted, whether the Russians, as alleged, are already laying nee down to Teberan or not. There are now two schemes afoot for an Indian line; hut there is a serious guestion as to the hest or moost practicable route. The Euphrates or Mesopotamian line would be 300 miles shorter than that by the Red Sea, but the tender mer-cise of the wild Asintics we fear are less to be Expirates or Mesopotamian line would be 300 miles shorter than that by the Red Sea, huit the tender mer-cies of the wild Asinties, we fear, are less to be trusted to than the easandities of the stormy sea. The Red Sea line would be mainly submarine, the Meso-potamian chiefly subterranean; and that the wild tribes who scane through rather than inhabit the territories adjaining the Eupbrates are but too likely to be perpetually tearing up the wire, an one superstito be perpetually teaming up to ward, in one supersi-tions or ignorant pretence or another, is much to be feared; so that an expensive, or rather an impracti-cable, police would be requisite, as Lord Palmerston states that the Company must see to that themselves. On the whole, it would seem that the Red Sca route is the likelises th become the established non. Besides its mure direct purposes and uses, it would, contin-cently he of section to our, uscine both near and gently, be of service to our marine, hoth naval and mercantile, as much of it would he coasting in its character.—The great Atlantic line is on the way. character.— The great Atlantic line is on the way. Two first-class United States steam-ships, the *Niagara* and the *Mississippi*, are to come the Eogland, where they will be associated with two similar British steamships, for the parpose of laying down the line from the middle of the Atlantic landwards. The telegraph the middle of the Atlantic landwards. The telegraph is reported as likely to come into operation about August next, hut we cannot place much reliance on that date. There is no doubt, however, that the utmost expedition is being used by all who have the practical part of this magnificent undertaking to carry out.—The Interneceoic Telegraph will thus soon put a belt around the globe; and one question which will then arise is,—What will be doneabout Snuday? Sandays will generally become confused. If the tele-graph offices in all marks of the world close on Sunday. Sundays will generally necome contised. At the tree-graph offices in all parts of the world close on Sunday, news arrangements will he greatly interrupted and delayed; for Sunday in one place will of course he Saturday or Manday in others. Another question suggests itself to ns on examining, at the Society of Arts Exhibition, a small piece of one

nf the Dover sub-marine lines, ticketed as follows :-"Piece of sub-marine cable taken up off Dover, covered with simple gutta-percha,—the electric wire cor-roded !" If this were intended to depreciate the merits roded [?] If this were intended to depresente the merics of "simple gutta-percha" in comparison with a com-bination of gutta-percha and ground cocce-nut shell beside which it lay, the purpose antirely fails, for the copper wire is clearly *not* corroded, at least to any appreciable extent; but what is very singular, and seemingly important; is the fact, that the wire is divided into short pieces of about half an inch each in the time to the source of a source and so and so if some seemingly important, is the nuc, that use wife is divided into short pieces of about half an inch cach in length, and as it were beat in at each end, as if some mechanical force had been used to sborten each piece, leaving small vacant intervals, just as if the wire had heen so contracted and consulidated that it could no longer retain its former length, and so had divided itself into separate marsels. If the electric force shot through such wires be a concentrative one-more analogous to cold, for example, than to heat, or to attractive force than to repulsive—as we have always maintained it to be, this curious result of its continued operation would be explicable. Whether it he possible to conteract it by some alternative process, is another question : doubtles, the electric message will still pass along a wire so disintegrated, but in a length of the such as that of the Atlantic tele-graph, may it not at length lead to insperfect ar more expensive working, if not also to other inconveniences P It may be worth noting here that in the fragment of cable alloded to the gutta-percha was nearly all to one each of the source accounter work of the work of the work of the source cable alluded to the gutta-percha was nearly all to one side of the wire, a comparatively thin film only cover-ing it on the other side.

THE TEMPLE FOUNTAIN AND GARDEN.

WILL you spare a corner in your paper, and lend our aid, to save from roin one of the most charming vour aid. I allude to the eclebrated Temple pots in London? spots in London? I allude to the externated remine fountain and garden, now doomed to destruction by the benchers of the Middle Temple—an irresponsible body, who symander away the funds of the society in acts of the most perfect Vandalism. I ask anybody who has a taste for the beantiful to visit this spot now that the tree are coming into leaf, and say whether any but barbarians chuld think of destroying it, and any but harbarians could think of destroying it, and envering the space with a mass of brick. London has surely need of all her vacant spots for the sake of health and enjoyment—more especially if they contain trees and verdure, such a relief to the eye and the mind fatigned. The Bar of the two Temples are unanimous in condemning this monstrons outrage on good taste and on all that is old and venerable, and a gummenous signed partition has plready hear sent in numerously signed petition has already been sent in, to be followed by several others in course of signature against the measure. Our rulers seem demented : but there is a secret cause for everything, and Sir R. Bethell could tell it you in this.

R. Bethell could tell it you in tors. Help us, sir, to save this lavely spot, and receive our united thanks and those of posterity. R. PATERNOSTER,

THE SOANE MUSEUM.

AFTER a long vacation, the collection in Lincoln's AFTER a long vacation, the collection in Linchia's-ion-fields is again open, and may he seen on the Thursday and Friday in each week till the end of the manth of June, by all persons who apply previously, by letter or personally, for tickets of admission. Some alteration in the management of this im-portant collection is much to be desired: its educa-tional value to the public is at present act to nothing. It is little better, in fact, than a sealed book

hook.

CHURCH-BUILDING NEWS.

Broughton-com-Filkins.—The new church of the recently consolidated parish of Broughton-cum-Filkins is to be consecreted on the 14th inst. It is in the Early Decorated Gothie style, from designs by Mr. G. E. Street.

Mr. G. E. Street. *Henteg.*—On the 25th nlt. the school chapel at Skirn.ett, in the parish of Hambleden, was opened. It is intended for the dualhe purpose of praviding a school for the infants of the hamilet, and a place for school for the manus of the hames, and a place for the necesional performance of Divine service, for which it has the hisbop's license. The building is very small, and is simple and inexpensive. The architect was Mr. H. Woodyer, of Grafibam, near Guildford, and the contractor, Mr. Courtney, of Hambleden,

Hambleden. Croydon.—St. Andrew's Church here was conse-erated on Thursday in last week. It is in the Middle Pointed Gothie style, with turret and bell, and has a nave, ebancel, and vestry-room, with sedilia, credence table, &c. The castern window is of stained glass, prospective of the sedice of the sedice of the sedice of the prospective of the sedice of the sedice of the sedice of the prospective of the sedice of the sedice of the sedice of the prospective of the sedice of the sedic rance, e.e. The cattern window is of scance grass, representing St. Andrew. The other windows are of Powell's patent stamped glass. The seats are all open. The pulpit is of Caen stone, and the font of the same material, inlaid with marble panels. The building is situated at Southbridge, hetween the old representing St. Andrew. The other windows are of it contains a vestihule, with a staincese to an end Powell's patent stamped glass. The seats are all gallery in front, and session-room, and other requisite open. The pulpit is of Caen stone, and the font of apartments in the rear. The front, which is set back the same material, inlaid with marble panels. The about 60 feet from the pulbi road, coosists of a hel-building is situated at Southbridge, between the old gable, in the under part of which is a deeply-recessed church of St. John's and the new church of St. Peter's. entrance doorway of cut stone, having pillars with

[April 11, 1857.

Mr. H. Wnodyer, of Guildford, was the architect, and

Mr. H. Wnodyer, of Guildford, was the architect, and Mr. Swayne, af same town, the builder. *Baschurch (Skropsitue)*—In the outlying district of the parish of Baschurch, called Weston, Mrs. Barrett, of Prince's-terrace, Hyde-park, formedy af Prescott, has erected a charch, and a parsonage-house attached, at a cost of 5,000/. and endowed the incumbency with 200/. sycar, besides a sinking-fund for repairs. The church, which is dedicated to the Holy Trinity, consists of nave and chanced, with vestry and north porch. A turret and spire, contai-ing two bells, spring out of the nave roof near the west end. The interior is fitted up with open scats for about 145 persons, free. The roof is open-timbered, and, like the pews, of stained deal. The parsonage-bouse, which stands on the south side of the church and parsonage is geometrical. The walking and dressings are of Cefu stone, and the style of the church and parsonage is geometrical. The walling and dressings are of Cefu stone, and the The wailing and dressings are of Celu stone, and the roofs are covered with blue Staffordshiper tile. The architect is Mr. Edward Haycock, jun. of Shrewshury; the builder, Mr. W. S. Rogers, of Beaumaris, who recently built the church at Trefnaut. The church was conservated on Tuesday before last by the Bishop Lichfield. nf

nf Lichfield. Batley. — A new Independent chapel has been apened here this month. It is built of Yurkshire stone, in the Early Decarated style of Gothie archi-tecture, and measures 68 feet by 36 feet, and 30 feet in height within (the roof not being apen to the aper). It consists of the chapel, vestry, with organ-gallery over, gallery at the wost end, and tower and spire 100 feet in height, placed at the south-west angle nutside the external walls. The whole has been exe-cuted from designs of Mr. Michael Sheard, jun. architeet, at a cost of about 1,700/. exclusive of the land. land.

Iand. Sedgley (Staffordshire).—On Monday week the memorial stone of a new Congregational chapel was laid by the Rev. T. A. James, of Birmingham. The edifice is intended to bold about 400 on the ground-floor, with sufficient height in the walls for galleries, though at present only an end one for children is contemplated. The style adopted is Early Decorated, and the material for the walling Gornal stone rubble work, with pert Kingswood, and Box ground stone dressings. The contract is about 1,400. The archi-tects are Messrs, Bildake and Lovatt, of Wolver-bampton; the huilder, Mr. Burkitt, of the same town. Smallbridge.—A painted memorial window, by

tects are Messre. Bidlake and Lovati, of Wolver-bampton; the huilder, Mr. Burkitt, of the same town. Smallbridge.—A painted memorial window, by Messre, R. B. Edmundson and San, of Manchester, has been prepared for the church of St. John the Baptist, at Smallbridge, near Rochiale. The window is for the chancel, and consists of three lights, with tracery, and is in the Transition style. The design comprises, first, six acts of mercy, three in each side light, the incidents of whole typicy the verse, "I was a bungred, and ye gave me meat; thirsty, and ye gave me drink; a stranger, and ye took me in; naked, and ye clothed me; sick, and ye visited me; in prison, and ye came unto me." The centre light shows the agony in the fareground, and "The Last Supper," introducing the heads of all the apostles. At the font is Obrist bearing the cross, and the Crucifixion. The two principal compartments in the Center depids the Resurrection and the Ascension. The tracery represents the lift of our Saviour; John bapting Christ, and Christ blessing little chil-dren. All the subjects are under canopies, and every part af the window is filled with minute details in foliage and geometrical work. *Wakefield.*—A public meeting of the inhabitants was held lat week, for the murose of taking pri-

Wakefield .- A public meeting of the inhabitants Wakefield.—A public meeting of the inhabitants was held last week, for the purpose of taking pr liminary measures for repairing the tower of the parish church, taking down and rehuilding the spire, and reseating the body of the church, &c. An esti-mate of the cost was laid hefore the meeting, showing that the amount required would he abant 8,0007, which it is proposed to raise by public subscription. After some discussion, the meeting adjourned until the 16th instant

the 16th instant. Aspull.—The foundation-stone of a new Roman Catholic chapel has been laid at the village of Aspull,

Catholic chapel has been laid at the village of Aspell, near Wigan. Belfasi.—The foundation-stane of a new Presby-terian meeting-house at the Maze was laid hy the Marquis of Downshire last week. The building, according to the Belfast Newsletter, is considerably advanced in ercetion. It is situated within a stone's throw of the bridge across the Ulster Canal. The style adopted is the Early English. Lord Downshire has granted the site for its ercetion. The ontside di-mensions are 60 feet in length, and 35 feet in hreadth. It contains a vestihule, with a stairesse to an end callery in front, and acssim-room, and other requisite

carved capitals and hosses, moulded arch, and other ornamental work. Over the doorway is a triple win-dow, and the gable is surmounted by a belivy, the total height of which is about 55 feet. The roof, which is of a steep pitch, will have the timber ex-posed to view inside, and the timber will be stained,

posed to view inside, and the timber will be stained, and varnished. There are diagonal buttresses at the corners, and three others ou each flack. The whole fabric is to be of brick, with cut-stone dressings. The total cost, it is said, will be about 7004. St. Johnston (County Donegal.)—The foundation-stone of the new (R.C.) church of St. Baethen, St. Johnston, county Donegal, was to be laid, according to the Londonderry Journal, on the 4th inst. The site is on a sloping and elevated ground, in the imme-diate neighbourhood of the old disfranchised borough of St. Johnston, looking out on the river Foyle and rail-way. The plan is in the form of a Latim cross, com-prising nave, transcepts, chancel, porch, and sacristy, with a bell gable over the chancel arch. The total with a bell gable over the chancel arch. The total length will be 109 feet 5 inches, and the greatest breadth 56 feet 5 inches. The height to the top of the bell-gable will exceed 70 feet. The character of the exterior will be simple. The principal light will the obtained from traceried windows in the four gables the obtained from traccried windows in the four galles concertermities of the cross. In the interior the chancel arch will form an important feature, from which six steps will lead up to the high altar, which will have all the arrangements necessary for the cele-bration of mass, provided in the building, including sedilia, piscina, credence, shelf, aumhry, rerclos, sereen, &c. The roof timbers will all show, and will perbaps be stained and varnished. The whole of the work is heing carried out from the designs and under the superintendence of Mr. E. W. Godwin, architect. IMr. Gore, of Londonderry, has contracted for the supply of all the cut-stone work necessary for the com-pletion of the building.

PROVINCIAL NEWS.

Lincoln.—The accommodation at the County Lonatic e Asylum, on Bracebridge-heath, having become in-sufficient, it has been determined to enlarge the same by raising the wings one story, and adding two back wings at the cuds of the dld wings. Drawings for these additions have been prepared by Mr. Thomas Parry, the Kesteven county surveyor, and tenders were opened here on the 12th March, from the following contrac-ators. Quantities supplied:--

Gco. Myers £1	1,000 0	0	
	0,500 0	0	
Huddlestouc (, in)	6,763 0	0	
	6,750 0	0	
	6,556 0	0	
Surveyor's estimate	7187 5	0

WMF. Young's tender was accepted, and the works bare been commenced by opening n quarry close to the asylum, on land belonging to the county. Mr. F. W. JGBI bas been appointed clerk of works. *Bannyton.*—The opening of the cburch-school at MASton, in this parish, is to be celebrated on the 13th winst. The huilding has been raised by the contractor, Mr. Robert Plaster. The architect is Mr. Castle, of SIMBey, near Oxford. *Devaning*—and school for this village it is easid will

Mr. Robert Plaster. The architect is Mr. Castle, of Milley, neur Oxford. *Populagy*.—A school for this village, it is said, will schortly be commenced. The first and only design the Government would sanction was too costly for an agricultural parisb, containing only two or three threadesmen and as mony farmers for contributors. Another set of plans have, however, been prepared, in which the chief architectural points have been pre-secreded in getting the approval of the reduced plans, and then the work will at once be commenced. The asserted, and Mr. Teulon, it is hoped, will have suc-seceded in getting the opproval of the reduced plans, and then the work will at once be commenced. The asserted is getting the opproval of the reduced plans, and then the work will at once be commenced. The asserted is getting the opproval of the reduced plans, and then the work will at once be commenced. The asserted is getting the opproval of the reduced plans, and then the owork will at once be commenced. The asserted is getting the opproval of the reduced plans, and then the owork will at once be commenced. The asserted is the commence of the chapel are completed. The building has been erected at the back of the chapel, with frontages towards Market and Castle streets. From the former are the principal entrances, four in number, the one adjoining the back of the chapel and vestricss : the centre one of the remaining three leads to a lobby, abeene into a larger room adapted for the holding of dectures and week evening services, with seating for detor are the deacons' and molatier's vestrics and and afford rethe deacons' and molatier's vestrics and an infand school, the latter having a distinct entrances and and assets. Street. On the first floor is a large whoor are the descons' and minister's vestrics and an "furfant school, the latter having a distinct entrance whom Castle.street. On the first floor is a large hachool-room, 58 feet by 34 feet, with recessed dais for the superintendeut at one end and two class-rooms at the side, througb which admittance is gained to the arcading and discussion class-rooms and library for the scaeding and discussion class-rooms and library for the scae of the Young Men's Institute, the remaining por-

tion of the floor being appropriated to seven class-rooms. In the basement are the heating-apparatus, builter-rooms, and cellars. The building is throughout heated hy bot water, the work in connection therewith having been exceeded by Messrs. Perry and Sons, of Bilston, and lighted hy gas in every room. The exterior of the building is Italian in style, exceeded in red brick and sione dressings. The cost, including fittings, will be ahout 2,500%. The architects were Messrs. Bidlake and Lovatt, of Wolverhampton, and the contractor. Mr. Fillett the contractor, Mr. Elliott.

the contractor, Mr. Ellicit. Tamworkh.-At a special meeting of the local board of guardians, it has been resolved, by the east-ing vote of the chairman, to accept the tender of Messrs. Ferguson and Allen, of Notingham, in pre-ference to that of Mr. Parnel, of Rugby, whose esti-mate was more than 50. lower than any of his competitors. The preference was shown to Messre. Competitors' are preserved was shown to access. Ferguson and Allen on account of their engaging to complete the work in a shorter period than Mr. Parnel. Six months, it is said, is the time fixed. *Densibury*.— The directors of the West Riding

Deteroury.— The directors of the west fiding Union Banking Company bave accepted tenders for the various works required in the erection of their new bank and manager's honse, according to drawings and specifications by Mr. Michael Sheard, Jun, architect. The probable cost will be from 3,0007. to 4,0007.

The probable cost will be from 3,000% to 4,000%. Durham.—The works for the Durham Female Training School have been let, and will be commenced immediately. The contracts amount to 4,3464. *Merdeen.*—About twenty years ago a benevolent physician in the city of Aberdeen, Dr. Watt, gave a douation of 1,000% for the establishment of a house of refuge for the destitute, and subsequently bequeathed an estate of eighty acres of land, near the town, for the purpose of supporting a reformatory for juvenile offenders. The rental having accumulated to a sum sufficient for the erection of suitable buildings, and douations having been received towards the support donations having been received towards the support of a new reformatory, the building was creeted, and opened on Wednesday week, in terms of the Reforma-tory Act for Scotland.

RECENT AMERICAN PATENTS.*

Tor an Improved Lathe for Catting Fluted Mould-ings. JAMES ANDERSON, JOHN M'LAREN, and JOIN BRIART, City of New York. Claim.--I. The adjustable rotating entires attached to shafts, which are fitted in frames, the frames heing fitted and work-ing in pendant guides attached to the adjustable block. 2. Placing the leg between centres, which are attached to a swinging frame fitted on a recipro-enting entire. the hein through a reciprocating carriage, the leg heing turned or rotated hetween its centres as the carriage moves by means of the inclined slot in the ledge or plate, and the lever and gearing.

and gearng. For an Improvement in Lathes for Planing Metal. WILLIAM W. HUBBARD, Boston, Massa-chusetts. Claim. — Arranging the tool carriages, silides, or supports, on the vertical sides of the frame or bed, in combination with arranging above such slides, and so as to project from the sides of the frame and over the slides, covers, or guards, whereby the slides are protected from dust, chips, or other matters matters.

For an Improvement in Catting Metals. ROBERT ANDERSON, U.S. Army, and AARON H. VANCLEVE, Trenton, New Jersey. Claim.—The use of the parallel table, revolving table, and traversing table, in connection with machinery for punching and shear-ing metals, when the soid tables are constructed and connected for cutting and unphing attribute anread operated for cutting and punching straight, curved, or irregular forms in metal.

For an Improvement in Cutting Files. CHARLES MILLER, City of New York. Claim.—Fitting the chiel to work in a stock which rests upon the file blank itself, or on a pattern of a similar form moving with it throughout the whole length of the movement of the bland itself. of the blank under the chisel, and serves as a stop to the chisel.

For an Improved Machine for Sawing Marble and Store. Geokes J. WARDVELT, Harriey, Canada. Store. Geokes J. WARDVELT, Harriey, Canada. Claim.—Suspending the swinging saw-frame from levers, when arranged as described, and constructed with or without the circular bearing surface, resting on the friction roller or rollers; in the end of the vertical lever or levers attached to, and swinging with, the order seen forme the swinging saw-frame

The Abbey of Saint Allan: some Extracts from its early History, and a Description of its Conventual Church. Second Edition. Intended chiefly for the use of Visitors. London: Bell and Daldy, 186, Fleet-street. St. Alban's: Langley. 1856.

THE Guide which the Rev. Dr. Nicholson drew up of The Guide which the Rev. Dr. Nicholson drew up of his Abbey Church, was an elaborate and most trust-worthy one; and we on a previous occasion made some use of its contents. It has now reached a second edition. It is to he wished that all our churches were illustrated with equal ability and re-search. Such a hand-book is not only instructive to the visitor, but invaluable to the future historian of the fabric reacted of as it rives a vasi fund of referthe fabric treated of, as it gives a vast fund of refer-ences to available sources of reliable information : the rev. author of the one of the same sector between the sector of the same sector pains, having even travelled to Cologue to gather muthemic materials. Dr. Nicholson's love for the venerable building in which he officiates is reflected in his book.

Pre-Raffaellitism; or, a popular Inquiry into some newly-asserted Principles connected with the Philosophy, Poetry, Religion, and Revolution of Art. By the Rev. EDWARD YOUNG, M.A. London: Longman, Brown, and Co. 1857.

THE pith of this interesting and clever book, so far as it relates to architecture, appeared originally in our pages,* and we need therefore the less excuse ourselves for having allowed it to remain so long without notice. It deserves and has obtained atteu long tion. The writer is carnest, acute, and in parts eloquent, and it is not too much to say that he is the most powerful opponent that Mr. Ruskin has yet found. His zeal occasionally overruns his discretion. showing how too much praise provokes too much abuse. Mr. Young feels this himself, and says in his preface.-

Prenkey.— "Something may be fairly set down to a defensive object; something to a sense of that very peculiar asser-tion of his supremacy, of which it may be said, as of oppression, that it "maketh wise men mad " and some-thing to an ever growing jealows of the materializing tendencies of the day we live in, and that disposition to by soild—the feeling in the knowing, from which in the disconnect many things in the Turner controversy." "The every statement of the sources of the sources of the disconnect many things in the Turner controversy."

The writer takes up with warmth the canse of the old masters. In reply to the complaint that Guido and the Caracci were Ecloctics, he says,---

IIc maintains, too, the gooduess of the present time as opposed to the mediæval period :--

Against the diclatorship of ntilitarianism our author protests strongly: admit that all employment of columns, save for what on the very straightest prin-ciples are for actual use is wastful, vicious, and in-

• "Revolutionary Architectural Principles." Vol. XIV. pp. 161, 171, 203, 227, and 200.

admissible, and away goes all that makes architecture a fine art :

a fine art :--"If the word 'useful' stand for anything short of what is necessary, then its distinction from 'the ornamental' is but one of degree also. The absolute contrast: 'useful recordrance 'Useful' means, I suppose, conductive to proper parpose. If, then, conclinese, hise God has made an ob-emblazoner of his own workmasship, he, as is appose they are, conductive to a proper purpose (and this is what I mean by ornament,-all besides or beyond is did significant in the great master outlinese is did significant of the ornamental? Who will asy thought of him who, reading 'Trip 40 of what ago, and pleasant fing it is to behold he work hould attright ago. "Means, for light and heat give us corn and cabbage!"."

Even those who dissent altogether from Mr. Young's views will find much to interest them in his hook

Miscellanea.

-A correspondent of the Literary Gazette THEBES (March 14th) writes an interesting letter from Thebes, He says,—" At present I have three gangs of men at work at selected points in the Dra-aboo-neggeh, the Shekh-Ahd-el-Goorneh, and the neighbourbool of Der-el-Medeench—the two critremes, and the centre of the necropolis; and 1 have another body of forty in the Valley of the Touchs of the Kings, where I am aurious to take the chance of examining every pro-bahle spot, before removing that party to the Western Valley, where there is a strong feeling that other royal sepulchres, hesides the very few now open there, remain to be discovered." ROYAL INSTITUTE OF BRITTSH ARCHITECTS.—At (March 14th) writes an interesting letter from Thebes.

ROYAL INSTITUTE OF BITTISTA ARCHITECTS.-At the next ordinary general meeting of the Institute, to be held on Monday evening, the 20th instant, the Royal gold medal, the Iustitute medals, the Soane medallion, and the prize in hooks, will be presented in conformity with the award of the special general meeting, held March 2. Evrl de Greey will preside. The SUNDERLAND EATHS AND WASHHOUSES.-Sunderland holds rother a distinguished place com-pared with some other towns in reference to its patronage of baths and washhonses; and, according to the Shields Gazette, they continue to increase in ROYAL INSTITUTE OF BRITISH ARCHITECTS.-

parco with some other towns in ricest corring parconago of haths and washhouses; and, according to the Shields Gazette, they continue to increase in public estimation and revenue. The increase in the last winter quarter was as follows:--Number of hathers, 81; washers, 2,855; and the hours during which the establishment had heen used had also increased to the extent of 155,048. The receipts during the same period had increased from bathers 16s, 7d, and from washers, 64/. 15s. 84d, giving a total increase of 652,12s. 34d. By far the larger amount is from the washing department, which is found to increase at a ratio of 10 to 1 over the baths. The haths in summer we ther, however, furnish a Large source of revenue to the establishment, whose income is now nearly 1,000/. a year. The total cost of the huilding has been about 4,000/. so that the corporation are actually deriving a substantial revenue corporation are actually deriving a substantial revenue towards the reduction of the rates in addition to the towards the reduction of the shadow to have a set of the shadow of the s Oliver, of Sunderland.

OFFER, of Sunderland. RAITWAYTRAFFIC-The traffic returns of railways in the United Kingdom, published for the week ending March 21, amounted to 406,3427, and for the corre-sponding week of 1850 to 390,3837. showing an increase of 15,9597. The gross receipts of the eight railways having their termini in the metropolis amounted to 165,7397, and hast year to 164,8247, showing an increase of 9157. The increase on the Eastern Counties amounted to 2847; on the Great Northern to 7667; on the Great Western to 8847; and on the North-Western to 5,1977. But from this deduct 547. decrease on Blackwall; 1,7427. on South-Const; 9357, on South-Western; and 1,4557. on deduct 54/. decrease on Blackwall; 1,742/. on South-Const; 935/. on South-Western; and 1,453/. on South-Bastern: together, 4,2167. The receipts on the other lines in the United Kingdom amounted to 240,603/. and last year to 225,559/. showing an increase of 15,044/.

NAPOLEON AND THE BIRMINGHAM ARTISTS.

NAPOLEON AND THE BIEMINGHAM ARTISTS. — The French Emperor has goodnaturedly agreed to lend the Birniogiam Society of Artists the valuable pictures by Delaroche, Vernet, Delarocis, aud others, sent by him to the Edinburgh Art Exhibition at the Scottish Royal Academy. They will, therefore, be handed over for exhibition at Birmingham at the close of the Edinburgh Exhibition. HOUSEN WITH STRANFOWER. — The Coventry Herald advertises houses with steam-power to be let. This plan, as we have before noted, is likely to be found advantageous to the working classes: in this case it will combine the advantage of the factory with the comforts of home. The haldings are not yet erceted. They are to be from designs by Mr. Alurray, the architect of the Coventry Core-Exchange, with drain-age complete, from plans by Mr. Rohinson. Messrs. Cash are the proprietors, who also propose to creet school-rooms, reading-room, Ibrary, &c. One im-portant regulation is that persons taking these houses are not required to work for Messrs. Cash. The port CORENTOR AND HALLS PATED WITH

are not required to work for Messra. Cash. RED FOR CORRIDORS AND HALLS PAYED WITH TILES.—A brush dipped in the water which comes from a common ley, or in soapy water, or in water holding in solution a tweetich part of pearlash, is in general drawn over the tiles. This washing thoroughly cleauses them, carries of the greasy spots, and dis-poses all the parts of the greasy spots, and dis-temper. They are then left to dry. Dissolve in cight pounds of water half a pound of glue : while the mixing is a state of ebuillion, add iwo pounds of red ochre, mixing the whole with great care: apply mixture is in a state of abulition, add two pounds of red ochre, mixing the whole with great care: apply a coat to the tiles, and let them dry. A second coat is applied with Prussian red, mixed np with drying lineed oil; and a third with the same red, mixed np with size. When the whole is dry, rubit with wax. The third coat may he dispensed with, if pulverized litharge be mixed with the previous colour, which will them become more drying. The constraint may be *short und*. be mixed with the previous colour, which will then become more drying. The operation may be shortened by reddening the new tiles with a preparation of the scrous and colouring parts of ox blood separated in the slanghter-house from the fibrous part. This preparation is exceedingly strong. If a single coat of red hole, mixed up with drying linseed oil, be then applied, it may soon after be waxed and rubhed. This application is solid, and costs less than the former. I have seen in a house inhahited for thirty years, the colour still retained its lustre without being in the least diminished.—Tingry, "Painters, &c. Guide." Syo. 1816.

FALL OF A RAILWAY BRIDGE. — The metal hridge crossing the railway at Attyfiin, in the county of Limerick, Ireland, fell in last week, completely blocking up the line. Fortunately, no one was seriously burt.

seriously burt. SHOGKING RAILWAY ACCIDENT IN CANADA.— Upwards of seventy lives have, it appears, heen lost through the giving way of a bridge over a eand, on the Great Western Railway of Canada, near Hamilton, while the train from Toronto to Detroit was pass-ing it, with about eighty passengers, including, it is said, many of the principal inhubitants of the pro-vince. The hreaking of an asle on the locomotive was said to have been the cause of the aerident; hut the Daily Colonist attributes it to the faulty construc-tion of the bridge: it says, — "The kridge breaking down with the locomotive on it, whither an axle were hroken or not, settles the matter of inadequate construction. The obstruction, whatever it was, is the only thing that we can detect that tore down the bridge, for we are unwilling to conclude, after the bridge, for we are unwilling to conclude, after the trials it has had, that it gave way under the bare weight of the locomotive."

EMIGRATION OF THE UNEMPLOYED .- The first EMGRATION OF THE UNEMPLOYED.—The list hody of emigrants to Australia (several with families), under the auspices of the "Wellington Emigration Fund," will leave London on the 16th inst. in the ship Essee. They have, it is said, been carefully selected from unemployed arisans who joined in the move-ment resulting from the late meetings at Smithfeld. The funds of the association are, it seems, increasing.

WREN'S MODEL OF ST. PAUL'S .- Permit me to form "Ex-Architect," through the medium of your WHEN'S MODEL OF ST. FAULS.—2 effinit he to inform "E-Archited," through the medium of your columns, that there is a very fine set of drawings in existence of Wren's original model for St. Paul's; consisting of geometrical drawings made by measure-ment from the model, and perspective views. I was favoured with several of these drawings as illustra-tions to the paper read before the Architectural Asso-ciation, which was fortunate enough to provoke the suggestion that something should be doue to rescue the model from its present condition. Those who saw these drawings will, I am sure, agree with me that if "Ex-Architect," and any of this friends, can persuade their author to engrave and publish them, an addition would be made to our English architectural literature of the highest value; and a lasting memorial of what I fear will soon fall to pieces from sheer decay will have been secured. T. ROGER SMITH. inform "

"EMPORIO ITALIANO,"-The endeavours of the "EMPORIO ITALIANO."—The endeavours of The Count Montemerii to establish an Institution in Italy's behalf appear to have been received with favour. The Institution is to he for the encouragement and dif-fusion of the moral, scientific, and industrial resources of Italy. The scheme includes a Review, the first number of which, in three languages, has been published

The Builder.

ECENTLY, in the notice of a statuc erceted iu a promiucut position in the metropolis, we adverted to the frequeut mistakes which there had been in the treatment of similar works, and expressed an intention of shortly returning to the subject. We would now inquire iuto the reasons of these failures. The subject is important, not only in the obvious relation to the improvement of the metropolis and proviueial towns hy the art which can be expressed in their streets

and public places-and which there has been the desire growing, to exhibit hy sculpture as well as

architecture-hut concerns the reputation of living English sculptors,-a reputation such as on other grounds, would claim no mean place, whether in relation to coutemporary talent abroad, or to the merit which has been manifested through their productions, by artists, modern or mediaval, at home. Indeed, to any one who has watched the recent progress of the statuary's art, as exhibited in works which now adorn the private galleries of the country, it can hardly be necessary to quote examples, to show that in imagination and poetry of couception, and in simplicity of treatment-as in beauty of modelling and dexterity of finish-the art of sculpture as practised in our day-at least in some main elements of its expression as au tween architectural art, and sculpture, or some art-confers honour on onr country and our of the fields of the latter art. It should be recols school. Whatever may be now accorded for our lected, more frequently than it is, whether as to works in painting-whatever merit there has painting or sculpture, that each has two distinct been in those of sculptors who are deceased, as main fields, --that is to say, either, one as in Banks, Bacon, Westmacott, sen., Chantrey, or participation with architecture, or as designedly even Flaxman, is paralleled, nay, rather is sur complete without it. In the latter category passed, by reason of what has been done by may be classed all cabinet and easel pictures, Bally, Behues, Westmacott, jun, Gibson, Foley, Marshall, Lough, MacDowell, Bell, Durham, Thomas, Joseph, Edwards, and many others. I How, then, comes it to pass, that when a of high merit. Where, however, works of paint-ties the status? "public statue" bas been subscribed for, the ing or sculpture are designed to form accessories article supplied should be so very different to in architecture, or cannot be viewed apart from what could fairly he anticipated? The real it, they clearly require to be subordinated to reason, we apprehend, lies in very narrow com pass ; and to some attempt at the exposition of to avoid loss, indeed, of labour and effect it, we ask for our readers' attention.

Although the one branch of art-" sculpture," like that of paiuting, has been followed with should have desired a very different principle of usuch assiduity, and as to many essentials, with decoration to that which has been observed in usuch success, there are hranches of the artist's the chief freeso paintings which have been comtstudy, called for in the conception of most if pleted, and even the use, perhaps, of gold backanot all works of art, which have not had sufficient consideration,-unless lately, in the course fof the inquiries into the principles of design, be founded on correct views. Where the several strue-whilst there are principles of art, some of harmonise-even should it be by omitting somewhich can be set forth in words, and some thing applicable elsewhere, -- or they will conwhich, perhaps, can be only felt-that, in one tend with and to a certain degree injure one in the case of painting, —perhaps because it is posts and rails and pavement, will all go to bikewise, that there are principles applicable uni-direct of the sednetion of colour—the coudition help or to injure the effect of the whole, a wersally—to sculpture, painting, or architecture essential, as we must hold, to its character as an and are matters which should be included

THE BUILDER.

haps, too little apprehended, is au idea based ou rational grounds. The philosophy of art forms one main division of human pursuit; and whether amougst the subdivisions of practice, architecture is to be classed with painting and sculpture, or as some have held with misic; also what constitutes poctry, and what is the relation to it of a vehicle of expression as that of words, may he left for our present purpose undetermined. A certain unity of sensation is not the less existent iu good works of art, because incapable of an exact analysis by language.

The several branches of art have, it is true been acted upon injuriously during their parsuit at oue time by the same men, and by the application of principles of one art to the medium of another. Architecture suffered during the period when painters were architects; yet, a painter-like power of composition, such as that ascribed hy Reynolds to Vanbrugh, is not the less a desir-able qualification for the architect. Whilst deriving what lesson there may be in general qualities, it is only requisite not to diseard the particular qualities which make the distinction. There should be no reason now for falling into the mistake of Italians. Unless discussion has had no practical value, essential principles are at present, capable of application.

The distinctive qualities of architectural art arise from its constant association with structure, and with use. It is not requisite only the eye should he delighted by beauty of that outline, justness of proportion, and symmetry of parts; but the *reason* must be satisfied, while t other conditions of the perfect result are ob-served. To expect that architectural effect would arise from more expression or embodiment of use, or from mere observance of what otherwise might be the elements of the beautifulcach course-we now simply observe, would be a wrong one.

There appear to us, however, points of uniformity of principle, peculiar to the relation besome general principle, for the mutual harmonydesigned. Thus it becomes comprehensible that the architect of the Houses of Parliament the chief freseo paintings which have been comgrounds. All, however, that we wish to say is that the intention in such a case as this last, would and requisites of art, in architecture. It is arts are in juxta-position, they must either saspect, a single "art," as painting or sculpture, another. Sculpture, however, does not present the statue is in short required, and will make ought to be guided by rules which would be ap-the difficulties of combination which may exist the "group,"—the pedestal, the site, the very iplied erroneously to another; but, it is evident in the case of painting,—perhaps because it is posts and rails and pavement, will all go to -- and with which every artist should be con- art—or, perhaps, because *predominance* of colour in the design of the artist, whether called aversant. Such relationship, indeed, is part of anywhere, is not favourable to the highest archi- architect or sculptor. And here, referring to what avists throughout the nucleus throughout the second seco what exists throughout the circle of human tectural effect. Any controversial points which the importance of that brauch of sculpture eknowledge: all arts and sciences are originally are here involved we need not at present which we have classed with architecture,—can aconnected : no one is complete without the pursue; enough will, we apprehend, be con-we avoid saying, that if little considered now, the the considered have been used in this is said to show that the ceded by all who have considered the relation it has one or twice in the history of art, formed egeneral unity of art, often spoken of, yet, per- of the arts, to serve our present argument.

The great point to be observed as to sculpture is, that in a large area of the field which it embraces as art, it is either one with the art of architecture, or is guided by collateral principles. As an actual thing modelled in the round (actual save as to the colour), iustcad of being a representation depicted on a surface-the work of sculpture ranks with that of architecture, and is subject to the same laws of proportiou and symmetry. Even the structural element of architecture has its correlative in the sculptor's group; the requisites of apparent stability have to be expressed in both. Whilst as to the result derived from a certain attention to pyramidal outline above, and spreading hase and growth from below, the more important works of sculpture have, as we shall shortly show, requirements for effect the same as the works of architecture.

Indeed, the exact requirements of sculpture which are just now wanting in the "public statucs," are veritably those which are present to the sculptor's mind in his use of the word "group," - of which term, the qualities as embodied in it, seem to be forgotten when the statue becomes, by allocation, a public monument. Perhaps, in some degree, the condition of the art which we have been adverting to, is due to the manner of giving commissions in cases such as those of the receut works,the practice being to require a statue rather than to leave the artist unfettered as to the appropriate form of monument. Sameness. therefore, becomes the characteristic of the works produced; poetry of conception and inventive skill which need not be eschewed at any time, have no opportunity for expression; and all the acknowledged difficulties of modern costume stand unmitigated, save by the artifice of the cloak. No doubt, the lack of funds, the desire of representing the man in his hahit as he lived, and the art and lasting heauty of the work, are difficult to he reconciled with one another; more, however, might be done, as we are prepared to argue, by means which might generally be found available.

We should, however, observe, that whilst our public monuments should exhibit design, heyond, that of the mere statue, more frequently than they do, it is not desirable that the cumbrous allegory of the monuments of Westminster Abbey should be revived. It is to he regretted that in those cases, sculptors so readily fell into a mauner which is rather wanting in art than characterised by it,-however excellent, particular figures may be in the modelling. The practice, exemplified in such cases, required to be referred to here, only that the remark may be now made, that from time to time a work appears in which there is a tendency to return to it. The works of Flaxman, and many recent productions, show that there is no reason for au alternative between invention and thought not readily intelligible, aud poverty of conceptiou as the accompaniment of simplicity of outline.

Whatever be the character of the statue, or group, it must be recollected that by the circumstance of its position as a public monument, it becomes ameuable to the principles, and requires consideration of the essentials which we have ventured to speak of as those of our own art-architecture. Something more than almost the sole, and yet the grandest, field of

VOL. XV .- No. 741.

the sculptor's labours and achievements? The the sculptor's labours and achievements? The function of the second second second to serve the purpose of what we may call architectural decoration; whilst in the mediaval works, so intimate is the connection between the two arts, that it is impossible to point to that which is merely architectural, or that which is merely sculptural. In the Gothie sculpture of the best elass, as the single figures, perhaps the variety of the treatment is not great in proportion to the number of works; but the seutment conveyed was beautiful; and it seems to have heen admitted by Flaxman, as again more recently, that the chief works posto seems to nave neer admitted by Flaxman, as again more recently, that the chief works pos-sessed characteristics of the highest at. As *sculpture*, they gained by heing designed in sub-ordination somewhat to general principle, and to leading forms in the architecture to leading forms in the architecture.

to leading forms in the architecture. Opposed to this is the modern system. A statue is ordered, and is east in bronze,— in regard to which particular vehicle some distinct points will have to he mentioned. The site, the pedestal, the accessories;—in fact, what will make or mar the group, seems to occupy no part of the sculptor's attention. The site is generally the patch of ground that can be got in a crowded thoroughfare, where, devoid of everything that would contribute to the effect, the figure is set down, much as an the effect, the figure is set down, much as an Italian image man would rest his plaster-cast Italian image-man would rest his plaster-cast upon a stump at a street-corner. At Cock-spur-street, the pedestal stands in the hollow with an extensive platform of mud in the field of view. Generally there is an iron railing-of a common sort—hiding the base on which much of the effect of any work depends; and there are four common street-lamps to group with the figure. Of pedestals, mention has been often made—as yet, with little result. There is one good one, to the statue of Charles I. and one in Russell-square, to the statue of the Duke of Bedlord, and there is something which is, at of Bedford, and there is something which is, at least, sufficient and appropriate in effect, to the sedent statue of Fox, in Bloomsbury-square; but, generally in recent works, a few mouldings, as conice and base, or more blocks of granite with diminished sides, form the exemplifica-tion of the art in that part of the composition. The Wellington statue in the City has one ad-vantage,—that resulting from its position in the platform of pavement before the Exchange,— the value of which last feature to the building the value of which last feature to the building named, it is well to uotice as illustrative of the present subject. To the Wellington monument at Hyde-park Corner, it is hardly possible to avoid making a reference. Let it be observed, then, that whilst this is designed as a colossal monument, it is hoisted in the air, where its dimensions are wholly inoperative in any effect, where size of the apparent size of the unless by reducing the apparent size of the structure on which it is placed. The question as to the position across the direction of the readway need not be revived,—except in the way of remarking that the principle of the design, or huilding, of the arch, being mainly that of adaptation of the character of an ancient structure, it may be considered that on that account, consistency should have been adhered to. But the lesson of this unfortunate case is from the fact that the whole difficulty came about by the want of proper regard on t part of the sculptor, for essentials of effect in his work.

his work. Now, what should be done towards cusuring a better result in our public statuces need hardly be described. It happens that at Charing-cross, in the statue of Charles I, the requirements of the case can be very readily made to appear exemplified. If the irou ruling were removed, the group there would show to the eye, as to principle of design, nearly all that we have contended for. Had we a public statue to ereet, we think we should go about it in this wise-missi we would select a sufficient area statuce to erect, we think we should go about it in this wise:—first, we would select a sufficient area, slightly elected above the surrounding street; we would have the area accurately leveled and evenly paved, with dwarf posts at the angles and at intervals; in the centre of this, if the area would suffice, we would place a much smaller platform, on a few steps, with pedestals at the angles having ornamental accessories in and at intervals; in the centre of this, if the be allowed to show on modern dress; and the area would suffice, we would place a much whole work is black and hukky, and deadening smaller platform, on a few steps, will pedestals in its effect, as it appears to be—more than it at the angles having ornamental accessories in really is, perhaps—in its art. We apprehend unison with the object of commemoration. On that a different elaracter of drapery might be a larger seale, the Nelson Monument, in Trafil-tried in bronze with advantage; that the eolos-gar-square, with its angles intended to receive as should be altogether avoided; and that the lions couchant, carries out a modification of the ingredients of the composition of the material

principle. In the centre of the platform, we would place the pedestal for the statue, with its *basso relievos*. But we would take care that every public monument erected should have that every public monument electron shows and a distinctive character, and freshness of design, by numerous variations of any simple plau, such as that here sketched out. Some of the public as that here sketched out. monuments should he of such importance that accessory groups of a superior class should be provided,—like the seated figures around the predestal of the Nelson Mouument at Liverpool; or as in the monument of Frederic the Great, which me which may he well quoted as a rich example of that which we would seek to provide for in effect, in all cases—though ofteu, as could he ue by the most simple means. With regard to the removal of iron railings. douc

the omission of such things is, we believe, quite essential to the effect of any pedestal or building,—unless in cases where there is a halustrade, as at the Clubs in Pall-uall—first designed for the particular situatiou. It forms the pith of argument that the effect of every groupour public monument, or statue, or huildinglargely upon its spreading has and foreground, —its union with the site, its stability of appear-ance, and the culminating of its effect. Mr. Edward Hall, who in the course of writings of his in the *Companion to the Almanac*, the *Art-Journal*, and other publications, has used part of the arguments which we may have given in this place, has observed somewhere that the huilding, like a great tree, should, for that the huilding, like a great tree, should, for the effect of it, seem to grasp the earth with its roots,—and this pretty well convers the sort of effect which should be sought for in every work of architecture and every monument, but which has seldom been provided in England, except in recently crected churches,—where the dwarf walls, and low railing, let it he observed, instead of concealing that part of the structure which is of most importance to its dignity and grouping, greatly aid the pleasing result by spreading out the area of design in the eye, and so giving the effect which bas been noticed as essen-tial. Something of the same object also was, we helieve, present to the mind of a writer in we helieve, present to the mind of a writer in our pages, at the time of the discussion as to the site for the Wellington statue, when he advocated a low pedestal, and referred to the profile of the *scolia* moulding, as what he con-ceived should be the approximate outline of the

hase of the group. The points which we have been referring to deemed unimportant hy those who will pursue the consideration of the effect realised hy buildings and other public monuments. There is, however, another reason why most of the recently erected statues arc failures. That reason the treatment of form in the material in which they are cast.

There are good arguments in favour of a difference of treatment in bronze statues from dimension of treatment in product scales from what would be proper for those in marble. One reason is, that with the colour of the material as exhibited in our streets, heavy masses of drapery cannot be satisfactory. Another point for recollection is that in works of art, of the for recollection is that m works of art, of the best class, the properties of material are to be always taken advantage of,—aud just as you will see a different proportion and treatment hetween the *candelabrum* of stone and that of iron, or the tracery in stone, and that in brass-work,'so we apprehend you will discover between the marbles and bronzes of the antique sculp-ture similar distinctive characteristics. We are sure at least that the observance of them would sure at least that the observance of them would be found consistent with the best principles of art. What, however, can have less of any dis-tinctive character than the statues which have been lately set up? Heavy folds of drapery, with little undercutting, are reproduced from a model—which may have been fitted for marble : uot a particle of the ornament which relieves the sombre tint of the mediaval hronzes can allowed to show on modern dress; and the

[April 18, 1857.

at present in general use should be reconsi-dered. It is worthy of note, that one of the best hronze statues—that of Charles I.—in addi-tion to its records are in the state of the stat best hronze statues—that of Cbarles I.—in addi-tion to its general merits, has many accessories of dress, which greatly belp to prevent the monotony of the impression derived; and we believe that the real reason of the objec-tions which are beard as to the statue of George 111, would be found, on careful analysis, to have more to do with the mud of the site, and the railing and lamp-posts, than with the ohnoxious nig-tail.— however indisthe suc, and the raining and tamp-posts, than with the ohnoxious pig-tail, — however indis-posed we may be as artists to the revival of that appendage in future costume. If we are right, it follows as a matter of course that the equestrian statues, as having more detail in them, as well as more matter of interest, will be more activitioner, the others of in them, as well as more matter of interest, will be more satisfactory than the others of recent production. Foley's Lord Hardinge, however, is an admirable specimeu. Beyond mucb of what lately has been done, we see no reason why the sculptors of the present day should not greatly advance; and to them, as our brethren, of one calling-requiring the like perceptions, and animated by the like enthusiasm—we venture to dedicate these not hastily formed, though inadequately expressed opinions, as to the value of grouping, and of attention to the properties of materials, as part of the subject which they have to consider towards reaching the purpose of their art.

CHIMNEY SHAFT, MANCHESTER.

AFTER reading Mr. Rawlinson's suggestive paper on "Chimney Construction," in our journal of the 28th of Fehreary, Mr. Thomas Worthington sent us the annexed illustrations of a chimney-shaft recently recrede in Manchester, under his direction, for the Manchester and Solford Boths and Laundries Comnumeries and Satora basis and hamming some pany. It serves the double purpose of a smoke-flue and a vapour shaft, the smoke heing discharged at the top, and the vapour through the openings at the sides. The smoke from the hollers and drying-furnaces passes into a chamber at the bottom, whence it is carried up a circular flue of boiler-plate, fixed in the centre of a a circular flue of bolter-plate, nixed in the centre of a brick shaft 5 feet square, which latter earnies off the vapour from the several parts of the building. The bolter-plate becoming heated, rarifies the surrounding air, and extracts the vapour very effectually. Our readers acquainted with Italy will perhaps recognise in the design somewhat of the character of the celebrated tower at Sienna, which is sketched by

every travelling architect. The builder was Mr. Neill. The height of shaft is

The outlier was Mr. Neth. The neight of shart as 90 fect. The outside measurement at hase is 8 fect square, with a slight batten up to the projecting top, where the vapour is discharged. The materials used are the ordinary seconds red slocks of the district, set and pointed in hack mortar, with dressings of coarse grit, from Yorkshire, roughly hewn and hoasted on grit, fro the face.

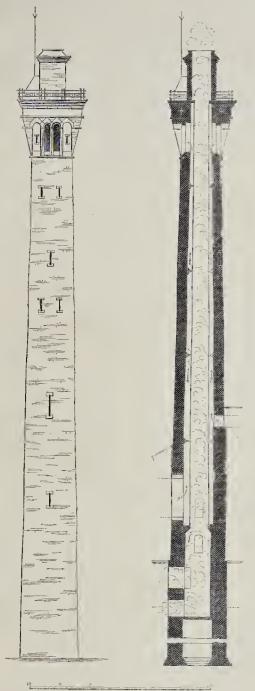

The boiler-plate central smoke-flue is, in five lengths, rivetted together like an ordinary boiler, the plates heing at the bottom 3.8th thick, and diminishing to neing at the output of the inters, and diministing to 5-16ths at the top. This flue is supported on a cast-iron base plate, built in on corbels, as indicated on section, the base-plate being 12-inch thick, with six-teen radiating ribs to strengthen it.

ROME.*

THE further we proscente the study of Roman topography, the more are we convinced of the fallacies of many of the opinions which once passed current with the world, the more do we passed current with the world, the more do we perceive upon what inscence foundations we have based the fabric of our belief. The vague-ness of the descriptions of the Romans them-selves, so loosely put together in the full security of their own intimate knowledge of the scenes they were describing, has been the cause of endless discussion upon topographical points, and scholar after scholar has deduced fresh results from every new light thrown upon them, until actual excavation has demonstrated the unui actual excavation has demonstrated the worthlessness of such theories, and shown that upon it alone must we look for the solution of these questions so long at issue. We before enumerated a few of the ancient historiaus upon whose works the early history of Rome has been founded and draw attention

of Rome has been founded, and drew attention of Rome has been founded, and drew attention to some of the sources whence still earlier writers, now lost, drew their knowledge; and we will now in like manner call attention to the sources of our knowledge of Roman topography.

* See n. 182, ante.

turies kept by the priests alone, enumerating the months and days of the year, nones, ides, &c.; together with festivals, astronomical observations, and public events. The latter were chronicles, such as the *annales maximi*; and from a similar arrangement of dates and events to that of the calendars the term *firsti* became avoid a working and the term *firsti* became

to that of the calendars the term *fasti* became equally applied to them, and indeed by a poetic licence to all historical records. Foggini, in his work npon the Prænestine Calendar, enumerates eleven of these fragments, named after the places where found, or the families who possessed them; and from which fragments he manages to extract the complete *fasti* of the whole Roman year. Of inscriptions, the most important specimen is the Marmor Ancyranum, or copy of the record of his acts; prepared by Angustus for his mansoleum, and inscribed upon the walls of the marble temple dedicated to him at Ancyra.

the inter inportant opportant preceded of his acts; prepared by Angustus for his mansoleum, and inscribed upon the walls of the marble temple dedicated to him at Aneyra.
An inscription of less inportance, but still of considerable value, is the Basis Capitolina, containing the names of the Vici of five regions, whose Curatores and Vicomagistri erceted a monument to Hadrian. Another singular relie of antiquity, and whose mutilated condition must ever be lamented, is that known as the Capitoline plan. It is a plan of Rome to a large scale, incised upon white marb'e, but in so imperfect a state that but little help can be derived from it. Canina has ascertained its scale, and Becker its bearings; but the topographical connection of the buildings described is very difficult to be traced.
The literary records of the Middle Ages that remain occupy the next place in the study of Roma topography, and constitute a feature in its new school, although reliance upon Mcdieval autionities is by no means satisfactory, nulless supported by collateral proofs, the corrupt state of the text of early writers being proverhiat. Amongst works of a prior date, the "Notitia Dignitatum Utrinsque Imperii," a statistical view of the Roman empire, with a description of the city tiself added to it, rank first. This MS. as Mr. Dyer observes, cannot be later than the reign of Constantine, since on Christian church is mentioned in it, nor, indeed, any building later than that emperor. Of the catabours of Einsiedlen," is the most valuable. This work appears to belong to the age of Charleman, written before the Cith Leonian was enclosed by walls.
Inferior to this is the *Orde Romanue*, a ritual of religious processions of the twelfth century, write twee burgentity, explains these disguises. Thus, for instance, was the temple of Julius Cæsar called the Asylum, "that de brenent," in which ancelot buildings are incidentally mentioned, but under strangely disguised names.
Medieval authorities, the content

called Mirabila Roma, many more such perver-sions are found. "In the last days of Pope Eugenius IV." says Gibbon, "two of his servants, the learned Poggius and a friend, ascended the Capitoline hill, reposed themselves among the ruins of columns and temples, and viewed from that commanding spot the wide and various prospect of desolution. The place and the object gave ample scope for moralising on the vicissitudes of fortane, which spares neither man nor the mondest of his works, which buries empires and FURNACE CHIMNEY, MANCHESTER.—MR. WORTHINGTON, ANCHITECT. FURNACE CHIMNEY, MANCHESTER.—MR. WORTHINGTON, ANCHITECT. The descriptions of the ancient writers that are and amongst them the fragments of *fasti*, or *kalendaria*, have been of service in marking the first being of course the exist-ing remains of the mouments of antiquity performed. These *fasti* walkings, search as written by one of the first who raised his even of the state of the set of the se

double row of vaults in the salt office of the capitol, which were inscribed with the name and capito, when were inserved with the name and munificence of Catallus. Eleven temples were visible in some degree,—from the perfect form of the Pantheon to the three arches and a marble column of the Temple of Pcace, which Vespasian erceted after the civil wars and the Jewish triumph. Of the number which he rashly defines of seven thermae, or public baths, none were sufficiently entire to represent the use and distribution of the several parts: but those of Diocletian and Antoninus Caracalla still retained titles of the founders, and astonished curious spectator, who, in observing their solidity aud extent, the variety of marbles, the size and multitude of the columns, compared the labour and expense with the use and importance. Of the baths of Constantine, of Alexander, of Domitian, or rather of Titus, some vestige might yet he found. The triumphal arches of Tifus, Severus, and Constantine were entire, both the structure and the inscriptions; a falling fragment was honoured with the name of Trajan; and two arches still extant in the Flaminian Way have been ascribed to the haser memory of Fanstina and Gallienus. After the wonder of the Coliseum, Poggius might have overlooked a small amphiheatre of brick, most probably for the use of the Pretoriau camp. The theatres of Marcellus and Pompey were occupied in a great measure by public and private buildings; and in the Circus Agonalis and Maximus, little more than the situation and the form could be investigated. The columns of Trajan and Antoniue were still creet; but the Egyptian obclisks were broken or huried. A people of gods and heroes,—the workmanship of art was reduced to one equestrian figure of gill thrass and to five marble statues, of which the most compicuous were the two horses of Phildas and Praxiteles. The two mausoleums, or sepulchres, Fanstina and Gallienus. After the wonder of Praxitcles. The two mansoleuns, or sepulchres, of Augustus and Hadrian could not totally he lost; but the former was only visible as a mound of earth ; and the latter, the Castle of St. Angelo, had acquired the name and appearance of a modern fortress. With the addition of some modern fortress. With the addition of some separate and uancless columns, such were the remains of the ancient city: for the marks of a more recent structure might be detected in the walls, which formed a circumference of ten miles, including 379 turrets, and opened into the country by thirteen gates." The work of Biondo Flavio, entitled "Roma Instaurata," published in 1513, may be con-sidered the first newplar treatise on Bornan tonce.

instantity publication for the sub-sidered the first regular treatise on Roman topo-graphy, and served as a foundation for the sub-sequent works of Andrea Fulvio, Fauno, and Marliauo, the condensed and accurate description of the last of whom may be considered a complete type of the first period of Roman topography, and Bunsen observes that in some parts it has never been surpassed

Of the numerous writers who flourished from the middle of the sixtcenth to the middle of the seventeenth century, may he cited Panvinio, who published, in 1558, his "Commentarium Republice Romane;" and under whom, and Marliauo, the study of Roman topography hecame as important a brauch of literature as under San Gallo, Labaceo, Serlio, Palladio, Scamozzi, Sauto Bartoli, Desgodetz, Piranesi, and Canina, it became at once a science and a fina et fine art

fine art. The next work of pretension was the "Roma Vetus et Recens," of Donato, published at Rome in 1633, but which was soon eclipsed by the more celebrated "Roma Antica" of Nar-dini, in 1666, and which continued the standard anthority to the heginning of the present cen-tury, the fourth edition of his work, edited by Nibbi, dating as late as 1S18. Nardini seems to have framed the ereed of Romau topography, but his merits were greatly overrated by his disciples. Mishilon and Montfauçou, learned Freuch Benedicines, towards the end of the seventeenth century, rendered much service to Freuch Benedictines, towards the end of the seventeenth century, rendered nucch service to the cause by their publications. Borrichins, in 1657, published a topographical sketch of Rome according to the regins. The more pretentious work of Venuti is mostly taken from Vardini and Piramesi, and, where original, is generally erroneous. Guattami, in his "Roma Descritta," is the parent of most modern guide-books; and, hasily, Nibki, in his "Foro Romano," "Via Saera," "Mura di Roma,"

and "Roma Antica," completes the list of the leading authors of the Italian school. Of English authors, the works of Lumisden, Hobbouse, Burton, and Burgess (the latter, especially, erincing the highest scholarship), are of a date antecedent to modern discoveries; but the excellent papers of Mr. Bunhury, and the late elaborate essay of Mr. Dyer, are most late elaborate essay of Mr. Dyer, are most welcome additions to our Roman topographical literature. Of the sparkling and invaluable observations of that eminent scholar, Forsyth, we can never weary, hut they are too short and discursive to be of much aid in modern times. It was in 1829 that a new era commenced in

Roman topography by the publication of the views of Niebuhr, Bansen, Platner, and Ger-hard, in the first volume of the "Beschreiwhere of Netonir, builden, failuer, and Od-hard, in the first volume of the 'Beschrei-hung,' which event produced as great a revo-lution in that science as that made by Nardini, a century and a half hefore. Their work was immediately received as the standard authority in Germany, but it made but little impression mere the lutimer as the parameter rest. in Germany, but it made but fittle impression upon the Italians, so long accustomed to the undisputed domain of the subject; and, so late as 1835, Nibbi, in his "Roma Antica," retains the old creed, and speaks with reverence of Nardini and his fallacious guides,—Victor and Rufus. The "Indicazione Topografica" of Canina, displays more originality and indepen-dence, but is still deficient in critical investiga-tion; but his rescarehes have thrown much light non nany points of obseuty. light upon many points of obscurity, and es cially in the localities round the Forum. T result of the publication of the "Beschreibung has been the formation of two distinct schools of opinion,-Italian and German, " the former attaching themselves more particularly to the investigation of the existing monuments, and making use of the authority of the ancient writers rather as a subsidiary resource, than as the first and primary source of information; the the first and primary source of information; the latter adopting more exclusively the historical mode of inquiry, and appealing only for occa-sional assistance to the relies of ancient build-ings: the Italian still looking up to Nardini as their great leader, and following with implicit faith the gnidance of the so-called *Regionarii*, Victor and Rufus; while the Cermans repel with uncompromising holdness the authority both of the one and the other."

Such is the expositiou of Mr. Bunbury, as contained in an excellent paper in the Classical Museum, wherein the writer clearly explains the leading points of difference between the adhe-rents of the two schools of opinion.

These schools, a few years back, These schools, a few years back, received a fresh involvement or subdivision in the person of M. Becker, already known to the world of letters by his "Gallus" and "Chairdes," who, in a little treatise, "De Rome veteris Muris atque Portis," and alterwards, more elaborately, in his "Handbuch," declared war against hoth schools at once. Speaking in terms of the greatest disparagement of the Italiau topogra-phers, he handles the Cerman ones but little less soverely. Still he belougs more to the received less severely. Still he belongs more to the German than the Italian side of the question, agreeing with the former, not only in his reliance npon the classic writers more than existing monuments, but in most of those leadexisting monuments, but in most of those lead-ing points which form the line of separation between the two sects. Still more markedly does he adopt their views with regard to the *Regionarii*, and in rejecting altogether the views of Nardini, whom he terms "home natus ad confinidenia purturbandaque comina!" The great advantage of his work over the *Beschrit*-ter advantage of the work over the *Beschrit*bung consists in its condensation, and notes which at once furnish the reader with the sources of his own conclusions, and a check upon them.

A review of bis work by M. Preller, though written in moderation, produced a furious reply from M. Becker in a pamphlet, entitled "Die from M. Becker in a pamplifel, entitled "Die Römische Topographie in Rom, eine Warnung," wherein he treats the paper of Preller as a manifesto of the Italian side. M. Url'chs, in his "Römische Topographie in Leipzig," sitts the arguments of Becker with equal asperity, and the controvery is brought to a close by a reply and a rejoluder written with correspond-ing bitterness. in

Thus is the matter left much as it was, except that the arguments upon hoth sides being now

before the world, the scholar has the advantage of forming his own judgment upon them.

Mr. Dyer is of opinion that many of Becker's views non important points of Roman topo-graphy are entirely crroneons, but acknowledges his obligations to hum in the production of his own elaborate article.

Before the German writers had expounded off the voke of Nardini bad previously appeared, and already bad Piale restored to the Forum of Angustus and Temple of Mars Ultor their true names, and had the still greater holdness to return to the view of the early topographers con-cerning the position of the Roman Forum, sub-sequently established without doubt. But before deposing Nardini, the two pseudo-regionaries, Victor and Rufus, whose catalogues of the buildings of ancient Rome according to the order of the *regiones* of Augustus formed the hasis of his work, had to be removed from their pedestals. It was long known that their lists were opposed to known passages in the classic writers, and great obscurity pervaded their names and the period of their lives. Bunsen bad concluded they should be discarded as spurious, when Sarti proved to him that the eatalogues were palpably not the work of any ancient anthors, even of the fourth or fifth centuries, but, in their present state at least, a mere com-pilation since the revival of letters, and probably not older than the fifteenth century, the founda tion of both being a third catalogue appended to the Notitia Imperii, and commonly cited under the rotate spir and commonly circle index that name; but from its insufficiency fittle re-garded by topographers. In spite, however, of Sarti's irresistible evi-dence of the worthlessness of these documents,

the Italians show a marked disinclination to discard their long-valued friends, and Canina gave to the world, in 1841, a third edition of his 'Indicazione Topografica,' in which the cata-logues are given in full at the beginning of each

Such are the authorities upon which the world now leans its belief,—such the divisions in which these authorities are classed. source of inquiry has of late years become fashionable—excavation; and the success that has attended it at Pompeii and Nineveh will doublices follow it is Rease. has attended it at Pompeii and Nineveh will doublies follow it to Rome. "Slowly as these excavations have been conducted," says Mr. Bunbury, "they have already been productive of incalculable benefit; and it is impossible to look at the present state of our knowledge in regard to the Roman forum and surrounding localities as compare i with t at possessed by the antiquaries of the last century, without feel-ing that the showel of the excavator has done ing that the shovel of the excavator has done more than all the labours of the learned." He then points out the advantage derived from any one point established, and cites the instance of the eight columns still standing on the slope beneath the Capitol, which were always thought to be the remains of the Temple of Concord, until the excavations beneath the Palazzo del

Senatore brought to light the real temple, as proved by the existing inscription upon it. From this other inferences were derived. Thus, for instance, knowing that the Temple of Juno Moneta was built immediately above that Juno Moneta was built immediately above that of Concord, and that the former was situate in the Arx, we obtain a point towards settling the disputed sites of the Arx and the Capitolium. But a discovery of still greater moment was made in 1835, in the steps of the Basiliea Julia, which fixed not only the site of that edifice, but also the western limit of the Forum ireal. itself

itself. The topographical history of Rome is divided into three periods, namely, the original city of the Palatine, the city of the seven hills of Servius Tullius, and the imperial city of Aurelian. The points of greatest interest to the general observer are the walls and gates, the Capitol and the Forum. The better under-standing that we now have of these two remark-able sites, is one of the greatest triumphs of Roman topography, hut much obscurity in the Roman topography, hut much observity in the latter still remains to be cleared up, and the former remains an open question, though the arguments upon it seem to as to preponderate so nuch upon oue side as to point to but one con-clusion. Nevertheless, the unfortunate ambi-guity of the ancient writers in their use of the terms Arz and Capitolium, may possibly prevent the question at issue being ever satisfactorily settled.

This question, as our readers know, is simply This question, as our readers know, is subply upon which of the two summits of the Capi-toline hill was the Arx, and upon which the Capitolium. The leaders of the German school, Nichuhr, Bunsen, Becker, and Preller, hold that the Temple of Juniter Capitolinus was strate on the south west survoit of the hill. situate on the south-west summit of the hill the Italians, led by Nardini, maintain the preeisely opposite opinion, and to which latter opinion Göttling aud Braun subscribe. A third class of writers, hut numerically few, hold that both the Capitol and the Arx occupied the same, that is, the south-west summit; but this same, that is, the soluti-west summit; but this summit, slightly the most elevated, is crowned by the church of Ara Celi ; the south-west is partly occupied by the Palazzo Cafarelli and its gardens, occupied by the Fanzzo Cattern and is guidens, partly by streets; all, however, of a compara-tively modern date. To the time of Donato the Italians held the opinion now adopted by Bunsen and Becker; while all the modern Italians have followed Nardini in the contrary opinion. Biondo and Marliano held the German opinion, founding their conclusions apparently upon the name of the church of Sta. Salvatore upon the name of the church of Sta. Salvatore in Maximis, the latter addition indicating the immediate presence of the Temple of Jupiter, Optimus, Maximus. The name of Monte Tarpeo is still preserved, both in the names of existing streets, and of churches founded early in the Middle Ages, as connected with the south-west end of the hill, and as it is well known that the Mons Tarpeius was the Capitol, and the name seems to have been confined to that portiou of the hill as distinguished from the Arx, one argument towards the location of the Capitol is obtained. Mr. Bunhury and Mr. Dyer emhrace oppo-site views in this question ; therefore, whilst giving a condeusation of the whole argument as explained by the former, we would recom-

as explained by the former, we would recom-mend the perusal of arguments of the latter, in

mend the perusal of arguments of the latter, in order to form a judgment upon the whole. The account by Dionysius of the landing of Herdonius ou that part of the bank of the Ther nearest the Capitol, whence, entering by the Carmental gate, he took first the Capitol and then the Arx—thus showing that the Forum was nearer the river than the latter—is another argument in the same direction. The bridge argument in the same direction. The bridge thrown by Caligula from the Palatine to the thrown by Caligula from the Palatine to the Capitoliue, in order to reach the Temple of Jupiter, &c.; the narrative of Tacitus of the attack of the Vitellians on the Capitol; and lastly, and perhaps the most couclusive, the story of Livy, that a mass of rock fell down from the Capitol into the Vicus Jugarius, which ram under the south summit—and thus proving that the Capitol was upon it—form the chief arguments in from of the Gargan side. To arguments in favour of the German side. To the above a collateral proof in favour of the Arx being situate on the other summit is the statement of Ovid, that the Temple of Concord (of which there is no doubt) was at the foot of the store backing the the the the four of the steps leading up to that of Juno Moneta, the latter being placed by numerous concurrent testimonies in Arce.

The remarks of Mr. Dyer upou all these points, and the arguments on the opposite side, will well repay the perusal, and doubtless give another colouring to the matter. The leading points of the other party are hriefly as follows:-1. The position of the Ara Celi is more im-posing, therefore more adapted for the site of posing, therefore more adapted for the site of the Temple of Jupiter Capitolinus; 2. The Arx, being for defence, would be situate ou the most important part for such purpose, and therefore clearly on that point of the hill nearest the river; 3. That the hill of Ara Celi answers the description of Diouysius of that of the Capitol, better than the opposite one; 4. That we are expressly told by Dionysius that the Genple of Jupiter fronted the south, whilst we learu from the other accounts that it hoked we leave from the other accounts that it looked ou the Forum; 5. That Vitruvius directs that the temples of Jupiter, Juno, and Minerva, should be placed "in excelsion loco."

SURVEYOR TO LLANELLY BOARD OF HEALTH.--Mr. Thomas Hand has been appointed surveyor to the Local Board of Health at Llanchy.

THE BUILDER.

THE APPREHENDED MURRAIN, AND IMPROVED FARMSTEADS.

CONSIDERABLE alarm is manifested on the subject CONSIDERABLE alarm is manifested on the subject of the probable appearance amongst our berds of a murrain said to he prevalent abroad, and it is desirable that the *right* steps to prevent the evil should he taken. We find Government prohibiting the importation of eattle from the Coutinent for fear of brinzing in disease which has never been absent, but which land-draining, improved agricalture, and better cattle-sheds have reduced, and which only pre-varils now on wet, nutrained land, and in filthy over-erowded cattle-sheds and pens.

browner entre-snows and p.ns. Dr. Greenhow, in a preliminary communication to the Board of Health on the subject, just now pub-lished, says the disease recently prevailing in Holstein and the adjoining countries is the "pulmonary mur-rain," and is identical with the "lung disease" that has proved so destructive among the berds and dairies of Great Britain and Ireland during the last fifteen to interevent or sixtcen years.

"Although possessed of infectious properties in a mode-rate degree, the 'lung disease' is known to arise spon-taneously under certain ill-understood conditions of lood and session, and is not usually helieved to have been imported hither from abroad. It is almost universally diffused throughout this country, having from time to time broken ont in an epidemic form in particular localities, and gain disappears as prevalent here as on the continent, no danger crists to our cattle from the importation of foreign cattle suffering from the disease."

All that bas heen written and paid for by Govern-ment on Quarantine is made of no avail. Even the experience of the last war goes for nothing, when every quarantine regulation in every port of the East was set at defiance, and without one single case of injury, hut incalculable benefit. Our vessels sailed in multy, but incarconate columns of the same and out of Constantionole, Smyrua, and other plague ports, during a cholera period, without either taking or leaving cholera; and now the ports of Great Britain are to he shut in the face of the world against cattle, hides, and hoofs. If this regulation were not something worse, it would be supremely ridiculous. As a nation, we show the world that we have no faith As a nation, we show the world that we have no faith in quarantice where buman life is concerned, and then would establish a rigid quarantice for cattle. Thin the overcrowded cattle-sheds of this metropolis and other places, cause these places to be ventilated and cleansed at short intervals, and cattle diseases will be reduced. Next, prevent diseased home-hred and home-fed cattle being slaughtered aud sold for human food, and the Custom-house officer may with a good nome-tee cattle being staughtered and sold for human food, and the Custom-house officers may with a good grace prevent discased cattle from being imported. The mortality in metropolitan milk cow-sheds is frightful; but as one of the owners remarked, "the cows don't die: we kill them." That is, all diseased cows are killed, as Paddy would say, "to save their lives." lives

hres." A damp subsoil and low temperature aggravate the epidemic diseases to which eather are liable. Drainage affects both of these, raising the temperature of the air from 6 to 8 per cent. In a report to the Board of Health on the parish of Penrith, Cumberland, made in 1851, the reporter, Mr. R. Rawliuson, points this out strongly, and says truly.—

rande in 1851, the reporter, Mr. K. Rawinson, points this out strongly, and says truly,—
a' It will be a curious and highly interesting problem and one in which the human race is deeply concerned, to trace out the origin and spread of these malignant and for the origin and spread of these malignant and trackably set, and re-act, directly and indirectly, one npon the other. Nany such wide spread diseases are recorded in history. In 1515 and 1579 nearly all the sheep in France smong the people, prohibited the sale of math yar, and in 1599, the Venetian Government, to stop a fatal disease mong the people, prohibited the sale of math yar, and in 1599, the Venetian Government, to stop a fatal disease mong the people, prohibited the sale of the sheep, show the prove the proper sheat by the provement, to stop a fatal disease mong the people, prohibited the sale of the sheep, and among the people, prohibited the sale of the sheep, and and from 1700 to 1711 it spread among cattle, sheep, and from 1700 to 1711 it spread among cattle, sheep, and from 1700 to 1711 it spread among cattle, sheep, and from 1700 to 1711 it spread among cattle, sheep, and from 1700 to 1711 it spread among cattle, sheep, in all parts of the flexi, according to Saurages, destroying at Nismes the torgue in 1576. From 1739 to 1760, the cattle were attacked by the sease like the small-point in all parts loss, billing, allocid, and the said that more than 200,000 bead of occh have been destroyed by it. There is also the recent disease in notatoes, which produced famine and fever in relatad to so fearful an extent, the effects of which have been discourd by a sease of faces of the shand, and to said that more tan 300 faces and expending in the towns and the sease for the shand, and the assolid the massol facil, ada, especially in the towns and the sease of faces of the shand, and to so fearful an extent, the effects of which have been discourded all variant of the shand, and the said that more tan a shand the shade fallowe and the sadd the m

Wide-spread disease in cattle, on undrained land, and in crowded, ill ventilated calle-sheds, follows a wet season. We have here, therefore, at once, points to which attention should be directed to ward off the dreaded murrain.

LIVERPOOL FREE PUBLIC LIBRARY. - The first stone of the proposed new building was laid by Mr. W. Brown, M.P. the munificent donor, on Tuesday morning last.

LONDON STATUES

MUTHLATION OF THE EFFIGY OF QUEEN ANNE, 1N ST. PAUL'S CHURCHYARD.

ALL must have heard with regret of the damage done by some mischievons person to the statue of Queen Anne, which stands within the railings at the west end of St. Paul's Cathedral.

In consequence of the occurrence, Dr. Milman, the dean, has ordered the gates which have afforded the mblic access to this enclosure to be closed.

the public access to this enclosure to be closed. Although this state is searcely worthy of con-sideration as a work of art, it is, notwithstanding, an historical record of considerable interest, and it is surprising that any one could he found to mutilate such a harmless monument, and in such a position. The Porland Vase, in the British Museum, when it was broken, was kept in an ont-of-the-way room to be the science and not are made on in sufficient which the visitors did not usually go in sufficient numbers to prevent mischief. It has been shown by many examples that the public is a good guardian of its own art-treasures.

its own art-treasures. It seems wonderful that the mutilation of Queen Anne's statue could have heen effected in such an open place, for it must have required considerable force to do the dumage which has been effected. It force to do the dynage which has been effected. It surely could not have hece done in the day-time, and it seems curious how in the night the matter could have escaped the notice of the police. The neighbourhood of the figure is, however, dimly lighted, and this circumstance no doubt tempted some foolish or cyll-disposed person to commit one of those now rare outrages which unfortunately afford to autho-rities who are not argues to zire the masses of the

Ionish or evil-disposed person to commit one of mose and now rare outrages which unfortunately sflord to authorities who are not anxious to give the masses of the people increased facilities for visiting our galleries and nusemons a pretext for shuting them out. The statue in front of St. Paul's was damaged most likely by a single individual, and, in consequence, the gates of the area are closed altogether to the public. We hope that no exertions will be spared to bring the perpetrator of this act to justice. It is to be hoped too, that the gates will be allowed to remain open during the daylight, for the ways across are very convenient, and in fine weather groups of women and children, from the narrow back streets about, may be seen enjoying this the only accessible in another direction, but at some distance, is Smithfield all barearden, and this is throatened: in another direction, but at some distance, is Smithfield and arrow courts and alleys.

laues, and narrow courts and alleys. The suggestion that the damage complained of must I ne auggestion that the damage complained of must have been effected at night, brings to recollection the dim lighting of many of the monuments in our squares : some of them nearly vanish with the light of day, although the stream of passengers moves along for hours without ceasing. With a little tasted for hours without ceasing. With a little tasteful management, and at a very small cost, the street statues might be made visible and interesting objects when the sun has gone : the light would also be a means of protection from damage.

NOVA SCOTIA.

SINCE my acquaintance with the Builder, I have frequently seen notices of improvement and progress in the arts of architecture and building in Canada, Australia, and other colonies, but have never yet seen Australia, and other colonies, but have never yet seen these subjects mentioned in connection with the colony of Nova Seotia. As the Builder has numerous readers in this province, and great activity and im-provement have prevailed here in these departments for the last two or three years. I had hoped that some more practised pen than mine would, ere this, have given you some account of our progress; but as none has hitherto appeared, I will, if you approve of the proposal, send you, on some future occasion, a few brief notices of our chief architectural works now in processes or in contemplation.

progress or in contemplation. I observe in the late English papers that great numbers of building operatives are out of employment, and much distress has been occasioned this last winter and much distress has been oceasioned this last winter thereby; and as we in this country are very much in want of labour, many works almost stopped, or pro-gressing slowly, while many more would be entered into if there was not so much difficulty in procuring skilled labour; my principal object in writing to you at the present time is to call your attention, and that of your workmea readers, to the advantage of this province as a field for emigration. I. Its provinity to England : we are now not more than twelve or fourteen days from there, and this spring there are two lines of steamers leaving Liver-pol (England) regularly for Halifax, one line afford-ing facilities for moving not bitherto given, by taking steerage passengers at low rates. 2. The elimate, &e. very similar to that of the old country.

conutry. 3. In the constitution of the Government, and the social habits of the people, an Englishman would find bimself at bome. And last, but not least, the certainty at the present time of constant employment, at what may be called high rates of wages, as living is cheap, carpenters, &c. getting 65, to 75, col. per day of ten hours; masons, bricklayers, &c. 105, to 125, 6d.; and other

massing, bricking etc. trades in proportion. I trust that you will give publicity in some shape to the sentiments contained in this hasty note, and that it may result in good to hoth employers and employed on each side of the Atlantic. A NOVA SCOTIAN.

ELECTRO-TELEGRAPHIC PROGRESS.

A NEW stride in the progress of Electro-Tedegraphic communication appears to he about to be made, by the formation of a new company working the patents of Mr. Allan for light-weighted inned-iron-wire lines of of telegraph. The *Times* gives a full account of this of telegraph. The Times gives n full account of this new system, from which we condense the following particula

particulars. Mr. Allan has devoted himself to the improvement of the cleatric telegraph, and has applied practicelly some of the more important recent discoveries of Pro-fessor Faraday and others of our obief cleatricians. He has invented n cable about one inch io diameter, the cast of which is formed by ninetcen wires, of thund-iron wire, twisted into one strand, an inch in circum-ference. This is acalcoal in a case of indiarubber, casted over with a mixture of tar and sand. The cost of the whole is oph 70/V, per mile, instead of 300/. to 500/, and its weight only 8 cwt, in place of 6 or 8 tons. The core of this cable is thus made both its strength and its conductor. The conducting power of iron as compared with copper is as 24 to 120, but the increased sectional arce afforded by the large iron strand more than compensates for the relative differ-ence. The preposterous weight of previous submarine cables, such as those for the Mediterranean, was the fatal error which interfered with their success; but experience has shown that within certsin limits, as to Mr. Allan has devoted himself to the improvement experience has shown that within certain limits, as to durability, the cable cannot be too light.

It is proposed, by the new company availing itself of these patcets, to establish, in the first instance, a system of telegraphic communication throughout the It is proposed, by the new company availing itself of these patcots, to establish, in the first instance, a system of telegraphic communication throughout the United Kingdom almost as complete and extensive as our present possida arrangements, and at a uniform rate for messages of a peany a word, or a shilling a mes-sage, whatever the distance within the limits of the hingdom. The chief nunufacturing towas are to form sub-centres with the smaller towns and even villages around them. The wires will be thinly conted in gutta-percha, and laid in numbers branching off to the different towas ar *note*. The cost of each of these wire cables will not exceed 10/4, per mile. It is esti-mated that if twelve of the largest towas in England send on an average fifty messages per day to each other, the gross receipts, without including intervening tations, would be 120,4502, while 24 towns scuding 100 messages per day would yield nearly 500,0007. Are annum. For carrying out this system Mr. Allan has devised an improved recording telegraph. The ocean lines are at the outset to be confined to haying a cable from the Land's-end to Flores in the Azores, and thence to Halifax, making the deep sea attretch, it is alleged, alout 400 miles shorter than the route between Newfoundland and Ireland, and avoid-ing the land lines, which are expensive to maintain, and increase the cost of messages. Should the Ameri-can cable do, it is intended then to extend the system to the Channel Islands, Gihraltar, Malta, and even andia.

FALL OF WALL NEAR COVENT-GARDEN.

Ar the back of Bow-street, Covent gradien, was a court known as Russell-place, with one opening to it nearly facing the police-court, and another in Russell-street, nearly opposite to the pit entrance to Drary-lane Theatre. The houses in this place were occupied by very abandoned characters, and other servoices lane 'lheatre. The houses in this place were occupied by very abandoned characters; and, other remedies failing, the agents of the Duke of Bedford resolved to pull five of them down. This bad heen nearly com-pleted, leaving the back wall, which also served as n back wall for some stables in King's-Head-yard, standing; when, on Good-Friday morsing, this wall fell to the ground bodly, spreading flat over the whole site of the court, and huried in the ruins four out of five mea engaged, the fifth having left the spot a five seconds. Two, Maurice Fitzgibbon and out of hve mea engaged, the fifth having left the spot a few seconds. Two, Naurice Fitzgibbon and Joha Shean, were killed, and the others dan-gerously injured. The wall was 70 feet long and 25 feet high. The party-walls of the stables in King's-ILcod-yard were not bonded into, but simply huilt against, the hack wall, so that when the party-walls of the houses in Russell-place were taken away. there was solving to inducit it of how the it the neural there was aothing to steady it, although to the casual observer it might have seemed tied to the stables At the inquest held on the 13th,-

CHURCH-BUILDING NEWS

St, Mary's, West Brompton.—The tower and spire of this church, at Bolton's, in West Brompton, left undone in the first instance, have hene completed, nuder the direction of Mr. Godwin, by Mr. Myers. Mr. Milman was clerk of the works. A view of the huilding will be found in a former volume. If the huilding will be found in a former volume. It is a cross church: an octagon lanttern, with four windows in it, surmounts the tower, and is itself crowned with a lofty stone spire, the angles of which are ornamented with hall-flowers. On the parapet, at the foot of the spire, are eight kneeling figures of angels, executed will much feeling and skill by Mr. Ruddock. The lantern is open to the church. This was objected to in the first case, in the fear that it would interfere with the transmission of the preacher's roice. Fortunately, however, it does not do so in the Fortunately, however, it does not do so in the voice. slightest degree.

slightest degree. Nornich.—The last of the four sides of the tower of Norvich Calhedral is now being restored. The first side was restored about twelve years since, and the repairs have altogether cost about 2,0004. The expense of the works has been defrayed by the deau and chapter. Mr. J. Browu is the architect employed.

Yarmouth .- At a recent meeting of the general committee of the proposed church on the beach for scamen, the several tenders for the work were opened. scamen, the several leaders for the work were opened. The proposals were as follow: Mr. Cossey, of Lon-don, for bricklayers' and stonemasons' work, §23/., for stome-missionry alone, 408/.; Messrs. Curtis and Balls, Norwich, for the whole work, 1,437/.; Mr. Key, Yarmouth, ditto, 1,394/.; Mr. Rott. Pratt, ditto, 1,271/.; Mr. Wricht, ditto, 1,699/. 16s.; Mr. R. Steward, ditto, 1,240/.; Mr. H. J. Norfar, ear-pentery alone, 398/. The tender of Mr. R. Steward, heing the lowest for the whole of the work, 1,248/. was accepted. The work will be commenced almost immediately. immediately.

Brockley.—An improvement has recently been made in the parish church of Brockley, Somerset. The north transpit has been enlarged, for the purpose At the inquest held on the 13th.— Mr. Charles Parker, the Duke of Boeford's surveyor we evidence as to ordering the houses to be pulled of the gallery are now exposed to view.

towards its endowment.

Peterhead.-The United Presbyterian congrega-tion at Peterhead have just contracted for the crection of a new place of worship. The contractors are-Messrs. Reid and Cheyne, masons; Messrs. A. and J. Lockic, &c. joiners; Mr. Wm. Stewart, plasterer; Messrs. Kirton and Merson, slaters. The exact amonut of the estimates is 1,166/. 10s. The building is to be commenced immediately.

is to be connected numericately. Kilburn.—The foundation stone of St. Mary's Church, Kilburn, was laid by the Hon. General Upton, on the 31st of May, 1856; and on Tuesday, the 7th of April, the portion of it that has been built was opened for divine service. The nave and aisles have heen floished, and the transcript covered with a temporary roofug, leaving for future crection the tower, chancel, and chancel nisles. The style is the Decorated Fundit Cottie, and the data will. the Decorated English Gothic, and the church will the Decorated Lights obtain, and the chirtch will seat upwards of 800 persons on the ground-floor. The cost of the works at present nadertaken amonts to 4,800%. leaving about 3,500%. to complete the structure. 60% were collected at the offertory, after a sermon by the Rev. T. Ainger, view of Hampstead. The architecies were Messrs. Francis; the builder, bit W. Hirrer. The architects Mr. W. Higgs.

PUBLIC EXAMINATIONS IN DRAWING.

DURING TEACHINATIONS IN DEAMVING. DURING the last month public examinations, con-ducted by the Department of Art, in elementary drawing, practical geometry, perspective, and model drawing, of two grades of proficiency, have taken place in the several district Schools of Art in the metropolis. Not only the students of the schools, but all who presented themselves, were eligible for examination, and to take the rewards. At Roher-pithe district School of Art 41 exercises were worked, and 6 rewards given ; at Lambeth 92 exercises, and 41 rewards; at Spithelids 168 exercises, and 42 rewards; at St. Thomas's, Charterhouse, 598 exercises, and 250 rewards. The proportions of rewards to exercise geometry, 24; in presten-tiox, so and each in drawing 53; in drawing from solid models, 3; and in drawing 53; in drawing thoxes, and similar object a needlu instrauenat, colour-hoxes, and similar object ansfell in drawing. These-were the first public examinations in drawing which have taken place in be metropolis, and which it is intended shall he held annually. DURING the last month public examinations, con-

SOVEREIGN LIFE OFFICE, ST. JAMES'S-STREET, PICCADILLY.

The building now in the course of comple-tion at the corner of St. James's street, Picca-dilly, for the Sovereign Life Assurance Office, is interesting, as showing the tendency at the present moment to the use of a much larger amount of carving for external decoration than has heretofore been employed. Few houses, indeed, are at this time built in the streets of Loudon without some attempt at decoration. The Holdon's inductions at the provided in the second s it is expected, by the end of this completed, month. The fronts of the ground and mezzauine floors, and the cornices and dressings to the upper part, are executed in Caen stone : the facing of the upper part is of Bath stone. The lower portion of this building is devoted

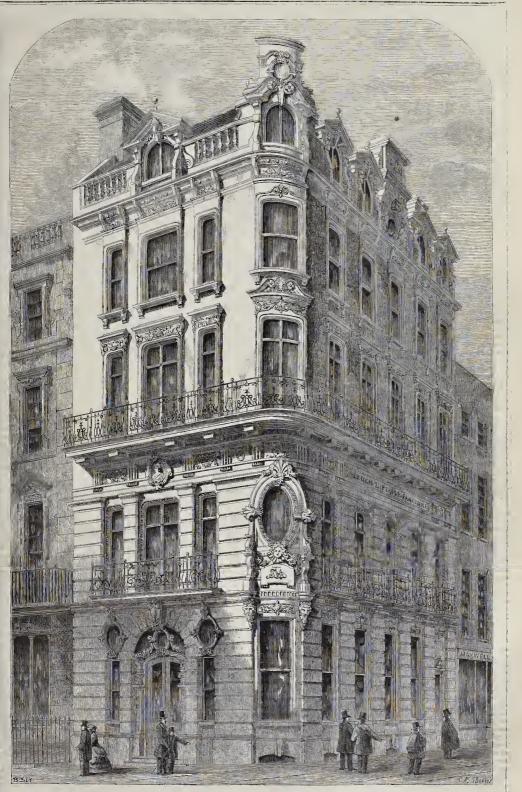

to the uses of the Sovereign Office. The ground floor contains the public office, secretary's and strong-room, the mezzaniue floor the board-room and lobby, directors' waiting-room, &c. and the medical officers' room; the basement contains washing-rooms for clerks, a second strong-room, housekeeper's apartments, and cellarage. The three upper floors are three separate sets of chambers, with three rooms, and requisite convenience to each set.

The contract was a little under 4,500%; and when completed the total cost, it is stated, will not exceed this contemplated amount. uot

Messrs. Pritchard and Co. of Warwick-lane, Newgate-street, are the contractors. Mr. Wm. Farmer, of Lambeth, has executed the carving. Mr. Woodfall is the clerk of the works.

THE BUILDER.

219

THE SOVEREIGN LIFE OFFICE, ST. JAMES'S-STREET, PICCADILLY.----MR. HORACE JONES, ARCHITECT.

ON HOUSES AS THEY WERE, AS THARE, AND AS THEY OUGHT TO BE. AS THEY

A Society that for a hundred years has applied itself to the encouratement of the judicious applica-tion of capital io arts, unaoufactures, and commerce, tion of capital io arts, unaofactures, and commerce, needs no apology for considering a few of the results of the employment of copital on some buildings and in some building operations; that is to say, for con-sidering the durability, convenience, and beauty,--the cost, profit, and value,--which some of our buildings, especially dwellings, at present afford nader competi-tion and iusufficient education. Any one of these subjects offers materials for an evening's discussion, and therefore a chert availanctions and descriptions subjects offers materials for an evening's unseasator, and, therefore, short exploations and descriptions only can be given: facts and figures must be taken as proved; and there will ooly be three definitions which must be borne in mind, viz. of the building owner, the architect, and the builder. A building corner, is a private nerson who invests

A building owner is a private person who invests his money in a building as a speculation, and who generally knows nothing of the construction and cost generally knows notang of the constants and even of the building. A person who invests his money in a matter of which he knows nothing, witbout any guarantee as to the stahility of the undertaking, and no information as to the character of the man with no information as to the character of the main with whom be is to cotrust that money, is one of the most lamentably ill-ducated people that the inquiries of this Society can discover; yet such is the case with a large proportion of those who either reat, buy, or pay for huilding any edifice of any sort.

An architect is a person whose business it is to know in his mind the building thoronghly which he has to design before it exists; to proportion the number and sizes of the rooms and their parts to their uses; to size of the rooms and their parts to their uses; to arrange them in a convecient mannar; to give beauly to those parts and their datails; and to place these graceful portions io good relative positions as to the uside and outside of the building; to foresee all the essentials required by enstom, health, law, locality, materials, site, &c. especially by the intention and prescribed expense of the building; to choose amongst the various methods of sound construction; and to be so reputable that bis' decision in dispute as to the meaning of contracts and the quality of the materials and labour employed in that construction shall be binding upon the huilding owner and the builder. A builder is a person whose business, it is to pro-

A hulder is a person whose business it is to pro-vide, in the elsepset market, good labour and good materials, and to supply threas and their results to the building owner at a reasonable profit, according to the directions in the drawings and specifications by which the architect expresses his decisions; this, and this apply it the larger manufactor of the bulker. which the architect expresses his decisions; this, and this only, is the legitimate province of the builder; who is, or professes to be, bricklayer, mason, car-penter, smith, plumber, joiner, plasterer, painter, &c. all in one. Our epoch of the division of labour has seen all the trades connected, however remotely, with huilding combined in single hands, to the loss of all eoneerned, except the capitalist: the good work of the present day is the bad work of fifty years ago.

The merchant knows what to expect, who orders au agent to make up au examined cargo of gools suitable to a particular market, which goods are to be furnished by a warehouse that does not keep many of them in stock, and bas to manufacture, or get manu-factured all the rest to order. This is the relation of the building arms the area the subjects at the transition of the huilding owner, the architect, and the builder. The merchant does not know what to expect, who

orders that a cargo of goods suitable for a particular market should be shipped without examination from market should be simpled without examination from such and such a warehouse; the goods may be very good, hat prohibited in the port they are sent to, or they may be legal, and of such a quality as not to pay for freight. This is the relation of the builder, without the intervention of the architect.

The preparation of this paper has been caused by the fact that in my professional education and pra-tice, during both which you have several times honoured me by your favourable attention, it has been my habit to examine, value, and repair buildings at their birth, prime, and decay : thus I have seen that old houses survive generations of oew ones; that new houses are generally ugly; and when pretty are fre-quently not worth in the market what they cost.

quently not worth in the market what they cost. The *Times* has called upon its readers to compare old London-bridge, faulty enough in design, but living for 600 years with Westminster-hridge, 1750, and Black/riars-bridge, 1760, both now supported on crutches. The first of them is waiting to be swept away as a misance some day; the other may remain au invalid until the crutches rot aud the fabric falls under the weight of a man, a horse, and a memute cort. This works the fored as No and all fairs and an empty cart. This weight is fixed as the fatal one, because it has once been enough to hreak down a railway bridge. There was no deodand, I believe, on the human body, but the cost of the

other animal and the cart must have been paid by

other animal and the cart must bave been paid by somebody. • The same comparison may be made with regard to houses. A work by the late Mr. Hadson Turner, which is still new, and called "Some Account of Donese built at the same time as Old Loudon Bridge, or ordier, and of houses built from that time to the year 1500, which are still standing. We need not recapitulate his list, but, acknowledging the hearty of nearly all his examples, we will take up the subject at the heginions of the sistenth century, when brick was a fa-hionable material. We shall find that a large number of the timber and

was a ta-hionable material. We shall find that a large number of the timber and of the brick houses that were hull between 1509 and 1649, still remain, and command what may be termed a fancy price. There is actually no saying when they will perish ; some in ruins like Tattershall are as good will perish; some in ruins like Tattershall are as good as onay a new bouse of the present day. If we visit London just on the skirts of the Great Fire, we see houses that need not be pulled down, which is more than can be said of the Londou that has been built since 1800. To say nothing of almshouses dating between 1550-1650, we shall find that houses built hefore 1600 in the Strand, Little Moorfelds, Cross-street (Islington), Holywell-street, Gray's inn-lane, Bishopsgate-street, were; till lately, or are now, exist-ing. These are certainly not in very good condition, but we shall find houses 1620-30 in Lineolu's iun-fields and Great Queen-street, 1637 in Chandos-street, Covent Garden, 1640-62 in Clare-market; 1657 in Middle Temple-lane, and 1660 in Haton-garden. Keeping generally westward with fashiou we find,

Middle Temple-Jane, and 1660 in Hatton-garden. Keeping generally westward with fashion we find, 1673, King's Bench-walk, Essex-court, and Farrar's-buildings in the Temple, Arundel-street, Exoter-street, and Schevill-estreet; 1680, the Old Jewry, King-street, St. James's, Crown-street, Wardour-street, and Scho-square; Paper-buildings in the Tem-ple, which Bagford says were so called from the slightness of their construction, 1685, were not re-built till 1849. So that eatually bouses built in what were then considered a slight manoer, have lasted 160 years; iudead; it was lately stated at ao inquest that a house was only 200 years old, and therefore could not have been supposed to be in danger; in fact, ought not to have fallen. This is a remarkable fact, ought not to have fallen. This is a remarkable proof of the extreme difference between the old and proof of the extreme difference between the old and the new houses; if we reflect that a glance through the journals of the last officer years will show the full of about as many bouses before they were finished, as of the old houses. Yet Neve, iu 1703, says, "the greatest objection against Loodon houses (being for the most part brick) is their slightness constraint h of the old houses. Yet Neve, in 1705, says, "the greatest objection against Loodon houses (being for the most part brick) is their slightness, occasioued by the fince (or ground-zents) exacted by the landlords, so that few houses, at the common rate of building, last longer than the ground lease, i.e. about filty or sixty years; and this way of building is very bene-ficial to trades relating to it, for they never waot work in as great a city, where houses are always repairing or building." And probably much of his observations applied only to houses on the outskirts of the then eity, for we find that about that time good houses were built as 1700, Red Lion-square, Buiton-street, Deronshire-street, Queen-square, and Great Smith-street; 1707-5, King-street, Godlen-square, Queen-square; 1716, New Bond-street, Coedui-street, and Hanover-square; 1718, Rathbone-place; 1730, Bedford-row; belore 1725, King-street, Coedui-garden, 1727, May Fair; 1730, Oxford-market, Half Moon-street, and South Audley-street; and 1737, Crown Office-row, is the Temple. The age of these houses is clearly marked by the

The age of these houses is clearly marked by the fact, that after 1708 the window-sashes in London and Westminster were placed io reveals by order of a Building Act; fifty years afterwards a new Building Act was necessary from the great increase of buildings, and the order for reveals extended to some outlying parishes; in 1766, Parliament again met the great

narises; in 1760, rarnament again file the great increase of buildings by a new Act; and in 1774 came the stringent Act called the Black Act. About 1765, Breners-street and Grosvenor-place; 1775, Maosfield-street and Stratford-place; 1778, Portman-square, Portland-place, and the Adelphi were built. Many of these streets, built 1760-1780, were built. Many of these streets, built 1760-1780, noder vigorous legislation, and lenses for nincty years, have houses that although old-fashioned, are hand-some, convenient, and far too good to be pulled down. The very foundations of this society's house are shown to foreigners, though perbaps few of my audicuos know that such a sight exists: except to those engaged in building, it is an uopleasant and useless visit.

Solution for the weight of a mail, a visit. Solution of a mail, a visit. But with the year 1790 we have Lisle-street; 1795, it determines that a more been emongh to be fatal one, because it has once been emongh to the New-rord; 1805, Great Surrey-street, Wale-street; and Russell-square; 1816, Bryanstone-square; 1815, be the New-rord; 1806, Great Surrey-street, Wale-street; and Russell-square; 1810, Bryanstone-square; 1815, park-ervscent; 1820, Regent's-park, Burton-ercscent, street rubbish was a term well understood by the followed.

[April 18, 1857.

workmen employed on it, and Regent-street rubbish,

workmen employed on it, and Regent-street rubbish, for a great wouder, it remains. I contoch upwards of thirty ernelss in one wall of a house there. But bad as that is, it is not really so bad as much that has been since built,—it stands. The public would seem to have a helief that a low reat and a good honse, in a good situation, are likely to he put before it mder the present system of com-petition. When the landlord was the builder, and evered four or five acres with houses, it was his in-terest to huild all enough well—the could get his rent: covered noir of new acres with noises, it was in an iterast to build all equally well—he could get his rent; builders, they cut down the cost of construction, in order to compete with each other for profit out of the rents, which their own competition made lower than rents, which herr own competition made lower than their landlord would have asked, and this system of competition is part of the secret of our present bad houses. The other part of the secret is the folly of people in reading or buying anything in the shape of a house, without knowing, or endeavouring to know, anything about it, yet the public will not hire or huy average the competence.

anyting about it, yet the puble will not hive of my a piano in the same way. The usual way of starting a street is to let the land to that anomalous being, a speculative builder. He need not he a builder, or a tradesman in any hranch of building : indeed, the persons whom 1 have known succeed best, were a sailor, who had succeeded to some property, and built two houses for $\pounds_{T_{i}}^{0,000}(0)$, which he sold immediately, in the most careless, open-headed were for any work and head builder's shore which he sold immediately in the most earlies, optim-handed way, for as much cach; a chandler's shop-keeper, who built a row of forty houses for £300 each, and sold nearly all of them, but mone for less than £600; and a forthand, who built a street in such a style that at last the tradesmeu actually refused to work any longer for him, but who complacently said, in the court of law to which he snomened them,

in the court of law to which he summoned them, tenants would occupy anything he put up. Between 1760 and 1810 many streets were built on a system which no longer prevails; it wus called hood for blood; because it a plumher took a piece of ground, he arranged with a brickdayer, carpenter, joiner, and painter to put their work over the ground, each taking one or more bouses finished with his plumbing in payment. Of course his lead was thin ; the brickwork was poor; the rafters and joists were weak; and the glass and painting discreditable. From 1800 to 1825 there was a different system : builders who gave themselves up to the business of

From 1000 to 1625 there was a underful System 1 builders who gave themselves up to the business of huilding streets on speculation, borrowed of their friends and tradesmen, and paid their debts according to the sale of their houses; this system dropped when the lenders found unfinished boases left on their hands. Since 1815 the timber merchants, &c. have lent money to the speculative builders, and of course lent money to the speculative huilders, and of course the quality of the materials they supplied could not be disputed; but these persons, especially the timber merebants, have apparently had reason to suspect collusion between speculative builders and ground landlords, and are now more wary. Indeed, the real speculator is often the landlord who lets ground and advances money, in the hope that the speculative builders would put a good deal more money of their own or other people's in the shape of carcases on his ground, and by failing would allow him as mortgages to forcelose and get, at a cheap rate, carcases to he finished scampishly and sold cheaply. We see houses built before 1700, at an apparently

Intrined semipsing and solid disappy. We see houses built before 1700, at an apparently reasonable price, actually still too good to be pulled down when 170 years old, and most of them are con-sidered good for another forty years at least; we see many houses only intended to last for 100 years, new fronted, and these also are considered good for at least Frontco, and these also are considered good for al leasy another forty years; and we see many houses that were built before 1800, that are now being tinkered in order to last that time. But we also see whole quarters of London consisting of houses hult since 1750, which the tenants quit from absolute fear; rows that many the momentum time of the link are well. exist where the representatives of the builders would be too happy to get rid of their prospective burdens, and sell their interest or rather burdens in their leases for a mere song

Why our dwelling houses in London are built after Why our dwelling nouses in Longon are only ance-one plan, viz. an entrance passage, a front room, a smaller back room, and a staircase by its side, is a mystery to many besides myself. The plan is no donbt a very good and healthy one, where it provides a thorough draft every time the back or front door is opened, but it has a great tendency to make the binarcase such and it keen the house very cool in opened, but it has a great fendency to make the chimneys smokes, and to keep the house very cool in winter. Why, also, the kitcheus should be placed in the basement is not clear; the open doors in summer carry all sorts of scents up the stairs. Indeed, in this respect the very small houses, like those in Canden-town, which have no basements, but have kitchens in the yard, might be usefully followed in here here and house of the user of the second witch he larger houses, and the servants' rooms might be above each other at the back of the house, and all the way up. Some good third-rate honses have the stair-ense io froot, and gain a handsome back room, at little expense to that in front, but this plan is rarely It is also curious that speculative builders

sery.

There is hardly a bouse fit for an invalid in Intere is minuty a buse it in a street contains on an average, one invalid in a year, and all the year round. Perhaps this is one reason why so many invalids live abroad, where all their home is on nany invalids live abroad, where all their home is on one floor, and where there is only one stairease, and that a very easy one to descend, in order to get into the garden or the street. Back houses, too, are quite gone out of fashion, as if our families had nothing to do but to sit at the front windows to see the passing vehicles. I was much struck, in several of the Bel-gian and Teroch towns, with the system—of which traces may still he seen in the eity, viz.—of having a enrriage entrance, in which a porter lives that stops all incomers to know their business. He and his with ext as servants, on occasion, to the immales of the front and back houses. Through the carriage entrance front and back houses. Through the carriage entrance front and back houses. Inrough the carringe entrance I passed into a pretty, though small, graden (I should say that no carriage except for an invalid entered), which separated the front and hack dwellings. In compliance with continuctal customs most of these were large enough to have a family or two on each floor, but I choice to have a namely of two on each node, but i visited where only one family occupied the pretty little house. There the porter is answerable for your house, you put the key on your hook in his lodge, and the whole family can leave for the best part of a summer's day, week, or month, with safety. The convenience of this system to men living in chambers of Dorden is on solviens. Use it is unmained to be concentence of this system to their fiving in coalinets in London is so obvious, that it is surprising that families have not adopted it. The cost of one servant is at least saved, and nearly one half of another is quite saved. The dust and noise of the streets does not affect the hack house, and by letting the front one for husiness, the rental of the ground is nuch increased. There, ought to be a ston must be the hardwaven surface for husiness, the rental of the ground is much intereased. There ought to be a stop put to the barbarous system of using basement floors as a sleeping rooms, and for overs. There is no occasion for the great part of our bread to be prepared in underground holes, where the haker's men can see nothing except hy candlelicht, and which are subject to all the dirt and effluvia—hut I need say no more on that point. In the hest houses in certain parts of London, the female servants are made to sleep in the basement. It was my business to spraye a house near Russells.comer the other day The set of size p in two bisement. It was my business to surve a house near Knsell-square the other day, and I found under the entrance passage, with a window looking (it would not open) into the enclosed shed under the steps, and a chimney-place blocked up, a close it which two servants were said to sleep. The fatti dodour was such as the mistress of the house unargentia then the site of the house of the house tottd odour was such as the mistress of the house apparently thought accidental, and she was good enough to explain to me that it arose, she thought, from the fast that her neighbour's cisteen always kept overflowing and made one side of this little hel-room rather damp, so damp, indeed, that the plastering could not be said to stand upon the wall. To find sink stones with the holes corked up is nothing new at house. Perhaps one of the greatest improvements in London houses of all sizes, would he to have the definis held so near the surface and so covered by drains laid so near the surface, and so covered by thoards in their line, that they could be examined or incards in their line, that they could be examined or cleaned without trouble; it present there is uothing which embarrasses me so much on surveying a house. If the floors are taken up and the drains are clear, there is great wrath at the trouble and expense; if ireliance is placed on the assertion that the drains are tenan it by no means follows that they are either clear or sound, and many a drain has been allowed to leak its contents away into the kitchen floor and the foundacontents away into the kitchen floor and the founda-tions, from which cause alone there are many damp awalls in London.

I shall say nothing about a backwardness in adopt I shall say nothing about a backwardness in adopt-ing patent sash-fastenings, calculated to render the labour of cleaning the windows less dangerous; or sensible designs for stove-grates; or speaking-tubes; or ventilating-glass in the windows; or self-fitting cok-handles; or small rooms fitted up for a hath or naths, where children might upset the bath without injury to the bouse, as is frequently provided abroad, aspecially in the north of Europe; or the possibility of making a house so nearly frequot, even if it be au bid one, that lives should not be lost in case of fire; nor of better shutters than the ugly contrivances now a use; nor of lifts; nor of several other things And of better shutters than the ugly contrivances now n use; nor of lifts; nor of several other things ugually nsoful and valuable: yet these are all matters which are neglected in our houses, of the common as ivell as of on theter sort; and I am inclined to think that it is because an architect is not employed. Per-paper we might go forther, and say that if an architect is said to be of no use except to increase the cost of house by the autount of his commission, at all events at annaleur, of a specific pointing building the source of the source Is house by the autount of ms commission, at all events an annateur, or a speculative builder, would certainly se sure to do better. You know that the new streets If London are filled with houses that have little or no leal convenience in them, and that the speculative Builder does not seem to eare a jot for the samilary and social improvements of the day; but you probably

never will put a ventilator to the top of the staircase, do not know the sort of faults committed by those and so the whole heated and damaged atmosphere of mee who, lotily saying, "we can do without an archi-the house is poured into the top rooms, which also teet," think themselves claver enough to direct thru happen to he he apartments for the invalid and the tradesmen. Houses without staircases, as in Hurtradesmen. Houses without starcases, as in Har-court-street, Dublin; without a front door, as at a house in Liverpool; without a front door, as at a client who became my godfather; without light to the stairs, which is common; or virtually cut in half, as by a military engineer; are absurdities seldom be lieved, but oftener perpetrated.

hered, but offener perfectated. As to competition, the matter is still worse. The puble decides that it wants a cottage, a shoop, a house, a school, a parsonage, or other buildings, of which it fixes the price. On what grounds it fixes the price nobody can say; yet the public, knowing nothing of the price of a huilding, appoints a committee to spend the price of a unitably appoints a committee to space this sum in a satisfactory building; whether the com-mittee, or a private person, wants the bouse, &c. the following steps are the same. A child who has to choose between a large plain eake and a small pretty cake, would ask if they were equally good; but the public expects to have its eake the biggest and pretticat t the same frice arithm campiter exp whether it is at the same time, without security as to whether it is good at all. So it advertises a competition. Where a lawyer, a medical man, or a broker, is wanted, the public can be tolerably safe in seeing if

name is on the rolls or lists of the respective the name is on the rolls or lists of the respective hodies corporate; but when the public requires the services of an architect; it accepts as one any person who chooses to take the title. Of course, in these days of competition and free trade, an architect on the rolls has no right to complain, either that he is not employed, or that a person not on the rolls is employed; but the veratious part of the business is, that it the public employs what the profession calls a quack, and is deceived, robbed, and ridiculed, it un-justly says, "What is the use of an architect?" Knowing the desire of the public to have its eake large and pretty, men calling themselves architects

ergage in competitions, and send the biggest and pretiest designs that occur. He who sends the biggest and pretitest is generally successful. Does the public believe that the apprentices and clerks of Diggest and believe that the apprentices and clerks of architects are capable of answering the purpose i if so, it is as much in the wrong as if it asked a chemist's apprentice to take of a limb or tie an artery. Yet one-half of the competitors are pupils, clerks, or young men without experience ; now, the publie has no right to depreciate a whole procession hecause the experiences are incapable. A large number of the competitors are eivil engineers and builders, men estimable, no doubt, in their own lines, but no more fitted for such competitions than they would think an architest fitted to direct the water-supply of a town, or to take a contract for the bricklayer's work of a public building. Does the public believe that the bicanest and nettiest eake officed to its acceptance at or to take a contract for the bricklayer's work of a public building. Does the public believe that the higgest and prettiest eake offered to its acceptance at the price named, is likely to he good in its constitu-tion ? A single judge might be so uncducated, but half a dozen or a dozen can hardly be so far wrong. This is it the dozene either interest on invities alf a dozen or a This is the dilemma, either ignorance or injustice ehooses a cake made so pretty and so big that it

ennot be good. To avoid this dilemma for public buildings, To avoid this dilemma for public buildings, the employment of an architect as judge is the only course to adopt, and bas been adopted in some eases; but the judge may well say that his is a thunkless office, when as has been the case, he has conscien-tiously to report that not one of the designs sent in the the may make all there obtained in the state of the second of the second seco by the men who call themselves arehitects, can be done for the money; or give the accommodation required. Then the committee generally throws aside the award, and makes a choice of its own.

It may be said that this is all very true of a com-mittee, but that an individual is always equally un-Intege, our that an individual is always equally and emphati-fortunate. This, however, can be justly and emphati-cally denied. If a private person employs no architect, his building may be whatever it will, if he employs the first packing-case maker, gardener, painter, undertaker, anctioneer, who calls himself an architect, let his building take the consequences. painter, undertaker, auctioneer, who calls himsett an architec), let his building take the consequences. Ellesmere-house, Holford-house, of the present day; Burlington-house, Marlhorough-house, of the past, are equally fine buildings, built by selected architects. The elub-houses are generally built by competition, but amongst selected men only, as was the Royal Exchange; and at Liverpool the most sensible of the encodulors offered handsome prizes to commetitive Exchange; and at Liverpool the most sensible of the speculators offered handsome prizes to competitive designs for bis new street houses. I shall say no more of architectural competition than that the prin-cipal leading architects do not enter unlimited com-petitions, miless justified by the importance of the occasion. Thus, in the approaching competition for the Government offices, the public will not have the advantage of the skill of half a dozen of our best men ; and thus, also, but a few established names of repute are attached to the forty-six sets of draw-ings now exhibiting at King's' College for the Con-stantinople Church.*

* To be continued

PROPOSED ILLUSTRATIONS OF WREN'S FIRST DESIGN FOR ST. PAUL'S

I REJOICE in learning from Mr. Rogers, that the drawings for the work I suggested are already pre-pared; and it is, therefore, the more to be expected, that the profession will bestir itself in hringing about the desired issue. All-sufficient as the present cathe-dral is for the justification of Wren's high fame, it is yet, without a knowledge of circumstances, an imper-feet witness; being, after all, no more than a com-promise between his genus and the compulsory medaling of those who evforced him to preserve the h lo cathedral plan, in the hopes of restored Catholicism.

Latholicism. It may be observed, that the hypereritical objec-tions taken to the building as erected, will not be found applicable to his "favourite model," which, for originality of conception, no less than for artistic judgment, is, perhaps, without an equal in modern design

The proposed work, in these days of lithography, need not he very expensive. A clever artist would be required for the anticipated effect of the views; hut the clevations and sections might be in outline; and there would be no occasion for minute detail. If W. Rogress could but detain the view of the section of the sect and there would be no occasion for minute detail. If Mr. Rogers could but obtain the estimated cost of such a publication, the *Builder* would soon show, by the response to an appeal for subscribers, whether the publication might be safely ventured on; and, hoping the "great ones" of the profession will lead the thousand little ones to follow in their wake towards a consummation so devoutly to be wished, I wait to forward my real name, as one of the least lovers, though not the least loving of the great and good Sir Christophev. EX-ARCHITECT, Christopher.

PUBLIC OFFICES COMPETITION.

If there was ever a competition in which justice should prevail over all other considerations it is the present. Marvellous reports are abroad as to the money expended by competitors, hut what is that com-pared with the thought—the labour of minds that have worked on the architectural problems of the rece? vear P

Sir B. Hall has no simple duty before bim, and one of no slight importance: for the result, architects will watch with fear and hope. Observe on what a thread that result hangs: as it is not possible to estimate exarth result langes ins it is not possible to estimate da-actly any man's favour of or prejudice against a parti-cular style, so will it be difficult or not possible to nominate judges who shall be *absolutely impartial and disinterested* in their verdict: a slight excess of

and disinferential in their verdict : a slight excess of the Gothie element among them, and a majority of the designs selected as the best are Gothie, and the same with regard to the Classic. Names of men known and honoured appeared as judges in the late Constantinople Church competition, but bearing in mind the "instructions," can it be said that the result has hene wholly satisfactory ? The selec-tion of the judges is a case of extreme difficulty : is here out yet, time, and is it not an occasion worthy to have

tonot the judges is a case of extreme diminuity: is intere-on yet time, and is it not an occasion worthy to have the suggestions and opinions, on the point, of those whose interests are deeply involved—the profession? Despite the opinion of those who insist that per-spective drawings are absolutely indispensable for the proper understanding of a urebitectural design, itseems to be little more, little less, than a mocey question. There are artists who can make a plaiu stone wall; and the connection, be he professional or amateur (in the the competitor, be he professional or anateur (in the present case there are more than one of the latter), who can seenre the said artist to tint his drawings, does so because he knows he then bas a better chance of zaining a prize than he who could not afford an unlimited sum to purchase an *effect*, and to have the plain stoue wall look like — anything but a plain one wall.

Besides, who is to say how far a perspective is cooked "-to look as it should, not as it will? Such things are done. And there are few even profes-sional architects who can woolly resist the favourable impression produced by views tinted as we have lately seen them; for example, the Liverpool Library and Constantinople Church.

Why allow bim wbo merely spends more mone

Why allow bim who merely spends more money in the cause this fital advantage over those who have worked day and night, night and day, with love, not willing to long the honour and fame they seek? What honourable objection can there be to with-drawing the perspectives until after the award, which then with justice on the part of the judges must be fair, and whom such a course would most effectually preserve from committing even unconsciously a great wrong. Keep hack the views for the present. Attach the names of the competitors, and let all that is done be open to the world. Does not the motto principle itself assume the influence of mame, an influence that it has no power to render nugatory, for who cannot at be open to the world. Does not the motto principle itself assume the influence of *name*, an influence that it has no power to render nugatory, for who cannot af aglance discover the designs of "Emiment Architects," to say nothing of private views and dinners before

the designs were sent in ? Away with the motto

On dit, that all designs prepared in defiance of the instructions will be at once remarked and returned to their owners—would it not be well to have them ex-hibited—of course, as excluded from the competition P If all that is told is to be believed, and the Chief Commissioner does not interly ignore the instructions and plan of the site issued by himself, many of the designs received will go to the "excluded from the competition" screen. The site is somewhat irregular, but presented little difficulty to those who at once mado it restangular, not fargetting to take their dimensions on the longer sides. Some have projected the official residence into the park far heyond the line: others, competing for one office ouly, leave no space on which the other could by any possibility be erected. It will be too late to point out these things after the design. mockery ! On dit, that all designs prepared in defiance of the decision

decision. When the day comes where will these designs be? Where should they be but on the "excluded from the competition" screens? But is the on dit a pleasant dream—a mytb? for it is also said, that all the drawings sent will be received, and, that deviations from the instructions will not exclude from the competition. If so, alsa! for out-line and LIGHT BROWN INDIAN INE.

IMPROVEMENT OF PAINT IN THE METROPOLIS.

The other day the City authorities discovered a pipe from the gas-works near Vanxhall-bridge dis-charging their foul refuse into the middle of the Thanes--thus giving forth, in that neighbourbood, a volume of salphuretted hydrogen, enough to account for the blackness of all the painted fronts from Yanxhall-hridge towards Belgravia which has this winter aboven itself so fully. The use of supharic acid, both in the reduction of the blue into white lead, and the universal use of it in clearing lussed oil, will account for the realiness with which this destructive element combines with the paint. May I, therefore, beg the favour of your urging the manufacturer to use a parer sectic acid, THE other day the City authorities

urging the manufacturer to use a purer acetic acid, and which may now be had free from either sulphuric or nitrie acid, as also to use Mr. Binks's process to or mire and, as into to use and, binas s process or purify the oil. This plan was fully described last autumn at the Society of Aris; because lead properly prepared, and mixed with pure linead oil, will resist even this securge. DATID G. LAING.

THE MIDDLE TEMPLE FOUNTAIN

THE MIDDLE TEMPLE FOUNTAIN. WHETHER the new library in the Middle Temple should he built on the site of the fountaiu or not, may be fitly discussed in the Builder: it is however a sub-ject for the exercise of a mature, refued, and unpre-judiced judgment, and should not be approached with a temper in which personal detraction and vitnperation are prominent, and art is made the vehicle for dis-paragement and abuse. Not one of your readers, the architect, engineer, operative, or artist, will read with-out pain the magnified terms of disrespect used by Mr. Paternoster against a body of mee, eminent for respectability and learning, who are now engaged in the nohle work of promoting and enshrining know-ledge; and that goulemen who has made so unfavour-able a d&but in a journal devoted to the promotion of art and science, should be cautioned that he obtrudes are and service, should be calmbdred that the overlates garb of art, and who eschew at once the hitter garnish of calumny, however adroitly it my be commised and concealed in the mess which be profires to them. PATER ABRAILAM.

STREET RAILWAYS.

Mr. T. W. RAMMELL, C.E. in a pamphlet just published hy Stanford, of Charing-cross, suggests new plan for Street Railways." · A

new plon for Street Railways." He proposes that the railways shall run through the streets on a level with the first floors of the honses, and simply consist of girder-rails and an atmo-spheric tube between them, the three constituents of the line heing firmly framed together and supported at a height of 14 fect (or more if the gradients require it), above the street surface by a similar row of cast-iron coloury alexade assemble shoust him of the head street anove the street surface by a smaller ow of east-non columns placed generally along the lue of the kerk-stone of the foot-pavements, the columns to be secured to cylinders of cest non sunk deep into the ground and solidly imbedded in concrete. The gauge be would have to be only of a standard width of 8 feet 9, and the members. have to be only of a standard width of 3 feet 9, and the carriages (for passingers only) of the lightest pos-sible description, much uearer to the level of the rails than at present, and constructed with special reference to the avoidance of noise: each carriage to hold from 30 to 60 persons. The lines would be accessible at frequent stations either built expressly or formed out of houses already existing, with stair-eases leading to waiting-rooms on the first floor, level with and one to the noisform with and open to the platform.

The advantages of his scheme Mr. Rammell thus sums up : it is simple and compact, yet strong; will occupy little lateral space and not interrupt the street traffic nor the communication between street and pave-ent the interrupt methods with a strengt of the strengt strengt of the strengt of the strengt of the strengt of the strengt strengt of the strengt of the strengt of the strengt of the strengt strengt of the strengt of the strengt of the strengt of the strengt strengt of the strengt of the strengt of the strengt of the strengt strengt of the strengt of the strengt of the strengt of the strengt strengt of the strengt of the strengt of the strengt of the strengt strengt of the strengt of the strengt of the strengt of the strengt strengt of the strengt of the strengt of the strengt of the strengt strengt of the strengt of the strengt of the strengt of the strengt strengt of the strengt of t traffic nor the communication between street and pave-ment, the intercolumniations being wide and each column of small diameter: neither light nor air would be obstructed: the appearance would not be inelegant: the whole might be so readily creeted or taken down as to be practically moveable, and hence easily niterable according to circumstances, neither erection nor altoration interfering with the street traffic : lastly, its cost would not be excessive. The projector also proposes certain modifications or adaptations of the atmospheric principle of pro-pulsion, to insure certainty and ecousy of working.

pulsion, to insure certainty and economy of working, into which we have not room to enter.

THE DWELLINGS OF THE LONDON POOR.

THE DWELLIARS OF THE LOADON POOR. S18,—The recent report made by Dr. Letheby to the City Commissioners of Sewers, was much called for, and will do good. It presents a frightful picture, and will doublies, startle many who have not already given attention to the subject. It has been referred to very extensively by the daily press, at which, of comres, as one wishing the cwils set forth should be remedied, I repice greatly; nevertheless, it have arcsecture up, and much diskerter many to fail shown be retrieved in Foote particular in sections in does exappende use, and must dishearten many, to find the press have taken up this report as if neither you nor any other person had written on the subject before. They speak as if these fillely and frightful facts were now made known for the first time: they ignore the now make known for the first finds : they ignore the circumstance that four or five years ago you dengged into the light of day the very places, Plnmtree-court, Rose-alley, &c. &c. which Dr. Letheby now very pro-perly again thrings forward, and described minutely the miserable condition of their occupants, and the the misorable condition of their occupants, and the unavoidable consequences of foreing mue and women to herd in such dens. Now that public attentiou is again awakened to the magnitude of the evil, and the vital necessity for change, it is to be hoped that something will be done. Do not relax in your endea-yours AN ENGINEER vours.

INSTITUTION OF CIVIL ENGINEERS.

On the 7th isst. Mr. G. P. Bidder, Vice-Presi-dent, in the chair, the paper read was "On the Lay-ing of the Permanent Way of the Bordeaux and Bayonne Railway," by Mr. F. R. Conder. A detailed description was given of the construction of the perdescription was given of the construction of the per-manent way, na well as of the sories of operations liat was necessary for its completion. It appeared that although called "Yoie Branch," the principle adopted was in no way identical with that of the Great Western and other broad-guage English railways; the only resemblance being the use of a bridge rail, and the longitudinal position of the short picces of timber that supported the rails, which were little more than half the dimensions of those used on Facility railways. English railways

On the Great Western lines the stability of the way On the Great Western has the stability of the way was effected by the housing of the transoms into the longithdinals, and by the holts which were passed through the latter, and were firally secured to the former; and the continuity of the longitudinal tim-bers was secured by a sort of dowle called a "joint plate," which had been found in practice to unite the solar of the index with a decree of solidity their plate," which had been found in practice to unife the ends of the timbers with a degree of solidity that could hardly have been expected, but which was an essential condition in the system. On this Bourdeaux and Bayonne line, unfortunately, all these precantions, which a long experience in England had proved to be necessary, were omitted. The short longitudinal tim-bers were merely laid call to end on the transoms, the rails were laid on and rivetted to the joint-plates, and the only tic hetween the outer and the inner rail was effected by the bolts, which passed vertically through the rail, the longitudinal timber, and the transom. transom

ST. MARTIN'S DISTRICT SCHOOL OF ART

ST. MARTIN'S DISFRICT SCHOOL OF ART. A SORREE, arranged entirely among the students of this school, was held on the 3rd instant, the Rev. W. G. Humphrey, of St. Martin's, in the chair. A collection of paintings, draw-ings, &c. contributed by Messrs. Ruskin, Bur-chett, Collier, Casey, and by some of the students themselves, covered the walls. The meeting was addressed by Mr. Cruikshank, who deeply regretted that be had not had such opportunities of early art study as could be now obtained. Mr. Ruskin next delivered a lengthened address, in which is mainly dwelt upon that power of eve and mind which the deriver a regiment anness, in which the harmy dwelt upon that power of eye and mind which the practice of drawing give; and then on the chemistry of painting; in the course of his remarks on which he touched ou doctines, rather more postjeal than orthodox, ia which phosphorus, subphur, nud carbon, and even the gas we burn, were regarded as metals, which some of them, after all, may eventually turu out to be. In respect to the air, however, of which

be also spoke, his doctrine was both poetical and true. The air be regarded as the soul of everything, which required to be "hurnt" into themerique metals or ther combustibles could ic general be made of nuclu sei au art. Man himself lived more on this soul of the earth than ou its body. The air of which he spoke, of course, was oxygen—the vital air and the supporter of all "burning." It was by this air, be observed, that many "burning." It was by this ar, be observed, that many art underlinks, such as colours, were prepared from the metals and other comhustible bodies. Perhaps Mr. Ruskin himself may not be aware that some of the ancient chymisis were not only well acquainted with ancient chymnis were uot only well acquances win oxygen (notwichstanding assertions to the contrary), but called it the soul of the world, and hydrogen the spirit. The meeting was subsequently addressed by Mr. Borchett, the head-master of the Normal school. The source was enlivened by music as well as cloquence, and passed off with spirit and éclat.

SOUND THROUGH WALLS AND FLOORS.*

Will you kindly allow me space for one or two observations on that part of the leading article in your last number which has reference to the trans-

observations on that part of the leading article in your last number which has reference to the trans-mission of sound through *flows*. Floors formed with troi joists and concrete, like those formed with brick arches, transmit sound by contact, *under certain circumstances*; but the cir-cumstances under which they do so form quite the exception to the general application of this principle of construction in dwelling-bonses: when a finished surface of cement, or other solid natorial, islaid down upon the concrete, and the structure celled underneath, so that the whole forms a solid, homogeneous mass, sound is undoubtedly freely transmitted; but, instead of this being the general castom, in forty-nine cases out of every fifty, the floors of rooms constructed on this principle are finished with a *boarded* surface, leaving a hollow space between the flooring-board and the top of the somerete; and, hesides this, in the majority of cases of superior rooms, a second hollow space is obtained by attaching a *counter* celling below, for which the structure affords ready facilities; the furth-r advantage of this latter mode of construction heing the there is no contact between the riou and the laster, and consequently no risk of the celling the mathematical structure. the plaster, and consequently uo risk of the ceiling being discoloured.

The floors of the new house at Balmoral are formed

The floors of the *new* house at Balmoral are formed in this maner, and for all practical purposes the con-struction is sound proof. It is, in fact, like a brick wall battened on both sides. As illustrative of the difficulty of preventing the transmission of sound through a *solid* body, however thick, I may mention the fact that in some of the old prisons in France, where the walls were nearly 15 feed *klick*, the prisoners found means of communicating with one another through them. JANNES BARRETT.

JAMES BARRETT,

SCENERY, MUSIC, &c.

SCENERY, MUSIC, &c. Italian Opera-House, Lyceum.—Short as the time has been since the Lyceum was closed on its dramatic manager, Mr. Gye has contrived to re-decorate the whole of the interior in a quiet, tasteful manner, and to introduce various improvements before the curtain, tending to the confort of the andience—a point very much neglected, by the way, in most of our theatres. I Purilain was the optern with which the season was commenced; and never did Grisi sing and act, even in the palmiest days, with more admirable effect. Mr. Beverley has paiuted a seene of hechives and flowers, for a new divertissement, Les Abeilles, which is pretty and quaint. Hagmarket Theatre.—The only estrayaganza

flowers, for a new divertissment, Les Abeilles, which is pretty and quaint. Haymarket Theatre. — The only extravaganca brought by Easter will be found at this house, under the earc of Mr. Buckstone. It is written by Mr. Talford—called "Atalanta; or, The Three Golden Apples," and gives occasion, as all our renders will, see at once, for some Greekisb scenery, in the pre-paration of which "The Winter's Tale" at the Princess's has not been overlooked. In the Royal Drawing-room, for the sake of lightness, prohably, the type is departed from, and sight coupled Alham . Irrite columns, with an Order of Caryatides above, are substituted. In the last scene, Doric temples, in . fairy colours, wonderful palm.trees, and living stames, form what Mr. Talfourd might perhaps have the hold-ness to call a palm-and-stonian coalition, while two delight the house, and do houour to Mr. Callott. —There is some truth'ul scenery in Mr. Bayle Bernard's exciting drama, "A Life's Trial," which Temby," the "George Inn Yard, Southwark," and a view in the Boroogh. A villa on Richmond-hill, with the Thames below, is charmingly tooed, but is marred by the erroneous perspective in the practicable marred by the erroneous perspective in the practicable

Three several correspondents inform us that they have succeeded in producing a material whereby all sound will be deadened. When we know something more about the inventious we may speak of them,

art of the building—the porch, the lines of which contradict all the rest of the structure. We mention bis the more particularly, as it is a mistake often nade on the stage. The piece itself is very interestng, and is contradicting the critics of the first night, who pernonneed it a failure.

ng, and is contradicting the critics of the first light, who pronounced it a failure. Barford's Panorama. — Assisted by Mr. Scloss, Mr. Burford has painted a very excellent picture of Moscow, with its Kremlin, 500 churches, gardens, and rivers. The foreground towards the north is neappied by the procession accompanying the Emperor into the fortress-palae. On the plateau formed by the highest ground, are seen the three Cathedrals of the Assumption, the Annunciation, and St. Michael, two of the vast imperial palaces, and the singular towar of St. John, with the far-famed great bell of Moscow at its base; also the treasury, arecal, two large monasteries, and several of the other blurches of the Kremlin; together with a long line of the walls, two of the principal gates, and many of the towers and spires hy which they are adorned. It is admirably painted, and gives a striking notion of the amount of wealth which has been lavished by a fuspoitie soverieg, on this, the heart of all Russia. Many of the buildings are characterised by vast size, a profinsion of domes, and a barbarie profusion of ornament.

Miscellanea.

MR. THACKERAY AND SCOTTISH ART. — At the dinner given to this gentlensa in Editionsh the dinner given to this gentlensa in Editionship the solved hav, Wr. Thackey proposed "The File Arts and the Royal Scottish Academy." In the course of his speech he said, "I assure you that I have been a constant visitor at the building with the Dorie pillars not far off, for I have spent no less than 1s. 6d. for various catalogues, and I have come away with the strong idea that the battle between the lion and unicoru is not altogether decided, and that I do not know what colours ought to have precedence on the pallet, and whether it should be those of England or of Scotland. I am perfectly certain of this, however, that the President of our Acade.ay could not paint, and world own himself that he could not paint, so good a portrait as the President of yours. I am perfectly certain that there is certain Francis Grani in London who could paint a picture as well as any Scotchman out of London, or any man in almost any other country. I know that one of our chief painters —one of our nuturalistic school—comes to draw his inspiration from Scotland, and that he finds his most wohle rocks, his most beautiful lakes, his most splendid deer, and his most beautiful lakes, his most splendid deer, and his most beautiful lakes, bit most southant a heast year found his autumn leaves, and his beautiful grass, and his glorions susset, worthy of Giorgione himself, by the banks of the Tay. I know which creates this immone attachment, but I begin, it ashney on, to feel it myself. What vitality is it in the air which causes ally on Scotchmen to have such and has taken away from it a little ark of her own, carrying with her many of your anionsl. I cannot say which creates this inmone attachment, but I begin, it assure you, to feel it myself. What vitality is it in the air which causes ally you Scotchmen to have such an intense nationality? Not that your artists eannot go to other places than to Scotland. Y resterday, in did John Bunyan, that Harve

that couple were going to do next." ARCHTECTURAL INSTITUTE OF SCOTLAND. — At the last meeting of the Architectural Institute of Scotland, held in their hall in George-street, Edinburgh, Mr. Smith, architect, in the chair, Mr. D. Cousin read the second part of a paper on "Jeffrey's Theory of the Beautiful." Beauty he considered under three heads moral, intellectual, and material. Moral beauty coulaisted in truth and goodness, and our sense of it arose from the relations springing out of those elements. Intellectual and material beauty arose from the elements of adeptation and order, including proportion, mumber, symmetry, &e. and our sense of it from the irelation of these qualities.

SANITARY CONDITION OF ST. LUKE'S, CHELSEA. —A " general report upon the sanitary cundition of the parish of St. Luke, Chelsea, during the year 1856, by A. W. Barclay, M. D. Medical Officer of Health for Chelsea," has been printed by urder of the Vestry. The results are, on the whole, favourable, notwithstanding the had state in which some of the more crowled districts of this suburban parish still abusist. The rate of mortality for all Chelsea appears to be to that of all London usarly as under 23 is to over 24. Nearly 4,000 hones were inspected, 3,000 by regular visitation by the inspector of nuisances: 1,191 sanitary improvements have been reported ou as finished, and others as in progress. The small streets and courts bordering un Leader-street, and extending down th Bond-street and College-place, west of the Marthorough-road, have an uncaviable pre-eminence in the midst of many had district, and give the largest ratio of mortality from epidemic causes. The saverage of eleven inhabilitants each, or more than three families. In Little College-street, ane house of tweet families. In Little College-street, an endurby, however, has done much for this street. Orverrowding scems to be one of the gratest evils in Chelsea, this pat to the metropolis containing an immeuse number of small houses subdivided amongst poor peop'e.

GNOLL COLLECE, VALE OF NEATH.—A scheme for the establishment of a scientific college for 200 students, from sixteen to eighteen years of age, at Gnoll Castle, in South Weles, is in progress. The course of instruction is to extend over three years, and to include mathematics, mechanics, physics, chemistry, natural and bunnan bistory, and design; the final courses comprising trigonometrical surveying, mechanical art, steam-power, and projectiles, traction, &c.; sanitary science, muing and metallic manufactures, commerce, letters, &c.; and construction and decoration. Every student is to pass through the introductory courses, while the intermediate and final courses will be selected for the students according to their special pursuits. The fees for each student, board and residence inclusive, will be two hundred gunces a year. The situation for such a college is advantagoous, both from its sochision and its healthfuless, as well as from its locality, surrounded by various industrial works, particelarly in metals and minerals, quarries, limestone, &c., and connected, at the same time, with the manufacturing districts, and with the metropolis, by railway, a stution of the South Wales line adjoining the park of Guoll Castle. Much, however, will depend on the way in which the scheme is carried out, as respects professors, and so forth. From the prospectus it does not appear that the teachers bave yet been selected or appointed ; nor are the president, wardens, and secretary, who are to control the establishment, mured in it. From what we huok, however, well.

CONFLETION OF COVENTRY SEWFRAGE: THEAT TO WORKNEN, DEVARING 100 workmen of Messis. Tomilinson, HI, Thearly 100 workmen of Messis. Tomilinson, HI, Thur, and Harpur (Devby), with some friends, members of the Town Council, and officers of the Local Board of Health, latdy eclebrated the completion of the contract for the sewerage of Coventry at a dinner in St. Mary's Hall, Coventry. Mr. S. Harpur presided. During the excendion of the contract, the contractors have laid in hranch drains for about 1,000 houses at the private expense of nearly 400 owners. These, together with the contract, euhrace a total length of 26,000 yards, or about 15 miles, of sewers and drains, consisting of pipes of 3, 5, 6, and 9 inches in diameter, and brick sewers varying from 12 inches in diameter to 3 feet 6 inches high and 2 feet 6 inches wide, and are placed in the ground at dupths varying hetween 3 and 21 feet. In the line of the sewers nearly 200 chambers have been built to facilitate iuspection, flushing, and cleansing when necesary, and numerous street guilies have also been constructed. The cost of the works was determined by a schedule of prices rauging from 4s. to 25s. per yard.

THE HON TRADE.—At the quarterly meetings at Walsall, Wolverhampton, Birmingham, and Dudley, the quotations of last quarter have been uplield, and the accounts. were much more promptly met than was expected, from the great difficulty of obtaining advances except at ruinous rates of interest. It was stated that some makers had reduced bars 10e, per ton, but the prices of last quarter were confirmed. The demand for pig-iron is said to he considerable, prices averaging from 4/, to 4/, 10s.; for soperior qualities, 52. Notwithstanding the great number of furances and other works in operation, many more are springing up, the most important of which are those now in course of creetion by Lord Ward in the neighbourhood of Dudley. These are capable of employing an immense number of hands.

THE RIVER THAMES.—A blue-book has appeared, containing the cupy of a report made to the First Commissioner of Works by Commander Burstal, R.N. on the state of the river Thames between Pathey and Rotherithk, dated the 27th January, 1857. The Commander gives a scientific detail of the changes which have taken place, including the great slication in the low-water surface of the Thames above Londonhridge, doubtless consequent on the removal of the eld bridge in 1832. From this report it appears that the bed of the river has deepened considerably since 1823, the average deepening at each station hetween Puthey and London-bridge varying from 2 feet to 9 feet 6 inches. The greatest change noticeable in the river bed among the bridges is at Blackfriars and Westminster, and a strong disposition to the same is evidenced at Sunthwark. From two cross sections made on the site of the old London-bridge, it appears that the whole of its piers and foundations have heen menuved to a level of 29 feet below Trinity datum, in a line with the centre areb, which corresponds with the depths of the present bridge, and as far as Allballows'-wharf above it, and 2 feet below Tri. From these facts, and from the solid nature of the material of which the old foundations are composed, it appears evident that the nutual scour of the river has been arrested at and near this point, and, consequently, the safety of the present structure preserved. Yet he cobs stream is so strong in the Pool as to cause a small and sufficient scour. The bulk of the volume is filled with a series of transverse sections. SEWERAGE OF PARIS.—The Prefeet of the Seine has just preseated a report to the muncel sever, to be formed in such a wanner as to carry off the waters of

SEWERAGE OF PARIS.—The Prefect of the Seme has just presented a report to the municipal council of Paris on the subject of a large tunnel sever, to he formed in usuch a manner as to carry off the water which in rainy seasons ionndates some quarters of Poris, particularly the Fanbourg Montmartre, Rue de Provence, Chaussée d'Adnin, and neighbourhood. The document states that the surveys made establish that the very slight fall of the river at Paris, where in fact the bed of the Scine is nearly on a level, renders it impossible to prevent the waters, when high, from flowing up into the sewers. The prefect conceived the idea of turning to account the bend in the river, which, about Asnicrs, approached near enough to Poris to serve as an outlet for the sewers of the quarters on the right bank about two mètres lower than the grand sewer which runs into the Scine at Unald. The report then goes on to describe how this new sewer is to be formed. The expense is estimated at 3.450,0000. Within Paris it would form a tunnel, and beyond the fortifications a covered entting. The sewer is to be to mètres wide, and high enough for boats to pass. One of the causeways at the side will have rails laid down for waggons, by which hereafter a general system of carrying off the work, and the prefect concludes his report by proposing a credit of 1,200,0006. for the first year's operation.

LUGB. SALOPIAN SOCIETY FOR IMPROVING CONDITION OF INDUSTRIAL CLASSES.—The principal objects which the promoters of this society intend to accomplish are habits of eleanliness, by the erection of public baths and washhouses on improved plans, and the construction of model cottages for families. It is intended to establish branch societies in Staffordshire and the adjoining counties, and prospectness have been issued by the directors. The liability of the shareholders is limited by royal charter.

THE GIBBON CARVINGS ON THE ALTAR-SCREEN OF ST. JAME'S CHURCH, PICCADILLY-LEARING that IA: Lock, of Leanington, had written to you, stating himself to have been the excentant of the restoration of these beautiful carvings—a work that had hen wrongly attributed, in the paper on St. Jame's Church supplied by me and printed in your number of the 14th of February, to two foreigners, I repaired to the gentleman on whose information I had recorded the incident. This gentleman was at the period referred to connected with the manageof the church; and he states, that during the progress of the general works of repair then going on in the church (ander the direction of Mr. Mayhew), he, day after day, saw the usen engaged on the carvings, and be "took them, from their appearame, to he foreigners." However, having easually heard that on some part of the screen there was an inscription urvisible to general observation—recording the eircumstance, I, with the assistance of one of the headles, made a starch, and, at length, discovered it, written on the inside of the pelicau's nest, and it runs thus:—" This carving was restored with 850 pieces, by G. Lock and G. Kerl, 1846." It will he as well to notice this fact, when you can spare a corner so to do, and thus give Mr. Lock the credit due to him, of having executed, in the instance referred to, a vary meritorious work.—FREDERICK CRANE, Churchwardem of the Parish of St. James, Westminster.

BUILDERS' COMPETITION .- The Colchester Burial BUTLDERS' COMPETTION.—The Colchester Burial Board, hearing, doubtless, that the huilding trades are not at this moment very husy in the great metropolis and its neighhornhood, have kindly and compassion-ately given them something to do, as will be seen from the following advartisement : — "To Builders: The Colchester Burial Board are about to enter into a constract for the erection of the assistant's cottage upon the burial-ground, in the Mersen-road, for a sum of expeciding 1201. All nersons willing to undertake not exceeding 120/. All persons willing to undertake the erection of the same are requested to send proper the erection of the same are requested to send proper drawings, plans, sections, and specifications, together with a tender for the same, to me, the undersigned," &c. &c. The drawings, plans, sections, specificatious, and tenders "to be without real name, but distin-guished by some private mark, with the name of the author in an accompanying sealed envelope, referring to the private mark, which will not be opened until after the selection is made: it will not be incumbent on the Board to accept the lowest tender." The architeets, whom the builders will of course consult as to the drawings, plans, sections, and <u>specifications</u>, architects, whom the builders will of course consult as to the drawings, plans, sections, and specifications, will thus come also in, at least indirectly, for a share of the patronage of the Colchester Bunial Board. Perhaps, too, by a little working on their kindly feel-ings, the Burial Board might even he induced to provide the successful competitor with a corner of their premises in which the could lie down comfortably and "take his rest" at the close of his labours.

and "take his rest" at the close of his labours. GAS.—The Imperial Gas Company of London has just held its half-yearly meeting. The profit from gas-rent for the half-year was 10,0007, over the half-year corresponding to 1835, and 10 per cent. was divided.——A meeting took place at Brentford last week, to hear a letter read from the Gas Company, containing proposals to reduce the price of gas from Gs. per 1,000 feet (preseot price), to 5s. fid. per 1,000, from Midsummer next. It was thought desirable to call a public meeting of the gas cousumers of the town, as early as possible, in order that the matter might he hrough helore them. Covyrer. ROASTING AT HOME.—The reason why

COFFEE-ROASTING AT HOME .- The reason COFFEE-ROASTING AT HOME.—The reason why the flavoor of ceffice is so superior in France to that generally put up with in England does not proceed from the excessive adultration in practice here so much as from the system adopted in preparing the infusion. The sceret is, that the coffee-berry is only rogasted immediately before being required for use, and in small quantities at a time; while here, it is kept in accords here, sometimes as lown as a forthight affer Touset innertimity before using including the day and in small quantities at time; while here, it is kept in porous hags, sometimes as long as a fortnight after heing roasted. Amongst the many scientific men and mechanical minds who peruse your valuable serial, some one may, I should think, he found who could invent a roasting-appartus that might be affixed to the common roasting-jack used in cooking. Very many presoes whose means are small possess a jack; for they are now comparatively inexpensive, and a necessary adjunct to the comforts of a home. The cost of such a coffee-roaster need be but trilling, while the benefit would be great to the working man of senty income, who woold thus he able to get a cup of coffee with all the true flavour of the herry—a matter very difficult, if not impossible, in the present age of adulteration.—CONYMEN.

The East of Cathness's STONE CUTTER.—A patent, dated 26th Angust last, has been taken out by the Earl of Caithness, for the machine already noticed in our columns. The apparatus is described as con-sisting of a set of vertical parallel hars of metal, ar-ranged in suitable guides in substantial framing, and furnished at their lower ends with steel or hardened metal enting or reducing edges. These hars are actuated by a crank movement, the rotary action of which, or other driving power, elevates them to a cer-tain predetermined height, when they are allowed to drop upon the face of the stone or other substance drop upon the lace of the stone of other stubstates under treatment, and thus chip or cut away the mate-rial to the required extent. As the cutting bars are thus caused to operate, the stone heing dressed is caused to traverse at a slow rate hencath them, and hence a fair plane surface is produced. The fixed framing of the machine resembles that of an ordinary Training of the machine resembles that of an ordinary engineer's pluning machine. A cam shaft operates upon the curter hars, and is either cast with its range of cams solid upon it, one cam for each cutter bar, or with the cams in loose pieces, strang on to the shaft. The cams being disposed heliacally upon the shaft, raise up and let fail the whole of the opera-ting entire hars in regular succession in line at right angles with the direction of traverse of the stone beneath them. The stone is supported upon bearing rollers or upon a carriage beneath, and it is moved forward a short distance after each revolution of the 'arm shaft, so as continually to present a fresh no-dressed portion to the cutting action. The same machinery may be employed for hreating masses of stone, as well as for cutting or reducing vegetable matter, such as zorse for foreing cattle. In the *En-gineer* of the 10th instant, there are two engravings showing the construction of this machine.

STRIKE AND INTIMIDATION .- At the Westminster Police Court, on the 8th inst. three labourers who had beeo employed hy Mr. Freake, at Prince's-gate and Exhibition-road, but had turned out, being dissatisfied with the amount of their wages (3s. a-day), and demanding 4d. more, were charged with using threatenand

With the amount of their wards (33, a-day), and demonding 4d, more, were charged with using threaten-ing and intimidating language towards other labourers who had agreed with Mr. Preake for the warges refused by the defendants. After hearing the evidence, the magnification and the second second second second announced that if there was any further interference with the men employed by Mr. Frenke, he would impose the full penalty on the offenders. WENTLATING APPARATUS.—A tract on 'Ventila-tion and its necessity to Health,'' is being circulated by Messrs. Boyd and Chapman, of Welbeck-street, London, with the view of recommending Boyd's patent for improvements io the construction of smoke and air-flues, hut containing some very proper stric-tures on the still prevalent acgleet of ventilation in inhabited apartments, even where there is so much additional used for it as in houses lighted at night by gas. The apparatus recommended for the ventilation The apparatus recommended for the ventilation oms consists of Boyd's pitent bricks and fluegas. of rooms con of rooms consists of boyd's part if the state of plates, smoke-fine ventilating-bricks and flue-plates, the writer of the tract swys. "This invention consists in the construction of the several smoke-flues of a grate. Of the ventual set where a mess-party, the writer of the tract says, "This invention cousists in the construction of the several smoke-flues of a house in such manner that, in place of the msual solid 'withes,' ventilating flues shall be formed (commenc-ing at or about the ceiling line) side by side with, and forming hollow ventilating partitions hetween, the several smoke-flues. These partitions to be cen-structed of hollow-bricks of cost-iron had one upon another, or of two tiers of plates of the same metal, huilt up side by side in huiding the chimney-stack. These bricks and plates being good conductors of heat, will impart warmin from the smoke-flue of each room to its ventilating-flue adjoining." The smoke-flue ventilator has a division-plate in the ventilator-hox for checking return smoke, and preventing it entering the room, as from ordinary chimney-valves. The fre-grate is "constructed to receive a continuons supply of fresh external air, and to discharge it into the

the room, as from ordinary chimney-valves. The fire-grate is "constructed to receive a continuous supply of fresh external air, and to discharge it into the hirds surfaces" at the back. BUILDING OPERATIONS IN NOTITIOHAM.—I am informed by a correspondent to the Midland Counties that the art of huilding, as now practized, has attained a very bigh standard in Nottingham. The builders in that down must be possessed of a great amount of scientific knowledge as regards the "strength of mate-rials." for they economise to a wooderful extent in both scientific knowledge as regards the "strength of mate-rials," for they economise to a wooderful extent in both quantity and quality of the same, and labour of every description that can hy any means be dispensed with is most corefully avoided. Young professional men whose experience in construction has been limited, would be much henefitted by studying for a time in that locality: they would ascertain to a micety the least possible amount of timber that could be put into a building, and find that the tables already published are only erroneous and extraversant. For instance, are quite erroneous and extravagant: for instance, these authorities would give the strength of a through joist as 7 in. by 3 in. a scanting of 7 in. by 1_4 in. is deemed quite sufficient, and, indeed, rather more than necessary, if the material used be surpting heiter than some rather more than necessary, if the maternal used be anything hetter thun spruce. The same care is shown, in hrickwork. All outer walls of ordinary cottages, except the front, are of half brick, and the inner and division walls of brick on edge. This is a good arrange-ment in many respects, some of which are, the inmates have the advantage of hearing everything that passes in their neighbours' houses, as well as the opportunity of quarrellarg with and blackguarding each other with-out heing subject to the interference of the police-n, amount of convenience which architers in some

an amount of convenience which architects in some the kingdom I am afraid have rather over looked .- JACK-PLANE. A CANADIAN CONTRACTOR .- Amongst the seventy

A CANADIAN CONTRAFOR.—Amongst indiseventy orighty passengers killed by the late dreadful railway accident at Hamilton, in Canada, was Sanuel Zimmer-mann, the great Canadiau railway contractor. A Roches-ter paper says. — "I le was horu in Huntingdon, co. mann, the great Canadian rail way constructor. A Rochest ter paper says, — "I le was hor in Huntingdou, co Penn. in the year 1815, and in 1842 removed to Canady having no capital lunt energy, farsightedness, a gray horse, and a buggy. He was then unit twenty-sever years of age. His first nudertaking was the construc-tion of four locks and an aquendue to the W-dhan dollars. Subsequently he built 120 miles of the Great Western Railway, and Peterbory', the Your railroad-hridge at Mirgara Falls, and of the great railroad-hridge at Mirgara Falls, and Ottor or Tilwy in Canad. Mr. Zimmernann orginatel and had just a new road to the West, nearly par-Idle with the Great Western, to the soulb of that line, and on a

[April 18, 1857.

shorter and hetter route. This work was to cost some ten millions of dollars, Some 18,000 acres of land in different parts of Canada, helonged to him. He estimated his property to he worth three millions of dollars."

[ADVERTISEMENT.] MESSRS. CLARK AND CO. 15, Gate-street, Lincoln's-inn-fields. GENTLEMEN, — After eight years' trial of your Patent Revolving Shutters, erected here, I can safely procounce them most effectual io their action, and they have given me the utmost satisfaction. I am, Geotlemen, yours truly, Geo. Downe. 155, Leadenhall-street, August 7th, 1856. TENDERS ਜ਼

THE BUILDER.

Builder. The

VOL. XV.-No. 742.

FTER we had laid bare, systematically and constantly, for a year or more, the frightful coudition of varions parts of this proud, populons, wealtby, overgrown London, the home of nearly three millions of people, the resort of the intellect of the world, -after we had shown

dnring many months the depths of the shadows lying here, there, and everywhere at the back of the hright thoroughfares where fashion disports itself, the festers and malignant sores with which the body of society is spotted, though they are earefully hidden away,-we

were told that enough had been said, that it was unnecessary to make the evil further nown, and that improvement would surely

ollow. Improvement is not so easily obtained, ood reader, when the evil is of monster size : t takes a long time to make the public appretate it, and they must be told a thing many ames before they will even hear, still oftener cfore they will move. Something has been one, and results are not wanting. For example, ie Registrar-General's return of the deatbs and arths in London, during the year 1856, shows that in 1847 the births in the metropolis were 3,331, the deaths 60,442-leaving a balance of yly 7,889 to he added to the population. But t the year which has elosed the births have men 86,833, the deaths only 56,786-leaving a alance of 30,047 to be added to the popu-dion! The life of man has already heen agthened.

Nevertbeless, the eauses of premature and unecessary deaths are still at work,-the hotkds growing a criminal population are still nowed to remain. The City officer of health, iddenly re-describes the unhealthy dens crowded ttb degraded life, pointed ont hy us years ago, d all Londou is perfectly astonished, its daily sess in particular, that such a state of things ald possibly exist. Eloquent leaders are ritten on all sides, some speeches, perhaps, ade, and then all the facts are ntterly fortatten, and the evil goes quictly ou, doing its adly work, and will be re-discovered by and hy, tain to he consigned to a convenient oblivion, mething has been done, it is true, hut to so hall an extent, that the body of the evil remains atouched : in parts, indeed, it is increasedc overcrowding is greater than ever. New rects are made without the slightest pronion for the poor people who are turned out; id they are forced, as we have again and again wwn, to quarter themselves where there is no om for healthful existence. The question where is they to go to never troubles the improver. In e of Mr. Planché's far-seeing extravaganzas, The Birds of Aristophancs," the king of the isds says to one of the characters, who has alueed bim to build a city in the air for the Isds,-

- F King. Where's Jackanoxides? I come to tell, The city's built-J. Jack. Fis well !

- Jack, 'Fin well !
 King, I would 'twere wellJack, 1st not well built ?
 King, 'The took well built ?
 King, 'The rooks are making confounded clatter;
 King, 'The well then, what's the matter?
 Jack, 'I built of the second second second second second second to lise in Peacock-square;
 Where can ther go to ?
 Jack, 'Go to P-any where!''
 Jack, 'Go to P-any where!''

garrets and cellars are to go, shont, without directions, and the appearance of certain parties thought,---

"Go to ?-any where !"

Let them be wise in time, or it may lead to mischief greater thau is dreamt of. Some time ago we ventured to assert that Paris was in greater danger of a revolution, through the destruction of the dwellings of the poor without the provision of other places of reception, than it had been for some time; and, quite recently, the Comte de Tourdonnet, iu the "Revue Con-temporain," echocs the alarm, and warns protemporain," echocs the alarm, and warns pro-prictors to hear the voice of reason in time, and lower their present demands; since, however Court of Assistants." strong a Government may he, it might yet be taken by surprise in the case of a sudden and universal outburst, and might be unable, at least for a time, to avert the vengcance of an infuriated multitude, of which the laudlords would be the first victims.

The Mctropolitan Board of Works are abont to form some new streets, in the construction of which thousands of poor people will he turned out of their lodgings, and will be forced, uuless proper provision be made, to flood the neighbouring localitics. We would exhort the authorities to give this point consideration.

There is a great want of dwellings so arranged that the families of the better description of mechanics in the metropolis may live in becom-ing privacy, and be accommodated with proper conveniences and means for cooking, at a rental of from 5s. 6d. to 7s. per week. This amount several thonsands of persons willingly pay for very in-convenient apartments. Should not capitalists endeavour to meet the requirement ? or, recollect. ing the passing of the Act of Parliament limiting liability, could not the London artisans do something for themselves? Large sums have been collected amongst them for the purchase of freeholds in ont-of-the-way places. Would it not be possible for them toorganise societies for the erection of honses which might he well drained and ventilated, and divided into flats? What can be done by means of association amongst the wealthy, is shown hy the palaee club-houses, where, for a payment which would seem inadequate for the enjoyment of so much luxury and comfort, the members who choose to avail themselves of it, have a splendid home. The problem how capitalists are to provide the required accommodation with a peenuiary return is not solved yet; but we must not touch that point just now

Our immediate purpose is to add one more special instance, to the host already given in our pages, of neighbourhoods that need reform. We refer to a large tract of laud known as Nova Seotia-gardens, situated near Shoreditch Church.

In passing along Old-street-road from the City-road iu scareb of this place, the subjeet of our engravings, the architectural features of the neighbourhood will be noted as peculiar. Many of the houses have been originally small buildings by the road side, and the various alteratious which have been made from time to time, to transform them into more fashionable taste, are eurions. These attempts, however, have not been altogether successful; and the street, and indeed the whole of this neighbourhood, presents a more picturesque appearance than usual. The shops are for the most part small, and many of them are occupied by dealers in old and new furniture and shop fixtures, including a collection of Highlanders for snuff-shop doors, Chinamen, and other devices, amongst them the effigy of a game cock, which cannot be less than 12 fect high. The number of barbers' poles in the Oldwho throng ont of some of the narrow passages, one gets an impression that many of the inhabitants of these back slums could searcely be placed amongst the useful and industrious classes of the metropolis.

Here are several almshouses, which were erected originally amid the green fields. On one is the inscription :-

" Erected A.D. 1624, by the Worshipful Company of Weavers, London, for the Widows of Twelve Poor Freemen

The motto helow the coat of arms is " Weave truth with trust." There are also Potter's almshouses for eight aged women, and Judge Fuller's almshonses, dated 1591, and relative by voluntary subscription in 1771. When the London almshouses need rebuilding, it will be better to dispose of the sites, and purchase a situation away from the town, and more in accordance with the original intentions of the benevolent founders. In some instances so great has heen the increase in the value of the laud that pecuniary benefits might be gained by such exchanges.

book night he written upon the A curious bookshops of Loudon, and the indications which their contents give of the nature of the surrounding population. In this district the serial publications are not of the highest order, and little dream-books, the art of fortune-telling, and Raphael's Almanac scem to be in request. We pass on, however, to Shorediteli Church, a short distance along the Kingsland-road, to Union-street, on the right hand side. This leads to Crah-tree row and Nova Scotia-gardens, which, notwithstanding its fine name, presents the appearance shown in the engraving, and points to a con-dition of things not to be thought of without astonishment and fear.

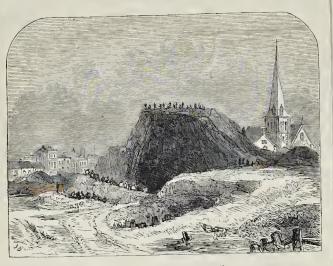

An artistic traveller this way, looking at the huge mountain of refuse which has here been collected, may fancy that Arthur's Seat at Edinhurgh, or some other monster pieturesque erag, has suddenly come into view, and the dense smell which hangs over the "gardens" will aid in bringing "and reckie" strongly to the memory.

At the time of our visit, the summit of the mount was thronged with various figures, which were seen in strong relicf against the sky; and boys and girls were amusing themselves hy running down and toiling up the least precipi-tous side of it. Near the base a number of women were arranged in a row, sifting and sorting the various materials placed before them, and many passing hy would bope that, by means of a force of so much strength, this great accumulation would he speedily got into a marketable condition, and be removed from the closely packed and very poor population surrounding it. While, bowever, thinking of these things, and looking with pity at the pale-faced children who were aniusing themselves on some of the smaller daughills, and wondering how this accumulation could have been allowed by those who had charge of the public health of the district, we saw five carts loaded with the same material of which the mountain is composed go towards the sorters engaged upon the gigantic unisance, and return empty. This is doing and undoing with a vengeance, -

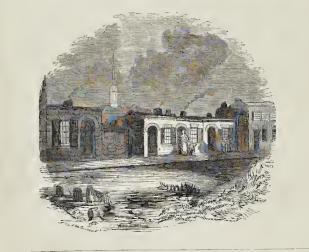

As Sisyphus against the infernal steep Heaves the huge rock, whose motions never may

ep. It appears that the magistrates, in consequence of remonstrances from those concerned, have ordered the removal of this dust-heap; but, kindly considering the interests of the It King. They can't afford to life in Paceock square; Where can they go to? B Jack. Go to ?-any where!"
Ingl. The handlet of balacet of balacet

THE BUILDER.

Nova Scotia Gardens, and what grows there.

profits of individuals in such a case, we may be belong to the habitation, but is used for the causing sickness and death to many who reside lodging of a donkey or pigs. in the neighbourhood. The district surgeon, who chanced to come in the way of one of our assistants, said that in the summer he is con-stantly called to attend cases of typhus fever on all sides of this refuse. To add to the mischief, there is nothing but surface draiuage and cess-pools. A woman, who lives in one of the little white cottages shown in the upper view, said that the smell, which was certainly bad enough at the time, was as nothing then in comparison with what it was in the summertime, when stale fish, and all other kinds of refuse, were left to putrify. The white cottages are built back to back ; one side of the row has no water-supply, and they are obliged to throw all the waste water in front of the houses, the small drain is constantly choked, and the closets are often overflowing.

On one side of the "Gardens" are streets thronged with people and children ; and the row throngen with people and church ; and the row performance in the rate of the Each of houses in our sketch is worthy of notice : one of them is perhaps the smallest in London. A tall man's head reaches to the top of the arch of "Manure." The next issued is to be "Iron Manu-the door. 'I he little shed adjoining does not facture."

The new church and schools contrast curiously ith what surrounds them, and serve as an indication of coming improvement.

A benevolent individual is disposed to use the site to better purpose, and to aid in the moral and physical elevation of the neighbourhood. Whether or not he will be enabled to carry out his views, however, remains to he seen. Certain it is, that the first step towards effectually raising the condition of the very poor is to give them wholesome dwellings. Until they are taken out of the dirt that brings death, there is no chance of diffusing that intelligence-

"Which binds us to the skies,-A bridge of rainbows thrown across The gulf of tears and sighs,"

ABBIDOMENTS OF PATENT SPECIFICATIONS.— The publication of a series of Abridgments of the Specifications of Patents, in classes according to sub-ject, bas been commenced in the Patent Office. Each

[April 25, 1857.

ARCHITECTURE OF GREAT BRITAIN. WHATEVER may be the condition of Architec-ture in Great Britain at present, as signifying what is worthily monumental of our nation and the time. the time, there is unquestionably a vasi amount of architectural display; but the latter may differ as much from the truthful result of sound ot architectural display; but the latter may differ as much from the truthful result of sound principles, operating on past experience and existing necessity, as the general forms of our present costume from the varied fashions adopted at a fancy-ball; and, indeed, during the last tweuty years, the genius of edificial design seems to have stood aloof, as if waiting for capricious experiment to resolve itself into some fixed and definite issue, either as to the most fitting style for common adoption, or as to certain differing modes most suiting particular but differing cases. Although no one especial manner may have catholic application to every class of building, we might reasonably expect, from our now acquired knowledge of ancient, mediaval, and more modern art (aided by the adaptive invention which has been at work during the period to which we have alluded), such universally admitted deductions as would confirm our architects in the selection of a style exclusively the most suited to each oceasion.

They still, however, continue in servile obedi-ence to the mere whims of their employers, or in blind eultivation of their own prejudices; mistaking, for matured judgment, the impres-sions first made, when it was their interest to please in any way, and to get "the job" on any terms; and thus some of them have hecome mere bigotted adherents to a peculiar phase of their art, incapable for ever after of its full con-sideration. This has more particularly shown itself in the Gothie monomania, doubtless to the advantage of that variety of design, in respect at least to the knowledge of its detail and the pre-cedental characteristics of its successive periods. But even the Church has not wholly resumed They still, however, continue in servile obedi-

But even the Church has not wholly resumed But even the Church has not wholly resumed lis Anglo-Gothic form; for, though the pure Greek or Roman styles, and their modifications under Palladio and Wren, are almost entirely abandoned in ecclesiastical design, we observe that our old church models are frequently put aside for the mere transitional varieties of Byzantium and Lombardy, or other fanciful con-tract metricale. As the are other researt build Byzantum and Londordy, of outer failent of the timental revirals. As to our other recent build-ings, public and private, they simply prove the uational feeling to be that of Shakspeare's Jaques, who, enamoured of the "mangled forms," in which *Touchstone* vents his wit, attaches forms," in which *Touchstone* vents his wit, attaches his sympathies to the jester's party-coloured dress, and exclaims, "Molley's the only wear,". While all meu of the same country, rank, or position, conform to a uniformity of habits in, every sense, the houses in which they live, the-charches in which they pray, and the halls of assemblage in which they meet, are as varied in fashion ("ay, 'fashiou,' ye may call it "), as if our particular land were peopled with occu-pants, not only of all nations, but of all times; as if the men of this day were no more than supplementary to our undying earliest ances-tors and their intermediate successors, British and foreign.

tors and their intermediate successors, British and foreign. Until the heginning of the present century, our architecture,---ceclesiastical, civil, and do-mestic,---was a plain record of distinct feelings, progressing in marked gradational sequence; and the history of British taste is successively written in chapters, respectively headed, the Norman, the Early Pointed, the Later Pointed, the Flamboyant, Perpendicular and Tudor Gothics, the Elizabethan, Jacobian, Palladian, Greek, and revived Anglo-Classic. But how will posterity read the architectural deuotements of 1S30to1S60? Haconspicuonstablet-stonermain not over every porch-door to signify the date of 1830 to 1860? If a conspicuous tablet-stoneremain not over every porch-door to signify the date of erection, verily the antiquarians of succeeding ages will be as mystified as an Abenakee Indian in rambling uninformed through the miscella-neous courts of the Sydenham Palace r Archi-tecture has been, heretofore, the history of the great religions, superstitions, or imperial achieve-ments of the world. The genius and power of Egypt, Assyria, Greece and Rome, of the Chinese, Hindus, and Mexicans, of the earlier and Mediaval Christians and Mahomedans, as well as of the more modern revivalists, have been emphatically exemplified with separately distinct

226

precision; but, in its present progress, architec-ture is little more than a "sign of the times" which the times alone can comprehend, indicating a conflict of tastes devoid of vital principles unless, indeed, it be said to exhibit the necessary confusion of that transitional condition which (agreeably to the temporal nature and "eternal fitness of things") is to precede the final accomplishment of a universal harmony. Be this as it may, it will be conceded that before any mode of design can be established, definited remembers

definitely expressing the geuius and judgment of our age, and forming a precedent for the respect and cultivation of posterity, our architects must agree among themselves tomake the general public agree with them. The present anarchy of feeling has occasioned a confusion of tongues, as hostile to the formation of a National Archi-tecture as that which arrested the building of the Tower of Babel, and left it an unmeaning conglomerate of hrick. Before we can have English art, art must speak English; however the language may be replete with derivatives from the Greek, the Latin, or other tongues, grafted into the Saxon and Mediaval British stock. stock. Let our architecture be, indeed, what our language is,-a compound of many others; but let the former, with the latter, speak the peculiar truths of our common faith, our feel-ings, our manners, and climate. Our religious, moral, and social impressions are not less nationally marked than the atmospheric laws which affect them; but it is certain they have at present to architectural expression, save such as denotes them to be inexpressible. That the speaking power of architecture can be but vague, and that its meanings must be to a considerable extent conventional, are admitted facts; but these only emphasize the necessity of such con-current extent on on the next of the active current exertion on the part of its artists as may ensure a generally accepted signification in its forms and details. Wherever architecture tits forms and details. Wherever architecture whas hecome great in any age, this conventional acatholicity has heen a despotic principle. In summissive obedience to this, rose the world-wor-shipped wonders of Egypt, the simple majesty (of the Greek temple, the complex pile of the "Christian Gothic cathedral, and the elahorate peptendours of the Mahomedan mosque; and it imust be admitted (though we have alluded to runch exceptional disturbance) that the tendency (of the present time in Great Britain is strongly in favour of the adoption of the Pointed Gothic in favour of the adoption of the Pointed Gothic for our churches and ecclesiastical edifices. But the adoption of au old style, and its adaptation The adoption of an old style, and its adaptation to new forms suiting present purposes, are two considerations which have not yet been regarded iwith sufficient distinction. We are not only zealous and prodigal in the repair and restora-tion of our ancient Catholic churches (as in the rease of St. Mary Redeliff, at Bristol), hut we montinue to erect "modern antiques," obstinately imindless of their unsuitability to the especial requirements of Protestant procession and remanufacts of their unsuitability to the especial requirements of Protestant worship; and re-markable is the amusing inconsistency of many, who, affecting an orthodox adherence to the old model as unimprovable, still complain of the marketical obstruction it occasions. They persist in the articlian of the second second second second second and second practical obstruction it occasions. They persist in the retention of nave and aisles, while they In the retention of nave and aisles, while they demounce the pillared arcades, which form them, us intercepting their sight and bearing of the opreacher; and often has the architect heen intriven to something beyond his wit's end by a cool inquiry, on the part of his employers, as bo whether he cannot do away with the very, and only means, hy which his admired general useful is obtained! All this, and much more abat might be adduced, is no condemnation of the Pointed Gothic as the style hest suited to mur churches. We believe, as the result of much monsideration, the reasonings of which were demonsideration, the reasonings of which were de-lailed by the writer of this article in a paper usued by the "Architectural Publication So-ciety," some years ago, that it is by far the most wirely for this article in the most essued by the "Architectural Publication So-chicty," some years ago, that it is by far the most chicty," some years ago, that it is by far the most chictle for this particular purpose, but we are in the same time free to state that these reasou-gords have not here afforded by the Oxford Sceturers, or by those of the profession attached to each high church party. Indeed, the writer could instance a Dissenting cluarch in the neighhour-wood of London, as more happily exemplifying the *adaptatice* capability of the Gothic model, ahan any specimen we can now call to mind botom among the new churches of the Establish-ement. We recur, then, to our former observa-

tion, that not only is there required a conventional catholicity as to style, but also a due distinction between the adoption of its details and the adaptation of its general forms to that purpose, which we trust is daily strengthening in our land, and the unqualified *expression* of which must be determined by the will of our people before we can have a national church architecture that may rival the past and inform the future. In admitting the Gothie style as best adapted

In admitting the Gothic style as best adapted to the service of our Church, we would extend that admission to all structures immediately allied to it. Still may our church colleges, the bishop's palace (if the Italian villa of Henry of Exeter, at Bishopstowe, rise not against ns), the parsonage-house, the cottages of the elerk and sexton, and the church school,—still may and sexton, and the church school,—still may they continue to show their coclesiastical rela-tionship; and glory in their high-pointed gables, their turrets, pinnacles, buttresses, ornate chim-neys, traceried windows, and corbelled oriels. There will be ever enough of them to give full play to the fanciful as well as to the subliner efforts of the Gothie designer; and these will be the more honoured by a character of art exclusively their own. Black-letter inscription and rubrical adornment will be their privileged pride and emphatic distinction, till commou acceptance endorse the conventional law which will preserve them in our hallowed respect for will preserve them in our hallowed respect for ever

But, with a conviction, equal in strength to that which would assign to the church and its depen-dencies the full right of Gothie adaptation, the writer would maintain the triumph which other styles have asserted, on the façades and within the halls and chambers of all our mere scentar huildings, public and private. Admired and respected be every veritable old structure of architectural pretension, whether it be a perfect thing of one style, or a mongrel of many; and "rulu seize the ruthless" hand which would uncecessarily pull down even the most monstrous combination erected in the time of Elizabeth ! The ugly picturesque thing that stands forth in the High-street of her own especial Excter ("semper fidelis") shall still remain as the time-stained page of a rare historical volume, telling of the more lacoffic of the Twolorie and Huling. of the mortal conflict of the Tudoric and Italian; when the combatants, like Duncan's horses, "ate us each other," saving only the small residue left by the Kilkenuy cats—their tails— or tales,—let the reader take it as he will—for "thereby hangs" one, in either sense. The final remnant of the Italian party had, however, life in it; and, under the nursing care of Inigo Jones, transferring it to Wren and his followers, it became a thing again of eminent beauty and witality. Respect, then, we say, the transitional links of our art's history; but repeat not their forms, with luconsiderate reverence, in the im-proving chain of progress; unless, in emulation of the mortal conflict of the Tudoric and Italian ; forms, with inconsiderate reverence, in the im-proving chain of progress; unless, in emulation of Hanket's paradoxical hypothesis addressed to Polonias, we would make the modern say to the ancient, "For yourself, sir, shall be as old as I am, if, like a crab, you could go backward." We mean to be serious in this fooling; applying to what we conceive to be frivolous the lan-guage of frivolity. In soberest truth we would repeat it,--let verilable antiques be revered at least, if not admired. Hesitate to restore, but he tenderly conservative. Renewal may be as least, it not admired. I esistate to restore, but he tenderly conservative. Renewal may be as false as an artificial skin or complexional decep-tion. Let the doctor do his best to perpetuate health and venerable existence, but abjure the health and vencrabic existence, but adjurte the principle of making the old look young or the young old. A gifted modern may be born at Exeter or Edhburgh, with natural parts, per-sonal and mental, resemblingly identical with those of another who appeared 300 or 2,000 years ago at Windsor or at Athens; but he is the heir to experiences and knowledge far more varied, and to feelings and habits widely dif-ferent; and the same spirit and person will ferent; and the same spirit and person will present themselves with an expression and habiliment more or less distinct from what they ould have been in the days of Elizabeth or Pericles, as the differing circumstances of time and place may occasiou. So architecture, in its ntilitarian sense as a thing of protective convenience, or in its expressive sense as a fine art, will resemble, or differ, in different countries will resemble, or differ, in different countries developments. We are not aware that any and periods, as the case may require; the un-compromising canon of its law heing, that it shall, in all places, and at all times, tell the *truth*.

The architectural truth of a building consists in the most suitable application of decorative taste to its form, and to the mode of its construction; and we must, in the first instance, suppose the amplest consideration awarded to these, without any regard whatever to the style of ornanceutation which may hereafter be employed. Every structure, from the cathedral to the cottage, is a hox, with certain divisions for rooms, holes for doors and windows, and other indispensable requirements. The material to be used will greatly affect the construction of the carcase, and a variety of prominent features will be thereby developed, giving character to the edifice, irrespective of what the artist will hereafter afford. In perfecting this mere machine, the substance of resultant grace will be iusured, as, in the human frame, the absolute completo-ness in its arrangement of bones, muscles, and functional parts, constitutes it instantly capable of the uncertainty capable of the superficial adorments that ultimately leave it a thing of unsurpassable beauty. Super-induced, then, as the skin and its complexional charms, the hair and its glossy pendant grace-fulness, and the filling-up of the features into expressive indication, should be the facial beauties which overspread a building, and con-vert an honest piece of utilitarianism into a truthful piece of art. By such a process of ratiocination have we come to the conclusion in favour of the Gothic style for our churches, &c.; and by the same reasoning process have we arrived at the conviction that it is *not* so suitable to other buildings as a modification of the so-called Classic varieties. The new House of Parliament stands forth

The new House of Parliament stands forth incontestably as the most magnificent modern Gothic structure in the world: and it would be absurd to bring into comparison with it any genuine old building of the Tudor period, hav-ing scenlar application. Indeed, even the gorgeons chapel of Henry VII. and those of the control Window work Kingde Gell. gorgeons chapel of Henry VII. and those of St. George, Windsor, and Kiug's College, Cam-bridge, as entire examples, do not display the same amount of pervadiug completeness without and within. - And yet, however architectural criticism may succoumb in deference to its general merits as a thing of its kind, the prac-tical utilitarian has grave charges to bring acting in the action in the most important general merits as a thing of its kind, the prac-tical utilitarian has grave charges to bring against it, as failing in the most important point of its purpose! The Lords hear but imperfectly; and the Commons have been obliged to curtail the lofty proportion of their chamber by concealing the original costly ceiling behind a lower one of differing form. Thus we have a hotch in the very presence-hall of have a hotch in the very presence-hall of popular representation; while neither House is hy any means of the form best adapted for sight and hearing. We at once acquit the architect of all blame in a defect which has been wholly occasioned by the uusuitableuess of the true

The Senate-houses of Paris, Madrid, and the United States are of the semicircular or theatric United States are of the semicircular or theatric model, obviously the most accordant with accus-tical and optical principles; and we have no doubt, had the advertisement to architects simply required that the designs for the New Westminster Palace should be wholly subject to the hest possible form for its two principal chambers for the Lords and Commons,—without any prescribed style of architecture, and with-out reference to a particular site, seeming to require such prescription,—the distinguished architect who has been (happily for the country) appointed to this great work would have ex-hibited his bold conceptive genius in the producappointed to this great work would have ex-tion of a *Greeo-Roman* design, as the natural resultant of his fully considering all the purposes required. But the matter began with a hunder, born of the then newly-arisen mania for Gothic revival; and the sage committee of manage-ment, in thoughtless idea of a style of art indigenous to the nation and representing its proudest historical period, demanded that the architects should confine themselves to the Gothie or *Elizabethan* mode! This last they Gotine of Entradential mode: This last they may have since learned to regard as the most vicious that ever prevailed, "lumpish, heavy, melancholy," and only interesting as the chrysalis in its transitional uature between two differing developments. We are not aware that any differentiate the this exclusion that the statement of the second seco

period of the Earlier Tudor; and, since there was to be a modern edition of this, modified by the inventive taste of the Victorian day, he has is secured to us the best example that might be afforded. What faults it has are those which, anorded. What takes it has no wavid; and, with more assurance, such as he himself would nots successfully improve upon; but, taking it as now existing, it may triumphanely challenge all other European structures of its kind, old or

It is, however, amusing to observe how some of the leading intentions, in the selection of the style and site, have here self-stullified. Respect for the old Hall and Abby, demanded the Gothie character to be observed in the new ad-Gothie character to be observed in the new ac-joining or proximate buildings; hut the result has been mutually deteriorating. The vast size and majestic simplicity of the Hall render it, in comparison with the chambers of the new palace, as a giant among men of ordinary stature; while the magnificent Victoria Tower status while the magnificent Victoria Tower utterly disconcerts the previous grandeur of the Abbey. This tower was necessary, not to any purpose of absolute utility, but to the artistic correction of the low length and infinite horicontailines of the main structure. The archi-tect, we presume, felt that one of the greatest characteristics of Gothic design was waiting, characteristics of Gothie design was walting, viz. that of vertical, as well as longitudinal, expression; and upward spraug the great tower, to draw with it the otherwise earth-bound imagination of the spectator. The partial eleva-tion of other portions, with the clock tower, ventilating lankern, and attached buttresses, were insufficient in a building of such vast contast, and the functarization with all the rich were insufficient in a building of such vast extent; and the fenestration, with all the rich surface-work between the windows, left the entire face unrelieved by any efficiently perpen-dicular effect. The plain piers between the windows of the Italian façade, and the emphatic vertical expression afforded hy the columns, and intermediate shadows of the Greek portico, were not to be obtained; nor could the grand and interinctions shadows into other offection, were not to be obtained; nor could the grand Gothic portal of Peterborough Cathedral be called in aid, because it is not of the Tudor period. Under such operating causes therefore the Victoria Tower, as unequalled in heauty as in bulk ; but this does not reconcile us to the loss of the structure we should have had, if Sir Charles Barry had been left to himself in the choice of style and site. The two secure cham-bers would have been, as we opine, a couple of Greek theatres: the sovereign, the lords, and the commons, would have had each their grand actions are site. The triganting demonstrate of our entrance portico. The tripartite character of our constitution would have been symbolised; and the crowning amplitude of a great central dome, over the common hall leading to the monarch's over the contact man heating to the montren's robing-room and to the two debating-rooms, would have represented the "majesty of the people." Perhaps, indeed, a third spacious hall, to which the sovereign, the lords, and commons had equal right, would have been the grand theatre of their combined meeting on the august occasions of opening and proroguing Parliament. We have been speaking, it is true, without Sir Charles Barry's sanction ; but we are not with-out hope that our readers will cry "hear! hear!" to our suggestions.

The course of our argument has now fairly brought us to the consideration of the Classic style as the most applicable to all uon-cocle-siastical purposes. The facts of antique or siastical purposes. mediaval purposes. The lates of antique of mediaval precedent, and the homage courcen-tionally awarded to it, weigh with us not one jot. The Egyptian and Mahomedau, the Greek and Gothie, the Roman and Byzantine remains have each their full share of our admiratiou and Tespect, as such; but they are as mere material in the quarry, or as specimens in the Museum of Design, to be used or not, as they may or may not suit the simple *Baz_aodet* to which may not suit the simple *Bax-model* to which allusion has been made. This having been formed, as aforesaid, we find it, in almost every building, except the church, to he a thing of floors above floors, either wholly or in parts, involving a large employment of horizoutal car-pentry; and, either actually or typically, re-quiring extensive application of the post and beam construction, in union with the pier and arch. In the windows we often seek a maximum of In the windows we often seek a maximum of light with a minimum opening, and with facilities for glazing, which wooden sashes or casements can alone afford. A compact economy of space

desired, inducing very generally rectilinear is desired, inducing very generally rectilinear and right-angled formations, and not unfre-quently the employment of the circle or half-circle on the plan, which may render necessary the cupola or hemispherical concave and the domicular roof above. Now, without saying all this may not be met by the ingenuity of the Gothic architect to an extent that may satisfy his employers, we would aver that the united architecture of Greece and Rome, as modified by the Palladian artist, not only suits it better than any other extant style of design, but with by the random mass, no only easy to both than any other extant style of design, but with an immediate precision that appears to us un-improvable. Our posts, beams, piers, and semi-circular arches might, indeed, be differently ornamented; hut we cau see no more reason for giving up their decorative presentment in the columns, entablatures, and secondary fashious of the revival Classic, than for seeking new or additional details for modern Gothic design.* GEORGE WIGHTWICK.

PROPORTION : ITS PRACTICAL APPLICA-TION TO ARCHITECTURE AND THE FINE ARTS.+

For the creation of architectural forms, and those employed in the fine arts, no correct standard is acknowledged, no compass is used to guide the student iu his studies or researches for the active cause of pro-portion and of heauty. There are numerous methods portion and of nearly. That are maintained and the interval in the observation of the invent. Not that there is no compass, for at the present day we have not only the knowledge of our ancestors, but many improvements which never occurred to them.

curred to them. In elementary works upon architecture, the effects or results are always given, and not the creative or developing causes: for instance, we are invariably told that there are three orders of Greeian architec-ture, and five orders of Roman architecture, and that an order consists of a column and ent-blature; and that a column consists of a base, shaft, and capital, and and the told ture to a combine firm acd and that a column consists of a base, shaft, and capital, and and turb turb ture here a combine firm acd and the column consists of a base, shaft, and capital, and and and turb turb turb turb. and au entablature has an architrave, frieze, and cor-nice. This is very instructive and proper for the *description* of an order of architecture, but if we desire ign or to create a style of architecture for the to design or to create a style of architecture for the present century, we must not limit our exertions to the mere description of the works of former ages. The primary or developing causes ought rather to be sought than the results produced by the architects and artists of former times.

No new style can be created by worshipping or idolizing only the works of antiquity : we must study and understand the laws relating to *form*, as well as those of colour, before any new features can he

Iu publications connected with science, medicine, natural philosophy, natural history, &c. a regular systematic treatment is adopted, and the first causes

systematic treatment is adopted, and the next causes and their consequences are nsually set forth in a clear and intelligent manner. It appears to me that there exists in art as in nature (upon which the former is founded) certain simple and universal laws, to which we are indehted all beautiful objects, and that these laws are in a for an beauting objects, and that these have the in a degree more or less present in the best works of all ages and countries; and that by comprehending these laws, and applying them as dictated by nature in her works, utility and beauty will be the consequence, and a certainty of success will uniformly attend our orderenous endeavours.

I will now proceed to consider the several systems which have been urged and used in proportioning architectural and fine art productions: these may be thus divided. 1. Of artificial systems. 2. Of fanci-The avoid of the second ing the orders of architecture :- " Several methods have been u-ed for forming the scale of equal parts, by which the orders are measured; but they are all founded on the diameter of the column at the hottom orders on the enhancer of the common st the bottom of the shaft; for those that use the module, or semi-diameter, as the measuring unit (which all bare done in the Dorie order), must still recur to the diameter itself. The authors have usually divided it into thirty parts, but all concur in measuring it by an unit founded on the diameters. founded on the diameter."

This system of dividing the lawer diameter of the shaft of a column into minute parts for copying the ancient architectural remains of Greece and Rome, shart of a communities interview part of Greece and Rome, has been adopted by architects from Vitravias (circa B.C. 25) to the present period. As a method

* To be continued.

⁺ The following is an abstract of part of a paper by Mr. W. Petit Griffith, F.S.A. read at the Liverpool Archi-tectural Society on the 15th instant,

[APRIL 25, 1857.

for producing ancient architecture, it is entirely for producing ancient architecture, it is entirely useless, for the several parts of Greein architecture cannot be reduced or sub-divided hy this system; neither does it apply to the architecture of Rome; there heing hut few, if any, buildings to which this method of division can be brought to apply. The architects of antiquity, fortunately for the progress of design, never employed so mechanical a process: if they had, the great variety of examples of the several orders could not have heen moduced.

orders could not have been produced. I shall concisely show that the classic architects did not have recourse to the monotonous division of au not have recourse to the monotonous division of modules, minutes, seconds, &c.; and that the said method does not accord with the remains of either Greeian or Runan architecture, and that it is equally useless for the purposes of invention, and, conse-quently, for the future progress of architecture.

quently, for the future progress of architecture. With regard to Grecian architecture, Mr. Witkins observes, in bis "Magan Gracia," that "among the early Greeks, it does not appear that there existed any rule for determining the height of columns from the diameter." Stuart, in the "Antiquities of Atheus," spefks of "the diameter of the column, as that neces-sary measure thy which the modulary proportions of huildings are adjusted;" hut he not being (strictly speaking) an architect, only alludes to that measure through its being in vogue in his time: he does not measure the Atheoian buildings hy a scale of parts dependent upon the dismeter of the columns, hecause it would have heen impracticable to have done so. Stant therefine says, "We have contented ourselves with setting down the measures of all these buildings it would have here impracticable to have done so. Stant therefore says, "We have contented ourselves with setting down the measures of all these buildings in English fect, and inches, and decimal parts of an inch; purposely forbearing to mention modules, as they necessarily imply a system, and perhaps too frequently incline an author to adopt one. Any artist may, however, from our measures, form whatever kind of module or modulary division he hest fearcies." fancies

Taylor and Cresy, in their "Antiquities of Rome," also figured their delineations of huildings in feet, inches, and decimal parts: in the letterpress, how-

texts:— Temple of Jupiter Stator, at Rome.—" On com-paring the capital," say Taylor and Cresy, " with the precepts of Vitruvins, we find its height exceed the lower diameter. The abacus is nearly one-seventh part of the height, and the second range of leaves does not occupy so much space as be allots. The architrare is less than prescribed by Vitruvius. The upper member appears diminuitye, but is a seventh of the whole epistylum, as prescribed by Vitruvius, not including the back at the foot of it. The order mem. member appears aliminative, but is a second of the whole ensistentian as prescribed by Vitravias, not including the bead at the foot of it: the other mem-hers do not accord with his instructions. The dimen-sions and arrangement of the cornice do not accord with the rules of Vitruvius."

Temple of Vesta, at Rome .--- "The columns do not accord in beight with the interior diameter of the cell, as prescribed by Vitruvius, hut exceed that dimension considerably.

Pantheon, at Rome .--" The eutablature is nearly

to mislead rather than to instruct the architectural student.

student. The most eminent modern architects assign pro-portions to the orders regulated by the modulary system which vary considerably: take, for instance, the height of the entablature of the Corinthian order. Palladio gives 3 modules, 23 parts; Scamozzi, 4 modules, 1 part; Serlio, 3 modules, 16 parts; Alberti, 3 modules, 10 parts; and Vignola, 5

There not heing any existing remains of the Tuscan There not heing may existing remains of the Tuscan order, no great difference onght to have existed as to the height of its column: hut even in this, the abort writers vary by 3 modules. One says 12 modules, and another 15 modules. Although Vitruvius pre-scribes modules, minutes, &c. yet he' alludes to a geometric system on more than one occasion; and there is no doubt that he introduced the unscientific and unsencessful method of dividing architecture into parts, already alluded to. In hook x. chap. 160 Vitruvius says, "But that those who are not master temples. That which Vitruvius did for Classic architecture, Batty Longley applied to Gotbic, and the attempt was equally fallacious.

Placing no confidence, then, is the module as a measure of proportion, I will proceed to consider the "fanciful and popular conjectures, without scientific investigation," which have here offered on beauty in architecture.

investigation," which have heen offered on beauty in architecture. If a reference be made to the writers upon beauty in architecture and the fine arts (among whom may be named, Bacon, A.D. 1605; Stukeley, 1743; Hume, 1752; Kant, 1755; Burke, 1756; Price, 1758; Warburton, 1760; Alison, 1790; Stewart, 1792; Hall, 1800; Brown, 1800; Dickenson, 1801; Knight, 1806, and others, it will be found that the majority of them comprise gentlemen of education, who were eapable of producing elegant compositions, but possessed little, if ony, practicel knowledge of art, being incepable of drawing or producing either a plau, section, or an clevation,—a penel isketch in per-spective being the utmost a select few of this class were enabled to accomplish; and yet these writers undertook to propond beauty in architecture and in the fine arts, and have submitted to the public from time to time their conjectures, based upon fancy, without any scientific investigation. The greatest evil which has arisen from these writers' endeavours is that many intelligent members of the architectural profession have been influenced by them, and to so great an extent that it is with difficulty the can he induced to believe that beauty of proportion is capable is that many intelligent members of the architectural profession have been influenced by them, and to so great an extent that it is with difficulty they can he induced to helieve that beauty of proportion is capable of heing practically demonstrated. Aristofle asserts that "the greatest species of the beautiful are order, aymmetry, and the definite, which the mathematical sciences especially evince." Sic Ohristopher Wren says, that "the true test is nataral or geometrical beauty," and that "architecture is founded upon the skill of the greatest geometricians." Inigo Jones maintains that "architecture depends upon demon-suration out fancy ;" and yet we meet, in our inquiries into the cause of heauty, with the following perverse information ..." Beauty is no idea belonging to men-auration and fancy ;" and yet we meet, in our inquiries into the cause of heauty, with the following perverse and geometry."—Backe. Dr. T. D. Whitaker oh-serves that Warton "treated of Norman and Gothie architecture, not indeed with professional examenes, hut with that feliety of real genius which illustrates and adorns every subject that it tonches." Knight of felieng, &c.—" an artist must work hy a kind of fileity, and not by rule." Other writers maintain that buildings should be designed in a picturesque various tints and forms happily blended, without rule various tints and forms happily blended, without rule or symmetry ;" and he then gives the following illus-tration...—" In the pictures of Claude and Gaspar, we or symmetry ;" and he then gives the following illus-tration....—" In the pictures of Claude and Gaspar, we perpetually see a mixture of Greeian and Gothie architecture employed with the happiest effect in the sume building: In a standard and popular Cyclopsedia we are iasame building.

The a standard and popular Cyclopædia we are in-rstructed that a certain degree of cultivation is neces-nary to the perception of heatty. This is a partial ladmission in the right direction, and as regards archi-tecture, especially, there is no doubt of a practical inducation being essential to a correct appreciation of the heatt sits beanty.

sits beauty. Among other arguments against the use of geometry in producing beautiful forms, it has been maintained ubat "it was to be remembered that the danger of a grigid geometrical basis in att was, that its presence and imperative laws prevented the student from exertising himself in those minute refinements of form which cher is the their winning charms to the highest which of grace." And another writer enforces that which each barrow and representations in a killing the same set barrow and representations.

Which lend their winning control to the anything which of grace." And another writer enforces that if the sense of barmony and proportion in a huilding swas dependent upon its harmonising or sympathising likith our own system generally, and particularly with the organ by which it was viewed—namely, the eye. And we are told by another that "the attempt to sub-dect to rules the fuer feelings of the mind could only and in fulure,—as much in architecture as it bad in runsic and in operty." I It is to be honed that these scopties will have

harmony and heauty of Greek and Gothic architecture being of a subtle inture, I have undeniably proved, in my published works, that our firest buildings can be subjected to the rigid tests of fact and experiment.

THE BUILDER.

THE NEW READING-ROOM OF THE BRITISH MUSEUM.

THE very fine Reading-room which has The very line Reading-room which does been constructed in the quadrangle of the British Museum, under the direction of Mr. Sydney Smirke, A.R.A. by Messrs. Baker and Fielder, is now nearly completed, and will be ing on the 8th of May, after which readers will be admitted under the usual regulations. It will be inaugurated, we believe, by Pl Albert and the Trustees, on the 2nd. Prince A Albert and the Trustees, on the 2nd. A plan of the building, and view of the interior as it was designed to be, will be found, with some particulars, in Volume XIII. of the *Builder* (1855), pp. 133-138. The statues at the springing of the dome, and the artistical decorations in the panels, shown in our view, have been omitted. The *Times* of April 21st, in an excellent descripting article wherein reference an excellent descriptive article, wherein reference is made to our early account of the intended structure, says,-

is made to our early account of the intended structure, says,—
"The dome is 140 feet in diameter, its height being 106 feet. In this dimension of diameter, its height being 106 feet. In this dimension of diameter it is only inferior 1180 feet; St. Maria, in Theoreme, 310 feet; St. Fault, 112 feet; St. Sphis's, Constantinople, 107 feet; and the clurch at Darastada, 106 feet. In other particulars our new dome is far superior. The new Heading room contains 1,200,000 etbic feet of space, its 'auburis', or surrounding literation, and the clurch at Darastada, 106 feet. In other particulars our new dome 10 superficient feet to each, including the brick casing, or 200 feet in all. This saving of space by the use of front is remarkable, the piers of support on white our dome rests only thus occupying 200 feet, whereas the piers of the Tranber of Bane 201 for the Unit of the standard was ouly fixed in January, 1865. In this new room, probably for some centuries, numbers of studious men and women will have an opportunity of searching amongst the enormous mass of printed matter which is accumulated within the of printed matter which is accumulated within the walls of the national museum, and condensing from it what may be useful in various ways.

It what may be useful in various ways. A great change has been made is the distribution of knowledge amongst the multitude since the time a collection of specimens of natural history and other matters were bequestled by a private individual under extrain conditions, for the use of the nation. Then came various additions, the Grenville and other libraries, manuscripts, and the splendid library col-lected by George III, called "The King's Library," which were placed in Montague House. Since the time these contributions have been arranged the press not only of this contributions have been arranged the press has heen most prolific, and waggon-loads of hocks have month after month been brought to the building inve monta arer monta been proper to break the building in Russell-street, many of them consisting ebiefly of chaff and stubble, in which, however, by careful search, a grain or two of corn may be found. Men who have written a few hooks are apt to look

upon them as of some consequence: a visit, however, to this library, must mike writers modest when they see the miles of ableves loaded with literature of various descriptions, and see how few amongst the number of volumes have stood the test of tim

number of volumes have stood the test of time. Thousands of persons visit the British Museum, who, while wandering through the great space occupied in the exhibition of objects of natural history and art, are little aware that hidden from the view of the general public there are rooms almost as extensive as those hence "seemed to which are more data from floated form" above referred to, which are crowded from floor to ceiling with manuscripts and printed books, and that

The old reading-rooms will, for long, be membered by many who have for years availed them-selves of their useful aid. They had hecome too small for their purpose, and the ventilation was very imper-fect : the lighting of the place was also not good, and

for their purpose, and the ventilation was very imper-fect : the lighting of the place was also not good, and it will he a pleasum change to remove to the new and aplendid apartment which has heen provided. It is not easy, in words, to convey an idea of the fine effect of the circular building: the vast space cannot fait to ereate feelings of both pleasure and surprise. Up to the spring of the dome are contless vibin in the dome are coloured a buildings, which are reached by ornamented and gift galleries. The paules within the dome are coloured a building, but he is the reached by ornamented and gift galleries. The paules within the dome are coloured a building but is the re-mainder is of white and gold: the side-windows and the large top light are filled with thick dull glass. At first sight many will be dissiponited at the apparent size, judging from the extent outside. This defect top and on the sides, instead of blending into a whole, break the space into pathens, which distract the eye. The large blue panels, contrasting strongly with the other parts, also destroy the idea of size. How splendid an apartment this might have been ande, if the rich colours of the books had been ex-tended in coloured ornamental forms to the windows. tended in coloured ornamental forms to the windows and dome. Art should have been called in to decorate. and dome. The omission, however, is not the fault of the de-signer so much as the consideration of \pounds . s. d.; and the length of time which it would have taken to mplete the work

eomplete the work. The scats and tables in the new reading-room radiate from the centre round which are the cata-logues and the superiotendent's department. The space for each reader is fitted with moreable book-rests, inkstand, and other conveniences: a divi-sion in the centre of each table will prevent the mixing of books and papers, which was sometimes complained of in the old place. For those who require more space, there are a number of larger tables without divisious. The floor has been covered with kamptalicon, which deadens the sound of footsteps ; and every provision seems to have been made to warm and ventilate the room. Round the circular reading-room, there is another

The vertex particular technolocity of the event lance to warm and ventilate the room. Round the circular reading-room, there is another circle, from which radiate various puzzling galleries, all ready for the reception of books. In order that every particular reception of books. In order that bookshelves are constructed double, with a passage for air between. By this courtivance double the number of books can be placed. The effect of the various branches, with railway accommodation for the convegance of hooks, the shelves divided and aub-divided, like the cells in a bechive, is very carious. A stranger might easily lose himself in this literary maze. Such of our readers as can make it convenient will, doubtless, visit the new room, and, perhaps, it may he interesting to some at a distance, to give a few particulars of the arrangement and regulations of this useful place of study. The written recommendation of a clergyman, or

The written recommendation of a clergyman, or well-known member of the medical profession, or any one of note in art of liferature, is sufficient to ob-tain the use of this great library for six months, and at the end of that time the admission can be renewed on presenting the original tieket.

On entering the reading-room, the visitors at first are at some loss to find out the books which they re-On entering the reading-room, the visitors at first are at some loss to find out the books which they re-quire, the various catalogues themselves forming a large library. In these are embraced the various works under the name of their authors; and if a publication by Smith is wanted, it will be the hebour of nearly an hour to get over the list. There are the catalogues of the manuscripts, newspapers, music, one expressly for the use of the reading-room, &c. Laving found the books needed, it is necessary to copy the name of the author, and description of the work, and also the press mark, on a printed form supplied. The ticket or tickets are then delivered to an attendant placed for the purpose, who passes it to another, who proceeds to the part of the library in which is the press which corresponds with the number wanted. It odue course the books are reistmed. In the reading-room, however, there are about 20,000 volumes, which can be taken from the shelves without any ticket. Here are ranged together the hest editions of the standard poets, dramatist, and novelists : the chief magazines, various editions of the Bible, dic-tionanrics, hoth English and foreign, fill many shelves. There are all the hest encyclopedias, biographical and a poerry." It is to be hoped that these scopties will bare ceedures to experimental polosophy, which will, and bare recourse to experimental polosophy, which will bare recourse the expected polosophy and the second polosophy and the polosophy plans to increase the available space for books. He shelves of various sizes constructed : notwithstanding dietionaries, voyages, and travels. There are also the

best of the serial publications : our own volumes begin best of the serial publications : our own volumes begin to present considerable hulk. There are also in their proper places the standard books on anatomy, chemistry, botany. Indeed, the reading-room, inde-pendent of the mass of material behind, is so well arranged and so useful, that we hope before long some means will he found of making its contents available to a large class who could use it only in the evenings.

We must congratulate Mr. Smirke on the satisfac-tory completion of this important and remarkable piece of construction.

"BUILT UP " IN ISLINGTON.

I AM, Sir, an old inhabitant of "Merrie Islington," and can remember in this neighbourhood many a shady spot which afforded a pleasant shelter in the hot weather. I also remember rows of hawthorn hedges which, in the season, were snowy white with "May," and sang little country-houses imbedded in trees, and so retired that it was net meanmone for trees, and so retired, that it was not uncommon for them to have loud-toned bells like those used in fac-torics for the purpose of giving alarm in case of when to face when I bear the cries of the costermongers, and see

when I bear the cries of the costenhouges, and the the great thronging of both buman beings and the brute creation in the Calcdonian-road and the streets which branch off from it in all directions, it puzzles whice branch on from it in all directions is possis-me to fix the site of well-remembered scenes. Can it be possible that in this spot, now blazing with gas-lights, the shop-windows decked with gay advertise-ments of teas and coffices, not much more than a score of years ago young artists would sit, day after day, blacking but direction game blueg and brayches? sketching the picturesque foliage and branches? At times I almost doubt, although I have seen it with must almost durit, almost if the operation, that splendid crops of hay have heen so recently made on what is now Copenhagen street, William-street, and my sp those near

Sometimes, Sir, I meet with one of the few remain-Sometimes, Sir, I meet with one of the few remain-ing old inbabitants whose memory goes back as far as mine, and we feel a pleasure in taking short jonr-neys along the rows of new streets, for the purpose of comparing our recollections. The square in which the New River reservoir is now placed, being a high point of land, is a favourie spot for observation. You would scarcely think that opposite to what is now the Bedridere Tavern, there was a place called "Brown's Pond," which was a spot on which all the refuse from far and near was collected. Then towards London were a few suburban taverns,—" Merlin's Gave" one of them,—and the New River Waterworks, with railing fort a wall round it, so that you might see the

Were a lew solution activity, - Merim Schler Ons-of them, --and the New River Waterworks, with railing (not a wall) round it, so that you might see the pleasant-looking water. By the way, there was, and still is, a very old house, with high-pitched pent root, of about James I.'s time, in the now enclosed area. Sadler's-wells was close by, and, over meadows in which cows were grazing and children and others at play, was a fine view of St. Paul's and what was then the outskirts of the great city. My ancient friends and I remember,--taking a posi-tion as far as possible from Brown's Pond, and still allowing a sufficient elevation,--that there were the Bagningco-well's Tea-gradens, a conntry-place of famous resort, where there were grottoes of shell-work and work, which were greatly thought of at that day. There were also the Findar of Wakefield, and a few wore satteed houses, but no Clerkenwell prison, no New St. Pancras Church, Tavistock or Seymour sequares. At the time when I have caught stickbeaks not far from what is now the Great Northerr station, and the start for sufficient each blie inverte ot far from what is now the Great Northern station, not tay from Weat is now the Great Norther's station, we had not dreamt of railways, and such like inven-tions, nor of omnihases or cabs. Montague House-and gardens, and Queen-aquare and the places adjoin-ang, were visible from this spot, but towards Mary-cebone fields and Paddington there were only a few * traggling houses, and a distant view of the country head thy recovered.

tragging noises, and a distant view of the couldry load this prospect. Towards the cast was the pieturesque Angel Inn, with its galeried yard; the pointed gables of the village of Islington; and, beyond, a clear green space towards Esser. On the north were the old Conduit play-fields, and places of refreshment and recreation adjoining. During these walks we talk of the dangers of the roads During these was as de tax of teatingers of the rotats in old times of coaches, stage-waggons, and other matters, which you have lately referred to, so that repetition is mancessary: indeed, pleasant as this old-time goesip as to us ancients, I find some of the present generation to be rather impattent listeners. I will, therefore, proceed to mention the circumstances which have lad me to see this computing the start of the set of the have led me to pen this communication.

have led me to pen this communication. It is a number of years now since I established myself in a little house on a spot which I thought to be at such a distance from modern huidings as to be out of the reach of improvements. This little dwelling had a nice slope in front towards the canal, and was pleasant with trees and flowers. I could hear the hells of St. Mary's, and so still was the place that the booming of the great hell of St. Paul's, so that the source of many other churches, were sounds com-

monly to be noted: the traffic on the water seen through gaps among the willows served to enliven the seene. Gradually, Sir, the hrickmakers approached, and the oir heeance less pleasant in con-sequence of the enrihly-smelling smoke which came the the wind area in action sources. Som it sequence of the earthly-smelling smoke which came when the wind was in certain quarters. Soon it mattered not from which "airt" the wind blew, for, on every side. I was beset hy the hrickmakers; and then roads were roughly hid out; and, like the skirmishing before an army, houses began to take possession of salient angles, and I wondered what madness could have induced persons to rear vast gin palaces so far removed from human hahitations. Soon, however, the foundations were dug ap, where the soil was gravelly; and the main body of the army, in the shope of rows of houses, marched irresistibly along; amongst these were churches and other useful institutions. Along the banks of the cenal, within my view, rose sortal large manufacturies

useful institutions. Along the banks of the canal, within my view, rose several large manufacturies, with tall chimneys and other unsightly architectural features, and whan is were, one after another, erected ; and then a church, with tarrets of Henry VIL's time, with slate roof, brick walls, and unplea-sant-looking windows. My trees hear to wither, and sant-looking windows. My rices negation when, that I began to have so little pleasure in my garden, that I consented to part with most of it. And then a sort of store arose, on which were planted various square erections of iron, so ugly that I regret that I cannot have for them but a peep at the chorch which before I had thought so little of. On the other side of me the builders are at work. The roads are im-passable in wet weather; and look in what direction will, I can see nothing agreeable to the eye. I must now, therefore, much as I like the spot and all its memories, beat a retreat, before a force which I cannot resist, and fly to some nook where I can quietly think over times past, and wonder at,—and feel a pride, notwithstanding my individual discomfort in—, the advancement of a district I have for so many years loved so well. AN ANCIENT OF DAYS. The roads are

GOVERNMENT OFFICES COMPETITION.

A CORRESPONDERT, who ought to he well informed, states that it has heen determined, room failing, to hang the ground-plans in an adjoining partiment! We are cnabled to say, however, that this is not correct: and that all the drawings will be hung together, though some, probably, will be high. Nothing is yet known as to the appointment of the judges, or of the time for onenjug the exhibition. of the time for opening the exhibition.

"Light Brown Indian lok" has favoured the readers of the *Builder* with an admirable piece of special pleading. Without laying so much stress on the importance of impartiality, wby did be not nn-affectedly say, "I have sent no perspective of my affectedly say, "I have sent no perspective of my design for the Public Offices, so withdraw all the per-spectives until after the award?"

He reminds me of nothing so much as the fox in the fahle, who, having lost his tail in a trap, sum-moned a conclave of bis brethren, and proposed that they should all cut off their tails. If my memory they should all cut off their tails. If my memory serves me, Mr. Tailles dwel on the excessive incon-venience of a long brushlike appendage, as proved in his own case. At least, he brought some specious, plausible reasons to bear on the subject. In reply, a Vulpine Pater Conscriptus made use of very convinc-ing arguments on the other side, and the result of the discussion is shown in the fact (so gratifying to hard to the side of the side of the to this country squires) that foxes wear their tails to this

day. In choosing the indges, Sir B. Hall bas, indeed, a difficult task. As to fuding persons "absolutely im-partial and disinterested," I fear that is impossible, unless we go to Lord R. Cccil's peasantry. Every man of education and cultivated taste (and such only should be judges) must have formed some opinion of architectural styles. Let the Goths and the Classicists have each their representatives, hut let the right honourable chief commissioner steer clear of

bigots. We may carp at the instruction issued by her Mijesty's Works, but they are the hest yet given for any competition. Let us do them justice. Abjuring any competition. Let us no them justice. Adjusting artistic trickery of colour in the views, requiring elevations in outline, laying down a uniformity of scale, fully describing the requirements for the plans, suggesting that "one view may accompany each design," and requiring no estimate; everything was done that could be done, to give everybody a fair chance.

When "L. B. I. I." says, "away with the motion mockery," he lays himself open to the suspicion of being an "eminent architect," for no others can afford to dispense with the *incognito*. If he have not attained eminence, he is proposing a suicidal course; unless, indeed, he has friends in higb places,

[April 25, 1857.

who will advocate a design bearing his name ? But I

who will autocate a design beaming its halter. But a will not this this of him. To exclude designs from competition because floors and corridors are made yellow and blue, and because walls are timted a shade or even four or five shades darker than light brown Indian ink, would be an art darker them hight brown Indian ink, would be as acc of narrownindedness unworthy of the members of a liberal profession, or of a fair stand-up English fight. Let us be chivalrous to one another ; let us scorn to oust our fellow-competitors by insisting too much on oust our fellow-competitors by insisting too much on these minor points. If any one has been mad enough to tint or shadow his elevations, let him be made a public example. Will there be one such ? I doubt it. RENARDUS P. C.

ARCHITECTURAL ASSOCIATION.

ARCHITECTURAL ASSOCIATION. A FUBLIC meeting and conversatione, in connec-tion with this Association, was held at Lyou's Inn-holl, Newcasule-street, Strand, on Friday evening, the 17th instant. In the absence of the presideut, the chair was occupied by Mr. 6.1. Wigley, who, in opening the proceedings, adverted to the many advantages arising to the Association from meetings such as that, not the least among which was that it brought amongst them many of the older members of their profession, whose avocations prevented their more frequent attendance at the ordinary meetings. He congrutated the members of the Association on the satisfactory pro-gress of their infirs, in a financial as well as in other respects: they were making up for past deficiencies, and were gradually getting out of deht; and he took occasion to refer to the approaching anniversary if that inter as of peculiar interest in the artist's life, and he hoped to see a large gathering upon the occasion. The Hev. C. Boutell was to have read a paper, hut was unexpectedly called out of town; and a member made some observations in life. occasion. The Rev. C. Boutell was to have read a paper, hut was unexpectedly called out of town; and a member made some observations in lieu.

SUGGESTIONS FOR FURNACE CHIMNEYS.

In adopting vertical lines in chimneys great In adopting vertical lines in chimneys great care should he taken to graduate the strength of the walls as the shaft is carried up, so as to secure lightness with elevation. The upper portions of tall chimneys should ever he light, so as to reduce oscillation. Tall chimneys, having heavy cornice finishings, have failen. A storm of wind sets them in motion, and over they go. There are the ruins of chimneys which were so weighted, and have failen, near Stoke-upon-Trent, and in other places. The student upon-Trent, and in other places. upon-irent, and in other places. The student must not be drawn into any mistake in this respect. A tall chimney must have a secure foundation, a well-arranged shaft, growing lighter in substance as it mounts upwards, and any ornamental finishing must be the lightest possible to secure the required annearance with any ornamental missing must be the lightest possible, to secure the required appearance with strength. Great attention must be paid to the mortar, so as to use the hest in quality and quite fresh.

We have arranged and engraved some of the de-We have arranged and engraved some of the de-signs for shafts, made by Mr. R. Ravinson, in illus-tration of his paper on "Chimney Construction," printed on p. 120, *earle*. Commencing out the right-hand side of the engraving, the first is a design for a tall ebinary, to be constructed with hrick of two colours. Stone may be used in the base, as shown. The plinth and shaft are square on section. The cornice may be terra-cotta and brick.

The second shaft is square on section : stone may The main he used in the plinth to form the set-offs. design is to be worked out in brickwork and terra-cota. The attic roof is of root. This design, although apparently elaborate, used not be very expensive, as the forms are repeated, and in their structure they should be simple.

In the third we have a detached shaft, square on section, formed of brick of two colours, with stone ornices in plinth, and iron roof to attic.

The fourth bas an attached shaft, square on section. Brick of two colours is used, with iron roof to attic.

The fifth has an attached hase. The shaft is octagonal. The cap, square, with octagonal lantern of iron. The base and shaft are of brick, of uniform tone and colour.

The sixth is a square shaft of brickwork, banded formed of bricks of two colours. The cornice and attic are of hrick and terra-cotta.

The seventh is a detached shaft, square on section, of brickwork, in two colours. The cornice is of brick and terra-cotta; the roof of attic to be iron.

Two cottage or house chimneys are shown, roofed over as in the East. Tile or terra-cotta may be used.

الع

DESIGNS FOR FURNACE CHIMNEY-SHAFTS .- From Sketches by Mr. R. Rawlinson.

ON HOUSES AS THEY WERE, AS THARE, AND AS THEY OUGHT TO BE. THEY

THE case of a private client with a selected chitect is a very different one to that of a THE case of a private chefit with a secretar architect is a very different one to that of a committee. Some persons complain that the client names beforehead the price which he will pay for the building that be wants, and thus confines the taste of his architect. On the contrary, the restrictions which the peculiar wants and wishes of the employer dictate should form the pressure to make the fountain of reauius play high.

sindui initia tie pressure to many direction of the second tell us how much it will cost." Mr. Jupp made nus design and estimate, which were approved by the Board, excepting as to the front. The Board offered that subject, not the whole work, to a limited compe-tition, I helicve, or, at all events, chose another archi-tect to design it. Mr. Jupp executed the work for less than bis estimate, and the Board poil the amount, with the addition of a gratuity to bim of 1,0004. rest that bit states, but in the state of the state of 1,0007. Such a gift was not singular in the last century, but now, we say, the more important the work the less we will pay far it in proportion.

In many cases the architeet is not the offender who auses a bouse to ba ngly-but the want of education in the client.

Frequently a good design is out down, to save some Frequently a good design is ant down, to save some trifting expense, and after the contract is made with the hulder, one altoration after another is made by the client, the contract is void, and the hills for extrus when added to the amount of the amended tender often greatly crassed the sum that would have com-pleted the original satisfactory design for the house. It is easy for a diment to suy that he will make no alterations; hut when a work is begun with the sole object of nearingmone before the mind may of tracthings object of parsimony before the mind, one of two things pens. If there is an architect employed, beauty utility are sacrificed to convenience and strength, happens and util and utility for securized to converience and strengto, the meagre starwad design does not come up to the expectation of the proprietor and his critical friends, and before and after completion as much is spent in various attempts to improve the house as would have sufficed at first to make it right; but even then the huiding durays betrays its soridd origin by its mean features, which can hardly be effaced; the unhappy carbitaty base his modify and between sill are architect loses his credit ; and, as the house will, haps, not fetch half its cost, the disappointed haps, not retent main its cost, the disappointed pro-priotor loss his monay, when even a speculative huilder would have known better. If there he no architect, the usual result, indeed, is, that ornament, not beauty, is put on to the building at the expense of the materials and labour: the proprietor has saved the cost of an architect, and has suck his monay in a honse that will frequently not sell, and will repairs three or four times as often as a good agly house, and these repairs will cost at least as much as the original price of the bouse, heing immeasurably more than the value of the repairs to an ugly good

When we hegin to consider the cost of a huilding we find another difficulty in stors for committees. The cake, reduced in size and shorn of its ornaments, is put out to tender, and the committee is puzzled by the result. The figures I produce sre tenders actually made within the last two months :--

*Avarage 2,315 ... 587 ... 330 ... 194

Fifty more examples of this sort of competition are at your service: there can be no hesitation in saying that the aversge of these would have amply remnnerated any respectable tradesman. The highest amounts, perhaps, arose from too expensive modes of proceeding, from the expectation of large profits, and some cases from mistakes : the lowest ones certainly arose from mistakes or intention.

Lamy arose from mistakes or intennon. If the committee prides itself on honesty, and pay-ing no more than a thing is worth, hut still wishes to pay the fair value of the huilding, what choice can it make in such tenders? There is an outcry if it does not take the lowest. If the difference arises from a mistake, the builder generally withdraws his tender on hearing of the large difference; hut if he is in a hurry to hegin, the committee may expect to have

* Read by Mr. Pspworth, at the Society of Arts. p. 220, ante. See

either continual quarrels, or to hear of the builder's hankruptey, with a demand from his assignces for the most extravagant value that can be put upon so much of the work as is done. A committee, by accepting such low tenders, also gets into the difficulty of spending eventually much more more than it in-tended. It chooses the biggest and prettiest cake which it learns that it can have for its money, and finds afterwards that it is certainly a large and good-looking cake, but of flour and water only; that the looking cake, but of flour and water only; other ingredicuts are wanting; that the building, when paid for according to contract, and perhaps not too well built for the money, will cost as much more to finish before it can be used; a result which several asylums and similar huildings have presented to their subscribers, owing entirely to the ignorance or injusof their comp ittees tice

an individual attempts to build without the Is an individual attempts to build without the assistance of an architect, he is liable to the same misfortume, and the quarrels which arise are amongst the nicest pickings for the barristers that can be given them, by judges who dread having to sit for several days over a case which consists of a builder's cat. hill.

The usual way of settling a disputed account for building is to measure all the work and pay the current price for it. This would be the housestest way of deal-ing in all eases, if all work were equally good and were done under similar circumstances, and if the curnent price could ever be strictly ascertained. It is admitted, too, that this "messure and value" system, still retained by the Government, was open to gross frands, and that it is in want of revision : many prices still asked are those for which the best work was formerly done. Amongst other duties, I have had to value bad work, and I can only liken the difficulty to the trouble of settling the precise value of adulterated

great objection to building by unrestricted тъ competition is, that it gives the hest chance to the worst man,—to the man who intends to break his contract or to defraud his creditors.

But no human system can he entirely free from imperfections and disadvantages. Both committees imperfections and disadvantages. Both committees and individuals are obliged to announce that they do

and individuals are doingen to innoduce that they do not bind themselves to accept the lowest tender. If called upon to name a better method, I should feel inclined to recommend the plan of taking the first, second, or third, as might he previously settled, below the average of tenders made, for we so often see our respectable builders classed together in the middle of such a list of tenders, that it is evident their prices were tolerably near the truth. At all events, they are the builders to whom I should apply in a limited are the builders to whom I should apply in a limited competition, and no doubt there are several gentle-men, themselves builders, in this Society, who will tell you that it is not worth while to compete, except under limitation, *i. e.* that you cannot expect to get good work by an unlimited competition. In order to build cheaply, the speculative builder, or the bad builder, resorts or connives at a system of scamping, which, if the work be executed under an architect, keeps every one connected with the building in a fever of onarrel: and which, if it is not excented

in a fever of quarrel; and which, if it is not executed in a fever of quarter; and word, if it is not executed under an architect, may be a great deal worse than the following picture of things which you may see daily if you will stop and look at the new houses on the outskirts of London.

the outskirts of London. The soil is perhaps clay, at first with no great drain near it : as soon as a large sewer, or a very hol season comes, the foundations of the house sink a little, and the walls crack considerably. Or the soil is marely dry rubbish, and the house gradually sinks into it. This would be of less inportance if the bouse could keep upright while sinking; or, if the soil he good, the foundations, that is to say, the hottom courses of the brickwork, are merely hits of sone and brick lying in a mass of mortar.

Lumps of old brickwork carefully built into new walls, and old road pavement, are not the worst mate-rials now used for walls; indeed, in themselves they are jewels compared to the hricks, which, instead of ringing like a hell under the strike of a hammer, crumble under the pressure of a strong hand or the touch of a light hammer.

As for the mortar, it is not much better than the bricks : it ought to be made of newly-burnt lime and river sand; but the lime is allowed to spoil before it is used, and the sand is sea sand or pit sand, or road sand, road drift, or road stuff, or the actual earth from the site of the premiscs: all these have the slight defect of either introducing vegetable rot into the new duces to either introducing vegenance rot into the new house, or of preventing the mortar from heconing bard. If good lime and sand are used, instead of being made by hard manual hour into a mass, having each particle of sand covered with a cost of lime (as to keeping it mellow, that is now never thought of),

as many hricks as they can to look laid. I have heard a man threatened with dismissal hy a foreman heard a man threatened for not laying half as many bricks again in s day as are allowed in the price of lahour for fair work. Often are allowed in the price of lahour for fair work. Often when the hricks are good they are sometimes so dry that the water is absorbed out of even well-made mortar, which drices into a powder. But in general our bricks are porous enough, without this additional fault; and you may always suspect this is the case when there is a rush of air into the room at the skirt-ings: this is healthy, and consequently ought not to he altogether stopped. You will observe that when new brickwork has bits of old hrickwork in it, the new settles down agood deal in the first incee months, but the old has up settlement to make, so there is a but the old has no settlement to make, so there is a crack on each side of it for some distance. Even where I have been watchful, advantage has been taken of my absence to finish a good piece of foundation of my assence to misin a good piece of iounantion with rubbish (and I have heen personally threatened for persevering in having it taken up), or to put rubbishing couerste instead of stone paving: in the latter case the building owner desired me not to inter-fere, the foreman had told him it was safer, and cost there, the obtained man total min is was said, and toos more than the stance. Bricks are hald now-a days with a hed of mortar, roughly smoothed out, when the bricklayer takes up a fittle on the trowel, where it off on the edge of a brick already hid, and puts the next oriektayer takes up a little on the trowel, wipes it off on the edge of a hrick already hid, and puts the uext brick in place with a sittle exertion as possible. When this little hit of moetar has perished, the air circulates in the wall in a manner that is advantageous to our health hut deciledly inconvenient and nunoying, and the house wants what is called pointing, of which you all understand the nature, expense, and trouble : in fact, the house requires painting and papering after it. But these are not actually germs of danger sufficient to cause the house to be pulled down : they may cause alarm to the inhabitants, but danger is real when the soil alters its condition, when the bottom parts of the wall turn up on to the kitchen fore the site cause the source on the soil alters in the source of the wall turn up on to the kitchen real when the soil alters its condition, when the bottom parts of the wall turn up on to the kitchen floor, when the walls and piers bulge out in the middle of their height, when the walls hegin to overhang, when the bricks in the arches of the windows begin to drop out like testh: in any of these cases I would recommend you to apply to a real architect, and if he should say 'Go out,' I would take the advice if possible. Sometimes, indeed, we hear of a few wedges should say "Go. out," I would take the advice in possible. Sometimes, indeed, we have of a few wedges being lightly driven into eracks, with the advice that the tensuts should "go" if the wedges fall by their own weight out of the cracks when the cracks get larger. Some persons are so strong-minded as to sleep without further precautions in such a house: others have some one to sit up all night and watch the wedges; but I recommend that little bells, or, better still, detonating balls, should he fixed to the wedges, because the old nurse or watchman might go to sleep as well as the rest of the family. as well as the rest of the family.

as well as the rest of the family. A building may be really dangerous, yet give no sign of the fact to most observers. A house may appear very dangerous without there being any real cause for its demolition. I suspect that we horrowed from France or Germany the system of tying one or more houses together with iron rods, which aanounce their existence by a sort of coal-plate fastened on the outsides. This affords an object for decoration, which has not yet been troated successfully in Londen but outsides. This anorus an object for decound, which has not yet been trongted successfully in London, hut ahrond these plates (which are technically called anchors) are full of significance and lovelluces of form and grace of design, to which the beauty of colour might be added.

Among the little defects of the public, I am in-clined to place the notion that an architect should he able to say whether a house is in danger or not by simply looking at it. Some architects certainly have ame to say whether a noise is in taking to not any simply looking at it. Some architects certainly have an apparently instinctive appreciation of reak danger, as some physicians can foresee apoplexy; but the medical usan gets the aid of the tongue, the pulse, the stethoscope, and a statement of the internal feelings : the architect is generally allowed, like the Eastern physicians, to see the skin of his patient, hut not to hundh it. There is probate mean outputs physicians, to see the skin of his patient, hut not to touch it. There is, perhaps, no outrage npon do-mestic comfart and private property more resented than the sensible attempt of a surveyor whom the public may employ to examine a house. Does he want to see if the roof and chinneys are sound; there is no way out to it except through a hole big enough for a child, but searcely for a man; and if he puts his head through, he generally sees that, miles he means to risk his neck, he had better send for a long ladder ender the control of the put his control of the put his to risk his neck, he had better soud for a long ladder and get np outside. The connection between long ladders and hroken slates, and the consequences, are familiar, of course, to nany present. If he wisbes to see that the floors are sound, and wants to have a heard iu each floor removed, it would seem that he had done an injury to one of the fimily; or, if the house he empty, and he tries to see what sort of house he empty, and he tries to see what sort of bricks are helind the stucco or plastered front of the walls, the landlord watches him as he would a thi they are mixed by hoys, and dreuched often with four hint the great explosion of wrath is caused by a hint water, for immediate use, and the mortar is supplied as to the foundations and the drains : in fact, the sur-to bricklayers who are engaged either by the piece or veyor who goes that length had better be a man able by the day: in either case it is their hasness to get which a prudent man ought to be satisfied before he takes a house for seven years, and much more before

haves a noise for seven years, and mach hove order he buys hoves property. Fortunately, however, there are other indications of the state of the health of a house, and I will likerally put you in possession of some of the princi-psl ones. If you walk over a house and find that the ps] ores.⁵ If you walk over a house and find that the walls are created or damp, that the paperhangings are changed in colour, that the floors shake, that the stairs creak, that the doors and windows have not fitted, then you may he sure that you are among the elements of a haunted house, and that you had better not enter it again without professional advice. I run no risk in this liberality, for people are found to take houses with a clause that "no dsucing is allowed on the premises." We all know cases where the supper has been demolished by the ceiling, and now we go to houses where the ground and first-floors are promed houses where the ground sud first-floors are propped up on the occusion of an evening party, though no dancing is contemplated.

But neither the public nor professional men csn tell without experience the signs of premature old age in a house. When it was young, the heedless, specu-lstive builder had caused the walls to be run up, and a bricklayer knows full well the meaning of that word. He put their footings on the wet ground, with no lead, or slate, or asphalte soles: be put no area round them, but wrapped them up with wet elay (ar, perhaps, he put an area under the elay, as is some-times rather uselessly managed). As to the chimney-stacks, they are, probably, as usual, only skins of brickwork, enclosing flues and those vast holes for the reception of real-hot soot which set so many houses on fire : the arches of the windows and door-tervisions a workeliky only shams, and as to the word. . He put their footings on the wet ground, with houses on me: the means of the window and as to the openings are, probably, only shams; and, as to the exterior cornices, let the corouer's inquests tell how they are made. Rotten paying-stones are laid, off exterior cornices, let the corouer's inquests tell how they are made. Rotten paving-stones are laid, off their halance, on the wall, and are to he kept in their place by a load of parapet, until the day when some one steps off a laider on to the cornice, either for re-pairs, or in case of fire, or until a new proprietor re-moves the parapet in the course of alterations and improvements. Then, perhaps, there is a large amount of what may be called hereditary disease in the house. For example, the carpenters employ sometimes decayed old stuff, and exhihit their forethought of using no more of it than can be holded by mutting using no more of it than can be helped, by putting that stuff at distances a quarter larger than is gen-rally allowed for new and good materials. Of course builders who will do that will not hesitate to do without a girder or a main beam, if possible, or will put a couple of joists to represent it, and will put unsea. couple of joists to represent it, and will put unsea, sourd breastsumers to carry the whole weight of a front npon story-ports that will bead, literally bend, under the weight of the breastsumer, before the brickwork goes upon it at all; or will carry a whole house npon little iron columns, which are so small that they are tike bradawls, and cut at top and bottom into these walls, which, of conrse, leads to settlements : as to partitions, so slight that we must not lean against them until they are lathed and plastered, but so framed that if a tenant wants to cut a doorway in them he cuts the one nices wants to cut a doorway in them he cuts the one piece of wood which holds the whule together, I am inclined of wood which holds the while together, I am inclined to deem them less prejudicial than roofs heavy enough in appearance hut of decayed or unacasoned wood. I must not, bowever, fail to give to our modere car-penters in London the credit of making two new joists, or two new hoards, out of a single old one. At Brighton, however, they can, and do, get three floor boards out of a single old one. It is, perhaps, rather unscientific to use the holf-joists in the present way y: they would, undoubtedly, be stronger if laid Λ : but then there would be nothing to nail the boards upon. The joiners are certainly to be pitied who are sent into a house to put their slips of dry wood into the crevices between each pair of floor-hoards that have shrunk, and to make the skirtings fit close to have shrunk, and to make the skirtings fit close to the floor; but it is generally considered best to re-move the doors which not only have their panels split, but one or living the shear they are short to the but are so twisted that when they are shnt at the top a rule may he passed near the bottom. A very usual cause of gradual and unseen decay in a house is the roof. The small-sized slates split and let the water in, and are laid so hadly that the water gets in if they do not split. They are fastened with iron nails that decay and let the slates slip and cut the gutter, which is either of zine or lead, and in both cases too thiu, and so leak: the junction of the slates with the walk is puttical up with cement, which cracks and lets the water in: the gutter is not deep enough, and over-flows; and the rain-water pipes are so small that tbey easily get stopped

The fall of ceilings is not always a mark of danger The fail of ceilings is not always a mark of danger : the the plasterers have covered the partition and ceiling to timbers so liberally with laths, that there is no room 6 for the plaster to be pushed letween them and turn a over, so as to make what is called a key, which in a fact is to fasten it to the laths; it will not stick of it itself to the laths for any length of time if there is the slightest tremor in the house: children playing in

the room should be taught that if they are very up-roarious the ceiling may tumble upon them, as in the case of a school lately. The great quantity of water used in making the mortar for plastering kept a house very damp for some time formerly; hut now the drying is forced by braziers full of charcool in each room : babits of tape and rule, and a deplorable want of scientific knowledge, invariably put a brazier under the flover in the centre of the ceiling ; the room heones very hot its lower sol mouldings begin to crack and perhaps to full, whilst cracks of infinite variety as to shape and magnitude appear on the ceiling and the walls. That is to say, this happens only when the doors sre left open, for many peopl shut them, and the charcoal fire goes out soon after anla words. Io few days the plastered walls are so many fields of blisters, arising from the badly burst line in the mortar; but this passes unregarded, for the painter and paper hanger have yet to come.

The painter attempts to disguise all defects with paint and putty, but as the work is done in a damp house, every patch and spot of the knotting or cover-ing of the bad wood, and of the nail holes filled with putty, can be seen through the finishing coat of paint: the paint, however, is to blame partly, for it has hardly been paint at all in the whole sense of the WO:

word. The paperhanger is equally nulucky: he does his best, I suppose, to get the joints of his papers to match, but it tries the temper to see a good red flock paper with a while bine at each joint, and to see half the colours disappear just hecause the papers were hung hefore the plastering was quile dry. When that is the case it is usual to see if the grates have not got write and are athind the obligned piece. Is the case if is using to see it the graces lave hold go rusty and so statued the chinney-proces; that stain nothing that I can name will remove. But what does all this matter ? We see along our suhurhs whole rows of houses unfinished, or partly

But what does all this matter? We see along our suharhs whole rows of houses unfinished, or partly unfinished: when the plastercrs begin their work, an isscription says, "This desirable (or this excellent) family residence to belet," and Kars-Williams Lodge is actually let in time to allow the board to he used for the next house—and so on along the row. Our forefathers were usually so short-sighted as to

Our intratacts were usually so short signed as to lose s year's rent, by waiting so long before they painted and papered, and the medical men seem to think that a damp house is not so safe to sleep in as the wet plaids of which we have heard. But the house is taken: let the tenant look to the rest, behave a flor all the trouble of moving furniture, per-haps new, s fire is lighted for the first time and in best room, probably to receive the bride on her entrance to home. You may imagine her exclamation when she ventured into the drawing-room, and was straightway saluted hy what Bulwer felicitously terms a joyous dance of those monals vulgarly called smuts or blacks; you feel indignation at the bridgeroom who exclaimed to the choking servant that he had to who exchange to the choicing servant that is had to go to the city, and rushed out with the blacks tunni-tuously following bin to the gate, one yard from the door-stop. The money value of the fretting, and finning, and worry, aud care, consequent upon the discovery that a chimney will not draw, may be cal-culated; but when balf-a-dozen chimneys rebel, the unit bacread helief; of canzes the cloude of emote sum is beyond helief: of course the clouds of smoke such as before meet. of course the course of an added that rehelilously will not roll up the chimney, but prefer going out by the door or the window, are endured in the hope that, when the chimney is dry, all will be right, but in the meantime the ceiling, the paper, and the paint get discoloured, and the to must bave no fire, or go to a chimuey-doctor. must ouve no ney of gy to a white wisard, engages to unbewith the chimney with a patent top, good in some cases on principles which he does not under-stand, and when at last the patient victim will try norre tops, he gets as a parting blessing the hint that perhaps there is a brick too much, or perhaps a brick too little is the advices.

perhaps there is a first too meet, or perhaps a brick too little, in the chinney. A guileless and uneducated portion of Eaglish householders, living in London, also appears to have a belief that all these points fall under the notice of the district surveyor. He is to be paid, the Act of Par-lianent says, and of course be is to do something for his money. Several district surveyors could tell you that they are often expected to do, for their fee of shillings, as much work beyond what the Act requires as an engineer would charge guineas for. It is desirable that the fiction of every Eaglishman's having a knowledge of the laws was in this case a fact: the district surveyor's duty is simply, on the part of the State, to watch the building owner, the architect, and the builder, and to see that they do not, from iguorance, carelessness, wilfulness, or misapprehension, transgress certain rales laid down in the Act.

If the public expects that any architect cau possibly see every brick laid, every heap of mortar made, every briek laid, every heap of mortar made, every bine done, it makes a mistake which should be everythin rectified. rectified. It might as well expect Mr. Rowland Hill to weigh every letter that passes into the Postoffice

Thus are houses built to he sold, and the question arises, can any better houses be built under the pre-sent system of competition ?

It is want of education, and also fashion, which allows the public to rent or buy any such houses at all, and which allows the huilders to erect such houses; and, as the attention of the society ap nears nouse; and, as the attention of the script appears to he especially turned at present to popular educa-tion. I hope that these observations, on points which are not thus treated in any hook, will he acceptable, as giving some insight into those most useful, but too much neglected, portions of knowledge as regards a subject to a unread by the avoid of the hearner much neglected, portions of knowledge as regards a dwelling. It is supposed by the public that because all orunament has not heen set aside economy was not a great object with the speculstive builder. This is a great fallacy. Where absolute partiamony is required, all orunament must be set aside, but when economy is the object, orunament is frequently requisite, for the desire to have some decoration in his dwelling is neual, perhaps inherent, in man; and speculative had huilders know the fact so well that they think rightly it is economical to spend some of the money saved hy bad construction on decoration. Thus the graining or imitative painting is an effective investment of or initiative painting is an encetive mixes men of capital. There are few eyes to which colour is not attractive, and an empty bouse, decorated in the best taste, if that be a simple one, is not casily let. It seems necessary to hang gaudy papers, and to paint the woodwork in imitation of oak and maple. The moment the bouse is furnished this effect disappears : the spots of gaudy paper that appear smong the fur-niture are obtrusive and uncomfortable : as for the niturc are obtrusive and uncomfortable : as for the woodwork, nohody sees whether the imitation be good, Woodwork, honory sees whether the initiation degood, had, or indifferent; and there only remains the vsr-nished marbled paper of the staircasa,—that is cono-mical, because the colour is desirable as giving an air of comfort, and spots of dirt are supposed to be part of the pattern. There can be no faith in the cleanly holds of meanly who are used as a set of the state. of the pattern. There can he no faith in the cleanly habits of people who put up a varnished paper on the stairease. The question of *slam*, as it is now gene-rally called, is intentionally avoided this evening: it is crough for my purpose to say that the imitation for doors, shutters, and skirtings, of woods that can-not be afforded, is generally a profitable investment of capital, like most of the other decentions by which we keep up appearances, ---deceptions which are re-garded by some earnest persons as offences less against good taste than against morality and political

At first sight it would seem that the investment of At next signt it would seem that the investment of capital in houses is a speculatiou to the recommended, either to a person wishing to purchase a residence for himself, or to a person having a little money to invest, For suppose the sum to be invested is 1,350%, and he For suppose the decides to build for himself hy unlimited competition be may get the following tenders (which have really occurred), I,497/., 1,445/., I,325/., I,298/., 1,198/. average 1,352/. If he takes the lowest tender he saves 150%. that he may find at 3 per cent, and will give him hack his 1,200% in seventy years. Perhaps be lets the house on lease, and avoids the repairs; but if not so lucky, he can usually manage to pocket three If not so tucky, he can usually manage to pocket three years' reut in seven, and if content with a clear profit rent of 7½ per cent. (instead of teu geuerally asked), he fancies that he sees in thirty-five years 1, 3507. In rent, without reckoning compound interest, and the honses to sell, and the 4127 made by bis original saving, and you will say that a house ought to clear more than three years' rent out of seven. But it does not, somebow, if it is not a good built house. On the other hand, if the 1,350/. had heen spent,

the huilder would only faney that he saw in thirty-five years I,3507. in rent, without compound interest, and the houses to sell; for such houses will fetch no the houses to sell; for such houses will fetch no more rent from a sensible public than the had ones in the same street: it nust drop its rent to the 90.7 which its competitor ena afford to take. Is it in human speculation to resist these results. Whom does it hurt? Why should the builder be forced to spend the extra 1507, ou each house or set of

The policy of honesty in building only shows itself afte a time

after a time. Every year of a badly-built house may he said to cost at least one-third of the rent in repairs : if they are not done the house goes to ruin at once, and many persons have not more spare money than that which they have invested : several such houses require that they nave invested: several sole noises require inde a man shall have capital, and the speculative huilders generally have little or none. Our modern houses are so badly huilt, that even speculative huilders now find it difficult to sell a lease,

and can scarcely get any one to take a seven, fourand can scarcey get any one to take a seven, non-teen, or twenty-one years' lesse: people begin to see the advantage of taking a honse on trial, and a three years' agreement is the consequence: at the end of that time so much is wanting to the honse, that the trouble and expense of moving is balanced by the incompanions of honize neglines. inconvenience of having workmen in the bouse, and by the discovery that not far off there is another new bouse to be let for three years, decorated after the latest fashion.

Intest fashion. In seven years the 1,2007, honses will have demanded the ontay of 1807, but the 1,3507, houses nothing : and suppose that neither have let, the truth gains at one. In fourteen years the 1,2007, houses will have cost 3607, in repairs, but the 1,3507, houses perhaps only 907. In the first fourteen years the 1,2007, honses may have luckily produced 5407, clear: the 1,3507, honses are hardly likely to have lost more than three tenaots, and would then have produced 9907, so that the halance on the side of good huilding at the end of fourteen years is, 9907.—902—900 against 5407.+1507, and interest, or 9007, less 7657.=1357, more than the bad huilding gives. It is quite true that at the end of the first seven

This quite true that at the end of the first seven years the rents may fall equally, but the proportion of profit will atter in favor of good building. The great damage that a bad house does to a good

one in the same street, or near it, is to reduce the rents and the market values to the same level. All All bonses have suspicions characters in the eyes of a pur-chaser at auctions. But when thirty five years have chaser at auctions. But when thirty-five years have expired, the 1,200% bouses will not be so good, with capired, the 1,200% bouses will not be so good, with all the money spent on them, as the 1,350% bourses, and at the end of seventy years, if not much sconer, their value will have perished, but the 1,350% houses will fetch about as much in thirty-five years as at present.

present. Aod society is interested in the question. Although the saving opparently of the 150/. is considered, there is a loss to society of 720/. on the 1,200/. bouses, but the repairs of the 1,350/. bouses are only a loss of 382/, so that society loses to the individual 338/. on every 1,2007. spent in bad building. 1 leave the importance of this subject to yourselves.

Speaking of honesty, I must not omit to mention that the speculative builder has a great advantage over that the speculative builder has a great advantage over the private huilding owner in the discounts allowed hy the trades, which allow him to sell his building, *while finishing*, at prime cost; whereas the private owner has to pay his builder that "prime cost," and a profit, and in large works prohably the amount paid to the architect for looking to his interests, before he can sell; and therefore he cannot afford to sell at huilders' prices : if he attempts to sell by auction, the scamped work of the speculating builders has ruined his property before he finished. But if he can hold the property, he can beat the others hy his honesty. honest

honesty. Thus I have shown you the various characters and difficulties of the building owner, either as a com-mittee or as an individual—of the architeet as an agent, whether professional or quack—of the builder, as a monopolist and a tradesman—and of the specu-lative builder. I have shown you the situation of many of our old London houses according to their age, and you can see their duration as well as myself. I have shown you most of the chief defects that exist in modern buildings, with many of the causes of their early ruio. I have shown you how, if good, their cost, at first, is extravagant to the building owner, but if bad, a good investment at the moment to the specu-lative huilder; and I trust that I have shown you lative huilder; and I trust that 1 have shown you that if the systems which I have condemned arc con-tinued, no blame for faults of construction or want of beauty in our buildings can justly be attributed to the members of the profession to which I have the honour to helong.

THE FALL OF WALL, RUSSELL-PLACE, COVENT-GARDEN.

Ar the adjourned inquest on the sufferers through this unfortunate occurrence, a joint report from Messrs. Parker and Hakewill was read, setting forth the particulars we have already given, and proceeding thus :-

thus:— "The appearance of the back wall fully bears out the assertion of its apparent soundness. The bricks them-seless are remarkably sound, and the moritor strong and binding, so much so that large masses of brickwork may the base, and formed a beap of rubbish. This has been broken off at its base and failen flat, and but for the crushing of the floor on which it fell would have settled a parement as even, nearly, in surface as the wall pre-sented before its fall. This is scarchy the effect presented by a new bondary wall when blown down by the wind. The portion of the wall also remaining in the basement is premarkably strong, and is even capable of being built appon agin.

is remarkably strong, and is even capacity of vong such appon again. The cause of weakness, entiroly hidden from the eye, existed at the exact level of the ground falcor. Here, for a space of about 18 inches ahove the underside of the well-plate, the morts had become deteriorated by damp, the drainage of the stables; and at this level a piece of bond-

timber inserted in the middle of the wall had become entirely decayed, the greater portion having quite lost its fibrous nature, and the mortar having become a light earth or mould, and in the courses of the brickwork imme-diately above innumerable cockroaches and mealworms

earth or mould, and in the courses of the brickwork nume-diately above innumerable cockroaches and mealworms were living. The wall-plate of the ground floor of the removed houses entering the wall at this level, further weakened the wall on this side, so that the whole wall practical the state side, and thus far fully only the slightest isteral pres-side, and thus far fully only the slightest isteral pres-ring on the side of the state of the stable build-ing, which is a lean to root of the stable build-the bouse to the front wall of the stables. d on

The coroner, in summing up, said it had been the bit of inries to return a verdict of "Accidental Incorport, in summory up, suit had been the habit of juries to return a verdict of "Accidental death" whenever the evidence fell short of a criminal charge. That might have been a very barnless course as the law formerly stood, but since other remedies were afforded to the friends of the decensed by properding in another court has the thereby it proby proceedings in another court, he thought it pos-sible that iu some cases a verdict of accidental death sible that in some cases a verdict of accidental death might be improperly used as a plea against any sub-sequent proceedings by the relatives of the deceased. Therefore he would suggest, if the jury felt that, although there might not attach any criminal respon-sibility to any person, yet something had been omitted to be done which ought to have been dooe, they might steer a middle course, and, instead of returning a verdict of accidental death, they might say that the deceased came to their death by such and such means, caused by such and such circumstances. Thus the parties reading he left free to take whatever other

coused by such and such or such and such fields, parties would be left free to take whatever other course they might think proper to adopt. The jury then retired; and, after being absent about three-quarters of an hour, they returned and delivered in the following verdict: — "That the decessed, Monries Fixeribhen and Lohn Shehm came to their Maurice Fitzgibbon and Jobn Shehan, came to their deatheby the falling of a wall, some portion of which being in ao unsound state, not externally visible; yet they are of opinion, through an error of judgment, sufficient precaution was not taken to secure the source. same.

COMPETITIONS.

Lichfield Museum. - From a large number of designs, the committee have selected three, namely, those prepared hy Mr. Craoston, of Birmingham; Mr. Veale, of Wolverhampton; and Messrs. Bidlake and Lovait, of Wolverhampton; and have requested three gentlemen to re-arrange their plans to suit another and more convenient site. The amended drawings were to go in on the 25th instant.

Tamworth Workhouse .- The guardians have se-lected the design of Messrs. Briggs and Everal, of

Birmingham. Birmingham. Hearmick New Cemetery.-Warwick New Cemetery.-The Warwick Burial Board have decided in favour of the designs of Mr. Edward Holmes, of Birmingbam, architect, which consist of two chapels, united hy a covered archway surmounted by a bell-turret; two robing-rooms, lodge, &c. The Episcopal Chapel is placed to the lodge, &c. The Episcopal Chapel is placed to the right, and the Dissenters' chapel to the left, and are different in design, the former being of the Early Decorated and the latter of the Early English period.

THE CRYSTAL PALACE.-HANDEL FESTIVAL.

THE programme issued by the Crystal Palace Company, and published in our advertising columns, shows that there will be no falling off in the attracanove that there will be he handling of a the attribu-tions of the coming season as compared with the last: the opera concerts (with the addition of the Cologne Choral Union), the flower shows, the great waterworks, and other events of last year, will be

repeated. We should be glad to see some intimation of an intention to render more available, in an instructive point of view, the architectural courts and the artis-tical collections. We have before suggested a series of conversational lectures at stated periods, illustrated by the contents of the huilding, and should be glad see it attempted. te

to see it attempted. The arrangements for the iotended Grand Handel Festival are being proceeded with rapidly. The orchestra, already completed, crequies a space of 168 feet in width (38 feet wider than Exeter-hall), and 90 feet in depth. The soats for the performers are raised, one above another, so that every instrumentalist and vocalist can have a full view of their mentalist and vocalist can have a full view of their conductor. The band will he in front, the chorus at the back. The aspect presented by this coormons superstructure, when erowded from roof to hase with singers and players, can bardly fail to be one of the most imposing description. Below, the beams of timber, screwed and bolted together (there are no nails), with their stage and struts and bearings, pre-sect the appearance of a complete forest of wood-work less scientific at first sight than further examiwork, less scientific at first sight than further exami-

nation shows it to be. The organ constructed expressly for the occasion by the firm

by Messrs. Gray and Davison, will occupy a platform of 40 feet wide by 24 deep, which will not only afford sufficient room for the pipes to speak, but ample passage between each division, so that any department of the structure can be approached without difficulty. The weight of the new instrument will be somewhere about 20 tons, and will demand a platform of the most solid and durable nature.

PROVINCIAL NEWS.

Norwich .-- The Norfolk County Lunatic Asylum is to be enlarged so as to accommodate sixty additional to be enlarged so as to accommodate sixty additional patients of each sex. It is also proposed to supply the establishment with water by means of a steam-engine. The expense of the works is estimated at 19,925.1, and at the Norfolk quarter sessions, the plans anhmitted were approved, and the money re-quired was ordered to be borrowed, and repaid by instalments in thirty years. The plans have been prepared by Mr. J. Brown, county surveyor. *Wrantage*.—The new schools attached to the Wes-levan change here were onened on Good-Fridar. The

propared by Mr. J. Brown, county surveyor. Wantage.—The new sebools attached to the Wes-leyan chapel here were opened on Good-Friday. The new building comprises a school-room 40 feet long and 19 feet wide, entered hy a porch 9 feet by 5 feet, two class-rooms respectively 28 feet by 17 feet, and 20 feet by 16 feet, with offices, &c. It is built on one side of a square plot of ground behind the chapel, having a krge playground in front, and is designed to har-monize with the chapel, with grey bricks and Bath stored ressings. The principal entrance is from Back-street, uoder an archway. Messrs. Poulton and Woodman, of Reading, were the architects J. Reading.—We understand, says the local Mercury, that the Government inspector has pronounced the rooms in Bridge-street unit for the purpose of a

rooms in Bridge-street unfit for the purpose of a school of art and design; and the committee arc now making arrangements for the erection of a suitable building, adjoining the New Hall, London-street. *Pelvorth* (Sussex).—A girls' school is about to he

erceted at Byworth, in this parish, the whole cost of which will be defrayed by the liberality of Miss Constaoce Wyndbam. The foundation stone was laid which will be detrayed by the internation of bits Constance Wyndham. The foundation stone was laid on Tuesday last. The huilding is to be constructed of local stonc, with ornamental brick dressings; the roof being covered with coloured ornameotal tiles. The design is furnished by Mr. James Castle, of Outcod Oxford.

Brighton .- At the recent county s Brighton.—At the recent county sessions, the com-mittee for building a County Lunatic Asylum reported that they had obtained tenders for a loom of 32,500. in instalments from the London Life Assurance Society, at 41. 10s. per cent. per annum. They had accepted a tender for building the asylum from Messre. Rees and Ayres, of Dover, for 36,0001. and 8001. addi-tional, the cest of making the external walls (shove 9 inches) hollow, to keep them from humidity and dampness. The contractors had entered into security of 5,0000. for the due performance of their contract. The report was adopted. Bridgnorth.—The new public hall has at length sions, the com

The report was adopted. Bridgnorth.--The new public hall has at length heeco completed, and fitted up with gas futtings by Mr. Gill. The room is still very damp, and will not be fit for opening for some time. Bristol.-The foundation stone of the Wesleyan reduction and the source of the site formation

Bristol.—The foundation stone of the Wesleyam Day Schoole, in course of creation on the site formerly occupied by the Circus, North-street, was laid on Tnessday in last week. They are to he upon a some-what extensive scale, accommodation being provided for 600 children, including a large number of infants. The cost of the building will be upwards of 4,0007. a considerable portion of which has been contributed by the Budgett family. Nearly the whole amount has already heen obtained. The building will be in the Tudor style; the walls of Pennaot stone, with freestone dressings. The ground-floor will contain a school-room for 200 infants, and an industrial school for givls. A large class-room, fitted up with a gallery, is attached to cach school-room. A stone state for girls. A large class-room, fitted up with a gallery, is attached to cach school-room. A stone staircase leads to the first-floor, which is occupied by a school-room, 60 feet by 31 feet, for the accommodation of about 400 children of both sexes. Two large class-rooms, fitted up with galleries, open into this room. A residence for the moster forous part of the building. There will be a playground in front of the schools, about 200 feet long by 40 feet in width, covered in a citter end and fitted up with swings. The architects are Messes. Fosler and Wood. The contractors are, for the mason's work, Mr. John King; for the car-penter's work, Mr. Thomas Morris; for the tiler's work, Mr. James Diment; and for plumber's work, &c. Messes. Gibbs and Thatcher.

Messrs. Gibbs and Thatcher. Coalbrookdale.—The Coalbrookdale Company had brought before them at their last meeting a plan for brought before them at their nas meeting and news suitable buildings for a library, reading and news room, &c. for the members of the local Literary and Scientific Institution. The plans were approved of, and have been placed in the hands of the architect. The necessary funds for the creation will be supplied

Birkenhead .- Negotiations are said to bave heen going on between the county magistrates and the Birkenhead commissioners with reference to the erecbit contrast commissions with reference to the effective tion of a new bridewell in the township, and the commissioners, it is also said, will recommend, at their next monthly meeting, the erection of a town-hall and hridewell on the vacant piece of land on the south side of Hamilton-square. The plans are said to he from the office of Mr. L. Hornhlower.

from the office of Mr. L. Hornhlower. Leeds.—The opening of the covered market just crected in Viear's Croft, took place on Thursday in week before lust. The building, so far, is in the Tudor style. The designs were prepared hy Mr. Charles Tilney, late borough surveyor, and improved hy Sir Joseph Paxton. It has been erected by Mr. George Nelson, of Leeds, under the direction of the present borough surveyor, Mr. Filliter, and is constructed almost errveyor, Mr. Filliter, and is constructed almost ex surveyor, Mr. Filliter, and is constructed almost ex-clusively of iron and glass, in the manner of the Crystal Palace. The building covers an area of 4,040 square yards, being 300 foet in length by 132 in width, and 35 in height, the west front running parallel with Viear-lane, the south end with Kirk-gatc, and the north end with Ludgatc-hill, the castern side fronting the wholesale market, to the cast. It contains forty-free stands, the in-terior being lighted up at night by 200 lamps in clusters around 196 iron pillars. A glass screen sur-clusters around 196 iron pillars. clusters around 196 iron pillars. A glass screen surrounds the building above the shops, and the entire space is covered in by three longitudinal roots. A guiltery can be constructed at a slight additional cost. There are seventeen cutrances, including three at each There are seventeen entrances, including three at each ead, which are closed by large ornamicatil gates. The contract was let to Mr. George Nelson, for 10,854/. The total cost, up to the present time, has been 33,869/. the extras being 2,329/. besides other items amounting to 6857. North Shields. — The private drainage in North Shields, says the local Gazetle, is progressing rapidly under the direction of the borough surveyor. Upwards of two thousand homes have new theor dwards and

under the direction of the borough surveyor. Upwards of two thousand houses have now been drained, and those portions of the town which most required drainage, namely, Milhurn-place and the Low-street, have been completed with a few exceptions. The village of Tynemouth also has been got through. Higgan. —The first stone of a new Wesleyan school, in the Gothic style of architecture, to hold 200 scholare, was hold on Wedneedure in hert work, at

300 scholars, was laid on Wednes Lamherbead-green, near Wigan. Wednesday in last week, at The school is to called the Atherton Wesleyan School. It is intended to creet a chapel adjoining the school at a future period. The architect is Mr. Wilson, of Bath. period.

CHURCH-BUILDING NEWS.

Richmond. -The foundation-stone of the propo sed new church on Richmond.hill was laid on Esster Tuesday, by C. J. Schwyn, Esg. Q.C. It is situated on a heautiful site, the gift of the late Mr. W. Selwyn, whose intentions have been liberally carried out by his son. The architect is Mr. G. G. Scott, the builders Massre Fursh and G. Bichardt out by his son. The architet is Mr. G. G. Scott ; the builders, Messrs. Piper and Son, of Bishopsgate-street. The courch, when completed will seat 950 persons on the floor, and consists of a nave and two values, characteristic a may end where and side chapels, and a noble tower and spire, 197 feet in height. The style is the later period of the Early English; the material Kentish rag-stone, with Bath stone of a hard quality from the Box tunnel. The contract is for 8,1752.; but this does not include the upper stories of the tower and the spire. The prin-cipal feature is the west front, with its centre doorway cipal feature is the west front, with its centre acorway and large circular window, the tower being incor-porated in the church on the north-west angle. The church is well situated for the wants of the locality, church is the site of the local to the and it is hoped will prove an advantage also to the numerous strangers who flock to this heautiful hill on Sundays. Upwards of 5,000% have been sub-scribed; but much more is required for the comple-

a scribel; but much more is required for the comple-stion of the work. Witsford.—On 13th inst. the foundation of the meretored parish eburch of Wilsford-cum-Lake was haid by Mr. Loder, of Wilsford House, who has under-taken as this own expense to take down and rebuild habe old church, nuder the superintendence of Mr. 1.T. H. Wyatt, the diocesan architect.

Kettering.—The organ of Kettering church has ten removed from the west gallery, and placed in the chancel near to the choir. There is now no in-Actienting. The open to see sallery, and placed in the chancel near to the choir. There is now no im-pediment in the way of throwing open to view the revestera window, which too, as seen from the in-terior, through the second story of the tower, would eincrease the perspective of the church.

THE BUILDER. to by the meeting. The restorations will cost no. wards of 4.000/

Bedminster .- A new church will we understand ho sbortly commenced near Bath-bridge, in the parish of Bedminster.

of Bedminster. Stapleton—The parish church of Stapleton, rebuilt by the late Bishop of Gloucester and Bristol, was con-secrated on Wednesday in last week, by the Bishop of Oxford. The new church stands on the site of a church of ancient date, the plan of which comprised church of ancient date, the plan of which comprised thread merge and wastern tower but with the chancel, never, and western tower, but, with the exception of the tower, which was heavy and low, no part of the original structure remained, baving been rebuilt in the debased style of the eighteenth century. The new structure occupies the space of the original plan, besides a considerable extension laterally and at the west end. The plan consists of chancel, north chapel, nave, north and south aisles, western tower, chapel, nave, north and south aisles, western tower, and north porch. The following are the several dimensions. - Chancel, 35 feet long by 30 feet wide; chapel, 22 feet by 13 feet; nave, 68 feet by 21 feet; aisles, each 68 feet by 14 feet; tower 14 feet 6 in. by 14 feet; porch, 10 feet by 9 feet 9 in. The main walls are 2 feet 6 in. thick; and the tower, 3 feet 6 in. and 4 feet. The material used is the local Pen-nant sandstone, of a blue tone of colour, and the several dressings are from quarries in the neigbbour-hood of Bath. The style is Middle Pointed, of a character more than usually ornate. The nave is character more than usually ornate. The nav separated from the nisles ou either side by an ar d of five bays. The great cast window is of five lights. the mullious and jambs enriched with small shafts o Devonshire marbl The side walls of the chancel are pierced with two-light traceried windows, the south isle wall with five three-light windows and two of four lights in the gables ; and the same arrangement occurs in the north aisle, with the exception of the second hays where the porch occurs. These windows are filled with tracery of varied character. The western tower forms the principal entrance through a carved doorway. The tower is lighted by a three-light window, which, owing to the unusual importance light window, which, owing to the unusual importance given to the doorway under, is dwarfed in proportion. The face of the walls (except the chance) is stuccood and coloured. All the roots are acutely rither and as there is no elerestory the height of the nave and aisles is nearly the same. The roots (discept the chance) are formed of stained and varialistic deal, and covered with boarding. The chancel vior of is earved in English oak. The enst chancel window is filled with painted glass by O'Connor, the subject of the Crucitizion occupies the upper plant, and below are subjects illus-trating the life of our Lord. The western tower occupies the upper part, and below are subjects mus-trating the life of our Lord. The western lower window is by Haghian, and forms a special memorial to the founder by the inhabitants of Stapleton--a kneeling fagure of the late prelate heing represented offering up a model of the restored church. The large knocing figure 37 the late prelate heing represented offering up a model of the restored church. The large four-light window at the east end of the south aisle is the work of the Misses Monk: the subject is the Adoration of the Magi, with angelic figures in the tracery over. The other windows in the south aisle are also the work of the Misses Monk, assisted by Mr. Bell, of Bristol. The centre area of the nave and sides is floared with red Steffordbirding the Athenael Mr. Bell, of Bristol. The conre area of the have and aisles is floored with red Staffordshire tiles, the chancel floor with Minton's coloured tiles, the sanctury with eucaustic tiles, the patterns enclosing emblematic figures. The seating throughout is simple, and formed figures. The seeing throughout is simple, and formed entirely of English oak, affording accommodation for nearly 500 persons. Externally the chief feature is the tower with spire, rising to a height of 170 feet. A greenish slate is need for covering the roots. A low dwarfed wall surrounds the churchyard. The architecture area for Northers, the dock of the The architect was Mr. Norton; the clurchyard, The architect was Mr. Norton; the clerk of the works, Mr. Wilkinson. Mr. Stamp, of Bath, was the contractor for stonework; Mr. Hughes, of Bristol, the for woodwork; Mr. Canter, for slating and plaster-ing; Messrs. Edbrooke and Leaman, for smith's work; ing; Messrs. Elbrooke and Leaman, for smith's work; and Mr. Gibbs, for plumhing. The wood and stone carving was excetted by Mr. Farmer, of Loudon. The ebancel and side chapel were rebuilt by Mr. J. G. Smyth, of Ashton Court, under the superintendence

Mellon Mowbray.—The rectory at Pickwell, Melton Mowbray, which has been building for some time past, is at length completed. It is huilt of stone, in the Tudor style. The architect was Mr. C. H. Ed-wards, of London. The builders were Messrs. Tyler, Smith, and Kitchen.

Smith, and Kitchen. Market Harborough.—A meeting was held in the Townhall, on the 13th inst. to consider as to making various alterations in the church, when the report of Mr. Law, the architect, was read; and the alterations, including the restoration of the whole of the body of the church, at a cost of 4200.; and of the stonework, arches, piers, cleaning and oiling timher, at a cost of 1600. were unanimously agreed to. Iptwich.—Tenders have heen received for the repair and restoration of the tower and the north and south

STAINED GLASS.

Worcester,-Three stained glass windows have heen presented by Mr. Perrins, of this city, to the church of St. Nicholas, and are put up at the east end. The windows north and south are each a single light, and the central one is circular. The subjects are allegorical. Mr. G. Rogers, of this city, executed light the

Bebington .- A window, according to the Chester Bebington.—A window, according to the Chester Chronicle, has heen put up at the east end of Bebing-ton church, in memory of a daughter of the rector, who was accidentally killed by poison. The centre east window was selected, and the committee deter-mined to unite the great truths of the Christian faith with the more peculiar subject of the memorial. It is a large window,—very late Perpendicular. The death and ascension of our Saviour were fixed on as the lower and upper centre subjects, occupying three lights each. The four side lights were devoted to the memorial. They represent the life of a fenale Christian, in subjects from Scripture. The design of Mr. Wailes, of New, They represent the ine of a female Christian, in subjects from Scripture. The design of Mr. Wailes, of New-eastle, was selected from others, and on Saturday be-fore last, the anniversary of Miss F. Feilden's death, he put in the window. It is in the pictorial style of the date of the window, the reign of Henry VIII, in some respects modified hy modern improvements. *Doneaster*.—A window is heing put up at Christ *Church*, Doneaster, to the memory of the late Mr. G. Jarratt Jarratt, the late patron. The new eastern window will be 22 fet 6 in others hich and 11 feet is

Church, Doncaster, to the memory of the late Mr. G. Jarrati Jarrati, the late patron. The new eastern window will be 22 fet 6 inches high, and 11 feet in width; that is, the space occupied by the stained glass. It will consist of five lights; the centre one being 2 feet wide by 14 feet 10 inches: the four lesser lights will be 1 foot 8 inches in width, and 13 feet 10 inches high; the tracery forming a large wheel at the top of the smaller lancet window, filled in with three trefoils. The centre and the two side lights are each lancet windows: and the two side lights are each lancet windows; and the two side ones support the wheel. The stained glass will be from M. Capon-nière. The stonework is nearly finished by Messrs. Ireson ; and the cost is to be defrayed by Mr. George Jarratt, the patron of the living.

Jarrat, the patron of the living. Blackburn.—A memorial window bas just heen gwt up at St. John's Charch, Blackburn, consisting of a pointing of the Nativity, and figures of St. Paul and St. Peter, with the usual endhematical designa. The work bas been executed by Mr. Baillie, of London. The comuniton-table bas been surrounded by new railings, carved, in imitation of antique oak, the pre-sent of Mrs. Marlen, wife of the incumbent. There are also a new pulpit and reading-desk, excended in a corresponding style, the expense of which will be de-frayed by subscriptions. The carved work on the executed hy Mr. Shaw, of Saddleworth.

CRUEL AND UNWHOLESOME SLAUGHTER. HOUSES.

THE able observations in a recent Builder on secret. or public slaughter-houses have not only respect to wholesomeness (for what animal killed in a feverish wholesomeness (for what animal killed in a feveriab state, and after torture, can bave or bequeath its flesh in a proper state?), but to bumanity. And will it be thought bitter or malicious to any that those who are knowingly and systematically indifferent to the sufferings of animals deserve much less pity for the "Nemesis" of their sufferings, from the in-jurious condition in which the flesh comes hefore them? At least treaty-five years ago the eligibility of public abattoirs (alanghter-houses), as in Paris for them to before max newsed on the backies in the

some time before, was pressed on the English public. The old slaughter-honses have often had such cruelty The out assigned - nonset have often had such cruckly practised in them by irresponsible mem-too often of hrutalized feelings—that it is actually "a shame to speak of the things that are done in secret." But it is a proved fact that sheep thrown down into under-ground cellars have had their legs broken, and have been left in that state, some twenty-four hours, till alled Nv setimeline. killed. No rational persons would suppose that con-ducive to wholesomeness. It even seems a useless piece of cruelty to pen them in the slaughter-house whilst they see their fellows killed.

whilst they see their fellows killed. But of all disgraces to a humane age towards ani-mals, the cALF torture is perbaps the worst. The treatment of this poor unoffending animal, to pander to an ignorant or else very unprincipled taste, which called for the animadversions of *Smollett* in "Pere-grine Pickle," who described the animal as "para-grine," as in fact it is by the ante-death sufferings; and the flesh (denounced by physicians as unwhole-some), in this unnatural state, as resembling "a *fricassei/of* kid gloves," was brought hefore the public several years ago in the *Builder*, and elsewhere; and it was said, in the former case, that, after discussion in the local papers, the hutchers at Derby bad come forward with a wish to give over the present crud practice. Every humane man might well put him. Encrease the perspective of the church. Bromsgrove.—A numerously attended meeting of the ratepayers and inhabitants of Bromsgrove was held at the Town-hall, on Wednesday in last week, for the purpose of receiving the report of the com-mittee appointed to take steps for the proposed restors. tion of the parish church, and to authorise the view and churchwardens obtaining a facelity for that pur-spesc, both of which objects were unanimously agreed 2944. 10s. 100 were unanimously agreed 100 were unanimously agreed

A CRYSTAL PALACE AT VIENNA.—The construc-tion of a Palace of Industry for the Vienna Exhibition is about to be commenced. It will be situated in the Schwartzeuberg garden, in that city. The exhibition does not take place mult 1859. THEE LIBRARY, PICTURE GALLERY, &C. FOR BALTINGR.—M. Peabody, the American merchant, has recently presented to the city of Baltimore the sum of 300,000 dollars (to be increased ultimately to one million), for the establishment of an institution comprising a free library, musical academy, and pic-tare gallery. gallery tare

tare gallery. Discovers of a ROMAN VILLA. — In Danny-park, Hurstpierpoint, according to the *Brightom Gazette*, the remains of a Roman villa have been hrought to light, near the Roman camp on Wolstanbury-hill.

to light, near the Roman camp on Wolstanbury-hill. RAHWAY TRAFFIC.—The traffic returns of the railways in the United Kingdom for Easter week, amounted to 440,2914, and for the corresponding week of 1856 to 407,3757, showing an increase of 32,9167. The gross receipts of the eight railways having their termini in the metropolis amounted to 187,0237,; and last year to 170,5647, showing an in-crease of 16,4597. The increase on the Eastern Counties amounted to 4,1997, ; on the Great Ner-thern, to 3577,; on the Great Neetron, to 2,2677.; on the North-Western, to 2,0067.; on the Blackwall, to 817, on the Brighton, to 3,1867.; on the South-Western, to 1,0987.; and on the South-Eastern, to 3,3157.; total, 16,4597. The receipts on the other lines in the United Kingdom amounted to 253,2687. and for the corresponding period of 1856 to 236,5117.; and for the corresponding period of 1856 to 236,8117.; showing an increase of 16,4577.

ROYAL INDUSTRIAL EXHIBITION OF BELGIUM. ROYAL INDUSTRIAL EXHIBITION OF BELGUM.— Last week's Gazette contains a copy of a despatch from the British minister at Brussels, enclosing an official notice that "An exhibition of designs, models, and finished works, connected with the industrial arts, the productions of Belginas or foreigners, will be opened at Brussels on the 15th August, 1857," by the Brussels Suciety for the Encouragement of Indus-trial Arts trial Arts.

THE ARTS. THE ART. UNION OF LONDON.—The annual general meeting of this important Association will be beld in the Theatre Royal, Haymarket, on Tuesday next, the 28th instant, at eleven for twelve o'clock, to receive the report of the committee, and distribute the prices. Lord Montacel will perside.

28th instant, at the committee, and distribute the prizes. Lord Monteagle will preside. PRESERVATION OF LEAVES.—Feeling the necessity of studying folinge from a trait types. I have made a collection of leaves, &c. for that purpose, but 1 find that in a very short time they become so shriveled as to lose a deal of their original shape, or are so crisp as to break whenever they are touched, and mounting does not remove the difficulty. I am told that botaists have a way of preparing leaves, by which not only the beauty of form is retained, but the colour also. Now, if one of your numerous correspondents can give me any information on this subject, it will confer a great favour upon—R.W. II.

2010ar halo. Taylor, if one only information on this sub-ject, it will confer a great favour upon—R. W. II. Gawouxs.—A return has been published of all gasworks established by Act of Parliament in England and Wales, with various particulars, such as the charge per foot, the average quantity of gas evolved from a ton of coal, the illuminating power, and the cost. The London Gaslight and Coke Company charges from 4s. to 4s 6d. per 1,000 cubic fect (Newcastle coals), and 6s. for eannel gas. The average quantity evolved is 9,000 cubic fect for Newcastle, and 10,000 feet from cannel coals : 5 feet of annel gas equal to 26 candles. The imperial Gaslight and Coke Com-pany charges 4s. 6d. per 1,000 feet, and produces 9,518 feet of gas from one ton of coal. The quantity of gas evolved in London varies from 8,500 to 10,000 feet from one ton of coal, and the ulluminating power fect from one ton of coal, and the illuminating power from 12 to 14'2 eandles. The Phœnix Company uses

Newcastle and cannel coals mixed. HIGHLAND ROADS AND BRIDGES.—The forty-third report of the Commissioners of Highland Roads and Bridges es to Parliament has just heen issued. It states the operations of the commissioners during the that "the operations of the commissioners during the year 1856 have been almost confined to the main-leaance of the works in their ordioary state of repair, although a considerable proportion of the expenditure is referrible to the execution of repairs, the necessity for which occars only at long intervals." The total amount of ascessment payable in 1856 by the several counties, under the operation of the Road Repair Act, to the commissioners, was 4,5757. 9s. 7d. : in 1855 the sum was 4,7982. 10s. showing a dicrease last year of 2232. 0s. 5d. At December 31st last year, the balances to the credit of the general funds and the different toll accounts was 1,4882. 6s. 10d. that

UR especial art is so much interested in all that tends to make a knowledge and love of art general, that we have for some years past given a prominent position to the proceedings of the Art-Union of London, which was established with that object mainly in view, and has admittedly effected it to a considerable extent. The annual meeting was held as usual on the last Tuesday in April (the 28th), in the Theatre Royal,

Haymarket, when the Right Hon. Lord Monteagle presided, and a large audience testified to the in-

terest felt in the proceedings. On the chair being taken

Mr. Godwin, Honorary Secretary, read the following

10

REPORT:

The council of the Art-Union of London, in making their report to the subscribers for the twenty-first time, would recall to the minds of those of the present body who have not watched its progress from the rommencement in 1836 (when a subscription of 489/. bold, was raised with difficulty, the increased appre-tiation of art and artists on the part of the public now as compared with what it was then, the amount of money at this time annually expended on works of of money at this time annually expended on works of modern art, and the growing perception of the im-sortance to the country of widely-spread art-educa-tion. Not many years ago the sale of a picture at the exhibition of the Royal Academy was a rarity, whereas now, at that and the other established eshibi-ions of works of art in the metropolis, purchases to the extent of thousands of pounds are made each eason, irrespective of the sums spent by the prize-holders of the Art-Union. At the three eshibitions if oil-pictures now open, --the British Institution, the society of British Artists, and the National Institu-ion at the Portland Galleries, --purchases to the amount of 9,1037, have already heen made by the general public.

amount of 9,103/, have already heen made by the general public. The Art-Union of London has played its part, and an important one, in producing this state of public bpinion. Addressing itself by its popular charactor of the masses, establishing local secretaries, not nerely throughout the kingdom and its dependencies wherever an Englishman is to he found, hut in various other countries, and disseminating far and wide its prints, hronzes, statucttes, reports, and eat-ing the state of the fine arts. Since the estab-ishment of the Art-Union it has collected and dis-lishment of the Art-Union it has collected and dis-tributed for the heacht of art and artists more than a quarter of a million of money, which otherwise would bot have been so applied, and has led to the expendi-vare in the same channel of very much more.

quarter of a million of money, which otherwise would just have been so applied, and has led to the expendivate in the same channel of very much more.
The subscription of the present year amounts to the sum of 13,2187. 98.
I Each subscriber is entitled to, and many have already received two energavings,—one of "The Piper," hy Mr. Frederick Goodall, A.R.A.; and one "I" The Clemency of Creur-de-Lion," by Mr. Cross.
I For next year a painting, by Turner, of "Belmin's pictures conveyed to the Church of the vedeentore, in Venice," has hene cngraved by Mr.
T. Willmore, A.E.R.A.; and the prints will be cady for delivery in the spring.
The volume of etchings prepared for the Association hy the Etching Club is completed, and will be found very interesting. Copies of it, as prizes, will form part of the present distribution.

THE BUILDER.

year. They have also arranged for the production of an engraving hy Mr. Willmore, after the picture hy Turner, in the National collection, known as "Childe Ilarold's Pilgrimage."

It is sometimes urged as an objection to the Art-Union, that its productions, being issued to large numbers of persons, become in consequence common and valueless. This is not the feeling in which works of art should be viewed. It is not so in litera-ture: a book is prized for the instruction it contains, or the delight it affords; and the value of it as a work of mind, is in an decre lessend because action are of mind, is in no degree lessened because copies are multiplied in thousands, and the book is placed within the rasch of every one. The heatty of the woods and the glory of the sea are common to all, but are none

the less surely beauty and glory. Arrangements have been made with Mr. Thomas Battam for the production, in Parian statuary, of Gibson's fine group, "Venus and Cupid," with the kind concurrence of the Earl Yarborough, to whom it helongs

In the department of bronzes, Mr. Stephens has executed for the Association a group, "Mercy on the Battle-field," and is now producing it in bronze for distribution as prize

The medal, commemorative of Sir William Cham-hers, has heen completed by Mr. B. Wyon, and a certain number of examples will be allotted as prizes to dar to-day

In the Report of a committee appointed hy the Royal Institute of British Architects to examine the Sollages Collection, now in this country, and to advise as to the expediency of recommending the Government to parchase it for the nation, honourable testimony is horne to the long-continued endeavours of the Art-Union of London, in the face of difficulties, to encourage the production of artistic bronzes in England

Eucland. The extraordinary collection of decorative objects of utility, of the fifteenth and sixteenth centuries, referred to, shows, in a striking manner, the extent to which the hest obtainable art was then applied to the most ordinary objects, whether a mirror-trane, a pair of bellows, an earthenware dish, or the dining-room fire-dogs. Nothing was deemed too trivial to occupy the highest talents. Wanting in some impor-tant qualities as the works of this period may he, the Souldges Collection is nevertheless one of extreme value and should uncarectionable he murchased by the value, and should unquestionably be purchased by the Government as a means of instructing the public mind, and collarging the field for art-application. It has been often urged that taste in maunfactures, which gives a country the world for a market, is only to he expected where the fine arts aro properly encouraged

encouraged. Amongst the current art questions which occupy attention, the determination of the best site for the National Gallery is not the least interesting. The commission appointed to take evidence on the subject, and which is now sitting, doubtless feel the import-ance of a central situation, casily accessible from all parts of the metropolis, and it is to be hoped will not remove the cational collections from amongst the workers muless the most conclusive reasons for the workers, unless the most conclusive reasons for the change arc given. The widest facilities for the con-templation of noble works of art should be afforded to Itempiation of noise works of art should be altorded to the people; access to collections should be made more easy, not more difficult,—inducements to visit them should be increased, not lessened. The want of public collections of pictures, and other works of art, in our provincial towns, before urged by your council, is still a discredit to us, calling the more and the statement in the statement.

urged by your council, is still a discredit to ns, calling for removal. Nearly every principal town in France possesses its collection, open to the public at stated times, and largely resorted to, with great advantage to the country, both commercial and social. Art gives pleasures that ucver pall, and, amidst the bustle and combat of every-day life, will brighten the passing bonr, and exait the thoughts and feelings. "That pleasure which is at once the most intense, the most elevation of the most pressing bonr."

he most elevating, and the most pure, is found in the outemplation of the beautiful."* the mo

Of the amazing number of noble works of art basessed by private individuals in Great Britain, the xhibition of Art Treasures in Manchester, to be possessed by private individuals in Great Britan, the Exhibition of Art Treasures in Manchester, to be opened to the public in a few days, will afford ascound-ing evidence, and will give such an opportunity for the study of the history and progress of the arts, the characteristics of the various schools, the position of modern Eaglish art, its strength and its weaknesses, as a norme here area negative never hefore was provided. The Museum of General Art, too, which has been as

gathered together there from all parts of the country, will illustrate in a remarkable manner every sort of whit interface in a return to the interference of the series of the interference of the series of th issued by the Art-Union will form part of the collec-tion. It may reasonably be expected that this mar-* Edgar Allan Poe.

vellous exhibition will give an impulse to many branches of art, while it will afford wholesome delight to thousands.

them,—that of spreading abroad the works issued by the Association,—your council gladly accepted an in-vitation to place all the Society's porcelain statuettes in the Ceramic Court in the Crystal Palace. The valuable and brantiful collection there, affords many striking instances of the importance to a country, even in a pecuniary point of view, of cultivating taste and hringing art to the ail of its manufactures. The attention paid to the arts in France from the time of Louis XIV, the establishment of the royal manufac-tories of Lapestry, furviture, and china, the organiza-tion of drawing-schools, and other arrangements with the same end in view, have made Paris the manufac-tory for the world of objects of decorative utility.

the same end in view, have made raris the manufac-tory for the world of objects of decorative utility. From Anstralia, as heretofore, the council bave received large lists of subscribers, and it is noteworkly that in that distant land an association has been formed under the tile of "The Victorian Society of the Fine Arts," the main feature of which is an Art-Union

Union. The conneil have to lament the loss by death of two valuable collengues, in the persons of Mr. Seyit. Thrompson and Mr. John Britton; and two other vacancies have been caused by the retirement of Mr. C. Harrison and Mr. W. J. Smith. In their places, Mr. Thomas Grissell, Mr. Robert Hudson, the Rev. Edward Coleridge, and Mr. Heary Thomas Hope, have been elected. have been elected.

The reserved fund now amonuts to the snm of 7.6957 A full statement of receipts and expenditure will

A full statement of receipts and expenditure with the hereafter appended to this report. Such as the two members of the general hody of subscribers, Mr. J. Jones and Mr. J. B. Scott, whom the council beg leave to thank, and three members of the finance committee com mittee.

The sum set apart for prizes, to be selected by the prizeholders themselves, will be thus allotted, viz. :---

With the parmission of the Society of British Artisis, the prizes were as usual exhibited in their gallery to the subscribers and their friends, and afterwards to the general public free and without limitation. It would be unnecessary now to say that not the slightest damage was done, or impropriety committed during the exhibition, but that the fact, in aid of endeavours to obtain for the British public free access to collec-tions of works of art and public monuments, cannot he too often stated. It connexion with this question, the desirablencess of having the public exhibitions open on the Saturday's very generally felt. The steps now being taken to extend art-education in this country, enrying out views which have heen urged for many years by your council, nust hefore With the permission of the Society of British Artists,

urged for many years by your council, must hefo long hear good fruit.

The national collections, most valuable means of In mational collections, host visuate means of instruction, are becoming yearly larger and more important. The munificent set of Mr. Sheepshanks, to which the country owes the last addition, descrves to be widely known. Mr. Sheepshanks has presented to the nation his fine collection of 233 paintings and to the nation his fine collection of 233 paintings and 103 drawings, by British artists, on certaiu cay con-ditions, one being that a suitable building, to he called "The National Gallery of British Art," shall he crected, to receive it on or near the estate at Kensing-ton purchased by the Commissioners of the '51 Exhi-hition, together with any other works of art that may be subsequently placed there by other contributors, as he does not desire that the collection should hear his name. He has shown his anxiety to protect the interests of artists, by providing that any such cagrax-ing or reproduction of a picture that may be made shall be approved of hy the artist of the picture, and that he shall he paid whatever sum may he received by the ex-officio trustee for the sale of such right. The donor suggests that arrangements should he made, The donor suggests that arrangements should he made, so that the public, and especially the working classes, may he ahle to see the collections on Sunday after. may he and to see the concentions on summay inter-neons: hut this is not insisted on as a condition of the gift. For so good an act, so nobly done, Mr. Sheepshanks deserves the applause and gratitude of every lover of art and admirer of public spirit.

The huilding is now nearly completed, and the col-ction will prohably he opened to the public hefore

the expiration of the present spring. In reference to the subject of public galleries, it may be mentioned that the council bave had under to may be included that the content out is a back of a per-manent exhibition in connection with the society. The desirableness of producing artistic works in glass and in porcelain, to be distributed as prizes, has also been under discussion.

been under discussion. The intention of raising a public movument to the Duke of Wellington in St. Paul's Cathedrah has heen made to afford sculptors an opportunity to distinguish themselves, of which, we do not doubt, full advantage

themselves, of which, we do not doubt, full advantage will be taken. Let us express a hope that such a course may be pursued for the determination of the competition as will give to the highest merit the highest reward, and secure for the country a work of art worthy of the object and the age. Scuptors will soon, prohahly, be further appealed to, to suggest a design for a memorial of the Great Exhibition of '51. Funds have been provided, and the committee wait only for the consent of ber Majesty to place it in Hyde-park on the site of the building in which the Exhibition monument, the Government will have to obtain a devision on the projects, now in will bave to obtain a decision on the projects, now in Westminster-Hall, submitted hy British and foreign

will have to obtain a decision on the projects, now in Westminster-Hall, submitted by British and foreign architects for the public offices and the improvement and decoration of part of the metropolis. The artistical adornment of cities,—important to the calture of the dwallers therein, to their happiness, to their health,—concerns us nearly, and it is earnestly to be hoped that the occasion will be made to develop the talents of our artists, and to aid in rendering London as eminent as a city, for fitcess, beauty, and may different as the substants are for skill, energy, and enterprise. To bring this about, such opportunities must be given to artists in our public buildings and elsewhere as may lead them to produce works of high teaching,—mohic turths set forth so as to awaken usile for entry. And not Locando da Vinci been called upon to decerate the walls of the Dominican Convent of the Madoum delle Grazzie, the world would not have had "The Last Supper." On Government should keep these matters in view, acknowledge the importance of developing the artistic talcut of the country, and at as if they knew the value of flow works of art.

A love and right appreciation of art on the part of the public will force this on, and to produce this feeling is a main object of the Art-Union of London.

GRORE GODWA, I HOLDON LEWIS POCOCK, Sectoria The Clairman, in moving the adoption of the report, congratulated the meeting on the progress of

their association. Twenty one years ago they started with 400 members, and now their numbers had reached the enormous aggregate of 13,000. He school and long occupy their time, for he knew by experience the impatience of an Art-Union andience, but still he thought it due to the annual meeting to make one or two ohservations. Their institution was a private institution, but still having the sanction of Parhäment, and it was hecause it was a private institution he thought it was most likely to he of public henefit. As a people's institution it had an immense amount of public sympathy, and he well remembered Dr. Chalmers asserting that public sympathy was the most powerful of all agents in forwarding any good work. The amount of public sympathy they had received was enough to hurl hack "the fool iscore," as Queen Elizabeth had called it, that the English as a people were indifferent to art. They could turn to Exter-hall to prove their taste for music, and to the Art-Union as an evidence of should not long occupy their time, for he knew hy They could turn to Exeter-hall to prove their taste for music, and to the Art-Union as an evidence of their love for the sister art. They could show the magnificent gifts of Messrs. Sheepshanks, Verona, and Turner, and they must also admit that something was done by the State. To the State they owed the recent purchase of that master-picee of Paul Veroues, the "Meeting of Alexander and Darius;" and there was, in his opinion, a singular propriety in the circum-stance that the tall factory chinneys of Man-chester. The returns of the Board of Tade showed a monthly increase of prosperity, and it was no novelty chester. The returns of the Board of Irade showed a monthly increase of prospecify, and it was no novelly that a fourishing commerce carried arts and eivili-zation in its train. Let them, then, hope that the progress of their wealth and commerce would still be coincident with the progress of art, and that every new year would add fresh strength and numbers to institutions like that whose anniversary they then celebrated U its Lordshin concluded by moving the elebrated. His Lordship concluded hy moving the

adoption of the report. Mr. Francis Bennoch, F.S.A. in seconding the motion, referred to the coming of age of the society, pointed to the formation of an Art-Union at the antipointed to the formation of an Art choice at the add-poids, and concluded an excellent speech by showing the value of art to this country. The report having been unanimously adopted, Mr. Henry Weekes, A.R.A. proposed a vote of thanks

to the council, and the hon. secretaries, and in the course of his observations, expressed his belief that there were few of our younger artists now emiuent, who would not acknowledge the advantage they had derived from the Art-Union of London, at critical

derived from the Art-Unton of London, at ertical moments in their carcer. Mr. Hurlstone, of the Society of British Artists, seconded the motion, which was earried unanimously. Mr. Walter Taunton, as a junior memher of the council, replied for that hody, and, in the course of his address, ledgeantly extorted those art students who filt within themselves the power of expressing fine thoughts, to persevere in a right course, assured that their efforts would not pass unregarded, and that helping hands were not far off.

that their efforts would not pass unregarded, and that helping hands were not far off. In redurning thanks, Mr. Godwin dwelt on the apathy of the Government in respect of art, and pointed to the new reading-room of the British Museum, the decoration of which was confaced to a blue tint and gilt mouldings: the architect had proposed to fill every panel with a painting, and terminate each rib of the done with a statue. The Government had not yet learnt that the beautiful was neefed. With reference to a measure in the remort, he mentioned the reference to a passage in the report, he mentioned the extraordinary fact that, at the private view of the two Water-colour Societies, on Saturday last, purchases were made to the amount of 3,5002. The speaker referred to the services of the assistant secretary, Mr. T. S. Watson, and concluded hy moving a vote of thanks to Mr. Buckstone, for his kindness in grant-

of thanks to Mr. Boekstone, for in Skindness in grant-ing the use of the theatre. Mr. Lewis Poeck, F.S.A. seconded the proposition, having first expressed his thanks, as honorary scer-tary, for the previous vote; and the resolution being entried, Mr. Sudlow and Mr. Walch accepted the office of servicineers, and Miss Marian Whitehead and Miss Stewart having consented to draw the numbers, has obtain in a good and a second to have the matrix is the distribution commenced. Thanks were afterwards voted to the serutineers, and to the two ladies, and to Lord Nonteagle for his admirable address and kind conduct in the chair, and the meeting then hroke up.

The following is a list of the principal prizeholders :-

growth. Such is the trne course for all of usthere can he success in no other. Interest let there he taken in any questions which concern the welfare of society or the comfort of sections the wenare of society or the comfort of sections of the people,—interest in the educational ques-tion, and in every one that has sanitary, moral, and social bearings—whether or not imme-diately appearing to belong to architecture and building. hnilding

Viewed in the light of narrowed interest, or of wider duty, there is one question that may well he deemed the most important to society, of any to which attention could he given ; and it is now, though tardily, claiming notice more prohably than has before been accorded to it. Here, then, let no architect—no one who values the means that forward social ends, or it. helieves in any benefits to accrue from moral training, cultivation of intellect, or the special pursuit of art,—let no employer of lahonr — no one who interests himself in the condition of the working classes,—no one with one touch of nature, or of kin—whether with those whose lot is lowly, or whose station is high—think that he has little concern with onr subject, though it may seem one that is foreign, in title rather than in fact, to what may he the general matter of our journal.

Female education and the social position of women,—as properly part of the question of improvement of the condition of the artizan is a subject of momentous interest to every reader of these pages; hut it has also nuiversal relations, such as no thoughtful mind can pursue without the deep sense of duty that will follow upon clear convictions. So presented, any one npon clear convictions. So presented, any one branch of our subject merges in with the general magnitude of an evil which, if we say, it per-vades all the fabric of society, we make no assertiou—the result of yesterday's opinious, or that differs from the couclusions which are now stated in glowing language by others. Of now stated in glowing language by others. Of rights of women, indeed, there are none, other than are the rights of men; but, equality of position has ever heen denied, hy custom and by law, to the half of nature's work, which, if only not endowed with the same qualities as the other half, is supplied with such as form part of the one creation—in which each half is complementary to, or incom-nets without the other. In these of means as form part of the one creation—in which each half is complementary to, or incom-plete without the other. In place of recog-nition of this equality of duty, of intellect, and of right,—this "communion of labour," as it is styled by the latest and hest of the writers on the subject,*—the position of woman instill that of a droughet one whole to have is still that of a dependant, -one who is to he in dulged and humoured in one sphere, and, sad to say, too generally, made a victim in others. Jealonsly excluded from the hulk of the em-Jeannay excluded from the full of the cur-ployment for which she would he fitted; re-stricted, till lately, in the enlivation of her intellect; her existence viewed as "merged in that of the man" (a condition which would he less serions, were it really fulfilled),—woman has cept marriage; and has too much interested in-ducement towards that provision for herself, to ensure that the relation shall be reciprocal in acquittance of duty, and the interchange of affection. Often not trained for any dutics of a wife,-not furnished with qualifications for the education and care of a family, or any which would relieve some of the cost of her maintewould reneve some of the bost of the hanne mance; sometimes in the higher class, consider-ing any sort of labour a degradation; not encouraged in developing any powers of her mind; neither the able helpmate of the artizan, nor the intelligent companion of the intellectual nor the intengent companion of the intendedual man,—she suffers from, whilst she is made to perpetuate, a condition of things whereby the married state too often presents itself rather as a danger to he avoided, than as it should he, one of the objects of life. It may seem like a parodox,—but the assertion will convey what is obvious to all who have looked into the subject, -that if there were any real alternative to the woman from marriage, marriages would be more numerons, as more frequently prosperous and happy. True it is that, as in the case of all social questions, one circumstance of evil cannot he disconnected in an estimation of it-as a result, or

* "The Communion of Labour : a Second Lecture, on the Social Employments of Women," by Mrs. Jameson, author of "Sisters of Charity at Home and Abroad," London : Longman and Co.

even an acting canse-from other evils, --though each may he widely separated in position from each may he widely separated in position from another. You may provide the working manwith a wife trained for the duties of a home; but the home also must he provided,—and with appli-ances, without which your work will be undone. Again, the provision of larmless objects of amusement; the extension of free libraries, of hubber and user hences and schools; the furuish: pations is necessarily followed hy refinement of baths and wash-houses, and schools; the furnish-ing opportunities for small investments; and even sneh improvement in the means of com-munication between different parts of the metro-polis as world lessen the tax to the workman, and present the averaging of the metroprevent the necessity of resorting to a public-house at meal-times, —all these are de-serving of attention, hut can be only referred to there, so much as may be required to show that their consideration is not neglected by ns. Thus there are, indeed, complicated evils, re-

sulting from the position and training of women, A11 come, as we helieve, from like false directions taken at the starting-point of life,—from the dis-turbance of natural tendencies—and ignorance widely spread, or practically exemplified, as to that which a nohle hand of female advocates have truly claimed as the "mission" of their Such being the nature of the subject, are we to take the course which some might deem we to take the course which some main which expedient, of speaking only to the experience of the working classes, and the sympathics of our readers, or to treat the real question,—that in which the world at large is interested? Thus however, drawn from one class, can trations, however, drawn from one class, can readily he made to show what exists elsewhere. Pansing, let ns ask, is there any reason other ransing, let ns ask, is there any reason other than prejudice, why architecture should not be followed more than as a study, by ladies? We put this question serionsly —is there anything in the work of architectural design and drawing, heyond what is exactly suited to the female mind aud hand? Even further, would it he a thing quite startling to know that the specifica-tion of an architect was drawn out by his wife. tion of an architect was drawn ont hy his wife or copied by his daughters? Is it impossible to the female intellect to square dimensions (whilst one of the best works on Arithmetic, the "Rational Arithmetic," of Mrs. G. R. Porter, is the work of a woman),—impossible to money ont an account; and could it rightly he that "society" should ever after the discovery that such things were done, point at the hapline shell takings whete characteristic are the set of Are these duties fulfilled in one rank of file, or in another: or in one case, is not the valued direction wanting? and for the home of the working man, is there the saving and ready hand? The fact is, if we may so state it from our own helief and knowledge, that the hest ex-amples of the performance of honsewifely duties are amongst the most intellectual of women. We know of one,—having the name of one discussed upper work are contributed We know of one, --hving the hand of the deceased who several years ago contributed articles which we valued, on perspective, to these pages,--she, her friends say, is equally apt in the entring out a garment, in holling a apt in the enting ont a garment, in holing a potato, in working ont a problem in geometry, or in writing an article for a quarterly review. Happily is she placed as the head of a school,one where music is not tangit to those who can never master it, and where philosophy and science, as well as duties and "accomplish-ments," are not tahooed. Look at what even ments," are not tahooed. Look at what even now, is done hy the women who equally adorn onr literature and brighteu a home. The writer of some letters on "Industrial Girls' The ation of ricitation and organical a barrier of the writer of some letters on "Industrial Griffs Schools," whose initials do not conceal the thoughtful mind and able pen of Mrs. Anstin, lately said, speaking of this question of the household duties, "The notion that these accomplishments are inconsistent with high mental culture, refined taste, or feminine grace, is alto-gether false. The conduct of a household with order and economy, makes large demands on the reason and ou the faculties of observation the reason and on the haddness of observation and discernment, and leaves these facilities strengthened for their application to purely in-tellectual objects. The conduct of a honsehold with grace and dignity, makes large demands on the sense of filmess, harmony, and heauty, and ripens that sense for exercise on purely esthetical objects.

the taste."* the taste."* And elsewhere contemplating one hopeful, hat too solitary example of a school fitted for the training of the future wife of the working man, she says, "This, thonght I, is the real type aud expression of the life and duty of woman. Take it at whichever end of the social scale you will, there is nothing higher than this :--the comfort, order, and good government of the honse, and the instruction of the young. To fit herself to fulfil these naramount duties of To fit herself to fulfil these paramonnt duties of her sex, a woman must acquire qualities intel-lectual and moral, second to none possessed hy man or woman."

man or woman." We well remember, many years ago, when there occurred one of the periodic ontbursts of the educational movement which has so much expanded since, how great was the value attached to infant-schools,—as the foundation for all edu-tion of the provided statement of the provided statement to on who cation,—how much honour was given to one who claimed to have originated them. We were then strnck by the omission of reference on all public occasions to the true foundation,—the education of women. We have lived to see such exertions as we could make, to which then there was no response, --such complaints as were then denied, as to the deficiency of female education, and the disproportionate attention given to "accomplishments" and to many paltry substitutes for the fiue arts, justified and supported by the brilliaut phalanx of writers since risen in the ranks of womanhood itself. Still, however, the social question is hnt slowly advancing,-though some amendment of the law which gives all the carnings of a wife and mother to a brutal ruffian, or allows a hushand to be kept responsible for the debts of a shame-less wife, has only too long been under the con-sideration of a Parliament and a Government which takes many other things leading to lament-

able results far too easily. What with the sort of dogma that Government is not to interfere with certain arrangements,-though Government does interferein the removal of dwellings, and the creation of In the remova of dwellings, and the relation of waste ground—in the way of doing ill; things are left to solve their own problem, by going the way of social ruin and eterual shame. Without entering npon any of those questions of capital and labour, which can he so readily settled by some who just leave out a few important considerations, -- there are surely many means now not employed, hy which the governing powers or the leading minds of a nation could benefit the masses of the people, and peradventure by an indirect course, secure the other objects that have been contcuded for. The doctrine that works like that of the provision of improved dwellings, must he effected hy private enterprise, would be very well did private enterprise act at all in that direction. But, whilst such enterprise is idle, demoralization and misers are not idle enterprise. and miscry are not idle; and it seems not to occur to the mind versed in legislation, or hred in office, that the constant sore which is open is more painful than the operation would be for the removal of it, —a sore, too, that may fester on to peril the constitution or the state.

This digression on a point so intimately allied to the one that we have been treating, we could not avoid at this moment. What we have for the present before us, is the education of the home in another aspect. Now, "what is education?"—what is the signification of the term?—is a question on which there has lately heen much careful splitting of hairs. There is a distinction made hetween *education* and *instruc-*-which, as there could be no dispute about tion .-conclusions, we need not enter into. But, heretofore, when we have touched npon another question—that of the education for our own question—that of the education for our own profession,—we have had to urge the simple truth, that education at all times should be viewed, and directly given, as the preparation for the future life. If the education or instruction of women could be set on the course thas plainly of women could be set on the course thas plainly designated, how vast an amount of hencfit would accrne to the condition of the artizan, how excellent a chance might there he that a wider

* The Athenaum, November 22nd, 1856.

social evil could be removed. The education of the woman should be equally such as will fit her to be in an independent position, or to acquit herself of the duties of the lamily and household. Whatever may be requisites for the married state in the higher classes, the wife of the working man is hardly ever competent in any portion of her duties. From such a home as there may be in a basement or a single room, she was launched at childhood through the glitter and temptations of London, to carn at some uninteresting drudgery, in a vitiated atmesphere, during hours far longer than those during which men work, wages for which it is incapable of demonstration that food and other reguities can be obtained. Need we say what too generally at such an age must be the result.—it is one most awful, whilst least to be wondered at. Or otherwise, if the girl is fortunate, she may be sent to a school, where we are told she may answer to, "Who was Cyrns?" hut grows to womanhood without knowing how to clean a room, to make a shirt, to huy good food, or to cook a dinner. Or she hecomes a servant in a family where everything is not her own, and waste and extravagance are to be found at least in the kitchem. Lu any case, what wife have we here educating for the working man? The writer, from whom we have already quoted, in words which hest convey all that we could express, says,—

"This, if I am not greatly mistaken, is the root to which we must trace much of that hitter harvest of depravity and brutality of which we daily see examples in our newspapers. It is now seven years ago, that a man of singular intelli gence, and of the widest and most intimate ac-quaintance with the working classes, foreman in an establishment in which he presided over five or six hundred of the best sort of artisans, uttered words which struck me as giving the dreariest insight into the condition and pro-spects of our working classes. I was making some inquiries concerning wages, and, hearing how large these were, I expressed the hope, or rather expectation, that these men laid by money, and were well off. Shocked at hearing that hardly one of them was worth a shilling, I inquired the reason. 'Was it vice-drunken-ness?'-'No, those were rare exceptions; we could not employ druukards in our business. is the had management of the wives. The moncy is muddled away. To say the truth,' added he, is the data way. To say the truth, numerous, 'there is no such thing now as a poor man's wife.' What a sentence to pronounce on the homes of England! The admiration with which one witnesses the energetic and intelligent labours of this noble race of men, is turned to skill and industry fails to secure to them the natural object and merited reward of man's toil -a comfortable home, and a decent provision for old age.'

And she says in a subsequent letter, she is convinced,---

continuent,— "That all the perplexities and gricvances of mistresses, the inefficiency, and recklessness, and corruption of servants, and the miserable deficiencies of working men's wives, are only symptoms of a general disorder of our social hody (no member of which has a distinct life), and that in order to arrive at a radical cure of any one of these evils, we must go into a complete examination of their mutual relation and common source."

Such conclusions are those of all who have inquired into this solemn question. A writer in the North British Review, in an article on "Outrages on Woman," attributing, as he might well do, the ill-treatment of wires not merely to the bad character of the man, but to the miserable dwellings, refers to the ignorance of "common things," and the want of all training in womanly duties and responsibilities, on the part of the wife. The deficiency is not a reason why wives should be heaten and stamped upon, hut it is a cause to be taken into consideration by philanthropists and legislators. And, again, the greatest one of all our social evils, attributed to the restriction of many employments which would be fitted for women, to the male sex, is due also to the circumstance that the married state does not present to men, we might say of

any class, the inducements which it was designed to hold out, ---sympathy, and companionship a home. Facts as they are too painfully p, and sented are gaining the tardy notice of the London journals; but viewing the position of either sex, the case has its elements of danger to the social fabric. Low standards of right, —even degrading vices like that of drunkenness, —are, we appreheud, likely to prevail where the reci-procal influences of the sexes in mind aud inunmarried population, or of one which only endures the obligations of the married life, is, we are surc, an element of weakness under any form of government. Is it a hopeless prospect for an old, a civilized country, that "The Communion of Love and the Communion of Labour form, as was its purpose, the strength and stay of a state,—should exist as the pledge of good order, and even progressive position. So far from its heing even the concern of the State to check the growth of population to a standard of the production of food in the country itself, we can conceive the possibility of a very With the wide different principle of action. open to the Auglo-Saxon race; world with possible improvements at home in agriculture, and discoveries even as to the production of food from new sources-as from substances which are now cast aside; with every year accelerated means of communication, by leviathan accentrate means of communication, by to introduce steam ships and oceanic telegraphs,—all parts of the world may be in like prosperity and in family union; and whilst the man of euergy and action will extend the triumphs of skill and the results of industry around the globe, the man of thought and intellect will, year the new of thought and intellect will, year hy year, address a wider British public from his seat at home. The Government of this country have only to prove equal to the occasion, to keep apace with the growth of the population which will be attendant upon the progressing sanitary and social amelioraprogressing sanitary and social antiona-tion,—and not as now, practically to apply a "preventive check," in apathy to the greatest and most pervading ills. To the women of England, whether saying with Mrs. Pochin (whose pamphlet,* let not the masculine reader disregard, for, the views taken, may he now only in advance of our time), that they have "very few real friends among men,"---" very few who examine their real wants; who would establish and respect their just claims," "who would encourage their efforts at improvement rejoice to see then cleaved into a truer and nohler life, even if it should involve a little sacrifice to themselves;" or with Mrs. Jameson, that there is "in general," "among mem---superior mem-a strong generous sympathy" with the same abs advantes. the "nohle ave with the cause she advocates-the good," as she has "found them," an the "noble and " and "raised in their manly power above all vulgar masculine icalousies. -we would offer gladly such sympathy and encouragement as our words and can give, conscious that such a cause as theirs is not alone that of one class, or one sex, hut one which concerns the whole human family.

ARCHITECTURAL NOTES, PRINCIPALLY ECCLESIASFICAL-IN HOLLAND, GER-MANY, AND SWITZERLAND †

The stone and workmanship of most of the Rhenish churches is excellent, which accounts for their preservation and freshness after the lapse of 600 to 800 years.¹ They mark a singular period of prosperity and progress in the locality, and, like the temples of Bashe and Palmyra, they indicate the c. urse of an almost forgotten commercial intercourse, which, like the nohle river on whose bosom it was carried on, fractified and cariched the countries through which it flowed.

The structures in this particular style most worthy of stuly are the three great e-their-ils of Spires, Worms, and Mentz; the church of St. Castor, at Collentz; at Cologne, the churches of the Holy Apostles, St Gereen, and St. Maria in Capitolio, the latter of which, according to Hone, is the counterpart of a Greek church in the ruins of Selencin. Three are also many others deserving notice in studying the progress and variations in the style, amongst " "The Right of Women to exercise the Elective Franchiles," by "Justifia," John Chapman. † See p. 203, ande.

1 The store is sandstone, of a light red or pink colour, pleasing to the eye, and capable of a considerable degree of hulth.

which may be mentioned Bonn, Andernach, Boppart, Lasch, Bacharach, the minor churches in Cologne, and the cathedral at Gelnhausen,—a very late specimen.

This peculiar style of Rhenish architecture pre This peculiar style of Khenish architecture pre-valied for about two centuries and a half. The intro-duction of the pointed arch, though it tended to Eighten its proportions, and was not without influence on its arrangements and forms, yet left the distribu-tion and general effect much as before. The eather and of Gelahausen, attributed to the early part of the 13th century, and in the pointed style, displays exter-nal galleries and circuit corbet tables, has plain low gables to each face of the ortagonal apse and of the towere and an extraorable could though earlied not ower, and an octagonal copola, though carried, not tower, and an octagonal copols, though carried, not on pendentives, but angular arches. About the mid-ille of the 13th century the style of architecture in the Rhineland was completely changed by the sudden introduction of the contemporaneous architecture of central France, probably the sublest type of Mediswal art in existence, and at that time in its most palmy state. The cathodral of Chartres was completed in the arch rest of the context function much much of the state. The eathedral of Chaitres was completed in the carly part of the century, though much of the work belongs to the preceding one. Rheims was finished about 1230. Antiens was commenced about the same period. The choir of Benurais was com-structed between 1240 and 1272. To rival, and if possible to surpass these magnificent structures, the eathedral of Cologue was founded, and the works commenced in the year 1248, the choir having been consecrated in the year 1322. The name of the architect of this world-famed building has not been consecrated in the year 1322. The name of the architect of this world-famed building has not been handed down to posterity. That he was a French-man seems extremely probable: in fact, the name of Master Gerhard, of whom we first eatch a glimpse in the year 1252, as master builder, may be only the German form of the common French name of Gerard. German form of the common Freuch name of Gerard, Be this as it may, however, of the Fracch origin of the design there can be no doubt: any one who will compare the three ground-plans of Amiens, Beauvais, and Cologne, will at once perceive that the systems of projection, arrangement, and distribution, are iden-tical. Each of the chors has double aisles on each side. Each has a polygonal apse in seven planes, with projecting three-sided chapels between the buttresses. At Amiens the extreme east, or Lady Chapel, projects as is usual in England. The complicated system of vaulting, radiating from the rond-point of the choir through the nisles and chapels, of which it is int of extremely difficult to find two examples alike, is the same in the three buildings. The parallel might be run through the whole building, in the construction, style of tracery, of mouldings and ornamentation, though in these allowance must be made for the fact, for any lengthened period, even on the same general design, much was left to the individual skill and taste of the workman, which varied of conrse with circum stances. Now in France every step in the progress and development of this school of architecture can be Traced back to its origin, whils in Germany it pre-sents itself suddenly, without preparation or growth, complete and perfect in all its parts. To attempt a detailed criticism of a building so

To attempt a detailed criticism of a building so well known would be ont of place: that if completed it would be the finest Gothic building in the world, few will be disposed to doubt.

icw will be disposed to doubt. The principle of contrepoise and mutual dependence uniting every part, so characteristic of the best age of Gothic; the vigorous feeling of buoyancy, power; and life, which this system is calculated to impart, is nowhere shown in more healthy development; yet the candid observer cannot but admit that harmony of proportion has been somewhat sacrificed in the conception, to breadth and height. The five aisles in with rranning through from ad to the entral valling, give an appearance of stuntdness to the building, which its vast isse onglith to admit.

building, which its vast size onght not to admit. The length of Aniens Cathedral, measuring over all, is somewhat greater than Cologne, whilst its breadth over the transcepts is considerably less, the nave also has only one aise on each side. These proportions give the building a sublimity of perspective intercally, which it is to he feared Cologne if completed could not surpass. On the principle that "a living dog is better than a dead lim," it must be admitted that in the existing

On the principle that "a living dog is better than a dead liou," it must be admitted that in the existing state of the buildings, Amiens is the nobler specimen of the two. Of their relative effects when completed, possibly some critic, writing about the year 2456, may be able to jndge.

There is not much of modern architecture of which Cologue has to boast. Oue of the innumerable family of Jean Marie Farina has recently erected a new depit in the Glocken Gasse, in the modern Gernan Gothic style, of which the principal characteristics are square stiff panels, rigid lines, and geometrical tracery. Nearly opposite, in the same street, is an crection not often met with in the midst of a crowded town. It is a large handsome conservatory

on the ground floor, and abutting on the street, open to the observation of the passers by. The interior is rather elegant, something in the Alhambra style, with polyeirromic decorations, and a fine collection of exotic plants. Leaving the ecclesiastical buildings on the Middle

Leaving the eccession encodes of the Alfallee Rhine, which we have grouped into one class with very striking resemblances, I will next refer to a few notes on the Cathedral of Strasburg. The building is now in a boantiful state of repair, the interior being is now in a beautiful state of repair, the interior bong thoroughly cleaned, and every defacement removed. The light pink colour of the sandstone, lighted up by the brilliant glauring haves from the profusion of stained glass, inparts a poculiarly gorgeous effect to the first aspect of the inside of the building. This eharacter is further strengthened by the bold solid style of the cest end and transpits, contrasted with the light and elegant proportions of the nave and aisles,

The earliest part of the huilding is the choir and transepts, which partake of the character of the Rhenish school of architecture, but are not exclusively Rhenish school of architecture, but are not exclusively of that elass. The choir extends westward to the west side of the transcepts, and is raised about 8 feet above the general level of the floor, with a Roman-esque crypt underneath. The est end is apsidal, projecting only its own radius, and valited hemi-spherically with brick. The transcepts are square, without aisles, with a cylindrical column in the centre of each. This part of the structure may be safely ascribed to the latter part of the 12th century. The arches of construction are pointed; the valiting of mixed form. The usual octegonal endoal is earried The arches of construction are pointed; the vanitage of mixed form. The usual octagonal euploa is earried up over the intersection, covered by a ribbed and vanited dome. To enter into a minute enumeration of the several details would be tedious, hut there is of the several details would be tealous, not indee is for the attentive observer much in every part of this building worthy of most eareful study. The work-manship of the whole is excellent, and the design evidently by a master mind. There is a fine scui-circular arched deeply recessed portal in the north transpet, with grotesque capitals. The large rose inclusion the income for a capita of small transept, with grotesque captorn. A term of small windows in the transepts, formed by a series of small eireles, are enrious aid interesting. In the east wall of the south transept there is a

pointed triple-arebed opening, under a semicirculur canopy, to which has been added a low open balus-trade, of Flamboyant character, of very beautiful design. Learning on this holestrade stands a figure in stone, the size of life, and painted in a very life.like manner, said to represent the architert, Erwin von Steinbach, to whose genuis we owe at least the western portion of the building.

The nave is a noble specimen of the very best style The nave is a noble specimen of the Very best style of 13th-century Gothia, and decidedly Fruch in character and treatment. The three sisles are wider than is usual in proportion to their height. The piers are shafted, with folinge capitals. The triforium con-sists of light open tracery, pierced behind for win-dows, as is the case at Amiens.

The elerestory windows are large, in four lights, with geometrical tracery heads, not unlike the E-rly English windows in Lineah Cathedral and Beverley Minster. The windows of the side aisles are similar Minster. The windows of the side asks are simily in character, and of large dimensions: a blauk scrade with detached shafts, and a stone hench, extends under these windows. The vaniting is of the usual simple character of French 13th-century work, with hold cross ribs (*arcs doubleaux*), and highter cross springers (*arcs ogives*), and pier the (*formercls*). Each bay is slightly domical. The two great western towards are corrided on eaches mening into the name Each only is signly dominant. Inc two prease wearen towers are carried on arches opening into the nave aisles. The work in this part differs in detail from the nave, and appears of later date, though the style is still preserved. There are here some fine seddlia, is still preserved. There are with rich crocketted canopies.

There are two very remarkable chapels occupying the two eastern bays of the nave, built outside, and opening from the side aisles. These are both of the latest style of Gothic; that on the south side is pro-Autors style of Goine; that on the solute state is pro-bably the latest in construction. On one of the walls eppears the date of 1480. The chapel on the north side is valided semicircularly with fan tracery, the rbs interpenetrating and crossing each other, with the ends cut off square. The chapel on the north side is valided with two low domes, intersected by under-st graine. On this cround work there is agreed out cut groins. On this ground-work there is spread out a rich interlineation of ribs in the most fantastical a rich forms, forms, intersecting and interpenetrating, ent off abruptly, and twisted into all mauner of shapes, in which the real principles of construction are ostenta-tiously ignored. There is in these chapels a pro-fusion of rich carving, the execution of which is admirable, whatever exception might he taken to the taste

On the north side of the nave stands a stone pulpit, of early 15th century character, probably one of the most elaborate in existence, being one incrustation of minute tracery, foliage, tabernacle work, and statues of admirable execution

There is a rich profusion of stained glass in the

windows, principally old. The pierced triforiom windows stained in the rich lines of antique glass impart a peculiarly sparkling effect to the interior. The exterior of the building is equally worthy of

The exterior of the building is equally worthy of study. The respective portions correspond of emures in style with the corresponding compartments of the interior, and do not need specific description. The cast end exhibits its Rhenib discret by the usual octagonal cupoler rising shore the intersection, sur-rounded by the open areaded gallery. The side chap-ls to which allusion has been made present externally very enrions illustrations of the Flambryant style, and of the system of interpretartation. In an ante-chapted added on the north side of the north transpt this is carried to an extent 1 uvers as exacutaled. The this is earried to an extent 1 ucver saw equalled. The principle adopted seems to be, to let every moulding principle anopted sectors to be, or the other managements are every other it comes in coutact with, and then to ent it off abruptly. A screen or open cloiter is carried along both sides of the clurch in the Flamboyaut style, with open

tracery without glazing, and surmounted by an open hattlement

hattlement. The far-famed spires are a noble specimen of mathematical skill and architectural construction. To earry up a structure to the height of 474 feet (the highest in the world*), the greater part of it being of a light, open, airy character, and so to frame its design and construction that without any subsequent the shall be added and the state of the state design and construction that without any subsequent hinding and eramping it boldly maintains its uprightness and stability unimpaired after the lapse than 400 years,--- is surely cough to immortalise the memory of any man, particularly as the same achieve-ment is not likely, so far as we can foresee, to be accomplished again.

Notwithstanding the lightness and elegance of the structure, I am not sure that the form of general outline adopted is the best adapted to embody the idea of aspiration naturally expected from it. The sudden change from the vertical to the sloping forms gives a stunded appearance to the samuit less pleasing than the gradually pyramidising lines of the steeple of

Antweep. The workmanship and materials are of the very The Workmanship and indernas are of the very best quality, and making due allowance for picturesque weather-stains, it is in excellent repair. The Minster of Freiberg, distant from Strasburg

The Minsler of Preiberg, distant from Strasburg about forty miles, is another very noble specimen of Mediaeval art. The nave and western tower and lantern belong to the same school and period as those of Strasburg, and are equally excellent but in design and excention. Some of the details are peculiar. There is no triforium in the walv over the pier archies, feneed by an open tracery balastrade, which is level with the cill of the elerestory windows. The vanling resembles that of the nave of Strasburg. The western tower is single, placed in the centre of the front, the lower portion forming are noen loftvorch. The side lower portion forming an open lofty porch. The side aisles have the arcade along the walls under the windows, as at Strasburg. This portion of the building is of the middle or latter end of the 13th century, is of the induce or never can be up structured, about cover, which Strasburg. The transports are Rumane-sque, of late 12th century work, some of the arches being slightly pointed; there are rose windows at the extremulties of the arms of the cross, with triple semicircular-headed windows underneith. The usual Rhenish association is preserved by an octagonal Rhenish association is preserved by an orlagonal expla on peudentives over the intersection. This has been modernized. The choir and its aisles are Flam-boyant in style of very late date; the choir-sercen is, in fart, Renaissance in elaracter, with Homboyant halastrade. The east end is semi-orlagonal: the zisles of the choir are low, and extend round the east end in a zig-zag form, somewhat resembling the aisles of Henry VII's Chapel, at Westminster. The vandling of the choir and its aisles is singularly complicated and interlacel, resembling the side chapels at Stras-burg already described: a little of the old Romanesque work still remains about the west end of the choir. There is a fine stone pulpit of late late in the nave. The aisle windows are glazed with fine antique stained glass of hilling to clours.

The arse winners are grace with the antiput school glass of brilliant colours. Externally the building is well placed to be seen to advantacr, standing in the middle of a large open "place." surrounded by antique buildings. The tower and open lantern, though resembling Strasburg tower and open initern, nongui resembining Strisburg in general design, have nucli beauty peruliar to them-solves. The parent underneath the tower is finely conceived. An inner portal, with a centre shaft, occu-jied by figures of the Virgin and child, and flowled by conceived four rows of statues on each side, occupies the whole brenith of the back wall. The doors have square heads, and the arched tympanam is righly sculptured. An areade is carried round the side walls of the porch, a statue nuder cach arch, and a canopy over. exterior archway has eight shafts and olders of ith a statue The

monildings. The architecture of the exterior presents speri of all styles from the Romane-que to the latest

* 24 feet higher than the great pyramid.

Medizeval, all good in their kind. The slender Rhenish turrets at the re-intring angle of the tran-septs and choir, still remain, but the upper portions have been modified to a later style. The whole is in septs and elor, solid remain, but the upper partons have been wouldied to a latter style. The whole is in excellent preservation and repair. The colour of the stone is a light red, which receives from the effects of time and we ther, a beautiful mellowess and glow, which it is difficult to describe.

The town-hall facing the such side of the Minster, is a curious low building of the 16th century, with an arreaded front, and projecting threats at the angles, arraided bront, and projecting unrees at the angles, carried on corbels, and surmonited Ly spirets, covered with roloared tiles. The groining nuder the arcades is of the same interfaced and interpenetrating design, as the chapels already alluded to. From Freiburg our course lay through Switzer-land. It would be tedious and uniteresting to sub-mit in detail memorauda, made in the various small

towns of this country, more remarkable for its natural beauties than for any pre-eminence in architectural skill, its remains in any case are more interesting an hacologically than urclitecturally. The aucient specimens of domestic huilding in stone are German in style, and in many cases have been ornamented with larges freecess externally. Most of these have perished, or have been defneed; but a few still remain Sebaffhausen aud elsewhere

The modern street architerture is usually Parisian in its style, detail, and arrangement. The timber buildings which constitute what we usually under-stand by Suiss architecture, are found the most com-plete and rommodions in the Cauta of Berne. The great principle adopted, is to combine all the build-ings of the bouse and farmsteading under one root. Considering the severe winters and the accumulations of snow in the valleys, this is probably the best arrangement under the previour iremustances of the country. The earlie are boused on the "rez de chaussé", i' the house occupies one portion of the upper stories, surrounded by a projecting wooden haleony, flanked by the buildings of the barn and other stores, the eaves of the run crutending in sbelter frequently by 6 or 8 feet projection beyond the wals. When kept in good order, with a thriving look of prosperity surrounding there, these huge masses have a very The modern street architerture is usually Paris kept in good orar, with a thread was a very surrounding them, these buge masses have a very picturesque look; but in upland, sterile districts, such as the Upper Vallais, the timber buildings have a as the Upper Vallais, the timber very squalid and dilapidated aspect.

I will conclude this paper by a few remarks on some of the Swiss cathedrals, which have been reently cleaned and restored.

Geneva, the eradle of Presbyterian Protestantism, preserved its eathedral of the Reformation. It is of the 12th century trausition style, extending down to the beginning of the 13th. The nave is only four the beginning of the 13th. The nave is only four hays in length, the transcript two bays each, and the choir one bay, besides the agridal end. The piers are cylin trienl, with grote-que and clossiral capitals: the pier arches are puinted, with Roumesque letails; the triforium semi-rirendar. The clear-story windows are triple, with detached sharts, something resembling chose of the Temple Church, London, and with foliaged explads. The vanding is pointed, with strong cross-rink, lighter cross-springer, without pier-ribs, and is domical in each compariment. The ends of the transcripts have rather fine rose windows. The car performing chapters rout the ansidal end

There are projecting chapters round the apsidal end of the choir, the lower windows of which are filled with original stained glass. The interior is now in an excellent state of repair, and free from all encombrance. There are a few monuments, but the general aspect is bare and cold. Externally the building is aspect is bare and cold. Externally the building is nuch displated, altered, modernised, and deprived of all character. The west end is terminated by a classical Corinthian portice, bringing to mind the more eclebrated one constructed by luigo Jones, at the west end of St. Paul's. The accurate func-date a generally, within the walls, presents little worthy of noire. Outside the walls, new streets have been laid out, and quays formed, on land partly accurate the blac gained from the lake

gamed from the lske. On the right bank of the Rhone a new suburb has arisen, called the Quartier des Bergues, containing some very megnificient hotels and other buildings creeted by private enterprise. The new Post-office erceted a few years since is in the Byzintine style, or what passes for such. There is a new English church, a modest structure in the Gothic style, buil possessing increasing for former. a mosest structure in the Gothic style, but possessing no particular features. The most noircable building is a new Roman Catholic church, or extindral, now in the course of ercetion, in the Gothic style, with nave, aiskes, and transpire, choir with polygonal uper, of large size and good design. The ecilings will be evaluated to the state of groined in stone

ground in store. We will now glance at the town and rathedral of Berne. Berne is very generally compared to the city of Chester, principally on a count of its acaded streets. There is undoubtedly a certain degree of resemblance arising from the venerable aspect of both either, as well as from the correspondence of the covered ways common to both. There are also many

points of difference. The "rows" in Chester are raised a story above the streets, or rather the streets are exeavated helow the natural level of the surface; and the superstructure is supported by heams and wooden posts. In Berne the areades are on a level with the streets, and the houses are carried by stone arehes. The architecture, indeed, is of a very sub-s'avtial character, and much of it picturesque Arcades in the streets of towns were not uncommon, particularly in those constructed in the 14th century. They are met with at Alby, in Languedoc; Dol, in They are met with at Alby, in Languedoe ; Dol, in Brittany ; Montpazier, in Aquitaine ; Payerne and They are met with at Alby, in Lenguedoc, Jol, in Brittany; Montpazier, in Aquitaine; Payerne and Estavayer, in Switzerland. The picturesque appear-ance of the streets of Beroe is greatly aided by the numerous fountains, of quaint derives, in which the hear in all attitudes plays an import unt part: and by the lofty ancient watch-towers connected with the old fortientime. fortifications.

The commanding situation of the town, and the magnificent view it affords of the great Alpioe chain,

magnineent view it allords of the great Alpice chim, add much to its interest and heavy. The eathedral is a singular building, deriving its principal interest from the illustrations it gives of the latest period of Continuental Gothic. Little of it is than the middle of the 15th century, and son earner than the middle of the 15th contary, and some of the work must be brought down nearly, if not quite, to the time of the Reformation. It is all in good repair, and well kept. The building consists of a western tower, with chapel at each side, nave in five have, with side risks. The eboir is a prolongation of the uave, separated hy a screen, and without tran-sents; the aisles are continued on for two bays of the septs , the ability are contained on the two ages of the choir, which is carried some distance that without aisles, and terminated by a semi-octagonal apse. The style internally is poor and meagre. The piers are splaved, and subwith a shaft ranning up the front. The pier arches are pointed segmental. The derestory The pier arches are pointed segmental. The clerestory windows have fautasic flowing tracery, with panclling running down to the pier arches without a triforium. Turning down to the pier arcness without a triforum. The validing is complicated in pattern, but poor, with sbields and armonial bearings at the intersections. The filling in of the vanits is plastered, and pointed with scrolls and borders in a grey colour. Side chaptes are projected out between the buttresses, and comined

ground. By an inscription, in old German, on one of the stones of the vanit of the north-west chapel, this portion appears to have been completed in the year 1476. The choir is separated from the nave hy a stone screen, in front of which is an arcade, with Classical Lonic columns, and entablature and seulp-tured frieze. The groined vaulting under this arcade is precisely the same in character with that of the rest of the church.

Externally there is a fine late porch at the west end, with a double doorway, the tympanum filled in with a sculpture of the Last Judgment. A figure of Justice, flanked hy angels, occupies the centre p The receding orders on each side are occupied The The receasing orders on each side are very statues of the five wise and five foolish Virgins. The arches are filled in with angels and figures, under canonies, with inscriptions. The whole is exceedingly canopies, with inscriptions. The whole is exceeding rich and well executed, though the details of the are The hand well excerted, though the defaults of mean-tectural mouldings are poor. The usual crossing and interpenetration of the mouldings pecaliar to the Flamhoyant is strongly marked. Two side portals are completed in the same style, but plainer. The upper part of the tower is very inferior to the portals just described, and is probably of the 16th century. The eastern end of the huilding displays the purest Matien at ehypacter. There is a great complication Mediaval character. There is a great complication of finials, pinnacles, galleries, and parapets about th upright and flying buttresses, each having five, which upright and flying buttresses, each having five, which gives a certain richness to the appearance as a whole.

There is considerable ingenuity displayed in varying e designs of the open-work battlements round the the designs of elerestory and aisle roofs, no two hays of which are alike. Some of them have quite a Renaissance character. racter. As studies for form's of tracery, they worth notice. Ou the whole, the building may are pronounced more eurious than heautiful, but remark ably interesting as an archaeological study.

There are several other huildings in Berne worthy of notice. The Kunst Palast, or Museum of Art, is a new building not yet completed. It is a large stone structure, with a centre, receding flanks, and wings holdly advanced. It is four stories in height, without a single Classical column, yet the effect produced is remarkably fine. The tone and character are given to the building by rustication,—arches with deeply-recessed mouldings to the windows,—an arcaded centre to the ground-floor, and an arcaded gallery above the centre on the fourth story. Diapered strings and corbelled cornices also contribute to the general effect. The doubling of the columns in the arcades, hy placing one behind the other, affording hroad soffic for ornamentation, gives a fine frature or ornamentation, gives a fine feature in a huilding of this kind.

A fulliance of this sind. A few words on the Cathedral of Basel will com-plete our remarks. Basel, though on the very edge of France, which almost comes up to its walls, is

intensely a German town. Though large and flon-rishing, there is not much of its architecture worthy of notice

The Ruth-Haus, of late Gotbic, has some curious old paistings; and some extremely singular balus-trade tracery, with three sets of patterns one over the ald other, interpenetrating in a very curious manner

The cathedral will well repay carfol, and even minute examination, by the architect and archaro-logist. The varieties of style, and the intermixture of work of all periods, render it a little complicated at of work of all periods, reader it a little complicated at first, but a little study will soon reduce the choos into order. The original corpus of the building is in the Transition style of the 12th century; the plan, a nave with two aidse, transcepts and semi-rircular apse, with the aidse carried round. Two additional aidse bare been added on each side of the nave, apparently late in the 13th century. The original pier arches are pointed, the triforium arches round. The triforium is a veritable gallery, extend-ing the width of the inner aidses. The derestory before several pier bar the transception of the several ing the width of the inner aidses. The derestory ing the width of the inner aisles. The cler wiodows arc single lights, two in one hay with arches. The vaulting is plain groined, with cross springers and cross ribs. The choir is raised consider ably above the nave

The windows in the apse are insertions of the 13th century, very large. The tracery of these windows is continued down to form an open sereen in front of the triforium gallery, which is continued round the

The ends of the transepts have rose windows, under which the triforium is carried round by a recess in the wall, and a blank areade. The piers in the choir the wall, and a blank areade. The piers in the choir are of the original 12th-century work, and are com-posed of detached shafts, beautifully wrought with ich-sendptured capitals and hands. The interior has undergone very careful eleansing and repair,—the stone appearing in its original tint of light grav, with a faint dush of pick. The new benches and chairs display some very good designs in earring. There is also a fue modern organ of very heatiful design, and arich stone-pulpit of 15th-century work. Externally the original western towers have been

a rice stone-pulpit of 15th-century work. Externally the original western towers have been replaced by towers and spires of the Flamboyant period, very rich in erockets, tabernaele work, aud open tracery. A centre portal is of the same period, hut has since been altered. The west window is au but has since neer nuree. In every move a second second insertion of the 13th century. In the elerestories, at the sides, and in the transepts, much of the original 12th century work remains. The flying huttresses of later date are terminated with statues io niches, with pics and pinnacles well executed. The apse eano canopies and primaries well executed. The appendix areades running under the lower windows, with corold table over, and a gallery with open parapet under the tilorium windows. The end of the south transept bas some curious original specimeus of Romanesque ornament about the entrance door.

The dwep-red colour of the huilding is stated by the guide-books to be the natural tint of the stone; but a genue-books to be the instruct on the store; but a very slight examination suffices to make the discovery, that the whole exterior has been painted a deep Indian red colour. When this tastless barbarisan was committed, and whether it is still perpetrated from time to time, I cannot undertake to say. The roof is covered by coloured tiles disposed in patterns, which give it a hright and pleasing aspect. The eloisters attached to the church are very extensive, thickly occupied by eenotaphs, of which many have been raised to the memory of early Protestant Reformers.

I have now hrought these imperfect memoranda to a close. To myself they are interesting as recalling incidents of travel, and impressing more vividly on the mind, observations, and deductions made on the spot; and, if they have the least effect in calling np spot; and, it tory have the test enter in training approximation of notes provide the spot of kindred pursuits, I shall feel that they have not been altogether peoned in vain. J. A. PICTON.

ART-ITS ORIGIN.

MAN is an artist as he is a man. The first rude spirings after adaptation to circumstances and heanty asprings a ter assignation to reconstrained and meanly of form were the necessary expressions of an inward principle. When man began—even in a small degree —to long for confort, for settledness, for material case; be hecame a framer of dwellings. The cavern in the rocks about him, the enclosure formed hy in the rocks about hum, the enclosure formed by tangled woods, the casily constructed moveable tent, had been the dwellings of his wandering life: now he felt that he must be a settler. The must for this leave all portable, travelling abodes, and form for hinseff a solid, well-foundationed, lasting house. The first attempt was rude and yet artistic. He brought to bear the skill that he possessed, and a habitation of some sort was creeted. Thus his constructive ability.

sures taken to render the building free from the effects of the elements. He had now obtained a bolding in a restrained and civilized mode of life—with its re-strictions and employs. He had become well imbued strictions and employs. The bala become were managed with an idea of his own wants, and the best manner of their supply. He had attained two points—the settledness of building, and its adaptation to his need and comfort. Now he naturally, in the spirit of con-stant advance which has been ever in man, urged himscart auvance which has been even in mail, ingen him-self to the realisation of something further. In pur-sning this, he improved on his former adaptations, made his materials of more enduring stuff, let his requirements take a wider range, and, further, he imprinted on his effort the stamp of his ereative mind. Ile uo longer formed his work with mere mind. He to longer formed mis work with nece utilitarian art: he added to that beachful art—equally utilitarian in its origin, only more gradual and re-stricted in its uses. The door had been before—it had opened and shut—it was artfully made—and was in every sense a door. Doors were still wanted—door every sense a door. Doors were still wanted-doors were made-they fulfilled their office-they were advances on the others, in that with construction were united proportion of form and well-placed emhellishment. This was the advanced post--the attainment from which the inventors did not recede, but proceed. heanty :

Then buildings retained use, proportion, hea ey were, in that sense, the works of man's art.

Art originates in invention. Man is in it a creator : here orgenizes in invention, shall is in its fractory the ever acts restrained by no honds: his mind may light, nnchained as it were, on the topmost turret of a temple, and east hroad glances on all that is helow. He is free to think: his thought and will are his action : his action is the origination of structure. The hand, as it guides the peu, forms its characters ; bought is there imprinted that was hefore The mind holds the germ : it there easts so that thought unfreed. The mind noise the generative and or forth its branches and is finally developed in word or in act. The mind conceives of beauty: it expresses that conception in word or in act. It conceives of that conception in word or in act. proportion, of grandeur, of solidity, of meetness, and guides the haud of the workman as he chips the

stone, or moulds the wood to express his purpos The huilders, in the youth of their em idealized little: they had to follow the rules employ, idealized little: such a state as theirs gave to them. Later, their need was proportion of parts and manifestation of feeling. They wanted that their huldings should be feeling. They white a has been analogs successively and the formation of the range. These uses were not merely for the body, they were for the mind and for the heart. The body wanted a dwelling, a covering, a home. The mind wanted an expression covering, a home. covering, a nome. The mind wanted an expression of thought, en arrangement of parts, an orderly fitting together of acquirements. The heart wanted taste, richness, fulness, heanty. The huilders knew that mon has a trinity of wants and they arranged a trinity of supply. They acted

and they arranged a trinity of supply. wisely and well.

ART-ITS OFFICE.

developes, in the framer, the gentler and to be: it developes, in the framer, the genuler and nohler of his powers: it affects the observer in his gentler and nohler feelings. Art has to deal with the tome of his heing. The void that it fills, the joys that it imparts, and the influence that it exerts, are all beneficial. Surchy that which exerts an influence for good is useful—whether or not it affect the temporal or physical advantage of any. Perfect at must have a merfect originator. More

or physical advantage of any. Perfect art must have a perfect originator. Man is not perfect—conscionsness tells us this—therefore he cannot form a perfect ensbrinement of art. He can only approximate—he ought to do this—he ought

ean only approximate - ne ought to do this - ne organ to draw as near to perfectness as he is able. The Almighty One, who made all things hy His will, was necessarily perfect—His work was perfect now; therefore the maintenance of the planets in their now; therefore the maintenance of the planets in their courses, and of this our world in its well-being, is perfect. There is no change in our seasons : year after year, spring, summer, autumn, winter follow on un-ecasingly : the mountains are still as once ; the valcasingly: the mountains are still as once; the val-leys also: the trees still spread themselves upward: the shrubs still flourish in their seasons: the minu-test operations in nature are still kept on —on always —on for ever. If we wish for a perfect concentration of use, proportion and harmony, and heauty; we have only to regard some fertile valley-closed in from harren country-the refuge of man, his bahitation, his home, the producer of his hlessings, the giver of home, the producer of his hlessings, the giver of joys. Art is there in all its supreme excellence: ks, hills, valleys, all teach us lessons--lessons that his joys. rocks, the artist, the framer, should learn well and use well

We have, in this day, as an universal rule, art in a some sort was creeced. Thus has constructive annity, we note, in this day, as an unvergant rule, art in a his invention, his art were exercised. His next effort very low stage: the streets of our large towns, the was made, with all the experience which he had no-house in country fields, all tell us that use alone is 'essarily cained, and was an advance: his wants were studied; — use too in its lowest being. The covering better known and better supplied, and hetter mea-is framed for the house; it is proof against the weather;

WORTHING WATER-TOWER AND ENGINE-HOUSE .---- MR. RAWLINSON, ENGINEER.

This should not he so. The individual energy of man was great in time

The individual energy of man was great in time past: the individual energy must be powerful now. Vigour should be with usy, then the workman would feel his work—as well as the architetet. Instead of one originating mind, there would he only the control of Government to produce a successful whole. Each workman would labour at the work he loved—would love on—and work in love. The workman would not be an implement, a tool, an instrument—he would be an agent, a worker, such as he should be. Art, in its highest state, indicates a very advanced state of refinement—intellectual and moral—in a peo-le. It is the exponent of the energy, the skill, the taste of a nation. It belongs to no form or race of forms. It does not rest in horizontality or verticality of construction. Every form shows forth a certain

of construction. Every form shows forth a certain development—less or more advanced.

be constructed advelopment-less or more advanced. The profit of man, his elevation, his joy are the purposes and aims of true art. The artist should therefore labour for this. S. F. C.

WORTHING WATER-TOWER AND ENGINE-HOUSE.

Is used to is bilancy ran, out, of fork. The water-tank is of cast-iron, 40 feet square, and 13 feet deep, and will contain about 110,000 gallons of water. It has been made and put up by the Messrs. Cliff, of Bradford. The strongest plates are $\frac{1}{2}$ -incli, and the thinnest $\frac{3}{2}$ -incli thick. The staircase is carried through the centre of the tauk, and tie-rods radiate from the stairs' well to the sides.

The engine is high-pressure, by Messrs. Headly and Manning, of Cambridge, and pumps scwage as also pure water. The sewage-pumps are at a little distance outside the engine-house. The purc-water well is inside the house, at the foot of the tower, and is sunk in chalk. The bottom of the tank is about 70 feet above the ground, and the tower and roof are about 110 feet in height in the whole. Tank and water, when the tark is full, are upwards of 500 tons in weight. The whole tower is upwards of 4,000 tons on the foundation. There is not the slightest crack or settlement about the work, and the tank is quite water-tight. The engine commenced work at the end of last year. The public sewers will be completed in about a month's time. At present, upwards of 400 houses have been drained, and have had the new metre bid or. The more commenceding with THE water tower at Worthing, of which we give a view, constructed under the direction of Mr. Rawlinson, C.E. is 40 feet square on plan, with a contral pier of brick, and spiral stairs of main structure of bricks, made on the ground: white and red brick from other places have

METROPOLITAN IMPROVEMENTS AND THAMES EMBANKMENT.*

THAMES EMBANKMENT.* THE subject on which I have undertaken to read a paper this evening is, even in its most limited sense, sufficient to chill one's enthusiasm and appall the most courageous improver; but, taken comprehensively, the difficulty is immensely increased. It is hard to resolve where to begin and what to reject, so as to touch the most important points, and hring them all within the compass of an hour's address. To treat shortly and infelligently a subject which embraces whatever relates to health, comfort, convenience, and general well-being of two millions and a-half of people, involves no trifting responsibility. Nothing raleudated to improve their condition ought to be ex-luded. Ventilation, drainage, subweg, public parks, calculated to improve their condition ought to be ex-cluded. Ventilation, drainage, sewage, public parks, baths, wash-houses, and all other sanitary regulations, whether superintended by corporations, Royal com-missions, boards of works, parish vestries, or local boards, are necessarily included under the general idea of metropolitan improvements. From such a catalogue of matters demanding our

attention, we ought not to consider as unworthy of

attention, we ought not to consider as unworthy of our notice, writer companies, gas companies, paving principles or street elemeniar; but as each subject commerated possesses in itself instead sufficient for a single paper, I shall content myself with enrority touching them as I pass, and new proceed in the more immediated any I have to perform, my purpose being to confine ay remarks to such improvements in our public the sufficient set in the pre-field of the traffic of the metropolis. Brore pre-reding to a miller our streaks as they now absolutely exists, we will rapidly survey the pass, sent, and partially exeruse the difficulties that bast as antipipate accurately the wants of the forme. Streats amply commodiums a hundred years ago as alon-gether insufficient for the necessities of today. Su short-signted are pursons in powe; that before the completion of the z approved distant they are fre-quently obliged to confirst the value are fre-quently obliged to confirst the Nore Confirst and particle the ther the inclusion and regret the mission of the z approved distant they are fre-quently obliged to confirst the Nore Londor. completion of the rapproved disigns they are fre-quently obliged to could start thunder, and regret the mistake they have committed. The New Londonthe mistake they have committeen. The view Domain-bridge was widened considerably atter the first design was settled and accepted, and had it been increased by 20 feet additional, the public Advant ge would have been better consulted. An idea prevailed in the by 20 feet additional, the have been better consulted. have been better consulted. An idea prevance in the City that 50 feet was maple for any first-rate street. Moorgate-street and New Canon-street were laid down and built under that idea by the then chairman of the Improvement Committee, in opposition to the better julgement of their enument archivet. The better julgment of their emiuent architect. The result is that entering Moorgate street from the wider result is that entering Mongate street from the wider, street beyond, is like entering a well. Prejuduce, ruled, and reason was left in abeyance. No first-class leading thoroughfare ought to be constructed on a scale of less than 60 foct-between the houses, from front to front. Nine fact for the fordway. This would enable two persons to walk abreast, and allow one person to pass in each direction on each side of the street, 42 feet for the eartinge way gives room for five or size convergances. One to stand, when necessary, we the kirk on each direct on the wearons street, 42 feet for the extrage way gives to in or incorrespondes. One to stand, when necessary, by the keth on each side; one line of slow waggons and another of a suit calus to proceed in either direc-tion. This establishes a principle that should ever be maintained. A less winth is product ve of unany interruptions, a greater width in a street of business or general traffic might lead to coofasion, but could not improve the convenience, while to erross on foot would be attended with considerable difficulty, if not observe the one. absolute danger.

That the throng fibres of London should continue as they are, is discaditable to us as an enterprising people, but hy uo means surprising. There is not ou the face of the glube a finer situation for the metro-polis of the trade, the commerce, the weith, and the invery of the civilised world; and those who chose it displayed good score and judgment. Nover dreaming of the anervalous fature, they only consulted their then necessities. A scalaring people, their highways were the prizes. Liable to situal from hostile tribes, their secarity was promoted by adopting a locality combining in itself the greatest under of natural advantagis. The first heing contiguity to the ocean, and yet sufficiently remote as to render any sudden attack unlikely by day, and utterly impracticable under the shadow of night; the serpentine rourse of the Thames rendering navigation in the dark atterfy That the thoroughfares of London should continue the Thames rendering navigation in the dark atterly hopeless. The second advantage was its excelled hopeless. The second advantage was its excellent situation for agricultural and grazing purposes. The natural soil being composed of gravel and loany elay. nations son acting composed or gravet and formy clay, rendered viry productive by the application of the refinse matter of large towns; the surface of the ground beautifully undulating, with a great variety of gentle hills and pleasant dells; the air temperate but moist, and innunerable springs supelying an abund ance of the purest water, made and makes London hy nature one of the healthiest situations that could have nature one of the healthiest situations that could have heen selected. A seconding the river, the site chosen was the fust really appropriate. Though easy of approach, the banks were, nevertheless, sufficiently elevated to form a natural harrier against the en-eroachment of the tides. The model in the middle of the room, kindly lent by Mr. Wyld, will give you, at a glance, the best idea of the audulating character of the ground on which London is built.

It requires no effort of the imagination to stretch It requires no effort of the imagination to steated hack a couple of thousand years and witness the painted natives building their tiny huts by the side of their plessant river. Coming down the stream of time we observe them gradually change. The strag-gling structures increase in unuber, and hy-and-by unite to form a picturesque but irreqular row of in-convenient, cabing; population in reased, but the hanks of the river were inflexible and could not be txtended, nor would it have be ac consistent with the halks of the times for the inhabitants to be scattered and dwelling for spart. They clustered together for and but the times for an intersection to be statedeen in agree to second second. Second secon

sides of the gentle slopes were covered with the huts of the early settlers. The space between the houses would necessarily be only such as to permit the inhi-hibits to pass and repass with their burdens on their heads or shoulders. When pack-horses supersedad human labour in the heavier work, the streets were, no doubt found the neurons, and then to bheir neuron human labour in the heavier work, the streets were, no doubt, found two purrow: and, true to their nature? Briton denomical that some excited and sturdy Briton denomical the then Chief Commissioner of Works for nevlect of altry. A collection of such speeches would, even now-adays, be of rare value, when no man seems to have capacity or power enough to grasp and conquer the giant evil. The streets, then to grasp and conquer the giant evil. The streets, theorem as now, followed to course of the river, narrow, winding, and inconvenient. In England, Scotland, Ireland, on the continent, and even in the United States, this law holds good. The river forms the base and determines the direction of the streets. Turninke reads, cauals, and ralways, those

Turnpike roads, canals, and railways, those triumpis of the genius of Macadam, Brindley, and Stephenson, in facilitating the intercentree of man with man, have considerably modified the haws pre-Stephenson, in facilitating the intercentree of man with man, have considerably modified the have pre-viously existing, and streak, straight as a line, and of admirable width, instand of being the exception, are becoming the rule. The founders of the city of Philadelphia were the first to abandon the picturesque, and determine that utility was the only rational prin-ciple that a tensonable people should adopt. But Nature seems to rebel against any and every system that would attempt to fusition it into anything like perfect uniformity. The streets of Philadelphia are in their arranzements as regular and formal as the When that would attempt starts of Pbiladelphin are in their arrangements as regular and formal as the squares on a chessbard, and can, from end to end, he flushed with the crystal water of the Schuyfkill every fushed with the crystal water of the Schnykhn every hour in the day. In setking for improvement and perfect utility they have failed to scenre uninterrapted privacy: so exactly alike are all the streets in the square, the same maible cornices, the same silver-plated bandles and knockers on the doors or bell-pull the streets of the set of the silver silver the silver. plated handles and knockers on the doors or bell-pull knobs, the same tell-tales at either side the window, the same number of marble steps leading to the door, and the same railing around the area, that even the cldest inhabitant is liable to invade his neighbour's honse. The doors are the same without, and the passages are the same within, that a person may take off his over-cont, hang nµ his hat, and never discover his mistake t11 startled by a goddess with a shrill voice demanding what the straneger wants in her voice demanding what the stranger wants in

The growth of London was like the growth of the English oak—slow but snre-mas if destined to live for ever; and like the onk, too, the first sign of decay was found near the centre.

struct near the centre. The earliest reliable map, of which there is one on e wall, gives us an ideo of the metropolis 200 years o. The old City of London, with its cathedral in the wa ago. the centre, seems to he a mere handful of h when contrusted with the endless labyrinth of houses WAVS when contains the wine the encuess tangenth of whys that now constitute the grant metropolis. Bityout the City boundary, and outside its liberties, we had the Moorfields, Sparfields, Conduit-fields, and she fields of Lincola's-ion. Within a comparatively re-cent period, the borough of Southwark was resorted to an allow of memory and healther exercise for the cent period, the unship of sourtwink was resoluted to as a place of amusement and healthy exercise for the youngermon, with an occasional manison occupied by the wealthier merchants; the enston then being for the general citzens, whatever their grade, to reside place of business. at

at their place of Dishess. Still the City grew; and grew with it all the io-conveolences that marked the formation of its first street. Narrow, undvalued, no free sirculation of air, closely port, up hooses, overlahanging the streets and sinting but the light. The congregation of houses shutting out the light. The congregation of house and closely packed inhabitants became a nuisance recking with every iunginable abomination. It sutting out the hight. The congregation of houses and closely packed inhibitants became a nuisancy, recking with every iunginable abomination. Its filthiness brought its own puotshment : plague and pestilence came with averaging swords, and periodi-cally slew thousands of the people. By fast, pros-trations, and prayers, they bond to appease offended Deity, and overcome the physical laws established by their Creator; hut still the epidemic came, and all the sufferings that afflict dirty humanity could not, and would not be banished, hecause they neglected simple eleadiness, so ner akin to godliness. At hat, as a boon, and as a blessing, came the Great Fire of 1666; conferring on the citizens of London oppor-tunities and alvantages similar in kind, if not in degree, to those which the late famine conferred on Ireland; rendering possible for the first time in its appeared to be a dire calamity poved to be a beavenly violation, the commencement of a new era, the dawn of a brighter day.

of a brighter day. Then, as now, the authorities were unequal to their position, and did not appreciate the loty conceptions of their men of genins. Wren might unleash his imagination, and give bis genins scope. Delighted with his conception, he might reval in glorious visions the scolar scolar scolar scolar scolar scolar scolar scolar scolar of the scolar scolar

Red tape existed then as now, and the philosophical architect was thwarted in every possible way by the environs hand of the then illustrions Barnacles. The plan suggested by Wren for the rebnilding of the City was, of course, rejected by the authorities, and the old City was reproduced with all its evils restored or aggravated. It is bunilisting to observe, that the wines the alterations: and the greater the innorveaggravated. It is humiliating to observe, that the wiser the alterations, and the greater the improve-iments now recommended, the nearer they approach the design of the great Christopher, to whose memory be every bosoner paid. The precise features of the plan suggested by Sir Christopher Wren heing imper-cedule incrude one are a large scale for

plan suggested by Sir Christopher Wren heing imper-lectly knowa. I have caused one on a large scale to be laid down, so that you may thoroughly understand it without difficulty. That plan is now before you. So soon as a city bursts the honds of its commer-cial requirements or trading necessities, and its mer-chants have realised property sufficient to be inde-pendent of trade, a new condition of things appears, bitment character are introduced, regulated by laws as pendent of trade, a new control of the property of the propert original houses was convenience for the purposes of gain; the second series of houses springs from the fact of accumulated wealth, and designs are produced on a scale of corresponding magnificence; the object being to gratify the senses by the indulgence of every luxury

The first streets, as we have seen, are regulated hy The first streets, as we have seen, are regulated by the course of the river; the second take an inde-pendent course. In almost every eity the enslern district is devoted to bahoar, the western district to recreation and its attendant pleasures. The cause of the difference, so far as London is concerned, is per-fectly clear. Reada where we will the first bouse feetly clear. Begin where we will, the first house becomes the centre of the system, and as the houses becomes the centre of the system, and as the houses increase they form a village, town, or city, there must be to each an eastern and a western side. The earliest founded becomes the centre of trade producing abun-dant wealth. With independence arises the desire to enjoy the fruits of industy. The north may be too chill, the south too warm, the east full of hustle and vapour, but the west is during nive months in the year freer from the annoying smoke which the prevail-ing wind kindly diffs towards the east. To the west, therefore, the num of pleasure retires, and there estab-lishes bimself. In the course of a few years he hecomes the centre of a circle whose sole object in life seems to he the pursuit of enjoyment, often frierolous, hecomes the centre of a circle whose sole object in life seems to be the pursuit of enjoyment, often fairefolus, and not unfrequently sinful. Though dwelling in the uncrowded west, they are, nevertheless, compelled oversionally, generally quarterly, to demean them-selves by visiting the previncts of trade, and so a free thoroughture is established east and west. What-ever course the streets of trade may take, the streets of picasure are genorally cast and west. This is the cass, motionly in London, but in Brighton, Bir. the case, not only in London, hut in Brighton, Bir-mingham, Manchester, Leeds, Huddersfield, Glasgow, the case, not only in London, hut in Defluction, Dir miggham, Manchaster, Leeds, Huddersfald, Glasgow, Edinhurgh, and Dublin; , the whole heing determined by the cureant of the wind. Mr. Glaizher, of the Royal Observatory, Greanwich, and one of our council, has farmished me with second very elahorate tables bering upon this point, which, I regret to say, I have been unable to use as fully as I at first in-tended. This, however, may prove to be an alvan-tage to the society, for I would suggest to our friend the propriety of his prenaring a paper for next session, to be cuittled, 'Which way does the Wind how?'' I am convinced that such a paper, formado on his almost innomerable but neemate observations hlow?" I am convinced that such a paper, founded on his almost immorphic but necentar observations with the several principles, legitimately deducible from them, could not fail to be highly interesting as well as instructive. I hope he will take the bint, In the late autumn, the winter, and the early spring, easterly winds µrevail, and the western subnrbs receive the smoke drifts from the cast; but, at that period, the weally are out of town, induluing in country.

the wealthy are out of town, indulging in country sports, Parliament is adjourned, while those who cansports, rartament is adjourned, while those who can-not afford the county establishment, barricade their front windows and retire to the rear, occupying the dingy chambers overlooking the stahle-yard of the adjoining mews, and hy a strong effort of the imagina-tion dream they are in the midst of a lively landscape. The whins and cargings of fashion are not to be un-The whims and caprices of fashion are not to he understood by any process of reason, any more than we can reconcile with the demands of common sense, the custom that makes the period for social intercourse and friendly association, the time that should be devoted to repose, seeking their couches about the time they onght to rise-

"When night's dark curtain's drawn aside By morning's rosy fingers."

Another reason for the streets taking naturally an Another reason for the schedule damin scheduler, casterly and westerly direction may, I think, ho found in the fact that they are by necessity better veutilated; not only does the westerly wind cool and sweeten them with its refreshing breezes, but during the This is a matter somewhat theoretical, but, I think, it is well worthy the consideration and careful inves-tigation of the sanitary student, with the view of ascertaining whether the direction of the streets bore any—and if any, what—influence on the general health of the population. Having thus glanced at the formation of our busi-ness streets and thoroughfares leading to districts dedicated to pleasure, we must turn our attention to the examination of the difficulties to be overcome before our main tranks of communication can be con-sidered perfect. or moderately convegient. This is a matter somewhat theoretical, but, I think,

sidered perfect, or moderately convenient.

How to employ the industrious poor; how to get rid of the criminal population, are, and ever have been, rid of the criminal population, are, and ever have been, exciting subjects for discussion. Reformatory socie-ties, prison discipline, labour regulating, crime repress-ing and fraud preventing, schemes, with suggestions numberless,' are spoken from the pulpit, thundered from the platform, and echoed hy the press, until the very air gets thick with thoughts of something to he done. Physical discomfort and its consequent moral degradations have atracted the attention of our Shafteshurys, our Lockes, our Rogers, and our Lethchys, and Parliament will, ere long, be forced to devise some true method of removing or abating those devise some true method of removing or abating those discreditable scenes so frequently disclosed. London is discreditable secnes so frequently disclosed. London is now an epitome of the universe, and contains within its horders not only all that is purest, best, most refined and holiest, but also all that is vilest, husest, wickedest, and barharons. The several districts are divided from each other, and as accurately defined by the habits of the people, as are the several countries of the earth on a map by Wyld or Arrowsmith, Belgravia, Tyhur-mia, Bethnalia, and the recently discovered Rogeriau district of Costermonogeria, are all peopled by trihes as different in their habits and modes of life, as are the different in their habits and modes of life, as are the Esquimaux and the longers on a Parisian houler ard. It is no part of my intention to dive into the recesses of these several regions, and bring into light either the genus and jewels of the one, or the loathsome fifth and recking crime of the other; I leave that for abler hands. My work is to endeavour to bring these several portions of the micropolis more closely insertion.

these several portions of the metropolis more closely together, by suggesting certain improvements, which if adopted, would render a journey from the west to the east of London possible in less than half a day. The difficulties of the north-west passages, the nearest ronte to India, the mountains of the moon, have all been measured and resolved. How to bring our Australian cousins into closer relationship, stand-ing as we do towards each other, hed to hel with only a clobe of earth between has had doe attorisio ing as we do towards each other, heel to heel with only a globe of earth hetween, has bad due attention from the public and the Legislature; hut how to bring the several parts of disjointed London into closer con-tact by increasing its number of bridges, wideoing its stretes, embanking its river, or extending and render-ing cootinnous a metropolitan belt of railways, has never to this hour received the stendy and determined attention of the authorities. A susmula movement have to his nour received the steady and determined attention of the anthorities. A spasmolic movement is accasionally made, but with little effect. Instead of a new bridge, they construct a crutch to support the broken hack of the old one. They commence a broken hack of the old one. They commence a street and leave a wilderness; they attempt a sewer and produce a cesspool. We devote thousands to and produce a cesspool. We devote thousands to the evangelization of the barbarous South Sea Islanders, and leave our unfortunate brethren in an adjoining street comparatively uncared for, wallowing in hotheds of crime, suffering, disease, and death. The hrightest intellects of the country and ablest engineers of the land, are devising means by which all parts of the of the land, are devising means by which all parts of the civilized globe shall be placed in immediate contact. The harnessed lightuing, obedient to our will, is de-bvering every moment, at every central seat of com-merce, the course of Exchange on Paris, or the price of Consols in Capel-court; but how to shortcu the overhaud route from Charing-cross to Whitechapel, is left to a few enthusisatic neutron parces and are left to a few enthusiastic private persons, who are, I fear, looked upon as lumatics, the matter seemingly being abandoned as hopeless, while the evil is increasing day by day.*

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

ARCHITECTS. ROME. Ar a meeting of the institute held on Monday, the 20th, Mr. Godwin, fellow, in the chair, it was an-nounced that the temporary indisposition of the pre-sident, the Earl de Grey, would prevent the presen-tation of the medils on that evening, as intended. Numerous interesting donations were presented, in-eloding a photographic view of the scalibilding for the erection of the column in Rome, commemorating the establishment of the dogma of the Immaculate Conception. Conception

Conception. With reference to the photograph, Professor Donaldson condenned the obsolete style of senfolding adopted in Rome; and the Chairman arged the more extended use of photography by architects in obtaining reports of the progress of their huildings.

* To be continued

THE BUILDER.

The Chairman said that Sir Charles Barry was ricbly entitled to the best thanks of the Institute, and of the profession at large, for the lostitute, and fonght, not simply for his own personal advantage, hut on behalf of the architectural profession. Govern-ment had admitted in the great competition now going on the principle of 5 per cent, and although in that they had not done all that was needed, still in what they had donc they hnd shown the injustice-he was compelled to say-with which they had treated Sir harles Barry

Mr. Ashpitel then read a continuation of his pay on the Roman Forum, but confined himself in it more particularly to the buildings on the Capitoline Hill. The following is a portion of his argu-

"We now come to the consideration of the Capitol itself-a subject which has lately awakened unusual interest. In addition to what had already heen written,

The reviewer, instances this order. Two things are agreed on by all, viz :--that the Temple of Jupiter Maximus stood on the Capitolium---and that of Juno Moneta, the Roman Miut, on the Arx, the spot where formerly was the home of Manlius. That the whole bill was called the Mint, on the Arx, the spot where formerly was the home of Manlins. That the whole bill was colled the Capitol, is clear from the fact, that it is always so named in the enumeration of the seven hills, just as the whole hill was formerly colled the Tarpeian, and before that the Saturnian Monnt. It took its name from the head of a man named Tolns (Caput Tol), being found fresh and bleeding under ground, while eccavations were being made for the foundation (Jul. excavations were being made for the foundation (Jul. Ohseq. 5). This event was considered such a prodigy exervations were being mode for the foundation (Jun. Obseq. 5). This event was considered such a prodigy as to justify the change of name. Now this was two centuries before the time of Romulus, and yet Livy (6. 10), describing his offering the Spolia Opima to Jupiter Feretrius, says, he ascended the Capitol, by which word, of course, the whole hill must be meant. When, however, classic authors speak of the hill alone without relation to the other hills, the Arx and the Cautiol are mentioned sensertely - time Livy, describ, without relation to the other hills, the Ars and the Capitol are mentioucd separately ; thus Livy, describ-ing the surprise of the place by Herdonius, of which we shall treat presently, says: 'The news went to Turenhum that the Arx was taken and the Capitol seized upon;' in another place, 'The Arx and the Capitol were in great danger;' in another, 'The Arx and Capitol, the dwelling-place of the Gods;' and nu-merous similar examples might be worded. But these nerous similar examples might be quoted. But there is even something more, the whole hill was sometimes called the Arx. Thus, Servius in his Commentary on Is even sometiming more, the whole full was sometimes earlied the Arx. Thus, Servins in his Commentary on the *i*Cheid, viii, 652, says: 'Thus on the other part of the shield was modelled the Capitol hecause this is manifestly the Arx of the City.' Mr. Dyer also eites a passage from Cicero (Vir. ii, 6), to the same effect.

Perhaps an example might be found among our own writers, when speaking of the Tower of London. It is often said such a one was sent to the Tower, At is ottak sour such a one was sent to the Tower, tried and beheaded there, when, in fact, the excention took place out of the Tower, upon the Tower, bill, and sometimes people are sold to have been excented on Tower, bill, when, in fact, they underwest their sentence on the rising ground called Tower, green, in front of the chapted and inside the Tower, walls. To doubt an Everify the sentence front of the enapel and uside the lower waits. To doubt an English historian's accuracy heavse he might confound one spot with the other, would be too severc—and yet these are distinct spots, with a broad most between them. Thus, with respect to the Capitoline Mount, one summit should be called the Capitol, the other the Arx, the Intermontium between them are a several data the might are the several theu; can we used lefthe the right names for each division? Becker tries to settle the matter at once, by quoting from Livy, xxxv. 21, "A large stone, whether

* We may take the opportunity to say that our own series of papers on Rome were determined on and com-menced before the introduction of the subject at the Institute. A continuation of these will appear in our

A letter from Sir Charles Barry was rend, inclosing copy of his protest against the decision of the vorrament in respect of his remaneration. The Chairman said that Sir Charles Barry was bly entitled to the best thanks of the Institute, and the southern hill, but it has been shown that the the profession at large, for the good fight he had ught, not simply for his own personal advantage, number, and threefore the passing expression proves the on held of the architectural profession. number, and therefore the passing expression proves nothing. He then quotes a passage from Suctomius, who, in relating the mad pranks of Calipula, says he built a bridge from the Palatine to the Capitol. If the Capitol had been on the northern summit, this bridge must have erossed the Forum at an angle, a thing highly improbable. But the fact is, we find on referring to the author, that the half erzard, half-resume worth was avied with the design of heine savage wretch, was seized with the desire of being savage wretch, was seized with the desire of being adored by the people, and that he sometimes sat be-tween the statues of Castor and Pollox in their temple, inviting public worship, and at last pretended to receive frequent visits from Jupiter Capitolinas. 'He then,' says the author,' throwing across a bridge (note transmisso) over the 'Kemple of Augustas, joined together the Palatine and the Capitol.' There is not a courd of the transmissol for the transmissol over the state of the transmissol over the transmissol over the 'Kemple of Augustas, joined together the Palatine and the Capitol.' There Joine logener the Palatine and the Capitol.' There is not a word of the Arx, nor of building a bridge. Not a word about the bridge in any other author, though such an creetion, a hundred feet high and a quater of a mile long, must have been something to talk of. A bridge is said to be 'transmissus', literally 's and auruse' upt over a paper areas but enced by taik of. A bridge is suid to be 'transmissus', fiterally 'sond across' not over an open space, but over the Temple of Augustus! Now, a little further, we read that another of his pracks was to scatter moucy from the roof of the Basilia Julia among the people; what then can he more casy and probable, than to suppose he had a light hridge, possibly moveable, thrown across from roof to roof of the temples, which would at last land him in the Tahulsriem, whereas he could accoud to the Acr or to the Conitol as he would at fast land hun in the Tahularian, whence he could acceut do the Arx or to the Criptiol as he pleased? It is evident he was in the habit of passing over the various roofs—and if so, what need had he of such a stopendons, such a gigantic bridge, of which no remains exist, and of which no anthor makes maritime. makes mention P

There is another story, of which Becker makes a great deal, and which requires a little more considera-tion. It is the account of the sudden surprise of the bob. It is the necount of the studies surgress of the Capitol by Appios Herdonius, a Soline by nation. The account is partly given by Livy, and at greater length by Dionysius of Halicentrashis (10-14). The facts occurred a little before the time of the famons story of Virginia. Herdonius seems to have been a sort of adventurer, who had

' Shark'd up a list of landless resolutes, For food and diet, to some enterprise That hath a stomach to it,'

That had a solution of the present that had a solution of the present to it; in fact, he had collected as many exiles and slaves as made together a hody of about 4,000 presons. In justice to all parties let us take the account given us by Diony-sins. He states, that Herdonius got his men together in some light hoats, that 'they crossed the Tiber at that part of Rome where the Capital stands, which is scarcely a stadium (a little over 200 yards) from the river; then, it being the middle of the night, and all the city being deep in sleep, they went up at their will through the unlocked gates, for thus do the sacred gates of the Capital remain through an oracle (they call them the Camental gates); then, sending up their power, they seized the $\phi_{0000000}$, or guard, then making an attack on the Arx (Aperac), they made themselves masters of it.' Now, Beeker reads the themselves masters of it.' Now, Becker reads the passage to mean that Herdonius came to the Carmen-I themselves masters of it. Now, Becker reads the passage to mean that Herdonius came to the Carmen-passage to mean that Herdonius came to the Carmen-passage to mean that Herdonius came to the city itself; that he slipped through them, and then scaled the toek and catered the Arx, and themee the Capitol. But these difficulties directly suggest themselves: is it to be reasonably supposed that a city would be carefully fortified with walls and gates, and yet the principal gate be always left open to the attack of an enemy? It can easily be understood why an inner gate should always be left open according to an oracle, tspecially when leading to a boly place like the Capitol, but an outer gate always open would be as useless as no gates or walls at all. But Dionysus does not say it was an outer gate; he says it was the gate of the Capitol, called the Carmenth gate, and this it might well be. It was close to the Alfar of carments, and it has been shown that its name had varied; it was sometimes called the Saturnian gate, sometimes the Porta Pundana. In fact, there is a strong presumption that it never meant the Carmenstal gate of the city, and that Herdonius brought his energy to yet. Now, if he uses of the card to the saturnian gate. strong presumption that it never meant the Carmen-tal gate of the eily, and that Herdonius brought his men by water. Now, if he passed the gate of the eily by the river, handed bis mea in the eily (which we can ca-ily conceive), and then rushed upon the open gates of the Capitol, seized on the guard, and make himself marker of the Arx and the Capitol, the whole affair is intelligible, and intelligible arecording to the notions of Canina. In fact, I must say, these arguments of Becker's seem to prove uothing; and besides, it is difficult to comperiend the account ac-cording to his views, and cavy to understand it according to the acles of Cauina and Mr. Dyrc." Professor Danaldson Objected to some of the views

Professor Donaldson objected to some of the views

entertained by Mr. Ashpitel, and described at con-siderable length the buildings in the Forum. Mr. Ashpitel having replied, Mr. William Haywood, of Guildhall, was elected a fellow, and the meeting separated.

DRAWING IN PAROCHIAL SCHOOLS.

WHEN the Department of Science and Art com-WHEN the Department of Science and Art com-menced the system at present in operation for teach-ing drawing in parchila schools, it was a nuch-vexed question whether the time which was proposed to devote to it (namely, one lesson per weck of one or two hours in each school) would be sufficient to give ordinary children such an amount of iostruction are mould be focus the sensitivity the short works. would be of any value, considering the short period of their continuance in the schools

Of their continuates in the schools. Optimions on the subject, which the Department obtained from a large number of those engaged in teaching drawing, were of the most coulleting kind; Leaching arawing, were of the most conditing kind; and although many prophesied that no practical good could result from a few lessons in drawing spread over a long period, some were of opiniou that they would sow the seeds of art, and probably lead to ofter and more complete means of obtaining an art educa-tion.

Now that the scheme has been fairly tried, it may not he out of place to make some remarks on the subject.

The method by which the proposed instruction iu The method by which the proposed instruction in parachial schools was to be carried out in London, was by making the teaching of them part of the education of advanced students in the head school at Marlborough House, who were undregoing a course of training hoth in art and art instruction, previous to their appointment in country schools of art as masters. masters.

These students had, as a part of their education, to These students had, as a part of their education, to give one or two lessons per week in the parochial schools; but, as a rule, cach student gave one lesson per week, of one hour, iu some national or other school to which he was appointed. The average unmher of children instructed by each master, during the hour's lesson, was about seventy; and as the lesson was of so short a duration, it became necessare to adout some system by which

became necessary to adopt some system by which each child might receive the full benefit of the lesson; each chuid might receive the fail hencht of the lesson ; and this, considering the number of children in-structed, was somewhat difficult, inasmuch as draw-ing may he said to he an art to acquire which requires careful and individual supervision. As the expense of material for so large a number of children expense of material for so large a number of children was also an important question, as the najority of pupils were of the poor class, some kind of inex-pensive material had to be thought of. These diff-culties were surmounted by the adoption of the *Ulack board* as a means of giving the lesson; the pupils drawing on slates the object which was drawn by the magior on the board. Then, as in the main with of arawing on slates the object which was drawn by the master on the board. Then, as in the majority of cases the children were very young, it was evident that some simple explanation should accompany the lesson, and a plan of instruction he resorted to, by which every the summer with minimum values of by which even the youngest child might understaud bow

which even the yonngest child might understaud bow to draw the object given. To obviate this difficulty a comparatively new system of teaching was adopted, and one which, judi-eiously practised, was calculated to be perfectly suc-cessful. This was the principle of giving construc-tional lines as a means of drawing the actual lines of the object, all hearing a certain proportion to the first line which was drawn. Thus, in a figure in which the *cyma recta* occurred, a straight line would be drawn as the central line; the position of the eurve indicated by another straight line, which would be divided iuto two equal parts, and upon this the curve be drawn.

The same thing would be repeated on the opposite The same thing would be repeated on the opposite side, provided the object were symmetrical. As a rule, symmetrical objects, such as vases, simple pieces of ornameni, and such-like subjects, were selected; so that a central line might be drawn, and the propor-tions of the figure to he drawn having heen already fixed by the master, the central Viae was divided into a certain number of parts, upon some of which the principal parts of the figure lay. The balance of the object would be obtained by passing lines at right-nagies to the central one, and marking off equal distances on each side of it, themselves bearing some angles to the central one, and marking off equal distances on each side of it, themselves bearing some proportion to the central lice.

proportion to the central lice. Suppose, for instance, a vertical line, A B, be drawn, and divided into two equal parts; the same length of line be drawn at the extremity A, half on each side A B, and the ends of this horizontal line he include the particular of the particular discussion. each side A B, and the ends of this horizontal line he joined to the extremity of A B at B, by straight lines; the two latter be bisected, and upon them two *equan recta* curves be drawn, forming a lotus-like figure, which is completed by drawing, from the extremities of the horizontal line access which and inwards and when is completed by drawing, from the extremities of the horizontal line, curves which tend inwards, and unite in the hisection of the central line. Other small features would be added without constructional line, in order to exercise the eyes of the pupils to see the proportion they bear to the rest of the figure, and

prevent the constructional lines from becoming prevent the constructional lines from decoding a more crutch. Such an example as this would be given for its simplicity, and might, perhaps, form the first exercise in the drawing of curves. The moster would draw it on the black board, step by step, and, would draw it on the black foard, step by step, and, as he drew it, make such remarks on the peculiar features of the figure as would best enable his pupils to understand it; whilst they themselves would copy each line as the figure progressed until the comple-tion of the object.

tion of the object. Besides his observations on the object drawn, he would give general cantions to beware of falling into certain errors which his previous experience told him they would be liable to as beguners; and afterwards he would go round to each abild, and correct his drawing, pointing out individual errors. The advantages to be derived from such a system of tuition were various. It combined both class and individual instruction (the latter being perfectly neces-sary), and as only a very short time was devoted to

individual instruction (the fatter being periceti) neces-sary), and as only a very short time was devoted to drawing, it was thus economized and made the most of. It made use of such materials for teaching as were already in the school-room and were very inex-pensive, and the manner of giving the lesson was such, that the simplist child could understand it per-

pensive, and the iname of giving the lesson was such, that the simplest child could understand it per-fectly. Perhaps for subjects previously out of the range of school education could have been so favour-ably accommodated and so easily bleuded with the already existing system of education. When the pupils had acquired a certain power in drawing straight lines and simple curves on their slates, paper was given them, and the same exercise which those who improved hut slowly continued to draw on the slates, those who showed more taste and improvement were allowed to draw on paper. This class was a step to the simpler examples of Dyce's drawing-hook, and as a pupil's eye became better cdurated to see proportion, and his lines showed greater refinement and firmness, he was advanced to the highest class in parcehial schools, viz. that of shadiog from solid models. I have hitherto spoken of this system in the past tense, hecause it was in such a manner that the ex-periment commenced, but in the majority of instances it is on such principles that the parochial schools are now taneth.

is on such principles that the parochial schools are tanght.

now tanght. Whether, as a rule, the system be *thoroughly* suc-cessful, is a question which can only he answered after careful and long investigation, and it is uot my inteution at present to enter into that part of the subject. I will, however, give the result in one in-stance of such tuition in drawing as I have described.

stance of such thition in drawing as I have described. In the Builder of April 18th you noticed the public examinations in drawing which have lately taken place in the London District Schools of Art, both of the students and whoever else wished to apply for exami-nation. At the Rotherithie school, the number of exercises worked was forty-one; the number of prizes given was six. Having myself had the care of the Rotherithe parochild frawing-elass during the past year and up to the present time, when the examina-tion was announced I was anxions to test the system of black-hoard teaching, upon which I have worked of black-hoard teaching, upon which I have worke the school, and I therefore seut some children for examination in freehand drawing from copies, which formed one of the subjects for examination. Upon concerning the six successful candidate formed one of the six successful candidates, 1 found that three were little hoys from my class at the parochial school, a fourth was a hoy who had attended hoth my class and that at the district school, whilst the reunsiong two were boys from Queen Elizabeth's School, Sonthwark, in which I am the drawing-master, and have taught the classes in it solely on the black-hoard system of tuition. Now in the case of five of these boys the average amount of instruction which each has received has heen one lesson of two nve of these boys the average amount of instruction which each has received has been one lesson of two hours per week during the past nine months, and this period includes the vacations and absences occurring in the time. The exercise given at the examination was one of Dyrec's examples, two conventional anthe-mion like floares. mion-like flowers, springing symmetrically from two bdus-shaped forms. The time given for the working lotus shaped forms. The time given for the working of the exercise was one hour, and those only who completed it received prizes.

Now, taking these facts into consideration. I think it sufficiently determines that the prescut system of hlack-board teaching is successful. If the difficulty of black-board teaching is successful. If the difficulty of the exercise and the absurdly short time allowed for its working he remembered, it will be evident that those who completed it must bave been possessed of considerable power; since to draw a symmetrical object in the time (and that no simple one) was no other who is a successful to be been required consideratic power; since to draw a symmetrical object in the time (and that no simple one) was no easy task. This power in drawing has been acquired by the ordinary system of parochial school teaching; and thus the question as to whether the system be a good one may. I think, be answered in the affirmative. That there are meany features in it which might and

Such facts as I have above stated will, other source. other source. Such facts as I only to be matter, one which has come especially under my own observation, and upon which I have expended much time and investi-gation. The probability of such instruction becoming general, in all national and other schools throughout the country, must render any practical information concerning it of some interest to those who are inter-ested in such subjects; I will therefore, with your permission, at a future time, give you some results of ing own experience on the subject, hoping that the difficulty of obtaining reliable information concerning it will render any I can give you not wholly un-werkome. WALTER SMITH. I trust, show the importance of the matter, one wh elcome.

PUBLIC OFFICES COMPETITION.

The public of these contributions. The public will be admitted to see the designs on Monday next (the 4th). The judges are appointed, hat Sir Benjamin Hall objects to their being known until the drawings have been publicly exhibited. We have received several letters as to the hanging, but as it is now them it would be nuclear to insert them it is now done, it would be useless to insert them.

Is your number of the 25th ult, your correspondent "Remardus P. C." writes, "If there he a competitor who has been made arough to that of shadow his elevations, let in me made a public example." I spree with "Remardus", "as regards the this (and should be "narrow and orridors made yellow or blue"), but not as regards he adaw. The "instruction and arrive elevations are to be in line only " and in our ender the elevation are to be in a should be a subwed to any critest. A runctions, after due consideration and advice, perhaps you will be so good as to give publicity to these remarks from

MECHANICS' HOUSES, ROSEBANK, EDINBURGH.

THE plans and details given on the oppo-

The plans and details given on the oppo-site page illustrate some houses built for the better class of mechanics and others at Rosebank, Edinhurgh, for Mr. Janes Gowans, under the direction of Mr. Alexander Mae-gregor, architect, of that eity. The advantages attained for each house by the plan are, first, a distinct and independent entrance; secondly, a plot of ground for bleach-ing or for flowers; thirdly, a water-closet; fourthly, a scullery, with washing-tubs, bath, and hot water; fifthly, a separate access to each apartment from the lohby, without going through the adjoining room; and, sixtbly, ample provision for ventblation and for warming the sull bed-rooms, which have no fireplaces. small bed-rooms, which have no fireplaces.

the small bed-rooms, which have no irreplaces. The cost of each house at Edinburgh, exceuted with well-squared rubble stone, and droved stone dressings, including all the appliances for warming, ventilation, and drainage, enclosure and stair-railings, &c. and finished in substantial style, are 2900 style, was 2202.

MAY 2, 1857.]

CHURCH BUILDING NEWS.

Chalford.—Some additions and alterations are at present heing made at Chalford Church, Głoucesterskire. The existing church was built in 1724, and consisted merely of a plain parallelogram, with gable ends, but with an M root, and with a small bell-oot. The north aisle has the somewhat unusual arrangoment of consisting of seven cylindrical vaults running at right angles to the nave, and terminated upon the outside by a corresponding number of gables. The length of the uave was increased, and a chancel added in 1741, by Mesars. Foster and Sons, of Bristol, architects. The contract has been signed by Mesars. Hook and Restall, huilders at Chalford, for the tower, spire, and porches. Mesars. Naylor and Vickers, of Sheffield, have offered to lend, and fix free of cost, a peal of six cast-steel bells for a year for approval. This, it is helieved, is the first instance of cast-steel bells being used in this country in peals. Including the tower and spire, and hells, and the other additions contemplated, the total cost will amount to about 1,7007. Mr. F. T. Gompertz is the architect employed.

Employed. (Bristol).—The new Moravian Chapel at Kingswood (Bristol).—The new Moravian Chapel at Kingswood was opened for divine service on the 25th ult. The huilding, which is in style a modification of the Italiau, coosists of a nave and transepts with an apsidal end. The transepts, on the groundfloor, are occupied by vestries, and over them are gallerics, the vestries being divided from the chapelby glazed screens with curtains. The roof is open to the timbers, except that over the apsc, which is hemispherical, groined, and finished in plaster. The internal length is 56 feet, the with 25 feet, exclusive of the transepts, and the height 25 foet. It will accommodate upwards of 270 persons, and has cost about 700/. The architects were Messrs. Foster and Wood, and the several contractors Messrs. Brown, Davy, and Diment.

Sneed.—The Bristol Times states that a meeting has been held, at the residence of Mr. J. S. Harford, of gentlemen residing in the neighbourhood of Sneed Park, to take into coosideration the propriety of erecting a new church on that estate, for the convenience of the growing population of the neighbourhood. A general understanding was arrived at that the work should be at once attempted. It was decided that the edifice should he made to accommodute 500 persons, and cost 3,0000. or 4,0007., more than a moiety of which sum was subscribed on the spot.

persons, and exis 3,000. or 3,000., more that a molety of which sum was subscribed on the spot. *Tedstone Delamere.*—The parish church of Tdstone has been restored by Mr. Scott. He has retained the old walls of the nave, strengthered them by buttresses, and made good the foundations. A new high-pitched roof has been provided, and a two-light window inserted at the west end. The bell-turret is of wood, surmounted by a pyramidal shingled roof. The south porch is of eak. The chancel has been entirely rehuilt. The east window is a triplet under a containing arch, with sbafts of polished serpentine arable in the interior: it is filled with stained glass by Hardman, representing "The Ascension." This window is the gift of Mr. James Wight of Tedstonecont. The sell of the south-east window is lowered to form the sellis. On the opposite side is a credence inche, and all open. There is accommodation for about 150 persons in the church. At the entrance to the eburebyard a lich-gate has heen erceted. The builder employed was Mr. Pearson, of Ross. *Basjond*.—A commutte has been formed, include

builder employed was Mr. Pearson, of Ross. Basford.—A committee has been formed, including the Duke of Newcasile, to carry out the restoration and enlargement of the parish church of Old Basford. Mr. Place, architect, has reported on a plan, whereby the accommodation will he increased from 414 to 714; and the duke thinks it could be easily extended to 800. The proposed works comprise the rescating of the interior, and rebuilding and calarging the north aisle. The tower is to be repaired, and new high roofs placed upon the cburch. A new morth porch is to be huilt, and a vestry provided at the east end of the north aisle. The ehurch is to be beated by hot air, and a hed of concrete laid under the floors against the damp. The masonry generally is to he restored, and the churchyard properly drained.

Large 2. The foundation-stone of the intended new Derby.—The foundation-stone of the intended new church of St. Michael, Derby, has heen laid hy Mr. T. W. Evans, M.P. The edifice will consist of nave, peculiarities of the site have caused some variation from the usual arrangement in the plan of the clurch. The widening the public road in Queen-street, with the site transcepts will have three and the window-heads will he filled with the clurcestory will be lotty, with foor trace arranged with the Local Board of Health, has so rethat, although the church will for means to account of the educet. that, although the church will be built at the extremity of the tower standing at the end of the entreit will consequently be creeted at the south-west angle, on the south side of wich is is the principalen trace to the church will be commod. The second of the church will be and the south side of the tower standing at the end of the nave; the south side of which is the principalen trace to the church will be and the church. The second means the main of the south side of the side of the south side

THE BUILDER.

yard, at the junction of St. Michael's-lane with Queenstreet, has caused the extension of the north aisle westward heyood the end of the nave : this projection forms an octagonal recess in the inside, solitable for an organ. The stone used for the walls will be from Duffield, Sydnope for the piers and arches, and for the windows, tracery, and corvings, stoues from Ancaster, in Lincolashire. The seats and timbers of the roofs will he of red deal, stained and varnished : the inner surface of the roofs will be lined with hoarding, and Groggon's asphalte felt will be laid underneath the slating. The style of the building will be Gothie, of the geometrical period of the fourtceuth century. An attempt has heen made to retain the same character in the new structure as the present one possesses. When the tower is completed it will be about 60 fete high, a little more than the height of the old one. With the limited means at the disposel of the committee, it has not been thought desirable to attempt a structure vicing in pretensions either with the spire of St. Alkmund's, on the one side, or the tower of All Saints', on the other, but to form a bold, massive feature, that would produce an agreeable contrast with both. Mr. H. I. Stevens is the architect, and Mr. Charles Moody the contractor. There will be accommodation in the new church for about 430 personsought be when when the date ac

double the number provided for in the old one. *Westbromnich.*—Efforts have heen for some years made to provide a church at Greet's-green ; and at length the contract for the erection of a church has been taken by Mr. George Rohusson, of Redditch, the amount heing 3,000/. Messes, Johnson and Son, of Lichfield, are the architects. The building will consist of a nave, with north and south alistes, upwards of 73 feet in length ; a chancel, and western tower. The total length of the church, from tower to chancel, is 120 feet, width, 58 feet. The exterior is of stone, and the style is Deconted Gothie. The huilding, including a children's gallery at the vestern extremity, will he capable of accommod-ting 607 adults and 227 children. The roof is to be open and stained. The site was given hy Sir Horace St. Paul and Mr. Edward Jones.

Bruckenfield.—The ancient chapel of the Holy Trinity, hitherto the only place of worship in the secluded 'illage of Brackenfield, having become from age and decay quite unfit for the requirements of the inhahilants, besides being situate in a remote and almost inaccessible part of the district, it was thought desirable to ercet a more suitable edifice. This has heen at length accomplished, and the new church has heen encessible part of the district, it was thought differ consists of nave, north aisle, chancel, vestry, and south porch. The style of architecture is that which was prevalent in the fourteent excituty. The roof is open-timhered, and the windows are traceried: the seats are open henches. Two windows at the west end of the nave are filled with stained glass, executed by Mrs. Turbutt, and representing the Apostles, St. Peter and St. Paul. The floor is payed with encaustic tiles, from Messrs. Minton's menufactory. There is a provision made at the western extrenity of the north aisle for the proposed tower, which will be completed when sufficient funds are inside for the purpose. The architect is Mr, J. C. Hine, of Notilugham; and the huilders were Messrs. Lindley and Son, of Mansfield. The amount of the contract was about 1,250. which has been met in a great measure by private subscriptions and grants from societies.

Walsall.—The foundation-stone of a new church at the Pleck, near Walsall, was laid on Wednesday inweek before last, by the Countess of Bradford. The edifice has been designed by Messrs. Griffin and Weller, of Wolverhampton, architects. It will be a Gothie structure of Early Decorated character, and will consist of nave, with north and south aisles, a north porch, north and south transepts, chancel, organ chamber, and vestry. The roofs will be high pitched, fraued with open timber, hoarded, and covered with blue and red tiles, the ridges being fusished with open creating. The sittings will be of deal, stained and varnished; the roof timbers also stained and varnished. The aisles and part of the chancel will be paved with thark and buff quarries, and that part of the chancel within the rail with Mintor's encaustic tiles. The east window will have three and the west four lights: the transepts will be not tracery. The elerestory will be lofty, with foor traceried windows : all the window-heads will be four disigned with a lofty bell turret, but it is expected that arrangements will be made for putting in the foundation of a tower and spire, to be aided at some future time. A stained window has heen promised for the chancel. The conchurch will afford accommodation to 600 persons, iicaldning children, on the ground-floor, The conctractor is Mr. Isaae Highway, of Walsall. It is in

MAY 2, 1857.

Nevoland.—The foundation-stone of a Wesleyan chapel and school-room was laid at Newland, on Monday last, hy Mr. John M. Hamilton, of Hull. The huilding is to be erected of white hrick, with stone dressiogs, and will be in the early English style. The fittings and all the interior wood work will be stained, in imitation of oak, and varnished. The accommodation will be for nearly 200. The contractors are Mr. Cressey, of Hull, for the brick and plasfer work; Mr. W. H. Shaw, for the mason's work; Messrs. J. and J. Benton, of Grimsky, for the carpenter's and joiner's work; Messrs. Richardson and Miller, for the planber's and glazier's work; and Messrs. Dawher and Son, for the slating. M. Botterill, of Hull; is the architet.

East Bergholt, Singlet.—Ou Wednesday, 22nd April, a new congregational chapel was opened in this place: Mr. C. F. Hayward, architect. The huilding is entirely of brick, the material of the neighbourhood, and the various colours are disposed with a view of bringing out the constructive lines. A triplet, with a circle above, fills the end galhe, and a lancet-light finals: it on each side, while below is the doorway, with a holdly projecting slatch hood. The side windows are lancet-lights, placed singly between buttresses. The roof, 35 feet span, is open, and the timbers staimed, and the fittings generally are finished in this manner. The around of contract was 8292. including, school-room, and the accommodation afforded with this latter addition, which forms also part of the chapel, is 506 sittings.

STAINED GLASS.

St. Thomas's Church, Salisbury.—The great east window of this church has heen filled with stained glass, designed by Mr. Alfeed Bell, architect, in illustration of the 36th verse of the 24th chapter of St. Luke's gospel: " And as they thus spake, Jesus himself stood in the midst of them," in pursuance of a request to that effect, contained in the last will of the late Mr. William Sanith, of Salisbury, who bequeathed 2000. therefor; the rest of the eost being provided for lay his widow. The window is a rather late Perpendicular one, of five lights, divided into two rows by a deep transom, with some debased and extensive tracery above. The central compartment of the top row is somewhat higher than the others, and this now contains the figure of our Lord in the act of henedition. Around him, in the remaining compartment are grouped the eleven Apostles, who were then assem²⁸, hiel together, all being so placed as to be looking up to Him (the central figure) in atifudes of surprise. Each of the Apostles is distinguisbed by his peculiar emblem. In the tracery ahove are contained representations of the dove and angels hearing palms. The drawings of the figures, and the forms and colourings of the robes, &c. are very fine, and we advise our readers to see for themselves this magnificent and munificent work, and addition to art in Salishnyr, The manufacture was hy Mr. Lavers, of Southamptonstreet, Strand, under the immediate direction of Mr. Bell.

dylesburg--Oue of the hancet windows on thenorth side of the chancel of St. Mary's church, hasjust heen filled with stained glass, the work of Mr.Olipbant, to whom was committed the execution ofthe oblitury window on the south side, presented bythe family of the late Mr. Fowler, of this town. Thegeneral pattern of both windows is a reproduction ofthe design of the early English glass, in ChetwodeChurch. The vesions of the new window contain reprecutations of the Bapirus and the Temptation of ourLord. The new window is presented to the chancelby the Archaecon and Mrs. Bickersteth, as an act ofkindly remembrance towards the late vicar, Mr. Pretyman, and his wife.

PROVINCIAL NEWS.

Beighton.—A national school has been opened at the small village of Beighton, between Norwich and Yarmouth. It is built with red brick and white facings, and roofed with mixed tiles, from a design by Mr. Brown, of Norwich, architect. The dimensions are 30 feet by 18 feet, and the cost las been 260/. The entrance is by an ornamental porch. The room above this porch is arranged for a free lending library, which will shortly he opened to the use of the cottagers. The school has been built by the aid of subscriptions and a government grant of 100/.

Of subscriptions and a government great of 1007. Newbury.—A Congregational school-room is ahout to he opened here. It is of brick, designed by Mr. Clacy, of Reading, and built by Mr. Hopson, of Newbury, and is 72 leet tolong by 33 feet wide, and 21 feet high, with means of converting a portion of one cud into two class-rooms; in addition to which it contains two class-rooms; in addition to which other 40 feet by 7 feet. The whole building will he lighted and ventilated with gas, on the new system of the "sun burner." The total cost of the 5% lights will be about 1,1007., a cousiderable portion of which has still to be raised. Chatham.-The large new tidal hasin in course of

Chatham.—The large new tidal hasin in course of construction at Chatham Dockyard is progressing, and, as soon as completed, will afford accommodation for line-of-battle ships. The new dock has been hull on the site of the old No. 2 dock, and will he of the length of 360 feet, and 92 feet broad. The founda-tion of the basin has been laid on beds of concrete, the bottom and sides beiog of granite. It is in con-templation to lengthen the adjoining, No. 3, dock nearly 100 feet, making its length upwards of 300 feet, so as to adjuit a larger class of vessels. Messra. Rigby, the contractors, have also lengthened No. 7 grante slip 60 feet, making its total length 330 feet. granite slip 60 feet, making its total length 330 feet.

granite sup 60 feet, making its total length 330 feet. Devizes.—The foundation-stone of the Corn Ex-change at Devizes was laid on Wednesday in week before last, by the Mayoress of Devizes. The huilt-ing (which is designed by Mr. Wun. Hill, of Leeds, architect) will be of Batb stone; and the contractor for the works is Mr. James Randell. The principal fagade towards the market-place will be 46 feet in length, and will consist of four Corinthian columns; with pusticated nikates at the angles, sunnortine a with rusticated pilasters at the angles, supportiog a cornice, with blocking and balustrade above. Surcornice, with blocking and balustrade above. Sur-mounting these, io the centre, will be a figure of Ceres with agricultural emblems, on an ornamental valuetation of the second Cress with agricultural emblems, on an ornamental pedestal; and vases will crow a the blocking at the angles of the building. The roof will be partially covered with slate, and the upper portion with glass. Arrangements are made for ventilation by louvres on each side of the whole length of the building between the slate and glass roofs. The interior area of the building will be 136 feet long by 42 feet wide. The floor will he of wood. *Arbridge--*Mr. Cox, of Higbbridge, builder, is the successful competitor in his contract for building the inteaded police-station and lock-up house for the county constabulary at Axbridge. Mr. Cox's con-tract was 1,350. There were five other estimates sent in for the work.

sent in for the work.

Birmingham, -- A new temperance hall, on a more comprehensive and convenient plan than the present one, is projected to be creeted at Birmingham.

Hull .- The Hull Ragged and Industrial Schools Hatt.—The Holl Ragged and Hollstran Schools approach completion. The scalibility has hen re-moved. It is in the Tudor style, from a design by Mr. Botterill, of Hall, architet, approved by the Committee of Conacil on Education, who contribute a liberal sum towards its creetion. The walls are of a liberal sum towards its creetion. The walls are of red pressed stock bricks, laid in dark-coloured mortar, and relieved with stone dressings. The roots are of high pitch, slated, with ornamental crest at the ridge The roofs are of Above one of the entrances, in the eastern facede, is a clock and bell turret, and a vonfilating turret sur-mounts the intersection of the roofs over the dormi-tories. The works have been executed by Mr. Hall, contractor, under the superintcudence of the iteet. The principal buildings comprise-on the th architect. The principal buildings comprise—on the ground floor—industrial rooms, 28 feet by 29 feet, and 27 by 16; committee-room, 18 by 11+; kitchen and seullery each 15 hy 15; boys' and girls' bath rooms, each 15 by 15; and on the first floor, boys' school-room, 27 by 28; girls' school-room, 25 by 28; and hoys' and girls' dormitories, 30³ by 15 each. The two phygrounds each contain about 450 equare vards, and arc segarated by the school buildings. architect. yards, and are separated by the school huildings

SCOTTISH BUILDING NEWS.

Edinburgh.—The restoration of Old Greyfrians Church is nearly completed. This church was do-stroyed by fire in 1845, and bas heen for nearly a year past in process of restoration, under the superinten-dence of Mr. David Consin, the city architect. The interview is cuitader acone and uncomputered by uillars achies of MF. David Cousin, the city arested. The interior is entirely open and ucencumbered by pillars or galleries. The roof is of open wood-work, and the windows are all filled with stained glass, as memorials of former ninisters. In the eastern gable is a large window of five lancet lights, contributed by the congregation. Above this is a small elerestory window of three lights, filled with stained glass by Mr. Ballan window tine, the artist in glass, as a personal contribution to the work of restoration. To the right of the great the work of restoration. To the right of the great window is a triplet window, created in memory of the Rev. Dr. Erskine, by Mr. Thomas Erskine, of Lin-lethan, and others. On the north side of the church, a twin lancet bas been filled with glass in memory of the Rev. Dr. Fullayson, after one of the early windows in Cologne Cathedral. This window is contributed by Painging Lee. To the left of the large and window In Cologue Catherral. This window is contributed by Principal Lee. To the left of the large east window is a triplet in memory of the historian, Dr. Robertson, erected by the Earl of Minds and others. On the south side of the church another triplet is creeted in memory of the Rev. Dr. Inglis. The glass is similar in cha racter to the former, and the subject of Paul preach of the fuct. Dr. fuglis. The glass is similar in cha-racter to the former, and the subject of Paul preach-tiful representations of architectural subjects, beyond in a dthem is introduced, in allusion, it is said, to perhaps any other purpose to which that art had been Dr. Inglis having originated the Mission for Schools applied, and it appeared to him that the profession in India. This window is contributed by the Dean of Paculty and Mr. H. M. Inglis, as a memorial of their facetry and Mr. H. M. Inglis, as a memorial of their facetry and Mr. H. M. Inglis, or the same. Having mentioned the reasons for considering that

Anthony Trail, W.S., in memory of the Rev. Robert Trail. The glass is similar in character, though less A twin window elaborate than the two former. A twin window has been erected, the work of Mr. Barnett, of Leith, on been erected, the work of Mr. Barnett, of Leith, on the north side, in memory of the Rev. Dr. Anderson. The triplet window facing the entrauce-door was creted at the cost of Mr. James Buehanan, of Moray-place, and is dedicated to the memory of the Seatish worthy, George Bachanan. The whole of these win-dows, with the exception meotioned, have been exe-ented in the establishment of Messrs. Ballantine and Allan Allan

Glasgow .- The Dean of Guild Court of Glasg ret last week to dispose of some applications for ilberty to erect new buildings. Among others, "Mr. Peter M'Fayden, cabinet-maker, Argyle-street," prays to he permitted to huild a range of dwelling-houses in Lyon-street, Cowenddens. This range is to be five stories in height, and is to be divided into single compartments of about ten feet square. Oue narrow comnon stair will conduct the occupants to six of these mon start will conduct the occupants to six of these rooms on each story, or, in other words, to thirty lodgicogs from the floor to the top of the building. Each room, of course, will be occupied, according to the arrangement, by a family which may be either large or encould be a start of the start of t the arrangement, by a family which may be either large or small—in the najority of cases large: if five be taken as the average, there will thus be 150 per-sons entering by one door and living up one narrow stain in thirty rooms of ten feet square! A more shameful proposal has never hear made. It is known already hy experieuce what such ranges of tenements are. They are deus of disease, of thieves, of dumken-ness, and of every form of profligacy; yet the court, for want of powers, necerding to the North British Mail, is compelled, against its own better judgment, to experie the proposal! to sanction the proposal !

-The repair of damage done to the break-Dunbar. Dimbar.—The repair of naming cone to the break-water of the Vietoria Iurbour during late storms is now proceeding. The work has here contracted for according to a plan and specification by Messrs. Sic-venson, C.E. and in keeping with an extensive im-provement of the whole works, and the despending of the Larbour on the land side.

Elgin .- The wooden fencing in front of the North of Scatland new Banking Office has been removed. of Srothand new Banking Office has been removed. The building, according to the *Dorres Gazette*, is there stories, and the Banking Offices are on the ground floor. The whole is partly dobbed and polished free-stone from Newton Quarry. Mr. Urquhart, huilder, sloter, and earpenter, has executed his parts of the work. The huilding occupying the site of the gloomy Trades' Hall gives an aspect of cheer/ulaces to this part of the town, which it knew not when the broud shadow of the old Jail and Court-honse reset on it. The shutters, which are new in the North. are Bunnet The shutters, which are new in the North, are Bunnet nd Co.'s patent nou-curviliocar shutter, of irou stripes, Venetian-blindwise.

Inverness .- In the terms of resolutions adopted at a Incerness.—In the terms of resolutions adopted at a recent public meeting, the inhabitants of the town and county of Inverness have forwarded a memorial to the Hone Sceretary, in which they say,—" That it is county of Inverness have forwarded a memorial to the Hone Sceretary, in which they say,—" That it is believed that, exclusive even of the conaties of Caith-ness and Argyle, the other great districts of the High-lands in question contain at least from 600 to 700 lunatics, most of them panpers;" and praying that authority be granted to the northern counties, by Act of Parliament, to borrow money for the purpose of defraying the cost of the original construction of an Aschem mone terms similar to those embedded in the defraying the cost of the original construction of an Asylum, upon terms similar to those embodied in the 19th and 20th of Victoria, cap. 117 (20th July, 1856), with power to assess themselves for its repayment, extending over twenty or thirty years, and this with-out waiting for the report of the General Lunacy Com-mission for Southead. mission for Scotland

ARCHITECTURAL PHOTOGRAPHIC ASSOCIATION.

On Wednesday, the 29th ult. a meeting of architects and others desirous of forming an association for pro enring and fursishing to the members, photographs of architectural works of various countries, by means a moderate subscription, was held, by permission the council of the Institute of British Architects, of

at their rooms, No. 16, Lower Grosseau-street, Grossenor-square, Mr. Ferrey in the ebair. Mr. Hesketh stated that be had only ventured in the first instance to ask the attendance of several the first instance to ask the atchance of several gentlemen, chiefly in the profession, with whom he was personally acquainted, in order to consult their views, and ask their advice before the proposition should he submitted to the profession generally and the public. He then pointed ont the particular adapta-tion of photography for obtaining correct and heat-tical explores the particular adapta-tion of photography for obtaining entred and back

the Honomunite the East-India Company might he willing to assist them in India. He had communi-cated also with a scientific officer of the Royal Engi-neers, who, with another officer of the corps, was present, and would, perhaps, inform the meeting whether they might hope for assistance from them and from the Company's Engineers in the different parts of the globe in which they were quartered. Sir Charles Barry expressed his cordial approval

of what bad been proposed, and urged that the Asso-ciation should be confined to architectural subjects exclusively. He also recommended that the Associa-tion should afford to architects facilities for obtaining photographs of their own works during their progress or otherwise, as it was a most useful means of ob-taining an intimate knowledge of the progress of He then moved the following works at a distance. resolution, which was passed :---

"That an association, having for its objects the pro-curing and supplying to its members photographs of resultactural works of all conntries, is eminently calcu-lated to be of benefit to the architectural profession, by obtaining absolutely correct representations of those works, and to the public, by diffusing a knowledge of the best examples of architecture, and thereby promoting an increased interest and love of the art."

increased interest and love of the art." The following gestlemen were requested to act as a provisional committee, to obtain members, and to draw up regulations for the management of the asso-cistion, to be submitted to a general meeting:—Sir C. Barry, Messre, Ashpitel, Ciliton, M. D. Wyatty, Ferrey, J. H. Hakewill, S. Wood, C. H. Clarke, Salvin, C. C. Nelson, H. B. Gatbug, P. C. Hardwick, G. Mair; Capt. Scott, R.E.; Capt. Ross, R.E.; Messre, Paynorth, Boutell, and Hesketh, with power to add to their numbers. Finally it was resolved,— That M. Resketh be requested to act as Honorary. at Mr. Hesketh be requested to act as Honorary, Th Secretary pro tem.

THE ARCHITECTURAL PUBLICATION . SOCIETY.

THE first part of the works for the year 1856-7 Inc. first part of the works for the year 1856-7, has just been issued, comprising illustrations to some of the articles in the letters A and B of the "Dic-tionary of Architecture." These, together with the previous plates, make thirty-five devoted to these letters.

The subjects are all of much interest at the present. day. "Agricultural Buildings" occupy the two first-plates, offording specimens of dairy farms creeted in Dorsetshire and Gionestershire : these plans show also the manure and surface drainages, and base been pre-sented by Mr. Henry Drake. Auother plan, com-prising the Scoleh system as practised in Berwick-shire, is contributed by Mr. Jobn Starforth, of Edim-burgh, whose plans, issued by the Highland and Agri-cultural Society of Scotland, are already familiar 4: many of our readers; and lastly a stock farm, as just completed in Kent, and contributed by Mr. A. Ashpitel. These, together with the plans issued last The subjects are all of much interest at the present. Ashpitel. These, together with the plans issued last year of practical farmsteads creeted in Lincolnshire by the late Mr. E. Willson, of Lincoln, make a choice selection of modern examples for study. Five interesting examples of interiors and exteriors of "Apse," from Como, Venice (2), Arezzo, and Sebaste, are placed with a series of seven plans, showing the manner of forming this termination of a church, as practised from the winth to the fifteenth centuries. "Arcade" has furwinth to the fifteenth centuries. "Areade" has fur-nished two specimens from Assisi and Siona, plain aud ornamented; and "Balcouy," is examples from Venice, Vicenza, Florence, and Verooa. "Bell" is illustrated by an exceedingly fine work, — that in St. Petor's at Rome: it is greatly to be regretted that this example was not made public at an earlier period, as, notwithstanding the defects in its very elaborate ornamentation, it forms a striking contrast to the paltry plainness of the "Big Bon" of Westminster, whose "decoration" is a disgrace to the state of the "decoration " is a disgrace to the state of the whose "decoration is a degrade to the balls Fine Arts of the present day. Sections of the balls at York and Montreal are also given. "Bench ends" (tinted) opens up a subject in which much can yet be done by those who are not addicted to conform to done by done by those who are not addicted to contorn to-strict precedent. The examples are taken from. Cologue (6), Piacenza, Palermo, Siean, and from. Great Tew and St. Cross in England. "Brickwork," showing its ancient applicability either for plain work, ent work, or use with terra cotta ornamentation, is illustrated in it wo tinted plates of examples from Siena, Veroua, Milan (the Great Hospital), the minutely detailed Campanile (thirteenthe sentury) of San Antonio, at Padua, with seven specimens of eornices from Bologna, Padua, Verona, Spoleto, and.

The introduction of the bands of brick in erwise stone cornice of Verona is especially sof attention : reference will be found made Street's "Brick Arebitecture." "Buttress" worthy example from Nuremberg of a more soal English character, with others for the latter sharing a wide substructure allows sa at Brighton. This would be strended with enor-mall archway, and, its projection admitting of most expense is a word in the street strends of the strends Venice. The introduction of the bands of brick in the otherwise stone cornice of Veroua is especially deserving of attention : reference will be found made to it in Street's "Brick Arebitecture." "Buttress" Buttress" to it in Street's "Brick Arebitecture." "Buttress" gives a worthy example from Nuremberg of a more than usual English character, with others from Bautzen, Cintra, Amiens, Troyes, and Brusted in Kent, which latter having a wide substructure allows for a small archway, and, its projection admitting of its heing used as a porch, is suggestive. Two exam-ples of Italian character are given from Florence and Venice. Venice.

The selection has been altogether judicious, and the members are greatly indebted to the liberality of those gentlemen who have thus so freely contributed those gentiemen who have this so freely controlled their drawings for the use of the society. Besider those above mentioned, who are new friends, we set the names of Messrs. W. Lightly, F. P. Cockerell, G Somers Clarke, H. R. Newton, W. Bouteber, and R Besides Somers Clarke, H. R. Newton, W. Bouteber, and R. H. Shout, together with the more familiar names, as connected with the society, of Messrs. E. H. Martineau, Octavins Hausard, J. W. Walton, J. Lockyer, jun. T. H. Lewis, S. S. Tenlon, and C. Fowler, jun. Messrs. Hansard and Lewis bave like-wise devoted much time to the collection and prepa-ration of the drawings. On page 212 will be found a list of some of the subjects in the letter C, which the committee are now preparing to illustrate. A few weeks since (p. 181), we adverted to the difference in the sale of books to architects and to encineers: and a strong example of the point we

engineers; and a strong example of the point we wished to advocate is given in the work in course of publication by the society. It is certainly a very striking instance of the fact, how little the profession interests itself in works more immediately bearing npon their pursuits, and how little it aids the bearing npon their pursuits, and how hille it ands the class of works relating to it. As we have often urged before, there ought to be at least a thousand sub-scribers to this "Dictionary," instead of the present few bundreds: this would then enable the committee to carry ont with energy the arduous task imposed upon them. Even the addition of some seventy or eighty members would now produce a year's issue without the necessity of a subscription. The profes-sion should come forward in earuest at once.

COMPETITIONS.

COMPETITIONS. Worcester Cemetery.--The committee have had much trouble in arriving at a decision. After long discussion by the towa-council, three designs were selected. The scaled envelopes accompanying the de-signs were then opened, and it was found that the architect of "Trefoil" was Mr. R. Clarke, Shakspeare-street, Nottingham; of "Finis," Mr. R. Wheeler, London; and of "Faith," Mr. C. H. Cooke, London. The committee were duly instructed to carry out the plans, advertise for tenders, and report from time to ima. Nankuich.-Designs have here.

Nantwich .- Designs have heen received for erectand the second s have been selected, and are to he carried out.

THE SERPENTINE IN HYDE PARK.

THE SERPENTINE IN HYDE PARK. FROM time to time public attention has heen directed to this well-designed piece of ornamental water, which, in general effect, is scarcely surpassed by any other public decoration of the metropolis. It is certain, however, that the Serpentine, beautiful as it looks, must be put in the list of painted sepulchers, if we may use such a term; and it is to be feared that, unless proper means are taken, the condition of things will become worse, and it will be necessary to get rid of the ornament for the sake of whole-someness. someness

It must be evident to every one who has looked carefully, as well as frequently, at this favourite place of resort, that the supply of water is quite insufficient carcing, as that the supply of water is quite insumments for the purpose of causing a proper current to clear away the impurities. Looking over the railings of the road which crosses the cast end of the Serpentine the road which crosses the cast end of the Serpentine the Knightsbridge harracks, instead of secing

mous expense; and it is doubted it suit water mought in this way, in such quantities as would be possible, would henefit the bathers in proportion to the cost; we could scarcely, in Hyde-park, by the mere pre-sence of a salt-water lake, manufacture the bracing atmosphere on which the beneficial effects of sca-bathing so much depend.

attings on which the other any thousands of per-bathing so much depend. Those who have seen the many thousands of per-sons who throug the Serpentine in the summer mornings and evenings, must feel how necessary it is that this piece of water should be kept in proper condition. We would, however, rather that this should be effected by means of a sufficient quantity of clean fresh water, natural in such a ucipbourhood. Are there no small rivers at a moderate distance from the spot which, by the expenditure of a reason-able sum, could be made to flow into the parks, and, after doing duty there, be sent to add a mite to the volume of "Father Thames?" for surely he will require some belp before long. Our old and useful, yet dirty, survant must be fed by water from the land, yet dirty, servant must be fed by water from the land, in order to enable him to throw back the regular attacks of the sea; otherwise he must continue, as he has for some time done, to get smaller and less

has for some time using to get similar and asso-vigorous at his extremities. This subject is well worthy of the careful con-sideration of all who feel an interest in the tasteful adorment of the metropolis, or who are anxious to provide a sufficient and proper bathing-place for large numbers of our pent-up mechanics and others.

THE AREA IN FRONT OF ST. PAUL'S

It is with much regret that we notice that this space, which, in the erowd and throng of the city, may in a way be compared to water in the descrit, is still closed against the public. The police, the tradesmen, and all who have business in this crowded thoroughtare, say that the opening of the gates of this inclosure was a very great advantage. This damage has been done, most probably, by a mischievous boy or other per-son, and it would be well that be should he brought to undice. Surely the Dean and Chouter of St. Deadle etiv Surely the Dean and Chapter of St. Paul's should have used some means of doing so, and not closed a space and a pathway so nseful to the public It would be just as reasonable to shut up the cathe A would be just as reasonable to sink the terms dwal of St. Paul's sloggether, in ease a mischierous person should unfortunately perpetrate some small damage in the interior; or that the British Museum should be closed, because a madmam in the absence of the attendants broke the Portland vase. A reward of IOs. bas heen offered for the apprehension of the offender. I have at times scen advertisements of 22, reward offered for a missing gentleman, and have wondered at the cheap consideration in which he was held, and the reward of 10s. offered for the apprehension of the person who bas caused the public to presension of the person who bas caused the public to he debarred the use of a most convenient privilege is hard to be understood, and shows a feeling which is not altogether creditable. I trust that the dean and chapter will reconsider this matter.—A WAYFARER.

GAS

GAS. THE half-yearly meeting of the Great Central Gas Consumers' Company was held last week at the London Tavern, Mr. Dakin in the chair, when the chairman read the report, and congratulated the meet-ing on the prosperous statement which it conveyed to them. Their results for the year ending Christmas last amounted to 54,2287. 7s. 4d. heing an increase of more than 5,800. over the preceding year, and 3,4002, over the rental at Christmas, 1854. This increase raised the net profit to 16,8021. 13s. 4d. The balance brought forward was 15,2597. 19s.: by deducting the auvount of the depreciation fund. as

[May 2, 1857.

Mr. Yardley, to answer a summons taken out hy Mr. Edward Fulcher, inspector of nuisances and sani-tary inspector for the Poplar District Board of Works, tary inspector for the Poplar District Board of Works, which summons charged that several nuisances existed on the Gas Company's premises. After a long discus-sion, Mr. Yardley said it was admitted on all sides that the nuisance was of a threefold character; and it was agreed as he suggested, instead of making an order at present, that the summous be adjourned for six weeks on the defendant undertaking to cover over the tanks and the blue hilly-pits, and prevent the escape of any offensive effluing, also, that none hut pure water should he used in cooling the glowing coke from the retorts, and that a longer time should be allowed to change the purification of the gas. Gas bus just for the first time been introduced into a Cornisb mine—Balleswidden. Mr. A. Wright,

a Cornisb mine—Balleswidden. Mr. A. Wright, C.E. who contracted to supply the gas, delivered a lecture on Gas to a large number of miners and others, assembled in the drying-house of the mine, and was

assembled in the drying-bonse of the mine, and was listened to with great attention. A public dinner was held at the Crown Inn, Staveley, on Wednesday week, to celebrate the open-ing of the gas-works in that place, created by Mr. Marriott, of Staveley, under the direction of Mr. T. F. Cashin, of Staveley, under the direction of Mr. T. F. Cashin, of Sheffield, engineer. The company are extending their mains to the remotst part of the village, and at present they are charging 5s, per 1000 for one but shortly they expect to reduce it.

france, has a present and an entry of the starting of perform for gas, but shortly they expect to roduce it. The existing Glasgow gas companies are paying dividends of 10 per eent. It is now proposed to establish a consumers' company, to meet the discontent which the present bight rates occasion, by limiting the dividend to T_2^+ per cent. The company is to remain independent, but its charges are not an-noineed.

PRESERVATION OF LEAVES.

IF your correspondent, "R. H. W." will take a dish and place his leaves and flowers on cdge, or in such position that be can embed them in fine dry san position that be can embed them in fine dry sand without disturbing their forms, and afterwards dry them in the oven, he will find this a ready means of attaining bis object. The heat should not be so great as to burst the delicate resears. I believe this preserves the colour better than any ordinary plan. The yellows generally stand well, however dried; hut whites, reds, and hlues, have always an unpleasant tendency to dirty brown. Plants dried in this way are more or less erisp, and inconvenient to keep: my herbarium, of about 1,000 specimens, is made hy placing a few sheets of newspacer over each plant. fine dry sand my heroarium, or acout 1,000 specimens, is made ny placing a few sheets of newspaper over each plant, applying pressure, and changing the paper daily until dry. This is quite sufficient for giving the correct outline of the leaf; and a study of the *habit* of the plant in its wild state will enable the artist to adapt it the line plant in the state of th it to his purpose. FINIAL.

ELECTRO-MAGNETISM AS A WORKING POWER

At the Institution of Civil Engineers, on April 21st, the paper read was "On the Application of Electro-Magnetism as a Motive Power," hy Mr. Rohert Hunt, F.R.S.

Hunt, F.R.S. The author commenced by giving the progress of the investigations by which Cersted first proved the connection hetween electricity and magnetism, and which led Sturgeon to construct the electro-magnet. The powers of this form of electric force, as deve-loped temporarily in soft iron, naturally induced the idea of employing it for the purpose of exerting mechanical motion—doing work. The principles of the electro-magnetic machines of Dal Negro, of Botta, of Jacobi, of Armstrong, of Page, and others, were next described. It was shown that all engines acting by a direct pull were inefficient, from the circum-stance that the repeated hlows received by the iron, so altered its character, that it eventually assumed so altered its character, that it eventually assumed the quality of steel, and had a tendeucy to retain a the quarky of seed, and had a tendency to Fean a certain amount of permanent magnetism. This in-duced Jacobi, after a large expenditure of money, to ahandon arrangements of this kind, and to employ such as would at once produce a rotatory motion. The engine, thus arranged, was stated to have been tried upon a tolerably large scale on the Neva, and brit hose to contain the content of the scale of the scale of the scale transformation. for the purpose of causing a proper current to clear away the imparities. Looking over the railings of the voad which crosses the east end of the Serpentine towards the Knightsbridge harracks, instead of seeing the water continually streaming down the artificial cascade, in nine cases out of ten the imitation rocks will be found dry—a stagnant green-looking pond at botom—the vegetation in the season more than half, cate are, however, rats, in somewhat strong fore, there are, however, rats, in somewhat strong fore, that it is not altogether so pure as it should be when it arrives at Kensington-gardens. In order to remedy a manifest and increasing evil and this is a good hint. Others say let us have the botom construction of the depth registed; and this is a good hint. Others say let us have the central Gas-works at Bow-common, appeared before central Gas-works at Bow-common, appeared before central Gas-works at Bow-common, appeared before central Gas-works at Bow-common, appeared the forest there ago hom. Charter at the depth registed; and this is a good hint. Others say let us have the central Gas-works at Bow-common, appeared before central Gas-works at Bow-common, appeared before central Gas-works at Bow-common, appeared before could be sefere there ago hom. Charter at a stage the same and the

concerved, was greatly in Invoir of steam, and adverse to the nse of electricity as a motive power. A discassion, which was commenced, was an-nonneed to be continued at the next meeting. Mr. T. Allan, whose improvements in electric telegraphs have been recently mentioned, has lately occasioned considerable excitement in Paris by the exhibition, at the desire of the Emperor Napoleon, of the destructure to the this electro-magnetic engines, which, according to the Mechanics' Magazine, are unquestionably the most successful examples in existence of the application of electro-magnetism as a motive power.

The main feature of Mr. Alan's investion consists in the application of electric currents so as to form several electro-magnets in succession, hy means of which several impulses shall be successively given in the same direction to a rod espatial of heing moved longitudinally to any extent which may be required. At the commencement of a stroke the first of a set of keepers mon the rod is placed sufficiently near to the first set of magnets to enable them to exert an avail-able force upon it, and to move it through the space able toree upon it, and to move it through the space that separates them. Therefore, when a current of electricity is applied to this first set of magnets, they accordingly draw down the keeper to them, and move the rod longitudinally through the space just men-tioned. The next keeper is, by this means, brought within the same distance from its magnets, and the summed of doctricity is of the same meaned and off entrent of electricity is at the same moment cut off from the former and applied to these, which there upon draw their keeper to them, and more the rod through an additional space or distance equal to the first; and the other magnets and their keepers will respectively act in a similar manner in succession, and thus complete the stroke of the rod; after which the opposite rod will be operated upon similarly, the reciprocating motion thus obtained heing converted reciprocating motion thus obtained heing converted into rotary motion by means of the connecting-rod and crank in the ordinary manner. Mr. Allan has also arranged a rotary engine upon analogous prin-ciples, and a writer in the scientific periodical just named states that he has seen it produce very ex-cultant engineers. cellent results.

RECENT PATENTS FOR ARTIFICIAL STONE.*

STOXE.⁴ No. 2,267. FREDERICK RANSOME, Ipswich.— Improvements in the manufacture of artificial stone, and in rendering it and other building materials less liable to decay. Dated 27th September, 1856.— This invention is applicable, first, to those descrip-tions of artificial stone which are compounded with sund, elay, and other mineral or earthy substances, together with soluble silica or a soluble silicate, and the invention consists in adding to the communities. together with soluble shield of a soluble suitate, and the invention consists in adding to the courposition of such artificial stone a substance which will fuse more readily than the sand, and will run into and fill the pores of the stone, and thus render it more dense than when compounded without such addition. The sub-stances which the patentee prefers to employ for this purpose are pumice-stone or a readily fusible glass. In preparing the artificial stone he prefers to mix the preparing the articlear score ne presers to first the ingredientis in the following proportions, by measure— Silicions sand, 30 parts; finely-powdered silica, 10 parts, solution of silica, or silicions eement, 5 parts, ap.gr. 1"00; powdered pipeday, 5 parts; pumice-tione prepared in a way described, 5 to 10 parts. When he employs a readily fusible glass in the manufacture of artificial stone, he prepares the glass by fusing together in a reverheratory furnace or crucible the following materials—Silicat of soda, 100 parts, sp. gr. 1,400 parts; oxide of lead, 100 parts; and in preparing artificial stone he substitutes for the 5 to 10 parts of prepared pumice-stone, in the mixture hefore mentioned, 5 to 10 parts of the fushile glass. The investing also consists in a method of readening hefore mentioned, 5 to 10 parts of the fushing glass. The invention also consists in a method of rendering artificial or natural stone, bricks, and other materials used for building purposes, less liable to decay. For this purposes the stone or other material is coated or saturated wholly or superficially with a solution of a soluble situated and hene flowment. soluble silicate, and has afterwards applied to it a solution of chloride of calcium, hy which an insoluble silicate of lime is formed in the hody of the stone or other material

2,282. GEORGE TOMLINSON BOUSFIELD, Sussex-2,282. GEORGE TOMINSON BOUSFIELD, Sussex-place, Loughborough-road, Brixton, Surrey.—Manu-facture of artificial stome. A communication. Dated 29th September, 1856.—This invention consists in a composition of matter to be used as a substitute for stone and bricks for huilding and engineering pur-poses. For this purpose the patentee takes of ordi-unry chalk from 80 to 85 parts, and of slaked lime from 15 to 20 parts, by measure. The ingredients

* From the Engineer.

are well pulverised and mixed together with sufficient water to give the proper consistency for moulding. The paste thus produced is then moulded with a proper degree of pressure, to cause the particles to adhere together into any form suitable to the purposes designed. After coming from the moulds the blocks or tiles are allowed to dry a few days in the open air, and are then ready for use. and are then ready for use.

RECENT BUILDING PATENTS.*

RECENT BUILDING PATENIS." 1339. J. NORRIS, Jun.—An Improvement or Improvements in the Manufacture of the Cutting Tools employed in Nail-making Machines.—A com-munication. Dated June 5, 1856.—In forming such cutting tools, the patentee employs a mixture of one-half of the best sterling iron incorporated with one-half of malleable iroo; or equal parts of white and grow irou producing a malleable iroo. The cutting-tool being cast in either of these mixtures, and the cudes and edges heing chill cast the cutter is dressed ends and edges being chill cast, the cutter is dressed or faced on a lap.

2056. EUGENE ARMAND ROY, JOHN ARCHIBALD 2050. EUTRE ARAND A01, JOHN ARCHINAD HALL, and WILLAR THOMAS BINNS, all of Camdeu-town, Middlescr.—Means of enswing Draught in Smoke Flues or Chinneys. Dated 4th September, 1556.—The patentees use a fan on the screw-propeller principle, to revolve in the flue or chimney, or in the pot or cowl, so as to propel the smoke and air.

2063. RICHARD ARCHIBALD BROOMAN, Fleet-Street.—Improvements in Buildings and Parts of Buildings.—A communication. Dated 4th Sep-temher, 1856.—The object of this invention is to provide economical means of constructing roofs, roof-frames, and other huildings or parts of huildings in iron. The parts are made in pieces, and so that they may be easily set up, taken down, and carried from iron. place to place

2083. PETER ARMAND LE COMTE DE FONTAINE MORFAU, Rue de l'Echiquier, Paris.-Making Arti-ficial Stone for Statues and ornamenting purposes.-A communication. Data de h September, 1856. The inventor mixes argil with red other or iron ores, in the proportion of about one-fifth argil. This mix-there is pulverised and sifed, and thrown into recipients there is pull cerised and sifted and thrown into recipients prepared for the purpose. It is then spriukled with acidulated water. The product of this operation re-sembles ordinary plastic clay, and may be moulded and manipulated by pressure, or hy any other known means. When required to produce oroannents like porcelain handles, the ordinary hand process is adopted, the joints being imperceptible after the baking. The material thus prepared and moulded to the required form is passed to the drying chamber, and thenee to the kin, where it is submitted to a temperature at least equal to that required for fur-bricks. At this degree of heat the product undergoes a certain amount of vitrification, which gives to it a polish and blueish of vitrification, which gives to it a polish and blueish colour, between that of iron and polished slate, and at colour, between that of iron and pointed state, and an the same time a hardness of texture which enables it to be advantageously substituted,—first, for granite and marble for pavements, chinney-pieces, table tops, statues, Kc.; secondly, haked earths for retorts, boilers, and vessels of all kinds employed in chemical manufactures, the composition being in no degree altered by the acids.

Gas. -M. Emile Kopp, of Paris, professor of chem-istry, has provisionally specified improvements in the manufacture of gas, which consist in new arrangements of furnaces and retorts in which gas is produced of infinites and retorts in which gas is produced, either from coal or other organic substances, in such manner that the preparation of gas, instead of heing intermittent, hocomes continuous; the furnaces and retorts being constantly heated to the required temperature, and never heing empty. By means of suitable mechanical arrangement, such, for instance, suitable mechanical arrangement, such, for instance, as an endless iron chain and a piston, coal or other fuel is gradually and continually introduced into the retorts, passes slowly through them, discugating gas and being converted into coke, which coke or other residuum is continually discharged, bydranlie occlu-sion preventing any undue escape of gas, which latter remains constantly of the same quality during the entire time of manufacturing.

2077. JOHN JUCKES, Dame-street, Islington.-Stoves and Fire-places. Dated 6th September, 1856. --In carrying out this invention, that portion of a stove or fire-place in which the fuel is contained is arranged to turn on an axis at the back, and it has a grating or set of fire bars in front. The basket or fire-place may be made of various forms: it is, however, pre-ferred to he of a spherical form, with a door at the top and the hottom, which is composed of fire-bars or otherwise for the passage of air. When the fire requires fresh fuel it is put into the fire-place through the doorway, which for the time being is uppermost. The door is then to be closed, and the fire-place or or fire-place in which the fuel is contained is arranged

. Gleaned from lists in the Mechanics' Magazine, the En

stove is to be turned half way round on its axis at the hack, hy which the fresh coal will come below the well-ignited fuel of the fire. The peculiarity of this construction is, that the axis is only at the back, and the fore hars are in front.—Not proceeded with.

ON THE APPLICATIONS OF BOTANY TO ORNAMENTAL ART.

AT a meeting of the Edinhurgh Botanical Society, on the 9th instant, Mr. George Lawson exhibited a paucl carved by Mr. B. Reeve, representing in its side ornaments Polypodiam alpestre and Poystichum side ornoments Polypodiam slpestrc and Poystichum Lonchitis. In connection with this study from mature, he called attention to the inexhaustible source of novelty in design which the vegetable kingdom presents, and which he hoped would be made more fully available than hitherto, for although "flowers have in all ages been used by the aspiring orna-mentist, and have ever been the basis on which the science of ornament has stood," much still remained to he done. Even in our own day novelites are occa-sionally introduced by enterprising designers; still, how easy would it he to catalogue all the vegetable forms that have, actually hear neferred to in design. how easy would it he to catalogue all the vegetable forms that have actually here referred to in design. Of the ninety-three thousand living plants (not to speak of dead species), how few have actually come into general use for this purpose! Dr. Lindley, and, more recently, Mr. Dresser have done much to eluci-date this very subject of the relations of botany to ornamental art, and with such aids, the wall of sepa-ration that has so long existed between the botanist and the ornamentiist will surely be specifly hroken down. Mr. Lawson then referred to some of the authors who had here instrumental in drawing attendown. Mr. Lawson then referred to some a the authors who had been instrumental in drawing atten-tion to this subject, alluding particularly to Pugin's "Horiated Ornanent," and to various writers in the Builder, Art Journal, &c. He proceeded—It is to be kept in view, when the artist is recommended to study nature under the light of science, that this does at a subject of a science of the subject study matrix much the light of strates indicates that the design of the subject. Attention to hotany is even more essential to him who would create a design by the conventional treatment of natural forms, than it is to the naturalistic designer. It is what anatomy is to the painter of the human figure. It enables him to modify his leaves and flowers according to the requirements of his design, without overstepping the houndaries of truth, design, without oversteeping the houndaries of truin, and originating a caricature, instead of adapting nature to his special purpose. It is a common error to suppose that the artist has merely to take natural forms as his starting-point, and give these a geome-trical disposition, molifying them according to his taste. Truth to nature is necessary in all decordions to be a supported and the second second second second second started by the denoted are medicated by the second seco taste. Truth to nature is necessary in all decorations intended for an educated eye, and especially so in an age of science. And the beautiful laws of form, and age or science. And the beautiful laws of form, and of colour, of number, and of arrangements of parts, that prevail throughout the vegetable kingdom, are necessary to he known hy the artist who has high aims. This knowledge loosens him from the tram-mels of a mere copyist, and gives him a wide range of conventional treatment, while his work assumes the character of an exposition of principles instead of a slavish court of details

It is a well-known fact that many of the finest earved works, in both ancient and modern huildings, are *direct* studies from nature ; and several modern are direct studies from nature; and several modern writers have lately pointed out of designers, that it is to "natural forms geometrically disposed" that they most all look for new inspirations. " By repeated copying," says Purgin, "the spirit of the original work is liable to he lost: so in decoration, the constant reproduction of old patterns, without reference to the natural type from which they were composed, leads to a mere cariesture of a beautiful original. It is impossible to improve on the works of God; and the matural outlines of leaves and flowers must he more natural outlines of leaves and flowers must he more perfect and heautiful than any invention of man."

METROPOLITAN BOARD OF WORKS. THE REGULAR LINE OF BUILDINGS.

Ar a meeting of the Board, held on Friday, the At a meeting of the Board, held on Friday, the 24th ult. a deputation from the Board of Works for the Westminster district attended, with reference to the building recently erected by Messrs. Broalwood and Sons, in the Horseferry-road, Westmuster. The particulars of the case will he recollected by our readers. The Board of Works having refused to sanction the erection, the duty of ordering the demo-lition of the work was cast, by the very objectionable arrangement in the Act, upou the District Board of Westminster. That body, for their own protection, took the opinion of coursel, and the following is the substance of the opinion so taken. Mr. Bovill, Q.C. to whom the subject was referred, ays ;--

substance of the optimion so tasks. Int. Journ, Q.C. to whom the subject was referred, says ;---"I can of optimion that the regular line of buildings mean funced in the 113rd section does not necessarily mean a regular line of buildings from one end of the street to the other end. Many portions of a continuous street or high-way are commonly known and considered as separate

streets, are distinguished by different names, and often situate in different parishes, and it is in my opinion suffi-cient to bring a case within the section of the statute that the buildings in any part of a continous street or highway are of such a number and character as to assume the form of a regular line of buildings in the order of the street, speaks of the regular line of buildings in the street, and not of the street, seems to me rather to lead to that con-dusion, and think the meaning is made clearer by the interpretation clusse."

Interpretation clause." He went on to develop the ground upon which this opioin had been formed, which he said was one of some importance, not free from difficulty, and sug-gested that a decision should be obtained in a special case to he submitted to a control flaw. An opinion was also obtained from Mr. George Pownall, surveyor, which agreed with the views taken by Mr. Bovill. Mr. Mills (a member of the deputation) said they attended from the District Board to ask this Board to give them facility for obtaining the fullest informa-down the hnilding, or to give any further opinion as to whether Messrs. Broadwood had complied with the Act of Parliament, but to put them in possession of Act of Parliament, but to put them in possession of all cases the Board might have on this subject. In all cases the Bonth high tasks to do an expect to ealing upon the District Board to carry out the law as haid down by the Mctropolitan Board, they really thought it was beginning at the wrong end, and that the Central Board should have the power of carrying

ont their own orders. The chairman said they sat there to administer the law, Law, and had no forther jurisdiction in the matter than the Act of Parliament conferred upon them. They had no power to demolish the building in ques-tion, as that was a duty cast upon the District Board, and could not now discuss any alteration in the law Any information that was possessed by the chie office would, of course, be at the service of the the chief the District Board.

RESTORATION OF THE BASILICA, TREVES

The traveller who descends from the surrounding heights into the valley of the Moselle, is chiefly attracted by two grand structures—the Simeon's Gute, which, according to Kugler, is a Merovingian struc-ture, whose buge store blocks have heccome blackened by the long lapse of time; while the *Basilica* rears its hold but slender brick structure up into the air. Its more our scener press screeture up nuto the air, There can be no doubt that this is a Roman building, and the so-called Roman Baths, which rise at a short distance from the present city walls, present the same hubling material, and the same style, and it becomes meahable that the whole materials and numung material, and the same style, and it becomes probable that the whole neighbourhood was once coerupied by a complexity of similar hubidings. This Basilica has been considered hitherto to have been a palace of Constantine, a theatre, or a hippodrome. It is Professor Steininger, the sections reaches of the is Professor Steininger, the assiduous searcher of the antiquities of Treves, who has proved its real destination, namely, that of a basilies, and any one who knows the description given by M. Wackernagel, of the the description given by M. Wackerfagel, of the Basilies of Pompeti, and compares them both, will be assured of the correctness of that belief. The hasilicas of the Romans served as courts of justice, and as a meeting-place for merchants; and when of late the modern accessories of the huilding bad become visible, this turned out to be still more evidently true, this to be seen now that of the accient Roman It is to be seen now, that of the original Roman structure, there only remains the semicircular tower called *Helenen*, or *Heidenthurm*, in which is the bold arcb of 60 fect span, and the we-tern longitudinal buildarcb of 60 foct span, and the we-tern longitudinal build-ing, with the two rows of large arched windows, which are separated by strong pillars, and a portion of the eastern wall, which may have here demolished on the building of the archiepiscopal palace. The whole huilding is constructed of flat hricks, combined by layers of mostar, and forms a square of 180 feet long, and 68 feet wide, its height heing 100 feet. On both sides of the semicircular building, in which stood the longitudinal walls, and form turrets for the stairthe longitudinal walls, and form turrets for the stair-cases, which reach above the roof, which serves for a vanit. The front, turned towards the present *Parada-plats*, in which is the main cutrance, has large niches instead of windows, in which statues will now he placed, and above the pediment the Christian emblem will be raised

As the soil bas risen, through the lapse of centu As the soil bas risen, through the lapse of centu-ries, 10 feet, a staircase leads on the west side down to the portal. The many fragments found in the rubhish show, that the floor of the main huilding was paved with marble and granite plates, forming various designs. This floor rested on small brick pillars, through which warming conduits passed. The floor of the tribunal also must have been transected by heating conduits. The walls of the circular build-ing, as well as the niches therein, were nicely painted or inlaid with many-cloured netheles mosnicelike.

The remnants of this Basilica had been presented by the manicipality to the King of Prussia, who ordered its restoration as a Protestant place of wor-ship. It was confided to the eare of M. Schnitzler, the architect, and M. König, the builder, and they have made it such a structure as may hardly be matched thisside the Alps. If we fancy the height and breadth of the building, whose interior is not divided hy either columns or pillars into several naves —its whole sphen-dour and majesty become apparent. On each side four rows of windows admit the light, to show us the ornamentation of the interior, which is quite in ac-ordance with the simple yet grand style of the build-ing. Strange also have been the fates of this mysticd, long-neglected structure. When the Franks had made an end to the Roman domination on the Moselle, the an end to the Roman domination on the Moselle, the Basilica of Treves was converted into a King's Court (Königshof), in which resided the palatines of the monarch, the suzerains of the Church, and, in fine, the hishops themselves. In the beginning of the eleventh century it was converted into a fortress flanked by turrets and fosses, until it got lost amongst the indifference of succeeding ages.

THE PAVING TILES OF THE MIDDLE AGES.

AT the second Connersazione of the Somerset shire Archæological Society, held at Taunton, some mediæval tiles from St. James's churchyard were exhibited, and the following remarks by Mr. C. E. Giles were read :

by Mr. C. E. Giles were read:— The clay manufactures of the Middle Ages have hitherto not been sufficiently investigated, and consequently are little understood : aucient examples should therefore be in all cases pre-served in their original positions if possible, hut otherwise in public Museums; and the facts connected with them should be carefully re-ulated The time found in the oburghuyed of The tiles found in the churchyard of corded. St. James, Tannton, are, I think, of interest, from the fact that the design or pattern on them is only superficial, or painted by haud, as in the case of china-ware. It has been supposed that the superficial colouring on elay was introduced into England through Italy from the East, in the reign of Elizabeth; but as tiles are said to occur of this kiud, of earlier date, the supposition is perhaps donbtful. In this case the pattern on the tiles seems to he of a much earlier character of design than is usually found in Elizabeth's reign. There are said to be tiles of this manufacture in the Mayor's Chapel at Bristol. An examination of the floors of our remote country churches in this district would, think, throw some light on the subject In I think, throw some light on the subject. In the larger churches the floors have been "bean-tified" in the eighteenth, and "restored" in the ninetcenth centuries; so that for these historical interest at least has eeased. But I have some idea that many churches west of Tauntou, including Tolland, still possess remains of their ancient floors, to the colours of which in late years, in some cases, has been added a rich natural green. It is, however, certain that tiles with superficial colouring did not form the staple manufacture of the Middle Arcs. The common type was made in this Т form the stapic manuacute of the Middle Ages. The common type was made in this manner: — A thin square of clay was par-tially dried in the sun, and then impressed by a stamp, having a design in relief. This produced a pattern in cavetto, into the hollows of which clay of another colour was afterwards inlaid. by a hole to both was are wants much The permanence of the work was then secured by a thin metallic glaze, which also gave rich-ness and tone to the whole. Sometimes the hollows were never filled at all, and in other hollows were never inicial at an, and in cavetto, cases the pattern, instead of being in cavetto, was in relief. The first was, however, the usual type of manufacture throughout Northern type of manufacture throughout Northern Europe. South of the Alps, incised stone or marble supplied the place of the clay tile; and for the pattern-coloured glass or precious stones, that of the coloured clay. There are examples of this kind in Canterbury Cathedral, and else-where in Northern Europe. Sometimes, after the glaze of the surface has perished, the inlaid

pattern has fallen out. This seems to have happened in the case of the tiles found at Messrs.

was older than the building, as the walls had been feur-de-lis in the centre. Probably they are of built into its mass. The remnants of this Basilica had been presented margins prevent the patterns from uniting margins prevent the patterns from uniting symmetrically; but perhaps the general effect of the floor was little worse on this account—the colour, and not the pattern, being in such cases the primary source of interest, as in the case of the ordinary Thrkey carpet, in which no one looks for a pattern; and while our Axminsters, Wilton, and Kilderminsters, the desigus of which have been considered, rather than the harmony of their colours, are so distressing in their obtrusive roses and cornucopias—the in. their obtrusive roses and cornucopias—the in-comprehensible and oft-repeated interlaced design of the old Turkey carpet seems never to

design of the old Turkey carptet seems never to wcary, and the moderu desigus for tiled floors have very commonly proved failnes, and almost in proportion to the symmetry and continuity of their patterns. Still, in the case of the tiles alluded to, the separation should not have been in the form of pattern, which is uumcaning if not continued: the relief should have been sought in colour. The tiles are evideutly of rude manufacture. Tiles are now produced by pressure on dry clay, the agent being either steam or hydrostatic power, which is applied until cohesion results. The cuts in the back are to keep the tiles from shrinking, and to hold are to keep the tiles from shrinking, and to hold them fast in the cement.

Mr. Elliot, at the close, said, according to the Mr. Ellict, at the close, said, necording to the Taunton Conrier, it was doubtful, whether any tiles had heen discovered in England, that present the features of the Norman style of decoration, the most ancient heing apparently of the thirteenth cen-tury. Having briefly described the process of manu-facture most commonly employed, he observed that it appeared probable that the origin of decorative pare-ment was to he sought in the medieval imitations of Roman payements. In almost every instance where the commental tiles hed here accidentally discovered. Roman pavements. In almost every instance where the ornamental tiles had been accidentally discovered, or dug up on the site of a castle or mansion, there had heen reason to suppose a consecrated fahrie had has facts reason to suppose a conservation land has once existed. Among the earliest specimens of glazed tiles might he mentioned the pavement discovered in the piory church at Gastle Acre, Norfolk. They were conselve excende : the cavities were left, and not filled in with any clay of different colour. Sets of four, nine, sixteen, or a greater number of tiles, form-ing a complete design, had hene sometimes found ; but examples of general arrangement were very rare and imperfect. In the ancient system a large pro-portion of plain tiles, hlack, white, or red, were in-induced, and served to divide the various portions which composed the general design. In modern imitations, where that division of compartments bad hene neglected, the effect had been unsatisfactory, having the look of oil-cloth or carpting. The fre-queut securence of hendlic decoration rendered them valuable as an evidence or illustration of the sancesive lords of the share and more were of the sancesive lords of the chase and manor were with a function of the same arrow of Fordurd the onec existed. Among the earliest specimens of glazed of the successive lords of the chase and manor were exhibited, and finally the royal arms of England, the lordship having, hy marriage, reverted to the crown. At Tawstock, Devon, were the tiles stamped accord-At Tawstock, Devon, were the files stamped accord-ing to the ancient process, with ornaments evidently copied closely from ancient originals, and in high re-lief—one of them berring a *I elser-de-lis*, the initials T. W. and date 1708. At St. Decommans, Somerset, there were similar tiles with raised patterns. Eri-denset test de is universe with the event shows the set dences tended, in unison with the general character of decoration displayed in the tiles of the fourteenth and decoration displayed in the tiles of the fourteenth and fifteenth centuries, to show that they were of Euglish manufacture. In 1833, a furnace of hrick was dis-covered on Priory farm, Great Malvern, constructed for the purpose of baking such tiles, and containing fragments similar to those which exist in the neigh-bouring churches. A similar furnace was discovered in 1837, in the parish of St. Mary Witton, near Droitwich, formed like that at Malvern. Now, though they had not discovered a furnace at St., James's they had not as near to it as may her as the though they had not assovered a hurace at St. James's, they had got as near to it as may be: as the children say in their play, "you burn." They had got the tiles with the glaze running one into the other, with the evidences of ender upon the surface.

Books Receibed.

Examples of Building Construction. By HENRY LAXTON. London: 19, Arundel-street, Strand. Volume for 1857.

Mu. LAXTON'S work, to which we drew attention on the appearance of the first part, has now attained the form of a volume consisting of eighty plates of large size. It is intended by the author as an *aide minimize* ing, as well as the tiches therein, were nicely painted or inlaid with many-coloured publies, mosaiclike, which forus a very humiliating contrast with the hara-like rooms now called Courts of Justice. When the soil around the Boilica had been removed, of late, a splendid piece of mosaic was discovered, which

[May 2, 1857.

in carrying out the several branches of trade requisite for public and private edifices." The details are selected from huildings by Messrs. W. Young, J. and J. S. Gwilt, H. Laxion, G. T. Rohinson, Scott and Moffatt, G. Morgan, J. T. Knovles, Smith and Thurston, P. W. Wyait, Sir R. Smitke, J. Shaw, Gandy Deering, Finden and Lewis, Brooks, V. Arnoid, J. K. Colling, Ashpitel and Whicheord, G. S. Clarke, Pennethorne, Grissell, J. Billing, Sir C. Barry, J. Thomas, H. R. Abraham, and others. The volume contains doors, windows, shutters, Inhustrades, cornices, roofs, gates, scats, staircases, coloured brickwork, and many other items, and will be found of the builder's workshop.

VARIORUM.

A set of very useful tables, by Mr. C. M. Willich, actuary, has been published by Messrs. Longman and Co. the parcoses of which will sufficiently appear from the title, which is as follows:—" Interest Commutation Tables; for changing at sight any amount of interest at any other rate, varying from 2½ to 10 per cent. Also, a Commutation Time-Table, for changing the number of days at 5 per cent. into the equivalent number of days curvesponding to any other rate, varying from 2½ to 10 per cent."——From the annual report of the directors of the Watt Institution and School of Arts, at Edinburgh, it appears that this sebool, which is one of the oldest in the country, having been established in 1821, is in a flourishing state. The total number of students attending its classes in mathematics, natural philosophy, French, (155 tickets), the mathematical elasses attracted the greatest mount of attendance (92 students, attending its classes in mathematics, natural philosophy, French, (155 tickets), the mathematical elasses attracted the greatest mount of attendance (92 students, actionsive of full-course ticket-holders). For drawing, there were 47 special students. At the annual meeting, Professor Fillans gently protected against the examination of candidues for Government appointments on English nurversity routine principles exclusively, as English students had thus an advantage over others which did not necessarily imply superiority on the part of the former, although it promoted their success and er examination.——The Scientific American is a weekly illustrated paper which ought to he more extensively eirendated in this country than it seems as yet to be. We observe in the advertising columns of the number for 28th March last, that a good field is ad to be open to builders, painters, oil and paint dealers, eahinetmakers, founders, blacksmiths, and others, at Nininger, in Minnesota, as to which informatiou is offered by Mr. A. W. Maedonald, at the Scientific American Uffice, New York. It u the number of the Scientifi

Miscellanea.

WAGES AT THE PORTSMOTTH DOCKTARD. — Sir Francis Baring, M.P. has paid a visit to this port, and received a depittion from the sailanakers and ropemakers belonging to the yard, complaining that they were not paid wages on the same scale as the men of other departments. They felt it as a great grievance, says the *Hampshire Independent*, that while shipwrights were receiving 27s. a week and painters 23s, they only got 21s. Sir Francis thought the best cornse was to send a petition to the Admiralky. An order has since been received at the dockyard that the ropemakers and sailmakers should receive 4d, per day in addition to their present pay.

PAIN TO A WIT ADDATES STONE. — My method is this:—Get some lumps of well-burut, fresh chalk, or grey stone lime: break them sanaller (about the size of walunts): dissolve some pearlash in soap lees (or "slutch"), which can he had of sosphoilers; holl it, and ndd it to the lime. Cover it over with an old sack, or the like: keep stirring it up with a stick, and when slaked and mixed, apply it hot to the paint of a good consistence (a brush for this purpose of the finest part of what carptch-brooms are made of), broom hass, or the husks of a large occon-ant. As a caution, cover your face with carpe, and put on a pair of thick leather gloves. Let the wash remain for a day or two if you can, and then apply the brush used before. If any part still adducers, apply the wash as at first : afterwards, it ir equires, wash it off with the clear water of the mixture, or common water.—T. GOODLEFE.

THE BUILDER.

STAMPED OR INCISED STUCCO.-Mr. B. Ferrey bas patented a process by which common rough stucco may be indented with suck ornamental patterns on the surface as the plasteriog proceeds, and whilst the materials are sufficiently plastic to admit of the desired impressions or indents being made. We shall take an opportuoity to say something more about it.

INDIA-RUBBER PUMP VALVES.—It seems to be a good idea to imitate, by means of an elastic tissue like vulcaoised rubber, the action of the valves in that living pumping apparatus, the heart and blood duets. This has to a considerable extent been effected by an ingenious Frenchman, M. Perreaux, who has patented his invention both in France and England, as well as elsewhere. This valve has two thin straight lips, which gradually thicken and spread out wedgewise into the form of the stump of a tube, so that when inserted and fixed, lips upwards, in the throat of the pump, the slightest pressure of the water from below opens the lips spart, thus allowing the water to pass, and again closing on the cessition of the upward pressure of valver, so as to refaio what has passed to the upper side of the valve whatever he the downward pressure, which only closes the lips the more firmly. There is thus, too, a clear throat, as it were, for the water-flow, without anything to order, as the ordinary pump valve is apt to do, even from the least triffe wedging an the hinge of it, so as to prevent its thorough elosure. M. Perreaux, it appears, was awarded the sulver modal for 1856, at the French Exposition d'Agriculture, for bis investion.

THE WORCESTER RAINWAY LITUIARY INSTITUE. —A public diomer to celebrate the establishment of this institution took place last week at Worcester. It originated with Mr. A.C. Sherriff, the general manager of the Oxford, Worcester, and Wolverhampton Company. During Mr. Sherriff's residence at York he had had occasion to note the henefits derived by between 500 and 600 men employed on the North-Exstern line from the establishment of a "Railway Literary Institution." In this school, knowledge on various subjects particularly connected with the railway dopartments was imported, at a very small cost, to the mea. Mr. Sherriff on going to Worcester, regretted to find no similar institution existing on the local railway, and suggested to the directors the desirability of such a society heing instituted. The directors of the Oxford, Worcester, and Wolverhampton Railway assisted Mr. Sherriff in his purpose, and his efforts have been attended with very answersble results. Altbouch uo appel has yet been made to the public for pecuniary assistance, nearly 600, have heen raised, ehiefly by the directors and managers of the company; and the dinner referred to, and the establishment of the institute, are the more immediate results.

CHIMNEY CONSTRUCTION AND THE "SWEEP" SYSTEM.—The Midland Association at Derby for the Suppression of the Use of Climbing Boys in Sweeping Chimneys, elaim our aid (which we willingly give) its calling public attention to the necessity of architests and others constructing chimneys in such a way that there may no longer be the slightest pretext for employing poor lads to ascend chimneys for cleaning. The mischief of hally-constructed flues is greatly exseggrated by a prejudiced public and by interested sweeps; but the mere calling of attention to the subject may do much to check an increase of the evil, for it is to be fared builders and others, in the provinces at least, think little of suffering humanity, as embodied in the climbing boys of this country. There is a law on the subject (section 6 of 3 & 4 Vict. eap. 63), hut this is often evaded, because it is no one's humises to look fare the builders of new honses, &c. Absurd chimney-pots are often an obstacle, in using the sweeping-machine, tending to perpetrate the use of boys.

THE POPLAR ASSISTANT SURVEYORSHIP.—" A Candidate" complains indignantly, that, in the midst of forty applicauts for this situation who filled the room and the passage appropriated to them while waiting the deliberations of the District Board of Works, who had advertised in our columns for an assistant surveyor, a stripping drove up, with his nucle, an iofluential member of the board, and was ushered into a special apartment, whence, after a mere show of examination of some few of those applicants who did not go away on seeing how the election was plainly destined to be decided, Mr. Stripping earne forth, and was fortbwith appointed to the vacant office, as was fully anticipated by all the more experienced and less suggine of those candidates who had no influential uncles on the board. Our correspondent asks, what was the use of advertising at all in such a case? In our opinion, if the case be fairly stated, it was not only useless, but a cruel uncker, so to excite the hopes and fears of nearly half a hundred, no dout meritorious, professional men in such awa.

THE LATE JOHN BRITTON AND THE WILTSHIRE ARCHLEGLODICAL SOCIETY.—The following letter has been addressed by the Hon. Secretaries to each member of the Wiltshire Archeeological and Natural History Society :—"Sir,—Some of the members of the Wiltshire Archaeological Society are desirons of expressing their respect for the memory of their late Vice-president, and honorary member. John Britton, For this purpose, and at the same time in acknowledgment of the general antiquities of England, and more particularly of those of the county of Wilts, it has been augested that some memorial be creted in the church of his native parish, Kinzton St. Michael, which is now to be restored. Mr. Britton bed heen for the latter years of his life in receipt of a small annual peusion from the crown. With his decease this expired, and his peculiary circumstances having heen found to be limited, it is further proposed that a subscription be raised to purchase an annuity for his widow. These suggestions are respectfully submitted to your approval, and contributions towards both or either of them, to be distinguished as domaions to the 'Britton Memorial,' or 'Mrs. Britton's Annuity Fund,' will be thunkfully received at the baak of Messrs. Locke and Co. Devizes." We understand that the Marquis of Lansdowne, Mr. S. Estourt, Mr, Sidney Ilcredert, and Mr. Poulett Scrope, have each subscribed ten guineas towards the accomplishment of the objects proposed. PAVNO THOROUGHARES AT BIRMNGHAM.—

PAVING THOROUGHEARES AT BERMINGEAM. — A plan for paving second-rate thoroughfares in this town has heen submitted to the local Public Works Committee. The system, though new to Birmingham, has heen for some time past in operation in North Staffordshire and other towns in the midland connties, and it consists in a diagonal arrangement of vitrified bricks, the chief advantages of which are represented to be great durability and solidity, as well as economy of cost compared with that of pebble and Rowley-rag pavements. The expense of the new pavement, including the laying, it issaid, would not exceed 1s. 6d, per supericial yard, or one half of the pebble paving.

in the laying, it is said, would not exceed 1s. 6d. per superificial yard, or one half of the pebble paving. INSTITUTION OF SCOTTENT ENGINEERS. — A numeron-ly attended meeting of engineers, presided over by Mr. Robson, lately assembled in the Philosophical Society's Itall, Andersonian Institution, Glasgow, to receive and consider the report of a committee appointed relative to the establishment of an Institution of Engineers. A series of rules were discussed and agreed to, and it was decided that the society should be styled the "Institution of Engineers in Scotland." The former committee consisted of Professor Rankine, Messrs. Walter Neilson, James R. Napier, and William Ramsay. The committee was re-appointed, Messrs. Robson, D. More, Alexander, Rowan, Downie, and M'Onie, having been added to it. ON DISINFECTANTS AT SOCIETY OF ARTS.-OD

ON DISINFETANTS AT SOCIETY OF ARTS.-On the 22nd April, the paper read at the Society of Arts, Adelphi, was "On Disinfectants," by Dr. R. Angus Smith, of Manchester. The nathor began hy giving some account of the precautions taken in reference to this subject in ancient times. Having expressed it as his opinion that much of the knowledge possessed by the ancients on these subjects has been lost, Dr. Smith proceeded to discuss some of the various changes which had been used as disinfectants, he gave the results of some experiments made by Mr. M'Dongal and binnelf in reference to this subject. They found that of all hases magnesis was the hest to use for the disinfection of manures, as the only one which gave an insoluth ammoniane slat, and preserved the ammonian at the same time, whilst it was an agent also employed regularly by nature in the cosmony of vegetation :---that of all acids subplurous acid was the best, and its power was at least equal to chlorine, but it had not the quality which chlorine possesses, of decomposing ammonia; whilst, when it had done its work, it was either converted into a alkali in the soil, hecame a sulphite, another agent used hy nature. They combined the base and the acid, and found that by this means disulfection was nearly completed by the use of only a small portion of material. They had tried the carbolic acid from coal tar, a homologue of creoote, but had not been able to produce good results by it alone. When the suphite acted there was still a small remaining smill, which the carbolic acid results by the able. Drok which langer come account of the successful ness of this powder, particularly in the town of Leck, which lind receanly been attacked by an epidemic, and when the distincetant was applied to the principa severs and cesspools, the discase was found gradually to abate. A discussion casued, in which Mr. P. H. Holland, Dr. Milroy, Messrs. Dugald Campbell, Rohert ACTION ON AN ACCOUNT FOR BUILDING A CHURCH. —The case of Messrs. Person, huilders, against the Rev, Wm. Coke, was heard at the last sitting of the Ross County Coart. It was brought for settlement of an account for building the new church at Brelstone-green, Marstow. For the plaintiffs, it was alleged that in July, 1854, Messrs. Pearson prepared drawings for the said church, and delivered a tender for the erection of the same. Mr. Nicholson, of Hereford, architet, afterwards prepared a specification, and Messrs. Pearson contracted to do the building for 5257, making an allowance of 40%, in that amount for old materials, but Mr. Coke pleaded the 407, as a set-off against the amount of the contract. The sum of 5192. (Jo. 104, was paid on account of the original estimate, and extra work done. After peared to him that Messrs. Pearson were catilded to 5257, plus the old materials, and if the inatter was misunderstool by Mr. Coke, that was no reason why Messrs. Pearson subuld suffer. From the terms of the contract, Messrs. Pearson were catilded to a clear 5353, in money. Mr. Coke raised an objection, but the judge said, he was bound by the muistake of his architect, if it was a mistake. The specifications included the old materials. He han do dout whatever that Mr. Coke was under the impression that the 407, were to be allowed off the 5257. Juligment withheld.

DOVETMED MASONEY. — Provisional protection has been secured hy M. Gustav Julius Günther, for a method of strengthening the coustruction of masonry by cutting building stones into such shapes as shall cramp together in various ways, so as to imitate a piece of solid rock in mass, even independently of coment or mortar. The principle is not new, and, indeed, M. Günther, to some extent, admits this, but we rather think it has been patented already: at all events, we remember noticing the model of a hridge constructed on a somewhat similar principle, which was exhibited (as a subject of a patent, if we mistake not) at the Great Exhibition of 1851. The same principle, it is obvious, is applicable to brick construction, to which allusion is also made in the prospectus addressed to capitalists by M. Günther, and has been adopted in more than one instance.

SCULPTURED STONE MONUMENTS IN SCOTLAND.— At a recent meeting of the Society of Scottisb Antiquaries, beld in Edinburgh, a paper containing descriptive notices of the localities of certain sculptured stone monuments in Fordrashire, namely, Benvie and Invergowrie, Mains and Strathmartin, Moniefieth, Cross of Canus and Arhirlot, was read by Mr. A. Jervise.

THE SHEFFIELD CRIMEAN MONUMENT. — The committee have made such progress in this movement, that it has heen resolved to advertise for designs for the monument, the cost of which shall not exceed J,2004. It is intended that the designs sent in shall be opened to the inspection of the public, previous to selection.

selection. WORRS AND PUBLIC BUILDINGS.—The Commissioners of Works and Public Buildings expended in the year ended 31st March, 1856, 183,0347, for Royal paleses and public huildings; \$13,377, for Royal parks and pleasure-gardens; 124,9457, for the New Houses of Parliament; 134,1587, for the General Repository of Public Records; 5,5547, for Holyhead Harbour, &c.; 21,8077, for the salaries and expenses of the Office of Works, &c.; 64,9627, for the British Museum buildings; 21,4077, for Battersca-park; 19,6587, for Chelsca-bridge; 22,9627, for the Erelsa embankmeut and public roadway; 5,9524, for the Downing-street improvements, new public offices, &c.; 17,0007, for Buckingham House, in Pall-moll; 3,7264, for Windos improvements; 2007, for the Nelson monument. The total sum expended was 604,7072.

A SLIGHT DIFFEEENCE.—What can he said to explain the following tenders for the plumher's and painter's work, to be done to twelve houses, Leahridge-road, for Mr. Claff ? Mr. E. Williams, architeet.—A. B.

J. Tunchffe	$\pounds655$	0	0

MONTROSE WATERWORKS. — These works are nearly in a workable state. The contractors have unade good progress with the works at Kinnaber is 22 feet deep and 25 feet in diameter. The buildings for the water-wheel and pumping machinery are fusished; the wheel is 12½ feet in breadth, and 16 feet in diameter, working power, 20 horses. The water will be forced in a continuous stream into the reservoir, which latter is being built with stone sides and hrick bottom, and will be 12 feet deep, and contain nbove 30,000 gallons. It is so situated as to canble the water to rise to the highest floor of the most clevated buildings in the town. The pipes to the town, which are laid, are nearly 3 miles, or about 15,000 feet, in length. They are connected with the old pipes and the reservoir at Lochside, which also

they can supply. DINDEE NEW HARBOUR WORKS.—The contract for these works has heen let to Messrs. Carstairs, Mitchell, and Co. of Kirkealdy, for 36,1337. Mr. Mitchell, and Co. of Kirkealdy, for 36,1337. Mr. Mover the horbon required's estimate was 30,0987. Of seven offers lodged by different contractors, two were above that amount and five below. Three of the tenders were within 5007. of each other. The lowest was that accepted. Mr. Carstairs, of Kirkcaldy, was the builder of the railway station and viaduct at Newcastle, and Mr. Mitchell, of Montrose, is also a railway contractor. One of the other six tenders was only a small sum above that accepted. The work estimated for includes the carrying of the main common sever (which discharges itself into the present tidal harbour) out to the river at the southcast point of the river wall; underfooting the quay walls of the present tidal harbour; the use quay walls of the present east tidal harbour will thus he converted into a wet dock, as authorised by the new Harbonr Act, and sanctioned by the Admiralty: the iron gates will be a separate contract. The completion of the nortwall of Victoria Dock, with its lock, during the progress of the works now contracted for, would give an immerse addition to the dock accommodation of the port. The contractors will commence their operations during the summer. The WARE COLONE Societies.—Both societies.

THE WATER COLOUR SOCIETIES.—Both societies are now open, and the collections are very satisfactory : we are forced, however, to postpone our notice of some of the more important works.

of y we are forced, numerical to postpone out notice of some of the more important works. ARCHITECTURAL ASSOCIATION.—The dinner of the members of the Association and their friends will take place on Tuesday evening uext, at 7 P.M., at the Alhion, Great Russell street, Covent-garden.

Great Russel-street, Covent-garden. REFORT ON CLOSERS.—The Sunderland Sewerage Committee have reported to their town council, on "Answers from various towns resplecting waterclosets." The report states in the outset, that the committee had caused extensive inquiries to be made through their surveyor, among the fully drained boronghs and eities of the empire, relative to the influence of such closets; and it is remarked in conclusion, that the information, liberally furnished, "whilst it shows that in a few and exceptional cases the inconveniences connected with water-closets, of which so much has heen said, have arisen, conclusively proves that they have been, when arising from the ignorance of those employing them, very temporary, and in many cases, that of Uxhridge for example, so partial as to have hardle existed at all. The only cases in which they have been extensive or permanent, have heen thove in which the water supply has been inadequate or ill managed."

NORFOLK AND NORWICH ARCH-ROLOGICAL SO-CIETY.—The annual meeting of this society was held at the Guildhall, Norwich, on Wedorsday in last veck, the Rev. J. Bulver in the chain, when the annual report was read, congratulating the members on the flourishing state of the society. The report was adopted, and other official husiness transacted. The secretary them read a paper from Dr. Husenbeth respecting mural paintings, especially those discovered in the church at Linupenhoc, Norfolk, in 1852. The chairman was rather surprised at the statement in the apper, that these paintings were done by itherant decorators. He thought that was scarcely possible, for though the majority of them were rude, many of them were exceedingly well done, and showed high attainments in art. Mr. Fitch said he had received a communication from Mr. D. Gurney and Mr. Pettitrew, stating that the Archeological Association of England would hold a meeting here in August, under the presidency of Lord Albemarie. He (Mr. Fitch) was sure that he expressed the sentiments of the members when he said that they would give the association the same hearty welcome as had been given to the Archeological Institute, when that body visited Norfolk. A vote of thanks to the retiring secretary, Mr. Harrod, was then passed, and the meeting separated.

MONUMENT TO THE LATE MR. ATTWOOD, AT BIRMINGHAM.—It is intended to erect a monument in Birmingham to the late Mr. Attwood (of Currency eelebrity, if we mislake not), and a sum of 8004. Ihas already been promised to that cod. Mr. Hollins, of Birmingham, and Mr. Thomas, of London, were to be invited to furnish designs or models for the monument, to be creeted on a site not yet determined upon, the cost not to exceed the sum of 8007.

SURVEYOR TO LOCAL BOARD OF HEALTH, MER-THYLE-TYDFL.-Mr. J. W. Harrison has been reappointed surveyor for the ensuing year, at a salary of from 150% to 175%, per annum.

or from How, to 1905, per annual. CANADIAN RALIWAYS: STONE AND WOODEN BRIDGES.—Another accident, similar to the one which recently occurred on the Great Western, at the Desjardin's Canal, in Hamiltou, though not accompanied by its appaling result, took place lately, at a place over the Muddy Fork, between New Albany and Salem, ludiana. Two passenger-cars were precipitated 15 feet into the water, by which one person was killed and two others were severely injured. The Great Western will be compelled to substitute stone and iron tubular bridges for the present wooden ones, said to be 236 in number. The Burlington suspension-bridge seems to be insecure. The *Hamilton Banner* ask, "Who is responsible for the safety of the suspension-bridges in the Burlington Heights over the Desjardin's Canal? Is it true that it has heen condemned as insecure by an engineer?" On the Grand Troub, the bridges are all of stone and Iron girders. The directors have given directions for a thorough and complete inspection of bridges; and Messrs. Shaukey, Keeper, and Starke, the company's engineers, are engaged in that duy.

TO THE ARCHITECTURAL PROFESSION, BUILDERS, PROPRIETORS OF HOUSE PROPERTY, &e.

GENTLEMEN,—It has come to our knowledge that, in several instances, persons have been deterred from experienced by those who have been induced to adopt the revolving shutters of other makers, which have been in some cases been mistaken for those of our manufacture, and thereby prejudicing our interest. We therefore feel it inemmbert on us to state that since our first introduction of Revolving Iron Shutters, in 1886, we have fixed many thousands in all parts of the United Kingdom, and also exported great numbers, without a single failure, whilst, on the other hand, we have heen frequently called upon to adjust and put into working order, and in several instances to remove altogether, the revolving shutters of our competitors, both of iron and wood, though hat a comparatively very short time in use, and it x our own in their place.

Our shutters are fortunately too well known to require us to publish individual testimouials, but we couldently refer to any of the numerous parties we have ever supplied, amongst which will be found the Royal Exchange, most of the bankers, large establishments, and public huildings in London and provincial towns. As an instance, the eminent firm of Swan and Edgar, in Regent-street and Piecakilly, were the first to adopt them to a large extent; a great number were fixed by us for them *eighteen* years ago, which are now in perfect working order and efficiency, and we continue to guarantee them so at a very trilling annual expense. We also beg distinctly to state that every real improvement in revolving iron shutters has been effected by ourselves, or has become ours by purchase, for the purpose of being incorporated with the practical suggestions of nearly tweaty years' most extensive experience, aided by the command of powerful and appropriate machinery. Of this nature is our new Patent Interlocking Curvilincer Shotter, which is snited for all purposes, particularly for mansions and private houses, being lighter, stronger, and cheaper than any other, and is effectually second from rust by a patented process.

In conclusion, we beg to observe, that availing ourselves of the kind and extensive patronage so long afforded us, we have made such additions and improvements to our extensive works and machinery, as will enable us to reduce our prices in all cases to the level of any other makers', and at the same time maintain the well-known superior character of our works, and to execute all orders with which we may be favoured, with promptitude and despatch.

We are, Gentlemen, your obedient servants, BUNNETT and Co.

Deptford ; Queen-street, City ; and Glasgow.

MAY 2, 1857.

The Builder.

VOL. XV .- No. 744.

HE Exhibition of the Royal Academy, which opened on Monday last, though containing many heautiful paintings, is not equal, in the interest and mcrit of the works generally, to the exhibitions of recent years. The steady progress and the excellence of British art are sufficiently established as facts, to prevent our regarding the present evidence otherwise than as exceptional; and it may be to the advantage of artists, as of others engaged in intellectual pursuits, from time to time to allow an unusual in-

terval to elapse between the production of their works : the mind is freshened by such relaxation, and manuerism is avoided. The chief of the painters who exhibit this year are Cope, Creswick, the two Coopers, Cooke, Dyce, Danby, Egg, Frith, Frost, Sir J. W. Gordon, Grant, F. Goodall, Hart, Herbert, Hook, Horsley, Knight, Leslic, Sir E. Landscer, Mulready, Maclise, Millais, H. W. Pickersgill, F. R. Pickersgill, Poole, Patten, Roberts, Redgrave, Stanfield, Stone, and Witherington ; be-sides Philip, Solomon, Rankley, Ansdell, Linnell, Linton, and others who have made a name, not in the ranks of the Academy. For the most part, however, these contribute a smaller number of works, and those less remarkable than they are accustomed to scud. Cope repeats the subject of his fresco in the Peers' Lobby of the Houses of Parliament, in oil; and Mulready exhibits (138) "The Younger Brother," a pieture painted for the Vernon Gallery, in pursuance of the will of the donor. Machise's principal work in oil is (78) a picture of Peter the Great with his "rough retinue," working as a shipwright at Deptford, visited by William III. a paiuting marked by the artist's nsual invention and elaboration, but which it is searcely possible for any architect to examine without the impression faultiness in the perspective; and whoever the observer may be, he may look long before discovering that the blow aimed by the stalwart figure with the adze, is not aimed at Peter but the block of wood behind him. Errors at in perspective and in the drawing of archi-tectural forms, are more general than they should be; and though in figure compositions, some departure even, from the strict groundplan, in perspective, may be justified on the score of gain by a compression of the interest, nothing can be justifiable which can mislead as to the artist's intention. Painting, as an art, would have stood even higher than it does, had there heen a higher appreciation of architecture in the Academy, and the required facilities given for architectural study. It is impossible, however, to look at the works of David Roherts, without feeling that we are under a debt to him for some help which his works have given to the maintenance of public interest in architecture : though his general perspective, admirable light and shade, and colour, and his skilful grouping of accessory figures, fill the eye in spite of Duomo at Milan."

THE BUILDER.

interest in the present position of architecture, produces the hest effect, -- whereas many recent connected with what is called Pre-Raffaellitism, would naturally lead us to that school with feelings different to the ordinary curiosity. Hunt, we may say, this year does not exhibit, and there are comparatively few other works of the kiud referred to that would deserve notice. What are exhibited by Millais ought to afford instruction, whether by their defects or their merits; for, they show, fortuitously for should necessarily attend upon elements of the architect of our day, how narrow is the line effect such as disposition of ground-plan, and that separates real excellence from caricature the details of piers and railings. The lodges or exaggeration. In the picture by the artist of Greck character, of course-as well as the just named, called "A Dream of the Past, Sir Isumbras at the Ford" (283), the beauty of childhood is exquisitely rendered, notwithstanding the enormous eyes of the little girl held on however, placed his equestrian figures in a the horse's neck by the aged knight, whose countenance so well expresses the chevalier sans peur as sans reproche. Such a combination of archivay of the Green-park; and some of his forms of expression is indeed art of the highest details are not good by standard of Italian class, and we almost forgive the wooden horse and some other portions of the work which are not true to nature.

The north room, which of late years has not been given up even in name to architecture, coutains but a poor display of architectural drawings. Indeed, the most interesting works in it are a really extraordinary series of drawings, forty-two in number, by Madise, illustrating the story of the Conquest. The archi-tectural drawings are confined to the lower portion of three sides of the rooms. If we wanted an endorsement to our regret at the inattention to architectural forms-wherein it might he thought a new field lay open to painters in oil-it would be afforded by a work that occupies a prominent place, uamely, (1025), "The Bellot Memorial," in which Greenuamely, wich Hospital is rendered in a style of delineation, that might make an admirer of Wren or Inigo Jones indignant .- Several of the drawings are new presentments of old faces. The designs for the Memorial Church, at Constantinople, by Mr. Burgess and Mr. Street, are both shown in part ; that is to say, of the former architect's design, there is the perspective view of the ex-terior enlarged, hy Mr. E. S. Cole (1009); and of Mr. Street's, a south-west view (1012), and the original site' (1033), is a consistent of a view of the interior (1132). The latter the tower, east of the transepts, terminating architect also exhibits a south-west view of his in an octagon and a tiled capping; and design for the Cathedral, at Lille (1010). The it has a western porch carried up, so as towers seem to have been raised in the design, to be in effect a transept. The design exsince it was exhibited in Suffolk-street,-at least, such is the impression from recollectionthe design gaining thereby. If we are wrong, our error testifies to a fact that well might be horne in mind generally,-that a single perspective view is really incomplete for purposes of representation-because it shows, especially in the case of interiors, the appearance of the object from a single point, whilst the impression is usually derived from many points of observation. The practice of drawing in perspective, however, it need not he said, is an indispensable aid to good design. Mr. Street also has an interior view of his design for the Lille Cathedral (1015). For the same huilding, there is a design by Mr. J.L. Pedley (1092)-with the full cathedral plan, western spires of open work, and a square central tower-in which the general grouping is successful. Mr. J. T. Wood exhibits a drawing (1006) of "The Casa Stralla, Mondovi" (in Piedmont), as altered and re-arranged from his designs,-showing a building with plain Italian dressings and cornice-like striugs, which may he those of the original building, but which too Reredos to the Choir of Lichfield Cathedral" the inattention to defineation of details. His nearly resemble one another to allow any effect (1083), where the panelling is intended to be principal work this year is (41) "Interior of the of proportion or breadth. The manner is one that, ornamented with the mineral products of the The pressure which there is upon ns just which we have often referred to-have shown than the structure, and seems too much a repernow, prevents any notice of some of the most the capability to improve upon. With proper tition of parallel lines with some minor details deserving works in the rooms. Were it provision of leading features, any number of to which exception might be found. No. 1134 otherwise, the points as to the philosophy and stories may be grouped in three general divi is an exterior view of the "Percy Chapel, Bath," principles of general art, which there are of sions—and three form perhaps the number that by Messrs. Goodridge and Son, which it may be

English designs, like the example hefore us, fail from inattention to a due subordination of parts.

Mr. C. J. Richardson's "Suggested Entrance into Hyde-park," which he shows with houses that are being erected on the estate of the Earl of Harriugton (1007), is considerably better than many of the park entrances of very recent date, where one wonders why poverty of thought should necessarily attend upon elements of entrances at Hyde-park-corner - are hetter, and may be again appreciated as they merit. The author of the present design has, direction crossing the line of route, in the objectionable manner of the statue over the archway of the Green-park; and some of his precedent-which it is well to regard for some purposes of convenience-and do not suggest by their beauty, a particular reason for their intro-duction. The "Cambridge Asylum for Soldiers' Widows'' (100S), which is now being completed by Mr. Ferrey, makes a good group of buildings in red hrick and stone; and the same architect's "Design for a Bleaching Estallishment" (1016), with few other features than are comprised in the simple arrangement of the huildings about an elevated centre and a tall chimucy-shaft, and in the overhanging eaves and low-pitched roofs, realizes some of the chief qualities of architectural effect, which are neglected in many more elaborate productions.

The " Design for the National Discount Bank, Mark-lane Chambers, lately erected" (1022), by Mr. N. T. Raudall, is searcely equal to other recent buildings in the City in regard to freshness of invention; and the arrangement of the stories would be open to some of the observations which we have made above. Messrs. Webnert and Ashdown exhibit (1026) a large view of Milford, Peauhrokeshire, the property of the Hon. R. Fulke Greville, with the proposed docks and improvements. Mr. Teulon's "projected church," at Hastings, " as designed for hibits some details of unusual character. Greater merit, however, is displayed in Mr. Teulon's "Small Brick Church, at Barringham, Lincolnshire'' (1129), which, without buttresses, and with little more decoration than is got by voussoirs of dark bricks,--by simply raising a portion which is square on the plan a little above the general height of the walls, and covering with a pyramidal roof, into which the other roof joins,-realizes, like one of the designs already mentioned, more by its plainness than many another does hy its claboration. James's design for a congregational church at Cbeshnnt (1037), bas a good tower, with a lantern and a tile-covered spire, that evidently owe something to published sketches from continental buildings. The design proposed for the rebuilding of Teddington church, by Mr. R. W. Armstrong (1046 and 1079), has long transepts, a tower and spire at one side, and a polygonal apsc to the chancel, with gables to the windows. Mr. Sydney Smirke's contribution is a "Design proposed for the we apprehend, some English architects-in works diocese. It appears to be of later character

recollected, from an illustration that we gave of it, has a large polygonal area in the centre of the plan, which is here shown carried up as a lantern, which again is terminated by a smaller lautern, with, as shown, somewhat too heavy a capping. Another of the works which we have illustrated is Mr. Horace Jones's "Sovereigu Life Assurance Office" (1063), at the corner of Piccadilly and St. James's street. Mr. Falkener's contributions are, as usual, the formation of the order of the order of the street of the order of t

Mr. Falkener's contributions are, as usual, interesting and valuable. The chief of them is (1056) "Ephesus—a Restoration of the City, from plans and measurements taken on the spot," in which the theatre, the diameter of which Mr. Falkeners tates was 40 feet greater than the length of the major axis of the Colosseum, occupies the foreground—the Grand Agora or Forum, with a lake in the centre, being amongst, the other interesting objects. Of a number of "Oriental sketches," one (1034) taken at Aiaslik, near Ephesus, represents the gate of the Mosque, near which is a circular tower, the shaft of which has a envirous pattern in red on a white ground. He also shows an interior view of the Mosque (1086), and some of the curiously-shaped head-stones, in a sketch of a Turkish cemetery at the same place. Mention should be made anongst the view, of one good one of the "Amphilbeatre at Pola" (1014), by Mr, J. Bell. The views, however, and some other matters of interest we must leave, many of them, unnamed, mindful of the other topies of interest that call for attention this week. It is curious to remark the clauge the

or merest that call for attention this week. It is curious to remark the chauge that is being made in the treatment of Cothie . architecture; with the object and intention of which, however, we can feel more satisfied than with the result. The now common pointed arches with the heads filled in with blank mesonry, or merely picreed so as to leave large blank spaces, as shown in recent designs for domestic and municipal buildings, seem to us to afford not the hest evidence of good use of the resources of the style, and in favour of the advantage of restricting attention so much to the models of the earlier periods. Vcuetian and other forms have been introduced into our modern English Gothic, to a greater extent Usan the merit of the forms would justify. This is seeu, we think, in the predominance of pointed arches to viadows in exteriors, even though the huildings he not arcnated internally, and in the use of singularly inclegant cusping (generally soffit eusping) to arches of great size, only trefoliated in the bead, if we may so say. In some respects, we think Mr. Scott even could have done better than the design of the separate into a tower, too, crowned with a roof and lautern-capping of disproportionate size; hut we admire much, the design of the separate there—on the principal arches of the roof—is in nowise large and chanusy. The arches themselves are filled in with quarte-folis, and are supported by hanner-beams bracketted from over the wall-sbafts. A work also of a modified Gothie style is

A work also of a modified Gothic style is Mr. A. Bell's "Little Dalby Hall, Leicestershre," of which the south front is shown in 1048. The coloured materials, we observe, are introduced in due subordination, and with judgment. Of similar character in intentiou is the "Town-ball at Cork, Ireland" (1090), by Mr. J. P. Jones. In the "Mounment" about to he erected at Melbourne "in memory of the late. Sir Charles Hotham" (1111), we cau discern, we think, and cau commend, Mr. Scott's object of novely. The present design, however, we submit, wants qualities which are equally necessary. Whils we are alive to the mistake sometimes made of condemning forms because of a far-fetched resemblance to something that is deemed vulgar, there really are particular structural forms, adapted to certain objects, which should not be repeated under different circunstaces. The shaft in the design before us would be well suited for that of a Gothic candlestick, or a modern table-lamp ; whills in the large scale, the shaft—provided with regular capital and base—would have the fault of the recent English initations of the Roman mounmental coluuns, in heing intended apparently for a 1

to support. Possibly the design may follow some ancient models; but the objection is not then removed. Mr. E. PAnson's novel and successful "Eastern Corridor at Merchant Tailors' Hall" is shown in a view (1050). "The New Post-office and Electric Telegraph Station at Calcutta," of which Mr. M. D. Wyatt exhibits an exterior view, is designed in one of the Indian styles of architecture, with areades in two stories--the arches tall four-centred pointed--with a large arch of entrance, bulbous domes, and an octagoual turret with balcony and clock. Two original sketches of a design for the Government Offices, in the Italian style, with superimposed orders, are shown in Nos. 1069 and 1070, and a study for the Foreign Office, by Mr. C. F. Hayward, of the same character of Gothic as we have been remarking upon, is shown in No. 1071. It has an open areade on the first floor, and has considerable novelty in details. Two or three of the designs for the Liverpool Library and Museum are here represented by view.

represented by views. Drawings of objects of decorative art there are hardly any; but the "Composition for a Ceiling" (1103), by Mr. J. Warwick, deserves to be mentioned for some details which are in good taste, and are well drawn. The festoons on a surface which is horizontal, of the Adam school, should, however, be avoided. Another ceiling, by the same haud (1107), has more of the Louis Quatorze clement. Mr. J. H. Powell exhibits a design for stained glass for the great west window of Beverley Minster (1133). The subjects in the side compartments are carried across several bays, but are not cut up disagreeably by the multions. The only other drawing which we had marked for notice is "The Albert Bridge, Windsor" (1087), designed by Mr. Page. It is an iron bridge of one span, and the spandrils of the arch are filled in with circles and Gothie cusping. There are, however, a few houses, as one designed by Mr. R. K. Penson, and built in Cardiganshire (1084), With a square tower, and a round tower at the angle,—"Arle Court, uear Cheltenbam" (1093), Gothie of a different character, by Mr. T. M. Penson, and some clurches and chapels which we have not noticed. But, the present state of what once had some till to its namo—the Architectural Room,—if it might afford a peg on which to hang observations useful at the juncture, would hardly hear out the claims which we have so often preferred for the ascription of nerit to English architects.

ST. JOHNSTON, COUNTY DONEGAL, IRELAND.

The foundation-stone of a new (R.C.) church was haid here on Saturday, the 4th of April, by the Right Rev. Dr. Magettigan, R.C. Bishop of Raphae.

The plan is that of a Latin cross, with porch and sacristy in addition. The entire length will be 109 feet 5 inches, and the breadth across transepts, which will only project sufficiently for the introduction of side altars, will be 56 feet 5 inches.

There will be a bell-gable over the chancel arch, and the height to the summit will exceed 70 feet. The light will be derived principally through

The light will be derived principally through traceried windows at the extremities of the cross, and the roof will of course be open.

Over the chancel arch will be a representation of the Aguus Dei, the ground-work being ornamented with a scroll pattern. On either side of chancel arch will be brackets, supporting figures of SS. Peter and Paul. The transpet arches will have plain single soffits, relieved with polychrome. All the masonry of the walls will be visible, pointed and coloured. The chancel walls, as high as the window-cells, will, however, he lined with freestoue. The principals of the chancel roof will he arched, and the spandrils pierced with foliated circles. The nave roof will be on the transed collar-heam principle.

stick, or a modern table-lamp; whilst in the large scale, the shaft—provided with regular capital and base—would have the fault of the recent English imitations of the Roman monumental weight very much beyond that which it is made weight very much beyond that which it is made

The floor of the chancel will be laid with encaustic tiles. The side altars will be supported on hrackets,

The side altars will be supported on hrackets, backed by three arched and gabletted compartments: alove the centre one, on the south side, will stand au image of the Virgin, and on the north side a figure of the patron saint. The font will be placed at the west end of the clurch, and will be constructed of native marble and freestone.

The architect is Mr. Edward W. Godwin, of Bristol.

ROME.*

In our last article upon this subject, in the passage relating to the capiture of the capitol and arx by Herdonius, p. 217, by a printer's error the word "Forum" was substituted for former, thus destroying the sense of the argument.

ment. Much of the ambiguity of the old writers in the use of the terms Arx and Capitolium may be traced to the elanges that lapse of time produced in the destination of these objects of antiquity. The term Capitolium, originally applied to the temple and its precincts only, was afterwards used for the whole hill wheu the fortress became of less moment than the chief abode of religion,—in which enses it is found in the Notitia, and continued to be used throughout the Middle Ages. So did the term Arx, in its true sense applicable to the fortress only, become applied not only to the whole hill, but even to the temple itself, when the citadel had ceased to be maintained for military purposes. Those conversant with the works of Livy will recollect his frequent use of the terms in question, as indicating two distinct localities, though in close proximity,—as *De arce capla*, *capitolione coexnato-mancii seniunt*: the two together meaning evidently the whole bill. Again, in the same writer, the term Arx, by poetic license, is employed in the sense of the Capitolium as a military station, as well as the Arx, is proved by such passages as *proscidia in arce*, *in Capitolio*, *in murit*, &e. Hence the Capitolium itself was frequently designated *Arx Targenia*, or Capitolio, naphrase that is was out *the* Arx that was referred to.

The preceding remarks show how loosely these various terms were used, and in the larguage of the poets still further embarrassment of the question arises from such terms as *Mons Tarpeius—Rupes Tarpeia*, often used without any precise signification. In fact, it is by the context only that the value of these terms can be indiged of, for the true secret of their meaning lies in all probability beneath the surface of the soil, and the spade may yet be destined to terminate a context which the pen seems potent only to embilite. One more opinion we will adduce before leaving this subject to futurity for its solution. In the *Quarterly* for September last, is a review of Mr. Dyer's article, in which, what may be termed a fourth theory, is advanced, namely, that originally the tarx was north, the temple south; hut in later times the Arx was disused and forgotten, and the temple sometimes usurped its appellation. The writer then gives a translation of the famous narrative of Tacitus, descriptive of the assault of the Capitol by the soldiers of Vitellius, and comments with much ingenuity upon the various *points* of the description, which he argues clearly indicate the southern summit, and upon which he places the temple or Capitol. Mr. Dyer, on the contrary, admits the attack to bave been made on the southern bill, but uses it as an argument for placing upon it the primitive or proper Arx, which he maintains to bave been the Capitolhen fortress of Tacitus.

The remaining points of interest connected with the topography of the Capitoline Hill may be briefly adverted to. Of the buildings that constituted the Capitolium, the temple of Jupiter Optimus Maximus was the principal, comprising under its roof the cells dedicated to the kindred deitics, Juno and Minerva, and among the numerous smaller temples that filled the sacred precincts, such as those of Jupiter

* See p. 214, ante.

THE BUILDER.

CHURCH AT ST. JOHNSTON, COUNTY DONEGAL, IRELAND .- Mr. Edward W. Godwin, Architect.

Feretrius, Fides, Mens, Veuus Erycina, Veuus Victrix, and others, the first moutioned was the most celebrated, as heing the most ancient re-corded temple in Rome. Tradition has assigned the height of Ara Celi as its locality, and Becker has pointed out that it is always men-tioned as *in Capitolio*, and especially in the Marmor Aneyranum, where it scemes difficult to imagine the term used in a mere general sense. To these small temples or *adicule*, Augustus added one to Mars Ultor, in gratitude for the recovery of the staudards of Varus, and one to Jupiter Tonans, supposed to have heen an edifice of a more stately character. Domitian also erected there a temple to Jupiter Custos, in acknowledgment of his preservation when the Capitol was burnt hy the troops of Vitellius. In addition to these, upon the same summit, yreserved *in grateful* remembrance of the tounder of the city. The open space designated as the Area Capi-tolina, scems to have been an elevated platform of considerable extent, in the centre of which

of considerable extent, in the centre of which stood the temple of Jupiter with its appur-teunances, a sufficient space being left round it for the assemblies of the people, and even for

The assembles of the people, and even of the passage of chariots. In the great work of Canina, the plan and general view of the Capitol, as he conceived it to have heen in its perfection, with the Temple of Jupiter, crowned with sculpture, towering here its more humble actualities converses on of Jupiter, crowned with sculpture, towering above its more humhle satellites, conveys an imposing notion of the general effect of this favoured eminence, and recalls to our memory the Acropolis of Athens in *its* superior propor-tions. The other sammit, occupied by the Arx, received hut few additions to its earliest sanc-tuaries. Connected with the Temple of Juno Moneta was the Officina Moneta, supposed to have heen the office of the public mint through-out the republican period, whence, in the empire, it was transferred to the neighhourhood of the Colosseum. Colosseum.

ton under Sylla. One more point of interest in this hill is the Tarpeian Rock. Custom has hitherto assigned as the actual ancient place of execution an over-hanging mass of eliff under the gardens of the Palazzo Cafarelli, on the west side of the hill. M. Dureau de la Malle, however, was the first to call attention to the fact that the passages in noisent writter describing the execution of ancient writers describing the execution of Manlius and Cassius, clearly point to the place of punishment as visible from the Forum, and the Forum, the been upon the This that, therefore, it must have eastern side, opposite to the Palatine. This view is now generally established, and the pre-cipitous cliff heneath the Palazo Marisectti has heen fixed on as the exact site of the memorable spot

We now get to the Forum, the spot with which some of the most stirring events in Roman history are associated. To give a connected account of the Forum would require a consideration of its state under its several phases of kingdom, republic, and empire; hut phases of Kinglob, report, and conver, ind our limits will only periodic avery cursory glauce at a few points in its history, and for the argu-ments that illustrate the differences of opinion in its details, the reader must refer to the writ-it of the residue of the residue of the writein its details, the reader must refer to the writ-ings of their several exponents. Of the architec-tural monuments of the empire which were gathered round it as a centre, many remains yet exist to tell their own story; hut of the edifices that surrounded the Forum in its earliest ages not one is to he found in its original state. Nevertheless, the fact of many of the works of the empire occupying the sites pre-viously covered hy those of the republic, fur-nishess of ar a clue to the unravelling the mys-tery of the past. It is to M. Bunsen that we must ascribe the merit of having cleared a way through the confused and emharrassed state-Corosseum: It is to A. Dunsen that we In the Intermontium, tradition has placed the wasylum of Romulus, *inter duos lucos*, as told by Livy, and in the same situation, *inter arcem et Logitolium*, Aulus Gellius places the Temple of ing out the periods of destruction and restora-

Vejovis, oue of the oldest deities of the aucient Latins. The only considerable remains that have been found upon the Capitoline, are those of the Tabularium or Record Office. From an inscrip-tion we learn that it was erected by Quintus Lutatius Catalus in U.C. 676, at the same time that he restored the Capitol after its conflarar-One more point of interest in this hill is the Tarpeian Rock. 259

toline Hill from the south side of the Forum to the Porta Carmentalis, and is supposed to derive its name from Juno Juga, the presiding deity of wedlock. The Vieus Tuscus, according to some authorities, was the quarter assigued in B.C. 507 to such of the yauquished Etruscans under Aruns as had fled to Rome, and desired to settle there.

To a few fixed points ascertained hy the process of excavation, the position and limits of the Forum can now he laid down down the east and west these arc marked hy the nature the cast and west these are interestly the ascent of the Velia, on the latter hy the Capitoline hill. Its northern houndary was traced by the road called Sacra Via. It is only of late years, however, that these houndaries have been recognised. that these houndaries have been recognised. Among the earlier topographers, views equally erroueous and discordant prevailed upon the subject; some of them extending the Forum lengthways from the Capitoline Hill to the summit of the Velia where the Arch of Titus now stands; whilst others, taking the space hetween the Capitoline and Temple of Faustina to have heen its hreadth, drew its length in a southerly direction, so as to encreach upon the Velabrum. The latter theory was adopted by Nardini, and prevailed till very recently. Piale (Del Foro Romano, Roma, 1818, 1832) has the merit of having restored the correct general riew of the Forum, though his work is not always accurate in details. The proper limits of the Forum were established by excavations made hetween the Capitol and Colosseum in 1827, and following years, when M. Fea saw opposite to the Temple of Antonians and Faustina, a picce of the payement of the Sacra Via, similar to that which runs under the Arch of Severus. A similar piece had been previously discovered during accurations mule in the end of Severus. A similar piece had been previously discovered during excavations made in the year 1742, before the church of S. Adviano, at the eastern corner of the Vin Bonella, which Ficoroni (*Festigie di Roma Antica*) rightly considered to belong to the Sacra Via. A line prolonged through these two pieces towards the Arch of Severus, will therefore give the direction of the street, and the burgley red the Foreway on that side and the boundary of the Forum on that side. The southern side was no less satisfactorily determined by the excavations made in 1835, determined by the excavations made in 1853, when the Basilica Julia was discovered; and in front of its steps another paved street, inclosing the area of the Forum, which was distinguish-able by its being paved with slabs of the ordi-nary silox. This street continued eastwards, past the ruin of the three columns, or Temple of Castor, as was shown by a similar piece of street pavement having been discovered in front of them. From this spat it must have pro-Sates pare inclusion of the analysis of the an of the Forum. Hence, according to the opinion now generally received, the Forum presented an obloug or rather trapezoidal figure, 671 English feet in length, by 202 feet at its greatest breadth under the Capitol, and 117 feet at its eastern extremity.

The position of the Basilica Julia being thus ascertaiued, the details of the Forum and situation of many of the buildings surrounding it followed in a natural sequence. The situation of this hasilica between the Temple of Saturn, of this hasilica between the Temple of Saturn, which stood ou the slope of the Capitol, and that of Castor and Pollux, heing kuown from the Marmor Aneyranum, the latter must have been immediately beyond the Basilica; on the side far-thest from the Capitol, and must either have been the temple near Sta. Maria Liberatrice, of which three columns are still standing or have stood between that and the Basilica itself. The known proximity of the Temple of Vesta to that of Castor and Pollux, and a comhination of other eireumstances, assign to it uenty the site of the circumstances, assign to it nearly the site of the modern church of Sta. Maria Liberatrice-a modern church of Sta. Maria Liberarice—a conclusion arrived at phony very different grounds by some of the earlier topographers. The fact of the discovery upon this spot early in the six-teenth century of honorary and sepulchral in-scriptions in commemoration of vestal virgins, there were an earlier of scanture within the otte, and scriptions in commemoration of vestal virgins, their privilege of sepulture within the eity, and the probability that their place of burial would adjoin their sanctuary, led M. Fea, in 1827, though still holding the views of the Forum then prevalent, to place the Temple of Vesta on this site. The position of the equestriau colossus of Domitian, as described in the well-known lines of Status heavens now itellicible. It of Domunn, as described in the well-known lines of Statius, becomes now intelligible. It stood nearly in the centre of the Forum, with its back towards the temples on the slope of the Capitoline, on its right the Basilica Julia, on its left the Basilica Zimila; while in front, and therefore at the narrow extremity of the Forum, under the slope of the Veliau hill, was placed the Temple of Julius Casar.

the Temple of Julius Casar. A clear notion respecting the nature of the Comitium, and the relation it bore to the Forum, was first conceived by Niebuhr, and afterwards developed by Bunsen. "That the Comitium," says Mr. Bunbury, "was originally nothing more than an open space, in which the assem-blies of the patricians, the Comitia Curiata, were held, seems to have been generally ad-mitted: but by a strauge misconcention of a mitted; but by a strauge misconception of a passage in Livy, which, beginning with Flavio, Biondo, was transmitted in snecession through the whole series of topographers, down to

THE BUILDER.

prodigics, as the falling of milk and blood, in-stead of rain, on the Comitium, and the growth of the sacred fig-tree on the same spot, all serve to show that it must have still renained an open, uncovered area. We are, indeed, told in very early times, that it was *inclosed*, but in terms which by no means necessarily *require* us to regard it as clearly distinct from the Forum, work here a contribution carthing the a much less as constituting anything like a sepa-rate edifice. On the other hand, from the rate edifice. On the other hand, from the frequent mention of buildings, or other moun-ments, which are spoken of at one time as being in the Forum, at others in the Comitium; and Still more clearly from a passage of Pliny, where he describes the sacred fig-tree as being in foro ipso ac Comitio, we may safely infer that it was a part of the Forum itself." The inference force all this is that the term

The inference from all this is, that the tectum of Livy alluded only to the temporary roofing of the Comitium, on the occasion of gladiatorial

displays. These circumstances have occasioned M. Bun-These circumstances have occasioned M. Bun-sen to conclude, that the Comitium occupied the upper or narrow end of the space allotted to the Forum generally. M. Becker, who takes the same view, has also remarked upon the fact upon the earliest edifices,—those referred by tradition to the four first kings of Rome being found at this notice, the service of the found at the notice of the service found at this portiou, - the remaining space being the Plebeian Forum, and served at first as being the revenue commit indicative at hista as a market place, or for other ordinary purposes, and took no regular form until the reign of Tarquinus Priscus, who, according to Livy, first surrounded it with shops and portices. The first surrounded it with shops and porticos. Tho theory of the German school is well told by Arnold. "From the foot of the Capitoline," says he, "to that of the Palatine, there was an open space of unequal breadth, narrowing as it approached the Palatine, and enclosed on both sides between two branches of the Sacred Way. The narrower end was occupied by the Comi-tium, the place of meeting for the *populus*, or great council of the burghers, in the earliest times of the republic; while its wider extremity was the Forma, in the stricter sense, the market-place of the Romans, and therefore the unburgh place of the Romans, and therefore the untural lace of meeting for the commons, who formed he majority of the Roman nation. The Comi the majority of the Roman matter. The Comi-tium was raised a little above the level of the Forum, like the dais or upper part of our old castle or college balls; and at its extremity, ucarest the Forum, stood the Rostra, facing, at this period, towards the Comitium; so that the speakers addressed, not indeed the patrician multitude as of old, but the senators, who had multitude as of old, but the senators, who had in a manner succeeded to their places, and who were accustomed to stand in this part of the assembly, immediately in front of the senate-house, which looked out upon the Comitum from the northern side of the Vin Sacra." The Curia Hostilia, or senate-house, built by Tullus Hostilius, was one of the principal buildings of the locality. From a remarkable passage in Pliny, to the effect that in early periods the hour of noon was marked when the sun, as seen from the Curia, stood in a line between the Rostra This, to the check that it carry periods the hole of noon was marked when the sun, as seen from the Curia, stood in a line between the Rostra and the Gracostasis (cam a Caria inter Rostra et Greecostasin prospeciesset Solem), Niebuhr pointed out that it must have stood upon the north side of the Forum. The preponderance of authority places the Rostra in the opeu space in front of the Curia, and, with reference to them, the sun at noon could ouly be observed from the Curia, if facing the south. The Gracostasis, which was an elevated area, was situate to the right, or west of the Curia. Varro, in describing the position of the Graecostasis, sub deatra Caria, speaks of one looking towards the south, which would bring the Graecostasis to his right; and this is intriber Hokmig towards the sound, when wond obig the Gracostasis to his right; and this is further proved by the next passage, "Seaucilum suppa Gracostasin ubi ædis concordiæ et Busilica opinia," meaning that the Senaenlum lay above

opinia," meaning that the Senaenlum lay above the Grecostasis, and towards the Temple of Concord, on the side of the Capitoline Hill. To the same side of the Conitium may he assigned the Vulcanal, or *Area Falcani*, an open space, of higher elevation than the Comitium, and looking directly upon it, and referred back to Romulus for its consecration. The relations between the Vulcand, the Grecostasis, and the Senaeulum have not beeo satifactorily explained, Nut it is the conjecture of Becker, that the for Biondo, was transmitted in succession through space, of higher elevation than the Comitium, the whole series of topographers, down to Nihby and Burgess, it was supposed that it to Romulus for its consecration. The relations had been subsequently roofed over, and con-between the Vulcand, the Grecostasis, and the verted into a covered huilding. Yet not only does the passage in question, rightly understood, hut it is the conjecture of Beeker, that the for-expressly *exclude* any such idea ; hut, as Niebuhr mer preceded the hatter, and formerly desig-has justly observed, the occurrence of such

[MAY 9, 1857.

and Senaculum cach comprised a part. The opioion of Canina regarding the Comitium, is, that it extended along nearly all the south side of the Forum. The views of Mr. Dyer upon this subject are independent and novel; and according to the opinion of the writer in the Quarterly, have much to recommend them. After carefully weighing the arguments upon both sides of this question, he decides upon embracing neither, but removes the debate-able spot to the north-west corner of the Forum, near the site of the Arch of Severus, making it, in fact, apart of the Forum itself. The Career Mamertinus ascribed to Ancus Martiusis, is the ouly building extant referable, with certainty, to the regal period; the lower valided chamber, added by Servins Tullius, and called the "Tulliamu," being doubtless that whose horrors are so foreibly depicted by Sallust. Under Numa Pomplius, the Forum received for many covenents. Besides the little Temple of Janus, *index belli pacisqua*, he built his Regia or palace, as well as the celehrated Temple of Vesta, both the latter being at the south-cast extremity of the Forum. With the reign of Tarquinius Priscus, as we observed, the Forum assumed its first architeo-tural features. On the slope beneath the Capi-toline the remains of two temples had long been seen—the one showing three columns, the other

seen—the one showing three columns, the other eight. The former was generally known as Jupiter Tonans (albeit the temple so dedicated by the testimony of Augustus himself is placed the Capitol, the pseudo-Victor alone placing in the Capitol, the pseudo-Victor alone placing it in clice Capitoliao-whence the hlunder origi-nated), the other, since the days of Poggio, as the Temple of Concord. The existence of a third temple adjoining the one assigned to Jupiter Touans was revealed by excavation, and from the inscriptions found there, as before alluded to, the site of the real Temple of Con-cord was established beyond a doubit. This point heing therefore fixed, it remained only to deterwine the names of the other two. Accord-ine to Varro, the Temple of Satury was founded ing to Varro, the Temple of Saturu was founded by Tarquinius Priscus on the Forum, on the spot where the altar to Saturn stood. Upon these ruins, again, authorities are at issue. Bunsen, followed by Beeker, gives the ruin of the three columns to Saturn; whereas Cauna, approved by Dyer, gives to that temple the ruin of the eight. Bunbury sides with Buusen.

The writers who mention this temple speak of it as situate at the lower part of the hill and beneath the Chrus. Thus Servins, sub imo Capitolino, and Festus, in imo clivo Capitolino, --thus was the Milharium Aureum, sub adem Saturni; and furthermore, the Marmor Ancyranum montions the Break Libra Luke as intern adam Castaria the Basilica Julia as *inter adem Castoris et adem Saturni*. The objections of Beeker are as follow:—First, that Servius mentions the Temple of Saturn as being *Jasta Concordia* Templem; and though the eight columns are near it, yet and though the eight contains are head R, you asserts they cannot be called *Jacka*. Secondry, the *Notitia*, starting from the Mamericae prison, names the three temples in the following order,—*Templum Concordiae et Saturni et Vas-pasiani et Titi.* This argument would be con-during acquid the *Notitit*, he walled as the ite clusive could the Notifization ended be col-clusive could the Notifization ended by the star warrant the reliance. Thirdly, he gives the inscriptions to the three temples as recorded by the Anonymous of Einstellen, who must have even the in the start of the start seen them in their integrity, and who gives them in a continuous sentence, without breaks to divide the inscriptions, but comprising all the fragments extant, but in the reverse order to that given in the Notitia, as proved by that of Concord which now comes last, and about which there is no question. The inscriptions are given by the Anonymous, as follows :-- "Senatus given by the Anonymous, as tonows :-- Senatus populasque Romanus inceadio consumplum resti-tuit. Divo Vespasiano Augusto. S. P. Q. R. Impp. Cæss. Severus et Antoninus Pii Felic. Aug. restituerunt. S. P. Q. R. ædem Concordiæ vetustate collapsam in meliorem faciem opere et cullu splendidiore restituerunt." Now it is in the dividing this inceriming

Now, it is in the dividing this inscription between the three temples that the most im-portant argument lies, and Becker, by giving the words, *D. Yesp. Augusto* to the first, assigns the ruin of the three columns to Salurn, and that of the eight to Vespasian; whilst Canina, by giving the word, *D. Yesp. Augusto*. S. P. Q. R. to the second, reverses the order, and assigns

the three columns to Vespasian, and the cight to Saturn.

to Saturn. Adjoining the Temple of Saturn was the small *Ædes Opis*, meutioned in the *Fasti. Amilernini*, and *Capranicorum*, and alluded to by Cicero, which served as a bank for the public money, and hefore it stood a statue of Silvanus and a saered

The tabernæ, erected by Tarquin, consisted of butchers' shops, sebools, &e, and were distin-guished by the names *Veters* and *Novæ*, whence the long sides of the Forum derived their names, and *Veteria* and *Novæ*, and *Novæ*, whence sub-Tetribus -- sub-Novis, and a passage in Cierco fortunately determines their relative positions. The next improvement was the con-verting the butchers' shops into those of silververting the butchers' shops into those of silver-smiths, or argentariae, the earliest uotice of whom we find in Livy's description of the triamph of Papirus Cursor (B.C. 308). It was by means of the cloace of Tarquin that the Forum hecame drained, and it is probable that to this mnromantic agency, the disappear-ance of the Lacus Curtius must he ascribed, rather than to the self-immolation of the Roman of thet near. It limited the sign of the Currather than to the sen minoration of the roman of that name. Ultimately the site of the Cur-tian lake was converted into a dry *puteal*, which, however, still retained its old name, and into this the people used to throw picces of money, as an *augurium salutis*, or new-year's gift for Angustus. The way in which modern *Ciceroni* can administer to the appetite of those who doat upon the wonderful, is humorously described hy Forsyth.

described by Forsyth. "Ou my first visit to the Campo Vaccino," says he, "I asked my valet-de-place where the Lake of Curtius was supposed to have heen P 'Behold it' circid he, striking with his cane au immense granite basin, called here a *logo*. 'Was this, then, the middle of the Forum ?' 'Cer-tainly 1' 'Does the Cloaca Maxima run under-neath?' 'Certainly !' 'And this was really the heave the arcifect the wave the mouve ?' lago where the ancients threw the money?' Certainly!' Thus was the lacus of some ancient fountain (probably one of those which M. Agrippa had distributed through the streets) transferred by a *Cicerone's* wand into the Curtian Lake! And thus are thousands cheated by sounds."

In the graphic and humorous passage from the Curculio of Plantns, commencing "Com-monstrabo quo in quemque hominen fucile in-veniatis loco," the first of the series of basilies that afterwards adorned the Forum is menthat afterwards adorned the Forum is men-tioned, namely, the Porcian, commenced in the censorship of Cato. Though it stood close to the Curia Hostilla, its exact site is not certain ; hut both were destroyed by fire at the funeral of Clodius (U.C. 702). The next in succession was the Basilica Fulvia, founded in the censor-ship of M. *E*milius Lepidus, and M. Fulvius Nobilior, B.C. 179, and sometimes called the *E*milian, sometimes the *E*milian and Fulvian. It stood on the north side of the Forum, behind the *Accession for the Basilica* function of the Basilica Portia. This Basilica was afterwards rebuilt by Lucins Æmilius Paullus, B.C. 53. A misapprehension of a passage in Cicero occasions a difficulty in reconciling this restoration with another alleged "Basilica Paulli" of still greater another alleged "Basilea Pauli" of still greater magnificence; the situation of the latter not being solvable, as only one Basilica Paulli is mentioned by ancient authors. The Basilica Sempronia, creted by T. Sempronius Gracehus, B.C. 169, constituted the third of these edifices. It stood on the south side of the Forum, behind The both of the sectors, probably some way back upon the Vicus Tuscus. The fourth and last Basilica of the republican period was the Opimia, crected by L. Opimius, close to the Senaculum.

THE EXHIBITION OF COMPETITION DESIGNS FOR THE GOVERNMENT OFFICES.

WHATEVER differences there have been as to the management of the competition for the Government offices, or whatever opinion may be forming as to the result, we may safely say that nothing so remarkable as the scene of West-minster-Hall during the first three days of this week, had been ever known of by architects. On Numder, hed, when the darian every first direct. Monday last, when the designs were first dis-played to the public, it is believed that 10,000 persons visited the exhibitiou; on Tuesday,

Westminster. It is a source of much satis-faction to us that this amount of interest in the exhibition is being taken by all classes. Every object that is desired for the advancement of our art will not immediately follow; but the public appreciation of architecture will be advanced vertheless

Such is the extent of the collection ; such the amount of architectural *matériel* in "Designs 1,2, and 3," in plans of all central London, or of "the space bounded by a referrat zondon or of the space bounded by a red line;" and in drawings, models, reports, aud specifications in different langmages; such is the work of examining 200 and odd designs,—some with two drawings and some with forty ; such the tronhle of trying to read what is placed too bigh, and disentanging read what is proceed too buy, and discharding ing one set of drawings from another, that many days may be spent in hreaking ground for the study of the designs. It may now perhaps be seen and understood better than it has heen before, what is the quantity and amount of thought and labour which architects give to even ordinary competitions, and how great should be the corresponding devotion of time and skill, to the decision on merits,-points which, strange as it might appear, we have had to say that architects-uay even competitors in previons cases, did not show that they had due apprehension of.

There are in all 218 designs, according to the official statement, but amongst these there is considerable variety, as to nature of subject and compreheusiveness. First, as might be exand compreheusiveness. First, as might be ex-pected, some architects have entered into the competition for the block plau ouly. Another portion have sent drawings for one or both of the offices only, viz. the Foreign office and War-office—the subjects for "Designs 2 and 3." A third portion have grappled with both the general and the particular schemes mentioned, making them more or less capable of being worked out unison. The numbers under this sort of in classification, in each head, can only be found hy analyzing each set of drawings, but we think the three classes would he about equal.

The whole area of the hall, except a narrow why to the law courts, and along the ends, is given up to the exhibition. The space thus allotted is divided, longitudinally, into four alleys, and a *dais* at the end; and cross divisions, with the requisite openings, are placed at certain distances. The inconvenience expected from this arrangement, as to the crowd, is uot felt,-and as to the light, there is no cause for complaint. It may, therefore, appear that we are disposed to find nunccessary *fault*, if we inti-mate that, in other respects, the arrangements are not what we should have desired. And we are compelled to say this, even after having heard of opinions from competitors, directly available the opinions from competitors, directly opposed to our opinion. But, as we have often presumed to say, committees and judges are not the only persons who have yet to grasp facts as they are. It is true that-excepting that it would have saved us some hours, if the different sets of drawings had heen encircled with a strip of red cloth, and if numbers had ranged consecutively (numbers 50 and 51, for instance, heing now at opposite ends of the ball, in different alleys),—we may gladly allow that as much has been done by the Office of Works, as existing covered space in a central locality ad-mitted of. But we must repeat,--one of the plain objects for competitors is to ensure to themselves that their drawings shall be exhibited where they can be seen. Without this there can be no advantage from competing. Of course, the decision cannot even go on merits. The majority of competitions which have occasioned dissatisfaction would have owed it alone to the fact that the committees had no place to arrange drawings for their own inspection. The points, therefore, which we have ventured to urge upon our professional readers, have beeu, that whilst there might he great advantage to be gained hy competitions, the prospect worthy of the exertion was in some way connected with exhibition, and that it was undesirable to em-bark in competition, without that point at least clearly stipulated and understood.

when the crowd was somewhat less, 7,000 were the Hall, with the motio beginning "Nec present; and on Wednesday the numbers again minimum meruere decus," is placed so high up reached to 10,000. The body of London archi- that its details, which are apparently of great tects seemed each day transported *en masse* to beauty, and are of eonrse most important even that its details, which are apparently of great beauty, and are of conrse most important even in the general effect, cannot be distinguished. Again, the general plan in No. 96 ("Pense à bien"), we looked at for a quarter of an honr, without being able to find what was the proposal as to the bridge routes. The the proposal as to the bridge routes. The real intention is, *inter alia*, to remove Hunger-ford-bridge altogether,—and we believe this design is the only one in the exhibition that has such a proposition. Surely—without our enter-ing into the merits of the plan—such a feature of the design is to be taken into account in balancing merits and defects. As to West-minster-bridge,—great attention is necessary to see whether commetitors change the site or not : minster-bridge,—great attention is necessary to see whether competitors change the site or not; for, independently of any line with approaches from Parliament-street or Whitehall, there are several sites, so to speak, varying only a few feet from one another. There is the site of the old bridge; there is that site plus Mr. Walker's addition to the piers, which some of the com-petitors have taken (mystified by the plus, which were very incomplete as to the bridge); there is the site of Mr. Page's intended hridge, i.e. the site of the old bridge with an addition on the up-stream side; and there is the site, per se, of that addition, which is thas sometimes been suggested, as indeed by ns, might form the whole bridge; as well as there are various lines that swerve a little in crossing. It is important surely to know—and it is a question of fect exactly what use any such competitor proposes lately; to make of the foundations put in lately whether advantage is taken or not of the points whether advantage is taken or not of the points as to the approaches, which constitute the ad-vantage of Mr. Page's line on the up-stream side; or, on the other hand, whether the foundations completed are proposed to be removed. For instance, some of the foreign competitors place their increased width to the original site, on the down-stream side, — perhaps without *knowing* what had been done, —but such things involve points that should not have heen doubtful points that should not have here doubtful on the drawings. Further, there are other plans, the arrangement of which cannot he done justice to, from the absolute im-possibility of reading the writing with the massisted eye, standing on the ground. As one instance, we may notice the important plans of the design No. 99, $\Delta \lambda ra$. From such discomptances the duty and responsibility of circumstances, the duty and responsibility of the indges' office will be very great.

The circumstances, in other points, correspond with what it did not require any great pre-science to see must arise. If we refer to what science to see must arise. If we refer to what we said in October and November last, on the offices, and in December and in our first number of this year, on the subject of Westminster-bridge, or to what we have said at other times, it would not be in self-gratulation, but to place in the true light the case of the profession—as interested in common with the country and the Government, in the objects of the scheme,-the advancement of art, and the efficient organiza-tion of public business. We spoke of the nu-necessary burry in which the project was being necessary ourry in when the project was being pressed forward; we argued that *information* was even needed before the objects to be attained by "particulars," or "instructions," could be set in the right light; that these "instructions" must be such as could not interfere with the logical and sequential order of idea second that logical and sequential order of ideas essential to the conception and realization of any work of art and intellect, and that they must not be such as would trammel freedom of selection, or suggestion, or lead to an alternative hetween, on the one side, depriving the country of the best ideas that could be brought to bear upon the subject; that could be brought to bear upon the subject; and on the other, nnfairness in the decision. We objected to the rigid demarcation of a homdary until the block plan had heen decided upon, and more especially to the selection of any sites for particular offices, as tending to in-terfore with suggestions as to the whole; but the red line being marked on the plan which accompanied the instructions, we wondered that it should enclose a site of such irregular form, and at one part leaving Richmond-terrace at one part leaving Richmond-terrace ding. We ventured to say that the and tion, and that it was undesirable to en-trian that it was undesirable to en-rik in competition, without that point at stelcarly stipulated and understood. Now the principal view in set No 116, in and that consequently the 500% would be far

beyond the value of the project that might me entitled to that premium.

The merit of the block plans generally, as exhibited, is small. Parliament-street is widened : the War office and Foreign-office are shown in the positions required, and the data are thus given for the whole. The only suggestions for given for the whole. The only suggestions for the grand object of concentration that are really valuable are in those drawings where the design. It has gone far more carefully into the design, than by a mere block-plan. The author of No. 99 above mentioned, thus makes the existing front of the Treasury the *dalum* of his group. The author of No. 116 perceives that two objects, not necessarily connected with one another, were attempted to be served hy the "hlock plan," — nancely, the London street improve-ments, and the general concentration of the offices; and if he is right, the "instructions" in that particular, have led to much waste of

offices; and the general series of the "instructions" in that particular, have led to much waste of lahour. The site of Richmond-terrace many of the competitors do not hesitate to appropriate. Of those designs which treat the London im-provements, a large proportion do not present any important variations on what have here eanvassed and discussed for years past. The sites of the bridges that we referred to in our article on Westminster-bridge, are gene-rally observed. With reference to the question of the site for Westminster-bridge, we helieve the numerical preponderance of opinion is de-cidedly in favour of the rotention of the site. Ahout one-third of the designs seem to make no reference to the bridge whatever. Of those plans which do contemplate the remoral, a con-siderable number show by the new position the very great disadvantage of the change,—nulless very great disadvantage of the change,the hridge were wanted, and could be kept for the sole use of the offices themselves.

the sole use of the offices themselves. These and many other points, however, will require our attention in subsequent notices. For any matured opinions as to the designs for the Foreign-office and the War-office, in which the chief interest of the collection may he found, there has been no time. Having only a day in advance of the crowd of Monday allotted to use it use here invessible even to see the to us, it has been impossible even to see the bulk (f the collection. The architecture of the designs will, however, be found to include more of novely and heauty that has been displayed in drawings for many years. The English archi-tects do not suffer as some would have said they might, heside the architects of other countries. Of these last there are many, and the number of foreign styles suddenly hrought hefore us is considerable. considerable.

The names of forty or fifty of the chief competitors are not in anywise secret. The judges, are also very freely reported. The exhi-bition will at least do this,—it will leave lasting influences npon the architects who are so assidu-ously studying it, and the valuable results will be seen in our huildings, as in the auconities of the profession for years to come. The days of exhibition are now only Monday, Tuesday, and Wednesday, from ten to six, and Saturday from twelve to six; and unless the exhibition shall he kept open longer than first intended, it can hardly by the day of closing, be seen in the manner which is desirable for either study, or adjudication. In auchter number we shall enter more into The names of forty or fifty of the chief

binding will at least do this, —if will have lasting influences mom the architects who are so assidt on long studying it, and the valuable results will be accessed to activate the average studying it, and the valuable results will be accessed to activate to average strates?
Construction of the set of the second strategies and the second strategies and the second strategies and strategies an

base many admirers. "The Evening Honr" (178), where we have an Italian peasant piping at eve, and looking mistly into the future, is full of heauty and feeling. O.kdey, Rivière, and John Glhert, have good-specimens of their art. Mr. Nash has an ex-cellent architectural portrait of "Bramshill, Hants" (188), and Mr. Read a good interior of "Milan Cathedral" (193). "Kilgerara Castle" (3), hy C. Branwhite; "Scene in Glen Nevis" (11), by T. M. Richardson; "Val St. Nicholas" (45), J. D. Harding; "Convent of La Madonna del Sasso" (98), W. C. Smith; "Schloss EL" (105), W. Callow,—are all very excellent landscapes. The exhibition of the new society consists of 354 drawings, including many works of high merit, from

The exhibition of the new society consists of as-drawings, including many works of high merit, from which purchases were made at the private view to the amount of nearly 9007. No. 97, "A Public Letter-writer in the remains of the Theatre of Marcellus, Rome," is the most admirable of several excellent works contributed by Mr. L. Haghe. The scribe sits within a vault dimly illuminated by an artificial light: the tone is delicious,—the sleeping man perfect. "A within a vault dimly illuminated by an artificial light: the tone is delicious, -the sleeping man perfect. "A Guard-room" (329), and "Cromwell and Ireton" (317), by the same artist, will not escape notice. Mr. Henry Warren's large picture, "A Street in Cairo, with a Marriage Procession, as seen from the Shop of a Dealer in Wearing Apparel and Arms" (218), is a very interesting picture, conveying truth-fully the scene intended. Mr. Corhould has expended much time and thougbt on "A Scene at a Prussian Fair" (S2), which is full of character, hut can scarcely please the indicious. In others of his subjects be is much time and nongood on A Scene at a Prussian Fair" (82), which is full of character, hut can scarcely please the judicious. In others of his subject 82 siy more successful. On the score of subject (83 s), "A New Pupil for John Pounds," by E. H. Wehnert, stands first in the gallery. The cobiler, John Pounds, it will be remembered, was the founder of Ragged Schools, and Mr. Wehnert shows him surrounded by the children he has coaxed in from the streets to teach. The execution is not equal to the intention, but it is nevertheless a picture which should be preserved. Mr. Mole has made an advance. Mr. Absolon is thinner and more papery than usual. Mr. Vacher has some expisite Italian and other landscapes,—see, for example (111), "The Environs of Mesilah." and Mr. Bennett is as vigorous as naus in (8211), "A River Scene," and others. The best landscape, how-ever, in the collection is exhibited by Mr. Edmand Warren, "Glen Sanaox, Isle of Arran" (226), which shows a most careful study of nature. His "Trysting Tree" (119), too, is an admirable drawing.

BYE-LAW AS TO THE FORMATION C NEW STREETS IN THE METROPOLIS. OF METROPOLITAN BOARD OF WORKS.

THE following by-law has been approved by the Right Honourable Sir George Grey, hart, one of her Majesty's principal Secretaries of State, pursuant to the Act for the Better Local Management of the Metropolis, and was published the 1st day of May instant :-

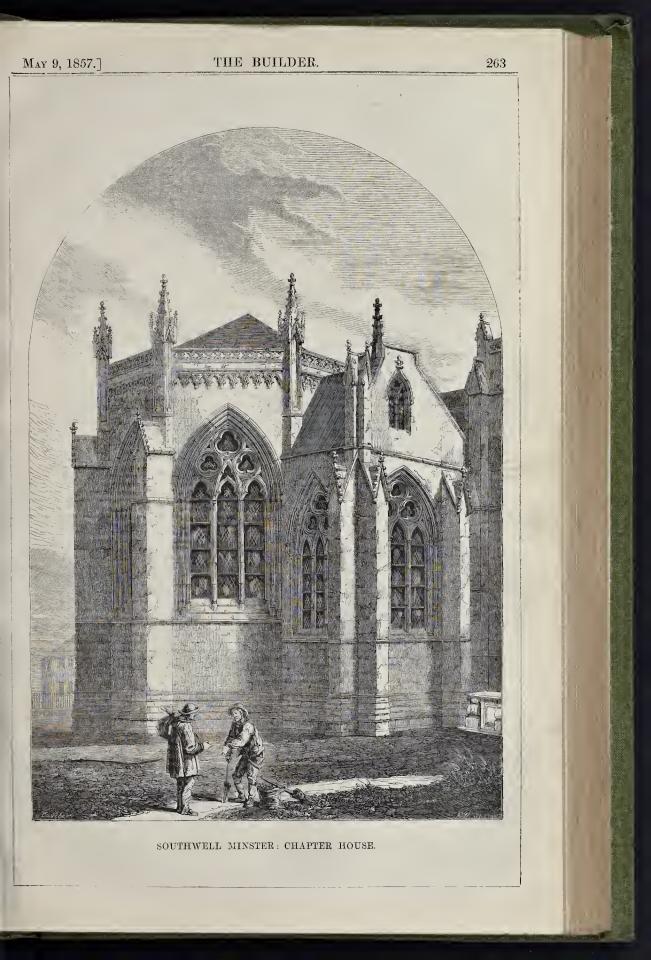

instant :— "1. Four weeks, at the least, before any new street shall be laid out, written notice shall he given to the Metro-poiltan Bard of Works, at their office, No. 1, Greek-street, Sobo, in the county of Middlesex, by the person or persons interading to lay court such new street, stating the persons interading to lay court such new street, stating the plan of the ground, showing the local situation of the same.

SOUTHWELL MINSTER. CHAPTER HOUSE.

In Mr. G. G. Scott's excellent lecture on "Mediaval Architecture," lately delivered at the Royal Academy, and published in the *Builder*, he points out the great advantage to be gained hy a continuous and patient study of such of the examples of our ancient architec-ture as come within our reach, from the humble parish church to the stately cathedral. At the same time he in a measure condennes all hasts. thre as come within our reach, from the humble parish church to the stately cathedral. At the same time, he, in a measure, condemns all hasty and careless sketching, and, as a rule, very pro-perly so; hut still there are times where no-thing more than a hasty sketch (it need not be a careless one) can be obtained,—and even this has its value, if it only adds, to the common stock, some fresh form of tracery or moulding. Again, this hasty sketch may be the only record of an conally hasty visit to some place incon-Again, this hasty sketch may be the only record of an equally hasty visit to some place incon-venient to reach, and which may, therefore, never be seen again; and it so happens that many of our finest examples of English archi-tecture are not easily to he got at,—such as Tewkesbury, Beverley, Ripon, and Sonthwell— all exquisite specimeus, but all, more or less, difficult of access. Let us take Southwell, for instance, and see what sort of a pilgrimage must he undertaken. Suppose the platform of the Great Northern Station at Newark reached : then there is that other station from whence yon shall be conveyed to Southwell in your anxiety to reach this, you hardly dare cast a look at the fine church, and the remains of the old castle. John shah of event this, you hardly dare cast a look at the fine chnrch, and the remains of the old castle. Useless speed! You will most pro-bahly find that you have to wait something like two hours for the next train; so there is no-thing for it, but to walk back into Newark and make a closer acquaintance with the church-no bid alternative; seeing that it is one of the finest in England. After this, another walk, and a short ride on the iron road, and you reach the so-called Southwell station. Still, the place itself is two miles off; but a plea-sant walk is no hardship, especially if the reward is to he so great, — for Southwell Minster is really what Rickman describes it,— "a large and magnificent edifice," combining Norman, Early English, and Early Decorated, all of the finest description. The north porch and some of the doors are excellent specimens of the former period: the choir and transepts, particularly the east end of the former, have Early English work, that can hardly he equalled; and there are some ornamental portions of a later character, such as the stalls and sedilia, of peculiar heauty: it is said that the latter were for a long time carefully cased up hy heavy and unsightly woodwork, and that their existence was only discovered hy one of the chorn hys climhing to the top of the unsightly erection, and by his weight bringing it to the ground : the result would he looked noon with more pleasner if the visitor was not obliged to hear that the freak cost the hosy his life. that the freak cost the hoy his life.

But perhaps the most attractive part of the building is the chapter-honse, a specimen of Early Decorated work, upon which, internally, almost every form of ornament has been lavished in the most abundant profusion. Here, indeed, no hasty sketching would do, nor would it be nearly the form of a program of a periles and as possible: the forms are so peculiar and so elaborate, that nothing short of the most eareful study would be of the slightest service. Although the room is small, a month might easily be spent there; and even then, only skilful fingers and the most untiring industry would produce any great results.

While staying at the village inu (for, after many hours' travelling, it is no shame for a man to be hungry), looking through one of the local guide-books, 1 met with the following sentence, taken from some old anthor,—"The minster is been with the result of the senter of the sente large and heavy, and of no particular beanty." Now, Rickman says, "it deserves the study due to a cathedral," and, so far as my own observa-tion goes, I an inclined to agree with the latter authority; hut still I would advise all who can do go to index for the would advise all who can do so to judge for themselves, for the above few notes, together with the accompanying sketch of the Chapter-house from the north, are the only results of a hasty visit to Sonthwell Minster, a visit to he repeated as soon as circumstances will permit, hecanse of the great heauty of the W. CAVELER. place.

THE ART-TREASURES EXHIBITION

MANCHESTER has certainly done a great thing. She has gathered together, at no small outlay of time and risk of moncy, such a collec-tion of results of fair and the state of tion of works of fine art as the world has never before seen under one roof, and from which good, in an educational point of view, must re-sult. The Exhibition was opened by Prince Albert on Tuesday, the 5th inst. with much pomp, fair weather, an elegant assemblage, 10,000 strong, and, as a general result, com-plete success. The original paper of sugges-tions on which the scheme was founded, and which has just now been printed for the first time, was signed by Mr. Peter Cunuingham and Mr. Jolm Deane, both of whom have assisted in carrying it ont to its present position. Doubts were at one time felt as to the willingness of owners to lend such works as were desired; but, tion of works of fine art as the world has never owners to lend such works as were desired ; but, with an admirable spiril, the art-treasures of the United Kingdom have heen poured out at the feet of the committee, without fear or stint. The corporation said, in their address to the Prince ;-

the Prince ;---" The encouraging example afforded by her Most Gradom Majesty and your Royal Highness in thus zealously supporting an exhibition originating in a desire to instruct and gratify the people has been emulated in the noblest intermediate the program of art-treasures there much the ingdom, and the promoters have thus the most of the ingdom, and the promoters have thus the people of their perposes which is presented in the im-posing spectacle around us." And the Desires a referred to the point in his

And the Prince referred to the point in his reply both to the corporation and to the execu-tive committee. To the latter he said,-" The tive committee. To the latter he said, —"The huilding in which we are assembled, and the wonderful collection of these treasures of art, as wonderful collection of these treasures of art, as you so justly term them, which it displays, re-flect the highest credit upon you. They must strike the beholder with grateful admiration, not only of the wealth and spirit of enterprise of this conntry, but also of flut generous feel-ing of mutual confidence and goodwill between the different classes of society within it, of which it affords so gratifying a proof. We behold a feast which the rich, and those who have, set before those to whom fortune has denied, the higher luxuries of life—bringing forth from the innermost recesses of their pri-vate dwellings their choicest and most cherished vate dwellings their choicest and most cherished treasures, and entrusting them to your care, in order to gratify the nation at large; and this, order to grathy the nation at large; and this, too, unhesitatingly, at your mere request, satis-fied that your plans were disinterested and well matured, and that they had the good of the country for their object." Our readers already know something about the building, but some additional details will probably be looked for. It has been erected upon a jet of land layer if it was in the total

probably be looked for. It has been erected upon a plot of land about 173 aeres in extent, situated at Old Trafford, a distance of two miles from the Manchester Exchange. The plot is bounded upon one side by the Manchester South Junction, Altrincham and Bowdon Railway, in connection with which econvenient and commo-dious stations have been provided, affording direct entrance into the huilding. Upon the other side of the building are the grounds of the Botanic and Horticultural Society, and arrange-ments have been made for easy access in either Botanic and Horticultural Society, and arrango-ments have been made for casy access in either direction. The accessibility of the site, by rail or by highway, is remarkably convenient. The Exhibition Building covers an area of 16,000 square yards, or three acres and 280 square yards; and the cost of the creetion is stated at about 30,000%. The total pecuniary liability already incurred, by the Executive Committee, in the building and arrangeements for the Exhithe building and arrangements for the Exhi-hition, amounts, it is said, to above 80,0007. The whole of the edifice, with the exception of the entrance-front, is constructed, externally, of corrugated iron sheets, fixed to cast-iron up-rights and neg microsult, the interior is liked

Corrugated from sheets, fixed to cast-iron up-rights and roof principals: the interior is lined with wood, and covered with paper-hangings. The building itself is, in external form (dis-regarding some projecting buildings at each end) a parallelogram, of about 33 squares of its width; that is, it is three and a half times as long as it is broad. The exact dimensions of the squares are 656 free in learth and 800 fort the square are 656 feet in length, and 200 fe

the extreme length from end wall to end wall is 704 feet. The east façade, in which is the principal entrance, has been greatly altered since its original design. Originally it repre-sented three bold circular-arched roofs, con-rooms, &c. The scond-class refreshment-room neeted, by lower intermediate buildings, with ridge roof. The two lateral arches cover the ing the main building and the railway corritor, it heirs entrand her and sented three bold cifetimatication roots, con-nected, by lower intermediate boildings, with ridge root. The two lateral arches cover the picture galleries: the central arche roots over the 56 feet central aisle of the great hall, and the two ridge roots cover the side aisles of the here we rage rouse over the state areas of the hall. But owing to a line of offices being car-ried northward in a line with this façade, and the railway corridor being also attached to it in a line southward, the façade is now composed of-palace 200 feet, railway corridor 150 feet, aud offices 96 feet; iu all presenting a front 446 feet in length. The entrance-front, which shows three large arches, is of cream-colour bricks, with red brick dressings and panels up to the with red brick dressings and panels up to the spring of the arches: the face of the arches themselves, filled in with glass, are of wood, pointed crean colour, and red to correspond with the lower part. It is not very handsome, --indeed, to speak the truth, it is squat and

ugly. The internal form, so far as it can be seen at once, say from the centre of the transpt, is that of the Latin cross, hut reversed as to the ear-dinal points of the extremities; the upper end or summit of the cross being the west cud.

The dimensions of the principal divisions of the building are the following :---

	Feet.
Length of great hall	632
Extreme width of hall	104
Leugth of north and south transepts	200
Width of transepts	104
Length of each range of picture-galleries	432
Width of each range of ditto	48
Length of water-colour gallery	200
Width of ditto	24
Length of smaller ditto	104
Width of ditto	24

The general construction will be understood by describing a soction through the main part of the building. The central portion of the soction will be the Great Hall, 104 feet across : section will be the Great rial, 104 feet across : this is divided by rows of coupled columns (at distances longitudinally of 16 feet apart) into three spans, the middle span formed by arched principals of wrought iron, without any cross tie-rods, springing from the tops of the coupled columns and rising in a semicircle to the height columns, and rising in a semicircle to the he ght columns, and rising in a semicircle to the height of 56 feet 6 inches at the crown, the span being 56 feet across. The two sides are each spanned by a hipped roof of 24 feet across. On each side of the Great Hall are picture-galleries of the width of 48 feet, covered by a semicircular roof, the principals of which are trussed by tie-rods and struts. The height of the crown of the roofs to the picture-galleries is 50 feet 6 inches. The height of the coupled columns in the Great Hall is 28 feet 6 inches. The oregan has been built, specially for the

The organ has been huilt, specially for the purpose, by Messrs. Kirtland and Jardine, of Manchester, and has been placed at the service Manchester, and has been placed at the service of the executive committee for the period of the exhibition. The organ-case has been excented by Mr. George Jackson, of Brazennose-street, from a design by Mr. E. Salomons, architect to the excentive committee. The centre, above the kcy-board, is occupied by a screen, 11 feet 6 inches wide, of silvered pipes, decorated with a diapering in colours. Above, there is an en-riched band, supporting a number of trimplets, in gold and silver, arranged on the radial lines of a semicircle. The effect of this is uot very good. On each side of the screen there are circular towers, 3 fect 8 inches in diameter, of gilded pipes, 9 inches in diameter; the pipes passing through the enriched band, and terminating in decorated coronets. Beyond, and slightly recessed, from the line of the towers, are screens of pipes according with those in the centre, but of less size; and, at the angles, there are other towers of pipes. The whole screen rests on a plinth and surbase, 4 fect 6 inches high. The case is, in the whole, 36 feet wide, by 26 feet high to the top of the centre trum-pets; and it is 18 fect 6 inches deep, a narrow passage being left hetween the back and the wall. The work of the screen has been done

ing the main offining and the raiway correct, it being entered through several doorways from the latter. The extreme dimensions are 132 feet by 72 feet; but 24 feet of the width is ent off, and devoted to retiring-rooms, &c. of which the supply is abundant.

the supply is abnidant. Very extensive cooking arrangements have been made, including a kitchen 50 feet long and 25 feet wide. The newspapers say that Mr. Donald will be able to supply 100,000 persons daily; hut inasmuch as, after four or five thou-sand persons had been supplied on the opening day, we found little obtainable but some polished boxes of lamb we must conclude that matters bones of lamb, we must conclude that matters

are not yet complete. The decoration of the huilding internally was Interaction of the minimum internation with entrusted to Mr. Crace. The sides of the central hall are decorated with a marcon paper, having a coruice in gold and colours, with tablets, in blue, upon which are inscribed the names of the artists whose productions hang beneath. The semicircular roof is divided into panels, the divisions consisting of the iron principals, and the longitudinal rius of timber. The compart-ments (picked out with a faiut border-line of crimsou) are an aerial grey. The ribs are of a light tea greeu, or rather greenish stone colour, high tea greed, or rather greens stone colour, with an ornamental edging of a light crean or vellum tint, and the faces are decorated alter-nately with Virtuvian and Greeian ornamenta-tion. Upon the lower edges of the principals there is a rosette ornament, and on the face of these alternative scaling of the task. (The them alternately a guilloche and the tau. The coupled columns (coupled, by the way, as an alterthought, to obviate a weakness) are of the alternongri, to obviate a wearness) are of the same tea-green colour, reliceed with gold. We must conless to liking this part of Mr. Crace's work less than the side aisles, the Oriental Court, and some other parts. The colour of the columns is gloomy and mean, even with the sum upon it,—and that luminary does not always shine in Manchester.

Down the nave on each side are groups statuary, mostly by modern artists, placed with admirable taste. Some more specimens are needed to coutinue the line to the further end. Beyond the statues on each side are large cases containing the General Museum, a collection of rare value, commending itself to the attention of architects, even more strongly than the paintof architects, even more strongly than the paint-ings; while against the wall on cach side are placed eases of smaller objects, carvings, cabi-nets, and other artistical and costly furniture. In going through these do not miss the head, in low relief, by Donatello, or Torregiano's bust of Henry V11. Ou the right hand, or north side of the nave, the main cases contain the Bernal out Scalarges collections. while these on the of the nave, the main cases contain the bornar and Soulages collections; while those on the south side are filled with the loans of private individuals and corporate bodies,—glass, china, porcelain, metalwork, and ivories. These speciindividuals and corporate bodies,—glass, china, poreclain, metalwork, and ivories. These speci-mens are not yet catalogued or labelled: until this is done their value and the great interest attaching to them will not be felt. Their value in a money point of view is enormous. The case of old china, for example, English and French, was priced, in our hearing, by a well-known importer, at 100,0004. This is probably not above the mark, for some of the vases would probably sell for 2,0004, apiece! The case of Gothic plate is very remarkable, containing specimeus from the pre-Norman Dunvegau cup, alluded to by Scott in "The Lord of the Isles," and det of by store in a particle of the test of the test of the store of the test of test Look kbockers [take a lesson, Birnungham], and that beautifully-worked steel casket of architectural design. The carved ivories are numerous and wonderful, from diptychs and triptychs of the thirteenth and foarteenth centuries, and Mr. Hope's crozier, to the more sensually beautiful flagous of the sevent century. The case of Oriental chin, with its delicate tints, should The splate are too feer in light, and you feer of your and it is 18 feet 6 inches deep, a narrow of the list is the spets; and it is 18 feet 6 inches deep, a narrow of the serve to revive the love for it which has been fanking the grand entrance; and at the other wall. The work of the serven has been done lessened by *Sceres* ware and Majolica. The vase fadlery. Each of these end by the water colour principally in carton pierce. If from Sicily, set by Mr. Edward Falkener, the gallery. Each of these end huildings adds 24 the first-class refreshment-room is approached for the whole, so that hy passing out of the north transept and along century (!), should be investigated. The whole of the museum has been gathered and arranged under the direction of Mr. J. B. the cases have had the special care of Waring : the Mr. Chaffers

On reaching the end of the nave next the transept, a collection of armour and of weapons will be found, arranged, under the direction of Mr. Planché, by Mr. Pratt, searcely to be rivalled. Lost to some extent in the large space, and in-jured by separation, the collection demands the study of all who are interested in the subject. To say nothing of the suits in series, the helmets from the earliest period of English history, notice the Roman British shield in the Meyrick collection, that ivory saddle of the time of Henry VI., the cross-how of the same period, and the exquisitely wrought and inlaid halbert on the other side, said to have been given by the Pope to Henry VIII.

In the south gallery, at this end, there are about fifty architectural drawings, not yet labelled or eatalogued; some are very unworthy, and the whole, if mistakenly viewed by a foreigner as an exponent, would give a wrong impression of the present state of the architectural art amongst us. Of the photographs and the admirable collection of engravings illus-trating fully the history of the art, we must speak another time.

The walls of the nave hold the British por The wais of the nave hold the British por-trait gallery, 337 pictures : the galleries on the south side contain the works of the ancient masters, arranged hy Mr. Scharf, 1,098 in number; and the galleries on the north side, paintings hy modern masters, the English school, about 600 in number. We may not now however, say worse of this extraordingty school, about 600 in number. We may not now, however, say more of this extraordinary collection, but shall return to it at an early opportunity. Suffice it, that all who find delight in works of art, would know the riches possessed by England, and would avail themselves of the most complete means of study ever afforded, must visit the Art-Treasures Exhibition at Old Trafford.

THE LAST VISIT TO THE OLD READING-ROOM, BRITISH MUSEUM.

On the 8th of Septemher, 1838, not quite a score of years ago, this useful place of study was thrown open to the readers ; and, during that time, much valua-ble information has been gathered from the enormous mass of books which forms our national libeary and laid hefore the public. The growth of the British Museum has been rapid

In growth of the british Muselin has been rapid since the days when the late Mr. Disraeli and two or three others were all who availed themselves of the books and manuscripts which were stored in Mon-tague House, and the changes since then have been great. The number of readers who now use the library annually is upwards of 30,000.

great. The number of readers who now use the library annually is upwards of 30,000. In 1886, two years before the opening of the old reading-room, the library of printed books consisted of 230,000 volumes. In 1851 it consisted of 470,000 volumes, or at the rate of I6,000 volumes a year on an average. It is probable that the increase of books added to the British Museum will, as education advances amongst the masses of the people, both at home and abroad, be much more than 16,000 16,000 in 1900 (forty-three years hence), will contain 1,270,000 volumes.

In 1851 the library occupied 51,050 feet, or very mearly 10 miles of shelves: at the end of this century the shelves will extend nearly 30 miles, or 10 miles farther than from London to St Alban's.

The old reading-room was thought a fine thing a few years ago; hut lately complaints have been constantly made of want of light, want of space, and want of ventilation. Notwithstanding all these faults, a long attendance had caused us to consider the place a tong attendance had caused us to consider the place with something of the same feeling which is ex-perienced for an eld and valued friend; and, uotwith-standing the hencficiel change which has been pre-pared, it was with some regret that we left the old room for the last time. Most of the well-known faces which are familiar to the visit here means in their sometoned challer

to the visitor here were in their accustomed places; but the other attendance was not so numerous as usual. All the volumes, with the exception of the usual. All the volumes, with the exception of the extalogues, had here moved away, and the place had an uncomfortable and desolate appearance, something like premises which have been swept by the sheriff. The eye wandered round the empty shelves to well-remembered spots formarry occupied hy books of re-ference. The readers looked hervildered and uncom-fortable and areas which have been been derived and uncom-

THE BUILDER.

more than ever appreciated the use of this depart-ment of the British Museum.

Books were written for as usual, hut did not come books were written for as usual, not can not come to hand with regularity, and many tickets were re-turned instead of the volumes wanted, marked "New Reading-room." Numerous clergymen and others, anticipating the fortnight's closing, rushed hurriedly d in many instances were disappointed in obtain-te materials they required. Other persons, who in, and in many instances were disappointed in obtain-ing the materials they required. Other persons, who had neglected to have their eards of admission re-newed at the proper period of each six months, attended in considerable numbers for the purpose of obtaining fresh tickets. Many regular visitors to the reading-room had not had new cards for years past, and some were lost, and much dissatisfaction was caused by the necessity of old readers being asked to apply for fresh introductions. Mr. Panizzi, who is, and concentrations which have earne under our notice. caused by the necessity of old readers heing asked to apply for fresh introductions. Mr. Panizzi, who is, on all occasions which have come under our notice, kind and considerate, gave instructions that all who close to call at the old room, and cauld be recognised by the attendants, should be spared further trouble.

At the time appointed, the readers slowly departed, and the alarum of the clock, and the ery of "All out," was heard here for the last time, and the old reading-room, like Montague House and the green fields and lanes adjoining it, -old Smithfield market, and other was made here. once well-known portions of London,-has become a thing of the past

When we contrast the snuggery occupied by the elder Disraeli and his few companions with the old reading-room, and then the new room with the old; old Smithfield market with the modern one; and the huildings erected for public and other purposes half a including effect of plant and one parposes and a century ago with those which are now being rearred in all directions, we see evidences of the advaucement of this great metropolis, and find good grounds for hope as to the future.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE Annual General Meeting of the Institute was held on Monday evening, the 4th of May, at eight o'elock,-to receive the Report of the council on the o'clock,—to receive the Report of the council on the state of the property and affairs of the Institute, and an account of the funds, together with a halance-sheet of the receipts and disbursements; to elect officers of the Institute, and examiners under the Metropolitan Building Act, for the ensuing year; and for the general despatch of husiness. Mr. A. Ashpitel, Fellow, presided. The following were elected:—

clected::--Parsinprint-Earl de Grey. Vicz.Parsingents-Messrs. J. B. Bunning, G. G. Scott, and J. J. Scoles. HONGRAT SKERTLARKS-Messrs. C. Nelson and M. COMPETITIONS.

Worcester Cenetery.—Ata meeting of the General Health Committee, held on Tuesday in last week, Mr. Clarke, whose design for the chapels has been selected by the Town-council for adoption, attended with an alternative design, which showed hut one archway instead of two in the connecting building be-tween the two chapels. The committee agreed unanimously to recommend the alternation to the council for adoption council for adoption.

Oldbury.-The ratepayers of this town, in vestry assembled, have rejected the design of Mr. W. Bourne, of Dudley, for the chapels, &c. for their new cometery, aud intend inviting competitions. The Burial Board and includ in the compositions of the barrier bound had accepted his plans, and procured tenders for the same; but it appears that their proceedings were not in accordance with *Vox populi*.

Derby Baths and Wash-houses.—The competition r these buildings has been scitled. There were for these baildings has been settled. There were twelve designs sent in, which bave been open for in-spection to the members of the Town Council for spection to the memory of the Town Conden to three weeks past. The Buiking Committee recom-mended the design under the motto "Nota-Bene," for the first premium, and that with "Con Amore" for the second. This recommendation has been unanimously adopted, and we understand the works will be immediately proceeding works with the open with the precedure the first mere the rector with the precedure that first mere the notes with the respective motioes, the first was found to he that of Messrs. Giles and Brookhouse, of Derby; the second, that of Mr. Oliver, of Sunderland

The Liverpool Wellington Monument Compefortable, and many who had before highly valued the advantage of having access without any trouble what conduct of the commetion completion completion advantage of having access without any trouble what conduct of the committee. He says, "I found my Chaple.street a new dispensary, at a cost of about ever to the well-arranged volumes in the reading-room, drawings, to all appearance, wilfully dirtied and 700% including 80% for a site.

defaced-walked upon, and nail-holes made through the face; returned in a reckless roll, with the ends twisted and open, tied hard with a hit of twine at each extremity; two shillings to pay, and a circular, stating they had heen forwarded, but without one word of thanks, or information as to the result of the competition. Such treatment, I am sure you will agree with me, is unbecoming a committee of gentle-men."

PROVINCIAL NEWS.

East Dercham. - The local Corn-Exchange Company, last week, had a meeting in the Corn-Exchange, to consider the expediency of building a suite of public rooms on the ground next Church-street, adjoining the present rection, when it was unanimously resolved to huld on the site without delay, and the directors were anthorised to raise the additional capital required to carry out the project.

Cambridge.—The want of adequate public rooms in Cambridge is leading, it appears, to the formation of a "Public Rooms Company," under favourable eir-cumstances, with a capital of 17,5007, in 3,500 shares at 5% each, for the purpose of erecting a series of buildings, comprising a grand hall, with suitable rooms buildings, comprising a grand hall, with suitable rooms attached, for balls, dinners, and catertainments; and also baths, swimming and private; washbouses, hotel of the first class, &c. A freehold site, according to the local *Chronicle*, has been secured in a central position, namely, at the head of Jesus lane, where the Hoop brewery, the free library, &c. now stand.

Dudley .- The new Connty Court buildings in this town are let to Mr. W. Nelson, huilder, for 3,4007. (the net lowest being 4,160/), and the works are to be commenced immediately. The accommodations consist of public office 33 by 18, court 55 by 28, chief clerk's office, registrar's offices, consulting rooms, chief eler's some, regardra's onnees, consulting rooms, judge's rooms, keeper's apartments, &c. The archi-tect is Mr. Reeves, of Guildford-square.——Part of the workhouse is being roofed in, but it will be some time yet ere the place is ready for the recep-tion of its immates. The front wing, board-room, &c. have the foundations only in, while the schools are not yet compared not yet commenced.

Burnham (Bristol) .- National schools have been Burnham (Bristo).— National ecitods invo over cretch in this parish, at the sole cost of Mr. Reed, a parishioner, and were opened has week, when 224 children of hoth seres attended. The site and building cost 907, odds, and the Council on Education contributed 2001. for fittings, houndary walls, &c.

Wombourn (Staffordshire) .- It is proposed to build schools and master's residence here, and at a new meeting of the vestry last week, the design of Messrs. Bidlake and Lovatt, of Wolverhampton, architects, were unanimously adopted.

Lichfield.—At a meeting of the Liehfield Corpora-tion last week, the design of the same architects was decided upon for the Museum and Free Library building for this city.

Reford. — New National Schools are about to be built at East Retford, which is certainly not before they are required, as the present building is totally unit for educational purposes, and has no provision for a girls' school. The new building is intended to accommodate about 180 boys and 120 girls, and is to accommodate about 150 boys and 120 grins, and is to have a teacher's residence attached. The designs, as prepared by Mr. William Kerby, of East Retford, architect, have been approved by the "Committee of Council on Education," and are in the Gothic style.

Shrewsbury.--Meetings are being held for the pur-base of promoting the erection of new schools for 5t. Chad's parish, eapable of accommodating 800 children.

Alfreton.-The new Town-hall, erected at the cost of Mr. William Palmer Morewood, has been opened. It stands on a site adjoining the George Hotel, and is a plain structure, containing assembly-room, with sessions court and offices, and other apartments for husiness, either public or private. The rooms on the ground floor are intended to he used as offices, &c. and two wide staircases lead to the large room above. and two which startcases lead to the large room above. This room is 50 feet loop by 30 feet high. The roof is of open wood framing, with arched ribs springing from stone corbels : the woodwork is stained and var-nished, and white ceiled plastering between the rafters. On the cast side are six windows with stone heads and sills. Mr. Wilson was the architeet, and Mr. Josh. Evans, the contractor.

West Hartlepool.—The foundation stone of national schools was laid here last week. The schools are to contain room for the tuition of 750 children, viz, 300 boys, 300 girls, and 150 infants. The amount of the respective contracts for the completion of the huildings is 2,3757, and the site is the gift of the West Harhour and Railway Company.

CHURCH-BUILDING NEWS.

Cambridge .- The vestry of St. Mary's Church is heing removed to make way for the erection of a new

Cambridge.--The vestry of St. Mary's Church is heing removed to make way for the erection of a new ehnneel. It is proposed to remove the Doetors' Gal-lery, and re-arrange the hody of the ehnrch, so as to increase the accommodation. The requisite means, however, have not yet been collected. *East Dereham*.--The chancel of the parish church has recently received some additional emhellishment from the Rev. W. C. Wollaston. The open roof has been displayed by the removal of the nasightly cell-ing; Early English windows substituted for those of a more debased style; and a window by Mr. Wailes, as a memorial to the late Mrs. Wollaston, now com-pletes the series of painted windows in this portion of the church. The vestry is said to have authorised the thereat. The vestry is said to have authorised the thereat. The vestry is said to have authorised the thereat. The vestry is said to have anthorised the thereat. The vestry is said to have anthorised the thereat. The vestry is said to have anthorised the parened, after being closed nine months for the purpose of restoration and enlargement. It was falling into a dilapidated condition, and was of too dimi-matire a size to afford adequate accommodation. The

into a dilapidated condition, and was of too dimi-nutive a size to afford adequate accommodation. The edifice has been enlarged and improved, at the cost of 800%. The alterations comprise the addition of a new south aisle to the church, which besides has undergone complete renovation. The aisle is parted new south aisle to the church, which besides has undergone complete renovation. The aisle is parted off by an areade consisting of five arches. The external walls are of Kentish rag, with hlack cement, and the porch, windows, doors, and buttresses, of Caen stone dressinge. The sittings, in lice of pews, are plain open henches, capable of holding a congre-gation of 300 persons, or more than double the number this old Norman church would before accom-modate. The huilding operations were entrusted to Messars. Grines and Sons, builders; and Mr. G. Luvkin, mason, Colchester. In altering the church the workmen discovered in the walls of the chancel a piscina, and Easter sequelare. piscina, and Easter sepulchre.

piscing, and Easter sepulchre. Newbury.—Plans for the improvement of Thatebam Church are ahont to he taken into consideration. Maidstone.—The foundation-stone of the new church of St. Philip, intended for the accommodation of the inhabitants of the Stone-street district, at Maidstone, was haid on Friday in hast week. The church is in the Transition style of the latter part of thirteenth century. The present contract extends only to the creation of a nave, 82 feet long by 32 feet wide, and a chancel. There are to he no galleries, and all the seats are to be open. The roof timwide, and a chancel. There are to he no galleries, and all the seats are to be open. The roof tim-hers are to be exposed. The porth (oa the north side) and bell-turret are to be of oak. The building has heen so arranged that transepts can be added at a future time, when the church will afford accommodation for 800: till then, it will give room for rather more than 500. Towards its erection, the Earl of Romers contributed the same of give room for rather more than 500. Towards its erection, the Earl of Rommey contributed the sum of 5002.—inclusive of the cost of the site, hesides a large quantity of huilding materials. The contract for the building has heen taken by Mr. Thompson, of Maidstone, who has stipulated to complete the work hy the 1st of November next.

Trainfork.—Some times since the memhers of the Independent Congregational Church in this town purchased a piece of ground situate in High-street, in order to erect thereon a new church. The edifice will be a Gothie structure, accommodating about 400 per-sons, and together with school-rooms and site will cost ahout 1,500%. The foundation-stome was to be hald on Wednesday of this week. Ramagate.—A chantry chapel has just been com-menced at St. Augustine's, Ramsgate. It is erected by Mr. Kenehm Digby, from designs by Mr. E. Welby Yugin. The exterior is hult of dint, with Whitby stone dressings. The interior is of Caen stone and alabaster, enriched with Galway, Derbyshire, and Purbeck markles. Craubrook .- Some time since the members of the

Purbeck marhles.

Purbeck marhles. *Chiseldon.*—At the picturesque village of Chisel-don, Wilk, the little church is about to he embel-lished with what is moreover a marked specimen of the parishioners' good taske and regard for propriety. The parish clerk, named Nash, having served about fifty years to the satisfaction of all and credit to him-solf, has gone to his last home. A stained glass window has been put ap to his memory.

solf has gone to his last home. A stained-glass window has been put up to his memory. Tunstall.—All the pews of the present church being rented, and the free seats being filled by school chil-dren, several of the leading families of Tunstall bave come forward to aid the incembent in his design of erecting a new ehurch, intended more particularly for the working classes. Mr. Edward Wood, of Porthill, has announced to the incumhent bis intention of priving 5002 towards the object in view.

an open-timbered roof, consisting of sixteen principals, with curved braces, &c. supporting an octagonal lan-tern, 17 feet 6 inches in diameter. The scats are arranged round the octagon amphitheatrewise, five tiers in depth, each tier rising 16 inches. The build-ing is in the Gothic style, and bas two three-light windows in front and back bay, the tracery of the latter being filled in with stained glass, representing the Dove descending. In this window the fracery is flowing Middle Pointed. There is a vestry, class-room, &c. attached to the chapel, the schools being detached. The contract for the chapel was 9957. ex-closive of the gas and heating, the latter of which is effected by steam. The builder was Mr. J. Peacock, and the architect Mr. W. Wigginton, of Dudly. *Kiddermater.*

and the architect Mr. W. Wigginton, of Dudley. <u>Kidderminster</u>.—The contracts for the erection of the new church at Kidderminster were signed on Thesday in last week, by Mr. Willon, the contractor. The church is Gothic, from the designs of Mr. Gilbert R. Blount, of London, and consists of newe, usiles, and chancel, with sacristics, tower, and spire. <u>Winterbourne</u>.—A new church, says the *Glouester Chronicle*, will be sbortly commenced in the parish of Winterbourne, between that village and Frenehay. A elergymau, a resident in the neighbourhood, is to pay the cost.

pay use cost. Chalford.—We are asked to say that the total cost of the works contemplated at Chalford Church is calculated at 7007. not 1,7007. as stated.

Clifton.—The necessary steps, preparatory to the commencement of the huilding of the tower of Christ to the ehurch, have been taking, and an appeal for public support in the work will shortly be put forth. A committee has been formed to carry out the uudertaking.

taking. Tatundon.—A competent person, says the *Exeter Gazette*, has undertaken to rebuild St. Mary's tower, Tauuton, for the sum of 0,500', ; and as 3,000', have been subscribed, it is proposed to ask the parisibiners to contribute 2,000', in ten annual rates of $2\frac{1}{2}d$. in dthe pound, and other means will be adopted for raising the other 1,000/.

the point, and other means will be adapted to this ag-the other 1,000?. Meethyr Tydfil.—On the 30th uit, the new chareb for the district of Cyfarthfa, Merthyr Tydfil, was con-secrated hy the Bishop of Landoff. The edifice is a cross church, of the Geometric Decorated period, and consists of a lofty nare, with clerestory, chancel, side aisles, transcrpt, chancel aisle, vestry, west and south porch. It is built of a species of purple rag stone, from the ueghbourhood, with Bath stone dressings. The vonsoirs of the arches are alternated with light blue Pennant sandstone, and the dark rag. A beffry at the west end is crowned by a spiracle. The west end is fit by a large rose window, of Geometric tracery. The arches of the nave are supported on Bith stone columns, alternately circular and colagonal, with carved capitals.. Bands of polished state are intro-duced in the columns with good effect. All the iu-

in connection with the district. Llastillo Crossenny.-The parish chorch of Llan-tillo Crossenny, siturted in a picturesque part of Mommouthshire, on the old road from Abergavenny to Mommouth, having become greatly dilapidated, a landowner, Colonel Clifford, M.P. for Hereford, has, at his sole expense, completely renovated it. The edifice was re-opened for divise service on Thursday in last week. The original type has been followed in such alterations as were requisite, as in the inser-tion of three new windows in the south aisle, and a new western doorway in place of mean modern oues. new western doorway in place of mean modern oues. The interior has had the stonework cleaned from whitewash, the modern ceiling removed, and the timwhitewash, the modern centry removed, are have and bers repaired and exposed to view. The nave and aisles have becure-seated with moveable open benches. The restoration has been effected by Mr. David The restoration has been effected by

come forward to aid the incambent in his design of erecting a new church, intended more particularly for the working classes. Mr. Edward Wood, of Porthill, has announced to the incamhent bis intention of giving 500. towards the object in view. Tapton.—The opening services of the Regent-street Taberoacle, Prince's-end, Tipton, closed on Tuesday in last week. The chapel has heen erected by the north, and a sonth porch. There is also Methodist New Connerion hody, and is calculated to seat 440, exclusive of 120 children, who are accom-modated in wings attached to the maiu building. The principal feature of the building is an octagon, having

Staffordshire tile. A hurial-ground, with houndarywall, and lich-gate next the road, are also to he pr vided. The cost of the whole will be about 1,6002.

vided. The cost of the whole will be about 1,6007. Bicton.—The chief stone of a parsonage-house for the chapery of Bicton was luid on Monday in last week. The design was furnished by Mr. E. Haycoek, Jun. and the contractors are Mr. H. Thomas, of Shrewshnry, and Mr. J. Evans, of Calleot. Col. Wingfield has contributed 1004 towards the work, and Mrs. Wingfield 504. Bordesley (Birmingham).—The Holy Trinity Chapel, Bordesley, has been decorated and reopened. The walls are white, the celling a hlue, that part over the altar heing ornamented with gold stars. The panels in front of the gallery are alternately oak and ultra-marine blue. Painted on the oak panels are white seroll bands relieved with blue, and on these are inscribed, in odd English letters, quotations from write seroit bacds rehered with blue, and on these are inscribed, in old Eaglish letters, quotations from Scripture. Following the curves of the upper win-dows are other bands, with passagos from Hofy Writ: these are bordered with foral designs in vermilliou, green, and hue. The reredos is covered with Gother organgent and symbolic characteristic mations characgreen, and fille. The follows is concerning to the observations of the second symbolic characters in various colours. The iron pillars supporting the gallerics are painted blue, and the gas stands, which are hrass, and similar in design to those at the Music Hall, are partly blue.

in design to toose at the Anter Fach at party ours The high, old-fashioned persons have not been removed and open sents substituted. The architest employed was Mr. Cranston. *Manchester*.—The Jews of Manchester have lately become divided into two socts, one holding to tradi-tion, who have just laid the corner-stone of another those provides are at the proof supergrame are at an employed. tion, who have just laid the corner-stone of another new synagogue, so that two new synagogues are at present in course of erection in this eity. The one now under notice is to be in York-street, Chechham-hill-road. The chief entrance will be at the west end, facing York-street, and will be approached by a flight of twelter steps, at the top of which will be a loggia, 24 feet wide by 12 feet deep. In the north and south fronts will be two other entrance-doors, leading to ther staircases to the gallerices, in addition to two others leading into the worship-hall, or, laterally, into ante-rooms, of which there will be two, supplied with lavatories, &e. The worship-hall will be 56 feet 6 inches wide, from north to south, and others leading into the work in the will be two, supplied with laratories, i.e. The worship-hall will be 56 (act 6 inches wild, from north to south, and 72 feel long from cast to west. It will be furnished with seats to accommodate 832 persons, besides ninety boys or pupils, there being also sixty free sittings. In the centre of the cast and will be a recess, formed by projecting plasters, to contain the ark, which will be covered with a curtain, in the usual manner. The galleries, which will be set apart for women, will contain 156 private and sixty four free sittings, besides accommodation for seventy girls. They will be creded over a Durie entablature of the Link will be creded over a Durie entablature of the Link will be creded with doors such the sitting of the set have the which will be a set apart for women, will contain 156 private and sixty.four free sittings, besides accommodation for seventy girls. They will be creded over a Durie entablature of the Coinhian order, supported on columns, and separating the eiling into three large divisios, the catter one of which will be raised about 5 feet above the others, so as to form a clerestory, which will be lighted hy eight stained.glass windows. The eeiling will he formed into panels, and in the centre of each of the four central panels will be placed a gas "sunlight" for lighting the hall, there being also single burners under to galerise. Undercach the hall will he a basement story, divided, hy moveable partitions, into a number of rooms, adapted for committee meetings or other purposes. The exterior of the synayogue will he of the talian style of architeture; the wost fraqade, froating York-street, being the most ornamental por-tor. The centre will consist of Corinthiau columns, forming the entrance to the loggia; and there will be wings enclosing the staircases with attacbed plasters, the whole supporting a Corinthiau columnst, forming the entrance to the loggia; and there will be wings enclosing the taircases with attacbed plasters, the whole suporting wings enclosing the startcases with attactory prosters, the whole supporting a Corinthian entablature. In the central part there will be a halastrade, but the two wings will be surmounted with domes. The whole of the front of the hulding will be constructed with polished stone; but the north and south sides will be faced with hricks, with stone dressings for the windows.

Lancaster .- A Roman Catholic church, or cathe Lancaster.—A holland value of the second sec church, which is to be dedicated to St. Feedy, was hald with much ceremony on Wednesday in last week. Mr. E. G. Paley, of Lancaster, is the architect of the church, the style of which is the Geometric. Its tower and spire will rise to a height of 240 feet, and the other portions of the huilding will he on an equal

scale. Burythorpe.—Subscriptions have been opened and responded to for the purpose of pulling down the present church of All Saints', Burythorpe, and build-ing a larger Early English structure on its site. The ehurch has become too small for the requirements of

the congregation, and is in a ruinous state. North Shields .- The consecration of that portion

of the North Shields hnrial-ground which is devoted of the North Shields bnrial-ground which is devoted to the Church of England took place on Saturday in last week. The new burial-ground is situated on the west side of Preston village, about 14 mile from North Shields. The quantity of land purchased by the hurial board was 33Å acres, but of that only about 28 acres are enclosed as a cemetery. The ground was laid out and levelled under the direction of Mr. Fen-wick the horsen. The wincipal enterpres haid out and levelled under the direction of Mr. Fen-wick, the borough surveyor. The principal entrance is in Hawkey's-lone, where stands the superintend-ent's honse. A gravel-path, 25 feet in width, run-ning due east and west, divides the ground into two equal parts; that on the right-band (the north side) being conserrated for the Church of England, and that on the south unconsecrated. The chaptel, lodges, and entrance-gates were designed by Mr. Johnstone, of Neweastle. The contractors for the chapels were Messars. Scott and Reed; for the lodges Mr. Foggin; for entrance-gates, Mr. Schooler; and for the boun-dary-walls, Messrs. J. and M. Rohson, of North Shields.

Shields. Neucoastle-upon-Tyne.—The consecration of that portion of the new cometery coostructed by the Burial Board of All Saints, which has been set apart for the Church of England, took place on Wetnesday before last. The connectory is in Jesmond-road; and is the first of four cometeries which the burial board of this town will ultimately open for public use. The whole purchase of land for the purposes of the All Saints' Cenetery consisted of 12 acres, situated nearly onposite the alward in the situated nearly whole purchase of land for the purposes of the All Saints' Cemetery consisted of 12 acrcs, situated nearly opposite to the already-existing Jesuond Cemetery. Of these, 10 acres bave been appropriated for burial-ground—five on each side; the other 2 acres being set apart as building sites. The castern side is ap-propriated to the Church of England. The ground has been nurchased at a cost of 5000 are some. has been purchased at a cost of 500%, per acre. The chapels and offices were designed by Mr. John Green, architect; and built hy Messrs. Gibson and Wilson. They are stone structures, iucluding, besides the checks are stone summaries, including, besides the Wo chapels, a superintendent's bouse, bolty, tool-house, and dead-house. The entire onthay for the new ceme-tery, including the cost of the land and amount of the contrasts, has been 10,068/.

SCOTTISH BUILDING NEWS.

SCOTTISH BUILDING NEWS. Edinburgh.—It was "overtured" hy the Free Synod of Angus and Mearus, at their last meeting, that the ensuing General Assembly of the Free Church of Scotland, at their next meeting, should adopt mea-sures for the creetion, as speedly as possible, of an Assembly-hall in Edinburgh, for the meetings of the Supreme Court of the Free Church. *Brechin.*—Mr.John Smith, of Andover, in America, halely contributed 1,500% towards the creetion and eudowmeet of schools in his native town, Brechin ; and has since announced that, in order to make the building ornamental as well as useful, he is to give

and has since announced that, in order to make the building ornamental as well as useful, he is to give other 2007, chirdly for a helfry and clock, and thut his brother, Mr. P. Smith, and his partner in busicess, Mr. John Dove, both also natives of Brechin, are to give 2007, each, to aid in the erection of a teacher's dwelling-house. The directors of the scheme intend to concert on the institution an industrial character.

dive 2007. each, to aid in the tetration of the scheme intend dwelling-house. The directors of the scheme intend i to engraft on the institution an industrial character, especially for heloof of girls. *Alloway*.—Funds were raised some time ago to build and endow a new church for the parish of Allo-way. Operations have just been commenced for the erection of the new building. The site is in a field opposite to the ioteresting ruin immortalized in "Tam •O'Shanter." The estimated cost is 1,750.

Berwick .-. The intention to erect a new church in is town has been announced (since his defeat) by Captaio C. W. Gordon, the unsuccessful candidate at the late election at Berwick. A site is now being sought out for the building.

PROCEEDINGS UNDER THE METRO-POLITAN BUILDING ACT.

Builder fined for not giving Notice .- Party-walls. At the Clerkenwell Police-court, on the 30th ult. Mr. Onthush, a builder, was summoned by the district surveyor of South Islington for having commenced an addition and other work at the back of No. 45, Mildmay-street, without previously giving two days' notice: he was also summond for irregular work. In the former case, the builder quoted in defence sec. 44, which provides that, in cases of "emergency," work may be done, provided that before the expiration of twenty-four hours, notice be given to the district sur-veyor; and he said that he had given the notice within that time. The "emergency" was, that baving let the house, had he not done the work he might have lost a tenant. The district surveyor maintained that AT the Clerkenwell Police-court, on the 30th ult. the house, had he not done the work he might have lost a tenant. The district surveyor maintained that the word "emergency" in the Act provided only for a pressing necessity or ease of danger; in which the magistrate, Mr. Tyrwhitt, agreed. Moreover, it was shown by the builder's own witnesses that the notice was not given within twenty-four hours after com-mencement. The magistrate fined the builder 40s.

but, with the concurrence of the surveyor, the sum

In the second case the irregularities complained of the state of the second case the irregularities complained of the the existing wall of the washness of Io the second case the rregularities complaned of were, that the existing wall of the washhouse of No. 46 had been made use of as a party-wall, wherein the chinney-back and a part left for a copper-flue were only 44 inches thick instead of 9 inches. Fur-ther, part of the enclosure of addition at the hack was formed of weather-boarding, and part of 43-inch work. The district surveyor stated that the first summons would not have been taken out bad the irregularities have notified. He further acid how irregularitics been rectified. He further said, how-ever, that works were done to such an extent in his district wholes where using given to him, that he was unable to see the requirements of the Act carried out. The builder was ordered to amend within four-teen days from the 30th of April, paying the costs of summonses

Much time was spent in making the points clear to the magistrate, who went into both eases with great patience, and pointed out how much better it would be were such matters referred to a professional tribunal.

Books Receibed.

How to Farm Profitably, particularly on stiff, heavy Clays. By Mr. SHERIFF MECHI. Longman and Clays. Co. London.

Co. London. As a coadjutor in the rather tardy settlement of the somewhat vexed question, — What are we to do with our town sewage; and as a general and agricultural "benefactor," who can make many "blades" grow where only "oue grew before," Mr. Sheriff Mechi merits the loan of the public car, while teaching the farming portion of that public bow to multiply ears of another order. In this pamphlet it is Mr. Mechi's purpose to disabuse the public mind of the notion that his farming is merely an expensive bobby, and that it is not for substantial peculiary profit, as well as for practical example, that he works. The fact is, as one assure this resolute that for several works he has as for practical example, that he works. The fact is, as he assures his readers, that for several years he has he assures his reaucts, that to several years to mas hear deriving a most gravityiog return for his expen-diture, a return of a very enduring and continuous ehoracter; hat the world does not helieve it, only giving bin credit and thanks for kindly losing money by his experiments to oblige the country. The agri-entitural and other classes ought to be grateful to Mr. Mechi for something else than this, even though his endeavour to show how the country could grow all the source of the saw new the country count grow all its own supplies of corn and meat were not so suc-cessful as it sceme to be. If ever there he such a grand development of agricultural manufactures as there has been of those of cotton and other fahries in this country, it must be by some such means as those Mr. Mechi is adopting; and we cannot but regard him as one of the most advanced and enlightened of the pioneers who are cutting out a clear and open way to this most desirable cud.

Way to this most destraine each of the paraphlet under notice are the incellention of the principle that, without drainage and manuring, little hesides the old jog-trot rate of reproduction can ever be done in farming operations; eternal ploughing, harrowing, and digging heing of little use without these grand stimulants; and, above all, that, in agricultural, as in other matters, a capital all, that, in agricultural, as in other matters, a capital must be invested before an interest of profit worth speaking of can be got; that, in fact, the real test of comony in farming is the cost-price per quarter, per ton, or per B, of the farm produce. When the Builder was younger than it now is, and when we had not beard so much about agricultural science as has not been so much about agreent way source as we have since done, we urged the very same prin-ciple in nearly the same way,—ever insisting that agriculturists should not consider the amount of the sum spent, so much as the amount realized.

VARIORUM.

Amongst educational books received, is one by Mr. Amongse culturational robots received, is one by Mr. J. Blain, late vice-principal of the Winchester Train-ing School (Longman and Co. publishers), titled, "The Rationale of Arithmetical Teaching Exempli-fied in a full Exposition of the Principles of Numeraheat in a thir Exposition of the Principles of Numera-tion, and the Four Elementary Rules; with Remarks on Teaching Arithmetic." We quite agree with Mr. Blatn, that children in general are made to hegin slate arithmetic too soon; and any treatise desigoed to obviate this evil merits a trial, as this little treatise

Miscellanea.

PRESERVATION OF PLANTS AND LEAVES .- In answer to your correspondent, who inquires the hest answer to your correspondent, who inquires the toxi mode of preserving plants, so as to retain their colour and form, I may state, that the plan I have followed for several years is that given in Withering's "Botany," page 39. I should, however, observe, that in some plants I have been unable to retain the that in some plants I have been unable to remain the colour perfectly for any great length of time. H. W. P. I.

MANAGEMENT OF LANDED PROPERTY .--- A course MANAGEMENT OF LANDED PROPERTY.—A course of sixteen lectures, on "A Agriculture and the Manage-ment of Landed Property," is to be delivered at King's College, by Mr. J. Lockhart Morton, as a justification of himself for dealing with such an im-portant and comprehensive subject. In his first lec-ture on the 27th ult. Mr. Morton stated that for ture on the 27th ult. Mr. Morton stated that for twelve years he had been engaged in the management and improvement of landed property. During that period he had heen occupied, not only in studying agricultural theories, but there was no system of manual labour pursued on a farm in which he had not taken a part. He mentioned this to show that he taken a part. He mentioned this to show that he was not a mere essayist, but a practical man. Mr. Morton then proceeded to show the necessity for landed proprietors having in their service daly-qualified agents. An agent might be a chemist, a geologist, or a practical farmer. Chemistry, geology, and practical experience in farming were severally desirable; but would a knowledge of either of them be sufficient to qualify a man to be the agent of an estate? The lecturer thought it necessary that theory and practice should be combined, and that, in the choice of an agent, practical knowledge was indiaof an agent, practical knowledge was indischoice pensable. THE IRON AND COPPER TRADES. --- In the iron

THE IRON AND COPPER TRADES. --- In the tron trade sales have taken place, of late, at prices 10s, per ton below those which prevailed at the time of the quarterly meetings. Copper has also fallen to the extent of a penny per pound. On the announcement being made at Birmingham, a meeting of the metal rollers was held, at which corresponding reductions were acreade upon in the prices of lyage wire and rollers was held, at which corresponding reductions were agreed upon in the prices of brass wire and tabing, and the following is now stated by the *Bir-mingham Journal* to he the general scale of prices :-*Manufactured* copper, 1s. 2d. per 1b.; best scleeted, 129/. per ton; tough eake, 126/.; yellow metal sheatbing, 1s. 0/4. per 1b. The reduction on brass wire is one-half penny per 1b.; rolle metal and hrass tubes, three farthings; copper wire and copper tubes, 1d. per 1b. Tollowing this, the brassfounders have issued circulars aanouncing an advance in their dis-1d. per Ib. Following this, the brassfounders have issued circulars announcing an advance in their dis-counts of 5 per cent. (2½ nett); and apart from the direct, the ludirect effect upon a great variety of trades will be such that it will not only be a very sensouable relief, but tend to stimulate trade gene-rally, at a time when something of the kind was waiting to give it an impetus towards healthy action.

SALE OF THE PANOPTICON, LEICESTER-SQUARE.-

Than, misorical painter of values, in states, has use covered that slate is superior to wood for engravings. It is easily worked, he alleges, reproduces the finest lines with remarkable exactness, and resists longer that would be action of the typographical press, so that several thousand copies of a design can he struck off without producing any sensible difference in the quality of the impression.

quality of the impression. IREMURENTION OF ARCHITECTS. — I notice in your paper of last week the observations made by Mr. Godwin with reference to the remuneration of arcbitects, and 1 highly approve of all that was said upon the subject. It becomes more necessary every day to uphold the bonour of the profession, sec-ing, as we do, that there are members who do all they can to degrade it, hy so readily responding to the calls of committees, corporations, and other persons who insult the profession hy asking architects to devote their time, mind, skill, and scientific know-ledge for an insignificant reward, barely congh to pay for the paper. Whether or not these hodies are ultimately benefited, is beyond the question : he that as it may, so long as there are architects who will condescent to enter into an expensive competition for a paltry considerations, and conservice on alter-take advantage of their folly. I see by an advertise-ment that architects, huilders, and others are invited so end designs, specifications, and estimates for alter-ations and repairs to be done for the corporation of the rower to be a rower to be a researd. It having there the rower to be a researd. REMUNEBATION OF ABCHITECTS. - I notice in ations and repairs to be done for the corporation of Hertford, the reward to he *Ten pounds*, it heing understood that the *successful* architect is not to calendate upon being employed; and by the particulars issued, if he he, he is to work mnder the superintend-ence and to the satisfaction of the *borough surveyor*. If, however, he is not to carry out his plans, which If, however, he is not to carry out his plans, which may have cost him 202, he must be content to sacri-fee the difference. Now, I would take the liberty of suggesting to the very liberal corporation of Hertford that they would only act properly by at once desiring their borongh surveyor to prepare place for the altera-tions, and not seek to rolt the profession of their hrains for nothing. If, however, they have not suf-ficient confidence in their own man, let them employ some one in whose scientific attaiuments they can depend.-I am, I hope,-AN honourable MEMBER OF THE PROFESSION.

YORK SCHOOL OF ART.—The annual meeting of this school was held last week. Mr. J. P. Brown West-head. M.P. presided. The report stated that the this school was held last week. Mr. J. P. Brown West-head, M.P. presided. The report stated that the number of students who had paid fees in the school during the past year had been on an average 103, who had paid the school fees (independent of 216 free students during four months in the year), while the average of the previous year was 96. The free classes for working men have resulted in the perma-nent stahlishmeut of a class for mechanical drawing, which was considered to be the kind of drawing per-tionlarly suited to the needs of working men, and and which was considered to the needs of working men, and ticularly suited to the needs of working men, and which has proved to be one of the most flourishing classes in the school. The halance sheet showed a valance sgainst the institution of about 400, and the chair-man announced himself a donor of 100. in liquidation of the debt. He also promised to hecome an annual subscriber, and offered to pay the cost of sending some of the pupils to visit the Manchester Art Trea-sures Exhibition. Mr. Swallow, the master of the school, read a statement to the meeting, giving some account of improvements he had effected, with the approval of the committe. METROPOLITAN TOLL REPORT.—A joint com-mittee of owners of public and private carriages was held on Wednesday in last week, at the Craven Hotel, Mr. H. Ingram, M.P. in the chair. In open-ing the proceedings, the clairman combated the many objections that have been raised to the abolition of toll-bars, which he viewed as muisances of so grave a character, that he considered the meeting perfectly classes in the school. The halance-sheet showed a balance

coll-cars, which he viewed as musances of so grave a character, that he considered the meeting perfectly justified in calling on the general public to assist them in their object. Mr. J. E. Braditeld gave a rapid outline of the agitation from the time it was first mooted in 1825 to the present date, and showed that the Metropolitan Roads Commission, instead of keeping to their promise of reduning turnulles within keeping to their promise of reducing turnpikes within ten miles of London, had increased them. Of 123 ten miles of London, had increased them. Of 123 miles of road in and round London, 112 were tolled, and eleven toll free; and while the repairs of the 112 miles cost about 35,000. or about 3400, per nile, the repairs of the eleven miles cost about 15,000. or about 1,400. per mile, and these roads, which were in the eacher of London, were paid by the people in the saburts. Appropriate resolutions were unani-mously passed in favour of the abolition of metro-politan tolls, and of an appeal to the public for funds. GAS.—The Uttoxeter Gas Comnany held its snunal

GAS .- The Uttoxeter Gas Company held its annual

THE CAMP AT ADDERSION. -- Infer nave been fresh fires here and more damage done. The fears we expressed, after visiting the camp long ago, and the caution we gave, have been instified at some con-siderable expense to the country ! INVERPOOL ARCHITECTURAL SOCIET. -- The fif-hearth fouridate meeting of the session was held on

LIVERTOD. ABCHITECTURAL SOCIETT. — The fif-teenth fortnightly meeting of the session was held on Wednesday in last week, Mr. 8. Horgeins, president, in the chair. Mr. Horner directed attention to draw-ings of three designs given in hy Mr. Macbryde for the Londouderry Monument, to be erected at New-tonards. He also requested attention to a drawing by the same artist, of the Liverpool Wellington Monu-ward. This latter had here created at New-in by the same artist, of the inverpoor of earling of a bonw, ment. This latter had heen executed to show, in some drgree, st least, the impolicy of combining a pillar with a statue in a monumental structure.—Mr., Verelst then proceeded to read an "Olla Politida, on the various subjects of the curse of cheapness, public learning of streets in the various subjects of the curse of cheapness, punc-monuments, the naming and numbering of streets in large towns, professional practice, cements, comparison of English and Koreign cathedrals, and composition." —The uest paper read was "On the Timber Trade of Liverpool," by Mr. A. Rimmer.

THE CLEARED SPACE AT ST. PAUL'S CHURCH-TARD.—A deputation from the Royal Institute of Architects was to have an interview, on Friday, 8th inst, with the Matropolitan Board of Works, respecting the preservation for the public use and enjoyment of the area recently eleared at the south-castern angle of St. Paul's Churchyard. The Improvement Com-mittee of the City Corporation were also to send a deputation to the Board on the same day, on the same subject.

deputation to the Board on the same day, on the same subject. EXGINEEE FOR PRESTON WATERWORKS. — The Town Council of Preston, as the Local Board of Health, have appointed Messrs. Fark, Son, and Gar-lick engineers to carry out their waterworks. The appointment was made unanimously. "It has heen knowa for some moulls back," says a local paper, "that they were to have the work; yet the Council advertised in Preston, London, Iáverpool, and Man-chester papers for an engineer, induced many persons to make application for the office; and then the com-mittee, without condescending to open the testimonials of the applications, recommended that our townsmen should be appointed. When the advertisements were first proposed to be issued, it was objected that such a course was unnecessary, as it was then known what the result would be; yet the announcements were issued, just to give the appearance of having sub-mitted the office to competition. We think such a course searcely fair,—holding out hopes which there was no interio to realize."

LEICESTERSHIRE ARCHITECTURAL AND ARCHLEOLO-GICAL SOCIETY. - A general meeting of this society was held on the 27th ultimo. Mr. T. Nevinson exhiwas held on the 27th uitmo. Mr. 1. Nermison can-bited a rubhing of the well-known brass of Abbot de la Mare, from St. Alban's Abbey. Mr. Thompsou read a short paper on the "Cbapel of Wyggsston's Hospital," with a view of callug attention to the building, which is threatened with destruction. At the committee meeting afterwards held, it was de-

the committee meeting alterwards near it was use-cided that the usual annual meeting and excursion of the society should take place at Asbby-de-la-Zouch, on the 5th and 6th of August. The ENGLISH CHURCH IN SWITZERLAND.—An attempt is being made to build a new Britisb chaple at Berne. The sum of 1,500/ is required for the purpose. An account for the "Fund for the pro-purpose.

purpose. An account for the " rund for the pro-posed chapt at Burce," has been opened, we hear, at Coutts's, where subscriptions can be paid. BATH FINE ARTS SOCIETY.—The fourth and last meeting of this society for the season has just been held, with the usual full attendance of visitors, and with more than the usual supply of works of art. The whole suite of Assembly Rooms is now not nore than sufficient for the purposes of the meetings. MCDOUGATL'S DISINFERTART POWDER cossists of subsite of memoria for better still of marcesian

The Builder.

Vol. XV.-No. 745.

ROWDS continue to visit Westminster-hall, to inspect the competition designs for the proposed Government Offices in Parliament-street, and the plans for taken for them, and the greatest excitement prevails amongst the competitors. The tribunal consists of the Dukc of Buecleuch, Earl roofs. Stanhope, Lord Eversley (the late Fellow of the Institute of Architects,

a mansion immediately adjoining the site to he German school ; indeed, the building, externally treated, about to be enlarged or rebuilt, and that at least, is an adaptation from well-known works Mr. Burn is his architect, may lead some to on the continent. assert, by and by, that predilection for certain are surmounted by peristyles; and a larger as weighed in the decision. All the judges, placed on the middle of each of these portions however, are understood to be men of the of the huilding. The entablature is surmounted highest integrity, and if they fail in making a by a range of ornament, formed chiefly of correct selection, it will not be through want of will to do what is right. The task is one of great responsibility, and, properly performed, will involve immense labour. Let us hope that character. The author contributes a block the judges are prepared to give that patient attention to the matter which it demands.

When we talk of the difficulty of the task, we speak from personal knowledge : none can judge of it but those who have made the attempt to master the various propositions set forth with pen and pencil by the various competitors. The intimation in our pages last week, that we should be glad to receive copies of any reports sent in with the designs, has brought upon us an overwhelming pile of papers, to say nothing of the correspondence on the subject, a small selection plan would provide some of the hest possible from which will be found in our present number. The reports will be looked at as they are nceded.

We alluded in a previous article to the fact that the authorship of a large number of the designs was perfectly well known : since then, the anonymous has been for the most part abandoned; competitors of any position felt that they were disadvantaged by remaining unknown, while the works of contemporaries were mentioned with the names of their authors; and the result is that throughout the Hall reserve has disappeared, and the anthorship of nearly every design of note is known and publicly recognized. Thus to name half a dozen noticeable designs to which we shall not arrive in the course of the present article,--No. 69 is given to Mr. Kuowles, 76 to Mr. Lamh, 77 to Mr. Garling, 99 to Mr. E. M. Barry, 112 to Mr. Rohert Kerr, 116 to Mr. Scott, 144 to Mr. Cockerell, and so on.

Omitting for the present any general ohservations, we now proceed to notice some of the various designs; but before doing so, we would appeal earnestly to the Government on hehalf

THE BUILDER.

hope, too, that the Exhibition will remain open with a portion of the buildings. The suggested longer than was first intended.

"Bramante," contributes a street plan, a block plan of the Offices, and a design for the Foreignoffice. He retains the present site of Westminster-bridge, adopts the site of the Horseferry, and widens Hungerford-bridge. He is one of those who boldly appropriate the site of Rich-mond-terrace. Thus he is able to get two similar blocks of buildings at opposite sides of Foreign-office and War-office on one side, and the new street — which takes the place of to the Privy Council and other offices on the Parliament-street in nearly all the designs. He improving the ucighbourhood also proposes to remove Dover House and the tailed into apartments, in the "block plan," generally. The judges have been Horse guards, and to construct, about the The style is a plain version of the now prevalent appointed, offices have been middle of Whitchall, a place, oblong or oval in revival of the French "Renaissance." plan, opposite the Banquetting-house. The style of architecture which he adopts is that of Bramante, with the addition of high curved

No. 7, "Roma," is a design for the War-office speaker), Mr. Stirling, M.P. Mr. and Foreign-office, which, as in most of the de-David Roberts, R.A. Mr. Burn, signs, are joined in one building. The plan exsigns, are joined in one building. The plan exhibits large inner halls, lighted from above, with and Mr. I. K. Brunel, member of the Institution of Civil Engineers. Apartments. In decorative character the design The fact that the Duke of Buceleuch possesses may be called Greco-Italian of the modern Square masses at the angles griffins or chimera.---No. 9, with the motto The Ides of March are come," appears to be a veritable German design, but of a different plan, in which he retains the site of Westminster-bridge, and a design for the War-office aud Foreign-office, in which the Gothic style, or what may be called a poor German version of it, is chosen. Groined ceilings are introduced throughout the rooms.

No. 12, marked A C, includes a general street plan, a block plan, and longitudinal section through the Offices, and complete sets of draw ings for the War-office and Foreign-office. The author appears to be a Frenchman The general arrangements for street communication conjoined with architectural effect; but displays an amount of disregard for existing lines of thoroughfare, such as no English competitor would have dared to venture upon,--the Strand and Cockspur-street being, we think, almost the only routes that are unaltered. With reference to the short time allowed for the designs, it may be well to refer to what this competitor says of his own case. If creceived the pro-gramme on the 25th of November, 1856; then spent six weeks in various studies; passed a fortnight in London, and had but six weeks left to finish his design in the midst of other engagements. His general arrangement (disregarding the present Board of Trade, which he preserves, like most of the competitors) is as seven blocks of building, symmetrically arranged, or on what the professors call a good "aeademic" plan, around a "Place du Gouvernement," crossed by the Whitehall extension, or new Parliamentstreet. On the major axis of the plan, so to speak, or dividing equally the castern portion of the ground, is the line of a street joining the of the large body of architectural assistants, place with a new site for Westminster-bridge. end of the National Gallery. The general di-and of the working classes generally, and ask. The latter forms the datum for the whole dis- vision of the offices is into seven large and other and of the whole allowed to remain open tribution. That datum, however, may be a smaller blocks; and we may here again observe till dusk, instead of closing as now at six o'clock. false one,—for; it appears to he chosen under the as to the majority of cases, that—first by There are hundreds who cannot hy any means reach Westminster-hall until after six o'clock, tated to the competitors. The mistake leads the wards by the dictation practically made by the who are yet most anxious to see the designs, author to the conclusion that Great George-street irregular site-absence of variety and sng-We have received many pressing letters on the would be unaccessary, and, therefore, to obtain gestion, and want of the desired concentra-subject, and would strongly urge that the re- absolute symmetry of plan, he has one proposed tion in the offices, are far too greatly cha-quest should be granted. We again express a arrangement covering the site of that street

site for the bridge, also, as in all the plans The author of the design No. 6, marked where a similar position is shown, has the effect of increasing the inconvenience of the traffie which it was one object to divert from the Offices, a point which will be found treated of in our articles of Dec. 13, 1856, and other dates. The Treasury, with an official residence in a semicircular projection, occupies the chief position, and is joined by covered ways to the other. The several buildings are shown de-tailed into apartments, in the "block plan." The general street plan, we may say, as much as the English plans, recognizes our plea for the provision of three carriage routes. It provides the Horseferry-bridge, and one with approaches from Charing-eross, but removes Northumherland House for one of those approaches. Indeed, there are six ways radiating from the tete du pont of the Charing-cross bridge, in this design, -viz. two, right and left, on the embankment; one north, cutting through the Adelphi, or thereabouts ; the ouc across the site of Northumberland House; one to the Horse-gnards; and one to Parliament-street, opposite the angle of the War-office.

A contrast to the character of the last-named design is afforded by the next work to it,. No. 14, with the motto, " Non omuia omnibus congruunt," which seems to be the work of a German architect. It is a design for the Foreign-office, and has arch-headed windows, with mullions and Gothic tracery, panelling to the masoury, and shafts to the angles. — The author of No. 16, "Light, Air, and Convenience," has a general plan, and designs for the Foreign office and War-office, in two-similar blocks, with road and archway between. He proposes, in addition to other bridges, one near to the Houses of Parliament, south ; but the most curious feature of the plan is the proposal to fill up the middle of the Thames, and form a garden, confining the water-way to two canals, one on each side. As plenty of "stuff" would be wanted for filling in, an observer suggests that the looked-for comet might be laid down : that, however, would set the Thames on fire. On the sheet of the general plan referred to, the author has written the words,-"" Pure air aud exercise versus dirty water."-The author of No. 17, with a monogram of the letters, Z and B, has some capital drawings to a good Italian design, with superimposed orders. Tis designs generally include a street-plan, a block plan, and a design for the Forcign-office. He preserves the present site of Westminsterbridge, and provides another bridge with two approaches from Charing-cross,-but appears to contemplate the removal of Hungerford-bridge, a suggestion which it thus appears is not peculiar to the plan mentioned in our last. No bridge, is shown at the Horseferry. Amongst his other improvements are the opening a way from the Strand to the Mall in the Park (as shown in many of the plans), the enlargement of the National Gallery, which most of the competitors apprehend rightly, should remain on the present site ; the crection of a building for the Royal Academy south of Trafalgar-square, near the Park entrance; and a road north to Oxford street from the west side of Trafalgar-square, past the

the Foreign-office is arranged with two iuthe Foreign-office is arranged with two un-ternal courts and corridors; but some of the latter are defective as to light, a disadvantage which also is found, to a great extent, in of the designs generally. The orders here, three in number, are of engaged columns and pilas-ters; and large arch-headed windows to the first floor, the Vignola cantilever cornice, and a balustrade with tall pinnacle-like terminations to the nedestals, are amongst the other features. to the pedestals, are amongs the other features. The principal front has a projecting centre, and in other parts narrow divisions breaking out; in other parts narrow divisions breaking out; and has an arcaded carriage porch. No. 18, "Veniumt et Specteutur," again like other de-signs for the two offices, has them in one, with a carriage-way through. The War-office has a great central court, roofed over with iron and glass, and having galleries round; but in the Foreign-office, corridors are provided. Here, again, there is a deficiency of light. Super-imposed orders and arcades form the decorative features. features

The names of the competitors so far in our The names of the competitors so far in our list, do not appear to be generally known. But in most other cases the authorship of the designs is either apparent on the face of the drawings, or, as we have already said, is generally spoken of in the Hall. There can be no advantage, of in the half. There can be no advantage, therefore, in our omitting names in this place. Indeed, it must not be forgotten, carrying out what we have said as to advantage from an exhibition, that the henefit does not accrue

mider the system of motioes. The excellent designs munhered 20, and marked "Corona," have strong points of resem-blance to the town-hall at Leeds. Their merit blance to the town-hall at Leeds. Their ment is both in the plan, and the decorative treat-ment. The drawings consist of a block plan, sketches of all the buildings proposed, and com-plete drawings for the War-office and Foreign-office. The author appears to preserve the present site of Westminster-bridge, but extends his plan over the site of Richmond-torrace. We should also observe that the parade at the Horso-markie is hown enclosed on a swmetrical plan Base observe that the parade up observe the root and guards is shown enclosed, on a symmetrical plan. He groups the offices mainly in three sym-metrical blocks. One of these, which may be described as in the form of the letter I with the addition of a semicircular piece at the top, is appropriated to the War-office and the Foreignappropriated to the War-office and the Foreign-office. These form one design externally, though there is a separation on plan, by reason of the nsual carriage-way across. The grand principle of distribution in the plan of each office, consists in the arrangement of the rooms round large inner halls, lighted from the top, with the three stories of rooms next the hall, set in,—each of the npper stories, 10 feet from the one helow it, —leaving room for the corridors or calleries on Leaving room for the corridors or galleries, on recessed stages. Thus, freedom of communica-tion and good light, it is supposed, would he provided hetter than in the ordinary arrangement, and with a more economical use of the ground. The author shows that in the section ground. The author shows that in the section of a building 130 feet across, by the snggested arrangement, a width of 30 feet would suffice on the ground level, for the area, or the dis-tance between the opposite sides, and the whole of each remaining 50 feet could he appro-priated to large rooms; whilst on the old prin-ciple, even with a total width of 140 feet, as 40 feet would he required for the area or court, both in the ground story and for the whole height, and 10 feet would have to he taken from each 50 feet in the middle of that distance for corri-dors, there would he both more ground taken ground. dors, there would he both more ground taken up, and less accommodation provided; or to get up, any ress accommodation provided of to get the same accommodation on the ground story, with required area, the whole dimension would have to be made 160 feet. In other words, as be says, the arrangement with 140 feet requires one thirtseeth, wave with be one-thirteeuth more width of ground; and that with 160 feet provides the desired accommodation, with an excess of ground over the chosen arrangement, of three-thirteenths. The deco-The deco-

enclosed by a balnstraded area, with tall candelabra on the piers. The other Government offices are shown treated in the same style. The defect of the design is one arising from the The defect of the design is one arising from the provision of two stories in the same height of columns: windows being introduced in such positions as involve disadvantages in the use of porticoes and likewise a certain detraction from the appearance of a portico itself. This point, as to the portico as a feature in a design, is one which we have heretofver treated of. The style, however, is selected on the plea that it em-phatically is one permanently exhibiting monn-mental character : whilst, other opinions of it mental character; whilst, other opinions of it we have heard expressed, to the effect that it does not exhibit the ellipse of the total to the total of the second sec

is a design for the Foreign-office and the Waris a design for the Foreign-bance and the Wal-office in one block, and is the work of a foreigner. The plan has a semi-circular projec-tion to the north, which is objectionable as shown, by requiring a similar eurve in the line of the street. The style is the Greco-Italian mentional in Generator. of the street. The style is the created taking practised in Germany. In the present design, many of the details are novel to English eyes, and perhaps suggestive; but good proportions are little regarded—some mouldings being enor-mous in size; and in grouping there is a want of relation between the centre and the wings. To the first floor there are square openings, each filled in with four columns with regular entablature returned at the ends, forming a loggia before the actual window. Some of the other windows have dressings diminishing upother windows have dressings diminishing up-wards. A range of statues without pedestals is placed along the cornice. There are several examples in the exhibition, of this German school of taste : invention is exhibited in them, or in their originals—the buildings of Schinkel, Klenze, and others—and much could he learned from them ; hut they should be looked at with discrimination. We have some difficulty in following the

We have some difficulty in following the order of the numbers, so disordered is the rota-tion in the hanging; hat we come to No. 21, "Confide Couquieseo," a design in the old style of builders' architecture, which is one of a lot in the collection, such as acquire a sort of enrions and historic interest from the growth of good art of which there is so much evidence in the works around them. Of the elass referred to is No. 22, with the motto "Only I," the ornament of which might have been designed hy a writing-master, or professor of penmanship, rather than au architect; also No. 24, "Baphca," in which the general plan (where the site of Westminster-bridge is retained) has had the chief attention, and where the Waroffice and Foreigu-office are in a version of Gothic; and No. 28, "Lahor Omnia Vincit," where Toronguonice are in a vision of both of and No. 28, "Lahor Orania Vineit," where there are as many as twenty-four drawings carefully mounted, but exhibiting corridors unillumined, and orders and window-dress-ings of the worst character and proportions. No. 29, "Gireum Tecta," a design for the War-office, seems to be on the model of Soane's Board of Trade, with the addition of a portice and eupola; whilst No. 31, "In spe laboro," copies the style of Gibbs, having two stories treated with major and minor orders. One thing is demonstrated by the present ex-hibition, alike by the good and the bad of the designs, uamely, the impolicy of ever going back and attempting merely reproduction of models. No. 26, "Nothing like trying," a design for the War-office, neatly lined in in brown ink, might be noticed for the peculiarity of its treatment, the style heing like the Floren-tine castellated, and the entrance being at the tine castellated, and the entrance being at the angle, through an arcaded porch, somewhat Byzantine in character, hetween massive towers. But No. 25, "All's well that ends well," a design for the War-office, shown in a neally-ontlined set of drawings, which might pass for he work, of a foreigner, deserves more attenarrangement, of three-thirteenths. The deco-rative character of the design is that of the Roman style: the Coritichiu order, with elab-rate enrichments being used. The portices are recessed and without pediments, and the attices are broken to form masses at the angles and intermediate points, for the support of sculp-tured trophics. The War-office has three por-tices at the end, with a graud fight of stops in the middle; whilst at the Foreign-office end, the residence is in the semi-circular projection,

[MAY 16, 1857.

Each of these portions has three main divisions Each of these portions has three main divisions or bays, marked by plasters, piers, and vermi-culated rusticated masonry, varied in design. The centre hay is deeply weeks and arched over at the top, with sculpture in the *tympanum*; and an open loggia or porch is introduced in the ground story, to the entrance. The top story derives its chief character from a small order of columns and ultasters. The stele is order of columus and pilasters. The style is the later or highly-enriched Florentine, but with traces of the study of modern works on the Continent. The window-dressings are earefully studied. The other elevations are differently treated, but are equal in merit to the one we have noticed.

No. 32—" Laboro et oro," exhibits a block-plan, and a design for the Foreign-office and the War-office, together. The design is Gothic, with pointed arched and traceride block is could, while poince at each of a stepped gables, which have, what appears, the detect of not according with any breaks in the front.——The author of No. 34—"Au hond droit," shows a street-plan, a general block-plan, and a design for the Foreign-office and War-office, in one, or with only arch wars and a certifice-drive. or with only arch-ways and a carriage drive, as the separation. He retains the site of Westminster-hridge, and places a bridge at the Horseferry, and one at Charing-cross. One of the approaches to the latter appears to require the removal of Northumherlaud House, a mea-sure which would be nnneeded by the plan sure which would be nnneeded by the plan referred to in our article of December 13, and shown in many of the designs. We even think the removal has not obvious remove St. Margaret's Church, a proposition which, though it has the advocacy of Sir Charles Barry, is, we apprehend, oue that it is not desirable to act upon. Several of the com-petitors, however, propose this alteration. The plau of the War-office in No. 34, shows the roangle, whilst the Foreign-office has a central rangle; whilst the Foreign-office has a central hall, 84 feet 6 inches hy 78 feet, covered over, nall, 54 feet 6 inches by 78 feet, covered over, and with stairs leading up from it. The resi-dence is next Charles-street, and it has a din-ing-room, 59 feet by 25 feet, and other apart-ments. The style of architecture is the French palatial. There are three stories; the two upper ones having could column and beck npper ones having conpled columns and broken entablatures, arch-headed windows, and trun-eated, or high Mansard roofs, curved as to the centre pavilion, with dormers and sculpture. The doorway wants prominence. The Foreign-office has nearly similar features, with a campanile of superimposed orders, inclosing a staircase, at the north-west angle. The draw-ings have great resemblance to some, unnhered 54, attrihuted to the Messrs. Habershon, which have the same motto.

No. 35, with the motio, "Thou hast covered my head in the day of battle," is a Gothic design for the War-office and Foreign-office, joined ; and hoth from the evidence which is on Joined; and both from the evidence which is on the face of it, and from report, owes much to Mr. Ruskin. Mr. Woodward aloue, or in con-junction with Sir Thomas Deane, has, bowever, some of the credit of the architecture. As in some of the ereal of the areinecture. As in the majority of designs, there is an archway in each of the opposite sides for a carriage-way through. The War-office portion in three stories and an elevated basement, forms three sides of an internal quadrangle. The entrances aud principal stairs are in the centre of the por-tion of the plan on the Parliament-street side; there are open conrts at the angles, and internal corridors, which, perhaps, are rather deficient in light, along the other sides. The Foreign-office with residence form au oblong hlock, with internal courts, and a staircase in the centre. It has three stories, and a *mezzanize* in one part, in addition. Windows, with pointed arches, and shafts coupled in the thickness of arches, and shafts coupled in the thickness of the wall; a range of windows, circular or multi-foil, in the basement of the War-office; and of square form, with shafts, in the corresponding position of the Foreign-office; stairs at the augles, which are marked externally by stepped openings, and raking lines in the fronts; high truncated roofs to square portions of the later dervers a recessed parch, the alternate

relief—on piers and spandrils—are the promi-office and War-office bas a great central court, nent characteristics of this design. Much of surrounded hy colonnades, or porticees, having the ornament is of great beanty, and displays three ranks of columns along two of the sides remarkable fertility of invention. It consists which give access to the corridors of the Offices, either wholly of figure subjects in a series, or Three are also two other open courts in each detached or of figures and foliated gramework Office. As to extend character the design either wholly of ngure sungers in a concentration of detached, or of figures and foliated ornament intermingled. One elaborate subject fills the *tympanum*, or space between the pointed tympanum, or space between the arch and a sub-arch, segmental in form, which is over the entrance to the quadrangle. In the façades, generally, the ornament is most elaborate near the hase of the huilding, in accordance with one asserted principle,-which, however, to us, appears inconsistent with the impression of an acrial lightness and heauty couveyed obviously in many cases by the ap-pearance of elevated position, as in the case of some of the peculiar forms in Gothic architecture itself, as the crocketted spire, and the battlements, pinnacles, and flying huttresses of battlements, pinnacles, and flying huttresses of most claborate character, which often enrich the top of the tower. The sculptured orna-ment, too, here, however good in itself, is scat-tered ahout, so that there is a deficiency of the special architectonic character,—the framework of lines, and the order in masses,—which most conduces to the effect of sculpture itself. Much of the orment might have here there on the of the ornament might have been thrown on the wall, as Turner is said to have hegun to paint a picture hy throwing his colours against the canvass. Still the ornament deserves careful examination. In No. 36, with the motto "Industria," the

author moves the Middlesex can do Westminster-bridge a little to the north, needlessly, and with some disadvantage as to the angle on the other side, at the junction with the Bridge-road, which suce, at the junction with the Brage-road, which results. He makes the change merely to get a piazza or *place*, about eight times the size of New Palace-yard which would form the angle of his new *place*. He would put the Law Courts south of the Honses of Parliament. A battor excercision which he are be the A better suggestion which he makes in common A better suggestion when he have a suggestion of the Hay-market southward to the park. The design for the War office and Foreign-office is Italian, with

the war office and Foregrounce is reality, when three-quarter columns; and there is a cupola which groups ill with the main front. No. 37, "Populis arthm vinculo conjungen-dis," a neatly drawn production of foreign origin, comprises a detailed hlock plan and drawings for the Foreign-office. The style is Italian, with Manarches enclosing windows with Italian dressings. —No.39, marked "Perseverantia No. I," shows the Foreign office and War-office in one block the foreign once and war-once in one offer, and the pian has what is called a "columniated gallery of communication," 370 feet long and 20 feet wide, which unless the author is columniated by ns, would be inadequately lighted from the ends of certain internal courts. Externally, the Italian style is attempted. There is a range of arches springing from ill-proportioned columns, and an ugly dome, which terminates in something that resembles a Corinthian capital supporting an ohelisk. The distinction which there is hetween productions of the class to which there is hetween productions of the class to which this design helongs, and those of *archi-tects*, was never so well defined as it is in this exhibition: "our architects," indeed, may now claim a very high place both for technical skill and tasta. Amount the latter a and taste. Amongst the latter class we may well and taste. Amongst the latter class we may went include the author of the design under the number 41, with the motto "Pro Regina et Patria Semper," said to be Mr. Rhind, of Edinburgh. He has two alternative street latter is which he uncomes convidently alterna. ed ratin comper, said to be out think of Edinburgh. He has two alternative street plans, in which he proposes considerable altera-tions about Whitehall; and he has projected a design for the whole of the offices,—those ou the west side of Parliament-street heing in two similar groups (of which one coutains the Foreign-office and War-office), joined in the street and in the park front hy colonnades on steps. It appears that he would complete the new Westmuster-hridge, and add another bridge with an approach from the middle of Whitchall, -- contemplating, also, one at the Minicially — contemplating, also, one at line Horseferry. He would remove the Horse-guards to the north of the parade—the site of the Admiralty,—and also Dover House and the present Board of Trade and Tradsury holidings, and would form gardens on the site gained, and free on the nersent site of the average. It a size

There are also two other open courts in the Office. As to external character, the design shows in the principal view a pleasing group of Italian features, including areades and colon-nades, loggias, and receding upper stories, set between square masses rusticated at the angles and carried up above the general height as towers with Italian cornices and roof coverings. In one part, a fourth story is added hetween the towers, and forms a good central mass. No. 42, with the motto "True," and the device

of three arrows crossed, is obviously by Mr. John Shaw, and is in his peculiar style founded on that of Chelsea Hospital, or rather of Sir Christopher Wren, with elaborate ornament added. In the present case, we should also say, he would intend to use only stone. The Warhe would intend to use only stone. The war-office and Foreign-office appear as two similar huildings externally, with a gateway in each front, hetween. One building has the corridors lighted through the floors. Much attention has heen given to the internal arrangements, which are shown in good sectional drawings. In the are shown in good sectional drawings. exterior, we should say, square masses are carried up as towers, with quadrangular domical roofs, at all angles of the huildings; the details the rusticated piers and pilasters are well studied; and the huilding is covered by a Man-sard roof, with dormers, and a railing at the top. The chimneys, as single shafts, are ranged along the front, over the external walls.—No. 44, "Pro Grege," includes a street plan, general block bloc and desires for the Wor offen and Paragent Protection of the War-Office and Foreign-office. The large plan shows that the author proposes to keep the site of Vestminster-bridge, to widen Hungerford-bridge, and to place a bridge at the Horselerry. In the War-office he provides an open areade to the ground story and a portico on the first-floor, reached hy the terrace over the arcade, and a hall and staircase in the centre, surmounted hy a dome. The corridors are well lighted from two large open courts. In the Foreign-office the same general principle of plan as to the courts, is carried out; and the decorative features are varied by the more prominent use of columns with hroken entablatures, and by the introduc-

Not not to small towers. No. 45, which hears the motto, "Le Bean dérive du Vrai; Le Vrai en Architecture c'est PUtile," we shall prohaly not he wrong in giving to Mr. Hector Horeau. The drawings are too slightly coloured to he seen properly; they however, exhibit a general street arrangement (hy they. a plan and view), a hlock plan, and designs for the Foreign-office and War-office united. In the general plan, the radiation of streets from one point gives some resemblance at first to the plan in No. I2; hut the site for Westminster-bridge is retained-widened, however, on the down-stream side; and the author removes Hungerford-hridge, spanning the river there-abouts hy a single arch; whilst he contemplates removes also a hridge at the Horseferry. He also appears to remove Northumherland House, and many of the conventual buildings about Dean'syard. The two Offices are united hy huildings of less elevation, and have a great central conrt; whilst each Office has two courts with corridors. As in many of the French plaus, convenience and effect are served by cutting off the angles of rooms and quadrangles. The the angles of rooms and quadrangles. The architecture of the design is a plain version of the Freuch style, with Mansard roofs, pavilions, and dormers

Such is the arrangement, or derangement of the exhibition, that we know not where some of the numbers are, and may therefore have to omit naming many designs from that cause alone. Of No. 47, "L'Espérace," which we come to next, we have only noted that the anthor proposes a skew-hridge from the middle of the ground, with curved approaches. But No. 49, a design for the Foreign-office, by a German, deserves to be looked at for its details, which are Italian, of a design for the modern Germau version. The author shows a fountain-court, roofed over with ornamental and would form gardens on the site gained, and iron-work and glass. Blocks of huildings at the also on the present site of the parade. He also angles are carried up; there is an open loggin in the top and hottom stories, and there are would remove St. Margaret's Church to improve of arches, decorated with fresco paintings on the area thereabout. The plan of the Foreign. the first-floor, and a helvidere story in the and some novel details are introduced.

centre. Small plain areh-hcaded windows are used; and there are plain pilasters to the prin-cipal story, bearing Persian figures in the story ahove.

No. 50 has the motto "No Corridors," which the author, Mr. Truefitt, has adopted to express the distinctive feature of his arrangement for the Offices. The rooms in each Office, he proposes should he ranged round a halls, with some peculiar proposals, also, in his street plan and general hlock plan. Preserving the site of and general hlock plan. Preserving the site of Westminster-hridge (though showing an alter-native site north of Richmoid-terrace), 'and widening Hungerford-bridge, and having a hridge at the Horseferry, he differs from the other competitors by leaving Whitehall and Parliament-street, as suitable for cart-traffic, nearly as at present; and with the view of giving a proper amyrach on state occasions. nearly as at present; and with the view of giving a proper approach on state occasions, and opening a visit to the Vietoria-tower, he forms a distinct way from Trafalgar-square, west of the Horse-guards, to a circus which he places opposite the centre line of Westminster-hridge. The parade he forms, west of this "way," ou a regular plan; and the Foreign-office and War-office he places at right-angles to each other, and perhaps not exactly as the instruc-tions required. The Foreign-office residence tions required. The Foreign-office res is detached, and looks somewhat small, The is decoding, and tooks somewhat small. The Italian style, without columns, is, adopted for the decorative character. The design appears to have suffered from a cause—hut for which it should constantly he recollected, the evidence of architectural talent in the present com-petition would have here content they of architectural talent in the present con-petition would have here even greater than it is, —we allude again to the inadequate time allowed hy the "instructions." As to No. 50, in which the leading idea as to lighting was good so far that it avoids the mistake of many of the designs, it is the mistake of many of the designs, it is curions to hear the passing criticism of the British public—traceable, we believe, not to the defects of the design, but merely to something which happens to dissatisfy in the colouring of the plans. It is one evil of competitions, that architects who look to them for employment, have to embark in so many, that due study of some one subject is in danger of being neglected.

No. 51, with the mottoes, "Urban" and "Non Notes Solum," to designs for the street arrange-meets, hlock plau, and the Foreign-office,—we need only refer to as showing a skew-bridge with approaches from Whitchall and Charingwith approaches from or which at a point in the Bridge road.—No. 55, a German or French design, with the motto, "The fair, the trath, the utility" (we always quote literally, the blunders whether of English or Latin notwithblanders whether of English or Latin notwith-standing; and of the latter sort there are many), is a design for offices, with many of the *minatize* of contrivance in plan to which we lately referred. One of the courts appears to have galleries at the ends, which are joined by a bridge. The decorative treatment, in a version of the Halian, is described for the second to 5.7, "Westminster; V. R." comprising a street plan, a hlock plan, and designs for the Foreign-office and War-office. makes a slight

Foreign-office and War-office, makes a slight alteration in the Middlesex end of the bridge, bridge, and proposes that the Park frout of the Office should be in the form of a crescent,----the Foreign-office residence to occupy one half and the Admiralty the other half ; and makes various

alterations in the street arrangements. No. 52, with the motto "Hope" in a triangle No. 52, with the motto "Hope" in a triangle and circle, by Mr. Lanc, has a well-studied plan for the War-office and Foreign-office, occupying three sides of the oblong, with the residence detached in the middle of the other side. The quadrangle is approached by a galeway from Charles-street, opposite the back of the resi-dence, through a range of connecting huildings one story less in height than the portions at the cnds; which hast, take the residence, are well provided with courts, and inner halls and star-cases; wherehy the corridors are hetter lighted than those in many of the designs. It is to be regretted that the merits of the arrangement are not shown hy sections. The design is in the Italian style. There are arch-headed windows

But, with the wish that will be felt that we should preserve some record of the circum-stances of an occasion which, we believe, will be referred to in future years as marking an epoch in tastc, we have no choice but to break off, bowever abruptly, till another week.

CORRESPONDENCE ON THE PLANS FOR NEW WESTMINSTER.

Is a few weeks at the longest, it will be decided how the next twenty public buildings and the uext two or three bridges are to affect, encumber, or obstruct, as long as Loodon lasts, the ways, the choos of fragments and heginangs that must always chos of fragments and beginnings that must always form the only ways through this huge chance-con-gested drift of chance-grown cities. Few graver and no harder questions have had to be settled in Rufu'ss useful Hall. The more choice of War-office or Foreigu-office, how their rooms shall he divided off, and in what new experiment of trave-tied scenery encased and dressed up, for the admiration of children and langhter of the next age is comparatively unimportant. A few weeks! That will give to each project a few minutes. Are the 200 to be all carried in the jadges' brains, from the two or three dozen rooms in which they hang, in all positions, with every side npward;

tbey hang, in all positions, with every side upward with every extent of environment, from nothing to a dozen square miles; with every outrageous (re.k and advertising device of colour, from black buildings and white ground to white buildings and black ground;

white ground to while buildings and black ground; and in some esses (if 1 am not mistaken) with different scales ? Enviable task! The simplest remedies seen often overlooked, because uo one thinks they can require pointing out. Would there be much difficulty in taking photographs on a wniform small scale (lobs of the small Ordanuce "London" might suffice) from all the block plans and more general plans, —in-so printing these photo-graphs from their ".arg.tives," as to give all neally be some denth of tono --mad then in placing them graphs from their "negatives," as to give an nearry the same depth of tone,—and then in placing them behind card-mounts whose aperture should exactly represent the prescribed area of clearing, with the surrounding map print d on the card; and hanging all in the 20 feet of vacant gallery remaining at the north-cast corner of the Hall? "Now serrous."

PROCEUSTES.

Among the little bits of information that would, as

Aroxe the fittle bits of information that would, as you have observed, have been necessary to the real designing of the future Westminister, I think you may reckon the following correction of a part of the bits of the following correction of a part of the struction plan, the error of which only lately and by chave presented itself to me. Wettriare of which that plan embraced any party way, helieve, the only pair of fines therein added to ex-prose presented itself to me. Wettriare of which that plan embraced any party way, helieve, the only pair of fines therein added to ex-press any change since the Ordnane Surrey, though and disenembering of St. Stephen's Porch, and the whilding of the solid and expensive church of St. Mathew, of none of which (nor of the plan, and f suppose, inviolable somethy, of the Westminster belood builting) could the foreign competitors have any guess. Now as only Victoria stret, smong all be changes, was represented, it was, I submit, reason-able to suppose that it might be drawn within seeve degrees of the map not quite a handred and and the spect, with the changes, was represented in the set in the toes degrees of the map not quite a handred and thirdy feet whether any block-plan has been influenced by this helion the and the beat. E. L. CARDETT.

E L. GARBETT

1x the Times of the 12th, a writer, signing bimself "I'vis Brinners," justly observes that the part of the subject connected with the proposed public offices requiring the first attention is "the block plan, and not the elevation," and that, in the majority of the designs, " the Houses of Parliament, upon which so much has been spent, and which ought to form the prominent feature of any plan for laying cut our official quarter, are effectually neutralized by a screen of public offices proposed to be creeted in front of them?"

Further suggestions are offered in the letter, iuto which it is noncessary to enter; but one important fuct is now coming out, that hut too little attention has been paid to the most important part of the

Noted pad to the host important part of the solution-the general arrangement. Now, it so happens that the instructions to com-positors (issued by the Commissioners of Works under date 30th Sept. 1850) restrict architects in more ways than one, and to uny mind so sorionsly as to destry the possibility of making a good design. The first plurgs at the man cheure that

The first plane at the map shows that the im-portant consideration is, bow to get the most easy and benefit access to Lumdon over the bridge. Clearly this is best done hy placing the new bridge

it right angles to the present Houses of Parl and with one hold sweep connecting it with Parlia-ment-street. What ideas of magnificence present of magnificence present themselves immediately under such an arrangement l A new bridge, adorned it may be with colosal statues of brouze; the new Houses of Parliament on the left; on the right a space affording room for one, and hut one, public building, of hut one story in height, surrounded by platatations; the view of the new Honses of Parliament unimpeded, and, passing on, the proposed buildings occupying the reetangle formed hy the park, by George-street, by the line of Downing-street, and of the new buildings of White-hall : and what a site | Notbing could be finer ; a splendid approach, an open space (how valuable in London), a new bridge adorned with statues, and no shutting out of what we now possess,-arebitect, engineer, and sculptor, all at work.

engineer, and scaliptor, all at work. But mark the fact. The rectangle above-named will not give the area required under the instructions for the new buildings; and to appropriate the space on the river hask to a building of great height, uot only would shat out in some measure the view of the provide the state of the state of the space. new buildings at Westminster, but would become a fractional portion dissevered from the main group of offices, the unity of which is as necessary for archi-tectural effect as for utility. Such was the difficulty felt by me, and, donbtless,

by many others, ou putting to paper the earliest sug-gestions of designs,—impracticable as they were under the Government instructions. The style of architecture, and the plan of the

buildings, important considerations in themselves, sink into insignificance in comparison with the general arrangement, so important to my mind as to lead me to hope that these hasty observations may not be considered unworthy of your notice. An Architect, but no Competitor.

NOTHING like in importance to this exhibition of NOTHING like in importance to the exhibition of competition drawings has taken place since the year 1836, when nin-ty-seven sets of designs, comprising 1,200 drawings for the New Houses of Parliament, were publiely exhibited in the National Gallery, not by the authority of the Government, but at the expense of the several competitors; indeed, it was with some difficulty that those who undertook the management of the exhibition could chtain from Lord management of the exhibition could chtain from Lord Dmennion the loan of the prize-drawings, in order that they might be exhibited with the rest of the designs. The case is widely different now, and it is to be hoped that the judges who may be appointed to select the designs worthy of the several premiums, may, by the fairness of their decision, satisfy the great body of the competitors. The number and magnitude of the premiums in this inslace consisting of seventeen distinct rewards, have induced an unusual number of professional men to embark in the competiton, for the premiums pro-mise at least a fair return for time and labour to the competitor who may succeed in gaining a prize, even

competitor who may succeed in gaining a prize, even if he fail in standing first on the list.

if he fail in staading first on the list. In this respect no previous competition offers any parallel. When designs were solicited for the New Houses of Parliament, "The Lords' Committee, agree-ing with the resolution of the House of Commons, offered premiums of 500%, to be given to each of the parties whose plans should be recommended by them, to be not less than three in number nor more than five, and that the successful competitor shall not be considered as having necessarily a chim to be ea-trasted with the expression of the work, but if not so trusted with the execution of the work, but if not so trastel with the execution of the work, but if not so employed he shall receive an additional reward of a 1,0004." In the present case no less than sisteen premiums are offered: two of S004; three of 5004.; two of 3004; three of 2004; and seven of 1004; making a total of 5,0004 as a stimulus to bring forth professional skill. Considering, therefore, the in-creased number of architects since 1836, it can scatcely cause surprise that so many men have been scarcely cause surprise that so many men have been

scarcety cluse surprise that so many men have seen found to enter the list of competitors. A corresponding increase in the value of the drawings produced is also perceptible. In 1836 the cost of production was estimated at 10,0007, the drawings now exhibited in Westminster-hall are

drawings now exhibited in Westminster-hall are thonghi to have cost upwards of 50,0007. The very magnitude of the scheme, and the vast sums expended in the preparation of the designs, make the subject well worthy of consideration, both in reference to its effects upon the profession, and its means of scenring the hest result. An examination of the multitude of drawings filling Westminster-hall, must tend to strengthen the opinion of those who hesitate to think that the procedure by open and un-restriced competition is the right way of obtaining the best facts of the country. Of the numerous designs, those mainly deserving of attention have heeu prepared by unen whose abilities are already known; and the impress of their style and manner is known; and the impress of their style and manner is so well understood, that, in spite of the iacognito veiled under a motto or device, their authors are at

MAY 16, 1857.

ment, once recognised. The idea, therefore, of the judges once recognised. The iden, therefore, of the judges being ignorant of the designs is absurd, and the pres-tige of names may possibly influence the final de-eision. It is undexiable that, amongst the mass there are several very meritorious designs; hut there are others chiefly rumarkable for wildness of conception and addity, and this must ever he the case where competition is open and wholly morestricted. The same fault prevailed in a few of the designs submitted for the New Houses of Parliament in 1886, and to such a degree that the committee hesitated for a time to suspend some of the drawings : still, whatever may be the faults inherent to open commetition in art, the he the faults inherent to open competition in art, the determination to adopt this principle in works of magnitude scems unalterable; but the fruits of the

magnitude seems unailerable; but the fruits of the system should be watched, especially when large sams of public money are expended in such experiments. The most remarkable effect of this competition is the development of some decidedly Italian Gothie designs. The attention to this style, which has here encouraged by the writings of Ruskin and others, has activity here a preducting frond, the usual background encouraged by the writings of Ruskin and orders, as eertainly heen productive of goods the usual hackneyed character of detail has given place to boldness of feature, which bids fair in the hands of able men to result in such a modification of English Gothie, as to render it much more applicable to modern require-ments; and, however excellent may be the composition ments; and, nowever excellent may be the composition of the several Classical designs, they certainly do not show novelty of treatment; while in some of the Mediaval designs, there is the most marked evidence of progress. When such liberal premiums are offered, it appears ungracious to find fault, but are offered, it appears ungracious to find fault, but there seems to be a great disparity hetween the prizes for the block plans as compared with the others. While every set of plans for the Department of the Sceretary of State for War and Foreign Affairs in-volves a large number of drawings and great study of arrangement, seven of them ean only gain premiums of 1002, each; but three block plans drawa upon single aberts of paper, enlarged from the Ordnance Map, showing the improvements in the principal approaches to the New Palace at Westminster, are to earry off prizes to be amount of S004. earry off prizes to the amount of 800%.

earry off prizes to be amount of S00. It unay perhaps be said that the object is to obtain the mind and ingenuity of the author; but surely the same reason applies with equal force to the other designs: it the general scope and conception be not successful, no extent of claboration in the details can ever make the composition acceptable. The skill of an architect is hest evidenced by his general design; and if it were not invitings to reaction numbers and if it were not invidions to mention numbers, some masterly examples of the kind might be named where the detailed portions (beautiful as they are) might have been withheid, and yet no competent person could fail to discover the excellence of the general designs without them. While making this communication, the names of the nohlemen and gentlemen constituted the judges in this matter are pub-lished : if fairness cannot be had from such distinguished men, I know not where it may be songht. It was one of the complaints attending the competition It for the Houses of Parliament, that the judges oamed previously to the competition had come to a foregone conclusion

This requark cannot apply now, and there is every reason to bope that the selection of the designs to har rewarded will be founded upon a careful examination of their merits alone. I would not have traubled you with these remarks ; but, as the then honorary secretary to the body of competitors for the New Houses of Parliament, I feel interested now, in a competition which is by far the most important which has occurred since BEN. FERREY.

FALL OF HOUSES, TOTTENHAM-COURT-ROAD.

ROAD. EARLY in the morning of Saturday, the 9th inst, three houses, Nos. 146, 147, and 148, Tottenham-court-road, situatal between Tottenham-place and Graton-street, lell to the ground, aod caused the death of five persons, besides injuriog others. The houses were undergoing repair at the time, and the accident has here attributed to the failure of one of the party-wells while heing and emission. walls while being underpinned.

An inquest on the sufferers was opened on Wednesday last, but no evidence as to the cause of the disaster was then taken. It was adjourned till Friday, disaster was then taken. It was adjoorned till Friday, and we prefer therefore to postpose particulars. The inquest was attended by Mr. Revee, the Surveyor to the Metropolitan Police, and Mr. Henry Baker, the district surveyor. Mr. Gifford, instructed by Mr. J. W. Chamberlain, appeared on the part of Mc. Maple, the relatives of the decased Frederick Byng, Mr. Raggett, Mr. Maple's surveyor, and Mr. Taylor, his builder. Mr. Gooper, barrister, was present on behalf of Mr. Hunter, Mr. Ridding, his surveyor, and Mr. Johnson, his builder. The contt was densely crowded, chiefly by professional mea and builders. The jury included Mr. A. Watson, architect, and six or seven builders.

TUNBRIDGE WELLS.

OPERATIONS have heen commenced for the crection of the proposed new St. John's Church, on the Lew. The crection of the proposed church on the Calvery estate will also, we believe, soon commence, so that Tunbridge Wells will have the advantage of two additional churches. It is to be hoped they may prove ornaments also in an architec-tural point of view. If those who own property and regulate the affairs of places of resort like Tunhridge Wells were wise, they would take care that every step made should tend to the improvement and adorument of the town. Some substantial shops have been recently built. On the 1st of May, when we happened to be in this pleasant place, that part of the well open to the pleasant place, that part of the well open to the wayfarer (the water of which, by the way, is of most literary character, having the taste of modified iuk), was littered with pieces of paper, sticks, and other rubbish. If the show be made of keeping a part open to the public, it should also be kept clean and wholesome in appearance. The "High Rocks," the most attractive sight in the neighbourhood, want a little artistic care. A very beer-shoppy aspeet has been given to part of this beautiful morsel of wayward Nature by some vulcar creditions and perverse arrange-

by some vulgar erections and perverse arrange-ments. It is to be regretted that Penshurst, hard by, is only to be seen on one day in the hard by, is only to he seen o week-Sidney's Pensburst,-

"Than whom no greater, braver man, His own delightfal genius ever feiguod, Illustrating the vales of Aroady, With courteous courage and with loyal loves."

THE LATE THOMAS SEDDON, ARTISP. THE SOCIETY OF ARTS

Ar the second conversations of the present session, held on Wednesday evening, the 6th, the pictures and sketches of the late Thomas Seddon were col-lected for exhibition under the superintendence of the committee for the "Seddon Subscription Fund," and of W. M. Rossetti, the Honorary Secretary. The paintings are still to be seen at the Society of Arts. The

Mr. Ruskin delivered a very interesting address with reference to them. In the course of it he said, as to the purchase by the nation of Seddon's picture of Jornsalem, he heliver that some objection had of derivation, he nerved that some optication have here taken to the idea of placing this picture in the national collection of paintings, because it was said that they sought to kring it forward as a unique pic-ture, or as one so admirable that they were never likely to look upon "its like" again. For his own part he differed from that view. It was not because part he differed from that view. It was not because he considered it remarkahle, hat hecause he considered he constant of the markante, into he cause he constant of it not remarkable, that he wished this picture to become the property of the natiou : he regarded it as the type of a class of pictures and of works which might he understood and imitated by other men, and might he understood and initiated by other men, and the understanding of which would be advantageous to the nation in future. In like monner it had been said that it was sought, as it were, to canonize Seddon as a saint-immortalise him as a hero-that they wished to bring forward his death as a mertydom to the cause of painting. But it was not so. The death of Seddon had nothing remarkable or extraordinary in its character, but was merely a type of a class of deaths which were being continually of a class of deaths whice were of all good men, but which, in this case, a concurrence of pathetic circum-stances justified them in hringing before the public notice. The simple sacrifice of like had in it nothing unusual: it was, on the contrary, a melaneholy thing to reflect how continn dly we all of as lived upon the lives of others, and that in two ways, viz. npon lives which we take, and npou lives which are given. It was a terrible expression to use-this of taking life. was a terrible expression to use—this of taking life— but it was a true one. We took life in all eases in which, either for higher wages, or by the compalsion of commercial pressure, men were occupied without sufficient protection or guardiauslip in dargerous employments, involving an average loss of life, for which life we paid thoughtlessly in the price of the commodity which, so far, was the price of blood. Nay, more than this, it was a well-recognized fact that there was scarcely an art or a science in the pre-sent day, in which there was not some concominant circumstance of dancer or discase, which science had sent day, in which there was not some concomitant erremustance of danger or disease, which science had not striven to ahate proportionally with the endca-yours to advance the skill of the workmen. And thus, though we had aholished slavery, we literally hargained daily for the lives of our fellow men, although we should shrink with horror at the idea of purchasing their hodies; and if these exils, arising partly from pressure of population, hat more from carclessness and erucity in masters and consumers, from desire of chemaneses or blind faith in convertevours to advance the skill of the workmen. And The engineering works include the reservoir, steam-thus, though we had aholished sharery, we literally engine and hollers, pump work, tanks, the hot and hargained daily for the lives of our fellow new, end hough we should shrink with horror at the idea of partly from pressure of population, but more from earlessness and eruely in masters and consumers, from desire of cheapness, or blind faith in commer-cial necessities,—if these evils went on increasing at

the rate it seemed hut too prohable they would, England would soon have to add another supporter to her shield. Ste had good right still to her lion, now more than ever; but she needed, in justice, another, to show that if she could pour forth life-blood uobly, she could also drink it crucily: she should have not only the lion, hut the vampire. These remarks applied to what was only too justly termed the taking of life; hut in other cases lives were given, as by the active and enterprising explorer of unknown regions, and the brace and devoted soldier and sailor. These secrifices we might accept, if the cause in which they were offered was a just one. He had to bring before them that evening an instance of such a sacrifice, and them that evening an instance of such a sacrifice, and to explain and justify its cause. At the close Mr. Ruskin proceeded to narrate the

At the close Mr. Ruskin proceeded to narrate the establishment by Seddon, with the co-operation of Mr. Nevill Warren, of the North London School of Design for Workmen, in Candeu-town, the principal superitudence of which devolved puon Seddon him-self, conjointly with the satisfaction of the other component of the set of the state of the other superiordial with the estisficient of the other ardinous claims upon his time, attention, and hard labour. His great exertions during that period of his life, it was believed, impaired his constitution, and his nic, it was believed, imparted and consistention, and were regarded as the primal cause of the failure of his health in Syria, and his dying there. Mr. Ruskin then entered into a recital of the labours of Mr. Seddon in his last great work of "Jorusalem," and concluded by appealing to the Society and those present to aid in doing justice to a great artist hy the recognition of his genius.

PARTIES FINED UNDER THE BUILDING ACT.

ON Wednesday, the 29th of April, a person calling himself a jouroeyman ironmonger was fined 21. at the Mansion-House, for putting up a stove for trade purposes, in the northern district of the City, without purposes, in the northern district of the Only, who has notice to the district-surveyor, the prosecution being conducted by the Metropolitan Board of Works, through their solicitor. The next day, Mr. Norton, a carpenter, in Long-lane, Bermondsey, was fined at the Southwark Police-court 24, for creating an earthenware funnel for carry-court 24, for creating an earthenware funnel

ing smoke from a copper furnace, and 1/. for the erection of an addition to a house, in each case, without such notice to the district surveyor.

such notice to the district surveyor. In both the first two cases penaltics had also been incurred, under see. 21, for work done contrary to the rules of that section, hat were not pressed for.

ESSEX COUNTY LUNATIC ASYLUM.

THE engravings in our present number illustrate the Essex Luuatic Asylum, completed not long ago under the direction of Mr. H. E. Kendall, jun. The design was obtained in a long ago under the direction of wir. It. D. Kendall, jun. The design was obtained in a private competition of ten selected architects, the invitation going from the committee of visitors, who offered the work to the author of the best design, 100% to the second best, and 50% to the third.

507, to the thrd. This was in 1849; and, in July, 1851, the committee accepted Mr. G. Myers's tender for the execution of the works, which were then commenced, and were completed in July, 1853. The outlay, on the certificate of completion being given, was as follows :--

	fittings	
0 0		£65,025

The asylum accommodates 450 patients. Ou The asylum accommodates for patients. Our the architect giving it up complete, it was arranged and prepared for the patients by Dr. Campbell, the medical superinteudent, under whose management it is at present conducted. It is greeted at Brentwood, ou the Eastern Counties line, about 18 miles from London : 86 acres of ground are attached to the asylum : the purchase-moncy for the latter was 8,000/.

The buildings works comprise the asylum, its offices, and out working offices, the chapel, and residents' house, ke, the whole occupying, within the houndary walls, an area of 8 acres of ground in extent; to-gether with a large gate-lodge, a bailiff's house and farm buildings, a large engine and boiler house, with drainage for every building throughout.

The engineering works include the reservoir, steam-

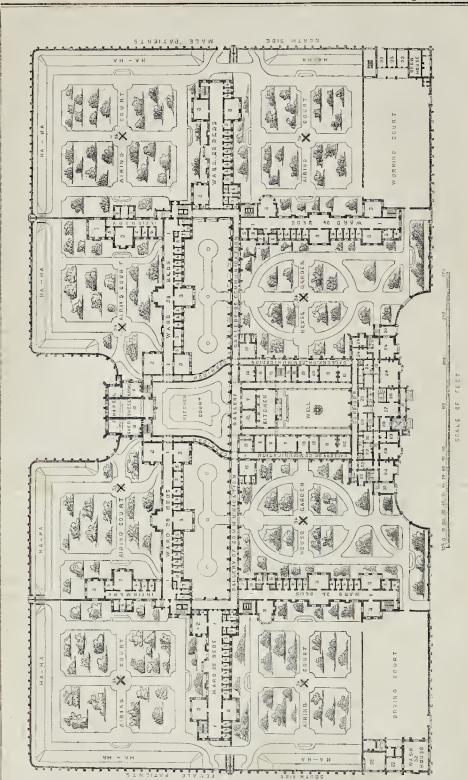

potients' wards and airing courts. The resident's house looks east, and forms the entrance to the asylum: removed from the public road about 300 yards, it includes the residence of the pby-ician sporintendent, the steward, matrow, and assistant-surgeon, all being distinct, with separate starcases to each, it contains also accommodation for the house-porter and domestic servants, a large committee room and circk's room, visitor's room, a room for the clap-lain, the patients' roception-rooms, male and female, kitchen offices for the superintendent and steward, a large central entrance hall, and eatrance areade. a large central entrance hall, and catrance areade, &c. From the house, passing round the kitchen offices, and to the right and left the patients' wards are approached by cloisters or galleries of com-munication, paved with Staffordshire tiles, blue and red, hid arris wise. The roofs are open timbered and stained : the door and window openings are of stone, some being filled in with quarried gizing, and some left open with ornamental iron work fixed therein. At the termination of these corridors, right and left, immediate access is obtained to all the wards and infirmaries of the main huilding devoted to the patients, the females occupying the wards or wing to the left, the males the wing to the right. There are seven wards and two infirmaries on one side, and six seven wards and two infirmaries on one side, and six wards and one infirmary on the other side, together accommodating 450 patients, 150 in single, and 300 in associated, rooms. The whole of the west front is given up to the undisturbed nse of the patients, having an uniuterrupted view of the extensive and becautiful seenery around, with free access of air and sun, &c. The building extends in length from south to north, forward 800 feet, a longitudinal line; only hroken just sufficient to allow of thorough light and ventibution at the ends of the galleries. The infirma-ries advance in front on either side at the junction of the wards; and the convulcement wards recede or re-turn from the front line on either side castward, turn from the front line on either side castward, turn from the front line on either side costward, entralising the residents' house, kitchen, offices, and chapel. The ward golleries are 12 feet wide and 13 feet high: they all have large oriels and hays, the day rooms thrown open to them, and windows at each end. The ceilings are arched, and fire-proof, con-structed with hollow hexagou-shaped hricks. The foors are boarded throughout the wards and in-firmaries, except in the case of two of them for the warden preistic where they are naved with Shifordunclean patients, where they are paved with Stafford-shire tiles, red and hlue, oruamentally arranged. The windows are of east-iron fancy patterns, the casements opening outwards above the transoms; but the frames opening outwards indee the transforms, our the transform heing double, when open, one of them remains in position unglazed, so that ventilation is obtained, combined with safety : this principle and the mode of opening is founded on a patent of the contractor, Mr. Myers. The chaptel is huilt with Kentish rag stome to mark its character. The accommodation is for 300, all the sittings being on the floors. The meta toward is own the semilary : a saft iron

The water tower is over the normality: a cast-iron eistern or tank holding 10,000 gallous is constructed therein, supported ou arched groining: from this tank the general distribution of water all over the asylum is made; 18,000 gallons per day heing about the consumption, colcutated at the rate of forty gal-lons per day each patient : this tank is supplied from sons per day each pattent: this tank is supplied from a large enclosed reservoir constructed at the bottom of the grounds holding 40,000 gallons, the water from the springs on the ground running through it, always with a waste: it is forced from this reservoir always with a waste: it is forced from this reservoir up to the task by means of a powerful non-condensing steam-engine, the height being about 150 feet, the distance 1,400 feet. Every part of the asylum is lighted with gas, sup-plied from the town gasometer. The engineering works were executed hy Mr. May for Mr. Myers, the responsible contractor. The style of architecture adopted throughout, ex-ternally and internally, is Mediteval: the materials are stone dressings and red brick facings interlaced with black.

with black.

THE BUILDER.

[MAY 16, 1857.

PLAN OF ESSEX COUNTY LUNATIC ASYLUM, BRENTWOOD.

THE BUILDER.

275

METROPOLITAN IMPROVEMENTS AND THAMES EMBANKMENT.*

So thoroughly has the tedious traffic of the streets got ground into the true Londoner's nature, that, to shorten his course from Piecadilly to the Bank, would be to roh him of a vest of right or a natural privilege. If a reilway train from Aberdeen or the Land's Eud arrives in London five minutes behind its time, the indignant traveller vents his spleen and writes a le to the Times; but your dog-collared occupant of the knife-board of a Clapham omnibus will stick on London-bridge for half au hour with scarcely a mur-

ch being the result of the existing state of things, 1 will now direct your attentions

I. To the couditions of our streets, direct and lateral. 11. What they have to accommodate. 111. How they may be improved.

We must first direct your attention to the commu-

nications, east and west, beginning with the river, whose ample width enables it to supply the best possible means of communication between the City and Westminster, and their immediate neighbourhoods

With all its advantages the Thames remains in a state absolutely disgraceful. The boats are the worst that sail on any river where the traffic is abundant. that sail on any river where the traffic is soundant. Our balfacenum, penny, and even our best boats, are a reproach to the metropolis. They are chiefly used by the very lowest, or perhaps I ought to say, the poorest or the bumblest classes. As there is no respectable approach to any pier on the south side, and very few on the uorth, the general moving public must avoid the river until the boats are enlarged and the anyocnehas made resurbable. the approaches made reputable.

Let any person examine the accommodation, and say whether it is not discreditable. Neither cab nor carriage can approach within two or three hundred yards of the piers, while the proper descents to the river by the noble stairs at London-bridge, are abandoned to other and not very creditable purposes. pier at Panl's-chain is equally inconvenient : the The the Hungerford, and Westminster, are repeated the objections already named.

would be interesting to arrive at the annual It amount of the loss sustained by brewers, what fingers, carriers, and proprietors of public conveyances, through carriers and proprietors of public conveyances, through stoppages in the streets. An ingenious friend of mine bas gone into the calculation, and come to the conclusion that, within the City boundary, what might be done in ten minutes usually occupied fifteen minutes, sacrificing one or two thousand pounds per day, or from 300,000/. to 600,000. Per annum; but taking the loss at 300/. per day, there was a loss of 100 000/. numelly-one groups dimest sufficient to 100,0007. annually—an amount almost sufficient to huild a bridge once a year.

What are the streets expected to accommodate? This portion of my address I shall give in a tabular form, so that, at a glance, all who take any interest in the question may possess themselves of facts not to he overlooked, in arriving at a just estimate of the duties to be performed. But 1 may here coudense a few facts, worthy of being permanently fixed in the memory.

memory. The population of London was in 1801, 958,863; in 1811, 1.138,815; in 1821, 1,378,947; in 1831, 1,654,994; in 1831, 2,361,640. Since 1801, or within 57 years, the population of the metropolis has very nearly trebled itself, and therefore, if the streets then existing were required to be of their then examply to accompadiate the nearly be of their then capacity to accommodate the popula-tion, it follows that a population of three times the tion, it follows that a population of three times the number demands a greatly increased width of thoroughfare

If population has increased so much, we find that public conveyances have increased in an equal ratio. The number of hackney-carriages were in 1801, 900; in 1811, 1000; in 1821, 1000; in 1831, 1,200; in 1841, 2,000; in 1851, 2,800; in 1857, 4,330.

in 1841, 2,000; in 1851, 2,800; in 1857, 4,350. In the first thirty years of the present century the increase of hackney-carriages was oaly 300, or 100 for each period of ten years, being at the rate of ten carriages in a year; while during the last six years the increase has heen 1,550, or over 250 per annum. Since 1801 the increase has been such as to multiply the then number cearly five times. Before 1828 that most convenient vehicle the omnibus was unknown in London, heing in that year inmorted from France by Mr. Shilliber; i yet we now

imported from France by Mr. Shilliber; yet we now observe in the public prints that week by week one company has a revenue of half a million sterling per amum, and the estimated capital invested in such property is nearly 3,000,000', the number of car-riages under license being somewhere about 3,000. Trade and commerce have doubless extended in a

like manner, and the number of waggons, carts, and

* From paper read by Mr. Francis Bennoch ; see p. 243,

horses must have increased proportionably. There-fore we believe we are justified in cancluding that in 1857 we have ten times the number of vehicles tra-versing the streets that we had in 1801; and what has been done to widen the streets in proportion to this tremendous increase of traffic? Absolutely nothing !

But, it may be argued, if our population has in-Dut, it may be argued, it our population has lo-creased as three to one, and our various conveyances as ten to one, our general metropulian advantages have increased equal to the domand. In lodging accommodation this is undoubtedly correct, but not in our streets, giving room for arterial traffic. For although many cabs may never, or only occasionally, enter the crowded parts to which we have been referring, uearly all the omuibuses, and uine-tenths of the carts and waggons, must visit these localities; but, estimating the increase at half what it really is, or five times the number since 1801, we repeat, that that has streets were then absurdly wide—an idea that has never for one instant been entertained—it is manifest that the main streets ought to have been nearly doubled in width.

append tabular statements of the traffic over I append count sector to the state of the state of the count of the state of the st London. These facts incentestibly prove the neces-sity for street accommodation; and it will be seen that generally the pressure is the greatest where the streets are the narrowest, or where they have not been expanded for fifty years, and cannot be widened

without an enormous expenditure. The only reasonable manner in which the evil can be overcome, and the wants supplied, is to open other currents of traffic wherever they are needed and ean accomplished. This introduces us to the third division of our subject.

How can our thoroughfares be improved? The protest improvements in modern times were the uniform widening of the streets,—the new streets opening with Leicester-squyre and New Oxford-street in the West-end, and within the City the construction of Moorgate-street and New Cannon-street; and above building of London-bridge, with its several all, but in the borough of Southwark, and the new Vic-tovia street, leading from Blackfriars bridge to Clerkeuwell.

euweil. In addition to the improvement, as already de-scribed, of Middle row and Temple-bar, in the com-munications cast and west, it is indispensably neces-sary something should he done to secure at least three great thoroughfares cast and west, so that in the cornet of reasing home required in either the the event of repairs being required in either, the other two might he always open. To meet this necessity we have on the north a direct line from Charing-cross to London-bridge, by way of the Strand, Fleet-street, Ludgate-hill, St. Paul's, and Canuon-street

The centre line should be the continuation of Cheapside, north of Paternoster-row, over Furring-dou-street by a viaduct bearing slightly to the south of Liucola's-inu-fields, and so on to meet the provements in the west, on a line with Piecedilly.

provements in the west, on a line with Piccadily. The northern line should be New Oxford-street, a part of Holborn, diverging at the top of the hill, and by a viaduct crossing Victoria-street to Smithfield, passing in froat of St. Bartbolomew's Hospital, through Bartholomew's-close, across Aldersgale-street on the level, and so in a line with and into London-wall, joining the pavement for Hoxford traffic, Bisbops-gale-street fur Hackuey or Shoreditch traffic, and proceeding down to the river-side by way of Hounds-ditch, the Minories, and Tower-hill, crossing the river ditch, the Minories, and Fower-hill, cros by a steam-ferry : all these we show ou the map now

by a steam-ter, before yon. On the south side, the new street, resolved upon by the Metropolitan Board of Works, will be of immense convenience, although 1 think the line chosen by Mr.

Peunethorae is infinitely preferable. The cross traffic of the metropolis, that is, the traffic north and south, is nearly as important as that traine north and south, is nearly as important as that east and west. To relieve Loudon-bridge of nuch of its heaviest traffic, I suggested to a committee of the House of Commons, some years ago, the propriety of establishing steam-terries at all convenient points on the river below London-bridge, and I rejoice to find that a nublic commany has recently been formed to the river below London-bridge, and I rejoice to find that a public company has receally been formed to carry out the project. If fairly tested and proved success'ul, of which 1 bave no doubt, a new cra will have commenced in regard to metropolitan thoroughfures

Southwark-bridge, though badly constructed, its gradients being nearly as steep as Holborn-hill, should, nevertheless, be made free of toll, and Queenstreet, between Canuon-street and Cheapside, mide of a width equal to that between Cannou-street and Thames-street

MAY 16, 1857.

gest, would, uext to London-bridge, have the largest very injurious. Its immediate demolition and recon-struction are alike domanded by the exigencies of the public service. As the new bridge would be lower in the heading by 4 or 5 feet, the incline would be greatly reduced, and still more so should the piers be

of stone, and the span of irou griders. Temple bridge would introduce a most important feature in the rearrangement. It would open up to the river the whole district of Liacoln's-jau-fields, and the squares north of Holbora in a direct line with the south, and thoroughly ventilate the wretched

neighbourhood of Drury-lane. Waterloo-bridge should be made free of toll, and Hungerford widened and strengtbened to bear eartraffic

At Westminster, whether we are to have one or two bridges, I may leave to the decision of the active gentleman who presides over the department of orks.

However necessary and indispensable the accom plishment of all these suggested improvements may be, and all of which are carefully described on the be, and an of which are containly described on one maps before you, they only introduce use to the main object of this paper, which was designed to refer-chiefly, if not solely, to the embankments of the river Thanes. Having at considerable length gone into the general question of improvements, I feel that I have cleared the way for the careful investigation and discussioned the show remeased

the general the way for the careful investigation of the pluss proposed. The details 1 shall explain viza voce, but yon will observe from the plan before you that it combines a promenale, a carringe way, and a railway, and should the Government suprove, and the river commissioners agree, to the scheme, the entire work might be excented without costing the metropolis or the country a single farthing. The revenue from the railway, a single farthing. a single farthing. The revenue from the railway, and the frontage obtained from the river, would not and the frontage obtained from the fiver, would not only compensate all persons having claims, but pay, it is presumed, a hadsome dividend to the projec-tors. The merit of the scheme, as now laid down, is chiefly due to Mr. Charles Liddel), the eminent eivil engineer, to whom 1 am personally indebted for the beautiful drawings now before us, all excended by Mr. Driver. Mr. Drive

You will observe that the embankment commences at Westminster-bridge and terminates at the proposed St. Paul's-bridge. A railway you will observe starts from the Post-office, being in continuation of the Fleet Valley Railway from King's-cross: it follows the road on the embankment along the river, enters a tunnel at Whitehall, and proceeds westwards to Rechmoul and Breatford, so as to catch the omnibus traffie of these districts, which is very large, and would be exceedingly profitable. The gardens of Whitehall and the Temple are not only relating that for the river is improved, and a greater coming down to the river is improved, and a greater You will observe that the embankment commences

amount of wharf accommodation secured than now exists. As time has failed me in having the whole of CXISTS. As time has inference in a naving one whole or this plau completed, I purpose, if acceptable to the council, to return to the subject next session, when the whole scheme will be complete, architectural embellishments introduced, and when it will be divested of the incumbrance of a general idea of metropolitan improvements.

Inefformation improvements. Here, however, I must explain that the railway starting from the Post-office, as already described, has a branch uniting it with the South-Western on the one band, while on the other it is connected with the South-Eastern. Could these junctions be effected, the four-ment and office discussed uppthem, how South-Eastern. Could these junctions be effected, this important and often-discussed problem, —how can the railways ou the north and on the south of Londou be effectually united P—would be solved, and that in the only way that is feasible, at a moderate expense. Taking advantage of the admirable street suggested by Mr. Pennethorne, Mr. Liddell has con-ceived the possibility of uniting the South-Western with the Brighton and South-Eastern Raikways, in a neurosc the current de surveysed 16 intered of manuer that cannot he surpassed. If, instead of sanctioning all surts of pedding schemes, the autho-ritics would resolve to grapple boldly with what is pressing and imperative, this entire scheme for embaukment, railway junction, and a high age at St. Paul's, would not only be com-Thames level bridge level bridge at SL Paul's, would not only be com-menced forthwith, but completed in five years. The drawing uow exhibited shows the nature of the con-struction. On the lowest level, facing the river, are the what's and other matters connected with trade : on a higher level, but receding considerably, is a promenade for pedstrians : next comes the space over which, on iroa columns, the railway is to be laid down next spaces the railway is to be laid St. Paul's-bridge, which I had the honour to sug- dowu: next comes the roadway for carriages, 40 feet

wide, and then another footway or promenade in front of the houses that may be erceted, the entire width for foot passengers, earringe way, and railway, being

of the houses that may be erceted, the entire width for foot passengers, earriage way, and railway, being 100 feet. Another line, it will be seen, might run along the side of the New-road, from St. Paul's to the Elephant and Castle, and branching off to the left, give railway, oourenicae to the immeuse contains population of Camberrell, Kennington, Brixton, Claphann, and Streathan, uniting with the Crystal Palace Railway to the west end; give facility to many visitors, and considerably relieve London-hridge of much of its superabundant traffic. It will be observed further, that it is proposed to unite the Thances Embaukment Railway in a maner, as I believe altogether novel, the merit of which belongs entirely to Mr. Liddell. To will see that the railway passes not only belind the houses facing the suggested new street, but than answired that it is preposed, it is believed that vibration could herely be detected. The sompletion of the Railway and Thances Embaukment Railway mosed, it is believed that vibration could herely be detected. The completion of the Railway and Thances Embaukment scheme would open the whole of the tradit way between the trans and the subject of the tradit of the tradit of the start of the tradit of the tradit of the second of the tradit way the detected. The completion of the Railway and Thances Embaukment scheme would open the whole of the tradit of the railway would convey inco. The piers would he more useful. The promende and carriage-way direct from the Bank to Charing-cross would relieve the traffic of on present overloaded streets, while the railway would convey inor St. Paul's to be particular to pay and the nore set of the Charing-erces would be railway would convey inor St. Paul's to the streets, will the appliances in general use.

Before resuming my seat 1 think it is due to Mr. Liddell, as well as to myself, to say, that the plans now before you have been in conrese of preparation for months, and the paper I have just concluded was in months, and the paper I have just concluded was in the hands of the printer more than a week ago; that neither the one nor the other have in the slightest degree been modified or influenced by the report on the embaukment of the Thames, which has recently heen published by the Netropolitan Board of Works, a report which seems to me to be exceedingly wague and inconclusive. Perhaps it would be well to give them the advantage of the plans I have now had the pleasure of submitting to this assembly.

AN AVAILABLE PORTRAIT-GALLERY, LITERARY AND ARTISTIC.

MR. HERBERT WATKINS, of Regent-street, has MR. HERBERT WATKINS, of Regent-street, has formed a very interesting collection of portraits of men connected with literature, the drama, and the arts. It includes Charles Meekay, William Russell (of the *Timee*), J. R. Planché (a capital likeness), George Grote, Alexander Dumas, Bolle, Albert Smith, Hepworth Dixon, Bayle Bernard, Chas. Dunce, Strillag Corne Karan Wardness George Lavie Pencel. Gover, Kenny Meadows, Gover, Lone, Lewis Porocek, John Deane, Madame Ristori, Miss Cushman, Charles Mathews, Wigan, Harley, Selby, Robson, Gordon Cumming, Owen Jones, and others. Some of our readers may like to know that these are obtainable at

readers may like to know that these are obtainable at the cost of a few shillings each. Mr. Watkins has further made portraits of Lord Palmerston (excellent), Lord Stanhope, Lord Laus-downe, Lord Broupkann, and other distinguished men, to he published in Fry's "National Gallery of Photographic Portraits." The whole collection will he found in the gallery of the Att-Treasures Exhi-bition Building at Manebester.

THE VACANT AREA NEAR ST. PAUL'S CATHEDRAL.

METROPOLITAN BOARD OF WORKS.

ON Friday, the Sth, a deptation from the Royal Institute of British Architects, including Mr. Tile, M.P., Professor Donaldson, Miessra Angell, Mocata, Pearose, Mylne, Innuan, C. C. Nelson, A. J. Baker (acting as bonorary secretary), and others, presented a memorial respecting the preservation for the public use and enjoyment of the area rescontly cleared at the south-cestern angle of St. Paul's-churchy ard. After setting forch that the Lustine are be their

After setting forth that the Listitute are, by their charter, colled upon to promote both the "domestic convenience of the citizens and the public improve-ment and embellishment of towns and citizes" the memorial urged,-

"That the space in question, if loft open, would afford the finest point of sight for viewing the Cathedral of St. Faul, the unsterpiece of Sir Christopher Wren, and the solitient work of modern architecture in the kingdom. That to cover any portion of this space again with buildings would be a permanent source of regret, as it houses a second state of the space again with buildings would be a permanent source of regret, as it favourable as well for the fine perpenditive composition which it offers as for the advantage of a southern aspect.

It further showed that by preserving the area, a great improvement could be made in the line of traffic from the north.

traille from the north. Mr. Deputy Hurrison afterwards introduced a deputation from the Improvement Committee of the Corporation of London, on the same subject. From remarks made by the members of the depu-tation, it appeared that it had been in contemplation by the corporation to huild on one-fifth of the ground, and to leave the remainder unoccupied. There was a willinguess to give up the whole plot if the Board would aid in the contribution. The value of the whole of the area would be 75,0002. There was much debatting as to whom the matter

whole of the area would be 75,0007. There was much debating as to whom the matter should be referred to, but it was very favourably re-ceived, and was ultimately referred to the Works Committee, and not to the whole heard, by a large majority, namely, 25 to 3.

CLOCK FACES.

As inquiry having her made in your last number as to the best material for a clock face in an exposed position, and decasionally washed with the salt spray of the sea, I would strongly recommend a slate slab, having its exposed side painted with several coats of colour mixed with japanner's gold size, with just sufficient turpentine added to make it work easily, and dry without a gloss: the figures, &c., should be painted with colour mixed in the same way, without any oil, or heirs afterwards varnished. any oil, or heing afterwards varnished. I painted an ornamental clock face upon slate with

this colour, which is now as hard as the slate itself, and looks as fresh as when first fixed, although it has

her ios as a consect position more than eight years. I feel confident that sea spray would have no in-jurious effect upon it, as I have used the same ma-terial upon an old church wall, where a moisture, moisture, containing a considerable quantity of salt, is con-stantly oozing ont, but does not destroy the painting. II. B. HAGREEN.

COLOGNE CATHEDRAL

COLOGNE CATHEDRAL. WILL you allow me to say a few words in reference to Mr. Picton's remarks on Cologue C-thedral? I find that he thinks that "few would he disposed to donht that if Cologue Cathedral were completed, it would be the finest Gothic building in the world." Now, when I see this kind of expression of opinion in a guild-book, I am content simply to protest to myself against its truth, hut when an architect (as I). myseit against its truth; hut when an architet (as 1) pressure Mr. Picton to bo) gives this as the result of his examination of many churches in France and Germany, I fear, lest any should be disposed to acquiese to what he says, as said by one entitled to speak with authority, and I venture, therefore, to say a few words in arrest of judgment. Cologue, no doubt, has had the henefit of an architest who could not be because of the beam of the set o see the heauty of the French system of planning, and who had the boldness to follow it in preference to the See the nearly of the French system of planning, and who had the boldness to follow it in preference to the ordinary German plans; hut the evidence of a French origin stops here, and in every detail throughout the huiding there is most numistalcable evidence of a German, and not of a French artist. The conse-quence is, that the completed portion of Cologae is inferior in a very marked manner to the correspond-ing portion of Amiens, and many other French churches; and it seems to me that the works which hare being carried out for its completion, serve to bring ont this inferiority more and more clearly. In these days, when all ot us rightly think it our duty to study ancient examples of our art abroad, as well as at home, it is doubly necessary that we should dis-criminate carefully hetween the good and the bad schools of Mediaval architecture; and, much as I rejoice in the recollection of my visits to cburches in all parts of Germany, I am yet bold euongh to say, that there was no part of Europe during the Middle Ages which achieved so little of a really noble and thoroughly artistic character as a the next meeting, to be held on Monday serving.

⁴ At the next meeting, to be held on Monday evening, the 18th instant, the Earl de Grey, president, will present the Royal and other Medale. On this accession, also, the president will present to Mr. Pennethorne the Chambers Gold Medal, as a mark of respect from his professional brethren. Mr. Digby Wyatt will offer a few observations on the Sacred Grotto (Sagro Spece) of 8t. Benedict, at Subiaco, and its Monastic Institutions. — Earl de Grey, as president, will hold bis annual conversation on the 29th inst.

that country. Every one who bas studied French buildings of the Middle Ages with the same care must have seen bow far superior they are in almost every point of view. Their ground plans were so superior that the architect of Cologne rightly acg-lected his national traditions, and copied them. Their sculptors were among the greatest the world has ever seen, whilst those of the German churches were sinceplay deficient in grandeur or simulicity of were singularly deficient in grandeur or simplicity of purpose, and have left nothing fit to be compared with any of the great French works. In this respect, purpose, and nave feit nothing it to the compared with any of the great French works. In this respect, indeed, it would be a reductio ad absurdum to con-pare Amiens and Cologne. In the treatment of window tracery and of groining, the same inferiority of the Germans is always evident. I have long felt that this excessive admiration of Cologne and of other German works of the same date might prove most damaging to the revival of Pointed architecture among ourselves, and year by year the impression hecomes stronger on my mind. It seems to me that we run a very great risk in allowing ourselves to he captivated by the fantastic traceries of German win dows, as we so often do, and by the excessive display of personal conceit and ingenuity of device so common in Germany, and so destructive of noble art. At the same time, if we neglect the teaching of those great men, the French architects of the twelfth and thir-teenth easturies, we most unquestionably neglect the teaching of men who raised our art to a point of excellence to which no other school ever attained. I woold never ask men to cease to admire, and reve-rently sing Westpointer on File. exectione to which up other school ever attained. I would never ask men to ccase to admite, and reve-rently study, Westminster or Ely, Wells or Lincolo, or any of our countless relies of early art in this country; but I would, at the same time, most ear-nestly advocate the duty of studying Amiens, Romen, Chartres, Laon and the other great churches of Design aurocate the duty of studying Amilens, Rolles, Chartres, Laon, and the other great churches of France, not less carefully nor less faithfully; and when they have done this, I am confident that they will never allow themselves to entertain for an instant the question of the relative merit of Amiens and Cologne;—the one the shrine of sculpture and archi-tecture most exqusitely combined; the other the largest and grandest example of the cold ingenuity of a scientific architect,

GEORGE EDMUND STREET.

RUSTIC PLAGUE-SPOTS.

HAVING this morning heard of a sad case of desti-tution in a village called Liddington, three miles from Swindon, I swallowed a basty meal, and betook myself to the spit. The only sleeping-room of the miserable hovel is 13 feet long by S feet wide, and in such a place, huddled together, sleep father, mother, and ten children, two of them horn on the 2nd inst. within three hours of the toil-worn mother's return from laborious field-work

Three other children, aged eighteen, fifteen, and

The value provided for away from home. The nation looks for much of valuable reform in the existing Parliament, and I trust that insertion of this in your world wide columns will help to stir up philanthropists to prevent recurrence of such seenes philanthropists to prevent recurrence of such scenes as are here imperfectly sketched. The hovel is the labourer's own, built upon the waste land, in a most abouinable swampy lane, the only water-supply being from a fifthy pond in the rear of the hovel; which pond does also duty as a cesspool for the scourings of the lane dicth, into which all the privies in the lane are arranged to empty. It is felopy to attempt micide : so would I make it, henceforth, felony to huild a dwelling so nufit for human abode. Present possessors I would not deprive of their homes without compensation, hut I would render it impera-tive that the fitness of a locality should he certified are future habitations should he sauctioned; and that ere future habitations should be sanctioned; and that rent should not be recoverable in any court without production of such certificate.

C. A. WHEELER.

CONSTRUCTION OF FLUES

A GOOD illustration of the danger in which many houses are from had contrivance in the flues, was "florded a few days ago, at No. 7, John-street, Adelphi, where a fire suidealy broke out in a locked-Autiput of the states of the s inter, has been ensue whony constitute, or greatly injured. An extrance being effected by the firemen, through the window, the fire was extinguished, when it was jound that it had commenced in a fireplace, against which the chief of the articles consumed had here placed. The explanation of the origin of the fire was that the flue communicated with one of another need placed. The explanation of the origin of the fire was, that the flue communicated with one of another fireplace, and that burning soot from the one flue had fallen down the other. Indeed, the discovery was made by the noise that was heard in the flue, by a

would, doubtless, have been destroyed, and prohably the whole hlock of buildings between John-street and the terrace, would have shared the same fate. After this, the houses in the Adelphi may hardly he deemed turs, the nouses in the Adeppin may hardly he declined so safe as their construction in some respects would lead prisons to suppose. A vast sum was expended in the foundations, vaults, and hasements, as well as in the walls and staircases, and other parts of the superstructure, but many of the details of construction and convenience are very defective.

ACTION AGAINST AN ARCHITECT.

ACTION AGAINST AN ARCHITECT. THE EXPENSES OF ATTEMPTING TO REMOVE DEX NOT. This was an action bronght by Mr. F. Mulholland gainst Mr. E. Welly Pugit, to recover 84. 11s, 34. the balance alloged to be due to plaintiff. For estimations and the communition, called the balance of the state plaintift. The case was tried in the Bloomebury County and the appeared in ordinance the discase known ser rout bad got into some flooring at Blion Grange, then in his service at asalyst, aid the knew to no too, and the necessary chemicals. The plaintiff, who was near Rugby, and that the defendant had instructions to the necessary chemicals. The plaintiff, who was could be account of 18, 11s, 34, was given him, he asked the necessary chemicals. The plaintiff or which the account of 18, 11s, 34, was given him, he asked the necessary chemicals. The plaintiff with owas could be the account of 18, 11s, 34, was given him, he asked the plaintiff for the 181, 11s, 34, was given him, he asked the plaintiff for the 181, 11s, 34, was given him, he asked the plaintiff for the 181, 11s, 34, was given him, he asked the plaintiff hor the 181, 11s, 34, was given him, he asked the plaintiff hor a blaintiff, who was the second approprious of the composition. This was denied by the defendant, who said his only object was thibbert, and he had only that morning obtained it from the recover and the has only descended to 10, which depreses are the plaintiff with the chemical the max as the plaintiff with the defendant for the in given the head as the 185, for personal troubles of the proceedings, amounting to 14. 108, which defendant is to account before the action was throught: THE CANAVENES SOCIEFY AND ST. MAKY

THE CANYNGES SOCIETY AND ST. MARY REDCLIFF, BRISTOL.

THE tenth anniversary of the Canynges Society, at Bristol, for the restoration of the church of St. Mary Redcliff, was celebrated on Thursday, the 30th ult under the presidency of Dr. Symonds.

under the presidency of Dr. Symonds. At the business meeting, held after bearing sermon in the church, the report of the committee for 1856 was read. Donations amonting to 606%, odd had been received, hesides subscriptions amounting to 175%. 7s. Since last meeting, 750% had been con-tributed towards the restoration of the church. The donations included fire of 100%, each, promised on condition that 2,00% should be otherwise raised, but since paid without awaiting the fulfilment of the cap-dition on secount of the dangerons state of the fabric. since paid without awaiting the miniment of the con-dition, on account of the dangerous state of the fabric, particularly the south side of the elerestory of the nave: two of the windows were now in progress, hut more funds were much wanted, while the committee regretted to note a diminution of the annual subscriptions. Reports from the Commercial and the Ladi Auxiliary Associations, the commercial and the Latits Auxiliary Associations, the former announcing that 400, had now been collected, and the latter 280%.; this latter sum being for the restoration of the Ladye Chapel, were then read. Mr. J. S. Harford addressed the meeting, w

Art. J. S. Harrord addressed the meeting, while moving its thanks to Mr. Proetor, as chairman of the restoration committee. He alluded to a visit made to the church by the Commendatore Canina. The Com-mendatore, said Mr. Harford, had some prejudices against Gothie architecture, and he had heard him up to be the architecture. call it harbaric, a name which sounded harsh on the ear of oue atlached to that heautiful style of structure. can be one an achieved to have beaching style of solutions. On entering St. Mary Redeliff he stopped, and after casting his eyes around said, "This is the most hear-tiful building I have seen in England." He had been staying with the Duke of Northumberland, and had seen Edinhurgh, Lincoln, York, and some of the most distinguished cathedral churches: he mentioned, in

articular, York Minster. Mr. Proctor was also present, and addressed the meeting, especially as to the dilapidation of the edifice: he only wished some of them could he per-suaded to ascend the leads and look at the buttresses stands to ascend the leads and look at the ontresses and the multilons of the windows: they were positively dangerons, and yet a few hundred pounds now would do much to obviate what thousands shortly would be required to do. A lecture "On the Principles of Beauty" was afterword edimicad by the president Dr. Symouls

After a few preliminary observations on the Fiue Arts, the lecturer entered upon his immediate subject. Arts, the reduce entered upon instance solutions in the solution of the solution is the purpose was to endeavour to simplify the theory of beauty, and to bring its principles within the general laws of sensation and thought. He considered that heauty might be referred to four principal sources—lat. Sensation.—2nd. Thought and have by the loss in the upper part of the house. Reflection.—3rd. Moral Sentiments.—4th. Asso-Had the fire commenced in the night time, the two ciated Emotions. In the treatment of the first of houses, Nos. 6 and 7, which are in communication, these, he remarked that simple visual pleasure was the

MAY 16, 1857.]

germ of beauty—namely, that pleasure which consists of a mere agreeable impression on the nerve of sight. He then showed how n anumber of co-cristent or closely-successive impressions create pleasure on the several principles of similarity, variety, or contrast, and continuity. The effects of simple lines, both straight and curved, were briefly considered, and then symmetrical and harmonicus combinations of forms were entered into at some length. Dr. Symonds gave an exposition of Mr. Hay's system of harmony of proportions, and expressed, in strong terms, his admiration of the originality of conception, as well as of the persevering industry which Mr. Hay bad manifested in his investigation of the interesting subject, the results of which investigation had been embodied in several books by Mr. Hay. Having expounded Mr. Hay's invest, Dr. Symonds

Having expounded Mr. Hay's views, Dr. Symoods proceeded to give a theory of bis own as to the explanation of the cause of the pleasure which resulted from the contemplation of forms which might be analysed into angles bearing these definite proportions. The leading idea was that as those movements of the body which are performed in conformity to definite proportions of time and space, as in marching, or in dancing to music, are productive of satisfaction and enjoyment, so those delicate movements of the eyes which, if the eyes are carried over spaces of harmonious proportions, must also he regular and rhythuical, will be attended with a feeling of pleasure, which feeling constitutes a large part of the beauty in question.

Miscellanea.

ARCHITECTURAL PURLICATION SOCIETY. — The annual general meeting of the subscribers will be held at the Institute of Architects, ou Wednesday afternoon, the 20th of May, to receive the report of the committee on the general affairs of the society, &c. when, it is to he hoped, there will be a good atteodance, and that arrangements may be made to ensure the rapid progress of the "Dictionary."

MANCHESTER EXHIBITION.—In connection with the Exhibition, Messrs. Day and Son are about to publish a chromo-litbographic work, "The Art Treasures of the United Kingdom." The series will embrace — Sculpture—The Ceramic—Metallic—Vitreons—Textile—and other Decorative Arts; and each division of the work will be accompanied by bistorical and descriptive essays, and the work will be produced under the direction of Mr. J. B. Waring. Messrs. Calnaghi, too, announce a work, cutiled, "Gems of the Art Treasures Exhibitioo," from photographs by Messrs. Caldesi and Moutcechi, from the most interesting specimens of art contained in the Art Treasures Exhibition. It will be divided into two sections, one embracing the works of the old masters, in painting, sculpture, engraving, and the most interesting works in armour, glass, porcelain, carving, while the other section will be taked from the works, in oil and water colours, of the modern school, modern sculpture and carving, and from the collection of historic portrails.

CHELTENHAN SCHOOL OF ART. — Last week a conversazione, in connection with the shove school, was held in the rooms of the Literary and Philosophical Institution, which were decorated with easts, evergreens, and plants in pols; the drawings and paintings executed by the pupils being also arranged around the largeroom, for the inspection of the public and the government inspector, who was making his annual visit to the school. The evening's entertainments include a "Lecture on Gothie Architecture in connection with the History of the Parisb Church," delivered by Mr. J. W. Hugall, the bon. secretary of the school; the chair being taken by Mr. W. M. Tartt. This renaion marks the countencement of the fifth year of the school's operations, carried on under the present master, Mr. James P. Kuight, and au iofluential committee.

LIVERPOOL ARCHITECTIEAL SOCIETY. — At the closing meeting of the session, on Wednesday evening the 6th, Mr. Illugrins presiding, the bonorary secretary, Mr. Weightman, read the report of the society for the session 1856-57, from which it appears that there are 4 tile members, 6 houvary, 25 professional, and 124 associate members—in all, 178. The folhowing were elected the officers and committee for the ensuing year : — President, Mr. S. Huggins; Vice-presidents, the Mayor of Liverpool and the High Sheriff, ex officio; J. M. Hay, and G. Chautrilf; hon. treasurer, T. Horer; hon. Birarian and eurator, G. Goodall; han, secretaries, W. H. Weightman aud William Stubbs; Council, H. Cox, Frank Howard, J. A. Picton, J. Boult, and John Hay. The treasurer's report was uest read, from which it appeared that the income of the society during the year was 1366. 7s. 7d., and the expenditure 1327. 14s. 5d. The president then delivered a very able closing address.

THE BUILDER.

INSTITUTION OF MECHANICAL ENGINEERS, BIR-MINGHAM.—The general meeting of the memhers of this institution was beld on the 29th ult. at their house, in Newhall-street, Birmingham, when some new members were elected, and an abstract of an adjourned paper "On the Application of Steam Power to Agricultural Purposes," by Mr. W. Waller, of Lincoh, was read; as also a paper "on Steam Coltivation," by Mr. John Fowler, of London; and a "Description of Improved Machinery for Turniog and Shaping Wood," hy Mr. J. W. Wilson of Banbury. This machinery is being employed for the mnoufacture, ou a large scale, of long rounded poles, such as broomstells, &c. of which as many as one per minute are turned ont. The wood to be rounded is fed through grooved rollers to a couple of revolving cutters, carried on a face-plate rotating at a bigh speed, hy which it is rounded, and passes out through a circular dic or hole in the plate. The revolving cutters are made of such

rounded, and passes out through a circular die or hole in the plate. The revolving outters are made of such ashape as to last for a long time without sharpening. SCOTTISH ART MANURACTURE ASSOCIATION.— The prize of twenty guineas, offered by this association for the best design and model of a useful and ormanental article of art manufacture, for general distribution among the subscribers, has been awarded to Messrs. Les Frères Wills, of London ; and the committee of management have adjudged an extra prize of five pounds to Mr. James Annon, junior, of Edinburgh, the unoid given in by him having been much approved of The models offered for competition by Mr. George Brookes, of Delkeith, were coasidered entitled to honourable mention.

INAUGURATION OF THE QUERN'S STATUE IN PEGL. PARK, SALFORD. — The ecremony of unväling the statue of her Majesty, erceted in commemoration of the Queen's visit to Salford in 1851, was performed on the 6th inst. by Primee Albert, in the presence of the mayor and corporation of the borough, and many thousands of spectators. The statue is erceted immediately in front of the new library and museum facing the road, and near the entrance of the park. The pedestal is of granite, and the Queen is represented in her state robes, and with a small coronic on the head. Mr. Noble was the sculptor. The Prime visited the Museum and Load Art-Exhibition at the same time, and was received there by Mr. Hammersly and a deputation of the committee of contributing artists.

Pictrication of Rivers. — Mr. John Buck, M.R.C.S. delivered a lecture on Thursday in last week, in the Maachester Town-hall, on the method of eleansing the river at Leicester, employed hy Mr. Thomas Wicksteed, C.E. The lecture was given under the anspices of the Manchester and Salford Sanitary Association. The chairman, Alderman Baacrott, said he had attended as one of a deputation from the Macobester council to Leicester respecting the cleansing of the river, of which a report had been presented to the general purposes committee. He must confess he saw difficulties in the way of adapting the principle employed successfully at Leicester to the three Manchester rivers, two of which had streams of eighteen and twelve million gallons per day. The Rev. Canon Richson, as chairman of the association, introduced the lecturer, and remarked that the experiment tried at Knott Mill had proved its practicability. The obstrict of the lecture would be a further step in the same direction. Mr. Buck hen explained Mr. Thomas Wicksteed's system of sewage and deodorising by means of diagrams, and pointed attention to the happy sanitary effect the drainage and deodorization had had in the town. In the discussion which followed, Mr. Richardson, sanitary inspector, said he thought the sum required to purify their rivers would he two or three hundred thousand pounds, and he doubted if it could he done at all unless adjoining towas cleansed the rivers which flowed into the Manchester streams. There were also the rights of water-war, &c. to be contended with. Canon Richson said that the association, without pledging themselves to the sebme described by Mr. Buck as the best, merely wished to show that the thing was facasible, and that there was ground for asking the help of the authorities in the matter. Mr. Buck added that mech moncy had necessarily been spent in Leicester in trying the plan, which would he saved elsewhere. Sr. MARLEBONE CEMERENT 206. — Can you

ST. MARYLEBONE CEMPERT JOB.—Can you collipbte me and mary fieldw-sufferens as to the likelihood of any satisfaction being got out of the parties who mismanaged this affair, or if the question is to be considered as buried with our money; and if the same persons will offer to oblige us with their services again in the proposed new job no to a school for the paper children.—A (FIRST) RATE PATER. The same children.—A (REST) RATE PAYER, THE ACADEMY DRAWINGS.—In your report on the architectural drawings of the Royal Academy, you say, "Town Hall at Cork, Ireland." That is an error in the catalogue: it should be "A design for the proposed Town Hall, Cork, Ireland." I hope you will correct this in your next, as it may lead to error. Jour P. JONE P.

POLICE TRESPASS.—Under Buildings Act.—In the Vice-Chancellors' Courts, before Sir R. T. Kindersley on Thursday in last week, a motion for an injunction against the Commissioners of Police was brought on, The question was, whicher undyr the Metropolitan Buildings Act (18th and 19th Vie., c. 122, ss. 69 and 73), the Police Commissioners had a right to enterupon the premises of the plaintif, Mr. Addison, Iving at No. 6, Delahay-street, for the purpose of repairing or underpinning the wall of his neighbour Mr. Henry Richardson's house, which wall was admitted to be in a dangerous or inscence state, and had been so represented by the plaintif himself to the commissioners, who had acted under a magistrafe's order, giving them power to enter, and repair the wall. After some discussion the Vice-Chancellor gave the following judgment :— I inhak this is a very plain case. The injunction must go. The plaintiff has a right to he protected from any person coming on his premises. It appears to me that the language of the Act of Parliament is plain. A justice of the peace makes an order upon the party to 'take down or otherwise secure the building to the satisfaction of the surveyor." If that is not done, the commissioners are not ordered to do, but they may do what they think requisite. They may take down, repair, or otherwise secure : but is their anthority. I thick that hey were bound to exercise that authority if there were really danger. But does that justify think not. I am not meaning to say that there might not he a case of such extreme pressure and necessity sub this Court would not interfere to prevent them. I do not see here the smallest symptom of danger to the public. The wall is already shored up by the plaintiff imself. It is not an external wall, producing a possibility of danger to passengers. Therefore, it appears to me that supposing a very extreme case might justify trepassing on another man's land, that case does not exist here. As to tha threr is no constrailetion in the fidewits. The injunction mu

or further order. GUEAT BLAST AT ILOLYHEAD. — Some of our readers who may be going to Manchester and others will probably be glad to know, that on the 21st inst. a grand blasting operation, in which 18,000 lbs. of powder will be used, under the superintcudence of Messrs. Rigby, the contractors, is to take place at the Holyhead Harbour Work Quarries. ENGLISH AND ERISH MACHETIC TELEGRAPH COM-

EXCLISH AND HEISH MAGNETIC TELEGRAPH COM-PANY.-The annual general meeting of the sharebolders in this company was held in the Clarendonrooms, on Tuesday in last week, Mr. J. C. Ewart, M.P. in the chair. The report called attention to the steady improvement in the receipts, not only during the past year, but from the commencement of the company's operations; and to the fact that, although the business transacted by the company during the last half-year of IS56receded that of the first half-year by 1,200%. the working expenses were less by 400%, notwithstanting a large additional expenditure incurred in the repair of lines, injured by severe storms. The directors had earried out the amalgamation helween the Magnetic and British Telegraph systems, and had every reason to be satisfied with the results of the union. The chairman mentoned that the company were receiving neurly I50%, a week from the agent of the Submarine Telegraph Company, which had never here, the ease heretofore.

heen the case herefolore. Worntrusto DuarNAOS.—Messrs Frend and Hamill complaie that in our account of "Worthing Water-Tower and Engine House" they are not mentioned. If they look again they will find they are in error. They say further—"As you have hroached the subject of the drainage of Worthing, will you allow us to inform you of a peculiarity in the mode of carrying out the house-drainage of that town. The resident engineer to the Local Board of Health, at the same time that he is acting in this capacity, is contracting for house-drainage, and executing it inder his own direction, or under no direction at all in other words, a pait of the town is being drained by a contractor without any engineer to plan the work, or to control its execution. This is not very likely to ensure to Worthing a sound drainage, for the private or house drainage is as much a part of any system pursued in draining a town as is the main or public drainage, and the imperfect construction of either will be sure to prevent the efficient action of the whole."

BATTLERSEA PARK.—Great excribins are being made to throw this park open to the public by August. The excavations for the oronamental water are completed, and the walks are nearly all ready.

THE GRAIN OF STONE.—Can any of your correspondects tell me of any composition which could he applied to stone columns with a view to hring out the grain and veins of the stone? I have four sandstone columns in a hall, which are of very varied enfours, and which would he very bandsome if stained and polished. Could they be afterwards varnished, or should they he polished ? and with what?

QUERIST.

ARCHITECTS' BILLS.—At the sittings in Banco, at the Bail Court, hefore Mr. Justice Coloridge, last week, a case, Simmondo: N. Moss, was argued upon a rule for setting aside an award by a juryman, who had been selected at the surgestion of the judge (Mr. Justice Crompton, at Guildhall), the case heing one savouring much more of necoult and filness for exa-mination by an arbitrator than by the Court. The case in question was an action to recover 1527. 35. for work and lahour in surveying; and there were two pleas,—never indekted, and a set-off. The award of the juryman, as arbitrator, was that the plaintif was calified to 1527. Sa, and that 537. 65. was due from, plaintiff to defendent, leaving a balauce of 987. 68. due to the plaintiff. Gross misconduct on the part of the juror arbitrating was alleged as a reason for setting aside the award, hut Justice Cole-ridge said that the allegations of great noise, tunult, partiality, and interruption, had been met in the most charged, and, considering the gross inputation thrown on the arbitrator, discharged with costs. MARTEMENTAL TEST OF THE CAUMIN VIADUCT. —The Taff Vale Extension of the Her-ford and Aber-gareeny Railway being nearly completed, an effort is being made to open it ou the Ist of June. "From

EXPENSENTAL TEST OF THE CRUMIN VIADUCT --The Taff Vale Extension of the Hr-ford and Jack meing made to open it on the 1st of June. "From its light and aerial construction," says the Star of Gueard, "it appears to the eye more like a piece of orramental net work—which might possibly be able to hear the weight of a foot passenger,—rather than a piece of mechanism of almost incalculable elasticity and strangth." The engineers and contractors can-cerned in its construction, tested the structure last Marcell, "It construction, tested the structure last Marcell, "And Marcell, "Sers, Kennard, G. Sayer, and Mr. Kidd, manager, Crumlin Works, Ec. Sayer, and Mr. Kidd, manager, Crumlin Works, Ec. Sayer, and Mr. Kidd, manager, Crumlin Works, Ec. Gaver, resident engineers vill costs. Kennard, G. Therevention or Sours,—The Saerdary of the Efforts of the Compare way and the man int and the

Maring. Drive the optimizer for truth, the sub-will be tested by the Government inspector. **PREVENTION OF SOUND.**—The Secretary of the Fibrous Slab Company says;—" I have just read in the Bailder of the 11th April an article containing a foreible description of the inconveniences attending the transmission of sound through ceilings and party walls, and an appeal to men of ingenuity to step forward and remedy the cvil. Allow me to inform you that the appeal, so long and so often repeated, free-proof, and sound-absorbing, shown by you to be o desirable, has heen produced. The patent wood or fibrous slab, among the advantages it has over the ordinary substance, some of which have been already pointed out in the Bailder, possesses that of being a non-conductor of beat and sound." WEEKLY RETURNS OF LINESS on DISEASE 18

pointed out in the Builder, possesses that of being a non-conductor of beat and sound." WEEKLY RETURNS OF ILLESS ON DISEASE IN THE METROPOLIS.—The Registrar General's weekly returns of deaths in the metropolis have now a promising auxiliary in a Board of Health weekly return of cases of illness short of death, the number of which is not included or implied in the number of actual deaths registered : in other words, the record of deaths very imperfectly represents, except to the most initiated, the multiple of sickness to which it corresponds. As justly remarked by the compiler of the new returns, Mr. Conway Evans, "To be warned is to he armed : so far as individual life is concerned, the warning of the death register is too late; sofar as sociarly is concerned, it is both too late; nod as sociarly is concerned, it is both too late; nod as sociarly is concerned, it is both too late; nod as sociarly is concerned, it is both too late; sofar as sociarly is concerned, it is both too late; sofar as sociarly is concerned, it is both and therefore, in the different districts of the metropolis, have united in an endeavour to ascertain the number of cases of illness of disease which arise in course of each week in their respective districts. The returns for the few weeks already printed are far too imperfect, as yet, as basis for useful inference; but it is to be hood that the officers of bealth will soon be effectually aided in their purpose both by hospital and other public authorities, and by private practitioners. EXAMINESE UNDER THE BULDING ACT.—At the last meeting of the Lastitute of Architers, in econ-formity wilb the recommendation of the conneil, the following geulemen were appointed to act as examiners under section 33, Metropolitan Building Aet, 1855,—

THE BUILDER.

WEILINGTON TESTIMONIAL, LIVERPOOL.--Read-ing in the last number of your valuable publication an account of the manner in which a competitor's drawings for the above had been treated by the ser-vants of the Testimonial Committee, I imagined you would not mind my troubling you with a few lines on the subject. My design, a drawing on D elephant paper, properly stretched on a frame, in the usual manner, was returned to me, having had some other frame forced quite through it, entirely spoiling my drawing for any purpose. As a proof that it was not done in the transit from Liverpool, the covers and thick mill-board in which it was packed were main-jured. Is there any refress in such a case ?--C. ELECTRO.TELEGRAPHIC. - In two months, we bear, the electric telegraph will be laid through Cora-wall to Plymouth, and Liskeard, Truro, and Fal-month are also about to be brought within the general electro-telegraphie organization, or innervation, of the

Builder. The

Vol. XV.-No. 746.

HE Exhibition of Designs for the Government Offices, and improvement of Westminster, continues to demand a large amount of attention from all who would properly avail themselves of the extraordinary opportunity for study afforded by the drawings and reports. To come to real conclusions on many points, or even to see the designs, is a work of enormous lahonr, and one involving long We and patient examination. are not in the habit of asking the indulgence of our readers but certainly there has been no case where we might so well

claim to be absolved from the effort to give at once, particulars-such as could be of the slightest use-after the limited opportunities that we have had to the present moment. The judges will he better than we are in professional subjects, if they do their duty in the time that we are taking abont onrs. The majority of the journals have ahandoned the subject in sheer despair of it .- sometimes having had to eatch at any numbers of designs, so as to fill in any way paper and type. Never before have we had the misfortuue to see so many false descriptions - such confusion of terms, and what is worse, of things aud ideas; and so generally loose a grasp of the matter in hand. At this rate of progress, the teachers are getting helind the knowledge of the publie. For the present, indeed, we fear there is an influence exerted even over opinions of architects, tending to a disproportionate estimate of the effort and the object in such a case as this, and of the positive time and consideration needed

for any judgment of the result. There is a limit to what can be done, even in these wonderful days. We do not expect a man to read through Homer in a few minutes or an ordinary person to master a language, as Sir John Bowring is said to do, before breakfast. From the devotion of centuries to a single cdifice, architectural practice has heeu lately running to the opposite extreme,-and by omitting much of that consideration and thought which are preparatory and requisite to the intended result, and are conducive, indeed, to the facile realization of it. One of the journals -referring, we suppose, to onr remarks on the inadequate time allowed and other points in the announcement of the competition-speaks of the course as "successful, notwithstanding the opposition of many architects, and the erities of the building press, who dared to restrict the competition by numerous conditions" (though onr complaint was rather of restrictions and conditions really imposed hy others), "and who declared the time given to draw the plans was insufficient. The fallacy of those anticipations is shown by the fact that there are no less than 219 competitors," &c. &c. Now, observe the notion which the writer bas as to the production of what he calls "plans," as to the production of what he calls "plans," taking,—that is to say, the giving premiums for which he evidently thinks require only a certain cach of the advertised objects to the same com-construct the same comeffort of musele, like drawing a cheque, or Saxon, Norman, Gothie and Modern Gothie," again, of the "Doric and Ionic styles," of " the Italian order," and "the Anglo-Saxon style."

to speak iu their own way, and get on at their own rate. We know the conntry, perhaps, and are not such daring riders.

We must give the bulk of this article to some general observations. Begging again to referless in justice to ourselves than to the profession -to remarks we have made respecting the autieipated result of the competition, we find it necessary to say, we did not predict that few designs would be sent in. We said the reverse, that there would be more drawings than the Hall would well contain; and so it has turned out. It has also been proved that onr frequent assertions, as to the real ability and taste which might be found in the profession, were abundantly warranted by the facts; and that the animadversions so hastily made upou "our architeets," from time to time, by the leading journals, should have been directed elsewhere. We did say that the competition itself, from the terms of its announcement, would be a failure as to the main objects. Great praise may be due to the Government, and the Office of Works, for the desire properly to reward competitors : those who contribute so largely of their time and money should have some hetter chance of compensation than is in ordinary eases allowed them. But, bccause designs are received, and taste and talent are displayed, it does not follow that the object has been answered, and that the public money has been devoted to premiums in the best manner for the country, or even for the profession. At Peel Castle in the Isle of Man, some five and twenty years ago, the old bomhardier who had charge of the ruins nsed to conduct visitors to a certain excavatiou in the ground, whereat he would ask if they had ever heard of a mau thirty feet in height. On the reply, he would point triumphartly to the treuch, saying,—"That grave is thirty feet long." The reasoning of the newspapers, as to the present competition, has been of the like conclusive character. We onrselves, must ohserve as applicable to the majority of the designs-and amongst the number to some which afford evidence of high professional skill-that the chief objects of the competition are not attained. Good as the designs may he in many respects, there are, we may say, none, which do not appear to us as exhibiting a measure of ability below what might have been expected from their authors, had sufficient and ample time heen allowed to the study and preparation for a project which not alone ourselves, or English architects, see, was one perhaps the most comprehensive and varied in its character ever submitted for professional consideration. In some cases, tolerable plans are found, with hastily designed elevations; in other cases, the drawings do not do justice to the real thought. It has resulted from the terms of the announcement, that the block plans are, in the majority of cases, almost valueless. In all cases, the scope for useful suggestion, either as to the general site, or the distribution of the individual Offices, was reduced to the narrowest limits; and even the general street plans-useful as some of them will be--cannot be considered, any one of them, so far original or claborate as to deserve a premium of 500%. Moreover, as we and everyhody foresaw, it is impossible for the judges to escape the dilemma-resulting from the impossibility of using designs hy dif ferent anthors for parts of one integral underpetitors-in which case a very large proportion drawing a cork. We pass over the mention of clever designs would be nnrewarded—or the which has been made of "all *styles* of architee- mere division of the awards on a principle thre — Dorie, Ionic, Corinthian, composite, which is not that put forth, and pays no regard to proportionate merits. The latter course eligibility from a public exhibition. These would remind us of the story told, we think, by points we should not have felt less hopeful of Italian order," and "the Auglo-Saxon style." Punch, of the one successful adjudication by a obtaining than under the present arrangement; We must leave the influential organs of opinion "third party," in a dispute between husband and we think it very likely that the superior

and wife, and the impurtial justice of thrashing both.

Disregarding for the moment the connection of the two Offices with the general arrangement, let it be recollected, that some of the sets of drawings which will probably receive preminms, show the two Offices either in one arrangement, or really in a connected design. How, then, according to any principle of fair adjudication-better than "tossing up for it " amongst the competitors-can one design be rewarded witbout an equal reward being due to the other?

Supposing, as we are inclined to think may he at present intended, that a premium is given to a block plan, and a premium to another competitor as the anthor of the best design for one of the Offices,-whichever of the two competitors is commissioned to make the working drawings, he will have to make a fresh design for his own, or the other portion of the general scheme,-whereby, cither he will be in effcet not premiated for his first design-having already spent the amount in preparing it, whilst it is reudered useless-or the country will he paying one or more premiums, without their conducing to the object in the manner which was coutemplated. This course, or any other which is, as we may designate it, disorderly in point of judgment, cannot conduce, as the present occasion might have been made to do, to the objects of all parties. The course which was really open to the Government, might have been either to have, as we were first disposed to recommend. a preliminary competition for the block plan, or to announce only one comprehensive set of preminms. The designs which are the most practicable, are it will be observed. all prepared ust as though this last had been the principle of the competition-the circumstance thus pointing to the conclusion that if "concentration" of plan and unity of design are to he hest attained, the whole work of the offices, if not also of the improvements connected with them, must be that of one directing mind. If on such supposition the work appear to be of vast extent, this shows only the necessity of taking up the design on a correct logical foundation, and of giving far more time than has been given in the present case, to the study of the subject. Indeed, we must admit, that a separate competition for a block plan is consistent only with the employmeut of the successful competitor on all the fnture designs, or with the alternative that unity of decorative character-as really requiring the employment of bnt one architect-should he not sought for. We have taken occasion to speak of some of the "block plans" in the present compctition, and may have to name others, as not only having the appearance at least, of the study of the wants of the several departments-which, more than a "block plan," is really what the Government required for their handsome premiums, but as having the buildings grouped with precise attention to symmetry. Would not the several parts of such projects require that they should be completed by the same hand f

But there would have been advantage in another respect from a different course in the iustructions, namely, that-whether having one or more competitions-suggestions could have been received for designs without the restriction of the "red line." The designs sent in, it may be said, would have been widely asunder in their principles, and would have given some difficulty in comparing them. But the question there would seem to resolve into-sufficient allotment of time for examining the drawings, and compensation to the competitors by money aud the

being found now. We should also observe, as to the choice of a different site, that it would not only have allowed of the appropriation of some or all of the present proposed ground to the purpose of a park, as recommended in several quarters, and lately, in a pamphlet, by Mr. Beresford Hope, and evidently thought of by some of the com-petitors, that it would have got rid of much of the difficulty which we apprehend there may he from the vicinity of the Abbey to the Honses of Parliament, heriveen which and the Offices it is Parliament, hetween which and the Offices it is clear there must be either assimilation of style, or some discordance and mutual injury. The perception of this circumstance has led some of the competitors to contend stoutly for the Gothic as a style, others to select the Elizabethan or Jacobean, as likely to prevent the harsh contrast which there might be alternatively at the Whiteball end, or at the south, and others to put forth as far as possible a new style with the same intention. Believing, as we have often urged, that architecture would be better underurged, that architecture would be better inder-stood and appreciated by the public were there bat one prevalent style, we think the question as to Gothic is whether it is likely to become soonest the style of the day, and if not, where in using it in a city we are to break off. What soonest the style of the day, and it not, where in using it in a city we are to break off. What-ever the style of the future, no douht it will be one owing much to the Gothic; and we are content for warranty for arguments that we which the present exhibition affords of the change that is going on in modern Gothic architecture itself.

There exists, we have said, very widely-Spread misconception as to the thought and labour needed in a project of this nature. A few months were abundant to get from A few months were anundant to get from our friends evidence of their taste and pro-fessional abilities, but were utterly inadequate to the object in the particular case. That enough has heen done to provide food for long and patient study, we well know, as also that no adjudication which can be just by the terms of the competition, or approach to giving satisor the competition, or approach to giving satis-faction, can he made, without an amount of trouble out the part of the judges which has never yet from any case been conceived or expected. We would, however, urge that there are interests here been when the set of of the competition, or approach to giving satisinterests both public and professional extending over the present juncture; and, allowing the justice to architects of liberal preniums—nay, contending that both the public aud private interests arc served hy compensating our interests are served by compensating our profession for its lahours, we yet appre-hend the danger of some disastrous revul-sion in the public mind, or in Parliament, should it appear that the expenditure, even of 5,000*t*, has not directly served its object. The objects of the Government, whether as to the better organization of the public service, or the improvement of the metropolis by hetter com-munications, and by the display of art in archi-tecture, should have the warm advocacy of tecture, should have the warm advocacy of every one. We regret to see any question made as lately in the Upper House, as to the real public demand for what the Government have proposed doing. The economical question has been gone into often enough, and we thought was uncontested; and even if the hire of offices now costs only 30,000/. and the in-terest of 1,500,000/. purchase-money of land, would be at 4 per cent. 60,000/. it does not follow that this correctly represents the money difference now, any more than it would do in future after the increased requirements as to business, and the probable rise in the value of premises. The objections raised by the Duke The objections raised by the Duke premises. of Somersel, and others, only show to us the necessity of at once proceeding to obtaining the whole of whatever site may be decided upon a general design adapted for it.

These points have appeared sufficiently important to he recorded, to keep us long from the continuance of the remarks on the several

eligibility of some one site would have stood are numbered 54, and bear the motto "Suaviter eligibility of some one site would have stood out so prominently in connection with a good plan and design, that there would have been veren less difficulty in selecting than, perhaps, is being found now. We should also observe, as to the choice of a different site, that it would not only have allowed of the appropriation of some or all of the present proposed ground to the purpose. Of a park, as recommended in several quarters, and lately, in a pamphilet, by Mr. Beresford Hope, and evidently thought of by some of the com-petitors; hut it would have got rid of much of the difficulty which we apprehend there may he in many cases where a principle of distribution similar to that of the present designs has been followed. The Foreign office and War office are treated, as by most of the competitors, in one design ; a carriage way separating the offices, on plan. Looking at the Foreign-office plan, the chief rooms are seen to surround a court-yard, the entrance to which-also for carriages-is at the east, from the way previously mentioued; and opposite-across the court-yard-is the minister's residence, with two principal staircases in it, one on each side. Similar staircases occupy the like relative positions to the entrance, in the official department. The plan of the Warofficial department. The plan of the War-official department. The plan of the War-around two oblong courts, whilst in the eastern portion of the building there is a hall with gal-leries, the height of several stories, from which the main corridors lead out. The lighting in the first decime however, appears to be the the first design, however, appears to be the hest, as by means of recesses about the court-yard, light is obtained for the corridors at inter-wording to prove in the the other than the yard, light is obtained for the corridors at inter-mediate places in their length. The decorative character of the design is given by buttresses and pinnacles, traceried windows, high-pitched roofs and gables, oriels and dormers, parapets with elaborate bratisbing, and octagonal masses at the angles of the buildings erowned by conical roofs. The War-office exhibits in the centre of the front a large six-light window, under a gable, and octa-gonal utrests and pinnacles,—the window lighting the ball before menutioned. In the designs in the French style, 51*a*, for the octa-gons on the plans, quadrangular masses are gons on the plaus, quadraugular masses are substituted, carried up as pavilions, with curved roofs; the centres of the principal fronts being crowned by domes, one quadraugular on plan. The Foreign-office, as seen from the Park, has two principal stories of coupled columns or pilasters, arch-headed windows, and columns or pulsaters, arch-headed windows, and a Mansard roof, with dormers; the masses at the angles (of three intercolumns) heing carried np a third story, and finished with a pediment to each face, above which is the curved roof. The roof to the central mass is raised on an attic, or podium. Some of the pavilion roofs are formed of curves of contrary flexure, and are very effective. The design No. 56, "Aucora Confidentia,"

by whomsoever it may he, exhibits a high degree of art in its composition; and it is one that we are the more disposed to notice, as, that we are the more unspect to unspect of from the absence of perspective drawings, and the position in which the elevations are hung, it may not receive the attention it deserves. The may not receive the attention it deserves. The author exhibits a general block plan, and separate drawings of his design for the Foreignoffice and War-office, which again arc united. We discover that be would retain the site of Westminster bridge, and also, like most of the competitors, Sir Charles Barry's existing Board of Trade. At the back of the latter he shows On the space of ground west of Parliament-street, and between Great George-street and Downing-street, he would create two similar structures. Of these, one is appropriated to the Foreign-office and War-office, and is shown surrounding a court 280 feet by 120 feet, surrounding a court 250 lett by 120 lett, the huilding on three sides being of three stories, besides an elevated basement story and a very loity trancated roof with dormers; and the portion, filling in the fourth side next Charles-street, where the entrance-gate is, heing of two stories. The Foreign-office residence is in the south-west of the building. The plan has an ample provision of stair-cases, and glazed areas and courts lighting designs in which we had not been able to eases, and glazed areas and courts lighting includes a general street plan, a block plan, advance far when we broke off last week. the corridors. Ventilation, also, has been well and views and elevations of designs for the Two designs, one for the Foreign-office and considered. The height of the hasement above offices generally, and separate drawings for the the other for the War-office, in the Gothie style, the ground-line is advisedly designed, having Foreign-office and the War-office. In the first-

regard to the appropriation of that story in the particulars, and to the difficulties of the site for drainage; hut the author, not unreasonably, suppose that the printing department might be supposes that the printing department might be placed more advantageously than as intended; and he therefore provides the rooms in bis lofty roof as an alternative. The style may be called Early Anglo-Italian; but, whilst the general character is Jacobean, there is little or none of the peculiar ornament of the last-named style, whilst in its place there are claborate re-dimens in proveds on the tarses of certain broad lievos in panels on the faces of certain broad areness in pairs, by which cach front is divided into a number of bays with many uniform win-dows and pilasters. The rustication of the masses is especially well grouped and varied. These piers are carried up, admirably studied become the ord are composed by the define. throughout, and are surmounted by the chim-

neys. 'Ihe design for the Foreign-office, numbered 58, and marked "Opera S1," and that for the Warsoffice-60, "Mars, Z,"—are spoken of as by Messrs. Banks and Barry. Under the first by Messrs. Banks and Barry. Under the first number, are well-studied street plan and a block plan of the Offices generally. In the street plan, the principal features, as shown, are the reten-tion of the site of the new Westminster-bridge; a hridge at the Horseferry; the widening of Hungerford-bridge, with a curved approach from a point east of Northunherland Honse; a crescent near the end of this bridge, with streets radiating—one to the Strand, opposite Bedford-street, and one to Whitehall-place—an emhaukment passing under the bridges, but Bedford-street, and one to Whitehall-place—an emhaukment passing under the bridges, but which, as in many of the designs, does not seem to provide any docks or receptacles for the harges, and joined to Whitehall by a street opposite the Horse Guards; communi-eations between Charing-cross and the Mall, and the Haymarket and Westminster by a road west of the Parade; the enlargement of the Hospital, removal of the Sessions-house and of the Margert's Church : the retention of the St. Margaret's Courch; the retention of the present Board of Trade building, new huildings being erected at the back; and the arrangement using created at the back; and the arrangement of the Parade on a regular plan. In the block-plan, the ground west of Parliament-street is divided into four blocks, one of them being made to correspond with the present Board of Trade; and on the opposite side there is a street numing in an chlima direction from (f Darade running in au oblique direction from "Downing-square" at the north end of Parliament-street, opening out a view of the clock-tower of the Houses. The "square" would require the appropriation of part of the site of Richmond-terrace. Astreet called Richmond-street is shown in place of the "Mews." Of the designs for the two chief Offices, only that for the Foreign-office ander the No. 58, quite accords with the blockplaus. The two Offices are separated by a street crossing Charles street, proposed to he called Clarendon-street. The Foreign-office has a Clarendon-street. The Foreign office has a quadrangle with a screen of five arebes and coupled columns. In the careful report accompanying the designs, it is stated that one-sixth of the gross area of the buildings in the Foreign-office is required for internal courts; and as to the question of one general huilding or two for the Foreign-office and War-office, it is doubted whether there is any ecouomy of space by having a single building. The rooms are distributed whether there is any ecouony or space by laving a single building. The rooms are distributed round courts; but the corridors in oue building, are not so well lighted as in the other. In deco-rative character, whilst the War-office is de-signed in the style of James I. the Foreign-office is of rather later Italian character. The latter exhibits superimposed pilasters, clustered in the centre of the front, arch-headed windows with dressing festions, a balayttade and vases, with dressings, festoons, a balustrade and vases, masses with high roofs, and chimneys at the angles of the building. The other design has

masses with high roofs, and chimneys at the angles of the building. The other design has rusticated pilasters, and has bow windows and others with multious and transoms. In No. 59, "Matter of Fact," though one portion of the corridor would be dark, areas or well-holes for light at the angles form one of the hest features in the design. The arched and coffered ceilings of the rooms are not with-out merit, hut the external details, which are of Italian obspracter, are commonlacc.—No. 61, of italian character, are commonplace.—No. 61, with the moto "Anglo-Saxon" in a circle, includes a general street plan, a block plan, aud views and elevations of designs for the

named plan, Westminster-bridge seems to be moved to a site north of Richmond-terrace. The present Board of Trade is removed, and the whole space "bounded by a red line" is treated as one design. Parliament-street is intersected by an oval *place* of covered ways, which are much used elsewhere, and is crossed by two archways. Ou the south, in Great George-street and Bridge-street, two similar elevations office and the War office have large open courts, with corridors lighted from them. The former Office has an inner hall or entrance corridor, 130 feet by 30 feet, with coupled columns and corridors round, forming what we may call aisles, through the coiling of which light is admitted. There are two versions of the de-sign, one in the English style of Elizabeth, and the alternative desire in the side househ, the alternative design in the rich French style the alternative design in the rich French style of early portions of the Lourre. Each specimen of style, as treated, has certainly merit. In the view of the Park front of the Elizabethan buildings, the residence of the Foreign Secre-tary, First Lord of the Treasury, and Chancellor of the Exchequer, are shown with arcades in the recesses in the lower story, loug projecting porte-cocheres, and the characteristic details of coupled and rusticated nilasters. multioned win. coupled aud rusticated pilasters, mullioned windows, and scroll gables. The ends are massed, with octagonal turrets at the augels, and an octagon and large crown in masonry in the centre. The other design has superimposed coupled columns, arched windows, and subsidiary orders; pavilions with high truncated roofs, and curved pediments broken for the insertion of sculpture; dormers; and caryatides. This design is very elaborate, and the interior decora-tion has been well studied. Arches, as before,

cross Parliament-street. No. 62, "God save the Queen," includes a street plan, a block plan, and a design for the Foreign-office and War-office in one building. This is joined to a building of corresponding design southward, by columns, which are pro-fusely employed throughout the design. There appear to he four stories, besides an open loggia or helvidere over the whole roof. One design for the Foreign-office is shown in the style of Windsor Castle. The corridors are lighted through the floors. No. 64, "Well considered," is shown in an

No. 64, "Well considered," is shown in an claborate set of drawings, about seventeen in number, including several large perspective views, and comprising a street plan, a detailed block plan and general views, and drawings of the Foreign-office and War-office separated by a covered street. The general plan scems to contemplate the retention of the site for new Westminster-bridge; but like some other designs which we have nuticed makes the misdesigns which we have noticed, makes the mis-take of showing the additional width on the *down* stream side. It also provides for a bridge at the Horseferry; the widening of Hunger-ford-bridge, with a curved approach from a point east of Northumberland Honse (a proposi-tion mkink as in other dozine with the curve tion which, as in other designs with the same feature, we may say would hardly place the route from Trafalgar-square in the most advantageous position); the removal of Dover-house, to provide an approach to Whitehall for the to provide an approach to Whitehall for the royal processions; the preservation of Sir Charles Barry's building, and the removal of St. Mar-garet's Church and formation of a square next the Abbey. The ground next the river is proposed to be given to the Ad-miralty, Home-office, Board of Trade, and Colonial-office in one block, having colonnades on a padium, two principal stories, and an Colonial office in one block, having colonnades on a podium, two principal stories, and an attic, a decastyle portico, and a dome above. Statues, fountains, and candelabra, are disposed about the area, south of the building, and on the embankment. In the length of Parliament-street, the War-office, and Paymaster General's-office, exhibit two similar fronts, with a central street. Looking at the War-office, there is a grand areh of entrance to an open court, next which the principal corridors are placed. From this court: crossing the accridor, a circular hall grand arch of entrance to an open court, next which the principal corridors are placed. From this court, crossing the corridor, a circular hall is reached: around this the staircase winds, and it is surmounted externally by a dome. The general elevations exhihit three stories of orders, a basement rusticated horizontally, and ordinary window dressings, and masses grouped at the angles. The Foreign-office is similar in plan, but has coupled columns, arch-headed vided between the official residence of the served that "this was the fruit of cosmopolite competition. Our Government had invited the

the subject. No. 65—"Meo jndicio"—a design for the Foreign-office, by Mr. S. Huggins—in our hamble judgment, treats the plan hetter than the decorative design, in which we can hardly help noticing the small semi-circular porticoes at the angles, ouly supporting equestrian sta-tacs, as surely at variance with principles which the anthor has done so much to expound. The grouped columns as piers to the arcaded The grouped columns as pers to the attached porch, and the perspective effect which is attained thereabouts, should, however, be com-mended.—No. 66, with the motto, "Treu und mended .- No. 66, with the motto, Fest," is a design for the Foreign-office, le ving Test, is a design for the rotting outer, botting the State Paper-office as a detached huilding, standing. In the basement, below the central court, a restaurant is shown. The portion of the design which deserves most notice, is the plan of the Minister's residence, where oval, circular, and augular forms are well combined for effect as well as convenience. The entranceporch, however, with conservatory over it, is of very ordinary character, and the official entrance very ordinary character, and the official entrance is surely too confined and narrow. The base-ment is elevated above ground, and there are three other stories, with details which may be called Italian, but which err in an opposite direction to those in a design which we have noticed,—the novelty being purchased rather at the expense of propriety and taste. Some of the windows have widely splayed reveals; others eu-close a distinct set of dressings with pediment below the clazed anerture of the arched head; below the glazed aperture of the arched head; there are statues and arches corbelled out, and some features which remind us too much of the mistakes which are commonly made in cement decorations. The rooms are proposed to he

heated by Pierce's stoves. No. 67, "Foi," which has the plans coloured to show the departments—to the manifest saving of time in examination—is a design for the War. office, which it may be well to look at, since it seems to provide the required accommodation on a less area of ground than other designs, whilst it has a considerable space appropriated to a cen-tral hall. This hall runs from front to hack, and is surrounded hy galaries, from which the cor-ridors lead; and in the centre, the nessengers' boxes and waiting-rooms are built up. This panopticon principle has not been adopted in so many cases as we should have expected ; though messengers' boxes placed with a similar intendeemed essential, in the existing offices. The elevations with an order of pilasters on arches, are to be ranked with those which lack the required invention,-No deficiency of the latter required invention.—No dedicately of the factor important requisite cru be found in the design No. 69, marked "Viator," of which we have already named the authorship. The War Office and the Foreign Office are proposed to be creeted in similar blocks, but united by two covered ways and a larger cortile in the centre,—each of the three, of two stories. Thus, a prominent feature in the plan is a "grand promenade" of 500 feet in length, and 80 feet in width, from end to end of the two Offices. This feature is divided into several halls, with the staircases from which the corridors lead out, these last being so arranged that they are lighted chiefly on one side, either from the hall, the stairs, or one of the open courts. The courts are forty feet across; and as the author shows that the *direct* rays would from the light only the floor of the corridor in the story next helow the top, it is inevitably suggested that those plans which provide less area for lighting should be tested as to the point in question. No. 69, however, we fear, is defi-cient in external window opening; and with all the merit of the design, the difficulty of combining good plan with regularity in the exterior, has not been quite overcome. Thus, a room has not been quite overcome. Thus, a room 28 feet by 27 feet, is lighted by a single window, -of about 7 fect indeed, but set near to one angle. Rooms 30 feet by 12 feet, also,

windows, and arcaded loggias. The plans and the *drameings* have obviously absorbed the author's whole time, so that the decorative design does not exhibit results of the thought that is required, or the author could, under more favourable circumstances, have given to the subject. are easily. In the share each two manages, or east and west,—one entrance in each case being from the *cortile*, which is enclosed by gates of bronze. The required distinction of the offices is not affected by the arrange-ments referred to. The plan extends for a distance of ahout 324 feet on the Parliamentstreet face, and the design marked "Suaviter Fortiter" has the same dimensions within 3 or 4 feet, whilst that marked "Foi" has only 988 fort 288 feet. The design does not bear much re-semblance to any existing building, unless in a few points to the work of the same architect at the conner of Fleet street and Chancery-lane, but it has more novelty than that building in its windows, and in the ornamentation, which includes forms modified from the Classical, Byzautine, Gothic, Renaissance, and Italian, and some Asiatic styles, combined with remark-the deliver device streets are several able skill, and mainly with propriety. The several fronts are generally like one another, with each one of the eight angular masses having resticated piers and turrets with pagoda-like cappings, and a larger termination, with much surface enrichment of the same general style in the centre. Enriched mouldings, tympana to arches adorned with relievos, traceried spandrils, Byzantine shafts and capitals, and windows sub-arcuated and shafted, are amongst the more remarkable de-tails. The ceilings have been well studied, and the lighting through glazed coffers is worthy of notice. The anthor proposes a similar group on the opposite side of Charles-street, hut, like other competitors would alter the site of Westmisster-bridge to make it centre with one side of the ground—in this thinking more of his own design than of the public interest and convenience

We shall return to the designs next week.

We have received a very large number of. We have received a very large number of. letters from the country idquiring how long the designs will be visible; and one asks if the Exhibition will remain open to the public on the Monday, Tuesday, and Wednesday of the Whitsan-week? Without being able to answer. the general questions, we may safely say that the Exhibition will be open on the days in the week we have inst now named. week we have just now named. Let us add that Mr. Samnel Angell and Mr.

George Pownall, both Fellows of the Iustitute of Architects, have been appointed assessors to aid the judges in selecting the best designs.

MR. BOUTELL'S LECTURES ON THE WESTMINSTER COMPETITION.

On Tuesday evening a second lecture on the Westmister competition was delivered by the Rev. C. Boutell, at Binfield Hall, Clapham-His purpose was to excite sympathy for the Gothic and national style, and antipathy to what he considered the excite character, monotony, and general barrenness of invention commou to the designs called "*Anglo*-Classic," "*Anglo*-Renaissance," &c. but which he denied had ever acquired a right to the prefix. We had no public buildings in those styles satisfactory enough to form authorities, nor indeed any evic building worthy to be so considered, with the sole exception of that in which, by a happy coincidence, the question was now being de-cided, Westminster hall. It was surprising how people standing in that building could speak of Cuthia as a programmer applemential style. Gothic as a peculiarly ecclesiastical style; it simply our native and national having heen style for all phrposes; but our eivic buildings having by sundry lamentable fatalities (with this exception) disappeared, and only ecclesiastical ones remaining from the reasonable times, we had come to so associate rational architecture with them, he said, as to fancy it a particulation table and a solution of the said a particular style, and an ecclesiastical one. a particular style, and an elecislastical of the gave another instance of the density of preju-dice, enveloping the general puble on such subjects. Two well-dressed, and, as far as he could judge, well-educated men, pausing before "the most purely-English of the designs," ob-served that "this was the fruit of cosmopolite architects of all nations, and the result was, that deluded aspirants from — knows where, had sent such outlandish exotics as this !" The lecturer strongly advised all visitors who would avoid such incredible blindness, to look up occasionally at the building in which the drawings hung. He concluded with some remarks on the choice of judges, who he had hoped would amount to the Englishman's favourite number that of a jury: and he ventured to read a list of some names (chiefly of noblemen and clerymen) that would have given him greater confidence. The list scemed to us to includeevery Englishman out of the profession, who has written on the subject of architecture; but if so, it disclosed a curions fact we had not before observed (and in which, if we are mistaken, we hope to be corrected), that the current styles have now, in literature, *ao lieing non-smolessional adecoate*.

rected), that the current styles have now, un literature, no living non-professional advocate. The only architect on the reverend lecturer's list was Mr. Pergusson, whom he said he would have preferred to Mr. Burn. It concluded with the name of Mr. Ruskin, who was present, and favoured the and/nece with some characteristic remarks, as sug-gestive as his always are. Alluding to the common opinion, that Gothic buildings are extravagant in cost, to fast deviced to the unit involted that we moth he first demarred to the inle implied, that we ought on all occasions to choose the very cheapest kind of work, a rule not followed by the most thrity house-keepers in any other matter, and which would be a bad guide in building, at least in the case of national and monumental works of the first order. But he, as well as the reverend locturer (who had maintained that all the costly corichments of the Palace of Westthat in the costly containents of the Lance of vest-minister had the effect of rendering it large, instead of more, Gothio), d-mide, utterly, that classic or Italian buildings could be mude thetaper than Gothic, except by excention in plaster and other sharms, lardly pos-sible in Gothic; and which he supposed the are would not admit in this class of works, whatever their style. Computer that the dowire No. 35 (2) (2) how have not admit in this class of works, whatever their style. Complimenting, then, the design No. 35 ("Thou hast covered my bead in the day of hattle "), Mr. Ruskin disclaimed any part therein, denying his ability to have produced such a work. As might be antici-pated by those who have read his last, hut least happy physe of architectured opioion, that stated in the outrageous preface to the third edition of the "Seven Lamps," he placed the whole superiority of Gothic in its affording fields for sculptne; regarding now, it apnears, rationalism of structure as non-mortant now, it appears, rationalism of structure as unimportant ike grammar or logic, it can (because, be taught by rule, we suppose); and mere structural beauty, --- the rule, we suppose) and mere structural nearly.—the subject of his "workmauly admiration,"—the benaty and sublimity, for instance, of Cologne or Specer Cathedrals,—the first Cistervian abbey that had any, —Westminister-hall,—or the Perstum-like temple that —Westminister-half,—or the Pestum-inke tempter case. Phillins tried to improve in mechanical design and did mot,—as showing no more art than the well-propor-tioned "placing of dishes on a table." The nawer is so obvious that it seems an insult to our readers to suggest k. If this thung he so easy, why is it not done? Why are not the "Crystal Paleee," or "the Design" at Recordson mode at least heaviling if and a subscience of the second suggeot 2. It this thing it so octy, why is it dot done? Why are not the "Crystal Paleet" or "the Boilers," at Brompton, made at least heuriful, if not beautiful and rational at once? If mechanical heurity needs so little art for its production, why can you ap-peal to no unquestioned example of init the century hast past? and to none uniting it with hegient reason, since the Density of the State of the century hast. past ? and to none uniting it with the Section of Palladio's the Renaissance? For, if you admit Jooes's or Palladio's the Benaiss use? For, if you admit Jones's on Pallatio's works, which no one pretends to be rational, as models of proportion; and a few eogineers' works, which oo one denies to be ugly, as rational and truthful; pray where is the work for these four centuries (since Ammanati's bridge at Florence) that nuites these qualities? Strange that which was so peculiarly medial to us, since leaving off external sculpture, should prove so unattinable, if it requires no art. We had hoped Mr. Ruskin's artivity and balance of mind would, ere this, have cleared bin of so strange an aberration, but it scenas he must write a little more aberration, but it seems he must write a little more that he may think more. He has got so far toward Carlyle's conclusion that "kunst is a great delusion. Carryle's contension that "kunsi is a great deuteson," as to hold new that all "kunsi" which is not pain-ing or sculpture, is a great delosion. But, in fast, there is far wore truth in the forwer extreme dictany, rightly accepted, that in this milder-looking per-version of it, fir we take Carlyle's meaning to be, that all art, which is not useful art, is a delusion. Neither painting nor sculpture was practised in the great times as what we call "Fine Art" (a new great times as w name properly given to a new thing); they were strictly useful arts, only done for the utilitarian purthey were poses of education, symbolism, public record, aschu-lest and satire, book-illustration, &c.; never lor 'decoration.'' They were decorative, and also deco-rated, because all work was so, and will be so again; rated, because all work was say and will be so again, the presect notion of making any art only useful being as great a blunder as the other, of having purely "fine" or "decorative" arts. There is no mere useful art, and (not "two Fine arts," but) no mere Fine art, possible to men; and whatever prefends to

he either is quackery and delusion. But the only he either is quackery and delusion. But the only measure we can have of the genius shown in pro-ducing any excellence is the rarity of it; and we deny that the "workmanly" beauty, which Mr. Ruskin now depreciates, has ever heen a very common quality even in the Middle Ages, whee truth and rationality were universal. Such designs as the Doge's Palare, or as Wenlock Abber, Subo, were measuring there in the ages of remove and the short exceptional even in the ages of reason, and the short after-period for which sculpture continued the only ects, and really, as he says, disappeared at the separation of those professions. Now, it may be quite true that we might as well talk of "immortal in the modern sense of the word, as of architects," in the modern sense of the word, as of "immortal shipbuilders," but the question is not who shall be called immortal, but what kind of build not ing shall be admired or followed. There are many things whose production does not constitute men immortal geniuses, which yet are highly desirable, and which nations like England may fruitlessly, for whole centuries together, make the most frantic efforts to attain. And such, we maintain, is (first) that truth and reasonableness of huildings which Mr. Ruskin once, and rightly, contended for as more essential than imagination, which can be taught to any dunce, which was *universal* till the "Remais-sance;" but of which we now find in 218 competitive designs, only a few that just show a faint appreciation or recognition; and (2nilly) that beauty or fitness of mechanical forms, which, though never uoiversal, was ouce exemplified, perhaps daily, in every large city, and now does not proceed beyond a paper project once a century. These things must not be forgotteo in the search for "a Phidias," who, when he comes, will "settle all our architectural difficulties in a very unexpected way :"—because Mr. Ruskin must be well aware that the real Phidias.did no such thing, for the trifling "workmanly" peruliarities of his Doric were not even improvements; and, as if to show that this may apply in the hasest architectural style as well as the highest, the modern Phidias fell on times notipulean to the former, and the similar peculiarities of Michelangelo's Renoissance are just as mistakee. So there is diversity of operations be-tween the scalutural and the architectural-there are Bezaleels as well as Bumarottis.

Allucing to the efforts now made after a less selfish use of the bichest art, it was observed that Gothie architechre alone solved the problem, by turning the great man's house, as it were, ioside-ont, the high art heing exposed externally, and quiet counfort within. This was what should be specially aimed at in national "offlees," that they be internally utilitation, well lighted, well vectilisted, well dexked, undistrating to the mind; but externally storied and speaking with the highest art we could command. Reference was also made to a pamphlet by Mr. Hope," urging (what would reduce all the competition work to wasto paper) the «theosion of the park to the river-side; on which Mr. Ruskin remarked, that so costly an addition to the "laues" of London would be better speet, both on sanitary and artistic grounds, in some locality far from existing "lungs," and suggested one for the City, that would have a grander effect than the same extent of space in any capital he knew; namely, the scale afforded by the traffic cossing oo the various landings would give such an opening prodigions landings would give such an opening prodigions landing would give such an opening prodigions would as the eathedral's length, leaving the ends in mystery, and keeping exact uniformity in the two halves of the potion exposed.

CORRESPONDENCE AS TO THE WEST. MINSTER DESIGNS.

WE have received letters from two or three of the competitors whose designs are in the Pointed style, justifying its use, and we iusert the following :--

"In making my design for the Government Offices, I have deliberately gone in the face of the publicly circulated report that a *Gothic* design would have no elance of success. I have not only done this, but have felt it the more incumbent on me to do so *in consequence of* this report.

How far this report was well founded I have no means of judging, but I am unwilling to believe that Sir B. Hall would have told the meeting of architects he called together, that be was determined to leave it in this respect perfectly open, if he at the same time mentally intended that those who acted on the faith of what he said would thereby deprive themselves of all chance of success.

* Public Offices and Metropolitan Improvements. By A. J. B. Berestord Hope, M.P. London : Ridgway.

Such however, has heen the influence of the report 1 have alluded to, that num-teaths of the architects whose taske would have led them in that direction have either been so frightened as to abstain from competing, or have actually gone in with Classic designs. Oue of the latter class I have since heard bitterly to express his regret. This is the sole cause of the paucity of Gothic designs.

My first argument in favour of a Gotbie design is the site. A building which presents a fromtage of 1.200 feet to the most important group of Gotbie buildings in the kiugdom, including the burial-place of our kings and statesmen, and the palace of the Legislature, ought, one would in one's simplicity suppose, and as I find every unsophisticated person does suppose, to have some relation to them in style. Of the three other sides, one is the park, where it would group chicfly with trees; the second, the river, where it would be equally free, excepting that it would range with the river-front of the Honses of Parliameut: the third is the only one affected by other buildings, and there they are, all of a mean kind, excepting one which is a mere fragment, and a second of a very medioere description, and which has taxed the skill of two architects to bring it into anything like a decent form. On the score, therefore, of the genius loci, there can be no kind of question.

My second argument is this — That the ordinary classic, or as it is the fashion to call it Anglo.Italian, style has made no development of late years, and seems almost effete, — so much so, that a large party are crying out for a new style. That I, sympathising in this wish, yet holding that no style can be developed without a basis, am of opinion that, if such a new style is to be aimed at, the revival of Gotbie architecture, which has from other causes been going on for the last fifteen years, at once offers lor it the hasis it demands, — a basis founded on the native architecture of the nations of modern. Europe,—the founders of our own civilization. We have done much to earry this idea out in church architecture, and have a *better* prospect in secular works, from the very fact that changes of habit and requirement will necessitate changes which will he so many elements of life and novelty.

I hold, then, that the greatest object in modern architecture is the zealous and determined endeavour to develope a new style upon this basis.

I would snggest, though I do not hold with such strictness as would come under the head of *Stanatum jus summa injuria*, that examination ought to be made as to whether architets have, or have not, limited the *two offices* to the plot inted yellow in the datum plans. I observe several designs, in which the difficulties which have fettered the arrangement have beeu got over by boldly stretching out into the Park, or otherwise deviating from this plot. The residence for the Foreign Secretary gains enormously by such deviation, but it seems bardly fair. <u>A COMPETION</u>.

A WORD FOR HERALDIC PAINTING.

The art of heraldry (to which architecture has been inhebted for some of its must beautiful ornaments) has very nuck suffired, and is likely to become lost, from the tax that was imposed upon it in a time of war now long passed away. This tax induced many to discontinue the fashion of emblazoning their arms or crests on their carriages or equipace, and the discarding of this decoration and memento of their ancestors threw out of employment a great number of ingonions artists and draughtsmen: no father dreamt of seeding his son appreatice to a heraldic paioter; and the old hands, who forty years ago carood capital wayes from this pursuit, were stopped in their career of acquiring a fortune, or supporting their reputition io an art that once received the highest patronage.

Striking improvements have heen of late years effected by the reduction, or entire removal, of the duty on different materials used in building, and we auticipate the same result for hersday. The art itself needs no vindication. Some of our first artists have exercised their talents in it: others have found it a stepping-stone to more extensive practice. There can be no doubt, if more facilities were offered to it, that the opportanity would elicit the abilities of numbers who are now unramployed, and at the same time revive a beautiful and aucient art. F. L. WREN'S ORIGINAL MODEL OF ST. PAUL'S CATHEDRAL

The Dean and Chapter of St. Panl's have agreed to exhibit this model at the Museum of Arts, South Kensington, on the understanding that it shall be put into repair under the direction of Mr. Peurose, their architect.

A sergeant of Royal Engineers, with sappers, commenced the removal of it on Monday last, and the model will be exhibited to the public whilst it is under repair. The museum will be ready for opening early in June.

NOTES ON EACH OF THE WESTMINSTER BLOCK PLANS.

The number and positions of the permanent bridges (if Englishmen can ever build permanent ones) must receive, at least as regards those between Waterloo and Vanxhall, a decision prior to and governing that of any future thoroughfores; while the latter must precede and govern that of the general plan for the *permanent* government huidings, for any built before that determination are nearly sure to be temporary;—this plan itself equally demanding priority to, and influence over, the internal arrangement of any one of them. Whatever the nrgency of the occasion, therefore, architects should not have been set to elaborate the details of the War and Foreign Offices, nor even their sites have been fixed, till the general plan be decided; and the six months given for the simultaneous production of these three designs would have far better sufficed for the drawing, comparison, and choice, first of the block plan, and then of the two particular plans, separately or together. This mistake accounts for so many able competitors neglecting the two latter, notwithstanding the more numerons prizes offered for them (fourteen, amounting to 4,2002), and concentrating all the attention on the block plan (for which there are only three, amounting to 5002.); their ambition being and undoing. Thus, if a foreigner wonders why Regent street was twisted into so many ingeniously disguised bends, he will find it was solely in order to reach and fit the fagade of Carlton Palace, which most solid and only dynified residence moders. London has had, just saw the completion of the atenne.

To no less than 75 of the 151 planners, the present Westminster-bridge has appeared so extremely out of place with reference to the chief actual or possible thoroughfares; that they have actually proposed the sacrifice of the foundatious already laid for one on the same site, which will have induced so remove than they have cost to build. The reasons, then, must be pretty strong that have induced so many independent thinkers (in fact, as will appear directly, a majority) to make such a proposal, in designs that they knew must, if not among the *three* best out of lundreds, become waste paper. This consideration makes it doubtful whether a single designer would have proposed the renewal of the bridge, had not these piers been thus prematurely the short piers already built, and making it a foot hridge. Thus 75 remove, for 73 who complete them.

Not less important is the distinction between plaus that do or do not anticipate a hridge approached diredly by Occkspurstret. Many look on such a bridge as an inevitable fact, —if not soon done by the public, sure to be so by a trading company. Accordingly, 34 of the plans represent one: the great majority do not extend far enough to give their authors' views of the question, and only 22 have thought a permanent substitute might he afforded by replacing Hungerford-bridge with a carriage one,—of course, only a suspension bridge, because any other, by requiring new piers, would be as costly at that awkward site as at the most convenient one. The design 99 alone predicts a carriage bridge at both these places, which can hardly be conceived uecessary, though likely enough to happen, hecause a company would best find their account in widening Hungerford, after which the public would still have to build the other.

Another grave question is raised by those 62 plans that propose a bridge (and in two cases, Nos. 76 and 174, two bridges) opposite the base or river end of St. James's-park; that is, too far south to be directly

* The writer is expressing his own opinions, not ours.--

THE BUILDER.

approached hy Cockspur-street, or any future road clearing the north of the park, and yet north of the present bridge, whose continuation only clears its south side. It is important because, with such a bridge, dividing its traffic like the present one, to both north and south of the park,—but, unlike the present one, sending rome straightforward,—it takes no great foresight to tell that the national teste for directuces would snon, in spite of all "block plans" to the contrary, require a continuation through that park. Only 51, indeed, of the 62, make their parkbridge carry traffic both to the north and sould; the other 11 having another bridge, either at Page's piers or Cockspur-street, either of which, by taking all the traffic of its own side of the park, would leave the park-bridge to be felt a most indirect path for the only traffic it conveyed (except to the government buildings), namely, that to the other side of the park.

Above Westminster Palace, again, every plan that extends as far as the Horseferry, places a bridge either there or nearer the palace. The former has been drawn merely because talked of for years, and talked of because two mere lanes happen to open there; that on the Lambeth side connerted with a road from the N.E. but none from the S.E. which would have to be opened for at least a nile; and that on the Westminster side barely extending a quarter of a mile, and having no cannection with any thoroughlare. Wheever glances at the whole map of Loudon, or beyond a radius of a quarter of a mile, at once sees that if either public utility or display of monuments were the object, the bridge most called for between Scotland-yard and Yauxhall-bridge is one in a line between the nearest bends of the two main S.W. and S.E. thoroughfares,—that through Chelsea, and that into Kent; in short, betweeo the southward elbow of the Westminster-road, a.d the isumilar, though more obtase elbow of Victorin-street, shaving off a little of the extreme north of Lunheth Palace gorden, and yzhreme south of Westminster College garden, hardly unching a huilding evcept the sonall Orphan Asylam (where it leaves the Westtmisster-road), a louse or two in Lamheth, the same in Abingdon-street, and the rookery about Od Pgestreet, and yet opening up the samy sides of Westminster Fulace and Abbey, at the very distruces they are designed to he seen from,—the former about 100 feet, and the latter thous 500 feet. Ten plans have this victoria Tower Bridge, and ouly one (No. 150) has neither this nor the Horseferry-bridge, but an intermelinte one.

intermediate one. Next to the bridges, the most important thing to note in the plans will be how many distinct designs they suppose or admit in the new buildings, because we shall find every number provided for, from one up to twenty,—the former, on the general aim to reduce them to as few as possible, being quite characteristic of the French (or else Gallicising, imperialising, or ultra-centralising) designers, notwithis anding the many instances France affords of the constant tailure of an architert thus charaly to secure to limselv the direction of vast prisperture works, at the cost maly of (what is undring to him) their utility and hest beauty,—that of imaginative variety.

Nothing can be esser, or require less imagination or thought, that the launching out, with a mp of Loadon and a ruler, into such designs as 99 or 138, or even 164,—a far more valuable work thun either, apart from being indicative of a healthier mind, because no man of moderate investive powers would or could waste his own or others' time on the mere mindless claloration of the two former; the amount of finish expended by the author of 164 being quite as much as they were worth. But experience shows the inability of any age thus to entail or successors a mortamin that wildl human nature invariably, at any cost of symmetry, beaks through. There is no evidence of its being ever done, even by the mighty priorthoads of Osiris or of Brannsh; no proof that any design, even for a single pile, has been uniformly completed at all, if not as soon as our own two uniform temples, Salisbury and St. Pad's,—that is, in some 30 years. The out 'i done worth follow inj, are originations of treat improvements, like those distinguishing the thit teentury; and out these so-called "grand" plans, like Jone's Whitehalt, for the repetition and display of his own conceits, er still worse, of work too uninventive even to have conceits.

In the following list, then, I have put, after each number of a design, the bridges it assumes as its busis, viz.—Ihn. a certiage bridge at Hungerford; C. a Cockspur-street bridge, that is, any one approached from that street without a decided turning; P. a patk-bridge, that is, any between Scotland-yard and the present Westimuistor-bridge; Y. a restoration of the batter; V. a Victuria Tower-bridge; and Ho. a. Horseferry-bridge. Then comes the number of designs (0 or 20) provided for or admissible in the new

buildings; for though I said this varied from 1 to 20 it really does from 0 to 20; the author of No. 138, though he reminds us that " Rome was not built in a day," appearing to think it *was designed* in a day, or that all official London should be so, in the day that Sir W. Chambers sketched his neat external lively for Somerset-place,—of which he alvises the manufacture of a mile or two more, to be applied from time to time, like his own stock of pilastered card, nound each new bluek of offices.

card, nund each new black of offices. After this number I have marked the style of block plan as Antique, Mediaval, or Modern. Now, as many persons seen to thiak that plans have nothing to do with artistic style, it is necessary here to define the differences of these three, especially opposite to the two former, that they refuse any common measure or rule of criticism, because they can find (like a Budchist and a Christian, or in art the Pre-Raffeellites and their opponents) no common standing ground.

The principles of the modern mode, in this set of block-planning, are too familiar to need much explanation. Every obild sees them to consist in making as many small things as yon can look like one-great always remains future), by exact square-setting, and rigorous doubling, and, if no-sible, quadruping of everything, as in the kileidoscope, or the famous French parden, where--

" Grove nods to grove; each alley has its brother And half the platform but reflects the other;"

in short, making the least amount of external design go as far as you can, round as much and as many huildings as possible.

It is also now koown to most peuple, thal these principles are forcing to Mediraval art, but not to so musy that they are equally forcing to the ancient or classical, which in fact only differed from the Mediraul in one point, and agreed with it is all those that distinguish it from ours. Nother Ancients nor Mediravals ever dreamed of making two offices look like one, or making two things that bud not the same function alike, or one design to serve for both. All thus is purely modern, original, and unpreedented,—in short, the invention of medern architects, who are falsely accused of wanting invention. But as "modern" is a word coultinuitly changing it mening, so that, by-and-hy, what we call "modern" will be a past style. I prefer giving it a chronological name, like the Norman, or Tudor, which, yeu will observe, does not imply any connection between the style and the peuple or "milly after which it is annel, but merely a correspondence in time. Thus you see that any historical fact which is found to synchronize with a particular style of art, however unconnected, may he taken as a chronological mark to as suchronize with a particular style of art, however unconnected, usy he taken as a chronological mark to answer? both in plauming and decoration, cannot, as far as I see, found to synchronize with any dynastic accession, or other great public event; but I tave observed it to ay arbunize usot rem rikably with a fact in the internal history of the art or polosion, namely, the cause, this is not an high-sounding an event as the Conquest and the Reformation, to mare a style of mission of so-and-sup per ent, noon then outlay." Of course, this is not an high-sounding an event as the Conquest and the Reformation, to mare a style of at by in the wents the content with what synchronizes, and so I will mark this as the "Per-centage-on-theoutly Syle," or briefly, "Perc, St." But to return to the points distinguishing the two

But to return to the paints distinguishing the two former styles of planning from ours, it is not generally observed that both Ancients and Mediava's were so far from wanning to make two buildings appear one, that they had a forcible mode of masking purposely their distination, or presenting each separately to the mind ; namely, by non-parallelism, never ranging them in a line, like chimney ornaments, or a uticles for sale, but setting them down visibly askew. And this is how their streets came to be never perfectly straight, though direct coungh to be just as conveniet as fired, and their courts and areas rayely quite rectangular. And what shows most the perfect contratistive to modern practice is, that this setting uskew was always more carefully attended to, the grander and more could the structures might be. People look on all this as "Guthic," whereas it is no more Gothie in particular than it is Attic, Syrian, or Egyptian.

But now observe, that while the non-percentage artists cared so much less that we about regularity and squarencess in the open spaces, they cared far more about it in the buildings. In fact, when thry had no straight or parallel-sided street, perhaps uo regularshaped court, and hardly a re-eutering anale that was a right angle, wither Aucients nor Mediavals could cadure au oblique satient angle, except in a regular polygon, and that not a mere dependent twored observe, such as our Gothicists try to disguise oblique angles with, but a *tower*, broad enough to he plainly independent and more stable than the buildings abutting on it. To their eyes the least unsquarencess in a salient angle seems to have so destroyed all parent strength, or digotily, or majersty, in anything but a tower or polygon, that they could not tolerate it in the most commonplace work even. But we design it without the least disguise in the chief angles of such works as the Royal Exchange, or half the present holex-plans; whose authors never think of the smallest sacrifice of mathematical exactness in an unrooled pace to obtain it in the roofed, while it was formerly never sacrificed in the mass to get it in the void. But the extreme phase of this modernism is seen in the (1 holieve peculiarly English) expedient of enred ranges of huikling; not mere colonnades, like those of St. Peter's and Burlington House, nor single er-cular rooms, which were quite enough for contrast; but sacrifices of all internal regularity in a whole speculators. observe, such as our Gothieists try to disguise oblique

range of rooms, imitated from the "crescents" of the speculators. So far the Autique and Mediaval modes then differed from ours, and agreed together. But the Antique differs from the Mediaval, and is more refined and artificial in this, that it gives the chief huildings of one system, or having a connection of purpose, a certain correspondence and balance, like the right and left of an animal, and this often in more directions than one; but never our perfect kalcido-scopic or gardener's repetition. There is no such thing in all those stopendons avenues at Thebes or Palmyra, which (though they were certailly not scopic or gardener's repetition. There is no soul thing in all those stopendous avenues at Thebes or Palmyra, which (though they were certainly not cramped by "vested interests," &c.) never have a straight axis----" He celled the name of that on the right hand Jachin, and the name of that on the left Bogz." It was such a symmetry as never cost one particle of variety, and never saved one line of plan or drawing. They would have valued the little twist which, in the Piezza of St. Peter's, we regord as a blunder, ör, in Trafalzan-square, a misfortune to be disguised; the disguise, however, being of a ludi-erously self-defeating character, for first the builder of the National Gallery, finding it cannot be perpen-dicular to hoth sides of the space, as they are not parallel, sets it square with one, rather than neither. It chanced that this gave an axis curving into that of then comes the architect of the column, and sets if down with the rigour of a meridium mark, as if the Gallery were an astronomer's den, and without the sightest reference to anything but that condemand pile (whose reconstruction might, indeed, restore the slightest reference to anything but that condemned pile (whose reconstruction might, indeed, restore the carvature of axis, but that now, between the column and King Charles, it is no longer eurved, but *troken*). Lastly comes another, who, finding only two things, the Gallery and column, set with gardeeer's exact-ness, cuts away the terraces, fountains, &c. with sole reference to these, and makes all the rest at once appear forced makeshifts for rectangularity and pre-cision; as will always happen where the old and new principles of planning are thus unnaturally conjoined. The macient symmetry there was a far more delicate and difficult matter than either our chinner-nices

I ne include symmetry theory was a far hole debate and difficult matter than either our chimney-piece principles, or the Mediaval rusticity, which had hardly advanced to ont-of-door grouping at all; their nearest approach thereto being in the vicinage of achtedrals, which, though never meant to have a whole side exposed at once, as Westminster Abbey at present, were always to have each front opposite a long and gently-enrying arenue, as King and Tschill streets, Westminster; or Ludgate-hill and Cannonalley, London; a cheep courtesy, that the modern rage for setting them in open fields, with all its fuss

Fage for setting them in open networks, which are not as and cond, denies them. The reader will now understand the distinction of the plans into the "Antique," "Mediaval,", or "Percentage," styles, to which latter I have added "Obl." or "Circ." when the modernism extends to the extreme degrees of admitting oblique main angles, or circular walls at the expense of internal regularity. or circular walls at the expense of internal regularity. I then add the old buildings each plan retains, viz. Wh. the Whitehall frontage of the present Home-office and Board of Trade; Tr. the Trensury, on the Parade, by Sie Robert Taylor; PC. the Privy Conneil-office, or rather Same's unsitered side of it, in Dowa-ing-street; SP. his State Paper-office; PL. the First Lord's house, of plain brick; Co. the Colonia-Joffice, of ditto; and BC. the Board of Control, in Cannon-row. row.

TABLE I

Competing and Non-compeling Block Plans not conspicuously transgressing the Site.

168 169 173 174 175 178 178 178 178 180 181 185 190 184 185 190 184 185 190 191 192 203 203 203 203 209 209 209 209 209 209 209 213 conspicuously transpressing the Side. I should observe that whether any of these give the prescribed area for each Office, is solely for the judges to ascertain, as the plaus are in few cases accessible for measurement. Second give, by their own written statement, less than was required for some of the Offices. Now, as others may do this without the homesty to state i, we see that, nuless the three prize plaus be laug within public reach,

the judges will be bound, on their honour as Englishthe plages will be norma, ou their mound as hardina-ment, to measure and eaclulate the area of every block npou them. Again, as I read the instructions, archi-tects were, hesides the preseribed Offices, to "provide for further buildings (to be afterwards appropriated as for turner nuitings (to be atterwards appropriated as the Government may determine) to such an extent as may he consistent with proper open spaces and thoroughfares: "" i.e. I suppose, lighting-courts and streets,—not gardens, or spaces and/y for ornament or architectaral effect (which, in fact, are commonly only for a crotehet, i.e. the reproduction or miniery of great extent.

some effect that has struck the author at another site, some effect that has struck the autoor at another suc-to which, and not to this, it was natural and proper). But, if this he the meaning, very many of the plans in this list are non-competitors. Observe, too, that as we have the word of the Westminster Palace archi-tect himself, that he designed the north-west part of his work to be seen from an enclosed court, *smaller* his work to be seen non-interactive to the optimizer than the present Palace-yard, there can be no pretext for sacrificing any portion of the red-bounded ground in *that* direction, as nearly all the designers do to a

TABLE II.

Many of these are fine examples of the modern mode of planning, and the first fourteen accompany elaborately-drawn projects for the two particular, buildings, of which some, as 6 and 20, are respectively able Renaissance; and even, as 134, attempt higher things : hut I must defer all comment on other than the block plans, having already trenspector space. E. L. GARBETT.

THE MANCHESTER EXHIBITION.

THE Art-Treasures Exhibition has scarcely taken such hold on the popular mind yet as will ensure success for it in a pecuniary point of view. Gradually, however, we have no doubt the importance and value of the collection will the importance and value of the collection will become known far aud wide, excursion trains will run, and the whole of England will supply visitors. At all events, a fine opportunity will be thrown away if it be not so. The London guests, on the occasion of the opening, complain greatly of utter inattention on the part of the committee, who appear on that day not to have thought of any thing or any nersons but themselves. From woo appear on that day not to have thought of any thing or any persons but themselves. Even men invited as holding official positions, and who went down at much personal inconvenience, had no reception, and were, in fact, ignored. One result of this is, a considerable chorus of dissatisfaction at London dinner tables, which here its affect has its effect.

The collection is now getting into good order, but several important departments remain with-out an available catalogue. It is very desirable that all the works should be *labelled*, so that their value and interest may be readily seen. The Bernal collection, the Soulages collection, The behaviour behaviour the bounges contacted in the eases on the south side of the nave, are at present little hetter than sealed books to the multitude. Amongst the departments less studied than it should be is the collection of eugravings exhi-bited in the uncotant colleger of the building iu the western gallery of the building. hited This is probably the finest ever made to illus-trate the history and progress of the art, from the middle of the fifteenth eeutury, when Tomaso Finiguerra was led to take an impression by means of a black pigment from the nicllo work needs of a black pigned right right has been work on which he was engaged, and so to originate the art, down to the admirable engravings of **our** own day. "At the precise period when the new art was discovered," says the eatalogue, "Venice was the great centre of commerce as between the East and the West; and not only which he bitting activity and the west; and not only did the Italian artists seek there purchasers for their productious, but the German masters also requented the market of that either the term in the term and the market of the either term in the term is the term of the market of the either term is the term of term of

For the arrangement of this collection in an emergency, the committee owe thanks to Mr. Dominic Colneghi.

In auother part of the west gallery will be In auother part of the west gallery will be found some early wood engravings of remark-able size, made up of blocks of wood, in oue case, 18 inches by 13 inches each. There is an excellent map-view of Venice (1500), many fect square, besides the "Passage of the Red Sea," after Titian (1549), to say nothing of the better-known "Arch of Maximilian," by Albert Durer and Burghmair (1515), the sheets of which are put together and make a whole 10 fect by 9 fect.

and Burghmair (1515), the sheets of which are put together and make a whole 10 feet by 9 feet. We have been asked to say again, as some misconception prevails, that the decorations of the two side aisles, used for the collection of aucient pictures and the collection of modern pictures, were excented by Messrs. Wilson, Little, and Henshaw, of Manchester. They commenced their work in December, 1856, and finished their several contracts early in April, using 44,000 square yards of calico, the same quantity of lining paper, 10,000 square yards of wall paper, and three-quarters of a ton of copper and zine tacks. These figures will give some idea of the large amount of work and materials employed upon the whole building. Messrs. Wilson, went over the space they decorated three times, and consequently covered, in round numbers, nearly thirty acres of wall surface.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

PRESENTATION OF MEDALS.

Ar a meeting held May 18, 1857, the Earl De Grey, president, in the chair, after some preliminary proceedings,

The chairmau said that it would now be his agreeable duty to present the testimonials of approbation which the eouncil had thought proper to award. Calling, in the first place, upon proper to award. Calling, in the first piace, groun Mr. Tarn, his lordship presented to that gen-tleman the medal of the Institute, for his essay on the "Application of Mathematical Science in Architectural Practice," with well-merited commendation.

lieved the public would be deeply indebted to any one who could improve our hotels.

any one who could improve our hotels. Another medal was presented to Mr. Parkin, for his design for the same subject; and a pre-sent in books to Mr. Underwood, for his Student's Sketches; the chairman observing on the importance of sketching, as the commence-ment and foundation of art.

The chairman then proceeded to present the Royal gold medal to Mr. Owen Jones. In doing so, he expressed the pleasure which he felt in attending on occasions like the present. Her Majesty's medal was a gift which the Institute should be proud of, and he had had much gratishould be proud of, and he had had much grati-fication in presenting it on former occasions. He felt bound to apologise to Mr. Owen Jones and the meeting for his absence when it had been originally fixed that the medals should be presented. The impartiality of the council in the award of this medal was shown by the fact that it had not been uniformly awarded to members of the Institute, but on some occasions to architects of other countries, entirely uncon-nected with the Institute, but of European repu-tation. But he had now the greatest possible pride in presenting the Royal gold medal to one of our own countrymen. It would be almost an act of nonsense on his part to state the pride in presenting the Royal gold medal to one of our own countrymen. It would be almost an act of nonsense on his part to state the grounds upon which Mr. Owen Jones bad been selected as the recipient of this medal. He was known by his works; works of immense value, which might not have been so productive to himself as to their publishers,—but which had certainly been of great service to his profession. These works had not fallen within the reach of every one, but in the Crystal Palace, which was accessible to all,—whether connected with art, science, or manufactures,—the genius of Mr. Owen Jones was manifestly displayed. He had the greatest possible pleasure in presenting had the greatest possible pleasure in presenting to that gentleman a testimonial of the respect and esteem of all his brethren in the noble and

aud esteem of all his brethren in the noble and honourable profession of which he was so dis-tinguished a member. Mr. Owen Jones briefly, but feelingly, acknow-ledged the award. He deeply felt the proud posi-tion in which he was placed, and the very kind way in which the uoble chairman had referred to bin. It was one of the areat wireleven of way in which doe doole charman has released to him. It was one of the great privileges of an artist, that if he had an earnest desire to advance his profession, his efforts would find him friends. He had been sustained under many trials by numbers of friends, and ultimately they had given him that reward which it was now his given num that reward which it was now his privilege to receive. The royal gold medal was one which every architect might wear with pride; given as it was by the sovereign, guided by the profession at large. He himself re-garded it as an honour which could not be too highly appreciated. He had been placed in his present position by the gentlemen around him; to many of whom he was known only by such efforts as he had made to elevate their profes-sion; and he felt that he must sustain the honour of the gallant corps of those who had goue before, and those who might follow him, in the same distinguished position. Mr. Tite, M.P. then addressed the chairman in reference to the gold medal of Sir William Chambers, which his friends had resolved to present to Mr. Pennethorne. The compliment which it was proposed to pay that gentleman was as well deserved as it was unusual. For many years there had been an office under the privilege to receive. The royal gold medal was

many years there had been an office under the Government, similar to that which Mr. Penue-thorne now held. Formerly the officer was ealled the surveyor-general, and in that eapaeity Inigo Jones rebuilt the ancient Somerset House, being paid at the rate of Ss. 4d. a day, with an allowance of 40*l*. a year for house rent, and a allowance of 40. a year for nouse-rent, limit a elerk. His design was one of peculiar simplicity and elegance, and had been repeated in the Straud front of the same building, when recon-structed by Sir William Chambers. It had also been copied at Oxford, and in the Commer-eial Sale-rooms, Mincing-lane. Sir William Chambers, the favourite architect of George III. bad left Somerset House in an unfinished state ; but the Georgement had entrusted its complebad left Somerset House in an animate state, but the Government had entrusted its comple-tion to a man of judgment, taste, and skill; and the work had heen most suecessfully earried out. Mr. Pennethorne, who was a relative of Mr. Nash, eame to London in the year 1820. Mr. Nash had then succeeded Mr. James

although Mr. Nash's style of architecture was anything but bold, his style of dealing with the improvements of the metropolis was so, and deserved the gratitude of this generation. Mr. deserved the gratitude of this generation. Nash had the judgment to appreciate the good taste of his young friend, Mr. Pennethorne, and many of his designs were carried through by the youthful ardour of that gentleman. The proper application of the large sums necessary for the purchase of property for great inprovements was an important part of the business of an architect; and Mr. Pennethorne had shown great ability in this branch of his dutics. The great street from the London Doeks to Spital Victoria-park, and Battersea-park, had all fallen into the hands of Mr. Peumethorue The cost of these had been very considerable, but the money had been applied usefully, eco-nomically, gracefully, and elegantly. He had had never seen a design by that gentleman which did not deserve the meed of praise. Mr. Tite proce eled to state that the present tribute to Mr. Pennethorue (originating with Professor Donaldson), had proceeded from the leading nembars of the profession, no less than seventy four of whom had signed the letter to him announcing their intention; and in presenting this medal they wished to record their sense of his ability as an architect, and his high qualities as a gentleman and a man.

Professor Cockerell considered the tribute to He himself belonged, if not to the same family, to the same school as Mr. Pennethorne; as Sir Tuylor was the masler both of Nash and of his (Professor Cockerell's) father : and he rejoiced to see the merit of that school acknowledged. With all his defects, Nasb was a courageous little man, and it was a matter of regret that no proper biography of him had With all his defects, Nash was eared. He concluded with a warm euloginm of Mr. Pennethorne.

Mr. Mayhew said that, as the district sur-veyor of St James's since 1832, he could not refrain from bearing testimony to the science and knowledge of Mr. Pennethorne, especially as displayed in the Musenm of Practical Geology, in Jermyn-street.

ebairman expressed his gratification in The being the medium of presenting the medal. So long ago as 1827, he had been brought into communication with Mr. Nash, during the erection of the United Service Club. As a part Mr. Nash's great plan of improvements, the exterior design of that club was left entire to that architect, but, as chairman of the Building Committee, his lordship had differed with Mr. Nash as to the effect of the staircase proposed by him, and, with the greatest gool temper and equaninity, Mr. Nash adopted the suggestion equaninity, Mr. Nash adopted the suggestion which he had ventured to make. He concurred in all the praise which had been bestowed on Mr. Pennethorne, and had lately been very much struck with the beauty of execution of the new western front of Somerset House. medal had been awarded by Mr. Pennethorne's hretbren, with a total disregard of professional jealousy, and he repeated that he had the greatest pleasure in presenting it. Mr. Pennethorne begged most succerely to

thank the meeting for this compliment. Pre-vented, as he was by domestic circumstances, from associating much with his professional brethren, he had been perfectly astonished to find that he was held in their esteem. Passing over the complimentary remarks upon himself, he wished to express his gratification at the remarks of the chairman, Mr. Titc, and Mr. Cockcrell, with reference to Mr. Nash. There had been much difference of opinion with regard to the merit of that architect, and it was parti-cularly agreeable to him, after a lapse of thirty years, to bear his works spoken of as they deserved. He was thankful to their noble ehairmon for the kind manner in which he had presented this medal, and in reference to the Museum of Goolease tasking in the second the Museum of Geology (which his friend Mr. Mayhew had mentioned) he might state that many alterations in the entrance-front of that many alterations in the entrance-front of that building had been made from the suggestions of bis lordship, who had been consulted on the subject by the Earl of Carlisle. In the west front of Somerset House he had felt bound to carry ont strictly the plan which Sir William Cham-bers might have been supposed to have adopted.

It might be donbtful, in the present age of competition, whether his official position would be maintained, or whether all the great public improvements would not hereafter be carried ont by the Metropolitan Board of Works and be carried their able architect. He highly esteemed the expressions of good-will from his friend Mr. Tite. There was no man whom he had more requently met adversely, but none with whom he had had less difficulty in coming to con-clusions. Years ago Professor Cockerell was thorne) was going thither as a student. By the advice of Mr. Nash, he went to Mr. Cockerell, and it was by the advice of the latter that he had studied the works of the modern rather than the ancient architects of Italy. On this ground, therefore, he should always feel a debt of gratitude to Mr. Cockerell. To Professor Doualdson he must also feel grateful, as the originator of this tribute,---a fact of which he had not before been aware : and generally he wished to express his thanks to the Institute, the members present, and to the chairman, whose kind manuer in presenting the medal had added much to the honour conferred upon him.

Mr. M. Digby Wyatt then read a paper on the Sacred Grotto of St. Benedict at Snbiaeo aud its Monastie Institutions, which was illus-trated by some interesting drawings, and to which we may refer hercafter.

EMPLOYMENT OF CONCRETE IN WORKS OF ENGINEERING AND ARCHITECTURE, INSTITUTION OF CIVIL ENGINEERS.

the meeting on May 5th, Mr. Robert Stephenson, M.P., President, in the chair, the paper read was "On the Employment of Rubhle Béton, or Cou-crete, in Works of Engineering and Architecture," by Mr. Rennie, F.R.S. The author commenced by succincily tracing the

The author commenced by succincity tracing the history of the art of construction, or building, from the earliest periods, as exhibited by the architectural remains in Egypt, Ascyria, Greece, Ernuria, Rome, and Chino, and in South America: , —thence to the comparatively more recent structures of the Continent and of this country, whose condition evidenced the care and attention devoted to the selection of materials, the due proportioning and mixing of the mortan and cements

The more immediate object of the paper was to in troilu e the system advocated by Mousiur Gariel, the manufacturer of the Vassy coment, of building hridges and other similar structures with rubble beton, or concrete, in the prosecution of which he had heen very successful. After concurrating a long list of struc-tures exceeded in this material, in all parts of France and Algeria, the author described more minutely the construction of the Pont dell'Alma, traversing the Seine immediately adjoining the lower in do if the halfding of the Annèxe, and which being in progress during the period of the International Exhibition of 1855, had diverged his attention to the solitet. concrete, in the prosecution of which he had been very directed his attention to the subject. The Pont de l'Alma consisted of three elliptical

arches, (" en anse de panier") whose spans were, the two side arches 38.50 mètres (126.23 feet e the two side and the middle areh 48' mètres (141'40 feet); the and the mode mode even as metrics (14.7.30 ref); the height or conjugate axis of the two side arches was 7.70 metrics (25.25 feet), and the middle arche 8.60 metrics (25.2 cet). The thickness of the arches at the centres was 1.50 metrics (42.2 feet); the breadth br-tween the faces of the arches was 1.30 metrics (33.35 feet), and the total length of the bridge was 13.9.69 mê'res (458'18 feet)

The peculiarity in this bridge was the mode of coustuation, the materials employed being, for the bearing, or body of the structure, rubble stoor, "pierre de mule," concreted by Vassy cement. The stores of the intrados of the arches were roughly squared and laid as vonssoirs, whilst the rest of the structure consisted entirely of rough stones, as they left the quarry, being only well washed with water to deprive them of earthy particles adhering to their surface, which d have prevented the adhesion of the coment, in which they were well holded, and which was poured in as grouting to fill up all the interstices. The outer faces of the bridge and of the piers were built in rut stone, very carefully tooled and fluished, like all the other bridges in the French capital. The bridge only occupied nine months in construc-

tion, and would have been finished sooner but for : n accident which occurred to one of the piers, during a heavy flood. This injury was stated to have been since repaired, by injecting a considerable quantity of Portland coment, which had consolidated the whole

[May 23, 1857.

simple and ingenious, and had here previously tested in bridges of considerable span. It consisted in sup-porting the centres on several explanets filled with dry sand, which was permitted to flow very gradually through an aperture in the bottom of each, and thus to lower the pistons and centres, without risk of the inequality of motion arising from slackening the wedges in the ordinary system. According to the official report of the meeting, " the

author then noticed the lahours of British engineers, architects, and others, introducing the use of concrete. arcticetes, and coness, introducing the use of roberete, citing the names of Smeaton, Semple, Higgins, Barker, Frost, White, Walker, Rennie, Smirke, Brunel, and Pasley, and the Essay hy Godwin, on the subject. Their recorded labours in that branch commenced in 1774, when concrete was first noticed in the works of Smeaton, who gave the proportions which had been found practically the best, hy Mr. Foster Nicholl. Copies were then given of the letter of Mr. T. Hard-Copies which and of the Report, in January, 1813, by Messes, Rennie, Lawis, Cockerell, and Browne, advising its nse for the foundations of the Peniteutiary; thus clear-ing; away the erroncous impression of Mr. (now Sir Robert) Smirke having introduced concrete into that building, upon which he was not cousulted until De-cember 1817, three years subsequently to the Report, which had in the mean time heen acted upon."

Several speciments were contributed by members taking part in the discussion. A cube of 12 inches of concrete, composed of one part of Dorking line, with elveen parts of such and washed shingle, weighing 136 lbs.--of the same materials and density as the increase will 2006 for the number 2005 several eleven parts or sour any materials and density as the river wall, 1,200 fact in length and 25 fect in height, in front of the new works of the Chelsea Water Com-pary, at Seething Wells, near Kingston, showed that its density was very nearly equal to that of Brankey Fall stone, a cubic foot of which weighed 138 lbs. Specimens were also shown of the concrete com-posed of White's Portland cement and shingle, forming the measure blocks used in building the piers and har-

pose of white's i orban centeria an shiring continue the missive blocks used in building the piers and har-bour works at Dover, Aldenney, Cherhourg, and other splaces, demonstrating the great solidity attained by these masses, which enabled very extensive works to On the 12th inst. in commencing the discussion

upon Mr. Renuie's paper, the anthor gave some fur-ther details of works which had heen alluded to, and particularly of the Pont de l'Alma. It was stated, that the material composing the arches was found originally to dry so irregularly, as to cause cracks in several places. This was first remedied by forming several places. This was first remedied by forming large detached blocks of the concrete in sita and thea cementing them together. But a further im-provement was made. It was found that, in making provement was made. It was tound teat, in manuage au arch of uearly 5 feet in hickness, therowas.un-qual expansion and contraction of the materials. To obviate this, a ring of small stones set in ecment was first haid, on which the coating of Vassy commut was first laid, on which the coating of Vass concrete was spread. In fact, the arch was built in concrete was spread. In fact, the arch was built in two rings. As regarded expense, it had been said, that the Pont de l'Alma had cost 40,000, but it was believed that 50,000, was more nearly correct. Now a bridge built at Liège, of dressed stone, of 550 feet in length and 30 feet in width, or 60 feet Source in length and so neet in Whith, or borber longer, and half the wildth of the Alma bridge, had cost only 26,0004. This did not show any great ecoaomy in cost, in favour of the use of coucrete; but, as regarded time, the one was hull in mine months, as stated in the paper, whereas the Liege bridge occupied three years in its creation.

bridge occupied three years in its erection. It was presenred that the paper was to be taken as a history of rubble and concrete up to a certain dute, for it did not convey any idea of the extent of its use at the present time. There were now existing, in various parts of Great Britain, some remarkable works in rubble masonry, which had not been alleded to, amorgst which might be mentioned the Liver-pool and the Bickenhead Docks. It was thought, but working in rubble had here researts neclested that working in rubble had been greatly neglected, and that engineers had gone to the opposite extreme, of building in expensive ashlar. But what was to of building in expensive ashlar. But what was to be most carefully guarded against was the adoption of a hybrid siyle of mesonry, consisting parity of ashlar and parity of rubble. This was looked upon as a daugerons system, as the anequal settling was almost sure to eause the ashlar facing to split, or part from the rubble backing.

It was remarked, as a generally received opinion, It was referenced, as a generally received option, that concrete marks with exarcfully washed gravel and sand was preferable to that which contained an ad-uixture of loam. Now, in some instances this had been proved not to be the case, for loam had heen used with positive advantage. If expensive processes of making concrete were adopted, it would be hetter in securit to note to make work. to resort at once to rubble work

To this it was replied, that it had been shown, that the composition of the sand ought to bear some rela-tion to the lime with which it was mixed, and that Portland coment, which had consolidated the whole structure. Under certain circumstances the presence of marl in the send was necessary. A careful examination of The method employed for striking the centres was the treatises on the subject of rubble masonry showed that little was known as to the weight it would sustain or the duty it would perform. It was of great importance to ascertain the resisting powers of rubble, composed of different materials, and set in different lines and eements; and also the composition and action of the ingredients which entered into the concrete or which were mixed up with the rubble.

with the rubble. A distinction orght to be drawn between concrete, or béton, and rubble work. The former was generally use for foundations, or for making an apron between the piers of a bridge, to prevent the evil efficets of secur, and also in breakwaters, where large masses of that material were three on the evil efficets of secure, and also in breakwaters, where large masses of the the model of the security of the security of the stone formed ahout three-fourths, or five-sixths, of the whole mass, whilst, in concrete, the proportion ancient buildings occupied a place between the modern oncrete and rubble, for in the works of the Romans the stone formed about one-third of the whole mass. The béton used in Russia had heen asslighted to a pressure of 5 tons per square foot. It was made of a particular elay, burnt according to the formula of Vieti, and thus a perfect artificial hydrashle lime had heen formed, nearly equal to natural lime.

A description was given of the system followed hy the late Mr. Walker and Captain Hudderi, in using washed gravel for the hacking of quay walls at the East and West India Docks and other places, by which great solidity was attained. Mr. John Rennie subsequently introduced the use of lime with the gravel, forming concrete. Mr. James Walker had used cement concrete very extensively in marine works at Dover, Alderney, and other places, with freat success. The concrete used at the two former places was composed of Portland eement mixed with shingle, in the proportions of one part of cement to ten parts of shingle, mudded into hlocks varying from 6 to 10 toms in weight. The general dimensions of that part of the hreak.

The general dimensions of that part of the breakwater so constructed were, --medium width, 90 feet, composed of a hearting of cement concrete blocks 60 feet in breadth, protected hy range work of blocks of Roach Portland stone, faced with gravite, of an average thickness of 15 feet on each side. The foundation of the wall was 45 feet below low water of spring tides, and the top rose to 20 feet above that mark, making a total height of 65 feet.

The had been observed, that the quality of the Portland ecement was not always uniform, and that expansion or disintegration of the blocks had take place two or three mooths after they were made and hefore they were bedded in position, which operation was generally delayed for six or nuce months, to allow them to become thoroughly dry. The manufacture of Portland concut was evidently one which hough its general employment was satisfactory, and its use was daily extending for all works of eivil engineering and architecture. To this it was replied, that the cases of expansion which had been noticed archable arcse from the works

To this it was replied, that the cases of expansion which had been noticed prohably arose from the presence of too much lime in the cement, —the result of careless or improper manufacture, hat such results had not been observed in cement supplied by good manufacturers. The lime so found m a free state, and not well incorporated with the other ingredients, would undergo the action of sloking by the atmosphere, and still more rapidly by see water, and disintegration would ense.

The manufacture of this cement was essentially one of confidence, and such defects as those mentioned rarely, if ever, occurred with the produce of experienced manufacturers. With regard to the works at Dover it was stated,

With regard to the works at Dover it was stated, that though nearly half a million cubic feet of coucrete in blocks were now laid annually, the proportion of breakage searcely exceeded one per cent.

The cost of the concretc blocks was assumed to be about one-half of the cost of the stone walls which had originally been intended to have here constructed. The large enbic contents and consequent weight of these blocks, the uniformity of their size, and their close contact, in the work, were relied on as promiment advantages in their use.

The French engineers had used concrete blocks, made of line and artificial pozzokana, at Marseilles, Roehefort, Algiers, and Cherbonrg. After a few years' exposure to the sea water, these blocks had disintegrated and falten to pices, -a result ascribed by M. Vicat to the presence of maguesia in the sea water, which acted injurionsly on the line. It was not without hesitation, therefore, that some years later they had counsenced the employment of Portland eement for their béton works; but the results ascritaned in the interval, as to its durability when exposed to the action of sea water, appeared to have justified the present general adoption of that imatorial, eren to the extent of nsing the blocks in external walls, without the protection of stone casing.

The injection of Portland cement into the founda-

THE BUILDER.

tions of the Pont de l'Alma was noticed as a method of forming béton nuder water, which, though allowable in exceptional cases, could not be recommended ou the score of economy, as in the case in question a quantity of eement, costing not less than 1,500?. Ind bece employed, one-third of which had, in all probability, here washed away by the current, and had

At Alderney the depth of water was greater than at Dover, and there was abundance of stone, which was thrown in as "pierre perdee" 'to form the substratum, and from the depth of 12 feet below low water a vertical stone wall was brought up, backed by conercte hlocks, to form the hearting. Descriptions were given of the large blocks of conments and the area between works at Marcelles and

Descriptions were given of the large blocks of concrete used at the new harbour works at Marseilles and at Algiers. They weighed upwards of 50 tons each, and were moulded close to the spot where they were to be used, and then thrown into the sea. At Algiers it was helieved that considerable disintegration had taken place, as it was evident that large evities existed in the work. When the sea was agitated, it was scarcely possible to walk on the mole, on account of the jets of water which were driven through the apertures with great velocity to considerable distances. The local engineers anticipated that these eavities would in time be closed by the accretions of shells, by which several had been already stopped; but this presumed that the disintegration of the blocks was not also progressing. It was questioned whether this disintegration had not arisen from the use of artificial instead of natural pozzabana.

unsategration had not erisen from the nee of arthread instead of nainrel pozzialana. Instances were adduced of the absolute overthrowing of walls, from the excessive expansion of the exemct used; and even of a thin coating of the sume kind of cement having expanded in the same remarkable degree. It was explained that this must have arisen from the admixture of an undue quantity of lime in the cement, an error not unfrequently fillen into hy incorrest.

arisen from the admixture of an undue quantity of lime in the cement, an error not nnfrequently files into hy inceprienced manufacturers. The now too general system of using a quantity of lime in the making of bricks was demonated as injurious, as the lime, when arted upon hy water, expanded, split the bricks, and destroyed the work. An instance was adduced where a lighthouse had been pulled down entirely in consequence of this action.

It was a question whether rubble concrete was really either so effective or so elecap as good brieks and cement for the superstructure of a bridge, however good and applicable it might he for the foundations, to which it bad been generally restricted in this contry. In such positions it was excellent, and but for its use many hazardous works could scarcely have here executed.

COMPETITION DRAWINGS.

Ar the closing meeting of the Liverpool Architectural Society, alluded to in our last, the president, Mr. Huggins, made some observations on Competitions.

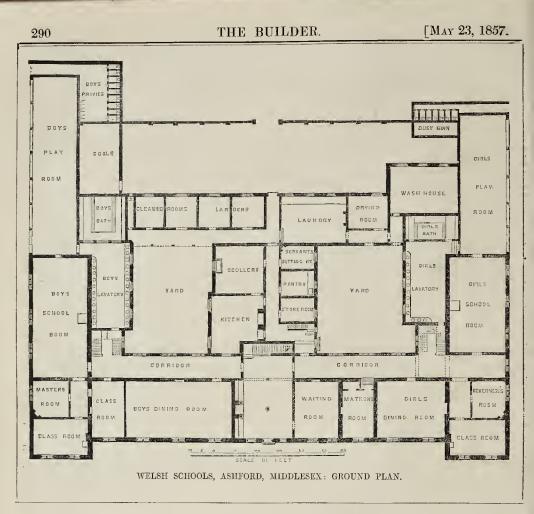

" The number and amount of the premiums in the great Government competition," he said, " should anyor good to architecture, as heing not only in themselves calculated to give an impulse to the slay of the art, but by their example to shame committees. from the insulting off-rs which, though not responded to, 1 should think, by any deserving the name of architect, are yet: calculated to degrade the entire profession in the eyes of the public. But while, as an architect, I cannot that feel headdlern to the Government for thus coming to the resene, I question whether, if the evil alluded to were remutiled, there would not still remain abuses sufficient to prevent any halance of good accruing to architecture. In proper hands, I know no means so potent to give new hife and vigour to the art as public competition. Rightly conducted, no noise patronagy, no royal charter, could do half so much for us. Some of the greatest achievements of art, you are aware, hoth in this country and on these arises from the undoe relative importance that, hy the usual and obvious principle of decision, heremes at present, the really must pay more attention than to the design itself. Conversing not long ago with a Liverpool architect on the subject of the Public Clines competition, I gathered from him that he was deterred trom competing solely hy consideration of the great spinal to the cope with the metropolitan architects. 'Yoo must make up yoor mind,' said he, 'to spend 50. for the getting up of the drawings, or you have no chance with mose London men.' I trust that the chief commissioner of public works

will take such measures for the decision of the competition in question, that both London men and provincial men who are trosting to aught else than merit in their designs will be disappointed; but the remark fully accorded with my own appretonsions from the experience of the past; and if rumours that have lately gone abroad be correct as to the expense that some competitors have incurred, he might have maned a far larger sum than 50%. I believe that in nine-teenths of the competitions of the day, if the hest design that had ever hear conceived in this world, surpassing in every excellence the master works of all Greek, Mediaval, or Italian genius, were submitted in line, or grounctrical shading only, the author disdiating to descend to the trickery of colossal perspectives, accidental shadows, and atmospheric eff. eds, it would not have the least chance of being chosen. So certain, generally specify, is the surcers of the largers and most dashing set of drawings, that three is some little danger of architecturr petting out of the hands of the architect allogether into those of the second or third rate water colour artist, who, if he arquired a little knowledge of the orders of columns and the disorders of huttresses, just sufficient to enable him to steal decently, would stand on a hetter fooling than the architect himself. One would suppose that the incompetency in committees that could bear such freig as this, and which I kelieve is working much mischief to architecture and degr-ding the system far more than dishonesty itself, the 'schoolmaster' who has been so much abroad of have years would soon remove. Surely the faintest glimmer of intelligence would suffice to tell any one that the excented work can he none the butter for the brillard the expense the designer shoult he competiled, or indeed sover it and the fine lates and gendemen who gave admitingly on it in the picture a at of it which I suppose the widh-st and blindest contractor would hardly undertake to excente. The design for a royal

MICROSCOPICAL EXAMINATION OF THE METROPOLITAN WATER SUPPLY.

By order of the Bourd of Health, Dr. Hassall has made a report on this subject, which has been printed, and from which it appears that, even in winter, the way in which (what we may without much scientific in the water which the impropriety call) vermin teems in the water which the ondoners-drink, we were going to say, hat rather don't drink, is still somewhat horrilying, to water-L drinkers especially; for, otherwise, it is rather a pleasant reflection to tea and coffee drinkers, and even to heer-drinkers, we suppose, that the vernin are at all events boiled-performs into wholesome, nutritive matter—who knows?—before it reaches their "scun-nering" Hps. Revolting as the live animalcules are, nering " lips. Revolting as the live animatcules are, however, they are not so injurious (at le st when fairly however, they are not as injurious (as it is of which there boile.) as the dead raw organic matter on which these aniundeales live, and which accumulates especially when these feeders on it are few. The New River water, which used to rank amongst the least objectionshie of which used to rais anonges the rease operation in o of the metropolitan waters, at a time when filtering and purifying processes were less heeded or practised hy any than they now are, hy no means now holds its own place in relative superiority: it has the bad preown place in relative superports? it has the oan pre-eminence, in this report, of a display of dead organic debis, though with less numerous animalevices than in some other instances, but still "particularly abun-daut," also,—in comparison with the Ch-lses, for in-stance (ugainst which at one time we had occasionally the stance time strenge vertices it may he memorized to urge rather strong protests, it may he remembered, which is now at the head of the whole list hall which is now at the head of the which has a relative purity, and next to which are the Wosi Mid-dlesex, East London, and Kent waters. The living organic productions were also rather numerous in the Grand Junction, but most numerous of all in the Southwark and Vanxhall, the Lambeth, New River, and Remeated wrotwer. A tast of relative number Southwark and remarker, the binarchy state purity ree-smoothed, is simply to view the water in bulk heside an equal quantity of really pure water, the im-pure being always more or less tinged or coloured, in quantities such as a gallou and upwards.

PAINTED WINDOW IN GLASGOW CATHEDRAL---A memorial window, the first of epwards of fifty to he put up, has been placed in the erypt, with an inscription to the memory of "Andrew Hamilton, Captain, 23rd Lancess, by bis Wife and Danghters," It was designed by Professor Huduce, of the Royal Academy, Dresden; and painted by Mr. Schreder director of the meanfactory at Misson.

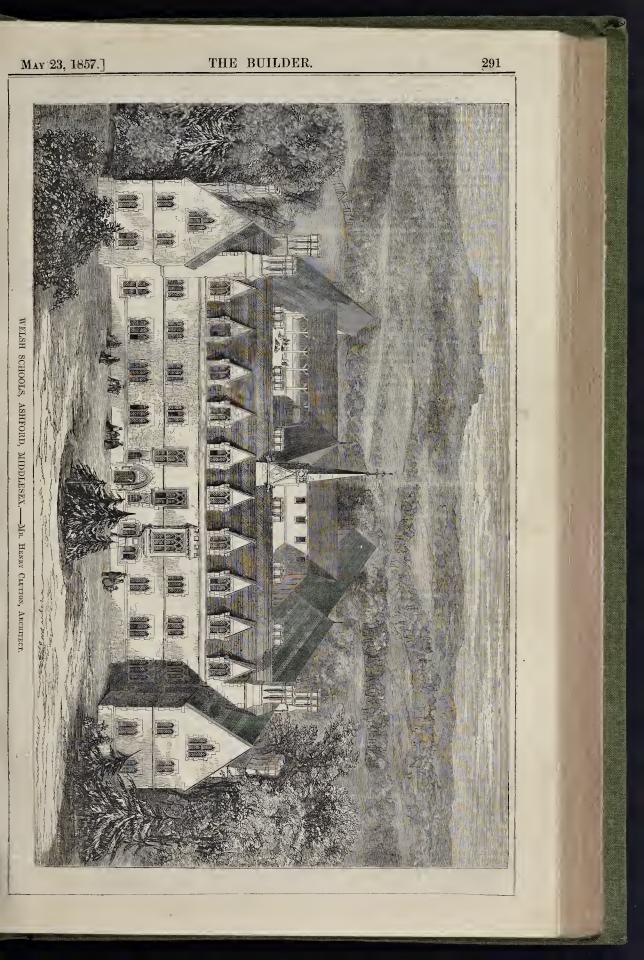

WELSH SCHOOLS, ASHFORD, MIDDLESEX,

We illustrate, in our present number, by plan and view, the Welsh Schools which have been erected at Ashford, to lodge and educate 200 cbildren, 130 boys and 70 girls, born in the metropolis, of Welsh parents. The institution was founded a century and a half ago, and has

are the City of London Schools, and about sixteen houses, now bounding the church-yard ou the cast-the school building being about the centre, and occurring on the centre line of the eathedral, but not standing quite square with it. The line of Old Change could uncer allower the school of the centre of the school building being standing quite square with it. The line of Old back of the General Post-office to Fore-street, and back of the General Post-office to Fore-street, and back of the General Post-office to Fore-street, and the school building the square with it.

CHURCH-BUILDING NEWS.

Emsworth.—The enlargement of the church of Emsworth, near Shorebam, has been begun by the contractor, Mr. Clare, of Purhrook, and is to be completed in three months.

Christchurch.—The memorial stones of the two chapels about to be erected at the cemetery were haid, on Tuesday in week hefore last, by the lady of Admiral Walleott, the member for the borough, assisted by Dir. Ferrey, the architect. A suitable address from Mrs. Walleott was then read by her husband. *Hendrod*.—The following tenders were submitted

Mrs. Wallcott was then read by her husband. *Alreaford.*—The following tenders were submitted for re-peving the new durch & c. - G. T. Fielder, Winchrster, S804.; — Lewis, Westmeon, S234.; John Browo, Wiochester, 7937.; G. Gover, ditto, 7744. 108.; — Fowler, Alresford (accepted), 7367.; — Thorne, Basingstoke (allowance for old muterials to be made), 7214. 108. The committee have determined on awarding a gratuity to Mr. Thorne, bis (the Jowest) tender not being accepted. *Ramagate.*—The chaotry at St. Angustine's, to which we recordly referred, has a vault beneath for the internent of the late Mr. Digby, jun. The building will be fuished in two months, and has a monlede

Ransgate.-The chaatry at St. Augustine's, too which we recectly referred, has a vault beneath for the internent of the late Mr. Digby, jun. The building will be fluished in two months, and has a monlided circular pitch pinc panelled roof. The builder is Mr. W. Jarvis, who is exceeding a picce of machinery for lowering the leaden cofficient to the vault by guides and halances, with a lever handle similar to the hydraulio lifting-machines.

Dursley.—The first stone of a new parish church was laid in the village of Coaley, new Dursley, on Monday in week before last. The architects are Muesra. Jacques and Son, and Mr. Charles Nihlett has taken the cootract. The chancel, the repair of which falls to certain lay impropriators, was rebuilt at the end of the last year by the same architects. Nuthurst.—The parish church of St. Andrew has

Nutharst.— The parish church of St. Andrew has heen re-opened after a complete restoration and enlargement, from the designs and nuder the superintendence of Mr. Jørnes G. Smither, of London, arebitect. The north and south windows of the chancel have here filed with stained glass, by Messrs. Powell and Sons, and the floors throughout have heen laid with Minton's enemstic tiles, in varions patterns and colours.

Socance.—Steps are now heing taken, says the Cambrian, to heavily and repair the uncient church of All Saints, Oystermouth, and greatly to enlarge the same, in order to meet the requirements of the district. The plans for the proposed alterations are prepared by Mr. R. K. Person, of Swansea, architect. According to these plans, it is intended to take down the front or northern wall, and extend it out a comsiderable distance. A small gallery for childreo will also be creeted, and the spire thrown np. The church at pre-ent will accommodate ahout 400 persoos, whilst hy the new plans it will be espable of seating nearly double that number. The estimated cost is ahout 2,0004.

Aston Uniton.—The Cleater Chronicle states that the chancel of this church, which was restored by the rector in 1549, has lately been adorned by a window of stained glass. It is described as the work of the old masters, and represents three figures, that of our Saviour being in the centre, supported on either hand by those of St. Peter and St. John, the draperies composed entirely of ancient glass. Markedref — "The eitrenal removing of the

Manchester. — The external renovations of the Manchester Cathedral having here fluished,—when the unsafe tower is to be rebuilt, observes the Courier, does not appear, -- the dean and canons have turned their attention to the internal decoration and imstate interior to the interior according and inter-provement of the eilfiler. Two works are in a forward state, namely, a carred oak throne of colosed dimen-sions for the bishop, and a screen of Caen stone for the alar. The architect of hoth works is Mr. James the altar. The architect of hoth works is Mr. Junes P. Holden, of Manchester, who is said jealously to guard every portal of information till their com-pletion. The bishop's throne is nearly I7 feet high, of Gothi design, in the perpendicular style, of old English oak, and carved. The shape of the hase is octagonal, ahout six feet in diameter, with a door on the east side. The body of the throne and the reading-desk are breast-high. At an altitude of 10 feet is the encour near which it suprast the futures. reading desk are breast-nigh. At an introduct of 10 feet is the canopy, upon which, it appears, the utmost skill of the designer and carver has been exerted. The carving has been exeruted by Messrs, Banks and West, of Manchester, sculptors, and the joiner's work by Messrs. Holmes and Heron, also of Manchester. The work of erectioo commenced at the beginning of last week, but the throne has heen in progress last week, but the throne has need in program twelve mouths. The canopy is supported on span-drils, and terminated with pinneles, fininds, and drils, and terminated with pinnels and carving. The pendauts, with a ceiling in panels and carving. The screen is at present hidden by the large altar painting, which will have to be removed. The screen is of Jaen stone. Mr. Williams, of Manchester, seulotor, has constructed it from the design of Mr. Holden. Caen stone. There is a group of three lights in the centre, and single ones on either side, all of which will he filled with plate-glass. The screen is 25 feet loog and 12

feet 6 inches high, in the perpendicular style, corresponding to the architecture of the building. Someminor improvements are being made in the choir. The stone flags are to be relaid, in order to remedy the dampness, and more effectually exclude the effluxia, which were at certain seasons more powerful than pleasant or healthy.

PROVINCIAL NEWS.

Ashby-de-la-Zouch.—The new market-house at Ashby, of which a very creditable engraving appears as as applement to the *Leicester Advertiser* of 9th inst. was imaginated on Monday in werk before last. The façade is of brick, reheved by stone facings. The two lower rooms of the front part of the building are devoted—the one on the left of the centre archway to the purposes of a reading-room, and that on the right for a refreshment-room. The upper story consists of a decorated apartment, which will be used as a Petry Sessions and County Court. The markethouse runs from the rear of the building, and cousists of two rows of builders' shops, covered over with a glazed roof, supported by lightly-constructed iroo griders. A third compartment still archer on (the whole, however, being connected, and uoder the same weak is devended to zoncel market wurposes.

nach, jahreit, orgeneral market purposes. Dadley.—New schools, in concection with the Wesleyan Chapel in King-street, are to be erceted from the design and under the superintendence of Mr. E. B. Nichols, of West Bromwich, architect.

Mr. E. B. Mchois, of West Bromwich, arcmitect. Decizes. — It is said to be contemplated to cred: a building to Devizes for the purposes of a conoty meseum and library, in connexion with the Archerological and Natural History Society of Withshire. *Wrington (Somersel)*.—New schools were opened here on the lat inst. They are in the Tador style of a school for the state of a school for

Wrington (Somerset).—New schools were opened here on the 1st inst. They are in the Tudor style of English architecture, and coosist of a school for girls, 44 feet by 17 feet, with a class-room, 18 feet by 18 feet, a school for infants, 36 feet by 18 feet; and a school for hoys, 33 feet by 16 feet, with class-room, 15 test by 13 feet, together with gravelled and walled play-grounds. There is also a residence, with garden, for the master. The schools are lighted by traceried windows, glazed with eath-dral plass, and the root is surmountal by a bell-turret, rising to the height of 70 foet. The loys' and girls' school-rooms are divided by folding-doors and curtains, which, when thrown opeo, afford a room for lectures und for public meetings, capable of scating about 300 persons. The work has here exceeded by the contractor, Mr. F. Koowles, of Wringtoo, under the superintendence of Messrs. Fosters and Wood, of Bristol, architeds. The school fittings were furnished by Mr. Atkins, buildor, from Norwich. The total rost of the building and fittings has been whout 1,350?.

Hereford.—The toundation-stone of a new cornexchange at Hereford was laid on Mönday in week before last by Lady Emily Foley, of Stoke Edith.

Willenhalt.—The foundation.stone of new schools was haid at Lanchead, Willenhall, by Mrs. Gorgb, of Gorsbrook House, near Wolverhampton, on Monday in last week. The site of the schools, which has been given by the Earl of Lichfield, is at the back of Holy Trinity Church. The new building, of which Messra. Griffin and Weller, of Wolverhamptoo, are the architects, is to be of brick and stone, consisting of a girls' school, which forms the main portion of the front, 53 feet by 20 feet ;--the left wing, which projects, containing the boys' schoolroom, 41 feet by 16 feet, adjuining which is a class-room, with lavatories for both sexes; and a residence for the teacher forming the opposite wing: the plan is so arranged that a schoolroom for iofants could readily be added. The style is Early English, with hink-hitchel mofs, the gables of the wings breaking the monotony of the front. The floors of the schoolrooms and classroom will be hoarted, and, the roof-timbers exposed internally, and stained and variabed. The contrast has been taken by Mr. J. Rowley. The total cost will he between 9004. and 1,0004. including the site.

Stockport.—The contract for the erection of Chustergate-bridge has heen let to Mr. Bartram, of Rouniley. The sum is 4,600. and the contractor will have the advantage of the materials on the ground as well as those sunk in the foundation.

COLOGNE CATHEDRAL.

WILL you kindly permit me to have a few words of friendly explanation with Mr. Street, on the morits of Cologne Cathedral, about which there seems a little misunderstanding between us, from his strictures on my paper ioserted in the *Builder* of May 2.: There are so many points on which weare agreed, that I should like to clear up the only subject of difference. He thinks, as I do, that the ecclesizational architecture of France, in the thirteenth century, " is the noblest type of Miclareal architecture in cristence." He agrees with me that Germany derived this style from

MAY 23, 1857.

France, and that the plan of Cologne Cathedral was, an imitation of those of Amiens and Beauvais--whether the architect was a Frenchman, or a German edurated in the French school, is of little consequence. The workmen were, no doubt, German, and excented their work in the German style. Whether this he better or worse than the French masony may be a most point, as l will presently show. For the most part I prefer, along with Mr. Street, the sculpture and detail of the French school; but there are instances, such as the olivesters of Zurich and the pulpit and other details of Strasburg, which almost surpass anything of equal richness to be found in France. But the gravamen of my offence is the statement that, " if completed, Cologne Minster would- be the finest for the building in the world."

But the gravemen of my offence is the statement thut, "if completed, Cologne Minister would-be the finest Gothic building in the world." The word "fine," according to Johnson, has the meaning, amongst other qualities, of "showy, splendid." It was in this sense I used the term, and still consider it well applied. The huilding would be the largest, the loftiest, the most homogeneous, the most complete in its kind of any in Europe, and therefore I humbly conceive the most showy and aplentid, or, the finest. It may he all this with many defects, both of detail and actistic skill. Switt says, "it is not impossible to be very fine, and very fithy."

To show how learned doctors who have written: books (aod I have read few with greater pleasure than: those of the two gentlemen is question) may differ, I will quote a few scattenees on the subject of Cologue Oathedral from Mr. Fergusso's "Handhook," vol. ii. pp. 739-41, which I had not seen at the time of writing my "Notes." Ha calls it "the great typical rathedral of Germany, excitainly oue of the noblest temples ever creeted by man in honour of his Creator... In this respect Germany has been more fortunate than either France or England,-for, though in the: number of edifices in the Pointed style, and in beauty of do sign, these countries are far superior, Germany alone possesses one pre-minent example in which all tho benuties of its style are united." Again, as to the details and artistic skill. "The choir of Cologue, which is almost of identical dimensions with that of Amiens, excels its French rived, internally, by its glazed triforium, the exquisite tracery of the windows, the general beauty of the details, and a slightly better proporion between the height of the aisles and the clercetury."

ere I think I may very safely leave the question. "Who shall decide where doctors disagree."

My safest course is to adopt the conclusion of Sir: Roger de Coverley, under similar circumstances, and admit that " much may be said on both sides." J. A. PICTON.

A NOTE ON THE NOTE OF "BIG BEN." Some time ago, good Mr. Editor, you gave us an account of Mr. Denisor's Big Ben of Westminster, and tol' as that the metal giant sang out E flat—hait what E flat? Is it such according to the Italian Opera pitch, or to what is commooly called here in England "concert-pitch?" and what is the correct onceri, pitch? Formerly in Italy it was much lower than it is now. The *Misserere* of Allegri (generally sang in the Sistine Chapel at Rome, in Holy Weck) is now usually transposed for the convenience of the soprani, so that the highest uote, *F in acuto*, becomes E flat; for, in the time of Allegri, concert-pich was nearly a tone lower than in the present day. Vellati, the tenor, is oper, caused the pitch of the Italian Opera in Englend to be raised (some thirty or forty years ago), and I believe it has been since raised again, to the detriment of "the singers" voices, for nothing can be got shrill and loud enough for the present taste. But I, suppose bells still keep the orthodox tradition respecting sound, and that Big Ben's E flat is the leguinate E flat of a bundred years ago and more. However, as you have many well-informed musical correspoodents, perhaps some of them may enlighten us on this point.

INFORMATION ON DISINFECTION AND DEODORIZATION.

A "Minute of laformation" on this subject has heen propared by Mr. Lindsey Blyth, analytic chemist to the General Board of 'H alth, and issued by the Board in a printed form. This is a very instructive and important minute; giving in few words much, information which will be very useful, especially in the summer and naturus assons now coming on. The very special distinction: hetween disinfectmats and deedoizers is here painted out, as well as the best or most appropriate of both kinds of agencies in particular circumstances. Though a sreening practical as to moles of action, chemical or electrical, or otherwise, which may admit of doubt, or of correction.

Thus, for example, disinfectants are specially pointed out as those which induce in certain organic com-pounds a condition of great readiness to become oxidized by the air,—such as lime, charcoal, &c.; but there is reason to believe, that there is also a class which induce the oxygen itself, on the other hand, to comhine with these organic compounds, by exciting *it* into something like the uzonous or active state; and, of these, hurning subpart, subpluter funce, or sub-phurous acid (the importance of which, as a powerful antiseptic, is here recognized), may, probably, he a most important one on this account, considering the most imports in the reconstruction, and, promy, as a most important one on this account, considering the ozonoas smell which such finnes excite; and at all events they hold a distinguished place amongst disia-fectaots, in the opinion of Professor Graham, and others, as we long since pointed out. Again, char-coal is here considered merely as a porous receptacle, in which the oxygen of the air meets with the enemy coal is here considered morely as a porous receptacle, in which the oxygen of the air meets with the enemy to be destroyed, whereas, we have shown reason to believe that it is not merely on this account that charcoal acts as a disinfectant, but hecause it actively promotes the combination of the two, whether hy inducing the oxygen to muite with the noxions ingre-dient, or vice vexul, or both; and, indeed, Mr. Blyth himself classes charcoal amoogst those disinfectants which ioduce the infections matter to unite with the oxygen, although by this he appears, from fur-ther explanation, simply to mean that it affords a receptacle for both "whereupon chemical combina-tion enses." These are at present merely selectific questions, however, although thy are capable, per-haps, of leading to a better appreciation of the relative merits and importance of disinfectant, some time sioce spoke of it ns if he adopted the idea pre-viously storted in the *Bailder*, namely, that it is not a mere receptacle only, but also itself an active stimu-lant (electrice) it may he) to the combination effected in its "pores."

VENTILATION OF SEWERS.

" WHERE THERE'S A WILL THERE'S A WAY."

AT a recent meeting of the City Commission of Severs the following remarks on severs' vectilation were made, and we quote them for the purpose of offering a few practical suggestions. When the majour molecular burgers "for the heares" as to a offering a few practical suggestions. A as to a practical ready to having technological that he has put on his nightcap as regards this most im-portant question. The ecovictions and will of a master rule results for good or for evil.

Master rule results are good or or even. Mr. Deputy Dakis said, that two years ago the question of the vestilation of the sewers was referred by the Coart to the engineer just he believed that nothing had heen done. Messes, Petty, Wood, and Co. complained in strong terms of the anoyance they experienced by reason of offensive smells from the sewers. * * * The engineer would not like the sewers. The engineer would not his to pledge bimself to the opinion that nothing could be done to alter or improve the existing system of ventilating sewers, yet he had very feeble hopes that much of an effectual mature could be done to remedy this evil

Great improvements have been made in the City sewers by the present able and indefatigable engineer hut some things, simple and easy to be accomplished hut some things, simple and easy to be necomplished, remain to be done, such as preventing large evolu-tions of fool gases being driven up the sewers and out at the galleys and street surface ventilators, and applying better-modes of drawing off foul gases from the sewers at points where there shall be no liability to injury. At present all the mouths of the large sewers on the hanks of the Thanes are open, exposed to every wind, so that gases of decomposition are forced back and out at uny open place in street or huilding: a temporary cauvass cover, at the evist of a few shillings for each sever month, will effectually prevent this, and need not in the least interfere with

huilding: a temporary cauvase cover, at the case of a few shillogs for each sever month, will effectually prevent this, and need not in the least interfere with the flow of savage. The evolution of foul gas is in proportion to the volume of fresh air blown over the reface, prevent the current hy the mouth of the saver, and the generation of gas will be reduced. To remove those gases which cannot he prevented forming, the severs may be connected with existing steam-cagine furunces and tall chinneys; or if the owners will not allow of this, ventilating-shofts for this especial purpose may be created. A small rate will gas for the harmless consumption of all foul gases now poured out of severs and drains. To this we shall come, and the sooner the hetter. A few years ago, a smoke-consuming Act was passed, but the Lambeth polters were exempted, hecause Messrs. De la Beche and Playfair reported that it would he impossible to carry on the trade without making smoke. The Messrs, Doubton have since proved the fallacy and rashness of such conductions. By means of new bine, with yer vinnile contrivances smale, is fallacy and rashness of such conclusions. By means of new kilns, with very simple contrivances, smoke is prevented, the ware is better burned, and coal is saved. Those who have no helief in smoke-hurning should

visit and inspect these kilns, and they will then hear from the Messrs. Doubton, and see in the kins, how simple is the change, how easy is the process, and how complete is the result. If such a visit teacher only a single smoke-maker to compreheod the maxim at the head of this notice, there will be no subsequent difficulty worth naming for such convert. So o sewer ventilation : let the City engineer prevent extr-evolution of foul gases as much as possible, and hurr that which cannot be prevented, remembering that gases may be buroed without actual fire: strainers of charcoal will deprive sewage gases of their noxiou-qualities, and this is all the burning necessary. There quantics, and this is an ine ourning necessory. There can be no excuse for delay, as mither the intercepting or the outlet severs proposed will prevent evolution of foul gases which will escape, as at present, to the anooyance and migury of the unforthance inhabitants, uoless such gases are drawn off at fixed points under control.

BUILDING IN TORONTO.

BELOW I give copies of tenders submitted, on the 17th of April, for a new church at Yorkville (suburbs of Toronto), from the designs of Messrs. G. K. and E. Radford. Quantities supplied by the architects:-----

	Excavator, Mason, Bricklayer, and Stonecutter.	Carpenter, Joiner, and Tinsmith.	Slater.	Puinter and Stainer.	Whole Tenders.

tions for the south and cast wings, which were let last fail to Mr. Walton, at 5,300/. and will be com-pleted early in May; and, to complete these wings, has been reserved for the present the whole of the plumber's and gasfitter's work, the glazier's, painter's, and a sincer's the whole of the floors to the correlators nonner's and gasancer's work, the gazer's painter's, "and saturer's, the whole of the floors to the corridors, entrances, passages, lobhies, &c. &c. which are in-tended to he laid with Minton's tiles; and the ridge tiles are intended to he imported from England.

J. H. PATTISON.

PROVISION OF HOUSES FOR THE WORK. ING CLASSES.

Nor cloaking for a moment sincerity in your encuest appeals for the improvement of the dwellings of the poor, I think you cannot omit the present most favourable opportunity of accomplishing this biject. There is a proper move now for making one universal rate for the poor on all parishes of the actropolis, any part of which is within the eirele of seven miles of St. Paul's Cathedral. The parishes that will be hencited by this movement will be those that the poor principally reside in. Therefore, why not make it a part of the bargain that what e ch porish saves in rates, by adopting this propo-s'tion, shall be put aside: for each three years, to be appropriated at the end of each three years, to be appropriated at the end of each three years, in the first instance, and progressively afterwards to the hencit end improvement, and comfort, and h appinces of the poor; in schools, washboases, laths, in lectures, libraries, museums, picture galleries, statuary galleries, music rooms, &c. &c. ("The poor yo will always have") in each such parish. This was is the parish shall at the end of each three years obtain the separate reports of three eminent archi-teries to the box re of accompting the poor Nor doubting for a moment sincerity in even such parish shall at the end of each life years obtain the separate reports of three eminent archi-tects, as to the hest way of appropriating each money to such purpose. The reports of the architects to be distributed amongst the parishioners, and the purishioners to decide how the money shall be spent, and to appoint a committee of twelve of themselves, to such a complete the the intergramment of the and to appoint a committee of twere of autometros, to see it so applied to the improvement of the dwellings of the poor first, and then to the benefit and comfort of the poor of the said parish, who do not receive assistance from the poor-rate.

S. P. X.

THE FALL OF HOUSES IN TOTTENHAM. COURT-ROAD.

At the adjourned inquest on the 15th inst. Mr. Henry Baker, district surveyor of St. Pan-cras, said, —The earliest proceeding with which I was connected in reference to these huldings which have fallen, was on the 9th April, a paper written hythe clerk of the works of Mr. Johnson, who gave me notice that he was ahout to commence works at Messrs. Hun-ter's. That notice was not in accordance with the Metropolitan Building Act, which provides that full particulars should he given. I went on the 15th and complained of the insufficiency of the notice. I went there again on the 15th April, and met' Mr. Johnson there. He pointed on the defective state of the party-wall hetween 147 and 148. It was in a very defective state, out of the upright, and cracked from top to hottom. He told me it ought to come down. I agreed with him, and under the provisions of the 69th scetion, I wrote to the Commissioners of Police the same evening, complaining that the place was a At the adjourned inquest on the 15th inst. the same evening, complaining that the place was a dangeroos structure. On the evening of the 21st of April I received a letter from the Police Commis-sioners, dated the 20th, stating that they had received sholers, dath the both stating that they had received my letter, informing them of the dangerous state of the premises, 147 and 148, Tottecham-court-road, and that the necessary steps should be taken thereon. What was done I cannot say, but I applied several times for the copy of the Police Commissioners' carreyor re-tificate, but the Police Commissioners' arreyor re-These to be the control of the second of the Jacques and Huy15,2000Thomas Storm.15,2000W. hours; and it was my intention to have summoned the parties on the Saturday, when the forty-eight hours had expired. When I saw the police certificate on the Friday, I was astonished to find that it con-firmed the taking down of the chimney breasts. I nrmed the taking down of the chinney breasts. I had a communication from Mr. Maple, or ou bis part, from his contractor, dated the 2nd of April, stating what he was going to do; which was to put in a new hressumer, remove de-cayed story-post, and put in a new brick pier, and make other alterations. That notice was in accord-ance with the Building Act. There was a new iron pier put up for the new hressumer to rest npoa. That iron pier was nut np to my satisfaction. I found pier pnt up for the new bressumer to rest npon. That iron pier was put np to my satisfaction. I found faults with Mr. Maple's premises, as to the floors ; hut they were attended to. I saw the other party-wall on Mr. Maple's side. It was very much eut abont. The surveyor for Mr. Maple wanted to cut away a chimney breast of that party-wall, and I re-fused. They did not attempt to cut away the chimney breast without my sanction.

breast without my sanction. The Deputy Coroner: Now I may ask you what is the cause of the accident?—Witness: There can be no doubt but that the entting away of the chimney of Mr. Hunter's party-wall was the main cause.

arr, runter's party-wall was the main case. By the Jury: I think the cutting away of the two holes for noderpinning, in the way I have described, was not only calculated to help to bring down the wall, but it was a perfect act of insanity. The Police Commissioners' certificate was dated the 25th of April. I should think that the party-wall fell bodily. By Mr. Cook: Whon I went to the new memisse an Commissioners certificate the thready wall fell bodily. April. I should think that the party-wall fell bodily. By Mr. Cook: When I went to the premises on the 18th of April, I cannot remember that I saw Mr. Hunter or Mr. Maple. I spoke several times both to Maple and Hunter, and told them the place was in danger, and on the Friday I showed Mr. Maple the party wall, but he wished me to allow it to remain. The old wall was 18 inches at the hasement and 14 inches above it. The whole of the brickwork was very rolten—the whole, back and front. By Mr. Rohinson: About the 15th I saw Mr. Reading (Mr. Hunter's surveyor), at my house. Mr. Johnson was the first to point out the dangerous state of the party wall to me. [The witness identified

Mr. Johnson was the first to point out the difference of the party wall to me. [The witness identified the notice given to Mr. Hunter by the police.] I do not ensure in the terms of that notice. It is as the notice given to Mr. Hunter by the police.] I do not concer in the terms of that notice. It is as follows:—After referring to the Act, 18 & 19 Vict. cap. 122, the notice proceeded: "We hereby give you notice, and require you to take down the party wall next to 147, where hulged and defective, make good with solud brickwork in element, all portions of the same where disturbed by the removal of the chinney breasts, in order to render secure the same structure within fourteen days from the date hereof structure, within fourteen days from the date hereof. structure, within four-ieen days from the date hereof. Dated Metropolitan Police Office, 4, Whitchall-place, 25th day of April, 1857." When 1 went there on the Wednesday (the 6th), I was surprised at the appearance of the chinney breasts. I did consider the place in danger, but it was then out of my hands and in the hands of the police. I made no commu-nication to any one that it was dangerons to life. As soon as the bressmort at Mr. Maple's was completed, the taking ways of the reliving shores would not soon as the pressumer at DIT. Hapters was compared, the taking away of the raking shores would not have contributed to the fall of the houses. The nave contributed to the fail of the houses. The removal of the chimcey breasts would leave the thick-ness of the wall about 9 inches in some parts, at others not more than 4 inches. If the holes were cut on each side of the place where the chimney breasts were removed from, that would be more dangerous.

Mr. Revers, the survey to the police, said the reading of the most essential part of the police, soid the reading of the most essential part of the police notice had been omitted, and asked that it might be read. It was a *noth-bene*:—"This notice does not supersede the necessity of giving the usual notice to the district sur-veyor two dues hefore enumerations the used of use necessity of giving use usual notice to the district sur-veyor two days before commencing the work of re-building, &c. agreeably to the 38th section 18 & 19 Vict. cap. 122, part 1st." Mr. Revers was subsequently sworn. Ho said: The first we heard of this was the letter of Mr. Baker,

dated the 18th April. In consequence of the receipt of this letter, the Assistant Police-Commissioner caused a survey of the premises to be made on the 20th April by Mr. Caiger, and the notice was issued. 20th April by Mr. Csiger, and the notice was issued. I have Mr. Csiger's written opinion, certified on the 23rd April. [He then read the opinion, that the the houses 147 and 148 were in a dangeroos state.] A notice, dated the 25th ult. from the police, was served on both Mr. Hunter and Mr. Maple on the 27th, and those notices expired on the very day the accident occurred. [He read the notices, one of which has here already given—that which was served with has here already given —that which was served with has here already given —that which was served with has here already given —that which was served with has baded, to afford proper hearings for the tim-bers of the first-pair floor, and strengthen and support the same.] The fourteen days' notice means that that time should be given to complete the works. bers of the new part of the fourteen days' notice means the same.] The fourteen days' notice means the same the same days is a same to complete the works. Mr. Cook: The 72nd section does not say fourteen days, it says "forthwith".

By Mr. Dyke: It is the duty of the district sur-veyor to watch the works going on. It is the duty

of the police to see the shoring-up forthwith of pre-mises pronounced dangerons. I cootend that when the district surveyor saw the chimmey breast removed, it was the duty of the district surveyor to inform the Commissioners of Police of the altered state of circumstances.

By the Coroner: No report whatever reached ns during the fourteen days after the notice was given, and I had no koowledge how far the works had proceeded

By the Jury : It is the duty of the Commissioners By the Jury: It is the dity of the Commissioners of Police not to order the shoring the premises pro-noonced dangerons, but to do it themselves at once. No doubt of that. I should not wait for a district surveyor's certificate. If the works contained in the commissioners' notice are not done, we should have immediately applied to a magistrate for a summons against the parties. We had no power to interfere until the expiration of foorteen days. (?) It depends upon circumstances as to whether it is dangerous to ert away chimney heresis. It is a nopeer precantion cut away chimney breasts. It is a proper procantion to be taken to shore up a wall when chimney breasts

are cut away. When the inquiry was resumed on Tuesday, Mr. When the inquiry was resoluted on reasons of the Reeves was first called, and presented the report of Mr. Caigor, another surveyor of the pobec commis-sioners, stating that the precises were in a dangerous state when he viewed them on the 23rd of April. state when he viewed them on the 23rd of April. The meaning of the word dangerous might not imply that they were in such a state as to endanger life. When that was considered the case, the commis-sioners would immediately shore up themselves. I am told that the premises were already shored he tween 147 and 148. With proper precautions taken, the mere cutting away of the chimuey breasts would not be objectionable. That is clearly contemplated by the notice served on Mr. Hunter on the part of the commissioners of noise. I did not communicate the commissioners of police. I did not communicate the nature of the police notice to Mr. Baker. It is not in accordance with the 38th section of the Me-tropolis Buildings Act to do this, and is out of course. builder is to furnish the district surveyor with that information.

Mr. Dyke (a juror) .- There is a fearful delay of fourteen days, and yet although you have had the wall certified as dangerous, you do not communicate at all with the district surveyor.

Witness said there was nothing prescribed in the t compelling him to do so. Mr. Cook called attention to the 72nd section of A

the Act, and asked whether the witness did not con-sider that under that the police were bound at once

start mat under that the poince were bound at other to shore up the wall. Witness.—The reason that was not done was, that the wall was already reported to be shored up. It is the duty of the commissioners, immediately that pre-mises are pronounced dangerous, to shore up. The 73rd section states that the police shall go before a resolution and that the moving that chell for the final and action states that the points shall go before a magistrate, and that the magistrate shall fix the time when the works shall be done. In this instance, the police assumed the authority of the magistrate. Mr. F. H. Caiger, essistant architect and surveyor

Aft, r. In ouger, essantial.—I am assistant aurveyor to the metropolitan police. The order to view these premises is dated the 20th, and I did not receive it till the 22nd. The cause of the delay is the routine the order has to go through. I inspected the premises on the 23rd. The result of my inspection was that each end, the cast and west end, was bulged. was that each end, the cast and west end, was bulged. I told Sparrow Harrison, Mr. Hunter's foreman, that they must come down. I then went to 147, Mr. Maple's, and inspected his side of the party wall, as well as the other portions of the house. There was not the slightest appearance of fracture on Mr. Maple's side. There were no works going on at that time. He told me he contemplated raising the first floor of No. 147 to the same height are the floor of 146 sone to the me he contempared raising the last noor of No. 147 to the same height as the floor of I46, so as to make them the same height. The Act specifics that the district surveyor shall have all works certified to him, whether they have been previously reported to the olice or not

Mr. Baker (the district snrveyor) .-By There is a By an end of the discussion of the operation of the opera the notice, the ordinary rule of our department.

Mr. David Reading examined,—I am a surveyor. I was engaged by Mr. Hunter as his surveyor, and prepared plans for rebuilding the back part of Mr. Hunter's premises, which had heen injured by fire. The works commenced in the beginning of April, Mr. Johnson being the builder. I visited the pre-mises two or three times a day. On the evening before the accident I was on the premises with Mr. Baker. He never said a word about the danger of the nell or survival. Mr. Johnson heing the builder. I visited the pre-line character of district surveyor, which he will still mises two or three times a day. On the evening retain, will give more authority to the proceedings. Baker. He never said a word about the danger of the wall or premises. I met him by appointment, and showed him the order made by the commissioners of police. He seemed surprised at the notice, and said he had not seen it before. He did not say a word about the police-order not heing calculated to before the active survey of the set of the did not say a published in the public papers, proves the old adage, word about the police-order not heing calculated to

prevent danger. He had written me a letter dated the 7th of May, in which he complained of the cutting away the chinney breasts and other works without giving him notice, contrary to the 20th sec-tion of the Act, and threatening to summon Mr. Hunter before the magistrates at the Clerkenwell Police Court. Mr. Baker said he would insist upon having the whole of the brickwork taken out and naving the whole of the break of a taken of the wall, and properly done throughout the whole of the wall, and not half the wall as we had done it. I wanted the wall down, and I went with Mr. Baker to Mr. Maple the wall was defective, be replied, "You are defective," Mr. Baker is defective, and I am defective." Mr. Unwton shee objected the to this or the well down ut Hunter also objected to taking the wall down. urged them both to have that wall down.

By the jury.—I was not aware of the contents of e notice served upon Mr. Hunter and Mr. Maple the police, or if it had been served upon the idear. the hy builders. I have a very indistinct recollection of having heard that the huilders had received a notice of any kind. A builder would be very culpable in a case of emergency for not showing such a notice to his surveyor. When I drew the plans, I intended the chinney hreasts to be cut away. I gave no direction for the holes to be cut in the party wall for under-pinning. I had a conversation with Mr. Moore, Mr. Johnson's derk of the works, on the subject, and it was understood that the hrick wall was to be taken out in small pieces. I attribute the falling of the houses to the defective manner in which the works on Mr. Maple's premises were being done. I entircly agree with the statement of Mr. Reeves, the surveyor Tentircly of the police.

Some other evidence having been heard, the inquiry was adjourned till Friday, 22nd.

DANGEROUS STRUCTURES AND THE METROPOLITAN BUILDING ACT.

THE lamentable accident which has occurred in Tottenham-court-road, from the falling of houses, resulting in the loss of life, and the various cases, of a like nature, which have previously happened, call public attention of the Metropolis Building Act, to ascertain what provisions the Legislature has made to ascertain what provisions the Legislature has made to prevent so great an evil. Soon after the passing of the Act, a small pamphlet was published, I believe, for private circulation, with the title,—" The Metropo-listan Building Act, 1855. The office and duties of a District Surveyorl By W. L. Donaldson, Solicitor to the Royal Institute of British Architects,"—and I ex-tract a passage from it, which appears to me to show clearly the defect of the regulation in the Act as to duameence structures dangerous structures.

"There is another duty to he performed by a dis-trict surveyor, which will not originate with himself, but will arise when he may he called upon by the commissioners " named in the Aet (viz. " If the structure be within the City of London, or the liberties thereof, the commissioners are the 'commissioners of sewers of the City of London;' so where the struc-ture is situated elsewhere, the commissioners are 'the commissioners of the police of the metropolis'): this is, to survey any structure which may appear

this is, to survey any structure when may appear to be in a dangerous state. The district surveyor, however, is required to make known to the commissioners any information he may receive, with respect to any structure being in suck dangerous state (see, 69).

As before mentioned, the exemption of the hnild-ings and works specified in sec. 6, from the regulation and supervision of the Act, does not extend to Part 2, 'Dangerous Structures,' but they are liable to sections 69 to S3, mentioned or the Act. Therefore, all such buildings are to be watched as to their security. If they important that district surgenergy should

It is very important that district surveyors should xercise much vigilance respecting dangerous structures, and they should give immediate notice to the tures, and they should give immenate notice to the commissioners of any information they may have re-ceived on the subject, for frequently loss of life has occurred from dangerous buildings falling down; and, even if there has been no neglect on the part of a district surveyor, it may be difficult in many eases for him to satisfy the public mind that such was the ca

It is to he observed that the commissioners are not has to be coupled that the commissioners are not hound to erouple the district surveyor to make the survey, but they may employ any surveyor, but there can be no doubt it will be most to the advantage of the public, that the district surveyor should be the surveyor cuployed to carry out this part of the Act. His character of district surveyor, which he will still retain, will give more authority to the proceedings.

to by any." The consequence is, that the important matter of preventing accidents from dangerous huild-ings is not sufficiently provided for. By the extract it is shown that very little respon-sibility is thrown by the Act on the district surveyor: in fact, the district surveyor is only required to make known to the commissioners "any information he may receive with respect to any structure being in such state as aforesaid." If he does this, bis daty is at an end, unless he is employed by the commissioners.

employed by the commissioners.

By the evidence on the present inquest, it appears that the district surveyor did give information, but the surveyor of the commissioners contends he ought The surveyor of the commissioners contradish to ought the surveyor of the commissioners contradish to ought to have renewed his information; but where is the legal obligation to do this: then there is the sur-veyor of the owner of the property in this case— three surveyors,—and yet, is any one of them respon-sible? I ectrainly think, under the Act, the district surveyor, unless he withholds information he has received in such cases, has no responsibility where the commissioners specially do, at least elsewhere than in the City of Loadon. It is to be hoped that the Building Act will be amended in this respect, and let the responsibility respecting dangerous build-ings be thrown upon the district surveyor, and let him be paid proper fees for his responsibility and habour in so important a matter. The public will be beenefield by such an arrangement, and you may depend upon it there will be less loss of life from falling houses. A HOUSEHOLDER. falling hou

ARCHITECTURAL PUBLICATION SOCIETY.

The annual general meeting of this society was held on Wednesday, the 20th, at the Rooms of the Royal Institute of British Architects, Mr. Godwin in the chair. Mr. Wyatt Papworth, honorary sceretary, read the report of the council, and the balance-sheet. It appears that there are now 313 members, and that the income for the note was well of the states. It appears that there are now 313 members, and that the income for the past year was 419%, the amount expended was about 2190, leaving in hand the sum of 2000, for the works still due to the subscribers of that year. The report said,---

2004. Not the report said,—
"For the year 18:6.7 just concluded, one part, containing eleven plates of illustrations to the letters A and B base been issued. At the time these plates were for the intermediate of the second second

make each article correct, by sending the slips to sixteen members of the committee, who altered or added according to their knowledge. Mr. W. P. Griffilh pointed out some objections

Mr. W. P. Griffith pointed out some objections to a proposal in the report to continue the year 1856-7 (commenced May, 1856) to the end of December next,—the object of which proposal was to make the subscriptions payable on the 1st of January in each year; and ultimately this clause was withdrawn, and the reports o altered was adopted. Thanks were voted to the officers of the society, to the Council of the Institute for the use of the rooms,—Mr. F. H. Lewis, Mr. Williams, Mr. Octavius Hansard, Mr. C. C. Nclson, and others, taking part.

rooms,—Mr. F. H. Lewis, Mr. winnams, Mr. Octavios Hansard, Mr. C. C. Ncison, and others, taking part. Mr. Jobn Papwortb explained at some length the mode parsued to obtain revision of the articles, and,—– Mr. Buruell showed the great necessity for this which existed, and gave examples. In the case of the article on "Crushing Weight," which he had writted, here are the atteraced by the arcsets he found in article on "Crushing Weight," which he had written, he was perfectly staggered by the errors he found in the books referred to as authorities, extraordinary misprints, the decimal points wrongly placed, and preated so in book after book. In one of Mr. Fair-bairn's works he said the erushing weight of a certain material given in one page as 70 lbs to the square inch was stated in another to be 70,000 lbs. The state of our knowledge on this head, he thought, was very unsatisfactory.

PREVENTION OF FIRES.

PREVENTION OF FIRES. Is the Builder of some two weeks ago, you in-serted some remarks from a correspondent relative to the prevention and reduction of fires in buildings, by closing all apertures, and preventing the access of air. This, as you remarked, is impracticable to a great ex-tenf, altbough there is little doubt many fires might be confined to the rooms they originate in, if "pre-sence of mid" were used by individuals in closing the doors, &c. to such. It is well known that for some time the water thrown upon a fire bas the effect of increasing rather than diminishing it. Many chemical substances are opposed to combustion-altun, sublabur and many others. Why does not science impress these into the service of fire-ex-tinguishing? These might be kept in a state of con-centrated solution, in small receptales, attached to tinguisting? These might be kept in a state of con-centrated solution, in small receptacles, attached to each engine, and gradually mixed with the water while the coursing area in constitute of a first. Lean the water fre. I can while the pumping was in operation at a fire. I conceive little difficulty in mechanical skill devi such apparatus. Were common sense more in fashion than it is, we should see our honses constructed so than it than it is, we should see our honses constructed so that a fire should not spread beyond the room or place in which it originated. Some mouths since I advo-cated that the doors might be partly (if not wholly), made of plate irou, and instead of the rude and auti-quated lath-and-plaster abominations called eeilings, plates of iron, from joist to joist, would form a very superior eeiling, not only fire.proof, but more cleanly : these could be painted, and easily cleaned, and eapable of extensive ornamentation. Fires often spread from door to floor, from the baster priving way from the or extensive ornamentation. Fires often spheral from floor to floor, from the plaster giving way from the excessive heat below : the latbs are thus exposed, and the flames, ever ready to ascend somer than descend, specific complete the process of destruction.

SCINTILLA.

ECCLESIOLOGICAL SOCIETY.

At the anniversary meeting of this society, held on Wednesday evening, May 13, by permission of the Directors of the Department of Science and Art, in the hourd-room, adjacent to the Architectural Museum, in Cromwell-road, South Kensington, the Rev. B. Webb, the sceretary, read the eighteenth annual report

Webb, the scritter, In the course of the report, the principal architec-tural works of the year were noticed. "The restorations of Ely Cathedral, by Mr. Scott," it said, "have been mount, responsible conversion of the present of the series of the series

further enrichment in the same material; and for Chiehester (where works are in progress under Mr. Slater) Mr. Clayton has designed a noble window, representing the *Te Deum*, for the sonth transept." At the conclusion of the report, Mr. A. J. B. Beresford Hope, after referring to the Manehester Exhibition of Art-Treasures, spoke strongly of the *mata fides* of the municipal authorities of Edinburgh with respect to the rebuilding of Trinity College Chureb in that city. He also urged the restoration of St. Bartholomew's, Smithfield, and of the Chapter-house of Westminster. Mr. Scott added Ely Cbapel as another mediæval remain in London urgently no ing restoration. Lord Robert Ceeil explained t lained that Ing restoration. This is able were only suspended till something was decided about making the church the see of a new bishop. He also spoke of the dis-satisfaction with which the choice of judges for the

ew Government Offices was generally regarded. The treasurer presented the audited balance-sheet of the society's accounts, showing a halance in band of 707. 17s. 8d.

A paper, on the Paganism of the Middle Ages, as exbilited in their literature and art, was read by Mr. W. Burges, which gave rise to some conversation, in which various members took a part.

The meeting then, after examining a collection of church-plate manufactured by Mr. Keith, proceeded to visit the large and convenient apartment in which the fine collection of casts of the Architectural Museum is now arranged.

THE MAIN DRAINAGE OF THE METRO-POLIS.

THE METROPOLITAN BOARD OF WORKS.

THE METROPOLITAN BOARD OF WORKS. At a meeting of the Board, held on the 15th inst. a letter was received from the Secretary of the First Commissioner of Works, informing the Board that the report of the three gentiemen, to whom the main drainage scheme sent up from this Board was referred, would not be ready before the end of next mouth. Mr. Carpmeel moved that the thanks of the Board should be forwarded for this communication. He took occasion to approve of the course which the chief commissioner's treatment of the Board was very stormy and irregular discussion ensued, in which the chief commissioner's treatment of the Board was

the chief commissioner's treatment of the Board was bitterly inveighed against by some of the members, and the ebairman was obliged to call "order," several times.

An amendment was moved and seconded, that a mere acknowledgment should be made, without returning thauks.

A long desultory discussion ensued, in which several members took part, some condemning, and some approving of the chief commissioner's conduct, in ap-The amendment being lost, by 17 against and 14 for it, the original motion was put and earried.

ARTISTS' BENEVOLENT FUND.

THE 30th auniversary dinuer of the Artists' Bene-volent Fund took place on Saturday, at the Free-masons' Tavern, Mr. Godwin, in the absence of Sir masons' Tavern, Mr. Godwin, in the absence of Sir Robert Peel, presiding. Among the company present were Sir Charles Loek Easthke, P.R.A.; Sir Wm. C. Ross, R.A.; David Roberts, R.A.; E. M. Ward, R.A.; J. T. Willmore, A.R.A.; J. H. Foley, A.R.A.; Mr. G. Dodd, Mr. J. H. Pbillips, Mr. J. Absolon, Mr. B. R. Green, Dr. Tbomson, Dr. Sibson, Mr. Thomas Waring, Mr. L. Peccek, Mr. Riviere, Mr. Wilbore, Mr. Cale, Mr. Hanhart, Mr. Lynch, Mr-Wilbore, Mr. Cale, Mr. Hanhart, Mr. Lynch, Mr-Wole, Mr. Ghan Dickinson, F.R.S.; Mr. Thomas Lupton, and numerous others connected with the arts. After the usual loval and natioual toasts bad been After the usual loyal and national toasts had been

After the usual loyal and national toasts had been disposed of, The Chairman, in proposing the toast of "Pros-perity to the Artists' Benevolent Fund," referred to the increasing attention which of late years had been bestowed by the public mom art, and instanced the large amounts which had been paid for the purchase of pictures during the present season. He stated, that at the private view of the two water-colour societies purchases were made of works exhibited to the extent of 3.600/2, at the British Institution, the Suffolk-street Galleries, and the Portland Galleries, before the opening of the Royal Academy, to the sound of 9,000/2, and that, adding the amount brought in by the Art. Union of London, and the seles at the Academy, the total of purchases made from the various exhibitions in London could not, in the present season, he less than 30,000/. Although these were gratifying proufs of an increased appre-ciation of art on the parts of the public, still it was immoment upon the grat body of artists to provide amongst themselvers some funds which should be avail-able for them, in the event of these unforeseen mis-fortunes which too often fell upon artists, even in the height of their prosperity. The Artists' Fund was

established so long since as 1810, and in 1827 it reexisting a solution of the second sec fund. During the past year a sum of 8637. had been paid as dividends to widows, and 1507. to the orphans of deceased artists.

The toast was enthusiastically drunk, and in the course of the evening other toxits complimentary of the Royal Academy, and the officers of the benevolent and amulty funds, were also proposed. The amount of subscriptions received at the dinner

amounted to 4507 .--- a sum larger, we believe, than has heen subscribed at any previous anniversary

NAPOLEON'S HOUSE AND TOMB, SAINT HELENA.

SAINT HELENA. In has here stated, in several of the leading Freuch and English journals, that the French Government have entered into arrangements with the English for the purchase of Napoleon's house at Longwood, and of the tomb. This sorry has often been repeated, and is nearly always current in the Island of St. Helens. One thing, however, is very clear, that if the French Government do not take the matter in hand, in the course of a very few years there will be little or nothing left of the old house at Longwood; for it is ravidly erumbling away, more from ill usage than rapidly crumbling away, more from ill usage than reputy erimnoing away, more from in using total from the effects of time: the two together have, however, played sad havoe with this interesting me-morial of the exiled Emperor. As it is on the erown lands, there is nothing to prevent a transfer to the French Government. It is too far gone to be restored : all that can be done is to hestow upon sufficient repair to effect its preservation ; and, to do this judiciously, so as to preserve its original torm, as occupied by Napoleon, it will be necessary to remove a whole series of woolen sheds, stores, huts, pristies, and sheep-pens, which have been tacked on to the original building. These nusightly rections saily disfigure the house, and onght never to have been placed there: they are in a ruinous condition, and scarcely worth the expense of pulling down even for firewood. If these unsightly appendages are removed, Scarcety worth the expense of pulling down even for firewood. If these unsightly appendages are removed, the external framework of the old house will be pretty much as when oc-upied by hapoleon, except the wanton damage committed by the agents of the East India Company, in converting Napoleon's last abode

on earth into the out-buildings of a farm. The entrance to Longwood is marked by two little The entrance to Longwood is marked by two little excitages, now, like every thing else, in a state of ruin-ous decay, once being lodges, though now mere cahins. Close to the left is a squared store, which marks the distance from James Town, and the height above the $sea_{n-1}/777$ fet. From these decayed lodges a nar-row strip of sward loads direct both to the new and the old house, the former of which, though hull expressly for, was never entered by, Napoleon. At the entrance to the house is a small trellised versa-dab, which is the only thrue in telerstile reseive and adds, which is the only thing in tolerable repair, and retains much of its original appearance. It is cut and scribbled over with names and initials of visitors in every accessible part: it is reached by dilapidated steps, correct with most and stutied grass. From steps, correct with most and stutied grass. From this verandab we enter direct into the first room. It is a woolen structure, being an additiou to the original building before it was made ready for the occupation of Napeleon. It has long since been completely dismantled, and interly stripped of every-bing. The walls door addition and windows computery dismantree, and interty stripped or every-thing. The walls, floors, ceilings, and windows, are in a ruinous condition, rapidly errunbling to pieces: it has been eut and hacked in every direc-tion by the knives of relie-seekers. The fireplace So no by the knives of rele-seekers. The fireplace and chinney are tottering to deesy,—bits of brick or stone, and even chips of mortar being carried away by visitors, so that everything movable has long since disappeared. It is covered with divity cobwebs, and what remains of the internal walls are seribbled all over with names, dates, and initials in chelk, which is generally provided by the electrone of the place, for the express use of such of the visitors as may be tronbled with the *cacoethes scribendi*. This, the largest room in the house, was used as the ante-chamher or waiting-room, and was lighted hy five windows and a sash door. It commands a fine view over a very

From this apartment we cuter into the most inte-resting room of all, that in which N rout this apartment we entry the the maximum resting room of alt, that in which Napoleon hreathed his last, and the one most wantonly descented. It is an utter ruin, being occupied hy farm machinery for winnowing and erashing corn. It is completely for winnowing and crushing corn. It is completely changed, heing entirely altered for fitting up the materials of the machinery, which is itself in a state of decay. Daylight shows through the roof in place, and has the appearance of having been wantonly defaced for the express purpose of desecrating a spot so interesting in its associations with the memory of the fallen Emperor. Englishmen are ashawed whe they cuter this melaneholy ruin, and well indeed the ðheu might be. It is a dark and dismal bole, dinibili li hy two windows, between which Napuleon died. From this we pass into a room still more dark than the this we pass into a room sum more dark than the former, which was the diming-room : it was lit by a glazed door, not having any window in it. Visitors at present grope through this room to reach the last at this end of the building, which was the Emperor's bbrary,—a small room, formerly with three windows, now entirely dismantled and used as a store-room.

The remaining part of the building, now a large stable, was originally divided into four small rooms, used by Napoleon,—one his bedroom, another his stable, was originally divided into four small rooms, used by Napoleon,—one his bedroom, another his study, the third his bathroom, and the fourth, a mere cell, was the room occupied by the valetde-chambre. These are all entirely obliverated, and to reach them it is necessary to pass into the yard, as the original door has been blocked up, its place being visible iu one of the stalls of the stable, for which it is now used is now used.

The extent of accommodation enjoyed by Napoleon during his exile in Saint Helena will be readily understood and painfully felt, when it is stated that his whole suite of apartments consisted of only six small rooms and a bstbroom : the whole were of limited dimensions, the building having been originally a mere temporary summer cottage of the deputy-governor. All the apartments are on the ground-floor. The outbuildings are now used as sheds for eattle, stables, oitbuildings are now used as steels for cattle, stahles, and stores. They are quite dilapidated, and in a ruinons condition. Some of these miserable stables are interesting as having heen occupied by Jas Casas, Montholon, Gourgaud, and Barry O'Meara, whose names are for ever associated with Napoleon in with exile

Part of Longwood House is covered with small thick slates, attached to common battens hy wooden bins, which are continually slipping down from decay pins, which are continually slipping down from decay of the pins and battens. The other part is merely covered with thick hrown paper, daubed over with tar, and many of the buildings were so covered in Napoleon's time. Internally the walls are stripped to the stone, and not a wreck remains to tell how they were coloured or papered: the plastering is all knocked down, and the boarding in every part in the last state of dilapidation, as much from ill usage as from the effect of Times "cfasing fingers."

Indicately after Napucon's death, the house and outhaildings were converted into a farmstead, and ruthlessly defaced by the Government of the day, the house occupied hy General Bertrand being used as the residence of the worthy farmer: thus for the long space of thirdy-siz genera Napoleon's last home has been harbarously employed as a receptuacle for activity. cattle

The site of one of the little patches of garden which used to front his bedroom is walled off for cattle-pens the other is occupied by the horse gearing used for the other is occupied by the horse-gearing need for driving the farm machinery, which encumbers the inside of the room in which he died. The only remaining mark of his promots is a little stone tank, in which the fallen Emperor essayed to keep a few fishes for his anusement: it is choked up and covered with weeds. It appears formerly to have been under the shelter of a small bank, to protect it from the trade winds, which blow unceasingly over it. A little to the eastward is a circular mound of earth, with a few straggling shrubs scattered about, which is said to mark the grave of a favourite horse. There is one interesting memorying left,—an old tree in front is one interesting memorial left, —an old tree in front of the bonse, under which he often sit. It was recognised by Emanuel de Las Casss, when he acrompanied Private de Joiville to Saint Helena for the exbumation of Napoleon's body. The elder Las Casas was conversing with Napoleon under the shelter of this tree when he was arrested by Sir Hudson Lowe.

If the French Government really obtain possession of this bouse, what is to be done with it? It is too far gone to be merely repaired; and to effect a thorough restoration, the change effected would be so complete, as in a measure to destroy the intercast attached to the present building. Externally it may be easily patched up and preserved from further decay,—for the stonework consists of rough rabble set in mud; but as all the interior is stripped bare to the walls, it would be a mere sham imitation to attempt putting them iuto anything like their original state. True, it would be Longwood still, -but not the Longwood of Napoleon. It has been proposed to remove the descerated buildings altogether, and erect a monument on their site : at present they are a hlot on the scutcheon of England-or at least of the East-Iudia Companyfor it was ruined by the Company's materials of the meetinery, which is theelf in a state of decay. Daylight shows through the roof in several directions, and when last there myself, part of agents; and Englishunca are heartly asbamed of the several directions, and when last there myself, part of an agents; and Englishunca are heartly asbamed of the several directions, and when last there myself, part of an agent is a quict, and concerned the floor. It is a miserable evered with thriving grass, interspersed with clumps

of furze and bramble, which gives it an entirely English appearance, though numerous tropical plants are visible, especially the aloe, whose lofty flower is

The visible, especially the aloc, whose long hower is conspicnous in many places. The hills in the neigh-bourhood are well wooded and pleasingly diversified. On the bounding hill to the lett of the tomb look-ing up the valley is a line of firs, said to be the remains of the letter N, planted on the slope enclosing the value work bits side the valley on this side

In consequence of the sinuous windings of the road, the toms itself is not visible till we enter the little glade; then, on suddeuly emerging from the grassy path, it stands at once before us, shadowed by a few th

path, it stands at once occore us, someonic ty at tall firs, cypress, and weeping willows. The touch is placed nearly in the centre of a nerrow patch of ground occupying the middle of the valley. This small space is separated from the rest of the small space is separated from the rest of the This small space is separated from the rest of the property by a common wooden pailing, now sadly tonched hy the band of Time, and bearing evidence of rapid deeny. These are the original pailings executed, after the Emperor's functal, to mark out, the limit of the land purchased for that purpose. Within these time-blauched railings are scattered about at random a few fir-trees, with several of the sombre plume-like China cypresses, and a scion or two of the original weeping willow, so intimately connected with the history of this interesting valley of the "shadow eath." The remains of the ever-famous "weeping of death." 'The remains of the ever-namous willows " were carried away to France by Prine

In the centre of the enclosure, formed by the worden railings, stands the empty how, such deep in the ground, lined with masonry, fenced in by some common iron palisades, fired in island stone. On the top of these iron rails has here thrown a common roof of thatch, to protect it from rain, and keep it as much as possible from decay. At times, however, this temporary thatch is removed, so that the whole place is tirely open to the elements. At the bottom of the tomb, which is lined with

solid masoury, is a receptacle formed to receive the coffin, which was then covered by a large slab of stone rds of 6 feet long and 3 broad On this slab was a layer of solid masonry, secured by eramps and eement, which protected the coffin from the effects of damp as used as from the coffic from the effects of damp, as well as from the weight of the superincumhent earth

Internally the walls are plastered over with lime, which is, however, chipped and cracked in many places, while in other parts the plaster has fallen off; in one or two places the walls are hulged, from the pressure of the adjacent earth. It must have heen pressure of the adjacent earth. It must have neen well hull originally, or it would not have stood open to the influence of the weather, as it has done for so many years, which is the more remarkable, as it was uccessfully excented in a great hurry, and inder con-Decessarily executed in a great hurry, and under con-siderable difficulties. It is a little damp inside, but not so much as might have been expected from its situation, in the bed of a deep valley, and close to a copious spring. Occasionally, in times of heavy rain, when the ground is suturated from the drainage of the surrounding hills, it contains a few feet of water. I have more than onec seen it in this condition. As a matter of course, the inside walls are scratched and scribbled over with names and writing,—thus earrying this inveterate habit into the very grave. There may he traced the straggling remains of many a line of petry run mad, and press on stilts, partly effaced by the green moss and lichen white ever accompany moisture. Some of the relie hunters have chipped off moisture. pieers from the hard lava coping stones, and others have been more free than welcome with pieces stolen from the railings, nothing heing too hard or too heavy for the genuine sentimental hero-worshipper. Of the for the genuine sentimental hero-worshipper. Of the shrubs and flowers piously planted hy Madame Ber-trand and companions in exile, nothing remains: they

trand and companions in exite, nothing remains they have long since disappeared. A few willows from the old stock still droop near the tomb, and slips are plentifully calivated in an adjoing patch of ground, to supply the demand created hy the numerous pilgrims to the tomb, of which considerable quantities are annually sold-and carried to Europe and America by the happy pur

Napoleon was not buried in consecrated ground, had not a start of land boght especially for the pur-pose. It was his own wish to be buried there, in case the English Government would not allow his remains to be corried to France, which turned out to be the case. The ground was purchased by the East-India Company, of the Torhett family, for the sum of 1.200/

Having heen fortunate enough to obtain a copy of The receipt given by the proprietor in exchange for the receipt given by the proprietor in exchange for the ls instalment of the purchase-money, the reader may perhaps peruse it as an interesting document con-nected with the last days of Napoleon.

"Received from the Governor and Conneil, on be-half of the Honourahle East-ludia Company, the

THE BUILDER.

twelve hundred pounds granted me by the said Honographe Company, in full of all and any demand or claim by me, my heirs and assigns, for the inter-ment of the late GENERAL BONAPARTE in my grounds, and for the free use and access to and from the toub and road thereto leading, and the full and sole occupancy of the space surrounding the said tomb by the railing now thereon erected, without any torno by the raining now thereon erected, without any obstruction to the same by me, my hoirs, executors, administrators, or assigns, DURING THE PERIOD for which the same may be required, together with all and every the rights, customs, and privileges, as now eujoyed and claimed in behalf of the East-India Com-many. (Signal) — D. Tenarce-(Signed) .R. TORBETT.

pany. Witness-J. B. BROOKE C. BLAKE. ,, YTrue copy. WM. HY. SEALE, (Signed)

twill be seen from the above document, that five years after Napoleon's death the English authorities still persisted in calling him GENERAL Bunaparte, and that the land was not purchased in perpetuity, but only for the period for which it might be required. Could the authorities have foreseen that, within fourteen years from the above date, bis remains would be translated to France with the honours due to a crowned head?

Colonial Sceretary."

After the exhumation, the ground of course became once more private property, as in terms of the agree-ment it reverted back to the original proprietor, in ment it reverted back to the original proprietor, in whose family it still remains. This family claimed the right and exercised the privilege of exhibiting the tomb, for which they charged a fee, and kept it for their own benefit. The Company and its officers had right of way-to the tomb, but not the public—hence the origin of the present gratuity,—for to reach the tomb enclosure other land of the proprietor must be passed. It has been occasionally sub-let to other parties, hy way of speculation, who trafficked in the enthusiasm of visitors, and levied black mail on every one approaching its precisets. It has more than once one approaching its predicts. It has more than once been offered for sale, as the following advertisement, eut from a Saint Helena paper, will show, in which

eut from a Saint Helena paper, will how, in which the tomb is in fact the principal item :-"Napoleon's Tomb.-For S.le, the Frechold Estate at Saint Helena, called Napoleon Vale, which con-tains the *Tomb of Napoleon*, late Emperor of the French. The proprietors being desirous of making a divisiou of their joint property, hereby invite offers for the purchase of this valu all estate, thereby affording to capitalists an eligible opportunity for an investment, which may be promptly and profitably reinhursed. The estate will be sold subject to the negociations with the French Government (now pending) for the purchase of the tomb for 40,000 frames. Apply, &c. 21st June, 1855." Here the proprietors demand 1,6007. for the tomb,

There is a strange and curious fact connected with the history of this grave not generally so well known as most events in his strangely varied life. Napoleon was buried nuder his kitchen hearth-stones ! Whether it arose from any difficulty, at the time of closing his sepulchre, of getting slabs of stones sufficiently large, sepinite, or getting states of source sumereury inter-or whether from hurry, or whatever other cause, certain it is, the three slabs which finally closed his grave were taken from his kitchun-hearth at Loug-wood. They formed a flat covering, and were left slone in their nakedness, without name, date, or initial

atone in their dageaness, who out have, dute, of initial being put upon them, -- and properly so, as a name on that grave would have been superfluous. Autommerhi observes, in his "Derniers Moments de Napoleon," that "Une énorme pierre, qui devait être employé dans le construction de la nouvelle maison de l'Emperonr, est destinée à fermer sa tomhe. Les cérémonies religiouses terminées, on recouvre la maçonnerie d'une couche de ciment," which was strictly verified at the exhumation, except that the large stone immediately covered the coffin, instead of forming the exterior tomb-stone, which was, in fact, formed by three slabs as above mentioned, which were carried away by the Prince de Joinville.

Though no epitaph was graven on the stones, yet one was written, by a venerable resident of Saint Helena, Major Sampson, himself a soldier, who had secs some service in the stirring times in which he lived. It is not remarkable for length, high sounding phrases, or elegance of expression; yet it expresses a great deal. Though written in uncouth metre and jingling rhymes, it is eminently suggestive. Here it is, in its simplicity and truth, as taken from his own lips, at the tomb itself :---

* The stones that did his kitchen psve, Closed at last Napoleon's grave ! !

Most persons are familiar with the well-known cast or mask of Napoleon's features, taken immediately

after death, but few arc aware of the difficulty which occurred at the time in finding sufficient plaster for the purpose

the purpose. Antommarchi states that Sir Hudson Lowe said to him, "'You have asked for plaster to take a mask of the defunct : one of my surgeons is very able in these kind of operations : be will assist yon." I thanked his Excellency : the moulling is a thing so easy, that I could do it without aid. Bur I HAD NO PLASTER. Madamo Bertrand had only received, in with of her xeelameting a KEN OF CHAIK I PLASTER. Madame Bertraud had only received, in spite of her reclamations, a KIND OF CHALK. I scarcely knew what to do, when Dr. Burton indicated a place where gypsum might be found. The admiral (Lamhert) gave his orders, a boat put to sea, and a few hours afterwards returned with some fragmen few hours afterwards returned with 'some fragments, which we calcined. I thus had plaster, and moulded the face.'' I can explain why Madama Bertrand re-ceived a kind of chalk instead of plaster of Paris, as asked for. Mr. Audrew Darling, the purveyor and undertaker to Longwood, who made the cofflins and superintended the funeral of Napoleon, left hebind him in MSS, a very interesting account of his pro-ceedings on this occasion, a enpy of which was given me by Mr. Charlette, his executor. The following extract from this curious document explains all about the chalk. It is dated the daw Napoleon died.

extract from this curious document explains all about the *chalk*. It is dated the day Napoleon dicd. "5th May, Saturday.—Went up ahout 12 o'clock in the day (to Longwood), met Mr. Dutton with a letter from Sir Thomas Reed, to send up some plaster of Paris; but as I knew there was none to be purchased, and none in store, having been on the look-out for the same article that same morning, and the day b-fore, and found that the only thing I could find use the ended down come income and we the find was to grind down some images, and use the material; but as the expense of them was considernaterial; but as the expense of them was consider-able, and not certain of the materials answering, I declined doing so till I had orders; there-fore, proceeded to Longwood House, where I knew Sir Thomas Reed was, and there found him and the governor in front of the new house. Told the circumstance to the governor, when be recommended the plan as it had been requested by Madame Ber-trand. I then mounted my borse, came to town, *purchased the figures* to the number of 150, all small, got the men that I had at work, and set about pound-ing them, which having completed, I had two Chinese in waiting, and started them off with the powder, and then left town myself for Longwood." I an auther part, alluding to other matters, be says.—"A mattress then left town myself for Longwood." In another part, alluding to other matters, he says..."'A mattress is now in my possession, amongst the stores, being much marked by the stains of blood, &c. from him, when he was turned round to shave the back part of his head, for the bu-t which was t-ken on the 7th May," by Doctors Burton and Antommarchi, and afterwards a bust taken from the same, which was very fair considering the time he hid heen dead, and the roughness of the material, which was packed up and taken by Antomnarchi, for the intention, as l was told by Madame Bertrand, to be sent to Canova, for a model in marhle

A little further on he observes, " Much time having been lost, and a delay in taking the hust, and the smell getting to be none of the ple-santest, I felt anxious to have him put into the coffin, having the people all ready for the purpose," &c. &c. There was no need of seuding a boat out to get the

rates was not been discoursed on a source of get me necessary gypsum for this operation, as it is found on the hills in the vicinity of Longwood itself, where I have collected it for the very same purpose of taking a cast. The images alluded to were the small coma cast. The images alluded to were the small com-mon cats, dogs, porrots, &c. so commonly sold forty years ago, before the Italian hawkers had taken their present more respectable position as dealers in superior casts from real works of art.

superor casts from real works of art. In a wooden hut or sentry-box near the tomb enclosure, the custos rotulorum, or cinerone, keeps the "Visitors" Books," for the convenience of such as may he disposed to jot down their thoughts on visit-ing this interesting spot. It is needless to say these books are full of rhymes and rhapsodies in all lan-guages—Ducth, German, French, English, Spanish, Portuguese, Arabic, Persian, Hindustani, and even one or two in the Chinese character. The English writers are generally anusing from

The Equilib writers are generally amusing from their abaurdity, and the French from the air of regret or defiance which pervades most of them. Ono French visitor writes thus, in unmistakeable

ebaracters,-J'ai vu-et j'ai maudit !!

Another follows him up hy a sentence equally short

A third is hrief, but pathetic-thus,-

St. Hélène-Hudson Lowe [1]

Another falls foul of Pitt in the following strain,-Horreur à l'exécrable Pitt.

The attacks against Sir Hudson Lowe are often repeated : he seems a favourite mark for the French visitors' execuation,-

Horreur au bourreau hudson lowe ! ! !

The following specimen is selected from many others of a similar kiud,---

O grande homme ! O grande Napoleon ! Malédiction ! ! ! Mais la France, et toi sont vengé,

Hudson Lowe est mort :

I will couclude these extracts with the following entries, selected at random, from which the difference between the French and English effusions is very evident. I string them together without comment

"The tomb of Napoleon we visit today, And tread on the spot where the tyrant lay: Thet bis equal sgain may never appear, Shall be sincerely prayed for many a tear. JACK LEE, Cork,"

"The sun of Austerlitz is set. And clouds have shone on Nap, the Great. Ambition brought the emperor here, To this bleak isle, both lone and drear. D. K."

" We Ichiboe gentlem Are hearty and stror We left James Town To visit Wood Long. On the way to Wood Long We visited the tomb, Where Napoleon the Great Lays conquered by fate."

"Here lies entombed of Bonaparte, Embalmed the body and the heart His ashes rest beneath yon willow Methinks it far too hard a pillow, For such a daring gallant fellow!"

dread bis. spurm oil 1?". " Several officers have paid their respects to the seene which furnishes the best notidote to military ambition that the world can yet present." I will couclude with the following translation from

I will conclude with the following translation from an entry, written in French, by a Russian visitor :----"I have the honour to be a traveller who has visited at Berne,--the clock at Money,--the moviment of Peter the Great, at St. Peterlaurg,--the Tunel at London,---the Jone of the Invalides at Paris,--the Table Mountain, and a thousand other things. I have now come to this place to contemplate the tomb of the deviatator of Gravepe,--othe great man of our age. Also, the space which has been as the which holds the humblest of his numerous victurs. Whether the zenorts lately circulation de la Russie l? Whether the zenorts lately circulation in the con-

Le Pélerin de la Russie l' Whether the reports lately circulating in the con-tinental journals be trae or not, one thing is certain, that something must be done, and that speedily, if it is wished to preserve Napoleon's last home from irretrievable ruin. It cannot exist many years longer in its present neglected state. The French Govern-ment had therefore better hestir itself, and come at conclusion. As Lonewood House is Crown ment had therefore better hestir itself, and come at once to a conclusion. As Longwood House is Crown property it may be easily obtained, for it is more than useless to the Government, and a sad eye-sore to than useless to the towerament, and a sad cyclore to the island: no donbt it would be readily ceded to the French on condition of its being put in repair, so as to preserve it from further degradation. The tomb has been long in the market, and the proprietor will be glad to sell; so that no ob-tucle exists here to prevent the French Government carrying out its prevent the French over the server they may be. JOSEPH LOCKWOOD.

PROCEEDINGS UNDER THE BUILDING ACT

ON Weinesday, the 13th, Mr. Wm. Wray, huilder, was summouel before Mr. Secker, at the Greenwich police-court, by Mr. Snook, district surveyor of Hatcham and Rotherithe, charged with using faulty materials in the external walls of two dwelling-houses in the course of construction at Hatcham. Complement and the tourse of tours the tour international place-bricks, said that Mr. Wray had used very had place-bricks, bats, and portions of bricks, and the mortar was com-posed of loam or soil with small particles of lime, so that the hricks would not adhere: thereby the walls were not properly bonded and solidly put together, as required hy the Act of Parliament. He therefore equired that the whole of the external walls be pulled down and re-creeted, as he had cautioned him against using such material several times during the progress of the work. Defendant douide that the specimens produced were used, while complainant positively swore that he took them from the work. The defendant was ordered to pay 12s. costs, and the case was adjourned for three weeks for him to produce his witnes

GRANTE QUARRITNG.—An extraordinary explo-sion of granite took place on Friday, the 24th ult in one of the quarries at Maca, in the parish of Constan-tine, helouging to Messis. Freeman. A hole was sunk 19 feet, and occupied three men and a boy ten days in sinking: the size of the blit was 6 inches, and the stem 14 inch: the charge of powder was 93 lhs. and a mass of granite has heen shot out 4 feet Irom its original position, measuring 55 feet in length, 30 feet wide, nul 24 feet deep; the solid contents heing 38,160 feet, or 2,726 tons.

Books Receibed.

Some Account of the Condition of the Fabric of Liandaff Cathedral from 1575 to its re-opening in 1857; with Extracts from the Act-Books of the Cathedral. Purker, West Strand. 1857.

The Bishop of Landah is the author of this tract, which his fordship has written as a record of the steps by which his cathedral has heen brought to its present condition of partial restoration. The pamphlet contains some extracts of interest, from a Chapter MS, and other sources, accounting so far for the ruin and disfigurement from which a considerable portion of the fabric has heen resued, and into which it first of all fell nearly three hundred years since. The first step towards its redemption was the insertion in 1844 of the present Early Geometrical five-light window by Mr. John Prichard, and from that day to this the vork has been slowly progressing, and the main features of the edifice have at length heen reconstructed according to the previous type, the Lady Chapel restored, the Norman Areb rest and exposed to view, other arches discussed to result. The flow restored to the discense used by progressing, and the main features of the edifice have at length heen reconstructed according to the previous type, the Lady Chapel restored, the Norman Areb rest and exposed to view, other arches dischance and the valid in the ave and alsies, and stone, besides the removal of last century's work, &c.; and still the authorities look to the continuation of the good work, much even now remaining to be done. At the re-opening of the eathedral on 16th ult. a considerable lift to the limited means of the chapter way given in offerings amounting to hetween six and seven hundred pomda, and the archdeacon offered 100/. In five years if 100 persons would do the same, so as to secure at once 10,000/. for the entire restoration of that portion of the hairic then aud since have termeaded he prospective means already to not far short of half the sum required. We shall give some particulars of the restoration in an early Number.

VARIORUM.

The article on the New Reading-room and Libraries I at the British Museum, published in the Timer, has heer reprinted, with a plan, by Murray, of Albennatch street, in the form of a penny tract, many of which appear to have heen sold to the public at the entrance to the Museum and Library during the week just appear to have heen sold to the public at the entrance to the Museum and Library during the week just past.—An article in the Engineer, by Mr. D. Camphell, F.C.S. Analytical Chemist to the Brompton Hospital, on the application of Sewage to Agriculture, h originally delivered as a lecture to the Chemical Society 2 in April last, has been reprinted in the shape of a gamphlet. There is much matter for consideration h on the interesting subject of which it treats, both in y this and in another paper Rogers reiterates his own 1 ideas on the subject of sewage a sregards town arrangementa. The title of this latter published by Mtchley and Co. of Great Russell-street, Bedfordand Fallacies of the Sewarge System of Londoo and other large Towns, with Plans, Elevations, i Defocts; showing that Pestilence is spread by its Deposit, detailing the Means of remedyiog its Evils, and pointing out the Necessity for public Lavatories, Closets, & e., as the first Step towards the moral Adwancement of the lower Classes." Peat charceal, we may remind our readers, is Mr. Jasper Rodgers's panacea. He dwells particularly, however, on the intensification of the sewage evil in the meantime by the extension of the lowes system, and in the publieation under notice he says, "All I ask at present is to get a metal pipe laid through the severs, into which all water-closet sheal and in the publieation under notice he says, "All I ask at for that is done, I say, get, if you ean, an Act of Parliament that every hed-room in every house shall have a water-closet." By the way, there is a fact of which we are remined by Mr. Campbell in his letture, to which we may here advert. Some time sicce we took occeasion to draw attention to the

THE BUILDER.

lished hy T. Richards, of Great Queen-street, a pamphlet, entitled, "The Cattle Plague and Diseased Meat, in their Relations with the pahlic Health, and with the Interests of Agriculture," being a second letter to Sir George Grey, the Home Sceretary. letter to Sir George firey, the Home Secretary. An Gamgee here exposes some of the vile doings in the sale of discased and putrid meat in our markels, and offers suggestions for their amendment, after due inquiry by the Government. He depresents restrictive measures on the importation of cattle as offering an increased premium for the fraudulent sale of our own had article. That much discased meat is continually sold in our markets there is but too much reason to believe; and the influence of such meat on the human block, and the inducte of such field of the full block block, and on the health in general, becomes a very sorious question. A circumstance which but last week came under the notice of the writer of the present notes on blocks received, and which occurred in the outskirts of London, will show how really-dis cased animals come to be sold as wholesome food. A Å milch cow (which, hy the way, had just yielded twee much cow (wnich, hy the way, had just) refere twenty-four quarts of milk—wholesome unik, we can scarcely say, as a day's produce, also for human food) fell down in a dying state on Sunday morning helore last, when the owner immediately sent for a botcher, and sold the cow at something like half price: the animal was immediately killed cut an and sont in the was immediately killed, ent up, and sent to the hutcher's premises for sale. In a similar way eleven cows have here *lost* (as the cow-keepers themselves describe the process) by one man since before last winter, and others have lost theirs in the same vicinity nder like eireumstances; and we cannot doubt that this is a system which extensively prevails in the unwholesome cow-houses in and around London. has issued a prospectus. Speedy opening, as Mr Andrew observes, is far more pressing than speedy transit and hence expensive formation in a case sucl transit and hence expensive iorination in a case such as this.——Amongst hooks received we have to add, a second edition, with additions, of Dr. H. Lloyd's "Elementary Treatise on the Wave Theory of Light," Longmau and Co. publishers; and "Trifles, historical and poetical, from an Idler's Common-place Book," by the same publishers,—an interesting collection.

Miscellanea.

THREATENED INVASION OF NORMANDY.—At the last meeting of the Newesstle-uppon-Type Society of Antiquaries, Dr. Bruce stated that an archeological excursion of some duration was projected, in which, he helieved, any member of the Newesstle Society would be allowed to join. An invasion of Normandy had been planned by the Sussex Archeological Institute. A steamer was to soil from Newharen, and if a landing were effected at Dieppe, a week would be spent in ransacking Normandy. Master Lower, he hoped, would be the Master Wace of the enterprise, and indite a poem thercupon; and the facts of the invasion would be pictorially handed down to posterity hy the facile fingers of certain Lewes Matildas.

SANTARY PROGRESS AT CROYDON,—No great and good movement is without its Quixotic exaggerations and grotesque accompaniments. Sanitary reform has so progressed at Croydon, that in an action brought on behalf of a miller and his men against the Local Board of Health, for contaminating the water in the mill-head and the mill-tail with sewage, and so thickening the flund as to make it sluggish, diminish its power, and retard the mill-wheel, &c. &c. the plaintiff lodged a list of nine several claims, amounting in all to 5,179ℓ. odds, and including 700ℓ. for obstruction of the flund severant, loss of service, expense, and inconvenience 1" That sanitary ideas are now taking a strong hold of the common scuse of the country clearly appears, even in the very uncommon severe of the Croydon miller and bis men.

Dense, and inconvenience !" That is suitary ideas are now taking a strong hold of the common scaes of the country clearly appears, even in the very uncommon scaes of the Croydon miller and bis men. NOVEL COMPETITION. — Two wood contractors, Mr. James Maepherson, Pitchroy, who purchased part of the forest of Clanchearuich, and Messrs. Grant, Carr Bridge, who have lately erected two circular saw-mills, had a trial, on the 17th ult. who could as wthe greatest quantity of timber in a given time. Each party had five men employed, and oue at each mill (mutually closes) for keeping the time. The work was commenced at 6 A.M. and the competition was keen. The Mess.s. Grant took the lead from the first, and, in electioneering language, kept at the head of the poll till the close of the coutest, having sawn 523 square-backed rallway sleepers, and 113 deuls. The other party had only 219 sleepers, and 83 deals. Mr. James Grant, millwright, near Granton, was the contractor for the Messrs. Grant's mill-*Charemeses Courier*.

MAY 23, 1857.

THE IMPROVEMENTS IN ST. JAMES'S PARK.— Last week the Earl of Malmeshury, in the House of Lords, endeavourde to raise a little policical capital by denoming the expenditure of capital of another description on public works, science, and education, and other cognate subjects forming the miscellanceus estimates, and in particular hy objecting to the outlay requisite in clearing out the mad, &c. from the ornamental water in St. James's Park, and laying the held of the water with concrete, an innecessary expense, he thought, on sanitary grounds, inasmuch as her Majesty's family and household had no reason to complain of the state of their health while at Buckingham Palace. Lord Grawille responded, informing Lord Malmesbury that, although her Majesty had male no complaint as to the stageant mud and water, the district modical officers had reparately done so on the part of the inhabitants over whose health they presided. These officers had characterised the state of lifth and stageation into while the water had got as an abominahle nuisauce, and there were other reasons for what had been done, such as the loss of lift with it was covered with ice, the depth being in many places too great for safety, and the hed of full of deep holes, that cleaning cut was a most expensive process, which would now be entirely ohviade bytic expenditures of some 10,000.00, ar 11,000.7, and 900. a year sared thereby. TEADEr NUESNERS COMMITTER or HEADTH

TRADE NUISANCES COMMITTEE OF HEADTH OFFICERS.—A committee of the Mctropolitan Association of medical officers of health appointed to inquire into trade nuisances have issued their first report, which relates to the nuisances arising from gas-works, and has been printed. It enters pretty fully into the subject of gas manufacture and purification, and points out how certain nuisances arise, and how they ought to he avoided. The Metropolitan gas-works have been visited, occasionally, since Octoher last, hy invitation from the managers, who are said to have shown every disposition to promote the objects of the committee.

OXFORD ARCHITECTURAL SOCIETY. — The first meeting of the Term was held in the Society's Rooms on Wednesday evening, the 13th. In the obsence of the President, the Rev. H. B. Walton took the chair, and introduced the subject of the evening's discussion, "The Internal Arrangement of Churches." Mr. Parker called attention to the triple division of our most ancient churches into nave, chancel, aid preshytery, and helieved that the Reformers in England wished to restore this ancient arrangement, and that altarrails were ordered for this purpose. Several churches were instanced which retain this arrangement. After further remarks from Mr. Lingard, Mr. Bennet, Mr. Lowder, and others, the subject of galleries was discussed; and it was agreed that galleries had been too indiscriminately condeumed, which were certainly essential parts of the plan of ancient churches, and in many eases would be a great addition to the accommodation of new occs.

The SUBREY GARDENS.—The directors of these gardens have commenced their new season very well : the oratorio of "Elijah," and a series of "opera recitals," are amongst the fresh things. Danson's modelled picture of "Firiy Land," though scarcely so good as some of his previous productions, is still a very elever and ploasing work. The necessity for innocent auusements, at small cost, for the multitude, is so great, that those who worthily provide them, hough with a view to their own profit, do good service. We have a proof of the demand for anusement in the fact that, in the seven days, from May 9th to the 16th, during which the new reading-room at the British Museum was open to the public, 162,489 persons visited it.

THE CRYSTAL PALACE.—The opera concerts here on Fridays are proving very satisfactory, and draw large audiences. The orderstra is formed in the great transcept, and four or five thousand persons can hear well with case. The charge of a sbilling for the words of the songs is an inposition, which should be abandoned. The first flower-show is anonuced for Saturday, the 30th, when the first display of the great fountain for the present season will also take place. Something should be done to maintain the character of the Crystal Palace as an educator, by the establishment of lectures, for example, or otherwise.

THE BROTHERTON MEMORIAL. — The memorial of Mr. Joseph Brotherton, late M.P. for Salford, is to consist of a monument over his tomb, in the Salford Contetery, and of a hronze statute in Peel-park, Salford. The commission for the statue has been given to Mr. Noble, and its cost will be 1,000 gaineas. The pedestal will be of granite.

CONSUMPTION OF SHORE.—In reply to a question in the Commons last week, Sir G. Grey said that, during the last six months, fifty-four convictions had taken place in London for violutions of the smoke law, and that the police prosecured those parties only who, after representations made to them, refused to comply with the provisions of the statute.

MAY 23, 1857.

BRIDGE OF BOATS AT CALCUTTA .--- A scheme is BRIDGE OF BOATS AT CALCUTTA.—A scheme is under consideration for the formation of a bridge, based on moored pontoons, across the Hooghly, at Calcutta, to the terminus of the railway at Howrah. The cost of such a structure has been estimated at from £125,000 to £150,000. A more solid and per-manent railway hridge, at an expense of £500,000, has been mooted; but it is considered a great object to have some sort of communication, at once to super-eate the present inconvenient mode of consister. and sedc the present inconvenient mode of crossing ; and besides, borings have shown that there was no foun and defines, notings neve sooren that there was no bon-dation for a massive structure in the bed of the river, mothing having been found but a light and loose soil and quicksands, even to the depth of 37 feet from the surface of the river bed. Objections, such as the bore wave, harrienens, &c., have hene considered, but are not thought to he at all visal. The bridge would hene would be one series the mercare of transle be so made as to open for the passage of vessels, and to fall or rise at the river banks, so as to suit the tides. The roadway would be 26 to 30 feet broad, or tides, The roadway would be 20 to 30 left broad, or sufficient for three earringes abreast, with a footpath on either side. Plans and a report have already been prepared by Captain Dieey, first assistant master attendant, at Calcutta, and approved of by Captain T. E. Rogers, superintendent of morine there. HINTS TO WORKEN: TO PROCURE SLAEP----

HINTS TO WORKMEN: TO FROCUES SLARF-Nothing is more injurious or prejudicial to health, and, if neglected long, it may terminate in insanity, than long-continued watchfulness and want of sleep. To remedy this, poor a pint of boiling water on an once of Epsom salts and a teaspoonful of calcined magnesia. Let it cool, and drink it on going to bed. The warm Let if cool, and drink it on going to bet. The warm both is another excellent remedy, as well as the sbower hath, both heing highly sedative. Never eat a bearly sopper, especially of animal food; and drink spirits and water, or beer, "if these are necessary," only after dinner. If these means fail to procure sound and refreshing sleep, lose not a moment in consulting a veryles aroutified normer. If M.

a regular qualified surgeon,-J. B. N. DOOR-KNOBS.-I am anxious to draw your atten-tion to the absurd construction of the door-knobs in tion to the ansard construction of the dor-knows in England. If a prize were offered for a handle which would present the greatest difficulty in opening a door, that condition could not be better fulfilled than in making it perfectly round and smooth. On the conmaking it periocity round and smooth. On the con-tinent, they in general have the sense to avail them-selves of the principle of the lever, in some shape, as we do ourselves in the case of handles to carriage-doors. If it is an object to turn the existing door-knobs to account, it may be easily effected by drilling a hole through and inserting a cylinder, thus imitating a carriage haodle. In the same manner, if we have to pull vertically and overcome a spring, why n New Zealander would use some form of the lever! In this Zealander would use some form of the lever! In this latter ease, I have adapted a wooden lever, although less neat than if made in the original manufacture. Although of less moment, I think any hard wood, ivory, and perhaps gutta-percha, a hetter material for door-knobs tinn metal; the latter abstracting the heat of the hand so rapidly as to be daugerous to delicate persons; but that is as nothing compared to the present objectionable form.—M. the present objectiouable form .- M.

THE ROYAL ACADEMY .- In the first page of the THE ROYAL ACADEMY.— In the first page of the catalogue of the Exhibition of the Royal Academy, there is a notice inviting exhibitors of this or last year to inscribe their names and become "candidates" for election as associates of the Royal Academy. Will you inform me if this rule is found to work well? Not being in the secret, to me it appears either a very impulsive a covert unit seculation. Is added in the politic, or a most unjust regulation. Is election to Royal Academy to he considered as a privilege or impolitic, or a most unjust regulation. Is election to the Royal Academy to be considered as a privilege or nn honour? If a privilege, one can understand why we are permitted to become *candidates*; and this circumstance may perhaps explain why, in so limited a number of members as sixty-six, there happens so frequently that we find the same name repeated (*lwo*) Coopers, *two* Landscers, *two* Pickersgills, and *two* Smirkes). Can it be that the Academy is reduced to this, and that the fill of *R.A.* is to be considered only as a mark of good fortune, and a proof bint a man must be possessed of some influence in order to he so elected? But perhaps I am mistaken, and the distinction is to be considered as an honour, myby should not the proof of this honour be in the fact that it is unsought? Why should not the conneil, each year, *solvet* the most meritorious artist, and invite him to become a member? Why should the newly-elected associate bodd men who had signed their names? But I have said it is *unjust*; for why should a man be tempted binseribo house, by should a man be changed being inscribe his name, when he stands no chance of heing leiceled, although he, poor man, is not aware of the inset? Inscribe his name, when he stands no chance of neurging ledeted, although he, poor man, is not aware of the i fact? Wby should be, by so doing, render himself a mail object of ridicale by his presumption, or bring qupon himself a balf-surpressed sneer, as he is recogning in nised as a "Would-he-Associate." AN OCCASIONAL READEE.

VALLETTA, MALTA. — A correspondent, jealons for the credit of Valletta, where he resides, finds fault with a writer in our contemporary, the *Illustrated* News :--- "The writer saw beauty in a beggar woman, News: In every set of the set of look around nime' Din he survey the alcoeld and beautiful efficies of grand musters, once the terror of the Algerine and Turk, and the bulwarks of Christian commerce in this sea? Did this writer even look up at the glorious painted roof, or regard the workmanship of the shrines? Had he done so for an instant, he must survey have found something. better to talk of than natives on their knees. Permit me, as a keen admirer of the few old and beautiful me, as a keen admirer of the few old and beautiful public buildings we possess, to suggest that Govern-ment should devote a little attention and a little money to the restoration of the paintings on the roof of this old extbedral. The cost would he small; the benefit, as regards the feelings of the mass, great: nay, I doubt not, much of the necessary ontlay would come from the Catholic population, did Government take the lead in the matter."

MODEL LODGING HOUSE SOCIETY AT WATER-MODEL LODGING HOUSE SOCIETY AT WATER-FORD.—From the report of the managing committee, it appears that this body started into existence in November, 1855, and had an income of 3771. for the experiment is said to have been already fully proved.

experiment is said to have been already fully proved. THE GRAIN OF STONE. — A "Querist" asks (p. 279), what composition would he applied to stone columns with a view to hring out the grain and vens of the stone, and then how they could be polished. A strong alkali,—soda, or lime and potash,—using it, if required, several times, would remove the earbon or dirt, and bring out the colours: afterwards emery powder, or pumicestone, rubbed well over, might polish the surfaces.—F.L. NEWS FROM MELBOURNE, AUSTRALIA.—There are few public works of any magnitude at present in

NEWS FROM NELBOURNE, AUSTRALIA. — Indee are few public works of any magnitude at present in course of prosecution here, excepting the making and repairing of roads and bridges, and the construction of the patent slip at Williamstown. A new Govern-ment printing-office, estimated to cost 20,0000. is in course of creation and the interior of the Legislative course of creetion, and the interior of the Legislativ Conneil Chamber is being completed and descrated. The Melbourne Exchange Company are advancing successfully. The plan of the building includes a large hoard-room, sectary's offices, library, and reading-room, 65 hy 32, and a basement canable of reading-room, os ny 32, and a basement capacity of being made into twelve offices; and it is anticipated that these rooms will he completed and ready for occupation hefore June 1st of the current year. The subject of artesian wells has begun to attract much stupiet of artesian wers has hegen to actuate inten-attention. Discoveries have heen made in various parts of the country which justify the most sanguine expectations of our being able to obtain hy such means the great desideratum of a sufficient water supply for the purposes of irrigation and personal comfort working men of Melbourne and the suburbs have The urbs have s Soriba among themselves nearly 1,000.1 in aid of the funds now heing raised to defray the cost of an addi-tional wing to the Melbourne Hospital. DISCOVERIES AT TUNIS.—The Malta Times speaks

DISCOVENTES AT LUXIS.— The Matte Fiber's speaks of the success attending the Rev. Nathan Davi's ex-plorations among the runs of Carthage. In addition to the discoveries of a sories of Punic mosaics, a fur-ther piece of mossic flooring, of about 12 feet square, had been brought to light. In the centre appears a basket of beautiful form and design, filled with members of the finny tribe and other inhabitants of the deep, consisting of several variations of fish, craw-fish, writhing eels, prawns, &c. delineated in colour and effect so as to vie with the most perfect al-painting. A CONTRIVANCE FOR SECURING STACKS OF CORN

A CONTRIVANCE FOR SECURING STACES OF CORM FROM THE ATTACKS OF VERMIN.—We have seen at Messrs. Dray and Co's, the agricultural engineers, of Swan-lane, Upper Thames-street, a very ingeoious method of excluding rats and other vermin from eorn ricks. A set of cast-iron pillars are so formed that an animal asceading to the top fields himself com-pletely at bay, heing covered with an impenetrable dome. With these pillars a set of iron elips are sup-plied, by means of which a farmer may readily construct a stack frame from any waste timhers found on the farm. The cost is ouly about 3/.—" *Parmers' Chab.*"

Sr. PAUL'S ORGAN.—As the keyboard at the west front of the organ gallery has been allowed to remain so long unfinished. I presume some alteration of the organ is contemplated : if so, I wish to suggest that no more money should be wasted ou this unjustly extolled, toncless instrument (built by a foreign work-man of no note), as a good opportunity of purchasing a really grand organ will shortly offer. If, however, it is intended to preserve the present "outrageous machico," I hope you will urge the immediate re-moval of the unsightly keyboard framework, and the restoration of the softer front. ST. PAUL'S ORGAN .- As the keyhoard at the west restoration of the gallery front. AMATEUR ORGANIST.

ARCHITECTURAL CONGRESS AT LINCOLN. itectural congress is to be held at Linco great arc great architectural congress is to be need at Lincoln, on the 26th of May, and two following days. The meeting will consist of the architectural societies of Yorkshire, Nortchamptonshire, Leicestorshire, Bed-fordshire, Worcestershire, and Lincolushire; and the officials of each body are expected to arrive in Lincoln on the day of the day are expected to arrive in Lincoln on Monday, May 25, for the purpose of holding a con-ference for the transaction of business. On Tuesday the whole hody will attend Divice service at the cathedral, and a lecture on the sacred edifice will be catacara, and a secure of the sacred cance will be delivered, by the Rev. 6. A. Poole. The castle, and other objects of interest in the town, will afterwards be inspected; and in the evening a fecture will be delivered upon the introduction of Christianity into delivered upon the introduction of Christianity info Linconshire during the Saxon period, by the Rev. E. Trollope, and another upon the architectural history, &c. of the eatbedral, by the Rev. G. A. Poole. On Wednesday, the 27th, an excursion will be made to Colehy, Somerton Castle, Navenby, Wellingore, Wel-bourn, Temple Braer, Dunstan Pillor, &c.; and in the evening the society's dinner will take place, either at the Great Northern Hotel or at the Corn Exchange. at the Great Northern Hotel or at the Corn Exchange. Lectures will fill up the evening, one being promised on the history of the captivity of John, King of France, at Somerton Castle, by the hon. acting score-tary. On Thursday, the 28th, another excursion will be made to Stow, Littlehorough, Marton, Torksey, Thorney, Doddington-hall, Skellingthorpe, and Brace-bridge; and in the evening the Mayor of Jincoln purposes to invite the members of the societies to an entertainment. The Duke of Newcastle, Earl Stan-hope, the Bishop of Lincoln, and other distinguished personages, are expected to be present. personages, are expected to be present.

THE USES AND ADVANTAGES OF SCHOOLS OF ART. — Mr. Young Mitchell, the principal of the Sheffield School of Art, delivered a lecture last week at the Sheffield school on this subject. There was a considerable attendance. Mr. W. Rhodes, the chair-man, stated that a committee of artisans and working was had hene formed to wise fund to liquidite the men had been formed to raise funds to liquidate the debt that now pressed upon the school. The commen has been formed to raise runds to alquarke the debt that now pressed upon the sobol. Tok com-mittee found considerable apathy in the minds of many, no doubt arising from ignorance of the nature and design of the institutioo, and had thought is desinche that a sories of lectures should be given to awaken synapsthy with the institution, and remove misapprehension, and Mr. Mitchell and Mr. Sterling Howard had come forward to deliver lectures on the applicability of art to Sheffield manufactures. Mr applicantity of art to Shemica manufactures. Dir. Mitchell, in course of his lecture, said :- It may be asked, What has the School of Art done for us? Although it has heen in existence but twelve years, with many difficulties to overcome, it has done much with many difficulties to overcome, it has done much. It has educated many hundreds of your artisans : it has been instrumental in advancing the material and social position of many who, hut for it, might have heen struggling on unknown : it has, I can prove, materially raised the character of your manufactures. In many instances the cool altimied here is utilized materially raised the character of your manufactures. In many instances the good obtained here is utilised at once, and this is particularly the case as far as en-gravers and chasers are concerned, for they, as it were, earry the principles they have learned over-night into the work they are eugaged in uext morning. At the close, the lecturer said,—I call upon you, arisans of Sheffield, to be wise in your generation, and not neglect advantages which will prove of the greatest benefit both to you and your children. I have spoken of art only as it advances a man in his ma-terial position; hut it has a higher mission than this, It is by nature a refining and elevating study, and is It is by nature a refining and elevating study, and is concected collaterally with so many other hranches of knowledge, that the art-student is insensibly led into many pleasant paths which otherwise be would not have trodden. He has no time for base and grovel-ling pursuits, but finds that, as he becomes a better artist, he also becomes a hetter man.

TO ARGINTEGTS, SURVEYORS, AND BUILDERS, THE Advertiser is desirous of an ENGAGE-MENT, u one of the above office. Is commended the A statutor is been as a second of the statutor of the statutor

TIMBER, STONE, MARBLE MER-MERCHANT, POTTEKY MARUFACTURERS, and HOP MERCHANT, Ac. -WANTED, by a Gondenna tow traveling time hidsa's and Western Counties, and invite a good counse-tion with builders, pluribers, Ac. a OUMMISSD's to Sell for any Mandfacturer of Merchang, as above, to account with his pre-ent engagement - Adures, Mr. G. C. C. General Fostodier, Direkol.

TO ARCHITECTS AND SURVEYORS, &c. THE Advertiser is desirous of a RE-exGastevent, in a OFFICE, or as CaREK of WURKS 1- accustomed to the preparation of functional working drawings pressing specifications, estimates of costs, &c. &c. as and the name router of an office. If a size has sime years expensione in the management, and direction of works, upper-ting, Great tauterbury-place, Lammeth, Survey.

PLUMBING. - EMPLOYMENT Wanted hy a propertable experienced Man, writing to mike himsel u efu!. No objection to town or conuiry. Respectatile references -Address. W. T. 65, Henry-street, Kennington-lane.

T I ENGINFERS, ARCHITECTS, CONTRACTORS, &c. MPLOYMENT WANTED, by a Young assorting to a good draghteman, and he had one derable control ou one of the day of the day of the day and references. Address, C. & Mr. Trimmers, Post-office, Breck-nock-place, Cambod Tox, N.W.

GOOD DRAUGHTSMAN, possessing a A. S. knowledge of detail and construction, and commetent to make working, buished, and perspective drawings, is open to an EAGAGENEAT.-Address, G. G. 89, Michaels-place, Bromp-ton W.

A CIVIL ENGINEER, of several years' 'EVIUK's wind practice, and possibility a good knowledge of a (GHI-'FLUK's in fersorial of an ENGASEMENT in cleher of the processions. The highest test monital case be given. - Apply, in c. E. Postoffice, Laureesta, Cornwall.

TO ARCHITECTS. AN Experienced Practical CLERK of Works 13 UPEN FOR REEACAGEMENT.- Address, A. 15. 12, Cropley stree, Hoxton New Yoru.

THOROUGH PRACTICAL CLERK of WINKS is desirons of a REENGAGEMENT: has had emanagement of very extensive public and private works: trans restimutink.-Address, H. Y. T. Other of "Fire Builder."

A N ENGINEERS and SURVEYOR, having A had year experience in England and the Courient, and barog a word drangunanna, winker to make an eNWAGEMENT, either in the Uffec ur on Works, where experience and ability can be made awninable. Unerceptionable testimuonias-Address, X. Y. Z. ear of Mr. spiller, Stanuere, Hotborn-Inil.

S WORKING FOREMAN of MASONS: A cau set out work, make working drawings, good letter-catter and carver, can superintend public works, or underlake the munagements of a general gard. Good refere ce and testimonials. Town or country --Address, L. A. Office of "The Ballyle".

TO ENGINE EERS, IMUNFOUNDERS, CONTRACTURS, AND OTHERS. A RESPECTABLE MAN, aged 36 years, weilsricht in accounty, ment time, modrautur, print COLLECTIN, as Security if required - Address, Mr. W. HXUN, at Mear. Berson, Bon, and Cock Johu's place, Holland-street, Souliwaik

TO ARCHITECTS, CIVIL ENGINEERS, BUILDERS, AND CONTRACTORS. SURVEYOR, of long standing and exten-tion of the standing and exten-sion of the standing standing and exten-sion of the standing standing standing standing measured away freed, upon terms advantageous is to be above of upon invoduring bunness he will share commission - address a. B office of "the bundle".

A GOOD ARCHITECT? BIAUGHTSMAN, thoroughly sequenced with perpos-ting is devined on method with an ENGLEMENT for the Wite University of the second second second second second second University of the Builder.

THE BUILDER.

MAY 30, 1857.]

THE BUILDER.

Vol. XV.-No. 747.

VERPOOL is full of activity. New sets of chambers of great cost and extent are rising on all sides, and display an amount of decoration, externally, somewhat surprising. Some husiness houses of considerable preten-sions are being erected in Boldstreet and elsewhere: the Exchange is to be enlarged, and part of Dale-street is to be taken down, to admit of the erection of Public Offices. In St. James'sstreet, at a short distance from the centre of the town, a new Roman Catholie Chapel is in progress, from the designs of Mr. Pugin. It is of

the Geometrical period in style, and

of considerable size, with claborate Die cast and west windows. Under the same architeet, a new presbytery and other additions are about to be commenced at St. Oswald's : these buildings will be in accordance with the church, which is in the Decorated style.

Amongst the most important works going on are buildings containing sets of chambers for business purposes. The most striking of these is the pile known as the "Tower-buildings," now in progress under the able direction of Mr. J. A. Pieton, and which will hereafter he seen from the water-side. This pile is 105 feet long one way, 06 feet the other, and 65 feet high. The fronts are of stone, with granite dressings, in three stories, and in the frieze and elsewhere display a large amount of carving, some of it very well executed by Stirling. The small columns to the windows hetween the columns of the principal order, have capitals of natural foliage. As we shall give a view of the huilding hereafter, we need at this time only add that the total cost will be from 18,000/. to 19,000/. Within, iron girders carry flat arches, and 2-inch oak planks from girder to girder form the floors.

" Middleton . buildings," nearly completed, close by, under the same architect, shows some novelty in the windows, and will afford us an example of the value of good business premises, in Liverpool, for the Cunard Company have agreed to pay for the ground-floor of this build ing 1,000%. per annum, which is at about the rate of 40%. per square yard.

In a building also for chambers, now being erected near the Exchange, Messrs. Haigh and Co. the contractors, Belgian marble is introduced in conrses in the fronts, with Darley Dale stone, to give variety. Some chambers, close by, in progress, from the designs of Mr. Colling, display in the front a considerable amount of varied ornament. It may be objected that this is flat (purposely, by the way), and that the windows are wide for their height, which renders them somewhat squat: as a whole the building, nevertheless, commands praise. Mr. Cockerell's Assurance-office is not yet sufficiently advanced to tell its own tale

The new landing-stage intended for sea-going stcamers is making rapid progress : it will be 1,000 feet long, and will cost more than 100,000l.; and if you commit yourself to one of the steamers close by it which pass constantly backwards and forwards to connect Lancashire with Cheshire, evidences of similar movement in disc of docks, ship-building yards, and manufac-tories ;-- a more healthful and promising activity

ago, when the land there was first bought by the by partly lowering the road, and partly raising they were about to absorb and wipe out. Liverpool.

There is a tradition that when the parish church of St. Peter was built, abont 150 years ago, Liverpool could not boast of a professional architect amongst its inhabitants. "An appli-cation," says Mr. Picton, in his "Architectural History" of the town, printed in our pages, was made to an architect in London to furnish designs for a doorcase. He sent down four sketches for the purpose. The anthorities here not being able to agree as to which should be preferred, it was suggested that the whole four should be adopted, which was accordingly done, as may he seen by inspection, each of the four entrance doorways being of a different design."

At the present time, if half-a-dozen local architects were needed for each doorease, or any other case, they could be found : Liverpool, indeed, has become au architectural centre, and has many attractions for those who would know what is being done in this way in the provinces. Its magnificent town-hall is of itself worth a journey, and will become more and more so as the arts of the painter and the sculptor are brought to bear on its adorument. The interior is already getting dirty, and the darkened condition of the metal doors and brass gaseliers, seems to suggest something wrong in the ventilation, notwithstanding the elaborate arrangement for it which exists, and the great attention paid to the matter by Mr. Maekenzie and the other resident officers. It is, indeed, elaborate, and, with the heating, costs about 2,0001. a year The air, admitted through huge vaulted passages in the basement, where it is *washed* at the entrance by an artificial Ecoteh mist! is sent forward by powerful fans worked by a steam engine over pipes containing hot water, or other-wise, according to the season, to an apartment where it is prepared for nse, and then, at any temperature that may be desired, according to the theory, is passed into the hall through openings the whole length of the floor. So completely do the officers assume to have it in hand, that the temperature is varied for after-dinner meetings, and during a large ball a uniform temperature, it is asserted, can be preserved under perpetually varying circumstances. Discharging shafts take away both the foul air from above and the smoke from the furnaces, and the whole building is in this respect one huge machine !

The interior of the new concert-room, at the end of the Hall, recently finished from the designs of Professor Cockerell, is singularly elegant in detail. It is oval in plan and light. in colour, with a considerable amount of gilding. The centre part of the ceiling is flat, and rather low. The effect of the mirrors over the orehestra is very good in daylight : how it may be at night, when looking glass often fails, we cannot say

The present aspect of the ground around the George's Hall is almost ludierous. A costly balustrade (with two columns, disjecta membra, rising out of it, opposite the railway station) and gates of great height and size, inclose an area, next the flank of the hall, the level of which is several fect lower than the level of the adjoining road ; and out of this area into which you have descended you ascend the steps leading up to the hall-steps down to steps up, in short. Lions, each formed out of more than one stone, with the faces of lugubrions judges, or masks in a pantomime, form part of the orna. The remedy would seem to be mentation. simple, and ought to be adopted without further eussion: the outer balustrading, with the

"It is not that the things arn'' rich and rare; One wonders how the devil they got there;"-

than that which was evident there some years should be swept away, and a level place formed, that what in vulgar estimation is princely,

aere and sold by the foot, and the owners of it the existing sunk area. The gates, of them-were thoroughly possessed with the notion that selves, look very much like a joke, heing of great and eareful strength, 11 or 15 feet iu height, surmounted by spikes and other defensive arrangements, with a low balnstrade at the side, over which any one may step at will.

The site proposed for the Public Library and Museum is behind the St. George's Hall. Some opposition to it has been offered lately, notwithstanding the circumstance that the first stone bas been actually laid. 'To say the truth, the site, situated as it is on a steep incline, and close to St. George's IIall, is not a good one; but it was shown, at the meeting of the Town Council whereat the opposition was offered, that it united greater advantages than any other available plot of land, and nearly all feeling that, at any rate, matters had gone too far to admit of further discussion, the objection was put on one side.

The plan of the proposed building is said to be good, but the design externally is a poor thing, not likely to maintain the character in an a chiteetural point of view that Liverpool has acquired. A foreign architect, writing to us recently on the subject, remarks,---

"Est-cc que vons savez que les Liverpooliens veulent, pour leur musée, copier National Gallery de Londres !! N'y aurait-il done par moyen de leur faire acheter à bon marché l'original, dont tont le monde attend la démolition ?"

The praises and compliments heaped on Mr. Brown for the wise appropriation of some of his snperfluons wealth, and which must have led many to exclaim, "Something too much of this," ought at any rate to lead to many similar acts, by which society may be benefited and advanced. Mr. Huggins, in his recent address to the Architectural Society of this town, to which we have hefore referred, made some observations in connection with this event which well deserve publicity.

"What struck me," he says, "most during the recent proceedings in honour of that gentleman was how easy and pleasant a path he had found to immortality compared with what. is usually trodden.

Ah! who can tell how bard it is to climb The steep where Fame's prond temple shines at r? Ak! who can tell how many a soul sublime Hath lelt the influence of mulignant stir, And waged with Fortune an eterpal war?

Hard, indeed, for the unblessed of Platus; however ennobled by the rare gifts of genins. But here is one literally strewed with flowers. and yet all but untrodden. To a multitude of men in Liverpool, Manchester, Bolton, worth hundreds of thousands, some half a million and more, how small a price is 30,000*l*.—when it could involve no self-denial nor the sacrifice of a single physical or mental enjoyment—to pay for being made the founder of an institution by which intelligent creatures will for agos to come be inspired with the breath of knowledge, raised in the scale of being, and made hetter and happier through life, and perhaps in death, than they could otherwise have been. Thirty thou-sand pounds! The price is too low, and ought to be raised; while the wonder should be, not at the extraordinary magnitude of the gill, but that it should be at all an extraordinary occurrence, and that Mr. Brown is without competitors.

I must confess that to my own mind the whole of the late almost deification of that gentleman was a satire on humanity. There is no cant in the assertion that rich men are but stewards, and have no right to the exclusive use of enormous wealth, which was given them in Birkenhead will be found in the construction columns, of which it has doubless been said,common daty, in common honesty, to do what Mr. Brown has been idolised for doing. So generosity, judged by a right standard, is barely justice, or less than justice." Scores of men in Liverpool, in Manchester,

Scores of men in Liverpool, in Manchester, in Leeds, in Bristol, in fact throughout the kingdom, could emulate Mr. Brown without any personal sacrifice, if they pleased; and would do so, if they were to reflect on their position in the right spirit.

"Let us hope," continued the speaker, " that Mr. Brown will have imitators, and even rivals, and that donations will pour in of sufficient number and amount to render our Free Library of Liverpool such a wonder of the age that the Bodleian, the Ratelille, and other renowned institutions of the kind shall be no more heard of, and make Liverpool in reality what Haydon must ironically have called it, the Florence of England.

But there is other ground besides the Free Library,—other, and some larger, fields for heroes of the class. We want a muscum of geology, of botany, of mineralogy. We want an architectural muscum : we want a good permanent gallery of art; a gallery, too, for annual exhibitions of painting, sculpture, and architecture: the present one is, I believe, only rented. We want a score of humanizing and refuing institutions that I am unable to name. What capital chances are here for our millionaires so many passports to immortality! We have, or can soom make, within and around St. George's Hall, an abundance of niches, braekets, and pedestals, which need not be all rated alike, or so high as 30,0007. but put up at different prices—say from I0,0007. to 50,0007. or 60,0007.

We would repeat the observations to the wealthy of each town in Eugland, and ery aloud everywhere, "Step in, gentlemen, step in."

Brief as our notes have heen, we have said enough to justify our assertion at starting, that "Liverpool is full of activity."

THE GOVERNMENT COMPETITION DESIGNS.

SHOULD any inaccuracies chance to be found in the letter of our correspondent last week ou the block plans, our disclaimer of responsibility at the time will be held sufficient. In accord ance with what we said at first, we apprehend that the halance of opinion on the Bridge ques-tion is not as he puts it; and even had he made no error in his elassification, the fact of a considerable number of designs showing a bridge in place of that at Westminster, on a different site, would be not conclusive; for there is much evidence here, as in other matters, that competitors indicate what they think will be accept able, and thus are not just to their calling and to themselves; whilst, further, the chief of the plans proposing a new site show the disadvan-tages of it, as we also have said,—the view of our correspondent in one place—that a removal northward would serve only the Park—heing really the same opinion as our own under another guise. We shall, however, continue to state what are the different propositions in the street plaus, so that our readers may judge how far we were correct in our generalization whether regarding the whole, or the more im portant, of the plans.

portant, of the plans. Under the number 65, with the motto, "Optimus ille est qui minimis urgetur," are included a geueral plan and block plan, and a design for the Foreign-office. In these the author, who appears to he a foreigner, retains Mr. Page's plau for Westminster-hridge, but adds another bridge, joining the northern portion of the ground by a line askew, to a point ou the opposite side,—not in the direction up, but doen the stream. He also shows colouaded, or other communications between the Offices, crossing Parlianeut street. Some objection having regard to the purpose of eoncentration has beeu seen by many of the competitors, to the break in the system hy the very wide street which follows almost of necessity from the instructions. The contrivances for remedying this are, however, in few cases sufficient.

No. 70, "Crescens," a design for the Foreiguoffice, is one of the better works in one, though that not the highest, of the classes of authorship into which the collection might be divided from evidence of drawings alone. This No. 70 may be of what we might call the student class,—a class very different to that of certain works referred to in our first uotice,—which had surely come from the least imaginative of "five orders" men, or the hopeless suburban school of shop-fronts and compo-pilasters.

come from the least imaginative of "five orders" men, or the hopeless suburban school of shop-fronts and compo-pilasters. No. 71, with the motto, "Spes est meum astrum ductum" (which we copy literally), and the device of a silver star on blue ground, in-cludes a general block plan and drawings, of a desigu for the War-office. We observe that design for the War-office. We observe that the author would more Westminster-bridge to a site approached from the middle of the ground a site approached from the matter of the glothan which is west of Parlianent-street. The gene-ral arrangement of the Offices is hased on the *datum* of the present Board of Trade building, which would be preserved,—adding a similar front at the south end of new Parlianent-street, from at the source end of the an anti-instead of and building the War-office as a centre. The design is an ordinary arrangement of columns and window openings, with masses at the ends, crowned by domes. The Offices adjacent to the crowned hy domes. The Offices adjacent to the Houses of Parliament, it is proposed should be Tudor, hut less florid in character than the Tudor, hut less florid in character than the Houses. This way of solving difficulties of the site is not a good one; but t.e present author only illustrates as others do, the disadvantage resulting from the prevalence of more than the one style. He proposes that the main streets should be 114 feet wide, from front to front. The ventilation has been considered; but the unrident mould be avite, dest (if is extraordi corridors would be quite dark (it is extraordi-nary how general this error is); and the inter-ual fronts of the courts exhibit no decoration, ual fronts of the courts exhibit no decoration,— they have mercly holes for light.—We hold that No. 72, "Vietoria and Alhert," is a work of in-structive character, properly looked at. Like some other desigus, it might show what to do, by the very opposite which in itself it practises. Its preteutious architecture in the hulding for the War-office and Foreigu-office, includes a major and wince order of columns a placed without the and minor order of columns, placed without the slightest harmony of proportion, a portico of seven columns, and had details. Fortunately there is power in the heauty of good architec-ture to hold its place, where the good and the bad are, as in this exhibition, side by side—provided only that each is *examined*; but the case is not so with the public always, or where comparison cannot be made. In his general plan, the author moves Westminster-hridge to the limit of author moves Westmaster-hridge to the limit of the ground-moth,—whereby he gets an unne-cessary augle in the Lamheth approach, which joins from the Bridge-road.—The design No. 73, "Arcana Imperii;" and No. 73a, " Vox populi dignitate urbis;" appear to be hy the same hand, though not accordant with one another. No. 73a includes a general plan and a hlock plan. West-minster-bridge is altogether removed; and a hidze at the Horseferry and one with anoroaches hridge at the Horseferry, and one with approaches httige at the HOTSCHETY, and the wird approach opposite the Horse Guards—seem to be considered sufficient. The blocks of building in Parliament-street would fail in effect, as shown, for the very reason that the fronts are ueither quite symmetrical, nor sufficiently different. The author of No. 73, as distinguished from the last, would leave Sir Charles Barry's building; and under the idea of harmonious junction of the styles north and south, he adopts for his design for the War-office, the Jacobean style, or, as he would call it, Anglo-Itahiau. The objections to the Gothic style are uot as the author puts some of them, "from the enormous expenditure, such as deco-rative style would involve," — these objections start from false premises. The general decorative details in No. 73 are plain, as appearing to the author most suitable to nurposes of business, and south, he adopts for his design for the War-office, defails in No. /3 are plan, as appearing to me author usors suitable to purposes of business, and include rusticated pilasters, and mullioued and transomed windows. The principal front has truncated roofs at the angles, and in the centre

No. 74, "In hoc spes mea," including a calculation as to effect from helow. The general plan, and a design for the pavilious at the angles have truncated roots, Foreign-office and War-office in one building. The angle plasters, or piers, are rusticated, and proserves the site of Westminster-bridge; and have capitals of novel and beautiful design, and proposes. In the plan of the Offices there is a dorways not made prominent, but are marked large central court, with a cortile north and by the wide flight of steps. In the flanks the south. Portions of the corridors are again central feature is different, and quite subordi-

inadequately lighted, as we find them in many designs where one central court is provided. The decorative character is rich Venetian, with arch-headed windows and orders.

No. 75, with the motto "Deus atque jus," is the work of a Frenchman, who signs "A. B. d'H. Inspecteur aux Travaux du Louvre," and appears to say he received "honourable men-tion " in the competition prior to the erection of the Exhibition hulding of 1851. The draw-ings here are likely to be passed without observation by many but they exhibit beauty of architectural detail and precision of drawing such as are not surpassed by any of haud petitors. The author at first felt the project to petitors. The author at first fell the project to be so immense that he should not be able to enter upon it; he, however, sends a general plan, a detailed block plan, and drawings of a design for the War-office and the Foreign-office. The general plan is not very clear at the height at which it is placed, but the author's chief intentions are explained in the block plan. This, as the bridge and the caveful attention This, as to the bridge, and the earcful attention This, as of the orage, and one calculate attended to symmetry, somewh at resembles the plan in No. 12, also by a Frenchman. As in that case, the site for the hridge would be an excellent one, were the sole object that of providing a communication hetween the Offices and a corresponding spot ou the Lam-beth hank; hut, for all traffic from the Birdcagewalk, the new site, would add four turns to the present direct route, and to the inconvenience of the Offices themselves. The chief difference between the two plans, is in the omission in No. 75 of the great place in the centre of the system, and (since the portions of ground, east and west of Parliament-street, do not accord in the northern line of houndary) in the placing the hridge to centre with the *western* ground : thus the norcine strength of a security of the secur present direct route, and to the inconvenience of thus, the precise symmetry considered essential thus, the precise symmetry considered essential by both authors, would be gained by No. 12 hy trespassing on Great George-street, and by the other hy a suggested appropriation of Rich-mond-terrace. The several blocks of building arc shown with galleries of communication across the streets. The internal courts are shown haid out in *parterres*, as also are the sunk arcas of the basement in the Foreign-office design as an alternitive surgestion. It is design, as an alternative suggestion. It is curious, that the value of shrubs and gardenground towards architectural effect should be more foll in France than in England, where horticulture is so well understood. The im-portance of the combination was better under-stood in the buildings of the Elizahethan period. The plans under No. 75, for the War-office and the Densing effice are characterized by the area The plats unrefine two by the true of the true and the Foreign-office, are characterized by the same attention to symmetry as the plan we have been noticing. In each Office there is an obloug court in the centre, with staircases well planned for effect; and generally the lighting has been properly considered. The drawings, however, are difficult of examination, not being drawn to the preseribed scale. The end elevations—the east of the War-office, and the west of the Foreign-office—consist of three principal stories ou an elevated basement, the latter rusticated horizontally, the ground story having arch-headed windows with archivotis, imposis, and plau circular panels in the spandrils; the story over, similar windows, with an order of three quarter Corinthian columns; and the upper the Foreign-office, are characterized by the same quarter Corinthian columns; and the upper story, short Corinthian pilasters, windows architraves and cornices, and a general entabla-ture cornice to the building, which is finished by a Mansard roof with dormers. The mould-ings on the roof are especially well calculated for effect. It should, however, be observed, that there is the usual arrangement in pavilions and the centre pavilion has an extra story, with pilasters and panelling, and a dormer, or similar feature, and a lofty curved roof with bold feature, and a lofty curved roof with bold enrichments at the angles and the summit, where there is an elaborate piece of decoration, forming the base for the flag-staff. The whole of this part of the design displays great heauty of ornament, general taste, and the required calculation as to effect from helow. The calculation as to effect from helow. The pavilious at the angles have truncated roofs. The angle pilasters, or piers, are rusticated, and have capitals of novel and beautiful design, and the another statues or vases. The

nate. In the general group, the two Offices appear to correspond in all points,—but they are united hy a two-storied huilding with gateways, a central pavilion and high truncated root. The a central pavilion and high trancated roof. The style is that of the later French Renaissance The interior decorations, in the style of Louis XVI. are studied; and, like all the ornamental parts, are drawn with a skilful touch. No. 76, with the motto "Grande Certamen,"

No. 76, with the motto "Grande Certamen," is a design manifesting considerable novelty. The authorship would be ascribed to the right quarker, without the help we gave. The drawings include a general street plan, a hlock plan and views, and drawings of the War-office and Foreign-office as one general building. The general plan has some marked peculiarities. The author would move Westaninster-bridge to correctly the centre of the westam participant. The author would move westminster-indige to opposite the centre of the vestern portion of the ground, but he would place another hridge, and a route crossing Whiteball, at a point a little north of the Horse Gnards, the road curving round to the Haymarket. Between the two new bridges, on each side of the river, the two new bridges, on each side of the river, he would place, if we see the plans aright, Offices and residences, with terraces on arches on the Surrey side. He would open a street from opposite the door of Westminster-hall, running due north across the site of Hungerford, such as the Stand. All the circuit proceeds running due north across the site of Hungerford-market to the Strand. All the streets proposed are of ample width, one on the Surrey side being 100 feet, and one from the new West-minster-bridge, through the Offices to the Park, being 150 feet wide. Parliament-street, of course, would be widened; and all the streets would have arches over them for communi-cation between the Offices. These arches model he built from time to fine as works of would have arebes over them for communi-cation between the Offices. These arches would he huilt from time to time, as works of commemoration. The present Board of Trade building, the present author would preserve. The War-office and Foreign-office would form one building, with three courts and corridors, for free communication from end to end, and across,—or the councetion of the Offices could he cut of at any time. A door of communica-tion hetween the residence and the Foreign-office also, appears to have been carefully left. office also, appears to have been carefully left. Entire separation is bardly desirable, and would involve constant inconvenience. The corridors would he lighted in great part by borrowed lights, which perhaps are not objectionable woma he ngined in great part by behaved lights, which perhaps are not objectionable where the rooms are for offices, and are themselves well lighted, and may be made conducive to effect in the passages them-selves. The principal entrances are from the centre court, which itself is reached from Charles-street, hy a cortile of three archways and transverse arches. The entrances men-tioned lead to halls lighted from the top, and staircases. In the Foreign-office the stairs wind round a large enclosed well-hole, if we may so call it. The entrance to the residence from the park is hy a bold flight of steps and archways, over which, in the first floor, is a loggia of arches. In the decorative effect, the sky-line of the building plays an important part, from the varying heights of the masses and the numerous domed turrets or other features of the same kind. The design shows three or four stories kind. The design shows three or four stories hesides an elevated basement, and a fifth story sometimes added, in the centre. The windows are numerous, and are often filled in as to the upper part, with something like Gothic nullions; and similar work is introduced to various arched recesses which occur in some parts, as in projections which are cor-belled out like oriels, the last being sometimes placed obliquely at the angles. In many other parts ideas taken from the Gothic style are expressed in form; we may mention the centre pier and statue to a doorway of coupled open-mers. The turrets we have mentioned, which hesides an elevated basement, and a fifth story per and statute to a doorway of competent open-ings. The turrets we have mentioned, which have tall finials; sculpture, freely introduced; and many varied defails, complete the design, so far as it can be described in print; for, the design which has most merit is necessarily that which it is difficult to place before the mind by written description; the results of negative which the

and that the Gothic style, when used in accord-ance with examples, gives little opportunity for applying the materials of our owu time, and that it is shown to be unsuited now to public and private buildings by the circumstance of the want of harmony which we observe in towns be-tween cluwerbag and public huildings. The style want of narmony which we observe in towns be-tween churches and public huiddings. The $style_{\sigma}$ therefore, which he produces from all sources, may be called the author's own. The construction of the building has been well considered. It is proposed to carry the fire-proof floors by iron brackets and landings forming a backbroposet to call landings, forming a horder or shelf, 2 to 3 feet wide, round each room, the hrackets being made ornamental. Thus the girders would be free at the ends, and the mode of construction would he at once most suitable to the material-iron, and hest calculated to allow accidental fire to be confined to the room in which it commenced.

No. 77, with the motto, "Fortiter et Fideli-"," includes designs for the War-office and ter," includes designs for the War-office and the Foreign-office, as distinct buildings, in a similar siyle of architecture. Both subjects, ienographically as well as decoratively, are treated hy the author (whose name has heen mentioned), with much technical skill and taste. Whether his chance is in jeopardy from the blacked and coloured plans which he bas sent in, we are not aware; but most of the compe-titors have very carefully striven to keep within the instructions, which ought to have been so clear as to leave no room for misconception. Both the designs now before us, are in the rich ter, Both the designs now before us, are in the rich Italian style, which, with the addition of new Julian style, which, with the addition of new features—the high pitched roofs and pavilions— hecame naturalized in France, and has been made by that country as much its own, as elsewhere it is Italian. The *style*, however, now has become no longer Italiau, but is European; and there is The balance of the second seco another to appear to he devoted to similar uses; and yet they are sufficiently distinct for variety. In the plan of the War-office there are four courts --56 feet by 46 feet each—and au octagonal hall in the centre from which the four principal cor-ridors lead out, 20 feet in width each, and join to other corridors round the huilding. Most of the corrier corracts round the authing. Most of the corridors are lined by columns and arches standing some distance from the wall, leaving space where light is admitted by glazed pauels in the floors and ceilings. The lighting on this method—looking both at the arca and the position of the services method by carried for the short of the openings—would be ample for the short length. The top corridor has a sky-light. Other corridors are lighted from the courts. The tempth. The top control has a sky high. Otoci-corridors are lighted from the courts. The central hall—lighted from the top—contains the main statrcase. Three flights of statrs meet at a landing in the centro of the hall, whence the upper flight joins the gallery, whence the stairs again ascend. Internal effect has been well con-sidered in the plan of the corridors. The building has three main stories, with a fourth story as attic to the pavilions; but there are also mezzanines with separate staircases above the ground and one-pair floors, in which above the ground and one-pair noors, it which are well placed the required conveniences. Each angle of the building has a pavilion sur-mounted by a truncated roof, on the attic story; and in the Parliament-street front there are two other pavilions, joined by a central portion of the building and a lower line of roof with availand denover and targing the bar with enriched dormer, and terminated by au Italiau louvre turret. Amongst the decorative details, three-quarter columns and pilasters, and It is allocated to the elocated with the description of the results of the elocated work of the solution of the series and the solution of the terms used for forms and details in the solution of the terms used for forms and details in the solution of the terms used for forms and details in the solution of the terms used for forms and details in the design now helore us certainly has, and pictorially composed masses. The author contends that the classical styles are inapplicable, is a quality with the the solution of the

are distributed so as to produce a rich effect. In the Foreign-office and Residence, the plan has, we think, a peculiarly distinctive character, in the collection. From a slight error—as to not showing source of the linesdotted—some little time may be required to understand the arrangement of the strenger which are excited with the distinct of the strenger which are excited with the distinct may be required to understand the arrangement of the staircases, which are contrived specially for distinct ingress and egress of the visitors at receptions. The plan includes two courts, with entrance gateways from the Park and a cross-way of communication from court to court. Of the gateware the owners the next is for the gateways, the one nearest the north is for the entrance of earliest the hold in Total is to doorway under it gives access to the staircase of ascent, 10 feet wide, near the foot of which of ascent, 10 feet wide, near the foot of which are servants' rooms and retiring-rooms. From the suite of reception-rooms, the distinct stair-case of descent brings the visitor to the landing at the foot, whence he can pass straight to the southern archway, or ean turn to the right through a large hall—which occupies the centre of the story on the park side, and is well adapted for footney waiting—and can enter his carrier for footmen waiting-and can enter his carriage that way. Another peculiarity of the plan is, that way. Another peculiarity of the plan is, that the Cahinet-room and Foreign Ministers Waiting-room are so placed, in the centre of the building, that they can be entered by a separate staircase from the way between the two court-yards. The Minister's private resi-dence is at the south-western angle, the cutrance dence is at the south-western angle, the entrance heing from the southern archway hefore men-tioned. The public offices are entered hy an arcaded loggia in the eastern front, and the inner hall and public staircase are ou the orthern side of the entrance hall. The offices of the Secretary of State may be com-pletely shut out from the more public portions of the building if required. The corridors are lighted similarly to those of the Warpletely shut out from the more public portions of the building if required. The corridors are lighted similarly to those of the War-office. A mezzanine floor, for the required conveniences, is arranged over the corridors and smaller rooms. In the exterior the uum-her of stories and the angle pavilious are arranged as in the other design, but are varied in decorrigic euriphenets. The roofs of the her of stories and the angle pavilious are arranged as in the other design, but are varied in decorative eurichments. The roofs of the angle pavilions are formed in enress of contrary flexare, with bold mouldings and eurichments, and have dormers and circular openings,— whilst the centre pavilion is finished with a pediment and senlpture, and high truncated roof, also much enrebed, and is flanked by pro-jecting masses in the façade. Salient columns supporting statues, candelabra, and sculpture, are used throughout the design, with great richness of effect as the result. Every part of these designs will well repay study. Lover in merit is No. 75, with the motto "Hoe Propono," attached to a general plan, a hlock plau and a design for the two Oflices in one huilding. The author keeps the site of Westimister-hridge. His design for the Offices has the general fault as to the corridors, and externally exhibits an order of Corinthian eo-lumus the height of three stories, and an attie with pine-cones as the termination of the podes-tals_-No. 79, with the letters S. P. O. Lipelules

Immus the height of three stories, and an article with pine-cones as the termination of the pedes-tals.—No. 79, with the letters S P Q L, includes a general plau, a block plau, and a design for the War-office and the Foreign-office in separate buildings, with a communication. He would remove Westminister-bridge altogether, place a remove Westminster-pringe antigenet; place a bridge at the Horseferry, and one opposite the Horse Guards, near which (or between White-hall and the river) he would have a new parade-ground. He would also extend the line of the Haymarket to the Park. In the plan of the Foreign-office, the residence next Downing: roreign-omee, the residence next Downing-street has archways for earninges to set down in a small court. The details of these designs appear to have been taken from books without real study, or freshness of invention.---No. 80, real study, or freshness of invention.—No. 80, "Omnia vincit Andre," by a foreiguer, is a poor work; but the anthor is at least cor-sisteut, for, after removing Westminster-bridge a little farther work, he utilizes the approach hy carrying a part of his office-buildings up to the elock-tower. To the cousternation of their architect, we should think, he would effect the "completion of Westminster Palace" hy ereeting a building in front of the Peers' Offices and Victoria Tower included.

ings, marked by some originality and effect, but altogether better suited for a building for a different purpose, and not a national work. From the holes plan we find the removal of Westminster-bridge contemplated, with the erec-tion of a skew-hridge with an approach in con-tinnation of Charles-street. In the plan of the Warden the street is the street of War-office there is a court of irregular form divided on the ground-story. In a small por-tion of the plan the sides of the court are but I so the plan the sines of the court are but 18 feet apart, so that the lighting might there be defective. The entrance from Parliament-street is by a bold areb with coupled columns and side openings, forming an effective *corlie*, and beyond this is a staircase semicirculur on plan, lighted floot above, with corridor round. The principal front is remarkable for round. The principal front is remarkable for its bold masses and recesses, its few large archheaded windows, of various proportions, its prominent rusticated work, and coin-stones cut with facets, and its panelling to the top story. In the principal mass, the centre in the top story is retrenched, and the sides are finished with pediments. Each of the two recesses is filled up on the ground story with a loggia of two arches. The Foreign-office and the Resi-dence are distinct in external design, as in plan, with the exception of a communication by colonnades on the ground story. The corridors are lighted by circular lights in the floors, and these could not be deemed sufficient. The entrance to the Official Department, is from Charles street, beneath a great portice, hexastyle and Constitution the start of the start of the start of the street of the start of the start of the start of the charles street, beneath a great portice, hexastyle Contracts street, benefit in a great portice, hexistyle and Corinthian, flanked by turrets; and the Residence has a carriage-porch next the park, a rusticated basement, two stories of arch-headed and Venetian windows, continuous enriched imposts, coupled columns and balconies, and is surmonuted by a done on a low tambour and square podium.

No. 53, with the mot'o, " The British Forum," as the work of an Italian, may be looked at with a certain kind of interest. It does not, however, testify to the vigour of our art now, on the very soil from which since the period The second secon interesting one: that there is no inherent feehlences—no finality—in any phase of the Italian style, we helieve can be shown from what has been effected through it, as also from the works in the present exhibition, --- neither is it clear the political state of Italy has to do with the condition of art, as often supused; for we apprehend that this state not less favourable on the whole, than were the circumstances under which the original were the encounstances inner when the original works were produced. Whilst, however, the state of political subjection is similar to what it ever was, the noble families no longer exist, possessed of the same wealth and influence; therefore, new buildings are not asked for, and our profession, when not drawn into the departbut processing its not not new into the depart-ment of engineering—in which the Italians have great skill—is absorbed in antiquarian studies and investigations, by which exclusiveness of persuit the ir ist mind is deadened, and the deficiency in power becomes fixed. This quesdealency in power necomes acceleration, however, we cannot now pursue. No. 83 includes a general plan, a detailed block plan, and separate designs for the Foreign-office and War-office. The motto indicates one idea, on and separate nesigns for the coverge War-office. The motto indicates one idea, on which it is based. Retaining the site of the new Westminster-bridge, the author would add tri-umphal arches, quite unaware how inappropriate these would be, considering the traffic of Loudon. In the *plans* of the Offices, we observe again remarkable defects, such as distinguish the old traine, buildings from those of our own period. Italiau buildings from those of our own period The convenience of having passages of commu-nication, instead of going through one room to get to another, appears to have been generally felt only in our times; and still it seems we have the only in our time, and said score back to have to be any south of the plans of those pas-sages —with due regard to lighting and couve-nicone. The Italians, however, judging from the initiations of their works in this country, the initiations of their works in this country, submitted to a considerable amount of incon-venience. The peculiarity referred to here as a defect, is remarkable in the plau of the War-office, in No. 83. External loggias are, in their place, excellent things; and

these have not till lately been adopted in English architecture to the extent that might have been expected. But, they do not answer as the only means of communication from room to room. The elevation for the War-office is of indifferent Palladian character. In the design for the Foreign-office there is little merit in the plan; but the elevation is of rather better cha-The elevation for the War-office is of rater, disfigured, however, by the royal arms in bronze, of enormous size at the top. The style is Venetian, and the centre has well-pro-portioned loggins in each floor, with arches on columns, and some of the angle piers arc in good taste

We shall resume our notice in another number

Notification has been made that the Exhi Induction has been made that the EXII-hitton will be closed on Saturday, June 6. The Hall will be open for the exhibition of the models for the monument to the Duke of Wellington, early in July; and it is stated that those designs for the Offices which may have selected to receive the premiums will be exhibited at the same time.

CORRESPONDENCE ON THE WESTMINSTER DESIGNS

I WOULD not willingly add to your editorial troubles I work the provide the set of the E. L. Garbett." I piss over the oracular spirit which pervades the

I piss over the oracning spirit which pervades the former part of that document, and its appropriate squel, the mode in which distinguished reputations, both iving and dead, are referred to. I come at once to his haboard altern, i to affix an opprobions sobrique to the architecture which three-fourths of the competitors the Government Offices bave adopted-characterizing it as the per-centage style. It is true that, like a pointloss arrow, the witless epithet falls harm-has to the ground—but look at the *animus* displayed. I see our discretion of the data and the data is signified. I le would insituate, that mea who have been Labour-ing with such indefstigable zeal and energy—many in the midst of pressing professional avocations, all with a great outlay of time and money—with very faint hopes of any reward, and often supported only by an nopes of any reward, and often supported only by an echlusisatic love of their work for its own sake—that such men have selected their style, on the base, pattry, contemptible principle of its comhining the least aucount of labour with the largest amount of pay

The malignily of the suggestion is only surpassed by its abaurdity. Why, I for one cau tell birn, from the bottom of my heart, and there are scores to re-echo the sentiment, that I would rather associate in your with works conceived in the spirit of those "grand" siyles which he *affects* to despise, for one per cent. renumeration, than with some of those unorbid creations which he affects to admire, for ten that amount.

But he also supplies us with tables, profess But ne also supplies as the analysis of the based upon facts, and presenting an enalysis of the various designs; and against the truth and accuracy of these I protest, as the result of his own reading of these I protest, as the result of his own reading of the Government instructions, and distorted view of

the converting designs. It countering designs. I do not for a numeut wish to provoke a discussion on this subject. Our works are now before a high, dignified, a.d. we hope competent tribunal, and for would care (o vingheate themselves at such a bar a there of end. as that official

I only rsk to be allowed to protest against his Tony say to be ellowed to protest against his supersions, such express a hope that the pages of the Builder will never be suffield by that intolerant spirit, characteristic of the Midule Ages, which, with a few honour ble exceptions, the votaries of Medicavalian seen to admite equally with its architecture. I enclose my eard, and an A COMPETTOR FOR THE BLOCK PLAN.

-IIitherto the advocates of Gothic Art amo Sin,—Hitherto the advocates of Colinic Art annous, your correspondents have written morphosed. One great gun bas be n field after another, and common sense makes no reply, and takes no pains to disabuse public optimion of the attempts to trammel it with the tedious repetition of the Pointed Arch and the cease-less cusp; as though one style alone were suited to iedious rep.tition of the Pointed Arch and the cease-less cusp; as though one style alone were suited to arc clurate, and as if that style alone were truthful One unbusia-tic aposite of Christ has left the Gospel or plast for Governmeet Offices in this bygone style. Even your elever correspondent Mr. Gribet has fallen foul of the beautiful buildings, on the Continent, of the teatures. There is not un architer two travels abroad but returns imbued with the desire to reproduce the

charming forms that have rendered his rambles so delightful. This remark holds good with the authors of most of the Gothic designs in the present compe-tition, and renders the proises of their critics highly ridiculous, claiming an English origin for what is actually an importation from abroad: thus Nos. 35 and 116 are deeddeedy Halian, and the "Noble Violi-cation of English Ari," No. 129, is most evidently continental. In thus rebutting the philogoths, I can desirous contor of abroactine the adposition of a really desirous only of alvocating the adoption of a really truthful and sound system of architectore, in which the meterials and construction of the present day should be used without recurring to styles long gone by

Surely it is not desirable to obscure our winde Surely it is not desirable to obsoure our windows with stone multions, or mince up fine sheets of glass into quarries, any more than we should darken the streets in our gloony elimate with heavy classic con-nices or shady portices. As long as we build in brick, the segmental arch is a proper constructive bend of an engineer mindow co door. Descent these head of an ordinary window or door. Decorate if you will sculpture may be applied here, as where, and is, as Mr. Ruskin well said, a more Decorate them said, a more beat where, and is, as Mr. Ruskin well said, a more beau-tiful mode of enrichment than plain mouldings. But for the proposed Government Offices we are not con-fined to brick: the hulding materials of the whole mation are available: in most freestomes, where large blocks are used as lintels, straight lines are easier to work than circular, and the square-headed window is the natural result. It was a favourite maxim with the late Mr. Pagin that small stones only were suited to Gothic architecture, and yet constructively a large the lafe Mr. Fugin that small stones only were suited to Gothic architecture, and yet constructively a large slab is preferable to the numerous joints hetween small blocks. I cannot agree with Mr. Gorbett that the mere fact of repetition, as in Italian buildings, is a fault: a tree is not less becutiful because it is governed with leaves so like each other as not to be everged with leaves so like each other as not to be distinguished at a glance: neither does an animal lose any of its beauty by having one cyc to corre-spond to the other, or its ease scally alike. On the whole, therefore, it seems quite numeessary to be restricted to one arch rather than auother: treat your work with taste and judgment, and be sure that light and shade, and elegance of ontline, will please as well and snade, and eigence of ontime, will please as well in one shape as another. And as to grouping the new buildings in harmony with the Abhry and Par-liament Houses, adopt the Gebbic principle of working out the characteristics of the present sgo, and the effect will be far more satisfactory than could be secomplished by the servile initiation of the forms of Mediaval Auglican Art.

Sceing that the *Bni/der* of last week states that Messrs. Angell and Pownall are appointed assessors to aid the judges in selecting *the best designs*, per-haps it can also inform its renders what is meant by these three much-used words. Do they mean the best plauss for the purpose with suitable façades, or the best faqueles? and in either case are they to be the best faqueles? And in either case are they to be the best in the Hall, or the best in accordance with the instructions? Lately, when a sub-committee chose the prettiest drawings laid before them, and was asked if the prize-sets fulfilled the instructions, the sub-committee ingeniously answered, that when it made committee ingeniously answered, that when it made the decision the instructions were moon the table; there was no difficulty in guessing what that meant. Certainly the number of competitors who have kept to the instructions is so unusually large, both as a majority of the profession as of the candidates; that I do not cory the fate of the judges, whoever they may be, if the Westmiaster-hall Exhibition terminates in a choice made "with the instructions upon the table;" and (which is unlukly for any bad choice) there will be no hope of avoiding much criticizen on the sclented and (where is infractly for any one charter the selected be no hope of avoiding much criticism on the selected designs ; a criticism which will be safely more furious if the prize-drawings are removed from public view.

Prace. With you allow me to offer a few suggestions as to the Goven ment Offices competition? Ist. That the mass of the competitors, most of them being well known, he atlifted to the drawings, and this and that the where exhibition. That the where exhibition and that the where exhibition and that the where exhibition and that the where the drawing and the sec-stations - N. B. The larger places only would suffice: and that the whole of the principal street elevations be placed in a continuous line, on a level with the eye, in a separate apartment, so that the various purely architec-tudied. They should be place for without containing, the dothic on the other, of some long gailery-say the commute-rooms corridor of the Houses of Pariment. 40. That the ground plane only answering to the showe devisions be hung immediately below the cleanions, hat the meaning and intention of the elevations be thus made rooms and the draw grawings, a fair judgment by consequence.

PEACE

C. B. A.

SOME RECOLLECTIONS OF THOMAS BEWICK, THE ENGRAVER.

BEWICK, THE ENGRAVER. THE value of the labours of Thomas Bewick, and his brokher R.bert, in advancing the arts amongst the masses in this country, can scarcely he overrated Before the days of the B.wicks, engraving on wood, to which this and other journals are now so nucle inducted, was a deal letter—the art being considered as only saitable for the roughest and most counton devations of words. It is true that before the time description of work. It is true that, before the time of Thomas Bewick, Albert Durer and others had cut of Thomas Bewick, Albert Durer and chois had cut func things on wood, but these works were uot so familiar to the prople of England seventy or eighty years ago us at present; in fact, five kad as oppor-tunity of so ing them. It is entions to note the erreturn-tances which led to the usefulness of the Bewicks, some of a small farmer. They were born at Ovingham-on-the-Tyne, a few miles from Neveeshle, a place surrounded by brandiful scenery, and which had formerly been a Roman station, and had in other was interesting associations. ys interesting associations. At the age of about fourteen years, Thomas Bewick

At the age of ubout fourteeu years, Thomas Bavick was apprenticed to an engraver named Brihy, at Newcastic-ou-Tyue, where he was tanght to engrave door-plates, dog-collars, silver plate, moulds, and similar matters. At that time the faces of the "eight day tlocks," as they were called, were chickly of brass, and were elaborately engraved with flowered and diapered patterns. In this department of work Thomas Bowick scon arguired great skill, and even when his tatent as a wood designer and engraver had been recognised, he was often pleased with the oppor-tunity of cuting a olaci-dial and hoasting to his pupils,---" Ahl boys, many a one of these Tve done."

The purples of the contrast of the purples of the p

with images which heendeavoured to convey in picture to the multitude. No one knew better than Thom Be the indicted is the other and showness of printing look illustrations from copper plats, for he had, besides his assal pursuits, often himself worked at the copper-plate printing-press; and the set about designing and engraving wood-cuts which could he printed with the

have had an opportunity of examining some of We have had an opportunity of examiung some of, the blocks which were engraved for the "History of British Birds," and these would surprise many of the wood-engravers of the present day. In parts they are sunk and hollowed to a considerable depth, in order to make the light tints anitable to the press printing. It is extraordinary to compare this primitive mechine with all those applications of steam which have, notwithstanding the rapidity of production, enabled us to dispense with the trouble-come process of lowering and on the sunk surface some process of lowering and on the such surface engraving the tints and textures. We, however, pro-pose in this brief article not so much to examine luto the artistic murits of Thomas Bowlek, as to give our

the artistic murits of Thomas Bowick, as to give our personal recellections of him. At the test can of the far-ous church of St. Nicholas, in the churchyard as it is called, in one of the houses which shift this chocked-up mass of mouldering deed, a plainly-pointed board announces that the place was occupied by "Thomas Bewick, eugraver and a preprilet printer." On ascending the outer stype, at the cul of a pas-sege might be noted the copper-plate multires. The bouse was hot two stores high, and on the door of the ouse was painted with the mercanfile multires. The bouse was hot two stores high, and on the door of the mper part was painted "T. Bewick's Workshop." Here, for several house in the day, the engraver might be found busily employed at his desk in a liftle sametuar: on one side was a small gluzd door, which

* During several years of his apprenticeship Thomas Bewick walked from Newcastic to Ovingham to see his parents, and back again, and did not by the way shut his eyes to natural incidents.

the reason of their failure—the only return they can have, and which they ought to have. 6th. That the professional judges be paid, and hberelly paid, for their work; such that they repert to the com-mission; the commissioners, as at present appointed, in the end fanely adjudicating. In this way will be advan-tages of a competent professional insight, and the prestige of a royal commission, be obtained, together with a fair satisfaction to those who shall be unsuccessful. C. B. A. another the pupils, and through this opening (lennell, William Hervey, Nesbit, and others, who have heen whief instruments in advancing the nasful have heen thief instruments in advancing the more art of engraving on wood, have received many a art of engraving on workart of engraving on wood, nave received hinly a useful lesson. On the valls of this study, or work-shop, were cases of stuffed hirds and fishes, and some choice old prints. The phase was plain and homely, like its immate, who, usually dressed in a suit of grey of nseful rather than ornamental cut, was ready to attend upon enstomers or to receive a wisit from some because attent or nutrulist.

brother attict on naturalist. Thomas Bewick was a tall, stontly formed man, of pleasant yet plain manners, and was always ready too speak his mind, distiking much the flattery which was at times bestowed by those ignorant of art on his works. works

During the printing of his illustrated books, a part of each day was speat in superintending the press-men, who were engaged at the old-fashioned presses men, who were engaged at the old-fashioned presses in printing the sheets; and even when up in years he spared no pains in getting studies from nature for his arawings of natural history subjects, and when busy with his small ent of the peaceck he travelled from Newcaski to Elswick, a distance of more than two miles, upwards of a dozen times, to each the opportunity of sketching this beautiful bird with its tail dis-ulaved. played.

ost of the examples which illustrate the history of birds were in the same way carefully studied from nature, as any be at once seen by comparing the animation of those done from the life with others

autination of those done from the fife with outers which have been drawn from shifted specimens. Thomas Bewiek was also an excellent musician, and played well on the Northannbrian bagpipes. Ou the news of the Peace of 1815 arriving at News astle, the church bells rang, the caunon on the old castle roared. and Bewick buckled on his pipes, and cause to area, to do so likewise; and, playing an appropriate tune, they marched several times in triumph round the

to do so hadwise; hill, indying at spinophare takes they marchicl several times in trimuph round the churchyard. During the early part of his life Bewick visited London, hat the publishers there were ignorant of the merits and uses of wood engraving, and be received is on little encouragement, and likel so little the bastle of the place, that he was glad, as he said, to shake the dust from his feet, and ennice k in a coller for his well-loved neighbourhoods, which no doubt often intruded their inages in his mind in the erowded thoroughfares. Even while in London he did not neglect the study of nature, but wondered to Bagninge Wells and Maiden-lane to study the docks and other plants which grew there in profusion. It is to he regretted that so few of Bewick's original sketches have been preserved, for their faithfulness must have made them valueble. It would be well if the wood engravers of the pre-sent time would, more than is now practised, follow Bewick's example with their pupils. He did not set them down at the heginning of their career with small blocks; and, without any knowledge or practice of drawing, make them, until the expiration of their engagement, cut tints and textures without their being able to make a sketch of the most simple kind either on paper or wood. This is not the way to raise wood engraving as an art. In winter nights, in the old-fashioned workshop, the youths sat down by reasule-light to their drawings, and in the summer avenings strolled to the hedge-sides, and studied art in the hest of schools. Some of the exquisite draw-ings of coarts seenery which are to be found in Bewick's insomer the schools. art in the hest of schools. Some of the exquisite draw-ings of coast seenery which are to be found in Bewick's volnucs are the work of Cleunch and others of his pupils — a circumstance equally creditable to the master and themselves.

At the time of their production, the li-n and some other engravings of animals on wood, which were about 6 inches square, were looked upon with wonder about 6 incles square, were leaked upon with wonder: indeed, it was no casy uniter to find the hax-wood necessary for ents of this size, for then the plau of joining small pieces of wood together had not bern invented, and it was by no mrans nunsual for a block to erack so much as to be useless either in the process of engraving or piruling. Harvey's large ent of the Assassingtion of Dentatus, was suggived on a joined block but either distance in a second Assassing of Dentatus, was engravel on a joined block, but although it was changed with iron, it was not long able to bear the working. We believe that the method of joining the blocks as now in use was bronght to its present slate by a Frenchman, whose name we have never been able to discover. Perhaps some of our readers can culighten us on the subject. But for this plan, the illustrated papers could never have been produced. An improvement is this mode however, is even now wanted. It there sugger. But for this pair, the interface papers could never have been produced. An improvement in this mode, however, is even now wanted. Is there no hard wood, say in Austrahn, from which incokes of larger size than is attainable in hox wood, could be i:ut i

NEWGATE. -- The recoustruction of Newgate, from the plans of the city architect, Mr. Banuiag, has been commenced. We shall give particulars hereafter.

FOREIGN INTELLIGENCE.

The Kölner Domblatt .- It is owing to the activity general, that it has become necessary to compile an alphabetical register of the whole series. M. Reich-eusperges, M.P. of Prussia, is at the head of the undertaking. Official Statistics of Railways,-Two most im-

General Statistics of Intercents, --Iwo most im-portant works on this subject have been lately pub-lished. "Decuments Statistiques sur les Chrmins de Fer," publisheit by the French Secretary of State for Agriculture, Commurce, and Public Works. For its compilation a commission has been formeil, consisting compilation a coumission has been formed, consisting of members of the directors of railways, engineers of mines, and of bridges and roads, presided by Citopen Comt Duboir. The other work is the third volume of the "Statistische Nachrisrkten von den Prus-sischen Eiseubahnan," published by order of the Prussian Minister of Commerce, Industry, and Public Works, by the technical bureau of railways. It con-tains the results of the year 1855, and likewise a general chart of Prussian railways, with sixteen plans do aisoellement. Act in Rewise - There has arisen of late, in St.

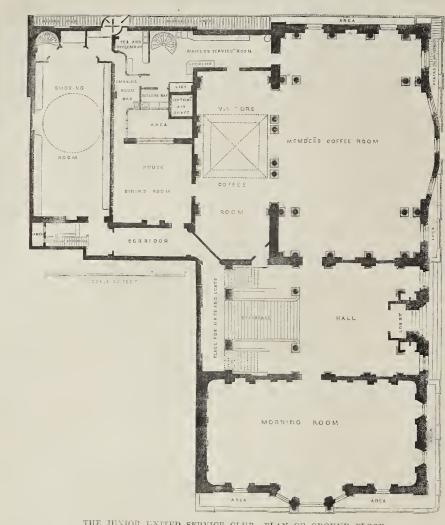

Art in Researc.—There has arisen of late, in St. Petersburgh, a Muscun of especial Ethnography, the new Muscum of the costmanes and weapons and armour of all periods of history and all nations. Of especial completent as here are the speciments belonging to the great Slavian nations of Russia, but even the Melineval period of Germany has not been neglected. While, ut 1845, many of the royal assends of the Continent verse plundered, their worthier contexts found a way to the Russian emittal and the visitor from any country. In 1845, many of the royal atsents of the Continen-were plandered, their worthier context found a way to the Knesian capital, and the visitor from any county will find here former acquaintences of his. This imacum has now been described in six volumes of text, and illustrated in four large follo volumes of colour-printed plates. The Library of Dresden pos-sesses already this, as well as the work on Crimean Autiquities. The St. Petershurg National Gallery has now been erriched by the complete arrangement of the Lairchtenberg hequests of pictures, which Eugène Bandharonis had parily collected when Vierrey of Italy. To this is to be added now the collection Parberige, formerly of Verice, and considered the finest after that of the Academy. Amongst these are above seventeen pictures by Titian, from his very first appli sketches up to the time when this spirited man, privards of ninety years of age, still had lost little of his former warmth and imagination.

THE GREAT BLAST AT HOLYHEAD.

THE GREAT BLAST AT HOLÝHEAD. Is presence of upwards of 1,000 persons, a portion of the 110/head moventain, which is 122 feet in height, was displaced, on the 21st inst. by a hlasting operation of upmaralleled magnitude. The removal of a considerable portion of the mountain is necessary for the formation of the mountain is necessary for the formation of the mountain is necessary myleli is now being constructed under the superin-tendence of Missirs. J. and C. Rigby, who personally superintended the operations, assisted by Mr. G. C. Reitheimer, the resident engineer of the firm. Two or three of these operations have already taken place, and so eminently successful were ther, as to induce testitemer, the result engineer of the him. Two or thre of these openitions have already taken place, and so cunnently successful were thry, as to induce the engineers to attempt another on a much larger scale. The arrangements contemplated the displace-ment of 120,000 tons of rock, by the application of 15,000 hs. of gunpowder. At the last moment, the engineers determined still further to extend the operation, and for this purpose two additional ehem-hers of mines were prepared, making the weight of gunpowler used 21,500 Hs. and the body of reck displaced, to less than 60,000 to 200,000 tons, being even far more than could have been calculated on. At a given signal, all the chambers were simul-tuneously ignited, and the harge hody of the rock and mourtain was upheaved, and fell down on the side in ange farguments of several tons each. It will be re-moved by tachway for the purpose of completing the hreakware, from which it is ahout two miles distant.

TO EXTINGUISH FIRES EFFECTUALLY .as the fire-engine is in readiness to work, stir into the water seven or eight pounds of *pearlash*, and conthe water seven or eight pounds of pearlash, and con-finance to add the same quark ty, as occusion may re-trying: taking care that it be directed against the there tunber, and not wasted against the brickwork. Where in a vessel of water, and as fast as it dissolves, mix a paiful in the water in the engine preity often. Wood, steeped in a strong solution of "phosphate of am-monia and horate of soda" becomes incombately are treated by these alkalies, fires will be next to impos-sible.—J. B. N.

THE BUILDER.

307

ROME.*

In the consideration of so disputed a point as the topography of the Roman Fornm, there is one peculiar feature in the claims to consideration of the theories of the late Commendatore Canina, that must not be lost sight of,-namely, Canina, that must not be lost sight of —namely, the fact of his being an accomplished architect, as well as a profound and crudite antiquery. San Gallo, Labacco, Scrlio, Palladio, Scammozzi, Desgodetz, and Piranesi were architects, but they were no topographers, at least, according to modern requirements in such. They could to modern requirements in such. They rear again the prostrate building, give b ick it: fair proportions to the runned portice, and cover the crumbling marble blank with living sculp-ture; but to fix the site where the temple or the basilica once stood, where all is now empty space, or modern brickwork, was not of their capacity. On the other hand, the great Italian and German topographers, from Flavio Biondo to Bunsen and Beeker, though so eminently fitted by their knowledge of the classic authors for the task of penetrating the obscurity in their writings that has proved such a legacy of dis-cord to the world in general, possessed not that knowledge of architecture which is of such material assistance in the laying out of au unfavourable site for a fixed purpose; and which if well performed, affords of itself so strong ar argument in the reading of a passage of doubt!'ul import.

In the case of Canina, however, both these qualifications were united in an eminent degree, and however mistaken he may have been both in his earlier and latter theories, his excellent scholarship, his thorough denowledge of the forms and requirements of the various civil and religious edifices of the Eternal City, the inde-fatigable industry with which he could mould the most inauspicions site to a particular struc ture, his minute attention to detail, and extra ordinary devotion to the great object of his honourable ambition, if not constituting of themselves an argument in favour of his ticular views, yct entitle those views to that consideration and deference which his greatest antagonists have felt honoured in paying to them. The author of twenty-four folio volumes them of plates, and ten or twelve octavo volumes el learned text, there must of necessity be much in bis works that must he ascribed to his own glowing imagination only, but, on the other hand, there is nothing in his elaborate restora-tions for which good reasons may not be as signed. Right or wrong in this topography, his notions of the dignity and magnificence of the Eternal City cannot fail to instruct and impress. Take, for instance, his views of the Forum, first in its desolation, then as he conceived it to have been in its imperial splendonr. Looking from the Rostra Julia towards the Capitoline, on the left, the Basilica Julia raises its imposing mass; the Temple of Jupiter Tonans, on the mass; the tempe of supper romans, on the ascent of the bill, comes next; and to it suc-ceeds the Temple of Saturn and the Arch of Tiberius; in the ceutre, side by side, rise the Temples of Vespasian and Concord; and to the right, the Carcer Mamerimus and the Basilica Temilie. The head-ground is filled up to the Emilia. The background is filled up, to the left, by the edifices of the Arx; to the right, The background is filled up, to the by the Temple of Jupiter Capitolians, towering above all; whilst in the foreground the Eques trian Colossus of Domitian, the Column of Phoeas, and numerous statues and monuments bewilder with their profusion.

equally imposing spectacle. To the left the Arch of Septimus Severus forms the chief object in the foreground; the Basilica Emilia object and Stationes Municipiorum follow, and are succeeded by the Basilica of Constantine, parsucceeded by the basisten of Constantine, par-tially concealed by the Temple of Antoninus and Faustina; whilst in the middle distance, the Basilica Fulvia, the Temple of Julius Caesar, and the Temple of Venus and Rome stand out against the bold background of the Colosseum. The space to the right is occupied by the Arc of Titus, the Curia Julia, Temple of Vesta, Basilica Julia, Arch of Tiberius, &c.; the built-ings of the Palatine forming the background on that side, and the area of the Forum occupied, as before, by statues, &c.

Such are the huildings that Canina groups Such are the huildings that Canina groups round the Forum. In the site of his Forum, and in the direction of its longer and shorter axes, he finally agreed with Bunsen, Beeker, and the German school in general, with the candour which distinguished him, at once admit-ting the indisputable evidence of the new dis-coveries, but retaining for it the form of a paral-lelegram instead of a transmission and differing lelogram instead of a trapezium, and differing much in the position of the surrounding huild So bigoted, on the contrary, was the late Professor Nibby to the old opinions, that in his latest work he adopts the expedient of making the line of pavement in front of the Basilica Julia mark the northern limit of the Forum instead of the southern, and allotting the space etween the Column of Phocas and the Arch of Septimius Severus to the Forum of Ciesal

The rule had down by Vitruvius for the pro-portioning the length and width of Fora, in the ratio of two-thirds of the former to the latter, was not applied to the Roman Forum, if the limits now assigned to it be correct; and the probability that, if different, he would have noted the exception, has not been lost sight of as an argument for certain views of the questim

Of the probable situation of the Gracostas we before spoke. It was so called from the fact of the Greek ambassadors, and perhaps also deputies from other foreign or allied states, "ubi natiomum subsisterent legati qui ad senatum essent missi," being allowed to " ubi nationan essent missi," being sentum essent thear the debates, just as the Stationes Municipiorum appear to have the Stationes Allotted to municipals for the senters an open space, same purpose. It was merely an open space, elevated above the surrounding level, and of similar character, as far as can be now judged, was the Senaculum, on which the seuators were accustomed to assemble before entering the Curia to deliberate. "Senaculum vocatum ubi senatus aut ubi seniores consisterent."

There is no account of any building, during the republican period, occupying the narrow end of the Comitium, where the Temple of Julius Cæsar was afterwards erected; but on the south Crear was afterwards erected; but on the solution side may be placed, with almost absolute cer-tainty, the Temple of Vesta and its appurte-nances. Of these, the Regia certainly fronted the Comitium, but whether the dwelling of the vestals (the *Virginea Domus* of Martial) also fronted the Comitium we have no further means of ducidic deciding.

We have already given a brief account of the history of the Forum during the first two ceu-turies and a half of its existence-that is, under One of the first works of the rekings. the public was the completion and consecration of the Temple of Jupiter Capitolinus. The uext of importance had its origin in the b tiful legend connected with the battle of the Lake Regillus, " a conflict," as Niebuhr re-Regillus, " a conflict," as Nicbuhr re-"between heroes like those in the Iliad." marks, The legend states that the dictrior, Anlas Posthumius, having vowed a temple to the Dioseuri, the twin gods, Castor and Pollux, were seen upon white horses, fighting in the ranks of the Romans, during that eventful day, and that, before the battle was well over, the and that, before the base of the device of the Roman Forum, and announced to the people assembled in the Comitium the happy result of the con-Near the fountain of Juturna, where they flict gave water to their horses, the temple to their Viewed from the opposite extremity, at the honour was creeted, and the eloquent verse of foot of the Campidoglio, the Forum presents an Macaulay has found a grateful theme in recording the event :---

e Or node they to the Forum, While harrel boughs and flowers, From house toys and from windows, Fell on their creats in abovers. When they drow night to Vesta, And wash'd their horsen in the well That aprings by Vesta's fame. And statight again they mounted, And rode to Vesta's door; Then, like a blast, away they pars'd, And no usin saw them more. And no usin saw them more.

Minerva Chalcidica (to which latter he assigns the three Corinthian columns so long known, from the statements of Lucio Rauno and Marliano, as those of Jupiter Stator, but which Poggio referred to the bridge of Caligula; Poggio referred to the outige of counting, Canina to the Caria Julia; Bunsen formerly to Castor and Pollax and Dyer latterly so); Canina phees it behind the Basilica-Julia; Becker in much the same position as Bunsen and Dyer, as we said before, where the three columns stand. It was commonly called *ades Castoris* only; and Cicero describes at once the importance of the temple and its position in the words, "Iu ade Castoris, celeberrino clarissimoque incommento, quod templam in occalis quotidi-anogae conspectu populi Romani est positan." It was restored by Metellus Dalmaticns, and rebuilt by Tiberius. Caligula conuccted it with rebuilt by Tiberius. his palace by breaking through the back wall and found a senseless gratification in placing himself between the statues of the twin-gods to be adored by the people. In commemoration of the legend, an annual procession took place of the legend, an annual procession Took place of the Roman knights, in state attice, and crowned with olive, who, leaving the Temple of Mars ontside the Porta Capeua, traversed the city, and proceeded across the Forum to the Temple of Castor and Pollux, where they offered their homage.

their homage. The invasion of the Gauls, A.U. 365, must have almost destroyed the whole city, as the Romans entertained serious thoughts of mi-grating to Vei, but the patriotism of Camillus changed their purpose and the city was rebuilt, and on measure of the averat the Tawnele of Comand in memory of the event the Temple of Con-cord was founded upon the Campidoglio. In U.C. 410, the Temple of Juno Moncta was conscerated upon the Arx, where the house of Manlius stood. In 449 a small bronze shrine was erected to Concord, upon the Vulcanal, by C. Flavins. In 542 a free is recorded by Livy, which destroyed the Atrium Regium, the Forum Piscatorium, the Septem Voteres Tahernae, and other huildings. Of the several Basilice of this period we have

already spoken. The same diversity of opinion which attaches to the sites of most of the buildings of the Forum is cutertained with regard to the Basilieas also, except the Juba and Amilia, and the difficulty existing about a right understanding of the several editions of the latter we before alluded to.

At the time of the crection of the Basilica Emilia the same consul whose name it hore crected a Temple of Concord upon the Clivus Capitolinus. And in the same year the Forum was adorned with the triumphal arch called Forux Fabins, or Fabianus, crected by Q. Fabins Allobrogicus, in commemoration of his triumph over the Allobroges, but of the position of which we are by no means certain. The few other works about the Forum during the republican period were merely restorations or alterations. Sulla, when dictator, made certain changes in the Curia Hostilia, and after its destruction in the Clodian riots it was rebuilt destruction in the Clodian rols if was rebuilt by his son Frantus. Crean, however, caused it to be pulled down in B.C. 45, nucler pretence of having vowed a temple to Felicitas, but in reality to efface the name of Sulla. In 652 Q. Initatius Catulus commenced the substructions of the Tabularium on the Capi-toline, as proved by an inscription found upon the next recording the areast

With the dictatorship of Julius Casar was connected that new era in the history of the Forum which was the cause of its subsequent appearance under the empire, and the building a new Curia was one of its most important features. features. The exact position occupied by the Curia Julia is another disputed point, but we shall not be able here to go into the arguments, and must content ourselves with the results. Suffice it to say, therefore, that Canina as to it the three columns standing near Sta. Maria Liheratrice; that Bunsen concludes it to have been the building of which the lofty brick walls are still standing belvind the Temple of the three columns; that Becker, agreeing with The exact site of this temple is a matter of a state regards the three columns. The exact site of this temple is a matter of a state remains of the Temple of Minerva, men-great dispute, though in its *whereabout* all are between the Basilica Julia and the Temple of under Nero; the Senate-house being transferred

Here, hard by Vesta's temple, Build we a stately dome Unto the great twia brethreu, Who fought so well for light

by Domitian to the angle of the Forum, near the foot of the Clivus Capitolinus, in which quarter we find it at a late period of the empire; and that Dyer places it on the site of the Hostilia and looking on to the Comitium, which, as we before showed, he places at the north-west angle of the Forum, near the Arch of Septimius Severus. The other works connected with Julius Casar

were the Forum that hears his name, with its Temple of Venus Genetrix, and the Basilica Julia. The latter, which scenar to have replaced the Sempronia of which we hear no more, he left to be fuished by Augustus, which fact, together with its situation between the Vieus Jugarins and the Viens Tuseus, or, in other words, inter ædem Castoris et ædem Saturni, is plainly told upon the Marmor Aneyranum. The mutilated inscription found in 1835 near the Buchated inscription found in 1855 heat the Column of Phoces, and which proved upon in-spection to be the same copied two centuries hefore by Gruter and Panvinic, and afterwards relurricd, has both no reasonable doubt of the site of this Basilica

Either hefore the death of Cæsar or imme diately afterwards, the Rostra also were removed from the place they had so long occupied in the centre of the plazza to the south side of the centre of the plazza to the south side of the Forum. Bunsen has pointed out that these new Rostra are not to be confounded with these Rostra Julia, which were, in fact, formed out of the basement of the Temple of Julius itself. the basement of the Temple of Julus Itself. Besides these, there appears to have been in later times a third edifice of this kind at the other end of the Forum, and to which Bunsen (adopting a suggestion of Canina) has ascribed the remains found adjoining the Milliarum Aureum. After the death and apotheosis of Julius Cesar, first an alter and then an Ædes divi Julii were erected where his hody was harpet burnt

The Temple of Antonians and Fanstina, at the extreme north-east angle of the Forum, was the last building of importance that adorned its circuit; and, as if to complete the circle of doubt and difficulty, the inscription upon the architrave, though entire, still leaves a doubt as to which of the Antonini it refers.

Of the works of Septimirus Severus, the only one that hears his name is the triumphal arch at the top of the Forum, which originally seems not to have spanned any road, as the latest ex-cavations prove it to have heen clevated above the level of the Forum. As a striking con-trast to the ruin of the glorious monuments of Column of Phoeas, the homage of a slavish minister to an unworthy master, yet rears its head, while all around is prostrate.

We have thus traced roughly the general features of the disputed points that have made the Romau Forum in its desolation, where—

"A thousand years of silenced factions sleep."

the arena for discussions as fierce as ever agitated it in the days of its might and glory. Upon topographical matters we must abstain from further argument, and coutent ourselves with a few more observations upon two or three of the remaining points of greatest importance in this extensive field of inquiry.

The old Forum had long ceased to serve for the Comitia for the election of magistrates, hut was still found so inadequate for the amount of judicial husiness, that Julius Cæsar conceived the idea of a new one devoted to that purpose alone; and which undertaking was terminated by Augustus, together with many others of his incompleted plans. Not many years, however, elapsed before Augustus had to add yet another rum for judicial purposes, and surpassing that Re Forthroof judician purposes, and surpassing time of Cessar in extent and magnificence. Each of these Fora contained a temple : that of Cæsar heing dedicated to Venus Genetrix, the reputed parent of the Julian family, and that of Augustus to Mars Ultor, for assistance reu-dered him at Philipmi

Augustics to Mars Offor, for assistance reu-dered lim at Philippi. No vestige of the Forum Julium remains, and topographers had merely agreed in placing it somethere on the north side of the Forum Romanum, when Nardini pointed to its correct site near Sta. Martina, and Canina produced the proof. Of the Forum of Augustus, all we

THE BUILDER. restored by Hadrian. In Palladio the portion Basilica, and regards a portion of wall still re of the wall of the Forum which he saw forms maining behind the church of SS. Cosma and coves on each side of the temple, with porticos Daniano as part of the cella of the temple

in which Augustus placed the statues of the greatest Roman generals. Remains of three of the handsome Cornithian cohomes with the the handsome Corinthian columns, with their entablaure of the Temple of Mars Ultor, still exist near the Arco de' Pantani.

The Forum Transitorium, or Forum of Nerva was begun by Domitian, hut dedicated hy Nerva. From the Temple of Minerva, placed in it by Domitian, it was also called Palladium, and it derived its name of Pervium or Transi torium because it was traversed by a street connecting the north and sonth sides of the city. Canina places it between the Temple of Pea ice, and that of Cæsar with its longer axis ex tending from the Forum Romanum, and shows upon it a fourfold archway of Janus Quadrifrons facing each of these separate Fora. Palladio restores this Forum in his work, and Du Perac alls it the most complete ruin of a Forum in ome. In the Via Alessandrina the remains of Rome. the enclosure of peperino may still be seen, together with two large Corinthian columns, half buried in the earth, with the entablatnes

halt burned in the earth, with the entailabores covered with mutilated reliefs, and over them an Attie with a figure of Minerva also in relief. The last and most splendid of the imperial Fora was that of Trajan, and its design was to connect these Fora with a certain important For a was that of Trajar, and its design was to connect these Fora with a certain important quarter of the town in a manner suitable to the magnificent structures on either side of it. Though hegun by Bomitian, it was executed hy Trajan, with the assistance of the calcbrated architect, Apollodorus of Damascus. But, as Mr. Dyce observes, "as no ancient author has left us a satisfactory description of it; we are obliged to make out the plan, as best we may, from what we can trace of the remains." It consisted of the following parts: --The Forum, properly so called, adjoining the north-west sides of the Fora of Cæsar and Augustus, and filling the whole space hetween the Capitoline and Quirinal. Next to the Forum, on the north-west side, lay the Basilica Ulpia, which extended across it lengthways, and thus served to form one of its sides; and on the northto form one of its sides; and on the north-west side of the Basilica stood, and still stands the column of Trajan, the finest speci-men of its class in the world, 127 feet high, and still the shaft heing composed of nincteen cylindrical pieces of white marble, in which the steps for ascending the interior are ent, and the surface covered with reliefs in spiral hands, representing the wars of Trajan against Decebalus, and con-taining no fewer than 2,500 human figures. In Fahretti, Piranesi, and De Rossi, the best illus-trations and deceriptions of this magnificent umn are to he found.

There are traces of the further extent of this Forum to the north-west. Excavations have brought to light enormous granite pillars, he brought to light enormous granite pillars, he longing prohably to the temple which Hadriau dedicated to Trajun, mentioned in the Notitia, in conjunction with the column. How long this Forum existed is uncertain. In the Mirais spoken of as a thing that has disbilia it

appeared. Before leaving the subject of the Imperial Fora, we will say a few words upon the position of the Temple of Peace. All antiquaries, from Poggio to our own time, have regarded the grand and imposing ruins still remaining he-tween the churches of SS. Cosma e Damiano Sta. Francesca, as those of this celebrated ple, erected by Vespasian, and destroyed by temple, erected by Vespasian, and destroyed by fire in the time of Commodus. Nibby was the first to call in question this long-received appellation, and to prove that the ruins in ques-tion were those of the Basilica of Constantine, the next question that arises is, whether the Temple of Peace previously occupied the site of these ruins, or whether we must seek its loca-tion elsewhere. On the one hand Poggio only eated the appellation that had from middle ages been assigned to them; on the other, from a passage from Procopius, it would other, from a passage from Procopius, it would appear that the runus of the Temple of Peace were still visible long after the construction of the Basilica of Maxenilus, and that consequently the two buildings could not have occupied the the proof. Of the Forum of Augustus, all we the two buildings could not have occupied the know is, that it was reduced in scale owing to same site. The latter view is adopted by Canina, the obstinacy of certain householders, and was who assigns to the temple a site adjoining the devices, &c. forund of virtified bricks. The north gable, fronting Humber-street, is surmounted by a

surrounding the sacred area; our bunsch, on the contrary, who assigns this wall to his Forum Transitorium, maintains that the Temple of Peace occupied the place since covered by the Basilica, and that the name of Forum Pacis was used to designate the Basilica, together with the elevated open space around it, recently laid hare hy excavations.

For those who may take an interest in this fresh subject of dispute, the short essay of Mr. Bunbary upon the Fora of the Emperors will convey in a condensed space the arguments pro et contra, as well as all other matters con-nected with these Fora. The following resume from his pen may save us further trouble in the

" The series of magnificent structures thus raised by successive emperors has probably never heen surpassed in point of architectural splendour; but they ar e of comparatively little in terest to the scholar, from the absence of all those ennobling associations which have hallowed the preciucts of the Republican Forum. Still, they formed a feature in the Imperial city, and it is impossible to pass them over without examination

Two attempts have recently been made, by collecting together the notices we find in ancient writers, and comparing them with the still existing remains, and with those of which the memory has been preserved to us as extant at a late period, to restore, as lar as possible, the form and arrangement of those monuments of imperial greatness. The one of these we owe to Canina, whose architectural attainments have here been of the greatest advantage; whilst Becker, who has adopted his views on this subject almost without alteration, has illustrated them from the ancient writers with great learning and shilly. The other system is that of Bunsen, which he has brought forward as a sort of sequel to that elaborate restoration of the Roman Forum, the leading points which have been already discussed. If 0 If his efforts in the present case seem less successful, it is hut justice to him to hear in mind In, it is not justice to find to heat in hind of that they are only put forth as an attempt, and with a very just sense both of the difficulty of the undertaking and the uncertainty of the results obtained. It will be readily seen that the arguments upon neither side can be consi-dered as entirely conclusive; and the decision the question can only be looked for from future excavations, unfortunately rendered very difficult by the new streets and masses of houses which have grown up here since the days of the earlier topographers. Much that even Palladio still saw has since atterly perished : much more which could then have been explained and laid open with comparative ease, is now buried, it is to be feared, for ever.'

We purpose concluding these notices upon Rome topographical in another number.

SCHOOL-BUILDING NEWS.

Horsington. — A new school-house has recently been opened at Horsington, from designs furnished by Mr. H. Hall, of Bath. The building consists of thr.e school-rooms and a dwelling for the master and mistress

Hull .- Steps are being taken for the erection new boys'school, on the north side of St. Paul's courch, Hall. It is to be 73 feet 6 inches by 30 feet, and there will be two elass-rooms, 20 fret by 16 feet and there will be two class-rooms, 20 fret by 16 feet 6 inches each, and every other requisite school accom-modation for upwards of 300 children. It will be built in the Early English style.
